Tarnovski Heights, Bulgaria, flora, floristic analysis, vascular plants

#### Abstract

Tarnovski Heights are located in the central part of Northern Bulgaria. Inventory of their flora was done for the first time. As a result, 964 species of wild vascular plants from 439 genera and 94 families were described. A floristic analysis was made that includes the following information: taxonomic structure, phytogeographic structure, endemic species, relict species, species with conservation status, distribution of species by biological type and by life form, medicinal plants, antropophytes. The number of invasive species is significant, almost half of the number of invasive plant species in Bulgaria.

#### Introduction:-

Tarnovski Heights are located in the central part of Northern Bulgaria between the rivers Vesselina and Negovanka. At the Tarnovski Heights we take the Prisovski Ridge, situated beside them. The two geographic sites are included in one protected area of the National Ecological Network of the Republic of Bulgaria, called Tarnovo Heights (with code BG0000213). This gives us reason to consider them together under the name "Tarnovski Heights". The Tarnovski Heights are located on the border between the Middle Danubian Plain and the Middle Forebalkan. They occupy 7 quadrants from the UTM network in Bulgaria: LH67, LH77, LH86, LH87, LH96, LH97, and MH07 (Figure 1). The total area is about 360 km<sup>2</sup>. The maximum height is 439.8 m above sea level.

