DNA (0.5µl) and the volume was adjusted to 25 µl ddH<sub>2</sub>O. The amplification condition consisted of an initial denaturation at 94°C for 2 min, denaturation at 94°C for 15 sec, annealing gradient at 53 to 57°C for 30 sec, extension at 72°C for 1 min. and final extension at 72°C for 10 min. After amplification the PCR product was checked using electrophoresis on a 1% (w/v) agarose gel and the band was eluted and purified by Minigel purification kit (Takara, Japan). Sequencing was done from Scigenom Lab Pvt, Ltd (Cochin, Kerala), on a charge basis.

#### matK data analysis:-

The Twenty one DNA sequences of the all samples were minimally edited and manually aligned using BioEdit software. The analysis of DNA sequences was conducted by Neighbour-joining to assess topology with MEGA 6.0. All the regions containing gaps and missing data were eliminated. The species identification and homology between the sequences was identified using BLAST method. The phylogenetic tree was developed using Neighbour-joining (NJ) method which was tested with Kimura 2-parameter for evolutionary distances in MEGA6.0 and node support was assessed on 1000 bootstrap replicates.

#### Results:-

The annealing temperature 55.6°C was found to be ideal to develop a high intensity molecular size band for *matK*. PCR and sequencing success rate was very high for all the twenty one species in the *matK* region (99.0% of individuals, 100% species) with a PCR product size of 800 bp (Fig1). The coding region of *matK* obtained from the 21 species was sequenced and the sequence was submitted to the Genbank of NCBI and the accession numbers were provided by NCBI; KU934093, KU736742, KX170829, KX455852, KX455853, KX455854, KX455855, KX148521, KX418654, KX650813, KX650814, KX650815, KX650816, KX650817, KX650818, KX650819, KX650820, KX650811, KX650809, KX650810 and KX650812. The sequences were used to construct the phylogenetic tree, having twenty one informative sites and the overall mean distance of all sequences was 0.108. The transition/transversion range between the species was 1.27. Tajima's Neutrality Test was conducted for all twenty one sequences to compare the number of segregating sites per site with the nucleotide diversity (Tajima, 1989) (Table 1).

The phylogenetic tree comprised of two groups in NJ-analysis; **Group I** contained *Curcuma raktakanta* and *Curcuma aromatica* showed no variation as they were represented with a 100% bootstrap value (Fig2). **Group II** has two branches and two monoclade, branch I has two clade A & B and two monoclade *Curcuma kudagensis* and *curcuma neilgherrensis* which comes under clade A with 41% similarity and *curcuma mutabilis* and *Curcuma oligantha var. lutea* comes under the clade B showed similarity with 51% *Curcuma karnatakensis*, *Curcuma oligantha var. oligantha* and *Curcuma coriacea* exist as a monoclade. Branch II has two clade C and D, Clade C has one subclade and two monoclade *Curcuma haritha* and *Curcuma aeruginosa* comes under same clade and *Curcuma vamana* and *Curcuma zanthorrhiza* which existed as a monoclade. Clade D has three subclade D<sub>1</sub>, D<sub>2</sub> & D<sub>3</sub>, *Curcuma longa* and *curcuma pseudomontana* which comes under the same clade. Similarly *Curcuma amada* and *Curcuma decipiens* represent the same. *Curcuma Montana* and *Curcuma ecalcarata* which comes under subclade D<sub>1</sub> with 46% similarity. *Curcuma inodora* and *Curcuma bhatii* existed as a monoclade.

Maximum Composite Likelihood Estimate pattern of nucleotide substitution was obtained where each entry showed the probability of substitution (r) from one base (row) to another base (column) (Table 2). For simplicity, the sum of r values is made equal to 100. Rates of different transitional substitutions are shown in bold and those of transversional substitutions are shown in italics (Table 2). The nucleotide frequency was 32.16% (A), 39.91% (T/U), 15.47% (C), and 12.46% (G). The transition/transversion rate ratios was  $k_1 = 5.744$  (purines) and  $k_2 = 2.54$  (pyrimidines). The overall transition/transversion ratio was  $R = 1.566$ , where  $R = [A * G * k_1 + T * C * k_2] / [(A + G) * (T + C)]$ .

**Discussion:-**

Chloroplast *matK* gene is considered as one of the most rapidly evolving gene (Vijayan and Tsou, 2010).PCR and sequencing problems have been reported for *matK* gene (Sass, et al., 2007; Fazekas,et al., 2008; Ford,et al., 2009;

Hollingsworth et al., 2009). PCR and sequence amplification success rate are important criteria for developing a DNA barcode (Kress and Erickson, 2007; Ford, et al., 2009; Hollingsworth et al., 2009). However, in the present study the results showed PCR and sequencing success rate of *matK* as high as 99%. Transversions are considered illegitimate mutations in constructing phylogenies (Lake, 1987; Quicke, 1993). In recently diverged sequences the observed Transition/ transversion ratios were high. Transitions are higher than transversions for highly diverged sequences and low for less diverged sequences due to rate of higher transversions than transitions (Holmquist, 1983). Here, the observed low transition to transversion (Ts/Tv) ratio (1.27) indicates comparatively high proportion of transversions in the gene. The evolutionary rate of *matK* gene makes phylogenetically resolving intergeneric and interspecific relationships of many angiosperms (Johnson and Soltis, 1995; Soltis & Soltis, 1998). According to Savolainen et al., (2000a) the relationships revealed using *matK* data are more robust than those derived from combining *rbcL* and *atpB* sequences.

Earlier intrageneric classifications of *Curcuma* were based on morphological characters using the position of the inflorescence that are confusing for many species (Škorničková, 2007). Molecular phylogenetic studies showed that *Curcuma* is a paraphyletic genus (Kress, et al., 2002; Ngamriabsakul, et al., 2004; Závieská et al., 2012). Based on the morphological classification of the species *C. haritha* showed close relationship with *C. aromatica* and share a few characters with *C. raktakanta*, however *C. raktakanta* closely resembles *C. aeruginosa* in morphological character (Sabu, 2006). Based on the molecular character related phylogenetic analysis, *C. aromatica* and *C. raktakanta* are close to each other. The present study showed the paraphyletic origin of these two species is moderate with (100 %) bootstrap value; however *C. raktakanta* did not show any relationship with *C. aeruginosa*. On morphological character, close relationship was established between *C. karnatakensis* and *C. oligantha* (Amalraj et al., 1999) that is incongruent with our work where these two species are grouped with different clade based on *matK* sequence data. However based on *matK* sequence both were placed in different clades.

### Conclusion:-

The genus *Curcuma* of the family Zingiberaceae is complicated to differentiate using traditional morphological parameters because the morphological differences developed due to wide species hybridization. Then a Molecular marker based identification and phylogenetic analysis is required for these medicinal and economically important species. The current study suggests the effectiveness of *matK* gene sequences data to resolve phylogenetic relationship in the genus *Curcuma*. This study reveals the sequence variation, mean evolutionary rates, patterns and transition/transversion rate in nucleotide sequence, nucleotide diversity of *matK* gene can be used for the interpretation of evolutionary relationship within inter species level of genus *Curcuma*. The *matK* sequence successfully discriminated the closely related *Curcuma* species. So these sequences can be used as a DNA barcode for the genus *Curcuma*.

Paranasal Sinuses (PNS), Osteomeatal complex (OMC), Deviated Nasal Septum (DNS).

#### *Abstract*

**Background and objectives:** The study was done to evaluate the role of computed tomography (CT) of Paranasal sinuses to determine the background prevalence of bony anatomical variations and mucosal abnormalities of paranasal sinuses in clinically suspected cases of sinusitis. The information provided by the preoperative CT Scan paranasal sinus (PNS) coronal view acts as a road map for the patients undergoing for functional endoscopic sinus surgery (FESS) to reduce the complications during surgeries and thus reducing morbidity and mortality of patients. The study was conducted on 60 cases attending CT section of Radiodiagnosis Department of Rajindra Hospital, Patiala.

**Materials And Methods:** The study was conducted on 60 cases over a period 3 years from 2010 to 2013 irrespective of gender and age group. Selection of patients were based on clinical features like nasal or post nasal discharge, nasal obstruction, headache, anosmia, cough and hoarseness of voice. Relevant history, clinical examination and non-contrast CT Scan of paranasal sinuses (PNS) was performed of every patient in Coronal view complemented by Axial view.

**Results:** It was observed that multi anatomical variations were more as compared to single anatomical variations. In our study deviated nasal septum was the most common finding seen in 46% of cases followed by concha bullosa, uncinata process variations, onodi cells, hallers cells and agger nasi cells.

**Conclusion:** Evaluation of CT Scan PNS concluded that deviated nasal septum and anatomical variations at lateral wall of nose causes narrowing of osteomeatal complex area which predisposes to sinusitis in the patients.

**Introduction:-**

Acute rhinosinusitis is a clinical condition lasting less than 4 weeks, and subacute rhinosinusitis is present for more than 4 weeks but less than 12 weeks. Chronic sinusitis is a clinical diagnosis and is defined as a rhinosinusitis lasting >12 weeks that includes two or more major sinus symptoms or at least one major and two minor sinus symptoms with or without findings on physical examination[1]. Chronic rhinosinusitis is the most common disease for which ENT consultation is required. The characteristic findings of sinus disease include air–fluid levels, mucosal thickening, and opacification of the normally aerated sinus lumen. The single distinguishing feature of acute sinusitis is the air–fluid level as an isolated finding, whereas the only characteristic finding in chronic sinusitis is sclerotic, thickened bone of the sinus wall[2].

Drainage and ventilation of paranasal sinuses are important for the normal function which in turn depends on effective mucociliary clearance. Drainage of secretions in paranasal sinuses follows definite course. The frontal and maxillary sinuses communicate with middle meatus through prechambers. Mucosa of prechambers are closely opposed and clearance of it is through ciliary action. These narrow prechambers are blocked by mucosal inflammation which affects ciliary clearance. It establishes a vicious cycle of infection and stasis causing chronic sinusitis[1-3]. The key region for these changes is that part of the lateral nasal wall that encloses the sinus ostia and their adjacent mucosa and prechambers. There is considerable anatomical variation in this area that may interfere with normal nasal function and predispose to recurrent or chronic sinusitis[3].

The anatomical variation of osteomeatal complex causes obstruction to OMC Complex and prevent mucous drainage and predispose to chronic sinusitis. Obstruction of the osteomeatal complex causes a vicious cycle of events that leads to sinusitis. Its obstruction leads to mucosal congestion that decreases airflow. These anatomical variations may lead to OMC obstruction.

Surgical clearance of these chronically infected sinuses while maintaining their ventilation and drainage is the treatment of choice.

Imaging of PNS has progressed from the realm of conventional radiograph almost exclusively into realms of computed tomography and magnetic resonance imaging. Both these two technological advances in imaging modalities provide greater detail and about the anatomic extent of disease. Plain radiography has limited value for imaging paranasal sinuses, especially the ethmoid sinuses and the ostiomeatal complex and its use is not indicated [4-5].

CT is the technique of choice in the preoperative evaluation of the nose and paranasal sinuses and is the gold standard for delineation of inflammatory sinus disease resulting from obstruction [6].

The two primary diagnostic imaging techniques for evaluating the paranasal sinuses are CT and MRI. CT PNS plays an important role in the preoperative evaluation of patients considered for FESS called SSCT (Screening Sinus CT). It is now mandatory and medico-legal requirement to evaluate the PNS and nose before FESS. CT is superior to MRI for the delineation of the fine bone structures of the infundibular complex, orbital lamina, orbital floor, and cribriform lamina. Thus, CT is superior to MRI in planning FESS. With MRI, these bone structures have low signal intensity, making them difficult to completely assess [7-8].

**Material and Methods:-**

The present study was a hospital based prospective study conducted in Rajindra Hospital Patiala in patients who presented with clinical symptoms of chronic sinusitis. The study sample was limited to 60 patients and was done over a period of three years from 2010-2013. Institutional review board approval for conducting this study was obtained and informed consent of study patients was taken.

CT scan was performed with Siemens-Somatom Emotion 6 slice third generation spiral CT. Slices of 5 mm were taken in axial and coronal planes. Coronal scan was done with patient lying prone with chin hyperextended and gantry tilted to the approximate plane at right angle to the orbitomeatal line. Scanning was done from anterior wall of frontal sinus to posterior wall of sphenoid sinus. In all the patients FESS was done under local anaesthesia 2% lignocaine with 1:1,00,000 adrenaline was used for mucosal infiltration for anaesthesia and vasoconstriction. Patients were placed in supine position with head turned towards examiner. Endoscope was fixed just above the

nostril with thumb and forefinger of left hand while it was gently introduced with right hand, care was taken not to cause mucosal damage. Endoscope was introduced initially along the floor of nose till nasopharynx was seen and then withdrawn slowly to look for disease pathology. It was then removed and reintroduced below the middle turbinate to examine middle meatus and sphenoidal recess. When endoscope was in middle meatus, the uncinate process, bulla ethmoidalis, hiatus semilunaris, infundibular opening and maxillary sinus opening were inspected. The endoscope was passed posteriorly after viewing the middle meatus area to examine sphenoidal area. Depending upon disease appropriate endoscopic sinus surgery was done which could be uncinectomy, middle meatus antrostomy, anterior ethmoidectomy, posterior ethmoidectomy, sphenotomy, resection of middle turbinate.

### Results:-

In present study, there were 35 males and 25 females in the study group. The disease frequency was found to be maximum in age group 21-30 years (31.66%). The common presenting symptoms were nasal obstruction in 70% cases and headache in 66.6%. On anterior rhinoscopy examination, deviated nasal septum (46.6%) was the most common sign followed by inferior turbinate hypertrophy (31.6%). Maxillary sinus was most frequently involved (80%).

**Table 1:-**Anatomical variations on CT scan in patients of chronic sinusitis.

Anatomical Variants	No. of cases	%age
Deviated nasal septum	28	46.6
Concha bullosa	20	33.3
Uncinate process variations	18	30
Agger Nasi cells	10	16.6
Haller cells	15	25
Pneumatization of crista galli (PCG)	5	8.3
Pneumatization of anterior clinoid process (PAC)	4	6.6
Onodi cells	17	28.3
Paradoxical middle turbinate(PMT)	5	8.3
Pneumatization of pterygoid process (PTG)	8	13.3
Enlarged bulla ethmoidalis	6	10

**Table 2:-** Bar diagram shows various anatomical variants in chronic sinusitis patients

DNS, Concha bullosa, uncinate process variations, Haller cells and onodi cells were the common anatomic variants noted in 46.6%, 33.3%, 30%, 25% and 28.3% cases respectively. The other less common variants noted were Pneumatization of pterygoid process, Agger nasi cells, Pneumatization of anterior clinoid process, enlarged bulla ethmoidalis, Paradoxical middle turbinate and Pneumatization of crista galli.

**Figure 2:-**

Coronal CT image shows right concha bullosa with S-shaped DNS and left maxillary sinusitis

**Figure 3:-**

Coronal CT image shows pansinusitis with left Haller cell.

### **Discussion:-**

The complex regional anatomy of the paranasal sinuses has only recently been elucidated through the use of modern imaging techniques. The advent of computerized tomography in the delineation of sinonasal pathology and anatomic variations has proven invaluable to the otolaryngologist in preoperative planning for functional endoscopic sinus surgery. Stammberger et al<sup>[9]</sup> proposed that stenosis of the osteomeatal complex, from either the anatomical configuration or hypertrophied mucosa, can cause obstruction and stagnation of secretions that may become infected or perpetuate infection.

### **Mucosal abnormality of sinuses on CT scan:-**

Mucosal abnormality percentage of various paranasal sinuses noted on CT scan in present study were compared with other studies. In the present study, maxillary sinus was most frequently involved in 80% cases followed by anterior ethmoid, posterior ethmoid, sphenoid & frontal sinuses respectively.

### **Patterns of sinonasal Disease:-**

Five recognizable patterns of inflammatory sinonasal disease were seen on CT in present study. In the present study OMU pattern was the most common pattern observed in 35% cases.

### **Anatomic variations in region to paranasal sinuses noted on CT scan:-**

Anatomic variations are important for that they may narrow normal drainage channels, thereby predispose to chronic recurrent sinusitis. They increase operative risk and surgeon should be forewarned about these. Different investigators report different prevalence rates. Though variations may be encountered in the normal population (without sinusitis) their prevalence rates are significantly higher in patients with chronic sinusitis. In our study we observed that DNS, Concha Bullosa,uncinate process, Haller cells, Onodi cells & Pneumatization of pterygoid process were the common anatomic variants in 46.6%, 33.3%,30%, 25%, 28.3%, 13.3% of patients.

### **Deviated nasal septum:-**

Nasal septum is fundamental in the development of the nose and paranasal sinuses. It is the epiphyseal platform for the development of the facial skeleton. 46.6% of the patients in our study presented with nasal septal deviation. Deviated nasal septum (Figure 2) causes a decrease in the critical area of the osteomeatal unit predisposing to obstruction and related complications. Similar finding were observed by Mamatha et al<sup>[10]</sup> (65%) And Dutra et al<sup>[11]</sup> (14.1%).

**Concha bullosa:-**

Concha bullosa (pneumatized middle turbinate) (Figure 1,2) has been implicated as a possible aetiological factor in the causation of recurrent chronic sinusitis. It is due to its negative influence on paranasal sinus ventilation and mucociliary clearance in the middle meatus region as quoted by Tonai et al<sup>[12]</sup>. The incidence of concha bullosa was 33% which is less as compared to the reported incidence of 53.6% by Bolger et al<sup>[15]</sup>, 42.6% by Maru et al<sup>[14]</sup>, 34.1% by Wanamaker et al<sup>[13]</sup>.

**Uncinate process variation:-**

Uncinate process may be curved or bent. Hypertrophied uncinate process causes narrowing of hiatus semilunaris and the ethmoid infundibulum. It has also been suggested as a predisposing factor for impaired ventilation of the inferior group of sinuses and frontal sinuses. In our study hypertrophy of uncinate process was seen in 30% of cases. Results were compared with study by Bolger et al<sup>[15]</sup> in which reported incidence was 2% and Asruddin et al<sup>[16]</sup> and 9.8% by Maru et al<sup>[14]</sup>.

**Agger nasi cells:-**

Agger nasi cells lie just anterior to the anterosuperior attachment of the middle turbinate and frontal recess. These can invade the lacrimal bone or the ascending process of maxilla. These cells were present in 16.6% of cases. The incidence is less as compared to 98.5% by Bolger et al<sup>[15]</sup>, 88.5% by Maru et al<sup>[14]</sup> and 96% by Wanamaker et al<sup>[13]</sup>. But Asruddin et al<sup>[16]</sup> reported an almost similar incidence of 48%.

**Haller cells:-**

Haller's cells (Figure 3) are ethmoid air cells that project beyond the limits of the ethmoid labyrinth into the maxillary sinus. They are considered as ethmoid cells that grow into the floor of orbit and may narrow the adjacent ostium of the maxillary sinus especially if they become infected. The incidence of Haller's cells in our study was 25%. Llyod et al<sup>[17]</sup> reported 15%, Tonai et al<sup>[12]</sup> reported 20%.

**Onodi cell:-**

Onodi cells are posterior ethmoid cells that extend posteriorly, laterally and sometimes superior to sphenoid sinus, lying medial to the optic nerve. The chances of injury of optic nerve are increased when the bony canal of the nerve is lying dehiscient. The surgeon must pay close attention to the occasional onodi cell in the preoperative evaluation to avoid potential complication of FESS. It was found in 3.5% of cases in our study. A similar incidence was found by Jones et al<sup>[18]</sup> in 8/200 patients.

**Paradoxical middle turbinate:-**

Stammberger et al<sup>[9]</sup> accepted paradoxical curvature of middle turbinate as an etiological factor for chronic rhinosinusitis because it may cause obliteration or alteration in nasal airflow dynamic. Incidence of paradoxical middle turbinate in our study was observed to be 8.3%. Incidence of paradoxical middle turbinate was <10% according to Yousem et al<sup>[19]</sup>, 27% by Bolger et al<sup>[15]</sup>, 15% according to Zinreich et al<sup>[20]</sup>, 12% according to Asruddin et al<sup>[16]</sup>.

**Pneumatization of crista galli, anterior clinoid process & pneumatization of pterygoid process:-**

In present study pneumatization of crista galli was seen in 8.3% cases and anterior clinoid process in 6.6% cases, pterygoid process pneumatization was seen in 13.3%. According to Bolger et al<sup>[15]</sup> any degree of pneumatization of the anterior clinoid process was considered significant and noted incidence of crista galli pneumatization in 83.7% cases of anterior clinoid process pneumatization in 13.3% and of pterygoid process in 43.6% of cases.

**Infundibular opacification and ipsilateral maxillary sinus disease:-**

In present study when infundibulum was opacified 94.4% of ipsilateral maxillary sinuses showed mucosal abnormality on CT scan, when infundibulum was normal, only 4.1% of the ipsilateral maxillary sinuses were abnormal. So, there was significant association between infundibular opacification and ipsilateral maxillary sinus disease. Our results are comparable to Bolger et al<sup>[15]</sup>, who found that when disease was present in infundibulum, 98% of cases had mucosal thickening of ipsilateral maxillary sinuses. When infundibulum was normal, ipsilateral maxillary sinuses were normal in 95.8% of cases.

**Conclusion:-**

CT may reveal an anatomic abnormality that predisposes to sinusitis, however, the treatment (medical or surgical) should be based on combined information extracted from clinical evaluation, CT and endoscopy findings. In present study, maxillary sinus was most commonly involved. DNS and Concha bullosa were the most common anatomic variants that lead to chronic sinusitis. CT is the imaging modality of choice to reveal mucosal changes deeper in osteomeatal complex which are not visible endoscopically and to identify extent of paranasal sinus disease.

Serum uric acid levels, non-embolic stroke, risk factor

#### Abstract

Serum uric acid (SUA) levels were estimated in a total of 100 acute non-embolic ischemic stroke cases comprising of 50 males and 50 females having mean age of  $59.10 \pm 10.20$  and  $60.50 \pm 11.10$  years respectively. Mean SUA levels were found to be  $5.41 \pm 1.88$  in males and  $5.47 \pm 1.53$  mg/dL in females. Frequencies of additional risk factors in these patients like hypertension, Diabetes mellitus, smoking, age above 65 years, and coronary artery disease (CAD) were also determined. The cases were divided into those with SUA levels less than and more than 7mg/dL to relate with the risk factors. A statistically significant ( $p < 0.001$ ) relationship was demonstrated between CAD and age  $> 65$  years with increased SUA levels. It is concluded that elevated SUA levels (in the upper normal range) are an important risk factor for acute non-embolic ischemic stroke.

#### Introduction:-

Stroke is defined as a rapid onset of focal neurological deficit, resulting from diseases of cerebral vasculature and its content. Stroke cases constitute nearly 20% of total neurological cases [1]. The mortality rate due to stroke in acute phase is as high as 20% [2]. Stroke is also an important cause of morbidity and long term disability [3]. Consequently early identification of individuals at high risk is likely to help in primary prevention strategies [4]. With this objective most of the epidemiological studies have been carried out to identify high risk factors that predispose to this debilitating condition. One such risk factor is hyperuricemia. Millions et al 2005 reported that the serum uric acid (SUA) levels are independent risk factor for acute non-embolic ischemic stroke [5]. The authors also suggested that treatments with hypouricemic action have a favourable effect on cardio-vascular event prevention. Hence the objective of the present study was to estimate SUA levels in cases with acute non-embolic ischemic stroke as a risk factor.

#### Materials and Methods:-

##### Selection of cases:

Patients with first ever in life time acute ischemic non-embolic stroke with computerized tomography scan (CT) evidence of infarction within 24 hours of onset of stroke were selected. These patients were admitted in the Princess Esra Hospital and research centre (Hyderabad).

The following categories of cases were excluded: i) Patients with previous history of Transient ischemic attack (TIA)/ Cerebrovascular accident, ii) those who are on thiazide diuretics, and iii) known cases of gout and patients with chronic renal failure. A total of 100 patients (50 males and 50 females) with acute stroke who met the selection

**Corresponding Author:- S. Mohd. Ali**

Address:- Department of General Medicine, Deccan College of Medical Sciences, Hyderabad, India.

criteria were included in the study. All subjects gave informed consent and the study protocol was approved by institutional ethical committee.

#### Collection of Blood samples and Biochemical analysis:-

Blood samples were collected within 24 hours of onset of stroke and biochemical tests were performed in a standard analyzer. The patients were further evaluated for the presence of additional risk factors using the following mentioned parameters: i) Hypertension: Known cases of hypertension having a systolic blood pressure of >140 mmHg and a diastolic of more than 90 mm Hg, ii) Known cases of diabetes mellitus with a fasting blood sugar of more than 126 mg/dL, and iii) Cases with a history of CAD, smoking and hyperlipidemia.

#### Results:-

Details of mean uric acid levels, and mean age of the patients are shown in Table 1. Out of a total of 100 acute non-embolic ischemic stroke cases 50 each were males and females. The mean age of male patients was  $59.10 \pm 10.20$  while that of females was  $60.50 \pm 11.10$  years. In both males and females the age range was 41 to 84 years. As for the mean serum uric acid levels are concerned, they were  $5.41 \pm 1.88$  and  $5.47 \pm 1.53$  mg/dL respectively in male and female cases respectively.

Mean serum uric acid levels in patients with and without additional risk factors are given in Table II. There was no significant difference between mean SUA levels in patients with and without hypertension. Similar observations were recorded for the risk factors hyperlipidemia and smoking. However, a significant ( $p < 0.001$ ) difference was recorded between the mean SUA levels in patients with and without diabetes mellitus and CAD.

Further analysis was carried out to see if a relationship exists between uric acid levels less than and more than 7mg/dL and the risk factors (Table-III). This analysis revealed that age more than 65 years and CAD have statistically significant ( $p < 0.01$ ) relationship with uric acid levels.

#### Discussion:-

Stroke is defined as rapid onset of focal neurological deficit, resulting from disease of cerebral vasculature and its content. Stroke cases constitute about 20% of total neurological cases in hospital admissions (6). Long term disability due to stroke is an important cause of morbidity and warrants further studies on identifying risk factor so that proper preventive measures can be suggested.

SUA is a major anti-oxidant and about 2/3<sup>rd</sup> of total plasma free radical scavenging activity is by SUA and hence thought to have a protective role in stroke. Ironically it has been shown that under certain circumstances like reduced levels of other antioxidants like ascorbic acid, SUA can function as a pro-oxidant [7]. Further evidence for a role of uric acid in the pathogenesis of stroke comes from the observations that elevated SUA levels are an important predictor of hypertension in 25% of patients with recent onset untreated hypertension [8]. Moreover, decreased renal blood flow that generally accompanies the hypertension condition also causes increase in SUA levels. Experimental studies provided additional evidence for a role of increased SUA levels in the pathogenesis of stroke which demonstrated that experimentally induced hyperuricemia also increased blood pressure in rats by a renal mechanism linked to inhibition of nitric oxide (NO), activation of rennin-angiotensin system and development of renal arteriosclerosis [9] It is known that cerebral infarction initiates a series of metabolic events in the surrounding tissues and free radical mediated oxidative damage appears to play an important role in the pathogenesis of cerebral ischemia [10]. The role of SUA in predisposition to non-embolic stroke is further supported by a study carried out in Chinese cohort which demonstrated that SUA levels as an independent risk factor for all cause cardiovascular and ischemic stroke mortality. [10].

**Table I:** Mean uric acid levels and Mean ages in male and female stroke patients

Gender	No	Mean Uric acid levels (mg/dL)	Mean Age (in years)
Males	50	$5.41 \pm 1.88$	$59.1 \pm 10.20$
Females	50	$5.47 \pm 1.53$	$60.50 \pm 11.10$

#### Introduction:-

Diabetes mellitus is a leading cause of disability and death world-wide. However, many governments and public health planners remain largely unaware of the current prevalence of diabetes and prediabetes, the potential for a future rise in prevalence and the serious complications associated with this disease. knowledge of the prevalence of diabetes and prediabetes related to risk factors could raise awareness of the disease and lead to new policy managements. There is a now abundant evidence that type 2 diabetes, which counts for greater than 90% of diabetes world-wide, is preventable ,therefore, Primary Health Care (PHC) is taken into account to be a good strategy to boost accessibility and usage of services, address the social determinants of health inequities and improve health outcomes through the implementation of comprehensive interventions through sectoral and intersectoral collaboration, direction of people, community participation and social mobilization. This study was to the contribution extent of primary health care in preventing diabetes prevalence. Therefore, this article proposes a study that will relay on the descriptive and analytical approach, also will be viewing on the literature and previous studies related to the subject of study. Questionnaires will be conducted among Health workers (Doctors, Nurses and Pharmacists) in Saudi Arabia to collect data on the causes of diabetes Prevalence , and the factors that lead to diabetes prevalence, goal setting; focus on Investigating the contribution of primary health care in preventing diabetes prevalence and examine whether the relationship between primary health care and the spread of diabetes.

#### Methods:-

This study depends on the descriptive and analytical approach, also will be viewing on the literature and previous studies related to the subject of study. For examining the contribution of primary health care in preventing diabetes prevalence

For this purpose the researcher will distribute questionnaires for preliminary information for analysis. The study will be conducted among Health workers (Doctors, Nurses and Pharmacists) in al Alaha hospitalsSaudi Arabia.

**Corresponding Author:- Abdullatif Mohammed ALomair.**

Address:- Medical intern, King Faisal University Al Hasa, Saudi Arabia.

Questionnaires will be delivered to Doctors, Nurses and Pharmacists working in health sector to collect data on the causes of diabetes injury, and the factors that lead to diabetes prevalence. Statistical methods will be used by the statistical program for Social Sciences (SPSS) to handle the data obtained.

### **Results:-**

Diabetes is a chronic condition related to multiple late complications, reduced life, and a marked limitation within the quality of life. The malady, its complications and late-onset consequences cause a dramatic burden for health systems.

Primary Health Care (PHC) is taken into account to be a good strategy to boost accessibility and usage of services, address the social determinants of health inequities and improve health outcomes through the implementation of comprehensive interventions through sectoral and intersectoral collaboration, direction of people, community participation and social mobilisation.

This study was to the contribution extent of primary health care in preventing diabetes prevalence.

### **Discussion:-**

Stellefson et al (2013) created a study that looked at the Chronic Care Model and Diabetes Management in US Primary Care Settings: A Systematic Review, The Chronic Care Model (CCM) uses a systematic approach to restructuring medical care to create partnerships between health systems and communities. The objective of this study was to describe how researchers have applied CCM in US primary care settings to provide care for people who have diabetes and to describe outcomes of CCM implementation. To achieve the goal of the study, the researchers conducted a literature review by using the Cochrane database of systematic reviews, CINAHL, and Health Source: Nursing/Academic Edition and the following search terms: "chronic care model" (and) "diabet\*.", also included articles published between January 1999 and October 2011. We summarized details on CCM application and health outcomes for 16 studies, The 16 studies included various study designs, including 9 randomized controlled trials, and settings, including academic-affiliated primary care practices and private practices. Results of the study showed that CCM approaches have been effective in managing diabetes in US primary care settings. Organizational leaders in health care systems initiated system-level reorganizations that improved the coordination of diabetes care. Disease registries and electronic medical records were used to establish patient-centered goals, monitor patient progress, and identify lapses in care. Primary care physicians (PCPs) were trained to deliver evidence-based care, and PCP office-based diabetes self-management education improved patient outcomes. Only 7 studies described strategies for addressing community resources and policies. The researchers recommended that future research about integration of CCM into primary care settings for diabetes management should measure diabetes process indicators, such as self-efficacy for disease management and clinical decision making.

Additionally, Green et al (2012) also created a study about "Primary prevention of type 2 diabetes: integrative public health and primary care opportunities, challenges and strategies", Type 2 diabetes imposes a large and growing burden on the public's health. This burden, combined with the growing evidence for primary prevention from randomized controlled trials of structured lifestyle programs leads to recommendations to include caloric reduction, increased physical activity and specific assistance to patients in problemsolving to achieve modest weight loss as well as pharmacotherapy. These recommendations demand exploration of new ways to implement such primary prevention strategies through more integrated community organization, medical practice and policy. The US experience with control of tobacco use and high blood pressure offers valuable lessons for policy, such as taxation on products, and for practice in a variety of settings, such as coordination of referrals for lifestyle supports. We acknowledge also some notable exceptions to their generalizability. This paper presents possible actions proposed by an expert panel, summarized in Table 1 as recommendations for immediate action, strategic action and research. The collaboration of primary care and public health systems will be required to make many of these recommendations a reality. This paper also provides information on the progress made in recent years by the Division of Diabetes Translation at the US Centers for Disease Control and Prevention (CDC) to implement or facilitate such integration of primary care and public health for primary prevention.

Furthermore, Harris(2008), titled "The role of primary health care in preventing the onset of chronic disease, with a particular focus on the lifestyle risk factors of obesity, tobacco and alcohol", the potential impact of primary health care in assessing and managing smoking, hazardous drinking, poor diet and physical inactivity has been

demonstrated among patients who are at higher risk. Effective interventions based around the 5As approach include the assessment of risk and readiness to change, brief motivational interventions and referral of suitable patients for more intensive interventions. Health checks have been demonstrated to improve the frequency of preventive care and support for behavior change. However their impact on health outcomes is uncertain. Expansion of the current complexity of different Medicare items is undesirable. Health checks should focus on specific evidence based preventive actions and involves the use standardized resources such as Life scripts and integrated health risk assessment tools. Other performance based incentives may be useful in targeting the needs of specific groups and encouraging primary health care to provide more outreach and culturally appropriate preventive care for disadvantaged groups. General practice referral of patients needing more intensive lifestyle interventions is infrequent due to a number of factors including cost and availability of providers and services and the integration between these services and primary health care. A major role of primary health care organisations is to coordinate and broker a network of referral services to support behavior change based on standards and quality assurance. Other key roles of primary care include the support of practices to monitor and improve their performance in providing preventive care. Structural reform of primary health care may provide opportunities for more integrated approaches to management of the lifestyle risk factors across private and public and national and state funded services.

### Conclusion:-

Diabetes: is a serious, chronic disease that occurs either when the pancreas does not produce enough insulin (a hormone that regulates blood glucose), or when the body cannot effectively use the insulin it produces.

Environmental Health Law, Sanitation  
 Hygiene and Refill Drinking Water Depot

**Abstract**

The lack of quality guarantee of drinking water produced then the community should be protected from the risk of water-borne diseases due to consumption of drinking water comes from refill drinking water depot that does not meet quality standards and sanitation hygiene requirements. The study aimed to how the legal provisions governing the sanitation hygiene of refill drinking water depot and how requirements and control of the use of refill drinking water depot in the perspective of environmental health laws. To achieve the objectives then author using a normative research method. The result of study about the development of refill drinking water depot has the potential to cause negative impacts on public health, if the lack of effective regulation. Every effort of drinking water depot must through acceptance tests because if not met the acceptance it will cause uncertainty of license of refill drinking water depot. The lack of water quality appears as caused by the low quality of controlling and it indicates by the amount of refill drinking water depot that does not meet health requirements. It becomes a factor for people who consume the water to be careful. The Decree of Health Ministry No. 43 of 2014 on sanitation hygiene of refill drinking water depot in standardization is less clear in determining refill drinking water depot as their existence. This is a problem and a shared responsibility between manufacturers of drinking water, consumers and government. To ensures the feasibility and safety of refill drinking water depot.

**Introduction:-**

In everyday life, water as a component that closest to human and become a basic need for quality and sustainability of human life, therefore it should be available in sufficient quantity and quality. This is not independent with the need of drinking water for humans. The fulfillment of drinking water for communities today is very varied. There are people who get drinking water from source water, river water, and groundwater either by using shallow and deep wells or in piping water that produced by the Local Company of Drinking Water, which is cooked before consumed. And also includes through drinking water depots. Drinking water depot is a business that process raw water into drinking water in bulk and sell directly to consumers.

Sanitation hygiene is a health effort to reduce or to eliminate factors that become the cause of contamination of drinking water and the means used for processing, storage, and distribution of drinking water at drinking water depots. The purpose of hygiene sanitation is the protection of communities from bad influence due to the consumption of drinking water comes from drinking water depots.<sup>1</sup>

Thus, the community will be protected from the exposure to risk of water-borne. The activities of industrial, domestic and other in drinking water depot impacted negatively to water resources, including water quality degradation. This condition can cause interference damage and danger for living organisms that depend on the water. It should be in accordance with Government Regulation No. 66 of 2014 on environmental health in article 13:

“The requirements of water health for hygiene and sanitation at least consist of: (a) the water in a protected state from sources of pollution, disease-carrying animals, and vector breeding; and (b) safe from possible contamination.”

The decree of Health Minister No. 43 of 2014 in article 17:

“Every owner of a drinking water depot must supervise or control the fulfillment of the requirements.”

The problem of water quality degradation arises due to the low quality of supervision is the amount of refill drinking water depots that do not meet health requirements. It found empirical facts in North Sumatra, the killing of people related to the poisoning after consuming a refill drinking water suspected to be contaminated by *Escherichia coli*. And *Coliform Coli*, it indicates contamination of feces (human). While, *Coliform* indicates unhygienic handling of the drinking water production process. Throughout in 2014, cases of diarrhea were found in the province of North Sumatra as many 215.651 cases, with the highest number is found in Medan city. Based on data obtained from the Health Office of North Sumatra Province, the prevalence of diarrhea in Medan throughout in 2015 as many as 29.769 cases.<sup>2</sup>

The development of refill drinking water depot potentially causes negative impact for public health, if the lack of effective regulation. Unclear license owned by refill drinking water depot is also a concern for users to be careful. Its standard is less clear to determine the refill drinking water as the existence is not in accordance with the Regulation of the Health Minister No. 907/ Menkes/SK/VII/2002 on requirement and supervision of drinking water quality.<sup>3</sup> Depot that fulfill requirement have a guarantee letter of raw water supply from the Drinking Water Company or the company has a license to get water from the competent authority.<sup>4</sup>

The company is also required to have a test result report of drinking water from water quality analysis laboratories that appointed by district or city governments. Not all refill depots have such requirements. Even some person use water from the water replenishment as a raw material. Depot is not according to the rules outlined by the Health Minister. Because they do not brush gallon when washed. Drinking water depot is usually just simply rinse gallon and do not turn on the Ultra Violet (UV) light for sterilization. Moreover, depot looked slovenly and did not pay attention to sanitation.<sup>5</sup>

Issue raised today is the lack of guarantee of quality to resulting drinking water. The peoples need to be protected from the risk of water-borne diseases due to consumption of drinking water that comes from drinking water depot does not fulfill the quality standards of hygiene sanitation and requirements.<sup>6</sup>

In relation it, this paper aimed to how the legal provision of sanitation hygiene of drinking water depot, and how the requirements and control of the use of drinking water depot in the perspective of environmental health laws.

### **Method:-**

The method of study was library-research as a process to find the rule of law, principles of law, and legal doctrines in order to address the legal issues faced. This is consistent with the prescriptive character of jurisprudence at this writing. It can be seen that the prescriptive character of jurisprudence is a normative research that trying to assess what should be on every issue.<sup>7</sup> Then, as analysis materials includes primary legal materials which are materials that are authoritative in the form of legislation. With a statute approach is done by examining all laws and regulations pertaining to the legal issues that are being addressed.

### **Discussion and Analysis:-**

Drinking water depot and then refers to a business that process raw water into drinking water in bulk and sell directly to consumers.<sup>8</sup> This can be carried out continuously using a fixed gallon. Hygiene and sanitation are inseparable things because it is very closely related. The principles of hygiene and sanitation for both food and drinks is about knowledge, attitudes, and human behavior in obey the principles of health, hygiene, and safety in the handling of food products and beverages.

According to the authors based on the principle of State's responsibility that the State guarantees the utilization of natural resources will benefit as much as possible for the welfare and quality of life of the people of both present and future generations, the State guarantees the rights of citizens on the environment is good and healthy. So, based on that the legislation related to the obligations of State and the government provides the publics' right to obtain monitoring the national drinking water quality in high health standard, by providing a healthy environment in the form of drinking water that meets the health requirements based on the results of monitoring the quality of drinking water, so that the community that consume drinking water free of health problems.<sup>9</sup>

### **Government Regulation No. 66 of 2014 concerning environmental health:-**

1. Article 39 paragraph 1 on Quality Standard of Environmental Health and health requirements set out in the medium of environment that includes: a. water;
2. Article 8, paragraph 1 the medium of environmental set out quality standards of Environmental Health and Health Requirements as referred to in paragraph (1) is an environmental media relating to or drinking water depot impacted directly to public health.
3. Article 9 on Quality Standards of Environmental Health and Health Requirements for water referred to in Article 8 paragraph 1 letter (a) consist of: a. Quality standards and health requirements for drinking water; b. Quality standards and health requirements of water for hygiene and sanitation;
4. Article 11 on health requirements of drinking water as referred to in Article 9 letter a at least consist of: a. Water in a protected state; and b. Processing, storage, and the serving must meet the principles of hygiene and sanitation.

The regulation of Health Minister No. 416/Permenkes/IX/1990 on the requirements and water quality control by issuing the regulation of Health Minister No. 736/Permenkes/VI/2010, then the regulation of Health Minister No. 416/Permenkes/IX/1990 along concerns drinking water, this regulation does not apply again. But to the requirement and controlling of clean water is still apply. Similarly, the regulation of Health Minister No. 492/Permenkes/IV/2010 on the requirements of Drinking Water Quality.

All drinking water facilities should be fulfilling the requirements as set out in this regulation. Furthermore, the regulation of Health Minister No. 736/Permenkes/VI/2010 on Procedures for Drinking Water Quality Monitoring. This regulation becomes main reference in conducting surveillance of drinking water quality. The regulation of

<sup>7</sup>Peter Mahmud Marzuki. 2011, *Penelitian Hukum*, cetakan ke-11, Jakarta: Kencana. Page.35

<sup>8</sup> Regulation of Health Minister No. 43 year 2014 article 1 point 1 concerning sanitation hygiene of drinking water depot

<sup>9</sup>Ridho Adiputra Tambunan. (2014). Peran PDAM Dalam Pengelolaan Bahan Air Baku. Air Minum Di Kota Yogyakarta *Jurnal Ilmiah Hukum Pertanahan Dan Lingkungan Hidup*. See: <https://ejournal.uajy.ac.id/5020/.../Jurnal%20ridho%20adiputra%20tambunan>.

health of drinking water depot as the Regulation of Health Minister of the Republic of Indonesia No. 736/Permenkes/IV/2010 concerning the requirements of physical, chemical, biological and radioactive to refill drinking water products that must be obeyed.

Supervisory activities were conducted on the quality of refill drinking water by the Health Office both municipal/district. For the examination of bacteriological quality, the raw water is checked at least one sample of three months once, as well as bottled water in at least two samples of at least once a month. Drinking water supply and sanitation are still experiencing difficulties, resulting in access to drinking water and sanitation is still weak.<sup>10</sup>

Based on the Regulation of Government No. 122 of 2015 on the development of Water Supply System in common explanation among others argued that:

“The development of water supply system is the responsibility of the government and the local government was organized in the framework of people welfare by ensuring the basic needs of community in drinking water that meets quality, quantity and continuity.”

That to realize the implementation of a supplying means optimally the people have access to drinking water and good sanitation requires cooperation in coordination, synergy and integration between government, public, and private or corporate, so that in its period all people both urban and rural areas can access drinking water that meets the requirements through the development of water supply system. The purpose of environmental quality improvement is the percentage in monitoring of drinking water facilities were carried out by 50% in line with efforts to achieve access to drinking water and sanitation, the percentage in monitoring of drinking water quality is an integral part in the achievement of universal access to drinking water.<sup>11</sup> Referring to the Regulation of Government No. 122 of 2015, stated that:

“Drinking water that produced from water supply system used by the public.”

Consumers must qualify based on the regulation of minister that implementation to be carried out through Drinking Water Quality Monitoring. This is an effort to provide guarantee to the public to use water from the water supply system whose quality meets health standards so that safe from disease or other health disorders. Supplying of safe drinking water includes the supply of water through piping network.<sup>12</sup>

Development of Drinking Water Supply System and Control of Drinking Water Quality requires coordination, integration, synchronization for implementation so that the people get the services such as access to drinking water optimally.<sup>13</sup>

The Regulation of Health Minister No. 416/Permenkes/IX/1990 concerning the requirements and water quality monitoring, its activity includes field monitoring and water sampling, water sample testing, analysis of test results, formulation of suggestions and ways of solving the problem and result monitoring and follow-up.

The Regulation of Health Minister No. 736/Permenkes/VI/2010 mandates the drinking water depots must conduct internal and external supervision. The process of Drinking Water Quality Monitoring must follow the regulation. In relation to the drinking water depot in which its existence is not yet clear in terms of licensing and registered, the main steps that need to be taken is to manage drinking water depot database with an inventory of existing drinking water depot, which has been monitoring the quality of drinking water both internally and externally.<sup>14</sup> In terms of trade in drinking water depot based on the decree of industry and trade minister No. 651/MPP/K/10/2004, drinking water depots must have an operating license, drinking water depots are prohibited from taking raw water source coming from the Local Water Company and should come from mountain springs that are free from contamination.

<sup>10</sup> Ronny, Dedi Mahyudin Syam. (2016) Studi Kondisi Sanitasi Dengan Kualitas Bakteriologis Depot Air Minum Isi Ulang di Kecamatan Panakkukang Kota Makassar. *Journal. Uinalauddin* ,2.(2).

<sup>12</sup> Suripin. 2002. *Pelestarian Sumberdaya Tanah dan Air*. ANDI. Yogyakarta. Page.32

<sup>13</sup> Effendi, H. *Op.cit*. page.56

<sup>14</sup> See detail review in each supervision objects in the Regulation of Health Minister No. 43 of 2014 concerning sanitation hygiene of drinking water depot.

Safe and healthy guarantees to consume drinking water depot based on laboratory testing by the National Agency of Medicine and Food, the steps that need to be done on drinking water depot addressed to related parties includes:

1. Before drinking water depot allowed to produce and sells produced drinking water, should the treatment system of drinking water must obtain certification from an agency that has the competence.<sup>15</sup>
2. At least once every six months are required to refill drinking water depot to check their products to laboratories that have been accredited and report the results to relevant agencies.

As the regulation of Health Minister No.736 of 2010 concerning the procedure of drinking water quality, mandates that as a target of external monitoring and retrieval as well as sample tests for physical and bacteria should be performed on drinking water depot.

#### **Acceptance Test of Sanitation Hygiene:-**

Acceptance test of sanitation hygiene is an assessment of the efforts of drinking water depot to control the factors of food or drinks, people, places and its equipment that may lead to illness or health disturbance or not, as well as the technical provisions of health are assigned to drinking water products, personnel, and its equipment that include requirements of biological, chemical and physical.<sup>16</sup>

Acceptance test of sanitation hygiene is conducted by the Municipal Health Office/district to drinking water depots are located in each region. Based on the regulation of Health Ministry No. 43 of 2014 concerning sanitation hygiene of drinking water depot.<sup>17</sup> To test the acceptance or not a sanitation hygiene is characterized by the Certificate of Sanitation Hygiene which is written evidence issued by the Health Office both district/municipal or the Port Health Office stating that drinking water depots have met quality standards or requirements of drinking water quality and requirements of Sanitation Hygiene. Drinking water depot is said to be accepted when the value obtained from the assessment of acceptance test at least 70% of sanitary hygiene including laboratory results qualified.

In conduct a business of refill drinking water depot, there are several requirements that must be met by businesses, includes about business license and locations of refill drinking water depot.

- a. Refill drinking water depot shall have:<sup>18</sup>
- b. Industrial business license or registration certificate of industrial and trading license;

<sup>15</sup> Article 19 (1) in order to improve the knowledge and skills of sanitation hygiene the owners and workers of drinking water depot must attend training/courses about sanitation hygiene. (2) Training/courses about Sanitation Hygiene referred to in paragraph (1) may be organized by the Ministry of Health, Provincial Health Office, District/Municipal Health Office, port health office or another agency/institution in accordance with laws and regulations. (3) Participant of training/courses that have passed can be given a certificate signed by the Head of Health Office both district/municipal or the Head of Port Health Office and the organizer of the training/courses. Sanitation hygiene is continuously; (4) the material of training/courses refers to the curriculum and training modules are issued by the Ministry of Health.

<sup>16</sup>Ender Budi Sasangko, Endang Widyastuti, Rawuh Edy Priyono.(2014).Kajian Kualitas Air Dan Penggunaan Sumur Gali Oleh Masyarakat Disekitar Sungai Kaliyasa Kabupaten Cilacap. *Jurnal Ilmu Lingkungan*.12(2):72-82.

<sup>17</sup>Article 2 (1) Each water depots must: a. ensure produced drinking water meet the standard quality or requirements of the quality of drinking water in accordance with laws and regulations; and b. meet the requirement of sanitation hygiene in the management of drinking water. (2) to ensure drinking water meets standards quality or requirements of drinking water quality as referred to in paragraph (1) letter *a*, water depots must follow the procedure of drinking water quality supervision in accordance the legislation.”

“Article 4 paragraph (1) each water depots must have a business license in accordance with laws and regulations. (2) to issue a business license of drinking water depots as referred to in paragraph (1), the local government both district/municipal should require the Certificate for Acceptance of Sanitation Hygiene.”

“Article 5 (1) The Certificate for Acceptance as referred to in Article 4 paragraph (2) was issued by the Head of Health Office both district/municipal. (2) Excepted from the provisions referred to in paragraph (1), the Certificate for Acceptance of sanitation hygiene for drinking water depots in the area of ports, airports, land cross post or issued by the Head of Port Health Office”

“Article 6 the Certificate for Acceptance of sanitation hygiene is valid for 1 (one) business place of Drinking Water Depot”

<sup>18</sup>.Decisionsof industry and trade minister. No.. 651/MPP /K/10/2004, drinking water depots must have an operating permit

1. License to get water or guarantee letter for raw water supply or other companies that have license to get water from the relevant authorities.
  2. Test result certification for drinking water products produced from the laboratory which has been accredited or designated by the minister.
- c. Refill drinking water depot should be in locations permitted by the local government both district and municipal.

Raw water is water that meets the requirements of water quality as stipulated in the decision of health minister No.416/Menkes/PER/IX/1990. As source of raw materials of refill drinking water depot, at least there are 3 (three) sources that come from mountain springs or tap water that ready to drink, ground water and tap water as clean water category.

Raw water used by refill drinking water depot must meet the standard quality of health minister. The attention of raw material source is substantially influences the tools that will be used for the production of drinking water sold in the drinking water depot. While the process of production of refill drinking water depot conducted themselves in the home industry with the production process using simple tools, such as the following:<sup>19</sup>

1. In principle, the treatment process of refill drinking water include raw water reservoirs, filtration, disinfection (ultraviolet light and ozone for sterilization) for heating and fill.
2. Refill drinking water depot must comply with the technical guidelines for good production.

### Conclusions:-

Legal Aspects of environmental health on sanitation and hygiene of drinking water depot in its implementation should be appropriate and referring to the Regulation of Government No. 122 of 2015 concerning Drinking Water Supplying System, the Regulation of Government No. 66 of 2014 concerning Environmental Health, Presidential Decree No. 185 of 2014 concerning the Accelerating of Drinking Water Supply and Sanitation the Regulation of Health Minister No. 43 of 2014 concerning sanitation hygiene of water depot.

The regulation of Health Minister of the Republic of Indonesia No.907/Menkes/SK/VII/2002, concerning the requirements and Water Quality Monitoring, Health Minister No. 492 of 2010 concerning the Requirements of Drinking Water Quality, the Regulation of Health Minister No. 736 of 2010 concerning the Procedures for Monitoring Drinking Water. Products of refill drinking water depot must have quality and healthy water qualities are clear, odorless, colorless and free from all kinds of harmful bacteria.

Each water depots must:<sup>20</sup>

- a. Ensure the produced drinking water meets the standard quality or requirements of drinking water quality in accordance with laws and regulations; and
- b. Meet the requirement of sanitation hygiene in the processing of drinking water.

As well as food safety in general, it is basically a question of the feasibility and safety of drinking water is a problem and a shared responsibility between producer of drinking water, consumers and government. In this case, drinking water producer should be able to control the process so that it generates decent drinking water and safe to drink. Consumers are entitled to obtain suitable drinking water and safe to drink and has right to refuse that does not comply with the requirements and raise objections. While, the task of government is to regulate and supervise in order circulating drinking water guarantee the feasibility and safety. The role of government (in this case the Ministry of Industry and Trade) for the supervision of deviations that occur, providing sanctions and brave issued a production ban for the creation of a quality refill drinking water depots and provide safety and comfort to its customers. The government is expected to play a role in terms of guidance and supervision of refill drinking water depots are proper safe for consumption.

### Abstract

The experimental sample of rectilinearly moving segmented mowing-machine of new construction and of minor power is represented, which can be used in small contour as well as medium type plots and mining terms for preparing food for neat horned cattle. Mowing-machine has 3-7 kvt power engine, sharp machine, new construction equipment of adherence set between engine and sharp equipment necessary for mowing work process, safe and economic manufacturing.

Copy Right, IJAR, 2017., All rights reserved.

### Introduction:-

Nowadays mowing-machines are equipped with basically segmented and rotationally sharp machines [3]. Segmented sharp machines work at comparatively low speed and have constructional complexity and relatively big weight and as for the mowing-machines having rotation sharp machines, they have big speed of working but as a result of practical research test in terms of mining field it was found out that they do not fully meet the requirements related to the harvesting without any loss but segmented machine which works on the principles of scissors through inter-action of segments dealt with the harvesting without any loss under the terms of mining field but with less productivity on the plot of one and the same area.

As you may know, considering the world practice experience the small and medium power mowing-machines are: manually mechanically transferrable, manually motorized, hanging or relocation wheeled mowing-machines. Among mechanic mowing-machines following are remarkable: Husqvarna 540 9649440-01 ([www.husqvarna.com](http://www.husqvarna.com)) manufactured in Switzerland, rill Razorcut Premium 33 manufactured in Germany (<http://www.reelmowerguide.com/brill-razorcut-premium-38-reel-lawnmower>) and other which are operated directly by operator with relocation without engine. The manual minor powered rotation mowing-machines are divided in mowing-machines which operate on electric as well as in-house combustion engines, and from them following electric mowing-machines are remarkable: MTD ET 700 41AC175G678 manufactured in Germany (<http://www.heise.de/preisvergleich/eu/mtd-et700-elektro-rasentrimmer>), Oleo-Mac TR92E 6002-9002 manufactured in Italy (<http://www.oleo-mac.co.uk>) and other, and in-house combustion working mowing-machines are: Stihl ES 38414000112377 manufactured in Germany (<http://www.stihl.de>), MTD 790 M AST manufactured in Mexico, Caiman VS 256W LUXE – manufactured in (<http://electromenagers.org/en/trimmer/2115-caiman-vs256w-tu26-luxe.html>) and other. From the wheeled relocation small powered mowing-machines following area remarkable: Swisher SST 22 625 NA –manufactured in Usa (<http://www.homedepot.com/p/Swisher-6-75-Gross-Torque-163cc-Gas-Walk-Behind-String-Trimmer-ST67522BS>), Triunfo – manufactured in Portugal

(<http://www.triunfo.com/>), Briggs and strattion –manufactured in France (<https://www.briggsandstratton.com>), Billy Coat BC2403JC –manufactured in USA and other.

As you may know the presented mowing-machines basically work on rotation sharp machines having high work speed but during the rotation manual mowing-machine test process several times were the herb cultures cut to their stems and in case of field food making the process of cutting clean at comparatively low level which caused certain difficulties while harvesting. But in case of using segmented mowing-machine НеваKH -1.1 which is manufactured in Russia (<http://machinspec.ru/kommunalnaya/kosilka/dlja-motobloka-neva.html>) comparing to rotation type this process is excluded but in case of work low work speed terms we received the low productivity of machine. The aim of our research is to process machine for cutting without support, being rectilinearly relocating segmented one of new construction, which will solve mentioned problem.

Aim and methods of research. The aim of the scientific work research is to process the construction of rectilinearly relocating segmented sharp machine on the base of minor powered energetic means in terms of field for the alternative of using the mentioned in preparing raw food, namely, the forms of segments of sharp machine are processed, the mechanism for transmission, machine construction and safety transmitting mechanism. The basic parameters of machine will be calculated and relevant methods of optimization of its construction will be determined.

Review of research results. The stable food base of animal-breeding is the term for further development of important field of agriculture. In the process of working on the construction of sharp mechanism of mowing-machines we considered the basic events of agri-technique of mowing like: obtaining maximally good food, mowing down at the height of 4-4.5cm, the stem should be cut without extra parceling and tearing off, it should be well adjusted to relief and the grass mow should be set up in rows without touching motoblocks to wheels.

Considering the above mentioned gaps the rectilinearly relocating segmented sharp machine has been processed which has following parts:

**Npic.** Rectilinearly relocating segmented sharp machine

Escalating stars 1, 3, sharp segments 2, toothed trap 4, driving star 5, driving tooth wheel 6. Sharp machine of mowing relocates through electric or in-hous combustion engine driving star, which moves toothed trap, on which there are triangular sharp segments and sharp segments relocating rectilinearly which accomplished the work process of mowing. For the purpose of safe work of trap the leading star of sharp machine drives from mechanism of adherence which has the ability to protect when touching solid bodies or big resistance. It comprises: clipping mechanisms 3, plural stocks 1 and overlapping 2 when sharp machine works exceedingly  $\sigma_p = 0,4 \times 10^8$  n/sq.m. resistance, overlapping 1 stops at sharp machine, and through plural stocks engine makes unoccupied relocation. After resistance is taken off machine gets back to the work process of mowing.

**Pic. 2.** Mechanism of adherence

Cutting the stem of herbs is determined by many factors which are directly related to the stem consistency and sizes and the basic requirement of technologic process is the secrecy of machine, energy volume, taking good and quick harvest. Meeting this criteria depends on the efficiency of sharp machine sharp segment which is determined by following factors:

**Pic. 3.** Basic parameters of sharp segment.

Cutting speed  $V$ , segment sharpening angle ( $\beta$ ), segment inclination angle ( $\alpha$ ), segment knife thickness ( $\delta$ ), segment thickness ( $\delta_0$ ) [Phillip c. Jonson, 2012].

The relative speed of sharp machine cutting edge is determined from the version [Trubilin E.I., Ablikov, 2008]

$$V_{relativ} \geq \sqrt{V_{cr}^2 - V_m^2}$$

Where  $V_{cr}$ -is the critical speed of edge,  $V_m$ - speed of machine relocation.

The distance between sharp segments is determined by following equation:

$$S = hctg\alpha + hctg\beta$$

Where  $\alpha$  is the segment inclination angle and  $\beta$  is the absolute speed vector inclination corner of cutting edge. The coefficient of using sharp edge is calculated under equation

$$K = \frac{V_m}{V_{relativ}} \left( \frac{S}{h} - ctg\alpha \right)$$

E

Experimentally it is found out that following forces act on the cutting segment (pic. 4): material resistance  $P_1$ , stem de-formation resistance force -  $P_2$ ,  $\varphi_2$ - friction force, friction resistance force on the edge at inclination  $\varphi_3$ -angle and normal - $P_3$ , and  $P_2$  is related to  $P_3$  in following way:

$$P_3 = P_2 \frac{\cos(\varphi_2 + \beta')}{\cos \varphi_3}$$

Where  $\beta'$  is the projection of sharpening angle

Fig. 4, forces acting on segment when relocating

The relocation of towards X axis divide in four stages  $X_1, X_2, X_3$  where relevantly the forces of cutting resistance are  $P_{X_1}, P_{X_2}, P_{X_3}$  [Makharoblidze R.M., Tedoradze O.M, 1995] where

$$P_{X_1} = \frac{E_1 Z_0}{E_1 + E_2} \left[ E_2 \frac{x}{x_y} + \frac{\eta V_x}{x_y} \left( \frac{E_2}{E_1 + E_2} - 1 \right) \left( \exp \left( -\frac{E_1 - E_2}{\eta V_x} x \right) - 1 \right) \right] dy$$

$$P_{X_2} = 0,2 + 0,2(\sin(\varphi_2 + \beta) + \cos(\varphi_2 + \beta) tg \varphi_3)$$

$$P_{X_3} = 0,2 + 0,4(\sin(\varphi_2 + \beta) + \cos(\varphi_2 + \beta) tg \varphi_3)$$

The stem consistency will be taken into consideration having following arguments :

$$E_1 = 9,98 \cdot 10^8 \text{ n/m}^2, E_2 = 6,40 \cdot 10^8 \text{ n/m}^2, \eta = 3,5 \cdot 10^6 \text{ n.sm/m}^2, n=0,3, \xi = 5,2, \sigma_p = 0,4 \cdot 10^8 \text{ n/m}^2, \varphi_{min} = 8,1^\circ, \varphi_{max} = 34^\circ. [2].$$

Based on the calculation we got :  $P_{X_1} = 1,8, P_{X_2} = 1,9, P_{X_3} = 3,8$ .

And the force of entire resistance is  $P_x = 7,5 \text{ n.m}^2$

And the segment relocation energy in case of edge speed  $V = 17, 19, 21, 23 \text{ m/sec}$  when  $\varphi = 9$  relevantly receive:

$$A_{cat} = \cos(\alpha - \varphi_1) P_x = \cos(27^\circ - 12^\circ) \cdot 7,5 = 6,7 \text{ j. } A_{cat} = 6,9 \text{ j. } A_{cat} = 7,1 \text{ j. } A_{cat} = 7,5 \text{ j.}$$

Let's draw the graph of speed and circle energy volume:

In cases of sharp segment  $\alpha=47^{\circ}$   $h=0,04\text{m}$   $V_{cr}=20\text{m/sec}$   $V_m=0,2\text{m/sec}$   $\beta=27^{\circ}$  you will get :

$$V_{relativ} \geq \sqrt{V_{cr}^2 - V_m^2} = \sqrt{20^2 - 0,2^2} = 19 \text{ m/sec}$$

And

$$S = 0,4(\text{tg } 47^{\circ} + \text{ctg } 27^{\circ}) = 0,1 \text{ m}$$

$$DdaK_{uss} = 0,8$$

D

### Conclusion:-

Presented cutting machine in comparison with the rotation machine is characterized with whole range of advantages, for example :

1. Such type of machine provides the constant speed, when the speed of circle in rotation machine is changeable according to the height of segment and location.
2. The inclination of such type machine's cutting edge in the period of whole phase of circle which has positive impact on the quality of circle.
3. The cutting edge of such machine is equally charged during the entire phase of circle which creates the conditions available for machine to operate.
4. The coefficient of using the sharp segment of cutting machine of such type reaches rate 1 which in rotation cutting machines is impossible.

On the basis of mentioned conclusions we may presume that new model of rectilinearly relocating segmented mowing-machine among minor and medium powered mowing-machines provides the process of taking harvest efficiently, with quality and no loss.

**Abstract**

The *Bluest Eye*, a novel by Toni Morrison, uncovers the deplorability of excellence in the public arena. Living in Lorain, Ohio in 1939, a 11 year old African American young lady Pecola Breedlove longs for the 'bluest eye', which she connects with a superior life where grown-ups wouldn't take a gander at her with a withdrew look and youngsters wouldn't taunt her. Drinking milk from a Shirley Temple container and picking 'Mary Jane' confections for the traditionally wonderful young lady enriching the wrapper, Pecola demonstrates her yearning to one day have her family turn into the encapsulation of the "Dick and Jane" family. A long way from her optimal, Pecola's family battles to have any feeling of affection live in their home. Both Mr. what's more, Mrs. Breedlove physically mishandle each other, and later on, Pecola is sexually manhandled by her dad, the peak of the story. At the point when her dad is in prison for an alternate wrongdoing, her family is part up. She then goes to the MacTeers' more steady home where Pecola turns out to be practically similar to a sister to the MacTeer young ladies, Frieda and Claudia. In the long run, Pecola's implausible wish gets the best of her, and she goes crazy, trusting she has the bluest eyes. Since she doesn't have blue eyes (she was deceived by malevolence Elihue, or Soaphead Church), individuals are not ready to see them, so she closes they are quite recently jealous.

**Introduction:**

The *Bluest Eye* is Toni Morrison's first novel, a book proclaimed for its fruitfulness of dialect and boldness of creative energy. African-American writing is created by the authors of African plummet living in the United States. It bargains chiefly with subjection, disparity, bigotry, sexism, classism, social conflict, and so forth. It takes after the old stories custom of narrating and incorporates oral structures like spirituals, sermons, gospel music, and so forth. Rigging up in the creator's girlhood main residence of Lorain, Ohio, it portrays the tale of dark, eleven-year-old Pecola Breedlove. Pecola appeals to God for her eyes to turn blue with the goal that she will be just as lovely and dearest as all the blondie, blue-peered toward children in America. In the harvest time of 1941, the year the marigolds in the Breedloves' greenery enclosure don't blossom. Pecola's life does change- in excruciating, decimating ways. The *Bluest Eye* stays one of Tony Morrisons' most intense, exceptional books and a critical work of American manufacture

The *Bluest Eye* is a harst warning about the old consciousness of black folks attempts to emulate the slave master. Piccolos request for more money and better house or even for more sensible parents; her request for blue eyes

something she never wins. Morrison does not have to recite the tale of three hundred years of black dominance by white culture for us to be mindful of this history of American Blacks, who have been victims in his calamity. The self-hatred that is at the core of Pecola's character affects, in one stage or another. Here we explore and analyze Toni Morrison's novels, in terms of the way to show the variability of Black feminism as characterized by the novelist who responds to the common sexist and racist context. Toni Morrison is a literary giant of the 1980s and 1990s and over all famous for being both a woman and an Afro-American. In her works, she has explored the experience and roles of black women in a racist in a male dominated society. In the center of her complex and multilayered narratives, there is the unique cultural inheritance of Afro-Americans. Her works also express the influence of Afro-American folklore, songs and women's gossip. In her endeavors to map these oral art forms into literary modes of theatrical performance, Morrison has created a body of work informed by a distinctly black sensibility while drawing a reading audience from across racial boundaries.

American Racism, ethnic American writers show their shared concern in their composition. The first body of ethnic writing to emerge. African American literature presents some of the most revealing investigations of racial discrimination. Early in the 19<sup>th</sup> century, slave narratives recount the dehumanizing effect of slavery. In probability, the period most famous African American text, *The Narrative of Frederick Douglass, an American Slave*, written by himself (1845). Frederick Douglass, born into slavery in Maryland details his own experience of slavery and articulates his dignity as a man. Refusing details his own experiences in slavery and articulates his dignity as a human being. Refusing to submit himself to his master, he declares, "You have seen how a man, was made a slave, you shall see how a slave was made a man." Although by a century later slavery is no longer present, racial discrimination still intrudes upon every aspect of the lives of African Americans and positions them as "Invisible Men". Ralph Waldo Ellison's *Invisible Man* (1952) portrays a quest for individuality within the organization of American racialism. Ellison's unnamed black narrator's search for self-definition begins with an indictment of racial favoritism. To invisible, understand, simply because people refuse to look me." Morrison also writes from a feminist perspective describes how racism defines standard of beauty that militate against blacks, women especially and leads to tragic outcomes. That black is not beautiful has been regulated by European standards of blond, blue-eyed stunner. In Morrison's novel the child Pecola's obsession with Shirley Temple and a desire to deliver "the bluest eyes" cause her to fall into madness. Her tragic story, Morrison illustrates another kind of soul-killing impact of American racism on African Americans. Founded on the same instance, John Okada's *No No Boy* (1957) here Neglect by the American dominant public and unwelcome in the Japanese American community for nearly two decades after publishing. The disfiguring effect of racial discrimination on the individual soul, the family, the Japanese American community, and other ethnic Americans prevails throughout the novel. This novel shows that blacks, Japanese, Chinese, Mexicans, Filipinos, and goes all strive for recognition as complete beings, namely as Americans, but so far few are able to cross the unseen walls constructed by racism. (Emanuel, 400-443)

The Black female body is the hottest thing. White men secretly revel in it, not only buying, trading, and wrapping it, but also assuaging the need and desire for mother's milk with it. Historically relegated to the auction block instead of the plinth, the black female body has been built at the ugly end of wearisome western dialectic; not frightened, but profane, not angelic but demonic, not fair lady but ugly dark. Only with her male counterpart, the black woman has belonged to one of those races "perceived as more animal like, and less godlike". One of the most potent and successful reappropriators of black representation is Toni Morrison,

In the *Bluest Eye*, this culturally mandated fracture is the impetus for what Pecola experiences as disintegration or self-erasure:

"Please God," she whispered to the palm of her hired man. "Please make me disappear." She pinched her eyes close. Little parts of her body faded away. Now slowly, now with a rush. Slowly begin again. Her fingers went, one by one; then her arms went out all the way to the elbow. Her feet now, Yes that was decent. Her legs were restless and tired all at once. It was the hardest above the second joints. She bore to be really still and pull. Her stomach would not exist. But finally it, likewise, died out. Then her chest, her neck. The facial expression was hard, too. Almost done, almost only her tight, tight eyes were set aside. They are always on the left.

The pain tightened eyes remain witness to the horror – a company in which the white female body gives more prominence than a black woman. Already "a minority in both caste and class. Piccolo can't even take pride in, the

main thing she can take her physical structure. For with few limited fonts, others affirm the undesirability of her life. Henceforth the reason Yacobowski did not see neither her body, nor the face, when Pecola had come to buy treats. At the point when Yacobowski had come to America, he adapted not to appear at the textual mode, nor the variety of dark masses. Morrison herself remarked in the thereafter to the novel, by the "Disguise of suspicions of unchanging inadequacy beginning with an outer expression. (Michiel, Vennessa, 195-200)

In *The Bluest Eye*, Pecola Breedlove is dealt with gravely both by the white people and dim cloned individuals. Indeed, her mom, Pauline Breedlove detests her for being dim, filthy, and dismaying. Her dad Cholly Breedlove is a drunkard. He misuses Pauline and Pecola physically, rationally, and inwardly. Pecola begrudges the white young ladies with blue eyes who are dealt with mercifully by the universe. She begs God to give blue eyes. She believes that the itinerary in which the world sees her will change on the off chance that she gets blue eyes like white young ladies. Towards the end of the novel, she gets blue eyes, yet at the expense of losing her brain. Frieda MacTeer, Claudia MacTeer, and Pecola Breedlove are all closely knit friends and all go to the same school. Piccolo goes to Frieda's home, and Frieda issues her bread rolls and milk. Pecola is not inspired by the milk, however the 'blue-and-white Shirley Temple mug'. She drinks three or some milk just to understand and grasp the Shirley Temple glass. Mrs. master reprimands Pecola in a roundabout way for drinking an excessive quantity of milk. Pecola and Frieda talk about how "adorable" Shirley Temple is. Claudia doesn't care for the discussion in light of the fact that she loathes Shirley. She doesn't begrudge her white skin and blue eyes. Yet she had feelings her for hitting the dance floor with Bojangles, who is her most loved uncle.

The entire Breedlov clan has their troubles as Morrison tells us. Cholly Breedlove deserves attention for the special way he channels his double consciousness. Unlike his daughter Pecola, Cholly seems to be largely unaware of the forces shaping him. We see several instances where Pecola longs to be free of the white ideologies oppressing her, but Cholly and the rest of the clan "took the ugliness in their hands...and went about the world with it". Morrison tells us at the outset that Cholly's particular way of giving way "about the world" is in a state of inebriety, and we can read his drunkenness on both the literal level and the degree of his awareness. Most interaction that Cholly has with other characters occurs when he is lifted up. The first time we meet Mr. Breedlove, he "had come home drunk". We quickly find out that Cholly's alcoholism "relieved the tiresomeness of poverty... gave them the stuff they need to get their lives tolerable". The numbing properties of Whiskey are metonymies drunkenness numbs Cholly's violent outburst as well as his awareness of his own dual-consciousness. Morrison arrives at his clear when she composes. "Nothing Nothing... interesting him now. Not himself, not other people. Only in the drink was there some break, some floodlight, and when the closed, there was oblivion".(Michele, 25,26)

Unlike the dark girls like Pecola, Claudia harts the black individuals' admiring and patronizing the white girls. Thus, she hates white young ladies and white dolls. At the point when black young girls appreciate and White Dolls with blue eyes and blonde hair, Claudia looks at the white doll's nose, blue eyeballs, and yellow hair to figure out 'what it is in them at all the world said is adorable'. Being unbiased and reasonable, she doesn't discover anything other than 'a mere metal roundness' in the white dolls. Claudia destroys white girls and ill-uses white young ladies. She needs to realize what makes individuals appreciate white young ladies and say "Awwwww" and overlook dark young ladies in the city. She unequivocally accepts that dim young ladies are as wonderful as white young ladies.

At the point when everyone had hatred and hate against Pecola for her darkness, Frieda and Claudia adore her and give her great fellowship and enthusiastic backing. Their white neighbor Rosemary Villanucci spies the young ladies and make incessant grumbings about them to their mom. Frieda and Claudia figure out how to reprimand or beat the white lady to take revenge. Claudia has a ton of sensitivity for the Breedloves who experience the ill effects of self-loathing and twofold consciousness. She illuminates that they live in a storefront not in the perspective of their dejection, yet since they feel that they are revolting. "Their dejection is standard and stultifying; it is not intriguing. Yet their unpleasantness is surprising." She needs to find where their revolting lies however couldn't find the source. She further says, "It begins from conviction, their conviction. It is generally as a all knowing master master had given everybody a cover of abnormality to wear, and they had each recognized it without request."

Whiteness as the quantity of beauty had become so entrenched in American club that many African Americans were negatively influenced by these measures of physical attractiveness based on skin color, which they could never reach. The community in the novel values light skin over dark skin, as typified by the "dream child" Maureen Peal. Morrison depicts the self-hatred that had become deeply rooted in many of the community members and reveals the way African-American women have been taught to hate or devalue their own bodies or physical properties. The

reference in the novel often takes this hatred out on their kids. Geraldine, ashamed of her blackness, calls Pecola a "nasty little black bitch," and Pecola's mother exhibits more love for the white daughter of her employer than for her own children. (Amy, 36)

Pecola Breedlove has an inner urge for people to love her as they tend to love white girls. She goes to the candy shop, seeing Pecola the business person looks at her furiously and this makes her beautiful. She feels seeing her darkness the business person hates him. "It has an edge; some place in the base top is the abhorrence. She has seen it prowling according to all white individuals. So. The dislike must be for her, her blackness." She buys Mary Janes confectionery and appreciates the excellence of the white young lady imprinted on the wrapper. She eats the confectionery as though she is eating her eyes. She needs to be as delightful as Mary Jane. Her enthusiasm for blue eyes and white skin is depicted indecently by the storyteller: "Three pennies had purchased her nine dazzling climaxes with Mary Jane. Beautiful Mary Jane, for whom a treat is named."

The Theme involving the ingestion of whiteness is too clear in Pecola's selection of candy from Yacobowski's store. She buys Mary Janes. Even the innocent act of buying candy becomes an opportunity for racial self-bitterness and self-deprecation. Something as presumably benign as a candy wrapper functions as a site of white cultural semiosis. Even as Pecolas is rejected and denigrated by the power embedded within Yacobowski's gaze, whose eyes, equally I have noted are blue, she seeks the power of Mary Jane's blue eyes through a procedure of "Symbolic Cannibalism." Blue eyes are menacing and still they also stand for safety and comfort. Blue eyes constitute a metonymy for white hegemony as this is expressed through White cultural aesthetic ideals. GunillaTheanderKester argues that "blue eyes" stand as a Pars pro toto, a Synecdoche for a clean little girl whom a racist culture would consider beautiful. Like the innocence of the milk, the slice of candy is believed to deliver power to bring about a true state of ontological change in Pecola, a change from Black to White from a state of "racialized somatophobia" to a state of clean somatic comfort and "normalcy"(George, 183-227)

At the point when dark young ladies are disfavored, lightly-cleaned rich young lady Maureen Peal is viewed as prevalent in the school. Frieda and Claudia despise her and attempt to discover errors in her. All the others in the school appear to regard her in her light-shaded skin. "At the point when Teachers approached her, they grinned encouragingly. Black young men didn't trip her in the lobbies; white young men didn't stone her, white young ladies didn't suck their teeth when she was allocated to be their work accomplices; dark young ladies moved to one side when she needed to utilize the sink as a part of the young ladies' can, and their eyes kneeled under sliding lids"

Maureen Peal saves Frieda, Claudia, and Pecola from the abuse of school boys who feel contempt and disgrace for their own particular darkness. Pecola is pulled in towards her while Frieda and Claudia get to be furious at her remark that they are dark - "Dark? Who you calling dark?" "You!" "You think you so adorable!" They attempt to hit Maureen and yell her epithet "Six finger-canine tooth-meringue-pie!" They abhor her for being light-cleaned, talking about obscurity to them, and discussing exposure to Pecola.

Geraldine's is a rich, slick dark lady who adores just her Cat for its 'cleanliness'. She educates her child Junior to play just with white children and not niggers. "She had disclosed to him the contrast between minorities, individuals and niggers. They were effectively identifiable. Minorities individuals were flawless and calm; niggers were messy and uproarious." According to her, she and her family fit in with the first gathering as they are rich and slick. Despite the fact that Junior needs to play 'Ruler of Mountains' with his dark companions and feel the soil while moving down on the dirt, he abstains from everything for the purpose of 'cleanliness'. At first he prefers Bay Boy and P. L. Gradually he persuades himself that Ralph Nisensky is beneficial for him and stays doing nothing. Junior needs to be a nigger, however, he is forced to carry on like a white kid. He yearns for genuine friendship from his mom and despises her feline. Getting baffled, he adds to the propensity for mishandling defenseless dark youngsters. He calls Pecolato his home and tosses his mom's feline on her. He appreciates a considerable measure by tormenting her. He giggles generously on seeing her getting alarmed and crying. At the point when his mom Geraldine goes into the house, he advises her that Pecola tries to murder her feline. She gets appallingly irate and yells, "You dreadful minimal dark bitch. Escape from my home." Pecola is profoundly insulted by the physical and verbal misuse in the rich dark family unit of Geraldine.

Frieda and Claudia go to see Pecola in the white family unit where Pauline Breedlove acts as a cleaning specialist. Pecola gets to be dismal while listening to a white kid calling her mom 'Polly', actually when Pecola calls her mom Mrs. Breedlove. Out of resentment or anxiety, she drops the silver dish with bubbling berry shoemaker on her feet.

As opposed to applying solution on her blaaze or supporting her, Pauline beats her and cautions her to leave the room quickly. She reveals her for making her "clean" room "filthy" with berry shoemaker. "Insane blockhead... my floor, a mess... look what you... work get on out now out insane... my floor, my floor... my floor." A little young white girl in the white family cries and Pauline persuades her by saying that she will make crisp berry shoemaker for her. She expresses "honey" words to the white kid in the wake of tossing words like 'spoiled bits of pieces of fruit's all alone dark kid and her dark companions. Pecola's mom, Pauline Breedlove herself is a casualty of twofold cognizance. Her feeling of excellence is broken by her twisted foot and a broken tooth. At the point when Cholly has intercourse with her, she feels youthful, really, solid, and capable. After marriage, they go to an inaccessible spot for work. She becomes frustrated with Cholly's darkness and conduct. She builds up the enthusiasm for purchasing unreasonable garments to look for consistent consideration from her neighbors. She loves white individuals actually when she recollects that her conveyance involvement in a hospital where a white specialist clarifies his youngsters that dark ladies 'convey immediately and with no torment... much the same as horses.'

She clarifies that it doesn't imply that dark ladies don't have torment as they don't 'hoop or holler' in agony as the white ladies. Being pulled in towards whiteness, she turns into a servant, dismisses her home, youngsters, and spouse, and discovers 'excellence, arrange, cleanliness, and applause' in her white expert's family. Pecola's dad Cholly Breedlove is a vagrant raised by Aunt Jimmy. He is constrained to have intercourse with his better half Darlene before two white men who come looking for their pooch amid chasing. He accepts that the white men are solid and outfitted, and his displeasure with them may crush him until the end of time. So he redirects his annoyance towards the dark young lady Darlene. Later he looks for honest nation cherish in Pauline. Pauline, who venerates magnificence and cleanliness cherishes Cholly as she feels lovely, solid, and effective in Cholly's vicinity. Gradually she loathes him for his unclean conduct. Being pulled in towards 'whiteness and cleanliness', she couldn't love the 'dim and messy' Cholly completely and turns into a housekeeper in a white family. Cholly turns into a boozier and torments Pauline and Pecola.

'Dirty Black' Cholly, father of Pecola rapes her, while the 'clean old man' Soaphead Church abuses young ladies who go to the congregation. Soaphead Church is a 'cinnamon-peered toward West Indian with gently seared skin' from a blended set of relatives. His unique name is Elihue Micah Whitcomb. He is a cynic, however he acts as a minister and pronounces himself as the 'Peruser, Adviser, and Interpreter of Dreams'. He despises 'tissue on substance'. He does not have the bravery to turn into a 'gay person'. He loathes "savagery" and 'homosexuality'. "His considerations slowly settled on those people whose bodies were minimum hostile kids... Since young men were offending, terrifying, and resolved, he further restricted his diversions to young ladies. They were generally reasonable and often enchanting." Seeing the activities young girls don't regret for, rather, he defends his activities by saying that the young girls appreciate the same. With young ladies it is all clean and great and neighborly."

The Bluest Eye depicts not only the wounds caused by inter- and interracial shamming but also the horrors of the father-daughter incest. But although "The Bluest Eye" depicts the shameful family secret of an incestuous rape, it also is caught up in a form of denial. Indeed, Morrison has described the rape as "almost irrelevant," insisting that she wants readers to "look at" Cholly and "see his love for his daughter and his powerlessness to help her pain." Cholly's "embrace, the rape," in Morrison's words, "is all the gift he has left. If Morrison, in writing the novel, found herself thinking the "unthinkable as she worked out the incest secret that lies buried at the heart of "The Bluest Eye", she also ran into difficulties as she felt the need to provoke the reader sympathy for Cholly, despite what he does to his daughter. By insisting that the "pieces of Cholly's life" can be rendered "coherent only in the head of a musician" who can connect together the various fragments of Cholly's life, the narrative invites the readers to focus on the connection between Cholly's fragmented trauma narrative and his rape of Pecola: that is, to understand Cholly's rape of Pecola, the reader must understand Cholly's traumatic sexual initiation as an adolescent. The fact that Morrison chose to tell the rape from Cholly's point of view and that Morrison's narrative, in part, endorses Cholly – for he is, in Morrison's own description, one of her "salt tasters," a "fearless" and "lawless" character suggests the hidden way in which the novel positions readers not only with the humiliated victim but also with the humiliator, the shamed, engaged father who projects his own shame onto his daughter and thus acts as an unwitting agent in the white society's humiliation of the vulnerable Pecola. Although Morrison wants to elicit reader sympathy for Cholly, she also invokes the pernicious – and shaming – racist image of the black man as rapist in this scene. And she risks shaming her readers as she breaks the taboo on looking and positions her readers as voyeurs of the incest scene.

**Race in Toni Morrison's Novel:**

Through her book, *The Bluest Eye*, Toni Morrison demonstrates a great sample, to the dark group and to the world, how social orders supremacist and false convictions on magnificence and self worth can do genuine damage if accepted and taken to heart. What more honorable case to demonstrate these repercussions than Pecola Breedlove, a detached and susceptible little girl who, lacking self regard and parental guidance, gets tied up with everything without a second thought and trusts herself to be one of the blackest ugliest young ladies of all time. Morrison utilizes Pecola and the theatrical roles as a part of Pecola's life to investigate the risks included in the dark group and all groups alike to get linked up with the thought that white, and just white had been splendid. These social measures created by the media and white people groups saw at the time were idiotic and one-sided, yet were genuinely widespread in America just about then. These social norms were unnecessarily harming individuals, and Morrison needed to demonstrate the agony that can emerge from getting tied up with those beliefs. Morrison tells that she got the innovative motivation for *The Bluest Eye* from a colleague she had in elementary school. The young lady longed for blue eyes, and Morrison saw that in longing for blue eyes, she was longing for an alternate character other than grim. She was bothered with who she was and it made Morrison consider excellence and how this new lady had come to feel sub-equation. She asked to dig into the internal workings of how somebody could come to accept that their race of individuals were not lovely, or just delightful on the off chance that they took after whites, on the reason that only whites were excellent. She needed to stick to reality, about beauty, our general public and our reality. She asked to draw down to the reasons why individuals could get linked up with a lie that they are not lovely in the effect that they are not clean. To come to the reasons why individuals would take a part in abusing themselves. The report is based on a young lady named Pecola Breedlove, who arises from a poor, grieved home. She and her family are pathetic and they seem to regard themselves as appalling. The story compasses the course of a year and is divided off into four seasons, Autumn, Winter, Spring, Summer. Pecola's Mother treats her own family ineffectively while being a phenomenal servant to a white family, and her dad, Cholly is a savage, furious inebriated. The larger portion of the Breedloves are viewed as dire and they have entirely grown to acknowledge themselves as out and out monstrous individuals. The overture to the story recounts how Pecola will be saturated.

Pecola goes to Soaphead Church with the wish of getting blue eyes. He guides her to kill a powerless, filthy puppy in his proprietor's home. Pecola runs with the fulfillment that God will allow her wish as she has done what the minister has requested that she do. In the interim, she is impregnated by Cholly. As opposed to sympathizing her, the entire neighborhood reviles her. "Can't resist the opportunity to be. Should be a law: two monstrous individuals bending over like that to make all the more appalling. Be in an ideal situation in the ground." Frieda and Claudia can not completely comprehend the circumstance. Anyway, they feel sorry for Pecola and petition God for her tyke. 'More firmly than her affection for Pecola', Claudia needs the child to survive "just to balance the widespread adoration for white infant dolls, Shirley Temples, and Maureen Peals". Amid her pregnancy, Pecola gets to be rationally shaky. She accepts that God has allowed her blue eyes through Soaphead Church. She continues conversing with her fanciful companion about her blue eyes. In view of her unlawful pregnancy, her mom and neighbors don't take a gander at her or converse with her. Yet she believes that they dodge her as they are envious of her blue eyes. She doubts whether her nonexistent companion is likewise envious of her blue eyes. *The Bluest Eye* presents a disturbing account of Cholly's rape of Pecola and then partially denies what he has described by insisting in the closure that Cholly loved Pecola even though his "touch was fatal" for the "love of free man is never safe." (Bouson, 39,42)

She asks whether her eyes are bluer than those of Joanna, Michelena, and other white women. In spite of Frieda and Claudia's prayer and sacrifice, Pecola's still-born child dies. Pauline Breedlove moves to the edge of the town. She keeps doing housework. The dirty, dark Cholly dies in the workhouse. Claudia remarks that Cholly adores Pecola a great deal. In any case his affection is lethal. "He, at any rate, was the person who adored her enough to touch her, conceal her, give something of himself to her. Yet his touch was deadly, and the something he issued her filled the grid of her distress with death." She includes that "Affection is never any better than the significant other."

*The Bluest Eye* begins with a black girl's entry into the procreative cycle; when Pecola first begins menstruating, Frieda reverentially informs her that she can now have a baby. Pecola's reproductive capacity, however, does not enable her to sustain the continuity of the natural cycle. We have already noted the disjunction between the movement of Pecola's story and the movement of natural cycle: Pecola begins menstruating in autumn, is raped in spring, and gives birth a stillborn baby in summer. Nowhere in the novel are black women celebrated as biological embodiments of the natural continuum; rather the reproductive function of the black woman character consistently goes awry, as with Pauline's rejection of her own daughter in favor of her mistress's daughter, Geraldine's transference

of maternal love from her son to her cat. Gubar says that Pecola is rejected by her mother and remains a victim as well as a symbol of the dying land. (Madhu, 43)

Evil individuals adore mischievously, rough individuals love roughly, frail individuals cherish pitifully, blockheads love moronically, yet the adoration for a liberated person is never protected." She says that the darling alone appreciates and the adored one endures. "The significant other alone has his endowment of adoration. The adored one is shorn, killed, solidified in the glare of the beau's internal eye." After all these episodes, Frieda and Claudia never see Pecola. They feel miserable that they wish and penance has turned into a waste and misgiving that 'its much, much, much past the point of no return'. Claudia mirrors that the minimal, dark, monstrous young lady has made the area look excellent.

Morrison's selection of the name "Breedlove" in "The Bluest Eye" is significant in various ways. Breedlove is the figure of the Madame C.J. Walker, the foremost African American millionaire, who had built her fortune inventing hair straighteners and skin Lighteners for blacks in the late nineteenth century. The Breedloves' acceptance of an outward evaluation of themselves breeds, in fact, a self hatred that manifests in diverse ways, from Pecola's desire for blue eyes, to Pauline's preference for the little white daughter of her employer, to Cholly's rape of his own daughter. There is yet, another sense in which Morrison's employs the name "Breedlove" as a signifies of the slave-breeding culture with its short-circuited desire and the desire for consensual sexual intimacy tat drives both Pauline and ChollyBreedlov. Pauline's desire appears at the conclusion of her first person stream-of-consciousness narrative in the cast of "musing, idle thoughts, sometimes full of old dreaminess":

His face is next to mine. The bed springs sounds like them crickets used to back home. He puts his fingers in mine, and we stretch our arms out wide like Jesus on the cross. I hold on tight....I know he wants to come first. But I can't. Not only he does. Not Until I feel him loving me, just me. Sinking into me. Not until I know that my flesh is all that be on his mind. That he couldn't stop if he had to. That he would die rather than take his thing out of me. Of me. Not until he has let go of all he has and gave it to me. To me.To me. When he does I feel powerless. I be strong I be pretty, I be young.

The erotic equation of sexual desire with the power to be desired reenacts the erotic circuit of the Song of songs. Rather than position women as an object of male desire, the woman here rewrites herself as the subject of her own narrative. Yet Pauline cannot bring this narrative moment into the cultural symbolic to the novel, and it si this failure that opens the space for Cholly Breedlove's rape of his own daughter Pecola. Indeed the novel begins with the realization of the transgression of the incest taboo, the original fall that drives desire in the novel.(Adrienne, Justine, 159)

"The greater part of our waste which we dumped on her and which she consumed. What's more, the majority of our magnificence, which was hers first and which she provided for us. Every one of us- -all who knew her- -felt so wholesome after we cleaned ourselves on her. We were so lovely when we stood on the back of her offensiveness. Her effortlessness adorned us, her blame purified us, her agony made us gleam with wellbeing, her cumbersomeness made us think we had a comical inclination. Her incoherence made us accept we were smooth. Her neediness kept us liberal. Indeed, her waking dreams we utilized -to quiet our own bad dreams. What's more, she let us, and in this manner merited our disdain." Claudia remarks that the entire neighborhood feels content and calmed on seeing the sufferings of Pecola. Twofold cognizance offends , contemplations, and conduct of the dark individuals. They create self-loathing and start to ache for whiteness. They love white individuals despite the fact that they are mishandled or offended by them. Pecola is loathed by white individuals, detested by her own mom, assaulted by her own dad, tormented by dark kids, and reviled by her dark neighborhood. She is left by Frieda and Claudia as well. The minimal dark young lady who is a casualty of twofold awareness needs to get blue eyes just to be dealt with merciful like the white young ladies. She is sold out by the white individuals, as well as by her dull cleaned folks and neighbors who themselves experience the ill effects of twofold awareness. Rationally unhinged, she lives alone with the fulfillment that she has got the blue eyes. "Nobody else will see her blue eyes. Anyway, she will. What's more, she will live cheerfully ever after."

Pecola's experience in Toni Morrison's *The Bluest Eye* exemplifies the multiple oppression of black women on the bases of gender, race and class. Charged with their slave heritage at the background, humiliated as members of a subjugated minority class and customized due to their race, black feminity causes Pecola's life to culminate in

obsessive self and race-hate. Raised up in a highly consumer-based capitalist society, Pecola becomes a victim of the Body Politics of the dominant Western Ideology, which has standardized the norms of feminine beauty in the gloomy-eyed slenderness of the white woman.; Regarding Blue-eyed beauty as the only norm of acceptability in American society, she is bewitched in a trap of eating disorder proceeding from several psychological and sexual frustrations. While her outcast-ness gains further psychological and familial forms with her victimization in her own father, ensuring in her pregnancy, her yearning for for blue eyes leads Pecola to be cooked by a child abuser spiritualist in still another sort of exploitation. Made to believe by him she is condemned to live out all alone in her home turned up outside the town as a physical mark of her outsidersness.(Yasmin, 469)

### **Conclusion:**

Toni Morrison is an amazing women's lobbyist figure in American Advanced Literature. Her capability lies in the photograph of dim society in America. Her female characters can be onlookers in supporting her work. Morrison shows her circumlocutory stun at having sexist and supremacist considerations in relationship with white social occasion. She focuses on a moral, social view as a bunch for the entire dull get-together; a get-together which needs societal sponsorship and imperativeness.

As the parts of race, social class, enslavement, and sex are therefore essential in Toni Morrison's books, social realists and faultfinders enthused about social issues examine her books from a few reasons for appraisal. Abusing the beforehand specified events in her fiction, Morrison has made perusers mindful of the catastrophes that African Americans face in their lifetime. Morrison has punctured into the brains of her cases, uncovering their considerations brilliantly. Her works can be an exceptional organization to impact the place of blacks and particularly diminish females from edge to center. Also, the imperativeness of Morrison's fiction falls on its vitality to consolidation issues of race, sexual introduction, sex, and social class meanwhile. The tip around her books is that paying little heed to the way that issues of predisposition and enslavement are focal, she has not expelled diverse subjects. That is, Morrison's books indicate general truths about the human condition and that is the reason her fiction is attracting both white and dull social gatherings of the giant unwashed.

In *The Bluest Eye* Morrison has shown the impacts of white culture on Dark individuals. In this novel Pecola is a photograph of out and out disintegrating as she faces both between inclination also, intra-predisposition. Other than she is kept from securing her mom's family relationship, is trapped by her father, and holds out a desperate rootless proximity. She is instigated that there is develop way out of each one of these matters – that is to have light blue eyes. Nevertheless, before the target she is left basically with an irreversible conclusion a hardship.

#### Abstract

This research is aimed at analyzing the factual model of classroom action research management training for Senior High School teachers which has been being used so far, and analyzing hypotactic model of classroom action research training aided by of E-Module for Senior High School teachers. Research and development were employed to pursue the early-mentioned problems. Meanwhile, the data collecting technique was done by interviews, documentation, observation, questionnaire, and test. Further, the result of the study showed that the final model of the classroom action research training aided by E-Module was highly effective. The expanded trial results showed that the training model of Classroom Action Research with help of E-Module was able to properly facilitate teachers to implement and compile Classroom Action Research reports independently and easily. Moreover, the E-Module of the Classroom Action Research helped teachers to understand the classroom action research. At last, the conclusion of this study shows that the Classroom Action Research training model aided E-module gives ease for teachers to conduct classroom action research since any participants can access the E-Module via the browser.

#### Introduction:-

Classroom Action Research is one of ways which is beneficial for teachers to understand what happens to their class as well as possible solutions for it.

Asrori (2007:6) states that classroom action research is a reflective study which is done by doing particular treatments to improve the teaching and learning process in class to be better so that students could have good achievement in learning.

Hamdani (2011: 326), action research is essentially a scientific activity that is able to reflect learning activities in the classroom through scientific research that can be accounted to the procedures and requirements, which can be done without reducing teachers' attention in the classroom and student achievement. Furthermore, Agung (2012: 64) says that action research is a research conducted by educators, and also is a type of research that aims to give teachers

**Corresponding Author:-Sadimin.**

Address:-Doctorate Program of Educational Management of UNNES Postgraduate Program, The Headmaster of State Senior High School Brebes.

opportunity to resolve the problems of teaching and non-teaching in the classroom carefully, systematically by using the existed rules.

**Gwynn Mettetal (2001:7) defines classroom action research as follows:-**

Classroom Action Research is a method of finding out what works best in your own classroom so that you can improve student learning. Meanwhile, Jean Mc Niff et al (2006:7) argues : Action research is a form of enquiry that enables practitioners everywhere to investigate and evaluate their work. They ask, 'What am I doing? What do I need to improve? How do I improve it? 'Their accounts of practice show how they are trying to improve their own learning, and influence the learning of others.

In fact, there are many teachers who have not implemented independently the classroom action research in order to improve the quality of learning and to the promotion of teachers. It was proven by the preliminary research which showed that teachers' competence in the understanding the classroom action research is still low. There are various possible causes for the low learning process conducted by the teacher. These possibilities include (1) lack of competence of teachers in the areas of classroom action research, (2) poor understanding of teachers to the benefits of classroom action research, (3) lack of competence of teachers in classroom action research, (4) there were only few products of Class Action Research produced by the teachers, (5) only few teachers promoted within the last 3 years.

In improving the quality of teaching and learning process at schools, it takes the ability of teachers to conduct classroom action research. Classroom action research is simple research that teachers do in analyzing the potential and weaknesses of the learning process. Ironically, the motivation of many high school teachers in Brebes to conduct classroom action research is still weak. This is due to ignorance of the teachers in conducting the research.

Since there are some lacks of classroom action research understanding, it is necessary to create any training model of classroom action research that can provide direct experience and real and not only emphasize the theoretical aspects, but also provide the opportunity for teachers to have applicative competence that will be able to produce competent and professional teachers. Therefore, it is necessary to develop a way of solving the problem by creating a training model of classroom action research aided by E-module, so the high school teachers' professionalism in Brebes can be improved and the promotion of teachers can be regularly implemented.

The problem in this research is how is the realization of the factual models of Class Action Research trainings that have been organized for high school teachers, how is the design of hypothetical model of classroom action research training aided by E-Module for high school teachers, how is the final models of classroom action research training using E-Module for high school teachers.

The purpose of this study is to analyze the factual models of classroom action research training for high school teachers that have been implemented over the years, analyzing the hypothetical model of classroom action research training aided by E-Module for high school teachers, analyzing the final model of classroom action research training aided by E-Module for high school teachers.

The Classroom Action Research Training aided by E-Module is done as part of efforts to facilitate teachers to improve the quality of learning and write proposals and classroom action research reports with hope that they can do it easily and independently. This training will provide convenience for teachers in preparing proposals and reports of classroom action research. The teachers will have the knowledge and skills in preparing proposals and reports of classroom action research. Moreover, the teachers will also have positive attitude (motivation) to implement innovation in teaching. Thus, the training of classroom action research aided by E-module is a training model that has high efficacy to facilitate the teachers effectively in preparing proposals and reports of classroom action research. This is in accordance with the opinion of Sharma (2013: 16) that the effectiveness of the training is the extent to which participants can learn and apply knowledge and skills acquired during the program. This is influenced by attitudes, interests, values and expectations of trainees and training environments. It is said to since the advantages of online learning resources as learning media have been demonstrated convincingly by several studies.

For the purposes of the implementation of learning, the government through relevant educational institutions has provided teachers with classroom action research training to improve the quality of learning. The training is learning

that is set to improve the current working performance. Meanwhile, training, according to the concept of state administrative agencies, gives more emphasis on the process of improving the ability of an individual in carrying out his duties (Admodiwirio, 2002: 35).

Training according to Nadler (1982), is a learning process that is prepared to improve the performance of a job in hand. Nadler emphasizes on human resource development. Meanwhile, training according to Rothwell (2003: 352) is an organized learning activities aimed at improving individual performance through changes in knowledge, skills, or attitudes. In a broad sense, the training is intended to meet the essential job requirements, update skills, to prepare people to improve career, improve knowledge and skills, as well as generate new insight or even create new knowledge.

According to Sulistiyani (2009: 219) training is a systematic process of changing the behavior of the employees in a direction to improve organizational goals. According to Mendoza (2009: 2) the purpose of training in a work situation, is to enable individuals to acquire the ability (competence), so that he can perform a given task or job adequately.

As according Meldona (2009: 238) the benefits of holding the training are: (1) To assist the development of skills a person, (2) To help improving the efficiency, effectiveness, productivity and quality of work, (3) Meet the personal needs of participants, (4) Improving working knowledge and expertise at all levels, (5) Transfer of knowledge and new knowledge.

Research conducted by Alomari (2009) showed that the online-based learning resources can support students' ability to gather information as a source of learning materials. The use of online learning resources is therefore not only beneficial for interactivity and accessibility, but also can enhance the independence of the students actively in learning.

Arani (2004) found that the use of online learning resources is more effective than traditional methods by delivering a lecture in front of the class. In addition, the development of e-book technology encourages the blend of print technology with computer technology in learning activities. Various printed instructional media, one of which is module, can be transformed into electronic form, hence that's the history of the electronic module or known as the e-module. There is no definite definition of the electronic module so far. With reference to the various terms associated with the electronic module, it can be defined that the electronic module is the incorporation of the term module which takes the form of electronic learning (e-book).

The results of this study are expected to provide benefits such as: product with the construction of a training model of classroom action research aided by E-Module for high school teachers. The successful training model developed is expected to be used as reference material in similar studies in the future. Thus, there will be any development of other types of products such as E-Module that provides convenience facilities for teachers in writing proposals and reports of classroom action research easily and independently, produces training packages in the form of: training, training manuals, guidebooks trainer, instructor guide books, e-training modules. Those training packages are expected to be a guide for the organization of training.

### **Research Method:-**

This study used research and development (Research and Development). According to Borg and Gall (2007: 590), R & D has the following characteristics: (1) conduct preliminary research to find relevant facts regarding the products to developed; (2) develop products based on the findings of the research; (3) do field test in the settings or actual situations where these products will be used; (4) do revision to correct the weaknesses found in the stages of field testing.

The selection of Research and Development design (R & D) in this study was based on research objectives, namely to produce a training model of classroom action research aided by E-Module. The model of the development of this study consists of four stages, namely: (1) a preliminary study to obtain information on training model of classroom action research ever conducted, followed by an analysis of the strengths and weaknesses of the model; (2) development of a model training classroom action research aided by E-Module; (3) validation of the Class Action Research training model aided by E-Module by experts and practitioners; (4) test the training model aided by E-Module.

The subjects in this study were high school teachers in Brebes. In this case the sampling for the study subjects was performed through cluster sampling and quota sampling. In this study, for the purposes of FGD, the researchers involved 15 high school teachers in Brebes district. For the testing purposes, the researchers limited the subject of the study to 10 high school teachers who come from high schools in Brebes district. To the expand the test, there were 25 teachers from various high schools in Brebes district.

The data collecting technique in this training is by having interviews, questionnaires, documentation, testing, and observation. Thus, the instruments used to collect research data is the questionnaire, documentation questionnaire, test, and observation sheet.

## **Results and Discussion:-**

### **Results:-**

In order to be able to develop a training model according to the needs of participants, it is necessary to analyze the quality of the previous trainings and do need analysis on the training from the teachers or participants of the training.

From the preliminary study on the quality of the previous training of Classroom Action Research, the teachers gave the following feedback: (1) 63.31% for the design of the training; (2) 64.90% for the training program; (3) 63.08% training materials; (4) 67.98% for training instructors; and (5) 64.20% for facilities and infrastructures.

Further, there is a need to develop training model of the Classroom Action Research aided by E-Module. Moreover, the results of the preliminary study which were aimed at uncovering the needs of teachers to classroom action research training gained average percentage of responses as follows: (1) the design of the training achieved 89.07% responses; (2) the training program achieved 86.79% responses; (3) training teaching material achieved 86.86% responses; (4) Training instructors achieved 88.78% responses; and (5) facilities and infrastructures achieved 86.80% responses.

By consideration the results of the field studies and the results of teacher responses towards the quality of the previous trainings and the training needs, it is necessary to develop a training model of Classroom Action Research aided by E-Module.

The current factual model of Class Action Research training used for the previous trainings is considered lack of sufficient competence for participants to develop proposals and Classroom Action Research reports independently. Therefore, the findings of the preliminary study can be seen in Figure 1.

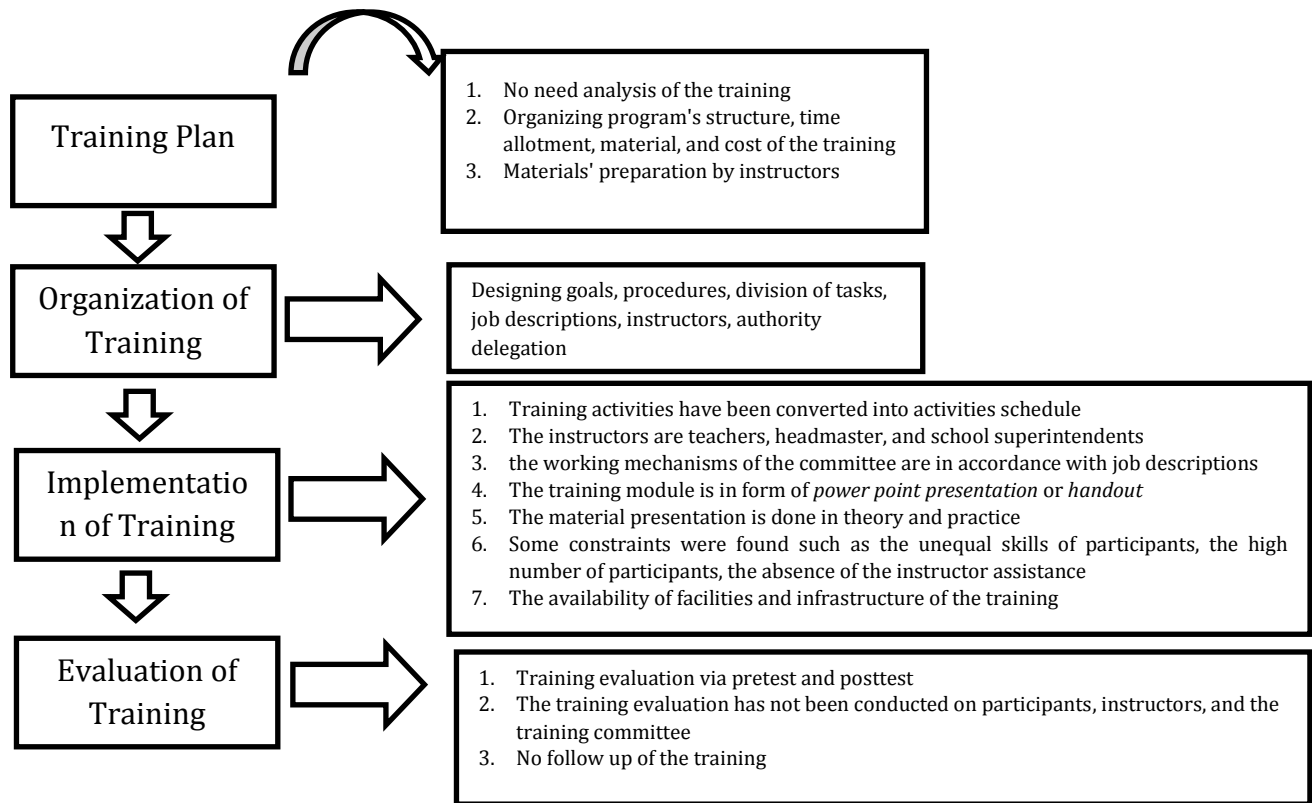

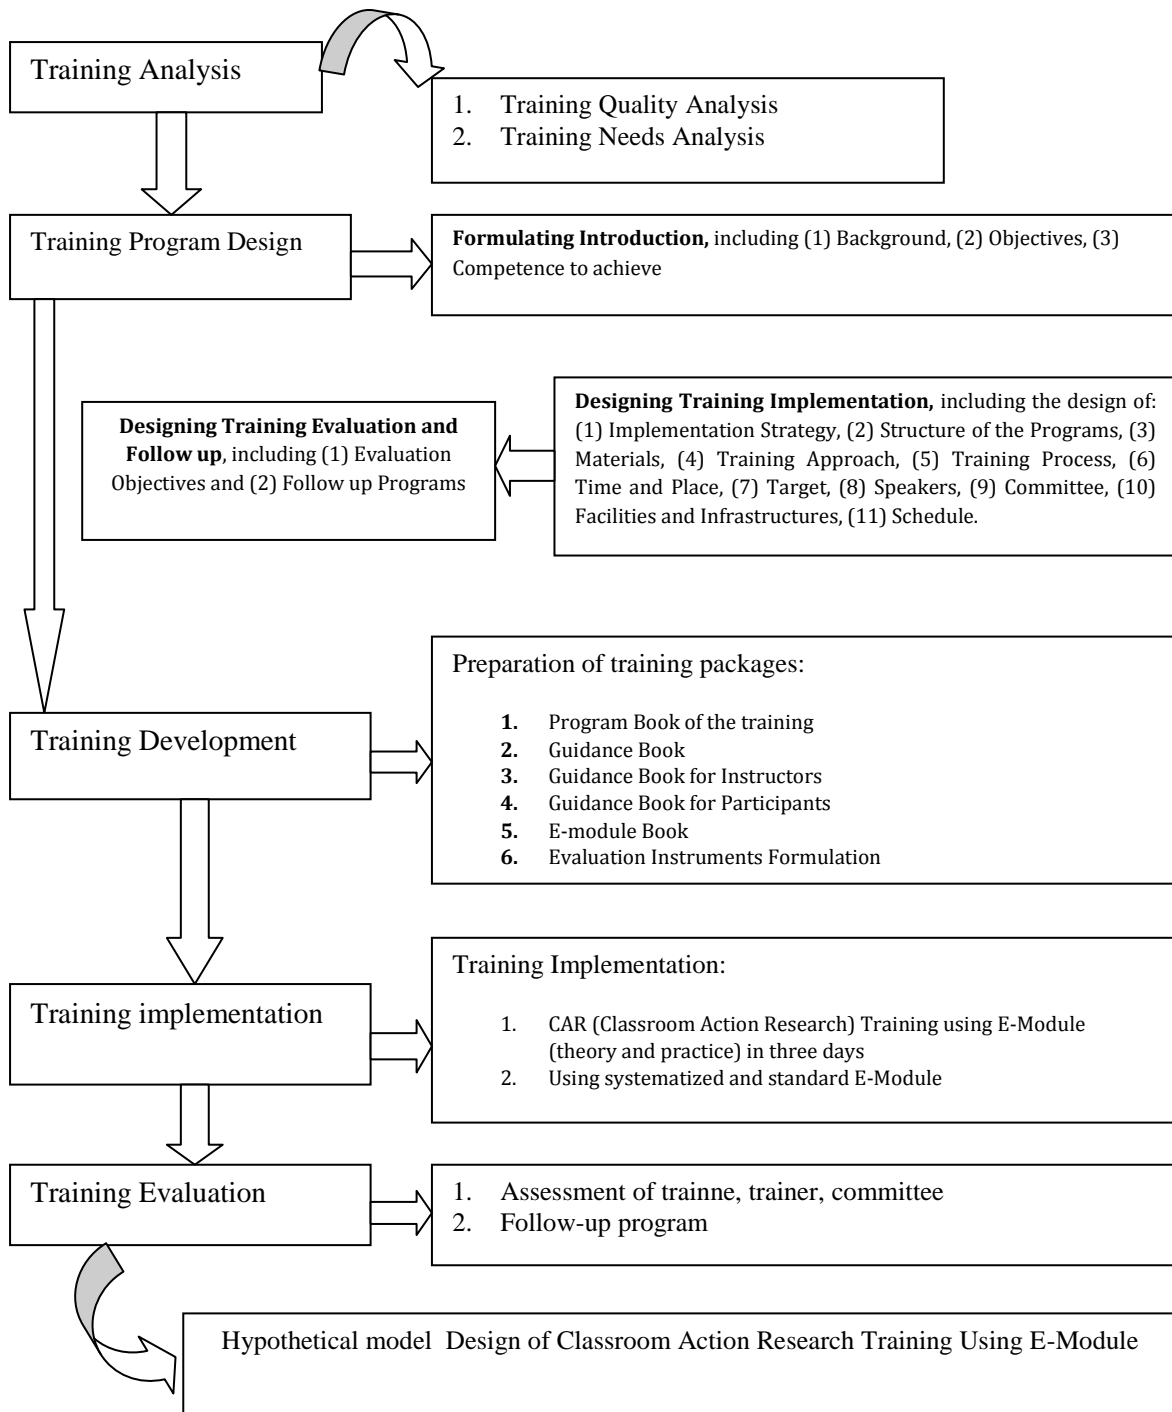

Figure 1:- The Factual Model's Scheme of Classroom Action Research Training

By taking into consideration the results of field studies and the results of teacher responses regarding the quality of previous trainings and the training needs, it is necessary to develop a training model of Class Action Research aided by E-Module by creating hypothetical model. The development hypothetical model of classroom action research aided by E-module training consists of three major parts: (1) introduction; (2) Design Classroom Action Research training model aided by E-Module; and (3) The closing section. Therefore, the Hypothetical model of classroom action research training aided by E-Module can be seen in Figure 2.

**Figure 2:-** The Hypothetical Model's Scheme of Classroom Action Research Training Using E-Module

To get the expected final training model, then, there was a trial on the hypothetical model. This trial was conducted with a limited field testing in the form of model implementation training for high school teachers. Again, this trial began with a test on a small group. In this case the small group trial was done once by the aim to simulate the application of the model and got an overview of the implementation of the limited field testing. The trial test was conducted on a small group of teachers who had never received training of classroom action research and were seen to have basic knowledge of classroom action research aided by E-Module. The aim of this trial was to obtain

feedback from teachers on the level of readability and feasibility of the training of Class Action Research aided by E-Module. Further, the responses of teachers of this trial were as follows.

The result of the trial treatment achieved 86.33% for the responses to the development of the Classroom Action Research aided by E-Module. This percentage of responses means that the development of the Classroom Action Research E-Module was considerably good. Meanwhile, the previous average percentage was derived from responses to the aspect, of page display which amounted to 88.50%, in response to the introduction which amounted to 84.17%, in response to the core aspects of the module by 85%, in response to aspects of the closing matter by 85%, and responses to aspects of bibliography of 90%.

The researchers also got inputs from the above-mentioned trial, namely the need of the availability of alternative answer to the exercise so that any wrong answers can be corrected and replaced by other alternative answers, the need of E-Module manuals, instructional videos and examples of proposals. Thus, there is a need to complete the E-Module.

After going through the stages of small group trial, the trial was continued to the limited field test. This limited field test was intended to determine the extent of the effectiveness of the training model of Classroom Action Research aided by E-Modules being developed. The indicators of the effectiveness were seen from the increase in teachers' knowledge, skills in writing proposals of Classroom Action Research, and positive attitudes towards the implementation of the Class Action Research training aided by E-Module.

As explained earlier, the extended field tests were carried out in the form of classroom action research training aided by E-Module for high school teachers in Brebes district. In this implementation, there were 25 teachers involved. The teachers were the representatives of various high schools in the district Brebes derived from state Senior High School. In addition, the venue of training was at SMAN 2 Brebes.

In the expanded field test, there was an activity conducted namely the practice of classroom action research proposal writing aided by E-Module. In this training, teachers were given an understanding on how to prepare proposals and reports of Classroom Action Research Action Research aided by E-Module. Through the E-Module, the teachers could write and organize the proposals and reports of classroom action research with ease and independence.

During the implementation of the Class Action Research Training aided by E-module, the teachers were given a briefing in the form of how to install and use the E-Module with the existing guidance. After the briefing, the teachers were mentored and guided to the practice and the implementation of the Classroom Action Research and proposal drafting aided by E-Module. Meanwhile, the training activities were guided by an instructor using an LCD projector. Further, the training approach used was an interactive discussion that created a conducive training environment.

In an effort of knowing the effectiveness of the training model of Classroom Action Research aided by E-Module, pre-test and post-test were given to the trainees. On the one hand, for the purposes of pre-test and post-test there had been set up 25 test items. The test items had been through the stages of expert validation and FGD as well as the validity and reliability test items as described in the early section. Meanwhile, to describe the skills of the teachers in the training, then the observations on the ability of teachers in preparing classroom action research proposal were done. Alternatively, to determine the attitudes of the teachers towards the training, the data collection was done through questionnaires attitude. The limited field trial activities were also done to determine the response of the teachers to the implementation of the training in general and the response to training packages developed through the questionnaire.

Data obtained from the pre-test and post-test were then analyzed with the help of SPSS.16 program. Meanwhile, the observation data of the skills and attitudes of the teachers on the implementation of the training and the training packages were analyzed with the help of MS Office Excel 2010 program.

The average value of pre -test was 15.28 with the percentage of achievement was 61.12%. Meanwhile, the highest score was 20 and the lowest score was 10. The number of participants who were able to achieve 50% percentage were 21 participants and participants who reached the percentage of achievement above 75% were as much as 3 people.

The average score of post-test was 20.04 with the achievement percentage of 80.16%. Meanwhile, the highest score was 24 and the lowest score was 17. Again, the number of participants who were able to achieve the results 50% were 25 participants and percentage of achievement which resulted above 75% were a total of 17 participants, or 68% of all participants who amounted 25 people.

Based on the results of the pre-test, it is known that the teacher's knowledge of classroom action research before training was generally good that is with an average of 15.28 or the average percentage score of 61.12%. However, not all participants could understand Classroom Action Research well. Meanwhile, the post-test result illustrated that there was an increase of teacher knowledge of classroom action research. It is proven by the average scores achieved namely 20.04 or with an average percentage of 80.16% of the achievement results. This post-test results indicate that there is an increased knowledge of teachers in the classroom action research after the classroom action research training aided by E-Module.

In order to determine the effectiveness of the training model, so the derived data and pre-test and post-test results were calculated using t-test in SPSS.16 program. However, before the t-test was carried out, the researchers did homogeneity test first. Homogeneity test is intended to determine whether the obtained data are derived from a homogeneous sample. After the homogeneity test was done, it resulted value of significance amounted to 0.209. The sig-hit value of the homogeneity test was greater 0.05 than the significant level which is 5%. The results of this analysis prove the data of pre-test and post-test obtained came from homogeneous sample. Furthermore, the t-test with SPSS.16 program could be conducted.

By using SPSS, the t-test results were as follows: (1) the average test scores (mean) got improvement before and after the training, namely from 15.28 into 20.04. From the mean value, it can be seen that the teachers' competencies increased having the training by using the training model of classroom action research aided by E-Module; (2) The standard deviation showed that the heterogeneity occurred in the data before and after the training were 2.76164 and 2.05102; and (3) the standard error of the mean before and after training were 0.55233 and 0.41020. Further, the standard error of the mean describes the distribution of the sample average of the average of the average of all possible samples.

After the data being tested using t-test with paired samples correlations models, the results of sig-hit of 0.00 and a correlation value of 0.675. Meanwhile, the analysis of paired samples with correlations is an analysis aimed at showing the relationship between the average value of pre-test before training and the value of post-test after the training sessions for the teachers. Based on the results of t-test with of paired samples model, the result showed that the correlations of Sig.count was smaller than  $\alpha$ , that was Sig. count (0.000)  $< \alpha$  (0.05). Therefore, it can be concluded that there was a significant relationship of the teacher competence before the training and after the holding of the training. Again, the strength of the correlation could also be seen in the amount of 0.675 which indicates that the data of the pre-test and post-test had a very strong correlation.

Based on t-test results, it is known that the training given to teachers by using classroom action research training model aided by E-Module provided a significant effect on improving the competence of the teachers in implementing classroom action research. This illustrates that the training model of classroom action research aided by E-Module is a training model that suits the teachers in doing and preparing classroom action research report.

Based on the t-test with a model of paired samples t-test, the t-count was obtained by -11.627 and sig.count as many as 0,000. The t-test model with paired samples test is intended to determine whether there are differences between the data derived from the pre-test with data derived from the post-test. Further, the results of the analysis using t-test were then compared with t-table value. The t-table value was derived from number of participants which were as many as 25 participants and further can be seen in the t-table which showed value of 2.064. By comparing the value of t-count and t-table, it is seen that t-count  $<$  t-table. It also appears that Sig.count had a significant difference between the pre-test and post-test scores and the participants.

The existence of significant differences between the pre-test and the post-test scores in training activities of Classroom Action Research aided by E-Module indicates that the training model of classroom action research aided by E-Modules being developed is capable of providing improvement on the knowledge of the teachers in implementing and compiling reports of classroom action research. Moreover, by looking at the differences in mean

of the pre-test and post-test, it can be seen that the model of classroom action research aided by E-Modules provides great impact for the improvement of the teachers' competence in the understanding of classroom action research.

The results of observations of the skills of teachers in preparing classroom action research proposal resulted the average percentage of 82%. These results came from the observation of the aspects of the writing skills of the title of 83%, observations of the introduction aspects of writing skills by 84%, observation of the aspects of the writing skills of the theoretical framework of 80%, and the observation of the aspects of the writing skills of research methods by 81%.

Based on the observation of the skills, it showed that most trainees already had skills in preparing the proposals of Classroom Action Research. The capability achieved by the participants came as the result of the application of the Class Action Research training model aided by E-Module. Thus, the Class Action Research training model aided by E-Module effectively provides knowledge and skills to the teachers in implementing and developing a proposal of Classroom Action Research.

These results are in accordance with the opinion of Sharma (2013) who states that the effectiveness of the training is the extent to which participants can learn and apply knowledge and skills acquired during the training program. The increase in knowledge and skills of the teachers in preparing classroom action research proposal is expected to have an impact on teacher professionalism so as to manage an active and interactive learning as well as to be able to foster learners to achieve optimal success.

This is in accordance with the opinion of Orlich (2010), who states that the functional level the teaching profession in learning is largely determined by the attitude showed by teachers towards students whether they could create any interactions or not. Therefore, the highest level of teachers' professionalism are showed by deliberately creating, and placing the top priority on the success of learners.

### **Discussion:-**

The expanded trial results showed that the training model of Class Action Research aided by E-Module is able to properly facilitate the teachers to organize proposals and reports of Classroom Action Research independently and easily. As a matter of fact, the E-Module of Classroom Action Research helped the teachers in understanding Classroom Action Research. This is understandable because the E-Module of Classroom Action Research is accessible anywhere and anytime via the Internet.

The results of this study illustrate that the training model of Class Action Research aided by E-Module had a high important effectiveness. This model will be able to assist teachers in implementing and compiling the reports of classroom action research. It is certainly very helpful for those who do not have sufficient ability to carry out classroom action research, thereby inhibiting teachers in improving the quality of learning.

The high effectiveness of the training model of Class Action Research aided by E-Module was reflected in the high percentage of achievement of the teachers' skills in preparing proposals of Classroom Action Research, the mean difference better between pre and post-test happened for the training model of Class Action Research aided by E-Module was capable of bridging between the teachers' needs and the limited ability of teachers in implementing classroom action research. In this case the teachers had the ease of preparing the report of Classroom Action Research independently with help of the E-Module.

The attitudes' survey towards training teachers obtained an average percentage of 85.17%. Besides, the participants' responses which amounted to 85.17% illustrates that the attitude of the participants towards the training of classroom action research aided by E-Module was very good. Additionally, the results achieved was derived from observation of the aspects of honesty by 82.3%, from the observation of the aspects of the discipline of 83%, observation of the aspect of responsibility by 83%, observation of the aspects of tolerance of 92% observations on aspects of cooperation by 80%, observations of the politeness amounted to 95.80%, and observations on aspects of confidence of 80.1%.

The attitude's observation illustrates that participants strongly agree on the development of the training model of Classroom Action Research aided by E-Module. It should also be understood that the training model of Classroom Action Research aided by E-Module has been able to provide facilities for the teachers in implementing classroom

action research so that the teachers were able to compile the reports of classroom action research independently and easily. Actually, the high percentage of the response of the trainees' attitudes towards the training model also illustrates that the training model of Classroom Action Research aided by E-Module was developed according to the needs of teachers.

These results are in accordance with the opinion of Sharma who states that training's effectiveness is influenced by attitudes, interests, values and expectations of trainees and training environments. The training program will likely be more effective if participants have strong desire to learn, engage optimally in their work and have a career plan.

Based on the analysis and discussion of the score of the pre-test and post-test, analysis of the results of the observation skills of the trainees, and the observation of the attitude of the trainees towards the implementation of the training, it can be concluded that the training model of Classroom Action Research aided by E-Module has very high level of effectiveness. In other words, the model training of classroom action research aided by E-Module is very effective to provide skills for the teachers in preparing classroom action research report independently.

The magnitude of the effectiveness of the training model of Classroom Action Research aided by E-Module is also reflected from the participants' responses to the implementation of the training which was of 88.40% or achieved very good predicate. The participants' responses came from the responses to the aspects of the development of the training model by 88%, response to aspects of training administration by 87%, in response to the trainers of 87.10%, and the response to the training's supporting facilities and infrastructures as well as the consumption amounted to 88.40%.

The high response to the development of the training model of Classroom Action Research aided by E-Module shows that the training program was developed according to the needs of the teachers. Moreover, the training model of Classroom Action Research aided by E-Module was designed in form of activity practices of Classroom Action Research's proposal preparation with the time allocation of 80% of the total time available in the training. Also, the training model of Classroom Action Research aided by E-Module is supported with training packages in the form of a training guide books. At last, the implementation of the training model of Classroom Action Research aided by E-Module for high school teachers was in accordance to the design being developed, namely with 80% in the form of the practice of classroom action research's proposal preparation.

The validation of the developed training model came in a bundle with the training packages. This validation was in the form of teachers' feedback through questionnaires.

The results of teacher responses to the training program achieved the average percentage of 89%. This results indicates that the early part of the program was designed with interesting title, contains a preface which is in accordance with program's contents, and contain the table of contents which correspond to the program's contents. The introductory part of the program has compatibility between the background to the training objectives, has a description of conformity with the goals of training, and has suitable texts which explain the competencies to achieve in the training.

The teachers' responses to the development of the participant guide books provided average percentage of 85.84% or got a very good response. The high response of the teachers to guide books of participants suggests that the development of the guidebooks have systematical suitability in accordance with the training programs.

The response of the teachers to the training modules provided an average percentage of 85.84% response, which means that it got very good feedback. This illustrates that the development of the training manuals got a good response.

The trainee teachers' responses to the E-Module of Classroom Action Research provided information on average of the percentage of responses for 85.84%, which means it got very good feedback. The high response indicates that the development of the E-Module of Classroom Action Research was in accordance with the needs of participants in the training.

Based on the discussion of the results and analysis of the pre-test and post-test, observation on the skills and attitudes survey of the teachers and the teachers' responses to the development of the training packages, it can be

concluded that the development of the training model of Classroom Action Research aided by E-Module has a very high effectiveness.

This is in accordance with the opinion of Sharma (2013) who states that the effectiveness of the training is the extent to which participants can learn and apply knowledge and skills acquired during the training program. In this case, the teachers who joined the training model of Classroom Action Research aided by E-Module have gained good knowledge and skills so as to be able to carry out Classroom Action Research and compile its reports. Therefore, the final model of the training model of Classroom Action Research aided by E-Module can be seen in Figure 3.

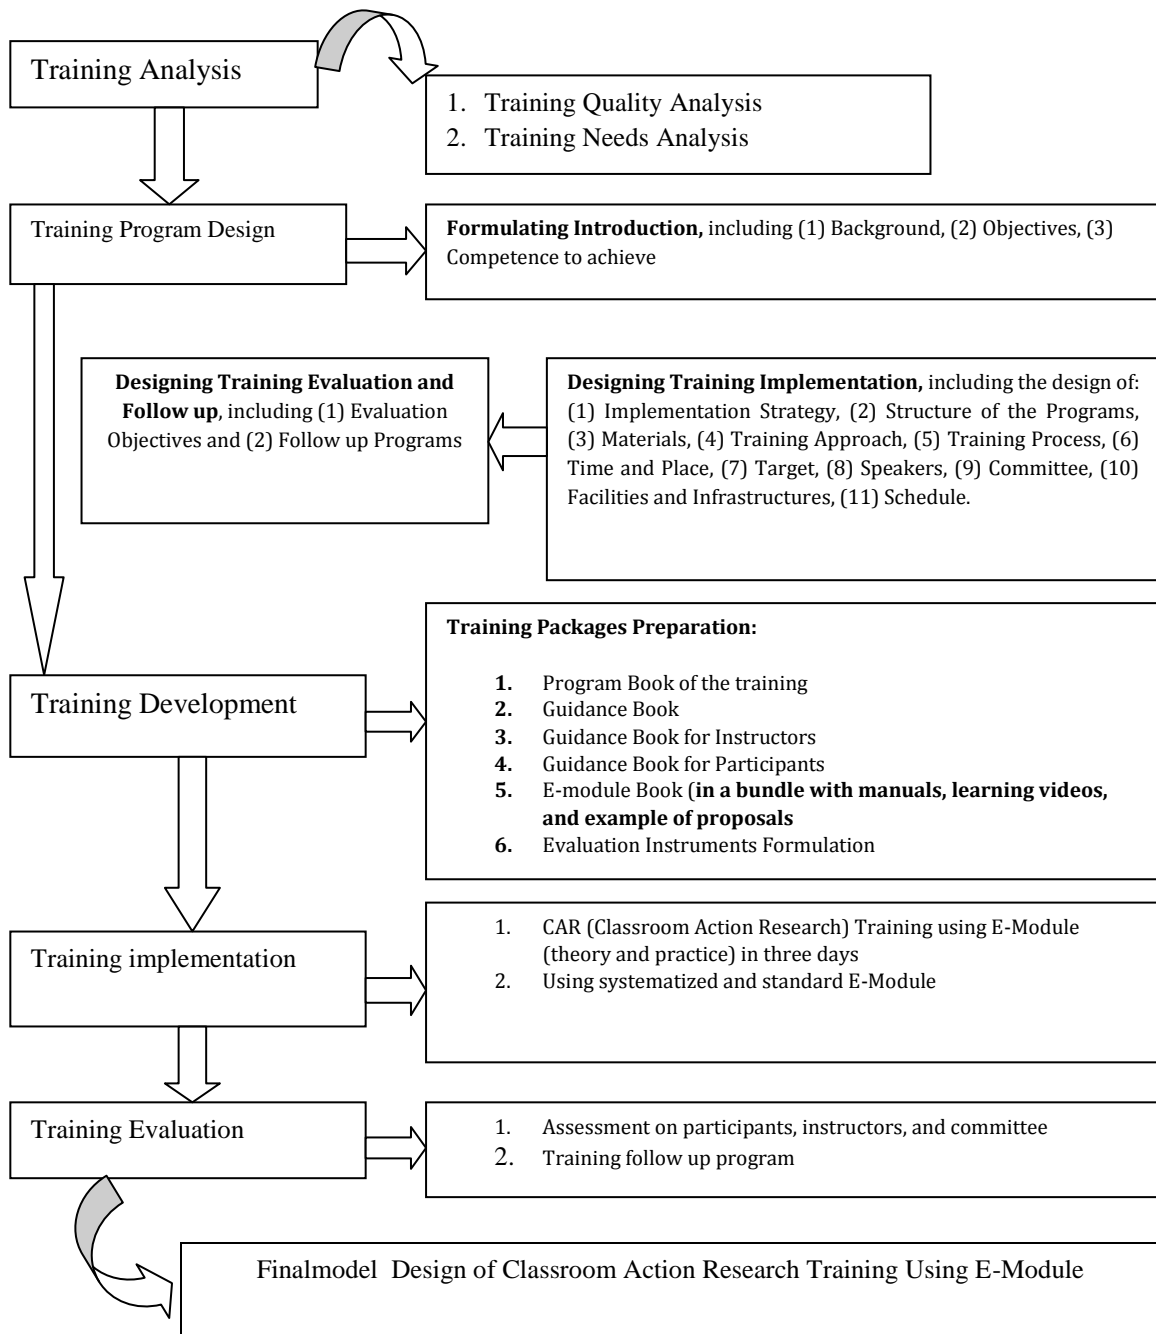

Figure 3:- The Final Model's Scheme of Classroom Action Research Training Using E-Module

### Conclusions:-

The training model of Classroom Action Research aided by E-Module is a training model that makes it easy for teachers to conduct classroom action research since the module are accessible for the participants via browser.

The training model of Classroom Action Research aided by E-Module is proved to have a high level of effectiveness. It is seen from (1) t-test results which showed significant difference between pre-test and post-test, the scores of the pre-test and post-test illustrates the increased knowledge of teachers about classroom action research, and the results correlation counting which presented that there was a significant relationship between pre-test and post-test; (2) The results of observations showed that the training model of Classroom Action Research aided by E-Module has provided an improvement on the skills of the teachers in preparing classroom action research proposal; (3) The results of the observations of the attitudes of teachers showed that teachers have very good attitude towards the training model of Classroom Action Research aided by E-Module; (4) The results of the teachers' responses to the implementation of the training are generally known that the teachers responded very well to the training event; (5) The results of the teachers' responses to the developed training packages showed that all the packages being developed received very good response from the participants.

**Abstract**

This article points to investigate Toni Morrison's "Beloved" by a cultural materialistic approach. We have sought to embrace African-American society and history. This story is of enthusiasm as it is founded on a comprehension of contrast. Cultural materialists emphasize on the cultural aspects and components of literary texts. They examine topics such as race, gender, sexuality, societal division, and slavery. In other words, they put under investigation the marginalized masses of social club, like black people, females, and slaves. In this regard, Toni Morrison is a great author whose compositions is replete with ethnic events. As Morrison accepts that each show-stopper 'must be political', she strives to uncover force relations in the American civilization through her exceptionally cognizant dialect and fastidiously shaped stories. She intensely opposes the overwhelming Euro American power and its pervasive talk, and overturns a few American myths, for instance, the kindheartedness of the blank and the savagery of the dark – exhibited by the prevailing talk. She likewise portrays force relations inside Afro American groups with no leanings toward the dark, to uncover how cataclysmic supplanting white prejudice with dark closedmindedness would. These records have helped me get into an entirely different society furthermore, history, and helped me in my comprehension of a generally ignored segment of the human group, whose spirits and societies, have been permanently affected, in the same fashion as our own, by radical and pioneer forms. As most of the principal characters of Toni Morrison's novels are black people, then it can be concluded that for her, marginalized people of society and minorities especially females, are at the core.

**Introduction:**

Chloe Anthony Wofford, later known as Toni Morrison. The melodies and stories of Chloe Wofford's youth without a doubt affected her later work; undoubtedly, Toni Morrison's oeuvre draws intensely upon the oral works of artistic production of African Americans. Toni Morrison's written work was likewise extraordinarily impacted by her crew. She was a greatly talented understudy, figuring out how to peruse at an early age and performing admirably as she learns at an integrated school. Morrison, who moved to Hawthorne Elementary School, was the main African American in her first grade classroom. She was additionally the main understudy who started school with the

Address:- Assistant lecturer, Cihan University, Sulaimani.

capacity to persevere. Since she was so talented, Morrison was regularly asked to help different understudies figure out how to persevere. She as often as possible worked with the offspring of new migrants to America.

Her guardians' longing to shield their child from the bigot environment of the South succeeded in numerous regards: racial bias was to a lesser degree an issue in Lorain, Ohio than it would have been in the South, and Chloe Wofford played with a racially assorted gathering of companions when she was young. Inevitably, on the other hand, she began to experience racial segregation as she and her companions developed more established. She graduated with distinction in 1949 and extended to Howard University in Washington D.C. At Howard, she majored in English and minored in classics, and was effectively included in theater expressions through the Howard University Players. She went on from Howard in 1953 with a BA in English and another name: Toni Wofford (Toni is an abbreviated form of her center name). She moved ahead together MA in English from Cornell in 1955.

A standout amongst the most basically acclaimed living scholars, Morrison has been a significant designer in making an artistic dialect for Afro-Americans. Her use of moving viewpoint, fragmentary story, and an account's voice greatly near to the awareness of her characters uncovers the impact of journalists like Virginia Woolf and William Faulkner: two authors that Morrison, not unintentionally, mulled over broadly while at school understudies. Every last piece of her work additionally demonstrates the impact of African-American fables, tunes, and women tattle. In her efforts to guide these oral artistic expressions onto abstract modes of theatrical performance, Morrison has drawn a group of work cultivated by a notably dark sensibility while drawing a perusing crowd from crosswise over racial limits.

### ***Beloved:***

In 1993 Toni Morrison was given the Nobel Prize for Literature. Her books connect with settings and inquiries running from the way of bondage in the frontier period to the poetics and legislative issues of Harlem in the Jazz Age, from investigations of the class contrasts that cut crosswise over relations between African American people also, groups to the physical and mental savagery that constituted isolation and Jim Crow. Certainly, it is difficult to distinguish an "American reality" in which Morrison has not produced an accurate and singing mediation; even as her books concentrate personally on the spirits of African Americans, white Americans are interpellated just as by the courses in which her investigations uncover the operations of whiteness—the repudiations of correspondence and the unsuccessful labors of equity that went into its creation and maintenance. Similarly, as the global point of persuasion of a large percentage of the members in the symposium illustrated, Morrison's record of the history of "race" is not in any case constrained to American Reality.

In *Beloved*, gender oppression is not a visible problem that exists between African men and women, but it is one that survives inside the context of the economic relationship between master and slave, and race is alone a later justification for the subjugation of African people. Understandably, then Morrison's choice of setting is germane in crystallizing the nature of African's oppression, for the economic origin of both race and gender oppression is unobscured in slavery. The crucial matter in her exploration of the collective solution to the African's oppression is the slave setting, for it serves to enhance the theme of *Beloved* by pointing up the dialectical relationship between problem and solution: that his solution to the problem arises from the status that makes it. Morrison's setting had to be one in which the strategy for solving the problem was not only clearly evident but also inevitable. (Dorothea, 94)

*Beloved* represents the difficult, conflicting racial inheritance and identity of the blacks, both life affirming and life devouring. It's an inheritance of pain, shame a despair that turns the victim in victimizer, love into killing. Its very beauty and triumph, sharpened by deprivation, is linked with despair and destruction. It's an inheritance, hard to embrace or disown – like the name of the *Beloved*. The symbolic configuration of *Beloved* as the racial identity is proposed in the epitaph of the book: "I will call them my people, which were not my people; and her beloved, which was not beloved."

*Beloved* represents the racial inheritance and identity that its people require both to acknowledge and disown, to love and to love, and it is a difference of opinion arising from the poignant sense that they are the forsaken people of God. The difficult black inheritance is suggested by the paradoxical relationship between Paul D and *Beloved*, when she makes love to him. Her insistence on him to holler her name elicits in him a torrent of memories that is the core of racial identity, hence that he croaked to himself, "Red Heart, Red Heat, Red Heart." *Beloved*'s mesmerizing effect on Paul D on her sexual advance both attract and repels him. The allusion to Lot's wife hits at

the danger of looking backward at a hard past. Beloved represented the racial identity embedded in the past memories that all the references in the book try to escape but cannot. Beloved's insistence of Paul D, against his revulsion, to call her the name Beloved externalizes Paul D's inner compulsion to recognize and comprehend the humiliating and life affirming racial past and identity. (Hong, 97)

Morrison makes a more complex Womanist space in the Beloved as characters, in their quests to obtain self-forth, the conflict between controlling and falling prisoner to the places they inhabit. Under schoolteacher's reign, Sethe Suggs tries to make Sweet Home her own by gathering flowers in the kitchen; however, she cannot relate safety because school teacher receives the force to turn sweet home into a space that ruptures Sethe's body, mind and family. Furthermore, Morrison initially suggests that 124 Bluestone road, under the Baby Sugg's dominion would offer Sethe the healing and nurturing community necessary to "remember" herself. Yet, even though Baby Suggs tries to eradicate the slavery's presence by remodeling 124, neither she nor Sethe can control this space after schoolteacher invades her yard. 124 threatens to destroy its inhabitants with its eighteen years of spiteful baby venom, and again after Sethe recognizes Beloved. For Sethe, domestic spaces represent sites of crisis and self-destruction.

In Beloved, Morrison strikes a balance between missing or hostile female community and a healing sisterhood. Beloved helps Sethe recall the painful memory of her birth, her mother's hanging, and her own feelings deprivation from her mother's inability to nurse her. (Elizebeth, 47,48)

The cultural importance of Toni Morrison's most popular novel, Beloved, hardly can be overstressed. Beloved, Toni Morrison's fifth Novel is "the book [that] had to exist. For Morrison, this publication was a conscious act towards healing a painful wound: this publication to the great social wrong of the enslavement of Africans. Her powerful words, behalf of millions give voice to a profound lament: the absence of a historical marker to remind us never to let his atrocity happen again. In its absence has neither erased nor diminishes its pain; rather, it reminds us only for itself: of what is missing. The author was pleading for the wall or that bench or that tower or that tree when he penned the final words. Morrison told The World. It is too significant, though not surprising, that Toni Morrison took the responsibility for action to correct the negligence. She frequently talks of the role of the black novelist in the world as one to address and explore issues meaningful to the well being of the whole world community. As it responds in kind to her expression of grief, and accepting her offering, Beloved made its way into the New York Time's Bestseller Morrison wanted to explore the nature of slavery, it's from a rational or the slave narrative perspective, but from within the day-to-day lived experience of the slave themselves. Morrison claims she experienced many more worries in writing Beloved than with any of her previous books. Morrison believed that this book is quite different from other books:

The dear was like I'd never a script ahead.... I recognized that I was in the society of people whom I absolutely adored, in a position which I absolutely loathed. To stand in their society, to heed, to imagine, to invent – and not to write – was exhausting. (Morrison and Richardson, 40)

The major difference for Morrison between "Beloved" over the other novels was the sense impression of melancholy she felt over the story. For exemplar, in writing the scene in which the minor is killed, she recalls going up periodically to take long walks and feeding back to rewrite, "over and o'er once more," She wanted the fact of infanticide to surface early in the narrative so that the information would be known, the repugnance of the act was equally difficult for her as it is for the readers. She was forced to struggle to find a voice communication in which the violence would not "engorge" her or her readers, or struggle with the language itself. She struggled against producing either obscenity or pronography. (William, Nelly, 9,10)

Beloved is a powerful, fully tender romance. Morrison strongly insists that her literary context is essentially African American, and Beloved overtly involves slave narratives as it processes. And the style and narrative procedures have more of a literary relationship to William Faulkner and Virginia Woolf, than to any African American Writers. Love is a long perspective, is a child of Faulkner's masterpiece, As I lay dying, while the heroine Sethe has more in common with Lene Grove of Light in August than with any female character of African American Fiction. This is anything but a limitation, aesthetically considered, but is rejected by Morrison and her critical disciples alike. Ideology aside, Morrison's fierce assertion of independence is the norm for any strong writer, but the author does not believe that this defense of a swerve from indubitable literary origins can be a critical value in itself. Honey is a calculated series of shocks; whether the retention of the shock is aesthetically persuasive

has to seem secondary in a novel dedicated to the innumerable victim of American Slavery. Morrison, whose earlier novels were not as over-determined by ideological consideration as *Beloved* is, many have sacrificed lots of her art upon the altar of a government, perhaps admirable in itself, but not necessarily in the inspection and repair of high literature. (Harold, 2,3).

Toni Morrison creates focal characters that don't live in a vacuum in light of the fact that they inhale and come together with others inside the story construction of every book. As they strike all through the novel, these characters uncover layers of feelings that expand the peer user's creative ability. Morrison goes to an affection scene that rattles the spirit. She uncovers an enthusiasm that rises above social and monetary foundations. Morrison emphatically puts stock in structuring an abnormal relationship inside her books; Sula Mae Peav and Nile Wright Greene in *Sula*, Jadine.

### **Race:**

The term **race** refers to groups of people who have differences and similarities in biological traits deemed by society to be **socially significant**, meaning that people treat other people differently because of them. For illustration, while conflicts and similarities in eye color have not been treated as socially significant, differences and similarities in skin color have. According to John H. Relethford, author of *The Fundamentals of Biological Anthropology*, race "is a group of populations that share some biological characteristics.... These populations differ from other groups of populations according to these characteristics." Scientists can divide some organisms into racial categories easier than others, such as those which remain isolated from one another in different environments. In contrast, the race concept doesn't go so comfortably with humans. That's because not only do humans exist in a broad scope of environments, they also move backwards and forward between them. As a consequence, there's a high level of gene flow between people groups that makes it tough to devise them into distinct groups.

Skin color remains a primary trait Westerner use to point people into racial groups. However, someone of African descent may be the same skin tone as someone of Asian lineage. Someone of Asian descent may be the same tone as someone of European origin. Where do one race end and another lead off? In addition to skin color, features such as hair texture and face-shape have been utilized to separate people into races. But many people groups cannot be categorized as *Caucasoid*, *Negroid* or *Mongoloid*, the defunct terms used for the so-called three races. Take Native Australians, for illustration. Although typically dark-skinned, they tend to hold curly hair which is often light colored. On the basis of skin color, we might be tempted to label these people as African, but on the basis of hair and facial shape they might be classified as European," Relethford writes. "One approach has been to make a fourth category, the 'Australoid.'"

Why else is grouping people by race difficult? The concept of race posits that more genetic variation exists interracially than intra-racially, when the reverse is true. But around 10% of variation in humans exists between the so-called races. Then, how did the concept of race take off in the West, especially in the United States? . The stand for the thought of race espoused by Judge Tucker, and still popular today, that there exist naturally, physical divisions among humans that are hereditary, reflected in morphology, and roughly, but correctly captured by terms like Black, White, and Asian (or Negroid, Caucasoid, and Mongoloid). Under this perspective, one's ancestors and epidermis ineluctably determine membership in a genetically defined racial group. The link between human physiognomy and racial status is concrete; in Judge Tucker's words, every individual's race has been "stamped" by nature. . . . [D]espite the prevalent belief in biological races, overwhelming evidence proves that race is not biological. Biological races like Negroid and Caucasoid simply do not survive. [A]. . . Newly popular [argument] among several scholars, [is] that races are totally illusory, whether as a biological or social concept. Under this thinking, if there is no natural link between looks and races, then no association exists.

On that point are no genetic characteristics possessed by all Blacks but not by non- Blacks; similarly, there is no factor or cluster of genes common to all Whites but not to non-Whites. One's race is not decided by a single factor or gene cluster, as is, for example, sickle cell anemia. Nor are races marked by significant differences in gene frequencies, the rates of appearance of certain gene types. The information accumulated by various scientists demonstrate, contrary to popular belief, that intragroup differences exceed inter-group conflicts [6]. That is, greater genetic variation exists within the populations typically labeled Black and White than between these populations. This finding refutes the assumption that racial divisions reflect fundamental genetic differences.

Note this does not imply that people are genetically indistinguishable from each other, or even that small population groups cannot be genetically differentiated. Small populations, for example the Xhosa or the Basques, share similar gene frequencies. However, specialization is a function of separation, usually geographic, and comes in gradations rather than across fractures. . . . The opinion that humans can be divided along White, Black, and Yellow lines reveals the social rather than the scientific origin of races. The estimation that there exist three races, and that these races are "Caucasoid," "Negroid," and "Mongoloid," is rooted in the European imagination of the Middle Ages, which encompassed only Europe, Africa, and the Near East. . . However, the history of science has long been the history of failed attempts to justify these social beliefs. Along the way, various minds tried to fashion practical human typologies along the following physical axes: skin color, hair texture, facial angle, jaw size, cranial capacity, head mass, frontal lobe mass, brain surface fissures and convolutions, and even body lice. As one student notes, "[t]he nineteenth century was a period of exhaustive and--as it turned out--futile search for criteria to fix and describe race differences." . . . Attempts to define racial categories by physical attributes ultimately failed. By 1871, some leading intellectuals had recognized that even applying the word "race" "was virtually a confession of ignorance or evil intent." The genetic studies of the final few decades have simply added more nails to the coffin of biological race. Evidence proves that those features usually coded to race, for example, height, skin color, hair texture, and facial structure, do not correlate strongly with genetic mutation. The rejection of race in science is now almost complete. In the final stage, we should embrace historian Barbara Fields's succinct conclusion with regard to the plausibility of biological races: "Anyone who continues to believe in race as a physical attribute of individuals, despite the now commonplace disclaimers of biologists and geneticists, might as well also believe that Santa Claus, the Easter Bunny and the tooth fairy are real, and that the earth stands still while the sun moves."

#### **Race in Social Culture:**

To define a "race" as a vast group of people loosely bound together with historically contingent, socially significant elements of their morphology and/or ancestry. I indicate that race must be realized as a sui generis social phenomenon in which contested systems of meaning serve as the links between physical features, races, and personal characteristics. In other words, social meanings connect our faces to our people. Race is neither an essence nor an illusion, [Anthias, Davis, ] but rather an ongoing, contradictory, self-reinforcing process subject to the macro forces of social and political struggle and the micro effects of everyday decisions. . . [R] referents of terms like Black, White, Asian, and Latino are social groups, not genetically distinct branches of humankind.

#### **Gender:**

Gender refers to the social attributes and opportunities connected with being male and female, the relationships between women and men and girls and boys, and the relations between women and between human beings. These attributes, opportunities and relationships are socially constructed and read through the acculturation processes [6]. They are context-/time-specific and changeable. Gender determines what is expected, allowed and assessed in a womanhood or a man in a given setting. In most societies there are conflicts and inequalities between women and men in decision-making opportunities, responsibilities assigned, activities undertaken, and access to and control over resources. Gender is part of the wider social-ethnic setting. Other important criteria for social-cultural analysis include class, race, poverty level, cultural group and age.

Gender equality refers to the equal rights, obligations and opportunities of adult females, human races, girls and male children. Gender equality is attained when the different behaviors, dreams and needs of adult females and human races are as respected and privileged and do not give rise to different events that reinforce inequalities.

#### **Gender in Toni Morrison's novel:**

Sexual orientation (Gender) is important in the evolution of self. Sexual orientation is the nation of being male and female. The term sex indicates those socially affirmed parts, exercises, activities and twists that are taken by a general public fit for adult males and dames. These particular parts bring about sexual orientation disparities i.e. those contrasts in the middle of adult males and women that deliberately offer support to one gathering by disfavoring the other. Sexual orientation will be broken down with a unique reference to a woman's right. Woman's rights, as a social development perceive and in the meantime scrutinize the male matchless quality and suggest systems to shift it.

Women's activists claim for the equivalent rights for the women and contend about women's equivalent experience society's prospects. Women's activist hypothesis endeavors to perceive the direction of imbalance by fixating its emphasis on sexual orientation governmental issues, gender relations, power issues and gender.

Disparity originates from the negation of equivalent rights. The main snag to balance is sexism. Women are viewed as the initial stifled gathering, confronting this sexism; women' concealment is most pervasive and most mysterious. No humans will give up sexual orientation advantage as any white gives up bigot advantage. Social hypothesis ought to be surrounded by women, holding back in perspective issues identified with the dames. Information gained from a male's perspective is one-sided; hence bullhead deceptions must be found if an exact epitome of learning is to exist.

History ought to be her story to reflect disregarded and trivialized women' commitments in writing. Because of this reason the scientist has picked Elaine Showalter's gyno critic model to measure the sexual orientation parts. Gynocriticism is a source recorded examination that investigates writing by focusing on the authentic foundation, topic, classifications, and social system of writing by women to edge a technique for investigating writing composed by women and to construct models of elucidation formed on female experience, instead of embracing male interpretive hypothetical models.

Dearest reports the lives of African American women who are battling tricky to gather their lives back again, to claim a feeling of self that they misplaced or that they never demanded in any shell. She exhibits, the one of a kind legacy of African American society at the inner of her complex and multidimensional story. The writer utilizes verifiable actualities and insights concerning the past to make her per user mindful of the deep and complex legacy of the African American culture and support of women in it. She "reminds" her pursuers of the past through divided pictures of dark personality, hereditary society, and the African family unit. Morrison's intentional portrayals, while not letting the per user, overlook the terribleness, and embarrassment of bondage, frequently return over to a prior time of personality, familiarity, and petition. Morrison joins the mental and social components of the dark group and investigates the issues of character, family, and confidence in our current reality where bondage has clearly worked into a grievous issue of the past, however develops, all through, as a frequenting vicinity. No matter, there are different manifestations of servitude that still subject and oppress women. The novel exposes the subject of sex character and the twofold mistreatment, confronted by Black women and the forms in which they can break free of this persecution, on the evidence that they are women as well as black. African American dark women battle hard to insure flexibility and to comprehend what such opportunity implies [Morrison, ]. Composed on the association of social personality, the novel is the chronicled and mental investigation of dark individuals to progress to an independent and detached self. To claim for this free self the dark women need to adapt to patriarchy, subjugation, neediness, prejudice, social separation, and various different cases of mistreatment. In the adventure of examination toward oneself the characters are battling once again with this outsider world, asserting for a self that merits regarding as opposed to living in the shadows, by submerging their personalities.

Toni Morrison tests profound into the spirits of the dark individuals to trace back the enthusiasm and psychic panics of subjection on their subliminal. The commonwealth of being suppressed, the torment of the reverse of making one's status as a person, have profound consequences for the intimate personality of the individual individual. These repercussions of the past are so exceptional thus significant that however one gets opportunity in the outdoor universe, yet the intuitive is still captured in the past traumatic world that holds the acknowledgment and genuine representation of the free self. As Seth puts it, "Liberating yourself was one thing; asserting responsibility for liberated self was an alternate".

#### **Racis and Gender on Black Women;-**

*"I think Black women were affected by the women's movement, but I think that for most Black women despite Clarence Thomas, Anita Hill, our first allegiance is to race. We feel that we are oppressed more by our color than our gender, and we want Black men to prosper and move ahead."*- **Author and social critic Bebe Moore Campbell**

Historically, gender and different types of separation, including racial segregation, have been considered in parallel. Nonetheless, interlinked and commonly fortifying patterns, including suggestions of United Nations gatherings and summits, have expanded the interest for a more exhaustive investigation of the flow of victimization women, including the convergence of the different distinctive manifestations of such discrimination.

The consolidated impacts of racial and sex segregation on the headway of women and their accomplishment of equity with men have pulled in expanding consideration, especially in the usage of the discriminating territories of

concern of the Beijing Platform for Action, and in connection to substantive issues, for example, relocation, including brutality against women vagrant specialists and trafficking in women and young women. [Batchu, Westwood, ].

The reasons Black women experience the ill effects of misuse are intricate. Bigotry and sexism are two of the greatest impediments that Black women in America face. But since numerous Black women and men accept prejudice is a greater issue than sexism, [Collins, ] Black women have a tendency to feel committed to put racial issues in front of sex-based issues. For Black women, a solid feeling of social proclivity and dependability to group and race renders a number of us quiet, so our stories frequently go untold.

One of the greatest related hindrances is our delay in believing the police or the equity framework. As Black individuals, we don't generally feel good surrendering "our own" to the treatment of a racially one-sided police state and as women, we don't generally feel safe calling cops who may hurt us as opposed to helping us. Furthermore when we do stand up or look for help, we time and again experience backfire from individuals from our groups who accept we are airing out filthy clothing and making ourselves look awful before White individuals.

Access to job and monetary independence are likewise imperative. Prejudice has an unique effect on Black individuals, men particularly, who have, for as long as six decades, reliably been held to an unemployment rate pretty much twofold that of white men.

In a general public that measures "masculinity" basically by one's capacity to give, being denied access to the intends to give can result in some men to look for force through ruling women. For some men, the venting of annoyance turns savage and their accomplices endure the best blows. Dark women likewise confront livelihood differences, procuring not as much as Black men and White men and women. This compensation uniqueness limits accessible alternatives and leaves numerous women, especially moms, feeling caught in awful connections where monetary needs trump all. Spiritual beliefs and negative views about mental health services also factor into why many Black women remain with abusive partners. One in three Black Americans who need mental health treatment actually receive it, and we are more likely to rely on religious guidance and faith-based practices when working through relationship issues. Religious beliefs often discourage divorce, encourage forgiveness and occasionally condemns those who seek psychiatric services instead of relying on faith.

Black women's perceptions of what constitutes abuse have been influenced by their negotiation of spiritual and mental health beliefs and how they have shaped our paradigms. Researchers have also found that Black women report feeling more obligated to fight back than to report abuse and that is reflected in the disproportionate rates of DV/IPV reported by Black men. Our attempts to embody the "strong Black woman" stereotype have often done more harm than good, to us and those we love.

Sexual orientation has been thought to be less notable than race among dark women. Information from two national reviews of dark Americans, led in 1984 and 1996, demonstrate that dark women distinguish as firmly on the premise of their sex as their race, and that these sexual orientation and racial personalities are commonly fortifying. By and by, among dark women, their ID with their race more effectively influenced their political mentality than did their distinguishing proof on the premise of sex, aside from in cases where the hobbies of blacks straightforwardly clash with the diversions of women. These exactly based discoveries identify with the issue of why the state of mind of dark women to contemporary sex issues can pointedly separate from those of white women.(White, )

### **Conclusion:**

As it has starting at now been stated, Toni Morrison can without quite a bit of an extend be scrutinized as a dim ladies' extremist maker. She talks as a Black woman in a world that still disparages the voice of the Black woman. Her books especially advance themselves to ladies' lobbyist readings because of the courses in which they challenge the social norms of sexual introduction, race, and class. Dull ladies' activists suggest that the Black woman and the Black woman writer organize different social regions in securing a place in American culture and composing—not only those of sex and class found in all ladies' dissident systems moreover that of race. Subsequently, Black women writers have always, out of need, expected to move outside of the mind-boggling white (tallying the white woman's) creative system. Their restriction from the standard masterful traditions drove them to make and use elective strategy for passing on, drawing upon their own specific experiences of manhandle and impenetrability to shape their compositions and to address the characters and conditions inside it. Morrison's mindfulness toward the Black society

and the perseverance of its momentous culture can be seen all through her theoretical work. She by and large returns to the subjects of underestimation and irritation of blacks in the white society.

Gynocentric perspectives help the pursuers to test into the lives of woman in Afro-American social universes bitterly. Woman endeavored to exist and expect their parts in all the possible courses in family and society however, men were either truant from the families or contracted from their commitments. Women have strived hard under the association of subjugation to fulfill their parts as mothers. This affirmation of self identity is the principal requiring of ladies' activists and it transforms into their circumstance in social requests where woman are taken as a useless animals, as items with a prize names. Remembering the true objective to think about themselves, dim women, fight for their rights and are regarded people from the dim social requests.

 Published: February 2017

##### Key words:-

Febrile convulsion, iron deficiency anemia, children.

#### Abstract

**Background:** Febrile convulsion (FC) is the most common convulsive disorder in children. The maximum age of occurrence is 14-18 months, which overlaps with the maximum prevalence of iron deficiency anemia (IDA) which is 1-2 years old.

**Aim:** To compare the iron deficiency rates in children with febrile convulsions with those in the febrile children without convulsions.

**Subjects:** This case-control study included 50 FC children (case group) with mean age of 30.3±19.2 months and 50 children with febrile illness without convulsion (control group) with mean age of 28.8±19.3 months attended to outpatient clinics of Neurology and Pediatric Departments, Zagazig University hospitals.

**Methods:** All patients had detailed history taking, thorough clinical general and neurological examination, laboratory tests (complete blood count, hemoglobin level, hematocrit value, mean corpuscular volume, serum ferritin level, serum iron level, total iron-binding capacity), and EEG.

**Results:** Respiratory tract infection & history of previous seizure were significantly higher in cases. Microcytosis & IDA were significantly more frequent in febrile seizure group. Median serum iron & mean serum ferritin levels were significantly lower in cases. Generalized seizures were significantly higher and the mean duration of seizures was significantly longer in cases with iron deficiency than in those without iron deficiency. Focal seizures were significantly more frequent in cases without iron deficiency.

**Conclusion:** children with low serum iron level and those having iron deficiency anemia are more liable to develop FC when compared with those with febrile illness without convulsion.

#### Introduction:-

The most common neurologic problem in children is convulsion which occurs in 4-10% of children before the age of 16 [1]. Febrile Convulsion (FC) refer to the convulsion that happens in children between the ages of six months and five years, with body temperature of 38°C or higher, not resulting from central nervous system infection or any metabolic imbalance and without any preceding afebrile seizures [2].

Febrile convulsion is the most common convulsive disorder in children, which affects 2-5% of neurologically healthy children aged 6 to 60 months [3].

**Corresponding Author:- Walid Reda Ashour.**

Address:- Department of Neurology, Faculty of Medicine, Zagazig University.

The most frequent micronutrient deficiency is iron deficiency (ID) which influences at least one third of the planet's population. Anemia is the most frequent clinical manifestation of iron deficiency, nevertheless, other systems and organs may also be affected. Restless leg syndrome, disturbance in behavior, Cognitive dysfunction, psychomotor retardation, pica, breath holding attacks and thrombosis have been linked to iron deficiency [4].

The age of FC maximum occurrence is 14-18 months, which overlaps with the age of maximum prevalence of iron deficiency anemia (IDA) which is 12-24 months [5].

Conflicting results have been shown by researchers about the association between iron deficiency and seizures [1]. Reports from some studies declared that the incidence of febrile convulsion in patients with IDA is higher significantly than that in control group [6,7]. Per contra, other studies concluded that the risk of FC in children without IDA appears to be more than that in children with IDA [8]. At last, other studies found no role of IDA in pediatric FC [9,10].

### **Aim of Work:-**

This study was done to compare the rates of both iron deficiency and iron deficiency anemia in children with febrile convulsions with those in febrile children without convulsions.

### **Subjects:-**

This is a cross sectional case-control study that enrolled 50 children who presented with febrile convulsion (27 males and 23 females with mean age of  $30.3 \pm 19.2$  months) as case group and 50 sex and age-matching children who presented with non-neurological febrile illness without convulsion (26 males and 24 females with mean age of  $28.8 \pm 19.3$  months) as control group from June 2015 to June 2016 presented to outpatient clinics of Neurology and Pediatric Departments, Zagazig University Hospitals.

- Informed consents were taken from the patients' parents.

### **Methods:-**

#### *A-Inclusion criteria:*

1. Case group: included only patients presenting with their first febrile convulsion (febrile convulsion defined as the convulsion that occur in children between the ages of six months and five years, with body temperature of  $38^{\circ}\text{C}$  or higher not resulting from central nervous system infection or any metabolic imbalance without any prior afebrile seizures [2].
2. Control group: included only age and sex matched patients who presented with acute non-neurological febrile illness without convulsion.

#### *B-Exclusion criteria:*

4. History of central nervous system (CNS) injuries including significant head trauma, CNS infection, afebrile seizure, receiving an iron supplementation or epileptogenic drug within the past month, history of perinatal complication or neuro-developmental delay or the presence of any chronic systemic diseases (metabolic, rheumatologic, malignancy, cardiac, and renal).
5. The exclusion criteria applied to case group were also applied to the control group.

