This cross sectional observational study was performed on 202 patients in the period from 20<sup>th</sup> January 2017 to 7<sup>th</sup> February2017 from Yamama Hospital in Riyadh, an approval from thehospital was obtained to perform this study. This study was performed after operation performing. Patients accepted to answer questions, theywere not exposed to any pressure andthey freely answered the questions, there was no exclusion for patients.

### **Questionnaire:-**

A questionnaire was established to record patients' answers. It was containing 10 questions written in both Arabic and English. The answers were recorded as Yes and No in the questionnaire to be easy for patients.

### **Statistical analysis:-**

Data were analyzed by using Statistical Package for Social Studies (SPSS 22; IBM Corp., New York, NY, USA). Continuous variables were expressed as mean  $\pm$  standard deviation and categorical variables were expressed as percentages. Chi square test was used for categorical variables. P-value  $<0.05$  was considered statistically significant.

### **Results:-**

This study was conducted on 202 patients after performing operation. The number of males was 69 (34.16%) while females' number was 133 (65.84%), the female represents most of patients in this study. The mean age of participants was  $32.84 \pm 10.94$ . Most of the individuals were Saudi 184 (91.1%) and few of participants were non Saudi 18 (8.9%). The majority of patients were from urban areas 197 (97.5%) and only 5 (2.5%) came from rural area. The questions of questionnaire are summarized in table1.

**Table 1:-** Questions presented to patients

Item No	Questions
Q1	Do you know what anaesthetics are?
Q2	Do you know that anaesthesiologists are doctors?
Q3	Do you know that anaesthesia is safe?
Q4	Do you know that there are different types of anaesthesia for different surgeries?
Q5	Do you know that, unless you give informed consent, nothing is performed?
Q6	Do you know that all types of pain can be managed by anaesthesiologists?
Q7	Do you know that labour can be painless with labour analgesia?
Q8	Would you prefer painless delivery? (Female only)
Q9	Would you know that you should follow certain preoperative instructions?
Q10	Did you have any benefit by visiting anaesthesia stall in this mela?

The answers were recorded as yes and no and percent of each answer was estimated. Figure 1 shows a high percent of participants knew about anesthesia (87.62%), most of patients (82.67%) knew that anesthesiologist is a doctor. 70.30% of them realized that anesthesia is safe and 61.88% had knowledge about different types of anesthesia. 72.77% of patients knew about the consent, more than half of patients (64.85%) knew that anesthesiologist can manage all types of pains. Only 11.88% did not know about painless labor. Most of females in this study preferred painless delivery (88.72%) over a painful one. The majority of individuals (92.08%) knew that there are certain preoperative instructions that should be followed and 72.77% found benefit by visiting an anesthesia stall.

**Fig 1:-** Answers of patients to the questions

There was no significant difference in all answers regarding gender except for question number 2, where females had more knowledge than males about anesthesiologist as a doctor. Table 2.

**Table 2:-** Participants' answers to the questionnaire by gender.

Item No	Question	Male		Female		*P-value
		Yes (%)	No(%)	Yes(%)	No(%)	
Q1	Do you know what anaesthesia is ?	61 (88.41)	8 (11.59)	116 (87.22)	17(12.78)	0.808

\*P-value<0.05 was statistically significant.

### Discussion:-

Complex surgery is now possible and easier due to developed techniques by anesthetists (Naod et al, 2016), indeed the role of anesthesiologist not only inside the operating room, but also in preoperative evaluation, pain management and intensive care(Erden et al, 2012). However public awareness about anesthesiologist is low. In the present study we investigated about the knowledge of patients about anesthesiologist and anesthesia, we found that most of participants 87.62 % knew about anesthesia, this is a high percent compared to many other studies (Prasad et al, 2014; Swinhoe et al, 1994; Ismaeil, 2011) where the percentage of people knew about anesthesia were 82%, 80% and 60.6%. In another study (Pandyat al, 2016) only 26% of participants knew about anesthesia. Most of our patients were from urban area this may explains the height in our patients' knowledge about anesthesia. In the present study high percent of participants 82.67% knew that anesthesiologist is a doctor, this in agreement with a study by Acosta-Martínez et al (2016)and Ahsan-ul-Haq et al (2004)where the percents in their studieswere 80% and 82% respectively, also in many studies by lee et al (2014),Prasad and Suresh(2014) and Bhandary et al (2016) the percentswere74.8%, 75 %and 60% respectively, however our results still higher. In other studies (Swinhoe et al, 1994; Khan et al, 1999),Pandyat al, 2016;Irwin et al, 1998), the percent was around 30-35%, whileitraised in Caribbean and Singapore studies toreach 59% and 65.8% respectively of patientsknew that anesthesiologist is a doctor [Hariharan et al, 2006; Chew et al, 1998), another study (Hariharan, 2009)recorded least percent, only 5.5 % of patients knew that anesthesiologist is a qualified doctor.This low percent reflects very poor knowledge about anesthesiologists who really are.This may return to many reasons such as; patients choose surgeons not anesthesiologist because some patients think that anesthesiologist is surgeon's assistant, another reason is the short duration often spent between patient and anesthesiologist (Hariharan, 2009).In replay to the question about safety of anesthesia, 70.30% of patients realized that anesthesia was safe; this result is close to one study(Garry, 2001)where 76 % of individuals felt anesthesia as safe, while in another study (Ahsan- Ul-Haq et al, 2004)only 40 thought anesthesia was safe. Although our result about safety of anesthesia seems to be good, much awareness still needed to patients, this will decrease their fears before surgery especially with the presence of developed anesthesia

techniques. There are different types of anesthesia for different surgeries, but only 61.88% of our patients knew that. This percent was lower compared to many other studies (Prasad et al, 2014; Ahmad et al, 2011), where percentage were higher 73% and 82.4%, however in other study (Kadri et al, 2014), it was found that 48.1% of patients were aware of the various types of anesthesia techniques, while in a study by Pandya et al (2016) 74% did not know about different anesthesia techniques. Informed consent is a document signed by the patient, it is a medicolegal binding between doctor and patient (Prasad et al, 2014). In the current study, 72.77% of participants knew that the consent is important and nothing will be performed unless patient signed it. In a study by Prasad and Suresh (2014), they found that 77% of patient knew about this consent, while lower percent 34.67% was reported by Naithani et al (2007), however in another study (Pandya et al, 2016) 57.69% of patients had awareness about this consent. Anesthesiologist can manage all types of pain, this fact was known by 64.85% of our patients and 88.12% knew about painless labor, our results were close to a study by Prasad and Suresh (2014) who showed that 69% knew the role of anesthesia doctor in managing pain and 72.5% knew about painless labor, while in a study by Ahsan-ul-Haq et al (2004) they found that only 34% knew about the role of anesthesiologist in managing pain. In Egypt (Swinhoe et al, 1994) only 4.3% knew about pain clinic, while 77.14% did not know about this role of anesthesiologist and 11.4% knew about the painless delivery. These results in Egypt are similar to that by Naithani et al (2007) who reported 12.67% of individuals knew about painless labor whereas only 19.4% said post-operative pain management by anesthesiologists in another study (Bhandary et al, 2016). In Finland study (Tohmo et al, 2003) 36% of patients did not know the role of anesthesiologists in pain clinics. These results show the weak awareness of patients about the role of anesthesiologists postoperatively. In the current study, a question especial to female was asked, it was about preferring painless delivery, 88.72% of them said yes, only 11.28% chose the painful delivery, whereas 73% preferred painless delivery in another study (Prasad et al, 2014). Although 11.28% is very low percent in preferring painful delivery, the fear of female from anesthesia may be the reason, it is recommended for pregnant to visit anesthesiologist before delivery, so she can know more about anesthesia and feel safe, as a result she may choose the painless way. By comparing our results to the results of Prasad and Suresh (2014) regarding preoperative instruction that patients should follow and benefit by visiting the anesthesia stall at the mela, we found that our patients were more aware of the preoperative instruction 92.08% than the other study 81%, whereas in the previous study more individuals get benefit by visiting anesthesia stall at the mela 92% than ours 72.77%. Regarding to gender as a factor affect awareness of individuals about anesthesiologist role, there was no significant difference in this study between male and female except for question number 2 about anesthesiologist as being a doctor ( $p$ -value=0.048), actually more female knew that anesthesiologist was a doctor, but in the other questions there were no significant differences between the two genders. Gender had significant association with knowledge of patients about anesthesia was a doctor. In contrast to our study, it was reported no significant differences between gender when asked if anesthesiologist was a doctor (Khara et al, 2013). However it was mentioned that gender had significant association with knowledge of patients about anesthesia (Naod et al, 2016).

### Conclusion:-

Awareness about the role of anesthesiologists and anesthesia of patients in this study was very good and promising, however good contact between patients and anesthesiologists preoperatively still required and period spent between them should be increased to raise patients' awareness and knowledge about anesthesia and anesthesiologists' roles. The good relationship between anesthesiologists and patients can remove any fear before operation, also increasing trust in anesthesiologist leads to good outcome of operation. Our patients had good awareness, but programmes of awareness and education still needed to cover all the area in society to reach the best results.

### Abstract

“Sarveroga Malayatanani” Etiology of all diseases is collection of toxic (Excretory) product in the body. Which happen due to faulty diet and change in life style? For healthy body we have to need balanced healthy diet, balanced physical activity and balanced sleep. These are explained in Ayurveda as three sub pillars of healthy body, which helps to maintain three pillars (Three Dosh) of living body. Here, we are discussing about most common and immerging diseases of Anorectal region. The commonest etiopathogenesis of these diseases is constipation, which is risk factor for metabolic diseases. If, we go on depth of Ayurveda, Main aim have to prevent constipation, Anorectal diseases and metabolic diseases by maintain proper digestive activity. Ayurveda deals both prevention and management of Anorectal diseases. Preventive aspect explained under headings of *Dincharya*, *Ritucharya*, *Dasaharavidha visheshayatana*, *Aaharopyogivarg*, *Sadavrita* and *Neendra*. Primary principal treatment of disease in Ayurveda is, to correct and ignited our Agni (Digestive Fire) along with detoxification of body. This will mentain our normal metabolic activity and makes us healthy.

### Introduction:-

*Ayurveda* in Sanskrit means 'science of life'. This ancient science of medicine & positive health, first originated in India, is still relevant and beneficial to modern life. Along with system of preventive medicine, *Ayurveda* also emphasizes a healthful & enlightened lifestyle a concept that's gaining wide acceptance across the globe. *Ayurveda* has first emphasis on *Aahar-vihar* & *neendra* of healthy person, which are important for healthy body. *Acharya Charak* has also emphasizes on health, medicine, hygiene, prophylaxis, diet and life-style in *sutra sthan*. The best way to increase the general life force of the body is by good nutrition, sufficient deep sleep, a positive mental attitude and yoga. The cause of Anorectal disorders (*Gudroga*) is mainly originated from irregular bowel habit (constipation). Due to busy life schedule most of the persons suffering from constipation because of change in diet, life style & sleep pattern (Harry & Curry). Constipation is an awkward problem that a lot of men and women suffer from on a daily basis. Processed foods, baked goods, red meat, caffeine, oily food and dairy products, change in daily life styles are the main cause for indigestion & leading to constipation.

In Anorectal a disorders mainly external & internal hemorrhoid, fissure in ano, partial mucosal prolapse, and sentinel tag develops from most common primarily due to constipation. In these cases, if we avoided constipation by

improving healthy fibrous diet, changing in life style & proper sleep than all most all the patients have been improved and also prevent recurrence.

### Causes Of Constipation:-

The aggravation of *Vata* causes constipation. Improper eating habits including eating a lot of food, eating food, which is difficult to digest (such as meat) and not eating enough vegetables and salads also lead to constipation. Irregular sleep habits or emotional disturbances (stress, grief, fear or worry) are other causes for constipation, due to accumulation of toxins in the colon or excessive stimulation of the nervous system. Smoking, consuming too much tea and coffee, or intake of prescribed illicit drugs can also cause constipation.

### Diet- (Aahar) In Anorectal Disorders:-

Our diet is an essential factor for the formation of our body. *Charak* Says that consuming improper diet in improper way is the main cause of disease. This is explained under heading of *Astaaharvidha vishesayatana*. As per the Ancient *Ayurvedic* Proverb by *Lolimbaraja* "When diet is wrong medicine is of no use. When diet is correct medicine is of no need.

### Importance Of Timely Food Consumption:-

A person should take meal only when he feels hungry. Lunch should be taken early between 12 and 1P.M. this coincides with the peak *Pitta* period, *Pitta* is responsible for the digestion. *Ayurveda* recommends that the lunch should be the largest meal of the day. Dinner should be lesser and lighter than lunch.

### Quantity Of Food:-

Generally half of the capacity of stomach should be filled with solids, ¼ th with liquids and rest kept empty for the free movements of body humors. Capacity of stomach can be analyze by ingestion capacity of a person.

### Importance Of Rasa In Food Consumption:-

*Madhur* (sweet) rasafood like fruits are advisable to take in the beginning of meal, food with *Amla* and *Lavana*(sour and salty) *rasa* in the middle and *Katu, Tikta, Kashay* (bitter ,astringent and pungent) foods should be taken at the end of meal for healthy one. This serial of food intake will prevent over eating by inhabiting sanitary center.

### Method Of Consuming Food:-

First wash the face, hands and feet before meal. Selected an isolated neat and clean place in pleasant environment with the affectionate persons in sitting position.

Food should be taken after complete digestion of previous one.

Chew your food until it is an even consistency before swallowing.

Hard items should be consumed in the beginning followed by soft and liquids subsequently.

Heavy substances are contraindicated after meals and should be avoided Do not drink cold drinks just prior to or while eating, also don't drink large quantities of liquid during meals. This weakens digestion.

Avoid consumption of excessive hot food, which leads to weakness. Also avoid cold and dry food leads to delayed digestion.

### Incompatible Food (Viruddha Ahara):-

- Milk followed by fruits and vice versa. Soar substance along with milk.
- Milk with salt, horse gram, green gram & cow gram Wheat preparations in *Tila taila*
- Hot drinks after alcohol, curd or honey Cold and hot substances together Banana with curd and butter milk Chicken with curd Ghee kept in bronze vessel Radish with jiggery Fish with jaggery or sugar Use of incompatible food leads to skin disorders, Gastro intestinal disorders, constipation, anemia, leucoderma, hyperacidity, impotence etc. hence these should be avoided.

### General Instructions About Meal –What Don't Do?

- Do not eat while being engaged in some activity as like television, excessive conversation or reading.
- Don't eat fruits immediately – Immediately eating fruits after meals will cause stomach to be bloated with air. Therefore take fruit one to two hours after meal or one hour before meal.

- Avoid meals when thirsty and water while hungry. Avoid meals after exertion.
- Avoid meals when you are having no appetite.
- Don't suppress the appetite as it leads to body pain, anorexia, lassitude, vertigo and general debility.
- Don't suppress the thirst as it leads to general debility, giddiness and heart diseases.
- Avoid spicy food, fast food, junk food, cold drinks, chocolates etc. Because of these foods disturb the digestive system & lead to constipation.
- Fried foods, beans, gas forming vegetables like cabbage, cauliflower and broccoli, nuts and dried fruits should be avoided.
- Do not mix too many kinds of foods in one meal.

#### **What To Do?**

- The diet taken during constipation must be easily digestible, Plenty of fruits, vegetables, salads, freshly cooked food, and chew food thoroughly.
- Including probiotic foods like curd in your daily diet. Eating Vitamin C and magnesium rich foods.
- Eating fruits like apples, orange, cucumber, guava, plums, pears, berries, and dried fruits.
- Intake plenty of water, about 3-4 liter in cold weather & 5-6 liter in hot season.
- During eating keep yourself in present mind and pay full attention on food.

#### **Life Style- (Vihar) In Anorectal Disorders:-**

- Wake up from bed early morning.
- Drink one liter of warm water and walk around for a few minutes Starting of the day with light exercises or a jog.
- Using an Indian toilet, or squatting when you poop.
- Avoid straining on during defecation. Avoid long sitting time in toilet.
- Go for toilets when you feel pressure, without pressure don't take time in toilet.
- Drinking hot green tea or hot water (with psyllium husk) every morning, to get things rolling.
- Walk a while (100 steps) after meal to help digestion.
- No travelling, exercise or sexual intercourse within one hour after meal. Regular physical exercise is also important for maintaining proper bowel movements
- Drinking a glass of warm milk before going to bed helps in easy evacuation in the morning. In case of severe constipation, mix two teaspoons of castor oil in the milk.
- Sleeping hours should be regulated and efforts should be made to have a sound sleep.

#### **Conclusion:-**

This study emphasizes the importance of diet and physical activity in case of Anorectal disorders. Diet & life style is also a part of treatment of these diseases. Without the use of healthy fibrous diet & changing in life style, the treatment of these diseases is difficult. So that for prevention of these diseases healthy diet & life style is compulsory. In our busy schedule, we have to remember the important instructions for healthy life.

##### Key words:-

under-triage, emergency department,  
 CTAS, pain, cancer.

#### Abstract

**Background:** Triage is a key factor to successfully prioritize patients coming to emergency department to identify life-threatening conditions and allocate resources for patients who need immediate management. Under-triage, defined as inappropriate assignment of a low level of severity during triage, is associated with high levels of substantial mortality. The aim is to identify risk factors & common diagnoses of under-triaged patients.

**Methods:** retrospective case-control study based on Canadian Triage & Acuity Scale (CTAS),

both groups were initially trained CTAS 4 or 5. The case group includes patients who got admitted and the control group includes patients who were discharged.

Sample of 71 patients was collected over 6 months. demographic characteristics, baseline health status, co-morbid diseases, initial complaint, vital signs, pain score and admission & discharge diagnoses.

**Results:** Pain played an important role in the triage decision. Pain-free patients were more likely to be under-triaged (42% of under-triaged patients versus 0% of correctly triaged patients). Conversely, cancer patients were more likely to be under-triaged than non-cancer patients, and this was statistically significant (47% of under-triaged patients had cancer, versus 20% of correctly triaged patients, p 0.023).

no statistical difference in average age or gender of under-triaged versus correctly triaged patients.

Under-triaged patients were relatively healthier, with less comorbid diseases, although this difference was not statistically significant (44% of under-triaged patients were healthy, versus 26% of correctly triaged patients, p 0.137).

**Conclusion:** Factors that led to under-triage include being cancer patient and pain-free at presentation. We recommend paying attention to those patients during triage.

**Introduction:-**

Triage is the key factor for successful management and prioritization of emergency patients to identify life-threatening presentations and to allocate resources for patients who need immediate medical management. One of the biggest problems in the triage area is deciding who is truly sick.<sup>1</sup>Mis-triage (inappropriate triage) can have serious consequences for patients with urgent complaints.<sup>2</sup>Under-triage, defined as inappropriate assignment of a low level of severity during triage, delays the initiation of treatment and may lead to deterioration of severely ill or injured patients.<sup>3</sup>

Since under-triage is a major concern, A lot of studies have been conducted. Many of them stated that under-triage is associated with high levels of substantial mortality.<sup>4-6</sup>It is also associated with higher costs because of the use of more interventions and diagnostics. And it is correlated with considerable poor outcomes, longer hospitalization, complications, and morbidity.<sup>6,7</sup>

There are many factors that contribute to under-triaging. Some factors are related to nurses and medical staff, such as lack of knowledge, training, and awareness regarding pain perception and management, which represent the main causal factors of under-triage.<sup>8</sup>Another study found that absence of vital signs measurement, poor recognition of neurological symptoms, and atypical clinical presentations, were associated with under-triage.<sup>9</sup>For example, normalized vital signs as a reason to forego objective testing for symptomatic patients with a risk factor for PE should not be relied on.<sup>10</sup>On the other hand, some other factors were more related to patients themselves; such as gender, age, and clinical presentation. A study in Denmark stated that women had a higher risk of being under-triaged than men. Elderly patients were at a significantly higher risk of being under-triaged as well, especially those older than 65 years, and it can have serious clinical consequences.<sup>11,12</sup>

Other studies showed that the common diagnoses of under-triaged patients range from falls from low height<sup>11</sup> to severe traumatic injuries, like chest, abdomen, head, and pelvis.<sup>13,14</sup>In one of those studies, traumatic brain injury (TBI) was the most common diagnosis of the under-triaged patients.<sup>15</sup>A study conducted in the United States suggested that some critically ill patients especially those with sepsis were also under-triaged.<sup>16</sup>In another study, the under-triage group predominantly included elderly males with head and neck injuries, or hemato-oncology diseases.<sup>17</sup>

As the previous studies suggested, under-triaging is associated with serious clinical consequences and poor outcomes. Since it is a major concern, we conducted the study in order to identify patient-related risk factors & common diagnoses associated with under-triaged patients. We identified under-triage by including patients who were initially assigned a Canadian Triage & Acuity System (CTAS) triage level of either class 4 or 5, but then got admitted to the inpatient services.

**Methodology:-**

A retrospective case-control study at king Fahad specialist hospital (the only cancer center in eastern province). Charts of all admissions originating from the emergency department were screened and reviewed to find out the initial CTAS categories assigned in the period of 6 months. we had 2 categories:

1. Patients admitted from the emergency department but were initially given a low triage priority (CTAS 4 or 5).
2. Patients discharged from the emergency department and were initially given a low triage category (CTAS 4 or 5).

Data of 71 patients were analyzed and demographic characteristics, baseline health status, co-morbid diseases, initial complaints, vital signs, pain score, and final admission & discharge diagnoses

**Results:-**

There was no statistical difference in the average age of under-triaged versus correctly triaged patients (31.6 vs 40.6 years, p 0.104). There was also no statistical difference in patients who were older than 65 years (11% under-triaged), versus those younger than 65 years (17% under-triaged, p 0.514). There was also no statistical difference

between males & females, although there was a trend indicating that more females were under-triaged (61% of under-triaged patients were female vs 40% of correctly triaged patients, p 0.098).fig. 1

Under-triaged patients were relatively healthier, with less percentage of comorbid diseases, although this difference was not statistically significant (44% of under-triaged patients were healthy, vs 26% of correctly triaged patients, p 0.137).

Conversely, cancer patients were more likely to be under-triaged than non-cancer patients, and this was statistically significant (47% of under-triaged patients had cancer, vs 20% of correctly triaged patients, p 0.023).fig. 2

Pain played an important role in the triage decision. Pain-free patients were more likely to be under-triaged (42% of under-triaged patients versus 0% of correctly triaged patients), whereas patients with a pain score of 6 were more likely to be correctly triaged (3% of under-triaged patients versus 21% of correctly triaged patients) p 0.013. fig. 3

**Fig.1:-**Effect of gender on patient’s triage score.

**Fig 2:-** Comparison between cancer patients who were correctly triaged and those who were under-triaged.

**Fig. 3:-** the pain score as an influencing factor in the process of triaging.

### Discussion:-

Triage is the key factor for successful management and prioritization of emergency patients to identify life-threatening presentations and to allocate resources for patients who need immediate medical management.<sup>1</sup> Under-triage, defined as inappropriate assignment of a low level of severity during triage, delays the initiation of treatment and may lead to deterioration of severely ill or injured patients.<sup>3</sup>

Many factors were studied including the patient's demographics, general condition, co-morbidities and presenting complaint in order to identify factors that led to under-triage. Regarding demographics, the literature states that old age –especially more than 65 years-and female gender are risk factors for under-triaging patients<sup>11,12,18</sup>. In our study no statistical significance was found. However, it showed a trend of under-triaging female. (61% of under-triaged patients were female Vs 40% of correctly triaged patients, p 0.098).

When looking at co-morbidities, cancer patients were more likely to be under-triaged (47% of under-triaged patients had cancer, vs 20% of correctly triaged patients p 0.023). it might seem counter-intuitive but This might be attributed to that fact that the study took place in tertiary hospital which is the only cancer center in the Eastern Province. So ER doctors might be more inclined to under-triage those patients as chronic complaint.

Regarding the presenting complaint, Pain played an important role in the triage decision. Pain-free patients were more likely to be under-triaged (42% of under-triaged patients vs 0% of correctly triaged patients). this seems quite fitting and parallel to the international literature<sup>19-21</sup>.

We faced some limitations in the sense that the study had a convenience sample, which has resulted in missing statistical significance for some results.

Our definition of under-triage might not be the most optimum definition. We did not have any gold standard triage to compare with.

Study was done in a tertiary cancer & organ transplant center, and might not be generalized to general hospitals.

### Conclusion:-

We concluded that Factors contributed to under-triage in our study include being a cancer patient & being pain-free at presentation. We recommend paying more attention to those patients during triage.

#### Abstract

**Background:** vitamin d deficiency has come up as a major public health issue in many parts of the world despite the fact that it can be synthesized in the body. Tobacco smoking is found to be associated with a low bone mass and an increased risk of osteoporotic fracture.

**Aim:** to find the association between smoking status and vitamin D levels in young adult Arab male population.

**Study design:** cross sectional study design

**Methods:** interview method was used to assess the smoking status. WHO STEPS questionnaire was used. Vitamin D levels were recorded from respective patient files.

**Results:** Vitamin D deficiency was found in 75% of study population. no statistically significant association was found between smoking status and vitamin d deficiency.

**Conclusion:** High prevalence of vitamin D deficiency warrants the need of more studies.

#### Introduction:-

Vitamin D concentration is increased by exposure to sunlight. Urban residents spend most of their time in indoor spaces, resulting in vitamin D deficiency, the prevalence of which is high worldwide. Vitamin D insufficiency ( $\leq 20$  ng/mL) is 41.6% in US adults, based on data from the 2005-2006 National Health and Nutrition Examination Survey [1]. Vitamin D deficiency causes a mineralization defect in the adult's skeleton resulting in osteomalacia. The associated secondary hyperparathyroidism causes an increase in the mobilization of the matrix and mineral from the skeleton that can increase risk or precipitate osteoporosis [2]. Osteomalacia is not only associated with mineralization defect of the skeleton, but is also associated with isolated or global bone pain, muscle weakness, and muscle pain which are symptoms that often go undiagnosed or misdiagnosed as some type of collagen vascular disease, such as fibromyalgia [3,4]

The interest in vitamin D status has increased substantially over the past decade because of the many roles of vitamin D in physiological functions; the reported worldwide prevalence of vitamin D deficiency [5,6] including countries with sufficient sunshine and lack of enough evidence on the impact of inadequate and deficient status on public health. In eastern of Saudi Arabia revealed the prevalence of vitamin D deficiency between 28% to 37%

**Corresponding Author:- Dr. Deepak Pathania.**

Address:- Department Of Family And Community Medicine, College Of Medicine, Prince Sattam Bin Abdulaziz University Al Kharj, Saudi Arabia.

Similarly, other are in Saudi Arabia on population at high risk reported the vitamin D deficiency to be 50% to 80%. [7]

In 2012, 21% of the global population aged 15 and above smoked tobacco. Men smoked at five times the rate of women; Smoking among men was highest in the WHO Western Pacific Region, with 48% of men smoking some form of tobacco. Smoking among women was highest in the WHO European Region at 19%. The rates at which adolescent girls aged 13–15 use tobacco average around 8% globally. This average does not include the WHO European Region or the WHO African Region due to unavailability of comparable data. [8] We tried to conduct this study to assess the association of vitamin d deficiency with smoking in young Saudi adults.

### **Objectives:-**

- To assess the association between smoking and vitamin D deficiency in adult male population of Al Kharj.

### **Methodology:-**

#### **Study Area:-**

The Study Was Conducted In Population Of Al Kharj Saudi Arabia.

#### **Study Population:-**

The Study Was Conducted In Males Of Al Kharj In The Age Group Of 20 Years And Above.

#### **Inclusion Criterion:-**

Respondents Satisfying The Following Inclusion Criteria Were Selected:

1. All males more than or equal to 20 years of age who have done vitamin D laboratory testing in the last 3 months
2. Those who have not taken vitamin D supplements in last 3 months

#### **Study Period:-**

The study was carried out over a period of two months i.e. From September 2015 to December 2015. During this period, finalization of study tool, field survey, data collection, data analysis and interpretation was done.

#### **Study Design:-**

A **hospital** based cross-sectional design was adopted for studying the association of vitamin d deficiency and smoking among individuals aged 20 years and above in the study area.

#### **Sample Size:-**

The sample size was calculated by using website: [www.surveysystem.com](http://www.surveysystem.com) taking into consideration

- A) The population of al Kharj city
- B) Confidence limit of 95%
- C) Margin of sampling error 10%

#### **Sampling Technique:-**

The population of al Kharj city is 234607 in 2013. [9] So the study sample size comes out to be 96. The study subjects were chosen from two hospitals: Prince Sattam Bin Abdulaziz University hospital Al Kharj and Military hospital Al Kharj. The former hospital serves as the teaching hospital for the students and latter collaborates with university in various trainings and courses. So these two hospitals were chosen due to convenience to have the desired sample size.

#### **Proforma To Assess The Smoking Behaviour:-**

To study the smoking behavior of respondents, World Health Organization's STEPS proforma was followed. STEPS is a sequential process starting with gathering of information on factors like smoking by use of questionnaire (**Step I**), moving to simple anthropometric measurements (**Step II**) and then the collection of blood samples for biochemical assessment (**Step III**).

**Step I:-**

The questionnaire recommended by WHO for this purpose was used with suitable modifications. The questionnaire contained identification and socio-economic data and data on tobacco. The definitions of various types of tobacco users used in this study are mentioned below:

**Current tobacco user/smoker:-**

Someone who at time of the survey, smoked/used tobacco in any form either daily or occasionally. People who smoked or used tobacco everyday with rare exceptions such as not on the days of religious fasting or during acute illness were still classified as a current smoker.

**Past Smoker/tobacco user:-**

people who were former daily or current smokers/tobacco users but currently do not smoke at all or use tobacco.

**Non-smokers /tobacco users:-**

Those who have never smoked / used tobacco at all.

**Step II:-****Blood Pressure:-**

Two BP readings were taken, one before the interview and second after the interview. The auscultatory method of BP monitoring with a properly calibrated and validated instrument was used. Participant was seated quietly for at least 5 minutes on the chair with feet on the floor and the arm supported at the heart level. An appropriate size cuff (cuff bladder encircling at least 80% of the arm) was used to ensure accuracy. SBP was the point at which the first Korotokoff's sound was heard (phase 1) and DBP was the point at which the Korotokoff's sound disappeared (phase 5).

**Weight:-**

A weighing machine was used for this purpose, which was standardized against known weight. The scale was kept on a hard and even surface and zero error was ensured. The participant was asked to remove the footwear and step on scale with one foot on each side of the scale. He/she was asked to stand still keeping his face forward and placing arms on the side. He was asked to wait until asked to step off. Weight was measured in kilograms up to nearest 100g.

**Strategy:-**

Males who fulfilled the eligibility were contacted once for data collection in the outpatient department of the two hospitals. The information about smoking behavior was taken by interview technique followed by general anthropometry. The results of vitamin d levels were obtained from the respective patient medical record file after completing all the codal formalities. Informed consent was taken from participants before taking interview and general anthropometry. Only those who were willing to participate were included in the study.

**Ethical Consideration:-**

The present study did not impose any financial burden to the patients and informed consent was taken from the participants before conducting the study. Prior permission was taken from the competent authority to have access to patient's record for vitamin d levels.

**Statistical Analysis:-**

Data has been presented as means + SD for continuous variables and as frequencies for categorical variables. Comparisons between the two groups (smokers and non- smokers) have been performed as Pearson chi- square test for categorical variables. All reported p values are two sided and a p value of less than 0.05 has been considered to indicate statistical significance. All statistical analyses have been performed with SPSS17.0 (SPSS Inc, Chicago, IL)

**Results:-**

**Table 1:-** Distribution Of Participants In The Study Population.

AGE GROUPS (IN YEARS )	n (%)
20-34	74(77.08)
35-49	10(9.60)
50-64	12(12.50)
Total	96(100)
Mean + SD	25.58+ 5.77
EDUCATIONAL STATUS	n (%)
Illiterate	5(5.20)
Primary school	12(12.50)
Sr. Secondary school	24(25)
Graduate	55(57.29)

**TABLE 2 : DISTRIBUTION OF PARTICIPANTS ON THE BASIS OF OCCUPATION**

Occupation	n (%)
Government employee	18(18.75)
Business	2(2.08)
Student	65 (67.70)
Retired	6(6.25)
Unemployed	5(5.20)

**Figure 1:-** Pie Chart Showing The Distribution Of Study Population According To Marital Status

**Table 3:-**Association Of Vitamin D Levels With Smoking Status.

SMOKING STATUS	VITAMIN D STATUS		Total n (%)
	NORMAL n (%)	DEFICIENT n (%)	
Smoker	16	60	76
Never smoked	8	12	20
Total	(25%) 24	72(75%)	96

The chi-square statistic is 3.0316. The p-value is .081659. The result is not significant at  $p < .05$

**Acknowledgements:-**

I would like to thank the Department of Family and Community Medicine for giving me an opportunity to conduct hands on research at undergraduate level. This has given me confidence to undertake bigger and better research

activity in future. I would like to thank DrJamaan Al Zahrani,Head of Department of Family and Community Medicine for giving us the permission to do research in Military Hospital, Al Kharj. Last but not the least I would like to thank Dr Nasser (Director, University Hospital) and DrMagdy (Deputy Director, University Hospital) for their whole hearted support

### **Conclusion:-**

1. In this study a statistically significant association was not found between Vitamin D levels and smoking status.( $p < 0.08$ )
2. A very high(75%) prevalence of vitamin D deficiency was found in the study.
3. A very large number (79.16%) of adults smoke which can be a potential stimulus for increased respiratory pathologies in the future to come.
4. Also an additional finding was an increase in body weights and blood sugar levels

### **Recommendations:-**

- Although the statistically significant association was not found between vitamin d status and the smoking status, yet considering the magnitude of vitamin d deficiency and large number of smokers more studies need to be undertaken.
- Due to restraint of time and resources, the study was undertaken in a small population. So the results cannot be generalized to the whole Saudi population and more studies need to be done multiculturally.

**Abstract**

Fire-resistant forest projects (YARDOP) have been undertaken in different geographical regions of Turkey in recent years in order to protect forests against fires. In this study, YARDOP area in the district of Kepsut were evaluated in terms of ecology. Soil structure and climate characteristics in this area were investigated in ecological studies. With respect to the soil structure, the area had a sandy-loamy texture, pH was neutral, the soil was non-calcareous or slightly calcareous, salt-free and weak in terms of organic matters. The climate type and water balance of the area were investigated using Thornthwaite's and Erinç's methods. The annual average temperature in the area was found to be 14.5°C, whereas the average temperature was 24.5°C in July and 24.3°C in August. The annual total rainfall was found to be 602.2 mm, whereas the average rainfall was 9.1 mm in July and 8.7 mm in August. According to Thornthwaite climate classification, the climate type of the study area was dry/sub-humid, mesothermal and close to marine conditions with moderate water surplus in winter, represented with C1 B'2 s2 b'3. According to Erinç's rainfall efficiency index, Kepsut was observed to have a sub-humid climate and the natural cover was dry forest resembling a park. Species for planting in the area should be selected according to these climate and soil characteristics.

**Introduction:-**

Forest fires affect approximately 350 million hectares of land in the world each year causing financial loss as well as loss of life. Fires may lead to acceleration in climate change (Stocks et al., 1998), air pollution (Ferrare et al., 1990), increase in carbon emission into the atmosphere (Zhang et al., 2003) and losses in products and services made possible by forests (Anderson et al., 1976; Garcia-Ruiz et al., 2013).

Fire-resistant forest projects (YARDOP) which have gained pace in our country in recent years, involve zoning works to protect various plant species against fire, changing the fire behavior and mitigating fire severity (Coşkuner and Bilgili 2013). To this end, fire-resistant areas have been created in the district of Kepsut, a rich area in terms of forests, and measures have been taken to mitigate the severity of forest fires (Yılmaz and Satıl, 2016).

It is necessary to analyze ecological characteristics of the area prior to plant selection. Climatic data and soil structure, which are important in plant development, must be investigated in detail before determining appropriate plants.

Knowing the climate type of a region is necessary for planning of several activities from selection of plants to be cultivated and industrial facilities to be built (Şensoy and Ulupınar, 2008).

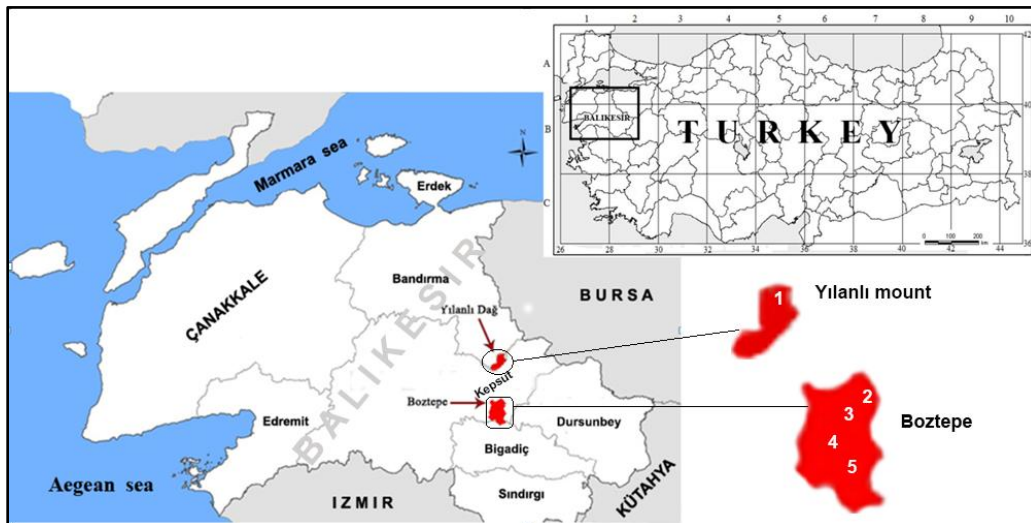

To the best of our knowledge, there is no study on the climatic data of the district of Kepsut. However, the climatic data of the Balıkesir Plain and its surroundings, 29 km from the district of Kepsut, have been investigated by Tağlı (2003).

The soil structure is as important as the climate for planting (Benek, 2006; Peker Say et al. 2012; Paksoy et al. 2016).

In this study, the climate and soil characteristics in Yılanlı Mountain and Boztepe localities in the district of Kepsut were investigated to create fire-resistant forests (YARDOP). Plant types suitable for this ecological environment were determined based on the results of the study.

### Materials AndMethods:-

The climate type and water balance of the area were determined using Thornthwaite's (1948) and Erinç's (Şensoy and Ulupınar 2008; Demir et al. 2015) methods. The meteorological climatic data of the area between 1990-2015 were examined in the study. The climatic data used in the study were obtained from the records of the General Directorate of Meteorology (Anonymous, 2015). The general view of the study area and soil samples obtained from 5 different points can be seen in Figure 1.

**Figure 1:-** The general view of the study area and soil samples obtained from trial areas.

**Soil Analysis:-**

Soil profiles were opened at five different trial areas and soil samples were obtained from these profiles at depths of 0 - 30 cm, 30 - 60 cm and 60 - 90 cm. Soil samples of about 1 kg each were brought to the Forest Sub-district Directorate in paper bags and kept until dry. The samples were then analyzed by the Ege Forestry Research Institute Directorate. Physical (texture, pH, calcitic lime (CaCO<sub>3</sub>), total salt) and chemical (N, P, K, organic matter) analyses of the soil samples were performed according to standard methods (Bayraklı, 1984) and the samples were examined according to Kaçar (1972).

**Discussion:-**

The climatic data and observation data related to climatic factors such as rainfall, temperature and evaporation shown in Table 1 were received from the General Directorate of Meteorology (Anonymous, 2015) and assessed according to Thornthwaite and Erinc methods. The annual average temperature in the area was found to be 14.5°C, whereas the average temperature was 24.5°C in July and 24.3°C in August. The annual total rainfall was found to be 602.2 mm, whereas the average rainfall was 9.1 mm in July and 8.7 mm in August. The annual average relative was found to be 69% and the annual average wind velocity was 2.8 m/sec. The highest wind velocity was 29.6 m/sec and the wind direction was Northwest. Table 1 shows the climatic values in the study area between 1990-2015. The climate type and water balance of the area were determined using Thornthwaite's (1948) and Erinc's (Şensoy and Ulupınar 2008; Demir et al. 2015) methods.

As shown in Table 1, the potential evaporation was found to reach high values between May-September, when the temperature rises and solar energy increases. The annual average potential evaporation in Kepsut was found to be 861.2 mm. The evaporation was found to start increasing in May and reach its highest value (147.6 mm) in July, start decreasing in September and reach its lowest value (20.8 mm) in December.

The water balance data of the trial areas were formed in order to determine the climate type of Kepsut based on the Thornthwaite method. The data can be seen in Table 2.

According to the results obtained using the Thornthwaite method, Kepsut had a dry/sub-humid and mesothermal climate type close to marine conditions with moderate water surplus in winter (C1 B'2 s2 b'3) (Table 2, Figure 2). The rainfall in November exceeds PE in Kepsut and the water surplus begins in this month. In December, the soil becomes saturated. The water surplus continues until the end of April. The situation changes in May and PE begins to exceed rainfall. However, there is not a lack of water in May since the soil is saturated in May. The low rainfall between May-June is compensated from the water accumulated in the soil. These months are when the accumulated water is consumed. There is no more accumulated water in the soil beginning from July. This situation continues until November, when the rainfall starts to exceed PE and these months are the time when lack of water is experienced (Table 2, Figure 2).

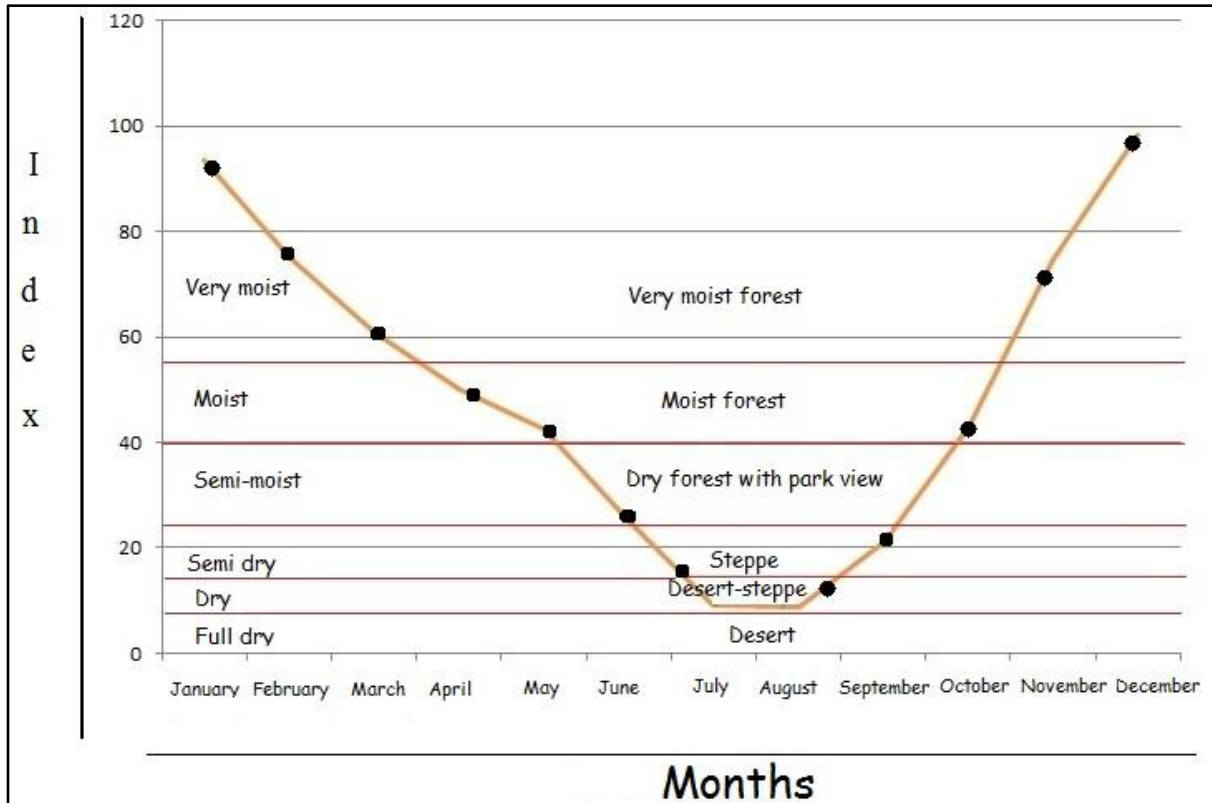

**Figure 2.** Water balance of Kepsut according to the Thornthwaite method.

According to Erinç rainfall activity index formula (Annual total rainfall / Annual average max. temperature), the area has an index value of 29.8 (Figure3). According to this value, Kepsut has a sub-humid climate and the natural cover is dry forest resembling a park (Şensoy and Ulupınar 2008). It was found that the climate is very humid in November, December, January, February and March; sub-humid in October, April and May; sub-arid in June and September; and arid in July and August (Figure 3).

**Figure 3:-** Diagram composed according to Erinç precipitation index formula.

It was determined as a result of the study that the climate of Kepsut is arid or sub-humid in general according to both classifications (Table 1). Climate demonstrates the characteristics and the state of a region in terms of weather events and also is accepted as a basic indicator of how the plant cover in the region is distributed (Usta et al., 2014). As shown in Table 1, plants selection should be made considering the lack of water and maximum evaporation level in June, July and August, high duty irrigation systems should be installed and an appropriate agricultural mechanization is required considering topographical conditions.

Analysis results are shown in Table 3-7. The texture of soils obtained from five different trial points was observed to be sandy-clayey and sandy-loamy in general and loamy in some places. The texture was observed to be sandy-loamy for soil samples obtained from a depth of 0-30 cm, sandy-clayey loam for soil samples obtained from a depth of 30-60 cm and sandy-loamy for soil samples obtained from a depth of 60-90 cm. The pH character of the soil samples obtained from trial areas were found to vary from slight acid to moderate alkali in general. The pH character was neutral in the trial area no. 1 and slight acid in the trial areas 2, 3 and 5 and moderate alkali in the trial area 4. Figure 1 shows the soil samples obtained from trial areas.

Considering the lime (CaCO<sub>3</sub>) structure of the trial areas, it was observed that the trial areas were generally non-calcareous, whereas the soil structure of the trial area no. 4 was found to contain moderate to high lime. The soil samples obtained from five different areas were found to have a salt-free character. All of the trial areas were found to have organic matter, albeit in low amounts. The organic matter content was moderate in the samples obtained from a depth of 0-30 cm in the trial areas no. 2, 4 and 5, whereas the organic matter content was low in the remaining trial areas. The organic matter content was moderate in the samples obtained from a depth of 30-60 cm in the trial area no. 2, the organic matter content was very low in all of the remaining trial areas. The organic matter content was moderate in the samples obtained from a depth of 60-90 cm in the trial area no. 2, the organic matter content was very low in all of the remaining trial areas. The N element was found in low levels in all of the trial areas. The rate of N was found to be similar in samples obtained from different depths (0-30 cm; 30-60 cm; 60-90 cm) and soils from all depths had a low rate of nitrogen. Whilst the rate of P was observed to be low in the soil samples obtained from a depth of 0-30 cm in the trial area no. 5, the rate of P was very low at all depths in all trial areas. Whilst the rate of P was observed to be moderate in the soil samples obtained from a depth of 60-90 cm in the trial area no. 5, the rate of P was very low at all depths in all trial areas.

### Conclusion:-

In conclusion, the fire-resistant plant species to be selected for fire-resistant forest areas should be able to adapt to the arid or sub-humid climate type and regions close to marine conditions. These plant species should be suitable for salt-free, slightly acidic or neutral soils with poor organic matter content in order to create long-lasting YARDOP areas.

#### Abstract

The success of micropropagation technique depends upon the use of growth regulators in the culture medium. Growth regulators regulate the growth and developmental processes. These are the key factors in initiating the process of regeneration in tissue culture. In most of *in vitro* studies, explants do not respond well on culture media without growth regulators. An interactive balance of auxins and cytokinins controlled the *in vitro* growth and differentiation response in plant tissues. This review highlights on the role of growth regulators in micropropagation of woody plants.

#### Introduction

The world has a very rich biodiversity of plant species. Many of which are herbaceous and many others are woody in nature. In the view of propagation, woody plants are difficult to propagate than herbaceous species. The difficulty in propagation is due to their poor seed germination capacity, as seeds are not viable in most of the time. In this case the favorable season is a very important criterion for the successful germination. Moreover, the slow growth is also a barrier, because apical and axillary buds become dormant during specific time periods. Therefore, woody plants require favorable season for the germination of seeds and buds. Further, some more conventional methods of propagation such as cuttings and graftings are also used for woody plants. But these are not much effective methods for their large scale production. As, for a wide population, woody plants are important source of timber, medicines, fruits, dyes etc. Therefore, there is a need to propagate them wisely as well as in large amount to fulfill the requirements of the population. The possible approach to overcome the problem is micropropagation.

Micropropagation is the technique of growing the plants from seeds or small pieces of tissues under sterile condition in a laboratory on a specially selected medium. It allows mass multiplication of a species from a small piece of tissue. One of the important aspects of this technique is that it is not dependent on the season for the propagation. Through micropropagation, a number of woody plant species have been propagated successfully during past years. But, the success of micropropagation technique depends upon the use of plant growth regulators in the culture medium. Growth regulators regulate the growth and developmental processes, which are present in various concentrations in different plant parts. These are the key factors in initiating the process of regeneration in tissue

culture. Miller and Skoog (1953) reported that *in vitro* root and shoot differentiation is regulated by exogenous hormonal interaction. In most of *in vitro* studies, explants do not respond well on culture media without growth regulators (Kumar, 1992; Kumari *et al.*, 1998; Kumar *et al.*, 2003; Walia *et al.*, 2003; Gururaj *et al.*, 2007; Sharma and Vashistha, 2010b; 2015c). Growth regulators applied externally might disturb the internal polarity and change the genetically programmed physiology of explants resulting in organogenesis from the explants.

Basically, plant growth regulators come under two broad categories- auxins and cytokinins. Commonly used auxins are- IAA, NAA, IBA and 2,4-D and cytokinins are- BAP, Kn, TDZ, Zeatin and 2-iP. An interactive balance of auxins and cytokinins controlled the *in vitro* growth and differentiation response in plant tissues. During indirect organogenesis, the formation of callus or somatic embryo from explants is stimulated by altering the levels of exogenously applied auxins or combinations of auxins and cytokinins. Similarly, direct organogenesis from apical or axillary buds is stimulated by the cytokinins or combinations of cytokinins and auxins in the culture medium. A variety of plant growth regulators have been used individually as well as in combinations to achieve the micropropagation of a number of woody plant species (Table 1). During past years, some reviews have been published on micropropagation of trees and woody plants (Sharma and Vashistha, 2015a; Sharma, 2016). In these reviews, problems of propagation of woody plants and their possible solution through micropropagation technique have been taken in to consideration. But, this review highlights on the role of growth regulators in micropropagation of woody plants, which categories under following headings:

#### ***In vitro* seed germination and shoot elongation**

Many woody plants are propagated through seeds under *in vitro* condition. GA<sub>3</sub> is a growth regulator effective for seed germination as well shoot elongation. A number of workers used GA<sub>3</sub> in their culture media and found useful results (Isogai *et al.*, 2008; Balaraju *et al.*, 2011; Joseph *et al.*, 2011 and Al-Safadi and Elias, 2011). Ghimire *et al.* (2016) reported that among different growth regulators tried in *Melastoma malabatricum*, GA<sub>3</sub> was the most effective for shoot elongation. But in *Pyrus boissieriana*, GA<sub>3</sub> negatively affected number and length of shoots (Zakavi *et al.*, 2016).

#### ***In vitro* shoot regeneration**

In case of most of woody plants, basal nutrient medium without growth regulator is not much effective in inducing shoot buds. Similarly no shoot buds developed in *Crataeva nurvala* (Walia *et al.*, 2003) and *Cinnamomum camphora* (Sharma and Vashistha, 2010c) on basal medium. Growth regulators applied exogenously have variable effects which varied with the type of growth regulator, its concentration and nature of explants. In woody species, *in vitro* shoot regeneration is achieved by two methods: direct and indirect organogenesis.

#### **Direct organogenesis**

Direct method involves the proliferation of apical and axillary buds. This method is most popular in woody plants for shoot multiplication because the apical (shoot tips) and axillary buds (nodes) have the potential to develop in to a shoot. In contrast to basal medium, it is observed that when the medium is supplemented with cytokinins individually or in combination with auxins shoot tips and nodal explants produced multiple shoots. The number and frequency of shoot induction is mainly dependent on the concentration of cytokinin used in the culture medium. The past studies showed that among the cytokinins (BAP, Kn, TDZ and Zeatin) tested in different woody species, BAP and Kn were most common. Further, in many woody species, BAP is more effective than Kn for shoot induction and multiplication (George, 1993; Sharma and Vashistha, 2010b; Sharma *et al.*, 2015). Bunn (2005) and Asthana *et al.* (2011) reported that BAP resulted in the highest shoot multiplication rates when compared to Kn and Zeatin. The superiority of BAP over other cytokinins has also been reported in *Capparis decidua* (Tyagi and Kothari, 2001) and *Pterocarpus marsupium* (Chand and Singh, 2004). In contrast, Shahzad and Siddiqui (2001) in *Melia azedarach* reported that Kn proved more effective than BAP for direct shoot regeneration. Similar observation is reported in *Gmelina arborea* (Kumar *et al.*, 2010). Further, it is reported that higher concentration of BAP and Kn are inhibitory in some woody plants (Anuradha and Pullaiah, 1999; Tornero *et al.*, 2000; Nair and Seeni, 2001; Balaraju *et al.*, 2011 and Sharma *et al.*, 2015). Besides these growth regulators, many workers used TDZ in their culture medium and found positive effects on shoot induction and multiplication as in *Pterocarpus marsupium* (Husain *et al.*, 2007), *Fraxinus pennsylvanica* (Du and Pijut, 2008), *Medusagyne oppositifolia* (Marriott and Sarasan, 2010) *Pterocarpus santalinus* (Balaraju *et al.*, 2011). In spite of these findings, a combination of cytokinin and auxin also used for shoot proliferation in *Salvadora persica* (Mathur *et al.*, 2002) and *Ficus religiosa* (Siwach and Gill, 2011).

### Indirect organogenesis

Indirect method involves the shoot regeneration through callus induction and somatic embryogenesis. For callus induction, different explants are cultured on nutrient medium supplemented with different concentrations of auxins individually or in combinations with cytokinins. Callus so obtained is further separated and transferred in to fresh medium supplemented with different concentrations of cytokinins individually for shoot generation. The somatic embryos initiate either directly from the explants or *via* callus formation and can grow in to seedling on suitable medium.

### Callus induction and plantlet regeneration

It is reported in most of woody species that basal medium without growth regulator failed to induce callus (Sharma and Vashistha, 2010a; 2011b). This is probably due to the insufficient level of endogenous growth regulators in explants to induce callus and therefore it requires an exogenous supply. In woody plants, commonly used auxins are IAA, NAA, IBA and 2,4-D. In some investigations, 2,4-D has been essential for callus formation, as in *Thevetia peruviana* (Kumar, 1992) and *Terminalia arjuna* (Kumari *et al.*, 1998). In addition to this, 2,4-D is effective in inducing callus in *Moringa oleifera* (Kumar *et al.*, 2009), *Citrus jambhiri* (Savita *et al.*, 2011) and *Simmondsia chinensis* (Bala *et al.*, 2015). According to Murashige (1974) 2,4-D is a most potent auxin and it stimulates callus formation and strongly antagonizes organized development. In contrast, NAA played an important role in callus formation in *Cinnamomum camphora* (Sharma and Vashistha, 2010a), *Pseudarthria viscid* (Cheruvathur and Thomas, 2011) and *Tinospora cordifolia* (Sharma and Vashistha, 2011a; 2014). Similarly, IAA has been used in some *in vitro* culture studies to initiate callus (Isah and Mujib, 2015; Sharma and Vashistha, 2015b).

**Table 1: Role of growth regulators in micropropagation of some woody plant species**

Woody plant species	Explants used	Growth regulators	Role of growth regulators	References
<i>Abies cephalonica</i>	Embryo	ABA	Somatic embryogenesis	Krajnakova <i>et al.</i> (2009)
<i>Aegle marmelos</i>	Cotyledonary node and Nodal explants	BAP, Kn, IAA and IBA	Direct shoot regeneration	Kumar and Seeni (1998), Nayak <i>et al.</i> (2007)

<i>Tinospora cordifolia</i>	Shoot tip, Node, Internode, leaf and petioles	BAP, Kn, 2iP, IAA, NAA, IBA and 2,4-D	Direct and indirect (callus) shoot regeneration	Gururaj <i>et al.</i> (2007), Sharma and Vashistha (2011b; 2015b; 2015c) Sharma <i>et al.</i> (2015)
<i>Vitex agnus-castus</i>	Apical & nodal explants	GA <sub>3</sub> , BAP, Kn, NAA and IBA	Direct shoot regeneration	Balaraju <i>et al.</i> (2008)
<i>Ziziphus jujuba</i>	Leaf explant	TDZ & NAA	Direct shoot regeneration	Feng <i>et al.</i> (2010)
<i>Zygodhryllum xanthoxylon</i>	Cotyledons, hypocotyl and radicles	BAP, NAA and IAA	Callus induction and plantlet regeneration	Sun <i>et al.</i> (2008)

### Somatic embryogenesis

Somatic embryogenesis and plant regeneration studies has been reported in many woody plant species such as *Crataeva nurvala* (Inamdar *et al.*,1990), *Thevetia peruviana* (Kumar, 1992), *Emblia officinalis* (Tyagi and Govil, 1999), *Pinus roxburghii* (Arya *et al.*, 2000 and Mathur *et al.*, 2000), *Acacia farnesiana* and *A. schaffneri* (Ortiz *et al.*, 2000), *Eucalyptus globulus* (Nugent *et al.*, 2001 and Pinto *et al.*, 2002), *Areca catechu* (Karun *et al.*, 2004),

*Acacia arabica* (Rout and Nanda, 2005) and *Psidium guajava* (Rai *et al.*, 2007). In *Azadirachta indica* (Rout, 2005) used a combination of BAP and 2,4-D for plantlets generation from zygotic embryo and ABA for maturation and germination of embryo.

### **In vitro rooting**

In few cases, *in vitro* formed shoots develop roots when transfer in basal nutrient medium (without growth regulators). Otherwise, in most of studies auxins are known to induce rooting. In some species IAA induced rooting (Anuradha and Pullaiah, 1999; Arockiasamy *et al.*, 2000; Raghu *et al.*, 2006). In other species NAA was effective in inducing roots under *in vitro* condition (Kumar and Kumar, 1995; Savita *et al.*, 2011). However, in many investigations, maximum roots were formed when medium was supplemented with IBA (Ndoye *et al.*, 2003; Babu *et al.*, 2003; Chand and Singh, 2004; Sharma and Vashistha, 2010b; 2015c). Babu *et al.*, 2003 in *Cinnamomum camphora* reported that although roots were developed on basal medium without any growth regulator yet maximum *in vitro* rooting observed on 0.5 mg/l IBA in the medium.

#### Abstract

This study aimed to optimize and characterize formulation factors in the preparation of drug-loaded polymeric nanoparticulate drug delivery system by employing response surface methodology (design of expert-DOE). Nanoparticles were prepared by three different methods namely solvent evaporation, solvent diffusion, and cross-linking method. Effect of important factors like method of preparation, surfactant type, stabilizer type on particle size, and percentage entrapment efficiency were studied using DOE. The prepared formulations show particle size and % entrapment efficiency in the range of  $602.11 \pm 12.5$  to  $1005.55 \pm 98.6$  nm and  $77.01 \pm 0.003$  to  $97.01 \pm 0.21\%$  respectively. Based on the result formulation prepared with nonionic surfactant (Tween 80), synthetic polymeric stabilizer (poly vinyl alcohol- PVA) and solvent evaporation method were found to be effective. After selection of optimized formulation, twelve formulations were prepared by altering key processing parameters like stabilizer and surfactant concentration and effective formulation was selected on the basis of in vitro release. Among various concentrations, formulation with combination of 0.50% w/v of PVA and 0.02% w/v of Tween 80 had sustain release property, stability and biocompatibility.

#### Introduction:-

Over the past decade, there has been a rise in particle manipulation and nanosizing of solute drug (simvastatin). The intrinsic shortcomings of conventional drug delivery and the potential of nanoparticles as drug delivery systems have offered incredible scope for researchers in the field of pharmaceuticals (Khan et al., 2013). Nanoparticles may be used for oral administration of gut-labile drugs or those with low aqueous solubility like simvastatin (Wong et al., 2010). These colloidal carriers have the ability to cross mucosal barrier as such. Besides, they have the potential for enhancing drug bioavailability via particle uptake mechanisms (Chen et al., 2011). It was therefore decided to prepare nanoparticles of simvastatin so as to optimize its delivery and overcome its inherent negative aspects like low solubility, low bioavailability, short half-life, dose-dependent adverse effect, etc. (PrakashKatakam et al., 2014). The success of formulation not only relies on the selection of technology but also based on the appropriate selection of polymer, surfactant, stabilizer, formulation parameters like stirring speed, temperature, etc. Nanoparticles are considerably easy to prepare but the stability and the selection of stabilizer(s) are the most challenging and critical step as they can affect drug bioavailability (Peltonen et al., 2010). Both polymers and

surface active agents have been utilized as stabilizer for pharmaceutical nanoformulation. Polymers like PVP, PVA, HPMC, PEG, CMC (Mahesh et al., 2014, Danhier et al., 2014) and surface active agents like pluronic F68, F127, Tween 80, Tween 20, SLS, lecithin were used often in preparation. Stabilizer can be non-ionic or ionic in nature and the overall stability is based on electrostatic force. Single stabilizer may be sufficient but combinations of stabilizers are utilized for narrow distribution in particle size (Valo et al., 2013, George et al., 2013). In general, stabilizers are thought to be pharmaceutically inactive excipients and the selection of the stabilizers is performed keeping in mind only the physical stability (prevents particle aggregation). However, these stabilizers are not inactive. Many polymers and surfactants utilized as stabilizers for drug nanocrystals are affecting the cells and cell layers leading to modified bioavailability of active drug.

To optimize the formulation variables, RSM is used (collection of mathematical and analysis of problems) in which a response of interest is influenced by variables and the objective is to optimize this response (Sabir et al., 2000, Singh et al., 2005). Moreover RSM is helpful in rapid development of optimum formulation with minimum number of experiments for the investigation of influence of the independent variables on results (Roy et al., 2009, Jain et al., 2013). The objective of this research work was to formulate simvastatin nanoformulation using chitosan by three different methods (solvent evaporation, solvent diffusion, and cross-linking technique) and optimization of nanoformulation by response surface methodology (Mennini et al., 2008). Initially, preliminary trials were done with 1:1, 1:2, and 1:3 drug:polymer ratios for obtaining lag phase during drug release. With 1:2 drug:polymer ratio, lag phase was obtained. Hence, this ratio was selected for the factorial design. During optimization, the effect of three independent variables, i.e., method of formulation (X1), stabilizer (X2), and surfactant (X3), on responses such as particle size (Y1) and % entrapment efficiency (Y2) were studied. This study encompasses the development of further 12 formulations, which were analyzed by *in vitro* release characterization. Optimized formulation finally subjected to stability and biocompatibility studies.

## **Experimental:-**

### **Materials:-**

Simvastatin was obtained as gift sample from Biocon Pharmaceuticals. All chemicals and polymers used in this study were purchased from Sigma Aldrich and were of analytical grade.

### **Preparation of nanoformulation:-**

Nanoparticles were prepared by solvent evaporation, solvent diffusion, and cross-linking technique (Krishna Sailaja et al., 2011).

### **Solvent evaporation method:-**

The organic phase consisting of simvastatin (SS) solution (dissolved in methanol) was added drop wise to the aqueous solution containing polymer, surfactant and stabilizer under stirring condition at 400 rpm for 3 hrs. Then it was homogenized at 10,000 rpm using Remi overhead stirrer. The formed nanoparticles were separated by centrifugation (REMI cooling centrifuge) at 20,000 rpm for 30 min followed by freeze-drying (Mao et al., 2008).

### **Solvent diffusion method:-**

The organic phase consisting of simvastatin (SS) solution (dispersed in dimethyl sulfoxide) was added dropwise to the aqueous solution containing polymer, surfactant, and stabilizer and kept in magnetic stirrer at 400 rpm for 3 hrs. Then it was homogenized at 10,000 rpm using Remi overhead stirrer. The formed nanoparticles were separated by centrifugation (REMI cooling centrifuge) at 20,000 rpm for 30 min followed by freeze-drying (Quintanar-Guerrero et al., 1996).

### **Cross-linking method:-**

Methanol was added to simvastatin (10mg/5ml), which was then incorporated to chitosan solution (20 mg dissolved in 5 ml of 2% acetic acid). This organic phase was added to the aqueous solution containing polymer, surfactant and stabilizer under stirring at 400 rpm for 3 h period. 150  $\mu$ l of 25% glutaraldehyde was added for cross-linking. Ethanolamine was finally added to block unreacted aldehyde group of cross linking agent (Murtaza et al., 2011). Then it was homogenized at 10,000 rpm using Remi overhead stirrer. The formed nanoparticles were separated by centrifugation (REMI cooling centrifuge) at 20,000 rpm for 30 min followed by freeze-drying.

After optimization by factorial design, appropriate method of formulation, stabilizer, surfactant and concentration of additives were chosen by preparing various formulations from F25 to F36 as given in Table 2 and characterized for its *in vitro* release.

#### **Experimental design:-**

A central composite design having a unit value of  $\alpha$  was applied according to reference protocols (Roy et al., 2009, Jain et al., 2013) to assess the influence of three independent variables (i.e., method of formulation, stabilizer and surfactant) on two dependent variables (i.e., particle size and encapsulation efficiency). All other formulations and process parameters were kept constant during the study. Stat-Ease design Expert®, version 7.0.3, was employed to generate and evaluate the statistical experimental design and construction of a design matrix with 24 experimental trials. This experimental trials of factorial design (table 1) consists of various combinations of three different methods, three types of polymeric stabilizers and surfactants coded as F1 to F24 as per Table 2. All the batches were prepared in triplicate ( $n = 3$ ). The experiments were performed in random order. The response variables were evaluated by the following second-order polynomial model, as in Eq.1

$$Y = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_1X_2 + \beta_4X_1^2 + \beta_5X_2^2 \dots (1)$$

Where  $\beta_0$ – $\beta_5$  represents regression coefficients,  $X_1$ – $X_2$  the studied variables, and  $Y$  the measured response with each factor level combination. Different combinations were selected on the basis of the experimental design.

#### **Characterization:-**

##### **Particle size analysis:-**

Mean particle size and size distribution of simvastatin-loaded polymeric nanoparticles were determined by dynamic laser light scattering (SEM-633, SemaTech, France) at 25 °C. The samples were diluted to an appropriate concentration using deionized water. Water was previously filtered through a 0.22- $\mu$ m membrane filter (Millipore, USA) to avoid the presence of any interfering particles. All measurements were carried out in triplicate; hence, each value is the mean of three independent readings within a batch and error represents the standard deviation of the mean particle size as an index of particle size and polydispersity.

##### **Transmission electron microscope:-**

About 5  $\mu$ L of nanoparticle suspension was deposited on a carbon film coated on a TEM copper grid and negatively stained with 2 % uranyl acetate. The grid was tapped with a filter paper to remove extra water and then air-dried. The observation was done at an accelerating voltage of 100 kV in a transmission electron microscope (Zeiss LEO-906, Germany).

##### **Entrapment Efficiency of Nanoformulation:-**

Entrapment efficiency of nanoformulation was calculated by using the following equation

$$\% \text{ Entrapment efficiency} = \frac{\text{Total amount of drug added initially} - \text{free drug in supernatant}}{\text{Total amount of drug added initially}} \times 100 \text{-----Eq.2}$$

A suspension of a representative nanoformulation was centrifuged at 12,000 rpm for 5 min until separation of all precipitate. The supernatant was collected for determination of drug content. It was then analyzed spectrophotometrically in triplicate at the wavelength of 238nm (UV-visible spectrophotometer, Shimadzu UV-1601, Japan). Calculation of simvastatin content was performed by using calibration curve method.

##### **In vitro drug release study:-**

*In vitro* release studies on formulation were carried out in PBS7.4 using dialysis bag technique. Then nanoformulation (10 mg) was placed in 500 ml dissolution medium and study was carried out for 24 h. The temperature was maintained at  $37.0 \pm 0.5$  °C and the stirring speed at 100 rpm. Samples (4 ml) were withdrawn and replaced with an equal volume of fresh dissolution medium at regular time interval and analyzed spectrophotometrically (model 1601, Shimadzu, Japan) at 238 nm. The concentration of simvastatin in the samples was determined from a standard calibration curve. The release studies were carried out in triplicate.

##### **Forced degradation studies:-**

The ICH guideline entitled stability testing of new drug substances and products requires that stress testing be carried out to elucidate the inherent stability characteristics of the active substance. Stability studies of both simvastatin and formulation were carried out under extreme stress conditions like acidic, alkaline, hydrolytic, thermolytic, oxidation, photolytic (UV exposure) as per stability indicating assay methods (SIAM).

**Acid degradation:-**

0.1 N HCl was taken in a 10 ml volumetric flask and then accurately weighed 10 mg sample was dissolved in it. To solubilize the drug, few drops of methanol was added and then the volume is made by 0.1 N HCl. Then, this solution was refluxed for 3 days at room temperature in water bath. The specific amount of solution was withdrawn at end of each day. After this, the absorbance was measured by scanning the prepared solution of required concentration in a UV spectrophotometer (model 1601, Shimadzu, Japan).

**Alkali degradation:-**

0.1 N NaOH solution was prepared. Accurately weighed 10 mg sample was taken in a 10 ml volumetric flask. Then, the volume was made with 0.1 N NaOH. Then this solution was refluxed for 3 days at room temperature in a water bath. The absorbance was measured every day by withdrawing the required amount of the sample. Then, scanning was performed with a UV spectrophotometer.

**Degradation in pH solution:-**

Accurately weighed 10 mg of drug was taken in a 10 ml volumetric flask. Then, little amount of methanol was added to dissolve the drug. The volume was adjusted up to the mark with different pH solutions (2,4,6,8,10). Then, that solution was refluxed for 3 days at room temperature in a water bath. The absorbance was measured at specific interval by withdrawing the required amount of sample solution. Then, scanning was performed with a UV-spectrophotometer.

**Thermal degradation:-**

A specific amount of sample was taken in a clean petridish and dried, then the petridish along with drug was placed into the oven at 100 °C for 3 days, 5 mg of bulk drug was taken from the Petridish each day and 1000 ppm solution with methanol was prepared. After this, the required concentration was made and the absorbance was measured in UV spectrophotometer. Percentage of degradation was calculated.

**Photolytic degradation:-**

Accurately weigh 10 mg of sample in a 10 ml volumetric flask and the volume was adjusted up to the mark with methanol. The prepared solution was placed in the photo stability chamber for 3 days. The absorbance was measured at end of each day by withdrawing the required amount of sample solution by using UV-spectrophotometer.

**Oxidation with H<sub>2</sub>O<sub>2</sub>:-**

10mg of sample was weighed accurately, 2–3 drops of methanol was added to solubilise the drug. Then the volume was made with 3% H<sub>2</sub>O<sub>2</sub> and placed it in a cupboard for 3 days. Specified amount of sample was taken and the required concentration was prepared each day. It was scanned in a UV spectrophotometer

**Hemolysis assay for biocompatibility:-**

Blood was collected from healthy adult volunteers and loaded into test tubes containing EDTA (anti coagulant) and diluted with PBS buffer. 0.2 mL of diluted blood was added into fresh test tubes containing test samples (drug, polymer, two concentrations of formulation, positive and negative control) and incubated for 60 min at room temperature. 0.2 mL of diluted blood in 10 mL SLS and PBS buffer served as positive and negative controls respectively (HA et al., 2014).

**Results:-****Appearance of nanoformulation:-**

The nanoparticles were in size range of  $602.11 \pm 12.5$  to  $1005.55 \pm 98.6$  nm (table 2) was confirmed by fig 3. The TEM images in fig.4 have shown the morphological properties and surface appearance of nanoparticles. The nanoparticles have nearly spherical shape and smooth surface. It also shows the homogenous molecular distribution of the drug in the polymer-based nanoparticles and drug distribution in the particulate form. There was no diffraction of transmission of electrons through the particles and that is why uniform dark particles were seen without any spot. Spotted particles support the presence of drug in particulate form rather than its distribution in molecular form.

The resultant equation for response-particle size Y1 is shown in Eq 3 and Figure 1.

$$Y1 = 75.7281 + 3.3580 X1 - 1.9108 X2 - 0.2312 X1X2 - 0.0198 X1^2 - 0.2109 X2^2 \dots (3)$$

**Drug entrapment efficiency:-**

Entrapment efficiency was in the range  $77.01 \pm 0.003$  to  $97.01 \pm 0.21\%$  (table 2) and was dependent on the encapsulating polymer, stabilizer, and surfactant. RSM results for response Y2 (entrapment efficiency) is given in Figure 2. The resultant equation for response Y2 is given in Eq 4.

$$Y2 = 27.047 + 1.087 X1 + 10.2130 X2 + 0.0475 X1X2 - 0.0930 X1^2 - 0.8078 X2^2 \dots\dots(4)$$

**In vitro drug release study:-**

Drug release from the nanoformulation depends mainly on the type and concentration of the polymers used in the formulation. All the formulations displayed fastest to sustained release pattern with 67–90 % (table 3) released in PBS at 24 h. The highest drug release is obtained for F33, F34, F35, and F36 in which both Tween 80 and PVA concentrations were higher. For formulation F25, F26, F27, and F28 (all contain 0.01% Tween 80), there is no such difference, which indicates concentration of Tween 80 play a role in drug release profile. Among F29, F30, F31, and F32, the F29 containing the 0.5% concentration of PVA/0.02% of Tween 80 showed the sustained drug release which is preferable for further drug development.

**Forced degradation study:-**

In this research, the nanosized chitosan-drug conjugates offers more stability as shown in Fig.5. Formulation minimally decomposed at acidic pH 2: however, the stability of this complex compared to simvastatin alone, for the same time interval, is much higher. At buffer above pH 6, simvastatin is totally degraded. But the dissociation of formulation complexes decrease in higher (basic) pH 10.0 (less than 5% of complex degrade) indicating the extensive stability of simvastatin at alkaline pH. The complexation event also protects simvastatin from the exposure to UV radiation ( $\lambda = 240$  nm) besides the damage by alkali. After a long exposure at short wavelength ~ 40 % of simvastatin molecules remains undamaged. At this condition, the uncomplexed or rather free simvastatin deteriorates ~100 %. So the chitosan/stabilizer can reduce the degradation of active moiety due to protection of drug by H-bonding only to certain extent (as long as it holds) when compared to raw drug, but extensive protection is not possible. No oxidative degradation was noticed throughout the experiment which might be due to anti oxidant properties of both drug and polymer present in nanoformulation. When formulation was exposed to thermal stress, the results indicated that the formulation is less degraded and more stable compared to raw simvastatin. The thermal protection given by chitosan is reason for this stability.

**Hemolysis assay for biocompatibility:-**

Our results disclosed that all the tested concentrations of formulation neither showed hemolytic activity nor thrombus formation making it biocompatible for circulation in the blood. SLS which was used as a positive control showed 100% hemolysis marked by complete lysis of the Red Blood Cells (RBC's) as shown in Fig. 6. While PBS which was used as the negative control, drug and nanoformulation did not show any hemolysis or toxicity to the RBC's making it a clinically suitable formulation.

**Discussion:-**

The main objective in this optimization study was to determine the experimental conditions which yield the best response including mean particle size around 500 nm, % entrapment efficiency of about 95%, uniform morphology and shape of the particles. Simvastatin was encapsulated by chitosan using an o/w emulsion solvent evaporation method. We studied the effect of three stabilizers on the characteristics of prepared nanoparticles, i.e., natural (xanthan gum), semisynthetic (carboxy methyl ethyl cellulose) and synthetic (PVA) and three surfactants, i.e., anionic (sodium lauryl sulfate), cationic (cetrimonium chloride), and nonionic (Tween 80), while other parameters such as drug concentration, polymer concentrations, stirring rate, temperature and the volume ratio of o/w phases were kept constant.

From the result of DOE, it was concluded that the formulation prepared by solvent evaporation method with nonionic surfactant (Tween 80) used at a concentration of 0.02 % w/v and synthetic polymer PVA (0.5%) was sufficient to facilitate the production of satisfactory nanoformulation. Attempts made in preliminary studies to use other surfactant types (except nonionic surfactant) failed to yield nanoparticles, but rather an aggregated mass was formed. Except synthetic polymer, other types of stabilizer resulted in decrease in the entrapment efficiency. Drug release from the formulation depends mainly on the type and concentration of additive used in the formulation. Formulation batches F25 and F29 which had a concentration 0.5% of PVA relative to that of chitosan showed sustained release of drug over the 24 h period of the release study. Being biocompatible, PVA is widely employed in the fabrication of drug delivery systems. Due to its polar groups, it is an efficient proton acceptor; therefore, it can

easily undergo hydrogen bonding with suitable compounds, especially polymers (chitosan) that behave as proton donors. The application of PVA as polymer matrix has been confirmed to possess significant outcomes, including enhancement of drug stability (Murtaza et al., 2011). Thus, simvastatin release was sustained from formulation F29 which contained a relatively accepted level of PVA. The nanoformulation with the highest concentration PVA showed fastest drug release in pH 7.4 buffer.

#### **Effect of constant formulation parameters on nanoparticles formation:-**

The drug:polymer ratio, stirring rate and temperature were kept constant which also influence nanoparticles formation. Chitosan (encapsulating polymer) is a natural polymer (Riva et al., 2011, Patil et al., 2014) does not adversely affect the mucosal lining instead adhere to membrane and helps to rid gastrointestinal problems, and is commonly used for the development of oral drug delivery systems (Agnihotri et al., 2004, Ludwig et al., 2005). Its degradation is pH dependent, being sparingly soluble in acidic medium due to the presence of acidic group (Huanbutta et al., 2013, Dudhani et al., 2010), but soluble in solution medium of pH > 6.0. It exhibits excellent swelling as a result of which it can retard drug release and is therefore used to achieve prolonged drug release (Dodane et al., 1998). This probably accounts for the very slow release of simvastatin from formulation F29 which contained a relatively optimum concentration of PVA and Tween 80. At this optimum concentration, polyelectrolyte complex formed between chitosan and PVA makes drug delivery effective in sustained release and higher entrapment efficiency with nanosize. Stirring rate also influenced the particle size and entrapment efficiency. The stirring speed of 400 rpm at 37° C produced the nanoformulation of optimum size. By increasing stirring speed above 400 rpm, there was no nanoparticle yield (data not shown). This low yield could be due to the formation of smaller nanoparticle which was lost during washing process. Decreasing the stirring speed promotes aggregation of the nanoparticles and causes materials to adhere to the walls of beaker, thus resulting in low yield.

