#### Introduction:-

Rift valley fever (RVF) is an acute viral zoonotic febrile disease that caused by a virus related to *Bunyaviridae* Family. It affects cattle, sheep and humans<sup>1,2</sup>. The disease transmitted to human by bits of infected mosquito or direct exposure to infected animals' tissues<sup>1, 3</sup>. Disease presentation ranges from mild, self-limited to sever form with hemorrhagic, ocular, meningoencephalitis complications<sup>4</sup>. Symptoms of RVF starts after the incubation period (2days to 1 week) as flu like symptoms with headache, photophobia, joint pain, retro-orbital pain and myalgia<sup>1,5</sup>. Sever cases, 7-8% will develop hemorrhagic syndromes, meningo-encephalitis and death. Ocular complications occur in 1- 20% of them<sup>2</sup>.

Ocular manifestation may include: retinal hemorrhages, anterior uveitis, vitreous reactions, optic disc edema, and retinal vasculitis. Macular and paramacular edema also could develop<sup>6,7</sup>. The first reported epizootic RVF outbreak was in Kenya 1930, since that year epidemics was spread through Africa until 2000 when the outbreak reaches southwestern region of Saudi Arabia and Yemen as a first epidemic outside Africa<sup>2,7-8</sup>. This case report aims to present the sequelae of retinitis secondary to RVF with brief review of literature of ophthalmic complications of RVF.

#### Case presentation:-

A 64 year-old Saudi gentleman, originally from Gazan (southwestern region) of Saudi Arabia presented with history of decrease vision in the right eye for 25 years. Patient gave history of Rift Valley fever (RVF) 25 years ago, that

He presented with nictitate his admission to the hospital for one week. He described right eye vision worsening after suffering from fever. He is not known to have any medical illness.

He underwent cataract surgery for the right and left eyes 3 years and 1 year back, respectively.

**On examination:-**

He had **visual acuity** of 0.16 in the right eye and 1.0 in the left eye.

**Slit lamp examination** showed pseudophakia in both eyes with no posterior capsular opacification (PCO).

**Fundus** of the right eye showed hypertrophic black chorioretinal adjacent to an atrophic scar in the macula, and the left eye showed diffuse retinal pigment epithelial (RPE) mottling as shown in figure 1-2.

**Figure 1:-** fundus photograph of the right eye showing atrophic macular scar.

**Figure 2:-** fundus photograph of the left eye showing retinal pigment epithelial mottling.

**Discussion:-**

Rift valley fever (RVF) is a viral zoonotic disease from the family of *Bunyaviridae* that affect both animals and humans<sup>1</sup>. Humans acquire the infection from bites of infected mosquitoes or through direct exposure to body fluid or tissues of infected animals<sup>1</sup>. The first epizootic outbreak of Rift valley fever was reported in Kenya in 1930<sup>2</sup>.

Affected individuals usually have mild, self-limited disease, lasting few days but severe disease with ocular, hemorrhagic, meningoencephalitis complications can occur<sup>7</sup>. Ocular manifestations accounts for up to 20 % of cases<sup>8</sup>. It was estimated that 1% of RVF cases have ocular complications during Gazan epidemic<sup>8</sup>. Ocular lesions usually develop within 4 weeks after the onset of illness. The pathogenesis of the lesions as suggested by fluorescein

angiography indicates that the lesions often start with primary occlusion of the retinal circulation, probably as a result of proliferation of the virus particles on the endothelial cells<sup>2</sup>. Before 1977, RVF caused mild disease in human and ocular complications were less frequent. In contrary, it was found that ocular complications were higher during Egypt outbreak<sup>3</sup>. The most common ocular presentation was macular and paramacular retinitis as found in several studies<sup>3,8</sup>. It was found during Gazan epidemic that macular retinitis accounts for 71 % while paramacular retinitis accounts for 29 %<sup>8</sup>. Retinitis can present alone or in association with other ocular abnormalities<sup>3</sup>. Anterior uveitis was reported first during Gazan epidemic. It was characterized by mild-moderate non-granulomatous type that resolved without any complication such as cataract, glaucoma or posterior synechiae<sup>3</sup>. Retinal hemorrhages occurred in 40% of cases, vasculitis was seen in 7%, vitreous reaction in 27% were seen along with retinitis. Optic nerve edema seen in 15%<sup>3</sup>.

The natural course of the disease depends upon the severity and the location of the retinal abnormality. Visual acuity may completely recover, with minimal loss of visual field, or there may be severe and permanent loss of vision, such as occurs in persistent total retinal detachment<sup>2</sup>. The most common complication was retinal scarring. Other complications include vascular occlusion leading to retinal ischemia and disc atrophy<sup>3,8</sup>.

In conclusion, retinitis is the most common ocular complication in RVF outbreak in Gazan, Saudi Arabia. Many studies recommend that Saudi Arabia and other Middle East countries have to sit a comprehensive strategy to prevent RVF recurrence.

#### Abstract

The geological geomorphological and Neotectonic studies of parts of Khandwa district Madhya Pradesh were carried out with the aid of Air photos between latitude 21°30'00 to 21°45'00 and longitude 76°15'00 to 76°30' in parts of Survey of India Sheet No. 55C\6 and an area about 720 sq.km. was covered by photo interpretation.

eologically the area comprised of Deccan trap and Quaternary sediment. The Deccan trap complex comprised of fifteen basaltic lava flows between 250 to 600 m above m.s.l. These lava flows constitute two formations viz. Khandwa formation (Nimar Group) consisting of six lava sheets between elevation of 250 to 360 m above m.s.l. and Asirgarh formation (Satpura Group) Consisting of nine lava sheets between 360 to 600 m above m.s.l. The exposed thickness of these lava flows is about 190 m.

The Quaternary deposits are represented by the sediments of two domain viz the sediments of present domain of Sukta and sediments of paleo domain of Sukta. These sediment predominantly comprised of sand, clay, silt and rock gravel. These deposits in the area are viz thin and occur as relict terraces and flood plain deposits, the average exposed thickness is about 3 m.

Geomorphologically the area comprised of nine surfaces each surface is characterized by distinct morphogenetic expression elevation, drainage, pedogenetic characters, slope elements and land use pattern. These surfaces are confined between 280 to 480 m above m.s.l. These surfaces in increasing antiquity are Quaternary terraces (280 to 300 m), Mordar surface (300 m), Sarala surface (320 m), Khadar surface (340 m), Borgaon surface (360 m), Jalandhar surface (400 m), Sarai surface (440 m), Gularpani (SE) 460 m and Gularpani (SW) (460-80 m). The morphogenetic expression of these surface has been appreciably by defaced by Neo-seismic events occurred in recent past along the network of lineaments traversing the area. The Sukta lineament trending in NE-SW, direction traverse across Mardar, Sarala, Khodar, Borgaon surfaces display selective entrustment and bear the imprints of Neotectonism in the area.

The other geomorphic features and land form elements association with the area are flood plain point bar, low level terraces, channel braids. Linear scarp, curvilinear scarp, knee shaped band, scree, re-treating

Address:- Ex. Director, Geological Survey of India.

scarp and relict terraces. Besides the area is associated with the morpho-tectonic elements viz perennial channel segments, impersistent and partly internal drainage, knee shaped channel band, linear scarps and rock cut terraces.

The study revealed the presence of five major lineament pattern in the area viz i) NE-SW, ii) NW-SE, iii) NNE-SSW to N-S, iv) NNW-WSW to E-W. The relative percentage of occurrence of these linear elements in different pattern is 29.7%, 23.4%, 23.4%, 14.1% and 9.4% respectively. The analysis of relative intensity of these lineaments reveal that major, intermediate lineament exhibit anisotropic intensity and minor elements isotropic intensity.

The Sukta is the major stream which drains across the northern part of area. Its course is controlled by NE-SW trending lineament named as Sukta lineament. It appears to be basement lineament and some movement has been taken place along this lineament in recent past. It is evident by morphogenetic manifestation of the area and imprints of Neotectonism along this lineament. A another prominent lineament which traverses between Sultanpur and Bodgaon along Moti Nala, display occurrences of hanging and impersistent drainage which often truncate against this lineament. It indicates the readjustment of base level of drainage system perhaps due to recent movement along the NE-SW trending lineament in the area. The imprints and signature of such events are documented by these first and second order streams being their sensitive and infant nature and their quick response to such events.

The Lakhauri NW-SE trending lineament and associated fabrics bears the imprints of Neotectonism and indicate some movement in the area.

The other lineament trending in NNW-SSE to N-S, NNE –SSE to N-S are associated with master joints and fracture and devoid of any significant signature of Neotectonic activity. The ENE –WSW to E-W in the area represent 9.4% of total lineament density of the area and bears some imprints of neotectonic activity east of Arud

The study of morphogenetic expression and analysis of imprints of neotectonism and overall morpho- tectonic manifestation of the area coupled with available data indicate that NE-SW trending set of lineament are active and some movement has been taken place in recent past in the area , as such the area appears to be active and prone to Neoseismic movements.

The critical analysis of data and application of keys combined with stratigraphic studies provide significant information to constrain timing and intensity and degree of movement of Sukta fault as inbuilt component of SONATA Lineament in the central western Narmada valley an important ENE–WSW-trending tectonic element responsible for the current interpolate seismicity being experienced in the central part of the Indian plate. The tectonic movements along the NSF during Late Pleistocene and Holocene have resulted three river terraces (NT\_1 to NT\_3) in Narmada valley which are in conformity of three major phases of tectonic movements in a compressive stress regimes recorded along the NSF: slow synsedimentary subsidence of the basin during Late Pleistocene due to differential movement, followed by inversion of the basin during the Holocene marked by differential uplift along the NSF. The study suggests that the inversion of the basin is in response to the significant increase in the intensity of compressive stresses in the Indian plate mainly during the Early Holocene. The occurrences of geomorphic land form elements and features, rock cut terraces , linear, scarp curvilinear scarp knee shaped channel band and segments ,

perennial channel segments, impersistent and partly internal drainage, and rock scar and plantation surfaces which are the resultant elements of tectonic movement related NSF fault to wards lat Holocene . The present incisive drainage and recent seismic activity along Sukta lineament indicate that the compressive stresses continue to accumulate along the NSF due to continued northward movement of the Indian plate.

### **Introduction:-**

The Geological and Geomorphological studies in parts of Khandwa district M.P. in Survey of India top sheet No. 55C/6 was carried out by the author with the aid of Air photos (scale 1:50000), and an area about 720 sq.km was covered by photo interpretation. The area is located south of the Khandwa and bounded by latitude 21° 30 '00" and 21° 45 '00" and longitudes 76° 5 '00" to 76° 30 '00" E in top sheet Nos. 55C/6. The district headquarter Khandwa is well connected by State Highways and is a major railhead for broad and meter gauge sections of Central Railways. The area lies 10 km. South of Khandwa and is approachable by all weather roads. Khandwa – Singot – Borgaon – Burhanpur road diagonally passes through the areas. The interior part of the area is well connected by network of forest roads. The Khandwa – Bombay broad gauge of Central Railways passes through the Central part of the area with Dongargaon Khodar and Bagmer are important rail head in the area. The Ajmer – Khandwa – Kachigoda meter gauge line passes through the north – eastern part of the area with Mordar is main rail head. (Plate No\_1)

The area of study consists of two Physiography units viz the Nimar Plain (Narmada Valley) in the north and Satpura upland in south. The Nimar plain is characterized by a moderately upulating topography with a few low lying flat topped hills. The Satpura up land in South is characterized by the ENE-WSW to E-W trending chain of highly dissected and terraced plateau extending from Bankri on the west to Dahinala on the east. The minimum elevation of the area is 280 m. maximum elevation of is 480 m. above m.s.l.

The area is characterized by sub dendritic to sub-parallel drainage pattern. The Satpura upland form the major water divide for northerly and southerly flowing streams of the area draining into Narmada and Tapti river respectively. Bham river flowing in a westerly and northwesterly direction along with its numerous northerly flowing tributaries constitute the major drainage in the eastern part of the area. The western and north central part of the area is chiefly drained by northerly flowing Sukta Nadi and Lakhauri Nadi. The southern and south eastern part of the area is drained by Amadnagar and Pandhar Nadi which ultimately join Tapti river in the north.

### **Previous Work:-**

The area is covered by basaltic lava flows, Sharma & Yadava (1984), Yadava & Kandpal (1985) studied various aspects of lava flows their petro-chemistry, mineralogy and built up the stratigraphy of the area.

### **Present Work:-**

The present work is based of data acquired ad accrued from satellite imagery (IRS) of optical signatures of micro neosismic episodes of the area related with recent movements along the lineament fabrics of Earthquake prone area . The keys of Geomorphology and morphogenetic manifestation are applied and used in the west central segments of the SONATA LIEAMENT ZONE to trace and & analyze the imprints of neotectonism. The results of data of imprints in terms of optical signatures and landform configuration acquired and accrued both in laboratory and from ground, its synthesis & analysis and modeling by computer has been presented for the first time

### **Geological Setup:-**

The area studied is underlain by the theolitic basaltic lava flows belonging to Deccan Trap complex. These flows are confined between altitude of 245m and 485m above m.s.l. The average thickness of these lava sheets is about 190 m. A total of 15 basaltic lava flows are reported in the area by Sharma & Yadava (1984), and Yadava and Kandpal (1985). In general these are fine grained, massive hard and compact and non Porphyritic to sparsely porphyritic and some moderately to highly porphyritic in nature. These flows generally exhibit 'Aa' characters. The thickness of individual flow varies from 20 to 40 m. These lava flows are divided into two formation designated as Khandwa formation and Asirgarh formation of Nimar and Satpura Group reported by Sharma & Yadava (1984). The Geological and lithostratigraphic sequence of the area is given in Table No.1 below:-

**Table No.1:-** Geological Succession of the area OSI

**Khandwa Formation:-  
(Nimar Group)**

The Khandwa formation consists of six lava flows identified between elevation of 250 to 360 m above m.s.l. The average exposed thickness of this formation is about 110 m. in the area. The lava sheets of this formation are generally highly vesicular, amygdule, and sparsely porphyritic in nature. The individual flows are fine to medium grained hard compact, at places these flows are separated either by red bole, weathered zone or inter-trappean bed. This formation is exposed in the northern part of the area.

**Asirgarh Formation:-  
(Satpura Group)**

The Asirgarh formation consists of nine lava flows identified between elevation of 360 to 600 m above m.s.l. The average exposed thickness of this formation is about 240 m. The lava flows of this formation are mostly vesicular, amygdular and are 'A' type. The some of lava sheet contain mega cryst unit of feldspar. These are generally fine to medium grained hard compact and joined in nature. The vesicular unit is mostly spherical and filled with secondary silica and zeolite. These flows are either separated by red bole or inter-trappean bed. This formation is exposed in the southern part of the area.

**Quaternary Sediments:-**

The quaternary sediments and residual soil have occupied the northern part of the area of study. The quaternary deposits comprised of sediment of two domains, viz the sediment of present domain of Sukta and sediments of Paleo, domain of Sukta. The former constitutes the sediment of active flood plain facies and represented by silt, clay and rock gravel. It is restricted to the narrow valley along Sukta and its tributaries at an elevation of 265 to 280 m above m.s.l. The average thickness of sediment is about 2.5 m. The later comprised of sediment of flood plain facies of paleo-domain of Sukta predominated by clay, slit sand and rock fragments. These sediments form the quaternary terraces which are ill due to neotectonic activity in the area preserved and confined within the meandering loop of Sukta river.

These terraces are identified at an elevation of 280-340-300 m above m.s.l. and represent the former level of valley floor.

The northern plateau area is occupied by black cotton soil of residual nature developed on basaltic terrain. The thickness of soil varies from 2.5 to 6 m and average thickness is about 4.5 m. The soil thickness generally increases towards north. (Plate No.\_2)

**Geomorphological Set Up:-**

In Regional morphogenetic analysis of Sukta sub-basin were undertaken by Remote sensing techniques to decipher and trace the very process and events and resulted morphogenetic land scape architect and design. As such this tool and techniques were found very useful in understanding the landscape expression and geomorphology of the area. The satellite data image of IRS, MSS on 1:25000 and 1:50000 supplemented by Aerial Photograph with RF 1:50000 were used and field traverses in critical and crucial sections. The geomorphological mapping was carried out both in field and laboratory, based on the image interpretation; the perceptual relief and geometry of the land form have how ever helped in differentiating various land form units in some cases. A megnesopic is used for better viewing of image forms and accurate cartographic presentation. The prime objective of the study is was to analyze the geomorphic and morphotectonic elements, their spatial pattern and classification of discrete morph units to understand the morphological developments and stages of evolution of the area.

Remote sensing technique was utilized to analyze the geomorphology of the Sukta sub basin The basic data inputs is in the study from the LANDSAT – 4 MSS B/W bands 1,2,3,4 on 1:500,000 scale and standard mode FCCs of bands 1,2,3 on 1:250,000 scale.

The geological and geomorphologic maps (on 1:1 million scales) as well as the physiographic map of National Atlas were consulted. Geomorphological analysis was carried out, following the standard methodology of visual image interpretation. The perceptual relief and geometry of the landforms has helped in differentiating the various geomorphic units.

The area studied forms the part of Narmada basin. It is drained by Sukta river and its tributaries. The Sukta rises from Satpura from the south east corner of area, at an elevation of about 500 m above m.s.l. The Satpura constitute upland of E-W trading hill ranges of Deccan basalt rising to an average height about 450 m above m.s.l. It forms the water divide between Narmada and Tapti basin. The area has been posed to renewed erosional and depositional activities and has been chiseled to various platforms surfaces and landform elements. Based on morphogenetic expression, elevation, drainage, pedogenetic characters, slope elements, land use pattern and diagnostics morphogenetic expression the area is divided into eight surfaces. These surfaces are both Quaternary terraces and Pre-Quaternary surfaces, the former are two surfaces of Sukta designated as (T\_1 to T\_2) which are resultant product of Aggradations & degradation of Quaternary sediment at an elevation of (280 to 300 m above m.s.l.)

Morder surface (300 m above m.s.l.) Peneplation Sarola Surface (320 m above m.s.l.) Peneplanation Khodar Surface (340 m above m.s.l.) Dissection & Peneplanation Bargaon Surface (360 m above m.s.l.) Dissection / pedimentation / peneplanation Jalandar surface (400 m above m.s.l.) Peneplanation Sarai surface (440 m above m.s.l.) Peneplanation Gularpani Surface (SE) (460 m above m.s.l.) Peneplanation Gularpani Surface (SW) (460-80 m above m.s.l.). These surfaces are described here under. (Plate No \_2)

#### **Quaternary Surfaces:-**

The Sukta river has formed two terraces besides its present day flood plain. These terraces are identified between elevations of 280 to 300 m above m.s.l. The occurrence of these terraces is restricted to Sukta and its meandering loop in the area. These represent the former levels of valley floors and were formed by cyclic rejuvenation of channel in recent past. These surfaces on Air photos are indentified by light to moderate grey tome, low drainage density, relict expression and agriculture land use pattern. The occurrences of river terraces between 280 to 300 m and rock cut terraces in same conformity am and elevation that the area is under compressive stress unstable.

The Quaternary landscaping the area of study is represented by of prominent stepped sequence of river terraces of fluvial origin which are well-developed in the Sukta valley. These terraces are both erosional and depositional in nature and are separated by linear and curvilinear scarp and represent former valley floor.

The Quaternary events of the Sukta portys two prominent terraces which are designated T\_1 to T\_2 besides T\_0 in increasing order of antiquity. The terraces are described in detail separately. These are both erosional and depositional terraces and identified & confined at an elevation of between 280m to 300 m above m.s.l. The T\_1 is being the youngest terrace andNT\_2 it is being the oldest terrace identified in the valley. The occurrence of these terraces is restricted in Sukta its meandering loop and along the margin of valley. The occurrences of river terraces between 280 to 300 m and rock cut terraces in same conformity and elevation indicates that the area is under compressive stress and is unstable.

The other geomorphic features and landform elements delineated in the area are flood plain, point bar, low level terraces, channel braids, linear, scarp curvilinear scrap knee shaped band, scree re-retreating scrap and relict surfaces The various morph tectonic elements identified in the area are perennial channel segments, impersistent and partly internal drainage, knee shaped band, linear scarp & rock cut terraces and rock scar which are the resultant elements of tectonic activity in area.

The salient and diagnostic elements of river terraces are incorporated in (Table No 2 \_ to\_6).

#### **Pre-Quaternary Surfaces:-**

The pre-quaternary surfaces are identified above the elevation of 300 m above m.s.l.on Deccan upland of Sapura. These surfaces are basically plantation surfaces, are developed in response to the tectonic up lift of the area and consequential adjustment of regional erosional cycle in the area during pre-quaternary times.

#### **Mondar Surface:-**

It is a pre-quaternary surface identified at an elevation of 300 m above m.s.l. and named after Mordar a prominent village, situated on this surface. It is covered by thick soil and is drained by Sukta and Lakhauri rivers. These streams display deep entrenchment, selective gullyng along their courses and have chiseled rock cut terraces. The Lakhauri Nadi south of Mordar depicts perennial water channel segment which is anomalous and morphotectonic manifestation. It appears water table in the area is effluent in nature and tapped by channel along the NNE-SSW trending lineament. The slope of this surface is towards north east. On Air Photos it is characterized by distinct elevation low to moderate drainage density and agriculture land use pattern.

#### **Arola Surface:-**

It is a peniplain surface identified at an elevation of 300 m above m.s.l. and named after Sarola a prominent village situated at the nose of meandering loop of Sukta in the area. The surface has occupied large area between Rampura in North West and Nimkhera in the east. It is covered by thick soil and is drained by Sukta Lakhauri and their tributaries. It displays deep dissection and entrenchment along drainage. The slope of this surface is about 8-10 towards north east. On Air photos this surface is characterized by distinct elevation intensive dissection and selective and intensive gullyng along NE-SW trending lineaments along the stream.

#### **Khodar Surface:-**

It is erosional surface delineated at an elevation of about 340 m above m.s.l. named after the Khodar a preminet village, situated on this surface. It has occupied large area between Rustampur in the east and Kumta in the west. It

is drained by Sukta and its tributaries. It exhibit intensive dissection and entrenchment along Sukta river. The impersistent and partly internal drainage are seen on this surface around Jamthi, east of Piparahati, Jamli, Khurd and Pachama. This drainage diversely oriented and generally abuts against the lineament traversing the area. These are the positive imprints of Neotectonism in the area. The density of these relict drainage is moderately high on the northern flank of Sukta river as compared to the south. It perhaps indicate that northern block is active and under the slow process of resettlements and relative re-adjustment. The NE-SW trending lineament traversing along Moti-Nala cut across this surface from Sultanpur, south of Pachamba, Pawai Kalan, north of Takli Kalan, Khodar, Sarola and Ardalan Kalan and beyond, appears to be active and some movements have been occurred along this element in recent past. It is also evident by the over all Neotectonic manifestation of the area. The slope of this surface is about 8-10 towards north east. On Air photos this surface is characterized by distinct elevation, slope element intensive gullying selective land dissection and truncated relict drainage element.

#### **Badgaon Surface:-**

The Badgaon surface is identified at an elevation of 360 m and named after Borgaon a prominent village situated on this surface. It is erosional surface and was formed by the cumulative process of dissection pedimentation and peniplanation. It is widely developed and has occupied large area along the northern edge of Satpura between Bhilkheri and Sukhtanagar and between Sukhtanagar and Rustampur. It is drained by Sukta river and its tributaries. These streams are mostly sub-parallel to parallel and their courses are controlled by concealed fractures and lineament. The Sukta river display intensive entrenchment across this surface. It is associated with relict impersistent and partly internal drainage element. These are the signatures of Neotectonism and are identified around Borgaon, west of Khirala, north of Khirala, and east and north east of Arud. These elements show some parallelism in their disposition and ENE-WSW trending lineaments. The Sukta river in the western part of this surface form the Knee shaped channel band and form the deep gorge of about 12 m bearing rock out terraces in the river bed. The intensive entrenchment along Sukta association of knee shape channel segment, rock terraces, relict internal drainage are the signatures of neotectonic activity. The prominent NE-SW trending lineament which traverse across the Sukta and other two E-W trending lineament north and south of Arud which about against Sukta lineament east of Piparahati appears to have been re-activated in recent past.

On Air photos this surface is delineated by distinct elevation truncated and hanging drainage land use pattern and diagnostic photo elements.

#### **Alandhar surface:-**

It is situated at an elevation of about 400 m above m.s.l. and named after Jalandhar a prominent village located on this surface. It is developed along the northern edge of Satpura and its best development is seen around Jalandhar in the eastern part of the area. It is essentially a peniplain surface and forms a distinct plateau. It is drained by sub-parallel to parallel streams exhibiting intensive entrenchment along their courses which are controlled by concealed features and lineament. This surface bears segment of relict internal drainage, faulted scarp and demonstrate intensive linear gulling and accelerated headward erosion. These elements are imprints and signature of Neotectonism and suggest that the area is active. On Air photos it is characterized by distinct platform, elevation, drainage, land use practices and other diagnostic photo elements.

#### **Sarai surface:-**

It is a relict peniplain surface identified at an elevation of about 440 m. above m.s.l. It forms distinct platform and separated by prominent curvilinear scarp. It is drained by sub-parallel stream which display accelerated headward erosion. On air photos it is delineated by elevation, relict characters and thick forest covers.

#### **Gularpani surface (se):-**

It is also a relict peniplain surface identified SE of Gularpani at an elevation of 460 m above m.s.l. It forms small plateau and separated by scarp on air photos it is identified by its elevation relict mode of occurrence, low to very low drainage density and forest cover.

#### **Gularpani surface (sw):-**

It is isolated erosional surface identified south west of Gularpani at an elevation of about 460-480 m above m.s.l. It forms small relict plateau separated by re-treating scarp. (Plate No\_2 & Table No 2 to 6 )

**Tectonic setting of the area:-**

Narmada River originates at Amarkantak at an elevation of about 1057m above m.s.l. descended from the mountainous tract traversing over a distance of 1280km across the middle of the Indian sub-continent to join the Gulf of Cambay, near Baroda in Gujarat state. The river course of Narmada is conspicuously straight, controlled by E-W lineament. It descends down the mountainous tract through deep and steep gorges in straight sinuous to meandering pattern with average sinuosity index of 1.38, which at places exceeds 1.55 for some selected segments of Narmada channel. It almost flows E-W along the Lineament over a length of 1300 Kilometers across the middle of Indian sub-continent to debouch into the Gulf of Cambay in the Arabian sea. It is bound by Vindhya range in the north and Satpura range to the south; the area in between these two upland is found to be ideal loci for a study of Quaternary sedimentation, as witnessed by the presence of multicyclic sequence of Quaternary terraces in the valley. These terraces represent the former levels of valley floors formed by cumulative erosional and depositional activities of the river system.

The area studied forms part of SONATA LINEAMENT ZONE which tectonically encompasses two crustal provinces of Central India Shield, namely, the Northern Crustal Province (NCP) and the Southern Crustal Province (SCP) (Acharyya and Roy, 1998; Roy, 1988). The two provinces are separated by a crustal level shear zone, referred as Central Indian Suture (CIS Jain et al. 1995). The southern part of the NCP, containing the Satpura and Son Narmada (SONA) valley geographic domain, is known as Central Indian Tectonic Zone (CITZ; Radhakrishna and the CITZ are marked by Narmada North Fault (NNF) in the north and CIS in the south (Acharyya, 1999). The Jabalpur earthquake affected area lies in SONA lineament zone which forms the northern units of CITZ. The SONA zone is about 1600 km long and 150 km-200km wide, extending from the southern margin of Kathiawar peninsula in the west to the margin of Vindhyan basin in the east (Crewford, 1978; Ahmad, 1964). The zone has been a major locus of episodic tectonism with evidences of reactivation. The E-W to ENE-WSW trending Narmada and Tapti lineament from a prominent tectonic belt (SONATA) in midplate continental India 2). Narmada tectonic line and its presumed eastward extension, Son, have been considered as a major Precambrian deep crustal features (Auden, 1949; West 1962) and possibly a palaeo-rift (Nayak 1990) extending hundreds of kilometer in E-W direction (Mishra 1987, 1992). Pascoe (1959) recognized the Narmada lineament as a rift at its western ends however, its eastward extension and the relative timing of the Narmada rifting and Deccan Trap eruption remained unknown. The correlation of structure and geo-physical data shows that the Son-Narmada and Tapti lineament together represent an interpolate rift with a central (Satpura Block) horst bounded on either side by grabens: the Narmada graben on the north and the Tapti graben to the south (Mishra et al, 1999).

The Narmada Rift valley is conspicuous ENE-WSW to E-W trending prominent composite structural system across Indian sub-continent. It consists of various blocks which are dislocated and faulted along various faults and lineaments in space and time. The Narmada Rift System consists of various sub-basins like Hiran, Sher Shakkar, Dudhi, Tawa, in eastern and central segment, where as in the western extension Sukta which are minor basins are integrated and built part of main rift System. These sub basins possess imprints of rifting, sinking and rifting events. These imprints are recorded in terms of manifestation and signature on landscape, drainage, of land form elements, present and paleo-meandering signature, river terraces, cut of meanders, paleo channels, scars, rock cut terraces, entrenchment and linear and curvilinear scars. These sub basins have developed transverse to the main axis of Narmada rifting and had deep cut across the quaternary blanket. The evolution of Narmada graben is differential and asymmetrical with rifting and sinking valley floor. In Sukta sub basin a prominent NW-SE trending lineament is identified which controls the course of Sukta, it is named as Sukta lineament. It traverses from Katra in the east to Mordar in the north west over the distance of about 45 km. It appears to be basement element and some movement has taken place along this lineament in recent to Segwal in about 19 km. in length, the upper segment of Lakhauri Nadi between Kumtha and Gandhwa, is controlled by this lineament. It beyond Gandhwa cut across Sukta and Itwa lineament north of Badgaon and about against NE-SW lineament south of Segwal. This lineament bears the signature of neotectonism as disclosed by morphogenetic setting of the area. Another NW-SE trending lineament east of Khodar deeply incised Sarala surface and traverse across the Sukta lineament and truncates against the Moti-Nala along knee shape channel band of Sukta. The Sukta lineament is an active lineament as manifested by neoseismic signature as displayed in the area. The area is unstable prone to earthquake. (Plate 1, 2, 3, 4 & 5)

**Lineament Febrics:-**

The study revealed that the area embraces number of major, minor lineament fracture and faults. Though they have been noted in varying length and in a number of directions, only the more prominent ones which are persistent are grouped and discussed. Accordingly, four major lineament patterns have been identified and discussed. These lineament patterns viz i) NE-SW ii) NW-SE, iii) NNE-SSW to N-S, iv) NNW-SSS to N-S, v) ENE-WSW to E-W. The relative percentage of occurrence of lineament in these different patterns is 29.7%, 23.4%, 14.1%, 9.4% respectively. The analysis of these linear elements reveal that mega and intermediate lineament exhibit anisotropic intensity and minor lineament, fractures and faults isotropic intensity. (Plate (Plate \_1, 2, 3, 4 & 5, 6)

**Ne-Sw Lineaments:-**

This set of lineament is very conspicuous and stretch across the entire length of northern part of the area. It consists of about 19 lineaments which is 29.7% of total lineament present in the area. The length of these lineaments varies from 25 to 25 cm and the average length is about 7.5 km. A prominent NW-SE trending lineament which is controlled by the course of Sukta and named as Sukta lineament. It traverses from Katra in the east to Mordar in the North West over the distance of about 45 km. It appears to be basement element and some movement has taken place along this lineament in recent to Segwal in about 19 km. in length, the upper segment of Lakhauri Nadi between Kumtha and Gandhwa, is controlled by this lineament. It beyond Gandhwa cut across Sukta and Itwa lineament north of Badgaon and about against NE-SW lineament south of Segwal. This lineament bears the signature of neotectonism as disclosed by morphogenetic setting of the area. Another NW-SE trending lineament east of khodar deeply linaised Sarala surface and traverse across the Sukta lineament and trunkets against the Mati-Nala along knee shap channel band of Sukta.

In the Satpura upland south of Gullarpani three prominent NW-SE trending lineaments are delineated and named as Dahi, Mandwa, and Amadnagar lineament. These lineaments cut across about 190 m thick piles of basaltic lava sheets and seem to be active in recent past as witnessed by the geomorphic setting, drainage, intensive gullying, selective entrenchment, re-treting scarp and alignment of isolated relict surface in the area.

**Nnw-Sse To N-S Lineament:-**

It includes 15 lineaments which constitute 23.4% of the total lineament traversing the area. The length of these elements varies from 2.5 to 10 km and average length is about 4.5 km. These elements are generally associated with master joints and fractures and seem to be transverse nature and conspicuously associated along the northern edge of Satpura upland with the Badgaon surface.

**Nne-Ssw To N-S Lineament:-**

This group of lineament constitutes about 4.1% of total lineament of the area. The relative length of these lineaments is comparatively less than the other group it varies from 2 to 6.5 km and average length is about 3.25 km. These are associated with master joints and fractures of the area. These elements are coupled with the contemporary NNW-SSE lineament and are developed in response to resultant stress and strain caused by major events.

**Ene-Wsw To E-W Lineament :-**

This group includes six lineaments which constitute about 9.4% of total lineament traversing the area. The length of these linear elements varies from 1.5 to 6 km and average length is about 3 kms. These lineaments east of Arud bear the imprints of Neotectonism.

**Neotectonism:**

The area studied is part of Narmada basin and is drained by Sukta and its tributaries. The Sukta rises from the Satpura at are elevation of about 500 m above m.s.l. It decends northerly in straight to sinuous channel pattern across the deep gorges of Satpura ranges and debauches in the plain east of Katra. The river takes sharp turn towards north west of Sukta Nagar and flows towards north east accorss the central part of the area and joins Chowta Tawa river around Rudhi. The other important tribularies drain the area is Bham, Lakhauri and Abna river. In the area the course of Sukta river has been controlled by NE-SW trending lineament which bears imprints of neotectonism. These imprints are of cyclic nature and are well documented in the erosional and depositional domain of Sukta. The signature of these neo-seismic activities is also displayed in over all morphogenetic expression of the area. The Sukta river is associated with several nectectonic and morphotectonic elements, like straight channel segment, flood

plain quaternary terraces, entrenched river bank, knee shaped bands, rock cut terraces, linear scarp perennial channel segments, and truncated hanging drainage.

The present flood plain of Sukta river is confined in the narrow valley along the river course. This flood plain occurs at the elevation between 265 to 280 m above m.s.l. and has entrenched its bank about 12 m. The deeply selective and incised entrencher nature of the channel suggests rejuvenation of the river due to re-activation of NE-SW trending lineament towards the later phases of quaternary sedimentation. The relict quaternary terraces associated with the meandering loops and entrenched valley is indentified at an elevation of 340-370 m about m.s.l. These are the former level of valley floor of Sukta and were formed by cyclic rejuvenation of channel twice in the recent past. It indicates at least two distinct sequential phases of neotectonic activity along NE-SW trending lineament during Holocene time.

The Sukta river is associated with knee shaped channel band around Sarala. It is bounded by ENE-WSW trending lineament in south and NW-SE trending lineament in east and west respectively. The northern and southern lineaments converge in the east around Badgaon. The disposition of this knee shaped band with respect to the quaternary terraces, entrenched valley and frame work of lineament indicate Neosiesmic activity along these lineaments in the area.

The Sukta is associated with prominent rock cut terraces/rock benches east and northeast of Sukta Nagar, east of Khairala, around Piprahati, north of Badgaon. These elements indicate anomalous high kinetic energy condition of channel system towards later phases of sedimentation. It is perhaps due to re-activation of NE-SW trending lineament in recent past.

The linear scarp is one of prominent element associated with Sukta river. These are essentially incision scarp and their total length is about 22 km. The height rises from 5 to 15 m and average height is about 12 m. These are cyclic scarp and display divergent relative disposition all along the channel it reveal that the channel has suddenly re-adjusted its base level cutting across the bed rock perhaps due to re-activation Sukta lineament in recent past.

The Sukta all along its length of 32 km in the area display its dry river course except perennial segments of channel pool around Badgaon. This erratic behavior of stream suggest its influent nature in the area perhaps due to concealed controlled of NW-SE trending lineament, which ease out its water to sub-surface water regime.

The perennial segment of channel around Badgaon exhibit reveral behavior of stream revealing effluent nature of water table due to interesting of NW-SE and NNE-SSE trending lineament around Badgaon.

The area north of Sukta Nagar display impersistent, partly internal and truncated drainage. It is seen around Arud, north west and south of Sultanpur south west of Rustampur east of Jamli khurd around Pawaikalan, north of Takli Kalan and around Shaikhpora. These drainage are diversely distributed and often truncated against the lineament traversing the area.

It indicates re-adjustment of base level of drainage, in the response to the recent movement along the network of lineaments traversing the area. It is interesting to note that these drainage elements are mostly confined north of Sukta river. It indicates that northern block is more active and under the slow process of re-adjustment as compared to other blocks (Plate \_2, 3, 4)

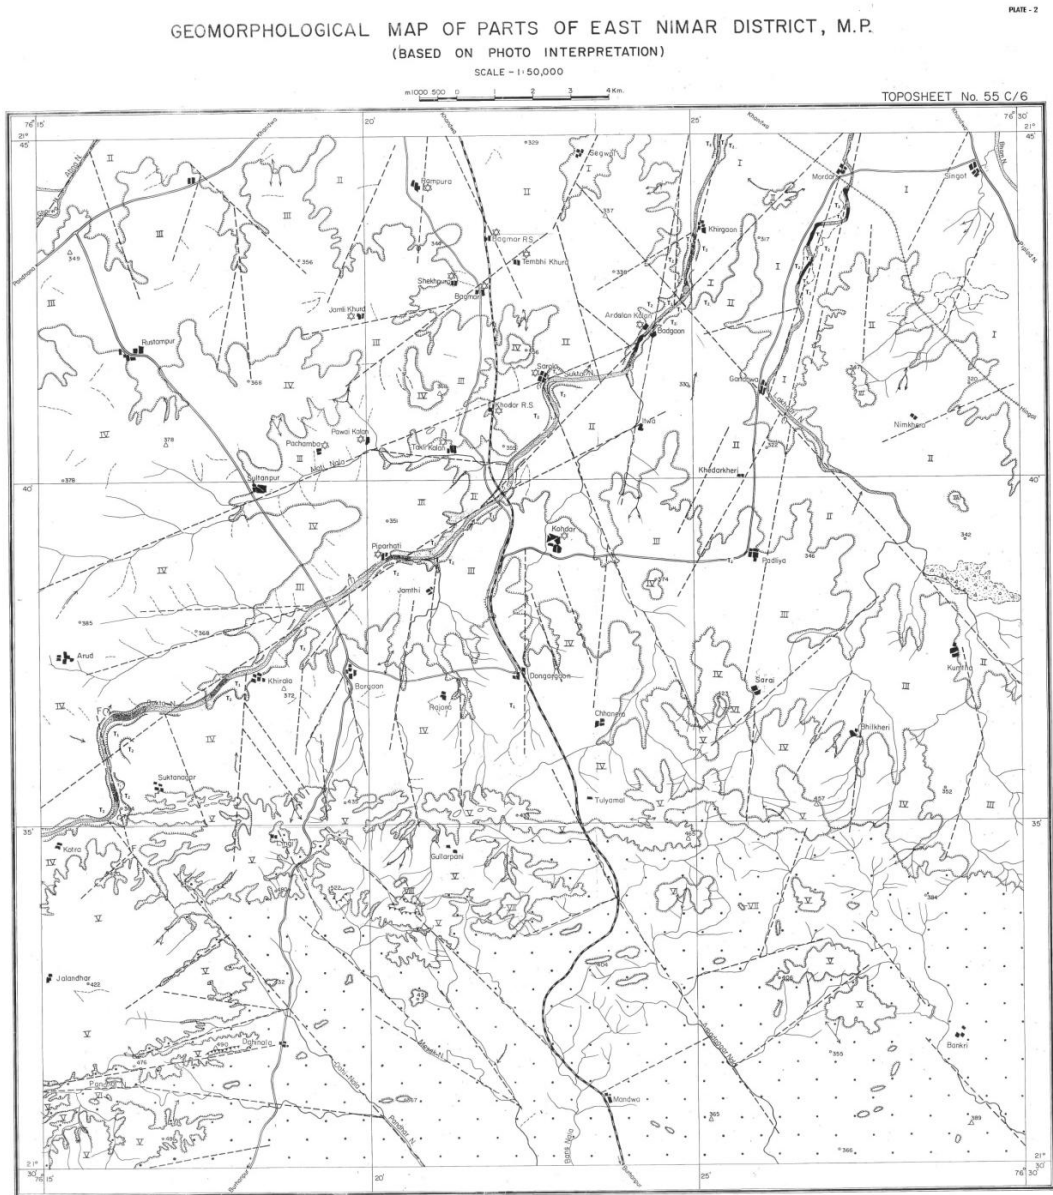

### **Summary Conclusion And Recommendation:-**

The geological, geomorphological and Neotectonic studies of parts of Sukta sub basin in parts of Khandwa district Madhya Pradesh were carried out with the aid of Satellite Imagery (IRS), air photos in Survey of India sheet 55 C /6 to acquired and accrued the data from optical signatures of micro neosiesmic episodes and recent movements along the lineament fabrics of Earthquake prone area . The Geomorphologic keys and morphotectonic manifestation in the west central segments of the SONATA LIEAMET ZONE are applied to trace and delineate imprints of neotectonism. The results of data synthesis, analysis of imprints and signature and modeling of the area by computer has been documented & presented for the first time.

The study reveals that geologically the area is occupied by Deccan trap and Quaternary sediments. The Deccan Trap complex consists of fifteen basaltic lava flows identified between 250 to 600 m above m.s.l. These lava flows are grey in color, moderately to highly vesicular in nature and each is separated by red bole intertrappean beds or mega

cryst unit. These lava flows are divided in to two formations viz i) Khandwa formation (Nimar Group) consisting of six flows between elevation of 250-360 m) and Asirgarh formation (Satpura Group) consisting of nine flows between 360-600 m above m.s.l. The exposed thickness of these flows is about 190 m.

The Quaternary deposits are represented by the sediment of two domains viz. The sediment of present domain of Sukta and sediment of palaeo-domain of Sukta. These sediments are represented by sand, silt, clay and rock gravels. The average exposed thickness of these deposits is about 3 m.

Geomorphologically, the area comprised of nine surfaces each surface is characterized by distinct morphogenetic expression, drainage, pedogenetic character slope elements and land use practices. These surfaces are identified between 280 to 480 m above m.s.l. These surfaces delineated in increasing antiquity are Quaternary terraces (280 to 300 m), Modar surface (300m), Sarola surface (320m), Khodar surface (340m), Bargaon surface (360m), Sarai surface (940m), Gularpani (SE) (460 m) and Gularpani (SW) (460 m). These surfaces bear imprints of Neotectonism in the area. Besides geomorphic landforms elements and features delineated in the area are flood plain, point bar, low level terraces, channel braids, linear scarp and relict terraces. The Morphotectonic elements are perennial channel segments, impersistent and partly internal drainage, knee shaped channel bend linear scarp and rock cut terraces. (Plate No.\_2)

The area embraces five sets of lineament viz i) NE-SW lineament, ii) NW-SE lineament, iii) NNE-SSW to N-S lineament, iv) NNW-SSE to N-S lineament, and v) ENE-WSW to E-W lineaments. The relative percentage density of occurrence of these elements in different categories is 29.7%, 23.4%, 23.4%, 14.1% and 9.4% respectively. The analysis of relative intensity of these indicate that major intermediate lineament exhibit anisotropic intensity and minor lineament isotropic intensity. (Plate No.\_6)

The Sukta is the major stream which drains across the northern part of the area. Its course is controlled by NE-SW trending lineament named as Sukta lineament. It is a basement fracture and has imprints of its re-activation all along the course of Sukta river. It is also evident by the channel morphology, morphotectonic manifestation and relative disposition of various geomorphic elements and their inter relation with these lineament.

The Lakhauri NW-SE trending lineament also bears some imprints of Neotectonism and suggests some movement in the area.

The NNW-SSE to N-S, NNE-SSW to N-S lineaments are generally associated with master joints and fractures, their depth persistently is erratic and shallow and they are devoid of any significant signature of Neotectonism. The ENE-SSE to E-W trending lineament are parallel to Narmada lineament zone constitute about 9.4% of total lineament density. This lineament bears imprints and signature of Neotectonism east of Arud.

The study of various aspects as discussed above indicate that Neotectonically the area is active and some movements have taken place along NE-SW, NW-SE and ENE-WSW to E-W trending lineament in the area in recent past. The movement along this lineament may be responsible for recent tremors in the area; it appears that it is tectonically active and prone to Neo-seismic movements..

##### Key words:-

Tracheobronchial injury, left main bronchus injury.

#### Abstract

Tracheobronchial injuries are rare injuries that occur in less than 1% of patients following chest trauma. It should be considered in almost all patient presenting with blunt chest trauma. The diagnosis initially depends on careful history and physical examination in addition to high index of suspicion and accurate interpretation of radiological findings. The prompt recognition of the injury, skillful airway management and early treatment greatly reduce morbidity and increase the chances of restoring normal pulmonary function. In case of proximal left main bronchus injury ideally it should be exposed via a right posterolateral thoracotomy. This will provide a good exposure to the left main-stem bronchus and the carina compared to approaching it thorough a left posterolateral thoracotomy where the overlying aortic arch will obscure the field and makes it difficult to repair. We present a case of proximal left main bronchus injury that underwent left posterolateral thoracotomy repair with all difficulties because the left lung was lacerated and single lung isolation was not tolerated.

#### Introduction:-

The first reported case of traumatic ruptured bronchus is attributed to Webb in 1848 following a postmortem on a man run over by a cart (1). Primary surgical repair was first successfully performed by Scannell in 1951 (2). Tracheobronchial disruption is an uncommon but life threatening injury associated with blunt thoracic trauma. Any injury to the trachea or major bronchi is commonly associated with high-speed motor vehicle accidents, In a large trauma autopsy series, 2% were found to have a tracheobronchial injury. Of those 81% died at the scene.

#### Case presentation:-

A 13 years old male referred from another hospital as a victim of road traffic accident. The patient was transferred from a peripheral hospital almost 24 hours after his injury. He was the driver and it was head on collision. Initial assessment revealed Glasgow coma scale was 8\15 for which he was intubated. His initial vital signs were normal and initial chest x-ray showed bilateral hemopneumothorax and evidence of lung contusion for which bilateral chest tubes were inserted. His work up demonstrated the following injuries based on pan computed tomography scan; head was unremarkable, his chest showed: intact mediastinal major vasculature with no definitive extravasation. Presence of pneumomediastinum extending through the neck region. Bilateral lung contusion and laceration more prominent at the left upper lobe. Right upper lobe consolidation collapse. Bilateral pneumothorax were demonstrated. There was a bilateral subcutaneous emphysema more extensive in the left side and associated with

underlying rib fracture from the first to fourth ribs. Thin paper like appearance of the left bronchial away from the carina about 2 cm likely represents bronchial injury (figure1). Abdomen showed a Grade 2 splenic injury. The patient drained from left chest tube around > 800cc in 4hours. The presence of significant left hemothorax due to possible lung laceration dictated exploration (figure2). Prior to exploration, flexible bronchoscopy was done and demonstrated a proximal left main bronchus injury with complete separation of both ends around < 2cm from the carina. Approaching the right chest through right posterolateral thoracotomy would dictate isolating the right lung. The expected damage to the left lung and significant hemothorax would not be a good option for intraoperative maintenance of oxygenation. The decision was taken to explore the left chest through left posterolateral thoracotomy. Upon access, hemothorax and clots were evacuated and a left upper lobe laceration around 8 cm identified as the source of the bleeding. The examination of mediastinum showed the distal end of the left main bronchus and the proximal end was embedded under the aortic arch. Mediastinal dissection cleared both ends and primary anastomosis was done first by the posterior membranous layer by continuous running suture PDS 4\0 and followed by the anterior layer by an interrupted suture with the same type. The patient tolerated the procedure well his post op bronchoscopy showed patent left main bronchus. Unfortunately, the patient went into sepsis, multi-organ failure and passed away after 6 weeks from this procedure.

Figure 2:-

Figure 2:-

## Discussion:-

Most tracheobronchial injuries (TBI) occurred within 2 cm of the carina. Injury to the right main bronchus is more common and diagnosed earlier. This is thought to be due to the fact that the left main bronchus is protected by the aorta. The median days until diagnosis for left sided injury was 30 days. The presentation for late diagnosis is often persistent pneumothorax. Historically, the outcome for left sided injury is more favorable than the right side, with a mortality rate of 8% compared with 16% (3). TBI usually varies from simple minor tear to avulsion or rupture at different locations. Road traffic accidents accounted for the majority of patients (59%), followed by crush injuries (27%) (4). The mortality from traumatic TBI has decreased from 36% before 1950 and 30% in 1966 to 9% in 2001(5). The most common presenting signs of traumatic TBI were subcutaneous emphysema (43.5%) and followed by pneumomediastinum (17.4%) (6). It is associated with a high degree of lethality. The mechanism of injury is attributed to the following three hypotheses: First: direct chest trauma will lead to decrease the anterior posterior diameter of the thorax with increase in the transvers diameter. As the lungs remain always in contact with the chest wall because of the negative intra-pleural pressure, they stretch laterally and produce a traction force to the carina. Second: shearing of the bronchus from its points of origin near the carina, resulting in rapid deceleration. Third: the greatest wall tension generated within the trachea bronchial tree with increased air way pressures, during compression of the chest wall against a closed glottis is at the carina (3). The initial management should follow the Advance Trauma Life Support protocol. The outcome of non-operative management is generally worse than operative management in certain types of TBI. Surgical repair should be performed as soon as possible. If an injury is identified early, primary repair should be attempted. The operative approach differs depending on the location of the injury. Findings on chest x-ray can include pneumothorax, pneumomediastinum, subcutaneous emphysema and air surrounding deep cervical tissue. "Fallen lung sign" where the collapsed lung falls away from the mediastinum is not often seen but is specific to bronchial injury. Findings on CT are similar to those of chest x-ray(3). The definitive diagnosis is made by bronchoscopy which is the gold standard. Early reconstruction depends on early diagnosis. If there is complete rupture the bronchoscopy should be used as a guide during ventilation. Cervical trachea injury is repaired via collar incision. Distal trachea, carina, and right main stem bronchus are approached through right posterolateral thoracotomy. The distal third of the trachea, carina and right main stem bronchus as well as the proximal left main stem bronchus is approached by a right thoracotomy. The distal left main bronchus will be better exposed via a left posterolateral thoracotomy. Debridement and end to end anastomosis must be attempted for significant tracheal and bronchial injury. Pneumonectomy should be avoided if possible. Lobectomy is performed if the injury is associated with lobar destruction. The mortality for those who underwent primary repair was lower than those who underwent resection of the injured bronchus and distal lung parenchyma (3% vs 13%) (3). Some patients cannot be approached conservatively therefore the most appropriate treatment is the surgical treatment as early as possible. The principles of surgery dictate the following: debridement of devitalized tissue including cartilage, end to end anastomosis, flexion of the neck to avoid anastomosis line tension and supporting the suture line with the local tissues as a flap (7). Left thoracotomy provides a good exposure to the distal left main-stem bronchus, distal part of aortic arch, descending thoracic aorta and proximal left subclavian artery. Nevertheless, it is hard to reach to the proximal left main stem bronchus, carina because of the overlying aortic arch and this is what we had to face in this case. The penetrating injuries in the chest are most probably accompanied by life threatening cardiovascular injuries. While median sternotomy ensures optimal access to the heart and major vessels, it is less beneficial for trachea, carina and bronchi. Moreover, it does not provide appropriate exposure for the restoration of additional esophageal injuries (7). The severity of associated lung injury is taken into consideration regarding the approach and that what exactly what we had to experience. Massive hemothorax or massive air leakage are two indications for rapid surgical intervention in TBI (8). In delayed presentation; sequelae of stricture and stenosis (atelectasis or bronchiectasis) predominates. Fiber optic bronchoscopy is indicated and findings indicating injury includes clotted blood, edema, or erythema. However, these underestimate the real extent of the injury. In acute setting, surgical repair is the standard. Indications for surgery depend on clinical, radiological and endoscopic assessment, but clear indications are tension pneumothorax, bronchopleural fistula after drainage, increasing pneumomediastinum, or surgical emphysema (despite conservative measures), transmural tear >2 cm, and prolapsed esophageal wall into trachea or mediastinitis. In delay settings, granulation and fibrosis starts to fill the distal ruptured segment in around 3 weeks. Some authors advice to wait and control in sepsis of the stump before surgery (9). In our case the left lung was lacerated and the patient would not have tolerated single lung ventilation, isolating the right lung and depending on the left lung. In conclusion, diagnosis of airway injuries depends on high index of suspicion with adjunct diagnostic modalities. The principles of approach and surgical management is agreed upon but exceptional cases have to be managed depending on many factors including associated lung injury and tolerance to single lung isolation.

#### Abstract

**Introduction:** Abnormal uterine bleeding is the most common gynecological symptom in reproductive age group. The etiology varies from unknown pathology to cancer. AUB is mostly under-diagnosed due to lack of awareness of its severity. This study was carried out to find the bleeding pattern in patient with AUB.

**Method:** This study was conducted in the Department of Pathology, Christian Medical College, and Hospital, Ludhiana over a period of two years, which include one year of retrospective study and one year of prospective study of samples received in the department.

**Result:** Maximum number 343 (47.7%) cases were in the age group of 41-50 years. 33.7 % presented with menorrhagia.

**Conclusion:** AUB mostly seen in the peri-menopausal age group with varied bleeding pattern in different studies.

*Copy Right, IJAR, 2017,. All rights reserved.*

#### Introduction:-

Abnormal uterine bleeding is a common gynecological symptom. Abnormal uterine bleeding occurring as heavy, prolonged or acyclic flow at menopausal transition or as spotting or minimal bleeding at postmenopausal period may be alarming and needs thorough evaluation, since this may be the only clinical manifestation pointing towards endometrial cancer. <sup>[1]</sup>Whilst most patients have benign disease, a thorough investigation is necessary, particularly in the peri- and post-menopausal women. <sup>[2]</sup>Abnormal and excessive endometrial bleeding without structural pathology occurs in reproductive women of all ages but is more common in adolescent and perimenopausal women. <sup>[3]</sup>Postmenopausally DUB is frequently associated with an atrophic endometrium. <sup>[4]</sup> Abnormal uterine bleeding signifies various patterns menorrhagia, metrorrhagia, menorrhagia, hypermenorrhea, hypomenorrhea, oligomenorrhea and amenorrhea, It is important to know the accurate characterization of the bleeding to assist in disease-specific management. Lack of awareness of underlying bleeding disorders has led to underdiagnosis in women with abnormal reproductive tract bleeding. This study was carried out to find the bleeding pattern in patient with AUB.

#### Method:-

This study was conducted in the Department of Pathology, Christian Medical College, and Hospital, Ludhiana over a period of two years, which include one year of retrospective study and one year of prospective study. In the retrospective study, cases from 1<sup>st</sup> January 2010 to 31<sup>st</sup> December 2010 were included, while the prospective study included cases from 1<sup>st</sup> January 2011 to 31<sup>st</sup> December 2011. A total of 719 specimens of endometrium sent as

curetting and hysterectomy received in the department with clinical diagnosis of abnormal uterine bleeding were included in the study. The clinical details were procured from the laboratory requisition form. Only non-pregnant women were included in the study.

### Results:-

The cases were distributed over a wide age range. The youngest patient was 18 years old while the oldest was 85 years old lady, mean age  $42.5 \pm 8.2$ . Maximum number 343 (47.7%) cases were in the age group of 41-50 years which was the most common age group. Majority 591 (82.2%) of the cases were seen in the fourth decade to fifth decades. (Table 1)

**Table 1:-** Age-wise distribution of cases with abnormal uterine bleeding.

AGE (years)	No. Of cases	Percentage
<20	4	0.6
21-30	51	7.1
31-40	248	34.5
41-50	343	47.7
51-60	58	8
61-70	9	1.3
71-80	5	0.7
81-90	1	0.1
<b>Total</b>	<b>719</b>	<b>100</b>

Out of 719 patients, 665 (92.5%) were premenopausal whereas 54 (7.5%) were postmenopausal.

Table 2 depicts bleeding pattern in all cases of abnormal uterine bleeding. 242 (33.7%) patients presented with complaints of menorrhagia, 198 (27.5%) with polymenorrhagia, 104 (14.5%) patients came with complaints of metrorrhagia, 103 (14.3%) patients came with complaints of menometrorrhagia, 10 (1.4%) patients came with complaints of oligomenorrhoea, 8 (1.1%) patients came with complaints of polymenorrhoea and 54 (7.5%) patients came with complaints of postmenopausal bleeding. (Fig 1)

**Figure 1:-** Bleeding pattern in patients with abnormal uterine bleeding.

### Discussion:-

The age of patients with abnormal uterine bleeding in the present study ranged from 18 to 85 years which is similar to the study done by Mirza et al 2012.<sup>[5]</sup> The peak incidence in the age of patients 41-50 years was seen in the 5<sup>th</sup> decade in the present study which is same as seen by Muzaffar et al 2005,<sup>[6]</sup> while Abdullah et al 2011<sup>[7]</sup> had it in the 6<sup>th</sup> decade. Because most cases are associated with anovulatory menstrual cycles, adolescents<sup>[8]</sup> and perimenopausal women<sup>[9]</sup> are particularly vulnerable.

The dominant menstrual problem was menorrhagia which was similar to that reported by Jetley et al and Bharat et al.<sup>[10,11]</sup> In a study of 400 perimenopausal women, the most common type of bleeding pattern was menorrhagia (67.5%).<sup>[11]</sup> Post menopausal bleeding was reported in only 7.3 % while Bhatta et al reported in 23 %. This variation may be due to age pattern.<sup>[12]</sup>

### Conclusion:-

- The majority (47.7%) of cases with abnormal uterine bleeding was seen in the age group of 41-50 years.
- Most common bleeding pattern encountered in abnormal uterine bleeding was menorrhagia, followed by polymenorrhagia.
- There is variation in bleeding pattern found in different studies among various age groups depicting a wide range of etiological factors.

### Introduction:-

**Guar gum** is a galactomannan biopolymeric material isolated from the endosperms of *Cyamopsis tetragonoloba*, which is native to north-western parts of India(1).Guar seed endosperm is a source of water soluble gum which is used as stabilizer, emulsifier and thickener in various food products and contributes to soluble dietary fiber portion of seed total dietary fiber (2). Its stability and solubility as well as its sorption capacity can be altered through functionalization by organic group and chelating agent. The ion exchangers based on guar gum powder is hydrophilic and biodegradable, whereas other ion exchangers prepared from petrochemical product are not hydrophilic and biodegradable. Due to rising prices of petroleum products the guar gum powder has been selected for development of guar gum resin, which are of low cost as they are locally available in large quantities from agriculture resources and these biopolymers are eco-friendly (3).Nowadays, microbial infections are a great concern because they are one of the main primary causes of death worldwide, especially in healthcare institutions, where people are generally more vulnerable (4-6).This fact is mainly due to the persistence of potentially pathogenic microbes(bacteria, viruses and fungi) in several locations, such as textiles, healthcare products, medical devices, water purification systems, sanitation facilities, among others (7,8).A variety of micro-organisms, including *E.coli*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* etc. may lead to food spoilage which is one of the most important concern for food industry (9).Most microbes are harmful and can cause numerous disease infections such as diarrhoea, respiratory illness, whooping cough and fever (10).

Antimicrobial polymers, also known as polymeric biocides are a class of polymer having the ability to inhibit the growth of micro-organisms such a bacteria, fungi or protozoans (11).The use of polymers as antimicrobial agents presents several advantages, since these products usually exhibit long-term activity and limited residual toxicity, are chemically stable, non-volatile and do not permeate through skin(7,12).Guar when crosslinked, inhibits and suppresses microbial activities, due to complexation with the crosslinking agent. This interaction caused disruption

on the microbial cells, which then changed their metabolism and led to cell death (13,14).

The aim of the present study is to synthesise guar based derivative ie. Guar epoxy n-methyl piperazine (GE-MP) and to investigate the inhibitory effect of the newly synthesized derivative against some pathogenic bacteria such as *E.coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Staphylococcus aureus* and fungi such as *C. kefir*, *C. tropicalis*, *C. glabrata*, *C. auris*, *Geotricum candidum*, *Rhodoturula*, *C. parapsilosis* and *C. albicans*. It was characterized by FT-IR, <sup>1</sup>HNMR, XRD, Mass spectra and elemental analysis. Other resin characteristics like swelling, moisture content, bulk density and specific bulk volume were also studied.

## Material and Methods:-

### Material:-

Guar(200 mesh size) was procured from local industry. All AR grade chemicals used were procured from Sigma, Loba Chemicals and Ases Chemical Works. The antimicrobial strains were obtained from Dr. S. N Medical College, Jodhpur(Rajasthan), India.

### Synthesis of Guar epoxy n-methyl piperazine (GE-MP):-

The synthesis of GE-MP is carried out in two steps:

#### Preparation of epoxy ether of guaran:-

1 mole of guaran powder was slurried in dioxane solvent in a round bottom flask. Then 50% aqueous NaOH was added in the slurry to make the reaction mixture alkaline, and the mixture was constantly magnetically stirred at 45°C for 2 hours. Further 1mole of epichlorohydrin was added gradually with continuous stirring and the pH was adjusted to 10 then this reaction mixture was refluxed with continuous stirring for another 4 hours. The whole reaction was carried out at 45°C. Later, the compound was filtered on vacuum pump with 80% aqueous methanol containing few drops of nitric acid to remove inorganic impurities of chloride ion and excess of alkali and then the compound formed was oven dried and used for further derivatisation.(FigureI)

#### Synthesis of Guar epoxy ether of n-methyl piperazine:-

The formed epoxy ether of guar was slurried in dioxane and 50% sodium hydroxide (NaOH) under reflux, upon constant magnetic stirring at 45°C and pH was adjusted to 9-10. 0.02 moles on n- methyl piperazine was then added to the reaction mixture. The whole reaction mixture was refluxed and stirred for 5-6 hours at 45°C on the water bath. The formed compound was washed with 50% methanol. Then the air dried compound was suspended in 0.1N HCl, after filtering it was successively washed with 0.1N NaOH and 0.1NHCl and then final washing was done with 100% ethanol and dried under vacuum.(FigureII)

### Characterization of newly synthesised GE-MP:-

The GE-MP formed was characterized using swelling and water regain, moisture content, bulk density, bulk volume, elemental analysis, FTIR, XRD, NMR, and mass spectroscopy.

#### Swelling and water Regain:-

GE-MP is of polar nature and it swells in polar solvent. Water regain refers to the weight of water taken up by 1 gram of dry resin.

Water regain is given by:-  $W_r = (W_1 - W_2) / W_2$

Here,  $W_1$  = Weight of wet substance (in grams)

$W_2$  = Weight of dry substance (in grams)

#### Moisture Content:-

1gram of GE-MP was dried to a constant weight in a vacuum desiccator at 40°C overnight and then weighed. Percentage of MC =  $(W_1 - W_2) \times 100$

Here,  $W_1$  = weight of resin before keeping in desiccator

(1g)  $W_2$  = weight of resin after keeping in desiccator

#### Bulk density and Specific bulk volume:-

1g of GE-MP was dried to a constant weight and poured in a 1cm<sup>3</sup> measuring cylinder. Then the cylinder was thrashed gently on the surface until the volume of the resin remains same.

Bulk density = 1/(specific bulk volume)

**Elementary Analysis:-**

The elementary Nitrogen content was determined using standard method.

**FT-IR Analysis:-**

The FTIR spectra of GE-MP formed was analysed using AT-IR(ALPHA EX Bruker) spectrophotometer in range of  $400\text{ cm}^{-1}$ .

**XRD Analysis:-**

The crystal structure of GE-MP was characterized using X-ray diffractometer (XRD , Bruker D8 advance) with Cu K  $\alpha$  radiation. ( $\lambda=1.54\text{\AA}$ ) as x-ray source, it was operated at 40mA and 40 KV in the range of  $2\Theta=20-800$ .

**NMR Analysis:-**

<sup>1</sup>HNMR characterization was proceeded on Bruker Advance(500MHz) at 297-303K.

**Mass Spectra Analysis:-**

The mass spectra of the new guar derivative was studied using Thermo Scientific TSQ 8000 Gas Chromatograph with Ion Source Type of EI source programmable to  $350^{\circ}\text{C}$  and with mass range of 2.1100 amu.

**Antimicrobial Activity:-**

The pathogenic bacteria and fungi were isolated from Dr. S.N Medical College, Jodhpur(Raj), India. They were maintained as pure culture in specific agar medium and were preserved by sub culturing every 6 month. The present study includes the study on pathogenic bacteria and fungi. If certain bacteria and fungi are resisted by any antimicrobial agent then it stops the growth of that particular bacteria and fungi and a zone is created where the growth of bacteria or fungi is not visible, this zone is known as zone of inhibition. Zone of Inhibition testing is a quick, qualitative means to measure the ability of an antimicrobial agent to inhibit the growth of microorganisms. In the world of antimicrobial substances, the degree to which these materials are inhibitory can be of greatly importance to the health of the consumer. The pathogenic strains of bacteria used in the present study are *E.coli*, *Klebseilla pnemoniae*, *Pseudomonas aeruginosa*, *Staphylococcus aureus* and the strains of fungi used are *C. kefyri*, *C. tropicalis*, *C. glabrata*, *C. auris*, *Geotricum candidum*, *Rhodoturula*, *C. parapsilosis*, *C. albicans*.

**Preparation of Inoculum:-**

Pure isolate of each bacterium and fungi were first subcultured in nutrient broth at  $37^{\circ}\text{C}$  for 24h. With this method, approximately 100 microlitres of standard inoculums from a single strain was spread over an agar plate using a sterile swab. By using a sterile swab, a suspension of the pure culture is spread evenly over the face of a sterile agar plate.

**Antimicrobial sensitivity test using well diffusion method:-**

In well diffusion method, wells of certain diameter are dig on the sterile agar plate. Then the resin is filled in the well using micropipette, then they were incubated. If the bacterial or fungal strain is susceptible to the antimicrobial agent, then a zone of inhibition appears on the agar plate. The diameter of inhibition zone formed was measured in mm with transparent ruler and the results were recorded.

**Results and Discussion:-**

The characteristic property of newly synthesised GE-MP is shown in tabular form (Table I) which gives the information about the physiochemical property of the resin. Spectral analysis gives the exact idea about the structure and information about the functional group incorporated in the newly synthesised derivative of guar. The relevant data shows that the desired functional group has been crosslinked with guar.

The spectral data is analysed as:

**FT-IR interpretation** (Figure III): FT-IR spectrum of GE-MP resin shows a distinct peak at  $3420.23\text{ cm}^{-1}$  which is characteristic peak for N-H stretching. The band at  $2922\text{ cm}^{-1}$  denotes  $\text{sp}^3$  C-H stretching vibrations. Peaks at  $1654.08\text{ cm}^{-1}$  and  $1383.27\text{ cm}^{-1}$  corresponds to N-H bending and C-N stretching vibrations respectively. Another weak peak of  $1096.27\text{ cm}^{-1}$  attributes to phenyl C-O stretching.

**XRD interpretation**(FigureIV): The XRD data indicates that n-methyl piperazine is loaded onto the surface of epoxy ether of guar. Actual XRD spectra of guar shows that it is amorphous in nature but upon complexation it may

become crystalline or semicrystalline. The spectra reveals that the structure of GE-MP resin is triclinic and its crystalline size is 96.9Å.

**<sup>1</sup>H NMR interpretation**(Figure V):The characteristic peak at  $\delta = 2.26-2.08$  appears due to  $-N-CH_3$  and other peaks at  $\delta = 1.70$  appears due to  $-CH_2-N-$  signal at  $\delta = 3.0-5.3$  is due to  $-CH_2$  of  $-(CH_2-O-R)-$  moiety. The resin was dissolved in  $CDCl_3$  solvent for spectral analysis.

**Mass interpretation**(FigureVI):  $M^+$  (247.2)

#### Antimicrobial Activity:-

The results of the antimicrobial activity of the newly synthesised GE-MP against bacterial and fungal strains are given in table II and table III. The present study depicts that different micro-organisms respond differently towards the newly synthesised resin, as a result different measurement of diameter of inhibition zone for different micro-organisms were recorded. Pure guar do not show antimicrobial activity but upon complexation it may or may not show response towards the microbes. In the present research GE-MP resin shows positive inhibition zone for antibacterial activity and antifungal activity, in all four bacterial strains and five out of eight fungal strains. GE-MP shows small inhibition zone for *E.coli*, *Pseudomonas aeruginosa* and *Klebseilla pnemoniae* and *S.aureus* (figure VII A). Some fungi like *C. glabrata*, *Rhodoturula*, *C. parapsilosis*, *Geotricum candidum* and *C.auris* shows positive inhibition zone while *C.kefyr*, *C.tropicalis*, *C.albicans* do not shows antifungal activity (figure VII B). The results of the present study are quite encouraging as it exhibited antimicrobial activity against pathogens.

#### Conclusion:-

The newly synthesised derivative of guar, GE-MP was synthesised by using natural base with nontoxic reagents hence it is environment friendly in nature. Also they show sufficiently effective antibacterial and antifungal activity against microbes and can be of great importance to the health of the consumer.

#### Abstract

Multiple factors are believed to be involved in the manifestation of Rheumatoid arthritis and Osteoarthritis. Genetic factors are also considered as important predisposing factor in these debilitating conditions. In the present study we investigated the role of Group specific component also known as Gc globulin gene polymorphism in susceptibility to these frequently observed arthritic condition. Gc globulin gene polymorphism was investigated in 115 RA patients, 47 OA cases along with 100 healthy controls. The percentages for Gc 2-2, Gc 2-1 and Gc 1-1 were 8%, 35% and 57% in the controls. Significantly increased frequency of Gc 2-1 heterozygotes was observed in RA 86.09% and OA 95.74% (\*p< 0.05). It is inferred that the individuals with Gc 2-1 globulin have high risk of developing RA or OA compared to those with Gc 2-2 and Gc 1-1.

#### Introduction:-

Arthritis is pain, swelling and stiffness of joints. As it is known that joints are parts of the body where two bones are attached and usually lined with cartilage, a rubbery material that prevents the bones from rubbing together [1]. Arthritis can result from too much wear and tear on the joint or from illness that can cause inflammation of joints [2].

Rheumatoid arthritis involves inflammation of the joint lining called synovium, which leads to joint deterioration. It is a chronic disease characterized by general ill health and chronic inflammation of the tissue around the joints and tendons [3]. It presents with symmetrical, inflammatory and destructive joint changes and tenosynovitis, but is also associated with other systemic findings that can affect virtually any body tissue or organ [4].

Rheumatoid Arthritis is a frequently observed disorder of connective tissue and is an important cause of disability, morbidity and mortality [5]. Rheumatoid Arthritis occurs worldwide with variable incidence and severity. The etiology of Rheumatoid Arthritis remains unclear but there is evidence of genetic predisposition to the disease [6].

OA is another form of arthritis, especially among older obese people [7, 8]. It is the joint disease caused by the breakdown of cartilage that firm rubbery tissue that cushions bones at joints. Men and women are affected but symptoms occur earlier and appear to be more severe in women [9]. The exact etiology of OA is unknown but it is believed that multiple factors (e.g. heredity, trauma and obesity) interact to cause this disorder. The pathophysiology involves a combination of mechanical, cellular and biochemical processes [10]. The interaction of

**Corresponding Author:- Arshia Fatima.**

Address:- Department of Genetics, Osmania University 500007.

these processes leads to changes in the composition and mechanical properties of the particular cartilage. Cartilage is composed of water, collagen and it absorbs energy from the shock of physical movement. In OA cartilage breaks down and wears away. As a result, the bones rub together, causing pain, swelling and stiffness. OA may also limit the range of motion in affected individuals [11]. Most often, OA develops in the hands, knee, hips and spine [12].

Genetic factors play a important role in the etiology of RA and OA in addition to biochemical and immunological factors. Candidate gene approach was employed using Gc globulin to investigate disease association in RA and OA patients.

The vitamin D binding protein (DBP) also known as Gc globulin is a multifunctional plasma protein that can bind several diverse ligands. It is a member of the albumin and alpha-fetoprotein gene family and shares considerable amino acid homology with this protein.

Gc is a 52 to 58 kDa multifunctional plasma protein, synthesized mainly by hepatocytes. Polymorphism in the Gc gene (Codominant alleles) gives rise to three major electrophoretic variants of Gc (Gc2, Gc1s and Gc1f) which differ by amino acid substitution as well as glycosylation [13]. They differ with regards to relative vitamin binding capacity. Reduced vitamin D binding capacity and reduced vitamin D levels are believed to be associated with susceptibility to autoimmunity as well as reduced bone density in RA and OA patients. The physiological significance related to the various phenotypes is yet to be discovered.

Gc is the major carrier protein of vitamin D and its metabolites in the circulation and is important for preservation of the Vitamin [14]. Gc globulin also transports components such as fatty acids and endotoxin and it is an important player in the actin scavenging system [15]. Gc binds actin released from cells upon injury and Gc actin complexes are rapidly cleared from the circulation, thereby preventing the harmful effects of actin filaments in blood vessels. The resulting decrease in Gc concentration makes Gc usable as a prognostic indicator of survival of patients with significant tissue injury after trauma and among patients with hepatic failure [16]. The vitamin D binding protein (DBP) is the major carrier protein for vitamin D metabolites in plasma. Polymorphisms in DBP have been described to be associated with an increased bone fracture risk and diabetes.

High frequency of the GC\*2 allele and a low frequency of the GC\*1S allele were observed in rheumatoid arthritis and osteoarthritis compared to controls [17]. There are few studies from India on role of Gc globulin polymorphism in susceptibility to RA and OA. Hence the present study was carried to investigate the role of polymorphic variants of Gc globulin in RA and OA.

### Material and Methods:-

The blood samples of RA and OA patients were collected from local Rheumatology centre in the Hyderabad under the guidance of a Rheumatologist. The control samples were randomly collected from general population.

Protein polymorphism of Gc globulin was determined in the blood samples of RA and OA patients by polyacrylamide gel electrophoresis and gels were stained by amidoblack. The method followed for electrophoresis and phenotyping was according to procedure described in **Giblet** 1961 [18].

**Table 1:-** Distribution of Gc Phenotypes in RA and OA cases

Category	Total	Gc 2-2	Gc 2-1	Gc 1-1
RA	115	2(1.74%)	99(86.09%)*	1(12.17%)*
OA	47	1(2.12%)	45(95.74%)*	1(2.12%)*
Control	100	8(8.00%)	35(35.00%)	57(57.00%)

\*p< 0.05

**Table 2:-** Distribution of Gc Phenotypes in RA and OA patients with respect to sex \*p< 0.05

Category	Total	Gc 2-2	Gc 2-1	Gc 1-1
RA				
Male	21	0(0.00%)	19(90.47%)	2(9.53%)
Female	94	1(2.12%)*	80(85.11%)	12(12.76%)
OA				
Male	8	0(0.00%)	7(87.50%)	1(12.50%)
Female	39	1(2.56%)	3(97.44%)	12(0.00%)

## Result and Discussion:-

A perusal of Table 1 reveals significantly high frequency of Gc 2-1 in both RA and OA patients compared with controls (86.09% in RA and 95.74% in OA (\* $p < 0.05$ ) and only 35% in controls). Relative risk analysis by odds ratio revealed that patients with Gc 2-1 have increased risk of developing RA and OA. In RA relative risk was found to be 11.49 while in OA it was 41.78. These results indicate that gene coding Gc globulin can be considered as potential candidate gene for RA and OA. The susceptibility is found to be higher even in OA than in RA patients. Distribution of Gc phenotype in male and female revealed that both male and female cases with Gc 2-1 phenotype are significantly higher than in the control samples.