All patients were assessed according to the following scheme of clinical evaluation and investigations:

#### **1-Detailed medical history.**

#### **2-Complete general examination.**

#### **3-Complete Neurological examination.**

Febrile convulsion (FC) has been defined as a convulsion associated with fever without acute disturbances in electrolyte balance or central nervous system infection in children with age ranging from 6 months to 5 years with no history of any afebrile seizures. Febrile convulsion is sub-classified as complex and simple. Complex FC is a seizure lasting more than 15 minutes and recurring within 24 hours [11].

#### **4-Electroencephalography (EEG) [done for cases].**

#### **5-Investigations (for both cases and controls):**

##### *A-Laboratory investigations:*

Complete blood count (CBC) including total and differential leukocytic count.

❖ Urine analysis and urine culture.

- ❖ Liver function tests.
- ❖ Renal function tests.
- ❖ Fasting and post-prandial blood sugar level.
- ❖ Erythrocyte sedimentation rate (ESR).
- ❖ Serum level of C-reactive protein (CRP).

B- Special investigations:

A venous blood sample was obtained from all the children in both groups and serum ferritin level, serum iron level, and total iron-binding capacity (TIBC) were measured for all children.

Anemia was defined as hemoglobin (Hb) level of less than 110g/L in 6 months to 2 years and less than 11.5g/dl in 2 to 6 years. Iron deficiency was defined as serum ferritin level of less than 12 ng/mL if CRP was negative or 1+, ferritin level of less than 30 ng/mL if CRP was  $\geq 2+$ , or serum iron levels of less than 22  $\mu\text{g/dL}$  or transferrin saturation (a percentage calculated as serum iron concentration/TIBC  $\times 100$ ) of less than 16% [12,13].

#### Statistical analysis:-

The data were collected, entered and analyzed using SPSS version 20 statistical software [14]. Data were expressed as mean  $\pm$ SD for quantitative variables, frequency and percentage for qualitative variables. Chi-square test ( $\chi^2$ ) and t-test were used when appropriate. Differences were considered statistically significant at P-value of less than 0.05 ( $P < 0.05$ ).

#### Results:-

A total of 100 children, aged from 6-36 months were included in this cross-sectional case-control study according to the above mentioned criteria. Fifty children [27 males (54%) and 23 females (46%)] with ages ranged from 6 to 36 months (mean age  $\pm$ SD was  $30.3 \pm 19.2$  months) who presented with febrile convulsion (case group) and 50 sex and age-matching children who presented with febrile illness without convulsion (control group) were included in this study as shown in **table 1** which also shows that age, gender distribution, history of fever before admission and mean body temperature on admission were non-significant between the two groups, however history of previous seizures was significantly higher in cases (40%) than in control group (18%),  $P=0.015$ , also respiratory tract infection was significantly higher in case group (60%) than in control group (28%),  $P=0.0012$ , on the other hand, gastroenteritis showed no statistically significant difference between the two groups.

**Table.2** shows the hematological and biochemical indices in the two groups. It shows that hemoglobin level  $< 110$  g/L, and microcytosis were significantly more frequent in febrile seizure group than in those with febrile illness without seizure [86% of febrile seizure cases had hemoglobin level  $< 110$ g/L vs. 68% of control ( $p=0.032$ )] and microcytosis was found in 86% of cases vs. 54% of control, ( $p=0.001$ ) respectively), mean cell volume was [71.6(9.4) in cases vs. 76.6(12.1) in control group ( $p=0.021$ )]. Also median (IQR) serum iron  $\mu\text{g/dl}$  was significantly lower in cases [16.9 (14.4-23.8)] than in control group [20.7 (15.3-26.4)], ( $P=0.03$ ). Iron deficiency anemia was significantly more frequent in cases (32.0%) than in children with febrile illness without convulsion (14%), ( $P=0.032$ ). Also, mean serum ferritin level ng/ml was significantly lower in case group [ $38.52 \pm 11.38$ ] than in control group [ $54.32 \pm 13.46$  ( $P=0.001$ )], while mean serum transferrin level was found to be non significant between the two groups.

**Table.3** shows number, type and duration of seizures among cases with and without iron deficiency. Generalized seizures were found significantly higher in febrile seizure cases with iron deficiency than in those without iron deficiency (75% of cases with iron deficiency were having generalized seizure, vs. 41% of cases without iron deficiency, ( $p=0.025$ )). On the other hand, focal seizures were significantly more frequent (58.0%) in cases without iron deficiency than in cases with iron deficiency (25%), ( $p < 0.025$ ). Also, the mean duration of seizures was significantly longer in cases with iron deficiency ( $7.52 \pm 3.77$ ) minutes than in cases without iron deficiency ( $5.17 \pm 2.95$ ), ( $p=0.01$ )

**Table 1:-** Demographic data and clinical characteristics of cases and controls.

Demographic data Groups	Cases (N = 50)	Control (N = 50)	P-value
Age (Mean±SD) months	30.3±19.2	28.8±19.3	0.77
Gender

## Discussion:-

Febrile convulsions (FC) are considered the most important and common seizure type occurring in childhood between the age of six months and five years, it affects nearly 2-5% of neurologically healthy children. [5]

This case-control cross sectional study included 50 children presented with FC [27 males (54%) and 23 females (46%)] and 50 age and sex matched control children [26 males (52%) and 24 females (48%)] who had febrile illness without seizure activity. The mean age ± SD of cases was 30.3±19.2 months and that of control group was 28.8±19.3 months.

In the present study, the respiratory tract infection was significantly more frequent among cases than controls (60% in cases vs. 28% in controls, (p=0.0012). On the other hand, gastroenteritis was present in 16% of cases and 24% of control but with no significant difference, In a case-control study done by **Bidabadi and Mashouf [15]** on

association between iron deficiency anemia and febrile seizures, upper respiratory tract infection and gastroenteritis were reported among the most frequent underlying cause of fever in cases and controls.

In the current study, the iron status of both children with FC and that of age and sex matched control group was assessed and compared, also different hematological parameters for identification of iron deficiency anemia (IDA) were assessed [Hemoglobin (Hb), hematocrite(Ht), Mean cell volume (MCV), serum iron, and serum ferritin] and reported to be significantly lower in children with FC than in control group. The Hemoglobin level <110g/dl was significantly more frequent in children with FC than in control [43(86%) in cases with FC vs. 34(68%) in control group,  $P=0.032$ ], [MCV ( $\pm$ SD) was 71.6( $\pm$ 9.4) in cases vs. 76.6 ( $\pm$ 12.1) in control,  $p=0.02$ ], microcytosis was also significantly more frequent in children with FC than in those with febrile illness without seizure [43(86%) in cases vs. 27(54%) in control ( $p=0.001$ )].

The median serum iron and mean serum ferritin levels were also found in this study to be significantly lower in FC children than in those with febrile illness without seizure activity [the median IQR of serum iron (ug/dl) was 16.9(14.4-23) in cases vs. 20.7(15.3-26.4) in control,  $p=0.03$ , mean serum ferritin level (ng/ml) was  $38.52 \pm 11.38$  in cases vs.  $54.32 \pm 13.46$  in control,  $p=0.001$ ]. Moreover, IDA was reported to be significantly more frequent in FC children than in control (32% of cases had IDA vs. only 14% of control ( $p=0.032$ )).

Our results concerning decreased hematological and biochemical indices for IDA and increased frequency of IDA among children with FC were supported and in agreement with studies of **Hartfield et al [6]** and **Modaresi et al, [16]** who found that mean Hb, Ht, MCV, serum iron and ferritin were significantly lower in FC children than in those with febrile illness without seizure. Also **Akbayram et al [17]** in their study reported a significantly lower serum iron level in children with FC than in healthy children group .

Another study [18] showed that the mean serum ferritin levels were found to be significantly lower in children with FC than in children with febrile illness without seizure. our results were also in accordance with a meta-analytic study done by **Habibian et al [5]** who found that IDA was 1.52 times more frequent among patients with FC than children with febrile illness without seizure, and added that IDA is considered a cofactor in producing FC in which genetics trigger the effect of IDA on the occurrence of FC.

Contrary to our findings, the study done by **Bidabadi and Mashouf [15]** showed that IDA was less frequent in children with FC in comparison to children with febrile illness without seizure .

In explanation for the causal relationship between IDA and FC, **Schultz et al [19]** showed that iron deficiency leads to dysfunction of myelination as well as disturbance of tyrosine and tryptophan hydroxylase synthesis which in turn plays an important role in production of neurotransmitters like (serotonin, dopamine and GABA) from the synaptic vesicles .

On analyzing the relationship between IDA and both the clinical type and duration of seizures in cases, we found that children with IDA were significantly having more generalized seizures than those without IDA (75% of cases with IDA presented with generalized seizure vs. 41% of cases without IDA,  $P=0.025$ ). Regarding the duration of seizure among cases, it has been found that cases with IDA were having statistically significantly longer duration of seizures than those without IDA (mean  $\pm$ SD) was  $7.52 \pm 3.77$  minutes vs.  $5.17 \pm 2.95$  respectively,  $p=0.01$ ). These results were in agreement with those of **Fallah et al [1]** who recorded that children with IDA were having longer duration of seizures.

### **Conclusion:-**

Children with low serum iron level and those having iron deficiency anemia may be at higher risk for developing febrile convulsions when compared with those with febrile illness without seizure. This makes iron deficiency anemia as a possible modifiable nutritional risk factor for febrile convulsions among children.

### **Recommendations:-**

Screening, early detection and correction of iron deficiency anemia should be considered in children presenting with febrile seizures, furthermore giving iron supplements should be routine in children who have a risk of developing febrile seizures like presence of family history of febrile convulsions.

**Study limitation:-**

The study had some limitations, as small sample size, and also the serum ferritin level, being a non-specific acute phase reactant which may rise during any inflammatory condition.

**Financial support and sponsorship:-**

Nil.

**Conflicts of interest:-**

There are no conflicts of interest.

#### Abstract

**Background:** Diabetes mellitus (DM) is a global public health problem. The prevalence of diabetes mellitus is increasing and the number of persons with the disease will double by 2025. The management of diabetes mellitus (DM) largely depends on patients' ability to self-care in their daily lives, and therefore, patient education is always considered an essential element of DM management. Studies have consistently shown that improved glycemetic control reduces the rate of complications and evidence suggests that patients, who are knowledgeable about DM self-care, have better long term glycemetic control.

**Objectives:** To assess the level of awareness, Attitude And Practice toward diabetes in Riyadh city to identify barriers.

**Methods:** A cross sectional analytical questionnaire based study among the general population in Riyadh city. This study (2016) was carried out among a sample of 461 subjects. The mean age of citizens was 28,82. To assess citizens' demographic factors and beliefs about diabetes consenting citizens completed an anonymous online questionnaire. The data was entered and analyzed using SPSS version 20.

**Results:** The sample is consisted of 65,8% women and 34,2% men. Among the respondents 7,7% reported suffering from diabetes and 13,6% confirmed having a history of diabetes illness in their family. The results of the study showed that 153 (34,8%) subjects had weak knowledge related to the disease, 260 (59,1%) subjects had average level of knowledge while only 27 (6,1%) subjects had good knowledge regarding diabetes. There was a statistical significant association between gender, educational level and the level of awareness about diabetes.

**Conclusion:** diabetes is a chronic disease that is potentially controllable but that cannot be cured. Education still be important overall the treatment of the patients.

**Background:-**

Diabetes mellitus (DM) is a global public health problem <sup>[1]</sup>. The prevalence of diabetes mellitus is increasing and the number of persons with the disease will double by 2025 <sup>[2]</sup>. The management of diabetes mellitus (DM) largely depends on patients' ability to self-care in their daily lives, and therefore, patient education is always considered an essential element of DM management. Studies have consistently shown that improved glycemic control reduces the rate of complications and evidence suggests that patients, who are knowledgeable about DM self-care, have better long term glycemic control <sup>[3-4-5]</sup>. Although the prevalence of DM is high among populations in the Middle East and Gulf countries, patients often lack the knowledge and skills to self-manage their condition <sup>[6-7-8-9]</sup>. During the past three decades, the population of the Kingdom of Saudi Arabia has undergone tremendous changes in lifestyle, primarily leading to decreased physical activity and unhealthy eating habits. These changes have had a considerable negative impact on the health of the society. Indeed, this lifestyle transformation is thought to be responsible for the epidemic of non communicable diseases and their complications in the country <sup>[10-11]</sup>. Our Study Was Designed To Examine Health Beliefs And Assessment Level OF Awareness Toward Diabetic among Population In Saudi Arabia, Riyadh city And Applies The Health Belief Model To Determine Barriers.

**Rationale:-**

Diabetes mellitus (DM) is a global public health problem <sup>[1]</sup>. The prevalence of diabetes mellitus is increasing and the number of persons with the disease will double by 2025 <sup>[2]</sup>. The management of diabetes mellitus (DM) largely depends on patients' ability to self-care in their daily lives, and therefore, patient education is always considered an essential element of DM management. Studies have consistently shown that improved glycemic control reduces the rate of complications and evidence suggests that patients, who are knowledgeable about DM self-care, have better long term glycemic control <sup>[3-4-5]</sup>. Although the prevalence of DM is high among populations in the Middle East and Gulf countries, patients often lack the knowledge and skills to self-manage their condition <sup>[6-7-8-9]</sup>.

**Objectives:-****General objectives:-**

To assess the level of awareness, Attitude And Practice toward diabetes in Riyadh city to identify barriers.

**Specific objective:**

The goal of this study was to examine community health beliefs regarding diabetes and their perceptions related to it and evaluate the role of demographic factors in shaping beliefs about diabetes and assess possible associations between demographic characteristics with the preventive behavior of interest.

**Methods:-**

**Study design:** cross sectional study.

**Setting and data collection:**

This survey analysis was conducted among community population in Riyadh city. A preformed self-administered questionnaire was distributed among the community population.

**Sample:-**

Subjects will be chosen according to geographical and sex distribution. Sample size was calculated based on web-site calculator <sup>[11]</sup>, taking the total size of Riyadh population (4,087,000) <sup>[13]</sup>, confidence level (95%) and margin error (5%) to be 285. additional 20 % was added to cover the missing data . The total sample obtained was **360**.

**Study population:-**

The study population included were both male and female in Riyadh city.

**Study tool:-**

Pre-formed Self-administered questionnaire that requires information about:

- 1- Socio-demographic data: age, nationality, gender, education level, income, marital status, and employment status.
- 2- Risk Factors Associated with diabetes– clinical manifestation of diabetes- incidence and prognosis of diabetes.
- 3- Beliefs about diabetes assessment including 8 questions. A score of 1 was given right answer and 0 otherwise. For each subject, a maximum score of 8 was calculated. A scoring system was applied to measure the

respondents' beliefs about diabetes. The awareness level was categorized into 3 levels indicated by weak (0–2), average (3–5) and good (6–8).

- 4- Knowledge about prevention behavior assessment including one question “Do you believe that psychological pressure is one of the diabetes factors?”. A score of 1 was given to yes and 0 otherwise. For each subject, a maximum score of 1 was calculated. The knowledge level score was categorized into 2 levels indicated by poor knowledge (0) and good knowledge (1).

#### **Ethical considerations:-**

An informed consent was obtained from the participants included in this research before filling the questionnaire.

#### **Statistical analysis:-**

Data were entered into the Statistical Package for Social Sciences (SPSS, version 20) and descriptive analysis conducted.

Association of respondents' characteristics with beliefs about diabetes and knowledge about prevention behavior of interest was evaluated using:

- 1- Frequencies and percentages.
- 2- Chi-squared test.
- 3- Independent Samples Test (T-test).
- 4- ANOVA one-way test.

Statistical significance was accepted at  $p < 0.05$ .

#### **Results:-**

##### **I-Examine community health beliefs regarding diabetes and their perceptions related to it:**

##### **1-Demographics of the studied subjects:**

The socio-demographic characteristics are shown in table (1)

**Table 1:** socio-demographic characteristics

	Frequency	Percentage (%)
<b>Age (Years)</b>		
Mean age: 28,82		
<b>Gender</b>		
Female	298	65,8
Male	155	34,2
<b>Nationality</b>		
Saudi	395	87,6
Non Saudi	56	12,4
<b>Educational level</b>		
Primary	6	1,3
Middle	15	3,3
Secondary	139	31,0
University	278	62,1
Master	6	1,3
PH.D.	4	0,9
<b>Marital status</b>		
Not married	233	51,5
Married	219	48,5
<b>Income (RS)</b>		
<3000	183	42,5
3000-5000	52	12,1
5000-7000	38	8,8
7000-10000	65	15,1
>10 000	93	21,6
<b>Employment status</b>		
Unemployed	277	61,7
Employed	172	38,3

By looking at table (1), related to the distribution of respondents according to demographic factors:

- The mean age of population was: 28,82 years.
- With respect to gender, a majority of the subjects (298)( 65,8%) were Female.
- -395 (87,6%) subjects had Saudi nationality.
- We see that (278) of the respondents have a university degree with a percentage of 62,1%.
- We see that (219) of the respondents are married with percentage of 48,5%.
- We see that (183) of the respondents have an income (<3000 RS) with percentage of 42,5%.
- We see that (277) of the respondents are unemployed with percentage of 61,7%.

**2-Knowledge regarding the diagnosis of diabetes**

**Table 2: Do you suffer from diabetes?**

Do you suffer from diabetes?	Frequency	Percent (%)
No	360	79,3
I dont know	59	13,0
Yes	35	7,7
Total	454	100,0

Out of 454 subjects, 360 (79,3%) subjects reported not being affected with diabetes, 13% did not know if they are affected or not and 35 (7,7%) respondents reported that they suffer from diabetes, as it is shown in the figure below:

**Figure 1: Do you suffer from diabetes?**

**3- Community health beliefs regarding diabetes and their perceptions related to it:**

**Table 3: Responses to questions on beliefs regarding diabetes**

(Green: correct answer)

	No	Yes	Don't Know
Do you suffer from diabetes?	360 (79,3%)	35 (7,7%)	59 (13,0%)
Q1: Is there a history of diabetes illness in your family?	291 (64,0%)	62 (13,6%)	102 (22,4%)
Q2: you have or ever had any of the chronic diseases?	246 (54,1%)	183 (40,2%)	26 (5,7%)
Q3: Do you think that diabetes could be prevented?	59 (13,0%)	228 (50,2%)	167 (36,8%)
Q4: Do you think that heredity play a role in having diabetes?	55 (12,1%)	273 (60,0%)	127 (27,9%)
Q5: Do you think that psychological pressure is one of the diabetes factors?	75 (16,5%)	217 (47,7%)	163 (35,8%)
Q6: Do you think that diabetes increases the risk of heart disease?	123 (27,1%)	65 (14,3%)	266 (58,6%)
Q7: diabetes may affect humans at any age category?	32 (7,0%)	250	172

		(55,1%)	(37,9%)
<b>Q8: If you have diabetes, do you feel socially ashamed by being affected?</b>	<b>161 (36,3%)</b>	<b>101 (22,8%)</b>	<b>181 (40,9%)</b>
<b>Q9: Do you think that diabetes can be cured?</b>	<b>47 (10,4%)</b>	<b>327 (72,0%)</b>	<b>80 (17,6%)</b>
<b>Q10: Do you think that diabetes can leads to death?</b>	<b>227 (49,9%)</b>	<b>88 (19,3%)</b>	<b>140 (30,8%)</b>

-Most of the respondents 228 (50,2%) answered that diabetes could be prevented.

- 273 (60%) of the patients were aware that diabetes was a genetically determined disease and 217 (47,7%) thought that psychological pressure is one of diabetes factors.
- Only 65 (14,3%) subjects knew that diabetes increases the risk of heart disease.
- Most of the subjects 250 (55,1%) knew that diabetes may begin at any age.
- The majority of respondents 181 (40,9%) did not know if they will be ashamed or not, if they have diabetes.
- The majority of respondents 327 (72%) think that diabetes can be cured and only 10,4% of the subjects knew the fact that the disease is not curable.
- The results of the study suggested that 227 (49,9%) subjects were aware of the fact that diabetes cannot cause death.

Figure 2: Responses to questions With "Yes"

**II-Evaluation of the role of demographic factors in shaping beliefs about diabetes**

**Level of awareness**

**Table 4:** Respondents' awareness evaluation for diabetes

Level of awareness	Frequency	Percent (%)
0-2 : Weak	153	34,8
3-5 : Average	260	59,1
6-8 : Good	27	6,1
Total	440	100,0

Table 4 shows that overall level of awareness on diabetes among the study participants showed that out of 440 subjects, 153 (34,8%) subjects had weak knowledge about the disease, 260 (59,1%) subjects had average level of knowledge whereas only 27 (6,1%) subjects had a good knowledge regarding diabetes(Figure 3).

Figure 3: Level of awareness

a. 0 cells (0,0%) have expected count less than 5. The minimum expected count is 10,24.

There is a statistical significant association between gender, educational level and the level of awareness about diabetes, respectively ( $p=0,01 < 0,05$ ) and ( $p=0,027 < 0,05$ ).

**III-Assessment of possible associations between demographic characteristics with the preventive behavior of interest.**

Psychological pressure is one of the diabetes factors, which is reported in the fifth question; that is why it is important to avoid stress as prevention of the disease.

**Table 5:** Do you think that psychological pressure is one of the diabetes factors?

Level of knowledge	Frequency	Percent (%)
Poor knowledge	238	52,3
Good knowledge	217	47,7

There is a statistical significant association between age, gender, nationality, marital status and the level of knowledge about stress as factor of diabetes, respectively ( $p=0,17 < 0,05$ ), ( $p=0,42 < 0,05$ ), ( $p=0,19 < 0,05$ ) and ( $p=0,41 < 0,05$ ).

**Discussion:-**

This study identified that:

- The majority of respondents have an average level of awareness toward diabetes.
- The majority of the studied subjects have a good knowledge about the fact that psychological stress is one of the factors of the pathology of diabetes.

- Our study showed that about half of respondents were not sure or were affirmative that diabetesis contagious, respectively 30,8% and 19,3%.

### Recommendations:-

- Therapeutic management is not limited to its molecular aspect by using drugs.
- Improving the health of a patient goes through many other aspects as essential as drugs: education, prevention, listening, social solidarity...This change in vision has made it possible:
- To become aware of all the consequences of illness on the quality of life of the patient
- To identify the handicap and the resulting social exclusion
- To consider that psychological suffering is as important to take In charge as physical suffering, Indeed, the purpose of treatments is not only to eliminate the symptoms but, more generally, to improve the quality of life , to return to the patient all his freedom in his relations with himself and with others .
- Patients with diabetes need to improve their knowledge of the disease and self-care methods to avoid exacerbation of disease.
- The disease requires systematic treatment and appropriate care.
- Health education is a main part of the management of diabetes.

#### Abstract

Congenital conditions of the major airways are very uncommon. Tracheal bronchus is the commonest, it affects 0.1-2% of the population. Usually asymptomatic but especially in childhood they may present with cough, recurrent infections, or hemoptysis. We describe a 25-years-old male trauma patient with a right-sided tracheal bronchus arising from the lateral wall of the trachea (Conacher's carinal trifurcation TYPE III) found incidentally on routine chest radiography upon admission to intensive care unit which confirmed by chest computed tomography and bronchoscopy. In adults with tracheal bronchus, the main concerns are complications during endotracheal intubation, risk of obstructive pneumonia, prolonged hypoxia, lung neoplasms and the association with cardiovascular, renal and other congenital anomalies.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Major airways congenital conditions are very uncommon, the most common anomaly is a tracheal bronchus that rises from the lateral wall of the trachea above the carina and supplies the right upper lobe, the prevalence of tracheal bronchus reported is 0.1-2% while the incidence was found to be 0.06% in other evidence (1, 2). This anomaly is usually asymptomatic, but it may present with respiratory manifestations especially in childhood (3). It is also referred to as "bronchus suis" or "pig's bronchus" because it is a normal anatomical finding in pigs, sheep, goats, and camels.

In intensive care units, intubation and bronchoscopy are done frequently for a variety of causes. However, the anatomical variants of the airways are not routinely included in the differential diagnosis either for consideration of possible endotracheal intubation complications, a recurrent infection, persistent cough, or hemoptysis, which may be associated with existence of pulmonary or cardiovascular anomalies or lung cancer in these cases (4, 5). Here, we report a case of tracheal bronchus detected incidentally in the intensive care unit during a daily practice.

#### Case Report:-

A 25-year-old man was admitted to the intensive care unit with multiple traumatic head injuries sustained in a motorcycle accident. He was intubated and placed on mechanical ventilation to protect his airway and remained in a coma in the intensive care unit for one month.

**Corresponding Author:- Kharaba Ayman MD.**

Address:- Department of Critical Care, King Fahad hospital, Madinah, Saudi Arabia.

He had no history of respiratory symptoms or admissions for any other indications. A review of systems was unremarkable, and physical examination revealed no clubbing of fingers and normal respiratory and cardiac examination. One pupil was dilated, and his score on the Glasgow coma scale was 7/15.

Chest radiographs (X rays and computed tomography), taken as part of complete trauma assessment at presentation (Figure 1) revealed a tracheal bronchus originating from the right lateral wall of the trachea, just above the carina, and supplying the complete right upper lobe.

After 10 days in the intensive care unit, he underwent tracheostomy with a flexible bronchoscope (Figure 2). During the procedure, we confirmed the finding of three openings: a tracheal bronchus to the right upper lobe with three clear segments, an opening from the carina supplying the right bronchus intermedius and the right lower lobe segments, and an opening from the carina supplying the left lobes. All openings originated at the level of the carina.

**Figure 1:-** Tracheal bronchus originating from the right lateral wall of the trachea, just above the carina, supplying the complete right upper lobe in a 25-year-old man admitted to the intensive care unit with multiple traumatic head injuries.

**Figure 2:-** Bronchoscopy revealed that the tracheal bronchus originated in the lateral wall of the trachea, less than 2 cm above the carina (Conacher's carinal trifurcation TYPE III).

**Discussion:-**

Tracheal bronchus was first described by Sandifort in 1785 as a right upper-lobe bronchus or “true tracheal bronchus, “originating from the trachea. The term “tracheal bronchus” has come to include all bronchial anomalies originating from the trachea or main bronchus and directed to either the upper lobe of either the right or left lung. They classified into two main types to either supranumerary (bronchial supply to affected lung segment is present) or displaced (bronchial supply to affected lung segment is absent) (3).

These congenital malformations are usually asymptomatic in adults, but they are often associated with respiratory complications, recurrent infection, cough, wheeze, stridor, respiratory distress, and thoracic masses in children (6). Chest radiography, as the initial radiological investigation, may show a bronchus directly arising from the trachea, as it did in our case. Computed tomography is the imaging modality of choice for investigating this anomaly because it shows the tracheal and bronchial anatomy. This anomaly usually is detected incidentally during bronchoscopy or by chest computed tomography performed for various respiratory conditions (6, 7).

Occasionally, tracheal bronchus represents the underlying cause of a chronic pulmonary disease, such as emphysema, bronchiectasis or persistent or recurrent pneumonia, especially if it involves the right upper lobe and reflects difficulties in clearing mucus from this lobe (3, 4).

Tracheal bronchus may be associated with many anomalies including ventricular septal defect, atrial septal defect, pulmonary stenosis, coarctation of aorta, azygos lobe, tracheal stenosis, pulmonary hypoplasia, hydronephrosis, kidney agenesis, deafness and Down's syndrome (6-8).

Among various classifications, the one proposed by Conacher is simplest and describes the anatomical relationship between the tracheal bronchus and the carina. Types II and III may present a problem for Intensivist and anesthesiologists during intubation, especially if one lung needs to be ventilated (9).

In adults with a tracheal bronchus, presented in a critical condition to emergency department, intensive care unit or going for surgery the main concern is endotracheal intubation. An endotracheal tube can obstruct the lumen of the tracheal bronchus, resulting in atelectasis of the involved lobe, post-obstructive pneumonia, or even respiratory failure (10). Accidental intubations of the anomalous lobe can cause pneumothorax and inadequate ventilation of the remaining lung. Patients with tracheal bronchus should be identified and those aware to have this anomaly must inform the anesthesiologist preoperatively for those going for elective surgery especially cardiothoracic surgery with single-lung ventilation because serious prolonged hypoxia and atelectasis may occur. (11-13).

In the absence of symptoms, tracheal bronchus need not be treated as in our patient where it went undiagnosed until his accident. In patients with a tracheal bronchus and right upper lobe disease with history of recurrent pneumonia which complicated by bronchiectasis, surgical resection of the anomalous lobe or segment is the treatment of choice (12-14).

**Conclusion:-**

Our patient was an adult with asymptomatic bronchial abnormalities with early identification for his anomaly at presentation, these tracheal anomalies are important to be considered in daily practice to prevent endotracheal intubation complications and to identify the patients with chronic respiratory manifestations and for whom lobectomy may be considered. If a tracheal bronchus is detected, other pulmonary, cardiovascular and renal abnormalities should be ruled out.

#### Abstract

Hepatitis E virus is claimed to represent the most frequent cause of acute hepatitis and jaundice all over the world. In 2008, HEV was reported possibly to be responsible for chronic infection in immunosuppressed patients such as organ transplant recipients. This study aims at detection of HEV RNA and HEV IgM and IgG antibodies in sera of renal transplant Egyptian patients compared to apparently healthy control group of matched age and sex. The present study was carried out on sixty renal transplant patients recruited from the Transplantation Unit at Alexandria Main University Hospital and sixty apparently healthy control subjects. Sera of all cases and controls have been subjected to Real Time PCR for detection of HEV RNA and qualitative ELISA determination of HEV IgM and IgG. Anti HEV IgG was positive in 56.7% of cases (34 out of 60) and in 75% of control subjects (45 out of 60). HEV RNA was detected in 2 cases (3.3%) among renal transplant recipients, while the sixty control subjects were all negative.

There is a high seroprevalance of HEV IgG among both patients and controls. The statistically insignificant lower prevalence among transplanted patients might be justified by intake of immunosuppressive drugs. Transplant recipients showed higher rate of HEV RNA positivity. The impact of immunosuppression on rate of viral clearance among such category of patients needs to be noted.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Hepatitis E virus (HEV) is considered the main cause of enterically transmitted hepatitis globally, being accountable for more than 50% of the cases of acute hepatitis in endemic countries where the disease is transmitted through drinking water and causes serious epidemic outbreaks. (Pérez-Gracia et al. 2013).

HEV is mainly prevalent in tropical and subtropical regions with much lower prevalence in developed countries. (Kumar et al. 2013) HEV infection courses as an asymptomatic or a self-limiting symptomatic acute hepatitis, but fulminant hepatitis may happen, particularly in pregnant women or in people with an underlying liver disease. (Péron et al. 2007) However, in 2008 it has been shown that HEV imposes a problem to immunosuppressed patients such as solid-organ transplant recipients, and HIV patients. Chronicity rates have been reported to be higher with failure of 60% of transplant

**Corresponding Author:- Sarah M Abdelhamid.**

recipients to clear the HEV, (Halac et al. 2012) and the possibility in 10% to develop cirrhosis within a short period of time. (Colson et al. 2009; Gérolami et al. 2008; Kamar et al. 2011; Ollier et al. 2009) Researchers have reported that an antibody response to HEV may be absent in these immunosuppressed patients and recommended the trial for the detection of HEV RNA when serum liver tests are elevated over several months. (Gérolami et al. 2009) Other researchers noted that Chronic hepatitis E in renal transplant patients has been found to be associated with normal liver enzymes and a negative serological assay. (Gérolami et al. 2008)

This study aims at detection of HEV RNA and HEV IgM and IgG antibodies in sera of renal transplant Egyptian patients compared to apparently healthy control group of matched age and sex.

### **Material & Methods:-**

The present study was carried out on sixty renal transplant patients recruited from the Transplantation Unit at Alexandria Main University Hospital during the period from 1/12/2013 to 28/3/2015. Sixty apparently healthy control subjects have been enrolled in the study with matched age and sex.

Serum samples collected from cases and control subjects were subjected to: RNA extraction using ISOLATEII RNA Mini Kit (Bioline, U.K) and amplification of HEV RNA by Real Time PCR technique using SensiFast SYBR No-ROX One – Step kit (UK) and a light cycler (Applied Biosystem, One Step)

In the present study a primer set on the ORF2 HEV genome was chosen in a highly conserved region, (GenBank accession no. X98292, strain hev037)(Orrù et al. 2004)

Primers used for HEV RNA amplification were 5'- GCGGTGGTTTCTGGGG -3' and 5' -TTCCCC AAC CAA CCT-3'

ELISA technique was employed for the detection of Specific IgM (DRG® International Inc. HEV IgM assays. USA) and IgG (DRG® International Inc. HEV IgG assays. USA) to HEV (Rostamzadeh Khameneh Z et al. 2011)

Aspartate transaminase (AST) and alanine transaminase (ALT) levels were measured for both transplant patients and healthy controls.

### **Results:-**

The age of renal transplant cases enrolled in the study ranged from 28-53 with a mean of  $38.48 \pm 6.41$ . Sex distribution showed 40 (66.6%) males and 20 (33.3%) females with no statistically significant difference when compared to controls. The graft age in the transplant group ranged from 2-9 years with the mean of  $6.225 \pm 2.638$ . Both cases and controls' sera were negative to anti HEV IgM . Table 1 shows distribution of cases and controls according to IgG positivity. HEV IgG positivity prevalence was higher among control group compared to cases with no statistically significant difference. ( $p= 0.098$ )

Transplant cases showed two positive HEV RNA cases by Real Time PCR (3.4%) while control subjects were all negative. There was no statistical significant difference ( $P=0.494$ ) (Table 2). IgG response was positively detectable in only one of the two PCR positive HEV cases.

In a comparison set between cases and control; the level of AST ranged between 12-65 IU/L with the mean of  $24.20 \pm 10.32$  IU/L for cases and 15-28 IU/L with the mean of  $21.42 \pm 3.75$  IU/L for control. There was no statistical significant difference between them. ( $P=0.311$ ).

In cases ALT level ranged between 15-85 IU/L with the mean of  $27.38 \pm 11.58$  IU/L and 16-34 IU/L with the mean of  $23.05 \pm 3.90$  IU/L for control, There was a statistically significant difference between cases and control regarding ALT. ( $P=0.017$ ) (Table 3).

Distribution of renal transplant cases with positive HEV RNA and transplant cases with negative HEV RNA according to liver enzyme level, AST showed a mean level of  $62.50 \pm 3.54$  IU/L for positive cases, and  $22.18 \pm 5.34$  IU/L for negative cases. There was a statistically significant difference between PCR positive and negative cases ( $P=0.018$ ).

ALT showed a mean level of  $70.0 \pm 21.21$  IU/L for positive cases, and  $25.13 \pm 5.09$  IU/L for negative cases. There was also a statistically significant difference between HEV RNA positive and negative cases regarding ALT level. ( $P=0.018$ ).

Comparing transplant cases with positive and negative IgG according to liver enzyme level, AST showed a mean level of  $23.83 \pm 9.08$  IU/L for positive cases, and a mean level of  $24.71 \pm 12.07$  IU/L for negative cases, with no statistically significant difference ( $P=0.891$ ). While ALT showed a mean level of  $27.65 \pm 13.53$  IU/L for positive cases, and  $27.0 \pm 8.67$  IU/L for negative cases. There was also no statistically significant difference ( $P=0.816$ ).

### **Discussion:-**

Hepatitis E virus (HEV) is responsible for more than 50% of the cases of acute hepatitis in endemic countries, and is considered to be an emerging infectious disease. (Pérez-Gracia et al. 2013)

To our knowledge this is the first cross sectional study to consider Real Time PCR for HEV in addition to serological tests in investigating the prevalence of HEV among renal transplant recipients in Egypt.

The present study was conducted on sixty serum samples collected from renal transplant patients; with sixty apparently healthy age and sex matched control subjects.

Most of the studies conducted for the detection of HEV RNA in serum samples selected the real time PCR as a reliable method for the assay. In a French study, Kamar et al, studied serum samples of 160 kidney transplant recipients and revealed HEV RNA in 7% of renal transplant recipients denoting the high endemicity of HEV infection in southern France.(Kamar et al. 2008a) In another study, he (Kamar et al), identified 6.5% positive cases of 217 patients, tested for serum HEV RNA receiving different types of grafts.(Kamar et al. 2008b)

In agreement with the previous data, our detection of HEV RNA by real time PCR results showed two positive cases (3.4%) in renal transplant cases while all control subjects were negative, which reflects a higher rate of detection of HEV RNA among transplanted patients compared to normal population. This observation can be justified by longer duration of viremia among immunosuppressed and less rate of clearance of the virus evidenced by many researchers.(Krain et al. 2014)

In a similar study, Legrand-Abravanel et al. detected HEV RNA using real time PCR. in 8% of 700 kidney transplant recipients (Legrand-Abravanel et al. 2011)

Serological assessment has been considered a gold standard for evidencing infection by HEV. Estimation of the IgG level in serum has been interpreted by many scientists to determine the state of infection whether past, acute or chronic infection.(Lin et al. 2000)

Our results of HEV antibodies of IgG in renal transplant cases were positive in 56.7% (including the two positive PCR cases) and negative in 43.3%. While the results in control subjects were 45 cases IgG positive and 15 cases IgG negative.

The negative results could be related to either the immunosuppressive drugs which may lead to a loss of antibodies or a possible weak antibody response.

In 2011 Rostamzadeh Khameneh et al. reported 28 subjects (30.8%) out of 91 kidney transplant patients were seropositive for anti-HEV IgG.(Rostamzadeh Khameneh Z et al. 2011) Another study by Kamar, et al showed the prevalence of HEV IgG was 14.5% from 241 kidney recipients, and 10.4% from 86 liver recipients. (Kamar et al. 2008b) Other researchers reported the seroprevalence of HEV in French renal transplant recipients to be 14.5%, while its prevalence in blood donors in southwestern France, represented as the general population, was 16.6%.(Mansuy et al. 2008)

In the present study the level of AST ranged between 12-65 IU/ml for cases and 15-28 IU/ml for control subjects. While, ALT level ranged between 15-85 IU/L for cases and 16-34 IU/L for controls. There was a statistically significant difference between cases and controls regarding ALT. ( $P=0.017$ ).

A similar association was also reported by Kamar et al who showed increase ALT levels from 13 to 156 IU/L (N =5–55), AST levels from 22 to 115 IU/L (N = 5–40) among renal transplant patient infected with HEV. (Kamar et al. 2011) Previous study by Kamar et al showed elevated ALT (15 to 200 IU/L) and AST level (25 to 110 IU/L) among renal transplant recipients infected with HEV.(Kamar et al. 2008a)

Confirming our results, Pas et al. studied 1,200 solid organ transplant recipients. Twelve HEV-infected patients had identified peak ALT level, 301 IU/L (81–909) and peak AST level, 172 IU/L (66–1016).(Pas et al. 2012)

In our study a comparison between transplant cases with positive IgG and transplant cases with negative IgG according to liver enzyme level, AST showed a mean level of  $23.83 \pm 9.08$  IU/L for positive cases, and  $24.71 \pm 12.07$  IU/L for negative cases. ALT showed a mean level of  $27.65 \pm 13.53$  IU/L for positive cases, and  $27.0 \pm 8.67$  IU/L for negative cases.

A similar association was also reported by Rostamzadeh Khameneh et al. In a comparison of patients' characteristics between the seropositive and seronegative groups for anti-HEV IgG, the ALT level ranged from 27–262 IU/L. The mean AST level was  $51.4 \pm 18.4$  IU/L. The mean ALT level was 1.71 times the normal values. Fifty patients (54.9%) had normal ALT levels, but 41 patients (45.1%) had elevated ALT levels.(Rostamzadeh Khameneh Z et al. 2011)

Our results confirm previous data reporting a high prevalence of HEV infection among Egyptian population. Furthermore, we agree with other researches that renal transplant recipients exhibited a higher rate of positivity for HEV RNA versus healthy control. Considering the small number of positive cases it was not possible to judge the possibility of HEV persistence.

The lower HEV IgG rates in transplant patients- although the difference was statistically non-significant - may be safely attributed to the known depression of immune response in such patients.

**Table (1):** Comparison between cases and controls according to seropositivity for HEV IgG.

	Cases (n = 60)		Control (n =60)		$\chi^2$	FE p
	No	%	No	%

#### Abstract

The emerging area of intelligent unmanned aerial vehicle research has shown rapid development in recent years and offers a great number of research challenges for distributed autonomous robotics systems. However, with the development of more complex robots that must operate in uncontrolled and dynamic environments, an autonomous UAV is understood to be intelligent robot capable of performing complex operations in dynamic, real-world, uncertain, sometimes hostile environments without any explicit human control over its movements and must constantly reconfigure itself to adapt to the external conditions and its own goals. To provide the aerial vehicles with these capabilities, robot control architecture is necessary. The challenge is to develop a UAV control system capable of obtaining intelligent, suitable responses to changing environments and adapt the software to the current situation. The definition of control architecture to manage these reconfigurations becomes of paramount importance for increasing the level of autonomy and successful navigation of such robots. The Control architectures define how these abilities should be integrated to construct and develop an autonomous navigation with little or no human intervention. Numerous intelligent control architectures do exist in the literature for mobile robots. However, none of these are specifically targeted at providing the required support for a wide range of UAV missions. Operations of UAV require robust methods for dealing with emergency scenarios such as performing forced landings and collision.

In this work, we firstly study and analyze the different architectures adopted in the literature, on the basis of their flexibility, ease of implementation, reactivity, robustness, efficiency and other architecture specifications. This analysis led us to propose intelligent and hierarchical control architecture, decentralized, generic and reusable, applicable to autonomous aerial vehicles flying in an unknown, dynamic and potentially hostile environment; our control is a hybrid architecture based on multi-agent technology (MAS), which can handle unpredictable events in an unstructured world, composed of distributed, independent and asynchronous behaviors. In addition, it integrates multiple knowledge representation approaches to build cognitive models and intelligent systems that significantly advance the level of intelligence we can achieve. Our architecture is a family of intelligent control systems, hybrid and decomposed into flexible autonomous subsystems, its containing elements of sensory processing, world

modeling, localization, Mission planning & high level Expert system, and action processes to achieve or maintain its goals. The reactive part will guarantee that simple tasks are achieved under time constraints (real-time) while deliberative part will grant planning and reasoning. The whole architecture assures the safety of the UAV and the environment, so it provides the mechanisms to deal and reduces the impact with hardware and software failures of onboard.

## **Introduction:-**

In the past several years, the rapid development of unmanned aerial vehicles equipped with autonomous control devices have become a real center of interest, and different kinds of autonomous vehicles have been studied and developed all over the world. UAV are mostly being used for military applications, but with the evolution of avionics technology (The newest sensors, microprocessors, lighter and propulsion systems are smaller and....), a huge market in civil applications is now emerging; major advantages are offered when used in emergency situations in disaster monitoring and contaminated environments (After a natural or industrial disaster such as wildfires, an active volcano, earth-quakes, a flood, or a nuclear disaster). Indeed, UAVs are better suited for dull, dirty, or dangerous missions than manned aircraft. The low down side risk and higher confidence in mission success are two strong motivators for the continued expansion of the use of unmanned aircraft systems. However, to realize these applications, seamless operation of UAV will be required. Increasing the levels of onboard autonomy will help to address this requirement. Additionally, increased autonomy also reduces the impact of onboard failures, potentially lower operational costs, and decrease operator workload. Autonomous intelligent control is execution of a given control strategy without human intervention and in an optimal manner, and capability to adapt autonomously and in a fast and efficient manner to a new set of circumstances on-line sensing, information processing and control reconfiguration[1]. It is essential for an autonomous intelligent unmanned aerial vehicle system to sense the surroundings, perceive the working environment, make decisions, plan a path and execute appropriate reaction using the sensors information. The design of perception, navigation, planning and control systems is a crucial step in the development of such autonomous flying machines. It must be able to fly within a partially structured environment, to react and adapt to changing environmental conditions. To provide the UAV with these capabilities, control architecture is necessary; it's one of essential part of robotics system development. Architecture is the structure that identifies, defines, and organizes components, their relationships, and principles of design; the assignment of functions to subsystems and the specification of the interfaces between subsystems.

Indeed, the main components that any autonomous robot has to include are the following: a deliberative component enabling it to reason about how to achieve high level goals, a reactive component to deal with the environment; and perception and actuators to deal with the physical world.

This work deals with architecture for controlling a mobile robot in accordance with the main objective in robotics, which is to develop a UAV control system capable of intelligent and suitable responses to changing environment. Our control architecture has to possess a number of desirable features: flexibility, real-time response, coherent behavior, adaptability, fault tolerance, easy design and granularity. There are good reasons for organizing the control of large systems in a hybrid distributed hierarchy. Among these are: deeper understanding facilitated by the hierarchical structure, reduction in complexity of communication and computation, modularity and adaptability to change, robustness, scalability and autonomy. UAV's actions are both the result of intelligent reasoning from superior and executive decision-making layers knowing the situation and actions that respond directly to environmental stimuli [2].

The key contributions of this work are tow fold: Firstly comparing each of these control architectures on the basis of their flexibility, ease of implementation, reactivity, robustness, efficiency and other architecture specifications. Secondly we propose a distributed architecture for autonomous unmanned aerial vehicle, in order to provide a system with several types of intelligence (Reactive intelligence, Deliberative intelligence and creative intelligence). An illustration of our study will be given in an application of control of an autonomous hexarotor developed by the team architecture of systems, to the ENSEM of Casablanca.

**Figure 1:-** A picture of the developed hexarotor (EAAS\ENSEM)

The paper remainder is organized as follows: In the next Section, an overview of architecture for UAV control is presented while section III gives and describes the proposed UAV control architecture based on a multi-agent system, for the autonomous navigation, allowing a UAV to navigate in an unknown and hostile environment. This architecture is being developed in a modular and incremental way allowing the incorporation of several techniques of mapping, localization and path planning independently of the reactive strategy. Finally, some conclusions and future works are presented in Section IV.

#### **Overview of Architectures Control:-**

Autonomous systems are typically quite complex, it is expected that the robot will be able to achieve high level goals while interacting with complex and dynamic environments. The robot must deal with its own dynamics, noise and uncertainty and has to be reactive to unexpected changes.

Well-designed software architectures can provide concepts, constraints and tools that make it easier to design, implement, and debug such systems. There are many ways to structure a robot, yet everyone will fall into one of the basic architecture control systems that can be found in technical literature: hierarchical/deliberative, reactive/behavior-based and hybrid. The categories differ largely in how they handle task achievement and in their reactivity. The aim of this section is to describe the three major paradigms of control strategies for a completely autonomous navigation [3]:

- Deliberative strategy: look ahead, think and plan, then act.
- Reactive strategy: no look ahead, react (time-scale)
- Hybrid strategy: think slowly, react quickly.

Brief descriptions of the above mentioned control strategies, the significance, advantages and drawbacks of the architectures are presented, discussed and compared with each other in the following paragraph.

#### **Historical control architecture:**

An overview of existing architectures in robotics is presented in this paragraph to identify relevant architecture design methodologies and give the benefits and shortcomings of different architectures. Robot architectures and programming began in the late 1960s with the Shakey robot at Stanford University. Generally, the literature on control architecture proposes three types of control architecture [4]. Their conceptual representation is presented in Figures 2/3.

#### **Reactive VS Deliberative Control Architectures:**

Reactive architecture is a fast response sense-act type of organization, which is particularly suitable for a dynamic environment. Since a planning stage is absent, it has low computational burden, but has relatively low level intelligence. Many modules connects several inputs sensors/actuators, each module implements a behavior. These behaviors are called "reactive" because they provide an immediate output of an input value, and cognitive otherwise [5]. Reactive architecture serves best when the real world cannot be accurately characterized or modeled. Very often, uncertainty, unpredictability and noise from the world cannot be removed. Reactive architectures were developed in response to this difficulty (figure 2-a).

An alternative to the reactive paradigm, for increasing decision capabilities a second type of architecture, called deliberative, is proposed (figure 2-b). This architecture presents generally three independent levels [6]: sense, plan and act. This decomposition facilitates considerably the development of each part of the architecture. In this kind of architecture, each layer provides sub-goals to the layer below. They include a global world model which is modified

and updated through perception. Based on this world model, planning and reasoning for making decision are carried out that result in actions to be performed by the UAV. As reasoning takes a significant amount of time, it becomes a bottleneck in the architecture.

Deliberative architecture is a high level, intelligent, top-down, suitable for a static environment. All the sensing data is utilized to set up a world model. Based on the world model, the planner then generates an action sequence.

Figure 2: (a) Reactive architecture (b): Cognitive architecture

As shown in table 1, the deliberative layer uses a purely symbolic representation and the reactive layer is free to choose its representation model. The reactive layer is usually represented in a way that facilitates the translation into actuators commands. Thus, there is a need for a common world model or knowledge system which shares information between these layers.

table 1: comparison with the deliberative and reactive architectures.

Deliberative	Reactive
(Purely symbolic)	(reflexive)
Speed of response	Predictive capabilities
Dependence on accurate, complete world models	
<ul style="list-style-type: none"> <li>- Needs internal representation</li> <li>- Slower response</li> <li>- High-level intelligence</li> <li>- Capable of learning / prediction</li> <li>- Finds strategic solution</li> </ul>	<ul style="list-style-type: none"> <li>- No internal representation</li> <li>- Real-time response</li> <li>- Low-level intelligence</li> <li>- very fast in terms of motions and computation</li> </ul>
<b>Limitations</b>	
<ul style="list-style-type: none"> <li>- Planning requires search through potentially all possible plans ⇒ these take a long time,</li> <li>- Requires a world model, which may become outdated,</li> <li>- Too slow for real-time response</li> </ul>	<ul style="list-style-type: none"> <li>- No/minimal state</li> <li>- No memory of the world</li> <li>- Unable to plan ahead</li> <li>- Unable to learn</li> <li>- Difficulty in coordination among the behaviors.</li> </ul>

**Hybrid Control Architectures:**

Neither the purely reactive scheme nor the purely deliberative architectures perform well when performing complex tasks, because of difficulties in modeling the world and relying too much on inadequate sensors. Hybrid Architectures aims to combine the best of both Reactive and Deliberative approaches, trying to reduce the restriction on the scope of each of these approaches: reactivity, so they can respond in real-time to changes in dynamic environments and deliberation, so they can plan and provide the adequate sequences of actions needed to achieve the goal using higher reasoning and an internal knowledge representation of the world, so the goals of the robot can be achieved efficiently. Thus, a hybrid paradigm connects deliberation and reaction reducing the response time of the robot to environmental changes and performing plans (figure 3). Control architectures for complex autonomous

mobile robots have largely settled on hybrid architectures for their suitability at dealing with the opposing forces of planning and reactivity [6].

#### *Discussion of control architectures:*

The robotic researchers all agree that control architectures should be deliberative, reactive, robust, generic, modular, and intelligence.

An autonomous robot is understood to be an intelligent machine capable of performing tasks in the outside world by itself, without any explicit human control over its movements. Also, an intelligent machine is taken to be a machine able to extract information from its environment and use knowledge about its world to move safely in a meaningful and purposive manner.

To achieve a comprehensive control system, robot needs more abilities that exceeds deliberative and reactive paradigms such as perception and world representation ability to enable information gathering and processing, fast reacting for static or dynamic obstacle avoidance, world modeling ability to insure the robot to localize itself relative to the environment, inference and decision making ability to make reliable decisions based on that particular information.

Various control architectures for autonomous navigation of mobile robot have been described and developed for building intelligent systems. Some of these (such as SOAR [7] and Expert Systems architectures [8]) are designed to model high-level cognitive elements of human reasoning. However, they do not address the low-level details of perception and real-time behavior in uncontrolled and dynamic environments. Others (such as Subsumption [9] and its many derivatives) have been designed to model low-level reactive behaviors. However, these do not address the high-level elements of cognition, knowledge representation, reasoning, and planning. Still others (such as AuRA [10] and RCS [11]) are hybrid architectures designed to combine high-level planning with low-level behaviors. The review of this architectures showed that the hybrid scheme has the best performing supervisory control architecture and it is more prosperous and promising dealing with unknown, dynamic navigation problem.

The review of this architectures showed that the hybrid scheme has the best performing supervisory control architecture and it is more prosperous and promising dealing with unknown, dynamic navigation problem.

After analyze these architectures, a list of important features has been defined. They include the way the architecture is built, its capacity to deal with real-time, the manner in which coordination is performed as well as the method used to do so, communication requirements, adaptability to different conditions and environments, capability to detect and repair failures, scalability, granularity and the level of abstraction used to program the components of the architecture.

The first step in our study for the conception of our architecture is to identify and analyze the qualities we want the architecture to have. The main objective is to use and provide a system with several types of intelligence to evaluate the performance of various algorithms in operational conditions and to study their robustness. In order to fulfill this objective our architecture requires much more qualities than : robustness, security, modularity, to ease maintenance, adjustable autonomy, and self-reconfiguration, re-usability, communication, concurrency, interoperability, parallelism and data flow synchronization. Of course, it is obvious that in a first time, our architecture must have a maximum of functionality that can contribute to the global autonomy of the systems (figure 4). Here are described the main qualities we want to provide to our architecture [12]:

**To ensure intelligent behaviors:** The intelligence results in perception, reasoning and action capacities. The perception translates acquired information into knowledge on the environment. The decisional system generates plans of operations that describe actions to undertake in order to reach objectives of a mission and to react in the face of asynchronous events. The amount of intelligence is closely linked to the different kind of environments in which the robot has to evolve, as well as to the complexity of tasks it has to fulfill [13]. The intelligence of the robot can be situated in several levels. The first one is associated to the local environment of the robot. Thus, in the case of an unknown environment, it is indispensable to endow the robot of an intelligent behavior allowing it to avoid obstacles met on a nominal path. This behavior relies on an on-line control of this path. The second level of intelligence is situated at the control level of the robot's behaviors. It is therefore necessary to have a mechanism that allows changes of strategy in order to adapt the robot's behavior to external events. In other words, this level of intelligence allows adopting adaptively an adequate behavior of the robot from evaluations of its internal state and those of its environment (We like that our architecture provide a system with several types of intelligence: reactive intelligence, deliberative intelligence and creative intelligence).

**Cognition:** From perception to action to learning: Cognition is the key to how robots will deal with unconstrained environments, learn from their encounters, and apply the new knowledge to similar situations in the future. Cognition is the process by which intelligent entities receive and handle information [14]. It is not one discrete thing, but a synergistic combination of multiple capabilities. For robotics, cognition is a combination of perception, understanding, motion planning, and automated learning. Improved cognitive ability means robot can work in diverse, dynamic, and complex environments autonomously and improve performance by learning from experience.

**To ensure rapid sensing and reactivity to the environment:** The mobile robot has to be able to manage external asynchronous events in real time so as to respect the dynamics of the environment (the capability to sense external events rapidly). An external event can have several origins: presence of an unforeseen obstacle, sudden breakdown, request from another robot, etc. The reactivity generally implies a real time processing of these events. The real time implies constraints on the reply delays and on some information flows (the ability to respond within a limited time period to external events occurring in its domain). These constraints depend on the equipment type and the way those events are managed. Thus, the command system has to include the notion of priority and urgency of event processing.

**Self-reconfiguration:** this ability is very important. First, in case of failure of one or more modules, or when the chosen modules are no more able to fulfill the designed task, the system must self-adapt and find a new module or series of modules to efficiently do the task. Second, the architecture must fit the needs of the users and adapt itself to his change (from a full remote control interaction to a supervised remote control one for instance). The architecture must also update and change the data exchange between the modules depending of the circumstance

**To ensure modularity and composability:** The modularity of the control architecture of a mobile robot is achieved by the decomposition in modules that can be developed, implemented, and realized separately. The ability to be reconfigured and to be extended are two characteristics that allow any command system to evolve by the addition of new functionalities and the endowing of a flexibility of adaptation. The main advantage of distributed controlled robots and subsystems is the decentralized task execution by the system components. This way, properties for the design of flexible control architectures like modularity, fault-tolerance, integrability and extendibility are easy to obtain, further it is possible to use the concepts of distributed knowledge and decentralized world representation.

**Maintenance:** the architecture must be designed to ease the maintenance. Especially the reconfiguration and the re-launch of a module must be possible while the system is running and without interrupting the experiments.

Moreover the module must be able to record and save online their internal data and their interfaces so that in case of failure, it is possible to identify the module responsible of this dysfunctional execution. The modules can also be tested alone, their input and their output perfectly controlled.

**To manage interruptability:** Higher priority environmental threats must be able to interrupt normal operations of the robot. The robot must also be able to resume its original task after responding to the threat. Therefore, the robot's control system must be able to halt an existing control process and later resume that process after completing the new control cycle initiated by the higher priority task.

**To manage Fault-tolerance:** one of the most primordial aspects in robotic control architecture is the robustness to the execution failure. All must be done in the architecture to avoid the system stop working in the correct way. Whatever the circumstances, the system must be as fault-tolerant as possible. In others words, the failure of a part of the system, e.g. of one or more modules, should not be synonymous with the failure of all the architecture, whatever the nature of this failure (lack of memory, data reading mistake, segmentation fault, etc.) [15]

To develop an architecture capable of integrating and validating new technologies, such as different kinds of actuators and sensors.

**Figure 4.** Main features of our architecture.

#### **The Proposed Control Architecture:-**

In this section, we propose hierarchical/intelligent control architecture for an unmanned aerial vehicle (UAV), including a deliberative part and a reactive part. The proposed architecture aims to supply autonomous behavior in unknown environment considering the uncertainties of the UAV's sensors and mainly the possibility of existence of mobile or stationary obstacles which are not expected in the navigation plan. The specificity of the control architecture that we propose, is the organization between perception (sensors), making decision and action (actuators) around the loops executed at different time scales: real-time loop closely linking sensors and actuators, and another loop taking place on a slower time scale that manages one hand the representations of the environment that builds drone, and others from various events that can happen to unforeseen moments. Hybrid architecture is used to control our UAV because he has both desirable properties: reactivity, so they can respond in real-time to changes in dynamic environments and deliberation, so they can plan actions ahead in time.

Our architecture is a family of intelligent control systems, distributed and decomposed into flexible autonomous subsystems, its containing elements of sensory processing, world modeling, localization, makes decisions, creates plans, and controls actions to achieve or maintain its goals as shown in figure 5.

The flow of information between the World Model and Mission planner is bidirectional. While the World Model provides Mission planner with information regarding the state of the external world, Mission planner provides the

World Model with information about the state of the task. This enables the World Model to represent what task is in progress, and what commands are currently being generated at each echelon in the Mission planner hierarchy. Mission planner also informs the World Model about plans for possible future actions. The World Modeling processes can then simulate the probable results of these possible future actions, computes an estimate of cost, benefit, and risk. This enables Mission planner to choose among alternative future courses of action. The flow of information between the World Model and Sensory Processing is also bi-directional. While Sensory Processing keeps the World Model updated, the World Model provides context and predictions that assist Sensory Processing in the interpretation of sensory data [16],[ 17].

Our architecture consists in five blocks organized around a sixth: perception processes, representation and world modeling, localization, mission planning, action processes and expert system. The core of the architecture relies on Expert system.

Our architecture, nommed “EAAS\ENSEM”, is potentially applicable to diverse robotic systems that could include aircraft, spacecraft, ground vehicles, surface water vessels, and/or underwater vessels. EAAS\ENSEM (see figure3) includes an integral combination of five coupled agents: a dynamic planning engine, a behavior agent, world model of knowledge, expert system agent and a perception agent. The perception and dynamic planning engines are also coupled with a memory in the form of a world model. EAAS\ENSEM is intended to satisfy the need for two major capabilities essential for proper functioning of an autonomous robotic system: a capability for reaction to unanticipated occurrences and a capability for re-planning in the face of changing goals, conditions, or resources.

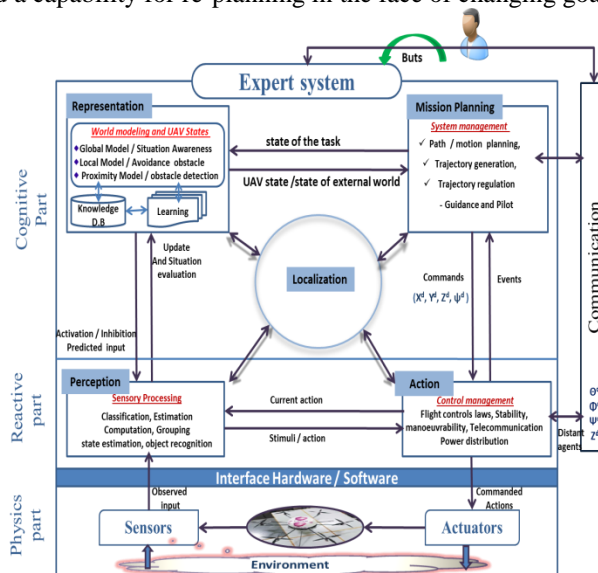

Figure 5:- Overall architecture of UAV (EAAS/ENSEM)

Fundamental capacities of our architecture encompass autonomy, Distribution of data and control, Robustness and reliability, Flexibility and Scalability, Real-time response, extensibility, coherent behavior, reliability and parallel execution. The architecture features a useful organization structure for high-level skills and offers flexible construction options for low-level behavior hierarchies.

#### Bottom-Up description of the Components:-

The five basic of processing modules from which our architecture is built, as can be seen in figure 5 are:

**Expert System module:** Our aim is to build a real-time expert system to make intelligent inferences from the environmental data. It must employ an efficient control strategy and must meet the specifications listed in the previous section. This module defines the meta-behavior of the UAV. It has the information about the overall mission objectives and constraints. This information, in conjunction with the sensory and situational awareness, is used to make appropriate decisions as trade-offs between the mission success and vehicle survivability. The decisions reached are relevant to achieving assigned missions efficiently and safely. it acts as an interface between the Mission Planner and the rest of the architecture. It ensures that changing the operating modes of the aerial robot

is done in the correct step sequences. It also reports the execution status of the current action to the Mission Planner. It also monitors some safety measures regarding the rules of the competition and conflict resolution. Also, this layer is responsible for collision avoidance, mission retaking, data analysis, fault diagnostics, and goal reassessment. It manages the data flow and ability to carry out fault detection/diagnosis procedures and accommodate faults (in the actuators and sensors) so as to assure an acceptable performance level (fault tolerance ability). It also manages the asynchronous events coming from the environment. Moreover, it allows adapting an appropriate behavior by aggregating several behavior modules in front of special situations. In other words the expert system here should be part of a conventional feedback loop with a process, a controller, a parameter/state estimator, a fault detector/isolator and a supervisor.

**Mission planning (The highest level):** This level can be defined as the “driver or cognitive” of a UAV that comprises various autonomy-enabling functions to achieve assigned goals. This is the hierarchical level of this architecture where the modules in Part deliberation which decompose the mission in executable tasks and decide what action to perform based on his knowledge of the environment and the internal state UAV. It takes inputs from the censoring system and uses targeting information (mission goals) to make appropriate decisions at its high level and to generate Autonomous, path planning, reference trajectories and commands for the Automatic Flight Control System at its low level. The UAV system must have the capability to plan and replan its own flight path. This results in the requirement for a high level computing environment where flight planning algorithms can be run. At this level, the important design challenge is to arrive at efficient algorithms (search optimization) for on-line generation and execution of a motion plan that enables the UAV to move to a desired location and perform a given task, even while avoiding obstacles. Given different way-points along a desired path, the objective of the autonomous trajectory generation system is to fit a feasible trajectory through the way-points, given the UAV and control input constraints. Many of the trajectories can be calculated off line and stored. However, in the presence of hazards and subsystem or component failures, the trajectory may need to be reconfigured on-line to reflect the new environment, or the new achievable dynamics, or both. Indeed, In the event of system faults, the UAV must have the capability to reconfigure itself and re-plan its flight path in a fail-safe manner. The control system will need to generate and execute the movement plan in near real-time and in an environment with a complex topology and with dynamically changing and uncertain components.

We have broken down in our architecture that level in tow modules with specific functions. These are prioritized and contribute to dissociate the different tasks in clearly identified functions: path planning and trajectory generation [18].

**Path Planning:** determining an optimal path for UAV to follow while meeting mission objectives and constraints, such as obstacles or energy requirements. The role of this layer is to generate the motion plan for the overall mission, and compute spatial and other constraints needed for the design of the desired trajectories. Many of the routes and constraints can be computed off-line to cover different situations. The constraints are computed in the form of safe set boundaries around the waypoints. In our architecture, we have included an automated planning systems onboard can potentially improve mission efficiency and reduce the need for laborious input from a ground based human operator. Dynamic path planning refers to onboard, real-time. He receive a description of the state of the world and a goal, and then in turn compounds produced plans of actions and implementing rules sequences corresponding to the realization of this objective. The supervisor associates sends him to realize the objective, and then monitors the execution of the plan in light of the events produced by the execution or by a changing environment. The adopted strategy is that instead of giving the mobile system a path to follow, it is more concerned to grant him a goal and let the control architecture independence in defining the optimal path to follow. This can be expressed in different forms: set of points in rallying, in a specific order, to reach position. This strategy needs an internal representation of the environment that is to define places of space in which perceptions are the same, and associate an action with each of them.

**Trajectory Generation:** The Trajectory Generation is determining control maneuvers to take in order to follow a given path or to go from one location to another. this level of planning receives as input, the paths to follow, and provides more accurate trajectories, taking into account local information from the environment. The aim of this layer is to fit a feasible trajectory through the way-points. A trajectory generator has the role of computing different motion functions (reference position, reference heading, etc.) that are physically possible, satisfy UAV dynamics and constraints, and can be directly used as reference trajectories for the flight controller. Reference trajectories can be preprogrammed and uploaded, or generated in real time onboard the UAV. Trajectory generation is commonly

based on minimization of a given criterion (e.g. time between the way points, energy consumption, or low exposure to known stationary threats), and can be generated either on-line or off-line. In the case of failures, upsets, or other anticipated or unanticipated events, the path planning layer automatically reconfigures the desired path by modifying the waypoints. This level is considered the level of refinement, and its existence is essential. Indeed, the upper level, the representations of the environment and tasks are necessarily incomplete because they are too abstract, they can't express in particular all interactions with the environment of the drone, the intrinsic parameters of the UAV system are generally fixed, as against the constraints of the environment are often vague and scalable.

**Environment modeling and Learning:** The world model is the system's internal representation of the external world. It acts as a bridge between sensory processing and behavior by providing a central repository for storing sensory data in a unified representation (Knowledge database). It decouples the real-time sensory updates from the rest of the system. During the mission, the modeling functions will help incrementally build models of the environment, through aggregation (or rather merge) successive models developed from sensory data corresponding to the various acquisitions.

World modeling processes maintain a rich and dynamic database of information about the world in the form of images, maps, entities, events, and relationships at every level. Other World modeling processes use that information to generate estimates and predictions that support perception, reasoning, and planning at every level.

We distinguish following spatio-temporal three criteria:

The instantaneous patterns: are constructed from common sense data and values of observed, estimated, and predicted attributes and state variables (corresponding to a given sensory acquisition).

Local models: the result of the merger of several flash patterns acquired in the same topological location. It's a short term memory containing iconic and symbolic representations of geometric entities and events that are the subject of current attention.

Global models: The global models are maintained update by a local models modeling process, aggregations of all local models built during a given mission. The global models includes models of portions of the environment, images, maps, models of entities, events, rules, task knowledge, abstract data structures, and pointers that represent relationships, and a system model that includes the intelligent system itself. For our architecture, this part can be defined as the process of data acquisition, data analysis, and extraction and inference of information about the vehicle's states and its surrounding environment with the objective of accomplishing assigned missions successfully and safely (figure 6).

It creates and keeps the knowledge database current and consistent (of maps, situations, relationships, and knowledge of task skills and laws of nature and relationships among them). It gives a best estimate of the state of the world to be used as the basis for predicting sensory feedback and planning future actions (learning). It predicts sensory observations based on the estimated state of the world. It simulates results of possible future plans based on the estimated state of the world and planned actions [19].

Figure 6: General schema of the modeling of the environment

Learning has the advantage that it allows the agents to initially operate in unknown environments and to become more competent than its initial knowledge alone might allow. Learning agents have the potential to learn about their environment and about other agents through adding to the knowledge held in their working memories.

For some problems, it is desirable to create agents that are capable of more fundamental learning: where the internal structure and processing of the agents adapt to changing circumstances. There are two techniques commonly used for this: neural networks and evolutionary algorithms such as the genetic algorithm (figure 7). It is possible for either an individual agent to be modeled using a neural network, or a whole society to be represented by a network, with each neuron given an interpretation as an agent (although in the latter case, it is hard to build in all the attributes of agents usually required for multi-agent modeling).[20]

**Localization:** Localization is a technique that permits the robot to give an answer to this question [21]: Where am I? It is the main point in any success physical interaction. For many applications an imperative need for UAV autonomy is the ability to self-localization in the environment, especially for extended periods of time, when estimator drift tends to destroy alignment to any global map. Indeed, precise localization is crucial in order to achieve high performance flight and to interact with the environment.

Increasing innovation in the field of electronic communications has led to a current trend of utilizing sensing system such as Global positioning system (GPS), radio technologies or vision-based solutions for localization of UAVs. Fusing data from different sensors helps to improve performance of the overall sensing system. For aerial navigation outdoors, fusion of GPS measurements with INS measurements by means of filtering techniques delivers the level of localization precision required by UAV missions. The proposed architecture provides routines for corrections in the positioning through the combination of information of the Mapping, Sensing and Location modules.

**Perception processes (Filter, detect, recognize, and interpret):** Perception in robotics means the ability to collect process and format useful information to the UAV to act and react to the world around. It covers the acquisition components, filtering, detection, segmentation, tracking, identification and interpretation. Strong perceptual abilities are a basic requirement for a robot working in an environment that was not specifically designed for the robot. Such a surrounding might be completely unknown or may change over time, so that a model cannot be provided to the robot a priori. The perception includes obtaining data about the vehicle and its environment and extracting useful information from the data. The Perception can be further divided into various functions on different levels such as mapping, obstacle and target detection, state estimation, object recognition and Situational Awareness (the perception of elements in the environment within a desirable volume of time and space, the comprehension of their meaning, and the projection of their status in the near future).

The sensory processing is a set of processes by which sensory data interacts with a priori knowledge to detect or recognize useful information about the world. Sensory processing accepts signals from sensors that measure properties of the external world or conditions internal to the system itself. Correlations between sensed observations and internally generated expectations are used to detect and classify entities, events, and situations. Differences between sensed observations and internally generated predictions are used to update the knowledge database.

Most people would only judge a robot to be truly intelligent if it perceives its environment, understands what is happening around it and acts accordingly (A robot that moves through an environment and interacts with it has to know what is going on around it, where it is, where it can go, and where objects necessary for its task are located). The correct interpretation of raw sensor data is often a crucial part when one aims at applications in the real world. A robot must be able to understand its surrounding, in order to work in it and interact with it. Without appropriate sensors a robot is very restricted in what it can achieve and is only able to work at very specific tasks. The topic of this module is therefore the interpretation of low-level sensor information and its application in high-level tasks.

**Action (Flight Control low) :** For UAV, the design of flight controllers low consists of synthesizing algorithms or control laws that compute inputs for vehicle actuators to produce torques and forces that act on the vehicle in controlling its motion (position, orientation, and their time derivatives). At this lowest level, we have the actual interaction with the physical plan: this is sometimes referred to as skill or reflexive level, and includes the traditional control functions (stabilization, regulation, commands tracking). The aim is to convert a trajectory into orders to be performed by the action. At this level, the desired role of the inner-loop controller is to assure rapid stabilization of the overall system in the presence of failures, control input and vehicle constraints, and improve accuracy of vehicle models through on-line learning. A hierarchical flight controller uses a system based on the nonlinear model of rotorcraft unmanned aerial vehicles (UAV) and considers a system's non linearity's as well as coupling between the

rotational and translational dynamics. By exploiting its structural properties, the standard mathematical model of rotorcraft UAVs has been transformed into two cascaded linear subsystems that are coupled by a nonlinear interconnection term.

In this part, we present the main steps for designing a hierarchical flight controller using the inner and outer-loop control scheme: when the flight path is laid out, a flight control system is required so that the UAV can follow the planned flight path and execute the mission. Control inputs are generated based on the reference paths and the current states. The flight control loop generates actuator signals for the control surfaces and thrust vector. The set points for low-level stabilizing controllers whose function is to maintain the vehicle in a stable state and to follow accurately the commanded trajectory are provided. After synthesizing control laws for each subsystem, there by resulting an outer loop with slow dynamics that controls the position and an inner loop with fast dynamics that controls the orientation. The asymptotic stability of the entire connected system is proven by exploiting the theories of systems in cascade. The resulting nonlinear controller is thus easy to implement and tune, and it guarantees the asymptotic stability of the closed-loop system.

**Physical layer:** Finally the physical layer represents the physical part of the robot, i.e. the articulated mechanical system and actuators to move the robot. This constitutes the basis on which the entire architecture is built.

The hardware link agent is an interface between the software architecture and real robot. Changing the real robot require the use of a specific agent but no change in the overall architecture.

Our architecture is a reference model architecture that provides a theoretical foundation for designing and integrating intelligent systems software for unmanned aerial vehicles (how their software components should be identified and organized). It prescribes a hierarchical control principle that decomposed high level commands into actions that employ physical actuators and sensors. Each module of our architecture is capable of accepting and decomposing task commands with goals into actions that accomplish task goals despite unexpected conditions and dynamic perturbations in the world. The architecture give plan on a model of the world rather than planning directly on processed sensor output. This may be accomplished by real-time sensors, a priori information, or a combination of the two in order to create a picture or snapshot of the world that is used to update a world model.

We note an interesting link between the desirable properties of intelligent control architecture for complex systems requiring a large degree of autonomy and the Multi-agent systems. To fulfill these requirements, we decided to use a multi-agent's formalism that fits naturally our needs. The Multi-Agent System paradigm is one of the most promising approaches to create autonomous, open and dynamic systems, where heterogeneous entities are naturally represented as interacting autonomous agents, who can enter or leave the system at will. In accordance with these properties, the multi-agent system is suitable for developing the control architecture of a UAV since it has inherent characteristics that are also desirable for architecture and offer many potential advantages. The fact that the architecture is a multi-agent system provides flexibility in terms of the software level. This architecture will have reactive and deliberative agents at least. The reactive agents will guarantee that simple tasks are achieved under time constraints while deliberative agents will grant planning and reasoning. The whole architecture must assure the safety of the UAV and the environment, so it should provide the mechanisms to deal with hardware and software failures.

#### **Agents' description and Task distribution:-**

One recent trend in autonomous robotic architectures has been the focus on multi-agent hybrid layered systems. Unlike the hierarchical and centralized structures, a distributed multiagent system can integrate its component capabilities to solve real-time complex problems.

Fundamental capacities of our architecture encompass modularity, encapsulation, scalability and parallel execution. To fulfill these requirements, we decided to use multi-agent formalism that fits naturally our need for encapsulation in independent, asynchronous and heterogeneous modules. The communication between agents is realized by messages. For us, a multi-agent technique is an interesting formalism and though our architecture could be implemented without them it led to a very convenient and scalable framework.

EAAS architecture consists in six types of agents: Human interface agent, actions selection agent, perception agent, action agent, the expert system agent and hardware link agent [22].

*The human interface agent (HIA)* is the high level of our control architecture. It must generate a succession of goal, or missions for the actions selection agent, according to the general mission of the robot. It also visualizes the progress of the mission while the UAV is executing it. It can follow up the UAV's position, trajectories, obstacle information, etc. It can show a local map, with the obstacles detected by the UAV and the global map with trajectories and the available readings of the different sensors.

*The perception agents* manage the processing of incoming data (the sensor measurements) and create representations of the environment. They are passive; they only run upon request, perform a one shot execution and then wait for a new message. A perception agent can activate another agent and build a more specific representation using its complementary data. The perception subsystem agents obtain information about the environment and the internal condition of the UAV (for example the level of the battery). They collect data from the sensors and adapt them to provide the information requested by the other agents in the system [23]. There are as many perception agents as there are sensors or sensor groups in the UAV. Finally, this agent is executed upon request by any other agent that has to use the UAV position and whenever new data are available.

*The actions selection agents:* The deliberative subsystem is composed of the actions selection agents in charge of carrying out high-level complex tasks which require a certain amount of time.

Five deliberative agents (actions selection agent) have been defined: *the mission planning, the path planner, the navigator for itinerary generation, the guidance and pilot and the localization*. The actions selection agent must choose and activate the UAV behavior suited for the mission according to all information available and necessary to this choice [24].

-Mission planning agent's goal is to plan the sequence of tasks based on the information provided by the interface and localization agents to know the position of the UAV on the global map, and to ensure that the mission is achieved. Also, the mission planning agent receives information from the battery charger agent to judge whether a mission is possible considering the level of battery charge.

-The path planner agent may take a goal as input and give a path for achieving the goal as output. The Navigator agent must translate a path into a trajectory for the guidance and pilot. The path does not take into account physical constraints of the robot, but the trajectory that it delivers must integrate them.

-The navigator for itinerary generation agents has two main goals: the calculation of trajectory to the goal that is free of non-moving obstacles, and the estimation of the energy consumption of the planned trajectory. The optimal trajectory calculation is obtained in two steps: first with a graph method to obtain a general sequence of destinations (considering only rooms and hallways), and second with a grid method to find the path between two consecutive destinations (considering all the non-moving obstacles). In both methods a search algorithm is used, Dijkstra's algorithm for the first and the A\* search algorithm for the second one. Once the trajectory is determined, an estimation of energy consumption is made based on the cruising speed. Other alternative methods for path planning can also be used, as for example potential fields [25].

The function of the guidance and pilot agent is to convert this trajectory into orders to be performed by the action agent. This agent may be totally autonomous or constitute the process that runs the human interface.

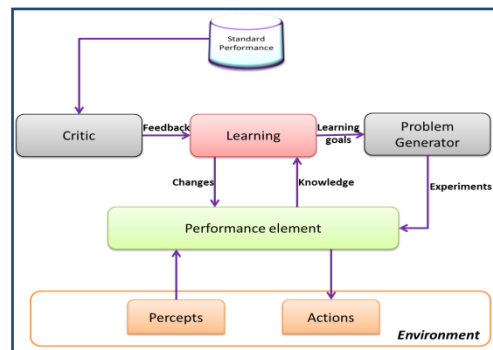

*The localization agent:* The localization agent's goal is to locate the UAV on the goal map. It receives the sensor measurements from the GPS, odometer, laser data and encoder agents as well as the map representation as input and outputs a representation containing the current position of the UAV. In order to accomplish the agent's goal, the localization agent collaborates with the mission planning. It also sends information to the encoder agent to prevent wide derivations from the current estimated position. In this way, the encoder agent can correct accumulative errors produced by the encoder's readings.

The action agents consist of a set of behaviors controlling the UAV effectors. It is activated by a specific request coming from the behavior selection agent. The selection orders him to work with a perception agent by sending its reference. The action agent sends in turn a request to the proper perception agent. This agent is responsible for driving the UAV to the goal position. Given a desired position and an orientation, and based on the current position and heading, this agent calculates the linear and angular speeds to drive the UAV to the target position (goal). It

receives the global coordinates of the UAV from the encoder agent and the desired points of the trajectory from the guidance and pilot agent from the battery agent. The basic action agents are the goal position and the avoid agents, although more agents can be added [26].

**The Expert System Agent:** The strength of our architecture is its expert system whose different diagnostics and recoveries envisaged at its level are the following: Fault diagnosis of sensors, effectors and communication links; Control of batteries (autonomy), accuracy of the trajectory and accuracy / quality of the measured data; Control of the embedded control software (partial failure).

**The learning agent:** The learning element uses feedback from the "critic" on how the agent is doing and determines how the performance element should be modified to do better in the future. The performance element is what we have considered to be the entire agent: it takes in percepts and decides on actions. The last component of the learning agent is the "problem generator". It is responsible for suggesting actions that will lead to new and informative experiences.

**Figure 7:-** A general learning agent

*The hardware link agent* is an interface between the multi-agent architecture and real UAV. Changing the real UAV require the use of a specific agent but no change in the overall architecture. Within a behavior, it is up to the action agent to analyze representations coming from the perception agent and to establish the correct control orders for the platform. Specifically, the hardware link agent communicates with the UAV and obtains its current position, sonar readings and battery charge, and distributes this information to the different sensor agents as required [27].

## CONCLUSION:-

This article describes our work concerning the development of effective architecture to control a UAV in hostile environment. We have created a robot control architecture based on a multiagent paradigm that allows various levels of autonomy and interaction between an operator and the UAV.

In this work, the first part presents the three paradigms used to develop UAV control architecture, the reactive, the deliberative and the hybrid paradigm. The significance, advantages and drawbacks of the architectures are described and compared with each other. The hybrid paradigm is the most used since it combines the advantages of planning in deliberative architectures and quick response of reactive architectures in dynamic or unknown environment. In it, we looked at the issue of control architectures for autonomous robot. First, we defined a set of requirements for such architecture, which focus on a different time of cognition (From perception to action to learning), provide a system with several types of intelligence, easy management of the competition, the satisfaction of robustness properties and verifiability, the satisfaction of modularity and composability requirements, and finally giving the ability to autonomous learning expands the variety and diversity of tasks that UAV can perform. Based on these requirements and analyzing the state of the art, we proposed hybrid intelligent control architecture for autonomous navigation of an unmanned aerial vehicle (UAV).

Our architecture consists of a multi-layered multi-resolutional hierarchy of computational modules containing elements of sensory processing, world modeling, Localization, Mission planning & high level decision making, and a Flight control laws.

Our architecture is a real-time intelligent control system for unmanned aerial vehicles operating in the real world. It provides an excellent control in which integrate multiple knowledge representation approaches (ranging from iconic

to symbolic and from declarative to procedural,) to build cognitive models and intelligent systems that significantly advance the level of intelligence we can achieve. Sensory processing and planning processes have access to a model of the world that is resident in a knowledge database; this world model enables the intelligent system to analyze the past, plan for the future, perceive sensory information in the context of expectations and thus give, on the one hand, the ability for the UAV to control its own autonomy, and on the other hand the capacity to evolve and to learn. The strength of our architecture is the expert system module. This module defines the Meta - behavior of the 'UAV'. It manages the data flow, as much as the perturbations. It also manages the asynchronous events coming from the environment. Moreover, it allows adapting an appropriate behavior by aggregating several behavior modules in front of special situations. It also manages the activation of a behavior module, and transfers the control to it.

#### *Abstract*

**Introduction:** Epilepsy is a brain disorder characterized by a pathological abnormality in electrical activity of the brain resulting in an unprovoked abnormal movement or behavior leading to a neurobiological, cognitive, psychological, and social consequence. The level of public awareness, and the attitudes and knowledge of epilepsy in the Saudi population is limited, and requires significant improvement.

**Objective:** This study aimed to assess the awareness about the definition of epilepsy in pediatric ages, types of epilepsy, managing an epileptic fit in children and awareness about the impact of epilepsy on children's educational and social performance among schoolteachers.

**Methodology:** 320 teachers were selected from different schools in Riyadh city KSA by a cross-sectional study. The data collected by 14 Statement questionnaires including our objectives.th data reviewed, and statistically analyzed using percentages and frequencies.

**Result:** the results show that 99.4% of teachers have heard about epilepsy, Most of the teachers want to learn more about epilepsy, and about 73% of teachers know that one type of seizure is generalized seizure, 35.9% know partial seizure. More than the half of the teachers has been a witness of an epileptic fit in their classes and around 43% of teachers' first reaction to an epileptic fit was trying to help. The first aid in epileptic fit, is to put a soft towel in the mouth to protect the tongue and keep airway open was 70%, and 46.3% think to secure the media around the patient. The media 38% encountered the most frequently as source of knowledge and an abnormal electrical activity in the brain 70.3% as cause of epilepsy.

**Conclusion:**This study has revealed a critical issue that a majority of schoolteachers do not have adequate knowledge about epilepsy. We recommend the mandatory implementation of epilepsy and basic life-support training and refreshing courses for all schoolteachers across KSA. In addition to enrolling in training courses, teachers must be aware of the availability of first aid kits at schools and the contact numbers of the Saudi Red Crescent Services.

## Introduction:-

Epilepsy is a common neurological disorder in Saudi Arabia, with a prevalence of 6.54 per 1000. The level of public awareness, and the attitudes and knowledge of epilepsy in the Saudi population is limited, and requires significant improvement<sup>1</sup>. Epilepsy is a brain disorder characterized by a pathological abnormality in electrical activity of the brain resulting in an unprovoked abnormal movement or behavior leading to a neurobiological, cognitive, psychological, and social consequence<sup>2</sup>. Epileptic seizures can be divided into two major classes, Partial-onset seizure is a seizure that begins on a focal area of the cerebral cortex. This class is further categorized as simple focal seizure the main characteristic thing about this seizure is that the level of consciousness is persevered. This type of seizures has subtypes, which are sensory, motor, autonomic, and psychic. Complex focal seizure; unlike simple complex seizure in this type of seizure there is an impairment of consciousness, those patients usually have an aura before their seizure and this aura is usually the simple focal seizure, it typically begins with a behavioral arrest followed by staring, automatism and postictal confusion. Secondary generalized seizure often begins with an aura then proceeds to complex focal seizure and then to generalized tonic clonic seizure.

## Generalized onset seizure; these are classified into six major categories:-

Absence seizure; brief episodes of blank staring with impaired consciousness, it's without aura or postictal confusion. Myoclonic seizure; brief rhythmic jerking motor movement. Clonic seizure; consist of rhythmic jerking motor movement with or without impairment of consciousness. Tonic seizure; sudden onset of tonic extension or flexion of the head, trunk and extremities for several seconds. Primary generalized tonic – clonic seizure (grand mal seizure); they consist of several motor behaviors, including generalized tonic extension of the extremities lasting few seconds followed by clonic rhythmic movement and prolonged postictal confusion. Atonic seizure (drop attacks); brief loss of postural tone often results in fall and injures. It is very important to know how to deal and handle an epileptic fit. When you see a person with an epileptic fit the first thing to do is, protect them from injury by removing harmful object, then cushion their head and time the length of the jerking movement, aid the breathing by gently placing the body in the recovery position, once the jerking have stopped, then stay with them until they fully recover, it is very important not to put anything in their mouth or try to restrain their movement, don't give them anything to eat or drink until they are fully recovered<sup>(2)</sup>. Epilepsy is a complex disorder that has an impact on many aspect of child's development, and school personals may have basic understanding about seizure and its related safety concerns but have less knowledge about the impact of seizure on child's emotional, behavioral and social adjustment. As a result, these children are at increased risk of learning difficulties and unsuccessful school experience; they might face difficulty in social engagement with friends and inadequate social skills and poor self-esteem. And that's why it's important for educators and family members and health care providers to partnership in the care of those children and provides a plan for academic success and safety<sup>3</sup>. A study was done on Kuwait among 824 teacher in 2016, about "Knowledge about Epilepsy and Attitudes toward Students with Epilepsy among Middle and High School Teachers in Kuwait", by cross-sectional study and randomly selected schools, and its show that there is a relatively poor knowledge about epilepsy among school teacher but they have positive attitudes toward students with epilepsy<sup>4</sup>. In 2015 a study about "Knowledge and practice of schoolteachers towards students with epilepsy in Khamis Mushate, Southern Saudi Arabia", among 315 male teachers. It shows that about three-quarters of schoolteachers had attended epileptic fits. About half of them believed that electrical discharges caused epilepsy. Most of them were not with teaching epilepsy separately, nor preventing them from activity. More than half of schoolteachers were not able to do first aid of seizure attacks<sup>5</sup>. In 2015 a study about "Knowledge and attitudes toward epilepsy among school teachers in West of Iran", conduct on 305 teachers from 25 schools. The study shows that the majority of schoolteachers heard about epilepsy. There were positive Attitude and knowledge about epilepsy, but there were deficits in first-aid of epileptic fit<sup>6</sup>. In 2014 a study about "Knowledge, attitude and practices of school teachers towards epileptic school children in Karachi, Pakistan". Among 120 teachers, it was showed that majority of the teachers heard about epilepsy, 14.5% of them think epilepsy is contagious while 72.7% see that epileptics children can succeed as other normal children. A 62.7% were willing to help if they attend epilepsy fit<sup>7</sup>. A study was conducted in 2013 by authors in King Abdulaziz University, Jeddah, about "Primary school teacher's knowledge and attitudes toward children with epilepsy", show that 17% of the teachers well informed about epilepsy. And according to the teachers' attitude, they found that it depends on teachers' knowledge, about 58% of teachers whom happened to have epileptic students in their class, didn't know what to do when they came across an acute seizure in the classroom as their first seizure attack they face<sup>8</sup>. A study was conducted on a sample of a 259 teachers and counselors in 2012 about "Knowledge and attitudes toward epilepsy among school teachers and counselors in Jordan". The results showed average knowledge of epilepsy, however they have poor knowledge about how to deal epileptic person<sup>9</sup>. A study in Pilsen, Czech Republic, that was published in 2012 about "Familiarity with and attitudes towards epilepsy among teachers at Czech elementary schools—The effect of

personal experience and sub specialization". They found significant differences between the teachers with and without personal experience in the aspect of their attitudes. Teachers without personal experience were convinced that epileptic student were more likely to have psychological problems and impaired self-realization than other student<sup>10</sup>. A study was done in Italy in 2011 about "Knowledge and attitudes toward epilepsy among primary and secondary schoolteachers in Italy". It was conducted on a random sample of 600 of Italian schoolteachers through a nationwide telephone interview, the result shows different knowledge and attitude among the teachers, around half of them believed epilepsy hereditary and incurable, and more than one third of them thought it requires support at school<sup>11</sup>.

In 2011 done a study in Gezira State, Sudan about Knowledge, practice and attitude toward epilepsy among Two hundred primary and secondary school teachers, they found that the majority of them had never informed about epilepsy nor previously trained to deal with it. Some of teachers considered epilepsy as an attack from a demon or contagious. About 64% of secondary schoolteachers had knowledge of the initial behaviour toward a child with seizure compared to primary schoolteacher, which shows only 47%<sup>12</sup>. A study was conducted by self-administered questionnaire on 189 teachers in Egypt 2010 about "Knowledge, attitude and practice with respect to epilepsy among school teachers in Assiut city, Egypt". Result show that all teachers had heard about epilepsy, and more than half of them deal with epileptic students as normal students<sup>13</sup>.

A study was in 2008 about "Knowledge awareness and attitude about epilepsy among schoolteachers of primary and secondary levels in India". Therresults show that the majority of schoolteachers were aware that epilepsy is a brain disease. More than 30 % were unsure if epilepsy is related to insanity, and have low IQ. Half of them allow their children to play with an epileptic. 27% only had given first aid to epileptic fit, and only 16% giving it properly<sup>14</sup>. A study published in 2005 about "Perception and attitude to epilepsy among teachers in primary, secondary and tertiary educational institutions in middle belt Nigeria". It was conducted on 460 schoolteachers, and found that even though almost the entire almost teacher had heard about epilepsy negative attitude towards epilepsy is still there. More than half did not knew the cause of epilepsy and several of them had wrong information on the etiology. Some of them misunderstood epilepsy for insanity<sup>15</sup>. In 2004 done "A study on awareness and attitude of teachers on epilepsy in Istanbul" the study done among 346 teachers, and it was showed that more than half of teachers heard about epilepsy, while 71.9% attended seizure attack, and 59.4% knew someone with epilepsy. There was some misconceptions like 2.3% think epilepsy is contagious, or a psychological disease 17.8%<sup>16</sup>.

In 2002 a study about "Awareness, attitudes and understanding towards epilepsy among schoolteachers in Medan, Indonesia", they found that 16% of the teachers are well informed about epilepsy, and there are significant proportion had negative attitude and misunderstanding the disease<sup>17</sup>. A study was conducted in 2001. About "knowledge and attitudes toward epilepsy among primary, secondary and tertiary levelteachers ". Among 300 teacher, show that almost all the teachers had heard about epilepsy, some teacher believe that the epilepsy either contagious or they don't know, and (43%) of teachers had knowledge of the initial procedures during a seizure<sup>18</sup>. The goal of this study was to assess the awareness about the definition of Epilepsy in pediatric ages, types of epilepsy, managing an epileptic fit in children and awareness about the impact of epilepsy on children's educational and social performance among schoolteachers.

### **Materials and Methods:-**

A cross-sectional study with a 14 Statement questionnaire about epilepsy knowledge was administered to teachers at general and private educational schools in Riyadh, KSA. The study was conducted for 6 weeks and starting November 2016. 32 schools were chosen randomly to be part of the study.

The questionnaire was designed to assess the knowledge among teachers about definition, types, management of epilepsy and epileptic fit and its impact on children's social and educational performance in school aged children. Teachers gave written consent before conducting the study.

The variables under study were having heard about epilepsy, sources of information about the disease, types of the disease, possible causes, the need of more knowledge about the disease, the differences when comparing epileptic children's behavior and school performance to their classmates, and finally whether they have ever encountered an epileptic fit , their first reaction and steps taken during management.

**Ethical approval:-**

The study was approved by the ethical committee at College of Medicine of Al Maarefa Colleges followed by approval of the ministry of education, Riyadh, Kingdom of Saudi Arabia.

**Statistical analysis:-**

After completion of data collection, it was reviewed, organized, tabulated and then statistically analyzed using percentages and frequencies

**Results:-**

The study conducted in Riyadh city KSA. The data was obtained from 320 teachers from different schools .The response rate was 100%, but many questions were unanswered. It was found 5.4% of teachers teaching kindergarten students, 37.2% teaching primary students, 35.3% teaching intermediate students and 22.1% teaching secondary students. 99.4% of teachers have heard about epilepsy, while 0.6% hasn't heard about epilepsy. Most of the teachers want to learn more about epilepsy, which represent 96.6%, while 3.4% don't care about it. About 73% of teachers know that one type of seizure is generalized seizure, 35.9% know partial seizure, 11% know complex partial seizure, 30% know absence seizure, 23% know generalized tonic clinic seizure, 28% know status epileptics and 7.7% know pseudo seizure (Table 1).

**Table 1:-**Demographic characteristics and epilepsy Knowledge among teachers.

	Frequency	Percent
Levels of teachers:		
Kindergarten	17	5.4%
Primary	118	37.2%
Intermediate	112	35.3%
Secondary	70	22.1%
Total	320	100%
Heard about epilepsy:		
Yes	315	99.4%
No	2	0.6%
Total	320	100%
Need to now about epilepsy:		
Yes	308	96.6%
No	11	3.4%
Total	320	100%
Types of seizure:		
Generalized seizure	199	72.9%
Partial seizure	98	35.9%
Complex partial seizure	30	11%
Absence seizure	84	30.8%
Generalized tonic clonic seizure	63	23.1%
Status epileptics	78	28.6%
Pseudo seizure	21	7.7%

It was found 55.2% of teachers have been a witness of an epileptic fit in their classes and 44.8% haven't been. 43% of teachers' first reaction to an epileptic fit was trying to help, 10.5% was feeling afraid and steeping back, 19.8% was calling for help and standing by and about 27% don't know what to do. 59% of teachers know the first aid in epileptic fit, 41.4% don't know (Table 2).

**Table 2:-** Comparison between teachers in dealing with a case requiring epilepsy.

	Frequency	Percent
Witness of an epileptic fit in class:		
Yes	99	44.8%
No	122	55.2%
Total	320	100%
First reaction:		
Feel afraid and step back	18	10.5%
Go and help	74	43%
Call for help and stand by	34	19.8%
I don't know what to do	46	26.7%
Total	320	100%
Knowing first aid:		
Yes	136	58.6%
No	96	41.4%
Total	320	100%

It was found 70% of teachers think that one of the first aid in epileptic fit is to Put a soft towel in the mouth to protect the tongue and keep airway open, 46.3% think to Secure the media around the patient, remove all harmful objects and put him on his left side, 43.6% think to try to put hard object in the mouth to protect the tongue and keep mouth open, 21.6% think to try to use any perfume to wake him up, 11.5% think to give him some water and about 10% think to give him his medication during the attack (Table 3).

**Table 3:-**Comparison between teachers in dealing with a case requiring first aid.

	Frequency	Percent
First aid:		
Try to put hard object in the mouth to protect the tongue and keep mouth open	99	43.6%
Secure the media around the patient, remove all harmful objects and put him on his left side.	105	46.3%
Put a soft towel in the mouth to protect the tongue and keep airway open.	160	70.5%
Try to use any perfume to wake him up.	49	21.6%
Give him some water	26	11.5%
Give him his medication during the attack.	23	10.1%

It was found about 38% of teachers know epilepsy from media, 22.1% from friends, 19.4% from relatives, 12% from affected member in their families and 8.4% from other sources (Figure 1).

Figure 1:-source of knowledge about epilepsy among teachers.

It was found 70.3% of teachers think one cause of epilepsy is an abnormal electrical activity in the brain, 23.8% think it's from brain trauma, 21.6% from brain infections, 14.4% from genetic defect, 14.1 from anxiety and stress, 7.8% from birth defect, 4.1% from brain cancer and about 12% don't know the cause (Figure 2).

Figure 2:-Opinion about cause of epilepsy among teachers.

It was found most of teachers think that epilepsy is a neurological disease witch represent about 84%, 6.9% think it's psychiatric disease, 5% think it's hereditary disease and 4.4% think it's from evil spirit or spell. It was found 83.3% of teacher thinks that there are many types of seizure and about 16.7% don't think. It was found 55.7% of teachers notice that an epileptic student doesn't have low school performance, 39% notice some of them and 5.2% notice

they have low school performance. It was found 4.5% of teachers notice an epileptic student have social behavior issues, 34.2% notice some of them and 61% don't notice.

### **Discussion:-**

Awareness about epilepsy is considered very important to the society in general, and among school teachers becomes even more, as they are in contact with children for long hours on daily basis, which makes them more prone to encounter epileptic fits or other emergencies. Therefore this research was made to assess the awareness of schoolteachers about epilepsy and how to manage an epileptic fit among children.

In our study, a sample made of 300 male/female teachers, from deferent levels, ranging from kindergarten to secondary grades. The majority were primary school teachers. Almost all of the teachers heard about epilepsy, from deferent sources, mostly from media. However, the majority emphasizes the fact that they want to know more about epilepsy.

There are deferent believes among people in the society regarding the nature of the disease, this intern, can affect how people adapt and behave towards it, many people are shy to even tell that they have an epileptic member in the family. In our study we found that most of teachers think that epilepsy is a neurological disease, in contrast to a study that was done in Italy in 2011 about "Knowledge and attitudes toward epilepsy among primary and secondary schoolteachers in Italy" that showed half of the sample believed epilepsy is a hereditary and incurable disorder. Surprisingly still there are some who think that epilepsy is a result of power from evil spirit. In another study done in Gezira State, Sudan about Knowledge, practice and attitude toward epilepsy among Two hundred primary and secondary school teachers, Some of teachers considered epilepsy as an attack from a demon or contagious.

The majority of the sample has a good knowledge about the cause of the disorder as they mention the correct answer that it is abnormal electrical activity in the brain.

In this study the majority of the school teachers knew that seizure has different types but mostly recognized generalized tonic clonic seizure and only one third of the sample knew about partial seizure, although a study that was made in Finland about " Distribution of seizure types in an epileptic population<sup>1</sup>. ", and showed that partial seizure accounts for 50% of epileptic disorders in children.

When teachers were asked about low school performance, more than half of the study sample noticed that epileptic students don't have a low school performance. And this result is supported by a study made in Nigeria about Academic performance of school children with epilepsy and <sup>2</sup>where they found that the overall academic performance of epileptic children without other chronic disorders attending normal schools is not different from that of normal children in the same setting, though they are under-achieving in some subjects.

In regards of the impact of the disorder on social behavior of epileptic children most of the teachers didn't notice any behavioral issues.

This study showed that there is no significant differences in the number of teachers have been a witness of an epileptic fit in their classes and those who haven't been. However, less than the half percentage of our sample had attended epileptic fits. In comparison with other researches that have same sample conducted in different cities in Saudi Arabia, it indicate d that the teachers in Khamis Mushate and Southern Saudi Arabia have attended epileptic fits more than in Riyadh, and Jeddah had the least attendance. In our study results, we found that most of schoolteachers know how to provide first aid when seizure attacks happened in classrooms, this was noticed by choosing the correct steps of management that was asked in the questionnaire. However, still there is more than half percentage of schoolteacher's think that they need more knowledge in handling a situation of an epileptic fit. As our study showed that most of our sample knew about epilepsy, however, the majority as well didn't know how to deal with an epileptic fit. This finding was similar to many other studies conducted about "knowledge and practice of school teachers toward students with epilepsy in Khamis Mushate, Southern Saudi Arabia, West of Iran, Jeddah, Jordan, Egypt, India, Indonesia and Italy". Gezira state and Sudan, showed higher percentage of knowledge about the initial steps taken toward a seizing child. When asking about the first aid in managing a child who is seizing, many teachers choose to put a soft towel in the mouth to protect the tongue and keep airway open and only Few teachers choose to secure the media around the patient and remove all harmful objects and put him on his left side and try to put hard object in the mouth to protect the tongue and keep mouth open. This study has confirmed that

most of schoolteachers have poor knowledge of how to deal with seizure attack as first aid. And accordingly we need to arrange more school activities talking about the awareness of epilepsy and let the teachers do practical application of first-aid management of epileptic patient.

### **Conclusion:-**

This study has revealed a critical issue that a majority of schoolteachers do not have adequate knowledge about epilepsy. We recommend the mandatory implementation of epilepsy and basic life-support training and refreshing courses for all schoolteachers across KSA. In addition to enrolling in training courses, teachers must be aware of the availability of first aid kits at schools and the contact numbers of the Saudi Red Crescent Services.

### **Authors' contribution:-**

All authors took part equally in writing, revising and final approval of the manuscript.

### **Conflict of interest:-**

The authors have no conflict of interest to declare.

### **Acknowledgements:-**

We would like to thank professor dr. Fawzia Ahmed Habib and associate professor dr. Basel Abdulbaset Alkahilfor there helpful supervision and contributions to this the study. We are also grateful to the ministry of education leadership and all teachers participating in this study.

Female Genital Mutilation, Society,  
Approach.

#### Abstract

The purpose of this study is to evaluate the current approach by the people of Kenya on eliminating FGM among the locals.

Female Genital Mutilation is a social nonconformist which has existed in Kenya just like in other countries. This research was based on review of literature, authors own experiences about female genital mutilation in his own community in Rift valley in Kenya. This study will describe Female Genital Mutilation in Kenya and evaluate the various approaches used to encourage the society to abandon Female Genital mutilation in Kenya.

However, it is worth to note that the fight to eliminate the FGM has full support of the previous and the current Government but the one million question which this research will try to find out Is the approach of Eliminating FGM among the locals in Kenya the right approach?.

This study finds evidence that suggests that Kenya's performance in this vice is far below international expectation as the practice is still there though in hiding or behind public knowledge. Several deaths are met as a results of the same and there is a likelihood that many are not reported or some of the over bleeding victims are not take to hospitals for treatment and hence leading to several complication in the later part of life.

It is on the context that the research finds that there is a likelihood to change the approach of discouraging the practice instead of using punitive measures like police harassment, chief or Government administration threatening the people, a new social based and participatory approach should be used to seek the buy-in by the society on the need to eliminate FGM in the communities around them.

A primary data analysis which uses data gathered through interviews and secondary data analysis which involves the utilization of existing data collected from the existing documents, questionnaires and interviews shall be conducted within sampled and selected individuals which according to the researcher are likely to provide an objective view of the evaluation of the practices or common view by those who practice and those who understand their society needs.

The target population under study was 80 individual in 8 counties or regions in Kenya, the distribution is to cover at least 15 Government administrators from the 15 different locations where it is assumed that the practice is higher than other regions, 10 elders from the identified areas who are mature enough to give independent opinion on the evaluation of current Government directives, 15 Officers working in

Gender Department within the Ministry of Gender, Sports and Social Services, 40 Girls who have undergone the practice (FGM) recently or some years back and have an opinion on their views of the same, 20 of the girls who have been rescued by the Government or Church and secluded from the others to avoid any force full or influence towards going back to the practice.

The study used both quantitative and qualitative data, tables, charts and graphs are used to illustrate findings. A conclusion on approach and recommendations to the future expectation as per the research in Kenya and the need for potential donors to understand the happening and views from the common people in Kenya about FGM.

### **What is Female Genital Mutilation (FGM):-**

According to World Health Organization (2008). Female Genital Mutilation involves an elderly women from the community slicing off all or part of a woman's clitoris and labia as part of a ceremony that is often conducted around the time that the woman reaches puberty.

According to Kalenjin culture circumcision of girls (Female Genital Mutilation) is the practice that is widely believed to increase a girl's chances of marriage, prevent promiscuity and promote easy childbirth. According to Thomas, an elderly Kalenjin man, Women who did not circumcise their daughters ran the risk of being seen as irresponsible, immoral and should be secluded from the inner circle of women on the kalenjin community.

From the two explanations, it shows that there is a different understanding of the Female Genital Mutilation in its concept and this could be attributed to the difference too in understanding the need to eliminate it in the society.

In relation to WHO, FGM is a violation of the human rights of girls and women. Female genital mutilation (FGM) comprises all procedures that involve partial or total removal of the external female genitalia, or other injury to the female genital organs for non-medical reasons.

In African tradition understanding, Female Genital Mutilation is a rite of passage from childhood to adulthood and to an extent to be ready for marriage.

### **What are the Importance of Female Genital Mutilation is the Kenya context:-**

Across all the 8 regions visited during this research demonstrated a common cultural understanding of the FGM, the reasons female genital mutilations are practice in their society are more of sociocultural factors which have been inherited from the previous generations and families in the communities. The following are some of the common cited background roots on the practice as stated or found by this research in Kenya:

It is a social acceptable norm with social pressure to practice based on the old practice in the community and the need to be accepted in social circle of friends and family, the fear of being rejected by the community in Kuria they called it ""**Machobere**"" , in Kalenjin they called it "" **Korket**"" , in Kisii they called it '**Irīgũ**and these are serious negative connotation used in the society against those who have not undergone FGM. In 6 of the 10 communities visited during this research, FGM is a universally performed and accepted practice in order to belong to the community of elders.

It is always considered necessary, the only way of raising a girl, and a way to prepare her to shift from childhood to adulthood, once the girl has been accepted in the community as an adult then it gives way for positive acceptance for marriage in the community.

Although there is No scientific proof, some communities' belief that FGM will reduce a woman's libido and that it helps resist extramarital sexual acts. This idea was upheld by some region strongly but some in the research did not put it as a genuine reason towards the practice.

Some of these views are supported by the previous research which stated that the other justifications offered for female genital mutilation are also linked to girls' marriageability and are consistent with the characteristics considered necessary for a woman to become a "proper" wife. It is often believed that the practice ensures and preserves a girl's or woman's virginity (Talle, 1993, 2007; Berggren et al., 2006; Gruenbaum, 2006).

WHO(2006) estimates that between 100 and 140 million girls and women worldwide have been subjected to one of the first three types of female genital mutilation (WHO, 2000a). Estimates based on the most recent prevalence data indicate that 91,5 million girls and women above 9 years old in Africa are currently living with the consequences of female genital mutilation (Yoder and Khan, 2007). There are an estimated 3 million girls in Africa at risk of undergoing female genital mutilation every year (Yoder et al., 2007).

Many girls and young women are still subjected to genital mutilation in the name of 'tradition.' According to Egypt's 2008 Demographic and Health Survey, at least 91% of Egyptian women between the ages of 15-49 have undergone genital mutilation and 72% of the practice is conducted by medical doctors. While the prevalence of FGM is down from 97% in 2000, combating it is a long-term endeavor that involves changing long-held beliefs. More than 200 million girls and women alive today have been cut in 30 countries in Africa. When the girls undergo FGM in the Igembi society, they make a vow with their blood that they will continue this tradition or bring down a curse upon their families and land.(Tanui 2006, 17.)

### **Global Approach towards eradicating FGM:-**

In 2013, with UNDP support, a 5-year national strategy for FGM abandonment and family empowerment was developed, in partnership with local authorities, civil society organizations and several UN agencies. The initiative is implemented with contributions from the European Union, the Governments of Sweden, of the Netherlands and of Germany.

Sweden was the first country in the world to ban FGM in 1982, and in 1999 the ban was extended to include circumcision carried out in other countries. But police have struggled to apply the law, securing only two convictions in more than 30 years

The education campaigns have been greatly successful in many communities that have now understood the incomparable difference between the informal education and the formal one. (Creel & Ashford 2001).

The practice was outlawed in the US in 1996, but at least 228,000 women in the US are thought to be affected, according to research from Brigham and Women's hospital in Boston.

"The strongest advocates are the families themselves," notes Ignacio Artaza, UNDP in Egypt Country Director. The momentum continues with a national broadcast campaign that advocates putting an end to FGM and, for the first time in Egypt, features real testimonials from families who refused FGM, bravely faced community pressure and decided to protect their girls. Women who were mutilated and men talk about their own experiences and how FGM negatively influenced their marriage and life.

In Egypt, the programme has held awareness sessions targeting 20,000 men, women and youth. Awareness meetings were held in primary and secondary schools at risk of FGM, addressing students and teachers, social workers and parental board members.

A study in UK estimated that 66,000 mainly African women resident in England and Wales in 2001 had undergone female genital mutilation and 23,000 girls largely from African communities here under the age of 15 were at risk of FGM or may well have undergone FGM (Efua 2007)

Recognizing that FGM is part of a bigger package, the programme also integrates comprehensive health, social and education services. It supported the improvement of science labs in schools and nurseries. Vulnerable women were aided in acquiring national IDs so they could receive public services and were trained on developing home economics projects to improve their income. Medical professionals received training on counseling and closing gaps in service and medical caravans were created to benefit almost 3500 villagers.

The existing Female Genital Mutilation Act 2003 prevents British citizens and permanent residents from assisting or carrying out FGM abroad but cannot be used against others who live in this country but take children overseas for the procedure. (The guardian 2014)

Putting an end to FGM requires a cultural shift, and changing the mindset of families and individuals is necessary to move FGM from a tradition to a crime. Already, people are recognizing that it is illegal for doctors to circumcise and young girls in schools say that FGM is a crime. The National FGM Abandonment Programme, set to run through 2017, will continue to institutionalize the issue and work through families and individuals to change traditions.

UNDP Gender Equality Strategy is well placed to ensure that gender equality and the empowerment of women are integrated into every aspect of its work to support countries to eradicate poverty and reduce inequalities and exclusion.

Organizations such as the United Nations have campaigned against the practice, calling for its abolition as a matter of global health and human rights. But despite a decades-old movement against it, FGC rates in some countries haven't budged. According to a survey by the Population Reference Bureau, in Egypt more than 80 percent of teenagers still undergo the procedure.

The number of American women and girls affected or at risk is believed to have grown by 35 per cent to at least 228,000 between 1997 and 2000, according to the African women's health center of Brigham and Women's hospital in Boston, Massachusetts.

#### **Kenya's Approach in eradicating FGM:-**

The pre-independent Kenya regime enacted various legislations between 1926 and 1956, seeking to eradicate FGM practice by reducing the severity of the cut, defining the age for circumcision among other regulations. After much opposition to this form of regulation in 1958, the colonial government rescinded all the resolutions outlawing FGM on the basis that it was a deeply rooted and acceptable practice in the communities (Concellia 2010).

In Kenya, circumcision of girls under the age of 17 was outlawed in 2001 as measures contained in the Children's Bill passed by parliament. However, the practice is still going on in the rural areas despite imprisonment of those found to have broken the law. The law leaves room to girls above this age of 17 to make a choice on whether to undergo the practice or not.

In 2001, former President Daniel arap Moi gave a presidential decree that Circumcising of girls under the age of 17 was a crime punishable by at least a year in jail. But despite the order, the practice remains widespread in rural Kenya. The next question is why was it not possible to implement the presidential order and according to the findings of this research is that the Police and chiefs who are supposed to implement the order are part of the society which believe and have practice it since the time of their grand fathers. The small catch of the order was that girls under 16 years were circumcised but in the records they were stated as above 17 hence they were within the law.

The other loophole in the order was the choice of girls above the age of 16 years to 23 to be circumcised or not depends on individual. Although many might not have been of the idea to undergo FGM but the community pressure and the thought of being considered outcast force many to be circumcised although the then new law protect them.

The Question of "Are you for or against FGM practice in your tribe" yield the following, that more than half young girls in the tribes sampled in Kenya still practices FGM or are for FGM. The results vary from ethnic groups e.g the Kisii (79%), Maasai (72%), the Kalenjin (60%), TaitaTaveta (52%) and Meru,(47%), Embu (38%), the Kikuyu (33%) and The Kamba(24%), the Mijikenda( 17%), Swahili/somali (10%).

S.No	Tribes	Percentage among the particular tribe	
		For It	Against It
1	The Kisii	79%	21%
2	The Maasai	72%	28%
3	The Kalenjin	60%,	40%
4	The Taita&Taveta	52%	48%
5	The Meru	47%	53%
6	The Embu	38%	62%
7	The Kikuyu	33%	67%
8	The Kamba	24%	76%
9	The Mijikenda	17%	83%
10	The Swahili/somali	10%	90%

Source: Author (2016)

There is a close link with the finding of the previous research such as the Kenyan Demographic and Health Survey in terms of the trends but there is too a lot of reduction in numbers currently(2016) as compared to the research period then(1998). From the result, it demonstrated that among Kisii a large number of those interviewed strongly are for the FGM to continue and closely followed by The Massai. The research combined the Taita&Taveta together, the Swahili and Somali together based on their close cultural practice and nearness to each other. There was a differing opinion from some independent observers during the interview that the practice is high or prevalent in the Somali community but they are not open to talk about it hence not easy to figure out the actual figures. Similar to Swahili which according to socialist within their society, the practice is still high though they closing guard any information from getting out of the immediate family:

The Question of “Do you think the Kenya Government is using the right Approach to eradicate FGM”, shows the following responses from each tribe sampled in the research.

S.no	Tribe	Percentage among the particular tribe	
		Yes	No
1	The Kisii	23%	77%
2	The Maasai	32%	68%
3	The Kalenjin	50%,	50%
4	The Taita&Taveta	47%	63%
5	The Meru	42%	58%
6	The Embu	46%	54%
7	The Kikuyu	58%	42%
8	The Kamba	50%	50%
9	The Mijikenda	70%	30%
10	The Swahili/somali	72%	28%

Source: Author (2016)

Although there are similar responses on the opposite direction,t the trend is closing following the negativity from the tribes which practice FGMe.g The Kisii find out not proper as according to them, this should be an individual choice if they like but not to force the tribe to follow a general Government directive. Swahili/Somali though they were the least in those who practice were strongly supportive of the Government approach as to have punitive measures against those who practice FGM, It is on this context that Most of them who still practice includes locals who reside outside Kenya but bring home their girls during holidays to undergo FGM within confines of their homes.

The Question of “who is doing a better role in eradication FGM among the 3 agents”, shows the following responses from each tribe sampled in the research.

S.No	Tribe	Percentage among the particular tribe		
		Government	NGO	Local Community
1	The Kisii	10	53	37
2	The Maasai	25	62	13
3	The Kalenjin	17	57	26
4	The Taita&Taveta	32	53	15
5	The Meru	30	56	14
6	The Embu	31	52	17
7	The Kikuyu	34	54	12
8	The Kamba	35	46	19
9	The Mijikenda	35	42	23
10	The Swahili/somali	45	20	35

Source: Author (2016)

There is a common trends among all the tribes that NGO is doing far much better than the Government and Local community combined. It was fully acknowledged from the research that The Government is contributing a lot in the fight against FGM in the Society as shown by the statistics in the table above. Although the local community plays a role but their contribution is so low when compared with the NGO and the Government whereas in the real life practice they should be the leading in fight against FGM.

#### **FGM behind the Government's back:-**

According to one senior nurse who is familiar with the practice, many young girls goes to dispensary the day before and they request for antibiotics and an anti-tetanus injection, request for a clean disposable razor or even buy from shops, this was supported by a shopkeeper in 7 areas visited during this research that disposable razor are in high demand during school holidays and more so during December holidays. Some of the learned ladies who happened to come from well-educated families but have undergone the FGM provided the research with a new view on approach behind the Government back, this is done in collaboration with Medical practitioners on a mutual personal understanding where young girls go to healthcare providers and have the circumcision performed there, stay in the hospital for some days in the pretext on a certain ailment, their semi modern group thinking is, if it is done by a doctor, it make it safer.

#### **Some of the Success approach in Kenya:-**

Mostly formal education from the locally recognize women and leaders within the community have yield positive results. The appointment of Hon MrsChebiiKilimo who had demonstration a real need for eradication of the practice shows a serious commitment by the Government of the day (2013-2017). The formation of a full time Government body to deal with Anti- Female Genital Mutilation gives a strong views and direction towards those who still have the desire or practice it behind the Government's back.

According to a common view which came from this research was that there is need for a multi-sectoral approach whereby the government, non-governmental organizations, religion, and the elite in the communities have a joint effort in the fight against this tradition by launching heavy education campaigns in the communities.

It was also found out by this research that Mothers are not solely in charge of the decisions for their daughters. There is need to target people who are in the extended family, and who have authority in these families, and who have a certain level of influences on them in the community. An practical encounter during this research among Maasai community where there was a meeting between reformed elders on the matter, senior church elders in the community and the youth led to serious heated debate which demonstrated a high level of cultural commitment to practice the same among the youth whereas the few reformed community people are fighting the same, a similar encounter was found in Kisii, Meru, Embuetc, the most difficult communities to understand their real thinking towards the fights of FGM are the Kalenjins, Kikuyu and Taitas since although there are a lot of talk against the vice but practically on the ground the practice is still strong. The research therefore recommend a society based participatory approach, increase the funding to the newly form Government agencies, close working relation between Government, NGO and community, increase community based education through baraza, film etc, need have male elders buy in the idea of eradicating the FGM in their community.

Islamic business ethics, spiritual intelligence, islamic leadership and performance manager

### Abstract

Performance is a problem that will always be faced by the management, as the management needs to know the factors that affect the performance of managers. Assessment the success of performance a manager is highly dependent from the performance of inferiors because a manager unable to work own .Hence a manager have to be able to apply islamic business ethics and lead inferiors performed well in his work , and have intelligence spiritual. The purpose of this study was to investigate the influence of Islamic business ethics and spiritual intelligence on the performance of the manager through the leadership of Islam as a moderating variable. The population in this study is the manager of Sharia Bank which has a network of offices in Surabaya. The sample in this study took the profile of Sharia Bank in Surabaya, with a total sample of 95 managers. Testing the hypotheses used in this study is a multivariate analysis with SEM using AMOS software. Based on data analysis using SEM and discussion of the results of research that has been presented, it can be concluded: That the Islamic business ethics to contribute positively to the Islamic leadership manager Sharia Bank in Surabaya, intelligence spiritual provide a positive contribution to the Islamic leadership manager Sharia Bank in Surabaya, Ethics Islamic business contributed positively to the performance manager of Sharia Bank in Surabaya, intelligence spiritual contributed positively to the performance manager of Sharia Bank in Surabaya Islamic leadership contribute positively the performance of the Sharia Bank in Surabaya.

### Introduction:-

As the country with the largest Muslim population, Indonesia should become a pioneer in the development of Islamic finance in the world. It is not an impossible dream because of the potential for Indonesia to become a global player in a very large Islamic financial, among others are: The number of large Muslim population into potential clients Islamic finance industry. The economic outlook is bright, reflected relatively high economic growth (6.0% -6 range,%), supported by solid economic fundamentals. (Alam, 2012). After experiencing relatively high growth in previous years, in the years 2013- 2014 syariah banks face the challenge of slowing growth. Slowing the growth of Sharia Bank is considered as a serious problem. Honorary Chairman of the Association of Indonesian Sharia Bank said that the slowdown in the growth of Sharia Bank in the year to whip for the banking industry to continue to find innovative ways that Sharia Banks remain in the hearts of the public. According Association of Indonesian Sharia

**Corresponding Author:- A Rochim Sidik.**

Address:- Yos Soedarso University Surabaya, Indonesia.

Bank, slowing the growth of Sharia Bank at least caused by several things. First, *pricing*. Sharia Bank less competitive. Second, product and human resources are less clearly distinguished from conventional banks. The balance of the growth of Sharia Banks, followed by the need for increased workforce. It aims to provide excellent service to consumers and educational Sharia Bank products. However, there are a number of problems in human resources in Sharia Banks. According Permana (2012) one of the biggest problems of human resources sharia is the banks difficult to find sharia banking human resources competent and qualified. Sharia Bank tends to take human resources from outside the college sharia for human resources in Sharia Banks usually just easier to give knowledge on Sharia Bank. Based on the above issues, the performance of managers in the spotlight major in solving problem the growing of Sharia Bank and human resources issues , Because managers in the life of any organization or institution or the other in Islam pushed in a common life, society and the nation motivate a manager based on the agreement to the public by giving to people you trust and are considered able to lead and give instructions to people on all the issues facing the life. A manager who is Muslim is obliged to follow the example of the Prophet Muhammad, for all his attitudes and behavior in leading Muslims is basically a paragon enviable and followed.

Performance is a problem that will always be faced by the management, as the management needs to know factors affecting the performance of managers. Assessing the success of a manager's performance is highly dependent on the performance of subordinates because the manager can not work alone. Therefore, a manager must be able to apply Islamic business ethics and lead subordinates to excel in his work, and has a spiritual intelligence. Factors that may affect the performance of the manager will make the company's management can take various policies required, so as to improve the performance of managers to match the expectations of these institutions. Areas of business ethics islamic very important to popularize the Islamic economic system, and it requires the search and excavation Islamic law relating to business ethics so that there is no longer practices that harm either party or both side. Moreover, there is no doubt Muslims to carry out their business. Doing business by selling and buying or other types of work are allowed to obtain sustenance is something that is commanded by religion because of the benefits to be gained from it for personal and community (Thanksgiving 2012). In the concept of Islamic economics, although humans have an important role as a principal economy, they still make moral principles in the law as a source of business ethics, as a base that must be held and executed a person or group in doing activity. Ethic need for working when people started to realize that progress in the field of business has led to people increasingly marginalized from the values humanity .In a tight business competition, companies that excel not only companies that have business criteria managerial good, but also companies that have good business ethics.

In addition to the Islamic business ethics which is owned by the employees, the leader's role in leading the organization to improve performance is also very instrumental in realizing the objectives of the company. According Siagian (2009) the ability and skill to a post as leader of the work unit can influence behavior by motivating others, especially subordinates to think and act in order to achieve performance in line with the objectives set. Applied management of Islam in these institutions certainly needs a leader which is expected to lead and bring the institution in order to develop and advance in accordance with the characteristics of the Islamic leadership. Leadership manager is a relationship between individuals or subordinates and superiors who influence others to get them to work towards the achievement of specific goals into organizational goals. Islamic teachings require the necessity of their manager despite of two. This is as stated by the Prophet Muhammad hadith narrated by Abu Daud argued that: "when leaving the three people on their way, let them lift one of them becomes the leader" (Mangkunagara, 2005: 57) The effectiveness of leadership greatly affect the effectiveness of the organization. To be a successful leader, intelligence is one of the requirements that must be possessed. The ability of a person is determined by its intelligence, that intelligence is *Spiritual Quotient* (SQ) or spiritual intelligence. Spiritual intelligence as the intelligence of a person in terms of finding and interpret the meaning, value, purpose deepest, and motivation of the most high, served as the cornerstone for the proper functioning of the intellectual and emotional intelligence effectively for spiritual intelligence is supreme intelligence possessed by humans. Based on the explanation above, the factor of Islamic business ethics, Islamic leadership and emotional intelligence is needed to prevent potential abuses and scandals at Sharia Bank to have the same possibilities with conventional banks as well as to improve the performance of managers. Sharia Bankers, executives and bank officials, including commissioners also human beings who have the desire to be tempted wallow material, so it is not impossible for corruption and irregularities can occur so that the transparency of the Sharia Bank to be very important in order to prevent a potential scandal. As an example of Religious Affairs had received the title agency's most corrupt in the management of pilgrims who were unable to show transparency in financial management, which is still in question would be transparency by the public for their alleged corruption as a religious symbol does not guarantee the institutions and people who are in these institutions net of irregularities .

Based on the description of the background, the formulation of the problem in this study is:

1. Does the Islamic business ethics affect the Islamic leadership manager Sharia Bank in Surabaya?
2. Does intelligence spiritual affect the Islamic leadership manager Sharia Bank in Surabaya?
3. Does Islamic business ethics affect the performance of managers Bank Sharia in Surabaya?
4. Does spiritual intelligence on the performance of Sharia Bank manager in Surabaya?
5. Does Islamic leadership affect the performance of managers in Surabaya Sharia Bank?

## **Matherial and Methods:-**

### **Research Variables:-**

Latent variable is a variable whose value is determined by measurable variables or indicators. In accordance with the background of the title, the formulation of the problem, objectives and hypotheses, in this study is 5 latent variables, namely: Islamic business ethics (X1), spiritual intelligence (X2), the leadership of Islam (Y1) and performance manager (Y2). Definition of variables -variable exogenous and endogenous intervening can be explained as follows:

### **Islamic business ethics (X1):-**

Person or organization doing business or mutually beneficial business contacts in accordance with the values of Islam. Indicators of Islamic business ethics, among others (Harahap: 2011: 78):

- *Unity* that emphasizes ethics and teachings which avoids any business practice that is forbidden.
- *Equilibrium* that is always trying to do justice in carrying out the work
- *Freewill* which are companies embed freedom of managers in making the rules in accordance with the norms of
- *Benevolence* that provide benefits to others.

### **Spiritual Intelligence (X2):-**

Intelligence to face and solve the problem of meaning and value, the intelligence to put the behavior and life in the context of a broader meaning and rich, intelligence to judge that the action or the way a person's life is more meaningful than others. The values of spiritual intelligence based indicators in Spiritual Intelligence (SQ) which is much needed in the business world, including the (Sukidi (2002: 94):

- a. Absolute Honest is the consistent stand managers Sharia Bank in carrying out the work and have confidence to always work honestly
- b. openness is the attitude of the manager of Sharia Bank in accepting any criticism and input for himself, open to any criticism and feedback
- c. self-knowledge is the way the manager of Sharia Bank behave and knowing who he was and the role of its work for the organization as well as to understand the duties and roles for the organization
- d. focus on the contribution that attitude and ability Sharia Bank managers to focus more giving than receiving. belief to focus more contributions than the right.
- e. Spiritual non dogmatic beliefs that have to be flexible in any situation at hand.

### **Islamic Leadership (Y1):-**

Leadership charged humanization values, liberation and transcendence. Indicators of Islamic leadership (Alwi, 2008: 874):

- a. Love the truth that is a leader who is faithful shall hold fast to the truth.
- b. Can keep the mandate and trust others namely leader must keep the mandate that has been granted to him .
- c. Altruistic and having the spirit of devotion namely in the running of a wheel his leadership
- d. Good in intercourse namely help one another in all sectors in life
- e. Wise is placing all the problems appropriately and proportionately.

### **Performance Manager (Y2):-**

Results in quality and quantity of work achieved by one's employees in carrying out their duties in accordance with the responsibilities given to him. Manager performance indicators are: Quantity of Work, Employment Quality, Timeliness, Cooperation and Personal Qualities. (Schuler and Jackson, 2005: 18)

- a. The quality of work, measured from managers 'perceptions of the quality of work produced and the perfection of the task against the skills and abilities of employees.
- b. The quantity of work, measured from the managers' perceptions of the amount of activity that is assigned and results.

- c. Timeliness, measured from perceptions of managers towards a completed activity from the beginning of time to be output. Can be completed at a predetermined time and maximize the time available.
- d. Working together, measured from Traffic employees in collaboration with co-workers and the environment
- e. Personal Qualities is the independence of an employee in completing the tasks assigned to them without the need for supervision of the supervisor.

#### **Population:-**

Population in research this is the manager of Sharia Bank that has network offices in Surabaya, which include: PT. Bank Muamalat Indonesia ; PT. Bank Victoria Syariah ; Bank BRI Syariah ; Bank BNI Syariah ; Sharia Bank Mandiri ; Sharia Bank Mega Indonesia ; Bank Panin Syariah ; PT. Sharia Bank Bukopin ; PT. BCA Syariah ; PT Bank Tabungan Pensiunan Nasional Syariah, Bank Niaga Syariah ; Bank Danamon Syariah dan Bank Jatim Syariah.

#### **Sample:-**

Sample for sampling in this study using the technique of Non-Probability sampling with purposive sampling that sampling based on the features or characteristics possessed by the sample. Sampling technique used is based on the guidelines for the measurement of the sample according to Augusty (2002: 48), among others:

- 100-200 samples for maximum likelihood estimation technique.
- The guidelines are 5-10 times the number of parameters to be estimated.
- Depending on the number of indicators used in the entire latent variables. The number of samples is multiplied by the number indicator 5-10. if there are 20 indicators, sample size is 100-200. Since there are 19 indicators, the number of samples in this study were  $(19 \times 5 = 95)$ , the sample used was 95 managers Sharia Bank in Surabaya.

#### **Data Analysis Techniques:-**

Data analysis stage is a stage which is very important because it required precision and accuracy are high, therefore the data processing using SEM as described below. The model used in this study were tested by the research instrument using *Structural Equation Model*. Use of *Structural Equation Model* considering that this method has the ability to see the effect of directly or indirectly, an influence of independent variables on the dependent variable. The size of the effect that occurs in a particular pathway will be apparent from the results of the calculation method of *path analysis*. According to Hair *et al.*,(2010), there are five steps that should be taken if using *Structural Equation Model* that is :

#### **Development of theoretical models:-**

The first step is the principle of testing causality in empirical theories that already exists and is used to confirm the theoretical models through empirical data.

#### **Development path diagram (path diagram):-**

The second step shows the theoretical models that have been built in the first phase will be described in a flow chart the relationship between the construct will be expressed through the arrows. A straight arrows indicate a direct causal relationship between the construct to construct another while inter construct curved lines with arrows on each end show a correlation between the construct. A construct that was built in the flowchart can be divided into two groups: a construct exogenous (*exogenous constructs*) and a construct endogenous (*endogenous construct*).

#### **Conversion chart a path into the structural equations and the measurement model:-**

##### **Choosing the matrix inputs and estimation models:-**

The fourth step explains that the data input *structural Equation Model* is the matrix of variance / covariance or correlation techniques for the overall estimation models do. Covariance matrix is used for *Structural Equation Model* has the advantage of presenting a valid comparison between different populations or different samples that can not be served by the correlation. In the use of *Structural Equation Model* suggested to use a matrix of variance / covariance at the time of testing the theory because it would better satisfy the assumptions methodology whereby the standard error filed will show the figures are more accurate than when using the correlation matrix.

##### **The possibility of the emergence of problem identification:-**

Step five explained that after to revise the model is still a *results*, unique estimation then other treatments is creating *composite variables* through *composite measure* or develop more of a construct.

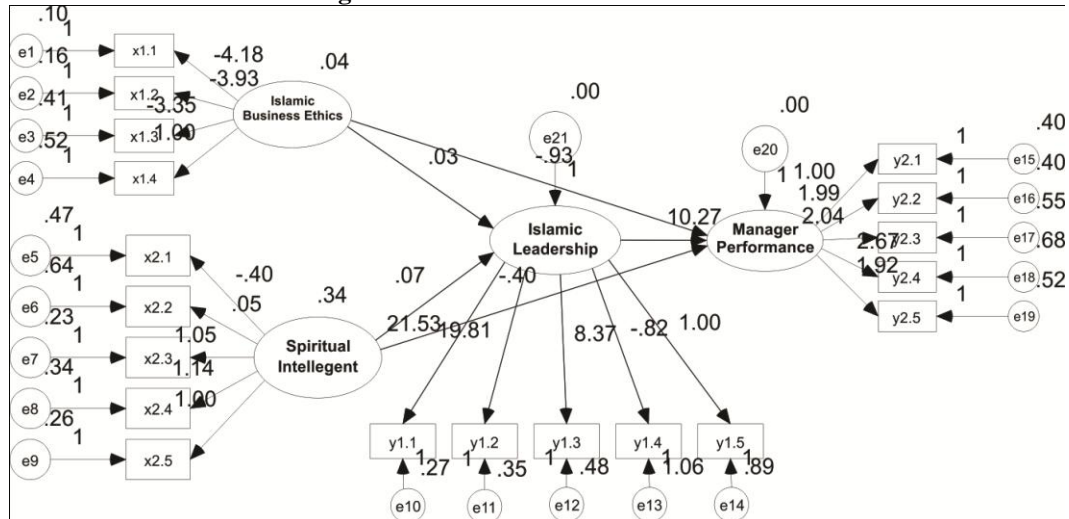

In the sixth step testing of the appropriateness of the model through an evaluation of the various criteria of goodness-of-fit.

**Results:-**

In the model SEM, the measurement model and the structural model parameters are estimated jointly. This method is rather experiencing difficulties in meeting the demands of the model fit. The possibility is caused by the interaction between the measurement models and structural models are estimated jointly (one - steep approach to SEM). (Hair, et al, 1998). The results of estimation and fit model one step approach to SEM using Amos 16 application program shown in Figure and Table Goodness of Fit below

**Figure 1:- Model and Structural Measurement**

**Criteria Table 1:- Evaluation of Goodness of Fit indeces**

Criteria	Results	Critical Value	EvaluationModel
C min / DF	1099	≤ 2.00	good
Probability	0154	≥ 0.05	good
RMSEA	0.032	≤ 0.08	good
GFI	0.900	≥ 0.90	good
AGFI	0.900	≥ 0.90	good
TLI	0955	≥ 0.95	good
CFI	0962	≥ 0.94	good

From the results of the evaluation of the model one step approach turned out from all the goodness of fit criteria are used, all of which are good results of the evaluation models, means that the model has been in accordance with the data. That is, the conceptual model was developed and based on the theory has been fully supported by the facts. Thus this model is the best model to describe the relationship between variables in the model

**Causality Test:-**

Direct effect [path coefficient] observed from standardized regression weights, with significance testing comparative value of p [probability] that is equal to the value t. If t is greater than t table means significant. Thus the regression coefficient of each factor can be trusted as seen on causality test below.

**Table 2:- Causality Test Data**

			Estimate	SE	Prob.
Islamic Leadership	<---	Islamic Business Ethics	1,168	0,766	0,000
Islamic Leadership	<---	Spiritual Intelligence	0,864	0,682	0,073
Performance Manager	<---	Islamic Leadership	0,542	0,652	0,057
Performance Manager	<---	Spiritual Intelligence	0,311	0,227	0,018
Performance Manager	<---	Islamic Business Ethics	0,093	0,048	0,053
Limit Significance					≤ 0.10

1. Islamic Business Ethics factors influence the Islamic Leadership Factor, acceptable [Prob. causal  $0,000 \leq 0,10$  [significant [positive].
2. Factors Spiritual Intelligence affect the Islamic Leadership Factor, acceptable [Prob. causal  $\leq 0,073$   $0,10$  [significant [positive].
3. Factors Islamic Business Ethics effect on Factor Performance Manager, acceptable [Prob. causal  $\leq 0,057$   $0,10$  [significant [positive].
4. Factors Spiritual Intelligence effect on Factor Performance Manager, acceptable [Prob. causal  $0,018 \leq 0,10$  [significant [positive].
5. Factors affect the Islamic Leadership Factor Performance Manager, acceptable [Prob. causal  $\leq 0,053$   $0,10$  [significant [positive].

### Discussion:-

Based on test results using SEM analysis, it can be concluded as follows:

**That the Islamic business ethics contribute positively to the Islamic leadership Sharia Bank, [Prob.  $0,000 \leq 0,10$  significant [positive]. This means:-**

- Manager always trying to do justice in carrying out the work to create islamic leadership.
- Manager provide benefits to others to create islamic leadership.

**Intelligence spiritual contribute positively to the Islamic leadership Sharia Bank, [Prob.  $0,073 \leq 0,10$  significant [positive]. This means:-**

- Attitude Manager consistent in carrying out the work and, have confidence to always work honestly is one of the ways to create islamic leadership.
- attitude Manager in accepting any criticism and input for himself to create islamic leadership.

**Business ethics Islamic contribute positively to the managers performance in Sharia Bank, [Prob.  $0,057 \leq 0,10$  significant [positive]. This means:-**

- Sharia Bank embed freedom of managers in making the regulations according to the norm to increase managers performance in Sharia Bank.
- Emphasizes the unity of common purpose in carrying out the work to increase managers performance in Sharia Bank.

**Intelligence spiritual contributed positively to the manager performance Sharia Bank , [Prob.  $0,018 \leq 0,10$  significant [positive]. This means:-**

- Managers understand the duties and roles for the organization to increase manager performance in sharia bank.
- Managers have the confidence to be flexible in all situations faced.

**Islamic Leadership contributed positively to the performance manager of Sharia Bank in Surabaya , [Prob.  $0,053 \leq 0,10$  significant [positive]. This means:-**

- Manager can be completed at a predetermined time and maximize the time available.
- The ability of managers in collaboration with employees to create islamic Leadership that can be increasing manager performance.

### Conclusion:-

Based on test results using SEM analysis, it can be concluded as follows:

1. That the Islamic business ethics to contribute positively to the Islamic leadership manager of Sharia Bank in Surabaya
2. Intelligence spiritual contribute positively to the Islamic leadership manager Sharia Bank in Surabaya
3. Business ethics Islami leave a positive contribution to the performance of managers in Surabaya Sharia Bank
4. Intelligence spiritual contributed positively to the performance manager of Sharia Bank in Surabaya
5. Islamic Leadership contributed positively to the performance manager of Sharia Bank in Surabaya

### Abstract

Produce water is an effluent discharge from oil processing, which have an physical-chemical characteristic is a high organic pollutant as an Chemical Oxygen Demand (COD), ammonium, sulfida, phenol, oil content and high temperature. Sometimes the pollutant also metal content as a mercury which an toxic substance that can be an inhibitor for biological processing. Five strain microorganisms i.e. : *Pseudomonas*, *Staphylococcus aureus*, *Thiobacillus ferrooxidans*, *Bacillus* sp, and *Alcaligenes* to be acclimated using produce water as a carbon source from real waste on batch system for 30 days. The condition in the batch system is a biomass concentration 10% (v/v), waste concentration 100%, CNP ratio 100:10:1, incubation time 4 days at room temperature (28°C). Growth rate microorganism was checked for make sure that microorganism could be growth, and the kinetic constant obtained is specific growth rate ( $\mu$ ) : 0,037/h, maximum growth rate ( $\mu_{max}$ ): 0.45/day organic removal coefficient (k) : 207.8 mg/l COD/day, and half velocity constant (Ks) : 35 mg COD/l. The operation continued to the biological reactor with step aeration processing after batch system. The flow rate in to continuous reactor is 0,90 l/h with detention time 2 (two) days and return sludge (r) : 0.5, dissolved oxygen > 2 mg/l and sampling periodic interval 0, 2 and 4 days. The result show that removal efficiency for organic matter as a COD is 87.1%, ammonia 95.88 %, sulfide 99.2% and phenol 99.7%

### Introduction:-

Water is very often found together with petroleum in the reservoirs where the water, as a consequence of higher density than oil, lays in vast layers below the hydrocarbons in the porous reservoir media. This water, which occurs naturally in the reservoir, is commonly known as formation water (Dorea et al., 2007). After oil and gas production has been occurring for a time, the formation water will reach the production wells and water production will initiate. The well water-cuts will normally increase throughout the whole oil and gas field lifetime, such that when the oil production from the field is shut down, the oil content can be as low as a couple of percent with ninety eight percent

water (Wang et al., 2007). To maintain the hydraulic pressure in the petroleum reservoir, which is reduced as soon as production is started, seawater is commonly pumped into the reservoir water layer below the hydrocarbons. This pressure maintenance due to water injection causes high extensions in recoverable hydrocarbons but simultaneously contributes to increased water production. During petroleum production, vast volumes of liquids have to be managed each day. Deferred production causes high economical losses and therefore continuous operations are always strived for. The capacity, reliability and performance of the produced water management system is often critical for continuous oil production particularly in mature oil field where the water production can greatly exceed the oil production (Liu et al., 2010). The water production system needs to be designed to receive continuously increasing quantities of water as oil production continues (Riviere and Garland, 1994). The most common practice in use in Indonesia for management of produced water is treatment in gravity based separation equipment and discharge to sea/water body (Sponza and Gok, 2010). This research is carried out to see if the biological process can be a good candidate to treat the produced water to meet the standards or regulation requirement.

## Materials and Method:-

### Microorganism:-

Isolation and characterization of bacteria isolated from several site of oil contaminated soil was conducted in order to find the bacteria that have an ability to metabolize produced water as sole carbon source. Cultures of bacteria were adapted with produced water as sole carbon source. Bacteria that able to degrade or use produced water as sole carbon were isolated and then used as inoculums in this research. Consortium bacteria containing five different bacteria which is *Pseudomonas* sp, *Staphylococcus aureus*, *Thiobacillus ferrooxidans*, *Bacillus* sp, and *Alcaligenes* to be acclimated using produced water as a carbon source from real waste on batch system for 30 days.

### Kinetics study of produced water biodegradation:-

To prepare the inoculums, mixed bacterial isolates were grown in 1-liter Erlenmeyer flasks containing 500 ml of the minimal medium (CNP ratio as Glucose:(NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>:K<sub>2</sub>HPO<sub>4</sub> of 100:10:1) as sole carbon and energy source. Isolates were grown to mid-log phase (app. 10<sup>6</sup> CFU/ml) and used as the inoculums (2%) for the biodegradation of produced water in the reactor. The growth conditions in the reactor were as follows: Room temperature, agitation at 110 rpm, pH 7.0 (adjusted with 1 N HCl-NaOH). The growth of microorganism was measured every certain time.

### Produced Water Biodegradation Assay:-

To determine the performance of bacteria in degrading produced water, a biodegradation assay developed and set up as follows:

- Continues baffled reactor equipped with diffused aerator.
- The flow rate adjusted to 0,90 l/h with detention time of 2 (two) days and return sludge (r) : 0,5, dissolved oxygen > 2 mg/l.
- Organic and biomass concentration were observed on certain time.

## Result and Discussion:-

### Growth kinetics determination:-

The aim of growth kinetic experiments is to determine the ability of isolated microorganisms in the degradation of produced water. The characteristics of produced water used in this experiment are as depicted in **Table 1**.

**Table 1:-** Characteristics of Produced Water

No	Parameters	Unit	Value
1	pH	-	7.470
2	BOD	mg/l	368
3	COD	mg/l	829.84
4	Nitrate	mg/l	0.8167
5	Nitrite	mg/l	0.023
6	Ammonia	mg/l	66.04
7	Total Oil	mg/l	37
8	Phenol	mg/l	2.56
9	Ortho Phosphate	mg/l	<0.002

The kinetics parameters to be determined are as follows:-

- Specific growth rate,  $\mu$ , 1/time
- Decay coefficient,  $k_d$ , 1/time
- Organic removal coefficient,  $k$ , mg/l.day
- Half saturation constant,  $K_s$ , mg/L

The growth of a microbial culture is a complex phenomenon composed of a number of simultaneously occurring events. The relative magnitudes of the respective rates determine what the net effect is upon the culture. The primary events are the utilization of substrate and the growth of organisms. These two events are closely related because it is only through the utilization of substrate that energy and carbon are made available for cell growth. The growth rate is referred to as a specific rate because it defines the rate of cell growth in terms of the concentration of cell present. To find the relation of cell growth and substrate utilization, bacterial consortia were grown on produced water with variation in substrate concentration which is 10%, 20%, 40%, 60%, 80% and 100% of produced water. Growth curve of bacterial consortia were linearized at exponential phase resulting regression line which slope is its specific growth rate.

**Figure 1:-** show the time-course of a liquid culture of the bacterial consortium using produce water as sole carbon source.

**Figure 1:-** Time course of mixed culture grown on various concentration of produced water as sole carbon source.

Growth curve of bacterial consortia were linearized at exponential phase resulting regression line which slope is its specific growth rate. Specific growth rate of bacterial consortia were shown in **Table 2**. The value of the kinetics parameters are very dependent upon the organism and substrate employed. If a given species of organism is grown on each of several substrates under fixed environmental conditions the value of kinetics parameters observed will depend upon the substrate. Likewise, if several pure cultures are fed the same substrate under identical environmental conditions, the value of kinetics parameters will depend upon the species of organisms.

**Table 2:-** Specific growth rate ( $\mu$ ) of bacterial consortia at difference substrate concentration

No	Produced Water (%)	$\mu$ (1/hour)
1	10	0.0118
2	20	0.0141
3	40	0.0163
4	60	0.0178
5	80	0.0171
6	100	0.0123

Based on **Table 2** above showed that specific growth rate of bacterial consortia tend to increase as substrate concentration increased. The highest specific growth rate occurs in bacterial culture that grown on 60% produced water which is  $0.0178 \text{ hour}^{-1}$ . Once data are available relating to  $\mu$  and substrate concentration, it can be used to estimate the kinetics parameter which is the half saturation constant ( $K_s$ ) and the maximum specific growth rate ( $\mu_m$ ). The most common transformation is obtained by taking the reciprocal of both side of the Monod equation, known as the Lineweaver-Burk equation. A plot of  $1/\mu$  as a function of  $1/C_s$  (**Figure 2**) give a linear regression were slope or gradient is  $K_s/\mu_m$  therefore the intercept on X is  $(-1/K_s)$  and to the Y is  $1/\mu_m$  (Schulz, 1994).

From linear regression yielding the half saturation constant  $K_s$  value of 35 mg/l and maximum growth rate value of 0.45 per day. It means that if  $\mu_m$  condition have achieved, increasing in substrate concentration specific would not take effect on growth rate of viable biomass anymore

**Figure 2:-** A plot of  $1/\mu$  as a function of  $1/C_s$  to determine the kinetics parameters  $K_s$  value showed the affinity of biomass to substrate and therefore a concentration of substrate at half of its maximum growth rate. Biomass which high affinity to substrate have a low  $K_s$  value, that mean growth rate will not effected until substrate concentration decrease to a very low value. As opposite if biomass which low affinity to substrate have a high  $K_s$  value, its mean growth rate will be effected by the remain substrate concentration which still high. If the substrate concentration is below the  $K_s$  value thus the growth of biomass will very slow. That why the addition of substrate in the reactor at least equal to or much higher than its  $K_s$  value.

#### Produced Water Biodegradation Assay:-

To determine the performance of both isolated bacteria in degrading produced water and bioavailability of produced water, a biodegradation assay was established as described in methods. A continuous step aeration reactor with flow rate of 0,90 l/h, detention time 2 (two) days, return sludge (r) : 0.5 and dissolved oxygen to be maintain  $> 2 \text{ mg/l}$  as depicted in **Figure 3**.

**Figure 3:-** A continuous step aeration reactor used for biodegradation assay of produced water

**Table 3:-** Organic (COD) removal efficiency

Hari	Inlet mg/l	Outlet mg/l	Efisiensi (%)
0	827	114	86.2
2	827	110.5	86.6
4	827	107	87.1

**Figure 4.** Time course of COD degradation and bacterial growth by bacterial consortia

**Figure 5.** Pollutant removal efficiency

### Conclusion:-

Referring to the Indonesian Ministry of Environmental (Decree no. 4/2007), it was mandatory to manage a safe treatment of these wastes (produced water) and also disposed off in an environmentally friendly manner. It was regulated that the final concentration of COD, ammonia, sulfide and phenol must less than 200; 5; 0.5 and 2 mg/l respectively. Based on the data presented in this paper indicate that the bacterial consortia have a quiet low  $K_s$  value (35 mg/L). Its mean that bacterial consortia that used in this study were effective to degrade the produce water to a final low concentration. COD, ammonia, sulfide and phenol removal efficiency in the continuous step aeration reactor was 87.1;95.88;99.2 and 99.7%, respectively.

Developmental disturbance,  
phleboliths, vascular malformation

#### **Abstract**

Venous malformations form due to disturbances during the developmental period of an embryo. Occasionally, associated with calcified bodies known as phleboliths. Pathological calcification of soft tissues is modulated by the deposition of calcium and other mineral salts. Phlebolith formation, is reported as a predictable feature of hemangiomas was first described in the splenic vein by Canstatt in the year 1843. The overall incidence of vascular anomalies is approximately 1 in 10,000 while children are more affected. They can occur anywhere in the body involving dermis, subcutaneous tissue, intraoral mucosa and skeletal tissue with an incidence around 40% in head and neck regions. They are arbitrarily distributed in various number and size, radiographs aid in detection of calcifications. Vascular malformations of oral cavity are not uncommon, with preponderance towards tongue, lips, buccal mucosa, gingiva, palatal mucosa and oropharynx. Treatment of vascular malformations are managed by more than one modalities like surgical excision, laser therapy and sclerotherapy. Herein we are reporting a rare case of an intraoral venous malformation with phleboliths.

Vascular malformations of oral cavity are not uncommon, with preponderance towards tongue, lips, buccal mucosa, gingiva, palatal mucosa and oropharynx. On literature search few cases in buccal mucosa, masseter, temporalis, mentalis muscle and floor of the mouth were found to be present as swellings.<sup>2,3</sup> Treatment of vascular malformations are managed by more than one modalities like surgical excision, laser therapy and sclerotherapy.<sup>5,6</sup> The present case of venous malformation with phleboliths was found intraorally on the buccal mucosa of a 45-year-old woman.

#### Clinical Details:-

A 45 years old woman presented with swelling and pain in the right cheek of 8 months' duration. No other relevant dental or medical history were found. History of an injury to the right cheek 3 years back with increase in the firmness of swelling over the years. Clinical examination revealed bluish tinge on the right buccal mucosa extending from the vestibule close to first molar to the anterior border of the ramus. Submucosal mass was firm in consistency, compressible and with no pulsation. Submandibular lymph nodes were palpable, parotid and submandibular salivary glands were normal. It was provisionally diagnosed as sialolithiasis.

#### Gross details & Histopathology: -

Excised specimen was yellowish blue in colour with multiple whitish hard nodules. Histopathology revealed loose adipose tissues with interconnected numerous dilated blood vessels. Thrombus formation with dystrophic calcifications were present inside these dilated veins. Thickened veins displayed collagen deposition on the wall lined by flat endothelial cells along with neutrophils, lymphocytes and plasma cells. The diagnosis indicated a venous malformation with phleboliths.

**Fig 1:-** Swelling in the right buccal mucosa. **Fig 2:-** The gross specimen yellowish blue in colour measuring around 10cmx2.5cmx2cm.

**Fig 3:-** Numerous interconnected blood channels with thrombus formations (4x Magnification, Hematoxylin & Eosin).

**Fig 4:-** A large dilated vein with phleboliths (10x Magnification, Masson's Trichrome).

**Discussion: -**

Venous malformations also known as venous hemangioma, cavernous hemangioma or cavernous angioma are rather old terms used quite often in the earlier literatures. These are present at birth but hardly make their presence obvious. The classification of hemangiomas and vascular malformations was clearly emphasized by mulliken et al.<sup>7,8</sup> It is based on their biological characteristics. Disturbances in vasculogenesis and angiogenesis leads to defects in the capillaries, veins, arterioles, lymphatics or combination of vessels. They are typically divided according to the blood flow into low-flow (capillary malformation, lymphatic malformation, and venous malformation) and high-flow lesions (arteriovenous malformations, arteriovenous fistulae). These have become the source of interest in the study of embryonic angiogenesis. Their presence is usually felt later in life. They accelerate during puberty, pregnancy as well as trauma like in our case.<sup>9,10,11</sup> The lesion was present in the buccal mucosa, for years till the trauma triggered it to expand with inflammation and pain.

Vascular anomalies have a propensity to occur in the skin, mucosa, subcutaneous tissue and muscle. Phleboliths associated with vascular anomalies in the maxillofacial region were discovered by Kirmission in 1905. They are more characteristic of low-flow vascular malformations. According to the theory adopted by Ribbert, phlebolith formation begins with intravascular thrombus formation and is followed by progressive lamellar fibrosis.<sup>12,13</sup> In initial diagnosis, radiographs are the essential tools. Based on the anatomic considerations, differential diagnosis depends on the contents in and around lesion, buccal pad of fat, minor salivary glands, lymph nodes, Stenson's duct, accessory parotid gland, numerous vessels and nerves. Since the mass was localized to an area for many years and not invading the other structures, malignancy was ruled out. Though major salivary gland functions were normal possible shortlisted differential diagnosis included sialolithiasis as bluish tinge of the mucosa was visible. Other possibilities were lipoma, vascular malformations, lymph node infections, neurofibroma, reactive soft tissue proliferation due to trauma, bacterial or fungal infections. Intraoral lipomas are seen most common on the buccal mucosa, with predilection for adult males. They are found to be soft and nodular masses sessile or pedunculated.<sup>14</sup> Venous malformations are present from birth but patient may be without symptoms unless or otherwise due to trauma or infection. Found intraorally more on the buccal mucosa, masseter or tongue. Colour of the lesion are clinically observed varies depending on the depth, from colourless to bluish tinge visible on the mucosa. Compressible lesions help in identifying venous malformations from lymphatic malformations. Calcifications requires differentiation mainly from sialolithiasis, phleboliths, calcified lymph nodes, healed acne lesions.<sup>15,16</sup> Histopathology revealed phlebotrombotic areas in numerous large dilated vessels with collagen formation, flat endothelial cells and haphazard channels. It was verified by Masson's trichrome special staining. Location, extent, growth rate, accessibility, patient's age, and aesthetics plays an important role in treatment options. Interstitial laser therapy has found to be effective for capillary and venous malformations. Embolization solely or accompanied with surgery holds good for high flow vascular malformations.<sup>17,18,19</sup>

**Conclusion:-**

Phleboliths in vascular malformations are calcified bodies, not many intraoral cases have been found in the literatures. Though clinical diagnostic hypotheses were numerous to deal in the present case, histopathology confirmed the diagnosis. Since, now the old terminologies are not in vogue, venous malformations are identified well, as clear entities on their own.

#### Abstract

Ultrasonographic examination of a five-year-old, male, mixed-breed dog, identified gallbladder wall thickness, accompanied by intraluminal contents suggestive of polyps mass. The liver present normal structure and limits with no mass lesions detected. A cholecystectomy was performed one week after initial case presentation. The gallbladder was enlarged (5 cm in diameter) with a thickened wall; intraluminal mass 2 cm in diameter .The fatty mass had a sessile attachment at the neck of the gallbladder and partial occluded the lumen. The surgical removed polyps were later confirmed as cholesterol polyp composed of fatty tissues

#### Introduction:-

The function of the gallbladder is very closely related to that of the liver. When one is "sick", it is likely to affect the other organ. Drugs that affect one can also affect the other. Therefore it is not uncommon for both diseases to exist in the same dog. The commonest affections of gall bladder and biliary tree included cholangitis, cholecystitis, cholecystolithiasis and choledocholithiasis. Among these the incidence of cholecystolithiasis is very less as evidenced from the published veterinary literatures. The incidence of disorders restricted to the gallbladder and the biliary tree is low, when compared with the parenchymal hepatic affections that occurs in dogs (Veronica et al., 2006). The extrahepatic biliary tract obstruction in dogs is caused most frequently by biliary carcinoma, pancreatic carcinoma, pancreatic disease and intestinal neoplasia. The biliary or intestinal inflammations are less commonly recognized in clinical practice. In human pathology, gall bladder polyps are outgrowths of the gallbladder mucosal wall. They are usually found incidentally on ultrasonography or after cholecystectomy. When detected on ultrasonography, their clinical significance relates largely to their malignant potential. The majority of these lesions are not neoplastic but are hyperplastic or represent lipid deposits(cholesterolosis). On the other hand, imaging in human pathology, gall bladder polyps are outgrowths of the gallbladder mucosal wall. They are usually found incidentally on ultrasonography or after cholecystectomy. When detected on ultrasonography, their clinical significance relates largely to their malignant potential. The majority of these lesions are not neoplastic but are hyperplastic or represent lipid deposits(cholesterolosis). On the other hand, imaging studies alone are insufficiently specific to exclude the possibility of gallbladder carcinoma or premalignant adenomas. Furthermore, even benign lesions can occasionally lead to symptomssimilar to those caused by gallbladder stones. The use of ultrasonography (US) imaging technique became widespread and popular, detection of polypoid lesions of the gallbladder (PLG) has increased significantly (Collett, 1998; Heyder, 1990). Initial studies estimated that PLGs are found in 2.6% to 12.1% of cholecystectomy specimens Heyder, 1990). In a large study of 3,608 Danish

subjects, the prevalence of PLG was found to be 4.6% for men and 4.3% for women and similar to other studies, these lesions had a higher prevalence in the third and fifth decades of life. Currently, most agree that the average prevalence of PLG in cholecystectomy specimens is about 3% to 12%. The polypoid lesion of the gall bladder rarely observed in veterinary medicine

### Description:-

A five-year-old, male, mixed-breed dog was presented with persistence vomiting, anorexia, weakness, for one week. Physical examination revealed icterus mucous membranes and a slightly tensed abdomen with normal hematological profiles. Serum biochemistry abnormalities included increased liver enzyme activities, including alkaline phosphatase (5,360 U/L; reference range 10-140 U/L) as well as hyperbilirubinemia (Total bilirubin 5.6 mg/dL; reference range 0-0.6 mg/dL) consistent with hepatocellular damage and cholestasis. With normal levels of blood urea nitrogen (10 mg%) and creatinine (0.2 mg%) were identified on the serum biochemical analyses. The radiographs demonstrated normal hepatic size and without hepatobiliary calcification (Fig.1). Subsequent ultrasonographic examination identified gallbladder wall thickness (Fig.2), accompanied by intraluminal contents suggestive of polyps mass. The liver present normal structure and limits with no mass lesions detected (Fig. 3).

**Fig. 1:-** Radiograph of hepatic and abdomen cavity demonstrating normancy

**Fig. 2:-** Large gall bladder with thickened walls indicating Polyps mass

### 3D Ultrasonography:-

After exact tracing of gall bladder and mass structures B-real ultrasonography (2D), 3DU image acquisition was performed as a volume of data with nearly immediate reconstruction and simultaneous display of sectional anatomy in three orthogonal planes (sagittal plane, transverse or coronal plane). Finally a 3D rotating animation of the gall bladder structures at the desired angle could be reconstructed for better visualization and recognition of different parts of mass with gall bladder (Fig. 4).

**Fig. 3:-** Transhepatic ultrasonograms of gall bladder with large mass (Polyp), without a distal acoustic

**Fig. 4:-** Three dimension (3D) reconstitution of gall bladder and intraluminal mass (polyp).

### Treatment:-

On the basis of these findings, a cholecystectomy was performed one week after initial case presentation. The gallbladder was enlarged (5 cm in diameter) with a thickened wall and intraluminal mass 2 cm in diameter. The fatty mass had a sessile attachment at the neck of the gallbladder and partial occluded the lumen. An exploratory

laparotomy performed at the time of cholecystectomy surgery did not identify other abdominal lesions. Microscopically the mass was composed of fatty tissue (cholesterol polyp).

### **Discussion:-**

The cause of most gall bladder disease is not well defined in the dog. Many dogs with gall bladder disease have some sort of underlying metabolic or hormonal problem (Weedon; 1984). Both hypothyroidism (low thyroid hormone levels) and hyperadrenocorticism (excessive steroid hormone levels) are associated with an increased risk of developing a biliary disease (Terzi, 2000). These are very rare tumors that account for less than even 1.5% of all canine tumors. However, secondary hepatobiliary tumors are more common and occur 2.5 times more frequently than primary ones (Collett,1998). In human medicine gallbladder polyps have been observed in 0.004 to 13.8 percent of resected gallbladders (Christensen, 1970; Stringer, 2003), and in 1.5 to 4.5 percent of gallbladders assessed by ultrasonography (Jorgensen, 1990; Veronica, 2006). In one report, no association was observed between the presence of polyps and the patient's age, sex, weight, number of pregnancies, use of exogenous female hormones, or any other risk factors that are generally believed to be associated with gallstones (Stringer, 2003). Gall bladder polypoid lesion has very rarely been reported in dog and domestic animal.

#### Abstract

The new era has begun in the area of art as in all social spheres after Uzbekistan gained independence. The new period requires the theatre to stage the people of that particular era. This, in the first place means a huge responsibility should be borne by playwrights and requires them to create an ideal character. The extent to which this task is being carried out, the achievements and pitfalls in this sphere, the theoretical and practical issues in creating a character in their example will be discussed in this article. The search that has been carried out in this direction will be assessed in the example of concrete plays.

*Copy Right, IJAR, 2017.. All rights reserved.*

#### Introduction:-

Although dramaturgy is one of the components of the theatre in creating literally perfect performance, it has a very complex inner composition. Therefore, dramaturgic play is not written, but built. All of the compositional parts of the play should be developed perfectly from the literal and logical point of view so that the play would develop as a single organism in harmony. The composition of the play, conflict, the sequence of events, character, speech, and even remarks are developed in an interrelated manner and if one of them is flawed, there is no chance that it won't affect others. The consistency of events, that is to say, the logical development of the plot and acuteness of conflict in any play is affected by the factor of character. "The importance of a fight will change when you replace one participant by another. In as much as, heroes have an individual attitude towards any event in the play. Their specialty depends on the concreteness of the characters" (Blok, 1963). This issue made playwrights of each period contemplate. Similarly, the fact that research has been conducted on creating character in contemporary Uzbek dramaturgy and the fact that there are a variety of cases on this issue is the absolute truth. On one hand, some playwrights are succeeding, on the other hand, the rest are facing serious problems. The primary reason of this is, as Karl Iglesias said, "Yet many writers obsess so much on plot points and structure that they often forget the people who inhabit the story" (Iglesias, 2005).

The playwrights of the Independence period have to meet new requirements. The heroes who were empowered with very strong political ideas who sought the soviet politics from an every aspect of life in the dramaturgy of former USSR have been replaced with the ones who possess positive qualities as well as pitfalls that can be found in people. More and more attention is being paid to national values in this period and naturally, the flavor of nationality increased significantly in the character of heroes. "The roots of Uzbek dramas are directly linked to the national character of the people, its pride and dignity" (Abdusamatov, 2000). In fact, this is the case that is applicable to the arts of all nations. Each piece of play reflects the features of the country in which it has been created in the first place. The play should concern the whole humanity with the topic it is portraying.