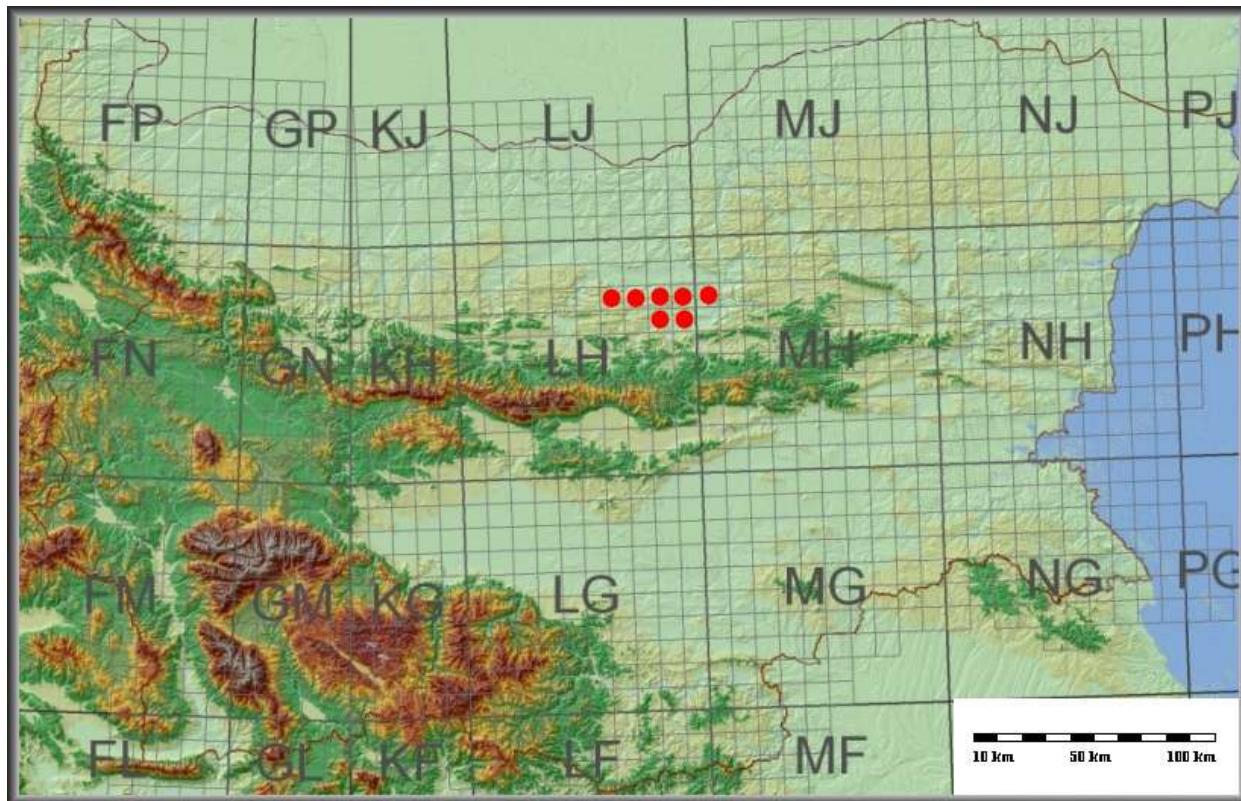

The Tarnovski Heights are located in the Temperate Continental Climate Area, Forebalkan Climate Region. The average annual temperatures are about 10-11°C. Average January temperatures range from -1.5°C to -3.5°C. Average July temperatures are in the range of 20.0-21.5°C. The annual rainfall is about 590-650 mm with a pronounced spring-summer maximum (May-June) and winter minimum (February). The snow cover lasts between 50 and 70 days. Western winds predominate in the direction.

The fullness of the rivers is spring (March-May). The reason for this is the spring-summer maximum of precipitation and the spring melting of the snow in the mountains. Lightning is in the late summer and autumn (August-September) [1]. The largest river in the region of Tarnovski Heights is Yantra River.

According to the FAO classification the soils within the Tarnovski Heights are two types: Leptosols (LP) and Luvisols (LV). The Leptosols are subtypes of rendzic (LPk). The Luvisols are divided into two subtypes: chromic (LVx) and albic (LVa) [2].

University of Shumen, Bulgaria.

**Figure 1:-** Geographical position of Tarnovski Heights

From a botanical-geographic point of view, Tarnovski Heights are located in the Forebalkan County of the Illyrian Provincial Region of the European Broad-leaved Forest Area [3]. Most of the Tarnovski Heights belong to the Forebalkan (eastern) floristic region. Their easternmost parts are located in the Stara Planina (medium) floristic region [4].

The first botanical studies in the region of Tarnovo Heights were conducted in 1885 by Josef Velenovski as part of his studies in Northern Bulgaria. Vassil Kovatchev also conducted his studies in the region of Veliko Tarnovo and published them in 1892 together with the data from other regions in his second botanical article “Materials on the flora of Northern Bulgaria” [5]. In 1901, the famous Bulgarian botanist Ivan Urumov published a list of established plant species in the then Tarnovo districts and Lovech districts [6]. Data on individual plant species from the region of Veliko Tarnovo are mentioned in the “Flora of the People's Republic of Bulgaria” [7, 8] and “Flora of the Republic of Bulgaria” [4, 9]. Until now, a full study of the flora of Tarnovo heights has not been carried out.

The aim of our study was to make a full inventory of the flora of Tarnovski Heights and to prepare a floristic analysis of the obtained data. This information is important due to the high conservation value of Tarnovski Heights. There are 12 protected areas and 4 protected zones of the NATURA 2000 ecological network. The protected areas are divided into 7 protected sites and 5 natural monuments [10].

### Materials and Methods:-

The present study of the flora of Tarnovo heights was carried out using the route method in the period 2015-2016. The following sources are used in the determination of taxa and life forms of the plants: Handbook for Plants in Bulgaria [11], Flora of PR Bulgaria [7, 8], and Flora of the Republic of Bulgaria [4, 9]. The names of the species are under Conspectus of the Bulgarian vascular flora [12]. The abbreviations of the authors' names of the plants are according to the International Plant Names Index [13]. The names of the family are according to APG IV [14].

The life forms are represented in the system of Raunkiaer [15]. Biological types are defined by Delipavlov et al. [11]. The floristic elements and the endemics are according to Asyov et al. [12]. The relics are presented according to Zahariev [16].