##### Key words:-

Ant Colony Optimization, makespan, performance.

#### Abstract

Task scheduling is the most important part of cloud computing. To optimize the system, the tasks have to be scheduled in an efficient manner. A scheduling algorithm must be efficient in a way that it improves the performance of the system. The primary goal of task scheduling algorithm is to reduce the makespan and to increase resource utilization. In this paper a task scheduling model using various algorithms has been analyzed. These algorithms take into consideration of various parameters and improve the system.

#### Introduction:-

##### Cloud Computing:-

Cloud computing is a shared pool of the various configurable computing resources (e.g. server, storage, network, services, and applications) that can be accessed remotely without owning the entire cloud. Cloud scheduling is the scheduling of incoming tasks to the available  $n$  resources. There are various scheduling algorithms and the traditional scheduling algorithms only aims at reducing the total execution time of the system. The meta-heuristic algorithms like Ant Colony Optimization (ACO) and Particle Swarm Optimization (PSO) tend to be efficient than traditional scheduling algorithms.

##### Need for Cloud Scheduling:-

Many users access the cloud at the same time and it is not possible to allocate each task manually. Due to increase in demand for cloud resources, the resources need to be allocated to each task in an efficient manner. So there is a need for cloud scheduling to schedule the tasks to resources efficiently.

Max-Min algorithm select tasks with maximum execution time on a faster available machine that is capable of giving minimum completion time. The disadvantage of this algorithm is that the tasks with minimum execution time are delayed. Hence this algorithm is not efficient for scheduling. Genetic algorithm is used to find the optimal sequence of tasks. By executing tasks in that sequence the makespan of the tasks gets reduced. PSO algorithm follows the behavior of bird searching for foods. It searches the perfect place to schedule the data by using the random number which is used to search the location. Ant colony algorithm follows the behavior of ants. It uses the pheromone laid on the path to travel. It will be disappeared after some time so that new paths are formed automatically. Bee colony algorithm follows the behavior of bees called foraging. It is used to find the feasible path for scheduling problem. The bees are divided into different groups and do the job like that in the bee colony.

**Related Works:-**

**Liji Jacob [1]** proposed the BAT algorithm for scheduling in the tasks in the cloud. This algorithm is inspired by the behavior of bats. Bats use echoes to sense food/prey and barriers in the darkness. They fly randomly with fixed frequency and loudness. Initially, bat population and its echolocation parameters are initialized. Candidate micro bats are then generated and it is evaluated. After evaluation, the echolocation parameters are updated. It is repeated until there is a feasible design. This algorithm is compared with other optimization algorithms and it has high accuracy, high efficiency, and high convergence rate.

**UmaraniSrikanth et al. [2]** proposed that in cloud computing it is very important to schedule the task correctly. If the task scheduling algorithm is used to schedule means it will take more time for allocation. In order to avoid that here, they are trying to predict a schedule for the new task set without running the task scheduling algorithm. For that, they are using the ACO, a swarm intelligence model to reduce the scheduling time. Here they use the utilization matrix.

**SumandeepAujla et al. [3]** proposed the hybrid Cuckoo algorithm. This algorithm is a combination of Genetic Algorithm (GA) and Cuckoo algorithm. First, the tasks are scheduled by genetic algorithm and the output from GA is given as input to the Cuckoo algorithm. The results are proven to be better than GA and Cuckoo algorithm in terms of energy, execution time and resource utilization.

**Awad et al. [4]** proposed the Load Balancing Mutation Particle Swarm Optimization (LBMPSTO) algorithm which is an enhanced form of PSO algorithm. This model is proposed for allocation of tasks to virtual machines with maintaining the reliability. The tasks that are failed to schedule are rescheduled using LBMPSTO, thus achieving reliability. This algorithm is compared with standard PSO and few other algorithms. It is found that this algorithm reduces the execution time, cost, transmission time and helps in achieving the load balancing between tasks and virtual machines. It provides a reliable and good distribution of resources when compared with other algorithms.

**NimaJafariNavimipour [5]** proposed the artificial bee colony algorithm. This algorithm works based on the foraging behavior of honey bees. This algorithm consists of employed, onlooker and scout bees. Each employed bee searches for the new food source in the neighborhood of its current food source. The onlooker bee evaluates the nectar information from all employed bee and chooses the best. The scout bees determine the abandoned sources and replace it with randomly produces new food sources. Food source represents the possible solution and the nectar amount represents the quality of the solution. This algorithm is proved to be better in terms of-of task execution time and waiting time.

**Ramya et al.[6]** proposed a cost efficient algorithm for task scheduling. It uses two scheduling heuristic. The first heuristic uses the concept of Pareto dominance to generate a cost efficient task schedule based on the execution time of the tasks and the monetary charges of VM's. The second heuristic complements to the first heuristic and attempts to minimize the monetary costs of non-critical tasks.

**Durga Lakshmi et al. [7]** proposed the genetic algorithm which is a heuristic search technique that produces an optimal solution of tasks. This algorithm mainly aims to find the best sequence of tasks to execute to optimize the overall waiting time of the system. The request from the Client User (CU) is stored in the Request Queue (RQ). Then GA Module Queue Sequencer (GAQS) interchanges the position of the tasks so that the waiting time of the tasks is less. The sequence of tasks is stored in buffer queue and then it is executed by the Job Scheduler (JS). This algorithm is compared with tradition scheduling algorithm and it increases the throughput of the system and can be implemented to increase the performance of the system.

**KokKonjaang et al. [8]** proposed the Max-Min algorithm to efficiently optimize the task scheduling by allocating the tasks with maximum execution time on a faster available machine. This algorithm aims at the first allocation of tasks with maximum execution time before assigning the tasks with minimum execution time for the purpose of minimizing make span. This enhanced algorithm is compared with Max-Min and Data Aware algorithms. It is found that it provides efficient resource allocation and reduces the make span. The drawback of this algorithm is that there will be a delay in execution of tasks with minimum execution time.

**Leila Ismail et al. [9]** proposed the Energy-Aware Task Scheduling (EATS) model which aims to increase the efficiency of the application and to reduce the energy consumption. In this model, the big data is divided and

scheduled in the cloud for distributed processing by taking into consideration of both the performance and energy consumption. They have taken the application to be a divisible load application so that it is divided into independent tasks and assigned to distributed resources. The distributed processing consumes less energy compared to sequential execution. It is shown that the ratio of consumption of energy in a fully utilized server to its consumption of energy when it is idle is 1.3 which says that the server should be fully utilized to reduce energy consumption and increase performance.

**Hussin M. Alkhashai et al. [10]** proposed an algorithm which is a combination of Particle Swarm Optimization (PSO), the Best-Fit (BF), and Tabu-Search (TS) algorithms called BFPSOTS. The BF algorithm is used to generate an initial population of standard PSO, the Tabu-Search (TS) algorithm has been used with PSO to avoid the trap of local optimality which occurred when using the standard PSO. The cloudsim tool is used for the implementation of this hybrid algorithm. This algorithm reduces the makespan, cost and increases the resource utilization. But still, this improvement is achieved at the expense of fulfillment of the time complexity.

**ShengjunXue et al. [11]** proposed the experiment and analysis of task scheduling of workflow under the cloud computing by using the particle swarm optimization. It is used to achieve the minimum cost of users. Workflow represents the logic and rules that how to organize the front and rear works together in the work process. Here they use the service cost optimization algorithm based on PSO (PSO-SC). This algorithm makes use of the matrix to solve the problem with the help of graph with in-degree and out-degree. In this, it not only decreases the total time it also adjusts the execution task with the help of virtual machines in the data centers.

**Parminder Singh et al. [12]** proposed an improved and adaptive firefly algorithm for efficient task scheduling in the cloud. This algorithm has two aspects. First is the development of the cloud framework for job scheduling while the second is the development of firefly algorithm which can be applied to the cloud to improve the task scheduling. This algorithm is compared with other meta-heuristic algorithms and it provides better results than others.

### Conclusion:-

By using ACO algorithm, a swarm intelligence model the scheduling time is reduced, pheromone value used will be disappeared automatically and the new path is formed for scheduling the task. Hence, it will increase the performance and efficiency of the model. This model will automatically schedule the tasks without using the task scheduling algorithm so that scheduling time is reduced.

#### Introduction:-

Nasal polyps is the most common group of mass lesions encountered in the nose.<sup>1</sup> Nasal polyps are a multifactorial disease, with infectious, non-infectious, inflammatory, anatomic and genetic abnormalities. Most theories consider polyps to be the ultimate manifestation of chronic inflammation.<sup>2</sup> Nasal polyp is a relatively common condition found in 1-4% of general population and in high percentage of some selected group of patients. Nasal polyps diagnosed clinically are not always inflammatory in origin. A variety of non-neoplastic and neoplastic conditions can present as nasal polyps. Though, inflammatory polyps are the commonest.<sup>3,4</sup> Nasal polyps are pedunculated smooth, gelatinous, semi-translucent, round or pear shaped masses of inflamed mucosa of the nose and para-nasal sinuses prolapsing into the nose. Nasal polyposis is often associated with asthma, and other respiratory diseases like cystic fibrosis, primary ciliary dyskinesia, and aspirin sensitivity.

The site of polyp origin is a particular narrow area in the upper part of the nose, lateral to the middle turbinate, and around the openings of the ethmoid and maxillary sinuses. This is a part where the mucous membranes come into close contact.<sup>5</sup>

The etiology of nasal polyps is still unclear and currently no single theory adequately explains the formation of all nasal polyps. The two most frequently mentioned theories are based on allergic and infectious causes. Although nasal polyp tissue is known to contain a high level of histamine (Drake-Lee et al 1984), there are hardly any details in the literature regarding the distribution and abundance of mast cells in nasal polyp tissue.<sup>6</sup> The present study is conducted to quantitate and study the localization of mast cells in nasal non- neoplastic polypoidal lesions of varied aetiology.

Nasal polyps are an available model for chronic airway inflammation research, since the biopsy is easy to obtain. Histologically, nasal polyps are characterized by a large number of inflammatory cells infiltration and structural modifications of the epithelium and lamina propria.

#### Aims and objectives:-

To calculate local and systemic eosinophilia.

#### Material and method:-

The present observational study was done in the department of pathology AIMS over a period of one and a half

year from 1<sup>st</sup> April 2014 to 30<sup>th</sup> September 2015. All patients with nasal polyps taken up for surgery were considered. The patients were evaluated clinically and history was taken. Ethical approval from institutional ethical committee of ADESH UNIVERSITY was taken before the start of the study. Proper informed consent was taken from all the patients.

#### Inclusion Criteria:

1. Only non-neoplastic lesions (eg. allergic, non-allergic like inflammatory, tuberculosis, rhinosporidiosis, fungal polyps etc.) of nose presenting as nasal polyp were taken up for study.
2. All patients of both sexes irrespective of socio economic status were taken up for the study.

#### Exclusion Criteria:

1. Patients with diagnosed neoplastic lesion (eg. Benign like inverted papilloma, transitional papilloma, angiofibroma and malignant like squamous cell carcinoma, adenocarcinoma, adenoid cystic carcinoma etc.) were excluded from the study.

The samples received were processed using standard technique and haematoxylin and eosin staining was done on all the samples. Only the polyps that were diagnosed as non-neoplastic polyps on H&E were taken up for study.

#### Observation:-

**Table-1:-** Age And Sex Incidence Of Nasal Polyps

Age	Male Number(%)	Female Number(%)	Total Number(%)	Ratio Male:Female
0-10	2(3.45)	3(5.77)	5(4.55)	0.67
10-20	16(27.59)	14(26.92)	30(27.27)	1.14
20-30	15(25.86)	10(19.23)	25(22.73)	1.50
30-40	12(20.69)	10(19.23)	22(20.00)	1.20
40-50	6(10.34)	7(13.46)	13(11.82)	0.86
50-60	5(8.62)	6(11.54)	11(10)	0.83
60-70	2(3.45)	2(3.85)	4(3.64)	1.00
Total	58(100.00)	52(100.00)	110(100.00)	1.12
Mean	29.87	30.73	30.30	
SD	14.99	16.40	15.60	

P value=0.543

Female patients outnumbered males in all decades except in 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> and 7<sup>th</sup> decade where males dominated females. Mean age in males was 29.87yrs and mean age in females was 30.73yrs. Overall mean age was 30.30yrs.

**Table: 2:-** Distribution Of Subjects According To Clinical Diagnosis

Histopathology	Number	Percentage
Allergic	29	26.36
Non-allergic	81	73.64

P value=0.000

Non-allergic polyps (73.64%) were significantly more than allergic polyps (26.36%).

**Table: 3:-** distribution of different non-neoplastic polyps in different age groups according to the histopathological diagnosis.

Age	Allergic polyp	Non- allergic polyps		
		Non-specific inflammatory polyp	Specific inflammatory polyp	
			Tubercular	Fungal
0-10	-	5		
10-20	6	20	1	4
20-30	5	11	1	7
30-40	9	6		7
40-50	4	7		2
50-60	5	5		1
60-70	-	4		
TOTAL	29	56	2	22
Percentage	26.36	69.14	2.47	27.16

Out of the total 110 cases, most of them were diagnosed as non-allergic polyps, with non-specific inflammatory being the most common (69.14), followed by fungal (27.16%) and tubercular (2.47%). Allergic polyps account for about 26.36% of the total polyp specimens received.

**Table: 4:-** gross examination of nasal polyps.

Gross feature		Number	Percentage
Gross colour	Grey white	78	70.91
	Grey brown	29	26.36
	Grey tan	3	2.73
Gross consistency	Soft	108	98.18
	Firm	2	1.82

Out of the total 110 cases, 70.91% cases were grey-white in colour, followed by grey brown(26.36%) and minimum grey tan(2.73%).

Out of the total 110 nasal polyps, 98.98% (108 cases) were soft in consistency.

**Table: 5:-** Distribution Of Symptoms

Symptoms	Number of cases	Percentage
Nasal obstruction	70	63.64
Nasal obstruction with epistaxis	2	1.82
Nasal obstruction with headache and difficulty in breathing	16	14.55
Nasal obstruction with rhinorrhea and sneezing	21	19.09
Ear pain	1	0.91
Total	110	110

Nasal obstruction (70%) was the commonest symptom followed by nasal obstruction with rhinorrhea and sneezing (19.09%), nasal obstruction with headache and difficulty in breathing (14.55%), nasal obstruction with epistaxis (1.82%) and ear pain (0.91%).

**Figure 9:** Distribution of symptoms.

**Microscopic findings in polyps:-**

The type and density of inflammatory cell population was observed. Majority of the polyps had lymphocytes, plasma cells, eosinophils, neutrophils and macrophages. The polyps were distributed according to the predominance

of stromal infiltrate which was mono-nuclear (comprising predominantly of lymphocytes and plasma cells) or eosinophil rich.

**Table: 6:-** Distribution According To Stromal Infiltrate

Infiltrate	Number of cases	Percentage
Predominance of mononuclear cells	64	58.18
Predominance of eosinophils	46	41.82
Total	110	100

58.18% (64 cases) of the nasal polyps showed predominance of mononuclear cell infiltrate and 41.82% (46 cases) showed eosinophil predominance.

**Table: 7:-** Distribution According To Absolute Eosinophil Count In Patients Of Nasal Polyps

AEC	Allergic		Non-allergic	
	Number	Percentage	Number	Percentage
0-500	4	13.79	78	96.30
501-1000	21	72.41	2	2.47
1001-1500	3	10.34	0	0.00
1501-2000	1	3.45	1	1.23
Mean	789.83		220.26	
SD	328.17		223.43	

P value=0.000

Significant peripheral eosinophilia was seen in 72.4% (21 cases) of allergic polyps with most common range of 501-1000 eosinophils per  $\text{mm}^3$ . Maximum absolute eosinophil count was 1824 eosinophils/ $\text{mm}^3$  and minimum was 248 eosinophils per  $\text{mm}^3$ . In case of non-allergic polyps, eosinophils were in range of 0-500 eosinophils per  $\text{mm}^3$  in 96.3% (78 cases), with a maximum of 1632 eosinophils/ $\text{mm}^3$ , seen in only one fungal polyp.

**Figure 14:** Distribution of nasal polyps according to the absolute eosinophil count.

**Peripheral eosinophilia levels:** Absolute eosinophil count was determined in blood sample of both study and control groups. More than or equal to 500 eosinophils per micro litre is considered as systemic eosinophilia.

**Table 8:-** Peripheral Eosinophil Count In Patients Of Nasal Polyps

Peripheral eosinophilia		Cases	Percentage
Non-allergic polyps (29)	Present	3	3.70
	Absent	78	96.30
Allergic polyps (81)	Present	25	86.21
	Absent	4	13.73

P=0.000

So, in our study, 86.21% (25 cases) of allergic polyps and 3.7% (3 cases) of non-allergic polyps showed significant peripheral eosinophilia.

**Table 9:-** Local Eosinophilia In Allergic And Non-Allergic Nasal Polyps

Group	Number	Present		Absent	
		Number	Percentage	Number	Percentage
Allergic	29	29	100.00	0	0.00
Non-allergic	81	16	19.75	65	80.25

p value=0.003

In our study, eosinophilia was seen in 100% of cases of allergic polyps and 19.75% of cases of non-allergic polyps.

**Eosinophil count in stroma:-**

The histological examination of the slide for calculating local eosinophil count were performed. In total of 10 representative fields of inflammatory infiltrate density on each slide were counted with relation to eosinophils. These counts were converted to the average cells per high power field. The average cells per high power field more than or equal to 20 were taken as significant local eosinophilia for statistical analysis.

**Table-10:-** Eosinophil Count In Stroma Of Nasalpolyps.

	Eosinophilia	Cases	Percentage
	Non-allergic polyps	Present	16
Absent		65	59.09
Allergic polyps	Present	29	26.36
	Absent	-	0.00
Total		110	100.00

Significant local eosinophilia was seen in 29% of allergic and 16% of non- allergic polyps.

**Table: 11:-** Percentage Of Eosinophils In Stroma Of Nasal Polyps

Percentage of eosinophils	Allergic polyp	Non-allergic polyp	Total (percentage)
<5%	-	8	8(7.27%)
5-19%	-	57	57(51.82%)
20-50%	14	16	30(27.27%)
>50%	15	-	15(13.64%)

In our study, most of the nasal polyps (51.82%) showed 5-19% eosinophils per high power field. In allergic polyps, all the nasal polyps showed >20% eosinophils out of which about 50% had more than 50% eosinophils per hpf. Correlation between peripheral and systemic eosinophilia:

**Table: 12:-** Correlation Between Peripheral And Systemic Eosinophilia In Nasal Polyps

Eosinophilia	Local eosinophilia absent	Local eosinophilia present	Total
Systemic eosinophilia absent	65	17	82
Systemic eosinophilia present	2	26	28
Total	67	43	110

(p-value <0.00001)

Our study showed that there is a significant correlation between local and systemic eosinophilia.

**TABLE: 13:-** Relation Between Eosinophils And Clinical Symptoms In Nasal Polyps

Symptoms	Eosinophils	
	Mean	Standard deviation
Nasal obstruction	10.43	9.40
Nasal obstruction with epistaxis	17.50	10.61
Nasal obstruction with headache and difficulty in breathing	28.74	21.02
Nasal obstruction with rhinorrhea and sneezing	54.76	13.74
Ear pain	20.00	-
P-value	0.000	

Significant relation was also seen between the percentage of eosinophils and clinical presentation of nasal obstruction, rhinorrhea and sneezing.

## Discussion:-

**Table: 14:-** Comparative Study Of Age Distribution Of Nasal Polyps

Patient age (years)	Busuttil <sup>7</sup> (1992)	Dandapath <sup>8</sup> (1993)	Present study (2015)
0-10	-	4 (3.54%)	5(4.55%)
11-20	2 (2.7%)	36 (31.86%)	30(27.52%)
21-30	16 (21.62%)	44 (38.94%)	25(22.73%)
31-40	19 (25.67%)	13 (11.5%)	22(20%)
41-50	19 (25.67%)	9 (7.96%)	13(11.82%)
51-60	6 (8.1%)	7(6.2%)	11(10%)
61-70	6 (8.1%)	-	4(3.64%)
71-80	6 (8.1%)	-	-
Total	74	113	110(100%)

In the present study, the youngest patient was 5 years old and oldest 69 years. Majority of patients were in the second decade [27.52%] and fourth decades [22.73%] of life, followed by 3rd decade [20.00%], 5th decade [11.82%], 6th decade [10.00%], 1st decade [4.55%], and least was in 7th decade [3.64%].

According to Busuttil et al(1978), nasal polyps were more common in the 4<sup>th</sup> and 5<sup>th</sup> decade so, their results did not correlate with our study.<sup>7</sup>

Dandapath et al(1993) observed 2nd and 3rd decade as the most common age group affected. The present study correlated with the study of Dandapath et al in which nasal polyps were common in second decade of life.<sup>8</sup> According to KirtsreesakulV(2005) , in the general population, the overall prevalence rate of nasal polyps in adults is about 4%. The prevalence is much lower in children, except nasal polyps usually occurs in the age group of 30 – 60 years when associated with cystic fibrosis. In the present study children are the less commonly affected group [4.55%, 5 cases].<sup>9</sup>

Klossek et al(1997) reported mean age for nasal polyps patients was  $49.4 \pm 17.6$  years.<sup>10</sup>

Ediger et al(2005) reported age range for nasal polyps is 19–63 years with mean age of  $38.29 \pm 13.27$  years.<sup>11</sup>

According to a study conducted by Pradhananga et al(2008), the patients of all age group present with nasal polyps with the peak age of 50 and above. In their study, nasal polyps were found in age range from 14 to 85 years with mean age of  $40.33 \pm 17.4$  years and the maximum number of the patients (37.2%) was in the age group of 20-40years,<sup>12</sup> whereas in our study, mean age was  $30.3 \pm 15.60$  years.

So as in our study the mean age was lower than all these studies, it may be because this region is more prone to infections, air pollution and allergies as compared to the other regions.

**Table: 15:-** Comparison Of Distribution Of Symptoms

Study	No of cases
Sethi et al <sup>13</sup> (1998)	6
Triglia and Nicollas <sup>14</sup> (1997)	46
Drake et al <sup>15</sup> (1997)	200
Present study	109

In other studies as well, nasal obstruction was the predominant symptom, which is in concordance with the present study.

Same results were obtained by Shulbha and Dayananda, that is both in non- allergic and allergic polyps, the commonest symptom was nasal obstruction, which was found to be statistically significant ( $P < 0.001$ )<sup>16</sup>

#### Comparison of local and systemic eosinophilia:-

According to Wardlaw et al<sup>17</sup> (2000), the hypothesis that eosinophils are important effector cells in allergic disease rests on the evidence that the eosinophils are found in tissues in allergic diseases, their mediators are relevant to the disease process and removal of eosinophils is associated with an improvement in the disease. GCs undoubtedly have a profound effect on eosinophils and their beneficial effects in allergic disease appear to go hand-in- hand with their inhibition of tissue eosinophilia, but they are of course broad- spectrum anti-inflammatory drugs.<sup>17</sup>

There is no doubt that eosinophils are intimately associated with asthma and the other atopic diseases. As there is virtually no evidence that eosinophils can ameliorate disease, we presume they must either be bystander cells or actively involved in pathogenesis. The current evidence is consistent with a role for eosinophils simply as markers of the inflammatory process. Perhaps eosinophils are part of a complex inflammatory process in which they favoursome aspect of the pathophysiology.

So, more work needs be done to determine the extent to which the eosinophilia might guide management of nasal polyps.<sup>17</sup>

Zhang et al<sup>18</sup> (2008) also assessed the infiltration and activation of eosinophils in nasal polyps immunohistochemically. They concluded eosinophilia is a prominent histological feature of nasal polyps, which indicates that the activated eosinophils may play vital role in the pathogenesis of nasal polyps.

According to Pradhananga et al<sup>19</sup> (2008), there is significant correlation between local and systemic eosinophilia. Thus this study correlated with our findings.

**Table: 16:-** Comparison Of Number Of Eosinophils Per Hpf

Study	No. of eosinophils per hpf	
	Allergic nasal polyps	
Aleksander et al <sup>18</sup>	$55.92 \pm 5.82$	$11.12 \pm 2.03$
Present study	$59.89 \pm 16.48$	$15.68 \pm 7.69$

The study done by Bryson et al<sup>20</sup> (2003) on biopsy of diseased sinonasal tissue from 116 patients undergoing endoscopic sinus surgery and 24 control group with normal nasal mucosa undergoing septal surgery showed that the area of inflammatory infiltrate density and the numbers of eosinophils were high in patients with nasal polyps ( $p < 0.0001$ ) and also it has significant correlation with degree of the polyps ( $p = 0.0017$ ).

The results were similar to the results of our study in terms of local and systemic eosinophilia.

**Table: 17:-** Comparison Of Percentage Of Eosinophils Per Hpf

Percentage of eosinophils	Luis et al <sup>21</sup> (2008)	Present study
<5%	3(7.5%)	8(7.27%)
5-19%	5(12.5%)	57(51.82%)
20-50%	17(42.5%)	30(27.27%)
>50%	15(37.5%)	15(13.64%)

The study by Garin et al<sup>21</sup> (2008) showed that most of the nasal polyps showed 20-50% eosinophils per high power field but this study did not correlate with our study, as in our study most polyps had 5-19% eosinophils.

### Conclusion:-

A male predominance was seen in the study with a male to female ratio of 1.12:1.

Most of the patients presented with the clinical features of nasal obstruction and a few presented with epistaxis, headache, rhinorrhea and sneezing and only one case presented with ear pain.

Out of the total 110 cases, 26.36% were allergic nasal polyps and 73.64% were non- allergic nasal polyps.

Eosinophilia- local and peripheral:

All the allergic polyps and about 20% of non-allergic polyp showed local eosinophilia in tissue sections. The percentage of eosinophils was more in allergic polyps than in non- allergic polyps in histology sections.

About 86% of the allergic polys and only 3.7% of non-allergic polyps showed peripheral eosinophilia. Hence, significant peripheral eosinophilia was seen in allergic nasal polyps compared to non-allergic nasal polyps. Thereby a direct significant correlation was seen between peripheral and local eosinophilia in our study.

An increase in the percentage of eosinophils was associated with symptoms of nasal obstruction, rhinorrhea and sneezing.

#### Abstract

Natural plant products have been used throughout human history for various purposes. This plant was used for multiple daily requirements, for instance, as food, fodder, fuel, fibre, medicines etc. It possess Anti-oxidant, Oxytotic activity, anti-inflammatory, anti-diabetic, hepatoprotective property etc.

This plant still remains under-utilized because of slow propagation and unawareness of its medicinal uses. The objective of this article is to focus on various pharmacological uses of Bombaxceiba as home remedies.

#### Introduction:-

Bombaxceiba plant is like a Kalpataru as its each and every part can be used for its medicinal and commercial importance. It is 'The best creation of god' for human beings and valuable gift of nature because its multipurpose eco-friendly uses.<sup>[1]</sup> Many custom, traditions, rituals, folk tales and rites are related to this tree. Bombaxceiba L. commonly known as silk cotton tree, Semal and it is popular in many tribal communities. This tree possess medicinal and commercial properties but it is exploited by using in Holika-dahan.<sup>[2]</sup> In India Bombaxceiba has different names in different language as Semal, Shalmali, Indian Kapok tree, Shimul, Mullilavu,<sup>[3]</sup> Moca, Picchila, Raktapushp, Katakdhya, Tulini, Semul, Shemalo.<sup>[6]</sup>

It's a widely distributed throughout Australia and Asia including India and Pakistan. It also found in Java, Sumatra, Malaysia, Bangladesh and Myanmar.<sup>[15]</sup> In India it is found in Southern Rajasthan because its drought tolerance ability.<sup>[1]</sup> It belongs to family Bombacaceae, genus ceiba is a tall, straight, rigid, deciduous tree. Its trunk is straight and tall and bears spikes for its protection from animals. Its leaves are palmate, large, spreading, glabrous, digitate having common petiole and 15 to 30 cm long.<sup>[3]</sup> In spring Pentamerous large red flowers come into sight (January to March) which are ornithophilous with cup shaped, thick and fleshy sepals. The flowers have a well-protected ovary with hard perianth containing stiff filaments. On ripening flowers produce a capsule enclosing white fibers embedded with smooth, black or gray seeds. The large, showy flowers usually appear when the trees are leafless.<sup>[4]</sup> In India various tribal people used this plant for fuel, food, fodder, fibre and medicine hence, it holds the socio-economic and ethno-medicinal values. Gum is light brown in colour and gradually becomes dark brown.<sup>[5]</sup>

The plant also known as 'King of Forest' because of its giant appearance and big flowers and has spiritual importance too. It is one of member of the five sacred trees of 'Panchvati'. Its each and every part like root, bark, gum, leaves, heartwood, flower, stem, fruit have specific medicinal importance.<sup>[1]</sup> Its medicinal benefits are found in Ayurveda, Unani and Siddha medicines.<sup>[15]</sup>

**Taxonomical Classification:-**

Rank	Scientific Name	common Name
Kingdom-	Plantae	Plants
Subkingdom-	Tracheobionta	Vascular plants
Superdivision-	Spermatophyta	Seed plants
Division-	Magnoliophyta	Flowering plants
Class-	Magnoliopsida	Dicotyledons
Subclass-	Dilleniidae	
Order-	Malvales	
Family-	Bombacaceae	Kapok-tree family
Genus -	BombaxL.	cottontree
Species-	BombaxceibaL.	Red silk cotton tree <sup>[7]</sup>
Binomial name: BombaxceibaL.; BombaxmalabaricumD.C.; Salmaliamalabarica <sup>[6]</sup>		

**Floral characters of *Bombaxceiba* :** <sup>[20]</sup>**Floral character Observation:**

Flowering period	January– March
Flower type	Somewhat ornithophilous
Flower color	Crimson
Odor	Absent
Nectar	Present
Flower opening time	Post-midnight to morning
Anther dehiscence time	After anthesis
Anther dehiscence mode	Longitudinal
Number of anthers	Many (100 approx.)
Average number of pollens per anther	88,630
Average number of pollens per flower	88,63,000
Pollen type	3-colporate
Pollen shape	Euoblate
Pollen size	± 38.8 ' 71.75 µm
Atmospheric pollen frequency	5.17% in 10.00 h
Stigma type	Above anther level, digitate with stout style and wet type.

**Medicinal Importance:-**

1. Roots of Bombaxceiba show antioxidant property.<sup>[8],[9],[22]</sup> and used in excess bleeding in menstruation<sup>[7]</sup>.
2. B. ceibashows cardiac stimulant properties<sup>[21]</sup>, hypotensive and hypoglycaemic activity, analgesic activity, traditional anti-inflammatory agent.
3. Dried tender fruits of B. ceiba are given in calculus affections and chronic inflammation and ulceration of the bladder and kidneys including strangury and other forms of dysuria<sup>[10]</sup>
4. Bark of Bombaxceiba shows anti-diabetic activity.<sup>[11]</sup> Fresh rubbed bark of B. ceiba was applied topically on pimples, acne, boils<sup>[18]</sup> wounds and to improve breast milk.<sup>[7]</sup> An infusion of the bark of B. ceiba is used as a tonic<sup>[19]</sup>
5. Tannins present in aqueous extract of Bombaxceiba bark is used against pathogenic bacterial strains<sup>[5]</sup> due to its anti-bacterial activity<sup>[12]</sup>
6. Flowers of Bombaxceiba shows hepatoprotective activity due to the presence of flavonoids and sesquiterpenoids.<sup>[13]</sup> and it also shows cardioprotective activity<sup>[14]</sup> and seminal flower green base part used in weakness<sup>[7]</sup>
7. Seeds<sup>[16]</sup>, leaves, stem, flower<sup>[1]</sup> possess oxytocic activity.
8. Seeds and roots of B. ceiba were used in the treatment of serious skin diseases like Leprosy.<sup>[17]</sup>
9. Flower and fruit of Bombaxceiba are used in snakebite and leucorrhoea.<sup>[2]</sup>
10. Phytochemicals present in plant help in providing protection against cataract, ageing, dementia, cancer.<sup>[16]</sup>
11. Leaves of Bombaxceiba used for blood purification<sup>[7]</sup>.

**Commercial Importance:-<sup>[2]</sup>**

1. It is commercially used for various purposes like toys and coffins making, artifact production, in match industry.
2. In Rajasthan (India) Kathodi tribes use its wood to make musical instruments like Dholak and Tambura while Bhil tribe uses to prepare spoons.
3. Seed oil of Bombaxceiba used as an illuminant and also for soap making.
4. Cotton extracted from its fruit is used as insulator for refrigerator, soundproof covers and in formation of padded surgical dressings.
5. Floss is generally used for making pillows and cushions because it is vermin-proof.

**Conclusion:-**

Bombaxceiba is overlooked because of some myths but it is a very valuable tree; each and every part of it is useful and valuable for various purposes. This article may develop awareness in people regarding importance and valuable uses of this tree and people can think to plant this tree in their garden in small cities and in kitchen garden in metropolitans. Various parts of this plant can be used as home remedies

### Abstract

Snail shell samples were washed and carbonized at 400°C, ground, sieved and activated with 0.1M HCl at 800°C in a furnace. The activated carbon prepared, were used as adsorbent to remove Congo red from aqueous solution. Factors such as contact time, temperature and initial concentration were studied through single-factor experiment, while other factors are kept constant (at 30min, 30°C and 50mg/L) in each. Adsorption isotherm, kinetic and thermodynamic studies were carried out for the corresponding experiment. The isotherm results show that, Freundlich isotherm has the best fit for the adsorption. Again, the adsorption kinetic followed pseudo-second order reaction with rate constant ( $K_2$ ) = 0.2667 g/mg.min, correlation coefficient, ( $R^2$ ) = 0.9999 and adsorption capacity, ( $q_e$ ) = 2.2573 mg/g. Also, the thermodynamic parameters, enthalpy ( $\Delta H$ ) = 23.93KJ/mol, entropy ( $\Delta S$ ) = 84.64J/mol.K and negative values of free energy ( $\Delta G$ ) were obtained. These results show that activated carbon from snail shell is a good low-cost adsorbent for the removal of Congo red from aqueous solution.

### Introduction:-

Dye removal from wastewater is the main problem encountered in the industries where they are used. Color is a visible pollutant and the presence of even very minute amount of coloring substance makes it undesirable due to its appearance. Therefore, it is required that the color-bearing effluents be treated to remove the color/dye in an economical fashion to the prescribed concentration level before they are discharged into bodies of water. All methods used for the removal suffer from one or other limitations, and none of them were successful in completely removing the color from wastewater. Adsorption process is efficient for removal of colors, odor, organic and inorganic pollutants from the industrial wastewater. Currently, the most commonly used adsorption agent in industry is activated carbon, which was successfully tested also for the removal of dye from wastewater. Although commercial activated carbon is a preferred adsorbent for color removal, its widespread use is restricted due to high cost, and its regeneration and reuse makes it more costly. Therefore, a number of nonconventional adsorbents have been tried for the treatment of wastewaters. Natural materials, biosorbents, and waste materials from industry and agriculture represent potentially more economical alternative adsorbents (Emrah et al, 2008).

**Corresponding Author:- Ikhazuangbe P.M.O.**

Address:- Federal University of Technology, Chemical engineering department, Owerri, Nigeria.

In this study, the ability of snail shell carbon to remove Congo red by adsorption is been studied. The Langmuir, Freundlich, Redlich-Peterson, Dubinin-Radushkevich and Temkin isotherms will be used to fit the equilibrium data. The order of the adsorption and the thermodynamic parameters will also be determined (Hakan, İlknur, & Belgin, 2008).

## Materials and Methods:-

### Preparation of adsorbents:-

Samples of snail shell were picked from the environment in Elele, Rivers State, Nigeria. The snail shells were washed with tap water until the washing water was colorless. They were respectively dried in the open air. The dried snail shells were carbonized in a furnace (SX-5-12) at 400°C for 3 hours and the charred snail shells were allowed to cool to room temperature, ground and sieved (200 – 600µm). It was chemically activated by weighing 100gram of the ground carbonized snail shells in 300 ml of 0.1M HCl solution, mixed and heated until it formed slurry. The slurry was heated in a furnace (SX-5-12) at 800°C for 3 hours, cooled, washed with de-ionized water and dried in an oven at 110°C for 2 hours (Gumus and Okpeku, 2015).

### Preparation of adsorbate:-

The Congo red used, is of laboratory grade (KEM LIGHT, India). The solution was prepared with de-ionized water from Ion-exchange (Indian) Ltd, Eleme, Port Harcourt, Nigeria. 150mg of the dye was weighed and dissolved in 1 liter of de-ionized water to prepare the standard solution.

### Adsorption experiment:-

1000mg of the activated carbon from snail shell was mixed with 50ml of Congo red solution (25, 50, 75, 100, 125 and 150mg/L) at 30°C in a temperature controlled water bath with constant shaking. The samples were withdrawn after 30 minutes and dye solutions were separated from the adsorbent using Whatmann filter paper. The concentration of the filtrate was measured with a UV spectrophotometer (2OD) at 496nm. The experiment was repeated using 1000mg of the activated carbon with 50ml of 50mg/L concentration of Congo red solution at 30°C. The samples were withdrawn after 30, 60, 90, 120, 150 and 180minutes respectively. Again 1000mg of the activated carbon mixed with 50ml of 50mg/L concentration of Congo red solution at 30, 35, 40, 45, 50 and 55°C in a temperature controlled water bath (DK – 420) with constant shaking was also carried out. The samples were withdrawn after 30minutes respectively.

The adsorption capacity of Congo red dye adsorbed onto the snail shell adsorbent at equilibrium was calculated with the following equation:

$$q_e = \frac{(C_0 - C_e)V}{X} \quad 1$$

Where  $C_0$  (mg/L) and  $C_e$  (mg/L) are the initial and equilibrium concentration of the dyes,  $V$  (L) is the volume of solution,  $X$  (g) is the weight of adsorbent in one container.

## Theory:-

### Langmuir adsorption isotherm (model) :-

The Langmuir equation is probably the best known and most widely applied adsorption isotherm. It is represented as follows in equation 3

$$q_e = \frac{a b C_e}{1 + a C_e} \quad 2$$

Rearranging equation 2, makes the equation linearized from which values of  $a$  and  $b$  can be determined from the slope and intercept respectively of the plot of  $C_e/q_e$  versus  $C_e$ .

$$\frac{C_e}{q_e} = \frac{1}{b Q_0} + \frac{C_e}{Q_0} \quad 3$$

Where  $Q_0$  and  $b$  are Langmuir constants,  $q_e$  is amount of solute removed or adsorbed at equilibrium.  $C_e$  is equilibrium concentration of mixtures. Thus  $Q_0$ ,  $b$  and the squared of the regression coefficient ( $R^2$ ), are adsorption parameters estimated by Langmuir model, which are used to suggest whether the adsorption can be modeled by Langmuir is isotherm.

### Freundlich adsorption isotherm (model):-

The Freundlich isotherm is an empirical relationship which often gives a more satisfactory model of experimental data. The Freundlich model can be applied onto heterogeneous surface involving multilayer adsorption. It can be expressed as follows:

$$K_f C_e^{1/n} \quad 4$$

However, the linearized Freundlich adsorption isotherm can be expressed in the form;

$$\text{Log } q_e = \text{Log } (K_f) + \frac{1}{n} \text{Log } C_e \quad 5$$

Where  $C_e$  and  $q_e$  are equilibrium concentration and amount of congo red adsorbed at equilibrium stage, while  $K_f$  and  $n$  are Freundlich constants which incorporates all factors affecting the adsorption process (adsorption capacity and intensity).

#### Redlich-Peterson isotherm (model) :-

The Redlich-Peterson (R-P) isotherm model can be represented as

$$q_e = \frac{K_R C_e}{1 + a_R C_R^\beta} \quad 6$$

Where  $K_R$  is the R-P isotherm constant (1/mg),  $a_R$  is also a constant  $(\frac{1}{\text{mg}})^\beta$  and  $\beta$  is the exponent which lies between 0 and 1. The R-P isotherm has a linear dependence on concentration in the numerator and an exponential function in the denominator. It approaches the Freundlich model at high concentrations and is in accord with the low concentration limit of the Langmuir equation.

#### Adsorption kinetics:-

The pseudo first order and second order kinetic models were tested at different concentrations in this study to determine which model is in good agreement with experiment  $q_e$  (adsorption capacity) value, thus suggesting which model the adsorption system follows.

#### Pseudo- first order equation:-

The Lagergren model, proposed in 1898, assumes a first order adsorption kinetics and can be represented by the equation.

$$\frac{dq_t}{dt} = K_1(q_e - q_t) \quad 7$$

Where  $q_e$  and  $q_t$  are adsorption capacity at equilibrium and at time  $t$ , respectively (mg/g),  $K_1$  is the rate constant of pseudo first order adsorption ( $\text{min}^{-1}$ ). After integration and applying boundary conditions  $t = 0$  to  $t = t$  and  $q_t = 0$  to  $q_t = q_e$ , the integrated form becomes:

$$\text{Log } (q_e - q_t) = \text{Log}(q_e) - \frac{K_1}{2.303} t \quad 8$$

The values of  $\text{Log } (q_e - q_t)$  were linearly correlated with  $t$ . The plot of  $\text{Log } (q_e - q_t)$  versus  $t$  should give a linear relationship from which  $K_1$  and  $q_e$  can be determined from the slope and intercept of the plot, respectively.

#### The pseudo second-order equation:-

The pseudo-second-order adsorption kinetic rates equation is expressed as

$$\frac{dq_t}{dt} = K_2(q_e - q_t)^2 \quad 9$$

Applying boundary conditions, the integrated form of the equation becomes.

$$\frac{t}{q_t} = \frac{1}{K_2 q_e^2} + \frac{1}{q_e} t \quad 10$$

The plot of  $(t/q_t)$  and  $t$  of equation 10 should give a linear relationship from which  $q_e$  and  $K_2$  can be determined from the slope and intercept of the plot, respectively.

#### Thermodynamic studies:-

The determination of the basic thermodynamic parameters: enthalpy of adsorption ( $\Delta H^\circ$ ), Gibb's free energy of adsorption ( $\Delta G^\circ$ ) and entropy of adsorption ( $\Delta S^\circ$ ), is important as it allows to estimate if the process is favorable or not from thermodynamic point of view, to assess the spontaneity of the system and to ascertain whether it is exothermic or endothermic. An adsorption process is generally considered as physical if  $\Delta H^\circ < 84 \text{ kJ mol}^{-1}$  and as chemical when  $\Delta H^\circ$  lies between 84 and 420  $\text{kJ mol}^{-1}$  (Zhang et al, 2011).

$$\Delta G = -RT \ln K_d \quad 11$$

$$K_d = \frac{q_e}{C_e} \quad 12$$

$$\ln K_d = \frac{\Delta S}{R} - \frac{\Delta H}{RT} \quad 13$$

where  $K_d$  is the distribution coefficient for the adsorption,  $q_e$  is the amount of dye (mg) adsorbed on the adsorbent per L of solution at equilibrium,  $C_e$  is the equilibrium concentration (mg/L) of the dye in solution,  $T$  is the absolute

temperature, R is gas constant,  $\Delta G^o$ ,  $\Delta H^o$ , and  $\Delta S^o$  are Gibbs free energy change, enthalpy change and entropy change, respectively.

**Table 2:-** energy parameters for Congo red adsorption by activated carbon

Temperature (K)	$\Delta G$ (KJ/mol)	$\Delta H$ (KJ/mol)	$\Delta S$ (J/mol.K)
303	-4.68	23.93	84.64
308	-4.96		
313	-5.91		
318	-6.08		
323	-6.31		
328	-6.78		

**Discussion:-**

The values of the adsorption model are presented in table 1, showing that the correlation coefficient of Freundlich isotherm is closer to 1 than that of Langmuir, indicating that it a heterogeneous adsorption process. This is also confirmed by the value of Temkin isotherm. While Dubinin-Radushkevich isotherm value showing that the adsorption is dominated by particle diffusion.

The kinetic of adsorption of Congo red onto snail shell was studied by using pseudo first- and second-order equations, for the examined system. The pseudo second-order kinetic model provided the best correlation of the experimental data.

The positive value of  $\Delta H$  indicates that the adsorption of Congo red on snail shell is an endothermic and a physical process. The positive value of  $\Delta S$  shows the existence of structural changes at the solid-liquid interface and  $\Delta S$  favors ion exchange and stability of adsorption.

**Conclusion:-**

The adsorption of Congo red onto snail shell based-activated carbon was investigated in this research work and the results of the study indicates that snail shell will be an excellent low-cost adsorbent for the removal of Congo red dye from industrial effluents.

#### Abstract

Nowadays, the concept of sense of place and place attachment are threatened by new developments, urban interventions, poor design and erosion in streets of towns and cities. These threatens lead to the loss of the character of city centers. There is no doubt that the sense of place and place attachment can be created by street attributes. Thus, this paper attempts to review the attributes of city center streets that contribute in influencing sense of place and place attachment. The study postulates this question: what are the street attributes that have influences on the sense of place and place attachment? The study aims at establishing the theoretical framework of street attributes in terms of creating sense of place and place attachment. The study reveals that streets have two types of characteristics, physical and functional. These characteristics can create and enhance street attributes that include vitality, diversity, transaction, accessibility, legibility, distinctiveness, comfort, and safety and security in terms of making place attachment, besides commerce, cultural value, social value, movement, accessibility, legibility, recognition, sense of comfort, and sense of safety in terms of making sense of place.

#### Introduction:-

It is worth noting, some environmental psychologists who argued the experience of place is one of the most important factors in sense of place such as, Shamai (1991), Kevin Lynch (1960), Relph (1976) and others. Those defined and explained many important definitions and concepts which related with place. In addition, they are regarded as pioneers in using experiential perspectives to reflect on place and 'sense of place'.

Relph (1976) described place as an interaction of three components i.e. 'physical setting', 'activity' and 'meaning'. While Sense of place is defined as a combination of three elements i.e. location, landscape, and personal involvement (Shamai, 1991). Spirit of place relates to the exclusive aspects of a place (Smaldone, 2006). Barker (1979) quoted from Bassett (2011), defined the sense of place as one of the most intangible concepts. Alford (2011) refers that unique identity of place is one of sense of place meanings. Moreover, she defined sense of place as relationship between people and their atmosphere.

Three components that contribute in making a sense of place were referred to by Najafi and Shariff (2011); and Beidler, (2007). They mentioned that activities, meanings and physical attributes are components related to places that contribute to creating a sense of place. It is worth considering that each place was built for serving a specific action, meaning activity could refer to actions served by the place (Najafi and Shariff, 2011). As for physical elements, it indicates to the characteristics and attributes of a setting that define the kind of place it is. Additionally, it can also be said, as mentioned by Najafi and Shariff (2011) that sense of place is defined as an overall impression surrounding the general ways in which people feel towards places, sense them, and assign concepts and values to them.

In parallel, place relationships were related with sense of place, since place is fully made of concrete things that comprise of shape, texture, substance, materials, and colour, which together determine the essence of a place (Shinbira, 2012). It is the area where one is acquainted of the unique character of given localities and perception is enhanced. The faculty of recognising various places and distinguishing different identities of a place is attributed to the concept of sense of place. People are effected by places and reciprocally place is affected by people due to the attribution of meanings to physical forms. Subsequently an interaction occurs with a place rather than a response to a place, hence enriching the place with meanings. For this reason historical and heritage places carry more sense of place compared to contemporary modern places. Based on the aforementioned, this study looks into the role of characteristics of streets in terms of their physical and functional aspects, while excluding the meanings of street.

About place attachment, commencing by 1970th, phenomenological studies are the earliest sorts of literature introducing place attachment. Place attachment is associated with the development of affective connection between people or individuals and specific places which is expressed through “interplay of affects and emotions, knowledge and beliefs, and behaviours and actions” as Ujang and Shamssudin (2012) quoted from Altman and Low (1992). Attachments can be formed between people and buildings, environments, homes, objects, landscapes, neighborhoods, towns and cities. Alford (2011) mentioned that place attachment is as an affective bond that people establish with specific areas where they prefer to remain and where they feel comfortable and safe. Scannell and Gifford (2010) defined place attachment as an emotional bond. (Jorgensen and Stedman, 2005; Lewicka, 2008; Raymond, 2010) Place attachment refers to bonds that people develop with places.

This study will centre upon street as urban space. Hence, Lynch (1960) mentioned that street is very considerable elements in cities, which reflects the image and character of cities. Moughtin (2003) defined the street as one of the important elements that act as a public open space. According to Sulaiman et al. (2008) the street is one of the earliest components of the urban and plays the most important role as a channel for communication, also generates outdoor activities that are vital for the visual introduction of the urban dwellers.

Nowadays, the concept of sense of place and relationship between place and people are threatened by new developments, urban interventions, poor design and erosion in streets of towns and cities. These threatens lead to weakness the role of character and sense of place in streets (Sulaiman et al., 2008). Thus, streets in cities loss their historical and cultural values (Najafi and Shariff, 2011). Because of strong attendance of commercial activities, many people who live around streets move to another places. This led to imbalance state in cities and made them noisy and unsuitable for living (Ja'afar et al., 2012). Hence, changes of street activities reduce its importance as one of the main components which performs cities and urban fabric. All these reasons aid to loss sense, attachment and character of places (Ja'afar and Usman, 2009; Ujang, 2008).

According to the aforementioned introduction, the street is one important component of the city that can strongly reflect its character, sense of place and place attachment. This means that the street has attributors that give its sense of place and place attachment. Strength of sense of place and place attachment are evident of the multiplicity of street attributors. So, it is important to review these attributes.

### **1. Attributes by which sense of place can be identified in streets:-**

Ja'afar et al. (2012), Lin (2011), Ja'afar (2006) and others who mentioned elements and features of streets to find the degree of sense of place. Physical and functional characteristics, and their division able to identify sense of place in open spaces or any place by brought about the relationship between it and its people (Lin, 2011).

### **1.1 Physical Characteristics:-**

Ja'afar et al. (2012) examines sense of place in traditional streets in Malaysia through three main qualities which are physical, activity, and meaning qualities to attract visitors. Physical quality encompasses physical elements (building and non-building). Activity quality encompasses activity element (formal and informal activity) and meaning quality encompasses meaning element (familiarity, historical and heritage).

Physical element is identified as the first important element contributing to sense of place in cities. It can be divided into two categories; buildings and non-buildings physical (Ja'afar and Usmar, 2009; Ja'afar et al., 2012 and 2008). The physical features plays an important role in influencing the sense of place (Ujang, 2008).

Buildings attract respondents to the street is associated with its use (activity inside the building). In the case, street character is reflected by the building use for business activities in all streets. For non-physical building, it is associated with presence of people. Meanwhile, non-physical building is associated with landscape element, soft and hard landscape. The mature trees are considered by respondents as a street symbol and contribute to the comfort environment which encourages a walkable atmosphere Ja'afar et al. (2012).

#### **(a) Accessibility:-**

Accessibility means the ability to easily get to and move through a place, thus provides ease of movement (Ujang, 2008). So, it is related to location of place. Location in context is one of the physical characteristics of the street (Shamsuddin, 1997). She finds that the location of the street becomes a recognisable feature, especially when its surrounding environment is easily identified. Streets and buildings are recognised by their location in relation to the buildings located adjacent to them or within their vicinity. Accessibility has two types: (a) Visual accessibility which allows people to see it and be informed about what is happening there, and (b) Physical accessibility which allows people to enter that space and use its functions. An urban public space should invite people to come inside and use its facilities (Jalaladdini and Oktay, 2012).

Each street forms both a destination and a connection to other places (South Gloucestershire Council, 2013). According to Ujang (2008), the location of the place play an important role in making the street accessible, particularly, when these streets are strategically located and are highly accessible from various locations, are well connected streets, are well connected pedestrian paths, and are accessible by various transport modes. These features of street location determine how the accessibility of a place is.

Ujang (2008) observed that street elements are vital in providing a foundation for an accessible built environment, while others (Ujang, 2008; Shamsuddin, 1997) noted they are important in recognising the street, especially buildings which act as landmarks. Places become more enjoyable to be in and more accessible to all when understanding and navigating through the built environment involves all of the senses through colour, light, shade, texture, sounds, and fragrances (Moreton Bay Regional Council, 2013). In this way, places can be designed to be easily comprehended and assist the individual to easily understand them, connect with them, use them and navigate through them (Moreton Bay Regional Council, 2013).

#### **(b) Recognition:-**

Recognition is another attribute of street that help to give a good sense to a place. People can recognize the street through its physical appearance. Physical form and appearance are the characteristics of the physical environment, especially buildings, which are distinctive and easily recalled (Shinbira and Sulaiman, 2010). Building and non-building appearances are consist of style, form, facade, material, color, height, size, age, condition, roof form, and signage (Abbaszadeh, 2011; Grabler et al., 2008; Shamsuddin,1997). Also, people can realize the place by its building that can act as landmarks and nodes, and can be used in determining the path of place or street (BMS, 2011; Mohammed, 2010; Long et al., 2007; Lynch, 1981).

#### **(c) Sense of Safety and Comfort:-**

They are another street attributes related to landscape features. According to Ja'afar, et al. (2012), landscape features are one of the physical elements of the place. The landscape elements include trees (soft features) and street furniture (hard landscape elements) such as pavements, lighting, public art, and fences (London Borough of Croydon, 2009; Ja'afar and Usman, 2009). The success of any given place is highly influenced by the safety, comfort and convenience which people experience while pass through and/or go to places, spaces, and buildings (CABE, 2008). According to Ja'afar, et al. (2012), the presence of signs, lighting at night, sitting areas, trees,

beautiful views, parking areas, facilities, and pavements with suitable width to walk on, contribute to making a comfortable environment. On the other hand, South Dublin County Council (2011) refers to six features that contribute in making the environment in street uncomfortable. These features are benches, dustbins, bicycle racks, bus stops, the quality of view, and pavements.

### **1.2 Functional characteristics:-**

Historically, streets have played a very important role for a variety of reasons, such as providing an environment to meet friends and neighbours, being a platform for political protests, a location for markets and fairs, and even being a play area for children in the residential setting. The heart of economic and social activities in a city is traditionally situated in the city centre, as it is regarded the main source of commerce and labour (Rastegar, N. et al., 2014). Sammas (2008) quoted from Moughtin (2003) states that streets have functional elements in the city. They serve many functions; not only the movement of traffic, but also economic, political functions and social amenity. Thus, the street contributes in commerce and trading prosperity, and moving people from place to others, as well as reflects social and cultural values and importance. These attributes will be more discussed as the following.

#### **(a) Movement:-**

According to Al-Obeidy (2017) quoted from Telford (2007), movement is the most important feature in determining the character of a street, and it is the main functional role of the street (Leeuwen and Timmermans, 2006; Mahdzar, 2003). As a channel of movement, streets connect one place to another (Sholihah, 2005; Sammas, 2008). People use streets to move from one place to another by foot or by car. The street provides a link between buildings, both within the street and in the city at large. As a link, it facilitates the movement of people, as pedestrians or within vehicles, and the movement of goods.

#### **(b) Commerce and Trading:-**

They are second functional attributors of the street. Sholihah (2005) mentioned that people use streets as a place to offer goods and a place to display as much as they were "allowed". Pedestrians see, compare, discuss with their companions, bargain and decide whether to buy an item or not.

#### **(c) Social Values:-**

Streets can reflect the social values of communities because they present as arena for social expression (Moughtin, 2006). Street can provides eleven social uses of streets, including using the street for strolling and window-shopping, resting, people-watching, vendors, telephones, newspapers, art works and banners, schmoozing, eating, waiting, orientation or information seeking, street performers, drinking fountains, and finally fountains (Eichner and Tobey, 1987). Moreover, Ortiz (2012) points out to the successful public spaces where celebrations are held, where social interactions take place, where one finds and gathers with one's friends, where ideas are exchanged, where one expresses oneself, where one rests and observes, and where one finds the public institutions of cities.

The street is also an environment that offers multiple lessons for children just by watching people and their activities. Experiences in public spaces are not only a source for the education of children in learning how to cope with new situations in real life (Jacobs, 1961), but also for the education of adults in learning, by observing the way people do things differently (Lofland). Additionally, seeing other people engage in activities can be an inspiration to engage in new activities. Hence, even in contemporary times, the street, as a social space, can play multiple roles and offer social contact and interaction, social awareness and learning, and social cohesion. Therefore, Donnelley (2010, pp.38) emphasises that the design of all streets should recognise the importance of creating places for people to enjoy rather than simply providing corridors for the movement of traffic. Streets should generally be designed with a focus on social interaction.

#### **(d) Cultural Values:-**

According to Lai, et al. (2013), culture is one of the attributes to devote the significance of a place. Streets can provide cultural values which refer to parades, street events, art performances, street musicians, traditional foods, culture-based goods such as crafts, and so forth, that form the life of a street (Sammas, 2008). According to McClinchey (2011), festivals, along with other leisure experiences, are perceived as important components of vibrant, diverse and creative urban spaces. Cultural festivals, in particular, are rapidly becoming an acceptable form of urban tourism in that they allow for the consumption of ethnic culture and are part of the overall experience economy. Cultural festivals have the potential to provide social benefits by contributing to a sense of shared identity, civic pride, cultural pride, community cohesiveness, place and belonging, and are also perceived as place image

boosters. In his study, McClinchey (2011) concludes that festivals may contribute to a sense of place, but not substantially. The role of the festival was as a space for the showcasing and communication of culture, as a connection that ethno-cultural group leaders needed to maintain throughout the year in order to connect to broader meanings of place and identity. The festival allowed cultural entrepreneurs to value their own ethnic identity, maintain their cultural traditions and increase the awareness of their culture.

## **2. Attributes by which place attachment can be identified in street:-**

Place attachment has employed by many researchers as (Ujang and Dola, 2007; Morgan, 2010; Ujang and Shamsuddin, 2008; Hidalgo and Hernandez (2001); Beidler, 2007). These authors and others divided place attachment to three categories namely, activity encompasses vitality, diversity and transaction, Physical elements encompass accessibility and legibility, and image encompasses distinctiveness, comfort, and safety and security.

### **2.1 Activity:-**

Three of the key attributes of the activity contributing to place attachment are vitality, diversity and transaction. Available these activities able to make vibrant street.

#### **(a) Vitality:-**

Vitality means the capacity of the place to make multiple choices of activities used by users of street. A successful or responsive street able to fulfill human needs, and accommodate people activities (Jacobs, 1993). Firstly, continuous attributes of place have ability to create and enhance attachments between people and place. Secondly, pedestrian movement is an important factor to feed public space specially, streets. Thus, the number of people who visit street and presence of facilities on street have ability to make vibrant street (Montgomery, 1998).

#### **(b) Diversity:-**

Diversity is another attributes which has a pioneer role in fostering place attachment in urban experience (Bentley et al., 1985). Many considerable researchers describe diversity as variety of building and facade forms, building types and activities. The best street has diversity in physical, social and economic aspects which make it more vital, active and safer (Jacobs, 1993).

#### **(c) Transaction:-**

It refers to good interaction between people and place. This positive interaction flows from positive surrounding atmosphere. Thus, the importance of this aspect is evident in street life. Opening hour of shops able to develop economic activity in street (Montgomery, 1998). Moreover, presence of events, celebrations, occasions and meetings encourage on strengthen of place attachment and sense of welcoming in streets. Moreover, all these issues work together to create sense of place (Sulaiman et al., 2008) and contribute with the character of streets in towns and cities.

## **2.2 Physical elements:-**

Two of the key attributes of the physical element contributing to place character are accessibility and legibility.

#### **(a) Accessibility:-**

Ujang (2008) mentioned that accessibility determines uses and activities of places, these uses encompass location, visual cues, and legibility. It means the ability to reach activities, services and people to place. Meantime, it means the ability to reach people from place to other places (Lynch, 1960). Here, should mention that connectivity plays important role in providing street's life. Connectivity is associated with the ability to easily get to and move through a place. Thus, it leads to safety and security concepts for users of these places (Commission of Architecture and the Built Environment, 2000).

#### **(b) Legibility:-**

Legibility is an attribute vital for good and successful places. A legible place is defined by vivid and integrated physical environment (Ujang and Shamsuddin, 2010). It eases the way of peoples' understanding, organizing and identifying their physical environment (Bentley et al., 1985). It explains how people can realize what opportunities a street can show.

### 2.3 Image:-

Lynch (1960) explains the meaning of image and mentioned that streets are good places which reflect identity and image of place. Many scholars state how we can measure image of city and determine three aspects namely, distinctiveness, comfort, and safety and security.

#### (a) Distinctiveness:-

It related with character and identity of street because it means uniqueness that can distinguish one place from others (Relph, 1976). Distinctiveness determines the quality of street and examine opinions of people in certain place. For example, ask people about do you have memories which relates you with this place? Why this place is important for you? This importance of imageability or legibility of place and its relation with sense of place that previously explained, Cadw's (2013, p.39) endeavours in making places legible is to make them easy to understand and navigate, so that people have a clear mental image of the place. He also emphasises that recognisable features or elements in a certain place contributes to give a sense of place. Since the place should be noticeable or recognisable through its physical characteristics, it is evident that the role of these characteristics is to make the street recognisable or noticeable or legible that make it distinctive.

#### (b) Comfort:-

Comfort is another attributes which give strong attachment between people and their place (Shamsuddin et al., 2008; Ujang, 2008). It performs successful streets in towns and cities. Comfort features generate sense of relaxing and sense of happiness by many elements such as landscape, water features and traffic free area. Thus, these issues will create beautiful and positive image for certain place or street, which received by its users or dwellers (Ujang and Shamsuddin, 2010; Lynch, 1960).

#### (c) Safety and security:-

Safety and security are the third contributes which have very important role to generate good image of city thus, strong attachments. Many aspects can encourage and strength safety such as presence of people, security officials and traffic free area in streets (PPS, 2013). Meanwhile, these aspects can reduce or deny the fear factor in peoples' feeling (Mehta 2007; Shamsulddin et al., 2008), crimes and bad events like, theft. Moreover, lighting of street is very important factor to available safety environment in streets.

### Measuring Street Attributes in terms of Sense of Place and Place Attachment:-

Identifying street characteristics and attributes is related to perceptions and feelings of users. Sense of place is studied to understand or examine current people feelings and perceptions, while place attachment is related to the long term period and studied to examine the memory of people. On such basis, the streets attributes in terms of sense of place can be measured by asking people or users about their feelings, opinions, or perceptions like "how do you feel, understand, or use the street?", and "Why". For instance, "do you feel comfortable when you walk in the street?" and "why?" The answer of "Do" question will be yes or no. And the answer of "Why" question will determine the reason. On the other hand, place attachment means an effective or emotional bond that people establish with a specific place as mentioned in the introduction. This bond can be strengthened during the time. Thus, to know how to measure place attachment, the degree of relationship between people and place must be known. This can be obtained by asking people about the degree of their feelings and perceptions. This type of questions is called likert scale questions. For example, I feel comfortable when I walk in the street. The answer should be strongly disagree, disagree, agree or strongly disagree.

Previous research on perception, evaluation, imageability of place, sense of place, and place attachment are approached through the use of mixed methods, quantitative and qualitative techniques, which are employed by many considerable researchers as Shamsuddin (1997), Affendi (2004), Sulaiman and Shamsuddin (1998), Hilmilia (2005), Alford (2011), Fullerton (2011), Abbaszadeh (2011), Ujang (2008), Ja'afar (2006), Lin (2012), Shamsuddin and Ujang (2008), Ja'afar and Usman (2009), Ja'afar, et. al. (2012), Ujang and Dola (2007), Ja'afar, et al. (2008) Ujang and Shamsuddin (2008), Haji Bilyamin (2014), Lynch (1960), and Creswell (2003) (see Table 1.0). All of them find the combined methods as the most appropriate in their field of studies.

For example, the study of Shinbira and Sulaiman (2010), also adopted the mixed method to support evidence and examine the physical and functional characteristics associated with street identity. Moreover, Abbaszadeh (2011) studied the characterisation of the physical elements of street design by using the mixed method to collect data.

Hence, the research suggests that the use of the mixed method can provide the study with a more complete understanding of the phenomena and support the findings. This study tries to explain how to achieve integrated methods of studying influential attributes of street in terms of sense of place and place attachment.

### Conclusion:-

Streets are an important icon of city. They have had pioneer role in strengthening of relationships among people, producing of services like shopping, by brought about vitality, diversity and transaction which reflect good place attachment, and functional and physical characteristics which reflect charm sense of place of streets in towns and cities. Figure 1.0 shows the theoretical framework of the study. It explains street characteristics and their attributes in relating firstly to sense of place and secondly place attachment. Commerce, cultural value, social value, and movement are functional contributors of street in terms of sense of place, while accessibility, legibility, recognition, sense of comfort, and sense of safety are its physical contributors. In terms of place attachment, the attributors of activity in the street are vitality, diversity, and transaction, the attributes of physical elements are accessibility, and legibility, the attributors of image are distinctiveness, comfort, and safety and security.

**Figure 1.0:-** Theoretical Framework that Explains the street Characteristics and Attributes, and their Relationships for Two Concepts, Sense of Place and Place Attachment.

To secure streets characteristics and keep unique character of city centers, the achieving sense of place should be sought firstly then place attachment. It means that the feelings or senses that affect people positively should be created first to make strong place attachment. No attachment (relationships between person and place) without sense of place (good feelings and emotions) first. Thus, both of sense of place and place attachment are important and contribute to secure the character of streets' city centers. Place makers, developers, and designers should take into consideration enhancing sense of any place through design and improve its functional and physical characteristics that contribute in making good senses or feelings to its users. Besides, activity, physical elements, and image are key attributes of streets to strengthen sense of attachment or belonging.

#### Introduction:-

Air pollution is a major environmental issue affecting people across the world. According to the World Health Organization (WHO), more than 2 million people worldwide die every year from air pollution. Of all the air pollutants, fine particulate matter (PM) is one of the most hazardous pollution for the human health. The particulate matter causes about 9% of lung cancer deaths worldwide, 5% of cardiopulmonary deaths and about 1% of respiratory infection deaths. There have been several studies done on assessment of ambient air quality and concentration of different pollutants of air (i.e. heavy metals, polycyclic aromatic hydrocarbons etc) in various regions of India. (Kaushik & Haritash, 2006; Haritash & Kaushik, 2007, Haritash & Kaushik, 2011). But the policy related interventions to improve air quality are still lacking in Indian context.

Air quality or ambient (outdoor) air pollution is represented by the annual mean concentration of particulate matter PM<sub>10</sub> (particles smaller than 10 microns) and PM<sub>2.5</sub> (particles smaller than 2.5 microns, about 25 to 100 times thinner than a human hair). The environmental and health concerns related to PM<sub>1</sub> is more since the penetration of fine particles into the respiratory system is deeper and associated health effects are also severe (Haritash & Kaushik, 2012). Considering health effects of PM<sub>1</sub>, SAFAR initiated monitoring of this pollutant in the air during second phase of Odd Even Scheme.

The Government of NCT of Delhi had implemented odd-even scheme aiming to reduce the pollution level in the city. The idea of this scheme came from the system that was implemented in Beijing in 2008 just before the summer Olympics. While the rule was initially said to be temporary, it turned out to be so effective the government made it

1215

permanent. Similar road-rationing rules are imposed in many places around the world like Paris, Mexico and Bogota to curb road jams and pollution.

The scheme has been performed in two phases. One from 1st to 15th January, 2016 and the second phase of the scheme was implemented between 15<sup>th</sup> to 30<sup>th</sup> April 2016 with the objective of reducing air pollution in Delhi. The odd-even scheme applied to four wheeler Passenger/Private Cars. The AAP cabinet announced private vehicles to run across the city based on their registration numbers. If a vehicle's registration number ends with an odd digit, it will be allowed on the road on January 1 that is on odd numbered days, while that ending with an even number can be driven on the second, and so on. This step has been taken as a measure to bring down and control air pollution.

Air-pollution levels in Delhi rose 15% during the 15-day period (January 1 to 15, 2016) of the state government's odd-even measure over the previous 15 days (December 17 to 31, 2015), according to an analysis of PM<sub>2.5</sub> (particulate matter) data, generated by various studies.

### **Odd Even Scheme:-**

The odd even scheme is one of the road rationing system also called as alternate-day travel is a travel demand management strategy aimed at reducing the negative obverse generated by urban air pollution or peak urban travel demand through artificially restricting demand (vehicle travel), especially during the peak periods or during peak pollution events. This objective is achieved by restricting traffic access into an urban area, city or district based upon the last digits of the license number on pre-established days and during certain periods, usually, the peak hours.

Delhi Government had imposed this scheme in two phases. Initially the scheme was implemented from 1<sup>st</sup> January 2016 to 15<sup>th</sup> January 2016 and the second phase had been in operation from 15<sup>th</sup> April to 30<sup>th</sup> April 2016. According to the notification issued by the government, from 8 am to 8 pm private vehicles with odd registration numbers will be allowed on the road on Mondays, Wednesdays and Fridays. Vehicles with even numbers will run on Tuesday, Thursday and Saturday. But on Sundays there was no as such restrictions.

This rule will not be applicable on emergency vehicles like PCR vans, fire tenders and ambulances, and on public transports like CNG-driven buses, taxis and auto-rickshaws.

The government also decided to exempt two-wheelers from this rule. This system, therefore, was applicable only on private-owned four wheelers running across Delhi, and on those coming in from other states. And that includes vehicles used by ministers and bureaucrats of all ranks.

To make the scheme work effectively the government has added the public transport will be strengthened from the first of January. This will include increasing the frequency of metro trains across the city.

### **Analysis of data:-**

The air quality in Delhi is monitored through a set of Continuous Ambient Air Quality Monitoring System (CAAQMS) and manual stations (NAMP). The present analysis is based on the data collected by CPCB from 08 operational CAQMSs including 04 of its own (Shadipur, Dwarka, Dilshad Garden & Parivesh Bhawan) and 04 belonging to DPCC (Mandir Masg, R. K. Puram, Punjabi Bagh & Anand Vihar). Apart from this, data has also been collected from 07 manual stations of CPCB (Pitampura, Sirifort, Janakpuri, Nizamuddin, Shahzada Bagh, Shahdara & BSZ Marg) which operate on alternate days. The overall contribution of vehicular pollution in ambient air in Delhi during winter season is estimated to be around 20-25% in respect of PM<sub>10</sub> and PM<sub>2.5</sub>. However, in terms of emission load, it contributes about 9% and 20% respectively for PM<sub>10</sub> and PM<sub>2.5</sub>, as per IIT Kanpur study, of which the 4-wheeler passenger cars contribute about 10%. The odd-even scheme could have theoretically contributed to PM reductions in respect of exhaust emissions from off-road odd or even cars, marginal reduction in road dust and secondary pollutants.

The pollutants for which data have been considered for the above said assessment include PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, Benzene, O<sub>3</sub>, NO<sub>2</sub> and CO. It may be seen that during January 1-15, 2016, the pollutants viz., PM<sub>10</sub> ranged between (161-629 µg/m<sup>3</sup>); PM<sub>2.5</sub> (79 – 507 µg/m<sup>3</sup>); SO<sub>2</sub> (4-42 µg/m<sup>3</sup>); Benzene (1-11 µg/m<sup>3</sup>); O<sub>3</sub> (2-66 µg/m<sup>3</sup>); NO<sub>2</sub> (9-159 µg/m<sup>3</sup>) and CO (280 – 1990 µg/m<sup>3</sup>).

The data analyses for days preceding (period from 25th to 31st December, 2015) and post (period from 16th to 21st January, 2016) to the odd-even scheme, shows that during pre-odd-even scheme December 25-31, 2015; the

pollutants viz., PM<sub>10</sub> ranged between (142-454 µg/m<sup>3</sup>); PM<sub>2.5</sub> (52-298 µg/m<sup>3</sup>);SO<sub>2</sub> (4-31 µg/m<sup>3</sup>); Benzene (1-7 µg/m<sup>3</sup>); O<sub>3</sub> (18-48 µg/m<sup>3</sup>); NO<sub>2</sub> (5-116 µg/m<sup>3</sup>)and CO (114 – 1244 µg/m<sup>3</sup>); while during post odd-even scheme, January 16-21, 2016; the pollutants viz., PM<sub>2.5</sub> ranged between (76-342 µg/m<sup>3</sup>); SO<sub>2</sub> (4-13µg/m<sup>3</sup>); Benzene (1-7 µg/m<sup>3</sup>) O<sub>3</sub>(13-34 µg/m<sup>3</sup>); NO<sub>2</sub> (17-47 µg/m<sup>3</sup>) and CO(278 – 1316 µg/m<sup>3</sup>).With no clear trend and wide fluctuations observed in the concentrations, it is evident that the meteorology and emissions from other polluting sources have been major factors impacting air quality of Delhi during the period. Higher wind speeds and mixing height in general result in better dispersion and lower pollution levels. Overall, it can be stated that while some reduction in air pollution is likely to happen due to odd-even scheme, a single factor or action cannot substantially reduce air pollution levels in Delhi. Therefore, a comprehensive set of actions following an integrated approach is required to make substantial improvement in air quality.

Another analysis done by **System of Air Quality and Whether Forecasting and Research** (SAFAR) also showed a similar trend in air quality status of Delhi.

The pollutants for which data have been considered for the above said assessment include PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, Benzene, O<sub>3</sub>, NO<sub>2</sub> and CO of which ozone, PM<sub>10</sub> and PM<sub>2.5</sub> is the major one. It also monitored the finer PM<sub>1</sub> particles, or particles of size less than 1 micron, which are known to penetrate deep into the lung tissues and the cardiovascular tract.

#### Ozone:

The levels of ozone, which scientists describe as the most critical summer pollutant in Delhi, between April 15 and 30, peaked at 88 parts per billion or 176 micrograms per cubic metre ( $\mu\text{g}/\text{m}^3$ ) on April 30, the last day of the odd-even scheme, according to SAFAR data. In comparison, during April 1-15, the levels peaked at around 60 parts per billion or 120  $\mu\text{g}/\text{m}^3$  on April 6.

On April 24, ozone levels hit 75 parts per billion or 150  $\mu\text{g}/\text{m}^3$ , the first sharp rise seen during the scheme, from around 62 parts per billion or 124  $\mu\text{g}/\text{m}^3$  the preceding day. Between April 19-22 ozone levels remained around 51-52 parts per billion or 102-104  $\mu\text{g}/\text{m}^3$ . According to scientists, the level of the pollutant spiked consistently between April 17 and 19, ranging between 75 and 80  $\mu\text{g}/\text{m}^3$ . An initial dip was reported between April 15-17.

Comparing this with data from April last year, the trends are quite similar, according to scientists. On April 24 last year, ozone levels had peaked at 90 parts per billion or 180  $\mu\text{g}/\text{m}^3$ , the highest between April 15-30. Between April 1-15 last year, a peak of around 70 parts per billion or 140  $\mu\text{g}/\text{m}^3$  was observed in ozone levels on April 5, the highest during the first fortnight of the month. This year, the peak was observed on April 6.

#### PM<sub>1</sub>

Between April 15-30, the data shows, PM<sub>1</sub> levels peaked on April 30 at around 78  $\mu\text{g}/\text{m}^3$ . After recording less than 60  $\mu\text{g}/\text{m}^3$ , till April 23 which is the safe limit for the larger PM<sub>2.5</sub> particles, the PM<sub>1</sub> levels escalated between April 25-28 at around 75  $\mu\text{g}/\text{m}^3$ . After dropping to 60  $\mu\text{g}/\text{m}^3$  again on April 29, the levels shot up on the last day of the scheme. "The safe limits for PM<sub>1</sub> are not defined as yet in India. But considering that these are finer than PM<sub>2.5</sub> and they can penetrate deeper into the respiratory and cardiac organs, the safe limits should be far lower," a studied. In comparison, between April 1-15, PM<sub>1</sub> levels peaked at around 70  $\mu\text{g}/\text{m}^3$  on April 3. Three peaks of around 60  $\mu\text{g}/\text{m}^3$  each were observed on April 4, 7 and 9, before the levels dropped to between 30 and 40  $\mu\text{g}/\text{m}^3$  till April 14. On April 15, levels again hit 60  $\mu\text{g}/\text{m}^3$ . PM<sub>1</sub> levels were not being monitored last year.