### **Materials and methods:-**

Creation of the character includes three directions that are interrelated. The playwright, director, actor lay the foundation for the interconnectedness of the events and the solution to the formation of a character that is perfect for the stage. "The dialectics of creating a stage figure come into existence on the basis of the actor's psychology, talent, his/her special nature, worldview, the extent to which their creative individuality has been formed, the formation and perfection of their abilities" (Eraliyeva, 2015). This means that, in the majority of cases, the director has to assign the role to the actor whose appearance and inner world fit the above-mentioned features. In other words, the roles are assigned deriving from the theatrical character of the actors. In the first place, it ensures that this figure is trustworthy; moreover, it allows the play to be staged in a short period of time. The actor seeks the necessary features needed for their character in their selves. The playwright's job when it comes to this is very difficult. He/she should ponder about the character of each hero and find the spiritual experiences beyond his/her nature. "The character is the carrier of the aesthetic ideal. The characters are represented and developed as a result of acting in a specific psychological situation." (Sultonov, 2005). The author's aesthetic ideal, the ideas that he puts forward in the play are decisive factors in the development of heroes' characters. Besides that, the nature of the character depends on the genre of the play. The genre normally represents in what ways the problem in the play can be solved and its type of expression. Deriving from the genre, the hero's attitude towards the events and problems varies.

**Creative approaches in the formation of character.** The drama and comedy are the main types of genres that are addressed in contemporary Uzbek dramaturgy. It is obvious that these genres are also divided into several sub-genres. Particularly, a lot of historical dramas have been created in contemporary Uzbek dramaturgy. The images of heroes have been created on the basis of historical facts in biographic-portrait plays whereas the plays written to criticize the Soviet period emphasized the conflict between the person and the period. As a result, the fate of a person has been interpreted philosophically in the oppression period. One of such plays is "The garden of grief" by the poet and playwright named Shukrullo. This play did not portray the life of a certain individual; it differs significantly from such plays as it expressed a general attitude towards a particular historical period. Primarily negative effects of the oppressive period on people's lives in the example of several heroes have been highlighted in this play. As a result of watching the play carefully, the author's introduction of personages appeals to the audience. Evidently, usually the main hero is introduced first in the play and other actors are introduced directly in connection to him/her. However, Shukrullo adopts a different approach and introduces others using the person who does not participate in the play. For example, Ulmas – the murdered soldier. The mother – Ulmas's mom. Murod – Ulmas's uncle, ...Mels, Ashrafiy, Azim – Ulmas's friends..." (Shukrullo, 2012). The corpse of the soldier called Ulmas is brought in the play and the story of so many soldiers who have been dying in the wars of colonization are told. The confused fates of Mels, Ashrafiy, Jamila, Azim and Kholikulov are directly portrayed in the play. All the heroes except Mels are divided into two groups – the positive and the negative. This very situation in the play shows that the audience and readers should pay more attention to the complex character in the dramaturgic play, the various colorations in the character of the hero with inner conflicts causes a surge in the interest to the further sequence of events in the play. It is true that "there are such characters in plays that are identical to each other with their attitudes towards society and life as well as their behavior and actions" (Abdusamatov, 2000). Hence, one cannot criticize the fact that authors classify heroes into certain types. Nevertheless, Mels who possesses a special character in the play has not been developed further. He gives up without fighting when he could fight and strive towards his goals. Mels's character is very complex. He is represented as the person who possesses true love and pure feelings at the beginning of the play. He loves Jamila from the deep of his heart with pure intentions without intending to satisfy any personal interests and his love has been reciprocated. Jamila also loves him so much. Their relationship arises such a feeling of love among the audience that it encourages spectators to envy them in a positive manner. In as much as, the feelings of admiration, spat, jealousy and trust in their relationship are experienced in the same sincere way. But the main risk factor to their relationship is the fact that Mels's father is to blame for Jamila's father's death. Jamila does not feel hatred towards Mels when she finds out this truth, she doesn't blame him, but she, as a conscious and proud person, realizes deeply that she cannot be with the murderer of her father. Because, this approach would not fit her values. Even though Mels was represented in a positive light at the beginning, his inner world became more and more evident as the sequence of events developed. He serves the system in which he was brought up with loyalty and he treats its enemies cruelly. Perhaps, it is impossible to criticize him from the principal point of view. However, it was not possible to find him innocent from the humane and spiritual perspective. The reason is that he confuses the true feeling of conviction and duty with disloyalty, hypocrisy, slander and disrespect towards his own nation. He becomes friends with Azim and Ashrafiy and informs the top political organizations of their views. He give every opinion a political coloration. Furthermore, he takes a dogmatic approach towards the ideas he believes. He was completely under the influence of fanaticism. Obviously, there is no absolute truth in real

life. Every event has its own pros and cons. It is possible to take a rational and objective approach to each event and interpret it deriving from the existing circumstances. But Mels used to estimate every single act beyond the existing situation, and jumped to conclusions without thinking about consequences of an oppressive regime. He started to realize that it was wrong to liquidate people for unworthy reasons and take an irresponsible approach towards other people's fate when there was a risk for his own life. Nonetheless, the fact that Mels commits a suicide without any apparent reason and the fact that the main event that expresses the play's idea happened with Kholikulov and as a result of the confusion over the ideological direction, there is an imbalance between the inner conflict of the hero and the conflict of the play. However, "the playwright should generalize the disagreement that lies under the dramatic conflict and the conflicts in the inner world of the personage and reveal the interrelationship between them. Because, the inner conflict is the triggering force of the character and it is the source that increases its activity in the plot." (Yuldashev and Tulyakhodjayeva, 1990). The abstractness of the concrete main hero leads to the abstractness of the plot's direction. As a result, one will have an impression that there are some events that express a certain idea rather than expressing ideas on the basis of events. In other words, the prose-related feature comes into existence in the play first rather than dramatic and theatre-related characteristics.

The character of the hero is researched more deeply and thoroughly in the psychological dramas among dramatic plays. Usually, a particular social event is chosen and its effect on the psychology of people is discussed in such type of plays. The play "The distance of stone's throw" by the author Usmon Azim, with its multilayer problematic feature, became a real phenomenon in contemporary Uzbek dramaturgy. The conflict in the play is the role of the spiritual and material wealth in people's lives, everybody's inner spiritual values, the living principle and the truth they are striving to. The playwright tries to reflect life as it is and to create the spiritual portrait of their contemporaries. Indeed, there is an ongoing conflict going on between material well-being and a spiritual development. Consequently, the wars, global problems and behavioral crises are widespread all over the world. Surely, anyone who read the play and watched the performance staged by the director V.Umarov will naturally contemplate about their life, and the life in society in which they are living. The author will come up with the heroes of the play deriving from the prototypes of various people we can meet in real life. They are similar to each other in appearance, their way of thinking, but differ from one another regarding their dreams and unattained goals. These characters are various and complex like life itself. "The liveliness of the character is the main factor that ensures the play's permanency." (Galsworthy, 2010). If we look at the essence of the issue more deeply, the playwright raises the classic conflict between two forces: goodness and evil. The negative hero Shokir is at the centre of the play's events and ideological direction. He acquired a significant amount of money by committing crimes. He sold his heart to the devil. As the author portrays, he did it consciously. It is understood from the events of the plot that Shokir who had a hard time and lived in poverty since his childhood aims to be wealthy. Becoming rich no matter how became the meaning of his life. As a result, he becomes so skilled in how to manipulate money that he made people who were interested in money work for him and ordered them what to do. The author made an effort to reveal the problems present in various layers of society in the example of one family. The atmosphere of the play is sad from the beginning to the end. It is implied that every hero considers themselves to be unhappy based on their speeches and thoughts about themselves. The name of the play originated from the father's dream whose three sons are the main heroes. The old man has lived all his life with a dream of going to Samarkand which was located in a close proximity. Not being able to go to Samarkand is definitely a surprising case for the person who lives in Uzbekistan. The participants in a play were also shocked to hear this. The author reveals the reasons of this by researching the three sons' characters. The investigation of these characters leads to the obvious expression of the main problem of the play. The old man's eldest son, Jura was the farm's director. He is one of the officials. He can't provide his family financially even though he works day and night as he is an honest man. His lifestyle doesn't resemble that of officials'. Shokir's worldview is completely different although they are brothers by blood relationship. He would do anything to acquire wealth. The brothers' character, their true principles and their hopes as well as dreams are demonstrated in their conversation:

"Jura: Our community has been investigated 7 times so far this year. They couldn't find any fault to accuse me. They tried to blame of something. I didn't bribe them. I am a man of principles. I won't give a penny to dishonest men.

Shokir: You won't accept bribes as well...

Jura: I won't!...

...Shokir: Why don't you live in abundance?...

Jura: I have been assigned a salary...Moreover, everyone has their own destiny. For example, you disappeared for 20 years...

Shokir: I left this village saying “I won’t come to my hometown unless I become rich”. I became wealthy, so I returned. Living in poverty doesn’t differ from living in prison. The only freedom is money. I don’t respect people who chase after money. Money should serve people... I am sorry bro, but you have so few such servants. I am not talking about your community’s money. It’s people’s money. You must have your own servants.

Jura: I am a man of ancient values. I think we should serve our people and nation anyway. Any person lives his life regardless of the fact whether they are full or hungry. It is a shame to live in abundance while so many people are hardly earning a living...” (Azimov, 2011).

“It is a particular sort of character that shows of what sort the choice is; hence character has nothing to do with speeches in which there is nothing of a general sort which the one speaking chooses or rejects” (Aristotle, translated by Joe Sachs, 2006). What two brothers want is evident from their conversation and this shows that there is a wide disparity between their worldview, character and values. It is impossible to judge them and say that one is morally right and the other is not in this argument. Looking at the issue from the perspective of the general truth, Jura’s honesty has been approved by wise men over thousands of years; honesty is the reason why human beings exist in this life. No matter how true this path is, any person who realized that one should live honestly sees that the present day society puts more emphasis on materialism than spirituality, people who have higher financial status are controlling others and honest people are increasingly becoming poor and consequently they are being left in a very poor condition. Shokir is represented as a figure who is very complex and full of conflicts in the play. As he is blunt, rich and since he expresses the problems faced by many people openly, he orders anything he wants and says anything that comes to his mind in order to laugh at and offend his friends. He is well aware of the fact that he doesn’t have friends. In fact he says: “A person who is involved in dealing with money doesn’t have any friends”. In the example of this play, we can see that the idea which states “Plot is the history of character, it develops character and the events of the plot are the means of creating character” is not that correct. The events of the play develop sometimes due to the heroes’ special characters and their individual approach to a particular occasion. In other words, the hero’s choice in the play and his striving towards his goals serve as a stepping stone in the development of particular events. The events develop consistently as a result of needs. One can observe it in the example of the old man’s youngest son Kosim in the play “The distance of stone’s throw”. He tells anyone what he thinks. Kosim’s words and behavior in the play show that there is no slightest element of dishonesty. Specifically, his quote: “We should love Allah unconditionally” is an example of this. Most of these people seem like those who have entered a shop. I pay to you, let me enter the paradise...” (Azimov, 2011). In harmony with these words, Kosim tells Eshmatov and Boltaboyev that they are criminals and involved in bribery. One thought arises at this point if Kosim didn’t have any secrets to hide from everyone. When the mine exploded in front of him in the war and he couldn’t have kids, in one word, would he be able to follow this path if he had something to lose in his life? It is possible to understand it when we replace him with the person of different personality, the one who is weak-willed and afraid of officials in this situation and make a comparison between them. If the situation is like the one mentioned-above, and if the hero’s character was different, he would not show any resistance or become totally depressed. Kosim preferred to free the world of one evil as the death was unavoidable... It is possible to realize by looking at the play deeply that the person ought to want goodness regardless of in what situation they are in and no matter who they are. It has been obvious that the consequences of crimes would be devastating after Shokir’s son who is very powerful and who achieved a lot of things in life was eventually arrested with accusations of drug dealing. And Shokir who used to not respect anyone started to panic. He was ready for all so that his only son’s life would be saved. Events make the play exciting to watch for the audience meanwhile characters develop the ideological aspect of the play. The author reveals the heroes’ inner world depending on their attitude towards existing situations and the conclusions they draw. The heroes’ nature that has been revealed consistently gives the audience a hard time and encourages them to understand the essence of this life deeply and understand the self. Certainly, only the figurative expression of an idea and the realistic end of events can make some ideas we have heard of so many times including honesty and dignity great. The play “The distance of stone’s throw” became one of the plays that looked global problems more vigilantly in the example of one family. The fact that none of the heroes of various destinies are happy make the audience come to know that the concept of absolute happiness is relative and that the person can realize the notion of happiness only when they gain insights to their inner feelings, their principles in life and when they give up the quality of being self-centered and live for the happiness of community.

Aristotle divided characters into four groups. According to this classification, the hero should be a gentleman, characters should be special; characters should be real; characters should be consistent (Aristotle, translated by Joe

Sachs, 2006). There are a lot of plays that satisfy above-mentioned criteria in contemporary Uzbek literature. One of such plays is the comedy "Life is behind the door" by Salokhiddin Sirojiddinov. The events of the play are connected with science-fiction and mystics. The main hero Bahtiyor's dream is also to achieve true happiness. The author did not portray the hero as a poet without a reason. Inasmuch as, the poet is the person who sings the humanity, great feelings, goodness and spirituality. It will become evident from the events that the poet didn't know people well. That's to say, he thought that all people said what they thought. He loses his concentration because of a single unusual and wonderful event. It became clear that people were not as simple and sincere as he thought. The woman in white whom he saw in his childhood comes up to Bahtiyor again when her hair becomes grey and tells him that she can't give the key to the door he asked for and tells the poet that he was mistaken in life. In spite of this, she gives one more opportunity to the owner of a sincere heart and promises him to realize his three wishes. Through this very quality, Bahtiyor gets to know the character of his wife in the first place as well as the personality of his neighbors and the head of the neighborhood. The author reveals the negative characteristics of heroes in the play with means of laughter. One of the privileges of comedy is that it strives to make the negative qualities in the character disappear with the help of laughter. Even though, no one considers themselves to be fool in this life, it is only natural for them to find themselves in foolish situations sometimes. This usually happens out of hurrying or actions carried out without thinking. All the participants' character apart from the main hero's are described in two interpretations. Contrast is given very convincingly and lively, each spectator and reader sees himself or the people surrounding him in the example of characters who are being represented. Indeed, if it is mentioned consciously, all the people try to behave well and show all the positive qualities of theirs in the public. However, the true face of a man is revealed in his attempts to satisfy his needs and interests. In the play, Ravshan does not worry about his wife's case of being dumb; he tries to make the most of this situation. He tries to get several things from Bahtiyor by accusing him of making his wife dumb. The head of the neighborhood talks about the interests of the neighborhood but he wants to acquire everything by being a wolf in sheep's clothing and he wants Bahtiyor to do what he says. Even Bahtiyor's wife who has lived with him so many years doesn't understand him. She only thinks about wealth and live extravagantly. Probably, living a good life may be the dream of majority, indeed. But, sacrificing the person one loves for the sake of wealth is to what extent humane? It is true, the door through which Bahtiyor and the woman in white had a conversation and what kind of life is there behind the door is not expressed clearly in the play, it is complex to comprehend that this is a miraculous power as it has not been justified sufficiently. Besides that, one should not forget one truth, even though dramaturgy is the basis of the performance, the dramaturgy cannot be interpreted as the performance itself. The director's unique solution in the staging process has an important role to play. For example, there is a difference between the end of this play and that of the performance. According to the play, Bahtiyor gets fed up with people who only think about their personal interests and doesn't want to live among them, so he prefers to fly to the sky and disappears at the end of the play. Inside the locked iron gates, his wife who had been looking after her son with fever was left alone. On the other hand, Bahtiyor doesn't accompany the woman in white even if she insists and tells her that he doesn't want to go to the other side of the door where he was going to take the key and says he is mistaken. Actually, the real life tells us that the real life is in the inner world of each of us and that the person can't find happiness in this world if they cannot find their selves and their real life. It is not at all surprising if this is the real theatrical solution. Hence, the theatre should express the clear patterns of hero's fight and destiny deriving from the idea of the play rather than leaving the audience in dilemma with the abstract end.

The play "Dance in Uzbek style" by Nurilloh Abboskhon has become a phenomenon among the comedies written in the independence period. This play succeeded in to some extent in the research carried out towards creating the character. The principal attention there is drawn to an Uzbek mother named grandmother Kumri and the Russian girl who was ready for everything to achieve happiness and bright future. Maria goes far away from her parents for the sake of her lover, Tursunboy. Definitely, she thinks about living a happy life with her lover in her imagination. But the thought that she is coming towards another nation, other people, different circumstances and different traditions doesn't cross her mind. She starts to imagine that she will face many difficulties after her first meeting with her mother-in-law. But she doesn't become afraid. She begins to fight for her happiness. This very fight starts to surge the audience's interest. It is true that grandmother Kumri does not do her any harm. But she becomes upset as her only son got married to a girl of different nationality. Because, she was very loyal to her national values, she used to practice the traditions loyally and she was a typical Uzbek woman who wanted the traditions to reflect in every minute of life. It is obvious, conflict does not always occur between positive and negative forces. Occasionally, two good people whose way of thinking and worldview are different can misunderstand each other. In addition, concepts like pride and shame may prevent people from admitting that others are right. In this very play, there are such cases in which the mother-in-law insists on what she says whereas the daughter-in-law tries to keep her self. It is

impossible to say one is right and another one is wrong and mention them as enemies here. The mother-in-law treats her daughter-in-law strictly as she wants her to comply with Uzbek traditions in the eyes of her neighbors and preserve the values that made her happy by teaching them to her daughter-in-law and since she sincerely wants her grandchildren to be happy. Even though the daughter-in-law wants to be happy with the son of a different nationality, she wouldn't like to forget her national values and forego her identity. As this is the case that is understandable for everyone, the conflict between them makes the audience laugh. The audience want them to kiss and make up and find their happiness. Maria acquires the name Maryam. She gets used to the local lifestyle slowly. As a result, Maryam who has a son, a daughter-in-law, and grandchildren becomes a housewife mother-in-law owing to the traditions she learned from her mother-in-law. The play covers the lives of several generations, it shows processes from Maryam's childhood till she becomes a senior citizen. It is true that not all events in this process are represented in sequence, but the events that reveal the playwright's idea are shown consistently. "We often talk about the infinity of the artist's imagination. In fact, there is a clear limit to both height and length of the artist's imagination no matter how great and wonderful their flight is. The limits are placed by historical time" (Sakhnovskiy-Pankeev, 1969). One of the playwright's important responsibilities is to indicate the period in which events are taking place. The very period shows how important or controversial the events described by the playwright are. Looking at the issue from this perspective, the description of complex 80s justify the fact that Maryam stayed with her mother-in-law despite so many difficulties. Nonetheless, the grandmother Kumri's hard working habit, sincerity and her kindness as well as mercy towards her neighbors always stayed in Maria's heart. The situations to which heroes are exposed are slightly exaggerated in comedies. In spite of this, it will become obvious from the hilarious situations of heroes that they have the sincere and pure hearts. As a result, the audience falls in love with them as if they are their close people. The audience's love grows stronger towards them as they laugh at every possible hilarious situation of theirs. One of the achievements of this play in which friendship between nations and love among people are described is that people who do dirty tricks and intriguers cause the relationship between the mother-in-law and the daughter-in-law to be closer. Co-operating against people who do dirty tricks brings them together. This, in turn, ensures the consistency of given events and creates the basis for characters to develop and become clearer as events take place.

**The theoretical foundation of character formation.** As it was mentioned above, characters provide the ideological direction of the play and the basis of the conflict. This case is the important feature in all plays. It is true, characters are not portrayed the same in all plays. It is possible to say agreeing with the views of Volkenstein, there are two ways of expression of characters in the dramaturgic play. First, the character rich in psychology that becomes obvious to the audience slowly. Second, as it happened in the commedia dell'arte, the fixed characters (divided into two groups via masks)" (Volkenstein, 1969). Almost in all plays in Uzbek dramaturgy, characters are interpreted in the first way. Certainly, not all of them achieved the same level of success. From one perspective although the issue of skills may seem to be the primary reason for this, actually playwrights pay too much attention on the format of the play and forget about the content. Thin in turn leads to discontentment towards playwrights in their efforts to create the character. According to Mamur Umarov, complaints to the creator of characters are expressed in four ways:

- ❖ For the portrayal of unimportant things;
- ❖ For portraying something against the common sense;
- ❖ For expressing something against their own opinions;
- ❖ For expressing something against the rules of art" (Umarov, 2014).

One can add the following agreeing with the ideas of M. Umarov, there might be a complaint if the playwright describes something against life! Certainly, the formation of such complaints derives from the definition of characters on the basis of certain requirements. The pitfalls in the dramaturgic play will be evident as a consequence of the partial accomplishment or total failure of demands, and this, of course, directly depends on the character. As M. Umarov talks about the above-mentioned criticism, he expresses his opinions on the definition of characters in literary books. In his opinion, the analysis of the character starts with collecting data about personage in three stages and it is accomplished as follows. The first – the definition given to the personage by the author – gender, age, profession, the living atmosphere are gathered from the play and remarks about it. Next, ideas, descriptions and comments about the personage made by others are sorted out and written. Thirdly, the opinions from monologue told by the personage himself are chosen and copied down" (Umarov, 2014). Certainly, it is possible to identify the participant's figure clearly through the means mentioned in the process of analysis by the scientist. Compared to the examples provided above, if we look at these methods, it is inferred that the first impression about the hero is developed from the first description of the hero by the author. Other's opinion of the personage and their own

opinion about themselves give certain ideas about the features of the character. However, these only are not sufficient to get to know the hero's character truly and thoroughly. Because, other's opinion about them depends on how they present themselves to others. Usually, it is possible to understand via real-life examples, any person wears a particular mask in the society. They might not have revealed their heart even to their close people including their parents, spouse, children and friends and they may have concealed certain aspects of their character. Moreover, it is possible to get to know one's character clearly from the way they describe themselves. Even the people's opinions of themselves when they are alone may not be the whole truth in their hearts. In most cases, in both real life and in the performances that are literal replications of real life, people prefer to boast and listen to their wants and needs rather than their conscience. It is possible to observe that people even commit a sin and try to lie to their conscience by stating that they were doing it in order to accomplish something good, with good intentions. Therefore, there is a need to add several processes to these cases in order to fully reveal the hero's character. Firstly, the hero's opinion about others. It is usually derived from the way heroes estimate others, their choices about how to choose people and their objectivity in assessing people. Secondly and most importantly, when the hero is left in a dilemma when they have to choose their own interests or other people's interests. Actually, "there is an element of fast pace of life that is typical of the modern world in the power of interests" (Sagdullayev, 2012). The primary reason why this is the most important factor is that people can express positive opinions about themselves and other people and others may know only good sides of them. Nevertheless, their true face is revealed when they are left in front of the real choice and this element is present in all classic and ideal plays. The research shows that leaving the hero in front of the choice, in majority of cases, is the peripeteia of the dramaturgic play. When the events that are beyond the hero's control suddenly take place under the influence of external factors, the events of the play develop in a totally unexpected direction and the hero's character is fully revealed. It is a pity to mention that this very feature is lacking in the plays that are being written in modern Uzbek dramaturgy is subsequently resulting in the fact that the hero's character becomes abstract and disappearance of sharing their problems and following them on the part of audience. It is well-known that the playwright cannot carry out in-depth analysis of all hero's characters in literary plays. It is for sure that if all the participants' characters are created perfectly and if they are not similar to each other and if each of them has a special feature. But accomplishing such a task is very difficult. Hence, in most cases only the main hero's character is developed and secondary heroes are reflected in particular simple templates. Especially, playwrights almost do not think about episodes. Therefore, when one talks about a particular famous actor, people state how skillfully they played a particular episodic role and how they developed a small role into the level of a figure. Because, actor find certain characters for this episode and they expand it depending on their horizon. But the playwright should develop the character of episodes to some extent so that they would become a force that direct other heroes in their mutual relationships and the power that means a certain truth. In a nutshell, the heroes who do not make a big difference and who just serve to attract the audience's attention are not needed. Such personages may confuse the audience from the main idea of the performance and be an obstacle to the consistent development of events. Nonetheless, another objective reason makes it necessary to express the main hero's character more and thoroughly in the play. This is related to the fact that one play is dedicated to the complex process of a certain individual and that it emphasizes all the details connected with the solution to the problem. Hence, almost all theorists claim that it is important to find the main hero's character. Specifically, Volkensteins recommendations on identification of the hero's character are worth noting:

1. According to their puposes and what they want;
2. According to the types of battle in words and actions. For instance, someone may try to achieve their goals by asking other people gently and begging them whereas others use threat and violence to do so;
3. According to temperament. That's to say, their attitude towards events or their perception of something;
4. According to their speech" (Volkenstein, 1969).

### **Conclusion:-**

Having summarized all the opinions of theorists on the character, the main and reliable method of identifying the hero's character in a dramaturgic play can be considered to be determining their goals and to what they are striving to achieve. People can sometimes make a mistake, follow the pursuit of their wants and occasionally do something bad against other people intentionally. Nonetheless, what dreams they have, to what they are striving to, what they want from the deep of their hearts identify their true face in their colorful character. "Drama – the type of art that describes determination" (Afinogenov, 1957) people's minds must mature and achieve perfection with the help of it. People must be able to look critically and objectively at their actions, they should live in this world not only thinking about their own satisfaction and joy but also be able to do good deeds and turn it into their daily activity. The main task before playwrights, specifically, present-day Uzbek playwrights is to develop moral framework for today's people and make the common interests the main priority in this framework. This in turn means that forming a

character is one of the primary problems in dramaturgy, and by only solving this issue, one can achieve their goals in creating a perfect play and convert the theatre into the social institute that is beneficial to people.

##### Manuscript History

Received: 14 December 2016  
 Final Accepted: 14 January 2017  
 Published: February 2017

##### Key words:-

quinones, binding, Benesi Hildebrand Plot, UV/Vis spectroscopy.

#### Abstract

Two Ruthenium(II) polypyridyl complexes  $[Ru(NN)_3]^{2+}$  [(NN)→bpy, dmbpy] were synthesised. The binding interaction of these ruthenium complexes with para quinones have been studied by absorption spectral technique. These metal complexes have the absorption maximum in the range of 448 - 458 nm. They have the emission maximum in the range 590-610 nm. The binding constant ( $k_b$ ) for these complexes are determined from the Benesi-Hildebrand equation using the absorption intensity data. Structural effect plays an important role in the binding of the quinones with the complexes.

#### Introduction:-

Quinones are ubiquitous in nature. p-quinones are important molecules in biological electron transport. They act as electron acceptor in photosynthesis [1-3]. They are well known for their cytotoxicity. They have very high toxicological and pharmacological effects. They are used as anticancer drugs. They have antiviral, antifungal properties. Quinones have the capacity to accept electrons and are easy to protonate. They form stable hydrogen bonds. Due to their high mobility and small size, they have the property to get reduced. In order to understand the electron transfer properties of quinones, several photosensitizers have been designed. Inter and intra molecular electro transfer reactions have been studied. Their properties can be changed on complexation with proteins [4]. Transition metal complexes have received a considerable amount of attention over the past three decades [5-7]. Of these, particularly ruthenium (II) polypyridyl complexes have received much attention due to its tunable photophysical and photochemical properties. These complexes have a potential application in the field of photochemistry and biochemistry [8-10]. Recently reports show the advantages of ruthenium complexes in the field of cellular imaging and act as anticancer agents [11-14]. They act as good photocatalysts, particularly in the splitting of water molecule into  $O_2$  and  $H_2$ , used in dye sensitized solar cells and used in photodynamic therapy. We present here a comprehensive study of interaction of ruthenium polypyridyl complexes with quinones in aqueous medium by using UV/Vis spectrophotometric parameters.

#### Experimental methods:

##### Materials:-

The ruthenium polypyridyl complexes  $[Ru(NN)_3]^{2+}$ , where NN = 2,2'-bipyridine (bpy) and 4,4'-dimethyl- 2,2'-bipyridine (dmbpy) were prepared by reacting  $RuCl_3 \cdot 3H_2O$  with the corresponding ligands according to the known procedures [15,16]. The ligands and quinones used for this present work were procured from Sigma Aldrich. Binding studies were carried out using double distilled water. All experiments were carried out at room temperature.

**Corresponding Author:- T. Sumitha Celin.**

Address:- Department of Chemistry & Research Centre, Scott Christian College (Autonomous), Nagercoil, Tamilnadu, India.

**Spectroscopic Measurements:-**

The absorption spectral measurements were carried out using SYSTRONICS 2203 Double beam Spectrophotometer. Emission intensity measurements were carried out using JASCO FP 8600 spectrofluorometer. The structure of the quinones used in the present study was shown in fig 1.

**Figure 1.** Structure of Quenchers; (a) 1,4-benzoquinone  
(b) 2,6-dimethyl -1,4- benzoquinone (c) 2,5-dimethoxy -1,4-benzoquinone.

The binding of  $[\text{Ru}(\text{NN})_3]^{2+}$  with various concentrations ( $4 \times 10^{-6}$  –  $2.8 \times 10^{-7}$  M) of quinones have been studied by absorption spectral techniques. The binding constant ( $k_b$ ) of the  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes with quinones were determined from Benesi-Hildebrand equation [16] using absorption intensity data [17].

$$1/\Delta A = 1/K_b \Delta \epsilon [H] + 1/\Delta \epsilon [Q]$$

Where  $\Delta A$  is the change in the absorption of the complex with various concentrations of  $[Q]$  of the quinones. The plot of  $1/\Delta A$  versus  $1/[Q]$  gives a straight line and the binding constant  $k_b$  is calculated from the ratio of y intercept to the slope of the straight line.

**Results and discussion:-**

The absorption spectrum and emission spectrum of  $[\text{Ru}(\text{bpy})_3]^{2+}$  in aqueous medium is shown in fig. 2. The complex shows a ligand Centred (LC) absorption peak of high energy at 290 nm which is due to the promotion of electron from  $\pi_L$  to  $\pi_L^*$  and a metal to ligand charge transfer (MLCT) peak at 448 nm. The weak shoulder around 320 nm corresponds to the metal centered (MC) transition from  $t_{2g}$  to  $e_g$ . The complex  $[\text{Ru}(\text{bpy})_3]^{2+}$  has the emission maximum at 596 nm.

**Figure.2:-** (a) Absorption spectrum and (b) Emission spectrum of  $[\text{Ru}(\text{bpy})_3]^{2+}$  complex in aqueous medium.

Table 1 gives the photophysical data of the two  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes. The red shift in the LC and MLCT transition, on the introduction of methyl group to the parent ligand bipyridine is due to the lowering of the excited state energy. The introduction of dimethyl ligand results in the red shift in the absorption maxima from 448 nm to

458 nm to the tune of 10 nm, while the emission maxima is red shifted to the tune of 8 nm in homogeneous medium.

**Table 1:-** Absorption maximum, emission maximum and lifetime of  $[\text{Ru}(\text{NN})_3]^{2+}$  in aqueous medium

Complex	Absorption maximum(nm)	Emission maximum(nm)	Lifetime(ns)
$[\text{Ru}(\text{bpy})_3]^{2+}$	448	593	*650
$[\text{Ru}(\text{dmbpy})_3]^{2+}$	458	605	*360

\*Data taken from the published report[18]

Electronic absorption spectroscopy is an important technique to explore the interaction of metal complex with p-quinones. In order to compare the binding strength of the  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes with quinones, the intrinsic binding constant ( $k_b$ ) were obtained to monitor the changes in the absorption intensities at 290 nm. The absorption spectra of  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  with incremental addition of 1,4-benzoquinone in aqueous medium is shown in fig. 3.

**Fig. 3:-** Absorption spectrum of  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex with incremental addition of 2,6 –dimethyl -1,4 benzoquinone in aqueous medium.

The absorption spectral studies of  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes show a steady increase in the LC and MLCT absorption maximum, with incremental addition of 1,4-benzoquinone, 2,6-dimethyl-1,4 benzoquinone and 2,5-dimethoxy-1,4-benzoquinone. These results indicate the formation of ground state complex. Addition of 1,4-benzoquinone to the  $[\text{Ru}(\text{bpy})_3]^{2+}$  complex increases the absorption at 290 nm and 448 nm, showing the binding of the quinone to the complex. All the quinones show a weak absorption near the MLCT absorption of the complex. So the quinones bind with the LC and MLCT absorption peaks of absorption peaks of  $[\text{Ru}(\text{NN})_3]^{2+}$  complex in the ground state [19]. The  $k_b$  values of  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes with the quinones 1,4-benzoquinone, 2,6-dimethyl-1,4-benzoquinone and 2,5-dimethoxy-1,4-benzoquinone are tabulated in table 2.

**Table 2:-** Binding constant,  $K_b$  ( $\text{M}^{-1}$ ) for 1,4 benzoquinone , 2,6 –dimethyl -1,4 benzoquinone and 2,5-dimethoxy -1,4 benzoquinone with  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes in aqueous medium.

Quinones	$[\text{Ru}(\text{bpy})_3]^{2+}$	$[\text{Ru}(\text{dmbpy})_3]^{2+}$
	Binding constant $K_b$ ( $\text{M}^{-1}$ )	
1,4 benzoquinone	$1.748 \times 10^4$	$2.729 \times 10^4$
2,6 - dimethyl -1,4 benzoquinone	$3.138 \times 10^4$	$5.412 \times 10^4$
2,5- dimethoxy -1,4 benzoquinone	$3.337 \times 10^4$	$9.754 \times 10^4$

The binding constant of  $[\text{Ru}(\text{bpy})_3]^{2+}$  complex with 1,4 benzoquinone and 2,6 –dimethyl -1,4 -benzoquinone are  $1.748 \times 10^4$  and  $3.138 \times 10^4$  respectively. There is an increase in the intrinsic binding constant value for  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex of  $2.729 \times 10^4$  and  $5.41 \times 10^4$  for the same quinones. The binding constant value for  $[\text{Ru}(\text{bpy})_3]^{2+}$  complex with 2,5-dimethoxy -1,4- benzoquinone is  $3.337 \times 10^4$  and  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex has a value of  $9.754 \times 10^4$  for the above said quinone. These datas show that the  $K_b$  values increase on moving from 1,4-benzoquinone to 2,5-dimethoxy -1,4- benzoquinone. The value of the binding constant increases when the ligand of the ruthenium complex is changed from bipyridine to dimethyl bipyridine.

Benesi-Hildebrand plot on MLCT absorption of  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex with incremental addition of 1,4-benzoquinone is shown in fig 4. The plot of  $1/\Delta A$  versus  $1/[\text{Quinone}]$  gives a straight line. The binding constant,  $k_b$  of 2,5-dimethoxy - 1,4-benzoquinone with  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex can be obtained from the ratio of y intercept to the slope of the straight line.

**Fig.4.** Benesi –Hildebrand plot on MLCT absorption of  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex with incremental addition of 2,5-dimethoxy -1,4- benzoquinone in aqueous medium.

The ground state interaction between the quinones and the bipyridine ring of  $[\text{Ru}(\text{bpy})_3]^{2+}$  complexes are hydrophobic and  $\pi$  –stacking in nature.  $\pi$ - $\pi$  stacking interactions exist between the ligands of the Ru(II) complex and the quinones, so the binding also becomes stronger. Binding occurs in the LC and in the MLCT absorption maximum of the complex in the ground state. The  $k_b$  calculated for the quinones shows that, the  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes bind strongly to 2,5-dimethoxy -1,4-benzoquinone than that of 2,6-dimethyl-1,4-benzoquinone and 1,4-benzoquinone.

### Conclusion:-

In this chapter a comprehensive study was carried out to study the binding interaction of  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes with p-quinones in aqueous medium by using absorption spectral techniques. The binding constants were calculated using Benesi – Hildebrand plot. The experimental results show that the binding of the  $[\text{Ru}(\text{NN})_3]^{2+}$  complexes with p-quinones depend on the size of the ligand as well as the quinones. Of the two complexes,  $[\text{Ru}(\text{dmbpy})_3]^{2+}$  complex shows the maximum binding interactions with the quinones. The binding of  $[\text{Ru}(\text{bpy})_3]^{2+}$  complex with 2,5-dimethoxy -1,4-benzoquinone shows a high value of binding constant  $3.337 \times 10^4$  which shows that this interaction is stronger than the other two quinones. This may be attributed due to the bulkiness of the quinone. The binding constant of  $[\text{Ru}(\text{bpy})_3]^{2+}$  complex with 1,4-benzoquinone is  $1.748 \times 10^4$  which is the lowest value, which shows the smaller size of 1,4-benzoquinone when compared to the other quinones.

#### Abstract

**Background:** Electrophysiological studies are playing useful and valuable role in the diagnosis and prognosis of lumbosacral radiculopathies. The correct diagnosis of lumbosacral radiculopathy is very essential for administration of timely and appropriate treatment. H-reflex is one of the types of electrophysiologic studies helpful in diagnosis of lumbosacral radiculopathies. Hence, it is reasonable to evaluate the diagnostic efficacy of H-reflex study in lumbosacral radiculopathy.

**Objectives:** The present study was undertaken to evaluate the diagnostic efficacy of various parameters of H-reflex in lumbosacral radiculopathy

**Methodology:** In this cross-sectional study, a total of 283 subjects (168 males and 115 females) aged 40 years and above who were clinically diagnosed as having lumbosacral radiculopathy were enrolled after getting ethical approval and informed written consent. All the patients were subjected to electrophysiological evaluation using RMS EMG EP Mark –II machine in Clinical Neurophysiology unit, Department of Physiology through which their H-reflex study was conducted.

**Result:** No statistically significant difference was observed between right and left sided values for all the H-reflex parameters tested ( $P > 0.05$ ). All parameters were found to have reliable sensitivity, specificity and accuracy in diagnosing lumbosacral radiculopathy

**Conclusion:** H-reflex studies are useful supportive diagnostic tool for lumbosacral radiculopathy.

#### Introduction:-

Radiculopathy is one of the most common causes for referral to the electromyography (EMG) laboratory. Studies have reported that lumbosacral radiculopathy affects 4-6% of the population at some point in their lives<sup>1</sup> and it has also been shown that L4-5 and L5-S1 are the most common level affected in lumbosacral radiculopathy. This disease is commonly caused by the compression of nerve root while coming out of the intervertebral foramen.

The diagnosis of lumbosacral radiculopathy is somewhat difficult which is usually done by employing radiological imaging techniques, electrophysiological evaluation involving nerve conduction studies and EMG, and rarely cerebrospinal fluid (CSF) examination.<sup>2</sup> Radiological imaging can usually recognize the presence of anatomical lesion compressing the nerve roots however, it is important to note that radiculopathy may occur without a structural

lesion seen on radiological imaging. In such cases additional investigation like electrophysiological study is usually required.

Electrophysiological studies are playing useful and valuable role in the diagnosis and prognosis of lumbosacral radiculopathies. In cases with negative and aberrant radiological and clinical findings, electrophysiological studies are particularly useful; whereas in cases with positive radiological and clinical findings, it plays a complementary diagnostic role. The correct diagnosis of lumbosacral radiculopathy is very essential for administration of timely and appropriate treatment.

Late response study which is one of the type of electrophysiologic study allows assessment of the functional state of the proximal portions of the peripheral nerves, which are affected to a varying extent in the course of lumbosacral radiculopathy. H-reflex is one of the types of late response in electrodiagnosis which was first described by Hoffmann<sup>3</sup> in 1918. M-latency, H-latency, H-M latency, H-amplitude are the various parameters of H-reflex study that can be taken into account while analyzing it.

As the appropriate and correct diagnosis can minimize pain, discomfort, disability, and the direct and indirect costs of care due to this disease, it is reasonable to evaluate the diagnostic efficacy of H-reflex study in lumbosacral radiculopathy. Therefore, the present study is undertaken to study the usefulness of various H-reflex parameters to diagnose lumbosacral radiculopathy.

### **Materials and methods:-**

The present cross sectional study was performed in a total of 283 subjects aged 40 years and above who were clinically diagnosed by the consultant orthopedic surgeon as having lumbosacral radiculopathy. We have excluded the subjects with diabetes mellitus, clinical or electrophysiological evidence of polyneuropathy, myopathy, myelopathy, neuromuscular transmission disorders, having symptoms of less than 3 weeks duration, in whom spinal surgery was performed within the preceding 15 years and the patients with local injuries/lesion that may interfere with the electrophysiological study. A total of 168 males and 115 females were recruited in the study after getting their written informed consent. Prior Ethics approval from the Institutional Ethics committee was obtained. After doing detailed clinical and neurological examination, the electrophysiological evaluation was performed using RMS EMG EP Mark –II machine in Clinical Neurophysiology unit, Department of Physiology through which their H-reflex study was conducted. All tests were performed under constant room temperature (30°C) to shortlist the errors.

H reflexes were readily obtained using percutaneous stimulation and surface recording techniques. The stimulating cathode was placed proximally to avoid the theoretical possibility of anodal block. Stimulus pulses of long duration (1 ms) were used to preferentially activate large sensory fibers. The stimulus frequency was 1 per 3 seconds or less to allow full recovery of the H reflex from a prior stimulus. By starting with submaximal stimuli and increasing to supramaximal stimulation, we determined that: (1) the “late” response should be larger than the preceding direct motor response, (2) the H reflex with the largest amplitude, and (3) the inhibition of the H reflex with increasing stimulus intensity. Latencies were measured to the onset of the responses. For calf H reflexes, the tibial nerve was stimulated in the popliteal fossa. Surface recordings were made from the soleus muscle. Active electrode was placed medial to the tibia at a point that was one half the distance between the stimulation site and the medial malleolus, with the indifferent electrode placed on the Achilles’ tendon. Settings were kept at sweep speed 10 ms/D, intensity 2 mV, frequency 2 Hz and stimulus strength duration was 1 ms. Stimulus intensities were amplified gradually in steps of 1-2 mA until the maximum H-wave amplitude was obtained and further by 2-5 mA until the maximum M-wave amplitude was obtained. Three stimuli were live averaged for single response. Downward deflection was marked as latencies of waveforms. Minimum stimulus intensity required obtaining an H-wave and M-wave of 0.4 mV amplitude was considered H and M threshold respectively.<sup>4,5</sup>

Electrophysiological parameters evaluated were M-latency in milliseconds (ms), H-M latency in milliseconds (ms) and H-amplitude in millivolts (mV).

Structured format was used to record the observations. Statistical analysis was done by using descriptive and inferential statistics using Kappa Statistics, z-test for difference between two means and diagnostic accuracy. The study observations were analyzed to find the Specificity, Sensitivity, Positive Predictive Value and Negative Predictive Value. The software used in the analysis were SPSS 17.0 and Graph Pad Prism 5.0 and  $p < 0.05$  was considered as level of significance ( $p < 0.05$ ).

### Results:-

The age and gender wise distribution of patients and physiological variable of study subjects are shown in table 1 and 2. Descriptive statistics of H-reflex study is shown in Table 3. No statistically significant difference was observed between right and left sided values for all the H-reflex parameters tested in posterior tibial nerves ( $P > 0.05$ ). The sensitivity, specificity, positive and negative predictive values of all the H-reflex parameters is shown in Table 4. H-reflex parameters were found to have reliable sensitivity and specificity in diagnosing lumbosacral radiculopathy. Accuracy of these electrophysiological parameter was also observed to be comparable to gold standard test and by using kappa statistics fair to slight agreement was found between H-reflex parameters and MRI. (Table 4).

**Table 1:** Age and gender wise distribution of patients

Age Group(Years)	Male (N)	Female(N)	Total(N)
40-49	75(26.50%)	45(15.90%)	120(42.40%)
50-59	47(16.61%)	33(11.66%)	80(28.27%)
60-69	32(11.31%)	31(10.95%)	63(22.26%)
70-79	12(4.24%)	5(1.77%)	17(6.01%)
$\geq 80$	2(0.71%)	1(0.35%)	3(1.06%)
Total	168(59.36%)	115(40.64%)	283(100%)

**Table 2:** Physiological variable in study population

Physiological Variables	N	Minimum	Maximum	Mean	Std. Deviation
Age(years)	283	40	81	53.31	9.89
Height(cm)	283	145	180	161.42	7.19
Weight(kg)	283	40	95	62.37	7.96
BMI(kg/m <sup>2</sup> )	283	17.54	33.76	23.91	2.48

**Table 3:** Descriptive Statistics for H-Reflex study

Electrophysiological Parameters	Right Side		Left Side		z-value	p-value
	Mean	SD	Mean	SD		
M- latency(ms)	7.08	1.76	7.34	3.16	0.13	0.89
H-M latency(ms)	25.1	4.15	24.29	3.30	0.30	0.76
H-amplitude (mV)	3.85	2.29	3.39	2.23	0.20	0.84

**Table 4:** Diagnostic Accuracy of H-reflex parameters

Diagnostic Accuracy	M- latency	H-M latency	H-amplitude
	Percentage (%)	Percentage (%)	Percentage (%)
Sensitivity	50.44	61.84	49.12
Specificity	85.45	74.55	78.18
Positive Predictive Value	93.50	90.97	90.32

Accuracy	57.24	64.31	54.77
Likelihood Ratio	3.46	2.43	2.25
Kappa Statistics	0.20	0.24	0.15

### Discussion:-

The H-reflex is considered the electrophysiologic equivalent of the Achilles' tendon muscle stretch reflex. It evaluates the physiological integrity of tibial or S1 sensory path even the intraspinal course of S1 root. H reflexes involve conduction in proximal fibres, and provide a valuable technique for defining proximal nerve injury and may be abnormal even when more distal studies are unremarkable<sup>6</sup>.

Velazquez Perez L et al<sup>7</sup> concluded that H reflex was useful tools for evaluating patients with compressive radiculopathies. They found H-reflex abnormality in 77.5% of cases of S1 radiculopathy. This is in accordance with

our observation. Our findings coincides with the observations by Tsao BE et al<sup>8</sup> who reported absent H-reflex or low H-reflex amplitude in 82 % of surgically proven cases of S1 radiculopathy. H-reflex, a monosynaptic reflex can differentiate to some extent, L5 from S1 radiculopathy. Many researcher have found the its sensitivities and specificities with respect to lumbosacral radiculopathy ranging from 32% to 88%.<sup>9,10,11,12,13</sup> Similar observations are also reported by I-Hsuan Tsai and Hao-Hsuan Tsai<sup>14</sup> who narrated that abnormal H-reflex profile parameters which includes M-wave, H-wave, H/M ratio, H-amplitude etc. were associated with both current and chronic lumbosacral radiculopathy.

Our findings are identical with the observations by Marin R et al<sup>15</sup> who reported that H-reflex showing 50% sensitivity and 91% specificity in L5, S1 radiculopathy. Hesham N Alrowayeh and Mohamed A Sabbahi<sup>16</sup> studied the electrophysiological changes in H-reflex amplitude and latency in patients with radiculopathy and found that decrease in H-amplitude is earlier sign of nerve root involvement in patients with radiculopathy compared with latency. Our findings are comparable with these observations. R E Rico and E J Jonkman<sup>17</sup> reported that H-reflex was not of any value in diagnosing L5 radiculopathy. This is in contrast to our findings as we found it to be useful diagnostic tool in L5, S1 radiculopathy.

We observed a significant reduction of the amplitude of the soleus H-reflex. This might be because of loss of axons, obstruction to impulse conduction or dispersion of the afferent volley and well correlates with no elicitation of the Achilles reflex. If the H-reflex is not delayed, then it is noteworthy that changes in H-reflex threshold and amplitude occur before any slowing of conduction through the nerve.

The severity of the compression of nerve roots may explain H amplitude reduction and prolongation of H latency of Soleus H-reflex study<sup>18</sup>. Because of nerve root compression, there is insufficient microcirculation and ischemia present in lumbosacral radiculopathy, this may lead to membrane potential and ion channel changes in the nerve fiber as well as focal disturbance to myelin. Both these factors together may influence the temporal dispersal of the compound sensory afferent volley and/or axonal conduction block.<sup>19</sup> This might be the reason why did we get abnormality in all the H-reflex parameters tested in lumbosacral radiculopathy.

### **Conclusion:-**

H-reflex studies are useful and valuable supportive diagnostic tool for lumbosacral radiculopathy. All the parameters of H-reflex study have reliable sensitive and specific in diagnosing lumbosacral radiculopathy.

#### Abstract

Ophthalmic pathology is the subspecialty of pathology. It is unique in many respects as it encompasses wide range of tissues, epithelial elements, connective tissue and specialized tissues. The present study focused on most common ophthalmic lesions and to establish their accurate pathological diagnosis. The study was conducted in department of Pathology in collaboration with department of Ophthalmology, Dr. D. Y. Patil Medical College, Hospital and Research Centre, Kolhapur, on 132 cases of ophthalmic lesions received in the Histopathology laboratory during period from May 2014 to April 2016. Ophthalmic specimens were routinely processed and H& E stain was performed. The study concluded that, ophthalmic lesions reported were mostly non-neoplastic. Eyelid was the commonest site followed by cornea and conjunctiva. A wide range of lesions including some rare conditions like retinoblastoma, were studied on various parameters and histopathological features were highlighted. Many neoplastic conditions clinically mimic other less aggressive neoplastic or inflammatory conditions and needs differentiation before definitive therapy is planned. So, to establish their accurate diagnosis, histopathological correlation is important and mandatory.

#### Introduction:-

Eye is a heterogenous tissue; hence we tend to see a variety of lesions, both non-neoplastic and neoplastic with tumoral types and subtypes. It is unique in many respects as it encompasses wide range of tissues, epithelial elements, connective tissue and specialized tissue.<sup>1</sup> The goal of the Ophthalmic pathology service is to enhance communication between the ophthalmic surgeon and the pathology laboratories.<sup>2</sup> Eye and ocular adnexa is composed of eyelids, lacrimal passages and glands, orbit, conjunctiva, cornea, sclera and intraocular tissue, mainly retina, choroid plexus, iris, etc. Ophthalmic lesions are divided into non neoplastic and neoplastic. Non neoplastic lesions include the developmental anomalies, inflammatory diseases and degenerative diseases. Neoplastic lesions are benign and malignant.<sup>3</sup>

Ophthalmic specimens submitted for histopathologic evaluation are obtained mostly from eyelids.<sup>4</sup> Among eyelid lesions, dermoid cyst is commonest, followed by epidermal inclusion cyst, intradermal nevus, sebaceous (meibomian) carcinoma, skin carcinomas (basal cell carcinoma, squamous carcinoma, accessory glands carcinomas,

Address:- Post graduate student, Department of Pathology, Dr. D.Y. Patil Medical College, Kolhapur.

and malignant melanoma).<sup>5</sup> The knowledge of corneal pathology is limited. The most common diseases are endothelial decompensation, fibrosis and vascularization. Conjunctival tumors are one of the most frequent of the eye and adnexa. They comprise a large variety of conditions, from benign lesions such as nevus or papilloma, to malignant lesions such as epidermoid carcinoma or melanoma.<sup>6</sup> Lacrimal gland lesions include inflammatory pseudotumor, malignant lymphoma, and leukemia. Among the epithelial tumors, benign mixed cell tumor (pleomorphic adenoma) is the most common.<sup>7</sup> Melanomas arising from the pigmented or potentially pigment producing cells of the uvea are the most frequent primary intraocular neoplasms in adults.<sup>8</sup> Retinoblastoma is the most common primary malignancy of young children.<sup>9</sup> The histopathological diagnosis of the diseases plays an important part in patient care.

### Methodology:-

The present study was conducted in the Department of Pathology at Dr. D. Y. Patil Medical College, Hospital and Research Institute, Kolhapur . This is a prospective study conducted for a period of 2 years from May 2014 to April 2016. The patients were selected at random irrespective of age, sex, socioeconomic status and residence. The eligible patients were briefed about the nature of the study and a written informed consent was obtained from the selected patients. Findings were recorded on predesigned proforma. All the biopsies related to the ocular site were included; the tissue samples included enucleated eyes, excision biopsies, corneal buttons, fine needle aspiration biopsies and intact tissue biopsies. The samples were processed according to the standard protocol and stained with routine technique and Haematoxylin & Eosin staining was performed. Histopathological interpretation was made by correlation of provided clinical data, studying of gross morphology and light microscopic examination.

### Results:-

In present study of 132 cases, 67 cases (50.75%) were males and 65 cases (49.25%) were females with male to female ratio of 1.03:1 suggesting a slight male preponderance. The most common age group in our study was 41 to 50 years with a total of twenty cases (20.45%) out of the total cases. Ophthalmic lesions we received were mostly non neoplastic (79 cases, 59.86%) and 40.14% (53cases) were neoplastic. Out of the neoplastic lesions 30.30% (40 cases) were benign and 9.34% (13 cases) were malignancies. Site wise distribution showed maximum number of lesions were from eyelids (48 cases,36.35%). Conjunctiva was the second commonest site (38 cases, 28.77%) followed by corneal lesions (34 cases, 25.74%); orbital lesions (5 cases, 3.77%) and lesions from intraocular tissues (4 case, 3.03%). Lesions from lacrimal gland and passages were least common.

Twenty seven cases (56.25%) were non neoplastic eyelid lesions and fourteen cases (29.17%) were benign eyelid lesions out of the 48 eyelid lesions. Majority of the cases were Inclusion cysts (11 cases, 40.74%), Nevocellular nevus (6 cases, 42.85%). Seven cases (14.58%) were malignant eyelid lesions out of the 48 eyelid lesions. Majority of the cases were Squamous cell carcinoma (4 cases, 57.14%), followed by Basal cell carcinoma (2 cases,28.57%).

Thirty eight lesions were received from conjunctiva. Majority were diagnosed as CIN (14 cases, 36.85%), followed by, Pterygium, Squamous cell carcinoma and conjunctival papilloma. Thirty four cases were received from corneal lesions. Majority were diagnosed as Suppurative and inflammatory lesions (26 cases, 76.47%). Five lesions were received from orbit. Of the 5 cases, three cases were diagnosed as Epidermal cyst (3 cases, 60%), one case of Neurofibroma (20%) and one case of Basal cell carcinoma (20%). Only 4 cases were from intraocular tissues, one case each (25%) of Retinoblastoma, Macular amyloidosis, Massive retinal gliosis and Choroid suppurative lesion were reported. Retinoblastoma, a rare paediatric tumor seen in 4years old was also received in this study. Three cases were received from lacrimal gland and passages.

### Discussion:-

In present study of 132 cases, 67 cases (50.75%) were males suggesting a male preponderance with male to female ratio of 1.03:1 and majority (27 cases, 20.45%) of the cases belonged to 41 to 50 years of age group. Various studies done by Shah N & Trivedi N et al<sup>3</sup>, Bastola P & Koirala S et al<sup>2</sup>, Shaikh I et al<sup>10</sup>, Akpe B A & Omoti AE et al<sup>11</sup> and Ud-Din N et al<sup>12</sup>; found similar results comparable to present study. Chauhan SC & Shah S<sup>1</sup> et al reported slight female preponderance. While Pudasini S<sup>13</sup>, et al, reported 3th and 4<sup>th</sup> decade as the commonest age group in their studies. In our study, 79 cases (59.86%) cases were non neoplastic and 53 cases (40.14%) were neoplastic. Various studies found similar results comparable to present study. Ud-Din N, et al<sup>12</sup>, reported neoplastic lesions more in their study. Maximum number of lesions were from eyelids (48 cases,36.36%) followed by conjunctiva (38 cases, 28.79%), and least were seen from lacrimal gland and passages. All the studies indicated that eyelids and conjunctiva were the commonest sites. While Akpe B A & Omoti AE<sup>11</sup> et al and Pudasaini S<sup>13</sup> et al reported conjunctival lesions to be commonest.

Among the eyelid lesions, 27 non-neoplastic, 14 benign eyelid lesions and 7 malignant eyelid lesions were reported. Non neoplastic lesions were Inclusion cysts, followed by Non specific inflammation and granulation tissues, Dermoid cyst, Chalazion, Tuberculosis verrucosa cutis and Hidrocystoma. Benign eyelid lesions were Nevocellular nevus, followed by squamous papilloma, benign adnexal tumors, benign fibrous histiocytoma, hemangioma and neurofibroma. The 7 cases of malignancies were Squamous cell carcinoma (4 cases), Basal cell carcinoma (2 cases), and Meibomian gland carcinoma (1case). Various studies done by Gundogan CF<sup>14</sup>, et al, Chauhan S, et al<sup>15</sup>, Al-Faky YH<sup>16</sup>, et al and Paul S<sup>17</sup>, et al found similar lesions. Many other lesions reported in their studies which were not encountered in our study were lipoma, keratoacanthoma, seborrheic keratosis, cutaneous myxoma, embryonal rhabdomyosarcoma and malignant melanomas.

In the present study, 38 lesions were from conjunctiva, majority were diagnosed as CIN, followed by Pterygium, Squamous cell carcinoma, papilloma, cysts, Rhinosporidiosis, Hemangioma and Non specific inflammations & granulation tissues. Various studies found similar lesions. Other lesions reported in their studies were granuloma pyogenicum, lymphoma, malignant melanoma and sebaceous carcinoma. Of the 34 cases of corneal lesions, majority were diagnosed as Suppurative and inflammatory lesions, followed by Fuch's dystrophy, Staphyloma, Pannus, Lattice dystrophy and aphakic bullous keratoplasty. Nilesh Shah<sup>3</sup> et al, and Akpe<sup>11</sup> et al, have reported only one case each of Lattice dystrophy and staphyloma respectively. We received only 5 orbital lesions of epidermal cysts, basal cell carcinoma and neurofibroma. While, other studies also reported Non- Hodgkins lymphoma and Rhabdomyosarcoma of orbit. One case each of Retinoblastoma, Macular amyloidosis, Massive retinal gliosis and Choroid suppurative lesion was reported in intraocular lesions. Other studies only reported retinoblastoma from this site. Only 3 cases were reported from lacrimal system. Study by Nilesh SC<sup>3</sup>, et al reported similar findings with 2 cases of lacrimal sac cysts. However, some studies also reported pleomorphic adenomas and sebaceous adenocarcinomas.

**Conclusion:-**

Many Neoplastic conditions masquerade as or mimic other less aggressive Neoplastic or non-Neoplastic. However some of the histological features are specific and characteristic for each entity. Hence, combination of proper clinical observation and histopathological study gives a conclusive diagnosis. So, we can conclude that all ophthalmic lesions removed surgically should always be subjected to histopathological examination to establish correct diagnosis for further management.

**Acknowledgment:-**

I would like to express gratitude and sincere thanks to Dr. (Mrs.) S.S. More, Dr. P.V.Purohit, Dr. P.Shinde, Dr R. S. Patil and Dr.R.M. Shinde for their help and guidance during my study.

Tribes, Ethno-medicinal, Anti-Keratinophilic, Saranda.

#### Abstract

Scenario of Anti-Keratinophilic Activity in Ethno-medicinal Preparations Used by Saranda's Tribes has been discussed in present research article. It was noticed that many promising drug candidates are of natural origin with the lessening of technical drawbacks associated with natural product research. There are better opportunities to explore the biological activity of previously inaccessible sources of natural products. In addition, chemical diversity of natural products is well suited to provide the core scaffolds for future drugs. There is need for further developments in the use of novel natural products and chemical libraries based on natural products in drug discovery campaigns. It is established that, majority of superficial infections are caused by a closely related group of Keratinophilic fungi called dermatophytes, which cause ringworm infection or Tinea infection (T. Pedis, T. Cruris, T. Corporis, T. Imbricata, T. Mannum, T. Barbae, T. Capitis etc.). Dermato-phytosis is caused by dermatophytes which colonize the hair, nails, and outer layer (stratum corneum) of the epidermis. There are 3 genera of pathogenic dermatophytes viz., Epidermophyton, Microsporum, and Trichophyton. Medicinal plants being used by the traditional herbal healers against skin diseases of local peoples of the Saranda forest have been documented. Interestingly, a total of 30 species belonging to 21 families of Angiospermic plants are documented. It was observed that many capable and natural origin drugs and their local preparations are very effective.

#### Introduction:-

It was noticed that many promising drug candidates are of natural origin with the lessening of technical drawbacks associated with natural product research. There are better opportunities to explore the biological activity of previously inaccessible sources of natural products. In addition, chemical diversity of natural products is well suited to provide the core scaffolds for future drugs. Medicinal plants have been the mainstay of traditional herbal medicine amongst rural dwellers worldwide since antiquity to date. The therapeutic use of plants certainly goes back to the Sumerian and the Akkadian civilizations in about the third millennium BC. Hippocrates (ca. 460-377 BC), one of the ancient authors who described medicinal natural products of plant and animal origins, listed approximately 400 different plant species for medicinal purposes. Natural products have been an integral part of the ancient traditional medicine systems, e.g. Chinese, Ayurvedic and Egyptian (Sarker & Nahar, 2007). Over the years they have assumed a very central stage in modern civilization as natural source of chemotherapy as well as amongst

scientist in search for alternative sources of drugs. About 3.4 billion people in the developing world depend on plant based traditional medicines. Medicine for their primary health care. According to the World Health Organization, a medicinal plant is any plant which, in one or more of its organs, contains substances that can be used for therapeutic purposes, or which are precursors for chemo-pharmaceutical semi synthesis. Such a plant will have its parts including leaves, roots, rhizomes, stems, barks, flowers, fruits, grains or seeds, employed in the control or treatment of a disease condition and therefore contains chemical components that are medically active. These non-nutrient plant chemical compounds or bioactive components are often referred to as photo chemicals. The science of application of these indigenous or local medicinal remedies including plants for treatment of diseases is currently called ethnopharmacology but the practice dates back since antiquity.

After the survey of Saranda the sal forest was selected to collect the sample. The sal forest is in Singhbhum district of Jharkhand State. Spread over 820 sq Km. and is famous for natural sal forest very rich in flora & fauna. There is need for further developments in the use of novel natural products and chemical libraries based on natural products in drug discovery campaigns. In addition, scenario of Anti-Keratinophilic Activity in Ethno-medicinal Preparations used by Saranda's Tribes has not been studied/documentated much; therefore, present study has been undertaken. It is established that, majority of superficial infections are caused by a closely related group of Keratinophilic fungi called dermatophytes, which cause ringworm infection or Tinea infection. Dermatophytes is caused by dermatophytes which colonize the hair, nails, and outer layer (stratum corneum) of the epidermis. There are 3 genera of pathogenic dermatophytes viz., *Epidermophyton*, *Microsporum*, and *Trichophyton*. In the present study, medicinal plants being used by the traditional herbal healers against skin diseases of local peoples of the Saranda forest have been documented.

### Methodology:-

**Ethno-medicinal preparation:** The traditional herbal healers, tribal heads and tribal person were contacted and enquired to gather the related information about various preparations used for the treatment of skin diseases. The ethno medicinal plant were collected and washed thoroughly 2-3 times with sterile distilled water, and then air dried on sterile blotter under shades. Fresh preparations of selected plants free from disease were collected from herbal healers of various tribal villages and brought to the laboratory (Mudgal et al. 1997; Singh et al., 2001; Verma et al. 1993; Oommachan et al. 1996). Twenty grams of each fresh preparations comprising of leaf/bark/root/seed/flower/whole plant, fruits and other ingredients were crushed in a mortar and the medicinal paste was then extracted.

**Ethno medicinal material extraction:** The ethno medicinal material was extracted with 100 ml of hot sterile distilled water. Another set of preparations was macerated and extracted in 100 ml of hexane and methanol separately for 24 hours. The plant extracts were then filtered with sterile Whatman filter paper No. 1. Preparations which showed anti-keratinophilic activity were further extracted by Soxhlet apparatus. Fifty grams of the shade dried powder was filled in the thimble and extracted successively with hexane and methanol in soxhlet extractor for 48 hrs. The extracts of the separate solvents were concentrated under reduced pressure and preserved at 5°C in air tight bottle until further use. For the extraction of oils, air dried leaves of selected plants were chopped and grinded into small pieces. The known amount of leaves was placed in a round bottom flask (1L) together with distilled water and hydro-distillation was performed using Clevenger apparatus. Essential oil was collected dehydrated using sodium sulphate dispensed into dark bottles and stored at 4°C until used.

**Microbial culture:** The three species of keratinophilic fungi viz., *Aspergillus niger* (MTCC 10180) *Trichophyton rubrum* (MTCC 7859), *Candida albicans* (MTCC 1637) and three keratinophilic bacteria viz., *Escherichia coli* (MTCC 77), *Bacillus subtilis* (MTCC 10110) and *Enterococcus faecalis* (MTCC 9845) were obtained from Institute of Microbial Technology (IMTECH), Chandigarh and two species of fungi i.e. *Rhizopus* microspores and *Cryptococcus neoformans* were collected from the soil. Culture maintained as per standard protocols.

**Preparation of microbial suspension:** Fungal suspension were prepared from 21 days old culture of *T. rubrum* and *R. Microspores* one week old culture of *A. Niger* and 24 hrs old culture of *C. albicans* and *C. neoformans* grown on Sabouraud dextrose agar medium. The petri dishes were flooded with 8 to 10 ml of distilled water and conidia were scraped using sterile spatula. The spore density of each fungus was adjusted with spectro-photometer ( $A_{595nm}$ ) to obtain a final concentration of approximately  $10^5$  spores / ml. *Bacillus subtilis*, *Escherichia coli* and *Enterococcus faecalis* were pre-cultured in nutrient broth overnight in a rotary shaker at 37°C, centrifuged at 10,000 rpm for 5

min, pellet was suspended in double distilled water and the cell density was standardized spectrophotometrically ( $A_{610}$  nm). Each of the plates was homogenized to ensure uniform distribution of the inoculums and air-dried to remove surface moisture.

**Preparation of impregnated paper discs:** Standard size Whatman filter paper discs (5.0 mm in diameter) kept on a sterilized Petri plates was sterilized in an oven at  $140^{\circ}\text{C}$  for one hour. The sterilized discs were saturated with the (20 mg/ ml) test extract,  $5\ \mu\text{l}$ / disc of oil and (1 mg/ ml) for control. For enhancing the essential oil solubility, Tween-80, 0.5%(v/v) was added. Plates with Tween-80 but without any plant essential oil were used as control. Discs were then dried at room temperature to remove any residual solvent that might interface with the determination.

**Anti-fungal and antibacterial activity:** The antifungal and antibacterial activity was tested by discs diffusion method (Gould and Bowie, 1952). The inoculums of the test organism were evenly spread on the surface of the Sabouraud dextrose agar/ nutrient agar medium. The impregnated discs were then placed on the surface of sterilized medium inoculated with the test fungi/ bacteria. Blank disc impregnated with water, methanol, hexane and Tween 80 at 1 ml. Followed by drying off was used as negative control. After the colonies grew, the zones of inhibition around the discs were measured and recorded. Different standard discs of nystatin (Dr Reddy Laboratories Ltd ketoconazole (Jhonson Jhonson Ltd.) and fluconazole (Cipla Pharmaceuticals Ltd.) for different fungi and streptomycin (Abott. Health care Pvt.Ltd.) for bacteria were used as positive control. Before incubation, all the test and control petriplates were kept at  $5^{\circ}\text{C}$  for one hour to allow the diffusion of the substance from the disc into the agar medium plate. All the experiments were done in three replicates to determine activity. The antibiotics known to be effective against their respective test micro-organisms were used as reference for comparison of the antifungal activity of the test samples. Ketoconazole (1000  $\mu\text{g}/\text{ml}$ ) was used against *Trichophyton rubrum*, nystatin (1000  $\mu\text{g}/\text{ml}$ ) against *Candida albicans*, fluconazole (1000  $\mu\text{g}/\text{ml}$ ) against *Cryptococcus neoformans*, *Aspergillus niger* and *Rhizopus* microspores. Streptomycin was used as positive control against *Bacillus subtilis*, *Escherichia coli* and *Enterococcus faecalis*. The filter discs (5mm diameter) impregnated with 20 mg/ml extracts,  $5\ \mu\text{l}/\text{disc}$  of oil and 1 mg/ml of control were for separate fungal species seeded plates. These were incubated at  $28^{\circ}\text{C}$  for 7-24 days for *T. Rubrum*, *R. Microspores* and *A. Niger* 2 days for *Candida albicans* and *Cryptococcus neoformans* in an incubator and were looked for the development of clearance / inhibition zone around the disc. The diameters of the inhibition zones were measured in three replicates by using antibiotic zone scale.

**Gas chromatography-mass spectrometry (GC-MS) of oil:** The chemical constituents of *Cymbopogon citratus* leaf oil identified by GC-MS analysis was carried out on a Shimadzu 2010 Gas Chromatograph equipped with an FID and 25 m x 0.25 mm x 0.25  $\mu\text{m}$  WCOT column coated with diethylene glycol (AB-Innowax, 7031428, japan) at Indian institute of integrative Medicine (CSIR lab) Jammu. Both injector and detector (FID) temperatures were maintained at  $260^{\circ}\text{C}$ . Helium was used as carrier gas at a flow rate of 3.0 ml/min at a column pressure of 152 kPa. Samples (0.2 $\mu\text{l}$ ) were injected into the column with a split ratio of 100: 1. Component separation was achieved following in a linear temperature program of 60 -  $260^{\circ}\text{C}$  at  $3^{\circ}\text{C}$  / minutes and then held at  $260^{\circ}\text{C}$  for 10 minutes, with a total run time of 20 minutes. The percentage composition was calculated using peak normalization method assuming equal detector response. The samples were then analysed on same Shimadzu instrument fitted with the same column and following the same temperature program as above. MS parameters used were; ionisation Voltage (EI) 70 eV, peak width 2 s, mass range 40-600 amu and detector voltage 1.5 volts. Results are based on GC-FID; MS acquisition started after 4 minutes. Peak identification was carried out by comparison of the mass spectra with mass spectra available on database of NISTO5 and WILEY8 libraries and co-injection of available pure standards. The compound identification was finally confirmed by comparison of their relative retention indices with literature values (Davies, 1990).

**Statistical analysis:** Need based analysis was conducted as per standard protocol.

### Results And Discussion:-

Out of thirty four preparations used in the district for skin diseases fourteen preparations were active against fungal species and twelve against bacteria. The remaining ethno medicinal preparations were neither effective neither against fungi nor against bacteria Tables 1-5). The presence of active ingredients in herbal medicines is directly linked to their ability to prevent or treat keratinophilic infections. Moreover, the anti-keratinophilic action of the plants on the tested fungi and bacteria responsible for superficial mycoses, confirms their therapeutic potency and

this appraisal may authenticate their use in traditional medicines by different tribes for certain skin infectious. Amongst the plant species investigated, oil of *C. citrates* leaf showed the most remarkable activity. This plant oil can be further subjected to isolation of the therapeutic antimicrobials and carry out further pharmacological evaluation.

The traditional herbal healers, tribal heads and tribal person were contacted and enquired to gather the related information about various preparations used for the treatment of skin diseases. The ethno medicinal plant were collected and washed thoroughly 2-3 times with sterile distilled water, and then air dried on sterile blotter under shades. Fresh preparations of selected plants free from disease were collected from herbal healers of various tribal villages and brought to the laboratory (Mudgal et al. 1997; Singh et al.,2001; Verma et al.1993;Oommachan et al.1996). Twenty grams of each fresh preparations comprising of leaf/bark/root/seed/flower/whole plant, fruits and other ingredients were crushed in a mortar and the medicinal paste was then extracted. The ethno medicinal material was extracted with 100 ml of hot sterile distilled water. Another set of preparations was macerated and extracted in 100 ml of hexane and methanol separately for 24 hours. The plant extracts were then filtered with sterile Whatman filter paper No. 1. Preparations which showed anti-keratinophilic activity were further extracted by Soxhlet apparatus. Fifty grams of the shade dried powder was filled in the thimble and extracted successively with hexane and methanol in soxhlet extractor for 48 hrs. The extracts of the separate solvents were concentrated under reduced pressure and preserved at 5° C in air tight bottle until further use. For the extraction of oils, air dried leaves of selected plants were chopped and grinded into small pieces. The known amount of leaves was placed in a round bottom flask (1L) together with distilled water and hydro-distillation was performed using Clevenger apparatus. Essential oil was collected dehydrated using sodium sulphate dispensed into dark bottles and stored at 4° C until used.

The three species of keratinophilic fungi viz., *Aspergillus niger* (MTCC 10180) *Trichophyton rubrum* (MTCC 7859), *Candida albicans* (MTCC 1637) and three keratinophilic bacteria viz., *Escherichia coli* (MTCC 77), *Bacillus subtilis* (MTCC 10110) and *Enterococcus faecalis* (MTCC 9845) were obtained from Institute of Microbial Technology (IMTECH), Chandigarh and two species of fungi i.e. *Rhizopus* microspores and *Cryptococcus neoformans* were collected from the soil. The fungal cultures were sub-cultured on Sabouraud Dextrose Agar (SDA) medium (peptone - 10g , dextrose- 20 g , agar – 20 g , distilled water-1000 ml ) incubated at 28± 1° C. The bacterial procured cultures were sub- cultured in a nutrient agar medium (beef extract – 3 g, NaCl – 5 g , peptone – 5 g , agar – 15 g , distilled water - 1000 ml) and incubated at 37° C. The stock cultures of fungi were maintained on sabouraud dextrose agar slant and bacteria on nutrient agar slant at 28± 1° C and 37° C respectively.

Fungal suspension were prepared from 21 days old culture of *T. rubrum* and *R. Microspores* one week old culture of *A. Niger* and 24 hrs old culture of *C. albicans* and *C. neformans* grown on Sabouraud dextrose agar medium. The petri dishes were flooded with 8 to 10 ml of distilled water and conidia were scraped using sterile spatula. The spore density of each fungus was adjusted with spectro-photometer ( $A_{595nm}$ ) to obtain a final concentration of approximately  $10^5$  spores / ml. *Bacillus subtilis*, *Escherichia coli* and *Enterococcus faecalis* were pre-cultured in nutrient broth overnight in a rotary shaker at 37°C , centrifuged at 10,000 rpm for 5 min, pellet was suspended in double distilled water and the cell density was standardized spectrophotometrically (  $A_{610nm}$  ). Each of the plates was homogenized to ensure uniform distribution of the inoculums and air- dried to remove surface moisture. Standard size Whatman filter paper discs (5.0 mm in diameter) kept on a sterilized petriplates was sterilized in an oven at 140°C for one hour. The sterilized discs were saturated with the (20 mg/ ml) test extract, 5 µl/ disc of oil and (1 mg/ ml ) for control. For enhancing the essential oil solubility , Tween-80, 0.5%(v/v) was added. Plates with Tween-80 but without any plant essential oil were used as control. Discs were then dried at room temperature to remove any residual solvent that might interface with the determination.

The antifungal and antibacterial activity was tested by discs diffusion method (Gould and Bowie, 1952). The inoculums of the test organism were evenly spread on the surface of the Sabouraud dextrose agar/ nutrient agar medium. The impregnated discs were then placed on the surface of sterilized medium inoculated with the test fungi/ bacteria. Blank disc impregnated with water, methanol, hexane and Tween 80 at 1 ml. Followed by drying off was used as negative control. After the colonies grew, the zones of inhibition around the discs were measured and recorded. Different standard discs of nystatin (Dr Reddy Laboratories Ltd ketoconazole (Jhonson Jhonson Ltd.) and fluconazole (Cipla Pharmaceuticals Ltd.) for different fungi and streptomycin (Abott. Health care Pvt.Ltd.) for

bacteria were used as positive control. Before incubation, all the test and control petriplates were kept at 5°C for one hour to allow the diffusion of the substance from the disc into the agar medium plate. All the experiments were done in three replicates to determine activity.

The antibiotics known to be effective against their respective test micro-organisms were used as reference for comparison of the antifungal activity of the test samples. Ketoconazole (1000 µg/ml) was used against *Trichophyton rubrum*, nystatin (1000 µg/ml) against *Candida albicans*, fluconazole (1000 µg/ml) against *Cryptococcus neoformans*, *Aspergillus niger* and *Rhizopus microspores*. Streptomycin was used as positive control against *Bacillus subtilis*, *Escherichia coli* and *Enterococcus faecalis*. The filter discs (5mm diameter) impregnated with 20 mg/ml extracts, 5µl/disc of oil and 1 mg/ml of control were for separate fungal species seeded plates. These were incubated at 28°C for 7-24 days for *T. Rubrum*, *R. Microspores* and *A. Niger* 2 days for *Candida albicans* and *Cryptococcus neoformans* in an incubator and were looked for the development of clearance / inhibition zone around the disc. The diameters of the inhibition zones were measured in three replicates by using antibiotic zone scale.

The chemical constituents of *Cymbopogon citratus* leaf oil identified by GC-MS analysis was carried out on a Shimadzu 2010 Gas Chromatograph equipped with an FID and 25 m x 0.25 mm x 0.25 µm WCOT column coated with diethylene glycol (AB-Innowax, 7031428, Japan) at Indian Institute of Integrative Medicine (CSIR lab) Jammu. Both injector and detector (FID) temperatures were maintained at 260°C. Helium was used as carrier gas at a flow rate of 3.0 ml/min at a column pressure of 152 kPa. Samples (0.2µl) were injected into the column with a split ratio of 100 : 1. Component separation was achieved following in a linear temperature program of 60 - 260°C at 3°C / minutes and then held at 260°C for 10 minutes, with a total run time of 20 minutes. The percentage composition was calculated using peak normalization method assuming equal detector response. The samples were then analysed on same Shimadzu instrument fitted with the same column and following the same temperature program as above. MS parameters used were; Ionisation Voltage (EI) 70 eV, peak width 2 s, mass range 40-600 amu and detector voltage 1.5 volts. Results are based on GC-FID; MS acquisition started after 4 minutes. Peak identification was carried out by comparison of the mass spectra with mass spectra available on database of NIST05 and WILEY8 libraries and co-injection of available pure standards. The compound identification was finally confirmed by comparison of their relative retention indices with literature values (Davies, 1990).

**Table 1:** Medicinal preparations being used by tribes of the district for keratinophilic infections

S. No.	Botanical and local names	Mode of preparations	Dose
1.	<i>Aegle marmelos</i> (Bel) + <i>Cicer arietinum</i> (Chana)	Equal ratio of fresh bark paste of bel and flour of Chana mix and make paste	Apply externally daily for 5 days
2.	<i>Annona squamosa</i> (Sitaphal) + <i>Ricinus communis</i> (Arandi)	Equal ratio of fruits of Sitaphal and leaves of Arandi pounded and make paste	Paste apply externally twice daily for one week
3.	<i>Argemone Mexicana</i> (Pili katai)	Root cut in small pieces and make paste	Apply externally twice daily for 10 days
4.	<i>Azadirachta indica</i> (Neem)	Leaves pounded and make paste	Apply externally 15 minutes daily for 5 days
5.	<i>Azadirachta indica</i> (Neem)	Bark cut in small pieces and make paste	Paste apply externally twice daily for one week
6.	<i>Azadirachta indica</i> (Neem) + <i>Pongamia pinnata</i> (Karanj)+ <i>Brassica campestris</i> (Sarson)	Equal ratio of bark of Nim, Karanj and seeds of Sarson pounded and make paste	Paste apply externally on the body twice daily for 3 days
7.	<i>Boswellia serrata</i> (Salay)	Bark pounded and make paste	Apply externally daily for 10 days
8.	<i>Caesalpinia sepiaria</i> (Sagar goti)	Leaves pounded and get extract	Extract apply externally daily for 7 days
9.	<i>Centratherum anthelminticum</i> (Banjira)	Seeds pounded and make powder	5g powder mixed with tap water and apply externally for 5 days
10.	<i>Cassia fistula</i> (Amaltas) +	Equal ratio of seeds of Amaltas and	2g powder mixed with tap

	<i>Plumbago zeylanica</i> (Chittawar)	root of Chittawar dry and make powder	water and apply externally daily for 5 days
11.	<i>Cassia tora</i> (Chakanda)	100g seeds put in container having one liter tap water, heated till volume remain ¼ part and get filtrate	2 ml filtrate apply externally daily for 10 days
12.	<i>Cymbopogon citratus</i> (Nimbu gass)	Leaves boiled with tap water	Extracted oil is then applied on the skin for one week
13.	<i>Cymbopogon nardus</i> (Nimbu gass)	Leaves boiled with tap water	Extracted oil is then applied on the skin for one week
14.	<i>Cymbopogon winterianus</i> (Nimbu gass)	Leaves boiled with tap water	Extracted oil is then applied on the skin for one week
15.	<i>Datura innoxia</i> (Pila dhatura)	Root pounded and make paste	Apply externally twice daily for 5 days
16.	<i>Eclipta alba</i> (Ghamra)	Leaves pounded and apply in hair	Apply in hair for 1 hour daily for 5 days
17.	<i>Elaeodendron roxburghii</i> Weight and Arn.(Jamrasi)	Bark crushed and extracted	Apply externally daily for one week
18.	<i>Ficus arnottiana</i> (Paras papal) + <i>Brassica cernua</i> (Raai)	Burn the fruits of paras papal till ash form and mix with seed oil of Raai	Ash mix with oil and apply externally daily for 15 days
19.	<i>Ficus arnottiana</i> (Paras papal)	Fruit pounded	Apply externally daily for 10 days
20.	<i>Holarrhena antidysenterica</i> (Bari karai)	Bark, cut in pieces	10g bark pieces chewed twice daily for 10 days
21.	<i>Holoptelea antidysenterica</i> (Bari karai)	Leaves pounded and make paste	Apply externally twice daily for 7 days
22.	<i>Ocimum gratissimum</i> (Kali Tulsi)	Leaves boiled with tap water	Extracted oil is then applied on the skin for one week
23.	<i>Mangifera indica</i> (Aaam)	Flower pounded and make paste	Apply externally twice daily for 2 days
24.	<i>Mentha piperita</i> (Podina)	Leaves boiled with tap water	Extracted oil is then applied on the skin for one week
25.	<i>Ocimum gratissimum</i> (Kali tulsi)	Leaves of the plant boiled with tap water	Extracted oil is then applied on the skin for one week
26.	<i>Ocimum sanctum</i> (Safed Tulsi)	Leaves pounded and make paste	Apply externally daily for 10 days
27.	<i>Plumbago indica</i> (Chitrak)	Root pounded and make paste	Apply externally with Cow urine for 6 days
28.	<i>Plumbago zeylanica</i> (Chittawar)	Root pounded and make paste	Paste apply externally twice daily for 5 days
29.	<i>Pongamia pinnata</i> (Karanj) + <i>Ipomoea pestigridis</i> (Panchpatri)	Equal ratio of fruits of Kanji and root of Panchpatri pounded and make paste	Paste apply externally twice daily 6 days
30.	<i>Pongamia pinnata</i> (Karanj)	Leaves pounded and make paste	Apply externally with mustard oil daily for 5 days
31.	<i>Selaginella bryopteris</i> (Sanjiwani)	Whole plant pounded and make paste	2g paste with honey daily for 2 days
32.	<i>Solanum anguivi</i> (Bhatkataliya)	Fruit pounded and make paste	Apply externally on the body daily for 3 days
33.	<i>Tectona grandis</i> (Sagon)	Dry leaves burn	Take fumes externally on body twice daily for 3 days
34.	<i>Terminalia alata</i> (Saja)	Leaves pounded and make paste	Paste apply externally twice daily for 5 days

**Table 2:** Activity of plant extracts (20mg/ml), oils (5µl/disc) and ( 1mg/ml) against keratinophilic fungi

### Conclusion:-

Out of thirty four preparations used in the district for skin diseases fourteen preparations were active against fungal species and twelve against bacteria. The remaining ethno medicinal preparations were neither effective neither against fungi nor against bacteria. The presence of active ingredients in herbal medicines is directly linked to their ability to prevent or treat keratinophilic infections. Moreover, the anti-keratinophilic action of the plants on the tested fungi and bacteria responsible for superficial mycoses, confirms their therapeutic potency and this appraisal may authenticate their use in traditional medicines by different tribes for certain skin infectious. Amongst the plant species investigated, oil of *C. citrates* leaf showed the most remarkable activity. This plant oil can be further subjected to isolation of the therapeutic antimicrobials and carry out further pharmacological evaluation.

With the increasing interest and so many promising drug candidates in the current development pipeline that are of natural origin, and with the lessening of technical drawbacks associated with natural product research, there are better opportunities to explore the biological activity of previously inaccessible sources of natural products. In addition, the increasing acceptance that the chemical diversity of natural products is well suited to provide the core scaffolds for future drugs, there will be further developments in the use of novel natural products and chemical libraries based on natural products in drug discovery campaigns. Further study at molecular level is needed to further authenticate the present findings.

#### Abstract

Epilepsy and migraine are comorbid with each other as they have common pathophysiological and electrophysiological phenomena. **Materials and methods:** Patients with Juvenile myoclonic epilepsy (JME) diagnosed by clinical and electrophysiological study (electroencephalogram) with or without comorbid migraine underwent detailed history for migraine headache, general examination, neurological examination and brain MRI and MRS.

**Results:** Migraine was clinically associated with JME in 58.6% of cases. NAA/CR and CHO/CR ratio were significant ( $P < 0.05$ ) between JME cases and control group and non-significant between JME cases with or without migraine ( $P > 0.05$ ).

**Conclusion:** migraine is highly comorbid with JME risk factors are female gender and family history of migraine, with no structural or functional comorbidity in MRS study

#### Introduction:-

Migraine and epilepsy are highly comorbid disorders and share clinical features that suggest overlapping, pathophysiological and etiological conditions with episodic manifestations (1)

Both migraine and epilepsy represent distinct families of neurological disorders with typical constellations of symptoms (2)

Juvenile myoclonic epilepsy is a common epileptic syndrome, the etiology of which is genetically determined. Its onset occurs from 6 through 22 years of age, and affected patients present with myoclonic jerks, often associated with generalized tonic-clonic seizures (the most common association) and absence seizures. (3)

Migraine and epilepsy are often comorbid. Risk factors are positive family history and female gender or triggers as (alcohol, menses, and irregularity of sleep) as well as prophylactic drugs (valproate, topiramate) are shared by both. This suggests that migraine and epilepsy may have some common pathophysiological mechanisms (4). Proposed mechanisms include an increased excitability of the cortex accounting for the increased risk of migraine and epilepsy or seizures being triggered by migraine attacks, as the term migralepsy of the International Classification of Headache Disorders (2004) (ICHDII) suggests. It is well known that seizures can trigger secondary headache attacks as postictal headache (5,6)

### Material and Methods:-

The study was conducted on 41 Egyptian patients at Mansoura University Hospital, divided into two groups. The first group was 29 patients JME cases with or without comorbid migraine. And the second group was 12 control cases (normal cases who are not epileptic or suffer from migraine with no family history of epilepsy with normal conventional MRI brain). with the following **Inclusion criteria:** JME cases definitely diagnosed by clinical and electrophysiological studies with or without migraine with no age specific for JME patients and Informed consent.

### Methodology:-

All patients diagnosed will be subjected to the following **(1)Detailed history** : The following history items will be considered in assessment of comorbidity and exclusion of other causes of epilepsy and assessment of the type of migraine (if it is present).

- Age, sex personal history of the patient.
- Age of onset of seizures.
- The presence of migraine and its temporal profile, diagnostic criteria, type (common, classic or complicated).
- A careful family history with attention to epilepsy, consanguinity, migraine.

### General examination and Full neurological examination.

**sleep deprivation Electroencephalogram EEG** including both hyperventilation and photic stimulation.

**Radiological examination:** including (a)Conventional MR imaging:

Imaging were reviewed to exclude other pathologic processes. (b)**1H-MRS** :Cho, Cr were calculated. The ratios of integrals of various metabolites calculated with respect to Cr included, Cho/Cr and NAA/Cr.

### Data analysis:-

- Data were entered and statistically analyzed using the Statistical Package for Social Sciences (SPSS) version 20.
- Qualitative data were described as numbers and percentages.  $\chi^2$  test and Fischer exact test were used for comparison between groups, as appropriate.
- Quantitative data were described as means (SD) or medians, as appropriate. They were tested for normality by Kolmogorov-Smirnov test. In the normally distributed variables, one way ANOVA test and Student t test were used for comparison between groups; Spearman correlation was used for parametric quantitative and ordinal variables correlation.
- "p value  $\leq 0.05$ " was considered to be statistically significant and  $< 0.01$  high statistically significant.

### Results:-

The study was conducted on 29 JME cases 16(55.1%) male patients and 13(44.9%) female patients with median age  $21.4 \pm 8.1$  with non significant difference between  $p > .05$  (**table 1**).

17 (58%) patients were comorbid with migraine 6(35.3%) male and 11(64.7%) female with median age  $23.12 \pm 7.03$ . 12 (42%) patients were not comorbid with migraine, 10 (83.3%) male and 2 (16.7%) female with median age  $19.25 \pm 5.92$  (**table 2**).

The median age for the onset of migraine in the studied group was  $14.12 \pm 4.9$ , median duration of migraine attacks was  $12.0(4.0-48.0)$ , for the onset of the symptoms of JME (myoclonic jerks) was  $10.66 \pm 2.6$ , the onset of absence seizures was  $11.4 \pm 2.7$  while the onset of GTCs was  $18.72 \pm 3.9$ . (**table 3**).

In JME cases with migraine 12 (70.6%) cases were common migraine, while 5 (29.4%) cases were classic migraine, and as regard time of migraine in relation to seizures one (5.8%) patient showed migraine attacks post ictal, 2 patients (11.6%) pre ictal and 14 patients(82.6%) showed migraine attacks not related to seizures. In this studied group 10(58.8%) of cases showed positive family history of migraine (**Table 4**).

From logistic regression analysis it shows that in JME cases female and patient with frequent GTCS are of high risk to develop migraine (**table 5**)

MRS study showed that there was statistically significant difference ( $p < 0.05$ ) in NAA/CR and CH/Cr ration in both frontal lobe and thalamus between patients and control group and no statistically significant difference in NAA/CR and CH/Cr ration in both frontal lobe and thalamus between JME cases with migraine and JME cases without migraine (table 6,7)

**Discussion:-**

Juvenile myoclonic epilepsy is a well-defined type of idiopathic generalized epilepsy that comprises 5–11% of patients with epilepsy; it is characterized by myoclonic jerks and generalized tonic clonic seizures (GTCS) and typical findings of generalized 4–6 Hz spike and wave or polyspike and wave discharges on electroencephalography (EEG) (7)

Migraine is a primary headache disorder characterized by recurrent headaches that are moderate to severe. Typically, the headaches affects one half of the head, are pulsating in nature, and lasts from two to seventy two hours. Associated symptoms may include nausea, vomiting, and sensitivity to light, sound, or smell (8).

Migraine and epilepsy are two chronic disorders characterized by repeated attacks of neurological dysfunction and are mostly accompanied by gastrointestinal, autonomic and other pathophysiological disorders. Migraine and epilepsy are linked by their symptom profiles, comorbidity and treatment. A person suffering from one of these diseases is twice as at risk of having the other one (9,10).

The association of epilepsy and migraine indicates comorbidity which does not occur by accident, according to epidemiological studies. The reasons are partly genetic (11, 12), but at the same time both disorders exhibit common

pathophysiological and electrophysiological phenomena. These two disorders also exhibit comparable clinical phenomena which may lead to confusion (13).

In our study we tried to find the comorbidity both clinically and functionally (through MRS) between specific type of idiopathic generalized epilepsy which is juvenile myoclonic epilepsy and migraine.

The myoclonic jerks were a core feature for diagnosis of JME present in all cases (100%) diagnosed as JME, and GTCs were also present in all cases (100%) in comparison to a general incidence of about (80-90%) in JME patients and about 17% of patients show typical simple absence seizures, with the general incidence of absence seizures in JME patients 20-30% (14).

Our study had demonstrated a clinical co-morbidity between JME and migraine in about 17 cases of the studied sample (58%) compared to a general incidence of association between epilepsy and migraine about 15-24% (15) while the maximum incidence of association between epilepsy and migraine described by *Syvertsen et al(16)* was 52%. While the incidence of clinical comorbidity between migraine and JME was estimated to be 36-41% (17, 18, 19). The slight higher incidence in our study may be attributed to the small sample size.

Female gender of JME patients who are comorbid migraine was higher than male gender (65% female and 35% male) which is matched with other studies done on either JME and migraine or done on epilepsy in common and migraine(17,20). And this is can be attributed to the general common incidence of migraine in female (21).

*Ito et al(22)* had investigated the post ictal migraine attacks that occur immediately after the attacks of epilepsy and found a prevalence of about 4.25% of cases of comorbid epilepsy and migraine which is matched to our results which postulates that about 6% of JME patients experienced immediate post ictal migraine and also the same result was described in other studies that investigated the actual timing of occurrence of migraine attacks in epileptic patients and the relation of the migraine attack to the epileptic seizure (23,, 24).

Since both JME and migraine are highly linked to genetic and hereditary basis, in our study positive family history of migraine was found to a higher incidence in JME cases with migraine 60 % compared to only 25% positive family history of migraine JME cases with migraine which supports a strong genetic background(25).

*Elmassry et al,(26)* had postulated that migraine onset was more likely to have occurred 1–3 years after the onset of epileptic attacks in comorbid cases, and it is concomitant with our study as the age of onset of JME (the onset of myoclonic jerks) was about 10.5 years with the age of onset of migraine attacks about 14 years.

On summarizing the MRS finding in our JME patients in relation to control group we found significant decrease in the frontal and thalamic NAA concentration and NAA/Cr ratio in JME cases than control group. These findings are concomitant with the finding of meta-analysis by *Anderson, J and Hamandi, K(27)*. These results are also coincident with the findings of other studies, including behavioral and neuropsychological studies that revealed that patients with JME were similar to those with frontal lobe epilepsy upon impairment (28,29).

In our study there was no significant difference in MRS findings both in frontal lobe and thalamus in JME cases with or without migraine (either common or classic). These findings are supported by the fact that in migraine MRS findings show only a reduction in NAA in the occipital cortex in migraine with aura (classic migraine) before and after visual stimulation with normal NAA level in between the attacks compared to normal NAA level in migraine without aura and control group (30).

### **Conclusion:-**

On summarizing our findings there is a well-established clinical correlation between JME and migraine, which may be attributed to sharing the same pathophysiological aspects or sharing common genetic background, but unfortunately this common clinical association cannot be confirmed objectively by using functional MRS modalities which gives no added information when JME is comorbid with migraine than JME cases only.

#### Abstract

Poverty is the state of being extremely poor. The poor are exposed to greater personal and environmental health risks, are less well nourished, have less information and are less able to access health care; they thus have a higher risk of illness and disability. Conversely, illness can reduce household savings, lower learning ability, reduce productivity, and lead to a diminished quality of life, thereby perpetuating or even increasing poverty.

Kerala is a land of baffling contradictions. Amidst the visible signs of affluence, there is a widening spectrum of poverty and deprivation, a phenomenon that continues to evade focussed attention. Large sections of the people in the State are faced with poverty. But poverty also has several unique dimensions in Kerala because of the peculiar path of socio-economic development of the State. The norms adopted by the Planning Commission to measure poverty, fail to capture these unique dimensions, leading to the gross underestimation of poverty in the State.

Among the programmes in Kerala for this purpose, Kudumbashree, literally meaning family prosperity is unique. This paper is an attempt to understand the

Kudumbashree programme in its nature and scope and its contribution to women's welfare in particular and as its spin off as social welfare in general. The paper will place the Kudumbashree programme in the broader context of measures alleviating poverty, improvising financial inclusion and majorly how it empowers women.

In the paper, part I will briefly explain about poverty specifically the nature of poverty in Kerala; part II will provide an overview of Kudumbashree from its inception to the present in terms of its stakeholders and their activities; part III will attempt an evaluation of Kudumbashree's progress in terms of what it has done, what it could not do, and the hurdles it faced towards poverty alleviation; part VI will bring together the highlights of the paper and argue why this programme should not be replicated in other states.

### **Poverty:-**

*Poverty is the state of being extremely poor.* The poor are exposed to greater personal and environmental health risks, are less well nourished, have less information and are less able to access health care; they thus have a higher risk of illness and disability. Conversely, illness can reduce household savings, lower learning ability, reduce productivity, and lead to a diminished quality of life, thereby perpetuating or even increasing poverty.

Kerala is a land of baffling contradictions. Amidst the visible signs of affluence, there is a widening spectrum of poverty and deprivation, a phenomenon that continues to evade focussed attention. Ostentatious display of luxury by a rising middle class, camouflaging of the severe vulnerabilities of large sections of the people and the nonchalant attitude of the entire ruling class together seem to be obscuring an objective assessment of the multiple dimensions of poverty and deprivation in Kerala.

Experts say that this paradox of visible affluence and hidden poverty has deprived the State of its due share of Central assistance on the one hand. On the other, the State has miserably failed to evolve a scientific strategy to map the extent and profile of its deprivations. Consequently, many of the programmes launched to help the disadvantaged sections in the State have missed the target apart from causing severe drain of its scarce resources over the years.

As per the Planning Commission's nutritional criteria and make a direct assessment of the rural poverty level in the State, it can be said that 84 per cent of the people were poor in the State in 1993-94 while their share has been 82.5 per cent in 1999-2000.

It has been widely recognised now that poverty alleviation is not just a matter of having adequate consumption of food or other necessities of daily life, but should also include such other dimensions of life as education and health. The former is usually referred to as the

'entitlement' aspect of poverty and the latter as the 'capability' aspect. It is only when these two aspects are combined that one can move towards a more holistic definition of poverty.

Although Kerala is only a sub-national entity, its experience is taken out of the national context to demonstrate what can be achieved with all the limitations of such an assumption in mind. At the same time, taking it out of the national context is not insignificant analytically or quantitatively. First of all, issues that fall under poverty alleviation in the Indian federal system are the responsibility of the state administrations. Secondly, the size of Kerala in terms of population (around 30 million in 1991) is much larger than that of a large number of developing countries.

The major role has been Kudumbashree' Poverty Eradication Mission indicates that there has been a decline in absolute poverty in the State since its inception.

### **Kudumbashree:-**

*Kudumbashree is a female-oriented, community-based, poverty reduction project of the Government of Kerala, state lying in the south-west part of the Indian subcontinent, where many development experiments are being tested, refined and implemented.* In 1988 Government of Kerala introduced Kudumbashree scheme as a comprehensive poverty alleviation programme to focus primarily on poor rural and urban women. "Kudumbashree" in local language means prosperity of the family which helps enjoy the economic opportunities by a good number of the poor women folks in rural and urban Kerala. It makes every effort to alleviate poverty through an integrated approach which involves an effective convergence of resources and actions, and moreover, the programme is essentially linked to local self-government institutions. Though local government institutions are not organically linked to Kudumbashree, they are active partners in the programme. Today, Kudumbashree is one of the largest women-empowering schemes in the country. The ultimate objective of the Kudumbashree programme is to improve the standard of living of poor rural women by setting up micro-credit and productive enterprises.

The programme has 39.97 lakh members and covers more than 50% of the households in Kerala. Built around three critical components, micro credit, entrepreneurship and empowerment, the Kudumbashree initiative has today succeeded in addressing the basic needs of the less privileged women. It shows that the majority of economically

backward rural women people are working in Kudumbashree units and they got a notable level of improvement in various behavioural competencies.

Various forms of microfinance practices have been in existence in Kerala from early days. When the concept of Self Help Group was introduced in Kerala in the 1980s, it was quick to gather momentum. Launched as a community network that would work in tandem with local self-governments for poverty eradication and women empowerment.

#### History & Background:-

<input type="checkbox"/>	Various forms of microfinance practices have been in existence in Kerala from	
	early days.	
<input type="checkbox"/>	When the concept of Self Help Group was introduced in Kerala	in the 1980s, it was
	quick to gather momentum.	
<input type="checkbox"/>	In the early nineties a community led poverty identification format was developed	
	as part of the Alappuzha UBSP Programme.	
<input type="checkbox"/>	By this time the NABARD promoted SHG, linkage banking	programme had
	established itself as a viable microfinance model.	

- In 1994, the CBNP project of Malappuram tried to assimilate these experiences and develop a women based community structure for service delivery of government programmes.
- The 73rd & 74th constitutional amendments strengthened PRIs and ULBs.
- Shortly afterwards, the People's Plan Campaign for decentralised Governance created strong local self governments (Panchayaths and Municipalities) in the State.
- Kudumbashree was launched in 1998 as a community network that would work in tandem with local self governments for poverty eradication and women empowerment.

#### The mission statement of the programme being:-

"To eradicate absolute poverty in ten years through concerted community action under the leadership of local governments, by facilitating organization of the poor for combining self-help with demand-led convergence of available services and resources to tackle the multiple dimensions and manifestations of poverty, holistically."

There are two distinguishing characteristics to Kudumbashree which set it apart from the usual SHG model of empowerment. These are

The universality of reach – from its very inception Kudumbashree has attempted to bring every poor woman in the state within its fold, as a consequence of which today Kudumbashree is present in every village panchayat and municipality, and in nearly every ward, colony and hamlet. The sheer spread is mind boggling, and it is only because the local community of women drive the system that it has managed to persevere.

The scope of community interface in local governance – the functioning of Kudumbashree is tied up to the development initiatives of the local government be it for social infrastructure, welfare or right based interventions or for employment generation. From food security to health insurance, from housing to enterprise development, from the national wage employment programme to the jagratha samiti, every development experience depends on Kudumbashree to provide the community interface.

It is using these opportunities that Kudumbashree strives to convert a microfinance led financial security model into a more comprehensive model of local economic development.

The three tier community based organisation of women includes Neighbourhood groups (NHG's), Area Development Societies (ADS)- area level and Community Development Societies (CDS) at the panchayath/municipality level.

The above said organisations work as the community wings of the local self-governments. This approach highlights that any woman who is residing in the gram panchayath can become a member of Kudumbashree NHG's irrespective of the fact that she belong to Below Poverty Line (BPL) family.

Since this aspect gives an opening for the APL families to enter in to the community structures envisaged by Kudumbashree, it is further ensured that majority of the office bearers should belong to BPL families. These structures give added importance to women empowerment both social and economic.

**The objective of Kudumbashree programme includes:-**

- Identification of the poor families through risk indices based surveys, with the active participation of the poor and the communities to which they belong.
- Empowering the poor women to improve the productivity and managerial capabilities of the community by organizing them in to Community Based Organizations.
- Encouraging thrift and investment through credit by developing Community Development Societies to work as informal bank of the poor.
- Improving incomes of the poor through improved skills and investment for self-employment.
- Ensuring better health and nutrition for all.
- Ensuring basic amenities like safe drinking water, sanitary latrines, improved shelter and healthy environment.
- Ensuring a minimum of 5 years of primary education for all children, belonging to risk families.
- Enabling the poor to participate in the decentralization process through the Community Development Societies, as it is a subsystem of the local government, under which it works.

**Neighbourhood Group (NHG):-**

The Neighbourhood groups consists of 10 to 20 women pergroup, total 261,000 NHG groups available across Kerala, 4.1 million members.

**Area Development Society (ADS):-**

The second tier is Area Development Society, which is formed at the local government ward level by federating 8-10 NHGs. The activities of the ADS are decided by the representatives of the poor elected from various federated NHGs.

**Community Development Society (CDS):-**

At the Local Government level Community Development Society (CDS), a registered body under the Charitable Societies Act, is formed by federating various ADSs. The advantage of this system is that it is managed wholly by the representatives of the poor and has the flexibility of a non-governmental organisation which helps in channelling additional resources from various sources both internal and external.

Kudumbashree project is implemented by the State Poverty Eradication Mission of the State government through local self-governing bodies. It aims at eradicating absolute poverty in ten years through concerted community action under the leadership of local self-government bodies. This mission is the transformation of earlier Urban Poverty Alleviation Programmes (UPAP) like Urban Basic Services (UBS) and Urban Basic Services for the Poor (UBSP) which had been successfully implemented by the Government of Kerala for improving the livelihood of the poor in urban areas with community participation.

Around 700 neighbourhood groups were linked to various commercial banks under the Linkage Banking Programme of NABARD. The implementation of Government-sponsored programmes for improving health and sanitation in all the District was channelled through neighbourhood groups.

Unlike several government sponsored schemes which dole out money to the poor without achieving developmental goals, KDMS programme provides altogether different experiences and results. With the strong backing of local governments and SHG initiatives, the poor women in Kerala are being empowered, socially, politically and economically. According to the experience of KDMS, poor women should not be viewed as objects of development but agents of development. Women in SHGs have the power in translating their welfare into the welfare of families. This multi-dimensional women oriented poverty alleviation programme has played a significant role in regaining the lost direction of "public action" that has now restarted to contribute to the improvement of quality of life in Kerala.

**Evaluation of kudumbashree's progress towards poverty alleviation:-****Social Development:-****Asraya:-**

Asraya is a destitute rehabilitation program designed by Kudumbashree. The program is targeted at the poorest of the poor population. While implementing the poverty alleviation programmes, it was observed that the programmes implemented by the Government and other agencies never reach this population. These people, who live in utter distress and despair, constitute a very small number in the society, approximately the bottom two per cent of the total population. Kudumbashree designed a project called Asraya - Destitute Identification Rehabilitation and Monitoring Project for the rehabilitation of destitute families. Destitute families are identified using a transparent risk index framed by the Mission. Individual needs of the family are identified through a participatory need assessment. The project envisaged to address lack of food, health problems including chronic illness, pension, educational facilities to children, land for home, shelter, drinking water, safe sanitation facilities, skill development, employment opportunities, etc.

It was primarily initiated in the gram panchayath areas in the state. Panchayath which were willing to take up the difficult and sensitive task of improving the livelihoods of such people, accept the continuous responsibility and meet at least 75 per cent of the cost of the project were identified for piloting the project.

The Asraya project, supported by State Government was tried in 179 Gram Panchayath in the year 2003. From the XIth Five Year Plan, Asraya programme was universalized and plan preparation began in the remaining gram panchayath, and the urban local bodies. Today, it is implemented in 1042 local bodies, including the gram panchayath, municipalities and corporations across the state.

**As an incentive to Local Governments to take up Asraya, Government have committed to provide 40 per cent of the project cost subject to a maximum of Rs.25 lakh as special grant to each of the local bodies:-** This is known as Challenge fund, and is provided via the Kudumbashree Mission. According to the guidelines for Asraya, the fund allocation has to be on a ratio of 60:40, wherein a minimum of 60 per cent of the funds need to come in from the local government by means of plan fund, convergence with schemes etc. There is no restriction on the amount the local government can contribute towards the project. But all other sources including the challenge fund cannot exceed 40 per cent of the total project cost. Also, the challenge fund cannot be used to meet the infrastructural needs of the Asraya beneficiaries, which needs to be done in convergence with the schemes under the local government or the Plan fund. Special Asraya projects for the tribal population have also been initiated in Local Self Government Institutions where Government provides up to 40 per cent of the project cost subject to a maximum of Rs.40 lakhs.

**Balasabhas:-**

An imperative attempt to retain the knowledge base through self-evaluation, participation and inquiry can be considered as the newest form of empowerment process. Along with about 2, 00,000 Neighbourhood groups all over the state, a similar yet distinctive methods have been used to mobilise and nurture children collective-Balasabha. The Sabhas are structured neighbourhood network of children. Each Sabha consist of 15 – 30 children in the age group of 6 – 18 years. *The prime objective of constituting Balasabhas is to prevent inter-generational transmission of poverty through capability enhancement of children.*

**At present, 66,743 Balasabhas, covering 10, 59,283 children, creating glorious dimensions to the endeavour.(as of March 2016)**

**Tribal Special Project:-**

The Tribal special project facilitates the creation of ST NHGs as well as At ADSs, if necessary in areas where there are more than two Tribal NHGs. The project provides a corpus fund of Rs. 10,000 at all newly formed ST NHGs. Micro finance and Micro enterprise activities are given special; focus among the tribals as part of the project activities. Measures have also been taken to ensure cent percent tribal participation in the MNREGS actives. Formation of special Ashraya projects, provision of supplementary food for the malnourished aged, infants and adolescent girls, formation of ST Balasabhas etc are some of the highlights of the project.

**As on March 2016, Kudumbashree has been able to bring about 5,401 NHGs covering 99,478 families under its organizational network throughout the state.**

**Financial Development through Kudumbashree:-****Microfinance:-****Thrift & Micro Credit:-**

Kudumbashree plays a vital role in enhancing the financial status of the less privileged women in the State through its thrift and credit program. The small regular savings of neighbourhood groups are pooled together and given out as internal loan to the most deserving member of the group. These loans acted as a leveller to address the immediate financial shocks of the group members.

The function of thrift and credit is the core activity of the Kudumbashree neighbourhood group (NHG), and forms the basis of the weekly meetings of the NHG. The amount of loan and the priority of disbursement are decided by the NHG. The repayment is collected weekly during routine NHG meetings.

**The total thrift collected by NHGs in the state comes to Rs. 3170 Crore (as on Sep 2016) and the internal loans generated are to the tune of Rs. 12094 Crore (as on March 2016). Details are reported in the monthly meetings by the CDS.**

**Bank Linkage:-**

The Bank linkage program has made inclusive growth possible by providing easy access to bank loans without any physical collateral. The efficiency and effectiveness of the NHGs are verified on the basis of some objectively verifiable and easily identifiable parameters. NABARD has developed a 15-point index for rating NHGs on the basis of which they will be allowed to link with various banks under the Linkage Banking Scheme.

**The total amount which has been mobilized under linkage banking is Rs. 531963 Lakhs (current live linkage) and 1,72,824 NHGs have availed of the loans. The linkage loans may be raised directly by the NHG or as bulk loan through the CDS.**

**Matching Grant to thrift and credit societies:-**

Matching Grant is an incentive provided to NHGs. This grant linked to amount of thrift mobilized, performance of NHG in the Grading and loan availed from banks. An amount of 10% of the savings of the NHG subject to a maximum of Rs 5000/- is provided as matching grant to each NHG. The grant is released based on their assessment rated using a 15-point grading criteria developed by NABARD. In order to avail Matching grant a NHG must have passed the grading and availed loan from bank. In case of SC/ST NHGs, matching grant will be provided if the NHG has passed grading. Availing bank loan for a SC/ST NHG is not compulsory in order to be eligible for matching grant.

**As on 31 March 2016, total of 89,752 NHGs have availed of Matching Grant facilities**

**Interest Subsidy:-**  
The interest subsidy scheme is a new initiative by the Government of Kerala to enhance the affordability of formal credit. As per the scheme, all commercial and cooperative banks that are prepared to lend to Kudumbashree NHGs under the linkage banking programme at 9% or below, will be participants in the scheme. The CDS would be raising the claim with the banks and the amount would be dispersed to a designated nodal branch by Kudumbashree State Mission in the case of commercial banks and to the concerned cooperative banks/societies by the district missions in the case of cooperative institutions. The interest subsidy would be provided as annual instalments to the banks. One highlight of the scheme is the inclusion of joint liability groups for farming in the ambit of the scheme. Around 10099 groups (1737 Joint Liability Groups and 8362 Neighbourhood Groups) have benefited from the scheme.

**Kudumbashree Mission has been able to disburse Rs. 989 Crore under this scheme to various NHGs and JLGs:-**

Under NRLM( Central Scheme) Interest subvention program all women NHGs in category 1 districts namely Palakkad ,Malappuram, Idukki and Wayanad are eligible for interest subvention on credit upto Rs. 3 lakhs at 7% per annum. Further, these NHGs will be provided with an additional 3% subvention on the prompt repayment of loans. For category II districts, all Kudumbashree NHGs in rural area are eligible for interest subvention to avail the loan facility at an interest rate of 7%. Here Banks will charge the SHGs as per their respective lending norms and the difference between the lending rates and 7% subjected to a maximum limit of 5.5% will be subvented in the loan accounts of the NHGs by Kudumbashree with the support of NRLM Fund.

A recent survey of the performance of Kudumbashree units in a few selected panchayath, has brought out certain factors, which have come in the way of realizing the objectives of the mission. The government's decision to limit the activities to women belonging to below the poverty line (BPL) has made its reach very small in relation to the total population and overall credit needs. The educated and middle class women, as a result, withdraw from the scheme. Lack of management expertise, non-availability of raw materials, faulty planning, lack of coordination between panchayath and Kudumbashree units, and poor marketing were other observed deficiencies. Kudumbashree, the poverty eradication mission of Kerala aims to enhance women's economic development and enable women to become 'active citizens'.

No doubt the programme has been largely achieving in respect of the numbers of women involved, their levels of engagement with the local governments, and their increased ability to save money and access subsidised credit. However the field experience arises some questions regarding the sustainability of the mission as a result of local political cultures and sustained patterns of social exclusion, some of the poorest and most marginalized and backward women find it difficult to access the programme, many of the women who are involved still lack decision-making power and autonomy and the empowerment is suspected to be polarized to certain insiders and making a lion share of the members the outsiders and find it particularly difficult to achieve leadership roles within Kudumbashree groups.

#### **Micro Enterprises:-**

Supporting and sustaining micro enterprises has always been a challenge for development administration. Problems of scale, capability, market and vulnerability do not offer easy solutions. In the recent past Kudumbashree has been attempting to analyze and resolve these problems specifically and jointly, both by increasing the interface with the LSG and the entrepreneur regarding existing programmes, and by bringing new strategies and new programmes that help converge resources and address arising issues proactively and creatively.

#### **Schemes under Micro Enterprises:-**

##### **• RME Scheme:-**

The success of centrally sponsored enterprise programme in the urban areas prompted the Mission to come up with similar enterprise programme in rural areas. The Rural Micro Enterprises (RME) Programme was initiated to help women to set-up Individual and Group enterprises. The minimum number of people required for a group enterprise being ten. Various activities like catering groups, traditional delicacies, paper products, super markets, direct marketing, various food products, goat rearing, dairy units, rabbit rearing, etc have been formed under the RME programme. Even traditional activities like Goat rearing and Dairy have been set-up under RME.

#### **Details of scheme:-**

Group enterprise

- Project cost – INR 250000 or above
- Subsidy per group – INR 100000 (or 50% of the project cost whichever is less)
- Subsidy per individual – INR 10000 Individual enterprise
- Project cost – INR 50000 or above
- Subsidy – INR 7500 (or 50% of the project cost whichever is less)

#### **Yuvashree:-**

The success of the Rural Micro Enterprises (RME) programme has encouraged Kudumbashree to come up with the 50K or Yuvashree programme to provide employment to educated youth in the State through micro enterprises. The Objective of the programme is listed below:

- To facilitate youth in securing sustainable employment opportunities.
- To foster economic development by creating jobs for the poor.
- To identify innovative areas to set up micro enterprises for the youths from BPL families
- To provide hand holding and escort services to the new generation entrepreneurs

The emphasis was on providing employment opportunities for the educated youth, hence 50K was restricted to educated youth (at least appeared in 10th examination) in the age group of 18-40. This programme also gave a chance to men from the Kudumbashree families to setup their enterprises. Individual and Group (minimum of 5) enterprises are set up under this programme; emphasis is given in setting up innovative enterprises.

The various steps followed for setting up enterprises were similar to the RME programme, but certain innovations were also added. The use of MEC (Micro Enterprise Consultants) for identifying entrepreneurs, project ideas, helping in preparing bankable project proposals and monitoring the projects has been found to be a successful experiment.

**Innovation fund/Technology fund:-**

Innovation fund was initiated for supporting innovative micro enterprise. The main objective is to cover initial risk. The maximum amount eligible should not exceed 50% of total project cost including subsidy plus innovation fund. Suitable innovative micro enterprise projects will be identified by Micro enterprise and Samagra teams in Districts and Head Office who will then submit proposals to the Head Office.

Technology fund is planned to procure advanced and innovative technologies for setting up micro enterprises under Kudumbasree. The cost of technology includes the cost to develop a new technology, purchase of a technology from research organization, laboratory, and individuals, NGOs etc. The proposal from the District Mission Team will be scrutinized by a

screening committee constituted for the purpose at State level. Project proposals for the procurement or development of technology for micro enterprises are drafted by the District Missions and submit the same to screening committee.

**Revolving fund:-**

Revolving fund is meant for meeting urgent requirement of working capital. Enterprises are eligible for revolving fund @ 15% of the total project cost subject to a maximum of INR 35000 per group.

One of the major issues faced by Micro Enterprise is the shortage of working capital due to delay in payments by wholesalers and departments. Kudumbasree succeeded in providing Revolving fund to units, which helped them in harnessing working capital for continuous production-supply.

**Crisis management fund:-**

Crisis management fund is meant for responding to an unpredictable negative event to prevent it from escalating into an even bigger problem related to Micro enterprise activities of Kudumbasree. The scheme has only recently become operational.

**Kudumbasree adopts a four pronged approach towards crisis management:-**

1. Anticipate potential crisis situations and prepare for them
2. Provide accurate information during a crisis
3. React as quickly as possible to the situation
4. Long-term solutions

**Mnregs:-**

The National Rural Employment Guarantee scheme is a wage employment programme launched by Govt. of India which guarantees 100 days of manual work to anyone who registers under the programme and seeks work. It is executed through the panchayats of the country, and has a very strong rights based elements in it. In Kerala the ward level committee of Kudumbasree, the ADS has been entrusted with the task of organizing public works under MNREGS. Muster Rolls and other records are maintained by the ADS, implements are provided to labourers by them. Welfare amenities to the workers are also provided by the ADS. The involvement of Kudumbasree has brought a lot of women into the programme.

**Joint liability Groups:-**

Joint liability groups of women farmers are formed under the collective farming initiative to help women cultivators' access agricultural credit from the banking system. These JLGs are structured along NABARD guidelines, and open bank accounts in the name of the JLG JLGs are brought under the purview of Interest subsidy scheme of Kudumbasree (ISS). They become eligible for ISS when they avail agricultural loan from banks. 5% subsidy on 7% interest agricultural loan is provided by state government of Kerala through Kudumbasree.

**Outcome:-**

Through the Collective Farming programme the twin benefits of poverty eradication food security and financial returns through agriculture and increased agricultural production are sought to be accomplished.

**Concluding observations:-**

The State Poverty Eradication Mission, which aims at eradicating absolute poverty within a definite time frame, opted to achieve the goal through empowerment of women. The working slogan of the Mission *is to reach out the family through women and*

*reach out the community through family.* The process of empowerment is by following sequential steps right from organizing them in to Community Based Organisation. Kerala has, for a long time, recognized the social and economic imperatives for broader financial inclusion and has made an enormous contribution to economic development by finding innovative ways to empower the poor.

Kerala started the pilot project of the participatory poverty alleviation programme initially in Allepey municipal area with the support of UNICEF. Based upon the survey done from the pilot phase the same model was extended to all municipalities in the state covering in total of 96 panchayath in the year 1995. Since the background of the project has involved a major study and intense experimentation, the Kudumbashree programme is mainly the sole copyright of Kerala which highlights the participatory strategy for taking power to the people and especially the poorest and the weakest of all. This paper reviews the

literature on major steps taken to eradicate poverty, empowerment of women – through social and financial inclusion and its development nexus, it has got the national and international recognition as an ideal and workable model of participatory development for eradicating poverty through removing gender inequality.

Kudumbashree, the poverty eradication mission has evolved as a strategic tool for poverty eradication and women empowerment in Kerala through various multiple schemes to reach out people and enhance their standard of living by all means. Women have started identifying their strength as a result of joining in the Kudumbashree programme. No doubt it has contributed to the socio economic development of the women folks both in rural and urban areas. All these are the brighter face of the Kudumbashree programme which is unique and one of the major step that was initiated by the Government of Kerala towards the major development of the state through poverty alleviation and bringing out the socio economic changes in the under development society by the ways of financial inclusion.

#### Abstract

Racial inequalities imposed on African American Americans resulted in historic repression of the blacks and created an imbalance in society to give a way to conflict for human rights in racially fraught America. It offered authority to whites and relegating the blacks to the rags. The whites dominated each sphere in economy and there was no scope left for the blacks. Racial crisis and cultural conflicts drove the blacks in utter poverty and rejected the right to life. Alice Walker as an eminent African American writer deals with the ethnic issues and throws light on the historic repression of the blacks in America to voice the African Americans. Her firsthand experience of her parents' lives as sharecroppers and their brutal exploitation enabled her to view it in her works more realistically. It encouraged the humanists to fight for the human rights in racially fraught America. The abolition of slavery did not uproot sharecropping completely. It continued even in more crude and violent form, ruined the blacks, and rejected them life worth to live as free human beings.

#### Introduction:-

The roots of cultural conflict in American society are in the white class mentality. The whites strongly believed in the subjugation and oppression of the African Americans and denied them their human rights. The proclamation of the abolition of slavery did not end the exploitation and discrimination in American society. The exploitation continued even in the most brutal crude forms of sharecropping system that oppressed blacks and propelled them to live in utter poverty, and rejected them their right to life. The cultural imperialism of the white masters denied the blacks their recognition as human beings, relegated them to the rags, and labelled them as bonded labourers. In *Society and Self in Alice Walker's In Love and Trouble*, Dolan Hubbard strikingly points out this reality: "Despite the abolition of slavery, blacks find it extremely difficult to redefine their historic roles as labourers in a culture that is antagonistic to their very being" (Hubbard 2000, 212)

Alice Walker throws light on the devastating effects of cultural conflicts on the blacks that propelled them to be bonded labourers in sharecropping system, which ruined their lives. In this regard Barbara Christian's observation about the cultural crisis between the blacks and whites that arise due to the bonded labour is striking. She says, "By tracing the history of Copeland family through three generations, Walker demonstrates the relationship between the racist sharecropping system and the violence that the men, women, and children of that family inflict on each other." (Christian 1985, 84) The cultural conflict between the whites and blacks had strong negative impact on the

families of the black people. Whites' cultural domination over the blacks destroyed the harmony in familial relationships in America and resulted into a family crisis. Grange Copeland, the protagonist throws more light on it. His exploitation as a sharecropper at the hands of his white master makes him more violent and abusive and turns him into a habitual drunkard who starts using his power against the weaker ones in his own family to get some power of feeling and authority over the family members. Alcohol serves here a means of an agent to take out his anger not on the white master but his wife and son. N. Seraman, N and A.R.Thillaikkarsi precisely comment on it and substantiate the same. They state, "He threatens his wife and son, taking too much of alcohol. It is a way to get some feeling of power." (Seraman 2013, 22)

His trap in cultural flux penetrates conflict in his own mind that does not allow him to understand the significance of education and as a result, he deprives Brownfield education. Grange's denial of education to his son proves how the slavery continued in sharecropping, kept the African Americans ignorant about the change that would come with education and relegated them to live their lives in abject poverty all their lives. Grange's exploitation in systemized bonded labour results in frustration that he inflicts on his wife and son. This cultural and racial crisis thus results in complete deterioration of Grange and his family. The exploitative nature of sharecropping that has its roots in cultural dominance, authority spoils Grange's life, and he remains in debt that he will never be able to pay off to his white master. His wife, Margaret tries to save her husband from the debt but in her attempts, she becomes a prey to the lust of the landlord. Thus, sharecropping does not result in mere Grange's exploitation in tiresome hard work but also a rape that Margaret is a victim of in a racist society that strongly imbibes the idea that the whites do have right to the black women. In this regard, Bell Hooks rightly comments on the black women's exploitation by the whites and the black masters, "American women have been socialized, even brainwashed to accept a version of American history that was created to uphold and maintain racial imperialism in the form of white supremacy and sexual imperialism in the form of patriarchy." (Hooks 1990, 120)

Cultural crisis and repression of the blacks ruined the entire humanity and brought the two cultures in flux. As the whites were in authority, their families did not suffer, rather they enjoyed the feeling of superiority over the black ones and did not question the unequal laws that stamped their authority. Even the black solidarity formed of the black community was not strong to stop wrong things happening in black culture. As a result the black women and children suffered and the black men became irresponsible and unaccountable towards their duties. In Grange's case, his failure in his duties as a husband and a father results in Margaret's suicide. Brownfield who is left orphaned too becomes what his father has left him for. He becomes the most degraded character in Walker's fiction.

Grange Copeland heads north to find some meaning in his life. But the intention with which he moves there results in despair and he soon finds the world unkind brutally ruled by the white cultural dominance everywhere. His encounter with a white pregnant woman who is deserted by her lover at the lake arises in him sentiments and the feelings of humanity for her. In order to save her from drowning in a frozen lake, he offers his hand to the woman who in turn calls him a nigger and humiliates him. Her expression of vicious hatred and racism directed at him angers him and he drops the idea of saving her and leaves the park. His encounter with the white pregnant woman results in cultural conflicts that leaves him repelled and he does not find any feelings of sympathy for anyone thereafter. In his violent disposition, that is the result of cultural domination and whites' superiority and authority over the blacks turns into violent anger that he vents at the whites and picks quarrels with them and fights with them. After realizing the futility of his actions, he soon returns south and tries to make amend for the wrongs, he caused in Brownfield's life, but finds that his son, Brownfield, rejects him. Grange takes the custody of Ruth after his son brutally kills his wife. Grange loves Ruth, sings and dances with her, tells her stories and even shares with her his experiences that he had in a culturally white dominated world. He shares, "The white folks hated me and I hated myself until I started hating them in return and loving myself. Then I tried just loving me, and then you, and ignoring them much as I could" (Walker 2004, 252) What Grange shared with Ruth throws light on Grange's response to the whites' hatred for him and the self realization that he should not hate himself but love. His vast experiences both in the south and north make him realize his sense of duty that he must have towards himself. He offers education to Ruth that he had denied to Brownfield. And for that purpose, he steals the books from the whites to provide her access in every subject to broaden her vision and understanding of the world around. Grange's sense of responsibility to look after his grandchild Ruth and protect her from every hostile culture and the deadly trap sets him on a new path for his emancipation into the first emergent black male protagonist in Alice Walker's entire work of fiction. He outshines as a wonderful human being completely changed and enamoured by the real feelings of love compassion, pity and sympathy that he completely missed in his earlier life.

Grange Copeland, in his pursuit of truth and his struggle with culturally dominated forces and the unjust law machinery and the court verdict, shoots his son in the court and makes his way to his farm with Ruth not to find an escape but to protect Ruth from the evil unjust court and law machinery that prevailed at the time. In his pursuit to save Ruth, he dies in the firing with the police. Grange's fight with the court throws light on the white culture that advocates unjust laws and discriminates between the blacks and the whites by affirming its trust in favouritism.

Cultural conflict does not end with Grange's fight with it but it continues even in the most evil form in Brownfield's life. Like Grange, Brownfield too becomes a victim of dehumanized culture that strongly believes in blacks' subjugation and oppression. Edwin Mhandu's observation in this regard is striking. He says, "Brownfield, as his name signifies, is a victim of the sharecropping system with its brown fields that is controlled by white as typified by Shipley." (Mhandu 2012, 7). It highlights the plight of black children who were denied the right to education due to their parents' ignorance and the blacks' world controlled by the racial imperialism of the whites that denied education to black children and forced them to work in the confines of the cotton fields.

Later in his life, Brownfield's knowledge of his young daughter, Daphne's work in the cotton fields enables him to find his family trapped in the chain of slavery that had begun with Grange. Daphne's mopping the cotton bushes with arsenic makes him realize the complex web of cultural dominance and slavery. The omniscient narrator observes, "It was the summer that he watched, that he had to teach, his frail five-year old daughter the tricky, dangerous and disgusting business of hand mopping the cotton bushes with arsenic to keep off boll weevils." (Walker 2004, 70) His daughter's work and her plight leaves him heartbroken and he senses that he is trapped in the same cycle of oppression and exploitation that his father lived. Realizing it, Brownfield contemplates suicide as he fails to get his family out of economic depression phase his family is witnessing. The narrator observes, "This was the year he first saw how his own life was becoming a repetition of his father's. He could not save his children from slavery..." (Walker 2004, 72) When he fails to find any way out, he starts taking out his anger on his wife, Margaret declaring her responsible for his failures. In this way, he too like Grange continues the same pattern to blame the whites and his wife for his own inactions as he fails to encounter with the cultural dominance of the whites and find any solutions to his problems. Like Grange, Brownfield too blames the white culture for his own inactions. Instead of accepting his faults and weaknesses, he blames the whites even for the results of his own actions. He believes as rightly stated by M. Evans: "that white folks are to blame for everything including his behaviour." (Evans 1983, 460)

He too like Grange, instead of confronting cultural dominance of the whites, vents his anger and frustration at his wife and three daughters. The narrator captures Brownfield's indifference and irresponsible behaviour towards his daughters in the following words:

TO HIS THREE DAUGHTERS Brownfield gave the dregs of his attention only when he was half drunk. To him they were not really human children, although his heart at times broke for them. He could not see them as innocent or even as children. He scolded Ornette, who had come a year after Daphne, with the language he would use on a whore. And the baby, Ruth, he never touched. (Walker 2004, 96)

Brownfield is torn in the cultural flux that he cannot escape the ghetto; the way Grange could break. The painstaking efforts and hardships in bigoted order emanate in him arrogance and violence that he uses as means of violence against his own family and thus it results in his family deterioration. The narrator recapitulates Brownfield's rough treatment as "He had enslaved his own family, given them weakness when they needed strength, made them powerless before any enemy that stood beyond him. Now when they thought of "the enemy," their own father would straddle their vision." (Walker, 287) Brownfield's irresponsible behaviour, his unaccountability and ignorance caused by fanaticism of the white culture, cripples down the entire family and destroys it terribly, making Brownfield alcoholic and more violent ever before. The pangs of cultural authority and superiority are so disturbing and destructive that makes the place menacing for the survival of the African Americans. In her interview with John O'Brien, Alice Walker regards *The Third Life of Grange Copeland* "a grave book" in which the characters observe "the world as almost entirely menacing" (Byrd, 2010, 50)

The white culture constantly made the blacks to move from one place to other. They did not permit the blacks to settle at one place and live life comfortably; rather they overworked the blacks and terminated them from the work after exploiting them for years of hardships. Mem Copeland is no exception to it. She is very much disturbed in xenophobic world that does not permit her to settle at one place. It results in disturbing her daughters' education and

they begin to suffer. Mem's plight throws light on the cultural crisis in which the white landlords did not allow the blacks to settle at one place. Sharecropping system kept them moving from one place to the other and that chain of moving had no end in their life. The narrator rightly captures this reality in Mem to throw light on her frustration she has experienced:

Being forced to move from one sharecropper's cabin to another was something she hated. She hated the arrogance of the white men who put them out, for one reason or another, without warning or exploitation. She hated leaving a home she'd already made and fixed up with her own hands. She hated leaving her flowers, which she always planted whenever she got her hands on flower seeds. Each time she stepped into a new place, with its new, and usually bigger rat holes, she wept. Each time she had to clean cow manure out of a room to make it habitable for her children, she looked as if she had been dealt a death blow. (Walker 2004, 77-78)

Mem Copeland tolerates the extremity of cultural dominance of the whites that drives her and her children to move from one place to the other. The moment she realizes the problem of her daughters' health, education and proper care, she rebels the circumstances and fights with the manipulative and abusive forces. She supports her husband despite his arrogance and negligence. She fails to understand the complex nature of her utilization in cultural imperialism. In *Racism and Feminism: The Issue of Accountability*, Bell Hooks explains, "The inability of American women to understand racism in the context of American politics is not due to any inherent deficiency in woman's psyche. It merely reflects the extent of our victimization." (Hooks 1990, 119)

Mem Copeland finds the white cultural environment hostile and the places she lived menacing for their existence and survival. Whereas Brownfield finds his existence at such menacing hostile places fit to inhabit as his life is destined to the lot he is conditioned in imperialistic world. The narrator rightly observes:

For Brownfield, moving about at the whim of a white boss was just another example of the fact that his life, as it was destined, had "gone haywire," and he could do nothing about it. He jumped when the crackers said jump, and left his welfare up to them. He no longer had, as his father had maintained, even the desire to run away from them. He had no faith that any other place would be better. He fitted himself to the slot in which he found himself; for fun he poured oil into streams to kill the fish and tickled his vanity by drowning cats. (Walker 2004, 78)

Like Margaret and Mem Copeland, Ruth too witnesses intolerance, but she cannot remain passive like them. To encounter the cultural dominance and authority of the whites, she turns to the civil rights movement and takes interest in it. She encounters civil right workers distributing some pamphlets regarding the movement and dares to drop the same at the white neighbour who leaves next to them. Grange has already informed her with the white neighbour's evil motive to usurp their land. Ruth's dropping of the pamphlets at the neighbours' farm is her first action and an entry into the civil rights movement. She is fascinated towards the movement, as she too desires for the equality and keeps a constant watch on the moves of the civil rights workers around. Education denied to Brownfield brings transformation in her life and expands her scope of knowledge. In a court on the day of verdict, Grange shoots Brownfield, saves her from his exploitation, and makes her free to make her way to any continent where she would find the environment fit for her survival and growth. Ruth's story towards the end of the novel offers more hopes for greater possibilities of freedom, growth and emancipation in an equal society that she would strive for and go beyond the black and white culture that is antagonistic to each other. Bloom Harold beautifully captures this would be reality in Ruth's life as below:

While Brownfield is a terrifying example of how the South can physically enslave and spiritually cripple black people, Ruth's story offers considerable hope because she is able to leave the South, rejecting the racist world which destroys Brownfield and, in so doing, move toward a larger, freer world which offers her fresh possibilities. (Bloom 2007, 91)

To conclude, racial and cultural crisis not only destroyed the lives of black men but it also critically affected the lives of black women and children in American society. Grange and Brownfield Copeland are the terrifying representatives and victims of destructive cultural imperialism. The involvement of Ruth in the civil rights movement and the active participation of even some whites signals towards the March for the world class human society that will be based on freedom, fraternity, equality, and social justice to benefit the entire humanity residing on this beautiful planet-the Earth.

Comminuted proximal Humerus fracture, Osteoporotic bone, Severe anemia, Minimally invasive technique.

#### **Abstract**

Severe proximal Humerus fractures when left untreated have a poor functional outcome because of severe displacement of the fragments. Reduction is essential even though there is a danger that Open Reduction and Internal Fixation may increase the risk of avascular necrosis, especially in 4-part fractures. Open reduction doubles the risk of avascular necrosis compared with closed treatment [1]. The risk is increased still further by the exposure required for plating compared with that for a lesser procedure [2,3,4]. Here we describe a case of 90-year-old elderly female presenting with pain and restricted range of right shoulder movements following fall at her residence and was incidentally found to be suffering with severe anemia which was managed with a minimally invasive technique.

#### **Introduction:-**

Proximal humerus fractures are common, and about 80% are well managed non-surgically, the remaining 20% require surgical intervention so as to ensure healing and to optimize function. The priorities in surgical stabilization of proximal humerus fractures are to restore the anatomic relationship between the tuberosities and the articular head fragment and to maintain vascularity of the articular fragment [5]. ORIF may allow for rigid fracture fixation, but soft-tissue dissection may endanger residual vascularity of the articular segment, however closed reduction followed by percutaneous K-Wire fixation reduces the risk from soft-tissue dissection and may reduce the fracture indirectly and achieving provisional fixation for anatomic healing. Closed reduction and percutaneous fixation was first described by Bohler [6] for pediatric proximal humerus fractures treatment. He under general anesthesia reduced the fracture of the patient and provisionally fixed the shaft to humeral head fragment the using percutaneously placed pins. This method then was adapted to the treatment of fractures in adults. Initially, the technique was applied to the management of two-part surgical neck fractures [7] where it was as successful as open methods. More recently, closed reduction and percutaneous fixation with pins and cannulated screws has been applied to the management of three- and even four-part proximal humerus fractures [8,9,10]. Although these approaches to more complex fractures are challenging, vascularity of the humeral head seems to be more reliably preserved than in open treatments that require soft-tissue dissection to place rigid fixation implants [11]. The incidence of osteonecrosis is reduced with these methods [8-10,12-16] because the principal vascular supply to the humeral head, the ascending branch of the anterior circumflex humeral artery, is left undisturbed with no dissection in the region of the bicipital groove or around the subscapularis (Figure 1).

#### **Case presentation:-**

A 90-year-old female patient presented to the emergency department with pain, restricted range of movements with swelling of the right shoulder following accidental fall at her residence. Local examination there was a gross swelling over the right shoulder with tenderness at the deltoid region with restricted and painful active and passive range of shoulder movements with no external injuries. Both antero-posterior and axillary lateral radiographs revealed a four part fracture according to Neer's classification, with osteoporotic bones with intact gleno-humeral joint (Figure 2a,b).

**Figure 2a:-** Plain radiograph AP View showing greater tuberosity fracture.

**Figure 2b:-** Plain radiograph Axillary Lateral View showing four part fracture

Her Hemoglobin initially at the time of admission was 3.7gm/dL i.e., she was severely anemic and rest of the routine blood investigations were found to be normal. Her 2D-Echo revealed AV sclerosis, mild to moderate MR with mild TR/PAH. While an open reduction and internal fixation is recommended for such type of fractures, which takes a lot of time for healing, with risk of infections, prolonged intubation period during anesthesia, blood loss and even high risk as per her age, hemoglobin level and cardiovascular status, in view of all the above complications she was thoroughly evaluated and blood transfusion with five packs of packed cell volume was done until her hemoglobin improved to 9gm/dL. Under general anesthesia fracture was reduced by manipulation with fluoroscopic guidance

and fixed with five K-wires three infero-laterally and two of them supero-laterally giving the fracture a rigid fixation (Figure 3).

**Figure 3:-** Post-operative plain radiograph showing fracture reduced and fixed with K-Wires.

Patient was then immobilized with a shoulder immobilizer for about 2 weeks and was then gradually mobilized starting with pendulum movements and later with controlled abduction movements, K-Wires were removed after 6 weeks. Shoulder range of movements were achieved to the extent that patient was able to eat herself and do her daily activities to some desired extent without pain.

### **Discussion:-**

In elderly patients fractures of the proximal humerus are common. The overall prevalence is about 70 per 100000 population/year, representing about 5% of all fractures [17-19]. Restoration of muscle power to the injured arm is not the prime objective in elderly patients. The main requirement is to handle activities of daily living which do not need much strength, but require a reasonable range of movement. There is a particular need for sufficient internal rotation for eating and for personal hygiene and enough external rotation for combing hair and washing. The main aims of management in these fractures are a good functional result and pain relief, irrespective of a compromise on restoring precise anatomical congruity [20]. A good functional outcome is when an abduction and elevation of 90°, external rotation of 25° and an internal rotation good enough to touch the L1 vertebra is achieved. The choice of treatment for patients with a complex fracture of the proximal humerus remains controversial and is mainly based on the personal experience of the surgeon treating the injury. Here we planned for a closed reduction and internal fixation due to patient's poor compliance, her elderly age and other co-morbid conditions. The results of closed reduction and percutaneous pinning are favorable in most series [7-10,12-15]. The largest two series have been published by Jaberg and associates<sup>7</sup> and Resch and associates [8,12]. Over the past 15 years, we have performed closed reduction and percutaneous fixation of more than 50 proximal humerus fractures. All patients have regained overhead motion and have achieved stable fixation. No osteonecrosis was observed; including the patients who had true four-part fractures.

### **Conclusion:-**

ORIF results in lower rates of nonunion, shorter time to union, earlier mobilization, and better anatomical reduction. But this case has been presented with almost similar outcome treated with minimally invasive procedure as the patient was not compliant, had co-morbid conditions like severe anemia, cardio-vascular disease and elderly aged, who almost required a shorter period of intubation compared to ORIF, post surgically she had a shorter hospital stay and early mobilization of shoulder was initiated. However outcome depends on accuracy of reduction, avascular necrosis, and degree of comminution.

**Conflicts of interest:** None.

#### Abstract

**Background:** Obstructive uropathy is a major clinical problem defined as the presence of any functional or structural abnormality of the urinary tract that leads to blockage or reduction of urine flow. It accounts for almost 10 % of cases of renal failure.

**Objective:** The purpose of this review article is to evaluate the different Obstructive Uropathy treatment options that could be offered for patients suffering from this condition.

**Methodology:** A medical literature search using Pubmed/Medline that addressed both the pathophysiology and treatment of obstructive uropathy was performed.

**Conclusion:** Various causes are claimed for the occurrence of obstructive uropathy. Once presence of obstruction is confirmed, intervention is warranted. The type of intervention depends on the location of the obstruction, its degree, and its cause, as well as the presence or absence of concomitant diseases and complications, and the general condition of the patient.

#### Introduction:-

Obstructive uropathy can be defined as any blockage of urine drainage from the kidney (renal calyces or renal pelvis), ureter, or bladder. As a result of the blockage, urine backs up into the kidneys, causing dilatation of the ureter, renal pelvis, and renal calyces, which can damage the kidney if it is not treated. The appearance of dilated or enlarged renal pelvis and calyces is referred to as hydronephrosis and is a symptom of obstructive uropathy. Obstructive uropathy can be a long-term disease (chronic) or occur suddenly (acute). As well, it can occur in one kidney (unilateral) or both kidneys (bilateral). Symptoms may include nausea, vomiting, excessive sweating (diaphoresis), and abdominal or groin pain. Obstructive nephropathy is of great importance to clinicians since it is a common entity that is treatable and regularly reversible. Patients with obstructive nephropathy might be asymptomatic or might show differing qualities of clinical disorders. Obstructive uropathy alludes to the vicinity of auxiliary or utilitarian changes in the urinary tract that hinder the ordinary stream of pee. Obstructive nephropathy is the renal malady brought on by impeded stream of pee or tubular liquid. Hydronephrosis signifies expansion of the urinary tract (1).

The occurrence of hydronephrosis reported by Bell (2) in a progression of 32,360 dissections was 3.8% (3.9% in guys, 3.6% in females). The rate of clinical signs of obstructive uropathy preceding demise was not reported, and it is likely that hydronephrosis was an accidental finding in a significant number of these patients. The rate of hydronephrosis at examination is to some degree lower in kids than in grown-ups, being 2% in one arrangement of 16, 100 post-mortems (3). More than 80% of youngsters with hydronephrosis at post-mortem examination were

under 1 year old, with the parity of youth cases being conveyed consistently through the adolescence years. Around 166 patients for every 100,000 populace had a hypothetical conclusion of obstructive uropathy on admission to healing centers in the United States in 1985 (4). Among male patients with kidney and urologic issue, obstructive uropathy positioned fourth at release (242 patients/100,000 releases). In females with kidney and urologic issue, obstructive uropathy positioned 6th as a determination at release (94 patients/100,000 releases). In the United States in 1985, around 387 visits for each 100,000 populace were identified with obstructive uropathy (5). New ultrasound methods have made conceivable the finding of obstructive uropathy in the baby amid pregnancy (6). In the grown-up, the occurrence and reasons for urinary tract obstruction fluctuate with the age and sex of the patient. In youthful and moderately aged guys, intense obstruction from renal calculi is common but provisional, and such cases would not be incorporated into post-mortem examination studies. In females of this age bunch, then again, pelvic disease is a vital reason for obstructive uropathy. In the more seasoned age bunch, urinary tract obstruction is more common in the anatomic or practical components are important in building up the reason for the obstruction. The level at which the obstruction happens in the urinary tract, and whether it is intraluminal, intramural (natural), or extramural (outward) are useful. The vital levels of obstruction in the urinary tract are the urethra and the bladder neck, the bladder and the ureterovesical intersection, the ureter, and the renal pelvis and ureteropelvic intersection. Obstructive uropathy is arranged by degree, term, and site of the obstruction. The degrees of obstruction are said to be high review when it is finished, and poor quality when partial or incomplete. When the obstruction is of brief term it is said to be intense. Most often this is because of stones. Obstruction that grows gradually and is durable is said to be unending, as in intrinsic ureterovesical variations from the norm and retroperitoneal fibrosis. Obstructive uropathy is because of useful or anatomic sores that can be found anywhere in the urinary tract from the renal tubules (gems) to the urethral meatus. Obstructive uropathy influencing the lumen of the renal tubules is said to be intrarenal, and those reasons for obstruction that emerge in the urinary tract are alluded to as extrarenal. Extrarenal obstruction thus is partitioned into upper urinary tract obstruction (over the ureterovesical intersection), which is normally one-sided in nature, and lower urinary tract obstruction, which by definition is respective. The causes of upper urinary tract obstruction can be characteristic or extraneous. Inborn causes are either intraluminal or intramural, with renal calculi being the fundamental driver of intraluminal obstruction. The intramural reasons for obstruction are either anatomic or useful. Anatomic lesions of the upper urinary tract, a less common cause of obstruction, incorporate ureteral strictures, considerate or malignant tumors of the renal pelvis and ureter, ureteral valves and polyps. The utilitarian issue incorporate vesicoureteral reflux and adynamic ureteral sections. The most common site of useful obstruction in the ureters is an utilitarian defect at the ureteropelvic junction. This is usually a disease of infants. The second most common cause is a functional defect at the ureterovesical junction.

Therapy for obstructive uropathy is largely determined by whether the obstruction involves one or both kidneys, and by the age of the patient. In the infant and child, obstructive uropathy is almost always due to a congenital malformation of the ureter, bladder, or urethra. Ultrasonographic prenatal diagnosis has permitted early detection and even fetal intervention for posterior urethral valves, although this form of treatment must be considered experimental at present. More important to the affected infant than optimal renal development is the prevention of pulmonary hypoplasia, which is a consequence of fetal oliguria and oligohydramnios. Removal of the stone can be accomplished surgically or by lithotripsy. Bladder outlet obstruction is usually secondary to prostatic hyperplasia, which may progress slowly, allowing a delay in surgical intervention. Neurogenic bladder may require intermittent catheterization or cholinergic therapy; those with hypertonic bladder may benefit from anticholinergics. Regardless of the patient's age, prompt and accurate diagnosis is essential to planning an optimal strategy for the management of obstructive uropathy (7).

#### **Objectives:-**

This study was undertaken to discuss the **Obstructive Uropathy and its treatment** with least rate of recurrence. And to highlight the most incidence causes of **Obstructive Uropathy** to educate patients who are going under surgical procedure about the condition that may cause more complication results than the condition was operated for, and also to evaluate the different **Obstructive Uropathy treatment** techniques that could be suitable for most of patients suffering from this condition.

#### **Methodology:-**

Medline (pubmed) literature review and analysis for previous studies that are discussing Obstructive Uropathy and its different management procedures for, which become a common nowadays, our searched was by using the search terms 'Obstructive Uropathy and its Treatment' and 'management of uropathy' alone and in combination. Publications were selected mostly in the past 30 years, but did not exclude commonly reference and highly regarded

older publications. The reference list of articles was also searched, identified by the search strategy and those selected that were relevant. Selected review articles and meta-analyses were included because they provide comprehensive overviews that may be beyond the scope of this article.

### **Results:-**

Here we would like to discuss different therapeutics aspects of Obstructive uropathy, in study that was performed by Gunter Wolf et al. in 2005 administration of an ACEinhibitor or an angiotensin II receptor (ATI) antagonist, to rats with unilateral ureteral obstruction, ameliorated the increase in interstitial volume and attenuated the increased expression of TGF- $\beta$ 1 in tubular cells, the increased production of extracellular matrix protein, the activation of NF- $\kappa$ B, the proliferation of fibroblasts and the conversion of their phenotype to myofibroblasts. A monocyte/macrophage infiltrate was present in the obstructed kidney of untreated rats and in the obstructed kidney of rats treated with the angiotensin II receptor antagonist. By contrast, this infiltrate was markedly decreased in the obstructed kidney of rats treated with an ACEinhibitor. This difference may be owing to greater generation of nitric oxide related to increased levels of bradykinin during ACE inhibition. In fact, rats with unilateral obstruction given both an ACEinhibitor and (LNAME)(an inhibitor of NO formation) had a substantial macrophage infiltrate. Administration of L-arginine in the drinking water significantly blunted the increases in interstitial volume, monocyte infiltration, interstitial collagen IV and smooth muscle actin expression (8).

There was a study by IoannisVakalopoulos et al. 2012 which discussed the Frontometaphyseal dysplasia is a rare genetic syndrome characterized by skeletal dysplasia comprising hyperostosis of the skull and modeling anomalies of tubular bones. The most common manifestations include supraorbital hyperostosis, hypertelorism, down-slanting palpebral fissures, and generalized skeletal dysplasia. The dysplasia manifests with thickening of the calvarium; agenesis of the frontal, ethmoidal, and sphenoidal sinuses; and bowing and undermodeling of tubular bone diaphyses and metaphyses, but the study indicates that obstructive lesions of the ureters and urethra commonly accompany frontometaphyseal dysplasia and should be specifically sought and excluded in individuals for whom the diagnosis is being considered. Our case represents a guide to how patients suffering from this rare syndrome may be approached to assess and correct functional and anatomical anomalies (9).

### **Surgical management and follow-up:-**

Emergency treatment of obstructive uropathy is needed in the presence of bilateral obstruction, urosepsis, uremia and hyperkalemia, persistent renal colic, worsening of hydronephrosis and renal impairment.

Regarding the dilemma to insert a ureteral stent (JJ stent) or a percutaneous nephrostomy, literature indicates especially Docimo SG et al. 1989 that both procedures do not show any statistically significant difference in terms of efficacy. However, in some hospitals, percutaneous nephrostomy is placed only by the interventional radiologists that may not be available in an emergency basis. In patients that receive anti-coagulation medication, the preferred therapy is JJ stent placement whereas in the case of urosepsis, percutaneous nephrostomy placement is the gold standard therapy. In obstructive uropathy due to cancer, there may be difficulties during the insertion of a JJ stent. After the management of the obstruction, polyuria may happen, especially in cases of bilateral obstruction or obstruction in a solitary kidney. Polyuria is due to a significant decrease in the receptor transport and because of reduced sodium reabsorption from the descending limb of the Henle loop. Usually, polyuria resolves when fluid and electrolyte homeostasis is achieved. Monitoring the level of consciousness and the vital signs, electrolyte supplementation and a gradual reduction of the administered intravenous fluids are essential (11).

### **Discussion:-**

A prospective study by Khalaf IM et al 2004 included 91 consecutive adult patients with the diagnosis of unilateral obstructive uropathy and a normal contralateral kidney. All patients had a nonequivocal cause of obstruction that was successfully relieved after treatment. All patients underwent plain abdominal x-ray, gray-scale ultrasonography, Doppler ultrasonography, excretory urography, and technetium-99m-diethylenetriamine pentaacetic acid radioisotope renography before and after treatment. Patients were seen regularly at 3, 6, and 12 months for a mean duration of 13 +/- 6 months (range 6 to 36). At each visit, ultrasonography and renography were performed, and excretory urography was performed at least once during follow-up. The study showed that On univariate analysis, the factors that significantly affected the recoverability of renal function after the relief of obstruction included preoperative renographic GFR, renal perfusion, parenchymal thickness, parenchymal echogenicity, corticomedullary differentiation, reduction of the renal resistive index of the corresponding kidney, and compensatory hypertrophy of

the contralateral normal kidney. However, using multivariate analysis, only the preoperative selective renographic GFR and renal perfusion of the corresponding kidney sustained their statistical significance as independent factors affecting renal functional recovery. A preoperative GFR value of 10 mL/min/1.73 m<sup>2</sup> was estimated as the cutoff point that can determine the best prediction of stabilization or improvement of renal function after the relief of obstruction(10).

### Conclusion:-

The absolute most regular reason for obstructive uropathy as far as we can tell is ureteral pressure because of a gravid uterus. Decision treatment much of the time is moderate treatment. At the point when regardless of moderate treatment signs and indications persevere; urinary by-go with anti-infection prophylaxis must be performed. Ureterorenoscopy as an indicative and helpful methodology ought to be thought about in pregnant ladies with ureteral lithiasis. Frequency of pre-term work was not higher than normal.

##### Key words:-

Neonatal respiratory distress syndrome,  
 Oxidative stress, Antioxidant.

#### Abstract

**Background:** Respiratory distress syndrome (RDS) is still an important problem in treatment of preterm infants. The imbalance between the oxidative forces and the antioxidant defense systems was suggested to predispose the lungs to the development of RDS. The present study aimed to investigate the alterations in biochemical parameters of oxidant/antioxidant and its role in development of neonatal RDS.

**Methods:** This case control study included 40 premature neonates with RDS and 50 healthy premature newborns. Quantification of levels of malondialdehyde (MDA), thiobarbituric acid reacting substances (TBARS) along with total antioxidant capacity (reduced glutathione, and superoxide dismutase SOD) in cord blood of healthy premature newborns compared with those with RDS.

**Results:** Status of markers of oxidative stress (MDA, and TBARS) showed a significant increase with depleted levels of total antioxidant capacity of reduced glutathione and SOD in neonatal RDS when compared to healthy newborns.

**Conclusion:** The study concluded oxidative damage and diminished antioxidant defenses in newborns with RDS that was evidenced in severe cases of RDS. This could be of clinical significance in studying the pathophysiology of neonatal RDS.

#### Introduction:-

Respiratory distress syndrome of newborn also called Infant respiratory distress syndrome (IRDS), previously called hyaline membrane disease (HMD), is caused by lung immaturity and insufficient production of surfactant during development. IRDS affects about 1% of newborn infants and is the leading cause of death in preterm infants (Rodriguez et al., 2002).

A fully developed lung is protected with defense lines that increase resistance to high O<sub>2</sub> tensions. On contrast premature lung is affected by insufficient/dysfunctional surfactant resulting in collapsed alveoli, atelectasis, ventilation-perfusion mismatching, and subsequent hypoxemia and respiratory acidosis. The poorly developed

peripheral airways and immaturity of cells important for lung maturation are the major causes of poor surfactant production by type II cells and inadequate antioxidant responses to increased ambient oxygen (Gleason et al., 2012). In addition to prematurity, premature neonates could be complicated by diminished antioxidant stores and antioxidant enzymes production. Oxidative stress is oxidant/antioxidant imbalances that resulting in production of free radicals. Adequately mature and healthy infants are able to tolerate this drastic change in the oxygen concentration. A problem occurs when the intrauterine development is incomplete or abnormal. Preterm infants are typically of this kind (Rahal et al., 2014; Marseglia et al., 2014). After birth, sudden increase in oxygen supply lead to overproduction of ROS and depletion of antioxidants. Oxidant stress promote expression of cytokines and the inflammatory process (interleukin-6, interleukin-8, and tumor necrosis factor- $\alpha$ ) (Gitto et al., 2004; Mutinati et al., 2014).

Oxidative stress in infants is implicated in the pathogenesis of the major complications of prematurity including respiratory distress syndrome (RDS), necrotizing enterocolitis, chronic lung disease, retinopathy of prematurity and intraventricular hemorrhage (Mutinati et al., 2014).

Newborns and especially pre-term infants are probably more prone to oxidative stress than are children and young adults as they are exposed to high oxygen concentrations, have infections or inflammation, have reduced antioxidant defense, and have free iron which enhances the Fenton reaction leading to production of highly toxic hydroxyl radicals (Saugstad, 2003; Saugstad, 2005). Phagocytes such as neutrophils are activated when stimulated by microorganisms or other means which increase their oxidative metabolism. If these toxic products are not inactivated, cell injury and respiratory cell death will induce (Esteban et al., 1999). Under these conditions, a surfactant deficiency may be aggravated by inactivation of the small amount of endogenous surfactant that is produced (Boda et al., 1998). Furthermore, if exogenous surfactant is given this may also be destroyed (Ikegami et al., 2000; Huertas et al., 1998).

For instance, the superoxide dismutase (SOD) activity appears in the developing lungs concomitantly with the surfactant synthesis by type II pneumocytes. So, the current study investigated the alterations in the biochemical parameters of oxidant/antioxidant by quantification of levels of malondialdehyde (MDA), TRBAS along with total antioxidant capacity in cord blood of healthy premature newborns compared with those with RDS. Umbilical cord blood provides valuable information regarding the status of the infant at birth that gives early predictors of some of the metabolic disorders in future adult life.

### **Patients and methods:-**

A total of 90 neonates were included in this case-control study. They were recruited from Neonatology department of King Abdul Aziz specialist Hospital (KAASH) Taif, Saudi Arabia, between August 2015 and September 2016. This study was approved by the Institutional Ethics Committee, and written informed consent for participation was obtained from the parents.

Cord blood samples were collected at the time of the delivery. The study group consisted of 40 preterm born < 33 weeks gestational age or of low birth weight < 1500 g with diagnosis of RDS. The control group was composed of 50 preterm low birth weight newborns. Exclusion criteria of the study were infection, congenital malformations, metabolic disorder and newborns with history of difficult delivery, genetic disorder, severe intraventricular hemorrhages, congenital hemolytic diseases caused by blood-type incompatible pregnancies, diseases requiring surgical treatment, and a gestational age of 22 wk.

RDS was diagnosed on the presence of typical clinical and radiological signs of the disease in the preterm infants. Newborns were considered to have RDS if they have tachypnea; grunting and cyanosis with several hours of birth required mechanical ventilation and typical radiographic findings on the chest X-ray. The diagnosis was established from the clinical symptoms and needed for oxygen treatment. RDS neonates were classified into mild, moderate and severe categories based on severity of oxygenation compromise.

Maternal age, date of last menstrual period, medical history and reproductive history were obtained from the hospital record.

Four mL of heparinized venous blood sample was collected from the umbilical cord just after delivery of the studied neonates and processed for the isolation of erythrocytes and plasma. The red cells were stored at 4°C and all serum

samples at  $-20^{\circ}\text{C}$  until analysis. The red cell samples were processed within 12 hours. For reduced glutathione determination erythrocyte mass was used, superoxide dismutase activity was determined in erythrocyte lysate (add 3 ml 0.9 % NaCl to 500  $\mu\text{l}$  of blood and centrifuge 660 g/10 min at  $4^{\circ}\text{C}$ , remove supernatant and repeat 4 times; after final removal of supernatant add 1.5 ml of chilled distilled water, leave for 20 min and freeze).

The following oxidant/antioxidant markers were measured

**Serum malondialdehyde (MDA)** marker of lipid peroxidation was measured using the colorimetric method described by Satoh *et al.* (1978), based upon the reaction of thiobarbituric acid (TBA) with MDA, one of the aldehyde products of lipid peroxidation. The absorbance of the MDA-TBA adduct thus produced was measured at 532 nm wavelength using a spectrophotometer.

**serum superoxide dismutase (SOD)** in erythrocytes was determined by the method described by **Marklund and Marklund (1974)** as modified by Nandi and **Chatterjee (1988)**, which is based on the inhibition of pyrogallol autoxidation brought about by SOD.

**Reduced glutathione (GSH)** was estimated by a method based on the development of yellow color with 5, 5' dithiobis-2-nitrobenzoic acid (DTB), which was measured at 432 nm using a spectrophotometer (**Beutler et al., 1963**).

#### Statistical analysis:-

Descriptive analysis was performed for demographic and clinical characteristics of the patients. MDA, TBRAS, reduced glutathione and superoxide dismutase levels were expressed as mean  $\pm$  SD. The levels were compared between the Study and Control groups by student's t-test or Mann 2 Whitney U test was used for comparison of numeric variables between two groups. Comparison between RDS group was determined by one-way analysis of variance (ANOVA) followed by Tukey post hoc test for multiple comparisons. Probability values (P) less than 0.05 were considered to be statistically significant.

#### Results:-

##### Characteristics of the studied groups:

The study included 40 premature neonates with RDS and 50 healthy premature neonates. 75% of RDS group were delivered by cesarean and 57.5% of them were infant of diabetic mothers. 65% of RDS group and 42% of control group were male table (1).

**Table (1):-**Characteristics of the studied neonates and their mothers: data are presented as number(percentage) and mean  $\pm$  SD

	RDS group n=40	Control group n=50

Data are presented as means $\pm$  SD; n = number of cases in each group. Statistical analysis was done using one-way ANOVA followed by Tukey post-hoc test for multiple comparisons. \*, P < 0.05

**Discussion:-**

The imbalance between reactive oxygen species (ROS) and enzymes needed for removal of free radicals is called oxidative stress. This process involved in the activation of a complex array of genes involved in inflammation, coagulation, fibrinolysis, cell cycle and signal transduction resulting in consequence on fetal structure. The rapid transition of the fetus from a relatively hypoxic to a relatively hyperoxic environment at birth gives rise to oxidative stress. However, oxidant defense mechanisms are induced late in gestation. Management of oxidative stress is a great challenge for both researchers and clinicians (Frank, 1991; Dizdar et al., 2011).

In the present study, we detected evidence of oxidative stress in cord blood of premature neonates suffering from RDS that was prominent with severe cases. Most of RDS cases in the present work were delivered by Caesarean section and some of them were infants of diabetic mothers. Substantial increased levels of oxidant markers MDA and TBARS in our study were accompanied with significant decreased levels of GSH and SOD.

Many authors have demonstrated that there is the same degree of fetal oxidative stress in vaginal delivery as that resulting from Caesarean section (Fogel et al., 2005; Hracsko et al., 2007). It is unclear whether oxidative stress is related to delivery itself or whether it reflects a pre-existing fetal level of oxidative status. Laurie et al. (2007) demonstrated that distressed fetuses delivered by emergency Caesarean section exhibited increased MDA concentrations, an indicator of lipid oxidative damage, and enhanced glutathione peroxidase (GPX), an antioxidant enzyme, in amniotic fluid and umbilical cord blood compared with non-distressed fetuses delivered by vaginal delivery. These findings are suggestive of elevated fetal oxidative stress (Georgeson et al., 2002; Laurie et al., 2007).

Orhan et al. (2003) implies that TBARS is one of the promising clinical markers of oxidative stress. They detected increased TBARS and decreased GSH levels in infant of diabetic mother and concluded the concept of oxidative

stress in diabetic pregnancies. These conclusions were in line with our results where most of RDS group were infant of diabetic mother but it is in disagreement with **Kinalski et al. (2001)** who found significantly higher levels of GSH in umbilical cord blood of infants of mothers suffering from diabetes mellitus.

Respiratory distress syndrome is accompanied by inflammatory processes with free radical generation and oxidative stress (**Nemeth, 1994, Krediet, 2006**). The imbalance between the oxidative forces and the antioxidant defense systems was suggested to predispose the lungs to the development of RDS (**Lang et al., 2002**). Many studies have shown increased oxidant stress markers and/or reduced antioxidant defense in preterm infants with RDS (**Ogihara et al., 1996, Miller et al., 1993**).

Malondialdehyde (MDA) is one of the final products of polyunsaturated fatty acids peroxidation. The present study showed increased concentration of MDA in neonates with respiratory disorders than that of control in consonance with the reported study (**Negi et al., 2015**). In addition, preterm infants appear to have deficient quantities of enzymes responsible for scavenging ROS, including superoxide dismutase. Frank, (1987).