The conservation statute is recognized using the following documents: Annex II to Council Directive 92/43/EEC of the European Community to protect natural habitats and of wild fauna and flora [17], Appendix I to *Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention)* [18], Appendix II to *Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES)* [19], Red Data Book of the Republic of Bulgaria, Vol. 1. Plants and Fungi [20], Red List of Bulgarian vascular plants [21], Annex II, Annex III, and Annex IV to Biodiversity Act of the Republic of Bulgaria [22]. Recorded are the species included in Order for special arrangements for the conservation and use of the medicinal plants in Bulgaria [23].

The medicinal plants are under the Annex to the Medicinal Plants Act of the Republic of Bulgaria [24], Stoyanov [25, 26], Stoyanov and Kitanov [27], Petkov [28], Pamukov and Ahtardzhiev [29], Landzhev [30], Nikolov [31]. The anthropophytes are presented by Stefanov and Kitanov [32]. The Invasive alien plant species are by Petrova et al. [33].

### **Results and Discussion:-**

As a result of our study, 964 spontaneous prevalent vascular plants belonging to 439 genera and 94 families were described. This represents 23.5% from all species, 48.1% from all genera and 67.6% from all plant families in Bulgaria. The described species represent 42.9% of the vascular plants distributed in the range 0-500 m above sea level according to Peev et al. [34]. Systematic list of identified species is presented in Appendix.

The Division Lycopodiophyta includes 1 family, 1 genus and 1 species. The Division Equisetophyta is represented by 1 family, 1 genus and 2 species. The Division Polypodiophyta is covered with 5 families, 6 genera and 8 species. The Division Magnoliophyta includes the most taxa: 87 families, 431 genera and 953 species. The distribution of taxa in them is as follows: Class Pinopsida is represented with 1 family, 1 genus and 1 species; Class Magnoliopsida includes 70 families, 334 genera and 774 species; Class Liliopsida includes 16 families, 96 genera and 178 species.

The most of the families and genera are presented with smaller number of lower taxa: from 1 to 4. The majority of families, 77 (81.9%) were presented with 1-4 genera. Only 17 (18.1%) of the families are represented by 5 or more genera (Table 1). Most genera belong to the following families: Asteraceae (53 genera), Poaceae (50 genera), and Apiaceae (29 genera). The majority of families, 55 (58.5%) were presented with 1-4 species. Only 39 (41.5%) of the families are represented by 5 or more species (Table 1). Most species belong to the following families: Asteraceae (117 species), Fabaceae (87 species), Poaceae (82 species), Lamiaceae (58 species), Rosaceae (46 species), and Apiaceae (43 species). The majority of genera were presented with 1-4 species. Only 39 (8.9%) of genera are represented by 5 or more species. Most species belong to the following genera: *Trifolium* L. (17 species), *Centaurea* L. (16 species), *Vicia* L. (16 species), *Carex* L. (15 species), *Lathyrus* L. (15 species), *Ranunculus* L. (14 species), *Euphorbia* L. (13 species), and *Veronica* L. (13 species).

**Table 1:-** Families with most genera and species (5 or more)

Families	Genera	Species
Amaranthaceae	5	13
Amaryllidaceae		11
Apiaceae	29	43
Asparagaceae	7	14
Aspleniaceae		5
Asteraceae	53	117
Betulaceae		5
Boraginaceae	11	22
Brassicaceae	24	39
Campanulaceae		10
Caprifoliaceae	8	21
Caryophyllaceae	17	38
Convolvulaceae		7
Crassulaceae		7
Cyperaceae	5	19
Euphorbiaceae		15