### Conclusions:-

The Government of NCT of Delhi has implemented Odd Even Scheme with aim to reduce air pollution level in the city. Data from either the DPCC or the CPCB has not shown any improvement in air quality. Similar trends can be observed from data from the Indian Institute of Tropical Meteorology's SAFAR, which showed that the quality of air continuously deteriorated from December 25, with pollution levels being "severe" on four out of the first eight days of January, worse than the previous week. It is concluded that the scheme did not worsen air quality; meteorological conditions did, but the scheme was not able to mitigate this impact. For one, wind, which disperses pollutants, has fallen consistently in speed since December. On the other hand, higher temperatures in this year as compared to the same time last year, usually improve air quality by dispersing pollutants in the atmosphere, but the concentration level of particulate matter in January 2016 is twice as much as it was during January 2015. It is quite clear from data about sources of air pollution in Delhi that cars are not the major polluters. The draft report of the Indian Institute of Technology, Kanpur, which was commissioned by the Delhi Government in 2013, on the sources of particulate matter found that vehicles contribute to 20 percent of PM<sub>2.5</sub> concentration. Among them, trucks and two-wheelers together contribute to 80% of pollution and cars contribute 10% only. This means that the contribution of four-wheelers to air pollution in Delhi is just 2%. On a given day, when half the cars are taken off the road during the odd-even trail, with additional exemptions, only a 0.5-1% reduction in pollution can be expected. This could be marginally higher depending on the impact of the wind.

In Delhi, the transport, industrial and the domestic sectors were also considered as the major contributors towards the rising ambient air pollution levels, in addition to the presence of natural dust due to meteorological conditions. Besides anthropogenic sources, some other factors that contribute in the buildup of pollution levels are climate and natural sources. Delhi has a semi-arid climate, with an extremely hot summer, average rainfall and very cold winters. Mean monthly temperatures range from 14.3 °C in January (minimum 3 °C) to 34.5 °C in June (maximum 47 °C). Dust storms occur frequently during summer months leading to build-up of particulate matter in the atmosphere. It is concluded that two-wheelers along with many other environmental factors are responsible for more PM<sub>10</sub> and PM<sub>2.5</sub> than cars when it comes to polluting the air.

#### Abstract

**Background and objective:** There are common genetic diseases in Hail, but the information about it are still limited. The objective of this cross-sectional study was to detect the most common genetic disease and the risk factor of consanguinity on genetic diseases in Hail.

**Subjects and methods:** The study samples were determined by multistage probability random sampling procedure. Genetic diseases were obtained from 500 papers and electronic questionnaires. The data were analyzed by using SPSS and calculator.

**Results:** The proportions of genetic diseases were ordered from highest to lowest as follow: Type 1 Diabetes Mellitus (20%), Congenital Heart Disease (9%), breast cancer (8.2%), Down syndrome (6.4%), Sickle cell disease (3.8%), Muscular Dystrophy (1.8%) and Thalassemia (1%). However, 49.6% of sample answered the question were consanguineous. The proportions showed Thalassemia was the highest disease affected by consanguinity relationship with (100%,  $p=0.023$ ), followed Sickle cell disease (73.68%,  $p=0.032$ ) and breast cancer (34.14%,  $p=0.039$ ).

**Conclusion:** The data suggested that the most common genetic disease in Hail is Type 1 Diabetes Mellitus and consanguinity is one of the risk factor on some of these genetic diseases as Thalassemia, Sickle cell disease and breast cancer.

#### Introduction:-

Quick search for published genetic diagnoses from Saudi Arabia readily reveals the clear bias toward autosomal recessive disorders [1] such as, Sickle cell Disease (SCD) and Thalassemia. The spread of these genetic blood disorders differs among the various regions of the Kingdom. According to the statistics released by the Ministry of Health (Health Marriage Against Genetic Blood Disorders Program: SCD and Thalassemia), from 1425H till the end of 1430H, the recorded incidence of SCD was 0.27%, whereas the incidence of thalassemia was 0.05%.

However, the Saudi Premarital Screening Program estimated the prevalence of the sickle cell gene in the adult population at 4.2% for sickle-cell trait and 0.26% for SCD, with the highest prevalence noted in the Eastern province (approximately 17% for sickle-cell trait and 1.2% for SCD) during February 2004 to January 2005 [2], but in the children and adolescents SCD was detected in 108 of 45,682 with a prevalence of 24 per 10,000. The regional distribution of SCD showed eastern region dominance with a prevalence of 145 per 10,000, followed by the southern

**Corresponding Author:- Halah M. Alrshedy.**

Address:- From the medicine and general surgery collage, University of Hail, Hail, Saudi Arabia.

region with a prevalence of 24 per 10,000, western region 12 per 10,000, and central region with 6 per 10,000. No cases were found in the northern regions. The male to female ratio was approximately 1:1 during 2004 to 2005 [3]. Prevalence of beta thalassemia trait are 3.22% and thalassemia disease had 0.07% mainly in the eastern, western, and southwestern parts of the country, and it was taken from 488,315 individuals screened in February 2004 to January 2005 [2].

Other genetic diseases as Down syndrome which is one of the most common chromosomal disorders in Saudi Arabia, its prevalence was 1.8 per 1000 since, July 1982 to June 1991[4]. Congenital Heart Disease (CHD) in Saudi Arabia has been reported in 4 regions of Saudi Arabia in (August 1988-February 2000) and 2604 individuals with CHD were evaluated. Ventricular septal defect was the commonest lesion (33.9%) followed by atrial septal defect (18.1%) and the sex distribution was similar; for 3 conditions, more males than females were affected and 2269 (59%) presenting in the first year of life, 566 (24.9%) had neonatal CHD [5].

Type 1 diabetes mellitus prevalence in Saudi Arabian in children and adolescents is 109.5 per 100,000 in 2001-2007. The male to female ratio was almost equal (26 males and 24 females) and its distribution by region shows that the highest was 162 in the central region, and the lowest was 48 in the eastern region. Children and adolescents were also grouped by age into 5-6 (prevalence 100), 7-12 (prevalence 109), 13-16 (prevalence 243), and 17-18 (prevalence 150) [6].

Muscular dystrophy which is X-linked genetic neuromuscular disease of childhood, it is relatively frequent, with an incidence is 1 in 3500 male live birth [7].

The yearly percentage distribution of incidence of malignant breast cancer showed a steady rise over the years, as compared to benign breast lesions. In 2000, 76.5% of the tissues submitted for histopathology were benign and only 23.5% were malignant. From 2000 to 2007, there was a steady rise by a mean of 4.8% in the annual incidence of malignant breast lesions, with the exception of 2003, when there was a slight decrease. The annual rate of a malignant breast lesions confirmed by histopathological examination ranged from 23.5% in 2000 to 47.2% in 2007. In contrast, after 2007, there was a shift of the trend toward more benign cases. There was increase in the percentage of people diagnosed with breast cancer from 23.5% in 2000 to 34.5% in 2010 [8]. The Saudi Cancer Registry reported a rising proportion of Breast Cancer among women of all ages, from 10.2% in 2000 to 24.3% in 2005[9].

The high rate of consanguinity has greatly impacted the landscape of genetic disorders in Saudi Arabia, so the most common genetic disorders are SCD, Thalassemia, Down syndrome, CHD, type 1 diabetes mellitus, muscular dystrophy and breast cancer [4].

In this recent study, we present the incidence of the most common genetic diseases in Hail region together with recommendations for developing strategies for prevention and health care system.

### **Methodology:-**

In this study participants were selected by multistage random probability sampling of Hail households from each region. This cross sectional sample was used to know the most common genetic diseases in Hail. A questionnaire was designed for this purpose and administered to the families through paper questionnaires or electronic questionnaires, male (34) and female (466) with total number of (500). One member of each family was asked about personal data as age, sex and the consanguineous marriage for member and member parents. Also this questionnaire asked about cases of genetic diseases in these families, including inherited blood diseases as thalassemia and sickle cell anemia, chromosomal disorders as Down syndrome, multifactorial disorders as type 1 diabetes mellitus and breast cancer, and also muscular dystrophy and congenital anomalies as CHD.

Data were analyzed by using the SPSS software package, and the chi-square test was used to compare proportions of cases in consanguineous. A statistically significant difference was assumed when the  $p < 0.05$ .

### **Results:-**

The highest proportion was 20% in Type 1 Diabetes Mellitus, accounting for (100) cases of genetic disorders from all collected samples. CHD was the second high proportion, occurring in 9% of cases, whereas Breast Cancer occurs in 8.2%. Down syndrome included in 6.4% of samples, followed by SCD occurs in 3.8%. Muscular Dystrophy was

1.8%. Finally, the lowest proportion in this questionnaire was in Thalassemia with percentage of 1% as shown in Table 1.

In our study, 500 of sample answered the question on consanguinity (49.6%) were consanguineous. Table 2 shows pattern of genetic disorders and parental consanguinity, indicating that Thalassemia was the commonest type accounting for 100% of cases, because they were 5 and all those were consanguineous. Then, SCD has 73.68%. Whereas Muscular Dystrophy included 55.55% of consanguinity relationship and diabetes mellitus Type 1 was 52%. Down Syndrome has 50% and CHD occupied 40% of cases. Finally, Breast Cancer was the least percent of consanguinity (34.14%).

**Table 1:-** Genetic disease in Hail city

Condition	Number of Condition	Percent %
Type 1 diabetes mellitus	100	20%
Congenital heart disease	45	9%
Breast Cancer	41	8.2%
Down syndrome	32	6.4%
Sickle cell disease	19	3.8%
Muscular dystrophy	9	1.8%
Thalassemia	5	1%

**Fig 1:-** the % distribution of most common genetic disease in Hail city

**Table 2:-** The relation of genetic disease and parental consanguinity in Hail city

Condition	Consanguinity	Non- Consanguinity	P value
Thalassemia	5 (100%)	0 (0%)	0.023
Sickle cell disease	14 (73.68%)	5 (26.31%)	0.032
Breast Cancer	14 (34.14%)	27 (65.85%)	0.039
Congenital heart disease	18 (40%)	27 (60%)	0.178
Type 1 diabetes mellitus	52 (52%)	48 (48%)	0.592
Muscular dystrophy	5 (55.55%)	4 (44.44%)	0.719
Down syndrome	16 (50%)	16 (50%)	0.963

**Discussion:-**

When comparing the result of genetic disorders in this study to previously published studies, the demonstrated rates seems to be much higher in some diseases and lower in other diseases than studies done before. For examples, prevalence of SCD washighest in the Eastern region with 13.41% per 1000, followed by Southern and Western regions with 5.56% and 2.85%, respectively and lowest in Central and Northern regions with 1.37% and 1.35%, respectively[10].In more, the regional distribution of SCD showed Eastern region dominance with a prevalence of 1.45%, followed by the Southern region with a prevalence of 0.24%, Western region 0.12%, and central region with 0.06%. No cases were found in the Northern regions [3]. However, the proportion of SCD in Hail was lower than Eastern and Southern regions,but higher thanWestern Central and Northern regions.Thalassemia was highest in the Eastern region (5.9%), moderate in the Southern, Western and Central regions (1.42%, 1.02%, and 1.01% per 1000, respectively) and lowest in the Northern region with 0.39% [2]. In this study, Thalassemia was lower than Eastern, Southern, Western and Central regions,but higher than northern region.The registry of King Faisal Specialist Hospital and Research Centre reported that the number of Breast Cancer cases has increased considerably,there were 1152 female Breast Cancer cases in 2008 in comparison with 1308 in 2009, and 1473 in 2010. Breast cancer ranked first among females accounting for 27.4% of all newly diagnosed female cancers (5378) in the year

2010[8]. Compared to the rate reported in the literature of Breast Cancer, we found Breast Cancer decreased than previous cases reported [9]. Our findings of Down's syndrome seem to be much higher than previous study[4]. Down's syndrome was ascertained in 0.18% of 23,261 consecutive babies born alive to Saudi women, giving an incidence of 1 in 554 live births (1.8 per 1,000)[4], so that lower than our findings of (6.4%). Muscular dystrophy, it is relatively high than study done before[7]. In Alqassim region, the pediatric cardiology unit of King Fahad Specialist, Buraidah had 320 of 379 patients with CHD, so the CHD in Alqassim lower than in Hail which Hail has 45 CHD of 500 samples [11]. Type 1 diabetes mellitus was not related with consanguinity [12] and this agrees about type 1 diabetes mellitus with our study.

Theoretically, consanguineous marriages have a relatively higher risk of producing offspring with genetic damage than that of general population. Accordingly, the concurrence of genetic disease should be higher in consanguineous marriages[4]. In countries, such as Saudi Arabia with a high consanguinity rate, it is tempting to blame consanguinity as one of the causes of condition with genetic diseases, so in this study SCD, Thalassemia, Down syndrome and type 1 diabetes mellitus were high in consanguineous marriages.

### Recommendation:-

Premarital screening to detect the Hb S (SCD) or Thalassemia to both partners. If they are carriers, they must have Genetic counseling trying the birth prevention of an affected child. Screening for presymptomatic individuals who are at risk for diabetes and breast cancer. Doing the triple test for the detection of Down Syndrome in the pregnant woman.

#### Abstract

**Background:** Mandible fractures lead to loss of masticatory function and therapeutic goal of any fracture management is to restore original anatomic form and function. For this, maximal bite force could be considered as a major factor for evaluating the success of treatment. The objective was to measure the bite force post-operatively in patients with mandible fractures treated with open reduction and internal fixation and close reduction and compared with normal healthy group.

**Methodology:** Normal bite force of control group was calculated bilaterally and compared with patients with mandible fractures treated with open and closed reduction in the region of incisors and molars at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week post-operatively using a customised Gnathodyanamometre .

**Results:** Post-operative bite force in incisor region is significantly reduced (1.86kg) for the first 5-6 weeks and gradually increases (5.42kg) later while in molars, it gradually increases(5.67kg) from 5 weeks and significantly increases after 7 weeks and reaches its maximum range(25.14kg) in a span of 12 weeks.

**Conclusion:** Both modes of treatment are equally popular among the surgeons, having different indications. As seen in the study after three months open reduction and internal fixation shows significantly better results than the closed reduction

#### Introduction:-

Bite force is the result of the coordination between different components of the masticatory system (muscles, bones and teeth). Its determination has been considered important in the diagnosis of disturbances of the stomatognathic system. Maximum bite force is understood as the capacity of the mandibular elevator muscles to perform a maximum strain of mandibular teeth against the maxillary teeth, under favorable conditions.[1] Gnathodynamometers and force transducers are some of methods for the evaluation of bite force.[2]

Every species has a definite value of bite force which falls in a range due to various factors like age, sex, dental status, temporomandibular joint status , strength of the muscle, condition of the jaw bone etc. Anyone of these factors can affect the power of the jaws and ability of an organism to chew the food which can gradually deteriorate the normal health status of an organism and can also hamper the quality of life. Similarly when a human being is in a healthy state he or she bears a bite force which helps to chew the food. But any physiologic or pathologic change which occurs in the maxillofacial region can affect the bite force. The treatment aims to restore the same force in the bite what the patient had earlier what he or she was in normal and healthy state. With the help of this study we are

trying to evaluate the variations in the bite force of the patients both pre-operatively and post-operatively of mandibular fractures and comparing it with his or her normal and healthy group.

Maximum bite force is a useful indicator of the functional state of the masticatory system and the loading of the teeth[3]. Bite force results from the action of the jaw elevator muscles which is determined by the central nervous system and feedback from muscle spindles, mechanoreceptors and nociceptors modified by the craniomandibular biomechanics[4]. Bite force is influenced by muscle efficiency and development of masticatory function. Maximum bite force increases with the number of teeth present. The number of occlusal tooth contacts is an important determinant for the maximally attainable bite force[5,6].

The etiology of facial bone fractures included mainly assaults and road traffic automobile accidents. Other common causes include accidental falls, sports injuries. Considering its incidence, mandibular fracture is the second most commonly occurring fracture next to nasal bone fractures when considering facial fractures. It is the tenth most commonly occurring fractures when considering frequency of bone fracture of the whole body. Majority of mandibular fractures were found in males and it contributes to around 61% of all facial bone fractures. Mandibular fractures outnumbered zygomatic and maxillary bone fractures by a ratio of 6:2:1 respectively.[7] The therapeutic goal of any fracture management is to restore the original anatomic form and function as soon as possible without any morbidity. For this the maximum voluntary bite force could be considered as a major factor for the evaluation of the success rate of the treatment provided. Although there are methods which are near to accuracy and convenient to determine voluntary maximum bite force which requires sophisticated instrumentation, intervention, investigation of many physiological parameters. However, it is difficult to establish exact mathematical model to estimate individual bite force[8].

### Materials & Method:-

Data collection – patients with mandibular fractures reporting to the casualty and interdepartmental referral patients of our institute were calculated. A customized Gnathodynamometre is used giving digital values in kilograms.

For the study sixty patients of mandibular fractures are included and divided into two groups. GROUP-A contains 30 patients of mandible fractures, treated with open reduction and internal fixation. GROUP-B contains 30 patients treated with closed reduction. For the comparison a control group, GROUP-C with 80 healthy individuals with Class-I molar relationship bilaterally were included between the age group 12-75 yrs containing 40 males and 40 females and bite force was evaluated. All the patients of mandibular fractures were evaluated clinically with detail case history. Bite force was calculated with respect to incisors and molars. Post-operatively the bite force was calculated and was compared with the control group. Follow up was done at 5 week, 7 week, 12 week interval and was compared with normal healthy group.

All patients with mandibular fractures were evaluated. Both males and females of all age group were studied. The medically compromised patients, patients with missing or loss of posterior teeth, pan-facial trauma, temporomandibular disorder. Patients unable to follow instructions or unable to comprehend information about the study were also excluded, from the study.

**Results:-**

**Measurements of control group (cg):-**

To evaluate and compare the bite force measurements, a study was done on a group of healthy individuals (n=80) which was considered as Control Group (CG), with 40 males and 40 females in the age group of 12 – 75 yrs. Bite force of the individuals in the CG on the right molar region ranged from 14 kg to 42 kg with a mean of 27.2 kg (std. dev +/-6.48). On the left molar region the bite force ranged from 15 kg to 44 kg with a mean of 27.6 kg (std. dev +/- 6.84). On the incisor region the bite force ranged from 5 kg to 17 kg with a mean of 10.5 kg (std. dev +/-2.49).

The measurements of the MALE individuals showed a bite force in the right molar region ranging from 19 kg to 42 kg with a mean of 29.8 kg (std. dev +/-6.661), on the left molar region ranging from 17 kg to 44 kg with a mean of 30.4 kg (std. dev +/-7.181) and at the central incisor region from 5 kg to 17 kg with a mean of 11 kg (std. dev +/- 2.689).

The measurements of the FEMALE individuals showed a bite force in the right molar region ranging from 14 kg to 34 kg with a mean of 24.6 kg (std. dev +/- 5.217), on the left molar region ranging from 15 kg to 37 kg with a mean of 24.7 kg (std. dev +/- 5.221) and at the central incisor region from 6 kg to 17 kg with a mean of 10.12 kg (std. dev +/- 2.232).

In the CG the males showed greater mean bite force when compared with females in all age groups.

**Fig:-** Maximum bite force of males and females individuals of CG at right molar, central incisor and left molar

**Measurements of group- 1 (surgically treated):-**

The mean of bite force measurement on right molar region at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week were found to be 7.09 kg, 13.24 kg and 25.14 kg respectively. On the central incisor region the mean of bite force measurement at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week were found to be 2.17 kg, 3.52 kg and 5.42 kg. whereas over the left molar region the bite force measurement at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week were found to be 5.67 kg, 10.90 kg and 18.48 kg.

**Fig:-** Maximum bite force of GROUP-1 at right molar, central incisor and left molar.

At 12<sup>th</sup> week the bite force of the MALES of GROUP- 1 at the right molar region ranged from 16.2 kg to 32.2 kg with a mean of 25.4 (std.dev +/-4.01)kg whereas on the left molar region from 21.5 kg to 37.6 kg with a mean of 26.5 kg (std.dev +/-4.29) and on the central incisor region it is 2.2 kg to 9.3 kg with a mean of 5.4kg (std.dev +/- 2.31).

At 12<sup>th</sup> week the bite force of the FEMALES of GROUP- 1 at the right molar region ranged from 17.2 kg to 29.1 kg with a mean of 23.4 kg (std.dev +/-5.02) whereas on the left molar region from 18 kg to 26 kg with a mean of 22.6 kg (std.dev +/-3.26) and on the central incisor region it is 3.2 kg to 9.8 kg with a mean of 5.7 kg (std.dev +/-2.86). In the Group- 1 the males had a significantly higher bite force as compared to females at the end of 12<sup>th</sup> week.

**Comparison of group- 1with control group:-**

The bite force of the patients in Group- 1 at the end of 12<sup>th</sup> week is lesser than the bite force of the healthy individuals of the control group. At the end of 12<sup>th</sup> week –At right molar Mean bite force of Group- 1 is 25.1 kg, mean bite force of the control group is 27.2 kg. At central incisor Mean bite force of Group- 1 is 5.4 kg, mean bite force of the control group is 10.5 kg. At left molar Mean bite force of Group- 1 is 26 kg, mean bite force of the control group is 27.6 kg. This data indicates that after surgical treatment bite force is almost restored to the values obtained in a normal healthy individual.

**Fig:-** Maximum bite force of GROUP-1 and CONTROL GROUP at right molar, central incisor and left molar

**Measurements of group- 2 (conservatively treated):-**

The mean of bite force measurement on right molar region at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week were found to be 6.16 kg, 11.24 kg and 18.78 kg respectively. On the central incisor region the mean of bite force measurement at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week were found to be 1.86 kg, 3.42 kg and 4.19 kg. whereas over the left molar region the bite force measurement at 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> week were found to be 5.67 kg, 10.90 kg and 18.48 kg. (fig. -)

**Fig:-** Maximum bite force of GROUP-2 at right molar, central incisor and left molar

At 12<sup>th</sup> week the bite force of the MALES of the GROUP- 2 at the right molar region ranged from 9.6 kg to 24.2 kg with a mean of 19.14 kg (std.dev +/-3.18) whereas on the left molar region from 7 kg to 27.5 kg (std.dev +/-3.74) with a mean of 18.64 kg and on the central incisor region it is 3.2 kg to 11 kg with a mean of 4.39 kg (std.dev +/-1.58).

At 12<sup>th</sup> week the bite force of the FEMALES of the GROUP- 2 at the right molar region ranged from 14.4 kg to 20.1 kg with a mean of 17 kg (std.dev +/-2.27) whereas on the left molar region from 12.24 kg to 21.5 kg with a mean of 17.7 kg (std.dev +/-3.43) and on the central incisor region it is 2.2 kg to 3.9 kg with a mean of 3.2 kg (std.dev +/-0.62).

In Group- 2 the males had a significantly higher bite force as compared to females at the end of 12<sup>th</sup> week.

#### Comparison of group- 2 with control group:-

The bite force of the patients in closed group at the end of 12<sup>th</sup> week is lesser than the bite force of the healthy individuals of the control group. At the end of 12<sup>th</sup> week – At right molar Mean bite force of closed group is 18.9 kg, mean bite force of the control group is 27.2 kg. At central incisor Mean bite force of closed group is 4.2 kg, mean bite force of the control group is 10.5 kg. At left molar Mean bite force of closed group is 18.5 kg, mean bite force of the control group is 27.6 kg.

This data indicates that after conservative treatment bite force restored was significantly less than normal healthy individual.

**Fig:-** Maximum bite force of GROUP-2 and CONTROL GROUP at right molar, central incisor and left molar

#### Discussion:-

Adequate mastication is known to give stimulus and proper function to the normal development of the maxilla and mandible. Any traumatic injury to the mandible may lead to disruption in the balance between the masticatory muscles which results in decrease in the bite force which is one of the most important functional aspect of the mandible and its musculature. Since ages various surgeons have suggested numerous modes of treatment for the fractured mandible. The objective of all these treatment modalities is to restore complete functional ability of the mandible. So with our study we have tried to quantify the restoration of the functional ability of mandible as a part of the masticatory unit in the post-operative phase after trauma.

A study was done on healthy individuals of the Indian population by Rajesh Kshirsagar et al on a group of 60 volunteers (male and female) and the mean bite force on the right molar was found to be 36.2 kg, on the left molar region it was 35.96 kg and 14.83 kg on the incisor region. The disadvantage of this study is that the age group of the volunteers involved in the study was not mentioned. A study conducted by Veena Jain et al on a group of 358 subjects (mean age group being 26.66 yrs). In their study the males showed a higher mean bite force of around 45.76 kg and of females around 30.23 kg. [9]

In our study we realized the importance of age related changes of the jaw and the associated musculature. Therefore our volunteer group were divided into four, based on age. Further the data was analyzed separately for males and females. With reference to the literature in the third decade in our study the males showed a mean bite force measurement as 32.28 kg and 23.53 kg for females which is lower than the measurements as per the study by Veena Jain et al[10]. This difference in measurements can be attributed to the different kind of customized bite force device that was used. We found that the maximum voluntary bite force of the CG at three different sites in the oral cavity ie at the right molar was of 27.2 kg, on the left molar region was 27.6 kg and on the incisor region was 10.5 kg. In all the above studies though different modalities of bite force measurements have been employed, females have always shown less bite forces when compared with males. This indicates that the bite force is influenced by gender.

In our study we also found a pattern of increased bite forces with increasing age in males and female till the age of 50 years, but in the age group of 51 – 75 years the bite force was lesser as compared to the younger individuals. The right and left molar regions did not show any significant differences in bite forces. Very few researches have been conducted on measurement of the restoration of the bite force after treatment of maxillomandibular trauma. The

study conducted by Rajesh Kshirsagar involved only six patients of parasymphyseal fracture who all were treated according to surgical protocols. They reported that the bite forces in molar region took six to twelve weeks to regain maximum voluntary bite force and compared to the volunteer group in their study[11]. Gerlach K.L et al reported their results after evaluating maximum voluntary bite force in twenty two patients with mandibular angle fractures. All the patients in the study group were surgically treated with miniplate osteosynthesis. They evaluated the patients from first week to sixth week and at the end of sixth week only 58% of the maximum vertical loading found in the controls were registered. In this study they stated that the normal values did not return until three months postoperatively[12].

In our study we have treated thirty patients in GROUP-1 with surgical protocols and have evaluated the bite force at the end of 5<sup>th</sup>, 7<sup>th</sup> and 12<sup>th</sup> postoperative week. At the end of 5<sup>th</sup> and 7<sup>th</sup> post-operative week the maximum voluntary bite force was significantly less than the range of normal bite force, but at the end of 12<sup>th</sup> post operative week the maximum voluntary bite force was restored towards the normal range. At the end of 12<sup>th</sup> week the males showed an improvement upto 85.23% on the right molar region, 87.17% on the left molar region and an improvement of 49.09% in the central incisor region was found as compared to the data from the CG. Similarly in the female patients of GROUP-1 has an improvement of 95.12% in the right molar region, 91.49% in the left molar region and 56.32% in the central incisor region with respect to the CG. Among the GROUP- 1 (surgically treated), the number of females were much lesser than the males which shows that the males are more exposed to maxillofacial injuries as compared to females. At the end of 12<sup>th</sup> post-operative week the maximum voluntary bite force generated by males was more than the females. This difference can be attributed to greater muscular potential of men due to anatomical variations of the type of muscle fibers, which are larger than those of females. As women are known to have a lower pain threshold, it might be a significant factor for lower bite force measurements.

Not many studies have been carried out in the literature regarding the bite force measurement after the treatment of mandibular trauma by conservative protocols. Here we have evaluated equal number of patients in GROUP-2 which underwent conservative treatment following mandibular trauma. Like GROUP-1, all the data for the conservatively managed patients were collected at the same time intervals. Here also, the values of the mean bite force were less in the 5<sup>th</sup> and 7<sup>th</sup> postoperative week which gradually increased up to the 12<sup>th</sup> postoperative week. The improvement at the end of 12<sup>th</sup> postoperative week in the males of GROUP-2 in relation to the CG at the right molar region was 64.22%, at the central incisors it is 39.9% and at the left molar region it is found to be 61.31%. For the females the percentage improvement at the right molar region is 69.1%, at the central incisors it was 31.62% and at the left molar region it was found to be 71.65% with respect to the CG. At the end of the 12<sup>th</sup> week though there was considerable improvement since the 5<sup>th</sup> week it was on the lower side as compared to CG. It is to be noted that even in this group at the end of 12<sup>th</sup> post-operative week the maximum voluntary bite force generated by males was more than the females.

The data of sixty patients who were treated surgically and conservatively were compared with the measurements obtained from our volunteer group. It is to be noted that the bite force measurement of the patients treated surgically(group-I) was much higher at 85.23% than that of (group II)conservatively treated at 64.22% on the right side. Similarly at the left molar and incisor region the measurements were higher in the group treated surgically than conservatively. This can be attributed to early precise anatomical reduction and rigid fixation which promotes contact healing of the fractured fragments. During conservative treatment though the fragments are immobilized and stabilized in occlusion the gap healing process between the fractured segments might contribute to lesser bite forces and longer time might be required to achieve the complete maximum bite force. . The further scope of this study lies in measuring bite forces after 6 months period allowing complete remodeling of fracture site to take place.

Spectrum, Software, Management,  
Propagation model.

#### Abstract

Spectrum is a basic natural resource as water, air energy, and so on, which has to be shared as the other natural resources due to new emerging technologies leveraging and new approaches developing to enable more effective and efficient use of the limited electromagnetic (EM) spectrum. Fortunately, evolving software radio managements will lead to the emergence of adaptive systems that offer the potential for quantum improvements in spectrum efficiency. Central to the current systems in the range (2-6GHz) will be the main contribution of this project controlled by rules of radio spectrum management tools, directly guided to the manner in which the system uses the EM spectrum. Study of the possibilities of preventing a harmful interference to other users or services will be our main target. The obvious question is: How does this new spectrum management tool would affect the spectrum plan in Iraq. Procedures to support, guide, and manage the behaviour of signals according to different services will be taken. This work will address this central question as it relates to Spectrum Management Software for Iraq.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Spectrum is like a river. We use it and it is our responsibility to keep it clean. Achieving the full promise of this vision will largely depend on how well we structure our spectrum management tool. We will have to make hard choices to achieve the tradeoffs that will bring the best balance, most capability, and greatest interoperability for the least cost. Our readiness and the force structure needed to execute our operational tasks between now and the year 2019.

It serves as the basis for focusing the strengths of each individual Service or component to exploit the full array of available capabilities and allow us to achieve full spectrum dominance in the mentioned range. It will also guide the evolution of joint education, and training to assure we will be able to achieve more seamless joint operations in the future. Lead to a success software technology aspects and basic facts must clarify, as follow:

#### Technology:-

Demand for radio spectrum is growing steadily due to technological, market and regulatory developments and spectrum availability will become soon a key element for future systems. This is not balanced by additional radio spectrum becoming available through the introduction of new and more, efficient technologies such as digital radio systems in the areas of broadcasting and mobile/personal communications. Technology could play a pivotal role in minimizing the interference and allowing for uniform access to the spectrum. Maximum power levels could be

**Corresponding Author:- Lway Faisal Abdulrazak.**

Address:- Lecturer at the Computer Science Dep., Cihan University –Sulaimanyia Campus, Iraq.

increased in rural areas so that service can be provided over larger areas at lower cost. In congested urban areas, where high transmitter power levels on one frequency can often adversely impact the use of other frequencies, the enabling of the use of lower power transmissions will be considered.

**Basic Facts:-**

Spectrum has some specific characteristics:

- It can be reused nearly indefinitely as we increase the number of the base stations and so the infrastructure cost (Major role of economic factor).
- The service given by spectrum usage is dependant on infrastructure design (MS to BS distance) and on highly variable propagation conditions.
- Different parts of the spectrum have different characteristics in particular in propagation.

In general sense, the coexistence and sharing between systems is a recently critical issue due to emerging new technologies and spectrum scarcity. At WRC-07, ITU-R allocated many bands for IMT systems (IMT-2000 and IMT-Advanced) on a co-primary basis along with FWA, FSS and WiMAX systems. Therefore, coexistence and sharing requirements like separation distance and frequency separation must be determined. Spectrum management tool is software established to assess these requirements. Furthermore, the effect of interference in terms of Interference to Noise (I/N) ratio of co-channel and adjacent channel, Carrier to Interference (C/I) ratio as well as Carrier to Noise (C/N) ratio can be predicted by this spectrum management tool. Also, additional isolation needed for co-sited and non co-sited base stations for adjacent channel would be estimated.

Propagation models are used extensively in network planning, particularly for conducting feasibility studies and during initial deployment. They are also very important for performing interference studies as the deployment proceeds. These models can be broadly categorized into three types; empirical, deterministic and stochastic. Empirical models are those based on observations and measurements alone. The deterministic models make use of the laws governing electromagnetic wave propagation to determine the received signal power at a particular location. Deterministic models often require a complete 3-D map of the propagation environment. An example of a deterministic model is a ray tracing model. Stochastic models, on the other hand, model the environment as a series of random variables. These models are the least accurate but require the least information about the environment and use much less processing power to generate predictions.

The current surge of new techniques and systems being applied to telecommunications requires radio propagation information, especially for short range propagation within buildings, long range propagation into buildings and vehicles, better knowledge and modeling of atmospheric ducts, and the influence of climate and ionospheric parameters on propagation modeling in general. The challenges to seek frequency allocations is our aim and to satisfy the ever-increasing global radio communication requirement. Most new systems and techniques require radio propagation information to assess their frequency sharing capabilities

**Background:-**

The radio spectrum is a limited and valuable resource, and as a result of the drastic growth demand for wireless communication applications, radio spectrum regulation and management have become increasingly significant (J. Mitola (1999)).

Due to scarcity of the frequency spectrum, many bands are allocated for more than one radio service and thus the sharing is necessary. Therefore, the increased sharing of spectrum translates into a higher likelihood of users interfering with one another (SDRF Technical Report 2.0, (1999)). Interference between two wireless communication systems (intersystem interference) occurs when these systems operate at overlapping frequencies, sharing the same physical environment, at the same time with overlapping antenna patterns which leads to capacity loss and coverage limitation.

The economic implications of spectrum misallocation (wrong pricing, scarcity, congestion) were recognised early (Herzel 1951; Coase 1959; 1960; Levin 1966; De Vany et al. 1969) but its manifestation only became obvious with recent shifts from wireline to wireless systems in telecommunications markets. This radical transformation of the spectrum user market considerably increased demand for specific bands, altering, in various countries, the methods commonly used to assign user rights.

International Telecommunication Union for Radiocommunication (ITU-R) has become involved with the spectrum allocation for next generation mobile communication services in WRC-07. During work performed within ITU-R working party (WP) 8F, several of the frequency bands had been identified for the future development of International Mobile Telecommunications–Advanced (IMT-Advanced) systems (Joint Tactical Radio System (JTRS) Operational Requirements Document (ORD), (1998)). These bands are already being used for current services like Fixed Wireless Access (FWA), fixed satellite services and WiMAX systems in many countries around the world including Iraq, which means that the probability of happening of the interference is probable. Therefore, the spectrum management and propagation prediction issues should be preceded by sharing and coexistence verification between current services and future systems(Federal Communications Commission, (2000)).

The radio frequency spectrum is a key strategic asset for the economies of industrialized nations. It is used for a broad range of business and consumer communication, R&D and IT purposes, such as private and public telecommunication operations (e.g., Fixed satellite receiver, wireless internet communication, aviation, shipping, defense, public safety), broadcasting, radar, astronomy and various other applications including countless short-range, low-power wireless devices. Sound and socially efficient management of electromagnetic spectrum usage is a key input into the performance of these markets. Flexible regulatory regimes and technologies that make spectrum use more accessible to start-ups and other small innovative operators offer significant potential to reduce lead times from innovation to market for communication products (Berggren et al. 2004; Chapin & Lehr 2007).

By contrast, current control and command arrangements in most countries rest on administrative licensing regimes that allocate blocks of spectrum to specific uses and entities (often large operators) as the need arises. Originally, control and command through licensing presented desirable properties in terms of interference control, international harmonization of frequency allocation and new products standardizations. However, as demand for spectrum rights grew spectacularly over time, the problem of spectrum scarcity became the main issue(E. M. Noam,(1995)).

#### **Frequency Management Systems Use of GIS:-**

Canada could be a good example since it has an international reputation for its ability to efficiently manage its frequency spectrum. Many of these spectrum management techniques and business practices have been incorporated into Automated Frequency Management System (AFMS) over the last decade.

In the frequency engineering realm analytical systems have been used for more than a decade. These tools are part of the solution telecom companies employ when designing telecom infrastructure and applying for frequency allocations. Spectrum regulators have only recently employed GIS as a means of speeding their application process in response to the growing demand for frequency allotments by telecom companies. More and more national regulators are focusing on the Technical Analysis and GIS components of Frequency Management systems (W. Kennard, FCC Chairman,(2000)).

#### **Current Challenges:-**

As mentioned previously, frequency management systems have only recently incorporated GIS. The following is a list of the current challenges both regulators and telecom applicants' face.

1. Regulators are not set-up to allow secure external access to information, therefore limiting applicant's ability to assess their application against the national database.
2. Regulators use worst case propagation modeling there by limiting their ability to use natural and man made barriers to propagation and limiting the number of potential frequency allocations for a given area.
3. Regulators and telecoms may not use the same map information for their assessments resulting in different analysis of frequency coverage.
4. Length of time required for interaction between regulators and telecoms penalizes growth.

The GIS Framework is an architecture that solves a specific requirement. In this case the requirement is to utilize spatial information and GIS processing for a more effective management of frequency allocations and take advantage of automated processes and imbed the functionality within the overall application workflow (Alex LIGHTMAN, (2002)).

#### **Objectives:-**

A spectrum management tool contains objectives and activities for radio frequency management and spectrum monitoring and control, including:

- To verify the feasibility of coexistence between the two systems depending on the input specification.

- To determine the separation distance and frequency separation to coexist the two systems.
- To estimate the additional isolation to decrease interference and achieve coexistence and thus spectrum efficiency.
- Analysis of channel occupancy measurements.
- Technical measurements: frequency, bandwidth, signal strength, signals & systems analysis, etc.
- statistical data for frequency management purposes
- frequency planning
- Estimate the coverage based on the ITU models.

#### Scope of work:-

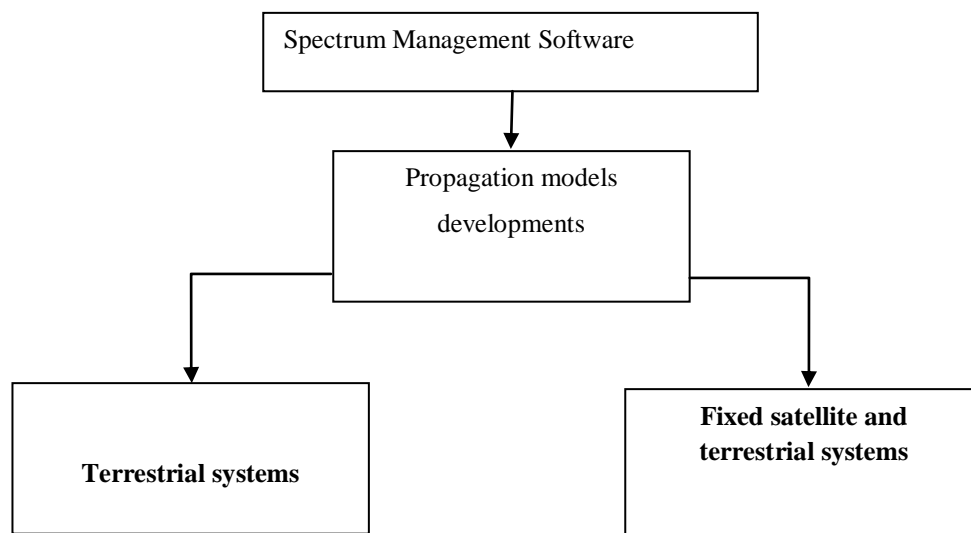

To carry the previous objectives of spectrum management tools and to achieve sharing and coexistence between systems all necessary formulas should be included in a data base as a library. All required standard coexistence and interference criterion values should be adjusted. Specifications, lowest and highest parameters values have to be assessed and Suitable radio propagation models and its parameters and standard values should be estimated. All the data required will be covered by study and analysis and the parameters will be taken according to the ITU recommendations, in term to prepare high accurate software according to the Iraqi environment. Later on, the results should be applied in the software by using computer language in order to obtain the objectives within a good looking (as mentioned by the methodology) (Radiocom Agency, (2002).

the principal components of a spectrum management program would involve the following activities like co-ordinate bilaterally the allocation of frequencies, depend on standards for radio equipment and systems (like ITU), establish operating procedures, and ensure radio apparatus are approved for use.

The propagation prediction part will be carried out by applying all the formals for the chosen ITU models, the antenna parameters such as radiation pattern, antenna gain will be assessed according to the standard values, propagation model will be suggested to the user based on different scenarios.

#### Design flowchart:-

Spectrum management software looks into both the technology and law side of the problem and recommended ways in which we can make more efficient utilization of the spectrum to achieve our objectives, the research divided into three parts in order to cover propagation prediction and interference investigations:

**Figure 1:** Spectrum management software main divisions.

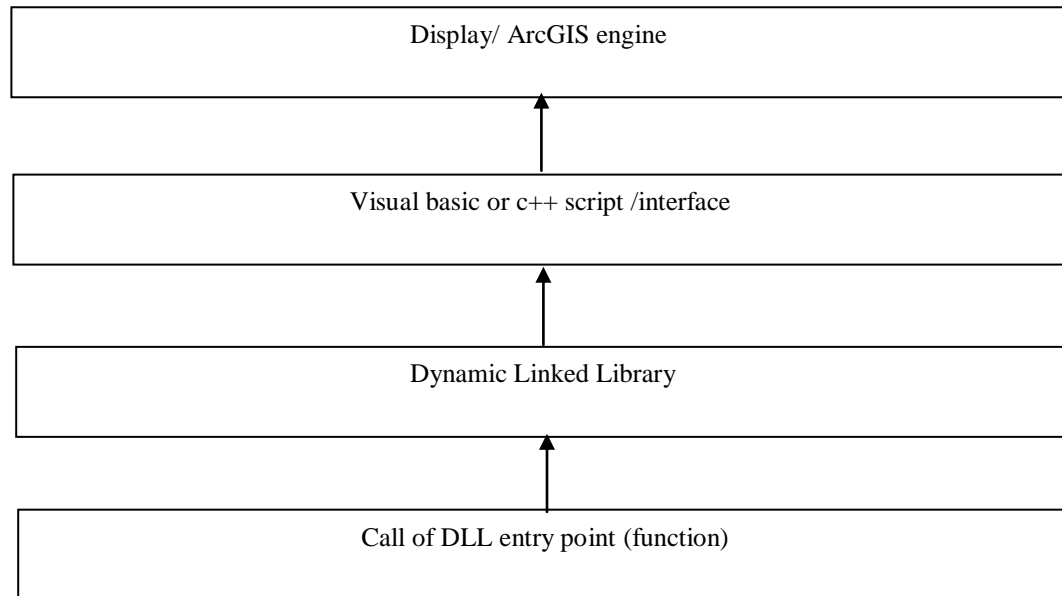

### Spectrum management propagation models developments :-

#### Phase 1: Propagation model library development

In this stage the all the formal from the chosen ITU models will be developed in Dynamic linked library files (DLL) using C++ programming language all related information for the propagation models will be taken into consideration.

A DLL is a library of functions that is not included in executables and that can be loaded and used dynamically .Dynamic Link Libraries are useful way to run simulations or computations on various Microsoft application with only one single file that contains all functions .It allows an easy and flexible management of the upgrade of DLL Functions (Special Issue of IEEE Personal Communications, August 1999).

**Figure 2:** Spectrum management library development

Phase 2 (Inputs): Antenna parameters database will be build in ASCII format to be accessible by the propagation models. The standard types of the available antenna database will developed. The general parameters of the antenna will be accessible for adjusting purposes (TIA,(2002)).

Phase 3 (Outputs): Coverage prediction, Interference calculation will be base on the input scenario and the results will be displayed which allow the user identify the possible coverage based on chosen model and the specific scenario used (Cengiz EVCI et (2001).

### Spectrum management between terrestrial systems:-

In the methodology of the spectrum management tool, there are number of stages should be follow to achieve the aforementioned objectives,

Phase 1 Database configuration: In which all the following should be formed and arranged: necessary formulas, required parameters and specifications for transmitters and receivers, type of deployment area, sharing and coexistence criterion. Propagation wave model also is a part of project requirements.

Phase 2 Interference Analysis: Perform an analysis on a frequency that has interference to determine the potential interference from existing transmitters or to existing receivers by determine the type of analysis model and interference scenario (co-channel, adjacent channel, guard band or overlapping).

Phase 3 results and Outcome: Desired and interference signal strength, Separation distance and frequency separation, additional isolation needed for each co-channel and adjacent channel either by spectrum emission mask model or adjacent channel interference model.

Phase 4 **Interference Report**: Create new interference reports and output them to the printer or to a file compatible with the system.

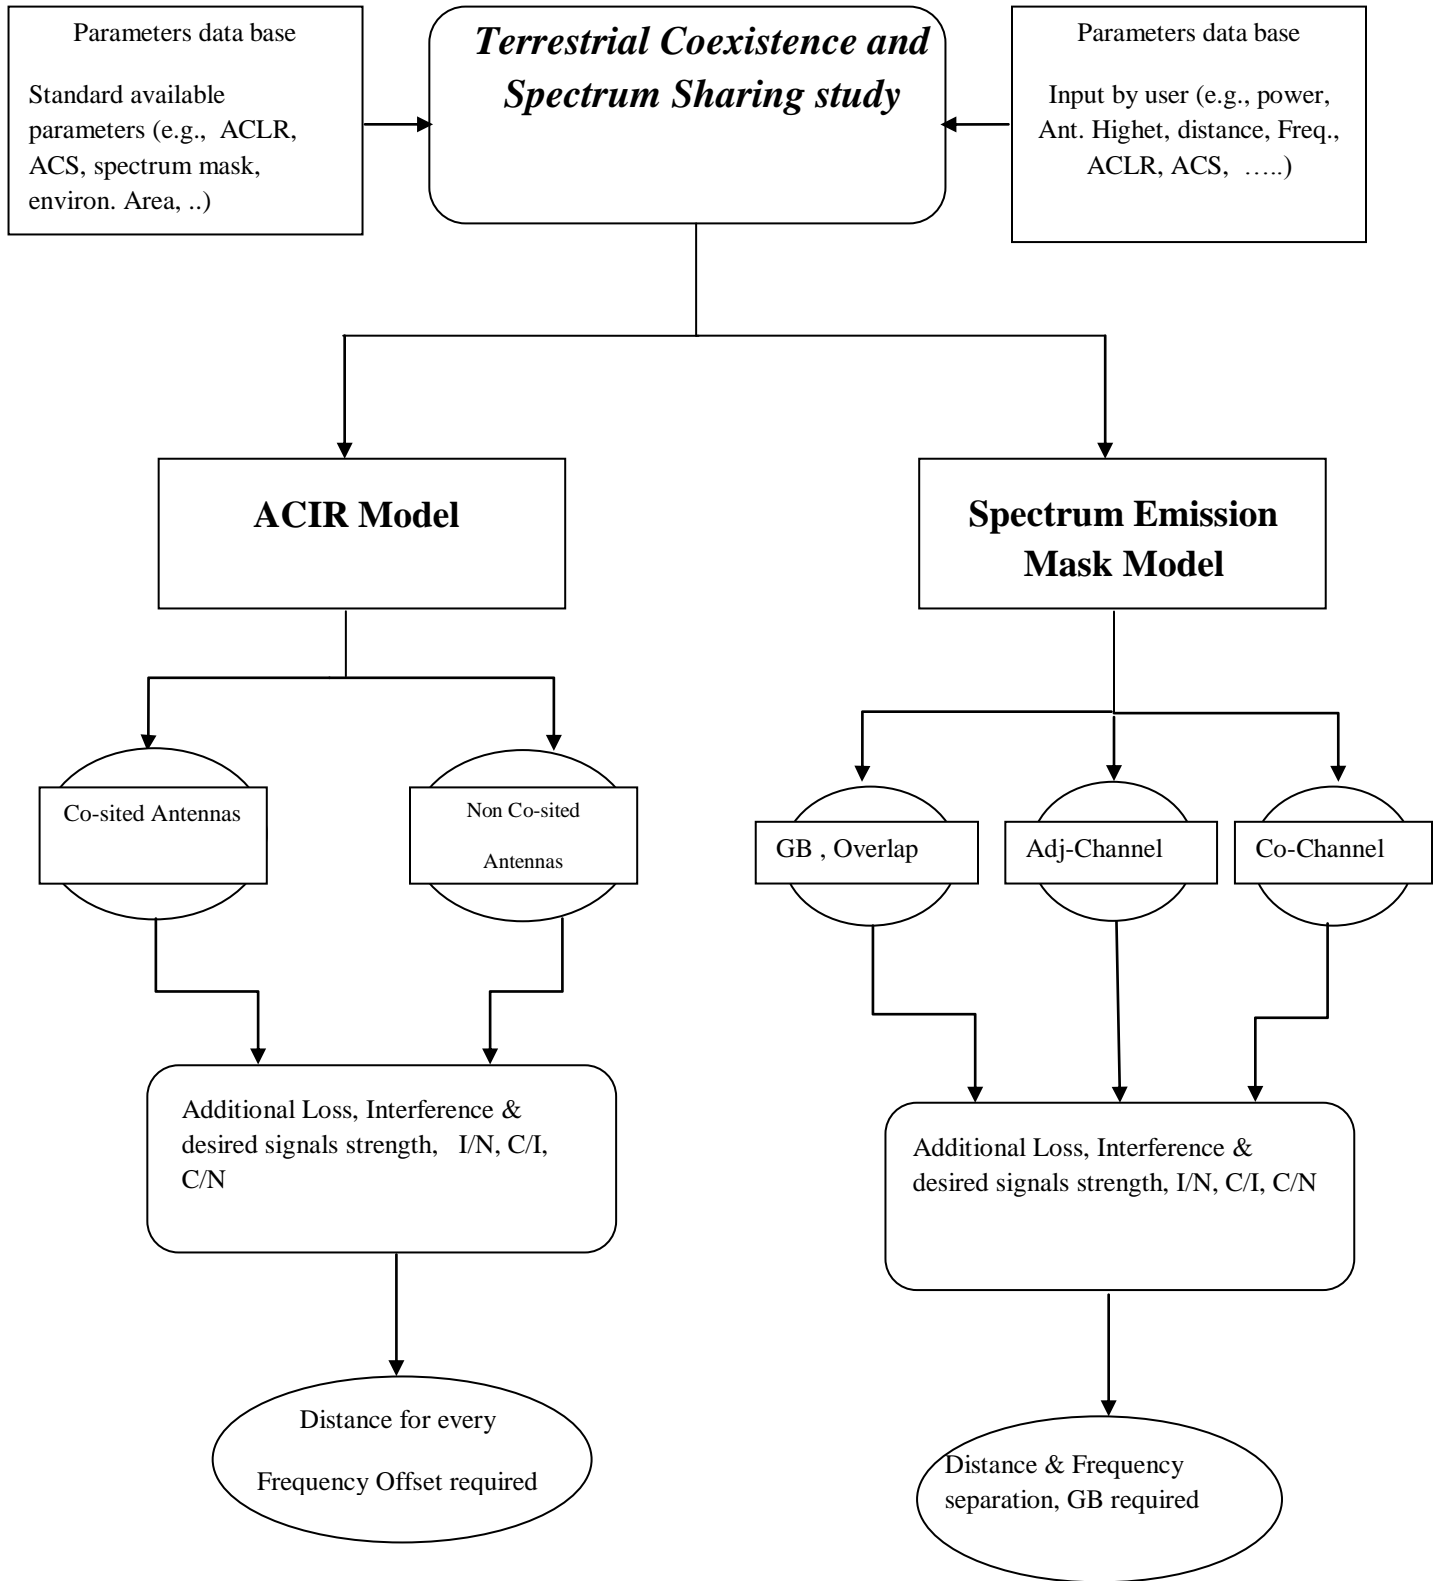

Figure 3: Flow Chart for Spectrum Management Tool Methodology Proposal.

**Spectrum management between Fixed satellite and terrestrial systems:-**

Phase 1 (Frequency Range): We chose the frequency range to suite the FSS and FWA band requirements. However, the FSS frequency range have already sat to be from 3400-4200MHz, at the same time we have the point to point FWA which suppose to operate on frequency range 3400-3600MHz. For FWA as point to multipoint we will cover this service because it's assigned globally by ITU to be work in frequency range 3400-3700MHz, so the software should be able to cover this service as well. Furthermore, we will cover the range 3300-3400MHz as an expected band for FWA because in a case that we will shift this services to be work on the band mentioned above we need a software to calculate the possibilities of deployments (Proceedings of 2nd.European Colloquium, (2002)).

Phase 2 (Inputs): Several types of information should be clarified, in term that we want a high capability and performance. For FSS inputs like propagation models (which will be base on ITU-R), select receiver type & specifications (ITU base) and multiple access technique ( E. Goodman. (2004, Mar)). For FWA we should consider the propagation models, receiver/transmitter Type and coverage (base on ITU), multiple access technique.

Phase 3 (Outputs): Interference calculation will be base on the input scenario and the results will be generated in a report which should include the interred case and the possible mitigations base on graphs. Recommendations will be provided (FCC. (2002, Nov)). Study will cover both co-channel and adjacent channel, for the adjacent channel all the possibilities of guard band will be included inside the library. However in the end we will be able to find the possibilities of deploy different services base on spectral power distribution.

Phase 4: Programming issues like data input, representing the date output, graphical design, generating reports and recommendations, ability to cover the mistakes, future developments base on the feedback and Compressions with the existing software.

**System Outputs:-**

The system output and results for this work are:

- Implementation of ITU-R propagation models for various radio services between 2 to 6 GHz.
- Verifying of the feasibility of coexistence between the two systems depending on the input specification by means standard criterion (e.g., I/N).
- Determination of the separation distance and frequency separation to coexist the two systems in case of Co-channel interference and adjacent channel interference.
- Estimation of the additional isolation to decrease the interference and achieve coexistence.
- Geographical Iraqi map based utilization and generation of the electronic report.
- Expecting recording frequency applications, frequency plans, frequency assignments, technical details and interferences.
- Identifying the priority of data items required for registration of stations in electronic data base.
- User-friendly data entry masks with on-line data validation mechanisms, if applicable.
- Signal strength calculation using propagation models within a selected area (coverage area), along a profile, along a polygon, at given points.
- Calculation of network coverage.
- Interference calculation around the concerned terrestrial transmitters and victim receivers.
- Interference calculation between Geostationary satellite Earth stations and BWA stations.
- Interference analysis for assigning frequencies to stations in given locations using relevant ITU-R recommendations, protection ratios and PSD (Power Spectral Density) masks of emissions.

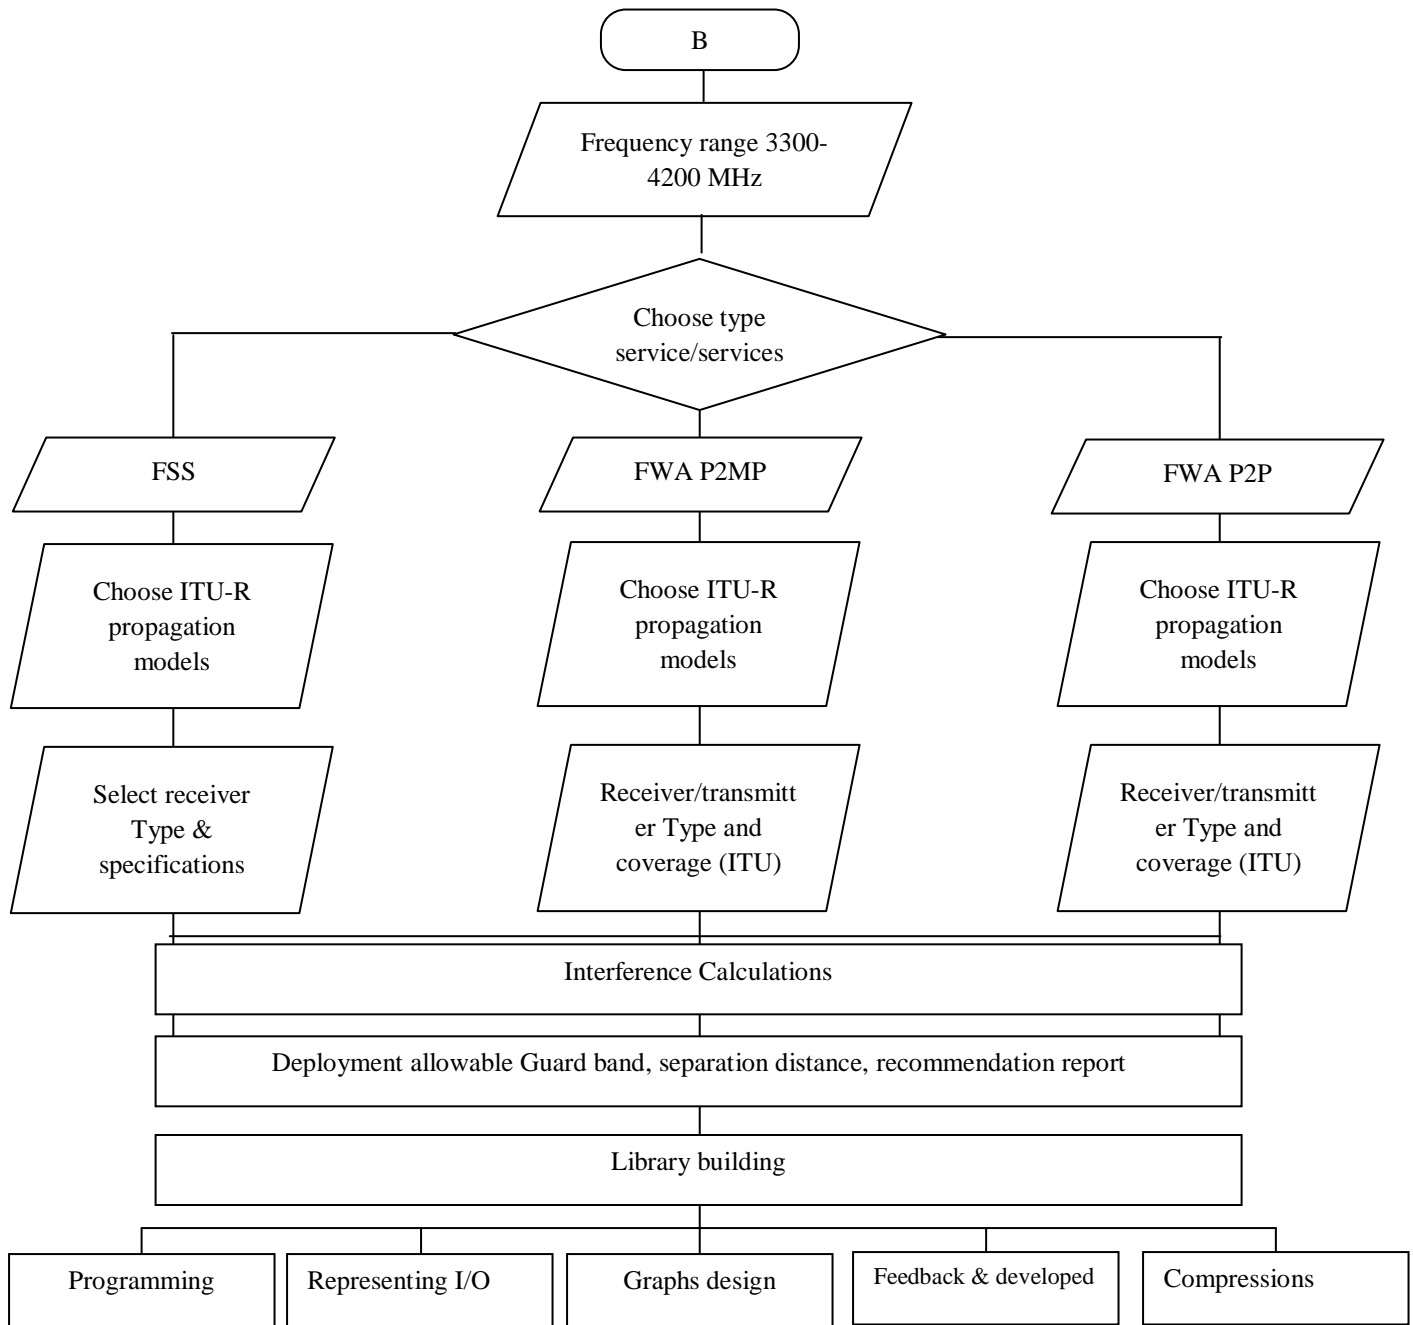

Figure 4: Flow Chart for Spectrum Management Tool Methodology Proposal

**Conclusion:-**

The information which will be gathered from this investigation will be extremely useful for Iraq to share with other countries through APT, WRC and other ITU forums. In addition to that new specialists to deal with new technologies on horizon will have a chance to explore more into this area. There will be good economic benefits for this project like: cost saving, revenue from consultancies, future estimation demand, and royalties from tools licensing.

#### Abstract

Keywords analysis is one of the important methods in corpus linguistics. It has the privilege to analyse texts/corpora in terms of statistical significance, by comparing two or more texts/corpora. This study regarded the keywords that are notable statistically in Dickens' 'A tale of two cities' using Laurence Anthony's AntConc tools. It aimed to find out a number of keywords of the mentioned Victorian novel (the node) compared with 35 Victorian novels (as a reference corpus). This study briefly shows and discusses a number of keywords of this novel as well as showing the limitations of this method of analysis. Quantitative and qualitative approaches are used; the quantitative analysis is by Laurence Anthony's AntConc concordancer whereas the qualitative analysis would be individual. Log-likelihood method, significant keywords as well as a number of negative

#### Introduction: -

The term "Keyword" is one of the research methods used in corpus linguistics which means: "words that are claimed to have a special status, either because they express important evaluative social meanings or because they play a special role in text or text - type" (Stubbs, 2010: 21). From this definition, keywords are the units that carry or participate in discovering the meaning of a text, this is from the perspective of Linguistics; from the social perspective, they are the units that have partial reference the culture and society, and also would represent the text type. There is an issue regarding the relationship between these two perspectives. Although in keywords analysis analysts correlate semantics with social aspects, the meaning of a text's keywords (semantics) tends not to be strongly related to the social and cultural world (Ibid, 2010). Words are the smallest units of meanings, but their meaning could be affected by a number of reasons: the combination with other words, the intention and purpose of saying/writing these words, as well as the participants who say/write them; and in social world, all these reasons are taken into consideration, therefore the social analysis is not strongly related to the individual semantic meaning of these keywords.

Stubbs (2010) argued that corpus linguistics studies are predominantly weak in social theory in the contrary of speech act theory – which means: regarding an utterance as a type of action which performs a function in language (*The Oxford English Dictionary*) - which provides 'powerful' social theory. However, it might be more sufficient to use empirical research of real data in studying the social theory. According to Stubbs (2010), there are three concepts

of keywords: the first concept is originated from ‘cultural studies’, the second is originated from ‘lexico-grammar work’, and finally, the concept that derived from the ‘comparative quantitative corpus analysis’. This essay focuses on the third concept of keywords which means searching for words that are notable statistically in a text or a number of texts by using Laurence Anthony’s AntConc tools. More specifically, this essay focuses on the keywords of Charles Dickens’ novel ‘A tale of two cities’ (taken as a node corpus), compared with 35 Victorian novels (as a reference corpus). It is interesting to find out the keywords of this novel to know what is different in its language, and what could they reveal in terms of understanding it. This essay briefly shows and discusses a number of keywords of this novel as well as showing the limitations of this method of analysis.

### **Keyness: -**

Keyness is “a quality possessed by words, words clusters, phrases etc., a quality which is not language -dependent but text -dependent” (Scott, 2010: 43). Therefore, words or keywords are not stand individually as a quality, but they are considered to be a quality in regard to the whole text or maybe in a number of texts, with also regard to social and cultural aspects. Because keywords are statistically significant in a text/texts (in comparison with usually a larger corpus), they tend to indicate the text’s ‘aboutness’ - simply, what the text is about- as well as the text’s style (Scott, 2010; Groom, 2010). On the one hand, keywords appear to provide an understanding about the whole or maybe just part of a text/ texts. On the other hand, these keywords would to a great extent participate in revealing aspects of styles of specific text/ texts which are different in comparison with the styles of others. As Scott (2010) pointed out, the use of the word ‘key’ is metaphorical. From this sense, key is what allow an individual to access a position which has not accessed before, or as he put it “enabling device” (2010: 44) i.e. as mentioned previously, they (keys/keywords) tend to provide an understanding of a text/texts.

Finding out the keyness of words in a text/ texts individually is not an easy process; the use of an automatic analysis (keywords tools) solves this issue. However, it has been claimed that the results of individual versus automatic analysis are not the same, for instance: Scott (2010) claimed that because keywords tools process analysis differently, their results are different (from that is of individual) quantitatively and qualitatively. It is not usually the case, sometimes the results could be the same even if the process is different and it is worth mentioning that because these two processes are different, in a sense, they are not comparable; as both of them has its advantages and disadvantages. The main differences in these both are: individuals seem not to agree consistently on the keywords of specific text/ texts picked by automatic tools, and automatic tools would provide keywords that are difficult for individual to notice (Ibid, 2010). The typical way of analysis is taking both processes together, using automatic tools to provide quantitative analysis and individual analysis using qualitative approach. However, there are a number of limitations regarding both approaches for example: the statistical process in comparing two or more texts is not always accurate, it tends to have a number of problematic issues considering the choice of keywords; taking, for example, a word from a text which is considered as a key in comparison to a reference corpus, but this word might tell nothing about the aboutness or the style of a text i.e. it might not be a key in this specific text.

This inaccuracy problem could be avoided by choosing the right reference corpus (Scott, and Tribble, 2006). In terms of qualitative analysis, the problem is not accuracy but it could, to an extent, be regarded as subjectivity. Individuals do have differences in perceptions, so, their analysis seems to be bias towards their perspectives. Avoiding this issue could happen only by perceiving the surroundings in objective ways.

### **Choosing the right reference corpus: -**

Choosing a reference corpus is an important issue. It affects all the statistical processes and results. The most important issues taken into consideration when choosing a reference are: the size of the corpus and its content. The larger the reference corpus is taken the more and accurate keywords detection (Scott, and Tribble, 2006). Moderate reference corpus may be sufficient as Scott (2010) argues, Sardinha (2004 cited in Scott, and Tribble, 2006) argued that the reference corpus should be five times larger than the node one and if it is more than that, it would be more accurate. Logically speaking, if the reference corpus is slightly larger than the node one, then there would be no significance in keywords and it is not a rule regarding the size but the more significant results wanted, the larger corpus should be used. In terms of content, there must be a relation between the node and the reference corpora. It would not be appropriate, for example, using a medical corpus as a reference to analyse the keywords of a literary work. It can be done, but the results would be inaccurate. Therefore, using ‘genre specific’ is a key aspect in finding the accurate results. In addition, using period specific which means the node and the reference corpora are originated in the same period of time, because social aspects change through time and it tends to have an influence on language; of course unless if the study is about the change of language through time or the effects of social aspects on

language, both of these are exceptions from the period specific principle. In this study the node text is a novel in the Victorian era 'A tale of two cities' and the reference corpus is 35 Victorian novels, so, the two issues (size and content) and time are taken into consideration.

#### **Open-class versus closed-class keywords: -**

Open-class words are the content words which allow an addition of new words, whereas closed-class ones are the functional words which do not allow any additions and it contains the grammatical and functional words. In keyword analysis, it is generally considered by discourse analysts that open-class keywords represent the aboutness of a specific text/texts or corpus, while closed-class words represent the style of a specific text/texts or corpus (Groom,2010; Scott, and Tribble, 2006). However, analysing the meaning of a corpus depends on the sequences of words not on the form of these words (Groom, 2010). In addition, Sinclair (1991 cited in Groom, 2010: 62) mentioned that "[m]ost everyday words do not have an independent meaning, or meanings, but are components of a rich repertoire of multi-word patterns that make up text". Therefore, analysing text/texts, using keywords, does not depend on the meaning of the words themselves, but on their meaning within the context. There is a slight distinction between closed-class and open-class keywords (Scott, and Tribble, 2006). Therefore, Groom (2010) argued that this distinction is regarded as a reason in skipping the analysis of closed-class keywords. It is possible to say that this issue is not a rule of thumb; it significantly depends on the text/texts or corpus. In a type of text, for instance, one can find the use of functional words (closed-class) is a representative of the style as well as the aboutness of this text but in other texts s/he may find these words represent just the style and not the aboutness. However, closed-class keywords would not be treated as the same as open-class keywords in analysing the aboutness, open-class keywords are always the prime indicators of aboutness (Groom, 2010; Baker, 2006).

There are two different methods of analysis: the quantitative and the qualitative, along with the distinction between aboutness and style. For closed-class keywords, quantitatively, they tend to have a statistical significance as they are grammatical and functional words; but, qualitatively, "these words can tell us almost nothing about the meanings and values expressed in a specialized corpus" (Groom, 2010: 63). Although these words are considered meaningless in terms of analysis, they appear to have the ability to reveal an indication of the meaning of a specific text/texts or corpus as well as the indication of the style; not when they are analysed individually, but when they are analysed contextually (Ibid, 2010). For open-class keywords, quantitatively, they, statistically, seem to be slightly lesser than the closed-class ones except for the proper nouns which always come first. Qualitatively, those keywords are the representative or the principal of meanings. Proper nouns tend to be also meaningless while analysing, except for a number of studies which require the analysis of them. Groom (2010: 70) points out that, considering closed-class keywords "irrelevant" or less important would be "wrong". It is possible to say that only a number of closed-class keywords could be 'tractable' to semantic (meaning) analysis, for example: the words 'the' and 'a', generally, provide almost nothing to indicate the aboutness. However, the word 'of' in Groom's (2010) study provided plenty of indication to the aboutness. In this study, both classes of keywords would be concentrated on to see whether the closed-class keywords in this novel provide indications of aboutness or not.

#### **Bottom-up versus Top-down approaches of analysis of discourse: -**

Bottom-up and Top-down approaches are contrasted. Simply, top-down approach is used when there is already an existed hypothesis or 'framework' of analysis and the reason of analysis is to support or prove the effectiveness of this framework. Whereas bottom-up approach is used when an analyst starts his/her analysis with the data (corpus/text(s) in order to reach or create a suitable framework of analysis (Biber, et al. 2007). Typically, the case of keywords analysis tends to be a bottom-up approach. However, it could be possible and effective to work with these two approaches in keywords analysis. In literary work analysis, which is the concern of this paper, 'corpus stylistics' appears to be the comprehensible approach of analysis. Corpus stylistics is the cooperation of methods of corpus linguistics and literary stylistics – where corpus linguistics is the bottom-up and literary stylistics is the top-down (Mahlberg, 2010; 2012). It is possible to claim that the relation between these approaches is similar to the relation between quantitative results and qualitative analysis, in a way that both of these relations could address difficulties and limitations of keywords analysis.

From a logical perspective, on the one hand, the bottom-up approach of analysis seems to be more difficult and subjective while working with alone and there is a possibility of wrong or odd findings. Therefore, taking the framework (top-down approach) – in this case, the literary stylistic methods – would be a guidance mostly towards significant findings. On the other hand, taking the top-down approach alone would be a time consuming; as Short (1996 cited in Mahlberg, 2010: 295) put it “analysing a long novel ... could take a lifetime”. Moreover, there are plenty of other limitations which would be mentioned later. To avoid such limitations, this essay would take these both approaches into consideration. In terms of top-down approach, this novel is on the time of French revolution, and the story is taking place in two cities, London and Paris. It has a sub story and the concentration is mainly on the characters of this story. It has a psychological effect on the readers because of the use of different techniques such as: ‘metaphors’, ‘comic relief’ (humour), ‘repetition’ ...etc. (Newlin, 1998). The language of this novel is highly stylistic and philosophical; moreover, it has a subjective element, by which it differs according to the characters’ perspectives (the view points of the characters are different because of the class distinction) (Ibid, 1998). The understanding of this brief summary would provide guidance and an idea about the analysis of keywords

### Methodology: -

The aim of this study is to find out a number of keywords of the Victorian novel ‘A tale of two cities’ and what these keywords could tell about this novel. Quantitative and qualitative approaches are used; the quantitative analysis is by Laurence Anthony’s AntConc concordancer whereas the qualitative analysis would be individual. Top-down and bottom-up approaches of analysis are used in this analysis to provide clearer insights and provide possible hypotheses, but the focus would be more on bottom-up approach. The node text (A tale of two cities) was downloaded from the Project Gutenberg website whereas the reference corpus was taken from one of the corpus linguistics lectures, which is also downloaded from the Project Gutenberg website. The reference corpus consists of 35 Victorian novels. By using AntConc, Log-likelihood method, significant keywords as well as a number of negative keywords are selected and analysed.

### Keywords Analysis: -

**Table 1:-** the significant keywords in this study

Rank	Freq	Keyness	Keyword
1	223	649.786	doctor
2	138	592.878	prisoner
3	63	362.907	citizen
4	60	297.528	spy
5	2011	268.943	his
6	76	212.373	streets
7	622	163.047	mr
8	134	137.103	business
9	20	131.850	patriots
10	22	115.954	tribunal
11	13	99.646	citizeness
12	54	87.528	faces
13	233	86.668	miss
14	98	84.531	until

**Table 2:-** the negative keywords in this study

Rank	Freq	Keyness	N. Keyword
1	18	240.434	mrs
2	1987	158.423	i
3	1045	137.901	her
4	27	65.414	oh

The word ‘doctor’, other than its normal role, emphasizes the role of social class, the well educated people and also there is a logical tendency with the term doctor as whenever there is an emphasis on doctors there must be patients, it might be a representative of the ill situation at that time i.e. sick people as a sign of not only physical sickness but the poverty and depression of maybe most of the lower or working class at that time. The word ‘prisoner’ in this novel is not surprisingly being a keyword as the story deals with prison and court. However, it also has a metaphoric use as in ‘must positively find the prisoner Guilty’ and in ‘innocent prisoner’ these two examples are not only metaphoric, but also a representation of injustice. Moreover, the word ‘spy’ used in this novel as also a representative of the world of injustice.

As citizen means “someone who has the right to live permanently in a particular country and has the right to the legal and social benefits of that country ...” (Macmillan dictionary). The use of this word in this context has two senses: the first one is the sense of formality, this word has been mentioned once in the first book of the novel and the rest 62 times were mentioned at the third book because the word occurred in the context of court which tends to be more formal than any other situation. It also carries positive aspects (most collocates are positive semantically). The second sense, this word is used metaphorically as good quality content must be existed in people (it is the ‘container’ conceptually; whoever supports the French revolution is called citizen/ess).

The use of the possessive pronoun ‘his’ is an indication of the major theme of this novel; it seems to be a male dominance. Although it does not deal with only one hero and it is not only a one story novel, it seems that the focus is on one hero of the sub story. For more support, it is obvious that the use of female possessive pronoun ‘her’ (which is negative keyword in this novel) is only half times than ‘his’ which also indicates the male dominance theme.