#### **Effect of method of preparation on encapsulation efficiency and particle size of the nanoformulation:-**

Among the three methods of preparation, the solvent evaporation method used for the preparation of the nanoformulation successfully entrapped simvastatin. The encapsulation efficiency for all nanoformulations prepared by o/w emulsion-solvent evaporation technique was found higher. Simvastatin is practically insoluble in water; therefore, this substance was preferred partitioning into the dispersed organic phase of the emulsion. The amount of the drug passing into the aqueous phase was very low; thus, high encapsulation efficiencies were obtained (Reis CP et al., 2006).

#### **Effect of PVA on encapsulation efficiency and particle size of the nanoformulation:-**

During the solvent evaporation process, there is a gradual reduction in volume, resulting high viscous dispersed droplets. These affect the droplet size equilibrium, causing the coalescence and the agglomeration of the droplets during the early stages of the solvent removal (Abdel-Mottaleb et al., 2009). This problem can be managed by adding a steric stabilizer, e.g., PVA, into the continuous phase, thereby providing a thin protective layer around the droplets and hence reducing their coalescence (Juntanon et al., 2008). Using an insufficient quantity of stabilizer would result in large particles, but too much quantity would cause aggregation of the particles.

Three different concentrations of PVA with Tween in the outer aqueous phase were used in this study to find the best grade for production of nanoparticles. Effect of PVA concentration on the mean particle size of the produced nanoparticles shows that the concentration of PVA used plays an important role in determining the particle size of the obtained nanoparticles.

PVA with lower (data not shown) and higher concentrations yielded larger particles ( $d=1005.55$  nm) in comparison to medium concentration (538 nm). PVA concentration in the external water phase is well known to influence the particle size of nanoparticle. Since the presence of PVA in the external phase stabilizes emulsion droplets against coalescence, increasing the PVA concentration usually leads to a decrease in the size of nanoformulation. However, we did not find any linear relationship between the PVA concentration and particle size. This might be due to the fact that higher concentration of hydrophilic polymer (PVA) makes particle to bombard leading to aggregation and larger particle size.

Particle sizes and morphology of the nanoparticles are given in fig 3 and 4. The particle size of formulations depends on viscosity of the dispersed phase which in turn directly related to the molecular weight of the polymer. As the energy level required to disperse even medium viscous solutions is too high, larger droplets formed during the emulsification process; as a result, greater nanoparticles were obtained when PVA concentration was increased. In

spite of the iterative workup procedure applied to the nanoparticles including several washings with water, PVA of 0.5% w/v concentration covered the nanoparticle surfaces relatively more than the other three concentrations. The binding of PVA on the particle surface is likely to happen when the organic solvent is removed from the interface, in which interpenetration of PVA and chitosan molecules takes place. The hydrophobic vinyl acetate part of a partially hydrolyzed PVA serves as an anchoring site at the oil interface for binding to the surface of encapsulating polymer during the particle formation (Pillay et al., 2005). According to the results, it could be concluded that the greater the PVA concentration, the higher amount of residual emulsifier despite the several washing cycles. In addition, it induces local gelatinization of PVA and subsequent agglomeration of the nanoparticles, which might be responsible for the polydispersity of the nanoparticles. Hence, this may be the reason for the larger particle size obtained for PVA with higher concentration. Use of PVA with a low concentration prevented the local gelatinization of PVA at the surfaces of emulsion droplets and restricted the aggregation of nanoparticles considerably. In light of these results, 0.5% PVA was good steric stabilizer agent in the outer aqueous phase.

#### **Effect of Tween 80 on encapsulation efficiency and particle size of the nanoformulation:-**

Some studies have indicated that particles with superior topographical characteristics were obtained when Tween 80 was used as an emulsifier, instead of Tween 20 or Tween 40, independent of their concentrations. This might be due to better emulsification capability of Tween 80 as compared with that of Tween 20 or Tween 40 (Hoeller et al., 2009). In addition, the Tween 80 molecules acting as amphiphilic molecules deposited at the particle surface resulting in increment of particle size; moreover, they could shield surface charge of the nanoformulation led to decrease in zeta potential. Three different percentages (0.01%, 0.02%, and 0.03% w/v) of Tween 80 in the external aqueous phase were selected according to the literature studies (Mitra et al., 2003, Prieto et al., 2013). It is known that the concentration of Tween in the external aqueous phase is an important key factor for the nanoparticles size. The effect of Tween 80 concentration on particle size and zeta potential of nanoformulation was investigated. According to the results, the mean particle size of the prepared nanoparticles was increased by increasing the Tween 80 concentration. Since nanoparticles were formed from the emulsion droplets after solvent evaporation, their size is intensely dependent upon the size and the stability of the emulsion droplets. Although an increase in size was observed when Tween concentration increased from 0.1 to 0.3 % (w/v), it was not significant above 0.4% (data not shown). The increased particle size nanoparticles at higher Tween 80 concentration is due to the further head group hydration resulting in greater emulsion droplets. These emulsion droplets are gradually solidified to form nanoparticles during the solvent evaporation process. Another reason for increased nanoparticle size may be due to higher emulsifier concentration which frequently results in increased viscosity of the outer phase, leading to highly aggregated droplets. This high viscosity leads to resistance toward shear forces in emulsion and less efficient stirring with a negative impact on the size of nanoparticles. According to the results, 0.2 % (w/v) of Tween 80 concentration is the optimal value to obtain nanoparticles with appropriate particle size around 500 nm.

It was found that the nanoparticles obtained from formulations containing 0.02% w/v Tween 80 could be suspended in solvent for 48 h before settling at the bottom of the test tube. This is due to deposition of Tween 80 on nanoformulation surface providing steric repulsion effect preventing agglomeration of the nanoparticles. Formulation with lower surfactant possessed more zeta potential, due to insufficient electrostatic repulsion to stabilize nanosuspensions. However, formulation with 0.03% Tween 80 possessed larger particle size but less zeta potential. It showed agglomeration and sedimentation of nanoparticles within 24 h as well. This implied that steric repulsion effect from Tween 80 could stabilize this system. Therefore, Tween 80 at the concentration of 0.02% w/v could be considered as a suitable concentration for stabilization of nanoparticles.

#### **Effect of PVA and Tween 80 concentration on drug release:-**

Among F29, F30, F31, and F32, the F29 containing the 0.5% concentration of PVA/0.025% of Tween 80 showed the sustained drug release, which is preferable for further drug development.

Two possible mechanisms could explain the drug release from F29 formulation. These are swelling/pore formation from the spherical matrices and the matrix erosion resulting from degradation of nanoformulation (Fu et al., 2010). In actual circumference, since both PVA and chitosan is hydrophilic, the drug release in 24 h should be faster. In contrary to this, at particular combination, formulation shows sustained release. At this concentration of stabilizer and surfactant polyelectrolyte complex which offer intra hydrogelation properties, formed making slower drug release (Ravi Sankar et al., 2013, Garud et al., 2012).

**Mechanism of stability produced by nanoformulation:-**

The oxidative degradation of drug substance involves an electron transfer mechanism to form reactive anions and cations. Amines, sulfides and phenols are susceptible to electron transfer oxidation to give N-oxides, hydroxylamine, sulfones and sulfoxide. The functional group with labile hydrogen like benzylic carbon, allylic carbon, and tertiary carbon or  $\alpha$ -positions with respect to hetero atom is susceptible to oxidation to form hydroperoxides, hydroxide or ketone (Ngwa et al., 2010, Boccardi et al., 2005). In this study no degradation above the limit was reported. The reason attributed is the anti oxidant properties of simvastatin and chitosan evidenced by many literature. In addition the electrostatic bond formed between amino group of chitosan and hydroxyl group of simvastatin resist the oxidative stress producing more stable compound.

In general hydrolysis is a chemical process that includes decomposition of a chemical compound by reaction with water. Hydrolytic study under acidic, basic and different pH condition involves catalysis of ionizable functional groups present in the molecule which is in bonded state in the formulation resisting decomposition. Less degradation compared to pure drug might be due to breakage of bond at particular pH which is also essential for sustain release of drug to produce its pharmacological actions.

Light stress conditions can induce photo oxidation by free radical mechanism. Functional groups like carbonyls, nitro aromatic, N-oxide, alkenes, aryl chlorides, weak -C-H and -O-H bonds, are likely to introduce drug photosensitivity (Alsante et al., 2003). Limited protection from chitosan is offered to formulation due to strong -N-H bonds. But the polymer couldn't withstand more light stress condition, so protection from light must be ensured.

**Effect of PVA and tween 80 in stability of nanoformulation:-**

Development of nanosized particles builds high energy surfaces, which can turn to aggregation and Ostwald ripening, if stabilization is not at an efficient level. Smaller the particle size, the more efficient the stabilization. Stabilization is required for the formation of nanoparticles as well as for the long-term stability during storage. Nanoformulation are formed from a solid core surrounded by a stabilizer layer and distinctive stabilizers are surfactants or polymers.

Since the drug candidate-simvastatin used here for nanoformulation are poorly soluble and hydrophobic, the stabilizers PVA and tween 80 tend to enhance the wetting and dissolution properties of the active drug. Stabilizers can either be non-ionic (tween 80) or polymeric (PVA) in nature, but the stability is based on the classical DLVO-theory reached either via steric hindrance or electrostatic forces.

Stabilization with Tween 80- non-ionic surfactants and PVA-polymer is based on the steric stabilization effect. Steric stabilization created in F29 formulation is based on the formation of a mechanical barrier, a steric layer, between the particles and it requires polymeric chains on the particle surfaces that are long enough which offered by PVA. Temperature and pH changes, during the drying, can affect molecular mobility and hence the efficiency of steric stabilization, which is maintained in our study (Kim et al., 2010). Electrostatic stabilization formed by combination of chitosan, PVA, drug and tween 80 is based on formation of repulsive Coulomb forces between the charged colloidal particles. The three fundamental requirements for an efficient stabilizer are firm attachment to the solid surface, high percentage of stabilizer coverage on the nanoparticle surfaces and hydrophilic/lipophilic balance of the stabilizer (here the balance between tween 80 and PVA chain lengths, is essential to anchor onto the nanoparticle surfaces) which are satisfactorily given by the appropriate concentration of stabilizers used in this formulation (Liu et al., 2015).

**Conclusion:-**

This study using DOE showed the response of independent factors on dependent factors with the help of response surface plots and polynomial equation. Optimized formulation of simvastatin-loaded polymeric nanoparticles achieved higher encapsulation efficiency with smaller particle size which was prepared by solvent evaporation method, synthetic polymer and with nonionic surfactant. The investigation for effective concentration of stabilizer and surfactant showed that the F29 containing the 0.5% concentration of PVA/0.02% of Tween 80 showed the sustained drug release, higher stability and biocompatibility.

**Abstract**

The search for a non-lethal method of crowd control goes on. A lot of literature in recent years has pointed to the fact that projectile based munitions should be reclassified as lethal weapons while quoting supporting facts and figures of mortality and morbidity caused by these weapons. In recent times, a new method of crowd control in the form of a pellet gun has been used by the authorities in Kashmir. The wide range and severity of injuries to extra ocular tissues caused by the pellets from this gun further buttresses the argument that projectile based munitions in all forms inflict severe injuries to all tissues. It is also important in the present day for all surgeons to be well versed with the challenges concerning the management of these injuries. The surgical skills need to be sharpened while continuing to send out a call for milder methods of crowd control.

**Introduction:-**

The Lone Ranger never killed a bad man. In 22 years of fighting for justice (on radio and television), he always aimed at the outlaw's gun. In doing so, he not only defeated his enemies, but he won over the hearts and loyalties of millions of kids [1].

The management of public dissent is a challenge for governments the world over. This dissent is especially difficult when it is shown by large crowds. Several methods of crowd control have been developed by agencies the world over. The intent of these weapons is to subdue or incapacitate violent or dangerous suspects without causing serious harm or death. Commonly used less lethal weapons include chemical irritant agents, explosive distraction devices, kinetic impact munitions, and electrical incapacitation devices [2]

Kinetic impact munitions are basically projectile based weapons which are fired to cause superficial injuries to the protestor as there is transfer of kinetic energy to the body. However, the amount of kinetic energy transferred to the human body by these munitions is variable depending upon the size of the munitions as well as the distance from which it is fired.

Address:- Lecturer, DEPTT OF GENERAL SURGERY, Skims Medical College Srinagar.

Kashmir has provided a rather large arena for the use of the pump action projectile pellet gun this year. While as most of the reportage has focused on eye injuries, a number of extra ocular injuries flooded the hospitals during the first month of the protests.

This report outlines the range of extra ocular injuries witnessed by our hospital, the management problems and the residual issues faced by these patients. It perhaps also provides significant ballast to the argument that the pellet gun should be classified as a lethal weapon.

### **Material and Methods:-**

The valley of Kashmir witnessed large scale protests and protesting crowds from July 8<sup>th</sup> 2016. The authorities used the pump action pellet gun on a very large scale to control the crowds with over 3 thousand shots fired. This caused injuries to many people. Our hospital also received a large number of patients injured by these projectiles. While as an unprecedented number of patients were hit in the eyes, we focused on the extra ocular injuries that we treated in the first month of the unrest. We report on 30 patients with extra ocular injuries who needed admission for management during the first month. Patients who could be treated on an outdoor basis were excluded from the study.

### **Results Observations:-**

Most of the superficial wounds were cleaned with antiseptics only. This was followed by regular dressings. In cases with larger wounds and multiple pellets lodged enmasse, the skin was debrided to the area where it started bleeding. Tendon injuries were debrided and reconstructed, but significant stiffness ensued due to underlying comminuted phalangeal fractures in two patients.

Three cases presented late with primary wound management done at a local level. Infection of the wound was the cause for referral as the patients had tried to remove the pellets themselves fearing police arrest or reprisals in the hospitals. All cases were treated with debridement of the wound followed by washes.

In two cases some pellets were present within the joints. Both bullets were retrieved and repeated joint washes were given.

A significant number of wounds were small but a large number sustained by being shot at close range caused significant damage at the entry site. This can be imagined due to 600 pellets striking simultaneously. Such wounds were surrounded by skin splits which were debrided.

Most of the larger wounds were managed in the operating theatre by longitudinal incisions in the fascia and skin to relieve the hematoma and remove the debris and the pellets within a zone of safety.

The muscle was debrided along the time-honored concept of color, consistency, contractility and circulation. The area was allowed to drain in cases with extensive damage. The primary wound tract, otherwise known as the permanent cavity was cleaned and washed. The contusion zone of muscle adjacent to the track created by the pellet mass was washed. The concussion zone formed by the shock waves produced during cavitation which causes damage distant from the immediate track area was not explored according to the principles of debridement.

We also received many patients who had sustained pellet injuries to chest and abdomen. Most of these patients had superficial injuries. Many of the pellets were superficial and were removed by the patients themselves and some pellets got spontaneously extruded from the skin. In these patients local cleaning with antiseptic solution was done. Some of the pellets were very superficial and were removed at the time of examination only. Some of our patients had got serious injuries to chest and abdomen. Nine patients had sustained pellet injuries to chest. Out of nine patients, intercostal tube drainage (ICTD) was put in 5 patients (two right ICTD and 3 left ICTD). Rest of the patients were managed conservatively.

**Table 1:-**

S.no	Age(years)	Sex	Type of injury	Radiology	Procedure
1	25	male	Pellet Right side chest	normal	Debridement with primary closure
2	23	male	Pellet injury to anterior right lower chest with small exit wound on posterior aspect	Contusion right lower lobe of lung.	Right ICT drainage with debridement and primary closure of wound.
3	17	male	Pellet injury left side of the chest	Left hemothorax	Left ICTD
4	17	MALE	Pellet injury left side of chest	Left pneumothorax	Left ICTD
5	20	MALE	Pellet injury right side of chest	Right side hemothorax	Right ICTD
6	18	male	Pellet all over chest	normal	Local cleaning with antiseptic solution
7	24	male	Pellet injury chest all over	normal	Local cleaning with antiseptic solution
8	18	male	Pellet injury left side of chest	normal	Local cleaning with antiseptic solution
9	24	male	Pellet injury left side chest	Left pneumothorax	Left ICTD

We also received patients who had sustained pellet injuries to abdomen. Some of the injuries were superficial which were managed by local cleaning with antiseptic solution and superficial pellet removal while as some patients had received serious intra-abdominal injuries requiring exploration. In three patients exploratory laparotomy with resection/primary repair of the perforation and covering stoma was done. Rests of the patients were managed conservatively.

**(Table 2:-**

S No	Age(Years)	Sex	Type of Injury	Radiology	Procedure
1	25	male	Pellet injury abdomen	Multiple perforation over right half of transverse colon with grade I liver laceration	Exploratory Laparotomy with transverse colectomy with end to end anastomosis with covering ileostomy
2	23	Male	Pellet injury abdomen	Grade I Laceration upper pole of right kidney, multiple foci of air in retro peritoneum. 11th rib fracture with no obvious gut injury.	Managed conservatively for abdominal injuries.
3	30	Male	Pellet injury abdomen	Hemoperitoneum	Exploratory laparotomy with primary repair sigmoid colon perforation with transverse loop colostomy.
4	17	Male	Pellet injury abdomen	normal	Conservative management
5	20	Male	Pellet injury abdomen	Hemoperitonium	Exploratory laparotomy with primary closure of gut perforation.
6	24	Male	Pellet injury abdomen	normal	Conservative management

We used second generation cephalosporins and aminoglycosides in all cases at the outset before obtaining culture sensitivity reports.

S.No	Age(yrs)	Sex	Injury	Exam	Procedure
01	25	Male	Pellet injury with fracture BB Right Leg (open type iii B)	Right Leg lacerated wound with loss of skin approximately 6x12 cm on anterior aspect of distal leg plus another lacerated wound with loss of skin approximately 4x8 cm on anterior aspect of leg. Tendon junction ok, DNVS ok	CR done and external fixate applied using two connecting rods (12 clamps)
02	24	Male	Pellet injury left thigh with fracture neck of femur with CCS in-situ fresh fracture subtrochantric left femur		Conservative management to be done for two weeks
03	28	Male	Pellet injury right gluteal region upper and lower back	Lacerated wound 3x2 cm right gluteal region multiple pellet injuries on upper and lower back	Debridement of wound under LA managed conservatively
04	16	Male	Injury fracture shaft of femur right side.		CRIF with ILIMN 10x40 mm
05	35	Male	Bilateral sub condylar fracture		ORIF with DFL palate for fracture femur rt. And fracture tibia rt.
06	19	Male	Pellet injury right Thigh (open type iii B with fracture shut of femur		OR with EF
07	24	Male	Pellet with fracture neck of femur left		CCS fixation left plus VAC
08	25	Male	Fracture both bones right Leg with Achilles tendon injury (compound type iii)		External fixation for fracture tibia with HLA tender repair
09	20	Male	Fracture shaft of femur right compound type iii		External fixation of fracture shaft of femur
10	21	Male	Injury right shoulder with fracture distal humerus right with fracture both bones proximal Forearm right floating elbow compound type iii B		External fixation for right shoulder
11	40	Female	Pellet injury both lower limbs with committed fracture proxy. Tibia left. (open type iii fracture medial tibia right Open type ii)		E.F and debridement left leg
12	16	Male	Pellet injury right leg with fracture medial femoral condyle with EF in situ with RVSG+STSG		

Out of 12 patients 11 were male 1 was female. 11 patients had lower limb involvement while as 1 patient had upper limb involvement. 6 patients were managed by external fixation, three patients had internal fixation, 3 patients were managed without fixations.

We continue to observe follow up patients. Several cases report discomfort due to the subcutaneous location of the pellets which has made some postures painful. A large number of patients are also reporting back with draining sinuses from several pellet sites. As the follow up is short, it is difficult to guess how many pellets may need to be removed over a prolonged period before these patients return to normal.

### **Discussion:-**

Many law enforcement and military agencies are adopting so-called “less-lethal weapons” that are also called “nonlethal weapons,” “sub lethal weapons,” or “less-than-lethal weapons.” [2].

In simple terms Non-Lethal/Less lethal incapacitation means ‘to render a suspect incapable of action by means of force which is highly unlikely to cause death or serious injury when properly applied’[3]

While less lethal weapons are significantly safer than traditional firearms, no weapon can be entirely non-lethal and no weapon can be made entirely safe. Medical providers may treat subjects exposed to less lethal weapons and should presume injury until proven otherwise. They should be familiar with less lethal weapons' actions, effects, and typical injury profiles [4]

Projectiles deform upon impact to provide maximal surface area and a reduced likelihood of penetrating injury. However, skin penetration does occasionally occur [5].

However, intra abdominal, intra thoracic, ocular, intracranial, and extremity penetrations of intact projectiles have all been reported. In addition, bean bag type projectiles have been reported to rupture upon impact, releasing their numerous small metallic pellets which then produce penetrating injuries [4].

Less-lethal weapons "were originally intended as a de-escalation tool, as a substitute for deadly force. But in many cases it became an add-on, substituting for a less serious form of physical force." [6] The manufacturer of pellet guns, used against protesters by armed forces in Kashmir, said they are generally used for hunting. No tests have been

conducted regarding their effect on the human body [7]. technically called 12 Bore Pump Action guns, can contain shots of various sizes ranging from 'BB' to 9, with BB being the largest and 9 number the lowest. The state police only make use of number 9 pellets to deal with the protestors [7].

The pellet gun injury raises several challenges for the treating doctor. These challenges are enumerated below

1. Lack of any literature as a guide for the management of these injuries.
2. Presence of hundreds of small projectiles spread over a rather large area involving bone, nerve, vessel, and muscle simultaneously in a large percentage of cases.
3. High incidence of missed injuries due to a large number and spread of the projectiles.
4. Difference between the types of injury caused by the projectiles fired point blank versus shots fired from a distance.
5. To avoid being arrested, several protestors had removed the superficial pellets at home with knives and razors creating additional wounds. These cases presented late and with infected wounds.

In all cases local wound care consists of superficial irrigation and careful cleansing followed by dressing. The tracks of the individual pellets are allowed to heal and only dressed regularly. In cases with large entry wounds caused by point blank shots, the wound track should be cleaned and pellets removed along with the detritus. In spite of significant debridement, some peripheral pellets remain. The margins of the entrance wounds should be excised and the missile tract thoroughly irrigated. A wide debridement of devitalized tissue is to be performed and foreign bodies removed. The patients with larger wounds should be returned to the operating room every 48-72 h for serial debridement. All contaminated subcutaneous fat and devitalized muscle must be removed. Bone without soft tissue attachments should be excised. Elimination of dead space is vital. Wound closure is to be avoided due to a significant chance of infection. The associated fractures should be stabilized by external or internal fixation. Secondary wound closure can usually be performed within 1-2 weeks after injury. We used

X- Ray and CT scanning liberally, however MRI would have been the most desirable. It was not possible to use it due to obvious reasons.

Two aspects of crowd control were found to have an effect on the management of these wounds. The gun per se does not have a significant research back up [7]. Without the research back up, the standard operating protocol about the use of these guns is difficult to guess. We, however observed that shots fired from a distance did not cause deep extraocular damage. According to the patients who had been shot at point blank range or from very short distances, the damage was significant. The severity of the injury in inverse proportion to the distance from which the gun was fired probably suggests that lethality is proportional to the intent of the shooter. It is pertinent to mention here that the Indian police and paramilitaries are signatory to the Geneva Convention, but the 'heat of the moment' may introduce dangerous uncertainties in the use of this gun. The amnesty international has reported that "In dozens of countries around the world, we've documented how police have misused and abused tear gas, rubber bullets and electric shock equipment, amongst many other dangerous devices, to quell protests [8]. In several situations, the goal of incapacitating an individual is not achieved whilst producing internal organ damage [2]

There is a lot of literature which supports the renaming of kinetic energy based munitions as lethal weapons. Recent research even focuses of non-projectile weapons stating that each type of non-projectile less lethal weapon also has a number of physiologic effects and specific medical issues that must be considered when the weapon is used. [9, 10, 11, 12, 13, 14] There is no clear evidence, yet that the non-projectile devices are inherently lethal, nor is there good evidence to suggest a causal link between sudden in-custody death and the use of irritant sprays or conducted energy devices [15, 16]

Users of less lethal kinetic impact munitions are trained to target the torso and proximal extremities of a suspect while avoiding the head, neck, precordium and groin areas. However, the relatively poor aerodynamics of these large surface area projectiles makes these weapons fairly inaccurate [3].

### **Conclusion:-**

Real efforts must now be made to identify or develop acceptable non-lethal (or less than-lethal) weapons. Better training of the police and the paramilitaries is also necessary so that acceptable damage is caused while crowds are being restrained. It is also important for surgeons to be fully trained in the management of ballistic wounds. In extension, there should be dissemination of literature concerning newer projectile munitions so that doctors are able to at work along some basic guidelines to improve patient care.

Antioxidant, Broilers, Diazinon, *Nigella sativa*.

#### Abstract

*Nigella* has historical and religious uses for preventing and treating many different kinds of diseases. Influences of *Nigella* on bird performance, biochemical, antioxidant and immunological status in birds toxified with synthesized diazinon were studied. 150 broiler chick were received and divided into three groups; G1 and G2 were supplemented with *Nigella* (1.4 gm / 100 gm; 2.8 gm / 100 gm ration; respectively) and G3 is control. G1 and G2 were toxified with synthesized diazinon (100 ppm / 1 L drinking water). A total of 180 samples (60 serum, 60 plasma and 60 intestinal swab) were collected during the study period. The results revealed the ability of *Nigella* to maintain biochemical parameters as TP; Alb; Glob; ALT; AST; Urea and Creatinine after prolonged deviation. Glutathione peroxidase was sharply decreased, Glutathione Reductase was sharply increased indicating the stimulation action. Superoxide Dimutase was significantly increased until the 4<sup>th</sup> week of age followed by significant decrease. Immunoglobines (IgG, IgM) were increased at the 2<sup>nd</sup> week of age followed by significant decrease by the protective effects of *Nigella*. On the other hand, IgE was increased and maintained at high levels. A sharp decline in both Total Bacterial Count and Total Enterobacteriaceae Count until the 4<sup>th</sup> week of age followed by sharp increase in both types in all treated groups suggesting the failure of the protective action. A follow up with the supplementation in higher doses may protect from the further changes in biochemical, antioxidant, immunological and bacteriological aspects.

#### Introduction:-

*Nigella sativa* was known in traditional and religious medicine for almost centuries in India, China, Far East and Middle East as a natural treatment for many diseases and as a flavoring agent that claimed a medicinal usage traced back to the ancient Egyptians, Greeks, and Romans; **Elkhayat et al., (2016)**. *Nigella* seeds have many medicinal actions such as bronchodilator, hypotensive, antibacterial, antifungal, anti-diabetic, anticancer; **Periasamy et al. (2016)**, analgesic, anti-inflammatory, antidepressant; **Sahak et al., (2016)** and immune-potentiating actions.

**Corresponding Author:- Essam S Soliman.**

Address:- Department of Animal Hygiene, Zoonosis & Animal Behavior, Faculty of Veterinary Medicine, Suez Canal University, Ismailia, Egypt, 41522.

*Nigella* was able chemically to reduce the levels of triglycerides and glucose once they were elevated in the body, as well as can stabilize cholesterol metabolism. Despite of its large benefits in the medicinal field, *Nigella* seeds were neglected and left behind although, *Nigella sativa* may possibly induce P-glycoprotein activity, **Hammad Shafiq et al., (2014)**.

Diazinon is one of the most commonly used organophosphorus compounds; and have many applications in the veterinary and agricultural fields; **Ghoneim et al., (2001)**. Diazinon is an organic phosphate and cholinesterase enzyme inhibitor that commonly used for the control of common chicken lice and other variety of insect in poultry farms. Diazinon was not recommended to be used in the presence of a live bird as chickens will consume the diazinon crystals, results in lacrimation, diarrhea, dyspnea, and death. Postmortem finding from toxicity may include lung edema, fatty livers, severe enteritis and the inclusion of diazinon crystals in the crop and gizzard contents.

The present study aimed for evaluating the influences of supplementary different concentration of *Nigella sativa* on antioxidant activity [superoxide dismutase (SOD), glutathione peroxidase (GSH-Px) and glutathione reductase], blood chemistry, bacterial load and immunological status before and after toxifying birds with synthesized diazinon.

## Material and methods:-

### Experimental birds and study design:-

150 broilers (one day old chicks) were purchased and placed under the same environmental conditions for acclimatization. The birds were divided into 3 groups (G1, G2, and control G3) according to the supplemented concentration of *Nigella sativa*. G1 supplemented with 1.4% *Nigella sativa* (1.4 gm / 100 gm ration); G2 supplemented with 2.8% *Nigella sativa* (2.8 gm / 100 gm ration) and G3 was kept as control. G1 and G2 were toxified with synthesized diazinon (100 ppm / 1 L drinking water; LD50= 6.31 mg / kg) after it have been compared to the commercial form for its chemical and physical properties as well as the compound stability.

### Diazinon:-

Diazinon was synthesized in the laboratory and the reaction mixture was then washed first with 400 mL of 0.1 N hydrochloric acid and then with 400 mL of 0.1 N sodium hydroxide solution. After Separating off the washing liquids, the xylene was distilled off in vacuum for the complete removal of the volatile constituents, the diazinon was finally distilled in a high vacuum (approximately 1 mbar) at 60 °C. The yield of 0,0 diethyl -0- (2- isopropyl -4-methyl -6 – pyrimidinyl) the ionophosphate was 280 g = 92.1% of the theoretical yield, **Budavari, (1996); Hansch et al., (1995); Geller et al., (2003)**.

### Sampling and samples preparation:-

**Blood samples:** A total of 180 samples were collected during the study period, these samples were collected on a weekly basis starting from 14<sup>th</sup> day old (zero sample), and three post challenge sample collections (P1, P2, and P3). **Serum blood samples** (60 samples) were left in a cool place for 2-3 hrs, then centrifuged at 3000 rpm / 5 min. The serum samples were separated in Eppendorf tube of 3 mL capacity and kept frozen until examination for Blood biochemical parameters as Total Protein (TP); Albumin (ALB); Globulin (Glob); liver enzymes as alanine aminotransferase (ALT); aspartate aminotransferase (AST); Cholesterol (CHOL); Triglycerides (TG); Urea (Ure); Creatinine and Glucose (Gluc), the parameters were measured calorimetrically using UV1100 spectrophotometer; **Young, (1995-2001)**, immunological assay was also performed on serum samples (IgG, IgM, IgE) using DIFFU plate method; **Berne, (1974), Heremans and Masson, (1973)**. **The whole blood samples** (60 samples) were centrifuged at 4000 rpm / 10 min; then aspirate off the plasma and stored at -80 °C. The erythrocytes were washed 3-4 times with 5 mL sodium chloride 0.9% solution and centrifuged after each wash at 4000 rpm / 10 min. Finally the washed erythrocytes were re-suspended in cold distilled water and mixed; the lysate were stored at -80 °C for antioxidant assay as superoxide dismutase; SOD (**Nishikimi et al., 1972**), glutathione peroxidase; GSH-Px (**Paglia and Valentine, 1967**).and glutathione reductase (**Goldberg and Spooner, 1983**).

**Intestinal swab** (60 samples); from the original dilution of all swab sample, 1 mL was transferred aseptically to a test tube containing 9 mL sterile 0.1% buffered peptone water (w/v) to prepare a dilution of 10<sup>-2</sup>, then from which tenfold decimal serial dilution up to 10<sup>-6</sup> were prepared to cover a wide range of samples contamination which could be easily counted. The dilutions were subjected to two types of bacterial counts; Total Bacterial Count (TBC) and Total Enterobacteriaceae Count (TEC).

**Bacterial Counts:-**

**Total Bacterial Count (TBC);** The number of Aerobic spore forming micro-organisms in samples was carried out using drop Plate Method by **Zelver et al., (1999)** and **Herigstad et al., (2001)** using standard plat count agar. The inoculated and un-inoculated control plates were incubated at 37 °C for 24-48 hours. **Total Enterobacteriaceae Count (TEC);** was performed using drop Plate Method; **Zelver et al., (1999)** and **Herigstad et al., (2001)** with Eosine Methylene Blue Agar (EMB). Plates were inverted and incubated at 37 °C for 24-48 hours. Counting the colonies on the plates showed 30-300 colonies per plates; **Cruickshank et al., (1975, 1980)**. Five typical colonies were selected and cultured onto MacConkey agar plates, and incubated at 37 °C for 24 hr, the pure colonies on MacConkey agar plates were inoculated onto nutrient slant and incubated at 37 °C for 24 hr and kept for further identification.

**Statistical analysis:-**

Statistical analysis was run through SPSS (version, 16) for windows Levesque, (2007). The obtained data were analyzed statistically using factorial experiments of Analysis of Variance (ANOVA) with general linear model procedures (GLM) for all tested groups, times and their interactions.

**Results:-**

Proteinogram in Table 1 revealed that total protein, Albumin and Globulin revealed non-significant ( $P \leq 0.05$ ) differences between G1, G2 and control at different sampling times. As well as, ALT, AST (Table 2) showed non-significant differences ( $P \leq 0.05$ ) in all groups at all sampling times. Urea (Table 2) revealed a non-significant increase ( $P < 0.05$ ) in G1 and G2 compare to control at P1, P2 and a non-significant decrease ( $P < 0.05$ ) in G1 and G2 compare to control at P3. Creatinine revealed significant decline ( $P \leq 0.05$ ) in G2 and control compared to G1 at zero time and a highly significant decrease ( $P < 0.01$ ) in control compared to G1 and G2 at P1 sampling time. Meanwhile, at P2 and P3 there was a non-significant difference ( $P > 0.05$ ) between groups.

Triglycerides and cholesterol (Table 3) showed a highly significant decrease ( $P < 0.01$ ) in G1 and G2 compared to control at zero sampling time and a non-significant difference ( $P > 0.05$ ) between groups at P1, P2 and P3 sampling times. Glucose showed a highly significant decrease ( $P < 0.01$ ) in G1 and G2 compared to control group at P1 and significant decrease ( $P \leq 0.05$ ) in G1 and control groups compared to G1 at P2 sampling time.

Glutathione peroxidase (Table 4) showed a highly significant ( $P < 0.01$ ) decrease in G2 and control groups compared to G1 at zero and P1 sampling times, and a non-significant difference ( $P > 0.05$ ) between all groups at P2 and P3 sampling times. Glutathione reductase and Superoxide dimutase revealed significant difference ( $P \leq 0.05$ ) between groups at zero and P2 sampling times.

Immunoglobines (IgG) revealed a highly significant difference ( $P < 0.01$ ) in Table (5) between groups during all sampling times and non-significant ( $P > 0.05$ ) decrease between G2 and control compared to G1 at P1 sampling time. IgM profile showed a highly significant difference ( $P < 0.01$ ) between groups at all sampling times; a non-significant decrease ( $P > 0.05$ ) between G2 and control compared to G1 at zero sampling time; a non-significant decrease ( $P > 0.05$ ) between G1 and G2 compared to control at P2 sampling time and a non-significant difference ( $P > 0.05$ ) between G1 and control at P3 sampling time; Table (5). IgE revealed a highly significant difference ( $P < 0.01$ ) between groups at zero and P1 sampling times, and a non-significant decrease ( $P > 0.05$ ) in G1 and G2 compared to control at the same sampling time. A significant difference ( $P \leq 0.05$ ) at P2 and non-significant difference ( $P > 0.05$ ) at P3 sampling time, Table (5).

TBC revealed in Table 5 a highly significant ( $P < 0.01$ ) difference between all groups at all sampling times, and a non-significant decrease ( $P > 0.05$ ) between G2 and control compared to G1 at P2 sampling time. Meanwhile, TEC showed a highly significant difference ( $P > 0.01$ ) between all groups at all sampling times and non-significant ( $P > 0.05$ ) difference between G1 and control; G1 and G2; G2 and control and G2 and control at zero, P1, P2, and P3 sampling times; respectively.

IgM and IgE (Table 6) showed a highly significant strong positive correlation ( $r = 0.646$ ;  $P < 0.01$ ) with TBC. Table (7) revealed a significant weak negative correlation ( $r = -0.394$ ;  $P \leq 0.05$ ) between TBC and Superoxide Dimutase. TEC in Table (7) showed a significant weak negative correlation with SOD ( $r = -0.336$ ;  $P \leq 0.05$ ).

### Discussion:-

A variety of medicinal plants as well as their extracted and purified constituents have shown many therapeutic effects. On a wide spectrum, medicinal plants was able to serve as therapeutic, medicinal alternatives, safer choices and effective treatment. Animals, broilers and human-being in a variety of cultures can be treated or prophylactic with medicinal plants. *Nigella sativa* from family *Ranunculaceae*, have been used for centuries as food preservative and medicinal plant. The oil constituents; thymoquinine (TQ), have shown a potential medicinal properties, as it possess anti-oxidant effects by enhancing the oxidant scavenger system, which as a consequence causes antitoxic effects induced by several problems; **Salem, (2005)**. The present study showed that Glutathione peroxidase possess a highly significant decrease in G2 and control groups compared to G1 at zero and P1 sampling times, and a non-significant difference between all groups at P2 and P3 sampling times. Glutathione reductase and Superoxide dimutase revealed significant difference between groups at zero and P2 sampling times.

Several diseases serve to contribute oxidative damage to many biological structures during their pathophysiological course especially in cardiovascular diseases and cancer. The oxidative damage was caused by imbalance between the pro-oxidant (free radicals) and the anti-oxidant (scavenging) mediators, as pro-oxidant predominated either by the increased generation of the free radicals contributed by excessive oxidative stress conditions, or by the poor scavenging capability in the body. Free oxygen radicals; O<sub>2</sub>, OH<sup>-</sup>, and NO<sup>-</sup> that are developed during a stress condition; are electrically charged and attack cells causing tearing of the cellular membranes and created a havoc with the nucleic acids, proteins, and enzymes existed in animal or human body, causing the cell to lose its structure and function completely. ROS are produced mainly by certain cells of immune system as macro-phages and neutrophils;

**Maxwell, (1999); Schulz et al., (2000); Hogg, (1998).**

The present study showed a sharp increase in the lipid profile and glucose, and this was attributed to diazinon intoxication. The elevated levels was declined latter as the bird proceed in age and this was attributed to the ability *Nigella sativa* to decrease the lipid peroxidation, increase the anti-oxidant mechanism and prevent the lipid-peroxidation-induced liver damage. *N. sativa* also was able to decrease the elevated glucose and MDA concentrations, increased the lowered GSH and ceruloplasmin concentrations. These results were supported with the finding from experimentally infected rabbits in **Meral et al., (2001); Mariod et al., (2009), and Umar et al., (2012).**

*Nigella sativa* showed beneficial immunomodulatory properties, as it was able to stimulate T cell- and natural killer cell-mediated immune responses. The oil and its active ingredients proved an excellent anti-microbial and anti-tumor properties. Gathering these beneficial and medicinal influences, *N. sativa* seed is a promising source for active ingredients that would be with potential therapeutic modalities in different clinical settings; **Salem, (2005)**. Immunoglobines (IgG, IgM) in the present study revealed a highly significant difference between groups during all sampling times with potential increase followed by decrease from the 3<sup>rd</sup> week of age proving the presence of immune barrier, that did not last for a period of time.

**Table 1.** Biochemical changes in proteinogram by groups supplemented with different *Nigella sativa* concentrations against Diazinon (OPC) toxicity.

**Conclusion:-**

*Nigella sativa* supplementations (1.4%, 2.8%) were able to protect the birds from intoxication at once up to the 4<sup>th</sup> week of age. Although it maintained the biochemical parameters in a normal levels after little deviation resulted from intoxication. Antioxidants were severely stimulated by the *Nigella sativa* supplementations (1.4%, 2.8%) to initiate its protective effect. A follow up with the supplementation in higher doses may protect from the further changes in biochemical, antioxidant, immunological and bacteriological aspects.

#### Abstract

The purpose of this project was to design a portable and low cost power system that combines both wind electric and solar electric technologies. This system will be designed in efforts to develop a power solution for remote locations such as rural and research areas as well as improve the general well-being of individuals in developing countries affected by natural disasters. For this reason, it is imperative to design a hybrid system that will deliver a minimum of 80-250 watts of continuous power which is enough to power a wide range of appliances and medical equipment.

Looking from the consumer perspective the cost of a hybrid system is still the biggest problem which can cost anywhere between 25,000 to 30,000 Rupee. Considering that a portable hybrid system is designed to deliver a limited amount of power, less than 1.5 kW-hr, this is a high price for such system. In order for this system to become more attractive to the public, we need to design and develop a product which will benefit their pockets.

#### Introduction:-

Buildings today consume more energy (41%) than either of society's other broad sectors of energy consumption industry (30%) and transportation (29%) [1]. India is fast growing country in the world. In recent years the electricity demand in India is increasing rapidly because of fast growing industry. 1.4 billion Still have no access to electricity (87% of whom live in the rural areas) and 1 billion that only has access to unreliable electricity networks.

Nowadays many issues appear due to the fact of using fossil fuel as a primary resource in generating electricity. The solution to such issues can be eliminated or reduced by means of using a renewable energy such as a solar power system. The first issue that is related to use of fossil fuels is the global warming, where the increase of using fossil fuels such as oil and natural gas in generating electricity resulted several health and environmental problems. Natural gas gives off 50% of the carbon dioxide, the principal greenhouse gas, released by coal and 25% less carbon dioxide than oil, for the same amount of energy produced. Coal contains about 80% more carbon per unit of energy than gas does, and oil contains about 40% more [2]. Global warming has many effects such as earth increase in temperature, sea level. Second issue is the air pollution. A lot of pollutants are produced by fossil fuel combustion that is used to produce electricity such that Sulphur oxides, and hydrocarbons. In addition, total suspended particulates contribute to air pollution can combine in the atmosphere to form tropospheric ozone, the major constituent of smog. Third issue, is the cost of the fossil fuel, the electricity that produced by the fossil fuel process is more expensive than the electricity produced by the renewable energy such that solar power.

We need smart and practical approaches because energy, as a driver of development, plays a central role in both fighting poverty and addressing climate change. The government of India's make in India campaign will introduce more industry in India then there will be acute demand for more and more reliable power supplies. The energy sources in India is mainly Coal (56.65%), hydro (19.13%), Gas(9.2%), Nuclear(2.32%), Oil(0.58%) and other renewable sources(12.9%). From all above the renewable energy sources are free and can be easily utilize to have more energy.

The existing system has several disadvantages like solar energy and wind energy that are being in the system as an energy source can supply the load only for a particular period of time. A major drawback of the existing system is the charging of energy from the solar and wind is not always available.

The solar Photovoltaic (PV) cell is an electronic device that essentially converts the solar energy of sunlight into electric energy or electricity. Photovoltaic system consists of many cells, panels and array. The large scale PV plants are used for electricity generation that is fed into the grid and load. Such system, typically consist of one or more PV panels a DC/AC power Converter/Inverter. Additionally such system could also include maximum power point (MPP) and storage devices. The electricity generated is either stored, used directly for self-consumption or is fed into large electricity grids. Interconnections of panel or array, predict the output voltage or current or power and it is a variable that depends upon the sunlight. The converters may be used to regulate voltage and current at the load to control the power flow. There are many advantages of using solar Photovoltaic as a source for generating power, such as clean energy, no pollution and maximum power at peak hours. The modelling of solar PV system is to obtain maximum power for load requirements. Therefore energy storage system is very important for balancing the system or energy management of the system [3].

**Block Diagram:-**

**Specification:-****Hardware:-**

- Solar panel
- Rechargeable Battery(12 ,7A/h)
- Microcontroller
- PIR Sensor
- Max 232
- Light Sensor
- Charge controller
- Lcd display 16x2
- Inverter

**Software:-**

- Protel 99 SE 2.8
- Proteus 7.8
- Keil uVision 4.3

**Type of PV system:-**

There are generally two types of PV systems [5] off-grid and grid-tied depending on their connection to the utility grid.

**Off-grid DC/AC PV system: (DC without inverter, AC with inverter):-**

□ Off-Grid DC system (without inverter) - The DC output is immediately directed to DC loads. Excess power is stored in the battery banks controlled by the charge controller. Common applications of this system are found in RVs, boats, cabins, farm appliances, or rural telecommunication services. A backup generator may be included as shown in Fig. 1.

**Fig 1:-** Off-grid DC system (without inverter)

□ Off-grid AC system (with inverter) - An inverter is added to this system. The generated energy is directed to the inverter that converts DC to AC electricity for conventional electric appliances. Excess energy is stored in batteries and an optional backup generator can be added/included as shown in Fig. 2.

Fig 2:- Off-grid AC system (with inverter)

□ Hybrid system- In this system, another renewable energy generator is added to generate more power. For example, the wind turbine can be added to generate electricity from wind. This system is useful in places where the weather is sunny and windless during summer but cloudy and windy during winter. This system is typically off-grid and the excess energy is stored in batteries included as shown in Fig. 3. If neither the PV panel nor the wind turbine generates enough electricity, backup power such as a diesel generator can be added to generate the more energy.

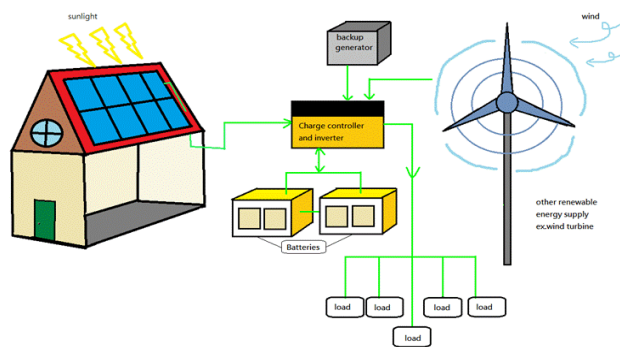

Fig 3:- Hybrid system

**Grid-tied system: with battery backup or no battery backup:-**

□ Grid-tied system (without battery backup) - In this system, the generated DC is converted to AC and used on-site. The solar power production is monitored by the solar production meter. If there is an excess energy, the energy can be fed into the electricity grid. If the PV system does not generate enough power because of higher demand, needed energy can be drawn from the grid included as shown in Fig. 4. This process of drawing or feeding electricity to the grid is monitored by the export/import meter.

Fig.4:-Grid-tied system (without battery backup)

□ Grid-tied system (with battery backup) - In this system, the converted AC is used on-site or stored in batteries. The charge controller monitors the battery capacity and excess energy is stored in the batteries for backup. If the batteries reach their full capacity, the excess energy can be fed into the electricity grid. On the other hand, if the PV system does not generate enough power, needed energy can be drawn from the grid included as shown in Fig. 5. This process is done automatically through a net metering program.

Fig.5:- Grid-tied system (with battery backup)

### Advantages and Disadvantages:-

#### Advantages:-

1. Electricity produced by solar cells is clean and silent. Because they do not use fuel other than sunshine, PV systems do not release any harmful air or water pollution into the environment, deplete natural resources, or endanger animal or human health.
2. Photovoltaic systems are quiet and visually unobtrusive.
3. Small-scale solar plants can take advantage of unused space on rooftops of existing buildings.
4. PV cells were originally developed for use in space, where repair is extremely expensive, if not impossible. PV still powers nearly every satellite circling the earth because it operates reliably for long periods of time with virtually no maintenance.
5. Solar energy is a locally available renewable resource. It does not need to be imported from other regions of the country or across the world. This reduces environmental impacts associated with transportation and also reduces our dependence on imported oil. And, unlike fuels that are mined and harvested, when we use solar energy to produce electricity we do not deplete or alter the resource.
6. A PV system can be constructed to any size based on energy requirements. Furthermore, the owner of a PV system can enlarge or move it if his or her energy needs change. For instance, homeowners can add modules every few years as their energy usage and financial resources grow. Ranchers can use mobile trailer-mounted pumping systems to water cattle as the cattle are rotated to different fields.

#### Disadvantages:-

1. Some toxic chemicals, like cadmium and arsenic, are used in the PV production process. These environmental impacts are minor and can be easily controlled through recycling and proper disposal.
2. Solar energy is somewhat more expensive to produce than conventional sources of energy due in part to the cost of manufacturing PV devices and in part to the conversion efficiencies of the equipment. As the conversion efficiencies continue to increase and the manufacturing costs continue to come down, PV will become increasingly cost competitive with conventional fuels.
3. Solar power is a variable energy source, with energy production dependent on the sun. Solar facilities may produce no power at all some of the time, which could lead to an energy shortage if too much of a region's power come from solar power.

**Application:-**

1. Agriculture-Water-pumping installations (very important in developing Countries): systems of automatic irrigation.
2. Industry, Telecommunications & Public Services-Cathode protection of gas, oil pipelines and other types of piping; provision of power in general, in particular for limited electric charges (in the order of a few kW) always in areas far from the grid or where power is unreliable (discontinuous electrical supply).
3. Radio/television relay stations: telephone devices; stations for data surveying and transmission (meteorological, seismic, for levels of watercourses, indicating the presence of fires), often very useful for civil protection services.
4. Lighting of streets, gardens and public transportation stops, street signaling.
5. Health- Especially for refrigeration, very useful particularly in developing countries for the conservation of vaccines and blood.
6. Residential-Power provision (especially lighting) for houses and mountain refuges. Very significant applications of this type in developing countries: photovoltaic systems do not require special maintenance and are easy to install.
7. Free Time- For charging boat and camper batteries.

**Conclusion:-**

The objective of his project was to design a portable power system that combines both, a wind turbine and a solar panel in one single unit. The main idea of combining the two types of systems together was to try to archive a constant power production, which would be available most of the time.

**Future Scope:-**

As a team with many innovative ideas we believe that the implementation of the following ideas will make the designed Solar and Wind Hybrid Power System a better product:-

1. Design and manufacture a cover for the permanent magnet wind turbine generator- In order to better protect the product and reduce customer complaints in the future, it is always a good idea to take protect the systems key component. By developing a cover for the generator, quality will increase tremendously as it will be protected from rain, snow, and dirt. Throughout time, these types of particles can have a tremendous burden on the system.
2. Design and adapt a lightweight base that is permanently fixed to the tower of the power system.- Many portable power systems in the market have been developing their products with built in bases. They are lightweight and are easy to assemble. By implementing a built in base to the design, customers will not have to worry about how they will be setting up.

**Key words:-**

Salivary gland tumors, Pleomorphic adenoma, Adenoid cystic carcinoma.

**Abstract**

**Background:** Salivary gland tumors are common neoplasms of head and neck region. These tumors are complex and some of them exhibit great deal of morphologic overlap. The majority of these neoplasms are benign. These tumours can occur in both major and minor salivary glands. 80% of major salivary gland tumours occur in the parotid glands, while most minor salivary tumours are located in the palate. As a general rule in clinical practice, the smaller the salivary gland is, the more likely the tumour is malignant.

**Objective:** This study was carried out to study the histopathological spectrum of salivary gland tumors and to know their pattern of distribution.

**Material and Methods:-** This is a two year retrospective study which was conducted in the Post graduate department of pathology Government Medical College Srinagar from January 2015 to December 2016. Post surgical specimens were studied in detail to know the histological patterns. In each patient, age, sex, site and histopathological diagnosis was seen from record section of the department. The histological diagnosis of each individual tumor was based on the 2005 WHO classification of salivary gland tumors.

**Results:-** During two year (from January 2015 to December 2016), 100 cases of salivary gland tumors were diagnosed with peak incidence in third to fourth decade (48%). Among these, 63(63%) cases were benign and 31(31%) cases were malignant. The commonest site was parotid gland (68%) followed by submandibular glands (19%) and minor salivary gland tumors were 13%.

## Introduction:-

Salivary gland neoplasms are rare lesions and represent less than 1% of all tumors and 3-5.5% of all head and neck tumors<sup>1,2</sup>. These comprise a wide variety of benign and malignant neoplasms, which exhibit difference not only in biological behavior but in prognosis as well. Tumours of salivary glands have the most varied spectrum. Approximately 80% of the salivary gland tumors are found in the Parotid gland and 10 to 15% in the submandibular gland. Majority of Salivary gland tumours are of benign histology (80-85%), with pleomorphic adenoma being the most common,<sup>3</sup> constituting 70% of benign tumours.

The mean age of patients with salivary gland tumours is 50 years with a peak in 6th and 7th decades of life<sup>4,5</sup>. Benign Salivary gland tumours occur more frequently in females whereas malignant tumors occur mostly in males<sup>6,7</sup>. Parotid gland is the most common site comprising about 70% of all salivary gland tumors<sup>8</sup>. Benign tumours mostly occur in the parotid gland comprising of about 80% most common being pleomorphic adenoma followed by Warthin tumor<sup>6</sup>. The most common malignant salivary gland tumour is the Mucoepidermoid carcinoma which involves mostly the parotid gland followed by the minor and submandibular gland<sup>9</sup>. Adenoid cystic carcinoma (originally known as cylindroma) is a generally slow growing but highly malignant neoplasm with a remarkable capacity for recurrence. In the parotid gland it is less common than the mucoepidermoid carcinoma and acinic cell carcinoma, but in the minor salivary glands it is the most common malignant tumour<sup>10</sup>. Acinic cell carcinoma comprises of 1-3 % of all salivary gland tumour. There is a male predominance and a peak incidence in the third decade of life.<sup>11</sup>

## Aims and Objectives:-

- To study histopathological spectrum of Salivary gland tumours.
- To classify benign and malignant lesions according to WHO Classification.
- To study the age, sex and site distribution of various salivary gland lesions.

## Materials and Methods:-

This is two year retrospective study which was conducted in the post graduate department of pathology in Govt. medical college Srinagar from January 2015 to December 2016, which included 100 cases of salivary gland tumours which were received in our department. These specimens were subjected to the routine processing and paraffin embedding. The sections were stained with routine Hematoxylin and Eosin (H &E) and examined. The relevant patient data such as age, sex, location of the tumor and histopathological diagnosis were taken from the record section of our department. The neoplastic lesions were classified according to the World Health Organization's histological typing of salivary gland tumors (2005).

## Results and Observations:-

In our study we received 100 cases of salivary gland tumours during two year period from January 2015 to December 2016, in which 63 cases (63%) were benign and 37 (37%) were malignant. Males predominate and were 69 cases (69%) where as females comprising of 31 cases (31%). Male to Female ratio was 2.2 : 1. The age range was from 17 to 77 years.

Among the all salivary gland lesions, the commonest lesion was pleomorphic adenoma which comprised of 42% of all lesions. Among benign salivary gland tumours pleomorphic adenoma was most common (42%) followed by warthin tumour (12%), basal cell adenoma (7%) and Myoepithelioma (2%). Similarly among malignant salivary gland tumours, Mucoepidermoid carcinoma was most common(17%) followed by Adenoid cystic carcinoma (12%), Carcinoma ex pleomorphic adenoma (4%), Acinic cell carcinoma and Polymorphous low grade adeno carcinoma

each comprising of 2% of cases. Among benign salivary gland tumours pleomorphic adenoma (47.6%), Warthin tumour (17.4%) and basal cell adenoma (8%) was most common in parotid gland.

From age wise distribution, it is observed that benign tumours of salivary glands were common in the second to fourth decade of life and malignant tumours were common from 5th decade onwards. Mucoepidermoid carcinoma was more common in males than in females with a male to female ratio of 3.2:1. Parotid was the most common site of occurrence for mucoepidermoid carcinoma (70.58%) followed by minor salivary glands (17.64%) and submandibular gland (11.76%). Of all 17 cases of mucoepidermoid carcinomas 9 cases (53%) were high grade, 5 cases (29.5%) were intermediate grade and 3 cases (17.6%) were low grade.

Adenoid cystic carcinoma was the second most common malignant salivary gland tumor (12%). Minor salivary glands (41.6%) were the most common site followed by submandibular gland (33.3%) and parotid gland (25%). Mucoepidermoid carcinoma (32.4%) and Carcinoma ex-pleomorphic adenoma (10.8%) were most most in parotid gland where as adenoid cystic carcinoma (13.5%) was most common in minor salivary gland.

In our study, male preponderance was seen in overall salivary gland lesions, but in benign tumours female predominance was seen 24 cases (38%). In malignant salivary gland tumours, there was an overall male predominance 30 cases (81%).

**Discussion:-**

In the present study out of 100 cases of salivary gland tumors, 63(63 %) were benign and 37 (37 %) were malignant. This observation was comparable to the studies including case series by Nepal A et al.<sup>12</sup>, Ali NS et al.<sup>13</sup>, and Moghadam SA et al.<sup>14</sup> where they noted a predominance of benign tumors over the malignant ones. The peak incidence of benign tumours in our study was between second to fourth decade which is similar to the other studies in the Asian subcontinent <sup>15, 16</sup>. The peak incidence of malignant tumors in our study was seen in the fifth decade onwards which is similar to the other studies in the literature<sup>17,18</sup>.

In the present study M: F ratio of malignant salivary gland tumours was 4.2:1 which is higher than the studies conducted by Ahmed et al <sup>19</sup>(M:F ratio 1.1:1), Mohd Ayub et al<sup>20</sup> (M:F ratio 2.25:1) and Iqbal MS et al <sup>21</sup>(M:F ratio 2:1).

In our study parotid gland was the commonest site of tumours (68%) followed by submandibular gland (19%) and Minor salivary glands (13%) which is almost same as studied by Ahmed et al<sup>19</sup>, Pablo et al<sup>22</sup>, Rewusuwan et al<sup>23</sup> and Bashir S et al<sup>24</sup>.

Out of total 42 pleomorphic adenomas in our study, majority occurred in the parotid gland 30cases (71.42%) followed by submandibular gland 9 cases (21.42%) and minor salivary glands 3 cases (7.14%). Potdar and Paymaster <sup>25</sup> reported 183 cases of pleomorphic adenomas, out of which 101 were involving parotid gland (55%).

Benign salivary gland tumours (63%) predominate over the malignant salivary gland tumours (37%). The study conducted by Deepak Soni et al<sup>26</sup> shows it to be 69.33% and 30.66% respectively. Pleomorphic adenoma was the most common salivary gland tumour accounting for 42% of all tumours and 66.6% of all benign tumours. Almost similar results were obtained by the study conducted by Bhavani K et al<sup>27</sup>. The male female ratio of pleomorphic adenoma was 1.8:1. The result was comparable with the result obtained by Vergas et al<sup>28</sup> which showed male female ratio of 2:1.

Warthin tumour comprising of 12% of all salivary gland tumours and 19% of all benign tumours. The study conducted by Pablo et al <sup>22</sup> shows it to be 10.48% and 13% respectively.

91.6% of Warthin tumour were found in the parotid gland which were almost similar to the results obtained by Mohd Ayoub et al<sup>20</sup> and Bashir et al<sup>24</sup>.

Mucoepidermoid carcinoma was the most common malignant tumour comprising of 27% of total malignant salivary gland tumours. The results obtained by the studies conducted by Deepak Soni et al<sup>26</sup> showed it 34.78%, Thomas et al<sup>29</sup> showed it 34.73% and Iqbal MS et al<sup>21</sup> showed it 40%. The peak incidence of Mucoepidermoid carcinoma was seen in 40-60 years with male predominance and male female ratio of 3.2:1 which correlates with the study conducted by Deepak Soni et al<sup>26</sup>.

In our study Parotid gland was the most common site (70%) for mucoepidermoid carcinoma followed by minor salivary glands (17.6%) and submandibular gland (11.7%). Richardson et al<sup>30</sup> reported 52 cases of mucoepidermoid carcinoma in the parotid gland out of 61 cases (85%).

In our study Adenoid cystic carcinoma comprising of 19% Of all malignant salivary gland tumours which correlates with the study done by Deepak Soni et al<sup>26</sup> (21.73%)

Minor salivary glands were the most common site of adenoid cystic carcinoma (41%) followed by submandibular gland (33.3%) and parotid gland (25%). Rewusuwan et al<sup>23</sup> found submandibular gland to be the most common site of adenoid cystic carcinoma in their study.

Carcinoma ex pleomorphic adenoma comprises of 10.8% of all malignant salivary gland tumours which correlates to the study conducted by Deepak Soni et al <sup>26</sup>

**Conclusion:-**

Salivary gland tumours exhibit broad histopathological spectrum. Benign tumours are more common than malignant tumours with Parotid gland being the most common site and Pleomorphic adenoma the most common tumour type. The hurdle in their management lies in the difficulty in distinguishing between benign and malignant tumours.

#### Abstract

The current study aimed to demonstrate the differences in hydatid cysts of *Echinococcus granulosus* (G6) camel strain by different viability status using secondary cyst development in the rat and to study physiological, immunological and histopathological changes associated with. A comparative study was conducted along time of exposure in different groups of rats which intraperitoneally injected with three different status of the viability of hydatid cyst fluid of camel origin (G6). The groups were: low viability protoscolices (1), high viability protoscolices fluid (2), not viable and not completely transformed to the calcareous status of protoscolices fluid (3), and one negative control group. The immunobiology of host-*E. granulosus* interactions were evaluated by measuring IL-10 a cytokine associated with immunoregulation of effector responses. Histopathological changes were conducted in liver, lung, and kidney because these organs are the target of infection and play an important role in the immune status of the host. Results showed that secondary infection by hydatid cyst fluid in the experimental model caused severe pathological changes which increased in rats of groups 2 and 3 along with the time of infection, in addition to considerable changes that revealed by hematological and biochemical tests. The median IL-10 level in rats of group 1 was 6.77 pg/ml compared to 5.74 pg/ml in control group, while the third group recorded the highest level equal 10.45 (above 10.0 pg/ml). The rats of the second group reached to 9.11 pg/ml, but no more survival of rats above 10.0 pg/ml. Elevated IL-10 levels were correlated with poor survival. We concluded that the most effective stage of hydatid cyst development was the stage before transformation to calcareous phase and the most effective changes in serological, biochemical, immunological and pathological changes occur during this stage.

## Introduction:-

Cystic echinococcosis is a chronic endemic helminthic disease caused by infection with metacestodes (larval stage) of the tapeworm *Echinococcus granulosus*. It is one of the most widespread parasitic zoonosis in animals and humans and one of the hygienic complications in both developing and developed countries (Budkeet *et al.*, 2006; Carmena *et al.*, 2008; Craig *et al.*, 2007; Menezes da Silva *et al.*, 2010). Hydatid cyst parasitizes many mammals including horses, camels, sheep, cattle, and man, in many organs (Rueda *et al.*, 1995) causes severe problems in different animal species especially in animals come in close contact with the final host (Namjoo and Arzanipour, 2014). In man, these cysts cause several complaints as pains or heaviness in abdomen and liver, cough, fatigue or anemia, and are often accompanied by hepatomegaly. It can also result in many acute complications such as anaphylactic responses depending on the number and location of the cysts (Rueda *et al.*, 1995). Ten strains of *E. granulosus* (G1–10) have been described with molecular biology techniques using mitochondrial DNA sequences (McManus and Thompson, 2003). The sheep strain (G1) and camel strain (G6) have a worldwide geographical distribution, specifically in North Africa, the Middle East and in some European countries (Dakkak, 2010; Khalifa *et al.*, 2014; Varcasia *et al.*, 2011). Comparative studies on the development of various isolates of the parasite have proved particularly useful, not only for speciation and taxonomy but also in the epidemiology and control of hydatidosis (Smyth & Davies, 1974; Thompson, 1977; Thompson, 1982).

On hydatid disease two alternative tools have been developed, one is in vitro culture and the other is laboratory animal models (Nakaya *et al.* 2006; Zak and Sande, 1999). Various species of animals (sheep, baboons, monkey, rabbits, mice, gerbils) and various ways of infection (intra-gastric administration of eggs, intraperitoneal, intravenous or subcutaneous injection of activated oncospheres and intraperitoneal inoculation of protoscolices or cysts) have been described (Zak and Sande, 1999). In this study, an attempt was made to develop hydatid cysts (G6 genotyping) in rats following intraperitoneal injection of protoscolices (different viability status) and following different changes occurred in rats of different groups along time of the experiment.

## Materials and Methods:-

### Collection of protoscolices:-

Naturally infected organs (lungs and livers) with hydatid cysts (G6) from camels were collected from El-Bassatein and El-Moneib abattoirs. Cyst fluids were aspirated using sterile disposable syringes and examined for fertility and viability. Cysts which contained no protoscolices (PS), as well as heavily suppurate or calcified, were considered infertile. Fertile cysts were subjected to viability test by centrifugation at 5,000 rpm for 30 min, a drop of the sediment containing the protoscolices was placed on the microscope glass slide and covered with the coverslip and observed for amoeboid-like peristaltic movements (flame-cell activity) with  $\times 40$  objective (Salih *et al.*, 2011). When it became doubtful or confusing to observe such movements, a drop of 0.1% Gentian violet dye solution was added to equal volume of protoscolices in hydatid fluid on a microscopic slide with the principle that viable protoscolices should completely or partially exclude the dye while the dead ones take it up (Macpherson 1985; Smyth and Barrett 1980). Protoscolices were isolated from the fertile cysts washed three times with phosphate buffer saline (PBS pH=7.2) and preserved in labeled sterile tubes contain the same volume of warm Hanks' Balarced Salt Solution (HBSS) for the experiment.

### Animals:-

Seventy-two male albino rats of *Sprague Dawley* strain, with average weight 160- 200 g were obtained from National Research Center, Dokki, Giza, Egypt. Animals were examined to be free from parasitic infection to avoid production of the antibodies before the experiments and kept in Animal house, Faculty of Science, Al-Azhar University, Cairo, Egypt under standard laboratory care of 21°C, 16% moisture, with water available *ad-libitum* and diet contains 20% protein, 3% fat, and 22% fiber. Rats were acclimatized for 7 days before the start of the experiment. Animal experiments were carried out according to Institutional Animal Care and Use Committee, National Research Centre Animal Care Unit.

### Experiment design:-

Animals were randomly divided into four groups (18 rats/ each) as follows: the first group intraperitoneally (IP) injected with low viable protoscolices (380 PS in 0.5 ml HBSS/rat), the second group IP injected with high viable protoscolices (1000 PS in 0.5 ml HBSS/rat), the third group injected with 0.5 ml/ rat of semi-calcareous fluid, before completely calcification, and has no protoscolices, whereas the fourth negative control group administrated with only HBSS. After injection, rats daily examined to monitor external and morphological changes for 3 weeks before

scarifying. Three animals per group were sacrificed at the end of each week from the 3<sup>rd</sup> to the 8<sup>th</sup> weeks (6 weeks) post infection for post-mortem examinations. Before scarifying, rats of the second and third groups died earlier at the 7<sup>th</sup> and 6<sup>th</sup> weeks respectively.

#### **Blood collection and preparation:-**

Rats were anesthetized using cotton wool soaked in chloroform and the abdominal cavity was opened until the sternum using medical scissors. The blood samples were directly drawn from the heart using 5ml sterile syringe into clean, dry centrifuge tubes that allowed to stand for 10 minutes at room temperature, then centrifuged at 3000rpm for 15 minutes using laboratory centrifuge (SM 800B, Surgifriend Medicals, England). Sera were carefully removed and stored frozen at -80° C until used for biochemical and immunological analyzes. Blood used for hematological analysis was collected into heparinized sample tubes containing EDTA to prevent the blood from clotting and taken for analyzes within 24 hours of collection.

#### **Hematological studies:-**

Hematological parameters including red blood cells (RBCs), white blood cells (WBCs) and platelets count in addition to hemoglobin level, hematocrit, mean cell hemoglobin (MCH), mean cell hemoglobin concentration (MCHC), mean cell volume (MCV) were accomplished. The samples were analyzed using the automated hematologic analyzer SYSMEX, KX-21 (Japan) as described by Dacie and Lewis, (1991).

#### **Biochemical analysis:-**

Serum samples were analyzed for total protein (Biuret method) (Smith, 1985), albumin (BromoCresol green (BCG) (Doumaset *et al.*, 1971), cholesterol (Cholesterol Oxidase/ Peroxidase method) (Allainet *et al.*, 1974), Bilirubin (Ballisteri and Shaw, 1987) and glucose (Caraway and Watts, 1987). The activity of liver enzymes Alanine aminotransferase (ALAT), Aspartate aminotransferase (ASAT) was measured by (Gella *et al.*, 1985) method, acid phosphatase (AcP) (Hilman and Klin, 1971), alkaline phosphatase (ALP) (Rosalkiet *et al.*, 1993) and Gamma-glutamyl-transpeptidase (GGT) by SZASZ method (Orlowski and Meister, 1963). All biochemical parameters were determined using a Technicon RA-2000 random access, automated analyzer.

#### **Measurement of cytokines in serum:-**

Rat IL-10 ELISA kit is an in vitro enzyme-linked immuno-sorbent assay for the quantitative measurement of rat IL-10 in serum, plasma, and cell culture supernatants. This assay employs an antibody specific for rat IL-10 coated on a 96-well plate. Standards and samples are pipetted into the wells and IL-10 present in a sample is bound to the wells by the immobilized antibody. The wells are washed and the biotinylated anti-rat IL-10 antibody is added. After washing away unbound biotinylated antibody, HRP- conjugated streptavidin is pipetted to the wells. The wells are again washed, a TMB substrate solution (12 ml of 3, 3,5,5'- tetra-methyl-benzidine in buffer solution) is added to the wells and color develops in proportion to the amount of IL-10 bound. The stop solution (8 ml of 0.2 M Sulfuric acid) changes the color from blue to yellow, and the intensity of the color is measured at 450nm. The data was calculated by measuring the mean absorbance for each set of duplicate standards, controls, and samples, and subtract the average zero standard optical density. The standard curve was plotted on log-log graph paper or using Sigma plot software, with a standard concentration on the x-axis and absorbance on the y-axis. (RayBio® ELISA Kits).

#### **Histopathological preparation:-**

At the end of each week, as shown earlier, portions of liver, kidney, and lung were washed in saline solution and fixed in 10% formalin for 24-48 hours at room temperature, embedded in paraffin and sectioned at 4-6 micrometers. Sections stained with haematoxylin-eosin stain using standard histological technique according to Bancroft (1975) for histopathological examination by Olympus BX51 light microscope.

#### **Statistical analysis:-**

The results were expressed as Mean  $\pm$  standard deviation (SD) of the mean. The significance difference between means was evaluated by one-way analysis of variance (ANOVA) followed by post hoc test for the comparison of significance using the Statistical Package program (SPSS version 23). Values of  $P < 0.05$  were considered as statistically significant.

## Results:-

### Parasitology Results:-

The current study revealed several external changes that represented in weight loss, loss of body hair and blindness in the infected groups at the end of the experiment, however, the visual inspection after the autopsy showed different changes as internal bleeding and splenomegaly. Autopsy results detected the appearance of laminated layer stage in livers and kidneys of groups 1, 2 and 3 that started at weeks 7, 6 and 3 after injection respectively (Fig. 1a, 1b) while, protoscolices formation appeared in the last rat of the first group at the end of the experiment. Cysts formation showed in all the infected groups as it appeared at week 7 and 8 in the livers and kidneys of rats in group 1. On the other hand, the second group showed cysts formation in rats' liver at the 7<sup>th</sup> week of infection, while all rats of group 3 showed a formation of cysts in both kidneys and livers starting from the third week of infection until the death of animals earlier at the 5<sup>th</sup> week of infection. No cysts formation were observed in other organs along the experiment. Nucleated layer (N. L.), brood capsule (B. C.), and protoscolices formation (P.) stages were reported in kidneys of group 1 at 8<sup>th</sup> week of the experiment. Also, a smear provoked from hydatid cyst showed hooks (Fig. 1c).

**Fig 1:-**Showing the four stages in the development of secondary hydatid cysts

### Hematological and biochemical results:-

In the current study, the effect of *E. granulosus* infection with different viability status on the hematological and serum biochemical parameters was studied for 6 weeks except for groups 3 and 2 where all animals died earlier at the 6<sup>th</sup> and 7<sup>th</sup> week of administration was summarized in tables (1) and (2) respectively.

Hematological parameters in the control and *E. granulosus* infected groups were recorded after 3 weeks of infection at the end of every week revealed that there was a gradual increase in the white blood cells (WBC) along with time in all studied groups as compared to control. On the other hand, the red blood cells (RBC), hemoglobin (HB) and packed cell volume (PCV) were gradually and significantly decreased all over the infected groups in a dose and time-dependent manner as compared to the control. The lowest values were estimated after 8 weeks of infection in the 1<sup>st</sup> group as all animals in both of group 2 and 3 died at the beginning of the 7<sup>th</sup> week of infection. Likewise, platelets showed a significant decline all over the infected groups in a time-dependent manner with some fluctuations as compared to the control. Mean corpuscular volume (MCV) recorded increased values in groups 1 and 3 except for group 2 that showed unchanged values until the 6<sup>th</sup> week of infection where it recorded a significant decrease as compared to the control values. Meanwhile, mean corpuscular hemoglobin concentration (MCHC) exhibited a significant decline in all treated groups at the beginning of the study that restored to be very close to normal at the 4<sup>th</sup> week except for group 3. Unfortunately, the values could not be followed for both group 2 and 3 as all animals died, but group 1 values showed a continuous decline in MCHC throughout the remaining time of the experiment. However, no significant difference in the mean corpuscular hemoglobin (MCH) between the values of treated groups and those of control was detected (Table 1).

Total protein values showed a significant increase after infection by *E. granulosus* throughout the experiment as compared to the control (Table 2). Meanwhile, albumin exhibited an insignificant decline in the different infected groups with some fluctuations especially in group 2. Moreover, the average globulin levels recorded a significant elevation that becomes clearly noticed from the 4<sup>th</sup> week of the experiment with the highest level in the third group as compared to the normal control. Infected rats showed a gradual significant increase in the glucose levels analog with time after exposure to *E. granulosus* in the different treated groups as compared to control. However, cholesterol levels showed great fluctuations that end in elevation in some groups. Peritoneal administration of *E. granulosus* showed an overall increase in the ASAT and ALAT activities in all groups in a time-dependent manner where the highest levels were obtained after 6 weeks in group 2 as compared to the control. However, *E. granulosus* infection did not show any significant change in the GGT activities in groups 1 and 2, its activity recorded gradual

significant increased values in group 3. In addition, group 1 showed a slight increase in GGT values in the last two weeks of the experiment. Furthermore, *E.granulosus* (G6), camel strain, infected rats showed a marked increase in the levels of serum ALP in comparison with that of control rats as shown in Table (2). No significant difference was detected in AcP levels in group 2, however, its level in group 1 and group 3 showed a gradual significant change that was inversely related to time in group 1 as compared to control. On the other side, the effect of *E.granulosus* showed an increased trend in bilirubin levels that was more pronounced in group 1 as compared to control.

**Table 1:-**Hematological parameters of the infected rats with different doses of *Echinococcus granulosus* as compared to control group.

#### Immunological results:-

The first signs of immune reaction can be observed with the naked eye in the liver, as the small accumulation of cells and appearance of hydatid cyst, as early as 3 weeks after infection. In the early phase of echinococcosis infection (21 days post infection), the concentrations of IL-10 in the sera of the infected rats of group 1 was the same as that of healthy control rats. However, comparing IL-10 concentration for the other two groups recorded increased levels that reached maximum level in rats of group 3. By progression, in the time of the experiment, we noticed a gradual increase in IL-10 levels (Table 3). We also observed when measured IL-10 levels in serum of infected rats; Group (1) still in low levels by comparison with other groups until the end of the experiment (56 days). Group (2) showed gradually increasing until 42 days after the rest of rats died. Group (3) started by an approximately high level of IL-10 and increased until reached to peak (10.45) in 35 days in the last rat of group 3.

### Histopathological results:-

The present study showed the histopathological changes produced mainly in kidneys, liver and to a lesser extent in lungs of rats which appeared as morphological changes, and also autopsy results showed the presence of hydatid cysts especially in both liver and kidney organs:

**Table 3:-** The change in Interleukin-10 (pg. /ml) levels in infected rats with different doses of *Echinococcus granulosus* as compared to control group.

### Liver:-

The histological sections in the liver of rat group3 (21days post-infection) showed focal hepatic necrosis associated with inflammatory cells infiltration as well as apoptosis of hepatocytes in addition to sinusoidal leukocytosis (Fig.2a, b,c). Also the histological sections in the same group but in 28 days post infection showed severe pathological changes which increased with post-infection (Fig.3a). These changes were Kupffer cells activation and small focal hepatic necrosis associated with inflammatory cells in addition to portal infiltration with eosinophils and cystic dilatation of bile duct and fibroplasia in the portal triad around the bile duct (Fig.3b), and at end of experiment the

liver of the last rat in group 1 showed dissociation of hepatic cords and cytoplasmic vacuolation of hepatocytes (Fig.3c).

**Fig 2:-**Sections of rat livers of group 3 after 3 weeks of infection showing focal hepatic necrosis associated with inflammatory cells infiltration as well as apoptosis of hepatocytes (a), sinusoidal leukocytosis (b), and Kupffer cells activation and small focal hepatic necrosis associated with inflammatory cells infiltration (c) (H & E X 400).

**Fig 3:-**Sections of rat livers of group 3 after 4 weeks post infection showing Kupffer cells activation and portal infiltration with eosinophil (a), and dilatation of bile duct and fibroplasia in the portal triad around the bile duct (b). Whereas, liver of rat from group 1 in 56 day post infection showing dissociation of hepatic cords and cytoplasmic vacuolation of hepatocytes (c) (H & E X 400).

#### **Kidney:-**

The histological sections in the kidney of infected rat groups are demonstrated in Figures 4a-c and 5a-g. Kidney of rats in group 1 revealed inflammatory cells infiltration in the renal capsule, atrophy of some glomerular tuft, congestion, and hypertrophy of another glomerular tuft, also results showed hyper-cellularity of glomerular tuft. Histopathological changes which occurred in 5 weeks post infection in the rats of groups (2 & 3) which increased by increasing the time represented in the eosinophilic proteinaceous material in the lumen of renal tubules. Hyper-cellularity of the glomerular tuft and the eosinophilic proteinaceous material in the lumen of renal tubules. Thickening of the glomerular basement membrane and focal inflammatory cells infiltration. Vacuolation of tubular epithelium, atrophy of glomerular tuft and distension of Bowman's space. Slight distension of Bowman's space, and thickening of glomerular basement membrane with congestion of glomerular tuft.

**Fig 4:-**Sections of rat kidneys of groups 2 & 3 after 5 weeks post infection showing inflammatory cells infiltration in the renal capsule (a), atrophy of some glomerular tuft, congestion and hypertrophy of other glomerular tuft (b), and congestion and hypertrophy and hyper-cellularity of glomerular tuft (c) (H & E X 400).