Fabaceae	23	87
Fagaceae		5
Geraniaceae		9
Hypericaceae		5
Iridaceae		5
Juncaceae		7
Lamiaceae	25	58
Malvaceae	6	10
Oleaceae		6
Orchidaceae	12	18
Orobanchaceae		5
Papaveraceae		7
Poaceae	50	82
Polygonaceae		21
Primulaceae		5
Ranunculaceae	10	26
Rosaceae	16	46
Rubiaceae		13
Salicaceae		7
Sapindaceae		6
Scrophulariaceae	11	37
Solanaceae		6
Violaceae		6

There are 54 floristic elements in the phytogeographical structure of the flora. The largest number of species belongs to following floristic elements: European-Asiatic (15.3%), Sub-Mediterranean (13.8%), and European-Mediterranean (13.8%) floristic elements. The distribution of the floristic elements correlate with the geographic location of the study area.

The endemic taxa are represented by 3 Bulgarian endemic species and 9 Balkan endemic species. The total number of endemic taxa of Tarnovski Heights is 12 species (1.2% of all species). It is significantly lower than the country average, which is 4.9% [34]. The reason for this is the low altitude of the studied area, which is characterized by a smaller number of endemic plant species.

The relic species are 59 species (6.1% of all species). Tertiary relics are 50 species (5.2% of all species). Quaternary relics are 9 species (0.9% of all species). Of these 4 species are quaternary glacial relics and 5 species are quaternary interglacial relics. The small number of quaternary relics is due to the same reason given for the presentation of the endemic species, namely the low altitude: the highest point of Tarnovo heights is located only at 439.8 m above sea level.

The species with conservation status are 64 species (6.6% of all species). In Annex II of Directive 92/43/EEC is included one species. In Annex V of Directive 92/43/EEC are included 2 species. In Appendix I of Convention on the Conservation of European Wildlife and Natural Habitats (Berne Convention) is included one species. In Appendix II of *Convention on International Trade in Endangered Species* of Wild Fauna and Flora (CITES) are included 22 species. In the Red Data Book of the Republic of Bulgaria are included 10 species in two categories: Endangered – 7 species, Vulnerable – 3 species. In the Red List of Bulgarian vascular plants are included 30 species in following categories: Endangered – 7 species, Vulnerable – 13 species, Nearly Threatened – 5 species, Least Concern – 4 species, and Data Deficient – 1 species. In Annex II, Annex III, and Annex IV of the Act on Amending and Supplementing the Biological Diversity Act of the Republic of Bulgaria are included 42 species. Under ban on collecting herbs from their natural habitats are 10 species. Under restricted collection of herbs from their natural habitats are 6 species.

The analysis of life forms (Table 2) shows the predominant participation of the hemicryptophytes, 447 species (46.4%). Next in number of species are following groups: therophytes, 213 species (22.1%), cryptophytes, 109 species (11.3%), and phanerophytes, 104 species (10.8%). This distribution can be explained by the combination of

several factors: the location of the studied area in the temperate zone, the large area of the forest habitats and the arable lands on the territory of Tarnovski Heights.

**Table 2:-** Distribution of the species by life form

Group	Subgroup	Number of species	Percentage
Phanerophytes (Ph)		<b>104</b>	<b>10.8</b>
	Megaphanerophytes	6	0.6
	Mesophanerophytes	46	4.8
	Microphanerophytes	32	3.3
	Nanophanerophytes	20	2.1
Chamaephytes (Ch)		<b>33</b>	<b>3.4</b>
Hemicryptophytes (H)		<b>447</b>	<b>46.4</b>
Therophytes- Hemicryptophytes (Th-H)		<b>57</b>	<b>5.9</b>
Cryptophytes (Cr)		<b>109</b>	<b>11.3</b>
	Geophytes	85	8.8
	Helophytes	12	1.3
	Hydrophytes	13	1.4
Therophytes (Th)		<b>213</b>	<b>22.1</b>

The biological spectrum includes all biological types, as well as all possible transitions between them (Table 3). Most species belong to the perennial herbaceous plants, 528 species (54.8%) and belong to the annual herbaceous plants, 213 species (22.1%). The dominant presence of the perennial herbaceous plants can be explained by the wide variety of communities and habitats that occur on the territory of Tarnovski Heights. The relatively large number of annual herbaceous plants is due to the following reasons: the large area of the arable lands, the significant number of settlements and the road network between them. As a result of human intervention in these territories, the soil is not covered by dense vegetation, which is favorable for the development of annual herbaceous plants. This group of plants is represented with a large number of species also in natural habitats with shallow and eroded soil cover.