The word ‘streets’ is significant in this novel, but it tells a little about the aboutness, simply as the actions are taken place in the streets. However, “but, when the streets grew hot” and “once-peaceful streets” in these examples ‘streets’ has another meaning: metonymic way of representing weather and personifying the impersonal.

The word “Mr.” is mentioned 622 times and it tells nothing but when comparing with the negative keyword “Mrs” which is mentioned only 16 times, one can assume that this novel is male dominance, though the word “miss” is significant (mentioned 233 times).

The word “business” used in different situations providing different meanings for instance: ‘business eye’ metaphoric use, ‘man of business’ used in two senses: men who have jobs and men who are in charge, ‘business mind’ means reasonable, ‘it’s not my business’ means not my responsibility. In addition, this word provides positive sense, however there are some instances of the negative use of this word as in ‘dreadful/murderous business’.

Although the word ‘patriots’ is mentioned only twenty times, it is significant in this novel. The instances are seen from the second half of book two and book three, when the revolution started, because of the fact that it appears to

be semantically and logically linked with the revolution.

The word 'until' is used as a preposition as well as conjunction. The conjunction 'until' is used more than the preposition one, and it might be more interesting in the sense that a certain action is depending on another action, so, this would tell a little about the language of this novel.

The word 'wot' is the non-standard form of the word 'what' and it is significant in this novel. Although it is not frequent enough, it shows the colloquial language used by people at that time. And also shows the subjective element mentioned above, which is not all characters use this word instead of 'what'; 'what' was used 384 times while 'wot' was used 20 times.

It is not unusual for the word 'and' to be a keyword; it is the additive element, so, it might be possible to say that this novel has a significant number of extensions. As for the possessive 'its', it is mostly preceded by the prepositions 'in, of' and only in small number of instances it is preceded by 'on, at, for'.

The word 'wos' is used ten times and it is significant in this novel for the same reason of the word 'wot'. It is the colloquial term of the word 'was', but in seven instances it was used as: 'if it wos so' and two times without 'so', 'if it wos' and only one time it was used alone.

The word 'faces' is significant in this novel; it represents the normal use of the word and: the metonymic concept of 'part represents the whole', so, face represents the whole body as in:

'and faces hardened in the furnaces of suffering'. It represents the status of a person as in: 'the faces changed, from faces of pride to faces of anger and pain'.

The only aspect of the significance of the word 'tribunal' in this novel may lie in the element of formality i.e. the court tends to be more formal than the tribunal and the fact that at the times of French revolution, the revolutionary court was oppressive and informal. Therefore, this could be the reason of using this word instead of the word court.

The negative keywords 'I' and 'oh' can tell that the use of the first speaker pronoun is not significant and it could be because the focus is on the indirect speech. As for 'oh' a representative of sigh and grief, it is unusual to be negative in this novel (as it is sorrowful and melancholic).

Finally, the keywords used in this analysis provided a number of elements regarding the aboutness and the style of this novel and provided an understanding on the surface level. In order to widening this research to gain an understanding on a deeper level, there are a number of limitations will be mentioned later. If a researcher takes them all into consideration, the results would be deeper and more generalizable. In Addition, the closed-class keywords in this novel appear to have nothing about the aboutness.

\* The examples are taken from AntConc directly and the whole text is referenced in the reference list.

#### **Limitations and further study: -**

There are a number of limitations in the study of keywords analysis other than the ones mentioned above. It is difficult to make 'generalizations' in a wide range of texts because it depends on the linguistic features of different registers and on the writer's style (in this case Charles Dickens whose style can be generalized in almost all his texts and that could provide clues to the analysis of a specific one(text) i.e. the style of a text tends to be subjective and the effect on readers/listeners may also be subjective – in a sense that text could affect readers/listeners differently (Mahlberg, 2012). A word could be a key that frequently occurs in one part of a text/corpus as in the case of the word 'citizens' in this novel. The keywords do not focus on grammatical, semantic or functional differences or even lexical similarities; they concentrate only on lexical differences (Baker, 2004a cited in Rayson, 2012). It is also possible that the selection of keywords could be subjective and that would to an extent frame the analysis in certain perspective. Mahlberg (2005: 17) pointed out that, generally, "corpuslinguistics is still a long way away from the creation of a unifying theory that accommodates individual findings within a broad framework".

For further study, it would be beneficial to include collocation analysis in researching keywords because perhaps it would provide a deeper analysis of keywords. Also using Scott's technique to find 'key keywords' would be

beneficial (Rayson, 2012) – key keywords are words that are keys in not only one text/corpus but in a large number of texts/corpora (Scott, and Tribble, 1996). This technique would support Groom's claim in focusing on the closed-class words (because key keywords frequently are from the closed-class group) as well as the phrasal/cluster analysis.

### Conclusion: -

In conclusion, keywords analysis is one of the important methods in corpus linguistics. It has the privilege to analyse texts/corpora in terms of statistical significance, by comparing two or more texts/corpora i.e. analysing the texts/corpora using the most frequent words. Theoretically, this method would be the most significant method of analysis in corpus linguistics, because it is an inclusive approach as it focuses at the text/corpora as a whole and selects the most frequent words for the analysis. However, texts/corpora are not just language, there is always aspects other than language (Social, cultural and cognitive aspects) which influence the language. Inevitably, these aspects affect the context of texts/corpora. With the fact that the meanings of words in texts are different from their meanings in isolation, keywords might to an extent be influenced by those aspects. Therefore, using multi-approaches (Top-down/Bottom-up) would result more accuracy in terms of analysis. Both of these approaches support the analysis of this novel as well as the choice of the reference corpus. Although the findings are not generalizable because the number of keywords analysed is not enough, there are a number of indications about the aboutness and style of the language used and this brief analysis reveals a number of aspects that support the understanding of this text.

Single visit apexification, artificial apical plug, Biodentine

#### **Abstract**

The management of a tooth with open apex consists of either the induction of a natural barrier or the creation of an artificial apical barrier. Since the conventional apexification using calcium hydroxide has certain drawbacks recent approach is to form an artificial apical plug using newer biomaterials. In addition to MTA, alternative materials are being developed and researched studied for the purpose. This article describes the successful management of traumatized and necrotic permanent maxillary incisor teeth with open apex using artificial apical barrier technique with Biodentine.

*Copy Right, IJAR, 2017., All rights reserved.*

#### **Introduction:-**

Traumatic injury to an immature permanent tooth leads to loss of pulp vitality and arrested root development. Thus, endodontic management of these teeth in young patients is a great challenge. The walls are divergent and wide open apex makes debridement and obturation difficult [1]. An Apical root closure may result from apexification or bridge formation. Apexification is defined as a method to induce a calcified barrier in a root with an open apex or continued apical development of an incomplete root in a tooth with necrotic pulp [2].

Various techniques were used to induce the apexification process. The most common traditionally used medicament is Calcium Hydroxide. It was first introduced by Kaiser and Frank in 1960's. The approximate time for induction of calcified apical barrier varies between 6 months and 24 months. Although technique is efficient with predictable outcomes, it has several disadvantages like prolonged treatment time, chances of re-infection and risk of cervical fracture [3].

An alternative to apexification with calcium hydroxide is formation of an artificial apical barrier technique using MTA. Literature suggests that MTA is biocompatible with cementogenic properties and has superior sealing ability. But it has certain disadvantages like questionable antimicrobial activity, difficult to handle, potential for discolouring the tooth [4].

To overcome the disadvantages of MTA, a new calcium silicate based material; Biodentine™ (Septodont) has been introduced in 2009 claiming to be a revolutionary material capable of offering a bioactive and biocompatible

replacement for dentine. The endodontic indications of the novel material are similar to MTA but are reported to offer several advantages including better consistency, improved handling, and quicker setting time (12 minutes) [5]. The following four case reports describe successful management of traumatized permanent anterior teeth with open apex with Biodentine apexification followed by root canal treatment followed by crown placement.

### Case Reports:-

Four cases of open apices reported at different time in the Department of Conservative Dentistry and Endodontics, Guru Nanak Institute of Dental Science and Research, Kolkata- 700114 with the **chief complaint** of discolouration in upper front teeth region of mouth. The age of the patients were in a range between 21 to 25 years. The medical and dental histories were non-contributory. All of the four cases were presented with similar features as follows :-

**History-** Trauma 12-13 years back.

#### Clinical presentation:-

- i) Discolouration
- ii) Offending tooth shows negative response in electric pulp test (EPT)
- iii) Non mobile and non tender

#### Radiographic presentation:-

Circumferential periapical radiolucency with wide open apex along with thin root dentin. The bony support of the tooth was completely intact.

#### Treatment procedure:-

The treatment protocol was performed as follows :-access cavity was prepared using no.2 round bur (Dentmark) and refined with endo Z bur (Dentsply) with rubber dam (Coltene) isolation. Working length was established by radiograph. Biomechanical preparation and circumferential filling was done with 80 K file. Irrigation was performed with 3% sodium hypochlorite and normal saline alternatively. Calcium hydroxide as an intracanal medicament was placed in the canal for 1 week and the access cavity was sealed with zinc oxide eugenol.

On recall visit, the tooth was found to be asymptomatic clinically and radiographically. Intracanal medicament was removed by irrigating with alternating solutions of 3% Sodium hypochlorite and saline. The canal was completely dried with size 80 absorbent paper point and the absorbable gelatin base foam (AbGel) placed apically as a barrier.

Biodentine (Septodont) capsule was tapped on a hard surface to diffuse the powder. After this, five drops of manufacturer's supplied liquid was dispensed into the capsule. The capsule was then placed in triturator for 30 s. After mixing, biodentine was placed at the apical region and gently adapted to the apical portion of the canals using endodontic pluggers until an apical plug of 4-5 mm was reached. Correct placement of Biodentine apical plug was assessed radiographically. Following the placement of biodentine over the barrier, butt-end of a paper point was used to clean out any excess material from the walls. After 10-12 minutes, the hardness of the biodentine was examined using the plunger to confirm its set. Rest of the canal space was obturated with gutta flow and post obturation access cavity restoration was done with light cure composite resin (Filtek Z 250 XT, 3M ESPE) on the same day. The patients were recalled at every 1 month interval for a period of 6 months for clinical and radiographic assessment during this period.

#### Case 1:-

(a)- Pre operative radiograph (22)

(b)- Post operative radiograph

(c)- 6 months follow up radiograph

(a)

(b)

(c)

**Case 2:-**

- (a)- Pre operative radiograph (11)  
 (b)- Post operative radiograph  
 (c)- 6 months follow up radiograph

**Case 3:-**

- (a)- Pre operative radiograph (22)  
 (b)- Post operative radiograph  
 (c)- 6 months follow up radiograph

**Case 4-**

- (a)- Pre operative radiograph (11)  
 (b)- Post operative radiograph  
 (c)- 6 months follow up radiograph

**Discussion:-**

Calcium hydroxide has been used in the conventional apexification technique to create an environment conducive to the formation of an apical barrier formed by osteo-cementum tissue at the end of the root canal in teeth with open apices. However, it has certain drawbacks like the long duration of therapy (3 to 21 months), susceptibility of the tooth to fracture during treatment, and susceptibility of the root canal to re-infection due to a temporary seal in the tooth [4]. With the introduction of MTA, a more convenient and less time taking technique by placing a plug of MTA in apical 4 mm of the root canal was conceptualized. MTA has a range of advantages such as biocompatibility, hard tissue formation, sealing ability, antibacterial property and MTA is not affected by the presence of blood [5]. But compressive strength of MTA is lower (40 MPa immediately after setting and increases to 70 MPa after 21 days) than Biodentine (300 MPa after one month).

Biodentine is a novel innovative bioactive and biocompatible material which provides a good biological seal and excellent marginal adaptation, a high degree of biocompatibility material that was introduced by Septodont. The powder is chiefly composed of tricalcium silicate with added CaCO<sub>3</sub> and zirconium oxide. The liquid portion contains calcium chloride (CaCl<sub>2</sub>), as setting accelerator, in the water reducing agent. Addition of CaCl<sub>2</sub> not only

decreases setting time but also improves its handling properties. Setting time of MTA is 2 hours and 45 minutes and needs at least two appointments to complete the obturation. But the setting time of Biodentine is 9–12 minutes, does not require two- step obturation and the treatment can be rendered in a single appointment. These factors reduce the chances of bacterial contamination [6]. Biodentine like MTA has an ability to initiate and continue the mineralization process. It has an elastic modulus of 22GPa which is very close to that of dentin 18.5GPa [7].

Many studies have been performed to demonstrate the bioactivity of Biodentine in clinical situations because it was able to stimulate initiation and development of mineralization [3]. Studies on management of large periapical lesion using Biodentine as retrograde restoration showed positive response in treatment outcome [8]. The only limitation of Biodentine is that it cannot be used in the presence of moisture unlike MTA. Hence, proper isolation is mandatory while using Biodentine. In the present case, the use of Abgel as apical matrix not only served in limiting the Biodentine to root canal but also provided an isolated environment for setting of Biodentine [9].

### **Conclusion:-**

Biodentine, a bioactive – biomimetic material, shows promising use for apexification, and reinforcement in management of immature teeth with open apex while serving as a monoblock. However, in such cases, long term follow up is necessary to ensure and evaluate success. Periapical healing was seen on radiographic observance. This may be due to the fact that Biodentine has superior marginal adaptation. Periapical radiolucency was almost completely healed after 6 months follow- up. In these cases, the circumferential diameter of radiolucency was decreased

Tacit Knowledge Sharing, Personal Competencies, Professionalism, Lifelong Learning

### Abstract

The knowledge-based view of competitive advantage acknowledges the importance of knowledge and human resource (HR) competencies as an organization's valuable assets (Hislop, 2003; Oltra, 2005). Intellectual ability of workers in particular tacit knowledge sharing and personal competencies are the essential pillars to build the organisation's capital. However, research has shown that people are reluctant to share because employees' beliefs that their shared knowledge is useful to others than the personal benefits they gain, especially in a professional network. This study explores the relationship among tacit knowledge sharing, professionalism and lifelong learning. The conceptual framework consists of three capable factors i.e. tacit knowledge sharing, professionalism and lifelong learning and three groups of domain of both factors; professionalism (Professional challenge, professional facilitation and work engagement) and lifelong learning (self-efficacy, change readiness, and openness & experience). This research contributes to a better understanding of tacit knowledge sharing and how that knowledge accrues personal competencies through professionalism and lifelong learning. Therefore, the proposed model might be used as an alternative theoretical model for evaluating the relationship among these factors in future studies.

### Introduction:-

In the era of knowledge-based economy, resources and competencies are expected to be the crucial factors for organizations to survive in dynamic and competitive environment (Subramaniam & Youndt, 2005; Teece, Pisano, & Shuen, 1997). The new economy is based on the rules which emphasize the role of knowledge and competencies in shaping the competitive advantage of the organization. As a result, the value of the organisation is based on the resources inherent in the knowledge and competencies of its employees. To better use of competencies, employees always have to borrow from tacit knowledge of their colleagues. Thus it is also important to be aware of those competencies that encourage knowledge sharing (Csepregi, 2011).

The main issue of KS is associated with managing tacit knowledge rather than explicit knowledge (Bollinger and Smith, 2001) as people are reluctant to share it because employees' beliefs that their shared knowledge is useful to others than the personal benefits they gain, especially in a professional network (Chiu et al., 2006; Siemsen et al., 2007; Wasko & Faraj, 2000; Wang & Noe, 2010). Professionalism focuses on the question of what qualifications

**Corresponding Author:- Preeti Choudhary.**

and acquired capacities, what competence is required for the successful exercise of an occupation (Englund, 2002:76). To maintain the status as a professional, the individual should continue to acquire new knowledge and practice his or her profession according to the code of the profession (Mottian, 2014). Successful societies and economies will depend on how well they enable these valuable assets to be shared, how well they learn from the knowledge they hold (Noor and Salim, 2011) and how they use it in their professions. The concept of professionalism is multifaceted in nature and, in spite of much research done in this field, it is still poorly conceptualised (Grinspun, 2007:22).

More recently, some studies empirically discussed the effects of knowledge sharing on various aspects of competencies. However, there is dearth of research of an integrative framework of tacit knowledge sharing, professionalism and lifelong learning together. Existing literature also shows that there is dearth of research which directly established a relationship between tacit knowledge sharing and personal competencies. Further there is lack of literature support that substantiates the interrelatedness between professionalism and lifelong learning. This study contributes to fill these gaps existing in the literature. Thus, the objective of this study is:

**Objective:-**

1. To study the relationship between tacit knowledge sharing and personal competencies.
2. To study the relationship between tacit knowledge sharing and professionalism.
3. To study the relationship between tacit knowledge sharing and lifelong learning.
4. To study the relationship between professionalism and lifelong learning.

**Literature Review:-**

**Tacit knowledge sharing (TKS)**

Tacit knowledge is unspoken and hidden and deeply rooted in action, procedures, routines, commitment, ideals, values, and emotions (Nonaka, Toyama, & Konno, 2000). This type of knowledge can be found in everyday discussions, face-to-face informal meetings, and reports (Panahi et al., 2012). This knowledge is a consequence of years of learning, gaining experience, and unspecified skill building within the mind, associations inexpressible by language, along with rules of inference and decision making (Ciechanowska, 2014). This knowledge resides in the mind of human being.

Tacit knowledge plays an important role in improving individual and organizational productivity and competitive advantage (Panahi et al., 2012). It is perceived as an important asset in improving quality of work, decision making, organization learning, productivity, competitiveness and major time saving for individuals and organizations (Herrgard,2000; Wahab et.al., 2010; Selamat and Choudrie, 2004). As a result, TKS is critical for individuals and organizations. Unlike explicit knowledge, tacit knowledge is more dependent to its human carrier (Grutter et. al., 1999). Even though the importance of tacit knowledge has been proved, unfortunately, in the work life, tacit knowledge is underrated.

**Personal competencies (PC):-**

According to Srivastava (2007), competencies means different things to different people. However, it is generally accepted as encompassing aptitudes (natural talent, susceptible to improvement), abilities (the practical application of a talent) and knowledge (necessary information for task achievement) (Lustri et. al., 2007). PC not only promotes learning, flexibility and adaptability but also contributes to the success of the entire organization. In order to enhance the productivity of knowledge workers, their competency enhancement and learning has to take place directly at their workplaces (Ley et al., 2008). The included items under PC are interpersonal skills, integrity, professionalism, initiative and lifelong learning. Without these attributes or competencies, the individual is not considered qualified. In this paper we have studied only two sub factors i.e. professionalism and lifelong learning.

**Professionalism:-**

Professionalism is a multidimensional concept that encompasses a number of different attributes including specialized knowledge, competency, honesty and integrity, respect, accountability, self-regulation and image etc. and, together, these attributes identify and define a professional. Professionals need to balance their own and their clients' interests through 'a voluntaristic commitment to a set of principles governing good practice and the realisation of these through day-to-day professional activities' (Hoyle and John 1995: 104).

Professionalism is a trait that's highly valued in the workforce. The three concepts of knowledge, autonomy and responsibility, central to a traditional notion of professionalism, are often seen as closely interrelated (Furlong et al., 2000: 5). Professionalism is related to proficiency – the knowledge, skill, competence or character of a highly trained individual, as opposed to one of amateur status or capability (Wingrave and McMahon, 2016). While nearly all organisations have some form of professionalism curriculum, how best to promote and evaluate professionalism is unclear (Swick et. al., 1999; Kao, 2003).

#### **Lifelong learning (LLL):-**

LLL has been characterised as the "capacity to respond flexibly to changing circumstances, to learn throughout a career, and to integrate theory and practice...to deal capably with previously unmet situations" (Bligh, 1982), but also more broadly, embracing learning in a variety of formal, informal, planned and opportunistic settings (Candy, Crebert, and O'Leary, 1994).

LLL is never-ending process that involves and engages the learners of all ages in acquiring and using knowledge and skills. It is flexible, diverse and beginning with learning from families, communities, schools, religious institutions, workplaces, etc. which takes place at all times and in all places. It is attitudinal—that one can and should be open to new ideas, decisions, skills, or behaviors. This determines what an individual need to learn and how to make and carry out the learning plan (Collins, 2009).

Learning flows from a variety of activities, for example, observing how other people do something, discussing with others, asking someone, looking up information, trying something for oneself and learning from trial and error, and reflecting on all the previous activities (Bolhuis, 2003). LLL has emerged as one of the major challenges for the worldwide knowledge society of the future (Collins, 2009).

#### **Conceptual Model and Hypotheses:-**

##### **Tacit knowledge sharing and personal competencies:-**

Knowledge sharing practices in the whole organization are very important for preserving valuable heritage, learning new techniques, solving problems, creating core competences and initiating new situations (Hu et al., 2009; Huang et al., 2010; Law & Ngai, 2008). Knowledge cannot be shared efficiently without having the adequate competences. To better use of competencies, employees always have to borrow from tacit knowledge (skills or experience) of their colleagues.

Sita Vanka, K. Sriram and A. Agarwal, in 5th International Conference on e-governance, ICEG (2007) also highlighted that there is lack of knowledge sharing, lack of personnel with appropriate background and aptitude and inadequate skill sets of personnel deployed in Indian e-governance system. Thus it is also important to be aware of those competences that are necessary for knowledge sharing (Csepregi, 2011). Knowledge sharing and competencies are the essential pillars in this knowledge era still the dearth of research of these two constructs together, exist in the organisations. Thus, the proposed hypothesis is as follows:

**H1:** There is an influence of tacit knowledge sharing on personal competencies.

A three-item scale of tacit knowledge sharing is developed by reference to a range of studies (Bock, Zmud, Kim, & Lee, 2005; Holste & Fields, 2010; C.P. Lin, 2007; H.F. Lin, 2007; Wang & Wang, 2012). These scales contain (1) Employee experience; (2) Know- whom and know-where; (4) Lessons from past failures.

##### **Tacit knowledge sharing and professionalism:-**

Leach (2003) mentions professionalism as "a commitment to a high quality qualification training, an expectation of continuing learning, improving expertise among qualified practitioners and an enthusiasm for maintaining and developing the knowledge base on which the work of the service rests through study, research and recording and writing up developments". Researchers find that employees with high confidence in their ability to provide valuable knowledge are more likely to both donate and collect knowledge with colleagues (Lin, 2007).

Holste and Fields (2010) highlighted that the perceived competence and professionalism of the source of the tacit knowledge is a more critical determinant of willingness to use such knowledge. He discussed that use of tacit knowledge may present a somewhat larger risk to a professional employee than the act of sharing such knowledge. If a worker chooses to use and apply tacit knowledge provided by another, and the results are not as positive as

expected, the recipient may need to present a responsible explanation to organizational management. Thus, the recipient of tacit knowledge must be confident about the consensus concerning the professional competence of the knowledge source. Knowledge sharing (KS) is important to promote the professional skill and competence in an organisation. Thus, the hypothesis proposed is:

**H2:** There is an influence of tacit knowledge sharing on professionalism.

**Figure 1.1:-** Relationship between Tacit Knowledge Sharing and Personal Competencies

#### **Associated characteristics of Professionalism:-**

**Professional Challenge:** Professional challenge is a fundamental professional responsibility. In this context it is about challenging decisions, practice or actions which may not effectively ensure the safety or well-being of a child or young person or his/her family. Many professional challenges will be resolved on an informal basis by contact between the professional raising the challenge and agency receiving the challenge and will end there.

**Professional Facilitation:** With respect to professional facilitation, the focus on the facilitation of professionals by the actual organizations they are employed in rather than by professional organizations. In working with support groups if they change how they view their own role in creating change. Accordingly, the professional facilitation is more taking place within the setting of specific organizations than on an overall "purely professional" level. This means that the actual organization they are employed by is more important to them than the embeddedness in organizations of professionals. Professionals must know and do certain things to be professional (content) and they must be part of professional organizations (control) to acquire content and be regarded as professionals with special privileges (Noordegraaf, 2007).

**Work engagement:** Work engagement is a "positive, fulfilling work-related state of mind that is characterized by vigor, dedication and absorption (Bakker, Albrecht, and Leiter, 2011). Research has indicated that engaged employees are highly energetic, self-efficacious persons who exercise influence over events that effect their lives (Bakker, 2009; Schaufeli et al., 2011). This suggests that work engagement is important to enhance the discretion of organizations despite protocols and other routines (Butter and Jo Hermanns, 2011). Based on these finding, the sub-hypothesis proposed are:

**H2a:** There is an influence of tacit knowledge sharing on professional challenge.

**H2b:** There is an influence of tacit knowledge sharing on professional facilitation.

**H2c:** There is an influence of tacit knowledge sharing on work engagement.

Three components of professionalism domain are Professional Challenge, Professional Facilitation and Work Engagement are Adapted from shortened version of Utrecht Work Engagement Scale (Schaufeli et al., 2006). The components that have positive impact are selected, while the components that have negative impact have been eliminated.

**Table 1.1:-** Items of the professionalism scales

<p><b>Professional challenge</b></p> <ol style="list-style-type: none"> <li>1. To me working mainly means earning money</li> <li>2. In my work, I have an important societal contribution</li> <li>3. In my work, I can shape a number of my ideals in a practical way</li> </ol>
<p><b>Professional facilitation</b></p> <ol style="list-style-type: none"> <li>1. My work gives me a lot of opportunity to construct tailor-made solutions</li> <li>2. In my work, I often face complex problems</li> <li>3. In my work, I am supported by adequate instruments and methods</li> </ol>
<p><b>Work engagement</b></p> <ol style="list-style-type: none"> <li>1. My work inspires me</li> <li>2. I am proud of the work that I do.</li> <li>3. I am enthusiastic about my work.</li> </ol>

**Tacit knowledge sharing and Lifelong learning:-**

In the knowledge society knowledge is the only resource that grows when shared. It is not easy to convey this kind of knowledge. The only way this can happen if people work together in a harmonized environment, being ready to share their knowledge.

Knowledge is the engine of the modern economy all around the world. Keglovits (2013) highlights and supports the concept of the LLL, meaning people have to learn and develop in every stage of their life, in order to be a beneficial and valuable member of the economy. Learning is an active, goal-oriented, cumulative, and constructive activity, in which prior knowledge plays an important role in hindering or facilitating further learning (Shuell, 1988). Each and every person's knowledge and experience support and enlarge the collective knowledge. Even though the importance of tacit knowledge has been proved, unfortunately, in the work life this type of knowledge is underrated. Thus, the hypothesis proposed is:

**H3:** There is an influence of tacit knowledge sharing on lifelong learning.

**Associated characteristics for lifelong learning:-**

**Self-efficacy:** Self-efficacy (Bandura, 1986), is an enduring concept in human behaviour research, particularly in relation to learning (Pajares, 1997). It represents a person's beliefs and judgements about his/her ability to accomplish a task or succeed in some endeavour, and these beliefs can determine how people feel, think, motivate themselves and behave. The relationship between self-efficacy and learning is strong, and can be influential in different ways (Pajares, 2002) including the choices students make, the effort expended on a learning activity, perseverance and resilience, and the degree of stress and anxiety experienced whilst engaged in learning. Studies have found that self-efficacy is significantly related to personal goals and performance (Mone, 1994), as well as cognitive strategy (Pintrich and DeGoot, 1990) use in the organisation. Firmin and Miller (2005) argue that lifelong learners are motivated to learn through a positive attitude, confidence in themselves and the ability to manage negative feelings effectively. Therefore, individuals with high self-efficacy are more likely to be engaged in lifelong learning (Bath & Smith, 2009).

**Change Readiness:-**

The concept of 'change readiness' has traditionally been examined in relation to psychotherapy and health behaviour concerns such as addiction and obesity (Prochaska, Redding and Evers, 1997), and also within the organisational context, examining workers adaptability, motivation, or willingness to change (e.g., Ingersoll et al. 2000). It is through the relationship to organisational research that change readiness has also been explored in relation to adult learning (Rogers, 1995; Cervero, 1985).

**Openness to experience:-**

Individuals who show openness to experience are described as '...curious, original, imaginative, creative, and unconventional and have a broad spectrum of interests' (Blickle, 1996, 338). Openness can impact on learners' motivation and engagement as well as their use of strategies and persistence after failure (Blickle, 1996). Also, along with need for achievement, openness to experience has been related to intelligence and creativity in a group of adults

(Harris, 2004), as well as decision-making performance in a changing task context (Lepine, Colquitt and Erez, 2000). Moreover, in terms of lifelong learning, Barrick and Mount (1991) found that of the “Big-5” personality dimensions, openness was consistently related to job performance specifically through training proficiency across a range of occupations including all the professionals (Bath and Smith, 2009). Based on these finding, the sub-hypothesis proposed are:

**H3a:** There is an influence of tacit knowledge sharing on self efficacy.

**H3b:** There is an influence of tacit knowledge sharing on change readiness.

**H3c:** There is an influence of tacit knowledge sharing on openness and experience.

The General Self-Efficacy Scale (Sherer et al. 1982) comprises 3 items containing locus of control, interpersonal competence and self-esteem. The scale was designed to measure generalized feelings of competence rather than being specific to a particular situation/behavior. Goldberg’s International Personality Item Pool (IPIP; 1999) includes an Openness to experience scale that includes emotionality, adventurousness and intellect. The third measure was adapted from Kriegel and Brandt (1996) who developed a measure of change-ready traits in relation to personnel and business management; contains three subscales; resourcefulness, adaptability and confidence. All the responses are made on a 5-point Likert agreement scale (1 = strongly disagree, 5 = strongly agree). The snapshot of all scales with items is mentioned below.

**Table 1.2:-** Items of the lifelong learning scales

<p><b>Self-Efficacy:</b> General Self-Efficacy Scale (Sherer et al. 1982)</p> <ol style="list-style-type: none"> <li>1. <i>Locus of Control:</i> I am a self-reliant person</li> <li>2. <i>Interpersonal Competence:</i> I avoid confrontation with others</li> <li>3. <i>Self-esteem:</i> When I make plans, I am certain I can make them work.</li> </ol>
<p><b>Change Readiness:</b> Kriegel and Brandt (1996)</p> <ol style="list-style-type: none"> <li>1. <i>Resourcefulness:</i> I explore everywhere to find solutions</li> <li>2. <i>Adaptability:</i> I do not give up even if the things are not working out.</li> <li>3. <i>Confidence:</i> I prefer to finish my work before deadline.</li> </ol>
<p><b>Openness to experience:</b> Goldberg’s International Personality Item Pool (IPIP; 1999)</p> <ol style="list-style-type: none"> <li>1. <i>Emotionality:</i> I enjoy examining my feelings about myself and my life.</li> <li>2. <i>Adventurousness:</i> I do not prefer to stick to doing things that I know.</li> <li>3. <i>Intellect:</i> I am interested in theoretical discussions.</li> </ol>

#### **Professionalism and lifelong learning:-**

As discussed in Collins (2009) study, Lifelong learning has emerged as one of the major challenges for the worldwide knowledge society of the future. G7-G8 group of countries named “Lifelong Learning” as a main strategy in the fight against Unemployment. He also discussed that Lifelong learning is now recognized by educators, governing bodies, accreditation organizations, certification boards, employers, third party payers, and the general public as one of the most important competencies that people must possess. Promoting lifelong learning as continuous, collaborative, self-directed, active, broad in domain, everlasting, positive and fulfilling, and applicable to one’s profession as well as all aspects of one’s life has emerged as a major global organizational challenge.

In many cases this learning will also involve knowledge development in the context of professional (or daily) life as new knowledge is needed to deal with innovation and new professionalism will be needed in such an organisation to understand and support new ways of learning and to create new learning environments (Weert, 2006). In other words, the concept of LLL has to enable meaningful education harmonized with one’s professional and personal life. LLL is defined by EU Commission (2002) as all learning activity undertaken throughout life, with the aim of improving knowledge, skills and competence, within a personal, civic, social and/or employment, and related perspectives (Dondi, 2004). Thus, the hypothesis proposed is:

**H4:** There is interrelatedness between professionalism and lifelong learning.

### Conclusion and Future Research:-

Knowledge sharing and personal competencies practices in firms contribute to competitive advantage. The conceptual framework consists of two capable factors and three groups of domain of each factor; professionalism (Professional challenge, professional facilitation and work engagement) and lifelong learning (self-efficacy, change readiness, openness and experience). By proposing a model discussed the influence of tacit knowledge sharing on professionalism and lifelong learning which in turn lead to strong personal motivation, high productivity, competitiveness and organizational success. This study contributes to fill the gap existing in the literature. Therefore, the proposed model might be used as an alternative theoretical model for evaluating the relationship among tacit knowledge sharing, professionalism and lifelong learning in future studies.

A number of issues are open to future research. First, more items should be developed for the personal competencies scale, such that its psychometric properties can be adequately studied. Also, increasing the range of items will probably increase the variance of the scale and thereby enhance its success as a predictor in competition with the other aspects of professionalism and lifelong learning. This study will be followed by an empirical study to test the validity of the model. It is believed that this study will increase the understanding of TKS on professionalism and lifelong learning in accruing personal competencies among employees.

### Limitations:-

This study has limitations. First, Constructs of both professionalism and lifelong learning will vary from individual to individual because of diverse workforce. Second, the credibility of tacit knowledge sharing can't be ascertained every-time as the employees reluctant to share it because they consider it important for themselves (Borges, 2012), as it can help them to remain valuable in the organization (Rehman et. al., 2011). The use of tacit knowledge may present a somewhat larger risk to a professional employee than the act of sharing such knowledge. If a worker chooses to use and apply tacit knowledge provided by another, and the results are not as positive as expected, the recipient may need to present a responsible explanation to organizational management (Holste & Fields, 2010). Third, Implementation of personal competencies is difficult without organizational support.

##### Key words:-

Warfarin, PT, INR, RHD.

#### Abstract

**Background:** warfarin is effective for the primary and secondary prevention of both arterial and venous thromboembolic disorders. Its variable dose response and narrow time therapeutic range (TTR) mandate periodic monitoring of the international normalized ratio (INR).

**Aims:** monitoring the dose change of warfarin therapy to adjust the INR in ideal values.

**Patients and methods:** this study included 200 patients (103 males and 97 females) on oral anticoagulant, their age ranged from 17 to 66 years' old, classified into group 1(69) patients suffering from rheumatic heart disease (RHD), group 2(115) patients suffering from valve replacement and group 3(16) patients suffering from other cardiac conditions. They were subjected to full clinical examination and laboratory investigations including prothrombin time (PT), prothrombin concentration (PC) and INR, recording and follow up to the dose of oral anticoagulants, the control group included 28 healthy subjects matched in age and sex.

**Results:** The target warfarin dose was 3-4 mg for RHD and 4-5mg for valve replacement; INR in the RHD versus valve replacement was 2/3 ( $p = 0.001$ ). PT in the RHD versus valve replacement was 16/23 sec. ( $p = <0.001$ ).

**Conclusion:** close monitoring of anticoagulant dose is required by blood testing (INR), during the initial stage of treatment, checking may be required daily.

#### Introduction:-

Warfarin is effective for the primary and secondary prevention of both arterial and venous thromboembolic disorders. Its variable dose response and narrow therapeutic index mandate periodic monitoring of (INR) . Less frequent INR monitoring may be feasible in stable patients (1). Patients who are well-established on a warfarin regimen there is need for routine monitoring of INR to improve safety outcome, and patient satisfaction, but more frequent INR assessment increase the (TTR)(2). TTR is a well-established surrogate outcome that indirectly correlates with the bleeding risk (3). The interpretation of the relationships between TTR and treatment efficacy is complex. More TTR would be associated with the safety outcome (4). INR values are influenced by various patient-related factors including age, sex, body weight, smoking, diabetes mellitus, liver failure, CHF, pulmonary disease, also concomitant use of other medications, particularly amiodarone (5). Also other patient-related factors, such as

**Corresponding Author: -Hasnaa A Abo-Elwafa MD.**

Address: -Clinical Pathology Department, Faculty of Medicine – Sohag University, Egypt.

culture and education, socioeconomic status, healthcare and quality of medical service, all these factors have profound impact on the efficacy of warfarin TTR, and safety of drugs (6). So Hospital/clinic specific policies and protocols, alone can't justify coverage, all mentioned factors must be working in combination (7, 8). The maintenance dose of warfarin can fluctuate significantly depending on the amount of vitamin K in the diet. Keeping vitamin K intake at a stable level can prevent these fluctuations (9). VKORC1 polymorphisms explain 30% of the dose variation between patients (10). Particular mutations make VKORC1 less susceptible to suppression by warfarin (11). Lowdose haplotype group (A) and a high-dose haplotype group (B) (12). For warfarin-managed patients, there are variable wide variations in INR control between countries and sites. This has been answered the questions regarding the relevance of the overall data for individual patients, or different countries, with more refined management systems (13).

Important factors responsible suboptimal use of warfarin especially in patients with AF is due to difficult achieving therapeutic anticoagulation, dietary modifications and the necessity for INR assessment, also warfarin require bridging with parenteral anticoagulants at the start of therapy (14). Bleeding risk for patients taking warfarin who are found to have INR prolongation, reversal can be accomplished with fresh frozen plasma, prothrombin complex concentrate (PCC), and vitamin K (15,16). Moreover, clinical outcome data of bleeding patients on warfarin, suggests indirectly that warfarin reversal may not be clinically beneficial (17). Contraindications of warfarin are pregnancy, fetal warfarin syndrome (FWS), warfarin embryopathy(18).

### **Patients and Methods:-**

**Study design and populations:** this study was conducted on 200 cardiac patients on warfarin therapy, at Internal Medicine Department, Sohag University Hospital, approved by the Ethical Committee of Sohag Faculty of Medicine; a written informed consent was obtained from all subjects. Their age was ranged from 17 to 66 years' old with median age 53 years, 103 males and 97 females. 28 healthy control subjects 17males and 11 females, their age ranged from 15 – 55 years' old with median age 46 year, were included.

#### **Inclusion criteria:-**

The study included 200 patients on warfarin therapy; they were classified into the following groups:

Group 1: Consisted of 69 patients suffering from RHD.

Group 2: Consisted of 115 patients with valve replacement.

Group 3: Consisted of 16 patients suffering from other cardiac conditions requiring oral anticoagulants.

#### **Exclusion criteria:**

Pregnancy, bleeding disorders.

#### **Preparation of samples:-**

4 ml of venous blood was drawn from each patient, 1.8 ml of which was added to trisodium citrate tube provided by B.D, centrifuged at 2500 – 3000G unit for 15 min. at 20°C to prepare platelet poor plasma (P.P.P), subjected to the prothrombin time. The remaining blood was subjected to the routine investigations.

#### **Procedures:-**

##### **Prothrombin time (PT):-**

**Reagents:** Thromborel<sup>®</sup> provided by SIEMENS, Cat. No. 54690523, Siemens Health Care Diagnostic Products GmbH.

Reagent: lyophilized thromboplastin prepared from rabbit cerebral tissues, dissolved in 4ml purified D.W. per vial

**Assay:** The test was performed on fully automated SYSMEX-CA1500 (SYSMEX Corporation, Marburg/Germany), USA distributor.

##### **Quality control:-**

Two different levels of control were used, control N Cat. No. 50771820, and control P Cat. No. 50998227.

##### **Recording the dose of oral anticoagulant:-**

Close monitoring the dose change of oral anticoagulant and recording the corresponding change in the INR. The recording system starting from the initial dose then from (4-5 times) from the 3<sup>rd</sup> day to the 2<sup>nd</sup> week to reach the target INR.

**Statistical analysis:-**

Both excel program of Microsoft Office and Scientific Package of Social Statistics (SPSS) program version 19 were used for a comparative evaluation between tests.

**Results:-**

Closed monitoring to INR was performed on 200 patients on warfarin therapy after a written consent, their age was ranged from 17 to 66 years' old and the median age of 200 cases was 53 years' old. The sex distribution in the study showed that 103 cases were males (51.5%) and 97 (48.5%) were females. The control group consists of 28 subjects, 17 males and 11 females (60.3%, 39.7% respectively), their age was ranged from 15 to 55 years' old; the median age was 46 years' old, they were clinically and laboratory healthy. Demographic data were present in table -1. **Diagnosis** of these patients were 69 cases RHD (34.5%), 115 patients with valve replacement classified as follow; 28 cases aortic valve replacement (14%), another 36 with aortic and mitral valve replacement (18%), the last 48 cases within this group with mitral valve replacement (24%), and the rest of other diagnoses were dilated cardiomyopathy, congestive heart failure (CHF), atrial fibrillation (AF) and DVT; all constitutes (8%) referred as other cardiac condition, as in table - 2. The target **dose** of warfarin was 3.8 mg in RHD and 4.7mg in valve replacement patients; with ( $p = 0.01$ ) was significant; as in table -3. The dose within patients with RHD and patients with other cardiac diseases were nearly the same dose so the  $p$ -value was (0.77) non-significant as in Fig -1. As regard **INR** in the RHD patients versus valve replacement patients; we noticed that the target INR of RHD patients was 2.45 and in valve replacement patients was 2.76, the  $p$ -value was (0.01) significant; only non-significant  $p$ -value (0.7) was noticed in the INR of the 1<sup>st</sup> week of therapy as in table- 4. When comparing INR in the valve replacement patients to those with other cardiac condition; the mean of target INR was 2.7 in both groups, ( $p = 0.9$ ) was non-significant. The PC in the RHD patients versus valve replacement patients was 52% and 68%, respectively ( $p = 0.001$ ) as in Fig-2.

**Table 1:-** Demographic data of the studied groups

Item	Rheumatic heart (n =69 )	Valve replacement (n =115 )	Other conditions (n =16 )	p-values

### Discussion:-

Warfarin is used to decrease the tendency for thrombosis or prophylaxis of further episodes in those individuals who have already had thrombus and help to reduce the risk of embolism (19). Dosing of warfarin is complicated by the fact that it is known to interact with many commonly used medications and even with chemicals that may be present in certain foods (2, 3, 20, 21, 22). These interactions may enhance or reduce its anticoagulation effect. In order to optimize the therapeutic effect without risk of bleeding, close monitoring of the degree of anticoagulation is mandated by measurement (INR) (4). In the present study PT, PC and INR were obtained from 200 patients with RHD, valve replacement and other cardiac conditions that required oral anticoagulants. The target dose of warfarin in RHD patients was about 3-4 mg but in patients with valve replacement; it was about 4-5mg and in those with other cardiac diseases it did not exceed 3mg, we followed up these patients daily from 4 to 6 times to get the target dose after two weeks, the dose in the RHD patients and in those with other cardiac conditions was nearly the same dose, this is in accordance with Hirsh et al, (2007) and Ratib et al, (2016) who had reported that during the initial stage of treatment, checking may be required daily; intervals between tests can be lengthened if the patient manages stable therapeutic INR levels on an unchanged warfarin dose. In healthy people, the INR is about 1.0. For patients on anticoagulants, the INR typically should be between 2.0 and 3.0 for patients with atrial fibrillation, or between 3.0 and 4.0 for patients with mechanical heart valves. However, the ideal INR must be individualized for each patient (23, 13). Although multiple studies by Streiff et al, (2013) had addressed the optimal testing frequency, current guidelines suggest a time interval not exceeding 4 weeks between INR determinations (6). In the current study the target INR of both RHD and valve replacement patients were ranged from 2 to 3, INR in patients with other cardiac disease was ranged from 2-4. The INR in RHD patients versus patients with other cardiac condition was nearly the same 2-3. This is in agreement with study was performed by Schafer et al (2007) and American Heart Association, (2014), who reported that; the target INR ranges of 2.0 to 3.0 or 2.5 to 3.5 have been recommended for most indications because INR values in these ranges are associated with the best combination of thrombosis reduction and bleeding avoidance (1, 5); it also agrees with Majeed et al, (2013) who stated that for patients on anticoagulants, the INR typically should be between 2.0 and 3.0 for patients with RHD; or between 3.0 and 4.0 for patients with AF; for patients on warfarin therapy, an INR recall interval not exceeding 4 weeks has traditionally been recommended; less frequent INR monitoring may be feasible in stable patients (14). In the current study, PC of patients with RHD was about 68% and in patients with valve replacement was about 52%, so warfarin therapy is complicated by a narrow TTR and substantial interpatient variability in dose response as reported by Piccini et al, (2014); if the INR values were not within the target range, anticoagulation service asked and recorded the most appropriate reasons (4). Random variation of INR values may occur in a patient on stable oral anticoagulant dosage, as a result of both biological and analytic variation. These data has been used to evaluate whether a change in the INR represents clinically insignificant random variation, or a clinically relevant change requiring warfarin dose adjustment. It has been calculated that in a patient on fixed dose and steady state warfarin, a change in the INR is significant only if it is greater than 0.28 times the previous INR value (3, 13, and 24).

**In conclusion** careful monitoring the dose response to anticoagulant therapy is mandatory to reach the best value of INR and prevent serious complication of over dose.

**Introduction:-**

Stevens-Johnson syndrome (SJS) is a mucocutaneous reactions, most commonly triggered by medications, characterized by extensive necrosis and detachment of the epidermis.

Fever, often exceeding 39°C (102.2°F), influenza-like symptoms precede by one to three days the development of mucocutaneous lesions [70]. Photophobia, itching or burning conjunctiva and pain on swallowing may be early symptoms of mucosal involvement. Malaise, myalgia, and arthralgia are present in most patients.

Ocular involvement is reported in approximately 80 percent of patients. The most common change in the eyes is a severe conjunctivitis with a purulent discharge, but bullae may develop. Corneal ulceration is frequent, anterior uveitis or panophthalmitis may occur. Pain and photophobia are accompanying symptoms. The eye changes often regress completely, but scarring with the development of synechiae between the eyelids and conjunctiva may be late sequelae [80,81].

**Case Report:-**

46 years old female patient came with sever eye dryness and epithelial defect . She had a history of knee pain 1 month and 20 days back for which she was treated with intramuscular voltaren in emergency department. She developed erythematous papular eruptions on the trunk, mouth, and limbs along with pain, redness, and watering from both eyes followed by gross diminution of vision and inability to open her eyes. She was subsequently admitted at the king Khalid hospital and diagnosed with Stevens-Johnson syndrome by dermatologist . The erythematous lesions resolved completely at 4 weeks with medications, but she was unable to open her eyes and she was referred to us for further evaluation and management .

**Ophthalmic Examination At the time of presentation:-**

**Visual acuity:-** 20/400 OU  
 With full EOM

**Eye lids and conjunctiva:-** congested, red conjunctiva, mucopurulent discharge with membrane formation in superior and inferior fornix of conjunctiva .

**Intraocular pressure ( IOP):-** 16 mm of Hg OU.

**Slit lamp:-** low tear meniscus, tear break-up time more than 10 s

**Cornea:-** sever dryness with epithelial defect OU

**AC:-** Deep and quit OU

**Iris:-** Normal OU

**Pupil:-** Equal round reactive to light

**Lens:-** Early posterior sub-capsular cataract OU

B-scan ultrasonography (USG) : acoustically clear vitreous, normal chorioretinal thickness, and normal optic nerve head with an attached retina.

Routine blood examination, blood glucose levels were within normal limits.

The patient was treated for ocular condition with frequent debridement of pseudomembran in superior and inferior fornix to prevent symblepharon formation. At that time we do not have amniotic membrane, although we prescribed for her predforte eye drop for ten days, then optilon eye drop for two weeks, frequent lubrication with artificial tears and punctual plugs.

#### **Outcome and Follow-up:-**

Best corrected visual acuity improved to 20/50 OU. The corneal epithelial defect healed, conjunctival pseudomembran regressed and improvement of the tear film. The patient follow up in ophthalmology clinic at king Khalid hospital with next appointment on fifteen of February 2017.

#### **Discussion:-**

This is the first case report in Hail, Saudi Arabia and there is Very little data is available on the prevalence of Ocular complications of Stevens-Johnson syndrome in general.

patients of SJS are treated by dermatologist in early phases and later referred to an eye care center. Patients often consult an ophthalmologist with severe ocular sequelae only after the resolution of skin lesions, as in our case. It obviously becomes challenging to diagnose and treat this disease .

Management is often effective . It involves keeping the eye moist and preserving the patient's own tears, as well as treating the underlying cause when found.

The selection of treatment modalities for patient with dry eye depends on the severity of their disease . Frequent use of lubricating eye drops and ointments. Punctual plugs always an option in treating dry eye.

#### **Conclusion:-**

In conclusion, a high index of suspicion and combined efforts from dermatologists and ophthalmologists with early treatment is important to improve prognosis and salvage the eye.

Ahara, Ayurveda, Dham, Himachal Pradesh, Mandi, Proper Diet

#### **Abstract**

In Ayurveda, *Ahara* (food) is considered as one of a major tripod of life. As per Ayurveda a good diet consist of all six *rasa* and are taken in proper sequence of *Madhura* followed by *Amla*, *Lavana*, *Katu*, *Tikta* and *Kashaya*. *Dhamis* a popular traditional feast of Himachal Pradesh (H.P.), which is a good example of complete food as per Ayurveda having all six *rasa* and is served in proper sequence. The dish composed of a sweet (*boondikameetha*) followed by *SepuBadi*, *kaddukakhatta*, *kolkakhatta*, *mahkidaal* and in the end of diet *jhol*. Served in *pattal* (plates made of leaves of *Taur -bauhinia vahli*) which have good antioxidant properties. The preservation method used in the region of ingredients of *dham* is also traditional as no chemical is used. All these make up *dhama* complete diet in terms of Ayurveda and also in terms of nutrition. Present study deals with various Ayurveda and scientific aspects of *dham* and its importance.

#### **Introduction:-**

Food (*Ahara*) is one of the tripods of life as per Ayurvedic classics<sup>i</sup>. Among the three *Upasthambha*, *Ahara* is considered as the best sustainer of life (*Vrittikaranam Sreshtam*)<sup>ii</sup>. Region wise food habits changes, which is important as per the climate and conditions prevailing in the region. But in present era with fast changing food habits and more and more use of canned food, chemical preservatives and junk foods, health is getting compromised. In order to preserve the health, food serves an important factor which must be given due importance. Ayurveda has incorporated various explanations regarding this vital pillar of life. This includes the classification of foods according to the geographical area and also with respect to the bodily *Tri-Dosha* and *Satvikadiguna*, different processing methods of food, importance and role of food on the body and mind, wholesome and unwholesome diets and the pattern of metabolism.

Himachal is a culture in terms of various nutritious traditional food, playing a role in everyday life as well as in festivals. In many families, everyday meals are sit-down affairs consisting of two to three main course dishes, carbohydrate staples such as Rice, varied protein and micronutrient rich accompaniments such as pulses and vegetables, as well as sweets. The people of H.P. have developed traditional food processing technologies for preparing the foods from locally available substrates largely governed by the ethnic preference, agro climatic

Address:- Research Officer Regional Ayurveda Research Institute for Nutritional Disorders, Mandi. H.P.

conditions, sociocultural ethos and religion. However, there may be local variation from region to region. A number of traditional foods are prepared and consumed by people in Himachal Pradesh for centuries, and these form a part of sociocultural life of the hill people<sup>iii-iv</sup>.

#### **Aim of study:-**

This review aims at scanning the scattered literature on proper diet in accordance with Ayurveda with special reference to a traditional food called as *Dham* of Mandi, H.P.

#### **Method:-**

Classical texts of Ayurveda as well as PUBMED, MEDLINE database and relevant journals were used for the search of relevant literature and research papers. Papers published between Jan 1960 to Jan 2017 were only considered. The key words used for the search was 'Ayurveda', '*Shad Rasa*' '*Ahara*' 'Traditional food' and '*Dham*' etc. information from conversation from local inhabitant of Mandi were also included in the review to search out and understand proper tradition of preparing, preserving and serving of *Dham*. Only research articles published in English language were considered.

#### ***Dham* (Traditional feast of H.P.):-**

In H. P. during functions and marriages, traditional community meal is prepared which is called *Dham*. *Dham* is a traditional festive meal, cooked only by *botis* (a particular caste of Brahmins who are hereditary chefs). Preparations for this elaborate mid-day meal begin a night before. Food is cooked in big brass utensils or mud pots and everyone sits on the ground in rows to have food<sup>v</sup>. In the present study *Dham* specifically of Mandi is being discussed.

As Sushrut explain the proper sequence of having meals and have mention that a proper diet should include all six *rasa*. In the beginning of food Sweet – *Madhura* dominant food should be taken then in the middle Sour – *Amla* and Salty – *Lavana* dominant food and toward the end of food Pungent – *Katu*, Bitter – *Tikta*, and Astringent – *Kashaya rasa* dominant diet should be taken<sup>vi</sup>.

*Dham* prepared in the traditional way is an example of *shadrasa ahara* (food with all six *rasa*) which is considered as a complete food as per Ayurveda and also served in the proper sequence of *rasa*.

The starters begins with *madhur rasa* (sweet dish), *Boondika Meetha* (prepared from chickpea flour) dipped in sweet syrup along with dry fruits).

The next item comes *Sepu Badi*, It is prepared from fresh spinach leaves and *badi*. *Badi* constitute of *Masha* (black lentil) and *Chana* (Bengal gram) deeply fried with the gravy of coriander and spinach leaves giving it a *Madhura-Amla rasa* (Sweet- Sour).

Then comes *Amla- lavana Rasa* (Sour- Salty) *Kadukakhata* Prepared from pumpkins and giving the dish a blend of sweet and sour taste.

Then comes *kolkakhata* (*makushtabheda -Vigna conitifolia*). Prepared from the pulse commonly known *askol*. It is sour and brings a grimace on face. Added with *Rai powder* it is *Katurasa* (pungent taste) dominant.

Then comes *Mahkidaal* that is *masha* (black lentils) the pulse is prepared with Fennel seeds, two three bay leaves, Green Cardamoms, Black Cardamoms, small stick of Cinnamon, Cloves, Coriander seeds, Bay leaves, Curd, Spinach, pinch of Asafetida, red chili powder, coriander powder and turmeric powder making it a *tiktapradran* (Bitter dominant) dish.

At last *Jhol* which is *iskashay rasa* (Astringent) dominant is regular prepared item in house of every *Mandyali* (native people of Mandi), prepared from curd and water in mud pot. In the local terms it is said “the food wouldn't digest until a glass of *Jhol* is not drunk” goes in accordance with Ayurveda. Its *rukhsaguna* which may help in cleansing of esophagus and gut from *Ghrita* rich food. Moreover as it is made up *takra* (butter milk) as its main ingredient hence it serves as a great *Pachana* (Digestive)<sup>vii</sup> especially of ghee & oil<sup>viii</sup>.

**Eating and Serving Styles:-**

Eating with your hands is considered important in Indian etiquette because a person eating with his hands knows the exact temperature of food before the morsel hits his mouth thus preventing blisters in mouth due to consumption of hot food<sup>ix</sup>. In H.P. specifically in Mandi region, a cleaned *Taur – bauhinia vahli* leaves are most commonly used<sup>x</sup> as a hygienic and visually interesting alternative to plates. The leaves have health benefits too in terms of antimicrobial effect and antioxidant properties<sup>xi</sup>. In addition the plant leaves are completely biodegradable. It also provide job and income to less privileged rural people thus forming one of the important part of rural economy in H.P.<sup>xii</sup>

**Nutritional and medicinal value:-**

Black gram (*Masha - Vigna mungo*) content of *sepubadi* and *mahki dal* is *Snigdha* (unctuous), *Balya* (increases strength), increases *Kapha* and *Pitta*, *Malakara* (increases bulk of faeces), *Sara* (laxative), *Guru* (not easily digestible), *Ushna* (hot in potency), *Vatahara* (mitigate Vata), *Madhura* (sweet in taste), and *ShukraVridhdhikara* (aphrodisiac properties)<sup>xiii</sup>. Black gram is very nutritious as it contains high levels of protein (25g/100g), potassium (983 mg/100g), calcium (138 mg/100g), iron (7.57 mg/100g), niacin (1.447 mg/100g), Thiamine (0.273 mg/100g), and riboflavin (0.254 mg/100g).<sup>xiv</sup> Black gram complements the essential amino acids provided in most cereals and plays an important role in the diets of the people of Nepal and north India.<sup>xv</sup> Black gram has been shown to be useful in mitigating elevated cholesterol levels<sup>xvi-xvii</sup>.

Bengal gram also called as chickpea (*chana dal- Cicer arietinum*) content of sweet and *sepubadi* is useful in throat problems, blood disorders, bronchitis, skin diseases and liver or gall bladder related problems [biliousness]<sup>xviii</sup>. In addition to these applications, the chickpea seeds are also used for blood enrichment, treating skin ailments, ear infections, and liver and spleen disorders<sup>xix</sup>. It is rich in nutritionally important unsaturated fatty acids like linoleic and oleic acid.  $\beta$ -sitosterol, campesterol and stigmasterol are important sterols present in chickpea oil. Calcium, magnesium, phosphorus and especially potassium are also present in chickpea seeds. It is a good source of important vitamins such as riboflavin, niacin, thiamine, folate and the vitamin A precursor,  $\beta$ -carotene<sup>xx</sup>.

*Kolki dal (Vigna conitifolia)*: It is quite different from *Mothki dal* described in Ayurved as it is bigger than original *moth*, and both are available in this region though as per botanical classification the latin name of both these pulses are same but as per locals both type of pulses are available in Mandi region the one commonly known as *moth dal* and the other which is used in *Dham* called as *kolki dal*. *Vigna conitifolia* is rich in (values per 100 gm) calcium 150mg, iron 10.8 mg, magnesium 381 mg, manganese 1.8 mg, phosphorus 489 mg, potassium 1191 mg, sodium 30 mg and zinc 1.9 mg along with thiamine, riboflavin, niacin, panthothenic acid, folate and Vitamin C. Among macronutrients it contains 343 calories, 23 g of protein, 62 g of carbohydrate and 1.6 g of fat<sup>xxi</sup>.

*Jhol* (spiced butter milk): buttermilk is a rich source of Vitamin B12, calcium, Riboflavin and probiotics which help strengthen the digestive system and the immunity of the body. *Takra* (Buttermilk) is very useful in the diseases associated with the *Agni Vikriti*. By means of its Properties it acts as *Tridoshaghana* (Vitiates all three *dosh* of body)<sup>xxii</sup>.

The utensils used for cooking sweet is iron vessels which gives extra benefit of iron, moreover loss of nutrients in iron vessels, brass vessels and mud pot cooking (used for making other dishes of *dham* other than the sweet) are also very less as compared to aluminum and cooker cooking of food.

**Seasonal consideration:-**

During winter season due to the contact with cold wind, the digestive power of healthy people get increased and capable of digesting any heavy food.<sup>xxiii</sup> In cold season *snigdha* and *ushna* food is indicated, hence *masha* (black gram) and *Ghrta* dominant diet is a good and nutritious food in this region<sup>xxiv</sup>. Hence *Dham* is a good food especially for cold hill region of Himachal. Moreover cooking it with plenty of spices and use of *jholat* the end of food also helps in proper digestion of the dish.

**Influence of Mana (Mental Factors) on Digestion:-**

Acharya Charaka mentioned the influence of negative emotions on the digestion of food<sup>xxv</sup>. Healthy and wholesome food if taken even in proper quantity do not get properly digested when the individual is afflicted with grief, fear, anger, sorrow, excessive sleep and excessive vigil. This is also considered in having *Dham* it is served in festive mood, where all people gather and have this dish together sitting on ground with the feeling of equality and happiness.

**Natural Preservation:-**

Rice being the main food is generally preserved by drying in sun<sup>xxvi</sup> and instead of using sodium benzoate (preservative), they use more *rai* which acts as a natural preservative owing to its good antimicrobial activity<sup>xxvii</sup>. And they also have unique way for preserving raw pulses for longer periods, in which they rub the pulses with mustard oil which protects it from pests and fungus. And they also treat the utensils in which these are kept, with smoke of red '*mirchi*' (chili). It helps in longer preservation<sup>xxviii</sup>.

**Conclusion:-**

India is a rich culture. Many of the Traditional practices, food habits have a scientific basis, though with course of time many wrong practice may have prevailed, but some practices like the food habits of different region have been studied from time to time and have been found to have better nutritional value and found in accordance with Ayurveda. One such dish popular in Mandi H.P. known as *dham* have been reviewed and found to follow the definition of proper diet as described in Ayurveda. Hence it can be concluded from the present study that such traditional food should be conserved and be made popular so the people may understand the importance of traditional food, and the method of traditional preservation and sequence of serving should be conserved which is getting changed with time as it may prove detrimental to the benefits which traditionally made and served *dham* may provide. As popularly said in Ayurveda: If one eats *pathya* (Proper food) then there is no need of medicine and if one don't eat *pathya* (takes improper diet) still there will be no need of medicine<sup>xxix</sup>.

Deblur, Blur, DNN, and GRNN.

#### Abstract

Image blur kernel calculation is critical to deblur a blind image. Many existing approaches describes blur features that are used only for identifying common blur across the images, which is impractical in real blind images because blur type is unknown. To avoid this problem, we have to identify the blur type for input image patch, and then the kernel parameter of the image This calculation can be done with the help of deep learning based pre-training method i.e., Deep neural network (DNN) which is used to find the blur type and a general regression neural network (GRNN), which is used to calculate its parameter. This method is very useful and easy to identify the different blur type in a mixed input of image blemish which contains various blurs and its parameters. The result of above method is more effectiveness and better compared to the Berkeley segmentation data set and the Pascal VOC 2007 data set.

#### Introduction:-

Images are used in many everyday applications such as photography, monitoring, medical imaging, astronomy, microscopy, and remote sensing. Digital images are made up of picture elements or pixels which are represented in the form of the grid. Each pixel contains an intensity value which determines the tone of the image. Sometimes, the captured images may be more or less blurry. Taking photos under dim lighting using a hand- camera is very typically today. There are many factors that cause blur such as motion during the capture process, long disclosure times, wide angle lens, camera shake, etc. , There are three ways to increase the brightness of the images reduce the speed of the shutter, use of large aperture, setting a high ISO. despite that, we require two images. We have found that the motion between two blurred/noisy images, when taken in a quick succession, is mainly a translation. This is significant because the kernel estimation is independent of the translation, which only results in an offset of the kernel. The analysis is done on the basis of performance, types of blur and PSNR (Peak Signal to Noise Ratio). A template-based method for estimating the blur type and its parameter is proposed which can identify by laplacian. Nowadays, image deblurring and restoration became an important subfield of digital image processing. Image deblurring is used to make images sharp and useful. The application of image processing is: recovering valuable photograph, watching distant star fields through a ground based telescope, watching space vehicle and satellite, radar imaging, tomography and medical imaging, microscopy, iris recognition.

Address:- Assistant professor, Department of Computer Science and Engineering, S.A.Engineering College, India.

**Blurring and its type:-**

Blurring refers to unsharp image areas that are formed or caused by movement of subject or camera, else caused by incorrect or selective focusing. Factors that cause blur in images are motion, defocus, capturing light over the non-zero area of the aperture and pixel, the presence of antialiasing filters on the camera sensor, limited sensor resolution. The different type of blur is box blur, Gaussian blur, alpha channels, motion blur, spin and motion blur, faster motion blur, domain shifting, blurring by Fourier transform, threshold blur, variable blur.

**Deblurring:-**

It removes the blurring artifacts of images such as blur caused by defocusing aberration or motion blur. There are many deblurring techniques used to sharpen images some of them are general linear model, singular value decomposition, Richardson-Lucy deconvolution approach, neural network approach, iterative method, wiener filtering, blind deconvolution approach, sparse representation.

**Related work:-**

In 2015, K. Gu, G. Zhai, X. Yang, and W. Zhang has proposed a paper titled USING FREE ENERGY PRINCIPLE FOR BLIND IMAGE QUALITY ASSESSMENT. Here the components utilized can be partitioned into three gatherings. The main includes the elements propelled by the free vitality rule and the basic debasement display. After component extraction, our calculation uses the bolster vector machine based relapse module to infer the general quality score. Very recently, the topic of noise estimation has obtained intensive researches. One type of methods is scale invariant based noise estimator (SINE) and its variant, which suppose That the kurtosis values tend to be invariant across scales for a natural image and this scale invariance will be deteriorated by the added noise. However, RR IQA still requires unique data by and by, prompting to its contrariness with most existing picture/video handling frameworks that don't allow additional RR data. It is regular that there exists a hole between the genuine scene and the mind's forecast, in that the generative model can't be widespread.

In 2015, Libin Sun, Sunghyun Cho, Jue Wang, James Hays, title EDGE-BASED BLUR KERNEL ESTIMATION USING PATCH PRIORS has proposed To pick legitimate fix priors we look at both measurable priors gained from a characteristic picture dataset and a straightforward fix earlier from engineered structures. In view of the fix priors, we iteratively recoup the halfway inactive picture  $x$  and the obscure piece  $k$ . A complete assessment demonstrates that our approach accomplishes cutting edge comes about for consistently obscured pictures. In this paper, we propose another edge-construct approach utilizing patch priors with respect to edges of the insert picture  $x$ . Patches can display picture structures superior to channel reactions. In our approach, we gauge a "trusted" subset of  $x$  by forcing patch priors particularly custom-made towards demonstrating the presence of picture edge and corner primitives.

In 2015, Wufeng Xue, Lei Zhang, Xuanqin Mou and Alan C. Bovik, GRADIENT MAGNITUDE SIMILARITY DEVIATION: A HIGHLY EFFICIENT PERCEPTUAL IMAGE QUALITY INDEX has proposed to The photo edges are sensitive to picture twistings, while assorted adjacent structures in a mangled picture persevere through unmistakable degrees of corruptions. This goads us to explore the usage of the overall assortment of slant based neighborhood quality guide for general picture quality conjecture. We find that the pixel-wise inclination greatness comparability (GMS) between the reference and mutilated pictures consolidated with a novel pooling procedure—the standard deviation of the GMS guide—can foresee precisely perceptual picture quality. The subsequent GMSD calculation is much speedier than best in class IQA strategies and conveys profoundly focused expectation precision.

In 2015, K. Gu, G. Zhai, W. Lin, X. Yang, and W. Zhang has proposed the paper titled NO REFERENCE IMAGE SHARPNESS ASSESSMENT IN AUTOGRESSIVE PARAMETER SPACE. In this paper, the author proposed means of the examination of AR model parameters, first figuring the vitality and complexity contrasts. In the privately assessed AR coefficients in a pointwise way, and after that evaluating the picture sharpness with percentile pooling to anticipate the general score. We sensibly assume that the balance increments with the distinction of AR parameters. In this way, a 3D sharpness measure can be built up utilizing the weighted aggregate of vitality and complexity contrasts to weight the ARISM demonstrate. It is regular that there dependably exists a hole between the genuine outside scene and the cerebrum's expectation. For the reason that the inner generative model can't be widespread all over.

In 2014, W. Xue, L. Zhang, X. Mou, and A. Bovik, GRADIENT MAGNITUDE SIMILARITY DEVIATION: A HIGHLY EFFICIENT PERCEPTUAL IMAGE QUALITY INDEX has proposed a system that is a critical undertaking to loyally assess the perceptual nature of yield pictures in numerous applications, for example, picture pressure, picture reclamation, and sight and sound gushing. A decent picture quality evaluation (IQA) model ought to convey amazing expectation precision, as well as be computationally productive. The proposed GMSD is much

speedier than most cutting edge FR-IQA techniques; however, supplies shockingly focused quality forecast execution. In the proposed GMSD demonstrate, the pixel-wise similitude between the inclination extent maps of reference and contorted pictures is registered as the LQM of the bent picture. The normal pooling system overlooks this reality and it can't reflect how the nearby quality corruption fluctuates. Utilizing picture inclination to plan IQA models is not new. The picture slope is a prominent element in IQA since it can successfully catch picture neighborhood structures, to which the HVS is very touchy.

In 2013, L. Sun, S. Cho, J. Wang, and J. Hays, EDGE-BASED BLUR KERNEL ESTIMATION USING PATCH PRIORS has proposed to pick appropriate fix priors we look at both measurable priors gained from a characteristic picture dataset and a straightforward fix earlier from manufactured structures. A complete assessment demonstrates that our approach accomplishes best in class comes about for consistently obscured pictures. The test comes about demonstrate that, shockingly, the straightforward manufactured fix earlier can produce a similar quality or far better outcomes than the educated factual earlier. Then again, the littlest groups catch complex surfaces and uproarious structures, and the fix a test inside these bunches can be essentially unique in relation to each other. This earlier can't be excessively expressive, i.e., it ought not to be permitted to express high recurrence surfaces or progressive changes in picture angles. It will begin to suit obscure and clamor in the inert picture, henceforth losing its energy to re-establish sharpness.

In 2013, Wei Hu, Jianru Xue, and Nanning Zheng has proposed the paper titled PSF ESTIMATION VIA GRADIENT DOMAIN CORRELATION. This paper describes an In view of the way that the angles of clean characteristic pictures are roughly uncorrelated to each other, we assessed the autocorrelation capacity of the PSF from the covariance framework of inclination area obscured picture utilizing the proposed fix based picture corruption demonstrate. The PSF is processed utilizing a stage recovery strategy to evacuate the vagueness presented by the nonappearance of the stage. Exploratory outcomes demonstrate that the proposed technique fundamentally lessens the computational weight in PSF estimation, contrasted and existing strategies while giving the practically identical obscuring piece. The watched obscured picture gives just a halfway imperative on the arrangement as there are numerous mixes of PSFs and "sharp" pictures that can be convolved to coordinate the watched obscured picture.

In 2012, A. Liu, W. Lin, and M. Narwaria has proposed the paper titled IMAGE QUALITY ASSESSMENT BASED ON GRADIENT SIMILARITY. This paper describes a Slopes pass on imperative visual data and is critical to scene understanding. Utilizing such data, basic and differentiation changes can be successfully caught. The MAD proposed in yields two quality scores, in particular, perceivability weighted blunder and the distinctions in log-Gabor sub-bands measurements. The two scores are then adaptively joined to get the last quality score. The DMOS estimation of the rest of the pictures can't be "accurately" anticipated from the IQA plot. In any case, can't represent the luminance change/twisting since it utilizes just the slope data as the information and the angle data is not influenced by the noncontract/structure changes.

In 2011, Daniel Zoran, Yair Weiss proposed the paper titled FROM LEARNING MODELS OF NATURAL IMAGE PATCHES TO WHOLE IMAGE RESTORATION. In this paper, we analyze the probability of a few fix models and demonstrate that priors that give high probability to information perform better in fix reclamation. Inspired by this outcome, we propose a bland structure which takes into consideration entire picture reclamation utilizing any fix based earlier for which a MAP (or surmised MAP) gauge can be ascertained. We demonstrate to determine a fitting cost work, how to improve it and how to utilize it to reestablish entire pictures. At last, we exhibit a nonexclusive, shockingly straightforward Gaussian Mixture earlier, gained from an arrangement of common pictures.

In 2011, Alexandre Ciancio, André Luiz N. Targino da Costa, Eduardo A. B. da Silva, Amir Said, Ramin Samadani and Pere Obrador has proposed a paper titled NO-REFERENCE BLUR ASSESSMENT OF DIGITAL PICTURES BASED ON MULTIFEATURE CLASSIFIERS. We begin with the era of a vast genuine picture database containing pictures taken by human clients in an assortment of circumstances, and the conduction of subjective tests to create the ground truth related to those pictures. We test this worldview by outlining a no-reference quality appraisal calculation for obscured pictures which consolidates diverse measurements in a classifier based upon a neural system structure. Exploratory outcomes demonstrate that this prompts to an enhanced execution that better mirrors the pictures' ground truth. At long last, based upon the genuine picture database, we demonstrate that the proposed strategy likewise beats different calculations and measurements in practical obscure situations.

In 2011, the authors **have** proposed the paper titled BLUR KERNEL ESTIMATION USING THE RADON TRANSFORMS. This proposed system works based Camera shake is a typical wellspring of debasement in photos. Re-establishing obscured pictures is testing in light of the fact that both the obscure piece and the sharp picture are obscure, which makes this issue extremely under compelled. Intuitively, different orientations are affected differently by blur, and the set of different edge profiles can be seen as a "signature" of the kernel. Formally, we show that we can recover the Radon transform of the kernel from the blurred edges. These methods tackle a vast arrangement of conditions to locate the sharp picture as well as the obscure piece that recreate the perception while adjusting. To an earlier information about obscure and characteristic pictures, something which is tedious and doesn't generally succeed. We present another probability term that portrays 2D obscure bits by their Radon change.

In 2011, Mariana S. C. Almeida and Luís B. Almeida has proposed the paper titled BLIND AND SEMI-BLIND DEBLURRING OF NATURA IMAGES. This paper describes an A strategy for visually impaired picture deblurring is displayed. The technique just makes feeble suppositions about the obscuring channel and can fix a wide assortment of obscuring corruptions. To conquer the evil posedness of the visually impaired picture deblurring issue, the strategy incorporates a learning system which at first spotlights on the principle edges of the picture and bit by bit considers. The utilization of compelled obscure models proper to the current issue, as well as of various situations, for the most part, enhances the deblurring comes about. In examinations with other best in class techniques, our strategy yields better outcomes and shows to be relevant to a much more extensive scope of hazy spots.

In 2011, the authors Anat Levin, Yair Weiss, Fredo Durand, and William T. Freeman have proposed the paper titled EFFICIENT MARGINAL LIKELIHOOD OPTIMIZATION IN BLIND DECONVOLUTION. This proposed system late research demonstrates that a key to achievement is to consider the general state of the back appropriation  $p(x, k|y)$  and not just its mode. This prompts to a qualification between MAP<sub>x,k</sub> methodologies which gauge the mode match  $x, k$  and frequently prompt to undesired outcomes, and MAP<sub>k</sub> systems which select the best  $k$  while underestimating over all conceivable  $x$  pictures. This paper determines a straightforward approximated MAP<sub>k</sub> calculation which includes just a humble adjustment of basic MAP<sub>x,k</sub> calculations. We demonstrate that MAP<sub>k</sub> can, indeed, be upgraded effectively, with no extra computational many-sided quality

In 2009, the authors Fen Chen and Jianglin Ma proposed AN EMPIRICAL IDENTIFICATION METHOD OF GAUSSIAN BLUR PARAMETER FOR IMAGE DEBLURRING this paper mainly The parameter gauge is browsed a gathering of competitor parameters. The obscured picture is reestablished by these competitor parameters under the presumption that the hopeful is equivalent to the genuine esteem. The gauge is chosen to be the most extreme purpose of the differential coefficients of reestablished picture Laplacian L1 standard bend. Trial results are introduced to exhibit the execution of the proposed technique.

In 2009, the author Anat Levin, Yair Weiss, Fredo Durand, and William T. Freeman proposed the paper titled UNDERSTANDING AND EVALUATING BLIND DECONVOLUTION ALGORITHMS. Late calculations have managed sensational advance, yet numerous parts of the issue stay testing and difficult to get it. The objective of this paper is to break down and assess late visually impaired deconvolution calculations both hypothetically and tentatively. The plenty of late deconvolution procedures makes an exploratory assessment on ground-truth information vital. We have gathered obscure information with ground truth and analyzed late calculations under equivalent settings.

In 2009, the author Anmin Liu, Weisi Lin and Manish Narwaria proposed the paper titled IMAGE QUALITY ASSESSMENT BASED ON GRADIENT SIMILARITY. Inclinations pass on essential visual data and are pivotal

to scene understanding. Utilizing such data, basic and differentiation changes can be successfully caught. Subsequently, we use the slope similitude to quantify the adjustment interestingly and structure in pictures. Aside from the basic/differentiate changes, the picture quality is likewise influenced by luminance changes, which must be additionally represented finish and more hearty IQA. Subsequently, the proposed conspire considers both luminance and contrast–structural changes to viably evaluate picture quality.

In 2009, the author Renting Liu Zhaorong Li Jiaya Jia proposed the paper titled IMAGE PARTIAL BLUR DETECTION AND CLASSICATION. We build up a few obscure elements demonstrated by picture shading, slope, and range data, and utilize include parameter preparing to heartily arrange obscured pictures. Our obscure discovery depends on picture patches, making locale astute preparing and classification in one picture efficient. The outcome in this progression gives helpful high-level in territorial data, encouraging an assortment of locale based picture applications, for example, content-based picture recovery, question-based picture pressure, video protest extraction,

picture improvement, and picture division. It can likewise fill in as one of the criteria for measuring the nature of caught pictures.