**Fig. 5:-**Sections of rat kidneys of group 1 after 6 weeks post infection showing hyper-cellularity of glomerular tuft (a), eosinophilic proteinaceous material in the lumen of renal tubules (b, c), thickening of the glomerular basement membrane and focal inflammatory cells infiltration (d), Vacuolation of tubular epithelium, atrophy of glomerular tuft and distension of Bowman's space (e), slight distension of Bowman's space, and thickening of glomerular basement membrane with congestion of glomerular tuft (f).

#### Lung:-

Pathological examination of alveolar tissues in the present study revealed that chronic interstitial pneumonia, interstitial pneumonia, and haemosidrosis, in the rat of group 1 in 8 weeks, while the last rat of group 3 at 5 weeks showed the same results in addition to perivasculitis (Fig. 6a-c).

**Fig. 6:-** Sections of rat lungs of group 3 after 6 weeks post infection showing chronic interstitial pneumonia (a), perivasculitis (b), haemosidrosis (c). Lung of rat from group 1 in 56 day post infection showing chronic interstitial pneumonia and haemosidrosis (d) (H &E X400).

#### Discussion:-

Although the last decade has clarified many aspects of host-parasite relationship in human cystic echinococcosis, establishing the full mechanisms that cause the disease in other intermediate hosts requires more studies (Siracusano *et al.*, 2012). It is generally accepted that *Echinococcus* is unaffected by the immune response during the developing stage. However, natural infections in sheep indicate that some cysts can be killed during the latter stages of development (Zhang and Zhao, 1992), with the relatively frequent occurrence of dead, calcified metacestodes or necrotic cysts. In our experimental study, Hydatid cysts of *E. granulosus* developed in internal organs (mainly the liver and kidney) of the three group rats as unilocular fluid-filled bladders that consist of two parasite-derived layers, an inner nucleated germinal layer and an outer a cellular laminated layer surrounded by a host-produced fibrous capsule. Brood capsules and protoscolices (PSC) bud off from the germinal membrane. Some cysts indicate enlargement in size, but in some portions active small-cysts takes place. These enlarged cysts have a close relation to brood capsule and scolex formation. In addition, no calcification could be detected in those lesions growing rapidly along this short cycle in early infection until the end of the experiment. A previous study by Holcman and Heath (1997) showed that secretions from the penetration glands of hatched and activated oncospheres of *E. granulosus* because lysis of host tissues may protect the parasite against the host immune response while the

laminated layer develops. Another study by Rogan (1988) explained that as the primary cyst having degenerated, leaving the cavity full of host leukocytes and protoscolex-derived daughter cysts. In our opinion, the infection is in progress not in the abortive form of the disease. Moreover, the progression of cyst degeneration does take place in group 3, then 2 and after that group 1 in ascending order may signify increased immunological stimulation with cyst progression. This in contrast to the reports by Wang *et al.* (2011) that they considered the mild calcification was easy to be detected in those lesions growing rapidly in short cycle.

In the present study, the increasing trend of WBCs may be considered as a defense mechanism against the inflammatory processes which may be produced in the body (especially in the liver) and lead to an increase of WBCs production of the stimulated bone marrow. Likewise, Younuset al., (2016) have been related these changes to the lytic effect of the newly developing *E. granulosus* hydatid cysts. These results are in agreement with the findings of Al –Nasiri, 2006; Moraitakiet al., 2010; Khalaf, 2013. Previous studies in experimentally induced secondary infections in mice, intraperitoneally injected PSC are surrounded by a considerable cellular infiltration within 3 days, initially involving activated macrophages and subsequently including neutrophils, eosinophils, and lymphocytes (Richards *et al.*, 1983; Riley *et al.*, 1986; Riley *et al.*, 1985). As far as, red blood cells, platelets, hemoglobin and packed cell volume are usually kept in normal levels through a balance between the new formation and the destruction of old cells in the control group. Our investigation recorded a significant decrease in these parameters which come in a dose and time-dependent manner that may be attributed to increased hemolysis or disturbance in the hemopoietin system which slows of its production (Guyton, 1993). Moreover, Frayha and Haddad, 1980 and Akhtar *et al.*, 1998 related these changes to HCF enzymes that cause an increase in the blood cells destruction. Similar results were obtained from previous studies by Tanveeret al., 1997 and Akhtar *et al.*, 1998 whereas Khalaf, 2013 reported no changes in these parameter concentrations in rats with *E. granulosus*. Increased MCV and decreased MCHC that observed in the inoculated groups of this study may indicate a macrocytic hypochromic anemia that cope with the increasing demand of oxygen requirement. The erythrocyte enlargement may be related to an accumulation of fluids after disturbance of cell membrane permeability. Similar findings have also been previously reported (Akhtar *et al.*, 1998; Xhemollari *et al.*, 2016).

Determination of plasma proteins reported having significant prognostic and diagnostic values, especially in liver diseases. Results of the present study revealed a marked increase in serum total protein that may be imputed to increased release of tissue specific enzymes and other intracellular proteins secondary to parasite-induced cell membrane disruption (Orhue and Nwanze, 2004). Similar findings have been reported by Tanveeret al. (1997) and Radfar and Iranyar (2004) but they attributed this increase in protein to incoming CHCF that already contained different kinds of proteins. Rueda *et al.*, 1995 and Anwar and Tanveer, 2000 interpreted this elevation in protein concentration with time by the formation of antibodies against antigens present in hydatid cyst fluid (HCF). In agreement with this, our findings revealed a statistically significant elevation in globulins. As far as serum globulins were concerned, several reports determined its alterations with various parasites and revealed its increase specifically in the endoparasites infection Ayazet al., 2007; Dede *et al.*, 2014). On the other hand, our results disagree with those reported by Smyth (1979) and Meduri *et al.* (1990) that reported a decline in protein level and related this to its use by the parasite, since the protoscolices of *E. granulosus* can digest host proteins. A drop in albumin levels was determined in our results in spite of there were no statistical difference as compared to control that may be attributed to the long half-life of albumin, therefore, a decrease in serum albumin is usually not apparent early in the course of liver diseases (Halsted and Halsted, 1981; Cheesbrough, 1998). This hypoalbuminemia may imply a combination of impaired synthesis and loss via the gut, kidney or both as revealed by several studies in various parasite diseases (Yeruhamet al., 1998, Turgut, 2000; Zygnere *et al.*, 2007).

Our biochemical results revealed a marked increase in glucose in the experimentally infected animals that may be due to the effect of the infection on the liver which play an important role in the glucose metabolism (Khalaf, 2013) or occurrence of glycolysis and gluconeogenesis cycles which related to energy production within parasite cyst (El-Bayati *et al.*, 2010). This in accordance with Shaafie *et al.*, 1999 and Muhsin *et al.*, 2015 who recorded high levels of glucose in the primary intermediate host. As far as the activity of enzymes is concerned, ALP, ALAT and ASAT activities were also measured showed an increase among the treated groups compared to the negative control group. Several studies have also previously reported significant increases in ALP, ALAT, and ASAT activities in *E. granulosus* infected animals (Abdulla, 2007; Shindala *et al.*, 2007). These studies explained that the liver infection with Cestodes tapeworms led to hepatocyte destruction and enzyme release or even indicates a cellular response. On the other hand, AcP values were closely related to the control values at the beginning of the experiment then trend to decrease with time. Rahman *et al.* (1992) suggested that the decrease in the activities of AcP might be due to the

increased permeability of plasma membrane or cellular necrosis that showing the stress condition of the treated animals. Taken together, the serum total bilirubin concentrations were dramatically increased in *E. granulosus* infected groups that may be related to additional enzymes produced by the protoscolices and/ or brood capsule (Anwar and Tanveer, 2000). Increased quantity of total bilirubin also may indicate the increased breakdown of hemoglobin that interprets the decreasing levels in hemoglobin and RBCs levels of our investigation.

During cystic echinococcosis (CE) the host-parasite relationship is interactive and the outcome of infection depends on the balance achieved by the combination of the different variables involved with the host immunity and the *E. granulosus* avoidance strategies (Siracusano *et al.*, 2008). There is no direct evidence that the viability, death or calcified of such cysts is due to an immunological phenomenon, but it is a likely possibility. In addition, there are no detailed studies of immunological events associated with the degeneration of different types of the cyst, and it is, therefore, unknown which mechanisms may be involved. Our experimental study in rat supported the possible local immunosuppression mediated by IL-10 as a possible mechanism that helps the parasite in escaping the host cell-mediated response in agree with Mondragón-De-La-Peña *et al.* (2002).

The co-expression of IL-10 and IFN- $\gamma$  at high levels in human hydatidosis suggests that the immune response to *E. granulosus* infection may be due to the very complex mixture of antigens in hydatid cyst fluid (McManus and Bryant, 1995) which probably contain distinct epitopes for each T-cell subset. Like other helminthic infections (Finkelman *et al.*, 1991; Lange, *et al.*, 1994; Pearce *et al.*, 1991), echinococcosis induces two very distinct Th1 and Th2 cytokine secretion patterns. It is not understood why hydatid infection can induce high levels of both Th1 (produce IL-2, IFN- $\gamma$ , and lymphotoxin), and Th2 cytokines (express IL-4, IL-5, IL-6, IL-10) since they usually down-regulate each other (Pearce *et al.*; 1991). In our results, elevated levels of IL-10 that produced in vivo experimental infection were correlated with poor survival in rats and accompanied with severe pathological changes which increased in rats of high and calcareous groups and period post-infection. This is in agreement with Haralabidis *et al.* (1995) who reported that primary and secondary infections elicit similar responses, which include elevated levels of IL-10. And the increased production of IL-10 in hydatid disease patients corresponds to high levels of IgE (Babba *et al.*, 1994).

### **Conclusion:-**

The effective stage of hydatid cyst development was the stage before transformation to calcareous stage. The most effective changes in serological, biochemical, immunological and pathological changes occur during this stage. Secondary infections by hydatid cyst fluid in experimental rats caused an alteration in liver functions in addition to changes in blood and body chemistry which showed by hematological and biochemical tests. Elevated IL-10 levels were correlated with poor survival in rats. Microscopically examination of livers and lungs of animals of different groups showed severe pathological changes which increased in rats of low and calcareous groups and period post-infection. The change of physiological parameters could be considered as a good diagnostic and reliable indicator to monitor the progress and severity of *E. granulosus* infection.

### **Ethical approval:-**

All applicable international, national, and/or institutional guidelines for the care and use of animals were followed.

### **Conflict of Interests:-**

The authors declare that they have no conflict of interests regarding the publication of this paper

#### Abstract

Traffic control can be regarded as a multi agent application in which car-agents and traffic-light-agents need to coordinate with each other to optimize the traffic flow and to avoid congestions. It is important to know the road traffic density real time especially in mega cities for signal control and effective traffic management. Traffic lights play an important role in the traffic management. The existing traffic lights follow the predetermined sequence. So these lights are called static traffic lights. These traffic lights are not capable to count the number of vehicles and the priority of the vehicles on intersection point. As a result some vehicles have to wait even there is no traffic on the other side. The vehicles like Ambulance and Fire Brigade are also stuck in traffic and waste their valuable time. In this paper, we propose an adaptive traffic light control algorithm that adjusts both the sequence and length of traffic lights in accordance with the real time traffic detected. Our algorithm considers a number of traffic factors such as traffic volume, waiting time, vehicle density, etc. and system also provides quality of service to Emergency vehicles.

#### Introduction:-

This paper presents an automatic road traffic management systems that manage road traffic with the goal of improving traffic safety, optimizing the speed of the flow of traffic, and minimizing the energy consumption of vehicles running on the roads. Most existing work use a fixed sequence for traffic lights control, and take minimum average waiting time and number of vehicle stops as objectives. Most of them use the sensor to calculate current volume of traffic but this approach has the limitation that these techniques based on counting of the vehicles and treats a emergency vehicles as the ordinary vehicles means no priority to ambulance, fire brigade or V.I.P vehicles. With this system, we can consider the priority of different type of vehicles and also consider the density of traffic on the roads by installing RF reader on the road intersections. Radio frequency identification is a technique that uses the radio waves to identify the object uniquely. Section {I} represents the method a model problem and some notation and traffic control algorithm to detect the traffic condition, and then determine green light sequence and the green light length , section {II} represents the performance of our algorithm through simulation and implementation and section {III} represents provides approach to information regarding the priority of the vehicle and type of the vehicle with the help of VIN based on RFID Technique. Radio frequency identification is a technique that uses the radio waves to identify the object uniquely. RFID is a technique that is widely used in the various application areas like medical science, commerce, security, Electronic toll collection system, access control etc. There are three main components of RFID: RFID tag, RF Reader and Database. Various types of tags are available but we can mainly

divide them into two categories: passive tags and active tags. The passive tags don't contain any internal power source. There are three parts of the tag: antenna, semiconductor chip and some form of encapsulation. The life of the passive tag is very long. The reader sends electromagnetic waves that produce current in the tag's antenna. In response antenna reflects the information stored in it. The active tags contain a battery as an internal power source used to operate microchip's circuitry and to broadcast the information to the reader. The range and cost of these tags is more as compare to passive tags . We have three kinds of tags which work on the three different frequency ranges: low – frequency, high-frequency and ultra high frequency. The Low frequency tags works on frequency lies between 30 ~ 300 KHZ and High Frequency and Ultra High Frequency Tag works on the frequency range lie 3 ~ 30 MHZ and 300 ~ 3 GHZ respectively

**Problem Modeling and Notations:-**

How to respond to a dynamically changing traffic environment adaptively to improve controlling efficiency. the efficiency includes maximum intersection throughput (the number of vehicles passing through the intersection), and minimum vehicle's average waiting time. the efficiency includes maximum intersection throughput (the number of vehicles passing through the intersection), and minimum vehicle's average waiting time. has two sensor nodes, one is installed at the intersection and the other is with a given distance, called *Sensor Distance*, from the intersection.

Fig. 1. Isolated Intersection

Subject to traffic safety rules, there exists a maximum of twelve different possible cases of green lights, in Fig. 2. Therefore, in face of dynamically changing traffic environment, the problem is transformed to decide which case should obtain green light next and how long it should last for.

Fig. 2:- Twelve possible configurations of green lights

To formulate the problem, we use the following notations, and assume that all vehicles run at a constant speed *speed* and all the vehicles are in the same type:

$I = \{\text{north, south, east, west}\}.$

$J = \{\text{forward, left}\}.$

$R = \{1,2,3,\dots,8\}.$

$C = \{1,2,3,\dots,12\}.$

$TP$ : total throughput.

$AVGWT$ : average waiting time.

$T$ : total time period.

$DP(k, t)$ : number of vehicles passing through the intersection at case  $k$  at time  $t, k \in C$ .

$WT(k, t)$ : sum of vehicles' waiting time at case  $k$  at time  $t, k \in C$ .

$RM(k, t)$ : number of vehicles at case  $k$  at time  $t, k \in C$ .

$Xy1$ : sensors installed at the intersection in lane  $y$  at direction  $X, X \in I, y \in J$ .

$Xy2$ : sensors installed with distance *Sensor Distance* from intersection in lane  $y$  at direction  $X, X \in I, y \in J$ .  
Efficiency:

$$Max\ TP = Max \frac{\sum_{t=1}^T \sum_{k \in C} DP(k,t)}{T}$$

$$Min\ AVGWT = Min \frac{\sum_{t=1}^T \sum_{k \in C} WT(k,t)}{\sum_{t=1}^T \sum_{k \in C} RM(k,t)}$$

Equation 1 calculates the maximum number of vehicles passing through the intersection within a unit of time ( $TP$ ), Equation 2 calculates the minimum vehicle's average waiting time ( $AVGWT$ ) during time period  $T$ .

**Proposed Algorithm:-**

Traffic light control algorithm based on the above established model. The algorithm contains three steps: vehicle detection, green light sequence determination and light length determination. Vehicle detection detects and calculates traffic information in real-time. Green light sequence determination uses the traffic information to determine the next green light to the case in the most need. Light length determination determines how long the green light will last for. At the beginning, we set a control cycle  $T_{control}$  first, which is defined as an upper bound of light length. This value of  $T_{control}$  is based on expert knowledge.

**Vehicle Detection:-**

The first step is to detect arrival and departure rate of vehicles in each lane, and then collect relevant data, with sensor nodes installed in each lane of the intersection, as illustrated in Fig. 1. Sensor nodes detect the number of vehicles in each lane and each vehicle's ID and type.  $Xy1$  is responsible to detect vehicles at the intersection,  $Xy2$  is responsible to detect vehicles from the intersection with distance *Sensor Distance* mentioned. *Sensor Distance* is equal to  $T_{control} \times speed$  so that  $Xy1$  will get the information of the vehicles which will reach the intersection after  $T_{control}$  time in advance through the communication between  $Xy1$  and  $Xy2$ . Using these detected data, the arrival rate and departure rate in each lane real-time can be determined. In a lane having green light, both arrival and departure rates are calculated in real-time. In a lane having red light has the departure rate of zero and the arrival rate reflects how many vehicles are waiting in the lane. Because each vehicle has a length  $L_{vehicle}$ , we divide lane length  $L_{lane}$  into  $m$  intervals with the same length  $L_{interval}$  equal to  $L_{lane} / m$ , shown as  $D1, D2, \dots, Dm$ .  $Di$  is demonstrated as interval  $[di-1, di]$ ;  $di$  is defined as the distance to the intersection, which equal to  $i \times L_{interval}$ .  $RM(Di, t), AR(Di, t), DP(Di, t)$  are defined as number of vehicles in, arriving in and departing from  $Di$  at time  $t$ , respectively. The arrival rate in  $Di$  at time  $t$  is equal to the departure rate in  $Di+1$  at time  $t - 1$ , and then  $RM(Di, t)$  can be calculated (in equation 3 and equation 4). After that,  $G(Di)$  can be determined (in equation 5), which is defined as the density of traffic flow in interval  $Di$ , and then the density of traffic flow in the lane  $VDDF(D1, D2, \dots, Dm)$  can be demonstrated in equation 6.

$$AR(D_i,t) = DP(D_{i+1},t-1) \tag{3}$$

$$RM(D_i,t) = \max\{RM(D_i,t-1) + AR(D_i,t) - DP(D_i,t), 0\} \tag{4}$$

$$G(D_i) = \frac{RM(D_i,t)}{L_{interval}} \tag{5}$$

$$VDDF(D_1, D_2, \dots, D_m) = f(G(D_1), G(D_2), \dots, G(D_m)) \tag{6}$$

This is a nonlinear function, a random function example is shown in Fig. 3. Different interval has different traffic flow density, that is different number of vehicles. At some intervals, there exists a sub-interval without any vehicle in, and its length is larger than  $L_{vehicle}$ . Here, we define this sub-interval as a *blank*. In order to check blank

accurately,  $L_{interval}$  should be equal to  $2.5 \times L_{vehicle}$ . Then, if there exists a  $G(Di)$ , whose value is lower than 0.4 and higher than 0.2, we can decide that there is a blank in  $Di$  and the blank length  $L(blank)$  is equal to  $L_{vehicle}$ . If there exists a  $G(i)$ , whose value is lower than 0.2, we can decide that there is a blank in  $G(Di)$  and  $L(blank)$  is equal to  $2 \times L_{vehicle}$ .

**Green Light Sequence Determination:-**

The second step is to make a decision to determine green light sequence, using the traffic data real-time. In order to make this decision, we define  $GLD(k, t)$  to indicate the case  $k$ 's green light demand at time  $t$ , so that the case which has the most urgent demand should get the green light following. Since our objectives are to maximize the throughput and minimize the average waiting time, number of vehicles in each lane detected, their corresponding waiting time, the blank circumstance are influential factors. To guarantee that each case would not wait too long, hunger level as well affect the green light sequence determination decision-making.

Furthermore, special circumstance and effect from the adjacent intersections can play a role, too. Equation 7 demonstrates all the factors of  $GLD(k, t)$ .

$$GLD(k,t)=a_1 \times TV(k,t)+a_2 \times WT(k,t)+a_3 \times HL(k,t) + a_4 \times BC(k,t)+a_5 \times SC(k,t)+a_6 \times Neibor(k,t) \tag{7}$$

Here,  $TV(k, t)$ ,  $WT(k, t)$ ,  $HL(k, t)$ ,  $BC(k, t)$ ,  $SC(k, t)$ ,  $Neibor(k, t)$  are defined as the weight of traffic volume, average waiting time, hunger level, blank circumstance, special circumstance and influence from neighboring intersections of case  $k$  at time  $t$ , respectively,  $a_i$  are defined as the coefficient of these parameters to demonstrate their priorities,  $i = 1, 2, 3, 4, 5, 6$ . In our problem, since the distance between two intersections is longer than  $SensorDistance$ ,  $Neibor(k, t)$  can be ignored in this problem. Therefore, we discuss the 4 main factors as follows.

**Factor 1) Traffic Volume:-**

After  $VDDF(d, RM(t))$  calculation, we can calculate the weight of traffic volume of each case. To calculate  $TV(k, t)$ , we need to obtain  $TraVol(i, t)$  first, which is defined as the total number of vehicles in the lane  $i$ , from time  $t$  to following  $Tcontrol$  time.  $FV(i, t)$  is defined as number of vehicles which would reach the intersection at time  $t$  in the lane  $i$ ,  $i \in R$ . Equation 8 shows  $TraVol(i, t)$  in lane  $i$  with the green light at time  $t$ , and equation 9 shows  $TraVol(i, t)$  in lane  $i$  with the red light at time  $t$ . So, traffic

volume in case  $k$  can be obtained (in equation 10),  $u, v$  are two lanes of case  $k$ . Then, the traffic volume weight can be calculated (in equation 11). Higher  $TV$  brings more influence in decision-making.

$$TraVol(i,t)=RM(i,t)+ \sum_{j=1}^{Tcontrol} (FV(i,t+j)-DP(i,t+j))+\Sigma L(blank) \tag{8}$$

$$TraVol(i,t)=RM(i,t)+ \sum_{j=1}^{Tcontrol} FV(i,t+j) \tag{9}$$

$$TraVol(k,t)=TraVol(u,t)+TraVol(v,t) \tag{10}$$

$$TV(k,t)= \frac{TraVol(k,t)}{\sum_{k \in C} TraVol(k,t)} \tag{11}$$

**Factor 2) Waiting time:-**

To calculate  $WT(k, t)$ , we need to obtain  $AVGTwait(i, t)$  first, which is defined as average waiting time in lane  $i$ , from time  $t$  to following  $Tcontrol$  time. Equation 12 shows  $AVGTwait(i, t)$  in lane  $i$  with the green light at time  $t$ , and equation 13 shows  $AVGTwait(i, t)$  in lane  $i$  with the red light at time  $t$ . So, average waiting time in case  $k$  can be obtained (in equation 14),  $u, v$  are two lanes which of case  $k$ . Then, average waiting time weight can be calculated (in equation 15). Higher  $WT$  brings more influence in decision-making

$$AVGT_{wait}(i,t)=0 \tag{12}$$

$$AVGT_{wait}(i,t)=\frac{RM(i,t) \times T_{control} + \sum_{j=1}^{T_{control}} FV(i,t+j) \times (T_{control}-j)}{TraVol(i,t)} \tag{13}$$

$$AVGT_{wait}(k,t)=\frac{(AVGT_{wait}(u,t)+AVGT_{wait}(v,t))}{2} \tag{14}$$

$$WT(k,t)=\frac{AVGT_{wait}(k,t)}{\sum_{k \in C} AVGT_{wait}(k,t)} \tag{15}$$

**Factor 3) Hunger Level:-**

The hunger level  $HL(k, t)$  is defined to guarantee the fairness, it can be determined by times of green light of case  $k$ , which is represented by  $N(k, t)$ ,  $k \in C$ , in equation 16. The more times the case got green lights before, the lower hunger level it gets currently; the fewer times the case got green lights before, the higher hunger level it gets currently.

$$HL(k,t)=1-\frac{N(k,t)}{\sum_{k \in C} N(k,t)} \tag{16}$$

**Factor 4) Blank Circumstance:-**

Blank plays a rather important role to calculate  $GLD(k, t)$ . We try to minimize frequency of the circumstance in which there is a blank at the intersection with the green light for the certain lane. In order to maximize the throughput and minimize average waiting time, we calculate how many blanks

there are in each lane, and the length of each blank.

Within a  $T(blank)$  time, if a sensor node cannot detect a vehicle passing through, we decide there is a blank of length  $L(blank)$ .

$$L(blank) = T(blank) \times speed$$

Blank detection indicates three possible circumstances: every case has blank, or some cases have blank, or none of them has a blank. Different circumstances have different solutions. When every case has at least one blank, we would like to give green light with high priority to the case in which the first detected blank has the farthest distance to the intersection. In this way, green light would be provided to let more vehicles leave. When some cases have blank, we would decide to give red light for these cases next directly. When none of them have blank, we treats them as the same priority.

**Vehicle Priority Algorithm:-**

The total vehicles are divided into 4 categories: First system category includes Ambulance, Fire Brigade vehicles and V.I.P vehicles. These vehicles have the highest priority. The second category includes the buses and school & college buses. These buses need to reach their destination on time so these vehicles also need a fast service. Third category includes the car, motor cycles and scooters and fourth category include the Heavy vehicles. Day time priority of 3rd category is high as compare to 4th category but during night hours the priority of the heavy vehicles high. Each intersection on the road has 4 traffic lights as shown in the figure 1. Each lane has its own RFID reader that stores the vehicles passing through it with time stamp. On the basis of the time stamp, we find the violators. For this purpose we store the duration of the green light. So the vehicles coming on the corresponding light are allowed to move in any direction. During this time reader corresponding to red light stores the vehicles passing through the lane.

Fig. 4:- Structure of the Intersection & placement of the reader

Intelligent Traffic Light Controller: Each city has multiple intersections as shown in the figure 2. Two lights are called linked Lights that are placed on opposite sides of the road that join two intersections. The RFID reader stores the records of all the vehicles that passed through the road. The Traffic light controller follows the same round robin sequence of the lights. But if an Emergency vehicle is detected at any traffic light then controller leave the round robin schedule and generate the green signal for the ambulance. The other task of the controller is to calculate the time of green signal that is based on the number of vehicle. To solve the problem of Starvation a time limit is defined. If this limit exceeds then that light gets its turn.

The flow chart given below represents the flow of the algorithm. In which after receiving the message from linked lights controller consider the factors like traffic density of the road, priority of the vehicles and queue length and starvation factor to decide the term of the light to display green signal. The flow chart given below not only works according to the number of vehicles near the traffic light but also solve the problem of starvation that can be arisen. Here the basic purpose of the algorithm is to calculate the green time duration and also provide the quality of the service to the Emergency vehicles like ambulance, Fire brigade and VIP vehicles so that they can reach at their destination as early as possible and reduce the time wasted at the Red Light.

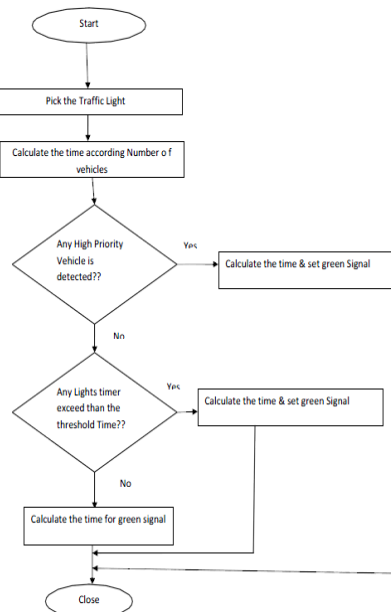

Fig. 5:- Flow Chart Model For Vehicle Priority approach

**Conclusion:-**

Using the proposed adaptive traffic light control algorithm, comparing it with fixed-time traffic control (FTC) and actuated traffic control (ATC), which are based on the same random arrival rate of each lane,  $T_{control}$ ,  $speed$ ,  $L_{vehicle}$  and  $L_{lane}$ . We set The objective of ATC refereed is to minimize the average waiting time, which is popular in existing ATC algorithm. We define *volume to-capacity* to indicate the busy degree of each lane. Here, *capacity* is defined as how many vehicles can be in the lane at the same time, equals to  $\frac{L_{lane}}{L_{vehicle}}$

Therefore, *volume-to capacity* is equal to  $\frac{TraVol}{capacity}$

The comparison items include throughput-to-volume and average waiting time. The intersection throughput values were calculated using the total number of vehicles departing the intersection per unit of time, and expressed as vehicles per second. Throughput-to-volume is defined as the percentage of passing vehicles in total traffic volume. The comparison items include throughput-to-volume and average waiting time. The intersection throughput values were calculated using the total number of vehicles departing the intersection per unit of time, and expressed as vehicles per second. Throughput-to-volume is defined as the percentage of passing vehicles in total traffic volume.

The work also considers not only the priority of the vehicles but also the density of the vehicles on the road and controls the traffic light sequence efficiently and more accurately and the accuracy of the RFID is more than Camera's so it also improves the performance of traffic light Violation Detection System.

**Acknowledgement:-**

I sincerely thank to my parents, family, and friends for their constantly inspiring and supporting nature. I like to express my deep thanks to my colleague Sonal Gupta (SE Accenture Pvt Ltd) for providing me time to time inspiration and helping me solving various algorithms and logics .

For their most support and encouragement. They kindly read my paper and offered invaluable detailed advices on grammar, organization, and the theme of the paper.

#### Abstract

Turmeric products such as curcumin, oleoresin and essential oils have coloring and medicinal functions. Boiling and drying are mandatory and quality determining steps in turmeric processing. But most farmers in Ethiopia boil mother and finger rhizome together, and give less concern to boiling temperature levels and durations that probably leads to loss of biochemical and physical qualities of turmeric. Hence this study was initiated with objective of optimizing the boiling temperature level (s) and duration (s) of rhizome set types of turmeric for its quality improvement. Accordingly, the result of this study revealed that almost all of the parameters considered were significantly affected by the treatments or their interaction effects. Temperature levels, durations and rhizome set types independently brought about a significant variation on dry matter, crude protein and crude fiber. Rhizome set types demonstrated significant effect on the color of whole rhizome and powder. Curing percent significant differed according to boiling durations.

#### Introduction:-

Turmeric mostly grows in South Asia, South Pacific Islands, East and West Africa, Malagasy, Caribbean islands, and the Central America (Sasikumar, 2001). 80% of world turmeric is from India (Chempakam and Parthasarathy, 2008; NMCE, 2007).

Currently high production in Ethiopia is found in Yeki woreda (Tepi area) and according to Zenebe and Bereke-Tsehay (1987) cited in Girma *et al.* (2008), turmeric was introduced in 1971/1972 to Ethiopia by Jimma Research Center and from adaptation results, it did well in areas such as Jimma, Mettu, Tepi, Bebeke, Wonago, Awasa, Mugi, and Bako.

From 2006 to 2009, the average land coverage by spices was 122,700 ha and produced 244,000tons/annum. Low land spices are dominantly produced in regions with potential order in SNNPRS, Oromia, Gambella and Amahara

National Regional states. In general, the over-all potential for low land spices in Ethiopia is assessed to be 200,000 ha (MOARD,2009).

Turmeric is a tropical perennial herb native to Southern Asia, and perhaps originated on the slopes of the tropical forests of the west coast of South India (Yu, 2006). Turmeric is geographically dispersed about Cambodia, China, India, Indonesia, Lao People's Democratic Republic, Madagascar, Malaysia, the Philippines, and Vietnam. It is extensively cultivated in China, India, Indonesia, Thailand and throughout the tropics, including tropical regions of Africa, America and Australia (Peter *et al.*, 2007). Burkill (1966) cited in Peter (2007) stated his believe that the crop spread to West Africa in the thirteenth and to East Africa in the seventeenth centuries, respectively.

The excellence of spices is assessed by its intrinsic and extrinsic characteristics. The former consists of the preservation of chemical principles like volatile oil, alkaloids and oleoresins while the latter stresses physical quality (Purseglove *et al.*, 1981). In addition, certain health requirements are also implemented as export quality standard *viz.* pesticide residue aflatoxin, heavy metals, Sulphur dioxide, solvent residues and microbiological quality. However, physico-chemical quality remains the ultimate attribute, while considering export requirement of spices as these properties delineate its grade in the market. The physico-chemical characteristics vary widely depending on the variety, agro-climatic conditions existing in the area of production, harvest and post-harvest operations (Jose and Joy, 2004).

Similar to other spices, primary processing is still being done with traditional means leading to many post harvest quality losses. Most of farmers in Ethiopia boil mother and finger rhizome sets together; similar activity reported by Velappan *et al.* (1993) where farmers in some provinces of India rarely boil bulbs and fingers separately to facilitate uniform boiling and to quicken drying. The other factor with little consideration and care is the way the harvested rhizomes is boiled. The optimum temperature at which rhizomes are boiled, the duration of boiling and types of boiling pots used are not standardized by research in Ethiopia. For illustration, the stage at which boiling is stopped largely, effects the colour and aroma; over boiling spoils the colour while under-boiling renders the dried product brittle (Kandiannan *et al.*, 2009). Additionally, Kemble and Soni (2009) stated that as more the boiling duration the more loss of curcumin and oleoresins will be. Also, little has been done on the extent of value parameters such as volatile oil and oleoresin contents of the high yielding farmer's varieties.

The information that is available is limited on the information that is obtainable on the degree of annihilation of bioactive values of spices throughout food processing. Subsequently the healthy, beneficial physiological properties of spices are attributable to their energetic principles, there is a requirement to assess the availability of the spice active ideologies in their original arrangement when spices are heat treated as in domestic boiling. (Srinivasan, 2005). In Ethiopia farming of spices for centuries has mostly remained old by small farmers (MOARD, 2009). Efforts to produce improved technologies were limited to agronomic practices with little effort to improve product quality, which is highly influenced through its value chain from pre-harvest to postharvest management practices including processing of final products. Moreover, little effort has been made to assess farmer's pre and post-harvest management practices that could be used as a benchmark for improvement works targeting product quality and sustainable supply (Endrias and Asfaw, 2011).

Therefore, studies were necessary to investigate the role of different boiling temperature levels and boiling durations on the quality of turmeric rhizome sets. Hence the following objective: To determine the effect of boiling temperature levels and durations on dry matter content, total ash content, crude protein content and crude fiber content of different rhizome set types of Turmeric (*Curcuma longa* L.) duration of different rhizome set types of turmeric (*Curcuma longa* L.) for its quality improvement.

## Materials And Methods:-

### Description of the Study Area:-

The experiment was conducted at the Southern Nations and Nationalities' Peoples Regional State, Sheka zone, Yeki Woreda at the Tepi Soil Analysis Laboratory and on the drying structures at Tepi National Spices Research Center in 2010/11 both of which are located in the Tepi town that is about 611 Km from Addis Ababa. It is located at approximate geographic coordinates of 7°30'N, and 35°00'E and altitude of 1200 meters above sea level. The experimental site receives a long term mean annual rainfall of 1688mm and has a mean maximum and minimum

temperature of 29.5 °C and 15.3 °C, respectively (Edossa, 1998). The relative humidity of the site reaches 80 to 90%, and the soil is classified as Dystric Nitisol and it is dominated by a loam texture (Girma and Kindie, 2008).

#### **Experimental Materials:-**

For this experiment matured (9 months old) rhizomes of turmeric variety Dame was taken from Tepi National Spices Research Center seed multiplication plot. Nine month old rhizomes were preferred because harvesting after nine or ten months after planting the biochemical and dried yield recovery contents were reported higher (Girma *et al.*, 2008). Totally 400 kilogram of fresh turmeric was dedicated for the experiment.

#### **Methods:-**

##### **Experimental Design and Arrangement:-**

The treatments were arranged in three factors factorial combination of three boiling temperature levels (80°C, 90°C and 100°C) X four boiling durations (30, 45, 60 and 75 min) X three rhizome set types (Mother, finger and mother-finger) in completely randomized design with three replications. The above treatment levels were set based on the fact that most of turmeric producing farmers in Ethiopia boil mother and finger mixture rhizomes together and give little care to boiling duration though 45-60 minutes were believed to be in practice .

##### **Preparations and boiling method of the rhizomes:-**

Mature rhizomes of turmeric variety (Dame) were harvested from the seed multiplication site of Tepi National Spices Research Center in February, washed thoroughly, and mother rhizomes separated from finger rhizomes. Rhizomes were left heaped for 24 hours for sweating for better development of aroma and flavor.

Next, three and half kilograms from each rhizome types (mother, finger and mother-finger mix) was taken separately for each treatment. Then, rhizomes were boiled using electrically operated boiling heater. Boiling was performed in laboratory using stainless steel of 10 liter capacity dishes on three hot plates having capacity of 230V and 2850W (SD8, Harry Gestingkeit GmbH, Angermunderstr.12, D-40489, Düsseldorf). During the course of boiling 5 liters of water filled in boiling dish was initially allowed to boil, mean-while each rhizome type put in the boiled water and left for a while until it attained the temperature level required and then heater temperature level was set. While boiling was commenced temperature fluctuations were monitored on interval check using thermometer. And when the specified duration boiling for each treatment was reached then the rhizomes were taken out to a bath of twenty kilogram holding capacity to stop further boiling of rhizomes. Rhizomes were delivered to drying beds as soon as cooled. The boiled fingers were dried in open sun spread with uniform thickness of 5-7cm until they attained optimum moisture where the fingers will snap cleanly with a metallic sound. Closer supervision was followed by stirring the samples in the day time for uniform drying and covering in the night. After drying the rhizomes were polished on stretched wire mesh by hand to remove the rough surface and improve its inherent color. Finally, weight of dried rhizomes and removed corkish layer were separately recorded.

##### **Data Collected:-**

Relevant data both for analysis and comparison purposes were recorded at different stages of processing steps. Data on drying durations (hrs.) of rhizomes was recorded as soon as boiled rhizomes were brought to bed. Before and after drying data on dry weight recovery (Curing %), diameter and length shrinkage magnitude (%), weight of corkish layer removed (%) and color of polished whole rhizomes (rating) were recorded. Finally data were recorded on essential (%), dry matter content (%), total ash content (%), crude protein content (%) and crude fiber content (%) from the grounded form of rhizomes.

##### **Total ash content (%TA):-**

The percentage of total ash content was determined by using furnace apparatus. It was determined by ignition of known weight (5g) of a sample at about 550°C in muffle furnace till all the organic matter is oxidized and lost as CO<sub>2</sub>. The residual represents inorganic constituents of total ash while the loss in weight was taken as the organic matter. Procedurally, weight of empty crucible (W2) was taken and five gram of sample transferred into it (W1).

The crucibles with samples were placed in furnace and waited till the temperature reached 550±10°C. Then the temperature regulator was adjusted at 550±10°C and allowed for 5hr. to ash the mineral. When the final duration was reached the furnace was switched off and waited until the temperature dropped to about 100°C to take out the

crucibles with the help of a pair of tongs. Crucibles (samples) were placed in desiccators for cooling and then after weighed (W3) and the percentage ash content was calculated.

% Total Ash =	W3-W1	X 100
	W3-W2	

#### Crude protein content (%CP):-

Crude protein content (%) was quantified using kjeldahl (HUAYE - SLO-6, China, Shanghai) apparatus. One gram of oven dried material was placed in the digestion flask, 10g of powdered potassium sulphate, 0.5g of copper sulphate and 25ml of concentrated sulphuric acid were added to it and digestion conducted by placing the flask in an inclined position and heating it below the boiling point of acid for 10min. The temperature was raised until the acid boiled briskly. A funnel was placed in the mouth of the flask to restrict the circulation of air. Heating was continued till the solution became clear. The contents were cooled and diluted by adding 200ml of water. Zinc 0.5g and 50ml of 40% NaOH solution were added to make the reaction strongly alkaline. The contents were mixed and at once attached to the distillation apparatus. In the receiving flask 25ml 0.1N sulphuric acid was taken. When two-thirds of the liquid had been distilled, it was tested for completion of reaction. The flask was removed and titrated against 0.1N caustic soda solution using methyl red indicator for determination of Kjeldahl nitrogen, which in turn gave the protein content (Indrayan *et al.*, 2009). The crude protein content was determined with a conversion factor of 6.25 (AOAC, 1990).

% N =	1.401 (V-B)N	X 100
	W x DM%	

$$\text{Crude protein} = \% N \times 6.25$$

Where

V = volume of HCl consumed

B = blank titration

N = normality of HCl

W = weight of sample taken

DM% = dry mater of sample

#### Total dry matter content (%DM):-

Dry matter or, more specifically, moisture determination is probably the most frequently performed analysis in the laboratory. It is an important analysis, in that the concentration of other nutrients is usually expressed on a dry matter basis (as a percentage of the dry matter). The procedure consisted of weighing the sample into a tarred (previously weighed) pan, placing the sample in a 105°C oven (KARL KOLB N7 220 V1N, West Germany) for 24 h and reweighing (Galyean, 1997). The moisture in a sample was lost by volatilization caused by heat. An empty hot crucible (W1) was weighed and five grams of air dried sample transferred into it (W2) and placed in an oven. The final weight (W3) was taken and dry mater content percentage calculated.

% Total DM =	W3-W1	X 100
	W3-W2	

#### Crude fiber content (%CF):-

Essentially, the procedure of determining crude fiber involved boiling a fat-free sample of feed with weak acid followed by weak alkali. The loss in weight on ignition of the residue was crude fiber (Galyean, 1997). Fiber content (%) was expressed based on Coarse Fiber Determinater (HUAYE - SLO-6, China, Shanghai) using H<sub>2</sub>SO<sub>4</sub> and NaOH solvents, Filter bag (F58), Impulse bag sealer and muffle furnace (KARL KOLB N7 220 V1N, West Germany) and Desiccator.

% CF =	(W3-(W1 x C1))	X 100
	W2	

Where:

W1 = Bag tare weight

W2 = sample weight

W3 = weight of organic matter (loss of weight on ignition of bag and fiber residue)

C1 = Ash corrected blank bag (loss of weight on ignition of bag/original blank bag)

**Data Analysis (common for all 3 papers):-**

The collected data on different response parameters were subjected to the Analysis of Variance (ANOVA) by using SAS version 9.2 computer software (SAS Institute Inc., 2008). Pearson's correlation analysis was carried out to estimate the association among response variables. Least Significance Differences (LSD) was used for mean separation whenever the treatments have significant different effects.

The fixed effects type model and the ANOVA table lay out have the following form:

Model

$$Y_{ijkl} = \mu + Ti + \beta_j + \gamma_k + (T\beta)_{ij} + (T\gamma)_{ik} + (\beta\gamma)_{jk} + (T\beta\gamma)_{ijk} + \varepsilon_{ijkl}$$

Where  $i$  = mother, finger and mother-finger rhizome sets

$j$  = Temperature levels = 80°C, 90°C, 100°C

$k$  = boiling = 30min, 45min, 60min, 75min

$l$  = 1, 2, 3, ..., 108

**Result and Discussion:-****Nutritional Composition of Rhizome Sets of Turmeric:-****Dry matter content:-**

The data subjected to analysis of variance showed no interaction effects existed among the independent variables for dry matter content in turmeric rhizomes. However, main effects (individual factor treatments) vis-à-vis temperature levels, rhizome set types and boiling durations brought about a very highly significant ( $p=0.0003$ ) variations on the quantity of dry matter, or reversely on moisture content of turmeric rhizomes (Table 8 and Appendix Table 1). The maximum (89.04%) percentage of dry matter was recorded from boiling of rhizomes at 100°C; while the lowest (87.45%) was obtained from 80°C. Boiling at 90°C recorded midfalling value, but yielded significantly higher and lower dry matter mean values than the 80°C and 100°C boiling temperature levels, respectively. The experiment results confirmed that an increase of 10°C in each levels of boiling temperature from 80°C to 100°C, there appeared increase of 0.91 and 0.68% in mean dry matter.

**Table 1:-** Analyses of variance for Oleoresin, Essential oil, Color value, Dry matter, Total ash, Crude protein and Crude fiber

NS, \*, \*\* and \*\*\* = Non-significant, significant, highly significant and very highly significant differences at 5% levels of probability respectively. DM=Dry matter, TA=Total ash, CP=Crude protein and CF=Crude fiber.

Rhizome sets responded differently to the dry matter percentage because of boiling. While the largest percent of dry matter was recorded from finger rhizome sets (88.79%) proceeded by mother-finger mix rhizome sets (88.42%); mother rhizome sets contained the lowest mean dry matter content (87.42%). Though insignificant variations existed among them, long boiling durations led to massive content of dry matter content. Boiling for 60min followed by 75min and 45min recorded the highest but invariable mean values (88.71%, 88.44% and 88.23%) of dry matter as per their order, but that of the 30min duration resulted in the lowest (87.46%) mean percentage.

Dry matter content is directly influenced by the final moisture content of the rhizomes under treatment. The secret lies on level of boiling temperature and boiling durations on different rhizome set types that directly influence the drying duration and final moisture content. Because treatments, mainly finger rhizomes receiving high temperature and long boiling duration may be forced to lose much of their moisture as compared to those treatments receiving low

temperature gradients for short durations; particularly mother rhizomes. In accordance with the current finding Govindarajan (1980) and Sampathu et al. (1988) reported that higher moisture content was observed in control (no heat treatment) samples and lower for boiled ones. A significantly negative correlation value ( $r = -0.59^{***}$ ) was noticed between dry matter content and drying durations showing that the one recorded high value for treatment or their combination the other got small value (Appendix Table 5).

#### Total ash content:-

The interaction effect among boiling durations, rhizome set types and temperature levels had significant effect ( $p = 0.0163$ ) on level of ash content of the turmeric (Table 7 and Appendix Table 1). Mother rhizomes boiled at 80°C for 30 and 45 min boiling durations contained statistically similar and the highest total ash mean values of 13.27% and 13.29%, respectively followed by boiling of finger rhizomes at 80°C for 30 min (13.08%), mother rhizomes boiled at 80°C for 60 min (12.69%) and 90°C for 30 min (12.45%) and mother-finger rhizomes boiled at 80°C for 30 min (12.83%) and 80°C for 45 min (12.42%); whereas the lowest value was recorded from 100°C for 75 min boiling of finger rhizomes (9.95%). The superiority of the treatment combinations that gave the highest yield (13.29%) is explained by more (14.52% and 25.13%) total percentage value than the grand mean (11.36%) and the least (9.95%) total ash content value. The least value deviated by about 12.41% from the grand mean value.

Total ash content amounts from finger rhizomes treated at 80°C for 30 min (13.08%) out yielded the amount of mean total ash from rhizomes boiled at 100°C for 75 min boiling (9.95%) which is the least value of total ash content. Similarly, mother-finger rhizomes boiled at 80°C coupled with 30 min duration produced high total ash mean value (12.83%), whereas one of lowest values for total ash was recorded from boiling at 100°C for 75 min (10.55%).

The overall outcome of this experiment indicated that the amounts of carbon containing compounds in the rhizomes are affected by temperature magnitudes and duration of stay on boiling. Higher temperature levels for longer boiling durations probably created room for maximum carbohydrate and other organic materials vanishing during boiling and when drying. With regard to the extent of organic compound in each rhizome set types it was observed that there exists almost no variation. Very highly significant and positive correlation between amount total ash content and dried yield recovered ( $r = 0.39^{***}$ ) was observed indicating the ash content increased as dry yield recovery increased due to treatments. (Appendix Table 5).

**Table 7:-** Interaction effects of boiling temperature levels, boiling durations and rhizome set types on total ash content (%) of turmeric

Treatment	Finger Rhizomes			Mother Rhizomes			Mother-Finger Rhizomes

T1=80°C, T2=90°C and T3=100°C boiling temperature; D1=30min, D2=45min, D3=60min and D4=75 min boiling durations. Means in the same column with the same letter are not significantly different ( $P \leq 0.05$ ).

#### Crude protein content:-

Though there was significant interaction effect observed, crude protein content mean values showed very highly significant variation ( $p < 0.0001$ ) due to individual treatment factors (Table 8 and Appendix Table 1), i.e. temperature levels, boiling durations and rhizome set types. Mean separation values pointed out that 30 min duration was sufficed to retain the highest (7.38%) mean crude protein percentage than the 45 min (7.11%), 60 min (6.86%) and 75 min (6.74%) durations. Boiling for 75 and 60 min yielded statistically similar and smallest crude protein values of 6.74% and 6.86%, respectively. Likewise the highest crude protein content value (7.56%) was attained when rhizomes

boiled at 80°C unlike the 100°C temperature degree that gave the least crude protein percentage (6.50%). There again, taking into account rhizome set types of their protein content, the highest percentage mean crude protein was found in mother rhizomes (7.21%) followed by mother-finger mix rhizomes (7.04%); in the mean time finger rhizomes contained the least crude protein content (6.82%).

Nearly about 4.88%, 7.14% and 2.63% crude protein yield advantages were observed when boiling carried out for 30min duration, at 80°C temperature level and for mother rhizomes, respectively when compared against the overall mean values of each treatment (Table 8). Also difference of crude protein content values between the highest and the lowest percents due to boiling durations, temperature levels and rhizome set types indicated 8.67%, 14.02% and 5.41% crude protein contents, respectively. The above degree of variations in crude protein content because of the three factors under consideration confirmed that the temperature levels have more impact on the crude protein content followed by boiling durations. Rhizome set types showed less degree of divergence in content of crude protein among them.

High and low mean percentage of crude protein values could be explained on the ground of inherent nature of proteins specifically their association with temperature regimes, duration of boiling and composition of protein in rhizome set types. Relatively extra resistance and capability of mother rhizomes to tolerate high temperature permit them to maintain more percent of protein. Supporting the result in this experiment, stated mother rhizomes are superior in protein content percentage than fingers, Chu *et al.* (1993) put forward that crude protein content was significantly higher for mother rhizome set (17.8%) than for finger sets (5.1-13.1%).

Since proteins are enzymes they have little chance to survive at high temperature which likely had lethal effect to majority of protein materials during boiling. When high temperature is accompanied by extensively long boiling duration, increase in loss is inevitable. Moreover, least loss in mother rhizomes could probably be for the reason that more strong and tough forms of proteins are present in them as compared to fingers which are easily liable to heat due to their delicate nature. Moreover protein loss might be associated with the degree of moisture loss during boiling and drying. It was indicated that the total protein content progressively decreased as the moisture content decreased because of boiling and drying (Chassagnez-Méndez *et al.*, 2000). Significantly negative ( $r = -0.58$ ) correlation was observed between amount crude protein content and dry matter, and positive ( $r = 0.42^{***}$ ) with dried yield recovered (Appendix Table 5).

#### **Crude fiber content:-**

The data garnered from this experiment showed that the crude fiber was very highly affected ( $p < 0.0001$ ) by treatment effect of boiling temperature levels, boiling durations and according to the three rhizome sets (Table 8 and Appendix Table 1). High variation in mean crude fiber content was observed when turmeric rhizomes boiled in different temperature levels with down falling trend when one goes from the lower to the climax. The output revealed that boiling at 80°C heat yielded the highest mean value (7.37%) over the 90°C boiling that gave mean value of 7.06%. In turn the 90°C temperature level yielded high mean crude fiber content than the 100°C that gave the lowest mean value (6.74%) among the three temperature levels. The highest crude fiber content (7.53%) was obtained from 30min duration while the least value was recorded from boiling for 75min (6.85%) boiling duration in which about 6.26% and 6.67% respective relative reductions were recorded.

In dealing with rhizome set types mean content of crude fiber was the highest in mother rhizomes (7.67%) than in mother-finger mix rhizomes (7.10%) and finger (6.40%) rhizomes, and the mix contain averaged while finger rhizomes the lowest content among the three rhizome set types. Mother rhizomes possessed 7.43% and 16.56% more crude protein when compared to the mix and finger rhizome sets respectively; the mix rhizome contained 9.86% higher crude fiber content compared to the finger rhizomes which provided the lowest mean value.

The variations in crude fiber contents, as affected by boiling durations, temperature levels and difference with respect to the rhizome set types, could be associated with the overall mean value for each factor in action. The 30min duration, 80°C level, and mother rhizome sets recorded 3.95%, 4.21% and 7.95% more values, respectively. On the other way, 6.8%, 8.55% and 16.56% difference existed between the highest and lowest crude protein contents for boiling durations, temperature levels and rhizome set types, respectively. It is obvious that the variation existed in rhizome set types is the largest value revealing crude protein content is highly affected by rhizome set types than boiling durations and temperature levels.

The reduction in mean fiber content probably could be break up of lignified plant materials by the high temperature levels and long boiling durations. Also, crude fiber is high in mothers may be because their high dry matter make ups made them potentially resistant to heat and therefore few loss of weight particularly when boiled at low temperature and duration ranges. In addition, mother rhizome sets are characterized by more fibrous nature than their respective daughters. There existed significant and positive correlation ( $r=0.75^{***}$ ) between crude fiber content with amount of dry yield recovered (Appendix Table 5).

In support of results from this experiment Renard (2005) reported, in the case of pears, the pectin fraction is degraded during boiling. In this respect, short periods do not affect the content in dietary fibre while long periods, over 1 h, lead to losses in the pectin content. Thus, it has been reported that the pectin content in the boiling water can increase upon 400% after one hour boiling, when compared with the pectin content after 20 min boiling. Further experiment result by Tatjana *et al.* (2002) confirmed that during boiling kidney-beans a solubilization of the aforementioned polysaccharides is produced, which results in a decrease of the total fibre content, mainly soluble. Purseglove *et al.* (1981) also discussed that rhizomes maintained more than one season like mother rhizomes in this case, have high accumulation of dry matter while the reverse is in quality.

**Table 8:-** Effect of boiling durations, temperature levels and rhizome set types on crude protein, dry matter, crude fiber content and diameter shrinkage of turmeric

### Summary And Conclusion:-

Primary processing is still being done with traditional means leading to many post harvest quality losses. Therefore, studies are necessary to investigate the role of different boiling durations and temperature levels on the quality of turmeric. Accordingly, the result of this study revealed that almost all of the parameters considered were significantly affected by the treatments or their interaction effects. Temperature levels, durations and rhizome set types independently brought about a significant variation on dry matter, crude protein and crude fiber. Again, rhizome set types showed significant effect on color of whole rhizome and powder. Curing percent significant differed according to boiling durations.

Dry matter content was highest for finger rhizome sets, at 100°C and for 60min boiling. Crude protein was at its peak when rhizomes boiled for 30min, at 80°C and for mother rhizome sets whereas the smallest values were recorded from 75min, at 100°C and finger rhizome sets. Crude fiber content was highest at 80°C, for 30min and in mother rhizome sets, whereas minimum at 100°C, for 75min and finger rhizome sets. Mother rhizomes boiled at 80°C for 30 and 45 min boiling durations contained statistically similar and the highest total ash mean values of 13.27% and 13.29%, respectively followed by boiling of finger rhizomes at 80°C for 30min (13.08%), mother rhizomes boiled at 80°C for 60min (12.69%) and 90°C for 30min (12.45%) and mother-finger rhizomes boiled at

80°C for 30min (12.83%) and 80°C for 45min (12.42%); whereas the lowest value was recorded from 100°C for 75min boiling of ginger rhizomes (9.95%).

Taking in consideration total ash, crude protein and crude fiber using short duration and lower temperature boiling of mother rhizome sets is regarded as effective. By considering the advantages of reducing the losses of fuel, labor, time, quality and difficulties in turmeric processing, the package of boiling conditions are beneficial to the turmeric growers and processing industries. However, though it could be not easy to control the temperature level in farmers' boiling process, exhaustive practical training sessions need to be put in place in order to make them familiar with the technology. To come up with sound recommendations, however, it would be imperative to repeat the study in replicated season and place.

#### Abstract

Brucellosis is causing serious medical and economic crisis, therefore there are many efforts to prevent infection through vaccination. Attenuated *Br. Melitensis* Rev 1 vaccine is considered the best vaccine available for now, but it has serious drawbacks. In the present work, Omp31 of *B. melitensis* vaccine (vectored vaccine) was evaluated in mice, in comparison with *Br. Melitensis* Rev 1 vaccine. The immune response showed similar and different trends. After vaccination, the vectored vaccine group showed nearly the similar trend in the TNF- $\alpha$ , IL-1 $\alpha$  and IL-12 (p40) levels with lower levels of IL-10, an anti-inflammatory cytokine, than *B. Melitensis* Rev 1 group. Moreover, vectored vaccine group showed lower weight, spleen and protective efficacy as those observed with *B. Melitensis* Rev 1 vaccine. In addition, vectored vaccine is less biohazardous, well-defined and non-infectious. The obtained results document effectivity of the vectored vaccine and can be considered as a promising candidate and could be included in the development of a multi-subunit vaccine in controlling of brucellosis.

#### Introduction:-

*Brucella* belongs to  $\alpha$ -Proteobacteria causing many pathogenic problems in mammals including humans. Ruminant animals are susceptible to be infected by such bacterium all over the world. One of those affecting domestic livestock is *B. melitensis* that affect sheep and goats. Because domestic ruminants are a vital source for the economy income, especially in low income countries, brucellosis is considered as a main cause of direct economic losses. Therefore, its control and eradication is the most important goals of public health programs in endemic countries (1,2).

Rev. 1 vaccine is formerly the only officially accepted vaccine for protection against *B. melitensis* infection, which induces significant protection in sheep and goats. On the other hand, the Rev1 vaccine can cause abortions, persisting agglutinins that can lead to mis diagnosis by using various serological tests in addition, it can infect humans through exposure to aerosols or accidental self-inoculation. (3, 4).

Subunit recombinant protein vaccines are considered promising vaccines because they are effective, less biohazardous, well-defined, non-infectious and persuade long-acting protection [5, 6]. Furthermore, it is essential to

provoke an effective vaccine with adequate immunological response against intracellular microorganisms as *Brucella* species, particularly for T helper cell (Th1) where the production of certain cytokines as IFN $\gamma$ , TNF $\alpha$ , and IL-12 (p40) are necessary for control the infection as Th2 response has a marginal function in this respect. Antigen delivery systems become obligatory needed when antigens are not effectively transported to the suitable fitting sites or presented to the immune system [7]. Our work is aimed to evaluate vectored vaccine based on outer membrane protein 31 (OMP31) expressed by *Escherichia coli* (K12) as it is nonpathogenic strain and can deliver our protein to antigen presenting cells and hence, promoting cellular immune response to control the infection with *B. melitensis* using mice model [8].

## Materials and Methods:-

### Laboratory animals:-

Forty-five female BALB/c mice with 4 to 6 week-old (obtained from a vet. Sera vacci Rec Institute–Cairo-Egypt) received one week previously, were distributed randomly into threegrups (fifteen for each). All mice were kept in cages and received water and food ad libitum.

### Strains of bacteria used:-

For cloning and propagation of the concerned plasmid, *Escherichia coli* strain JM109 competent cells  $>10^8$  cfu/ $\mu$ g (Promega, Madison, WI) were used while for recombinant protein expression, *Escherichia coli* strain K12 (Biolab, England) was applied. Bacteria strains were grown at 37°C in Luria-Bertoni (LB) broth agar that supplemented with 100  $\mu$ g/ml of ampicillin (9). For challenging purpose, *B. melitensis* 16 M was used (obtained from vet. Sera vacci Rec Institute, Cairo, Egypt) and was cultured under optimal conditions in tryptose soya agar supplemented with yeast extract 10 g/ lml (Oxoid, England) incubated overnight at 37°C for 72 hrs in 5% CO $_2$  to ensure sufficient cell density (10). The obtained bacteria were harvested and suspended in PBS and the abundance was adjusted to be  $1 \times 10^5$  CFU/200 $\mu$ l for protection experiment.

### Amplification of *Omp31* gene of *B. melitensis* 16M

Extraction and measuring the DNA of *B. melitensis* 16M were performed by using the CTAB method as previously described (11). PCR amplification of *Omp31* gene of *B. melitensis* 16M was done as described earlier (12) by using two primers, 31sd (5'-TGACAGACTTTTTTCGCCGAA-3') and 31ter (5'-CATTCAGGACAATTCCCGCC-3'). The primers were selected according to *omp31* nucleotide sequence (13)

### Recombinant *B. melitensis* *Omp31* protein:-

DNA fragment (687-bp) of *B. melitensis* responsible for encoding *Omp31* was cloned in pCAGGS (Addgene, MA, USA), expressed in *E. coli*, and purified as designated before (14). Briefly, the obtained plasmid that contained *Omp31* gene was amplified in transformed competent *Escherichia coli* (JM109) which were propagated in LB broth supplemented with 100  $\mu$ g/ml of ampicillin (9) till reached 1 nm at OD600. Intact plasmid construction and function were confirmed via sequencing across the DNA inserted. The plasmid was isolated by using a Megaprep kit (Qiagen, Dorking, UK) and the DNA concentration was evaluated using spectrophotometry at 260/280 nm. COS-7 cells were transfected as stated by manufacture's instructions with pCAGGS+*Omp31* and Lipofectamine reagent to verify *Omp31* expression which checked and confirmed by Western blotting with specific MAb A59/10F09/G010 as reported previously (15). The *Limulus* amoebocyte lysate analysis kit [Sigma, St. Louis, Mo.] was used to corroborate the purity of r*Omp31*.

### Immunization of mice:-

Mice were allocated randomly into three groups (fifteen mice in each group). The first group was vaccinated with the commonly used vaccination dose for commercial *B. melitensis* Rev 1 vaccine as positive control (16), the second group was immunized by I/P route with 0.2ml suspension of recombinant *E. coli* K12( $10^7$  CFU) bearing pCAGGS plasmid containing *omp31* gene (vectored vaccine) in phosphate buffer saline (PBS, pH 7.2). The colony forming units per ml was adjusted at OD 600 nm (OD $_{600}$ ) and the injected dose was determined retrospectively by triple plating onto tryptic soya agar supplemented with yeast extract. Finally, the third group was received PBS as negative control.

**Protection Experiments and evaluation of Brucella strain persistence:-**

To evaluate the efficacy of vectored vaccine for protection against *B.melitensis* infection, five mice from each group was challenged by intra peritoneal route (I.P) with approximately  $1 \times 10^5$  CFU/mouse of *B.meletensis* 16M. On the 30<sup>st</sup> day after vaccination, the mice were euthanized by cervical dislocation; their spleens were removed aseptically and weighed. The persistence of challenging strain of *B.meletensis* M16 in mice was determined as described previously (9, 17), by determination of *B.meletensis* CFU in the spleen. The obtained spleens from five mice in each group were macerated individually and homogenized, Ten-fold serial dilution in PBS were plated onto tryptic soy agar supplemented with yeast extract and incubated to determine the bacterial count. The experiment was conducted twice, and the results were represented as means  $\pm$  SD (n = 5) of the log CFU/spleen. Log units of protection were calculated via subtracting the mean log CFU of the vaccinated group from the mean log CFU of the control immunized group.

**Measurement of immune response against Omp31:-**

Indirect enzyme-linked immunosorbent assay (ELISA) was subjected to determine the antibody response against Omp31 in collecting sera (17). Serum titers of Antibody evaluated as the highest serum dilution inverse yielding value at OD<sub>405</sub> two times higher than of the dilution buffer (blank). The titer of IgG was recorded as means  $\pm$  SD of the log of the titers taken from five mice analyzed individually. Regarding the evaluation of Cytokine levels in the spleens of immunized mice in response to the injected vaccines (vectored vaccine and *B.melitensis* Rev1), five mice from each group were vaccinated as described above and their spleens were collected at 0, 7, 14, 21 and 28 dpi (pre-challenge period in protection experiments). CHAPS detergent (Thermo Fisher scientific, USA) was added (1% final concentration) to the homogenated mouse spleens in PBS to maintain protein activity and lysis the splenocytes [18,19]. cell debris was separated and removed by centrifugation after one hour incubation at 4 °C, and the supernatants were kept at -80 °C till use for cytokine quantification. The collected supernatants were subjected to sandwich ELISA to quantify the levels of interferon- $\gamma$  (IFN- $\gamma$ ), tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ), interleukin-1 $\alpha$  (IL-1 $\alpha$ ), IL-10 and IL-12 (p40) with commercial kits specific for mice cytokines according to the manufacturer instructions (BD Biosciences, San Diego, USA) as illustrated before [20]. The results were recorded for each immunized group as means  $\pm$  SD of the detected cytokine quantity (ng) in the spleens of five individual mice at each point of time.

**Statistical Analysis:-**

Data obtained were expressed as mean  $\pm$  standard error of the mean. It was analyzed using SPSS version 18.0 (IBM SPSS Statics 18, USA). Data were subjected to one-way analysis of variance (ANOVA) and the post-hoc test was applied for multiple comparisons. Values of P <0.05 and P <0.001 were regarded as statistically significant and highly significant, respectively.

**Results:-****Inflammatory response of used vaccines:-**

Spleen weight was taken as an indicator to compare the degree of inflammatory response in vaccinated groups. The vectored vaccine did not induce significant inflammatory response on the assay span while Rev1 group showed a strong response that reached its maximum level at 14<sup>th</sup> day post inoculation at which the spleen weight reached 4 times higher than that of vectored vaccine group, as illustrated in **Figure 1**.

**Figure 1:-** Estimation of spleen weight in vaccinated mice  
Results are expressed as means  $\pm$  SD (n=5) of the spleen weight at each point of time.

#### Humeral immunity response against *B. melitensis*:-

The serum immunoglobulin G (IgG) level was estimated in the mice of protection experiment up to day 28 post inoculation (before challenge) with either PBS (control negative), Rev1 attenuated vaccine or vectored vaccine. In mice vaccinated with Rev1 vaccine, the titer of IgG was detected in the 7<sup>th</sup> day after inoculation and increased progressively up to the end of the experiment while the IgG level was higher in mice vaccinated with vectored vaccine along the experiment. In comparison, the antibody response in the Rev 1 vaccinated group was delayed and first detection was on 14<sup>th</sup> day post inoculation and was lower than that noticed with vector vaccinated mice at all time-points checked, as shown in **Figure 2**.

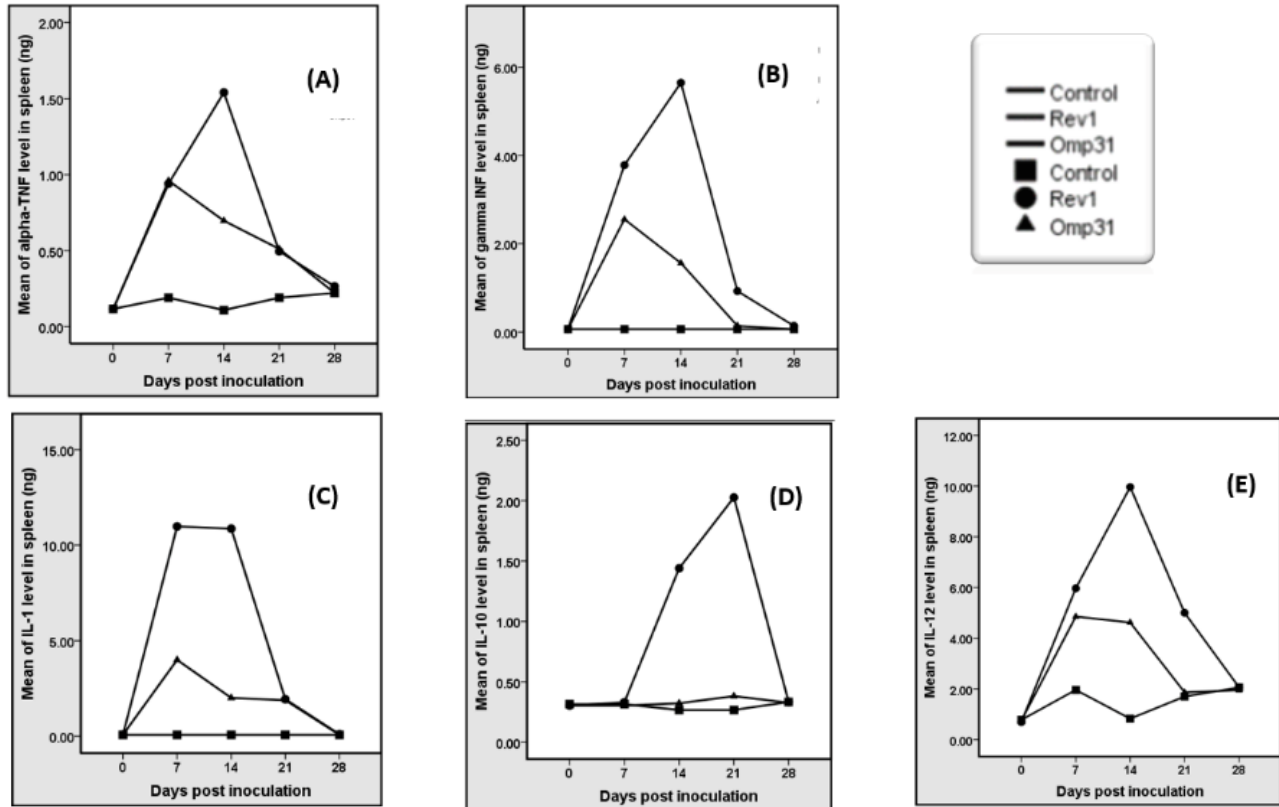

**Figure 2:-**The antibody responses in mice sera  
Results are expressed as means  $\pm$  SD (n=5) of the log of IgG titers by ELISA at each point of time.

#### Detection of spleen cytokines in mice:-

The cytokine level in spleen of inoculated mice was estimated until the day 28 post infection. Spleen of vaccinated mice with Rev1 vaccine showed the highest level of TNF- $\alpha$ , INF- $\gamma$ , IL-1 $\alpha$ , IL-10 and IL-12 (p40). Except IL-10, all cytokines in Rev 1 vaccinated group showed high levels and reached the peak at day 14 post inoculation then, begin to decrease until the day 28 at which all cytokines of the other group had profile too large extent like those evaluated in control negative group (PBS inoculated). Regarding IL-10, it has the similar trend, but its highest level was

detected on day 21 post inoculation. The strongest response was detected with both IL-1 $\alpha$  and IL-12 (p40) in the maximum concentrations around 11ng per spleen followed by the level of INF- $\gamma$  that record about 6 ng per spleen whereas the level of TNF- $\alpha$  and IL-10 showed the lowest recorded levels about 1.6 ng and 2 ng per spleen, respectively. Mice of vaccinated group with opm31 also induced cytokine production like, but to a lesser extent those of the Rev1 vaccinated group, except for IL-10 level that scored concentrations did not show statistically significant differences with those of control group (Figure 3, A-E).

**Figure 3:-** evaluation of the levels of cytokines in spleen of mice

TNF- $\alpha$  (A), INF- $\gamma$  (B), IL-1 $\alpha$  (C), IL-10 (D), and IL-12(p40)(E). Results are expressed as means  $\pm$  SD (n=5) of each amount of cytokine in spleen at each point of time.

#### The challenge Experiment:-

All groups were inoculated with a virulent strain of *Brucella melitensis* M16 in a dose of  $0.9 \times 10^5$  at the day 28 after vaccination. After three weeks of infection, the bacteria in spleen were counted. The challenge result revealed that the rev 1 and vectored vaccines conferred nearly the same protection (P.0.05). In comparison with the control group, the two used vaccines induced reduction in the bacterial load in the mice spleen about three log units (Figure 4).

**Figure 4:-** Protection against virulent *Brucella melitensis* M16 strain by the *Brucella* vaccines in mice.

Results are expressed as means  $\pm$  SD (n=5) of the log of the CFU/spleen. Significant differences between mice immunized with each vaccine and control mice inoculated with PBS are marked with (\*) that means high significant ( $P \leq 0.001$ ).

### Discussion:-

Researchers and scientists working in the field of the disease control are always do their best to discover and synthesis alternative vaccines to live attenuated strains to be able to fend off infections especially those burden the human being health. Currently, the best choice available vaccine against *Brucella* spp. is *B. melitensis* Rev1 vaccine (21,22). So, it was used to be the reference in our study to compare the efficacy of our recombinant vaccine. Nevertheless, it has significant disadvantages that may constrict its usage. As it is live attenuated vaccine, not completely safe, there is high probability to be a potential bioterrorism agent (23), cause severe complications in immunocompromised animals (24), cause abortion, difficult to transport and delivery where it needs special requirement to maintain condition and creates serological immune responses against O that causes interference in interpretation of many serological tests especially in the discrimination between natural infected and vaccinated animals (25). In contrast, recombinant proteins based vaccines, are less biohazardous, well defined composition, avirulent and non-infectious (6).

Subunit vaccines have been studied for years and have not given sufficient protection against *Brucella* spp. (26). Many approaches had been taken for development of vaccines based on bacterial recombinants (27). One of these approaches consists of expressing the foreign antigen on the surface of transfected bacteria. Subcellular vaccines could shun the drawbacks of live attenuated vaccines where is being safer in manipulation, not causing abortion and not interfering with immunodiagnostic tests as it has different antigen (28) and having the capacity to trigger the both arms on the immune system (29).

The better protective activity for the Rev1 vaccine was forecasted and detected by the evidences of the strong inflammatory response, as increasing the immunized mice spleen weight and cytokine profiles than those provoked by vectored vaccine (Figure 1 and 2). On the other hand, the protection granted by vectored vaccine against the experimental *B. Melitensis* infection was closely equipollent to that offered by *B. melitensis* Rev1 vaccine (Figure 5). The obtained result may be attributed to many factors and reasons. The first is the greater antibodies production able them to bind the virulent inoculated *B. melitensis* strain that detected in vaccinated mice with vectored vaccine (Figure 3) and opsonized them to facilitate their phagocytosis (29). This give an advantage to our recombinant vaccine and proves the fact that the antibodies have a greater impact in the protective immunity against *B. melitensis* than that for lymphocytes (30). The second reason, it is well known that  $\text{INF-}\gamma$  is playing the essential and vital role in controlling the *Brucella* infections whereas it stimulates the bactericidal function in macrophages (31,32),  $\text{INF-}\gamma$  recorded notable high level in both vaccinated groups (Figure 3-B). Third, the stoner response of splenocytes from *B. melitensis* Rev1 mice vaccinated group in production of more  $\text{IL-1}\alpha$ , which has potent stimulation of T-helper (CD4) and T-cytotoxic (CD8) lymphocytes against the inoculated antigen (33) than

splenocytes gained from mice either vaccinated with vectored vaccine or non-vaccinated group (Figure 3-C). Finally, splenocytes of *B. melitensis* Rev1 mice vaccinated group induced powerful IL-10 response. It was established that IL-10 has anti-inflammatory effect (34, 35), this fact gives an advantage to our tested vaccine over the commercial used one.

Another positive aspect of vectored vaccine is the protective function that comes with slight degree of inflammatory response (36, 37). On the other hand, the smooth lipopolysaccharide (S-LPS) represents the main component in *B. melitensis* Rev1 vaccine (38, 39) therefore, severe inflammatory response would be occurred leading to shock or even death (40,41) when the body exposed to LPS in an excessive or systemic manner via blood. According to our results, vectored vaccine stimulate and enhance solid immune response with triggering both Th1 and Th2 lymphocytes cytokines in a form making it capable to control *B. melitensis* infection as professionally as vaccination with *B. melitensis* Rev 1. In taking into account the disadvantages of vaccination with *B. melitensis* Rev 1 (42, 43), the Omp31 depending vaccine constitutes a promising candidate and could be included in the development of a multi-subunit vaccine in controlling of brucellosis.

#### Acknowledgement:-

The present study was achieved in the frame of PROCAMED project, supported by the European Union (Trans frontier cooperation in the frame of European Neighborhood and Partnership Instrument-Joint Operational Programme of the Mediterranean Basin (IEVP-CT), managed by the Joint Managing Authority- Autonomous Region of Sardinia( Italy) and coordinated by CIRAD-France. Many thanks for the help of Prof. Dr. Mohamed khodeir and Prof. Dr Saleh ElAyoubi.

#### Abstract

**Context:** Diabetes mellitus is a leading cause of vascular morbidity. Etiology of diabetic vascular complications is multifactorial. Alteration of blood coagulation and fibrinolysis along with poor glycaemic control in diabetes has also been implicated in the development of diabetic vascular complications. Plasma level of D-Dimer reflects the amount of lysed cross-linked fibrin and hence is an accepted marker of hypercoagulability.

**Aim:** The aim of this study is to evaluate the clinical significance of plasma D-dimer in type 2 Diabetes Mellitus.

**Settings and Design:** This study is a cross sectional study.

**Methods and Material:** A total of 90 patients were selected based on clinical status and divided into 3 groups: 30 patients of newly detected type 2 DM, 30 patients having diabetic nephropathy and 30 patients of DM with coronary artery disease. Plasma Ddimer was measured using Second-generation latex agglutination (immunoturbidimetric) method in Cobas Integra 400 plus. The lipid profile and HbA1c were also measured.

**Statistical analysis used:** Statistical analysis was performed by one way ANOVA, scheffe post hoc test and independent t- test.

**Results:** Patients with diabetic nephropathy had significantly higher plasma D-dimer levels ( $2.48 \pm 1.28 \mu\text{g/mL}$ ) than patients without complications ( $0.28 \pm 0.12 \mu\text{g/mL}$ ) ( $p < 0.0001$ ). There were significantly higher plasma D-dimer levels in patients with coronary artery disease ( $2.05 \pm 1.06 \mu\text{g/mL}$ ) than patients without complications ( $0.28 \pm 0.12 \mu\text{g/mL}$ ) ( $p < 0.0001$ ). And there is no significant different in lipid profile in DM with or without coronary artery diseases.

**Conclusions:** Our data suggest that in DM patients presenting with coronary artery diseases without dyslipidemias, the D-Dimer can serve as a novel marker for prediction of the risk of coronary artery diseases and higher level of D-Dimer in diabetic nephropathy patients suggest that increased thrombogenic state may be related to increased susceptibility of vascular disease in these patients.

**Introduction:-**

Diabetes mellitus comprises a group of common metabolic disorders that share the phenotype of hyperglycemia. In patients with diabetes mellitus having vascular complications, control of blood glucose levels is a crucial factor in determining prognosis. The mechanisms that mediate vascular complications in diabetic patients are not fully understood. Etiology of diabetic vascular complications is multifactorial.

Alteration of blood coagulation and fibrinolysis along with poor glycemic control in diabetes has also been implicated in the development of diabetic complications. Type 2 diabetes mellitus is a growing cause of disability and premature death, mainly because of cardiovascular diseases and chronic complications<sup>1</sup>.

Prolonged exposure to hyperglycemia is now documented in the pathogenesis of diabetic complications like nephropathy and cardiovascular disease (CVD):

1. Glycated proteins and lipids which can interfere with their normal function by disrupting the molecular conformation, alter enzymatic activity, reduce degradative capacity and interfere with receptor recognition. In addition, the glycated proteins interact with specific receptors present on all cells relevant to the atherosclerotic process which includes monocyte-derived macrophages, endothelial cells, and smooth muscle cells. The interaction of glycated proteins with their receptor results in the induction of oxidative stress and proinflammatory responses<sup>2</sup>.
2. Oxidative stress could further aggravate complications<sup>2</sup>.
3. Protein kinase C (PKC) activation by prolonged hyperglycemia and glycated protein with subsequent alteration in growth factor expression. Importantly, these mechanisms may be interrelated. For example, hyperglycemia induced oxidative stress promotes both the formation of advanced glycosylation end products (AGE) and PKC activation.