**Table 3:-** Distribution of the species by biological type

Biological type	Symbol	Number of species	Percentage
Annual herbaceous plant	a	213	22.1
Annual or biannual herbaceous plant	a-b	46	4.8
Annual or perennial herbaceous plant	a-p	11	1.1
Biannual herbaceous plant	b	36	3.7
Biannual or perennial herbaceous plant	b-p	27	2.8
Perennial herbaceous plant	p	528	54.8
Perennial herbaceous plant or shrub	p-sh	1	0.1
Shrub	sh	44	4.6
Shrub or tree	sh-t	13	1.4
Tree	t	45	4.7

The medicinal plants of Tarnovski Heights are 444 species, belong to 284 genera and 81 families. They represent 46.1% from all species, 64.7% from all genera and 86.2% from all plant families of vascular plants, identified in the study area. They are distributed within the following groups: 37 species of trees (8.3%), 23 species of shrubs (5.2%), 251 species of perennial plants (56.5%), 16 species of biennial plants (3.6%) and 63 species of annual plants (14.2%). The remaining 54 species (12.2%) belong to the transitional groups between them.

The presence of anthropophytes species is significant, 545 species (56.5%), distributed as follows: 17 species of trees, 18 species of shrubs, 5 species of transitional group shrubs – trees and 505 species of herbaceous plants. The number of adventive species and cosmopolitan species in the flora of Tarnovski Heights is 39 species (4.1%) and 46 species

(4.8%) respectively. These results can be explained by the large number of settlements and the considerable area of arable lands.

The number of invasive species is significant. There are 29 species, which is almost half of the number of invasive plant species in Bulgaria. These species are as follows: *Acer negundo* L., *Ailanthus altissima* (Mill.) Swingle, *Amaranthus hybridus* L., *Amaranthus retroflexus* L., *Ambrosia artemisiifolia* L., *Amorpha fruticosa* L., *Bidens frondosa* L., *Cuscuta campestris* Yunck., *Datura stramonium* L., *Eclipta prostrata* L., *Elaeagnus angustifolia* L., *Elodea canadensis* Michx., *Erigeron annuus* (L.) Pers., *Erigeron canadensis* L., *Euphorbia davidii* Subils, *Galinsoga parviflora* Cav., *Gleditsia triacanthos* L., *Helianthus tuberosus* L., *Impatiens glandulifera* Royle, *Laburnum anagyroides* Medik., *Lycium barbarum* L., *Oxalis corniculata* L., *Parthenocissus quinquefolia* (L.) Planch., *Phytolacca americana* L., *Robinia pseudoacacia* L., *Solidago gigantea* Aiton, *Sorghum halepense* (L.) Pers., *Xanthium italicum* Moretti, *Xanthium spinosum* L.

The majority of invasive plants (20 species) are herbaceous plants, 5 species are trees and 4 species are shrubs. Most of these species are spread in human-influenced natural habitats and in arable lands.

Most of the invasive species (14 species) originate from North America. Originating from both North America and South America are 6 species. Originating from South America are 3 species and from Asia are 4 species. One species originates from other parts of Europe and one species originates from the Mediterranean.

In the DASIE List of Worst invasive alien species threatening biodiversity in Europe [35] are included 4 species: *Ambrosia artemisiifolia* L., *Ailanthus altissima* (Mill.) Swingle, *Impatiens glandulifera* Royle, and *Robinia pseudoacacia* L.