ROS potentiate tissue damage by lipid peroxidation (**Saugstad, 2005**). A common site of damage is the basement membrane and other elements of the lung matrix. One consequence of this damage is increased microvascular permeability and vascular leakage, resulting in oedema formation containing protein rich fluid (**Groneck et al., 1994**). This protein rich fluid is considered as an ideal target for oxygen reactive species. In order to initiate the oxidative attack, ROS causes an imbalance in the lung protease-antiprotease system through inactivation of alpha-1 protease [**Saugstad, 2000; Winterbourn, 2001**]. ROS also interact with pulmonary surfactant as well as with other protein and lipid structures, thus delaying the normal functioning of the lung. Therefore, surfactant administration before the initiation of mechanical ventilation diminishes the severity of lung lesions by providing consistent ventilation [**Carty et al., 2000**]. This oxidation process has been proven to contribute to pathogenesis in newborns with RDS [**Buonocore et al., 2000**].

The present study observed reduction in total antioxidant status in newborns with RDS compared to healthy newborns. One study also reported decreased level of total antioxidant activity in newborn with RDS (**Dizdar et al., 2011**). Oxidant-antioxidant balance shifts in favor of the oxidative damage in premature newborns with RDS due to diminished antioxidant activity. Antioxidant defenses of the immature lung will be prepared neither for the hyperoxic environment nor the inflammation found in association with respiratory distress (**Davis and Auten, 2010**). The lung depends on a delicate balance between oxidant and antioxidant systems to maintain normal cellular function. The lungs of prematurely born infants suffering from respiratory distress syndrome may be ill-adapted for protection against ROS. Antioxidants clearly have an important role in the defense against free radical induced lung injury in newborns with RDS (**Negi et al., 2015**).

The present study showed that the elevated level of MDA and TBARS might be risk factor; reduced level of total antioxidant status (reduced GSH and SOD) might lead to the RDS in newborn and control its severity. Total antioxidant status might serve as prognostic marker in newborns with RDS and might help distinguish high risk infants.

### **Conclusion:-**

The result of this study indicates that newborns with RDS were manifested by oxidative stress accompanied by reduced antioxidant defenses which could play a role in the pathogenesis of RDS and affect its degree of severity.

 Prevalence, Nursing staff

### Abstract

**Background:** Health care workers especially nursing staff are at risk of acquiring nosocomial skin infections through occupational exposure. Nosocomial skin infections (NCSI) can be caused by viruses, bacteria, fungi and parasite.

**Aims:** To determine the prevalence of occupational nosocomial skin infections among the nursing staff in Baqubah teaching hospitals and to assess the factors responsible for non-compliance of infection control measures amongst nursing staff.

**Patients and Methods:** A cross sectional study was conducted among nurses in two teaching hospitals in Baqubah city from 1<sup>st</sup> September 2015 to 31<sup>th</sup> of March 2016. Special questionnaires were used to determine the prevalence of nosocomial skin infections among 200 nurses who worked at the two hospitals were chosen randomly, and dermatological examination was performed by dermatological specialist.  $p < 0.05$  was considered statistically significant.

**Results:** The prevalence of occupational nosocomial skin infections was (53/200) (26.5%) and it was most common in Baqubah teaching hospital; (68%) in medical ICU and (64%) in surgical departments. The majority of cases were infected with scabies (73.5%), other infections; fungal infection (15%), while pediculosis, warts, molluscum contagiosum each one compose (4%) of infections. High prevalence was among males (62%), with age group more than 35 years old (47%), with bad hand hygiene (41%).

**Conclusions:** We conclude that scabies were the most common occupational nosocomial skin infections among the male nursing staff with age group more than 35 years old, with bad hand hygiene, working in Baqubah teaching hospital.

### Introduction:-

Nosocomial infections, or hospital-acquired infections are those infections acquired in hospital or healthcare service unit, that first appear 48 hours or more after hospital admission or within 30 days after discharge following in patient care. The Nosocomial infection transmitted by five main routes which includes; contact, droplet, airborne, common vehicle and vectorborne. [1].

Address:- (M. B. Ch. B, D. C. M, F. I. B. M. S. Occupational & Environmental Medicine), Assistant Professor, Department of Family and Community Medicine, Medical College, University of Diyala, Iraq.

Medical staff move from patient to patient thus providing a way for pathogens to spread, inadequate sanitation protocols regarding uniforms, equipment sterilization, washing and other preventive measures that may either be unheeded by hospital personnel or too lax to sufficiently isolate patients from infectious agents and lastly the routine use of anti-microbial agents in hospitals creates selection pressure for the emergence of the resistant strains of microorganisms. They are unrelated to the original illness that brings patients to the hospital and neither present nor incubating at the time of admission. [2, 3].

Nosocomial infections are classified as infections that are associated with the delivery of health care services in a health care facility. Nosocomial microorganisms may also be acquired by health personnel working in the facility and can cause significant illness and time loss from work [4].

Nosocomial infection continues to be a burden to the world health care system through increased risk to patients and employees. These infections have tremendous health and financial costs with an estimated incidence of 2,000,000 infections per year, 20,000 deaths per year and added costs of billion dollars per year. Effective infection control programs are essential to controlling and preventing nosocomial infection [5,6].

#### Aims:-

To determine the prevalence of occupational nosocomial skin infections among the nursing staff in Baqubah teaching hospitals and to assess the factors responsible for non-compliance of infection control measures among nursing staff.

#### Patients and Methods:-

A cross-sectional study was carried out at two teaching hospitals in Baqubah city (Baqubah and Al-Batool teaching hospitals) over a period from 1<sup>st</sup> September 2015 to 31<sup>st</sup> of March 2016. Special questionnaires were used to determine the prevalence of nosocomial skin infections among 200 nurses who worked at the two hospitals were chosen randomly. The questionnaires were administered by using face-to-face interviews. The questionnaires were designed and constructed by the researcher including (occupational and demographic variables; age, gender, departments, uses of personal protective measures, hand hygiene, risk factors of nosocomial skin infections) and dermatological examination was performed by a dermatological specialist. To describe and analyze the findings of the study, the statistical means used were: Mean, Frequency and percentage as descriptive statistics and Chi-square as inferential statistics. All data were recorded and analyzed using SPSS 20, and  $p < 0.05$  was considered statistically significant.

#### Results:-

The prevalence of occupational nosocomial skin infections was (53/200) (26.5%) and it was most common in Baqubah teaching hospital (68%) in medical ICU and (64%) in surgical departments. The majority of cases were infected with scabies (73.5%), other infections; fungal infection (15%), while pediculosis, warts, molluscum contagiosum each one compose (4%) of infections. High prevalence was among males (62%), with age group more than 35 years old (47%), with bad hand hygiene (41%).

**Table 1** shows that the higher percentage of nosocomial skin infections were among males (62%) and (85%) of them in Baqubah teaching hospital and (15%) of them were in Al-Batool teaching hospital, while the female compose (38%). This result was statically highly significant ( $p < 0.001$ ).

**Table 1:-** Distribution of Nosocomial skin infections (NCSI) in the two hospitals according to the gender.

### Discussion:-

This study showed that, The prevalence of nosocomial skin infections was (26.5%) and it was most common in Baqubah teaching hospital (68%). High percentage of cases were infected with scabies (73.5%), mostly among males (62%) and (47%) of them were (>35) years old, with bad hand hygiene (41%). This reflects obviously low awareness of health care, inappropriate and inadequate health services, bad sanitation of hospital environment and bad nursing staff hygiene and not using personal protective measures.

The result of this study shows that the prevalence of scabies (73.5%) was high, which agree with other studies done in Canada, 25% reported cases of scabies among their residents during a 1-year period [7]. Over a 1-year period, 17% of Michigan's nursing homes reported scabies in the facility. In Oslo, Norway three scabies outbreaks occurred in three nursing homes over a period of 6 months [8]. The close contact between staff and residents and between visitors and residents in nursing homes may contribute to a repetitive and prolonged duration of scabies outbreaks. [9–10].

In relation to gender, most of nurses in this study (62%) were male; as the number of nursing staff (mainly of male gender) especially in the night shift, taking care of the patient unit or environment as an important aspect of patient care. This finding comes along with result obtained from study done in Baghdad [11].

The present study explores that high prevalence of hospital acquired skin infections were in medical ICU and surgical department more than other departments. This study agree with studies done in India, Serbia, Switzerland and Spain [12-15].

This study show that the prevalence of nosocomial skin infections was higher among the nursing staff not using the personal protective measures, disagree with the findings of a study done by Okechuku, in Nigeria which revealed that health care workers always used gloves when they anticipated contact with body fluids, non-intact skin and mucus membranes [16].

The result on lack of knowledge of hand washing among nurses for the prevention of nosocomial skin infections. The above result agree with study conducted by Idang N. Ojonget al in Nigeria [17].

This study shows the risk factors of nosocomial skin infection was not statistically significant, disagree with study done in Kampala, Uganda [18].

### Conclusions:-

We conclude that scabies were the most common occupational nosocomial skin infections among the male nursing staff with age group more than 35 years old, with bad hand hygiene, those working in Baqubah teaching hospital.

### Recommendations:-

1. Training and re-training is necessary to increase nurses' knowledge toward nosocomial skin infections, immunization, improved hygiene, particularly hand washing.

2. *Infection control should be incorporated into the curriculum of medical/dental students, student nurses and other paramedical. Enhance or develop the qualification of nursing staff.*
3. *further research in the health care providing especially nursing staff are directed to prevent and control the acquisition of nosocomial skin infections.*

### **Acknowledgment:-**

Author acknowledges the cooperation of the nursing staff and thank Dr Nadhim Khazal Noaman for data management support, quality check and analysis of data.

**Conflicts of Interest:** None.

#### Abstract

A malicious attacker can exploit a vulnerability of a sensor node within a wireless sensor network to easily create a compromised node and attack the sensor network. The main purpose of a flooding attack, which is one kind of denial of service (DoS) attack, is to shorten the lifetime of the sensor network by exhausting the energy of the compromised node and of other sensor nodes along the path to the base station (BS). Existing security schemes to protect against flooding attacks do not take into account the amount of energy remaining in each sensor node. Therefore, in the case where the sensor network was installed long ago and its nodes have little remaining energy, such schemes are unsuitable because they are likely to completely drain individual nodes. In this paper, we propose a security scheme that includes multipath routing to reduce the load on each sensor node and thereby increase the sensor network lifetime. Experimental results herein confirm that the proposed scheme extends the network lifetime, increasing the energy efficiency of one sensor node included in the path by 40% compared with an existing scheme and reducing the number of exhausted sensor nodes by more than 60%.

#### Introduction:-

A wireless sensor network (WSN) consists of a number of small sensor nodes that detect events and a base station (BS) that receives and analyzes data collected by the sensor nodes. WSNs are deployed in areas that are hard to reach or where information needs to be received in real time. When a relevant event occurs in the region where the WSN is deployed, the sensor node located closest to the region is selected as the source node, and the event is detected. The source node collects the detected event information, generates an event packet, and transmits the event packet to the BS [1]. However, sensor nodes are vulnerable to attack because they have limited computing power, low energy, and use wireless communication. Using these vulnerabilities, an attacker can easily compromise a node. Using a compromised node, attackers can subject the sensor network to various attacks such as eavesdropping or other attacks that do not yield important event messages in the network. Typical attacks include denial of service (DoS), selective forwarding, sybil, sinkhole, and wormhole attacks [2-4]. Security techniques that can detect or prevent attacks continue to be studied. In this paper, we propose the energy efficiency of each node and the lifetime extension of the sensor network when a flooding attack, which is one kind of DoS, attacks the sensor network. The rest of this paper is organized as follows. Section 2 describes flooding attacks and multipath routing. Section 3

explains the proposed scheme including multipath routing, and Section 4 presents experimental results and analysis of the existing and proposed schemes. Section 5 presents our conclusions and future plans for this work.

### Related Works:-

#### Flooding attack:-

WSNs are mainly deployed in open environments. Therefore, a malicious attacker can easily damage a sensor node and attempt various attacks on the sensor network using the compromised node. The flooding attack, which is one kind of DoS attack, is an attack on the network layer of the sensor network. In a flooding attack, a continuous false event is generated to paralyze the network and exhaust the energy of the sensor nodes included in the path, thereby shortening the sensor network lifetime. In general WSN communication, when an event occurs, the sensor node closest to the event area collects data on the event and is selected as the source node. This source node creates a packet containing the event information, selects the shortest path to the BS, and sends the event through the network to the BS. However, in a flooding attack, the malicious attacker uses the compromised node to forward false event packets to the BS. The sensor nodes included in the path send and receive false event packets, thereby consuming energy continuously. The network lifetime is shortened when the energy of a sensor node included in the path is exhausted.

**Fig. 1:-**Flooding attack

After this, even if an important event occurs, a sensor node whose energy is exhausted due to a flooding attack may be included in the path but cannot transmit to the BS.

#### Multipath routing:-

When single-path routing is used, the node included in the path set by the nature of the sensor network carries the load. For this reason, when a flooding attack occurs, the energy of the sensor node can be easily exhausted. One way to solve this problem is to use multipath routing [5-6]. Multipath routing is a method of establishing multiple available routes and forwarding packets to the BS. In this type of routing, packets are routed in a distributed manner that more evenly distributes the load among sensor nodes. In this way, the energy efficiency of each sensor node included in the path is increased, and the lifetime of the sensor network is extended.

Fig. 2:-Multipath routing

Multipath routing configurations of sensor networks are divided into various types depending on the number of nodes arranged in the sensor field and their density. Typical multipath routing schemes are divided into three types: those based on node-disjoint paths, link-disjoint paths, and partially disjoint paths. In the node-disjoint path scheme, data is transferred using different paths. If a sensor node or link has a problem, only the path to which the corresponding node or link belongs is affected. In the link-disjoint path scheme, backup links exist, but all paths include at least one common sensor node in the path. The problem with this scheme is that the entire path can be affected when a problem occurs in that one common sensor node. Finally, in the partially disjoint path scheme, each data transmission path includes multiple paths resistant to the failure of any single node or link. Multipath routing can be more reliable than single-path routing but also has drawbacks. The number of hops may be greater than in the case of single-path routing. Thus, the network may consume more energy overall when multipath routing is used.

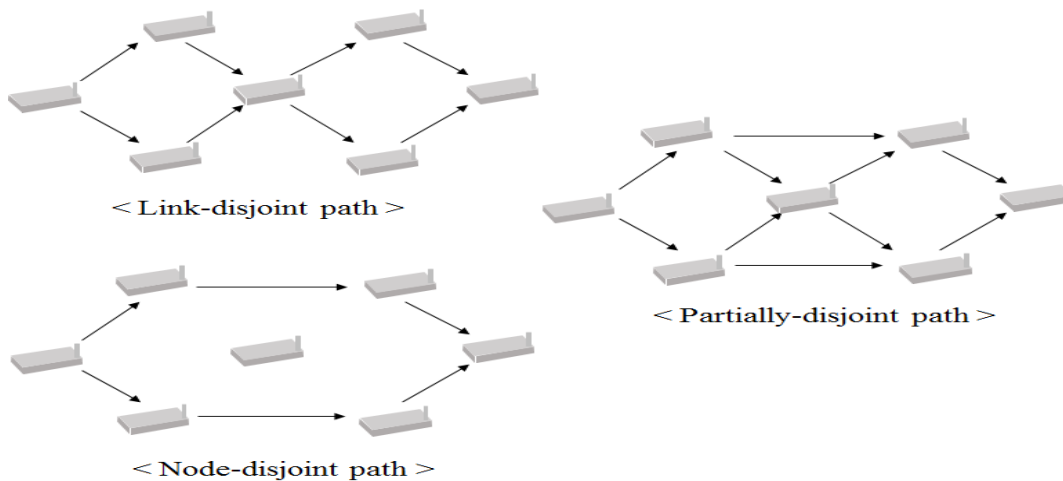

Fig3:-Multipath routing types

**Proposed Scheme:-**

When a WSN is subjected to a flooding attack, a large number of packets are transmitted to the BS, which can allow detection of the attack. However, because many packets are sent in a short time, the nodes in the path may consume a great deal of energy before verification can be completed at the BS. Once a WSN is configured, the sensor nodes are typically not recharged. Thus, the older is the WSN configuration, the less energy there is remaining in each sensor node. For this reason, we propose a multipath routing scheme to increase the energy efficiency of each sensor

node and increase the lifetime of the sensor network. The proposed scheme compares the lifetime of the sensor network in flooding attack occurring in single-path routing and multipath routing and the energy efficiency of the sensor node included in the path.

In the present work, we used a grid-based cluster routing environment to model single-path and multipath WSN routing schemes. The energy of each node in the sensor field was set to 1/100 of the initial energy of the sensor node to indicate that the WSN configuration was out of date. Each node consumed 16.25  $\mu$ J and 12.25  $\mu$ J per byte when transmitting and receiving, respectively. False event packets were large TinyOS packets of 29 bytes each [7]. The chosen detection scheme adapted the algorithm of Flooding Attack Prevention (FAP) to detect a flooding attack in the ad-hoc network for use in the sensor network [8].

Fig4:- Flooding attack in multipath routing

**Algorithm 1:-** Detection of flooding attack by the BS

- Step 1.** Collect events from the source node.
- Step 2.** Check the source ID in the cluster head node and compare it to source IDs contained in the blacklist.
- Step 3.** Check the forwarding time and source ID of the packet delivered to the BS.
- Step 4.** Increase the flooding attack count (FAC) if the previous and present packets equal source node IDs and the packet arrival times differ by 1 second or less.

**Algorithm 2:-** Attack detection and blocking

- Step 1.** If the FAC exceeds a threshold value, this signals a flooding attack.
- Step 2.** The BS determines the node originating the attack, adds that node's ID to the blacklist, and forwards the blacklist to the cluster head node.
- Step 3.** The cluster head node receives the blacklist from the BS and drops transmissions from any source node on the list.
- Step 4.** The BS resets the FAC to zero.

Fig. 5 shows a flowchart of the overall algorithm.

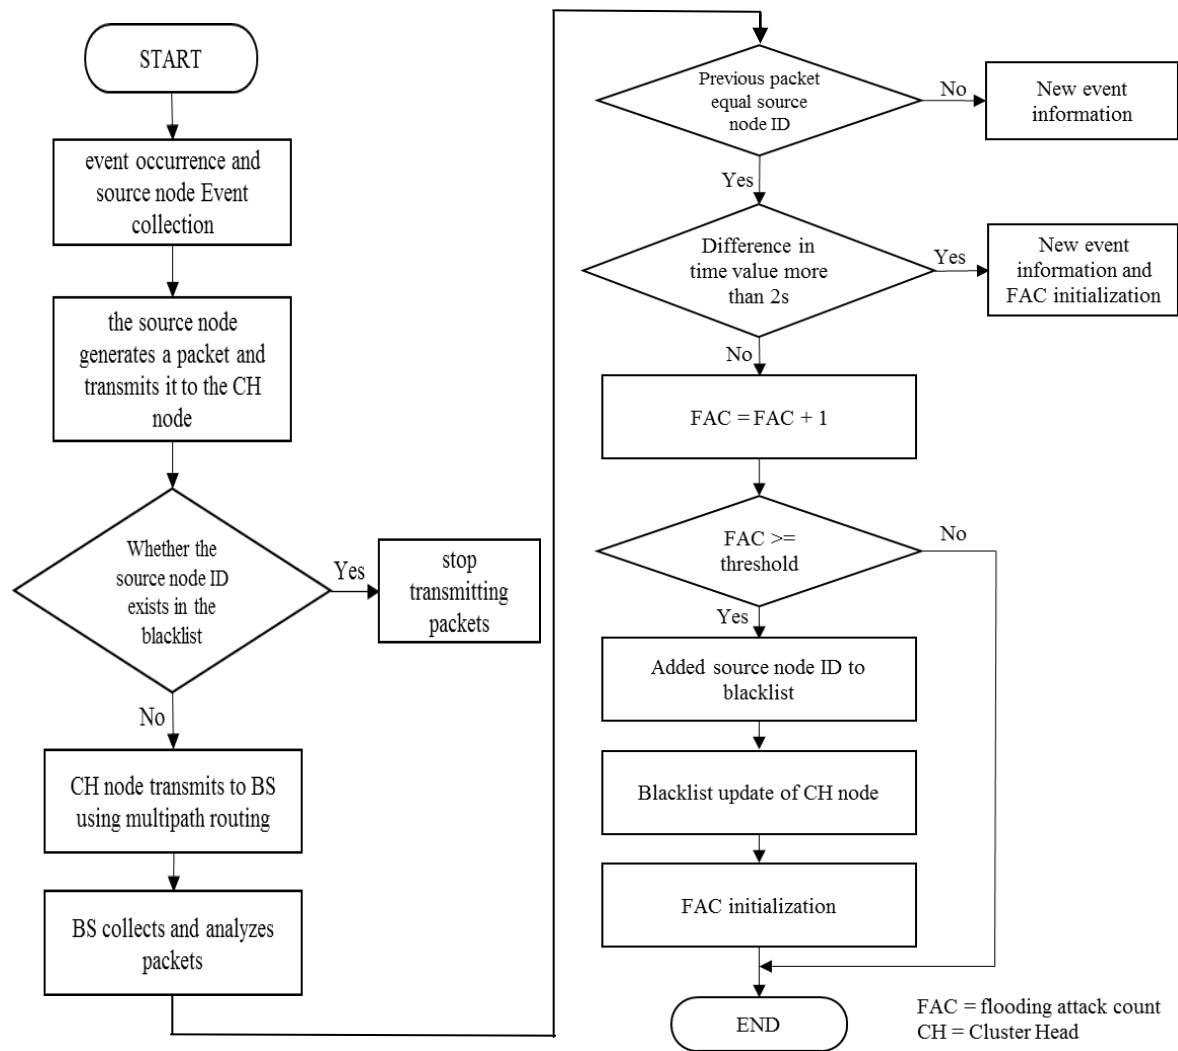

Fig. 5:- Algorithm flow chart

**Experimental Results:-**

The proposed scheme was implemented using C++. Table 1 lists the parameters used in the experiments.

**Table 1:-**Sensor network parameters

Item	Value
Sensor field size	200 × 200
Number of sensor nodes	100
Number of cluster head nodes	25
Sensor node type	Mica2
Transmission range	150m

The FAC threshold of 15 was used in the experiments. Also, the probability of successful packet delivery was set to 96%. The number of flooding attacks was set to 10, 20, and 30. The sensor network lifetime for each case was analyzed based on the results.

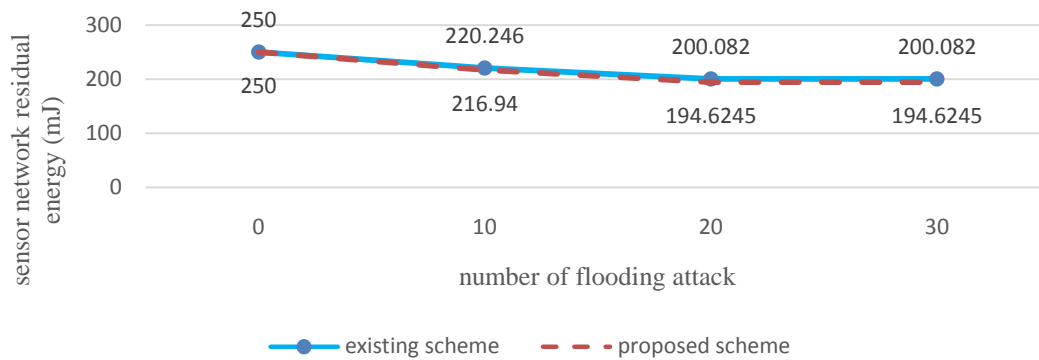

Fig. 6:-Sensor network residual energy after flooding attack

Fig. 7:-Residual energy of one sensor node included in the path after various numbers of flooding attacks

In the modeled flooding attack experiments, the proposed scheme consumed slightly more energy overall throughout the sensor network (Fig. 6). The reason for this is that more hops between the source node and the BS were used in the proposed multipath routing scheme. However, under the proposed scheme, the energy consumption was spread more evenly throughout the network. Thus, the proposed scheme avoided the exhaustion of some single nodes that would have been completely exhausted of energy under the existing scheme during an attack, and flooding attacks of 15 packets and more were detected and stopped, thereby avoiding further energy consumption (Fig. 7).

Fig. 8:- Flooding attack detection ratios

The existing and proposed schemes had similar attack detection ratios (Fig. 8). Both schemes detected all flooding attacks numbering 18 or more.

Fig. 9:-Number of exhausted sensor nodes after the flooding attack

Analysis of the experimental results showed that the energy of the cluster head node of the cell containing the compromised node was exhausted in the case applying proposed scheme. In the existing scheme, the proposed scheme includes depleted sensor nodes and additionally depletes the energy of the cluster head nodes included in the path. Therefore, the energy consumption of the sensor node is lower when the proposed scheme is used. The number of sensor nodes that are depleted of energy depends on the location of the compromised node. However, when comparing the existing scheme with the proposed scheme, the proposed scheme reduces the number of exhausted energy sensor nodes. The number of exhausted sensor nodes is the same when using either twopaths orthreepaths (Fig. 9); therefore, double path routing is sufficient for the present detection scheme. When the energy of a cluster head node is depleted, it is replaced with a sensor node having the mostenergy among thoseremaining in the cell. However, if the other sensor nodes in the cell have littleor no remaining energy, the cluster head nodes cannot be replaced. Therefore, other sensor nodes included in the path will be depleted of energy before the flooding attack is detected. Then, even if an important event occurs later, the sensor nodes will be exhausted and thus unable to transmit data.

**Conclusions:-**

In this paper, we proposed a scheme to detect flooding attacks in WSNs, including multipath routing to reduce the load on sensor nodes and extend the network lifetime. In a flooding attack, an attacker uses a compromised node to transmit many false packets to the sensor network, depleting the energy of the sensor nodes included in the path to the BS and shortening the lifetime of the sensor network. Existing schemes to detect flooding attacks include the use of single-path routing, but this results in high energy consumption at individual nodes, which is a problem in old networks whose individual nodes have little remaining energy. The proposed scheme includes multipath routing to distribute the energy consumption among sensor nodes, increasing energy efficiency and thus the overall network lifetime. Future work is needed to reduce the energy consumption of the cluster head nodes located in the same cell as the compromised node and that of cluster head nodes located in other cells along the path to the BS.

#### **Abstract**

**Introduction:** Almost 30 years after recognition as histologically distinct tumors, neurocytomas remain enigmatic. Central neurocytomas are rare intraventricular tumors that arise from neuronal cells of septum pellucidum and represent 0.1-0.5% of primary brain tumors. Although they are relatively benign tumors, they have been classified as WHO grade 2 tumors.

**Materials and methods:** Here we are reporting 2 cases of this rare enigmatic entity. Case 1: 25 year old female presented with headache, vomiting, giddiness and transient blurring of vision since 1 month. On MRI, lesion was in frontal horn of left lateral ventricle. Patient was operated by trans-cortical transventricular approach and tumor was excised. Histopathology sections revealed features of central neurocytoma. Patient had no recurrence at the end of 12 month follow-up. Case 2: 38 year old male presented with headache, frequent falls, decreased vision and vomiting since 2 months. MRI studies revealed solid cystic lesion in the body of right lateral ventricle. Shunt surgery was performed and followed by trans-cortical transventricular excision of tumor. Histopathology showed features of central neurocytoma with some degree of anaplasia. This patient underwent radio-therapy and there was no recurrence of the tumor at the end of 1.5 year follow-up.

**Conclusion:** Central neurocytomas are rare entities and are classified as WHO grade 2 tumors. Early diagnosis and treatment are imperative as patients with these neoplasms are potentially salvageable.

spontaneously. There was no history of convulsions, ear discharge, loss of consciousness and trauma. no significant past and personal history. On examination, patient was drowsy and not fully oriented to time place and person. Patient was able to follow verbal commands and speech was normal. Ophthalmological evaluation revealed bilateral vision 6/36 and features of early papilloedema were present. There were no cranial nerve deficits. Her motor and sensory examination was essentially normal. Bowel and bladder were continent. Contrast computed tomography study showed well defined inhomogeneously enhancing lesion in left lateral ventricular region measuring 5.9\*4.5\*4.0 cms with areas of calcifications and cystic changes with hydrocephalus. Ventriculo-peritoneal shunt was immediately performed followed by contrast magnetic resonance imaging (Pic 1A) was done which showed 5.7\*5.1\*4.0cms lesion at septum pellucidum extending both in lateral and third ventricle, more in left lateral ventricle which showed patchy dense enhancements with no definite wall or sub-ependymal infiltration of the mass. In this patient left posterior parietal craniotomy was done and under ultra-sound and brain lab guided microscopic assisted trans-cortical trans-ventricular near total excision of tumor was performed. Hisopathology (PIC: 1c) showed ovoid to fusiform cells with cytological atypia. Cells were uniformly monotonous and with single nuclei with perinuclear halo. Delicate fibrillary matrix with plexiform arcade with occasional mitosis and no evidence of necrosis s/o central neurocytoma. This was confirmed by immunohistochemical staining which showed positive for neuron specific enolase, synaptophysin and GFAP antibodies. Postoperative period was uneventful and patient was discharged on 12th post-op day with no residual weakness. Patient was followed up regularly and there was no recurrence of tumor at the end of 1 year follow-up.

PIC 1A:

**Case 2:-**

38 year old male patient presented with chief complaints of headache, vomiting, convulsions and frequent falls with giddiness since 1 month. Headache was intermittent dull aching type. Patient had 3 episodes of generalized tonic clonic seizures since 1 month. Patient had recurrent attacks of giddiness and blurring of vision and frequent falls since 1 month which increased in past 15 days. On examination patient was drowsy and following verbal commands on repeated asking with slurred speech. Ophthalmological evaluation showed signs of established papilloedema. Cranial nerve examination was normal and there was no sensory and motor deficits. Contrast CT scans showed right lateral ventricle body solid cystic mass lesion abutting septum pellucidum with hydrocephalus. Ventriculo-peritoneal shunt surgery was performed. MRI contrast studies showed 3.3\*3.4\*3.5 cms solid cystic intraventricular lesion in the body of right lateral ventricle abutting septum pellucidum and obstructing foramen of munroe causing ballooning and out-trapped frontal horn of right lateral ventricle(Pic 2a,2b). The lesion showed solid with few internal cystic areas with few foci of internal calcifications with heterogenous contrast enhancements. In This patient right temporo-parietal craniotomy was done and ultra-sound guided microscope assisted near total excision of tumor was performed. Patient had moderate intraventricular hemorrhage in the immediate post operative period for which external ventricular drainage was done for 5 days. Patient had no residual weakness and sensorium improved at the end of 15th post operative day. Histopathology(Pic 2d) showed uniformly round cells with hyperchromatic nuclei and peri-nuclear halo with fibrillary matrix. Few cells showed anaplasia. Immunohistochemical assay showed positivity for synaptophysin and neuron-specific enolase s/o central neurocytoma. Patient was discharged on 5th post operative day and was followed up regularly. In the view of anaplasia , patient was given radiotherapy. Patient had no recurrence at the end of 1.5 year follow-up.

### Discussion:-

Central neurocytomas are a rare intraventricular tumors representing 0.1-0.5% of all primary brain tumours.<sup>1</sup> Almost 30 years after recognition as histologically distinct tumors, neurocytomas remain enigmatic<sup>2</sup>. Because of advanced imaging techniques and developments in immune-histochemical techniques more and more of these tumors are being diagnosed recently. The majority of central neurocytomas grow inwards into ventricles forming intraventricular neurocytomas. This leads to primary symptoms of blurred vision and features of increased intracranial pressure as in our cases. Treatment for a central neurocytoma typically involves surgical removal, with 1 in 5 chance of recurrence<sup>3</sup>. Central neurocytomas are classified as a grade II tumor under world health organization tumour grading<sup>4</sup>.

### Historical perspective:-

Central neurocytoma is an uncommon neuro ectodermal tumor of young adults, usually situated in the lateral ventricles at the foramen of Monroe, and was first individualized by Hassoun et al<sup>5</sup>. In 1985, Wilson had also described a rare case of "differentiated neuroblastoma" in the lateral ventricle that resembles oligodendroglioma on light microscopy. However, the name central neurocytoma was given by Hassoun<sup>6</sup>. Neurocytomas were probably historically misdiagnosed as intraventricular oligodendroglioma or clear cell ependymoma prior to this. With its non-aggressive behavior the tumor has often been called "benign central neurocytoma". It is believed to occur in young adults from the neuronal cells of the septum pellucidum and the subependymal cells of the lateral ventricles.

Initially these were reported to be benign. However, as more information was gathered the name benign central neurocytoma was started to be seen as a double misnomer because these tumors are not always benign nor centrally located. Many recent studies suggest that their location, biological potential and clinical behavior are observed to be more variable than previously thought. Recent studies indicate their uncommon location, aggressive biological behavior and frequent recurrences following after surgical resection have generated significant interest in various treatment modalities and also in their terminology, lineage potential and molecular regulation<sup>6</sup>.

**Epidemiology:-**

CNC represent 0.1-0.5% of primary brain tumours<sup>7</sup>. There is a genetic predisposition of these tumors in people of Asian origin<sup>8</sup>. Central neurocytomas predominantly occur in young adults, most commonly during the second or third decade of life. In our study both the patients presented during 3<sup>rd</sup> decade of life. There is no sex predilection<sup>9</sup>.

**Pathology:-**

Grossly these tumors are grayish in color, resembling the gray matter that comes with areas of hemorrhage. The tumors are soft, lobulated to nodular masses that are generally well circumscribed. Some variants exhibit calcifications<sup>10</sup>.

Tumor samples examined under the microscope revealed that these are well-differentiated tumors with benign histological features. The tumor is composed of uniform, small-to-medium-sized cells with rounded nuclei, finely stippled chromatin and inconspicuous nucleoli, along with scant cytoplasm. These are characterized by perivascular pseudo-rosettes, circular/flower-like arrangements of cells with a small blood vessel at the center, and polygonal small cells with a clear perinuclear halo, sometimes called the 'fried egg' appearance and is clear or slightly eosinophilic. The main differential diagnosis is oligodendroglioma<sup>11</sup>. While the tumor cells are dense in some areas, areas with anuclear, less dense tumor parts were dispersed throughout. The anuclear areas may have a fine fibrillary matrix, like that of neuropil regions. Long, thin-walled, capillary-sized vessels represent the vascularity of these tumors. These vessels are arranged in a linear branching pattern, with an endocrine appearance. Thin-walled dilated vascular channels, as well as foci of calcification, were readily identified in many cases.<sup>10</sup> In our cases both the patients had common feature of uniformly round cells with perinuclear halo with fibrillary matrix. (Figure 1)

Strong immune-staining for synaptophysin has been recognized as the most suitable and reliable diagnostic marker (Figure 2). Typically, synaptophysin immunoreactivity is noted in the neuropil, especially in fibrillary zones and perivascular cell-free areas, and not in the cell bodies of normal neurons<sup>10</sup>. Tumor cells have been reported to express neuron-specific enolase. Immunostaining for synaptophysin and neuron-specific enolase confirm the neuronal nature of the neoplasm. Neuronal nuclear antigen expression is generally associated with tumor cells displaying terminal neuronal differentiation and is often helpful in resolving ambiguous synaptophysin staining. The significance of GFAP reactivity in tumor cells is difficult to explain, but *in vitro* experiments with neurocytomas have shown a shift from synaptophysin to GFAP expression with cell passages<sup>11</sup>. It has been suggested that CN originates from bipotential (neuronal and astrocytic) progenitor cells in the periventricular region that persist into adulthood<sup>11</sup>. In our cases cells stained positive for synaptophysin and neuron-specific enolase thus confirming diagnosis of central neurocytomas.

Yasargil *et al.* reported that 2 of the 8 patients had evidence of anaplasia and were treated with post-operative radiation after total excision. In our cases, one patient had some degree of anaplasia and hence was given radiotherapy. This patient had no recurrence at 1 year and 1.5 year follow-up.

The MRI images of central neurocytoma are usually characteristic. Most of them occur as an exophytic, well circumscribed, globular mass that protrudes into the ventricles. Large tumors are not uncommon. Calcifications are common and easily identified by CT scans. Central neurocytomas that arise in the lateral ventricles typically adhere to the septum pellucidum. Hydrocephalus is common. On T2-weighted image, they are isointense to gray matter. Contrast enhancement is common but variable and it can be intense. From the imaging point of view, the differential diagnoses include heterotopia, oligodendroglioma, ependymoma, subependymoma, subependymal giant cell astrocytoma, choroid plexus papilloma, and intraventricular meningioma.<sup>12</sup> (figure 3,4,5,6,7,8,9)

**Clinical features:-**

There is a wide range of symptoms that patients show. Symptoms can lie dormant, but come about due to obstructive hydrocephalus. These include: Headache, blurring of vision, Vomiting, Lightheadedness, Impaired mental

activity, gait instability. In rare and extreme cases, more severe symptoms can be observed: Memory disturbance, dementia, hemiparesis, seizures and hemorrhage<sup>13</sup>. In our cases both the patients had features of obstructive hydrocephalus.

#### **Treatment:-**

The mainstay of treatment is surgical excision<sup>14</sup>. Two adjuvant therapeutic strategies are stereotactic radiosurgery and fractionated convention radiotherapy (FCRT). Both are highly effective means of treatment<sup>7</sup>.

#### **Surgery:-**

Surgical excision of the central neurocytoma is the primary consensus among practicing physicians. Craniotomy is performed. The ability to remove the tumor and to what extent it is removed is dependent upon the location of the tumor and surgeon experience and preference. The extent of the disease plays a large part in determining the effectiveness of surgery. The main goal of a complete surgical resection, of the tumor, can also be hindered by the adherence of the tumor to adjoining structures or hemorrhages<sup>13</sup>. If there is a recurrence of the central neurocytoma, surgery is again the most notable treatment<sup>14</sup>. In our report, both the patients underwent microscope assisted transcortical trans ventricular near total excision of tumor. In one patient, where tumor was in left lateral ventricle, underwent brain lab and ultra-sound guided excision to prevent motor strip injury.

#### **Radiotherapy:-**

There is not much evidence supporting whether radiotherapy is a beneficial and effective means of treatment. Typically, radiotherapy is used postoperatively in respect to whether or not a partial or complete excision of the tumor has been accomplished<sup>15,16</sup>. It is not clear if tumors with anaplasia have a higher relapse rate or if they need additional treatment. Yet it appears that some cases of CNC may be more aggressive despite benign histological feature<sup>2</sup>. The histopathological features of CNC, neuronal differentiation, low mitotic activity, absence of vascular endothelial proliferation, and tumor necrosis, suggest that the tumor may be resistant to ionizing radiation. However, when radiotherapy is used, whole brain or involved-field treatment is given. This method utilizes a standard fractionation schedule and a total tumor dose of 50-55 Gy<sup>13</sup>. One of our cases who had some degrees of anaplasia on histopathology received post operative radiotherapy and patient had no recurrence at the end of 1.5 year follow up. Gamma knife surgery is a form of radiotherapy, more specifically radiosurgery that uses beams of gamma rays to deliver a certain dosage of radiation to the tumor. Gamma knife surgery is incredibly effective at treating neurocytoma and maintaining tumor control after the procedure when a complete excision has been performed.<sup>17</sup> Some studies have found that the success rate of tumor control is around 90% after the first five years and 80% after the first ten years. Gamma knife surgery is the most recorded form of radiotherapy performed to treat remnants of the CNC tumor after surgery.<sup>17</sup>

#### **Chemotherapy:-**

Chemotherapy is typically limited to patients with recurrent central neurocytoma. The course of chemotherapy used for CNC is one of two platinum-based regimes. The two regimes are:

- Carboplatin + VP-16 + Ifosfamide
- Cisplatin + VP-16 + Cyclophosphamide

Because chemotherapy is used in rare cases there is still information to be gathered as to the efficacy of chemotherapy to treat benign CNC. Therefore recommendations must be viewed as limited and preliminary.<sup>18</sup>

#### **Outcome and Recurrence:-**

The majority of patients can be expected to be cured of their disease and become long-term survivors of central neurocytoma. As with any other type of tumor, there is a chance for recurrence. The chance of recurrence is approximately 20%<sup>3</sup>. Some factors that predict tumor recurrence and death due to progressive states of disease are: high proliferative indices, degree of anaplasia, and disseminated disease with or without the spread of disease through CSF<sup>13</sup>.

Long-term follow up examinations are essential for the evaluation of the outcomes that each treatment brings about. It is also essential to identify possible recurrence of CN. It is recommended that a brain MRI is performed between every 6–12 months<sup>2</sup>. In our study, both the cases had no recurrences and no residual neurological deficits at 6 month and 12 month follow-up.

**Conclusion:-**

Central neurocytomas are rare entities and its early diagnosis and treatment is necessary as patients with these neoplasms are potentially salvageable. Effective surgical treatment and accurate histopathological diagnosis are crucial in proper management of these cases. The role of radiotherapy is yet to be fully established. As some of these tumors show anaplasia and in the event of incomplete excision, radiotherapy can be effective in preventing recurrence.

### Abstract

Aim of this study was to assess neurological improvement after administration of Panchakarma procedures in traumatic paraplegia. On the basis of MRI findings, patient was advised for the surgical intervention. As there is no satisfactory treatment available in biomedicine. The patient was treated with Kati basti, Sarvanga abhyanga nadi sweda Patra Pottali sweda, followed by Panchatikta Ksheera Basti (16 days) and shaman oushadhi upto 3 months Substantial improvement was reported after 3 months of Panchakarma and Shaman oushadhi in existing neurological deficits and in quality of life.

### Introduction:-

Traumatic Paraplegia is an unanticipated catastrophe in an individual's life, passing a huge economic as well as social burden. The health care does not end with time but it involves multiple personnel and family members. In a developing country like India, where tertiary health care is not universally accessible and acceptable, the consequences of traumatic paraplegia and its complications are unimaginable<sup>1</sup>. The prevalence of traumatic paraplegia in India is estimated 236 per million<sup>2</sup>. It can be correlated with the Abhigatajanya Adharangavata<sup>3</sup>. Ayurvedic intervention in terms of Panchakarma and shaman oushadhi may impart significant recovery from traumatic paraplegia<sup>4</sup>. This case report is of a patient with Traumatic paraplegia with lesion at L4-L5, L5-S1 level with spinal canal stenosis, where we achieved substantial recovery with Panchakarma and shaman Yoga.

### Case Report:-

A 53 years old patient came for consultation in Panchakarma OPD of S.S.V.P. Ayurvedic hospital, Maharashtra, India. He was admitted and thoroughly examined. It was revealed that he was unable to move his both lower limbs. He was fully conscious but he was not able to move his lower part of body. Patient had autonomic dysfunction and was neither able to feel nor control the urge for micturation and defecation.

The patient had a history of trauma due to accidental injury happened in the afternoon when he was going to sell his milk 6 months back. After the accident, patient was unconscious for 1 ½ Hrs. and regained consciousness on the way to hospital. He was admitted in I.C.U. for 8 days with administration of other supportive medication. There also patient had incontinence of urine and stool. Patient's MRI was done. This revealed multiple level prolapsed intravertebral discs with spinal canal stenosis L4-L5 and L5-S1 with disc buldge with ligamentum flavum hypertrophy.

Address:- Professor and H.O.D.Dept.of Panchakarma, S.S.V.P. Ayurvedic college and R.I., Hatta Dist..Hingoli MUHS Nashik Maharashtra, India.

The patient was not getting any response from the treatment and the patient was advised for surgical intervention by neurosurgeon. Recommended physiotherapy was continued for 3 months, but no improvement was seen in the clinical condition.

After that the patient came to our institute for the needful. He was diagnosed as Abhigatajanya Adharangavata and was treated by the line of treatment of vata vyadhi<sup>5</sup>.

Diagnosis - Abhigatajanya Adharangavata.  
Date of admission - 17/02/2016  
Date of discharge - 28/04/2016

### Principle of Treatment:-

Reduce the pain inflammation, improve the movement, promote blood circulation, increase muscle tone and relax the muscles and improvement in neurological deficits. .

### Treatment Given:-

Panchakarma Procedure	Materials	Dose/day	Duration.
1. Katibasti	Bala ashwagandha taila	100 to 120 ml	20 to 25 min. for 16 days
2. Sarvanga abhyanga	Bala taila	app 60 to 70 ml	20 min. for 16 days
3. Nadi swedana	Dashamoola kwatha	-	10 to 15 min. for 16 days
4. Patra Pottali sweda	Eranda, Arka, Nirgundi, shigru patra, Mustard and Fenugreek powder +lemon juice	App. 400 to 500 gm bolus	20 to 25 min for 16 days
2. Panchatikta Ksheera Basti	Guduchi, Patola, Nimba, Kantakari, Vasa + Panchatikta ghruta	150 to 200 ml.	15 days

### Shaman Yoga:-

Rasaraja Ras(125 mg 1 ratti bd) + Ekangaveera rasa (125 mg 1 ratti bd) + Trayodashanga guggulu(3 gm / day) With Honey + ginger juice and Maharasnadi Kwatha. (20 ml bd) was given for 3 months<sup>6,7</sup>.

### Assesment Criteria:-

1)	Pricking pain	0	-	Absent
		1	-	Mild
		2	-	Moderate
		3	-	Severe
2)	Stiffness	0	-	Absent
		1	-	Mild
		2	-	Moderate
		3	-	Severe
3)	SLR Right	0	-	No Movement
	Left	0	-	No Movement.
4)	Ability to turn on bed		-	Absent
			-	Present
5)	Ability to sit		-	Absent
	With the support		-	Present
6)	Ability to stand		-	Absent
			-	Present
7)	Ability to walk		-	Absent
			-	Present

Signs and symptoms	BT	AT
1. Pricking Pain	2	0
2. Stiffness	3	1
3. SLR Right	0	70 <sup>0</sup>
SLR Left	0	75 <sup>0</sup>
4. Ability to turn on bed	Absent	Present
5. Ability to sit with the support	Absent	Present
6. Ability to stand	Absent	Present
7. Ability to walk	Absent	Can walk more than 300 mtrs in 20 min.
8. Muscles function grade		
Right hip	0	3
Left hip	1	3
Right knee	1	3
Left knee	1	3
Right ankle & toe	2	3
Left ankle and toe	2	3
9. Sensory function	Present	Absent
tingling sensation	Present	Absent
Numbness	Present	Reduced
10. Reflexes		
Right knee jerk	2	1
Left knee jerk	2	1
Right ankle jerk	2	1
Left ankle jerk	1	1
Superficial abdomen reflex	1	1
Plantar reflex	Absent	Present
11. Muscle tone right lower limb	Spastic	Less spastic
Muscle tone left lower limb	Spastic	Less spastic
12. Bowel activity	Incontinance	Normal
13. Bladder activity	Incontinance	Normal

### Discussion:-

As patient with traumatic Paraplegia, was correlated with abhigatajanya Adharangavata. The general line of treatment for vatavyadhi was adopted to treat this condition.

The mulasthanana of this disease locates at Katipradesha. Kati basti was selected as a bahi parimarjana chikitsa with bala – ashwagandha taila to reduce inflammation, stiffness and to give nourishment to dhamani i.e. nerves. Sarvanga abhyanga and Nadi swedana was recommended which acts as passive exercise which brings relaxation in spinal musculature of both lower limbs and reduced the spasticity.

As patient was admitted, in afternoon time, Patra pottali sweda was given to reduce pain, swelling and to improve the muscle tone.

Basti is the best treatment of vata. Pakwashaya is the main site of vata and basti mainly passes vata shamana property.

### Mode of Action of Panchatikta Ksheera Basti:-

Considering the involvement of Asthi dhatu, majja dhatu, mamsa dhatu in Katipradesha and predominantly dosha as vyan vata Karmahani, Panchatikta Ksheera Basti was given.

Tikta rasa has vayu and akasha mahabhuta in dominance. Hence it has got affinity towards the body elements like Asthi dhatu.

Most of the ingredients of Panchatikta Ksheera Basti have tikta rasa, ushna virya madhura rasa and katu vipaka and shothagna property which helps to increase dhatwagni. So the nutrition of all dhatus will be increased. Ghrita is

vatapittashaman, balya, agnivardhaka, madhura, soumya, sheet, vayusthapan so acts as a nourishment to pacify the vitiated vata.

Initially there was no retention of basti. Bowel evacuation was found only after Basti administration. The shaman yoga is helpful in vatika roga and showed balya and rasayana effect.

### **Conclusion:-**

Sarvanga abhyanga, Nadi swedana, Katibasti, Patra pattali sweda, Dashamoola niruha and Pancha tikta Ksheera basti has given a miraculous results in this patient.

The patient was admitted for 2 months and 11 days and completely recovered from functional disability, pain and stiffness etc. The over all effect of all panchakarma procedures with shaman yoga showed a marked improvement in this patient. This approach may be useful for clinical practices and further studies also .

#### Abstract

Preeclampsia is characterized by new-onset hypertension, proteinuria and is responsible for substantial maternal and fetal morbidity. The electrolytes like sodium, potassium and chloride contribute significantly in the functioning of the vascular smooth muscles and may play an important role in hypertension.

This study was carried out to measure serum levels of sodium, potassium, magnesium and calcium in preclamptic women. Sixty blood samples were collected from patients in period between June to October 2016, chosen from Omdurman Maternal hospital (thirty of them used magnesium sulfate as supplement and thirty not used supplement) and sixty normal pregnant women as control.

Serum sodium and potassium were measured by using ion selective electrode (Easylyte), while serum magnesium and serum calcium were measured by using Mindray 380

The study showed that, women with preeclampsia had significantly lower levels in means serum total calcium, magnesium, and potassium ( $7.34 \pm 0.51 \text{ mg/dL}$ ) vs. ( $8.58 \pm 0.71 \text{ mg/dL}$ )  $P < 0.05$ , ( $1.29 \pm 0.23 \text{ mmol/L}$ ) vs ( $1.83 \pm 0.32 \text{ mmol/L}$ ), and ( $3.08 \pm 0.24 \text{ mmol/L}$ ) vs  $3.55 \pm 0.34 \text{ mmol/L}$  p value  $< 0.05$  respectively. There was significant increase in mean of serum sodium in women with preeclampsia compared to control group ( $144.57 \pm 3.93 \text{ mmol/L}$ ) vs ( $138.27 \pm 3.8 \text{ mmol/L}$ ) p value  $< 0.05$

There was significantly positive correlation between serum magnesium in preclamptic women used magnesium sulfate and preclamptic women not used magnesium sulfate ( $r = 0.3 / p = 0.049$ ), while there were weak negative correlations between serum calcium and potassium in these two groups.

#### Introduction:-

Hypertensive disease of pregnancy (HDP) is one of the most common complications of pregnancy, occurring in 5-8% of the pregnancies<sup>(1)</sup>. Hypertensive disorders are the second most common cause of maternal deaths worldwide<sup>(2)</sup>. There are several major categories of hypertensive disorders in pregnancy ranging from mild to moderate rise in blood pressure without proteinuria (usually called pregnancy induced hypertension (PIH)), preeclampsia (hypertension with proteinuria), severe preeclampsia and eclampsia<sup>(3)</sup>. Maternal hypertension, even of the mild to

moderate category, can lead to adverse perinatal outcomes like low birth weight, pre-maturity, stillbirth and intrauterine growth retardation <sup>(4)</sup>.

Hypertension results primarily from the interplay of internal derangements (primarily in the kidney) and the external environment. Sodium, the main extracellular cation, has long been considered the pivotal environmental factor in the disorder. Numerous studies show an adverse effect of a surplus of sodium on arterial pressure <sup>(5, 6)</sup>. By contrast, potassium, the main intracellular cation, has usually been viewed as a minor factor in the pathogenesis of hypertension. However, abundant evidences indicates that potassium deficit has a critical role in hypertension and its cardiovascular development <sup>(7,8)</sup>.

Calcium plays a critical role in the function of the cardiac and vascular smooth muscles. It is known that the deficiency of calcium may lead to irritable nervous muscular symptoms, even tetanic convulsions, bleeding diathesis, capillary haemorrhages, tissue exudation and osteomalacia. These features have got some resemblance to the clinical manifestations and pathological findings in pregnancy induced hypertension (PIH), particularly eclampsia. Increase in the intracellular calcium causes vasoconstriction, increase in the peripheral resistance and therefore, an increase in the blood pressure <sup>(9)</sup>. Magnesium modulates the cardiovascular effect of sodium and potassium and it is the cofactor for the sodium potassium ATPase activity <sup>(10)</sup>. Since the electrolytes: calcium, magnesium, sodium and potassium contribute significantly in the functioning of the vascular smooth muscles, the present study was designed to evaluate the role of these electrolytes in the genesis of PIH.

### **Materials and Methods:-**

**Study Population:** The study was carried out at College of Medical laboratory Sciences, and the subjects were recruited from Omdurman Maternal hospital, in Khartoum(Sudan) from June to October 2016. A total of 120 pregnant women were enrolled in this study ; divided into three groups, 60 healthy normotensive pregnant women (Control group), 30 pregnant women with preeclampsia , and 30 women with preeclampsia under magnesium sulfate as treatment. The study was approved by hospital's ethics committee. Informed consent was obtained from patients before blood sampling.

### **Inclusion criteria:-**

Patients with an onset of hypertension more than 140/90 mmHg during the second or third trimester of pregnancy, Excretion of more than 300 mg of urinary Protein per 24 hrs, edema, Patients with or without convulsions .

**Control-** pregnant women with normal Blood Pressure , absence of proteinuria and without any other systemic or endocrine disorder and age-matched with the cases. All subjects included were in their third trimester (gestational age of  $\geq 24$  weeks).

**Exclusion criteria** Patients with congestive heart failure, Diabetes mellitus, kidney disease, thyroid and parathyroid disorders, cirrhosis of the liver , alcoholics and any other systemic disease were excluded from the study.

### **Blood sample and Analysis:-**

About 2ml of venous blood was collected from the antecubital vein by taking aseptic precautions. Care was taken to prevent venous stasis during the sample collection. The blood was allowed to clot and the serum was separated by centrifugation. The estimation of the parameters was carried out within 4-6 hrs. The samples were analyzed for serum total calcium by the O-Cresolphthaleincomplexone method <sup>(11)</sup>, serum magnesium by the calmagite dye method <sup>(12)</sup> and for serum sodium and potassium by Electrolyte analyzer (**easlyte**). The internal control sera of two different levels were used to calibrate the instruments.

Data was analyzed using SPSS computer program, the mean and standard deviation were obtained and the independent 't.test' used for comparison (p value of  $\leq 0.05$ ) was considered significant.

### **Results:-**

The mean age of the preeclamptic patients was  $29.4 \pm 5.2$  years (range 19-40) , while in preeclamptic group under magnesium sulfate treatment with magnesium sulfate was  $29.2 \pm 4.9$  year, and in control group was  $29.6 \pm 4.6$  years with p value (0.89, 0,78 respectively) .

In comparison with the controls, women with preeclampsia had significantly lower in means of serum total calcium, magnesium, and potassium (7.34±0.51mg/dL) vs. (8.58± 0.71mg/dL) P<0.05, ( 1.29±0.23mmol/L) vs (1.83±0.32 mmol/L), and (3.08±0.24 mmol/L) vs 3.55±0.34 mmol/L) p value <0.05 respectively . There was significant increase in mean of serum sodium in women with preeclampsia compared to control group (144.57±3.93 mmol/L) vs (138.27±3.8 mmol/L) p value <0.05 as in table 1.

**Table1:** means comparisons of serum calcium, magnesium, sodium and potassium in preeclamptic women compared to control group.

Variable	Patients (mean ± SD) N=60	Control (mean± SD) N=60	P-value
Calcium (mg/dL)	7.34± 0.51	8.5± 0.71	0.000
Magnesium(mg/dL)	1.29±0.23	1.83±0.32	0.032
Sodium(mmol/L)	144.57±3.93	138.27±3.80	0.000
Potassium(mmol/L)	3.08±0.24	3.55±0.34	0.041

Results expressed as Mean ±SD and significant differences considered as p-value ≤0.05.

**Table 2:** means comparisons of serum total calcium, magnesium, sodium and potassium in preeclamptic women used magnesium sulfate compared to preeclamptic women not used magnesium sulfate.

Variable	Preeclamptic women used magnesium sulfate N=30	preeclamptic women not used magnesium sulfate N=30	P-value
Calcium (mg/dL)	7.3± 0.5	8.01± 1	0.000
Magnesium(mg/dL)	3.0 ± 0.8	1.3± 0.2	0.000
Sodium(mmol/L)	136.4± 4.7	144.7 ±3.9	0.02
Potassium(mmol/L)	3.3 ± 0.3	3.08 ± 0.2	0.04

Results expressed as Mean ±SD and significant differences considered as p-value ≤0.05.

In comparison with preeclamptic women used magnesium sulfate with preeclamptic not used magnesium sulfate there was significantly increased in serum magnesium (3.0 ± 0.8 mg/dL) vs (1.3± 0.2 mg/dL) with p value (0.00), while there were significantly decrease in serum sodium, and calcium as in table 2

There was significantly positive correlation between serum magnesium in preeclamptic women used magnesium sulfate and preeclamptic not used magnesium sulfate ( r= 0.3 / p= 0,049) as in fig 1, while there were weak negative correlations between serum calcium and potassium as in fig ( 2, 3)

**Figure 1:-** Correlation between Mg level in Preeclamptic women used and not used magnesium sulfate. P-value <0.05 consider as significant.

**Figure 2:-** Correlation between serum calcium level in Preeclamptic women used and not used magnesium sulfate. *P-value*<0.05 consider as significant.

**Figure 3:-**Correlation between Na<sup>+</sup> level in Preeclamptic women used and not used supplement. *P-value*<0.05 consider as significant.

**Figure 4:-** Correlation between K level in Preeclamptic women used and not used supplement. *P-value*<0.05 consider as significant.

**Discussion:-**

Preeclampsia is a multi-factorial process and multi organ dysfunction with no individual factor strictly essential or sufficient for causing it. The numerous complications associated with it have triggered a phobia in pregnant women (13).

From the finding of this study it appears that serum levels of calcium, magnesium and potassium were significantly decreased and the serum level of sodium was significantly increased in preeclamptic women group compared to control group (p, value=0.000). This result agreed with study carried by many authors<sup>(14,15,16,17)</sup>, which showed that; Low serum calcium may cause high blood pressure by stimulating parathyroid hormone and rennin release which in turn increases intracellular calcium in vascular smooth muscle. This causes vasoconstriction, increase of vascular resistance and rise in blood pressure in preeclamptic women. Magnesium is known to increase the prostacyclin release from the endothelial cells of blood vessels, which acts as potent vasodilator. Like Calcium ion, lowered Mg<sup>2+</sup> levels are thought to potentiate contractile response of vascular smooth muscle to vasopressor. An increase in renal clearance during pregnancy may contribute to the reduction in serum Mg<sup>2+</sup>. In addition Mg<sup>2+</sup> depletion increases the vasoconstrictor effect of angiotensin II and noradrenaline. Mg<sup>2+</sup> also has a substantial beneficial effect in preeclampsia for the prevention and treatment of convulsions. Potassium deficit in body is as a result of inadequate conservation of potassium by kidney and alimentary canal, fecal potassium losses can exceed even urinary losses.<sup>(18)</sup> Hypokalemia in preeclampsia may be due to abnormality in the transport of sodium and potassium across the vascular smooth muscle cell membrane, which is normally responsible for the maintenance of blood pressure.<sup>(19)</sup>

The precise mechanism of sodium retention in preeclampsia is not clear, though the retention is likely due to vasoconstriction leading to reduction of glomerular filtration rate and stimulation of rennin-angiotensin-aldosterone mechanism. The net effect is decreased intracellular fluid and increased extracellular fluid volume.<sup>(20)</sup>

Also the findings of this study showed that, there was significant increase in blood pressure in preeclamptic women not used magnesium sulfate compared to preeclamptic women used magnesium, (p value=0.000). This result was in agreement with another study<sup>(22)</sup> which finding confirmed that, Systolic and diastolic blood pressures were significantly decreased during MgSO<sub>4</sub> treatment in preeclamptic patients (p < 0.0001).

Serum magnesium was significantly increased in preeclamptic women used magnesium sulfate as supplement compared to the levels in preeclamptic women not used supplement (p, value =0.000). The results were in agreement with another studies carried by Handwerker,<sup>(21)</sup> showed there is over a 100% increase in venous serum levels of ionized Mg during intravenous MgSO<sub>4</sub> therapy of preeclamptic patients.

**Conclusion:** According to the results of this study it is concluded that the serum levels of calcium, magnesium and potassium are significantly decreased, while the level of sodium is significantly increased in preeclamptic women compared to control group. Magnesium sulfate supplement increase the level of serum magnesium in preeclamptic women.

#### Abstract

Schiff base are flexi-dentate ligands, which are important to expand the Schiff base complexes. These complexes form excellent catalytic reaction by forming stable complex with metal ions and producing the biological activity against antibacterial, antifungal, anticancer and anti-malarial activities. In this study, we have explore the Minimum Inhibitory Concentration (both liquid & Disc method) of schiff base ligand such as Pyrazole, diketone and their metal (Ni, Cu, Co, Mn, Vn, Ca, Zn) bound complexes against various microbial pathogens. Minimum Inhibitory Concentration (MIC both liquid & disc method) were analyzed for the various human microbial pathogens such as *Pseudomonas aeruginosa*, *Escherichia coli*, *Klebsilla pneumonia*, *Staphylococcus aureus*. The sensitivity towards the various commercial antibiotics (Rifampicin, Streptomycin, Ampicillin, Gentamicin, Neomycin, Bacitracin, Erythromycin & penicillin) for the selected microbial human pathogens were also evaluated and compared. The MIC values indicate the most of the complexes have higher antimicrobial activity than the free ligand. The variation in the antimicrobial activity of different metal complexes against different microorganism depends on their impermeability of the cell or the differences in ribosomes in microbial cells. The lipid membrane surrounding the cell favours the passage of any lipid soluble materials and it is known that lipo solubility is an important factor controlling antimicrobial activity. The presence of low activity of some metal complexes is may be due to their low lipophilicity, because of which penetration of the complex through lipid membrane was decrease and neither block nor inhibit the growth of the microorganism.

#### Introduction:-

Heterocyclic compounds are cyclic compounds, which has two different types of functional elements in the ring. Syntheses of heterocyclic compounds consist of potential pharmaceutical relevant properties and medical importance; therefore, these compounds have huge industrial application (Bhava et al., 2013; Tharmaraj et al., 2009) for the biological products. Schiff-base ligands are derived from an amino and carbonyl group of compounds typically

importance class of ligand in chemistry for the development of Schiff base complexes. Due to this, Schiff-base ligands are potentially capable of forming stable complexes with metal ions via C=N azomethine nitrogen group for the biological activities such as antibacterial, antifungal, anticancer and anti-malarial activities (Lippard and Berg, 1995; Naeimi et al., 2007). The terms of bidentate and tridentate ligands, they are simultaneously coordinated with metal in the centre of ligand for the synthesis of homo and hetero metallic complexes with different stereochemistry. Among the many different dinucleating ligands, the phenol-based compartmental ligands had drawn particularly wide attention of scientific community. Over the decade, several reported studies on the application exists in the homogenous and heterogeneous catalysis, hence this work mainly enlighten the catalytic activity of Schiff base complexes (Dickson and Robson, 1974; Lippard and Berg, 1995; Naeimi et al., 2007). Syntheses of such compounds are highly importance in the pharmaceutical and chemists are focused in this area for the industrial application to develop the pharmaceutical products to human health. Schiff-base compound has donors imine group in the structure, which has structure similarities with neutral biological systems that are utilized to elucidating the mechanisms of transformation in the biological system (Gibson et al., 1970). This ligand formation requires some conditions that are not very stringent, necessitating in the method of dry solvent or a removing the water produced in the reaction between an aldehyde/ketone and an amine. Precisely, the lone pair on the nitrogen atom of the imine moiety in the Schiff base compounds offers an appropriate donor atom for coordination with metal ion. Therefore, these compounds are highly active with adept at binding transition metal ions, in the diverse range of uses to catalysts biological mimics (Creaven et al., 2010). Schiff bases are utilized as initial source in the synthesis of industrial products and are regarded as privileged ligands. Depending on their binding mode with transition metal ions in the living system have been of quite interesting in this field. In addition, metal bound complex of schiff bases have been reported to be high enzyme inhibitors and pharmacological applications (Pervez et al., 2016). These compounds would pave the antitumor effect against some Gram-negative bacteria and are used to be distinct in the field of microbiological testing for the tumour chemotherapy. Moreover, Copper coordination complexes have oxidation state of the copper ion in +1 or +2 with most stable conformation. The Copper (II) metal ion complexes derived from S-benzylthiocarbamate and saccharinate consist of anticancer properties against the leukemic cell line. Nickel (II) complexes have different variety of geometries that may vary from octahedral to square planar including the tetrahedral coordination modes. Consequently, in this work, Schiff-base ligands Pyrazole, diketone and their metal bound complexes were analyzed against anti-microbial activity. The activities of the standard drugs such as Rifampicin, Streptomycin, Ampicillin, Gentamicin, Neomycin, Bacitracin, Erythromycin and Penicillin were taken for comparative studies with pyrazole, diketone and their metal bound complexes.

## **Materials:-**

### **Physical Measurement:-**

All the reagents are AR grade chemicals used from commercial sources with well purification. Nutrient broth, Potato Dextrose Agar, Muller Hinton Agar, Tris base, sodium chloride, hydrogen peroxide and other chemicals were purchased from SRL, India.

### **Preparation of Metal complexes:-**

The compounds Co (II), Cd (II), Ni(II), Zn(II), Mn(II), Vn (II) and Cu(II) were reacted and formed using an ethanolic solutions of metal halides/nitrates. The mixture was heated in the water bath for 2-3 hrs. The mixture of metal ions was mixed with pyrazole and diketone ligands solution for metal complexes.

### **Collection, Identification and Cultivation of Microbial Pathogens:-**

The various microbial pathogens such as *P. aeruginosa*, *E. coli*, *K. pneumoniae*, *S. aureus*, were cultivated in nutrient agar medium. The grown pathogenic cultures were further identified based on morphological, microscopy and biochemical test.

### **Antibiotic sensitivity assay:-**

The sensitivity towards the various antibiotics such as (Rifampicin, Streptomycin, Ampicillin, Gentamicin, Neomycin, Bacitracin, Erythromycin, Pencillin) against the pathogenic microorganism was analyzed. Sterile 50 ml nutrient broths were prepared and inoculated with *P. aeruginosa*, *E. coli*, *K. pneumoniae*, *S. aureus*,). The flasks were incubated in shaker for 24 hours at 37°C. Sterile Muller Hinton agar plates were prepared and were aseptically inoculated with the pathogenic cultures after 5 minutes the different antibiotic standard discs (Rifampicin, Streptomycin, Ampicillin, Gentamicin, Neomycin, Bacitracin, Erythromycin, Pencillin) were placed over the culture plate (Nomiya et al., 2000). After 5 minutes the different antibiotic standard disc (Nystatin) were placed over the culture plate. The plates were incubated at 37°C for 24 hours. The Minimal inhibitory concentration (MIC) in various

antibiotic susceptibility discs were tested (Fig. 1). The antimicrobial activity of metal ligand complex by disc method were analyzed as referred(Rafi et al., 2016). The sterile disc with metal and ligand was prepared with the minimum inhibitory concentration. All the selected complexes and the parent ligand were screened for their activity against the test organisms.

**Minimum Inhibitor concentration:-**

The MIC of the various metal ligand complex and ligand were analyzed as referred(Andrews and Andrews, 2001). 9ml of sterile Muller Hinton broth medium was prepared, and added with various metal ions such as Copper, Zinc, Cobalt, Manganese, Vanadium, and Nickel with the various concentration 50,100,150,200,250µ/ml by dissolving with 1ml of dimethylsulfoxide solution. After preparation of 10ml of Muller Hinton, broth in that 100µl was discarded and added with 100µl of culture. (*P. aeruginosa*, *E. coli*, *K. pneumoniae*, *S. aureus*). After incubation, the tubes were incubated in shaker incubator for 24 hours at 37°C. The Minimum inhibitory concentration of growth was determined.

### Results and Discussion:-

Among the observations in the MIC of metal bound pyrazole complex and metal free pyrazole, Ni-Pyrazole complex showed MIC activity of 100  $\mu\text{g/ml}$  against *S. aureus*; 150  $\mu\text{g/ml}$  against *K. pneumoniae*; and 200  $\mu\text{g/ml}$  against *E. coli*. The Cu pyrazole complex has shown 100  $\mu\text{g/ml}$  of MIC activity against *K. pneumoniae*; 150  $\mu\text{g/ml}$  of MIC against *E. coli*; 200  $\mu\text{g/ml}$  MIC against *S. aureus* and *P. aeruginosa*. In metal free pyrazole, it shows MIC of 150  $\mu\text{g/ml}$  against *P. aeruginosa*, *S. aureus*; 300  $\mu\text{g/ml}$  against *E. coli*; 350  $\mu\text{g/ml}$  against *K. pneumoniae* (Bhattarai et al., 2012). The metal complex such as Nickel and copper showed very good MIC of 100  $\mu\text{g/ml}$  against *S. aureus* and *K. pneumoniae* respectively (Fig. 2).

In magnesium diketone complex, 100  $\mu\text{g/ml}$  against *K. pneumoniae* and *P. aeruginosa*; 200  $\mu\text{g/ml}$  against *E. coli*. The zinc diketone complex it shows, MIC of 100  $\mu\text{g/ml}$  against *P. aeruginosa*, 200  $\mu\text{g/ml}$  against *E. coli*, *S. aureus*, and *K. pneumoniae*. The cobalt diketone complex it shows MIC of 150  $\mu\text{g/ml}$  against *E. coli*, *S. aureus*; 200  $\mu\text{g/ml}$  against *P. aeruginosa*, *K. pneumoniae*. The vanadium diketone complex it shows MIC of 100  $\mu\text{g/ml}$  against *E. coli*, *P. aeruginosa*; 150  $\mu\text{g/ml}$  against *K. pneumoniae*; 200  $\mu\text{g/ml}$  against *S. aureus*. The cadmium diketone complex shows MIC of 150  $\mu\text{g/ml}$  against *E. coli*, *S. aureus*; 200  $\mu\text{g/ml}$  against *P. aeruginosa*, *K. pneumoniae*. Nickel diketone complex it shows MIC of 50  $\mu\text{g/ml}$  *E. coli*, 100  $\mu\text{g/ml}$  against *S. aureus*; 150  $\mu\text{g/ml}$  against *P. aeruginosa*, *K. pneumoniae*. In diketones shows MIC of 150  $\mu\text{g/ml}$  against *S. aureus*, 200  $\mu\text{g/ml}$  against *Escherichia coli*, *P. aeruginosa*, *K. pneumoniae*. (Yadav et al., 2013) Comparative results of MIC activity of diketone alone and diketone-metal bound complex, the metal complex shown very good MIC activity than the pyrazole complex alone (Fig. 2).

### Antimicrobial activity of the Metal ligand complexes by Disc Method:-

The disc method of microbial inhibition study was performed using nickel-pyrazole complex with the concentration ranges from (180, 190, 200, 210 and 220  $\mu\text{g}$ ) against the *E. coli*. The MIC activity showed 17 mm high zone of inhibition in the concentration of 200  $\mu\text{g}$  against *E. coli*. In *P. aeruginosa*, the various concentration ranges (180, 190, 200, 210, 220  $\mu\text{g}$ ) were performed and the MIC activity shows high zone of inhibition 7 mm against the concentration 200  $\mu\text{g}$ . In *S. aureus*, MIC activity of 20 mm zone of inhibition against the 100  $\mu\text{g}$ . In *K. pneumoniae*, the MIC of 6 mm zone of inhibition against the 150- $\mu\text{g}$  concentration (Fig. 4).

In copper-pyrazole complex, the effect of the complex was analyzed with various concentration in the range of (130, 140, 150, 160, 170  $\mu\text{g}$ ) against *E. coli*. The MIC activity showed 12 mm high zone of inhibition in the concentration of 150  $\mu\text{g}$  against *E. coli*. In *P. aeruginosa*, the various concentration ranges (180, 190, 200, 210, 220  $\mu\text{g}$ ) were performed and the MIC activity shows high zone of inhibition 15 mm against the concentration 200  $\mu\text{g}$ . In *S. aureus*, MIC activity of 20 mm zone of inhibition against the 100  $\mu\text{g}$ . In *K. pneumoniae*, the MIC of 7 mm zone of inhibition against the 150- $\mu\text{g}$  concentration (Fig. 5).

In cobalt-pyrazole complex, the effect shows the concentration ranges from 130, 140, 150, 160, 170  $\mu\text{g}$  against *E. coli*. The MIC activity showed 17 mm high zone of inhibition in the concentration of 150  $\mu\text{g}$  against *E. coli*. In *P. aeruginosa*, the various concentration ranges (180, 190, 200, 210, 220  $\mu\text{g}$ ) were performed and the MIC activity shows high zone of inhibition 15 mm against the concentration 150  $\mu\text{g}$ . In *S. aureus*, MIC activity of 24 mm zone of inhibition against the 150  $\mu\text{g}$ . In *K. pneumoniae*, the MIC of 14 mm zone of inhibition against the 200- $\mu\text{g}$  concentration (Fig. 6).

While analyzing all above, the maximum zone was absorbed in MIC of 150  $\mu\text{g}$  with 24 mm in *S. aureus*. In ligand pyrazole, the effect shows the concentration from (280, 290, 300, 310, 320  $\mu\text{g}$ ) performed in *E. coli* the MIC of 300

$\mu\text{g}$  shown the zone which was obtained as 14 mm. *P. aeruginosa* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 7 mm. In *S. aureus* the concentration from (130, 140, 150, 160, 170,  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as a mm. In *K. pneumoniae* the concentration from (330, 340, 350, 360, 370  $\mu\text{g}$ ) was performed the MIC of 350  $\mu\text{g}$  shown the zone which was obtained as 9 mm. Resulting from the above, the maximum zone was obtained for nickel-pyrazole 200  $\mu\text{g}$  with 17 mm zone of inhibition in *E. coli*, for copper pyrazole 200  $\mu\text{g}$  with 15 mm in *P. aeruginosa*, for 14 mm in *E. coli*.

In Magnesium-diketone complex the effect shows the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) in *E. coli* was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 5 mm. In *P. aeruginosa* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 10 Mm. In *S. aureus* the concentration from (80, 90, 100, 110, 120  $\mu\text{g}$ ) was performed the MIC of 100  $\mu\text{g}$  shown the zone which was obtained as 12 mm. In *K. pneumoniae* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 8 millimeter (Fig. 7).

In Zinc-diketones complex shows the concentration (180, 190, 200, 210, 220  $\mu\text{g}$ ) in *Escherichia coli* was performed, the minimal inhibition concentration of 200  $\mu\text{g}$  shown the zone which was obtained as 10 mm. In *P. aeruginosa* the concentration from (80, 90, 100, 110, 120  $\mu\text{g}$ ) was performed, the MIC of 100  $\mu\text{g}$  shown the zone which obtained 9 mm. In *S. aureus* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 6 mm. In *K. pneumoniae* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which obtained as 20 mm (Fig. 8).

In cobalt-diketones complex the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) in *E. coli* was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 7 mm. In *P. aeruginosa* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 15 mm. In *S. aureus* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 9 mm. In *K. pneumoniae* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 7 mm (Fig. 9). In vanadium-diketone complex the concentration from (80, 90, 100, 110, 120  $\mu\text{g}$ ) was performed, the MIC of 100  $\mu\text{g}$  shown the zone which obtained as 7 mm. In *P. aeruginosa* the concentration from from (80, 90, 100, 110, 120  $\mu\text{g}$ ) was performed, the MIC of 100  $\mu\text{g}$  shown the zone which was obtained as 6 mm. In *S. aureus* the various concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 9 mm. In *K. pneumoniae* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 7 mm (Fig. 10). In cadmium-diketone complex the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) in *E. coli* was performed, the MIC of 150  $\mu\text{g}$ , shown the zone which was obtained as 7 mm. In *P. aeruginosa* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 7 mm. In *S. aureus* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 9 mm. In *K. pneumoniae* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 7 mm (Fig. 11). In Nickel-diketone complex the concentration from (30, 40, 50, 60, 70  $\mu\text{g}$ ) in *E. coli* was performed, the MIC of 50  $\mu\text{g}$  shown the zone which was obtained as 25 mm. In *P. aeruginosa* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 9 mm. *S. aureus* the concentration from (80, 90, 100, 110, 120  $\mu\text{g}$ ) was performed, the MIC of 100  $\mu\text{g}$  shown the zone which was obtained as 7 mm. In *K. pneumoniae* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 8 mm (Fig. 12).

In ligand diketone the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) in *E. coli* was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 12 mm. In *P. aeruginosa* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 12 mm. In *S. aureus* the concentration from (130, 140, 150, 160, 170  $\mu\text{g}$ ) was performed, the MIC of 150  $\mu\text{g}$  shown the zone which was obtained as 20 mm. In *Kelbsilla pneumoniae* the concentration from (180, 190, 200, 210, 220  $\mu\text{g}$ ) was performed, the MIC of 200  $\mu\text{g}$  shown the zone which was obtained as 12 mm.

Results shows the maximum zone was obtained 150  $\mu\text{g}$  with 10 mm in *S. aureus*, 200  $\mu\text{g}$  with 20 mm in *K. pneumonia*, 200  $\mu\text{g}$  with 15 mm in *P. aeruginosa*, 200  $\mu\text{g}$  with 9 mm in *S. aureus*, 50  $\mu\text{g}$  with 25 mm in *E. coli*. Antibiotic susceptibility test of streptomycin, it consists of 17 mm (sensitive) in *E. coli* when compared to the metal ion concentration of 200  $\mu\text{g}$  it was obtained as 17 mm (Sensitive), the zone formation is sensitive. In *S. aureus* it

consists of 20 mm (sensitive) when compared to metal ion concentration 100 µg is 20 mm sensitive. Antibiotic susceptibility test of Gentamicin, the highest zone in *S. aureus* and *E. coli* as 25 mm (Sensitive) when compared to metal ion it gives the 25 mm (Sensitive) in Nickel complex. Antibiotic susceptibility test of Neomycin in *E. coli* consists of zone is 25 mm sensitive as like the Nickel complex. Antibiotic susceptibility test of Erythromycin in *S. aureus* consists of zone is 25 mm sensitive as like the ligand diketones.

### Conclusion:-

The various metals Nickel, Copper, cobalt, Zinc, Magnesium vanadium, cadmium and ligand bound metal complexes (Schiff base) ligands such as pyrazole and diketones were prepared. The various microbial pathogens such as *Pseudomonas aeruginosa*, *Escherichia coli*, *Klebsilla pneumoniae* *Staphylococcus aureus*, were cultivated in nutrient agar medium. The sensitivity towards the various antibiotics such as Rifampicin, Streptomycin, Ampicillin, Gentamicin, Neomycin, Bacitracin, Erythromycin and penicillin was analyzed the activity against the pathogenic microorganism. Result enlightens that, the minimal inhibitory concentration (MIC) values found to have higher antimicrobial activity with ligand bound complexes than the free ligands compared with antibiotics. Moreover, in the pyrazole bound complex, the maximum zones were obtained in nickel-pyrazole complex in the concentration of 200 µg with 17 mm zone of inhibition against *E. coli*, copper-pyrazole complex in the concentration of 200 µg with 15 mm in *P. aeruginosa*. In the case of diketone complex, the maximum zone was obtained 150 µg with 10 mm in *S. aureus*, 200 µg with 20 mm in *K. pneumonia*, 200 µg with 15 mm in *P. aeruginosa*, 200 µg with 9 mm in *S. aureus* and 50 µg with 25 mm in *E. coli*. Overall from this study, the prepared Schiff base compounds showed higher activity against the pathological microorganism and potential to inhibit the growth of organisms.

#### *Abstract*

**Background:** Acne vulgaris is one of the most and common chronic inflammatory skin diseases, which affects people in both developing and developed countries. This study aimed to investigate and define the relation between diet and acne among residents of Al-Madinah Al-Munawwarah, Saudi Arabia.

**Methodology:** This cross-sectional study was conducted between October 2016 and January 2017 where all the participants were from Al-Madinah Al-Munawwarah. Participation was done on a voluntary basis and all the participants filled an electronic questionnaire.

**Results:-** There was a significant association between acne and irregular menstruation ( $p=0.008$ ), while no significant association was found between acne and other diseases. The belief in the ability of certain kinds of food (junk food, sweets, chocolate, soda, chips and spicy foods) to aggravate acne severity was significantly higher among participants with acne compared with participants with no acne ( $p<0.001$ ,  $p<0.001$ ,  $p<0.001$ ,  $p=0.01$ ,  $p<0.001$  and  $p<0.001$ ), respectively.

**Conclusion:-** The present findings suggest a positive association between some food and acne vulgaris in the Saudi context. An interventional dietary study will be required to further ascertain the effects of these foods on acne vulgaris.

#### **Introduction:-**

Acne vulgaris is one of the most and common chronic inflammatory skin diseases, which affects people in both developing and developed country, (1,2), it affects particularly teenagers between 15-17 years and about 15-20% of young adults (3,4). It can persist to adult life where several studies addressed that there is increased prevalence of adult having acne (3,5). It is characterized by "sebum overproduction, follicular hyperkeratinization, and increased release of inflammatory-mediating chemicals along with androgens and other pathogenic influences". (1)

Several studies indicate that having acne can be a huge deterrent to adequate growth and self-confidence of young university students who represent the future of our country (1,6) where physical appearance is one of the most sensitive aspects of our society and plays a vital role in our social and physiological well-being. It has a direct impact on our self-esteem and ability to function with confidence. One of the most intriguing facts of physical appearance is acne and it is a phenomenon which has affected all of us at some point in our lives (7-12). This aspect is of particular importance to teenagers and young adults who are constantly influenced by media to have a certain physical appearance in order to be accepted by their peers and society. (7-12)

Despite having such a pervasive impact, there are certain areas of this topic that are not given the attention they rightfully deserve. There have been extensive amount of research done on medication and other remedial actions to cure acne. There are numerous factors that contribute to the occurrence of acne in human body rather than a single cause. It is believed diet plays one of the more significant contributing factors directly and otherwise in acne existence. However, inadequacy in investigating the relationship between diet and acne is to say the least, alarming where the lack of attention given to this relationship is primarily due to the absence of a correlation between diet and acne found in earlier studies. However, more recent studies have shown a strong relation between diet and acne contrary to the common belief held in the past. (13)

Historically, the relationship between diet and acne has been highly debated, where in 19<sup>th</sup> and first half of 20<sup>th</sup> centuries, the relation between diet and acne was addressed strongly and all dermatologists recommended avoiding certain kinds of food (chocolate, fats, and sweets), then during the second half of 20<sup>th</sup> century several studies were conducted and dismissed the relationship between diet and acne and considered it as a myth. However, during the last two decades, the relationship appeared on the surface again and a lot of studies were conducted that addressed the correlation between diet and acne. Those latest studies depended on several factors e.g. glycemic Index (GI) and glycemic load (GL). More understanding of acne pathogenesis, the role of endocrine mechanisms in acne pathogenesis and the necessary duration of time for a given treatment to influence acne development is needed (6,14,15).

Our study aimed to investigate and define the relation between diet and acne among residents of Al-Madinah Al-Munawarah, Saudi Arabia.

### **Methodology:-**

This cross-sectional study was designed and conducted between October 2016 and January 2017, the participants were from Al-Madinah Al-Munwarah community, Saudi Arabia. Participants were between 16 to 40 years, and the participation was on a voluntary basis. An ethical approval was obtained from the ethical committee in the College of Medicine, Taibah University and all participants provided informed consent before filling the questionnaire. All eligible participants were asked to fill an electronic questionnaire, which consisted of two parts: the first part is demographic and anthropometric data (age, gender, weight, height, BMI, acne severity, acne medication, chronic illness and, history of oral contraceptive use), and the second part was regarding diet habits and food-aggravated acne beliefs. This questionnaire was presented to dermatologist for validation. The researchers divided the participants to four groups depending on acne severity (no acne, mild acne, moderate acne and severe acne).

All statistical analyses were performed using SPSS version20, categorical data was presented as numbers and percentages, and parametric data was presented as means and standard deviations (SDs). Chi square test was used to compare between acne severity groups regarding food habits and beliefs and to find the relation between acne severity and diet habits. p values <0.05 were considered significant.

### **Results:-**

Total of 580 adults (106 males, 474 females), half of them from the age group (21-30) joined the study. Two hundred ninety-one participants (50.2%) reported no acne, 238 (41.0%) reported mild acne, and 51 (8.8%) reported moderate to severe acne. There were no differences in sex, BMI, and number of meals per day between groups. Participants with mild acne were significantly higher in groups age 16-25 (61.8%) compared with participants with no acne or moderate to severe acne (53.2%) (p=0.001). Similarly, participants with mild acne were significantly higher (72.6%) in receiving medication for treating their acne compared with participants with no acne or moderate to severe acne (27.4%) (p=0.001). There was a significant association between acne and irregular menstruation (p=0.008), while no significant association was found between acne and other diseases (**Table 1**).

Participants with acne compared with participants with no acne reported a greater consumption of the following kinds of food per day: milk, rice, pasta, cheese, soda, sweet, coffee and tea with no significant difference, while there was significant difference in the consumption of the following food type: oil-butter, chips and white bread. Conversely, participants with no acne (compared with participants with acne) reported a greater consumption of the following kinds of food per day: fruits, vegetables, meat, egg, peas, yogurt and low fat milk with no significant difference, while there was a significant difference in the consumption of fish and nuts. On the other hand, the consumption of skimmed milk and brown bread were equal between both groups (**Table 2**).

A greater percentage of participants in the acne groups reported diet to influence acne severity (88.2%) compared with participants with no acne (11.8%) ( $p < 0.001$ ). The results showed that the belief in the ability of some kinds of food (junk food, sweets, chocolate, soda, chips and spicy foods) to aggravate acne severity was significantly higher among participants with acne compared with participants with no acne ( $p < 0.001$ ,  $p < 0.001$ ,  $p < 0.001$ ,  $p = 0.01$ ,  $p < 0.001$  and  $p < 0.001$ ), respectively. Moreover, the belief in the ability of some kinds of food (fruits, vegetables, fish, brown bread and yogurt) to decrease acne severity was significantly higher among participants with acne compared with participants with no acne ( $p < 0.001$ ,  $p < 0.001$ ,  $p = 0.002$ ,  $p = 0.007$  and  $p < 0.001$ ), respectively (**Table 3**).

**Discussion:-**

The relationship between diet and acne was established since the 19th century, and a lot of studies were conducted to detect this relation and the types of food, which were considered as risk factors in developing acne. (16). The classic Saudi diet contains complex carbohydrates, vegetables, meat, and fish. However, in the last few decades, there was a significant increase in the rate of consumption of junk foods, sweets and sugary drinks particularly in the younger populations. In 2013, there was a study by Kumari et al. in which the authors reported the relation between growth hormone (GH), insulin, and insulin-like growth factor-1 (IGF-1) hormones and the increase in sebum production during puberty (16, 17). Moreover, they reported that hyperinsulinemia and insulin resistance were risk factors for acne development (16). Those conclusions and observations had been emphasized and recognized in subsequent studies (13, 18 and 19). In a study in New York in 2014, the authors reported the significant influence of diet with high GI and GL as a main cause that aggravated acne. Similar results were reported by the study of Colidan et al. where the authors reported the absence of acne among Papua New Guinea and Paraguay population due to their low glucose index diet (5,20). Similar results were found in a big randomized control study (20) where the authors reported the positive effect of low glucose load diet on decreasing acne lesion numbers, raising insulin sensitivity and decreasing weight (19,21). The results of the current studies coincide with the previous study, where the results showed significant association between acne and consuming carbohydrate.

Several other studies demonstrated the link between acne and skimmed milk or whole milk but not with cheese (16-18). This link is stronger with skimmed milk more than whole milk due to the fact that the link is not related to fatty substances in the milk but due to protein substance (13,15), where several studies reported that milk has a three- to six-fold higher GL and insulin-trophic response than predicted. This means that the total consumption of milk proteins had a big influence on acne (13,15). However the findings of the current study couldn't demonstrate this link. In contrast to Burris et al. study that was done among young adults in New York and addressed the relation between acne and milk, specially skimmed milk (17). Moreover, the study of Okoro in Nigeria reported higher acne prevalence among people who drink milk daily than those who don't (72.6% vs. 62.0%;  $p = 0.035$ ). Also, they reported that acne has a relation with eating cake more than any other snacks such as biscuits. This may be supported by the fact that cakes need a large amount of milk in the content (18).

Our study found a significant association between acne and consumption of oil, butter and chips where similar results were found in two cross sectional studies conducted in 2010 in which the authors reported a link between acne development and increased consumption of fried foods (17, 22, and 23). In contrast, the authors in the Nigerian study didn't find this association (18).

Compared with the "no acne group", the consumption of fish was less among acne group. This coincided with the previous studies (15,17,18). This negative effect on acne may be due to the fact that fish had a large amount of omega-3 fatty acids, which exhibit anti-inflammatory properties and help in decreasing IGF-1 levels. In 2012, a case-control study was conducted by Di Landro and colleagues where the authors determined the negative association between eating fish and acne severity (OR 0.68) and they concluded that frequent consumption of fish which is rich with n-3 fatty acids have a protective effect on acne (15,24). However, few studies focused on this link but still there is a lack of evidence on this kind of association (17).

The current study didn't find any significant association between acne and yogurt, cheese, pasta, sweet and soda. However there was a significant association between drinking water and acne, where the group of "no acne" drink water more than the acne group. This is consistent with the belief that shortage in drinking water is a reason for aggravating acne. Regarding the beliefs of aggravation of acne by some kinds of food, most of the participants either from the "acne group" or the "no acne" group reported that soda, chips, pizza, sweets, spicy food and chocolate are related to an increase in acne. Similar results were found in New York study where the authors reported that there is no enough study about the relation between acne and chocolate. Further studies are recommended to detect this relation (17).

**Limitations:-**

The difference in the portion sizes of milk and fish consumed among groups is relatively small. Thus, the clinical relevance is questionable. Also, the nature of the study (cross-sectional) design may make the interpretations of the results limited where the results cannot be used to determine causation.

**Conclusion:-**

The present findings suggest the presence of associations between some kinds of food and acne in the Saudi context, where the milk and saturated fat became on the top of risk factors. Fish consumption showed positive effects in reducing acne. Whenever the food is low in glucose load, low in saturated fat, and rich in grains, vegetables, fruits and Omega-3 fatty acids, the best effect on health and acne is achieved. An interventional dietary study will be required to further establish the effects of those foods on acne vulgaris.

#### Abstract

Hypertensive disorders of pregnancy complicate up to 10% of pregnancies worldwide, constituting one of the greatest causes of maternal and perinatal morbidity and mortality. The basic pathology of pregnancy induced hypertension (PIH) is poor placentation, and vasospasm of vessels along with alteration of hematological profile. The study was conducted in Dr. D. Y. Patil Hospital and Research institute, Kolhapur, on 50 patients clinically diagnosed as PIH, and 50 normotensive pregnant women both with gestational age  $\geq 20$  weeks. In the present study of the 50 PIH cases 22 cases (44%) had severe PIH (diastolic BP  $\geq 110$ mmHg) and 28 cases (56%) had mild PIH (diastolic BP  $\leq 100$ mmHg) PIH was found to be common in young primigravidas. Thrombocytopenia was the most common haematological aberration seen in PIH. In the present study thrombocytopenia ( $<1.5$  lakhs) was seen in 12 (24%) of total PIH cases. We made a conclusion that simple and routine tests like CBC with platelet count and platelet indices are highly helpful in suspecting deranged coagulation early in courses of disease and have a crucial role in reducing mortality and morbidity of both mother and fetus.

#### Introduction:-

Hypertensive disorders of pregnancy, including preeclampsia complicate upto 10% of pregnancies worldwide, constituting one of the greatest causes of maternal and perinatal morbidity and mortality worldwide. The term hypertensive disorders of pregnancy includes a heterogeneous collection of disease complicating pregnancy and form one of the deadly triad along with haemorrhage and infection.

The diagnosis of pregnancy induced hypertension is made in women whose blood pressure reaches 140/90mmHG or greater for first time at  $\geq 20$  weeks of gestation. Preeclampsia is characterized by hypertension (Blood pressure of 140/90 mmHg or greater), proteinuria ( $>0.3$ g/dl), edema and new signs of end organ dysfunction and begins as early as 20<sup>th</sup> gestational week. Eclampsia is occurrence of seizures in women with preeclampsia which develops before, during or after labour.<sup>1</sup>

The basic pathology of preeclampsia is endothelial dysfunction, poor placentation, and vasospasm of vessels along with alteration of hematological profile<sup>2</sup>. Out of all hematological abnormalities that occur in PIH, thrombocytopenia is the most common seen in 11-29% of patients. These pregnancies also are associated with

qualitative changes suggesting increased platelet production and destruction. There is shortened life span, increased number of megakaryocytes in bone marrow and an increase number of immature platelets seen in peripheral smear<sup>4</sup>. Walker J.J. et al showed that in pregnancy induced hypertension there are changes in platelet number, platelet survival and mean platelet volume, which have been interpreted as evidence of increased platelet consumption<sup>9</sup>. The MPV and PDW were elevated proportionally with the severity of pre-eclampsia when compared with the normotensive control group. There is a gradual increase in MPV from normotensive pregnant women to pre-eclampsia and eclampsia. This increase in MPV in pre-eclampsia and eclampsia probably indicate hyperdestruction of platelets due to shorter platelet half-life<sup>11</sup>. There was an increase in PDW from normotensive pregnant women to pre-eclampsia and eclampsia in the study conducted by Tygart et al. This probability reflects increased platelet turnover which would support the idea that platelet survival time is decreased resulting in increased destruction of platelets<sup>12</sup>. Clinically, platelet indices can be a useful screening test for early identification of pre-eclampsia and eclampsia. Also platelet indices can assess the prognosis of PIH in pregnant women.

### Methodology:-

After ethical approval one year prospective study was carried out in D Y Patil Hospital and Research Institute during the period of June 2015 to May 2016. This study was undertaken in Department of Pathology with collaboration of department of Obstetrics and Gynecology, Dr D Y Patil Hospital and Research Institute Kolhapur. The present study includes 50 patients aged 18-35 years clinically diagnosed as pregnancy induced hypertension with gestational age  $\geq 20$  weeks attending outpatient department or admitted in antenatal ward/labour room in department of OBG, Dr. D. Y. Patil Hospital and Research institute, Kolhapur. Fifty normotensive pregnant women in the age group of 18-35 years with gestational age  $\geq 20$  weeks were included in the control group. CBC values were determined by Mindray BC- 3000 Plus hematology analyser which is a fully automated three part hematology analyser. Platelet count, mean platelet volume(MPV), platelet distribution width(PDW) estimation was compared between the normotensive pregnant women with PIH patients. The statistical analysis used was mean, standard deviation and students t-test. The p value  $< 0.05$  was accepted as significant.

### Results:-

PIH is common in young primigravidas, in the present study mean age was  $23.8 \pm 3.56$  years and primigravidas constituted the majority of patients (68%). Thrombocytopenia is the most common haematological aberration seen in PIH. In the present study thrombocytopenia ( $< 1.5$  lakhs) was seen in 12 (24%) of total PIH cases. The mean platelet count in mild PIH was  $2.23 \pm 0.64$  lacs/cumm and that in severe PIH was  $1.67 \pm 0.55$  lacs/cumm. The mean platelet count in normotensive control was  $3.14 \pm 0.80$  lacs/cumm. (Table No. 1)

**Table 1:-** Table showing mean platelets count in mild and severe PIH and control cases

	Mean platelet count $\pm$ SD (lacs/cumm)
Control(n=50)	$3.14 \pm 0.80$
Mild PIH(n=28)	$2.23 \pm 0.64$
Severe PIH(n=22)	$1.67 \pm 0.55$

### Mean Platelet Volume and Platelet distribution width (PDW):-

In the present study MPV ranged from 7.6 femtolitre to 12.6 fl in mild PIH & 7.8 fl to 13.6fl in severe PIH. Mean MPV in PIH was significantly higher ( $10.57 \pm 2.67$  fl) compared to that in control group ( $7.74 \pm 0.92$  fl) p  $< 0.05$  significant. In the present study mean PDW in PIH cases was  $13.2 \pm 1.97\%$  whereas it was  $11.82 \pm 1.52\%$  in control. Mean PDW was significantly increased (p $< 0.05$ ) in PIH group compared to control (Table No. 2)

**Table 2:-** Table showing mean MPV in PIH and control cases

	Mean MPV $\pm$ SD (fl)	Mean PDW $\pm$ SD (%)
PIH (n=50)	$10.57 \pm 2.67$	$13.2 \pm 1.97$
Control (n=50)	$7.74 \pm 0.92$	$11.82 \pm 1.52$

### Discussion:-

Women with severe pre-eclampsia develop a variety of hematological aberrations. These hematological aberrations have an impact on the outcome of delivery of these patients so that aggressive therapy can be initiated to prevent maternal and neonatal morbidity and mortality.

Thrombocytopenia is the most common haematological aberration seen in PIH. It is caused by increased platelet destruction as shown by decreased platelet lifespan, increased number of megakaryocytes in the bone marrow and an increased proportion of young, oversized platelets (megathrombocytes) in the peripheral blood film. Thrombocytopenia is associated with progressive disease & also with disease severity. Thrombocytopenia occurs in 15% of patients with pre-eclampsia. A significant reduction in platelet count is seen frequently during and even before the onset of disease<sup>13</sup>.

Kelton J. G, et al<sup>4</sup> in their study observed that 34% of patients had thrombocytopenia, Thomas A, et al in their study reported that 16% had thrombocytopenia<sup>14</sup>. Vrunda J K. reported 41% thrombocytopenia, Ruchi Verma et al reported 31% thrombocytopenia in their studies. In the present study 24% had thrombocytopenia (Table no. 3).

**Table 3:-** Table showing comparison of percentage of PIH patients having thrombocytopenia in different studies.

Authors	Thrombocytopenia(%)
Kelton J. G, et al <sup>4</sup> (n=26) (1985)	34%
Thomas A. et al <sup>14</sup> (n=80) (1998)	16%
Vrunda JK <sup>15</sup> (n=72) (2004)	41%
Ruchi Verma et al <sup>16</sup> (n=35) (2015)	31%
Present study (n=50)(2016)	24%

Severity of PIH and thrombocytopenia are closely correlated which indicates that thrombocytopenia is directly proportional to severity of PIH. The mean platelet count in present study were: 3.14 lacs/cumm in normotensive pregnant women and 2.23 lacs/cumm in mild PIH and 1.67 lacs/cumm in severe PIH cases. When mean platelet count was compared between control and PIH cases, a significant decrease in platelet number was observed and correlated well with the values of other studies. ( Table No-4)

**Table 4:-** Table showing comparison of mean platelet count in normotensive and varying degree of PIH and correlation with other studies

Kulkarni and Sutharia <sup>20</sup> (n=90) (1983)	2.5	1.84	1.19
Srivastava M <sup>17</sup> (n=119) (1995)	1.94	1.79	1.64
Vrunda Jk <sup>15</sup> (n=122) (2004)	2.2	2.01	1.4
Jambhulkar et al <sup>18</sup> (n=194) (2001)	2.38	2.30	1.70
S Mohapatra <sup>19</sup> (n=90) (2007)	2.38	2.23	1.82
Ellora Devi et al <sup>21</sup> (n=60) (2012)	2.44	1.82	1.42
Present study (n=100) (2016)	3.14	2.23	1.67

The normal range for MPV is 8.63±0.87 fl in many studies and distribution of platelet sizes is related to PDW. Platelet size and platelet distribution width are both increased in pre-eclamptic patients even with normal platelet counts. Rise in MPV & PDW can predict the haemostatic abnormality in them<sup>7</sup>.

Walker J. J. et al<sup>9</sup> has indicated that rising MPV can be used as a marker for intervention in pre-eclamptic patients. Stubbs et al has reported increased MPV of 11.5fl in his study of PIH patients compared to control subjects (9.7fl). Similar observation was made by various other authors and also in present study. (Table no. 5).

**Table 5:-** Table showing comparison of mean MPV in present study with other studies.

Authors	Mean Platelet Volume(fl)	
	Control	PIH
Stubbs et al <sup>7</sup> (n=20)(1986)	11.5	9.7
Giles et al <sup>10</sup> (n=550) (1987)	8.7	9.9
Ahmed et al <sup>22</sup> (1993)	9.6	10.2
Vamseedhar et al <sup>11</sup> (n=182) (2011)	8.2	10.2
Fahmi E M et al <sup>23</sup> (n=70) (2013)	9.5	10.6
Present study(n=100) (2016)	7.7	10.7

Increased mean platelet distribution width of 13.2% in PIH case compared to 11.82% in control cases was observed in present study. Similar observation was made by various other authors (Table No:6)

**Table 6:-** Table showing comparison of mean platelet distribution width (PDW) in present study with other studies

Authors	Mean PDW (%)	
	Control	PIH
Giles et al <sup>10</sup> (1987) (n=550)	12	16
Vamseedhar et al <sup>11</sup> (2011)(n=182)	11.07	15.51
Fahmi E M et al <sup>23</sup> (2013)(n=70)	11.2	13.99
Present study(n=100) 2016	11.82	13.2

### Conclusion:-

Pregnancy induced hypertension is the most common complication of pregnancy and remains a leading cause of maternal and fetal morbidity & mortality. As a result of the haemostatic aberrations in PIH, postpartum hemorrhages sometimes so severe as to lead to maternal death may occur. Fetal growth retardation is more frequent in the thrombocytopenic groups. This study gives an outline of the investigations to be done in cases of PIH which can alert the physician of the severity of disease so that appropriate and timely management can be initiated. The estimation of platelet count and platelet indices is a reliable method. In this study an attempt has been made to assess the role of platelet count and platelet indices like MPV and PDW in PIH patients.

#### Abstract

Solitary Rectal Ulcer Syndrome is most common in young adults and occurs on the anterior rectal wall. It is thought to result from localized chronic trauma or ischaemia associated with disordered puborectalis function and mucosal prolapse. Symptoms include minor bleeding, mucus per rectum, tenesmus, perianal pain with severe constipation. A 42 years old male patient who presented with complaints of severe constipation, shirashoola, perianal pain, H/o – minor bleeding per rectum only once and colonoscopy shows the impression as Solitary Rectal Ulcer Syndrome. Considering the vitiation of Apana vata, patient was treated with snehana, swedana, Erandamuladi Basti and Gudapichu with Jatyadi taila. This management showed significant result in the above case study, such as relief in parianal pain, straining at defecation, passage of mucus per rectum, bleeding per rectum as well as Healing of an Ulcer in colonoscopy after treatment.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Solitary Rectal Ulcer Syndrome is the most common in young adults and occurs on the anterior rectal wall. It is throughout to result from localized chronic trauma or ischaemia associated with disordered puborectalis function and mucosal prolapse.

The ulcer is seen at colonoscopy and biopsies show a characteristic accumulation of collagen. Symptoms include minor bleeding, mucus per rectum, tenesmus, perianal pain and severe constipation. Treatment is often difficult but avoidance of straining at defecation is very important and treatment of constipation may help or else surgical intervention is the next line of treatment for this condition<sup>1</sup>

The symptomatology of patient suggestive of vitiation of Apana vata due to Purishvaha strotodusthi. In first stage patient was C/o severe constipation(Purishasanga), abdominal distension (Adhamana). Sometimes abdominal pain (Pakwashaya shoola) due to H/o Suppression of natural urges i.e. Vegavarodha<sup>2</sup>. Which in turn leads to severe constipation, perianal pain, mucous per rectum, minor bleeding per rectum etc. and showed the impression as colonoscopy revealed a solitary rectal ulcer syndrome.

Considering Purishavaha Sroto dushti, vitiation of Apana vata and Vegavarodha as main causation, this condition can be correlated with Purisha vegavarodhajanya Udavarta leading to Gudagata vrana.<sup>3</sup> Acharya Sushruta stated the symptoms of Purisha vegavarodhajanya udavarta as Abdominal distension (Adhamana and atopa); severe constipation (Purisha sanga), Perianal pain (Parikartana), Belchings (Urdhwa vata) etc. which may lead to local

**Corresponding Author:- Vd. Deepali Sherekar.**

Address:- Assistant Professor Dept.of Panchakarma, G.A.C. Nanded MUHS Nashik Maharashtra, india.

ulcer formation due to chronic traumatic injury due to severe constipation.<sup>4</sup> Acharya Sushruta stated the treatment of Udavarta with Vata predominance is snehana, swedana and Asthapan Basti.<sup>5</sup>

Erandamuladi Basti was selected for this case which is indicated in Purisha and Vayu graham.<sup>[6][7]</sup> and wound healing procedures described by Sushruta still holds its place today. The faster the wound healing, the faster is the recovery of the patient enabling him to resume his daily routine. So for local application (ropana) Jatyadi taila was selected for Guda-pichu as Guda-gata vrana comes under Sukharopaniya Vrana<sup>8</sup>

### Case Report:-

A 42 years old male patient came Panchakarma OPD of Government Ayurved College, Nanded, Maharashtra, India presented with the complaint of an ulcer on anterior rectal wall associated with severe constipation, perianal pain, mucus per rectum, Sometimes abdominal distension, Pain in calf muscles (Pindikodweshtanam) and H/o minor bleeding per rectum once only – 3 months back.

Before one year patient was alright then, later on he was suffering with severe constipation (Purishasanga), belchings(urdhva vata), abdominal pain (Pakwashaya shoola), Head ache (shirashoola) etc. due to H/o Suppression of urges as past history of medical illness.

After medication, some symptoms were relieved. But since 4 months again patient was suffering with the same symptoms.

### On examination:-

General condition – moderate, afebrile

Pulse rate - 70 / min, Regular

BP – 100/70 mmHg

No H/o HTN/DM/Any major illness/Surgery.

H/o – Suppression of urges due to workload,

H/o - occasionally drinking .

Family H/o Nothing specific.

### Investigation:-

Routine haematology – (Hb, TC, DC, ESR, RBS, Platelet count) and urine investigations were done and were within normal limits.

### Colonoscopy:-

**Rectum:-** Small superficial ulcer with few erosions.

**Impressions:-** Solitary rectal ulcer syndrome

**Biopsy report:-** Non specific mild chronic inflammation. No definitive feature of Solitary Rectal Ulcer Syndrome seen given biopsy.

Patient had received treatment for it but there was no relief in symptoms so came to Ayurvedic hospital for the needful.

As Sushruta has described the treatment for Purishavegavarodhajanya Udavarta and guda-gata vrana is Snehana, Swedana, Asthapan basti and for guda-gata vrana – ropana was planned.

### Treatment Given:-

Patient was treated with Snehana, swedana, and Erandamuladi Nruha Basti and Guda-pichu with Jatyadi taila.

Procedure	Medication	Dose	Duration.
Sarvanga abhyanga	With Muchitaila taila	approx 60 ml	25-30 min per day 8 days
Nadi swedana	Dashamoola Kwatha	-	10-15 min/day for 8 days Twice daily for 8 days
Guda-pichu	Jatyadi taila	3 to 5 ml.	
Pradhan Karma Yoga Basti	Anavasan with Prasarini taila	80 ml	Start with Anvasana Alternate day
	Asthapana with Erandamuladi basti	Approx 480 ml	8 days

## Ingredients of Erandamuladi Basti.

	Drug	Quantity
Honey	Makshika	20 gm
Rocksalt	Lavana	10 gm
Sahachara taila	Sneha	100 ml
Yastimadhu	Kalka	30 gm
Erandamujladi	Kwatha	320 ml
	Approximate	480 ML.

Anuvasan with -> Prasarini taila – 80 ml daily

Niruha -> Kalka -> yasthimadhu – 30 mg

Kwatha -> Erandamoola – 3 parts + Palasha + Laghupanchamoola + Rasna +

Aswagandha + Atibala + Guduchi + Punarnava + Araogawadha + Devadaru – each 1 part & Madanphala – 1 part.

**Preparation:-** The process for preparation was followed as described by Sharangadhara in Hina matra.

**Assesment Criteria:-**

1)	Perianal pain (Parikartanam)	0	-	Absent

Colonoscopy	Solitary ulcer syndrome	Healing rectal ulcer

**Discussion:-**

The symptomatology of Solitary Rectal Ulcer Syndrome denotes the apana vayu dushti due to vegavarodhajanya hetu, again leads to vata prakopa. Severe constipation leads to trauma producing the ulceration at superficial rectal wall.

Basti is the main line of treatment for vataprakopa and Erandamuladi Basti helps in malnirharana and vatunolamana.

Madhu is vranaropaka and used as catalyst. The fatty acids present in honey stimulates peristalsis.

Saindhava due to its sukshma and tikshna property helps the basti dravya to reach up to microcellular level.

- Yashtimadhu helps for vatanulomana and acts as vranaropana.
- Eranda is Kaphavatahara acts as rechana and shoolahara. Palasha as deepana and bhedana, Laghupanchamoola as shothahara and Rasna as amapachana and shoolahara.

Prasarini taila is Kaphavatahara and does vatanulomana. Punarnava is shothhara Ashwagandha as Balya, rasayana, Atibala as balya and brumhana, Argawadha as rechana and Madanaphala and Devdaru as vatanulomana helps Erandamuladi basti to reduce strotorodha.

Prasarini taila also kaphavatahara and does vatanulomana.

So in this case study, patient got relief in perianal pain, constipation, headache, abdominal distension, mucous per rectum and healing of an ulcer was reported in colonoscopy after completion of treatment.

### Conclusion:-

Basti acts through systemic correction and regulation of doshas which involves in the formation i.e. Apana vata dushti in solitary rectal ulcer syndrome.

Erandamuladi Niruha Basti showed very good result in reducing the symptoms as well as in healing the ulcer.

From the above study, it can be said that Erandamuladi Basti and ropana with Jatyadi taila might prove beneficial to the patients with Severe constipation leading to Solitary rectal ulcer syndrome.

It was an attempt made to provide safe and effective management with least expenditure.

 Sheep.

#### Abstract

The deficiency of information and updates related to normal haematological and biochemical parameters study of certain species, such as the case of *Ammotragus lervia* species (Barbary sheep), generates the need for further research in this area. Therefore, in this work were used five animals of the *Ammotragus lervia* species, one male and four females, to the preliminary study of its hematological parameters. All quantitative and qualitative determinations were established by conventional techniques, and used the same techniques of domestic ruminants. Haematological values obtained for the average *Ammotragus lervia* species were: RBC  $13.17 \times 10^6/\text{mm}^3$ ; 14.02 hemoglobin g/100 ml; PCV 42.20%; MCV 32.38 fl; MCH 10.72 pg; MCHC 33.18%; WBC  $9.92 \times 10^3/\text{mm}^3$ ; Basophils 0%; Eosinophils 3%; Band Neutrophils 3%; Segmented Neutrophils 66%; Lymphocytes 27%; Monocytes 1%. In the statistical analysis was determined just the average of the variables, just like standard deviation and confidence intervals, due to the small number of individuals and of inequality between the number of males and females. Standard techniques used in the preparation of haematological exams for the domestic ruminants are effective for *Ammotragus lervia* species. Haematological values obtained for the *Ammotragus lervia* species exhibit a variability regarding the data of hematological values described in the literature. The discoid biconcave format and the smaller size of the red blood cells observed in this study for the *Ammotragus lervia* species are equal to the shape and size of the cells described in the literature for the same species.

#### Introduction:-

Currently, the use of laboratory examinations in veterinary medicine complements the clinical work, as it often can facilitate the observation of some physiopathological changes arising from any illness. The correct evaluation of the physiological state of an animal, the extent of the damage to the tissues and organs and the response of the defense

mechanism of the patient depends directly from the appropriate analysis of the results of laboratory tests, physical examination and clinical history (Coles, 1984; Tibbo et al., 2004).

In the clinical pathology of wild animals field, few studies have been developed, mainly related to hematological and biochemical normal parameters of certain species. There is deficiency of information and many of the available studies in the literature are old or the variables used in this studies, have changed a lot since the preparation of some parameters, as climate, geographic distribution, eating habits and destruction of natural habitats. According to Peinado et al. (1999) there are several studies on the Hematology of Artiodactylas, but these are very incomplete and there are still several gaps in this area.

The species *Ammotragus lervia* (Barbary sheep, Aoudad) of the order Artiodactyla is of African origin, which occurs in Highlands in desert areas and semi-deserts areas of Morocco and Western Sahara to the Egypt and the Sudan (Wilson and Reeder, 2005), is small, with a frizzy hair and both sexes feature a large fringe on throat and chest region extending to the lower parts of the forelimbs. Its coloration varies between the brown sand color, being the lowest parts of moderately clear coloring, features prominent horns, strong and full of pleats, and the horns of adult males are larger and more prominent than the females (Casinello, 1998; Nowak, 1999).

The *Ammotragus lervia* is the wild sheep more common captive-breed, as it is the only one that adapts quickly (Tumbleson et al., 1970; Wallach and Boever, 1983; Jessup, 1999). In addition, there is a great ecological interest in this species, since many of these specimens were removed from their natural habitats and transferred mostly to the Americas with the aim of its use for the practice of sport hunting (Boever, 1986; Nowak, 1999).

The great interesting in the study of *Ammotragus lervia* species is due to the fact that this is considered at risk of extinction, the category of vulnerable species (VU C1) as the IUCN Red List of Threatened Species classification (IUCN, 2016), as well as in Appendix 2 of CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora) (Shackleton, 1997; Casinello, 1998; Nowak, 1999; CITES, 2016).

According to Tumbleson et al. (1970) the *Ammotragus lervia* species has great tendency to the natural occurrence of atherosclerosis and the study of their values of serum biochemical and haematological parameters can help establish this species as model animal for studies of the disease.

This work aims to contribute with preliminary standards haematological parameters for *Ammotragus lervia* species in order to decrease the existing shortcomings in the literature, improving knowledge of data in the area of wild ruminants.

### **Material and Methods:-**

It was studied five animals of the *Ammotragus lervia* species, from the livestock of Rio Zoo Foundation/R.J., one male and four females, clinically healthy.

The females were marked with numbered rings in his ears, and the male did not present any markup. This work was not taken into consideration the age of the animals.

### **Hemogram:-**

From each animal was taken 3 ml of blood sample by external jugular vein puncture using a 5 ml disposable syringe (BD brand) and a disposable needle (25x7) as recommended by Peinado et al. (1999), Tumbleson et al. (1970), Wallach and Boever (1983), Kitchen (1986) and Fowler (2003).

Immediately after venipuncture were made three smears with the blood sample, without any contact with the anticoagulant, and later the blood was transferred to a tube containing EDTA (Vacutainer EDTA 26 BD brand). After the homogenization of the sample with the anticoagulant and air-drying of smears, with their respective IDs, the samples were immediately processed in own laboratory of Rio-Zoo Foundation.

All of the following quantitative and qualitative determinations were established by conventional techniques according to Schalm et al. (1975):

- a) Erythrogram: Red blood cell (RBC - hemocytometer), Hemoglobin concentration (Hb - cyanometahemoglobin – spectrophotometry), Packed cell volume (PCV -microhematocrit). Mean corpuscular volume (MCV), Mean

corpuscular hemoglobin concentration (MCHC), and Mean corpuscular hemoglobin (MCH) were calculated according to the following formula:

$$\text{MCV} = \frac{\text{PCV}}{\text{RBC}} \times 10; \text{MCH} = \frac{\text{Hb}}{\text{RBC}} \times 10 \text{ e } \text{MCHC} = \frac{\text{Hb}}{\text{PCV}} \times 10.$$

- b) Leukogram: white blood cell count (WBC - hemocytometer) and differential leukocyte count, as well as May-Grünwald-Giemsa stain blood smears (MGG) for qualitative analysis of red and white cells (Rullier, 1968).

On statistical analysis of hematological values of the five animals of the *Ammotragus lervia* species was determined only the average of the variables studied, as well as the values of standard deviation and confidence interval (lower and upper limit), due to the small number of individuals and of inequality between the number of males and females, which made it impossible for a more specific statistical survey on the difference between these averages.

### Results:-

It was not necessary the use of tranquilizers on animals of Rio-Zoo Found by the fact that, in addition to these animals are already accustomed to the daily management of their handlers, the speed of the process and the low nuisance which is caused to animals (Fig. 1), offering a final result of the analysis of the material without interference from medication.

**Fig. 1:-** Mechanical restraint of a specimen of the *Ammotragus lervia* species blood collection

In relation to the shape and size of the blood cells of the *Ammotragus lervia* species, it was observed that the red blood cells present a discoid biconcave format in the proportion sizes as the domestic goats and sheep cells.

The individualized results obtained from peripheral blood samples of the five animals of the *Ammotragus lervia* species (Barbary sheep) are described in tables 1 and 2, respectively.

### Discussion:-

It was possible to observe the existence of similarity between the results described in the literature for the *Ammotraguslervia* species, with few differences in relation to some variables for both the highest values of the parameters as to the lower values of the parameters. This is according to Peinado et al. (1999) that report be, the occurrence of these differences, probably due to the effects of climate, captivity, age, methodology used in the preparation of the samples and biological agents as was noted during the preparation of this species.

**Eritrogram:-**

The results determined on this study show average values for Red blood cells (RBC) ( $13.17 \times 10^6/\text{mm}^3$ ) were lower compared to the values reported by Tumbleson et al. (1970) and Huisman et al. (1968), respectively  $15.27 \times 10^6/\text{mm}^3$  and  $17.32 \times 10^6/\text{mm}^3$ .

The values for the limits of the confidence interval for Red Blood Cells (RBC) obtained in this work ( $10.90$  to  $15.44 \times 10^6/\text{mm}^3$ ) were lower than those found by Tumbleson et al. (1970) studying the blood samples of twenty-one copies of *Ammotragus lervia* ( $11.25$  to  $23.42 \times 10^6/\text{mm}^3$ ), despite the average value ( $13.17 \times 10^6/\text{mm}^3$ ) of this work is within the confidence interval reported by the authors.

Haematological values obtained for Red Blood Cells (RBC) on this work for the *Ammotragus lervia* species present significant difference compared to haematological values described by Kitchen (1986) and Fowler (2003), both for the higher values and the lower values. The values found by the authors for the average and the limits of the confidence interval of RBC are much smaller ( $5.8 \times 10^6/\text{mm}^3$  –  $5.38$  to  $6.2 \times 10^6/\text{mm}^3$ ) in relation to the same variables of this study ( $13.17 \times 10^6/\text{mm}^3$ - $10.90$  to  $15.44 \times 10^6/\text{mm}^3$ ), including the average value ( $13.17 \times 10^6/\text{mm}^3$ ) obtained in this work are within the limits of the confidence interval described by two authors ( $5.38$  to  $6.2 \times 10^6/\text{mm}^3$ ).

For the hemoglobina values, the present research found ( $14, 02 \text{ g/dl}$ ), lower value compared to the values reported by Huisman et al. (1968) ( $15, 3 \text{ g/dl}$ ) and Tumbleson et al. (1970) who found  $14.3 \text{ g/dl}$ , for 21 animals, but within the limits of the confidence interval of the same ( $11.7$  to  $16.2 \text{ g/dl}$ ), established by Tumbleson et al. (1970). However, the value determined in this study was higher than the values found for Peinado et al. (1999), Wallach and Boever (1983), Kitchen (1986) and Fowler (2003).

The average Packed Cells Volume (PCV) of this work ( $42.20\%$ ) was higher than the average PCV obtained by Tumbleson et al. (1970) in 21 animals of *Ammotragus lervia* ( $41.25\%$ ) species, and than Wallach and Boever (1983), Kitchen (1986), Peinado et al. (1999) who studied six specimens, and Fowler (2003) and than Huisman et al. (1968) in four animals. As to the limits of the confidence interval found on this work ( $34.54$  to  $49.86\%$ ), the upper limit was above those found by Tumbleson et al. (1970) and Wallach and Boever (1983) which was  $47.5\%$ , and for Kitchen (1986) and Fowler (2003) who found  $37.2\%$ , as Peinado et al. (1999) which registered  $46.0\%$ .

On the other hand, the value of the lower limit of the confidence interval of the PCV obtained by the work ( $34.54\%$ ) is higher than that found by Tumbleson et al. (1970) and Wallach; Boever (1983) ( $32.3\%$ ) and Peinado et al. (1999) which registered  $22.5\%$  and lower than the value reported by Kitchen (1986) and Fowler (2003) ( $35.7\%$ ).

The same occurs with the values of the Mean Corpuscular Volume (MCV) obtained at this work which are higher ( $32.38 \text{ fl}$ - $25.87$  to  $38.89 \text{ fl}$ ) then the values reported by Huisman et al. (1968) ( $27.3 \text{ fl}$ - $18.1$  to  $34.9 \text{ fl}$ ), but the average value ( $32.38$ ), is within the limits of the confidence interval described by the authors.

About the values obtained for Mean Corpuscular Hemoglobin (MCH) on this work, the values of the averages and the lower limit of the confidence interval were higher ( $10.92 \text{ pg}$  and  $8.55 \text{ pg}$ ) than Tumbleson et al. (1970) and Wallach and Boever (1983) that were  $9.6 \text{ pg}$  for the average and  $6.2 \text{ pg}$  for the lower limit, and Peinado et al. (1999) which were, respectively,  $9,79 \text{ pg}$  and  $8,51 \text{ pg}$ . The value of the upper limit of the confidence interval found in our research ( $12.89 \text{ pg}$ ) was similar to Tumbleson et al. (1970), which featured  $12.3 \text{ pg}$ , but higher than Peinado et al. (1999) which was  $10, 7\text{pg}$ .

Finally, analyzing the results obtained for the values of the Mean Corpuscular Hemoglobin Concentration (MCHC) by Tumbleson et al. (1970) for the average and for the upper limit of the confidence interval ( $35.2\%$  and  $36.7\%$ ) and by Peinado et al. (1999), respectively ( $39.1\%$  and  $44.8\%$ ) that are higher than the values of this work ( $33.18\%$  and  $33,26\%$ ) and the value for the lower limit of the confidence interval found by Tumbleson et al. (1970) ( $32.8\%$ ) is lower than the value of the MCHC of this work ( $33.10\%$ ), but within the limits of the confidence interval ( $32.8$  to  $36.7\%$ ) reported by the same authors. However, Peinado et al. (1999) determined higher value ( $35.6$ ) and, in this case, our value is outside the confidence interval.

**Leucogram:-****White blood cells:-**

The value for the White blood cells (WBC) obtained for the upper limit of the confidence interval of five animals of *Ammotraguslervia* species ( $9.92 \times 10^3/\text{mm}^3$  and  $12.11 \times 10^3/\text{mm}^3$ ) on this study were below the values reported by Tumbleson et al. (1970), for twenty-one animals of *Ammotraguslervia* species, that was  $11.2 \times 10^3/\text{mm}^3$  for average and  $17.0 \times 10^3$  to  $5.21/\text{mm}^3$  for confidence interval, lower, too, that was published by Kitchen (1986) and Fowler (2003) ( $92 \times 10^3/\text{mm}^3$  13.2 and  $14.8 \times 10^3/\text{mm}^3$ ), but were higher when compared with the findings of Peinado et al. (1999) working with six animals ( $3.70 \times 10^3/\text{mm}^3$  and  $6.0 \times 10^3/\text{mm}^3$ ).

Although the value obtained for the lower limit ( $7.73 \times 10^3/\text{mm}^3$ ) of the confidence interval, in this work is higher than the value obtained by Tumbleson et al. (1970) to the lower limit ( $5.21 \times 10^3/\text{mm}^3$ ) and Peinado et al. (1999) ( $1.85 \times 10^3/\text{mm}^3$ ), but lower than the values quoted by Kitchen (1986) and Fowler (2003) that was  $11.6 \times 10^3/\text{mm}^3$ .

**Differential leukocyte count:-**

During the study of the differential leukocyte counts for *Ammotraguslervia* species values obtained for Segmented Neutrophils were average of 66% and for its limits of the confidence interval 53% to 79%, values similar to those described by the authors Peinado et al. (1999), Tumbleson et al. (1970), Wallach;Boever (1983), Kitchen (1986) and Fowler (2003).

The study on the values of the Band Neutrophils for *Ammotraguslervia* species in five animals evaluated in this research had as 3% average and the limits of the confidence interval of 1 to 8%. Peinado et al. (1999), Tumbleson et al. (1970), Wallach;Boever (1983), Kitchen (1986) and Fowler (2003), in its publications, did not report any value for the Band Neutrophils.

The values described by the authors Peinado et al. (1999), Tumbleson et al. (1970), Wallach; Boever (1983), Kitchen (1986) and Fowler (2003) for Lymphocytes to *Ammotraguslervia* species are quite similar to the values obtained for this variable in this study (27%). However, when we compare the results of the values of the literature consulted, we found that the values of Peinado et al. (1999) are higher (43.45%) than the values of others.

The results obtained for Monocytes to *Ammotraguslervia* species of five animals in this work for the average (1%) and for the limits of the confidence interval (0-3%) are similar to values reported by Peinado et al. (1999), Tumbleson et al. (1970), Wallach; Boever (1983) although Kitchen (1986) and Fowler (2003) did not report any value for this variable in their work to the same species.

The values determined for Eosinophils to *Ammotraguslervia* species, by Peinado et al. (1999), Tumbleson et al. (1970), Wallach; Boever (1983), Kitchen (1986) and Fowler (2003) are similar to the values found in this work for the average (3%) and to the limits of the confidence interval (1 to 6%) for the five animals of *Ammotraguslervia* species in this work, having only just above the upper limit of the values described by the authors.

The result given to the values of Basophils to *Ammotraguslervia* species in this work was 0%, which is consistent with the results reported to the values of Basophils by Peinado et al. (1999), Tumbleson et al. (1970), Wallach; Boever (1983), Kitchen (1986) and Fowler (2003) did not determined any value for this variable.

**Conclusions:-**

The results obtained in this study are likely to minimize the difficulties faced by Veterinarians who specialize in wildlife, and technicians who work in Zoological Parks. The continuation of research not only with haematological parameters, but also with biochemical, enzymological and genetic studies that in future will provide subsidies for a better evaluation of the sick animals of this *Ammotraguslervia* species, particularly regarding the vulnerabilities of the species to diseases that before had no contact, including zoonoses, that concerns of the human population and public health.

#### Abstract

**Background:** Acute mesenteric ischemia is a syndrome caused by inadequate blood flow through the mesenteric vessels, resulting in ischemia and eventual gangrene of the bowel wall; it is a potentially life-threatening condition. This study aimed to identify the specificity and sensitivity of using lactic acid serum level in early detection of bowel ischemia.

**Method:** This is a retrospective study conducted at King Abdulaziz University Hospital from August to October, 2016, enrolled all patients admitted with diagnosis of acute mesenteric bowel ischemia.

**Result:** Out of the 192 cases included in the study, 54.2% of them were males, and 45.8% were females, with mean age score  $60.9 \pm 17.3$ , 46 patients (24%) were positive for bowel ischemia and 21 cases out of them (45.7%) had an operative notes Correlated with CT findings. 2 (1%) cases had no correlation with CT findings, and the rest reported no operation. Less than quarter 44 patients (22.9%) reported suffering from only bowel Ischemia without any risk factors or comorbidity, while 34 patients (17.7%) reported a coexisting several risk factors and other diseases. Approximately 107 patients (55.7%) had high lactic acid level. There was significant relation between lactic acid rang and CT scan findings where more than two third of the cases with positive CT had high lactic acid level (69.6% high vs 30.4% normal,  $p=0.02$ )

**Conclusion:** Further studies are needed to be conduct on the base of serial measurements of lactic acidosis and on a base combining serum lactate with other biomarkers such as intestinal fatty acidbinding protein to increase the accuracy of diagnosis.

#### Introduction: -

Acute mesenteric ischemia (AMI) define as " syndrome caused by inadequate blood flow through the mesenteric vessels, resulting in ischemia and eventual gangrene of the bowel wall". Although relatively rare, it is a potentially life-threatening condition (1). There are several diseases related to AMI such as acute arterial mesenteric ischemia, acute venous mesenteric ischemia, non-occlusive mesenteric ischemia, ischemia/reperfusion injury , ischemic colitis (2).

Address:-Faculty of Medicine, King Abdulaziz University, Jeddah ,Saudi Arabia.

There is high mortality rate due to AMI, ranging between 50–90%, early diagnosis and treatment are essential to improve the outcome of Acute mesenteric ischemia (AMI) accounts for about 1:1000 acute hospital admissions. Untreated, AMI will cause mesenteric infarction, intestinal necrosis, an overwhelming inflammatory response and death, Early diagnosis and prompt treatment are the goals of modern therapy, but there are no randomized controlled trials to guide treatment and the published literature contains a high ratio of reviews to original data. Much of that data comes from case reports and often small, retrospective series with no clearly defined treatment criteria. (3)

Acute bowel ischemia has a wide range of possible clinical and pathological presentations since it can be caused by a variety of different conditions and presents with various clinical and radiological findings. Therefore, it may easily be missed or misinterpreted initially. (4) primarily because the diagnosis is usually based on nonspecific clinical symptoms. In spite of massive tissue necrosis, clinical symptoms are often atypical or lacking, many researchers have attempted to find a simple laboratory test that could identify ischemic bowel before irreversible damage occurs. (5)

Catheter angiography is unequivocally the gold standard imaging modality for the evaluation of AMI, However, it is invasive, expensive and time consuming, Color Doppler is also another helpful diagnostic tool but may be technically difficult in patients with AMI due to bowel gas. The introduction of spiral Computed Tomography (CT) improved the ability of CT to image the mesenteric vessels and the bowel wall but it still was not sensitive (64%) for the early detection of AMI. (6)

Many potential serological markers have been investigated over the last decades, and several clinical reviews have been published. In general, these reviews are narrative, prone to the selection bias, and do not provide a comparison of diagnostic accuracy. (7)

The performance of the currently available serological markers is suboptimal for routine clinical use, but novel markers of intestinal ischemia such as D-lactate, glutathione S-transferase (GST), and intestinal fatty acidbinding protein(I-FABP) may offer improved diagnostic accuracy. (8)

Traditionally, the serum marker which clinicians frequently rely on is serum lactate. Still, the discrepancy between the common usage of serum lactate and the certainty of diagnosing acute mesenteric ischemia is extremely wide. The ideal marker for acute mesenteric ischemia should therefore not only have a higher sensitivity and specificity, but – most importantly – also enable earlier diagnosis. (9)

Several studies were conducted to investigate the relation between serum lactate and acute mesenteric ischemia, where the results showed that the level of no single serum marker, including serum lactate, is elevated early and specifically enough in the serum to diagnose acute mesenteric ischemia. (7,8)

Since that early diagnosis of intestinal ischemia remains a challenge, a further research is required to identify improved serological markers and to demonstrate their clinical utility in the individual patient (6) Our aim in this study is to identify the accuracy of using lactic acid in for early detection of bowel ischemia.

### **Methodology: -**

This was a retrospective study conducted at King Abdul-Aziz University Hospital from August to October, 2016, enrolled all patients admitted with diagnosis of AMI (all types). The study protocol was reviewed and approved by King Abdul-Aziz University Hospital Health and Research Ethics. Inclusion criteria: patients aged more than 18 who underwent CT abdomen and pelvic without/with IV contrast and serum lactic acid to rule out bowel ischemia. The exclusion criteria include incomplete CT abdomen or missing serum lactic acid data. A total of 227 files were reviewed during the period, and only 192 files matching the inclusion criteria and enrolled in the study, while the rest were excluded for several reasons, 2 cases were less than the age of 18, and 33 cases hadn't complete information of serum lactic acid level. The Data were retrieved from patients' files and radiology PACS system using a data collection sheets included patient (age, gender, CT findings, operative notes, affected segment, type of bowl ischemia, duration of symptoms, other chronic illness, lactic acid level, examination time).

### **Statistical analysis:-**

The collected data were analyzed using the SPSS statistical software package, version 20. Parametric data are presented as mean and standard deviations (minimum and maximum) and categorical data were presented as number

(percentage). Relation between lactic acid range and other categorical variables was made using Chi – square test. Pearson's correlation between lactic acid and age was done.  $P$ -value  $<0.05$  was considered significant.

### Results: -

Out of the 192 cases included in the study, 54.2% of them were males, and 45.8% were females, with mean age score  $60.9 \pm 17.3$  range (20-96) years. (Table 1 & Figures 1 & 2)

More than threequarter of CT scan reports 146 patients (76%) were negative for bowel ischemia and other diagnosis such as inflammatory bowel disease and infectious colitis were confirmed, while 46 patients (24%) were positive for bowel ischemia, from these cases 21 (45.7%) had operative notes Correlated with CT findings. Only 1 patient (2.2%) had no correlation with CT findings, and the rest reported cases did not undergo an operation. (Tables 2 & 3 & Figures 3 & 4)

Regarding affected segment, type and symptoms duration, the majority of the cases 146 patients (76%) reported no evidence of bowel ischemia while only 37 patients (19%) reported multiple affected segments, on the other hand several types were reported in this study with different rate, 17 patients (8.9%) reported as (Non occlusive intestinal ischemia.), follow by 9 patients (4.7%) with chronic intestinal ischemia and 12 patients (6.2%) are seen in acute superior mesenteric artery occlusion & acute superior mesenteric vein occlusion. There are more than two third of the patients 133 patients (67.8%) had the symptoms for less than 1 week, followed by 25 patients (12.8%) cases had the symptoms for 2 weeks to 1 month. (Tables 4, 5 & 6 & Figures 5, 6 & 7)

Less than quarter 44 patients (22.9%) reported suffering from only bowel Ischemia without any other diseases, while 34 patients (17.7%) cases reported suffering from several comorbid diseases, 15 patients (7.8%) cases reported organ failure, 12 patients (6.35%) cases had lower limb ischemia. 22 patients (11.4%) divided equally between Other causes of acute abdomen & Malignancy of other organs. There are 14 patients (7.2%) divided equally between cholecystitis & bowel obstruction., and only 4 patients (2.1%) had Cholelithiasis. (Table 7 & Figure 8)

Regarding lactic acid and INR ranges and day & night shifts at the time of the diagnosis, more than half (107-55.7%) had high lactic acid level and almost half had high INR range (95- 49.5%), in respect to the shifts 122 (63.5%) cases reported positive during day shift while 70 (36.5%) cases reported positive during night shift. (Tables 8 & 9 & Figures 9, 10, 11 & 12)

There was significant relation between lactic acid range and CT scan findings where more than two third of the cases with positive CT had high lactic acid level (69.6% high vs 30.4% normal,  $p=0.02$ ), also there was significant relation between lactic acid range and type ( $p=0.03$ ), on the other hand the results showed high level of lactic acid among male than female, and also among patients who had duration of symptoms less than one week rather than patients who had the symptoms for almost a month with no significant difference. (Table 10)

Pearson correlation showed non-significant positive correlation between lactic acid and age.

**Discussion: -**

AMI consists of two varied pathophysiological existence diagnostic & treatment , while the treatment consist of instrumental arterial reperfusion and resection of necrotic bowel segments, still the diagnosis had several challenges & difficulties due to the fact that patients could be admitted to the ER without specific symptoms of abdominal pain , (2,10) In two thirds of the cases the cause of intestinal ischemia were "arterial embolism or thrombosis with blood flow impairment in the superior mesenteric artery (SMA) distribution affecting all or portions of the small bowel and right colon" which increase CT-scandisparity , (2)

The fact that there is diagnostic uncertainty regarding variety in the results of symptoms, laboratory tests, and radiological imaging demonstrate the essential need to find an early dependable diagnostic tool in order to diagnoseintestinal ischemia as soon as possible to reduce the mortality rate motivate a lot of researchers to investigate more and more to find this tool. A study conducted in 2009 by Evennett et al, the authors recommended the use of serological markers such as D-lactate, GST, andI-FABPand study their accuracy in diagnosis (2,11)

Where the pathophysiology of acute mesenteric ischemia is the decreasing in mesenteric blood flow which induce cells dying, these necrotic cells in the gut wall release chemical substances to the blood , by detecting these substances which serum lactate is one of them , doctors could diagnose acute mesenteric ischemia early, however this hypothesis didn't take to the account the other causes of increasing serum lactate level such as damaged liver or kidney function in sepsis and shock, agents that can uncouple oxidative phosphorylation ( toxins, drugs) or underlying disorders change lactate metabolism (congenital mitochondrial disorders, diabetes, malignancies). (7)

several studies (case series, experimental and prospective) since 1970s conduct to investigate the effectiveness of using serum lactate levels changes as a reliable biomarker of AMI. (12,13)

One of the early case series study to detect the relation between high serum lactate level and AMI was the study of Janda et al in 1984 followed by Nutz and Sommer study in 1987, where the author of both studies demonstrated increasing in the level of serum lactate among AMI patients and explained that by the increasing in demands of blood and oxygen by intestine and increase the depending on anaerobic metabolism causing acidosis and a serum lactic acid increase (lactacidemia), however both studies didn't include time factor between onset of ischemia and time of diagnosis. (7,14,15.) On the other hand, in USA study the authors addressed several factors influence the effectiveness of the markers: site, amount, releasing mechanism, separating from the serum and specificity for the intestine. (16) These kinds of studies continue during the 21<sup>st</sup> century where some studies confirmed the relation and others didn't confirm the relation. (17,18)

Several experimental studies were conduct with debatable findings and without providing conclusive evidences of the efficacy of using serum lactate level as marker for AMI, in study on rabbits by Nutz et al, the authors observed increasing in the level of serum lactate among the subjects with occlusion of the superior mesenteric artery, these results couldn't be confirmed in 1995 study on pigs conducted by Schlichting and Lyberg, (19,20) In addition to that several experimental studies during the first decade of 21<sup>st</sup> century concluded that serum lactate level is not a specific and early diagnostic marker for AMI. (13,21,22)

Several prospective clinical studies on lactate levels and acute mesenteric ischemia were conduct, from these studies the two studies conduct 1994 and 1997 by Lange and Jackel and also Lange and Toivola where the authors concluded that even with the high sensitivity of serum lactate the specificity was low which mean that doctors couldn't rely on serum lactate as specific markers. (7,23,24), during the last few years the number of prospective studies comparing the accuracy of several biomarkers were increased and demonstrated the fact that that none of the using biomarkers had the level of accuracy to be used alone as diagnostic markers. (25,26), in 2015 a study was conduct to assess the accuracy of repeated measurement of serum lactate as a marker and the authors reported that there are several factors influenced this accuracy. (12) The results of current study consistence with previous study results that serum lactate is not accurate as the doctors want and need to be combine with other markers to diagnose AMI, however still a lot of doctors rely on serum lactate as diagnostic tool due to the facts that there is no good biomarkers could replace it, it is easy to measure in any laboratory hospital and easy to repeat it. (7,12)

During 2009 Evennett et al conduct a comparative analysis study of all major serum markers of acute mesenteric ischemia and they demonstrated D-lactate as the best markers, (6,7) after that in 2015 study conducted by the authors reported that the D-lactate is a good markers for sever cases with high level of specificity, and recommend to combine it with I-FABP which has high sensitivity and low specificity. (11)

### **Conclusion: -**

In the second decade of 21<sup>st</sup> century, still there is a serious difficulty to find dependable diagnostic biomarker to diagnose acute mesenteric ischemia in early stage, this fact led doctors to rely on serum lactate level as a marker of acute mesenteric ischemia even that the evidence showed that it is unspecific marker for early detection. However, this study depends on measuring lactate level of one time only, further studies need to be conduct on a base of serial measurements of lactic acidosis and on a base combining serum lactate with other biomarkers to increase the accuracy of diagnosis.

##### Key words:-

Pulmonary Tuberculosis, Tubercular Endometritis, Histopathology, Z-N staining AFB .

#### Abstract

##### Background:-

After tuberculosis has been declared as Global emergency it has reawakened the interest of doctors. Genital Tuberculosis has been a subject of keen interest because it has impact on female infertility. Here this study aims at to study the Histo-pathological outcome of endometrial biopsy in diagnosed cases of Pulmonary Tuberculosis.

##### Methods:-

62 females Cases of diagnosed PTB of age Group 15-45 years having history of genital tuberculosis were enrolled in this study. The endometrial tissues of each patients collected and subjected to Histo-pathological examination and wherever required for bacteriological examination i.e. Z-N staining for AFB.

##### Results:-

Among 62 patients, highest incidence (59.68%) belong to 21-30 years age group and presented with in 1<sup>st</sup> year of development of PTB. Secondary amenorrhea, list of vaginal discharge and cervical erosion were observed in 24.19% and 25.81% of cases respectively, Eight (8) cases (12.90%) had histological finding of chronic endometritis. Out of them Four (4) cases (6.45%) were AFB positive on Z-N staining of endometrial tissue.

##### Conclusion:-

Endometrial tuberculosis though rare in pulmonary tuberculosis cases, bacteriological and histo-pathological examination of endometrial tissue should be done for early diagnosis and treatment.

#### Introduction:-

The World Health Organization in 1993 declared tuberculosis, a common infectious disease in the Indian subcontinent, as "a Global emergency". (Talib et al, 1993) India, the world's second most populous country, accounts for a quarter of the world's annual incidence of TB. Every year, around two million people develop TB in India and 300,000 die of TB. Over 15 million patients have been treated and three million cases were cured in last decade. (VK Arora et al 2017, MOHFW, Govt of India, 2017). Endometrial tuberculosis though rare in developed countries it is still common in developing and poor countries. (Khan Nawaz, 2005) It is almost secondary to a primary focus elsewhere in the body. Fallopian tubes are commonly the initial site of involvement and is affected

mostly. (Nabamber, 2001) From primary site of tubercular infection it spreads to genital tract initially to the tubes and in most cases through the blood stream. (Kajal B Punyashetty, 2012) Female genital tuberculosis accounts to be 5–15% of infertility cases among Indian women. (Kriplani et al 2017) In India, the incidence of genital tuberculosis in infertility has been reported in 19% cases and among them 41% have tubal cause. (Tripathy and Tripathy 2002) As genital tuberculosis has a tremendous impact on the reproductive health in our country, in present scenario it has been a subject of keen interest. Many studies have been undertaken in this context (Kemal Güngördük, 2007). With this background this study aimed to find out the histopathological features of endometrium of infertility cases associated with pulmonary tuberculosis, so that early diagnosis and treatment with anti-tubercular drugs may be helpful in patients of genital tuberculosis.

### **Materials and Methods:-**

This observational study was carried out from 2013 to 2016 in the department of Pulmonary Medicine in collaboration with department of Obstetrics and Gynecology at a tertiary care hospital of Odisha. The ethical clearance was obtained from Institutional Ethics Committee. Written informed consent form was obtained from all the willing participants fulfilling the inclusion criteria. (Jai B Sharma et al, 2014)

As per the inclusion criteria, 62 females in the reproductive age group (15-45 years) diagnosed as pulmonary tuberculosis (RNTCP, 2012) along with some gynecological problems who were on with or without anti-tubercular treatment were enrolled. The gynecological problems included amenorrhoea, menorrhagia, dysmenorrhoea and other menstrual irregularities. The females with primary or secondary infertility cohabiting with their husbands were also included. (Kriplani et al 2017) The women with extrapulmonary tuberculosis and genital infection with other non tubercular infection were excluded from the present study.

A detailed history was undertaken and general physical examination; respiratory system as well as pelvic examination was carried out on all subjects. Pervaginal examination was performed on all women to observe any abnormality in vagina, cervix and uterus or adnexal mass if any. In all selected subjects the endometrial samples were taken for microscopic examination for AFB and histopathological examination. The patients were kept on antitubercular treatment under RNTCP.

The basic characteristics, clinical findings, radiological observations and laboratory data were noted in a case record form. The data were analysed using MS Excel.

### **Results:-**

Among total 62 women with pulmonary tuberculosis in the study sample, 59.68% (n=37) were in the age group of 21-30 years. (Table-1) Among them 51.61% (n=32) had far advanced pulmonary lesion on chest X-ray (radiological status, table-2) As mentioned in table-3 the menstrual irregularities in most of the women were secondary amenorrhoea (48.39%; n=30) However menorrhagia and irregular cycle were two other commonest presentations next to secondary amenorrhoea observed in 16.13% (n=10) and 14.52% (n=9) patients respectively. Dysmenorrhoea was also one of the complain in 6.45% (n=4) patients. Maximum number of the study population presented with secondary amenorrhoea were in the first year of development of pulmonary tuberculosis. (0-6 months: n=9 and 7-12 months: n=14) The women with irregular cycle were also observed within 0-6 months (n=6) and 7-12 months (n=2).

On per vaginal examination the vaginal discharge was observed in 24.19% (n=15) of patients. Cervical lesion including erosion (25.81%; n=16) and ulceration (12.09%; n=8) were also noted. (Table-4) The uterine size was normal in 25.81% (n=16) and small in 16.13% (n=10) females. Adnexal mass was also found in 9.68% (n=6) women. (Table-4)

In our study population, the maximum histological pattern with the proliferative endometrium was observed in 38.71% (n=24) females. The secretory endometrium was seen in 25.81% (n=16) women. When the endometrial tissues of both histological patterns were subjected for Z-N staining for AFB, all were found to be negative. (Table-5) The endometrial reaction is said to be present when there is local infiltration of lymphocytes intermingling with stroma or well defined lymphocytic aggregation or presence of plasma cells. In this study 12.90% (n=8) cases were taken as chronic endometritis due to endometrial reaction. In histopathological examination of endometrium, the non caseating granuloma and caseation alone were taken as the surest evidence of tubercular endometritis. 4 cases (6.45%) showed evidences of tubercular endometritis on histopathological examination and were also found to be

AFB positive on Z-N staining of endometrium. All cases of histologically proved endometritis occurred within 1 year of development of symptoms of pulmonary tuberculosis.

**Table No. I :-** Distribution of cases according to age groups

Age in Years	No. of cases	Percentage
15-20	10	16.13

**Discussion:-**

Pulmonary tuberculosis is a communicable disease usually involves the lungs but may involve the other organs particularly genital organs though rare. Genital TB occurs mostly secondary to pulmonary tuberculosis, commonly spreads by the haematogenous route in a manner similar to spread to other extra-pulmonary sites like urinary tract, bones and joints etc. The fallopian tubes are affected in almost 100% of the cases of genital tuberculosis followed by the endometrium in 50%, ovaries in 20%, cervix in 5% cases. Also vagina and vulva are other commonly involved sites. (Weerakalet et al, 1999) Endometrial tuberculosis though uncommon, still an important clinical entity in developing countries like India. (Hassimoto A et al, 1994, Haider P et al, 1992, Hunter B et al, 1998, Jhon M et al, 1999)

In the present study, it was observed that 59.68% patients of pulmonary tuberculosis associated with gynaecological problems were in the age group of 21-30 years. Our study observations corroborate with that of Nawaz et al, 2005 who reported the TB endometritis is more common in the reproductive age group mostly between 20-45 years.

In this study sample, the commonest menstrual disorder was observed to be secondary amenorrhoea (48.39%) and the patients had it in the first year of development of pulmonary tuberculosis. Menorrhagia was another symptom which was found in patients with far advanced lesion of lungs in pulmonary tuberculosis (16.13%) and dysmenorrhoea in 6.45% of cases. In an earlier study, Samal *et al.* reported that the patients of genital TB had oligomenorrhoea in 54%, menorrhagia in 19.0%, and amenorrhoea in 14.3% of cases.

Histopathological observations of endometrial tissue in our study revealed proliferative endometrium in 38.71% cases but when these endometrium were subjected to Z-N staining for AFB, came out to be negative. The endometrial tissue obtained in secretory phase (25.81% of cases) and chronic endometritis (12.90% cases) were also negative for AFB in Z-N staining. Tubercular endometritis was seen in 6.45% of cases and all these endometrium obtained in these females were bacteriologically positive for AFB in Z-N staining. But in the study of Butt et al., 2003. microscopic examination by Z- N staining revealed absence of AFB in all endometrial tissues even in a larger sample size.

**Conclusion:-**

As endometrial tuberculosis is one of the causes of infertility and other gynecological complications, the bacteriological examination of endometrium with Z-N staining for AFB should be done along with histopathological evaluation for early diagnosis. As tuberculosis is amenable to modern drug treatment, the importance of early diagnosis becomes more relevant.

**Acknowledgement:-**

#### Abstract

Undoped and the impact of amino acid dopants such as L-Glutamic acid (LGA), L-Asparagine (LAS) and L-Serine (LS) on the growth process and properties of potassium hydrogen phthalate (KHP) single crystal by slow evaporation solution growth technique have been examined. The unit cell parameters of the grown crystals have been affirmed by means of single crystal X-ray diffraction analysis. The crystallinity of the title materials was examined by powder X-ray diffraction. The FT-IR spectral studies identify the presence of expected functional groups of the grown crystals. The optical transmission of the grown crystals has been recorded using UV-Vis spectral analysis. The thermal stability of the grown crystals has been analyzed by TG-DTA studies. Microhardness mechanical studies show that hardness number increases with the load for the grown crystals by Vickers microhardness method. The nonlinear optical (NLO) properties were analyzed utilizing Kurtz and Perry powder technique.

#### Introduction:-

Alkali metal hydrogen phthalate crystals which includes Potassium hydrogen phthalate (KHP) or Potassium acid phthalate (KAP), Sodium hydrogen phthalate (NaHP) or Sodium acid phthalate (NaAP), Rubidium acid phthalate (RbAP), Cesium acid phthalate (CsAP) and Lithium acid phthalate (LiAP) are semi-organic materials extensively recognized for their utility in the long-wave X-ray spectrometers and requirements within the volumetric analysis [1].

Currently, for a deposition of thin films of organic nonlinear materials, alkali metal hydrogen phthalate crystals have been hired as substrates. Specifically, a single orientation of thin poly (diacetylene) films is prepared by epitaxial growth on organic crystals consisting of alkali metal salts of phthalate and having a lower degree of symmetry than alkali halides [2] and those crystals are crystallized as noncentrosymmetric rhombic structures. Crystals of alkali metal hydrogen phthalates have covalent (intramolecular), ionic (cation-anion), Van-der Waals (among neighboring molecules) and intermolecular hydrogen bonds O-H...O (H-bonds among anions in chains) and for this reason they may be ascribed to strong H-bonds for which might be feasible the fermi-resonance interactions of stretching vibrations  $\nu(\text{O-H})$  with combinations of bending in-plane ( $\beta(\text{O-H})$ ) and out-of-plane ( $\gamma(\text{O-H})$ ) vibrations due to intraanionic anharmonicities.

Potassium hydrogen phthalate (KHP) are widely hired in the subject of x-ray spectroscopy as a monochromator and additionally as an analyzer. KHP exhibits pyroelectric, piezoelectric, elastic, nonlinear optical (NLO) properties, elasto-optic [3] and electro-optical studies on a sequence of alkali substituted hydrogen phthalate crystals which included it [4] and it crystallizes in an orthorhombic crystal structure with space group  $Pca2_1$  [5]. KHP has platelet morphology with perfect cleavages alongside the (010) plane. The usage of the periodic bond chain evaluation, the morphology of KHP has been decided [6]. Presently, for the growth of highly oriented thin films of conjugated polymers with nonlinear optical susceptibility, KHP crystals have been hired as substrates [7,8]. KHP is taken as the model compound due to its well-evolved surface pattern on the (010) face inclusive of high and very low growth steps which can be distinct without difficulty located by using optical microscopy [9,10] and it is extensively hired as Q-switches for Nd:YAG, Nd:YLF, Ti:Sapphire and Alexandrite lasers. In view of this, a series of crystalline salts of amino acids doped KHP have been investigated [11-15]. In this manuscript, single crystals of amino acids doped KHP were successfully obtained by introducing additives inclusive of LGA, LAS and LS adding in pure KHP solution. The crystal structure of the grown crystals has been confirmed by single crystal X-ray diffraction analysis and the grown crystals were characterized by various instrumentation techniques such as powder X-ray diffraction (PXRD) analysis, spectral, optical, thermal, mechanical and NLO analysis in order to check its suitability for device fabrications. An attempt was made to impact of amino acids dopant single crystals in the pure KHP and their characterizations.

### Experimental details:-

All high-purity commercially available reagents have been purchased and used without in addition purification. The commercially obtainable raw material of Potassium hydrogen phthalate (E-Merck) and L-Glutamic acid (E-Merck), L-Asparagine (E-Merck) and L-Serine (E-Merck) were used to synthesize the grown crystals. The double distilled water was used to prepare the aqueous solution of the grown crystals. The calculated amount of pure KHP is first dissolved in double distilled water and stirred continuously for 4 hours to yield a homogenous solution. After filter the solution by Whatman filter paper, it was kept in temperature controlled water bath (accuracy  $\pm 0.1^\circ\text{C}$ ) by means of slow evaporation at ambient temperature. After a span of 21 days, the crystal with good transparency and well-defined shape were harvested shown in the Fig. 1a.

**Figure 1:-** As grown crystals of (a) Undoped KHP (b) LGA doped KHP crystal (c) LAS doped KHP crystal (d) LS doped KHP crystal

Amino acids doped KHP crystals were obtained by the calculated amount of 0.5 mole % of LGA, LAS and LS were slowly dissolved separately using different beakers in the pure KHP solution. The reactants have been stirred continuously for 4 hours to yield a homogenous mixture of the solution. The prepared solutions were filtered through Whatman filter paper. To grow the crystal of high quality, the prepared solutions were kept in the temperature controlled water bath. In the course of the slow evaporation, well-defined, colourless single crystals of LGA doped KHP, LAS doped KHP and LS doped KHP with good transparency were obtained in the duration of 32 days, 34 days and 37 days respectively. The photograph of the as-grown crystals is shown in Fig. 1b, Fig. 1c and Fig. 1d.

### Results and Discussion:-

#### Single crystal X-ray diffraction:-

The single crystal XRD data of the grown crystals have acquired using an ENRAF NONIUS CAD 4 diffractometer with  $\text{MoK}\alpha$  radiation ( $\lambda=0.71073 \text{ \AA}$ ) to identify the unit cell parameters. The grown crystals crystallize in an orthorhombic symmetry with a space group of  $Pca2_1$ . The obtained unit cell parameters for undoped and amino

acids doped KHP crystals are presented in Table 1. From Table 1, the grown crystals have been confirmed by examining the presently calculated lattice parameters values with already reported values [16] which give the close agreement.

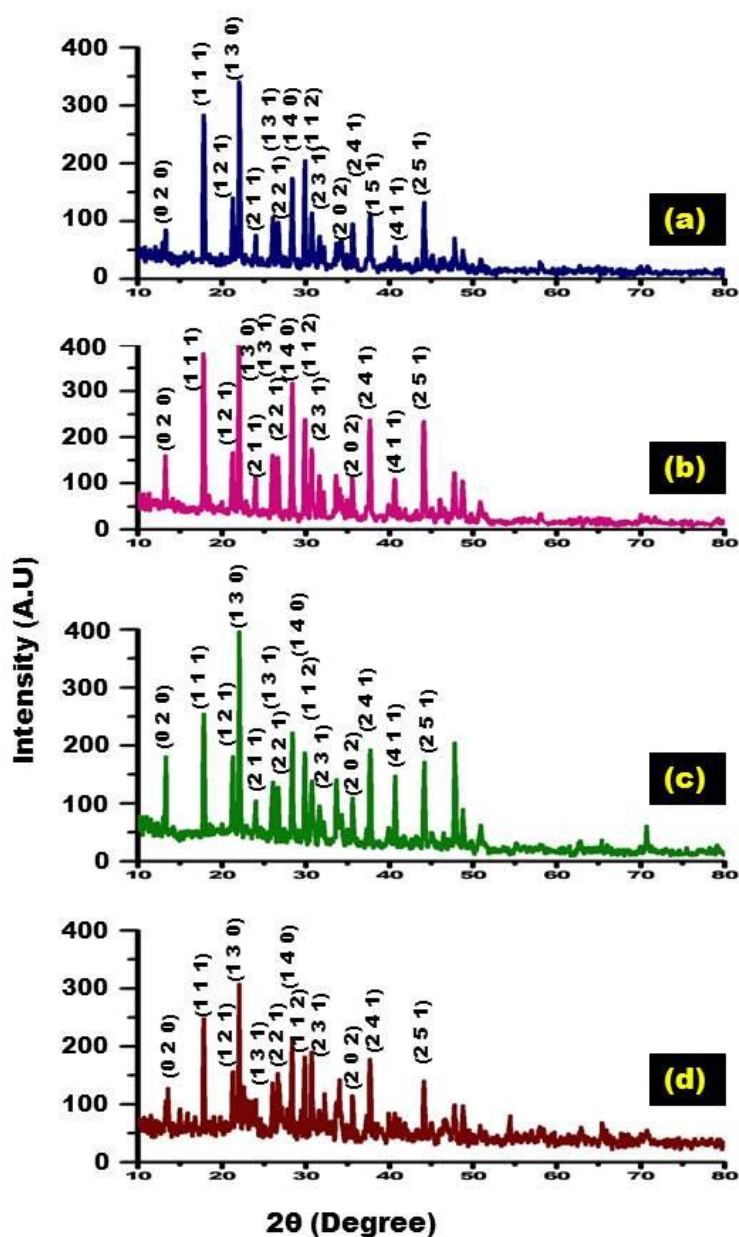

**Table 1:-** Unit cell parameters of undoped and amino acids doped KHP crystals

Unit cell parameters	Reported value KHP [16]	Undoped KHP Present work	LGA doped KHP	LAS doped KHP	LS doped KHP
a	6.48 Å	6.56 Å	6.53 Å	6.44 Å	6.51 Å
b	9.61 Å	9.60 Å	9.52 Å	9.58 Å	9.48 Å
c	13.37 Å	13.38 Å	13.42 Å	13.48 Å	13.41 Å
$\alpha = \beta = \gamma$	90°	90°	90°	90°	90°
Volume (Å) <sup>3</sup>	832.58	842.61	834.26	831.65	827.59

**Powder x-ray diffraction:-**

The grown crystals were finely powdered and subjected to powder XRD analysis with a X'pert PRO powder X-ray diffraction (40 kV) using Cu-K $\alpha$  radiation of wavelength  $\lambda = 1.5406$  Å. The powder XRD patterns of undoped KHP, LGA doped KHP, LAS doped KHP and LS doped KHP crystals are shown in Fig. 2a, Fig. 2b, Fig. 2c and Fig. 2d. All the detectable peaks could be indexed by using standard reference data (JCPDS card no: 31-1855 for pure KHP).

**Figure 2:-** Powder XRD pattern of (a) Undoped KHP (b) LGA doped KHP crystal (c) LAS doped KHP crystal (d) LS doped KHP crystal

**Spectral analysis:-**

FTIR spectra of the grown crystals were recorded in the range  $400 - 4000 \text{ cm}^{-1}$  using KBr pellet in a Perkin-Elmer spectrometer. The FTIR spectra of undoped KHP, LGA doped KHP, LAS doped KHP and LS doped KHP are shown in Fig. 3a, Fig. 3b, Fig. 3c and Fig. 3d.

**Figure 3:-** FTIR spectrum of (a) Undoped KHP (b) LGA doped KHP crystal (c) LAS doped KHP crystal (d) LS doped KHP crystal

To establish the presence of amino acids within the lattice of undoped KHP, the O-H stretching vibration of KHP is considered because the O-H stretching vibration is greater touchy to hydrogen bonding interaction with the doped

amino acids. The band assignments of the grown crystals are given in Table 2.

**Table 2:-** Vibrational Assignments of undoped and amino acids doped KHP crystals

Wavenumbers (cm <sup>-1</sup> )				Tentative Assignments
Pure KHP	LGA-KHP	LAS-KHP	LS-KHP	
3528	3509	3512	3522	O-H stretching hydrogen bond
2482	2487	2489	2480	C-H aromatic stretching
1949	1951	1954	1957	C=C asymmetric stretching
1673	1677	1680	1688	Carboxylic acid C=O symmetric stretch
1562	1566	1570	1580	C=O carboxylate ion asymmetric stretching
1483	1486	1490	1499	C=C ring stretching
1381	1386	1391	1397	C=O carboxylate ion symmetric stretching
1282	1285	1288	1297	C-O stretching
1147	1145	1150	1155	C-C stretching
1089	1092	1099	1102	C-C-O stretching
850,806	848,804	852,810	855,815	C-H out of plane bending
763	768	765	759	C-C stretching
719	714	720	711	=C-H out of plane deformation
681	688	685	684	C-O wagging
549	552	557	555	C=C-C out of plane ring deformation
441	438	445	447	C=C out of plane ring bending

Considering the phenyl ring vibrations, there's no change observed due to doping in C-C stretching, C-H stretching, C-C skeletal aromatic ring vibrations, C-H aromatic stretching, C-H in-plane bending and C-H out of plane bending for the grown crystals. Considering the carboxylic acid vibrations, a small change is observed due to doping in C=O bending, C-O stretching and O-H stretching. Further, a small change is observed in C=O symmetric stretching in the case of doped crystals. The carboxylate ion (COO<sup>-</sup>) vibrations (C-O and C=O bond symmetric and asymmetric stretching) are modified slightly due to doping. So, the results imply that the dopant molecules have entered into undoped KHP crystals matrix. Also, the amino acid can be present at the O-H stretching of the carboxylic acid due to the fact there is no shift in the phenyl ring. The obtained FT-IR spectra are in excellent agreement with that pronounced in the literature for undoped KHP crystals [17].

#### Optical analysis:-

The optoelectronic efficiency of the NLO material is typically decided by way of the transparency window in the UV-Visible region. The optical transmission spectra of the grown crystals have been showed within the wavelength region from 190-1100 nm using a Perkin-Elmer Lambda 35 UV-Visible spectrophotometer. The lower cut-off

wavelength is observed at 300 nm for the grown crystals. The transmission percentage of undoped, LGA doped KHP, LAS doped KHP and LS doped KHP crystals are 70%, 94%, 82% and 60% respectively (Fig. 4a, Fig. 4b, Fig. 4c & Fig. 4d).

**Figure 4:-** UV-Visible Transmission spectrum of (a) Undoped KHP (b) LGA doped KHP crystal (c) LAS doped KHP crystal (d) LS doped KHP crystal

Of all the four crystals, LGA doped KHP crystal indicates highest transmission percentage. The enhancement in the optical transmission is the direct outcome of the improvement in the crystal quality in the LGA doped KHP crystal in compared to other three crystals. The obtained results were compared with the reported work [12].