This study was undertaken to investigate the role of coagulation/fibrinolysis in the pathogenesis of diabetic complications by evaluating the association of d-dimer in type 2 DM.

**Materials & Method:-**

The study was carried out at Shree Krishna Hospital and H M Patel Centre for Medical Care and Education, a 550 bedded tertiary care rural based, teaching hospital attached to Pramukh Swami Medical College, Karamsad, from September 2013 to October 2014. A study protocol was set before undertaking this study and it was approved by the Institutional Human Research Ethical Committee.

This was a cross sectional study consisted of 90 individual above the age of 40 years are included divided into three groups. All the participants in the study were explained clearly about the purpose and the nature of the study in the language best understood by them. The samples were drawn from the participants only after obtaining a written and informed consent.

Out of this the group-1 consisted of 30 patients of newly detected type 2 DM who were recruited from those attending medical outpatient department and health check-up department. Group-2 consisted of 30 patients having diabetic nephropathy, whose serum creatinine was  $>1.4$  mg/dl, admitted in medical intensive care unit were recruited for study and group 3 consisted of 30 patients of type 2 DM admitted in emergency and cardiac ICU within 6 hrs of clinical signs and symptoms of acute coronary syndromes without any history of diabetic nephropathy were included in this study. The patients had been diagnosed depending upon the assessment as per the clinical symptoms such as chest pain with or without radiation, chest heaviness, shortness of breath, lower jaw pain, left arm pain, epigastric pain, palpitations and signs like hypotension and ECG changes suggestive of MI. The samples were collected from group 3 patients before any thrombolytic treatment. Patients were considered to be diabetic based on ADA criteria for the diagnosis of diabetes mellitus<sup>16</sup>.

All the patients with Liver disease, Malignancy, Trauma, Pregnancy, Pulmonary embolism, Disseminated Intravascular Coagulation were excluded from study to avoid false positive result of D-Dimer. The study protocol was set before undertaking this study and it was approved by institutional Human Research Ethics Committee. Plasma D-dimer was measured using Second-generation latex agglutination (immunoturbidimetric) method<sup>17</sup>, HbA1c was measured using Immunoturbidimetry Standardized according to IFCC method<sup>18</sup>, creatinine was measured using Colorimetric Compensated Jaffe kinetic method<sup>19</sup>, Triacylglycerol was measured using Colorimetric Endpoint GPO-POD Method<sup>20</sup>, Cholesterol was measured using Colorimetric Assay with Endpoint CHOD-POD Method<sup>21</sup> and HDL-

Cholesterol was measured using Homogenous Enzymatic Colorimetric Assay<sup>22</sup> in Cobas Integra 400 plus. Analysis was performed using the commercially available statistical software SPSS – 14.0 version and Microsoft excel. Values are given as mean±SD. Comparison of Renal function tests, HbA1c, D-dimer in three groups of patients by ONE WAY ANOVA and pairwise mean comparisons by Post hoc (scheffe test).

Comparison of lipid profile in DM patients with or without coronary artery diseases by independent t-test. The p value of less than 0.05 was considered statistically significant.

### Result:-

The Patients enrolled for the study were in the age group of 40 to 80 years. The mean age of the diabetic patient without complication, diabetic with nephropathy and diabetes with coronary artery diseases was 55.43±9.57, 60.93±10.57 & 62.1±7.8 years respectively.

The mean ± SD of duration of diabetes in the group 1 individuals is less than one year, whereas it is 8.64±2.34 years in group 2 and 9.28±2.88 years in the group 3.

### ONE WAY ANOVA:-

**Table 1:-** Comparison of Renal function tests, HbA1c, D-dimer in three groups of patients

Parameter	DWC (Group-1)	DN (Group-2)	DM+CAD (Group-3)	ANOVA P VALUE
HbA1c Mean±SD	8.24±1.74	8.68±2.3	9.17±2.34	0.247
Creatinine(mg/dl) Mean±SD	0.73±0.23	3.45±2.29	0.95±0.27	<0.0001
D-Dimer(µg FEU/mL) Mean±SD	0.28±0.12	2.48±1.28	2.05±1.06	<0.0001

Using ANOVA p-value we conclude that

1. There is no significant difference in at least one pair of mean of HbA1c among all three groups.
2. There is difference in at least one pair of mean of creatinine among the three groups.
3. There is difference in at least one pair of mean of D-Dimer among the three groups.
4. Post hoc (scheffe test) revealed that there is no statistically significant difference between mean HbA1c in either a pair

**Table 2:-** Pairwise mean comparisons of D-DIMER among three groups

Parameter	Mean±SD of D-Dimer (µg FEU/mL)	P-value
DWC (Group-1)	0.28±0.12	<0.0001
DN (Group-2)	2.48±1.28	
DWC (Group-1)	0.28±0.12	<0.0001
DM+CAD (Group-3)	2.05±1.06	
DN (Group-2)	2.48±1.28	0.230
DM+CAD (Group-3)	2.05±1.06	

### Post hoc (scheffe test) revealed that:-

1. Mean D-Dimer (µg FEU/mL) is statistically significantly higher in the diabetic with nephropathy patient as compared with diabetic patient without complication (P=<0.0001).
2. Mean D-Dimer (µg FEU/mL) is statistically significantly higher in the diabetic with
3. coronary artery patient as compared with diabetic patient without complication (P=<0.0001).
4. There is no statistically significant difference between Mean D-Dimer (µg FEU/mL) in the diabetic with coronary artery patient and Mean D-Dimer (µg FEU/mL) in the diabetic patient with diabetic nephropathy (p=0.230).

**T Test:-****Table 3:-** Comparison of lipid profile in Diabetic with and without CAD.

Parameters	DWC (Group-1)	DM+CAD (Group 3)	P value
<b>Total cholesterol(mg/dl) Mean±SD</b>	171.43±33.65	168.46±53.00	0.797
<b>Triglyceride(mg/dl) Mean±SD</b>	153.03±73.95	156.66±69.53	0.845
<b>HDL(mg/dl) Mean±SD</b>	42.43±11.39	35.86±8.16	0.013
<b>LDL(mg/dl) Mean±SD</b>	98.26±30.67	101.26±43.44	0.758

Independent sample t test revealed that

1. Mean HDL (mg/dl) is statistically significantly lower in diabetic with coronary artery disease subjects than the diabetic without complication individuals.
2. Mean total cholesterol (mg/dl) ( $p=0.797$ ), mean triglyceride (mg/dl) ( $p=0.845$ ) and Mean LDL (mg/dl) ( $p=0.758$ ) are not statistically significant between diabetic patient without complication and diabetic with coronary artery disease individuals.

**Discussion:-****Comparison of HbA1c:-**

In the present study, the mean HbA1c value in diabetes without complications was  $8.24 \pm 1.74$ . The mean HbA1c value in diabetic with nephropathy was  $8.68 \pm 2.3$  and in DM with coronary artery disease was  $9.17 \pm 2.34$ . This was statistically not significant with P value 0.247.

Takashi Yamada et. al.<sup>7</sup> observed that there was no statistically significant difference in HbA1c values in patients with ( $6.6 \pm 1.0$ ) or without ( $7.3 \pm 1.6$ ) microvascular complications, P value being 0.72. The comparison of the patients with ( $7.0 \pm 1.5$ ) and without ( $7.1 \pm 1.4$ ) macrovascular complications also did not show any significance difference, P value being 0.202.

The HbA1c is effective in monitoring long term glucose control in patients with diabetes mellitus. The complications of diabetes not only depend on the duration of diabetes mellitus but also on the long lasting poor glycemic control as indicated by a high level of HbA1c. Hence, there is requirement of a marker for monitoring long term diabetic complications.

On the basis of the knowledge of coagulation/fibrinolysis imbalance in DM, the observation of plasma D-dimer in complicated DM patients, we can use at least complimentary role of D dimer in early identification of complications.

**Comparison Of D-Dimer:-****Diabetes mellitus without complication:-**

In my study diabetes patients without complications with mean age of  $55.43 \pm 9.57$  years, the d dimer level was  $0.28 \pm 0.12$   $\mu\text{g FEU/mL}$  which was similar to the study by Yolanda Lopez et al<sup>8</sup> of diabetic patients, under metabolic control and presented with no signs of retinopathy, neuropathy or nephropathy (corresponding to our group 1 with a mean age of  $54.3 \pm 15.2$  years), the concentration of D-Dimer was within the normal range  $267.10 \pm 25.8$   $\mu\text{g/L}$ . This value when converted to the units used in our study is 0.26  $\mu\text{gFEU/mL}$ .

Diabetic with coronary artery diseases

When we compared plasma D-dimer levels between diabetes without complications (group 1) and diabetic with coronary artery diseases (group 3), plasma D-dimer levels were found to be significantly ( $p < 0.0001$ ) higher in diabetic patients with coronary artery diseases. Our results are similar to other studies<sup>9,10</sup>.

Tariq A Zafar(2010)<sup>10</sup> found that significant high plasma D-dimer levels in diabetic patients with myocardial infarction, compared with diabetic patients without myocardial infarction and the control group ( $445 \pm 352$   $\mu\text{g/L}$ ,  $340 \pm 249$   $\mu\text{g/L}$ , and  $156 \pm 107$   $\mu\text{g/L}$  respectively). D-dimer levels of patients with myocardial infarction were significantly higher than in the patients without myocardial infarction and the control group ( $P = 0.002$  and  $P = 0.001$ . respectively).

Ezekiel U. Nwose et al. (2007)<sup>9</sup> in a study 343 participants were selected based on the clinical status and divided into 7 groups: control, family history of diabetes, pre-diabetes with/without CVD, diabetes with/without CVD and CVD without DM. An overall significant difference between groups ( $p < 0.002$ ) and a steady rise in D-dimer levels that became increasingly higher than control as the disease progressed from pre-diabetes to cardiovascular complications was observed.

T. Yamada et al.<sup>11</sup> in their study observed that the d-dimer level in the diabetic patients without macroangiopathy was  $0.63 \pm 0.37$   $\mu\text{g/ml}$  and with macroangiopathy was  $1.12 \pm 1.24$   $\mu\text{g/ml}$ , this was not statistically significant ( $p = 0.69$ ) which is not agreement with my study. In the present study, Diabetic patient with coronary artery disease had total cholesterol level  $168.46 \pm 53.00$ , TG level  $156.66 \pm 69.53$ , HDL level  $35.86 \pm 8.16$  and LDL level  $101.26 \pm 43.44$ . In Diabetic patients without complications the TC level  $171.43 \pm 33.65$ , TG level  $153.03 \pm 73.95$ , HDL level  $42.43 \pm 11.39$  and LDL level  $98.26 \pm 30.67$  showing only small difference in the lipid profile in the two groups. There was significance difference only in the HDL level ( $p = 0.013$ ).

Our data is similar to Tariq A Zafar et al.<sup>10</sup> in which diabetics with MI, TC level being  $225 \pm 38$ , TG level  $176 \pm 81$  and HDL level  $37 \pm 5$  and in diabetics without complications, TC level  $202 \pm 40$ , TG level  $127 \pm 97$  and HDL level  $42 \pm 7$ . There are small differences in the lipid profile between the two groups.

It has been reported that over 50% of all future vascular events may occur in persons without dyslipidaemia and that plasma D-Dimer can be a novel risk marker for the prediction of future cardiovascular events in those with normal lipid profile<sup>12</sup>.

Our report suggests that besides the involvement of diabetic dyslipidemia in coronary artery diseases, diabetic hypercoagulation is another pathological process in development of CAD.

Ezekiel U. Nwose et al. (2007)<sup>9</sup> suggested that laboratory determination of both total cholesterol & D-dimer could reduce chances of making false negative decision about diabetics with CAD complication.

#### **Diabetic nephropathy:-**

When we compared plasma D-Dimer levels between diabetes without complication (group 1) and diabetic with nephropathy (group 2), the plasma D-Dimer levels were found to be significantly ( $p < 0.0001$ ) high in latter group. Our results are similar as other studies<sup>4,13,14,15</sup>.

Ichiro Wakabayashi et al.<sup>4</sup> they observed that the mean level of log converted D-Dimer after adjustment for age and sex was significantly higher in subjects with microalbuminuria ( $p < 0.01$ ) than in those with normoalbuminuria. They concluded that the D-Dimer is associated with microalbuminuria in patients with diabetes and this suggests that glomerular dysfunction is in part mediated by hypercoagulability.

J. W. J. van Wersch et al. (1991)<sup>13</sup> in a study including 116 patients with type 1 DM found that the presence of lower HDL-cholesterol, higher triacylglycerols and the elevation of fibrin monomers and D-Dimers is more pronounced in the microalbuminuria group.

Takashi Nagai et al. (1993)<sup>7</sup> studied NIDDM with and without nephropathy along with normal subjects and observed elevated levels of D-Dimer in nephropathy patients.

Kano Y, Kobayashi K et al.<sup>14</sup> In their study had been performed in 18 diabetic nephropathy patients and 16 hypertensive patients with nephrosclerosis reported higher level of D-Dimer in both group.

Cihangir Eremet al.<sup>15</sup> studied diabetic with or without nephropathy and observed no significance difference in D-Dimer.

T. Yamada et al.<sup>11</sup> in this study d-dimer level in patients without diabetic microangiopathic was  $0.54 \pm 0.17$   $\text{mcg/ml}$  and with microangiopathic  $0.88 \pm 0.90$   $\text{mcg/ml}$  there was not statistically significance ( $p = 0.264$ ) this is not similar to my study.

In Diabetics pathophysiological changes start before development of complications and severity of vascular complications was concordant with microangiopathies (eg. DN) and macroangiopathies (eg. CAD) in the patients

with an increased coagulation/fibrinolysis abnormality. Identification of circulating risk molecules (plasma D-dimer) may help to identify diabetics with high risk of vascular complications. Plasma D-dimer test is now routine and can measure easily. So we can use complimentary test in early identification of complications.

### Conclusion:-

In the present study, consisted of 90 patients of type 2 DM in the age of 40-80 years and the complication started after 6 years duration of diabetes. The study showed equal distribution of diabetes and its complication in male and female. If DM patients present with coronary artery diseases, without dyslipidemias, the D-Dimer can serve as a novel marker for prediction of the risk of coronary artery diseases. D-Dimer if employed as an additional test may improve the risk assessment for early coronary artery diseases in DM patients. In our study there is a higher concentration of D-Dimer in coronary artery diseases. We also got a higher level of D-Dimer in diabetic nephropathy patients. It indicates increased procoagulant activity in diabetic nephropathy patients. It is reasonable to assume that the higher level of D-dimer is primarily the result of increased fibrin clot formation and subsequent breakdown. The increased thrombogenic state may be related to increased susceptibility to vascular disease in these patients. D-Dimer, hence, can be used as an additional, novel biomarker of diabetic complications.

#### Abstract

The purpose of this study to evaluate the changes in the activity of muscles of mastication by using neuromuscular occlusion versus centric occlusion repositioning splint in treatment of myofascial pain dysfunction syndrome.

Search was made in 2 databases including PubMed and CENTRAL , title and abstract were screened to select studies comparing changes in the activity of muscles of mastication by using neuromuscular occlusion versus centric occlusion repositioning splint in treatment Articles which did not follow the inclusion criteria were excluded. Included papers were then read carefully for a second stage filter, this was followed by manual searching of bibliography of selected articles. The search resulted in 5 included papers. One study evaluated the patient satisfaction, while the other 4 evaluated the masticatory function . Two of them used VAS as a measurement tool , while the other two used VAS and CAT .reducing muscle activity , relief pain clicking disappearance were the main outcomes of the included papers. Conflicting results was observed between the two types of stent.

#### Introduction:-

Myofacial Pain Dysfunction (MPD) is a musculoskeletal dysfunction involving malrelationship among the neuromuscular system, temporomandibular joints, and dental occlusion<sup>1</sup>

Pain, discomfort and disability associated with myofacial pain dysfunction can greatly affect a person's quality of life, as well as perpetuate a headache, commonly described by the patients as tension headache, or even cause a migraine<sup>2</sup>

A variety of treatment modalities have been suggested including pharmacological management, occlusal appliances, physiotherapy and many others. Occlusal splints are removable interocclusal appliances that are usually fabricated out of hard acrylic<sup>3</sup>

The objectives of splint use in the treatment of temporomandibular disorders (TMD) and myofascial pain dysfunction (MPD) include: eliminating occlusal interferences, stabilizing tooth and joint relationships, passive

stretching of the musculature to reduce abnormal muscle activity, decreasing parafunctional habits, protecting against tooth abrasion and decreasing joint loading<sup>(4,5)</sup>

Repositioning splints: Plane bite splints increase the vertical dimension but should not affect the position of the mandible when habitual clenching occurs on the splint. It guide mandible into a different position at closing, which is supposed to facilitate repositioning of the disk and reduce the load on retrodiscal pain sensitive areas<sup>6</sup>

In the natural dentition a slide from centric relation (CR) to centric occlusion (CO) takes place mostly with a vertical and sometimes also with a lateral shift in the mandible's position. One important goal in the fabrication of a plane splint is to create an area around the contacts at habitual closing (neuromuscular position) which makes it possible for the mandibular teeth to move from CR to a CO position without such vertical or lateral shifts<sup>7</sup>

The maxillo-mandibular realignment theory proposes that the mandible is malpositioned relative to the maxilla at the position CR. It is believed that if the mandible is repositioned, a more optimum maxillo-mandibular relationship can be evolved, and the symptoms eliminated<sup>8</sup>

However CR cannot be properly registered in most patients with acute signs and symptoms of TMJ disorders. It may even be contraindicated to try to make such a registration. Any pushing of the mandible in a patient with TMJ inflammation and/or internal derangement can increase tissue injury<sup>9</sup>

For myofascial pain dysfunction syndrome patients receiving superior repositioning splints, would the use of splint with neuromuscular occlusion result in less pain intensity and improve muscle activity or not

The aim of this study to evaluate the changes in the activity of muscles of mastication by using neuromuscular occlusion versus centric occlusion repositioning splint in treatment of myofascial pain dysfunction syndrome.

## **Materials and Methods:-**

### **Search Strategy:-**

**An Electronic Search of the literature was performed on PubMed Cochrane, using the following search terms**

**:-**

1. Dentulous Jaw
2. Centric relation recording,
3. Centric relation occlusion,
4. Centric relation record
5. Occlusal splints
6. Occlusal splint therapy
7. Occlusal splint bruxism
8. Soft Occlusal splint
9. Hard occlusal splint
10. Occlusal splint and bruxism ,
11. Occlusal splint tmd
12. Nuromusclar splint
13. Oral splint
14. TMD
15. Disc displacement with reeducation
16. Disc displacement
17. 17- 9 OR 10 OR 11 OR 12 OR 13 OR 14 OR 15 OR 16
18. 8 AND 17

Hand search was done on the bibliography of the included papers. Last hand search was performed on the 25<sup>th</sup> of April – 2016

### **Selection criteria:-**

**Clinical trials comparing different occlusal splints for the dentulous patients were selected according to the following inclusion criteria:-**

- Human studies

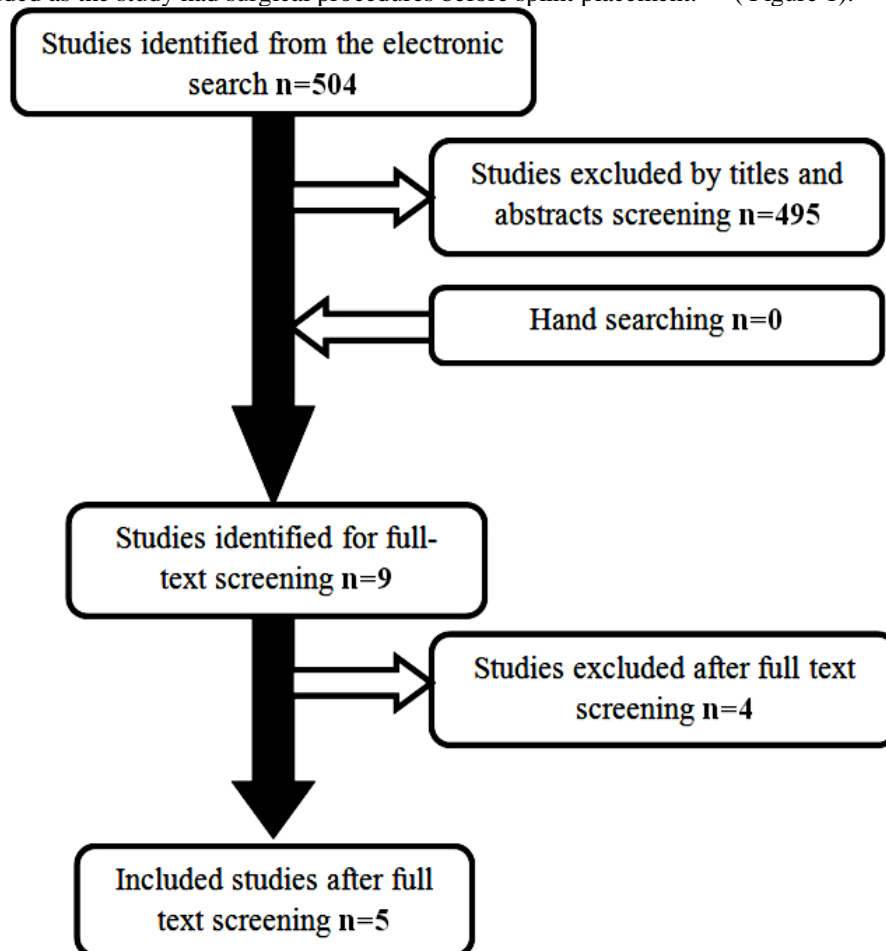

- Clicking
- Limited mouth opening
- Complete dentulous

### Study Selection:-

Retrieved titles were all screened, and all papers that met the inclusion criteria were selected. Abstracts of all headings chosen were screened and obtained for inclusion criteria. After abstracts were screened, full text studies were retrieved for the selected papers. In case both the heading and the abstract of an article wasn't enough to obtain data needed to make a decision regarding inclusion criteria, full texts were retrieved. Full text papers meeting inclusion criteria were screened upon their methodology and results. Two reviewers performed the screening procedure.

### Results:-

A total of 504 titles were identified by the electronic search. After initial titles and abstracts screening, 495 irrelevant articles were excluded and a total of 8 articles were selected for full-text screening. No additional articles were found through hand searching. After full text screening, 5 articles<sup>(10-16)</sup> were included in the present analysis. One study was excluded as edentulous patients were included which didn't match the inclusion criteria<sup>(17,19)</sup> also other study was excluded as the study had surgical procedures before splint placement.<sup>18</sup> (Figure 1).

The 5 articles included in this study were published in a period ranging from 1995 to 2012. They differed widely with respect to methodology, study designs and outcomes. So the possibility of attempting a meta analysis was eliminated. (Table 1)

**Table 1:-** Included Studies.

**pain analysis:-**

Four studies<sup>(18- 21)</sup> has evaluated the ability for pain relief within comparison of two groups of patients . A 100 scale VAS (mm) was used to asses the ability to speak for all the four studies. No significant difference between groups was reported, Feine and Heydecke studies<sup>(18, 19, 21)</sup>. In those studies , VAS records was higher for the fixed group in studies<sup>(18,19)</sup> , while in Heydecke study<sup>(21)</sup> , VAS was higher for the removable group . While a significant difference in favour of the removable group was reported in study<sup>(20)</sup>.

A single study<sup>(21)</sup> has reported into depth the speech quality & errors by using a fixed prosthesis in one trial and a removable prosthesis in another trial. This study tested stops, fricatives & vowels between both the removable and fixed groups. The study revealed a statistically significant difference for the favour of the removable group in case of correctly produced sounds, specially for stops & fricatives, while non significant difference was observed for vowels, with higher means for the removable prosthesis.

**Electromyographic activity of the masticatory:-**

- all studies have evaluated the efficiency of mastication between oral splints . Jaw mastication muscles, and mandibular movements were recorded using an electromyographic activity. It was reported that There were no statistically significant differences in the electromyographic activity of the masticatory muscles in the different time periods The use of a Lucia jig over 0, 5, 10, 15, 20 and 30 minutes did not promote any statistically significant increase in muscle activity<sup>(22)</sup>

**Patient satisfaction:-**

Four studies<sup>(18- 21)</sup> reported the patient satisfaction with different reporting methods and outcomes. Two studies<sup>(18, 20)</sup> out of four has used a 100 mm VAS (Visual Analogue Scale) and CAT (Categorical Scales),to asses the patient own words in describing his satisfaction about the splint in different aspects, while the other two<sup>(19, 21)</sup> only used VAS. (Table 2)

In studies<sup>(18- 20)</sup> using the VAS, Significant difference was obvious between the treatment groups regarding rapid pain relief in favour of the centric splint , while non significant difference between both groups was reported regarding the clicking disappearance ,<sup>(18, 19)</sup>.

Increase mouth opening was significantly better for the repositioning splint in studies<sup>(18, 19)</sup>. On the contrary it was significantly better in favour of neuromuscular splint in study<sup>(17)</sup> ,while no significant difference was noticed in study<sup>(20)</sup> between both groups .

A contradicting outcome evaluating the general satisfaction between the two groups gave a significant difference for the centric splint group in study <sup>(20)</sup>, while reporting no significant difference between studied groups in study <sup>(18)</sup>, with higher VAS means for the repositioning splint group

### **Discussion:-**

Patients with any systemic disease were excluded from the study to decrease the variables between groups and also to be sure for the right effect of the stent <sup>(21,22)</sup>

Occlusal splint is “Any removable artificial occlusal surface used for diagnosis or therapy affecting the relationship of the mandible to the maxillae. It may be used for occlusal stabilization, for treatment of TMJ disorders, or to prevent wear of dentition.” The appliance can be made to cover the occlusal surfaces of maxillary or mandibular teeth and can be fabricated from many different materials, giving it a hard, soft, or intermediate feel. <sup>(23)</sup>

Splint therapy is considered an adjunct to pharmacologic therapy and most appropriate when nocturnal parafunctional activities can be identified. Typically, a flat-plane maxillary occlusal splint designed for bilateral contact of all teeth is fabricated. <sup>(24)</sup>

It has been hypothesized in the literature that the presence of a foreign object in the palate may reduce nocturnal jaw muscle activity, possibly due to changes in the oral tactile stimuli, a decrease of oral volume, and space for the tongue <sup>(25)</sup>

It has also been hypothesized that an intraoral splint may make the patient aware of the position and potentially harmful use of the jaw this has been labeled a “cognitive awareness” concept.

Disc displacement with reduction (DDWR) of TMJ is common in TMD clinics. Patients usually present with a complaint of joint sounds, and only few patients present with persistent TMJ pain or locking of the jaw. MRI is a standard diagnostic tool for DDWR but the goals of treatment are to reposition the disc, eliminate the joint sounds and pain, and achieve rehabilitation of jaw functions. <sup>(26)</sup>

Although joint sounds and disc displacement without pain or impaired jaw functions were considered less important clinically, the elimination of sounds contributes to a patient’s well being. <sup>(27)</sup>

A normal disc position might prevent more severe diseases from occurring early, making a noninvasive method with a short therapeutic time and less complications preferable to radical surgery or ignoring the problem. <sup>(28)</sup>

It was believed that different TMDs need different splint designs and various treatment regimens. Although upper stabilization splint is good for muscle disorders and bruxism, ARS might be suitable for DDWR, but each has its own shortcomings, which need to be overcome. These are open bite, difficulty having normal diet when wearing the appliance, and osteoarthrotic changes in the condylar form. <sup>(29)</sup>

Some patients need complex dental treatment for stabilization of occlusion. Splint therapy for TMDs may be classified into three major groups on the basis of splint functions: stabilization splints (centric splints) the neuromuscular splints, and ARS <sup>30</sup>

The stabilization splint provides a balanced bilateral occlusal contact on a flat splint surface; during lateral movement, only cuspids are in contact with the splint this method is used to stabilize occlusion, muscles, and joints. <sup>31</sup>

The ARS is used to treat DDwR and DDwoR The treatment goals of splint for DDwR of TMJ are to reposition the condyle downward and recapture the disc anteriorly, correct the relationship between the glenoid fossa, articular disc, and condyle ,improve jaw function , reduce joint pain and sounds, eliminate mechanical interference and prevent progression of the disorder <sup>(32)</sup>

We elevated the bite vertically just enough to eliminate the joint sounds, but we did not reposition the jaw anteriorly in three groups however, the conventional ARS was designed to protrude the mandible anteriorly to varying amounts. <sup>(33)</sup>

Treatment time should be long enough to recapture and to stabilize the disc, and the splint should be removed gradually. Although the length of treatment time is still controversial, we suggest 4–8 weeks, followed by slow weaning off to avoid surgery and post treatment occlusal therapy (prosthetic or orthodontic treatment).<sup>34)</sup>

In this study, we were able to perform MRI in patients to confirm the diagnosis and results of treatment this make proper diagnoses of the internal derangement before treatment. The MRI examination on patients showed a high correlation between clinical examination and MRI image finding.<sup>35)</sup>

A plastic sheet was used to be sure of standardization of position of electrode during period of follow up using fixed anatomical landmarks.

Although surface electromyography has been presented for long time as a method in dental medicine for muscular activity research and evaluation, there is no evidence about its role in TMD diagnosis. While one group of authors disagrees with regard to EMG in TMD diagnosis and treatment evaluation, others stressed on its major role in diagnosing alterations in neuromuscular function considering both views, in this investigation our aim was to evaluate masticatory muscle activity alterations in TMD patients.<sup>38)</sup>

The use of electromyography in temporomandibular dysfunction diagnosis is based upon the hypothesis that various pathologic and dysfunctional conditions, such as muscle hyperactivity, muscle fatigue and muscle imbalance, can be detected from the EMG recording. The term muscle hyperactivity has been used to describe any increased muscular activity over and above that necessary for function. Muscle hyperactivity thus includes not only the parafunctional activities of clenching, bruxing, and other oral habits but also any general increase in the level of muscle tonus.<sup>36)</sup>

In the first instance, EMG signal analyses are qualitative with the inspection of the raw signal in the last decades, the application of mathematical models and statistical analyses has offered a better understanding of EMG signal properties, allowing the evaluation of the physiologic events of muscles. Such advances have made it possible to study muscle electrical manifestations in amplitude domain as well as wave frequency.<sup>37)</sup>

However this investigation has confirmed that EMG is a useful and non-invasive method in TMD diagnosis. However, EMG is not sufficient if applied alone, but together with other methods it forms a complementary approach in TMD diagnosis.<sup>39)</sup>

The maxillo-mandibular realignment theory proposes that the mandible is malpositioned relative to the maxilla at the position of maximum tooth intercuspation (CR). It is believed that if the mandible is repositioned, a more optimum maxillo-mandibular relationship can be evolved, and the symptoms eliminated.<sup>(40,41)</sup>

More than one type of scale is used to measure patient's satisfaction. Out of those is the OHIP (Oral Health Impact Profile) which is meant to provide information about perceptions of oral health however, the complete 49 item version is not always applicable in a clinical study because its time consuming. This led to the development by Slade, a simplified version, the OHIP-14<sup>(36)</sup>. This questionnaire includes 14 items, two from each domain, selected because they have been shown to be the most frequently reported. The OHIP questionnaire includes seven main scopes<sup>(37)</sup>. Another type is the Visual analogue scales (VAS) and categorical scales (CAT) which are known to be predictable assessment tools<sup>(38)</sup>. VAS, is frequently used to measure subjective perceptions, while CAT questions are used to collect information about the patients' physical, psychological function and general health. Patients are asked to choose a word from a four-point scale that best described their response. Our included studies used a VAS scale from 0 to 100, other authors have used VAS with scores from 0 to 10 or from 1 to 5<sup>(39)</sup>. The need for multidimensional evaluation of implant therapy, using consistent instruments and valid tools when available, has been displayed in literature for many years<sup>(40)</sup>.

Conflicting results in our systematic review, is mainly due to lack of randomization in all of the included studies<sup>(18-21)</sup>, outcomes vary obviously when true randomization takes place, rather than a patient centered protocol, in matter of directing patients to a specific treatment group. Follow up period wasn't enough to judge satisfaction scores, only two months were given for patients to test their perception. Only five studies were included in our review, which isn't a valid number to synthesize a definitive conclusion about the treatment options. In two studies

<sup>(19,21)</sup> only a single scale measurement (VAS) was used while its recommended to use more than one assessment tool for more reliable outcome results.

The degree of patient satisfaction is the result of a complicated interaction between psychological and physiological factors <sup>(45)</sup>. Even though, up till now, there is no any accurate scale or a questionnaire with items related to personal behavioral habits, which might be relevant for motivating the patient to shift their choices towards a specific prosthesis design, keeping in mind conservation of the oral tissues functions <sup>(46)</sup>.

### Conclusion:-

This study clarified that Temporary splint does not cause permanent or irreversible changes in the structure or position of the jaw or teeth. It has better patient compliance, fewer side-effects, and is more cost-effective than surgical treatment

Splint using centric relation record has a greatest patient satisfaction and easy in manipulation , Pain relief was achieved in all groups use of repositioning splints might be very useful in the initial management of TMJ pain and dysfunction. Decreased internal pressure and relieve of retrodiscal tissues ,There are different types of occlusal appliances, each one has its special design, indication and precautions that should be followed so that it was strongly advised to thoroughly understand the masticatory system dynamics and perform a comprehensive examination to the TMJ and its related structures to be able to choose correct appliance perfectly with fewer complications, Further and bigger randomized controlled trials need to be conducted to verify the findings.

Paraquat is among the most dangerous poison in medical

#### Abstract

field. It causes rapid irreversible damage of lungs and lead to renal failure and liver failure causing to death. It is highly toxic compound for humans with very high mortality due to lack of antidote available. We report a case of a 17 yrs old female, who has ingested a 5ml of paraquat (1, 1'-dimethyl-4, 4'-dipyridylum) which is used as a herbicide and easily available substance in a developing countries like India. Despite it's widely availability in India, its poisoning is uncommon and diagnosis is often difficult in the absence of proper history and lack of definitive laboratory investigations.

Sometimes despite of early diagnosis we may not able to save the victim as in our case because of lack of any effective treatment.

#### Introduction:-

Paraquat or N, N'-dimethyl-4, 4'-bipyridinium dichloride is a toxic chemical that is widely used as a herbicide primarily for weed and grass control. It is present in varying concentration and requires to be diluted prior to its use. Paraquat is highly toxic chemical to human beings. The most likely route of exposure that would lead to poisoning is ingestion. Paraquat poisoning is also possible after skin exposure if skin exposure lasts for long time or skin that is not intact (skin that has sores, cuts or a severe rash). Inhalation exposure to paraquat can irritate the airways and mucus membrane but rarely causes systemic manifestations.[1]

Paraquat causes direct damage when it comes into contact with the lining of the mouth, stomach or intestines; it causes toxic chemical reactions to occur throughout of the body primarily the lungs, liver and kidneys.

The main systemic effects are pulmonary edema, convulsions, cardiac, renal and hepatic failure [2]

We are reporting a case of fatal paraquat poisoning from Eastern Indian state of Odisha. The patient was admitted in our tertiary care hospital. This paper discussed a case of acute paraquat poisoning and detailed review of literature.

#### Case Presentation:-

A 17 years old female patient from a farmer family background was brought to our Emergency department with history of alleged consumption of approximately 5 ml of paraquat taken 11 hours prior to presentation. She had a dispute with her mother regarding her marriage and she has taken paraquat which was kept in their house for farming purpose. They brought the empty bottle of paraquat by the trade name of "Gramoxone" with them. She doesn't have any past medical or psychiatric illness. She has consumed approximately 5 ml of herbicide as a suicidal

attempt which is followed by repeated vomiting. Primarily she was taken to Peripheral Health Centre after half an hour of consumption where gastric lavage done and she was referred to higher Centre for further evaluation and management. There was no documentation available with patient's attendant, therefore we can't confirm whether charcoal administration was done at PHC during gastric lavage.

Vitals at the time of presentation in ED are; GCS-15/15, Blood pressure at right arm 100/60mmHg, pulse rate-108/min, Respiratory rate-20/min, Temperature at axillary-98.4 F, Oxygen saturation-97% at room air, Random blood glucose-103mg/dl, bilateral pupils were normal size and reactive to light.

On Primary survey Airway was patent, Lungs were clear to auscultation, there was no respiratory distress, had normal heart sounds, Capillary refill time was < 2 seconds and all peripheral pulses were present.

Secondary survey showed her oral mucosa red and congested and rest of the examination from head to toe were unremarkable.

At Emergency patient has started on maintenance IV fluids, antiemetic and PPI for supportive measures. Foley's catheterization has been done to measure urine output.

All initial investigations (CBC, RFT, LFT, PT/INR/APTT, ECG, X-RAY CHEST, URINE TOX SCREEN), UPT (Negative) were done from Emergency.

Patient then shifted to ICU for continuous monitoring. On the First day in ICU, patient remained asymptomatic. Initial complete blood count, LFT, RFT were within normal limits. ECG revealed sinus Tachycardia with no ST-T changes. Initial chest X-Ray was within normal limits. [Figure 1].

Patient was kept nil orally and on maintenance IV fluids, antiemetics, antacid and triamcinolone acetonide mouth paste to reduce pain and swelling inside the mouth. On the second day she has developed oliguria and increased in urea and creatinine levels for which Nephrology consultation was done and advised to increase the IV fluids and Planned for Hemodialysis if renal function further deteriorates.

On fourth day patient had developed oliguria and further deterioration of her renal function, Hemodialysis was performed and kept on a regular session of hemodialysis. Patient had developed fever (T-101.3°F) for which broad spectrum antibiotic started. Urine routine examination showed 20-25 pus cells/HPF, RBC-10-15/HPF and granular cast suggestive of urinary tract infection and acute tubular necrosis. [Figure 2].

On fifth day patient had 2 episodes of hamatemesis for which Pantoprazole infusion and UGI Endoscopy done suggestive of extensive oropharyngeal and esophageal ulcerations with oozing. [Figure 3].

On the following day patient became severely hypoxic, spo2-85% while on 100% FIO2 on Non Invasive Ventilation was used. Heart rate was 124/min, Respiratory rate 36/min and blood pressure was 120/66mmHg. ABG showed PaO2 of 45.0mmHg with Respiratory alkalosis [figure 4]. Chest X-Ray was done showed bilateral alveolar shadows predominately in mid and lower zones suggestive of ARDS. [Figure 5].

Subsequently patient became drowsy, Spo2 was 80% on 100% FIO2 on NIV. In view of persistence hypoxia patient was intubated and kept on mechanical ventilation.

Patient was continued on mechanical ventilation and hemodialysis was performed on daily basis but her condition didn't improve and she expired on 11th day of her admission.

### **Discussion:-**

Paraquat poisoning is a medical challenge for emergency physician because it's rare especially in the northern part of India and patient's vitals remain stable in the initial hours of presentation apart from mouth erosions and it causes mortality in a large number despite treatment in tertiary care setting [3]. Paraquat poisoning is common in southern part of India, Srilanka and in Africa (Trinidad, Tobago, South Trinidad) [4][5][6]. A lethal oral dose of the 20% concentration solution is about 10 to 20 ml in an adult and 4 to 5 ml in a child [1]. Ingestion of large amounts (>15-20 ml of 20% ion) results in fulminant organ failure resulting in renal and hepatic failure, GI ulceration, pancreatitis.

Toxic myocarditis and death from cardiogenic shock and multi-organ failure within 1-4 days [1]. Ingestion of smaller quantities usually leads to toxicity in kidneys and lungs developing over the 2-6 days. Renal failure develops quite rapidly. Paraquat accumulates inside renal tubular cells causing reduction oxidation (redox) cycling and increase reactive oxygen species formation with subsequent proximal tubular injury [7]. A decrease in paraquat elimination due to renal failure aggravates systemic toxicity [8]. The major effect of paraquat follows its accumulation in the lungs, it accumulates in the alveolar cells of the lungs, where it is transformed into a reactive oxygen species, the superoxide radical [1]. The pulmonary lesion has two phases: an acute alveolitis over 1-3 days followed by a secondary fibrosis. The patient develops increasing signs of respiratory involvement over 3-7 days and ultimately dies of severe anoxia due to rapidly progressive fibrosis up to 5 weeks later [9].

Gastrointestinal toxicity is present in majority of the case because most common mode of poisoning is self ingestion or accidental. A burning sensation of the lips and mouth may occur within a few minutes to hours followed by ulceration. Sometimes they may result in perforation, mediastinitis or pneumomediastinum. Direct contact with paraquat solutions may cause skin burns and dermatitis [10].

Some liver toxicity (jaundice, transaminase rise) is also common in these patients.

Early diagnosis are important .we need to obtain details of the exposure, route of exposure, concentration of the product and estimated amount, time of occurrence. Measurement of plasma and urine paraquat concentration is useful both to confirm poisoning and predict prognosis [11][12]. Complete blood count, electrolytes, renal and liver function should be done regularly. Serial pulmonary function test, chest radiographs, arterial blood gas determinations may be used to monitor toxicity.

A CT Scan of the chest may be helpful in detecting early lung fibrosis or assessing long term damage in survivors [9]. Upper GI endoscopy should be performed to identify the extent and severity of mucosal injury.

Any exposure to paraquat is an Emergency and patient should be admitted even if the patient is asymptomatic. Treatment involves the assessment and management of airway, breathing and circulation as per guidelines. However mild to moderate hypoxia should not be routinely treated with oxygen as it will worsen oxidative stress and it increases mortality in animals models [13][14]. Supplemental oxygen should be withheld unless the PaO<sub>2</sub> is less than 70mmHg because oxygen may contribute to the pulmonary damage which is mediated through lipid peroxidation [15]. Maintain intravascular volume and urine output to prevent prerenal kidney injury.

Immediate GI decontamination with absorbents that bind paraquat is indicated in a patient with protected airways. A single dose of activated charcoal (1 to 2 gm/kg) can be used. Charcoal hemoperfusion can remove paraquat and has been recommended to be started as soon as possible and continued for 6 to 8 hours but there is no evidence to show that prognosis improved [1][16].

Hemodialysis and hemoperfusion has been tried in many centers to remove paraquat but the benefit of this is very limited because paraquat is rapidly distributed to the lungs and other organs [17][18].

Immunosuppression with combination of cyclophosphamide and methylprednisolone was shown to be beneficial in moderate to severe cases by prevention of ongoing inflammation that lead to lung fibrosis and death [19][20].

Intravenous Methylprednisolone 1gm/day for three consecutive days, Intravenous Cyclophosphamide 15 mg/kg/day for two consecutive days followed by Intravenous Dexamethasone 8mg thrice a day until pao<sub>2</sub> is >11.5kpa(80mmHg) and repeated pulse therapy with Methylprednisolone(1gm/day for 3 days) and cyclophosphamide(15mg/kg/day for 1 day) which if pao<sub>2</sub> is <8.64kpa(60mmHg)[20]. However a 2003 Systemic review of the effectiveness of immunosuppressive therapy in paraquat poisoning found lack of proven efficacy[21]. Several antioxidants like vitamins C and E have been clinically used to protect against free radical toxicity however only animals studies have been done that showed mixed response and human studies are either small or uncontrolled.

### **Conclusion:-**

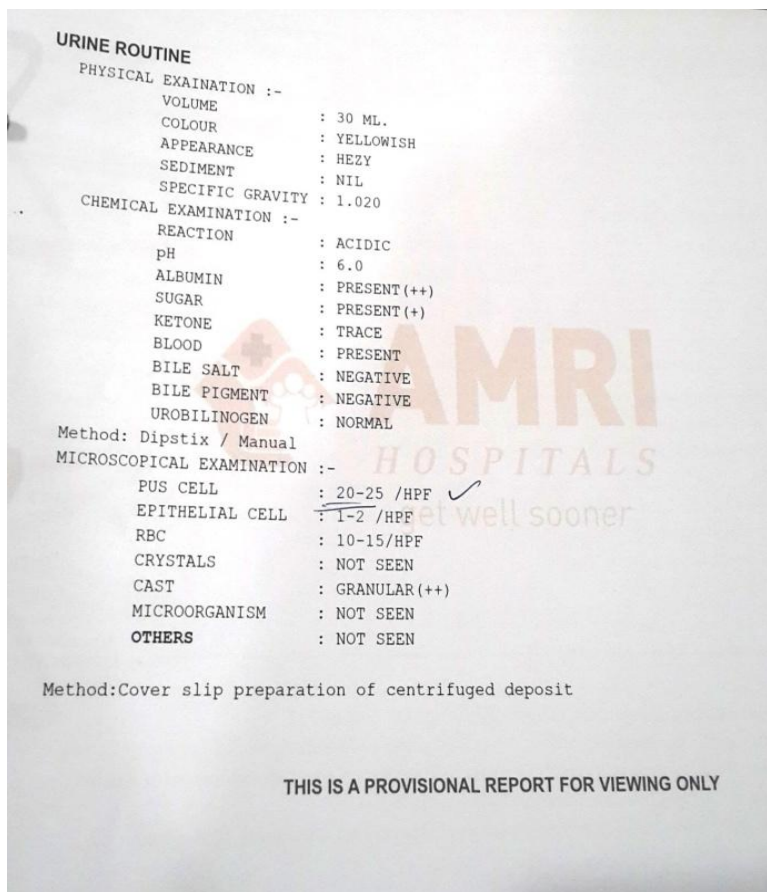

Patient presenting to the Emergency department with alleged history of ingestion of paraquat poisoning should be admitted even if they are asymptomatic initially. There is no specific antidote available and prognosis depends upon the amount of paraquat ingestion. Oxygen should be used cautiously in these patients. Early administration of

cyclophosphamide and steroids at Emergency at least 2-3 hours after paraquat exposure is important because it will not be effective once cells have already been infiltrated. However a large randomized controlled trial is required to affirm the role of Immunosuppression in paraquat poisoning.

#### Abstract

**Purpose:** The loss of natural teeth leads to bone resorption and muscular hypotonicity, which may affect the structures involved in mastication. Atrophy of supporting tissues, poor adaptation, reduced masticatory efficiency, and psychosocial embarrassment are major complaints of edentulous patient wearing old/faulty denture. The need for this study is to examine the effect of old/faulty dentures and a new denture on the masticatory muscle efficiency with the help of electromyography.

**Materials and methods:** 15 edentulous patients wearing complete denture prosthesis selected as a subject for the investigation. Surface electrodes from electromyographic unit were placed in the region of right and left anterior Temporalis muscle and Masseter muscle, and the patients will be asked to perform maximum voluntary contraction. The muscle activity analyzed twice for each patient: (1) with the old/faulty dentures and (2) 5 month following insertion of new denture.

**Results:** The electrical activity during maximum voluntary contraction exhibited statistically significant improved muscle efficiency with new denture when compared to those with old dentures in place for 5 months.

**Conclusion:** New dentures or improvements in occlusion and vertical dimension produce a positive benefit to the patient by reducing the muscle effort during chewing without affecting masticatory performances. The reduction in muscle effort is likely to cause less tissue and in the end may minimize residual ridge resorption and new complete denture allows for neuromuscular reprogramming, which contributes to muscular balance of the masticatory system.

#### Introduction:-

The “stomatognathic system” is complex system that acts as a functional unit of the body characterized by several tissues of different origin and structure that act in consonance to perform different functional tasks. It comprises the

Address:- Assistant Professor, Department Of Prosthodontics, Coorg Institute Of Dental Sciences Virajpet -571218 Karnataka India.

joint connection between the mandible and the base of the skull, which in turn has muscle and ligament connections to the neck region. It consists of skeletal components (maxilla and mandible), dental arches, soft tissue (salivary glands, nervous and vascular supplies) temporomandibular joints (TMJ) and muscles. These structures are interconnected and interrelated; when activated, they aim to achieve maximal efficiency with protection of all the participating tissues. The masticatory system is also a part of this complex stomatognathic system. In dentulous subjects, mastication is highly coordinated neuromuscular function that involves fast effective movements of the jaw and continuous modulation of forces in craniofacial system. Masticatory functions generated by rhythmic contraction of masticatory muscles. These muscles have capacity to contract during daily use of the stomatognathic system and maintain the muscle tone in mandibular rest position. Whereas, in edentulous subjects these mechanism acts with marked differences. The loss of natural teeth leads to bone resorption and muscular hypotonicity, which may affect the structures involved in mastication leading to reduced capacity in various functions of stomatognathic system[1].

When teeth are lost, a change occurs in the mandibular posture, the speech pattern, esthetics, and deglutition as well as in the individual's social, emotional and psychological behavior. Along with this, some age related changes, such as deterioration in the fast and slow-twitch fibers of the striated muscles, results in impaired muscle force. Edentulous persons have reduced capacity to perform various functions of the stomatognathic system such as occlusal forces, tactile thresholds and chewing ability. The loss of teeth and elimination of periodontal afferent innervations flow lead to changes in the neuromuscular patterns causing the reduced chewing efficiency when new complete denture replaces teeth[2]. For the patient who has previously worn dentures, the clinician must determine the OVD(occlusion at vertical dimension) based on the clinical presentation. By establishing, an appropriate OVD in the patient who has worn the same dentures for 15 years or longer can be challenging. Excessive wear of the denture teeth in a long-term wearer can cause the patient to function at a reduced OVD, possibly compromising the oral cranio-facial system. In addition, older denture wearers may suffer age-related morphologic changes, such as decreased facial height, because of mandibular ridge resorption and a downward and forward rotation of the mandible[1]. An increase in the vertical dimension may lead to changes in the oro-facial structures, i.e. jaw elevator muscles and temporo-mandibular joints. An increase in the vertical dimension may influence the masticatory performance both in a negative way, (hampered chewing cycle) and in a positive way (increased bite force).

Although, various techniques are available for examining the stomatognathic system, the electromyographic recording is one of the convenient and useful methods because it directly measures muscle activity. Electromyographic techniques have permitted more precise assessment of the muscle functions compared to previously possible clinical observation. Technological development has led to the optimization and application of computerized diagnostic systems such as electro-gnathography[3]. The first effort to apply electromyography in dentistry was made by Robert E. Moyers. It used to corroborate the neuropsychological analysis of the factors linked to prosthetic rehabilitation procedures. Electromyographic data representing muscle activity during movements of the mandible (e.g.chewing) are the result of several variables which are operating simultaneously-i.e., continual variation in muscle length, bite dimension, and temporomandibular joint axis. The study of such data has contributed to our knowledge of the relative function of the masticatory muscles and has certainly indicated the potential value of electromyographic data in dentistry[4].

## **Materials and Methods:-**

### **Sample selection:-**

Fifteen edentulous patients (eight men and seven women aged between 40 and 80 years) with complete, old maxillary and mandibular dentures, worn for over 10 years were selected for the present study. The patients were selected from the out patient department of Prosthodontics. All patients presented diminished occlusal vertical dimension (OVD), with deficient dental occlusion, and severe bone resorption, particularly of the mandibular arch. They were all asymptomatic and presented no signs or symptoms of neuromuscular and temporomandibular disorders (TMD). The selected patients were informed about the treatment to be instituted and signed a term of consent in accordance with the recommendations of the Human Research Ethics Committee.

### **Screening examination:-**

The computerized system was used for recording the EMG data. The components of this system comprises of a display monitor, a cathode ray tube and electrodes (surface and hypodermic needle). The monitor helps in screening and it display the amplitude of muscle activity by special **RMS EMG software** (figure no 1). The cathode ray tube (CRT) transmits the activity of muscle from electrode to the monitor, and the electrode, which filters the muscle

activity and it, transmits to the CRT for amplification. Surface EMG utilizes sensing electrodes placed on the skin, which allows the clinician to directly and accurately monitor muscle activity.

#### Preparation of the patients:-

On the day of EMG recording for old denture and with the new denture after 5-months follow up, any needed adjustment to the intaglio, cameo and occlusal surfaces of the complete dentures were made. During the electromyographic recording (figure no. 1), the patient was asked to seat on nonconductive chair, which reduces the interferences in an upright but relaxed position. The head was kept unsupported, and aligned according to Frankfort horizontal plane, parallel to the floor. The conductivity of the electrode-skin interface was increased using conductive gel after thorough cleaning of the skin with 99.5% alcohol swabs and skin preparation gel to enable an easy transport of electrical potentials. The electrode must be firmly attached to the skin, with adhesive tape, to avoid bias due to movements (figure no 2). The application of conductive gel reduces the impedance below 20kV. The recordings were performed 5 minutes later, which allowed the conductive paste to adequately moisten the surface. The EMG signals were filtered (0.003-1.0) and amplified with a time constant of 10mili second, and displayed on the cathod ray tube (CRT) monitor for on line monitoring.

Figure No1:- Electromyogram.

Figure No 2:- Electrodes, Conductive Gel & Adhesive Tape.

Figure No 3:- Electromyographic Recording

#### Experimental protocol:-

The wires were connected. The appliance is equipped with a trial test, which is necessary to verify the correct state of the electrodes and connections. The anatomical locations for area of interest were recognized and palpated. Each EMG recording lasted 10 s and a computer calculated the root-mean-square (RMS) value of the EMG activity (figure no.3). The subjects were allowed to practice prior to the start of the experiment. Once the patient and instruments were prepared for the collection of data, the procedure for recording muscle activity by EMG was

carried out. The electrical signals were captured and the electrical activity of the muscles was analyzed. Each EMG recording was repeated at about a 1-min interval to avoid muscle fatigue. For EMG recording the patient was asked to clench his/her teeth, and keep them clenched for two seconds. Next, the patient was asked to relax the muscles, slightly separating the teeth for another two seconds. The operator controlled all the times. The electrical activity was recorded manually for 5sec, rested for 15sec and repeated the clenching cycle 5 times. To record maximum tooth clenching, the patient maintained tooth contact for two seconds, and electrical activity was recorded. The averages RMS-EMG of the two repeated recordings were used for the statistical analysis.

### Data Collection:-

#### EMG recording for bilateral anterior Temporalis muscle: (figure no. 4 and 5):-

For recording EMG activity of anterior Temporalis muscle, two pair of miniature surface bipolar Ag/AgCl electrodes were placed over the anterior Temporalis muscle 1-inch posterior and 1-inch superior to the outer canthus of the eye with adhesive tape. These electrodes were placed parallel to the muscle fibers, with a centre-to-centre distance of 30mm to avoid the endplate region and thus to obtain stable recordings. They were positioned at the motor point, on each portion of the anterior Temporalis muscles, so that their electrical activity could be assessed. The placement of the electrode was determined by manual palpation of the muscles bilaterally. The muscle activity is checked by asking the patient to gently clench the mouth in maximal intercuspal position following the longitudinal alignment, parallel with the direction of the muscle fibres. The ground electrodes were placed over the center of forehead in order to eliminate possible external interferences. The subjects clenched manually for 5sec and rested for 15sec and repeat the clenching cycle 5 times. The highest EMG activity was considered the maximum clenching.

Figure no 4:- Emg Recording For Right Anterior Temporalis Muscles.

Figure No 5:- Emg Recording For Left Anterior Temporalis muscles

**EMG recording for bilateral Masseter muscle: (figure no. 6 and 7):-**

The EMG activity of Masseter muscle was carried out by placing two pair of miniature surface bipolar Ag/AgCl electrodes over superficial fibres of Masseter muscle. The superficial fibres of Masseter muscle originate at dorsal surface of zygomatic bone and inserted to the ramus of the mandible. A band of superficial Masseter muscle was palpated by manual method from the prominence of zygoma until the gonial angle of the mandible. The activity this muscle was assessed by forcing the teeth for clenching. These electrodes were placed 2cm above the lower margins of the mandible halfway between the mandibular angle and anterior borders of muscles. These electrodes were placed parallel to the Masseter muscle fibers, with a centre-to-centre distance of 30mm to avoid the endplate region and thus to obtain stable recordings. They were positioned at the motor point, on each portion of the muscles, so that their electrical activity could be assessed. The subjects clenched manually for 5sec and rested for 15sec and repeat the clenching cycle 5 times. The highest EMG activity was considered the maximum clenching.

**Figure no 6:-** Emg Recording For Right Masseterr Muscle.

**Figure no 7:-** Emg Recording For Left Masseterr Muscle.

In all the procedures, the capture and analyses of EMG signals were carried out as recommended by the International Society of Electrophysiology and Kinesiology (Willians 1987). Recordings and analysis of the muscles electrical activity were obtained with the mandible in the maximum voluntary clenching. The EMG signals were stored and analyzed as root mean-square (RMS) values expressed in microvolts ( $\mu\text{V}$ ) in the maximum intercuspation position (figure no. 3). Finally, a new set of complete dentures with corrected occlusal vertical dimensions, an appreciable occlusal anatomy and well-polished cameo surface were delivered to all old denture wearers. The same procedures were performed after 5-months with new set of complete dentures. The statistical analyses were performed using paired t-test. A significance level of 0.05 was adopted for all tests.

## Results:-

The data engraved from this study were subjected to statistical analyses by using paired t-test. A significance level of 0.05 was adopted for all tests. The data of the study was analyzed and the results are presented in the table 1 and 2. These tables represents the mean values of electromyographic activity of Masseter and anterior Temporalis muscles with old and new denture after 5-months of follow up during maximal voluntary contraction(MVC) in the intercuspal position.

**Table 1:-**

This data showed during maximum voluntary contraction of Anterior Temporalis Muscle. The Mean activity of 242.4 $\mu$ V on right side and 237.67 $\mu$ V on left side with old denture and, 168 $\mu$ V on right side and 166.07 $\mu$ V on left side with new denture after 5-months follow up. The paired difference between the old denture and new denture, the activity of Anterior temporalis muscle for right side is 74.4 and on left side 71.6, thus from these values it infers that right side of Anterior Temporalis muscle is more efficient than the left side of the muscle. Statistical analysis reveals highly significant increase in muscle efficiency ( $p=0.000^*$ ,  $p=0.000^*$ ) with new denture after 5-months follow up when compared to subjects with old denture during maximum voluntary contraction.

Anterior Temporalis Muscle	With old denture ( $\mu$ V)		With new denture ( $\mu$ V)		Difference		P Value
	Mean	SD	Mean	SD	Mean	SD	
Right	242.4	38.13	168	32.34	74.4	42.3	0.000*
Left	237.67	43.26	166.07	44.15	71.6	39.9	0.000*

\*Significant at  $p \leq 0.05$

**Table 2:-** This data showed during maximum voluntary contraction of Masseter Muscle. The mean activity of 231.93 $\mu$ V on right side and 230.60 $\mu$ V on left side with old dentures and, 163.13 $\mu$ V on right side and 171.73 $\mu$ V on left side with new denture after 5-months follow up. paired difference between the old denture and new denture, activity of Masseter muscle for right side is 68.8 and on left side 58.8, thus from these values it infers that right side of Masseter muscle is more efficient than the left side of the muscle. Statistical analysis reveals highly significant increase in muscle efficiency ( $p=0.000^*$ ,  $p=0.002^*$ ) with new denture after 5-months follow up when compared to subjects with old denture during maximum voluntary contraction.

	Mean	SD	Mean	SD	Mean	SD	
Right	231.93	59.12	163.13	42.73	68.8	40	0.000*
Left	230.60	46.87	171.73	75.30	58.8	61.4	0.002*

\*Significant at  $p \leq 0.05$

## Discussion:-

In dentulous subjects, mastication is highly coordinated neuromuscular function that involves fast effective movements of the jaw and continuous modulation of forces in craniofacial system[1]. These muscles have capacity to contract during daily use of the stomatognathic system and maintains the muscle tone in mandibular rest position. Whereas, in edentulous subjects these mechanism acts with marked difference. The loss of natural teeth leads to bone resorption and muscular hypotonicity, which may affect the structures involved in mastication leading to reduced capacity in various functions of stomatognathic system[2]. Masticatory function occurs because of the interrelation between organs of the stomatognathic system, proprioception, brain centers, and occlusal function. Any change in the occlusal characteristics, temporomandibular joint or masticatory muscles may affect the pattern of the masticatory movements and, consequently, their effectiveness. Edentulous persons have reduced capacity to perform various functions of the stomatognathic system such as occlusal forces, tactile thresholds and chewing ability[3].

According to Luis Angeline & Joseph a. Clayton (1960) A study conducted to evaluate the Quantitative Electromyography of the Masseter Muscle and the usefulness of electromyography depends upon the ability to characterize quantitatively the "normal" population. Moreover, it concluded that, the data now do not permit such a characterization, because of the lack of standardization in recording techniques and the obvious difficulty in expressing the resultant electromyogram in simple quantitative terms[4]. When teeth are lost, a change occurs in the mandibular posture, the speech pattern, esthetics, and deglutition as well as in the individual's social, emotional and psychological behavior. Along with this, some age related changes, such as deterioration in the fast and slow-twitch fibers of the striated muscles, results in impaired muscle force[5]. Age and muscular fatigue affect the function of

the masticatory system and this is frequently accompanied by tooth loss, prosthetic rehabilitation, and, also by the development of local and systemic circumstances that may greatly influence this physiological process and reduce the masticatory ability of elderly individuals. Because of ageing in the oral cavity, there is a reduction in food intake, as well as opting for softer foods, which leads to an imbalance in nutritional intake. This fact leads to metabolic alterations, which can cause general ageing of tissues of the body[6].

P. Slagter et al (1992) investigated the relationship between the ability of patients with complete dentures to comminute a tough artificial test food, and their answers to questions about chewing experience. It has concluded that the subjective chewing experiences of complete denture wearers were related to ability to comminute test foods and degree of resorption of mandibular ridge was related to comminute test foods[7]. The loss of teeth and elimination of periodontal afferent innervations flow lead to changes in the neuromuscular patterns causing the reduced chewing efficiency when new complete denture replaces teeth. Other factors can affect chewing ability in complete denture wearer such as age, gender, personality type, denture experience, denture quality and occlusal schemes. Ellsworth K reported that age did not affect masticatory performance except the patient who is lower than 35 years old and upper than 75 years old. Yamashita S showed that the maximum in masticatory performance found in natural dentition, lower in removable partial denture and the lowest in complete denture wearer[8]. Iwao Hayakawa et al (2000) examined changes in masticatory function of complete denture with soft liner and was shown that applying a soft lining material to the mandibular dentures of 6 edentulous patients improved masticatory function with no adverse effect on the muscular tasks[9].

However, the differences were not statistically significant. Restorative procedures, in which the vertical dimension is increased, may influence the mechanisms of chewing cycle. Furthermore, changes in masticatory muscle length resulting from vertical opening may influence the length–tension relationship. An optimum muscular force measured under static conditions occurred at a jaw openings varying between 5 and 10 mm were measured at the first molar region. Hence, increasing the vertical dimension of occlusion may increase bite force during mastication. Thus, an increase in the vertical dimension may influence the masticatory performance both in a negative way, (hampered chewing cycle) and in a positive way (increased bite force and thus better breakage of food particles)[10]. For the patient who has previously worn dentures, the clinician must determine the OVD based on the clinical presentation. By establishing, an appropriate OVD in the patient who has worn the same dentures for 10 years or longer can be challenging. Excessive wear of the denture teeth in a long-term wearer can cause the patient to function at a reduced OVD, possibly compromising the oral craniofacial system.

In addition, older denture wearers may suffer age-related morphologic changes, such as decreased facial height, because of mandibular ridge resorption and a downward and forward rotation of the mandible. These morphologic changes, manifested primarily in the mandibular arch, result in a progressive forward posturing of the mandibular denture that can lead to a reduced horizontal overlap[11]. Peyron et al. found a progressive muscular loss as age advances, ranging around 40% when individuals were 75 years old, and, also a decrease in masticatory performance. The Effect of gender on masticatory performance did not differ in complete denture wearer. On the contrary, gender affected masticatory performance in natural dentition. However, the improvement in denture quality significantly affected masticatory performance in complete denture wearer. Changes in the occlusal vertical dimension are a common procedure in prosthodontic treatment. An increase in the vertical dimension may lead to changes in the orofacial structures, i.e. jaw elevator muscles and temporomandibular joints. Furthermore, an increase in the vertical dimension will lead to a decreased activity of the jaw elevator muscles in postural position. Restorative procedures, in which the vertical dimension is increased, may alter the length of the main jaw elevator muscles as well as the position of the mandibular head in the fossa temporalis[12].

Although, various techniques are available for examining the stomatognathic system, the electromyographic recording is one of the convenient and useful methods because it directly measures muscle activity. Electromyographic techniques have permitted more precise assessment of the muscle functions compared to previously possible clinical observation. Technological development has led to an optimized application of computerized diagnostic systems such as electrognathography[3]. The first documented experiments dealing with EMG started with Francesco Redi's works in 1966. Redi discovered a highly specialized muscle of electric ray fish generated electricity. Marey made the first actual recording of this electrical activity in 1890, who also introduced the term EMG. In 1922, Gasser and Erlanger used an oscilloscope to show the electrical signals from muscles. Clinical use of SURFACE EMG [SEMG] for the treatment of more specific disorders began in 1960's and was used

by Hardyek The first effort to apply electromyography in dentistry was made by Robert E. Moyers. It used to corroborate the neuropsychological analysis of the factors linked to prosthetic rehabilitation procedures[4].

Electromyography can be used in many clinical and biomedical applications. It acts as a diagnostic tool for identifying neuromuscular diseases, disorders of motor control and, used as a control signal for prosthetic devices such as prosthetic hands, and lower limbs. Electromyographic data representing muscle activity during movements of the mandible (e.g., chewing) are the result of several variables which are operating simultaneously-i.e., continual variation in muscle length, bite dimension, and temporomandibular joint axis. The study of such data has contributed to our knowledge of the relative function of the masticatory muscles and has certainly indicated the potential value of electromyographic data in dentistry.

#### **Various applications of EMG in dentistry:-**

a) It provides an objective means by monitoring changes in muscle activity. b)To study action potentials in actively contracting lingual and masticatory muscles. c)It is used in the treatment of Myofascial Pain Dysfunction where the procedure is called a Auditory or Visual electromyographic feedback, It supplies information to the patient concerning to the muscle activity. d)To study biomechanics of jaw and facial muscle functions. e)EMG is useful for identifying asymmetry of muscle action and particularly for judging the results of the therapy. f)Used for monitoring of nocturnal bruxism and jaw muscle tracking. g)Used as one part of a full assessment protocol to determine if a patient has significant muscle asymmetries possible postural disturbances and significant muscle fatigue.

The usefulness of electromyography depends upon the ability to characterize only quantitatively the "normal" population. At present, data does not permit a characterization based on quality of a muscle activity because of the lack of standardization in recording techniques and the obvious difficulty in expressing the resultant Electromyograms in simple qualitative terms. The two main types of electrodes used for the study of muscle dynamics are surface (or 'skin') electrodes and deep electrodes (usually wire or needle)[13]. Deep electrodes: the electrodes inserted within the muscle by using two thin-coated wire filaments, which introduced by means of a hypodermal needle.They are superior to surface electrodes, as the quality of the electromyogram is better. There are lesser technical artifacts, because distance between the muscle and the electrode remains more constant. There is a risk of infection associated with the use of needle electrodes. They may also be painful. After insertion of the needle, it is always important to confirm that the needle correctly placed by asking the patient to contract the muscle being tested. The most important guideline for adequate needle insertion is to observe and palpate the muscle in contraction, while the test maneuver is being performed. This rule is applicable to almost all superficial muscles. If the needle is correctly positioned this maneuver should easily produce crisp action potentials[5].

The Surface EMG method: most widely and commonly used for recording muscle activity. Surface EMG has been advocated as a "modern scientific approach" because the output from such devices is presumed to be both "quantitative" and "objective". Surface EMG employs surface electrodes, which are non-invasive, painless and reduced risk of infection. Using a surface electrode always presents the possibility of loosening of the electrodes during nerve stimulation. Surface electrodes also give rise to errors when the distance between the electrodes and the muscle changes during muscle contraction. They are much more convenient for clinicians, more acceptable for patients and produce less movement; this is a noninvasive and user-friendly method. Surface electromyogram (EMG) analysis in studies of muscle function has attained increasing attention during recent years and has been applied to assess muscle endurance capacity, anaerobic and lactate thresholds, muscle biomechanics, motor learning, neuromuscular relaxation, muscle soreness, neuromuscular diseases, motor unit activities, and skeletal muscle fatigue[5].

Electromyographic examination of masticatory muscles may have confirming value for clinical diagnosis of myospasm (Spasmodic contraction of a muscle), which characteristically shows a marked increased in EMG activity. Surface EMG of muscles of mastication used routinely as a part of diagnosis and treatment of TMD. The duration of temporary pause in ongoing EMG activity of jaw closing muscles during maximal clench has been found to be longer, on average in a group of TMD patients. Several studies have quantitatively investigated the EMG during postural activity of the mandible and during maximal bite in the intercuspal position. The EMG values for the temporal and masseter muscles have been quantitatively investigated in these studies for control subjects without functional disorders and for patients with functional disorders.

**The purposed usefulness of surface electromyography:-**

A clinical use of SEMG has been proposed for the diagnosis and treatment of TMD. It's based on the assumption that various pathological or dysfunctional conditions can be discerned from SEMG recordings of masticatory muscle activity. The muscle activity including postural hyperactivity, abnormal occlusal positions, functional hyperactivity and hypoactivity, muscle spasms, fatigue and muscle imbalance. SEMG activity has been suggested to be useful in documenting changes in muscle function before and after therapeutic interventions as evidence of successful treatment. SEMG also has been used in biofeedback concerning the awareness and control of nocturnal and diurnal para-functional habits[14].

Masticatory forces in complete edentulous mouth directly depends on- a) the size of muscle creating the forces, b)their position in the mandible, c)type of chewing, d)shape of edentulous alveolar ridges and e)the degree of intermaxillary separation. Bite forces in complete denture wearers are significantly decreased in relation to person with natural teeth. There is fundamental difference in the distribution of functional energy in the complete denture wearer and subjects with intact teeth. Reduction of masticatory efficiency in denture wearers may be caused by irregular activity of masticatory musculature or is the consequences of irregular flow of energy during mastication[3].

**Clinical evaluations revealed the following Conditions:-**

Severe decrease in lower face height yielding poor facial esthetics, inadequate fit of complete dentures, worn denture teeth, clinically perceptible deficiency in OVD, acquired protrusive maxillomandibular relationships secondary to resorption, or angular cheilitis. The new complete dentures were made according to the procedure recommended by Zarb et al[12].

Although numerous studies have described comparison of different parameters in edentulous subjects and natural dentition, little comparative information has been regarding the complete denture patients. The data engraved from this study (Table-1) showed significant increase in muscle efficiency of right Anterior Temporalis muscle when compared to left Anterior Temporalis muscle. The mean difference between the values of electrical activity of muscles analysed in maximum voluntary contraction were higher for old denture wearers in comparison with those patients with new complete denture wearers following 5-months follow up. The data obtained from this study (Table-2) showed significant increase in muscle efficiency of right Masseter muscle when compared to left Masseter muscle. The mean difference between the values of electrical activity of muscles analysed in maximum voluntary contraction were higher for old denture wearers in comparison with those patients with new complete denture wearers following 5-months follow up.

According to Seung-Ho Lee Dang-Wan Kang (2002) showed during maximum intercuspation, chewing position, the proportionality of anterior temporalis muscle to masseter muscle activity was lower than other positions, and Naeije Shi found similar results. He also concluded that the temporalis muscle activity is especially sensitive to immediate changes in lateral positioning and that the masseter activity remains unchanged when conditions of stable bilateral occlusal contacts are present. Clinically, the use of new complete denture will allow new occlusal contacts to be reestablished, functionally benefiting the masticatory system by allowing a return to normal parameters.

Zuccolotto et al (2007) showed patients who have been edentulous for over 10 years and have adapted to their unsatisfactory prosthesis may need extra time to reestablish their musculature after changing the prosthesis and it may be necessary to consider new parameter for these patients. The above-mentioned observations indicate that the subjects with old denture wearers show greater muscle activity and hence improved muscle efficiency. The new dentures showed improved facial esthetics, adequate fit, correct maxillomandibular relationships, and anatomical teeth with cuspal morphology[14].

Having new denture after 5-months follow up for adaptability of dentures to the musculature infers minimal muscle activity and greater muscle efficiency. Due to the poor condition of dentures, these edentulous patients follow a diet based on soft foods. For that reason, it was assumed that the musculature would show hypotonicity. By suppressing proprioceptive mechanisms corresponding to the preservation of hypoactive muscle activities and eliminating possible interference from the occlusal relationship of the old dentures, new denture with improved occlusal surface and vertical dimension could promote musculature reconditioning. This fact probably occurred and allowed hypoactive muscles to optimize their electric activity.

The increase in mean temporalis muscle values is clear evidence of its role in mandibular positioning to establish a new horizontal maxillomandibular relationship. Factors such as OVD, occlusal plane conditioning, integrity and adaptation of old dentures, and the possibility of muscle hypoactivity before treatment, could cause functional imbalances. After being corrected and using new set of complete denture, these were probably characterized by an increase in muscle efficiency. In this study, patients who were evaluated during the whole period of the study, reported that they felt greater comfort and that they were pleased with the aesthetics. Seventy per cent reported that they could chew better when wearing the new set of complete dentures than they did with the old dentures. From these results, it could be concluded that new set of complete dentures allow for neuromuscular reprogramming, which contributes to muscular balance of the masticatory system.

As might be expected the data suggest that there are differences in the levels of muscular activation in elderly individuals during masticatory function. However, there is a need for further long-term studies concerning elderly individuals, with the purpose of elucidating if these results are important for dynamic, specific or non-specific functional activities. By use of new complete denture with established occlusal contacts and vertical dimension, that functionally benefits the masticatory system by allowing a return to normal parameters. Thus, the musculature's EMG activity (anterior temporalis) may be reduced, allowing muscles to work more efficiently during 'tooth' contact. Other authors have affirmed that patients with new dentures increased masticatory efficiency, even with poor muscular adaptation and reduced electrical activity in the masticatory muscles. This increased masticatory efficiency may have developed from muscular adaptation, reestablishment of OVD and occlusal surfaces. The new dentures with correctly positioned cusps facilitated intercuspation and perhaps required a lower amount of force to chew the food. This could lead to greater chewing of food and a better quality diet.

In the present study, the reduction in the number of cycles occurred mainly at the end of mastication. By electromyography, we can also see muscular changes in patients requiring prosthetic rehabilitation; therefore, we can state that rehabilitation need interferes on muscle harmony thus improvement in the efficiency of muscle activity. It is essential to explain to complete denture users, the importance of attending periodical visits in order to evaluate their dentures and oral conditions. These factors are factors intimately linked to aesthetics and functionality.

#### **Limitations of the study:-**

(1)The principal limitation of the present study is the number of analysed subjects, that was under the proper sample size to avoid type II errors. (2)In this study, 5 months was not enough time to observe increased efficiency with the new complete dentures. (3)The complex neuromuscular skills required to overcome the limitations of dentures. Adaptation of neuromuscular system takes an extended time and may be a determinant factor in influencing the EMG activity and this aspect can change the results. (4)Reestablishment of the artificial tooth cusps with anatomic teeth and conventional balanced occlusion positive outcomes can be expected. (5)Patients who have been edentulous for over 3-5 years and have adapted to their old (unsatisfactory) prosthesis may need extra time to re-establish their musculature after changing the prosthesis and it may be necessary to consider new parameters for these patients. (6)The patients investigated in the present study were healthy physiologically and psychologically and, results may be different in psychologically distressed patients. (7)Electrodiagnostic resources are still far from a concrete professional reality due to the lack of knowledge about the technique along with high-cost equipment.

#### **Further scope of the study:-**

(i)A complementary approach in TMD diagnosis by EMG with other methods is sufficient if applied. (ii)Improved masticatory efficiency would be explained by enhanced bilateral balanced occlusion obtained with the new dentures. (iii)The behavior of the dynamics masticatory muscle activity, like chewing swallowing and in rest postural position underlines the importance of an integrated analysis of both kinematics and EMG activity in the follow up of patients with new dentures. (iv)The studies should clarify the association among masticatory efficiency and alterations in anatomical occlusal form. (v)Further investigations are needed to explore the relationship between occlusal features and muscular activity, designed following specific criteria (randomization, inclusion and exclusion criteria, similarity between groups at baseline, detailed description of the protocols to facilitate replication, blinding methods) in order to establish if a causal association between these variables really exist, thus avoiding spurious associations. (vi)Longitudinal studies with the purpose to appraise the long-lasting effects of occlusal disturbance on the activity of masticatory muscles. (vii)Finally, a greater accuracy of the electromyography would be desirable to confer to the results obtained an absolute reliability.

**Conclusion:-**

According to the methodology used and according to the results obtained it may be concluded that the electrical activity of Anterior Temporalis muscle and Masseter muscle during maximum voluntary contraction was reduced; hence, muscle efficiency has been improved after 5 months with the new complete denture in place. The difference was statically significant. The results show that new dentures or improvements in occlusion and vertical dimension produce a positive benefit to the patient by reducing the muscle effort during chewing without affecting masticatory performances. And it also indicate that in edentulous subjects with a old denture used for several years, after the delivery of a new denture 5 months of follow-up, the EMG activity of right side of the anterior Temporalis muscle decreases hence, the muscle efficiency is improved as compared to other group of muscles examined. The reduction in muscle effort is likely to cause less tissue trauma and in the end may minimize residual ridge resorption.

A new complete denture allows for neuromuscular reprogramming, which contributes to muscular balance of the masticatory system. With wear of old complete dentures over a period (more than 5-6 years), lead to the compromise in esthetic and function with reduced masticatory efficiency. Thus, recognition of these expected gains to the patient is important for the dentist to make treatment recommendations about making new dentures for every 3-5years. Moreover, improvement in occlusal surface (anatomic cusp), reestablishment of new vertical dimensions significantly improves the esthetic, function and increased masticatory efficiency. However, further improvement in muscle efficiency in edentulous patient leading to better nutrition and digestion. All these factors considered for physical and psychological benefit to the patient's health, condition and well-being.

**Acknowledgment:-**

A special note of thanks to Dr. Muddapur for helping me out in every step of my data entry, analysis and understanding of the statistical procedures employed and Dr.Datta Nadiger MD, DNB Neurosurgeon for all the technical help and support involved in this study.