In the list of invasive species of EPPO [36] are included 6 species: *Ailanthus altissima* (Mill.) Swingle, *Ambrosia artemisiifolia* L., *Amorpha fruticosa* L., *Helianthus tuberosus* L., *Impatiens glandulifera* Royle, and *Solidago gigantea* Aiton. In the List of observed invasive species of EPPO [36] is included *Bidens frondosa* L.

The reasons for the wide diversity of invasive species of Tarnovski Heights are related to the geographic location of the studied territory. The Tarnovski Heights are located in the central part of Northern Bulgaria, where the main roads connecting the eastern and western parts of Northern Bulgaria, as well as Northern and Southern Bulgaria are intersected. In the study area pass many roads and rail lines, which are used very intensively. Road infrastructure is one of the main ways of spreading invasive species. Second is the passage of one of the big rivers that are internal to Bulgaria (Yantra River) through the studied territory. Part of invasive species are spread along its banks.

We recommend monitoring the distribution and number of the invasive species and taking measures to control their numbers in the protected areas and the protected zones.

### **Conclusion:-**

The results of the inventory of vascular plants on the territory of Tarnovski Heights show a considerable variety of vascular plants. The obtained results can be used for comparison with the data on the flora of different geographic sites in Northern Bulgaria as well as in the whole country.