In 2008, the author Neel Joshi Richard Szeliski David J. Kriegman proposed the paper titled PSF ESTIMATION USING SHARP EDGE PREDICTION. Picture obscure is brought about by various elements, for example, movement, defocus, catching light over the non-zero zone of the gap and pixel, the nearness of hostile to associating channels on a camera sensor, and constrained sensor determination. Our strategy handles obscure because of defocusing, slight camera movement, and inborn parts of the imaging framework. Our calculation can be utilized to quantify obscure because of restricted sensor determination by assessing a sub-pixel, super-settled PSF notwithstanding for in-center pictures. It works by foreseeing a "sharp" variant of a hazy info picture and uses the two pictures to illuminate for a PSF.

In 2007, the authors Blume Metal proposed THE BLIND DECONVOLUTION OF SEVERAL NOISY IMAGES BLURRED BY An SHIFT-VARIANT POINT-SPREAD-FUNCTION (PSF) FOR BLIND IMAGE DEBLURRING this paper mainly focus on a setting many images of the same object, and transform it between these images is found. This setting occurs frequently in biomedical imaging, for instance in microscopy or in medical ultrasound imaging. Restoration from multiple images degraded by camera motion blurs.

### **Conclusion:-**

This survey is on removing the noise and removing the blur effect from an image. Many methods are proposed for solving super-Resolution and image deblurring by restoration or reconstruction and deblurring the image but it is not suitable for real time video images. If we use supervised learning method using GRNN and DNN to find the blur types and its parameters and apply Grayscale conversion, dilation, erosion and fast Fourier transform on that parameters, we would get a high quality deblurred images which is very useful in many applications.

Strategic actions, Domestic airlines

### Abstract

This paper explores the foundations and implications of competitive inertia in Nepali airlines industry. Eighty respondents answered on a structured Likert type questionnaire in two stages. Results of the field study found a significant relationship between competitive inertia and tactical actions but no relation of competitive inertia with strategic actions. Variables for tactical actions included price cut, promotion with other non-airlines companies and commission to agents while variables for strategic actions included new services and frequent flyer programs. The study found that past history for inertia varied between tactical and strategic actions, the previous being determined more by performance and the second by growth in markets. These outcomes advocate the action of two separate models of the organizational learning, one reactive, the other experimental and that there is competitive inertia in the strategic actions and no competitive inertia in tactical actions. Implications of the findings are discussed.

### Introduction:-

Organizational inertia is defined as the tendency of a mature organization to continue on its current path (Creative Advantage, n.d.). This inertia can be described as being made up of two fundamentals, viz.: resource rigidity and routine rigidity. Resource rigidity, as stated in Creative Advantage, stems from a reluctance to invest, while regular rigidity stems from a powerlessness to change the patterns and reason that underlie those investments. Resource rigidity relates to the motivation to respond, regular strictness to the structure of that response.

In the words of (Miller, Danney; Chen Ming Jer, 1994) competitive inertia is defined as the level of activity that a firm shows when altering its competitive position in areas such as pricing, marketing, new product or facility introductions, and market reach. Inertia is argued to be determined by managers' incentives to act, their consciousness of action alternatives, and the constraints on their capacity to act. They differ that competitive inertia specifies the number of market-leaning deviations a company makes in trying to appeal customers and outfox players. Inertia will be said to be high when, relative to rivals of similar scale, companies make little alterations in competitive practices. These actions together make up a firm's repertoire of competitive performance.

Similarly, competitive inertia is regarded as major strategic and more minor tactical types of actions, both of which are essential components of all competitive arsenals (Chen M.-J., 1988); (Chen, Smith, & Grimm, 1992). According

to (Chen, Smith, & Grimm, 1992) both cases are actions that are specific, concrete, and detectable. Tactical actions might include price changes, advertising campaigns, and incremental manufactured goods or service adjustments. Strategic actions may comprise key facilities enlargement, mergers and acquisitions, strategic alliances, and important new products or services. In principle, strategic actions engross a greater expenditure of resources, along time prospect, and a greater departure from the current situation than perform tactical actions (Galbraith & Kazanijan, 1986); (Dutton & Duncan, 1987).

According to (Acharya, 2012), officials of international airlines based in Kathmandu say they observe great potential for enlargement if some of the primary structural challenges to do with safety and infrastructure can be dealt with.

There has been little literature found that are related with the status of domestic airlines of Nepal that can be related with the competitive inertia. Therefore, the study of the current topic is very much relevant to enrich the literature also.

There has been little academic research carried out that is related with competitive inertia in Nepali aviation industry. This study attempts to understand about competitive inertia in Nepali domestic aviation industry. The basic issues the study addresses are:

How does a tactical action lead to competitive inertia in domestic airlines of Nepal?

How does a strategic action lead to competitive inertia in domestic airlines of Nepal?

The objectives of the study are to understand the nature of competitive inertia in the Nepali aviation industry. For this purpose, the domestic airlines are chosen for the current study, as there is no sufficient sample for International airlines operating from Nepal.

Due to the hilly and mountainous terrain the importance of airlines becomes very high. However, airlines business involves high investment that leads to limited market players. This leads to monopolistic situation in the country like Nepal. Therefore, it is important to review the status of competitiveness of airlines in Nepalese context.

### **Literature:-**

The literature on organizational change, culture, and decision making suggests three indispensable classes of factors that activate organizational action and, thus, competitive inertia. Main is the incentive to act, the motivational aspect of action discussed mostly by political decision philosophers and scholars of managerial designation (e.g. (Allison, 1971); (Schelling, 1971); (Staw, 1976); (Miller, Danney; Chen Ming Jer, 1994); and (Milliken & Lant, 1991)). Second is the perception of action requirements and substitutions, the knowledge component of action discussed by most learning philosophers (e.g. Cyert & March, 1963; (Levitt & March, 1988); (Huber G. P., 1991)). Third are the constraints on managerial act, the potential component of act discussed by writers on organizational change, structure, and motion (e.g. (Hannan & Freeman, 1984); (Tushman & Romanelli, 1985); (Meyer & Zucker, 1989); (Amburgey & Minner, 1992); and (Miller, Danney; Chen Ming Jer, 1994)).

According to (Starbuck & Milliken, 1988); and (Milliken & Lant, 1991) competitive inertia will be highest when there are very less incentives to act. Such incentives may be internal or external to the organization. The previous includes poor show that makes managers question the acceptability of their methods and motivates them to exploration for improvements.

Enticements to act that come from outside the firm might include escalating markets that give managers the self-assurance to invest in the pursuit of innovative chances (Miller D. , 1993). Inertia may also overcome when managers perceive relatively few alternative ways of performing (Huber G. P., 1991 March).

(Miller D. , 1993) and (Chen, Smith, & Grimm, 1992) debate that the encounter in the literature about the impact of performance on inertia can be determined in part by making the dissimilarity between tactical and strategic actions. Further, to add opinion they state that, poor performance may induce tactical changes, as these are normally easy to make, entail few reversals in policy, and create little embarrassment. Strategic decisions may signal changes in policy that violate the preferences and reverse the riches of those in power. Even in the outcome of poor results,

then, managers may resist captivating these actions. Strategic decisions will be less responsive to performance loss than tactical decisions (Miller, Danney; Chen Ming Jer, 1994).

As per (Miller, Danney; Chen Ming Jer, 1994) there is no strong relationship between tactical actions and market growth: Tactical changes may be no more motivated by an expanding than by a falling market. Strategic actions will be far more likely when a growing market provides some large assurances of resources if a shrinking market signs tough times ahead.

(Danney & Chen, 1994) conducted a study in the Aviation industry of U.S. using 21 types of actions to distinguish between tactical and strategic actions supporting competitive inertia. The variables they have taken for the study were: mergers and acquisitions, feeder and inter industry alliances, frequent flyer programs, and new airplane purchases. Similarly, activities that are easy to introduce and easily roll back with less impact to the organization are termed as Tactical actions. For the current study the following variables have been considered as tactical actions: Price Cut, Commission Rates changes for Agents, Promotions with Non Airlines Companies. Similarly, New Service introduction and Frequent Flyer program have been taken as strategic actions. Based on these variables the theoretical framework is designed as given in Fig.1.

**Fig 1:-**Theoretical Framework of Competitive Inertia

Based on the above theoretical framework and the research questions the following hypothesis have been formulated and tested.

**Hypothesis 1:** Strategic actions related to competitive inertia results in growth of domestic airlines.

**Hypothesis 2:** Tactical actions related to competitive inertia and decline in domestic airlines.

### Methods:-

In this study the data were collected in two stage using convenience sampling method. In the first stage, fifty respondents responded to the structured questionnaire at Tribhuvan international airport domestic terminal. For this purpose the questionnaire was used by (Shrestha, 2014). Based on the analysis of responses from the first stage of data, three airlines – Buddha air, Yeti airlines and Nepal airlines- were selected for the second stage of data collection. In this stage, responses on structured questionnaire used by (Sturesson, 2010) was used. Besides questionnaire, unstructured interview was also carried out with the respondents, who were member of travel agents in Kathmandu Valley and are doing domestic ticketing of the selected airlines.

Based on the response three top airlines: Buddha Air, Nepal Airlines Corporation and Yeti airlines were selected for second stage of data collection. The second stage of data collection was focus of the components of tactical and strategic actions adopted by the domestic airlines.

### Results:-

From the analysis of the data collected at the first stage at Tribhuvan international airport domestic terminal it was found that 57 responses with 95% response rate have returned the questionnaire duly filled. Of the respondents

19.30% were female while 80.70% were male, 24.5% were under SLC, 54% were bachelor level and 21.5% of respondent were university graduate.

**Table 1:-** Correlations between Passenger Movement and Competitive inertia

Indicator	Passenger Movement	Price for ticket	Commission to Agents	Promotion with non-airlines companies
Passenger Movement	1	-.028	.396	.153
Sig. (2-tailed)		.931*	.202*	.634**
Number of Observation	12	12	12	12

Remarks:(\* significant at 5%, and \*\* significant at 10%)

The table above shows that passenger movement is correlated with variables of competitive inertia. The passenger movement is significant with commission to the agents and price of ticket at 5% level of significant. Similarly, promotion with non-airlines is significant at 10% level of significant. This supports our first hypothesis, Strategic actions related to competitive inertia results in growth of domestic airlines.

From the correlation analysis, it is seen that passenger movement is not significant with frequent flyer program and new service. Hence we reject our second hypothesis, Tactical actions related to competitive inertia and decline in domestic airlines.

**Table 2:-** Correlations between Passenger Movement and Tactical inertia

Indicator	Passenger Movement	Frequent flyer programme	New Services
Passenger Movement	1	.019	.539
	Sig. (2-tailed)	.953	.070
	12	12	12

Remarks:(\* significant at 5%, and \*\* significant at 10%)

### Discussion:-

The aim of this study was to examine the correlation between competitive inertia and passenger movement in Nepali domestic airlines. Using a field study of 76 respondents it was found that there exist significant relationships. Significant relationship between past performance and tactical actions while moderate relationship between past performance and strategic actions was found. There is an indication that domestic aviation industry in Nepal shows an association with tactical actions. Similarly, aviation industry should focus on the pricing decision, as the price has significant negative relation between passenger movement and pricing decision. This is why aviation companies has various pricing package to offer- full fare, economic price, cost on cancelation and millage is also different based on price of ticket.

Similar study was carried out by ARTUĞER (2013) entitled "The effect of Frequent Flyer Program on Customer Loyalty". The report suggests that members consider the intangible rewards more important than the tangible benefits. Therefore, focus should be given to the millage program as it has significant relationship in the tactical action.

As there is no academic study carried out in competitive inertia in Nepali Organizations, hence this study can be a stepping stone for further research in any form of inertia in Nepali organizations. Further, many of the results, can be understood through the lenses of two separate replicas of organizational learning what might be called "reactive" and "experimental" learning March (1991).

Consistent with the model of reactive learning as mentioned by Lindblom, (1959), Cyert & James (1963) inertia in tactical actions was very much a function of organizational success. Tactical adjustments were more common when poor performance signaled the need to act Cyert & James, (1963), Levinthal & James (1981), Lant & Montgomery (1987). In our study tactical actions such as promotion with non-airlines was found to be introduced. Even there are very little promotional activities carried out by airlines. The reactive learning model functioned less well, however, in forecasting inertia in strategic actions.

**Limitation:-**

The current study is limited in many ways, most important limitations is data collection. It was carried out based on the questionnaire used by (Artuger, 2013) and (Shrestha, 2014). Therefore, the representativeness of the questionnaire may limit the data collections. However, to cater this limitation, unstructured questionnaire was also administered during the data collection phase. Similarly, sample collected may not be sufficient for the generalization of the study. Further, data collection was done only within Kathmandu valley, therefore heterogeneity of respondents may be missing in this study. The domestic aviation industry is dominated by a few players in the market, therefore for first level of study in Nepali context may not be appropriate.

Despite of such limitation, we expect that this study will lay foundation on study on competitive or any other form of inertia in Nepali organization as well as global context. Further, this study will also help to further elaborate the concept of inertia. Continued research is necessary before recommending official or non-official commendation of inertia in Nepali domestic airlines or other airlines in the world.

**Introduction:-**

Until few decades ago, pain was considered as an inappropriate term for neonates and so pain assessment and management was not part of routine care in NICU. In NICU, neonates are exposed to environment stress. During their stay in the NICU, on an average 14 painful procedures are experienced by neonates during the first 2 weeks of life<sup>1</sup>. Studies have shown that repeated painful stimuli can lower pain threshold in neonates<sup>2</sup>. Repeated painful stimuli alters neurodevelopment and programming of the stress system thereby increasing the pain perception in neonates who are born as preterm<sup>3</sup>. Repeated painful stimuli causes abnormalities in brain maturation which persists through childhood and adolescence leading to adverse neuro developmental outcomes<sup>4</sup>. Hence minimizing pain helps in prevention of occurrence of long term neurological outcome.

Musical intervention acts as a source of distraction and positively affects the distress levels and pain perception in neonates<sup>5</sup>. Studies on the positive effect of mother's voice (infant directed speech/singing) on pain reduction and better oxygen saturation, improvements in heart rate and respiratory rates are also available<sup>6,7</sup>. But studies comparing mother's voice and music are not available in Indian context and so, we studied effectiveness of music and mother's voice (infant directed speech) in pain reduction during venepuncture in neonates.

**Methodology:-**

The study was registered in Clinical Trials Registry - India and the Institutional Human Ethics Committee (No: PG/2014/47). After the informed consent was taken this open labeled randomized controlled study was carried out at neonatology unit at Mahatma Gandhi Medical College & Research Institute (MGMCRI), Pondicherry, South India from January 2014 to December 2014. All neonates undergoing venepuncture in the post natal ward were included in this study. The neonates were in awake state. Neonates 1) with intravenous cannula, 2) critically ill, 3) associated with painful conditions, 4) immunized within 24 hrs were excluded. Total 300 neonates were included in the study. They were divided into music, mother's voice and control groups by block randomization method. Each group consisted of 100 subjects. All the neonates were checked for hearing loss by startle reflex given by them to the auditory stimulus in the form of clapping hands by the investigator. The neonates without any hearing loss were included in the study. The neonates in music group were exposed to pre recorded lullaby 5 minutes before starting the venepuncture and during the procedure of venepuncture. Music was played through music player using

speakers placed 30 cm from the neonate. The speaker used was JBL Flip 2 portable wireless stereo speaker with maximum SPL of 86dB and frequency response of 100Hz-20 KHz. The sound decibel of the music played was checked using Benetech GM 1351 digital sound level meter. The volume of the speaker was adjusted such that the NICU environment sound level never exceeded beyond 65 dB.

The neonates in mother's voice group received pre recorded mother's voice [infant directed speech<sup>8</sup>] 5 minutes before and during venepuncture procedure. Both the music group and the mother's voice group received in total 15 minutes of intervention each. The control group received no intervention but received only the standard nursing care during the venepuncture procedure. The pain levels were assessed using NPASS by the investigator. The physiological parameters were assessed by an independent observer. The NPASS was done 5 minutes before, during and 5 minutes after the procedure. NPASS used in our study was commonly used to assess pain response in infants during painful procedures<sup>9</sup> as the score evaluated 5 parameters – crying, behavioural state, facial expression, extremities tone and vital signs. The heart rate, oxygen saturation were monitored using pulseoximeter and the respiratory rate was counted manually. Minimum and maximum possible scores were -10 and 10 respectively. The investigator also noted the duration of crying spells when neonates started and stopped crying by using a stop clock. No neonate was sedated during the venepuncture procedure. Eight neonates were excluded from this study as they were in sleep state and didn't awake after venepuncture. 292 neonates were analyzed. The other neonates were in awake state during the study.

#### Statistical Analysis:-

The results were analyzed by using Kruskal Wallis for comparing all the three groups. Mann Whitney U Test was done for intergroup comparison.

#### Results:-

Results of Neonatal pain, agitation and sedation scale (NPASS) for each of five domains crying, behavior state, facial expression, extremities tone and vital signs), 10-point NPASS for music and control groups are shown in table 1. NPASS score of mother's voice and control group are shown in table 2 and mother's voice and music group are shown in table 3.

All five domains of NPASS- vital signs, irritability, facial expression, behavioral state, tone and the total NPASS have shown significant lower pain perception in music group when compared to control group (P=0.000). All the five domains of pain – vital signs, irritability, facial expression, behavior state, tone and the total NPASS were lower in mother's voice group when compared to control group (p=0.000). There was significant difference in the heart rate, respiratory rate, facial expression and behavioral state and the total NPASS (p=0.000) between the mother's voice and music group. Music was better than mother's voice and control group in pain reduction during venepuncture.

### Discussion:-

Venepuncture is the one of the most common recurring painful health-related procedures in clinical practice. Various measures to reduce pain during venepuncture have been explored, including positioning and restraining the neonate in relatively flexed posture, kangaroo care, breastfeeding, use of oral analgesics, oral sucrose / saccharine solutions, tactile stimulation, skin-cooling techniques, skin-to-skin care, non nutritive sucking pacifiers, music therapy, etc<sup>(7-12)</sup>. Music therapy offers a safe and harmless intervention for reducing pain in neonates.

Joanne Loewy<sup>16</sup> recorded use of culturally based musical tunes in the form of lullabies can improve neonatal function and hence in our study we used lullabies in Tamil language as most of the patient population visiting the hospital spoke Tamil language.

In our study the peak HR(heart rate) was lowest in the music group when compared to mother's voice and control group. The peak HR in the mother's voice group was lower than the control group. This signifies that both music and mother's voice decrease the heart rate during painful intervention and music had more positive effect than pre-recorded mother's voice infant directed speech. These findings were in consistent with the study by Coleman et al<sup>17</sup>, Arnon et al<sup>18</sup> where there was decrease in heart rate after the neonates were exposed to music. Statistically significant difference was found with regard to heart rate when music intervention was done in studies conducted by McIntosh et al<sup>19</sup> and Bo LK<sup>20</sup>.

In our study, the music group had better oxygen saturation than control group with a p value of 0.000. Similar findings were found in Cassidy et al's<sup>21</sup> study where there was statistically significant difference between recorded music and control group. In studies by Burke et al<sup>22</sup>, Chou et al<sup>23</sup> and Standley et al<sup>24</sup>, the degree of fall of oxygen saturation was less in music group when compared to the control group. Caine et al<sup>25</sup>, Collins et al<sup>26</sup>, Whipple et al<sup>27</sup>, Butt et al<sup>28</sup> and Arnon et al<sup>18</sup> recorded statistically significant difference in the behavioural parameters between the mother's group, music group and the control group.

Our study showed significant improvement in all five parameters of Neonatal pain, agitation and sedation scale (NPASS); i.e., facial expression, cry and movements and also in duration of crying spells. There was statistically significant difference in the peak HR, RR(respiratory rate), lowest recorded oxygen saturation, behavioural parameters and NPASS during intervention between the music and control groups. There was statistically significant difference in the maximum NPASS, peak HR, peak RR, least recorded and all the behavioural parameter between control and mother's voice group.

#### **Proposed mechanism of action of music Therapy:-**

When auditory stimuli of music passes through the sound pathway to the cerebral cortex, there is reduction in the signalling in the amygdale. The reduced signalling of amygdale causes reduced level of stimulation of the hypothalamus, pituitary and endocrine glands. Hence there is decreased secretion of the cortisol and glucocorticoids thereby having effect on the autonomic system<sup>29</sup>. This explains the lower heart rate and better oxygen saturation in the music therapy group when compared with the control group. The underlying mechanism is explained by Farhat et al<sup>30</sup> that music has its effects on the limbic and the autonomic system thus music reduces the stress and inducing comfort and relaxation in neonates.

Limitation of our study was the fact that the study was conducted in NICU and not in a sound proof room. Blinding could not be done in this study.

#### **Conclusion:-**

Music and mother's voice reduce the pain perception in neonates during venepuncture and they have beneficial effects on the physical and behavioural parameters. Pre recorded music is better than mother's voice in decreasing pain perception. Hence for routine painful procedures like venepuncture, music therapy could be helpful in neonates in reducing the pain perception.

##### Key words:-

Glioblastoma Multiforms, Intracranial cranial hemorrhage, intracerebral hemorrhage, primary brain tumors.

#### Abstract

**Context:** glioblastoma multiform (GBM) is the stage four of glioblastoma tumor(1). It is the most common primary intra-cranial tumors(2). GBM can be presented by intracranial hemorrhage (ICH) with an incidence between 1 – 10 % and usually occur in the late course of the disease. The general prognosis of GBM with ICH is poor and worsen in elderly(8)(5).

**Aims:** Determining the effect of the hemorrhage on the disease prognosis, exploring the prevalence and predisposing factors.

**Methods:** A retrospective medical record review had performed for patients diagnosed with GBM between 2008 through 2013 at national neuroscience institute in King Fahad Medical City. Inclusion criteria are male and female with age more than 18 years old diagnosed with glioblastoma multiform grade four and were followed in the King Fahad Medical City Clinic. The exclusion criteria is any patients with the hemolytic disorder.

**Results:** . A total of 87 out of 530 patients with GBM were identified. 15 (17.2%) of GBM patients have ICH while 72(82.8%) non-hemorrhagic. 61 (70.1%) were male while 26 (29.9%) were female. No difference between prognosis between hemorrhagic and non-hemorrhagic GBM patients. Tumor size, and gender are not predisposing factors.

**Conclusion:** there were no difference in the prognosis and between hemorrhagic glioblastoma multiform and non-hemorrhagic and gender and Tumor size are not predisposing factors.

**Introduction:-**

Gliomas is a collection of tumors arising from glia or their precursors within the central nervous system. Histopathologically, gliomas are divided into four grades; the most aggressive of these grades is 4 or GBM.(1)

GBM is the most common primary intracranial neoplasm of the central nervous system. It has an incidence for 15% to 20% of all primary central nervous tumors. These GBM tumors can be presented in different forms. Intracranial hemorrhage (ICH) is one of these forms, which can happen to different degrees and extension with variation in degree of prognosis. It has been reported that GBMs can masquerade as traumatic ICH, or intraventricular hemorrhage (IVH).(2)

The prognosis and clinical manifestation depend on multiple factors which share together according to their severity and their stage, namely; tumor size, location, infiltration range, eloquent area involvement, and the extent of the surgical resection. The main histopathological features include micro vascular proliferation, pleomorphic cells, necrosis, increased cellularity, mitoses and microscopic intra-tumoral hemorrhage.(3)

Intracerebral hemorrhage (ICH) is defined as bleeding into the brain parenchyma.(4)

ICH is a common neurological emergency in patients with intracranial tumor, which usually occurs late in the course of disease, in some time it heralds the cancer diagnosis. The presence of ICH in patients of GBM usually occurs by unique mechanisms, especially intratumoral hemorrhage or coagulopathy, whereas hypertensive hemorrhage is rare.(5)

A highly vascularized, malignant primary brain tumor (BT) like a GBM and metastatic BT tends to bleed spontaneously. Glioblastoma multiform should be included in the differential diagnosis of non-traumatic ICH.(6)

In pathogenesis of sudden massive bleeds into cerebral tumors, the ischemic necroses areas are formed.(7)

The general, prognosis for GBM associated with ICH worsens with increasing age in elderly patients. The surgical removal of both the hematoma and the tumor with adjuvant treatment are associated with prolonged survival rate.(8)

In the short-term prognosis of ICH patients with GBM the report demonstrates about 22 % to 31 % mortality at 1 month, and 48 % to 75% have partial or complete independence at discharge. However, in the long-term prognosis of ICH with GBM, the underlying malignancy prognosis are often poor (78 % mortality at 1 year), and ICH generally occurs late in the neoplastic course.(5)

For the median survival rate in the GBM Alone is about 12 months. In 2-3% of the patients have long survival rate with more than 3 years. (22)

In this study we want to see if there is any significant difference between the prognosis of hemorrhagic GBM compare with non hemorrhagic GBM and the predisposing factors.

**Methodology:-**

Retrospective medical record review has performed from 2008 through 2013 on 53 existence data recorded at the national neuroscience institute in King Fahad Medical City. Inclusion criteria was any patients diagnosed with Glioblastoma multiform world health organization grade four both male and female with age more than 18 years old who Fellow in the King Fahad Medical City clinic. The exclusion criteria was any patients have any hemolytic disorder. The research team has reviewed how many patients presenting with ICH among GBM, data of the predisposing factor which is common between ICH GBM (gender, tumor size) and compared it with non hemorrhagic GBM patients. In addition, the study reviewed the prognosis of ICH GBM patients and compare it with non hemorrhagic GBM patients (post operative survival rate, partial or full resection). To look for differences of either age, tumor size and survival rate with hemorrhagic and non hemorrhagic condition, we used (T-test ) analytic method. For the association between the location of tumor and gender with hemorrhagic and non hemorrhagic condition, we used (Chi-square) analytic method.

## Results:-

The study involved 87 subject with GBM divided into two groups hemorrhagic or non-hemorrhagic. The most frequent location of for Hemorrhagic and non-Hemorrhagic GBM is in frontal lobe by 37.8% and the frequent location in hemorrhagic GBM is Temporal. (see CHART 1). 15 (17.2%) of the study population that attended National Neuroscience Institute at King Fahad Medical City in Riyadh City had intracranial hemorrhage and 72(82.8%) had non-hemorrhagic GBM. Most of them were male 61 (70.1%) and 26 (29.9%) were females. The distribution of Hemorrhagic or non-Hemorrhagic GBM and sex is summarized in **Table 1**.

**Table 1:** Distribution of patients in both groups

Hemorrhagic or non-Hemorrhagic	Gender		Total
	Male	Female	
Hemorrhagic	13 (14.6%)	2 (2.3%)	15 (17.2%)
Non Hemorrhagic	48 (55.2%)	24 (27.6%)	72(82.8%)
Total	61 (70.1%)	26 (29.9%)	87 (100.0%)

Independent t-test was conducted to measure the difference between intra cranial hemorrhage and non-hemorrhagic GBM. ICH GBM age Median= 54.40 years with 18.157 standard deviation, tumor size Median= 105.19 cm<sup>3</sup> with 61.990 standard deviation and survival rate Median = 2.07 years with 1.387 standard deviation and non-hemorrhagic GBM age Median= 53.64 with 18.120 standard deviation, Tumor size Median= 106.60 cm<sup>3</sup> with 83.081 standard deviation and survival rate Median= 2.25 with 1.172 standard deviation.

A chi-square test was performed to know if there is significant relationship between the frequency of ICH GBM and non-hemorrhagic GBM in gender  $\chi^2 = 1.511 (1)$ ,  $p = .219$ , tumor location  $\chi^2 = 15.012 (8)$ ,  $p = .059$  and surgery type  $\chi^2 = .803 (3)$ ,  $p = .849$ .

## Discussion:-

In this study, we aimed to find the prevalence of patients who are presented with intracranial hemorrhage and non-hemorrhagic, to find predisposing factors and which GBM group at high risk to develop ICH and difference in the prognosis of GBM with ICH compare with GBM without ICH.

In this study, we found that the prevalence of ICH as a complication of GBM was 17.2 % while the non-hemorrhagic was 82.8 % of 87 adult Patients attended National Neuroscience Institute at King Fahad Medical City in Riyadh. The prevalence of ICH in GBM in the other studies was between 1-2% and other studies reported it between 7% to 10%. (5)

There are no differences between hemorrhagic and non-hemorrhagic in prognosis. So, the survival rate is almost the same in each group with median survival rate of hemorrhagic 2.07 year and median of survival rate of non-hemorrhagic 2.25 year with P value .595. In literature review the prognosis of GBM patient with ICH are 78% mortality by 1 year (5). Chi-square has performed to look for the surgery type either partial or complete resection affect the prognosis and the result show no effect on the prognosis with P value .849. ICH is not affect the prognosis of GBM. Tumor size and gender are not predisposing factors that make the GBM more prone develop ICH. For confirm that we had performed T-test on tumor size and Chi-square on gender but they did not show any differences between hemorrhagic and non-hemorrhagic with .951 P value of Tumor and .849 P value for gender.

For age, we did T-test to see the Age distribution between each group. The results are 54.40 years old for hemorrhagic and 53.64 years old for non-hemorrhagic. So, the aging people are not high risk for GBM developing ICH than younger patients.

no difference between the prognosis of GBM with ICH compare GBM alone may be because the GBM itself has poor prognosis although The ICH alone is known to have poor prognosis. (23) (22) we looked if ICH worsen the prognosis of GBM but the study show it is not.

There are some limitation of the studies as nonrandomized study which are the sample size is small but it is convenient, the study cover one city which is Riyadh City and as retrospective cohort study there is possible for selection bias.

**Conclusion:-**

Our study show that ICH is no affect the GMB prognosis and tumor size and gender are not predisposing factors for developing ICH in GBM patients.

#### Abstract

**Objective:**-To Assess Attitudes and behavior of female medical students related to facial skin care routine and to study factors that influence buying-decisions of skin care products.

**Study design:**-Cross-sectional study.

**Setting:**-King Abdulaziz University Hospital.

**Subjects and Methods:**-Self-administered questionnaire was conducted randomly to 301 female medical students from February 2016 to May 2016.

Descriptive analysis was done for all the data in order to obtain the frequencies and percentages needed.

**Results:**-Results indicated that majority of students (76.7%) do not follow regular skin care routine, Further analysis indicated that (66%) don't use sunblock and (29%) reported to have previous history of sunburn.

Most commonly used skin products were body lotions and moisturizers (74%), The use of makeup was obviously higher than the use of skin care facials.

Among the study sample, factors that were distinguished as an evaluative criteria to participants when buying products were greatly affected by brand of product (68.7%) followed by friend's recommendations (51.3%), one of the factors affects buying behaviour is price of a product, our Students had a little concern regarding price (32%) in comparison to other factors.

Results also revealed that majority of respondents never cared to check ingredients of their products (48%).

**Conclusion:** Our society need to be more educated about the importance of getting a proper skin care routine, further studies with wider distribution of the questioner in different cities and to different age groups is advisable.

#### Introduction:-

**Corresponding Author: Mawaddah Tallab.**

Address: Medical intern, King Abdulaziz University Hospital, Jeddah, Saudi Arabia.

The skin, is the body's largest organ, it helps to secure the integrity of the host and at the same time, allows the individual to communicate with the outside world. <sup>(1)</sup>

Skin care is an essential part of personal hygiene and well-being. The proper care of skin is important as unclean skin favors the development of pathogenic organisms and infections. <sup>(2)</sup>

Healthy and functioning skin barrier is an important protector against dehydration, penetration of various microorganisms, allergens, irritants, reactive oxygen species and radiation. The skin barrier may be specifically adjusted to allow penetration, for this reason daily skin care may increase skin regeneration, elasticity, smoothness, and thus temporarily change the skin condition. <sup>(3)</sup> A study revealed that the focus is found to be more on skincare in East Asia and on make-up in Southeast Asia and India. <sup>(4)</sup>

Sunscreen use is a modifiable behavior that can help reduce the risk for skin cancer, prevent sunburns, mitigate photo-aging, and treat photosensitive dermatomes. <sup>(5)</sup> Researchers from the Centers for Disease Control and Prevention (CDC) examined the results of a 2013 survey that asked participants how often they use sunscreen when outside in the sun for more than an hour. Only 14.3 percent of men and 29.9 percent of women reported that they regularly use sunscreen on both their face and other exposed skin. <sup>(6)</sup>

Choosing the right ingredient of skin product for each skin type is essential, as various skin care preparations are not tolerated, and they may induce skin irritation. Increasing knowledge and awareness of the benefits and optimal use of skin products can improve outcomes.

In an effort to protect consumers' rights to information and to promote their freedom of choice, the South Korean government has been enforcing a policy called the cosmetics full ingredients list system since 2008, which requires cosmetics manufacturers to list all of the ingredients used in their products <sup>(7)</sup>, this sheds a light on the importance of checking the ingredients before buying products.

Brand satisfaction is perceived as an important issue on skin care industry. Obviously, customers are the important stakeholders in organizations and their satisfaction is a priority to the company. <sup>(8)</sup> In a study was conducted in 14 cities, regarding taking a look at important aspects when buying make-up, results suggested that in Seoul, the criteria for decision-making are different from other cities, with environmental friendliness among the top considerations, alongside good basic quality/functions and brand reputation. In contrast to Hong Kong and Taipei where, in addition to quality/functions, price was an important factor, in all three Chinese cities, reasonable price and brand image rank near the top for both make-up and skincare. <sup>(4)</sup>

To our knowledge, adequate studies regarding the skin care routine and the methods of selecting the correct skin products are still lacking in Saudi Arabia.

Our aim in this study was to explore the skin care routine among female students at King Abdulaziz University, and to focus on their considerations when buying skin care products.

### **Objectives:-**

#### **Primary objective:-**

To explore attitudes and behavior of Female medical students related to facial skin care routine.

#### **Secondary objectives:-**

1. Factors that influence buying decisions related to choosing facial skin care products
2. Identify the most commonly used skin products.

### **Materials and Methods:-**

The study protocol was reviewed and approved by King Abdulaziz University Hospital Health Research and Ethics committee.

This was a Cross-sectional study .

A self-administered questionnaire was conducted randomly to 301 Female students (aged 18-23 years old) at King Abdulaziz Universityhospital,Jeddah, SaudiArabia, during the period (February 2016 to May 2016). There were no exclusion criteria.

Data was collected using a data collection sheet that includes for example demographic information like name, age and nationality.

Regarding Skin care routine we first determined if students wereroutinely using regular facials and sunscreen,consulting dermatologists before choosing skin products and if there was a previous history of skin irritations to cosmetics.

There wasalso few questionsfocusing on skin type and the most important buying behaviors influencing their decision-making when choosing skin/make-up products such as type of ingredients,brand of product, friend's recommendations,price, packaging and convenience.

#### **Statistical Analysis:-**

In the present study, data was coded and entered into the statistical Package for Social Sciences (SPSS version 20). Descriptive analysis was done for all the data in order to obtain the frequencies and percentages needed.

Descriptive statistics (Frequency tables, Cross tabulation and Charts)

#### **Results:-**

A total of 301 female medical students were included in our study. The background characteristics of the study population are shown in (Table 1.)

Most of ourfemale medical students (76.7%) do not follow regular skin care routine,Further analysis indicated that (66%)of students don't use sunblock before sun-exposure and (29%)reported to have a past history of sunburn.

Most commonly used skin products among our study sample were sequentially: body lotions and moisturizers (74%), sunscreen (30%) and also other products as visualized in "Fig. 1".

Results regarding frequency of using makeup products are shown in (Table 2.)

Reactions to different kinds of cosmetics is increasingly recognized as a relevant problem,a lot of our students reported to have history of reaction to some cosmetics (38.7 %) and unfortunately most of them (44.9%) never consulted dermatologists regardingtheir skin concerns nor for their opinion before choosing skin/make-up products.

As shown in "Fig. 2"Factors that were distinguished as being important evaluative criteria in buying products to our participants were greatly affected mainly by brand of product (68.7%) followed by their friend's recommendations (51.3%). One of the factors that can have an effect on buying behaviour is the price of a product, studentshad a little concern regarding price of the product (32%) in comparison to other factors.

In addition to the buying factors related to choosing skin products, ingredients of the product playalso an important role, results revealed that majority of our students never cared to check the ingredient of product before buying it (48.7%), and (33%) of them preferred to choose the natural ingredients while (22%) looked for oil-free ingredients, (10.3%) alcohol-free ingredients, (5%) dye-free, (4.7%) petroleum-free. "Fig. 3"

**Table 1:-**Nationality and skin type of participants.

Questions	Value
<b>Nationality</b>	
Saudi	280 (93.00%)
Non- Saudi	21 (7.00%)
<b>Skin type</b>	
Combination skin.	154 (51.20%)
Oily skin	54 (17.90%)

Dry skin	45 (15.00%)
I don't know what is my skin type	24 (8.00%)
Normal skin	24 (8.00%)

**Table 2:-**Frequency of using makeup.

How many times do you wear makeup?			
		Frequency	Percent
Valid	Daily	72	24.0
	3-4 times /week	64	21.3
	Once per week.	60	20.0
	Rarely	104	34.7
	Total	300	100.0

**Figure 2:-**Buying Behaviors of students.

**Figure 3:-** Products-ingredients Buying factors.

### Discussion:-

To our knowledge and after an extensive literature review, this is the first population-based study in Saudi Arabia to evaluate skin care routine and to study skin products buying factors.

Our study results indicated that only (23.3%) of our students use regular facials as a routine, this rate is very low when compared with similar cross sectional study of a sample size (200), revealed that 100% of their respondents were skin care product users, the majority of respondents were from china. <sup>(9)</sup>

Most of our medical students use make up more often than skin care products, in contrast to another study comparing use of skincare products and make-up products, the use of skincare products was higher in East Asian cities Hong Kong, Taipei, Seoul and the three Chinese cities (Beijing, Shanghai, Guangzhou). Conversely, use of skincare products was higher in Southeast Asia and the two Indian cities (Delhi and Mumbai). It appears that the focus was on skincare in East Asia, including the three Chinese cities, and on make-up in Southeast Asia and India. <sup>(4)</sup>

Most commonly used skin product by our students were body lotions and moisturizers (74%), our study results were consistent with results of previous studies, in which one of them revealed that face lotions were used by at least (50%) of study responders. <sup>(4)</sup> In another study, Results showed that when asked about what kind of facial cream the respondents used, the majority of all women said they use moisturising facial cream (69,6%) <sup>(10)</sup>

We found that most of our students don't use sunblock before sun exposure (66%) and some of them have a previous history of sunburn (29%), in comparison to a study was done in al-Qassim, conducted in 2010 of sample size (1376), results showed that (29.4 %) had a history of suffering from sunburn before, (8.3%) were using a sunscreen as a routine before sun-exposure, only (114) persons (8.3% of study participants) reported use of sunscreen preparation. <sup>(11)</sup>

Results of our study revealed that a large number our students don't care to check the ingredient of their skin care/make up product before buying it (48.7 %), and only (33%) cared about buying natural-ingredients products , in contrast, a study carried out for Finnish women, the respondents were also asked whether they would be willing to pay more for such facial skin care products that consist completely of organic ingredients (product consists of natural ingredients which have also been farmed so that no artificial fertilizers or pesticides have been used), Very

few (15,2%) respondents said they are willing to pay and nearly a half (44,9%) reported they would not be ready to pay more for organic facial skin care products.<sup>(10)</sup>

Brand of the product was obviously the most important factor mattered to our students (78.7%), our results goes along with the results of a study in terms that consumers take relatively less time to shop for brands they are familiar compared to brands that are new to them.<sup>(8)</sup> A study which was done in 14 cities, Showed that in all three Chinese cities, reasonable price and brand image rank near the top for both make-up and skincare, a reasonable price was a common consideration among their women while among our students, women looked for different things other than price, they obviously had a little concern about the product price (32.0%).<sup>(4)</sup>

Approximately (51.3 %) of our students take into consideration their friend's recommendation as an important evaluative factor when buying products and only (5.3 %) had concerns about product packaging, while in comparison to the results obtained from a study conducted also in this field revealed that among young women, the packaging (8,9%), and consistency of a products were not considered very important. On the other hand, only (8.9%) thought friends recommendations as determined factors when choosing one facial skin care product over another.<sup>(10)</sup>

### **Conclusion and Recommendations:-**

Our society need to be more educated about the importance of getting a proper skin care routine, further studies with wider distribution of the questioner in different cities and to different age groups is advisable.

Titanium Alloy (Ti6A14V) -  
Osseointegration - Cell culture -  
Histopathology-DLC coating

#### Abstract

Titanium alloys (Ti6A14V) are biomaterials of choice in dentistry, due to their resistance to the biological constraints of the environment. Their use still causes in a number of cases, problems of osseointegration that urge us to raise again the question of the interface of titanium alloys with mineralized tissues in particular. The purpose of this study is first to evaluate the biocompatibility of these implants in the biological medium while offering alternative proposals for improving the osseointegration of these implants. Two studies were first conducted for this evaluation: *in vitro* study on human fibroblast cell cultures and bacterial colonization in the presence of four bacterial strains (*Escherichia coli*, *Klebsiella pneumoniae*, *Staphylococcus aureus*, *Haemolytic streptococcus*) with and without implants, *in vivo* study on *Wistar wistar* rats (n = 35) which consists in the implantation of the biomaterial at the gingival sulcus and the renal capsule; procurement of target organs of the cytotoxicity (sulcus, kidney and liver) and their morphological study with an optical microscope. Our results showed that the implants of titanium alloy (Ti6A14V) indeed disrupt the cellular structure of the organs studied compared to controls. The proliferation of bacterial strains studied was substantially similar in culture plates with and without implants. The proliferation of human fibroblasts in cell culture showed no significant change between the implants pits and the control pits. We concluded that the implants of titanium alloy (Ti6A14V) were biocompatible *in vitro* but cause some problems *in vivo*. This could explain the negative impact of these implants on osseointegration. The surface of implants could be a limiting factor for the biocompatibility and the osseointegration of titanium alloys (Ti6A14V). We have then showed, with a similar histopathological study, that the coating of the implants of titanium

alloy with Diamond-Like Carbon (DLC) reduce completely the observed effects in the kidney and the liver rat.

## Introduction:-

Titanium alloys (Ti6Al4V) are choice biomaterials used in implant and maxillofacial surgery, given their resistance to the biological constraints of the environment. Titanium is an excellent biomaterial whose integration is done by plastic deformation of the bone-implant interface. The metal is permanently incorporated into the bone [1, 2, 3]. The success of osseointegration depends on the existence of multiple factors: biocompatibility of the biomaterial implant-bone interface, the surface of the implant, the impact of the chemical fluids on the material, the adhesion and proliferation of bacteria in the oral cavity on the surface of the implant, and finally the prosthetic imperatives [4, 5, 6, 7, 8, 9, 10, 11, 12]. However, although these biomaterials are already in use, their use still causes problems in a number of cases, that is what led us to raise the question of bio-reactivity interface of titanium alloys with mineralized tissues in particular [6, 7, 13]. To improve the biocompatibility of these implants, the coating by Diamond-Like Carbon (DLC) is often suggested for its good biocompatibility in the oral cavity [14, 15]. In this research, we first reassessed the biocompatibility of titanium alloy implants (Ti6Al4V) by two types of study, with an in vitro human fibroblasts culture and a colonization test with four bacterial strains, and with an in vivo study on *Wistar Wistar* rats by implantation of biomaterial at the level of the lower gingival sulcus and in the renal capsule. Then, in order to improve osseointegration of the titanium alloy implants (Ti6Al4V), we proceeded with the coating of the titanium alloy implants by Diamond-Like Carbon (DLC) already tested biocompatible and not cytotoxic in stomatology.

## Materials and Methods:-

### Biomaterials:-

Implants made of titanium alloy Ti6Al4V (80% titanium, 6% Aluminum, 14% vanadium) were made by using a disk placed on a mandrel carried by a hand-piece, in several samples of 2mm length and 3.75 mm width. Implants were disinfected (by Hexanios G + R, Anios Laboratory) for 15 minutes then sterilized by moist autoclave (Tau Clave 3000, Vacuum) 120° C for 30 min.

### Coating technique:-

The deposition of carbon layers has been made in the laboratory of Condensed Matter Physics of the Faculty of Sciences of Amiens, using the technique of plasma enhanced chemical vapor deposition described by Bharat Bhushan and [7]. Initially, an etching was made at a pressure of 3Pa, power voltage of 250W-770V, subsequently, the amorphous carbon layers were deposited using the following parameters: 1Pa, 250W - 454V for 95min.

### Cell culture:-

The cells used are from a primary culture of human fibroblasts from a gingival biopsy performed during the extraction of a healthy 3rd lower molar imposed by orthodontic indication with the patient's consent. The culture medium used is the HAM'S whose composition is 10% fetal calf serum (Eurobio), 1% L-glutamine (Eurobio), 0.5% penicillin-streptomycin (Eurobio), 5% of the Ultrosor G (Biosepra), 0.5% Fungizone (Sigma). Once they become confluent, the cells were trypsinized, samples of Ti6Al4V titanium implants were placed in culture plates of 12 pits, and cells were seeded at a concentration of  $1 \times 10^5$  cells per ml. Control pits were prepared in the same conditions without implants. All cell cultures were observed daily for a week, using an optical microscope with an inverted stand (Swift Instruments International SA). The cell density was assessed by cell counting in a Malassez's cell according to the exclusion principle of Trypan blue.

### Bacteriological study:-

Four bacterial strains related to the oral cavity and referenced at the Pasteur Institute of Morocco were used for this study (*Escherichia coli*, *Klebsiella pneumoniae*, *Staphylococcus aureus*, *Streptococcus β-Haemolytic*). The culture medium used is the Muller Hinton agar for *Escherichia coli*, *Klebsiella pneumoniae*, *Staphylococcus aureus* and Muller Hinton blood for *β-Hemolytic Streptococcus*. Samples of Ti6Al4V titanium implants were placed on the surface of agar plates previously seeded with the four bacterial strains at a concentration of  $1 \times 10^8$  bacteria / ml. The experiment was performed three times for each bacterial strain. The negative control plates were prepared in the same conditions without the implant. The total period of incubation lasted seven days. The bacterial growth was observed daily to the naked eye and with the use of a binocular magnifying glass (Olympus VMZ, Japan).

**Histopathological Study:-**

The study was conducted on 25 *Wistar Wistar* rats, adult male and female, body weight of 250 to 350 g, from the Centre for Research and Training of the Faculty of Medicine and Pharmacy in Casablanca. The rats were divided into 3 groups: 10 rats implanted in the sulcus, 10 rats at the left kidney capsule and 5 control rats. The animals were anesthetized intraperitoneally with a solution of 1 g of thiopental (Sandoz GmbH, Kundl, Austria) dissolved in 100 ml of NaCl 9‰ at 1.5 to 2 ml of this solution. No antibiotic therapy was administered in particular. Daily for one month, the side effects: vomiting, diarrhea, hair condition have been observed and identified. Each week, the presence or absence of inflammation and gingival bleeding was noted. The sacrifice of animals was performed 30 days after implantation. Each animal was first anesthetized as described above and samples of liver, kidney and implanted para-symphyseal mucosa were performed. A macroscopic study was performed before fixation in formalin 10%. The samples were embedded in paraffin and cut on a microtome (4µm). A color standard in hematein-eosin was performed and microscopic slides were observed under an optical microscope (Olympus, Japan).

Statistical study

Statistical study was performed by using Epi Info using the Chi-square test for qualitative data.

**Results:-****Cell culture:-**

Cells grown in the presence of titanium alloy implants showed a similar cell proliferation in all wells with or without titanium implants throughout the experimental period. Variances compared to controls were not significant ( $p > 0.05$ ). The morphology and cell behavior were similar in control and experimental pits (Figures 1 and 2c et d).

**Bacteriological study:-**

The proliferation of the four bacterial strains (*Escherichia coli*, *Klebsiella pneumoniae*, *Staphylococcus aureus*, *Streptococcus β-haemolytic*) studied with different culture media chosen was similar in both culture dishes witnesses in culture dishes in the presence of implant titanium alloy (Ti6Al4V) ( $p = 0,057$ ). However, observations of various boxes of bacterial cultures with a dissecting microscope and found that bacterial growth is important at the periphery of several boxes and decreases gradually up to the implant, with an area of reduced growth below 0.5 mm around the implant. In the remaining boxes, bacterial growth is normal as well as around the periphery of the implant (Figure 2).

**Histopathological study in animal model:-**

During the implantation period, no animal has shown the sought side effects. However, the observation of sections by optical microscope indicated some cytotoxicity in the gum and kidney and manifested by a slight enlargement of the gingival epithelial cells and kidney with low chromatin condensation in renal cell. It also reflected a stimulation of cell proliferation in vivo ( $p = 0,0037$ ). Liver cells and lobular veins and centrilobular hypertrophy are significant in comparison to the control cells ( $p = 0,13$ ) and indicated a cardiovascular failure that is induced by chronic cytotoxicity due to the implant (Figures 3). Observation of sections of the gingiva revealed no difference between control rats and implanted rats.

**Discussion:-**

The in vitro study in cultured human fibroblasts of the oral cavity and bacterial colonization has shown that titanium implants Ti6Al4V show no cytotoxicity. However, the in vivo study shows some cytotoxicity of implants in the animal model used. This could be explained by the multiple interactions of the biological environment on the biomaterial that promote low failure rate of osseointegration implantology. Indeed, the topography of the implant promotes contact between cell components and molecular bio-guests and the surface of the implant during osseointegration [2, 16, 17, 18]. According to J. Sternad [9,10,13, 19, 20], roughness, surface chemistry and surface treatment of implants has a great impact on the bone-implant interface. Many current research focuses on changes of surface topography of implant materials to improve osseointegration [2, 3, 18]. The exact role of the surface topography of implants on the early stages of osseointegration of dental implants remains poorly understood. In addition, comparative clinical studies with different implant surfaces are rarely performed [13,20]. The originality of this study is that it is carried by two types of studies in vitro and in vivo for the first assessment bioreactivity and cytotoxicity of titanium alloy implants (Ti6Al4V), which pose still some problems osseointegration and then to improve osseointegration of titanium alloy implants with a coating of Diamond - Like Carbon (DLC).

The results of cell culture and colonization of the four bacterial strains does not confirm this cytotoxicity. This prompted us to consider further studies in vitro assays of enzymes and oxidative stress factors involved. We also used to assess the fibroblasts of titanium alloys, but it might be wiser to work on osteoblasts that are involved in the mechanisms of osseointegration. The fibroblasts, however, have the advantage of being more accessible and widely distributed in all the body. Our results of in vivo studies have shown that implants made of titanium alloy (Ti6A14V) more or less disturb the cellular structure of organs studied compared to controls. We concluded that implants made of titanium alloy (Ti6A14V) are biocompatible in vitro but pose some problems biorectivity vivo. This could explain, at least in part, the impact of those implants osseointegration and mineralized tissues in particular. The surface of implants, would by most authors, the limiting factor of this biorectivity (C, D, E).

To improve the osseointegration of titanium alloys (Ti6A14V), we suggest lining or coating of titanium alloy implants by Diamond - Like Carbon (DLC) already tested biocompatible and not cytotoxic in dentistry [15, 24, 25]. Indeed, in vivo evaluation of titanium alloy coated with DLC carbon in our laboratory has demonstrated the disappearance biorectivity problems described in this study [preliminary results].

We concluded that the coating of titanium alloys by the diamond-like carbon could improve osteointegration of titanium alloy implants implantology.

Oral Cancer, squamous cell carcinoma, tobacco and alcohol.

#### Abstract

**Objectives:** We would like to launch the epidemiology of oral cancer in Casablanca - Morocco and target the type of tobacco which brings about the greatest part of oral cancer

**Methods:** An epidemiological study was conducted in Casablanca (Morocco) from the 1st of January 2011 to the 1st of January 2012, at the Oncology Center, the Centre of Consultation and Dental Treatment, the Centre of Otorhinolaryngology and Maxillofacial department. Data collection form helped us to collect the necessary information.

**Results:** The collected total was 83 patients with oral cancer. 92.8% of patients are over 40 years. 68.7% of patients are males. 56.6% of patients are cigarette smokers. 38.3% of patients are alcoholics and smokers. 96.4% of patients have squamous cell carcinoma.

**Conclusions:** From these findings, the epidemiological profile of patients with oral cancer in Morocco is closer to the Western profile which is mainly caused by tobacco and alcohol.

#### Introduction:-

Oral Cancer is a part of Aero Digestive Tract Cancer Superior. In Morocco, according to the cancer register of Casablanca (2005-2007), it represents 30% of head and neck tumors and 1.77% of total cancers (1). It is more than 90% of squamous cell carcinomas. Men between 50 and 70 years are the most concerned, although, a rejuvenation and feminization of the affected population have been recently seen (2). Nowadays and in general terms survival is approximately 30% in 5 years and from 5 to 10% in 10 years.

Tobacco leads to 90% of oral cancers. Tobacco smoking is a known cause of oral cancer, pharynx and larynx. Epidemiological studies have shown that alcohol is a co-factor of oral cancer, oropharynx, hypopharynx and larynx. Tobacco and alcohol poisoning is often accompanied by poor oral hygiene. Tobacco is the initiator and alcohol is the promoter (3-5).

Address:- A PhD student of Centre of Doctoral study in health science-Doctoral training in genetics and molecular pathology-Faculty of Medicine and Pharmacy of Casablanca-Hassan II University of Casablanca.Morocco.

In the West, the epidemiological profile of oral cancer is that of an elderly male patient who is addicted to alcohol and smoking (6-8). Unlike the West, the epidemiology of oral cancer in Senegal has shown that a middle aged female patient, who neither smokes nor drinks alcohol has a poor oral hygiene (9). In Morocco, according to official medical sources (2005-2007) several of data are missing or incomplete(1). We would like to launch the epidemiology of oral cancer in Morocco and target the type of tobacco which brings about the greatest part of oral cancer.

### Materials And Methods:-

The epidemiological study was conducted from the 1st of January 2011 to the 1st of January 2012, at the Oncology Center, the Centre of Consultation and Dental Treatment, the Centre of Otorhinolaryngology and Maxillofacial department.

Data collection forms helped us to collect the necessary information including: sociodemographic characteristics (name, age, sex, health), addiction (tobacco poisoning, type and amount smoked, duration of poisoning and alcohol), the localization of the cancer and its type (anatomopathological findings and TNM classification). This information has been given to all of the above centers.

Statistical analysis was performed using theepi info 6.04d.

### Results:-

**Table 1:-** Summary Table of socio demographic characteristics

Characteristics	n	%
Sex		
Male	57	68.70%
Female	26	31.30%
Age		
>20 years	01	1.20%
20-40 years	05	6%
<40 years	77	92.80%
Income		
Low	61	73.50%
Medium	20	24.10%
High	02	2.40%
Study level		
No		
Primary	41	49.40%
Secondary	24	28.90%
University	18	21.70%
	0	0%
Family history of cancer		
Yes	02	2.40%
No	81	97.60%

The collected total was 83 patients with oral cancer. 60.2% are taken from the Oncology Department. The socio-demographic data show that 92.80% of patients are over 40 years and 68.7% of patients are males(Table 1).

**Table 2:-**Distribution of patients according to the type of tobacco smoked

Toxic habits	n	%	Average/ day	Duration (years)
Cigarette	47	56.60%	20.40	27.50 (pack-years)
Alcohol	18	21.70%	1.16	15.38
Hashish	7	8.40%	3	13.57
Kif	6	7.20%	5.66	13.50
Chewing Tobacco	1	1.20%	3	20
Snuff	1	1.20%	10	1

**Table 3:-**Distribution of patients according to the alcoholics and smokers

Variables	N	%
Tobacco	47	56.60%
Alcohol	18	21.70%
Alcoholic and smoker	18	38.30%

As far as addiction in our sample is concerned, 56.6% of patients are tobacco smokers, among whom 8.4% smoke Hashish, (7.2%) use Kif, (2.4%) snuff and chew tobacco. 38.3% of patients are alcoholics and smokers. One patient (5.55%) is female (Table 2) and (Table 3).

**Table 4:-** Distribution of patients according to the localization of oral cancer

Site	n (%)	N (%)
Lip		25 (30.10%)
Upper	3 (12%)	
Lower	20 (80%)	
Corner of the mouth	2 (08%)	
Tongue		20 (24.10%)
Lateral edge	18(90%)	
Ventral face	1(05%)	
Dorsal face	1(05%)	
Gum		12 (14.50%)
Upper	5 (41.7%)	
Lower	6(50%)	
Upper and Lower	1(08.3%)	
Cheek	12 (14.50%)	12 (14.50%)
Floor of mouth	9 (10.80%)	9 (10.80%)
Palatale		9 (10.80%)
Hard	4(44.4%)	
Soft	4 (44.4%)	
Hard+ soft	1 (11.1%)	
Retro-molarregion	9	9 (10.80%)
Other site		
Lung	1	1 (1.20%)

**Fig.1:-** Distribution of patients according to the type of oral cancer

The study showed that the main localization is in their lips (30.10%) and tongues (24.10%), oral mucosa (14.50%), gingival mucosa (14.50%), palatal (10.80%), Mouth Floor (10.80%) and the retromolar region (10.80%). The study also showed that the overall number according to 96 localizations in 83 patients was only one localization in 72 patients (86.74%), two localizations in 9 patients (10.84%) and three localizations in 2 patients (2.41%) (Table 4). 96.4% of patients with squamous cell carcinoma and 84.34% are well differentiated (Fig.1).

### **Discussion:-**

For the distribution of patients according to the age, our results are similar to a study conducted in France. It showed that oral cancers rarely happen before the age of 35, and that the incidence increases from the age of 40 and reaches its peak between 65 and 70 years (9-13).

The study showed that the incidence of oral cancers in men is higher than in women with a sex ratio of 1.79. Similarly, a study in Burkina Faso showed that there is a male predominance with a sex ratio of 2.0 (14,15). In men, the incidence of oral cavity and pharyngeal cancers is high in western and southern Europe, whereas oral cavity cancers have a higher incidence in south-east Asia, southern Africa and Australia. In women, pharyngeal and oral cavity cancers have a relatively high incidence in south-central Asia and oral cancers have a higher rate in south-east Asia and Australia (16).

Our study showed that 43.4% of patients were non-smokers, while the others (56.6%) all smoke tobacco. Among the latter, 8.4% smoke Hashish, 7.2% take Kif, 2.4% snuff and chew tobacco.

Tobacco leads to 90% of oral cancers. its contribution appears smaller in women. The risk is determined by the dose of the carcinogenic (number of cigarettes smoked) and the time of smoking. The dose-effect is constant between the number of cigarettes smoked and the risk of developing head and neck cancer (17,18,19).

The tobacco chewing (small bag of tobacco put into the mouth) is practiced primarily in Sweden and the United States and in other countries around the world including Morocco. The user puts an amount of tobacco between his lower lip and teeth (from 10 to 30 min) and swallows the juice and spits the surplus. The risk of cancer caused by this practice is not yet clear (20). But repeated chemical attacks by friction can cause painful sores or ulcers (18, 21). The correlation between cannabis use and the occurrence of cancer is not yet clear. Cannabis is used as "herb" - or as a resin made by mixing dried leaves and resinous tops of female plants - (Marijuana) or resin secreted by the flowering tops (Hashish). The resin is always smoked with tobacco. The herb is consumed pure or mixed with tobacco (Kif). The use of "Sebsi" (a small tube in which tobacco is put to be smoked) in Morocco favours lip localization. The simultaneous use of tobacco and cannabis makes it difficult to know the effect of cannabis but trials run on smoking machines (22) have shown that smoking marijuana regardless of its mode of use, contains 6 to 7 times more tars and carbon monoxide than the manufactured cigarette and that the resin is associated with the tobacco inhaling benzene 2 times and 3 times of toluene. That is to say, three cannabis cigarettes are equivalent to one packet of manufactured cigarettes.

In our study, 21.7% drink alcohol. According to the literature, this is the 2nd factor which can cause oral cancer (23). All types of alcohol (wine, spirits, beer ...) contribute to increasing the risk, as well as the dose of pure alcohol contained in beverages without threshold effect (18). Epidemiological data show that for oral and pharynx cancers, the risk is multiplied by 2 for a daily consumption of 25g of pure alcohol, by 3 for 50g and by 6 for 100g (24).

In our study, the simultaneous use of alcohol and tobacco affect mainly the tongue (13.63%), the lip, the floor and the retromolar part. In terms of literature, for the alcohol drinkers, cancer of the lateral edge of the tongue is less common than other cancers of the tongue (including the base of the tongue), and cancer of the mouth floor is two times more common than that of the cheek (25).

The effects of tobacco and alcohol do not add up but multiply (3). This synergy is expressed by a 6-fold increased risk for a person who smokes more than 25 cigarettes and drinks less than 35 g of alcohol per day compared to someone who does not smoke and drink less than 35g of alcohol. The risk is multiplied by 103 for the person who smokes more than 25 cigarettes and drinks on average 100g of pure alcohol per day (26). Kumar R and al, suggest that alcohol, tobacco and high-risk Human papilloma virus infection act synergistically or complement each other in the process of Head and Neck Cancers development (27).

In our study, we have a decrease in the frequency of different types of tobacco (chewed, Snuffed and smoked), and this may be due to either the patient's withholding of information or the consumption of this type of tobacco is lower in Casablanca and its suburbs. This requires us to conduct similar surveys around areas where the production of the different types of tobacco is high.

The study showed that the main localization is in their lips (30.10%) and tongues (24.10%). In Australia, there is a high rate of lip cancer due to solar radiation(28). A Retrospective Study of 740 Cases in a Brazilian Population, showed that squamous cell carcinoma (SCC) were found principally on the tongue(29).

The study showed 96.4% of patients with (SCC). According to the literature, SCC accounts for 90–95% of tumours. Other tumours include minor salivary gland tumours, lymphomas and rare tumours such as melanomas, liposarcomas, rhabdomyosarcomas (30).

In conclusion, the epidemiological profile of the patient who has cancer in the oral cavity in Casablanca - Morocco is closer to the Western profile whose main causes are tobacco and alcohol. The results of the topographic distribution of cancers of the oral cavity by the toxic habits are not sufficient to draw generalized conclusions.

Kunar River, Erosion, Sediment-transport, Sedimentation, HEC-RAS model

#### Abstract

Rivers are easily accessible resources of water for miscellaneous uses but the erosion and sedimentation in rivers are unique and great deal of importance. The analysis of flow and sediment in river under different conditions is a base for rivers' behavior and decision making on engineering aspects. Kunar River is an important river of Afghanistan, has considerable interest because of strategic and environmental condition regarding water resources project planning, agriculture, forests, hydropower and industrial scope. This study is carried out to simulate the process of erosion and sedimentation using HEC-RAS model to assess hydraulic parameters and sedimentation processes in 250 Km stretch of Kunar River from Nari district of Kunar province to Pul-e-Kama of Nangarhar Province. The model was calibrated manually for hydraulic parameters of river flow and then sediment transport model was simulated. The changes in transverse and longitudinal profile, velocity and shear stress variation along the river, mass inflow and outflow, bed level change of river and suspended sediment concentration is studied for the modeled length. The sediment transport from river tributaries and gullies joining the river from two sides of narrow valley is also assessed.

#### Introduction:-

Rivers are the major source of water supply for different purposes, the understanding of river conditions, erosion and sedimentation are the main priorities of engineering projects. River is a dynamic system, undergoes continuous changes. The river is also a self-regulatory system as it changes its characteristics in reaction to any change in environment. The environmental changes can either be natural due to climate change and variation of vegetative cover or artificial due to damming, river training, river diversion, sand and gravel mining, channelization, bank protection and bridges and highway constructions. To restore rivers to equilibrium, they will be adopted to new conditions with changes in bed slope, roughness, bed material size, cross sections shape and meandering pattern. History of each river has dominant influence on the sediment transport rates and the river sediment transport cannot be estimated without sound knowledge of watershed history and dynamics. The phenomenon of sedimentation including the erosion, sediment transport, sedimentation and consolidation of sediments are most important.

Reasonable estimate of sediment transport in alluvial rivers is important in the context of a number of water management issues. Sediment transport is a widely studied topic in which numerous researches have built models for predicting bed material transport in an alluvial river. Information on soil erosion and its effects on water quality at catchment scales are explored by catchment managers. Among several issues resulted from complicated erosion processes, the deposition of sediments are more important especially in rivers having the ability of high sedimentation level (FarhangAzarang et al, [3]).

Sediment accumulation is a problem in many large reservoirs in Afghanistan and worldwide. Available storage of reservoir is decreasing while demand for water is increasing. The reservoirs of Nughlo dam and Kajaki dam which are major water resources project in Afghanistan facing serious problem of reservoir sedimentation. The present study is carried out on sediment transport evaluation and sedimentation capacity of Kunar River with help of HEC-RAS model. Kunar River basin is a main tributary of Kabul Riverbasin that is upper limit is Karakoram of Himalaya Mountains and also carry flow from the southern slopes of Hindu Kush Mountains.

Kabul River basin has 94267 Km<sup>2</sup> watershed area with all its sub-basins which are Logar, Panjshir, Kunar, Center Kabul and Swat. Kabul riverbasin includes 10.6 % area of Indus Riverbasin. Around 40% (1228 tones/km<sup>2</sup>/year) of the sediments leaving the Karakoram are glacier-derived. The most of sediment is deposited in the plains, reducing sediment delivery to the Arabian Sea to about 230 tones/km<sup>2</sup>/year, leading to high sediment fluxes in the small sub-basins within the Himalaya-Karakoram tectonic zone (David N. Collins 1996, [10]). Kunar Riverbasin as Sub-basin of Kabul River also fed from Karakoram glaciers and has sediment yield around 562.606 tones/Km<sup>2</sup>/Year and hence needs serious consideration of sedimentation problems for planning of any water resources activity on this river.

Since the rate of sediment transport is complex and related to various variables such as physiographic characteristics of river basin, bed and flood plain materials of river, stream power and hydraulic characteristics of river thus sediment transport modeling is difficult. Sediment data is uncertain and transport theory is highly sensitive to a lots of physical variables and modeling parameters.

Mathematical modeling of rivers need more physical relationships for sediment transport processes. The fluvial processes are governed by continuity, flow resistance, sediment movements, river bank stability and variation of channel width and are difficult to be presented. Generally width of river changes simultaneously with variation in river bed profile, slope, channel pattern, river channel roughness etc. All those changes are inter-related which maintains a dynamic state of equilibrium and any imposed factor on the river will be absorbed with combination of above responses (Harinarayan Tiwari et al, [12]).

Hydrologic Engineering Center River Analysis System (HEC-RAS) is a mathematical model for river sediment analysis. HEC-RAS includes mobile boundary and sediment transport capabilities for sediment routing and adopts the channel cross sections in response to sediment dynamics. Sediment transport models require hydraulic parameters, therefore HEC-RAS computes hydraulics before sediment routings or updating cross sections means it keeps flow constant for each flow record, calculate sediment transport on record duration. HEC-RAS 5.0 couples sediment transport computations with either quasi-unsteady hydraulics or unsteady hydraulics.

In this study, steady flow backwater equation for series of flow with associated time are solved using quasi-unsteady model and then unsteady flow model is used to solve the Saint-Venant equation implicitly.

The 47 Km length of Sistan River was studied using HEC-RAS model. The purpose of study was to determine the sediment exposed areas of Sistan River. The transverse and change of longitudinal profile of river, shear stresses changes, and sediment transport capacity were examined (Mahdi Motalebian et al. [1]). The HEC-RAS mode was applied to Boshar River, a main upstream reach of Khersan River in Karoon catchment which is located in Kohkeloyeh and Boyerahmad Province-Iran, in order to identify the suitable locations for sand and gravel mining along the river reach. (Mohammad Gharesifard et al. [2]). The simulation of erosion and sedimentation processes and also considering cross section geometric changes, prediction of river and total sediment load of Karun River using HEC-RAS model. The results showed that the Karun River has had sedimentation in its most cross sections while the erosion has been rarely observed. (FarhangAzarang et al. [3])

### Study Area:-

Kunar riverbasin is a major tributary of Kabul river basin which upper limit is Karakoram Range of Himalaya Mountains. Himalaya Mountains supplies the world major part of sediment flux to ocean through the five bigger river of south Asia the amount of sediment is estimated 1.73 Giga tones which is 9% of global sediment flux (David N. Collins 1996, [10]). Another side of this watershed is limited with southern slopes of Hindu Kush Mountains. The river catchment include mountains and highlands which is mostly dominated by natural forests.

**Figure 1:-**Modeled area of Kunar River for sediment transport.

The modeled part of Kunar River for sediment assessment shown in Figure 1 has around 250 km length starting from location with Northing 800413.817, Easting 4023940.034 and Altitude 2126 meters and ending at Northing 640141.777, Easting 3809967.814 and Altitude 538 meters. The relief between starting and ending of the river is 1588 meters and the average slope is determined as 0.00512 for the river channel indicating its scouring.

Kunar River is divided here into two parts (1) upstream (150 – 250 Km) reach and, (2) downstream (0 – 150 Km) reach as shown in Figure 1. The upstream channel located between mountains with stable bed and banks in this narrow rocky valley. Kunar River is steep sloped with high capacity of sediment transportation. The river bed is changed to a fluvial bed in downstream and the river valley becomes wider with less slope and low flow velocity, thus the river stream has low sediment transport capability. Hence, in the second half part of the river, extreme sedimentation occurs and Kunar River converts its bed to several channels and hilly patterns looking from sediment accumulations inside the river channels.

### Methodology:-

In this work, HEC-RAS 5.0 model which is developed by United States Army Corps of Engineers (USACE) has been used for simulation. The mentioned software is able to simulate the steady flow, gradually varied flow, water quality, and sediment transport. This model has advanced graphic abilities to display the software outputs.

**Figure2:-**Data required in HEC-RAS model for sediment modeling

The part of this model for sediment load has been developed to simulate one dimensional deposition of sedimentation and erosion of the rivers. The three main inputs data needed for sediment transport computations are shown in Figure 2.

In addition HEC-RAS model need to specify the Transportation Function (TF) based on soil properties of basin. The TF given by Acker-White, Yang and Wilcock has been used in present study and accordingly Sorting Method (SM) and Fall Velocity (FV) is chosen.

**Geometric Data:-**

For analyzing of a flow problem, geometry is basic input. The geometry is generated using Digital Elevation Model (DEM) in Arc-GIS with help of Geo-RAS. Geo-RAS is an extension of Arc-GIS developed with Hydrologic Engineering Center (HEC) and used to obtain the riveralignment, banks location, flow path and cross section in GIS environment.The geometric data include cross sections, reach lengths and bank locations that is imported to HEC-RAS from ArcGIS.

The Manning’s n value should be introduced for each cross section ofriver, banks and flood plainsseparately. In this study, Manning’s n is considered 0.031 for riverand 0.02 for flood plains as per guide of United States Geological Survey (USGS Water-Supply Paper 2339 [9]).

**Flow Data:-**

In the quasi-unsteady flow, a time series of flowdata is requiredto simulatethe sediment model. The flow datais defined as upstream and downstream boundary conditions. In this study, the Gahwardish stations is the upstream boundary and Pul-e-Kama is the downstream boundary of Kunar River. In addition to this, data of Asmar and Kunari tributaries are added to as flow change locations. The flow hydrograph is given in Figure 3.

**Figure3:-** Flow data for Kunar River as flow series in different years.

**Sediment Data:-**

Sediment data consist of river bed gradation, sediment loads (sediment rating curve). The size of sediment particles plays an important role in erosion and sedimentation processes, each cross section should have a gradation curve in the discrete bed. In this study, the cross sections having statistical data of gradation for river reach from upstream to downstream have been used and the interpolation has been used to generate data for cross sections which do not have data. The rating curve and bed gradation data used in this study are given in Figure 4 and Table 1 respectively.

The rating curve determines the sediment discharge into the river based on the river discharge. The obtained flow discharge-sediment load curve for Kunar River is  $Q_s = 1.4424 Q^{1.7131}$ ,  $Q_s$  is suspended sediment load in tone/day and  $Q$  is river discharge in  $m^3/s$ .

Figure4:-Sediment rating curve for Kunar River.

Table 1:-Bed gradation data

No	Class	Diameter (mm)	Percentage of finer
1	Fine sand (FS)	0.25	0
2	Silty sand (MS)	0.50	8
3	Clay sand (CS)	1.00	24
4	Well graded clay sand (VCS)	2.00	34
5	Very fine gravel (VFG)	4.00	50
6	Fine gravel (FG)	8.00	68
7	Silty gravel (MG)	16	79
8	Clay gravel (CG)	32	85
9	Well graded clay gravel (VCG)	64	95
10	Silty clayey sand with gravel (SC)	128	99
11	Gravelly silty clay with sand (LC)	256	100

**Results and Discussions:-**

The quasi-unsteady flow (unsteady flow analysis) has been carried for given geometric data and flow data of river for sedimentation study in HEC-RAS model. In this software, well known equations are used to determine the total sedimentation load. Predicted change in bed level, maximum change in elevation and other effects are observed which are mentioned in graphical form.

HEC-RAS model for sedimentation give detailed information of erosion/deposition of each cross section, river invert and water surface elevation, flow, velocity, shear stresses, mass changes.

The longitudinal bed profile of Kunar River under the study length is shown in Figure 5. The upstream (150 – 250 Km) reach half of river has more slope than the downstream half-length (0 – 150 Km) reach which causes serious erosions in the upstream half-length and sedimentation in the downstream length of river.

Figure5:-Longitudinal surface water profile along Kunar River

The variation of velocity along length of Kunar River is shown in Figure 6. There is large fluctuations in velocity along the considered reach of channel. The maximum velocity observed is 4.253 m/sec and minimum velocity is very small in some sections where the water depth is more and has a wide surface area.

Figure 6:-Velocity distribution along Kunar River

The shear stresses are frictional force which acts against gravity action and they are directly proportional to specific weight of water, hydraulic radius and slope of the channel. Variation of shear stress given in Figure 7 along the

riverstream indicates that there is almost no shear stress in downstream of river(0 – 150km) reach but in upstream (150 – 250 Km) reach shear stresses are more and fluctuating.

Variation of shear stress along Kunar River may be due to variation of bed slope. Maximum shear stress is 12.588 Pa while the minimum stress are 0.252 Pa. The maximum shear stress in upstream reach as seen in Figure 7 gives the idea that Kunar River in upstream flows through rocky and narrow valley resulting more friction losses and leading to severe erosion problems.

**Figure 7:-**Shear stress variation along Kunar River

The variation in mass changes in both positive and negative (sedimentation and erosion) direction along Kunar River in Figure 8 exhibits intermittent happening of both erosion and deposition processes. In the middle, there is no erosion or deposition in 120 Km to 150km reach. The highest erosion and deposition is observed around 50km reach.

The magnitudes of bed level changes in Kunar river is illustrated in Figure 9. The intermediate occurrences of erosion and sedimentation are observed in all parts of the river.

The maximum depth of erosion in these reaches is about -2.449 m which happens in 50 Km and 80 Km river stations and the maximum deposition is about 1.495 m in downstream (30 – 40 Km) reach of river having wide cross section. It is seen that Kunar River experiences sequentially both erosion and deposition.

The sediments are transported by a river in form of dissolved, suspended load, saltation, wash and bed load. Suspended sediments are part of clastic load which move through channel in water column.

Mainly silt and sand are kept in suspension by upward flux of turbulences generated at bed of the channel. Maximum sediment concentration along Kunar river is obtained to be 506,605.9 mg/L. The variation suspended load concentration along Kunar river is given in Figure 10.

Figure 8:-Mass changes along Kunar River

Figure 9:- Bed level changes along the modeled length of Kunar river.