#### Thermal analysis:-

The grown crystals become analyzed by way of subjecting it to TG/DTA analysis in a closed chamber with controlled nitrogen flow atmosphere under 1000 °C at a heating rate of 20 K/min using a Perkin-Elmer thermal analyzer STA 409 PC. The thermal behaviors of a crystal have a significant role in a crystal growth and its applications. Thermal behaviors like thermal expansion, specific heat and thermal conductivity are basic properties for lasers, especially for high power systems. When a beam of laser interacts with a nonlinear optical crystal, a locality of its incident energy is regenerate into thermal energy resulting in a temperature gradient inside the crystal and if the NLO crystal exhibits large specific heat, then the increase in the thermal gradient of the crystal is small. Such a crystal might have large damage threshold and observes application in high power laser systems. TG/DTA curves for undoped, LGA doped KHP, LAS doped KHP and LS doped KHP crystals are shown in Fig. 5a, Fig. 5b, Fig. 5c & Fig. 5d.

Figure 5:- TG/DTA thermogram of (a) undoped KHP crystal.

Figure 5:- TG/DTA thermogram of (b) LGA doped KHP crystal

Figure 5:- TG/DTA thermogram of (c) LAS doped KHP crystal

Figure 5:- TG/DTA thermogram of (d) LS doped KHP crystal

From the TG thermogram, undoped KHP crystal showed four stages of weight loss. In undoped KHP crystal, the weight loss starts at around 263.3°C and about 97.2 % of the entire mass loss has come about at some stage in the initial decomposition of undoped KHP crystal. In doped KHP crystals, the weight loss starts at around 265.4°C, 267.6°C and 269.2°C and about 96.5%, 98.7% and 92.5% of the entire mass loss has come about at some stage in their initial decomposition of LGA doped KHP, LAS doped KHP and LS doped KHP respectively. As according to literature survey of Newkirk et al and Belcher et al has reported that the KHP decomposed into  $K_2CO_3$  and char at

800 °C in the N<sub>2</sub> environment, the prevailing work is of the same opinion properly with these said consequences [18,19]. DTA showed sharp endothermic peak observed at 290°C, 300°C, 302°C and 304°C for undoped, LGA doped KHP, LAS doped KHP and LS doped KHP can be attributed to the decomposition of the grown crystals respectively. Hence, the endothermic peaks above 304.9°C can be due to the formation of volatile fragments. Further, the grown crystals are observed to decompose without melting or phase transformation. As a result, the maximum temperature up to which KHP can be exploited for nonlinear optical applications is limited to 304.9°C.

#### Hardness analysis:-

Vicker's microhardness measurements were carried out the use of Leitz Weitzler hardness tester fitted with a diamond indenter. The mechanical strength of the grown crystals was studied by means of quantifying microhardness because it performs a tremendous position in the fabrication of optoelectronic devices. Vicker's microhardness ( $H_v$ ) is a measure of the hardness of materials calculated from the size of an impact produced under load by the diamond indenter. Hardness value was calculated by the relation

$$H_v = 1.8544 P / d^2 \quad (\text{Kg/mm}^2) \quad \text{----- (1)}$$

Where, P (Applied load in Kg), d (Diagonal length of indentation impression in mm) and 1.8544 (Constant of the geometrical factor for the diamond pyramid). The plot of Vicker's hardness ( $H_v$ ) versus load (P) of the grown crystals is shown in Fig. 6a.

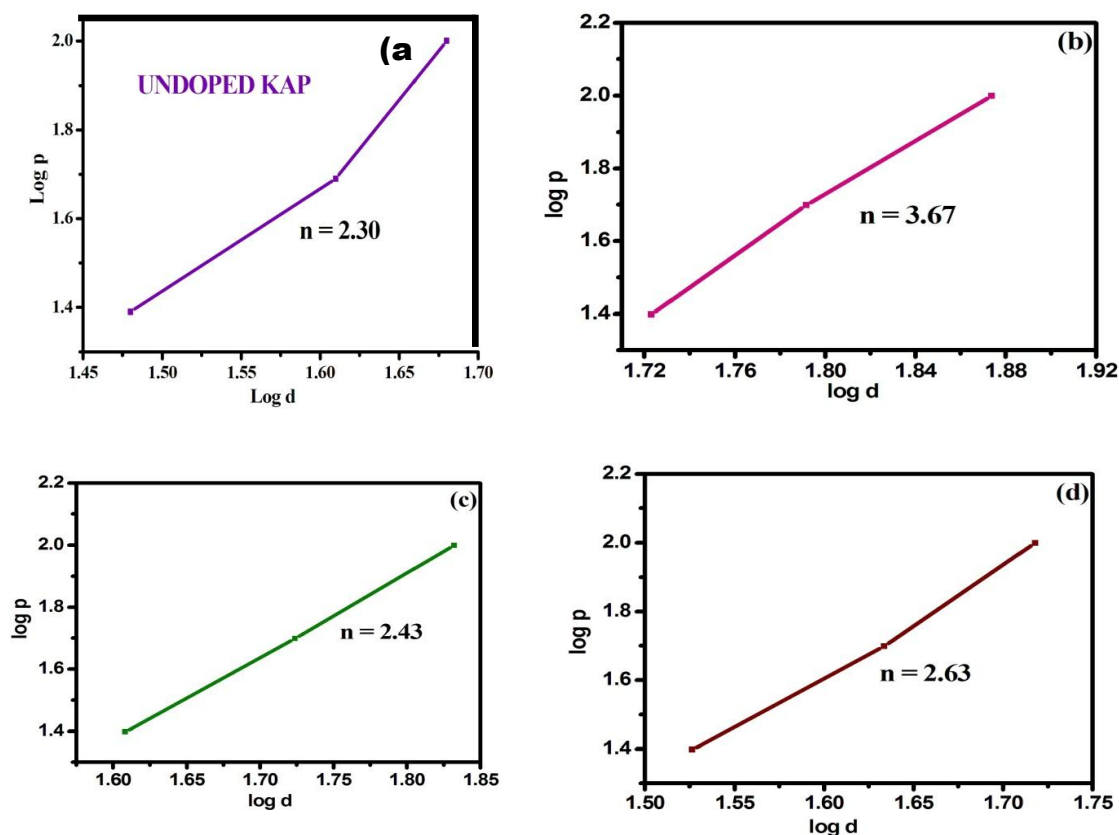

**Figure 6:-** Load P vs  $H_v$  for (a) Undoped KHP (b) LGA doped KHP crystal (c) LAS doped KHP crystal (d) LS doped KHP crystal

From the Fig. 6a, it is seen that hardness value of LGA doped KHP crystal is higher than the hardness value of other three crystals. This is due to the fact the predominant contribution to hardness is ascribed to the high stress required for homogeneous nucleation of dislocation in the small vicinity indented [20]. The presence of cracks shows the decrease in microhardness and it was observed that amino acid doped KHP crystals are highly stable towards the application of mechanical stresses. The noticed changes in the microhardness values of the amino acids doped KHP crystals may be due to the strong interaction of O-H groups of KHP with the COO groups of amino acid [21]. Greater stress is required to form dislocations in an ideal crystal. Hence, the higher hardness value of LGA doped KHP crystal indicates greater stress required to form dislocation which confirms greater crystalline perfection. The work hardening coefficient (n) was estimated by the plot of  $\log p$  vs  $\log d$ . The plot of  $\log d$  vs  $\log p$  for the grown crystals shows a straight line and its slope provides the work hardening coefficient (n)

$$P = K_1 d^n \quad \text{----- (2)}$$

Where  $K_1$  (Standard hardness value which is found from the plot of  $P$  vs  $d^n$ ). The plot of  $\log p$  vs  $\log d$  of undoped KHP (Fig. 7a), LGA doped KHP (Fig. 7b), LAS doped KHP (Fig. 7c) and LS doped KHP (Fig. 7d) depicts that the grown crystals belong to the soft material category.

**Figure 7:-** Log d vs Log p for (a) Undoped KHP (b) LGA doped KHP crystal (c) LAS doped KHP crystal (d) LS doped KHP crystal

#### Second harmonic generation (SHG) analysis:-

The grown crystals have been subjected to a Q-switched Nd:YAG laser beam of wavelength 1064 nm was fired within an input beam energy of 3.2mJ/pulse and pulse width of 8 ns, the repetition rate being 10 Hz. KHP and NaAP crystals are being the phenyl ring and  $\pi$ -electron system that are liable for its NLO efficiency [22]. The estimated SHG efficiencies of undoped, LGA doped KHP, LAS doped KHP and LS doped KHP crystals are found to be 1.5, 1.9, 1.6 and 1.7 times that of the reference material KDP crystal respectively. It genuinely found out that LGA doped KHP crystal which is having SHG efficiency value higher than that of undoped, LAS doped KHP and LS doped KHP crystals.

#### Conclusion:-

Semiorganic single crystals of undoped, LGA doped KHP, LAS doped KHP and LS doped KHP were effectively grown by slow evaporation technique. Single crystal XRD confirmed that the grown crystals have an orthorhombic lattice with  $Pca2_1$  space group for the grown crystals. The powder XRD study confirms that the crystalline perfection of the grown crystals. The presence of functional groups becomes confirmed by means of FTIR spectral analysis. The UV-Visible study implies the optical quality of LGA doped KHP crystal is better than that of undoped, LAS doped KHP and LS doped KHP crystals. The melting and decomposition temperature range of the grown single crystals has been studied by TGA/DTA analysis. In the microhardness analysis, LGA doped KHP crystal has much higher hardness value than undoped, LAS doped KHP and LS doped KHP crystals and it confirms that the grown crystals belong to the soft material. LGA doped KHP crystal is an excellent candidate for SHG applications than LGA doped KHP crystal due to its SHG efficiency value much higher than that of LGA doped KHP. All these properties suggest that LGA doped NaAP crystal may be a promising material for optical applications.

##### Key words:-

FTS (fibroma of tendon sheath),  
Excision, Biopsy.

#### Abstract

**Background:-**The clinical and pathological features of fibroma of tendon sheath are presented. Fibroma of the tendon sheath is an uncommon soft tissue tumor presenting as a solitary, slow-growing, firm, small nodules, which shows strong attachment to the tendon or tendon sheath. The main presenting symptom was an insidiously growing mass causing mild tenderness or pain. It is usually localized on fingers and hand tendons in adults between the age of 20 and 40 years old but localized on foot is a rare entity.

**Material & methods:-** This case concerns a 40-year-old women presenting with a 3-year history of localized painful swelling on dorsal aspect of right fore foot without history of any trauma, and constitutional symptoms. X ray of right foot was normal. Excision & Biopsy confirmed fibroma of the tendon sheath. Here, we report on a very rare case of fibroma of the tendon sheath arising from Extensor tendon of foot in female, which supports the pathogenetic hypothesis that this tumor may be a reactive process rather than a true neoplasm.

**Result:-** Patient was on regular followed up to 6 months with no signs of recurrence.

**Conclusion:-** Fibroma of tendon sheath of foot is a rare occurrence. Excision of mass gave us excellent result. Excisional biopsy confirmed the diagnosis.

#### Introduction:-

Fibroma of the tendon sheath (FTS) is a rare, benign soft tissue tumor<sup>1</sup>. The tumor usually presents as a single, slow-growing, firm, pain full, localized swelling, which strongly attaches to the tendon sheath and it is often localized on the hand, particularly on the thumb<sup>1,2</sup>. It usually occurs in males between the age of 20 and 40 years old<sup>1,2</sup>. Histopathologically, it is characterized by a well-demarcated nodule that consists of haphazardly-arranged, fibroblast-like spindle cells embedded in a dense collagenous matrix<sup>2</sup>.

A few cases of FTS have been described in the literature<sup>1-7</sup>. However, FTS arising concurrently on dorsum of foot in female has not yet been reported. Here, we report on the unusual presentation of FTS.

#### Case Report:-

A 40-year-old woman presented with approximately a three-year history of palpable, firm and localized painful swelling on dorsum of fore foot. She recognized the skin lesion on her right dorsum of fore foot area after she felt discomfort and pain upon walking. The lesions have increased in size over the last three years on dorsum of foot. He

complained from time to time of stiffness and numbness on his feet. There was no recollection of associated trauma. His family history and past medical history were unremarkable.

**Pre-op clinical pic No.1:-**

As the nodules were deeply located, visible, & palpable. No limitation of foot or toe motion was observed. No joint swelling or other specific skin lesions were found.

**Intra-op clinical pic No.2:-**

Laboratory tests, including blood cell count and blood chemistry, were all within normal ranges. Foot X-ray showed no remarkable findings. For histological diagnosis, a 4\*2.5\*2cm mass was performed from the lesion on the right

foot. Histopathological findings showed relatively well-circumscribed nodules of extensively collagenized tissue with spindle and stellate cells, that are very few and far apart which appears paucicellular.

Based on these clinical and histological findings, he was diagnosed as FTS. She has been followed up on 12 days of post op for suture removal then 2 months & last followed up on 6 months and her pain and numbness relieve. The FTS has since remained stationary.

<b>CLINICAL DIAGNOSIS:</b>	Foot swelling
<b>SPECIMEN:</b>	Excision Biopsy
<b>GROSSING:</b>	Received irregular multinodular mass measuring 4x2.5x2 cm. External surface is nodular. Cut surface shows whitish homogenous nodules of varying sizes. 142,A-D/17: Whitish nodular area
<b>MICROSCOPY:</b>	142,A-D/17: The sections show well circumscribed nodules of extensively collagenized tissue with spindle and stellate cells, that are very few and far apart. The lesion therefore appears paucicellular. There are many cleft-like vascular spaces.
<b>COMMENT:</b>	The overall features are those of fibroma of tendon sheath.

**Histopathology Report pic. No 3:-**

**Last follow up at 6month:-**

### **Discussion:-**

Chung and Enzinger first defined FTS as an entity in 1979<sup>11</sup>. This rare tumor has been reported mainly in the orthopedic field and generally occurred as a solitary nodule on the fingers, feet, elbows, and knees, and, rarely, intra-articular areas<sup>1-7</sup>.

The pathogenesis of FTS has not been clearly established with regard to whether the origin is a neoplasm or reactive fibrosing process. Dal Cin et al<sup>10</sup>. reported that the presence of clonal chromosomal abnormality characterized by a

t(2:11)(q31-32;q12) in ten out of 20 karyotyped cells suggested that this proliferation is not a reactive fibrosing process, but a neoplasm. Others have found that the right hand was more frequently affected than the left, and most cases occurred in the palm of hand and in the plantar region of the foot<sup>11</sup>. This finding suggests that the origin of FTS may be a reactive process by trauma, stimulation, or inflammation. This case also favored the reactive pathogenesis in formation of FTS. Skin lesions developed on foot and are consistently affected by prolonged pressure and motion. Her symptoms of morning stiffness and numbness showed moderate improvement with administration of oral anti-inflammatory agents. Since we placed her on oral anti-inflammatory agents, the number and size of FTS have been maintained. From these findings, sustained inflammation and stimulation may play an important role in FTS.

The majority of patients with FTS are between the ages of 20 and 40 years and the male: female ratio has been described as 1.5~3:1<sup>7,11</sup>. Most patients do not complain of any symptoms. However, 31% of cases present with tenderness and mild pain due to compression of nerves underlying FTS<sup>11</sup>. Numbness and morning stiffness were observed in this case also. Although her symptoms were controlled by oral anti-inflammatory agents, the possibility of compression of nerve on foot cannot be excluded. Therefore, even though it is practically difficult to excise out all FTSs, removal of the tumor is necessary, which provokes pain. Surgery for local excision should be performed carefully, because the recurrence rate is 24% and all of the cases are in the hands and finger<sup>7</sup>.

Differential diagnosis should be made with an epidermal cyst, mucinous cyst, neuroma, leiomyoma, nodular fasciitis, and giant cell tumor of the tendon sheath (GCTTS)<sup>12</sup>. In particular, clinical features of GCTTS are similar to those of FTS. However, FTS is distinguished from GCTTS by histopathology features, which include the fact that GCTTS are less hyalinized and more cellular, and with histiocytes and monocytes as well as multinucleated giant cells, foam cells, and hemosiderin-laden macrophages<sup>12</sup>. Regarding multiple nodules on the palmar area, Dupuytren's contracture should be considered as a differential diagnosis. It is the best known multiple palmar fibromatosis<sup>13</sup>. Clinical manifestation usually showed flexural contracture of the hand, particularly the ring and little finger area. This patient did not show any limitation of foot or toe movement; therefore, diagnosis of Dupuytren's contracture was easily ruled out in the clinical setting.

We herein report on a very rare case of FTSs on the foot. This case implies that FTS may not be a true neoplasm but a reactive process provoked by sustained inflammation and stimulation.

### **Conclusion:-**

Fibroma of tendon sheath of foot is a rare occurrence. Excision of mass gave us excellent result. Excisional biopsy confirmed the diagnosis.

#### Abstract

The present study was carried out to evaluate the Skinfold Thickness, Height for age, Weight for age, BMI, and MUAC of Koraga tribal people representing three taluks of Udupi district, Karnataka State. In Karnataka, Koraga tribes are identified as PVTG. The data or information was recorded through interview schedule and a survey was conducted. Total 500 individuals were studied from twenty hamlets in three taluks of Udupi District. The foregoing study reveals that among the total samples 90.8% (454) of them are suffering from different grades of Chronic Energy Deficiency.

#### Introduction:-

As per the 2011 census, the tribal population is 8.6% of the total population. 89.9% of them reside in rural areas and 10.0% in urban areas. Whereas in Karnataka, as per 2011 census the total tribal population is 6.95% of the total population with 19.27% of them residing in urban and rest of 80.72% of the peoples are found in rural parts. Few studies in India provide detailed descriptions of the tribal community. Good nutrition is a basic element of health. A healthy person leads thenation in abettermanner. Most of the tribal people of India have their own geographically isolated lifestyle. Inadequate food habits along with traditional socio-cultural and biological activities may lead to a high proportion of child undernutrition (Balgir et al. 2002; Rao et al. 2006). Most of the tribal people are exposure to different kinds of diseases and suffering from malnutrition. Good nutrition of the people is avital component of healthy life. The Indian tribal people are deprived economically.

Tribal peoples are recognized to avery close relationship with the ecology and the environment because of their fulfillment of daily nutritional requirements with food foraged from nature. They are dependent on the forest. But after the forest act tribal are not allowed to collect forest produces due to this reason tribal are not getting any nutritional supplements. The government has providing nutritional supplements to the tribes, but most of them are not aware of the food and they are not using. This leads to malnutrition. Inadequacies in nutritional intake or under-nutrition can be considered a major source of many adverse effects on the growth and health of individuals (Gordon et al., 1968).

Most of the tribal community in India is addicted to alcohol consumption and they don't care about their health. They have their strong traditional beliefs and practices of healing the diseases. They have their own ethno

Address:- Research Scholar, Department of Studies in Anthropology , Karnatak University, Dharwad, Karnataka State, India.

medicines. Still, most of them are practicing their own tradition to heal of the disease. The present study shows the anthropometric description of the tribal people to know their nutritional status.

Anthropometry is a key component to assess the nutritional status. This is the study of measurements and proportion of the human body using different anthropometric instruments. MUAC is the circumference of the left upper arm, measured at the mid-point between the tip of the shoulder and the tip of the elbow (Olecranon process and the Acromium).

### **Material and Method:-**

For the present study a total of 500 subjects which 243 male, 257 female were selected during the study. Fieldwork was conducted during the month of March to August. The Data were gathered from different hamlets of Koraga tribes in three taluks of Udipi District. Anthropometric measurements were taken using the standard procedure. The anthropometric measurements (*Height, Weight, Mid Upper Arm Circumference and Skinfold Thickness at Triceps*) of Koraga tribal people were recorded using techniques given by Jelliffe (1966). The height was measured with the help of Anthropometric rod, weight was measured with the help of a digital weighing machine and it was measured to the nearest 0.1 kilogram., MUAC was measured with the aid of tape to the nearest 0.1 cm. and skinfold thickness was measured to the nearest 0.1 millimeters with the help of futubaskin fold calliper.

### **BMI was computed using the following standard equation:-**

$BMI = \text{weight (in Kg)} / (\text{height})^2$  (in meters). Nutritional status was evaluated using internationally accepted BMI guidelines (WHO 1990: 854). The following cut-off points were used: CED BMI <18.5, normal: BMI= 18.5–25.0, overweight: BMI  $\geq$  25.0-30.0 and above (PujarA et.al., 2016).

The data was analysed with the use of Statistical Package for Social Science 22.0 Version software.

### **Koraga Tribe:-**

In Karnataka, totally 50 tribes are scheduled under the list of Schedule Tribes. Among them, two tribes are identified as Particularly Vulnerable Tribal Groups (PVTG, earlier it called as PTG-Primitive Tribal Groups) who has a low level of literacy rate, the pre-agricultural level of technology and declining population. Koraga is one among them. Most of the Koraga population resides in coastal regions of Karnataka that is Dakshina Kannada and Udipi district. According to the 2011 census, their population in these two districts is 14,794. As the census of India, Koraga tribal population is drastically declining over the period of time. They are skillful in making baskets using creepers (Beelu), canes, and bamboos by splitting and weaving them artistically. Basketry is the main source of income of Koraga tribal community. But then nowadays majority of them working as daily wage laborers in panchayat, municipality, hotels, and hostels etc. Physically they are very quiet and inoffensive race, small and slight, the men seldom exceeding five feet six inches, black skinned, thick-lipped, noses broad and flat, high cheek bones and sloping foreheads and with wavy dark rough hairs and very distinct eyes and lips. They speak Koraga language, which is the mixture of Tulu and Kannada, but while communicating with others they speak the Kannada language. In three taluks of Udipi district, Koraga tribes speak a different dialect. These taluk people culture, tradition is also differed each other.

### **Results and Discussion:-**

A total of five hundred individual's height, weight, MUAC and skinfold thickness at triceps were recorded with the help of anthropometric instruments. A total 500 individuals comprising 48.6% males and 51.4% were females (Table 1, Fig: 1).

Table no. 2 (Fig:2) shows that maximum number of individuals 36.4% (182) were suffering from CED Grade-II (16.0-17.0) type of malnutrition following 34.8% (174) respondents were suffering from Grade-III (<16.0) type of malnutrition and 19.6% subjects were suffering from Grade-I (17.0-18.5) type of malnutrition. Totally, out of 500 respondents, 454 subjects were suffering from different grades of Chronic Energy Deficiency.

In the 4-6 years age group there was a slight difference in the mean height of males ( $97.5 \pm 11.38$ ) and females ( $96.1 \pm 13.4$ ). In the 7-18 years age group also, there was no much difference in the mean height of males and females. 19-60+ years of age group there was a huge difference in mean height found. In the age group of 4-15 years of age group, there was slight differences in weight of male and females, whereas above 16 years upto 60+ age

group female were shorter by about 6-7 kg lighter as compared to themale of the same age group. The tribal peoples were shorter and lighter when compared with the NCHS and ICMR standards(Table No-3, Fig-3).

In the 7-9 years age group there was much difference in the mean MUAC of male ( $14.80 \pm 2.34$ ) and females ( $18.39 \pm 14.2$ ).In the age group of 13-15 years,there was also much difference in the mean mid-upper arm circumferencesin males ( $17.6 \pm 2.76$ ) and females ( $22.0 \pm 2.93$ ).In remaining age group there 1-2 cm differences found between male and females.In the 10-12 years age group there was much difference in the mean Triceps skinfold thickness of male ( $9.38 \pm 2.66$ ) and females ( $7.79 \pm 2.86$ ). In remaining age group, there were 1 mm differences found between male and females (Table No-4, Fig-4).

**Conclusion:-**

Healthcare is one of the most important of all human endeavours to improve the quality of life especially of the tribal people (Balgir, 1995, 2000, 2005 & 2007). Health problems and health practices of tribal communities have been profoundly influenced by the inter- play of complex social, cultural, educational, economic and political practices (Balgir 2005). Most of the tribal population in India suffering from malnutrition because their general customs, traditions, values, beliefs and practices associated with their health and disease and it has been closely related to the treatment of diseases. In most tribal communities, there is a wealth of folklore associated with health belief and tribal people are mainly depend upon the forest products after the forest act (2006) implemented tribal are restricted to enter in to the forest and this is one of the important factor that tribal are suffering from malnutrition.

In Karnataka Koraga tribes identified as *Particularly Vulnerable Tribal Groups (PVTG)*. The present study reveals that the only 8.4% and 0.8 % are respectively falling in normal and obese categories remaining all are suffering from different grades of malnutrition. This is also a prime reason for community stagnancy or decline in population. The finding reveals precautionary actions are desirable to progress the health and nutritional condition of the Koraga tribe in the state.

#### Abstract

**Background:** Skeletal tuberculosis accounts for 1 to 3% of extra pulmonary tuberculosis of which 10% involve foot and ankle, which is 0.1 to 0.3% of extra pulmonary tuberculosis. Spine is the most common site and involvement of foot is rare for tuberculosis. The bones involved are usually the calcaneum, talus, first metatarsal, navicular and lateral and intermediate cuneiforms. Because of rare occurrence, diagnosis of tuberculosis of foot remains a dilemma especially when confined to a single bone without articular involvement.

**Material & Method:** A 9 year old girl presented to us with swelling, gradual increasing pain in right foot more so on weight bearing from last six months. There was no history of constitutional symptoms or trauma. There was no family history of tuberculosis.

On examination there was a swelling on dorsal aspect of right mid foot with tenderness. There was no other positive finding.

The x-ray shows a lytic lesion of Lateral cuneiform with sequestrum with normal tarso-metatarsal and inter-tarsal joints of right foot.

Routine blood investigations were normal. The lesion was addressed by dorsal approach and curettage biopsy was done. After through curettage, the lesion was packed with cancellous bone grafts. The histopathology confirmed it to be tuberculosis. The Foot -ankle was immobilized by below knee plaster slab for 8 weeks and then patient was gradually mobilized.

**Result:** Patient was followed up for 1<sup>1/2</sup> year with no signs of recurrence.

**Conclusion:** Isolated tuberculosis of cuneiform bone is a rare occurrence. The curettage and bone grafting gave us excellent result, which is the treatment of choice.

#### Introduction:-

Tuberculosis is a challenging infectious health problem for both developed and developing countries. Skeletal tuberculosis accounts for 1 to 3% of extra pulmonary tuberculosis. The spine is most commonly affected, and foot and ankle involvement is rare, accounting for about 10%<sup>1</sup> in which Calcaneum is the most common bone involved.<sup>2</sup> Diagnosis of tuberculosis of the foot remains a dilemma because of its rarity in lower limb, especially when confined to a single bone with or without articular involvement. Hence, the chance of misdiagnosis and delay in diagnosis may add to morbidity.<sup>3</sup>

**Corresponding Author:- Dr. Jainish Patel.**

Address:- Department of orthopedics, Dhiraj General Hospital, SBKS MIRC, Piparia, Vadodara .

Some diseases like chronic pyogenic osteomyelitis, fungal osteomyelitis, Madura mycosis and some bone tumours may mimic tuberculosis of foot.<sup>4</sup> Presumptive diagnosis can be made on the basis of X-ray, MRI and histopathology of the pathological tissue.

Here we are reporting a case of 9 year old girl with swelling and pain over a right mid foot diagnosed as tuberculosis of cuneiform on subsequent X-ray, MRI and biopsy.

### Case Report:-

A 9 year old girl presented with complaints of pain and swelling over right foot for last 6 months. Swelling and pain was progressive in nature. It has increased over the last 2 months such that the patient had difficulty in walking due to pain. Associated history of dry cough since 25 days. There was no history of fever, weight loss, and loss of appetite, any infective foci or any contact of tuberculosis.

On examination, there was swelling of dorsal aspect of the foot. There was exfoliation of skin over the dorsum of foot. There was tenderness over mid foot. The temperature was mildly raised as compared to the other foot. There was inguinal lymphadenopathy.

**Figure 1:-** Pre op clinical photograph and x-rays

On blood investigation, ESR was 50 mm after one hour. Mantoux reaction was positive. Rest routine investigation was normal.

X-ray of right foot (ap and oblique view) showed a lytic lesion of the lateral cuneiform and ill-defined sclerotic margin. [Figure-1]. There was also sign of osteopenia and coarsened primary trabeculation. Chest radiograph appeared normal.

Surgical intervention was done by debridement and curettage of the lateral cuneiform with bone grafting. Intraoperatively soft tissue surrounding lateral cuneiform was unhealthy and the cavity inside it contained unhealthy granulation tissue. Tissue and pus was sent for Gram staining, Ziehl Nielsen staining, KOH mount, culture for fungi, pyogenic organisms, and mycobacterium tuberculosis and for histopathological examination.

**Figure 2:-** Post op. X-rays

Ziehl Nielsen staining revealed acid fast bacilli and culture on Lowenstein Jensen media grew mycobacterium colonies.

Histopathology revealed fibro connective tissue showing many epithelioid granuloma with central neutrophilic microabscesses surrounded by small area of caseous necrosis with multinucleated Langhan's type of giant cells.

Diagnosis of tuberculosis of lateral cuneiform was made and anti-tubercular therapy was advised for 9 months and below knee slab was applied. Nonweight bearing walk was started. At 6 weeks followup, the splint was removed and physiotherapy of ankle was started. Partial weight bearing was started when pain reduced and progressively increased as tolerated.

The patient was followed for one and a half year. Painless normal range of motion was present with normal skin condition [Figure-3]. Radiograph showed sclerosis and mineralization of surrounding bones.

**Figure 3:-** Followup x-rays

### **Discussion:-**

Musculoskeletal tuberculosis is difficult to diagnose. The classic presentation of localised pain, fever and weight loss is rarely seen. Radiological features of musculoskeletal

tuberculosis may include bone marrow oedema, osteoporosis, lytic lesions or may be nonspecific. The surrounding tissue may show synovitis, joint effusions, tenosynovitis or abscess.

Isolated tubercular involvement of foot bones with an osteolytic defect is a rare entity.<sup>5</sup>

Dhillon et al studied 92 cases of foot tuberculosis over 20 years, 23 were of osteolytic variety out of which 2 had lesions in the cuneiform.<sup>5</sup> Tuberculosis of cuneiform is rare and may mimic fungal osteomyelitis, Madura mycosis, chronic pyogenic osteomyelitis and bone tumours. ESR is almost always elevated in case of tuberculosis.<sup>6</sup> In our case there was a positive Montoux test, raised ESR, histopathology of the tissue specimen, Ziehl Nielsen staining and isolation of Mycobacterium on Lowenstein Jensen media, which finally lead to diagnosis. Treatment should not be delayed as delay in treatment may result in less than optimal outcome.<sup>7</sup> The aim of anti-tubercular treatment is to eradicate the organism and to obtain a supple, pain free weight bearing functional foot. With treatment radiological changes do take place and cavities may persist for years, which have no clinical significance.<sup>7</sup>

### **Conclusion:-**

It is concluded that isolated cystic tuberculosis of lateral cuneiform is rare. Open biopsy, curettage with bone grafting and histopathology, Ziehl Nielsen staining and culture for mycobacterium tuberculosis confirms the diagnosis. Anti-tubercular therapy for a period of 9 months should be given for better prognosis and to prevent recurrence.

#### Abstract

The present computational investigation deals with performance improvement of a low speed centrifugal compressor by inexpensive partial shroud near the rotor blade tip. Computational study of centrifugal compressor is carried out with finite volume method upwind scheme using ANSYS CFX-15.0 software are carried for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  at three values of tip clearance, viz.  $\tau = 2.2\%, 5.1\%$  and  $7.9\%$  of rotor blade height at the exit. Performance tests are carried out for a total of two configurations. From these measurements, partial shroud is found give best performance. The improvement in the compressor performance may be due to the reduction of tip leakage flows by the small extension of partial shroud (2 mm on the pressure surface side). The axial distribution of static and total pressure coefficient at rotor exit for the four flow coefficients, clearly indicate increase in total pressure in the rotor tip region for the configuration with PS compared to that for the basic configuration (without PS). Similar increase is observed in the static pressure distribution at the rotor exit for the higher values of clearance. The mass averaged total and static pressures at the rotor exit for both configurations at the three values of tip clearances clearly show that partial shrouds are beneficial in improving the pressure rise of the compressor.

**Introduction:-**

The tip leakage flow thus would have dominant effect on the performance of a compressor. A comprehensive review of tip clearance effects in centrifugal compressors is given by Pampreen (1983). Senoo and Ishida (1987) gave analytical expression to quantify the tip clearance effects in centrifugal blowers Hayami (1997) has found from his experiments that axial movement of the casing has better efficiency over the movement of casing in radial and axial directions. Tip clearance in centrifugal compressor causes the leakage of high pressure fluid from pressure surface to suction surface of the impeller blade, making the flow field highly complex and effecting the performance. The tip clearance studies are conducted to understand the flow behavior in order to minimise the effect of tip clearance. Pampreen (1973), Mashimo et al. (1979), Sitaram and Pandey (1990) have conducted experimental studies and suggested that by reducing the tip clearance gap size, the tip clearance effect can be minimised. The required tip clearance can be obtained by shifting the casing in radial or axial or combined radial and axial directions.

All the angles are measured w. r. t. tangential direction

**Partial Shroud:-** The partial shrouds are made of stainless steel of 0.1 mm thickness. The stainless steel sheet is cut to the shape of rectangle pieces of 50 mm x 5 mm size. These rectangle pieces are attached to the tip of the blades using araldite. The configurations tested (basic configuration without partial shroud and configuration with partial shroud) are shown in Fig. 1.

**Fig. 2:-** Centrifugal compressor without and with partial shroud

**Fig. 3:-** Computational domain of single passage with and without partial shroud.

Geometry and mesh: The geometric model used for the computational simulation of impeller with PS and without PS configuration consists of single passage impeller blades. These are done with the assumption that flow is periodic in each vane passage. This avoids the necessity of modeling the entire centrifugal compressor stage thereby saving enormous computational time and resources. The geometric model used for the computational simulation of Centrifugal impeller with above specifications with 2mm thickness throughout the blade for generation of three dimensional blades was done as shown in **Fig.2**. A single passage of the impeller with inlet at 50mm ahead of the impeller and outlet at a distance of 35mm downstream of impeller is shown in **Fig. 3**. Casing is designed with 0.7mm clearance throughout the blade height. Three tip clearances of 2.2%, 5.1% and 7.9% of trailing edge blade height are obtained by moving the casing axially. ANSYS CFX 15.0 version software is used for obtaining the solution and standard the SST  $k-\omega$  model was applied to obtain turbulent quantities, assuming that the flow in the compressor is fully turbulent. The design rotational speed was 2000rpm. The total pressure, total temperature, and flow direction were specified at the impeller inflow boundary ( $P01 = 101300$  Pa and  $T01 = 288.15$  K), and the mass flow rate was specified at the diffuser outflow boundary. In CFX we have to use turbo mode for this problem statement, with respective to this stationary, rotating components are defined. The density going to vary compressible fluid with pressure fluid properties kept as air ideal gas. Rotating domain interface used as Stage. The stage averaging at the frame change interface incurs a one-time mixing loss. Physical Time scaling value was observed to be taken as  $10^{-3}$  s. Accuracy criteria of RMS solution was decreased to  $10^{-5}$  for better accuracy.

#### Validations for tip clearance:-

Prior to comparing the performance of the test cases, the numerical result for the three values of tip clearances ( $\tau=2.2\%$ ,  $5.1\%$  and  $7.9\%$ ), was validated with the experimental data. Experimental results were validated by comparing the computed characteristic curves of the efficiency and energy coefficient with the experimental data, static pressure coefficient, and total pressure coefficient, mass-averaged static and total pressures at outlet of the blade with the computational data. The CFD results showed satisfactory agreement with the experimental results over the full range of operating conditions. The overall flow structure predicted by the numerical simulations, including the jet-wake flow pattern, was qualitatively well captured, as observed by comparison with the experimental results. Improved results may be obtained with PS.

#### Results And Discussions:-

PERFORMANCE CHARACTERISTICS: Effect of Configuration: The result of the computational investigations revealed that **Figure 4** shows the performance characteristic in terms of efficiency,  $\eta$  vs. flow coefficient,  $\phi$  for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and at the tip clearance  $\tau = 2.2\%$ , for both configurations. At the value  $\tau = 2.2\%$ , of tip clearance, PS gives higher value of efficiency compared to that without PS due to reduced tip leakage flows. In fact the efficiency of the rotor with PS even at the highest value of tip clearance observed is higher than the efficiency of the rotor without partial shroud at the lowest value of tip clearance. Experimental and Simulation results can be concluded that partial shroud is very beneficial to the performance of the compressor. In the present both investigations, partial shroud with a very small extension of 2 mm on the pressure surface side of the impeller blade is provided. The effect of the two configurations on the performance of the centrifugal compressor in **Figure 5** shows the performance characteristic in terms of energy coefficient,  $\psi$  vs. flow coefficient,  $\phi$  for the three values of tip clearance  $\tau = 2.2\%$ ,  $5.1\%$  and  $7.9\%$  for the both configurations. The value of  $\phi$  where  $\psi_{\max}$  occurs is reduced, thereby increasing stable operating range.

Fig. 6:- Performance of the centrifugal compressor:  $\eta$  vs.  $\phi$

Fig. 5:- Performance of the centrifugal compressor:  $\psi$  vs.  $\phi$

Impeller Exit Flow Measurements

**Total Pressure Coefficient,  $\psi_{02}$**

Distribution of total pressure coefficient at the rotor exit for both configurations for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the three values of tip clearance  $\tau= 2.2\%, 5.1\%$  and  $7.9\%$  for both configurations is shown in Fig. 6. From the figure, it can be clearly seen that rotor with partial shroud (PS) shows increased total pressure coefficient, compared to basic configuration for all the flow coefficients at the tip clearance ( $\tau=2.2\%$ ). From the figure, it can be seen that the extent of region of improvement increases with reduction in flow coefficient. That means the higher the loading more is the benefit due to the partial shroud. For the tip clearance  $\tau=5.1\%, 7.9\%$  the benefits of PS are reduced. For all the flow coefficients it is seen that the total pressure coefficient decreases with increase in tip clearance. At larger flow coefficients the reduction in total pressure coefficient with tip clearance is high. It can also be observed that, the total pressure coefficient increases as the flow coefficient decreases for all the tip clearances. From the figure, it can be seen that the exit of region of improvement increases with reduction in flow coefficient. At larger flow coefficients the reduction in total pressure coefficient with tip clearance is high. The total pressure coefficient difference for 2.2% to 7.9% tip clearance is increasing with flow coefficient increase.

Fig. 6:- Total Pressure coefficient variation at the impeller exit

#### Static Pressure Coefficient, $\psi_{s2}$

The static pressure coefficient distribution at the impeller exit for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the three values of tip clearance  $\tau=2.2\%, 5.1\%$  and  $7.9\%$  for both configurations is shown in **Figs.7**. From this figure, it can be clearly observed that impeller with partial shroud (PS) shows increased static pressure coefficient, compared to basic configuration for all the flow coefficients at the three values of tip clearances ( $\tau=2.2\%, 5.1\%$  and  $7.9\%$ ). Static pressure for a larger extent from the shroud, as the flow coefficient decreases. It can also be observed that, the static pressure coefficient is increasing as the flow coefficient increases for all the tip clearances. This may be attributed to the partial shrouds attached to the tip of the blades restricting the tip leakage flow. Trend of the static pressure coefficient is almost same for both configurations at three values of tip clearances. The static pressure coefficient drop with increment in tip clearance is more for higher flow coefficient.

Fig. 7:- Static Pressure coefficient variation at the impeller exit.

#### Mass Averaged Flow Performance Of Impeller:-

The mass averaged values of total pressure coefficient ( $\bar{\psi}_0$ ) and static pressure coefficient ( $\bar{\psi}_s$ ) at the rotor exit for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the three values of tip clearance  $\tau=2.2\%, 5.1\%$  and  $7.9\%$  for both configurations is show in **figure 8**. In the present both investigations, partial shroud with a very small extension of 2 mm on the pressure surface side of the impeller blade is provided at the tip of the blade region along the axial direction away from the shroud was over analyzed by CFD due to a higher intensity tip clearance flow. The static pressures over the entire operating range for all blades with partial shroud reduced tip clearances were higher than those in the basic configuration case, indicating that reductions in the tip clearance at the tip of the blade

improved the static pressure rise. The exit of the impeller total pressure also increased for the impellers with reduced tip clearances. With partial shroud had the highest static and total pressures as compared with the basic configuration, because the tip clearance was reduced at the tip of the blade.

Fig. 8:- Mass averaged performance

**Static pressure Contours at Meridional Plane:-**

Pressure contours at a meridional plane for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the tip clearance  $\tau= 2.2\%$  for both configurations is shown in **figure 9**. The contours show high pressure on pressure side (PS) of the blade, low pressure on suction side (SS) of the blade. Fluid flow with PS on tip of the blade a slight pressure drop is observed on suction side. Fluid flow without PS on tip of the blade, significant reduction in pressure on suction side is observed.

Fig. 9:- Static Pressure contours at Meridional Plane for the tip clearance  $\tau= 2.2\%$  at without and with PS at mass flow rate  $0.087\text{kg/sec}$ .

**Total Pressure Contours at Meridional Plane:-**

Total pressure contours on meridional plane for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the tip clearance  $\tau= 2.2\%$  for both configurations is shown in **figure 10**. Fluid flow without PS on tip of the blade, on suction side near tip region, low total pressure area caused due to passage wake is observed. With PS on tip of the blade, low total pressure area of passage wake is reduced. The leakage flow from the PS is interacting with passage wake. With PS on tip of the blade for  $2.2\%$  clearance, total pressure is higher at pressure side shroud corner due to the rotation and meridional curvature and low total pressure is observed near the suction side shroud corner because of the boundary layer on stationary domain.

**Fig. 10:-** Total Pressure contours at Meridional Plane for the tip clearance  $\tau= 2.2\%$  at without and with PS at mass flow rate 0.087kg/sec.

**Velocity Contours at Meridional Plane:-**

Velocity contours on meridional plane for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the tip clearance  $\tau= 2.2\%$  for both configurations is shown in **figure 11**. The contours show improved velocities on suction side with PS. The low velocity passage wake area on suction side of the blade is reducing with without PS on tip of the blade. However, the velocity in passage wake region is much lower with without PS on tip of the blade as more leakage flow is interacting with the main flow.

**Fig. 11:-** Velocity contour on meridional plane for the tip clearance  $\tau= 2.2\%$  at without and with PS at mass flow rate 0.087kg/sec.

**Velocity Vectors at Meridional Plane:-**

Velocity vectors on meridional plane for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the tip clearance  $\tau= 2.2\%$  for both configurations is shown in **figure 12**. Passage wake with low velocity is observed on suction side near casing of the blade. With PS on tip of the blade, reduction in passage wake area is observed. Fluid flow with PS on tip of the blade for 2.2% tip clearance, a circulating flow near the suction surface is observed due the strong centrifugal forces. For other clearances, wake growth is altering the flow pattern. At higher clearances, increase in leakage flow observed.

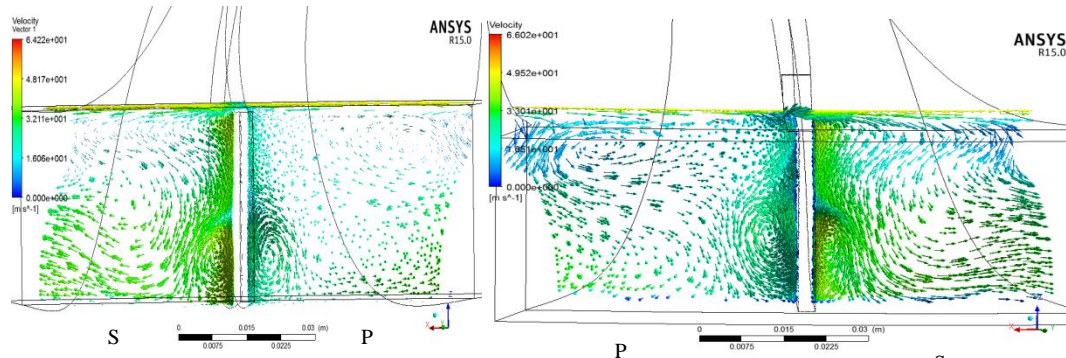

**Fig. 12:-** Velocity vectors on meridional plane for the tip clearance  $\tau= 2.2\%$  at without and with PS at mass flow rate 0.087kg/sec.

**Velocity Vectors at Outlet:-**

A velocity vector at the exit of the impeller for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the tip clearance  $\tau= 2.2\%$  for both configurations is shown in **figure 13**. The fluid flows with PS on tip of the blade velocities are high on suction surface than pressure surface because of blade curvature. With increase in tip clearance, the velocity on both pressure side and suction side is decreasing. For 2.2% and 5.1% clearance, high velocity of the fluid above the blade from pressure side to suction side through tip clearance is clearly seen.

**Fig. 13:-** Velocity vectors at exit of the blade for 2.2% tip cle: : for without PS and with S t mass flow rate 0.087kg/sec.

#### Blade loading chart:-

Blade loading curve for 2.2% tip clearance at without PS and with PS were shown in **figure 14**. Fluid flow without PS and with PS on tip of the blade, significant change in pressure on suction side is observed. Low static pressure on suction and high pressure on pressure side of the blade is observed. With increase in tip clearance for 2.2% to 7.9%, static pressure on both pressure side and suction side are reducing.

**Fig.14:** Blade loading for 2.2% clearance at without and with partial shroud at mass flow rate 0.087kg/sec.

#### Conclusions:-

A low speed centrifugal compressor for four flow coefficients  $\phi=0.12, 0.18, 0.28$  and  $0.34$  and for the three values of tip clearance  $\tau=2.2\%, 5.1\%$  and  $7.9\%$  for both configurations are analysed. The results are compared with the without partial shroud. With partial shroud on tip of the blade, velocity at the meridional section at with the partial shroud is increased; the pressure at outlet is reduced because of more leakage of flow with the basic configuration. With partial shroud on tip of the blade, flow passage wake, the velocity and total pressure improvement is observed. Also with partial shroud on tip of the blade, static pressure rise at outlet is observed for all coefficients.

#### Abstract

**Objective:** to compare the early results of isolated CABG, using on-pump and off-pump, in patients with preoperative mild to moderate elevation of serum creatinine (1.6 to 2.5 mg/dl) level whom do not require maintenance dialysis to support renal function.

**Methods:** This prospective non-randomized study included 60 patients who complained of symptoms of Coronary Artery Disease and subsequently underwent myocardial revascularization at National Heart Institute of Egypt, from July 2013 till May 2014.

**Results:** no statistically significant difference between the two groups except for:

- The Hemoglobin, which is lower in on-pump group due to hemodilution effect of CPB
- The troponin, as we discussed before, the 6 patients who had recent infarction we preferred to do them on-pump.
- Kidney function tests

**Conclusions:** In general, there is no single accurate investigation that can surely predict renal function outcome after cardiac surgery.

- □ General Measures to prevent renal dysfunction after Cardiac Surgery should be utilized in all patients with special attention to those with preoperative renal dysfunction.
- □ Regarding postoperative renal dysfunction and need for dialysis, results were in favor of the off-pump technique.

#### Introduction:-

The development of cardiac surgery in the last 30 years is directly related to the improvement of the techniques of Cardio-Pulmonary Bypass (CPB). However, CPB utilization constitutes one of the primary causes of perioperative complications.[1] In an attempt to avoid the above-mentioned complications, recently, there was a renewal interest in the performance of Coronary Artery Bypass Grafting (CABG) without using CPB, (off-pump).[2] Despite the improvements in surgical techniques, CPB circuit and postoperative patient care, renal dysfunction is still a major complication in patients undergoing cardiac surgery with CPB. It has been reported that acute renal failure requiring dialysis develops in 2-7% of cardiac surgery patients and is strongly associated with postoperative morbidity and mortality.[3] Although, the cause is multi-factorial and depends on the patient's clinical status, age, type I diabetes, recent exposure to nephrotoxic drugs, etc., yet the CPB-related events, such as hypotension, hypoperfusion, loss of pulsatility, hemolysis and release of proinflammatory substances, may contribute significantly to this condition.[4] In addition the duration of CPB has a considerable negative influence on alterations of kidney function integrity.[5]

Although multiple risk factors have been entertained, the most consistent preoperative risk factor for developing renal insufficiency is preexisting renal insufficiency.[6] This is not surprising, because the incidence of postoperative acute renal failure in patients with previously normal renal function is less than 1%.[7] Thus an elevated preoperative serum creatinine concentration (1.5 mg/dl) is an important independent risk factor for mortality and morbidity rates after cardiac surgery suggesting that mild elevations in serum creatinine concentrations are a red flag for bad outcome both before and after cardiac surgery.[8] Mild to moderate elevation of creatinine (1.6 to 2.5 mg/dl) adds moderate risk, but preoperative values higher than 2.5 mg/dl are associated with markedly increased risk of postoperative dialysis and in-hospital mortality.[9] At least some of the factors that precipitate renal dysfunction after cardiac surgery are relatively well known. Haemodynamic changes probably play a major role, specifically vasoconstriction of the renal arterioles and the redistribution of blood flow within the kidneys, which leave parts of the renal parenchyma underperfused and thus hypoxic. Prolongation of this vasoconstricted state leads to permanent cellular damage; shorter periods result in transient dysfunction. Among the well known causes for renal vasoconstriction that are frequent in cardiac surgery are hypovolaemia, dehydration, and many other alterations of systemic haemodynamics. There are also hormonal changes that may adversely affect renal function, such as increased vasopressin, catecholamines, aldosterone, angiotensin, and decreased atrial natriuretic factor and nitric oxide.[10] In an attempt to reduce the incidence of this complication, several therapeutic strategies, such as pulsatile perfusion, hemofiltration, natriuretic hormone, have been investigated and used. Nevertheless, because there has been a trend in operating on higher risk patients with preoperative comorbidities, the development of this complication is still an important and challenging problem.[4] Advances in surgical instruments for the stabilization and visualization of an optimal surgical field have facilitated CABG without CPB.[4] Once the safety of off-pump coronary procedures had been established, the use of beating heart surgery has focused on improving operative outcome by eliminating the morbidity of cardiopulmonary bypass. Operative mortality rate, postoperative length of stay, and perioperative blood usage were improved by the use of off-pump CABG when compared with on-pump CABG.[11] The avoidance of CPB use may also provide beneficial effects on perioperative renal function by preserving pulsatility, and by preventing the adverse side effects of CPB.[4]

### **Patients and Methods:-**

This prospective non-randomized study included 60 patients who complained of symptoms of Coronary Artery Disease and subsequently underwent myocardial revascularization at National Heart Institute of Egypt, from July 2013 till May 2014.

### **Inclusion Criteria:-**

Any patient submitted to isolated elective CABG within the mentioned time interval with: A) Preoperative mild to moderate elevation of serum creatinine levels between 1.6 to 2.5 mg/dl. Level who do not require maintenance dialysis to support renal function. AND B): 1- Multi-vessel coronary artery disease. 2- Patients undergoing isolated on-pump (conventional) surgery. 3- Patients undergoing isolated off-pump (Beating Heart) surgery. 4- Controlled risk factors e.g.: hypertension, diabetes mellitus, hyperlipidemia, and smoking.

### **Exclusion Criteria:-**

1- Patients with normal serum creatinine levels. 2- Patients with single-vessel disease. 3- Patients undergoing emergency surgery. 4- Left ventricular ejection fraction < 30%. 5- Patients planned for OPCAB and reverted to on pump due to hemodynamic instability. 6- Patients for redo CABG.

### **Aim of the work:-**

In this study we compared the early results of isolated CABG, using on-pump and off-pump, in patients with preoperative mild to moderate elevation of serum creatinine (1.6 to 2.5 mg/dl) level whom do not require maintenance dialysis to support renal function. We examined if off-pump coronary revascularization offers a superior renal protection when compared with conventional coronary revascularization with cardiopulmonary bypass.

### **Methodology:-**

Patients were submitted for either group according to the surgeon's preference as follows: •□ Group A patients (the on-pump group): included those who underwent conventional myocardial revascularization by means of LIMA on LAD grafts plus additional SVGs. •□ Group B patients (the offpump group): included those who underwent off-

pump myocardial revascularization by means of LIMA on LAD grafts plus additional SVGs. The 2 groups were similar with respect to age, sex and preoperative variables.

#### Statistical analysis:-

Data was analyzed by Microsoft Office 2003 (excel) and Statistical Package for Social Science (SPSS) version 16. Parametric data was expressed as mean , SD, and non parametric data was expressed as number and percentage of the total.\* P value  $\leq 0.05$  is considered significant.

**Discussion:-****Risk Factors other than renal Insufficiency and preoperative data:-**

Analysis of the tables shows no significant difference in preoperative data and in risk factors percentages( smoking, hypertension,DM, Dyslipidemia, and previous MI) in both groups which indicates that no preference was made for any risk factor on aiming at off-pump as long as the patient was fulfilling the inclusion criteria for our study. In our study the percentage of hypertensive patients in both groups are higher by 10 % up to 40 % compared to some papers which as discussed below raised our attention towards the quality of our screening programs for hypertensive patients and recommending more follow up of such patients and these recommendations were raised to mortality and morbidity committee in Measurement of glycosylated haemoglobin [1] (HbA1c) and admission of patients with levels < 6% for the operation, and delaying the operation if HbA1c  $\geq$  6% is recommended. As HbA1c  $\geq$  6% was associated with an increased risk of postoperative superficial sternal wound infections and a trend for higher mediastinitis rate and significantly higher mortality three years after CABG[12]

**Preoperative abdominal and pelvic U/S:-**

Analysis of the preoperative abdominal and pelvic U/S shows there was no statistically significant difference between the two groups as 10 patients had normal U/S examination in both groups. As for the other findings, these are not considered to be risk factors for renal impairment postoperatively as Ultrasound of the kidneys is a useful screening tool for kidney stones, cysts and masses. It can assess complications of obstructive kidneys stones. It provides useful information when a patient is in renal failure or if there is blood found in the urine. It can also provide information for those suffering from repeated urinary tract infections. But it's not considered a renal function test.[13] Analysis of post operative results (as will be discussed later) showed no correlation between preoperative finding of abdomio-pelvic U/S and postoperative renal impairment.

**Operative Data:-**

Pump time: Comparing our pump time to different studies showed that our patients stayed for a longer time on the CPB, however, when this is plotted against number of distal anastomoses we have mean of 3.5 distal anastomoses /

patient compared to Loef, et al [14], Pramodh, et al [15], Vedin [16], and Ascione, et al [17]. that were less than 3. The more prolonged total time of surgery in the OPCAB group can be attributed to the relatively more difficult technical demands of the technique and the fact that before every anastomosis there is some time needed to stabilize the heart without compromising the hemodynamics. It also worth mentioning here that there was no incident of hemodynamic instability at any of our patient of the OPCAB group necessitating conversion to on-pump technique.

#### **Number of distal Anastomoses:-**

Analysis of the table shows no significant difference in number of distal anastomoses in both groups which indicates that no preference was made on aiming at off-pump as long as the patient was fulfilling the inclusion criteria for our study.

#### **Need for IABP:-**

Although slightly more patients in our study needed IABP support but the results are just slightly higher. Noted also that in the mentioned studies, including ours, more patients in the on-pump group needed IABP. In the On-pump group, the 3 patients who needed IABP were: Patient number 7: EF was 30%, Patient number 14: EF was 30%, Patient number 17: EF was 28% In the Off-pump group, the 2 patients who needed IABP were: Patient number 21: EF was 40%, Patient number 24: EF was 45%

So although more patients in the on-pump group needed IABP but these patients were more critical than the patients in the off-pump group with respect to EF criteria.

#### **Need for Inotropes:-**

In our study, few more patients in the on-pump group were put on inotropic support than in the off-pump group, intraoperatively. In other studies much more patients in the on-pump group were put on inotropic support, that may be to overcome periods of stunning after CPB. But there is a huge difference between the percentages of our total number of patients who were put on inotropic support in both groups when compared to other studies; this is due to the anesthesia protocol utilized in our center to transfer the patients on low dose inotropic support to the ICU.

#### **Post Operative Data:-**

Analysis of the postoperative laboratory results among the two groups shows there was no statistically significant difference between the two groups except for: • The Hemoglobin, which is lower in on-pump group due to hemodilution effect of CPB • The troponin, as we discussed before, the 6 patients who had recent infarction we preferred to do them on-pump. • Kidney function tests, this will be discussed separately in details later.

#### **Postoperative Vital Signs:**

Analysis of the postoperative vital signs among the two groups shows there was no statistically significant difference between the two groups except for: • The Heart Rate: lower in the off-pump group, this can be attributed to the usage of higher doses of inotropic support in the on-pump group. • The Diastolic Blood pressure: lower in the on-pump group, this is due to post CPB vasodilatation as the vasoconstriction present during the CPB gives way to vasodilation after CPB has been discontinued, and particularly after the administration of protamine [18]

#### **Postoperative need for blood transfusion:-**

Although there is no statistical significant difference between the two groups, on-pump group patients needed higher amounts of blood transfusion than off-pump patients in our study and in other studies, this is could be attributed to coagulopathic effect of CPB.

#### **Complications other than Dialysis:-**

##### **Re-opening for bleeding:-**

Our results are different from other studies regarding the rate of reopening for bleeding in the off-pump group which is even much higher than in our on-pump group. Moreover, both of our groups had a higher rate of reopening than other studies. We failed to explain this phenomenon. However, and due to these results, more attention were paid to our haemostasis and wound closure techniques.

**IABP post operative:** Apart from patients who needed IABP support intraoperatively:

• In the on-pump group, patient number 23 was complicated with AF and MI resulting in hemodynamic instability necessitating IABP support for 96 hours. • In the off-pump group patient number 10 was complicated with AF and MI resulting in hemodynamic instability necessitating IABP support for 48 hours.

**Myocardial Infarction:** Despite the technical precautions, newly developed postoperative ECG ischemic changes and elevated cardiac enzymes complicated the outcome of 3 patients in the on-pump group and 3 in the off-pump group. The incidence of postoperative MI in our study is comparable to other studies and it is also noted that there was no difference between both on and off-pump groups.

**Arrhythmias:** In the on-pump group 7 patients were complicated with Arrhythmias as follows: o Patient number 2 with 1st degree AV block. o Patients number 5, 7, 15, 19, 23, 27 with Atrial Fibrillation. In the off-pump groups 9 patients were complicated with Arrhythmias as follows: o Patients number 1, 7, 10, 14, 18, 23, 28 with Atrial Fibrillation. o Patient numbers 12, 25 with Ventricular Extra systoles. The incidence of postoperative AF in our study is comparable to other studies and it is also noted that there was no difference between both on and off-pump groups.

**ICU stay:** There is no statistical significant difference in ICU stay between the on-pump group and off-pump group in our study. Also noted that our ICU stay is much longer than other studies, this is due to our ICU protocol of Patient discharge. Comparison between pre and postoperative vital signs in on-pump group.

#### **Renal Dysfunction:-**

According to ACC/AHA 2004 Guideline Update for Coronary Artery Bypass Graft Surgery, the first major multicenter study of renal dysfunction after CABG surgery was published in 1998. This study of 2222 patients who underwent myocardial revascularization with CPB defined postoperative renal dysfunction (PRD) as a postoperative serum creatinine level of greater than or equal to 2.0 mg/dL or an increase in the serum creatinine level of greater than or equal to 0.7 mg/dL from preoperative to maximum postoperative values.[19] In on-pump group According to the criteria mentioned in the guidelines we have 13 patients in the on-pump group Vs only one patient in the off-pump group diagnosed as (PRD) Postoperative Renal Dysfunction. These previous tables and graphs showed that in the 13 patients in the on-pump group and the one patient in the off-pump group who were diagnosed as having PRD, according to the increase between pre and postoperative serum creatinine levels, showed incremental decline in other kidney function tests as noted with levels of BUN and Creatinine clearance but no notable change in albuminuria levels. PRD Patients who required dialysis: In the on-pump group, there were 6 patients who required dialysis. These patients were number: 3, 7, 21, 23, 26, 27 and they were among the group of 13 patients whom were diagnosed as PRD. So the questions is why these 6 patients especially? Another question, can we predict patients who will require dialysis? The same applies for the off-pump group, where only 3 patients required dialysis (patients number 1, 13, 15) but only 1 was diagnosed as suffering PRD so again stay the same questions. To answer these questions we will compare the 6 patients in the on-pump group to the rest of the 13 patients, and we will examine the 3 patients in the off-pump group this will be done via plotting these patients in the Cleveland Clinic Foundation Acute Renal Failure Scoring System[20] Cleveland Clinic Foundation Acute Renal Failure Scoring System: • Female gender--1 • Congestive heart failure-- 2 • LV ejection fraction <35%-- 1 • Preoperative use of IABP-- 2 • COPD-- 1 • Insulin-requiring diabetes-- 1 • Previous cardiac surgery-- 1 • Emergency surgery-- 2 • Valve surgery only (reference to CABG)-- 1 • CABG+ valve (reference to CABG)-- 2 • Other cardiac surgeries-- 2 • Preoperative creatinine 1.2 to < 2.1 mg/dl-- 2 • Preoperative creatinine  $\geq$  2.1-- 5 For the 3 off-pump patients the results came as they were supposed to be and this scoring system was valid to predict postoperative renal dysfunction in this group. BUT, in the on-pump group the results were not accurate in predicting PRD, which could be attributed to the following:[21] 1. There is no parameter in this scoring system to consider the various pathophysiological parameters of the CPB. 2. Throughout the literature there is a strong agreement that multiple risk factors and multiple pathological and physiological factors interact together to affect the kidney functions such as: a. Preoperative factors: i. Lack of renal reserve. ii. Renovascular disease. iii. Prerenal azotemia. iv. Recent diuresis. v. NPO status. vi. Impaired LV function. vii. ACEI / ARB. viii. Nephrotoxins. ix. Intravenous contrast. x. Other medications. xi. Endotoxemia. xii. Inflammation. b. Intraoperative: i. Decreased renal perfusion. ii. Hypotension. iii. Lack of pulsatile flow. iv. Vasoactive agents. v. Anesthetic effects. vi. Embolic events. vii. CPB-induced Inflammation. viii. Nephrotoxins. ix. Hemolysis. c. Post Operative: x. Systemic inflammation. xi. Reduced LV function. xii. Vasoactive agents. xiii. Hemodynamic instability. xiv. Nephrotoxins. xv. Volume depletion. xvi. Sepsis.

Another study suggested also that the following are risk factors: • Age (yr). • Weight (kg). • Preoperative creatinine (mg/dl). • Cardiopulmonary bypass time (minutes).[20]

From the above there is no single accurate investigation that can predict renal function outcome after cardiac surgery in general, and this notion gained acceptance in the literature as we discussed before in the previous chapters of this current study, but still to validate this hypothesis we have to discuss each patient whom required dialysis separately.

The on-pump group patients. Analysis of the previous two tables strongly confirms the interaction of multiple risk factors on the outcome of renal affection. In most of the reviewed studies including ours, renal function is better preserved in patients undergoing off-pump CABG than those undergoing onpump CABG. Also, its notable that, in our study, there is higher percentage of patients who developed PRD requiring dialysis postoperatively than in the other different studies, especially in the on-pump group but this is expected as the criteria of inclusion for all our patients was “patients with preoperative renal impairment (serum creatinine 1.6-2.5 mg/dl)” but some of these studies included patients with normal serum creatinine preoperatively and measured the affection beyond normal renal function, and as we mentioned before the preoperative renal impairment is considered by itself a risk factor for postoperative renal dysfunction.

### **General Measures to prevent renal dysfunction after Cardiac Surgery:-**

**Identification of High-Risk Patients.** In patients who undergo cardiac surgery, identifying patients who are at high risk for ARF is critically important. The important risk factors and scoring systems that can be used for this identification purpose have been discussed before.[21] Optimization of renal perfusion and avoidance of nephrotoxins.[21] Factors that alter renal blood flow and lead to prerenal azotemia should be identified and corrected. Treatment of volume depletion and congestive heart failure before cardiac surgery will increase cardiac output and renal perfusion. Perioperative hydration and the use of hemodynamic monitoring and inotropic agents to optimize cardiac output may be necessary. It is unknown whether intraoperative optimization of bypass flow, perfusion pressure, and oxygen delivery would affect the subsequent development of renal dysfunction, although conceptually this would seem to be a reasonable goal. Medications such as NSAID and other nephrotoxic agents should be discontinued. Whether ACEI and ARB should be discontinued before surgery is not known and is a source of some debate[22]. If radiographic contrast is needed, then newer isosmolar contrast agents may be less toxic.[23] In stable patients, cardiac surgery should be postponed in patients with contrast-induced ARF. Pharmacologic Interventions to Prevent PRD after Cardiac Surgery.[21] Pharmacologic interventions have been attempted with inconsistent results, and at this time, there are no known drugs that have demonstrated conclusively renal protection. The failure of these measures to prevent ARF after cardiac surgery may be related in part to a number of factors. First, the pathophysiology of ARF after CPB is more complex than originally considered and simple approaches to target single pathways are unlikely to succeed. Second, late pharmacologic intervention is likely to meet with failure. Third, patient populations that have been studied are often at low risk for renal dysfunction after CPB, thus potentially masking small beneficial effects of therapies. Last, most clinical trials enroll a small number of patients and are powered inadequately to detect small benefits. Most therapeutic trials in ARF after CPB have been prevention studies in which treatment was initiated before the insult and in the majority of cases have shown no significant benefits. Diuretics may reduce the severity of ARF by preventing tubule obstruction and decreasing oxygen consumption.[24] In a double-blind, randomized, controlled trial, furosemide treatment was found not to be protective as the incidence of ARF was twice that of the dopamine or placebo group.[25] Similar negative results have been seen in other studies[24]. Mannitol has a variety of effects, including the production of an osmotic diuresis with a reduction of tubular obstruction, as well as the capability of scavenging free radicals. It is often added to the prime solution during CPB, with the thought that it may help to maintain urine output during the procedure, minimize tissue edema, and serve as a free radical scavenger.[25] An early study in children who underwent cardiac surgery demonstrated that prophylactic administration of mannitol (0.5 g/kg body wt) was beneficial in the prevention of ARF.[26] Fisher et al.[27] demonstrated that mannitol added to the CPB prime solution was effective at maintaining urine output at varying doses. However, several other studies did not confirm these findings, and the potential role of mannitol remains unclear. In fact, Carcoana et al[28] showed an increased urinary excretion of  $\beta$ -2 microglobulin in patients who received mannitol and dopamine, suggestive of increased tubular injury in this group. Sirivella et al. randomly assigned 100 patients with postoperative oliguric or anuric renal failure to therapy with either intermittent doses of loop diuretics or a continuous infusion of mannitol, furosemide, and dopamine (2 mg/kg per min).[29] Whereas 90% of patients who received the intermittent diuretic required dialysis, only 6.7% of the patients who received the continuous mannitol, furosemide, and dopamine infusion required dialysis. Furthermore, early therapy with this "cocktail" was associated with early restoration of

renal function. Future studies are required before this approach can be broadly recommended. Drugs that Block Inflammation Inflammation is well documented to occur during CPB and has a prominent role in the pathogenesis of ARF and CPB.[30] It thus is an attractive therapeutic target. Pentoxifylline a phosphodiesterase inhibitor, blocks the activation of neutrophils by TNF- $\alpha$  and IL-1 and TNF- $\alpha$  release by inflammatory cells.[31] Pentoxifylline has been demonstrated to reduce cardiac dysfunction and TNF- $\alpha$  release in ischemia-reperfusion models[32]. However, pentoxifylline did not affect renal function in elderly patients who underwent cardiac surgery[33]. Dexamethasone also failed to protect against renal dysfunction after cardiac surgery.[14] A recent study examined the effect of blocking complement activation in patients who underwent CPB. A single-chain antibody specific for human C5 (pexelizumab) was found to block complement activation and postoperative myocardial injury. However, renal function was not an outcome measure of this pilot study.[34] N-acetylcysteine (N-AC) has been shown to block inflammation and oxidant stress in cardiac surgery patients and thus may hold promise as a simple, nontoxic protective measure.[35] However, N-AC has not been used in a prospective clinical trial that examines renal outcomes. N-AC has been studied most extensively in the prevention of radiocontrast-induced nephropathy. In this area, the utility of N-AC has been questioned with the publication of a meta-analysis of 16 controlled studies that demonstrated no protective benefit.[36] Other Strategies. The sympathetic nervous system is activated during and after cardiac surgery and may lead to impairment of renal function through a hemodynamic mechanism. Clonidine (B2 agonist) has been used to attenuate these effects, with improvement in hemodynamic stability during CPB[37]. In a study of 48 normal risk patients who underwent cardiac surgery, preoperative treatment with clonidine prevented the deterioration of renal function in this small trial, with creatinine clearances significantly higher in the clonidine-treated group 24 h after CPB.[38] Diltiazem has been used in clinical trials to prevent ARF after cardiothoracic surgery. Diltiazem has been shown to inhibit some of the inflammatory effects of CPB and is often used to prevent vasospasm of radial grafts.[39] Although diltiazem reduced urinary excretion of markers of tubule injury ( glutathione s-transferase and N-acetyl- $\beta$ glucosaminidase), [40] its effectiveness in the prevention of renal dysfunction was inconsistent.[41] In patients who were at highest risk for PRD, prophylactic hemodialysis has been attempted. In a single study, 44 patients with a baseline serum creatinine  $>2.5$  mg/dl were randomly assigned to either perioperative prophylactic dialysis or dialysis only when postoperative ARF that required the procedure was indicated (control). In the group that received prophylactic dialysis, mortality was 4.8 versus 30.4% in the control group. Furthermore, postoperative ARF that required dialysis was reduced from 34.8% in the control group to 4.8% in the intervention arm. These results will have to be repeated in other randomized, controlled studies before this invasive approach can be broadly recommended.

### Conclusions&Recommendations:-

**From reviewing the literature and from our results in this study we concluded that:-**

- Safety and success of the off-pump CABG surgery along with the new concerns about economics, together with advantages over CPB in avoidances of its recognized risks, added in resurrection of this technique in the past decade.
- Analysis of postoperative results showed no correlation between findings in abdomio-pelvic U/S and postoperative renal impairment.
- Cleveland Clinic Foundation Acute Renal Failure Scoring System does not take in consideration the various patho-physiological parameters of the CPB.
- Throughout the literature there is a strong agreement that multiple risk factors (pre, intra, and postoperative) and multiple pathological and physiological factors interact together to affect the kidney functions.
- In general, there is no single accurate investigation that can surely predict renal function outcome after cardiac surgery.
- General Measures to prevent renal dysfunction after Cardiac Surgery should be utilized in all patients with special attention to those with preoperative renal dysfunction.
- Regarding postoperative renal dysfunction and need for dialysis, results were in favor of the off-pump technique.
- Renal function is better preserved in patients undergoing off-pump CABG than those undergoing on-pump CABG.
- CPB is associated with a higher risk for PRD, and this injury is associated further with substantial morbidity and mortality.
- At present, no pharmacologic interventions have demonstrated conclusively efficacy in the prevention of renal dysfunction after cardiac surgery.
- The pathogenesis of kidney injury during CPB is complex and involves hemodynamic, inflammatory, and other mechanisms that interact at a cellular level.
- Ultimately, a successful therapy will utilize strategies that target these multiple pathways. This integrated strategy would target hemodynamic, inflammatory, and oxidative pathways and act at the points of proximal cellular injury.
- CPB offers an attractive model to study these pathways, because the timing of the insult is known and potentially modifiable.

#### Abstract

**Background:** With advances in medical therapy and life expectancy, reoperation to replace dysfunctional mechanical heart valve prosthesis is an increasingly common procedure and there have been gradual decreases in perioperative risk for redo valve surgery over the past 2 decades

**Aim of the work:** The aim of this study was to investigate the overall outcome of adult patients undergoing redo-mitral valve replacement (redo-MVR).

**Patients and Methods:** forty cases had previous mitral valve replacement were admitted for redo mitral valve replacement. They were divided into two groups:

Group (A): (Twenty cases) were admitted as emergency cases from the ER.

Group (B): (Twenty cases) were admitted from out patient clinic as elective cases.

**Results:**The hospital mortality was (20%). There was no effect regarding age, sex, cardiac rhythm, number of previous operations, type of the previous prosthesis, and interval from last implantation. Taking in consideration that mortality was higher with emergency group (15%).

**Conclusion:** pre operative parameters of morbidity and mortality that showed higher incidence in emergency group were: NYHA functional class, LVEDD, LVESD dimensions, Redo cardiac surgery, Infective endocarditis, left ventricular dysfunction EF less than 35.

#### Introduction:-

Since the first valve replacements in the 1950s, major advances have been made in mitral valve (MV) surgical technique, prosthesis design and peri-operative care. Improved survival has inevitably meant that more patients require redo-MVR during follow-up. However, redo surgery may be associated with significant risk, which must be balanced against the benefits to the patient. Avoiding the complications of redo-sternotomy such as injury to prior grafts and haemorrhage must be taken in consideration. (Khan & Younan, 2009). Patients undergoing valve reoperations have a diverse and complex clinical profile. Thrombi may form on mechanical valves and cause orifice obstruction, leaflet malcoaptation, and acute valvular dysfunction (Tang, et al., 2007; Mahesh, et al., 2005). So, redo valve surgery is associated with a higher operative mortality rate than first time valve surgery and certain risk

factors may be preventable (Tang, et al., 2007; Rankin, et al., 2006). With advances in medical therapy and life expectancy, reoperation to replace dysfunctional mechanical heart valve prosthesis is an increasingly common procedure and there have been gradual decreases in perioperative risk for redo valve surgery over the past 2 decades, likely due to increased surgical experience, better myocardial protection, and improved patient management. However, mortality rates remain higher than first-time valve replacement surgery (Rankin, et al., 2006; Borger, et al., 2002). Several studies have been studying the predictors of mortality during reoperative valve surgery (Rankin, et al., 2006; Borger, et al., 2002).

**Aim of work:-** The aim of this study was to investigate the overall outcome of adult patients undergoing redo-mitral valve replacement (redo-MVR).

### Patients and Methods:-

Forty cases had previous mitral valve replacement were admitted for redo mitral valve replacement. They were divided into two groups: Group (A): (Twenty cases) were admitted as emergency cases from the ER. Group (B): (Twenty cases) were admitted from out patient clinic as elective cases. All patients were opened through median sternotomy and cardiopulmonary bypass with aorto-bicaval cannulation. A mechanical valve is inserted with horizontal mattress pledgeted non absorbable sutures.

### Inclusion criteria:-

surgery for prosthetic endocarditis. Surgery for para-valvular leak. Surgery for structural valve degeneration. Surgery for prosthetic valve thrombosis .

### Exclusion criteria:-

Impaired renal or liver functions. previous cerebro-vascular disease. impaired respiratory functions( eg. Chronic obstructive pulmonary disease, emphysema, suppurative lung disease, etc..) concomitant coronary artery disease or aortic valve disease

**Figure 1:-** A showing intraoperative view of a stuck mitral valve prosthesis. & B showing a thrombus obstructing the mitral valve with a large left atrial thrombus .

### Statistical analysis:-

patients categorical predictor variables and outcomes were analyzed using Pearson Chi-Square ( $\chi^2$ ) test for Independence. Statistical analysis was performed using Microsoft® Office Excel 2010 and SPSS (Version 20, 2011).  $P$  value < 0.05 was considered statistically significant.

### Results:-

Forty cases underwent redo mitral valve replacement in department of cardiac surgery in National Heart Institute and Cairo University in the period between November 2012 and November 2014 after obtaining local ethical approval. There were 17 males (42.5%) and 23 females (57.5%), the age ranged between 22 and 58 years with a mean of 40 years. The predominant NYHA score classification was (II) =13 patient (32.5%), followed by (I)=11 patient (27.5%), then (III)=10 patients (20%), and finally (IV)= 6 patients (15%). Considering hemo-dynamics 5 patients were unstable (12.5%), 5 patients arrived operation room (OR) shocked with pale cold skin, low urine output, tachypnic, tachycardic and reduced conscious level, 30 patients were stable (75%), 5 patients were on inotropes (12.5%). Regarding number of previous mitral valve replacement 33 patients (82.5%) had previous mitral valve replacement once before, 6 patients (15%) had it twice, 1 patient (2.5%) had it thrice.

**Table 1:-** showing demographic data of the patients,

	Elective MVR	Emergency MVR
Age (span)	24-55	22-58
Gender	11 male/ 9 female	6 male/14 female
Body surface area( normal expressed by BMI less than 25 )	18 normal/ 2 over wt	19 normal /1 over wt
Euro score II	(2- 30%)	(15-60%)
NYHA score	I => 11 II=> 5 III=>4 IV=>0	I=>0 II=>8 III=>6 IV=>6
Previous MVR		
Once	18	15
Twice	2	4
Thrice	0	1
Bioprosthesis	1	0
Mechanical	19	20
Time to re-operation	(2 month- 19 .5 year)	(6 month- 15 year)
Indications for re-operation		
Thrombosis	14	12
Paravalvular leak	5	4
Endocarditis	0	4
Degenerative	1	0
Hemodynamic stability	20 stable	10 stable 5 on inotrope 4 shocked 1 shocked and arrested with induction

Indications for re-operation were thrombosis in 26 patient (65%) , paravalvular leak in 9 patients (22.5%), endocarditis in 4 patients (10%) and degenerative 1 patient (2.5%). Considering preoperative echo data : ejection fraction varies from (40-72%), and 2 cases were below than 50%.

**Table 2:-** pre-operative ejection fraction

Pre-op Ejection fraction	Elective	Emergency	Total
Good(> 50%)	18	8	26
Moderate(< 50% and >25%)	2	7	9
Poor (<25%)	0	0	0
<b>Total</b>	20	15	35

**Table 3:-** showing preoperative data.

	Elective MVR	Emergency MVR
Ejection fraction	( 42- 72%) 18 cases above 50% 2 cases below 50%	(40- 62 %) 5 cases were not assessed pre operative
LVESD	( 2.6 – 4.9)	( 2. 5 – 4.6)
LVEDD	(4.9 – 7.9)	(4.7 – 8.0)
Tricuspid regurge	17 severe TR 3 moderate TR	14 severe TR 1 moderate TR 5 cases were not asses
Atrial thrombus	14 cases	12 cases
Gradient (max)	( 11 -23) mmhg	(16- 26) mmhg
Gradient (mean)	(6- 14) mmhg	( 9 – 18)
Mitral valve area (cm2)	(0.3 -2.7) cm	(0.4 – 2.6) cm
Systolic pulmonary artery pressure	(20 – 74) mmhg	(25- 85) mmhg

Tricuspid regurge was found in all pre operative assessed cases, severe tricuspid regurge in 31 patients (77.5%) and moderate tricuspid regurge 4 cases (10%). Atrial thrombus was found in 26 patients (65%). Prosthetic valve gradient varied from (11-26 mmHg) as maximum gradient, and (6-18 mmHg) as mean gradient. Mitral valve area ranged from (0.3 -2.7%) cm<sup>2</sup>. systolic pulmonary artery pressure ranged from (20-85%) mmHg.

**Table 4:-** showing .Intra operative and immediate post operative events

	Elective MVR	Emergency MVR
Cross clamp time	(55 -145) min	(65- 185) min
Cardio pulmonary bypass time	(75- 240) min	(90 -260) min
Concomitant procedure	20 de vega	16 de vega
Type of prosthesis settled	Monleaflet 1 Bileaflet 18 Bioprothesis 1	Ball and cage 1 Bileaflet 19
Blood loss	2 cases Catastrophic blood loss	4 cases catastrophic blood loss
Pace maker device intra operative	3 cases	3 cases
Haemo filtration need	12 cases	15 cases
Intra operative mortality	1 case	4 cases
First two day ICU mortality	1 case (poor LV function)	2 cases (poor LV function)
Re opening (2 <sup>nd</sup> look)	1 case ( bleeding)	1 case ( open chest)
Prolonged ICU stay (> 7 days)	2 cases 1 (chest infection) 1 ( weaning inotrope)	3 cases 2 ( chest infection) 1 ( weaning inotrope)
Need for dialysis	0	1 case

**Considering intra operative and immediate post operative data:-**

Cross clamp time is a little bit shorter in elective cases (55-145) min compared to (65-185)min for emergency cases, and bypass time goes with the same sequence (75-240) min for elective cases and (90-260) min for emergency cases. Prosthetic valve types were as following; 1 patient (2.25%) with monoleaflet valve , 1 patient (2.25%) with ball and cage , 1 patient (2.25%) with bioprothesis , most of cases were bileaflet 37 patient (92.5%). Intra operative events included Catastrophic blood loss occurred in 6 patients (15%). Epicardial lead temporary pacemaker was needed in 6 patients (15%) also, most of cases needed hemofiltration 27 patients (67.5%). Intra operative mortality were 1 case (2.25%) for elective cases and 4 cases (10%). hospital mortality was 1 case (2.25%) for elective cases and 2 cases for emergency cases due to poor contractility. 2<sup>nd</sup> look was needed for 1 case in elective cases due to bleeding , and 1 case for emergency (open chest ).*Considering post operative data* :Permenant pacemaker was needed for 1 case. Residual infective endocarditis remained in 1 case (fungal type).1 case had cardiac tamponade (patient was discharged and came back 3 week later to emergency department with severe dyspnea , echo revealed massive effusion that was drained with subxiphoid incision )and 1 case left hospital with lt side hemiparesis.

(It is worth saying that these complications occurred in the emergency group.)*Considering post operative 6 month echo data* : Ejection fraction improved in most of cases , also left ventricle dimensions. Residual tricuspid regurge in 6 patients (15%) of each group a sum of 12 patients (30%). Gradients also decreased in all patients , maximum gradient ranged from (6-12) mmHg for elective group , and almost the same for emergency group (6-14) mmHg. Also mitral valve area ranged from (1.8- 3.1) cm<sup>2</sup> for both groups.Elective cases had a much better outcome considering mortality (2 cases for elective group compared for 6 cases for emergency group) and morbidities.

Delayed (6 m) mortality	0	0
Over all mortality	2 cases	6 cases

**Discussion:-**

The reported mortality risk of elective re-operation may be as low as 5.4% to 11%, while, for emergency procedures, it could be as high as 38 to 61.5%. Replacement operations in emergency cases are generally performed in a functionally compromised group of patients, so these patients tolerate complications poorly in comparison to elective cases. *{FormattingCitation}(Sampath Kumar et al., 2002; Wauthy, Goldstein, Demanet, & Deuvaert, 2003)*. Nevertheless, there is evidence that clinical outcomes following redo-valve surgery have improved especially in emergency cases owing to advancement in cardiac critical care units (*Vohra et al., 2012*). In particular, it is necessary to identify the perioperative variables (including technical complications and the patients' preoperative condition in both emergency and elective cases) in order to offer patients the most appropriate interventions. (*Vohra et al., 2012*). In this study, the overall hospital mortality was 8 patients (20%), (2 cases for elective group (5%) one intra operative mortality and one ICU mortality compared to 6 cases for emergency group (15%) with four cases intra operative mortality and two cases ICU mortality). Brandao et al reported a hospital mortality of 10.9% for emergency redo cases. (*de Almeida Brandão et al., 2002*). In another study done in 2002, Kumar and associates reported mortality of 11% in emergency redo mitral valve operation (*Sampath Kumar et al., 2002*). Overall operative mortality was 8.4% in elective redo mitral operations (*Beghi et al., 2002*). Wauthy et al. observed in elective redo valve surgery a mortality rate of 8% (*Wauthy et al., 2003*). Such difference in mortality may be; as mentioned by Wauthy, related to technological evolutions of cardiac critical care units (e.g. defibrillation patches, improved ECC technology, the use of ECMO, the Cell Saver, etc.) and increased surgical experience. In this study, mortality in relation to NYHA classification were 2 cases (5%) from the elective group NYHA III, while it was 6 cases (15%) for emergency group (5 cases (12.5%) NYHA IV) and (1 case (2.5%) NYHA III). NYHA functional class IV was also a risk factor in short term survival as mentioned by Akay and associates and others in many studies (*Akay et al., 2008*). Our conclusion regarding NYHA classification as a statistically significant factors for mortality in both groups. Vohra et al also confirmed that New York Heart Association functional class was highly significant for operative mortality; as operative mortality in their study was 4% for functional classes (I through III), and 19% for functional class (IV), they reported NYHA functional class as an important risk factor for hospital mortality. NYHA FC is considered as the most frequently quoted risk factor associated with death in redo valve surgery. This was due to that mortality in their study reached up to 30% with stage IV (half cases were emergency) compared to less than 10% in stage II and III (all cases were elective). (*Vohra et al., 2012*). Considering morbidities, reopening was done in 1 case (2.5%) for elective group and 1 case (2.5%) that was left open chest for emergency group. This morbidity was not statistically significant between the two groups. Akay and associates reported bleeding in 5.6% of his patients with equal incidence for both emergency and elective cases (*Akay et al., 2008*). Pother et al had excessive postoperative bleeding (more than 1,000 mL in the first 24 postoperative hours) occurred in 14.5% (9% were for emergency group) of patients while re-exploration was done in only 8% of them (*Potter et al., 2004*). In this study, need for dialysis 1 case (2.5%) due to constant rising creatinine and potassium levels in emergency group. 6 cases (15%) had renal dysfunction 4 cases in emergency group (10%) and 2 cases in elective group (5%) in form of rising creatinine level that responded to diuretics and drug dose adjustment. Akay and associates reported 14.2% with postoperative renal dysfunction 10% for emergency group (*Akay et al., 2008*). Preoperative renal impairment, CVS, prolonged bypass time and cross clamp time are risk factors for postoperative renal dysfunction. In this study, permanent pacemaker was installed in 1 case (2.5%) in emergency group due to complete heart block that did not recover after 14 days. This morbidity was not statistically significant between the two groups. Pother et al had complete heart block and brady arrhythmia in 3% of cases of redo mitral valve surgery only 0.3% of cases needed permanent pacemaker (one case after redo aorta and mitral). (*Potter et al., 2004*). In this study, cerebrovascular accident (inform of left hemiparesis) was noticed in 1 case (2.5%) in emergency group. Hemodynamic instability and disturbed conscious level in absence of evidence of stroke were noticed in 5 patients (12.5%) in emergency group with 1 case (2.5%) that arrested with induction. This makes this parameter of statistically significance between the two groups. Potter in his study in 2004 documented 2.8% stroke in patients with repeated mitral valve replacement (75% of cases occurred in emergency cases. (*Potter et al., 2004*). Residual infective endocarditis evidenced by blood culture was

noticed in 1 case (2.5) in the emergency group. This morbidity was not statistically significant between the two groups. In our study the cause of this prolonged time for bypass was in most cases due to extra time needed for circulatory support due to associated left ventricular dysfunction. Mean cross clamp time for elective cases were 100 min and for emergency cases 125 min, as for bypass time were 157.5 min and 175 min respectively. This was not statistically significant for both groups. McGrath et al stated that long bypass time and long cross clamp time are predictors of mortality (*Wauthy et al., 2003*). Brandão mentioned that among the intraoperative variables associated with higher hospital mortality was Cross clamp time longer than 120 min (*de Almeida Brandão et al., 2002*). Global myocardial ischemic time alone was a strong predictor of hospital mortality in many studies. In contrary others had denied both factors as significant predictors for the hospital mortality (*Potter et al., 2004*). In our study, the sex (11 male, 9 female ) for elective group and (6 male, 14 female) for emergency group and age of patients mean for elective group (39.5 years) and mean for emergency group (40 years) were not statistically significant in both groups. Vohra et al showed that sex and age did not affect the outcome in both elective and emergency groups (*Vohra et al., 2012*). Another study done by Akay and co-workers shows that re-do cardiac surgery in patients over the age of 70 can be undertaken with acceptable operative morbidity and mortality. Advanced age is associated with decreased physiologic reserve and increased comorbid factors. Their functional reserve capacity is diminished compared with younger patients. They confirmed that females are significantly labile to mortality than males (*Akay et al., 2008*). In our study thrombosis was found in 26 patient (65%) with 14 (35%) elective cases and 12 (30%) emergency cases. paravalvular leak in 9 patients (22.5%) including 5 (12.5%) elective cases and 4 (10%) emergency cases, endocarditis in 4 patients (10%) all were emergency cases and 1 elective degenerative valve case (2.5%) . Indication of reoperation had no statistically significance regarding outcome for both groups. Brandao and Vohra mentioned that the indication for surgery had no impact on in-hospital mortality (*de Almeida Brandão et al., 2002; Vohra et al., 2012*). According to Maciejewski et al ; operative mortality was significantly higher in those patients who reoperated because of prosthetic endocarditis (*Maciejewski et al., 2011*). Presence of valve infection is also a predictor (*Potter et al., 2004*). Other observations suggest that the factors responsible for higher mortality are active infective endocarditis and valve thrombosis (*Sampath Kumar et al., 2002*). In our study Atrial fibrillation was observed in all patients (100%), this may be attributed to the fact that the main cause of the primary surgery for valve replacement was due to rheumatic affection but its effect on hospital mortality was not significant. Atrial fibrillation has been identified as a risk factor for mortality and morbidity associated with valve surgery (*Maciejewski et al., 2011*), as it may cause low cardiac output during the postoperative period or predispose to thromboembolic events. In our series, atrial fibrillation was not identified as a risk factor for hospital mortality. In our study, 33 patient (82.5%) had the operation once before (18 cases (45%) from elective group and 15 cases (37.5%) from emergency group). And 6 cases (15%) had it twice before (2 cases (5%) for elective group and 4 cases (10%) for emergency group. 1 case (2.5%) from elective group had it three times before. Number of prior operations did not show a significant effect on outcome on both groups. Although there was a trend to higher operative mortality with increasing number of prior cardiac operations, this factor was not significant in multivariable analysis.. Some reported that second reoperations were not more risky than first reoperations, but by the third reoperation, risks were high for all subgroups. This was confirmed by Beghi et al where the number of previous reoperations was independent determinant for reoperation (*Beghi et al., 2002*). Our study suggests that left ventricular dysfunction was associated with higher hospital mortality in both groups (1 case (2.5%) for elective group and 2 cases (5%) for emergency group). This was statistically significant. Low left ventricular ejection fraction (less than 35%) and increased LVEDD more than 50 mm have been reported of significance in mortality by Akay and associates (*Akay et al., 2008*). According to Maciejewski et al operative mortality was significantly higher in those patients who were had impaired left ventricular function (*Maciejewski et al., 2011*).

### Conclusion:-

Redo valve surgery is an increasingly common problem. Recent decades have seen a steady increase in the number of cases referred for redo cardiac surgery, which are associated with increased risk of morbidity and mortality compared to the first-time operations. Many studies were done to address the outcome ( mortality and morbidities) following redo mitral valve replacement. forty cases had previous mitral valve replacement were admitted for redo mitral valve replacement. They were divided into two groups: Group (A): (Twenty cases) were admitted as emergency cases from the ER. Group (B): (Twenty cases) were admitted from out patient clinic as elective cases. The hospital mortality was (20%). There was no effect regarding age, sex, cardiac rhythm, number of previous operations, type of the previous prosthesis, and interval from last implantation. Taking in consideration that mortality was higher with emergency group (15%). In conclusion, pre operative parameters of morbidity and mortality that showed higher incidence in emergency group were: NYHA functional class , LVEDD , LVESD

dimensions, Redo cardiac surgery sternotomy and adhesio-lysis carries a significant risk of catastrophic bleeding especially with the rush accompanying hemodynamic instability, Infective endocarditis, left ventricular dysfunction EF less than 35. Post operative morbidities noticed in emergency group were : (cardiac tamponade, permanent pacemaker, residual infective endocarditis , need for dialysis and cerebro vascular accidents ) were not statistically significant.

#### Abstract

Primary Cutaneous T-Cell Lymphoma (CTCL) poses a diagnostic challenge. The diagnosis can be delayed for years due to the similarities to common skin diseases such as psoriasis. The discrimination between clinical and histopathological is crucial for optimal diagnosis and treatment. The treatment of CTCL requires multidisciplinary approach and combinations therapy such as chemotherapy, biological therapy, & Extra-Corporal Phototherapy (ECP). Stem Cell Transplantation (SCT) plays a role in treatment of CTCL. Autologous Stem Cell Transplantation (ASCT) is associated with lower toxicities, but higher relapse rate, whereas Allogeneic Stem Cell Transplantation (Allo-SCT) is associated with lower relapse rate, but is associated with higher morbidity and mortality. Here we present a case of CTCL that was misdiagnosed as psoriasis and finally the correct diagnosis was reached and appropriate treatment was initiated. We here explore the diagnostic challenges and the therapeutic options.

#### Introduction:-

Primary cutaneous T-cell lymphomas (CTCL) are heterogeneous group of extra-nodal non-Hodgkin lymphoma, which is confined to the skin. The most common type of cell is T-cell derived which represents approximately 75% of the cases. It is classified into two main categories there are Mycosis Fungoid (MF), which has generally indolent behavior and Sezary Syndrome (SS), which is an aggressive and leukemic variant. MF and SS present with numerous variants that mimic benign skin conditions such as eczema, folliculitis, pigmented purpuric dermatoses, psoriasis, and vitiligo. Even after histological examination MF can resemble inflammatory dermatoses. MF can pose diagnostic challenges for dermatologist, but not for pathologist.<sup>[1]</sup>

#### Epidemiology:-

Surveillance, Epidemiology, and End Results (SEER) registry data, show the incidence of CTCL is the highest between male and African Americans. CTCL is not common in pediatric and young adult populations, often associated with histopathological variants of MF. The median age of diagnosis is mid-50s and increase 4-fold in patient over 70. Patient with MF and SS are significantly at increased risk of developing second lymphoma, Hodgkin lymphoma and CTCL subtype lymphomatoid papulosis as well as non-hematological malignancy.<sup>[1]</sup>

• Cutaneous $\gamma/\delta$ T-cell lymphoma	<b>&lt; 1%</b>	-
Cutaneous NK/T-cell lymphoma, nasal type	<b>&lt; 1%</b>	-

#### **Etiology:-**

MF is believed to develop as a result of chronic antigenic stimulation that leads to uncontrollable clonal expansion and the accumulation of T helper and memory T cells in the skin. Infections have been suggested have a role in development of MF particularly staphylococcus aureus (*S. aureus*). One study found high rates of *S. aureus* colonization's in patient with erythrodermic MF (EMF) and SS with clinical improvement of both conditions after antimicrobial treatment of the infection. Most CTCL serologically are associated with human T-Lymphotropic virus type 1 (HTLV-1). Other viruses have been identified in patients with CTCL like Epstein-Barr virus (EBV) and Cytomegalovirus (CMV) but the evidence that support virus as the etiology of disease is minimal. Immunosuppression medication is considered an risk factors for development of the disease. Certain occupations can put the patient at risk to develop the disease such as working in the glass, pottery and ceramic industry, but still the evidence is controversial. Also, military exposure, herbicide exposure has been linked to non-Hodgkin lymphoma, but still non-specific to CTCL.<sup>[2]</sup>

#### **Clinical presentation:-**

1. Classic patients with mycosis fungoides (MF) present with slowly progressive disease over years. Patients can present with a patch plaque on the skin of non-exposed areas such as breast, buttocks, lower trunk and groin. These patch plaques progress to tumor at the end.
2. Sezery Syndrome (SS) and Erythrodermic Mycosis Fungoides (EMF) are aggressive and leukemic CTCL variants characterized by atypical T- cell (sezery cell), diffuse (erythroderma) and severely disabling pruritus with or without lymphadenopathy. Some may have non-specific dermatitis. SS usually arises de novo in short time or takes indolent course arising from Classic MF.
3. Erythrodermic MF presents with erythroderma and together with SS formerly erythrodermic CTCL. EMF is generally considered a progression of MF and distinguished from SS by absent or minimal blood involvement. A low burden tumor of circulating sezery cells is seen in the circulation without meeting the criteria of SS. The skin appearances in EMF range from mild erythema to generalized exfoliative with keratoderma and fissures on the palm and soles. These finding may be associated with hair loss, electrolytes imbalance, hypothermia and eyelid change/ ectropion. Also, these can be missed in elderly people and attributed to advanced age, drug reaction, or infection. Generalized Seborrheic Dermatitis, Psoriasis and Chronic Photosensitive reaction can resemble Erythrodermic CTCL. Table II below shows the classification of international society of cutaneous lymphoma.<sup>[2]</sup>

**Table II:-**Proposed classification for erythrodermic cutaneous T-cell lymphoma and relative hematologic criteria developed by the international Society for Cutaneous Lymphoma in their consensus conference on erythrodermic cutaneous T-cell lymphoma<sup>[2]</sup>

<b>Erythrodermic CTCL</b>	<b>Pre-Existing MF</b>	<b>Blood finding</b>	<b>Tumor, node metastasis, blood staging</b>
Sezary Syndrome (SS)	Rarely	Leukemic	T4, No-3, M0-1 B2
Erythrodermic MF	Always	Always	T4, No-3, M0-1 B-1
Erythrodermic CTCL not otherwise specified	Absent	Absent	T4, No-3, M0-1 B-1

CTCL, Cutaneous T-cell lymphoma; MF, mycosis fungoides.

B> 5% circulating Sezary cells;

B1, Sezary cell count of B> 1000 cell/m<sup>3</sup> or >20% atypical T cell on peripheral smear, B2, Sezary cell count of < 1000 cells/m<sup>3</sup> or <20% typical T cells on peripheral smear.

### Case Report:-

32 years old male patient admitted with history of persistent skin lesion for eight years. The patient was diagnosed initially at the age of 24 as a case of psoriasis. He was managed as case of psoriasis for period with clear slow progression of the disease until it reached the stage of Erythrodermic state with multiple nodules all over the body, with the largest under the right armpit reaching the size of basketball. The skin lesions were scaly erythematous plaque involving the whole body. Then, the patient was seen by a senior dermatologist at King Abdulaziz University (KAU) and skin biopsy was done which showed the diagnosis to be a CTCL rather than psoriasis. Because the patient was beyond the topical therapy for CTCL he was referred immediately to hematology department at KAU for consideration of systemic rather than topical therapy. The patient was very sick with fever and multiple skin discharges he was admitted to complete diagnostic evaluation and treatment plan discussion in the lymphoma tumor board. Peripheral blood film showed 3% of Sezary cells and pan CT scan of the whole body showed generalized lymphadenopathy without visceral involvement. Bone marrow aspiration and biopsy confirmed the presence of sezary cells in the bone marrow also confirming the state of sezary syndrome based on peripheral blood sezary cells rather than the bone marrow ones. Molecular cytogenetic studies did not reveal any abnormalities. The treatment options that were considered during the weekly hematology grand round are; systemic chemotherapy, local radiotherapy for large areas as a palliative intent, or surgical excision of the large tumor mass under the left armpit. The case was discussed in the lymphoma tumor board and in the city-wide lymphoma club and recommendation was made to commence chemotherapy of CHOP chemotherapy (Cyclophosphamide, Hydroxydaunorubicin, Vincristine (Oncovin), and Prednisolone) to be followed by allogeneic bone marrow transplantation (BMT) if feasible or autologous stem cell transplantation (ASCT) if possible. HDAC Inhibitors of Vorinostat can be considered after debulking with chemotherapy as maintenance therapy or after transplantation for minimal residual disease (MRD) eradication. The patient received eight cycles of CHOP with dramatic response and excellent mid treatment response upon evaluation clinically and radiologically. Three months later the disease came back again by reappearing of the skin lesions. Reevaluation of the disease activity by clinical and radiological evaluation and re-biopsy to confirm the pathology was carried out. The patient was salvaged with **ESHAP** chemotherapy protocol (Etoposide, Solumedrol (methylprednisolone), High dose cytarabine (Ara C) and Platinum (cisplatin)), for two cycles and he achieved very good partial remission and then he received two cycles of oral HDAC Inhibitor of Vorinostat. The plan was to perform ASCT after the biological therapy, at the same time we tried to arrange for Extra-Corporal Phototherapy (ECP) but both procedures were not feasible due to lack of ECP and lack of logistics to carry on ASCT. Patient expectedly progressed and developed new generalized plaque skin lesion and he was readmitted two months after the completion of the Vorinostat cycles. He was readmitted with multiple sites of infection and pus discharge and bacterial swabs showed strep. Alagctiae and S. aureus. He was started on Co-Amoxiclav 625 mg tablet TID. Patient was evaluated again by the dermatology service and they recommended continuing fuisdic acid & Vaseline and no need for repeating the biopsy. Pan CT scan was done again and showed no visceral organ involvement and bone marrow aspiration and biopsy was done and did not show any involvement of the bone marrow. Patient was salvaged again with a third type of chemotherapy that is Gemcitabine based therapy of **GDP** (Gemcitabine, Dexamethasone, & Platinum (Cisplatin)). He received the first cycle and in process to receive the second cycle to be followed by ASCT since he has a chemo sensitive disease and this time the biological therapy will be used after ASCT for MRD rather than before as it was done before.

**Discussion:-****Table III:-**illustrates the main differences between the two entities

CTCL	Plaque Psoriasis
Mid-50s.	Between 15-30.
Male and African Americans commonly affected.	White commonly affected.
Medication to treat HTN.	Medication to prevent malaria and lithium
No definitive risk factor except HTLV-1.	Common risk factor: stressful event, strep throat, cold or dry weather and cut, or scratch or bad sunburn.
1- Reddish patch plaque cover the whole of the body (no specific place). 2- Patch can be itchy. 3- Lymphadenopathy. 4- Patch prone to be ulceration. 5- Nail dystrophy. 6- Alopecia. 7- Edematous skin. 8- Hepatosplenomegaly.	1- Raised, reddish patch on the skin called plaque. 2- patches cover with silvery-white coat called scale 3- Most of the patch appears on the knee, elbows, lower back and scalp. 4- Patch can be itchy Scratching the itchy patch causing thickening of the patch. 5- Nail involvement.

This 32-year-old male who presented with large mass in right armpit and of the chest wall and scaly erythematous plaques that cover his whole body represented a therapeutic dilemma after confirming his original diagnosis. The option for treatment of this large mass was surgery, radiation therapy, or chemotherapy. After multidisciplinary and multiple presentations in tumor board and city wide lymphoma club a decision was taken to give this patient chemotherapy of CHOP. Patient received eight cycles with excellent response to treatment. Surgery for the large mass was not recommended by the surgeon because patient will need a large flap and his skin is already affected by the disease and the rate of complication after the surgery will be high, so surgery was not an option. Radiation therapy can be used only for palliation and intent in this patient was a curative treatment, so radiation will not be used here. The complications of radiation include alopecia, atrophy of sweat glands and of the skin, radiation induced dermatitis, skin edema, and skin squamous cell carcinoma is associated with high dose radiation. It is very important for the radiation dose to be given in fractions to prevent other complications. The total dose of radiation if exceeded 36 Gy the rate of the complication will be high also. The patient relapsed three months later after a complete response with chemotherapy. He was salvaged with ESHAP chemotherapy for two cycles with good response. Then, he was given HDAC inhibitor of Vorinostat for two cycles for eradication of MRD and in preparation for ASCT. However, patient presented with his third relapse. He was readmitted to KAUH with multiple skin infections. His skin condition improved after starting antibiotics which suggested that skin infection may play a role in development of this disease especially infection with *S.aures*. Patient was given a third line of chemotherapy of GDP to be followed by ASCT for disease eradication and this time Vorinostat will be used post ASCT as a maintenance therapy for MRD and prevention of relapse. At the same time we are still trying to arrange for ECP as a tool for disease control and eradication.

**Risk-Stratification (Staging):-**

In SS and MF TMNB (tumor, node, metastasis, and blood) play an important role for the prognosis and help to form a risk-adapted approach for the treatment. In 2007 TMNB have been reviewed by EORTC and ISCL for staging of MF and SS. If the patient has only one patch/plaque, then he has stage I, but stage I is divided into two stages which are: stage AI (<10 % of the body surface is involved or T1) and stage IB (> 10% of the body surface is involved or T2) based on the extent of the skin disease. The Palm and the digits represent 1% of the body surface and this is very helpful for clinical practice. The current recommendation of staging and diagnosis does not recommend biopsy of clinical normal lymph node, but it recommends when the size of the lymph node is more than 1.5cm. Dutch system, grade the lymph node staging system to be based on the presence of large cerebriform nuclei (7.5 um) and the degree of architecture effacement. In another staging system classification is based on the number of atypical lymphocyte (not the size) and the architecture of the node on the specimen to determine nodal involvement. In a patient with a patch/plaque stage T1/T2 and architecture preservation of any abnormal clinical lymph node classified as limited-stage disease. The median age of these patients is measured in decades along with the survival of patient with stage AI. At the time of the diagnosis majority of the patients with MF have limited-stage disease. On the other hand, patients with tumor stage (T3), erythroderma (T4), nodal involvement characterized by partial or

complete architecture effacement (N3), visceral metastasis (M1) or significant leukemic involvement (B2) have advance-stage disease. The median survivals 1-5 years are observed in patient with extensive disease.<sup>[1]</sup>

#### The modalities of the treatment of MF/SS:-

##### HDAC inhibitors (Histone deacetylase):-

HDAC Inhibitors are a new group of biological therapy that works on epigenetics. HDAC is catalyzing the removal of acetyl group from both Histone and non-Histone proteins. HDAC inhibitors affect Histone proteins which are responsible for gene expression in cell-cycle and apoptotic regulator protein while non-Histone proteins are involved with regulation of cell growth and survival, angiogenesis, aggresomal formations and DNA repair. Also, it affects the micro-environment of the tumor via reactive oxygen species. It enhances antigens presentation and down-regulation of immunodulatory cytokines, like IL-10. Vorinostat (suberoylanilind hydroxamic acid, SAHA) and romidepsin (depsipeptide) inhibit class I and II HADCs and both drugs are being used in lymphoproliferative disorder due to high effectiveness of these novel therapy. The overall response rate is 30% in of advanced stage disease and the median duration of response to the drug is estimated to exceed 185 days but most responses were rapid <two month in patient with SS. Side effect of the these new medications include GI (nausea, vomiting, diarrhea) and hematological (anemia and thrombocytopenia). Vorinostate may cause prolong QT interval. The table shows the side-effects of the medication.<sup>[1]</sup>

**Table IV:-**Zolinza™ (vorinostat) clinical or laboratory adverse events occurring in CTCL patients (incidence  $\geq$  10% of patients).<sup>[3]</sup>

Adverse events	Zolinza 400-mg once daily (n = 86)			
	All grades		Grades 3-5*

Table IV summarizes the frequency of specific adverse events, regardless of causality, in CTCL patients using the National Cancer Institute-Common Terminology Criteria for Adverse Events, version 3.0 (Olsen et al 2001; Foss et al 2005).

##### Extracorporeal photopheresis (ECP):-

In extracorporeal photopheresis, the product of leukapheresis and plasmapheresis are exposed to 8-mthoxyypsoralen (8-MOP) before extracorporeal circulation through 1-mm thick disposable cassette exposed to UVA radiation. The

irradiations of leukocytes represent about 5% of the peripheral blood leukocytes in circulation and are given back to the patient. Psoralens covalently bind and crosslink DNA after UVA exposure and this leads to cellular death by several mechanisms. On the other hand, ECP leads to monocytes activation which stimulate antigens presenting cell and gene expression change leading to enhancement of the immune response. To use this finding there is a new protocol “trans immunization “where the blood products incubated overnight before following UVA radiation. This protocol not commonly used due to the risk of the infection and lack proven efficacy. Following the landmark study by Edson et al. describing response in 27 out 37 patients with erythrodermic CTCL treated by ECP, ECP was approved by Food and Drug administration (FDA) of USA for treatment CTCL and now is considered the first line of management of patients with SS in many centers. The response to the treatment varies between different case series, and the overall response rate is 60% and complete response rate is around 20%. In current protocols of treatment with ECP, oral administration 8- MOP is no longer required. ECP is generally well tolerated by the patients with schedule of two consecutive days every two to four weeks. The mechanism of action of ECP is not completely understood. ECP has immunomodulatory effect which augments the immune response (host anti-tumor immunity). So, the median time to response is approximately six month. Median survival time after the treatment exceeds eight years as it has been observed in these patients. A lot of patients experience a durable response which may permit for some weaning from CTCL directed therapies. Some factors may affect the response to the treatment especially if there is significant nodal or visceral involvement. Also, ECP can be combined with other therapy such as interferon, or bexarotene.<sup>[1]</sup>

#### **High-dose chemotherapy and hematopoietic stem cell transplantation:-**

In CTCL the use of autologous stem cell transplantation is derived from case series study, but the durable response for treatment is observed after allogenic stem cell transplantation. This finding may be explained by the graft versus lymphoma immune response. A retrospective analysis of 60 patients with advanced-stage who underwent allogenic stem cell transplantation was recently reported. In this study, the patients had received a median of four prior therapies before the allogenic stem cell transplantation using a conditioning of either reduced-conditioning (73%) or myeloablative (27%) conditioning before related (75%) or matched-unrelated donor (25%) transplantation. Mortality rate for non-relapse at one year was only 14% for patients who received reduced intensity conditioning or HLA identical/related donor stem cell and 38 to 40% for those who received myeloablative conditioning or match-unrelated donor graft. Transplantation during early phase of treatment was associated with relapse rate (25 vs. 44%) and a statistically insignificant increase 3-years overall survival (68 vs.46%). The use of match-related donor was associated with superior overall survival (63% at 3 years). 17 out of 26 patients who relapsed received donor lymphocyte infusion. 47% achieved complete remission and this provides evidence for graft-verse-lymphoma effect in MF/SS. On the other hand, the experience with B-cell non-Hodgkin lymphoma, chemotherapy sensitivity before the transplantation or the extent of the burden of the disease did not influence overall survival. The conjunction of total skin electron beam therapy with allogenic stem cell transplantation may consider in selected cases.<sup>[1]</sup>

#### **Conclusion:-**

Cutaneous T-cell Lymphoma (CTCL) can be difficult to diagnose. In our case report the patient received four lines of systemic therapy that included three lines of chemotherapy (CHOP, ESHAP, & GDP) and one line of biological therapy (HDAC Inhibitor; Vorinostat) that halted the disease progression, but due to recurrent skin infections disease reactivation and progression occurred. A plan of high dose chemotherapy followed by stem cell rescue is planned to eradicate the disease and to be followed by biological therapy of Vorinostat for Minimal Residual Disease (MRD) eradication.

#### Abstract

Provides a conceptual theory of identification fossil rugosa. Discusses the possibility define the boundaries of the variability of their featured. With specific examples showing ways distinguishing consimilar and different phenones. It is shown that based on the facts already discrete phenotypes identified between the two sets of signs, one could argue about the reproductive isolation of each single species

#### Introduction:-

We do not work with fossil corals idea of the species as such, in the usual sense of the term; we will explore the remains of the stone specimens, samples and sample series. The first thing we do - combine them into groups of similar instances phenotypic - phenone (group of organisms isolated by analyzing the morphological anatomical characteristics). Phenone, collected in one locality (geological horizon) may represent different species or intraspecific differentiates. To be able to select the identification of alternatives, it is necessary to thoroughly examine individual variability, having fully its qualitative and quantitative analysis. Only if there is a sufficiently large number of carefully labeled specimens is possible a comprehensive analysis of the variability (Mayer, 1969; Latypov, 1984; Latypov et al, 1998).

At particularly high variability of corals and diverse, "if we know its limits, we will be able to know the boundaries of dissimilar types" (Vaughan, 1907, p. 4). The values of the individual features of corals may change 10-15 times even in the same population (Latypov, 1980; Latypov, 1984, Latypov et al. 1998). D. Hill studied the variability of coal rugosa Scotland united under one specific name 77 species and 7 genera established by previous researchers. Study in detail the variability of modern scleractinian species *Stylophora*, Ch. Veron and M. Pichon clearly showed a complete series of transitions from thin-branchy to massive colonies of the species *S. pistillata* and brought 12 different species of five genera in the synonymy of this species (Hill. 1938; Veron & Pichon, 1976). Yu. Latypov showed that in different sections of the microstructure of the coral septa could be holacant and rabdacant, bottoms plate could be cystiphyllid and full sub horizontal in close proximity to each other. Inside one sample (population) we can successfully trace all types of variability, including polymorphism (Latypov, 1976, 1977, 1982).

The author at rugosa has been shown that the more a series of samples, the more fully represented in them signs of variability and accurately define the boundaries of the morphological characteristics of the species. It was found that the degree of variability of traits directly increases with the number of copies in a population. With a large increase in the number of copies and variations of border populations signs are aligned, revealing the degree of volatility that characterized the specific features of each species (Fig. 1). Persistent symptoms showed no more than a 1.5-fold,

and variable - 12-15-fold variability (Latypov, 1982, 2014). However, the identification of known or establishment of new types of a lower taxonomic categories are extremely important for both practical and theoretical biology problems, ecology and biogeography, paleontology, paleoecology and stratigraphy - science and the industries in which no univocal determine the type of impossible any successful research .

## Results:-

### *Conceptual Introduction*

Now, on several series of samples of fossil corals look at examples of different phenone recognition and influence the result of a comprehensive analysis of the variability in the separation of taxa previously made two methodological reservations. Firstly, in all its taxonomic constructs we will be guided hypodigm. Hypodigm of taxonomists at this time and for this taxon includes all instances, personally known to him at this time, considered it as an unmistakable member of the taxon. They are used collectively as a model, which concludes as the population (Simpson. 1961). Secondly, most corals grow during the whole life cycle, and, for example, fossil and modern single scleractinian may be 1000septum. During the evolution from the single rugosa also showed an increase in number of septum up to 6 to 150. In this regard, assume that quantitative traits (such as the number septum, the cross-sectional dimensions of the bottoms of plates, their numbers at unit height, and so corallites) by themselves do not mean anything, but different meaning only relative and correlative connection or relationship with each other. They identified, usually only if a statistically significant number of treated material.

### *Phenones morphologically distinguishable*

There is a sample Silurian rugosa (about 200 copies) from one biostrom capacity of slightly more than 1 m and a length of 30 m. On the external shape all instances, except for two, completely indistinguishable. According to morphological characters, easily distinguishable from the first observation, the entire sample of the coral breaks down into 10-13 phenones, many of which are recognized by a well-defined and easily. But some of phenone in their characteristics do not allow firm conclusions about their affiliation to any known taxa, as well as to classify them to new taxa.

According to a well defined set of morphological traits identified three fairly distinct phenones cystiphyllid rugosa.

- First - Cystiphyllidae with septa arranged just rare, not radials oriented, short spikes on the surface of the septa. Deferred sclerenchyme on the horizontal skeletal elements of the minor.

- Second - cystiphyllid with radial beaded septa. Deferred sclerenchyme abundant, sometimes in the form of broad basal rings.

- And finally, a clear cystiphyllid radials arranged rows rabadant septa resembling normal lamellar septum. Deferred basal sclerenchyme moderate (Fig. 2).

Corals of phenones are significant differences in the structure of the septa, but do not have those in the structure of the bottoms and septa. Knowing that the horizontal skeletal elements have rugosa very changeable sign (Wedekind, 1927; Latypov, 1977, 1982), and, as a rule, reflects the intraspecific variation, we do not attach much importance to it.

Comparing each of the phenone a number of features set them apart from all known species characteristics cystiphyllid coral. On the other hand, a clear gap symptoms as poor development of septum in the same group of corals and clearly ranks radial rabadant numerous septa the other allows the researcher to highlight the extreme phenones into separate taxa in the hope that it does not clog the biological literature has a pair of synonyms.

But do not jump to conclusions. It is necessary to examine the age and the individual variability of coral at least one phenone. The first ten copies show that in the course of ontogenesis there are significant changes in the structure of these rugosa. All holders of clear radial partitions do not have them in the initial stages of growth, sometimes up to his middle. They are randomly scattered short septal spines, sometimes grouped only on one side of the cup. Subsequently, these groups begin to form spikes and radials arranged rows of septum. Thus, the seemingly distinct morphological gap between individual phenones in the analysis of age variation was eliminated by itself.

Analysis of these corals age variability revealed that septal apparatus during ontogeny can vary from individual spikes, length 0.15 mm without any orientation, up to 27 rows of radials arranged spikes clearly 3.5 mm (Fig. 3).

Also changeable structure themselves thorns, it varies from holacant to rabdacant. But for all its volatile nature of the septum, forming in the course of ontogeny, they have a surprising unity of development. The initial group of spikes begin to form first on one side of the cup, and then during the growth of the same side of the first radial spikes are laid. In this radial arrangement of septa is not identified at diameter of corallites less than 12 mm. Horizontal skeletal elements change in ontogeny of coral from fine swollen vesicular plates to flat variously angled up to sub horizontal.

Identification of individual variability across the sample series shows that these signs are extremely variable and not fractures. They should be considered only as intra-taxa. So, it was high variability in the number of septa, their morphology and size. When corallites diameters from 13 mm to 22 mm radial orientation of sept can be clearly consistent or completely absent, and the number of rows of spines varies from 6 to 61, and not very dependent on corallites diameter. Wherein spikes themselves may be long or short, thick and thin, as a series of dots or dashes (see Fig. 2 and 3). All signs have shown a very high degree of variability. septum length varied by 23.3 times; sixes plates bottoms - 22; fat thickness basal sclerenchyme - 24 times. The diameter of the cup corallites changed only by 1.7 times. *It is a permanent was only coloration of corallites!*

This wide range of phenotypic differences corals both phenones is a product of the same gene pool, because they do not detect ruptures on any basis, thus reveals the taxonomic integrity of phenones and reflects the intraspecific variation of many members of the same population. Indeed, they have exactly the same course of ontogeny the ever persistent attitude of the two polymorphic forms: single septal spines on septum at coral wall at the earliest stages; then forming on one side of the cup coral groups spikes, their radial orientation; and, finally, the appearance clearly radials oriented spikes (see Fig. 2-1 and 3-4). In principle, the same structure of horizontal skeletal elements, consisting of inflated vesicular plates, differentiated on the axial and peripheral areas. They develop the same type of deposits sclerenchyme lifelong coral, and there is a painting of the same skeletal elements. In all instances corallites painted in yellow-brown color.

No other specimen of thousands rugosa of the study area were found a painting corallites that would differ from the color of the host rock. By the way, when was detected this peculiarity of this species, it was suggested that copies of the form *Cysticonophyllum dentatum* (Ivanovsky 1963), similar to our species, but not having a radials oriented septum, should be painted in brown. Asked whether corallites originals *S. dentatum* yellowish-brown color, the Central Siberian Geological Museum has sent an affirmative answer.

Compare inter-population variation between set limits morphological variability characters species as a whole, showed flexibility and stability of its phenotypic traits as an indicator of the stability of the population system and the integrity of a single taxon, existed on a large space for a long time the Silurian period.

*Phenone morphologically consimilar*

Because the same biostrome there are two other phenones which slightly differ morphologically. With essentially the same structure of the skeletal elements, these coral samples at first denied signs to classify them to different taxa. At the same time almost every feature they have slight variations, yet not allow uniquely combine them into one taxon (see table).

**Table:-** Comparison of signs of morphologically similar phenones

Phenone 1	Phenone 2
Septum are banded, reach or do not reach the axis, sometimes in a weak convoluted Vortex	Septum are banded, reach or do not reach the axis, often convoluted in moderate Vortex
The location of the septum is clearly symmetric	Location of septum pinnately-subradials
Home protosepta short, the opposite-a long, comes to axis	Home protosepta stands out no longer systematically, can reach up to axis
Small septum can reach in length half radius corallite	Small septum can reach more than half the radius of the corallite
Number of septum by when diameter 9-20 mm is equal to 32 x 2-39x2	Number of septum by diameter 6-22 mm equal to 31x2-39x2
Bottoms close to cystiform	Bottoms close to cystiform
Dissepiments numerous small	Dissepiments numerous small

As the table shows, a noticeable difference corals of phenones is reduced mainly to the symmetrical arrangement of septal apparatus in one case and the absence of, at least, apparently - in another (Fig. 4.). Analysis of age variability shows that changes in the ontogeny of both phenones corals are about the same. First formed a large septum, i.e., sporadic, discontinuous septum, small partitions. With increasing diameter corallites is a further increase in the number septum both cycles. During growth of the axial ends of the spirally septum tend to curl to a greater or lesser extent. Number of septum corals both phenones fluctuates around the same range. Roughly the same behavior in all other features of both phenones, as already mentioned, in addition to the orientation and topography septum cardinal and the other septum.

When plotting the amount of septum corallites diameter (Fig. 5A) revealed a clear pattern, which imparts additional specific and, in our opinion, an essential feature that allows to distinguish the studied phenones. In corals 1st phenone new septum stopped inserted in the range of diameter sizes from 10 to 15 mm, while the rugosa 2nd phenone they continued to be inserted at corallites diameters of 18-20 mm. Both of these are characteristic for each phenone is not the modification, and the hereditary nature. It determines a different development of septal walls in ontogeny. Morphologically it is expressed in a clear bilaterally oriented arrangement of septa in one case and pinnately subradials - in another. Is not the same topography and the opposing major protoseptum in both cases. In this regard, numerous become clear phenotypic difference almost every feature. Live corals were different in structure and individual development gastrovascular cavity. The number, orientation septum time of termination of their insertion in the course determined by the number of life-cycle orientation, termination of education radial chambers, as well as mesenteric filaments and in the intestinal cavity of the polyp. In other words, these corals phenones different device throughout the organ systems, representing at *Anthozoa* physiologically isolated intestine (Villee, 1959; Beklemishev 1964; Goreau et al, 1979.; Latypov, 2016). In this case, there can be traced variously organized digestive system that was most likely due to differences in food consumption (structure, size and so forth.). Such differently arranged groups of corals is likely to be genetically determined and had concise essentice distance.

### Discussion:-

Dismantling and phenones analysis lead to the need to make decisions about their attribution to certain taxa. And in the case of differing phenones were installed transitions between the most extreme forms, and these transitions are controlled in the ontogeny of a single instance. Therefore, the assignment of phenones to the same species is not in doubt. In case of similar phenones full transitions were found, on the contrary, a sign was found that distinguishes one from the other phenone. Having one sign by which two different phenones. it is useful to obtain a conclusive determination of correlations on other, less obvious signs.

Having identified the difference between the two phenones one basis, a detailed analysis can be found a lot less visible signs, which differ in these taxa. This will more likely include such taxa to different species - known *Neocystiphyllum lateseptatum* Ivanovsky and new *N. lateseptatum* (Latypov, 1979). Building a scatter plot ratio to the number of cup diameter septum showed a clear gap between the two is also on these grounds (Fig. 5B).

Getting a complete picture of the variability of other cystiphyllid phenones all samples to determine the differences as intraspecific, take all of the samples belonging to the same species and, moreover, a subspecies *Holmophvllum holmi* antis, described Latypov (1977) considered synonym of *N. dentatum* (Ivanovsky). There is likely an example of how the members of a population (polymorphic variants) have been described by various investigators as representatives of different genera. Iwanowsky (1963) has 12 copies rugosa these different safety with septal spines without radial orientation, in any case, is clearly visible. Author (Latypov 1977) had more than 70 copies. of the same population, the vast majority of which have been well expressed by the radial orientation of the septal apparatus at a late stage of growth. After studying all the samples of the seven local populations (stratigraphically consecutive populations or populations of the system) have been discovered corals with septa, varying from single spikes to very clearly radials oriented rows rabadacant septum. It traced in the course of ontogeny the same copies of corals with multiple septal spines, not orientated radials. In each population there are two well-identified forms cysisphyllid, the frequency of occurrence of one of them (more rare) was quite high (1:15), to re-consider its rate of mutation. And roughly the ratio of occurrence of different phenotypes maintained in all populations throughout the Wenlock. Thus, it reveals not only a high degree of continuous variation of characters, but also intermittent volatility, and hence two classes of ordered groups of corals at a very prominent classification criteria, representing actually polymorphs - members of the same taxon (Fig. 3), i.e., one species (Mayr, 1969; Latypov, 1984)

Here we have an example of what species of a biological phenomenon has existed at all times that this is not an invention of taxonomists and not special "paleontological" species (Simpson, 1961; Mayr, 1969; Latypov et al., 1998). All the revealed facts - the same course ontogeny, development sclerenchyme similar formations, coloring elements of the skeleton, polymorphism frequency stability of all the members of this population system - indirectly point to the existence of this situation, the system homeostasis (Bernard, 1879). It was she who supported physiological stable conditions in many individuals all seven populations that existed during the Wenlock, in a clearly changeable environment. This is known to be quite complex regulatory system aimed at support constant internal environment, in terms of principle is the same not only for the members of the local population, but also for all members of the species. In this case we had more time to make sure.

FIG. 1. Chart limits variations signs one type of coral. 1- number of septae at the same diameter, 2- width, 3- length of main protoseptum, 4- diameter corallite. Ordinate dimensions. Abscissa layers cut. 2-4 - Ordinate axis line of magnitude indications one specimen.

FIG. 2:- Cross-sections cystiflyllid three morphologically different phenons. 1-developed individual septal spines. 2-radial ranks of septal spines, 3-rows of thorns, blending in septum.

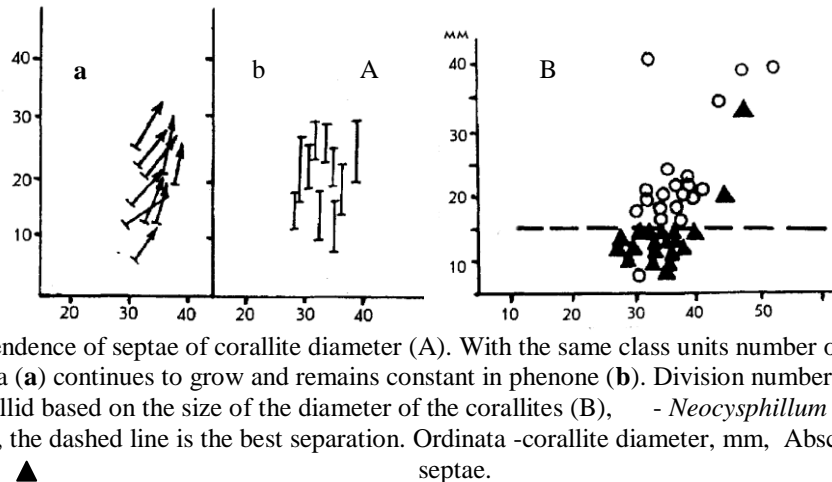

**FIG. 3:-** Individual variability in populations of *Holophyllum dentatum* from the foundation strip-pit 64 outcrops Mojero River (Siberian). 1-6-cross sections of various corallites near the bottom of the cup. Good traces transition between extreme, individuals with poorly developed septal apparatus and specimen with numerous radial rows of thorns.

**FIG. 4:-** Cross-section of corals far in the sibling relation. *Pseudophaulactis* – late Llandovery, *Caninia*- early Carboniferous.

**FIG. 5:-** Dependence of septae of corallite diameter (A). With the same class units number of corallites diameters septae phenona (a) continues to grow and remains constant in phenone (b). Division number of septae two species of cistyllid based on the size of the diameter of the corallites (B), - *Neocysphyllum simmetricum*, ○ - *N.lateseptatum*, the dashed line is the best separation. Ordinata -corallite diameter, mm, Abscissa - is the number of septae.

### Conclusion:-

By comparing samples from different populations, spatial or temporal, taxonomist looking for information that would help to decide where to put these populations - to the same or different taxa. The issue of full identity population in this never arises, for population genetics for a long time to convince us that there is a world of two completely identical individuals, even among identical twins, not to mention the identical populations (Mayr, 1969; Dobzhansky et al., 1977; Thorpe & Sole-Cava, 1994; Fukami, 2008). Therefore, the detection of statistically significant differences for any researcher certain groups of organisms - a self-evident matter.

When working with corals with extreme variability of almost all signs and. As a rule, polytypic species often gets question - if large enough differences between the samples (populations), allowing them to consider different types? In most cases we have isolated geographic or stratigraphically allopathic populations (Latypov et al., 1998; Manchenko et al., 2000; Baker, 2006). The criterion of reproductive isolation in pure form unfortunately, we can not use. And besides, to cross two or experimental specimens of suspected species we first must establish that this particular one or two related species, and this is our main problem. It remains to rely on probable evidence that reproductive isolation is correlated with the a certain degree of phenotypic outwardly visible difference and fairly constant within a given taxonomic group, i.e., to act on the reverse. If detected within a given taxon group is quite clear morphological differences, with good signs of a break, then we can assume that these groups - good views.

Thus, the problems encountered in the establishment of intra-and intraspecific differences identified morphophysiological, ecological and Ethological means, can be solved by using biochemical, cytogenetic, electrophoresis studies. But in any case, the original conclusion about the similarities or the differences between taxa is done based on the absence or presence of the unfilled gap in those or other signs, identification and comparison of the specific characteristics of each taxon. Then it turns out what biological reasons cause the differences and similarities of traits. And based on the facts already discrete phenotypes identified between the two sets of signs, one could argue about the reproductive isolation of each single species (Mayr, 1969; Latypov, 1984; Latypov et al., 1998; Manchenko et al., 2000, Latypov 2014, 2015).

#### Abstract

The current paper is concerned with elaborating the improper semantic interpretations by Iraqi EFL learners concerning the performance of the idiomatic expressions. In particular, the paper shows the semantic failures of Iraqi EFL learners concerning the use of food idioms. The most important thing which it attempts to encompass is to show whether a food item in certain contexts is understood as a kind of food or as an idiomatic expression. This is mainly done through analyzing the responses of the learners when doing a test containing this type of idiomatic expressions. The study reveals that EFL learners fail when they attempt at explaining such food idioms due to various levels of semantic inefficient knowledge.

#### Introduction:-

This type of idioms is a very interesting field of investigation as it provides insights on how people utilize language figuratively to be more effective and as it is part of the cultural aspect of the users of that language. A pure idiom, as defined by Fernando and Flavell (1981:48), is a 'non-literal set expression whose meaning is not a compositional function of its syntactic constituents but which always has a homonymous literal counterpart.' Fernando (1996:35-36) gives a more working definition of it as 'a type of non-literal, multiword expression.' The current paper attempts at showing the various levels of semantic failures of the use of such idioms when by Iraqi EFL learners. An empirical test is administered to show the attributes of semantic failures when learners explain food idiomatic expressions in specific contexts.

#### Definition and Main Properties of Idioms:-

There have been many attempts to define the word 'idiom'. An 'idiom' is usually understood to be as "a unit of two or more words whose meaning is not the combination of its syntactic elements" (Pinnavaia 2010: 25). Since, as this definition suggests, the whole meaning of an idiom is not inferred from the meanings of its constituents, idioms can be described as being semantically opaque expressions (Svensson 2008: 84). In fact the assumption that all idioms are opaque to the same extent is not altogether correct. It is argued that an expression can be defined as transparent when "a language user understands it without any problems, without any other previous knowledge than understanding the separate words that make up the expression". Expressions which are usually characterized by a high degree of transparency are similes such as easy as pie, as good as gold and white as snow (ibid).

In other cases, an expression such as kick the bucket can be labeled as opaque, since its idiomatic meaning bears no relationship to the meanings of its constituents (Tabossi and Zardon 1993: 145). Similarly; idioms have been shown

**Corresponding Author:- Dr. Mukhalad Malik.**

Address:- Department of English, Cihan University, Sulaimanyia.

to range from fully frozen to fully flexible. In other words, although “[c]ertain morphological and syntactic operations are allowed for virtually all idioms (e.g., insertion of an auxiliary in the phrase)”, idioms vary in the extent to which they can undergo morpho-syntactic transformations without losing their idiomatic meaning. Thus, in the case of a frozen idiom like kick the bucket (i.e. to die); it is not possible, for example, to passivize the idiom (e.g. the bucket was kicked by John) and still retain the idiomatic meaning. On the other hand, in the case of a more flexible idiom like lay down the law (i.e. to give strict orders), the passivization of the idiom (e.g. The law was laid down by her father) is possible in that it does not appear to change the figurative meaning of the idiom (Peterson and Burgess 1993: 208).

The other important intrinsic property concerning idioms is that they have some apparent communicative or discourse purpose. In other words, the acceptability of an idiom’s variant is dependent on the extent to which a listener/reader can infer communicative intent from the use of the idiom’s variant. For example, in the decomposable idiom spill the beans, the lexical substitution of pour for spill might be considered acceptable or not. If a listener/reader is not able to infer a communicative purpose from the replacement of spill with pour, then the variant pour the beans will be viewed as a mistake Glucksberg (1993: 19).

The latter function implies that speakers/writers can express positive or negative opinions about a particular fact or event by means of idioms, or, more precisely, by exploiting the positive or negative evaluations conveyed by idioms. The reason for the use of idioms as tools to express personal opinions lies in the communicative effects that can be obtained on listeners/readers (ibid: 302).

### **Analysis of Food Idiomatic Expressions:-**

This section is entirely devoted to analyse the food idiomatic expressions as they are used in various contexts focusing mainly on their non-literal meanings so as to have a better understanding of how they function in a given language. This means that the analysis will comprise the semantic level of language since such idioms fall within the study of the meanings they intend to convey and also other levels such as the culture and society in which such idioms are used.

### **Semantic Analysis of Food Idiomatic Expressions:-**

There is no doubt that food idiomatic expressions fall within the non-literal (or figurative) study of semantics since they convey meanings which are not related to their literal interpretations at all. Many food idiomatic expressions originated from colloquial speech and slang, the others can be presented as the result of specific historical circumstances. For example: "to be worth one's salt" –is idiomatic expression meaning "someone getting a salary not for nothing," but when translated literally it means "to be worthy of salt." Although today salt is one of the cheapest products in the history of man-kind, there have been periods when the salt was equal to gold. Thus, "to be worthy of salt" reflects human rights importance. As food is a prerequisite condition of human being almost every culture it finds important ceremonial, ritual and symbolic meanings connected with lexical level of language. In general, the semantic features of the majority of food idioms can be seen as types of connotations which can be defined as "additional semantic markers which are associated with the value judgments of a speech community or of an individual speaker or writer" (Gläser 1998: 127). They are usually used to cause an emotional reaction or to emphasize something that has been written or said by the user of language. Concerning food idiomatic expressions, three major types of connotations can be recognized: expressive, stylistic and register connotations. Expressive connotations can be of various types including humorous (e.g. "to have a bun in the oven"). Stylistic connotations are usually used in conversations and can be informal (e.g. "bad egg"). Finally, register markers, as a final type of connotations, usually appear in dictionaries as references to a specific field and can be related to astronomy, economics, medicinal etc. (ibid: 128).

### **Cultural Analysis of Food Idiomatic Expressions:-**

Since the paper focuses on the use of food idiomatic expressions in contexts and why learners may fail to interpret them efficiently, it is very significant to shed light on the use of such idioms as far as their use and meanings in culture and society are concerned. This is basically due to the fact that foods have a range of cultural meanings; they communicate information in terms not only of occasion but also social status, ethnicity and wealth. These meanings, however, are not intrinsic in foodstuffs. The meanings of such idioms rely heavily on the social context in which the items are found (Murcott, 1982: 203). The preparation and consumption of food provides, moreover, a material means for expressing the more abstract significance of social systems and cultural values. It may be argued that what people are prepared to take inside their bodies reflects their social identities, and their membership of social groups.

To view eating habits as a matter of culture is to understand that they are a product of codes of conduct and the structure of social relationships of the society in which they occur. Food, then, has both a material and a symbolic significance (ibid: 204).

### **Methodology of the Test:-**

Brown (1989: 129) defines a test as “a method of measuring a person’s ability or knowledge in a given area”. A reliable test should include testees, relevant data to achieve the aims of the test, scoring of the subjects’ answers to the test items and the interpretation of the response (ibid). The test is based on “A Lesson on Food Idioms” by Yen-Ling Teresa Ting (appendix1). The test includes food idiomatic expressions used in specific context to be interpreted by those learners with answers as typical interpretations so as to compare them later on to the responses of the learners. The test is given to each learner on a sheet of paper and each one is given a proper time to read and then answer. The sample includes ten students from the fourth grade are chosen from the Department of English/ Cihan University/ Sulymania/ for the academic year 2016-2017. The responses are then analysed for the purpose of showing the kinds of the semantic failures the learners may commit while trying to explain such idioms. As far as the scoring is concerned, Harrocks and Schannover (1969:76) believe that for the purpose of objectivity of the test, a scoring scheme must be objective and accurate. In scoring the subjects’ responses to the test items, the researcher depends on a ‘write-wrong basis’ or the ‘1-0’ principle by giving ‘1 mark for the correct answer and ‘0’ for the incorrect one.

### **Results and Analysis:-**

Within this vital section, the responses of the learners are analysed and discussed in detail so as to determine the semantic inefficient knowledge while trying to interpret the given idioms. Each failure is grouped according to the type of the semantic inefficiency or lack of knowledge.

#### **Failure due to Literal Interpretations:-**

This is the most frequent kind of the semantic failure which the responses of the learners showed. Mainly, this failure can be clearly attributed to the fact that learners did not recognize that a given food idiomatic expression is used in a non-literal sense instead of a literal one. In other words, the learners explained the idioms with regard to its literal interpretation; food stuff (as found in the test) is deemed purely food by the learners since they have a severe lack of knowledge about the non-literal use of food idiomatic expressions. The result of such explanations was entirely improper and not related at all to the intended meaning of the idiom as in the following examples:

Ex (1) “bring home the bacon means that Bob is eating a kind of meat.”

Ex (2) “well I think that this guy is interested in delicious food.”

Ex (3) “Mark doesn’t know to choose good egg.”

Ex (4) “He may not prefer tea but other kind of drinks, I think.”

Ex (5) “He needs a piece of cake in his job so as not to feel hungry.”

Ex (6) “ we need butter for health and other things.”

So the learners, as the responses clearly reveal, do not match the intended meaning; they totally interpret them as food stuff because they only took literally the meaning of the food (as for example the word ‘bad’ with ‘egg’ referring to a bad person) ignoring the other words which appear with the food expression or, in some cases, they ignored the entire idiomatic expression (as for example half-baked referring to an issue under discussion). In doing so, the entire context is ignored by the learners and this means that not recognizing that such expressions are used non-literally is a clear evidence of the fact that the learners have inefficient knowledge of the idiomaticity of food expressions and, thus, they are unaware of the communicative function of the use of such idioms. The total percentage of failure due to this factor is 25%.\*

\* The statistical procedures are recommended and supervised by the statistical expert Assist. Prof Dr. Atheer Anwar / College of Business Administration/ University of Anbar.

#### **Failure due to Improper Non- Literal Interpretations:-**

Although some responses showed that the learners are aware that the food idioms are used non-literally, they were unable to identify the exact or intended meaning of the given food idiom. So, they had knowledge of the fact that food is used as idioms but they did not have knowledge of what they exactly mean, again the result was improper

interpretations due to the fact that they are unfamiliar with the intended meaning as used in the given context as in the following examples:

Ex (7) "hot potatoes refer to an idea which they try to have."

Ex (8) "spill the beans is something unusual which may be difficult."

Ex (9) "one smart cookie means to get a new thing in life."

Ex (10) "it is the big thing that is not really important."

Ex (11) "we must say the truth when we talk about spill the beans."

The total percentage of failure due to this factor is 18%.

#### **Failure due to Total Lack of Semantic Knowledge:-**

In some cases, learners showed total awkwardness and severe shortage of semantic knowledge. This can be seen clearly when the responses were left unanswered or they included weak performance of language as in the following examples:

Ex(12) "his noodles are .....not clear.. noodles."

Ex (13) "chew is something that is.....not sure

The total percentage of failure due to this factor is 18%.

#### **Conclusion:-**

Food idiomatic expressions are one of the important idioms used in English language in various spoken and written contexts. The main feature of such idioms is the fact that they are used non-literally to make the use of language more effective and more colorful. In most cases, they have important communicative functions and various purposes. In general, Iraqi EFL learners lack knowledge of the intended meanings and communicative functions of food idiomatic expressions due to semantic attributes. They are unaware of the non-literal aspect that such idioms have when they are used in various contexts either because they are not familiar with them or they were not exposed to such idiomatic expressions in their academic studies. In some cases, the responses of the learners show that they lack total knowledge of semantics particularly the lexical meanings of certain words. In fact, Iraqi EFL learners should be exposed to such kind of knowledge so as to have a better performance and so as to improve their skills of communications when using various kinds of idiomatic expressions.

**Appendix 1:-**

Read the following passage carefully then explain the underlined idioms according to the way they are used in the passage:

**Bringing Home the Bacon on the Gravy Train:-**

Bob works hard to **bring home the bacon**<sup>1</sup>, and put **bread and butter**<sup>2</sup> on his family's table. Every morning, he drags himself to his desk at the bank and faces his tedious 10-hour-a-day job. His boss, Mark, is a **bad egg**<sup>3</sup> but has somehow taken a liking to Bob so he always speaks well of Bob in front of Mr. Davies, the owner and **big cheese**<sup>4</sup> of the company. Mark tells Mr. Davies that Bob's **the cream of the crop**<sup>5</sup> and is **one smart cookie**<sup>6</sup> who **uses his noodles**<sup>7</sup>. Mark likes to **chew the fat**<sup>8</sup> with Bob during coffee break and discusses **half-baked**<sup>9</sup> company plans with him because he trusts Bob and knows that Bob won't **spill the beans**<sup>10</sup> behind his back. On these occasions, Bob tries to avoid any **hot potatoes**<sup>11</sup> and, even if Mark isn't **his cup of tea**<sup>12</sup>, Bob makes an effort to **butter him up**<sup>13</sup> by leading Mark into discussions about electronic gadgets which Mark **is nuts about**<sup>14</sup>. Bob really thinks that Mark is **out to lunch**<sup>15</sup> and **nutty as a fruitcake**<sup>16</sup>, but **in a nutshell**<sup>17</sup>, if he **polishes the apple**<sup>18</sup>, his job could become a **piece of cake**<sup>19</sup> and maybe one day he will find his **gravy train**<sup>20</sup>.

**Typical Interpretations:-**

Idiom	Meaning	Idiom	Meaning	Idiom	Meaning	Idiom	Meaning
1	Make a living	6	An intelligent person	11	Problematic issues	16	A little crazy
2	Food	7	Thinks	12	The type of person he likes	17	Basically
3	Scoundrel	8	Share confidential information	13	Chat	18	continues to be servile and brown-nose his boss
4	Boss	9	On the table but still not official	14	Really likes	19	Very easy
5	The best	10	Show admiration	15	A little out of touch with reality	20	Big income with little effort

##### Key words:-

Customers, Islamic Banking, Religiosity, Scholars, Sharia and Spiritual Marketing.

#### Abstract

The districts of Cianjur known as the city of students (*santri*), with 98% of the total population are Muslim. So that makes the Islamic scholar (*ulama*) as a central figure in deciding an issue or phenomenon that occurs in the community. Islamic banking have grown in Cianjur district, but the community's decision to choose Islamic banking in Cianjur very low. Cianjur community decision should choose Islamic banking is very high because it is motivated by the religiosity of the scholars. It's a big question for researchers, actually how much influence religiosity and scholars in an increasing number of Muslim Islamic banking customers in Cianjur. This study proves that the factor of religiosity (piety) of the Islamic scholars (*ulama*) has a significant effect on the increased number of customers of Islamic banking in Cianjur. However, the scholars also insist that the procedures need to be improved, since there are still some problems in the contract that violates the principles of Sharia. One of them is the practice of *mudaraba*, where the Islamic banking should emphasize more in the aspect of trust instead in the aspect of insurance owned by clients or potential clients. While from the aspect of profit sharing, the Islamic banking still based its profit from the expected return rather than on the actual return. Similarly in the practice of *murabahah bil wakalah*, which is considered to be inconsistent in practice (*akad*). All this, eventually affect the public doubt in the aspects of Sharia compliant on Islamic banking itself. For the rational, this condition has become the reason to re-switch into conventional bank; but for the emotional, it has no effect whatsoever. Because, the condition of conventional bank used interest system (*riba/usury*) in practice (contradictory with principles of sharia). This study also offers solution in the form of Islamic banking marketing model accompanied with spiritual approaches. This particular approach of spiritual values is one of the most effective ways in order to increase the participation and awareness in Cianjur district to use Islamic banking in its economic activities. This research strengthen the theory of Philip Gerrard, J. Banton Cunnghen, S.A Metawa, and Almosawwi, which proves that the customers are motivated by religious factors (customers emphasized to principles of sharia loyalty) in choosing Islamic bank. The study also, at the same time, denied the theory by Norafifah Ahmad and Sudin Haron, Baeck Ulrich, and T.

**Corresponding Author:- Uus Ahmad Husaeni.**

Address:- Awardee LPDP and Islamic Economic and Business Faculty, Suryakencana University.

Coyle, which concluded that the motivation of customers is not influenced by religion instead on the profit calculation.

### **Introduction:-**

Islamic economic developments in the world starting with the establishment of Islamic banking and then followed by the establishment of Islamic financial institutions. Rapid growth encourage academics in various universities conduct more in-depth studies in various forms of research, discussion, and even develop it into a course either undergraduate to doctoral. Along with the Islamic economic development that have surfaced various research results which stated that the increase in the number of customers of Islamic banking and Islamic financial institutions are motivated by factors of religiosity and material benefits (rationality), where the public insists on adherence to the principles of Islam and the benefits to be obtained.

Various studies, which states that the decision of the people choose Islamic banking and Islamic financial institutions are motivated by factors such religiosity conducted by Philip J. Gerrard and Banton Cunngghen<sup>[4]</sup> which concluded that 22.6% of respondents from among the Muslim states that religiosity of religious reasons is the main motivation for saving money Islamic banking and Islamic financial institutions. The conclusion drawn in Muslim circles in Singapore as its object. S.A Metawa and Almosawwi<sup>[5]</sup>, this study proves that in choosing Islamic banking customers are motivated by a factor of religiosity, in which the customer stressed to compliance with the principles of Islam. Later, this conclusion is also expressed by Sehrish Rustam, Saiqa Bibi, Khalid Zaman, Adeela Rustam and Zahidul-Haq in the Perceptions of Corporate Customer toward Islamic banking Products and Services in Pakistan<sup>[6]</sup>. The conclusion of this study, stated that religiosity factors and factors of economic rationality a big influence on the selection of corporate customers in Pakistan. However, they still have less knowledge of the Islamic banks.

Meanwhile, the results of research which states that public perception to the Islamic banking and Islamic financial institutions are motivated by a gain factor of material (rationality) were performed by Norafifah Ahmad and Sudin Haron<sup>[2]</sup>, the study concluded that the decision of the people (customers) in choosing Islamic banking not influenced religiosity or faith in religion, but more influenced by the gains in the use of bank services. Next, research conducted Ulrich Baeck<sup>[1]</sup>. The results of this research are knowledge and education more factors influence their attitudes and behavior in choosing Islamic banking, the higher the education, the knowledge and awareness of the Islamic financial system will be better. Then, the research conducted T. Coyle<sup>[10]</sup>, the results of his research concluded that the motivation of customers choose the services of Islamic banking is not influenced by religiosity but tend to be based on the profit motive.

The society decision to choose Islamic banking in Cianjur very low. Currently, customers of Islamic banking in Cianjur only about 5-8% of the total population of 2.335 million. In fact, 98 % of the population in Cianjur is Muslim. Also known as the city of students, which makes scholars as the central figure in deciding an issue or phenomenon that occurs in the community. Supposedly, the decision of the people choose Islamic banking in Cianjur will be high because motivated by factors religiosity scholars. This, the big question for researchers, actually how much influence the religiosity of scholars to the increasing number of customers of Islamic banking in Cianjur.

### **Materials and Methods:-**

The research seeks to investigate the effect of Islamic scholar religiosity and the increased number of Islamic banking customers by using questionnaires sent to participants. The data used in this study are primary data in the form of results of a questionnaire distributed to the peoples in the district of Cianjur. The number of respondents was 100. According to Elis RatnaWulan and Uus Ahmad Husaeni<sup>[11]</sup>, that the nonprobability sampling technique was applied, in particular accidental sampling, which means sampling by coincidence, i.e., anyone who by chance met and elected to be the respondent. Data analysis techniques used in this study is as follows:

#### **Likert Scale:-**

According to Sudarmanto<sup>[7]</sup>, RS Likert developed a grading system that represents a bipolar continuum. At the left end are lower grades indicating a negative answer, while at the right end are greater numbers that indicate a positive answer. The Likert format is designed to allow customers responded in varying degrees on each item that describes services or products. The benefit of using the Likert-type format over a check list format that only provides "yes" or "no" responses is that the former accounts for the diversity of the responses for an item, ranging from 1 to 5. This

allows the consideration of various dimensions of perception and attitude regarding a given issue, allowing respondents to express their opinion about it.

#### Validity Analysis:-

According to Sudjana<sup>[8]</sup>, validity indicates the level or degree of data being used as evidence to support the conclusions drawn from the value derived from the size or scale used to measure the degree to which something is supposed to be measured. The data is said to be valid when the value corrected Item greater than the value of r table with  $df = n - 2$ .

#### Reliability Analysis:-

According to Sugiono<sup>[9]</sup>, reliability is defined as the extent of measurement that is free of variance error. To estimate the reliability of the variables studied, we used Cronbach's alpha. The coefficient is generally determined with SPSS software, which is designed to be able to calculate the estimate of reliability. A variable is said to be reliable if the value of Cronbach's Alpha is  $> 0.6$ .

#### Correlation Analysis:-

According to Sudjana<sup>[7]</sup>, correlation analysis is useful to assess the strength, significance, and direction of the relationship between the two variables. The direction of the relationship tested in the correlation analysis can indicate three patterns of relationships. The first pattern is a positive relationship or relationship in a unidirectional pattern; the second pattern is a negative correlation or relationship patterned in the opposite direction; and the last is where there is no pattern in the relationship. In measuring the degree of correlation, Pearson's correlation method was used and the analysis was completed through the SPSS software.

#### Regression Analysis:-

According to Sudarmanto<sup>[7]</sup>, regression analysis is a type of parametric analysis that can serve as a basis for predicting and analyzing the variants. Some of the objectives of regression analysis, among others, are to determine the regression line equation based on the value of the constants and the resulting regression coefficients, which indicate correlations between independent variables with the dependent variable, and to test the significance of independent variables on the dependent variable through F. Regression analysis is used to test for correlations partially between independent variables with the dependent variable and examine the significance of independent variables on the dependent variable through the *t*-test.

### Results and Discussions:-

#### Validity and Reliability Test:-

The validity and reliability tests were conducted to determine how many questions are valid and reliable, on the basis of a survey of 100 respondents. The results of tests on the validity and reliability of the questionnaire items are presented in table 1.

**Table 1:-** Operationalization Islamic Scholar Religiosity, and Increased Number of Islamic Banking Customers

Variable	Item	Correlated Items	Cronbach's Alfa
Islamic Scholar Religiosity	R1	0.484	0.626
	R2	0.376	
	R3	0.434	
	R4	0.383	
	R5	0.373	
	R6	0.464	
	R7	0.321	
	R8	0.258	
	R9	0.425	
	R10	0.373	
Increased Number of Islamic Banking Customers	I1	0.633	0.641
	I2	0.331	
	I3	0.651	
	I4	0.354	
	I5	0.533	
	I6	0.580	
	I7	0.558	
	I8	0.201	
	I9	0.576	
	I10	0.533	

As shown in Table 1, all items pertaining to the variables considered were valid because the value of Cronbach's alpha was positive (+) and greater than 0.1966 (r table) with  $df = n - 2$  or  $df = 98$ . The value of Cronbach's alpha for each variable was greater than 0.6, ranging from 0.628 to 0.641, which shows that the four variables were reliable.

#### **Correlation Analysis:-**

A close relationship was noted between Islamic scholar religiosity and increased number of Islamic banking, and the value of R was 0.756. This indicated a strong correlation between the variables of Islamic scholar religiosity and increased number of Islamic banking. The positive (+) sign of the value indicates that Islamic scholar religiosity and increased number of Islamic banking have a unidirectional relationship, indicating that the higher the value of Islamic scholar religiosity, the higher the value of increased number of Islamic banking.

#### **Regression Analysis:-**

Correlation analysis of independent variable on the dependent variable was followed by regression analysis to determine the influence of independent variable on the dependent variable. The results of the regression analysis are expressed as the following regression equation:

$$Y = 1,001 + 0,571 X$$

In regression analysis, a significant influence simultaneously or together was noted between the dependent variable and independent variable. This is evidenced by the results of the F test, which had a significance level of 0.000, a value that was lower than  $\alpha = 0.05$ . This is also supported by the results of the analysis of determination coefficient, which indicated that the independent variable in this study are related to increased number of Islamic banking customers in 57.1% of the cases, while variables other than those included in this study accounted for the remaining 42.9%.

#### **Spiritual Marketing (the New Marketing of Islamic Bank):-**

Based on the results of research on the Effect of Religiosity and the Islamic Scholar Increased Number of Islamic Banking Customers in Cianjur. It can be concluded that the variables Islamic Scholar Religiosity significant effect of 57.1% on the variable Increased Number of Islamic Banking Customers. It is very interesting if the Islamic factor Scholar Religiosity was developed to increase the number of customers of Islamic banking into a new approach to the science of modern marketing. Nowadays, almost all research on Islamic banking to conclude that Islamic banking still need to be developed from various aspects and dimensions so that truly meet the expectations of not only Muslim societies but also the world community. Problems often arise about the public perception of Islamic banking are public assumes that the Islamic banking and conventional banking alike, Islamic banking do not professional services, until the assumption that the brand image of "sharia" is used by the banking industry is only a symbol and identity. A very interesting fact is people who have mistaken views and skeptical of the Islamic banking are Muslims themselves.

Therefore, the results of this study provide a basic concept of spiritual marketing for Islamic banking, the authors focus on the concept of Islamic Scholar Religiosity. Based on interviews and research directly to the public as a key informant in the study (*majelis ta'lim*) in parts of the district of Cianjur. The results showed that the public strongly believes the adage or advice issued by local clerics while running recitation. And the role of the clergy as a resource not only spiritual, but also serve as the policy makers in deciding a problem of individuals or groups. The scholars view that that principle of Islamic banking operations need to be improved. Because, there are still some problems in the contract that are contrary to the principles of sharia economy. One of them is the practice of *mudaraba* should emphasize the aspect of trust, but in reality the Islamic banking more emphasis on aspects of collateral owned by clients or potential clients. Then, from the aspect of the determination of profit sharing, Islamic banking based on the expected return and not on the actual return. Similarly, the practice of *murabahah bil wakalah*, which is considered to be inconsistent in the application of it contract. This, impact on the public to doubt the aspects of sharia compliant Islamic banking itself. To the rational, these conditions have an impact on the selection of another bank switching (conventional banking). However, for groups of religious emotional this condition has no effect. Because the condition of conventional banks which use the system of interest (riba/usury) in practice, so contrary to Islamic principles. They cling to one of the rules of *ushul fiqh* which is "*ma la yudraku la yutrakukulluh*" meaning that cannot be left entirely do everything.

It is, to be one way Islamic banking to pursue cooperation with the Islamic scholars in Cianjur district to promote Islamic banking in order to increase the number of customers of Islamic banking increased. By way of approach of the scholars through Islamic factor Scholar Religiosity is recommending congregation or his students to become customers of Islamic banking. The scholars can be used as an alternative by Islamic banking to be the reference group in increasing the number of customers. The reference group is the group that is the size of a person's behavior shaping personality and attitude of a person to make his choice. According to Paul Peter and Jarry Olsen, there are three reference group influence, namely: information influence occurs when an individual uses the behavior and opinion of the group members as a contribution very useful information. Normative influence, sometimes referring to the utilitarian influence, occurs when the individual meets the expectations of the group to get a direct reward to avoid sanctions. Identification influence, also called value-expressive influence, occurs when an individual has experienced internalization of values and norms of the group<sup>[3]</sup>. According to investigators, spiritual approach to marketing done by the scholars to recommend congregation or its students to become customers of Islamic banks will succeed because the people in the district of Cianjur when obedient and submissive to the advice and recommendations given by the scholars.

### Conclusions:-

1. Based on the research that has been discussed, it can be concluded that: Testing is done on the hypothesis (Ha) Effect of Increased religiosity are the scholars of the Islamic Banking Customers in Cianjur. Can be seen from the t test resulted in the regression test  $t_{count} > t_{table}$  (11.416 > 3.94) thus proving the hypothesis (Ha) is accepted and the coefficient of determination (R<sup>2</sup>) of 0.571 or 57.1%
2. Based on interviews and research directly to the public as a key informant in the study (*majelis ta'lim*) in parts of the district of Cianjur. The results showed that the public strongly believes the adage or advice issued by local clerics while running recitation. The role of the clergy as a resource not only spiritual, but also serve as the policy makers in deciding a problem of individuals or groups. By way of approach of the scholars through Islamic Scholar Religiosity factor is recommending congregation or his students to become customers of Islamic banking. The scholars can be used as an alternative by Islamic banking to be the reference group in increasing the number of customers using the spiritual marketing concept.

### Acknowledgment:-

## CORRELATION BETWEEN CLINICAL MANIFESTATIONS AND CD4 COUNT LEVEL IN SERO-POSITIVE HIV PATIENTS WITH TUBERCULOSIS.

Dr. Priyanka Das, Dr. Naliniprava Das, Dr. Gopal Krushna Sahu and Prof. Dr. Jyoti Pattnaik.

Department of Pulmonary Medicine, M.K.C.G Medical College and Hospital, Behrampur.

#### Manuscript Info

##### Manuscript History

Received: 10 December 2016

Final Accepted: 15 January 2017

Published: February 2017

#### Abstract

##### Aims & Objectives:

- 1.To study the various clinical manifestations of both pulmonary and extrapulmonary tuberculosis in HIV positive patients.
- 2.To observe the impact of CD4 count on the severity of manifestations of TB in HIV positive patients.
- 3.To determine the correlation between clinical manifestations and CD4 count level in seropositive HIV patients with tuberculosis.

##### Materials And Methods:

Study was conducted on 100 HIV sero-positive patients with TB ( Pulmonary and Extra pulmonary)

##### Inclusion Criteria:

- Patients who were HIV sero-positive according to NACO guidelines.
- Patients diagnosed as new TB (Pulmonary and Extrapulmonary as per WHO criteria)

##### Exclusion Criteria:

- Patients with past H/O TB or diagnosed TB before being detected as HIV positive.
- Patients on long term immunosuppressive therapy or having co-existing immune-suppressive conditions.

##### Results:

- Mean CD4 count in the study was relatively higher at  $289.96 \pm 177.49$ .
- Extra pulmonary TB was the most common type. Amongst the extrapulmonary TB, TB lymphadenitis was the most common in 40% followed by Pleural effusion in 20%.
- Amongst X-ray findings, Pleural effusion was most common followed by infiltrative lesions, mediastinal and hilar lymphadenopathy.
- Sputum positivity was relatively low.

##### Conclusions:

- Correlating CD4 levels with the various forms of TB and radiological manifestations of PTB, proves beyond doubt that sputum+ve PTB occurs at a much higher CD4 count followed by sputum-vePTB, EPTB, disseminated TB with gradually diminishing CD4 count.

**Corresponding Author:- Dr.Priyanka Das.**

**Address:-** Senior Resident Department of Pulmonary Medicine, M.K.C.G Medical College and Hospital, Behrampur.

- Thus overall the significant correlation of CD4 count with clinical and radiological manifestations revealed in this study re-establishes CD4 count assay as a useful diagnostic tool, prognostic indicator and a guide to assessment of response to therapy.

### **Introduction:-**

Association between tuberculosis and HIV –HIV TB coinfection is an immediate, grave public health & socioeconomic problem in the developing countries.

Impact of HIV on TB –It worsens the tuberculosis situation by increased reactivation of latent tuberculosis infection in dually infected persons, favouring rapid progression of new infection.

### **CD-4 Cell:-**

CD4 cells or the T-helper cells, are a type of WBC'S that fight infections.

HIV has a special predilection for CD4 cells.

Effect of HIV on CD4 cells is that it can destroy entire “families” of CD4 cells following which opportunistic infections take over.

Typical characteristic of tuberculosis is that it occurs throughout the course of HIV at all levels of CD4 counts.

### **Clinical Manifestations Of HIV-TB:-**

Pulmonary involvement occurs in 75% of all HIV – TB coinfection.

Clinical manifestations depend on the level of immunosuppression . Typical manifestations occur when CD4 + T cell count > 200 cells/cumm. Atypical manifestations and extrapulmonary manifestations ( ranging 46% to 79% ) occur at CD4 cells + T cell count < 200 cells/ cumm.

### **Aims And Objectives:-**

To study the various clinical manifestations of both pulmonary & extrapulmonary tuberculosis in HIV positive patients.

To observe the impact of CD4 count on the severity of manifestations of TB in HIV positive patients.

To determine the correlation between clinical manifestations & CD4 count level in seropositive HIV patients with tuberculosis ( both pulmonary & extrapulmonary )

### **Methods:-**

The study was conducted on 100 HIV sero-positive adult patients with tuberculosis ( both pulmonary & extrapulmonary) who visited the department of Pulmonary Medicine ( OPD & indoor)

### **Inclusion criteria –**

Patients who were HIV seropositive as per NACO guidelines.

Patients who were diagnosed as new tuberculosis cases ( both pulmonary & extrapulmonary ) as per WHO criteria .

### **Exclusion criteria :**

Patients with past history of tuberculosis or diagnosed tuberculosis before being detected as HIV positive.

Patients on long term immunosuppression therapy or co-existing immunosuppressive conditions .

**Results:-**

Mean CD4 count was high at  $289.96 \pm 177.49$ .

Extrapulmonary tuberculosis was the most common type of TB.

Amongst the extrapulmonary tuberculosis , tuberculosis lymphadenitis was the most common (40%), followed by pleural effusion(29%) .Sputum positivity was low.

**Distribution Of Extra Pulmonary Tuberculosis**

CD-4 Count And Chest X-Ray Distribution Of Lesions

Correlation Of CD4 Count & Zonal Distribution Of Chest X-Ray Lesions

Correlation Between Sputum Positivity With CD-4 Count

**Salient Features On Discussion:-**

Maximum number of patients were in the productive age bracket of 20 to 50 years.

The study marked an extremely skewed sex ratio. The percentage of female seropositivity was much less (18%) as compared to males (82%).

As regards occupation, the maximum number of patients were drivers. No occupation or class is absolutely immune.

**Symptoms:** weight loss & fever were the most common symptoms.

**Signs :** anemia was the most common sign .

**Radioimaging :** normal chest X-ray was seen in majority of patients which made it imperative for a culmination of clinical experience, knowledge, bacteriologic & other relevant tests for prompt diagnosis .