#### Abstract

Persistent and effective talent is a prerequisite for facing the tremendous challenges posed by the ever evolving and competitive business environment. While the companies are being pushed to innovate in regards to its recruitment strategies on one hand, the budgets to do the same continue to be snipped. Thus, companies have been seen to resort to use of information technology as a medium to source, select, recruit and place its candidates. The use of IT in recruitment is not only an economically feasible alternative but is also found to be a viable option in regards to its time effectiveness. *The objective of this paper has been to primarily understand the transformation which has taken place in regards to recruitment initiatives of corporates in general and IT firms in particular. Further, the focus of the study has been to gain relevant insights pertaining to the current status of technology adoption in the recruitment domain of IT firms. The significant findings from the study were that there has been a definite shift in Human Resource Management architecture. It has witnessed a thorough changeover from being merely an administrative job to today contributing towards the strategic business objectives of the firm. The adoption of information technology has reduced the overall workload of HR personnel thereby enabling them to redirect their energies towards tactical decision making. Firms have been seen shifting towards adoption of E-recruitment drives in order to differentiate their market standing in regards to the available talent pool. Even though organizations continue to witness certain resentment in terms of completely adapting to system based HR functions, stakeholders at different levels are slowly realizing the value add due to such an initiative and are thus effectively contributing towards smoother transition of the same.*

#### Objectives:-

1. To study the traditional and modern recruitment function.
2. To understand recruitment process in IT Industry.
3. To gauge the impact of Information Technology (IT) on recruitment function.

**Introduction:-**

Information Technology essentially refers to a process that is developed for storing, processing and transfer of data. The advent of massive transformations with regards to information technology is an evident result of rapid globalization observed during the turn of the century. The IT industry has thus undoubtedly become one of the most dynamic industries in every country. Since, it is seen to contribute heavily to the overall revenue of any country, its prime emphasis is always on enhancing productivity to the maximum extent possible. To achieve this objective, it continues to lay focus on the quality of its human resources. Due to the very same reason, there has been an evident shift in the role of HR department in an IT firm. From being merely a support function, it is today recognized as a strategic business partner, indirectly contributing to the bottom line revenues of the firm. The way in which human resource functions are carried out has seen a drastic transformation in the recent years. Human Resource activities are now broadly categorized as-

Transactional - Involving activities such as pay roll information, administration of employee benefits, etc.

Traditional - This involves the basic HR function of recruitment, selection, training and development, performance appraisal and rewards and recognition.

Transformational - These include activities that bring certain value addition such as developing innovation as an inherent culture in an organization.

Emphasizing particularly on the Recruitment function of HR, it is the process of finding and hiring the best qualified candidate for a job in a timely and a cost effective manner. Recruitment by way of information technology has led to coining of a new term called E-recruitment which is the process of recruitment through the internet. This has definitely sped up the process of competency mapping and subsequent matching of the candidates with the specific job profiles and its requirements. Also, posting jobs online through search engines allow employers to constantly be updated about the fresh talent available in the market.

Another advantage of E-recruitment is its ability to reduce the overall cost of recruitment, e.g.-postal cost, announcement cost, etc. In a recent survey, it was declared that E-recruitment helps reduce 75% of the traditional recruitment cost. It also helps in shortening the recruitment process by twelve days on an average. With such advantages coming into picture, a number of E-recruitment tools such as, IT blogs, Virtual World, Identity Management websites have been developed and utilized across organizations. (Jain, 2014) Information Technology facilitates the organization to make changes and improve its structures, processes and systems. It serves as its back-end-support mechanism. It has thus been proved umpteen number of times that Information Technology can act as a strong pillar of support to the Human Resource function in an organization.

In this review paper, emphasis has been laid on the role of IT in transforming the traditional HR activities, specifically in relation to recruitment strategies followed in the IT industry. In addition, it is has been endeavored to evaluate the pros and cons of amalgamating information technology under the overall ambit of HR's transformation journey towards becoming a strategic business partner.

**Discussion:-**

In the past decade, the business world at large has undergone a significant change. With the key focus on *strategic growth*, businesses today are witnessing rampant change, both in terms of its organization structure as well as its management pattern. To keep pace with these vagaries, effective management of human resources has become a very crucial contributing factor for the success of any firm. (Long, 2009) In order to create the requisite market standing, the pressure today is more in terms of owning high quality human resources than merely distributing differentiated products in the market. Thus, the firms are concentrating on strategically utilizing and managing its personnel at all levels, thereby building and sustaining competitive advantage over its peers. (Kay, 2000)

With this objective in mind, there is a pestering need to divert attention from the traditional Human Resource Management practices to new HRM practices wherein the team continuously focuses on delivering services in alignment with the strategic goals of the company. This in turn has resulted in enhanced expectations from human resource professionals specifically in terms of their contribution towards value adding initiatives within the firm. (Ettinger, 2009)

On the other hand, companies today are also particularly interested in adopting and implementing Information Technology tools across the board. The prime motive behind this desire to adapt to modern IT tools and technologies is to cut down on cost, achieve effectiveness in workplace and thereby improve the overall service quality. The ubiquity of internet is increasing by the day and hence there is a definite shift in the overall job content which is now seen to be more knowledge oriented than just being manual/labor specific. Further, IT tools are being employed extensively to augment routine procedures and consequently achieving the set targets in a shorter time span. (Fitzgerald, 2009)

This dissemination of Internet and technology use has widespread implications across different departments in the organizations. Human Resource function is no exception to this. There are multitude arenas in which technology has impacted the HR function. For example, there is tremendous pressure on HR to attract and retain the best talent in the industry. HR has been constantly endeavoring to do the very same by adopting various innovative techniques to differentiate its brand in the market space. Effective advertising using technology has been a crucial contributor to this effort. Another domain where technology has played a significant role is training and development. (Mamoudou, 2014)

E-Learning has been successfully adopted by certain big names in the industry like IBM Corporation and General Motors Corporation. Online Training has resulted in humungous cost savings for these firms thereby adding on to their bottom line revenues.

The amalgamation of technology and Human Resource function has also simplified the job of a HR professional to quite an extent. Real time availability of databases for ready reference, has enabled the HR personnel to focus their attention on analyzing existent records to strategically plan the career path of its employees. Another favorable effect of technology has been the ease of communication, which has in turn given substantial autonomy to HR professionals in their routine jobs. (Cappelli, 2001)

On the reporting front, certain potent tools such as Decision Support System (DSS), Online Analytical Process (OAP), have resulted in timely and quick decision making by HR professionals. Data crunching capabilities have been enhanced due to such tools, which in turn enable the HR team to generate crucial reports for analysis at the executive level. (Khera, 2012)

Now, if we talk from the Recruitment perspective specifically, we are aware that conventionally the organizations used newspaper advertisements and in-house employee referrals as major sources to attract candidates for job postings. Today, we see an evident shift from these traditional sources to certain modern means of employee selection, recruitment and placement. Social Media sites like Facebook, LinkedIn and various e-recruitment portals like Naukri.com, Monster India and Timesjobs.com are extensively used by both employees and employers to hunt for information about both jobs and job seekers. It is infact argued that, such modes of online recruiting have been a *catalyst* in promoting use of internet in other facets of HR as well. (Ramanujam, 2012) A very constructive use of online job postings is that the resumes are received in an electronic format which enable the HR team to proficiently track its candidate pool by stocking, sharing and recording resumes. This is further used to statistically analyze the accrued costs of the entire hiring process as well as the turnaround time for filling each position.

Another very interesting implication of the process is that this mode of recruitment facilitates companies to target a wider pool of talent by not staying restricted to a particular geography only. However, it is a common perception that the use of internet can sometimes also turn out to be punitive, if the authenticity and repute of the websites being used is not validated before use. Another challenge faced by HR professionals is that due to the wide access and ease of use of internet today, there is often an overload of resumes received as compared to the actual requirement for a position. (Wang, 2006)

Post the initial shortlisting, resumes are further screened with the use of smart screening software, which, simply exclude the resumes which do not include certain pre-fed key words. While this is a very advantageous tool in terms of niching down from the vast amount of applications received, a lot of people try to manipulate the entire process by including the buzzwords in their resume thereby making it through the screening process. Also, certain HR professionals have been seen to use technology to conduct online assessments as part of the selection process. While this technique helps generate instantaneous results thereby resulting in lower overall costs, the validity of the tool is again questionable to a certain extent. (Adewoye, 2012)

Videoconferencing is another widely used tool for conducting preliminary interviews online. Given the current rate of advancement in technology, it is known to be one of the most cost effective tool for gauging employee behavior before the actual personal interview is conducted. (Gulati, 2012)

Given the above backdrop, we can see that there is a definite inclination of firms today to resort to the aid of technology for its recruitment activities. However, HR is still seen to be plodding carefully on this path and prefers a personal touch while making its recruitment decisions.

Therefore, even though the use of information technology as part of the recruitment drives within a firm, has a lot to offer on the platter, specifically in terms of its time viability and economic feasibility, its actual contribution and adaptability is still debatable. (Nielson, 2002)

Now, when we talk of adopting technology as a crucial part of the HR business functions, the industry vertical which is seen to be adapting to this transition most comfortably is that of the IT sector. Since, the very core of an IT firm is the use of software and modern tools and technologies to keep abreast with the dynamic business environment, the inclination of these firms to resort to real time strategic processes is a commonly observed phenomenon.

When a case based analysis of certain IT firms was done, it was observed that since majority of the IT firms have a project based work culture, a lot of emphasis is laid on handling talent through the use of information technology. A lot of dependence is on managing the sourcing procedure, right from the application stage to the final stage of fitment of an employee for the identified position. To fill in the job positions created due to the dynamic requirements of the on-going projects, information technology is particularly used in regards to transitory recruitment. (Anderson, 2003)

However, one of the major challenges faced is in responding to the periodic resource requests with maximum accuracy and minimal cost. Also, the time gap incurred between the conversions from sourcing to placement needs to be minimum.

To quote a few examples, let us first see the case of *Microsoft*, a large multinational corporation, which resorted to the use of information technology to devise its recruitment strategies. Realizing the threat that it faced from its competitors in the market, this computer giant was forced to rethink on its approach towards recruitment. In contrast to a website which was overloaded with data, Microsoft today has a smart Career site, enabling a distinguished user experience for the aspiring job candidates. The site is not only a central repository for global recruitment at Microsoft, but also acts as a one stop solution for all the queries pertaining to working in the firm. Further, the firm has also been working towards restructuring its *employer branding* strategies with the aid of modern technology. It has also successfully made its online presence felt to a considerable extent through social media platforms such as Facebook, LinkedIn, and Twitter. In terms of monetary benefits, Microsoft saved up to £60,000 on recruitment cost by niching down on expert skill sets, through profile hunting on LinkedIn.

Another firm which was seen shifting towards adoption of effective use of information technology for making recruitment related decisions, is *Google*. Known for its innovative practices, the firm decided to develop an algorithm to determine the success rate of a candidate post his induction in Google. This helps in identifying the best talent pool in the industry. An initiative started way back in 2013, under the name of a project called Janus, the algorithm also examines rejected resumes in order to identify top performers which the company might have missed during the recruitment process. Another interesting contribution of the project has been the finding that conducting more than four interviews for filling a particular position actually turns out to be unproductive and hence consequently the cycle time of the hiring process was considerably reduced by the firm.

*Wipro* is another example of a tech giant which understood the competitiveness in the IT sector in terms of attracting fresh talent at a very early stage, thereby forcing them to develop an online portal for uploading resumes. An optimized search engine in essence, their recruitment portal acts as a medium to match the resumes received with the available positions within the firm. Once, an initial requirement mapping is done, the identified candidates are contacted through an online medium itself thereby reducing the recruitment related costs by a significant amount.

According to a Glassdoor Recruiting Survey, while majority of the companies are more than willing to add on to their recruitment numbers, shortage in available talent is becoming a major concern. Targeting this very need of firms, recruitment vendors have come up with innovative technology based mediums to enhance the overall recruitment efficiencies of such firms. The objective is to streamline the entire application and selection process through effectual use of technology. *iCIMS Inc.'s Social Distribution* is one such interface through which firms today are able to publicize their job openings and to engage potential candidates online. Contributing further to such initiatives, are certain major HR technology enterprises, such as, *Success Factors, Taleo Corp. and Workday Inc.*, who have developed mobile based recruiting applications, which has enabled the recruiters to connect with candidates on the go. This has been a game changer in today's scenario wherein, the probable incumbents are so heavily dependent on technology.

Another interesting innovation has been the Insights tool created by *HireVue Inc.* which helps companies get a comprehensive perspective about their recruiting decisions through the use of customizable dashboards. It also gives a perspective on the reliability of certain hiring choices of interviewers.

This clearly is indicative of the fact as to how even standalone vendors are coming up with certain interesting value propositions in regards to recruitment strategies adopted by firms.

As far as analytics and reporting is concerned, certain softwares (Business Intelligence Tools) are used effectively to generate relevant reports in order to further restructure the overall business strategy based on the trends observed.

Such reports may include evaluating cost incurred per employee hired, turnover rates and accrued costs, return on investment per position and so on. Although these reports might not culminate into cutting down the overall recruitment cost, they definitely help in getting to the forefront activities, which are either time consuming or are not impacting the bottom line revenues in any manner. Activities/initiatives thus identified, can be restructured to be more fruitful in nature.

The success or failure of IT systems, particularly in such B2B based firms, heavily depends on the ease of integration of one system to the other and subsequently the effective flow of information. To quote an example, the Performance review of an employee would be used as an input for competency mapping and acquiring the necessary talent thereon. (Borstorff, 2007)

Another very relevant implication of the use of information technology in IT firms is that it not only enables local sourcing but also helps in sourcing and staffing at the global level. Since, IT firms usually have employees working on projects with International clients, managing resources effectively is of prime importance. It is a general belief that a robust Information Technology system needs to be in place to cater to International arrangements in a real-time situation. (Jain, 2014)

Having analyzed the positives, certain challenges which are commonly faced by such firms also need to be discussed. The principal cause behind hindrance to an effective adoption of information technology is seen to be the lack of hand holding from the company's perspective for its employees during the change management process. Less emphasis is laid on training employees to efficiently handle the adoption of new or improved technology. Also, a lot of times, even though the resources may have been sufficiently equipped, the competency to merge the new technology in accordance with the conventional practices, might be a perplexing task. Thus, it is the duty of the HR managers to ensure that the end-users are made adequately comfortable and aware about the plausible use of IT in their daily work. (Seyni, 2014)

### **Recommendations:-**

Globalization has driven the need to align IT with the overall business strategy in all facets of an organization. The domain of Human Resource Management has been no exception to this rule and has infact become an integral part of driving business excellence in any industry across the board. Hence, in regards to creating additional value, better management of resources is becoming a critical differentiator for any firm today. Understanding its relevance, firms today, are seen to be associating HR business functions with technological transformations under the ambit of strategic initiatives.

Having discussed the entire spectrum of information technology and its impact on human resource functions in an organization in general and recruitment in particular, we would now like to make certain recommendations pertaining to the same.

First and foremost, when any kind of technological change is adopted across the organization, it is essential to recognize the key goal/motive behind the same. For example, for an IT organization, recruitment via the online mode could be due to the need to provide for/offer consistent and quality services in terms of human resource allocated to projects across different geographies.

The next step should be to identify certain key performance indicators, such as, cost of hiring, employee turnover rate, and time taken to fulfil a position. This would enable the firms to analyze the accomplished results vis-à-vis the desired outcomes. Such an investigation would help gauge the effectiveness of resorting to an IT enabled HR function.

Further, in order to win the *talent war* in today's competitive business environment, corporate executives, line managers and HR professionals should work in tandem and ensure that information technology proficiently influences the HR practices. There is a definite need to shift from the conventional HR practices to the modern approach of e-HR.

Organizations need to identify certain benchmark firms in their industry; trying to analyze their use of internet for resume hunting and job advertisements. This would enable firms to further enhance their current success level of e-recruitment. Also, the firms should try and widen their outlook in terms of utilizing online databases especially to fill critical job positions. Requisite balance should however be maintained in terms of using technology for sourcing applicant pool and maintaining the personal touch while screening applicants during interviews.

As pointed above, a lot of IT Corporations have successfully managed to adopt technology based recruitment process. However, an immediate implication has been the surfeit resumes, which HR professionals have been forced to accept and sift from. One probable solution of handling this issue could be by designing an overall e-recruitment plan and then incorporating a recommender system in it. This recommender system would enable the raters to vouch for certain resumes over the others based on their professional work experience with the individual in question or due to an otherwise personal experience with him/her.

It is also imperative that before any such wide scale implementation of technology is conducted in an organization, the level of preparedness is evaluated. Specific HR process proprietors should be willing and ready to adapt to the change that would now drive the business goals and objectives. Undermining the need for evaluating this readiness, could result in a comparatively less payback than what possibly could have been otherwise achieved by the exercise.

Preparing the critical participants at different levels of change management is of utmost importance. Since, there can be a lot of initial resentment when technology is adopted as a vital part of any HR function, management assurance to its employees is extremely important.

Additionally, during the entire transformation process, it is essential that the stakeholders are reminded time and again that HR as a function has to be seen more from a strategic standpoint now, than merely an administrative job. Since, managing change would be a continuous process, it is required that employees are given that extra support even post implementation until the entire transformation has been entrenched in the organization's culture.

In spite of all the probable shortcomings, it should be noted that the adoption of such streamlined systems would definitely positively influence the HR function in general and the recruitment function in particular. The basic aspect which needs to be kept in mind is that the entire strategy to implement technology as part of HR functioning, needs to be well planned, structured and phased out over a period of time. Since such an execution could be a key contributor to the HR transformation in the long run, it is imperative that there is successful acceptance of the process by all patrons, thereby enabling maximum value seized during the entire journey.

**Conclusion:-**

The use of information technology for recruitment is taking huge leaps and bounds especially in the IT sector. Certain trends have been predicted that are likely to take over this function of Human Resources by a storm as far as its overall approach is concerned. Major changes that are expected to be seen include:

**Social Media Hiring**—As of now, majority of the hiring/recruitment happens through websites such as Monster.com, Naukri.com etc. With the further impact of information technology, *recruitment would also be done through social media websites such as Facebook, Instagram, Twitter, etc. to find and target an even larger pool of candidates.*

For e.g. - In the present day, poaching takes place by locating people with specific skills sets through search on websites such as LinkedIn or through personal networking. Enhanced use of information technology is likely to enable poaching of required candidates through their personal accounts on Facebook as well.

**Online Video Hiring**- would also become the *most used form of recruitment* and selection. Although this mode of hiring is very much prevalent even today, it is likely to become a standalone mode of recruitment in times to come.

**Social Media Profile Verification** - In the future, whenever candidates apply for jobs online, the recruiters would be able to get an instant glimpse of their recent tweets, Facebook posts and their LinkedIn profile recommendations. This would be enabled by the *integration of applications received with various social media interfaces.*

**Increased Value Proposition** - The importance of this is increasing day-by-day and thus *effective employer branding is likely to be the real differentiating factor in the future.* This exercise if supported with proficient means of technology, is likely to help the HR professionals contact and engage a large pool of highly talented prospects. This in turn would enable the organization to grow further by strengthening their foothold in the market space.

**How Technology is likely to Kill Jobs** - Although the information technology industry is India's largest job creator, its pace in recruitment is estimated to slow down, putting the entire blame on technology for making many job profiles redundant. Indian Information Technology firm NASSCOM, is predicting a decrease in its job offerings by 13% in the financial year 2016 while InfoTech plans to reduce it by 5%-10%. Cognizant India, although plans to continue as a net hirer but its pace in recruitment is likely to decrease. With the *IT industry continuously incorporating technology and automation in its work culture*, where once, one man could assist ten customers, now one man can serve fifty customers, thereby augmenting the overall productivity levels. As an obvious outcome of this, the overall manpower requirement to do the same old jobs, has reduced.

**Cloud Computing and Recruitment** - Companies are now focusing on expertise such as artificial intelligence and cloud computing. In this particular context, it is basically the process of using databases and modern softwares for the purpose of recruitment. Such extremely potent tools in the field of recruitment, help in providing data/information as soon as desired, without finding a need to store it (real time). When it comes to sourcing the right candidate, a platform called '*private cloud*' aids in creating a common job portal for job postings and other critical information about potential hires. This one source is then further used for tracking, measuring and reporting data pertaining to potential recruits. It is easily implementable/accessible and can thus start running efficiently within a few weeks, thereby making it easier for companies to adopt it on a large scale.

These softwares have an open Application Programming Interface, which increases smooth communication amongst various systems for exchange of information. Such customized applications and solutions definitely help companies in achieving larger business goals. Thus, *cloud based recruitment is likely to be the new face of recruitment in the near future making it the most used method of sourcing potential employees.*

*The study was limited to the IT industry* in particular and hence there is a definite scope for future research in other industries as well, given that human resources are assets for any organization, regardless of its sector. Also, the variables under study were restricted to information technology and its impact on recruitment strategies. To broaden the spectrum of study, another facet of Human Resource function could be considered for further analysis. Example – HRIT and its impact on Manpower Planning.

### Abstract

This article presents the results of a profound research in the Bulgarian Armed Forces that probed opinion of military personnel who have participated in peace support operations for the last two and a half decades. The goal of this research was to accumulate the experience of the military who took part in peace support operations, and to produce some lessons in order to improve further participation in such operations. The research team chose to do the survey by conducting interviews with military personnel who took part in peace support operations. A total of 237 military personnel were interviewed. Subsequently, the team concentrated on processing information through specialized software. There were two types of analyses - quantitative and qualitative. The results of both methods were scrutinized and compared, though the priority was given to the qualitative method. The team wrapped up the survey results in a report, distributed among military institutions and the units of the armed forces. The general conclusions of the report were that the Bulgarian Armed Forces had made significant progress in the preparation and participation in peace support operations. Military personnel who participated gained vast experience in performing different duties and responsibilities in Theaters. They performed various tasks with merit and pride and withstood difficulties of different character. During the interviews they shared willingly and openly their experience and opinion as to how to improve future preparation and performance of our units for these types of operations. Survey results came out to be more strategically and operationally geared rather than tactically orientated. The research has been highly praised and supported by the Ministry of Defense, operational HQs and units.

It turned out that although positive results were predominant there was still a lot of ground for improvement in almost all researched areas. So much so, that the research team produced a list of recommendations to improve national legislation concerning participation in peace support operations, optimization and enhancement of personnel selection and career development, raising level of ambition in operations, improving national logistics and administration, and arming and equipping the units with advanced technological items corresponding to the requirements of the contemporary operational environment.

---

**Introduction:-**

The world is changing at a hectic pace in many aspects. Geopolitical and strategic shocks of high magnitude are determining the new world order and are altering our perceptions of conflict. Despite those changes, conflict is still ubiquitous and ever present in the pursuit of political goals by other means. Science, technology and globalization will greatly influence the nature of future conflicts. Military scholars are creating and implementing new security paradigms, such as cyber warfare, hybrid warfare, antiterrorism, etc. They predict the future dimensions and actors in conflict and military operations. However, whatever military operations will be like in the future, they will require post conflict stabilization and restoring the state of the affected country back to normal. Therefore, to achieve this end, the military will need the knowledge and know-how about dealing with the challenges of stabilization and reconstruction.

The modern trend in conflicts turned out to be a decisive operation that continues for a very short time, carried out by ad hoc coalitions followed by long and tenuous stabilization operations that produce numerous casualties, as well as the expenditure of enormous resources and political energy. This is another premise to prove the necessity of knowledge and experience from the field of stabilization and reconstruction operations. The most important weapon of the military from the battlefield is the knowledge that they gather, analyze, disseminate and implement in their future activities.

Most knowledge management experts claim that the most important and informative knowledge is tacit knowledge. They argue that while explicit knowledge comes from mere study and defines “know-what”, tacit knowledge epitomizes “know-how”, i.e. the results of experiential learning. Therefore it is important for the military to invent such methods and tools that make possible collecting and processing unarticulated subjective insights, judgments, and experience, which personnel acquire by participating in military operations. One of the tools that proved to be successful is the empirical study that engages the target audience and extracts tacit knowledge. As a final result it proceeds with the information and turn conclusions of the study into plausible recommendations for the leadership.

Having in mind all of the above, a team from the Defense Advanced Research Institute (DARI) adjunct of “G. S. Rakovski” National Defense College in Sofia has conducted a research and has finalized a comprehensive empirical study named “Lessons from the Participation in Operations for Support of International Peace and Security”. This study was initiated as a part of a larger multinational scientific project, led by the European Research Group on Military and Society (ERGOMAS) that is taking place currently, and is scheduled to be finished by the end of this year. There are eleven countries from Europe, North and South America, Africa and Asia who participate into the project.

Particularly, the goal of the Bulgarian project was to sum up the accumulated experience of the units from the Bulgarian Armed Forces that took part in operations in support of international peace and security, and to formulate some lessons with respect to improving the manning, equipping, training, and enhancing the performance of Bulgarian military personnel in multinational operations of that type.

The research was conducted in several military units of the Bulgarian Armed Forces. The research methodology was developed on the basis of two concomitant approaches i.e. qualitative and quantitative approaches. The core of the research was a semi-structured questionnaire to lead the research team in the survey. The principal tool of the survey was an interview that followed the logic of the questionnaire. All interviews with military personnel were held on site. They were conducted with different depth, scale, span, and length as the research team took into consideration knowledge, competencies and experience of the interviewees. Data processing was done by specialized qualitative and quantitative analysis software (SPSS and En Vivo). Conclusions from the research were drawn through analyses and synthesis of the survey results. On the basis of the conclusions, the research team developed a set of recommendations, aimed at improving participation in multinational operations in support of international peace and security.

The study necessitated a lot of work (about 350 man-hours) for doing the interviews and more than two months for the analytical activities. In the course of research the team enjoyed full cooperation from the commanding officers and the surveyed personnel.

Sample of the Research:-

Figure 1:-

A total of 260 interviews of the surveyed personnel were taken. Some of the interviews did not provide the necessary information, so the team discarded them. There were 237 interviews that were taken into consideration for analysis. 226 of the respondents were males (95 percent) and there were 11 females (5 percent). 82 percent of the interviewees were married, and the rest were single. Many of the interviewees had participated in more than one mission, so that prior to calculations it was accepted that each separate participation was taken as a single event for analysis. There were 489 events in total. Distribution of personnel by arms was as follows: Army-89 percent, Air Force-9 percent, and Navy- 2 percent. The distribution of respondents by rank is shown on Fig. 1.

The scope of the research extended from Bulgarian participation in PKO after the end of the Cold War up to 2014. Distribution of participation of Bulgarian contingents in PKO is shown on Fig.2.

Figure 2:-

**Quality of Training:-**

According to the analysis of the respondents' answers, concerning pre-deployment training, it seems that **the quality of training** for participation in operations in support of international peace and security has improved significantly for the last ten years. Most of the interviewees insisted that training had undergone a noticeable evolution. In the respondents' opinion, the cornerstone of this positive change was Bulgarian participation in the stabilization and reconstruction phase of operation Iraqi Freedom and the NATO mission in Afghanistan.<sup>1</sup> The majority of respondents reiterated that our participation in these operations marked a radical change of approach to training. Planning, organization and conduct of predeployment training since then has been systemically updated and streamlined, in accordance with the specific requirements of mission tasks, as well as the conditions of their accomplishment. Interviewees shared the opinion that following 2004, new methods and forms of training of units were implemented, to quote:

- conduct of training in conditions and environment close to the real situation in missions;
- training with weapons and equipment, with real organizational structures and equipment;
- use of opposing forces during training accompanied by imitation and live firing exercises;
- use of instructors who had already taken part in similar missions;
- use of advanced forms of training of staffs through computer simulations.

Most importantly, the research team concluded the fact that the predominance of commissioned officers shared that the commanders on training sites received all rights, tools and authority to train the personnel in the manner that they deemed necessary, in order to meet the mission standards. The research concluded that it was very productive for the newly created missions for the Bulgarian Armed Forces to use mobile training teams from nations that have already participated in those missions. Another important conclusion of the research concerning training was that all respondents united around the premise that joint training on various NATO member states ranges had been extremely helpful and productive. This kind of training, according to most of the military personnel who attended it, had been vital to their real preparedness for missions. Notably, they mentioned training ranges in Germany, the Netherlands, Poland, Norway, and Romania.

Support to pre-deployment training was another issue of the research. It came to the conclusion that support has improved a lot. Respondents shared that all initial training for new missions has suffered from poor support. This applied also to some missions that alter conditions in the course of their conduct. They pointed out some drawbacks like insufficient number of vehicles to practice driving and special tactics; accepting provisions by replacing mission vehicles with substitutes, which affected training in undesirable ways; deficiencies of the special equipment, etc. Many interviewees pointed out that our training ranges did not correspond completely to the real missions' conditions and created wrong perceptions and expectations.

Some of interviewees had the opportunity to go through online pre-deployment training. They shared the opinion that this training played significant role in enhancing their knowledge about the host country, its nature, culture, the customs of the indigenous population, etc. They praised online training and admitted that it had provided most of them with the necessary information about their real duties and responsibilities. This applied mostly to officers who took part in missions in various NATO or EU headquarters.

Induction training on site was also included in research. In 47percent of the researched cases, respondents shared that they had undergone induction training in the mission area. One of the conclusions was that during the initial missions there was little or no induction training, especially when all participants received their zones of responsibility and respectively their tasks in Theater. As a result of the previous experience of allies, and lessons learned, extensive training had been implemented. In this case during rotation and hand off it was ensured that there was enough time for the incoming units to gradually become accustomed to their tasks by the "right seat rider" system with the outgoing units. This approach was highly praised by all interviewees concerned. They pointed out that this type of organization of mission hand off was highly effective for the incoming contingent. Induction training was conducted with almost all staff officers in the multinational headquarters. Many of the respondents admitted that this training helped them a lot to adapt to their real staff tasks, and gradually increase their contribution to their respective departments. They also shared the opinion that had they not undergone this smooth transition they would not have been able to perform their functional duties and responsibilities.

---

<sup>1</sup>Bulgaria took part in Iraq stabilization with infantry battalions and other contingents from 2003 till the end of 2008, and in Afghanistan from 2002 and is currently taking part in Resolute Support.

Responses with regards to specialized training had also been taken into research considerations. The team explored how this training influenced the knowledge and skills of the trainees in improving their preparedness to deal with their respective functional duties. The majority of interviewees (78 percent) answered positively about specialized training on host country peculiarities, governance, specificity of national culture, as well as how to behave and apply intercultural communication. Most of the respondents expressed very high appreciation of countries' handouts, distributed to all personnel prior to deployment (Afghanistan, Bosnia, and Iraq). About a third of the researched personnel pointed out that specialized training for their respective position was not satisfactory enough. This applied mainly to officers who were assigned to staff positions in the headquarters of the multinational forces, ISAF HQ, or the like.

Language training was also an issue for the research. Predominance of interviewees shared that initially, once deployed to mission area military personnel faced difficulties communicating in multinational environment and with the local population. Later on, they overcame the psychological barrier, gained self-confidence and became more proficient in communicating with other nations. It was established that language training of non-commissioned personnel did not fully meet requirements.

Figure 3:-

The results in Fig. 3 clearly show that in the majority of cases respondents (354, 72 percent) gave a positive assessment of pre-deployment training. They believed it was necessary to improve support of training. Interestingly enough, most of the generals and senior officers expressed the opinion that the quality of training is a function of commanders' leadership qualities.

There was an extensive research on **logistic support** of contingents in this study. The results of the interviews show that logistics is a key factor for the successful accomplishment of tasks. The main issues that the research team explored were related to individual clothing and equipment of the military; armament and equipment of contingents; accommodation, dining, communal services, and medical support. The team explored as separate research issues: the quality and ergonomics of clothing, and individual gear: Kevlar helmets, backpacks, flak jackets, tactical goggles, tactical vests, gloves and other equipment. The majority of respondents (Figure 4) evaluated the quality of individual equipment as good, meeting the mission requirements. One third of the respondents expressed the opinion that there were certain drawbacks in the provision of individual equipment. Every fifth respondent believed that the individual equipment of the military for the mission was not good enough. Individual clothing and footwear emerged as a central bone of contention in the research and people think that logisticians need to improve them in future.

Figure 4:-

A large number of military shared their opinion that the logistic support of the contingents had undergone a positive development. They think that in the process of incremental participation of the Bulgarian Armed Forces in missions abroad the commanders and staffs that were in charge of manning, equipping and training the units had gained experience and responded adequately to the needs of contingents. Each subsequent contingent deployed was much better equipped than the previous one. Some respondents shared that in most of the cases where negative assessments were given, it was due to overreaction by some of the personnel and it did not correspond to the real situation. They thought that contingents had been equipped with all the best the Armed Forces had at their disposal at that time.

The team paid particular attention in the study to personal and crew-served weapons and equipment. The majority of respondents expressed a positive opinion about armament and other crew-served equipment which they used during the missions. They estimated that the available weapons (individual and collective) had decent tactical performance and met the requirements of concurrent peace keeping operations. The same opinion was expressed about the performance of vehicles and other equipment. The interviewees shared that in most cases the equipment was in line with the mission requirements. In some missions, in Afghanistan in particular, part of the tasks was performed with equipment provided by the coalition partners, which according to respondents was also adequate for the assigned tasks.

In 28 percent of the explored cases respondents said that the armament and equipment corresponded to some degree to the missions' requirements. According to them, the tasks could be accomplished with the available weapons and equipment, but with a number of caveats. In this case assessments of weapons were more positive, rather than negative. Talking about vehicles, there were mixed feelings. Many respondents said that during the first missions (Cambodia, Bosnia, Kosovo, Iraq 1.2) they had to do their duties with available standard equipment at that time (mainly Russian - UAZ, ZIL, BRDM, GAZ, BTR-60 PB), but these were the realities, and albeit conditionally, the equipment performed adequately. Around 6 percent of the interviewees estimated that the above mentioned armament and equipment did not meet mission requirements. Some soldiers thought that the above mentioned equipment was hopelessly outdated and they performed their duties with difficulty. In Iraq and Afghanistan all vehicles and other military equipment of the coalition were equipped with diesel engines, but Bulgarian contingents were equipped with gasoline ones, so that their refueling in Theater was a challenge for logisticians. What is more they did not provide ballistic protection for personnel.

Analysis of research results for accommodation, food and communal services shows that this was one of the areas with a very high degree of approval. In 92 percent of cases the interviewees praised this type of support. There was a central support for accommodation, meals and communal services in general. As a common practice those types of

services were included as clauses of the Memorandum of Agreement between the lead country (organization) and the rest of participants. Following the deployment accommodation, meals and communal services have been traditionally provided by civilian contractors. Typical responses of the interviewees in this area were like: "The accommodation, food and services were excellent. Everything was excellent; there was no shortage of anything, everything one wished was available. There were very good living conditions, there was air-conditioning, Internet was available, and you name it." There were, however, about 5 percent of the respondents who expressed dissatisfaction with organization of accommodation, meals and communal services. Finally, in approximately 3 percent of the cases, the military openly stated that the conditions were unsatisfactory. Further analysis made it possible to pinpoint the missions in which soldiers identify logistics as poorly organized. The gaps are most closely associated with the initial missions in Afghanistan (ISAF-1, 2, 3, 4), Iraq (SFIR 1, 2) and especially the mission in Cambodia. Medical support of contingents was widely praised by respondents.

The military who was part of the project proposed a lot of recommendations for the further improvement of logistics, such as improving the quality of clothing and footwear and procuring them for universal wear both within the country and abroad; procuring adequate individual equipment; modernization of individual arms by equipping them with night vision capabilities, modern optical sights and the like.

Taking into consideration that the country as a NATO and EU member has commitments to achieve certain capability goals, there will be a necessity for us to seriously change and improve in this area. That said it will influence the overall look of military. The opinions of respondents and analysis lead to the conclusion that the future participation of Bulgarian units in operations in support of international peace and security will require a radical improvement in the planning and logistic support.

Another central question for research in this study was the issue of relationships in missions, both in multinational environment within the framework of multinational coalitions, where Bulgarian military was involved as well as within national contingents. The link between relationships and the effectiveness of command and control was explored. Several key questions were answered, namely: hierarchy in coalitions and the degree of autonomy for independent decision making; the nature of the command relationships within coalitions; command relationships in the Bulgarian contingents, and the nature personal relationship with coalition partners from other nations and the local population on a daily basis.

The research team examined the **hierarchy within the coalitions** and the ability of our commanders to take independent decisions, to defend them and to put them into effect in accomplishing their units' tasks. Notwithstanding the restrictions, a majority of the commanders said they had the necessary autonomy of action in order to freely command and control their units. Some estimate that during the missions they had greater freedom of action than in everyday military life in Bulgaria. "I had a great degree of autonomy, greater than in Bulgaria." The largest group of officers (37 percent of cases) reported that they had a limited degree of autonomy for independent decision making. The reasons for this were based mostly on the fact that they occupied positions as staff officers in the multinational headquarters. One third of the respondents, mostly officers on staff positions and the majority of NCOs and soldiers reported that they worked in units in which they were not able to take independent decisions, i.e. they had held executive positions. To the fullest extent this applies to officers who held staff appointments in multinational HQs (MNF-I, MNC-I, ISAF HQ, etc.). Officers occupying such positions said that in most cases they were executive officers and fulfilled their tasks. They shared that in most of the cases they would propose something concerning the job; their proposals were not taken into consideration and remained without consequences.

The majority of respondents (almost 80 percent) evaluated the **relations within the coalition** as decent, well-intentioned and collegial (Fig. 5). Coalition partners demonstrated understanding, sympathy and helpfulness. In most cases, they were responsive and accurate. A significant percentage of respondents shared that there was a certain initial stage of studying each other during the mission, the so called "examination stage", and then partners treated you the way you had performed: "Initially there was a stage of study, but if you won their trust, coalition partners were very cooperative, benevolent and helpful." Another group of soldiers (5.5 percent) had the opinion that command relationships within the coalition were official (diplomatic) and reasonable subordination was observed. A very small proportion (approximately 3 percent) believed that there was an element of domination by the partners of the leading nations over the others within the coalition. For this reason, some general and senior officers proposed that Bulgaria should have a higher level of ambition and should be represented in multinational HQ proportionately

to the contribution of troops we provide. In this way, they deemed, we would have more influential role on decision making process within the coalition.

**Figure 5:-**

A small percentage of soldiers believed that there was tension between the Bulgarian troops and coalition partners. They think that there had been a „double standard“, as a result of which there was no fair distribution of daily chores among partners in the zone of operations. Some received easier tasks, while others were charged with the most laborious and dangerous ones. Some interviewees shared that differences in perceptions of operational command and operational control often occurred, as well as misperceptions regarding capabilities and national caveats of the Bulgarian contingent.

Nearly three-quarters of respondents expressed the opinion that the **relations within national contingents** were good, principled and well mannered. Many of the respondents evaluated the relationships during missions as better than those in Bulgaria. They think that hardships and threats tie people together, imbue friendship, and create a common sense of responsibility, loyalty and dedication to the group. These characteristics were manifested in teams and formations and made units more cohesive. "When on a mission, people are much more disciplined and execute their duties more accurately, clearly and promptly."

According to the majority of respondents the commander plays a vital role for the morale and discipline of his (her) unit, as well as for the state of morale within the unit. He is the principle driver for the successful accomplishment of tasks. The commander strongly influences his military formation throughout the mission, especially in difficult times, when a quick and correct decision is needed. Caring for people and leading by personal example earns the trust of subordinates. "The integrity of the commander is very important. The commander must apply the principles of leadership. He should be close to his people. If he does not think and care about his people their trust evaporates very soon."

Almost one fifth of respondents shared the opinion that morale during the missions was good. However they thought that there was not a clean line of subordination apparent, especially between the national commander and the units. This was due to distanced locations and lack of perception what was going on the site of the unit. Another small group of soldiers (about 5 percent) indicated that relations had been strained in many cases, when national commanders had taken decisions without paying attention to unit commander's opinion or considerations. This was due to the collocation of national commander and unit commander. A small group of soldiers reported that tensions had arisen once in a while when there was no fair distribution of labor within the units, i.e. some soldiers took more tasks than others.

Another field of exploration was **relations with other participants** in the missions, present in the same zone of responsibility. First, the team analyzed the relations with coalition partners. According to the analysis' results over two thirds of respondents (78 percent) defined relations with coalition partners as well-intentioned, honest, professional and even friendly. At the same time another group of soldiers (about 7 percent) defined relations with coalition partners as professional and polite. This group thought that in the course of working together with coalition partners relations had had a more formal and polite character, as subject to the necessary subordination and mutual respect without seeking greater proximity. There were different views expressed by nearly 9 percent of the respondents that deserve attention. These soldiers argue that there was a tendency of „double standards" that they have felt in one way or another, taking into account the attitude of some coalition partners. Along with the prevailing positive assessments of relations with coalition partners, the analysis of the data shows that there were some negative assessments that may deserve attention. Some of them (a very small group- of less than 4 percent) said that at times, relations with the coalition partners were strained. This is mostly associated with the perception of domination attempts, arrogance, dismissive attitude and others.

The research team also investigated **relations with local authorities** and indigenous population. About 42 percent of the respondents reported such relations. The rest of personnel had no contacts with locals, because of the fact that they performed their duties in contained environment, or at remote sites. Most soldiers who had contacts define these relations as very good, collegial and cooperative. They worked together with understanding, cooperation and well-disposed interaction. The majority (64 percent) of the respondents indicated that they had working relationships with local armed forces in the mission area. Most of them define the relationships as collegial, very good, fair, honest and professional. Representatives of the local armed forces have shown cooperativeness and understanding. In general, they had good attitude towards the Bulgarian teams because previous teams have created a good foundation. Respondents reported that many Iraqi and Afghan troops had previous knowledge about Bulgaria and have demonstrated good feelings. A small number (less than 2 percent) of respondents said that at some point, relations with local Armed Forces were strained (green on blue accident in Afghanistan; the events in Karbala, Iraq, 2004). More than half (60 percent) of the respondents define their relations with the local population in the mission area as very good and normal. The attitude of Afghans to Bulgarians has been very good, unlike some other nations. Some Afghan people had ties with Bulgaria because they had graduated from Bulgarian universities, so that they preserved good memories. That is why they showed empathy and friendliness. Some soldiers shared that when they travelled throughout Afghanistan and local people saw their national flags waving on vehicles, they would raise their hands and salute. To the best of their knowledge, honesty, openness and integrity in relations were important factors for the success of the mission.

Some of the respondents suggested bringing to negotiations and planning conferences a higher level of ambition that corresponds proportionately to Bulgarian contribution to operations in support of international peace and security. According to most of them there must be an even distribution not only in numbers of troops' participation but also in key coalition positions. They support their suggestion with the argument that those who take part in these types of operations should have the leverage to take part in decision making process. Thus this would increase our share of responsibility in missions and would increase respect on the international arena.

Respondents underlined the necessity to increase the requirements for commanders' leadership qualities and professionalism. Commanders must be able to work with people, to motivate and lead them towards successful achievement of mission goals and tasks. The refinement of command relations within the contingents, keeping a clear line of command and control and strictly observing subordination, as well as enhancing the confidence of the Bulgarian military were other suggestions of the respondents.

The research team was convinced that after exploring relationships in missions and the almost unanimous answers of the respondents, a main conclusion could be drawn, that the Bulgarian contingents performed their duties with dignity and valor. For more than two decades they have proven to be respected and reliable partners in operations in support of international peace and security.

Achievement of self-sustainment and equality in the missions and tasks accomplishment, acquisition of better armament and equipment, as well as professionalism, strengthen the self-esteem and confidence of our personnel with regards to their capabilities and in relations with the coalition partners. Openness, integrity, benevolence, tolerance and ability for intercultural communication in the mission area increase the guarantees for good relations and successful cooperation with local authorities, the armed forces of the host country and the local population.

### **Morale and Discipline:-**

Another issue that emerged in the research as one of the most important topics was the theme of morale and discipline. In the opinion of the majority, morale proved to be the most important component of the combat power of the units and their ability to perform duties and accomplish various tasks. Data analysis has shown that the majority of the interviewed military (51 percent) determined the level of morale as good. They expressed the opinion that there was a good level of morale, discipline and cohesion in the contingents there. People were ready to share the difficulties of everyday military chores and showed willingness and ability to overcome tensions that had arisen in the course of mission. Many respondents expressed the opinion that "relationships among military personnel in missions were relatively better than those back home. Dangers kept people and units cohesive and disciplined."

Another group of soldiers (38 percent) shared that the level of morale was satisfactory. They said that in general morale was good, but once in awhile it happened that certain individuals showed temporary weaknesses. Those aberrations were mended by the commanders', colleagues' and friends' aid and the affected soldiers overcame their difficulties and successfully continued to carry on their duties. According to respondents, these deviations did not significantly influence the performance of units. "Overall, the level of morale was good. There was always someone who tried to „go astray" but the team drew him back to doing everyday duties and things got better."

A small group of respondents (6 percent) believed that morale in missions was not good enough. They thought that the level of morale of some units was rather unsatisfactory. Some interviewees recounted various isolated cases of attempts of dereliction of duties, violation of discipline and the like. They thought that these abnormalities affected negatively the image of Bulgarian contingents in the coalition and undermined national dignity. On the other hand, they shared that negative events greatly diminished the morale and discipline in units. This kind of disruption created an atmosphere of mistrust, tension and uncertainty. In those cases, they pointed out, commanders' role was crucial to mend the microclimate and alleviate the strain. Some respondents shared that morale and discipline depended greatly on the mission itself: "The nature of the mission determined the level of morale. Units were much more cohesive and people helped each other and backed one another in the toughest military missions. When on a mission there was less of a threat and there was more free time, there were more conditions for violations of any character."

The study leads to the conclusion that the Bulgarian contingents in missions demonstrate high morale and discipline. It also concluded that it were the commanders and staffs that needed to focus on improving morale and discipline, especially within the framework of participation in PKO of any type. It is necessary to make efforts in mastering the necessary command and leadership practices to maintain good organizational and psychological climate in the formations.

The research team also analyzed the degree of **satisfaction** of the interviewees from participation in missions abroad. The vast majority of soldiers shared their positive assessments and **self-esteem**. Most of respondents insisted in their feedback that they were satisfied with their participation because they had fulfilled their duties with honor and dignity and had contributed to the overall achievement of the mission's duties and tasks. According to more than 90 percent of respondents another major factor for their satisfaction was that those activities helped them enhance their professional knowledge and skills and their ability to cope with various situations in a complex environment. They believed that this was particularly important in cases where they played a vital role to help their colleagues and the whole unit to cope with missions and tasks. The positive self-esteem of the participants in missions vary depending on the issue that has proved most important to them, such as the achievement of "successful cooperation

and mutual assistance with peers", "positive interaction in multinational environment", "good relationship with local authorities and the local population", "contribution to common mission and tasks", etc.

Commissioned officers who occupied commanding positions hold dear certain aspects of their command that raised significantly their self-assessment. In their opinion a great deal of the successful accomplishment of tasks was due to good leadership and implementation of good command practices. Most of them connect success and personal satisfaction with completion of the mission without any loss of life. "I was greatly pleased and relieved when every one of my subordinates came back safe and sound"; "I am proud that I took command of 60 people and brought all of them back home." Some respondents of this category said that it was a great relief for them that the mission had been conducted without incidents.

Another aspect of self-esteem the respondents thought very important was the organization of work, the perception of significance of soldiers' work and the positive attitude one received from international partners. The majority of interviewees shared that it was essential for them that by doing their job they contributed to overall success. This category could also include people who emphasized positive evaluation by coalition partners. They adopted the mission as a kind of personal fulfillment and self-realization.

The **motivation** of soldiers to take part in missions in support of international peace and security was another fundamental question of the survey. The graphs are shown on Figure 6. The research team discussed with respondents the factors that motivated them to participate in missions abroad. During the interviews, the typical factors with a high degree of recurrence emerged as follows: the challenges of the mission; opportunity to work in a multinational environment; enhancing personal knowledge and skills; proving oneself as a professional; financial benefits; to contribute to the mission; getting to know new people, places and cultures and others.

Figure 6:-

Asked if they would apply for participation in another mission, 92 percent of respondents answered, in one form or another, that they were willing to take part in missions once again. Almost all soldiers, NCOs and junior officers categorically manifested their willingness to go on a mission again. The most important factors that motivate soldiers for further participation in missions abroad are the financial benefits, the opportunity to enhance their knowledge and skills, to work in multinational environment, and to prove their professionalism.

In the final part of the survey the research team discussed with respondents their specific proposals in the areas of research to improve the participation of our units in operations in support international peace and security. Figure 7 below shows the results of this discussion.

Figure 7:-

It was an opened question so that respondents might propose more than one option. Interviewees suggested reasonably that selection of personnel for participation in missions abroad should be refined; training of contingents should be improved and simulate as much as possible the real conditions of the mission; logistics and support should to be refined in order to meet missions' requirements. Most of the interviewees put a special emphasis on lessons learned sharing and their implementation in practice in order to avoid mistakes and employ the best practices. Respondents offered some proposals of strategic, institutional and administrative nature.

### Conclusion:-

In conclusion the survey results demonstrated that despite the positive results from the participation of Bulgarian contingents in operations in support of international peace and security there were areas that needed development and improvement. Based on data analysis and the proposals of the respondents it was clear that there was a ground for further improvement of the preparation of contingents of the Armed Forces for participation in peace support operations. All proposals should lead to final conclusions that should be taken into consideration by the civilian and military leadership, in order to translate them into actions and reach tangible results.

### Abstract

It has been long recognized that innovation performance varies considerably across nations. This observation rises immediately to important set of questions. The land mark judgment of "Diamond vs. Chakrabarty 1980 on genetically engineered bacterium changed the status of biotechnology. It has been 36 years since this landmark decision, from that time it affected the lives of virtually everyone on earth and continuous to be in the news of benefits and controversies. This revolution in biotechnology all over the world has resulted in the issuance of thousands of patents, the formation of hundreds of new companies. The objective of this study is in the context of patentability in Biotechnology, analysis of the current patent filing situation in India, PCT filing trends in the IPR. The second objective of the study is to observe the innovation performance of India on the basis of GII report 2016 in comparison with different geographic regions G7, BRICS and SAARC.

### Introduction:-

Biotechnology is called as industrial Art of the biological sciences and often falls into controversies of playing with god creations, for its genetic manipulation techniques. The United Nations Convention on Biological Diversity<sup>1</sup> as defines biotechnology as "Any technological application that uses biological systems, living organisms, or derivatives thereof, to make or modify products or processes for specific use." There are few ethical concerns and public opposition in specific areas, but overall biotechnology became a passionate research subject from past few decades and continuous to be so because of its capability of solving many problems in health and hunger. World got benefitted in medical therapies, genetic testing, crop yields and renewable fuels.

Biotech industry has recognized the potential importance of obtaining patent rights and especially where competitors are involved, enforcement of those rights. The market dynamics of world biotechnology reveals the potential of this sector. The anomaly in patenting biotechnological products arises because patent law was intended to satisfy the requirements of the industrial technology. The increasing use of patents to protect inventions by public, private and research organizations is closely connected to recent evolutions in innovation processes, economy and patent regimes. One of the compounding aspects of such laws is the relationship between the patent system and the inputs and output of biotechnology research. The issue of living organisms such as micro organisms, plants, animals, or naturally occurring substances such as DNA and proteins, cloning and bioinformatics is still a matter of concern. The biotechnology industry relies heavily on patents. This role of patents in the global economy has become part of

a much wider discussion in terms of research, ethics, investment, business and economic development strategies. For some developing countries shifting from initially weaker patent to stronger patent system is important path of economic development. What we need to understand is that Biotechnology research and developments are never going to be end and it will continuously challenge legal and ethical issues related to it. For example the recent announcement of synthetic human genome project “HGP-write<sup>2</sup>” which intended to construct human genome by synthesizing the human genome and inserting those strings into human cells growing in labs.

#### **Objectives of the study:-**

The objective of this study is in the context of patentability in Biotechnology, status of biotechnology patent filings during past few years in India, analysis of the India multi-dimensional facets of innovation performance at global level on the basis of selected parameters from Global Innovation Index report (GII-2016)<sup>3</sup>. For this purpose the study focused on international organizations G7, SAARC and BRICS group of countries with view on India. Comparison of patenting procedural variations of selected countries.

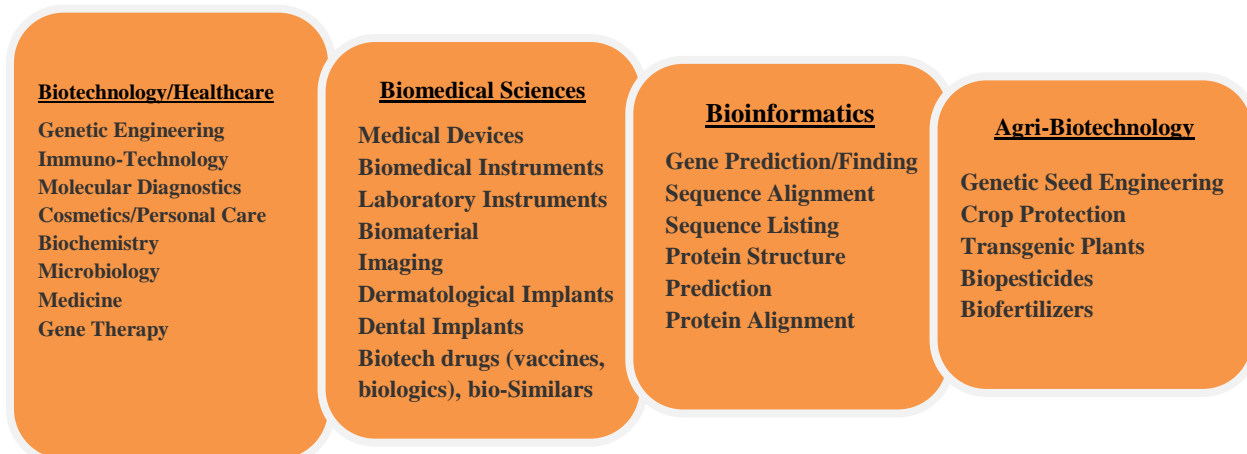

- To study the status and scenario of patents filed in office of the Controller General of Patents, India.
- To study the difference between national patent filing and International patent filing.
- To identify the Bio Innovations patentability Factors in selected countries.
- To analyze Innovation performance of selected geographic regional groups through selected parameters of Global Innovation Index report (GII-2016).

National and International Status of India in Bio-innovations: Patents are indicators of knowledge economy and innovation capacity of a country. The patent filing status of India in comparison with global level indicates output of research, industrial capacity for innovation. The requirement of such study about Indian Biotechnology research and investments. In Biotechnology sector India has quality research institutes and researchers, at the same time India gets huge R&D investments because of large consumer base and domestic market. India had become top 12 destination in the world with 2 percent share of the global biotechnology business of the world and ranked 3<sup>rd</sup> in Asia-Pacific region (APEC). In recent list of Global Innovation Index 2016 - 'Winning with Global Innovation' India is ranked 61. As a investment destination and as a center of research for biopharma technology industry, India is to reach \$11.6 billion by 2017- according to Global Industry Analysis.

Here the study requirement is on “how to protect our biotechnology inventions and innovations of private investors in R&D institutes. Is our patent system is uniform and strong compared to global patent protection, Is there any gap in regional patent filings, research expenditure and patents filed by non residents from abroad.

Bio-Pharma technology segment continues to dominate biotech industry with big share in the overall revenue. The attractive reasons for capital investment in biotechnology are to gain market share and expanding a company's platform of products to increased efficiencies and increased R & D potential. Increase in competition resulted significant increase in IP disputes. Patent litigation became an instrument of competition. Most commonly these disputes arises from prior art, license fees, patent infringements, misinterpreted clauses in licensing or sublicensing agreements. In global market place it is very important to seek patent protection for major inventions at least in those countries where patenting laws are very strong. Patent litigation became an instrument of competition.

**Fig 1:-** Promising areas of Bio-innovations for Patents.

In globalized scientific research and economic competition, Indian patent law underwent significant changes during the last fifteen years. From 2005, Government of India accorded priority to IPR protection in Biotechnology. India became party to several international treaties that directly impact on biotechnology regulation and management. In respect of Patents, India is a member-state in World Trade Organization (WTO) with effect from 1995, Convention establishing World Intellectual Property Organization, (WIPO), Paris Convention for the protection of Industrial Property with effect from 1998, Patent Co-operation Treaty (PCT) with effect from 1998, Budapest Treaty with effect from 2001 responsible for the promotion of the protection of intellectual property throughout the world. In the past few years, there have been several extensive techno-legal disputes and litigations after patents were issued. The patent controversies of turmeric and basmati cases in U.S and neem by European patents office as an anti-fungal product raised important questions about the weak Indian Patenting system. These analyses points' two critical needs: India must fill the gaps in its statutory framework, and the government must build a stronger policy system.

TRIPS agreement<sup>4</sup> was introduced to guarantee the same minimum standards of protection across countries. In India the Patents (Amendment) Act, 2002<sup>5</sup> introduced product patent protection to all fields of technology i.e drugs, food, technology and significant changes with regard to the patentability of biotechnological inventions by specifically allowing for the patentability of microorganisms with the requirement of article 27.3(b) of the TRIPS Agreement. Plant breeder's rights received official international recognition in 1961 at Paris International Convention for the Protection of New Varieties of Plants, called UPOV.

#### **Bio Innovations patentability factors:-**

The comparative look at the procedure in patentability for Bio-innovations and patent is particularly important because of IP's impact on research are particularly crucial to the companies which want to invest in R & D activities in biotechnology and to expand its biotech business internationally. It is important for them to understand the differences. This biotechnology assessment of IP trends will help in taking decision on investment or choosing the country for protection. Another trend in expansion of biotechnology business is international collaborations in research and technology transfer. Tech transfer trends often reflect foreign investments in biotech. "If any Indian company wanted to expand its base in other part of the world , ex. in South Africa, then the Indian company must know the Biotech regulations and Patent protection of that particular geographic country.

Country	Types of protection for inventions	Term of protection	Subject matters excluded from patentability or not considered to be inventions
India	Patents	20 years from the date of filing Extension of patent term is not possible	<b>Excluded from patentability:</b> - Plant and animals varieties - Inventions contrary to morality/public order - not considered to be inventions: - Discoveries - Isolated parts of human beings - Traditional knowledge - Scientific theories/mathematical methods - Presentation of information <b>Not considered to be inventions:</b> - Discoveries - Scientific theories/mathematical methods - Diagnostic, therapeutic and surgical methods for the treatment of humans and animals
South Africa	Patents	20 years from the date of filing Extension of patent term is not possible.	
Japan	Patents Utility models	Patents: 20 years from the filing date Extension of patent term is possible on: Regulatory approval for pharmaceuticals Regulatory approval for agricultural chemicals	
Denmark	Patents Utility models	Patents: 20 years Utility models: 10 years Extension of patent term is possible on the following grounds: Regulatory approval for pharmaceuticals Regulatory approval for agricultural chemicals	
Germany	Patents Utility models	Patents: 20 years Utility models: 10 years Extension of patent term is possible on the following grounds: Supplementary protection certificates based.	
United states of America	Patents Trade secrets Design patents	Patents: 20 years from the filing date Trade secrets: indefinite Design patents: 14 years from the date of grant Extension of patent term is possible on the following grounds: Regulatory approval for pharmaceuticals Patent Office delay

The studies on comparing different countries patent systems will provide information on uniformity of International procedures and minute differences in national patent laws, regulatory regimes, IP barriers, differences and requirements of labelling bio products. In international patent filings there are many other issues which are common in patent industry across nations trying to solve are differing judicial standards for enforcement, compulsory licensing, adequate data protection patent office inefficiency and infringement.

#### **India at Bio-Patents and Procedure for Patent filing:-**

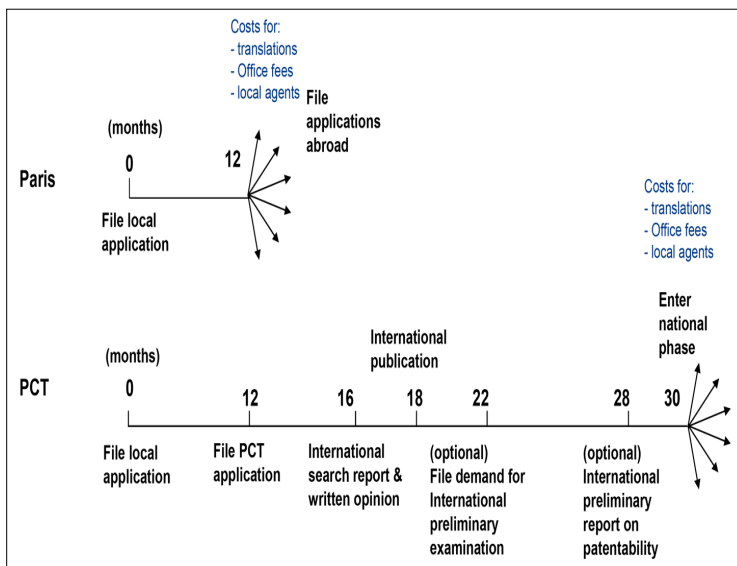

The TRIPS agreement which came into effect on January 1, 1995 harmonized the process of patenting of all WTO member countries at global level. TRIPS established the minimum standards for patentability and covers areas from pharmaceuticals to information technology, business practices to human gene sequences. The most relevant provision is Article 27 of TRIPS regarding patentable subject matter. Article 27.1 sets up the three basic patentability requirements, i.e., novelty, inventive step (non-obviousness) and industrial applicability (utility). The

patenting of life-forms and living processes is covered under Article 27 sets down minimum standards for many forms of IP regulation as applied to nationals of WTO Members.

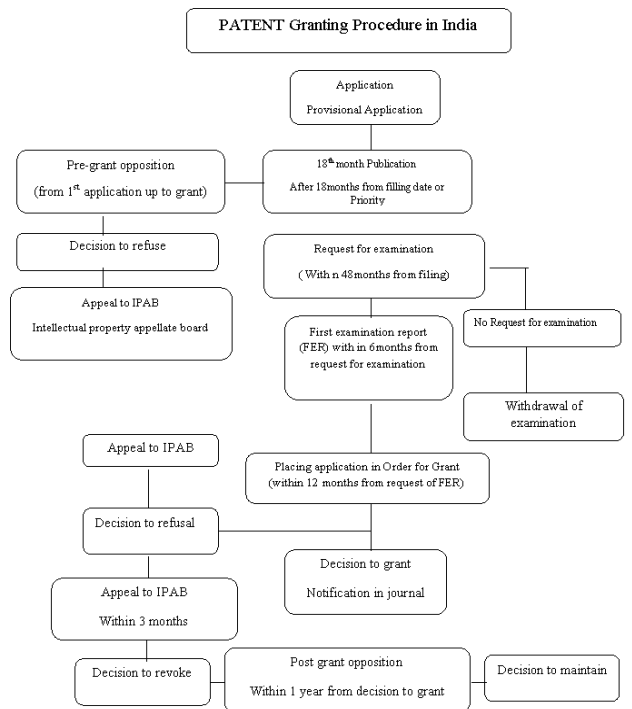

The fundamental requirement for a patent is Novelty, patentable subject matter, Inventive Step (Non-Obviousness) and Industrial applicability. Any invention is new when it is not anticipated by prior art. The Sufficient Disclosure of an invention, disclosed in the application to patent office, an inventor will obtain rights on the invention after going through established procedure. In India the Patent Office, under the Department of Industrial Policy & Promotion (DIPP), Ministry of Commerce & Industry, performs the statutory duties in connection with the grant of patents for new inventions and registration of industrial designs. The Patent System in India is governed by the Patents Act, 1970 (No. 39 of 1970) as amended by the Patents (Amendment) Act, 2005 necessitated by India's obligations under TRIPS. Indian IP rules were amended 2003, 2005, 2006, 2012, 2013, 2014 & 2016.

Patent rights were granted by each country through their national offices but one needs to understand that except in case of PCT applications, the patents issued by national patent office's provides a statutory right to the owner to stop others from using, selling or working out his invention, and exploit it commercially only within the territorial limits of the country for almost 20years.

The PCT application elaborately called as Patent cooperation treaty is a procedure established by WIPO to match the needs of inventors and business investors to protect their inventions in chosen countries required for them with a single application filing at regional office (RO). The advantage patent system is mainly to protect inventor's right and avoid duplication.

**Fig 2:-** International patent Filing. Paris and PCT Route.  
Image courtesy: <http://www.wipo.int/pct/en/faqs/faqs.html>

**Fig 3:-** Patent Filing procedure in India.

In India the patent act was enshrined in the Patents Act, 1970. The rights granted by IP office India is operative only in India. The patent process starts with an application by the true and first inventor(s) alone or jointly the applicant in the Indian Patent Office. Rules, procedures, form numbers, processing fee is followed as per provisions of the India patent Act 1970 (Fig-3). Only one patent will be issued for one invention on the basis of three prerequisites, novelty 'non-obviousness' or 'inventive step' and industrial applicability to align it with the definition of article 27 of the TRIPS. Inventors who required patent protection in many countries there are three basic approaches to procuring international patent protection existed (direct, traditional filing route Paris convention and Patent Cooperation Treaty (PCT) Chapter II). The World intellectual property organization WIPO International Bureau administers the process of PCT application preliminary search, evaluation, Publication on PATENTSCOPE search database and communicate documents to offices but does not grant the international patent<sup>6</sup>. The single application now can be

transmitted to any of the designating country required by the applicant in the list of 145 member countries national patent offices. The patent is finally issued only by the national patent office of the particular country. The direct approach is filing individual applications on same date separately in every country which is expensive, Paris convention procedure which is least expensive provides advantage of 12 months of time after the first or priority filing date in any PCT contracting member country, which In PCT one can file a single “international” patent application in India as receiving office under PCT, an international treaty with more than 145 contracting states administered by WIPO. Nationals/Residents of India can file an international application with the Indian Patent Office. The PCT process is divided into two Chapters, Chapter I and Chapter II. In Chapter II application will pass through international phase which includes International Searching Authority patent search and an International Search Report. PCT has two phases, an international phase when the international applications are in the International Bureau, and national phase which is the designated country patent office. (Fig- 2).

**Patenting trends in India:-**

The Indian patent act Section 3 (Patent Amendment 2003) defines Patentability Criteria of Novelty, Inventive step, Industrial applicability. The trend in India patent filings are published in the annual report of Controller General of Patents, Designs & Trade Marks. The number of patent applications under major fields of inventions granted from 2010-11 to 2014-2015 indicates technological developments of related to chemical, food biotechnology fields related to other engineering sectors of electrical ,mechanical, general engineering and computer elated inventions. Every year the increasing number of domestic and foreign patent filings with national patent office indicates that India is emerging nation for bio research and commercialization in Biopharma, and Biotechnology. Realizing the economic importance of Biotechnology patents the government research institutes, universities and private companies are interested in getting protection for the inventions. The analysis of the patent filing trends shows the number of patent filings in Biotechnology is in the increasing trend and in 2014-2015 out of 1297 patent applications 262 patents were granted.(Fig-4&5). Among top Indian applicants (Institutes / Universities) Indian Institute of Technology (IIT) tops with 337 patents. In scientific research organizations, Council of scientific & industrial research (CSIR) is second with 317 patents followed by DRDO with 98 patents, ICAR with 68 patents. ( Fig-7). In top ten PCT patent filings by foreign inventors at India National patent office, United States tops the list with 8,237 applications followed by Japan, Germany, and Netherlands. (Fig-6).

**Fig 4:-** Number of patent applications filed from 2010-11 to 2014-15 under major fields

**Fig 5:-** Number of Biotechnology total patent applications Filed and granted from 2010-11 to 2014-15 in Indian.

Fig 6:- Top applicant countries for PCT National Phase in India

Fig 7:- Top Indian Applicants for Patents from Institutes and Universities

#### Analysis:-

The research collaborations with universities, private funding from companies in universities should be encouraged. Government should improve measures to improve a systematic mechanism to produce more patents and entrepreneurs from Bio sector. India is signatory to many conventions in Biotechnology innovations, ethical committees, rights groups. India have an image of good market for Bio-Pharma, Bio-Agriculture and Bio-energy sectors, this image will improve more if India focuses on Patenting system ,encouraging domestic patent filing by the researchers will improve the status. To improve innovation performance research and development funding expenditure from Gross domestic product (GDP) is important but this alone will not improve India status. Protection of intangible assets and innovation absorption is also important. In India the connectivity between universities, funding agencies and Industries is not promoted much. To improve the domestic patent filings by Indian researchers combination of Publication-Patent concept should be encouraged with legal help from the institution .The more industry collaborations and doctoral research for real applied technological problems may improve innovations. Innovation promotes more innovation, so promotion technology transformation towards economic development. Harmonizing global mechanisms, deploying more subject specialists as patent examiners, patent analysts and quick justice to patent disputes, preventing technology infringement for patents will encourage domestic and foreign patent filings.

#### Innovation Performance International Trend:-

Innovation Performance is linked to many factors of a country. It may not be possible to calculate the value accurately but capacity of innovation performance output is possible to estimate on the basis of selected parameters. There are many international organizations like World Bank, WIPO, OECD which releases index of performance of world countries based on reports, policy studies on economic, industrial and scientific resources available. This part of the paper tried to analyze the status of India innovation performance at national level and international level comparing the selected countries geographic regional associations based on the data available on National patent office, Global Innovation Index, World Bank development indicators on science and technology.

#### Methodology:-

This paper evaluates the impact of innovation inputs provided and outputs mainly focusing on research and development in India. For this purpose for comparison the selected countries data where India is a member country had been analyzed as different geographic regional associations of emerging national economies, Brazil, Russia, India, China and South Africa (BRICS). The South Asian Association for Regional Cooperation (SAARC) and G7 countries. BRICS group represents fast growing economic countries of the world. The SAARC regional group where India is also a member represents developing countries. The G-7 regional bloc of industrialized democracies

United States, United Kingdom, France, Canada, Italy, Japan, Germany are developed technologically and tops the innovations list. Comparing these countries data will give an idea on the level of inputs to be pumped in to the system to get preferable outputs. It determines the linkage between the innovation input and output parameters

THE GLOBAL INNOVATION INDEX (GII) is a yearly publication of INSEAD indicates innovation performance of the world countries on the basis of selected parameters of innovation outputs and inputs. This gives an idea for a country innovation performance to maximize the benefits from its research and development expenditures, technology creation, absorption international collaboration, the diffusion of technology knowledge across borders. For many policy makers and business leaders, this is a benchmark to perform a country towards its efforts in knowledge economy. GII index was started in 2007 by INSEAD and from past nine years and it became synonymous for reference to Innovation. In collaboration with WIPO, it is published by Cornell University, United Nations, World Bank and its knowledge partners The Confederation of Indian Industry from India. The GII report 2016 covers total 128 economies, 97.9% of global GDP and represents 92.8% of the world's population. The Global Innovation Index 2016 ranks India moving up to 66<sup>th</sup> rank compared to its previous year rank 81 in 2015

The Innovation Index GII-Input Indicators: Research and development (R&D), Researchers, Gross expenditure on R&D (GERD), Global R&D companies, average expenditure top 3, QS university ranking average score top 3 universities, Knowledge workers, Intellectual property payments, Innovation linkages, Patent families filed in at least two offices, University/industry research collaboration, Knowledge absorption, Research talent in business enterprise

Two output pillars capture actual evidence of innovation outputs: Knowledge and technology outputs and Creative outputs. GII-Output Indicators: Knowledge impact, Knowledge diffusion, Intellectual property receipts, Creative outputs, Intangible assets, Patent applications by origin, PCT international applications by origin, Utility model applications by origin, Knowledge and technology outputs, Knowledge creation, Scientific and technical publications, Citable documents H index. This GII report helps researchers to find out country specific linkages between Public, research, innovation and technology absorption the final observations are what makes a country to transform in to regional innovator to global innovator. In many ways India is always compared with China because of demographic similarities, GDP and economic growth. The China innovation ranking is top 25<sup>th</sup> at innovation Index and top 5 patent filing country in WIPO rankings. Brazil which is very similar economic, industrial and scientific resources is very similar outputs like to India

#### **Analyzing Global Innovation Index:-**

The Global Innovation Index 2016 with theme "Winning with Global Innovation." explores the Innovation quality and share of innovation carried out via globalized innovation networks.

The GII Indicator Rankings & Analysis report shows list of 128 countries where Switzerland tops the list and Yemen ranked 128 is least. In the list of G7 countries which represent 46% of the global GDP, United Kingdom (3) ranks at, United States (4) in the list, Canada (15), France, Germany (10), Italy (29), Japan (16), China (25<sup>th</sup>) and most of the Southeast Asian countries are performing well. The Association of Southeast Asian Nations (ASEAN) member country Singapore ranked 6<sup>th</sup>. In contrast, no member country of the South Asian Association for Regional Cooperation (SAARC) features in the top 50. India leads the way at 61, followed by Sri Lanka (91). Nepal (115), Bhutan (96), Bangladesh (117), and Pakistan (119), all ranked 100<sup>th</sup> up or below.

India is a member country in BRICS and SAARC. The GDP of India is very high among the SAARC nations. In the SAARC regional group R&D expenditure percentage in GDP India(0.82%). Pakistan (0.29), Sri Lanka (0.1), Nepal (0.3) Among SAARC nations in GII innovation index India ranked at 66<sup>th</sup> and the other nations ranks are Pakistan 119, Sri Lanka 91, Nepal (115), Bangladesh 117. In innovation performance India is showing improvement in GII index. In innovation input-parameters of knowledge absorption and innovation linkages Bhutan is doing best. In knowledge diffusion Nepal is doing better than India following sustainable practices in dispensing knowledge. In intangible assets and patent applications Sri Lanka is doing better on performance index.

World bank Indicators among SAARC nations patent filing trends India has much gap in number of patents filed by foreign inventors and the domestic inventors, comparing with Sri Lanka where domestic innovators patent filing is much than the foreign inventors. India is maintaining study growth in foreign patent filings at USPTO, EPO and WIPO. This indicates India has more technological advancement and R&D investments competing with developed

nations. The other SAARC countries like Srilanka, Nepal , Bhutan ,Pakistan, Bangladesh also creating favorable innovation ecosystem in producing creative out puts and protecting intangible assets.

Fig 8:- The Global Innovation Index 2016 for BRICS countries Input-Output Index of selected parameters.

In the BRICS regional group R&D expenditure percentage in GDP, China (2.05%) is similar to the countries in G7 group. Brazil (1.24%) and Russian Federation (1.19%) is spending more than India (0.82%) and South Africa(0.73%).( Fig-10). China Innovation performance in GII index comparatively leading than rest of the four countries and in many of Input-output parameters closer to G7 group of High income countries. The other four nations were similar overall performance rankings. In Global innovation index China rank improved to 25<sup>th</sup> and became first developing nation to reach High economic countries list in innovation performance. The four BRICS nations ranked as Russia (43), South Africa (54), India (66), Brazil (69). The G7 countries which contribute high R&D expenditure percentage in GDP, United States (2.73%), Japan (3.58%), Germany (2.87%), United Kingdom (1.7%), France (2.26%), Italy(1.29%) are on top of the list in Innovation performance. United Kingdom (3), United States (4) , Japan (16), Germany (10), France (18), Italy (26).

**Comparative analysis of Science and technology world Development Indicators:-**

The world bank every year release set of cross country comparable data of more than two hundred countries which includes more than fourteen hundred parameters is a guide to policy planners, analysts, economists and researchers<sup>7</sup>.The “Science and technology world development indicators” which provides data on number of researchers in Research and development (R&D) working in a country per million people, productivity of Scientific and technical journal articles, Expenditures for R&D percent of GDP Patent applications filed at national offices by residents, nonresident domestic and foreigners innovators. The statistical analysis of this data for selected countries indicates current scenario of science development in different geographic regions.(Fig-9)

Fig 9:- Science and technology world Development Indicators of countries taken as sample (Data Source-The World bank, as on date 01.03.2017).

Fig 10:- Expenditures for R&D percentage in GDP 2005-15, of countries taken as sample.

United States, Germany, Japan and United Kingdom have maintained consistency in four observed parameters. Singapore is on top for having highest number of researchers and maintained balance between research publications and patent filings. This indicates scientific policy which optimizes technology innovation and applicability of innovations. India is least in the Researchers in R&D (per million people) selected sample list of sixteen countries however in terms of publishing scientific publications India is in Sixth position. The number of Non-resident patent filing is more compared to the resident patent filing. China tops the list in resident patent filings which indicates aggressive patent filings and cooperative patent system for Innovators. At the same time China is in second position in patent filings by nonresidents indicates conditions of technology protection for licensing, manufacturing, technology collaborations between companies and research institutes.

### **Conclusion:-**

The National and International filings are possible with a single application in established patent procedures according to TRIPS agreement. The Biotechnology patent filings are raising every year in India through national filings and PCT is an indication of technology transfer trends and knowledge sharing. Correlating patent filing data with R&D Investment percentage of GDP indicating the necessity of improving Domestic patent filing by Indian residents and speedup the process of granting procedures. Spending on R&D is important basic factor for all the countries to do better in Innovation Index. But it depends on the GDP income of a country to invest in long term innovation goal and knowledge economy. The Global Innovation Index, innovation parameters interlinked with each other. Large investment may not necessarily raise the innovation capacity. Data indicating that GDP and innovation have direct relation but optimizing basic and applied research goals, international collaborations in technology development, technology protection, improving national patent office capacity towards global standards remained as important factors. The uneven investments of low income and high income level countries has developed innovation divide. Besides investments the other important factor is increasing awareness, education and technology absorption capacity of the people. The policy changes will help to improve this crucial, vibrant and competitive knowledge economy.

#### Abstract

The economic significance of catalysis is enormous because most industrial chemical processes are catalytic. The use of heterogeneous catalysts and their importance have grown in recent years as a result of the economic and environmental benefits it has, compared to homogeneous catalysts. In that sense, a study deals with the use of catalytic supports on which active phases are deposited, is also developed. This review focuses on the most widely used catalytic supports, zeolite and clays. Among the topics discussed in this report are characteristics, types, synthesis and applications of the catalyst support referred above.

#### Introduction:-

During last years, environmental organizations and some sectors society have claimed for a strict control over effluents generated in processes like oil extraction or use of dyes, which may pollute the environment. Therefore, efforts are being made to perform the replacement of the classical stoichiometric processes with homogeneous basic catalysts, such as sodium hydroxide, potassium ethoxide, by processes with heterogeneous basic catalysts to decrease generation of these contaminants and increasing economic and environmental benefits (Martín, 2001). Among materials that can be used as catalyst, zeolites and clays are the most widely used as their porous structure has interesting properties to be used in catalysis, ion exchange and adsorption. However, another materials, natural or synthetic, have also been used through the years as catalyst support in the catalyst.

The support performs many functions, but the most important one is the maintenance of high surface area for the active component. Support functions as stable surface over which the active component is dispersed in such way that sintering is reduced. To work as a catalyst, the support must resist higher temperatures, than the active component, which means a higher melting point, and must be easily manipulated to produce optimum texture properties. The most direct effect of the support on the catalyst is related to dispersion and morphology (Mirzaei, Vahid, & Torshizi, 2013). For applications, these materials have been characterized by X-ray diffraction analysis (XRD), Fourier-transfo infrared spectroscopy (FTIR), scanning electron microscopy (SEM), energy-dispersive X-ray spectroscopy (EDX), reflectance, and cation exchange capacity analysis (CEC) and other techniques.