**Figure 10:-**Sediment concentration along Kunar River

Kunar river seems to be a non-aluvial river in upstream because of the river channel passes through rocks. There are also pools that are very deep up to 100m which effectively trap sediments. Without three main right tributaries which flow toward Kunar River, 98 temporary streams that can be called gullies join with Kunar River from right side along the river and 110 gullies join from the left side as an example is shown in Figure 11.

The gullies have very steep slopes which are located at two sides of the valley. Some of the gullies have comparatively large watershed area with steep slope that creates flooding during precipitation and transport huge amount of sediments from high mountains of both sides to river as Kunar River in this part has high ability of transport so flow transports these sediments and Kunar river changes to alluvial nature in downstream part due to huge sedimentation therefore river bed changes and divided into multi channels as seen in Figure 12.

**Figure 11:-**Gullies entering to main stream of Kunar river

**Figure 12:-** Kunar River at downstream reach with multi channeling and sediment hills

### Conclusions:-

1. The model was first calibrated manually using excel sheet for flow hydraulics and then simulating for sediment transport was carried out. The results showed that Kunar river experience erosion in upstream half-length (150 – 250 Km) reach and sedimentation happens in half-length of downstream (0 – 150 Km) reach. There are many pools in upstream length which causing sediments trapping.
2. The maximum erosion is -2.449 m which happens in 50 Km and 80 Km river stations and might have different reason as high flow velocity or alluvial bed materials. Kunar River has steep slope at upstream half length which can be main reason of erosion processes.
3. The maximum deposition is about 1.495 m in downstream (30 – 40 Km) reach length where Kunar River gets multi channeled feature and sediment hills. One of the main causes of the sedimentation phenomenon can be sudden reduction of river longitudinal slope.
4. It is observed that erosion has been more significant in the areas with steep longitudinal slope and tight transverse sections, while the sedimentation was observed more in the area with flat slope and wide transverse section.
5. Formation of large sand bars due to sedimentation and lack of regular dredging of the river have caused numerous problems including reduction of river capacity in passing flood discharge, severe reduction of Kunar River water quality.
6. The annual sediment yield calculated for Kunar river basin is 562.606  $\text{tone}/\text{km}^2/\text{year}$  that is equal to 11.2313  $\text{Mm}^3/\text{year}$  which is near the sediment yield reported by (David N. Collins 1996, [10]) for rivers of Karakoram region.

#### Abstract

Potential toxicity and effect on biochemical parameters of Deltamethrin and Carbofuran on gonads of *Chrotogonstrachypterus* was investigated. LC<sub>50</sub> values (24 hrs.) for Deltamethrin 22.069 ppm, 2.498 ppm and for Carbofuran 14.263 ppm, 1.711 ppm on female and male *Chrotogonstrachypterus* respectively. Toxicity of two insecticides were not similar for both sexes but male having higher degree of toxicity than female adult at 24 hrs of LC<sub>50</sub> values. The effects of sub-lethal doses of Deltamethrin 11.034 ppm, 7.131 ppm; Carbofuran 1.249 ppm, 0.855 ppm on gonads of adult female and male *Chrotogonstrachypterus* were analysed respectively. Investigation of results evaluates the Carbofuran having greater potential toxicity than Deltamethrin. Analysis of biochemical parameters as protein, cholesterol, alkaline phosphatase and ATPase were evaluated at 12, 24 and 48 hr treatment. Hyperproteinemia (p<0.001) exhibited at 12, 24 and 48 hrs after application of Deltamethrin and Carbofuran in both sexes. The acute toxicity of pyrethroid and carbamate were compared by static exposure on *Chrotogonstrachypterus*. Analysis of LC<sub>50</sub> value, evaluate that synthetic pyrethroids are less toxic than carbamates. Synthetic pyrethroid and carbamate insecticides have been developed for major uses to control crop pest in agriculture and public health.

Copy Right, IJAR, 2017. All rights reserved.

#### Introduction:-

Agriculture relies heavily on the use of pesticides control of insects and other pests. Synthetic pyrethroid and carbamate insecticides constitute the most important class of present day pesticides which control of a pest species by affecting its unique biochemical system. The surface grasshopper, *Chrotogonstrachypterus* (Blanchard) (Orthoptera- Acrididae) is a destructive pest of wheat, barley, oil seed crops, maize, jowar, sunhemp, bajra, rice, sorghum, groundnut, pearl millet, cotton, vegetables, indigo, opium, red gram in different parts of the World. Deltamethrin and Carbofuran cause differential fluctuations in biochemical constituents (protein, cholesterol, ATPase and alkaline phosphatase) on gonads of *Chrotogonstrachypterus* which leads to sterility. LC<sub>50</sub> values of Monocrotophos 36SL and Cypermethrin 25 EC on both the sexes of *Chrotogonstrachypterus* were 353.9 ppm, 151.0 ppm and 33.11 ppm, 16.38 ppm respectively (Shakeet and Bakshi, 2009). Histopathological studies of

Cypermethrin and Monocrotophos on expose to sublethal doses (16.56 ppm, 8.34 ppm and 176.95 ppm, 75.5 ppm) at 12, 24 and 48 hrs on both sexes of *Chrotogonstrachypterus* Blanchard greatly influence process of spermatogenesis and oogenesis respectively (Shakeet and Bakshi, 2009a, 2009b).

Deltamethrin belongs to the most commonly used pesticides worldwide. Pyrethroids are divided by characteristic into type I and type II. Both types of toxicity cause neurological symptoms and reduce reproductive potential. Pyrethroids are synthetic analogues of the natural pyrethrins, extracts of the ornamental *Chrysantemum cinerariaefolium* and its related species. Deltamethrin [(s)  $\alpha$ -cyano-3-phenoxy benzyl-(R)-cis-3-(2, 2-dibromovinyl)-2,2-dimethyl-cyclopropane carboxylate] a synthetic pyrethroid type I. It is highly effective against a broad spectrum of insects with potent insecticidal properties (Manna *et al.*, 2006). Pyrethroid caused alterations in biochemistry, hematology and reproduction (Yousef *et al.*, 2006, El-Demerdes, 2004) and that kills insects on contact and through digestion. Synthetic pyrethroids are less persistent and less toxic to mammals and birds (Sayeed *et al.*, 2003), they are highly toxic to a number of non-target organisms such as bees, freshwater fish and insects even at very low concentrations (Oudouet *et al.*, 2004), for this reason, these are extremely used in agriculture and forestry. LC<sub>50</sub> of Deltamethrin on female and male adults of *Chrotogonstrachypterus* were 22.069 ppm and 14.263 ppm respectively. Earlier observation on Fenvalerate and Chlorpyrifos toxicity on *Chrotogonstrachypterus* were 105.1 ppm, 85.52 ppm and 606.1 ppm, 349.9 ppm respectively (Jangir and Bakshi, 2011).

Carbofuran (2,3-dihydro-2,2-dimethylbenzofuran-7-yl methylcarbamate) or Furadan is an anticholinesterase carbamate commonly used as an insecticide, nematicide and acaricide in agricultural practice throughout the world. Carbofuran is highly toxic by inhalation and ingestion and moderately toxic by dermal absorption. As with other carbamate compounds, carbofuran's cholinesterase-inhibiting effect is short-term and reversible. Carbofuran has a potential to cause damage to the reproductive system and to health by prolonged exposure (Nasir Aziz, 2008). LC<sub>50</sub> of Carbofuran on female and male adults of *Chrotogonstrachypterus* were 2.498 ppm and 1.711 ppm respectively. Carbofuran has decreased the contents of carbohydrates and total protein in testicular tissue (Wael M. Al-Amond, 2012). The aim to conduct the present study was to determine the potential toxicity and biochemical alteration in gonads of *Chrotogonstrachypterus* after exposure of insecticides: Deltamethrin, Carbofuran, Cypermethrin, Fenvalerate, Chlorpyrifos and Monocrotophos.

## Material and Methods:-

### Insecticides:-

Carbofuran and Deltamethrin will be selected for study these were purchased from Rathore Beez Bhandar, Sabzi Mandi, Lal Kothi, Jaipur, India.

### Rearing of *Chrotogonstrachypterus*:-

*Chrotogonstrachypterus* were collected from the fields (Rajasthan University ground), low crop ground, bare soil and grass or the waste land. The collected insects were conditioned in the laboratory. Rearing was done at room temperature ranging from 27 to 37°C in summer months and rainy days. During winter, temperature range from 27 to 32°C was maintained in the cages. The rearing was carried out at room humidity 35 to 65 per cent.

### Mode of Application:-

*Chrotogonstrachypterus* were treated by dipping method because of the smaller size and hopping behaviour of the insect. About 5 ml solution of a sub-lethal concentration of the Deltamethrin and Carbofuran was taken in a small crucible, cleared and sterilized. A grasshopper held dorsally at the thoracic region by forceps was just dipped in the insecticide contained in the crucible.

Observations were recorded on the basis of insect's mortality at 24hrs. The results obtained were subjected to Quantal Response Assay. The LC<sub>50</sub> of Deltamethrin and Carbofuran against *Chrotogonstrachypterus* were obtained by using the following formula -

$$\text{Log LC}_{50} = \text{Log } x_0 + \frac{0.50 - P_0}{P_+ - P_0} \Delta$$

Where  $x_0$  be the highest dose that gives a reaction,  $P_0 < 0.50$ ,  $P_+ > 0.50$  and  $\Delta$  = dose step (Ipsen *et al.*, 1970).

**Determination of Sub-lethal Dose of Deltamethrin and Carbofuran against *Chrotogonustrachypterus*:-**

The LC<sub>50</sub> values of Deltamethrin and Carbofuran against female and male *C. trachypterus* were 22.069 ppm, 14.263 ppm and 2.498 ppm, 1.711 ppm respectively. In continuation of above results the sub-lethal dose of Deltamethrin and Carbofuran on female and male adults of *C. trachypterus* was 11.034 ppm, 7.31 ppm and 1.24 ppm, 0.855 ppm respectively when applied by the dipping method. The effects were observed after 12, 24 and 48 h intervals and compared with control.

**Bio-chemical Estimation:-**

1. **Estimation of Protein:** Total protein was estimated by the Lowry *et al.*, (1951) procedure. The absorbance was read at 640 nm against blank. The activity was expressed in mg/g of the wet tissue.
2. **Estimation of Cholesterol:** Total cholesterol was determined by the method described by Zlatkiset *al.*, (1953). Cholesterol has unsaturated bonds and phenanthrene ring structure. The absorbance was read at 540 nm against blank. The activity was expressed in mg/g of wet tissue.
3. **Estimation of Alkaline Phosphatase:** Alkaline phosphatase was estimated by the method after Fiske and Subba-row (1925) for the determination of phosphate liberated with modification including the incubation procedure of Bodansky (1932, 1933) using alkaline buffer. The phosphatase activity is the difference between the inorganic phosphate content of the incubated and control samples and is expressed in terms of Bodansky unit corresponding to the liberation of inorganic phosphorus from the tissue in mg pi/g/h.
4. **Estimation of Adenosine Triphosphatase(ATPase):** For quantitative analysis of the activity of ATPase, the method given by Sickevitz and Potter (1953) was followed. Tissues were homogenized in sucrose. Disodium salt of ATP was used as substrate. The activity was measured in term of inorganic phosphorus liberated from the tissue as for the acid and alkaline phosphatases. The absorbance was read at 640 nm.

**Statistical Analysis:-**

The results obtained were expressed as mean±S.E. The statistical analysis by use of Student's t parametric test was performed to determine significant differences. The significance levels were expressed in 'P' values as

NS = Non significant

P<0.05 = Significant

P<0.01 = More significant

P<0.001 = highly significant

**Results and Discussion:-****Toxicity Results:-**

Results of the bioassay of Deltamethrin and Carbofuran tested against the female and male adults of *Chrotogonustrachypterus* were summarized in table 1.

Effect of Deltamethrin on female adults: Insects mortality at 400, 800, 1100, 1200, 1300 ppm concentration were 3.57, 14.29, 41.18, 76.47 and 100% at 24 hrs respectively (Table 1). LC<sub>50</sub> value for female adults at 24 hrs was found to be 22.069 ppm with confidence limits of 24.06 and 7.81 (Table - 2, fig -1).

Effect of Deltamethrin on male adults: Insects mortality at 200, 400, 550, 600 and 750 ppm concentration were 10, 44.44, 71.43, 88.46 and 96.97% at 24 hrs respectively (Table 1). LC<sub>50</sub> value for male adults at 24 hrs was found to be 14.263 ppm with 95% confidence limits of 17.16 and 11.84 (Table -2, fig -2).

Effect of Carbofuran on female adults: Insects mortality at 0.4, 0.1, 0.12, 0.16 and 0.2 ppm concentration were 3.13, 8.33, 23.53, 66.67 and 95% at 24 hrs respectively (Table 1). LC<sub>50</sub> value for female adults at 24 hrs was found to be 2.498 ppm with confidence limits of 3.11 and 2.00 (Table - 2, fig -3).

Effect of Carbofuran on male adults: Insects mortality at 0.2, 0.5, 0.6, 0.8 and 0.1 ppm concentration were 3.45, 9.52, 33.33, 81.25 and 95.65% at 24 hrs respectively (Table 1). LC<sub>50</sub> value for female adults at 24 hrs was found to be 1.711 ppm with confidence limits of 1.93 and 1.62 (Table - 2, fig -4).

**Effect of Deltamethrin on biochemical parameters:-****1. Protein**

**Male:** -A highly significant (P<0.001) increase was recorded in protein level of male insects after 12, 24 and 48 hrs of treatment (Table 3, Fig. 5).

**Female:** - Protein level highly significant increase ( $P < 0.001$ ) at 12, 24 and 48 hrs in females (Table 3, Fig. 5).

## 2. Cholesterol

**Male:** - There was a highly significant ( $P < 0.001$ ) increase in cholesterol level at 12 and 48 hrs of the treatment which was followed by highly significant ( $P < 0.001$ ) decrease at 24 hrs (Table 3, Fig 6).

**Female:** - Highly Significant ( $P < 0.001$ ) decrease was recorded at 24 hrs in cholesterol level while at 12 and 24 hrs highly significant ( $P < 0.001$ ) raised (Table 3, Fig. 6).

## 3. Alkaline Phosphatase

**Male:** - A significant decrease in alkaline phosphatase activity was recorded 48 hrs after treatment, but slightly significant increase ( $P < 0.01$ ) after 24 hrs and highly significant ( $P < 0.001$ ) increase 12 hrs of the treatment (Table 3, Fig. 7).

**Female:** - A non-significant increase in alkaline phosphatase level at 24 hrs while at 12 and 48 hrs significantly declined (Table 3, Fig. 7).

## 4. ATPase

**Male:** - ATPase level highly significant ( $P < 0.001$ ) increased 12, 24 and 48 hrs. (Table 3, Fig. 8)

**Female:** - ATPase analysis of result in females recorded similar as in males but at 24 hrs slightly fluctuation was occurred (Table 3, Fig. 8).

### Effect of Carbofuran on biochemical parameters:-

#### 1. Protein

**Male:** - A highly significantly increase ( $P < 0.001$ ) in protein level was recorded at 12, 24 and 48 hrs (Table-4, fig-9).

**Female:** - There was a highly significant ( $P < 0.001$ ) increase was recorded in treated females at 12, 24, 48 hrs similar as in males (Table-4, fig-9).

#### 2. Cholesterol

**Male:** - Increase in cholesterol level was highly significant ( $P < 0.001$ ) at 12 and 48 hrs of the treatment and slightly decrease at 24 hrs in cholesterol level (Table-4, fig- 10).

**Female:** - Continuously highly significant ( $P < 0.001$ ) increase in cholesterol level at 12, 24 and 48 hrs were recorded (Table-4, fig-10).

#### 3. Alkaline phosphatase

**Male:** - A highly significant ( $P < 0.001$ ) increase in alkaline phosphatase was recorded at 24 hrs of the treatment. Thereafter a highly significant ( $P < 0.001$ ) decrease in the activity of alkaline phosphatase was recorded at 12 and 48 hrs after the treatment (Table-4, fig-11).

**Female:** - There was a highly significant ( $P < 0.001$ ) increase in the activity of alkaline phosphatase at 24 hrs and decrease the level of alkaline phosphatase on 12 and 48 hrs (Table-4, fig-11).

#### 4. ATPase

**Male:** - A continuous increase of ATPase level which was highly significant ( $P < 0.001$ ) at 12, 24 and 48 hrs after the treatment (Table-4, fig-12).

**Female:** - Experimental result analysis similar as in males (Table-4, fig-12).

Treatment with Deltamethrin and Carbofuran were found potentially effective, quantitative estimation of biochemical parameters viz. Protein, Cholesterol, Alkaline phosphatase and ATPase in the gonads of *Chrotogonustrachypterus*.

### Discussion:-

#### Potential Toxicology:-

Toxicity of insecticides is highly dependent on the duration, frequency, intensity of exposure and the susceptibility of the target organism which is influenced by age, sex, fitness and genetic variation. The tested insecticides, Deltamethrin and Carbofuran exhibited a fair degree of contact toxicity on female and male adults of *Chrotogonstrachypteris*.  $LC_{50}$  values (24 hrs.) for Deltamethrin and Carbofuran on female and male *Chrotogonstrachypteris* were 22.069 ppm, 14.263 ppm and 2.498 ppm, 1.711 ppm respectively. Observation findings emphasize that male adults were more susceptible to compounds than female adults. Results directly reflected that more mortality of male *Chrotogonstrachypteris* also reduce the fertility. Earlier observations revealed that the  $LC_{50}$  value of Monocrotophos 36 SL and Cypermethrin 25 EC against female and male adults of *Chrotogonstrachypteris* by dipping method, were 353.9 ppm, 151.0 ppm and 33.11 ppm, 16.38 ppm respectively (Shakeet P. and Bakshi S., 2009). Jangir N. and Bakshi S. (2011) also observed that Fenvalerate (85.52 ppm) is more toxic than Chlorpyrifos (349.9 ppm). Present findings also supported by Choudhary *et al.* (2000), that Fenvalerate (pyrethroid) were more toxic than chlorpyrifos (phosphate) when they investigate relative toxicity of insecticides against *Acrotylushumbertianus* grasshopper. Toxicity on subterranean termite *Coptotermes formosanus* were determined on Deltamethrin (pyrethroid)  $LD_{50}$  was most toxic and Chlordane least toxic (Su, Nan- Yao *et al.*, 1990). According to Blair D. Siegfried (1993), the acute toxicity of three pyrethroids (permethrin, cypermethrin, bifenthrin) greater than one organophosphate insecticide (chlorpyrifos). Radka Dobsikova (2003), revealed that test of acute toxicity with Carbofuran confirmed the high toxicity of the chemical to selected species of aquatic organism than terrestrial organism. According to Nitin Sood and Sharma D C (2004), synthetic pyrethroids have higher persistent toxicity than neem derivatives. Experimental results also exhibit both the insecticides have shown to be consistent effective in controlling *Chrotogonstrachypteris* in field crops. The present findings derive ample support in pest management and saving the crops against damage from the pest *Chrotogonstrachypteris*. Conclusion of the present investigation analyse that the carbamates are more toxic than synthetic pyrethroids and organophosphates. Potential effect of toxicity on insecticides were -

Chlorpyrifos (349.9 ppm) <Monocrotophos (151.0 ppm) <Fenvalerate (85.52 ppm) <Cypermethrin (16.38 ppm) <Deltamethrin (14.26) <Carbofuran (1.71) (Table - 2)

### Biochemical Parameters:-

#### Protein:-

Current study results summarize *Chrotogonstrachypterus* treated with sub-lethal dose of Deltamethrin and Carbofuran exhibited hyperproteinemia or increase the protein level in both sexes till 48 h when the experiment was terminated. Smitha and Rao (2010), evaluate sublethal dose of selenium on silk worms showed significantly increase in females at 12hrs after treatment and also showing hyperproteinemia on all exposure periods. The effect of *Bacillus thuringiensis* var. *kurstaki* on biochemical alteration in haemolymph found protein content increase in experiment (Tripathi and Singh, 2002). Toxicant influence of Fenvalerate the proteins and glycogen levels totally decreased in various tissues of *Channapunctatus* (Bloch) (Satyavardhan, 2010). Biochemical alterations after effect of sub-lethal doses (176.95 and 75.5 ppm) of Monocrotophos on gonads of female and male *C.trachypterus* as protein, cholesterol and alkaline phosphatase decrease and ATPase level increase (Shakeet and Bakshi, 2010a). Deltamethrin induced a significant decline in serum total protein concentration, albumin and globulin at third day of first, second and fourth week after application of Deltamethrin in buffaloes (El Nabarawy., 2008). Histochemical results revealed that animals given Carbofuran had decreased contents of carbohydrates and total proteins in the testicular tissue. Treating mice with Carbofuran and vitamin C showed an improvement in testicular damage (Wael M. Al-Amoudi, 2012). Significantly reduced total head protein after 24, 48, and 72 h treated of *Ageratum conyzoides* L. and *Artemisia vulgaris* (L.) in third and fourth instar larvae of *Spodopteralitura* (Renuga and Sahayaroj, 2009).

#### Cholestrol:-

Earlier observation of Shakeet and Bakshi (2010b), effect of Cypermethrin on biochemical parameters on gonads of *C.trachypterus* as the protein, cholesterol, acid phosphatase and ATPase increase in level and decrease the level of alkaline phosphatase. Current results showed that cholesterol level was highly significantly ( $p < 0.001$ ) raised at 12, 48 hrs and slightly decline at 24 hrs after exposed to Deltamethrin and Carbofuran in both sexes. The effects of sub-lethal doses of Cypermethrin on the sixth instar larvae of *T. castaneum* (Saleem *et al.*, 2005) the high cholesterol level on gonads of *L. augur* parasitized by *H. vishwakarma*. Level of cholesterol level significantly increased in mice after exposure of carbosulfan and adverse effects on liver functions leading to physiological impairment (R.L. Ksheerasagar1, M.B. Hiremath and B.B. Kaliwal, 2011). It is expected that the changes in the cholesterol level in the tissue may contribute to the dis-functioning of hormonal balance due to disturbed metabolism and affecting reproduction.

#### Alkaline Phosphatase:-

A non-significant increase in alkaline phosphatase activity treated with Deltamethrin at 24 hrs was recorded in female adults and significantly declined ( $p < 0.01$ ) at 12, 24 and 48 hrs in male adults. While after application of Carbofuran, highly significantly ( $p < 0.001$ ) increase in alkaline phosphatase level at 12 and 48 hrs in male adults and slightly fluctuations at 24 hrs in both sexes. Spinosad caused depletion in alkaline phosphatase activity while increase in acid phosphatase activity in treated *T. castaneum* (Hussain, 2009). Methomyl (carbamate) induced gonadal dysfunction, biochemical contents and enzyme activities in male albino mice. Biochemical studies of testis and epididymis showed methomyl at doses of 2, 3 and 4 mg/kg/day and in 4 mg/kg /day for 10 and 20 days of methomyl treatment caused significant decrease in the levels of DNA, RNA, protein, glycogen and sialic acid whereas cholesterol increased significantly and alkaline phosphatase and ATPase decreased (Manawadi S.I. and Kaliwal B.B., 2010).

#### ATPase (Adenosine Triphosphatase):-

The activity of the energy enzyme ATPase obtained highly significant increase in both the sexes treated with Deltamethrin and Carbofuran. The finding of the present investigation reveals that enough energy is consumed during metabolism due to the effect of the Deltamethrin since an increase in the activity of ATPase. Helena Cristina Da Silva de Asiset *al.*, (2009) found that Deltamethrin inhibited the activity of gills and heart  $\text{Na}^+$ -  $\text{K}^+$  ATPase., induced liver total CYP 450 as well as the liver EROD activity.

#### Abstract

**Aim:** The aim of this study was to investigate, by means of three-dimensional finite element analyses (3D-FEA), the influence of post materials and luting cements on stress distribution within posts, root dentin and their displacement under 100N identical perpendicular loading,

**Materials and Methods:** A 3 mm section of endodontically treated canine tooth was scanned and reconstructed for 3-D modelling and Finite Element analysis (FEA). A ceramic post (CP) and a glass fibre post (GFP) were tested individually with four luting cements zinc phosphate (ZPH), glass ionomer (GI), resin modified glass ionomer (RMGI) and resin based cements (RC). A push-out test was conducted by subjecting all models to 100 N perpendicular loading at the post.

**Results:** The maximum stresses generated along the CP-cement interface were significantly higher than corresponding stresses in the GFP-cement interface regardless of the cement type. GFP generated seven times higher stresses within the root dentine than metal posts when ZPH and GI were used, and three times higher when RMGI and RC were used. The displacement of GFP was double (20 $\mu$ ) the displacement of CP (50 $\mu$ ) in all groups.

**Conclusions:** The low elastic modulus of GFP generated lower stresses along its interface and higher stresses within the root dentine, therefore the probability of debonding and root fracture in the GFP group was lower.

**Introduction:-**

The criteria for the use of a cast metal, metal ceramic or all ceramic restoration of a tooth that has been damaged to the extent that it must be reinforced or protected to withstand the masticatory load without fracture. Most individual teeth requiring cemented restorations, as well as many fixed partial denture abutments, have been damaged enough to require modification of classic preparation design. The amount of tooth structure destroyed is only one factor to consider in selecting a restorative material and designing a preparation.

Endodontically treated teeth usually undergo several changes due to loss of blood supply, dehydration, alteration of the physical and mechanical properties of the tooth, let alone the loss of significant sound tooth tissues. Subsequently endodontically treated teeth become susceptible to crack or fracture especially when posts are considered for restoring these teeth.<sup>1</sup>

Restoration of endodontically treated teeth is a common problem in restorative dentistry, related to the fractures occurring in such teeth. Endodontically treated teeth are affected by a higher risk of biomechanical failure than vital teeth. The access preparation for endodontic treatment causes the loss of the roof of the pulp chamber, which may account for the relatively high fracture incidence documented in pulpless teeth.<sup>2</sup>

The clinical decision as to whether to restore an endodontically treated tooth by provision of an intracoronal or extracoronal restoration is empirical. When the endodontically treated tooth is left with limited supraosseous tissues, a post might be considered for their restoration to provide a platform for retention, either for an intracoronal or extracoronal restoration. Various in vitro and in vivo research advocated improved root fracture resistance, the reported success rate for post and core restorations was 83–97%.<sup>1</sup>

On the contrary, post-induced stresses within root dentine, particularly in debonded posts, are the main factors in initiating crack formation which might lead to root fracture. Some studies suggested that a post should only be considered when there is insufficient coronal remaining tissue to retain the core and support the definitive restoration.

Fibre reinforced posts have several advantages over other posts owing to their elastic modulus which is similar root dentine and bonding potential when resin based luting cements are considered. The clinical performance of fibre posts and direct composite full cuspal coverage was comparable to indirect metal crowns over a period of three years in clinical service.

The ultimate aim of bonding fibre reinforced composite post is to create a monoblock within the root canal system, as the elastic modulus being similar to root dentine, in order to improve the root fracture resistance and reduce the problems associated with debonding of fibre posts.

The purpose of this study was to investigate, by means of three-dimensional finite element analyses (3D-FEA), the influence of post materials and luting cements on stress distribution within posts and root dentine, and their displacement under 100 N identical perpendicular loading.

The hypothesis to be tested in this study was that no difference exists between ceramic posts and glass fibre posts cemented with different luting cements in terms of their stress generation and the risk of root fracture under occlusal loading.

**Materials and method:-**

An endodontically treated canine root was scanned using micro computed tomography. Scans were imported by for segmentation and masking depending on pixel density. Subsequently, a 3-D model was developed to represent a post (ceramic or glass fibre), cement, root dentine, periodontal ligament (PDL) and alveolar bone (Figure 1-7). Four luting cements [zinc phosphate (ZPH), glass ionomer (GI), resin modified glass ionomer (RMGI) and resin based cements (RC)] were employed and divided into two groups: Ceramic post (MP) (n = 4) and glass fibre post (GFP) (n

= 4) groups. Finite element (FE) meshing was carried out by AnsysPreprocessor to create eight FE models, each of which was 3 mm thick; within these eight models the thickness of PDL and cement was identical (0.2 mm)(Figure 7,8).

Care was taken to concentrate elements in the region of greatest interest of stress distribution pattern. The element was defined as 10 nodes having degrees of freedom at each node; the elements were constructed so that their size aspect ratio would yield accuracy. elastic modulus and coefficient of poisson which were obtained from the literature. The FE model comprises 20165nodes and 15904 hexahedral elements, and the aspect ratio throughout the model was close to 1:1. All the vital tissues (cortical bone,PDL, dentin), ceramic post, and four luting cements zinc phosphate (ZPH), glass ionomer (GI), resin modified glass ionomer (RMGI) and resin based cements (RC) except glass fibre post (GFP) were presumed to be linearly elastic, homogenous and isotropic. Glass fibre post (GPF) was considered orthotropic.

The corresponding elastic properties such as young's modulus and Poisson's ratio of bone, periodontal ligament, dentin, luting cements, ceramic post and glass fibre post were determined using literature survey(Table 1). All eight models with ceramic and glass fibre post and four luting cements were used for load application and load analysis. A 100N push out force was applied vertically to calculate the stresses in root dentin, post and luting cement and the amount of displacement induced.

These different models were analyzed by the processor and displayed by post processor of the finite element software (Ansys, version 8.0) using von mises stresses analysis. Von mises stress values are defined as the beginning of deformation for ductile materials. Failure occurs when von mises stress values exceed the yield strength of a material.<sup>3</sup>

### Results:-

The study is done using three-dimensional finite element analyses (3D-FEA), to study the influence of post materials and luting cements on stress distribution within posts and root dentine, and their displacement under 100N identical perpendicular loading.

**Table 2** and **Table 3** show the comparative values of principal stress, post stress, dentin stress, cement stress and deformation with ceramic and glass fibre post.

**Figure 4-8** show the comparative values of stress distribution among the four luting agents [ zinc phosphate, GIC, RGIC, RC]

### Discussion:-

Post and core systems are commonly used for the restoration of endodontically treated teeth when the teeth have suffered coronal damage. Loosening of the post and core or fracture of remaining dentin root are most frequent problems observed.

Several methods have been used to analyze the effects of the post-core system on the stress distributions in dentin. Experimental methods and the finite element method are commonly used. Experimental methods include tensile test, shear loading test, and photoelastic analysis. Photoelasticity is based on the property of some transparent materials to exhibit colorful patterns when viewed with polarized light.

In the two dimensional (2D) method, models are fabricated using a transparent plastic sheet. However, 2D finite element models are regarded as inadequate since the tooth structure and the loading forces are not two-dimensional. A 3D finite element method is a more accurate way to analyze the stresses in a tooth using ANSYS software. The finite element method has been used for more than two decades for stress analysis of teeth.<sup>4-8</sup>

All mechanical properties are measures of the resistance of a material to deformation, crack growth, or fracture under an applied force or pressure and the induced stress. An important factor in the design of a dental prosthesis is strength, a mechanical property of a material, which ensures that the prosthesis serves its intended functions effectively and safely over extended periods of time.

In this 3-D FEA study, a section of the upper canine root was from segmented micro CT data to create a sophisticated model which was subjected to a push-out pressure at the post area to estimate post displacement and stress distribution in different cement types and post materials. 100N Push Out Test was performed and the Stress Distribution was studied along ceramic post(P1), glass fibre post(P2) and four luting agents; zinc phosphate, glass ionomer, resin modified GIC, resin cement [TABLE 2,3]

The stresses generated in ceramic post using four luting agents were (23.782Mpa, 23.849Mpa, 22.268Mpa, 23.269Mpa) respectively which were uniform

Post and core systems are commonly used for the restoration of endodontically treated teeth when the teeth have suffered coronal damage. Loosening of the post and core or fracture of remaining dentin root are most frequent problems observed.

The stresses generated in glass fibre post using four luting agents were (18.256Mpa, 18.266Mpa, 18.405Mpa, 18.341Mpa) which were uniform among four cements. The stresses generated were more in ceramic post than the glass fibre post irrespective of the luting agents.

The stresses generated in ceramic post are less when RMIC was used (22.268Mpa) and more when ZP was used (23.782Mpa) when four luting cements were used. The stresses generated in Glass fibre post are less when RC was used (16.554Mpa) and more when GIC was used (17.318Mpa) when four luting cements were used.

The stresses generated among cement interface was less when glass fibre post was used with RC (12.529Mpa) and more when ceramic post was used with ZP (20.673Mpa).

The stresses generated within dentin were less when glass fibre post was used with RC (9.369Mpa) and more when ceramic post was used with RC (16.425Mpa.)

The deformation of the post was less when glass fibre post is used with RC (0.02mm) and more when ceramic post was used with RMIC (0.05mm).

The elastic modulus of fibre posts which is lower than the ceramic post and similar to root dentine generated lower stresses along the post-cement interface compared with ceramic posts. The stresses generated within the root dentine were much less in the Glass fibre post groups as the elastic modulus of glass fibre post is similar to dentin.

The findings of this study are in agreement with another recent 3-D FEA study which indicated that stress within root dentine is lower in the GFP group than their counterparts, the risk of root fracture is lower in the fibre post group.<sup>9-10</sup>

Root cracks are usually initiated after posts debonding takes place; the level of induced stresses will be dramatically increased and become concentrated at the small surface area of the root dentine. When these concentrated stresses exceed the tensile strength of root dentine, it will subsequently result in a clinically or radiographically detectable root fracture.<sup>11,12</sup>

Creating a monoblock within the root canal system with post having similar modulus of elasticity to root dentin is a key for long-term survival of posts. Therefore, fibre posts bonded to root dentine with dual-cure bonding resin cement is a prerequisite for a durable restoration.<sup>13</sup>

Glass ionomer and resin modified glass ionomer cements have bonding potential to root dentine, lower solubility, higher tensile strength and fluoride release. However, they suffer some limitations like solubility and microleakage which makes them susceptible to hydration and expansion, and subsequently debonding and failure of the whole restoration.<sup>14</sup>

Resin based luting cements are most widely used in bonding posts to root dentine. However, some studies have cast doubt on their bonding strength to root dentine and indicated that degradation and disintegration might happen over time. Subsequently, this might lead to microleakage along the dentine-cement interface.<sup>15-16</sup>

Conversely, other reports indicate resin based cements improve fracture resistance of endodontically treated teeth and reduce microleakage compared to other cements. In light of the findings of this study, it has been demonstrated

that resin cement along with fibre posts reduce, to a great extent, the stress along the root-cement interface and post displacement and subsequently root fracture which was in agreement with another push-out FEA study.<sup>17</sup>

#### **Summary:-**

Post-core restored endodontically treated teeth are complex systems due to the small dimensions, structural complexities, multiple components with significantly different material properties, and variations in loading directions and the magnitudes. A 3D finite element model has been developed, which includes dentin, PDL, bone, post and luting agent. Because of their elastic modulus being similar to dentin, the cementum is included in the dentin portion of the tooth. All components have been assumed to be perfectly bonded, and all materials have been assumed to be homogenous, isotropic, linear and elastic.

The geometrical model has been built using Pro/Engineer and the commercial finite element analysis package ANSYS has been used for the generation of the finite element model, stress calculations and post processing. A convergence test has been conducted to determine the proper number of the elements. Principal stresses in dentin, posts, luting agent and the deformation have been calculated, and the results have been shown in graphic forms.

#### **Conclusion:-**

Within the limitations of this FEA ANSYS software study, the following conclusions were made;

1. A post with high elastic modulus causes high stress concentrations in dentin and the posts.
2. The stress distributions in both dentin, post and cement interface were high in ceramic post when compared with glass fibre post.
3. Deformation of the post is more in ceramic post(50 $\mu$ ) when compared to glass fibre post(20 $\mu$ ).
4. Among the luting agents resin cement and resin modified GIC showed lower stress concentrations when used with ceramic and glass fibre post.
5. High stresses in dentin are highly undesirable because they may cause the fracture of dentin and failure of the restored tooth.

#### **Acknowledgement:-**

I take this privilege & pleasure to acknowledge the contributions of many individuals who have been inspirational & supportive throughout my work undertaken & endowed with the precious knowledge to see success in my endeavor. It is my privilege and honour to express my most sincere and heartfelt thanks to **Dr.KALESWARA RAO ATLURI**, Professor & H.O.D, Department of Prosthodontics and crown & bridge, Drs.Sudha&Nageswara Rao Siddhartha Institute of Dental Sciences for his valuable guidance, keen interest, perennial inspiration & everlasting encouragement. I shall forever remain indebted to him for having inculcated in me a quest for excellence, a spirit of diligence & perseverance, a sense of humility, honesty & respect for the moral & ethics which govern our sciences & without whom this work would not have seen the light of the day.

I would like to thank **Dr. V. RAVI KIRAN**, Professor, **Dr. T. SUNIL CHANDRA**, Reader, **Dr. S. HEMCHAND**, Reader, **Dr. A. PREMALATHA**, Reader, **Dr. T. DURGA PRASAD**, Reader, **Dr. V. HARSHA**, Senior Lecturer for their valuable guidance, constant encouragement and suggestions throughout the study.

I am thankful to **Dr. M. V. RAMOJI RAO**, Principal for permitting me to utilize the facilities required for the study.

I would like to thank **M. NAGABHUSHAN**, FEA software analyzer who helped me to complete my study through his skill and support.

I thank my batchmates **Dr. Y. TEJASWI** and **Dr. K. DURGA BHAVANI** for their support and encouragement. I also thank my juniors **Dr. P. PAVANI**, **Dr. CH. DEEPIKA**, **Dr. P. ANISH**, **Dr. K. SRIVANI**, **Dr. K. SUSHMA** and **Dr. CH. TEJASWI** for assistance during my study and also for their love and moral support.

#### Abstract

Misusing of antibiotics has been increasing in our society especially with easy access and the deregulations from the authority of selling antibiotics without medical prescriptions. With the misusing of the antibiotics, the resistance increased in our community and hospitals. Many reasons had led us to this problem other than the easy access to the antibiotics, lack of education from health caregiver, stop antibiotic when feeling better, using leftover antibiotics, using antibiotics in viral illness such as upper respiratory tract infection. The aim of this study is to evaluate the awareness of misusing antibiotics in the senior medical student at Umm Alqura University. This study is a cross-sectional study was done in march 2016 to October 2016, and a total number of 170 of senior medical student males and females participate in this study and it showed female were the higher percentage in using the antibiotics, 69% of abused drug in female was Augmenting.

#### Introduction:-

Antimicrobial resistance a drug become less powerful against some type of microorganism which makes treating the infectious disease more challenging and increasing in the mortality from infectious disease [1, 2]. 2 million people acquire infections with resistance bacteria that are resistant to one or more of the antibiotics that developed to treat that infection and 23,000 people annually dies as result of antibiotic resistant in the United States [11]. Most of these infections are a common organism and this what makes the problem more serious. As we can see the number is really high and it has been increasing recently and it consider as a global health issue [2]. There are many reasons behind this antibiotic resistance but the main reason is misusing OTC antibiotic and self-medication with the lack of medical background [4,6,7] other reasons like saving time and money, feeling better with same antibiotics in a previous illness, leftover medicine available [12]

The prevalence of antibiotic misuse seems to be much higher in developing countries and it's increasing more and more comparing to the developed countries, which have more strict rules when it comes to prescribing antibiotics, and making the only way to get antibiotics is with medical prescription [10][3]. It has been estimated that tow third of antibiotics that people take orally is misused and shouldn't be taken [5].

The aim of this study is to assess the antibiotic misuse and to evaluate the awareness of the medical student when it comes to deal with over the counter antibiotics in Umm Alqura University Makkah Saudi Arabia

**Method:-**

This is a cross-sectional study was done on senior medical student males and females at Umm Alqura University, with a sample size (170), calculated by ROASOFT, sample size calculator with a 5% margin of error, 95% confidence level and 50% response distribution.

Data was collected through an online questionnaire using Google survey.

SPSS software (version 21) was used for data analysis and P value less than 0,05 used for significance, the chi-square used to assess the association between variables.

Approval of the ethical committee and the student consent to participate in this study has been taken.

The aim of this study measures the prevalence of antibiotics misuse among senior medical student in Umm Alqura University.

The study was a self-funding study.

**Result:-**

Among 170 of senior medical student males and females participants (85 males and 85 Females). The total percentage of antibiotic misuse was 10.58% (n=170) of all participants. Regarding of the gender, the higher proportion of female senior medical student misuses the antibiotic when compared to male. And the augmenting where is the most used antibiotic 66.3%

**The results showed the percentage of antibiotic were show height percentage in female by 69 % *figure (1)*.**

**FIGURE 1**

The results shows the percentage of the most antibiotic used was be Augmentin by 66.3 % figure (2).

CS:cephalosporin. FQs: fluoroquinolones

### Discussion:-

In this study we found that majority of participants were familiar with different types of antibiotic abuse, our finding agrees with general reports in different countries.

Based on high response rate from each group, it can be stated that the result obtained in this investigations are representative of the target population.

The results indicated that female was higher than male by 69% of the total participants, and we observed that the Augmentin was the highest antibiotic use among all antibiotic by 66.3%.

In general, there are several limitations in this study, low sample size that may introduce nonresponsive bias. And this study may offer important exploratory findings for a senior medical student in Saudi Arabia. Future studies could attempt a different study design to gain more insight into factors contributing to antibiotic abuse.

### Conclusion:-

The prevalence of antibiotic misuse among senior medical student in Makkah region considers high. Female misuse the antibiotic more frequently than male and the Augmentin is the most used. We recommend the creation of continued public health education about their side effect. Further investigation and studies could be conducted to assess the educational level and the awareness of their side effect.

 Investigation, Synchronization

#### Abstract

This study examines the essence of investigation authority against gratification crimes. This study aimed to provide an overview of the synchronization and harmonization of investigation systems on gratification in criminal law enforcement in Indonesia. The study was carried out by using a normative research, primary legal, secondary and tertiary materials, with deductive-reasoning method. The results of study showed that the investigative authority against corruption in general and gratification in particular are given the responsibility to the police, judiciary and the Corruption Eradication Commission of Indonesia. The third of law enforcement agencies, in addition to the authority to conduct investigations, was also given authority as coordinator, supervisor and controller of gratification crime investigation under the Act that became the legal basis respectively. Act that become investigation basis for both judiciary and the Corruption Eradication Commission rule out the concept of coordination and supervision as defined in the provisions of the Criminal Procedure General in this regard is the Code of Criminal Procedure. Therefore, the concept of inter-agency coordination, in addition not have a strong legal foundation is also a potential conflict of interest and the main obstacle in law enforcement against gratification crime.

#### Introduction:-

The strategic role between agencies, especially the eradication of corruption in law enforcement is a unity of integrated legal system. The term of integration in the context of enforcement agencies' role in the criminal justice sphere, known as the integrated criminal justice system.

According to Larry J. Siegel and Joseph J. Senna, looking at the criminal justice system as follows: -

“Criminal justice may be viewed or defined as the system of law enforcement, adjudication, and correction that is directly involved in the apprehension, prosecution, and control of those charged with criminal offenses”<sup>1</sup>

<sup>1</sup> Larry J. Siegel and Joseph J. Senna, *Essentials of Criminal Justice*. (USA : Thomson Learning, 2007), page 28

**Corresponding Author:-Andi Mulyono.**

Address:-Manokwari Law School, Jl. KaryaAbri, Sanggeng, Manokwari, West Papua 98312, Indonesia.

B.N.Arief,<sup>2</sup> argued there are 4 (four) components of the criminal justice in power subsystems, namely: 1. the power of investigations; 2. the power of prosecution; 3. the power to prosecute and convict; and 4. the power of criminal execution. While, I.S.Adji,<sup>3</sup> divides 4 (four) institutions that carry out the criminal justice system, namely: 1. Police institute; 2. Prosecution institute; 3. Judiciary institute; and 4. Penitentiary. The authority of law enforcement agencies above is the authority of attribution which comes from the 1945 Constitution and Act.<sup>4</sup>

Indeed, from the aspect of formal crime legal,<sup>5</sup> the handling of special crimes, the police have the authority as the investigation and investigator bodies<sup>6</sup> although it has itself regulation, not many differences in the handling of corruption special criminal of the police and the prosecution institute, including ad hoc institution such as Corruption Eradication Commission.

One particularity of the Act of the Eradication of Corruption concerns the material criminal law of gift and receipt of gratification. Regulatory review that gratification can be considered bribery act, if it associated with his/her position and contrary to his/her obligations and duties. In other words, gratification has a negative impact and can be abused, especially in service delivery for the public sector in the government, so entered into the legislation concerning corruption crime.

Correspondingly, when observe the implementation of duties for the third of law enforcement agencies above, the handling of corruption associated with the gratification, can be ascertained that the Corruption Eradication Commission is a body of investigation, investigator and prosecutor are very prominent and optimized to eradicate gratification in law enforcement for corruption cases. The granting of authority to the police officers, prosecutors, and the Corruption Eradication Commission to investigate corruption cases did not cause corruption diminish but that seems on the surface is the pull of authority between the institutions that impact on the delay of the law enforcement process. For example, in District Court of Ciamis ever happened a corruptor acquitted because the judge considers that the competent institution to investigate is prosecutor not police consequently corruptor were released.

Overlapping between subsystems within the criminal justice system about who is authorized to conduct investigations on corruption cases.<sup>7</sup> In grammatical, the meaning of a sentence based on the criminal law referring to Act No. 8 of 1981 on the Criminal Code, because in addition to the Criminal Code there is no other criminal procedure law applicable in Indonesia.

In Indonesian's criminal justice system, the position of the Prosecutor has a central role. It is not independent of the prosecutor authority in terms of determines whether a case can be filed to the trial or not. The authority to determine whether a case can be continued or not based on valid evidence is *Dominus Litis* owned by Indonesian prosecutor.<sup>8</sup>

Under the provisions of Article 35 of the Act No. 16 of 2004 on the attorney that: "The Attorney General has the duty and authority to: a) establish and control of law enforcement and justice policies within the scope of duties and authority of the prosecutor; b) streamline the process of law enforcement provided by law. "The provision authorizes the prosecutor to control the investigation, including the investigation of corruption crime in which there is a criminal act of gratification.

<sup>3</sup>Indriyanto Seno Adji, *Arah Sistem Peradilan Pidana*, (Jakarta: Prof. Oemar Seno Adji, S.H & Co. Law firm, 2001), page. 49

<sup>4</sup>The authority of police institution as stipulated in Article 30 paragraph (4) of the 1945 Constitution that: "National Police of the Republic of Indonesia as the state's instrument to maintain the public security and orderliness shall be assigned to protect, serve the public, and reinforce the law".

<sup>5</sup>Formal criminal law contains regulation that regulates how the criminal law that is abstract must be applied in concrete. Often, the person mention the type of this law as criminal law in P.A.F. Lamintang, *Dasar-Dasar Hukum Pidana Indonesia*, (Bandung: Sinar Baru, 1984), page.10

<sup>6</sup>Article 5 and 7 Act No. 8 of 1981.

<sup>8</sup>Marwan Efendi, *Kejaksaan R.I. Posisidan fungsinya dalam Perspektif Hukum*, (Jakarta : Gramedia, 2005), page. 105

Furthermore, the investigator of Indonesian National Police are given authorities as coordinator and investigation supervisory, as defined in Article 7 paragraph (2) of Act No. 8 of 1981 on Procedure of Criminal.

The third of investigators - the police, judiciary and the Corruption Eradication Commission are given the authority to investigate criminal such as gratification, each is given authority as coordinators, supervisors and controllers. Thus, the system of coordination between institutions that built does not have a strong legal foundation, and can give rise to multiple interpretations which resulted disharmonious and not synergetic in the coordination of inter-institutions.

In this context, corruption as a violation of social and local economy rights as an extraordinary crime, the eradication measures can no longer be done "as usual" but "demanded by extraordinary enforcement."<sup>9</sup>

#### **Identification of the Issue:-**

The issue to be discussed in this article is about "how the synchronization of gratification crime investigation in law enforcement in Indonesia."

#### **Method of the Research:-**

Type of this study was normative. The study examines the concept of investigation authority for gratification crime in criminal law enforcement in Indonesia, so it can be constructed the concept of synchronization synergistically in the investigation system. The data used were secondary data that consists of primary law materials in the form of legislation, tertiary legal materials such as reference books, expert opinion or the results of previous research, and tertiary legal materials such as dictionaries, scientific laws dictionary and black law dictionary.

The method of analysis in this article begins by abstracting primary, secondary and tertiary legal materials, in order to know the essence of investigative authority for gratification crime in criminal law enforcement in Indonesia, to analyze the weaknesses of legality for each investigative institutions, conduct systematically and lastly by using deductive-syllogism reasoning.

#### **Analysis and Discussions:-**

##### **The Scope of Gratification in Criminal Justice System:-**

Recently, the eradication of corruption is no longer just a national issue for a country only, but has become an international problem involving many countries. Corruption has become a transnational crime whose eradication requires cooperation from various countries. The condition was confirmed in the United Convention Against Corruption (UNCAC), which states:

*"Convinced also that the globalization of the world's economic has led to a situation where corruption is no longer a local matter but a transnational phenomenon that affects all societies and economies, making international cooperation to prevent and control it essential."*

Many poor and developing countries in Asia and Africa as a victim states are very experienced negative impact as a result of corrupt practices. Even then corruption is regarded as one of the causes of sluggish economic growth and leads to a low level of social welfare.

In a study conducted by the IMF donors in 1996, states that corruption can have consequences significantly decelerate economic growth. Based on the formulation of corruption substances in the United Nations Convention Against Corruption as described above, it can be understood that the arrangement of corruption law material are not formulated specifically about gratification. Observing the formula above, it can be concluded that gratification were formulated in Act No. 31 of 1999 on Corruption Eradication in Indonesia is the interpretation of elaboration of bribery substance.

Bribery crime in the formulation of the United Nations Convention Against Corruption is always followed by the key elements, namely: a) Act or refrain from acting in the execution of his official duties; b) Trading in influence; c) misappropriation of influence; d) Abuse of functions; e) Trading in influence; f) Illicit enrichment. Elements of such actions are bribery and gratification elements in Indonesia Corruption Act. Therefore, the limitation of difference between bribery and gratification becomes blurred or unclear.

<sup>9</sup>ErmansyahDjaja, *MemberantasKorupsiBersama KPK, KomisiPemberantasanKorupsi*, (Jakarta :SinarGrafika, 2009), page. 28.

United Nations Convention against Corruption is also advocate and emphasize to each member state, in order to adopt the legislative action and other measures necessary to establish into the substance in the Acts or national laws regarding corruption meets international standards. Therefore, the corruption eradication acts should be amended in accordance with the substance of the United Nations Convention Against Corruption, in order that the Acts meets international standards and facilitate the Indonesian state in the process of law enforcement against corruption within the scope of corruption outside the jurisdiction (international).

Gratification elements can be obtained from the elucidation of Article 12B of Act No. 20 of 2001, the gift in a broad sense, including money, goods, rebate (discount), commissions, interest-free loans, travel tickets, lodging, tours, free medical treatment, and other facilities. Such gratification whether received at home and abroad and carried out by using electronic means or not.<sup>10</sup>

The definition shows that gratification is actually meaningful gift that is neutral. A gift becomes a gratification as bribe if related to the position and contrary to the obligation or duty of the recipient.<sup>11</sup>

Basically, gratification is a new type of criminal. According to Eddy Omar Sharif, a professor of criminal law in faculty of law, GadjahMada University, argued that “the differences of gratification and bribes lies on whether or not a meeting of mind at the time of receipt. On the crime of bribery, there is a meeting of mind between the giver and recipient of bribes, while in gratification crime there is no meeting of mind between the giver and the recipient. Meeting of mind is another name of consensus or things that are transactional.”

According to AdamiChazawi, mentioned differences gratification and bribery, that “the provisions of gratification has been no malicious intent (*mens rea*) of the recipient at the time the money or goods received. Malicious intent exists when such gratification is not reported within 30 working days, so that after passing the time regarded bribe until proven otherwise. Whereas the provisions on bribery, the recipient has malicious intent when money or goods are received.”

Settings and the mention of gratification specifically known since the enactment of Act No. 20 of 2001 on Amendments to the Act No. 31 of 1999 on the Corruption Act. The Act provides for the obligation of public servants or state officials to report to the Corruption Eradication Commission any gratification associated with the position and contrary to the duties or obligations of the recipient. If the gratification that considered as bribery is not reported to the Corruption Eradication Commission, then there is a risk of violation of the law both in the realm of administrative or criminal.

#### **The Authority of Investigation in Gratification:-**

In addition to police investigators, prosecutors and the Corruption Eradication Commission, there are also some institution of civil servant investigators are authorized to handle the interrogation of criminal related to the field of duty or legislation on which the respective law. There are some investigative institutions which according to existing legislation is given the authority to conduct investigations.

In practice, it is possible to avoid overlapping of authority, especially in complex cases associated with some legislation. In the absence of a particular institution that integrates the distribution of authority in the investigation process, the mechanism of coordination and supervision in the investigation process was very difficult in practice. Each investigator often operate on their own and thus potentially creating conflicts among investigators itself due to the overlap of authority.<sup>12</sup>

#### **Police Investigator:-**

Pursuant to Article 14 letter g of Act No. 2 of 2002 on the Indonesian National Police, that:

<sup>10</sup>KomisiPemberantasanKorupsi, *PedomanPengendalianGratifikasi*, (Jakarta: KPK, 2015), page. 9.

<sup>11</sup>*Ibid*, page. 9.

<sup>12</sup>Sukardi, *IllegalLoggingdalam PerspektifPolitikHukumPidana: KasusPapua*, (Yogyakarta: UniversitasAtmaJayaPress, 2005), page.128.

“The Indonesian National Police assigned to conduct investigations and inquiries to all parties in accordance with the criminal law procedure and other legislation”.

The process of corruption handling by police investigators using procedure as a case of common criminal, which is based on the Criminal Procedure Code.<sup>13</sup> Any investigation conducted by the Police always followed up with a Notice of Commencement of Investigation to the public prosecutor, and then public prosecutor conduct pre-prosecution, to examine the completeness of case files, both formal and its material and to give instructions.<sup>14</sup>

Under the terms of Act No. 8 of 1981 on Criminal Law Procedure which is some formal provisions applicable in general, the Indonesian National Police is the institution that given “the responsibility of management” in the investigation of crime. Therefore, for synergy and harmonization of criminal investigation system, then all institutions of the investigator should be in a system of coordination and under the supervision of the Indonesian National Police Investigator.

#### **Attorney Investigator:-**

The provisions of Article 1 (1) of Act No. 16 of 2004 regarding the Attorney of the Republic of Indonesia determined that prosecutors were functional which is authorized by this Act to act as a public prosecutor and the executor of court decisions that have acquired the force of law and other authority under Act. The Attorney of the Republic of Indonesia as a state institution of government that implements state power in the prosecution must be free from the influence of government power and other.

According to EviHartanti,<sup>15</sup> attorney as a public prosecutor in a criminal case must know clearly all work to be done investigator from the beginning until last things to be done by law. Attorney will account for all of treatment of the accused began to suspect investigated, then examined his/her case, then arrested, and finally whether the prosecution conducted by the attorney is valid and correct or not according to the law, so it’s really a sense of justice are met.

The enactment of Act No. 8 of 1981 on Criminal Law Procedure abdicates the authority of investigation of attorney agencies and fully handed over to the Police. With the enactment of the Criminal Code, the authority of investigation is only charged to the Police as a single investigator. However, with the provisions of Article 284 paragraph (2) still allow other investigator beside police that is attorney to conduct an investigation for certain crime perpetrators, including corruption.<sup>16</sup>

The authority of attorney as investigation controller defined in the provision of article 35 letter a Act No. 16 of 2004 on the attorney is unclear because few considerations: The Attorney General has the duty and authority to set and control the policy of law enforcement and justice within the scope of duties and authority of the attorney.

#### **The Corruption Eradication Commission Investigator:-**

The Corruption Eradication Commission<sup>17</sup> is the state institute in conduct its duties and authorities are independent and must be free from any influence, it is similar to other institutions have the authority to carry out duties and its objectives. In outline, the authority of the Corruption Eradication Commission in Act No. 30 of 2002 on the Corruption Eradication Commission can concluded with the details; the authority as duties of the Corruption Eradication Commission, the rights to exercise authority, the authority relating to technical implementation of duties and others.

The duties and authority of the Corruption Eradication Commission as gratification investigator in Article 6 paragraph (1) letter c of Act No. 30 of 2002 on the Corruption Eradication Commission as follows: conduct an inquiry, investigation, and prosecution of corruption. The authority of investigation by the Corruption Eradication

<sup>13</sup>Said Karim Mispansyah, Harustiati A. Moein Irwansyah. “Justice in Granting Remission for Corruption Prisoners (A Review of Indonesian Criminal Justice System).”*International Journal of Scientific & Technology Research*, 4(11): 208-213

<sup>14</sup>Andi Hamzah, *Pengantar Hukum Acara Pidana*, (Jakarta: Ghalia Indonesia, 1983), pages. 75 - 77

<sup>15</sup>EviHartanti, *Tindak Pidana Korupsi: Edisi Kedua*, (Jakarta: Sinar Grafika, 2007), page. 32

<sup>16</sup>Faisal Salam, *Hukum Acara Pidana Dalam Teori dan Praktik*, (Bandung: Mandar Maju, 2001), page. 138.

<sup>17</sup>The Komisi Pemberantasan Korupsi (KPK) is the Indonesian Corruption Eradication Commission, which was formed after special consideration on the extraordinary nature of corruption in Indonesia, which has become systemic and widespread, and has violated the human rights of the Indonesian people. The KPK was formed under Act No. 30 of 2002 on the Corruption Eradication Commission.

Commission is special investigative procedures were given authority to the Corruption Eradication Commission. However, the special authority override the general procedure set forth in the provisions of the criminal law procedure, that is in Act No. 8 of 1981 on Criminal Law Procedure. It is as defined in Article 38 paragraph (2) of Act No. 30 of 2002 on the Corruption Eradication Commission, that:

1. All authorities related to inquiry, investigation, and prosecution as stipulated in Act No. 8 of 1981 on Criminal Law Procedure applied also to investigators, and public prosecutors at the Corruption Eradication Commission.
2. The provisions referred to in Article 7 paragraph (2) of Act No. 8 of 1981 on Criminal Law Procedure does not apply to the corruption investigator as defined in this Act.

Related to the existence of investigation by the Corruption Eradication Commission, it interesting to observe considerations of the judge in the decision of pretrial in the District Court of South Jakarta No. 36/Pid.Prap/2015/PN.Jak/Sel. Based on consideration of the judge mentioned above, it can be understood that the judge in interpreting the provisions of the Act do not just use grammatical interpretation alone in interpreted the word of case of Act as the everyday sense, but also judges using teleological interpretation as interpretation of the purpose of law by law maker.

In this case, the judge to try to understand the will or intent contained in the formulation of article purpose by the maker. In addition, the judge also uses a systematic interpretation by looking the provisions of Corruption Act as one element in the criminal law system; therefore, the Act must not conflict with other both horizontally and vertically.

The consideration of judge about the existence of Corruption Eradication Commission investigators are sourced from police officers who had been dismissed as police investigators, reinforce the belief that the legality of the Corruption Eradication Commission investigators can affect the legality of legal products in the form of administrative and investigation actions and investigations conducted by the Corruption Eradication Commission investigators.

#### **The Concept of Coordination Synergic Between Investigator:-**

Coordination is the process of integrating the objectives and activities of distinct units (functional departments) within an organization to achieve objectives efficiently and effectively.<sup>18</sup> According to E.F.L. Brech in his book, "The Principle and Practice of Management", the coordination is to balance and move the team to give the location of activities appropriate to each and maintain the activities carried out with proper alignment between the members themselves.<sup>19</sup>

Based on the definition above, it may be mentioned that coordination has requirements that:

- a. Sense of Cooperation, the feeling of working with each other, looked per section.
- b. Rivalry, in large organizations, often held a competition between departments, in order to compete with each other
- c. Team Spirit, one another per section should be mutual respect.
- d. Esprit de Corps, a part of mutual respect will be more excited.

Nevertheless, in practice the coordination between law enforcer, including the level of coordination of the criminal justice system is still showing lack of a common vision in the direction of law enforcement.<sup>20</sup> This is possible due to a variety of interests and differences in the interpretation and perception of the existence of gratification itself, whether arising scientifically and influenced by a variety of interests and other aspects such as politics, economy and social culture.

Gratification crime is a case that multi-dimensional involves various agencies and stakeholders that exist. Therefore, the law-enforcement efforts also would involve various agencies and institutions involved. Coordination with agencies/related-government officials in relation to corruption in order to handle cases with indications of

<sup>18</sup>T. Hani Handoko, *Manajemen*, (Yogyakarta: BPF, EdisiKedua, 2003), page.195

<sup>19</sup>SoewarnoHandayaningrat, *PengantarStudiAdministrasidan Management*, (Jakarta: GunungAgung, 2002) page. 54

<sup>20</sup>Arie, M. (2016). An Approach of Legisprudence Theory to Assess the Quality of Local Regulation. *Hasanuddin Law Review*, 2(3), 371-384. doi:<http://dx.doi.org/10.20956/halrev.v2i3.699>

gratification, in fact is very difficult. Concerned agencies are often less transparent/support in the disclosure of gratification occur.

This is consistent with the theory put by SoerjonoSoekanto,<sup>21</sup> that the success of law enforcement is not solely concerning the enforcement of applicable law, but depends also on several factors:<sup>22</sup>

First, the law, the legislation should be made to follow the principles that apply, such as the legislation is not retroactive, that are specifically override the general laws; it made by higher authorities have a higher position as well; it that apply later to overturn legislation in force earlier, it is not inviolable. Similarly, the legislation should be eligible in philosophical/ ideological, jurisdiction terms and socio-logical, it means the legislation are made must not conflict with the ideology of the state and it must be made in accordance with the provisions governing the authority of legislators as set out in the state constitution, and it must be in accordance with the needs and conditions of the society in which it is enforced.

Second, the law enforcer, the parties directly involved in the field of law enforcement that includes law enforcement and peace maintenance. Law enforcement must conduct their duties properly in accordance with their respective roles that have been regulated in legislation. In conduct these duties by emphasizing fairness and professionalism, so that it becomes a model for community and trusted by all parties, including all members of society.

Third, the means or facilities to support law enforcement. The facilities include a means or manpower that have been educated and skilled, good organization, adequate equipment, adequate financing, and so on. Availability of adequate facilities is a necessity for the success of law enforcement.

Fourth, the community, the community environment in which they may apply or applied. It means, that community should know and understand the laws that apply, as well as complying with the law would apply to full awareness and necessity of the law to peoples' lives.

Fifth, the culture, as a result of the work, creativity and taste which is based on human initiative in social life. In this case the culture includes the values underlying the applicable law, the values of which are abstract conceptions of what constitutes good so embraced, and what is considered bad so avoided.

### **Conclusion:-**

In general, the authority of investigation against corruption and gratification in particular are given to the police, judiciary and the Corruption Eradication Commission. The third of law enforcement agencies, in addition has authorities to conduct investigations, was also given authority as coordinator, supervisor and controller of gratification investigation system. Act as basis of investigation against judiciary and the Corruption Eradication Commission rule out the concept of coordination and supervision as defined in the Indonesian Criminal Procedure Law. Therefore, the concept of coordination between investigative agencies, in addition to not have a strong legal foundation, is also a potential conflict of interest and the main constraint in law enforcement against gratification criminal acts.

Needed a revision of the related-Act to realize the coordination systems are synergic and harmony between law enforcement agencies. The judiciary as the only agency of the prosecution, ideally just given responsibility as the prosecution and not charged for investigation authorities, to be more professional in the field of prosecution. Meanwhile, the Corruption Eradication Commission as investigator should ideally be recruited as a civil servant investigators and coordination system and investigative supervision under the Police investigator.

#### Abstract

**Background:-** Aggressiveness of neoplasm may be linked to the biological characteristic of tumor cells, represented by the level of expression of specific molecular markers. **Aim:** was to examine the co-expression of survivin, COX-2, DNA ploidy and S phase fraction (SPF) in colorectal carcinomas and assess its prognostic value. **Material and Methods:-** neoplastic tissue from 100 patients with primary non treated colorectal adenocarcinomas were assessed by immunohistochemistry and flow cytometry. Statistical analysis evaluated the correlation of marker expression with clinicopathological variables and with the expression of other markers. **Results:-** Survivin and COX-2 cytoplasmic immunoreactivity was detected in 65% and 73% respectively of the studied adenocarcinomas. Flow cytometry revealed that 62% of carcinomas were aneuploid and 47% had high SPF. COX-2, DNA aneuploidy and high SPF showed significantly association with lymph nodes (LN) involvement and Dukes' stage (P = 0.04, P = 0.02 and 0.03, respectively for LN and P = 0.03, P = 0.01 and 0.04, respectively for Dukes' stage). DNA aneuploidy was positively associated with histological grade (P = 0.03). High SPF and DNA aneuploidy were positively associated with tumor localization (P = 0.03 for both). COX-2 displayed positive association with survivin expression and with recurrence (P = 0.04 and P = 0.02 respectively). High SPF significantly associated with survivin, COX-2 and DNA ploidy (P = 0.005, P = 0.004 and 0.02, respectively). The expression of more markers by each carcinoma was positively correlated with LN involvement (P = 0.04) and advanced stage (P = 0.001). **Conclusions:** Our analysis demonstrate that the score of markers co-expression correlates significantly with the poor prognosis of patients with colorectal adenocarcinomas.

#### Introduction:-

Colorectal malignancy is included as one from the most common malignancy around the world, and is regarded as one of the major reasons of cancer related mortality [1]. The growth and development of colorectal carcinoma

**Corresponding Author:- Samah S.Elbasateeny.**

Address:- Pathology Department, Faculty of Medicine, Zagazig University, Egypt.

proceeds via sequences of multistep genetic alterations including the stimulation of cancer causing genes and damage of tumor suppressor genes. The majority of colorectal carcinomas develop on top of dysplasia of benign adenomas that progressively enlarge and transform into a villous adenomas. The continuous gathering of genetic changes (e.g., DCC, ras, p53, and APC) drive the evolution of normal colonic and rectal epithelium to adenoma as well as the transformation to dysplasia and malignant adenocarcinoma [2].

Despite the progresses in surgical techniques and adjuvant chemotherapeutic regimens have decreased the earlier elevated local recurrence rates of colorectal cancer and have provided patients with better survival [3], many patients presented with local recurrences or distant metastasis following seemingly curative surgical operations resulting in low survival [4]. Evaluation of prognostic molecular factors that is linked to a certain prognostic outcome would as a result, be helpful for detection of cases who are probable to improve with adjuvant treatments, resulting in better prognosis [5].

Survivin is considered to be one of the members of the group of inhibitor of apoptosis protein (IAP). It is involved in controlling the physiological development of embryonic cells and monitoring the cycle of the cell, with double jobs that block apoptosis and stimulates cellular multiplying. Overexpression of survivin stops apoptosis via several mechanisms, which is favorable to the divisions of abnormal cell and promotes neoplastic transformation [6-8].

The fetal tissues and majority of neoplastic tissues show expression of survivin while; negative expression is detected in normal mature tissues. Survivin displays highly discriminating positive expression in malignant neoplasms, and its expression is associated with the high cellular proliferative activity, the resistance of neoplasms to cancer therapy, high metastatic capability of tumors, high recurrence potential, and the unfavorable outcome of patients. As a result, survivin had considered to be an important diagnostic marker for wide variety of tumors and a molecular target for successful cancer therapy [9-11].

Cyclooxygenases are important enzymes that catalyze the cellular alteration of arachidonic acid to prostaglandins. In humans, two types of cyclooxygenase enzymes have been detected, the constitutive form COX-1 and the inducible form COX-2 [12]. The upregulation of COX-2 in transformed tissues and in several types of malignancy is proved by epidemiological and experimental studies, and as a result, it is essential in neoplastic transformations. It is approved that expression of COX-2 is implicated in differentiation, angiogenesis and apoptosis of the neoplasms. [12, 13] Many researches have revealed that the expression of COX-2 occurs at high levels in 80–90% of the adenocarcinomas of colon and rectum. [14, 15], and selective suppression of COX-2 decrease tumorigenesis of the colon and rectum in various carcinogenesis models [16].

DNA ploidy and S-phase fraction (SPF) measured flow cytometry, are significant and independent prognostic factors in patients suffering from colorectal carcinoma [17]. Most investigators [18-20] agree that there is association between the presences of aneuploid cell populations by flow cytometry and unfavorable outcome.

We aimed to study the co-expression of immunohistochemical staining of survivin and COX-2 proteins, DNA ploidy and the proliferative activity using SPF in colorectal carcinomas and their correlation with patient's clinicopathological characteristics to assess their prognostic value.

## **Materials and Methods:-**

### **Patients and Tissue Samples:-**

Our research was done at the Departments of Pathology and Surgery, Faculty of Medicine, University of Zagazig in the period from January 2012 to May 2016. One hundred neoplasms were obtained from patients with primary sporadic colorectal carcinoma. The age, the sex, the location of the tumor, Dukes' stage and other clinicopathological variables were gotten from surgical and pathological sheets. All of the cases had no history of hereditary colon cancer syndromes. There was no chemotherapy or radiation given to the cases before the operation; but after surgery, patients with stage III tumor and stage IV tumor received chemotherapy without any radiation for both colon and rectal cancer. The committee of ethics of Zagazig University approved this research and all patients gave a consent of agreement prior to their inclusion in the research. All samples were fixed with formalin and implanted into paraffin, the blocks were sectioned at 3- microns and stained with ordinary H&E stain to confirm the diagnosis and grade the neoplasms.

**Immunohistochemical Staining:-**

The Sections of 3- $\mu$ m thick were cut from paraffin blocks of the collected colorectal neoplasms. Sections were deparaffinized and rehydrated and deposited in 0.5% hydrogen peroxide in methanol for 10 min to stop endogenous peroxidase activity. Antigen retrieval was achieved by keeping in 0.01 M citrate buffer (pH 6.0) for 5 minutes in a pressure cooker. The primary antibodies were added to the sections at room temperature for 60 min. The strept avidin-biotin-peroxidase complex technique was applied for antibodies against survivin (monoclonal anti-survivin antibody, Clone 12C4, Code M3624, Santa Cruz Biotechnology, Santa Cruz, California, USA, Dilution 1:100) and against COX-2 (rabbit polyclonal Anti- COX-2, RB-9072-R1; Lab Vision corporation, Neo Markers, Dilution 1:200), by utilizing diaminobenzidine (DAB) as the chromogen. Negative control slides in the lack of primary antibody were considered for each staining. A colon carcinoma, which intensely expressed survivin mRNA by RT-PCR [21], was considered as a positive control. As a positive control for COX-2, we used a normal kidney tissue or an intestinal metaplasia.

**Scoring Criteria for survivin:-**

According to previously described reports [22,23], the mean proportion of positive carcinoma cells in at least five fields using high power was established and allocated to one of five groups: (1) 0, <5%; (2) 1, 5% to 25%; (3) 2, 25% to 50%; (4) 3, 50% to 75%; and (5) 4, >75%. The intensity of survivin immunostaining was recorded as (1) weak, 1+, (2) moderate, 2+; and (3) intense, 3+. The proportion of positive tumor cells and staining intensity were multiplied to get a final score for each neoplasm. In neoplasm showing heterogeneous immunostaining, the predominant staining pattern was evaluated for scoring. Neoplasms having final scores < 1 were described as negative; the rest of neoplasms were stated as positive.

**Scoring Criteria for COX-2:-**

For COX-2 evaluation [24], intensity of immunostaining was scored as 0 (negative), 1 (weak), 2 (medium), and 3 (strong). Extent of immunostaining was assessed as 0 (0%), 1 (1–25%), 2 (26– 50%), 3 (51–75%), and 4 (76–100%) depending on the proportions of areas with positive immunostaining in relation to the entire tumor area. The sum of the intensity and extent score was used as the final staining score (0 –7) for COX-2. Neoplasms were recorded as positive when having a final immunostaining score > 2.

**For flow cytometry:-**

Two to four 50  $\mu$ m sections for DNA FCM were located into glass tubes. The neoplastic tissue for FCM was first deparaffinized by using two bathes of toluene (10 minutes, each), Rehydration in gradually decreasing concentrations of alcohols for 10 minutes in each grade. At the end, the tissue was washed in refined water. The tissue was then milled with blades and yielded to 0.5% pepsin digestion for half an hour. Then, the cells were taken with a syringe and filtered with using a 50- $\mu$ m filter mesh and put on a two layer sucrose cushion to remove the debris. ANase and propidium iodide were put for half an hour prior to the process. The sample then analyzed with a flow cytometer equipped with an argon laser light beam (wavelength 488 nm.) [25].

**DNA Quantitation and S- phase fraction Estimation:-**

The machine computes the DNA index (DI), coefficient of variation (CV) and cell cycle indices including S-phase fraction (SPF). For each slide, 20 lymphocytes were used as an internal diploid DNA content standard for that slide. At least 200 nuclei which is non-overlapping from each slide were then measured. Peak statistics are depended on employer distinction of the histogram. The CV of each peak is measured in the standard deviation of demarcated peak divided by the mean. Histograms were considered as uninterpretable for ploidy if the CV for the DNA diploid G0/G1 peak was > 8. The histograms were regarded as diploid when a solitary peak present at the diploid position (DI range 0.90- 1.10) and less than 15% of cells were present at the tetraploid position. If an extra distinct peak was detected, the lesion will be categorized into one of the 5 non-diploid groups based on DI. Thus the lesion will be regarded as DNA hypodiploid for DI<0.9, hyperdiploid for DI in the range of 1.1-1.90 tetraploid for the DI in the range of 1.9-2.10 and hypertetraploid for DI more than 2.10 .If more than one non-diploid peak was detected, the lesion will be categorized as multiploid. For tetraploid lesion, the extra peak should be detected in the tetraploid region and should have  $\geq$ 15% of cells in the presence of identifiable G2/M peak. The aneuploidy term is used to designate hypodiploid, hyperdiploid and hypertetraploid subgroups of nondiploid tumors as single category. According to Taylor and associates (26), S-phase >5 % was considered hyperproliferative and  $\leq$ 5% was considered as normoproliferative.

**Statistical Analysis:-**

Analysis of the result was done by using SPSS, version 10.0 (SPSS, Inc., Chicago, IL, USA). Categorical data were expressed as frequencies (and percentages) and continuous data were expressed as the mean  $\pm$  standard deviation. The chi-square test was used to assess any possible association among survivin immunoeexpression, COX- 2 immunoeexpression, ploidy of DNA and the fraction of S phase and the clinicopathological variables. Statistical significance was reflected for P values  $< 0.05$ .

**Results:-****Clinicopathological results:-**

The mean age of the studied 100 colorectal adenocarcinomas patients at initial surgery was  $59 \pm 10$  years, rang (40-75years), 70% were males and 30% were female, 31% were proximal tumors and 69% were distal tumors. All colorectal carcinoma patients' clinicopathological variables are outlined in Table 1.

**Table 1:-** Clinicopathological characteristics of 100 patients with colorectal cancer.

Characteristic	No. of patients (%)
<b>Age (years)</b>

**Immunohistochemical Expression of Survivin in Colorectal Carcinomas:-**

Survivin immunoreactivity was expressed mainly in the cytoplasm of adenocarcinomas cells but minimal nuclear reactivity was also seen in a few cases. In contrast, no survivin expression was identified in either the tumor stromal cells or in the nearby normal mucosa (Fig.1). Based on final scores, 65 (65%) colorectal carcinomas were considered as Survivin positive and 35(35%) colorectal carcinomas were described as Survivin-negative (Table 2).

**Immunohistochemical Expression of COX-2 in Colorectal Carcinomas:-**

Immunohistochemical staining of the colorectal cancer specimens revealed that COX-2 expression was restricted to the carcinoma cells and was not demonstrable in the stromal compartment of the cancers. Immunostaining pattern of COX-2 within the tumors was mainly in the cytoplasm, adjacent non neoplastic colonic mucosa was negative for COX-2 immunoreactivity (Fig. 2). 73 of 100 (73%) colorectal carcinomas analyzed, revealed expression of COX-2 immunoreactivity (Table 2).