Tuberculin sensitivity was high due to greater number of patients, higher mean CD4 count, early diagnosis & prompt initiation of treatment .

**Age And Sex Distribution**

**Occupation**

**Symptomatology**

**CECT Thorax Of A Patient Showing Right Hilar Lymphadenopathy with Right Pleural Effusion.**

**Chest X-Ray PA View Of A HIV Seropositive Patient Showing Bilateral Hilar Lymphadenopathy With Right Sided Minimal Pleural Effusion.**

**Chest X-Ray PA View Of A HIV Seropositive Patient Showing Bilateral Infiltrative And Fibrocavitary Lesions.**

### **Conclusion:-**

Correlating CD4 count level with the various forms of tuberculosis and radiological manifestations of pulmonary tuberculosis, proves beyond doubt that sputum +ve pulmonary tuberculosis occurs at a much higher mean CD4 count ( $444.09 \pm 144.57$ ) followed by sputum -ve pulmonary tuberculosis ( $399.44 \pm 234.07$ ), extrapulmonary tuberculosis ( $245.56 \pm 149.41$ ) & disseminated tuberculosis ( $240.0 \pm 79.24$ ) with gradually diminishing mean CD4 count level.

Typical radiological manifestations of upper zone affection, fibrocavitary lesions & single hemithorax affection occur at a relatively greater percentage at a higher value of CD4 count.

Atypical manifestations of middle/lower/multiple zone affection, miliary lesions & hilar lymphadenopathy occur at a lower CD4 count level.

Thus overall a significant correlation of CD4 count was established with the severity of clinical and radiological manifestations in HIV- TB coinfection.

CD4 count assay is an important diagnostic tool, prognostic indicator & assessment of response to therapy of unequivocal importance.

#### Abstract

The ever increasing technologies with parallel advancements in the development of notorious attempts, to play with the integrity of the information, in the field of communication over the internet present the need for the equally enhancing security measures. We here, try to analyze the security steps and related phenomena which have been developed specific to the symmetric cryptosystems. With the application of different protocols and their related drawbacks, we try to introduce a few changes, if possible, without diminishing the essence of such protocols. Our attempt is to look for the possibility of introducing asymmetric cryptosystem security measures to meet our purpose. The works already being done are a source of reference to invoke something inquisitive towards our topic. Such works include techniques such as key management, magic rectangle, hash functions, encrypted key exchange, etc.

*Copy Right, IJAR, 2017., All rights reserved.*

#### Introduction:-

Over the years, the topic of cryptosystems and their associated safety has been gathering the attention of the security related departments to safeguard such systems against the attacks; they undergo or may counter in future references. Before we move towards exploring the potential security protocols, we must remember that any cryptosystem primarily is composed of two main processes namely, encryption and decryption respectively. The main idea behind the application of encryption technique is to strengthen any communication system with the security feature of confidentiality and not integrity. The sole idea of confidentiality is to provide the information exchange between authorized parties and restrict the reach of unauthenticated party (ies) to the information.

The various issues concerned regarding the algorithms and protocols for implementing the same are as follows:-

- The process of authorization should be kept intact.
- The private key used by the sender to encrypt data should not be susceptible to a usual guess by the attacker.
- The communication channel being used to transfer the data from sender's end to the receiver's end should be made protected against any suspected cryptanalytic activity.
- There should be a mechanism to monitor the information flow.
- Not just passwords or any usual practice of securing data should be used but some mathematical application should also be looked into.
- The algorithm being used to carry out associated steps must be compatible to the system's configuration.

**Corresponding Author:-AshishAgarwal.**

Address:-G.L. Bajaj Institute of Technology & Management, Plot 2, Knowledge Park 3, Greater Noida, Distt. Gautam Budh Nagar, Uttar Pradesh, India.

- The techniques of making confidential communication should not be mistaken with the methodologies of keeping integrity of the information.
- Also, our protocols should not violate the rules and regulations as laid by standard organizations.
- The semantics should take care of proper speed and sequencing of data.
- The message should reach the intended receiver located at any part of the world.

There may be some other issues beside the above listed. In order to have glimpse at the utmost need to the safety in terms of security of the information of user, we can take aid of several statistical data being published by respective organizations timely. This will let us understand the need to upgrade the various available security measures with some new updates or design absolutely new methodology to meet the need. The WhatsApp vulnerability to spying of the messages even after the application of end to end encryption using signal protocol, points to the need of continuous and comprehensive enhancements in the technologies that are in use at present. That is the reason for increased interest in pursuing research in the field of network security.

Therefore, it is needed that the techniques available should be able to shield our data with optimum security features without allowing the attackers to play with the connection between sender and receiver. We can use a predictive analysis i.e. a form of advanced analysis that uses both new and historical data to forecast future activity, behavior and trends.

### **Cryptography:-**

It is a technique, using suitable algorithm(s), which deals with the encryption and decryption of the secret information. The method of applying cryptographic techniques classifies it into two categories namely symmetric key cryptography and asymmetric key cryptography.

*Symmetric key cryptography*, as the name suggests, the key used to shield the information is same and shared between sender and the receiver. We can apply several asymmetric measures or algorithm(s) to enhance the security of this shared key. A key which is used to encrypt & decrypt the information is called *private key* or *secret key* or *shared key* as it is known only to the parties involved in direct communication using the communication channel. The main issue in secret key cryptography is the protection of this shared key. As available algorithm such as *Diffie-Hellman Key Exchange* is used to share a secret key but suffers a drawback as a result of man-in-the-middle attack. RSA algorithm is used to again encrypt this shared key so that it is delivered free of threat, but is still vulnerable to attacks. The main class of attacks being invoked by notorious people to steal away information includes brute force attack. In order to counter such threats, one can definitely look for applying logarithmic complex calculations to generate a factor that would be able to lock our keys. It can be represented as follows:-

#### **Let us suppose shared key:- S**

Encryption key by RSA: E

- E → S i.e. E encrypts S

Now, in order to transmit the information packed in double shield, we may try to apply the binary logic in accordance with mathematical principles in order to guarantee its safe disposal at receiver's end.

The key in symmetric key cryptography can be protected by either of the two stated methods-

- Protecting the channel by applying public key encryption algorithm such as RSA algorithm.
- Applying modified version of RSA algorithm on key before transmission of key in channel.

*Asymmetric key cryptography*, as the name suggests, two keys are used namely *private key* and *public key*. The message may be encrypted using the public key of receiver and to be decrypted by his/her private key. The most popular asymmetric algorithm in use is RSA algorithm. Its importance can be understood from the fact that it is used even in symmetric key cryptographic systems to render the security to the secret or shared key. It can be represented simply as:-

- Message say, M
- Sender say, S
- Receiver say, R
- Encryption using public key of R say, R''

- Decryption using private key of R say, R' respectively.

Again, we may try to apply different protocols to give this communication a level of security such as image encrypted using PGP i.e. Pretty Good Privacy in somewhat modified manner.

Recently US based security agency i.e. NSA, USA (National Security Agency, United States of America) has identified a problem named 'Going Dark Problem', which they have suggested, could be controlled using split key encryption in which the service provider retains half of the master key and law enforcement would retain other half so that decryption process requires the participation of both the parties. To such problems, we may think to apply protocols already available such as Kerberos but for the receiver's end i.e. whenever information is read, a ticket confirming the retrieval and consisting of the shared piece of identity, is sent to sender.

#### **Future Scope:-**

As it can be predicted that the area of information transfer is the one that covers many possibilities to unfold the new methods and protocols for safe communication, meanwhile preserving the confidentiality. Many new techniques have so far been suggested based on research but their implementation relies on the possibilities to counter changing trends. Furthermore we can think to introduce some changes in the functioning of RSA algorithm in order to safeguard against threats in form of attacks. It is not just the protection of information which is necessary but it is equally necessary to identify the attacker. Though, there may be drawbacks to the protocols already in use, we should try out different possibilities in terms of network methodologies.

#### **Conclusion:-**

The research area in the field of cryptography and associated security is ever widening, so is equally important to look for modified algorithms and rules governing them. Protecting the information as well as communication channel are the major ways to make any cryptosystem secure and safe in terms of its application to information exchange. The concepts of double encryption or half encryption being talked about and former used also, suggests same that information may be secured at the cost of increasing complexities to the process of communication. Thus it is a challenge to establish a balance between the security measures and the overall cost of the system in terms of time, computation, space, etc.

Calcium, creatinine, pre-eclampsia, pregnancy, supplementation.

#### Abstract

Pre-eclampsia, a hypertensive multisystem disorder is one of the major causes of maternal morbidity and mortality. The exact aetiology is still unknown, though numerous hypotheses have been put forward. Studies have found that low serum calcium level may be associated with development of pre-eclampsia.

The aim of this study was to find the association between serum calcium level and pre-eclampsia by comparing the serum calcium levels in pre-eclamptic women with that of normal pregnant ladies. Our findings in this study indicate that pre-eclamptic women had a significantly lower serum calcium level than normal pregnant women ( $p < 0.01$ ) and creatinine level was found to be higher in preeclamptics. ( $p < 0.01$ ) This study concludes that low serum calcium level may be a causal factor for the development of pre-eclampsia. So, intake of mineral supplements like calcium may reduce the incidence of pre-eclampsia.

#### Introduction:-

Preeclampsia syndrome, a hypertensive multi-system disorder either alone or superimposed on chronic hypertension forms the deadly triad, with hemorrhage and infection. It has often been labeled the "disease of theories" due to the numerous hypotheses that drive research into this complex disease (Solomon CG and Seely EW, 2004). This complication of pregnancy is one of the most common causes of maternal morbidity (Sukonpan K and Phupong V, 2005).

Preeclampsia is characterized by high blood pressure  $\geq 140/90$ , oedema and proteinuria. It typically occurs sometime in the second or third trimesters — after 14 weeks of pregnancy — with symptoms like swelling of the hands and face, and sudden weight gain. In severe cases, symptoms include nausea, vomiting, vision changes, headache, belly pain, haemolysis, elevated liver enzymes, thrombocytopenia, pulmonary oedema and foetal growth restriction [Chesley LC (1978)]. It is a pregnancy-specific syndrome characterized by variable degrees of placental dysfunction and a maternal response featuring systemic inflammation (Evans KN, *et al.* 2006). Studies suggest a failure of the trophoblastic invasion of the spiral arteries, leading to maladaptation of maternal spiral arterioles. This is associated

**Corresponding Author:- Aparajeeta Bora.**

Address:- Department of Biochemistry, Silchar Medical College and Hospital, Silchar (Assam), India.

with an increased vascular resistance of the uterine artery and a decreased perfusion of the placenta [Walker JJ(2000)].

The exact cause of preeclampsia is still unknown, despite considerable research.( Bringman J, *et al.*2006). The relationship between the aggravation of hypertension and the change in maternal serum level of various minerals during pregnancy have been shown in many clinical studies. (Kisters K, *et al.*2000). Modification of plasma calcium concentration leads to the alteration of blood pressure. The lowering of serum calcium and the increase of intracellular calcium can cause an elevation of blood pressure in pre-eclamptic mothers (Ray J, *et al.* 1999).

Also, various studies have reported elevated levels of serum creatinine in hypertensive disorders of pregnancy and also its effects on maternal and fetal outcomes. (Manjareeka M and Sitikantha N. ,2013).Serum creatinine levels are a part of work up for the hypertensive pregnant women .The elevated level of this parameter is due to decreased urinary clearance secondary to reduced GFR and increased reabsorption ( Jeyabalan A and Conrad KP,2007).

Research suggests intake of supplements, mainly calcium may help in the reduction of incidence of pre-eclampsia especially in a population of a developing country like India where the nutrition is poor.Hence, focus should be given more on prevention measures to manage preeclampsia. The present study aimed at measuring the serum calcium and creatinine levels in pre-eclamptic women and comparing the same with that of normal pregnant women.

### **Materials and Methods:-**

This hospital based case-control study was conducted on 200 pregnant women admitted in the indoor ward in the Department of Obstetrics and Gynaecology, SMCH, a tertiary care hospital, in southern Assam, India during July,2015-July,2016. They were divided into 2 groups comprising 100 normal pregnant women taken as controls and 100 pre-eclamptic women taken as study group. The pre-eclamptic patients were chosen in accordance with the American College of Obstetrics and Gynaecology guidelines. The normal pregnant women had normal blood pressure with no proteinuria. All subjects were primi below 35 years of age and >20 weeks of gestation. All maternal / foetal abnormal pregnancies (except pre-eclampsia), patients with essential hypertension, systemic or endocrine disorders and patients on calcium supplementation were excluded from the study. Written informed consent was taken from each subject and the study was approved by the Institutional Ethics Committee. Detailed family and medical history was taken from each patient. A thorough clinical examination was done on each subject and systolic and diastolic blood pressures were carefully recorded. Under aseptic precautions, 5 ml of venous blood was collected from each subject. The collected blood was allowed to clot spontaneously in a container, and then centrifuged at 3000 rpm for 10 minutes. Whenever possible, the analysis was done immediately. When there was a delay, the samples were stored at -20 degree till further analysis. After centrifugation, serum calcium and creatinine levels were estimated using standard procedures in AU-480 analyser in the laboratory of Biochemistry. The data obtained were tabulated and entered in MS Excel Worksheet. Data were expressed as mean  $\pm$  SD. Independent student t-test was applied for parametric variability considering  $p < 0.05$  to be statistically significant. Data analysis was done by Graph Pad InStat (Version 3.10).

### **Results:-**

The study was an observational hospital-based case control study of 100 preeclamptic (cases) and 100 normotensive pregnant (controls) of < 35 years of age conducted during July 2015 – July 2016. The study subjects were investigated for and results were analysed by using unpaired student's test which was two tailed.

Figure 1:- Age distribution in case and control groups

The maximum number of subjects in each of the two groups was in the age group of 20-25 years. The maximum number of preeclamptics 63% belonged to the age interval of 20-25 years. Second largest group of preeclamptics (23%) were distributed in the age interval of <20 years. The other two age interval 26-30 years and 31-35 years contributed 10% and 4% respectively.

**Serum Creatinine:-**

Mean serum creatinine of cases and controls along with SD, SEM and p value given in following tables and figures.

Table 1:- Comparison of serum Creatinine in cases and controls.

	Mean	SD	SEM	95% CI for Mean	p-value
Cases	1.27	0.53	0.05	[1.16, 1.37]	<0.01
Controls	0.77	0.18	0.02	[0.73, 0.80]	

In the present study the mean serum creatinine level in cases was  $1.27 \pm 0.53$  and in controls  $0.77 \pm 0.17$ . In the Unpaired t test between case and control groups, the two-tailed P value < 0.01 which is considered significant.

Figure 2:- Graph showing correlation between S.B.P. (Systolic blood pressure) and creatinine levels

R=0.02

Pearson’s correlation coefficient between systolic B.P. and creatinine is 0.02.  $R^2=0.000$

P value=.847, which indicates positive correlation, but it is not significant since p value>0.05.

**Figure 3:-** Graph showing correlation between D.B.P. (Diastolic blood pressure) and creatinine levels  
 $R = -0.007$ ,  $R^2 = 0.000049$   
 Pearson’s correlation coefficient between D. B.P. and creatinine is  $-0.007$ .  
**P value= .944**, which indicates insignificant correlation, since  $p \text{ value} > 0.05$ .

**Serum Calcium:-**

Mean serum calcium level of cases and controls along with SD,SEM and p value given in following tables and figures.

**Table 2:-** Comparison of serum Calcium in cases and controls.

	Mean	SD	SEM	95% CI for Mean	p-value
Cases	7.98	0.47	0.05	[7.89, 8.08]	<0.01
Controls	8.78	0.81	0.08	[8.62, 8.94]	

We found mean blood level of serum calcium in preeclamptic cases was  $7.9 \pm 0.47$  and in controls was  $8.7 \pm 0.81$ . In the Unpaired t test between case and control groups, the two-tailed P value  $< 0.01$  which is significant.

**Discussion:-**

Pre-eclampsia is associated with increased morbidity and mortality in developing countries but the exact cause of pre-eclampsia is still unknown. Several inferences can be drawn on the basis of the available results of this and other previous studies.

Our study assessing the serum calcium levels in pregnant women with and without pre-eclampsia showed serum calcium level to be significantly reduced in women with pre-eclampsia compared to normal pregnancy. This correlates well with the other studies ( Malas NO and Sheridan ZM, 2001).

Studies investigating calcium supplementation of pregnant women at risk of developing pre-eclampsia have shown that this intervention reduces the incidence and severity of the disease. An inverse relationship between calcium intake and hypertensive disorders of pregnancy was first described in 1980 and led to the hypothesis that an increase in calcium intake during pregnancy might reduce the incidence of high blood pressure and pre-eclampsia among women with low calcium intake (Belizan JM and Villar J, 1980).

Low serum calcium may predispose women to pre-eclampsia for the following reasons: (1) by increasing parathyroid hormone release and thus increasing vascular smooth muscle intracellular calcium, which promotes vasodilatation; (2) by stimulating renin release, which increases angiotensin II levels; (3) by decreasing serum magnesium levels, inducing vasoconstriction in vascular smooth muscle; (4) by diminishing the effect of endothelial

nitric oxide synthase, a calcium-dependent enzyme with vasodilatory action; and, finally (5) by reducing circulating prostacyclin, a calcium-dependent enzyme and a potent vasodilator. (Hofmeyr GJ, *et al.* 2010).

Recent evidence indicates that calcium supplementation affects uteroplacental blood flow (it lowers the resistance index in uterine and umbilical arteries). Supplementation in the second half of pregnancy appears to reduce blood pressure directly, rather than preventing the endothelial damage associated with pre-eclampsia (Hofmeyr GJ, *et al.*, 2010).

Calcium supplementation may play a beneficial role in the prevention of PIH by maintaining plasma ionized calcium levels within the narrow physiological range. Studies have shown that maintaining this range is crucial for the ongoing synthesis of vasoactive substances such as prostacyclin and nitric oxide in the endothelium and consequently for a normal endothelial function and thus lowering the blood pressure.

In one study by Deepa Kanagal *et al.*, the serum calcium concentration was significantly lower in the pre-eclamptic group compared to normotensives ( $7.84 \pm 0.87$  mg/dl Vs  $8.97 \pm 0.69$  mg/dl,  $p < 0.001$ ) (Deepa Kanagal, *et al.* 2014). Akhtar S *et al.*, in a study from Bangladesh showed significantly lower levels of calcium in pre-eclamptic women (Akhtar S, *et al.* 2011).

Jain *et al.*, Sukonpan and Phupong found a decrease in both serum calcium and magnesium in pre-eclamptic pregnant women as compared to normal pregnant women in their study thus supporting the hypothesis that hypocalcemia and hypomagnesemia are possible aetiologies of pre-eclampsia (Sukonpan K and Phupong V, 2005). A study from Northern part of India by Chaurasia *et al.*, found significantly lower levels of serum calcium and magnesium in pre-eclamptic women compared to normal pregnant women (Chaurasia PP, *et al.* 2012).

In the present study the mean serum creatinine level in cases was  $1.26 \pm 0.53$  and in controls  $0.76 \pm 0.17$ . In the Unpaired t test between case and control groups, the two-tailed P value  $< 0.001$  which is considered significant. Serum creatinine is a marker of GFR and renal dysfunction. Thus, in our study, we observed elevated levels of serum creatinine in preeclampsia when compared with normal pregnant women. This is in accordance with previous studies (Padma Y, *et al.* 2013).

The kidney is the organ most likely to manifest endothelial injury related to preeclampsia. Although the plasma creatinine concentration is generally normal or only slightly elevated (1.0 to 1.5 mg/dL (88 to 133 mmol/L), this could represent a decrease by 30–40% of glomerular filtration rate (GFR) for the values experienced in pregnant normotensive controls. Renal failure is an unusual complication that most often occurs in patients who develop severe preeclampsia. Progressive renal insufficiency i.e. serum creatinine concentration  $> 1.1$  mg/dL or a doubling of the serum creatinine concentration in the absence of other renal disease along with preeclampsia is a feature of severe preeclampsia (K. P. Conrad, *et al.* 2009).

Manjareeka *et al.* 2013, also found serum creatinine, expressed in mg/ dL to be significantly elevated in preeclamptics ( $0.72 \pm 0.387$ ) when compared to normotensives ( $0.58 \pm 0.283$ ) (Manjareeka M and Nanda S., 2016).

One study by Salako BL, found there was no significant difference in the mean values of uric acid and creatinine in the two groups. This was contrary to the findings of other workers that serum uric acid and creatinine levels are usually raised in patients destined to develop pre-eclampsia (Salako BL, *et al.* 2003). However, the inclusion criteria used in some of these studies were slightly different from those of the present study. Hayashi *et al.* demonstrated that abnormally high blood creatinine levels are seldom observed and those of uric acid often are normal even though the clearance was reduced in patient with preeclampsia (Hayashi T. and Philadelphia P., 1956).

### Conclusions:-

Our study shows a significant reduction of serum calcium level in pre-eclamptics compared to normotensives. This supports the hypothesis that hypocalcaemia may have a role in the aetiology of pre-eclampsia. It also emphasizes the need for monitoring the serum calcium level during the antenatal period so that appropriate measures may be instituted to reduce the incidence of pre-eclampsia.

 infratentorial,astrocytomas.

#### Abstract

**Background:** Astrocytomas are the most common glial tumors of the central nervous system among the pediatric age group. Most of the childhood tumors occur infratentorially (medulloblastoma, astrocytoma and ependymomas ). Supratentorialastrocytomas are more likely to be low grade compared with their infratentorial counterpart. Pleomorphic xanthoastrocytomas are rare tumors accounting for only 1% of all astrocytomas. Despite its highly pleomorphic and bizarre looking cytology, it appeared to have a favorable prognosis and a relatively benign course. Its correct diagnosis is crucial.

**Conclusion:** Pleomorphic Xanthoastrocytoma is a rare slowly growing tumour of childhood and young adults. Hypothalamus is a very rare site for pleomorphic xanthoastrocytoma. It can present with unusual sensory manifestations. Classical neuroimaging and histopathological characteristic are useful aids in diagnosis. Complete excision is the treatment of choice and gives very good results. A close follow up is always needed, as both recurrence and anaplastic transformation has been reported. Role of radiotherapy and chemotherapy is controversial except in malignant growth.

#### Introduction:-

Astrocytomas are the most common glial tumors of the central nervous system among the pediatric age group. Most of the childhood tumors occur infratentorially (medulloblastoma,astrocytoma and ependymomas). Supratentorialastrocytomas are more likely to be low grade compared with their infratentorial counterpart<sup>1</sup>.Pleomorphic xanthoastrocytomas are extremely rare tumours accounting for only <1% of all astrocytomas. It was described for the first time by Kepes et al in 1979<sup>2</sup> . Among all sites, occurrence of the tumour in hypothalamus is extremely rare. The peculiarity of this tumor is despite its highly pleomorphic and bizarre looking cytology, it appeared to have a favorable prognosis and a relatively benign course. Its correct histological diagnosis is crucial and outcome is good when managed appropriately by surgery. Here we describe one such rare case in a rare location i.e hypothalamus which was managed successfully by surgery without any adjuvant therapy.

#### Case Report:-

A 11 year old female child patient presented in our outpatient department with chief complaints of decreased vision in both eyes and deviation of eyes since 10 days . No history of convulsions, loss of consciousness, vomiting and limb weakness.

**Corresponding Author:-Vijaykumar S. Shabadi.**

Address:-Department of Neurosurgery B. J. Medical College and Civil Hospital, Ahmedabad, Gujarat, India 380016

She had normal cognition and behavior. Her school performance was also good. Past and family history was not significant.

**On examination:-**She had normal higher functions, normal speech, decreased vision in both eyes . Patient had Right eye- Finger Counting +ve and Left eye- Perception of light +ve and bilateral 6<sup>th</sup> nerve paresis. Rest of neurological examination was essentially normal. Hormonal profile was normal.

**MRI BRAIN:-** Large suprasellar lesion, which is iso-intense on T1 weighted sequence, iso-intense to hypointense on T2 weighted sequence and heterogeneously enhancing on post contrast images extending upto floor of 3<sup>rd</sup> ventricle.

FIG:1

**Surgery:-** Right side Ventriculoperitoneal shunt was done followed by left frontal craniotomy with sub-frontal approach with near total excision of tumor under GA. Patient had post operative diabetes insipidus which was managed conservatively. Patient had significant improvement in vision after surgery :- RT eye:- >6/60 and left eye 6/60. Extra-ocular movements improved significantly and diplopia subsided.

**Histopathology:-S/O Pleomorphic xanthoastrocytoma**

FIG:2

Astrocytic cells having large irregular hyperchromatic nuclei and small lymphocytic like cells. Uni-nucleated and multinucleated tumor giant cells and scattered lymphocytes in a glial background. No significant vascular endothelial proliferation seen. Large pleomorphic cells, prominent eosinophilic granular bodies, lipidized astrocytes, focal perivascular lymphocytes, abundant reticulin network, absent or scant mitoses.

**FIG 3: Immediate post op CT:- Complete tumor excision.**

**No adjuvant therapy was given. Patient was followed up regularly at 6 months , 1<sup>st</sup> year and 2<sup>nd</sup> year.**

MRI Brain showed no evidence of tumour at 6 months follow-up. No neurological deficits. Vision improved significantly and diplopia completely subsided. Patient had normal cognitive development.

FIG 4: MRI image at 6 month follow-up.

**MRI brain after 2 year:-** No evidence of tumor recurrence seen after 2 years of follow-up. Patient is attending school regularly with normal intellectual capacity.

FIG 5: MRI images at 2<sup>nd</sup> year follow-up:

### Discussion:-

In 1993, the World Health Organization recognized Pleomorphic xanthoastrocytoma as a distinct tumor in the classification of grade II tumors. It represents less than 1% of all the astrocytomas. It can occur throughout the supratentorial compartment, mostly commonly in the temporal lobe, next in frequency are the parietal, occipital and frontal lobes<sup>3</sup>.

To the best of our knowledge, only one case of pleomorphic xanthoastrocytoma involving hypothalamus has been reported in the literature<sup>4</sup>. Location outside the supratentorial compartment has been reported in cerebellum and spinal cord.<sup>5</sup>

Patients typically present in the second or third decades of life, with the median age of 14 years. Both sexes are affected equally. Most patients have seizures and headache and focal location related deficits<sup>2</sup>. Patient may present with decreased vision if tumor located in sellar and suprasellar region, as in our case. Rarely, patients present with symptomatic hemorrhage from the tumour<sup>7</sup>.

Supratentorial tumours are most often cortically based, adjacent to the meninges but not involving the dura-mater. On CT and MRI as a cystic structure with an enhancing mural nodule. Both CT and T1 weighted imaging reveal a focal, ill defined mass with mixed intensity, isointensity or hypointensity to the gray matter. Well defined contrast enhancement of nodule is often seen on CECT and contrast MRI. On T2 weighted imaging, tumor is hyperintense and cyst also hyperintense. Typically, cyst wall is non enhancing and mild to moderate amount of edema may be present and calcification is very rare<sup>2</sup>.

Grossly, tumors are usually firm, variable in color, and relatively avascular. A yellowish cyst with a mural nodule is common, with the solid portion contacting the lepto-meninges. The characteristic histopathological features of PXA include:- large pleomorphic cells, prominent eosinophilic granular bodies, lipidized astrocytes, focal perivascular lymphocytes, abundant reticulin network, absent or scant mitoses, and absence of necrosis<sup>2</sup>.

PXAs demonstrated immunoreactivity for glial fibrillary acidic protein (100%), S-100 (100%), class III [beta] tubulin (73%), synaptophysin (38%), NF (nuclear factor) proteins (18 and 8%) and MAP2 (microtubular associated protein 2) (8%)<sup>7</sup>. These tumors are relatively slow clinical course, a favorable prognosis and does not require an aggressive postoperatively therapy. The overall prognosis is good with only 30% tumors recurring and undergoing anaplastic transformation.

Increased mitotic activity, high MIB-1 and proliferating cell nuclear antigen labeling indices and necrosis are poor prognostic factors, whereas abundant lymphocytic infiltration is associated with more benign biological behavior. Other factors influencing clinical outcome include extent of resection, old age, peri-tumor edema, and increased FDG uptake on PET. A close follow up is needed in order to detect any recurrence with malignant transformation.

Craniotomy and gross total resection is the treatment of choice. Patients with subtotal resection or high mitotic index or necrosis on pathologic examination should at least undergo vigilant, routine gadolinium-enhanced MRI as surveillance for progression. Patients with favorable anatomy, repeat resection may be attempted. Malignant transformation may necessitate adjuvant treatment with chemotherapy and radiation.

**Conclusion:-**

Pleomorphic Xanthoastrocytoma is a very rare slowly growing tumor of childhood and young adults. Hypothalamus is a very rare site for PXA. It can present with unusual sensory manifestations. Classical neuroimaging and histopathological characteristics are useful aids in diagnosis. Complete excision is the treatment of choice, gives very good results. A close follow up is always needed, as both recurrence and anaplastic transformation has been reported. Role of radiotherapy and chemotherapy is controversial except in malignant growth.

#### Abstract

In this paper an attempt has been made to study explicitly the effect of viscous dissipation in the MHD Rayleigh problem with inclined magnetic field is investigated in this paper. Numerical results and graphs are presented to study the combined effect of Hartmann number, Hall Parameter, Rotation parameter, Eckert number, angle of inclination and Prandtl number.

#### Introduction:-

The study of Magnetohydrodynamics of a conducting fluid has applications in a variety of geophysical and astrophysical problems. The unsteady free- convection flow of a electrically conducting, viscous incompressible fluid have gained considerable attention in the presence of applied magnetic field in connection with the theories of fluid motion in the liquid core of the earth, oceanographic and metrological applications.

The *viscosity* of the fluid in a viscous fluid flow will take energy from the motion of the fluid and transform it into internal energy of the fluid. That means heating up the fluid. This partially irreversible process is referred as *dissipation* or *viscous dissipation*. Viscous dissipation is defined as the irreversible process by means of which the work done by a fluid on adjacent layers due to the action of shear forces is transformed into heat.

The effect of viscous dissipation in natural convection was analyzed by Gebhart [1]. Iqbal et.al [2] studied the viscous dissipation effects on combined free and forced convection through vertical circular tubes. Hossian [3] studies the effect of viscous and Joules heating on the flow of an electrically conducting fluid past a semiinfinite plate when temperature varies linearly with the distance from the moving edge and it in the presence of a uniform transverse magnetic field. Vajravelu and Hadjiniwlaou [4] analyzed heat transfer in a viscous fluid over a stretching sheet with viscous dissipation and internal heat generation. The problem of heat transfer on a moving plate with a uniform magnetic field has attracted the attention of many researchers such as Ali [5], Takharet. al. [6] and Zakaria [7].

The simultaneous effects of the heat transfer and Hall current on a MHD flow with a porous medium in a rotating system was investigated by Dileepsing [8]. Loganathan [9] analyzed the viscous dissipation effects on unsteady natural convective flow past an infinite vertical plate with uniform heat and mass flux. In all the above cases either normal or horizontal magnetic field is considered, but this cannot support the entire physical scenario. In Science

and Engineering problems oblique magnetic field also play a vital role. Hence this paper mainly deals with the problem involving viscous dissipation and oblique magnetic field.

**Author’s Contribution:-**

The effect of inclined magnetic field with viscous dissipation may become very important in several flow configurations occurring in the Engineering problems. In view of the importance of an inclined magnetic field and dissipation effects, the effect of viscous dissipation in the MHD Rayleigh problem with inclined magnetic field is investigated in this chapter.

**Formulation of the Problem:-**

An unsteady free convection flow of an electrically conducting viscous incompressible fluid with heat transfer along an infinite flat plate occupying the plane  $y = 0$  has been considered. The  $x$ -axis is taken in the direction of the motion of the plate.  $z$  – axis lying on the plane normal to both  $x$  and  $y$  – axis. Initially it is assumed that the plate and the fluid rotate in unison with a uniform angular velocity  $\bar{\Omega}$  about the  $y$  - axis normal to the plate are at the same temperature  $T$  everywhere in the fluid. At time  $t > 0$ , the plate starts moving impulsively with the uniform velocity in its own plane along the  $x$ -axis. Also the temperature of the plate is raised/lowered to  $T_\infty$  and there after maintained uniform. A uniform magnetic field  $H_0$  is applied in a direction which makes an angle  $\theta$  with the positive direction of  $y$  - axis in the  $xy$  – plane. The magnetic Reynolds number of the flow is taken to be small enough so that the induced magnetic field can be neglected.

Here  $\bar{q}=(u,0,w)$  represents the velocity vector,  $\bar{H}=(H_0 \sin\theta, H_0 \cos\theta, 0)$  is the magnetic induction,  $\bar{E}=(E_x, 0, E_z)$  is the electrostatic field and  $\bar{\Omega}=(0,\Omega_y,0)$  denotes uniform angular velocity. Under these conditions, the governing boundary layer equations are

Equation of continuity  $\nabla \cdot \bar{q}=0$  (1)

Equation of motion  $\frac{\partial \bar{q}}{\partial t} + (\bar{q} \cdot \nabla)\bar{q} + 2\bar{\Omega} \times \bar{q} = -\frac{1}{\rho} \nabla P + \nu \nabla^2 \bar{q} + \frac{1}{\rho} (\bar{J} \times \bar{B})$  (2)

Here  $P$  is the pressure,  $\rho$  is the density,  $\nu$  is kinematic viscosity and  $\bar{J} \times \bar{B}$  is the Lorentz force.

The Energy equation  $\rho C_p \left[ \frac{\partial T}{\partial t} + (\bar{q} \cdot \nabla)T \right] = K \nabla^2 T + \mu \Phi$  (3)

where  $C_p$  is the specific heat at constant pressure,  $K$  is the thermal conductivity and  $\Phi$  is the dissipation function due to viscosity.

The generalized Ohm’s law is,  $\frac{\bar{J}}{\sigma} = (\bar{E} + \bar{q} \times \bar{B}) - \frac{\bar{J} \times \bar{B}}{n.e}$  (4)

where  $\sigma = \frac{e^2 n}{m_e \tau}$  (is the electrical conductivity). Here  $\bar{J}$  is the current density,  $e$  is the electric charge,  $\tau$  is the mean collision time,  $n$  is the electron number density and  $m_e$  is mass of an electron. As the plate is infinite, all variables in the problem are functions of  $y$  and  $t$  only. So the term  $(\bar{q} \cdot \nabla)\bar{q}$  reduces to zero and  $\nabla P$  vanishes as  $P$  is constant in equation (2).  $T(y, t)$  is the temperature of the fluid in the boundary layer and  $T_\infty$  is the fluid temperature far away from the plate and let  $T(y, t) - T_\infty = \theta_T(y, t)$ . Subject to the boundary conditions,

$u = 0, w = 0, \theta_T = 0$  for all  $t \leq 0$  and for all  $y$   
 $u = U_0, w = 0, \theta_T(0, t) = ae^{i\omega t}$  for all  $t > 0$  and  $y = 0$   
 $u \rightarrow 0, w \rightarrow 0, \theta_T \rightarrow 0$  for all  $t > 0$  and  $y \rightarrow \infty$  (5)

Let us introduce the following non-dimensional quantities:

$y^* = \frac{U_0 \cdot y}{\nu}, u^* = \frac{u}{U_0}, w^* = \frac{w}{U_0}, t^* = \frac{U_0^2 t}{\nu}, \theta_T^* = \frac{\theta_T}{a}, m = \omega \tau, M^2 = \frac{\sigma H_0^2 \nu}{\rho U_0^2},$   
 $Pr = \frac{\nu \rho C_p}{K}, K^2 = \frac{\nu \Omega_y}{U_0^2}, \xi = \frac{\nu \omega}{U_0^2}, Ec = \frac{U_0^2}{a C_p}$  (6)

Equations (1), (2) and (3) transform to the following non-dimensional forms (dropping the stars)

$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial y^2} - \frac{M^2 \cos^2 \theta}{(1+m^2 \cos^2 \theta)} (u + mw \cos \theta) - 2wK^2$  (7)

$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial y^2} + \frac{M^2 \cos^2 \theta}{(1+m^2 \cos^2 \theta)} (mu \cos \theta - w) + 2uK^2$  (8)

$\frac{\partial \theta_T}{\partial t} = \frac{1}{Pr} \frac{\partial^2 \theta_T}{\partial y^2} + Ec \left[ \left( \frac{\partial u}{\partial y} \right)^2 + \left( \frac{\partial w}{\partial y} \right)^2 \right]$  (9)

with the corresponding boundary conditions,

$t \leq 0: u(y, t) = w(y, t) = 0, \theta_T(y, 0) = 0$  for all  $y$

$$\begin{aligned}
 t > 0: u(0, t) = 1, w(0, t) = 0, \theta_T(0, t) = e^{i\xi t} \\
 t > 0: u(y, t) \rightarrow 0, w(y, t) \rightarrow 0, \theta_T(y, t) \rightarrow 0 \text{ as } y \rightarrow \infty
 \end{aligned}
 \tag{10}$$

**Solution of the Problem**

By using (7) and (8), we get

$$\frac{\partial q}{\partial t} = \frac{\partial^2 q}{\partial y^2} - \left[ \left( \frac{M^2 \cos^2 \theta}{1+m^2 \cos^2 \theta} \right) (1 - im \cos \theta) - 2iK^2 \right] q
 \tag{11}$$

with the boundary conditions,

$$\begin{aligned}
 q(y, 0) = 0, \quad q(0, t) = 1, \quad q(\infty, t) = 0 \\
 \theta_T(y, 0) = 0, \quad \theta_T(0, t) = e^{i\xi t}, \quad \theta_T(\infty, t) = 0
 \end{aligned}
 \tag{12}$$

Equation (11) reduces to the form,

$$\frac{\partial q}{\partial t} = \frac{\partial^2 q}{\partial y^2} - \alpha q
 \tag{13}$$

$$\text{where } \alpha = \left( \frac{M^2 \cos^2 \theta}{1+m^2 \cos^2 \theta} \right) (1 - im \cos \theta) - 2iK^2$$

$q(y, t) = e^{i\xi t} g(y)$  in (13) gives

$$g''(y) - (i\xi + \alpha)g(y) = 0
 \tag{14}$$

Equation (14) can be solved under the boundary conditions,

$$g(0) = e^{-i\xi t}, g(\infty) = 0
 \tag{15}$$

The solution is

$$g(y) = e^{-i\xi t} e^{-y\sqrt{i\xi + \alpha}}
 \tag{16}$$

$$\text{Hence } q(y, t) = e^{i\xi t} \left[ e^{-i\xi t} e^{-y\sqrt{i\xi + \alpha}} \right]
 \tag{17}$$

Real and imaginary parts of equation (17) are

$$u(y, t) = e^{-yS_1} \cos yS_2
 \tag{18}$$

$$w(y, t) = -e^{-yS_1} \sin yS_2
 \tag{19}$$

$$\text{where } S_1 = \sqrt{\frac{a + \sqrt{a^2 + (\xi + b)^2}}{2}} \text{ and } S_2 = \sqrt{\frac{-a + \sqrt{a^2 + (\xi + b)^2}}{2}}$$

$$\text{Equation (9) reduces to } f''(y) - i\xi \text{Pr} f(y) = \text{Pr} Ec e^{-i\xi t} \left[ \left( \frac{\partial u}{\partial y} \right)^2 + \left( \frac{\partial w}{\partial y} \right)^2 \right]
 \tag{20}$$

where  $\theta_T(y, t) = e^{i\xi t} f(y)$  with the boundary conditions,

$$f(0) = 1, f(\infty) = 0
 \tag{21}$$

Hence the solution is

$$\begin{aligned}
 f(y) = & (\text{Cos}yS_3 e^{-yS_3} - L_7 \text{Cos}yS_3 e^{-yS_3} - L_8 \text{Sin}yS_3 e^{-yS_3} + L_7 e^{-yS_1}) \\
 & - i(\text{Sin}yS_3 e^{-yS_3} - L_8 \text{Cos}yS_3 e^{-yS_3} - L_7 \text{Sin}yS_3 e^{-yS_3} - L_8 e^{-yS_1})
 \end{aligned}
 \tag{22}$$

$$\text{where } L_1 = \frac{4S_1^2}{16S_1^4 + \xi^2 Pr^2}, L_2 = \frac{\xi Pr}{16S_1^4 + \xi^2 Pr^2}, L_3 = \frac{16(S_1^2 - S_2^2)^2 - \xi^2 Pr^2 + 64S_1^2 S_2^2}{(16(S_1^2 - S_2^2)^2 - \xi^2 Pr^2 + 64S_1^2 S_2^2)^2 + 64(S_1^2 - S_2^2)\xi^2 Pr^2},$$

$$L_4 = \frac{8(S_1^2 - S_2^2)\xi Pr}{(16(S_1^2 - S_2^2)^2 - \xi^2 Pr^2 + 64S_1^2 S_2^2)^2 + 64(S_1^2 - S_2^2)\xi^2 Pr^2},$$

$$L_5 =$$

$$L_1 PrEc(S_1^2 + S_2^2) + 8L_3 PrEcS_1 S_2 \text{Sin}2yS_2 (S_1^2 - S_2^2) + 2L_4 PrEcS_1 S_2 \text{Sin}2yS_2 \xi Pr - 16L_3 PrEc(S_1^2 S_2^2) \text{Cos}2yS_2,$$

$$L_6 =$$

$$L_2 PrEc(S_1^2 + S_2^2) + 8L_4 PrEcS_1 S_2 \text{Sin}2yS_2 (S_1^2 - S_2^2) - 2L_3 PrEcS_1 S_2 \text{Sin}2yS_2 \xi Pr - 16L_4 PrEc(S_1^2 S_2^2) \text{Cos}2yS_2, L_7 = L_5 \text{Cos}\xi t + L_6 \text{Sin}\xi t, L_8 = L_6 \text{Cos}\xi t - L_5 \text{Sin}\xi t$$

Hence

$$\begin{aligned}
 \theta_T(y, t) = & e^{i\xi t} ((\text{Cos}yS_3 e^{-yS_3} - L_7 \text{Cos}yS_3 e^{-yS_3} - L_8 \text{Sin}yS_3 e^{-yS_3} + L_7 e^{-yS_1}) \\
 & - i(\text{Sin}yS_3 e^{-yS_3} - L_8 \text{Cos}yS_3 e^{-yS_3} - L_7 \text{Sin}yS_3 e^{-yS_3} - L_8 e^{-yS_1}))
 \end{aligned}$$

**Shearing Stress and Nusselt number**

The shearing stress at the wall along  $x$  - axis and  $z$  - axis are given by  $\tau_x = \left( \frac{\partial u}{\partial y} \right)_{y=0}$  and  $\tau_z = \left( \frac{\partial w}{\partial y} \right)_{y=0}$

From equation (18) and (19),  $\tau_x = -S_1$  and  $\tau_z = -S_2$

The rate of heat transfer at the plate in terms of the Nusselt number is given by  $Nu = -\left(\frac{\partial T}{\partial y}\right)_{y=0}$

**Results and Discussion:-**

To get a physical insight to the problem graphs are drawn by varying the physical parameters such as Hartmann number, Hall Parameter, Rotation parameter, Eckert number, angle of inclination, Prandtl number and time. Following results are obtained from the graphs.

**Figure 1:- Effect of Hartmann number ( $M^2$ ) on primary and secondary velocity profile when  $m = 1; K^2 = 2; \theta = 30^\circ; \xi = 1$**

**Figure 2:- Effect of Hall parameter ( $m$ ) on primary and secondary velocity profile when  $M^2 = 1; K^2 = 2; \theta = 30^\circ; \xi = 1$**

**Figure 3:- Effect of Rotation parameter ( $K^2$ ) on primary and secondary velocity profile when  $M^2 = 1; m = 1; \theta = 30^\circ; \xi = 1$**

**Figure 4:- Effect of angle of inclination ( $\theta$ ) on primary and secondary velocity profile when  $M^2 = 1; m = 1; K^2 = 2; \xi = 1$**

Figure 5:- Temperature profile for various values of time ( $t$ ) when  $Pr = 0.71$ ;  $M^2 = 1$ ;  $m = 1$ ;  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$ ;  $Ec = 1$

Figure 6:- Temperature profile for various values of Prandtl number ( $Pr$ ) when  $t = 1$ ;  $M^2 = 1$ ;  $m = 1$ ;  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$ ;  $Ec = 1$

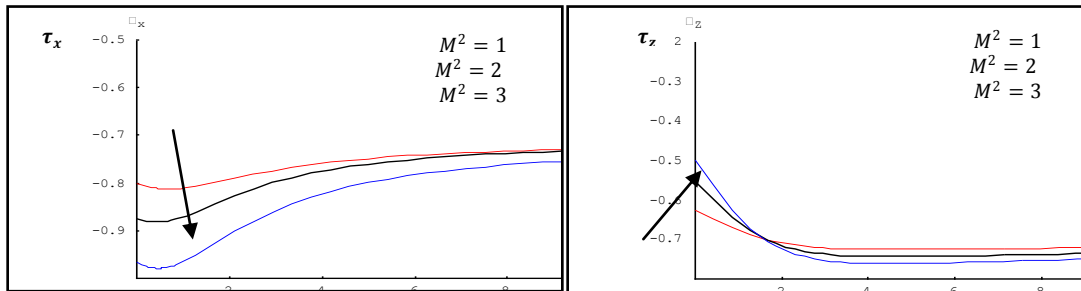

Figure 7:- Shear stress  $\tau_x$  and  $\tau_z$  for different  $M^2$  when  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$

Figure 8 : Shear stress  $\tau_x$  and  $\tau_z$  for different  $m$  when  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$

**Figure 9:- The amplitude  $|Nu|$  when  $M^2 = 1$ ;  $m = 1$ ;  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$ ;  $t = 1$**

**Figure 10:- The amplitude  $|Nu|$  when  $Pr = 0.71$ ;  $m = 1$ ;  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$ ;  $t = 1$**

**Figure 11:- The amplitude  $|Nu|$  when  $Pr = 0.71$ ;  $M^2 = 1$ ;  $K^2 = 2$ ;  $\theta = 30^\circ$ ;  $\xi = 1$ ;  $t = 1$**

Figures 1 illustrate the velocity profiles of both primary and secondary for various values of Hartmann number. It is clearly seen from the figure that the profiles increase near the plate and attains a free stream away from the plate. Figure 2 represents the variation of the primary and secondary velocities under the influence of the Hall parameter. It is evident from the figures that when the Hall parameter is increased, both the velocity profiles almost remain as constant. The effect of Rotation parameter retards both the velocity profiles are shown in figures 3. Figure 4 reveals the primary velocity component increase while the secondary velocity component decreases with an increase in the angle of inclination of the magnetic field. This implies that the angle of inclination of the magnetic field accelerates the primary velocity whereas it has a retarding influence in the secondary velocity. In figure 5 and 6, the temperature profile for different values of time and Prandtl number are presented. Here temperature profiles are gradually decreases near the plate and reach the free stream temperature.

The shear stress along the  $x$  - axis and  $z$  - axis with increase of Hartmann number with respect to the Hall parameter are shown clearly in the figure 7. When the strength of the applied magnetic field is increased, the primary skin friction  $\tau_x$  decreases due to the Hall effect. The secondary skin friction  $\tau_z$  increases near the plate. Figure 8 clearly depicts that the shear stress along the  $x$  - axis, the primary skin friction has a higher influence and it accelerates whereas the shear stress along the  $z$  - axis, the secondary skin friction retards with increase of Hall parameter with

respect to Hartmann number. Figures 9 – 11 depicts the profiles of amplitude  $|Nu|$  when Eckert number is increased with respect to Prandtl number, Hartmann number and Hall parameter. Eckert number expresses the relation between kinetic energy and the enthalpy. Figures clearly show that the amplitude  $|Nu|$  increase considerably when Eckert number increases with the increase of Prandtl number, Hartmann number and Hall parameter.

### Conclusion:-

When the magnetic field is increased the velocity profiles also increase but the Hall parameter is not having a notable influence in velocity components. When the rotation parameter is increased the velocity profiles decrease. The primary velocity increase and secondary velocity decrease when the angle of inclination is increased. The temperature profile decreases when time and Prandtl number are increased. The shear stress  $\tau_x$  at the plate decrease and  $\tau_z$  at the plate increase with increase of Hartmann number and with increase of Hall parameter  $\tau_x$  increase and  $\tau_z$  decrease. With increase of Prandtl number, Hartmann number and Hall parameter, the profile of amplitude  $|Nu|$  accelerates.

#### Abstract

In Nagpur region, Central Ground Water Board (CGWB) is monitoring the ground water quality of the district since the last four decades through its established monitoring wells. Ground water trace and exploration has become a cumbersome task in central India in due to irregularities in annual rainfall. The objectives behind the monitoring are to develop an overall picture of the ground water quality of the district. Hydrological traces and possibilities is sought with the help of natural landscape elements like topographical landforms, drainage patterns and watersheds, vegetative land use, soils patterns etc. by image interpretation techniques. The present study was carried out in an area covering around 520.86 sq.km. to deduce the groundwater potential zones in urban industrial fringe area of Nagpur (Maharashtra Industrial Development Corporation - MIDC, Butibori), based on the remote sensing techniques and interpreting and overlaying basic natural landscape parameters.

#### Assigning Rank and Weightages:-

The weights and rank have been taken considering the earlier works carried out. The maximum value is given to the feature with highest groundwater potentiality and the minimum given to the lowest potential feature. The higher rank factors are assigned to low drainage density because the low drainage density factor favors more infiltration than surface runoff. Lower value followed by higher drainage density. The primary study of slope gradients was carried using top sheet of Survey of India, Nagpur region, while soils data was taken from National Bureau of soil survey and land use planning and remote sensing data was referred from Maharashtra Remote Sensing Applications Centre, Nagpur. The overall analysis is tabulated in following table no.1as:

**Table. No. 1:-** Showing various parameters with ranking and weightages.

Parameter	Classes	Rank	Groundwater prospect	Weightages (%)
<b>Slope Gradients</b>	Almost Flat (1-3%)	5	Very good	40
	Gently sloping (3-5%)	4	Good	
	Sloping (5-10%)	3	Moderate	
	Steep Sloping (10-15%)	2	Poor	
	Very Steep Sloping (15-35%)	1	Very poor	
<b>Soil Types</b> (based on sand, silt and clay contents)	Tamboli	5	Very good	30
	Paunar	4	Good	
	J Yenwa	4	Moderate	
	Pangagoan	3	Moderate	
	Jawal	2	Poor	
<b>Geology</b>	Basalt	5	Very good	15
<b>Drainage density</b> (Km/Km2)	0 – 1.2	5	Very good	15
	1.2 – 2.4	4	Good	
	2.4 – 3.6	3	Moderate	
	3.6 – 4.8	2	Poor	
	4.8 – 6	1	Very poor	

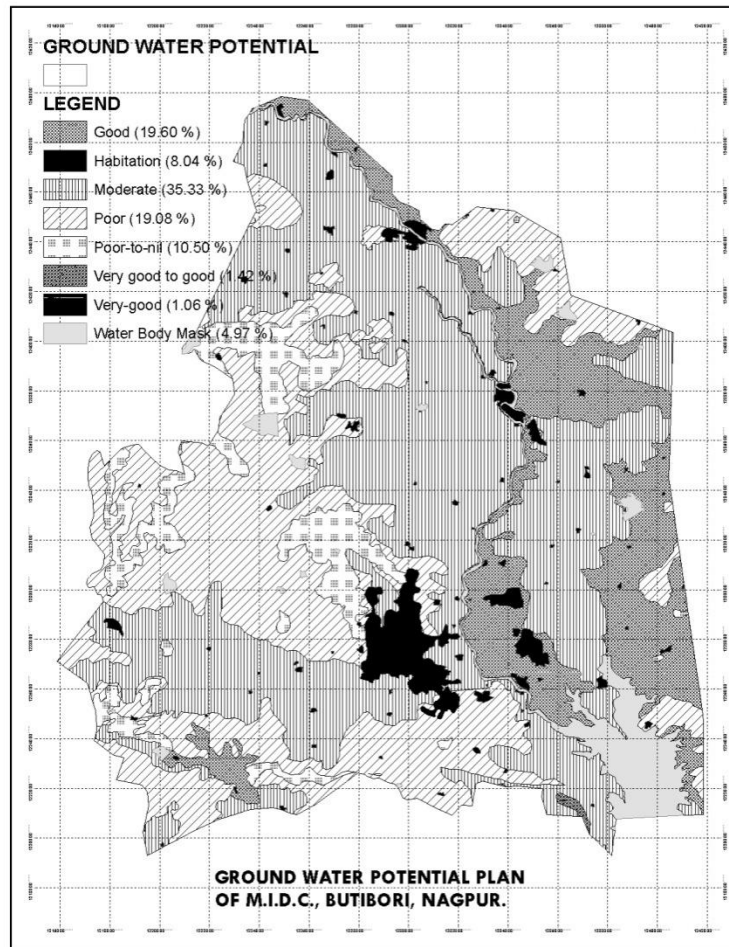

Figure showing Derived Ground Water Potential Plan of Butibori, Nagpur.

**Table 2: Area and Percentage wise Ground Water Potential of Various Zones:**

Sr. No	Potential zones	Area (Km <sup>2</sup> )	Area (%)
1	Very Good	5.52	1.06
2	Very Good to Good	7.39	1.42
3	Good	102.09	19.60
4	Moderate	184.03	35.33
5	Poor	99.38	19.08
6	Poor to Nil	54.69	10.50
7	Habitat Mask	41.88	8.04
8	Water Body	25.88	4.97

**Conclusions:**

1. Different thematic layers such as geology, slope gradients, soil types drainage density and the other relevant associated detail give a broad idea about the groundwater prospect of the area. Remote sensing proves to a very effective tool for delineation of groundwater.
2. Geographical information system and remote sensing has proved to be powerful and less time consuming method for determining groundwater potential in parts of MIDC, Butibori, Nagpur.
3. The study reveals that integration of basic natural landscape parameters such as drainage density (with 15 as weight percentage), slope gradients (40%), geology (15%) and soil types (30%) as combination gives first hand information to local authorities and planners about the areas suitable for groundwater exploration.
4. Moderate ground water potential is been observed in one third of the study area while one sixth share is been taken by both good and poor categories. Very Good and Good categories received a negligible share of around 1 -2 %. The major factor being the dominance of clayey soils with less sand contents having average to flat slope conditions.
5. This groundwater potential information will be useful for effective identification of suitable locations for utilization of water for biomass and other environment friendly development. Further, it is felt that the present methodology can be used as a guideline for further research to determine further combinations using other landscape parameters.

#### Abstract

Craniofacial penetrating foreign body involving the pterygopalatine fossa is a rare condition, it present 2.17% of all head and neck trauma. It could be life-threatening due to injury of vital surrounding structure such as eyes, carotid arteries and cranial nerves.<sup>35</sup>We present a case of a sustained foreign body in the pterygopalatine fossa in a 3-year-old boy sparing the eyes and vasculature. The object was a gun shoot.it was removed successfully using endoscopic approach with no complication.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Skull base penetrating foreign body is a rare condition.<sup>3 5</sup> In our case, the foreign body was found as sustained foreign body in pterygopalatine sparing the eyes and vasculature, it was removed successfully using endoscopic approach with no complication.

Here we are presenting a case of accidental gun shoot victim who presented to our university hospital in Saudi Arabia.

#### Case:-

3 years old Saudi boy was a victim of accidental gun shoot in the right dorsum of his nose. They presented to a local hospital in Saudi Arabia with excessive bleeding at the site of bullet not associated with any neurological symptoms nether irritability or vomiting. 15 days later, they were referred to our university institute because they do not have the facilities of skull base surgery. The patient's status upon referral was stable the bleeding was stopped and the wound wasn't showing any discharge, sparing the eyes and craniofacial vasculature,

Patient's hemoglobin and blood indices all were in the normal ranges. CTscan of head and neck showedforeign body located in right pterygopalatine fossa situated in the right sphenoid bone within right foramen of rotundum area(**figure 1**), CT angiogram showed no vascular insult with normal course of internal and external carotid arteries. Even though the patient was asymptomatic, a decision of surgical removal was done and accordingly Trans-nasal endoscopic removal was done successfully under general anesthesia with no complication. Post-operative, the patient was vitally stable doing well with no neurological deficit.

Address:-Medical Intern, Imam Abdulrahman Bin Faisal University

**Figure 1:-**

### **Discussion:-**

Skull base penetrating foreign body is a rare condition, it present 2.17% of all head and neck trauma. It could be life threatening due to injury of vital surrounding structure such as eyes, carotid arteries and cranial nerves.<sup>35</sup> Compared to our case, the carotid arteries & cranial nerves were spared. CT scan is the method of choice to diagnose and localize the foreign body, however wood particles can be missed, in this case MRI can be used, CT angiogram should be performed to rule out vasculature injury.<sup>5,6</sup>

The metallic foreign body has to be removed even in asymptomatic patient because it can lead to infection & is believed to be a cause of chronic irritation and could be cancerous due to epithelial alteration.<sup>3</sup> Endoscopic and open surgeries both are the available approaches of removal, however endoscopic approach was described to be associated with less complications.<sup>4</sup> Prognosis and timing of removal is contingent on the patient's overall status.<sup>15</sup> Compared to our case, trans-nasal endoscopic approach was done & the foreign body was removed with no complications.

### **Conclusion:-**

Penetrating metallic foreign body has to be removed to prevent infection & chronic irritation. The endoscopic approach of removal is preferred due to less complication compared to open surgery.

##### Key words:-

Water pollution, Wastewater, Salinity, Arsenic Contamination, and Treatment.

#### Abstract

Bangladesh, a developing country, located in South Asia along with large population size but with limited land. Due to rapid industrialization and urbanization, scarcity of clean water is rising up day-to-day. Contrary, contamination or pollution of water is still increasing for which many factors are playing roles. The prime source of drinking water in Bangladesh is groundwater and the wide causes for the water pollution is arsenic contamination. Then other major sources of water pollution included industrial wastewater, municipal wastewater, pesticides and chemicals usage in agriculture, road construction, oil spills, salinity intrusion, heavy metals, sedimentation deposit during the flood, and illegal disposal of suspended matters into water bodies. Currently, water pollution is a principal environmental issue in Bangladesh. With-a-view to solving this paramount problem, a lot of water treatment technologies have already been introduced in Bangladesh paradigm – physical, chemical, and biological process (shafi filter, tin kolsi method, oxidation, coagulation, precipitation, adsorption, reverse osmosis, solar desalinization, and new technology for oil removal. But in a case of industrial effluent and municipal wastewater treatment is still limited within primary treatment process. Salinity intrusion is a big problem in the whole southern part of the country but it still unresolved. Further, agricultural pesticide runoff is causing depletion of fishes but there is no step for controlling it. For removing sedimentation deposit in a river, a degrading program has already commenced but not sufficient. But still, there is not found any resource recovery process from wastewater in Bangladesh.

#### Introduction: -

Bangladesh is a densely-populated country and being developing country, rapid and haphazard urbanization and industrialization is frequently expanding, which is responsible for significant environmental damage suchlike water pollution (Mahmud, 2003). Consequently, the water pollution in Bangladesh has become the worst problem comparing with the other pollutions based on historical data and this situation is triggering by the result of human induced activities among the poor nations of the world. A British study shows that, about 80 million people from Bangladesh (South Asia) were exposed to a high level of toxicity from the water contaminated with arsenic. Besides, an international team of researchers has detected water intake from arsenic contaminated wells and the impact of

**Corresponding Author: -Prantor Kumar Mondal.**

12,000 people in the last decade. Further, it was identified that the death of five people was directly linked to the elevated levels of arsenic in the bodies of the victims of the Bangladesh water. The problem is known for some years now and, hence local residents were advised to dig deeper wells to avoid the potentially contaminated surface water consumption (Smith et al., 2000; Mukherjee, 1999). Dhaka is the capital and the densely-populated city in Bangladesh while the biggest problem of the city is the arsenic in the water. Unfortunately, there is a plenty of dust and soil; hence the main pollution of Bangladesh is on the water. Some studies indicate that 20 years are needed for the morbid effects of arsenic poisoning to disappear. About 59 districts out of 64 are affected by arsenic contamination. Arsenic contamination level varies from 0–20,000 ppm while WHO permit level in drinking water is 10 ppm but 50 ppm in Bangladesh standard while some experts have recommended 20 ppm (Safiuddin & Karim, 2001).

Rivers and canals in Bangladesh are becoming increasingly polluted from industrial wastewater dumping by factories, especially textile industry. Leather tanneries are also a significant source of toxic pollutants to the air and water. The important river of Dhaka city is mainly polluted due to tanneries effluent discharges. The water pollution threatens food production as well as raising both environmental and human health hazards. According to Human Rights Watch report, toxic from tanneries are seriously affecting workers like skin diseases, and respiratory illnesses caused by exposure to tanning chemicals, and limb amputations caused by accidents in dangerous tannery machinery (Miti et al., 2009). Runoff agricultural pesticides mixed water; oil spills from tankers, household wastewater discharge, and thermal water pollution from hydroelectric project are also contributing river water pollution in Bangladesh major or minor scale.

Bangladesh is a deltaic country with total area of 147,570 km<sup>2</sup> where the major part consists of alluvial sediments deposited by the rivers of Ganges, Brahmaputra, Tista, Jamuna, Meghna and their tributaries. The coastal region covers about 20% of the country but in case of the cultivable lands cover more than 30%. About 53% of the coastal areas are affected by salinity. Agricultural land use in these areas is very poor for salinity intrusion, which is much lower than country's average cropping intensity. The factors which contribute significantly to the development of saline soil area, tidal flooding during wet season (direct inundation), and upward movement of saline ground water during dry season. The severity of salinity problem in Bangladesh increases with the dehydration of the soil. The dominant crop grown in the saline areas is local transplanted Aman rice crop with low yields (Haque, 2006).

Pesticide use in Bangladesh is often excessive and unregulated. Despite of their worldwide ban, Persistent Organic Pollutants (POPs) and other harmful organ-chlorine pesticides are widely being used yet. The presence of POPs such as DDT in agricultural wastewater which is carried into rivers flows or nearby water bodies during rainfall causes serious water pollution. This is responsible for dying of fishes and extinction of abundance fishes from rural water bodies (Hasan et al., 2012). Consequently, the abundance fishes in water bodies of Bangladesh have already declined remarkably. A study shows pesticide sprayed in farm lands is higher dust than non-spraying. The distributions of the pesticides throughout the various rooms sampled suggest that the strictly agricultural herbicides are potentially being brought into the home on the farmer's shoes and clothing. These herbicides are not applied in or around the home but they appear to be getting into the home para-occupationally. For agricultural pesticides, take-home exposure may be an important source of home contamination (Curwin et al., 2005).

Storm water and flood water runoff carry silts and waste material into river or channel flows and thus pollute water bodies as well as fill up. This water also carries construction debris and oils from road or park lots. Moreover, deforestation, soil erosions and land use change are resulting into sedimentation deposit in water flows and finally, these water bodies are becoming dry up depleting fish resources. Therefore, pollution in Bangladesh has brought enormous problems throughout the country suchlike drinking water source destroy, irrigation water supply problems, household, and industrial water supply troubles. Defective implementation of laws and lack of awareness among mass people is retarding water pollution control efforts.

#### **Investigation Of Water Pollution Situation In Bangladesh: -**

Day-to-day water pollution situation in Bangladesh is becoming worsened. The factors which are responsible for water pollution and increasing severity are diversifying frequently as well as new sources are adding everyday due to rapid population growth, economic growth, improvement of living standard, and more chemicals, pesticides, and heavy metal usages for different purposes. But they are still under control range. The major types and sources of water pollution in Bangladesh are described as follows.

### Municipal Wastewater: -

Bangladesh is an over populated country and urbanization process is continuously expanding frequently but indiscriminately. There are 11 city corporations, 119 municipalities and 310 urban centres while urban population rate is 28.4% now. Besides, about 3-4 % people are migrating to the urban areas every year for searching of livelihood or better living standard (BBS, 2011). Hence, high rate of rural people migration to urban areas is worsening the environmental situation. Consequently, more population is producing large volume of wastewater and directly discharging into water bodies. Hence water pollution from municipal household sources is a big problem in Bangladesh now. Further, per capita polluted water discharge and per capita pollutant load in water bodies is rising up. For detecting the pollutant load in the river, river flow fluctuation derived from the tidal level fluctuation was important to be considered in regards to both water quantity and quality (Parvez et al., 2007). Enough knowledge about the nature of wastewater is essential to design and operate collection, treatment, and disposal process to manage quality of environment. As example: Municipal wastewater of Sylhet city originates from different types of sources and then falls into the Surma River through different channels without any treatment. The discharged wastewater quality of Sylhet city is medium for suspended solids, BOD and chlorides, and strong for alkalinity (Alam et al., 2006).

Similarly, in other cities like Khulna Municipal area wastewater is discharged to the nearby rivers, canals, etc. without treatment. The observed values of different parameters lie within the range to permit reuse in agriculture. The values of DO are found to be below the permissible level recommended for irrigation while some values of EC and TDS exceed the irrigation water quality standards. Chloride was the dominant anion following bicarbonate, sulfate, phosphate and nitrate whereas calcium is the dominant cation following magnesium, sodium and potassium in wastewater generated in Khulna city. This domestic effluent dominated wastewater flow through the numerous concrete and earthen drains which finally dispose of to the nearby water bodies without treatment. As the quality of wastewater is not fully satisfactory, there are valid probabilities for occurring pollution problems in river waters (Mridha, 2011). In the same way, others cities of Bangladesh paradigm Dhaka, Chittagong, Rajshahi, Barisal, Gazipur, Narayanganj, Comilla, and Rangpur discharge their daily generated municipal wastewater into nearby water bodies (especially river) without making any pre-treatment which is responsible for polluting the concerning water bodies. Thus the water pollution situation in Bangladesh is enhancing rapidly which has become a tough task to control if it is delayed.

Figure 1: - Bangladesh political map indicating major cities

**Industrial Wastewater: -**

There are total 30 industrial estates in Bangladesh currently according to Bangladesh Small and Cottage Industries Corporation (BSCIC). BSCIC was created through an Act of Parliament in 1957 which was later amended in 1992. Likewise, the Bangladesh Export Processing Zones Authority (BEPZA) was established to setup and operate export processing zones in Bangladesh under the Bangladesh Export Processing Zones Authority Act, 1980. According to Act the Chittagong Export Processing Zone (CEPZ) was established in 1983 and later, the Dhaka Export Processing Zone (DEPZ) created in June 1993. The rest industrial parks are dispersedly located in different parts of Bangladesh mainly in Chittagong, Dhaka, Khulna and some others placed in distinct place of the country (Yunus and Yamagata, 2012).

**Figure 2:-** Industrial effluent discharge and river water pollution in Dhaka

The most polluting industries are tanneries, textiles, chemicals, dyeing and pharmaceuticals factories. All the industries produce gigantic volume of effluent every day during their normal operations as by-products. This wastewater contains TDS, TSS, heavy metals, nutrients, and toxic chemicals which are responsible for destroying water quality and making unsuitable water bodies for survival of organisms as well as for other purposes of use like household, irrigation, industrial, and drinking. Almost all the factories discharge their daily generated wastewater directly into nearby water bodies without any pre-treatment. Majority number of industrial units has their own effluent treatment plants (ETP) but they don't use regularly to save cost. Only a few industries partially operate their installed ETP regularly. All the ETP use mainly biological process to remove BOD, TSS, and others. But they don't collect nutrients and heavy metals from wastewater. Therefore, their treated wastewater is also unsafe for further usage (Yardley, 2013).

**Groundwater Pollution: -**

The groundwater has been used for agricultural and drinking purpose since 1960's in Bangladesh. With a view to bringing change in conventional groundwater extraction system, another initiative based on previous agencies on principal began to supply of safe drinking water for rural people by installing tube wells headed by UNICEF in 1970s. Unfortunately, this project was the cause of one of the worst environmental calamities in the delta's history. Arsenic is a naturally occurring element that exists in the earth. Besides, most of the tube wells weren't penetrated into deep rather extracts subsurface water. But there is more potentiality of arsenic availability in sub surface water source. Consequently, later for the past two decades the water from over a million tube-wells has been slowly poisoning with naturally occurring arsenic predominantly in the village areas. According to WHO, up to half the country's tube wells, estimated to number 10 million, are poisoned by arsenic contamination (2001). Hence, it is estimated that about 35 to 100 million people are at risk of drinking arsenic-contaminated and large scale groundwater extraction is the root cause of arsenic contamination in the ground water.

Purification of drinking water using various methods was practiced in ancient India and it is a shame to find the very source of potable water contaminated in the Bengal Basin. The region has constantly struggled in its attempt to administer safe and adequate water resources, making it easier for people in the Bengal Basin to access safe drinking water. By the late 1980s, surface water was the main source of drinking water in the region which was severely polluted. As a result, the population largely suffered from diarrhea and various water-borne diseases. Then Bangladesh government, UNICEF and various other aid groups suggested using groundwater as an alternative source for drinking water. This idea seemed logical because of the ample number of aquifers in the Bengal Basin and the deltaic alluvium which was easy to dig (Telfeyan, 2009).

In 1993, studies detected the first patient suffering from arsenic-contaminated groundwater. The Bangladesh government began to face a very difficult and serious water problem. Arsenic is a known carcinogen and highly toxic substance. It has gradually affected people in the Bengal Basin. But it is difficult to realize that drinking water is affected by arsenic because it is colourless, tasteless and odourless. Now, this disaster is widespread in the Bengal Basin and about one-third of the population of the Bengal Basin suffers from various diseases such as warts, skin lesions, and cancers. This serious water problem can be attributed to the combination of ineffective water resource management, industrialization and the rapid increase of population. Anyhow, the arsenic-contaminated groundwater problem is mainly caused by the lack of knowledge of water resources (Mukherjee, 1999).

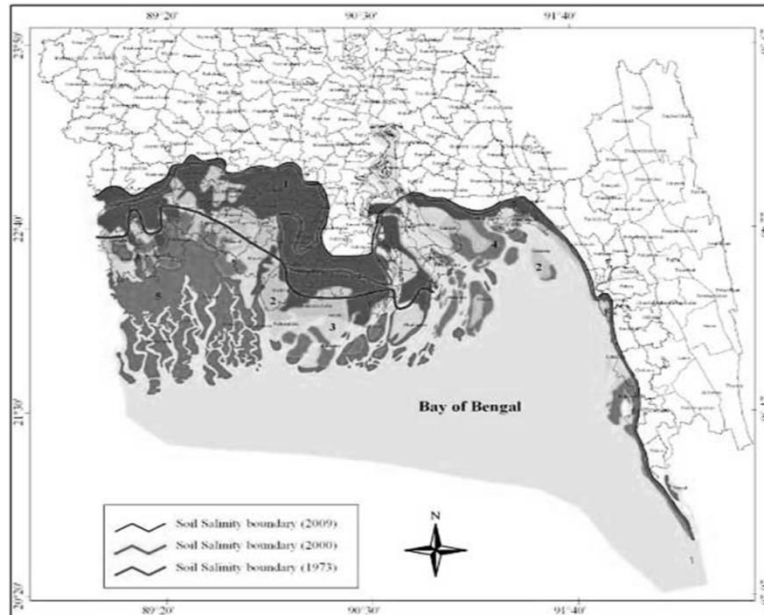

**Figure 3:-** Arsenic contamination showing map of Bangladesh

#### **Salinity Intrusion in Fresh Water Sources: -**

Bangladesh is a riverine country and the whole southern part of the country is covered by the Bay of Bengal. But the water of the Bay of Bengal is saline and so the southern part of the country is affected by salinity intrusion through ground water infiltration or inundation by flood water. Moreover, salinity intrusion is an impact of climate change and it has become a common phenomenon in the country's coastal belt. The intrusion of salt water into arable land is now severely affecting boro rice cultivation in the dry season. But about 2.85 million hectares of land is available in the coastal belt where only 0.83 million hectares of land is cultivable amidst 0.44 million is now salt-affected (Haque, 2006). As a result, they can't grow rice in their belonging lands due to salinity effects. Contrary, a large number of farmers are cultivating boro rice in salt-affected areas, while most of them are using hybrid rice and local rice variety which require 145 to 160 days to harvest. Farmers need to prepare seedbeds in November, followed by main land preparation and transplanting of rice seedlings in the main field in December-January. Similarly, the farmers are facing serious problem in cultivating boro rice due to increasing salinity intrusion in these areas. So, they get low yields and sometimes no yield at all (Hassan, 2009; Haque, 2006).

For overcoming rice production problem, Bangladesh Institute of Nuclear Agriculture (BINA) in collaboration with International Rice Research Institute (IRRI) has developed salt-tolerant rice variety named Binadhan-8 which can survive up to 10 ds/metre. The National Seed Board of Bangladesh officially released Binadhan-8 in 2010 to enable farmers to cultivate this variety a larger scale in the salt-affected areas. With this variety, it is possible to yield six tons per hectare in salt-free land. So Binadhan-8 can be cultivated in both salt-affected and salt-free lands (BINA, 2014).

**Figure 4:** Salinity intrusion extent in different time in the southern part of Bangladesh map.

Anyhow, farmers in the southern region of the country got desired results from this salt-tolerant rice variety under close technical follow-up and supervision by IRRI and DAE field staff and its partner NGOs as well as private seed companies. It was found that without any salinity, farmers received around 5.5 tons of rice per hectare, which required 135-145 days to harvest. But when the variety was planted in salt-affected lands (8-12 dsm/metre), farmers received around three to four tons of rice per hectare, depending on the degree of salinity. Both farmers and farm labourers of the coastal areas are getting benefits from the cultivation of Binadhan-8, which is salt-tolerant and high-yielding (Haque, 2006).

#### **Agricultural Pesticides: -**

Bangladesh is an agricultural country. Most of the part of the country is fertile but total land area is limited. Besides, rice and fish are our staple food. Moreover, our population volume is large along with high growth rate. For meeting the high demand of food, farmers are using more pesticides and chemical fertilizers for getting highest production within limited land. But these pesticides are very harmful for environment and fishes though they can destroy insects. During heavy rainfall and flood this agricultural wastewater runoff into nearby water bodies or rivers and get mixed with river water and occur water pollution. For this reason, our historical abundances of fish is declining rapidly and appearing scarcity of fishes. Pesticides and chemical fertilizers use in agricultural crops or farm is the main cause of fish reduction in Bangladesh (Kabir and Rainis, 2012). In many developed countries, this harmful and toxic pesticides use has already banned for saving environment. But in developing countries like Bangladesh, these pesticides are still widely used in agriculture and farms.

**Figure 5: - Agricultural pesticides use and nearby water bodies' pollution**

#### **Oil Spills and Road Construction Materials: -**

Bangladesh imports all the consuming oil from middle estate countries. Therefore, oil pollution is not a familiar and serious pollution in Bangladesh. But when some ships discharge their oily wastewater directly into the Bay of Bengal or wash up their ship then water pollution occurs. The Bay of Bengal is vast, so it is not a big problem. On the other hands, road construction and park lots oil mixed materials get mixed with rain water runoff during heavy rainfall and flood which is finally carried into Inland River or channel waters and happen water pollution. Very recently, (9<sup>th</sup> December, 2014) a large-scale oil spills took place in Sela River of Sundarbans. Consequently, the fragile Sundarbans region stared at an ecological nightmare after a vessel carrying 350 tonnes of oil crashed, spilling the toxic liquid over an 80-sq-km area along the Sela River in Bangladesh and threatening a sanctuary of rare Irrawaddy and Ganges dolphins. Sundarbans, a UNESCO world heritage site, has a unique land-marine eco-system which includes the Bengal tiger. The tanker, Southern Star VII, sank after colliding with another vessel early Tuesday while trying to steer through dense fog. Now it is considered as an ecological catastrophe (Mukherjee and Chakrabarty, 2014).

#### **OIL SPILL IN SUNDARBANS MANGROVES, KHULNA, BANGLADESH**

**Figure 6: - Oil spills from tanker (left) and oil spread through river map (right)**

#### **Thermal Water Pollution: -**

Thermal pollution is not a big factor in Bangladesh now. But it is increasing gradually due to rapid industrial growth. Majority of the industries in Bangladesh directly discharge their used water into nearby water bodies making hot. This hot water reduces oxygen availability of the water and make unsuitable for fish survival. Besides, in Chittagong there is one hydro-electric project which use river water and discharge the used hot water into Kaptai

Lake. Consequently, it is decreasing oxygen availability from the lake which is resulting into fish production or survival problem.

#### Natural Disasters (Flood and Storm): -

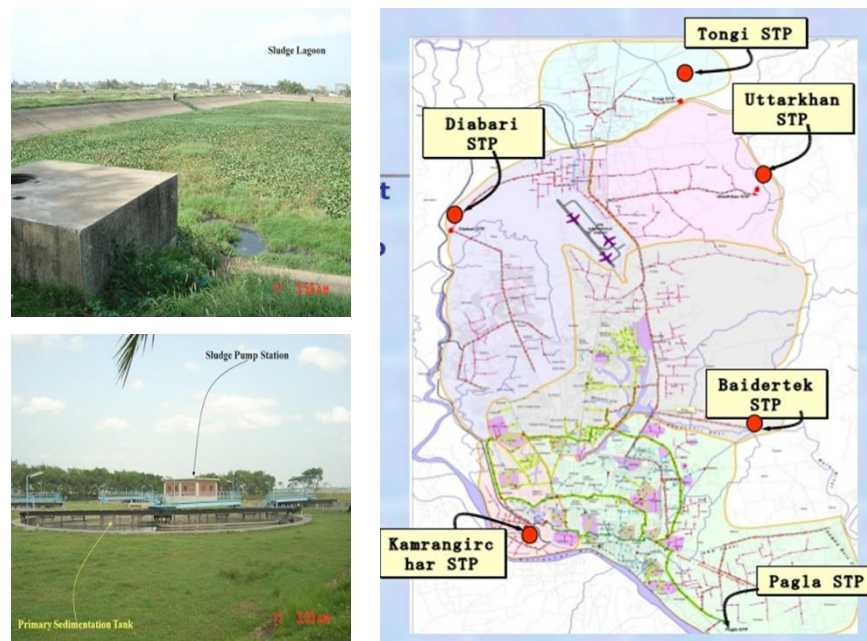

Bangladesh is a disaster-prone zone and many natural disasters visit this country every year suchlike flood, cyclone and storm. These disasters sweep away waste, silt and clay from land during disasters and deposit in river, channel, lake or wetland water and cause water pollution. It is also responsible for occurring eutrophication process in lake or lagoon because this water runoff carries nutrients along with wastes.

#### Some Applied Strategies for Wastewater Treatment In Bangladesh: A Few Case Studies:

Currently, Bangladesh is giving priority on arsenic removal from ground water, municipal sewage treatment, industrial effluent treatment, and salinity removal from coastal inland water sources and they are major concerning issues too. All the major water pollution control process and technology are described below –

#### Municipal Wastewater Treatment: -

Municipal sewage treatment is one of the biggest problems in Bangladesh but still neither central government nor local government has taken proper steps to resolve this trouble rather they are planning to do something for treatment of sewage. Anyway, Dhaka City Corporation had established one sewage treatment plant namely Pagla Sewage Treatment Plant in 2003 which can treat only 10% comparing to the total daily sewage generation. The current area and population of Dhaka city is 348.57 sq. km. and about 15 million. Consequently, this large population generate huge volume of sewage which demands more sewage treatment plants. Hence, one study suggests that Dhaka city need five new sewage treatment plants immediately to increase efficiency. In case of sewage treatment, they use conventional treatment process and limited within primary treatment (figure 7). But in case of other cities there is no sewage treatment plant yet. So, major fraction of sewage is remained untreated and causes water pollution (Amin, 1998; Arafin, 2011).

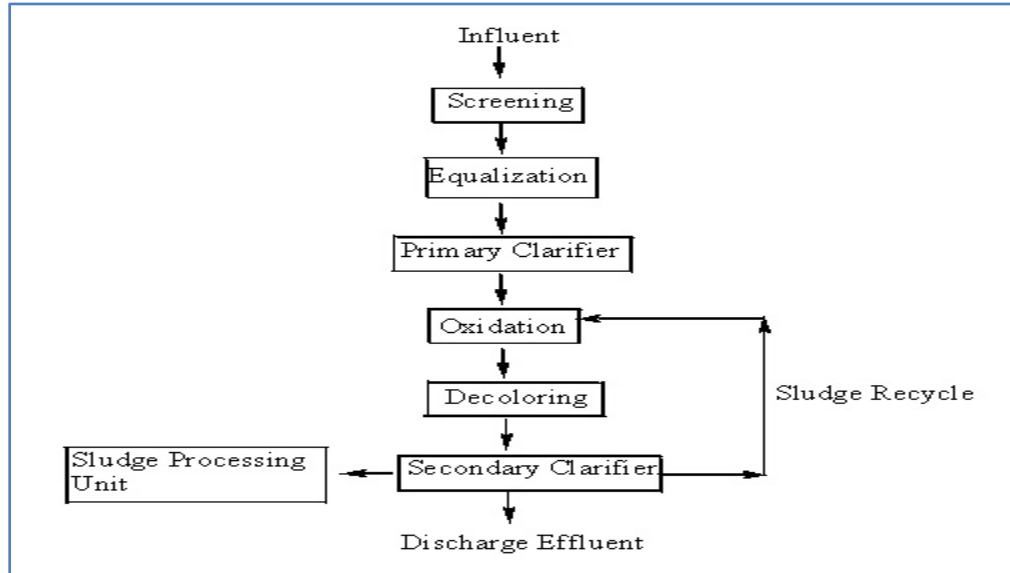

**Figure 7:** - Pagla Sewage Treatment Plant, Dhaka (left) and proposed map for new plants.

While for sewage and drinking treatment, there are six plants in Dhaka city and they can supply only about 35% and the rest comes from ground water. Then in other large cities suchlike Chittagong, Khulna, Rajshahi, Sylhet, Barisal, and Narayanganj they have only drinking water treatment plant but no sewage treatment plants still.

**Industrial Wastewater (effluent) Treatment: -**

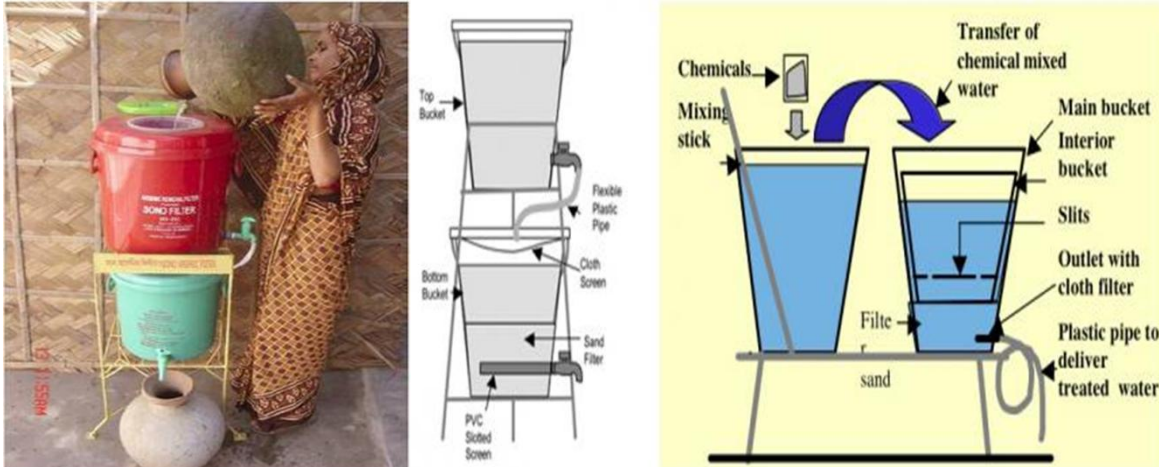

In Bangladesh industrial growth is rapidly occurring but in haphazard and unplanned way. Most of the small-scale industry has no effluent treatment plants. Contrary, medium and large scale industries have their own effluent treatment plants but don't operate regularly with a view to saving cost. But the large-scale industries that operate their sewage treatment regularly are not sufficient because they do partially not fully. Most of them use physical, chemical and biological process mixing up as well as conventional technology. But they give priority mainly on biological process rather than chemical ones. Very few small industrial parks in Dhaka has their common effluent treatment plants while large scale common effluent treatment plants are only in Chittagong and Dhaka located at Chittagong Export Processing Zone and Dhaka Export Processing Zone. There is given one process flow chart of effluent treatment in Bangladesh (figure 8) (Alam&Guha, 2012).

**Figure 8: - Industrial effluent treatment process flow chart.**

**Arsenic and Iron Removal from Ground Water: -**

The presence of elevated levels of arsenic in groundwater has become a major concern around the world, especially in South Asia. Up to date, there is no effective treatment for curing health impacts due to the intake of high levels of arsenic. A wide range of technologies has been developed for the removal of high concentrations of arsenic from drinking water. The most common arsenic removal technologies use oxidation, coagulation, precipitation adsorption, ion-exchange and membrane techniques while local technologies are Shafi filter and Tin-Kolsi Method. All the arsenic treatment technologies ultimately concentrate arsenic in the sorption media, the residual sludge or in a liquid media. To avoid indiscriminate disposal and environmental pollution, these wastes need to be treated or disposed of properly. In the areas where the drinking water contains unsafe levels of arsenic, the immediate concern is finding a safe source of drinking water. There are two main options: Finding a new safe source or removing arsenic from the contaminated source. If an arsenic safe water source cannot be established, the short-term goal is to reduce arsenic levels. There are several methods available for removal of arsenic from water. Both local and import technologies can remove arsenic 3-20 ppm while the highest level of arsenic contamination in Bangladesh is about 20,000 ppm. Besides, the government has taken one step to keep away people from collecting drinking water from arsenic contaminated sources by painting red colour in affected one and green colour in arsenic free one. Thus, people are being aware about arsenic. Now people are using many methods for arsenic removal at household level and three from them are shown in (figure 9) (Ahmed, 2001).

**Figure 9:** Sono filter (left) and bucket treatment Unit (middle), and Stevens Institute Technology (right) household-level filters for arsenic removal from drinking water.

#### Desalination of Drinking Water: -

Salinity intrusion into drinking water source and agricultural land is a big problem in the southern part of Bangladesh. Hence, they suffer from different water-borne diseases and can't grow crops. For resolving this problem many technologies have been imported from other countries but costly and not sufficient according to social and community demand (Sobuz et al., 2010). Meanwhile, some local technologies are also developed for removing salt from water suchlike –

- ❖ Reverse Osmosis (RO) Method,
- ❖ Solar Desalination,
- ❖ Multi-Stage-Flash (MSF),
- ❖ Multieffect-Distillation (ME) with Thermal Vapour Compression (ME-TVC), and
- ❖ Thermal Solar Desalination.

**Figure 10:** - Solar desalination plants at Kaligoanj, Khulna (left) and RO Plant (right)

Anyhow, the situation is gradually changing and many national and international NGOs are working together with Bangladesh government to resolve this problem. But still the problem is unresolved though many technologies have been imported and developed due to lack of sufficient fund and awareness among mass people. Contrary, some saline tolerant varieties of crops have also been invented by Bangladesh Rice Research Institute.

#### Agricultural and Oil Contaminated Water Treatment: -

Agricultural pesticides and chemical fertilizers mixed wastewater from agricultural field and farms are runoff into surrounding water bodies and pollute water. The whole country is suffering from this problem but no initiative has been adopted still to remove it though it the root cause of fish reduction from our natural water bodies. Once, natural sources of fish were abundance with varieties of fishes but now it is just like a dream.

Then oil pollution is also getting remarkable due to uncontrolled trend of it. Bangladesh is much undeveloped in case of oil pollution treatment of water. Oil is used as fuel both in land and water transport along with some oil mixed materials in construction works but they are not conscious about its misuse and getting polluted water bodies. Chemical spray, neutralization process, and hand collection are the available technologies for oil removal from water but last year a new technology was developed based on local ones.

### Concluding Remarks: -

Comparing with the population growth, the industrial development and urbanization process is also expanding. Consequently, water scarcity is intensifying as well as water pollution is triggering day-to-day. Arsenic contamination, salinity intrusion, industrial effluent discharge, and municipal wastewater discharge are the major water pollution in Bangladesh now. Large scale industrial wastewater treatment plants are in Chittagong and Dhaka. Then in case of municipal wastewater treatment, there is only one Sewage Treatment Plant in Dhaka. For desalination sea water, in the Khulna there are a few small or medium scale treatment plants but not sufficient. Almost the whole country is affected by arsenic contamination as well as Dhaka and Chittagong is more polluted cities in Bangladesh. The rest cities and places are not so seriously polluted. Therefore, that still it is possible to protect the whole country being polluted because the extent of present water pollution situation is under control. But appropriate policy, plan, and public awareness are required to resolve the problem first.

#### Abstract

This study compares the prevalence of Vitamin D deficiency in pediatric patients of type 1 diabetes mellitus in the central and western regions of Saudi Arabia with children having no type 1 diabetes mellitus.

Research Methods: A control cross sectional study conducted in Al-Yamamah Hospital (Central Saudi region) and Hera General Hospital (Western region). New cases or known cases of type 1 diabetes were recruited in the outpatient clinic and measurement of blood Vitamin D level, PTH, Ca, Phosphorous and Alkaline phosphatase were done.

Result: The study showed that among type 1 diabetic patients, 71.1% were severely Vitamin D deficient, 20.6% were moderately Vitamin D deficient, 8.1% were mildly Vitamin D deficient and 0.2% had normal Vitamin D levels. In the control group 42% were severely Vitamin D deficient, 18.8% were moderately Vitamin D deficient, 8.7% were mildly Vitamin D deficient and 30.4% had normal Vitamin D levels. So overall nearly 100% of the children with Type 1 Diabetes Mellitus were deficient for Vitamin D as compared to 69.5% of the control children.

Conclusion: - Vitamin D levels must be done for every child that has proven Type 1 diabetes mellitus (T1DM). This will ensure early detection of Vitamin D deficiency and proper management. This will ultimately yield a better outcome and prognosis.

#### Introduction:-

Diabetes mellitus is a common disease and is especially prevalent (almost as an epidemic) in the Middle Eastern countries. Many researchers have been highlighting the association of Type 1 diabetes and Vitamin D deficiency. Vitamin D is known to regulate the functions of over 200 genes in our body and is essential for growth and development. (1).

Type 1 diabetes mellitus (T1DM) is the most commonly diagnosed type of DM in children and adolescents. It usually presents with symptomatic hyperglycemia and implies the immediate need for exogenous insulin replacement. (2).

Vitamin D3 is a fat soluble vitamin required for normal growth of all tissues originating from the ectoderm (e.g. bone, teeth, hair and skin). This is especially evident in children. Vitamin D deficiency can result in manifestations of rickets in children and osteomalacia in adults.

The main source of Vitamin D is sun exposure through skin synthesis under the action of ultraviolet irradiation of ergosterol (D1) transferred to a crystalline compound called ergocalciferol (D2) and cholecalciferol (D3) which is formed in our body. Vitamin D is described as "the Sun Vitamin". It is a steroid with hormone like activity. Minor sources of Vitamin D come from dietary sources such as oily fish, meat and egg. Until 1980, the role of Vitamin D in the functioning of the immune system was unknown.

In recent years an effort has been made to understand possible non-calcemic roles of Vitamin D, including its role in the immune system, particularly on T cell-mediated immunity. Vitamin D receptors are present in significant concentrations in the T lymphocyte and macrophage populations. However, their highest concentration were found in the immature immune cells of the thymus and the mature CD-8 T lymphocytes. The significant role of Vitamin D compounds as selective immune suppressants is illustrated by their ability to either prevent or markedly suppress animal models of autoimmune disease. Results show that 1,25 dihydroxyvitamin D3 can either prevent or markedly suppress experimental autoimmune encephalomyelitis (3, 4).

The incidence of diabetes is increasingly approaching an epidemic population in many countries including Saudi Arabia. There was a study done in 2010 in the Saudi province of Dhahran among a population of children younger than 15 years from the period of 1990-2007. Results showed an increase in the rate of diabetic patient from 18.05 per 100,000/year in the first 9 years to 36.99 per 100,000/year in the next 9 years. (5)

#### **Research Methodology:-**

From a control cross-sectional study of all samples collected from Al Yamamah Hospital OPD as well as Hera General Hospital OPD, we selected a sample of Saudi patient type 1 diabetes to measure their total Vitamin D3 level in the blood. This laboratory investigation was done in two hospitals of different regions in Saudi Arabia, the first one was in Al Yamamah Hospital in Al-Riyadh which is the capital of Saudi Arabia and marked by high temperatures during the day and low temperatures at night. Most of the country follows the pattern of the desert climate with very hot weather especially in Jun, July and Aug reaching temperatures up to 55 degrees Celsius. The second analysis was done in Hera General Hospital in Makkah which is the Islamic capital for Muslims that has a similar climate as Riyadh.

The patients referred to both centers either as newly diagnosed type 1 diabetes based on clinical presentation for the disease, mostly DKA on admission, or rarely presented by hyperglycemia without DKA. Also known cases of T1DM being managed in the two hospitals were included in the study. Diagnosis of T1DM was confirmed by measuring C-peptide.

The data was collected in a period between Jan 2008 to Jun 2015. The sample consisted of 135 patients aged between 1 to 16 years. All patients were Saudi. Family history regarding T1DM or any risk factors for Vitamin D Deficiency (e.g. Sun exposure, nutritional history) were obtained from the parents. Vitamin D3 levels were measured by (Roche diagnostic GmbH German) 411 Immunoassay analyzer (after the patients recovered from DKA episode). PTH, Ca, Phosphorous and Alkaline Phosphatase were measured as well. Patients then were followed monthly or every 3 months in OPD. Patients started on a conventional treatment in the form of NPH and Regular insulin. Patients presented from Al-Riyadh city didn't like multiple daily injections (50%) but remaining patients (50%) started on multiple daily injections in the form of long acting insulin (Lantus) and rapid acting insulin (Novorapid). The results of vitamin D3 levels were categorized according to Vitamin D Council (15).

We divided the levels into severe type, which is less than 30 nmol/l, moderate type between 30-50 nmol/l, and mild type between 50-70 nmol/l and normal more than 70 nmol/l which is defined as an adequate vitamin level where there are no symptoms or signs of vitamin D deficiency and the same was used in control group. We selected the control patient referred to OPD with complaint of non-thriving. The control group consisted of 83 patients.

There were certain Exclusion criteria:

- Children Younger than 1 year who have signs of rickets
- Other endocrinal gland disease like (Hypo or Hyperaldosteronism)
- Chronic disease (lungs, gastrointestinal disease)

**Research sample:-**

There were a total of a 135 patients included in the study having type 1 DM. The mean age was 8.0356 years old (range from 1 to 16 years old) with BMI mean 15.832 (11-25) P-value <0.005. There were 62 (45.9%) males and 73 (54.07%) females. The mean vitamin D3 level for all patients was 22.993 nmol/l (4-89nmol/l) P-value<0.005. Mean HbA1c for all patients was 10.887 (1-17.5) P-value <0.005.

**Figure 1:-**Summary of Age of type one diabetes.

This diagrams shows the age vs. the number of type 1 diabetes patients. There are two clear peaks visible, one before the age of 5 and another between the ages of 9 and 15. Children are prone to infections around the age of the first peak (3 years) and around the second peak (11 years) they can suffer from pre pubertal hormonal secretion.

**Discussion:-**

There have been a lot of studies carried out showing the prevalence of vitamin D deficiency in type 1 diabetes compared with a control group. One of these studies is the north Indian study (6) which showed a Vitamin D deficiency in 91.1% of the subjects with diabetes, and in 58.5% of the healthy controls, (60%) of the cases had severe Vitamin D deficiency compared to 8.3% in the control group. Another study done in Qatar revealed that Vitamin D deficiency was considerably higher in T1DM children (90.6%) compared to non-diabetic children (85.3%). (7)

There was a significant difference found in the mean value of Vitamin D between T1DM and non-diabetic children in Egypt, among diabetic cases, 55% were Vitamin D deficient; meanwhile 45% of cases had normal Vitamin D levels ( $P < 0.01$ ). (8)

In the T1DM children of Bin Abbas group, 64% were mildly Vitamin D deficient, 16% were moderately Vitamin D deficient, and 4% were severely Vitamin D deficient as compared with 52% (mildly), 6% (moderately), and 1% (severely) in the control group. Overall, 84% of the T1DM children, and 59% of the healthy children were Vitamin D deficient (9).

Also in another study of 129 Swiss children and adolescents with type 1 diabetes, 78 (60.5%) were Vitamin D deficient. In this study, Vitamin D deficiency was defined as a 25-hydroxy-Vitamin-D level below 50 nmol/L. During the winter this number rose to 84.1%. 25-hydroxy-Vitamin-D levels showed marked seasonal fluctuations. There was no correlation with diabetes control, despite the high prevalence of Vitamin D deficiency (10).

Prevalence of Vitamin D deficiency was 60.5% in a Swiss study (11), 43% in an Australian study (12), approximately 25% in an Italian study (13). In a cross-sectional study performed in Jeddah on 510 children aged between 4-15 years, 13.7% had a normal Vitamin D level, 58.8% had relative deficiency, 27.4% had severe deficiency. Saudi and Yemeni patients were more affected than Egyptian and other nationalities but all children which were included in the sample were not diabetic (14).

In our study, almost 100% of the children of type 1 diabetes had insufficient level of Vitamin D in comparison with (69.5%) in control group. Severe deficiency was 71.1% in T1DM group and 42% in control group. Moderate deficiency 20.6% vs 18.8%, mild deficiency 8.1% vs 8.7% and only 0.2% had sufficient Vitamin D levels vs 30.5%.

**Figure 2:-** Summary for VD3 in type one diabetes.

This diagram shows the level of Vitamin D in nmol/l vs. the number of T1DM patients. It is obvious that most of the patients lay in the insufficient area and they are mostly present with severe deficiency.

### Conclusion:-

Vitamin D level should be a routine test for pediatric patients with Type 1 DM during diagnosis and follow up. Early detection of Vitamin D deficiency and appropriate management will lead to better prognosis and better quality of life, especially the effect on improving glycosylated hemoglobin (H<sub>A1c</sub>). This area is an evolving field of research and our knowledge regarding Vitamin D role in T1DM outcomes is not yet complete.

 Peninsular India, Kerala

#### Abstract

The genus *Rotala* L., is represented by about 44 species and primarily distributed in tropical and subtropical regions. In India, the genus has represented by 66% of the globally known species and among that 83% are remarkably endemics which show its evolutionary significance. The study on this genus led to discuss a novelty to science, which has been collected from the lateritic plateau of northern Kerala, India. The species is similar to *R. densiflora* (Roth ex Roemer & Schultes) and *R. malampuzhensis* R.V. Nair ex C.D.K.Cook, but differs from the former by having smaller habit (size), aristate bracteoles, clawed petals, and presence of nectar glands etc., and from the latter by its habit, trimerous flowers, shorter or absence of calyx appendage.

#### Introduction:-

The Genus *Rotala* L. (Lythraceae), has tropical and subtropical distribution and is represented globally by 44 species (Mabberley, 2005), with highest distribution in tropical Asia (Cook, 1979). After Cook's revision, it is represented, as per the revised estimate, in India by 29 species, of which 24 are from the Peninsular India (Joseph & Sivar., 1988, 1989; Pradeep *et al.*, 1990; Mathew & Lekshminarasimhan, 1990; Yadav *et al.* 2010; Prasad *et al.*, 2012; Gaikwad *et al.*, 2013; Prasad & Raveendran 2013 a, b; Sunil *et al.*, 2013; Anto *et al.*, 2014; Ratheesh Narayanan *et al.*, 2014; Lemiya & Pradeep 2015). The authors collected an interesting specimen belonging to the genus *Rotala* L. from the muddy substratum of drying depressions on the lateritic rocky areas of Kanayi village in Kannur District of Kerala, India. Detailed studies of these specimens revealed that it is distinct from all the known species of the genus and hence being described and illustrated as new species.

*Rotala kanayensis* Rijuraj, Rajendraprasad, Shaju & Pandurangan *sp. nov.* (Figs. 1 & 2).

Type: INDIA, Kerala, Kannur District, Kanayi village, ± 60 m, 9<sup>th</sup> January 2017, Rijuraj, Rajendraprasad & Shaju (Holotype, TBGT; Isotype, MH).

The new species *R. kanayensis* resembles *Rotala densiflora* in having erect habit, decussate leaves and calyx appendages, and *R. malampuzhensis* by decussate leaves, campanulate calyx tube and presence of nectar glands. It differs from the former by having smaller habit (size), aristate bracteoles, clawed petals, and presence of nectar glands and from the latter by its habit, trimerous flowers, shorter or absence of calyx appendage (Table-1).

Address:- Plant Systematics and Evolutionary Science Division, Jawaharlal Nehru Tropical Botanic Garden and Research Institute, Karimancode P.O, Palode, Thiruvananthapuram – 695 562, Kerala, India.

Erect, marshy-terrestrial annuals. Stem single, to 15 cm tall, much branched at the tip, rooting from the nodes below, inconspicuously 4-angled below, strictly angled and narrowly winged on young branches, reddish when mature. Leaves simple, decussate, sessile, linear lanceolate to oblong, greenish, 1.5- 2.0 x 0.3-0.5 cm, base slightly cordate to amplexicaul, margin entire, reddish-tinged, apex obtused, midrib prominent below, canaliculated above, reddish when mature. Flowers solitary in axils, sessile, strictly 5-merous, 2-2.5 x 1.5 mm; bracts similar to foliage leaves; bracteoles linear lanceolate, slightly cordate at base and aristate at tip, 3 mm including 1 mm long arista, exceeding calyx tube. Calyx appendages narrowly triangular, tip acuminate, 1-1.5 mm long, longer than calyx lobes; calyx tube campanulate, 1.5 – 2 mm long, lobes broadly triangular, ca. 0.5 mm long. Petals 5, obovate, rounded at tip, 1-1.5 x 0.7-1 mm long, distinctly clawed, alternating with calyx lobes, bright pink. Stamens 5, inserted at the base of the calyx tube with a pair of nectar glands, equalling to the level of calyx lobes, filaments 0.75-1mm long, anthers 2, globose, dorsifixed, nectar glands triangular, fleshy; ovary sub globose, sessile, 3-locular, trilobed, 1 mm; style short; stigma capitate. Capsule sub globose, 3 valved, equal or slightly exceeding calyx tube, 1.5 mm long and 1mm diam. Seeds numerous, semi ovoid, 0.3 mm long, bright yellow.

Flowering & Fruiting: December-January.

**Table 1:-** Comparison of morphological characters of *Rotala densiflora*, *R. malampuzhensis* and *R. kanayensis*

Characters	<i>R. densiflora</i>	<i>R. malampuzhensis</i>	<i>R. kanayensis</i>
Habit	Erect, amphibious or terrestrial annuals, simple or branched, 50 cm tall	Tufted creeping annuals, to 30 cm tall	Erect, branched, terrestrial annuals, to 15 cm tall
Stem	4-angled, often winged	Terete, not winged	Inconspicuously 4-angled, narrowly winged on tender branches
Leaves	Sessile, ovate or elliptic-oblong, apex acute to acuminate, to 2-2.5 cm long	Sessile, linear to lanceolate, greenish, apex acute to shortly truncate, to 1.5 cm long	Sessile, linear-lanceolate to oblong, base cordate to amplexicaule, apex obtuse, 1.5-2.0 cm long
Bracts	Ovate or elliptic, much shorter than foliage leaves	Linear-lanceolate, as long as foliage leaves	Elliptic, leaf like, as long as foliage leaves.
Bractioles	Lanceolate-acuminate, exceeding calyx	Capillary, equalling calyx lobe, 1mm long	Linear lanceolate lanceolate, 3 x 0.5 mm long, exceeding the calyx, arista 1 mm long
Flowers	Usually 5 merous, occasionally 4 merous	Strictly 3 merous	Strictly 5 merous
Calyx appendage	Longer than calyx lobe	Shorter than calyx lobe, sometime absent	Twice as long as calyx lobe
Petals	5, 0.5-1 mm long, obovate, 2-lobed at apex, pink	3, elliptic to oblong, acute at apex, bright red	5, obovate, rounded at apex, distinctly clawed at base, 1-1.5 mm long, bright pink
Stamens	5, rarely fewer, attached below the middle of the calyx tube	3, inserted above the base of the calyx tube	5, inserted at the base of the calyx tube
Nectar glands	Nectar glands absent	Nectar glands 3, prominent alternating with stamens	Nectar glands 5 pairs at base of each stamen
Style	Style as long as ovary	Sub sessile	Shorter than half the ovary or sub sessile
Capsule	Globose, 2-3 mm long, 3-4 valved,	Globose, longer than the floral tube 3-valved	Subglobose, 1.5 mm long, 3 valved
Seeds	Semi ovoid, yellow	Semi ovoid, bright red or yellow	Semi ovoid, smooth, bright yellow

#### Distribution and Ecology:-

*Rotala kanayensis* is so far known only from the type locality, Kanayi, a laterite area in Kannur District. Significantly a small population occurs in the marshy substratum of a drying depression on the lateritic rock surface. Our observations confirmed that there are less than 50 individuals growing in the site of collection in association

with *Pogostemon deccanensis* (Panigrahi) Press, *Lindernia antipoda* (L.) Alston, *Lindernia tenuifolia* (Colsm.) Alston var. *tenuifolia*, *Drosera burmannii* Vahl etc. It is therefore necessary to identify more areas of its occurrence towards planning further conservation measures as per IUCN guidelines and criteria (IUCN 2010, 2012); since it has been discovered now, *Rotala kanayensis*, could be categorized as 'Data Deficient (DD)'.

**Eponymy:-**

*Rotala kanayensis* is named after its type locality Kanayi in Kannur District, Kerala.

#### **Endemism and habitat preferences of *Rotala* in Peninsular India**

The study on endemism provides an insight into the centres of diversity and clues to the pattern of distribution and process of speciation. The evolutionary history of all endemics starts as neoendemics and end up as palaeoendemics (Richardson, 1978). Neoendemic species are newly evolved endemic species of relatively recent origin from an actively evolving genetic stock in a particular ecotone. They develop in different ecological niches or habitats through speciation and will have closely related taxa occurring in the same area. Neoendemics generally have herbaceous and shrubby forms and they occur in the areas that are prone to climatic and environmental stresses. All these factors substantiate the view that narrow endemism exhibited by the species of *Rotala* on the Peninsular India may indicate that they are neoendemics and the region can be considered as one of the centres of active speciation of the genus. The Peninsular Indian region has always been considered as an oceanic island in having conditions favourable for high degree of endemism (Turrill, 1964).

*Rotala* is an aquatic or amphibious, tropical and subtropical genus with a considerable number of phenotypic plasticity (Joseph & Sivar., 1988). Based on the nature of habitats, species of the genus *Rotala* falls under two groups, namely obligate aquatics which grow in shallow waters and semi-aquatic or terrestrials which thrive in marshy lands. Most of the species in Peninsular Indian regions are mainly distributed in amphibious ecosystems of lateritic plateau, especially in northern Kerala. Edaphic matrix of lateritic plateaus provides smaller scale habitats with hydro-geo-morphological anomalies that support significant plant taxa, especially endemics in restricted areas. The restriction of endemic plant species to nutritionally imbalanced substratum (laterite/serpentine) is a wide spread phenomenon in endemic rich areas. There is much evidence to suggest that this nutritionally imbalanced substrate provide a strong selective force for the evolution of endemic plants. In India, the genus *Rotala* is represented by 29 species, with their maximum morphological diversity in Peninsular India manifested by 26 species including 18 endemic taxa. Kerala is the major centre of distribution for the genus in Peninsular India with 21 species, in which 14 species are endemics, including 9 exclusive endemics. This highest degree of endemism of the genus is mostly represented from the lateritic zones of northern Kerala with very narrow distribution range. Endemics with extremely small range size, *i.e.* <5 km<sup>2</sup> are regarded as point endemics (Cowling, 2001), a category of narrow endemics. The analysis of distribution patterns of endemics gives a clear picture about the zones of their concentration and possible areas of active speciation. In this background an analysis of endemism in the genus *Rotala* L. in Peninsula Indian region with distribution status (IUCN, 2012) summarised in Table 02.

**Table 02:-** Distribution pattern of the genus *Rotala* L. in Peninsular India

Peninsular Indian Endemic species	Haibtat	Distribution
<i>Rotala anamika</i> Lemiya	Wet mashy area	Kerala *
<i>R. belgaumensis</i> Yadav <i>et al.</i>	Temporary pools in depressions on lateritic rocks	Karnataka*
<i>R. cookie</i> Joseph & Sivar. (IUCN: Endangered)	Paddy fields, lateritic annual pools	Kerala*
<i>R. cheruchakkiensis</i> Anto <i>et al.</i>	Laterite hilly area	Kerala*
<i>R. dhanesiana</i> Sunil <i>et al.</i>	Semi marshy areas in the moist deciduous forest	Kerala*
<i>R. fimbriata</i> Wight (IUCN: Least concern)	Shallow water or marshes in lateritic area	Maharashtra, Karnataka, Tamil Nadu & Kerala
<i>R. floribunda</i> (Wight) Koehne (IUCN: vulnerable)	Wet rocks	Maharashtra*
<i>R. illecebroides</i> (Arn. ex C.B. Clarke) Koch (IUCN: Least concern)	Wet places and on dripping rocks in hilly areas	Maharashtra, Karnataka, Tamil Nadu & Kerala
<i>R. kasargodensis</i> Prasad & Raveendran	Water logged soil on the lateritic plateau	Kerala & Karnataka
<i>R. khaleeliana</i> Sunil <i>et al.</i>	Temporary pools on the lateritic plateau	Kerala*
<i>R. malabarica</i> Pradeep, Joseph & Sivar. (IUCN: Critically Endangered)	Temporary pools in depressions on lateritic rocks,	Kerala*
<i>R. malampuzhensis</i> Nair ex Cook (IUCN: Least concern)	Temporary pools on the lateritic rock, paddy fields	Maharashtra, Goa, Karnataka & Kerala
<i>R. meenkulamensis</i> Prasad & Ravi	Temporary pools on the lateritic plateau	Kerala*
<i>R. ritchiei</i> (C.B. Clarke) Koehne (IUCN: Endangered)	Shallow margins of fresh water ponds.	Maharashtra, Karnataka, Tamil Nadu & Kerala
<i>R. sahyadrica</i> Gaikwad <i>et al.</i>	Fresh water pool on the lateritic plateau at high altitude	Maharashtra*
<i>R. tulunadensis</i> Pasad & Raveendran	Temporary pools on the lateritic plateau	Kerala*
<i>R. vasudevanii</i> Joseph & Sivar.	Fresh water pond	Kerala*

Dentists, marketing, opportunity.

#### Abstract

**Aim:** To investigate the effects of dental marketing on a dentist's career

**Objective:** To evaluate the importance of dental marketing done within the guideline

**Background:** Dental marketing is a way to attracting new patients but it needs to be done in an appropriate way by following the guidelines provided. Dentists have different opinions regarding this issue as some dentists think that they should hold themselves to a higher ethical code instead of acting like a salesperson while other dentists view it as a great opportunity to actively market their practices in order to maintain themselves in the business, especially with the growing interests towards dental health from the public.

**Materials and Method:** A questionnaire survey was conducted among 200 practicing dentists in Chennai. All participants were provided with a list of 12 questions related to dental marketing with answers given for each question. The participants were told to choose only one answer based on their personal opinion.

**Result:** The results from the study indicate the importance of dental marketing to a dentist's career provided that it is done within the guidelines given by the dental council.

#### Introduction:-

In today's world, the competition between dental practitioners has increased tremendously, which causes them to seek marketing alternatives to survive and prosper in this challenging field.<sup>[1]</sup> Dentists all around the world have started showing their interests in dental marketing as their view and perception on the subject has changed throughout the years, leading to the great evolution in dental marketing.

Nowadays, dentists have begin to realize that they cannot depend solely on the quality and reputation of their practice to gain and maintain their patients' interest and trust, instead they should also focus on creating an image and brand for themselves. A good reputation is important for a dentist to be successful and it can be achieved by focusing on how to make their practice big enough to earn such reputation. In order to attain a good reputation, a dentist should be able to market themselves well in the community. Since dental care is considered as a part of business like any other sector, dentists should apply the same principal and strategies to achieve a profitable business.<sup>[1]</sup>

**Corresponding Author:- Nur Liyana Hannah Binti Izham Akmal.**

Address:- Saveetha Dental College and Hospital, Chennai-600077, Tamil Nadu, India.

It is very important for dentists to be well-prepared with the information about their practices in order to provide a clear and consistent communication that can make them stand out in the sea of sameness.<sup>[2]</sup> Planning of dental marketing normally involves market data, marketing budget, budget allocation, priority promotion medium, deployment strategies for each medium, line item costs and a period of when to implement each component within the plan.<sup>[3]</sup>

#### **Unique Value Proposition (UVP):-**

UVP refers to a clear statement that explains what a dentist has to offer, how they provide the patients' needs and what makes them different from the other dentists. It is also known as unique selling proposition (USP).<sup>[4]</sup> The UVP of a dentist should be easy to understand, concise and appealing, solving the patients' problems, communicate specific value that is unlike primary alternatives and better than alternatives to the patients.<sup>[2]</sup> UVP helps dentists to stand out by clarifying how they are different from their competitors in a way that matters to their target patients. By knowing their target patients, dentists can better understand their patients' needs and able to meet their expectations in a distinctive, relevant and remarkable way.

People normally perceive that all dentists offer the same thing, which makes them less interested in knowing more about the profession.<sup>[2]</sup> This is actually a great opportunity for dentists to introduce their practices to the people and convince them on why they are better than their dental competitors in solving their patients' problems. UVP is a form of dental marketing that enables dentists to attract possible patients especially those living in the market area surrounding the dental practice. Planning a UVP requires an effort, in which a dentist needs to know their business, target patients, competitors and strategy to fulfill the specific market need. In order to create an effective UVP, a dentist should be able to identify who, where, what, why and when as part of their dental marketing plan.

#### **Materials and Method:-**

A questionnaire-based study was done among dentists with various years of practice. A total of 200 practicing dentists in Chennai participated in the survey. All the participants were provided with a list of 12 questions related to dental marketing with answers given for each question. The participants were told to choose only one answer based on their personal opinion.

#### **Dental marketing, yay or nay?—a survey:-**

1. Do you have patients who visit you on a regular basis?
  - Yes
  - No
  
2. How often do your patients come for regular check-ups?
  - Every 6 months
  - Once a year
  - Every 2 years
  - Occasionally
  - Other: .....
  
3. How did your patients find out about you?
  - Referral by family member / friend / neighbor
  - Referral by another dentist
  - Referral by acquaintance
  - Phone book
  - Saw sign / location
  - Advertisement
  - Other: .....
  
4. Do you notify your patients when it is time for a check-up?
  - Yes
  - No

5. How do you notify your patients for a check-up?
- Phone call
  - Text message
  - Email
  - None of the above
  - Other: .....
6. Do you have any form of social media (ex: Facebook, Twitter, etc.) to promote your dental practices?
- Yes
  - No
7. Do you often communicate with your patients (ex: out-of-office referrals, events, email, etc.)?
- Yes
  - No
8. Do you provide special offers or discount coupons for your patients?
- Yes
  - No
9. Do you have a clear plan for your dental marketing activities?
- Yes
  - No
10. Do you spend a lot on dental marketing (ex: more than 10 lakhs)?
- Yes
  - No
11. Do you think dental marketing is important for your career as a dentist?
- Yes
  - No
  - Not sure
12. What type of dental marketing do you prefer?
- Advertisement
  - Social media
  - Special offers, discount coupons, etc.
  - Other: .....

#### **Discussion:-**

According to Figure 1, a total of 168 participants in the survey have patients who visit them on a regular basis while the remaining 32 participants have patients visiting them once in a while. The larger number of participants is represented by 84% and the remaining 16% represents the smaller group of participants.

The result obtained from Figure 2 indicates about 55% of the participants have patients who visit them every 6 months for regular check-ups, which is equivalent to 110 of the total number of participants in the survey. 25% of them have patients coming for treatments once a year, 19% with occasional patients and the rest 1% had chosen “other” as the answer without specifically stating how often their patients visit them. None of the participants have patients who visit them every 2 years.

Based on Figure 3, 81 or 40.59% of the participants have patients who found out about them through a family member, friend or neighbor. 17.82% or 36 have patients coming to them by referral from another dentist and 12.87% or 26 of them were recommended by their patients’ acquaintance. The result also indicates that 8.91% and 18.81% of the participants were recognized by their patients through phone book and saw sign or location respectively. Only 0.99% of them showed different opinion from the given answers in the survey.

When asked if they notify their patients prior to a check-up, 84% of the participants answered “Yes”, which is equivalent to 168 dentists. The remaining 16% or 32 of them answered the opposite.

The participants were further asked on how they notify their patients for a check-up, in which 39.42% or 79 of them prefer phone call and 38.46% or 77 normally use text message as a method to notify their patients. Email notification was chosen by 6.73% or 13 participants and the rest 15.38% or 31 of them usually do not notify their patients prior to a check-up.

It can be seen that most of the participants have a basic knowledge on dental marketing with 158 or 79% of them having a form of social media to promote their dental practices while the remaining 21% represents the smaller group of participants who do not promote their practices through social media.

According to Figure 7, 64% of the participants often communicate with their patients in various occasions such as out-of-office referrals and events while 36% of them only communicate with the patients during their visits to the dental clinic.

It can be said that most of the participants have interests towards dental marketing as 66% of them provide special offers or discount coupons to their patients, which is similar to 132 of the total participants in the survey. 68 participants answered the opposite indicating that 34% of them do not provide any special offer or discount coupon to their patients.

Figure 9 shows that 64% of the participants have a clear plan for their dental marketing activities indicating their awareness and knowledge on the subject. However, planning of dental marketing still remains ambiguous for the remaining 36% of the participants.

Based on Figure 10, 73 or 36.36% of the participants are willing to spend a lot on marketing their dental practices, which is lesser than the remaining 127 or 63.64% of them who disagree with the idea of spending more than 10 lakhs for dental marketing.

The result obtained from Figure 11 indicates that 55% of the participants in the survey view dental marketing as a way to boost their career as a dentist, while 28% disagree with the idea and the remaining 17% are not sure whether dental marketing affects their career in any way.

Based on their basic knowledge on dental marketing, 43.40% of the participants had chosen social media as a great platform for them to promote their dental practices, followed by 28.30% for advertisement and 19.81% of them preferred special offers, discount, coupons, etc. as a medium for dental marketing. The remaining 8.49% or 17 of them had chosen other form of dental marketing without clearly stating them.

### **Conclusion:-**

Dental marketing has both its advantages and disadvantages on a dentist's career. Previously, dentists engaged in marketing and advertising their dental practices were constantly criticized for being unprofessional and dental marketing campaigns were often ridiculed and even taken to court. As time goes by, a lot of dentists have started to realize that a form of marketing plan is required in order for them to maintain themselves in this competitive field. Although dental marketing can be very helpful to a dentist, it must be done within specific guidelines to prevent them from false or misleading advertising. According to a guideline provided by the American Dental Association (ADA), "a dentist's marketing materials must not contain a material, objective representation, whether express or implied, that the advertised services are superior in quality to those of other dentists, if that representation is not subject to reasonable substantiation."<sup>[5]</sup>

Comparing the results obtained from this study to a similar survey done by Jim Du Molin in 2007, it can be seen that dentists have different opinions on dental marketing throughout the years. Based on his study, previous dentists had split opinions regarding the issue as 54% of the participants in the survey disliked the idea of marketing their dental practices claiming that dentists should always hold themselves to a higher ethical code instead of acting like a salesperson. The remaining 46% of them believed that dental marketing can actually help dentists to survive in this competitive world without being negatively judged by the public.<sup>[6]</sup>

In today's world, dental marketing has become an important role in the dental industry that dentists who do not take part in marketing their dental practices risk falling behind those who use dental marketing as a medium to reach out to their patients. A California dentist mentioned that, "It costs so much to market, it's hard to tell if it's working, and we all have to do it to keep up with the other dentists who have started advertising."<sup>[7]</sup> There are also some dentists who showed their concerns regarding this issue as seen from a statement by a North Carolina dentist, "Heavy advertising reduces dentistry to a commodity rather than a professional service," and "We are cheapening our profession," said a Washington general dentist. As opposed to that, more dentists have come together to show their support for dental marketing, "Today's consumers rely on advertising to make their choices. People used to rely on neighbors to recommend dentists. Now you are lucky if you meet your neighbor within five years. I have increased my advertising over the past 18 months, and it has been very rewarding financially," said a New Hampshire dentist.<sup>[7]</sup>

Despite the different opinions among dentists, dental marketing has continuously proven itself to be one of the effective ways for dentists to attract new patients provided that it is done within the guidelines given by the dental council. According to Jim Du Molin who is the founder of The Wealthy Dentist and the Internet Dental Alliance,

"Sooner or later, all dentists will realize that if they don't market their dental practices, they're going to go out of business."<sup>[7]</sup>

##### Key words:-

Education, System, Envisioned, Rote learning, Gurugula System.

#### Abstract

R.K.Narayan is the most famous Indian novelist, his reputation as one of the founding figures of Indian writing in English. This paper attempts to explain the Educational view of R.K.Narayan as envisioned in his novels. He carried an untiring crusade against the memory based Indian System of Education throughout his writing career. Narayan was of the opinion that he resented anything that cramped the soul and believed in return to an educational system based not on rote learning but on story- telling, games for the young and appreciation of the Indian Culture. He did not fail to indicate his new notions of education. He aimed at an ideal education and it was possible only in a free atmosphere. Narayan was not only criticised the education system but also had given solution for the problem. He favoured the Gurugula System of learning, the age old system which gave opportunity to the students and teachers lived together, learning without books. It was sort of natural learning.

#### Introduction:-

The Educational set up in Indian society with reference to the novels of Narayan is discussed in this paper. The Indian school system does not produce conducive atmosphere to the learners; instead, it gives boredom to the students. It is reflected in the first page of his first novel *Swamy and Friends* itself. Swaminathan, an average school going boy in the novel does not like to think about the school which is opened on Monday after enjoying Saturday and Sunday holidays and even the very thinking of school gives him bitterness:

It was Monday morning Swaminathan was reluctant to open his eyes. He considered Monday especially unpleasant in the calendar. After the delicious freedom of Saturday and Sunday, it was difficult to get in to the Monday mood of work and discipline. He shuddered at the very thought of school:that the dismal yellow building; the fire eyed Vedanayagam, his class – teacher; and the Head Master with his thin long cane... (SF, p.3)

Narayan boldly criticised colonial educational system. He resented anything that cramped the soul and believed in areturn to an educational system based not on rote learning but on story–telling, games for the young and appreciation of the Indian culture.

Raju the hero of *The Guide* describes the bitter experience of his early education:

**Corresponding Author:- Dr. R. S. Baskkaran.**

Address:- Omar Al- Mukhtar University, Al-Gubba, Libya.

When the sky lightened, my father was ready for me on the *pyol*. There he sat with a thin broken twig at his side. The modern notions of child psychology were unknown then; the stick was an educator's indispensable equipment. 'The unbeaten brat will remain unlearned', said my father, quoting an old proverb. He taught me the Tamil alphabet. He wrote the first two letters on each side of my slate at a time. I had to go over the contours of the letters with my pencil endlessly until they became bloated and distorted beyond recognition. From time to time my father snatched the slate from my hand, looked at it, glared at me, and said, 'What a mess! you will never prosper in life if you disfigure the sacred letters of the alphabet'. Then he cleaned the slate with his damp towel, wrote the letter again and gave it to me with the junction, 'If you spoil this, you will make me wild. Trace them exactly as I have written. Don't try any of your tricks on them', and he flourished his twigs menacingly.

Although the lessons had seemed interminable to me, my mother said the moment she saw me, 'so you have been let off! I wonder what you can learn in half an hour!'

I told her, 'I'll go out and play and won't trouble you. But no more lessons for the day, please.'

..... 'You will go to a school tomorrow and every day'  
'Father!' I cried. He was passing a harsh sentence on me.

It was what was called a *pyol* school, because the classes were held on the *pyol* of the gentleman's house.

For the first few days I enjoyed all this attention, but soon developed a normal aversion;  
..... His interest in us was one rupee a month and anything else in kind we cared to carry  
..... The dropping off my school unobtrusively.

Raju has become school dropout. School going and learning is boring for Raju and Swaminathan.

The writer criticises the existing educational system in his novel *The English Teacher*:

This education had reduced us to a nation of morons we were strangers to our own culture and camp followers of another culture, feeding on leaving and garbage. I am up against the system, the whole method and approach of a system of education which makes us morons, cultural morons, but efficient clerks for your entire business and administration of office source. (ET, p.203)

Narayan carried an untiring crusade against the memory based Indian system of education throughout his writing career, by series of ironic jibes at schools and teachers.

Krishnaswami (2006) quotes in his article in 'The Hindu,'

Narayan is also a great favourite syllabus planner at both the school and the college level. When he became Rajya Shaba M.P. (Member of Parliament) he wanted to reduce the burden of school children. As member of the Rajya Sabha, Narayan made children the subject of his inaugural speech, highlighting the issue of the "crushing burden of the heavy school bag". "I have investigated and found that an average child carries strapped to his back like a pack-mule, not less than six to seven kilograms of books, note-books and other paraphernalia of modern education in addition to lunch box and water bottle ..... it made many children hang their arms forward like chimpanzees..... I am now pleading for abolition of the school bag by an ordinance, if necessary – so that childhood has a chance to bloom".

In response, the Deputy Chairman said: "The entire House associates with Mr.R.K.Narayan and I feel that the whole country will notice it."

The examination system as it is practised in India is particularly primitive.

To quote Narayan (1974): "the whole aim of our education is to strain the faculty of Memory."

April is the cruelest month for Indian students. Two weeks before the examination, Swami and his friends were seized by a phobia of examination.

Instead of inculcating a natural interest in studies the system of education practised in India only creates disgust for books. Reading outside the school and examination preparation, is rarely thought of.

The conversation between Swaminathan and his father during the vacation is suffused with deep irony. Father asked Swaminathan:

‘How many days it is since you have touched your books?’  
 Swaminathan viewed this question as a gross breach of promise:  
 ‘Should I read even when I have no school?’  
 Father asked again ‘Do you think you have passed BA?’  
 ‘I mean Father, when the school is closed, when there is no examination, even then should I read?’  
 Father said vehemently:  
 ‘What a question! You must read.’  
 ‘But Father, you said before the examinations, that I need n’t read after they were over’.  
 He quoted the instance of Rajam as a norm:  
 Even Rajam does not read. (SF, p.64)

It is worth examining how Narayan’s criticism works. Rajam bitterly complained of a home tutor who came and pestered him for two hours a day thrice a week. Narayan drives home the point that reading is rendered unpleasant to Indian students. Narayan expands on the theme when he records Swaminathan’s protest, before a more sympathetic Granny. “If one has got to read even during holidays, I don’t see why holidays are given at all.” (SF, p.65)

He even showed a spirit of revenge to his mother’s joining hands with father in setting him to the torture of learning, by pulling the sheet under his young brother and made him roll on the ground. When Swaminathan sat in his father’s room to do a simple equation problem in arithmetic, Narayan represents artistically, his own disinclination towards figure work:

Father held the Arithmetic book open and dictated:  
 ‘Rama has ten mangoes with which he wants to earn fifteen annas. Krishna wants only four mangoes. How much will Krishna have to pay?’ (SF, p.66)

Narayan touches humourously on the inadequacy of formal education, when Swami, Mani and Rajam could not make head or tail of the letters they received from Messers Binns, Madras. The concern had asked to send twenty five per cent advance payments with their order. When Rajam expressed his inability to interpret it, Swami said: “I am surprised that, you cannot understand this letter” (SW, p.89)

In the opinion of Narayan the educational methods are defective; you got 80 percent in the last examination. The first part of the novel ‘*The Bachelor of Arts*’, Narayan expresses his views on education from the other student point of view. At the higher level, text books and examinations replace the appeal to the big stick of the lower one, as potential threat to students.

As a young man with a poetic turn of mind, Krishnan in *The English Teacher* subjects his own profession of teaching to serious assessment, though as a teacher he behaves as any other teacher in his circumstances would do. Narayan’s treatment of education is suggestive not cavilling and the eccentric Head Master of Leela’s School, introduced later in the novel, represents the positive aspects of Narayan’s own conception of the ‘Leave alone’ system of education.

Narayan’s opinion against the system of Western education speaks through the hero Krishnan of *The English Teacher* that he is both a product and an operator of that system by being a teacher of English:

In it I was going to attack a whole century of false education. I was going to explain why I could no longer.... feed them on the dead mutton of literary analysis and theories and histories, while what they needed was lessons in the fullest use of the mind. This education had reduced us to a nation of morons; we were strangers to our own culture and camp followers of another culture, feeding on leavings and garbage. (ET, p.205)

**R.K.Narayan (1974) in his article, “My Educational outlook.” He points out:**

My educational outlook had always been different from those of my elders and well wishers. And after five or more decades, my views on education remain unchanged... I am not averse to enlightenment, but I feel convinced that the entire organization, system, outlook and aims of education are hopelessly wrong from beginning to end; from primary first year to Ph.D.

The examination system as it is practiced in India is particularly primitive. To quote Narayan (1974) “the whole aim of our education is to strain-in the faculty of memory.”

Narayan (1974) warns the powers: “If our education system is not to continue as a well-endowed elaborately organized, deep-rooted farce, a remedy must be found immediately.”

Such is the outlook of Narayan on the western system of education which was implemented in India. He described the reality of the Examination Hall of today. Narayan criticised how examiners behaved and sometimes they fell asleep, one Examiner was sitting in drowsiness: “One supervisor was drowsing in his chair; another was pacing up and down, with an abstracted look in his eyes.” (SW, p.46)

Our weak Examination pattern gives too much importance and emphasis to write and not to develop other skills like listening, speaking and reading which are also very important for learning any language.

**Narayan (1974) criticises the evaluation system of our education:-**

Your examiner, he is also a human being subject to fluctuating Moods caused by unexpected domestic quarrels or a bad digestion just when he is sitting down to correct your papers; also, not being an adding machine, occasionally he may slip and arrive at 7 while totalling 8 and 3. Please forgive him.

**Narayan criticises the question paper, its secrecy and the paper evaluation in our examination system:-**

If I became Vice-Chancellor, my first act would be to abolish all secrecy that surrounds question papers. Instead of permitting wild speculations or as it happens nowadays, advance sale of questions in the block market, I would take advertisement space in newspapers and publish the questions in every subject, adding under each a credit line; ‘Set by Professor So-and-so’. I would not hesitate to announce with courage the names of those who are going to evaluate the answers and decree failures and successes. (1974)

**Narayan offers remedy for the present education system:-**

Memory is not so important today. Our need is for more libraries and multiple copies. The only condition I make for my boys is that they spend at least six hours a day in the library a month before the examinations and while writing the answer I permit them to refer to the books. (1974)

Narayan also highlights the corruption in the education system through his novel *The Financial Expert*, Margayya inducts himself into the Administrative Committee and manages a pass for his son, till the matriculation examination. There he goes paper tracing, but with no positive result.

Margayya (*The Financial Expert*) resorts to carefully considered bribery in order to secure his son’s future through the hallowed halls of learning. In the novel *The Vendor of Sweets*, Jagan cannot understand his son Mali’s sullen obstinancy where going to school is concerned.

R.K.Narayan does not fail to indicate his new notions of education. He aims at ideal education and it is possible only in a free atmosphere. His views on education of children find full expression in other novels *The English Teacher* and *The Bachelor of Arts*. *Swamy and Friends* with their class mates, their fear for masters and their frequent quarrels with their school mates brings into focus various aspects of student life – a life which a youth had to lead in the masters’ house staying with him doing all service to him and learning from him was an old education system called *Gurugula* system of education. He went on to recommend the ancient Sanskrit method of learning which took many years, and dispensing with books, relied on memory. “It’s a sort of natural training”. But modern circumstances are different and Swamy does not praise his masters but curses them; Narayan loves his masters, learns his subjects and all the more loves the college atmosphere. The only defect is that he takes the period of study as a casual and pleasurable period of his life.

Lord Macaulay proposed to produce cheap clerks through the medium of English education. Lord Macaulay in his famous Minute of 1835:

We must at present do our best to form a class who may be interpreters between us and the millions whom we govern; a class of persons, Indian in blood and colour, but English in taste, in opinions, in morals, and in intellect; to that class we may leave it to refine the vernacular dialects of the country, to enrich those dialects with terms of science borrowed from the Western nomenclature, and to render them by degrees fit vehicles for conveying knowledge to the great mass of the population (Krishnaswamy and Lalitha Krishnaswamy, 2009).

### Conclusion:-

Swami Vivekananda says that India wants man making education. Hence Narayan line of thinking is the same.. Narayan carried an untiring crusade against the memory based Indian system of Education throughout his writing career by series of ironic jibes at school and teacher. He resented anything that cramped the soul and believed in a return to an educational system based not on rote memory but on narration and games for the young and appreciation of Indian Culture. The main impulse behind his consistent rejection of colonial education has been his deep concern for his own culture. The writer advocates his educational philosophy in his novel *The English Teacher*. He criticises the Education System of Macaulay which produced mere clerks for the British Empire. Education as it is practised in modern India has caught the Western model in the wrong end. It is unfortunate over the years in spite of many education commission reports, nothing concrete has been achieved. It is worked out on the basis of memory with no effort to develop analytical reasoning. It does not allow the scholars to flower forth into intellectuals. Narayan feels that this education has reduced our nation to a nation of morons; we have become strangers to our own culture and camp followers of another culture. Such is the outlook of Narayan on the western system of education which was implemented in India. Education as practiced in India is legacy of Macaulay that was interested in churning out clerks for British administration. The Education System should undergo drastic revision if Indians are to be the Managers and intellectually superior in coming era. Indian should awake to the great opportunities and potentials of emerging world order and to take lead roles in it.

### RESEARCH ARTICLE

## THE IMPACT OF AGE ON SOME PHYSIOLOGICAL, HEMATOLOGICAL AND BIOCHEMICAL PARAMETERS OF NEONATAL NATIVES CALVES IN QENA, EGYPT.

Mohamed Saied M. M.

PH.D., Veterinarian at GOVS (general organization of veterinary service) in Egypt.

#### Manuscript Info

#### Manuscript History

Received: 22 December 2016  
 Final Accepted: 26 January 2017  
 Published: February 2017

#### Key words:-

Calf, neonatal period, physiological parameters, blood parameters, biochemical parameters.

#### Abstract

The study was carried out on twenty calves suspected while all animals were belonged to the villages scattered in the Qena Governorate Egypt. Blood samples were taken from the external jugular vein, and then centrifuged and stored until analyses.

Blood was taken aseptically from all the animals and transported to laboratory for hematological and biochemical analysis. The hematological parameters (Hemoglobin, total erythrocyte count, total leukocyte count, packed cell volume) and biochemical parameters (Total protein, creatinine, calcium, phosphorous, iron, copper, sodium, chloride, AST, ALT) values were statistically analyzed, mean and standard deviations were calculated and set as reference values. The results showed a significant effect of days of life ( $P < 0.05$ ) only on total Rbcs, Wbcs, Hb. Total protein, Calcium, Phosphorus, Chloride, a Copper and GOT during the first week of life and a significant effect of days of life. In conclusion, modifications of studied parameters could be attributed to functional development of calves in neonatal period and contribute to the knowledge of adaptation processes in calf during the first week and the first month of life resulting useful for the diagnosis and treatment of any neonatal diseases.

The aim of this work was to follow the changes, during the early growth of calves, of a wide range of blood variables commonly used by veterinarians to aid the diagnosis of disease.

Copy Right, IJAR, 2017., All rights reserved.

#### Introduction:-

Physiological, hematological and biochemical variables are most widely used medical decision making tool. Hematological and biochemical analyses of blood are very useful to get an insight in health status of animal. The neonatal period represents a critical time during which all organ functions must adapt to the extra-uterine life; it is a transition phase from the sheltered intra-uterine to the exposed extra-uterine environment (Piccione et al., 2008).

#### Material and Methods:-

This study was carried out in Qena Governorate, Egypt, on twenty clinically healthy and full-term-born native calves (eight males: mean body weight  $26.23 \pm 2.29$  kg; twelve females: mean body weight  $25.21 \pm 2.1$  kg) which were monitored for 30 days. Calves were kept with their mothers and were fed only with maternal milk. For each calf, physiological parameters were measured and blood samples were collected at the same hour (10am). The studied

**Corresponding Author:- Mohamed Saied M.M.**

Address:- Mohamed Saied M.M., PH.D., Veterinarian at GOVS (general organization of veterinary service) in Egypt.

parameters were assessed on all animals in the following experimental conditions: from the day after the birth, daily for one week and every seven days for 30 days. Rectal temperature was recorded using a digital thermometer and respiratory rate was visually recorded using a stopwatch over a 5min period.

From all animals, blood samples were collected from the external jugular vein into 10mL in Vacutainer tubes with no addition of anticoagulants after collection all blood samples were centrifuged at 3000rpm for 10 minutes; serum were separated and stored at -20°C until analyses. Serum were analyzed with commercially available kits by means of a UV spectrophotometer. Serum concentrations of the following blood parameters were measured: total protein, calcium, iron, phosphorus, chloride, and sodium for each parameter. All results were expressed as mean±standard error of the means (SEM). On all data, normally distributed ( $P < 0.05$ , one way analysis of variance (ANOVA) was used to evaluate the effect of days of life during the first, second, third, and fourth week of life. If ANOVA showed an acceptable level of significance ( $P < 0.05$ ).

## Results:-

The obtained results represented in tables 1,2,3,4.

**Table1:-** Average values ( $\pm$  standard errors) of physiological parameters, with the statistical significances observed in twenty calves during the first month of life.

\*significant at ( $P < 0.05$ )**Physiological parameters:-**

Temperature, heart rate and breath/minute represented at **table 1**, the values were not increase with days.

**Hematological parameters:-**

Data in **table 2**, indicated that the values of Rbcs, Wbcs, Hb. And Pcv were increased by the day of life of calves .

**Blood biochemical parameters:-**

**Total protein** Results in table 3 indicated that, the concentrations of plasma total protein were increase from one day (5.75 $\pm$ 0.88 ) to (6.92 $\pm$ 0.9g/dl) at 30 days.

**Plasma glucose** Data in **table 3** indicated that, the concentrations of plasma glucose were decreased with time from one day(4.7.8 $\pm$ 5.2 ) to (4.4 $\pm$ .2mg/dl) at 30 days.

**Urea** values in **table 3** showed that, the concentration of urea values increased with time from one day(54.25 $\pm$ 5.2 ) to (55.25 $\pm$ 6.1mg/dl) at 30 days.

**Creatinine** Data in **table 3** indicated that, the concentrations of plasma creatinine were increase in dam from zero time (1.5 $\pm$ 0.5) to (1.6 $\pm$ 0.2 mg/dl) at 30 days.

**GPT: glutamate pyruvate transaminases** showing that in table 3 there are no variations of the values from one day to 30 day. (6.75 $\pm$ 1.1)to(6.66 $\pm$ 0.2(u/l)).

**GOT: glutamate oxalacetate transaminases** data indicated that there are an increase of the values from one day46.5 $\pm$ 2.4to48.2 $\pm$ 2.3(u/l)at 30 days in **table 3**.

**2-blood electrolytes**

**Calcium level** Results in **table 4** indicated that there was an increase in calcium level in calves at one day (7.34 $\pm$ 0.5) than at 30 day (8.5 $\pm$ 2.1mg/dl).

**Phosphorus level** results in **table 4** indicated that, the concentrations of plasma phosphorous were variations in the value of calves from one day 2.1  $\pm$ 0.2to2.6  $\pm$ 0.3 mmol/L) at 30 day.

**Sodium level** Data in **table 4** indicated that, the concentrations of plasma sodium were increased in calves from one day (132.5 $\pm$ 2.2) to133.6 $\pm$ 3.4(mmol/L).

**Chloride level** Results in **table4** indicated that, data indicated that there are an increase of the values from one day (93.5 $\pm$ 2.6) to94.1 $\pm$ 2.1(mmol/L) at 30 days .

**Iron values table 4** Results indicated that, the concentrations of plasma iron were slow increased in calves from one day (25.2 $\pm$ 1.6)to(26.1 $\pm$ 3.1) (mmol/L)at 30 day.

**Copper values table 4** Results indicated that, the concentrations of plasma copper were increases in the value of calves from one day (133.1  $\pm$ 3.6)to(135.3  $\pm$ 6.1 mg/dl) at 30 day.

**Discussion:-**

The obtained data did not show a significant effect of days of life on the studied physiological parameters (rectal temperature, heart rate, and respiratory rate) during the first month of life. Rectal temperature was between 39.1°C and 39.3°C for the first days of life, with no significant differences recorded (**Piccione et al., 2007b**). Also in the present study for respiratory rate during the first month of life there are no significant effect of days of life on the respiratory rate. Also there is no significant effect of days of life on the heart rate. Regarding to the age influence, the results indicate the influence of the age of cattle on the red blood cells, white blood cells, hemoglobin, and packed cell volumes which are significantly more in young cattle than in adult.(**Moosavian et al., 2010**),(**Mohriet al., 2010**),( **Nezar et al.2013**),(**Mohriet al. 2006**),(**Brun–Hansen et al. 2006**)and(**Hege C. et al. 2006**).

Immediately after parturition the values of (PCV), haemoglobin (Hb) and number of red blood cells are higher in newly calves (Harvey 1997), while (Mohri et al. 2007) observed a decrease of PCV and Hb from birth to the age. The obtained results showed a significant effect of days of life on total proteins, these agree with (Muri et al., 2005), Egli and Blum (1998), (Peterson et al., 1981). Total protein data increased with the increasing the age of calves and significant at ( $P < 0.05$ ) (Egli and Blum (1998), (Knowles et al. 2000), (Neama .A. Ashmawy 2015), (Csilla Tóthová et al. 2016).

Plasma glucose increase with the increasing day of life, these agree with (Knowles et al. 2000) and ECLI and BLUM 1998).

The concentration of urea in blood depends from nutrition, diagnostically is important also at diseases of kidneys (Kraft & Dürr, 1999b; Jazbec, 1990). Increased concentration of urea in calves' serum indicates increased catabolism of proteins and appears at long lasting diarrheas (Jazbec, 1990). Hanschke and Schulz (1982), (Maria et al, 2011, Campanile et al, 1997 and, Grasso et al, 2007). The obtained results are not increase with the age of calves, this are not agree with the results obtained by Hanschke and Schulz (1982), (Hugi et al. 1997), (Knowles et al. 2000).

GOT is present in different tissues and is a sensitive indicator of soft tissue damage. In heart and skeleton musculature as in liver there is high activity of GOT, (Kurz & Willet, 1991), Hammon and Blum (1998) glutamate oxalacetate transaminases have an increase change with day of life., this agree with (Egli & Blum, 1998). Mohri et al. (2007). while the (GPT) glutamate pyruvate transaminases; have no change with day of life.

Age-related changes have been detected for Calcium, and Phosphorus. Egli and Blum (1998). The obtained data showing an increase in the values of calcium (Bostedt and Schramel, 1982), While Egly and Blum 1998) said that it is decreased with the age.,

The values Sodium and chloride in the present study are increase with age, this agree with (Dubreuil and Lapierre 1997), (Reece, 1984), (Maach et al., 1991). (Jozcia and Martin 2006) they reported the increase of sodium and chloride levels with age. Other researches said that the values of Cl, Na and K were within the published reference values for adult cattle. (Dubreuil and Lapierre 1997). and copper with the days of life of the calves significant at ( $P < 0.05$ ) while the values, this agree with (Birgit Puschner et al. 2004). For diagnostic purposes, liver copper concentrations of newborn calves are often used to determine the copper status of dams (Gooneratne and Christensen 1989).

The values of phosphorus are increase with the age of calves, this agree with (Underwood & Suttle, 2001), (Kraft 1999b) (Rosol and Capen, 1997), (Steinhardt and Thielscher, 2000), (Mohri et al. 2007). The iron is very important for synthesis of haemoglobin. The level of iron have slow increase with the increasing day of life of calves, this agree with the result achieved by (Egli and Blum 1998), (Knowles et al. 2000). Creatinine is excreted with urine. It is important for the assessment of functioning of the glomerular system in the kidneys, but its concentration increase only at serious damage (Kraft & Dürr, 1999b). the values of creatinine obtained are not increase with the age of calves, and this are not agree with the results reported by (Maach et al. (1991), (Klee, 1985), they observed increase of creatinine concentration to the age of calves.

### Conclusion:-

The age of calves influence the hematological and biochemical variables what should be considered by interpretation of laboratory results.

The results of various studies on age dependent dynamics of hematological and biochemical variables in calves are different. The differences are influenced by the fact that blood samples were taken in different age periods, breeds, rearing systems, geographic regions, and were analyzed with different methods.

For proper interpretation of laboratory results it is the best to use the reference values from the laboratory which performed the analyses of blood.

The results of the present study showed that for some physiological, hematological and biochemical parameters. The results from this study provide data on 20 calves followed over time and may serve as preliminary reference intervals. However, because of differences between herds in relation to geographical regions, management and feeding strategies of dairy cows and calves cautions must be in mind to use appropriate reference range.

#### Introduction:-

- The term Bio-therapeutics usually refers to therapeutic materials produced using biological means, including recombinant DNA technology.
- Therapeutic agents that are produced from living organisms or their products(including rDNA technology, biotechnological manufacturing & chemical synthesis using nucleotides or amino acid).
- Includes monoclonal antibodies antibody fragments, peptides, replacement factors, fusion proteins, oligonucleotides, and DNA preparation for gene therapy as well as vaccines.

**Types of Biopharmaceutical Modalities:-****How they are different from biopharmaceuticals:-****Biopharmaceuticals:-**

- Small molecule drugs are organic or metallic compounds which bind with proteins in the body, thereby altering their function and their role in disease.
- Size is <600 Da
- Typically made utilizing chemistry synthesis.
- Work intracellularly.
- Less specificity.
- Easier to deliver (often oral, e.g., aspirin, antibiotics).
- Generally cheap to manufacture and easy to replicate after patent expiration (the high cost is the initial development)

**Bio-therapeutics:-**

- Large molecule therapeutics treats diseases using biological matter, e.g., proteins monoclonal antibodies, peptides, RNA, cells, vaccines etc.
- Size is ~150,000 Da.
- Typically grown and extracted from living cells
- Work extracellularly.
- High specificity limits toxicities
- Difficult to deliver (usually must be injected)
- Generally expensive to manufacture.

**Additional Challenges for Bio-therapeutics:-**

- Delivery options are currently limited (main routes are intravenous and subcutaneous).
- Target Mediated Disposition may lead to **Nonlinearity**.

- Manufacturing is significantly more complex and a critical factor in safety and efficacy thus manufacturing changes have to be carefully assessed (**Comparability**).
- Products can lead to **immunogenicity where the body mounts** an immune response to the product. This is especially true for products that contain other species components (i.e. giving human protein to animals for safety studies).
- Species specificity may limit standard preclinical models for safety testing.
- First pass metabolism i.e g.i.t degradation.

#### Examples of Special Bio-therapeutics Considerations:-

- **Nonlinearity**

#### Comparability:-

Understanding potential changes in a product due to manufacturing changes.

- Comparable means “highly similar” not identical”
- ICH Q5E

“The demonstration of comparability does not necessarily mean that the quality attributes of the pre-changed post-change products are identical; but that they are highly similar and that the existing knowledge is sufficiently predictive to ensure that any differences in quality attributes have no adverse impact upon safety and efficacy of the drug product”.

#### Potential changes to manufacturing process:-

##### Expression system:-

Master cell bank  
Working cell bank

##### Fermentation

Raw materials, cell culture conditions, scale, equipment, site change

**Purification process:-**

Column/resin, reagents, scale, site, equipment.

**Formulation and filling:-**

Excipient, liquid tolyophilized or *vice versa*, equipment, change in manufacturing protocol.

**Drug product:-**

– Batch definition, shelf-life, container/closure, shipping, storage.

**Immunogenicity in Bio-therapeutic Development:-**

- Immunogenicity refers to the production of an unwanted immune response directed at a bio-therapeutic.
- These are typically called anti-therapeutic antibodies (ATA) or anti-drug antibodies (ADA).
- Any exogenous protein may be viewed by the body as foreign and trigger immune response that lead to generation of endogenous antibodies against that protein.
- **Immunogenicity of biological products is a high profile concern for industry and for regulatory authorities:**
  - Immunogenicity may impact safety and efficacy.
  - FDA & EMA require that immunogenicity of bio-therapeutics be evaluated.
- Development of bio-therapeutics for chronic use is increasing the need to understand potential implications of immunogenicity.
- Immunogenicity strategies and data are essential components of Target Product Profiles, INDs, and BLAs.
- **Immunogenicity of the administration route: intradermal > inhalation > subcutaneous > intraperitoneal > intramuscular > intravenous.**

Clinical Impact	Clinical Outcome
<b>Safety</b>	<ul style="list-style-type: none"> <li>➤ Hypersensitivity or anaphylactic reactions</li> <li>➤ Neutralize activity of endogenous counterpart with unique function causing deficiency syndrome</li> <li>➤ Immune complex formation</li> </ul>
<b>Efficacy</b>	<ul style="list-style-type: none"> <li>➤ Neutralize activity of therapeutic protein</li> <li>➤ Increase or decrease efficacy by extending or curtailing half life</li> <li>➤ Increase or decrease efficacy by changing bio-distribution</li> </ul>
<b>Pharmacokinetics</b>	<ul style="list-style-type: none"> <li>➤ Extend, or curtail half life</li> <li>➤ Alter biodistribution</li> <li>➤ PK changes may dictate changes in dosing</li> </ul>

#### Advantages To Bio-therapeutics:-

- ❖ Favorable attrition rate.
- ❖ Minimum risk for non-mechanism based toxicity and safety issues.
- ❖ Can augment bodies normal growth factors, hormones, and enzymes.
- ❖ Able to modulate protein/protein interactions intractable to small molecules.
- ❖ Applicable in multiple therapeutic areas and for a variety of targets.
- ❖ Inherently highly specific for the target.
- ❖ Maintain natural biological activity.
- ❖ Broad range of protein expression capabilities, including enzymes, cytokines, hormones and mAbs.
- ❖ Scalability.
- ❖ Safety, potency and consistency of the end product.

#### Pharmacokinetics Of Rituximab:-

- **Rituximab (RTX; Rituxan, MabThera)** is a **chimeric monoclonal antibody (mAb)** that binds the CD20 antigen, a transmembrane phosphoprotein specifically expressed by B-lymphocytes. RTX induces target cell death and is used in combination with polychemotherapy in the treatment of all histological types of B non-Hodgkin lymphoma (B-NHL) and in chronic lymphocytic leukemia (CLL), both as first-line and as rescue therapy. Furthermore, it is used for maintenance therapy of B-NHL and for treatment of several autoimmune diseases, in particular rheumatoid arthritis.

**Doses and routes of administration:-**

- RTX is usually administered by **intravenous (i.v.) injection**. The first approved schedule for induction therapy of B-NHL was 375 mg/m<sup>2</sup> i.v. given for 4 cycles, and this was based on the pivotal trial of the antibody.
- Limited to the treatment of central nervous system (CNS) lymphomas, an intrathecal or intraventricular route has also been attempted since maximal RTX levels in cerebrospinal fluid are generally not more than 1% of serum levels after i.v. administration. Doses administered by the intrathecal or intraventricular route are generally 10 or 25 mg antibody every few days.
- A more convenient administration would be the **oral route**, but this is limited by **pre-systemic degradation** in the gastrointestinal tract, and by inefficient diffusion or convection through the intestinal epithelium. To bypass the low oral bioavailability, and as an alternative to i.v. administration, a number of mAbs are delivered **subcutaneously (s.c.)**. The subcutaneous route has been employed for antibodies used in the treatment of allergy or autoimmune diseases, but more recently has been extended to trastuzumab, an anti-human epidermal growth factor receptor (HER)-2 antibody approved for treatment of breast cancer.

**The proposed s.c. dose for RTX is a fixed dose of 1400 mg.**

**General aspects of RTX PK:-**

- PK of RTX has been mostly studied after i.v. administration. In this case, RTX disposition is characterized by a 2-exponential decay, with a long elimination half-life of about 3 weeks (Fig. 1). The 2-compartment open PK model with first-order elimination represents the best structural model and seems to provide the best fit of RTX disposition, both during and after treatment, even with different schedules of drug administration.

**Figure 1:-** Biphasic PKs of RTX. The model shows high clearance by specific binding to CD20) which, after saturation, leads to low clearance through non-specific binding via FcγR (RES).

**Absorption:-**

- After i.v. administration of RTX, all the drug administered reaches the systemic circulation (by definition the bioavailability (F) by this route is 100%), while after s.c. administration only a fraction of RTX dose ( $F \cong 60\%$ ) is absorbed because, during the absorption phase, a portion of the drug undergoes proteolytic degradation or phagocytosis.
- Primary pathways for systemic absorption include **convective transport** of antibody through lymphatic vessels and into the blood, and **diffusion** of antibody across blood vessels distributed near the site of injection; however, on the basis of its molecular size, it is considered more likely that the RTX administered via s.c. injection is absorbed mainly via convection through lymphatic vessels.
- Generally, after s.c. injection, absorption occurs slowly and the time to reach maximum plasma concentration varies from 2 to 8 d. The bioavailability is determined by the extent to which the drug after s.c. administration undergoes pre-systemic catabolism and systemic absorption. In general, the absolute bioavailability reported varies from 50 to 100%.<sup>59</sup> Clearly, RTX will also bind to CD20 on B cells after s.c. administration.
-

**Figure 2:-** Model of mAb absorption and clearance after i.v. or s.c. administration. Absorption and clearance pathways are shown.

#### Distribution:-

- Antibody distribution kinetics is influenced by rates of convective transport, binding to tissue sites, and rate of catabolism within tissue. After i.v. administration, RTX binds to the CD20 antigen present on the surface of normal or neoplastic B cells in the peripheral blood, bone marrow and lymph nodes.
- After distribution at the level of tissue blood vessels, there are different mechanisms of transport of the antibody from the systemic circulation through the capillary endothelial cells and into tissues. RTX diffusion across vascular endothelial cells is very slow and the movement of RTX through or between the cell membranes mainly occurs via transcellular (endocytosis) or paracellular mechanisms, i.e., convective transport of the antibody within the movement of the fluid flow
- For both i.v. and s.c. administration of antibodies, FcRn plays an important role by reducing mAb catabolism and mediating mAb transport across endothelial cells, thus promoting the distribution of the antibodies across tissues.
- The volume of distribution of RTX at steady-state is approximately 9.6 L. Since the plasma volume is only 3–3.5 L, this suggests that the mAb distributes into the extracellular spaces of tissues, except the CNS.

#### Elimination:-

- The total clearance is the sum of specific target mediated internalization, which is not linear and saturable, and non-specific clearance, which is linear and mediated by both FcγR-dependent and independent mechanisms (Fig. 1).
- Binding to FcRn generally reduces clearance because the antibody is recycled through FcRn to the surface and released into the cell environment. Therefore, FcRn binding protects mAbs from intracellular degradation.

#### The mechanisms of antibody eliminations are three:-

1. target-mediated elimination
2. proteolysis by the liver Kupffer cells and by monocytes/macrophages of the reticuloendothelial system (RES).
3. non-specific, FcγR-independent, endocytosis.

#### Accumulation:-

- Because RTX distribution and elimination are very long and clearance rate can vary, the extent to which the drug could accumulate after multiple doses is difficult to estimate. A steady-state condition (i.e., the condition in which, during each dosing interval, the intake of a drug is equal to the amount eliminated from the body) is achieved after approximately 3–5 half-lives (Fig. 3).
- In fact, small molecules (e.g., chemotherapy) have an elimination half-life in the magnitude of hours and rapidly achieve steady-state following administration (hours-days), while large molecules (e.g., mAbs) have a very long elimination half-life (in the magnitude of weeks) and may take up to 12 weeks to achieve steady-state.
-

**Figure 3:-** Model of RTX PK after multiple dosing.  $C_{max}$ ,  $C_{trough}$ , AUC and steady-state, reached after about 5 cycles, are shown.

#### Factors Affecting RTX PK:-

The association between tumor burden and RTX levels. Circulating RTX levels have been shown to be affected by the “tumor burden” (tumor volume) in an inversely proportional way. Clinical studies have demonstrated that a high “tumor burden” is associated with low RTX serum levels. This is because the tumor cells act a sink for the antibody, adsorbing RTX through CD20 binding and inducing target-mediated elimination. A similar phenomenon is associated with the observation that a decrease in serum antibody levels during maintenance treatment can be predictive of relapse. Indeed, tumor growth adsorbs antibody, whose levels consequently fall in the circulation, in some cases anticipating clinical relapse.

#### Association between RTX levels and clinical response:-

Exposure to RTX (assessed by the area under the serum concentration-time curve [AUC]) and trough/pre-dose concentration of the drug are the PK parameters most frequently related to the patient’s response (Fig3).  $C_{max}$  represents a measure of drug concentration in the blood immediately following i.v. administration, but it should be noted that during the first hours after drug injection, the changes in serum concentration do not always reflect a proportional change in the concentration of RTX in all other tissues, and hence in the amount of drug in the body. The balance between plasma/serum and tissue concentrations is obtained only a few days after drug administration. This is probably the reason why AUC and  $C_{trough}$  are more directly related to clinical response compared to  $C_{max}$ . This has suggested that maintaining RTX above 25  $\mu\text{g/ml}$  would be beneficial.

#### Gender effects:-

An interesting aspect that has recently emerged is the effect of gender on RTX PK.  $C_{trough}$  and AUC were generally higher in females than males both in the induction phase and in the maintenance phase, resulting in a better quality of response.

**Comparison of Analytical Assays for Protein Quantitation:-**

Variable	Immunoassay	Direct LC-MS	Immuno-capture LC-MS
Limit of quantification	5-200ng/ml	500-1000ng/ml	20ng/ml
Target Concentration	Mixture of free and bound	Total	Mixture of free and bound
Precision	Medium, No internal standard possible	High, with internal standard	Same as Direct LC-MS
Time for development.	8 months	Less than 1 month.	4 months
Throughput	High	High	Low, automation (robot)
Cost	Low	High	High

**When to use LC/MS/MS****First Choice:-**

- Peptides.
- Oligonucleotides in tissues.
- Early discovery (when no reagents are available).
- Antibody drug conjugates.

**LC/MS/MS as a compliment to ligand binding assays (ex. ELISA)**

- When there are issues with unresolved interference.
- Characterization – to understand what the ligand binding assay is measuring.

**Conclusion:-**

- ✓ Bio-therapeutics are becoming an increasingly important part of drug development.
- ✓ There are multiple types of bio-therapeutics each with their own distinct characteristics and drug development challenges.
- ✓ Bio-therapeutics have unique challenges for drug development when compared to small molecules including (but not limited to) target mediated disposition, comparability, and immunogenicity.
- ✓ A key factor for Bio-therapeutics is the development of fit for purpose bio analytical assays with the appropriate validations.
- ✓ Over the past 15 years, however, many data have been obtained on PK and PD and different prognostic factors have been identified, allowing better prediction of what could be the best treatment regimens.
- ✓ At least in the context of B-cell malignancies, the maintenance of a minimum level of drug (currently defined as > 25 µg/ml) for a prolonged time (at least 200 days for induction therapy and up to 2 y for maintenance), seems to be more important rather than the rapid achievement of a very high dose (200–300 µg/ml) for a shorter time.
- ✓ Better timing, simplified administration (fixed doses, s.c.) and different schedules with respect to chemotherapy are being introduced, on the basis of the present knowledge and of the widely different characteristics of therapeutic mAbs compared with standard drugs in terms of both PK and PD.
- ✓ Several of the lessons learned from RTX studies should be valuable for other anti-cancer mAbs.

##### Key words:-

Teaching, linguistics, culture, values, foreign languages, intercultural relations, communicative competence, social-cultural competence.

#### Abstract

The article is devoted to theoretical aspect of formation of social-cultural competence which is necessary in teaching foreign languages. After getting independence the educational system in Uzbekistan was changed by making a number of reforms aimed at preparing further generation with high intellectual development, moral and spiritual upbringing. Since obtaining national sovereignty the system of education is improving by embedment of new methods and models of teaching. The content of teaching, of course, contains teaching culture and spiritual heritage. Essential in this aspect becomes formation of the social-cultural competence in the process of teaching foreign languages.

*Copy Right, IJAR, 2017., All rights reserved.*

#### Methods and Materials:-

The methodological ground of the present research includes theoretical issues of N. Muravyova, Z. Nikitenko, I. Bim, G. Ferapontov and others who devoted their investigation to the problems of integration of teaching culture into the process of teaching foreign languages. Methods used for the present research are: descriptive method – for description of the problem; method of observation – for revealing main aspects of forming of social-cultural competence and its integration into teaching process; componential analysis – for dividing the process of social-cultural competence formation into components; method of critical analysis of the researches done in the sphere of investigation.

#### Results and Discussion:-

The new model of education aims at effective teaching foreign languages and formation of educated personality. New approach in teaching foreign languages makes an accent at teachers training institutions. Teaching programmes should match new demands of theory and practice of teaching foreign languages.

Knowledge of a foreign language is based on not only language skills but on knowing cultural peculiarities and lingual behavior as well. As foreign languages serve as means of intercultural relations between countries, so they should maintain perfect dialogue of different cultures.

Integration of teaching culture in the process of foreign language teaching has become wide. Mastering a foreign language deals with mastering national culture of its native speakers, cultural background and ability to comprehend the mentality of its speakers in the process of communicative dialogue.

**Corresponding Author:- Omanov Pulat Habitovich.**

Address:- Uzbekistan State World Languages University, Scientific researcher.

The present manuscript explains the notion of social-cultural competence and its peculiarities of formation in the process of teaching foreign languages.

The aim of teaching a foreign language is formation of communicative competence, which includes lingual, social-cultural competence. The absence of social-cultural background knowledge will lead to incorrect communication and can't maintain communicative competence.

Social-cultural competence is an effective means of formation of a personality of a foreign language teacher. It brings to development of students' personal qualities such as creativity, new ideas, comprehension of communicant's psychological state, tolerance to diversity and another point of view, positive attitude to foreign culture and its bearers<sup>1</sup>.