The main objective of this review is to present two materials commonly used as catalyst supports, their characteristics, sources, synthesis and industrial and environmental applications as catalytic supports. Zeolite and clay supports are widely used due to their properties such as high surface area, thermal stability, strong acidity and presence of nanosized spaces within their pores.

**Zeolite:-****Introduction:-**

Zeolites consist of interconnected aluminosilicate building blocks of  $\text{AlO}_4$  and  $\text{SiO}_4$  tetrahedral units, which form three-dimensional framework with linked channel systems and well defined micropores. Because of their high degree of open pores and microporous nature, these materials possess very high surface area (Kim, Rajesh, & Yu, 2013) and it is possible to find more than 170 different zeolite crystal structures and their crystallographic data from the database of the International Zeolite Association (IZA). Natural zeolites were discovered around 1756 by geologist A. Cronstedt when he observed that certain minerals when heated, melted and boiled at the same time, then called them Zeolites (Greek for "zeo" boil and lithos stone) (Martín, 2001). Generally, the following chemical formula is used to represent zeolites,

where A is charge-balancing cation with valance m, (x + y) is the number of tetrahedral units per crystallographic unit cell, x/y is the ratio of silicon to aluminum and z is the number of water molecules associated with the zeolite unit cell. The ratio x/y usually varies from 1 to 5 although pure silica form of zeolite is also available with x/y being infinite (Kim et al., 2013).

Zeolites are the catalyst supports more employees and their industrial applications are due to their physicochemical properties, which have favored the use in many industrial processes such as adsorption, ion exchange and molecular sieving (Musyoka, Missengue, Kuisakana, & Petrik, 2014). Mainly have been studied acidic zeolites for their industrial importance, but environmental advantages offered by basic zeolites, such as replacing processes that generate large amounts of contaminants, makes their study is in development (Martín, 2001).

**Zeolite synthesis:-**

The first synthetic zeolite was produced in 1950 by Union Carbide Linde Corporation in United States to be used as ion exchangers, and then increase their use as catalysts, adsorbents or detergents. Synthetic zeolites have been taken an unprecedented growth, to the extent that today various patents related to the synthesis of these materials are known (Rios, Williams, & Castellanos, 2006). Zeolites are typically synthesized under hydrothermal conditions from alkaline aqueous solutions. A typical hydrothermal zeolite synthesis can be described in briefest terms as follows: 1. amorphous reactants containing silica and alumina are mixed together with a cation source, usually in a basic medium; 2. the aqueous reaction mixture is heated (for reaction temperatures above 100°C), often in a sealed autoclave; 3. For a period at synthesis temperature, the reactants remain amorphous; 4. After the above "induction period", the crystalline zeolite products are formed; 5. Gradually, most amorphous materials are replaced by an approximately equal mass of the zeolite crystals (Cundy & Cox, 2005). Most used silicon sources are aqueous colloidal silica (Zhang, Tang, Zhang, & Yang, 2013), silica foam (Nabavi, Mohammadi, & Kazemimoghadam, 2014), sodium silicate, tetraethyl orthosilicate (Zhang, Tang, & Jiang, 2013), and a mixture of them (Zhang, Tang, & Jiang, 2013). Sodium aluminate (Mousavi, Jafari, Kazemimoghadam, & Mohammadi, 2013; Nabavi et al., 2014; Zhang, Tang, Zhang, et al., 2013) or a mixture of sodium aluminate, aluminum sulfate, alumina, aluminum hydroxide and aluminum isopropoxide (Zhang, Tang, & Jiang, 2013) are the alumina sources. Cation source, usually is sodium hydroxide (Nabavi et al., 2014; Zhang, Tang, & Jiang, 2013; Zhang, Tang, Zhang, et al., 2013).

Typical hydrothermal synthesis using chemicals is described above and times and conditions for each case vary according to the type of zeolite to be obtained. However, the high cost and limited availability associated to these chemicals have promoted the search for alternative low cost raw materials. Some of the alternative unconventional feedstocks are coal fly ash, rice husks, natural clay minerals and bagasse, among other feedstocks. The type and source of silica and alumina feedstock strongly influence the quality and the purity of the final zeolite product (Musyoka et al., 2014).

**Synthesis of different types of zeolites:-**

Synthesis of zeolites from clays obtained from South Africa has been investigated. The conventional alkaline hydrothermal treatment of the starting material (90 °C for 8 h) was preceded by a fusion step (550 °C for 1.5 h) to improve the solubility of aluminium and silicon. X-ray diffraction patterns showed that a mixture of hydroxysodalite zeolite and zeolite X was formed when starting from bentonite and red clay, whereas the main zeolitic product formed from white clays was hydroxysodalite zeolite. Upon addition of extra Al to the synthesis mixture, zeolite X

was found to be the main zeolitic material that was formed after the hydrothermal crystallization. A well defined morphology for the formed zeolite X was observed when starting from red clay synthesis feedstock (Musyoka et al., 2014).

In another study, mine waters obtained from coal mining operations in South Africa were used as a substitute for pure water during the synthesis of Na-P1 and X zeolites from coal fly ash (Musyoka, Petrik, Fatoba, & Hums, 2013). When circumneutral mine water was used for Na-P1 synthesis, extra cations did not have any profound effect in the crystallization of this specific zeolite. For zeolite X case, a mixture of hydroxysodalite and zeolite X was obtained, which was unlike. Use of the acid mine water, for Na-P1 synthesis only a single phase hydroxysodalite zeolite could be obtained, whereas for X zeolite synthesis had the formation of hydroxysodalite zeolite with trace amounts of zeolite X. Both zeolites, Na-P1 and X zeolite have applications in water treatment.

Moreover, a variety of organic compounds have been degraded over iron or copper exchanged zeolites. Fenton like processes have been used in the catalytic treatment of phenol, azo dye and others, such as is shown in Table 1 (Garrido-Ramírez, Theng, & Mora, 2010).

**Table 1:-** Catalytic degradation of organic compounds over iron or copper exchanged zeolites through different Fenton-like processes (Garrido-Ramírez et al., 2010).

**Novel Support applications:-**

Different zeolite nanocrystals as ZSM-5, Beta polymorph A (BEA) and Faujasite (FAU) were used as solid supports for the preparation of Ag nanoparticles with different morphologies. Silver nanoparticles supported on zeolite crystals are considered for enhancing the efficiency of hybrid photovoltaic solar cells due to their plasmonic properties, besides Ag nanoparticles could induce light scattering and increase the number of photons entering the cell. The problem of hole-electron recombination or loss of excitation in classical solar cells can be solved with the fabrication of very thin photovoltaic solar cells (few hundreds of micrometers) using Ag nanoparticles on zeolites. Incorporation of silver in zeolites has antimicrobial and medical applications because when moisture or liquid film gets in contact with Ag-zeolite, silver ions are released to the bacteria by forming chelate complexes with the DNA and block the transport processes in the cell.

Also, zeolites have been functionalized with molecular targeting vectors that enable specific high affinity binding to in vivo molecular targets (such as cell surface receptors). In addition, these materials possess unique properties that enable radionuclides and contrast agent metals to be concentrated for applications in magnetic resonance imaging (MRI) and positron emission tomography (PET) (Zaarour, Dong, Naydenova, Retoux, & Mintova, 2014).

**Mineral Clays:-****Introduction:-**

Clay is hydrated aluminosilicate whose chemical formula is  $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$ . Its chemical composition is characterized by the presence of amounts of Mg, Mn, Fe, Ca, Na and K, mainly. Clays belong to a particular class of minerals known phyllosilicates or sheet silicates. Silicates are, from a practical point of view, the set of most important minerals of nature as they constitute 25% of the known minerals and about 40% of the most common.

Phyllosilicates are a large family of minerals that commonly show layered structures and include kaolin, smectite, chlorite, mica and serpentine groups. Based on their layered structure, clay minerals can be categorized as types 1:1 or 2:1. Each layer forming a clay mineral particle is fundamentally built of one or two tetrahedral silicate (Si\O) sheets and one octahedral metal oxide/hydroxide (M\O or M\OH) sheet. A 1:1-type clay mineral consists of one tetrahedral sheet and one octahedral sheet.

Examples of 1:1-type clay are kaolinite, halloysite and serpentine. A 2:1-type clay mineral is composed of an octahedral sheet between two tetrahedral silicate (Si\O) sheets, and examples of 2:1-type clay minerals include vermiculite, montmorillonite, saponite, and sepiolite (Zhou & Keeling, 2013).

**Active sites:-**

Some properties of the clay minerals such as the exchange capacity, good catalytic support, large surface area, mechanical and chemical stability and low price, make them suitable as heterogeneous catalysts. At this respect, clay minerals such as, montmorillonites, iron-enriched zeolites, kaolinite, allophanes, goethite, magnetite and wustite, have been used as solid catalysts in the heterogeneous Fenton and electro Fenton reactions or to prepare modified electrodes (Garrido-Ramírez, Mora, Marco, & Ureta-Zañartu, 2013). The inherent properties of clay minerals also make them chemically active and adsorptive, thereby leading to a variety of uses as absorbent and catalyst products.

In clay minerals, the active sites may arise from 1. "Broken edge" sites and exposed surface of aluminol and silanol groups, 2. Isomorphic substitutions, 3. Exchangeable cations, 4. Hydrophobic silanol surfaces, 5. Hydration shell of exchangeable cations, and 6. Hydrophobic sites adsorbed on inorganic molecules (Figure. 1). These peculiar chemical features combined with the nanometer scale layering and the interlayer spacing, allows for a variety of functional materials with potential applications in advanced technologies, in particular, nanotechnology (Zhou & Keeling, 2013).

**Figure 1:-** Schematic drawing of 2:1- type clay mineral showing active sites (Zhou & Keeling, 2013).

Considering the development of the clay minerals as catalysts, their chemical functions generally need to be intensified to improve efficiency. Possible ways of making ‘catalytically active sites’ within and onto the matrix of clay minerals are with active species in the framework of clay minerals, which can be made accessible; through the ions within the interlayer space, judiciously exchanged with active components for catalysis purpose; with functional nanoparticles (NPs) or clusters onto or within the clay nanostructure (Zhou & Keeling, 2013).

#### Clay mineral modification:-

For several decades, modified clay minerals have been an important alternative for the generation of materials with potential applications in catalysis, either as catalysts or catalyst supports, due to their low cost and abundance. Their physicochemical and mechanical properties allow a very wide range of possibilities for structural, textural and chemical modifications. There are two methods for modifying a clay mineral, pillaring and delamination (Pérez, Montes, Molina, & Moreno, 2014).

The Pillared InterLayered Clays (PILCs) synthesis procedure can be divided into three main steps (Ramirez et al., 2007): (i) Preparation of polyoxocations by careful hydrolysis of certain multivalent cations, which under appropriate conditions give rise to cationic polymeric species; (ii) Ionic exchange of the original charge-compensating cations of swellable smectite clays by the polyoxocations before synthesized, this exchange giving rise to the so called ‘‘intercalated clays’’ and (iii) Stabilisation of the intercalated clays by calcination at relatively high temperatures, which transform the metastable polyoxocations into ‘‘pillars’’, stable metallic clusters, close to oxihydroxy phases. The most widely used pillaring agent is aluminum, however, there are different poly-oxohydroxy metal cations can be used as pillaring agents like chromium, titanium and iron (Park, Jung, Seo, & Kwon, 2009).

The process of clay mineral modification can lead to arrangements of the laminar face–face type as in the case of pillared clays, where microporosity is predominant, or edge-type or edge-side edge aggregates, as in the case of delaminated clays, which are predominantly meso and macroporous materials (Pérez et al., 2014).

PILCs, intercalated with Al and containing iron or copper species (Garrido-Ramírez et al., 2013; Nogueira et al., 2011; Ramirez et al., 2007; Sanabria, Alvarez, Molina, & Moreno, 2008), have been used for the oxidative degradation of organic compounds through the Fenton-like reaction. Catalyst with intercalation of metal (Fe-Al-PILC) have higher basal spacing than for their Fe-PILC counterparts (Li, Lu, & Zhu, 2006). In Table 2 are showed catalysts for the degradation of recalcitrant organic compounds via Fenton-like reactions.

**Table 2:-** PILCs as heterogeneous catalysts for the decomposition of various organic compounds via Fenton-like reactions (Garrido-Ramírez et al., 2010).

Compound	Catalyst/support	Clay	Process	Reference
Azo dye X-3B	Fe-PILC	Bentonite	Photo-Fenton	Li et al. (2006)
Al-Fe-PILC				
Methylene blue	Fe-PILC	Natural montmorillonite	Photo-Fenton	De León et al. (2008)
Orange II	Hydroxyl-Fe-PILC	Bentonite	Photo-Fenton	Chen and Zhu (2006)
Acid Light Yellow G	Fe-PILC (catalyst)	Natural bentonite	Photo-Fenton	Chen and Zhu (2007)
Azo dye Orange II solution	Al-PILC impregnated with Fe	Natural saponite	Fenton-like reaction	Ramírez et al. (2007a)
Ciprofloxacin (fluoroquinolones)	Fe-PILC	Laponite (synthetic hectorite)	Photo-Fenton	Bobu et al. (2008)
Phenol	Mixed (Al-Fe)-PILC	Commercial Greek bentonite	Catalytic oxidation wet with $H_2O_2$	Barrault et al. (2000a)
Phenol	Al-Cu-PILC	Commercial Greek bentonite	Catalytic oxidation wet with $H_2O_2$	Barrault et al. (2000b)
4-Nitrophenol	Fe(III)-exchanged PILC	Montmorillonite	Fenton-like reaction	Chirchi and Ghorbel (2002)
Phenol	Al-Al-Fe- and Al-Ce-Fe-PILC	Natural Colombian bentonite	Catalytic oxidation wet with $H_2O_2$	Carriazo et al. (2005a)
Benzene	Al-PILC as supports for Cu, V, Fe	Natural sodium montmorillonite	Fenton-like reaction	Pan et al. (2008)
p-Coumaric acid and p-hydroxybenzoic acid olive oil mill wastewater	Cu-PILC	Commercial bentonite	Catalytic oxidation wet with $H_2O_2$	Caudo et al. (2007)
Polyphenols olive oil mill wastewater	Cu-based zeolite	Zeolite and commercial bentonite	Catalytic oxidation wet with $H_2O_2$	Giordano et al. (2007)
Cu-PILC				
Wastewater from agro-food production	Cu-PILC	Commercial bentonite	Catalytic oxidation wet with $H_2O_2$	Caudo et al. (2008)

**Clays characterization:-**

Heterogeneous catalysts prepared by a modified raw-clay with iron oxides, have been used in oxidative reactions of toluene. Fe-ppt and Fe-imp were prepared by precipitation and impregnation of iron oxide, respectively (Figure 2.) (Nogueira et al., 2011). The measurements of specific surface area indicated an increasing of the surface area from  $17 \text{ m}^2 \text{ g}^{-1}$  for raw clay, to  $62 \text{ m}^2 \text{ g}^{-1}$  for Fe-ppt catalyst. However, for Fe-imp sample the particle size distribution was found to be even more uniform than for the raw clay. Also, it is interesting to observe that there are iron phases with high crystallinity in the Fe-ppt compared with the Fe-imp, indicating a higher exposure of iron oxide.

**Figure 2:-** Preparation scheme of iron oxide on montmorillonite (Nogueira et al., 2011).

Alumina-pillared montmorillonite was used as a support in the oxidation of chlorobenzene over palladium and platinum. The catalysts were prepared by wet impregnation (Aznárez et al., 2015). The selectivity to chlorobenzene was considerably higher over the Pd/Al-PILC catalysts than over their Pt/Al-PILC counterparts, due palladium is known to be a more active chlorination catalyst than platinum.

Due to the increase in the emission of gaseous pollutants into the atmosphere, adsorption and/or retention of gases by clays has also been studied (Volzone, 2007). The presence of the different interlayer cations in smectite, changes the behavior of the clay minerals in aqueous dispersions and also the adsorption of gases. It has been demonstrated that the adsorption of  $O_2$ ,  $N_2$ ,  $CO$ ,  $CH_4$ ,  $C_2H_2$  and  $CO_2$  gases by different cation exchanged montmorillonites, decrease in the order  $H^+ > K^+ > Ca^{2+} > Al^{3+} > Na^+$  montmorillonite. The capacity for adsorption of gases by PILCs follows the order: Al-PILC  $\cong$  Zr  $>$  Ti  $>$  Cr-PILC and the gas adsorption capacity of all these PILCs follow the order  $CO_2 > CH_4 > N_2 = O_2$ . The modified-Al-PILCs are better solid adsorbents than Al-PILCs for  $CO_2$ ,  $CH_4$ ,  $N_2$ ,  $O_2$ ,  $C_2H_2$ ,  $CO$ .

### Conclusions:-

Desirable characteristics of a catalyst-support are stability, inertness, reusability, high surface area, porosity and appropriate chemical structure. Among a wide range of support-materials, so far, materials that appear to meet optimally these characteristics optimally are Zeolite and Clays. Supports keep the catalytic phase highly dispersed, thus protecting it from sintering and supported catalyst has shown better catalytic performance for catalytic processes. The type of the modification affects the activity of the supported catalysts because modifications affect substantially the chemical nature of the surface and on the pore texture formation. Results suggest supported catalyst are employed in antimicrobial, medical and environmental applications.

#### Abstract

It goes without saying that education without experiential exposure is futile. Learning anything is best understood when it is retained for long and this can be ensured only when the knowledge that one has gained can be applied to real life situations. **Environmental Education is a course which teaches an individual the basic essence of the living surroundings.** Having understood the significance and the implications of doing a course on environmental education, **the study undertaken gives an insight into the different pedagogical tools that have been adopted across the three top notch schools in Pune.** Emphasis has been laid on such tools because this channel facilitates the flow of knowledge from the learned to the learners. The **objective** of the study was to analyze the **Role of Innovative Pedagogical Tools and Teaching Techniques** adopted by primary level schools to evaluate the effectiveness in terms of predefined learning outcomes of environmental education. **Primarily, an in depth study of the composition mix of the theory-practical element that exists in the pedagogy used by each of the schools was examined** followed by evaluating the success of the respective composition mix. Since the research was extended to more than one school it helped us to give a broad outlook in terms of the innovative modes adopted in the delivery mechanisms. The study helped us to **find the highlights; the positives and negatives of the techniques used to impart the subject matter.** It also examined the limitations on part of the students, teachers and the parents that hinder the smooth functioning of the teaching-learning process and seeks to give valuable suggestions so that the activity is translated into a more meaningful practice. **It was also found that there is a fundamental change in the existent syllabi of environmental education in schools** which now promotes cognitive capacity and resourcefulness in order to make the child curious about social phenomena thereby nurturing the curiosity and creativity of the child particularly in relation to the prevalent environmental uncertainties and related sustainability goals. **The research intends to help policy makers in formulating an appropriate response strategy** with regards to primary level education in India. Finally, the research aimed to develop and implement an effective tool kit for environmental education, based on the identified

gaps and assessment. The study was however **limited to survey results based on research carried out in three schools of Pune.**

### **Introduction:-**

**“What sculpture is to a block of marble, environmental education is to the children!” - Joseph Addison:-**

The role of education as a facilitator of social and economic progress is well acknowledged universally. Education is the most critical input for endowing people with the requisite skills and knowledge for productive employment opportunities in the future. Thus, continuous enhancements in the methods of education delivery are not only expected to augment efficiency but also amplify the overall quality of life. Education facilitates children to set an objective in life and consecutively enables them to work towards that set goal, exploiting their true potential in the process. This role of education stands uncontested and valid even today.

However, due to immense competition in every sphere and the constant pressure to perform well, the role of education has been reduced to simply being an instrument of material success. Individual ambitions and unreasonable competitive practices are placed above the joy of learning and gaining knowledge from each other.

It needs to be understood that students are not just young people for whom adults should devise solutions. They are critical observers of their own circumstances and needs, and should be participants in discussions and problem solving related to their education and future prospects. Hence, participatory learning and teaching, emotion and experience need to have a definite and valued place in the classroom. The topic of our research paper is “Role of Innovative Pedagogical Tools in Enhancement of the Quality of Environmental Education in Primary Schools: An Indian Perspective”.

The prime motive behind selecting environmental education was due to the fact that only this course had the leverage of including innovative techniques to a considerable extent. In addition, it was also imperative to question whether or not environmental education at the elementary level ensures that the future population is more concerned and aware about the environment and issues related to it.

### **Objectives:-**

1. To analyze the scope and significance of Environmental Education being imparted in Indian schools as part of the Primary Level Education in India.
2. To determine the relationship between the use of innovative pedagogical tools and enhancement in the quality of education at primary level in schools.

### **Limitations:-**

1. The study was limited to three schools in the city of Pune.
2. The study was limited to the subject of Environmental Education.

### **Review of Literature:-**

**Gupte, Medha (2015)** in her paper titled “Does information and communication technology (ICT) have an important role to play in Indian higher education?”, has researched about how ICT can play a crucial role in transforming the current education scenario in India from the point of view of three critical stakeholders: teachers, students and government. She further explains that if used creatively, CT will not only make a big difference in the current teaching-learning methodologies practiced in Indian schools but also help in the incorporation of 21<sup>st</sup> century skills like digital literacy, innovative thinking, creativity, sound reasoning and effective communication. The study attempts to give a comprehensive outlook on how ICT is likely to enhance the quality of education through blended learning, by augmenting the traditional chalk and talk method.

**NCERT (2005)**, in its review of the National Curriculum Framework, specifically pointed out that it is imperative that learning at school be seen beyond the use of textbooks and greater emphasis be laid on experiential learning while imparting knowledge. The document suggested to adopt a comprehensive strategy which would ensure learning without any kind of burden on the students.

Further, the report recommended the need for a fundamental change in the existent syllabi of environmental education in schools so as to promote cognitive capacity and resourcefulness in order to make the child curious about social phenomena, starting with the family and moving on to wider spaces and to finally nurture the curiosity and creativity of the child particularly in relation to the prevalent environmental uncertainties prevailing in the world.

### **Research Methodology:-**

#### **Sampling Method used and Size of Sampling:-**

#### **Sampling Technique:-**

*Probability Sampling Technique* was used to carry out the research. Under this, the following technique of sampling was used:

*Stratified Random Sampling* – The first step entailed identifying a particular *cluster* (area) to narrow down the population size. For this, the case perspective of Pune was taken into consideration and the observations were assumed to be representative of the situation pan India. Further, within Pune as well in order to create *stratified random samples*, three schools were identified to carry out the primary spade work. Additionally, to form even smaller groups/strata from within these schools, teachers were characterized based on their designation. Finally, the *stratum* which was chosen for the study was that of the PRT (Primary Teacher) teachers responsible for Environmental Education in their respective schools.

#### **Sample Size:-**

A field visit was undertaken across three renowned schools in Pune. The sample size comprised of fifty respondents comprising of School Teachers (TGT, PRT, PGT) i.e., approximately seventeen per school.

#### **Data Collection:-**

##### **Primary Data**

Primary data collection was the principal mode of enquiry. It involved collecting data through a questionnaire consisting of twenty questions which essentially aimed at bringing out relevant data to meet the objectives of the research.

##### **Secondary Data:-**

The critical data sources included; Environment Education (EE) curriculum in Schools, Recommendation by NCF (National Curriculum Framework) 2005, Various Publications targeted at enhancing environmental education such as that of Eklavya, National Council of Educational Research and Training (NCERT), and Centre for Environment Education (CEE), Other Books available in the market, alternate books/ games/ audio- visual exposure given by schools if any.

Other Sources of secondary data collection encompassed; journals and previously published papers available over the internet.

#### **Data Analysis:-**

Once the relevant data had been gathered, the researchers undertook both qualitative as well as quantitative analysis of the same.

#### **Qualitative Analysis:-**

As part of the qualitative study, an *experimental design* was structured, which entailed conducting a brief classroom session in each of the three schools. Such kind of analysis is condensed under the umbrella of '*Observations through being Participant in Education Delivery*' methodology.

#### **Quantitative Analysis:-**

On the other hand, the survey results were used to scientifically and objectively classify the data using certain commonly used tools such as *SPSS, Microsoft Excel and Microsoft Power Point*. Relevant *excel formulas, charts and graphs* were then used to further infer and test the applicability of the existing hypothesis.

**Hypothesis:-**

- **H0 (Null Hypothesis):** Innovative means of teaching does not have any role to play in enhancing the quality of education being imparted at various levels.
- **H1 (Alternate Hypothesis):** Innovative pedagogical tools augment the overall understanding of a student and there is a definite behavioral change which can be observed in the student as a result of the same.

**Results:-**

**Figure 1:-** Level of Agreement on appropriateness of curriculum in achieving prescribed environmental education goals

**Discussion:-**

From the above Figure 1, it is seen that 68% of the respondents agreed that the curriculum was appropriate enough to achieve the prescribed environmental education goals at Primary level in schools. The respondents opined that present syllabus is designed to forge an integrated perspective for the primary stage of schooling that draws upon insights from Sciences, Social Studies and Environmental Education.

**Table 1:-** Level of Agreement pertaining to long term objectives being targeted by the proposed curriculum.

SNo	The Curriculum Targets to Achieve Certain Long Term Objectives (Behavioural Change/Awareness/Social Benefit)	n=50	Percentage
a)	Strongly Agree	14	28
b)	Agree	22	44
c)	Neutral	8	16
d)	Disagree	4	8
e)	Strongly Disagree	2	4

**Discussion:-**

From the above Table 1, it is evident that most of the respondents firmly believed that the proposed curriculum definitely contributes towards inculcating a behavioral change amongst students in regards to developing sensitivity towards the environment.

Figure 2: Level of Agreement on the statement that students learn faster with innovative techniques like games, quiz, presentations and illustrations are used

**Discussion:-**

From the above Figure 2, it can be seen that 56% of the teachers agreed with the notion that innovative methodologies have a definite positive role to play towards imparting quality education and ensuring faster learning amongst the students. Further, they also believed that, text books should only be used as guidelines in terms of what topics need to be covered. The prime focus should be on alternative teaching techniques. Learning by rote is must in terms of enhancing reading and writing skills but for experiential learning it is imperative that innovative methods be used.

Figure 3: Level of Agreement that the students tend to be more participative when innovative teaching means are used rather than conventional teaching methods

**Discussion:-**

From the above Figure 3, it can be seen that 68% of teachers agree that students tend to be more participative and enthusiastic in class when innovative teaching means are used as against conventional teaching methods. They further opined that since it is a life subject, rather than gaining theoretical knowledge only, understanding of the concepts through practical experience is more important. An interesting initiative which was highlighted includes - a No-Vehicle Day on a weekly basis to reduce the pollution level.

Further, they also believed that if the curriculum is focused on learning by doing approach then the students tend to be more enthusiastic, active and participative in the class.

**Figure 4:-** Level of Agreement on the fact that conducting relevant workshops on Environmental related issues tend to enhance the cognitive ability of students

**Discussion:-**

From the above Figure 4, it can be inferred that more than 50% of the respondents agreed to the fact that conducting relevant workshops on current Environmental related issues tend to nurture the curiosity and creativity of the child particularly in relation to the natural environment. Teachers also felt that these workshops engage the child in exploratory and hands-on activities and helps them acquire basic cognitive and psychometric skills through relevant observation, classification and inference.

**Hypothesis Testing:-**

In order to establish a quantitative relationship between Innovative Techniques adopted and Performance of the Students in Environmental Education subject, **two variables namely Quantitative Performance Technique (QPI) and the Number of Sessions conducted using Innovative Teaching Methodologies** were studied.

Mathematically; **QPI = Grand Total Marks of Students Appeared / (Total Number of Students \* Number of Subjects)**

A Correlation (Bivariate) analysis was done using SPSS. A Two-tailed test (which allows positive or negative correlation) was done to calculate Karl Pearson’s Correlation Coefficient.

*Note* – For this particular test, the subject wise marks of Class IV students from all the three schools, were collected and studied.

**Table 2:-** Calculation of p value.

		QPI	Number of Innovative Sessions
<b>QPI</b>	Pearson Correlation	1	0.760
	Sig (2-tailed)		0.001
	N	20	20
<b>Number of Innovative Sessions</b>	Pearson Correlation	0.760	1
	Sig (2-tailed)	0.001	
	N	20	20

\*Correlation is significant at the 0.01 level (2-tailed).

Since, the p value is  $\leq 0.05$  (significance level), the test is significant (there is a significant relationship between the number of sessions held using Innovative Techniques and the QPI).

Also, the value 0.760 indicates a **strong positive Pearson correlation** between the two variables, that is,  $r(18) = 0.760$ ,  $p = 0.001$ .

The above result **rejects the null hypothesis** which states that “Innovative means of teaching does not have any role to play in enhancing the quality of education being imparted at various levels”.

Hence, the **alternate hypothesis** which states that “Innovative pedagogical tools augment the overall understanding of a student and there is a definite behavioral change which can be observed in the student as a result of the same” can be **accepted**.

### **Conclusion:-**

The conclusion of the entire study are being discussed in the light of the objectives.

**The first objective** of the study was to “analyze the scope and significance of Environmental Education being imparted in Indian schools as part of the Primary Level Education in India”.

It was found that increasing concern on Environmental Education (EE) in India gained impetus after its importance was recognized by the Government and requisite policies were framed subsequently to introduce Environmental Education in schools. After execution of the planned study, one of the key findings was that there was a difference in the learning outcomes across the three schools. In case of the first school under study, it was observed that the curriculum focused more on learning by doing approach. In line with the stated objectives of the curriculum it was felt that the students were more enthusiastic, active, participative and willing to learn. Further, it was analyzed that they were able to apply the knowledge in a better way when resorted to innovative means. On the contrary, in the other two schools, students were seen to be more mechanistic in their response as the school authorities preferred text book based learning. The restrictive exposure given to the students lead to a limited applicability of their knowledge in real life situations which further narrowed down their scope of thinking. Another interesting result which can be inferred is that particularly in case of government aided schools due to lack of in service programmes/training of the teachers their ability to implement the prescribed curriculum effectively in the class, has been restricted. On the other hand, due to continuous training of the teachers in the other schools they have been able to enhance the quality of education delivery.

**The second objective** of the study was to “determine the relationship between the use of innovative pedagogical tools and enhancement in the quality of education at primary level in schools”.

There was a definite positive connection which could be established between the use of innovative pedagogical tools and enhancement in environmental education at the primary level. Certain positive initiatives were taken by the schools like Cleanliness Drives (Kirkoskar Clean School Green School Programme), Participation in the Green Olympiad at the National Level which encouraged students to develop knowledge about the global environment situation.

Although the schools have adopted the E-learning method of education yet there is ample scope for augmenting the effectiveness of the delivery mechanisms. Since the study involved a very broad base of students, one of the core issues which came to light was the existence of a language barrier. During certain instances this was an evident obstacle towards imparting vital knowledge. So, in order to overcome this problem, the teachers have to ensure that at all times certain parity exists while conducting classes.

It was also observed that in majority of the classes since the strength of the students is high it leads to two pertinent problems- firstly, the grasping power of all the students is not similar as a result of which special attention needs to be given to certain students. Secondly, the attention span of the students varies and thus they tend to get distracted easily. An implication of this is that only some of them actually benefit from the classes. Another appalling gap which continues to persist in the whole system is the trivial role played by the parents due to lack of adequate education and awareness. There is a discontinuity in the learning process which is carried from the classroom to their respective homes. Finally, we could say that since the level, scale and form of implementation of the teaching methods varies in different schools, there is ample scope for further research in the same domain by considering a wider spectrum.

**Recommendations:-**

A comprehensive outlook emerged post the intensive research. In lieu of the Participant-Observant Method, critical stakeholders were identified and it was observed that each one of them had an imperative role to play. The prominent links which arose out of the study include:

**Weakest Link – Parents:-**

**Policy Level:** The policy design is highly desk bound and the policy makers fail to take into consideration the viability of the same. It needs to be realized that the learning process is not confined to the schools only. Therefore, more focus should be laid on After School Centers so that continuity in the learning process is maintained. It is thus imperative that the whole system is streamlined and is more cost effective so that it does not automatically exclude the people who cannot afford it.

**Strongest Link – Teachers:-**

**Policy Level:** At the policy level, work needs to be done towards capacity building of the teachers. The teachers need to be adequately trained on a regular basis by improvising on the Teacher Training Packages.

**Critical Link – Pedagogy:-**

**Policy Level:** In order to ensure experiential learning in the schools certain subsidy mechanism should be put in place. This will ensure that the schools especially the government aided schools have adequate funds available for implementing the requisite tools. Also, a uniform content needs to be developed, taking usage of pedagogical tools into account, in order to maintain an overall parity level across all the schools.

#### Abstract

**Background:** Bedside teaching is an important part of the medical education system. It is extremely impossible to develop good physicians without the interaction with the cases. The lack of students' experience and the lack of privacy of the patients may cause negative attitude of the patients toward the students and may limit the benefit of bedside teaching. In this study we are trying to evaluate the attitude of patients and their perspective toward bedside teaching.

**Method:** Cross-sectional study. A self-administered questionnaire was distributed among inpatients from 4 different hospitals in the holy city of Makkah, Saudi Arabia.

**Results:** A total of 300 participants completed the questionnaire, 149 of them were males (49.7%) and 151 were females (50.3%). 90.3 % (271) of the patients allow both male and female medical students to view their medical file, 90 % (270) patients allowed both genders to take their medical history and personal data in the presence of a doctor, and 81.7 % (245) allowed both genders to do so even in the absence of a doctor. The majority of patients allowed both male and female medical students to be present during rounds (266; 88.7 %), in OPDs (260; 86.7 %), and in the operation room if they were having surgery (196; 65.3 %). Regarding physical examination, 77 % (231) allowed both genders to be present while a doctor is examining them, 67.3 % (202) allowed both genders to examine them in the presence of a supervising doctor, and 56 % (168) allowed themselves to be examined by both genders even in the absence of a supervising doctor. When patients were asked about their acceptance regarding diagnostic and other procedures, 77.7 % permit male and female medical students to be only present, while 54.7 % (164) permit them to perform such procedures

**Conclusion:** The study showed an overall positive attitude toward medical students regarding bedside teaching and education in different hospitals in the city of Makkah, Saudi Arabia. This attitude however was influenced by different sociodemographic aspects, especially gender, level of education and monthly income. The majority of patients knew that they had the right to refuse medical students.

**Introduction:-**

Bedside teaching is an important part of the medical education system. It is extremely impossible to develop good physicians without the interaction with the cases. The lack of students' experience and the lack of privacy of the patients may cause negative attitude of the patients toward the students and may limit the benefit of bedside teaching [1]. In this study we are trying to evaluate the attitude of patients and their perspective toward bedside teaching. Bedside teaching is an important part of medical education system as it is facilitator of student development of professional skills as well as communication skills, they also act as exemplars of their conditions and diseases [2].

Patients' autonomy gives them the right to refuse medical students. This issue makes the bedside teaching a conflict to be a cornerstone in medical education. In a study has been done at the University of Newcastle in Australia, 100% of students thought that bedside teaching was the most effective way of learning clinical skills such as communication and physical examination [3]. Thus direct contact of the students with patients would play a crucial role in the development of clinical reasoning, communication skills, professional attitudes and empathy.

Convincing the patients of the great benefits of bedside teaching would create a sense of personal health care and trust, and enhances the respect that develops with the teaching doctor. These can be achieved by several methods such as explaining to them the benefits of bedside teaching as it is important part as the textbook learning, realizing the importance of the triple relationship between doctor, patient and student by including them in an open conversation, patient-student relationship [4].

Patients are generally satisfied about bedside teaching with little reluctance to students. According to a study by Rima M Sayed-Hassan and her colleagues at Damascus University teaching hospital, 67.8% approved the presence of medical students during the medical consultation, and 58.2% expressed comfort with the presence of medical students [5].

Another study by Yousef Marwan showed that 80% would permit medical students to take their history with the presence of a supervising doctor; but 51.2% refused without the presence of a supervising doctor. 62.2% refused medical students to examine them without a supervising doctor, the majority of the patients 57.4% would allow students to be present while the doctor is examining them and 54% to examine them with the presence of a supervising [6].

**Method:-**

The is a cross-sectional study, data were collected during the month of March 2015, from patients at several hospitals in the holy city of Makkah, KSA (Al-Noor Specialist Hospital, Hera General Hospital, King Abdulaziz General Hospital, and King Faisal General Hospital). The data were collected using a self-administered modified questionnaire developed by *Yousef Marwan* in his research [10]. The questionnaire has 23 questions divided into two main sections: section one was about the sociodemographic of the patients, while section two was about patients' perception of medical students and bedside teaching.

The analysis was done using the Statistical Package for Social Sciences (SPSS) with two-tailed P-value < 5% to be considered significant. Descriptive statistics for every variable were computed, as well as cross-tabulation between section one and two.

**Results:-****Sociodemographic Characteristic:-**

Our total sample is 300 patients from different hospitals, genders, occupations, age, and education. Of them 100 patients were from Al-Noor Specialist Hospital, 100 from King Faisal General Hospital, 50 from King Abdulaziz General Hospital, and 50 from Hera General Hospital. The samples were taken from both internal medicine and general surgery departments. There are 149 males (49.7%) and 151 females (50.3%). 243 of the sample were Saudi Arabian (81%) whereas 57 were non-Saudi (19%).

Of the sample, there were 191 married (63.7%), 77 single (25.7%), and 32 (10.7%) divorced or widowed. The education level distribution is as follows: Less than intermediate (88,29.3%), Intermediate (56,18.7%), High school (79,26.3%), Diploma (27, 9%), University or higher (50,16.7%) the mean age of the participants was 40.02 years old (Table1).

#### Reaction Toward Students:-

90.3 % (271) of the patients allow both male and female medical students to view their medical file, 90 % (270) patients allowed both genders to take their medical history and personal data in the presence of a doctor, and 81.7 % (245) allowed both genders to do so even in the absence of a doctor. The majority of patients allowed both male and female medical students to be present during rounds (266; 88.7 %), in OPDs (260; 86.7 %), and in the operation room if they were having surgery (196; 65.3 %). Regarding physical examination, 77 % (231) allowed both genders to be present while a doctor is examining them, 67.3 % (202) allowed both genders to examine them in the presence of a supervising doctor, and 56 % (168) allowed themselves to be examined by both genders even in the absence of a supervising doctor. When patients were asked about their acceptance regarding diagnostic and other procedures, 77.7 % permit male and female medical students to be only present, while 54.7 % (164) permit them to perform such procedures (Table 2). Data analysis with two-tailed P-value < 0.05 to be considered significant showed that different sociodemographic are statistically associated with the overall acceptance of medical students. Male students were more accepted by male patients, while female students were more accepted by female patients. Analysis also showed that patients who were biased by gender had low level of education and low monthly income.

Questions	Answers			
	Only Males	Only Females	Both Males and Females	Neither Males nor Females
	n (%)	n (%)	n (%)	n (%)
Would you permit medical students to read your medical file?	8 (2.7)	5 (1.7)	271 (90.3)	16 (5.3)
Would you permit medical students to be present in the outpatient clinic if you were having a consultation with your doctor?	16 (5.3)	13 (4.3)	260 (86.7)	11 (3.7)
Would you permit medical students to be present in the ward rounds if you were admitted in the same ward?	19 (6.3)	12 (4.0)	266 (88.7)	3 (1.0)
Would you permit medical students to be present in the operation room if you were having a surgery?	12 (4.0)	37 (12.3)	196 (65.3)	55 (18.3)
Would you permit medical students to take your medical history and personal details from you with the presence of a doctor?	12 (4.0)	9 (3.0)	270 (90)	9 (3.0)
Would you permit medical students to take your medical history and personal details from you without the presence of a doctor?	5 (1.7)	19 (6.3)	245 (81.7)	31 (10.3)
Would you permit medical students to be present while your doctor examining you?	12 (4.0)	40 (13.3)	231 (77.0)	17 (5.7)
Would you permit medical students to examine you with the presence of a doctor?	26 (8.7)	47 (15.7)	202 (67.3)	25 (8.3)
Would you permit medical students to examine you without the presence of a doctor?	28 (9.3)	43 (14.3)	168 (56.0)	61 (20.3)
Would you permit medical students to be present while you're having diagnostic/other procedures (e.g. x-ray, drawing blood, inserting catheter, endoscopy...etc)?	22 (7.3)	18 (6.0)	233 (77.7)	27 (9.0)
Would you permit medical students to perform diagnostic/other procedures on you (e.g. x-ray, drawing blood, inserting catheter, endoscopy...etc)?	11 (3.7)	13 (4.3)	164 (54.7)	112 (37.3)

### Discussion and Conclusion:-

The acceptance of medical students in hospitals was variable based on multiple aspects. Overall medical students were allowed to view the medical file, be available during rounds and in OPD. This high acceptance may be attributed to the indirect contact between the medical student and patient, as well as the small role the medical students play in the medical care provided. These results are similar to what have been founds in other studies [7,8,9].

Only a small number of patients did not allow medical students from taking their medical history with and without the presence of a supervising doctor. This refusal maybe because these patients have a low confidence in the skills of the medical students in obtaining a sufficient history that will help guiding the treating doctor in reaching the final diagnosis, also some patients may view this as a time wasting process, since they already gave their history to the treating physician. Previous studies demonstrated another possible reason, which is that patients don't feel comfortable discussing their sexual history and issues with medical students [11, 12, 13].

Regarding physical examination, the majority of patients permitted medical students to not only observe, but also to examine them in the presence and absence of a supervising doctor. These results are similar to the findings of Monnickendam et al in his research [8], where a small number of patients refused to be examined by medical student in the presence of a doctor and alone (7.2 % and 33.6 % respectively).

Less than one quarter of our patients refused the presence of medical students in the operation room when they are being surgically treated. Which is less than what was found by Yousef Marwan[10].Where the refusal was 26.7 %.

A possible explanation for this refusal is that patients may feel uncomfortable exposing their bodies to medical students, or maybe they believe that medical students may participate in the operation causing complications and unwanted outcomes.

When it came to allowing medical students to attend and/or perform diagnostic and other procedures, most of our patients had a high level of acceptance. Opposite results were observed by Yousef Marwan[10], Chipp et al. [14], and Passaperuma et al. [15].

Data analysis showed that in all aspects of patients' perspective toward medical students, female expressed a higher level of acceptance toward female medical students compared to male patients. These results were supported by similar findings from other studies [7, 14, 12]. An easy explanation for such behavior, is the embarrassment a female patient would feel being exposed, particularly to a male medical student, especially here in Saudi Arabia where the majority of the population is Muslim and raised in a conservative way. Another observed association was between the low level of education and low monthly income, and the attitude toward medical students, these patients showed a lower level of acceptance toward both male and female medical students, with the latter having a higher level of acceptance, probably due to the fact that the majority of patients with low level of education and low monthly income were females.

68.7 % (206) of the patients believed that the presence of medical students in hospitals had no effect on the quality of health care, while 27.3 % (82) believed that their presence improves the quality, and only 4 % (12) believed that it decreases the quality. Those patients with the positive believes probably thought that since medical students spend a lot of time in history taking, physical examination, reviewing their medical file, and discussing the case with their clinical tutors, they may discover some missing details that will aid in reaching the final diagnosis. However, those with the negative believes probably think that the supervising doctor will spend more time teaching the medical students than caring for his/her patients.

81.7 % (245) of our patients knew that they had the right to refuse medical students from history taking, physical examination, reading their medical file, and other aspects involving their health care, while only 18.3 % (55) did know that they had such right.

In conclusion, the study showed an overall positive attitude toward medical students regarding bedside teaching and education. This attitude however was influenced by different sociodemographic aspects, especially gender, level of education and monthly income. The majority of patients knew that they had the right to refuse medical students.

#### Abstract

This paper aims at highlighting, by means of a synthetic approach in combination with analytical elements, some of the elements and peculiarities of Pinter's dramas, which made him one of the most important playwrights of postmodern era. We will mainly focus on his silences and pauses he is so famous for, which became a trademark of his dialogue otherwise called the "Pinter Pause". We will explore how failure in communication and the breakdown of human relations paved the way for ambiguity, nebulousness and menace. Our aim is to make clear Pinter's ideas on silences and pauses when he used them, what he meant and we will reveal that the uttered and spoken word is important, but the most important is what is left unsaid, the idea understated beyond silences. Elements of postmodern literature found in his work made it difficult to understand and analyze Pinter's work, often referred to and classified as illogical and irrational. Finally, we will try to restate once again the importance of silences and pauses expressed by 3 dots(...) in the Comedies of Menace, as the only way to penetrate through the real hidden significance of these dramas.

#### Introduction:-

This paper will deal with peculiarities of Pinter's absurd dramas so as to reveal his influence on audience and explore how his ambiguity paved the way for multiple readings leaving his plays open-ended. One of the main elements of an absurd drama is the dramatic conflict in the traditional meaning. It is thought that conflicts of personality clashes are closely related to a temporary and strict attitude, in a meaningless world, these kind of conflicts are meaningless too. The absence of a traditional dramatic conflict in an absurd play can be explained with the absence of events and movements on the stage which is totally different to what frequently happens in a traditional play. For the very same reason we could say that the absurd plays can be given the name of the Situational Theatre's plays. Despite the fact that Pinter was first criticized by both the audience and the critics for the nature of his plays which appeared to be a combination of bestial language and characters as well, he was one of the most distinguished playwrights who dominated the second half of the 20<sup>th</sup> Century and one of the most influential since George Bernard Show. Bock and other critics agreed on one point that all of Pinter's plays written after "The Homecoming" never had the quality of his very first plays (Bock.H. 2008). The originality of his fiction and the greatest impact of his works was seen in his early years with his early plays despite the first rejection of his peculiar approach.

Pinter's positioning in the british drama was gradual, but at the same time very influential and strong once the critics were introduced to the Plays of the Theatre of Absurd, which in 1960 became a separate dramatic literary movement, coined by Martin Esslin (Schumacher, C. 1990). The sense of evasiveness, aggressiveness, violation of identity and the self were major themes depicted in his plays. Many critics tried to classify them as plays of menace,

identity, memory, and political plays which all aimed at highlighting and exploring the specific principles of the human existence, but Pinter did not like being classified and being part of any literary movement. He tried to deploy the characteristics of the Theatre of Absurd which "strived to express the anguish and the uselessness of the human condition, the inadequacy of the rational approach by the deliberate abandonment of rational devices and discursive thought. (Esslin, 2004)

#### **Pinteresque plays and ambiguity:-**

His plays were given the name of naturalist, realist, existentialist and impressionist dramas (Randisi. J. L.1984). He was very much distinguished for his style and ability to use certain elements in a versatile style that his themes were accepted as his trademark in the history of Playwriting. As far as his artistic personality was concerned, he was well-known for the frequent use of such elements:

- Absence of deliberate or accidental communication between characters
- Decoded conversations and silence
- Lack of logic, coherence and rationality in the dramatic narration
- Characters' fixations and jealousy
- Use of pauses and silences to express what was left unsaid
- Characters' outer fearfulness
- Characters' isolation
- The unknown threat that was at the very center of their lives
- Their mental anguish, their neurosis and psychosis
- The abandonment of language and rationality as means of communication
- The benefit from elements of traditional drama
- Everyday language, slang
- Lifelike characters and situations
- The difficulty of reaching and understanding the immediate meaning

As Esslin puts it, the most important thing for Pinter was to reveal to the audience that what we spoke every day was illogical and senseless (Esslin. M. 1965)

*Truth in drama is forever elusive. You never quite find it but the search for it is compulsive. The search is clearly what drives the endeavor. The search is your task. More often than not you stumble upon the truth in the dark, colliding with it or just glimpsing an image or a shape which seems to correspond to the truth, often without realizing that you have done so. But the real truth is that there never is any such thing as one truth to be found in dramatic art. There are many. These truths challenge each other, recoil from each other, reflect each other, ignore each other, tease each other, are blind to each other. Sometimes you feel you have the truth of a moment in your hand, then it slips through your fingers and is lost.*

#### **Harold Pinter (Pinter. H : 2005)**

According to him, everything said or unsaid can be either true or untrue or it can be both. You never know for sure which is which. Truth is relative. There are no hard distinctions between what is real and what is not, what is true and what is false. A thing is not necessarily either true or false because it can be both at the same time. These assertions still make sense and do apply to the exploration of reality through art. So as writers we can stand by them, but as citizens we cannot, as citizens we must ask: What is true? What is False? He created lifelike situations where characters, their actions and dialogue came out to be unreal at the end. Firstly, he set his characters in a concrete environment: a room, a house or an enclosed shelter which symbolized "warmth and coziness towards the threatening outer world", which on the other hand served as a prison itself (Bock, H.1981).

In that room, characters were dominated by a feeling of “loneliness, aggressiveness, separation and loss” which served as Pinter's main themes in his Comedies of Menace. They were given such a name because they perfectly combined humor and threatening elements. They were unique works of art and you can never find similar dramas elsewhere, he can't be compared to any other contemporary playwright. Pinter's characters were totally paralysed, afraid of the outer world and its intruders. Through the character of Rose in “*The Room*” Pinter wanted to reveal to both readers and the audience, the sense of insecurity given through her fear of going outside the room she inhabited (Gale.S. H. 1996). They were totally scared from the world outdoor and they preferred to create their own worlds/ realities with their own rules and live peacefully there better than observe the rules outside the room. The element of Room was very much used by Pinter in most of his works. What draws our attention as readers and audience is the ambiguity and we do not understand where it came or derived from. This sense of ambiguity creates tension, a sense of insecurity and menace which is given in the text by the use of the 3 dots (...), pauses, silences or the deliberate lack of communication among characters, whose autonomy, the sense of past and future were unstable.

Another very important element that threatens these characters and makes ambiguity stronger is the idea of an intruder coming from the outside without being invited. The feeling of being threatened leads us to another issue, the one of power and violence, which are powerfully given through dramatic elements of theatre for example the total darkness, poor lightning and lights fade. In those few moments of darkness, the familiar environment became threatening and hostile. Despite the high load of aggressiveness and shadows of doubt of his dialogue, he tried to come to terms with a comic model in his plays. Such a model was first used in his first play “*The Room*”. Some of the main features of this model were incongruity, illogical outcomes, frequent repetition and restating over and over what we already knew as an audience. Two of these elements were clearly visible in the dialogue between Rose and Mr. Kidd, the landlord- incongruity as far as the term Bed-Room of his sister was concerned and an illogical and irrational conclusion of the conversation. The first intrusion occurred with the entry of the landlord, Mr. Kidd, whose evasiveness and vague answers to Rose's inquires served, as much as Bert's silence, to increase Rose's uncertainty about the world outside and undermine the security of her room.

- Rose: How many floors you got in this house?
- Mr. Kidd: Floors? (He laughs). Ah, we had a good few of them in the old days.
- Rose: How many have you got now?
- Mr. Kidd: Well, to tell you the truth, I don't count them now. Oh, I used to count them once... I used to keep a track on everything in this house... That was when my sister was alive, but I lost track a bit after she died.
- When Rose asks him if anyone lived upstairs, “Up there?” Mr. Kidd ponders, “There was one but gone now.”
- Rose: what about your sister, Mr. Kidd ?
- Mr. Kidd: What about her?
- Rose: Did she have any babies?
- Mr. Kidd: Yes, she had a resemblance to my old mum, I think. Taller, of course.
- Rose: When did she die then, your sister?
- Mr. Kidd: Yes, that's right; it was after she died that I must have stopped counting... [

The conversation is vague, unclear and it gives us the impression that what Mr Kidd is referring to are people not floors. It eventually becomes a series of attacks and counter-attacks and Mr. Kidd seems very keen on pinpointing Rose's vulnerabilities when he says that Rose's room has once been his bedroom. This fact inevitably reminds Rose of her status as tenant and temporary occupant of the room. Comicity in this and other plays comes as an important feature of the conflict itself. What still remains important to pinpoint as a trademark of Pinter are these three elements: Pauses, silences and 3 dots (...) instead of one full stop. They have a different meaning, not the one we expect them to have (Pinter.H in Gussow 1994). Pause is a pause because of what has just happened in the mind and guts of the characters... and a silence means that what happened before made everybody unable to speak for a while until they recover from what had happened before the silence took place.

Silences carry upon the importance of pieces of dialogue. They create an island of sounds and have their own dramatic significance. They become more powerful when they are in isolation, pause in itself does not mean that the action is over; in fact it implies that the character is still active, looking for new words to use, a new way of being saved or a new interactional approach. On the other hand *Silence* is a defense tactic which signals the end of communication. What Pinter had in mind was that words were not the only way to communicate with the world, we often notice other elements when we make use of silence. Through silence we can transmit much more, we can become deaf because of such deafening silence which carries and conveys more meaning and significance than

words can. We have to read through the lines and uttered words, we communicate more by staying silent. Since communication among characters has failed, it can open ways to a multiple of readings and interpretations on Pinter's plays. This makes his plays ambiguous, unclear and difficult to decode and interpret. They are open-ended plays and one can interpret them from their view point.

Pinter thought that if we stay silent we highlight our actions. We could perfectly communicate only by means of our movements and gestures, so in this way words get replaced by gestures, as it frequently happens in Pinter's works. His plays rarely start with uttered words, but we see the opening of the curtains and the appearance of one or two actors are standing up, sitting or lying down. Silences are broken by their utterances but they will soon give way to silence once again, and this time it will prevail. Pinter knew these small tricky details perfectly well since he was both an actor and art-director and he knew how to manipulate the dramatic action to make the audience experience what was happening on stage. In this and other plays like "*The Birthday Party*" and "*The Dumb Waiter*", he used certain techniques borrowed from Alfred Hitchcock's melodramas, so as to increase suspense and tension.

What seems to be a sinister and evil situation, in fact it is not and vice versa. This viewpoint was adopted by Hitchcock. Paranoia was intertwined with ambiguity, evasiveness and a spark of black humor. His plays still remain enigmatic, encoded and very mysterious. We never really understood who Riley was, or who were McCann and Goldberg and who they worked for, and we never got to know the previous profession of Stanley in "*The Birthday Party*". All these enigmatic elements and unanswered questions increase the symbolic significance of his works. His plays depict characters with a disoriented personality. Even nowadays, his plays remain ambiguous, unclear, doubtful and full of mystery. His most enigmatic play was considered "*The Homecoming*" since Monna Lisa (Carpenter. Ch. A). Characters were not given a proper identity and we cannot understand if the story they narrate is true or not.

"*The Homecoming*" is full of implications, vagueness, uncertainties and ambiguity. Max is a butcher, but Lenny calls him "a dog who cooks", his "driver" Sam cannot drive, Teddy who is a philosophy lecturer cannot answer a philosophical question which makes us doubt about his profession. When things are not well defined, it leaves room for multiple interpretations and readings and brings forth ambiguity in his plays. Apart from ambiguity and fear, he also made use of absurd elements and because of this, his plays started in a funny or comic way and ended up in physical or psychological violence. Menace is hidden behind the front door and it can dress up in different forms and ways. One such technique Pinter used to create panic and terror was absence of concrete physical violence on stage, but characters and the audience perceived it was in the air, in the circumstances and in everything surrounding them.

### Conclusion:-

So in Conclusion we could say that the master of the absurd and ambiguity had a very unique style, full of ambiguity and uncertainty which made his work impenetrable for a period of time and even nowadays. It will always be like this if human communication fails and people do not communicate, they eventually will just listen but they will never hear what the others have to say. We often communicate through a different means of communication and this is Silence. It seems a paradox but, it may be true because we say more when we say nothing at all. We reflect and meditate better if in pause, otherwise it will result a useless process. The master of pauses and silences helped us view the world from a different perspective through his plays.

#### **Abstract**

Injury to the peripheral nerves results in chronic neuropathic pain that its mechanism is not well understood. Associated with neuropathic pain is allodynia, painful sensation to non-painful stimuli. Since the mechanism is not fully understood, there is yet no effective treatment for allodynia. The aim of this study is to monitor the time course of tactile allodynia after induced injury to the sciatic nerve. To achieve this aim, 4 Lewis rats were used. Baseline measurements were taken one day before performing chronic constrictive injury (CCI) model of neuropathic pain. Comparing with the contralateral paw, on the first day after CCI, the paw withdrawal threshold of the ipsilateral paw started to decrease, but did not reach the level of significance. The sixth day though, paw withdrawal threshold in ipsilateral was significantly different. Thus, successfully establishing allodynia. On the fifteenth day, measurements of paw withdrawal threshold increased, showing tendency to recovery from CCI. These changes may be related to different immune reactions to nerve injury. Knowing the role of different immune cells and relating them to the time course of allodynia development may give us an idea about the mechanism, and thus, an effective treatment.

#### **Introduction:-**

Pain is an undesirable sensation to intense stimuli. Depending on the intensity and duration of pain, it can be classified as either acute or chronic. There are many types of pain; each type is a clue of an underlying condition. Nociceptive pain is a type of protective pain to either external stimuli such as needle prick, or internal stimuli such as angina pain. Nociceptive pain stops whenever the noxious stimuli are handled and removed (1). Inflammatory pain which is the result of a tissue injury. In the inflamed area, sensations are exaggerated and prolonged to prevent further damage and to complete the healing process (1;2). Neuropathic pain results from nervous system damage. It is divided into two categories based on the location of injury: Central neuropathic pain, which can result from strokes or spinal cord injuries (3). The second type is peripheral nervous system injury, which we will focus on in our study.

The peripheral nervous system responds to injury in two ways: axonal degeneration or segmental demyelination. Either ways, if the injury is too proximal and the cell body is to be affected, it will result in neuropathic pain. Injury to the peripheral nerves is usually associated with allodynia, which is pain produced by non-painful stimuli.

Studies of neuropathic pain are done more often on animal models, which experience different types of allodynia, which is feeling pain from non-painful stimuli, or hyperalgesia, increase sensitivity to painful stimuli. There are many mechanical injuries to the peripheral nerves that can induce allodynia: Chronic Constriction Injury (CCI) when applied on a rat model resulted in cold and mechanical allodynia (4). Partial Sciatic nerve Ligation (PSL) also induced mechanical allodynia (5). A study on the sciatic nerve was to observe a steady state of allodynia and hyperalgesia after transecting different combinations of the three branches of the nerve. Large levels of mechanical allodynia resulted after transection of tibial and sural nerves (6).

Mechanisms of neuropathic pain are still not fully understood despite the research that has been done. In this study, changes in allodynia after nerve injury at different time points will be investigated, which will add to the general understanding of the concept of neuropathic pain.

## Methods:-

### Animals and surgery:-

Male Lewis rats (Charles River, UK) at 11-13 weeks of age were used. All experimental animals were housed in standard plastic cages designed to allow easy access to food and water ad libitum. All animals were kept in appropriate room temperature ( $24\pm 1^\circ\text{C}$ ). All experiments complied with King Faisal University and international ethical guidelines for conduct of research on animals. Also, efforts were made to minimize the numbers of animals and their suffering. The CCI of the sciatic nerve was performed on rats anesthetized using isoflurane. During the surgical procedure, the sciatic nerve was exposed at the level of the middle of the thigh and freed of adhering tissue. Four ligatures (4.0 chromic gut) were tied loosely around the nerve such that its diameter was slightly constricted with about 1 mm spacing. After this, the incision was closed in layers by suturing of the muscle tissue and by metal clips on the skin. The surgery was performed under aseptic conditions.

### Allodynia measurement:-

Paw withdrawal threshold (PWT) allows us to assess tactile allodynia by using automated von Fray-type system, which is the mechanical planter test apparatus (Ugo Basile, Milan, Italy). Before testing the rats, they are given a week to habituation to the settings. The tests are held at mornings, and the environment is kept under control. Baseline standard measurements of PWT were taken on day -1, which is a day before the procedure, 10 min were allowed for rats to acclimate to the surroundings. 15 min to habituate over a mesh floor while placed in Perspex enclosure (Ugo Basile). Then, a metal filament is forced against the rats' planters that goes from 0 g to 50 g over 15 seconds. The paw withdrawal threshold can then be recorded by observing paw reflexes. The test is done three times with 2 minutes interval between each test stimulus. This is to avoid causing hypersensitivity in the rats' planters.

### Experimental design:-

4 rats were used to study tactile allodynia changes at different time points. At first, before testing the rats, they were given a week of habituation to the surrounded settings. Next, the baseline measurements were taken on day (-1), the day before the surgery. Then, the CCI of the sciatic nerve was performed on day (0). After that, on the days post CCI (1), (6), and (15) the measurements were taken on the ipsilateral and contralateral paws of each rat. See **figure (1)**.

**Figure 1:-** Days of behavioral testing and CCI surgery.

## Results:-

### General behavior of animals after CCI:-

In general, animals were looking well, drinking, eating, exploring and showing normal level of activities. After CCI, there were no reported illnesses or abnormalities in animals except that they were avoiding using the injured paw when stepping or putting their full weight on it. They were depending more on the non-injured paw when standing and walking.

### Time course of allodynia:-

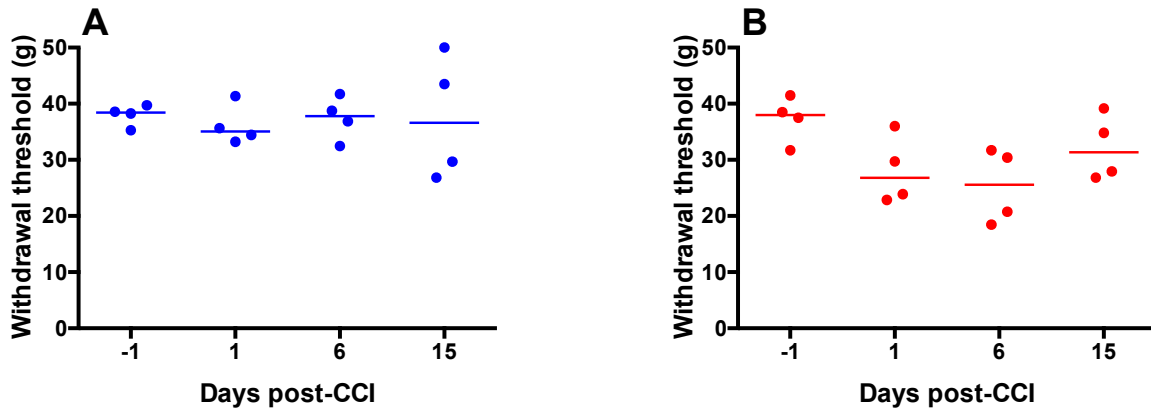

**Figure 2** represents changes in paw withdrawal threshold measurement (g) at different time points by comparing the median of the paw withdrawal threshold for the contralateral and ipsilateral paw. On day -1, which is the day for baseline measurements, there was no significant difference between the median of paw withdrawal threshold of the ipsilateral and the contralateral paw. Early after CCI on day 1, the median of the paw withdrawal threshold for the ipsilateral paw started to decrease, which indicates that the animals started to develop allodynia. On day 6 post-CCI, there was a significant decrease in the median of the ipsilateral paw withdrawal threshold compared to that of the contralateral paw ( $p < 0.05$ ). Indicating that allodynia was established in the injured paw. On day 15 post-CCI, the median paw withdrawal threshold in the ipsilateral paw showed a tendency to recovery from allodynia, as the median ipsilateral paw withdrawal threshold increased and had no statistically significant difference from that of the contralateral paw.

**Figure 2:-** Changes in paw withdrawal threshold measurements (g) at different time points. The blue line (● Contra) refers to the contralateral paw. The red line (● Ipsi) refers to the ipsilateral paw. The star (\*) indicates a significant difference ( $p < 0.05$ ) between the medians of the contralateral and the ipsilateral paw withdrawal threshold. Data are presented as medians and interquartile range.

### Variability of allodynia measurements:-

**Figure 3** shows that there is a behavioral variation between the animals' paw withdrawal thresholds (g) on different time points at both the contralateral and ipsilateral paws. This could be the result of genetic variation between the animals or due to technical difficulties.

**Figure 3:-** Behavioral variability of animals in paw withdrawal thresholds at different time points. Graph (A) shows the behavioral variation between the animals in the contralateral paw. Graph (B) shows the behavioral variation between the animals in the ipsilateral paw.

### Discussion:-

Looking at the time course progression of allodynia after nerve injury may add to the understanding of the underlying mechanism of neuropathic pain. After exposing the rats, in the current study, to the chronic constriction injury (CCI) of the sciatic nerve, their paw withdrawal threshold to tactile stimuli has been measured. Compared to their contralateral side, their ipsilateral paw established allodynia with a significant difference 6 days after the procedure. Behavioral variations have been taken into consideration, and continuous assessment showed that on day 15, the ipsilateral paw showed tendency to recovery where there was no significant difference with the contralateral paw.

Contribution of immune cells in nerve injury might have a direct effect on exaggerating neuropathic pain in the periphery (7). A study on partial nerve ligation (PNL) model had shown that at the site of injury, resident mast cells are the first respondent. Degranulation of mast cells due to activation releases proinflammatory mediators such as Histamine (8-10). These proinflammatory mediators have an algogenic effect on the site of damaged nerves (7). It was seen that giving histamine receptor antagonists to neuropathic rats suppresses mechanical allodynia, which means there is a direct connection between mast cells degranulation and allodynia (9). Thus, the mast cells may have contributed to the presence of allodynia in the first few days after the CCI (7).

During the early stages of neuropathic pain, neutrophils are recruited by mast cells to the injury area (11). In CCI model, it was observed that there was significant infiltration of neutrophils in the ipsilateral side of the rat. But there was no noticeable infiltration in the contralateral side (12). The contribution of neutrophils in neuropathic pain is that they are responsible for the release of proinflammatory mediators, such as chemokines that attract macrophages (13;14).

The phagocytic cells, macrophages, have a role in making neuropathic pain a chronic condition. Whenever there is an injury to the nerve, the blood-nerve barrier will allow circulating macrophages to join the resident macrophages in the nerve itself; this takes 2-3 days after injury (15). The hematogenously derived macrophages outnumber the resident macrophages and start releasing pronociceptive mediators (7;16). Along with the phagocytic function, this can explain the significant changes of allodynia on day 6. A study was done to test this concept by attenuating macrophages recruitment to the injured nerve. The result was reduction in neuropathic pain behaviors and delayed Wallerian degeneration of the nerve (17;18).

Resident mast cells and the recruited neutrophils and macrophages are not the only immune cells that were found in nerve injury area; T cells of both types were found in some nerve injury models (19). After CCI on athymic nude rats, which have no T cells, mechanical allodynia was attenuated, which points to the role of T cells in the establishment of allodynia (20). According to the cytokines produced by T cells, they can be divided into T helper type 1 and type 2. In which, type 1 produce proinflammatory cytokines, and type 2 produce anti-inflammatory cytokines (7). Further investigations on the nude rats revealed that after transferring type 1 helper T cells, their

levels of pain have increased. However, transferring type 2 cells gave an opposite result, it decreased their pain sensitivity (20). Thus, T helper Type 2 cells might have contributed to the tendency to recovery on day 15.

Cytokines are important factors affecting neuropathic pain. Cytokines can be produced by the different immune cells, or one induces the production of others (7). Macrophages secrete many proinflammatory factors; one is IL-1 $\beta$  (21). The effect of IL-1 $\beta$  had been tested in the periphery by different administration routes. It resulted in prolonged allodynia and hyperalgesia (22-25). When IL-1 $\beta$  binds to its receptors, it initiates several mechanisms resulting in inflammatory and nociceptor gene transcription (26;27). In CCI model, there is an up regulation in IL-1 $\beta$  mRNA (28;29). A study found that neutralizing antibodies to IL-1 $\beta$  receptor, IL-1 Type 1 receptor, caused reduction in associated pain behaviors in neuropathic rats (30;31). IL-1 $\beta$  has been considered as an algogenic agent that has a role in neuropathic pain (7).

In several neuropathic pain models, TNF- $\alpha$  mRNA are increased (32) along with increased protein expression (33;34), and enhanced expression of TNF- $\alpha$  receptors 1 and 2 after CCI (35) have been associated with development of allodynia.

Another cytokine, which is found to have a contribution in neuropathic pain mechanisms after CCI, is the proinflammatory cytokine IL-6 (19). It was seen that IL-6 knockout mice, genetically engineered mice that lack IL-6, had an attenuated mechanical allodynia after CCI (36). Thus, there is a link between existence of IL-6 in injury site and mechanical allodynia (19).

Paw withdrawal thresholds were not the same in all rats that were tested. There was variability even when the rats were in the same circumstances. Such variance might be due to gene polymorphisms resulting in variation in pain sensitivity. Technical factors play an important role in this matter too. When placing the ligature around the sciatic nerve, we can never tie exactly in all rats. Thus, the amount of damage created is never the same.

### **Conclusion:-**

Neuropathic pain is not the result of change in one cell; it is the interactions between immune cells and their proinflammatory secretions. Understanding the different actions of each, contribute to the general understanding of neuropathic pain. After analyzing the results, there was a significant difference in paw withdrawal threshold between ipsilateral and contralateral sides on the sixth day. Macrophages and Helper T cells Type 1 might be the cells contributing to this difference. Different cytokines secreted at the site of injury may have had a direct effect on the time-course of allodynia.

Enzyme activity, Land use type, Number of isolates, Soil quality

#### Abstract

Variability in land use have substantial influence on biological properties of soil that persistently associates with soil quality, evaluated by microbial and biochemical indicators in soil. Kerala, located in the southwestern tip of India, geographically divided into eastern highland, central midland and western lowland. The natural classification of Kerala's landmass is an excellent illustration for describing land use types and environmental changes. This study scrutinizes the comparative activities of exo- $\beta$ -1,4-glucanase, endo- $\beta$ -1,3-glucanase and protease in *Streptomyces spp.* from different highland, midland and lowland areas of Kerala. Soils collected from 7 different locations of each land area were analyzed for estimating enzyme activity by semi-quantitative and quantitative approaches. A significant fluctuation in exo- $\beta$ -1,4-glucanase activity was observed in three land use systems, showed high activity in highland areas where natural vegetation occurs and significantly decreased to lowland regions, mostly arable areas. Number of *Streptomyces* isolates also revealed a decreasing trend from highland to lowland areas. pH, electrical conductivity (EC), soil organic carbon (SOC) and soil organic matter (SOM) were showed a significant correlation with the number of *Streptomyces* isolates. The variation of exo- $\beta$ -1,4-glucanase activity from highland to lowland suggested the sensitivity of the enzyme as an ecological and a soil quality indicator, hence it can be used as a conspicuous indicator of environmental changes.

#### Introduction:-

Soil microbial biomass and their enzyme activities in soil are very sensitive to environmental stresses and changes in soil management practices. The exposure of soil to degradation primarily affected its biological properties and diminishes the productive capacities. Enzyme activities in soils are the useful contenders, which provides information about soil ecological stress linking soil degradation (Yang et al., 2012). Rigorous anthropogenic activities, primarily land changes, from forest to intensive agriculture, causing severe consequence on soil quality and drastic health problems in plants (Matson et al., 1997). Microbial enzymes that mediate the biogeochemical

cycles, in addition, promptly responds to environmental signals considered as sensitive indicators of environmental variations and soil qualities (Schloter et al., 2003). In addition, it can also be used as active measures of soil productivity and effect of pollutants (Tate, 1995). In recent years, there have been a growing interest in the exploration of microbial diversity as a tool for indicating environmental and ecosystem changes.

Conversion of natural ecosystem to arable land masses by human interventions intensify the use chemical fertilizers and pesticides (Matson et al., 1997). It extremely affect soil biota, by changing their population and biochemical activities. Moreover, soil mineralization is accomplished by the metabolic and enzyme activities of soil microorganisms. The soil enzyme activities are sensitive to soil biochemical characters like pH, temperature, electrical conductivity, soil water potential etc. Considering the environmental significance of exo- $\beta$ -1,4-glucanase, endo- $\beta$ -1,3-glucanase and protease, these three were incorporated in the scenario. Exo- $\beta$ -1,4-glucanase and endo- $\beta$ -1,3-glucanase are cellulosome complex enzymes (Zhang and Zhang 2013). The activities of  $\beta$ -glucanases and protease in soil are regulated by many factors like climate, organic matters and soil properties. The modulation of these enzyme activities in different ecosystems by the input of pollutants and the impact of climate change, requires investigation (Sinegani and Mahohi, 2010; Vranova et al., 2013).

*Streptomyces* communities are the most fascinating members in the world of microbial diversity. They are most cherished organisms with great research interest due to high pharmacological and commercial concern. They are filamentous Gram positive soil bacteria, contribute significantly to the turnover of complex biopolymers such as lignocellulose, hemicellulose, pectin, keratin, and chitin. Subsequently there is vital evidence accessible due to the introduction of genome and protein sequencing data, *Streptomyces spp.* has been continuously screened for the production of various enzymes (Sharma, 2014). They are also serving as good models for the production of vital metabolites and enzymes with respect to stress response. Many evidences indicated that *Streptomyces spp.* have been isolated from diverse habitats like deserts (Hozzein et al., 2008), marine (Valli et al., 2012), protected forest areas (Thakur et al., 2007) etc. Very less information is available regarding variation of *Streptomyces* isolates between different geological land areas.

Kerala is located at the south- western corner of Peninsular India, between  $8^{\circ}17'30''$  N and  $12^{\circ}47'40''$  N north latitudes and  $74^{\circ}27'47''$  E and  $77^{\circ}37'12''$  E east longitudes. The geographical landscape of Kerala exhibits high variability in distribution of the landmass. Based on the physical features of Kerala, its total landmass naturally categorized into three geographical zones namely high land, mid land and low land. These regions run parallel to each other from northern end to southern end of the state. Highlands are the mountain ranges located in the eastern ends mainly sloping down from the Western Ghats. Lowlands are the unique agricultural areas in Kerala that cover coastal areas, back waters, lagoons and river deltas. Major parts of low land areas lies below the sea level. Midland is located between highland and lowland, characterized by undulating hills and valleys. This study scrutinizes the enzyme activity profiling of exo- $\beta$ -1,4-glucanase, endo- $\beta$ -1,3-glucanase and protease in *Streptomyces spp.* in different highland, midland and lowland areas.

## Materials and Methods:-

### Site description and soil sampling:-

The investigated sample sites were widely distributed in three geographical zones of Kerala, namely highland, midland and lowland areas (Figure 1). Seven different locations were selected from each land areas. Highland soil samplings were done in Western Ghats areas like Chinnar, Munnar, Marayur, Anaimalai, Nelliampathy, Agasthyakoodam and Wayanad. Midland areas were Bonacaud, Palode, Kallar, Neryamangalam, Kothamangalam, Ottapalam and Thaliparamba. Lowland areas represented primarily paddy fields from different locations namely Kainakkari, Puthupalli, Mankombu, Changanasseri, Nedungad, Mavelikkara and Thiruvalla. The location, elevation, land use type etc were provided in Table 1. In each location, three sampling points were randomly apportioned at a distance of 30 m and upper organic layer of soil approximately 5 to 10 centimeters of depth were aseptically taken by an auger.

### Enrichment, isolation and purification of *Streptomyces*:-

Soil samples were mixed with 1%  $\text{CaCl}_2$  and incubated at  $28^{\circ}\text{C}$  for 10 days before use for enrichment. Standard dilution plate technique was followed for the isolation of Actinomycetes. For each sample, one gram soil was oven dried and suspended in 9mL sterile distilled water and thoroughly vortexed for 30 min at 150 rpm at room temperature. The suspension was serially diluted to obtain  $10^{-1}$  to  $10^{-6}$  dilutions. 1.0 mL of  $10^{-3}$  to  $10^{-6}$  dilutions were plated on Inorganic salt-starch agar (ISP-4) media (Starch,10g;  $\text{K}_2\text{HPO}_4$ ,1g;  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ ,1g;  $\text{NaCl}$ ,1g;

(NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 2g; CaCO<sub>3</sub>, 2g and Trace salt solution, 1ml). After incubation of 7 days at 28<sup>o</sup>C *Streptomyces* like isolates were selected randomly based on their morphology. Number of total *Streptomyces* colonies were evaluated and transferred to Yeast extract- malt extract agar (ISP-2) plates (Yeast extract, 2g; Malt extract, 10g and Dextrose, 10g) to check the purity and maintained by periodical sub culturing.

#### Semi-quantitative screening of Enzyme Activities:-

The *Streptomyces* strains were initially screened for detecting exo -β-1,4-glucanase activity on synthetic medium containing Avicel (Sigma, USA) as the sole carbon source. The composition of medium was as follows: Avicel, 1%; yeast extract, 0.1%; Peptone, 0.1%; KH<sub>2</sub>PO<sub>4</sub>, 0.1% and MgSO<sub>4</sub>.7H<sub>2</sub>O, 0.05%. The strains were spot inoculated on Avicel agar plates and incubated for 5 days at 28<sup>o</sup>C. After incubation 0.1% congo red dye was spreaded over the plates and washed with 1 mol.L<sup>-1</sup> NaCl, used as a destaining solution. Exo-β-1,4-glucanase production was indicated by the presence of a pale halo around the colonies. A semi quantitative approach was used for measuring the enzyme activity that is the enzymatic index (EI) of strains were calculated using the expression.

$$EI = \frac{\text{Diameter of hydrolysis zone } (\varnothing h)}{\text{Diameter of colony } (\varnothing c)}$$

The endo-β-1,3-glucanase activity was screened using AZCL- Pachyman (Megazyme, USA) agar plates with medium composition of AZCL- Pachyman, 0.2%; Yeast extract, 0.1%; Peptone, 0.1%; KH<sub>2</sub>PO<sub>4</sub>, 0.1% and MgSO<sub>4</sub>.7H<sub>2</sub>O, 0.05% by spot inoculation and incubated 5 days at 28<sup>o</sup>C. Presence of blue zones around the colonies were indicated as enzyme activity by potential strains. The EI values were calculated by measuring diameters of blue halo and colony.

Protease production of *Streptomyces* isolates were screened on skimmed milk agar containing Casein enzyme hydrolysate, 5%; Yeast extract, 2.5 and Glucose, 1%. The plates were spot inoculated and incubated at room temperature for 5 days at 28<sup>o</sup>C. Positive isolates were detected by the appearance of clear halos around the colonies. The enzymatic index (EI) of strains were calculated.

#### Quantitative Enzyme Assays:-

The exo-β-1,4-glucanase assay was carried out by measuring reducing sugars by DNS method (Miller, 1959) liberated from 0.5% (w/v) Avicel which is dissolved in 100mM sodium- acetate buffer (pH 5.0) was used as substrate. 0.5 ml of filtrate was added to 1 ml of 0.5% Avicel and incubated at 30<sup>o</sup>C for 1hr in shaker incubator. 2 ml of DNS reagent was added and incubated in boiling water bath for 5 minutes. After adding 0.5 ml 40% Rochelle salt the absorbance was taken at 540 nm wavelength using visible spectrophotometer. One unit of exo-β-1,4-glucanase activity (U mL<sup>-1</sup>) was defined as the amount of enzyme that released 1μmol of reducing sugars as glucose equivalents from one ml of Avicel per minute under given assay conditions (Oliveira et al., 2014).