**Fig. 1:- Representative samples of survivin immunorexpression in colorectal carcinoma.** (a) Normal colonic mucosa displayed no expression of survivin. (x 200) (b) Colorectal carcinoma GI-II showed diffuse moderate survivin immunoreactivity (x 200). (c) Colorectal carcinoma G II showed diffuse intense survivin immunoreactivity (x 400). (d) Colorectal carcinoma GIII showed diffuse intense survivin immunoreactivity (x 400).

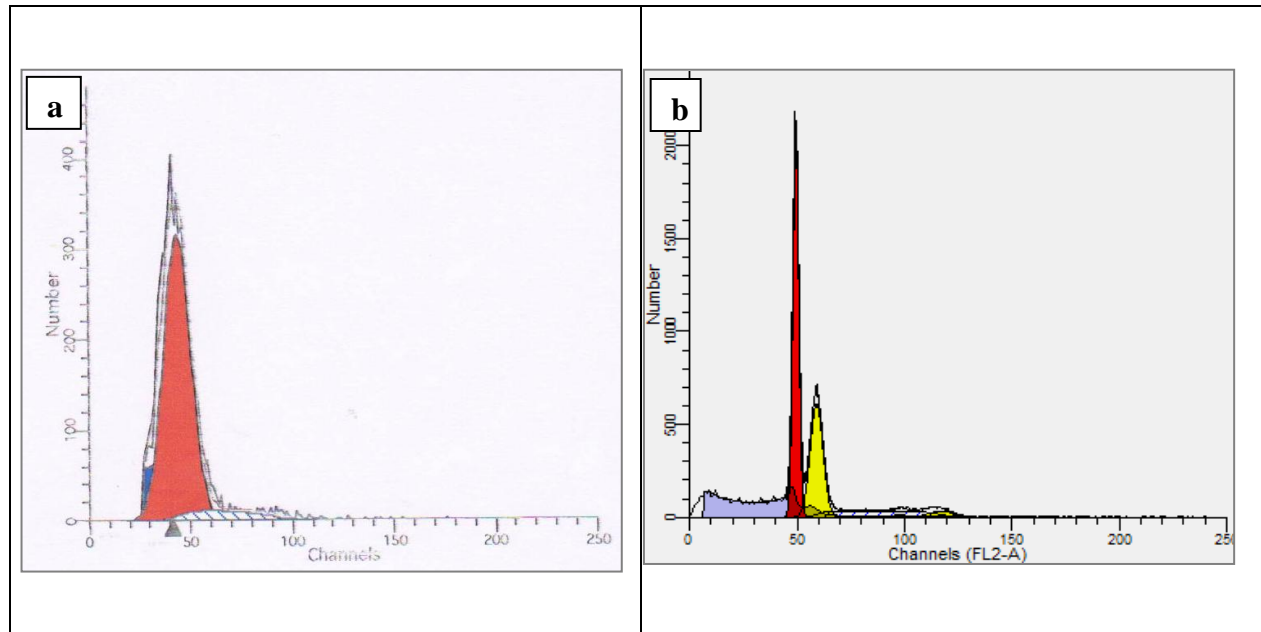

**Fig. 2:- Representative samples of COX2 immunoeexpression in colorectal carcinoma.** (a) Normal colonic mucosa exhibited negative expression of COX-2. (d) Colorectal carcinoma GII displayed weak immunohistochemical staining for COX-2. (d) Colorectal carcinoma GII displayed strong immunohistochemical staining for COX-2. (d) Colorectal carcinoma GIII displayed moderate to strong immunohistochemical staining for COX-2. (X400)

#### Flow cytometric analysis:-

Of the 100 carcinomas examined, 38 (38%) were designated as DNA diploid and 62 (62%) as DNA aneuploidy (Table 2). Aneuploid tumors had mean DI of 1.75 (range, 0.93–3.21). These colorectal cancers had SPF ranged from 7.5% to 45.6%. The median SPF was assessed to be 18.3%. There was a significantly higher SPF in DNA-aneuploid tumors when compared with DNA-diploid tumors (29.3%, 16.6%, respectively,  $P = 0.001$ ) (Fig. 3). Depending on the median value of SPF as point of cut-off, neoplasms were consequently separated into high ( $>18.3$ ) and low ( $\leq 18.3$ ) SPF neoplasms (Table 2).

**Fig. 3:-** Flow cytometry DNA histogram of colorectal cancer showing diploid peak (DI=1.01) and the SPF was (9.98) (a) and diploid & aneuploid peaks (DI=1.01&1.77) and the SPF was (19.86) (b).

**Table 2:-** Patients Distribution depending on the result of immunohistochemical expressions and flow cytometry.

Marker	No of patients (%)
<b>Survivin</b>	
Negative	35 (35%)
Positive	65 (65%)
<b>COX-2</b>	
Negative	27 (27%)
Positive	73 (73%)
<b>DNA ploidy</b>	
Diploid	38 (38%)
Aneuploid	62 (62%)
<b>SPF</b>	
≤ 18.3%	53 ( 53% )
> 18.3%	47 (47%)

**Association of survivin expression, COX-2 expression, DNA aneuploidy and high SPF with tumor clinicopathological variables and markers expressions:-**

The result of markers expression was investigated in associations with the following variables: patient's gender, age, lymph nodes involvement, distant metastasis, Dukes' stage, histological grade, localization and recurrence as well as expression with the other markers examined (Table 3). COX-2, DNA aneuploidy and high SPF showed statistically significant association with lymph nodes involvement and Dukes' stage ( $P = 0.04$ ,  $P = 0.02$  and  $0.03$ , respectively for LN involvement and  $P = 0.03$ ,  $P = 0.01$  and  $0.04$ , respectively for Dukes' stage). DNA aneuploidy was positively associated with histological grade ( $P = 0.03$ ). High S phase and DNA aneuploidy were also positively associated with tumor localization ( $P = 0.031$  and  $P = 0.036$ , respectively). COX-2 displayed also positive association with tumor recurrence ( $P = 0.021$ ). No association was observed with other clinicopathological variables. Between marker expressing tissues, high S phase showed statistically significant association with survivin, COX-2 and DNA ploidy ( $P = 0.005$ ,  $P = 0.004$  and  $0.02$ , respectively). In addition, there was association between survivin expression with COX-2 ( $P = 0.04$ ).

**Table 3:-** Marker expressing colorectal carcinomas in associations with clinicopathological variables and co-expression with other markers

Number of positive carcinomas for survivin, COX-2, DNA aneuploidy and high SPF (% of each category see Tables 1 and 2)

### Discussion:-

In the present research, the prognostic significance of the result of immunohistochemical staining of survivin and COX-2, DNA ploidy and SPF in colorectal cancer tissues was studied by associations with the clinicopathological variables of colorectal cancer patients. Our analysis revealed that: (I) Expression of three of the four markers (expression of COX-2 with DNA aneuploidy and high SPF) was independently associated with lymph nodes involvement and Dukes' stage whereas one or two markers were also associated with histological grade, tumor recurrence and tumor localization. Furthermore, some of the clinicopathological variables were also associated with the number of the expressed markers by each neoplasm, the more expression of markers associated with lymph nodes involvement and advanced Dukes' stage. (II) There was association between high SPF and survivin, COX-2 and DNA aneuploidy. In addition, there was also association among the immunoexpression of survivin and COX-2, probably indicating that they might have a common molecular pathway in the carcinogenetic process.

The prognostic value of survivin, COX-2, DNA ploidy and SPF in colorectal adenocarcinomas patients had been presented in many previous researches. However, in this study we attempted to evaluate the prognostic value of their co-expression score.

In our analysis, Survivin expression was detected in 65% of the colorectal carcinomas, mainly cytoplasmic within the tumors with no staining in normal colonic epithelium, which is generally in agreement with previous reports, Kawasaki et al. [27], Suga et al.[28] and Sarela et al.[29] stated that survivin staining was observed in the majority of colorectal carcinomas included in their studies. Survivin immunoeexpression was non correlated with any of the examined histopathological variables of colorectal carcinomas, and this result is in concordance with previous related studies [27, 29]. In contrast to our finding, others found that survivin expression is significantly associated with the histological differentiation of colorectal carcinoma [30, 31]. This different reports may be explained by using different primary antibody clone, different immunohistochemical technique and different method in assessments of marker staining.

In our series, 73% of the colorectal carcinoma expressed COX-2 with immunostaining pattern, predominantly cytoplasmic within the cells of the tumors. The non-neoplastic colonic mucosa nearby to the carcinomas displayed no immunostaining for COX2, which is in alignment with previous studies [32-34]. We found that COX-2 overexpression, though not correlated with the other clinicopathological features, was significantly associated with Dukes' stage (P=0.03), lymph node positivity (P=0.04), and recurrence (P=0.02). These observations are in concordance with previous studies [35, 36].

In our study, we found that 62% (62/100) of carcinomas had an aneuploid DNA content, this is in agreement with others [37-39]. In both our study and some previous studies [39, 40], a significant association between DNA ploidy and lymph nodes involvement (P=0.02), Dukes' stage (P=0.01), histological grade (P=0.03), and tumor localization (P=0.03), were found. Finally, similar to previous reports [38, 40], DNA ploidy in our series was not related to other clinicopathologic parameters.

In our study, we found the median SPF of the whole series to be 18.3%, which is similar to findings of others [39]. We also detected a statistically significant correlation among SPF and lymph nodes involvement (P=0.03), Dukes' stage (P=0.04), and tumor location (P=0.03), which is in agreement with others [40].

Regarding the markers co-expression in our investigations, high SPF showed statistically significant association with DNA ploidy (P=0.02), that is similar previous reports [39, 40]. In addition, there is highly significant association between survivin and high SPF (P=0.005), a result that agree with Ito et al., [41] who reported that survivin expression strongly associated with the proliferation index and overexpression of survivin lead to an increase in the SPF in human hepatocellular carcinoma. In addition, Kawasaki et al., [42], found that survivin immunoeexpression was positively associated with the labelling index of Ki-67 in colorectal cancer. Moreover, Sarela et al., [43], reported that there was positive significant linear correlation among survivin final scores and proliferative index (P=0.001) in pancreatic cancers.

Regarding COX-2 expression in our series, we found statistically significant association among COX-2 and high SPF (P=0.004), a result that come to an agreement with Mrena et al., [44] who informed that the expression of COX-2 was associated with the labelling index of Ki-67 (p=0.013) and SPF (p<0.0001) in gastric cancer. Moreover, Yamagishi et al., [45], told that the expression of COX-2 was correlated with the labelling index of Ki-67 in human advanced gastric cancer.

There was also association between survivin expressing with COX-2 (P = 0.04) in our study. Similar finding in gastric cancer have been published by Yu et al., [46], where association between survivin and COX-2 overexpression was detected at both mRNA (P=0.001) and protein levels (P=0.041). Also, our analysis were in agreement with findings of Barnes et al., [47], indicating that the presence of cytoplasmic survivin correlates with the expression of COX-2 in mammary adenocarcinoma. Yang et al., [48], stated that COX-2 expression showed significantly strong correlation with Survivin (r = 0.659, P<0.001) in hepatocellular carcinoma.

In conclusion, we displayed that the co-expression score of survivin, COX-2, DNA aneuploidy and high SPF in colorectal cancer tissues correlates significantly with the poor prognosis of patients with colorectal adenocarcinomas and might be of clinical routine. These results may help in understanding the carcinogenesis of colorectal carcinomas and help the advance of therapeutic strategies like suppression of COX-2 or survivin silencing.

#### Abstract

**Objective:** This study aims to evaluate the knowledge, attitude and behavior toward evidence based medicine (EBM) among undergraduate medical student in Saudi Arabia and to highlight barriers preventing the use of EBM effectively.

**Methods:** This cross sectional study was conducted on sixth year medical students at Umm Al-Qura University (UQU) by distributing a self-administered questionnaire manually and electronically between November 2014 to January 2015.

**Results:** The survey completed by only 32.5% (n=87) students, all sixth year medical students at UQU showed a good knowledge and a positive attitude towards evidence based medicine. Most of the students find their evidence on the internet, while 52.9% (n=64) never used reliable and peer reviewed sources (Cochrane database) in their searches. There are 58% of student who spend an hour or less daily looking up evidence, while 32.2% (n=28) do not spend any time during their usual day. Lastly, 65% believe that EBM takes too much time for busy medical students and only 29.9% believed that EBM is clearly incorporated during teaching sessions.

**Conclusion:** Good level of knowledge and positive attitude towards evidence based medicine was reported by the students. On the other hand, there is a gap in their actual behaviors of practicing EBM. Accordingly, improvement on education system of EBM is needed to increase the quality and effectiveness of student's skills and their ability of applying EBM in their future by incorporate the EBM in various teaching activities. Further studies are required on a larger scale for generalizing the results.

#### Introduction:-

Evidence-based medicine is defined as a particular approach that incorporate the patient values, the best available scientific evidence, and clinical expertise.<sup>1</sup> Since there's a great discrepancies between the huge variety of the new updated information and health care practice, the need of evidence based medicine is becoming mandatory among physician and undergraduate health care provider.<sup>2</sup>

**Corresponding Author:-Naif A Bawazeer M. D.**

Address Mail: Teaching assistant. Faculty of medicine in Umm Alqura University at Makkah, Saudi Arabia.

Practice supported by evidence usually improves the outcomes. There is a clear improvement in the quality of care given to the patients along with cost and results satisfaction as well as physician gains better clinical judgment and decision making with EBM practice.<sup>3</sup> One of the key elements to fully applied evidence based medicine is having a good grasp on the use of searching techniques on databases, in order to obtain trustworthy and reliable information and also greatly helps in overcoming the difficulties and diversity in the medical literature.<sup>4</sup>

Weak understanding of statistic and EBM concepts were found in many medical students and physicians which reflected as a barrier in practicing evidence based medicine, thus many countries felt the need to implement lectures and materials in their curriculum regarding the evidence based medicine. In addition to some other hindrances to effectively teach and use EBM on daily basis are lack of access to the materials needed to engage EBM, and more importantly the lack of time.<sup>5,6</sup>

Since EBM had been greatly emphasized in medical sciences, therefore assessing and identifying the factors that affect its proper use is essential. Taking all this into account this study examine the perception, knowledge and attitude among undergraduate sixth year medical student at Umm- Al-Qura university, in order to determine the current attitude of the students and to highlight the main barriers preventing the use of EBM effectively as daily practice.

### **Materials and Methods:-**

This cross-sectional study was conducted by distributing a questionnaire among 6th year medical students from Umm Al-Qura University, Makkah, Saudi Arabia, to assess the level of awareness toward evidence based medicine (EBM), the data collection carried out from November 2014 to January 2015. Both males and females were included as they had completed their academic curriculum and clinical rotations, 325 students in total (161 males and 164 females).

The questionnaires were distributed to the students by two methods. First, a questionnaire manually distributed to the students in their classroom. After that, an electronic one, shared through Google Form and their personal emails. They were requested to use, one of the two methods. Informed consent were taken, for the voluntary participation and their personal information will be confidential. The ethical approval was obtained from *Ethics Committee for Scientific Research* at the college of medicine, Umm Al-Qura University prior to conducting this study.

In this study a descriptive survey entitled " knowledge, attitude, and behavior questionnaire (KAB questionnaire) " have been used, which is a valid questionnaire to assess the awareness about the evidence based medicine, particularly for undergraduate medical student, as it cover the students' perspective regarding their knowledge, attitude and behavior toward evidence base medicine.

The KAB questionnaire is derived from a comprehensive literature review by Dr. Janice M Johnston and other experts, and permission was granted from the authors to use this questionnaire, and to edit as suitable to make other correlations. The internal reliability for this survey with Cronbach's alpha is 0.71–0.88. The questionnaire had 43 questions and we added questions regarding the students' cumulative GPA and their previous exposure to EBM education or practice. The measurement of Construct validity was by correlating the factors with other measures of EBM. Responsiveness of the questionnaire was tested through paired t-tests of the pre-factor and postfactor mean scores (Johnston et al., 2003; Brown et al., 2010). Responsiveness was reported to be reliable and valid (Johnston et al., 2003). Data entry and statistical analysis was done using SPSS version 20.

### **Results:-**

Our total population is 268 of sixth year students at UQU medical college, 127 students were males and 141 females. Of the responders, only 87 students completed the EBM-KAB questionnaires. Out of these, 46 were males and 41 females, GBA of the majority of the students (47.1%) were less than 3.0, and (18.9%) 3.0 or more. Overall, 56 students were previously exposed to EBM; 37 students during curriculum, 13 from attended an extra curriculum lecture, and formal EBM training (certified courses) for 6 students. On the other hand, 21 students without previous exposure to EBM.

Most students 67.7% (n=59) have a clear understanding of what evidence-based medicine means. And 73.5% (n=64) agreed that effective searching skills, accessible bibliographic databases, and evidence sources are essential to

practicing EBM. Almost 80% (n=70) were aware that to determine the quality of research, critical appraisal skills is needed. When asked how frequently they access to medical evidence in general, majority of students 29.9% (n=26) access every month, 21.8% (n=19) every week, and only 4.6% (n=4) every day. While 22% (n=19) reported had never accessed to medical evidence. Table 1 shows the frequent accessing, to different sources of medical evidence.

Compared to one year ago, 24 students reported that they now looked up evidence as information relating to the patient's condition approximately for 2-3 times, during or after clerking each patient on the ward or in the clinic, 22 only one time, and 20 did not look up for evidence.

Fifty-one students spent 1 minute to an hour, every day to find or look up evidence, compared to the previous year, this time does not include their study time. In addition, when they clerked a patient, 47 students took up to 30 minutes to look up the evidence relating to his/her illness, and the remaining 40 students did not look up evidence for their patient, this time was only spent on retrieving the evidence material. Moreover, about 30% (n=26) students believed that EBM practice can affect the management or outcome of their patients. Furthermore, it was found that most 59.7% (n=52) students familiar to use internet as source when looking up for evidence after clerking a patient, while only 8% (n=7) students were using text book. The percentage of using different sources of evidence after clerking a patient shows in figure 1.

They were asked about how much they felt that evidence increasing their understanding of the disease or condition. It was found that 20.7% (n=18) reported that the evidence increased their knowledge by over 80%, 31% (n=27) noted an increase of between 61% and 80%, and other 31% (n=27) stated an increase up to 60%. Fifteen students (17.2%) reported an increase in understanding by 40% or less when using EBM.

Regarding the frequency of raising the role of current best evidence at clinical rounds/sessions, the students answers showed 15.1% (n=13) never, 65.4% (n=57) sometimes, and 19.5% (n=17) often. During teaching rounds or bedside teaching, 29.9% (n=26) of students reported that when discussing a particular clinical problem, current best evidence is moderately used, and 35.6% (n=31) were prepared for the clinical teaching sessions in the last month, while the majority 60.9% (n=53) were unprepared.

Almost 27% (n=24) have changed the way they learn after practicing of evidence based medicine, similar number considered the practice of EBM is somewhat a routine part of their learning. However, 42.5% (n=37) believed they have some confidence to clinical decision-making. Most 78.1% (n=68) believed that EBM will be useful in future practice as doctor, and 72.3% (n=63) are willing to practice evidence based medicine as a doctor in the future. Table 2 shows details students' answers toward EBM practice. Fifty-one students (61%) agreed it is easy to find the evidence in order to practice evidence-based medicine while 39% (n=32) disagreed, 57 students (65%) believe that EBM takes too much time for busy medical students, on the other hand 78.2% (n=68) agreed that evidence based medicine should be an integral part of the undergraduate medical curriculum. Table 3 outlines a summary of students responds to other EBM attitudinal questions.

Attitudinal Questions	Agree (%)	Disagree (%)
EBM is a "cook-book" medicine that disregards clinical experience.	53(60.9)	34(39.1)
No personal reason to adopt EBM, because it is just a "fad" (or "fashion") that will pass with time.	25(28.7)	62(71.3)
EBM is the future of clinical medicine and will become the standard of care.	66(75.9)	21(24.1)
The validity of EBM, makes anyone can see patients and do what doctors do.	34(39.1)	53(60.9)
EBM ignores the "art" of medicine	36(41.3)	51(58.7)
EBM should not be practice, in general, because medicine is about people and patients, not statistics.	20(22.9)	67(77.1)
Choosing the best treatment for a patient, by work experiences is more important than a research findings,	39(44.)	48(55.2)
Appreciating the advantages of practicing EBM.	62(71.2)	25(28.8)
Personal observation and experience, that EBM is being practiced currently in Saudi Arabia	50(57.4)	37(42.6)

**Summary of Results:-**

Overall, all 87 of sixth year medical students at UQU, showed a good knowledge and a positive attitude towards evidence based medicine, 37 of them were previous exposed to EBM during curriculum, 58% of them spent up to 1 hour, every day to find or look up evidence, In addition, when they clerked a patient, 47 students take 30 minutes in

maximum to look up the evidence relating to his/her illness, it is found that 59.7% (n=52) students more familiar to use internet when looking up for evidence after clerked a patient.

### Discussion:-

This study was designed to evaluate the knowledge, attitude and behavior toward EBM among medical students. There are multiple modalities to teach EBM as mentioned in the literature: workshops, journal clubs, the problem-based method, or the integration in the curriculum in the basic science and clinical years.<sup>7</sup> Umm Al-Qura University use integration of EBM in the clinical years curriculum as the modality of teaching EBM. The target participants in this study were the final sixth year medical students because they were exposed to clinical training and bedside teaching since fourth year, in addition to their supposed familiarity with EBM concept and practice.

Majority of participants 76.7% (n=67) declared that they have a clear understanding of what is the concept of EBM. This good percentage reflects the college's plans as (Research and evidence) module has been considered as a vertical module in the new reformed curriculum at the faculty of medicine in Umm Al-Qura University. Vertical modules were designed to deliver holistic understanding of medical phenomena and cases, while being studied through the curriculum from the second year till the sixth year.

Forty-two percent of the participants 42.5% (n=37) stated that their previous exposure was only during the curriculum, while there are 24.1% (n=21) claimed that they never exposed to EBM before. Our students have been exposed to EBM, according to the curriculum's objectives and plans, but still small proportion do not realize the integration of EBM in the curriculum, for unclear reasons. Therefore, more efforts are needed to clarify this integration in their daily education. 14.9% (n=13) attended an extracurricular lecture and only 6.9% (n=6) got formal EBM training in certified courses. *Barghouti et al.* concluded that 2-week short, intensive course in EBM conducted on fifth year medical students had significantly improved their EBM skills and knowledge.<sup>8</sup>

Low levels of knowledge about EBM were reported among Persian medical students and Omani medical residents.<sup>9</sup> <sup>10</sup> In Ireland, occupational therapy students were knowledgeable and aware of the required EBM skills.<sup>11</sup> In Netherland, *Scholten-peeters et al* compared the level of EBM knowledge in four groups: physical therapy students, their teachers, supervisors and physical therapist, they found that the highest level is in the teachers' group while students ranked their knowledge from insufficient to average.<sup>12</sup> *Johnston et al.* reported lower score for medical students in second and third years compared to their colleagues in fifth year.<sup>13</sup>

Over half of the participants 59.8% find their evidence on the internet (excluding MEDLINE and Cochrane Reviews), 25.3% on the internet and research papers, 6.9% from original research papers and secondary sources. Only, 8.1 % (n=7) use textbooks as a source of evidence. Students in this study are not aware enough about the value of using a peer reviewed sources as well as the important of extracting the information from reliable source like Cochrane library or PubMed search engine, instead they rely on easy access sites from the internet, despite that Cochrane library is considered as the main source of systemic reviews and meta-analyses.<sup>9</sup> That's why it is a must to support and encourage students to adapt this important concept during their search and to get familiar with such databases and overcoming the difficulties and diversity in the medical literature. Similarly, some studies reported that many students still rely on textbooks and seniors' opinion mainly to solve clinical problems.<sup>12</sup>

Most of Irish occupational therapy students reported that they were prepared with evidence when they were on the fieldwork placement, which indicate their positive attitude and effective behaviors to practice EBM.<sup>11</sup> Also, many other studies reported the same positive attitudes toward EBM by undergraduate students.<sup>12-14</sup>

In the view of EBM current practicing, 52.9% look up evidence during or after clerking each patient in the ward or the clinic. While, last third 23% do not look up for any evidence at all. It is recommend that the academic educators to consider EBM practicing as an essential part of daily sessions and their objective during the exams in order to evaluate the required skills and knowledge levels on periodic occasions as well as to illustrate the way of using EBM in relation to clinical experiences under various clinical scenarios.

More than half of participants spend an hour or less daily finding or looking up evidence while 32.2% do not spend any time during their usual day looking up evidence. Furthermore, 65% students believe that EBM takes too much time for busy medical students. So encourage the students to use EBM on a regular basis during their bedside training along with teach them how to search the available databases effectively to get the updated evidences in

minimal time is very important. In Umm Al-Qura University, good resources and access for many publishers are available, but there is a need to periodic classes to guide students on how to search effectively the available databases. *Stronge and Cahill* found that over half of occupational therapy students assessed evidence every day or every other day and only one third of them spend over than an hour looking up evidence.<sup>11</sup> *Johnston et al.* reported positive correlation between the future use of EBM and the frequency of practicing EBM and the need of evidence per day.<sup>13</sup>

Among many studies discussing teaching EBM effectively, only a few ones focused on how medical student perceive, utilize and apply their EBM knowledge in clinical practice.<sup>7</sup> In Saudi Arabia this study is one of the very few studies to assess undergraduate's perception of EBM with using a tested questionnaire for its reliability and validity. KAB questionnaire is considered one of the view tools developed specifically to assess undergraduates EBM knowledge, attitude and behavior.<sup>13</sup> Never the less, out of the 268 questionnaires that had been distributed, only 87 students participated voluntarily with response rate of 32.5% , which was much lower compared to *Johnston et al.* (author of the KAB questionnaire) who reported 99% response rate among fifth year medical students in Hong Kong university as they found that response rate to be higher in fifth year medical students compared to their colleagues in second and third years.<sup>13</sup> In addition, *Scholten et al.* and *Al-amrani et al.* reported even lower response rates than this study (20% and 21% response rates consecutively).<sup>12</sup> From authors point of view, this low response rate mainly due to the long list of questions (43 questions in 5 pages), this questionnaire took about 12 to 15 minutes to be completed. In addition, a major part of the students returned the questionnaire with uncompleted questions especially from the last page. Never the less, other factor could play a role like high workload of students, method and timing of distribution. The knowledge and skills of evidence base medicine and its integration in the learning process and application on the clinical practice is a highly complex and dynamic process that cannot be easily measured and analyzed. The use of subjective questionnaire (as KAB- questionnaire) could give a biased results than the actual situation. Despite that there are many tools which designed to measure this process, an objective and easy to use assessment of EBM is needed to address the actual level of the required skills and knowledge among student.

The low response rate and the fact that this is a cross-sectional study, may have affected the generalizability of the results which limit the representativeness of our data. Therefore, we advise that our data must be interpreted with cautions. In addition, the long term effects mastery of EBM behaviors among our students still unknown and need to be evaluated by robust assessment tools. Therefore, longitudinal study with different subsets and multiple occasions is strongly required.

### **Recommendations:-**

In a previous study conducted among physicians in Saudi Arabia, lack of knowledge and basic skills were the main barriers to implement EBM in clinical practice.<sup>15</sup> *Al-Almaie et al.* found the lack of training in EBM to be the major barrier in Damman region.<sup>15</sup> In Asir region, *Khoja and Al-ansary* reported the patient overload and unavailability of a local library are the main perceived barriers.<sup>16</sup> In another study in Riyadh region, *Khoja and Al-ansary* found the patient overload and lack of personal time to be the two main barriers.<sup>17</sup> In Western region, *Al-Omari and Al-Asmary* found that the unavailability of distributed updated clinical letters, journals or guidelines is the major barrier to practice EBM.<sup>18</sup>

Accordingly, the authors emphasize on the importance of teaching and applying EBM effectively to undergraduates and insuring that they have the required knowledge and skills to bring EBM to real clinical practice with confidence. Therefore, it is recommended to incorporate the EBM in various teaching activities such as: small group teaching, task assignment, morning meetings, ward rounds and journal club with continued evaluation by academic educators.<sup>19</sup> Furthermore, the academic educators have to become EBM role models themselves for the student.<sup>20</sup> Also, training students to search effectively the available resources like electronic and online databases of systemic review and EBM summaries on daily or weekly bases is an important element in teaching.<sup>21</sup> Further studies are needed to assess how viable is the educational curriculum to prepare the Saudi medical graduates with EBM practice to meet the Saudi community health needs.

### **Conclusion:-**

This study gives us an insights into the knowledge, attitude and behavior toward EBM of sixth year medical students at UQU as well as small representation of Saudi Arabia, which shows that the majority were knowledgeable and have a positive attitude. However, improvement and focusing on EBM education system in pre-graduate student,

both are needed to increase the quality and the effectiveness of student's skills as well as their ability to apply EBM in the future, and further studies are required on a larger scale for precise identification of the problems in order to improve the quality of our graduates.

Trade tax Revenue, Trade reforms,  
 Granger's Causality.

#### Abstract

This paper tries to find out the implications of trade liberalization on international trade tax revenues and its macroeconomic implication on Pakistan economy. The theoretical approach of trade reforms and its impact on the direction of change of revenue is ambiguous because of its dependence on the productivity of 'trade tax revenues'. By using the data of twenty five years, the paper first establishes the productivity of 'trade tax revenues' in Pakistan, then by an econometric analysis exploration of the relationship between trade revenues and trade liberalization in Pakistan is done. It was observed through our analysis that there is high productivity of trade tax revenues, further, our results show a positive and significant relationship between trade liberalization and collection of trade tax revenue. To support this relationship, a second test of Granger's causality is also performed which confirm the causal relationship between trade tax revenues and trade liberalization. It was suggested that supportive macroeconomic policies are prerequisite for successful trade liberalization.

#### Introduction:-

With the changing of time, economists are very strongly referring economic development to international trade and feel a strong international trade become an integral part of economic development. The world is rapidly transforming into a global village. Trade has contributed to this transformation more significantly than any other factor. In fact, the high economic, social, cultural, political, human and intellectual integration witnessed in the world in the recent past is due to trade among its different countries. Further, trade has contributed much more to the development of the world economies than any other factor. Thus, trade and development go hand in hand and therefore the strategies adopted in the case of the former have a strong bearing on the latter.

After second world war many trade related agreements took place and the most important problem which had been faced by developed as well developing countries are different international trade taxes. GATT tried to overcome the issue of trade tax and by encouraging the elimination of both qualitative and quantitative restrictions, it facilitate free trade activities. After some time it replaced by WTO and the concept of trade liberalization has become a common strategy for trade policy among countries. And this trade liberalization is accepted greatly by developing as well as developed countries and is further enhanced by the way of globalization.

Address:-(Ph.D, Scholar, National College of Business Administration & Economics, 40/E-1, Gulberg III, Lahore-Pakistan.

A number of market-oriented moves have surged during the last couple of decades in the world. In the wake of these moves, the global trend has also witnessed the liberalization of the capital account, foreign exchange, credit, domestic consumption and trade in different countries. However, the area which has received unprecedented emphasis in various economies is trade liberalization. Trade liberalization denotes the reduction in barriers to the movement of goods and services in international trade. In the words of Bhagwati and Krueger, "any policy which reduces the anti-export bias will lead towards liberalization of trade". A new explanation by Edwards (1993) describes a liberal trade regime as one in which all trade distortions including import tariffs and export subsidies are completely eliminated. Globalization is a relatively new concept in the social sciences and is acquiring a critical importance for the academic as well as the political agenda of the twenty-first century. In social theory the universalizing tendencies and transnational structural transformations bound up with globalization.

Other than benefits, some costs are also associated with trade liberalization. A substantial problem arising from reducing trade barriers in the wake of trade liberalization is the loss in tariff revenue that accounts for 10-20 percent of government revenue in developing countries [B.Yasmin ,Z.Jehan, M.A.Ch (2003)]. If tariffs are reduced or eliminated, these countries will have to impose large increases in other taxes in order to keep their budgets in line, causing some economic distortions.

Economists have different argument about the effect of trade liberalization on the productivity of trade tax revenue, so the relationship of trade tax revenue and trade liberalization is ambiguous. The higher tariff stimulate importer for seeking exemptions so it may affect the productivity of tax system. the lower tariff in some areas become a cause to increase in the tax base by lowering the marginal benefit to avoid taxation, hence liberalization leads to rise in revenue (Prithett and Sethi (1994)). So this is not always the case that the reduction of tariff due to liberalization leads to the reduction in revenue.

In case of developing economies, where the large portion of government revenue is based on the collection of tariff and other international trade taxes, trade liberalization proves a negative impact on revenue collection, according to Keen and Ligthart (1999), Fiscal problems will arise when trade restrictions drop below their revenue-maximizing level of around 10 percent to 15 percent. In these countries, the collection of direct taxes is very poor. After the trade liberalization, the tax system also failed to overcome this collection problem. So the revenue collections by government become lower than before trade liberalization.

Pakistan has made significant efforts in liberalizing its trade regime during the last two decades. The maximum tariff rate had declined from 225 percent in 1990-91 to 45 percent by 1996-97. It was further reduced to a maximum tariff rate of 25 percent (barring automobile sector) during fiscal year 2007-08. The average tariff rate stood at just 6 percent in fiscal year 2007-08 as compared to 65 percent in 1990-91. The number of tariff slabs was reduced from 13 to 4 during same period. Quantitative import restrictions have already been eliminated except those relating to security, health religious and cultural concerns. The number of statutory orders that exempted certain industries from import duties was phased out by June, 2004 and import duties on 4000 items were reduced. Import liberalization measures were adopted for agricultural and petroleum products. Restrictions on agriculture exports were also removed.

A sound fiscal position is vital for achieving macroeconomic stability, which is increasingly recognized as being critical for sustained economic growth and poverty reduction. The sooner Pakistan improves its fiscal position by making sharp fiscal adjustments, the lesser the price is likely to pay for its fiscal indiscipline. A sharp fiscal adjustment can reduce large external current account imbalances, restore the confidence of global investors, ease financing constraints, support growth and contain inflation. Pakistan's fiscal policy position remained focused on sustained economic growth in unison with declining debt services, alleviating poverty and investing in physical and human infrastructure. During the last 17 years, tax-to-GDP and hence revenue-to-GDP ratios have shown a declining trend, owing mainly the structural deficiencies in the tax collection system (Economic Survey, 2008). The combined result of such characteristics is the low and stagnant tax-to-GDP-ratio, which represents the country's fiscal effort, has remained stagnant in the neighborhood of 12 to 14 percent over the last three decades. (ibid.). Along with the reduction of tariff and non-tariff barriers for liberalizing the trade, the government has initiated successive reforms in tax system since 1990. Induced largely by trade liberalization, the customs collection declined sharply over the past decade, but rose sharply from FY2002-03 because of higher imports. As a share of GDP, customs collection declined from 55% during 1990-91 to 25% during 2007-08. With the rationalization of import tariff regime in the country whereby the average tariff rates have come down from 55% in 1995 to 17 percent in

2004 have obviously influenced the volume of international trade in the economy (Schuler (2004)) Such a large slippage on the fiscal side has already caused severe macroeconomic imbalances. The hard-earned macroeconomic stability underpinned by fiscal discipline appears to have been lost and Pakistan is likely to pay a heavy price in terms of deceleration in growth and investment, reversal in poverty trends, widening of current account deficit, rise in public and external debt, depletion of foreign exchange reserves and mounting pressures on the exchange rate.

This paper try to evaluate the implications of the process of trade liberalization on revenue generation from trade restrictions. The paper focused on quantitative restriction in form of tariff but at the same time it also focused on the theoretical explanation of the effect of trade liberalization on trade tax revenue by hypothesizing the crucial fact that the trade liberalization leads to a significant affect in trade tax revenue.

### Overview of Relevant Literature:-

By the emergence of WTO and then introduction of trade liberalization, most of the developing countries were attracting toward it, to see their dream come true to be industrialized nation. Trade liberalization may help them a lot, but we intended to see the fiscal impact of trade liberalization, in Pakistan which can better analyze with the help of research experience done in other countries.

**Tanzi (1989)** hypothesized a several wide-ranging issue to check the relationship of different macro economics variables, he also included inflation, exchange rate and most prominently tax revenues. He observe there is often an inverse relationship between a country's tax revenue and real level of its exchange rate, he is of the view that overvaluation has a direct effect by suppressing import and export bases measured in domestic currency term. This in turn reduces the collection of international trade taxes and sales and excise taxes, which are usually levied upon domestic and imported consumption. On other hand he also concludes that, the tax collection method is different in different countries. It is therefore not possible to generalize about the effect of changes in trade liberalization and the surrounding macroeconomic environment on tax revenues without examining the structure of the different components of revenues and the importance of each different component in the total.

**Reisen (1990) and Seade (1990)**, formulate hypotheses on similar issues and tested the relationship of tax revenue and exchange rate, they also found an inverse relationship between them,

**A. Matlanyaneand Harmse (2002)**, highlight the implications of trade liberalization on international trade tax revenue and the macroeconomic implications thereof in the context of the **South African economy**. It follows quantitative restrictions in the form of tariffs for liberalizing trade in South Africa.. By using econometrics techniques, it is estimated that customs revenue highly influenced by trade liberalization. It was suggested that Government should couple the liberalization polices with other macroeconomic policies such as exchange rate liberalization that would woThe main focus of the paper is on quantitative restrictions in the form of tariffs. Customs revenue is used as a measure of trade tax revenue. The estimation results show that customs revenue is highly productive. In addition, trade liberalization has a significant influence on customs revenue and that an increase in imports may lead to a reduction in trade tax revenue. On the other hand the results suggest that supportive macroeconomic policies.

**Ali Zafar(2005)** World Bank Policy Research Working , observed that **Niger** has suffered major fluctuations in revenue since the 1970s. The revenue/GDP ratio has fallen from 14 percent in 1980 to 10.6 percent in 2002. Using data collected during several operational missions, this study finds that the principal reasons for low revenue mobilization are: the adverse fiscal impact of trade liberalization, the defiscalization of agriculture in the 1970s, the collapse of the uranium boom in the 1980s, and the poor record of the VAT in mobilizing revenue. The large reduction in tariffs during the 1980s and 1990s in the context of structural adjustment programs and West African regional integration initiatives had adverse effects on trade tax revenue during the period 1980-2003. However, higher import levels after 1994 succeeded in partially mitigating the revenue losses. The experience of Niger demonstrates that without accompanying macroeconomic policies, parallel improvements in tax and customs administration, and success in mobilizing domestic taxes, most notably the VAT, trade reform can have adverse fiscal consequences.

**Dutta D, and Ahmad N (2006)** by using the data of 1973-1995, they empirically analyze the relationship of trade liberalization and industrial growth in **Pakistan**, with this relationship, they also analyze the impact of trade liberalization and revenue collection of a country, in this context, they use two method for empirical analysis, the

Co-integration analysis and error correction modeling have been used. It is suggested that there exists a unique long run relationship among the aggregate growth function on industrial value added and its major determinants of the real capital stock, the labor force, real exports the import tariff collection rate and the secondary school enrolment ratio.

**Bushra Yasmin, Zainab Jehan, Muhammad Ali Chaudhary (2006)**, empirically analyzed how trade liberalization has affected economic development in **Pakistan**. Its effects have been examined with respect to four measures of economic development: per capita GDP, income inequality, poverty and employment over the period from 1960-2003. The analysis shows that, over the study period, trade liberalization has not affected all the chosen indicators of development uniformly. It has affected employment positively but per capita GDP and income distribution negatively. However, it has not affected poverty in any way. The obvious message is that trade liberalization has not affected all the indicators of development favorably in Pakistan. It thus implies the need of a cautious move towards liberalization. The focus of trade liberalization should be to bring about improvement in the performance of mediating factors and to focus exports on labor-intensive products.

**An IMF working Paper (2006)**, "Fiscal Implications of Multilateral Tariff Cuts" The paper contributes to the discussion about the revenue implications of trade reform by assessing the approximate fiscal revenue impact of different liberalization formulae under consideration in multilateral trade negotiations for a group of low- and middle-income countries. The study applies a linear optimization framework to data for bound tariffs, applied tariffs, and imports at the HS-6 digit level for 58 developing countries, and simulates results for different sets of import demand elasticities and developing country "flexibilities." While only a small number of countries face a significant impact, results point toward the need for complementary fiscal measures in the countries most affected by revenue loss.

**Joseph Pelzman and Amir Shoham(2007)** focusing on the experience of the **Israeli economy** in the twenty year period (1984-2005) where Israel undertook both major tariff liberalization and a related domestic tax reform, with no reversion to border taxes. The Israeli experience highlights the initial budget revenue concerns associated with tariff liberalization, and quickly moves the issue away from border tax substitutes to domestic issues concerning enforcement. By de-linking the two issues the paper demonstrates that it is feasible to successfully tackling both external and internal tax reforms. Furthermore, it demonstrates that it is possible not to fall into the trap of looking at border taxes as a cure for internal high costs of tax revenue. The appropriate prescription for other developing or newly industrialized countries is to de-link the two tax issues, focus on the collection side of the domestic tax structure while at the same time reducing local taxes and broadening the tax base.

**Panel Data** very broadly covers the relationship of trade liberalization and revenue effect, in fact the trade liberalization impact in panel data analysis helps us to examine the policies of different countries in order to adopt trade liberalization and other countries can learn from their experience.

**Khattry and Rao (2002)** investigate the issue of fiscal impact and trade liberalization, on the basis of the data of 1970-1998 from 84 countries, by applying the fixed effect model, they conclude that with trade liberalization, lower and middle income countries had experienced lower fiscal income as a result of fall in trade related tariff and income and trade liberalization is negatively correlated with total tax revenue and international trade tax revenue.

**Agbeyegbe T, Stotsky J, and WoldeMariami (2004)** on the basis of empirical evidence find out the relationship of trade liberalization, exchange rates and tax revenue. By using the panel data of 22 African countries of the period of 1980-1996, they try to check this relationship, for this purpose they use Generalized Method of Moment Method. They prove a sensitive and negative relationship between trade liberalization and tax revenue. According to them in general, trade liberalization is not strongly linked to aggregate tax revenue, it is basically linked with higher income tax revenue. They suggest that to adopt trade liberalization, the countries should be careful to apply some macro economic policies to preserve the overall revenue yield.

By using the data from 125 countries, **Baunsgaard and Keen (2004)** give their point of view about the relationship of trade liberalization with tariff revenue, they find that after trade liberalization middle-income countries had been able to recover between 35 and 55 cents per dollar of income from lost trade income, whereas lowest income countries had recovered basically none.

**Methodology:-**

Econometric methods of analysis are used to achieve the above objectives. The following equation, adapted from the work of Osoro (1993) is estimated using the method of ordinary least squares to determine the productivity of trade tax revenue;

$$\ln T = \ln \phi + \alpha \ln Y + \mu \dots \dots \dots (1)$$

Where **T = customs revenue**

**Y = GDP**

**α ..= a measure of revenue productivity/ tax buoyancy**

In order to test the main hypotheses, trade revenue is specified as a function of the import base, the exchange rate, the average tariff rate and a dummy variable representing trade liberalization. The specific equation to be estimated is;

$$\ln TR = \gamma_0 + \gamma_1 \ln M + \gamma_2 \ln w + \gamma_3 Lib + \gamma_4 r + \eta \dots \dots \dots (2)$$

Where **TR** is customs revenue as a percentage of GDP,

**M:** is imports as a percentage of GDP representing the import base,

**W :** is the exchange rate,

**Lib:** is a variable for trade liberalization which is calculated as import duties as percentage of total imports.

and **TR :** is the average overall tariff rate and □

**η :** is the error term.

The import GDP ratio is included in this equation to isolate the effect of trade liberalization on international trade, which can then be related to the effect on revenue, while the exchange rate is used to represent the macroeconomic effects of this policy. The tariff reform Liberalization and the average tariff rate will then indicate the direct effect of the reduction in the average tariffs on trade tax revenue.

**Estimation Techniques and data:-**

Ordinary least squares is used to estimate the productivity of trade tax revenue and to establish the effect of trade liberalization on tariff revenue. The equations are estimated in linear logarithmic form. The exchange rate is expressed as Rupee per US dollar. This means that an increase in the exchange rate represents a depreciation of the Rupee. Customs revenue is used as a proxy for international trade tax revenue. Because of data efficiencies, the overall average tariff rate was calculated from the series on customs revenue and that of the value of imports. Although not all imports are subject to trade restrictions, this measure gives an ideal of the average tariff based on all import commodities. Annual time series data ranging from 1971 to 2007 has been used.

**Estimation Results:-**

This section presents and discusses the estimation results of the above equations.

**Table 1:-**Dependent Variable: LOG(CUSTOM)

Variable	Coefficient	t.statistics
C	2.059167	1.684347*
LOG(GDP_RS_)	0.802002	17.97399**
R-squared=0.902252	F-statistic=323.0642	Prob(F-statistic)= 0.000000

\*Sig at 10% level of significance \*\*sig at 1% level of significance

**Table: 1** shows the estimation results of the productivity of trade tax revenue. The results exhibit a good fit of 90 percent. The coefficient of GDP is positive and significant as expected a priori. This implies that a rise in output will lead to an increase in international trade tax revenue. A one percent increase in output will increase customs revenue by approximately 10 percent. This coefficient also shows that tax revenue is highly responsive to changes in output. This relationship is significant at 1% level of significance. On other hand the overall model is also highly significant, which can be analyzing by the value of F-statistics. The overall model presents a good and significant picture of data.

**Table2:-**Dependent Variable: LOG (TR)

Variable	Coefficient	t.statistics
C	-3.634763	8.808166***
LOG(M)	0.484176	2.238925***
LOG(W)	-0.030953	1.018211
LIB	2.357378	2.476208***
TAR	18.19182	3.380701***
<b>R-squared=0.978407</b>	<b>F-statistic=362.4953</b>	<b>Prob(F-statistic)=0.0000</b>

\*\*\*sig at 1% level of significance

The estimation results of the determinants of import and trade tax revenues are shown in Table2. The dependent variable in this regression is customs revenue as a percentage of GDP. The coefficient of the exchange rate is negative but not significant. This result has two implications. Firstly, it means that when the depreciates takes pace in the currency, the volume of imports falls and hence leads to a loss of trade tax revenue. Secondly however, the fact that this coefficient is not significant in statistical terms implies that the value of imports rises in Dollar terms and partially makes up for the loss in revenue resulting from lower trade taxes. The coefficient of the import-GDP ratio is positive and significant at 1 percent level of significance. A one percent increase in the import-GDP ratio results in a increase in customs revenue- GDP ratio by approximately 0.48 percent. This indicates that even if the volume and value of imports increase (by a higher proportion than GDP) as a result of trade liberalization, import tax revenue actually has increased. This could imply that although a combination of lower tariffs and the depreciation of the current depreciation of the local currency may increase imports both in terms of volume and value, the effect of these two factors on revenue as well.

The relationship of imports as a percentage of GDP with trade Liberalization is positive and significant at 1% level of significance. This states that by the increase in the volume of imports there is an increase in the trade tax revenues of a country. On other hand the relationship of trade liberalization and trade tax revenue is positive and highly significant at 1% level of significance. The coefficient of the average tariff rate is positive and significant as expected. This confirms the hypothesis that a reduction in the tariff rates results in a significant loss of customs revenue as indicated by the coefficient of the import GDP ratio. The coefficient liberalization is positive , indicates the positive impact of trade liberalization in Pakistan economy, implies that with the trade liberalization , there is more increase in revenue and economy as well the fiscal implication of the liberalization have positive impacts as well. This implies that liberalization policies have been able to significantly affect international trade tax revenue in short as well as in long run.

Two main conclusions can be drawn from this analysis. Firstly trade liberalization in the form of tariff reforms has not reduced trade tax revenue significantly. Secondly, macroeconomic policies that support the prevailing macroeconomic environment can significantly facilitate successful trade liberalization. In this regard, the government can take advantage of the depreciation of the Rupee to increase exports and thus the fiscal implication of liberalization is positive.

**Granger’s causality Test:-**

Granger causality test has also been performing to check the causal relationship trade liberalization and Trade tax revenue

$$TR_t = \alpha LIB_{t-1} + \beta TR_{t-j}$$

$$LIB_t = \lambda TR_{t-i} + \gamma LIB_{t-j}$$

For this purpose upto two lags of both variables has been taken and with one lag we got the result that trade liberalization has a strong causal effect on Trade tax revenue but on other hand trade tax revenues has no casual effect on trade liberalization. So it is concluded that trade liberalization has a strong causal effect on trade tax revenue which is significant at 1% level of significance.

**Table 3:-** Granger causality with lag “1”

Regression	Granger causality test
LIB on TR	12.2742* (0.00134)**
TR on LIB	1.61558* (0.21260)**

\* F-value \*\* Probability value

From the Granger's causality test the causal relationship of trade liberalization and trade tax revenue has been proved at one lag and it indicate that the direction of causality is from trade liberalization to trade tax revues

**Table 4:-** Granger causality with lag "2"

Regression	Granger causality test
LIB on TR	8.18624* (0.00146)**
TR on LIB	6.71527* (0.00389)**

\* F-value \*\* Probability value

From the Granger's Causality test, the relationship between trade tax and trade liberalization has been proved from table 4 which basically indicates two way causal relationships between these two variables. So by the results it is conclude that the trade liberalization has a causal effect on trade tax revenues but at the same time the trade tax revenues also has a causal effect on trade liberalization.

### Concluding Remarks:-

This paper set out to establish the effect of trade reform on government revenue. This task is executed by an econometric analysis of the determinants of trade tax revenue. From the analysis, it can be concluded that trade liberalization in Pakistan has led to a significant improvement in trade tax revenue in both short as well in long run. Even, given the significant positive effect of the import-GDP ratio on customs revenue, it is imperative for government to couple the liberalization policies with other macroeconomic policies such as exchange rate liberalization that would work to mitigate budgetary pressures. One of the important conclusions that can be drawn from the analysis is therefore that a sound macroeconomic policy environment can significantly facilitate successful trade liberalization. In this particular case, prudent exchange rate policies are crucial. Taking advantage of the depreciation of the Rupee by increasing import earnings could ensure enough earnings from imports to offset the loss in revenue from trade taxes due to lower taxes. The results for Pakistan economy are quite different from many developing countries. Granger causality supports the argument that the trade tax revenue has increased by the trade liberalization mainly because of tax reforms initiative from Federal Board of Revenue and growth of GDP during the period. This relationship encourages liberalization policies accompanied by macroeconomic policies to increase GDP and economic growth in the economy.

**Introduction**

The most important purpose of learning and teaching a foreign language is to be able to communicate it in different situations for expressing thought and information. Nowadays, concentrating only on spoken English is not enough, written competency has also become indispensable for an EFL learner. Also, they have to respond to questions in the form of written assignments, essays and many other ways. So, there is a need for the language learner to explore and express the ideas properly. If we, the teachers change the strategy or implement the new technique in English language teaching, can enhance the students' English Language Learning Performances.

This can be done through the use of literary texts in the classroom which will augment the language learning process not only interesting but also enjoyable. Engaging the students in the process of reading and listening a literary text will result in enhancing the productive skills speaking and writing. According to HouriaElhabiri (2013), literary texts can be a valuable resource for enhancing students' response to texts due to the fun and interest imbedded in them and particularly, short stories which will develop the writing skills.

Literature text has the capability to express human values and culture, applying this teaching strategy promotes better expression of ideas. The language style and use of vocabulary in the literary texts can enrich the students' knowledge. ParvinGhasemi (2011), proposes a variety of strategies with the use of short story to improve reading and writing skills. These techniques include pre reading activities, in-class oral reading, textual analysis and post reading assignments. Particularly using a short story in the classroom will provide a chance to the learners to learn new vocabulary and different writing styles. Gradually, students can use the selective vocabulary in their writings and also construct the sentences and paragraph in a perfect way.

Moreover, using short stories in the EFL classroom can create a positive learning environment. The short story's distinctive features create interest among the EFL learners. If the teachers select a suitable short story according to the proficiency level of the learners, this strategy can stimulate an intellectual and emotional involvement among the EFL learners. According to Pardede, P. (2011), short story can be used a powerful and motivating tool for ESL/EFL learners to develop their writing skills, as it can serve both as a model and give a context for creative writing. Thus, this paper tries to prove that suitable selective short story facilitates the students and can develop EFL learners' language learning process. Also, short story can be used as a valuable tool for improving the sub skills of writing, i.e. vocabulary development, development of ideas, grammar and the logical and critical thinking.

### Problems Faced by the Arab Students

Arab learners, in particular, the students in graduate level first year are not able to utilize the opportunity to speak in English in their formal school classrooms because of their mother tongue interference. The students are exposed to the English Language instructions only for a few hours per week. These instructions focus more on written form than listening and speaking. Moreover, the school curriculum was not concentrating English Language; their primary focus is only on the courses which are all in Arabic. Because of this barrier the students are not showing interest to learn or know about English Language. The main problem is their mother tongue influence in the classroom teaching. Students are not getting chance to learn the language in a systematic way. The students concentrate only on their marks and to pass. In addition to that, they also prefer to read online translation materials in Arabic although there is an option to change into English.

Writing in English involves several processes namely, collecting data/information, organisation, and other mechanics such as prewriting, revising and rewriting. Saudi learners find it all the difficult to write, which is mainly due to the limitation of vocabulary, complex grammatical structures, style, cultural hindrances, lack of exposure, practice and less experience in using the rhetorical structures of English language.

### Aim of the study

The aim of this study is to use short stories to create a positive environment and develop the writing skill in an enjoyable way.

### Participants

The participants of this study were thirty students, who have taken up English as their major in the Bachelor's degree from the fourth level.

### Using Short Stories in the Writing Class room

This research study used the short stories of Oscar Wilde to determine if the use of short stories can help in the development of writing skills of students. Oscar Wilde's story was selected as he was considered to be a major figure of the aesthetic revival in English art. This study was done by selecting five short stories of Oscar Wilde for the duration of one semester, and employed them in the classroom, and then checked the progress of the students through small written tests and presentations. In order to measure the effects of writing progress, a qualitative approach was used. The design assessed if short stories are used in the classroom, it helped in the active participation of the learners, in turn, enhanced the writing skills of the learners.

### Methods to Use Short Stories

The text book which is used for Writing-I course is Interactions-I Middle East Edition. This text focuses on the sub skills of writing, i.e. vocabulary development, development of ideas, grammar and the logical and critical thinking. Short story was selected according to the interest of the students. Moreover, all students are interested to listen to stories, especially, the Arab students who are not much exposed to stories in their young age.

### Oscar Wilde's 'The Model Millionaire'

First, brainstormed the students by showing clippings related to the story and then asked the students to create a vocabulary chart of what they have observed.

(Pictures selected from

[https://www.google.com.sa/search?q=the+model+millionaire&safe=strict&source=lnms&tbm=isch&sa=X&ved=0ahUKEwiowfDD\\_e7RAhWethQKHx4-FYQ\\_AUICCG&biw=1078&bih=501](https://www.google.com.sa/search?q=the+model+millionaire&safe=strict&source=lnms&tbm=isch&sa=X&ved=0ahUKEwiowfDD_e7RAhWethQKHx4-FYQ_AUICCG&biw=1078&bih=501))

After this activity discussed the clipping shown, and then provided a paragraph with blanks to be filled up with the vocabulary list given on top. By this way, the students understood the meaning of the words and how to use the vocabulary.

#### **An extract from ‘The Model Millionaire’**

Unless one is wealthy there is no use in being a charming fellow. Romance is the privilege of the rich, not the profession of the unemployed. The poor should be practical and prosaic. It is better to have a permanent income than to be fascinating. These are the great truths of modern life which Hughie Erskine never realised. Poor Hughie! Intellectually, we must admit, he was not of much importance. He never said a brilliant or even an ill-natured thing in his life. But then he was wonderfully good-looking, with his crisp brown hair, his clear-cut profile, and his grey eyes.

Subsequently, a paragraph was provided to the students to be read. After reading the paragraph, the same paragraph was offered with blanks. In this manner, the students recognized how to employ the vocabulary appropriately.

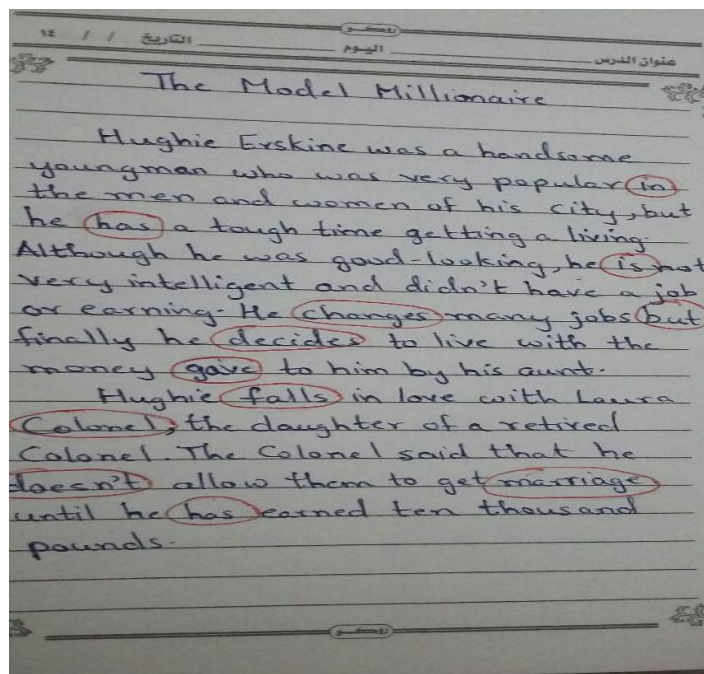

To make matters worse, he was in love. The girl he loved was Laura Merton, the daughter of a retired Colonel who had lost his temper and his digestion in India, and had never found either of them again. Laura adored him, and he was ready to kiss her shoe-strings. They were the handsomest couple in London, and had not a penny-piece between them. The Colonel was very fond of Hughie, but would not hear of any engagement.

'Come to me, my boy, when you have got ten thousand pounds of your own, and we will see about it,' he used to say; and Hughie looked very glum on those days, and had to go to Laura for consolation. (Extracts taken from <http://www.wilde-online.info/the-model-millionaire.html>)

#### **Video**

Next, played the video of the story (<https://www.youtube.com/watch?v=HEqTmN5EPWQ>) and then provided the opening lines of the story to be developed into a paragraph. Majority of the students developed the first part of the story in a logical way. This activity is carried out to enhance the logical and critical thinking skills of the students. While performing this activity, the students' grammatical level can be observed. After analysing the errors, measures are taken to rectify the inaccuracies.

### Conclusion

This study made known that short stories have an immense effect on students learning process and can be used as a powerful tool to enhance the sub skills of writing. It was also found that the students feel it more appealing when they are allowed to think outside the text and develop their ideas in an interesting way. Moreover, it can be established that employing any short story will create a positive environment for the development of learning writing skills. This can be one of the strategies which will be beneficial to enhance the writing skills of the students. Teachers can adopt suitable strategies according to nature of the classroom.

Environment, Policy, Planning,  
 Sustainable Development.

#### Abstract

This paper examines implementation of environment policy and planning particularly on making India eco-friendly. Environment policy and planning maintained of environmental quality, it is essence of requirement for improving quality of life leading to sustainable development. Environment considered have been an integral part of the Indian culture the need for conservation and sustainable use of natural resources has been expressed in Indian scriptures, more than three thousand years old and is reflected in the constitutional, legislative and policy framework as also in the international commitments of the country.

#### Introduction:-

An environmental policy being interdisciplinary in nature draws together technology, economics, and natural and social sciences. In order to develop sustainable policies, therefore, it is necessary to have sound knowledge of the actual and potential environmental impacts of certain activities and some knowledge of the technical characteristics, economic costs, social acceptability and possible side effects of alternative policy options. Environmental policies involve certain measures aimed at achieving a sound environment. They are usually developed in the context of public policy, based on economic theory, which focuses more on the level of costs and benefits associated with the implementation of environmental policies than on the quality of the environment. When governments propose and subsequently implement strict standards, sectors that pollute the environment will have to take measures, and this cannot be achieved without incurring extra costs. Polluting industries are, therefore, often keen to highlight the likely costs they have to incur due to the proposed environmental measures. Annan Kofi, the former UN Secretary General, had observed: "Perhaps the biggest challenge of our times is the task of achieving a transition to sustainability, a transition that will enable people around the world to live free from want and fear without compromising the ability of future generations to do so as well", (quoted by Kasemir B. 2003:1). World Development Report 2003: *Sustainable Development in a Dynamic World-Transforming Institutions, Growth, and Quality of Life* has shown that such a transition is a manageable challenge. It requires, on one hand, an appropriate modeling of a dynamics of socio-economic development and designing operationally viable and result-oriented policy-mix which includes an environmental policy, and on the other hand, implementation of policies with utmost vigilance. Obviously, the stakeholders - the state and the citizens have a crucial role to play in this mission.

**Corresponding Author:- Sharqa Noori Ansari.**

Address:- Research Scholar, Dept. of Geography, Aligarh Muslim University. Aligarh- India.

**Aim and objectives:-**

The aim of the study is to evaluate the impact on environment that has occurred already with the following objectives:

1. To assess the existing air quality.
2. To assess the extent of pollution of water bodies due to developmental activities.
3. To assess the quality of soil and extent of soil pollution and soil degradation.
4. To assess the extent of noise pollution.
5. To assess the quantities and types of solid wastes generated, assess the efficacy of present disposal method and to propose suitable methods disposal.
6. To assess the amounts of sewerage generated and its quality.
7. To assess the efficiency of existing sewage system and propose sewage treatment facilities.

**Provision of environmental law in India:-**

Apart from international laws, every country has enacted laws regarding environment protection, pollution control etc. In India, there are several acts for environment protection that says protection of environment is the duty of government. Also the purpose of state is welfare of citizens and establishment of such a society that ensures people a human dignity a human living and finally an equal and humane socio-economic relationship. The intermeshing of human rights can be seen from the fact that ecology and environment are today considered control focus of a person's entitlement.

In India a separate ministry namely The Department of Environment was established in 1980 to ensure a healthy environment for the country. The main acts for environment protection in India are as follows:-

1. The Forest Conservation Act, 1980.
2. The Prevention of Air and Water Pollution, 1974, 1981
3. (The Central Pollution Control Board) (CPCB) was constituted under this act.
4. The Air Prevention and Control of Pollution, 1981.
5. The Atomic Energy Act. 1982.
6. The Environmental Protection Act, 1986.
7. (It came into force soon after the Bhopal Gas Tragedy)
8. The Environmental Conservation Act. 1989.
9. The National Environmental Tribunal, 1995.
10. National Environmental Appellate Authority Act, 1997.
11. National Environment Management Act (NEMA), 1998
12. Handling and Management of Hazardous Waste Rule in 1989.
13. The Public Liability Insurance Act (Rules and Amendment), 1992.
14. The Biomedical Waste Management and Handling Rules, 1998.
15. The Environment (Siting for Industrial Projects) Rules, 1999.
16. The Municipal Solid Waste (Management and Handling) Rules, 2000.
17. The Ozone Depleting Substance (Regulation and Control) Rules, 2000.
18. The Biological Diversity Act 2002.

**Environmental Challenges: Causes and Impacts:-**

The key environmental challenges that India faces relate to the nexus of environmental degradation with poverty in its many dimensions, and economic growth. These challenges are intrinsically connected with the state of environmental resources, such as land, water, air, and their flora and fauna. The proximate drivers of environmental degradation are population growth, inappropriate technology and consumption choices, and poverty, leading to changes in relations between people and ecosystems, and development activities such as intensive agriculture, polluting industry, and unplanned urbanization. However, these factors give rise to environmental degradation only through deeper causal linkages, in particular, institutional failures, resulting in lack of clarity or enforcement of rights of access and use of environmental resources, policies which provide disincentives for environmental conservation (and which may have origins in the fiscal regime), market failures (which may be linked to shortcomings in the regulatory regimes), and governance constraints. Environmental degradation is a major causal factor in enhancing and perpetuating poverty, particularly among the rural poor, when such degradation impacts soil fertility, quantity and quality of water, air quality, forests, wildlife and fisheries. The dependence of the rural poor, in particular, tribal societies, on their natural resources, especially biodiversity, is self-evident. Women in particular

face greater adverse impacts of degradation of natural resources, being directly responsible for their collection and use, but rarely for their management. The poor are also more vulnerable to loss of resilience in ecosystems. Large reductions in resilience may mean that the ecosystems, on which livelihoods are based, break down, causing distress. The loss of the environmental resource base can result in certain groups of people being made destitute, even if overall, the economy shows strong growth. For the poor, several environmental resources are complementary in production and consumption to other commodities, while a number of environmental resources are a source of income or food. Poverty and environmental degradation are also reinforced by, and linked to population growth, which in turn, depends on a complex interaction of diverse causal factors and stages of development. Poor environmental quality has adversely affected human health. Environmental factors are estimated as being responsible in some cases for nearly 20 percent of the burden of disease in India, and a number of environment health factors are closely linked with dimensions of poverty. It has been shown that interventions such as reducing indoor air pollution, protecting sources of safe drinking water, protecting soil from contamination, improved sanitation measures, and better public health governance, offer tremendous opportunities in reducing the incidence of a number of critical health problems. It is also evident that these environmental protection measures would be difficult to accomplish without extensive awareness raising, and education, on good practices with respect to public and private behavior.

### **Suggestions:-**

The existing legal provisions are inadequate to control the enormous problems of environmental pollution of various types in the country. Therefore, the judiciary has to play a more active and constructive role. This has become all the more essential in view of the lack of awareness in the masses of the pollution problems; lack of planning and the plenty of the industries and the local bodies in this regard. New jurisprudential techniques have to be devised to deal adequately with the problems of pollution control and protection of environment.

1. Environmental law should be implemented effectively by adopting new instruments, mechanisms and procedures like environmental impact assessment and environmental audit and incorporate environmental objectives in manufacturing processes, minimum usage of hazardous materials and toxic chemicals, careful usage of toxic gases will reduce environmental load.
2. Legal provisions granting a perspective right to pollute air and water should be constructing restrictively by the courts.
3. Legal provisions intended to prevent or control pollution should be interpreted in such a way that even the subtle invasions of the anti-pollution laws are covered.
4. Government must initiate the programmes to create public awareness with regard to relation between human rights and environmental protection and also related laws.
5. Sincere commitment to good environmental practices must be supported throughout the globe for sustenance of life and adopting green technologies, viz, using solar energy, low CFC emitting technology, those which are highly innovative, cost-effective, eco-friendly technologies.
6. The decision of the Supreme Court in the case of Ratlam Municipal Council should be treated as containing the basic guidelines in determining the primary responsibility of the local bodies as also of the industries.
7. Coordinating efforts globally between all states and locally among governments centre and states, private groups, organizations, operational and financial institutions and people at large in appropriate aspects of their respective activities through Exchange of information, sharing of expertise knowledge, developing arrangements for technical cooperation is needed.
8. The sentencing policy should place emphasis on abatement of pollution of environment rather than imposition of fines or traditional penalties.
9. Public interest litigation for protection of the natural environment should be permitted In view of the wider social interests affected by environmental pollution. The court has to inculcate new methods and devise new strategies for the purpose of providing access to justice to large masses of people who are denied their basic human rights. Especially having regard to the peculiar socioeconomic conditions prevailing in the country where there is considerable poverty, illiteracy and ignorance obstructing and impeding accessibility to the judicial process.
10. Promoting programmes to sensitize decision makers, including public officials, legislators and members of the judiciary, as to the need to develop a sense of commitment to the protection of human and environmental rights and to adopt more holistic approaches to integrating the requirements of sustainable development in the interpretation and application of national and international norms for the protection of those rights and sustainable development concepts.

11. Among all the laws on the subject, Sec. 133 of Cr. P.C. 1974 can play a pivot role in controlling all types of pollution viz, air, water and noise. Being a speedy and summary remedy every one can use it effectively by raising the guns of section 133 to go in to action, whenever there is a public nuisance caused by pollution to the environment.
12. The Magistrate and the Courts must invoke the provisions of Sec.133 for achieving the social justice by ordering the abatement of public nuisance caused by pollution to the environment.
13. United Nations and governments of nations can do three key course of action: 1. Proper information regarding seriousness of the environmental problem. 2. Incentives may be provided to those who develop standards to meet the challenge of environmental pollution. 3. To set up a unified Research center and implement the principles of sustainable development.
14. This is a very small step when what are needed are giant strides in an eco friendly direction. The crying need of the hour is to educate the public and make them aware of their rights as citizens of this country to a clean environment, to clean water, clean air and clean surroundings. They must act together to fight corruption in governance and ruthless exploitation by the captains of industry. A strategy for environmental protection could be adopted.
15. Reduce fertility rates and control population, reducing pressure on natural resources. Educate and inform the people about the gains of environmental protection and sustainable development. They must stand up for their rights

It is high time that the general public, public entities, state and central government realize the damage, which our developmental process has made to the living environment. The extent is such that it cannot be resorted. There a necessity to think about the needs of present and future by compulsion and also need to balance the public interest and environment protection. It is to be noted that unless the humanity rises to the occasion for the prevention and control of the pollution and protection of environment with necessary zeal and speedy trial, the progressive and prosperous living and to procure welfare state will become a nightmare. There is still hope for us. We can, to a certain degree, reverse the process of degradation of our surroundings, for Mother Earth is forgiving and able to heal her wounds if we do not inflict more grievous ones on her. As Paul Bigelow Sears said, "How far must suffering and misery go before we see that even in the day of vast cities and powerful machines, the good earth is our mother and that if we destroy her, we destroy ourselves." So we should act today for a better tomorrow for our children.

### **Recommendations:-**

As the measures suggested above are important and even several NGOs and Government agencies try to spread awareness about them, it has been observed that the implementation of these measures fails to a greater extent. The extravagance of the celebration of this spiritual festival continues to degrade the environment and increase the levels of pollution. The problem identified through the study is the ineffective communication of these measures which must be communicated effectively if they are to be implemented successfully. Several NGOs and Government agencies are trying to communicate the measures to masses but the communication needs to be done on a greater scale. The recommendations for the effective communication of these measures are presented as below:

1. All these measures can be incorporated in the syllabus of the subject 'Environmental studies' in primary schools and colleges.
2. Awareness programmes such as slide-show presentations, street-plays can be organized on a greater scale in schools, colleges and at public places.
3. The government agencies, NGOs, schools and colleges may form groups for carrying out such awareness programmes on a greater scale.

### **Conclusion:-**

The moot point then is what does the future hold in terms of environmental policy. If the past is anything to go by, the likelihood is that social concerns will continue to play second fiddle to the management of the environment. yet, legal and policy spaces will continue to emerge through which proponents of an alternative vision of environmental management and development will launch their struggles. Such struggles must engage more deliberately with existing neo-liberal discourses of good governance and the market instead of shy away from them. Communities are already enmeshed in the market and located in geographical spaces that will eventually come into the gamut of good governance strategies. Instead of being swallowed up by these discourses as is currently happening, communities and those who speak for them need to help shape them instead. The market and good governance rhetoric are after all as bad or good as the ideological context in which they are located.

#### Abstract

**Introduction:** Hepatic elastography (HE) is a noninvasive technique that measures liver stiffness and is used to diagnose hepatic fibrosis. It can help patients who are thought to have early-stage disease avoid a staging liver biopsy, but only when confounding variables that increase liver stiffness are excluded. Chronic inflammation from hepatitis C virus (HCV) infection is not considered to be one of these variables.

**Aim of the study:** To detect whether histologic and biochemical inflammation could confound the predictive value of hepatic elastography in patients with chronic hepatitis C virus infection.

**Patients and methods:** Study population included 68 patients with HCV and METAVIR fibrosis scores of 0 – 2 in 288 patients with chronic liver disease, patients were  $49.6 \pm 9.0$  years old, 64.3 % were male, and they had an average body mass index of  $26.7 \pm 4.1$  kg/m<sup>2</sup>.

**Results:** Inflammation (based on histologic analysis) and level of alanine aminotransferase

(ALT) were associated with liver stiffness. The chances of a patient having a level of stiffness that indicates cirrhosis increased with grade of inflammation and level of ALT. By using a conservative 14.5-kPa cutoff for the diagnosis of cirrhosis, grade 3 inflammation had an odds ratio of 9.10 (95% confidence interval, 2.49 –33.4). Likewise, levels of ALT greater than 80 and 120 IU/L had odds ratios of 3.84 (95% confidence interval, 2.10 –7.00) and 4.10 (95% confidence interval, 2.18 –7.69), respectively. The effect of the level of ALT persisted when analysis was restricted to patients with fibrosis scores of F0 to F1.

**Conclusions:** Patients with HCV infection and early-stage fibrosis, increased levels of ALT correlate with liver stiffness among patients in the lowest stages of fibrosis (METAVIR scores 0–2). Patients without fibrosis but high levels of ALT could have liver stiffness within the range for cirrhosis. Inflammation should be considered a confounding variable in analysis of liver stiffness.

**Introduction:-**

Hepatic elastography (HE) depends on ultrasound and shear waves to measure the liver stiffness. It is a validated and reproducible, noninvasive method for making the diagnosis of liver cirrhosis. At the opposite end of the fibrosis spectrum,

However, the predictive value of HE is a matter of ongoing study. Of chief interest for the practicing hepatologist is how chronic inflammation, as in the case of hepatitis C, affects the predictive value of HE. It is already recognized that certain conditions intrinsic to liver pathophysiology such as acute hepatitis, sinusoidal congestion, and obstructive cholestasis increase liver stiffness independent of fibrosis stage (1).

Hepatic inflammation, when acute and severe, has an effect on the visco-elasticity of the liver and results in an overestimation of liver fibrosis stage by HE, as is the case with hepatitis B flares and reappearance hepatitis C after liver transplantation (2, 3).

In the setting of smoldering inflammation (e.g., chronic hepatitis C or steatohepatitis), however, the impact of inflammation on the predictive value of HE is less certain. Liver stiffness measurements (LSMs) did not correlate with varying degrees of necro-inflammation in chronic hepatitis C; likewise in steatohepatitis, there are reports of no correlation between LSM and necro-inflammatory activity or alanine aminotransferase (ALT) (4, 5). However, Oliveri et al concluded that necro-inflammation was independently associated with liver stiffness, even though in hepatitis B-infected individuals. There is sufficient animal model evidence that visco-elasticity of the hepatic parenchyma is decreased before the deposition of collagen scar (6), the etiology of this dynamic, physical property is poorly defined, although cellular edema and cyto-skeletal changes are possible contributors. Patients with advanced fibrosis (METAVIR F3-4) were excluded and focused specifically on the earliest stages of fibrosis (METAVIR F0-2) to determine whether histologic and biochemical inflammation confounds the predictive value of hepatic elastography.

**Patients and Methods:-**

This is a prospective study of liver stiffness by transient elastography (TE) in patients with chronic liver disease undergoing liver biopsy has been in place since 2009, with correlation of LSM to clinical data and histologic grade and stage of disease by METAVIR score. LSM was evaluated by using the FibroScan between December 2009 and September 2013. The total study population included men and women of at least 18 years of age with viral hepatitis.

*Inclusion criteria:* Patients with diagnosis of chronic hepatitis C (detectable serum HCV RNA), successful LSMs (kilopascals [kPa]), and liver biopsy obtained within 3 months of each other.