Being the elements of culture, languages function in the frames of a definite culture. Students, who are taught these languages, should be aware of cultural peculiarities. National-cultural competence includes specifics of speech behavior of language native speakers and elements of social-cultural context: customs, traditions, norms, rules, social conditions, rituals, country study knowledge.

All these problems are attracting more attention of researchers who point the necessity of including teaching culture into the process of teaching foreign languages. N.G. Muravyova points: "Social-cultural competence is an integrative characteristics of a person, being aware of various social-cultural spheres and being able to communicate with different people basing on life experience"<sup>2</sup>.

Learning the culture of the country of a foreign language develops mutual understanding, tolerance to each other, respect to another culture, comprehension of its peculiarities in the process of communication with foreigners<sup>3</sup>.

The most effective way of learning foreign language culture is living in that country, being involved into the atmosphere of culture, traditions, customs and social norms of the country of foreign language. But not all the learners have chance for it. So we should offer the most effective ways of development of social-cultural competence outside of authentic language sphere.<sup>4</sup>

#### **The development of social-cultural competence includes 4 main steps:-**

1. Social-cultural knowledge – materials about the country of a foreign language, its spiritual values and cultural traditions, peculiarities of national mentality;
2. Experience of communication with foreigners – choice of the style of communication, correct expression of thoughts, and correct explanation of phenomena of foreign culture;
3. Personal attitude to the facts of foreign culture – tolerance and ability to avoid social-cultural conflicts in communication with foreigners;
4. Correct usage of socially marked language units in various spheres of cultural communication, comprehension of diversity and difference of foreign culture with native one.

We see that a language is a means of transformation of cultural experience of a country and reflection of historical changes.

Social-cultural competence suggests that knowing the norms of speech behavior gives opportunity to reveal nationally marked lexics in the texts of different styles.

Formation of social-cultural competence deals with practical, developing and upbringing functions of a language. The upbringing function is the most essential as it helps to increase the feeling of patriotism and feeling of internationalism in a young learner. Learning English, we form comprehension of world culture in a person's mentality. We compare lingual phenomena, customs, traditions, art, and way of life of people.

<sup>3</sup> Nikitenko Z.N. Specifics of teaching english in primary school. – Moscow: Pedagogical university, 2010. – PP. 115.

<sup>4</sup> Bim I.L. The content of teaching English in basic course. // Foreign languages at school.- 1996. - № 2. - PP.11.

A.B. Minenko identifies social-cultural content of communicative competence with a) country study, б) language study, в) culture study, г) culturology<sup>5</sup>.

Social-cultural component in teaching a foreign language creates the basis of background knowledge about realias, tastes, customs, and traditions of the country of the learned language. All these elements are necessary in the speech act, verbal and non-verbal behavior and are included into the content of national culture. This component has a vast potential in the dialogue of cultures and introduction with national cultures in the development of humanity culture.

### **Conclusion:-**

The analysis of different explanations of the notion “social-cultural competence” lets conclude that this competence is built on ability to reveal similar and different points between various countries and civilizations, ability to represent native country and its culture.

In this way, the context of professional training of teachers includes ability to interconnect with representatives of foreign culture, ability to interconnect with pupils as they are also representatives of different cultures though they speak the same language.

The result of social-cultural education is formation of social-cultural competence which leads to successful intercultural communication. Introduction with the culture of foreign language country takes place by comparing and evaluating of earlier obtained knowledge and new knowledge in this aspect. Comparison reveals specifics and similarities between different cultures and brings to kind relations and respect to different countries, people and their traditions.

#### Abstract

**Introduction and background:** Diabetic foot disease is a major challenge for the healthcare system, with enormous economic consequences for people living with diabetes, their families, and society, affecting both quality of life as well as the quality of care. The burden of diabetes and its foot complications is increasing in Saudi Arabia. Prevention of these complications through foot care education should be explored. The objectives of this study is assessing the level of awareness of diabetic foot among patients with type 2 diabetes mellitus (T2DM) .In addition to finding the effectiveness of health education in improving foot care practice among diabetes patients in Al Ahsa .

**Methodology:** A cross-sectional study was conducted among patients with T2DM .The study involved 360 diabetic patients who attended diabetic clinics in Al Ahsa city , Saudi Arabia between January 2016 to November 2016. Structured questionnaire was used to assess their knowledge and practices regarding foot care. The questioners containing 9 parts involving age , sex , educational level , economic status , duration of DM , current complications , any surgical intervention for the foot and foot care practices . The data analyzed using SPSS 20 version software . Appropriate statistical tests used to analyzed the data .

**Result :** The study involved 360 patients with T2DM. Out of the total sample, 221 (61,4%) were male and 139 (38,6%) were female. There education levels were (24,4%) illiterate, (33,3%) elementary, (13,3%) secondary, (13,1%) higher, and (16,1%) academic. 70% of them had middle income. (16,7%) of the participants had previous foot injury due to diabetes. Less than half of the participants 147 (40,9) obtained an awareness about diabetic foot injury. 214 (59,6%) reported having basic knowledge about diabetic foot injuries were the rest did not have basic knowledge. Educational level ( $p= 0,001$ ) and household income ( $p= 0,001$ ) had a significant impact on knowledge about diabetic foot injuries.

**Conclusion:** The results from our study revealed that patients were unaware of diabetes foot risk factors and the importance of foot care practice to their health . Awareness programs should be implemented in all hospitals to help to overcome the paucity of knowledge among the

participants coupled with regular assessment of the patients foot at each visit to the diabetic clinic.

## **Introduction and Background:-**

Diabetes mellitus is common chronic disease, affecting nearly all the population in the developing and developed countries .Worldwide, more 120 million people affected by diabetes mellitus. It is expected that this number will reach to 250 million by the year 2050 (1). In Saudi Arabia, more than 25 percent of adult population over 30 years of age is suffering from diabetes mellitus and by the year 2030 this number will be more than double. (2) Diabetes mellitus complications especially diabetic foot problems are a major cause of morbidity and premature mortality. Annually around 3.2 million deaths in the world occurs as result of Diabetes mellitus complications. (3-4) 20 percent of diabetic hospitalizations are attributed to diabetic foot problems. The risk of lower limb amputation is found to be 10 to 15 times higher among diabetic patients compared with non-diabetics. (5)

Diabetic foot disease considered as a major challenge for the healthcare system, with enormous economic consequences for people living with diabetes, their families, and society, affecting both quality of life and quality of care. (2) The burden of diabetes and its foot complications is increasing in Saudi Arabia which demanding for effective prevention strategies.

The studies have revealed that there is marked correlation between the level of awareness of diabetic foot lesions and reduction of its occurrence rate. proper education of patients regarding the foot care and awareness of diabetic foot disease have shown to achieve a marked reduction in the limb amputation rate. it reduced the amputation rate by half in addition to minimizing the rate diabetic foot hospitalization and its burden. (5-8) since education of patient about diabetic foot care is considered as a mainstay of prevention for the diabetic foot complications by many Literatures. This study aimed to assess the level of awareness of diabetic foot among patients with type 2 diabetes mellitus (T2DM). In addition to finding the effectiveness of health education in improving foot care practice among diabetes patients in Alhasa city.

## **Methodology:-**

### **Study design and setting:-**

A cross-sectional study was conducted among diabetic patients. The study involved 360 diabetic patients who attended diabetic clinics in Alhasa city, Saudi Arabia between January 2016 to November 2016. The sample size calculated by using Rosoft website, with a margin of error of 5%, and confidence interval of 95%.

### **Data collection:-**

Structured questionnaire was used to assess their knowledge and practices regarding foot care. The questioners containing 9 parts, (a) personal data ( age, gender, educational background, socioeconomic status and Province ), (b) duration of DM, (c) current complications ( retinopathy, nephropathy, Diabetic neuropathy, stroke, coronary artery disease (CAD) and peripheral artery disease (PAD)), (d) prior foot or leg problem, (e) surgical intervention for the foot, (f) current treatment for DM ,(g) Hb A1c level , (h) Self-assessment of the Feet, (i) duration of foot washing,

(j) Walking barefoot, (k) foot care practices (using nail clipper, warming feet in the winter ,checking water temperature before feet washing , using herbal medication ,wearing comfortable footwear), (l) patients knowledge about diabetic foot disease and its risk factors ( the patient should indicate the source of information), (m) number of feet examination by doctor. After obtaining a written consent, the patients were asked to check the appropriate boxes for the questions. the questionnaire translated to Arabic to ensure full understanding of questions by the patients.

### **Statistical analysis:-**

The data analyzed using Statistical Package for Social Sciences version 22 Descriptive analysis was carried out to analyze the date. In addition to chi-square test and t-test which done tounderstand the variables associated with awareness of Diabetic foot problems. The data checked at 95% confidence interval (CI) and significant level of p-value of <0.05.

**Result:-**

A total of 360 diabetic patients were involved in the study. The mean age of the respondents was 57,2 years .out of 360 respondents, 221(61,4%) were male and 139 (38,6%) were female. \Around one third (33.3%) of the sample was having elementary education and one quarter (24,4 %) of the sample was illiterate. Only 16,1 % completed university. The majority (76,45%) of them were living in city and 23,6 % was living in village. regarding the household income around 70 % were having middle income. ( Table 1)

**Table 1:-** Demographic characteristics of study population .

<b>Categorical Variables</b>	<b>Frequency</b>	<b>Percentage</b>
<b>Gender</b>		
Male	221	61,4
female	139	38,6
<b>Education level</b>

OHA + Insulin	78	21,7
Insulin only	54	15,0
<b>Quantitative variables</b>		
	<b>Mean</b>	<b>Standard deviation</b>
Age	57,2	13,1
Duration of DM	11,6	8,3

The mean duration of diabetes was 11,6 years. More than half (57,8%) of responders were using oral hypoglycemic agent only, 21,7 % were using oral hypoglycemic agent in combination with insulin, 15,0 % were using insulin alone and only few (5,6 %)of them were following diabetic diet only. (table 1)

Regarding the diabetic complications, large number of patients were suffering from retinopathy 145(40,3%) and Peripheral Neuropathy 84(23,3%) . Other complications were reported with lower frequencies 52 (14,4%) Diabetic Peripheral Artery Disease of feet , 46 (12,8%) Nephropathy , 29 (8,1%)Brain stroke , 26 (7,2%) Coronary artery disease .141(39,2 %) were not suffering from any complications . (table 2)

The greatest number of respondents 300 (83,3%) had no any previous foot injury due to diabetes were 60 (16,7%) only had previews foot injury due to diabetes. Around half of the participants who suffered from diabetic feet injury undergo feet surgery . ( table 2 )

Regarding foot care, some practices were taken into consideration such as using nail clipper, monitoring water temperatures, drying the feet after each exposure to water, warming the feet during winter, using herbs to treat the feet, wearing cotton socks, wearing comfortable closed shoes , self-examination of the foot , duration of foot washing with water and walking barefooted . Of the total sample , Almost all the respondents 352 (98,1%) used nail clippers to cut their nails, 302 (48,1%) monitored water temperature before washing foot or shower ,167 (46,5%) dried their feet after water exposure , 314 (87,5%) kept their feet warm during winter, 258 (71,9%) of the respondents wore comfortable cotton socks , 242 (67,4%) wore closed comfortable shoes and 338 (94,2%) did not use herbs to treat their feet . Regarding self-examination of the foot, 81 (22,5%) of the participants perform it regularly, were 196 (54,4%) perform it in case of pain and 83 (23,1%) don not perform self-examination at all. (table 3).Considering duration of foot washing with water, three quarters of the participants 275 (67,4%) washed for less than 5 minutes. 67 (18,6%) of the participants wash from 5 to 10 minutes. The least number of participants 18 (5%) wash for longer than 10 minutes. The majority of the respondents 253 (70,3%) do not walk barefooted, were 106 (29,4%) of the do walk barefooted .(table 3)

Around one third of the respondents 125 (34,7%) have basic knowledge about the risk factors of diabetic foot injury, while the majority 235 (65,3%) of them were lacking of these basic knowledge. The knowledge of the patient who reported having basic knowledge about the risk factors of diabetic foot injury were furtherly assessed by asking them to select one or more of the following if they think that it could be a risk factor ; duration of foot washing, walking bare foot, and wearing inappropriate shoes Out of the 125 (34,7%), 79(63,2) of them thought that the duration of foot washing increases the risk of diabetic foot injury, as 62 (49,6) of them thought that walking bare foot do. While only 39 (31,2) of them thought that wearing inappropriate shoes is a risk factor. (table 5)

**Table 5:-** Assessment of the participants' knowledge about the risk factors of diabetic foot injuries

**Discussion:-**

Our current finding revealed that over half of the participants had a basic knowledge about diabetic foot injury. The majority of these knowledgeable participants were having high household income in addition to having an academic degrees. only minority of them were illiterate. the educational level (p=0,001) and household income (p=0,001) of the participants had shown an impact on patients' knowledge about diabetic foot injury .The results of our study exposed that the most educated patients are the most knowledgeable about diabetic foot injuries, which come in consistence with the results of other studies. [3,6]

The majority (57,8%) of responders were on oral hypoglycemic drugs alone or in combination with insulin (21,7%). A smaller number (15,0%) were on insulin therapy alone. only little number of participants (5,6 %) was on diabetic

diet. Among these participants, the mean Hb A1C level was (7,8) which indicates that their serum glucose level is not well controlled. This could be a result of medication adherence failure due to lacking of knowledge about the importance of taking medication on regular pattern .

Foot care practices did not show any correlation with patients' knowledge about diabetic foot injury. The patients performed these practices despite their poor background knowledge.. A study have found similar result and attributed this result to basis of Islamic rituals .patients were performing some of these practice religiously without knowing their benefits to their own health  
(6)

Worldwide, there are more than 1 million lower extremities amputation (LEA) surgery per year, at the rate of one every 30 seconds (9) up to 50% of the diabetic patients require another lower LEA within 3–5 years from the first LEA . Furthermore, the 5-year mortality rate after LEA on diabetic patients is ~50% (10). despite these facts , only 63 (17,5%) of patients received foot examination at each visit to the doctors and similar percents 61 (17%) of patients had not received any examination even if they had a complaint. additionally , our study reveled that there is a paucity of knowledge among participants with previous foot injuries and surgeries due to diabetes. Previous foot injury ( $p=0,131$ ) and previous feet surgery ( $p=0,560$ ) due to diabetes were not significantly associated with better knowledge or foot care practices .This result is similar to the result of study done in India. (11) .Taking in consideration that up to up to 85% of the LEA are completely preventable by simple foot care practices , (12) diabetic patients are in need for effective awareness strategies taken by medical facilities .

More than half of the respondents 214 (59,6%) reported having knowledge about diabetic foot injuries .But when they further asked about the risk factors diabetic foot injuries ,Most of them (64,9%) were found to be lacking of knowledge about the risk factors. The rest of them were found to have poor knowledge about the risk factors.

Duration of having diabetic mellitus was believed to be as a risk factor by (63,2%), were walking bare foot (49,6%) and wearing inappropriate shoes (31,2 ) was the lest to be known as risk factors. Which approves the result of a study carried out in Africa. (13) 212 (59,1%) of the respondents reported obtaining proper awareness about diabetic foot injuries . The majority of them obtained their awareness from doctors 83 (56,5%) and relatives 32 (21,8%) , while the least number of them obtained it either from social media 27 (18,4%) or health education campaign 19 (12,9%) .on the other hand , 147 (40,9%) of the participants did not obtain any awareness . Indicated that the Saudi population need to be aware on the problem size and its impact on the quality of life . There should be awareness campaigns in the hospitals , public area and on social media coupled with educational programmers at the schools and universities ,to highlight the risk factors of diabetic foot injuries and put more emphasis on the urgent need for serious preventive strategies. Furthermore , The provided information through the educational programs should correspond with educational background of patients without affecting the amount or the quality of the provided information .

### **Conclusion:-**

The results from our study revealed that patients are unaware of diabetes foot risk factors and the importance of foot care practices to their health . Awareness programs should be implemented in all hospitals to help to overcome the paucity of knowledge among the participants coupled with regular assessment of the patients foot at each visit to lower the rate of diabetic foot injuries . in addition to enhancing the role of educational campaigns and social media in improving the level of awareness among Saudi population . furthermore , serious preventive steps should be taking by the Saudi population and ministry of health to lower the risk of diabetic foot injuries as well as the complication of T2DM.

### **Acknowledgment:-**

The authors express their sincere thanks to Syed Sibt-ul-Hasnain Iheb Bougmiza, Associate Professor of Preventive & Community Medicine for his contribution in the statistical analysis of data . We are also thankful to the diabetic patients for their cooperation and participation in this survey .

#### Key words:-

Fournier,s gangrene(FG), Candida albicans, diabetes mellitus .

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Fournier's gangrene characterized by fulminant necrotizing fasciitis of the perineal, genital or perianal regions, is generally caused by aerobic and anaerobic bacteria. Although it is thought to be an idiopathic process, Fournier's gangrene has been shown to have a predilection for patients with diabetes mellitus is reported to be present in 20–70% and chronic alcoholism in 25–50% patients and immunocompromised patients%. [1] The focus of infection is usually located in the genitourinary tract(20-40%), lower gastrointestinal tract(30-50%) or skin(20%). The development and progression of the gangrene is often fulminating and can rapidly lead to multiple organ failures and death(7.5-50%). Characteristically in Fournier's gangrene exists synergism between theoretically low aggressive bacteria alone. For example, one microorganism might produce the enzymes necessary to cause coagulation of the nutrient vessels. Thrombosis of these nutrient vessels reduces local blood supply. Thus, tissue oxygen tension falls. The resultant tissue hypoxia allows growth of facultative anaerobes and microaerophilic organisms. These latter microorganisms, in turn, may produce enzymes (e.g., lecithinase, collagenase), which lead to digestion of fascial barriers, thus fueling the rapid extension of the infection [2,3]. The most commonly isolated aerobic microorganism are *Escherichia coli*, *Klebsiella pneumonia*, *Staphylococcus aureus*, *Proteus* spp, *Corynebacterium* spp, *Enterococcus* spp. The most commonly isolated anaerobic microorganism is *Bacteriodes fragilis*, *Clostridium*, *Fusobacterium*. [4,5]. Actually both aerobes and anaerobes are present in the tissues but anaerobes are less frequent isolated because these samples are more difficult to preserve. In some series, a mean of four different organisms is cultured from each patient [6]. Rare reports of other organisms being cultures include *Candida albicans* and *Lactobacillus gasseri* . [7.8]

#### Clinical Case Report:-

We report a case of Fournier's gangrene caused by *Candida albicans* and *Klebsiella pneumoniae*. A 41-year-old man with diabetes mellitus was admitted to the First University Hospital at Urology Department with following

**Corresponding Author:- Didbaridze T.**

**Address:-** Microbiologist MD. PhD. TSMU The First University Clinic (Tbilisi, Georgia).

complains: common weakness, body temperature 39°C, pain in the scrotal region. A 10 days before he was hospitalized, a patient started suffer from 2 cm perineum erythema and pain in the perianal region. On examination, he was conscious. There was no pallor, icterus, and lymphadenopathy. His pulse was 105 /min, regular, and good volume. His blood pressure was 150/90 mm Hg. Systemic examination revealed no abnormality. Local examination of the scrotum revealed that scrotum was enlarged, edematous, and tender along with palpable crepitations. There was 8 cm necrotic skin lesions over the scrotum and foul-smelling purulent discharge. A provisional diagnosis of FG was made. Fournier's gangrene severity index (FGSI) was 8. A score of less than 9 is associated with 78% probability of survival. (Picture 1) He was prepared for emergency surgical debridement. Blood haemogram revealed hemoglobin 15.5g/dl, white cell count— $12.0 \times 10^3/\mu\text{l}$ . Biochemical parameters: serum creatinine- $104\mu\text{m/l}$ , random blood sugar- 500mg%. Operative techniques under general anesthesia included: revision of scrotum and testicles with opening tunica vaginalis, drainage, resection of scrotum, necrectomy. Pus was taken for a bacteriological research under compliance with the appropriate protocol and sent for culture and sensitivity test. Empirical treatment was started with Piperacilline and Tazobactam and metronidazole. The bacteriological research included: isolation of a pure culture, Gram staining, use of the rapid identification systems (api20E, api20Caux, biomérieux) and Antimicrobial Susceptibility Testing (AST) determination through Kirby-Bauer method by using of standard discs (EUCAST guidelines). Pus was cultured on the enrichment and differential-diagnostic medium. After 18-24 hours of aerobic and anaerobic (Gen-Bag biomérieux) incubation at 37 °C, appeared growth of mucoid colony on the bloody agar (TSA 5% with sheep blood) and on Endo agar (for Enterobacteriaceae family) which were stained by use of Gram procedure and bacteria were identified by the amplification profile index special panel (api20E), identification of the bacteria was determined by Apiweb. The isoaited was a Gram-negative, nonmotile, encapsulated, lactose-fermenting, facultative anaerobic, rod-shaped bacterium *Klebsiella pneumoniae*  $10^5/\text{ml}$ . Fungi *Candida albicans*  $10^8/\text{ml}$  was isolated on Sabouraud dextrose agar. Since pus culture revealed *C. albicans*, fluconazole was added to the therapy. Antibiotic therapy regimen included Piperacillin and Tazobactam, metronidazole and fluconazol. He responded to the treatment very well. Regular wet dressing was done along with topical application of povidone iodine. (Picture 2) He was discharged on 6nd postoperative day with pentose drain to prevent the build up of fluid, which was removed after three days from discharg. After 2 weeks the wound was completely healed, scrotum return in the normal size and shape, painless (Picture 3).

### Conclusion:-

In our opinion this case is interesting because of *Candida albicans* caused Fournier's gangrene is very rare; This case has been reported to emphasize that yeasts should be considered as pathogenic agents in diabetic patients with gangrene. Fungal infections should be considered as rare causes of necrotizing fasciitis and antifungal treatment considered in at-risk immunodeficient individuals. FG with diabetes mellitus always poses a greater challenge in reducing morbidity and mortality. It is recommended to adopt a multidisciplinary approach in treating a case of FG to achieve a low morbidity and mortality, especially in presence of the comorbidity like diabetes and multi organ failure.

### LANGUAGES IN CONTACT: THE INFLUENCE OF ARABIC ON MODERN ISRAELI HEBREW SLANG.

#### Abstract

Ongoing contact between the Arabic and Hebrew languages in the Land of Israel has engendered interesting linguistic phenomena in diverse fields. Prominent among these is the penetration of words of Arabic origin into Modern Hebrew slang. Lexical borrowing and penetration from one language to another have existed since ancient times. However, the complex reality in Israel, particularly the phenomenon of bilingualism, has contributed to the enrichment of the Hebrew vocabulary, on all levels, with words drawn from Arabic. The use of slang words of Arabic origin is not the exclusive preserve of any specific population, but can be found among all Hebrew speakers, in both the written and spoken languages, in the media and on social networks. Most slang words of Arabic origin undergo changes in the semantic sphere, and some are employed in a metaphoric sense. These words are declined according to Hebrew rules, but their declension for gender, number, the construct case, and definiteness is usually irregular. The use of slang words meets linguistic functions required by speakers: they contribute to broadening forms of word formation and allow the derivation of new values, the borrowing of expressions, extensions of meaning, and so forth. Regular morphology, alien sounds, borrowed consonants, an unusual social structure, and arbitrary patterns of definiteness are just some of the more prominent characteristics of slang words of Arabic origin in Modern Hebrew. Slang changes according to fashion, is influenced by its surroundings, and can be found in diverse forms in the language of politicians and statespeople, correspondents and interviewees, and all members of the language community.

#### Introduction:-

Discussion of Hebrew slang, specifically slang of Arabic origin, has been significantly enriched since Israel's establishment by the growing use of slang among Jews of Arabic origin. Linguistic scholars tend to define the concept of "slang" as a collection of strange words – vulgar language that creeps into standard language, impairing the articulacy of the language and its clarity of expression (Yannai, 1990). Conversely, others argue that slang is the birthplace of new words, changing constantly, and constituting evidence of a natural language or a type of language current among people who are young in age or in spirit. The use of slang constitutes a deliberate deviation from institutionalized and standard language, and accordingly represents a voluntary and deliberate register (Nir, 1999).

**Corresponding Author:- Dr. Thaier Kizel.**

Address:- Head of the Department of Hebrew Language and Hebrew Literature, Arab Academic College of Education, Haifa.

Slang can be seen as a sociolinguistic mechanism that enables speakers to depart from social formality and make utterances that are not otherwise allowed by social norms (Rosenthal, 2008). Sapan defines slang as words and expressions on the margins of the spoken language that are considered improper and unworthy of inclusion in decent or formal speech (Sapan, 1974). Nir notes that slang is not characterized solely by the use of substandard forms; indeed, it is sometimes accompanied by a certain sense of intellectual superiority, not only in lexical terms but particularly in various aspects of grammar (Nir, 2003). Muchnik (2001) defines slang explicitly as substandard language used in unofficial situations by diverse groups of speakers, including young people, students, soldiers, professionals, the elderly, and so forth. However, she adds that recently slang has noticeably expanded into the remaining sectors of the population.

Hebrew slang has enjoyed particular attention in the Israeli consciousness thanks to the vigorous work of Dan Ben-Amotz and Netiva Ben-Yehuda, who undertook a historical enterprise that enjoyed surprising success (Ben-Amotz & Ben-Yehuda, 1972). This process is not unusual in the history of languages and is a natural phenomenon. Today, cub reporters make extensive use of common slang, a practice that has become a norm of journalistic writing and is also accepted by younger editors (Rosenblum, 1992).

Hebrew-speaking Israeli society uses slang expressions extensively; this is illustrated by the growing use of slang by many politicians for social purposes. Over the past decade, slang has penetrated the language of media, advertising, and even literature (Rosenthal, 2008). No external body can determine which slang word will be adopted and which will be rejected. The speakers are exclusively responsible for determining the fate of migrant and new words. Very few slang words become part of the standard language, but many of them show resilience in their slang function—words drawn from Arabic particularly so.

Initially, slang words were collated in separate dictionaries, such as Ben-Amotz & Ben-Yehuda (1972); Ahiasaf, Radar et al. (1993), Rubik & Rosenthal (2005), and EetaYisraeli (2005). Later, slang words were admitted to the Even Shoshan dictionary (2004 edition), which included numerous slang terms. Some of these slang dictionaries preserve forgotten words, many of which are no longer in use, while at the same time new words have penetrated the language from every possible direction and field. This highlights one of the features of spoken Hebrew as a language that often reflects the social changes experienced by the Jewish people, particularly in the Land of Israel. Thus Hebrew dictionaries also reflect sociolinguistic changes.

### Israeli slang:

One of the key questions raised by study of Israeli slang is why words such as telephone, fax, and television, that entered Hebrew from English, have been accepted in Hebrew as standard words in the language, whereas words that entered from Arabic, such as *deh̄ilak*, *saḥ̄bi*, and *maskhara*, were repelled to the margins of the language (Muchnik, 2004; Haramati, 2000). Israeli Hebrew slang has been influenced mainly by English, Yiddish, and Arabic. Initially, Yiddish was the most influential language, but today it has been surpassed by Arabic, due to the protracted contact between the two languages in the Israeli domain.<sup>1</sup> Since the 1990s, there has been a noticeable increase in slang of Arabic origin, which is present in impressive proportions in the group of emotional words, greetings, exclamations, and curses (Dana, 2008).<sup>2</sup> The encounter between the Israelis and the Arabs who lived in the country had a profound influence on slang, leading to the adoption of words such as *deh̄ilak*, *inshallah*, *ṣaḥ̄tein*, *mabṣuṭ*, *aḥ̄la*, *ahbal*, *majnun*, *fadiḥa*, *kasah̄*, and *freḥa*. A significant portion of the Hebrew slang vocabulary has its origins in colloquial Arabic (Netzer, 2007; Marai, 2008).<sup>3</sup> It is difficult to find a Hebrew speaker who does not use greetings of Arabic

<sup>1</sup> Sapan's study (1963) found borrowings at a level of 40 percent from Yiddish, 39 percent from Arabic, and very small percentages from European languages such as English, Russian, and French. An updated study might yield different results due to the significant changes in Israeli society over recent decades. Rosenthal (2005) claims that 35 percent of the slang vocabulary can be attributed to Arabic, 31 percent to English, and only 21 percent to Yiddish. It would seem that the dwindling of the generation connected to Yiddish has led to a reduction in the use of slang from Yiddish in favor of the contact with the Arab population.

<sup>2</sup> Dana lists diverse curses that have passed from Arabic to Hebrew, with phonological changes and even metathesis.

<sup>3</sup> Netzer (2007) categorizes slang according to its sources, discussing the Arabic source. Marai provides an impressive review of the forms of integration of Arabic in Israeli slang, arguing that to date the Arabic source has been mentioned only in footnotes that cannot paint the full picture.

origin, despite the fact that expressions of politeness constitute a social value in every civilization, and although every culture has a different definition as to what is considered polite. Hebrew has also been influenced by slang of English origin; in particular, many English words were absorbed during the British Mandate period. Words and phrases such as “fifty-fifty” and “trem” (i.e. “tramp,” meaning “hitchhike”) remain from this period. During the 1970s, Hebrew was influenced by words borrowed from English through the field of rock and pop music, while in the 1990s new technology served as the vehicle of penetration (Fischerman, 2004; Koren, 2010-2011). Another source that has enriched slang vocabulary in Israeli Hebrew is military slang. The military creates ideal opportunities for the emergence of slang, since it constitutes a closed framework of young people who undergo an intensive and challenging experience—one that is shared by most speakers of Modern Hebrew. Some of the words, expressions, acronyms, and verbs created from words that emerged in the military setting have since become part of general Israeli slang—these include *leshapitzer* (“to improve, touch up”) and *jobnik* (a soldier or worker who performs an undemanding and safe function) (Almog, 1993; Eldar, 1994; Granot, 1993; Sapan, 1966). Since the 1980s, there has been a sharp fall in the influence of military slang and a rise in subtle and elusive slang drawn from the language of young people. Another factor that has contributed to slang vocabulary is the technological revolution and the emergence of social networks. Most of the words from this field are taken from English, and this source functions as a type of media “highway” (Rosenthal, 2008, 2013; Marai, 2013).

### Characteristics of slang use:-

Studies show that the use of slang is usually spontaneous and is often shaped by the specific situation in which the conversation takes place or by its purpose. Motives such as amusement, entertainment, or adapting the discourse to the addressee increase the use of slang. The following are some key characteristics:

- Linguistic and cultural reasons and political or geopolitical changes (Marai, 2015).<sup>4</sup> Slang plays an important role in shaping the humor of different societies and cultures. The use of a slang term often has an amusing effect.
- In the context of Jewish settlement in the Land of Israel, slang played a unique function against the background of the use of other languages brought by Jewish immigrants from Arab and European countries. Slang helped bypass the prevailing position at the time that foreign elements ought not be included in the Hebrew language (Rosenthal, 2007). Despite this position, words from Arabic, Russian, Yiddish, and English penetrated into Hebrew during different periods, under the influence of extralinguistic factors (Muchnik, 1994; Schwartzwald, 1998).<sup>5</sup>
- Slang provides words and expressions that are absent in the intermediate and elevated language. In some cases, it even provides speakers with alternatives for words and expressions that exist in the standard language but are not used, for various reasons.
- Slang is the main tool used to facilitate discussion of taboo topics such as racism and violence, as illustrated in the slang words *zapta* and *box* (both of which mean “a blow”) (Rosenthal, 2007; Netzer, 2007). Slang can be regarded as a sociolinguistic mechanism that enables speakers to break norms without threatening social values (Ben Yehuda, 1984). The younger generation is often seen as the main conduit through which slang creeps into spoken Hebrew, though in recent years a tendency to use slang has also become increasingly apparent among media workers, politicians, and other social strata.
- Speakers feel a need to create a stronger impact on the listener than is possible using the standard and routine word. This phenomenon is reflected in the replacement of the usual expression with a more forceful or vigorous one. Examples of such pairs include *tov* (“good”) and *kabir* (“wicked”); *barur* (“obvious”) and *ashkara* (“totally”); or *meluchlach* (“dirty”) and *ma’afan* (“grotty.”) Others see this phenomenon as an example of the principle of economy in speech: the natural tendency to alleviate the physical and psychological effort involved in speech encourages the emergence of truncated forms or acronyms (Sapan, 1963).

<sup>4</sup> Marai explains that the linguistic reasons are that Hebrew and Arabic are sister Semitic languages, while the cultural reasons are that Arabic served as a mother tongue and traditional language for many members of the Mizrahi Jewish communities. Political changes refer to the nature of the contact with the Arab population in Israel.

<sup>5</sup> Muchnik notes that Ben Yehuda showed a tolerant attitude and positive discrimination in favor of the adoption of words of Arabic origin, in contrast to the European languages. She identifies two key periods in terms of Arabic influence: the pre-state period, which was dominated by wars with the Arabs, and the period following independence, which was marked by coexistence between Arabs and Jews who arrived from the Arab countries.

- The absence of words for everyday use; the emergence of closed societies in Israel; rebellion and protest and accepted rules of courtesy and conduct, ideology and language; and a longing for rough and down-to-earth speech are all key reasons for the use of slang (Shalev, 1962).
- Ostrovsky (2006) remarks that speech characterized by the use of slang expressions reflects the Israeli ethos. Accordingly, the characteristic violence of this society is manifested in slang, as for example in the use of the word *kasakh* (“kick ass.”) Similarly, the use of the term *khafif* (“half-ass”) reflects a culture of superficiality, an attempt to impress others, and hedonism, and even implies a sense of dissatisfaction with a given situation.
- Sometimes speakers deliberately aim to be incomprehensible to an alien or hostile environment. An example of this is the jargon used by thieves, prisoners, and criminals, and this explains the use of slang among these groups. The use of slang may also be perceived as an act of social identification by speakers from higher social circles with other parts of the people. It is hardly surprising that many speakers view slang as a sub-language that characterized lower-class sections of the population – but one only needs to watch television to realize that this is a mistaken view.

### Arab vocabulary in Israeli slang:-

Slang words of Arabic origin that have penetrated Modern Hebrew are today used by speakers from all sections of society. They have penetrated the language through media such as television, radio, newspapers, and the internet. These words are used by speakers from diverse backgrounds and classes and are no longer the exclusive preserve of any particular section of the population. The following list presents the main slang words of Arabic origin used by Jewish speakers, divided according to word classes:<sup>6</sup>

D.1. Slang words from Arabic used in Hebrew as nouns: *intifada* (literally “uprising,”<sup>7</sup> *bassa* (“too bad,”) *basta* (“market stall,”) *jura* (“drain,” “big mouth”), *jama’a* (“gang,”) *dakhkot* (“laughs,” “pranks,”) *dawin* (“an attempt to impress,”) *zubur* (“hazing,”) *khalita* (“blanching”) *khamisa* (“charm against the evil eye,”) *khafila* (“rave,”) *kharta* (“crap”) *khirba* (“dump,” “hovel,”) *keyf* (“fun,”) *mukhtar* (“big boss,”) *musayra* (“politeness,”) *mangal* (“barbeque,”) *maskhara* (“wheeling-and-dealing,”) *nagla* (“round,”) *sababa* (“cool,”) *sulkha* (“make-up,” “ending feud,”) *fadikha* (“bad,” “shame,”) *fanan* (“laid back,”) *fashla* (“cock-up,” “error,”) *shakhta* (“toke” [on a cigarette or joint].)

D.2. Slang words from Arabic used in Hebrew as adjectives: *abadai* (“tough [guy],”) *agbar* (“great [guy],”) *ahbal* (“bird-brain,”) *akbar* (“greatest,”) *asli* (“100%,”) *buma* (“owl”) *baladi* (“original,” “country-style,”) *darwish* (“sumple”) *wakhad* (“helluva,”) *zabala* (“crap,”) *zift* (“garbage,”) *khabub* (“mate,”) *khara* (“shitty,”) *khatyar* (“old,” “over-the-hill,”) *mabsut* (“happy,”) *majnun* (“crazy,”) *mal’un* (“cursed,” “damn,”) *mastul* (“wasted,” “high,”) *ma’afen* (“grotty,”) *nakhs* (“bad,” “luckless,”) *sakhbaki* (“[over]-friendly,”) *ars* (“pimp,” “hood,”) *frekha* (“bimbo,”) *kakhba* (“whore,”) *sharmuta* (“slut,”) *ta’aban* (“beat,” “tired,”) *khafif* (“half-assed,”) *rasmi* (“above-board.”)

D.3. Slang words from Arabic used in Hebrew as verbs:<sup>8</sup> *uskut* (“shut it,”) *hitkharfen* (“went crazy,”) *histakhbek* (“was a buddy with,”) *shuf/shufuni* (“look [at me,]”) *tezamber* (“you screw over,”) *tislam* (“way to go,”) *tfadal* (“go ahead,”) *kise’akh* (“beat the crap out of,”) *khifeff* (“did something in a half-ass way.”)

D.4. Slang words from Arabic used in Hebrew and not included in the other categories. These words include exclamations, curses, greetings, statements of amazement, requests, and other expressions: *abu Ali* (“strongman,”) *akhulmanyuk* (“sonofabitch” [in positive sense,]) *in’al* (“curse,” [often accompanied by “your father,” “your God,” etc.,]) *inshallah* (“God willing,”) *eshhada* (“whassat,”) *ashkara* (“totally,”) *bekhyet* (“for the life/sake of” [often accompanied by “your God,” “your father,” etc.,]) *dugri* (“on the real,”) *dekhil* (“for the sake of” [often accompanied by “your God,” etc.,]) *dirbalak* (“mind out,”) *walla* (“really,”) *khalas* (“enough,” “cut the crap,”) *ya Allah* (“Oh my God!”) *yawilli* (“my lord,”) *yazalameh* (“you guy,”) *ya haram* (“too bad,”) *ya salaam* (“no way,”) *yaieini* (“my dear,”) *ya-balash* (“for nothing,”) *ya-khabibi* (“my man,”) *yarabak* (“[for the sake of] your God,”) *ya’anu* (“like,” “kind of,”)

<sup>6</sup> The items in the following lists are transliterated according to the usual pronunciation by Jewish speakers of Modern Hebrew (see also section E below).

<sup>7</sup> In the figurative sense of the term, referring to mess or disorder.

<sup>8</sup> Verbs derived from nouns will be presented separately below. This paragraph lists borrowed verbs.

*kus* (“pussy,” often accompanied by “your mother’s,” “your sister’s,” etc.) *mabruk* (“way to go,”) *sakhtein* (“good for you,”) *ma’alesh* (“no sweat,”) *min ayuni* (“I really mean it,”) *min Allah* (“from God,” “fate,”) *salamtak* (“thanks,”) *ahalanwasahalan* (“welcome,”) *akhushilling* (“wicked,” “amazing,”) *eyzehbatikh* (“what a bummer,”) *ilifaatmaat* (“water under the bridge,”) *al khamdulillah* (“thank God,”) *Allahuakbar* (“God is great,”) *Allah yustur* (“God forbid,”) *anaaref* (“what do I know,”) *hada min Allah* (“it’s from God,”) *zubi* (“my dick,” “no way,”) *yomasal – yom basal* (“one day up and the next day down,”) *yomnakhs* (“a shitty day,”) *ala kefak* (“fun,” “cool,”) *ala rasi* (“on my head” = “I promise,”) *shufuniyanas* (“look at me, guys,”) *tamam* (“okay,”) *akhla* (“great,”) *ala fadi* (“for no reason,” “pointless,”) *aleyhum* (“picking on someone.”)

### Characteristics of the slang words in Hebrew discourse:-

**1. Words that undergo phonological and phonetic changes:** Some slang words of Arabic origin underwent phonetic or phonological changes following their absorption in Hebrew discourse in order to adapt to Hebrew pronunciation. By way of example:

- ض (d) > ד (d): The Hebrew plural form *dakhkot* (“laughs,” “pranks”) is taken from the Arabic singular form *ḍahka*, which begins with the Arabic consonant ض (d). This phoneme is absent in Hebrew, and accordingly it was replaced by d. The same applies to قیضای (*q*) *abaday*, which in Hebrew becomes *abaday*.
- ظ (z) > ד (d): The Hebrew *fadikha* (“bad,” “shame”) reflects the Arabic فظیحة *faziḥa*. The same change is seen in تفضال *tefaḍal* > *tfadal* (“go ahead”), علفاظی *ala fazi* > *ala fadi* (“pointless”), and انتفاضا > *intifada* (fig. “mess.”)
- ق (q) > گ (g): The Arabic *naqla* was absorbed in Hebrew in the form *nagla* (“round,”) reflecting the pronunciation of ق as g in some Arabic dialects. This change is not universal. *Kahba* (whore), for example, uses g, which is closer to the original Arabic q.
- ص (s) > א (s): عرص *arṣin* Arabic could have been absorbed as *artz*, but in fact appears as *ars* (“pimp,” “hood.”) Similarly: *ašli* > *asli*, *şulḥa* > *sulkha*, *şababa* > *sababa*, and *ba’aşa* > *bassa*.
- غ (gh) > ג (g): دغری *dughri* > *dugri* (“on the real.”)
- خ (kh) > כ (k) (usually pronounced kh): *maskhara* (“wheeling-and-dealing,”) *kharta* (“baloney,”) *khara* (“shit,”) *frekhat* (“bimbo,”) *khetyar* (“old,”) *manfukh* (“show-off,”) *khafif* (“half-ass,”) *hitkharfen* (“go ape-shit.”)
- ذ (dh) > ד (d): *eshhadha* > *eshhada* (“whassat.”)

### Use of borrowed consonants or sounds that do not exist in Hebrew and that preserve the Arabic pronunciation:-

Words such as *jama’a* (“gang,”) *jura* (“drain,”) *majnun* (“crazy”) and the relate *janana* (“crazed state,”) and *ajbar* (“tough guy”) all maintain the “j” sound from Arabic, which does not exist in standard Hebrew. This is one of the most notable phenomena of slang words.

### Absence of grammatical declension:-

Most functional words, greetings, and exclamations of Arabic origin used in Hebrew do not have a plural form or other declensions. For example, words such as *aleyhum*, *sakhtein*, *rasmi*, *dugri*, *wallah*, *khalas*, *mabruk*, and others do not have a plural form and cannot take the possessive suffixes. Thus the absorption of these words in Hebrew is evidently incomplete and, to an extent, arbitrary. Many nouns do not decline for possession as do “regular” Hebrew nouns. For example, the Arabic *fashla* (“cock-up,” “error”) can be declined for possession of any person, number, and gender by use of the usual enclitic pronouns. Arabic speakers can say *fashli* (“my error,”) *fashleh* (“his error,”) and so forth. In Hebrew, it is not possible to use the analogous forms: instead of \**fashlato* (“his error,”) for example, Hebrew speakers use the construction with the separate possessive pronouns: *fashlasheli* (“my error.”) Similarly, \**fashlshelo* is used for “his error.” The same applies to nouns such as *fadikha*, *khafila*, *sulkha*, *basta*, and *khashish* (grass).

### Non-use of the definite article:-

Slang words used in Hebrew as adjectives do not take the definite article. The word *akhlais* used as an adjective in Hebrew, for example in phrases such as *akhlaokhel* (“great food.”) Regular Hebrew adjectives can take the definite article, but *akhla* does not do so. The same applies to *akbar*, *agbar*, and other slang words of Arabic origin. These words express quantity or degree and would be expect to serve as functional words, but in fact their quality is

<sup>9</sup> The three Arabic consonants ص, ض, and ظ amalgamated in Hebrew in the consonant ז. Here, however, the “d” sound, which is phonetically more similar to the consonant ض, has instead been used.

adjective. When the adjective appears before the noun, as in *akhlaokhel*, the definite article is not used, while when it follows the noun, as in Hebrew, the article may be used.

#### Use of the dominant gender form:-

Slang words used as adjectives usually appear in the dominant gender form, without agreement for the less common gender. For example, words such as *asli*, *baladi*, *majnun*, *ta'aban*, *mastul*, *mabsut*, and others usually appear in the masculine, although it is also possible to use the feminine forms – *aslit*, *baladit*, *majnuna*, and so forth.

#### Creating new words using Hebrew lexical patterns:-

abstract nouns are derived from adjectives borrowed from Arabic using the standard Hebrew suffix *-iyut*. For example, *dugriyut* (“straight-upness,” “honesty”) is formed from *dugri*, and similar forms include *khafifnikiyut*, *asliyut*, *arsiyut*, *baladiyut*, and so forth. Similarly, adjectives are derived from nouns by adding the Hebrew suffix *-i*, creating such words as *keyfi*, *arabushi* (“Arab” as an adjective,) *frekhit*, *khafifniki*, and *ahbali*. New nouns can be created using the suffix *-iya*, such as *khumusiya* (“humus joint”) or *sakhbakiya* (from *sakhbak*, meaning “relaxed and friendly atmosphere.”)

#### Preference for the singular:-

While the original Arab words are used freely in singular or plural, the tendency in Hebrew is to prefer the singular. *Maskharais* much more common than *maskharot*; Hebrew speakers refer to a *sulkhabut* rarely to *sulkhot*; and the same is true of such slang nouns as *zubur*, *sababa*, *ma'aruf* (“favor,”) *keyf*, *khashish*, *jama'a*, *bassa*, and others.

#### Changes in semantic field:-

Some slang words show changes in their semantic field and meaning by comparison to the Arabic original:

- The word *akhlain* Arabic means “most beautiful” or “sweetest.” In Hebrew, it is used to mean “best” or “excellent” in all instances.
- In Arabic, *shahtameans* “line,” “small stripe,” and also “itch.” In Hebrew, a process of lexical reduction has led to the use of *shakhtato* refer solely to a “toke” on a cigarette; today, the word is used mainly in the context of the use of soft drugs.
- The Arabic word *dawawinis* used to refer to a collection of art works, and by extension came to refer to frivolous things. The Hebrew form *dawinim* refers to vacuous behavior intended to attract attention.
- In Arabic, *jama'a* refers to any group of people – friends, family, and so forth. In Hebrew, the term is used mainly in a delinquent context. The process here is one of lexical reduction and metaphorical adaptation.
- *Jura* in Arabic refers to a pothole in a road, a ditch, or a pool for collecting sewage. In Hebrew, it is often used to refer to a “big mouth” – someone who talks nonsense or is excessively fond of cursing.
- In Arabic, the word *shakbaki*, from *shakib* (“friend,”) means a “friend” in a positive sense. In Hebrew, *sakhbaki* usually refers to someone who acts informally when the occasion demands formality. Thus the sense has been inverted from the positive to the negative.
- The Arabic *freha* comes from *farah*, meaning a chick or gosling. The Hebrew *frekha* has come to be used to refer to a young woman who behaves in a “common” or undignified way – a metaphorical extension.

#### Preservation of the Arabic meaning:-

It emerges that many words of Arabic origin are used in Hebrew slang in an identical sense to the Arabic. These words have penetrated Hebrew without difficulty and are widely used without any significant change in their form or meaning. This pattern is particularly common in the case of expressions, proverbs, explanations, and supplications. The words involved convey diverse connotations and accordingly are used extensively. Examples include *ahlanwasahlan*, *nakhs*, various curses, *mastul*, *mabsut*, *ashkara*, *yomasalwayom basal*, *alayhum*, *shufuniyanas*, *ala fadi*, *majnun*, *inshallah*, *anaaref*, *sulkha*, and many others.

#### Changes in word class:-

Some of the slang words are used in Hebrew in a different word class to the Arabic original. This is possible since, in many cases, the meaning of the word changes, thereby requiring or facilitating a change in word class. In most cases, these words are still used in the original word class in certain contexts. For example, in a Hebrew sentence such as *hudiberelavdugri* (“he spoke to him straight-up,”) *dugri* functions as an adverb. However, in a sentence such as *dugri, magi'alahemlehafsid* (“straight-up, they deserve to lose,”) it is used as an exclamation or parenthesis. Similar usages can be seen with such words as *rasmia* and *ashkara*. The words *sharmuta*, *kahba*, and *freha* are nouns

in Arabic but in Hebrew are used both as nouns and adjectives. *Ahla*, *akbar*, and *ajbar* are superlative adjectival forms in Arabic, whereas in Hebrew they are usually used in a simple adjectival context.

#### Words and expressions used in a fixed form similar to the Arabic:-

The duplicated verbal form *shufshuff* ("look look") is used in Arabic to express surprise, and serves the same function in Hebrew. This category also includes many of the expressions and proverbs, such as: *ala fadi*, *shufuniyanas*, *illifaatmaat*, *min ayuni*, as well as interjections beginning with the vocative particle *ya*, such as *ya Allah*, *yarabak*. The forms *uskut*, *tfadal*, and *tislamare* used solely in the second person.

#### Portmanteau and compound word formation:-

These forms are particularly common in the case of exclamations with strong emotional connotations of compassion, mercy, anger, surprise, excitement, and so forth, as well as in curses. In most cases these forms are used in a similar form to the Arabic original, without significant changes in form or content:<sup>10</sup>

- *Ya* particle + base (slang): Used in direct speech, particularly among friends. *Ya + zalama*, *ya + sakhbi*, *ya + khabibi*, *ya + balash*, *ya + kharam*, *ya + willi*, *ya + salaam*, *ya + eini*.
- *In'al* ("cursed") + base from Arabic: used to form curses: *in'alabuk*, *imak*, *ukhtak*, *dinak* ("damn your father/mother/sister/religion,") etc.
- *Bekhyet* ("for the life of") + base from Arabic: used to form requests, such as *bekhyetabuk*, *rabak*, *dinak* ("for the life of your father/God/religion.")
- Preposition *ala* ("on") + base from Arabic: used to form expressions of surprise, exclamations, etc., such as *ala eini*, *rasi*, *fadi*, *abuy*, *dinak* ("by my eye / my head/ nothing / my father / your religion.")

#### Pronunciation of consonants contrary to standard Hebrew in order to preserve the original form of the word:-

According to standard Hebrew rules, the consonant pairs b/v, p/f, and k/kh are allophones; the voiced consonant in each pair is required at the beginning of a word and in certain other contexts, while elsewhere the unvoiced consonant is used. Despite this, the form *fishel* ("he screwed up") is used rather than *\*pishel*, and *lekayeff* ("to have fun") and not *\*lekhayef*, thereby preserving the sound of the original Arabic. Similarly, *lehikhafeff* ("to do something half-ass") is used, rather than *\*lehikafefas* required by standard Hebrew grammar; *lekase'akh* ("to beat the crap out of") and not *\*lekhase'akh*; *fanan* and not *\*panan*; *fadikhar* rather than *\*padikha*; *frekha* and not *\*prekha*, and so forth. This phenomenon is common in the use of slang in general, and particularly in the case of slang words of foreign origin.

#### Fixed stress not shifting in declension:-

Slang words of Arabic origin maintain their stress even when the word is declined. For example, the plural of *'fashlais* *'fashlot* – the stress remains on the first syllable, despite the fact that the feminine plural suffix *-otis* always stressed in standard Hebrew. The same principle is reflected in the plural forms *'dakhkot*, *mab'sutim*, *'ahbalim*, *'frekhot*, *shar'mutot* and many other words. Arabic slang words here follow the pattern seen in slang words of foreign origin in general.

#### Unusual syllable structure:-

Slang words create unusual patterns in stress and syllables. Multisyllabic words ending in a vowel have penultimate stress:<sup>11</sup> *in-ti-'fa-da*, *shar-'mu-ta*, *fa-'di-kha*, *'sul-kha*, *'ju-ra*, *'ba-ssa*, and many others. These words maintain the stress of the original Arabic, along with other components of its structure. This helps a speaker who is unable to identify the unusual stress of the word. This pattern leads to some forms that have antepenultimate stress, contrary to the rules of standard Hebrew, such as: *mu-'sa-ye-ra*. Some multisyllabic words have final stress, such as *akhulman'yuk*, whereas in standard Hebrew penultimate stress is more common. Similarly, masculine plural nouns often have penultimate stress, contrary to the norm in Hebrew: *da'winim*, *mab'sutim*, *'ahbalim*, etc.

<sup>10</sup> This is generally the case in formulas of politeness (Avidor, 2000).

<sup>11</sup> This pattern may suggest that Arabic words have preserved the stress of their proto-Semitic ancestors. During the third stage of the development of stress in Hebrew, when most words had penultimate stress, final vowels were dropped, thereby creating a final stress pattern, with the exception of words ending in open syllables and long vowels, which maintained their penultimate stress within the verb system. A similar pattern can be seen in the words examined here. For more detailed discussion, see: Blau, 1970.

**Regular morphology:-**

Feminine forms ending in *-a*: *sharmuta*, *frekha*, *basta*, *fashla*, *fadikha*, *maskhara*, *nagla*. All these words have penultimate stress, as in Arabic, despite the fact that the feminine suffix in Hebrew is usually stressed. Similarly, adjectival forms ending in *-ido* do not have final stress, again contrary to the Hebrew norm: *'asli*, *'baladi*, *'sakhbaki*.

**“Orphan” words without related terms in Hebrew:-**

The noun *mukhtar* (“big boss,”) borrowed from Arabic, has no related words used in Hebrew. The native Hebrew word *mukhtar* (“crowned”) has an extensive family of connected words: *keter* (“crown,”) *hakhtara* (“enthronement,”) *hikhtir* (“he enthroned,”) *koteret* (“title.”) The borrowed word *fashla* has no relatives in Hebrew, while a native word such as *pesila* (“disqualification”) has many related terms.

**Multiple root letters:-**

many slang words have a larger number of root letters than is common in Hebrew. Examples include *dawinim*, *sharmuta*, and *intifada*. Although this phenomenon is encountered in Hebrew, it is rare, and usually the product of the secondary production of verbs from nouns.

**Derivation of Hebrew verbs from slang words of Arabic origin:-**

Many verbs in Hebrew slang were formed from slang words that penetrated Hebrew from Arabic and were later absorbed in the Hebrew verb system. The formation of verbs from nouns and adjectives is more common than the direct borrowing of verbs, which is a separate subject:

- The word *bassawas* used to form the verbal form *hitba'ess* and associated conjugations, meaning “to be bummed off.”
- The noun *khartawas* used to form the verb *khirtet*, meaning “to lie” or “to hoodwink.”
- From *khafif* comes the verb *khifef*– “to do something half-ass.”
- From *kasakh* comes the verb *lekase'akh* – “to beat the crap out of.”
- From *mastul* comes *hitmastel*– “to get wasted/stoned.”
- The noun *mangal* was used to form the verb *mingel*– “to barbeque.”
- From *fashla* comes the verb *fishel*– “to screw up.”

**Conclusion:-**

This study highlights the absorption of slang words of Arabic origin in all areas of Hebrew speech. However, a clear quantitative distinction can be seen between the different word classes. The borrowing of nouns and adjectives is extremely common. Words denoting both concrete and abstract entities are adapted from Hebrew for use in spoken and written Hebrew in all registers. By contrast, the penetration of Arabic verbs and adverbs into Hebrew slang is extremely limited and examples are few. Most of the verbs used in Hebrew slang were formed by derivation from nouns using the standard Hebrew patterns, though the noun in question is of Arabic origin. This pattern underscores the closed character of the verb system, which does not usually allow changes, whereas the Hebrew noun system is rich and open to change. Numerous expressions used for exclamation, greeting, and requests have also found their way into Hebrew and are popular among speakers. This group shows a high level of borrowing alongside frequent usage. Slang words that have penetrated Hebrew have adopted Hebrew rules and attempt to behave like “natives,,” although in many cases this is difficult due to the significant differences between the two languages in morphology, phonetics, phonology, and semantics. The diverse characteristics of slang words of Arabic origin show that alongside full integration in the colloquial register, the resilience of a word depends on various factors and does not predict the extent to which the word will be absorbed in the standard language. These factors include the ability of the word to survive on an ongoing basis in the media and a morphological and phonetic structure facilitating the application of Hebrew grammatical words without restrictions, particularly for frequent use in written and official Hebrew (examples include *rasmia* and *sulkha*). Many words may be used by numerous speakers in the spoken register only, over an extensive period. Moreover, it is difficult to predict the extent to which a particular word will be absorbed in Hebrew slang. Nevertheless, such absorption clearly depends on the timing of its use in the media; the extent of exposure of speakers; and the diverse connotations for which it is employed. The successful combination of these factors may increase the likelihood that a word will be absorbed.

The scope of this study did not permit a broader investigation of the attitudes of native Jewish speakers toward the use of slang, on the one hand, and toward the status of words in language, on the other. It will be informative to

undertake a comprehensive examination of these attitudes and usages, and such an examination will indeed be forthcoming.

##### Key words:-

Imam University, medical students, brain death, I, II, III and 4<sup>th</sup> year.

#### Abstract

**Background:** The brain death is the colloquial term for the determination of human death by showing the irreversible cessation of the clinical functions of the brain. This research from which we want to know what is the concept of brain death for medical student in college of medicine in Mohammad bin Saud Islamic university.

**Material and method:** in this randomize sampling study the survey was taken from four levels of preclinical years.

**Results:** 81.5% of participant had knowledge about the concept of brain death. 72.2% of participant had knowledge about the organ donation, 7.4% of participant had donated blood and 92.6% had never donated out of these donors 11.1% had donated due emergency and 1.9% of donors developed complications post donation. Nevertheless, the number of respondents in this study, but we found a very appropriate number for their understanding of the subject.

#### Introduction:-

The colloquial term for the determination of human death by showing the irreversible cessation of the clinical functions of the brain, has been practiced since the 1960s and is growing in acceptance throughout the world. Of the three concepts of brain death--the whole-brain formulation, the brain stem formulation, and the higher brain formulation--the whole-brain formulation is accepted and practiced most widely. For medical students especially for medical students at the Imam Muhammad bin Saud Islamic University This study is very modern in this university, especially given that college of Article called brain death. Given for one semester only through which to promote , explain and enhance this concept, through it we have this research note that there are several institutes, universities and hospitals outside the Kingdom, especially in Western countries are in the research and dear this concept in their communities and universities.

#### Objectives:-

1. Definition of Brain Death concept.
2. Awareness of Medicine students' community of Brain death.
3. Awareness of Medicine students' community of Organ Donation.
4. Enhancement of Medicine students' community of Brain death and Organ Donation.

**Material and Methods:-**

The study was randomized sample descriptive survey from first, second, third and fourth year from IMSIU College of medicine in Riyadh, KSA. The data was selected randomly so that was distributed 54 paper survey. After that all the data has been collected and incorporated in the program SPSS Version 21 in an accurate and correct method.

**The Result:-**

The end result of this study showed the following:

- 1- 81.5% of participant had knowledge about the concept of brain death.
- 2- 72.2% of participant had knowledge about the organ donation
- 3- 7.4% of participant had donated blood and 92.6%. Had never donated.
- 4- 11.1% of participant had donated due emergency.
- 5- 1.9% from donors developed complications post donation.

**Discussion:-**

Brain death and organ donation concept are taking into the consideration since there is a high demand of organ donation in Saudi Arabia and it is a cost effective process in Saudi health care system, thus the study is designated to promote, educate and recognize the current status of Brain death and Organ donation concept in our Saudi society among Medical student since they are involved in the future as a physician who is responsible to promote and educate society regarding the concept of Brain death and organ donation .

Regarding the age of the students it was varying proportionally were certain percentage of the majority of students were between 18-23 years 77.77%, then followed by 24-29 years 16.66% and the lowest one was 30-35 years 5.5% in the green color as in graph below.

The majority of students are the third year students and represents 68% while the minority is the Fourth year students 3.7% as seen below.

81.5% of students acknowledge that they knew about the concept of brain death.

72.2% of students acknowledge that they knew about the concept of organ donation.

7.4% of students answered yes for the donation and 92.6 of students answered no. All the donations were blood donation among to those students who answered yes.

7.4% of students donated for relative, 48.1% of students donated for a non relative and 42.6% of students not answered

11.1% of students' Donation due to emergency, 57.4% of students' donation were not urgent and 31.5% of students not answered.

1.9% of students developed complication post donation, 59.3% of student are free of complication and 38.9% not answered .

66.7% of students were not asked for donation, 27.8% of students asked for donation and 3.7% of students had not answered.

66.7% of students had visited the donation centre and 33.3% of students had not.

**Conclusion:-**

We concluded that there is a high percentage of the student who had an adequate information and knowledge about the brain death. A high percentage of these students, understood the concept of organ donation versus

A small percentage of students did not understand the purpose of the survey duo to their beginner’s status in medical school.

Despite the high percentage of students knew and understood the concept of brain death and organ donation, there are those who didn’t understand or know about the topic. We advice that the topic should be included in the medical school curriculum .

**Limitations:-**

We were not able to provide an information guide to the participants, also one of our limitations is that we were not able to communicate with the first year student to understand what was difficult in our survey.

**Acknowledgment:-**

We would like to thank everyone who helped us in this Research project  
And we would like to thank all of our follow students for their time and effort

**Thank you**

##### **Key words:-**

Utilization, maternal health, antenatal care, skilled delivery, postnatal care and context specific framework.

#### **Abstract**

Utilization of skilled maternal healthcare services during pregnancy, delivery and post delivery can reduce maternal deaths from preventable conditions. However, despite the usefulness of utilizing the skilled maternal healthcare services, utilization has remained low in Siaya County while women continue to die from preventable conditions. The aim of this study was to identify the correlates of utilization of skilled maternal healthcare services in Siaya County and consequently develop, pilot and evaluate a context specific framework for increasing utilization of skilled maternal healthcare services in Siaya County.

**Method:** The study followed a three (3) phased approach, whereby baseline data was first collected from the study participants to ascertain their past maternal health services utilization experience ( antenatal, delivery and postnatal care services), followed by development and piloting of the framework which was informed by the findings of the baseline, and finally evaluation of the effectiveness of the framework. The framework was piloted through a longitudinal study involving 517 pregnant mothers with previous delivery experience from selected community health units in Siaya County. Statistical package for social sciences (SPSS) version 22 was used to analyze both descriptive and inferential statistics.

**Result:** Indicate that both community and health facility factors affect utilization of skilled maternal healthcare services. Compared to the baseline, 4<sup>th</sup> Antenatal visits increased from 58.7% to 63.9%, skilled deliveries from 55.7% to 64.6% and postnatal care services from 23.6% to 47.4%. Knowledge on available maternal healthcare services and danger signs also increased by 28.6% and 26.4% respectively. Of note is that compared to the baseline, continuum of care was also enhanced as the number of households visited by community health volunteers (CHVs) increased from 83.7% to 93.5%. an indication that there was increase in uptake of skilled maternal healthcare services.

**Conclusion:** The framework was effective in increasing utilization of skilled maternal healthcare services in Siaya County and will be useful in providing guidance on designing and integrating context specific

.....  
**Introduction:-**

Globally, a woman dies every two minutes from complications related to childbirth (WHO, 2012). Of note, approximately 800 women die from preventable causes related to pregnancy and childbirth every day, with most of the deaths and disability occurring among women of reproductive age in the developing countries of the world (U. WHO, UNFPA, The World Bank and the United Nations Population Division, 2014). Previous studies have shown that a woman's lifetime risk of dying in pregnancy or childbirth is 1 in 150 in developing countries compared to 1 in 3800 in developed countries (WHO, 2012). This is partly due to inadequate utilization and poor quality maternal health care, antenatal care, skilled attendance at birth and postnatal care (W. Wang, Hong, Rathavuth, 2015; Zohra et al., 2015). Hence there is a need for women to maximize utilization of skilled maternal healthcare services (antenatal care, skilled attendance at birth and postnatal care) in order to prepare physically, mentally and even logistically for childbirth. Studies have shown that antenatal care is critical in improving maternal and neonatal health outcomes (W. Wang, Hong, Rathavuth, 2015; Zohra et al., 2015) through delivery of targeted interventions and use of emergency obstetric care services at the health facilities (W. Wang, Hong, Rathavuth, 2015).

The World Health Organization (WHO) recommends a minimum of four antenatal care visits, based on reviewing the effectiveness of different models of service delivery (Villar et al., 2001). WHO guidelines also specify the content of antenatal care visits, which should include blood pressure measurement, urine testing for bacteriuria and proteinuria, and blood testing to detect syphilis and severe anemia (WHO, UNFPA, The World Bank and the United Nations Population Division, 2014). Some other services, including giving tetanus immunization, providing iron and folate tablets and teaching women about danger signs of pregnancy complications, are also important to improve both maternal and newborn health (Wang et al., 2010). Access to skilled delivery care is key to reducing maternal mortality, particularly in sub-Saharan Africa, where 99% of maternal deaths occur (WHO, UNFPA, WORLD BANK, 2012). Evidence suggests that skilled attendance at birth, access to emergency obstetric care and postnatal care are key factors in reducing the risk of maternal death, in both industrialized and developing countries (Graham, Moodley, & Selipsky, 2012; Wang et al., 2010; WHO, ICM, & FIGO, 2004). However, utilization of skilled attendance at birth in developing countries low with only 34% in the least developed countries delivering in a health facility providing skilled care (WHO, 2012). Compared to antenatal care and skilled attendance at birth, postnatal care has been largely neglected in safe motherhood programs in developing countries (Wang et al., 2010). Postnatal care, especially within the first 48 hours after birth, is critical to the management of postpartum hemorrhage, an important cause of maternal deaths in developing countries (Wang et al., 2010). Postnatal care is an important opportunity to assess the physical and psychosocial health of the mother and baby and has been shown to be a key strategy for reducing maternal mortality although the majority of women in developing countries do not receive it (Simkhada B, 2008;WHO, 2014).

Continuum of care throughout pregnancy, childbirth and postnatal period is also considered key in improving maternal and newborn health in order to reduce maternal and child morbidity and mortality (Siddharudha Shivalli, 2015; WHO, 2011). According to partnership for maternal, newborn and child health, 2011; Community Health Volunteers are important in identification of pregnant mothers and referrals, follow up and provision of community maternal health care services(WHO, 2011). Previous studies and reviews have showed that that community health workers are important in provision of a continuum of care for maternal and child health services(Gilmore B, 2013; Glenton C, 2013; Lewin S, 2010; Yeboah-Antwi et al., 2014). An effective continuum of maternal health care services that includes intervention packages from pre-pregnancy through to delivery and post delivery and from health facility to household has also been proven to be effective in improving the life of the mother and the baby (PMNCH, 2010; Annie and Carlo, 2003). Other studies have also shown that strengthened linkage between health facility and community enhances care continuum thus reducing morbidity and mortality (WHO, 2013). In limited resource settings, community-level interventions are also potentially effective to address the problem at its roots, as decisions to seek and access health care are strongly influenced by the socio cultural environment (John, Guadalupe and Stewart, 1999). Engagement of community health volunteers (CHWs) has proven to be effective in improving health status of the community (Beam & Tessaro, 1994; Bhutta, Lassi, Pariyo, & Huicho, 2010; Haines et al., 2007).

Kenya is one of the Countries with high maternal mortality levels approximated at 495 per 100,000 live births (Kenya National Bureau of Statistics et al., 2015b), well above the MDG target of 147 per 100,000 by 2015 (Statistics, 2013). Kenya was rated among the top ten countries that contributed to 58% of the global maternal deaths reported in 2013 (U. WHO, UNFPA, The World Bank and the United Nations Population Division., 2014), with over 6,000 women dying every year due to pregnancy related conditions despite the launch of Safe Motherhood campaigns twenty years ago (Macro, 2010; Starrs, 2006). In addition, it is estimated that another 20-30 women suffer serious injury or disability due to complications during pregnancy or delivery in Kenya (Human Rights., 2012). These high rates have persisted despite improvements in other health indicators over the past decades (Health, 2014). This problem is partly due to lack of access to skilled maternal health services, including ante-natal care, skilled delivery, and post-natal services (Health, 2014). Although there has been increased growth of health sector infrastructure, many women still face various barriers to accessing skilled maternal health services (Bourbonnais, 2013; Health, 2014; M. A. Pell C, Were F, Afrah NA, Chatio S, Manda-Taylor L, et al. (2013) 2013), This is attributed to supply-side and demand-side factors including individual and household factors, socio-cultural factors and health facility factors (Health, 2014; M. G. Kenya, 2010; M. o. H.-. Kenya, 2012). In Kenya there are major gaps and challenges associated with supply-side and demand-side factors leading to geographical disparities in coverage of health services between counties, urban and rural residents and different population groups (Kenya National Bureau of Statistics et al., 2015a). In attempt to address the identified challenges affecting uptake of skilled maternal healthcare services, the government of Kenya introduced community health strategy to empower individual and families to take responsibility for their health (Health, 2006) and also introduced a policy of free maternity services in all public facilities (Bourbonnais, 2013). As recommended by Kerber et al., 2007; the continuum of care for maternal, neonatal, and child health requires access to care provided by families and communities, by outpatient and outreach services, and by clinical services throughout the lifecycle, including adolescence, pregnancy, childbirth, the postnatal period, and childhood. Saving lives depends on high coverage and quality of integrated service-delivery packages throughout the continuum, with functional linkages between levels of care in the health system and between service-delivery packages, so that the care provided at each time and place contributes to the effectiveness of all the linked packages (Kerber et al., 2007).

While it is acknowledged that most causes of maternal deaths could be prevented through utilization of skilled maternal healthcare services (Graham et al., 2012; Wang et al., 2010; WHO et al., 2004); utilization of skilled maternal healthcare services have remained low in Kenya especially in counties like Siaya County despite massive investments on interventions to increase uptake of these services while mothers continue to die from preventable causes (DHIS 2014). Siaya County in Kenya is one of the counties with high MMR of 691 deaths for every 100,000 live births that is above the national average of 495 deaths for every 100,000 live births with most of these deaths occurring at home (MICS4 2011). Previous studies and reports in Siaya County associated the low uptake of skilled maternal healthcare services to poor communication between health workers and women, socio cultural beliefs, distance to health facilities and quality of ANC services (Pell *et al.*, 2011; Bottleneck analysis 2012; Siaya investment case for MNCH 2013). However despite attempts to address the identified barriers, uptake of skilled maternal healthcare services has remained low (DHIS, 2014). The high maternal mortality ratio in Siaya County has been mainly attributed to low utilization of skilled maternal healthcare services (DHIS, 2014). Data indicate that the proportion of women attending at least one ANC visit are 85%, those attending four ANC visits are 45%, 52% receive skilled care during delivery while only 30% receive postnatal care within two days after delivery (DHIS, 2014).

Different policies, frameworks and strategies have emerged to respond to the growing concerns on low utilization of skilled maternal healthcare services coupled with high maternal mortality levels in developing countries (Aday, 1974; Andersen, 1995; MOH, 2006; MOH, 2007; KNHSSP 11, 2005; WHO, 2006; MOH, 2014; WHO and PNMCH, 2011). However, despite massive investments in strategies to increase utilization of skilled maternal healthcare services and reduce maternal mortality, the gains have been very minimal (Siaya Health Department Performance Report 2013/14; Siaya County Integrated Development Plan, 2013 – 2017).

The use of community health workers in creating demand for skilled maternal health care services in Siaya County began in 2006 after the launch of the second Kenya national health sector strategic plan (KNHSSP 11). However despite all the effort, Counties like Siaya County continue to have high maternal deaths (691/100,000 live births) above the national average of 495 deaths for every 100,000 live births, with most of these deaths being attributed to home deliveries and low utilization of skilled maternal healthcare services (Statistics, 2013). Previous studies done in Siaya County to establish factors affecting utilization of antenatal care services associated low uptake of antenatal

care with uncertainty about pregnancy, poor communication between health workers and women, cultural and religious beliefs, vague knowledge and quality of ANC services among others (M. A. Pell C, Were F, Afrah NA, Chatio S, et al., 2013; UNICEF, 2013). However, the researcher could not trace any study related to uptake of skilled delivery and postnatal care services in Siaya County despite the worrying trend.

In the quest to increase utilization of skilled maternal health services in Siaya County, the health department managed to scale up implementations of key interventions such as provision of free maternity services, training of healthcare providers on focused antenatal care, 100% scale up of community healthcare services and payment of monthly stipend to all community health volunteers to motivate them to further intensify demand creation (Siaya, 2013; www.hiskenya.org, 2013/14). However despite the investments, utilization of skilled maternal healthcare has remained low; 4<sup>th</sup> antenatal care- 45%, skilled delivery -52% and postnatal care- 30% (www.hiskenya.org, 2013/14) while mothers continue to die from preventable conditions. Taken together the above observation, the aim of this study was to develop and evaluate the effectiveness of context specific interventions to enhance maternal healthcare continuum and optimize utilization of skilled maternal healthcare services in Siaya County,

## **Methods:-**

### **Study design:-**

This was a longitudinal retrospective – prospective study conducted in 8 selected community units (CU) and their link health facilities in Siaya County. The baseline took 21/2 months, framework development 2 weeks and framework piloting/ intervention took 12 months from 27<sup>th</sup> March 2015 to 27<sup>th</sup> February 2016. The community health volunteers (CHVs) and the healthcare providers were sensitized on the study before commencement of the study and at every stage updated on the progress and their roles. The mothers were followed up by community health volunteers (CHVs) to ensure that they received all the recommended skilled maternal healthcare services which include 1<sup>st</sup> to 4<sup>th</sup> antenatal care visits, skilled delivery services and postnatal care services.

### **Study setting:-**

Siaya County is one of the counties in Kenya located in the western region of the Country. It has six sub counties namely Ugenya, Ugunja, Gem, Siaya Alego, Rarieda and Bondo with an estimated population of 935,555 (KNBS, 2009). The county has sex-balanced ratio of female: male (52:48) with the population being predominantly youthful and 23 percent of the population is made up of women of reproductive age 205,356 (15-49). The estimated no of pregnant women is 37,592 and estimated deliveries is 37,592(www.hiskenya.org, 2013/14). The study was conducted in selected community Units and their link health facilities. The County has a total of 156 health facilities out of which 122 are government facilities. The County has 187 community units (an equivalent of a sub location) linked to the government health facilities and 2148 Community health volunteers (CHVs) who provide community based healthcare. Each community unit has approximately 10 CHVs who manage about 100 households each. The study sites included Ndori community unit linked to Akala Health Center in Gem Sub County; Nyawita Community Unit linked to Nyawita dispensary in Bondo sub county; West Katweng'a Community Unit linked to Chianda Dispensary in Rarieda Sub County, Gongo community unit linked to Gongo Dispensary in Gem Sub county and Ulafu and Umala community unit linked to Umala dispensary in Alego Usonga sub county, Marenjo community Unit linked to Midhine dispensary and Yiro west community unit linked to Sikalame dispensary in Ugunja sub county. The term community unit referred to in this study is an equivalent of a sub location (MOH, 2010)

### **Study participants and recruitment:-**

A total of 517 pregnant mothers living within the selected community units were purposively recruited for the study. For purposes of knowing the previous maternal health services utilization status, only pregnant mothers who had had experience of giving birth previously (*Not pregnant for the first time*) were given the chance to participate. The participants were recruited through a combination of random and purposive sampling methodology. Some were invited to participate in the interview after being attended to at the link health facility; others were identified through snowballing technique and others through household's visitation.

### **Sampling and sample size calculation:-**

The desired sample size was determined using the formula of Fisher et al 1991 as cited in Mugenda and Mugenda 2003: The target population was pregnant women in Siaya County while the accessible population was pregnant women from the selected community units. Since Siaya County has a population of 939,793(Siaya AWP3, 2014) and women of child bearing age form 23% = 216,153 (Siaya Annual Work Plan 3- 2014/15). The target population is pregnant women who account for 4% of the total population = 4% of 939,793 = 37592

**Calculation:-**

$$n = \frac{N}{1+N(e)^2}$$

$n$  = the desired sample size (if the target population is greater than 10,000)

$N$  = Population size

$e$  = Accepted level of error taking alpha as 0.05

therefore:

$$n = \frac{37592}{1+37592(0.05)^2}$$

$$n = 400$$

The sample size was increased by 20% to take care on non-response and fall outs. A final minimum sample size of 480 was obtained. However since the study was longitudinal with the likelihood of having fall out, all pregnant women who were willing to participate were enrolled for the study thus bringing the number to 517.

**Study sites:-**

The study sites were selected using multistage simple random sampling methodology. From a sampling frame of all community units per sub-county, one community unit was randomly picked from the list in each sub county and having calculated that each community unit would have approximately 50 pregnant mothers, for the study to achieve the recommended target of 400, an additional of 2 community units had to be selected randomly to be included. In total 517 sampled pregnant mothers who were willing to participate in the study were interviewed using structured questionnaires. All the questions were directed to the women's maternal health utilization experience in the previous pregnancy.

**Data Collection:-**

Data was collected using structured questionnaires focusing on the use of maternal healthcare services (antenatal care, skilled attendance at birth and postnatal care), participant's awareness and knowledge on maternal health, and continuum of care situation.

**Informed consent process:-**

Detailed information about the study was given to the participants by research assistants before being asked to decide on whether to participate or not. The consent was then read to the participant in the local language (Luo) after which those who accepted to participate were requested to sign. The study questionnaires and key informant interviews were administered thereafter.

**Data analysis:-**

The quantitative data was analyzed using both descriptive and inferential statistics. The descriptive statistics was used to describe and summarize the data in form of tables, frequencies and percentages. The inferential statistics was used to help make inferences and draw conclusions. Statistical tests including chi-square test, bivariate and multivariate logistic regression analysis was carried out to identify barriers associated with utilization of maternal health care services. All tests of significance was computed at  $\alpha = 0.05$ . The Statistical Package for Social Sciences (SPSS) version 22 was used to analyze the data.

**Ethical consideration:-**

The study was approved by the ethical review board of University of East Africa Baraton (REC: UEAB/05/02/2015). All the study participants parents and legal guardians gave their written informed consents.

**Results:-****Phase 1: Baseline findings****Characteristics of Participants:-**

As shown in table 1, most women (32.5%) were aged between 15-19 years, 72.5% were married and 39.1% were farmers. Most of the women and their partners or husbands had primary education 64% and 46% respectively while a majority (57.3%) walked to the health facility. In addition for most (38.7%) women it is their husbands who had authority over health issues.

**Table 1:-** Summary of Socio-demographic characteristics of respondents (n=517) and utilization of maternal healthcare services in Siaya County.

Characteristics	n (%)	P Value

Values in parentheses indicate % of total (n = 517). Chi-square test was used to test association between socio-demographic characteristics and utilization of maternal health services and other group. Bold font indicates “significantly associated at  $p < 0.05$ .”

#### **History of utilization of skilled maternal health care services in the last pregnancy:-**

Out of the 517 respondents, 439 (84.9%) of the mothers received antenatal care (ANC) services, 288 (55.7%) received skilled delivery while only 122 (23.6) received post-natal care. Out of the 517 respondents, 439 (84.9%) of the mothers received Antenatal care (ANC) services while 15.1% did not receive the ANC services. Out of those who received ANC services, 53.2% received  $\geq 4$  ANC visits while their counterpart's 46.9% received  $< 4$  ANC services. Moreover, out of the 288 (55.7%) of the mothers who had Skilled delivery services; 47.7% of them had  $< 4$  ANC visits while 52.3% of the mothers had  $\geq 4$  ANC visits. Again, out of 122 (23.6%) of the mothers who managed to have Postpartum care services, 55.2% of them had  $< 4$  ANC visits while 44.8% of the mothers had  $\geq 4$  ANC visits (Table 2).

**Table 2:-** Previous skilled maternal healthcare services utilization history

Maternal Health services	Total, n (%)	<4ANC (%)	≥4 ANC (%)	P value
				<b>0.003</b>
Antenatal care (ANC)	439 (84.9)	46.9	53.2	
Skilled delivery	288 (55.7)	47.7	52.3	
Postpartum care	122 (23.6)	55.2	44.8	

**Association between knowledge and utilization of skilled maternal health care services.**

Knowledge plays a very important role in enhancing utilization of maternal health care services. Our data indicate that a majority of the respondents at 338 (65.4%) had **inadequate** knowledge on maternal health services. Furthermore, a majority (58.7%) of the respondents who were knowledgeable attended  $\geq 4$  ANC. The findings revealed significant ( $p=0.007$ ) association knowledge and utilization of ANC services. Out of 517 mothers who participated in the study, 55.9% had adequate information on maternal health danger signs while 44.1% had inadequate. Out of the 55.9% of the mothers who had adequate information on danger signs; majority of them at 62.4% attended  $\geq 4$  ANC visits. The findings further revealed that there is association between knowledge of danger signs and utilization of maternal health care services ( $p = 0.001$ ).

**Table 3:-** Knowledge and utilization of antenatal care services

Characteristics	Total, n (%)	<4ANC (%)	≥4 ANC (%)	P value
Knowledge on importance of maternal health services				0.007
Adequate	179 (34.6)	41.3	58.7	
Inadequate	338 (65.4)	58.1	41.9	
Information on danger signs				0.001
Adequate	289 (55.9)	37.6	62.4	
Inadequate	228 (44.1)	62.8	37.2	

**Participants profile and utilization of skilled maternal health services;-**

Multivariate regression analysis revealed that those with no source of income (aOR=0.96, 95% CI: 3.21–8.27) and those who were farmers (aOR=0.37, 95% CI: 7.32–6.74) were less likely to utilize maternal healthcare services relative to traders/self-employed and salaried. Further analysis showed that those with is secondary (aOR=2.62, 95% CI: 4.33–4.58) and tertiary (aOR=1.43, 95% CI: 2.87–4.63) education were more likely to utilize maternal healthcare services relative to those with no education and those with primary education. Similarly, the respondents' whose husbands had no education (aOR=0.89, 95% CI: 2.07–1.60) or had primary education (aOR=0.89, 95% CI: 2.07–1.60) were less likely to utilize maternal healthcare services relative to those whose husbands had secondary or tertiary level of education. Those who walked (0.91 (1.62-2.88) or used bicycle 0.84 (1.69-2.02) were less likely to utilize skilled maternal health services compared to those who used motorbike or private car.

**Table 5:-** Factors associated with utilization of maternal health care Services

Variables	Yes, n (%)	Unadjusted odds ratio (95% CI)	Adjusted odds ratio (95% CI)

**Maternal healthcare continuum:-**

On the continuum of care situation, Table 4 below shows that the majority of the mothers 438 (84.7%) had a CHV attached to their household. In addition, out of the 438 (84.7%) of the mothers who had a CHV attached to their household, only 119 (23%) of the mothers had been referred to the health facility by a CHV for pregnancy related care. In addition, all the mothers who participated in this study had no book/document in their household where health services provided by the CHVs or other providers who visit the household were recorded or referred to for continuum of care purposes. In addition, 434 (83.9%) of the mothers had the opportunity of being visited in their households by other health providers other than the CHV. However, only 6.4% received pregnancy related services from these providers.

**Table 4:-** Continuum of care

Characteristics	Yes, n (%)	No, n (%)
Do you have a CHV attached to your HH?	438 (84.7)	79 (15.3)
Were you ever referred to the health facility by a CHV in your last pregnancy?	119 (23.0)	398(77.0)

Malaria testing and treatment	28 (6.4)	406 (93.6)
Net distribution	66 (15.1)	368 (84.9)

The strategies outlined in the framework below were implemented for a period of twelve months with intensive follow up after which an evaluation was carried out and results shown below.

### Phase 2:-

#### Developed context specific framework;-

The development of the piloted integrated framework was informed by both the baseline findings and the suggestions from the users and maternal healthcare providers. The proposed strategies for increasing utilization of skilled maternal healthcare services were fed into the design of the framework. The framework took into considerations those interventions that target both the supply and demand side barriers to utilization of skilled maternal healthcare services. Included are also suggestions made by key informants and focus group discussants within the selected study sites. The framework contains six prioritized interventions which are interconnected. In line with the available structures, six strategic areas for enhancing maternal healthcare continuum and optimizing utilization of skilled maternal healthcare services were identified by the study and evaluated. They include 1) use of maternal health job aids for guidance at the health facility and community, 2) mother baby booklet, 3) use of referral tools, 4) empowering CHVs to educate the women and provide basic community maternal healthcare services 5) testing for pregnancy at the community/household level and 6) availing documentation tool at the households for reference and care continuum.

The framework explicitly defined how one intervention informs the other and the feedback mechanism. The interventions were addressing both community and facility bottlenecks which included: Increasing women's awareness on importance of maternal health; Availing 24 skilled delivery services at the health facilities; Improving the quality of interaction between healthcare providers and community; Strengthening community – facility linkage by use of a household log book to document health services provided ; Empowering community health volunteers to educate women and provide community maternal healthcare services and pregnancy testing services at the household to enhance early identification of pregnant women for early initiation of antenatal care, and use of antenatal and postnatal care job aids both the health facilities and community health workers as shown in Table below:-

**Table 1:-** Framework for increasing utilization of skilled maternal healthcare services

Strategy	Justification	Key findings that support the strategy	Recommendations for service delivery (practice)
(1) Increasing women's awareness on available maternal health services and danger signs	i) Studies have shown that one of the major barriers to utilization of skilled maternal healthcare service is lack of awareness of the available and importance of skilled maternal health services (Mpembeni, 2007; Tsawe, 2014)	i) Baseline findings showed that only 34.6% of the women in the study had adequate knowledge on available maternal health while 55.9% had adequate information on maternal health danger signs. ii) Baseline findings also revealed that 83.9% of pregnant women had had the opportunity of being visited at their households by other health providers other than the CHVs to offer other services not pregnancy related. This is an indication that opportunities exist that could be used to disseminate maternal health information by integrating the services during the household visits.	i) Every opportunity that either a skilled provider or a community health worker interact with the women should be used for education and review of women's understanding of maternal health. ii) Women should continuously be given information on maternal health and treated with respect so as to reduce fears and increase the uptake of skilled maternal healthcare services. (iii) Every health provider who visits a household having a woman of reproductive health is encouraged to provide information on importance of skilled maternal health services.
(2) Improving quality of	i) Cases of missed opportunities exist as evident	(i) Previous studies in Siaya County revealed that quality	(i) Train providers on respectful maternity care

providers and users interaction and positive attitude change	in the DHIS, 2004 data that shows that whereas 82% of women attend first antenatal care visits, only 45% attend 4 <sup>th</sup> antenatal care visits and 52% receive skilled delivery services.	of interaction between provider and pregnant women was poor as women had vague information about services offered even after interacting with skilled providers (Pell C, 2011) (ii) Baseline findings revealed that although 84.9% of the women received antenatal care, only 55.7% and 23.6% received skilled delivery and postnatal care respectively.	(ii) Promote use of antenatal and post natal job aids to enhance quality interaction.  iv) Efforts should be made to enhance maternal healthcare continuum by strengthening community-facility linkage by ensuring there is effective communication between the skilled provider and the community health volunteer. (Documentation in the mother baby book to be strengthened as part of communication enhancement).
(3) Introducing the use of a household log book for documentation of all health services provided at the household level (Strengthening community – facility linkage)	(i) There has not been any tool at the household level where services provided at the household are documented thus different providers who visit the household have no reference document for enhancing care continuum and also ascertaining which services have been offered at the household has been a challenge.	i) Reports indicate that all (100%) of households in Siaya County have a CHV who visits on monthly basis and who is paid stipend by the County government. However, baseline findings revealed that 15.3% of the households had never been visited by a CHV which is an indication that some CHVs do not carry out their mandate.	i) Development, sensitization of providers, community and the mothers, and distribution of a household health visitors log book for documentation of all services provided at the household level and for reference. ii) Provide referral tools to all CHVs and provide space for skilled provider's comments and assignment to CHVs in the mother baby booklet.
(4) Empowering community health volunteers with knowledge on maternal health and danger signs	(i) The majority of the CHVs have not been trained on maternal healthcare and therefore they may not be confident to share the information with the mothers/women during household visits.	(i) Baseline findings revealed maternal health knowledge gap amongst the study participants which may be attributed to lack of opportunities for education on maternal health.	i) Training of CHVs on Community maternal health. ii) Development and promotion of use of antenatal and postnatal care job aids to guide CHVs when providing maternal health education.

### Phase 3:- Evaluation of the effectiveness of the framework

End line results have indicated that the majority of the mothers at 468 (92.3%), 328 (64.6%) and 241(47.4) received Antenatal care (ANC), Skilled delivery and postnatal care respectively compared to the baseline where mothers who received maternal healthcare services were 439 (84.9%) , 288 (55.7%) and 122 (23.6%) respectively. The findings imply that after intervention, more mothers received skilled maternal healthcare services at the various health facilities in Siaya County.

**Figure 1:-** Utilization of skilled maternal health care services

The results below indicate that the number who utilized the recommended 4 antenatal care visits or more ( $\geq 4$ ) at end line increased by 18%, an indication that the framework was effective in increasing uptake of skilled maternal health services.

**Figure 2:-** Utilization of skilled maternal healthcare services Vs Antenatal care services received at Baseline and at End line

Compared to the baseline where only 179 (34.6%) mothers had adequate knowledge on maternal health; intervention findings revealed that 321 (63.2%) had adequate knowledge on available skilled maternal health services. In addition, those who utilized  $\geq 4$  ANC visits increased from 58.7% to 63.9%. Moreover, those who had knowledge on maternal healthcare danger signs also increased from 289 (55.9) to 418 (82.3) with an increase from 62.4% to 78.8% amongst those who took up  $\geq 4$  ANC visits. The findings revealed highly significant positive relationship between knowledge on availability of skilled maternal healthcare services, knowledge on maternal danger signs and number of antenatal care services received ( $p < 0.04$  and  $p < 0.002$  respectively).

**Table 2:-** Knowledge on maternal health services (MHS) Vs Antenatal care (ANC) services received at Baseline and at End line

Variables	Baseline results				End line results			
	Total, n (%)	<4ANC (%)	$\geq 4$ ANC (%)	P value	Total, n (%)	<4ANC (%)	$\geq 4$ ANC (%)	P value
<b>Knowledge on available MHS services</b>				<b>0.007</b>				
Adequate	179 (34.6)	41.3	58.7		321 (63.2)	36.1	63.9	
Inadequate	338 (65.4)	58.1	41.9		187 (36.8)	52.8	47.2	
<b>Knowledge of maternal danger signs</b>				<b>0.001</b>				
Yes	289 (55.9)	37.6	62.4		418 (82.3)	21.2	78.8	
No	228 (44.1)	62.8	37.2		90 (17.7)	49.0	51.0	

### The findings on the maternal healthcare continuum situation:-

On the continuum of care situation among the mothers, the researcher designed a questionnaire to collect views of the respondents on the same. The mothers' respondents were presented with statements that had continuum of care situation connotations with different answering techniques. The researcher computed percentage frequencies of the responses from the mothers and was tabulated as shown in the table 3 shown.

**Table 3:-** Continuum of care situation

Variables	Baseline results		End line results	
	Yes, N (%)	No, N (%)	Yes, N (%)	No, N (%)
<b>Do you have a CHV attached to your HH?</b>	438 (84.7)	79 (15.3)	475 (93.5)	33 (6.5)
<b>Were there services (MHS) offered to you at home during the time you were pregnant?</b>	376 (72.7)	141 (27.3)	408 (80.3)	100 (19.7)
<b>Are there any book/ document in your household where services provided by the CHVs are usually recorded?</b>	-	517(100.0)	414 (81.6)	94 (18.4)

The descriptive statistics on cross tabulations indicates that the number of mothers with CHWs attached to their households in Siaya County increased from 438 (84.7%) to 475 (93.5%) during the end line. However, 33 (6.5%) of the mothers still did not have any CHV attached to their household at end line compared to 79 (15.3%) at baseline as indicated in Siaya County 2014-15 performance report. Of note, compared to baseline, the number of households with health visitor's documentation booklets increased from 0% at baseline to 81.6% at end line

### Discussion:-

The results of this study show that the context specific framework was effective in increasing utilization of skilled maternal healthcare services in Siaya County. Whereas at baseline, those who received at least one antenatal care visit were 84.9%, skilled delivery were 55.7% while only 23.6% received post-natal care within 48 hours of delivery, at end line antenatal care (ANC) increased to 468 (92.3%), skilled delivery to 328 (64.6%) and postnatal care to 241(47.4) respectively. The baseline findings were consistent with data in DHIS which reflected low utilization of skilled maternal healthcare services in Siaya County ([www.hiskenya.org](http://www.hiskenya.org)). Of note was that compared to baseline where only 53.2% received the WHO recommended  $\geq 4$  ANC visits, at end line 71.2% received  $\geq 4$  antenatal care visits. The above findings are similar to findings from previous studies which revealed that knowledge on maternal health, awareness of importance of maternal healthcare services, knowledge on danger signs and enhanced continuum of care can increase utilization of skilled maternal healthcare services (Jerome, Per-Olof, Eleanor, & Karen, 2011; Mwangome, Holding, Songola, & Bomu, 2012; Pembe et al., 2009; Shahram, Hamajima, & Reyer, 2015; Stevens, 2000).

Similar to previous studies that showed that utilization of skilled maternal healthcare services is influenced by a multiplicity of factors including economic status of the mother, mothers education, husbands income, husbands education and distance to health facility/ transport costs (Deo KK, 2015; Doku, Neupane, & Doku, 2012; Idris, Sambo, & Ibrahim, 2013; KC et al., 2011; Malhotra, 2014; Siddharudha Shivalli, 2015; Titaley, Dibley, & Roberts, 2009), the findings of this study showed that participants with no source of income (aOR=0.96, 95% CI: 3.21–8.27) and those who were farmers (aOR=0.37, 95% CI: 7.32–6.74) were less likely to utilize maternal healthcare services relative to traders/self-employed and salaried. Women with secondary (aOR=2.62, 95% CI: 4.33–4.58) and tertiary (aOR=1.43, 95% CI: 2.87–4.63) education were more likely to utilize maternal healthcare services relative to those with no education and those with primary education. Similarly, women whose husbands had no education (aOR=0.89, 95% CI: 2.07–1.60) or had primary education (aOR=0.89, 95% CI: 2.07–1.60) were less likely to utilize maternal healthcare services relative to those whose husbands had secondary or tertiary level of education. In consistent with other studies, the findings of this study also revealed that means of transport/ means of reaching the facility had effect on utilization of skilled maternal healthcare services ( Kawakatsu. et al, 2012; Worku et al, 2013; Ayele et al, 2014). Those who walked (aOR= 0.91 (1.62-2.88) or used bicycle (aOR=0.84 (1.69-2.02) were also less likely to utilize skilled maternal health services compared to those who used motorbike or private car.

The findings corroborate with previous studies, that knowledge on available skilled maternal health services and knowledge on maternal health danger signs is associated with utilization of skilled maternal healthcare services ((Jerome et al., 2011; Mwangome et al., 2012; Pembe et al., 2009; Shahram et al., 2015; Stevens, 2000), this study

showed that at baseline when only 36.4% had adequate knowledge on importance of skilled maternal healthcare while 55.9% adequately knew the maternal danger signs; utilization of skilled maternal healthcare services was also low. Whereas at end line where 63.2% of participants had adequate knowledge on importance of skilled maternal healthcare; utilization of skilled maternal healthcare services increased.

Although it is acknowledged that community-level interventions are potentially effective ways to address the problem at its roots, as decisions to seek and access health care are strongly influenced by the socio-cultural environment (Lawn *et al.*, 2005; John *et al.*, 1998) and that Saving lives depends not only on high coverage but also on the quality of care delivered through the continuum (PNMCH, 2010; Portela *et al.*, 2003), the baseline findings showed that contrary to reports in Siaya County which shows that all households receive CHV services in Siaya County (Siaya County health department performance review report (2014/15), some households (15.3%) had never been visited by a community health volunteer at all. This is an indication of disconnect in the continuum of care (Siaya County health department performance review report (2014/15). However, at end line, the results showed some improvement although 6.5% still did not have an opportunity to be visited by a CHV despite the emphasis that all be followed up. More puzzling was the finding at baseline that, there was no (0%) book/document/evidence in all the households where services provided by the CHVs and other health providers were recorded or could be referred to for continuum of care purposes. However, at end line after intervening, the majority (81.6%) had the household booklets for documentation of all health services provided at the households. The context specific framework was found to be suitable for increasing utilization of skilled maternal healthcare services. However there is still room to further refine it to include other strategies proposed by previous scholars.

The implications of these findings are that each strategy contributes some percentage increase in utilization of skilled, maternal health care services. Therefore integration of several strategies brings synergy and yields better results. The context specific framework should be considered for programming towards increasing utilization of skilled maternal healthcare services.

### **Conclusion:-**

Based on the findings of the longitudinal study carried out between March 2015 and December 2015, it is evident that no single intervention is by itself sufficient to increase utilization of skilled maternal healthcare services. Context specific, evidence based framework maximizes the benefits of a range of interventions which complement each other resulting in enhanced continuum of care and increased utilization of skilled maternal healthcare services.

### **Declarations**

### **Acknowledgements:-**

Authors would like to acknowledge Department of Health, Siaya County, Skilled health providers and community Health workers in Siaya County, Research assistants, and all the participants who participated in this study.

### **Ethical considerations:-**

Ethical clearance was obtained from Research Ethics Committee of University of Eastern Africa, Baraton, Eldoret (REC: UEAB /05/02/2015). The research assistants were trained on research ethics. Informed written consent from the study participants was obtained and the objective of the study was explained to them. Privacy and confidentiality of collected information was ensured at all levels.

### **Consent to publish:-**

Consent to publish was obtained from Research Ethics Committee of University of Eastern Africa, Baraton, Eldoret (REC: UEAB /05/02/2015).

### **Competing interests:-**

The authors declare that there are no competing interests.

### **Funding:-**

This work was supported by kind contributions from friends.

### **Author Contributions:-**

OEO conceptualized the paper, searched literature, and wrote the manuscript draft. ASO contributed to the design of the study and provided advice regarding data interpretation. FAA helped develop the data analysis framework and

also helped train field researchers for data collection. OEO and ASO analyzed the qualitative data. AK made critical revisions to the paper and provided advice regarding data interpretation. OSO participated in data collection and helped write the results and discussion sections. All authors read and approved the final manuscript.

##### **Key words:-**

Young female adults, Awareness of sexual harassment, Avoidance strategies for sexual harassment.

#### **Abstract**

Young female adults are most vulnerable to harassment and violence towards them. These strategies could be learned either from circumstances surrounding or by some organized training. A descriptive, cross sectional survey design on 200 female undergraduate students from two women colleges and two co-educational colleges from University of Delhi, India was undertaken using convenient sampling technique. A semi structured interview and a structured awareness questionnaire developed by researcher was used. Results: Awareness was not found to be correlated to any of the variables and the type of college (women or co-educational college) they attended. Females in coeducational college had more awareness regarding description of sexual harassment, identification of high risk situation, actions against sexual harassment and prevention of sexual harassment. Female in women college had a view to ignore sexual harassment incidence than co-educational college females. Implications: Youth need to be aware and avoid risk factors for safety of self and how to report the incident to prevent further harassment. Conclusion: Awareness about avoidance strategies of coeducational college females was more in some selected aspects of awareness about avoidance of sexual harassment.

#### **Introduction:-**

Strategies for avoidance of sexual harassment are essential for everyone, whether female or male right from childhood. Strategies are identification of risk before the incidence occurs. Perception of threat from a situation makes an individual alert and decides when to take action for self safety<sup>i</sup>. The situation of facing harassment might differ in type of college females are studying. In co educational colleges females are more exposed to situations of sexual harassment and they learn from their experiences and are prepared to deal such situations in future where as in all women college female tend to ignore such situations to avoid embarrassment. A study done among college student in Bangalore reported that students from co-education colleges faced sexual harassment more as compared to those who study only in Women Colleges<sup>ii</sup>. The objectives of the study were: To find out the association between awareness of young female adults about strategies for avoidance of sexual harassment with type of college (women/Co-ed).

**Corresponding Author:-Ms. Keerthi Mohanan..**

Address:-Principal Investigator, Clinical instructor, Institute of nursing, KgmU Lucknow.

### Methodology:-

A quantitative approach, cross sectional survey was used and 200 young female adults studying in degree courses in the age group of 17-21 years from four selected colleges of Delhi University, two co-educational colleges and two women colleges were included by convenient sampling method. Students unwilling to participate were excluded from the study.

Fig no.1:- Sampling design

### Tools used:-

Subject data sheet: structured questionnaire for socio demographic profile and selected variables of the subjects and informed consent form. Tool 1: Interview schedule (IS) (05 items) to assess previous experience with sexual harassment either on self or observed by subjects and preferred action against sexual harassment and whom they would like to inform in a situation of sexual harassment. Tool 2: Structured questionnaire (AQ) (40 items-12 single answer questions and 28 multiple answer questions) for assessing the awareness of Young female adults about avoidance strategies for sexual harassment divided into seven groups (Table no 1). Each item was given a score of one and maximum score could be 172. The awareness was scored on five point scale, some<36, slightly(36-72), fair (73-108), just enough (109-144), good(145-172) and was further categorized as awareness levels- Excellent- good awareness scores, Satisfactory-just enough awareness scores and less than satisfactory-fair awareness scores. The content validity was done and reliability of the tool was assessed by test retest method by McNemer Chi square test and p value was found not significant for all questions. Pilot study was done on 30 subjects and was found to be feasible. Ethical clearance was obtained from ethical committee of AIIMS, New Delhi and informed consent was obtained from subjects. The data was collected from June to November 2014. Data were analysed using STATA 16.1 by appropriate descriptive statistics-frequency, percentage and inferential statistics- Pearson's chi square test and Fisher exact test.

### Description of the subjects:-

Mean age of the subjects was  $18.77 \pm 1.118$  years and the maximum age was 21 years and minimum was 17 years. All (100%) subjects were unmarried. Almost half (54%) of the subjects monthly family income was greater than Rs 60,000 /- Most (89.5%) of the subject belonged to Hindu religion and Most (65%) of the subjects were residing in urban area in Delhi NCR .

### Results:-

Nearly half of subjects in women's college had slight awareness and one tenth of subjects had just enough awareness about avoidance strategies for sexual harassment. Among subjects from co- educational college 34% of subjects had slight awareness, half of subjects had fair awareness and one fifth of the subjects had just enough

awareness about avoidance strategies for sexual harassment. There was no statistically significant difference between awareness of the subjects studying in women's college and coeducational college hence the knowledge of two groups is comparable. (table no 1)

Out of total 40 item awareness questionnaire a statistically significant difference was found in 13 questions among awareness of subjects about avoidance strategies for sexual harassment in women's college and co-educational college. Women in coeducational college had more awareness than in women only colleges in areas like definition of sexual assault, danger of sexual harassment from known to persons like neighbours and co-workers, place like crowded markets and office of officials need to be avoided as a prevention method, regarding informing media like radio and print media regarding incidence and were more aware regarding legal facilities against sexual harassment, regarding alarming signs for a date rape and importance of raising an alarm and asking help from others in an incidence of sexual harassment. Whereas females of women college had had a view to ignore an incidence of sexual harassment. (table no.2)

**Table no.1:-** Association of awareness of avoidance strategies among two women's college and two co-educational college (n=200)

Group	Awareness scores			
	Slight	fair	Just enough	P value
Females in women's college (n=100)	41(41%)	45(45%)	14(14%)	p=0.573
Female in co-educational college(n=100)	34(34%)	49(49%)	17(17%)	

**Table no.2:-** Comparison of awareness of subjects about avoidance strategies for sexual harassment among two women college and two co-educational colleges (n=200)

Areas of avoidance strategies	Awareness of avoidance of sexual harassment	Group 1(n1=100)	Group 2(n2=100)	p value
Description of sexual harassment	Sexual assault is sexual contact that uses force or coercion	41	67	0.005
Identification of high risk situation	There is need to be aware from neighbours for fear of sexual harassment	48	62	<.0001
	There is need to be aware from co-workers for fear of sexual harassment	49	64	0.047
	Sexual harassment can take place in crowded market	44	59	0.032
	One should avoid office of official due to fear of harassment	25	40	0.024
Actions against sexual harassment	If sexual harassment occurs outside office building by work related personnel, victim can file for harassment	83	96	.003
	Victim of sexual harassment should inform media like radio	24	13	0.045
	Victims of sexual harassment should inform media like newspaper journalist	30	14	0.006
	Women facing sexual harassment suffer from mental distress	85	94	0.038
	Aware of legal facilities against sexual harassment	34	50	0.022
	Victim should ignore unwanted sexual advances	17	07	0.030
Prevention of date rape	Getting a double meaning from friend on a date is alarming sign for possible harassment	50	66	0.022
Training to prevent and combat sexual harassment	Raising an alarm and taking help from others would be most useful to avoid sexual harassment	56	70	0.040

**Conclusion:-**

The female studying in co-educational colleges seems to be more prepared to deal a situation of sexual harassment. Women colleges need to introduce more awareness among their students about avoidance of sexual harassment.

**Implications:-**

School and college teachers need to identify early signs of harassment and take preventive steps in college premises. Youth need to be aware and avoid risk factors for safety of self and how to report the incident to prevent further harassment. In all institutional settings there need to identify signs of harassment, counsel the victim and referring to social worker and counselors for further services. Gender sensitization should be included in curriculum and in service education.

**Remedial actions taken:-**

During data collection all doubt pertaining to sexual harassment and avoidance strategies were explained if asked by subjects.

**Limitations:-**

No follow up counseling could be given to those subjects who required it due to time constraints.

**Recommendations:-**

Similar study can be done with larger sample size, with a qualitative approach, among different college going population, general population among boys and men.

NPWT-negative pressure wound therapy.

#### Abstract

**Introduction:** Vacuum Assisted Closure (VAC), sometimes referred to as Micro Deformational Wound Therapy (MDWT) or Negative Pressure Wound Therapy, has revolutionized the way wounds are treated over the last decade<sup>1</sup>.

**AIM:** To study and compare number of secondary amputations and number of debridements required between VAC and conventional moist dressing.

**Material and Methods:** 30 patients were selected. VAC was applied in 15 patients and changed every 3<sup>rd</sup> day and conventional dressings were done in 15 patients and dressings were changed twice daily.

**Results:** Number of secondary amputations and debridements has significantly reduced in Vac therapy than conventional.

**Conclusions:** Use of Vac in our study led to significant results and better outcome.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

In 1993, Fleschman et al., first documented the use of sub-atmospheric pressure to manage chronic wounds<sup>2</sup>. Argenta expanded this method by publishing a clinical report on effect of NPWT on complicated wounds<sup>3</sup>. It works on the principle of application of micromechanical forces that promote wound healing<sup>4,5</sup>.

In separate studies, Saxena et al<sup>6</sup> and Greece et al.<sup>7</sup> have further elucidated the role of open pore foam dressing in the creation of micromechanical deformations of the wound surface. These microdermal deformations are caused when negative pressure draws tissue into the foam pores. This stretches cells and promotes cell division that stimulates granulation tissue formation<sup>6</sup>. The rate of granulation tissue is faster in the later setting than the former<sup>8</sup>.

VAC dressings should be changed every 2-3 days. This hastens the wound healing by a) increasing the rate of growth of granulation tissue, b) stimulating proliferation of capillaries (angiogenesis), c) increasing local blood flow, d) applying mechanical pressure to promote wound closure, e) reducing bacterial load in the wound, f) suctioning matrix metalloproteinase in wound credentials, g) maintains a moist micro environment, beneficial for wound closure.<sup>9,10,11</sup>

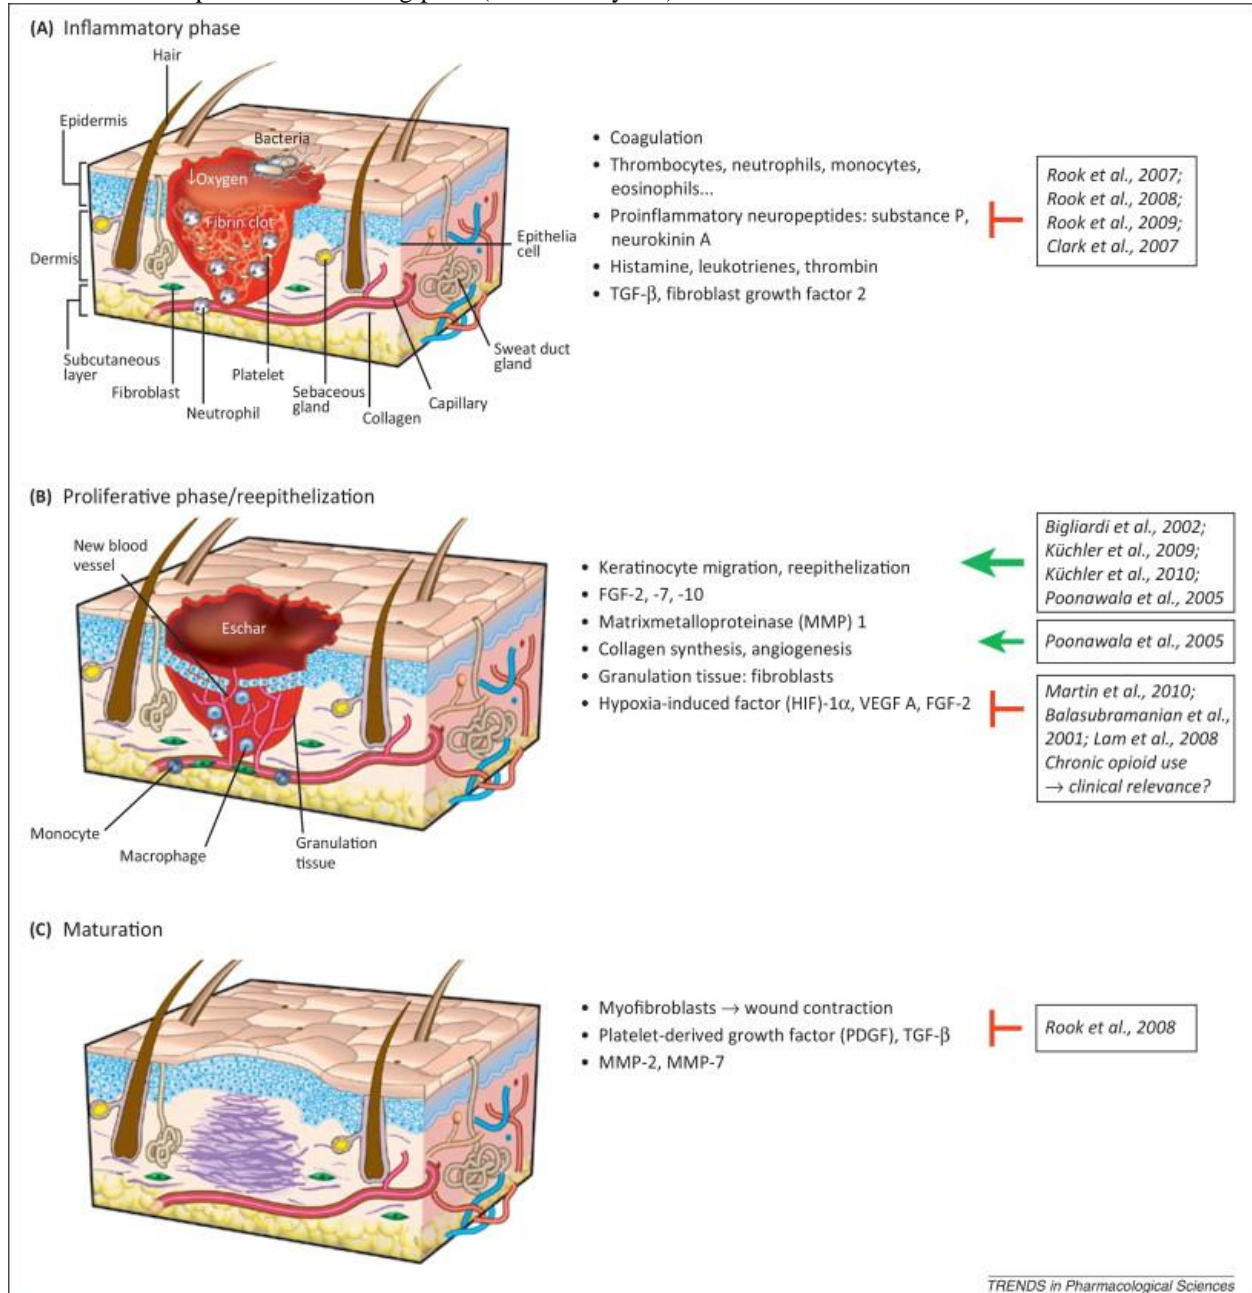

**Corresponding Author:- Dr. Saurabh Agarwal.**

Address:- Associate professor Department of General Surgery Himalayan institute of medical sciences, Doiwala, Dehradun.

Wound healing is the summation of a number of processes that follow injury<sup>12</sup>. The same events, in the same order, occur in every healing process in all the tissues. Duodenal ulcers, myocardial infections, cellulitis, long bone fractures, surgical incisions and traumatic wounds all undergo the same reparative processes<sup>13</sup>.

**Sequence of healing process:-**

1. Inflammatory phase or reactive phase(1-6weeks).
2. Proliferative phase or regenerative phase(2weeks- 2years).
3. Maturation phase or remodeling phase(6months- 2years).

Clinical factors affecting wound healing<sup>13,14,15</sup>

**Local factors:-**

Infection,presence of necrosis,foreign body,site of wound-excess local morbidity (such as over the joint),venous and lymph stasis due to poor drainage,recurrent trauma,inadequate blood supply,poor surgical apposition,wound dehiscence.

**General factors:-**

elderly age,hypoxemia-anemia, hypovolemia,shock of any cause,coronary heart disease leading to peripheral shut down,congestive heart failure causing odema and fluid over load,C.O.P.D causing reduced O<sub>2</sub> saturation of the blood,acute respiratory disease such as pneumonia,malnutrition,diabetis with poor glyceemic control,immunodeficiency,obesity and smoking.

**Chronic leg ulcers**<sup>14,15, 16,17,18</sup>

A chronic leg ulcer is a loss of skin below the knee on the leg or foot which takes longer than 6 weeks to heal despite of standard treatment of underlying disease and local wound care.However the SIGN(1998) guidelines consider 4 weeks to be definitive.

**Complications of vac<sup>6</sup>:-**

Common complications include bleeding,infection,pain,foam retention within the wound,tissue adherence.other less complication include hypergranulation.

**Aim:-**

To compare the efficacy of VAC over regular conventional dressing.

EFFICACY includes:number of debridements required and the number of secondary amputations required and graft uptake.

**Materials and Method:-**

Out of 60 pateints presenting with ulcer over a period of 5 months,30 patients were selected.

*Criteria for exclusion:*Patients with malignant ulcers, with venous ulcers,with peripheral arterial occlusive disease,with ICU stay,with ulcers greater than 15cm size in largest dimension,with more than one ulcer,with chemical burns,charcot`s disease.

In experimental group after surgical debridement, simplified VAC was applied and changed every 3 day.

In control group saline soaked guaze dressings were applied at the time of surgical debridement and changed twice daily.

**Method:-**

VAC –procedure

- Placing a sterile,polyurethane foam dressing,into the wound defect after it has been trimmed to shape.
- Adhesive drape was used to cover the foam and additional 3 to 5cm of surrounding intact skin.
- A slit measuring 1 to 2 cm long was created in the drape –it acted as the diameter of the circular hole which was cut in the drape.The non-collapsible tube was placed directly over the hole in the drape and connected to the electronic vacuum pump.
- Finally,negative pressure was applied to the wound via the therapy unit,causing the dressing to collapse into the wound.
- A standard negative pressure of -125mm of hg was applied to the wound,continuously.
- Change of dressing was performed every 48 to 96 hours in the ward for the patient by a trained technician from KCI wound care in the presence of doctor/nurse.

**Conventional dressings:-**

- Conventional dressing used cleansing of wound with hydrogen peroxide or normal saline and application of betadine.
- Wound dimensions were measured with a ruler. Examination was done on the day following first debridement for control and on the day of application of VAC for study group. Graft uptake was assessed on the day of discharge.

**Factors Assessed:-**

- Number of redebridements that followed.
- Number of amputations that followed.
- Graft uptake.

Data analysis: A t-test was used to compare means of variables in between the groups and z-test used to compare proportions.

A p value of 0.05 was used to determine statistical significance.

**Results:-**

Number of total cases: 60

Cases included in the study: 30

**Amputations:-**

p=0.0378

3 patients in control group had to undergo amputations in the lower limb whereas none of the patients in VAC had to undergo amputation.

**Graft uptake:-**

In 27 patients in VAC group and 22 patients in control group had graft uptake of more than 50%.

**Redebridements:-**

$p=0.0004$

6 patients in VAC group had to undergo a second debridement following application of VAC where as 16 patients in control group had undergone a second debridement.

**Discussion:-**

- Vac therapy resulted in significant reduction in number of amputations.
- Vac therapy resulted in statistically significant improvement in graft uptake.
- Vac therapy resulted in significant reduction in number of surgical debridements.

**Comparison with other studies:-**

A randomized control study by Ali et al (2014)<sup>19</sup> concluded that VAC therapy results in faster appearance of granulation and fewer amputation, a conclusion similar to our study.

A multicentre randomized control study by Blume et al<sup>20</sup> concluded that Vac therapy results in reduced amputations, a conclusion similar to our study.

Demerits: The difference in the wound characters were not studied at histopathological level. Study has observer bias as it is not a blinded study.

**Conclusion:-**

The efficacy of NPWT in promoting healing of ulcers of lower limb has been largely accepted by clinicians. We believe that advances in mechanobiology, the science of wound healing, the understanding of biofilms, and advances in cell therapy will lead to better care of our patients.

#### Abstract

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

##### Insomnia:-

Insomnia comprises complaints of disturbed sleep despite optimal time and conditions for sleep." According to the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV-TR®), primary insomnia is defined as difficulty initiating or maintaining sleep, or nonrestorative sleep, at least 3 times a week for at least 1 month that does not occur in the presence of another mental disorder or comorbid medical condition and results in next-day functional impairment. The patient's experience of insomnia may be related to sleep onset (difficulties in falling asleep) maintaining sleep (uninterrupted sleep without nocturnal awakenings), or total sleep time (inadequate amount of time asleep or waking too early). All of these circumstances can result in complaints of poor daytime functioning. More than one study showed that women were reported more than men to have insomnia with day time disfunction. Other study showed that People with severe nocturnal awakenings who were unable to return to sleep were more likely to suffer from daytime sleepiness (odds ratio [OR], 2.1), cognitive difficulties (OR, 2.8), moderate or

Severe fatigue (OR, 2.6), depressive disorders (OR, 2.5), or anxiety disorders (OR, 1.9) than were those who awoke frequently and could return to sleep. Insomnia associated positively with age, female gender and lower education. It is also found to be more in urban residents more than in rural people. About one forth is the prevalence of insomnia in studies were conducted USA, Austria, Taiwan and Poland.

Sleep apnea:

Obstructive sleep apnea (OSA) is a common disorder. There are important clinical consequences for affected individuals. A characteristic is repetitive collapse of the pharyngeal airway during sleep yielding hypoxia and hypercapnia and to reestablish airway patency arousal is required. Consequences are daytime sleepiness, decreased cognitive performance, decreased quality of life and a higher risk of car accidents. OSA may also lead to adverse cardiovascular consequences such as hypertension, myocardial infarction and stroke[3]. Sleep disordered breathing (SDB) is an abnormal breathing pattern during sleep that is often quantified as the apnea-hypopnea index (AHI). The presence of SDB and symptoms of sleep disruption are required for the clinical diagnosis of OSA. The term

SDB refers to the physiological abnormality observed in patients with the clinical syndrome of OSA[4]. In the general population the occurrence of SDB concerns about 9% of middle-aged women and 24 % of middle-aged men. Only 2% of women and 4% of men complain also of daytime sleepiness and meet the strict criteria for OSA. Older and more obese populations have a higher prevalence [4]. Diabetes and obstructive sleep apnea (OSA) are common disorders and coexist very often. The presence of the shared risk factors, i.e. obesity, may be the reason for this overlap. Maybe there is also a more complex relationship between these conditions in which an underlying metabolic disorder predisposes to both or in which metabolic and autonomic abnormalities associated with one influence the development of the other. There is a possibility that the presence of both conditions results in additive or even synergistic health risks, because diabetes and OSA are associated with increased cardiovascular morbidity and mortality. Patients with diabetes suffer very often from sleep apnea. According to research 50% of male patients with diabetes have sleep apnea [2] The prevalence of SDB (AHI>20) was 36% in patients with diabetes compared with 15% in normoglycemic subjects , reported in a study among middle aged men. Therefore increased awareness of symptoms and signs of OSA in a diabetic patient population[4].

with diabetes compared with 15% in normoglycemic subjects , reported in a study among middle aged men. Therefore increased awareness of symptoms and signs of OSA in a diabetic patient population[4].

**Statement of need:-**

- Many studies were made worldwide to determine
- the frequency of insomnia , but none of these studies were done
- locally . This study was made to correct this
- defect.

**Objectives:-**

**Specific Objectives:-**

**To Determine:-**

- The frequency of insomnia in a large Saudi population presenting directly to the general physician (GP).
- The impact of insomnia on the quality of life, on the use of health-care resources and on co-morbidity.
- To assess the prevalence of sleeping problems and their relation to sociodemographic characteristics in the Saudi population.
- To differentiate poor from good sleepers.
- To find the association between depression and insomnia.
- To assess the level of insomnia among Saudi population

**Secondary Objectives:-**

To assess whether co morbid factors were associated with sleep disorders in this population.

**Methodology:-**

This study was conducted at systemically random chosen primary care Centers, in Riyadh. patients who met our inclusion criteria were interviewed at each site.. The interviewer explained the objectives of the study and obtained patient consent for enrollment in the study. The data collection was carried out by personal interview, using a structured questionnaire adapted from earlier relevant published studies. All questions were accurately specified and thoroughly discussed and reviewed with the survey conductors before the study started.

This questionnaire has been translated into Arabic and validated.

**Study Design:-** Quantitative observational cross-sectional.

**Sampling Method:-**

The primary centers were chosen systemically random depending on the 5 region in that city (north, south ,west, east and central) . And the days of a week were chosen systemically random.

**Study Subjects:-**

**Inclusion criteria:-**

We will enroll all patients of age >18 years.

**Exclusion Criteria:-**

1. Patient refusal.
2. Psychiatric disorders

**Sample Size:-**

We interview all consecutive patients who met our inclusion criteria at systemically chosen primary centers in Riyadh. Our aim is to have 400 patients.

**Location and time :-**

.....of this sample were taken from Iry care clinic in king Fahad National Guard hospital , ..... Were taken from Iry care clinic in King Khalid hospital and ..... were taken from Iry care clinic King Saud complex hospital the sample was divided to..... male and ..... female in each hospital

The sample was selected mainly in the time from 7am to 4pm in all the hospitals.

**Data Collection tool:-** Questionnaire

The study questionnaire is divided into 5 sections as follows:

**Section 1:-**

Includes questions on common demographic characteristics such as age, gender, and height, weight, education level, marital status, employment, special habits.

**Section 2:-**

Includes questions in past medical history ,chronic illnesses and medication taken.

**Section 3:-**

Includes questions about insomnia. It consists of five validated questions[11] The first three questions about symptoms of insomnia, difficulties falling sleep. Awake up too early, if they have difficulty falling a sleep after awakening. The other 2 questions are about second daytime dysfunction (mood change, or tiredness) due to insomnia

Patients are considered having insomnia (level one) if answered yes to any of the first three questions and considered to have insomnia with daytime dysfunction (level two), if answered yes to at least four of the five questions.

**Section 4:-**

It is the Epworth Sleepiness Scale

The aim of this questionnaire is to get a measure of your sleepiness during the day. This helps distinguish between normal everyday tiredness and an abnormal level of sleepiness.For each of the situations below please indicate how likely you are to doze off or fall asleep. This refers to your usual way of life in recent times. If your sleepiness is variable (for example if you work shifts) then try and give an average.If you have not done some of these things,try and imagine how they would have affected you.

**Use the following score to indicate the most appropriate Answe:-**

- 0 = would never fall asleep in that situation.
- 1 =there is a slight chance of falling asleep in that situation.
- 2 = there is a medium chance of falling asleep in that situation.
- 3 =there is a high chance of falling asleep in that situation.

**Section 5:-**

Quality Index (PSQI) [13]. Nineteen individual items generate seven “component” scores: subjective sleep quality, sleep latency, sleep duration, habitual sleep efficiency, sleep disturbances, use of sleeping medication, and daytime dysfunction. The sum of scores for these seven components yields one global score.

Patients with a PSQI score  $>5$  are conventionally defined 'poor sleepers', whereas those with a score  $<5$  are considered 'good sleepers'.

#### **Section 6:-**

This section includes questions about depression using rapid screening for depression questionnaires developed for medical patients by Jefford, M et al .

#### **Data Analysis:-**

##### **software used:-**

##### **sampling technique:-**

##### **▪ Pilot Study:**

#### **Report:-**

The pilot study was conducted to test the translation of the questions, to see if there is any difficulty in understanding the questionnaire ,and to gain feedback from the participants.

We did the pilot study in period interval of 2 days from                    to                    in the same location as the main study was conducted, in primary care centers that were chosen by systemically random from Riyadh city, and the primary care centers were King Saud Complex Hospital, King Fahad National Guard hospital ,and King Khalid University Hospital.

We divided the team into three group ,each group composed of 3 to 4 students , and each group was given one location from the three main primary care center.

We interviewed the participants from 8 a.m. to 3 p.m. for 2 days, and the total participants were 50 person that have been chosen randomly , and the time taken for each interview was ranged from 8 to 20 minutes with average of 14 minutes.

The male participants were more cooperative and no difficulties were found in interview and giving feedback about the questionnaire.

#### **Team observations:-**

1. Getting permission will make the work more feasible, less time consuming, and of course more official.
2. Difficulties in contacting and communicating females, and no comments were earned
3. There were many refusals, because they were afraid to miss the scheduled appointment if they had the interview.
4. And also there were many interruptions because the participants had to stop the interview to see his or her doctor when the time of the appointment came.

#### **Participants' suggestions:-**

- First, many participant said that the interview method was a better way to understand the questions that the self-administered form.
- Second, most of them suggested to conduct the interview after the participant get out from his or her appointment to prevent any interruption.

#### **Results:-**

- After analyzing the answers given by the sample that we chose to conduct our study on, we came to these results:
- About 77% of the sample is suffering from insomnia in age ( $34.9 \pm 14.5$ ). It is been shown a high prevalence among the people who are poor sleepers (PSQI $>5$ ). About 48% of insomniac has a depression (more in female) & BMI ( $27.3 \pm 5.3$ ). There is no deference between the insomniac & normal people according to their neck size ( $14.5 \pm 2$ :  $14.8 \pm 2$ ), ESS & BMI. The ratio between male & female is almost equal.

#### **Discussion:-**

- The prevalence of insomnia in Saudi general population were similar to what has been reported in literatures.
- About 77% of the sample is suffering from insomnia in age ( $34.9 \pm 14.5$ ). It is been shown a high prevalence among the people who are poor sleepers (PSQI $>5$ ). About 48% of insomniac has a depression (more in female) &

BMI ( $27.3 \pm 5.3$ ). There is no difference between the insomniac & normal people according to their neck size ( $14.5 \pm 2$ :  $14.8 \pm 2$ ), ESS & BMI. The ratio between male & female is almost equal.

**Table 1:-**

Attributes	Insomnia		P-Value
	No (n=75)	Yes (n=245)

PSQI*	$4.6 \pm 2.7$	$6.4 \pm 3.2$	0.0000
Sex (Male)	50 (67)	163 (67)	0.9830
Obese (BMI $\geq$ 30)	19 (25)	71 (29)	0.539
ESS $\geq$ 10	18 (24)	47 (19)	0.364
Poor Sleeper (PSQI $>$ 5)*	32 (43)	172 (70)	0.000
Depression	32 (42.7)	118 (48.2)	0.404

Comparisons on the basis of insomnia presence

Attributes	Sex		P-Value
	Male (n=213)	Female (n=107)	
Age(year)	$35.1 \pm 14.7$	$32 \pm 12.2$	0.0566
Neck Size (inch)	$14.6 \pm 2.1$	$14.6 \pm 1.9$	0.7922
BMI	$27.4 \pm 5.7$	$26.7 \pm 5.2$	0.2773
ESS*	$5.9 \pm 3.8$	$7 \pm 4.9$	0.0236
PSQI*	$5.6 \pm 2.9$	$6.7 \pm 3.6$	0.0022
Insomnia	163 (77)	82 (77)	0.9830
Obese (BMI $\geq$ 30)	60 (28)	30 (28)	0.980
ESS $\geq$ 10*	36 (17)	29 (27)	0.0320
Poor Sleeper (PSQI $>$ 5)*	127 (60)	77 (72)	0.030
Depression*	78 (37)	72 (67)	0.000

\* p<0.05

**Table2: Comparison on the basis of Sex**

### Conclusion:-

Insomnia in the population is a major health problem with a high prevalence among poor sleepers & depressed persons.

Poor sleeping & depression are risk factors to develop Insomnia. However, the problem is still under diagnosed in the population. Therefore, we recommend to train the GP in primary clinics to diagnose chronic sleep disorders such as Insomnia & do more health education for the society to know how problem is big.

### RESEARCH ARTICLE

#### PEDIATRIC CASE OF ACCIDENTAL ORAL OVER DOSE OF METHOTREXATE.

**Mohammed Almadan, Hedayah Hodayah and Ghufraan Hodyah.**

Pediatrics Department, King Fahad of The University Hospital, Khobar, Kingdom of Saudi Arabia.

#### **Manuscript Info**

##### **Manuscript History**

Received: 10 December 2016

Published: February 2017

#### **Abstract**

We present the second youngest reported case of a single oral overdose of methotrexate in otherwise well 19 month old child. Initial history revealed possible ingestion of 10 tablets, each containing 2.5 mg. The peak methotrexate level was 92 mmol/L measured 8 hours following ingestion.

*Copy Right, IJAR, 2017.. All rights reserved.*

#### **Introduction:-**

paediatric cases of accidental overdose has been one of the most common causes of injury in children less than 5 years of age (1). Although preventive measure has decrease the incidence of paediatric overdose, it continues to occur. Early recognition and treatment is essential to prevent morbidity and mortality. Our case is an accidental oral overdose of MTX, the management is not well established, it's mainly based on experience following parenteral overdose of methotrexate in children.

#### **Case Report:-**

A 19 month old girl presented to the paediatric emergency of King Fahad Hospital of the University 2 hours after she was discovered by her mother that she was playing with her grandmother methotrexate tablets that had fallen to the floor, and some in her mouth. The exact number of tablets was not known, but each tablet contains 2.5 mg of methotrexate. The total tablets were 50, the possible ingestion of 10 tablets. There were no symptoms between ingestion and presentation to local hospital. Patient was given activated charcoal and sent home, but she presented to the emergency department. The child was otherwise well with no significant medical history. The child had no history of nausea, vomiting, abdominal discomfort or stool changes, and was not on any medication.

She appeared well and alert with normal observation. Her weight was 11.2 kilogram and clinical examination was unremarkable. The patient was admitted for observation. A peripheral intravenous line was established and blood sample were sent for routine laboratory studies with determination of methotrexate levels at a reference laboratory. With serial laboratory result (Table 1), the initial methotrexate level was not available from a reference laboratory; however, because the patient could have taken up to 25 mg of methotrexate (51 mg/m<sup>2</sup>), she was admitted to the paediatric ICU for monitoring. Serial laboratory studies and leucovorin therapy given as needed. She was managed initially with IV hydration with sodium bicarbonate (40 mg/l) and folic acid given orally in a dose of 1 mg/day.

The following morning it was decided to start treatment with 10 mg of calcium folinate infusion (leucovorin) every 8 hours which is equal to 40 mg/day equivalent to the maximum dose of methotrexate ingested (1 mg/mg MTX).

**Corresponding Author:- Mohammed Almadan.**

Address:- Pediatrics Department, King Fahad of The University Hospital, Khobar, Kingdom of Saudi Arabia.

The child remained in the paediatric ward while she completed 72 hours of leucovorin rescue. Later that first day of admission, the methotrexate level from the initial blood test confirmed a toxic level  $0.92 \mu\text{mol/litre}$ . The dose of calcium folinate was  $10 \text{ mg six hourly on day 2}$ , and  $15 \text{ mg six hourly on day 3}$  based on the corresponding methotrexate level. On day 4, the methotrexate level was less than  $0.02 \mu\text{mol/litre}$  and calcium folinate discontinued.

### Discussion:-

Methotrexate (MTX), a folic acid analogue and antagonist, is used in the treatment of particular cancers, autoimmune diseases, placenta accrete and ectopic pregnancy. MTX binds to the enzyme dihydrofolate reductase (DHFR), inhibiting the formation of reduced folate and thymidylate synthetase, resulting in the inhibition of de novo thymidylate, purine and protein biosynthesis.

At oral doses of  $< 20 \text{ mg/m}^2$ , MTX is rapidly absorbed by an active saturable transport mechanism with a bioavailability of 50–95%, a peak concentration of  $0.3\text{--}2.2 \text{ mmol/l}$  being reached within 1.5–2.5 h from intake, and an elimination half-life of 4–6 h, which is dependent on numbers of factors including age, concentration, duration of exposure, and renal function.

There is great variability in blood levels, toxicity and response among patients receiving the same dose per weight or body surface area. This diversity can, to some extent, be linked to some extent to the sequence of variations in genes involved in drug absorption, metabolism, excretion, cellular transport, and effector targets or target pathways.

Millimolar concentrations of MTX for minutes or hours may lead to acute renal, CNS, and liver toxicity, whereas concentrations of  $0.05\text{--}0.1 \mu\text{mol/l}$  for more than 24–48 h will result in haematological and gastrointestinal toxicity. DNA synthesis in bone marrow and intestinal epithelium will be inhibited if MTX concentration was greater than  $10 \text{ mmol/L}$ .

Oral ingestion of MTX results in little toxicity. This may be attributable to the pharmacodynamics of MTX. Toxicity from overdose, however, as its indications for use increase, more accidental overdoses can be expected. MTX toxicity can affect multiple organ systems including bone marrow, liver, intestinal tract, kidneys, lungs, skin, and blood vessels, resulting in death in severe cases.

The physical side effects of MTX in children are the same as in adults, though children generally tolerate MTX well. The most common side effects involve the gastrointestinal tract, including nausea and vomiting, transient elevation of liver-associated liver enzyme levels, usually occurring within the first 24 hours. Most cases are mild, cause no symptoms, resolve within 7 to 10 days, and result in no permanent liver damage. Large overdose can result in acute hepatitis.

**Table.1** Result of blood tests including methotrexate levels taken at this times shown post ingestion

	Time postingestion							
	8h	24h	Day 2	Day 3	1 week	2 week	3 week	4 week
Methotrexate, $\mu\text{mol/l}$	0.92	0.04	0.01	0.01	Nil

Phosphate, mmol/l (1,20-1.70)	5.7	5.1		3.8	5.1			5

Few data exists in the literature to guide management of oral MTX overdose in children or to inform prognosis. (6)

Treatment recommendations for pediatric MTX exposures do not differentiate between routes of exposure. Management of symptomatic patients involves supportive care, if available the administration of antidotes, and the removal of the offending drug from the body. (7)

In this case the patient was asymptomatic and had ingested unknown amount of MTX. Her initial serum level of 0.92 mmol/L, reported after admission, was 10 times the threshold for toxicity. Leucovorin rescue at a dosage equal to the maximum amount of MTX ingested has been initiated along with urine alkalinisation and diuresis to enhance elimination. Additional care includes continued leucovorin treatment, activated charcoal in ER and monitoring of MTX levels. The available recommendation of managing oral overdose of MTX includes the use of activated charcoal, gastric lavage, folic acid rescue and urinary alkalinisation. The factors which are important to be addressed in the management of MTX poisoning are the time of presentation and severity of toxicity. (10)

In case series of mainly adult oral overdoses of methotrexate there were no adverse outcomes in patients where folic acid rescue was withheld; however, there is no information regarding ingested amounts or serum methotrexate concentrations and is therefore of limited value. (11)

In the context of MTX poisoning leucovorin is given within a time period of 4 hours of the overdose with most of its therapeutic effectiveness occurring within the first hour of the overdose. Moreover, the initial doses should be equal or greater than maximum possible dose of MTX ingested. (4)

The favourable outcome seen in our patient despite delayed folinic acid rescue brings into question the urgency and the level of treatment required following a single oral overdose of methotrexate. Low to moderate level of MTX and the limited time of exposure following single oral overdose of MTX may contribute to the benign outcome in this case.

There is probably insufficient data in children at the current time to avoid intravenous leucovorin therapy and monitoring for toxic side effects. However, supportive care and observation only should be considered the mainstay of treatment. (6)

**Introduction to Microfinance:-**

Basically microfinance is a channel which provides fund to the community or group who do not have approach to banking services. Micro-credit, by definition, means short term loans that are advanced to poorer sections of the society for the purpose of self-employment or any activity plan which help them to earn income and take care of their families.

Over the past few decades, Microfinance sector has grown rapidly. In 1976, Muhammad Yunus, established Grameen Bank, Bangladesh which was considered as the foundation of the modern MFIs. This bank was established with the objective of providing financial facilities to the needy and weaker sections of the society. This bank focuses more on women to help them increase their standard of living, earn profit and become financially strong and independent. According to Yunus, poor people are like 'human bonsai'. They were deprived because society had not accepted their existence and left without the real social and economic support to develop. Grameen Bank took effort to shift the neglected community to the main stream of the society. For the pioneering work on micro-finance, Nobel Prize was awarded jointly to Mr. Mohammad Yunus and Grameen Bank in the year 2006.

**Corresponding Author:- Dr. Mrs. Manisha Vikas Jagtap.**

Address:- Assistant Professor, Rajarambapu Institute of Technology, Department of Management Studies, Sakharale.

Today, this micro finance business has progressed into a vibrant industry. By providing short term loans to promising entrepreneurs, this sector helped them to establish new businesses. When talking about giving refinance facility to MFIs significant role has been played by the Non-Banking Financial Companies, Regional Rural Banks, Commercial Banks, Co-operative societies etc.

Microfinance sector has become imperative sector. It was initially started with micro investments, micro saving then it was engaged in micro credit. Now they transformed into micro enterprises. This continuous progression has created a chance to the rural people to develop and achieve reasonable monetary, societal and educational empowerment. Thus, it has helped them in moving toward improved standard of living and quality of their life.

### **Role of Microfinance:-**

The latest research of World Bank highlights that, India is a country with almost one third of the world's poor. Central government and state governments are taking efforts for poverty alleviation. Many programs are currently active in various regions of India. Along with them the microfinance is also contributing through their work towards financial inclusion. In the past few decades it has actually provided money to the unnoticed communities and thereby helped to get rid of poverty. Government Reports be evidence for the progress of the people who have taken advantage of micro credit facility and have been able to enhance their earnings and hence the standard of living.

Through 'Pradhan Mantri Jan-Dhan Yojna' the government is taking efforts to attract more and more public for opening their saving accounts with zero balance, total 21.61 crores account opened till date i.e. 21<sup>st</sup> Sept., 2016. This indicate that yet major portion of the Indian population still don't have their savings account in banks and thus unable to avail all banking services. Underprivileged communities also require monetary services to accomplish their wants like spending, construction of property and security against future uncertainty. Microfinance institutions serve as an addition to banks and in some sense a superior because along with providing credit they also offer other financial services like savings, insurance and non-financial services like personal counseling provide guidance and support to start small business etc. The borrower gets all mentioned services at their door step and many time the MFI design repayment schedule in such a way which borrower find convenient. But important drawback lies with these institutions that all services & facilities come at high cost. The interest rates charged by them are higher than commercial banks and vary widely from 10 to 30 percent.

### **Case Study of Bandhan:-**

"Bandhan is about togetherness, we work for inclusive growth" Mr. Chandra Shekhar Ghosh, Managing Director and CEO of Bandhan Bank.

### **Background:-**

With the desire of changing Kolkata's agrarian surroundings, Mr. Chandra Shekhar Ghosh founded— Bandhan, India's largest tiny loans giver.

Mr. Chandra Shekhar Ghosh founded Bandhan Financial Services Limited (BFSL) in the year 2001. This micro finance institution is involved in providing loans to small customers, those who have no or less way in to official banking services. From past 15 years, BFSL is funding for small business entrepreneurs and women borrowers. Thus, it has earned trustworthiness and many great compliments for their contribution for the development of the community who are unnoticed by the formal banking system.

The organization has a network of 2,022 branches spread across 22 Indian states and Union territories, serviced by over 15,000 employees.

### **Management:-**

Dr. Ashok Lahiri is the Chairman of Bandhan Bank. And Chandra Shekhar Ghosh is acting as the managing director and chief executive officer of the bank.

### **Interest Rates (August, 2015):-**

- The interest rate for the savings bank account has been fixed at 4.5% for a balance of up to Rs. 1 lakh and 5% for balance above Rs. 1 lakh

- The interest rate for term deposit has been fixed at 8.5% for 1-3 years. It will also give additional benefits of 0.5% extra interest to senior citizens.

### **Its Progress & Transformation:-**

Bandhan has its headquarter at Kolkata; it is the first bank to be set up in eastern part of India after Independence. Bandhan bank's two-third branches and three fourth of its loans are in West Bengal, Assam and Bihar. It had a gross loan portfolio of about Rs 5,700 crore as of March 2014 though it functions in under-banked regions of India.

Bandhan received the in-principle approval of the Reserve Bank of India (RBI) for setting up a universal bank in April 2014. Then Bandhan Bank Limited was incorporated on 23rd December 2014 as a wholly-owned subsidiary of Bandhan Financial Holdings Limited. In June 2015, the banking regulator gave its final permission. Bandhan Financial Holdings is owned by Bandhan Financial Services Limited (BFSL), the largest micro finance organization in India.

As per the RBI licensing norm, capital limit to start a new bank is Rs. 500 crore. But the Bandhan Bank started with a capital base of Rs. 2,570 crore. As on 31 March, 2015, Bandhan Financial Services Limited had provided loan of about Rs. 9,524 crore and the repayment rate is over 99%.

The BFSL 2,022 branches have transformed into door step service centers for Bandhan Bank. The Bandhan bank has thus started with 501 branches and 50 ATMs on day one. Now the total staff strength of the bank is around 19,500. The bank had made net profit of Rs. 275 crore during eight months period i.e. August 2015 to March 2016.

Bandhan Bank expects to propose its outstanding banking products and services to all different sectors of the society. Though it is a bank for all, yet they want to continue their focus on providing funds to meet the financial requirements of community who are ignored by the formal banking system. Also they expect to extend their services by focusing more on generating better education, wellbeing and self-employment opportunities to the poorer sections of the society.

The management of the Bandhan bank now desires to expand the loan portfolio by increasing lending funds to retail business and Micro and Small Medium Enterprises.

### **Investors:-**

Besides its founder, Chandra Shekhar Ghosh, Singapore Sovereign Wealth Fund GIC, World Bank's International Finance Corporation (IFC), North Eastern Financial Inclusion Trust, Bandhan Employees Welfare Trust and Small Industries Development Bank of India (SIDBI) are the main investors of the bank.

### **Conclusion:-**

Micro finance institutions are basically established with the objective of providing financial facilities to the needy and weaker sections of the society. They helped the government to get rid of poverty and achieve economic development of the country.

The banking sector gives the impression to get a new competitor and a boost in the economy in India. After 11 years, India has got a new private bank – Bandhan Bank. The bank is a full-blown commercial bank that came into being recently. Bandhan is also the first microfinance company in India that has been transformed into a bank. It got a banking licence from the Reserve Bank of India in 2014. The bank is set up to cater to the needs of the unorganized sector such as daily wage earners and women running small business. The bank focuses on Eastern India as banking penetration is still poor in the region but at the same time want to expand their loan portfolio by increasing lending funds to retail business and Micro and Small Medium Enterprises. In future, it expects to offer saving, insurance and remittance services to the needy people of the society.

#### Abstract

This paper presents the introduction of Biometric and multimodal biometric system. Then this paper addresses various advantages and applications of Biometric system. It also discusses about various existing algorithm for image processing and voice recognition.

*Copy Right, IJAR, 2017.. All rights reserved.*

#### Introduction:-

Security system can be used for Identity, Security and Time & Attendance. These systems can be used for all of your sites to accurately record time & attendance of all of your workers/solders including Home, Office and border.

Why do we use face and voice recognition?

1. Universal: Everyone has a face and voice, everyone can enroll.
2. Non-intrusive: A contact is not needed for verification process.
3. Incredibly Fast: Verification takes approximately 5 seconds.
4. Accurate: Better than humans at verifying identity, and able to work 24 hours a day.
5. Dependable: Successfully deployed in challenging real – life environments, overcoming usual biometric obstacles such as dust, dirt, grease, variable lighting and user co-operation.

#### Biometric system:-

Biometric consists of methods for uniquely recognizing humans based upon one or more intrinsic physical or behavioral traits. A biometric system is operates by acquiring biometric data from an individual. We are extracting a feature set from the acquired data, and comparing this feature set against the template set in the database. Depending on the application context, a biometric system may operate either in verification mode or identification mode. In the verification mode, the system validates a person's identity by comparing the captured biometric data with her own biometric template(s) stored system database. In the identification mode, the system recognizes an individual by searching the templates of all the users in the database for a match. Biometric system have now been deployed in various commercial, civilian and forensic applications as a means of establishing identity. These systems rely on the evidence of fingerprints, hand geometry, iris, retina, face, hand vein, facial thermo gram, signature, voice, etc. to either validate or determine an identity. (11) Most biometric systems deployed in real-world applications are unimodal, i.e., they rely on the evidence of a single source of information for authentication. These systems have to contend with a variety of problems such as: Noise in sensed data, Intra – class variations etc. (11)

Examples of some of the biometric traits associated with an individual Fig.1.1

- (a) Fingerprint,(b) face,(c) hand geometry,(d) signature,(e) iris and (f) retina

Address:- Chottu Ram Institutions of Law Rohtak, Haryana, India.

Some of the limitations imposed by unimodal biometric systems can be overcome by including multiple sources of information for establishing identity. Such systems, known as multimodal biometric systems, are expected to be more reliable due to the presence of multiple, (fairly) independent pieces of evidence. These systems are able to meet the stringent performance requirements imposed by various applications.

#### **Multimodal biometrics:-**

A multimodal biometric system uses multiple applications to capture different type of biometrics. This allows the integration of two or more types of biometric recognition and verification systems in order to meet stringent performance requirements. A multimodal system could be, for instance, a combination of fingerprint verification, face recognition, voice verification and smart-card or any other combination of biometrics. This enhanced structure takes advantage of the proficiency of each individual biometric and can be used to overcome some of the limitations of a single biometric (14).

A multimodal system can combine any number of independent biometrics and overcome some of the limitations presented by using just one biometric as your verification tool. Multimodal are generally much more vital to fraudulent technologies, because it is more difficult to forge multiple biometric characteristics than to forge a single biometric characteristics. Multimodal biometric systems provide anti-spoofing measures by making it difficult for an intruder to simultaneously spoof the multiple biometric traits of a legitimate user. By asking the user to present a random subset of biometric traits (e.g., right index and right middle fingers, in that order), the system ensures that a “live” user is indeed present at the point of data acquisition. Thus, a challenge-response type of authentication can be facilitated using multimodal biometric systems.

#### **Modes of Operation:-**

A multimodal biometric system can operate in one of three different modes: serial mode, parallel mode, or hierarchical mode. In the serial mode of operation, the output of one biometric trait is typically used to narrow down the number of possible identities before the next trait is used. This serves as an indexing scheme in an identification system. For example, a multimodal biometric system using face and fingerprints could first employ face information to retrieve the top few matches, and then use fingerprint information to converge onto a single identity. This is in contrast to a parallel mode of operation where information from multiple traits is used simultaneously to perform recognition. This difference is crucial. In the cascade operational mode, the various biometric characteristics do not have to be acquired simultaneously. Further, a decision could be arrived at without acquiring all the traits. (14)

#### **Applications of biometric systems:-**

The applications of biometrics can be divided into the following three main groups:

Government applications such as national ID card, correctional facility, driver’s license, social security, welfare – disbursement, border control, passport control, etc.

Forensic applications such as corpse identification, criminal investigation, terrorist, identification, parenthood determination, missing children, etc. (14)

#### **Still-image versus video:-**

In the literature, two main forms of face recognition exist: Still image based face recognition and video face recognition. Still image face recognition relies on classifying an individual based on a single image obtained from a still shot camera. Conversely, video based face recognition relies on a sequence of frames to extract more information about the face of a subject.

An inherent advantage of using still-image-based face recognition over video based systems is that the images are of higher resolution. As a result, current face recognition algorithms are able to recognize a face more accurately. Further to this, still image based recognition is useful in controlled environments where pose and illumination are relatively fixed. One example of such an environment is while taking subjects photograph at the airport check in (8). The disadvantages of still-image-based face recognition occur when such a controlled environment is not easily attainable. An example of this scenario would be a security camera used to identify a subject in a public place. In this case, video-based recognition yields better results.

The clear advantage of video-based face recognition occurs in situations where the image resolution is low and the video feed is continuous. Video-based algorithms capitalize on both spatial and temporal variations in a subjects face.

Nevertheless, natural disadvantage is the low resolution of the images being captured (10). Since an individual might be located at a distance, the pixels that represent this individual's face might not constitute a sufficient information base for the algorithm to operate correctly. Hence, the need for the two different approaches occurs in different situations.

#### **Algorithms for face Recognition:-**

##### **Principle component analysis:-**

PCA is an algorithm developed by Turk and Pentland that treats face recognition as a two dimensional recognition problem(1). The correctness of this algorithm relies on the fact that the faces are uniform in posture and illumination. PCA can handle minor variations in these two factors, but performance is maximized if such variations are limited. The algorithm basically involves projecting a face onto a face space, which captures the maximum variation among faces in a mathematical form. During the training phase, each face image is represented as a column vector, with each entry corresponding to an image pixel. These image vectors then normalized with respect to the average face. Next, the algorithm finds the eigenvectors of the covariance matrix of normalized faces by using a speed up technique that reduces the number of multiplications to be performed. This eigenvector matrix is then multiplied by each of the face vectors to obtain their corresponding face space projections. Lastly, the recognition threshold is computed by using the maximum distance between any two face projections (8). In the recognition phase, a subject face is normalized with respect to the average face and then projected onto face space using the eigenvector matrix. Next, the Euclidean distance is computed between this projection and all known projections. The minimum value of these comparisons is selected and compared with the threshold calculated during the training phase. Based on this, if the value is greater than the threshold, the face is new. Otherwise, it is a known face (8)

##### **Linear Discriminant Analysis (LDA):-**

Another popular algorithm used in face recognition is LDA. Although this algorithm was initially developed for data classification, it has been adapted to face recognition. Whereas PCA focuses on finding the maximum variation within a pool of images. LDA distinguishes between the differences within an individual and those among individuals. That is, the face space created in LDA gives higher weight to the variations between individuals than those of the same individual. As a result, LDA is less sensitive to lighting, pose, and expression variations (22). The drawback is that this algorithm is significantly more complicated than PCA. As an input, LDA takes in a set of faces with multiple images for each individual. These images are labeled and divided into within-classes. The former captures variations within the image of the same individual while the latter captures variations among classes of individuals. LDA thus calculates the within-class scatter matrix and the between-class scatter matrix, defined by two respective mathematical formulas. Next, the optimal projection is chosen such that it "maximizes" the ratio of the determinant of the between-class scatter matrix of the projected samples to the determinant of the within-class scatter matrix of the projected samples"(7). This ensures that the between-class variations are assigned higher weight than the within-class variations. To prevent the within-class scatter matrix from being singular, PCA is usually applied to initial image set. Finally, a well known mathematical formula is used to determine the class to which the target face belongs. Since we have reduced the weight of inter-class variation, the result will be relatively insensitive to variations.

##### **Independent component analysis (ICA):-**

ICA is the third mathematically-based algorithm for face recognition. Whereas PCA depends on the "pair wise relationships between pixels in the image database," ICA strives to exploit "higher-order relationships among pixels." (8) That is, PCA can only represent second-order inter-pixel relationships, or relationships that capture the amplitude spectrum of an image but not its phase spectrum. On the other hand, ICA algorithms use higher order relationships between the pixels and are capable of capturing the phase spectrum. Indeed, it is the phase spectrum that contains information which humans use to identify faces (3). The ICA implementation of face recognition relies on the infomax algorithm and represents the input as an n-dimensional random vector. This random vector is then reduced using PCA, without losing the higher order statistics. Then, the ICA algorithm finds the covariance matrix of the result and obtains its factorized form. Finally, whitening, rotation, and normalization are performed to obtain the independent components that constitute the face space of the individuals. Since the higher order relationships between pixels are used, ICA is robust in the presence of noise. Thus, recognition is less sensitive to "lighting conditions, changes in hair, make-up, and facial expression"(4).

**Neural networks:-**

Unlike the above three algorithms, the neural networks algorithm for face recognition is biologically inspired and based on the functionality of neurons. The perceptron is the neural network equivalent of a neuron. Just like a neuron sums the strengths of all its electric inputs, a perceptron performs a weighted sum on its numerical inputs. Using these perceptions as a basic unit, a neural network is formed for each person in the database. The neural network usually consists of three or more layers (8). An input layer takes in a dimensionally reduced (using PCA) image from the database. An output layer produces a numerical value between 1 and -1. In between these two layers, there usually exist one or more hidden layers. For the purposes of face recognition, one hidden layer usually provides a good balance between complexity and accuracy. Including more than one such layer exponentially increases the training time, while not including any results in poor recognition rates. Once the neural network is formed for each person, it must be trained to recognize that person. The most common training method is the back propagation algorithm (8). This algorithm sets the weights of the connections between neurons such that the neural networks exhibits high activity for inputs that belong to the person its represents and low activity for others. During the recognition phase, a reduced image is placed at the input of each of these networks, and the network with the highest numerical output would represent the correct match. The main problem with neural networks is that there is no clear method to find the initial network topologies. Since training takes a long time, experimenting with such topologies become a difficult task (8). Another issue that arises when neural network are used for face recognition is that of online training. Unlike PCA, where an individual may be added by computing a projection, a neural network must be trained to recognize an individual. This is a time consuming task not well suited for real – time applications.

**Genetic algorithms:-**

Another biologically inspired algorithm that is commonly used for face recognition is the Genetic Algorithm (GA). While neural networks mimic the function of a neuron, genetic algorithms mimic the function of chromosomes. Like neural networks, genetic algorithms are only well suited for the recognition of a limited number of individuals and are generally not too scalable. To start with, the images are divided into two classes: those that belong to the target person and those that belongs to other people. Each of these images is transformed into a binary coded truth table. Within each of the above mentioned classes, the image 13 are further subdivided into F-tables and T-tables, where each image occupies a row in the table. Initially, the rows in F-tables and T-tables do not match. However, by gradually changing some of the F-table value to don't –cares, some rows end up matching with each other. Hence, the F-table obtains the generalization ability. The evolution process ensures that the modified F-table includes as many rows in the T-table as possible. Once evolution is complete, the modifications that the result in the best fitness are chosen for each category (target person and unknown people) and applied to the F-table (15). During the recognition phase, the input image is passed through the tables that correspond to both categories. Two counters keep track of the number of pixel matches in each of the categories and the counter with the highest value classifies the input face as belonging to the corresponding category (15). The obvious drawback of this algorithm is that entire tables have to be created whenever a new individual is to be detected. As in neural networks, the scalability of this algorithm is hindered by the exponential complexity involved when training for multiple target faces.

**Issue with face Recognition:-**

Although face recognition systems have advanced remarkable over the past few years, there still exist some major obstacles that need to be overcome. In general, still image face recognition accuracy fades away as image variations are increased. The main image variations are illumination levels, pose variation, and changes in facial expression. Moreover, the problem of face detection, or the extraction of a face from an image, is a required first step for face recognition. The illumination problem occurs in an uncontrolled environment where “the same face appears different due to a change in lighting” (5). The problem is emphasized when the variations in lighting are greater than the variations between people. One solution to this problem involves preprocessing the images and introducing contrast normalization and compensation. Another approach attempts to reconstruct all possible lighting variations from a selection of training images for each individual. A third method relies on creating a separate linear illumination subspace. This is similar to the space created to capture face variations, except that it captures lighting variations (8). Pose variation also impairs the face recognition process. Pose variation becomes especially pronounced when it is combined with illumination changes. One solution to the pose variation problem involves obtaining images with multiple views of an individual. In this case, multiple process are available during both training and recognition. During the recognition process, each pose is aligned with a similar pose in the database to achieve correct classification. The obvious drawbacks are that multiple views of an individual are not always available. A more popular solution involves using multiple poses during training but only a single pose during recognition. One such implementation creates and Eigen spaces for each pose to achieve pose-invariant recognition

(8). The problem of facial expression variation is also common in the literature. If only one image of an individual is available, recognition accuracy drops considerably. However, if many images are available, algorithms like PCA can absorb these changes. It is important to note that during expression changes, parts of the face remain largely unchanged. As a result, algorithms that segment the face are more robust to these variations (8). Many databases available today contain training images with multiple expressions, and face recognition systems have been capable of making accurate image classifications despite expression variations. Lastly, it is important to discuss face detection in the context of the face recognition problem. The need for face detection arises when one or more faces must be extracted from an image. Furthermore, face detection and extraction is essential to reduce external factors that might hinder the recognition process. One common method of face detection relies on the use of Haar classifiers. These classifiers sweep through the image and apply several filters to detect the presence of a face. Another method, mentioned earlier, relies on skin color to detect a face. As such, face recognition is a growing field with potential applications in security, entertainment, and personal identification. The recognition algorithms can be grouped in to mathematical/statistical (PCA, ICA, LDA) algorithms and biological (NN, GA) algorithms.(22) Many of these algorithms have been implemented by several researchers with high recognition rates and recognition times within the margin of real time applications. However, long training times and the scalability of face recognition has been a recurring concern in all of these implementations. Finally, common face recognition problems include illumination changes, pose variations, and the issue of face detection and extraction.

### **Speech Recognition:-**

Speaker recognition is basically divided in to two-classification: speaker recognition and speaker identification and it is the method of automatically identifying who is speaking on the basis of individual information integrated in speech waves (6). Speaker recognition is widely applicable in use of speaker's voice to verify their identity and control access to services such as banking by telephone, database access services, voice dialing telephone shopping, information services, voice mail, security control for secret information areas, and remote access to computer AT and T and TI with Sprint have started field tests and actual application of speaker recognition technology; many customers are already being used by Sprint's Voice Phone Card (7). Speaker recognition technology is the most potential technology to create new services that will make our everyday lives more secured. Another important application of speaker recognition technology is for forensic purposes. Speaker recognition has been seen an appealing research field for the last decades which still yields a number of unsolved problems.

### **Algorithms for Speech Recognition:-**

There are a lot of approaches to speech recognition. Algorithms like zero crossing, energy, measurement and feature extraction are based on the acoustic-phonetic approach. Algorithms such as template matching come under the pattern recognition approach, while algorithms that depend on knowledge sources, stochasticity of speech signals and neural networks are based on the artificial intelligence approach. However, an important approach to speech recognition is stochastic modeling, in particular stochastic using Hidden Markov Models (25) in conjunction with the Viterbi algorithm. Among these the most popular and accurate algorithm is the template based Dynamic Time Warping (25).

### **Zero-crossing and energy-based speech Recognition:-**

As compared to other approaches, zero-crossing and energy-based recognition systems require far fewer computations and fewer sets of parameters (30). For the purpose of recognition, sets of parameters are obtained from several frames of speech data. Parameters such as average zero-crossing rate, density of zero-crossings within frames, excess threshold duration, standard deviation of the zero-crossing within frames, mean zero-crossing within frames, and energy estimates for each frame have all been used. These parameters are then compared with fixed thresholds to determine the spoken word. For example, the zero crossing rate at the beginning of words starting with strong fricatives is higher than for words starting with weak consonants. This classifies a set of words into two groups and makes the process of recognition easier. A system develop by Chok-ki Chan (20) is based on the parameters such as zero crossing and energy. It is a speaker dependant, isolated Cantonese digit and words, limited vocabulary SR system, developed and implemented on a PC-386, with a recognition accuracy of 97.2%. This system works reasonably well for isolated digits but when tested to isolated words, the accuracy dropped to 76% (920). One more example of such a system is the one developed by Chan Y.T. (29) on an MC68000 microprocessor based system. It was a speaker independent, isolated-word, limited vocabulary SR system. The system when operated in speaker-dependent mode had an accuracy of 87%, but when operated in speaker independent mode, the accuracy dropped down to 78%. The system when developed for a 10 word vocabulary took around 6 minutes (19) to recognize a word but with inclusion of every 3 words in the vocabulary the recognition speed dropped by 40%.

**Feature-dependent speech recognition:-**

Feature-dependent speech systems are based on principles of human speech perception. These systems try to mimic human performance in recognizing speech. Some of the features that are used in such system are: frequency location of the first few formants, the maximum and minimum frequency of the first few formants, the duration of a periodic energy, formant transitions and the ratio of high frequency energy to low frequency energy. To obtain the above sets of features, parameters such as spectrum, pitch, zero crossings, total energy, energy in low, mid, and high frequency bands are produced using signal processing routines. The decision structure is arrived at by first selecting a set of measures that are likely to provide a clean grouping of letters into a set of classes. A recursive clustering algorithm is used to determine the optimal grouping of letters into clusters until the errors are minimized. An example of such a system is, FEATURE, a speaker independent isolated letter recognition system (21). This system performs recognition on an 80 letter vocabulary generated by 20 different speakers. The recognition accuracy of 85% was obtained across 2 speakers for a speaker-independent mode while an accuracy of 91% was observed when operated in dynamic adaptation mode]. The different algorithms for the system were implemented on a Fast Processor Array, Motorola 68000 microprocessor, and VAXI 1/750.

