The purpose of the study was to compare the physical fitness variable of Kho-Kho and Kabaddi Players. To fulfill the objective of the study 25 Kho-Kho and 25 Kabaddi male players of Calicut University were selected who have participated at minimum inter collegiate level of Calicut University. The data were collected in different coaching camps organized by the colleges of Calicut University. The age of the selected subjects ranged from 19 to 25 years. (Standing Board Jump and 60 yard dash tests) were used to measures the selected physical fitness variables of the players. In order to analyze the data t-test was used to analyze the data and investigator observed the significant different between Kho-Kho and Kabaddi players.
Review of related literature:-
Gupta et al. (2002) [2] conducted a study of the physical fitness, spinal mobility and flexibility in footballers. The study deals with physical fitness spinal mobility, and flexibility of 95 footballers of national and inter-university levels. The player’s performances were competed with adequate controls. Three physical fitness tests viz, sit-ups standing broad jump and shuttle run, anterior and lateral spinal flexion and spinal extension were conducted on all the subjects. The results of this study indicated a greater physical fitness in footballers.

RUDI M, et.al, (2001) [1] A total of 146 professional rugby league football players, contracted to 2 teams competing in England (n = 45) and Australia ( n = 101), participated in this study. All players completed the following series of physical fitness performance tests: 1 repetition maximum squat and bench press, 15- and 40-m sprint, agility run, 5-minute run for distance, 60-second sit-up, 30- second plyometric push-up, and measurement of body weight and subcutaneous skinfold (4 sites). Analysis of variance with a criterion α level of p< 0.05 was used to determine if any significant difference could be found when grouping players into 3 different positional categories typically identified in the sport. There were a number of significant differences with respect to test results between categories, and this was apparent for all 3 systems of categorization. On the basis of these findings, we recommend that to more efficiently structure the physical fitness training of players, the players should be grouped either according to the 2 broad positional categories of forwards or backs or according to the 4 categories of forwards, distributors, adjustable, and outside backs. Grouping players according to the 9 specific positions played on the team is not warranted.

Objectives of the Study:-
The proposed objectives of the present research were follows.
1. To study the Physical fitness components of Kabaddi players.
2. To study the Physical fitness components of Kho-Kho Players.
3. Comparison of the Physical fitness components of KABADDI and KHO-KHO players.

Significance of the Study:-
The study will be of great interest to all sports lovers of the nation. It will also be useful to the society in general and Kabaddi and Kho-Kho players in particular, we will find it more beneficial to:
1. It will be provide an opportunity to give suggestions for the promotion of Kabaddi and Kho-Kho.
2. It would serve as a ready reference to the players, coaches and officials to get any information regarding to the game of Kabaddi and Kho-Kho.
3. Being a storehouse of latest information it will serve as a stepping-stone for further researchers.

Hypothesis of the study:
There exists no significant difference between Physical fitness components of Kabaddi and Kho-Kho male players.

Delimitation of the study:-
The present study was delimited on the following aspects such as:
1. Only 50 Male (25 Kabaddi and 25 Kho-Kho) students were considered.
2. The age of the subjects were ranged from 19 to 25 years.
3. The physical fitness components i.e.-strength, agility, speed, and endurance was considered for the present study.
4. Only those male subjects of Calicut University were selected who have participated at minimum inter collegiate level of Calicut University

Method and Procedure:-
Selection of the Subjects:-
The subjects were selected in following basis:
1. He should be male student.
2. He should attain the age of 19 years and not more than 25 years.
3. He should be studied in Calicut University.
Criterion Measures:-
The criterion measures were used to collect the data in a deal and systematic way to record in a correct unit and style for each test item.
1. Explosive leg strength was measured by Standing Broad Jump test and scores were recorded in centimeters.
2. Speed was measured by 60 Yards Dash and time was recorded to the nearest 1/100 of a second with the help of digital stopwatch.

Statistical Techniques Used:-
For the present study, the mean value, standard deviation, 't' test were applied to analyze the data, different steps in 't' test were used and the final conclusions was drawn and it was also compared with the significant value at .05 level of confidence with 99 degree of freedom. The utilization of mean values, standard deviation and ‘t’ test were made according to the requirement of the present study as per the statistical technique.

Results and Discussion:-
Table 8.1: Comparison of Strength Component of Kabaddi and Kho-Kho Male Players in Standing Broad Jump.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Kabaddi Mean</th>
<th>Kabaddi S.D</th>
<th>Kho-Kho Mean</th>
<th>Kho-Kho S.D</th>
<th>SEd.</th>
<th>t-ratio</th>
<th>Level of significant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strength (Standing Broad Jump)</td>
<td>2.18</td>
<td>.15</td>
<td>2.11</td>
<td>.076</td>
<td>.038</td>
<td>2.018</td>
<td>Significant</td>
</tr>
</tbody>
</table>

*Significant at .05 level

The mean score (2.18±.15) of the strength component of physical fitness of Kabaddi players is high than the mean score (2.11±.076) of Kho-Kho players. However, the t-ratio is 2.018, which is significant at 0.05 level. High score better strength. It means that Kabaddi players have better strength of physical fitness than the Kho-Kho players.

Therefore, the null-hypothesis of significant difference in the level of strength of Kabaddi and Kho-Kho players will be rejected.

Table 8.3: Comparison of Speed Component of Kabaddi and Kho-Kho Male Players

<table>
<thead>
<tr>
<th>Variable</th>
<th>Kabaddi Mean</th>
<th>Kabaddi S.D</th>
<th>Kho-Kho Mean</th>
<th>Kho-Kho S.D</th>
<th>SEd.</th>
<th>t-ratio</th>
<th>Level of significant</th>

</thead>
<tbody>
<tr>
<td>Speed (60 yards dash)</td>
<td>7.69</td>
<td>.54</td>
<td>7.44</td>
<td>.46</td>
<td>.134</td>
<td>1.835</td>
<td>No Significant</td>
</tr>
</tbody>
</table>

*Significant at .05 level

The mean score (7.69±0.54) of the Speed component of physical fitness of Kho-Kho players is high than the mean score (7.44±0.46) of Kabaddi players. However, the t-ratio is 1.835, which is no significant at 0.05 level. High score better speed. It means that Kho-Kho players have better speed of physical fitness than the Kabaddi players.

Therefore, the null-hypothesis of significant difference in the level of Speed of Kabaddi and Kho-Kho players will be accepted.

Conclusion:-
On the basis of the analysis of data the Kho- Kho players were having better mean values among speed than Kabaddi male players. Kabaddi players were having better mean values among strength than the Kho-Kho male players.