Endo-β-1,3-glucanase activity was estimated by measuring the release of reducing sugars in a reaction mixture of 0.5ml of enzyme and 1ml 0.2% (w/v) CM- curdlan (Megazyme, USA) in 100mM sodium- acetate buffer (pH 5.0) incubated at 30<sup>o</sup>C for 1hr and the remaining procedures were similar as exo-β-1,4-glucanase assay. Enzyme activity was expressed by 1μmol of reducing sugar released per minute under standard assay conditions.

The protease enzyme activity was determined by a modified method of Rupali (2015). Casein is used as substrate for determination of protease activity. 1% (w/v) of casein in 50mM phosphate buffer (pH 7.0) was used as substrate and incubated with 0.5 ml enzyme solution at 37<sup>o</sup>C for 30 minutes. The reaction was stopped by adding 2 ml of 100 mM trichloroacetic acid. After centrifugation at 7000 rpm for 15 minutes, 0.5 ml supernatant was taken and added 2 ml 0.5 M Na<sub>2</sub>CO<sub>3</sub> and 0.5 ml diluted Folin phenol reagent, then kept it in incubation under dark conditions for 30 minutes. The absorbance was read at 660 nm. One unit of protease activity is defined as the amount of enzyme that liberated 1μmole of tyrosine per ml per minute under standard assay conditions.

#### Determination of Soil pH and Electrical Conductivity:-

Soil pH and electrical conductivity (EC) were determined in 1: 3.0 soil/water ratio by a combination glass electrode HI98129, Hanna Instruments.

**Determination of Soil Organic Carbon and Soil Organic Matter:-**

The soil organic carbon (SOC) content was estimated by dichromate oxidation method in which the oxidation of  $K_2Cr_2O_7$  in a concentrated  $H_2SO_4$  medium and the excess dichromate was measured using  $(NH_4)_2Fe(SO_4)_2$  (Yeomans and Bremner, 1989). Soil organic matter (SOM) were determined according to Pribyl, 2010.

**Statistical analysis:-**

All part of experiments in this study were performed in triplicate. Data were presented as mean  $\pm$  SD. The p values  $<0.05$  were considered statistically significant. To determine the correlations between the parameters linear regression analysis (Pearson method) was performed.

**Results and Discussion:-****Number of *Streptomyces* Isolates:-**

Morphologically different 95 *Streptomyces* strains were isolated from 21 locations of three different land areas viz. highland, midland and low land. The number of strains showed a decreasing trend from highland to lowland (Figure 2). Soils from natural ecosystem were observed higher microbial content when compared to agricultural ecosystems. Highland areas in Kerala mainly Western Ghats regions represents high levels of biological diversity, less unexplored and mostly covers with protected land mass. Due to the lack of anthropogenic activities, number of *Streptomyces* isolates are significantly high in these areas when compared with other two geographical landmasses such as midland and lowland areas. Taxonomically diverse *Streptomyces* species are found in forest soils, they are involved in recalcitrant biopolymer degradation. This leads to the prominence of *Streptomyces* in forest nutrient turnover (Bontemps et al., 2013). According to Zhou et al., 2016, rich plant biomass in paddy field expects high number of hydrolase producing organisms, however gets only very small fraction of isolates from the area. Application of the high level of mineral fertilization along with chemical weed control agents predominantly detriments the biological activity of the soil because of higher loss of micro-organisms due to rigorous chemical plant protection (Bielińska and Pranagal 2007). The number of isolates showing a decreasing trend from highland to midland to lowland. This study, clearly reveals the relation between ecological variations and *Streptomyces* population, hence number of *Streptomyces* isolates can be considered as a delicate indicator of environmental changes.

**Screening of Enzyme Activities:-**

All the 95 isolates were evaluated for semi-quantitative exo- $\beta$ -1,4-glucanase, endo- $\beta$ -1,3-glucanase and protease production. From the total 95 isolates 85 strains were shown exo- $\beta$ -1,4-glucanase activity (equivalent to 89% of the strains evaluated) 60 shown endo- $\beta$ -1,3-glucanase activity (equivalent to 63% of the strains evaluated) and only 61 shown protease activity (equivalent to 64% of the strains evaluated). This is based on the observation of growth and measurement of hydrolysis halo, used for calculation of the enzymatic index (EI). The pale halo around the exo- $\beta$ -1,4-glucanolytic colonies corresponds to the zone of Avicel (specific substrate for exo- $\beta$ -1,4-glucanase) degradation (Figure 3a), blue colouration around endo- $\beta$ -1,3-glucanolytic colonies indicating the zone of Pachyman (specific substrate for endo- $\beta$ -1,3-glucanase) degradation (Figure 3b) and appearance of clear zone around the colonies surrounded by white color background indicated the presence of protease activity, corresponds to the zone of protein degradation (Figure 3c).

Strains from different land areas were given significantly wide ranges of EI. Exo- $\beta$ -1,4-glucanase activity was more prominent in high, mid and lowland isolates. In highland isolates, EI of exo- $\beta$ -1,4-glucanase, endo- $\beta$ -1,3-glucanase and protease were shown in between 2.17 to 6.03, 2.0 to 8.53 and 1.03 to 3.03 respectively (Table 2). Midland isolate EI values were ranged from 1.80 to 7.27, 1.8 to 5.0 and 1.20 to 3.13 for exo- $\beta$ -1,4-glucanase, endo- $\beta$ -1,3-glucanase and protease respectively (Table 3). In lowland soil isolates the EI values of exo- $\beta$ -1,4-glucanase was in between 1.50 to 4.20, endo- $\beta$ -1,3-glucanase in between 2.30 to 3.63 and 1.40 to 3.03 for protease (Table 4).

### Quantitative Enzyme Assays:-

As a result of semi-quantitative primary screening, strains with high EI values were considered as potent enzyme producers and were selected for quantitative enzyme assays. 8 isolates from highland areas and 7 isolates from midland areas, both expressed EI values in and above 4.5 and 5 isolates from low land area with EI values in and above 3.5 were selected for exo- $\beta$ -1,4-glucanase assay. Endo- $\beta$ -1,3-glucanase assay was carried out with highland strains showed EI values in and above 4.5, midland strains with EI values in and above 4.0 and lowland strains with EI values in and above 3.0. Protease quantitative assay was done with selected isolates from highland with EI values in and above 3.0, midland and lowland with EI values in and above 2.0.

The quantitative assay clearly revealed that activity of exo- $\beta$ -1,4-glucanase in highland was ranged between 95 to 76 Units.mL<sup>-1</sup>, in midland between 70 to 58 Units.mL<sup>-1</sup> and in lowland it was in between 48 to 52 Units.mL<sup>-1</sup>. The exo- $\beta$ -1,4-glucanase activity was recorded highest in highland areas and gradually decreased in low land areas (Figure 4a). Here the activity was greatly affected by land use type. Endo- $\beta$ -1,3-glucanase activity were ranged from 136 to 231 Units.mL<sup>-1</sup> and protease activity was from 3 to 14 Units.mL<sup>-1</sup> in all land types. So there was no significant variation in the activities of endo- $\beta$ -1,3-glucanase (Figure 4b) and protease (Figure 4c) in different land areas. The

significant variation of exo- $\beta$ -1,4-glucanase activity from highland to lowland suggest the sensitivity of the enzyme as an ecological and a soil quality indicator, so it can be used as a prominent indicator of environmental changes.

Knowledge in relation with soil enzyme activities provides necessary information relating to soil fertility. Land disturbances can negatively affect soil fertility, may leads to the manual addition of soil fertilizers and weedicides, adversely affect soil microbial population. In other words soil functional diversity in some extent is controlled by microbial enzyme activities (Gonnety et al., 2012). Among the three enzyme activities explored, exo- $\beta$ -1,4-glucanase expressed great variation in their activities in three different geographical land areas. It displayed highest levels of activities in high land areas and the lowest activity was observed in lowland areas. Midland areas showed an activity in between highland and lowland. When considering Kerala's geographical land masses, the anthropogenic activities are increasing from highland to lowland. In this study, exo- $\beta$ -1,4-glucanase activity decreased with increasing anthropogenic activities. This trend was not observed in endo- $\beta$ -1,3-glucanase and protease. In the light of these observations we can consider exo- $\beta$ -1,4-glucanase as a best sensitive indicator for environmental changes. According to Gao et al., 2010, depending on the type of land use, land management and type of enzyme, the absolute enzyme activities may vary in different land areas. Activity of soil enzymes is more related to physical and chemical properties, geology and land uses of soil. Improper land management is obvious in majority of agricultural systems, by the rotating cultivation of crops. Soil quality degradations due to frequent land use changes decline soil microbial biomass and enzyme activities in arable soils compared with natural vegetation (Mganga et al., 2015). Kerala's natural geographical land classification is a best example for changes in environment and land use types. Highland areas are mostly covered with natural vegetation. A combination of natural and agricultural land areas are seen in midlands. But almost all part of lowland areas are arable lands. In this study, the results evidently validates that the sharp declining of number of *Streptomyces* strains and activity of exo- $\beta$ -1,4-glucanase enzyme by changing the environment from natural vegetation to arable lands.

#### **Soil pH and Electrical Conductivity (EC):-**

p<sup>H</sup> and EC are the most significant parameters for measuring soil quality. Soil samples collected from three land areas were showed slight variations in pH. Soils under natural vegetation was characterized with high pH that means they are low acidic soils when compared with agricultural vegetation. pH values significantly decreased from higher to lower land regions. pH in highland areas ranged from 7.2 to 6 and in midland areas it was in 6.1 to 5.0. The highest acidity was noted in lowland regions, where the soils collected from paddy fields ranged from 3.7 to 4.8. This may be due to the application of herbicides and heavy fertilization of soils over the years for agricultural practices. A significant positive correlation ( $r^2 = 0.724$ ) was shown between soil pH values and number of *Streptomyces* strains (Figure 5a). Along with number of *Streptomyces* isolates pH values also showed a decreasing trend from highland to low land. Significantly very low pH was detected in lowland areas. Decrease in pH was another strong reason for lowering microbial content and soil enzymatic activity. An increase in the concentration of hydrogen ions in soil has a negative effect on its enzymatic activity (Acosta-Martinez and Tabatabai, 2000).

Highest EC was recorded in lowland soils, ranged in between 679 to 885  $\mu\text{s cm}^{-1}$ . In midland and highland it was detected at a range of 447 to 635  $\mu\text{s cm}^{-1}$  and 107 to 352  $\mu\text{s cm}^{-1}$ . It gradually decreased from lowland to high land. Number of microbial isolates and activity may be affected by EC. A highly significant negative correlation ( $r^2 = 0.908$ ) was shown in between number of *Streptomyces* isolates and soil EC values (Figure 5b). EC values indicate large accumulation of soluble salts in soils. Negative significant relationship between EC and number of isolates validates that increasing salinity and sodicity tremendously affect the soil *Streptomyces* community. With increasing salinity microorganisms tend to dehydrate, diminishes microbial growth and activity. Microbial biomass and enzyme activity decreased exponentially with increase in EC (Rietz and Haynes, 2003).

#### **Soil organic carbon and soil organic matter:-**

SOC and SOM percentage was increased with decreasing altitudes. Highest SOC and SOM percentage was reported in lowland areas, unfortunately the area with very less estimated number of *Streptomyces* isolates (Figure 6). SOC and SOM showed an increasing trend from high land to low land areas, whereas a decreasing trend was obtained in case of number of strains. 3.5 fold increase in SOC and SOM percentage were detected in lowland areas and 2 fold increase in lowland areas when compared with highlands. It may be expected that due to the loss of microbial load in agricultural lands by improper soil management practices reduces the rate of carbon mineralization (Chander et al., 1998).

**Conclusion:-**

The study was conducted to observe how *Streptomyces* isolates and their enzyme activities fluctuate between the natural geographical land areas in Kerala, highland, midland and lowland. According to this study, large number of *Streptomyces* strains were isolated from highland areas, the inhabitant of natural forest, compared to other land areas. pH and EC were highly correlated with the obtaining results, that point out to soil quality. Cumulative anthropogenic activities such as change in land uses especially from forest to rigorous agriculture for sustaining livelihood cause severe consequence on soil quality. Among the three enzymes we have selected for this study, the enzyme exo-  $\beta$ - 1,4- glucanase from paddy field isolates showed declining activity than high land and midland isolates. So we can use this enzyme as a most sensitive indicator of environmental changes. Soil *Streptomyces* biomass and enzyme activities are very sensitive to change in environment and are crucial for maintaining soil quality. In conclusion, unsuitable land use and depletion of nutrients due to the extensive practice of agricultural chemicals influenced soil enzyme activities and microbial dynamics and demonstrated poor soil quality.

##### Key words:-

Yellow phosphorous arrhythmias,  
myocardial infarction, hepatic failure.

#### Abstract

Yellow phosphorus is an inorganic substance used in fire crackers, fertilizers, and as rodenticide. It has very strong garlicky odor and the toxic dose ranges from 15-100 mg. Therefore, in a 70 kg adult the dose would be approximately 0.2-1.4 mg/kg<sup>[1]</sup>. The fatality rate has previously been reported to be between 10-50%<sup>[2]</sup>. The present study report a case of acute yellow phosphorous due to intentional ingestion causing fulminant hepatic failure with cardiovascular involvement of atrial fibrillation and acute inferolateral myocardial infarction. Thereafter, we evaluate the challenges in appropriate management of the case.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Elemental phosphorus exists in two forms—red and yellow. Red phosphorus is nonvolatile and unabsorbable, and therefore nontoxic when ingested. Yellow phosphorus (also referred to as white phosphorus), the most readily available source is rodenticide as powders containing 2 to 5% of compound.<sup>(3)</sup>

Yellow phosphorous is a severe local and systemic toxin causing damage to gastrointestinal, hepatic, cardiovascular, and renal systems. Acute cardiovascular collapse accounted for majority of the deaths. We describe here a case of acute yellow phosphorus poisoning that led to fulminant hepatic failure and developed acute myocardial infarction with atrial fibrillation.

The heart is one of many organs affected by phosphorus, and several electrocardiographic abnormalities have been reported<sup>(4,5)</sup>. However, changes diagnostic of or consistent with myocardial infarction have not been described in previous studies. In the present study we treated a patient with acute yellow phosphorus poisoning whose electrocardiogram disclosed changes interpreted as evidence of acute infarction of the infero-lateral wall of the left ventricle. Eventually, the patient recovered with conservative management with resolution of the abnormal electrocardiographic pattern within few weeks.

#### Case Report:-

A 60-year-old man was brought to the hospital with an alleged history of consumption with suicidal intent of an unknown quantity of rodenticide paste (Ratol, containing 3% yellow phosphorus). He was taken to the local hospital minutes after ingestion and gastric lavage was done. After 2 days he was brought to the emergency due to persistent

vomiting and jaundice. There was no history of lethargy, altered sensorium, or convulsions. There was no history of abdominal pain, breathlessness, or oliguria.

On admission, the patient was conscious, known diabetic since 2 months and afebrile with blood pressure as 100/60 mm Hg and vitals being stable. Mild pallor and icterus was present, but no edema was seen. The liver was palpable 2 cm below the costal margin, soft, and with rounded margins. Other systems were essentially normal.

Results of the investigations done on the day of admission and subsequently are shown in Table 1. Blood smear for malarial parasites and viral markers were negative. Chest X-ray done was normal and abdominal sonography showed mild hepatomegaly.

On the second day of hospital stay, he was noticed to be lethargic and drowsy. A diagnosis of West Haven classification of Grade 2 hepatic encephalopathy was made and the patient was given intravenous (IV) fluids with 10% dextrose, IV cefotaxime, vitamin K and pantocid. He was also started on oral lactulose. Intake and output was strictly monitored and blood glucose was measured six-hourly.

Despite initiation of antihepatic failure therapy, he progressed to coagulopathy on day 2 of admission with prolonged PT and aPTT and was administered 4 units of fresh frozen plasma.

**Figure 1:- ECG Changes Of Acute Inferolateral MI.**

On day 5 of admission he developed chest pain and ECG findings were suggestive of atrial fibrillation with fast ventricular rate along with ST-T CHANGES and broad QRS complex with troponin T positive pointing to acute inferolateral myocardial infarction. Echocardiographic findings included RWMA of basal inferior and lateral wall mildly hypokinetic with fair LV systolic function with EF 45%. He was stabilized with initial doses of anti platelets, statins and sorbitrate with anti arrhythmic and other supportive measures.

**Figure 2:-ECG After 24hrs Resolution Of MI**

Over 24hrs ECG changes were monitored from evolving phase to resolution phase. He was treated after a plateau period of 10 days, the sensorium started improving, with a simultaneous improvement in his laboratory parameters [Table 2]. Thereafter, he made a partial recovery and was stabilized and discharged after few weeks.

### Discussion:-

Yellow phosphorus is an inorganic substance that can get absorbed through skin, mucus membrane, respiratory and gastrointestinal epithelium. After absorption, the peak level is reached after 2 to 3 hours of toxic oral ingestion. Bile salts are important for absorption of phosphorus. Because of water content and low oxygen tension, phosphorus remains stable in gut for longer period.<sup>(3)</sup>

Fernandez and Cannarez, in their series of 15 patients have reported a mortality of 27% which confirms that yellow phosphorous is extremely lethal when ingested<sup>(6)</sup>. Phosphorus is a general protoplasmic poison causing cardiac, hepatic, renal, and multi-organ failure. The patient with yellow phosphorus intoxication passes through three stages. The first stage occurs during the first 24 hours in which patient is either asymptomatic or has symptoms of local

gastrointestinal irritation. The second stage occurs between 24 to 72 hours after ingestion. It is an asymptomatic period where there may be mild elevation of liver enzymes and bilirubin in this stage. The third stage (advanced) occurs after 72 hours until the resolution of symptoms or death.[1]This stage is characterized by multi-organ failure<sup>(3,7)</sup>. Our patient presented to us in stage 3 of intoxication with encephalopathy, acute liver failure, and coagulopathy.

Patients may present with acute hepatic failure, coagulopathy, and deranged liver function, as was witnessed in our patient. Central nervous system effects include changes in mental status like confusion, psychosis, hallucinations, and coma. Some patients may develop acute tubular necrosis and present with acute renal failure.<sup>(8)</sup>

Cardiac toxicity includes hypotension, tachycardia, arrhythmias, and cardiogenic shock<sup>(9)</sup>. Alteration in ECG such as inverted T waves, changes in QRS complex, tachycardia, arrhythmias and decreased ventricular contractility has been reported<sup>(8)</sup>. In a cross sectional study where 85 patients were studied, dysrhythmias were noted in only two patients, another four showed tachy-bradycardia<sup>(10)</sup>. Damage to myocardium reported in studies included fatty infiltration of the muscle, markedly dilated heart chambers, and necrosis of myocardium<sup>(8)</sup>. Pathological changes in heart were also reported by Tally et al.<sup>(9)</sup>. In our case, the hepatic and cardiac dysfunction was self-limiting and recovered with supportive therapy.

Our patient manifested with arrhythmias and myocardial infarction as a consequence of cardiac toxicity. His cardiac involvement started after 7 days of consumption, thus emphasizing the importance of anticipating this complication as a delayed manifestation. This presentation can complicate the preexistent multi-organ failure.

There is no specific antidote for yellow phosphorus. Treatment is directed at removal of the poison with gastric lavage and supportive therapy. Careful monitoring of hepatic, cardiac and renal function and management of their failure is required.<sup>(11)</sup>

Mortality rates were 23% for patients who had early symptoms of vomiting or abdominal pain; 73% for those where the first manifestation of intoxication was restlessness, irritability, drowsiness, stupor, or coma; and 47% for patients who had a combination of these GI and CNS symptoms initially.<sup>(12)</sup>

### **Conclusion:-**

Our case report highlights the possibility of late onset persistent cardiac dysfunction as a sequelae with yellow phosphorous poisoning necessitating a high index of suspicion for the same. The indiscriminate use of yellow phosphorus in the manufacture should be eliminated. Physicians should therefore be aware of the toxicity and its management.

### **Limitations:-**

Patients with diabetes are at high risk for developing cardiovascular disease and associated morbidity and mortality, and this risk increases dramatically with age. In the present study, we are uncertain, if the Acute MI is a manifestation of either the toxicity or a age related event precipitated with the associated stress.

#### **Abstract**

Metastasis to epitrochlear lymph node from primary invasive breast malignancy is extremely rare and to the best of our knowledge, only one case has been reported in literature till date.

Here we report a case of invasive ductal carcinoma of breast in a premenopausal female who developed metastasis to ipsilateral epitrochlear lymph node almost two and a half years post treatment of the primary tumour.

*Copy Right, IJAR, 2017,. All rights reserved.*

#### **Introduction:-**

Metastatic breast cancer (also known as stage IV or advanced breast cancer) is the cancer that has spread beyond the breast to other organs of the body. The five leading sites of metastatic involvement at autopsy are lung, bone, lymph nodes, liver, and pleura<sup>3</sup>. A few cases of unusual metastasis to urinary bladder, retroperitoneum, gall bladder, colon, rectum have been reported before.<sup>5,6,7</sup> Here we report a post-treated case of breast cancer with metastasis to epitrochlear node, which is an extremely rare site of metastasis. The time interval between treatment of primary tumour and development of metastasis being about two and a half years. The case being presented here, happens to be the second case report of its kind as per literature.

#### **Case Report:-**

A 47 years old premenopausal female presented to our out-patient department in February 2014, with the complaint of painless right breast lump of two months duration. She was a known diabetic and hypertensive and on regular oral medication. On examination, general condition of the patient was good. A 4x4 cm lump was palpable in the upper outer quadrant of right breast which was non tender, mobile, firm to hard in consistency. Overlying skin and nipple areola complex was normal. There was no palpable lymph node in right axilla and supraclavicular fossa. Contralateral breast, axilla and supraclavicular fossa was unremarkable. Fine needle aspiration cytology of right breast lump (done outside) was suggestive of ductal carcinoma in situ. Core needle biopsy of the same revealed invasive ductal carcinoma grade II; ER/PR/Her2neu negative. Metastatic work up showed no evidence of metastasis (cT2N0M0). In view of early stage of the disease (stage IIA), upfront modified radical mastectomy was done in April 2014. Post operative histopathology was suggestive of invasive ductal carcinoma grade II; tumour size 3.5x3x3 cm; lymphovascular and perineural invasion negative; lymph nodes 20/20 negative (pT2N0M0). The patient further received six cycles of adjuvant chemotherapy (Cyclophosphamide, Adriamycin, 5 Fluorouracil regimen). She tolerated the treatment well and was kept on regular follow up. However, the patient defaulted.

**Corresponding Author:- Vinita Trivedi.**

Address:- Department of Radiation Oncology, Mahavir Cancer Sansthan.

In August 2016, patient presented to us again with complaint of painful swelling over the medial aspect of her right elbow of 3 months duration. As per patient, the swelling was rapidly progressive in size. On examination, general condition of the patient was well preserved. Primary disease was locoregionally controlled. Contralateral breast, axilla and supraclavicular fossa was normal. Diffused swelling measuring approximately 10x8 cm was palpable over medial aspect of right elbow which was tender and inflamed, firm to hard in consistency, fixed to underlying structures. X ray (right elbow) showed a lobulated soft tissue swelling at posteromedial aspect of lower end of right arm without any evidence of bony involvement. Biopsy of the epitrochlear lymph node showed fibrous tissue infiltrated by tumour composed of malignant epithelial cells having pleomorphic hyperchromatic nuclei exhibiting increased mitosis. Cells arranged in clusters and in glandular pattern in the background of lymphoid tissue, suggestive of metastatic adenocarcinoma; ER/PR/Her2neu negative. Metastatic work up done was unremarkable. As epitrochlear lymph node was the only site of metastasis, patient was advised for surgical excision with wide margin of the involved lymph node. However she refused any surgical intervention and defaulted to followup.

In January 2017 she again came to us with progression in size of epitrochlear node swelling associated with marked increase in pain along with multiple nodules over right neck region. On examination, general condition of the patient was average, right chest wall and axilla was normal with multiple right supraclavicular lymph nodes, contralateral breast, axilla and supraclavicular fossa was normal. Multiple ulcerated lesions with discharging sinuses were present over medial aspect of right elbow. Multiple non tender, mobile and firm nodules were palpable over right cervical region involving level IV and V; largest measuring 4x3 cm. Fine needle aspiration cytology of the neck node was suggestive of metastatic adenocarcinoma. All other Metastatic work up was otherwise unremarkable. In view of progressive disease patient was further advised for palliative chemotherapy.

**Fig 2:-** H&E of IDC; X ray (Right Elbow).

**Discussion:-**

Breast cancer is the most common malignant disease in females. In these patients, distant metastases is the main cause of death.<sup>1</sup> Approximately 10–15% of patients with breast cancer have an aggressive disease and develop distant metastases within 3 years after the initial detection of the primary tumour.<sup>2</sup> The five leading sites of metastatic involvement at autopsy are lung, bone, lymph nodes, liver, and pleura. The incidence of metastasis in these five sites were: lung 57-77 %, bone 49-74%, lymph nodes 50-76%, liver 50-71%, and pleura 36-65%.<sup>3</sup> The most commonly involved axillary lymph nodes are the level I nodes, they are involved in more than 90% of all patients with any number of positive axillary lymph nodes. Involvement of only level I lymph nodes occur in approximately 60% of the patients. Involvement of level II lymph nodes without involvement of the level I lymph nodes is uncommon. Involvement of level III lymph nodes with negative levels I and II lymph nodes is rare, occurring in < 3% of all patients with positive axillary lymph nodes<sup>4</sup>. A few cases of unusual metastasis to urinary bladder, retroperitoneum, gall bladder, colon, rectum have been reported before.<sup>5,6,7</sup> Lymph node involvement is the most important determinant factor for distant metastasis. In this case all dissected axillary node was negative. The chances of skip metastasis to the epitrochlear lymph node are very rare. The exact pathogenesis is not known for this kind of metastasis. To the best of our knowledge there has been only one case of epitrochlear nodal metastasis reported in literature.<sup>8</sup>

The epitrochlear lymph nodes are part of the superficial lymphatic system of the upper limb. There are usually one or two of these lymph nodes. As a general rule, the epitrochlear station drains the lymph from the last two or three fingers and from the medial aspect of the hand itself. The drainage areas of the upper limb are widely variable interindividually. Some lymphatic vessels arise from the epitrochlear nodes and extend to the axillary station.<sup>9</sup>

Epitrochlear lymph nodes may be enlarged as a part of generalized lymphadenopathy, isolated enlargement of epitrochlear lymph nodes is very rare. Malignant causes include lymphoma and malignant melanoma. In transit metastasis to epitrochlear node are encountered from primary melanoma of the forearm, wrist and hand. Cat scratch disease, leprosy, leishmaniasis and tuberculosis are a few reported benign causes of isolated epitrochlear lymph node enlargement.<sup>10</sup>

There is no definite guideline regarding treatment of epitrochlear nodal metastasis. Surgical resection of the node is to be done where possible, provided there are no other sites of metastasis. This patient was reluctant for surgery, so planned for palliative radiotherapy and was further subjected to chemotherapy on progression of disease.

##### Manuscript History

Received: 20 December 2016  
 Final Accepted: 20 January 2017  
 Published: February 2017

#### Abstract

Metals and alloys have found their many role in many applications like structural and corrosive, environment. The alloys/composites having high strength to low weight ratio have gained attention of many researchers. In the above work, Aluminium metal matrix composite was prepared by die casting route, by varying the weight % of reinforcement. Made composite specimens are subjected to 3-body abrasive testing by varying applied load and time, the epoxy particles of 900 grit size were used as abrasive particles. It was observed that with increase of weight of wear resistance of composite was also increasing and on comparison it was found reinforced composite gives good wear resistance to the base alloy.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Since last two decades, composite materials have attracted researchers than their counterpart Monolithic materials due to ability to alter their physical properties and mechanical properties by varying filler phase. Based on type of matrix phase, composite are divided into metal matrix (MMC), polymer matrix (PMC), ceramic matrix composites (CMC) . MMCs have good strength, thermal conductivity, damping properties, low coefficient of thermal expansion and lower density. For these reasons it is preferred in tribological applications.

#### Experimental Procedure:-

##### Material:-

In this work, as already mentioned, Aluminium alloy was used as metal matrix composite. In this alloy, magnesium has poor alloying element, hence magnesium was used as wetting agent for proper mixing. The chemical composition and mechanical properties are given in table 1 and 2[13].

**Table 1:-** Chemical Composition of Al 8011

Material	Fe	Si	Mn	Zn	Cu	Ti	Cr	Mg	Al
Weight %	1	0.8	0.2	0.1	0.1	0.06	0.05	0.04	97.5

**Table 2:-** Mechanical Properties of Al 8011

Density	Elastic Modulus	Strength to Weight Ratio	Ultimate Tensile Strength	Thermal Expansion
2.72 g/cm <sup>3</sup>	91GPa	50kN-m/kg	110Mpa	31.8µm/m-k

**Reinforcement:-**

Graphite powder of an average size of 50 microns were used as reinforcement, Graphite powder has physical properties like good electrical and thermal conductivity, high purity, and temperature stability. Graphite is a well-recognized solid lubricant which also has the advantage of low density. In graphite reinforced Aluminium Matrix Composites (AMCs), Graphite serves as a solid lubricating layer between the composite and rubbing surface helping in reduction of composite wear and does not need any additional solid and liquid lubrication [14].

**Composite preparation:-**

The Al-cr composite was fabricated by two step mixing stir casting method, stirring speed was gradually increased up to 600rpm and it was done for about 500sec. When compared to conventional stirring, double stir casting results in more uniform microstructure . The Al 8011 alloy ingots, were cut into small pieces using hand press, placed in graphite crucible and heated in a resistance furnace up to  $750^{\circ}\text{C}$  above its melting point ( $860^{\circ}\text{C}$ ), the maximum temperature level of furnace being  $1200^{\circ}\text{C}$ .

**Figure 1 a:-** Specimens before wear test.

**Figure 1 b:-** Specimens after wear test.

**Result and Discussion:-**

In 2-body abrasion process, particles are rigidly attached to the second body, where as in 3-body abrasion process, wear is caused by loose abrasive particles which can freely move between contact surfaces. The wear rate in the three-body abrasion is lower when compared two-body abrasion [16]. The results of 3-body abrasive wear test for various combinations of applied load and time were tabulated.

**Microstructure:-**

Figure 2(a) shows optical micrograph of Al alloy 8011 with 2% reinforcement, at 30 magnification scale. Similarly figures 2(b), 2(c) and 2(d) show micrographs of 4%, 6% and 8% reinforcement in Al alloy 8011 respectively. The microstructures show that uniform distribution of graphite particles throughout the aluminium alloy. This indicates that there is good bonding between the alloy and reinforcement particles resulting in good wear resistance.

**Conclusion:-**

3-Body Abrasive wear behaviour of Al was studied in this work.

The samples were subjected to wear test by varying the load in the range of 10-40 kgs for various durations of time at constant speed of 600 rpm. From the experimental investigation following main conclusions are drawn:

Successful fabrication of 8011 Aluminum composite reinforced with cu is possible by simple two- step stir casting process.

On comparison it is found that reinforced composite gives good 3-D wear resistance than base Al alloy.

Employer Branding, Internal Customers, Employee Value Proposition, Attraction and Retention Strategies.

#### **Abstract**

One of the key sources of competitive advantage today is taken to be talented human capital base. In lieu of the same, different firms have been seen to employ the generic marketing strategies to augment the complete employment experience. In this context, employees are viewed to be 'Internal Customers' and the 'Job' as a product, which the firm offers to its personnel. The practice of adherence to such marketing principles under the purview of human resource management, is today popularly christened as 'Employer Branding'. Given the relevance that the firms today are laying on this concept and the committed efforts initiated by them towards becoming the 'Employer of Choice', is clearly reflective of the significance of this employee friendly strategy. Employer branding is thus defined as "a targeted, long-term strategy to manage the awareness and perceptions of employees, potential employees and related stakeholders with regards to a particular firm" (Sullivan, 2004). It is thus emerging as a potent tool to convey the 'Employee Value Proposition' to existent and plausible recruits. It would be interesting to note that due to such dedicated efforts by varied organizations (spanning versatile industries) the current and potential employees tend to form certain perceptions about the employer brand. This dissertation therefore aims to study certain relevant dimensions of employer branding and their subsequent impact on effectively attracting and retaining, employees. The focused group for collecting data entailed employees currently working in certain prominent IT giants and Business School students who are likely to enter the corporate sector in the upcoming days. A survey was conducted and a total of two hundred responses was collected for subsequent analysis. Further, exploratory factor analysis was undertaken using SPSS for reducing the identified dimensions into certain tangible and relatable factors. It was finally concluded that strategic employer branding has a direct (positive) implication on retaining critical talent pool. Also, branding and other pertinent advertising strategies employed by organizations facilitate in enhancing employer attractiveness for potential hires. Thus, the 'Brand Promise' which the employers of today are extending to their workforce, has been comprehensively discoursed in the paper.

---

**Introduction:-**

Conventionally, Branding as a concept has often been used to differentiate an organization's products in general over that of its competitors. Today, with the entire transition from an industrial age to a more information oriented age, Branding now is seen from versatile perspectives. From adding economic value to its customers and its other relevant stakeholders, this strategic tool of creating a distinguished identity is now also focused on developing the right attraction and retention policies for its employees. Thus, the new buzz word today is 'Employer Branding' wherein organizations are particularly shifting focus towards creating a positive perception in the minds of the key stakeholders, potential recruits and current employees. Given that this entire initiative involves a mind-set level change, this exercise is definitely a long term one. The term which picked up popularity in the last decade of the previous century, is now adopted by a lot of global organizations as part of their premeditated human resource initiatives. With immense competition in every sphere, the obvious outcome was poaching of critical talent resulting in dearth of an endowed workforce. Perturbed by this growing scarcity of potential recruits, a lot of firms realised the importance of creating lucrative incentives to adequately attract and retain the right talent pool.

At a broader level, branding of such kind entailed dedicated efforts by any organization towards conveying to its current and potential employees that it is a 'desirable place to work'. The 'Pre-eminent Employer' image is something all organizations strive for, clearly highlighting the value addition they perceive with this entire exercise. The leadership of esteemed organizations are evidently aware of how requisite investment in skillful human resources can bring in long term gains thereby subsequently enhancing the overall performance of the organization. It is thus a wholesome package which is offered to an employee whether it is in terms of the economic gain (lucrative salary packages and equitable income opportunities), the functional upliftment (through training and managerial facilitation) or the most pertinent of all, the psychological contract (sense of autonomy at workplace).

There are certain minimal expectations that any employee has out of his/her employment today. These anticipations could vary from a suitable organization culture, to lucrative pay packages, streamlined job activities, right job fitment and managerial effectiveness. Keeping this view in mind, two sets of questionnaires were prepared. One questionnaire entailed seventeen variables, selected for data collection from employees of renowned IT firms. The intention was to cater to the 'retention' element of the intended research. The respondents had to rate the relevance of the identified variables in regards to their contribution towards creating a differentiated brand. The second questionnaire comprised of questions directed towards students in their final year of management degree. The objective behind selecting this particular sample of respondents was to gather their opinion around what 'attracts' them to opt for a given employer brand over the other. A total of eighteen variables were considered in this case which were mostly overlapping with the first questionnaire but with the addition of certain relevant variables which were fitting contextually. The rankings were done on a Likert Scale ranging from 'Very Important' to 'Unnecessary'. These were further ramped up with certain demography related questions. Finally, to determine crucial 'psychographic aspects', an exploratory factor analysis was conducted on the collected data set.

**Problem Statement:-**

In increasingly competitive labour markets of today, attracting and retaining critical talent has become a matter of grave concern. Employers need to understand the range of factors that influence career decision making and in particular the role of employer branding in attracting the 'best fit' employee who would subsequently contribute towards the premeditated goals of an organisation. The problem therein lies in trying to understand the impact and relevance of employer branding as an essential element of attraction and retention strategies and devise suitable ways through which companies could maximise their brand awareness in the employment market.

**Objective of the Study:-****Primary Objective:-**

To understand the nature of relationship between employer brand image and employee attraction and retention.

**Specific Objective:-**

1. To identify and list certain attributes that make up a 'desirable' employer, subsequently creating a strong, genuine and lasting employer brand.
2. To understand as to what extent the branding strategies implemented by IT firms impact the potential recruits' decision about joining the firm.

**Hypothesis 1:-**

- H0 (Null Hypothesis): Strategic Employer Branding does not have any role to play towards retaining employees in a firm.
- H1 (Alternate Hypothesis): Strategic Employer Branding reinforces the entire employment experience thereby positively *influencing* the retention levels within a firm.

**Hypothesis 2:-**

- H0: Branding and advertising strategies do not lead to attracting employees with superior skills and knowledge.
- H1: Branding and advertising activities executed as part of the recruitment experience *positively impact* the candidate pool; thereby leading to better potential recruits.

**Review of Literature:-**

Employer Branding as a concept has gained importance in recent times. As an ideology, it can be said that this is an extension of the conventional marketing principles which primarily focused on generating the requisite customer satisfaction (Gupta, 2014). While until recently, the entity 'customer' comprised of individuals external to the organization, the paradigm shift in employer mind-set has resulted in introduction of the concept of an 'internal customer' (Chhabra & Sharma, 2014). The apparent question which now arises is that who are these internal customers and why are organizations today willingly ready to prioritize them over their revenue generating counterparts.

In the rampant competitive business environment of today, the only logical answer to this question is that these customers are none other than the organization's personnel. (Lievens & Highhouse, 2003). The rationale necessitates that if an employee is considered to be a customer then in all likelihood the product in question is the Job which he/she is currently or likely to be associated with in the future. The Job as a product should therefore be able to attract, inspire, develop, satisfy and retain employees. Further, a strategic value chain would ensure that a contented employee serves the customer (external) satisfactorily (Moroko, 2008).

Building further on this value proposition it can be said that employer branding is about providing an all comprehensive employment experience. Now, while this might sound an execution level strategy, it first and foremost requires a visionary leadership (Pingle & Sharma, 2013). Leaders who not only understand the value addition that a talented workforce brings to the table, but also have the conviction to deal with the nuances of this imperative change. Further, these front runners are the ones who would set the culture rolling thereby empowering the people on the ground to devise and execute differentiated human resource practices (Priyadarshi, 2011). The alignment of branding strategies with HR practices might therefore be a long drawn process but once set in the right direction is likely to have only positive implications (Tuzuner & Yuksel, 2009).

A renowned employer brand would invariably maintain its position in the competitive labour market through attractive engagement and retention initiatives, thereby resulting in unquestionable brand loyalty. Given the magnitude of impact and benefit this particular exercise is likely to generate, it is definitely not a trivial undertaking (Buttenberg, 2013). A phased approach of implementation needs to be followed and the first critical step is realising the unique value proposition that the firm in question has to offer. The differentiating factor thus identified needs to be broken down into relevant attributes/dimensions in order to further determine the core values/characteristics that set the organization apart. Once your latent strengths and weaknesses have been identified, the next important step entails understanding in-depth your probable target audience. This involves identifying current and potential recruits who are currently/or are likely to be associated with your brand. This would enable the firm to effectively communicate its value proposition internally as well as externally, instigating the requisite level of affinity in the bargain. Once you are successful in 'selling' your brand in a righteous manner, the next logical step is to actually fulfil the promise that you have made to your (internal) customers and ensure that your image of a virtuous employer continues to remain intact (Davies, 2008).

A strong employer marque can thereby result in two immediately realisable benefits. First, ensuring that the right set of talent is 'attracted' towards the organization and second that the desirable 'retention' levels are maintained. 'Employer attractiveness' in very simplistic terms can be defined as the anticipated benefits that are perceived to be realisable by current or plausible workforce, thereby motivating them to choose one brand over the other in the competitive labour market.

Thus, this notion is closely associated with the behavioural and psychological traits of any individual, thereby making it an interesting research area for far too many academicians and corporate managers (Alnaçık & Alnaçık, 2012).

Further, this bond which is created through a persuasive brand image, also contributes towards retaining employees for a longer duration of time. The benefits might invariably be intangible but the compelling sense of belongingness which surfaces eventually, is enough to ensure continuum loyalty. Hence, it can be said without doubts that a lucrative 'Employee Value Proposition' is a potent tool for becoming the employer of choice (Agrawal & Swaroop, 2009).

While these tactics have been popularly adopted across the board, one of the most prevalent industries which puts this perception to effective use, is that of Information Technology (IT). A reasonable explanation for this could be the fact that the IT industry is essentially 'people driven' and hence establishing the indispensable psychological contract with its people, is of utmost importance to them. Further, it can also be said that since the industry practices involve client facing roles and responsibilities, a highly convinced and dedicated employee is critical for their survival (Jenner and Taylor, 2009). An employee who is likely to stick around inspite of the dynamic work environment, is the one who would eventually generate concrete economic benefits for them. Thus, professed to be one of the most employable business, firms in IT industry have been actively involved in executing employer branding strategies. The endeavour has been to ensure that the employee's ethics and values are in perfect alignment with the broader vision and mission of the organization, thereby ensuring that these individuals are developed into innate brand ambassadors for the firm in question. Given the immense potential for study in this domain, the researchers decided to niche down the scope to IT industry (Ritson, 2002).

Another interesting facet of this research work is the bifurcation which has been made in relation to the respondents which have been targeted. While one segment constitutes of existent employees who have been successfully retained within firms due to certain employer branding initiatives, the other section comprises of students who are latent recruits for such organizations. Students are often expected to be lured by hefty pay packages and other tangible benefits but past research work in the domain has proved otherwise. While compensation may be a supreme decision criterion related to their employment, students are also often seen to consider a variety of other facades (Dam, 2006). These could include dimensions such as an established corporate profile or effective advertisement/promotional strategies that are adopted by their potential employers. Thus, such predictive factors that motivate recruits to apply for a particular job vacancy, is still an unopened Pandora box in the research field. The current study thus attempts to bring to the forefront such underlying aspects, in the bargain, answering certain critical questions for the managers of giant IT organizations (Vijayalakshmi & Uthayasuriyan, 2016).

## **Research Methodology:-**

### **Pilot Study:-**

In order to gauge the feasibility of the intended research, a pilot study was instigated. Keeping in mind the overall objectives of the study, two questionnaires were framed. These were then filled out by 10 respondents per questionnaire (10% of total sample size).

Based on the analysis of the responses from the identified stakeholders and discussions/deliberations within the team, the authenticity of the established hypothesis was discussed. This enabled us to reinstate our intention to conduct further research in the recognised domain.

### **Sample Details:-**

- A field visit was undertaken across certain renowned brands in the field of Information Technology.
- The Sample Size comprised of 100 respondents (employees working in IT firms, specifically targeting new recruits and employees who are part of middle level management). A healthy male to female ratio was maintained while collecting the responses.
- A separate Sample of 100 respondents was collected which comprised of Student Managers currently pursuing their post-graduation study from reputed B-Schools in the city.

### **Data Collection Tool:-**

The data collected for this study primarily constitutes of the following two sources:

- **Primary Data:** Primary data collection has been the principal mode of enquiry. It entailed collecting data through two well-structured questionnaires consisting of twenty or more questions which essentially aimed at bringing out relevant information to meet the overall objectives of the research. The responses were filled out in a hard copy format as the survey was personally conducted by the researchers in each of the aforementioned areas.
- **Secondary Data:** Data which is originally collected for a different purpose but we use it as reference for our research work, encompasses secondary data. Various sources of secondary data collection comprised of journals, newspapers, databases and previously published papers available over the internet.

#### Validation of Hypothesis:-

Once the relevant data had been gathered, the researchers undertook quantitative analysis of the same -

#### Quantitative Analysis:-

The survey results were used to scientifically and objectively classify the data using certain commonly used tools such as **Statistical Package for the Social Sciences (SPSS) and Microsoft Excel**.

For detailed analysis/interpretation of the survey results, certain appropriate tests were run using SPSS and relevant conclusions were made thereon. **In order to validate the authenticity of the alternate hypothesis certain psychographic dimensions were considered and a Factor Analysis was done on them to club them under relevant Factor heads.**

To get further insights pertaining to our hypothesis, appropriate excel formulas, charts and graphs were also used. This enabled us to further infer and test the applicability of the existing hypothesis.

Moreover, since the research work has been a field study, the researchers were also be able to come up with a concrete outlook based on the observations they made pertaining to the employee/student behaviour (while they responded to the questions asked). Such kind of analysis can be condensed under the umbrella of 'Observations through being Participant in actual Field Study' methodology which later also towards building our overall opinion about the study.

To measure the qualitative responses, such as those related to the respondent's feelings, perception, likes, dislikes, interests and preferences, the **scaling technique** has been used.

For this research, a type of an interval scale, known as a **Likert scale**, was incorporated in the questionnaire. This measurement scale was developed by Rensis Likert. Under this, the respondents were asked to indicate a degree of agreement or disagreement to a series of statements. Each scale item had five response categories ranging from 'Very Dissatisfied' to 'Very Satisfied'.

#### Data Analysis and Interpretation:-

The subsequent pages display certain graphical representations along with related discussions based on the survey results.

#### Part 1:- Student Questionnaire.

##### Age:-

**Fig 1:-**Age of the Respondents.

Out of the 100 respondents, 51% of the students interviewed were in the age group of 20-23 years and 49% of the students belonged to the age group of 24-27 years.

**Gender:-**

**Fig 2:-**Gender of the Respondents.

Out of the 100 students surveyed, 46% were female and 54% were male.

**Location:-**

**Fig 3:-** Location of the Respondents

It was observed that out of the 100 respondents, majority of the respondents were from the B-Schools in Khadki, Hinjewadi, and Ganeshkhind consisting of 30%, 26% and 20% of total respondents respectively. Other B-Schools comprised of 13%, 11% of total respondents.

**Concern towards Employees:-**

**Fig a:-** Concern towards employees.

**Discussion:-**

The above figure represents responses of students in regards to the work environment of an organization, particularly about ‘concern towards employees’.

The figure illustrates that 50% of the students have given a neutral response to concern towards employees. It is not the most important factor that affects their attrition or retention although 35% of the students feel it is an important factor which is considered by them. Only 15% students feel that this factor holds a lot of importance and have

responded to it as a very important factor. No respondent states that this factor is either not important or unnecessary stating that every student considers it a relevant factor while selecting their future employer.

**Investment in training and Development:-**

**Fig b:-**Investment in training and development.

**Discussion:-**

The above figure represents the level of importance a student attributes to investment in training and development by its plausible future employer.

The figure elucidates that 50% of the students take a neutral position while demonstrating the importance given to investment in training and development whereas 41% of the respondents find it an important factor. Only 2% of the respondents find it to be a very important factor. There are no students who state that training and development is unnecessary and does not impact their decision making.

**Job/role rotation frequency:-**

**Fig c:-**Job/role rotation frequency.

**Discussion:-**

It is observed that most students after MBA do not consider job/role rotation a dominant factor while selecting their future company and find job rotation and mobilization acceptable.

The figure states that 41% of the employees do not find this an important factor while 36% of the respondents have given a neutral response to it. While 22% of the respondents find this as an unnecessary factor, there is however no student that finds it a very important or most important factor.

**Openness in organizational culture:-**

**Fig d:-** Openness in organizational culture.

**Discussion:-**

It is observed that openness in the organizational culture holds high importance amongst individuals while selecting their future company.

The above figure depicts that 75% of the respondents find it important to have openness in the organizational culture while 25% find it to be a very important factor. There are no students with a neutral, not important or an unnecessary response in regards to this variable.

**Freedom to take up initiatives:-**

**Fig e:-** Freedom to take up initiatives.

**Discussion:-**

With the newer generation entering the corporate sector we can see the paramount importance provided to and the need amongst them to take up initiatives on their own. The above figure depicts the same by illustrating that 82% of the employees give very high importance to having freedom to take up their own initiatives. This is one of the major factors that affects their decision while selecting their future employer while 16% of the respondents find it important with 25% giving a neutral response to it. No respondent finds freedom to take up initiatives not important or unnecessary.

**Salary hikes:-**

**Fig f:-**Salary hikes.

**Discussion:-**

It can be observed by the above figure that regular salary hikes are an important variable considered by students while choosing their future hirer.

90% of the respondents have stated it to be a very important factor while 10% state it to be important. No respondent has provided a neutral, not important or unnecessary factor response in this scenario.

**Internal and external equity in pay determination:-**

**Fig g:-** Internal and external equity in pay determination.

**Discussion:-**

The above figure states that internal and external equity in pay determination holds high value for students as 58% of the students have considered it to be an important factor while selecting their future employer with 42% stating it as a very important factor.

No respondent considers this factor to be neutral, not important or unnecessary.

**Management’s contribution towards employee career planning:-**

**Fig h:-**Managements contribution towards employee career planning.

**Discussion:-**

It can be seen that maximum respondent’s i.e.55 % students have provided a neutral response to this factor. Being the first company post MBA, it is very unlikely for the respondents to continue in the said firm for a very long time and thus management’s contribution in career planning holds a neutral spot while 43% of the respondents find it an important factor.1% response is recorded for both very important and not important with no one responding to it as an unnecessary factor.

**Opportunities for International work assignments:-**

**Fig i:-**Opportunities for International work assignments

**Discussion:-**

It can be observed by the figure above that maximum respondents i.e. 49% of them find it a neutral factor that plays a role while selecting their employer while 37% of them find it an important factor that is considered while decision-making. 7 % of the responses have been recorded for both not important and an unnecessary factor. No respondent finds this factor as very important.

**Size of the organization:-****Fig j:-** Size of the organization**Discussion:-**

It is observed that 55% of the respondents do not consider the size of the organization an important factor while selecting their future employer while 23% consider it an unnecessary factor.

21% of the respondents have given a neutral response to this with only 1% finding it important.

No respondents considers this to be a very important factor.

**Stress-free work environment:-****Fig k:-**Stress-free work environment**Discussion:-**

It can be seen that students do not consider a stress free work environment very crucial with 52% giving a neutral response to it and 27% finding it not important as they feel they can handle and work well in stress.

20% respondents do consider it an important factor while only 1% finds it unnecessary and no responses have been recorded for this factor to be highly important.

**Employer prestige in market place:-**

**Fig l:-**Employer prestige in market place.

**Discussion:-**

Employer prestige and the brand name holds high dominance for the respondents.

It can be observed that maximum respondents i.e. 51% of the students find it an important factor while deciding and selecting their future employer with 36% of the students find it a very important factor, thus making this as one of the major factors influencing the decision taken.12% of the respondents have provided a neutral response with only 1% response for it being not important.

No respondent has stated that it is an unnecessary factor.

**Scope for creativity in work assigned:-**

**Fig m:-**Scope for creativity in work assigned

**Discussion:-**

It can be observed from the above figure that respondents find it necessary to have scope of creativity in any project they handle with 71% of them stating it to be a very important factor with 22% of them finding it important.

Only 8% of the respondents have given a neutral response to creativity as a criterion. No respondent finds this factor not important or unnecessary stating that scope of creativity in work is crucial.

**Social media presence (Networking through Facebook, Twitter, and LinkedIn):-**

**Fig n:-** Social media presence (Networking through Facebook, Twitter, LinkedIn)

**Discussion:-**

All respondents find social media presence a major influencer and attractor while selecting future hirers.65% of the respondents hold this factor as an important one with 35% of the respondents finding it a very important factor.

No respondent considers it to be neutral, not important or unnecessary stating the high significance of social medial marketing.

**Word-of-mouth reputation through ex-employees:-**

**Fig o:-**Word-of-mouth reputation through ex-employees

**Discussion:-**

Maximum respondents consider word of mouth advertising before taking their employment decision. The above figure states that 63% of the employees consider this to be an important factor before they make their decision with 18% finding it very important and 19% giving a neutral response. No response has been recorded for this factor to be not important or unnecessary thus depicting its major influence on respondents.

**Print and electronic advertisements:-**

**Fig p:-** Print and electronic advertisements.

**Discussion:-**

It is observed that print and electronic advertisements do not hold much value now-a-days. It can be confirmed by the figure shown above depicting 67% respondents finding it unnecessary with 20% finding it not important and 13% responding to it as neutral.

No respondent considers this to be an important or very important factor while selecting their future employers.

**Reach-out during relevant seminars, conferences and webinars:-**

**Fig q:-**Reach-out during relevant seminars, conferences and webinars.

**Discussion:-**

The above figure states that 52% of the respondents find this factor to be a neutral influencer with 27% finding it important.

20% of the respondents do not find it important and 1% find it as an unnecessary parameter.

No respondent finds it to be a very important factor.

**Prevalent market image as a virtuous employer:-**

**Fig r:-** Prevalent market image as a virtuous employer.

**Discussion:-**

All respondents find it important for their selected employer to have a prevalent market image as a virtuous employer with 53% finding it important and 47% finding it a very important factor.

**How relevant do you feel is branding and advertising strategy in attracting better potential recruits?**

**Fig 4:-**Relevance of employer branding in attraction and retention of employees

**Discussion:-**

Majority of the respondents feel that employer branding plays a major role in attracting and retaining employees in an organization.

It can be observed from the figure that 77% of the respondents find employer branding very relevant for attracting and retaining employees with 23% finding it an important factor.

**Are there any specific parameters that would motivate you to select a particular organization over the others?**

Majority of the respondents look into organization’s social media presence and word-of-mouth (through ex-employees) before selecting a particular organization over others.

Job specific training sponsored by the company augments the inclination towards a future employer. Career management seems to have an influence on the perceived quality of employment experience. Working conditions

influence the entire working experience increasing overall satisfaction of employees. Other specific parameters being stable growth and remuneration prospects offered by the organization, transparency in leadership decision making and open culture of the organization. Thus, these are the factors which play a dominant role while a prospective employee makes decisions about his/her future employment.

### Part 2:- Employee Questionnaire

Age:-

**Fig 1:-**Age of the Respondents

As evident in the graph above, 72% of the respondents belonged to the age bracket of 21-28 years. The intention was to capture the responses of freshers/young professionals working in the IT sector. On the other hand, 27% of the respondents belonged to the age bracket of 29-36 years which constitutes the middle management layer of the respective organizations.

Gender:-

**Fig 2:-** Gender of the Respondents.

The above male to female ratio is reflective of the general diversity ratio observed in the organizations which have been considered. While this ratio was once dominated by the male counterparts, it can be seen from the above figure that there is a definite alteration in the conventional trends and thus today the female professionals are as much part of the private sector jobs as their male colleagues.

The prominent parameters which came out from the study include:-  
**Investment in training and development**

Note: X axis is to measure the scale of importance while percentage of respondents has been assimilated in Y Axis

Fig a:- Investment in training and development

**Discussion:-**

Majority of the respondents (60%) were satisfied with the current exposure to requisite Training and Development programs and thus considered it as one of the prime parameters to be considered while evaluating the internal brand image of an employer.

**Freedom to take up initiatives:-**

Note: X axis is to measure the scale of importance while percentage of respondents has been assimilated in Y Axis

Fig b:- Freedom to take up initiatives.

**Discussion:-**

Majority of the Respondents (75%) rated Freedom to take up initiative as a very high parameter towards satisfaction in their respective employment. This is clearly indicative of how autonomy at workplace can play a prime role in retaining employees in an organization.

**Workforce diversity:-**

**Note:** X axis is to measure the scale of importance while percentage of respondents has been assimilated in Y Axis

**Fig c:-**Workforce diversity.

**Discussion:-**

Majority of the respondents (62%) were of the opinion that workforce diversity definitely helps the organization in establishing a renowned brand image. Diversity at workplace shows that the organization is open to versatility in its talent pool and is cognizant towards the importance of maintaining a healthy balance in the male – female ratio.

**Internal and external equity in pay determination:-**

**Note:** X axis is to measure the scale of importance while percentage of respondents has been assimilated in Y Axis

**Fig d:-**Internal and external equity in pay determination

**Discussion:-**

Majority of the respondents (58%) were satisfied with the kind of time and investment their respective organizations were making towards maintaining internal and external equity during pay-outs. Ensuring that the salary/increments/yearly bonus are marked to market, is extremely important in today’s competitive business environment. This ensures that the respective firm does not lose out on its critical talent. Benchmarking salaries also helps in attracting the best-in-class talent when it comes to recruitment.

**Employer prestige in marketplace:-**

**Note:** X axis is to measure the scale of importance while percentage of respondents has been assimilated in Y Axis

**Fig e:-** Employer prestige in marketplace.

**Discussion:-**

The above figure is clearly indicative of the fact that a significant portion of the respondents were extremely satisfied in regards to the prestige of their organization in the IT industry. This evident inclination brings out the fact that an established and well-known brand in the market place is a definite plus point when it comes to attraction and retention of employees.

**How relevant do you feel is strategic employer branding towards ensuring enhanced retention levels within the firm?**

**Note:** X axis is to measure the scale of importance while percentage of respondents has been assimilated in Y Axis

**Fig 3:-**Relevance of strategic employer branding towards ensuring enhanced retention levels.

**Discussion:-**

67% of the respondents felt that employer branding is extremely important in attracting and retaining employees in an organisation. Further, 30% of the respondents were of similar opinion. The results seen above are in definite alignment with the primary objective of the entire research which is being conducted.

**Are there any specific parameters that would motivate you to stay loyal towards your current job?****Discussion:-**

Certain concrete parameters which came out through this particular question include: higher education facilitation, work life balance, brand name/market standing of the organization, opportunities to handle diversified portfolio, transparency in leadership decision making, progressive culture (at par with market dynamics), variability in routine job - more exposure, benefits to cater for diversity at workplace, opportunities to upscale skill-sets and access to versatile profiles within the organization.

The above factors are essentially responsible for preferring one organization over the other. Successful incorporation of the above factors also result in differentiating a virtuous employer from other several employers in the marketplace.

**Hypothesis Validation:-**

The employee questionnaire consisted of certain relevant variables which reinforce the entire employment experience thereby *positively influencing* the retention levels within a firm. A total of seventeen such variables were considered and Factor Analysis was done on them (using the SPSS tool) in order to club these variables under broader factors. The intention has been to define certain relevant factors which would have a direct implication on retention levels within a firm.

Under factor analysis, we do not make any categorical distinction between a dependent and an independent variable. Infact the relationship between each of the independent variables are studied to be able to classify them under common heads based on certain commonalities which may exist. Thus, a set of procedures are conducted to examine the relationship between a set of interdependent variables with a broader objective of data reduction and summarization.

In this context, factor analysis would help us to determine the underlying factors which according to the employees have a crucial role to play while establishing a renowned employer brand.

Before we delve into the results of the factor analysis which was conducted, it is important to highlight the steps which were followed to do the same.

First and foremost the objective behind conducting the analysis was set, which in our case is to try and point out certain relevant variables which according to employees of certain renowned IT giants are required to ensure that they stay loyal to their respective organizations. Further, the KMO and Bartlett's test of Sphericity helps us to understand if the variables are adequately correlated with each other and whether or not Factor Analysis is relevant in the given situation. A value greater than 0.5 and significance level equivalent to 0.00 indicates that it is acceptable to process with Factor Analysis for further examination. Further, Varimax method of rotation is selected and the requisite procedure is executed.

The variables that were considered as part of the employee survey are as follows –

1. Concern towards Employees
2. Investment in Training and Development
3. Job/Role Rotation Frequency
4. Openness in Organization Culture
5. Freedom to take-up Initiatives
6. Variation in Routine Work
7. Workforce Diversity
8. Work as per Pre-determined Schedule
9. Relevance of Academic Degree
10. Salary Hikes
11. Internal and External Equity in Pay Determination
12. Management Contribution towards Employees' Career Planning
13. Opportunities for International Work Assignments
14. Size of Organization
15. Stress – Free Work Environment

16. Employer Prestige in Marketplace  
 17. Scope for Creativity in Work Assigned

The 100 employees who were surveyed across versatile roles/profiles were asked to rate these variables in terms of their relevance towards creating the image of a virtuous employer. The ratings were given on a scale of 1 to 5 varying from Very Relevant to Irrelevant. These were then entered in SPSS to conduct Factor analysis. The result of the same is as follows –

<b>Factor Analysis</b>

### Inferences:-

A 'KMO' (Kaiser-Meyer-Olkin measure of sampling adequacy) value of 0.620 indicates that Factor Analysis is the relevant process to be conducted. Once it has been established that Factor Analysis is appropriate in the context, we move on to choose the various approaches within it. In this case, we selected the Principal Component Analysis method, in which the total variance spanning the data set is considered. The factors thus derived are termed as Principal Components. The next table is the 'Community' table which indicates the magnitude of variance each variable shares with all other variables considered. The next important outcome is the 'Total Variance Explained' table. The 'Initial Eigen Values' / or simply Eigen Values given in the table are values that give us the variance explained by each factor. The variance attributed to each factor is in decreasing order of magnitude (as seen in the table).

Under this approach, only factors with values greater than one are considered for further study while others are left out. Thus, the total factors in our case are 6. Also, it is to be noted that a Cumulative Variance % between 60 and 70 is considered to be appropriate (which is 62.15 in our case).

The next diagram is commonly called as the 'Scree Plot'. This is a plot of the calculated Eigen Values against the number of factors which have been extracted. The shape of this plot is significantly used when it comes to determining the actual factors to be considered. There is an evident break in this plot with an initial sharp slope of factors with Eigen value greater than one which is subsequently followed by a sprawling set of other factors. This gradual trailing off is referred to as the Scree and it has been proven that the point at which this Scree begins denotes the actual number of factors. However, it is to be kept in mind that the factors so determined are invariably one or more than the ones determined by the Eigen Value table. In our result, the point at which the trailing off begins is 8 (2 more than the factors which we got from the previous table). One of the most significant output of this exercise is the 'Component Matrix' table. However, the initial or the 'Un-rotated Factor Matrix' as it is termed may not be the most reliable output to be independently taken into account. This is because the initial solution generally witnesses a correlation between a single factor and many associated variables. Such results if obtained are difficult to interpret.

Thus, in order to simplify things, the 'Rotated Component Matrix' is taken into consideration which essentially rotates the original solution to ensure that the factors have significant loadings with only the relevant variables. Thus, using the results of the Rotated Component Matrix Table, we would place certain associated variables under the same umbrella. In order to do this, the researchers will have to predetermine a certain cut-off across components. For the study under consideration, the benchmark which has been set is 0.65. Thus, all variables with a score above 0.65 (under a given component) would be clubbed under a common factor heading. The relevant factors and their subsequent variable/s thus identified include –

**Factor 1:-**

- Investment in Training and Development
- Variation in Routine Work

**Factor 2:-**

- Opportunities for International Work Assignments
- Size of Organization
- Employer Prestige in Marketplace

**Factor 3:-**

- Openness in Organization Culture

**Factor 4:-**

- Salary Hikes

**Factor 5:-**

- Workforce Diversity
- Work as per Pre-determined Schedule

**Factor 6:-**

- Scope for Creativity in Work Assigned

The 17 variables initially considered have been thus reduced to 10 relevant variables which span across 6 factors. The factors so framed are based on the opinion of the employees working in IT companies. The results thus signify the important variables that have a key role to play in placing a given employer brand at a superior position as against its counterparts.

The factors identified above can now be assigned suitable heads based on the initial literature review conducted.

**Factor 1 – Variability in Job Setting and Overall Development/Empowerment**

**Factor 2 – Organizational Reputation and Flexibility**

**Factor 3 – Work Environment**

**Factor 4 – Compensation and Career Progression**

**Factor 5 – Workforce Assortment and Streamlined Job Activities**

**Factor 6 – Requisite Autonomy at Workplace**

Apart from the above set of variables, an additional question was also asked to collect opinion regarding the positive impact of strategic employer branding initiatives in regards to retention levels within a firm. The rating was collected on a Likert Scale ranging from 'Very Relevant' to 'Extremely Irrelevant'. The results were as follows –

Rating	Number of Responses (out of 100)	Percentage of Responses (%)
1 – Very Relevant	67	67
2 – Relevant	30	30
3 – Neutral	3	3
4 – Irrelevant	0	0
5 – Extremely Irrelevant	0	0

The derivations from the factor analysis and the above result evidently support the pre-determined hypothesis which states that – ‘Strategic Employer Branding reinforces the entire employment experience thereby positively *influencing* the retention levels within a firm’. The identified set of factors further help us point out the specific branding initiatives which have critical role to play in the mentioned arena.

The second set of questions were for students from premium management institutes in the city of Pune. The student questionnaire consisted of certain relevant variables which reinforce the fact that branding and advertising activities executed as part of the recruitment experience *positively impact* the candidate pool; thereby leading to better potential recruits. A total of eighteen such variables were considered and Factor Analysis was done on them (using the SPSS tool) in order to club these variables under broader factors. The intention has been to define certain relevant factors which if catered to, would result in definite attraction towards the latent employer. The variables that were considered as part of the employee survey are as follows –

1. Concern towards Employees
2. Investment in Training and Development
3. Job/Role Rotation Frequency
4. Openness in Organization Culture
5. Freedom to take-up Initiatives
6. Salary Hikes
7. Internal and External Equity in Pay Determination
8. Management Contribution towards Employees’ Career Planning
9. Opportunities for International Work Assignments
10. Size of Organization
11. Stress – Free Work Environment
12. Employer Prestige in Marketplace
13. Scope for Creativity in Work Assigned
14. Social Media Presence (Networking through Facebook, Twitter, LinkedIn)
15. Word-of-Mouth Reputation through Ex-Employees
16. Print and Electronic Advertisements
17. Reach-out during Relevant Seminars, Conferences and Webinars
18. Prevalent Market Image as a Virtuous Employer

The 100 students who were surveyed belonged to versatile academic backgrounds and were asked to rate these variables in terms of their relevance towards creating the image of a virtuous employer. The ratings were given on a scale of 1 to 5 varying from Very Relevant to Irrelevant. These were then entered in SPSS to conduct Factor analysis. The result of the same is as follows-

**Inferences:-**

A ‘KMO’ (Kaiser-Meyer-Olkin measure of sampling adequacy) value of 0.579 indicates that Factor Analysis is the relevant process to be conducted. The next important outcome is the ‘Total Variance Explained’ table. The ‘Initial Eigen Values’ / or simply Eigen Values given in the table are values that give us the variance explained by each factor. The variance attributed to each factor is in decreasing order of magnitude (as seen in the table). This is because the initial factors would be more dominant than the consequent trailing ones. Under this approach, only factors with values greater than one are considered for further study while others are left out. Thus, the total factors in our case are 7. Also, it is to be noted that a Cumulative Variance % between 60 and 70 is considered to be appropriate (which is 63.02 in our case).

The next diagram is commonly called as the ‘Scree Plot’. This is a plot of the calculated Eigen Values against the number of factors which have been extracted. There is an evident break in this plot with an initial sharp slope of factors with Eigen value greater than one which is subsequently followed by a sprawling set of other factors. In our result, the point at which the trailing off begins is 9 (1 more than the factors which we got from the previous table). One of the most significant output of this exercise is the ‘Rotated Component Matrix’ which essentially rotates the original solution to ensure that the factors have significant loadings with only the relevant variables. Thus, using the results of the Rotated Component Matrix Table, we would place certain associated variables under the same umbrella. In order to do this, the researchers will have to predetermine a certain cut-off across components. For the study under consideration (student data), the benchmark which has been set is 0.6. Thus, all variables with a score above 0.63 (under a given component) would be clubbed under a common factor heading. The relevant factors and their subsequent variable/s thus identified include –

**Factor 1:-**

- Size of Organization

**Factor 2:-**

- Internal and External Equity in Pay Determination

**Factor 3:-**

- Investment in Training and Development
- Scope for Creativity in Work Assigned

**Factor 4:-**

- Openness in Organization Culture

**Factor 5:-**

- Reach-out during Relevant Seminars, Conferences and Webinars
- Prevalent Market Image as a Virtuous Employer

**Factor 6:-**

- Social Media Presence

**Factor 7:-**

- Print and Electronic Advertisements

The 18 variables initially considered have been thus reduced to 9 relevant variables which span across 7 factors. The factors so framed are based on the opinion of the students currently studying in management institutes in the city of Pune. The results thus signify the important variables that have a key role to play in placing a probable employer brand at a superior position as against its competitors.

The factors identified above can now be assigned suitable heads based on the initial literature review conducted.

**Factor 1 – Organizational Reputation****Factor 2 – Compensation and Career Progression****Factor 3 – Requisite Autonomy at Workplace and Overall Development/Empowerment****Factor 4 – Work Environment****Factor 5 – Promotional Initiatives by a Firm and Righteousness of Potential Employer****Factor 6 – Brand Endorsement in Virtual World****Factor 7 – Extensive Marketing Strategies to Attract Future Incumbents**

Apart from the above set of variables, an additional question was also asked to collect opinion regarding the critical role that enhanced recruitment experience plays in attracting a better talent pool. The rating was collected on a Likert Scale ranging from ‘Very Relevant’ to ‘Extremely Irrelevant’. The results were as follows –

Rating	Number of Responses (out of 100)	Percentage of Responses (%)
1 – Very Relevant	77	77
2 – Relevant	23	23
3 – Neutral	0	0
4 – Irrelevant	0	0
5 – Extremely Irrelevant	0	0

The derivations from the factor analysis and the above result evidently support the pre-determined hypothesis which states that – ‘Branding and advertising activities executed as part of the recruitment experience *positively impact* the candidate pool; thereby leading to better potential recruits’. The identified set of factors further help us point out the specific branding initiatives which have critical role to play in the mentioned arena.

**Significance of the Outcome:-**

Organisations have profusely used marketing and branding practices to stimulate product/service brand loyalty in customers. Building up on similar lines, firms today are intensifying this activity to further distinguish themselves as against their counterparts, thereby making them desirable employers in the eyes of their current and/or plausible workforce. Through this dissertation, we attempted to highlight the need for IT organisations to strategically align their HR function, most specifically functions like recruitment, learning and development, and marketing/communication, in order to build the image of a an *admired employer* thereby resulting in enhanced attraction and retention levels.

The researchers have tried to point out that if managers at the planning and execution level in IT organizations try to focus their energies on the identified set of factors, it would definitely facilitate them to uplift the stature of their respective organizations. Finally, this synergic initiative would aid the firms to be branded with the title of 'Employer of Choice', subsequently elevating their financial standing as well.

### **Conclusion and Recommendations:-**

At a broader level, firms have been seen to realise the significance of building a strategic employer brand. This understanding has been proven by the fact that organizations today are expending a substantial amount to expand the realm of employer branding. The intention is crystal clear; invest in attracting the best talent pool in the industry, employ streamlined initiatives to retain them and consequently ensure that there is economic value add out of the entire exercise. Further, successfully attracting the best minds in the industry gives the firm an evident edge over its competitors.

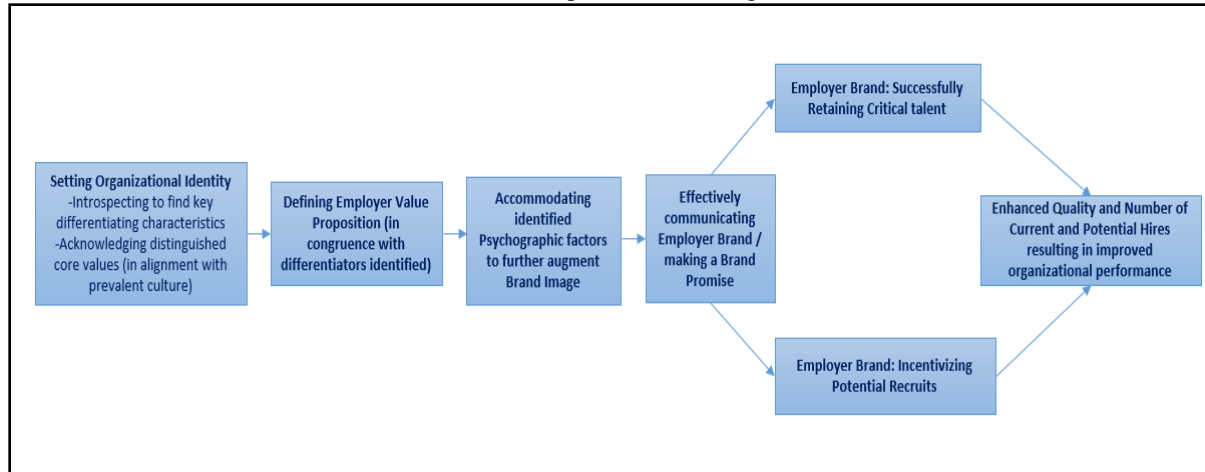

At an individualistic level, the benefits of employer branding are again manifold. Potential recruits rely on their personal perceptions about a brand or the generic word of mouth while evaluating the pros and cons of being associated with a potential employer. There are off course certain other evident benefits of establishing an Employee Value Proposition. The first and foremost being the ability to curb the total time taken to fill in a position. Since an established brand automatically attracts decent quality talent, the ensued time required for advertising and related search activities is cut down by a great extent. The next important dimension is that of the cost per hire. A targeted brand promise helps in enticing the right talent pool, thereby plummeting the need for employee referral. As recruitment related expenditures are done within a certain pre-determined amount of budget, the reduced cost per hire turns out to be significantly beneficial. Further, during adverse trade cycles, such as a situation of recession, an appealing employer brand warrants that the current workforce is retained, thereby contributing towards financial stability. Finally, since the umbrella of employer branding also entails eminent learning and development initiatives, it is consequently ensured that the overall 'quality of hire' is enriched; thereby guaranteeing better client servicing by the organization.

Another point to be noted here is that since bulk of the operational costs (65%-70%) comprise of human resource related expenditure, curbing it down would inevitably make sure that the business is profitable. It is thus imperative to understand that even peripheral improvement in attraction and retention levels would facilitate long term sustainability of the firm.

In this study, we tried to capture the perceived importance of varied psychographic factors. To do the same, a sample of both employed and unemployed (seeking job opportunities) personal was taken. Each of these individuals were asked to rate each of the variables considered, in regards to their relative importance, on a multi-rating scale. Further, through exploratory factor analysis (principal component method), the significant dimensions in regards to employer attractiveness and employee retention, were brought to light.

Factors such as Variability in Job Setting, Overall Development/Empowerment, Organizational Reputation, Flexibility, Compensation and Career Progression emerged to be dominant factors across the sample size considered. This is reflective of the fact that the workforce of today demands autonomy at workplace and adequate space to be creative in their daily tasks and responsibilities. Further, corporate image and prestige in marketplace was observed to be a substantial determining factor for an employee's decision regarding pursuance of any employment. Also, a significant number of respondents were seen to be in agreement with the stated hypothesis, thereby certifying the relevance of the research conducted. These results therefore have pertinent managerial implications and can be thought provoking as far as human resource management is concerned. Hence, comprehending the versatile preferences of impending job hunters, would enable the line managers to be proactive in their approach and ensure that productive employment messages are adequately conveyed, as and when required.

The above discussions can be illustrated with the help of the following framework –

Finally, it needs to be acknowledged that the study had certain **limitations**. The research sample consisted of two broad segments - employees working in four renowned IT Corporates and job seekers who were currently pursuing a management degree across five celebrated institutes, in the city of Pune. Thus, it is suggested that further study in this regard should be inclusive of an even more representative sample so that generalizations about a set of population could be made. Also, the research scope could be enhanced beyond the variables: attraction, retention and could include relevant dimensions such as employee satisfaction. Furthermore, the statistical means used could be expanded to incorporate a confirmatory factor analysis.

#### Glossary:-

1. **Employer Brand** – In this context, the term means becoming 'the employer of choice' by promoting unique benefits as part of the employment experience, subsequently enhancing the value proposition for existing and potential employees.
2. **Employer Attractiveness** is defined as the envisioned benefits that a potential employee sees in working for a specific organization. The objective is to enable the firm to gain a competitive edge in the labour market.
3. **Retention**, in this background, encompasses those employees who are willing to stay in an organization for a period greater than two years because they trust the employees they work for and take conceit in the work they do.

#### Abstract

Purpose of the Study: determine the knowledge of King Faisal University students about cigarette smoking cessation options of male students, by King Faisal University, Saudi Arabia. A random sample of 300 students from 5 different colleges at the university answered a self-administered questionnaire based on a modified and translated research questionnaire by Lisa Hope titled "Smoking Cessation Knowledge and Clinical Cessation Techniques Among Medicine Residents". 62% of smokers knew about counseling option, while 83% of non-smokers knew about it. 58% and 65.8% from smokers and non-smokers, respectively, knew about nicotine replacement therapy. 18% of smokers and non-smokers knew about Prozac and Bupropion. The study showed lack of anti-smoking campaign exposure, 44.6% of participants have not seen any anti-smoking campaign in the past year.

#### Introduction:-

Smoking is a major worldwide public health problem and one of the main preventable cause of morbidity and mortality. <sup>i</sup>Smoking related disease will kill one in 10 adults globally by 2030, if current trends continue, smoking will kill one in 6 people worldwide. <sup>ii</sup>Smoking currently kills five million people a year worldwide and, according to estimates, will probably kill eight million people a year between now and 2030 and one billion over the course of the 21st century. Although many of the adverse health effect of tobacco occur later in life, smoking has health implication for young people. <sup>iii</sup>According to studies conducted in Saudi Arabia the prevalence of smoking ranges from 2.5-52% (median 17%), and among young adults ranges from 2.4-37% (median 13.5%). <sup>iv</sup>21.6% (n=1382) is the prevalence of cigarette smoking among male students of King Faisal University (KFU).

Many cigarette smokers find it difficult to quit smoking despite being aware of its hazards. Frequent failed attempts are reported globally. However, there are many success stories around the world. With the help of anti-smoking centers there is higher possibility of succeeding in quitting. This study aims to determine the knowledge of KFU Students and attitude about cigarette smoking cessation options and compare the knowledge among smokers and non-smokers.

**Method:-**

The number of KFU students in 2013 is 31,849 . Because of huge number of KFU students and limited time we had decided to take only 20% out of total student number from five collages. We estimated that our sample size is 300 students. Our research method is cross sectional and it compares the knowledge between smokers and non-smokers about their knowledge and attitudes about cigarette smoking cessation. We have chosen this method because it is not expensive, fast and easy to do, and the limited time we had.

We have read some researches to know the appropriate questions to use them in our questionnaire. After that we have discussed to took most of our question from "Smoking Cessation Knowledge and Clinical Cessation Techniques Among Medicine Residents" research done by Lisa Hope. By modifying the questionnaire from the research by Lisa Hope to a more simplified form and added some questions we had made by ourselves. We had also to translate the questionnaire to Arabic to make sure our sample fully understand the questionnaire. The questionnaire contain both English and Arabic translation of it.