**Template-based speech Recognition:-**

Template-base speech recognition systems have a database of prototype speech patterns (templates) that define the vocabulary. The generation of this database is performed during the training mode. During recognition, the incoming speech is compared to the templates in the database, and the template that represents the best match is selected. Since the rate of human speech production varies considerably, it is necessary to stress or compress the time axes between the incoming speech and the reference template. This can be done efficiently using Dynamic Time Warping (DTW). In a few algorithms, like Vector Quantization (VQ), it is not necessary to vary the time axis for each word, even if any two words have different utterance length. This is performed by splitting the utterance into several different sections and coding each of the sections separately to generate a template for the word. Each word has its own template, and therefore this method becomes impractical as the vocabulary size is increased (500 words). Itakura of NTT (31) developed an SR system with the concept of TW for non-linear alignment of speech. The system performed a speaker-dependant isolated-word recognition task with a 97% accuracy on a 200-word vocabulary. Performance of this system degraded to 83%), when the vocabulary size was increased to 1000 words. A template-based system for connected speech was implemented by H. Sakoe (17). It was a speaker-dependent connected-digit large vocabulary speech recognition system that had an accuracy of 99.6%. It was implemented on a NEAC-3100 computer, with a memory requirement of 10 Kbytes per word, and had a vocabulary of 600-2500 words depending on the training set (17). This system performed well for speaker-dependent speech recognition, but one of the shortcomings of the system was that it took more than 150 minutes (25) to recognize a word with a vocabulary size of 600. For the same set of space. This represents a 130:1 reduction for the VQ recognizer would require around 250 Kbytes to 1.2 Mbytes of memory space. This represents a 130:1 reduction for the VQ recognizer over the DTW model. In some cases of template matching, no time alignment is needed to perform the recognition, as in the case of the system developed by J.E. Shore et.al. (21). It was a speaker independent, isolated word, limited vocabulary SR system, implemented using a VQ approach. It had an accuracy of 98% for speaker dependent recognition while for speaker independent recognition the accuracy reduced to 85%. The system was implemented on a DEC VAXI 1/750 with floating point accelerator. Template generation required 20-22 minutes, while classification of a single utterance with these templates took about 1-1.5 minutes.

**Knowledge –based speech Recognition:-**

Knowledge-based speech recognition systems incorporate expert knowledge that is, for example, derived from spectrograms, linguistic, or phonetics. The goal of a knowledge-based system is to include the knowledge using rules or procedures. The drawback of these systems is the difficulty of quantifying expert knowledge and integrating the multitude of knowledge sources (16). This becomes increasingly difficult if the speech is continuous, and the vocabulary size increases (16). A good example of a knowledge-based system is HEARSAY, developed on a PDP-11 microcomputer, at Carnegie-Mellon University. It was a speaker-dependent continuous-speech recognition system with a vocabulary of 1011 words. Using a very restrictive syntax (perplexity 4.5), it achieved a recognition accuracy of 87% (32). It took 13 hours to compile the algorithm developed for HEARSAY. Fifty knowledge sources were used to develop this system and the amount of storage required for each one was about 80 Kbytes. Comparing this storage requirement with that needed for the Vector Quantization algorithm shows a reduction (22) of the order of 30 or more. This would mean far less memory storage would be required for codebooks generated by VQ approach than by the knowledge sources in the above approach.

**Stochastic speech Recognition Systems:-**

Speech recognition based on stochastic modeling is another approach for Speech Recognition systems. Probabilistic models of speech are used in this approach to deal with incomplete information or uncertainty. The most widely used model is the Hidden Markov model (HMM) (11). The HMM uses states that model generic speech sounds and transitions between states with associated transition probabilities to model the temporal behavior of speech. This model assumes that speech was produced by a hidden markov process. To derive the transition probabilities, an efficient estimate-maximize algorithm, the forward backward algorithm, is often used (33). Though the HMM approach can give substantially accurate results, if the time factor is taken into consideration, then algorithms based on template matching using Vector Quantization or DTW prove to be much faster than the ones based on HMM (11). An example of a system based on the HMM approach is the one developed by Rabiner et al. at Bell Labs (12). The system used the techniques of Vector Quantization in conjunction with HMM in a speaker independent, isolated-word recognition system. It achieved an accuracy of 96.3% word accuracy for a 10 digit vocabulary. The system was implemented on a SUN-workstation. Despite the fact that the system could recognize words from any speaker, the system had a drawback, which was the large amount of time it took to train the system to a given set of words. For the given case, 10 digits took more than 15 hours to train the system (12). Another example of a system based on HMM and statistical methods (14) is SRI's DECYPHER system, which has a 1000 word vocabulary, is speaker independent, accepts connected speech input, and has a recognition accuracy of 95.6%. Since DECYPHER is a connected speech recognition system, the recognition algorithm involves more computation than a discrete recognition system (by a factor of 3 (23)), and real time performances is more difficult to achieve. In this system, a statistical bigram grammar is used that reduces perplexity to 60 (without grammar, any word can follow a given word). Using this grammar, the recognition accuracy for DECYPHER improves from 75.5% (no grammar) to 95.6%. This system was implemented on a microcomputer and required more than 16 Mbytes of workspace to perform calculations (14).

**Connectionist speech recognition systems:-**

Connectionist speech recognition is based on artificial neural networks that use learning strategies to organize and optimize a network of processing elements (neurons). These networks are used as classifiers or mapping functions to recognize the incoming speech. Thus the speech knowledge or constraints used for speech recognition are distributed among many, but simple processing elements (13). The concepts and ideas of applying neural networks to speech recognition are relatively new, and researchers are investigating a number of approaches. An example of connectionist system developed for keyword spotting (23) is the one implemented using a time-delay neural network (22). This speech recognition system, implemented on a PC-486, was compared to an HMM recognizer in the task to recognize the phones "B", "D", "G" out of a database of 5240 Japanese words. For different speakers, the HMM had a recognition accuracy of 90.9% to 97.2%, while the neural net achieved an accuracy of 97.5% - 99.1% (24). One of the advantages of neural network based speech recognition systems is that they can achieve the capability of handling a really large vocabulary (24). One of the disadvantages of the system, which is the same as that of an HMM-based system, is that a large time may be required for training the system.

**Speech Recognition using c#:-**

Speech recognition in C# we use Microsoft speech SDK tool. The tools use to speech enable would be the speech SDK 5.1. Speech SDK 5.1 is the latest release in the speech product line from Microsoft. Microsoft speech SDK is one of the many tools that enable a developer to add speech capability into applications. Speech SDK can be used in either C#, C++, VB or any COM compliant language. Speech recognition can be of two types based on the grammar that the recognition is based on. (Grammar is in other words the list of possible recognition outputs that can be generated.) An application can limit the possible combination of the words spoken by choosing proper grammar. In a command and control scenario a developer provides a limited set of possible word combinations, and the speech recognition engine matches the words spoken by the user to the limited list. In command and control the accuracy of recognition is very high. It is always better for applications to implement command and control as the higher accuracy of recognition makes the application respond better. In Dictation mode the recognition engine compares the input speech to the whole list of the dictionary words. For the dictation mode to have a high accuracy of recognition is it important that the user has prior trained the recognition engine by speaking in to it. The training or creating of a profile can be done by using the speech properties in the control panel.

**Hardware/software co design methodology:-**

G.F. Zaki, R.A. Girgis, W.W. Moussa and W.R. Gabran proposed that an embedded face recognition / verification systems has been implemented on an FPGA. Its small size allows us to apply these systems wide range of applications. The system is based on FPGA which offers high configurability in the design phase. The hardware/software co design methodology was used which enabled optimizing the system to meet different design constraints including size, cost, and power dissipation. A number of DSP algorithms were used or created to detect the face from a background, enhance the image and recognize the person. The principal component analysis algorithm was used for feature extraction (5).

Che Ming, Chang Yisong proposed that the implementations of a face detection algorithm on FPGA for eye mouse control system. An improved algorithm of skin color module and binary image projection is used to ensure real-time detection. The system is based on a hardware/software co-design, which consist of a dedicated hardware accelerator that solves the parts of the algorithm with higher computational cost and an embedded microprocessor that manages the control process and executes the rest of the algorithm. Several optimization methods have been accomplished to enhance performance. The system has been implemented on an Altera Cyclone 2 FPGA using a Nios embedded soft-core processor and it is benchmarked against a soft ware implementation.

**Objective:-****Aims and objectives of this dissertation work are summarized as follow:**

1. We have implemented a security system that based on both hardware and software along with wireless connectivity.
2. It's based on face and voice biometrics for recognition.
3. Soul of the system is based on PCA algorithm for face recognition and for voice recognition using Vb.net.
4. This security system based on microcontroller to reduce the cost and complexity of the system.
5. Comparing the result with FPGA based system.

**Conclusion:-**

This paper described the introduction of Biometric and multimodal biometric system their mode of operation, advantages and applications of Biometric system. The future, we will discuss about various existing algorithm for image processing and voice recognition. The last section of chapter presents the aim and objective of the dissertation work.

Gastric size, sleeve, surgery

#### Abstract

**Background:** Gastric size determines the amount of dietary intake which in turn determines energy intake. Body weight loss depends on negative energy balance.

**Objectives:** The primary purpose of the present study was to assess body weight loss for 36 months in patients who underwent gastric sleeve surgery. A secondary purpose was to examine the impact of gender and age on weight changes before and after surgery.

**Methods:** A total of 309 patients were enrolled sequentially. Age, body weight, gender, BMI, and comorbidity were assessed before and after gastric sleeve surgery for 36 months.

**Results:** Results showed that body weight before and after surgery was influenced by both age category and gender. It was also noted that the rate of body weight reduction was faster during the 1<sup>st</sup> 12 months compared to the 2<sup>nd</sup> 12 months.

**Conclusions:** Based on the results of the present study, it can be concluded that prior and post gastric sleeve surgery body weight is influenced by age and gender. The rate of weight reduction after gastric sleeve surgery is faster during the first 12 months, compared to the second 12 months. Gastric sleeve affected body loss and that can be considered as effective treatment for obesity and obesity related diseases.

#### Introduction:-

Sleeve gastrectomy is a surgical procedure that is performed in overweight individuals in which vertical segmentation of stomach is performed in order to reduce the stomach's surface area so that it greatly helps to modify BMI of an individual. Obesity is related to different morbid metabolic conditions hence sleeve gastrectomy provides an efficient way of reducing mortality in morbidly obese patients. It is performed through open and laparoscopic approach, laparoscopic being the modern way is more reliable. After surgery it depends on the person that how he couples up with his changing body requirement and eating habits. Once the surgery is performed dietary requirement is reduced to a great extent but bouts of binge eating may stretch the stomach musculature and cause weight regain that may lead to an alarming situation for the person who underwent sleeve gastrectomy once. In certain conditions re sleeve gastrectomy is to be performed keeping in view the weight regain due to unavoidable eating habits. Different researches have been done in different geographical areas of the world and study population includes individuals from both the genders so that results may be applied to general population undergoing sleeve

gastrectomy. Based on physiology of human body stomach is made up of rugae, these are muscle layers which increases the surface area of stomach and as the person eats it causes a stretch response in the stomach's musculature and it causes an increase in the stomach's size which is reflected as a protruded abdomen. This protruded abdomen significantly depicts weight gain and this is a leading problem to other physiologic and metabolic disorders. Sleeve gastrectomy provides a way to prevent obesity by decreasing the capability of stomach to make room for food and thus decreasing or more appropriately limiting the food absorption. As a result of multiple surgeries multiple cases came forth. Some reported weight regain and some weight loss. All depends upon individual's dietary consumption and metabolic body requirements.

### Literature Review:-

Obesity is one of the high risk factor for many other morbidities and with the modern era of industrialization, obesity is expected to increase and the number of the people affected is raising with every passing day thus exposing the obese population to a compromised quality of well-being and health. Super obese patients are those who have a BMI greater than 50kg/m<sup>2</sup>. They are at a greater risk to develop hypertension, diabetes, arthritis, sleep apnea and pulmonary dysfunction as compared to people with BMI less than 50kg/m<sup>2</sup>. Obesity has led many people to develop inferiority complexes and psychological problems (Almogly et al., 2004). Sleeve gastrectomy is one of the surgical procedures performed in obese patients as an approach to limit the gain in weight. It is an effective method with little risk of post-surgical complications (Benaiges et al., 2015). Although sleeve gastrectomy is an affective procedure but it has been observed and reported in some studies that it's affects are short term and patients having a BMI greater than 60kg/m<sup>2</sup> have been reported a failure in maintaining a long term weight loss and weight regain has been the most common complication reported so far in many such cases (Regan et al., 2003). Sleeve gastrectomy cannot be considered as the only best surgical procedure for the weight reduction rather several approaches should be collectively employed for better and long term results. Roux-Y gastric bypass is another technique and a combination of both these surgical procedures may be employed to reduce comorbidities and reduce the risk of relapse and weight regain (Yang et al., 2008). Sleeve gastrectomy as compared to all other surgical methods that have been used to reduce the morbidity and obesity by far is the most favorite procedure for the surgeons because it is comparatively less invasive and has a shorter operating time. The risk of post-surgical complications is also less as compared to other methods but the only limitation is the relapse and recurrence because in this technique a part of the stomach is removed and an anastomoses is created with the duodenum thus the volume of the stomach is decreased but weight regain after sleeve gastrectomy is associated with widening or enlargement of the sleeve after surgery with increased capacity of the gastric tube (Weiner et al., 2007). Post- bariatric surgical procedure there is a lifelong threat of being obese again that persists throughout. Eating habits and behavior modulation also plays its role for the solution. Feeling hungry all the time when one urges for food that has high caloric value and low dietary fiber is also one of the problems that led to regain after surgery (Odom et al., 2010). Thus laparoscopic sleeve gastrectomy can be performed as a primary procedure if the aim is to get rid of excessive weight with the least post operating risks (Brethauer et al., 2009). Laparoscopy that has allowed the surgeon to insert a micro camera and made the surgical procedure easy for the surgeon, less invasive for the patient and every fine detail can be visualized through laparoscopy. Laparoscopic sleeve gastrectomy is also being used rather it has revolutionized the procedure and has further served to decrease the risk of per-operating complications and risks. Minor procedural errors can also be reduced and high level of precision can be achieved through laparoscopic surgical procedures (Rubin et al., 2008). Advantages of laparoscopic sleeve gastrectomy also include marked decreases in plasma ghrelin levels, Ghrelin is a growth hormone and is controlled by hypothalamus (Kojima et al., 1999). It is also an important factor for weight loss but the decrease is seen for the initial 6 months after which a stability in the level of ghrelin has been observed thus leading to no further weight loss. Behavior modulation and dietary habits at this stage should be monitored with great care otherwise a weight regain may be seen (Langer et al., 2005). Laparoscopic sleeve gastrectomy is being widely used for treating morbid weight gain. This method advocates lesser restrictions on dietary intake following surgery. Since no prosthetic or foreign materials have been implanted in this surgery so post-operation risk of complications is also greatly reduced which in turn renders this to be a superior method among the others for the treatment of morbid obesity. The only limitation that goes against this bariatric procedure is that it is short term and relapse has been reported in many cases (Skrekas et al., 2008). Nature has blessed us with a body that adapts to different physiologic and pathologic stressors quite well. It stretches under the conditions like excessive intake of food. In sleeve gastrectomy anastomosis of stomach and duodenum is made in such a way that stomach attains a very small size, typically it shapes like a banana. This is a logical observation that a stomach of a very small size will not be able to tolerate much food hence it causes weight loss which is a therapeutic surgery in case of morbidly obese patient. On the

contrary post surgically if the patient is non-compliant and eats junk and fatty food weight regain occurs but obviously this is a time taking procedure and does take a comparatively larger time than usual.

Its other name is roux en Y by pass. By pass means creating an alternative channel. There are specific pre requisites of this surgery to assure the desired results which are not the highlights of the topic under study but yes they do affect the outcome of the procedure under discussion (Kojima et al., 1999).

Indicators of noteworthy postoperative weight recover after bariatric surgery incorporate markers of pattern expanded nourishment inclinations, diminished prosperity, and worries over addictive practices. Postoperative self-checking practices are emphatically connected with opportunity from recapture. These information propose that weight recover can be expected, to a limited extent, amid the preoperative assessment and conceivably lessened with self-observing procedures after RYGB (Odom et al., 2010). Sleeve gastrectomy (SG) is getting noticeable quality around the globe as a bariatric technique both as a first-organize system in high-risk or super fat patients and as a fundamental operation. The potential purposes of enthusiasm of the SG are that it presents provoke control of caloric confirmation, does not require course of action of an outside body or require modifications, and can all around be performed in less time than required for avoid frameworks. The possible downsides of the SG consolidate the irreversibility, extended specialist peril differentiated and other restrictive frameworks, and unproved quality. The explanation behind the present efficient review was to evaluate the current evidence as for weight lessening, trouble rates, postoperative mortality, and co-terribleness a great many SG (Benaiges et al., 2015). Sleeve gastrectomy can be performed safely with commendable entrapment rates and awesome weight decrease. The rate excess weight decrease reported from this course of action of up to 66% at 3 years is engaging. We think about our audit quantifiable limitations as already recorded and the, 'as of recently, minimal patient numbers in the more amplified term. Reasonable examinations will continue with reference to what is the perfect bariatric strategy. Possibly a more supportive open thought could be on the assurance criteria for different sorts of bariatric method with respect to the individual patient's goals, conditions moreover, needs.

#### Statistical Analysis:-

Data were analyzed by using Statistical Package for Social Studies (SPSS 22; IBM Corp., New York, NY, USA). Continuous variables were expressed as mean  $\pm$  standard deviation and categorical variables were expressed as percentages. The t-test was used for continuous variables and chi square test was used for categorical variables. Changes were assessed at different study phases compared to baseline levels using adjusted analysis for pairwise comparisons using benferroni correction of repeated measures ANOVA. A p-value  $<0.05$  was considered statistically significant.

**Table 1:-** Baseline characteristics of the studied sample

	All 306		Male 100(32.68%)		Female 206(67.32%)		p value
	Mean(SD)		Mean(SD)		Mean(SD)		
Age	33.00	(10.86)	31.00	(11.00)	33.97	(10.69)	0.025
Age <25 (%)	92.00	(30.07)	40.00	(40.00)	52.00	(25.24)

Table 3 described the Long-term Results of Sleeve Gastrectomy for Obesity by age group and showed that there is no a significant difference in the rate of weight loss among age group all time except before surgery, after 3 months, after 30 months.

### Results:-

The total number of subjects who underwent Sleeve Gastrectomy and included in this study was 306, with a mean age of 33 years old, and females were statistically significant older compared to males. The majority of them were females (67.32%), while males represented only 32.68%. The largest proportion (30.07%) of the participants was in the age group of <25 years old, when looking to male participants only the majority (40.00%) of them were in the age group of <25, while a different finding from female gender was observed where 56.00% of females who underwent sleeve gastrectomy were in the age group of 25-34 years old. The mean weight of the participants before surgery was 124.07, and males had statistically significant higher weight compared to females. The mean Body Mass Index (BMI) for the whole studied sample before surgery was 46.49 kg/m<sup>2</sup>, and males had a statistically significant higher BMI compared to females (49.77 kg/m<sup>2</sup> and 44.80 kg/m<sup>2</sup> respectively). 10.46% of participants had Diabetes Mellitus (DM) as comorbidity, 9.15% had hypertension and 3.27% had Dyslipidemia, all of these three comorbidities were higher in males compared to females but the difference was not statistically significant. (Table 1)

Table 2 showed the Long-term results of Sleeve Gastrectomy for obesity by gender, and it was found that, overall, there was a continuous decrease in body weight with increasing the time after surgery till 30 months. Postoperatively, the mean weight (kg) after 3 months, 6 months, 9 months, 1 year, 18 months, 2 years, and 30 months for all participants was as following: 110.82, 101.26, 92.32, 85.92, 85.76, 82.91, and 78.53 respectively. There was a significant difference in the rate of weight loss between the two genders in all times except after 18 and 30 months. After the third year from surgery, it was noticed that, for overall and male gender specifically, the weight started to increase. Where, it was found that the mean weight was increased by 32.07 kg in males compared to the mean weight in the period of 30 months after surgery. This weight regain continued in the fourth year after surgery. For females, the results were slightly different. The difference in the rate of weight regain was statistically significant between the two genders. Then the overall results showed that the weight started to decrease in the period of six years after surgery, where the mean weight was 81.31 compared to 89.66 in the period after four years. This was also clearly shown in Figure (1) where weight loss after gastric sleeve surgery was faster during the first year, and then from the second year the rate of weight loss decreased until the third year where the subjects started to regain weight.

Table 3 described the Long-term results of Sleeve Gastrectomy for Obesity by age group and showed that there was no statistically significant difference in the rate of weight loss among age groups in all times except the time before surgery, and the time of three and 30 months after surgery.

### Discussion:-

The results of the present study showed that body weight is affected by age and gender. Thus an individual rate of weight loss will depend on factors such as age, gender and the initial weight before surgery. The gender and age differences found in the current study support the findings of several previous studies (Paxton *et al.*, 1994; Rolls *et al.*, 1997; Thompson *et al.*, 1997; Middleman *et al.*, 1998; O'Dea, 1999) (O'Dea,1994; Abraham *et al.*, 2001), that

showed body weight dissatisfaction, weight concerns, attempt to lose or gain weight, attempt to skip meals are more common among females than male. In addition, age also affects body weight, for example during the age of 20 – 30 years old excess weight loss is faster because of minor changes to eating habits and increased activity levels to lose weight (Bosy-Westphal *et al*, 2003). On the contrary, losing weight requires more effort as the individual reaches middle age due to reduction of muscle mass. Although there is no exact mechanism explaining reduction in muscle tissue with age, it seems that wear and tear on the muscles, combined with hormonal changes, may make the body less efficient at replenishing damaged muscle cells (Elia, 1992). Clearly, when muscles cells are diminished, calories expenditure is decreased. However caloric expenditures depend on the metabolic rate. For example during activities metabolic rate is high, hence, the muscles require 60-70% of cardiac output, but at rest the muscles receive only 15% of cardiac output (Linde *et al.*, 1989; McCully KK *et al.*, 1995). At rest, the metabolic organs actually contribute heavily to metabolic rate and use a higher percentage of cardiac output (about 50%). Even bone receives more than 10% cardiac output at rest (Gallagher *et al.*, 1998). Therefore, it is the level and the duration of activities that determine the metabolic rate of muscular metabolic rate. Although representing only about 6% of bodyweight, the metabolic organs contribute much more dramatically to resting energy expenditure than the quantifiably heavier muscle and fat tissue (Elia, 1992). This new concept provides the basis of “specific energy expenditure” which has critical clinical applications, specific to changes in resting energy expenditure induced by diseases such as cancer, metabolic disease and diabetes, muscle dystrophy, heart diseases, lungs diseases, and spinal deformities.

The results of the present study showed that there were no significant differences among gender in terms of the presence of comorbidity for hypertension, diabetes and dislipdemia in both group being studied. Therefore the observed post-surgery changes in body weight might had been influenced by gender independent of the impact of “specific energy expenditure” to some extent.

It was also observed that the rate of post-surgical weight loss was faster during the first 12 months, as compared to the second 12 months period. These findings can be explained based on the structural remodeling of the gastric musculature. These findings were consistent with previously reported findings (Aarts *et al.*, 2011; Benaiges *et al.*, 2012). Clearly the amount of dietary intake induct stretching of the gastric wall which in turn becomes more effective during the second year after more tissue of gastric remodeling had been established. Further similar observations were noted on quarterly basis. The observations of the present study, regarding post-surgical weight loss, were lower than findings reported by others for patients with similar pre surgery BMI (Brethauer *et al.*, 2009). However the observed post-surgical weight reduction of the present study was comparable to the recommended level set by the World Health Organization (WHO,1997).

### **Conclusions:-**

Based on the results of the present study, it can be concluded that prior and post gastric sleeve surgery body weight is influenced by age and gender. As observed (not carefully statistically analyzed), the rate of weight reduction after gastric sleeve surgery is faster during the first 12 months, compared to the second 12 months. As observed, (not carefully statically analyzed) gastric sleeve affected body loss and that can be considered as effective treatment for obesity and obesity related diseases.

### **Limitations:-**

The present study is limited by some patients who did not complete all examinations after surgery and second, patients who did not report their dietary intake and that might had influenced actual energy intake.

Vaginal malignant melanoma, possibly radiation-induced, rare.

#### Abstract

Vaginal melanoma is a rare gynecological malignancy, with no clearly defined risk factor. It presents mostly in postmenopausal women as a painless lump in lower vagina. Surgical excision with or without adjuvant radiotherapy is the treatment of choice. Despite all treatment modalities, it is characterized by its poor survival outcome. There isn't yet any conclusive evidence on the possibility of radiation induced carcinogenesis.

#### Introduction:-

Vaginal malignant melanoma (VMM) is a rare entity with an estimated incidence of 0.026/100,000 women per year [1]. It has a very aggressive clinical course with poor survival outcomes [1]. No definite risk factor has yet been identified and prior therapeutic radiotherapy as an etiology is a matter of speculation right now [2]. We describe here a case of VMM which developed 6 years after radical radiotherapy for carcinoma cervix.

#### Case Presentation:-

A 66 year post-menopausal female resident of Punjab, P 3+0, was referred to our clinic for cervical brachytherapy in early August 2009. She was a diagnosed case of squamous cell carcinoma of cervix, FIGO stage IIB and had received external beam radiotherapy by Cobalt-60 to a dose of 46Gy in 23 fractions, completed in July, 2009. On local examination, a 2 x 1cm residual was seen at cervix with thickened medial one-third of right parametrium; left parametrium and rectal mucosa were free. We treated her with 35 Gy Low Dose Rate (LDR) equivalents by Medium Dose Rate (MDR) Selectron applicator. Post treatment patient had clinically complete response. Hence, she was kept on periodic follow-up and was asymptomatic till December, 2015 when she developed swelling around her genitalia. Local examination revealed a 3.5 x 2.5 cm ulcerated growth over upper two-thirds of anterior vaginal wall which bled to touch. The cervix was completely flushed with no evidence of any disease recurrence and bilateral parametrium were fibrosed. Contrast enhanced computed tomography (CECT) chest, abdomen and pelvis showed a well-defined heterogeneous mass 3.5 x 3.5 cm involving upper two-thirds of vagina causing circumferential wall thickening [Fig 1]. Three well defined heterogeneously enhancing masses along right external and internal iliac vessels were also seen, suggestive of metastatic lymphadenopathy [Fig 2]. Biopsy of the lesion showed predominantly epitheloid tumor cells with large nuclei, vesicular chromatin, prominent nucleoli and scanty to moderate cytoplasm, arranged in sheets in dermis. The cells were extending to deep dermis. Few tumor cells showed intracytoplasmic

pigmentation. The tumor cells stained positive for HMB-45 and S-100 while negative for pancytokeratin. A pathological diagnosis of nodular melanoma was reported<sup>[Fig 3]</sup>.

Her general condition was not considered fit for surgery hence palliative radiotherapy (30Gy in 10 fractions) to the primary and inguino-pelvic regions was planned. She tolerated radiotherapy well and vaginal bleeding stopped. Thereafter, she was started on three weekly palliative chemotherapy with cisplatin (30mg/m<sup>2</sup> Day 1-3) and dacarbazine(375mg/m<sup>2</sup> Day 1-3). She completed chemotherapy uneventfully. Her last clinical examination showed a marginal decrease in size of the vaginal mass post treatment.

### Discussion:-

VMM accounts for less than 3% of all vaginal malignancies [1]. They occur mostly in post-menopausal women in their fifth and sixth decades and commonly present with vaginal bleeding and discharge or with lump in the lower third of vagina or its anterior wall [1,3,4]. Macroscopically, VMM are mostly polypoid and ulcerated with a pigmented appearance [3, 5]. The non-pigmented ones look like epithelial tumors of the vagina [3, 5]. The most common histopathological variants of VMM are epitheloid (55%), mixed (28%) and spindle (17%) [3,5]. In our case, the tumor was ulcerated with a pigmented appearance, located in upper two-thirds of vagina and pathologically it belonged to the mixed variant.

Vaginal melanomas are better staged surgically using the AJCC system, which incorporates Breslow and Clark micro staging [6]. Wide local excision (WLE) with negative margins is the standard surgical procedure for VMM [4]. Lymph node dissection is not recommended because of the low rate of lymph nodal metastases in such patients [4]. Hence, sentinel lymph node biopsy has gained popularity [7]. Pelvic exenteration has fallen out of place because of its accompanying morbidity and very modest survival benefit over WLE and adjuvant radiotherapy [4, 8]. Immunotherapy with interferon (IFN) or interleukin-2 (IL-2) has shown survival benefit in VMM, but toxicity of the therapy often excludes its application in elderly patients [9]. Combining immunotherapy with chemotherapy (known as 'biochemotherapy') has shown improved response rates over chemotherapy alone in cutaneous melanomas, but its role in VMM is yet to be proved and its toxicity is a major concern [9]. Our patient was 66 years old and her general condition was not fit for any surgery or immunotherapy. Hence we treated her with palliative radiotherapy to vagina and inguino-pelvic regions followed by palliative chemotherapy with reduced doses of cisplatin and dacarbazine, even knowing the little benefits these cytotoxic agents had in VMM [10].

Regardless of the treatment modality, the prognosis of VMM is very poor with a 5 year survival estimate of only 5-25%, because most of the cases are diagnosed at a late stage [1, 11 and 12]. The rich vascular and lymphatic network is thought to contribute to early tumor spread and metastases [4]. Tumor size less than 3 cm is supposedly the most important prognostic factor for survival, irrespective of the treatment delivered [13]. In our case the vault primary was more than 3 cm and the disease had already spread to external iliac nodes by the time it was detected. Hence palliative treatment was chosen keeping in mind the dismal prognosis of the patient.

The etiology of VMM is not clearly defined and there are no significant racial or ethnic differences in its incidence [2]. Exposure to Ultraviolet radiation has been clearly linked with cutaneous melanomas [14], however, whether therapeutic radiotherapy can be a risk factor for melanomas has not yet been documented clinically. With extensive search, we could find only one molecular medicine research article reporting that radiotherapy induced decrease in substance P may potentiate melanoma growth [15]. We are not sure whether radiotherapy induced changes in immune

environment in melanocytes of vaginal mucosa is implicated in the development of VMM in our case, but the link can't be rejected either.

### **Conclusion:-**

At this moment we can suggest that vaginal melanoma may be a possible clinical entity as a late sequelae of radiation therapy, which can only be substantiated with further case reports in future.

Postpartum depression ,risk factors.

#### Abstract

**Background:** Pregnancy and delivery are big events in a woman's life , it could associated with physiological and psychological problems lead to postpartum depression (PPD) , This study aimed to assess the prevalence rate of post-partum depression symptom among post-partum mother in Jeddah , Saudi Arabia

**Method:** This cross sectional study was carried out at five health care centers in Jeddah , Saudi Arabia during the period from January to December 2016, among post-partum mother who admitted to obstetrics & gynecology units , A semi structure questionnaire was used to collect the data.

**Result:** A total of 512 postpartum females were included in this study, (68.8%) were from group age 25-40 46.5% were housewives and 66.6% had a university education , 65.6% were from group monthly income more than 8000 SR, 25.0% reported medical problem, 43.9% planned for pregnancy. The EPDS mean score was  $12.7 \pm 5.8$  rang (0-30) , there was significant association between PPD and the following sociodemographic and medical characteristics ( maternal age, maternal education ,maternal occupation, monthly income , medical problems , planning pregnancy and previous psychological problems).

**Conclusion:** The current study showed that advanced age , lower educational level for both mother and father , medical problems were risk factors . Further studies need to be conduct to investigate the relation between PPD and other risk factors in Saudi community.

#### Introduction:-

Pregnancy and delivery are big events in a woman's life , it is a blessing and joyful experience in normal situation, however the opposite can happen due to the fact that childbirth could associated with physiological and psychological problems lead to postpartum depression (PPD) , which is defined as " in the Diagnostic and Statistical Manual for Mental Disorders as major depression with postpartum onset with episodes of depression beginning within 4 weeks of giving birth" . (1) and also as "a non-psychotic depressive state that begins in the post-partum period, after the child birth , it is a mood disorder that can occur at any time during the first year after delivery " . (2)Mental health problem are major public health issue for women in reproductive age in both developing and developed countries ,(2)where several studies reported postpartum depression as the most common

**Corresponding Author:- Dareen H. Alamoudi.**

Address:-Medical intern:- King Abdulaziz University – Jeddah – Saudi Arabia.

psychological complications among childbearing women , with prevalence rate between 10-20% , (1,3,4) this variety in the prevalence due to several factors : time of survey, population characteristics, culture issues. (1) in the first day after delivery mother will be concentrated on her baby and excited about it but after a few days her mood go down and she may feel sad ,depressed and had insomnia that what we called a baby blues and it begin from the early days after birth to two weeks later and it would may develop to a postpartum depression, (3,5) . The main characteristics of PPD are: tearfulness, anxiety, emotional stress , guilty feelings , loss of appetite, suicidal thoughts, sleep disorders, concentration and memory problems, exhaustion, and irritability, as well as feelings of weakness and incompetence to deal with the baby. (1,3,4).

the post-partum depression is a relatively common disorders with onset between one and six months after delivery and may last six month or longer, (4) and can affects the health of both the mother ( poor life quality and death) as well as the child (malnutrition , developmental delay, poor growth, and damaged mother-infant relation). (1,3,4,6) There are several risk factors associated with PPD: Family history of previous depressive illness or other psychiatric in the patient or her relatives, life stress , (4) ,labor pain (1) inadequate antenatal care, socio-economic status, (7) chronic illness, caesarian section, (post partum), nutritional deficiency (3), poor social support, (vigod) violence during pregnancy (7), in addition there are few risk factors seen only in developed countries : multiparity, baby gender and multiple births (2,3).

This study aimed to assess the prevalence rate of post-partum depression symptom among post-partum mother in Jeddah , Saudi Arabia and to identify the risk factors associate with PPD in order to help mothers avoiding them.

### Method:-

This cross sectional study was carried out at five health care centers in Jeddah , Saudi Arabia during the period from January to December 2016, among post-partum mother who admitted to obstetrics & gynecology units , A semi structure questionnaire was used to collect the data from the mothers, where it divided to three parts : first demographic data (age, education level, occupation and monthly income), second pregnancy and delivery characteristics (delivery place, postnatal care service level, delivery mode, planning pregnancy, labor duration, abortion, gravidity and parity, baby health, medical problem during pregnancy, complications, surgical history, depression history, family history) and the third part is the Edinburgh Postnatal Depression Scale which consists of 10 questions with 4 points scale , (8) The data collected was analyzed using SPSS version 20 statistical software. Mean and standard deviations (minimum and maximum) were used to presented parametric data while number (percentage) were used to presented non-parametric data. Comparison for categories variables ( sedation drugs and delirium presentation ) was done using Chi – square test . Statistically significance was considered at the 0.05 level and extreme significant at the 0.0001 level .

### Result:-

A total of 512 postpartum females who completed the demographic , obstetric variables section and the EPDS questionnaire were included in this study. The majority of them (68.8%) were from group age 25-40 and 19.9% were less than 25 years, 73.4% were Saudi. The females who participated in the study included housewives (238, 46.5 %), those employed outside the home (205, 40.0%), those with a university education or higher (341, 66.6%), and those who attend high school education (126, 33.6%). The majority of the participants (90.8%) were non-smokers and (65.6%) from group monthly income more than 8000 SR, more than two third reported that their husband were employed (68.8%) , with university degree or higher (69.9%). (Table 1)

Out of the 512 postpartum females 128 (25.0%) reported medical problem, 40 (7.8%) reported Previous psychological problems and 143 (27.9%) reported family history of PPD . ( Table 2)

Out of the 512 postpartum females 225 (43.9%) planned for pregnancy, 190 (37.1%) reported medical problems during pregnancy , those who had Marital problems numbered 99 (68.3%), those who suffered from depression during last pregnancy at least for one semesters numbered 314 (61.3%). Out of the 512 postpartum females 368 (71.9%) delivered in private hospital and 136 (26.6%) delivered in governmental hospital, those who spent Puerperal duration in her family house numbered 215 (42%), most of the female delivered Spontaneously and from them only 93 (25.8%) received epidural analgesia, 407 (79.5%) reported that baby gender not as they wish, 102 (19.9%) reported medical problems during delivery and 91 (17.8%) had complications after delivery. Half of the

women (253-50.4%) had baby girl ,252 (49.2%) had baby boy and 2 (0.4%) had both, only 15 (2.9%) baby reported medical problem, 46.1% reported both kind of feeding . **(Tables 3 ,4&5)**

The EPDS mean score was  $12.7 \pm 5.8$  rang (0-30) and was divided into two categories with cut off  $> 13$  , of the 512 mothers, 257 (50.5%) had depressive symptoms (EPDS score  $> 13$ ), and 255 (49.5%) did not have depressive symptoms (EPDS scores  $\leq 13$ ). **(Table 6)**

The results showed significant association between PPD and the following sociodemographic and medical characteristics ( maternal age, maternal education ,maternal occupation, monthly income , husband occupation and education level, medical problems , baby health, planning pregnancy , Medical problem during pregnancy and delivery , complication and semester depression , family history of PPD and previous psychological problems ) where advanced age , lower level of education, working mother , lower monthly income, husband level of education, working husband , positive medical problems before-during pregnancy and during and after delivery , positive family history of PPD and previous psychological problems and un planning pregnancy showed higher scores in EPDS (p=0.02, p<0.0001, p<0.0001, p<0.0001, p<0.0001, p<0.0001, p=0.04, p=0.03, p=0.04, p=0.03, p=0.04, p=0.01, p=0.04, p=0.01 and p=0.006) respectively. **(Table 7)**

### Discussion:-

Several studies were conducted about the prevalence of PPD and the associated risk factors, where PPD had big influence on the baby emotional and social development and this influence continues during teenage and adult years. **(3,9)** In industrial countries there is rapid screening for PPD so an early intervention can be done to decrease the negative effects of PPD on mothers and babies lives. **(3,10,11)** The current study showed that almost the half of participants mothers (49.5%) had depressive symptoms during post-partum period. Previous studies in Nepal and Saudi Arabia reported the prevalence of PPD 30-33% with cut off score  $\geq 10$ , **(2,3)** also the results from Pakistan and India studies the prevalence was between 11%-40% , while in other studies with cut off  $\geq 12$  the prevalence was 6%-12% , **(2,12,13)** and 15.4% in Turkish study with cut off  $\geq 13$ , **(7)** this variation in the prevalence rate could be due to the difference cut off, multi-cultural and multi-social factors, sample size and methods. **(2,3,7,12,14,15)**

The findings of current study showed that mother aged more than 40 years are more likely to develop PPD than younger mother , similar results were found in Singapore Nepal and Canada studies the authors reported high prevalence of PPD among women aged 35-40 , **(1,2,16)** in contrast in Turkey and Canada studies the authors reported high prevalence of PPD among young mother , **(2,7,17,18,19)** while in Saudi Arabia study the association was between older and younger age. **(3)**

Several studies investigated the association between PPD occurrence and sociodemographic data (mother's education and occupation , monthly income and father's education and occupation), **(6,20-26)** where the results showed contradictory evidence **(1,2,3,7)**, in Nepal ,Singapore, turkey and Saudi study there was no association between mother's education level, occupation and low monthly income and PPD , **(1,2,3,7)** while in other studies there was positive association between PPD and mother's lower education , being a housewife , and lower monthly income. **(2,3,7 27-32)** also in 2007 study the authors reported significant association between lower partner education and occupation and PPD , **(7,33)** the current study showed consistent with previous study regarding mother low educational level and controversy result regarding mother occupation and monthly income, where the high prevalence of PPD was between working mothers and high monthly income.

The current study findings showed that any medical problems in any time before or during pregnancy , during or after delivery had a strong effect on developing PPD (p=0.03p=0.004,p=0.03,p=0.01) ,this consistent with previous studies, **(1-7, 34-36)** in Saudi Arabia study the authors reported significant association between anemia during pregnancy and PPD **(3)**, in Singapore study there was significant association between medical problem during pregnancy such as GDM and hypertension and PPD. **(1,37,38)**

In addition to that the current studies confirmed previous studies findings that stressful life such as family problem , week relation with husband or his family , previous psychological problems specially anxiety , exhausts , pregnancy depression, tearful and lack of sleep , and family history of PPD either first degree relative or second degree relative , **(1-7)** in Nepal studies the authors reported that there is relation between PPD and early contractions during pregnancy and maternity blues after seven days from delivery, **(2,39)** in Turkey study the authors confirmed the relation between PPD and antepartum depressive symptoms which assessed by HADS-D , and they reported that thinking in committing suicidal during pregnancy is a high risk factors in developing PPD (odds ratio 6.99, CI 2.08-

23.49), (7,40,41) similar results were found in Singapore study where the authors reported high prevalence of PPD among women with previous psychological problems. (1,37,38)

Regarding planning pregnancy and baby gender, the results of the current study showed significant association between developing PPD and unplanned pregnancy ( $p=0.01$ ), this consistent with Turkey study. (7)

Pain during delivery considered as the most severe pain could be experience by some women during their entire life, it is not life-threatening, however it has association with the risk of development post-traumatic stress disorder, mood disorders, weakness of cognitive function and causing post-partum depression. Epidural analgesia was addressed in several studies as an effective way to reduce delivery pain and decreasing the incidence rate of PPD on the Edinburgh Postnatal Depression Scale (EPDS). The new guidelines recommended to use epidural analgesia when mothers ask if there is no medical contraindication, this use affected by several factors such as labor progress, mother condition and preferring. (1, 42-44) In Singapore study the authors reported significant association between the using of epidural analgesia and decreasing the score of Edinburgh Postnatal Depression Scale ( $P=0.0078$ ), (1) similar result was found in Hiltunen et al study (odds ratio [OR] 0.25, 95% confidence interval [CI] 0.09–0.72), (45) and Ding T et al study (OR 0.32, 95% CI, 0.11–0.89,  $P = 0.029$ ), (43) although the current study couldn't establish this relation.

There was no significant difference in the prevalence rate of PPD regarding mode of delivery, smoking and baby gender wishing.

### Conclusion:-

This study highlighted the high prevalence rate of PPD symptoms. Whenever the early detection of the risk factors for PPD, the easier for the doctor to intervene to treat and remedy it and prevent it from getting worse. The current study showed that advanced age, lower educational level for both mother and father were risk factors, however there are many other risk factors couldn't be detected in the current study. Further studies need to be conducted to investigate the relation between PPD and other risk factors in Saudi community, more awareness campaigns need to be held to raise the awareness about PPD among mothers and community, also psychiatrist and social worker should attend a postnatal care unit on a regular base to talk with mothers, advise them and help them in facing their fear.

### Acknowledgment:-

The Authors would like to acknowledge the following medical interns (Elaf A. Bahanshel, Alhanouf B. Alqarni, Rahaf T. Eskandrani, Sara O Amro, Renad H. Ateeq, Ohoud M Baajlan, Hala MA Kanawi, Rana M Jubran, Esraa A Alzahrani and Leena E Azhar) for their efforts in collecting the data.

##### Key words:-

subjective well-being, sense of humor, personality type of the big five personality, gratitude, social support, work reward and working condition.

#### Abstract

The objective of this research is to trace effect of the individual factor (intrinsic) including sense of humor, personality type of the big five personality, gratitude, and situational factors (extrinsic) consist of social support, work reward, and work condition of subjective well-being, finally it will be known the determinant factors of subjective well-being for the worker in the organization in Indonesia. The research subjects are 139 workers and 56 supervisors in the PT. Y. The Collecting data method use closed and opened questionnaire, observation, interview and focus group discussion. To understand different between subjective well-being viewed from work level and gender is used statistic analysis, those are the regression analysis and t-test. Sense of humor and social support become determinant of high-low subjective well-being PT. Y's labors. At supervisor, predictor of subjective well-being are personality type variable of openness to experience, agreeableness, gratitude and work reward. The result show that labor's subjective well-being is higher than supervisor, because positive psychology centered to the meaning of life, that is, how persons give a meaning everything happen of their life. For supervisor, work reward is tool for self actualization, those are, prestigious, autonomy, safety, and protect, while for labors, work reward is used to fulfill basic needs. This matter makes labors more satisfied easily with work reward that is gotten because the work opportunity is also more limited.

#### Background:-

In the midst of an increasingly tough environmental conditions like today, every man would want to live a happy life, not to mention the employees. Often people get frustrated, stressed, and even to suicide because they feel confident that he will not get the happiness he wants in life. Maybe that's the concept of subjective well-being owned by some individuals with low subjective wellbeing. Feeling happy indeed subjective nature, differing between individuals from one another, as well as employees will feel very happy when he first accepted to work in a company. Is feeling happy and satisfied will also be experienced after a long time in the world of work, both the worker and supervisor-level employees. Indonesia as a developing country, has always held a development in all fields. One of the priority areas of development is the industrial field. Along with the development of industrialization, found many companies that have sprung up in major cities. Field of industrialization is very concerned with the employment factor that can not be separated from the human factor as an asset that support industrial progress. This industry absorbs the most workers, both men and women. Research Herzog & Strevey

(2007) states that a sense of humor can increase subjective well-being of individuals. Abel (2002); Lefcourt (2001); and Martin and Kuiper (2001) (in Herzog & Strevey, 2007) gives an example of that humor has a functioning network for immunity and reduce stress or any variable that can produce stress. A study shows that individuals who are closer to the gratitude showed a high level in terms of life satisfaction, self-esteem, and optimism. Results of a meta analysis of the relationship between subjective well-being of gratitude with  $r = 0.17$  (Emmons & Crumpler, 2000). Kennedy (1999) and Maltby (1999) wrote that the type of gratitude has a positive emotional valence. Allegedly gratitude is the root of the basic tendency to experience positive emotions and well-being. In the classification of the Big Five Personality, grateful people have high extraversion scores (positive effect) and neurotic low (negative effect) because both these personalities have relevance to the emotional experience. The experience of people who are grateful to have specific levels of positive emotions such as happiness, enthusiasm, optimism, hope, and satisfaction in life. Conditions lower subjective well-being can be influenced by the presence of social support. Individuals who receive social support will feel at ease in running their lives, activities, because the environment can encourage individuals, particularly in achieving life goals. Kaplan and Killilea (Sarason et al., 1990) says that a support system can help individuals in encouraging the sources of psychological, releasing pressure, sharing tasks, and obtain important information about solving problems.

Strauss and Sayles (1980) states that social support is a means to improve the subjective well-being. Social support can be obtained from family, co-workers, supervisors, and others (Miner, 1992). There are studies that show that when people get the least of someone who can provide social support, especially emotional support, then the experience of subjective well-being increased, with  $r = 0.49$  (Davis & Newstrom, 1993). This is in line with research Gademmann & Zumbo (2007) which showed that social support has a positive and significant correlation with subjective well-being,  $r = 0.63$ . Besides social support has a positive and significant correlation with positive affect,  $r = 0.52$ , with negative affective aspects of subjective well-being has a negative and significant correlation,  $r = -0.38$ , and with the satisfaction of having a positive and significant correlation with  $r = 0.57$ . The study of remuneration in the organization of work show that: 1). Well-being achieved if the consideration received appropriate or feasible perceived by employees; 2). The feeling of satisfaction is influenced by the comparison between the remuneration obtained, with what is obtained by other people; 3). Satisfaction is influenced by how satisfied employees by intrinsic and extrinsic rewards; 4). Preferred Rewards vary from different sides of a person's career, at the age levels and a variety of situations, and 5). Money is a reward that encourages something of prestige, autonomy, security, and protection. Rewards or awards may be given by the leader, groups or individuals themselves, either directly or indirectly increase the subjective well-being of employees (Gibson et al., 1994). Diener research results (in Eddington & Shuman, 2005) states that it is generally low but significant correlation between remuneration or income with subjective well-being found on a representative sample in the United States. Remuneration which is also consistently associated with subjective well-being in a country (Diener et al., 2005). One possibility is that the income only affects the subjective well-being at a lower level, where basic needs have not been met. However, if basic needs are met, an increase in income or wealth is only little effect on happiness.

#### **Research purposes:-**

This study aimed to explore the effect of individual factors (intrinsic) and situational factors (extrinsic) to the subjective well-being, which ultimately will be known contributing factors subjective well-being of workers in work organization PT. Y in the town of East Java. The general objective can be described more specifically below:

To determine the relationship between personality variables openness to experiences, conscientiousness, extraversion, agreeableness, neuroticism, humor, gratitude, social support, employee benefits, and working conditions to the subjective well-being, both individually and together. To find out the differences and factors that influence levels of subjective well-being among workers and supervisors.

#### **Hypothesis:-**

Personality openness to experiences, conscientiousness personality, personality extraversion, agreeableness personality, sense of humor, grateful, social support, working conditions and employee benefits is a supporting factor subjective well-being, whereas neuroticism personality is a factor inhibiting the subjective well-being.

#### **Material And Methods:-**

##### **Subject Research:-**

The population in this study were all employees and employee production supervisor at PT. Y Sidoarjo. Production employees at PT. Y amounted to 139 people, while the supervisors of employees amounted to 56 people consisting of a Section Head (Head of Section) and Group Team Leader (GTL). Making the subject of study is a Total

Population Study with consideration of the entire population is used as a research subject. Researchers took the subject to all members of the population due to the limited number of employees and production employees have the same characteristics ie at least high school educated and occupying grade I, whereas the employees supervisor entirely educated minimal S1 and scholars all have men between 2-15 people.

#### **Instrument and Data Collection Procedures:-**

To obtain data on the variables in this study used seven instruments in the form of scale of assessment, Summated scale rating, complemented by interviews, and focus group discussion. Summated rating method is popular with the name of the model Likert scaling is a method of scaling-oriented responses. In other words, in this method, the response category will be placed on a continuum. The entire instrument using five kinds of ordinal categories.

#### **Results And Discussion:-**

When depicted on the analysis of quantitative data on production employees, predictors that support the subjective well-being as follows:

**Figure 1.** Predictors of Subjective Well-being Employees Production

The results showed that the predictors that have a correlation with the criterion of subjective well-being of employees is the production of personality agreeableness, neuroticism, sense of humor, and social support. Thus the determining subjective well-being more influenced by internal factors, namely private high agreeableness, neuroticism personal low, and has a sense of humor. Subjective well-being of workers also increased when obtaining social support from outside. Results of regression analysis obtained by  $F = 5786$  and  $p < 0.01$ , respectively. These results indicate that personality agreeableness, neuroticism, sense of humor, and social support can be a significant predictor of subjective well-being of the production employees. Effective contribution obtained throughout the predictor is 31.1%, this shows that there are still 69.9% of other variables that affect the subjective well-being of production employees who have not taken into account in this study. When sorted, the fourth most powerful predictor of the effect is the personality of agreeableness, neuroticism, sense of humor, and social support have the smallest influence. Agreeableness personality can be a predictor of subjective well-being significantly with the production employees  $r = 0.379$ ,  $p < 0.01$  and  $\beta = 0.278$  and  $p < 0.01$ , respectively. These domains focus on how much people appreciate his relationship with others. Individuals who are agreeable to appreciate relationships with others. They are full of awards, friendly, generous, helpful, and willing to compromise their interests with others. People who are agreeable also have an optimistic view of man. This agreeable person who according to external demands in a corporate environment, so that it becomes easier to accept people who are not satisfied with the environment and conflict. Production employees who have never experienced the conflict will easily reach subjective wellbeing (Burke et al., 2006). This is in contrast with the disagreeable person who puts his interests above others. They tend to be less concerned with the well-being of others, and tend to keep a distance with others, this is what makes employees shunned and effect on subjective well-being is becoming weaker. There are two possibilities that could be the explanation could be the strongest predictor of agreeableness to subjective well-being of the employees of production, namely:

The first possibility is a rule that is already tight so it does not need self-discipline in managing the implementation of activities, so that although the type of characteristics do not fit the job, but the environment to force any employee to be able to adjust to external demands, so that subjective well-being can be realized because it does not make a conflict with a friend in the work environment or the company where she worked. The second possibility is typical of Indonesian people are affected strongly by culture Java and all Java production employees also have tribes. Javanese culture has a strict view of the importance of alignment. Deeply internalized feelings in the soul of the Javanese is the sensitivity to not be humiliated in public. Thus fostering a feeling of conformity, controlling behavior, and maintaining strict social harmony. The conflict was muted mightily. Normal reaction of everyone Java

in response to conflicts is avoidance, "wegah crowded", and mediation by a third party (Henry Susetya, 2007). When the conflict erupted, particularly when taunted each other and mutual contempt case, then what emerges is a feeling of shame and loss of face. This agreeableness character according to the type of personality that is liked by the management of PT. Y the character a quiet, does not stand out, according to, and routine. With the suitability agreeableness personality types with external demands companies make his subjective well-being increased. Personal neuroticism can also be a significant predictor of the subjective well-being, with  $r = -0.354$ ,  $p < 0.01$  and  $\beta = -0.268$  and  $p = 0.001$ . This shows that the more neurotic person, the lower his subjective well-being, and vice versa less neurotic then the higher his subjective well-being. This domain is concerned with the tendency of someone who is experiencing negative emotions such as anxiety. People who have high levels of neuroticism tend to have a high emotional reaction. They respond to emotional events that could have an impact on others (Ho, 1995). Problems in setting these emotions can reduce people's ability to think clearly neurotic, make decisions, and cope with stressful problems. Individuals who have low scores on neuroticism tend to be quieter and emotions tend to be reactive. They tend to be more stable and free of negative feelings. The majority of production employees who also have private neuroticism that level quite as much as 97.84% (Table 33) and used to living hard, was still experiencing anxiety about the future, especially for the cost of living in the future. Personal neuroticism become anxious, irritable, prone to depression, sensitive, redundant, and vulnerable, so much dominated by negative emotions and lower positive emotions. This is what makes neuroticism negatively correlated with subjective well-being. Most production employees have enough personality neuroticism on the category (97.84%) so that his subjective well-being is also at the high category (68.34%) (Table 31 and 33). This study supports the results of the study Gaderman & Zumbo (2007); Burke, et al. (2006); and Gutierrez, et al. (2005) which showed that the higher a person's neuroticism, the lower his subjective well-being.

The correlation between the sense of humor with subjective well-being, the value of  $r = 0.199$ ,  $p = 0.009$  and  $\beta = 0.206$ ,  $p = 0.009$ , thus there is a significant relationship between the sense of humor with subjective well-being. This is consistent with research and Strevey Herzog (2007) which states that a sense of humor can increase subjective well on production employees. Abel (2002); Lefcourt (2001); and Martin and Kuiper (2001) (in Herzog and Strevey, 2007) gives an example of that humor has a functioning network for immunity and reduce stress or any variable that can produce stress. Subjective well-being and sense of humor are related because basically has the same single phenomenon that is self-objectivication, the ability to see yourself. Humor art aims to alleviate community in living her life (Kleverlaan et al., 2000). Individuals who have a sense of humor can reduce negative affect and increase positive affect and it will increase the satisfaction that ultimately subjective well-being will increase as well. It became apparent, after explained that humor is one of the factors that have an important contribution to the subjective well-being. Isen, Daubman and Nowichki (Herzog and Strevey, 2007) demonstrated the results of experiments that positive affective, can improve their skills in problem solving. Positive mood and thinking flexibly dealing with a good sense of humor. According to Martin and Kuiper (2001) mechanism that connects between humor and subjective well-being is a positive emotion that is where it accompanies the humor. A sense of humor has the power to produce the "pleasure" associated with positive emotion or mood (Herzog and Strevey, 2007). Other results that support is currently conducted interviews and focus group discussions, the production employees feel happy and at home working at PT. Y because of its pleasant atmosphere, between friends joking with each other and throws a "joke" making the morale be growing. Even the results of FGD 11 of 14 (78.57%) production employees say that the most important work is able to meet friends, be "joking" or "gojegan" and "teasing", and can "ngrumpi" than at home had no friends and no income, this will have an impact on positive affective or feeling happy that the production employees.

#### **Research on Employee Supervisor:-**

Predictors of high or low criterion that affects the subjective well-being between production employees and employee supervisors indicate a difference. Predictors equally be a determinant of subjective well-being of employees and employee production supervisor is agreeableness personality.

Other predictors that determine the level of subjective well-being of the employees supervisor is different, as follows:

**Figure 2:-** Predictors of Subjective Well-being Employee Supervisor

From the results of hypothesis testing on the correlation between the predictor with the criterion of the employees supervisor, only personality type openness to experience, agreeableness personality types, grateful, and employee benefits showed a significant association with subjective well-being (table 15). Thus the determinant of the high-low subjective well-being of employees supervisor is entirely internal factors that personality openness to experience and agreeableness), grateful, and employee benefits, especially the intrinsic rewards associated with the completion of tasks, achievement, autonomy, and personal development. Results of regression analysis obtained  $F = 8152$  and  $p < 0.01$ ,  $R^2 = 0.644$  means that donations predictors of sense of humor, personality openness to Experiences, Conscientiousness, Extraversion, Agreeableness, Neuroticism, grateful, social support, employee benefits, and working conditions on subjective wellbeing amounted to 64.4%, while the remaining 35.6% is influenced by other factors.

The relationship between personality openness to experience with subjective well-being of employees supervisor, obtained  $r = 0.362$  and  $p = 0.003$ . This shows that there is a significant relationship between personality openness to experience with subjective well-being of employees supervisor. Results were positive correlation indicates that the stronger the personality type openness to experience in employee supervisor, the higher the well-being of subjectivity. Openness to experience is a valid predictor, actually not surprising, since the research results Warr, Bartram and Martin (2005); Murphy and Davies (2006), found a positive effect openness to experience on the job performance and subjective well-being of the sales. This could be due to being able to move in advance, the necessary curiosity and willingness to learn (Barrick and Mount, 1991; Costa and McCrae, 1992; and Hogan and Holland, 2002). The results support the research Burke et al. (2006) and Gutierrez et al. (2005), which states that there is a significant correlation between personality type openness to experience with subjective well-being. Openness to experience refers to how a person is willing to make adjustments on an idea or a new situation. Openness to experience assume the character of easy tolerance, the capacity to absorb information, to be very focused, and able to be alert to the feelings, thoughts, and impulsivity. Employees supervisor who has the personality type openness to experience (87.50%) in the table 35 has a value of imagination, broadmindedness, and a world of beauty. Someone who has openness to experience higher levels will also have thoughts and insight, not conservative, and liked changes, so as to build personal growth. Achievement of creativity are more prevalent, so curious or open to the experience will be much easier to get a solution to a problem, so it will gain a sense of excitement as well as having the satisfaction that will improve the subjective well-being.

The relationship between personality agreeableness to subjective well-being of employees supervisor. obtained  $r = 0.509$  and  $p = 0.000$  (Table 16). This shows that there is a significant relationship between personality agreeableness to subjective well-being of employees supervisor. In the classification of the Big Five Personality, it is recommended that people who are grateful tend to score high on agreeableness which shows the social and behavioral oriented on others. Saucier and Goldberg (in Emmons and McCullough, 2003) also reported that two items contain properties measured personality grateful and thankful correlated with agreeableness ( $r = 0.31$ ). Agreeableness can be called social adaptability or likeability that indicate someone who is friendly, has a personality that always give in, avoid conflict, and has a tendency to follow others. Based on the value of the survey, someone who has a high agreeableness scores is described as someone who has values like helping, forgiving, and compassionate. This very personal agreeableness in accordance with the generic competency PT. Y one of which is self-control is an ability to control emotions and reactions are controlled display, so that interpersonal relationships can be maintained properly. With the core competency of individuals who have a high agreeableness scores will be adaptable, this is what makes his subjective well-being is increased.

The relationship between subjective well-being grateful to the employees supervisor, obtained  $r = 0.600$  and  $p < 0:01$  (Table 16). This shows that there is a significant relationship between subjective well-being grateful to the employees supervisor. It supports research Emmons and McCullough (2003) which states that a person who is grateful to have positive emotions and good well-being. Some experts and researchers write that type are grateful to have a positive emotional valence. Allegedly gratitude is the root of the basic tendency to experience positive emotions and well-being. Experiences of people grateful to have a specific level of positive emotions such as happiness, enthusiasm, optimism, and hope and satisfaction in life. Gratitude or grateful also be conceptualized as a virtue (Emmons and Crumpler, 2000). Klein (in Emmons and Crumpler, 2000) found that people experiencing gratitude protected from harmful impulse of jealousy and greed. Instead, jealousy is a fertile field for ingratitude. Practice gratitude as spiritual study (thank you therapy) has been suggested as a remedy for individuals materialist excessive and negative emotions that go with it, jealousy, resentment, disappointment, and bitterness. The core issue of jealousy (envy) is to be a blessing unconsciousness that surrounds a person consistently (Bonder, in Emmons and Crumpler, 2000). Mc. Cullough and colleagues expressing gratitude or gratitude as a moral emotion, something that drives a person to pay attention to others and support social ties supportive. The results also support previous research that there is a relationship between subjective well-being grateful. Another study by Koenig, Smiley and Gonzales (in Santrock, 2004) said that it was grateful related to subjective well-being. Survey of American adolescents and adults showed that more than 90% of respondents expressing gratitude, thus helping them to feel happy (Gallup, in Emmons and McCullough, 2003). The results also support previous research conducted by Arbiyah, et al. (2008) which states that there is a positive correlation between subjective well-being thankful to the poor. Results of the analysis of the above data show a positive correlation, ie the higher the level grateful that employees supervisor, the higher the well-being of subjectivity.

That is because the feeling of gratitude can cause positive emotions like peace of mind, interpersonal relationships are more comfortable and also happiness (Bono, Emmons and McCullough, in Seligman, 2005). In particular, McCullough et al. (in Bono et al., 2004) says that people who are grateful are likely to experience positive emotions more often, enjoy the satisfaction in life, and more hope, and less likely to experience depression, anxiety, and envy. Individuals who are grateful tend to be more empathetic, forgiving, helping, and showing support for others.

Emmons and Crumpler (2000) states that gratitude has three functions specific morals, namely: 1). Serves as a moral barometer that gratitude or grateful signifies generosity is felt, that someone had given him a gift, 2). As a moral motive is gratitude encourages a person to act in reciprocity to the other people who helped him directly (direct reciprocity) or something else (upstream reciprocity), and 3). As a moral booster (moral reinforce), as gratitude or grateful to increase the chances of generous behavior in the future. Thankful called an empathetic emotions (Lazarus and Lazarus, in Emmons and McCullough, 2003) because it was predictable as the capacity to recognize the benefits of the action in one's life. Thankful is also the root of the nature of the East Asia which has high sensitivity and attention to others. Some research suggests that there are many dimensions of time perspective, which consists of past-negative, past-positive, present-fatalistic, present-hedonistic, futures, and transcendental-future (Zimbardo and Boyd, 2010). The supervisor captures the attitude towards the past, not record the events good and bad objective. Positive attitudes towards the past reflects the positive events that actually people experiencing, or positive attitude that allows individuals to make the best of circumstances is very difficult. What people believe happened in the past affect the thoughts, feelings, and behavior in the present. People who experience severe events but if it is able to finish with positive ways will be resilient and optimistic. Results of this study was supported by research Zimbardo and Boyd (2010), which uses the first semester students in the United States show that students who are Muslim has the past-negative scores are low, the lower the present-fatalistic, as well as the future time perspective is high. This is because the followers of Islam had never been to prioritize pleasure, always controlled, focused on the routine of worship and always remember the result of the behavior in the future. It is this factor that makes Muslims who mendominasi subject of this study, namely 100% of production employees and 82.14% in employee supervisor has a high level of subjective well-being.

The relationship between employee benefits to the subjective well-being of employees supervisor obtained  $r = 0.427$  and  $p = 0.001$ . This shows that there is a significant relationship between employee benefits to the subjective well-being of employees supervisor. Creed et al. (2001) showed that certain groups can attain happiness when materialistic needs are met as well as the economic establishment (Cotton and Hart, 2003). The study of remuneration in the organization of work show that: 1). Well-being achieved if the consideration received appropriate or feasible perceived by employees; 2). The feeling of satisfaction is influenced by the comparison between the remuneration obtained, with what is obtained by other people; 3). Satisfaction is influenced by how

satisfied employees by intrinsic and extrinsic rewards; 4). Preferred Rewards vary from different sides of a person's career, at the age levels and a variety of situations, and 5). Money is a reward that encourages something of prestige, autonomy, security, and protection. Rewards or awards may be given by the leadership, groups, or individuals themselves, either directly or indirectly increase the subjective well-being of employees (Gibson et al., 1994). Research results Blanchflower (2001) stated that in general low but significant correlation between remuneration or income with subjective well-being found on a representative sample in Japan. Remuneration which is also consistently associated with subjective well-being in a country (Diener et al., 2005). Kingdon and Knight (2004) and Baker et al. (2005), the research results gained that employee benefits have a positive and significant correlation with subjective well-being. Diener et al. (2005) also states that at the individual level and the national level, changes in income over time have little effect on subjective well-being. The results showed that there is a correlation between fulfillment of expectations payroll or compensation with subjective well-being (Hubbard, 2005). One possibility is that the income only affects the subjective well-being at a lower level, where basic needs have not been met. When basic needs are met, an increase in income or wealth is only little effect on happiness. There are some who say that in terms of religiosity can also obtain happiness (Compton, 2005). But from the interviews although there has been a remaining finances, they have not been able to achieve a high subjective well-being. Thus further confirming that emotional factors play a Role in providing optimization of subjective well-being.

### Conclusion:-

1. Personality agreeableness, neuroticism, sense of humor, and social support determines the high-low subjective well on production employees at PT. Y, it is because of cultural kinship company has three functions such as family functions, ie functions of affection, the maintenance function, and the function of empowerment, so that among employees like family members would be easy joke / "gojekan", mockery, "ngrumpi" and give support especially emotional and informational support, and give considerable attention to the development and training of employees and increasing autonomy.
2. In the employee supervisor, who became a predictor or determinant of the high-low subjective well-being is a personality type variable openness to experience, agreeableness personality types, grateful, and employee benefits.
3. Personality agreeableness be a predictor of subjective well-being of employees and employee production supervisor. Javanese culture has a strict view of the importance of alignment. Deeply internalized feelings in the soul of the Javanese is the sensitivity to not be humiliated in public. Thus fostering a feeling of conformity, controlling behavior, and maintaining strict social harmony. The conflict was muted mightily.
4. The high-low Determinants of subjective well-being of workers are employees of internal factors that personality agreeableness, neuroticism, and a sense of humor. The workers will also increase the well-being of subjectivity when obtaining social support from outside.
5. That showed significant differences between production employees and the employees supervisor is the subjective well-being, personality type openness to experience, conscientiousness, agreeableness, neuroticism, humor, gratitude, social support, employee benefits, and working conditions. Subjective well-being of employees is higher than the production supervisors employees, because positive psychology centered on the meaning of life, how people interpret everything that happens within him. At the employee supervisor, employee benefits are a means to encourage something that is prestige, autonomy, security, and protection.
6. Predictors showed no difference between the employee and the employee production supervisor extraversion is the personality type, as well as subjective well-being in terms of gender.
7. Humor appreciation and humor tolerance has a significant correlation with subjective well-being in the production employees. This suggests that subjective well-being of employees will increase production even if just to appreciate the humor created by others, or respond to other people's jokes. Humor production and humor coping may not be a predictor of high and low subjective well-being, because not everyone is able to create humor and being able to use humor to resolve the issue. It thus shows that even though a person is able to create humor or being able to use humor to solve the problem, but if it is unable to appreciate the humor in the environment, then he will not be able to improve the well-being of subjectivity.
8. The correlation between social support and well-being aspects of subjective production employees, shows that emotional and informational aspects have a significant correlation with subjective well-being. Instrumental aspects and assessment has no relationship with subjective wellbeing Thus the size of the instrumental support or materialistic as well as support for assessment or giving feedback does not determine the level of subjective well-being, when the emotional support or informational support is not obtained.

9. Aspects grateful that correlated with subjective well-being is an aspect of good intentions, act positively, and grateful transpersonal, while aspects of the appreciation of someone or something and thank personally can not be a predictor of high and low subjective well-being of employees supervisor. Subjective well-being can be achieved not just good intentions, but it must be done with a real positive actions and with gratitude transpersonal. Through concrete actions, one will soon get feedback from their behavior, and through transpersonal grateful to be gained comfort and relief, so that subjective well-being can be increased.
10. Employee benefits are correlated with subjective well-being of employees employee benefits supervisor is intrinsic, whereas extrinsic employee benefits may not be a predictor of high and low subjective well-being of employees supervisor. These results indicate that the employee supervisors interpret the work as a career like characteristics always perform task completion, achievement, autonomy, and personal development. Employee benefits are correlated with subjective well-being of employees employee benefits supervisor is intrinsic, whereas extrinsic employee benefits may not be a predictor of high and low subjective well-being of employees supervisor. These results indicate that the employee supervisors interpret the work as a career like characteristics always perform task completion, achievement, autonomy, and personal development.
11. Familial culture is growing rampant in PT. Y, because of the socialization and perception of the way to work. The first is the perspective of socialization which employees assess that co-production becomes a very important thing, to social support had a significant correlation with subjective wellbeing production employees. In building that relationship which must be adhered to is the value of equality that all men are equal and therefore must be mutual respect between people. Another perspective is the perception of the way to work, have to balance between the achievement of social relationships. Therefore, salaries or employee benefits is not a measure or predictor for subjective well-being of workers, particularly the production employees.
12. A steady income through minimum wage has no effect on the high-low subjective wellbeing and effect only when the system of employee benefits following the performance.

Infertility, Prolactin, Thyroid stimulating hormone, Sex hormones.

#### Abstract

Hormonal and biochemical disturbances play an important role in development of infertility cases. Therefore, this study was conducted to evaluate the prolactin level and to explore the association between prolactin and thyroid stimulating hormone (TSH) and other hormones in the diagnosed infertile women in Ma'an governorate. The study was performed on 151 women (age group 20–40 years) who visited the Gynecology and Obstetrics Department at Ma'an governmental hospital. The study sample was divided into three groups: fertile group (n= 27), primary infertile group (n= 82) and secondary infertile group (n= 42). The results showed high incidence of prolactin abnormalities in both primary and secondary infertile women (90% and 92%, respectively). Furthermore, TSH abnormalities were found in 90% of primary infertile and % 93 of secondary infertile women. In addition, the results revealed the positively significant correlation between TSH and the fertility. Positive correlations were found between the levels of prolactin and TSH in primary and secondary infertility. Also, there were positive correlations between the levels of prolactin and other hormones, including luteinizing hormone, follicle-stimulating hormone, testosterone, estradiol and progesterone. In conclusion, the present study revealed a significant correlation between prolactin and TSH and other hormones in infertile women. Therefore, assessment of serum TSH and prolactin levels are mandatory in the work up of all infertile women, especially those presenting with menstrual irregularities.

#### Introduction:-

Infertility is defined as the inability of non-conceiving couple to achieve pregnancy in one year (Roupa *et al.*, 2009; Turchi, 2015). In the second decade of the new millennium, infertility remains a highly prevalent global condition. Infertility is estimated to affect between 8 and 12% of reproductive-aged couples worldwide (Inhorn and Patrizio, 2015). Primary infertility is diagnosed in couple who do not have any living children, while secondary infertility is diagnosed when female have been pregnant at least once but are unable to carry subsequent pregnancies (Whitehouse and Hollos, 2014). The female infertility can be a result of various conditions such as ovulation disorders, uterine or cervical abnormalities, fallopian tube damage or blockage, presence of endometriosis, primary ovarian insufficiency, pelvic adhesions and using of cytotoxic chemotherapy for cancer treatment (Abrao *et al.*, 2013).

Furthermore, disturbances of several hormones can play a crucial role in development of infertility cases. These hormonal disturbances may involve one or more than sex related hormones including prolactin (PRL), thyroid stimulating hormone (TSH), follicle-stimulating hormone (FSH), luteinizing hormone (LH), estrogen, progesterone and testosterone (Veeresh et al., 2015). Besides, prevalence of hypothyroidism in the reproductive age group is 2–4% and it has been shown to be the cause of infertility and habitual abortion (Verma et al., 2012; Kameswaramma, 2017). Hypothyroidism can be easily detected by assessing TSH levels in the blood. Many infertile women with hypothyroidism had associated hyperprolactinemia due to increased production of thyrotropin releasing hormone (TRH) in ovulatory dysfunction (Goswami et al., 2009).

Moreover, there is a number of scientific studies that have revealed significant correlations between some biochemical alterations and the infertility. These biochemical disturbances involve glucose concentration, lipid profile such as triglyceride, total cholesterol, high density lipoproteins (HDL) and low density lipoproteins (LDL) levels (Allahbadia and Merchant, 2011; Szaboova and Devendra, 2015). This study was, therefore, performed to evaluate the prolactin level in selected females (age group 20-40 years old) from Ma'an governorate, and to explore the association between prolactin with TSH and other hormones, including sex hormones.

## **Material and Method:-**

### **Study population:-**

The study was conducted on 151 women (age group 20–40 years) who visited the Gynecology and Obstetrics Department at Ma'an governmental hospital during 1/4/2014 to 30/9/2014 for a period of six months. The study was achieved in Ma'an governmental hospital laboratory. This study was conducted after taking informed, written consent of all patients. Infertile women on treatment for thyroid disorders or hyperprolactinemia were excluded from the study. All females underwent a complete physical examination, with measurement of weight, height and body Mass Index (BMI). Patient were grouped into three categories according to the Asia-Pacific classification of obesity: overweight (BMI 23-24.9 kg/m<sup>2</sup>), class I obesity (BMI 25-29.9 kg/m<sup>2</sup>) and class II obesity (BMI > 30 kg/m<sup>2</sup>) (Flegal et al., 2012).

### **Blood sample collection:-**

Blood samples from fasting participants were collected at 8.00-10.00 am. Venous blood was collected in an evacuated tube with a gel and a clot activator. Blood samples for FSH, LH, prolactin, TSH, testosterone and estradiol analysis were taken in second day of the menstrual cycle. For progesterone determination, the blood was taken at day 21 of the menstrual cycle. The serum samples were rapidly separated by centrifugation for 3-5 minutes at room temperature at 3500 rpm and were separated into two tubes and stored at -20 C until analysis.

### **Biochemical analysis:-**

The glucose levels in serum were measured by glucose hexokinase method (Hitach-912, Germany). The lipid profile, including triglyceride, cholesterol and HDL, were assessed by automated enzymatic colorimetric method (Hitach-912). Low LDL level was calculated by using the Friedewald formula = (Total cholesterol – HDL) - Triglyceride /5 (Friedewald et al., 1972). The normal reference ranges for glucose, triglyceride, cholesterol and HDL and LDL are 4.20-6.80 mmol/L, 0.70-1.90 mmol/L, 3.90-6.70 mmol/L, 1.06-1.52 mmol/L and 2.80-4.80 mmol/L, respectively. TSH, LH, FSH, prolactin, testosterone, estradiol and progesterone were measured by electrochemiluminescence assay as per the instruction manual for Elecsys, 2010 (Roche Healthcare, Basel, Switzerland). The normal reference ranges for TSH, LH, FSH, prolactin, testosterone, estradiol and progesterone are 0.27-4.20 mIU/ml, 0.40-20 mIU/ml, 2.00-13.00 mIU/ml, 3.40-24.10 ng/ml, 0.025-15.00 ng/ml, 12.50-166.00 pg/ml, 4.90-71.90 nmol/l, respectively.

### **Statistical Analysis:-**

The data were presented as the mean ± standard deviation (S.D). Association between variables was assessed by pearson's bivariate coefficient of correlation. *t* -test for independent samples was also used to determine significant difference between means of two continuous variables. Simple linear regression was also employed to analyze the data. *P* ≤ 0.05 was considered significant. All statistical analyses were performed using the SPSS Statistics program, version 16.0 (IBM Corp., Armonk, NY, USA).

## Results and Discussion:-

### Patients' characteristics:-

The mean age of the women included in the present study was  $31.14 \pm 4.29$  years. Figure 1 illustrates the characteristics of the subjects according to infertility status. It was found that 20.53 % of subjects were fertile women, while 47.0 % of the subjects having primary infertility and 32.5 % with secondary infertility. Some characteristics of the subjects, including irritable breast, overweight, amenorrhea, secretion of prolactin from the breast, facial growth increase and obesity, are shown in table 1. Most women in this study were obese according to BMI values. The relationship between obesity and reproductive functions has been known for many years (Dağ and Dilbaz, 2015) and it is still being explored (Klenov and Jungheim, 2014). Several mechanisms are involved in the relationship of fertility and obesity. The insulin resistance and leptin levels are increased and hyperandrogenemia occurs in obese women. Similarly, anovulation, changes in adipokine levels and the hypothalamic–pituitary–gonadal axis (HPG axis), and steroidogenesis in obese women affects the reproductive system (Pasquali *et al.*, 2003; Chen *et al.*, 2013).

**Figure 1:-** Fertility status (%).

**Table 1:-** Distribution of the study population characteristics (n=151)

Characteristics	Status	Number, percentage (%)
Fertility status	Fertility	27 (17.88)
	Secondary infertility	42 (27.81)
	Primary Infertility	82 (54.3)
Hair loss		84 (55.6)
Weight increase		93 (61.6)
Irritable Breast		46 (30.5)
Amenorrhea		90 (59.6)
Secretion of prolactin from breast		73 (48.3)
Hair growth increase		86 (37.1)
Body mass index:	20-25	3 (2.0)
	25-30	51 (33.8)
	>30	97 (64.2)
	>30	

### Serum levels of glucose and lipid profile:-

The results were shown according to fertility status and were grouped into fertile, primary infertile and secondary infertile. Table 2 shows the levels of glucose and lipid profile in all groups. Glucose levels were significantly ( $P \leq 0.01$ ) higher in both secondary and primary groups than in fertile group. The high blood sugar is linked to polycystic ovarian syndrome, which in turn affects the balance of hormones in the body which affects the ovulation process thus negatively happen difficult pregnancy (Chamberlin *et al.*, 2013). The most important hormones is insulin to keep blood sugar at a normal level. Estrogen works to make the body more receptive to insulin (which helps the action of insulin) and therefore it tends to reduce blood sugar, while progesterone works on blocking the action of insulin, and therefore it tends to increase the proportion of sugar in the blood, and there are wondrous harmony between hormones to work (Moce *et al.*, 2005).

Some infertile women have a condition underlying their blood sugar problems. This condition is called polycystic ovarian syndrome (PCOS). In PCOS, too much testosterone is produced and this affects the ability of the eggs to mature within the ovaries (Wu *et al.*, 2012). In turn, this will affect the balance of hormones in the body which affects the ovulation process thus negatively happen difficult pregnancy (Chamberlin *et al.*, 2013).

Lipid profile, including cholesterol and LDL levels, were significantly ( $P \leq 0.01$ ) and ( $P \leq 0.05$ ), respectively, higher in both secondary and primary groups than in fertile group, while triglyceride and HDL showed insignificant changes compared to fertile group. High saturated fat raises LDL cholesterol in the body, which affects the body's sexual and reproductive ability. Cholesterol levels may be an important factor in healthy couples who do not have infertility problems. Cholesterol may be related in fertility because it is a building block of all hormones, male and female, such as estrogen and progesterone in women and testosterone in men, because they affect the sperm and semen of men quality, as well as the ovulation, in planting and maintaining a healthy pregnancy in women (Elis *et al.*, 2013).

**Table 2:-** Levels of glucose and lipid profile (cholesterol, triglycerides, HDL and LDL) in the serum of all groups.

Measurements	Fertility (n=27)	Secondary infertility (n=42)	P value *	Primary infertility (n=82)	P value *
Glucose(mmol/l)	5.48 ± 0.75	6.07 ± 0.97	≤ 0.01	6.02 ± 0.94	≤ 0.01
LDL(mmol/l)	3.49 ± 0.46	3.69 ± 0.8	≤ 0.01	3.68 ± 0.45	≤ 0.01
HDL(mmol/l)	1.31 ± 0.11	1.34 ± 0.09	NS	1.36 ± 0.09	NS
Triglyceride(mmol/l)	1.67 ± 0.46	2.16 ± 0.6	NS	2.12 ± 0.52	NS
Cholesterol(mmol/l)	4.99 ± 0.85	5.82 ± 0.85	≤ 0.01	5.64 ± 0.67	≤ 0.01

Results are expressed as the mean ± S.D. NS: not significant

\* Compared to the fertile group.

### Levels of hormones in serum:-

The hormonal levels in serum are illustrated in table 3. The prolactin levels were significantly ( $P \leq 0.001$ ) higher in both primary and secondary groups than in fertile group. Prolactin does not only work on body to increase the production of milk, but it also affects the ovulatory menstrual cycle. The high prolactin level in the blood is a common reason for the absence of ovulation cycle leading to infertility. This is why it is rare occurrence of pregnancy for women during the period of breast-feeding. Prolactin works on inhibition of two hormones needed for ovulation: FSH and gonadotropin releasing hormone (GnRH). In addition to the lack of ovulation, it also can cause irregular menstruation periods (Cousineau and Domar, 2007; Shafik, 2009; Rebar, 2014).

The pituitary hormones that are related to the process of ovulation and cycle, including FSH and LH, were analyzed in the three studied groups. FSH hormone was significantly ( $P \leq 0.01$ ) higher in both primary and secondary fertility groups than in the fertile group. Likewise, the levels of LH were significantly ( $P \leq 0.01$ ) higher in both primary and secondary groups as compared to the normal fertile group.

LH measurement is useful in the diagnosis of ovarian bagging and recurrent miscarriage. The normal level of LH indicates that the ovary is active, but high number indicates failure of the ovary or the menopause stage of the woman. On the other hand, the low level of LH indicates a lack of secretions by the pituitary gland in general (Pakarainen *et al.*, 2005; Berinder *et al.*, 2007). The FSH measurement gives an idea of the remaining stocks of eggs in a woman's body. In addition, FSH helps to distinguish between the primary and secondary ovarian failures.

The high levels of this hormone are consistent with the primary ovarian failure which is due to failure of ovarian development and chromosomal abnormalities such as Turner syndrome. Meaning while, the of secondary ovarian failure is caused by radiation and chemotherapy syndrome, PCOS and diseases of the thyroid and adrenal glands (Arachchige *et al.*, 2012).

**Table 3:-** Hormones levels in the serum of all groups.

Hormone level	Fertility (n=27)	Secondary infertility (n=42)	P value *	Primary infertility (n=82)	P value *
Prolactin (ng/ml)	16.26 ± 6.68	40.48 ± 12.6	≤ 0.001	35.9 ± 6.53	≤ 0.001
LH (mIU/ml)	11.19 ± 4.48	27.91 ± 9.57	≤ 0.01	21.76 ± 5.9	≤ 0.01
FSH (mIU/ml)	10.0 ± 3.65	25.08 ± 8.54	≤ 0.01	19.4 ± 5.58	≤ 0.01
TSH(mIU/ml)	3.24 ± 1.11	8.86 ± 4.1	≤ 0.01	6.19 ± 2.83	≤ 0.01
Progesterone (nmol/L)	39.8 ± 8.81	14.97 ± 9.72	≤ 0.01	19.14 ± 6.69	≤ 0.01
Testosterone (ng/ml)	5.71 ± 3.75	15.85 ± 4.46	≤ 0.01	14.77 ± 2.58	≤ 0.01
Estradiol (pg/ml)	48.2 ± 12.31	19.14 ± 16.4	≤ 0.01	20.11 ± 6.73	≤ 0.01

Results are expressed as the mean ± S.D.

\* Compared to the fertile group.

Furthermore, TSH levels were significantly ( $P \leq 0.01$ ) higher in both primary and secondary groups than in the fertile group. Thyroid hormones interact with reproductive hormones, estrogen and progesterone, to maintain the function of normal development of the egg and ovaries. The over secretion or hyposecretion of thyroid hormones could lead to the imbalance in these reproductive hormones, causing ovulation disorders, irregular menstrual cycle and reduced fertility (Crain *et al.*, 2008; Artini *et al.*, 2013).

Progesterone levels were significant ( $P \leq 0.01$ ) reduction in both primary and secondary groups as compared to the fertile group. Progesterone is considered of the most important hormones in a woman's body where it plays a major role in maintaining the regularity of menstrual cycle and thus is responsible for the pregnancy process. The shortage of this hormone in women is linked to some symptoms including delayed pregnancy, an increase in weight, especially over the abdominal area, disrupted menstrual cycle dates, low motivation and sexual coldness, fluctuation in mood and depression (Segar *et al.*, 2013).

Testosterone levels were significantly ( $P \leq 0.01$ ) higher in both primary and secondary groups than in fertile group. High proportion of the male sex hormone (Testosterone) causes disorder and irregular menstrual cycle and ovulation where the menstruation comes every two or three months and sometimes only with the help of reproductive medicine. It is often accompanied by blisters or grain in the face and increased hair growth on the face, abdomen and chest (Barry *et al.*, 2011).

Estradiol levels were significant ( $P \leq 0.01$ ) reduction in both primary and secondary groups when compared to the fertile group. Estrogen controls the thickness of uterine and the maturity of the egg when menstruation or pregnancy, reduces the pH in the vagina, and reduction of bacterial infection. Low estrogen levels may cause osteoporosis and menopause. Estrogen affects libido in women and controls the production of milk from the breasts (Stefanidou *et al.*, 2009; Yu *et al.*, 2014).

#### **Correlations between prolactin and different hormones:-**

Table 4 displays Pearson correlation coefficients between prolactin and TSH and sex hormones in primary and secondary infertility groups. The results in table 4 showed significant correlation between prolactin and TSH in both primary and secondary groups. In a previous study, Kumkum *et al.* (2006) showed a positive correlation of 1:4 was found between hypothyroidism and hyperprolactinemia. These findings are in accordance with the results of a study showed that there was a higher prevalence of hyperprolactinemia which positively correlated with thyroid disorder in infertile women (Goswami *et al.*, 2009). In a recent study, Bassey *et al.* (2015) concluded that hyperprolactinemia with thyroid dysfunction may be a major contributor hormonal factor in infertility among infertile women. In addition, both groups showed significant correlation between prolactin and other hormones, including LH, FSH, prolactin, testosterone, estradiol and progesterone (Table 4). These findings are in line with the results of a study

showed a positive correlation between estradiol and progesterone with hyperprolactinemia in infertile women (Isong *et al.*, 2016).

**Table 4:-** Pearson correlation coefficients between prolactin and different hormones in primary and secondary infertility groups.

Measurements	Secondary infertility		Primary infertility	
	<i>r</i>	<i>P</i> value	<i>r</i>	<i>P</i> value
LH(mIU/ml)	0.783	0.003*	0.745	0.003*
FSH(mIU/ml)	0.740	0.002*	0.684	0.002*
TSH(mIU/ml)	0.815	0.010*	0.677	0.010*
Progesterone (nmol/l)	-0.799	0.002*	-0.725	0.002*
Testosterone (ng/ml)	0.801	0.003*	0.681	0.003*
Estradiol(Pg/ml)	-0.803	0.004*	-0.703	0.004*

\* Indicates significant at  $P \leq 0.05$

### Conclusion:-

Hyperprolactinemia are mandatory in all infertile women especially those with amenorrhea. There was a significant high prevalence of hypothyroidism and hyperprolactinemia in the infertile women. A decrease in FSH level which could lead to the problems with the development of the follicle and infertility. There was a significant correlation between prolactin and TSH in both primary and secondary groups. Therefore, assessment of serum TSH and prolactin levels are mandatory in the work up of all infertile women, especially those presenting with menstrual irregularities.

### Acknowledgments:-

#### Abstract

**Aim:** To summarise the application of CBCT in dentistry emphasising on its important in precise diagnosis.

**Background:** CBCT is the abbreviation for Cone Beam Computed Tomography. It is capable to project the dental imaging in three dimensions, which is better than the two dimensions radiographs. Generally, CBCT is a very useful tool for imaging the craniofacial region, by providing a detailed and sharp image under high resolution. The image produced can be used as a guidance for further diagnosis, treatment and even surgical procedures. In fact, CBCT also has low radiation exposure.

**Reasons:** To acknowledge the application of CBCT in of dentistry and its usefulness in diagnosis and treatment planning.

#### Introduction:-

Generally, radiograph is the image produced on the radiographic film by the exposure of the X-ray radiations. There are lots of imaging techniques that are still available and used till now especially in dentistry, such as intraoral and extra-oral radiography, computed tomography and also tuned aperture computed tomography (TACT). Cone Beam Computed Tomography which is also known as CBCT is the advanced radiographs technology that enlightens the various field of dentistry, by giving a sharp three dimensional (3D) image.

CBCT creates a realistic and high resolution three dimensional image of the object on the oral and maxillofacial region, at a lower radiation dose [1]. The CBCT is also cheap and affordable when compared to conventional CT. Although its radiation dose is low when compare to other techniques, the radiation risk is almost similar to those intraoral radiographs, panoramic radiographs and also full mouth radiographic radiographs.

In addition, CBCT also provides a multiplanar image for the maxillofacial region and this process is known as multiplanar reformation (MPR), in which it produces image of a “real time” in axial plane as well as in two dimensional images in the coronal, sagittal, oblique and even in curved image planes [3]. In fact, CBCT also able to provide imaging in a single 360° rotation of a patient in a digital format, in relation to each rotation of the radiographic projection [4]. Then, the image is reconstructed by using an algorithm of volumetric tomography [5].

Hence, CBCT it is appropriate for the imaging of craniofacial area. Therefore, most of the dental practitioner tend to used CBCT, due to its various advantages in producing the radiographic image.

**History:-**

Cone Beam Computed Tomography (CBCT) was established by the Japanese and Italian groups in late 1990s [6,7]. They were working independently in developing this new tomographic scanner which is also known as digital volume tomography (DVT), for specific function on maxillofacial and dental only.

In 2001, the first dental CBCT radiograph had become commercially accessible for the dentomaxillofacial imaging [5]. This was the beginning for the commercialized used of the CBCT. It had gain lots of attention from people especially from the dental practitioner, due to its various advantages like low dose, detailed image and also low cost. Along with its various functions in dentistry such as caries diagnosis, implantation, periodontal bone characterization and also its application in endodontics.

**Figure 1:-** Examples of hybrid CBCT. (a) KODAK Dental Imaging 9000 3D, (b) Veraviewepocs 3D, and (c) Picasso Trio [3].

**Advantages of CBCT:****Limitations of X-ray Beam:**

CBCT can be adjusted to scan small regions. This can be done by reducing the size of irradiated area by collimation of the primary X-ray beam to a particular area along with reducing the dose of the radiation [3].

**Image Accuracy:**

Voxels which is a 3D block of smaller cuboid structures is a volumetric data that display the degree of the X-ray absorption, and its size help in determining the resolution of the image. All CBCT systems have isotropic voxels resolutions, which mean it is equal for all of the three dimensions. Thus, this will result to formation of the sub-millimetre resolution from 0.125 mm to 0.4 mm [3].

**Shorten Time of Scanning:**

CBCT can be done in a single 360° rotation of a patient, in a short period of 10 to 70 seconds, to produce image [3].

**Lower Dose:**

The radiation dose used in CBCT is very low compare to conventional fan-beam CT up to 98%. This will result to decreased of the effective radiation dose to almost 4-15 times of a single panoramic radiograph [3].

**Decreased the Image Artifact:**

Through manufacturers artifact suppression algorithms, the CBCT will display the image on a low level of metal artifact, specifically in designed for the secondary reconstructions for observing the teeth and jaws of the patient [9].

**Applications of CBCT:****Caries Diagnosis ( General Dentistry):**

In general dentistry, CBCT imaging is very beneficial for assessing the detection of the caries and its depth in the approximal and occlusal lesions [1].

### Endodontic Applications:

CBCT play a significant role in the endodontic applications because it provide a three dimensional image of the anatomical features of the structures inside of the mouth, that cannot be produced either by intraoral or panoramic radiographs. The CBCT is commonly used for diagnosis of the peri-apical lesions due to the pulpal inflammation, visualization of canals, clarification of internal and external resorption, and also recognition of root fracture [1].

Following are the beneficial used of CBCT in endodontic applications:

### Assessment Of Tooth Morphology:

All root canals can be demonstrated in three dimensional image by the CBCT technique. Through this, the root canals can be accessed, cleaned, shaped and also obturated [10].

The CBCT able to identify the second mesiobuccal canal (MB2) in maxillary first and second molars [12]. The accuracy of the identifications of the MB2 is differs, based on the investigation method used in a range of 69% to 93% accuracy [10]. On top of that, CBCT images also showed the existence of untreated or missed canals intraoperatively or in root filled teeth, including its complications [11].

**Figure 2:-** In (a) a periapical lesion can be seen through the periapical radiograph. The CBCT imaging accurately displayed the previous additional canal that was not treated (b) 0.076mm and (c) 0.076 parasagittal [3].

### Detection of Apical Periodontitis:

CBCT can identified the radiolucent finding beforehand. The peri-apical radiolucency is detected first before it is displayed on the conventional radiographs [11]. CBCT can detect any bone defect in the cancellous bone and cortical bone separately [11], although they cannot be detected conventional radiographically especially in the cancellous bone [13]. Thus, this shows that CBCT has high potential in detection of radiolucencis in apical periodontitis when compare to peri-apical radiography [14].

### Pre-surgical Assessment:

CBCT has a significant role in detection for palatal roots of maxillary first molars in planning for its peri-apical microsurgery [15]. The measurement of the gap between the cortical plate and apex of palatal roots can be established by the CBCT as well as the existence or absence of the maxillary air sinus in between the roots of the maxillary first molars. Thus, the thickness of the cortical plate, fenestration, pattern of the cancellous bone and also inclination of teeth's roots can be determined preoperatively by using CBCT for surgery planning [16].

### Traumatic Injuries and Sequelae Assessments:-

#### Assessments of Root Fractures:

The fractures of the crown is more common compare to the fractures of the roots, and it occur about 7% or lesser in dental injuries [17, 18]. CBCT can assessing the vertical roots fractures under the influence of the root canal filling. Potentially, it demonstrated a highly accurate image compare to periapical radiographs [19]. In fact, CBCT also can be used to detect the horizontal root fractures as we can see in figure 3 (b). This capability of CBCT has been reported and approved by the Kamburoğlu et al [20]. Hence, CBCT is an accurate technique that can be used to diagnose any root fractures.

**Figure 3:-** Horizontal root fracture on the anterior dentition due to traumatic injuries. (a) Image produced by using periapical radiographs and (b) image established using CBCT [3].

**Assessments of Roots Resorption:**

CBCT is an excellent system for assessment of the root resorption. It has been successfully used for the determining and confirmation of the internal root resorption (IRR) and differentiate it from the external root resorption (ERR) [21].

**Assessments of Post-operative:**

CBCT is used to monitor the success of the healing of the peri-apical lesions [10].

**Periodontal Applications:-**

In periodontal, CBCT help in displaying the image of the periodontal bone in an accurate description. Researchers Vandenberghe and colleagues [22] studied on the structure of the periodontal bone by using the 2-dimensions CCD and also full volume of the 3-dimensions CBCT000- based imaging modalities [1,22]. From their investigation, they found that the measurements of periodontal bone levels and defects of CBCT image were comparable to the intraoral radiographs. In fact, they also concluded that CBCT images have high capability in displaying the morphologic description of periodontal bone [1].

In a research conducted by Misch and team-mates [23], they found a similar result about CBCT as in the study of Vandenberghe. However, in their research they found a significant characteristics of image produced by the CBCT, in which the image produced by the CBCT is precise and similar to the used of periodontal probe in measuring the bony defects. This is along with providing a detailed morphologic description of the architecture of the bone [23, 24]. It also can be used for imaging the interproximal regions and also for the measurements of defects on buccal and lingual areas.

**Figure 4:-** The (a), (b) and (c) image demonstrated a complete periodontal furcation of second molar. (a) A furcation is highlight by the circle. (b) and (c) The arrow on the images show the extent of lesion from facial-lingual and axial views [1].

In an article of digital volume tomography (DVT) for diagnosis in periodontology written by Kasaj and Willershausen [25], they concluded that CBCT is a perfect techniques for periodontal application. Especially in the intrabony defects, dehiscence and fenestration defects regions, periodontal cysts as well as for the diagnosis of the furcation that involved molars teeth. This is due to its lower radiation dose and production of high resolution image [1,25].

#### **Applications in Oral Maxillofacial Surgery:**

CBCT helps to display the jaw pathology, pre and post surgical evaluation of fractures, impacted and super numerary teeth, assessment of bone graft, paranasal sinuses and etc [24] in a three-dimensional image that is important for oral maxillofacial surgery.

#### **Implantology and Prosthodontics [26]:**

**Figure 5:-** (a) The images displayed on the faulty implant planning. (b) The images shown on the implant planning [24].

CBCT is used for evaluation of the site of implant, accurate measurements and planning of implant that corresponds to vital structures, surgical guide and also for computerized prosthesis for any developmental disturbances [24].

#### **Plastic Surgery [27]:**

CBCT is used for estimation of the dental age and three-dimensional face reconstruction. It is useful for evaluating any ENT problems like DNS , paranasal sinuses, syndromes, pre and post evaluation after the plastic surgery [24].

#### **Orthodontics applications:**

The CBCT images can also be used in orthodontic assessment.

#### **Conclusion:-**

CBCT is an effective diagnostic aid in all field of dentistry. The advantages of CBCT outweigh the disadvantages. In fact, it is better compared to other radiographs in many aspects, like producing high resolution and sharp images, low dose of radiation and can be used widely in many areas as it able to demonstrate accurate and detailed image on the particular areas. In addition, the CBCT also available as a low cost technique.

Duodenum, Adenocarcinoma, Young adult

#### Abstract

The incidence of duodenal adenocarcinoma in general population is very rare. It may arise from duodenal polyps seen in familial polyposis or can be associated with celiac disease. Usually duodenal adenocarcinoma is seen in middle or elderly age group. It can occur in young age also when it is associated with polyposis syndromes or with any inflammatory diseases affecting small bowel. But when there is no such syndromes or diseases, duodenal adenocarcinoma in young age is very rare. We are reporting a case of 28 years old male who presented to us with history of recurrent abdominal pain. After evaluation it was diagnosed as adenocarcinoma arising from junction of first and second part of duodenum without any associated polyposis syndromes or inflammatory bowel diseases.

#### Introduction:-

Duodenal adenocarcinoma is an aggressive malignancy though it is seen rarely<sup>1</sup>. Primary malignant tumors of the duodenum makes 0.3% of all gastrointestinal tract tumors and up to 50% of small bowel malignancies. Duodenal adenocarcinoma must be differentiated from malignant tumors of the ampulla, pancreas and common bile duct<sup>2</sup>. It may arise from duodenal polyps seen in familial polyposis or can be associated with celiac disease. The common location of the tumour is second part of duodenum. Usually duodenal adenocarcinoma is seen in middle or elderly age group. It can occur in young age also when it is associated with polyposis syndromes or with any inflammatory diseases affecting small bowel. But when there is no such syndromes or diseases, duodenal adenocarcinoma in young age is very rare. We are reporting a case of 28 years old male who presented to us with history of recurrent abdominal pain. After evaluation it was diagnosed as adenocarcinoma arising from junction of first and second part of duodenum without any associated polyposis syndromes or inflammatory bowel diseases.

#### Case Report:-

28 years old male ECOG performance status 1 with no co morbidities presented to us with upper abdominal pain and vomiting of one month duration. There was no history of any malignancy in family. Local and systemic examination was within normal limits. Routine blood investigations were normal. Upper gastrointestinal scopy done showed (Fig 1 & 2) ulcerating lesion present in D1 and D2 junction of

**Corresponding Author:- Dr. Midhun.P.Gopalakrishnan MS. DNB.**

Address:- Senior Resident in Surgical Oncology, Malabar Cancer Centre, Thalassery, Kerala, India.

duodenum with stenosis of that area. Endoscopic biopsy was suggestive of moderately differentiated adenocarcinoma of duodenum. Colonoscopy done was normal. Contrast enhanced CT scan showed (Fig 3) mild circumferential irregular wall thickening up to 1.3 cm in D1 part of duodenum with extension in to the D2 segment. There was a large node seen in the peripancreatic location superior and medial to the pancreatic head measuring 3.2 cm in size. Another node of size 2.8 cm present in the porta hepatis. No evidence of periduodenal fat stranding, para aortic or distal adenopathy or distant metastasis.

After completing evaluation Whipple's resection was done for this patient. Post operative period was uneventful. Histopathological report came as moderately differentiated adenocarcinoma duodenum with a tumour of size 3\*3 cms with 1.7 cms thickness, infiltrating through the muscularis propria in to the sub serosal connective tissue and invades adjacent pancreatic tissue with positive lymphovascular invasion. Metastatic carcinomatous deposits in four out of twenty two lymph nodes dissected seen. Extra capsular spread in one lymph node noted. Periportal lymph node dissected is negative for malignancy. All resected surgical margins are free of malignancy. pT4b pN2 (AJCC 7<sup>th</sup> edition).

After discussing the case in institutional multi specialty board, it was decided to give 8 cycles of chemotherapy (CAPEOX). Now the patient has completed 5 cycles of chemotherapy and is doing well.

**Fig 1:-** Ulceroproliferative growth in D1 - D2 junction.

**Fig 3:-** CECT scan showing duodenal lesion with peripancreatic and periportal lymph nodes

### Discussion:-

The most common tumour of the duodenum is adenocarcinoma<sup>3</sup>. The other histological varieties seen are carcinoid tumors, lymphomas, stromal tumours, leiomyosarcomas and gastrinomas. Adenocarcinoma of the duodenum may arise from duodenal polyps observed in familial adenomatous polyposis, Gardner's syndrome, Lynch syndrome, Muir Torre syndrome, Puetz Jeghers syndrome, and are or it can be associated with Crohn's disease and Celiac disease<sup>4</sup>. Duodenal adenocarcinoma is usually seen in middle or elderly age group. But it is seen in young age also when it is associated with polyposis syndromes or inflammatory diseases. But occurrence of duodenal adenocarcinoma without such syndromes in young age is very rare.

The common symptoms of duodenal carcinoma is nausea and vomiting, mass in the abdomen, abdominal pain, acid reflux, unexplained weight loss, upper gastrointestinal bleeding and obstructive jaundice. The diagnostic investigations for duodenal carcinoma includes upper gastro intestinal endoscopy, contrast enhanced CT scan, barium study and routine blood investigations. Upper gastrointestinal endoscopy shows the exact location of the tumor and endoscopic biopsies can be taken to confirm the diagnosis. Contrast enhanced CT scan helps to confirm the anatomical location of the lesion, operability of the lesion and to rule out any metastasis. Barium study usually reveals an irregular stricture of the duodenum but it can be either benign or malignant stricture. If you are suspecting any syndromes like familial adenomatous polyposis colonoscopy should be done to rule out colonic polyps.

If the lesion is operable and non metastatic after evaluation the treatment is curative resection by Whipple's procedure. The 5 year survival rate varies widely according to different series published, but is generally reported to be >40% in case of curative resection<sup>5</sup>. The presence of lymph node metastases is not a bad prognostic factor in most series and is not a contraindication for curative resection<sup>6</sup>.

### **Conclusion:-**

Though rare, duodenal adenocarcinoma can occur in young age also. Primary malignant tumours of the duodenum must be differentiated from malignant tumours of the ampulla, pancreas and common bile duct. The prognosis of duodenal adenocarcinoma is better than peri ampullary, pancreatic or cholangiocarcinoma. Treatment of this condition is by curative resection.

#### Abstract

Globalization converted the world into a global village which is closely interconnected through Social Media. 2010 and 2011, were the years of large scale political uprisings in Middle East. The uprisings were mainly the result of the political mobilization that was generated by the Social Networking sites such as Face book, Twitter and YouTube Social media played an important role in awakening the people and mobilizing them to protest for their rights, and against the authoritarian regimes they were living under The research discusses the role of social media in bringing up the Arab spring.. The aim of research paper is to articulate how the revolution has been fostered by the Social Media and the role social media play in political mobilization. The research is both qualitative and quantitative in methodology in which the primary sources for qualitative data are the newspaper archives and books on empowerment of the social media while the secondary sources are the academic research papers. Quantitative analysis will be based on the survey conducted by the author himself. This paper concludes that social media has made an unequivocal contribution in fostering the revolutions and bringing up the revolution in Middle East during Arab Spring.

#### Introduction:-

Arab Spring was set apart by the arrangement of progressive anti-government challenges and demonstrations that started from Tunisia and spread over the entire Middle East. It began when individuals started to be enraged by the Authoritative Regime. The Arab world have been battling long to change their legislatures gradually, however they were falling flat, until finally in 2010 oppositions began, the self-immolation of a vegetable merchant simply energized up the procedure of these demonstrations. None would have accepted that the challenge of a young vegetable merchant named Muhammad Bouazizi would have unleashed a stream of protests for democracy in the Arab world. Muhammad Bouazizi set himself ablaze before the organization of the Tunisian Government on December 17, 2010 in the wake of being embarrassed by a female officer. The rebellions for a popularity based government or democracy had started, which, later on extended across the whole of Middle East. To bring down or dissolve the dictatorial regime became the motto of the protestors.

The Arab Spring had many causes; however, the most obvious among them was Social Media. This notion was elegantly illustrated by a protestor that they utilized Facebook to plan the dissents; Twitter to synchronize the protests and finally YouTube was used to show the world the protests and riots going on in Middle Eastern world. Social networks and outlets made the persecuted individuals to express their thoughts, to see the ruthlessness they

**Corresponding Author:- Dr. Muhammad Younis.**  
 Address:- Forman Christian College , A Chartered University.

are long enduring and to make them to act and to stop this administration severity and the illegitimate control of government. Bouazizi's video of setting himself on fire was exclusively shown on the social sites like Facebook, Twitter and YouTube for getting attention of the population and to encourage them to come out and fight for their rights. This created his story to be told over and over. This drove the general population to condemn the legislature and urged them to remain firm against the savagery of the government. An influx of protests and riots begins that toppled the legislature of Tunisia, and after that the government of Egypt. Civil war started up in Libya and protests started in the boulevards of Morocco, Algeria, Yemen and Syria.

The Arab Springs in the Middle East was mainly fostered by the Social media which has played a role of mobilization towards pro-democracy movements. The goal of the study is to understand how social media helps in bringing up a revolution. The research paper is aimed to highlight how social media helped transfer information and mobilize the protestors. In addition, how social media promoted Arab Spring and helped protestors in their movement for a democratic government and, in doing so, how the revolutions were fostered resulting in the fall of Governments in Middle Eastern countries.

### **Methodology:-**

The research is mostly qualitative based on the rhetoric analysis of the primary and the secondary data. The primary data sources include the news archives, while the secondary data is collected from the academic research papers. The dependent variable in this case is the Revolution or the Arab Spring while the independent variable is social media. The research also includes a portion of quantitative analysis in which a survey is conducted in which the relationship of social media with political mobilization and social awareness has been examined on the basis of data collected through the surveys.

### **Literature Review:-**

The utilization of Social Media to achieve some desired objectives has turned into the most persuasive event of the present world. Individuals utilized Social Networking sites like Twitter, Facebook, YouTube and numerous other sites and applications for social association. They utilized them to make themselves watchful and aware of the things happening around the globe. Online networking and systems administration have come to characterize another era of correspondence and have molded a stage that has interminable capacities to associate, share, and investigate the world (Bhulyn, 2011). Online networking is a standout amongst the most critical worldwide jumps forward in mankind's history (Omidyar, 2014). It furnishes people with the methods of expression for themselves, what they feel and get them on mutual understanding. Social Media has transformed our world into a global village and has connected everyone around the globe.

Web-based social networking sites have been turned into devices or gadgets that associate individuals and their thoughts and philosophies. Prior to the Social Networking Sites, Middle East had government controlled media outlets where everything was blue-penciled and government was depicted to be the most ideal in all ways. No one was permitted to evaluate the validity of any event or incident and if someone would spoke the truth, he or she would be muted by the administration. The fear of death never allowed anybody to speak the truth. Media was completely controlled, while a limited access was provided to the facts and figures of any incident. What was in the interest of the government was displayed, and thus this became the rule of society. In those conditions the arrival of Social Media into the life of Middle Eastern folks assisted them overwhelmingly in the articulation of their thoughts on any issue. Frequent use of these sites by the individuals was compelling the governments to create majority based rules system, since web-based social networking destinations gave individuals a voice to express their sentiments about government (Bhulyn, 2011). The social networking sites including the Facebook, twitter, YouTube permitted individuals of Middle East to have the power they had longed for.

After the innovative progress of Internet in the locality of Middle East, the nations were loaded with internet cafes. A big population of people mainly comprising the youth and educated class rushed to these cafes and spent their time in making them politically aware. They acquired information about the political activities of the globe. People vastly equipped themselves with tools of technological advancement and started to use these tools to make a keen observation over the political incidents of their state and political happenings around the world. The year 2009 vested cell phones to half of the population of Egypt. In the end of 2010, three forth of the population had one and a substantial number of new associations were emerging every month (Cole, 9). However, in Tunisia everyone had cell phone by 2009. The youth encountered by Cole felt that it was imperative for them to have these cell phones for

their politicking (Cole, 11). Youth utilized the social networking sites to display the discontent and disappointment towards their legislature. Furthermore, Cole interprets how young generation invested a large proportion of its time surfing the web and perusing the news on their phones as they did not trust the printed daily papers and magazines due to political pressure of the state on media houses, resulting 2010 to be the year of social and political awareness. By the end of 2010, there were tens of millions of Arabs on the social networking sites and had access to the internet. 15 million of the Arab population was using social networking sites like Facebook, twitter etc. Youth between the ages of 15 to 29 encompassed seventy-five percent of Facebook clients (Cole, 11).

The internet has furnished the general population with a significant access to the data. It has provided the people with the accurate, unbiased and most importantly most up to date information of the political incidents. During the Arab Spring a large amount of evidence and information of the political scenario was spread over Twitter. Prior to the condition of Arab Spring, there were about hundred million clients in Egypt, but as the upheaval finished the number expanded to 1.1 Million clients of Twitter (Amer, 2011). Local Google supervisory Wael Ghonim terrifically indicated the reason for the liberation of a society. He proposed that to liberate a society, the society should be bombarded with internet. The internet and the products of internet that include the social networking sites are proved to be effective weapon of the feeble, and have stifled individuals against their tyrant oppressors.

#### **Assumptions:-**

1. Social Media played a very important role in encouraging the revolution in the Arab Spring.
2. Social media made people aware of the ongoing political change and led to political mobilization which was the root cause of the Arab Spring.
3. Social Media and networking sites have yielded a Pro Democratic environment.

#### **Descriptive Analysis:-**

Social media has now evolved to be the basic source of information, news, and a source to read criticism and political analysis. Almost every living soul has its hand on Social media and, can easily access social media and its usage has evolved as the most influential occurrence in the present society. People from all age groups use these social networking sites like Facebook, YouTube, twitter, WhatsApp, Snapchat, Instagram and many other social media outlets for communication and interaction. The use of social networking sites is not only restricted to social interaction and communication but these are also used by the online gaming applications and YouTube has become the main source of entertainment for entire population. It is providing the world with a platform to share and express their thoughts and ideas, entertain them and also make them aware of the global happenings.

Middle East has long been ruled by the dictators and monarchs. Under their rule, if any media outlet would broadcast or publish news that was against the government that media outlet would face severe consequences. All the media was censored by the government. But with the invention of Social Media Middle East underwent much digital advancement. Social media enabled people to share their feelings and thoughts. Social Media became the voice of the people. People made themselves aware of the world politics and how people in a democracy enjoyed their rights. The Middle Eastern People realized how less they were given the rights and how their rulers were exploiting them. The pro democratic feelings aroused in the people and they started thinking of having a government of their own choice. Thus, they became frustrated by their rulers, and expressed their frustrations via these Social networking sites. These social networking sites and applications persuaded the masses to have the power they were always fancied for.

Before the start of Arab Spring, few of the countries had already had the online public groups where political thoughts and views were shared, and these were free from the censorship of Government. The videos of the lavish lifestyles of the rulers were shared on Facebook and YouTube. People became aware of the corruption of their rulers and also showed to international communities how they have been living under these corrupt ruler ships. Once the protests erupted, the Middle Eastern countries started a wide shut down on the social activists and the bloggers and also the human rights activists. A huge number of social activists faced the brutality and excesses committed by the government. But the Social media and social networking sites became the tools for public to support pro democratic movement and protest for a democratic government, and also to highlight the corruption and brutality of the Authoritarian regimes.

A detailed impact of Social Media and Social Networking sites on the Revolutions in different states during Arab Spring is given below:

**Tunisian Revolution:-**

Social Networking sites, mainly facebook, are considered to be the catalysts that ignited the Tunisian Revolution. One of the activists of the revolt, Rochdi Horchani, who was also a relative of Bouazizi, said that the activists grabbed a stone in one hand and a phone in the other (Ryan, 2011). The greater part of the activists was young fellows that could be seen holding their phone cameras and archiving the scenes. Footage of the tranquil activists and terrible scenes that contained the brutality of the police were uploaded on Facebook, YouTube, and Twitter where people could be exposed to the truth. Horchani indicated that they could have protested for two years or more, but without the videos and recordings, no one would have noticed (Ryan, 2011). Bouazizi was not the first man to set himself on fire, there had been numerous men before him, however, none knew about them. The only reason that Bouazizi's self-immolation created such hype was the eminent presence and the usage of Social networking sites that displayed and shared his story on the Social sites and that's what drove individuals to know reality.

Tunisian government consistently had attempted to stop the general population from selecting the social destinations by web restriction. Tunisian authorities started regular assaults on activists using Gmail and Facebook accounts by infusing distinctive kind of viruses. Ben Ali's monitors could acquire passwords of the records, bolting out the activists and gathering email arrangements of asserted protestors (Zuckerman, 2011). Government began to capture the conspicuous activists. Zine El Abidine was so anxious of losing the power that he did everything conceivable to stop the protestors, including the utilization of live ammo. All the interpersonal communication sites were hindered aside from Facebook. But quick interaction of people on Facebook and twitter gave information to the protestors how to counter the security forces. Maps demonstrating areas for the protestors and rational aides for what to do when exposed to tear gas was utilized and assisted a number of the protestors to save their lives. The severity and brutality of the security powers was viewed by the general population with extreme anguish and wrath. And finally, as a result of these protests, the revolt became successful and on 16<sup>th</sup> January 2011 Zain el Abidin surrendered.

**Egyptian Revolution:-**

Another product of the Social Media is the Egyptian Revolution that started on January 25, 2011. Social Networking sites, mainly twitter, was exclusively used that made "Egypt" and "Jan25" to be the most tweeted hash tags of the following year. Everybody was equipped with phone during the Egyptian Revolution. Like Tunisia, Egypt also had a huge population that used social media outlets. These Social Media outlets were the destinations where major fundamentalists, analytical columnists, and isolated citizens connected with each other (Howard & Hussain, 21). These social media outlets became the only source of expressing views and without utilization of these outlets there was no medium that could help in the elevation of the expression against the legislature. These destinations enabled them to voice their worries and political perspectives about the nation.

Wael Ghonim, regional executive at Google, started a page on Facebook, in the memory of a young blogger from whom Egyptian Police violently pounded the life out in 2010 in Alexandria for exposure of their vicious extortion, entitled as "*We Are All Khalid Saeed*". Ghonim posted on the Facebook page that today they killed Khalid, on the off chance that I don't represent his purpose tomorrow they will kill me as well (Vargas, 2012). Pictures of his battered face were taken and passed around from one phone to another. Those were seen by a great number of individuals who initiated their own pages on Facebook looking for equity for Khalid Saeed, and consolidating protests on the Social Media sites and outlets. The web pages created to remember Saeed turned into an entrance for aggregate sensitivity (Howard and Hussain, p.21). During the dissent, Ghonim was captured and locked up behind the bars. Ghonim was discharged following two weeks, and it was then that he turned into the voice of the Arab Spring in Egypt. Be that as it may, Ghonim rejected this thought, pronouncing that he was not a saint, and that he was only participating through the web, wasn't revealing his life into risk, but the actual legends are those people who were fighting and protesting in the streets of Egypt (Smith, 2011). Ghonim was called upon for an interview by CNN in 2010 in which he projected that Social Media was in charge of the Arab Spring. He also commented that he was indebted to Mark Zuckerberg, the founder of Facebook. This change began on the social networking site mainly Facebook. This upheaval began in 2010, when a large number of Egyptians began working together in the digital space. They would post a video on Facebook that would be shared by 600,000 individuals on their Facebook walls within few hours (Smith, 2011).

Through the peak times of the revolutions, the Tahrir Square was occupied by the protestors who were protesting against the brutality of governmental institutions. They messaged from their cell to persuade each other to turn out to roads and show dissent. Countless reacted to the catch and poured out to show solidarity with the protestors. The government felt it didn't have any other option except to block all Internet access in the nation (Abdulla, 2012).

Be that as it may, this minute was thought to be the water shed moment in the political Scenario of Egypt. The Mubarak's rule came to an end because of this progression of government, as even those individuals who were not among the protestors, the individuals who were watching the dissent from home , also went to Tahrir Square to expanded the weight on the administration, and eventually ,Mubarak's Government fell.

### **Libyan Revolution:-**

Arab spring also knocked the doors of Libya. The revolution in Libya started on February 15, 2011. However, before it began in Libya, its ruler, dictator, Muammar Gaddafi in his speech, severely condemned Tunisian people for bringing down the government of Ben Ali. He audaciously and sarcastically expressed his feelings by depicting that Social media had created problems for the people in knowing the truth, as any deranged individual or a personal who was under the influence of any drug or mental illness could write anything and people would believe in whatever he wrote (Lynch, 2001). But unluckily, Gaddafi himself was assassinated, and his government was toppled over by his own people with the help of the social networking sites.

Social Networking sites, mainly Facebook, played a vital role in bringing up the uprising in Libya. A Facebook page was created like in the case of Egyptian revolution on January 2011. The page made people aware of the brutality and hardship they have been living under along with portraying the lavish lifestyle of their rulers. Through this page, the activists asked the Libyan individuals to follow in the strides of the Tunisians and Egyptians and strive for democracy in their political system. The page also reinforced people to end Gaddafi's regime and broadcasted him as a deceptive and vindictive killer. The page also demonstrated, how Qaddafi's children were burning cash on extravagant events and private yacht trips, and gave proof of the corruption of the government and its institutions.

Finally, the struggle for democratic government started. On February 15, 2011 a small population of the youth of Libya reacted against the government and rebelled in the city of Albyeda. These protests got reinforced as the government executed two of the rebels and caught the others and put them into the prisons. Gaddafi felt threatened by the ongoing Social Media role in the protests, and to tackle which he called a meeting with all the renowned Libyan activists accompanied by the bloggers and threatened them of the critical results if they kept blogging on informal sites, but , it was of no use to cry over the spilt milk. By the time the warning came, it was already too late, and many of the Libyan citizens had already started using Facebook pages to criticize the government and its institutions.

Through mid-February 2011, countless Libyans revolted in the streets of second largest City of Libya, Benghazi, to end the ruler ship of Gaddafi (El Mahjub, 2013). At the point when the rebellion started Gaddafi was being ignorant and attempted to control his peoples by manipulations. All the media outlets were taken under control of the government and every TV or News channel showed pro-state songs and documentaries. The news of the fatal conflicts between the protestors and the security forces and murdering of individuals were nowhere to be shown. But in this scenario, Social Media became the voice of the people. The general people, who were on the roads fighting with the state forces, procured pictures and recordings of the riots as they were happening, and posted them on YouTube and Facebook. The communication of protestors on social networking sites also attracted the attention of the International World and whole of the international community soon started to condemn the Gaddafi government (El Mahjub, 2013). Due to these social networking sites whole world saw the uprising of Libyan people and supported them in their urge for democracy.

Gaddafi attempted to counter that movement by posting the videos of people loyal to him on social networking sites believing that people would see him as a good man. But all his efforts went in vain, as the protests and riots heated up more. The final option for Gaddafi was the use of his military. He used heavy ammunition, rocket launchers and the tanks to regain the power. About 600 of the protestors were killed and their killing by the military forces was shown on social media. These were so brutal and dreadful that even international community acted against it as a result of which United Nations imposed no-fly zone. After that, the protestors were titled as the freedom fighters, and they succeeded in taking the control of the government. Gaddafi was caught and killed.

Social Media ad networking sites without any doubt played a noteworthy part in the Libyan turmoil. In the event without Social Media, the general population of Libya could never have possessed the capacity to expel Gaddafi from power.

**Syrian Revolution:-**

The success of the toppling of the governments of Tunisia and Egypt aroused the general population in Syria to begin their own revolution. Social media also proved to be a helpful medium of expressing views. Gradually, people and the revolutionists group began to voice their thoughts on Facebook and other online networking sites. People were afraid of being monitored by the government so the expression of public opinion was kept under secret chat groups.

On 5<sup>th</sup> March, 2011 some school boys painted the mainstream progressive slogans and included that the general public need to topple the government. They aggravated matters for themselves by including their names to the painting. The Syrian law enforcers caught these young men, and for quite a long time, their whereabouts were unknown to the families. In reaction to it, the general population of Daraa protested against the government unlawful act and demanded the children back. Syrian aggressively acted on the protests and they started shooting at the protestors, murdering many individuals and harming others. In solidarity with the Daraa killings, a rush of challenges spread to different urban areas in Syria (Shehbat, 2012).

It is to be noted that Syrian revolutionists were not given complete access to social media because of the fear that government may be monitoring and keeping tabs on all the social networking activities of individuals. Hence, Social Media's part in Syrian revolution was limited. Still the activists knew that social media and networking sites were their only choice to get their exploiters out of the nation, and also for the world to know, how the Bashar administration worked. The protests were organized by the Facebook groups that gave the location of the protest at eleventh hour of the protests. Syrian government was doing everything to stop the riots and protests; they were also making the use of arms. While the only ammunition the protestors had was YouTube, where they would show videos of brutality of the government and let the world know about viciousness of the Bashar's regime. In the end of May, 2011, a video that demonstrated the abused, and plainly tormented dead body of 13-year-old kid was uploaded to YouTube. This video proved to be a spark, and whole world witnessed the viciousness of the Bashar's government (Shehabat, 2012). After this event, numerous protestors started to express themselves on twitter, Facebook and YouTube. Additionally, Skype was used that would provide live broadcasting of the news. The Bashar's government now started censoring the media content on the social networking sites by cutting off the cell phones and Internet links in Daraa and Homs (Shehabat, 2012). To counter this act of government, people started to use the smuggled Sims from neighboring states. They used the Jordanian and Turkish Sim cards. The internet connection was cut down so people started to use 3G services on their phones.

The ruling government was tired of these events and finally came on air to express its anger. It condemned the social networking sites and told that the people might be the winners on the social media but on actual grounds the winner would be the government. Syrians used YouTube as the main tool for expressing their views and brutality of the government. Facebook was also used by the protestors and helped to make the international community aware of the hardships being endured by the people of Syria. Skype also played an important role in this revolution. People and famous analysts would communicate on skype. But unfortunately, the Syrian people did not achieve the results in their favors but the civil war broke out in the country that is continued till now.

Social Media started a chain of revolutions that affected the whole Middle Eastern World. The revolts not only ended on Syria but continued to all the Middle Eastern states. Yemen was also struck by the revolts that were started right after the Tunisian revolutions. Protests also broke out in the Jordan and Bahrain. The result of the revolution was different in Syria, but still Social networking sites played an important role in mobilizing the people, and made them vigilant and politically active. Pro democratic expressions were born in the individuals for which they fought and toppled the regimes. Syrian's had controlled and monitored social media which made it difficult for the people to organize their revolt effectively against the government. Strict monitoring and quick actions of the government against the activists hindered the Syrian revolution, causing them not to topple the government. To what an extent the social networking sites made the revolutions successful, is debatable but their role in bringing up the revolutions cannot be dismissed altogether.. Social media gives the oppressed and depressed people a medium to voice their thoughts and to develop democratic thoughts. So we can say that the Social Media was an effective tool in bringing up the revolutions and forming pro democratic expressions in the general public.

**Statistical Analysis:-**

The statistical analysis is based on the survey that was conducted from 22<sup>nd</sup> November 2016 to 2<sup>nd</sup> December 2016 at Forman Christian College, Lahore in which 100 participants were involved. Different Questions were asked from

the participants that allowed us to explain the role that social media played in revolutions during Arab spring. The analysis is given below

- **What does Social Media mean to you the most?**

For this question the participants were given four options whose percentage is shown in the pie chart.

It is evident from the table that a large proportion of students use these social networking sites for Entertainment purpose, and after entertainment they use it for communication.

**Most time spent on Internet is utilized in?**

For this question the participants were given four options whose percentage is shown in the below pie chart.

The results showed that a large number of the population of the participants utilized internet for social networking sites, and then secondly, reading the news.

**Does Social Media help you to stay in touch with current affairs:-**

To answer this particular question, the participants were given two options of YES or NO. Following is the data obtained.

The above chart clearly shows that social media and the networking sites greatly help people to stay in touch with the current affairs; thus, making them more politically active and aware of the surroundings.

**Do you use social media to follow news and political events?**

To answer this question on the survey, the participants were provided with two options of either YES or NO. Following are the results.

The above chart indicates that a large number of participants use social media to become aware of the political events.

**Do political news from social networking sites made you aware?**

To answer this particular question, the participants were given two options of yes or no. following is the data obtained.

The above diagram shows that political news that the participants obtained from the Social networking sites made them socially and politically aware.

**Have you ever been a part of any social media oriented political demonstration or protest?**

In this question the participants were asked about a personal experience in which they were asked about taking part in any political event or protest that was oriented in social media. Following is the data collected on question.

It is evident that people actually did go to the political events that were oriented by the social media. A large proportion of participants participated in social media oriented political events.

**Criticism on Social media is effective in building up political awareness?**

In this question the participants were asked about whether the criticism on the social media has impact on them or not. Following is the data collected.

It is illustrated by the chart that high number of participants actually were affected by the criticism they read on the social networking sites. And this reading of the criticism actually benefited them to become politically aware.

**Time Spent on Social Networking Applications:-**

For this activity each participant was asked to give time they spend on the social networking applications. Following is the average data collected

Social Media Applications	Hours Spent
1) Facebook	5.25 Hours
2) Twitter	3.43 Hours
3) YouTube	2.25 Hours
4) Instagram	2.33 Hours
5) WhatsApp	5.36 Hours
6) Snapchat	1.89 Hours

The Chart shows that the participants spent a lot of time on the social networking sites making them aware or socially connected.

**Final Table:-**

In the last step of the survey the participants were given to fill a table, in which they were asked to tick the level of agreement or disagreement for the lines given to them. Following is the data collected.

**Has social Media proved to be free and objective?**

Following is the data collected for this account:

As the chart shows, a large number of participant strongly agreed with the statement that social media has proved to be free and objective, so, one can say that Social media is objective and free.

**Is Social media a tool for bringing up revolution?**

Following collected:-

is the data

As the chart indicates that most of the participants think that the social media is the tool for bringing up the revolutions and revolts across the world.

### Arab Spring was a product of Social Media?

The data given below illustrates this:

It is evident from the chart that almost all the participants consider the Arab spring to be the product of Social Media and social networking sites

We can conclude, on the basis of data, that Social media plays a vital part in making the people aware both socially

and politically and also persuade them to take part in the social media oriented protests and demonstrations. So, we can say that social media has become an integral part of the society not only to interact socially on these networking sites and applications but also to make us politically more aware. Social media, by making us politically aware, also enables us to actively express our feelings and thoughts on the ongoing political activities. The social media is fostering the revolutions by making us to express our opinion on any issue and also to react against any unlawful act of the Government. The revolts and protests included in Arab Spring were all fostered by the Social Media.

### Conclusion:-

This paper has examined the role of social media and social networking sites including Facebook, twitter and YouTube by utilizing both the qualitative and the quantitative analysis. There is a fluctuation of opinion on how much part social media had played in fostering the revolutions during the Arab Spring, but there is no denying to the fact that Arab spring was the product of Social Media and social networking sites. The availability of advanced media including the online networking sites like Facebook, YouTube and Twitter has given individuals a chance to promote their voices, their political thoughts and send their demands the high structures of Legislatures. Social media has also provided a way through which the voice of general public reaches the other structures of the government, making the government and institutions to listen and react favorably, and if they ignore, the same voice strikes them like a big flood and takes away with it their governance. Before social media, people of Middle East were living under the Authoritarian regimes, and were also deprived of many basic rights, while the rulers lived their lavish lives without the fear of losing the power. But Social media became the savior for these oppressed people and made them able to voice their feelings and thinking. Before social media, the people were not allowed to take part in active politics, but after these Social networking sites every individual became socially and politically active. They started to keep keen observations on the political activities, and if any incident was found to be against their wishes, they posted it online, criticized it and protested against it.

For the same reason, we can now see every political person on these social sites, and social media cells of every political party working to promote its mandate and propositions to come to power. Social Media is also used by them to give updates of the projects and other happenings, and their thinking or defense to a particular event. Thus by this analysis we can conclude that social media has made us more active and respondent and the government to be more vigilante, and have also promoted the pro democratic views and thoughts among the general public.

The internet and its major component, the social media, assumed a central part in the Arab spring. The Arab spring would have not been achieved if there was no social media. Social Media gave voice to the people's opinion and

**Introduction:-**

Attention Deficit Hyper-Active Disorder (ADHD) is one of the most common neurobehavioral developmental disorders among children. It has a special prevalence in preschool and early school years<sup>(1)</sup>. It is characterized by three main symptoms which are: persistent and debilitating inattention, over activity and impulsivity<sup>(2), (3)</sup>. Presently, there are three main subtypes of ADHD which are classified to: primarily inattentive (50–75%), primarily hyperactive/impulsive (20–30%) and a combined subtype (less than 15%).<sup>(4)</sup>

ADHD may associate with a different psychiatric comorbidities as disruptive behavior disorders, anxiety and/or mood disorders.<sup>(5)</sup> Additionally, to psychiatric, ADHD could be compound with difficulty in learning and social-emotional development<sup>(6)</sup>.

Epidemiological knowledge of ADHD was estimated in different countries by several studies on children between the ages of 6 and 12 years<sup>(7)</sup>. The prevalence of ADHD in the US was 4-8%<sup>(8), (9)</sup>. While in Korea it was between 7.6% to 9.5%<sup>(10)</sup>. However, the prevalence was reached 20 % in India<sup>(11)</sup>.

On the other hand, the prevalence rate of ADHD in all Arabic countries in general was ranging from 1.3% to 16% in one study<sup>(12)</sup>.

However, the prevalence in other studies like the one conducted in Qatar it showed that incidence of ADHD 9.4% to 18% in Qatar. While, a similar study in the United Arab Emirates, showed the prevalence as 14.9%<sup>(13)</sup>. According to a local study which was conducted in Saudi Arabia, 11.6% is the prevalence rate of ADHD<sup>(14)</sup>.

The underlining etiology of ADHD includes several factors like genetic, dietary, and environmental. Nutritional factors in particular, such as color agents which have been determined to raise the risk of ADHD<sup>(15)</sup>.

It is still argumentative whether or not there is a relation between ADHD and sugar consumption. As in Wolraich et al's study, where they found that dietary food with high sucrose had no significant effects on behavior and cognitive performance in children<sup>(16)</sup>.

The diagnosis of ADHD is usually controversial as concerns are expressed by parents, teachers, healthcare professionals and the public as well. The diagnosis and treatment of ADHD in children will be dependent mainly on the knowledge and perspectives of every person around the child. The diagnosis and treatment of children with ADHD require a good participation and cooperation among the family and educational and health professionals to achieve a common goal<sup>(17), (18)</sup>.

There are two definitive treatment lines for those children; medications, behavioral therapy or even both<sup>(19)</sup>.

Many global studies involving different professionals (teachers, teacher trainees and general physicians) have displayed that the misconception about ADHD and its treatment is persistent<sup>(20)</sup>.

We plan to determine the awareness of the Saudi population about such a complex disease in order to improve the current practice and to contribute to the management of ADHD as the society is in need to play its role as well.

**Methodology:-**

A multi-items cross sectional survey was conducted. The study population and sampling included both genders from 15 years and above as we don't aim to determine the incidence of the disease but we would like to assess the general knowledge about it. We chose our sample using random sampling method. We excluded people living outside Madina region, and who did not match our target age. We chose the questionnaire as a collecting tool (electronic and paper based questionnaire). This questionnaire reached to our target group through social media as well as, in the public places, secondary school students, and finally university students.

The variables we have been considered were age, gender, specialty, and occupation. Those whom are in the medical field were excluded. Before starting with our observation process, we explained the purpose of our study. Validity and reliability has been taken into account. Pilot study and pre-test has been done to clarify any ambiguous question.

Data were analyzed by the Statistical Package for the Social Sciences (SPSS) version 20 acquired by IBM for statistical analysis.

Frequency tables were used to present the distribution of nominal variables. Results were expressed in numbers and percentages of respondents to each question and presented in tables. Their responses to 9 different related question which were: "have you heard of ADHD?", "where did you get information about ADHD", their believes about whether ADHD is a real disease and its underlying etiology, their knowledge about underlying causes and their treatment preferences.

**Results:-**

			Percent
	Male (%)	63.1	
	Female (%)	36.9	
	Age (range),(mode)*	15-50	21-25
	Level of education (mode),n 421.		Secondary School

**Table 1:-** Sociodemographic data n (450),\* graph 1.

**Graph 1: Age of the respondents.**

Interestingly, approximately three-quarters of respondents had heard of ADHD, 373(71.8%) and they were able to provide information about sources of their information. 25.1 % knew the disease through their experience with an ADHD patient known to them. 14.7% read about ADHD through medical websites, 7,3% and 7.6% knew about it from newspapers and social media, respectively, 9% didn't recall the source of their knowledge about it.

In addition, the majority of the sample, 71.3%, believed that ADHD is a real disease, 22 % believe that it is a behavioral disorder, 16 % consider it as a neurological disease while 18 % considered it as a psychiatric disorder. On the other hand, 31 .8 % believe that ADHD is a mixed disorder and only 11 % did not know anything about the nature of the disease.

When asking the respondents about the underlying causes, 32.2 % believe that it is a genetic disease, 23.1% blame nutritional habits, 19.3% believe that preservatives and dye contents of certain types of the food are the main cause, 4.9 % considered insecticides the main cause ,1.1% connected it to smoking and the rest believe that it is multi-cause disease.

5.6% of respondents believe that medical management is the main modality of treatment, 27.1% think that behavioral therapy is main treatment option and 59.8% suggested both modalities and the rest considered it as not a treatable disease.

**Graph 1: Beliefs of respondents about treatment options.**

### **Discussion:-**

Although a high percentage of participants in the study are young population and had a knowledge about ADHD, the vast majority of them didn't get the information from the ideal source as they get them through sharing experiences with others. This might reflect two things, first is how common is the problem second thing is the need to increase the awareness of how to seek more concise medical knowledge.

The good thing is that most of the participants are believing that ADHD is a disease and they believe in the importance of treatment.

### **Recommendations:-**

Based on the results we have we believe that Madina society is in a tremendous need to increase their awareness about ADHD in a simple layman language.

##### Key words:-

Cervical Cerclage, Fibrosis, Nylon Sutures, Pre-term delivery, Silk Sutures

#### Abstract

**Introduction:** The term 'cervical incompetence' is used to describe a disorder in which painless cervical dilatation led to recurrent second trimester pregnancy losses. Structural weakness of cervical tissue was thought to cause or contribute to these adverse outcomes. Cervical cerclage is used for the treatment of cervical incompetence. The relatively muscular and elastic internal Os is responsible for retaining the pregnancy in utero and a cerclage represents an attempt to physically support a weakened cervix. Though various studies have proven the efficacy of cerclage procedure, a number of questions still exist. What is the effect of the type of suture on the cervix? Is there any difference in the outcome following cervical cerclage with a multifilament suture, compared to a monofilament suture? The present study was thus conducted with the objective of comparing difference in cervical cerclage by silk and nylon as a suture material in terms of operability and outcome. The intention is to know the difference between monofilament and multifilament suture.

**Materials & Methods:** A Randomized control study was conducted in the Department of Obstetrics and Gynecology of a Tertiary Care Hospital and Medical college. After fulfilling the inclusion and exclusion criteria, total 50 cases of cervical length less than 3cms were selected and divided into two groups randomly using table of random numbers: **Nylon Group:** McDonald cerclage procedure using nylon sutures (25 patients) and; **Silk group:** McDonald cerclage procedure using silk sutures (25 patients). The patients were compared with respect to time taken for procedure, intra-op complications, ease of operability and ease of stitch removal. All the patients were followed up till delivery as per routine ANC schedule and development of fibrosis and outcome were compared. Data was analyzed using SPSS software ver. 21.

**Results:** The mean age and weeks of gestation in nylon group was 23.80±2.71 years and 20.66 weeks whereas in the silk group was 23.24±3.19 years and 21.41 weeks (p=0.507, 0.051). The mean time taken for the procedure in nylon group was 21.20±5.26 min whereas the mean time taken in silk group was 17.20±4.35min (p<0.01). No difference was observed between the study groups with respect to

difficulty in operability and ease of suture removal ( $p > 0.05$ ). Intra operative bleeding was significant in 24% women from nylon group and in 12% women in silk group ( $p = 0.46$ ) while Discharge and leakage was reported by 20% of cases each in nylon group and 12% and 20% cases in silk group ( $p = 0.78$ ). No difference was observed between the study groups with respect to development of fibrosis and outcome i.e. type of delivery ( $p > 0.05$ ).

**Conclusion:** The average time taken for the procedure was lesser with silk sutures while significant fibrosis was associated with nylon sutures. Both the suture materials were comparable in terms of operability, complication rate and ease of removal and outcome.

### **Introduction:-**

Cervical incompetence is defined as the weakness of the sphincter mechanism of the internal cervical os leading to painless effacement and dilatation of the cervix. This results in either mid-trimester pregnancy loss or pre term rupture of membranes or preterm labor and pregnancy failure.<sup>1</sup>

Despite major research efforts, more than 10 million births before 37 weeks of gestation occur annually worldwide, and more than 1 million infants die from this common complication of pregnancy (5–12% incidence)<sup>2</sup>.

Cervical cerclage (tracheloplasty), also known as a cervical stitch, is used for the treatment of cervical incompetence (or insufficiency). The treatment consists of a strong suture being inserted into and around the cervix early in the pregnancy, usually between weeks 14 to 16, and then removed towards the end of the pregnancy when the greatest risk of miscarriage has passed.

Shirodkar introduced the application of transvaginal cervical cerclage as treatment of cervical incompetence in 1951.<sup>3</sup> Initially, the operation was performed during pregnancy after the detection of a gradually yielding cervix seen in a woman who had entered seventh month of pregnancy. McDonald introduced his transvaginal cervical cerclage in 1957.<sup>4</sup> McDonald cervical cerclage was performed when dilatation of cervix and bulging fetal membranes were present during the second trimester of pregnancy.

Several observational studies into the efficacy of cervical cerclage have claimed high rate of successful pregnancy outcome in women with a poor obstetric history attributed to cervical incompetence.<sup>5,6</sup> Cervical cerclage is probably effective in the prevention of mid-trimester miscarriage. Many case series quote a viable delivery rate of 70 to 90 percent after cerclage, compared with 10 to 30 percent prior to the procedure.<sup>7</sup>

The relatively muscular and elastic internal os is responsible for retaining the pregnancy in utero and a cerclage represents an attempt to physically support a weakened cervix. Though the intention is good in providing mechanical support to a weakened cervix, a number of questions still exist. What is the effect of the type of suture on the cervix? Is there any difference in the outcome following cervical cerclage with a multifilament suture, compared to a monofilament suture?

Different surgical suture materials used are: silk, nylon, polyester, polypropylene and polybutester. They are basically divided as monofilament and multifilament (braided/ unbraided). The Royal College Obstetricians and Gynaecologists in a most recent guideline in 2011 advised that the choice of suture material should be at the discretion of the surgeon.<sup>8</sup>

Silk suture is a multifilament, non-absorbable, sterile, surgical suture composed of an organic protein called fibroin. Its advantage is that it is best in handling and tying, however it has least tensile strength, high tissue reactivity, increases risk of infection due to high capillarity.<sup>9</sup> Nylon sutures are synthetic non absorbable suture (monofilament). They have high tensile strength, minimal tissue reactivity and low cost.<sup>9</sup>

The present study was conducted with the objective of comparing difference in cervical cerclage by silk and nylon as a suture material in terms of operability and outcome. The intention is to know the difference between monofilament and multifilament suture.

### **Material & Methods:-**

A Randomized control study was conducted in the Department of Obstetrics and Gynecology of a Tertiary Care Hospital and Medical college. The study population included patients attending Antenatal clinic of the tertiary care Hospital with following inclusion and exclusion criteria:

#### **Inclusion Criteria:-**

After ruling out the contraindications of cervical cerclage, the pregnant patients attending antenatal clinic were selected with cervical length less than 3 cms on ultrasound.

#### **Exclusion Criteria:-**

1. Emergency cervical cerclage
2. Patient with history of previous cervical cerclage
3. Any associated medical disorder of pregnancy
4. Active vaginal infection

#### **Sampling Technique:-**

After fulfilling the inclusion and exclusion criteria total 50 cases of cervical length less than 3cms were selected and divided into two groups randomly using table of random numbers.

- **Nylon Group:** McDonald cerclage procedure using nylon sutures (25 patients).
- **Silk group:** McDonald cerclage procedure using silk sutures (25 patients).

#### **Methodology:-**

Detail demographic history along with previous gynaecological and obstetrical history, physical examination and digital assessment of portiovaginalis of cervix was recorded on a pre-structured and pretested proforma. Base line investigations as for ANC were done mainly to rule out underlying medical disorders if detected. The McDonald cerclage procedure using nylon/ silk sutures was performed as per standard technique under general anaesthesia.

Patients were observed for 1 hour in the post-operative room. After shifting the patients to the ward, they were observed for FHS, Uterine contractions, voiding of urine/urinary retention and lower abdominal pain and leaking. Patients were advised bed rest with minimal mobilization i.e. allowed to be ambulated for their toileting and for meals. No tocolysis was given to any patients. Patients were advised to follow up after 8 days or to report immediately if any of the complaints like leaking, bleeding, contractions occur and were asked to follow up as per routine ANC schedule thereafter.

Primary outcome was the term delivery rate, preterm delivery rate before 37 weeks of gestation and percentage of cesarean section.

#### **Follow-up:-**

- Patients were followed up till delivery as per routine ANC schedule.
- Suture removal was done as follows:
  - At 37 completed weeks after confirmation of maturity.
  - If she has complains of leaking.
  - If she has gone into frank preterm labour.
- Associated complications, ease of removal of sutures and fibrosis at suture site if any was recorded. The amount of fibrosis was noted as follows:
  - Grade I – upto 25 %
  - Grade II – upto 50 %
  - Grade III – upto 75 %
  - Grade IV – whole cervical rim

**Data Analysis:-**

Data was analyzed using SPSS 21.0 (SPSS Inc., Chicago, IL, USA) using appropriate statistical tests.

**Results:-**

The mean age and weeks of gestation in nylon group was  $23.80 \pm 2.71$  years and 20.66 weeks whereas in the silk group was  $23.24 \pm 3.19$  years and 21.41 weeks ( $p=0.507$ ,  $0.051$ ). It was observed that 68% women in nylon group were primi-gravida whereas 52% women in silk group were primi-gravida ( $p=0.387$ ). The mean cervical length in nylon group was  $2.15 \pm 0.42$  cm and in silk group was  $2.12 \pm 0.44$  cm ( $p=0.794$ ) (Table 1).

The mean time taken for the procedure in nylon group was  $21.20 \pm 5.26$  min whereas the mean time taken in silk group was  $17.20 \pm 4.35$  min ( $p < 0.01$ ). Stitch was removed at  $37.12 \pm 0.73$  weeks and  $37.12 \pm 0.53$  weeks of gestation in nylon and silk group respectively ( $p=0.99$ ) (Table 2).

No difference was observed between the study groups with respect to difficulty in operability and ease of suture removal ( $p > 0.05$ ) (Table 3 & 7).

Intra operative bleeding was significant in 24% women from nylon group and in 12% women in silk group ( $p=0.46$ ) while Discharge and leakage was reported by 20% of cases each in nylon group and 12% and 20% cases in silk group ( $p=0.78$ ) (Table 4 & 5).

Significant fibrosis at the site of suture site was observed in 8% cases in nylon group whereas in 4% cases with fibrosis at the site of suture site were observed in silk group (Table 6).

Full term normal delivery occurred in 46% of nylon group and silk group each. LSCS was required in 24% of cases in nylon group and 20% of silk group ( $p=0.60$ ) (Table 8).

**Discussion:-**

There are many surgeries that can be performed for cervical cerclage operation. The two main techniques of transvaginal cerclage are the McDonald method and the Shirodkar method. The McDonald's method is the most popular method in modern obstetrics.<sup>10</sup> It is because of the ease with which it can be performed. In the present study, we performed all the cases by McDonald's method. Out of 50 cases, 25 surgeries were performed with silk and 25 with nylon.

In the study population, the mean age in nylon group was 23.80±2.71 years whereas in the silk group was 23.24±3.19 years (p=0.507). Kaukab Naheed et al.<sup>11</sup> studied the cases of cervical incompetence in their study and observed the mean age of presentation of 26 years.

Out of all chosen patients, overall percentage of Primi-gravida patients was 60% and multigravida was 40%. The lower percentage of multigravida can be attributed to the exclusion criteria i.e. patients with previous history of cervical cerclage. Also the other reason for more number of primi-gravida is incompetent os due to decrease muscular content (less than 10 %).<sup>12</sup> Less number of multigravida required encirclage because of the cervical changes related to age or previous injuries leading to fibrosis.<sup>13</sup>

The mean time taken for performing the procedure in nylon group was  $21.20 \pm 5.26$  min. and the mean time taken in silk group was  $17.20 \pm 4.35$  min. The average time was possible to calculate as a single surgeon has performed all the cases to remove operator bias. On an average, the time taken for performing the procedure in nylon group was 4 minutes more which was statistically significant. Therefore it can be concluded that the suturing time is less for silk easier knotting and gripping of the cervix with suture material.

The operability was easy in 76% cases in both nylon group and silk group. In 8% cases from nylon group and 4% cases in silk group the operability was reported to be difficult. However, the figures are insignificant as the difficult procedure was not because of the material used but because of the excessive shortening of cervix. Also, no significant intraoperative bleeding was seen in 82% of cases. We have considered bleeding to be significant when there was soaking of more than 2 swabs (4 layered). Patients in whom there was significant bleeding, 2/3rd cases were with nylon but it can be attributed to the trochar point needle which was used for nylon. Hence, it was not related to the suture material used per se. So, the difference was statistically insignificant.

The complications reported with cerclage include sepsis, premature rupture of membranes, premature labour, cervical dystocia, cervical laceration at delivery (11% to 14%) and haemorrhage<sup>14-21</sup>. Discharge and leaking were the common complaints reported by patients in the present study. Discharge was reported by 20% of cases in nylon group and 12% cases in silk group. Discharge which was found in our case was not there with the infection because it was not foul smelling. There were limitations to our study that we could not send swab culture. The vaginal discharge which was present was because of diffuse tissue reaction of vaginal mucosa to suture material but the difference which was found in the present study is 20% with nylon and 12% in silk which was insignificant. Leaking was reported by 20% cases in both the groups showing that there is no difference.

Stitch removal was planned after confirming the maturity of the foetus. Average gestational age for stitch removal in both the groups was  $37.12 \pm 0.73$  weeks (nylon) and  $37.12 \pm 0.53$  weeks (silk) ( $p > 0.05$ ). Stitch removal in 6 patients who went in spontaneous preterm labour (PPROM) was not related with the amount of intraoperative bleeding or infection or type of suture material used. We removed the stitch in procedure room in all cases but in these 6 cases of leaking we removed suture in pre-labour room.

Significant fibrosis was present more in cases of nylon group (8% vs 4%), but with respect to overall fibrosis, it was not significant ( $p > 0.05$ ). According to some authors threaded silk in superficial and deep sutures has demonstrated some advantages over cotton suture. This is also a twisted multifilament suture, producing a less severe inflammatory reaction around the stitches,<sup>22-24</sup> as compared with cotton. Among the synthetic suture materials, nylon undoubtedly produces the mildest tissue reaction.<sup>24,25</sup> This is also a non-resorbable monofilament suture, and is widely used in sites where aesthetics is important. Fibroblastic and capillary proliferation related to this type of material occurs earlier in comparison with the other kinds.

It was easier to remove the silk stitch because there was only one thread. The amount of embedding of the silk suture was not evident in our study which was contrary to the assumption that suture material is embedded in mucus membrane. Nylon sutures were also easy to be removed but in 4% of the cases, only 1 string was cut, then there was more difficulty in removal of other string (we did cervical cerclage with nylon with double strings). The difference observed in both groups was not statistically significant.

Caesarean section was done in 11 cases. Majority of these were due to other obstetrical indications. Out of 11, only 3 were done for cervical dystocia that had occurred because of severe fibrosis due to cervical cerclage. Full term normal delivery occurred in 46% of nylon group and silk group each. LSCS was required in 24% of cases in nylon group and 20% of silk group. Among the total 24% cases undergone LSCS in nylon group, cervical dystocia was the most common indication for LSCS (12%) followed by twin pregnancy, breech pregnancy and android pelvis in 4% each. In silk group total 20% of cases were delivered by LSCS with fetal distress (8%) as common indication followed by CPD and breech presentation. Intra operative bleeding was seen in 24% women from nylon group whereas in 12% women in silk group. The difference observed in nylon and silk group was statistically insignificant.

It may be suggested that in cervical incompetence the mechanical or biochemical properties of the cervix vary from those of the normal cervix, making possible a different pattern of labor. A recent study tested the connective tissue changes of the cervixes of normal pregnant women and those of women with cervical incompetence. It was shown

that, although the cervixes of patients with cervical incompetence contained normal collagen concentrations, there was a high collagenolytic activity in these cervixes, indicating a high turnover of collagen. This newly formed collagen had low strength and high distensibility properties.<sup>26</sup> It has been shown further that women with a classic history of cervical incompetence have reduced elasticity as measured by intracervical balloons. Other authors have stated that the cervix does not dilate normally after a cerclage, presumably because of the foreign body reaction to the suture material and the formation of scar tissue. The scar tissue does not efface or dilate normally, but rather ruptures and "gives off" at the point at which the tensile forces of the uterine contractions overcome those of the tissue.<sup>27-29</sup> We could not confirm these claims; similar labor patterns were found in women with cervical cerclage and the comparison group. Cervical dystocia is commonly cited as a complication of cervical cerclage, causing faulty progression of labour and a higher caesarean rate.<sup>30-32</sup>

Takashi Yorifuji et al.<sup>33</sup> conducted a retrospective study to determine the sustained effects of emergency cerclage using slowly absorbable monofilament sutures, changes in cervical length after cerclage. They concluded that absorbable monofilament suture appears useful for emergency cerclage. Vincenzo Berghella<sup>34</sup> conducted a study to assess whether type of suture material affects cerclage efficacy for preterm birth prevention and they concluded that type of suture material may not affect ultrasound-indicated cerclage efficacy in high-risk women with short CL, but further study is needed. Y. E. Abdelhak<sup>35</sup> compared the efficacy of traditional non absorbable suture to delayed absorbable suture for used in McDonald cervical cerclage. They conducted a retrospective analysis of all cerclage procedures over a one year interval and stratified by the type of suture material. They reported that delayed absorbable suture material may be a reasonable alternative during cerclage placement, with the added benefit of spontaneous degradation versus surgical removal.

### **Conclusion:-**

We thus conclude that average time taken for the procedure was significantly less with silk sutures while more intra-op bleeding (24% vs 12%) and complaint of discharge (20% vs 12%) was seen with nylon sutures. Both the suture materials were comparable in terms of operability, fibrosis, ease of removal and outcome.

### **Recommendations:-**

We thus recommend that silk suture should be preferred in McDonald cerclage procedure, as significantly lesser time was required for the procedure and it also has a lower complication rate.

### Abstract

In this research work, we establish a theorem on Weyl fractional derivative of the product multivariable polynomials and I –function. Certain special cases of our theorem have been discussed.

**Mathematics Subject classification** - 26A33, 33C 60, 44A15.

### Key words:-

Weyl fractional derivative operator, multivariable polynomials and I-function

Copy Right, IJAR, 2017., All rights reserved.

### Introduction:-

The I- function of the one variable is defined by Saxena (1982) and we will represent here in the following manner:

$$(1.1) \quad I[z] = I_{p_i, q_i; r}^{m, n} [z] = I_{p_i, q_i; r}^{m, n} \left[ z \left| \begin{matrix} \dots, \dots \\ \dots, \dots \end{matrix} \right. \right] = I_{p_i, q_i; r}^{m, n} \left[ z \left| \begin{matrix} (a_j, e_j)_{1, n}; & (a_{ji}, e_{ji})_{n+1, p_i} \\ (b_j, f_j)_{1, m}; & (b_{ji}, f_{ji})_{m+1, q_i} \end{matrix} \right. \right]$$

$$(1.2) \quad = \frac{1}{2\pi i} \int_L \theta(s) z^s ds,$$

where  $i = \sqrt{-1}$ ,  $z (\neq 0)$  is a complex variable and (1.2)  $z^s = \exp[s \{ \log |z| + i \arg z \}]$ . In which  $\log |z|$  represent the natural logarithm of  $|z|$  and  $\arg |z|$  is not necessarily the principle value. An empty product is interpreted as unity. Also,

$$(1.3) \quad \theta(s) = \frac{\prod_{j=1}^m \Gamma(b_j - f_j s) \prod_{j=1}^n \Gamma(1 - a_j + e_j s)}{\sum_{i=1}^r \left[ \prod_{j=m+1}^{q_i} \Gamma(1 - b_{ji} + f_{ji} s) \prod_{j=n+1}^{p_i} \Gamma(a_{ji} - e_{ji} s) \right]}, \quad m, n, p_i \text{ and } q_i \forall i \in (1, \dots, r) \text{ are non-negative}$$

integers satisfying  $0 \leq n \leq p_i$ ,  $0 \leq m \leq q_i$ ;  $\forall i \in \{1, \dots, r\}$ ,  $e_{ji}, (j = 1, \dots, p_i; i = 1, \dots, r)$  and  $f_{ji}, (j = 1, \dots, q_i; i = 1, \dots, r)$  are assumed to be positive quantities for standardization purpose. Also  $a_{ji}, (j = 1, \dots, p_i; i = 1, \dots, r)$  and  $b_{ji}, (j = 1, \dots, q_i; i = 1, \dots, r)$  are complex numbers such that none of the points.

$$(1.4) \quad S = \{(b_n + v) | f_h\}, h = 1, \dots, m; v = 0, 1, 2, \dots,$$

which are the poles of  $\Gamma(b_h - f_h s), h = 1, \dots, m$  and the points

$$(1.5) \quad S = \{(a_l - n - 1) | e_l\} l = 1, \dots, n; \eta = 0, 1, 2, \dots,$$

Which poles are of  $\Gamma(1 - a_l + e_l s)$  coincide with one another, i.e. with

$$(1.6) \quad e_l (b_n + v) \neq b_n (a_l - \eta - 1),$$

for  $v, \eta = 0, 1, 2, \dots; h = 1, \dots, m; l = 1, \dots, n$ .

Further, the contour L runs from  $-i_\infty$  to  $+i_\infty$ . Such that the poles of  $\Gamma(b_n - s), h = 1, \dots, m$ ; lie to the right

of L and the poles  $\Gamma(1 - a_l + e_l s), l = 1, \dots, n$  lie to the left of L. The integral converges, if  $|argz|$

$< \frac{1}{2} B\pi, B > 0, A \leq 0$ , where

$$(1.7) \quad A = \sum_{j=1}^{p_i} e_{ji} - \sum_{j=1}^{q_i} f_{ji} \text{ and}$$

$$(1.8) \quad B = \sum_{j=1}^n e_j - \sum_{j=n+1}^{p_i} e_{ji} + \sum_{j=1}^m f_j - \sum_{j=m+1}^{q_i} f_{ji} \quad \forall i \in (1, \dots, r)$$

Let A denote a class of good functions. By good function f, we mean Miller [1975, p.82] a function which is everywhere differentiable any number of times and if all of its derivatives are  $O(x^{-\nu})$ , for all  $\nu$  as  $x$  increases without limit. We define the Weyl fractional derivatives of a function  $g(z)$  as follows:-

Let  $g \in A$ , then for  $q < 0$ ,

$$(1.9) \quad {}_z W_\infty^q g(z) = \frac{(-1)^q}{\Gamma(-q)} \int_z^\infty (u - z)^{-q-1} g(u) du.$$

For  $q \geq 0$

$$(1.10) \quad {}_z W_\infty^q g(z) = \frac{d^n}{dz^n} ({}_z W_\infty^{q-n} g(z)),$$

$n$  being positive integer, such that  $n > q$ .

The general class of multivariable polynomials is defined by Srivastava and Garg [1987]:

$$(1.11) \quad S_L^{h_1, \dots, h_r} [x_1, \dots, x_r] = \sum_{k_1, \dots, k_r=0}^{h_1 k_1 + \dots + h_r k_r \leq L} (-L)_{h_1 k_1 + \dots + h_r k_r} A(L; k_1, \dots, k_r) \frac{x_1^{k_1}}{k_1!} \dots \frac{x_r^{k_r}}{k_r!},$$

where  $h_1, \dots, h_r$  are positive integers and the co-efficient  $A(L; k_1, \dots, k_r), (L; h_i \in \mathbb{N}; i = 1, \dots, r)$  are arbitrary constant, real or complex.

Evidently the case  $r = 1$  of the polynomials (1.11).

Would correspond the polynomials given by Shrivastava [1972]

$$(3.1.2) \quad S_L^h [x] = \sum_{k=0}^{[L, h]} \frac{(-L)_{hk}}{k!} A_{L,k} x^k \{L \in \mathbb{N} = (0, 1, 2, \dots)\},$$

where  $h$  is arbitrary positive integers and the co-efficient  $A_{L,k} (L, k \geq 0)$  are arbitrary constant, real or complex.

**Mathematical pre-requisites:-**

To establish the main result, we need the following integral of the H-function by SaigÖ[1992]:

$$(2.1) \quad \int_x^\infty t^{\rho-1} (t-x)^{\sigma-1} I_{p_i, q_i; r}^{m, n} \left[ zt^\mu (t-x)^\nu \left| \begin{matrix} (a_j, e_j)_{1, n}; (a_{ji}, e_{ji})_{n+1, p_i} \\ (b_j, f_j)_{1, m}; (b_{ji}, f_{ji})_{m+1, q_i} \end{matrix} \right. \right] dt$$

$$= x^{\rho+\sigma-1} I_{p_i+2, q_i+1; r}^{m+1, n+1} \left[ zx^{\mu+\nu} \left| \begin{matrix} (1-\sigma, \nu), (a_j, e_j)_{1, n}; (a_{ji}, e_{ji})_{n+1, p_i}, (1-\rho, \mu) \\ (1-\rho-\sigma, \mu+\nu), (b_j, f_j)_{1, m}; (b_{ji}, f_{ji})_{m+1, q_i} \end{matrix} \right. \right],$$

where

(i)  $\rho, \sigma$  are complex numbers and  $\mu, \nu$  are positive real numbers,

(ii)  $|\arg z| < \frac{1}{2} A\pi$ ,  $A$  defined as

$$A = \sum_{j=1}^{p_i} e_{ji} - \sum_{j=1}^{q_i} f_{ji},$$

(iii)  $\min \left[ \operatorname{Re} \left( \frac{1-\rho-\sigma}{\mu-\nu} \right), \min_{1 \leq j \leq m} \left[ \operatorname{Re} \left( \frac{b_j}{f_j} \right) \right] \right] >$   
 $\max \left[ -\operatorname{Re} \left( \frac{\sigma}{\nu} \right), \max_{1 \leq j \leq N} \left[ \operatorname{Re} \left( \frac{a_j-1}{e_j} \right) \right] \right].$

**Weyl Fractional Derivatives Of The Product Of Multivariable Polynomials And I-Function.**

**Theorem.**

Let  $m, n, p_i$  and  $q_i$  be non-negative integers such that  $0 \leq n \leq p_i, 0 \leq m \leq q_i$  and

$$\sum_{j=1}^n e_j - \sum_{j=n+1}^{p_i} e_{ji} + \sum_{j=1}^m f_j - \sum_{j=m+1}^{q_i} f_{ji} > 0$$

together with the set of conditions (i) – (iii) given with equation (2.1). Then, for all value of  $q$ ,

$$(3.1) \quad {}_z W_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^{h_1, \dots, h_r} \left[ c_1 x^{\delta_1}, \dots, c_r x^{\delta_r} \right] \right.$$

$$\left. \times I_{p_i, q_i; r}^{m, n} \left[ yx^\mu (x-z)^\nu \left| \begin{matrix} (a_j, e_j)_{1, n}; (a_{ji}, e_{ji})_{n+1, p_i} \\ (b_j, f_j)_{1, m}; (b_{ji}, f_{ji})_{m+1, q_i} \end{matrix} \right. \right] \right\}$$

$$= \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-\sum_{i=1}^r k_i \delta_i - 2} \sum_{\substack{k_1, \dots, k_r=0 \\ h_1 k_1 + \dots + h_r k_r \leq L}} (-L)_{h_1 k_1 + \dots + h_r k_r} A(L; k_1, \dots, k_r) \frac{c_1^{k_1}}{k_1!} \dots \frac{c_r^{k_r}}{k_r!}$$

$$\times I_{p_i+2, q_i+1; r}^{m+1, n+1} \left[ yz^{\mu+\nu} \left| \begin{matrix} (2-\sigma+q, \nu), (a_j, e_j)_{1, n}; (a_{ji}, e_{ji})_{n+1, p_i}, (1-\rho-\sum_{i=1}^r k_i \delta_i, \mu) \\ (2+q-\rho-\sigma-\sum_{i=1}^r k_i \delta_i, \mu+\nu), (b_j, f_j)_{1, m}; (b_{ji}, f_{ji})_{m+1, q_i} \end{matrix} \right. \right].$$

**Proof :** Taking left hand side of equation (3.1) and using equation (1.11), we get

$$(3.2) \quad {}_z W_\infty^q \left\{ x^{\rho+\sum_{i=1}^r k_i \delta_i - 1} (z-x)^{\sigma-1} \sum_{\substack{k_1, \dots, k_r=0 \\ h_1 k_1 + \dots + h_r k_r \leq L}} (-L)_{h_1 k_1 + \dots + h_r k_r} A(L; k_1, \dots, k_r) \frac{c_1^{k_1}}{k_1!} \dots \frac{c_r^{k_r}}{k_r!} \right.$$

$$\left. \times I_{p_i, q_i; r}^{m, n} \left[ yx^\mu (x-z)^\nu \left| \begin{matrix} (a_j, e_j)_{1, n}; (a_{ji}, e_{ji})_{n+1, p_i} \\ (b_j, f_j)_{1, m}; (b_{ji}, f_{ji})_{m+1, q_i} \end{matrix} \right. \right] \right\},$$

Now using equation (1.9) and definition of I – function, easily we can find the proof of equation (3.1).

For  $q \geq 0$  invoking the definition (1.10) the relation (3.2) further reduces to