Cyperaceae:** *Carex caryophyllea* Latourr.; *Carex depauperata* Curtis; *Carex digitata* L.; *Carex distans* L.; *Carex divulsa* Stokes; *Carex flacca* Schreb.; *Carex halleriana* Asso; *Carex hirta* L.; *Carex otrubae* Podp.; *Carex pendula* Huds.; *Carex praecox* Schreb.; *Carex remota* L.; *Carex sylvatica* Huds.; *Carex tomentosa* L.; *Carex vulpina* L.; *Cyperus fuscus* L.; *Eleocharis palustris* R.Br.; *Pycreus flavescens* (L.) P.Beauv. ex Rchb.; *Schoenoplectus lacustris* (L.) Palla; **Fam. Hydrocharitaceae:** *Elodea canadensis* Michx.; *Najas marina* L.; **Fam. Iridaceae:** *Crocus flavus* Weston; *Crocus pallasii* Goldb.; *Gladiolus communis* L.; *Iris graminea* L.; *Iris pumila* L.; **Fam. Juncaceae:** *Juncus articulatus* L.; *Juncus bufonius* L.; *Juncus compressus* Jacq.; *Juncus conglomeratus* L.; *Juncus effusus* L.; *Juncus inflexus* L.; *Luzula campestris* (L.) DC.; **Fam. Liliaceae:** *Gagea arvensis* (Pers.) Dumort.; *Gagea lutea* Ker Gawl.; *Lilium martagon* L.; **Fam. Orchidaceae:** *Anacamptis pyramidalis* (L.) Rich.; *Cephalanthera damasonium* Druce; *Cephalanthera longifolia* (L.) Fritsch; *Dactylorhiza romana* (Sebast.) Soó; *Epipactis helleborine* (L.) Crantz; *Epipactis microphylla* Sw.; *Gymnadenia conopsea* (L.) R.Br.; *Himantoglossum caprinum* Spreng.; *Limodorum abortivum* (L.) Sw.; *Neottia nidus-avis* (L.) Rich.; *Ophrys apifera* Huds.; *Ophrys cornuta* Steven ex M.Bieb.; *Orchis morio* L.; *Orchis purpurea* Huds.; *Orchis simia* Lam.; *Orchis tridentata* Scop.; *Platanthera chlorantha* (Custer) Rchb.; *Spiranthes spiralis* (L.) Chevall.; **Fam. Poaceae:** *Achnatherum calamagrostis* P.Beauv.; *Aegilops cylindrica* Host; *Aegilops lorentii* Hochst.; *Aegilops triuncialis* L.; *Agrostis capillaris* L.; *Aira elegantissima* Schur; *Alopecurus myosuroides* Huds.; *Anthoxanthum odoratum* L.; *Apera spica-venti* (L.) P.Beauv.; *Arrhenatherum elatius* (L.) P.Beauv. ex J.Presl & C.Presl; *Avena fatua* L.; *Avenula compressa* (Heuff.) W.Sauer & Chmel.; *Botriochloa ischaemum* (L.) Keng; *Brachypodium pinnatum* (L.) P.Beauv.; *Brachypodium sylvaticum* P.Beauv.; *Briza media* L.; *Bromus arvensis* L.; *Bromus commutatus* Schrad.; *Bromus japonicus* Thunb.; *Bromus mollis* L.; *Bromus racemosus* L.; *Bromus squarrosus* L.; *Bromus sterilis* L.; *Calamagrostis epigeios* (L.) Roth; *Catabrosa aquatica* (L.) P.Beauv.; *Chrysopogon gryllus* (L.) Trin.; *Cleistogenes serotina* (L.) Keng.; *Cynodon dactylon* (L.) Pers.; *Cynosurus cristatus* L.; *Cynosurus echinatus* L.; *Dactylis glomerata* L.; *Dasypyrum villosum* (L.) P.Candargy; *Deschampsia caespitosa* (L.) P.Beauv.; *Digitaria sanguinalis* (L.) Scop.; *Echinochloa crus-galli* (L.) P.Beauv.; *Elymus caninus* L.; *Elymus elongatus* (Host) Runemark; *Elymus hispidus* (Opiz) Melderis; *Elymus repens* (L.) Gould; *Eragrostis minor* Host; *Eragrostis pilosa* (L.) P.Beauv.; *Festuca arundinacea* Schreb.; *Festuca heterophylla* Lam.; *Glyceria maxima* (Hartm.) Holmb.; *Holcus lanatus* L.; *Hordeum bulbosum* L.; *Hordeum leporinum* Link; *Hordeum murinum* L.; *Koeleria macrantha* (Ledeb.) Schult.; *Koeleria nitidula* Velen.; *Koeleria simonkaii* Adamovič; *Leersia oryzoides* (L.) Sw.; *Lolium perenne* L.; *Lolium temulentum* L.; *Melica ciliata* L.; *Melica pica* C.Koch; *Melica uniflora* Retz.; *Milium effusum* L.; *Molinia caerulea* (L.) Moench; *Phalaris arundinacea* L.; *Phleum phleoides* H.Karst.; *Phleum pratense* L.; *Phragmites australis* (Cav.) Steud.; *Piptatherum virescens* Boiss.; *Poa annua* L.; *Poa bulbosa* L.; *Poa nemoralis* L.; *Poa palustris* L.; *Poa pratensis* L.; *Poa trivialis* L.; *Sclerochloa dura* (L.) P.Beauv.; *Setaria italica* (L.) P.Beauv.; *Setaria pumila* (Poir.) Roem. & Schult.; *Setaria viridis* (L.) P.Beauv.; *Sorghum halepense* (L.) Pers.; *Stipa capillata* L.; *Stipa epilosa* Martinovský; *Taeniatherum caput-medusae* (L.) Nevski; *Trachynia distachya* (L.) Link; *Tragus racemosus* (L.) All.; *Vulpia ciliata* Dumort.; *Vulpia myuros* (L.) C.C.Gmel.; **Fam. Potamogetonaceae:** *Potamogeton crispus* L.; *Potamogeton natans* L.; *Potamogeton nodosus* Poir.; *Potamogeton pectinatus* L.; **Fam. Typhaceae:** *Sparganium erectum* L.; *Typha angustifolia* L.; *Typha latifolia* L.; *Typha laxmannii* Lepech.; **Fam. Xanthorrhoeaceae:** *Anthericum ramosum* L.