**Procedure:-**

Our procedure was as the following: first we had to take permission from the university administration to do our research on five collages . Then we took permission from students by writing on the first page of our questionnaire "The return of questionnaire will be considered as permission from the students to use the information in the research" . Also, we promised them to keep confidentiality of this information by writing " the confidentiality of information will be strictly maintained" .Then we did a pilot testing in ten students. After that, We fixed any problem in the questionnaire if there were any. finally we started distributing the questionnaire to the students from the five selected colleges "Medicine, Pharmacology, Engineering, Computer Science and Veterinary Medicine" .

**Material:-**

In material we are supposed to go to the students of the five selected colleges and introduce ourselves and our research .Then hand them questionnaire and ask him to fill and return it back. The questionnaire contains three sections. First section about Demographic information, the second section is about Tobacco use history and current behavior and the third and final section is about knowledge and attitudes .

**Gantt Chart (Timeline):-**

	Yes	9	18.0%	46	18.9%	2	28.6%	.799
	No	41	82.0%	197	81.1%	5	71.4%	

**Table 4:-** Anti-smoking campaign exposure in the last 1 year.

Crosstab													
Count													
		How many anti-smoking campaign have you seen in the last 1 year?											Total
		0	1	2	3	4	5	6	9	10	14	20	
smoking	Smoker	23	8	7	6	1	3	0	0	1	0	1	50
	Non-smoker	109	62	37	10	8	11	2	2	1	1	0	243
	Ex-smoker	2	2	0	2	0	1	0	0	0	0	0	7
Total		134	72	44	18	9	15	2	2	2	1	1	300

134 have not seen any anti-smoking campaign , 72 have seen only once , 44 have seen 2 and 50 have seen more than 2 campaigns.

### Discussion:-

Our study showed that most of participants knew about counseling option in cigarette smoking cessation. However there were significant difference ( $P < 0.05$ ) between (smokers 62%) and (non-smokers 83%) . But participants were less knowledgeable about pharmacological smoking cessation options. Only 18 % from smokers and non-smokers knew about Bupropion and Prozac. Participants were mostly knowledgeable about nicotine replacement therapy more than any pharmacological cigarette smoking cessation option (58% smokers) and (65.8% non-smokers). There is no difference ( $P > 0.05$ ) in the knowledge of pharmacological cigarette smoking cessations options between smokers and non-smokers. Only 58% of smokers think their chances of quitting would be doubled if they were advised to quit smoking. Only 54% of smokers think that nicotine is as addictive as other drugs , while 86% of non-smokers think it's addictive .There is significant difference between smokers and non-smokers ( $P < 0.05$ ). However there are no hard evidence that nicotine is as addictive as drugs like cocaine , some researches say it's and some say its not . It's controversial between Scientists and can't be used as argument for poor knowledge. 134 out of 300 of participants, which makes up 1/3 of them, have not seen ANY anti-smoking campaign in the past year! And 2/3 of participants have not seen more than 1 campaign.

### Limitation:-

Our sample size is 300 students from only 5 selected colleges. The time was very limited, because of exams and other assignments. We didn't have enough time to gather and analyze more sample size and take sample from all over the university colleges. Also our questionnaire was taken from other research that was "Smoking Cessation Knowledge and Clinical Cessation Techniques Among Medicine Residents" research done by Lisa Hope and we tried our best to modify and translate the questionnaire to suite research purpose.

### Conclusion:-

There were some significance in difference between the knowledge in counseling between smokers and non-smokers . However pharmacological cigarette smoker cessations options showed no significant difference between smokers and non-smokers. There were lack of anti-smoking campaign and 2/3 of participants have not seen more than 1 anti-smoking campaign advertisement.

### Recommendations:-

1. Perform a larger scale study for conformation
2. Educate smokers through seminars about smoking cessation options that it can reduce the withdrawal symptoms.
3. Increase the numbers of anti-smoking campaigns.
4. Use modern communication to raise awareness about smoking cessations options.
5. Anti-smoking campaign advertisements must be in a place were any person can see whatever his social , economic and education state.
6. Inform doctors to recommend and educate patients about cigarette smoking options.

 Final Accepted: 22 January 2017  
 Published: February 2017

#### Abstract

Energy consumes maximum cost in manufacturing so its management is important aspect which should be studied. Energy management deals with planning, organizing and implementation of energy resources to get maximum productivity. Energy management function should be integrated with organizational culture so as to attain cost effective utilization of resources. Energy conservation is an important part in eco-friendly production and defines ethics of organization towards environment. Energy audit process is carried out these days to study use and utilization of energy. Maintaining energy balance is principle which must be followed while managing energy. Technical and economic feasibility of energy should be studied while implementing projects so that cost effective utilization of resources can be possible. Global resource utilization can only be possible through managing and conserving energy reserves.

Copy Right, IJAR, 2017,. All rights reserved.

#### Research Methodology:-

The data used for research is secondary data obtained from publications, reports, and surveys by government, private and international organizations. The research is Descriptive, Exploratory and explanatory in nature for study of various dimensions related to energy and its management.

#### Objectives:-

- To study national and global energy consumption
- To study role of energy management function in an organization
- To study energy conservation techniques and methods
- To study energy audit method
- To study energy balance and its importance
- To study importance of integrating energy management function with organizational culture for global energy conservation.
- To study economic and technical feasibility of energy in manufacturing and production management process.

#### Introduction:-

Energy management deals with planning and operation of energy production and energy consumption units. As conservation of energy is becoming a global issue of concern it is important need to integrate energy management function with organizational structure so that energy management techniques can be developed and implemented properly. The central task of energy management in an organization is to reduce costs for the provision of energy in buildings and facilities without compromising work processes. Energy prices fluctuate constantly which can significantly affect energy bills in an organization. Poor energy procurement decisions costs organization a high

loss. Organization can control and reduce energy costs by taking a proactive and efficient approach in buying energy. Even a change in energy can be a profitable and eco-friendly alternative.

**Energy Consumption:-**

Sector wise Energy Consumption Pattern

Sectors	International Level	National Level	State Level
Industry	51.7%	29%	25%
Transport	26.6%	30%	0.6%
Domestic	13.9%	27%	49%
Commercial	7.8%	9%	17%
Others	0	5%	8.4%

(Source: World Energy Outlook 2014)

The main reasons for higher specific energy consumption in Indian industries are:

- Obsolete technology
- Lower capacity utilization
- Causal metering and monitoring of energy consumption
- Lower automation
- Raw material quality and poor handling
- Operating and maintenance practices
- Lack of knowledge/awareness among the employees

**Energy procurement:-**

**Eliminate Waste:-**

Ensure that energy is used at the highest possible efficiency.

**Maximize Efficiency:-**

Utilize the most appropriate technology to meet organizational needs. **Optimize Supply:** Purchase or supply energy at the lowest possible cost. Energy management practices may vary from simple maintenance and operational activities that ensure equipment and systems use energy efficiently and effectively, to capital intensive installation of new, more efficient technology.

**Energy audit:-**

Energy audit is an inspection, analysis and survey of energy flows energy for buildings, process or system. The audit process starts by collecting information about a facility’s operation and about its past record of utility bills. This data

is then analyzed to get a picture of how the facility uses and possibly wastes energy, as well as to help the auditor learn what areas to examine to reduce. In any industry the top most three expenses are on energy whether its energy, labour and material.

If one were to relate cost which can be manageable or potential cost of savings in each of the above components, energy would be invariably top ranker in cost and thus energy management function constitutes a strategic area for cost reduction. The energy audit would give a positive orientation towards cost reduction, preventive maintenance and quality control.

#### Dimensions of energy Audit:-

- **energy as a system** – to study natural role, laws and use of energy for its judicious use and energy resource utilisation.
- **Conversion**- It accounts for energy input, storage, conversion, waste, sales and consumption.
- **Statistics measurement**- measures instruments, calibration, measuring rate, and instrument management. This also includes the scope of energy report, frequency of submission, breakdown level, depth of analysis, etc.
- **indicators of energy consumptions**– it accounts for a company's energy consumption, but not its energy inputs.
- **Operating efficiency** – operating techniques and its efficiency in production process.
- **Energy consumption during manufacturing** - includes consumption per unit of output value, per unit of product, direct and indirect energy consumption and energy consumption per comparable unit product.
- **Energy cost indicators** - multiplies energy consumption by energy price.
- **Energy savings techniques and methods**- differentiates actual energy consumption and benchmark consumption. Setting energy usage standards and its implementing procedures.
- **Economic analysis of energy-saving projects** – makes a comparative analysis of energy economic costs for similar products and conditions. Analysis of energy feasibility of project.

#### Identification of Energy Conservation Opportunities:-

- **Fuel substitution:** Identifying the appropriate fuel for efficient energy conversion, finding substitutes for rare and costly fuels and energy sources.
- **Energy generation :** Identifying Efficiency opportunities in energy conversion equipment/utility such as captive power generation, steam generation in boilers, thermic fluid heating, optimal loading of DG sets, minimum excess air combustion with boilers/thermic fluid heating, optimizing existing efficiencies, efficient energy conversion equipment, biomass gasifiers, Cogeneration, high efficiency DG sets, etc.

- **Energy distribution and supply management:** Identifying Efficiency opportunities network such as transformers, cables, switchgears and power factor improvement in electrical systems and chilled water, cooling water, hot water, compressed air, Etc.
- **Energy usage by processes:** This is where the major opportunity for improvement and many of them are hidden. Process analysis is useful tool for process integration measures.
- **Technical and Economic feasibility**

**The technical feasibility should address the following issues:-**

1. Technology availability, space, skilled manpower, reliability, service etc
2. The impact of energy efficiency measure on safety, quality, production or process.
3. The maintenance requirements and spares availability

It is observed that 25% of energy cost can be saved if energy management techniques are applied in various manufacturing and production functions.

- Logistics: it is an important factor of energy consumption as transport of goods and products requires large consumption of fuels.
- Supply chain management: if proper supply chain management techniques are applied wastage of energy can be prevented.
- Production planning and control: planning organizing and directing energy resources towards cost effective production techniques.
- Material Management: adequate procurement and storage of material if implied properly can utilize energy and prevents its over use.

**Findings:-**

- Increasing energy consumption is felt throughout globe in recent years of industrialization.
- Energy management function is gaining popularity in organization due to its key task of cost reduction.
- Energy conservation is must for eco-friendly production and manufacturing process.
- Energy audit and energy inspection techniques are necessary for cost effective production.
- There should be integrating of energy management function with organizational culture for global energy conservation.
- The economic and technical feasibility plays important aspect of energy conservation and cost reduction in manufacturing and production industries.
- Energy balance: it studies amount of energy used by a site or unit, its supply and its utilization. It deals with how much amount of energy is supplied or used and how much should be supplied or consumed

**Conclusion:-**

Global energy scarcity is issue of concern that's why energy conservation and energy management has got prime important in many countries. For Cost effective production and manufacturing, energy management function should be implemented in organizational culture. Energy audit is an investigative and analytical part of energy management which is gaining popularity. Ethical standards should be implemented to control overall energy consumption in organization. Maintaining energy balance is must to utilize energy resources in standard and gain maximum profit. Technical and economic feasibility should be studied while implementing manufacturing techniques and production processes. Global resource utilization is possible only if energy reserves are managed properly.

#### *Abstract*

**Introduction:** Fever is a very common and basic symptom in pediatric population. Parents reaction to fever might put their child under risk of chronic hepatic toxicity in case of inappropriate use of antipyretics. We aimed to evaluate knowledge and attitude of care givers in Madina region toward a febrile child to determine if there is a risk of chronic acetaminophen hepatic toxicity.

**Methodology:** A cross sectional study was conducted, questionnaire was used as a collecting tool (electronic and paper based) Pilot study and pre-test has been done to clarify any ambiguous question. Specific coding mechanism was set, data were analyzed using the Statistical Package for the Social Sciences (SPSS) program.

**Results:** The vast majority of parents know their children's weight and they know the exact definition of fever. However, their knowledge about antipyretics in different routes of administration, duration between different doses regardless of the route and their action in case of persistence of fever in terms of the use of cold compression, are not satisfactory for a symptom which is very common like fever.

**Conclusion and Recommendations:** Physicians and pharmacists must explain to parents the appropriate dosing method of over the counter antipyretics.

It is preferable that these medications are suspended based on physician's prescription. Otherwise, Preparations which might lead to chronic liver toxicity should be replaced by other safe medications.

#### **Introduction:-**

Fever is a very common and basic symptom in pediatric population. Although it is a reflection of a good immune system to some extent, it might be a red flag for a serious condition.

Over counter antipyretics are common all over the world. However, reaction of care givers toward a child with fever are variable, their definition of fever is not necessarily clear specially with different measuring scale options. Doses and intervals in between might vary as well particularly if they use different routes of administration.

**Corresponding Author:- Khaled Alghamdi.**

Address:- Lecturer of Pediatrics, Taibah University, Madina, Saudi Arabia.

Chronic liver toxicity in children whom are exposed to higher doses of acetaminophen is a significant health care issue that seems to be under investigated. We aimed to evaluate the current attitude of parents towards a febrile child. This is to highlight the importance of increasing the awareness of the society about the proper ways to control fever in children.

Acetaminophen doses of 10 to 15 mg/kg per dose given every 4 to 6 hours orally are generally safe and effective.

Ibuprofen (10 mg/kg per dose) is at least as effective as or more effective than, acetaminophen (15 mg/kg per dose) in lowering body temperature when either drug is used as a single or repetitive dose. <sup>(1)</sup>

There is no evidence to indicate a significant difference in the safety of standard doses of ibuprofen and acetaminophen in healthy children between 6 months and 12 years of age with fever.

However, Data are inadequate to support a specific recommendation for the use of ibuprofen for fever or pain in infants younger than 6 months. <sup>(1)</sup>

No consistent evidence has indicated that the use of an initial loading dose of acetaminophen by either the oral (30 mg/kg per dose) or rectal (40 mg/kg per dose) route improves antipyretic efficacy. <sup>(2)</sup>

Although hepatotoxicity with acetaminophen at recommended doses has been reported rarely, hepatotoxicity is most commonly seen in the setting of an acute overdose. However, there is a significant concern of acetaminophen-related hepatitis in chronic acetaminophen overdose. The most commonly reported scenarios are those of children receiving multiple supratherapeutic doses or frequent administration of appropriate single doses at intervals of less than 4 hours (ie, >15 mg/kg per dose or more than 90 mg/kg per day for several days ).

In 1 case series, half of the children with hepatotoxicity had received adult preparations of acetaminophen. <sup>(3,4)</sup> On the other hand, nephrotoxicity is reported in numerous case reports in children with fever who treated with ibuprofen. Thus, caution is encouraged when using ibuprofen in children with dehydration or with complex medical illnesses. <sup>(5,6)</sup>

Although there is some evidence that combination therapy may result in a lower body temperature for a greater period of time, there is no evidence that combination therapy results in overall improvement in other clinical outcomes.

The possibility that parents will either not receive or not understand dosing instructions, combined with the wide array of formulations that contain these drugs, increases the potential for inaccurate dosing or overdosing. Finally, this practice may only promote the fever phobia that already exists. <sup>(7,8)</sup>

## **Methods:-**

A cross sectional study was conducted in Madina Region, Saudi Arabia, on February-April 2016. We chose our sample using random sampling method. We excluded people living outside Madina region. We used the questionnaire as a collecting tool (electronic and paper based questionnaire). This questionnaire reached to our target group through social media as well as, in the public places and waiting areas of pediatric hospitals in Madina.

Before starting with our observation process, we explained the purpose of our study. Validity and reliability has been taken into account. Pilot study and pre-test has been done to clarify any ambiguous question.

Ambiguous questions were explained to parents who were interviewed in the waiting areas and a contact number of the research supervisor was added to the electronic form in order to answer any question parents might have.

First paper of the questionnaire was a consent form to accept the participation in the study.

The variables were the (age ,sex ,weight, level of parent's education and questions about how do parents deal with a febrile child).

By using specific coding mechanism we will collect the data suitable for analysis using the Statistical Package for the Social Sciences (SPSS) program.

Study was approved by the ethical committee at Taibah University.

Family History of Liver Disease	4.4
	6.3

Parents who measure their children's temperature were (80.7 %), on the other hand (19.3 %) of them do not,(6.59% )of parents, measure their children's temperature by under the tongue measuring method, (56.98%) by armpit and (36.43%) by auricle.

(4.11%) consider 37 degrees centigrade as a fever, (28.48%) consider 37.5 degrees centigrade and (67.41)% consider the child febrile when his temperature reaches 38 degrees centigrade. (79.75%) give antipyretic orally first and (42.1 %) start with suppository antipyretic. (37.97%) seek medical advice when fever persists despite antipyretics, while (62.03%) they don't.

**Figure 1:-** Type of oral antipyretic using trade name.

Dose of antipyretic was determined in(57.59%) by the pediatrician,(17.41%) by the pharmacist and (25%)of parents determine it by themselves.(65.82%) of parents determine the dose based on the age of their children, (24.37%) determine it based on the weight and (9.81%) they determine it based on degree of the temperature. (13.9%) of parents don't know their children's weight.

In case of persistence of fever despite the use of oral antipyretics, (84%) of parents give their children anal suppository and (16%) add another type of oral antipyretic. (19.94%) of parents give the next dose of antipyretic after less than 4 hours from last dose and (80.08%) give them after more than 4 hours .

(79.1%) of children receive an antibiotic when the fever doesn't subside. While (20.9%) of children don't receive an antibiotic. (14.13%) of parents that give their children an antibiotic when the fever continues without prescription , while (85.87%) seek medical advice before giving an antibiotic.

(85.44%) of parents use cold compresses to reduce their children's body temperature, while (14.56%) they don't. (68.52%) in case of using cold compresses use a room temperature water . While (31.48%) use a cold water or ice.

### Discussion:-

The vast majority of parents know their children's weight and they know the exact definition of fever. However, their knowledge about antipyretics in different routes of administration, duration between different doses regardless of the route and their action in case of persistence of fever in terms of the use of cold compression, are not satisfactory for a symptom which is very common like fever.

Although most of the parents answered the question of who describe the medication appropriately, they answered the next question of based on what inappropriately. That might indicate either parents selected the ideal answer or physicians didn't explain the importance of prescribing antipyretics based on patient's weight.

The good thing that the majority who selected the option of antibiotics answered the next question of prescribe it appropriately.

The other good thing is that most of the children who are exposed to frequent inappropriate doses of antipyretics have in majority no risk factors of chronic liver disease but still chronic acetaminophen toxicity is a major concern.

### Conclusion and Recommendations:-

Physicians and pharmacists must explain to parents the appropriate dosing method of over the counter antipyretics.

It is preferable that these medications are suspended based on physician's prescription. Otherwise, Preparations which might lead to chronic liver toxicity should be replaced by other safe medications.

Education about actions when fever persists must be encouraged in every mean as the knowledge about dealing with febrile patient is less than the expected level.

#### Abstract

We describe a case of aplastic crisis caused by parvovirus B19 in an adult sickle-cell patient presenting with Fever, abdominal pain and headache. Reticulocytopenia in patients with Sickle-cell disease suggests B19 infection where Anti-B19 IgM and IgG were detected

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction: -

Parvovirus B19 is a small single stranded DNA virus that infects and replicates in erythroid progenitor cells of the bone marrow and blood, leading to inhibition of erythropoiesis<sup>[1]</sup>. It causes aplastic crisis by inhibiting erythroid series formation through the pathogen's direct cytotoxic effect on erythroid burst and colony forming units. B19 commonly infects rapidly dividing cells such as bone marrow or developing fetal tissues<sup>[2]</sup>. It is now recognized as an important human pathogen causing transient aplastic crisis (TAC) in chronic hemolytic anemia patients. This clinical presentation is related to the tropism of the virus for bone marrow precursors, mainly erythroblasts<sup>[1]</sup>. During an acute infection, this results in a significant drop in hematocrit. In healthy individuals, RBC production returns in 10 to 14 days. However, in individuals with an increased RBC turnover, even a limited cessation of RBC production can lead to a clinically significant drop in hemoglobin and transient aplastic crisis (TAC)<sup>[3]</sup>. Severe anemia is most likely to occur in individuals with underlying hemolytic anemia (e.g. sickle cell disease, hereditary spherocytosis)<sup>[4]</sup>.

#### Case Report: -

A nineteen years old Saudi female from Al-Khobar and living there. Admitted to the KFHU through ER when she was complaining of abdominal pain and fever for 5 days duration.

The patient is a known case of sickle cell disease and G6PD deficiency since childhood. She was on folic acid 1 tablet/day. The patient gave history of recurrent attacks of Vaso-occlusive painful crisis (VOC) for more than 12 times per year since childhood, which decreased 1-2 attacks per year during the last 4 years. The attacks were precipitated by cold and stress and it were managed in the ER with analgesic and IV fluids. Also, she has a history of recurrent admission to the hospital 1-2 times per year. Last admission was one year back. There is no previous history of ICU admission. She had blood transfusion when she was 10 years old. No history of previous surgery.

Six days prior to the presentation, the patient started to have fever that was about 38.1C<sup>o</sup>, which associated with chills and headache. Also, the patient gave a history of watery diarrhea 3 to 4 times per day not associated with blood or mucus. There was no chest pain, shortness of breath, palpitations, sweating, or meningeal signs. She sought medical advice in a private hospital where blood investigations were done. She had been managed by Paracetamol and antibiotics where the fever subsided.

Three days later she started to have acute progressive continuous right hypochondrial pain not related to food or specific position, localized not radiating to other site. The pain was associated with nausea and vomiting moderate amount with no hematemesis or diarrhea. No history of similar symptoms in the family. She went to the ER where she was managed by IV fluid and analgesia.

At the day of presentation she came to the ER complaining of worsening of the abdominal pain not associated with nausea or vomiting.

### **Physical Examination: -**

Physical examination reveals a well-developed, alert, and oriented woman in pain. Her blood pressure was 110/70 mmHg, pulse 110 bpm, respiratory rate was 20 bpm and temperature was 37.7°C. The patient had pale conjunctiva without jaundice. Chest examination is normal EAE. Cardiac examination shows normal S1, S2 with grade III/VI systolic murmur at pulmonary area. Abdominal examination reveals soft and lax abdomen with mild tenderness in the right hypochondrial area and no hepatosplenomegaly.

Laboratory evaluation was performed on admission to the hospital. The patient's hemoglobin was 3.9 g/dL, the hematocrit was 11.1%, RBC was 1.2, platelet count was 148, reticulocyte 1.9%, and the leukocyte count was normal. Results of blood chemistry, urinalysis, chest radiography and abdominal ultrasound were normal.

### **Management:-**

On admission, the patient was treated with oral analgesics and IV fluids. After obtaining the blood cultures, IV antibiotic therapy was started. Also the patient is transfused with 3 units of packed RBC. Her hemoglobin increased to 8.3 g/dL. Acute parvovirus B19 infection is suspected and confirmed by B19-specific serology that reveals an IgM value of 86.27u/ml (positive value >11) and IgG of 21.93u/ml (positive value >11u/ml). The patient's pain and fever resolve by the 2<sup>nd</sup> day of admission. She had been discharged on 4<sup>th</sup> day of admission afebrile with no headache or pain on antibiotic.

### **Discussion: -**

Parvovirus B19 commonly infects rapidly dividing cells such as bone marrow or developing fetal tissues. Infection is most frequently found in the late winter or early spring. As parvovirus DNA has been found in respiratory secretions at the time of viremia, the most common route of transmission appears to be respiratory<sup>[5]</sup>.

Here we describe parvovirus infection in an adult with sickle cell anemia. After reviewing the literature and reported cases, we found that usually the infection occur during childhood or early adolescence. The peak incidence rates occur in 6 to 14-year-old<sup>[5]</sup>, but rarely during adulthood. Parvovirus infection causes transient aplastic crisis in patients with hemolytic anemia such as sickle cell anemia, hereditary spherocytosis and thalassemia. Clinical presentation may vary depending on the extent of the infection. Usually they present with severe symptomatic anemia secondary to the massive drop in hemoglobin level. Other presentation could be due to drop in leucocytes count or platelet count. In the case we described here the patient presented with vague symptoms such as abdominal pain, fatigue and symptomatic anemia. Upon laboratory investigations a drop on hemoglobin level with accompanying reticulocytopenia will raise the suspicion of parvovirus infection in those patients, other cell lineage might be affected too, inducing leucopenia or thrombocytopenia.

Serum IgM testing is recommended to diagnose acute viral infection in immunocompetent patients, with 89 percent sensitivity and 99 percent specificity. Elevated IgM antibodies will remain detectable for two to three months after acute infection. IgG testing is less useful because it only indicates previous infection and immunity<sup>[6]</sup>.

### **Conclusion:-**

Anemia with reticulocytopenia in patients with hemoglobinopathies and in immunocompromised hosts (e.g. patients with AIDS, transplant recipients) should alert the clinician to the possibility of parvovirus B19 infection. Tests are available to confirm the diagnosis. Management includes packed red cell transfusions and, in cases of immunocompromised patients, administration of intravenous immunoglobulin<sup>[7]</sup>.

#### Abstract

Pancreatic cancer is a lethal disease, presenting in the old age. We describe a rare case of a young male patient presenting with fever of unknown origin and found to have pancreatic cancer. Upon review of literature, only one case was reported.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction: -

Pancreatic cancer is one of the most notorious diseases. It ranks as the 4<sup>th</sup> cause of cancer-related death. In the US, in 2009, an estimated 42,470 new patients were diagnosed with pancreatic cancer (21,050 men and 21,420 women), with 35,240 deaths from it (18,030 men and 17,210 women).<sup>[1]</sup> Between 2002 and 2006, the median age at diagnosis was 72 years and the median age at death was 73 years for cancer of the pancreas. The age-adjusted incidence rate in this period was 13.1 per 100,000 men and 10.4 per 100,000 women per year.<sup>[2],[3]</sup> In Saudi Arabia, pancreatic cancer represents 1.75% of all cancers with 1585 registered cases from 1994 to 2007 accounting 2.5% for males and 1.1% for females of all types of cancer and it is the fifth most prevalent gastrointestinal cancer among Saudis. The median age at diagnosis was 63-year-old ranging from 15-96 years. [4] The most recognizable risk factor for pancreatic cancer was cigarette smoking. Hereditary pancreatic cancer occurs in 5-10% of cases and it occurs at earlier age and usually associated with other syndromes like hereditary pancreatitis, Peutz-Jeghers syndrome, familial atypical multiple mole melanoma, familial breast cancer syndrome, and hereditary non-polyposis colorectal cancer syndrome.

Pancreatic adenocarcinoma is the most common pathological type and it's 80% located in the head of the pancreas. It usually presents with jaundice, abdominal pain, anorexia, cachexia, new onset diabetes mellitus and venous thromboembolism. Fever as the initial presentation is rare and scarcely described in literature. Therefore, we here report a case of pancreatic adenocarcinoma diagnosed in a young patient and presenting as fever at time of diagnosis.

#### Case Report: -

We report a case of a 29 year-old male who works as an office clerk in Ministry of Health, who presented to the ED of King Fahad University Hospital (KFUH) with history of fever (39°C), anorexia, weight loss of 7 Kg, RUQ abdominal pain and jaundice for 6 weeks. He denied history of diarrhea and arthralgia.

On physical examination, a young, malnourished gentleman lying in bed, conscious and alert, apparently looking jaundiced and pale. Temperature was 39° c at presentation with no chills. Abdominal examination revealed hepatomegaly (16 cm liver span), however, no splenomegaly or ascites.

**Corresponding Author:-Dr. Ali Al-Amri.**

Address:-Oncology Associate consultant professor at Imam Abdulrahman Bin Faisal University – Dammam.

The patient has no significant past medical history except for cigarette smoking 1 pack/year for the past 10 years. No history of contact with febrile patient, alcohol consumption, blood transfusion, IV drug abuse or recent history of travel. There was only a brief exposure to cattle in a farm but no raw milk ingestion. No personal or family history of cancers.

Patient was extensively investigated. Laboratory work up results are summarized in Table 1.

Test	Result
Complete Blood Count	Leukocytosis: $11.1 \times 10^3$ cells/mm <sup>3</sup> Neutrophilic predominance 79% Hemoglobin: 10.8 g/dL MCV: 80.6 fL
Liver function Test, Amylase and Lipase	Hyperbilirubinemia: Total bilirubin 5 mg/dL, direct bilirubin 4.3 mg/dL Albumin: 2 g/dL Lactate dehydrogenase: 1141 U/L Gamma-gultamyltransferase: 381 U/L Alkaline phosphatase: 334 U/L Aspartate aminotransferase: 83 U/L Alanine aminotransferase: 35 U/L Amylase: 27 U/L Lipase: 123 U/L
Septic work up	Repeated blood culture: no growth. Malaria smear, hepatitis profile, monospot test, EBV serology, HIV serology and echinococcus serology all were negative. Brucella serology was 1:320
Inflammatory markers	ESR: 120 h/mm CRP: 21.1 mg /L
Autoimmune markers	ANA, ANCA, RF,AMA and ASMA* all were negative.
Cancer markers	CA 19-9 : 2289 AFP and CEA not elevated
Random Blood Sugar	93 mg/dL

\* ANA: Antinuclear Antibody, ANCA: Antinuclear cytoplasmic antibody, RF: Rheumatoid factor, AMA: Antimitochondrial antibody and ASMA: Antismooth muscle antibody.

Abdominal ultrasonography revealed multiple hypoechoic lesions in the liver and hepatomegaly. Gallbladder, kidneys were normal and no free fluid collection in the abdomen (Figure 1). A computed topography (CT) scan with contrast was requested and revealed bilateral cervical lymphadenopathy, hepatomegaly and multiple hypodense lesions of variable size and density involving both right and left hepatic lobes (Figure 2). Also, a necrotic, cystic mass lesion was noted in the head of the pancreas, measuring 3x2.8x2.4 cm in its transverse, antero-posterior and cranio-caudal dimensions, there is adjacent necrotic lymph node in the pancreatic bed (Figure 3). No splenomegaly or ascites noted.

**Figure 1:-** US showing multiple hypoechoic lesions in the liver.

**Figure 2:-** CT scan showing multiple Hypodense lesions in the liver.

**Figure 3:-** CT scan showing mass in the pancreatic head.

The case was approached by a multidisciplinary team involving Infectious disease team and Gastroenterology team. Initial management plan was to start the patient on antibiotic regimen for brucellosis, Doxycycline and rifampicin were given for 6 weeks with no improvement of symptoms. A suspicion of malignancy leadthe team to carry out an ultrasound- guided liver biopsy and it revealed multiple metastatic clusters and cords of anaplastic malignant epithelial cells dispersed in a desmoplastic stroma. Extensive tumor necrosis was noted.

Oncology team was consulted and assessed the case. The treatment suggested was perusing palliative care with analgesia and chemotherapy in the form of gemcitabine and erlotinib, which is not available at our hospital. Patient was referred to a tertiary care hospital for perusing chemotherapy.

**Discussion: -**

Fever of unknown origin (FUO) is defined as temperature  $\geq 38.5^{\circ}\text{C}$  for  $\geq 3$  weeks in a healthy immunocompetent individual despite a 1-week extensive investigation. Infection accounts for the most cases of FUO, followed by neoplastic fever. Neoplastic fever is a common presentation of certain malignancies like hematological, colon and renal cancers. Neoplastic fever is noted especially in metastatic malignancies. [5] Therefore, we report our rare case of a young patient presenting with fever as the main presentation of pancreatic cancer.

There are multiple mechanisms to explain fever in setting of malignancy. Infection is the usual precipitant, however, neoplastic fever can be induced by the tumor related release of pro-inflammatory cytokines. Also, aggressive body immunological response mounted against tumor with leukocytosis add to the production of pyrogens.

Pancreatic cancer is a disease of the old population. Early onset pancreatic cancer (EOPC) is defined as pancreatic cancer in  $\leq 50$  years of age. Several risk factors have been linked to the susceptibility for developing pancreatic cancer at a younger age, among them, smoking and genetic factors were the key players. In a case control study conducted by Hassan MM et al., there was a 60% greater risk among the ever-smokers. [6]

EOPC usually presents as a poorly differentiated adenocarcinoma with distant metastases. In a retrospective analysis of consecutive cases of patients with EOPC, 61% had poorly differentiated pathology and 84% had metastatic unresectable disease at time of diagnosis. [7]

Pancreatic adenocarcinoma in the young carries a poor prognosis with average survival as short as 5 months unfortunately. The patient is offered a palliative care in the form of analgesia and chemotherapy.

**Conclusion: -**

We conclude that pancreatic adenocarcinoma can present in earlier age with smoking and genetic susceptibility being the most critical risk factors. In addition, we found that pancreatic adenocarcinoma can present with fever of unknown origin.

#### Abstract

In response to the financial crisis in 2008, the Federal Reserve implemented all possible monetary policies without significant success. The result was the presentation of the quantitative easing (QE) policy, which is a monetary policy where the Federal Reserve purchases mid-to long-term bonds and thus liquidates the market and increases money supply. This paper will illustrate how the quantitative easing benefitted the US economy to overcome the financial crisis. It will illustrate difficulties that QE has not solved like a strong increase in national debt along with US companies' hoarding large amounts of cash abroad, which has made the mission of recovery very difficult for the Federal Reserve. Lastly, it will look at potential solutions besides QE to stabilize the United States economy.

*Copy Right, IJAR, 2017,. All rights reserved.*

#### Introduction:-

Quantitative Easing (QE) is a monetary policy where Federal Reserve purchases mid-to long-term bonds and thus liquidates the market and increases money supply (Lu, 2013). The cause behind QE is due to banks holding immense amounts of excess reserves. One reason banks retain large amounts of excess reserves is that there is a weak loan demand associated with regulatory uncertainty alongside a slow recovery of the economy. Another motive is the unprofitability to lend loans since interest rates are at or below cost of capital, which more likely will lead to a potential loss (Thornton, 2010).

One of the reasons QE occurred was that the previously implemented monetary policy of setting interest rates between 0-0.25percent did not lead to the anticipated relief in the market (Farley& Juvenal, Quantitative Easing: Lessons We've Learned, 2012). In addition, other measures were pursued with the same negative outcome. As a last resort, the Federal Reserve under Bernanke implemented the first quantitative easing measure on November 25<sup>th</sup>, 2008.

There were three main problems the QE was supposed to solve, 1) stop the economy from worsening, 2) stabilize various industries and markets in the United States, and 3) improve and create growth throughout the United States economy.

The decision to implement the quantitative easing was difficult since there wasn't much data on prior integrations and its success rate. One could only speculate the consequences but the Federal Reserve under Bernanke valued the risk of implementation lower than the alternative of not doing anything additionally. An indication of success can be found by assessing the United States unemployment rate from 2006 to 2014. As a reminder the crisis didn't start until late 2007 and the first quantitative easing wave was released late 2008.

**Corresponding Author:- Sandeep Sehrawat.**

Address:- Assistant Professor, Satyawati College [Evening], D.U., Ashok Vihar, Phase-III, Delhi-110052, India.

It can be observed that after 2010 the unemployment rate has consistently decreased and has reached 6.7 percent in March 2014. This indicates that the quantitative easing policy did benefit the economy by decreasing unemployment although it is not back to pre-crisis levels, it is moving in that direction.

Besides the unemployment rate decreasing, an improvement in the gross domestic product (GDP) has been observed. The GDP is a significant measure because it provides a good indication of the growth of a country. In 2008, the United States GDP depreciated 3.3 percent, which revealed the actual impact of the financial crisis, especially since the Federal Reserve anticipated growth of 2.4 percent (Silver, 2012). One of the reasons that this unfitting forecast occurred was that the economists of the Federal Reserve often overestimate forecasts to protect themselves and their names as economists (Silver, 2012). In addition, it is a very difficult job as an economist to forecast future growth based off economic statistics alone since there are so many variables they potentially have to account for. Although the forecast was falsely projected and the economy slid into a recession, it showed the positive impact QE had on the United States GDP. As observed in the unemployment and GDP, the financial crisis had its worst impact on the United States economy in 2009.

### Concerns In Qe:-

There have been multiple indications that the quantitative easing policy was a beneficial choice to prevail the impending crisis. Although this is true there are a variety of concerns for the future.

One of these concerns is inflation. The idea behind quantitative easing was to avoid deflation by buying mortgage based securities (Dabrowski, 2010). This did prevent deflation but buying mortgage based securities means that more money is put into circulation, which by definition should increase the inflation rate. Authorities feared that this increase in monetary flow could potentially cause a hyperinflation as experienced by Germany in 1919.

Another prevailing concern besides inflation is the fact that US companies are holding over \$1.5 trillion in cash abroad due to the high corporate taxes in the United States (Kaisaris, 2013). This has been a major setback to the US economy and the Federal Reserve since the economy would greatly benefit from this amount of cash flow. But US companies do not see any reason to lose 35% of their revenue through corporate taxes; therefore they leave their cash in foreign subsidiaries (Kaisaris, 2013). With that said, US businesses will maintain their cash back abroad unless the United States decreases its corporate tax rate to a more competitive rate as of 15-20 percent (Kaisaris, 2013).

Beside the concerns of inflation and foreign cash stacks, the United States should pay close attention to its rapidly increasing debt rate. Although the quantitative easing by the Federal Reserve has been effective in decreasing the unemployment rate as well as increasing the gross domestic product, it led to a high increase in expenditure by the Federal Reserve. It is shown how rapidly the Federal Reserve expenditure has grown since 2002. It prevailed that the Federal Reserve has increased their output from around \$850 billion in 2007 to \$4,100 billion in 2013; this is a substantial increase of over \$3 trillion in five years (Farley & Neely, Four Stories of Quantitative Easing, 2013). This expenditure can be directly correlated to the national debt of the United States, which has been increasing since the early 2000s but took a significant leap since 2009.

As we can see the National Debt has severely increased over the last decade and has surpassed the annual GDP. Currently the National Debt is 1.0153 times greater than the GDP of the United States, which could lead to tensions in the future if the budget doesn't get improved accordingly. In addition, it is seen that the GDP to debt ratio of the United States has rapidly worsened since the implementation of QE in 2008.

As we can see the Federal Reserve had to make a trade-off by improving the economy in the expense of heavily increasing debt. The QE policy is stated to stay in effect till 2015, but what will happen afterwards? This question is difficult to answer, but one thing seems certain to occur and that is uncertainty. If the United States does not continue to grow at the anticipated rates it will cause questions about the stability of the United States economy. It is also difficult to forecast how long the United States will need to figure out their debt and budget reduction. The US might lose its financial status of a safe haven and might be downgraded even further by rating institutes like Moody. With that said, research by Yangzi Lu has shown that there is a solution to reduce any potential uncertainty and benefit the US financially, which would be by developing and implementing a world currency (Lu, 2013).

### Alternatives To Qe:-

In this paper, there is a discussion on the effects of the quantitative easing implementation and described research that documents how QE has been beneficial in stabilising and improving the United States economy. One of the main issues with the accomplishment is the expenditure by the US government that had to be implemented to realize this task. The reason why this high expenditure has not affected the United States, as it has other countries like Greece, is that the United States uses its “sovereign currency as the international reserve currency” (Lu, 2013). Before the US dollar became the international reserve currency, precious metals were the international reserve currency. Due to the complex outreach of today’s world economy the possibility of returning to precious metals as the international reserve currency is not an option anymore, instead something new should be established that has no direct link to any sovereign country (Lu, 2013). This new establishment has been perceived as a World Currency. The advantages of it would include more certainty in the world economy, stabilization of the United States and no interference of politics involvement.

An increased amount of certainty could singlehandedly be worth the transition to a world currency. In today’s difficult economy, entities always look to the big countries like the United States, China or Germany for advice and more importantly financial support. But if a country like the United States is heavily struggling itself and needs all its resources for themselves, where should these other countries or the United States itself seek assistance? In the case of a world currency, countries could look for support from the world currency rather than be reliant on the larger nations. This improved environment would benefit investors since that would have the trust and certainty that every country was overseen and protected by an independent entity. A board of directors could lead this entity similarly to the International Monetary Fund.

There are several factors that could benefit the United States and the rest of the world from having a world currency; there are also factors that speak against an implementation. The most important factor being that the United States would lose their financial independence and leverage over every country linked to the US dollar. In addition, a more radical budget restructure would have to be enforced similar to what was seen in Greece, Ireland, and Island because the United States would not have their financial leverage anymore. Because this would be devastating to the United States and its economy, it is the main reasons why a world currency will not be enforced anytime soon.

### Conclusion:-

This paper tries to find out the reasoning behind the implementation of quantitative easing. It looked at the benefits it created with stopping the financial crisis from getting worse. The unemployment rate has been decreasing since the implementation along with the gross domestic product increasing. Although there were many benefits from QE there have been deficits as well, as the heavily increase of Federal Reserve expenditure that caused the national debt of the United States to surpass the gross domestic product. A potential solution of the dilemma would be to implement a world currency as the international reserve currency, relieving the US dollar from that role. Although this could be very beneficial for the United States and other countries, it will not be implemented any time soon since the United States would lose all its financial leverage. At this time the US cannot afford to lose that leverage since that would cause economy turmoil and lead right back into a recession.

##### Key words:-

Dexmedetomidine, butorphanol, day care, analgesia, Ramsay Sedation Score.

#### Abstract

**Background And Goals:** Development of selective alpha 2 adrenoceptor agonists may provide a new concept for the administration of perioperative anaesthesia & analgesia in day care surgeries. Goal of this study was to compare Inj.Dexmedetomidine&Inj.Butorphanol with respect to time required for onset & offset of sedation, quality of intraoperative as well as postoperative analgesia & the time required for post-operative recovery.

**Methods:** After obtaining permission from Institutional Ethical Committee (IEC), study was conducted in 40 patients of ASA I and II divided into 2 groups A & B by computer generated random number table. Patients, in group A received injDexmedetomidine 1 mcg/kg i.v and group B received inj.Butorphanol 10 mcg/kg i.v, in infusion over 10 minutes prior to induction. Induction was done with injPropofol i.v 2mg/kg & maintained with 33% O<sub>2</sub>, 66%N<sub>2</sub>O & 0.6-0.8% of isoflurane with patient breathing spontaneously. Throughout the surgery the sedation and analgesia was maintained with injDexmedetomidine 0.7 microgram/kg/hr infusion in group A and with injButorphanol 2 microgram/kg/hr in group B. Patients were evaluated in postoperative recovery room with help of Visual Analogue Scale (VAS) for pain, Ramsay Sedation Score & Standard Aldrete Score for recovery.

**Results:** Demographically, the two groups were similar. Requirement of inhalational anaesthetic agents was significantly reduced in the group A ( $p < 0.05$ ). VAS was significantly less (2.75  $\diamond$  0.44) in the group B after 90 min and earlier rescue analgesia was given in group A ( $p < 0.05$ ). Eye opening was earlier (45.5  $\diamond$  23.61) in group A and was highly significant ( $p < 0.001$ ). Postop recovery was significantly improved (9.8  $\diamond$  0.41) with dexmedetomidine group. **Conclusion:** Dexmedetomidine produces better sedation and analgesia without significant adverse effects and can be used as sole sedative and analgesic for day care surgery patients with better recovery.

**Introduction:-**

Pain is “an unpleasant sensory and emotional experience associated with actual or potential tissue damage, or described in terms of such damage.”<sup>[1]</sup>

Dexmedetomidine is the dextrorotatory *s*-enantiomer of medetomidine. It is a  $\alpha$ -2 agonist. Use of  $\alpha$ -2 adrenoceptor agonist is not new, it dates back to 1960's but it was approved in December 1999, as the most recent agent in this group and was introduced into clinical practice as a short-term sedative (<24 hours). The development of new, more selective  $\alpha$ -2-adrenoceptor agonists with improved side effect profiles may provide a new concept for the administration of perioperative anesthesia and analgesia.

Dexmedetomidine, mechanism of action is unique and differs from those of currently used sedative agents, including clonidine. By binding to the presynaptic alpha-2 adrenoceptor, it inhibits the release of norepinephrine, therefore, terminate the propagation of pain signals. Activation of the postsynaptic alpha-2 decrease sympathetic tone, with attenuation of the neuroendocrine and hemodynamic responses to anesthesia and surgery; reduce anesthetic and opioid requirements; and cause sedation and analgesia. They allow psychometric function to be preserved while letting the patient rest comfortably.

Butorphanol tartrate, (-) - 17 - (Cyclobutyl-methyl) morphinan-3, 14 - diol D- (-) -tartrate (1:1) (salt), is a synthetic intermediate acting opioid, agonist-antagonist of phenanthrene series. Butorphanol tartrate exhibits partial agonist-antagonist activity at  $\mu$  opioid receptor and agonist activity at the  $\kappa$  opioid receptor. It is five times more potent than morphine. An analgesic dose of butorphanol tartrate given by i.m, i.v or epidural route often produces marked sedation<sup>[2]</sup>. Butorphanol tartrate is a time tested analgesic used commonly in anaesthetic practice.

Dexmedetomidine has been recently added to the armamentarium of anaesthesiologists for intra-operative and post-operative analgesia<sup>[3]</sup>. In this study we have compared it with butorphanol tartrate when used in providing intra-operative and post-operative analgesia.

**Aims and Objectives:-**

1. To compare Dexmedetomidine with Butorphanol in short general anaesthesia- day care surgeries.
2. To see whether Dexmedetomidine and Butorphanol reduce the induction dose of propofol and volatile inhalational anaesthetics.
3. To compare the untoward effects of Dexmedetomidine and Butorphanol.
4. To compare the efficacy of Dexmedetomidine achieving intraoperative and postoperative analgesia with that produced by using Butorphanol.

**Materials & Method:-**

- Prior permission of institutional ethical committee was obtained to conduct the study.
- The study was conducted in 40 patients. In group A patients received Dexmedetomidine (n=20) & in group B patients received Butorphanol (n=20) .
- All patients were subjected to thorough pre-anesthetic evaluation and relevant laboratory investigation.

**Inclusion Criteria:-**

1. ASA grade I or II.
2. Age 18-60 years.
3. Availability of informed consent.
4. Patients undergoing elective short gynaecological procedures under short general anaesthesia.
5. Hemodynamically stable patients with all routine investigations within normal limits.

**Exclusion criteria:-**

1. Patients unwilling or hesitant to undergo the procedure under prescribed anaesthesia.
2. Patients with known hypersensitivity to opioids.
3. Patients addicted to opioids.
4. Patients with chronic obstructive pulmonary disease, bronchial asthma and or respiratory insufficiency.
5. Patients with head trauma and raised intracranial pressure due to any cause.
6. Patients suffering from psychiatric illnesses.

## 7. Emergency surgeries

### Method of randomisation:-

A statistician was consulted and with the help of computer generated table the randomization was done, adequacy of sample size and power of test was confirmed and then 40 patients were divided into 2 equal groups of 20 patients each ie. Group A and group B.

- Group A: Patients were given Inj.Dexmedetomidine 1mcg/kg body weight as loading dose and maintained on 0.7 mcg/kg body weight.
- Group B : Patients were given Inj.butraphanol 10mcg/kg body weight and maintained on 2 mcg/kg body weight

### Methodology:-

Anaesthetic plan was discussed and explained to all the patients a day prior to surgery. Patients were asked for any previous history of allergy to any anaesthetic given before or any kind of medication.

All patients were kept fasting overnight prior to scheduled day of operation.

In operation theatre, pre-operative vitals i.e. Pulse rate, BP, oxygen saturation were recorded. 20 gauge i.v cannula was placed in situ. All patients received inj.glycopyrolate 0.004 mg per kg body weight and injondansteron 0.1 g per kg body weight intravenously and inj.dexmedetomidine 1 microgram /kg body weight intravenously in infusion pump over 10 minutes prior to induction of GA in group A & inj.Butraphanol 10mcg/kg in infusion pump over 10 minutes body weight intravenously prior to induction of GA.

After medication patients in both the groups were analysed for sedation using Ramsay sedation scale & anxiety prior to induction.

**Table 1 - Ramsay scale for the assessment of the level of sedation**

LEVEL OF ACTIVITY	POINTS
Patient anxious, agitated or restless	1
Patient cooperative, orientated and tranquil	2
Patient responding only to verbal commands	3
Patient with brisk response to light glabella tap or loud auditory stimulus	4
Patient with sluggish response to light glabella tap or loud auditory stimulus	5
Patient with no response to light glabella tap or loud auditory stimulus	6

**Source: Arq. Bras. Cardiol. vol.93 no.6 São Paulo Dec. 2009.**

All the patients of group A were maintained on 0.7mcg/kg dexmedetomidine infusion and all the patients of group B were maintained on 2mcg/kg butarphanol infusion. Infusions were stopped 5 minutes prior to end of surgery.

Following preoxygenation induction of GA was done with inj. propofol 2 mg/kg body wt. After the loss of eyelash reflex / patient in apnea patients were ventilated via face mask till the patient regains the spontaneous ventilation. Anaesthesia was maintained with 33% oxygen, 66% nitrous oxide and isoflurane (0.5% to 0.8%), with the patient breathing spontaneously. In the recovery room patient were followed up for vitals, for pain using visual analog scale & standard Aldrete score<sup>[14]</sup> for recovery.

Table 2:- Vas.

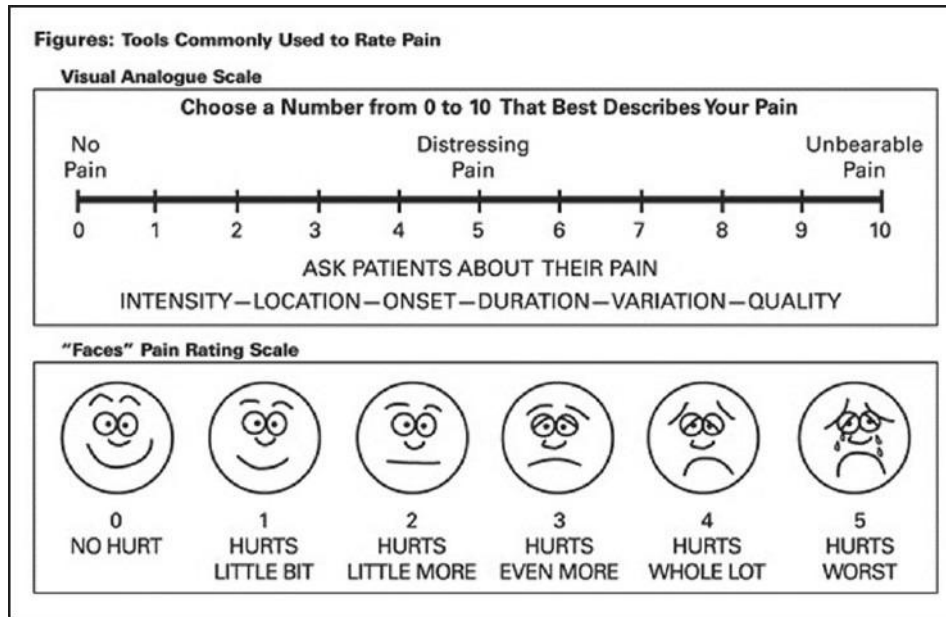

Table 3:-Standard Aldrete score.

Criteria	Points
<b>Vital signs</b>	
Within 20% of preoperative baseline	2
Within 20~40% of preoperative baseline	1
> 40% of preoperative baseline	0
<b>Activity level</b>	
Steady gait, no dizziness, at preoperative level	2
Requires assistance	1
Unable to ambulate	0
<b>Nausea and vomiting</b>	
Minimal, treated with oral medication	2
Moderate, treated with parenteral medication	1
Continues after repeated medication	0
<b>Pain: minimal or none, acceptable to patient, controlled with oral medication</b>	
Yes	2
No	1

Along with this, vitals were monitored. (Pulse, BP, SPO<sub>2</sub> and RR). The patient were followed up until the VAS was more than or equal to 5.

Then the rescue analgesia will be given if required.

The time will be noted and patient will be released from the study.

Results in both groups will be tabulated and compared to draw the conclusion.

#### Parameters Recorded:-

1. Pre operative vitals
2. Base line vitals before premedication.
3. Vitals before induction.
4. Intra operative events (average).
5. Post operative vitals.
6. Duration of surgery
7. V.A.S score :
  - ❖ T<sub>0</sub> – at the time of premedication: drugs to be given.
  - ❖ T<sub>1</sub> – when patient wakes up/responds to verbal stimuli
  - ❖ T<sub>2</sub> – when patient starts complaining of pain with V.A.S > or equal to 5 (rescue analgesia to be given)
  - ❖ T<sub>1</sub>-T<sub>2</sub> = total duration of action
8. Ramsay sedation score.
9. Standard aldrete score for recovery.

#### Results:-

There was no significant difference in pulse rate. There was significant fall in systolic ( $z = 2.55$ ) and diastolic ( $z = 2.04$ ) blood pressure in dexmedetomidine group after induction. ( $p < 0.05$ ). Requirement of inhalational anaesthetic agents was significantly reduced in the dexmedetomidine group ( $p < 0.05$ ) as compared to the butorphanol group (graph 1). VAS was significantly less ( $2.75 \diamond 0.44$ ) in the butorphanol group after 90 min and earlier rescue analgesia was given in dexmedetomidine group ( $p < 0.05$ ) (graph 2). Sedation score in both the groups was similar as assessed by Ramsay sedation score. Eye opening was earlier ( $45.5 \diamond 23.61$ ) in dexmedetomidine group as compared to the butorphanol group and was highly significant as  $p < 0.001$  (graph 3). Recovery was significantly improved ( $9.8 \diamond 0.41$ ) with dexmedetomidine group than butorphanol group and its  $p < 0.001$  as assessed by Standard Aldrete Score. (graph 4)

### Discussion:-

In the modern day hospitals, there is an established principle of ambulating the surgical patient as early as possible. Day care surgery has been defined by the Royal College of Surgeons as when the surgical day case patient is admitted for investigation or operation on a planned non-resident basis and who requires facilities for recovery. This definition excludes upper and lower GI endoscopies, outpatient procedures such as flexible cystoscopy, and minor superficial surgery under local anaesthetic, none of which require full day care facilities for recovery. It is important to mention that day care surgery is different from out-patient surgery in that the patients of day care surgery need some degree of post-operative observation for a few hours. All day care surgical patients essentially come early in the morning and after the surgery is over and the post-operative observation is uneventful, the patient is discharged home the same day.

The reduction in cost to both the patient and community, coupled with the advantages of Day Surgery for both patients and their relatives, have served to increase the demand for Day Surgery. The use of a Day surgery facility reduces the number of in-patient beds required. Shortened hospital stays and earlier mobilisation also reduces the risk of hospital-acquired infections and venous thromboembolism (VTE). The bulk of these patients come from specialties of ophthalmology and ENT, followed by Gynaecology and General Surgery. The other super-specialties only contribute a very small fraction<sup>4</sup>.

In last few years, a great enthusiasm has been shown toward the use of  $\alpha_2$  agonists in anaesthesia practice because it has been found to decrease serum catecholamine levels by upto 90%,<sup>5</sup> to blunt the haemodynamic response to laryngoscopy, tracheal intubation, pneumoperitoneum and extubation<sup>6</sup>, to provide sedation without respiratory depression and to decrease post-operative analgesic requirements<sup>7</sup>.

Whereas butorphanol is used as a pre-anaesthesia adjunct, narcotic analgesic for the relief of moderate to severe migraine, postoperative, or obstetric pain. Early studies suggested that butorphanol did not produce complete respiratory depressant effects and a 'plateau or ceiling effect' was observed<sup>8</sup>.

In 2003, Ard et al and Nelson et al suggested that Dexmedetomidine provides sedation, analgesia, and anxiolysis with minimal effect on respiratory function during the awake craniotomy similar to sedation during natural sleep.

In 2009, Wang F et al study found in a study that the butorphanol combined with intravenous morphine PCA in patients undergoing abdominal hysterectomy shows effective analgesia with sedation and fewer side effects. This

study also demonstrated that the butorphanol group had analgesia superior to the physiological saline control. The study found that there were no differences between urinary catheterization of more than 24 h, first time out of bed and time to discharge to home.

We choose butorphanol as drug of comparison with dexmedetomidine because the analgesic activity is 4-7 times that of morphine, 15-30 times that of pentazocine and has fewer side effects than other opioids and all of them can be reversed by naloxone. The safe dose of butorphanol that can be given intravenously is 20-40 µg/kg<sup>9</sup>. We have used 10 µg/kg of butorphanol in our study. The duration of analgesia after intravenous injection of 1 or 2 mg of Butorphanol lasts for 3-5 hours.

### **Conclusion:-**

Our study demonstrated that dexmedetomidine produces better sedation and analgesia without significant adverse effects compared to butorphanol. It can be used as sole sedative and analgesic for day care surgery patients. Patients also show better and faster recovery on usage of dexmedetomidine.

**Geography And Territorial (Under)-Development. A Brief Reflection On Sierra Leone – West Africa:-**

When we talk about development we have to consider a huge number of geographical factors, that are represented by specific and complex indicators, of both the human (social, cultural, economic) and the natural sphere. These elements analyse and describe the territorial performances of the local communities, especially their mutual relationship with the environment: structures, infrastructures and info-structures, as well as socio-economic activities, political life and the expressions of culture contribute to forge a unique geographical landscape, that intersects with those of other geo-systems.

For this reason, geography, thanks to its systemic and holistic approach, helps us in the recognition of the above mentioned experiences, that are both the result and the promoters of the territorial development in this current globalized dimension.

Globalization can be a challenge, but it becomes a risk if it is not sustainably governed. Thus, competitiveness seems to be a stimulating condition for the sustainable development: it doesn't exclusively foster the economic growth, but also the social and the cultural system and the ecological integrity, i.e. conditions like "conservation and development of human capital, social gender equality; reduction at all scales of economic, social and environmental segregation; decline in quantity and intensity of flows of materials, energy, transport; promotion of participatory subsidiary models based on cooperation and partnership" (Gemmiti, 2011, p. 47). In other words, competitiveness is sustainable if a territory supports (and sustain) market competition from the local enterprises (a mix of social, environmental, economic factors), promotes innovation and the know-how (tertiary education, scientific research, culture) thanks to investments from local or international stakeholders, who become actors of the territorial development. This happens when a territory is able to produce and maintain the maximum value added, as well as cooperation for both the social and the environmental quality, and is capable to interact with other territorial systems (Prezioso, 2006; Gaddoni, Pistocchi, 2013).

**Corresponding Author: Filippo Pistocchi**

Address: PhD Filippo Pistocchi, Adjunct Professor of Political and Economic Geography, University of Bologna, Italy.

Underdeveloped regions usually don't benefit from these conditions: they still lack positive policies to enhance phenomena of social fragmentation, of informal fragile economy, of widespread illiteracy, of illegal squatter settlements, of corruption, pollution, exploitation and mistreatment, and so on.

It is then necessary to evaluate several geographical aspects, that go from history to culture, from geopolitics to economy. New or old form of slavery, poverty, and dependency on rich economies are still indicated as the main aspects of underdevelopment (Alie, 1990; Latouche, 2007; Olivier de Sardan, 1995; Pistocchi, 2009; World Bank, 2009). Moreover, environmental problems like pollution, land- and water-grabbing, deforestation and desertification, mixed with the loss of local cultures, that are consequences of underdevelopment, in turn accentuate forms of territorial poverty.

Not different is the situation in Sierra Leone, a country that globally emerged from silence few decades ago, during a terrible "civil" war (1991-2001), which was caused by a complexity of reasons: the ambition of a group to control the domestic diamond sector, the anger of the people against the Government for the underdevelopment, the interest of international actors to control the region... That conflict, however, contributed to erode the socio-economic fabric of the local communities and worsened the dramatic condition of the infrastructural and economic sectors.

Although a period of attempts to raise from darkness, Sierra Leone is still one of the Heavily Indebted Poor Countries (and it is fully qualified for debt cancellation) and one of the lowest (181 on 188) for the Human Development Index (2015). The main causes of this condition can be attributed to a complicated system of political and economic aspects at both the national and the global scale. Sierra Leone is facing a sort of paradox, that is typical of underdeveloped countries: despite its poverty (illiteracy, diseases, civil revolutions, and economic dependency on foreign investments), it is rich of resources (underground, territorial, cultural), with a quite varied and abundant quantity of vegetables and fruits. Such a frailty must be attributed both to the past (transatlantic slave trade and colonialism) and to the present globalized economy.

### **Sierra Leone Between Local And Global Economies**

Sierra Leone is divided into four administrative regions, and more specifically in three provinces (*North*, with Makeni as capital city; *Eastern*, with Kenema as capital city, and *Southern*, with Bo as capital city) and the so called Western Area of Freetown, the capital.

The country is one of the 16 African states that are part of West Africa, according to the regionalization criteria adopted by the United Nations. Sierra Leone, and all the countries of the Region, that formerly belonged to the British, French and Portuguese Empires, have politically emancipated after WW II. These states, except Mauritania which came out in 2002, make up ECOWAS, namely the Economic Community Of West African States (CEDEAO in French, *Communauté Economique des Etats de l'Afrique de l'Ouest*), a regional economic grouping created May 28, 1975 in order to promote the integration of states in all the economic and productive fields, included infrastructures and energy, social and cultural issues. Its founding treaty was revised, integrated and reaffirmed in Cotonou (economic capital of Benin) in 1993; it asserts (art. 2) that ECOWAS is the only economic community in the region for economic integration and the attainment of the objectives of the community itself (Gamberoni, Pistocchi, 2013, pp. 230-231). Among the various initiatives, ECOWAS has been working in order to adopt a common currency, the ECO, by 2020<sup>1</sup>, notwithstanding, this appears quite difficult and problematic, primarily due to the different level of economic growth, to the diversity of the economies and to the drastic differences in size of the GDP of the countries that would adopt the ECO (e.g., Nigeria alone has a GDP of 260 billion dollars, compared to 75 billion the entire UEMOA). It is understandably a long and tortuous path, since it requires the fulfillment of a series of conditions and characteristics identified as key by WAMI (West Africa Monetary Institute). To do this, a stable and active domestic economy is necessary, to move funding and to promote projects, collaborations and globalization processes.

<sup>1</sup> The idea of adopting a single currency in West Africa by 2020 dates back to June 2007, when the Heads of State of the region's countries had signed a declaration called "Vision 2020". As in the past the Franc CFA (*Franc Colonies Françaises d'Afrique*) was pegged to French Franc, the ECO should be pegged to the Euro. According to the Liberian Toga McIntosh, current Vice-President of the ECOWAS Commission, the path to reach the single currency should provide for a first phase of integration between the Portuguese-speaking countries and those of the English language; then the full monetary integration between them and the French-speaking area UEMOA (*Union Economique et Monétaire Ouest Africaine*), in which the CFA Franc is already in force (<http://atlasweb.it/2013/09/12/africa-occidentale-entro-il-2020-arriva-leco-la-nuova-moneta-unica-579.html>).

India, Brazil but especially China are the new economic superpowers that are responsible of a quite controversial economic development: the combination «infrastructure in exchange for resources» sums up this sort of relationship. China, which is experiencing a fast process of economic growth and that it is lacking raw materials (especially energy) is “forced” to turn to Africa and buy or trade its resources by building in exchange large infrastructures (roads, hydroelectric dams, airports).

These are impressive works, which on the one hand improve the spatial performance of entire regions, and contribute to raise the quality of life of entire human groups: this could be an opportunity for the local development, even in a scenario of South-South partnership<sup>2</sup>; on the other hand, however, the local governments and the local communities lose any kind of control on these vast areas. Although in the short term these large investments and the impressive works by Chinese companies (there are 30 currently active in the territory of Sierra Leone) produce some benefits, in the long term the major Chinese projects do not contribute to build the foundations for a long-lasting, solid and resilient development, since it does not protect land resources, and do not promote local expertise, which, when they are not replaced by Chinese labor, are exploited in a working condition of subordination. That's why someone talks about «China's Silent Storm in Sierra Leone» (Datzberger, 2013).

This is what matters: «[...] looking at China as an infrastructural developer for Sierra Leone, they have made significant progress on the Freetown urban landscape from the multi-use national stadium to Youyi building (ministerial complex). Over the past decades; they have built bridges, power transmissions, a dam and some roads. More recently, the Chinese contractors finished constructing a new foreign ministry building, additional offices for parliament and the 100-bed China Sierra Leone Friendship Hospital at Jui, outside of Freetown. And President Ernest Koroma, early in July, 2013 signed a deal with Chinese Railway International Company to build a new airport and a railway amounting in the total of \$ 8 billion. Thus, China has significantly supported some level of economic growth for Sierra Leone» (<http://standardtimespress.org>).

But the newspaper article “The growing interest of China in Sierra Leone”, 27th August, 2016 (<http://standardtimespress.org>), complaint that China continues to ignore the level of corruption in this country and in particular in the high ministerial and government troops. This for a number of reasons such as opportunism and practicality: China, for its projects in Sierra Leone, use Chinese workers instead of local workforce and seems not interested in the internal political dynamics. Unfortunately, this *laissez-faire* attitude seems to worsen the fragile socio-political system, because it breaks down the sense of belonging and the civic participation of the locals, who better appreciate those new, quick, and efficient infrastructures.

### **Political power and the Shadow-State model**

This weakness is largely dependent on the so called «shadow-state», originated from a two-hundred-years period, when these territories have experienced a rapid political transition, from pre-colonial state (made of noble lineages and of a society divided into strict social classes) to colonial (dual, made of white settlers and blacks subjects) to the post-colonial era (the current one, of independent but non self-sufficient states). The colonial state completely reshaped societies, and transformed the form of aggregation and organization (law and economics), repositioning individuals or entire ethnic groups in new geographic spaces (provinces, administrative districts, municipalities) that had little or nothing to do with places and traditional territories (kingdoms, ethnicities). They thus created the political dichotomies and conceptual dyscrasia (common law vs. civil law, urban world vs. rural world, the center vs. periphery, leadership vs. mass of citizens, rich vs. poor) that form the basis of the serious problems related to underdevelopment. Such conditions cause on the one hand fragmentation and separation, on the other the contradictions of a democratic society (Turco, 2004), made of territorial systems in which the gap between town and country is still very strong, and in which the same urbanization is characterized by interstitial spaces and overwhelming informal economies (Gamberoni, Pistocchi, 2013, p. 97).

Sierra Leone is still struggling to emancipate. In the past, it «was the first centre of modern civilization in West Africa» (HIGSON 1961, p. 191). But at the dawn of the independence processes other countries like Nigeria and Ghana were beginning to take on a leading role in the regional economy. So, Sierra Leone needed «improved

---

<sup>2</sup> This is legitimated by the FOCAC, the *Forum On China and Africa Cooperation*, established in 2000, which provides for bilateral economic agreements between the Beijing government and each partner African state. However, it seems to be an unequal exchange.

services (especially of education in the Protectorate<sup>3</sup>) and these cost money. This can be raised by loans from abroad or by increased production within the country. Loans can only be a temporary solution: increased production will require the combined efforts of the whole population. The national income could, however, be added to in the near future by the: 1) regulation of the diamond industry and prevention of illicit mining and selling of the stones; 2) rapid development of swamp rice production; 3) increase of iron ore and other mineral production; 4) development of plantation cultivation of bananas, citrus fruits and pineapples; 5) more scientific cultivation of oil palm, to ensure greater output and better quality. The economic problem of Sierra Leone is a serious one and must be solved as soon as possible in order to allow for the orderly and natural development of self-government» (Higson 1961, p. 191).

## A Contradictory Development

The following tables (table 1, 2, 4, 4) summarize some of the major geographical performances about Sierra Leone from the World Bank Development Index 2016.

**Table 1:** Demography of Sierra Leone

Population	Population density	Urban population	Population of the Capital City (census 2014)	Capital population density	Net migration 2010-2015
6,300,000	87 people per sq. km	40%	951,000	2,664 people per sq. km	- 21,000

**Table 2:** Socio-economic Aspects: Growth, Employment, Poverty

GDP per capita	GDP per capita growth rate	Annual GDP growth rate			People under the poverty line (2011)		Foreign Direct Investment
		1999-2000	2000-2009	2009-2014	Less than 3,1\$ a day	Less than 1,9\$ a day	
700 \$	+2.3%	-3%	+7.2%	+11%	80%	52.8%	690 million \$

**Table. 3:** Society and Quality of Life

Child mortality (0-5) (2015)	Maternal mortality (2015)	Fertility (15-19) (2014)	HIV Adults (15-49) infected (2014)	Youth literacy rate (15-24) (2005-2014)	Digital divide (2014)	
					New mobile subscriptions	Private use of Internet
120‰	13.6‰	120‰	1.4%	64%	+77%	2%

**Table 4:** Environment and pollution

Deforestation 2000-(2015)	Protected areas (2014)	Fresh water per capita (2014)	People with access to good sanitation facilities	CO <sub>2</sub> emissions (2011)
-0.28%	3.8%	25,334 m <sup>3</sup>	63%	0.9 millions of tons

Table 1 shows the total population of Freetown, the capital, and its population density (2,664 inhabitants / km against the country's average 87). This of most of the territories in rapid process of growth: the urban gigantism and the primacy of the capital city or a few other urban settlements than the rest of the territory. Big-primatial cities in underdeveloped or developing countries are still very controversial, because the relationship between the global and the local is negative. Often, unscrupulous businessmen choose the chaotic capital city of underdevelopment as a free territory, to hide their illegal activities. For these reasons, urbanization needs responses for the impacts it produces on the territory, the environment, the society and its economy. In particular, the main environmental problems are particularly concerned with water and energy waste, pollution and the resulting social ills: economic poverty and

<sup>3</sup> That book was edited in 1961, the same year of the Independence. "Protectorate" meant the inner areas: the author underlined the urgency to enhance education in the "peripheral" areas, namely those where people were still mainly living mainly with the primary sector subsistence activities.

social marginalization slow down and discourage political intervention and planning aimed at making sustainable the progressive urban growth.

However, this condition is not only typical of the poorest areas of the earth: cities such as Tokyo, New York, Paris, London, for example, can in some way be defined «primatial». But with one major difference: their level of urbanization determines the strengthening of the economic structure also of the suburbs, and urbanization enhances the entire territory; on the contrary, in underdeveloped regions or emerging economies, urbanization does not necessarily correspond to a better quality of life.

Freetown attracts a lot of people from the countryside and suburbs: it provides some excellent services (headquarters of banks, multinational corporations), but still lacks some basic services to citizens and cannot provide services for the suburbs and the surrounding countryside.

Surely, the country is in strong economic growth (tab. 2). Even EPA, the Environmental Protection Agency, confirms the positive development of Sierra Leone's economic performance, growth which, however, has taken place at a much lower rate than that of other countries in sub-Saharan Africa. «The poverty headcount has declined from 66.4 percent in 2003 to 52.9 percent in 2011. The overall reduction was led by strong growth in rural areas, where poverty declined from 78.7 percent in 2003 to 66.1 percent in 2011, yet this figure was overall still higher than urban poverty. Urban poverty declined from 46.9 percent in 2003 to 31.2 percent in 2011. This decline was despite an increase from 13.6 percent to 20.7 percent in the capital, Freetown. District level poverty analysis showed that by 2011 most districts had converged to poverty levels between 50 and 60 percent, with the exceptions being Freetown at 20.7 percent and levels above 70 percent in Moyamba and Tonkolili. Underlying this poverty reduction was an annualized 1.6 percent per capita increase in real household expenditure from 2003 to 2011» (EPA, 2014, p. 12).

Although the growth rate of per capita GDP is positive (+ 2.3%), this process is still unable to eradicate widespread and extreme poverty that emerges from the data for the percentage of people living under the absolute poverty line (52.8% of the population) in 2011.

What emerges from the economic indicators is also reflected in the social conditions (tab. 3): the gap between rich and poor is still wide, as well as between the services provided and the people's needs. Even health data are not entirely comforting, especially those related to maternity-care and child-care. In particular, child mortality 0-5 is dramatic: it means that health facilities and medicines, as well as physical and economic accessibility to medical care are not guaranteed.

Talking about environment (tab. 4), a reflection on wrong policies is required: although availability of fresh water is medium-high (25,334 m<sup>3</sup> compared to the world average of 5,925), sewage and water treatment systems are still poor, justifying the high percentage of some of the more frequent diseases (diarrhea, fever, cholera, malaria) due to the assumption or the presence of dirty or contaminated water.

Uncontrolled deforestation is decreasing, but an ecological approach for the preservation and the institution of protected areas don't seem to be a governmental priority. Indeed, in a vision of development and sustainability, it could be a successful policy for both the environment and the promotion of tourism that, in turn, could support the socio-economic sector. The level of dioxide emissions is very low. This is attributable not to policies<sup>4</sup> to prevent pollution and protect the environment, but, again, to an economic and industrial system underdeveloped.

This is a challenge: the country is constantly exposed to risks of instability and periodic events that slow down or block the path toward a stable development. For example, in the past two years Ebola caused many deaths, as well as socio-economic problems connected with farming and environmental health: the affected areas were quarantined and rural areas were left abandoned and remained uncultivated for months; children and the youths didn't go to school; any other activity was suspended.

---

<sup>4</sup> In this current global scenario, the country has been trying to adapt its policies to the Millennium Goals.

## **Ebola And Intervention Policies: Victory Or Defeat?**

Ebola is an insidious disease because it is of easy infection and difficult to cure, which put a strain on not only some regions of West Africa (Guinea, Sierra Leone, Liberia), but the whole humanity: the disarming impotence in front of the spread of such a disease (without being able to stop it promptly) causes amazement, dismay, sense of failure.

Africa is living a strong and fast economic growth. However, the gap between wealth (little and poorly distributed) and poverty (and very widespread) is still marked.

For these reasons, the challenge of solving a health problem opens complex scenarios, since it is part of a broader field of study, which inevitably also involves the economic, political and social sphere. The disease in Africa is closely linked to the complex food- cultural- social- and economic- system.

A very low human development, a fragile health system and a large internal migration led to the spread of Ebola and to the collapse of the country. Besides these reasons we must not forget the archaic traditional rites around death and the dead, during which the corpse is exposed to people.

It is not for mere irony that Ebola has spread in the same areas affected by the drama of the blood-diamonds war and the child-soldiers. Those are vast border areas, passageways from one State to another, poor of institutional barriers and delimited by the so called «porous» borders: they divide two States, but only one ethnic region, that is inhabited by the same people. That ethnic group was divided during the colonial and post-colonial power, and suffered a sort of geographic *diaspora*. So, they now nourish a strong sense of belonging and live in continuous contact, ignoring the constraints imposed by international geopolitics. The state is unable to ensure an effective and active control: illegal trade, smugglers, terrorists, and diseases are not stuck by borders. For example, «while Nigeria's border problem is related to this colonial history, its porosity has been exacerbated by the failure of succeeding governments to properly administer these borders. As Okumu noted, «the high level of insecurity on African borders is largely due to the way they are administered and managed, and less to do with how colonialists drew them. In this respect, Nigerian borders are known for the limited presence of security and law enforcement officials. The few that are deployed are poorly trained, work with inadequate and obsolete equipment, and sometimes poorly remunerated. In addition, most border communities have for long been neglected by the government, making it difficult for government to leverage on their position to curtail illicit crossborder activities» (Onuoha, 2013, p. 4).

The most affected districts were those at the border with Liberia (Kailahun and, by geographical proximity, Kenema) and Guinea (Bombali and, by geographical proximity, Port Loko): those are the districts through which the main interregional roads pass from one country to another. Moreover, Makeni (Bombali District) is the capital of the whole Northern Region, and Kenema (Kenema District) is the capital of the Eastern Region, therefore, they are the most populated urban areas of those regions.

In the absence of adequate equipment and sanitary facilities, it was difficult to make a prompt diagnosis to prepare an effective contrast therapy. The symptoms of this disease, in fact, are generally high fever (more than 38°C), headache, muscle aches, vomit, diarrhea, abdominal pain, bleeding, that are very common to many other diseases (malaria, yellow fever...). Therefore, at the beginning of the outbreak of Ebola, people were not alarmed and behaved without precautions: many civilians helped doctors and nurses in hospitals and took care of their loved ones and so they have been infected too.

To avoid infection, while waiting for an international systematic intervention, it was made an ambiguous and controversial choice, the «quarantine»: whole areas of Sierra Leone, in particular the rural and less accessible, have been isolated, with the prohibition for the inhabitants to leave their houses, to go into the fields and to support each other.

The result was that entire plantations were abandoned, the countryside was invaded by wild-nature, and all the rural economy was destroyed: these safety and prevention strategies have caused hunger and malnutrition, have weakened the body and the immune system of people and have favored the emergence of other diseases.

The prices of everyday products such as rice, potatoes, and oil have increased by 30% (tab. 5). This has led to a surge in inflation, that grew up in a few days from 6.39 at 7.8%.

**Table 5:** Ebola impact on the production and sale of the main agricultural products and foodstuffs in Liberia, Sierra Leone and Guinea (FAOSTAT 2015, p. 4).

Country	Rice		Cassava		Corn	
	Reduction of production (tons)	Loss of production value (\$ USA)	Reduction of production (tons)	Loss of production value (\$ USA)	Reduction of production (tons)	Loss of production value (\$ USA)
Liberia	24,000	10,000,000	19,000	2,000,000	-	-
Sierra Leone	100,000	43,000,000	37,000	4,000,000	2,000	300,000
Guinea	55,000	23,000,000	4,000	400,000	24,000	4,000,000

Many foreign companies, such as *China Union*, the *Vale* and the *Marampa*, have drawn all their employees at home. These sudden closures led to the collapse of all commercial transactions and, consequently, the unemployment of many workers who worked in sectors linked with these big foreign companies.

The growth rate of GDP (2001-2014) was -29.67%. This data must precisely be imputed to the fact that for at least 169 days, half of the entire population of the country has lived without money. Schools and universities were closed: teachers and administrative staff did not receive salary, while students have lost a whole year of training and have delayed a year their entry into the world of work.

Ultimately this phenomenon, which has severely affected the socio-economic sector, has also damaged the tourism industry: data show that the number of tourists in a few months dropped by 50% or even 60%.

On 7<sup>th</sup> November 2015, Sierra Leone was declared Ebola-free, since, in accordance with safety procedures, no negative test for the Ebola virus was recorded in the previous 42 days. The population started to return to their daily lives and to their work activities. Yet, in late January 2016, new infection cases alerted the community. It took month to definitely proclaim Sierra Leone Ebola-free.

For now it seems that Ebola has claimed nearly 4,000 deaths in Sierra Leone, nearly 5,000 in Liberia and more than 2,500 in Guinea.

## Final Remarks

Sierra Leone is not yet a State democratically made; scholars even define it a failed state. A young country like Sierra Leone needs a strong political and administrative system, able to guarantee cohesion, in safeguarding and promoting the complex socio-cultural structure.

The cultural, political, economic identity of Sierra Leone, like that of any other territory, does not end within its territorial unit; on the contrary, it can be understood through a global vision of its political and economic dynamics.