*Exclusion criteria:* active malignancy, uninterpretable biopsy specimen, hepatitis C virus (HCV) therapy within last 6 months, other chronic liver disease (including Wilson's disease, alpha<sub>1</sub>-antitrypsin deficiency, cholestatic liver disease, or hemochromatosis), clinical ascites, body mass index (BMI)  $\geq 40$  kg/m<sup>2</sup>, pregnancy, or an implantable cardiac device. The study was restricted to those patients with F0–F2 fibrosis. All patients provided written informed consent. Data collected were age, sex, BMI, stigmata of liver disease, ALT levels at the time of TE, and imaging results. Hepatitis B virus coinfection was ruled out by routine serology. LSMs (kPa) were determined as previously described. FibroScan was considered accurate if patients had at least 8 successful measurements, a minimum 60% success rate, and an interquartile range/median liver stiffness ratio of  $< 0.3$ . The reproducibility of HE has been well-established in prior studies, with published intraoperator and interoperator agreement statistics of 0.98 (7). This finding is generalizable across studies that compare patients with the same underlying disease (8).

Intraoperator and interoperator variability was evaluated at one center. Measurements taken by 2 different people on the same day (interoperator) and measurements taken by the same person 1 week apart (intraoperator) had coefficients of variability of 2.97% and 5.37%, respectively. Liver biopsies were obtained within 12 weeks of TE, and the METAVIR stage and grade were determined by one of two blinded, experienced hepatopathologists. The length of each liver biopsy specimen was established in centimeters. Fibrosis was staged according to METAVIR scoring system, a 0–4 scale: F0, no fibrosis; F1, portal fibrosis without septa; F2, portal fibrosis and few septa; F3, numerous septa or bridging fibrosis without cirrhosis; and F4, cirrhosis. Inflammatory activity was graded on a 0–3 score; 0, none; 1, mild; 2, moderate; and 3, severe. Steatosis was categorized as grade 0 ( $< 5\%$ ), grade 1 (5%–32%), grade 2 (33%–65%), and grade 3 ( $> 66\%$ ) on H&E staining.

The number of patients who met inclusion criteria was 68 from a total number of 288 patients with available LSMs. The reason for exclusion from the study was a stage of fibrosis on biopsy of F3 or F4. The mean age of our study was  $49.6 \pm 9.0$  years, with 64.3% men, and most patients had HCV genotype 4 infection (90.8%). The average body mass index was  $26.7 \pm 4.1$  kg/m<sup>2</sup>, which is considered overweight. The mean biopsy size was  $1.74 \pm 0.6$  cm. Nine patients had stage F0 fibrosis (14.0%), 32 had F1 (47%), and 27 had F2 (39%).

Two patients had grade 0 histologic inflammation (3%), 38 had grade 1 (57%), 26 had grade 2 (37%), and 2 had grade 3 (3%). 25.4% of patients had ALT < 40 IU/L, 45.6% of them had ALT between 40 and 80 IU/L, 14.4% had ALT between 80 and 120 IU/L, and 14.6% had ALT > 120 IU/L. 43.7% of patients had Steatosis and 7.2% of patients had diabetes (Table 1).

**Table 1:-** Basic characteristics of study population divided by METAVIR score. Age, grade of histologic inflammation, and liver stiffness differ significantly across stages of fibrosis.

Total, N = 68	F0 fibrosis (n = 9)	F1 fibrosis (n = 32)	F2 fibrosis (n = 27)	P value
Age (years)	$47.3 \pm 9.2$	$49.1 \pm .1$	$51.0 \pm 8.5$	0.001
Sex (Male; Female)	5 ; 4	21 ; 11	18 ; 9	NS
BMI (kg/m <sup>2</sup> )	$26.0 \pm 4.2$	$26.6 \pm 4.1$	$27.0 \pm 4.1$	NS
ALT (IU/L)	$62.9 \pm 44.11$	$76.3 \pm 88.7$	$82.0 \pm 65.2$	NS
Steatosis (yes; no)	5 ; 4	13 ; 19	12 ; 15	NS
Grade of inflammation	$1.04 \pm 0.48$	$1.31 \pm 0.52$	$1.62 \pm 0.54$	< 0.001
LSM (kPa)	$7.2 \pm 7.1$	$7.42 \pm 4.3$	$9.2 \pm 7.4$	0.001

The statistical analysis of the study was modified according to the nature of the variable. Patients' demographics given as mean  $\pm$  standard deviation. Table 2 showed that the grade of inflammation was transformed into a continuous variable, and ALT was represented in multiples of the upper limit of normal (ULN) (40 IU/L). Student t testing for 2 variables with Normal distribution (Table 3), one-way analysis of variance with Scheffé method for multiple comparisons for more than 2 variables of normal distribution (Tables 1 and 3), regression techniques, and other descriptive statistics were performed. (Tables 2 and 4).

## Results:-

Controlling for stage of fibrosis, the most significant associations with liver stiffness was in grade of histologic inflammation and ALT levels. First a univariate analysis with a number of variables that could possibly impact liver stiffness. There were 4 significant relationships: grade 3 histologic inflammation (beta 9.68, P = 6.96E-07), ALT expressed as a multiple of ULN (beta 0.76, P = 5.30E-10), gender (beta 0.072, P = 0.003), and BMI (beta 0.19, P = 0.0009). Age, Steatosis, and diabetes did not significantly impact liver stiffness. From then, by using the variables found to be significantly associated with liver stiffness by univariate analysis, and by using multiple linear regression analysis, again controlling for fibrosis. Here, only grade 3 histologic inflammation (beta 9.07, P = 1.15E-06) and ALT expressed as a multiple of ULN (beta 0.69, P = 1.85E-08) were significant.

Because of the association of inflammation with liver stiffness, we examined the effect of inflammation on the false positive staging of patients in whom elastography suggested advanced fibrosis (METAVIR F3-4), as defined by

criteria set forth by Castera et al,<sup>4</sup> Fraquelli et al,<sup>7</sup> and Zioli et al.<sup>9</sup> Among these, the lowest cutoff for F3 was from Castera et al (9.5 kPa).

The proportion of our patients who met these criteria by ALT was as follows: 12.0% (ALT < 40 IU/L), 15.2% (ALT < 80 IU/L), 17.8% (ALT < 120 IU/L), and 44.8% (ALT > 120 IU/L). As the grade of inflammation or ALT level increased, an increasing proportion of patients received false-positive stiffness measurements. Although the greatest effect of histologic inflammation appeared to occur at grade 3, the effect of inflammation measured by ALT appeared to be linear.

When the analysis is restricted to patients with F0-F1 only, many patients met elastographic criteria for significant fibrosis.

Many still met criteria for cirrhosis. Although no more than 5.2% of patients with ALT < 40 IU/L met any of the criteria for cirrhosis, of the patients with ALT > 120 IU/L, 26.1% were cirrhotic by the criteria of Fraquelli et al<sup>7</sup> (11.9 kPa), 19.6% by those of Castera et al<sup>4</sup> (12.5 kPa), and 13.0% by those of Zioli et al<sup>9</sup> (14.5 kPa). Many more met the criteria of Castera et al for F3 (9.5 kPa): 9.5% (ALT < 40 IU/L), 11.5% (ALT < 80 IU/L), 17.1% (ALT < 120 IU/L), and 39.1% (ALT > 120 IU/L).

**Table 3:-** Association of Study Variables with Liver Stiffness

Variable	Univariate linear regression			Multivariate linear regression		
	$\beta$	Standard error	P value	$\beta$	Standard error	P value
Grade of inflammation

Grade 3	9.68	1.93	6.96E-07	9.07	1.85	1.15E-06
ALT (x ULN)	0.76	0.12	5.30E-10	0.69	0.12	1.85E-08
Steatosis (yes/no)	0.41	0.13	0.18			
Age (per year)	0.04	0.026	0.09			
Gender	0.072	0.24	0.003			NS
BMI (kg/m <sup>2</sup> )	0.19	0.06	0.0009			NS
Diagnosis of diabetes (yes/no)	0.84	0.47	0.08			

Table 4 shows the odds of inflammation causing patients with F0–F2 fibrosis to receive LSMs that meet cutoffs for > F3 and > F4 fibrosis by elastography. Castera et al<sup>4</sup> concluded that effective cutoffs to diagnose F3 and F4 fibrosis are 9.5 kPa and 12.5 kPa, respectively. Fraquelli et al<sup>7</sup> used cutoffs of 10.3 and 11.9 kPa for F3 and F4 fibrosis, respectively. Finally, Zioli et al<sup>9</sup> used a 14.5-kPa cutoff for F4 fibrosis. For this analysis, variables were chosen according to their statistical significance in the multivariate regression: grade of necroinflammation and ALT as a multiple of its ULN (40 IU/L).

The effect of histologic inflammation on the odds of a false-positive measurement by elastography (Table 4) was first examined. By comparing the proportion of patients in each grade of histologic inflammation that met the above criteria for advanced fibrosis, we determined the odds ratio (OR) for obtaining a falsely significant result as a function of inflammation.

We repeated this analysis for the effect of histologic inflammation restricted to those patients with F0-1 fibrosis. In this restricted stage of fibrosis, there were some patients with grade 2 inflammation and fewer patients with grade 3 inflammation.

The effect of inflammation as reflected by the ALT level was examined. There was a significant effect of ALT on elastography, whether the data were analyzed by using patients with F0-2 (Table 4) or only F0-1 fibrosis (Table 2). ALT levels > 40 IU/L (ULN) exhibited a trend toward a significant effect for patients with F0-2 (OR, 1.51–1.71 with CIs that cross 1) but significantly increased the odds that a patient's LSM would meet criteria for F3 fibrosis for patients with F0-1 (OR, 2.46; 95% CI, 1.24 – 4.88 for 9.5-kPa cutoff and OR, 2.22; 95% CI, 1.08 – 6.24 for

10.3-kPa cutoff). For ALT levels > 80 and > 120 IU/L, there was a reliable, sizable effect on false-positive LSM results, irrespective of the inclusion of F2 patients (Tables 2 and 4).

## Discussion:-

In this study of patients with chronic hepatitis C and early fibrosis, we showed that inflammation increases liver stiffness.

For a large number of patients with F0–F2 fibrosis, inflammation significantly increased the odds of receiving a liver stiffness score indicative of advanced fibrosis and cirrhosis. TE is generally accepted for its ability to diagnose cirrhosis and exclude clinically significant fibrosis in published data on studies with hepatitis C (4, 7 and 9). There is ongoing open discussion about the interpretation of TE in clinical practice, particularly because of the confounders intrinsic to acute and chronic liver disease that might also increase liver stiffness. The variable with the most conflicting evidence to date is the presence of chronic inflammation, as in the case of hepatitis C and NASH (4, 5, 10 and 12).

Our results provide further evidence for a viscoelastic property of the liver that is influenced by conditions other than fibrosis, similar to that observed in cases of acute flares of hepatitis B or the reappearance of hepatitis C after orthotopic liver transplantation. A potential mechanism is that parenchymal edema increases stiffness in the absence of fibrosis and is responsible for the dramatic shift of stiffness seen with acute inflammation. Because more than one-half of liver biopsies are performed for the staging of chronic hepatitis C, it is necessary that the hepatologist understands how to interpret elastography findings in the presence of chronic inflammation.

Our study showed the following findings: *First*, we showed that some patients with chronic hepatitis C and F0–F2 fibrosis are being read as cirrhotic on TE. This includes 40%–50% of patients with grade 3 histologic inflammation and 18.8%–28.1% of patients with ALT levels > 120 IU/L, depending on the stiffness cutoff used. *Second*, by multiple regression, we showed that the only variables with a significant impact on liver stiffness aside from fibrosis are markers of inflammation (ALT and histologic grade). *Third*, we quantified the effect of inflammation with the odds that a given ALT or grade of inflammation will cause a reading of F3 or F4 fibrosis. *Fourth*, we found that when we restrict our analysis to only the lowest stages of fibrosis (F0–F1); the effect of grade of inflammation is not measurable, whereas the effect of ALT level remains strong. In summary, chronic necroinflammation, best reflected by ALT, can lead to an overestimation of liver fibrosis by HE.

We chose to isolate the earliest stages of fibrosis for 2 reasons: (1) it is at the opposite end of fibrosis spectrum (stage F4) where the positive predictive value of elastography is already considered reliable and where the relative contribution of inflammation is overwhelmed by the effect of total collagen and scar, and (2) the decision to avoid a staging liver biopsy (in any case other than cirrhosis) very much depends on predictive values at the lowest stages of

fibrosis. In an aim to assessment and prioritizing of patients for the decision-making for liver biopsy, it has been suggested that elastography measurements in the cirrhotic range ( $> 12.5$  or  $14.5$  kPa) do not need biopsy, and results in the intermediate ranges (between  $7.3$  and  $12.5$  kPa, for example) would need biopsy only if a specific stage of fibrosis is desired to make treatment decisions (1). Our study evaluates the diagnostic implications at the lowest stages of liver fibrosis.

It was shown that stiffness increased during flares of hepatitis (2 and 13) and acute hepatitis (10) and decreases after virologic response to treatment (14). Others found that higher ALT for a given METAVIR score correlated with higher stiffness (10,12 and 15). Conversely, a meta-analysis supports the accuracy of HE across many disease types even in the presence of inflammation (16) However, none of the above studies focused solely on early-stage fibrosis in hepatitis C.

Castera et al <sup>4</sup> in 2005 showed that in 183 patients with hepatitis C and F1–F4 fibrosis, the effect of necroinflammation on stiffness is negligible when controlling for fibrosis in a multiple regression. Our data from 68 patients with hepatitis C and F0–F2 fibrosis suggested an association between LSM and both histologic and biochemical measures of necroinflammation. This difference with our data is best explained by the fact that Castera et al had 0 patients with F0 fibrosis and 100 patients with F1–F2 in their study.

The utility of our findings should be evaluated in a context where minimal fibrosis is proportionate with HE reading of  $kPa < 5.5$  or  $kPa < 7.3$  kPa. Our data strengthen the negative predictive value of widely held criteria, while weakening the positive predictive value of measurements that fall within an intermediate and advanced range. This interpretation is a reflection of the potential viscoelastic alterations caused by a chronic inflammatory state of the liver. We conclude that for chronic hepatitis C, TE readings  $< 7.3$  kPa should be regarded as accurate for excluding F3-4 fibrosis regardless of the grade of inflammation. Elastographic results in the intermediate range (between  $7.3$  and  $13$  kPa) should be interpreted with caution, and  $ALT > 2 \times ULN$  is more likely to exert this confounding influence. An alternative to biopsy in such cases is to use noninvasive serologic markers of fibrosis, because concordance would add predictive value.

So the grade of histologic and laboratory-based inflammation seen in chronic hepatitis C is positively correlated with liver stiffness at the lowest stages of fibrosis (F0 –F2). As a result, the predictive value of TE is compromised when intermediate and advanced scores (kPa) are obtained but strengthened when low scores are obtained. This might lead the hepatologist to consider many more patients for therapeutic intervention or liver biopsy, when in reality they have a clinically less significant stage of fibrosis. The hepatologist should recognize this limitation and account for chronic inflammation when interpreting TE results.

### **Recommendation:-**

Future studies could look specifically at combining patients with early-stage fibrosis and divergent elastographic measurements with a noninvasive serologic panel of fibrosis markers. This “second opinion” might provide more confidence in differentiating the true-positive from the false-positive result.

#### Abstract

For the purpose of technological valorisation of sewage sludge resulting from the treatment plant domestic waste water from Settat city (Morocco), a Physicochemical and microbiological characterization was carried out.

The results obtained showed up that sewage sludge collected from the first sample are full in fertilizers. Metallic traces elements are clearly inferior to european standards.

Micro-organism composition of the sewage sludge is similar as the waste water treated by the station.

Composition of this sewage sludge suggest there valorisation by composting or direct manuring.

#### Introduction:

Les développements démographique et économique du Maroc se sont accompagnés d'une augmentation de la demande en eau pour la consommation humaine et les activités industrielles et agricoles. Ceci génère des quantités d'eaux usées de plus en plus grandes qui étaient déversées directement dans la nature, sans aucun traitement. Cependant et suite aux sécheresses successives qui sévissent et qui ont rendu l'eau une denrée précieuse, le Maroc a considéré que les eaux usées constitueraient une ressource hydrique mobilisable, après épuration. En effet, le volume des eaux usées rejetées qui était de 600 millions de mètres cube en 2005, devrait atteindre 900 millions de mètres cube à l'horizon 2020 [1].

Les eaux usées ainsi épurées sont actuellement réutilisées en agriculture, pour l'irrigation des espaces verts ou pour le lavage de la matière première en industrie minière [2].

Cependant, le traitement des eaux usées s'accompagne d'une production de grande quantité de boues dont les débouchés pour leur élimination sont de plus en plus restreints. Le devenir des boues est donc un problème préoccupant, étant donnée qu'elles sont considérées comme déchets à risques, vues leurs compositions physico-chimique et microbiologique [3]. Il est à noter que l'élimination et le traitement des boues résiduelles représente l'un des plus grands problèmes auxquels sont confrontés les gestionnaires des stations d'épuration [4]. C'est pourquoi, elles doivent subir des procédés de gestion à fin de limiter leurs nocivités, par traitement, recyclage et valorisation [5,6].

Plusieurs possibilités sont offertes pour la gestion des boues telles que l'incinération, l'épandage ou la mise en décharge contrôlée. Cependant, le choix est tributaire de la nature des boues, du coût de mise en œuvre, de la valeur ajoutée du produit qui en résulte et de l'impact que pourrait avoir la filière retenue sur l'environnement.

C'est dans ce cadre que cette étude a été réalisée dont le but est la caractérisation physico-chimique et microbiologique des boues issues de la première collecte de la station d'épuration des eaux usées domestiques de la ville de Settat. Ceci est dans l'objectif d'une valorisation future de ces boues en vue d'une production de produit de haute valeur ajoutée et minimisant les risques de pollution.

## **Matériel et Méthodes:**

### **Présentation de la ville de Settat et sa station d'épuration:-**

La ville de Settat est située dans la région de la Chaouia (centre du Maroc) à 290 m d'altitude.

Le climat est de type continental et la température moyenne est de 17.3 °C. La pluviométrie annuelle moyenne est de 372 mm. En 2014, la ville de Settat comprenait 141 637 habitants.

La station d'épuration des eaux usées de la ville Settat a été mise en service en 2006. Elle est gérée par la régie autonome de distribution de l'eau et de l'électricité de la Chaouia. Le système de traitement est le lagunage naturel avec trois niveaux de traitement (bassins anaérobie, facultatif et de maturation). La capacité de traitement de 13 500 mètres cube par jour, soit l'équivalent de 6100 Kg DBO<sub>5</sub> par jour. Le niveau de traitement est tertiaire. Les eaux épurées sont exploitées par une association d'agriculteurs de la région, en partenariat avec l'agence du bassin hydrique de Bouregreg et de la Chaouia et les délégations des ministères de l'agriculture de la santé publique.

L'opération de curage des boues a été effectuée pour la première fois, au mois d'avril 2016, par la société M-Terratube par le procédé géotube (sac constitué d'une membrane de polypropylène unique, spécialement conçue pour laisser passer l'eau et retenir les solides). Après pompage et injection de coagulant suivi d'une filtration, les boues ainsi obtenues ont été séchées puis stockées pour atteindre une siccité minimale de 33%. Le volume de boues ainsi extrait était d'environ 25 000 mètres cube.

### **Echantillonnage:**

Les analyses ont été effectuées sur un échantillon composite de 10 kg. Des carottages ont été effectués au niveau de plusieurs ouvertures des sacs. Chaque mesure est effectuée en triple et les résultats sont exprimés en pourcentage par rapport à la matière sèche.

### **Analyses physico-chimiques:**

#### **Mesure du pH:**

Le pH est mesuré à partir d'une solution de boues diluée au 1/5, à température ambiante à l'aide d'un pH-mètre préalablement étalonné.

#### **Taux d'humidité:**

Le taux d'humidité est déterminé sur un échantillon de boues, après séchage dans une étuve à 105°C pendant 48 heures [7].

#### **Dosage de l'Azote total:**

L'azote total a été déterminé par la méthode Kjeldahl après minéralisation, distillation et dosage de l'ammonium [8].

#### **Dosage de carbone organique total:**

Le taux de matière organique est déterminé après calcination et combustion totale de la matière organique. Le pourcentage du carbone organique total est alors déduit [9].

#### **Dosage du phosphore:**

Le dosage du phosphore total a été réalisé par colorimétrie après minéralisation à chaud en milieu acide [10].

#### **Dosage des éléments traces métalliques:**

Après calcination et dessiccation acide. La détermination des métaux étudiés a été réalisée par spectrophotométrie d'absorption atomique [11].

**Dosage de l'azote ammoniacal:**

L'ammonium est dosé par distillation en milieu alcalin. L'ammonium se transforme en ammoniac qui est récupéré de l'acide borique puis dosé par l'acide sulfurique en présence d'indicateur coloré.

**Dosage de l'azote nitrique:**

L'azote nitrique est dosé en présence de soude et d'alliage de Devarda, après distillation et titration avec l'acide sulfurique.

**Analyses microbiologiques:**

La recherche des coliformes totaux est effectuée sur une gélose lactosée biliée au cristal violet et au rouge neutre et incubation à 30°C pendant 24 heures. Les coliformes totaux se colorent en rouge violacée.

La recherche d'*Escherichia Coli* se fait sur une gélose tergitol 7 au TTC (Triphenyl Tetrazolium Chloride) et incubation à 44°C pendant 24 heures. *Escherichia coli* donne des colonies de couleur jaune d'œuf résultant de l'absence de réduction du TTC et par la formation d'un halo jaune visible, dû à la fermentation du lactose. La confirmation se fait par le test à l'oxydase et le test d'indole.

La recherche des *Entérocoques* intestinaux a été effectuée sur une gélose Slanetz Bartley et incubation à 36°C pendant 48 heures. Les colonies des *Entérocoques* intestinaux se colorent en rouge suite à la réduction du TTC. Pour confirmation, on transfère sur milieu BEA (gélose Bile Esculine Azide). Après 2 heures d'incubation à 44°C, on note l'apparition d'un halo noir dû à la réduction de l'esculine en présence de la bile.

La recherche des *staphylocoques* pathogènes (*Staphylococcus aureus*) est effectuée sur le milieu de Baird Parker au quel on ajoute du jaune d'œuf et du tellurite de potassium et incubation à 37°C pendant 48 heures. Les colonies caractéristiques sont les colonies noires entourées par halo clair. L'identification de *Staphylococcus aureus* est effectuée par le test à la coagulase.

La recherche des Salmonelles est effectuée après enrichissement dans de l'eau peptonnée à 37°C pendant 24 heures, puis sur milieux Rappaport Vassiliadis et Müller- Koffmann suivi d'une incubation à 41°C et 37°C pendant 24 heures. L'isolement se fait sur milieu sélectif (EKM Edel et Kampelmacher et Hektoen).

**Résultats et Discussion:**

Le volume des boues résiduaires de la station d'épuration des eaux usées domestiques de la ville de Settat, produite par curage, est de 25 000 mètres cube. Cette opération de curage, qui devrait être effectuée initialement en 2011, n'a eu lieu qu'en avril 2016.

Les boues ainsi obtenues ont été mises en sacs et stockées aux bords des bassins, en attendant leur évacuation. Actuellement, il n'existe aucune loi au Maroc qui encadre directement la gestion des boues des stations d'épuration. Considérées comme déchets et sur la base de cette définition (loi 28-00 relative à la gestion des déchets et à leur élimination), la valorisation des boues reste alors la seule issue écologique. C'est pourquoi nous sommes intéressés à la caractérisation physico-chimique et microbiologique de ces boues à fin de choisir la meilleure filière de valorisation.

Le tableau I regroupe l'ensemble des résultats des analyses physico-chimiques obtenues.

**Tableau I :** Composition physico-chimique des boues de la station d'épuration des eaux domestiques de la ville de Settat. (Les résultats sont exprimés en % par rapport à la matière sèche).

Détermination	Résultats
pH (extrait 1/5)	7,01
Matière sèche	28,7
Humidité	71,3
Matière organique	25,4
Carbone organique	14,7
Azote total	2,11
Phosphore total	0,93

L'analyse des résultats obtenus montre que les boues analysées sont sèches. En effet, leur teneur en eau ne dépasse guère 72%. Ceci est dû au procédé de séchage et de stockage comme exigé par le cahier de charge établi entre le gestionnaire de la station et la société ayant procédé à l'extraction des boues et qui garantit une siccité minimale de 33%.

Les boues analysées sont neutres (pH égal à 7,01) par comparaison à celle issues de la station d'épuration de la ville de Marrakech qui sont alcalines avec un pH de l'ordre de 8,3 [12]. Cette différence est sûrement due à la qualité des eaux usées traitées et à la nature du sol sur lequel a été établie la station d'épuration.

Les boues de la station d'épuration de la ville de Settat sont très riches en matières organiques, qui représentent plus du quart de la matière sèche totale. Le carbone organique représente 14,7%, l'azote total 2,11% et le phosphore total 0,93%. La teneur en azote ammoniacal était de 297 mg par kg de matière sèche et celle des nitrites était de 69 mg par kg de matière sèche. Le rapport C/N est de 6,97. Ce même rapport est égal à 20,8 pour les boues issues de la station d'épuration des eaux usées de la ville de Marrakech [12]. Ces boues se caractérisent par des teneurs en carbone organique et azote total de 31,2% et 1,5% respectivement. Le taux d'humidité est relativement élevé (46,46%).

Les boues de la station d'épuration de Choutrana (banlieue nord de la ville de Tunis) se caractérisent par une teneur plus élevée en carbone organique (29,01%) et une teneur plus faible en azote (1,47%), ce qui donne un rapport C/N de 19,73 [13].

L'analyse des éléments métalliques présents dans les boues issues de la station d'épuration de la ville de Settat a donné les résultats qui figurent sur le tableau II :

**Tableau II:-** Composition métallique des boues de la station d'épuration des eaux domestiques de la ville de Settat. (Les résultats sont exprimés en % par rapport à la matière sèche).

Détermination	Résultats
Conductivité	3,98 mS/cm
Chlorures	0,15
Calcium	9,64
Magnésium	4,17
Sodium	0,36
Potassium	0,28

Comparée à la composition physico-chimique moyenne des boues au Maroc [14], on remarque que les boues analysées se caractérisent par des teneurs élevées en magnésium (4,17 au lieu de 1,26), calcium (9,64 au lieu de 6,76). Par contre la teneur en potassium est identique (0,28). Ces différences trouvent, en partie, leur explication dans la composition des eaux traitées et leurs origines. En effet, les eaux de la ville de Settat, issues de la nappe phréatique de la région sont réputées avoir une dureté et une salinité très élevées [15-18].

L'analyse de la composition en éléments traces métalliques présents les boues issues de la station d'épuration de la ville de Settat a donné les résultats qui figurent sur le tableau III.

**Tableau III:-** Composition en éléments traces métalliques des boues de la station d'épuration des eaux domestiques de la ville de Settat. (Les résultats sont exprimés en mg/kg de matière sèche).

Eléments	Résultats
Manganèse	99,4
Cuivre	42,6
Zinc	34,2
Bore	13,2
Molybdène	8,30
Chrome	7,65
Cadmium	5,80
Nikel	4,91

Cobalt	4,10
Mercure	4,00
Sélénium	3,50
Arsenic	3,10
Plomb	2,61

Les résultats obtenus montrent que les teneurs en éléments traces métalliques sont très faibles et nettement inférieures aux valeurs limites tolérées par certains pays européens comme la France ou l'Allemagne [19-21]. Ceci est, en effet, dû à l'absence de rejets industriels étant donné que la zone industrielle de la ville de Settat n'est pas raccordée au réseau d'assainissement urbain. Par contre, dans le cas de la ville de Marrakech, certains éléments traces comme le chrome est présent dans les boues à des concentrations qui dépassent deux fois les limites tolérées. Ceci est à cause des rejets de certaines unités industrielles de la ville de Marrakech [12].

À part l'origine industrielle, les causes de la présence des métaux dans les boues sont variées et spécifiques à chaque métal. Il s'agit généralement des eaux de ruissellements des voies de circulation, des canalisations ou des produits d'usages domestiques.

L'analyse microbiologique des boues issues de la station d'épuration de la ville de Settat a donné les résultats qui figurent sur le tableau IV.

**Tableau IV:-** Analyses microbiologiques des boues résiduelles de la station d'épuration des eaux usées domestiques de la ville de Settat

Coliformes totaux	1,1 x 10 <sup>-3</sup> UFC/g
Escherichia coli	6 x 10 <sup>-3</sup> UFC/g
Entérocoques intestinaux	2,2 x 10 <sup>-2</sup> UFC/g
Staphylocoques pathogènes	6 UFC/g
Recherche de Salmonelles	Absence (UFC/25g)

La composition microbiologique des boues reflète celle des eaux usées traitées par la station d'épuration. Ces germes sont normalement présents dans les matières fécales rejetées dans les réseaux d'assainissement des eaux usées et donc inévitablement présents dans les boues brutes.

### Conclusion:

La richesse des boues issues de la station d'épuration des eaux domestiques de la ville de Settat en éléments fertilisants et les faibles teneurs en éléments toxiques leur confèrent un intérêt agronomique certain pour les sols et les plantes par épandage direct ou après compostage avec un co-substrat végétal. Cependant la réutilisation éventuelle de ces boues doit tenir compte des besoins nutritionnels des plantes sans toutefois compromettre la qualité des sols ni celle des eaux superficielles et souterraines. C'est pourquoi il est nécessaire de maîtriser les risques éventuels liés aux micro-organismes et aux métaux par des limitations d'usage telles que les distances à respecter vis à vis des habitations, des points d'eau, des cours d'eau et les délais à respecter avant l'installation de cultures maraîchères ou avant la mise au pâturage des animaux. Ceci doit se faire dans un cadre juridique et réglementaire. À l'échelle internationale plusieurs normes existent, au Maroc un projet de loi relatif à la protection environnementale du sol est en cours d'élaboration.

### Remerciements:

Ces travaux de recherche ont bénéficié du soutien financier du ministre de l'environnement du royaume du Maroc, dans le cadre du projet « boueset ». Nous tenons à le remercier vivement. Nos vifs remerciements vont également à tous les partenaires du projet, à savoir la régie autonome de distribution d'eau et d'électricité de la Chaouia, l'institut national de la recherche agronomique de Settat, la direction des eaux et forêts et de la conservation des sols de Settat, la délégation du ministère de l'environnement de Settat et la société Orobrique à Berchid.

 Shared psychotic delusion.

#### Abstract

Shared Psychotic Delusion (SPD) is a fascinating yet poorly understood psychological phenomenon. characterized by the transference of delusions from an individual who suffers already from a psychotic disorder, to mentally sane individual or individuals who are in close association and relative social isolation in a frame of complex and dependent relationship. In our case present a case of schizophrenic young female that transmitted her bizarre delusion of misidentification to her mentally sane sister after a period of total isolation and in a frame of a complex dependent relationship. Successful management plan composed of using antipsychotic that had led to significant improvement of the primary schizophrenic patient and simple physical separation cured the other

#### Introduction:-

Shared Psychotic Delusion (SPD) is a fascinating yet poorly understood psychological phenomenon. This disorder was referred to as Folie à deux and Induced Psychotic disorder. However, it is nowadays known as Shared Psychotic Disorder (SPD) as mentioned in DSM-5. SPD is characterized by the transference of delusions from an individual (the primary patient), who suffers already from a psychotic disorder, to mentally sane individual or individuals (the secondary patient) who are in close association and relative social isolation in a frame of complex and dependent relationship. [2]

#### Methodology:-

Interviews and full mental state assessment were held for both sisters before and after treatment. Family members were also involved throughout the process of diagnosis and treatment.

#### Case History:-

Miss (A) is a 26 years old Saudi female, college graduate. She lives with her sister Miss (B) who is a 29 years old, college graduate. They come from a religious family with an average socioeconomic status. Miss (A) has a domineering personality and a stubborn character with a special interest of astronomy and fortune telling. On the contrary, her sister Miss (B) is known to be passive and kind.

**Corresponding Author:- Lina M. Abu Gharara MD.**

Address:- College of Medicine, University of Dammam and King Fahd Hospital of the University, Alkhobar, Kingdom of Saudi Arabia.

Miss (A) became psychotic with multiple bizarre delusions, including that her parents are imposters, her father seems to be some sort of special DNA mixture of multiple historically famous figures and current celebrities, and that her biological mother is the former Indonesian housemaid.

According to these delusions, Miss (A) started to isolate herself and gradually became hostile towards all her family members. These delusions were transferred to her mentally sound sister Miss (B), after living in total isolation for 6 months' duration. One month prior to presentation, Miss (A) started to express aggressive behavior such as destroying properties, threatening others to be out of her life and eventually threatened her mother with a knife.

Miss(A) was forced to get admitted to a private hospital. There, she was diagnosed to have schizophrenia and was put on antipsychotics. Later on, Miss (B) was brought to our service where she was admitted for diagnosis. Miss (B) was found to have the same delusion but with a lesser extent and a less bizarre way, as mentioned by her family members. Simple separation of the sister was enough to shake and eventually resolve the delusion of the secondary patient (Miss B). While the primary patient was presented to our service for follow up and to keep on getting antipsychotic drugs (Zyprexa 10 mg PO BID, Risperdal 50mg IM every two weeks) with excellent responses later on.

Finally, both sisters were gradually allowed to contact each other and thus returned to live in the same house.

### **Discussion:-**

In 1651, Harvey was the first to describe an induced psychosis of phantom pregnancy in two sisters. The term Folie à deux dates to a classic report by Lasègue and Falret in 1877. In 1942 [4], Gralnick published a classification of four Folie à deux subtypes, as follows:

- Subtype A is termed folie imposée. The delusions of a person with psychosis are transferred to a person who is mentally sound. Both persons are intimately associated, and the delusions of the recipient disappear after separation.
- Subtype B is termed folie simultanée. The simultaneous appearance of an identical psychosis occurs in two individuals who are both intimately associated and morbidly predisposed.
- Subtype C is termed folie communiqué. The recipient develops psychosis after a long period of resistance and maintains the symptoms even after separation.
- Subtype D is termed folie induite. New delusions are adopted by an individual with psychosis who is under the influence of another individual with psychosis.[5]

Our case fulfills the criteria of induced delusional disorder according to ICD10 and DSM IV with a specific Subtype A known as “ folie impose”.

As stated through literature, the most common psychiatric disturbance is schizophrenia and the most common delusions are of persecution [6]. While our case involves delusion of misidentification.

Major cases in literature involve members of a nuclear family, most commonly is between mother and a child, husband and a wife or siblings. As suggested by other case reports, the primary patient is usually of an advanced age, have superior intelligence and a forceful aggressive character. While the secondary patient is younger in age, passive, dependent and less intelligent than the primary one. However, In our case, the primary patient is neither older nor superior in intelligence, but has more dominating and stronger personality traits.

Furthermore, this relatively rare disorder has no systematic treatment regimen found to be effective. Inconsistencies in literature regarding treatment modalities exist between either one of two; Separation, as the sole treatment for the secondary, or psychotherapy and medical intervention in conjunction with separation, for cure of the secondary [6]. In our case, we separated them physically by admitting the primary patient to the psychiatric ward and receiving antipsychotics. Individual psychotherapy and psychoeducation, were enough to cure the secondary patient.

### **Conclusion:-**

It is crucial to recognize such rare cases in order to identify the exact approach of management. Such cases need intervention in a timely manner to understand the psychodynamic and plan for regular follow ups to help the patients to overcome such disorder.

Female infertility, Polycystic Ovarian Syndrome, Cytokinesis-block micronuclei (CBMN) assay

#### Abstract

Female infertility is defined as the inability to conceive naturally or to carry a pregnancy to full term. It occurs for almost 15% of all women worldwide. The etiology of infertility is an important criterion for recognition and characterization of infertile women. The common factors for infertility in females are anovulatory disorder, tubal factors, endometriosis, uterine and cervical factors. Infertility affects 40% of women with PCOS and is the most common cause of female infertility. The present study was undertaken to evaluate the cytogenetics and molecular genetics on female infertility with special emphasis on polycystic ovarian syndrome by investigating the various anthropometric and clinical aspects of the subjects. Seventy five female subjects with infertility and 50 healthy women without any chronic illness were involved in this study. Reproductive hormones namely leutinizing hormone (LH), follicle stimulating hormone (FSH), prolactin and estradiol were estimated in each subjects after obtaining their informed consent. Cytokinesis-block micronuclei (CBMN) assay was also carried out in the lymphocytes of the subjects to assess the somatic DNA damage. The study demonstrated that the micronuclei frequency significantly elevated in the study subjects than control subjects. Infertile women with various risk factors such as increasing age, BMI, family history of infertility, family history of cancer, menarche, endometriosis etc. can lead to increased genetic instabilities and the severity of infertility. Lifestyle modification with diet and exercise will reduce the risk for infertility.

#### Introduction:-

Female infertility is defined as the inability to conceive naturally or to carry a pregnancy to full term (Gaware et al., 2009). The incidence of female infertility is rising and varies from 10 to 20% (Moghadam et al., 2013). Female infertility is caused by genetic, hormonal, or environmental factors. In addition, pelvic inflammatory disease, uterine fibroids, age-related factors, tubal blockage, and hostile cervical mucus can cause infertility in females (Olooto, 2012). Female infertility occurs in about 37% of all infertile couples (Unuane et al., 2011).

The etiology is an important criterion for recognition and characterization for infertile subjects. Advanced age, high body mass index, age of onset of sexual activity, prior pelvic surgeries and stress were the most significant risk factors associated with women's infertility (Romero et al., 2008). Problems regarding menstruation (amenorrhoea, menorrhagia polymenorrhoea, dysmenorrhoea) along with insanitation are the major danger alarms (Maeda and Tsukamura, 2006). Any cause leading to irreversible or non-compensable damage to the genital tract, uterus, fallopian tubes or ovaries may cause inability to conceive (Jain et al., 2004; World Health Organization, 2003).

The polycystic ovary syndrome (PCOS) affects 7 to 8% of women (Azziz et al., 2004) and may be the most common cause of female infertility (Norman et al., 2002). Women with PCOS have an increased risk of miscarriage, gestational diabetes, preeclampsia and preterm labour (Boomsma et al., 2006).

Accumulating evidence suggests that genetic factors contribute to the etiology of female infertility in humans (The ESHRE Capri Workshop Group, 2008; Matzuk and Lamb, 2008). Genes involved in meiosis are also good candidates for genes contributing to female infertility (Sanderson et al., 2008). Karyotype analysis is also performed in women presenting with primary amenorrhoea, premature menopause, and recurrent pregnancy loss (ESHRE Capri workshop group, 2000). The sex chromosome aberrations and the presence of constitutional inversions, translocations, or small supernumerary marker chromosomes (sSMC) can lead both to infertility and repeated abortions (Liehr et al., 2004; Shah et al., 2003). Diminished ovarian reserve (DOR) is a primary infertility disorder characterized by a reduction in the number and/or quality of oocytes, usually accompanied by high follicle-stimulating hormone (FSH) levels and regular menses (Broekmans et al., 2007). Cytogenetic studies of female patients enrolled in an intracytoplasmic sperm injection (ICSI) programme reviewed by Gekas et al., (2001) have shown an unexpectedly increased incidence of abnormal karyotypes, ranging from 1.1 to 9.8% when cases with low level sex chromosome mosaicism were included.

As many as 20% of women with infertility problems (including fecundability and early pregnancy loss) have been diagnosed with PCOS (Diamanti et al 1998). PCOS is the most common cause of menstrual irregularity that leads to infertility. There is now a greater focus on the management of the metabolic consequences of PCOS, primarily through lifestyle interventions to achieve weight loss and increase physical activity (Sevendsen et al., 2005). The investigation and management of female infertility can be done by changing lifestyle, regular exercise, dieting etc. and this is one of the debated topics. No serious attempts were made earlier to correlate DNA damage and female infertility with polycystic ovarian syndrome. Hence the present study was undertaken to correlate various cytogenetics and molecular genetics on female infertility with polycystic ovarian syndrome.

### **Materials and Methods:-**

Seventy five study subjects with a clinical diagnosis of infertility referred from various infertility centers of Kerala to Genetika, Centre for Advanced Genetic studies, Trivandrum. Fifty healthy subjects without any chronic illness were also selected as control for this study. Detailed demographic, clinical and biochemical characteristics of the subjects were recorded using proforma. In this study, Cytokinesis Block Micronuclei (CBMN) assay was carried out in each subject. CBMN assay was performed by using Cytochalasin B for quantitating the extent of somatic DNA damages.

Seven ml of blood sample was collected by venepuncture. Two ml of blood was transferred into sodium heparinized vacuutainers for quantifying the extent of somatic DNA damages by Cytokinesis-Block Micronuclei (CBMN) assay. The remaining five ml of blood was transferred into a plain tube. Blood was allowed to clot, serum separated immediately. Blood sugar and lipid profile were estimated using semi-automated clinical chemistry analyzer.

Two ml blood was added to a culture tube containing 10 mL RPMI 1640 supplemented with 100units/mL penicillin, 100µg/mL streptomycin, 15% fetal bovine serum and 100µg/mL phytohemagglutinin. Cytochalasin B was added to the cultures at a final concentration of 4.5µg/mL (Sigma) after 44<sup>th</sup> hours of initiation of cells with phytohaemagglutinin. Cells were harvested after 72 hr incubation, and they were treated with a hypotonic solution (0.075M KCl) for 1 min and fixed in fresh fixative solution (methanol: acetic acid, 3:1). The cells were dropped onto slides and the slides were air dried and stained with 10% Giemsa. Micronucleated cells were analyzed under light microscopy at 100X magnification. The number of micronuclei is not less than 1000 binucleated cells were scored and the distribution of micronuclei among binucleated cells was recorded.

**Results:-**

In the present study 75 individuals were taken as the study subjects and 50 healthy individuals were taken as the control subjects. The study subjects showed a mean CBMN frequency of 13.18 while the control subjects showed a mean CBMN frequency of 10.63. This difference in mean CBMN frequencies showed a statistically significant difference.

**Table 1:-** Distribution of mean CBMN frequency according to various demographic characteristics

Category	Variables	Total	Percentage (%)	Mean CBMN Frequency
Age (Years)	20-28	40	53.3	13.01
	29-36	35	46.6	13.38
Birth Order	<3	51	68	13.02
	4 to 6	20	26	13.46
	7 to 9	4	5.3	13.76
Residence	Coastal	8	10.6	12.98
	Rural	52	69.3	13.11
	Urban	15	20	13.54
Parental consanguinity	Yes	8	10.6	13.45
	No	67	89.3	13.15
Duration of married life (Years)	1 to 5	52	70	13.14
	6 to 11	23	29.3	13.27
Social Status	High	9	12	13.69
	Low	2	2.6	13.11
	Medium	64	85.3	13.11
BMI (Kg/m <sup>2</sup> )	<20	1	1.33	12.06
	20 to 25	42	56	13.02
	>25	32	42.66	13.33

The subjects were grouped on their demographic characteristics such as age, birth order, residence, parental consanguinity, duration of married life, social status and BMI (Table 1). Among the 75 study subjects, 40 subjects (53.3%) were between the age of 20 to 28 years and showed a mean CBMN frequency of 13.01. The highest mean CBMN frequency of 13.38 was shown by 35 subjects (46.6%) of age between 29 to 36 years. The highest mean CBMN frequency (13.76) shown by subjects between 7 to 9 birth order. Majority of the study subjects were belonged to rural (69.3%) followed by urban area (20%) and coastal area (10.6%). The highest mean CBMN frequency was observed in urban area (13.54). Subjects with parental consanguinity showed highest mean CBMN frequency of 13.45. Subjects having 6 to 11 years of married life showed highest mean CBMN frequency of 13.27. From the study subjects, 9 (12%) subjects were showed a high social status with a highest mean CBMN frequency of 13.69. 64 subjects (85.3%) were belonged to middle social status and showed a mean CBMN frequency (13.11). On the basis of BMI, subjects with <20 Kg/m<sup>2</sup> showed mean CBMN frequency of 12.06 and 20 to 25 Kg/m<sup>2</sup> showed mean CBMN frequency of 13.02. Highest mean CBMN frequency (13.33) showed by subjects with BMI >25 Kg/m<sup>2</sup>.

**Table 2:-** Distribution of mean CBMN frequency according to various clinical characteristics

Category	Variables	Total	Percentage (%)	Mean CBMN Frequency
Family H/o infertility or subfertility	Yes	6	8	13.19
	No	69	92	13.18
Family H/o cancer	Yes	3	4	13.22
	No	72	96	13.18
Family H/o chronic illness	Yes	71	94.6	13.19
	No	4	5.3	12.93
H/o X-ray exposure	Yes	70	93.3	13.19
	No	5	6.6	13.05
Menstrual periods	Irregular	38	50.6	13.21
	Regular	37	49.3	13.16

Menarche (years)	13 to 15	69	92	12.87
	16 to 18	6	8	13.21
Endometriosis	Yes	9	12	13.22
	No	66	88	12.91
Contraceptive drugs used	Yes	12	16	13.18
	No	63	84	13.16
Clinical conditions	Abortion	30	40	13.35
	Infertility	45	60	13.07

The subjects were grouped on their clinical characteristics such as family history of infertility or subfertility, family history of cancer, family history of chronic illness, history of X-ray exposure, menstrual periods, menarche, endometriosis, contraceptive drugs used and clinical condition (Table 2). Subjects with family history of infertility/subfertility (8%) showed highest mean CBMN frequency of 13.19. Subjects with family history of cancer showed higher mean CBMN frequency (13.22) than subjects without family history of cancer. Family history of chronic illness was reported in 71 out of 75 study subjects with mean CBMN frequency of 13.19. Subjects with irregular menstrual periods showed high mean CBMN frequency of 13.21. Majority of study subjects (n=69; 92%) attained menarche between 13 to 15 years of age and the remaining 6 subjects attained menarche between 16 to 18 years. Those who attained menarche between 16 to 18 years of age showed highest mean CBMN frequency of 13.21. Nine subjects had endometriosis with mean CBMN frequency of 13.22. Consumption of contraceptive drugs was reported in 12 out of 75 study subjects and their mean CBMN frequency was 13.18.

**Table 3:-** Distribution of mean CBMN frequency according to various biochemical and endocrinological characteristics

Category	Variables	Total	Percentage (%)	Mean CBMN Frequency
Fasting blood sugar (FBS) (mg/dl)	70 to 100	7	9.33	13.17
	101 to 126	30	40	13.19
	>126	38	50.6	13.20
Total Cholesterol (mg/dl)	<200	26	34.6	13.04
	≥200	49	65.2	13.2
HDL (mg/dl)	21 to 31	18	24	13.27
	32 to 42	44	58.6	13.22
	43 to 51	12	16	12.95
LDL (mg/dl)	<100	6	8	13.13
	100 to 150	32	42.6	13.18
	>150	37	49.3	13.19
TG (mg/dl)	<150	53	70.6	13.04
	150 to 250	19	25.3	13.10
	>250	3	4	13.22
Follicle stimulating (FSH) (mIU/ml)	<25	41	54.6	13.09
	25 to 30	12	16	13.24
	>30	22	29.3	13.37
Luteinizing hormone (LH) (mIU/ml)	<45	16	21.33	13.04
	45 to 60	41	53.33	13.18
	>60	19	25.33	13.30
Estradiol (pg/ml)	<25	8	10.6	12.84
	25 to 75	36	48	13.20
	>75	31	41.3	13.24
Prolactin (ng/l)	<25	24	32	13.02
	≥25	51	68	13.53

The subjects were grouped on their various biochemical and endocrinological characteristics such as FBS, total cholesterol, HDL, LDL, TG, FSH, LH, Estradiol and Prolactin (Table 3). Normal FBS was reported in 7 (9.33%)

subjects and remaining subjects were pre-diabetic and diabetic. The mean CBMN frequency of pre-diabetic subjects and diabetic subjects were 13.19 and 13.20. Normal serum total cholesterol was reported only in 26 (34.6%) study subjects and the remaining subjects were hypercholesterolemic (>200 mg/dl). The mean CBMN frequency of hypercholesterolemic subjects were 13.2. Subjects with triglyceride value <150 mg/dl showed mean CBMN frequency of 13.04. Highest mean CBMN frequency (13.22) was shown by subjects with triglyceride value >250 mg/dl. The study subjects showed FSH value >30 mIU/ml had higher mean CBMN frequency (13.37) compared to <25 mIU/ml (13.09) and 25 to 30 mIU/ml (13.24). Study subject with LH level >60 mIU/ml showed highest mean CBMN frequency of 13.30. Subjects with >75 pg/ml value of estradiol showed highest mean CBMN frequency of 13.24. Majority of the subjects have prolactin level  $\geq 25$  ng/l and showed highest mean CBMN frequency of 13.53.

### **Discussion:-**

The prevalence of female infertility varies worldwide ranging from 3% to 7%. Polycystic ovarian syndrome is a common condition estimated to affect 4-18% women in the reproductive age. PCOS is associated with reproductive, psychological, metabolic and cardiovascular diseases (Boomsma et al., 2006).

According to Zlotogora, (2006) in communities with a high level of consanguineous marriage, diagnosis of a recessive disorder in one or more members of the same family is generally indicative of a recent mutation, whereas the presence of a rare disorder in several families suggests an older mutational event or previous admixture through marriage with a person from another community. In the present study, subjects with parental consanguinity showed highest mean CBMN frequency.

Mokhtar et al., (2006) revealed that females with the age of menarche more than 15 years were more risky to develop infertility than those with age of menarche less than 15 years. In the present study, the subjects with advancing age of menarche were showed a high mean CBMN frequency.

BMI is a common feature in women with PCOS, with prevalence of 30-70%. Certain single nucleotide polymorphism associated with obesity and it contributed to elevate the body mass index in PCOS (Ewens et al., 2011). The present study showed a high CBMN frequency among the subjects with obesity.

According to Wijeyaratne et al., (2005) those with PCOS had significantly higher median BMI. Regarding BMI, 69.2% of overweight/obese patients had polycystic ovary morphology. The higher incidence of overweight may be linked to the lack of exercise amongst women and fatty food habits. Increasing BMI was significantly related to an increasing trend in the proportion of women with the metabolic syndrome. PCOS is one of the most common risk factor among female infertility. Thus in the present study it is showed that mean CBMN frequency increases with increasing the BMI.

According to Guastella et al., (2010) patients with polycystic ovaries have statistically significant higher LH levels and LH/FSH ratios than patients with normal ovaries. In the present study, majority of the subjects were shown hormonal disturbances and also increased mean CBMN frequency.

### **Conclusion:-**

The present study involves Cytogenetics and Molecular Genetics on Female Infertility with Special Emphasis on Polycystic Ovarian Syndrome. The distribution of mean CBMN frequency according to demographic, clinical and biochemical characteristics of the study subjects was observed. Age, birth order, parental consanguinity, and BMI etc. showed increased level of mean CBMN frequency. The level of mean CBMN frequency was high among those who have the family history of infertility, family history of cancer and family history of chronic illness. FBS, total cholesterol, FSH, LH, prolactin and estradiol were also found to be significantly elevated in study subjects. These findings suggest that the women with PCOS have a high risk for infertility. While PCOS cannot be prevented or cured, it can be controlled, with varying degrees of success, by maintaining a healthy diet and by exercising. Healthy lifestyle factors, including exercise, are associated significantly with reduced DNA damage.

Orbital fracture, enophthalmos, orbital volume, CT scan

#### Abstract

**Background And Objective:** Loss of vision, Diplopia and Enophthalmos are major complications of orbital fracture, possibly leading to functional eye impairment and disturbed facial appearance.

**Aim:** we compared the changes in orbital volume of patients with unilateral orbital fractures treated surgically and conservatively with normal contralateral orbit.

**Method:** We measured volumes of hard tissue defects of orbit in 54 patients by facial CT scan, and degree of enophthalmos by Hertel's exophthalmometer, post trauma, 7<sup>th</sup> day and at 3 months interval and compared it with normal contra lateral orbit. Patients having orbital fracture with no deficit were managed conservatively and those with any ophthalmic defect, were surgically treated.

**Result:** Out of 54 patients, 23 patients were treated surgically and rest were managed conservatively. Among 53 patients, 18 patients showed enophthalmos, four patients showed diplopia and five showed extraocular muscle entrapment and two had complete loss of vision.

**Conclusion:** Patients who were surgical treated showed significant improvement in ocular activity and restoration of normal orbital volume.

#### Introduction:-

The face occupies the most prominent position in the human body and renders it vulnerable to injuries quite commonly. The zygomatic bone or zygoma is a strong buttress on lateral portion of middle third of facial skeleton and is responsible for midface contour and protection of orbital contents. The prominence of zygomatic bone predisposes it to bear the brunt of facial injuries. The etiology of the zygomatic complex fractures include road traffic accidents, assaults, falls, sports and missile injuries.

Zygomatic complex fractures are more prevalent in males. They range in age from 18-70 years, with a mean age of 32 years<sup>[1]</sup>. Patients in the 21-30-year age group are most often involved. There is a significant association between road traffic accidents and fractures among the age groups.

Common clinical features of zygomatic complex fractures include diplopia, enophthalmos, subconjunctival ecchymosis, flattening of the cheek, gagging of the occlusion and sensory disturbances. Diagnosis of zygomatic complex fractures is usually clinical, with radiographic confirmation. In this study, the volumetric analysis of hard tissue defects of orbit was measured by facial CT, and degree of enophthalmos and exophthalmos by Hertel's

Exophthalmometer after injury and after healing of zygomatico-orbital fractures and compared with healthy contra lateral eye.

### **Material and Methods:-**

Fifty four patients with unilateral zygomatico-orbital fracture reported to the casualty and interdepartmental referral patients of Sri Aurobindo Institute of Medical Sciences was evaluated with a follow up at three month. Facial CT (Somatom, Definition AS, 64 slices) for axial images (start at the mid-orbit and work upward and downward), for coronal images (work anteriorly and posteriorly from the mid-orbit) & for sagittal images (work from medial to lateral), was taken after injury and after healing of zygomatico orbital complex and the change in orbital volume & soft tissue volume due zygomatico-orbital fracture was evaluated and compared with healthy contra lateral eye. The following parameters was evaluated: (a) Magnitude of displacement (minimal, moderate, severe), (b) direction of displacement of zygomatic complex at frontozygomatic suture, (c) location and extent of internal orbital fractures, (d) anteroposterior and mediolateral dimensions of internal orbital fracture defects, (e) the overall volume of healthy & fractured orbit, (f) Time gap between the occurrence of fracture and surgery, enophthalmos measured by Hertels Exophthalmometre. Patients with unilateral zygomatico-orbital fracture were included in the study. Patients with bilateral zygomatico-orbital complex fracture and who was unable to follow the instructions of the study protocol, or to comprehend information about this study and give voluntary consent were excluded.

### **Results:-**

A total of 54 patients of zygomatico-orbital complex fracture between the year 2012- 2014 were included in this study. The CT examination and the orbital volume measurement in all these patients was made and compared to the non involved side. The mean patient age was 27 years. The time interval after injury to surgical intervention was between five -seven days

Isolated blowout fracture with severity ranging from minimal or undisplaced to severely displaced was present in 54 patients. Among these 32 had right side and 22 on left side. These patients were further divided into two groups based on treatment protocol Group A (n =23) was surgical management and group B (n=31) was conservative management. In Group A, 21 patients were males (91.3%) and two patients were female (8.7%). In Group B, 29 patients were males (93.5 %) and remaining two were females (6.5 %). These data shows that more than 90% of patients with orbitozygomatic complex fracture were males.

### **CT Measurements:-**

CT measurement were done according to the following parameters: Anteroposterior (AP), Mediolateral (ML), and Superoinferior (SI) distance were measured in the normal and involved eye pre operatively and post operatively.

### **Group A – Surgical Treatment:-**

#### **Linear Measurements:-**

The mean of ‘anteroposterior measurements’ in the normal eye was 45.647 mm. (SD +/- 3.5) The pre operative measurement of the involved eye was 46.304 mm. (SD of +/- 3.5). Post operative measurements were calculated at seventh day (45.721 mm.) and at three months (45.735 mm.) with SD +/- 2.8.

The mean of ‘mediolateral distance’ of patients of the normal eye was measured at 35.469 mm. The mean pre-operative measurement of involved eye was 37.047 mm. indicating a significant increase in ML distance. Post-operatively the mean measurement on the seventh day (36.528 mm.) and three month post-op (36.273 mm.) shows a mild improvement from pre-operative measurement but not a complete restoration towards normal eye measurements.

The mean of ‘superoinferior measurements’ of the patients were at 38.508 mm. and the mean measurement of involved eye was 45.222 mm. shows significant increase due to trauma. The post-operative mean measurements at seventh day 39.449 mm. and three months post-op 39.270 mm. showing significant improvement post-operatively.

### **Volume Measurements:-**

The mean volume measurement of the uninvolved eye was 27.558 mm<sup>3</sup>. (SD +/- 3.56) whereas the mean orbital volume of involved eye was around 29.504 mm<sup>3</sup>. (SD +/-3.3). On the seventh post-operative day the mean orbital

volume was reduced to 28.604 mm<sup>3</sup> and it was further reduced to 28.360 mm<sup>3</sup> at three months after surgery. (Table 1). Here a significant decrease in the volume post-operatively was recorded. (Fig.3)

### **Group B – Conservative Management:-**

#### **Linear Measurements:-**

The mean AP measurements in the normal eye were 45.300 mm. (SD +/- 3.5) and 45.493 mm. in involved eye (SD +/- 3.6). The mean measurement at seventh day and three months follow up was 45.558 mm. (SD +/- 3.5) and 45.461 mm. (SD +/- 3.5). The mean ML measurement in the normal eye 33.754 mm. (SD +/- 3.0) and in involved eye was 34.297 mm. (SD +/- 3.1). The seventh day and three month follow up the measurements were 34.297 mm. (SD +/- 3.1) and 34.242 mm. (SD +/- 3.1). The SI measurement in the normal eye 38.358 mm. (SD +/- 4.6) and in involved eye was 38.822 mm. (SD +/- 4.7). The seventh day and three month follow up the measurements were 38.822 mm. (SD +/- 4.7) and 38.790 mm. (SD +/- 4.7).

#### **Volume measurements:-**

The mean volume measurement of the uninvolved eye was 28.418 mm<sup>3</sup>. (SD +/- 3.7) whereas the mean orbital volume of involved eye was around 28.816 mm<sup>3</sup>. (SD +/- 3.6). On the seventh follow up day the mean orbital volume was reduced to 28.793 mm<sup>3</sup>. and by three months follow up it remains unchanged i.e. 28.793 mm<sup>3</sup>. (Table 2.) This indicates that there is restoration of the orbital volume towards normal but still some discrepancy remains. (fig.4)

#### **Ophthalmologic Evaluation:-**

Among 54 patients all the patients had circumorbital ecchymosis, subconjunctival hemorrhage and periorbital oedema associated with involved eye. 18 patients (33.9%) showed enophthalmos as compared to normal contralateral eye and out of which 14 patients (60.9%) were treated surgically. four patients (7.5%) had diplopia and five patients (9.4%) had restricted eye movements. two patients had loss of vision, one reported with corneal laceration and one with blurred vision. (fig. 5)(Table 3.)

Out of 54 patients, 18 (33.9%) had fracture of infraorbital and lateral wall of orbit, 31 (56.6%) had infraorbital wall fracture, two (3.7%) had supraorbital wall fracture, one (1.9%) had medial wall fracture and two (3.7%) had infraorbital and medial wall fracture. (Table 4)

Among the patients treated surgically one patient (4.3%) had minimally displaced fracture, 13 (56.5%) had moderately displaced fracture and nine (39.1%) had severely displaced fracture. Whereas the patients managed conservatively 22 patients (71%) had minimally displaced fracture, eight (25.8%) had moderately displaced fracture and one patient (3.2%) had severely displaced fracture. (Table 5)

#### **Measurement of Enophthalmos:-**

In our study 18 patients were found to have enophthalmos among which 12 patients had enophthalmos less than 2 mm. and six patients had enophthalmos greater than 2 mm. Based on the clinical features like severity of fracture, presence of diplopia, restriction of eye movements 14 patients were treated surgically and four patients were managed conservatively.

Based on the treatment protocol Group A was evaluated for enophthalmos using Hertel's exophthalmometer. The maximum enophthalmos in our study group was found to be 4 mm. These patients underwent early surgical intervention with orbital floor exploration, release of muscle entrapment, retrieval of fat tissue and reconstruction of floor with titanium mesh. There was a significant improvement up to 2 mm. in enophthalmos post operatively. one patient had complete resolution of enophthalmos after three months (0 mm.). Pre operatively the mean enophthalmos in affected eye was 1.39 mm. (SD +/- 0.499) and post-operatively after three months it improves to 1.34 mm. (SD +/- 0.507) showing highly significant ( $P=0.00$ ) according to paired sample test ( $P>=0.05$ ). In Group B the mean of pre-operative enophthalmos was 1.87 mm. (SD +/- 0.341) and during the final measurements with conservative treatment protocols also the enophthalmos has improve to 1.45 mm. the improvement is shown to be significant ( $P=0.00$ ) according to paired sample test ( $P<=0.05$ ).

#### **Discussion:-**

Orbital fractures in maxillofacial trauma are frequent findings. These fractures are of obvious ophthalmologic importance as the orbit houses the eye and soft tissue structures supporting the globe. Direct or indirect injury to

orbit may lead to ophthalmic functional impairment and aesthetic deformity. The management of the orbital fractures has evolved with the advent of surgical techniques, imaging modalities and use of various alloplastic materials. Accurate diagnosis and treatment can limit the late complications like diplopia, enophthalmos and motility defects. Very few studies were performed to assess the quantitative and qualitative defects of these injuries. Here, in this study we measured the quantitative defect of orbit after trauma through CT scan and qualitative improvement after treatment.

Orbital fractures have been classically classified into blow out and blow in fractures by Smith and Regan. The treatment plan in either type of fractures has been generally based on the severity of the fractures, associated functional impairment and evident aesthetic deformity. When treatment options have been considered according to Edward Ellis III<sup>[2]</sup> et al the CT scans were examined for the details like magnitude of ZMC displacement (minimal, moderate, severe), direction of ZMC displacement/ rotation at the fronto-zygomatic suture region, location of internal orbital fracture defect, anteroposterior and mediolateral dimensions of the internal orbit fracture defect and the vertical dimension of orbital soft tissue prolapse into the sinus.

In our study based on the severity of the orbital fracture 23 patients were surgically treated as they fell under the category of moderate to severely displaced fracture and 31 patients which were having minimally displaced or undisplaced fracture were treated conservatively.

The status of the internal orbit after reduction of ZMC was determined by Edward Ellis III<sup>[1]</sup> et al and found that volume change of the injured orbit can change either due to comminuted fractures or significantly displaced fractured segments causing change in shape of the orbit.

In our study the linear CT measurements were done according to parameters like anteroposterior, mediolateral and superoinferior dimensions pre-operatively and post-operatively that was compared with normal contralateral eye. A significant improvement in linear measurements was recorded postoperatively which improved from the seventh post op day to three months gradually. A major difference was found in orbital volume in patients with moderate to severely displaced fractures (28.36 mm<sup>3</sup>). There was no significant difference in patients with minimally displaced or undisplaced fractures. The complete restoration of the linear measurements was not seen at the end of three months follow up in patients treated either conservatively or surgically.

The patients with minimally displaced or undisplaced fracture were treated conservatively (Group B) as there was not much discrepancy (28.816 mm<sup>3</sup>) in the orbital volume pre operatively. After three months follow up mild improvement in the volume was seen (28.793 mm<sup>3</sup>) as compared to uninvolved eye (28.418 mm<sup>3</sup>). The patients with moderate to severely displaced fracture had significant change in volume pre operatively (29.504 mm<sup>3</sup>). These patients were treated surgically (Group A) and the orbital walls were anatomically reduced in position. Post operatively there is significant improvement in orbital volume towards normal (27.558 mm<sup>3</sup>) at seventh post operative day (28.604 mm<sup>3</sup>) and by the end of three months (28.360 mm<sup>3</sup>). This data suggests that surgical treatment brings about a significant improvement in the restoration of the orbital volume.

Enophthalmos is the most common complication caused by discrepancy between soft tissue volume and bony volume in the orbit. It may result from failure to anatomically restore the orbital fracture or from loss or atrophy of the orbital soft tissue. According to Edward Ellis<sup>[2]</sup> et al approximately 1cu.cm. displaced orbital soft tissue (or increase in orbital volume) produces 1mm. enophthalmos.

In our study 18 patients reported to us with enophthalmos. In all these patients enophthalmos were measured by hertel's exophthalmometer. Further these patients were divided on the basis of extent of enophthalmos ; those that had less than 2 mm enophthalmos (n=12) and rest more than 2 mm (n=6). Along with the six patients who had enophthalmos more than 2 mm another eight patients (enophthalmos less 2 mm) were subjected to surgical treatment taking into consideration all the clinical features, functional and the esthetic disabilities.

The maximum enophthalmos in our study group was found to be 4 mm. Patients with enophthalmos greater than 2mm were those with blow out fractures, entrapment of muscles and herniation of fat in maxillary sinus. These patients underwent early surgical intervention with orbital floor exploration, release of muscle entrapment, retrieval of fat tissue and reconstruction of floor with titanium mesh. There was a significant improvement up to 2 mm. in enophthalmos post operatively. one patient had complete resolution of enophthalmos after three months (0 mm.).

This data proves that surgical treatment is mandatory in patients where enophthalmos is more than 2 mm and the investigatory modalities reveals herniation of fat into maxillary sinus. In the patients who had treated conservatively had enophthalmos less than 2 mm and showed mild improvement (mean).

According to Zhiyong Zhang<sup>[3]</sup> et al the overall volume of herniated orbital contents correlated significantly with the amount of enophthalmos. The volume of herniated soft tissues posterior to the eyeball equator showed correlation with the amount of enophthalmos. In our study group 18 patients who had enophthalmos, ten patients had combined infraorbital and frontozygomatic fractures, five patients had isolated infraorbital fracture, two had combined infraorbital and medial wall fracture and one patient had isolated medial wall fracture.

Diplopia is potentially one of the serious complications. Early diplopia indicates involvement of extraocular muscle either through entrapment, edema, hemorrhage or damage to motor nerves. Man<sup>[4]</sup> et al recommended that if vertical limitation exists with large herniation of orbital contents into maxillary sinus, a 'wait and see' policy should be employed to allow resolution of the initial hemorrhage and residual edema and if eye movements improve should be delayed. Hiroki Yano<sup>[5]</sup> et al suggested that in punched out and burst type of fractures, early diplopia may result from temporal palsy after neurogenic or musculogenic injury, and its frequently diminishes within two-three days, but if it remains, the hung up contents or dislocated muscle position can be properly attended through elective surgery. Diplopia resulting from alteration of orbital form can also be reconstructed electively. In our study we encountered four patients with diplopia. In three patients the diplopia was completely resolved after three months post surgery. And in one patient there is mild improvement in diplopia post operatively as he reported to us 20 days post trauma.

Muscle incarceration is common in punched out and burst type of fractures and it requires immediate surgery. According to Hiroki Yano<sup>[5]</sup> et al it presents a more serious condition in floor fractures rather than medial wall fractures because of the structural differences of the paranasal sinuses and herniation caused by forced tension caused by the Bells phenomenon at the time of injury. In our study five patients had restricted eye movements. They all underwent immediate surgical intervention with orbital floor exploration and release of muscle entrapment and reconstruction of the orbital floor. They all presented with complete resolution of diplopia with normal eye movements after three months. This indicates that in cases of diplopia with muscle entrapment early surgical intervention should be performed to save and improve the orbital muscle recovery. The literature suggests that the correction of muscle entrapment in the patients correlates to the degree of damage and time of surgery. Therefore in all our patients immediate surgical intervention were performed with good results.

### **Conclusion:-**

Surgical management of zygomatico-orbital fractures have been the mainstay for restoring the orbital volume and improving the aesthetics of the patient. Evolution of high-tech radiographic modalities provide the clinician with stable platform to work out a holistic treatment plan and compare the results with the normal contralateral eye. Long term follow up of the patients who are managed conservatively is important to assess the healing of tissues as well as to counter and repair delayed complications.

#### Abstract

Generally we have survey of drinking water of some selected area's in Nanded(MS). Nanded city having the population approximately 336129 and the chief sources of water supply are the Hand pumps, Bore wells, Wells, Ponds, Dam and River etc. The following parameters applied for monitoring of drinking water qualities for practical and study proposes. We are using some analytical parameter such as Temperature, pH, Electrical Conductivity (EC), Total Dissolved Solids (TDS), Alkalinity, Hardness, Chlorides and Fluoride quantity in Drinking Water.

*Copy Right, IJAR, 2017,. All rights reserved.*

#### Introduction:-

Water is an essential not only for survival of human being, but also for animal plants and all other living being. Water is one of the most valuable natural resources used for drinking, irrigation, navigation, propagation of wild life, fisheries etc. Ground water is the most important source of water supply for drinking, irrigation and industrial purpose. Increasing population and its necessities have led to the deterioration of surface and sub-ground water.

Water the matrix of life is exposed to pollution, unhealthy environment resulting in human affliction and diseases transmission due to rapid industrialization and population.

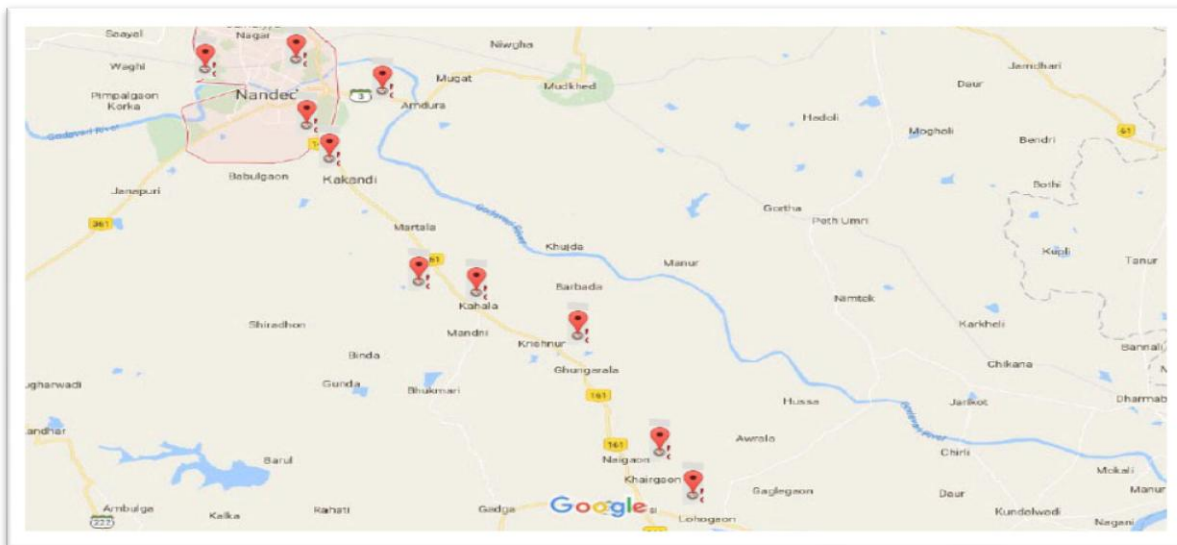

The monitoring and assessment of water quality on continual basis has become essential on part of the associated. Water quality can be defined on the basis of two criteria such as abiotic and biotic, along with the water quality standards are also formulated based on this classification of water quality through estimation of various parameters.

#### Materials And Methods:-

We have randomly selected ten area of Nanded District of Maharashtra show in table -I, collected drinking water samples in sterilized bottles from various water resources like as hand pumps, bore wells, wells, ponds, dam and river etc. We have applied some physicochemical parameter for analysis of drinking water qualities, like Temperature, Colour, Odour, pH, Electrical conductivity [EC], Total dissolved solids [TDS], Alkalinity, Hardness, Chlorides and Fluoride etc. First to know the Temperature of each samples at RT by thermometer in °C, pH by digital pH meter, electrical conductivity measured by conductivity instrument in  $\mu\text{s}/\text{cm}$ , TDS by disk filtration in mg/l. Titration Method used for Total alkalinity, total hardness and Ca concentration of drinking water known in mg/l. For chloride test,  $\text{AgNO}_3$  with  $\text{K}_2\text{CrO}_4$  indicator is used. Standard 0.02N  $\text{H}_2\text{SO}_4$  with methyl orange indicator is used for alkalinity measured in mg/l. Fluoride was estimated with standard method as prescribed by Groltman (1978), Trivedi and Geol (1984) and APHA (1998).

**Results and Discussions:-**

The pH values are normal drinking water ranges 6.5-8.5 on pH meter scale, most natural water is alkaline in nature due to presence of bicarbonate and carbonate. The carbonate are much stronger alkaline than bicarbonates.

we have gain pH value of water from selected area shown in table-I. The maximum pH value 7.7 Malegaon and minimum 6.2 MIDC Nanded (Maharashtra Industrial Development Corporation). The most of bio-chemical and chemical reactions changes the pH value of drinking water. The industrial area located in this area which exhaust there waste effluent without treatment. Commonly drinking water has EC range 500- 800  $\mu\text{s}/\text{cm}$  at 25°C. The EC is used to measure the concentration of dissolved solids substances in water [Navneet, *et al*, 2010]. We have our research gain results of EC highest 1262  $\mu\text{s}/\text{cm}$  at MIDC Nanded and another 1134  $\mu\text{s}/\text{cm}$  of Krishnur Nanded and lowest 132  $\mu\text{s}/\text{cm}$  Kahala as shown in fig. Alkalinity of water is due to the presence of hydroxide carbonates and bicarbonates total alkalinity for drinking water ranges 200-600mg/l we gain research. The results of the alkalinity maximum value 340 mg/l at Malegaon and minimum value 160 mg/l of MIDC Krishnur. Total hardness range 300-

600mg/l. The maximum values 428 mg/l at MIDC Nanded and lower value 234 at Kahala high value of hardness at MIDC attribute industrial west effluent discharge.

The recommended limit of Ca are 75-200 mg/l Our research experiments result are maximum concentration of Ca at MIDC site and minimum value 56 mg/l dam. Almost all natural water contain chloride ion .There concentration vary considerably according to the mineral content of the earth in any given area . In small amount it is not significant zn large concentration it present problem ,low to moderate concentration of chloride ion add palability to water. Zn fail it is for in fact this reason, excessive concentration of it ,can make water unpleasent to drink .The value of chloride in normal drinking water are range 250-1000mg/l .We have gain quantites of chloride such results the maximum value 90mg/l at Narsi and manimum value 70mg/l at Kahala. Recommended fluoride concentration in drinking water limits 1-1.5mg/l ,it is an essential constituent of drinking water mainly because of it's role in prevention of dental .We have gain experimental result ,the maximum value 0.65 at MIDC and minimum value at 0.24 at Kahala.

### Conclusions:-

The present study indicates the effect of overall development, industrialization and urbanization are felt on the quality of water has resulted few untreated wastes and impact can be easily observed by water minerals, properties changed.

#### Abstract

Six genotypes were studied of which each three genotypes from blackgram and greengram. Drought has been found to decline the almost all the morphological characters including leaf area in both the crops as compared to those of irrigated ones. The plant height is reduced, plants not having branches, even one or two plants having branches with shorter and unproductive, number of pods per plant, pod length and number of seeds per pod also much reduced. The hundred seed weight (g), single plant yield and dry matter production (kg/ha) were reduced compared to irrigated condition. The susceptible genotypes of Co 8 in greengram and Co 6 in blackgram were much reduced in all the biometrical characters compared to water stress tolerant genotypes VRM(Gg)1 and VMGG012-005 in greengram and VBN(Bg)4 and VBN(Bg)6 in blackgram. Among the genotypes CO 8 in greengram and CO 6 in blackgram had very low membrane stability. The reduction in photosynthesis under stress can also be attributed to a decrease in chlorophyll content in all the genotypes especially very high in Co 8 greengram and Co 6 in blackgram. The increased proline accumulation in drought tolerant genotypes of VRM(Gg)1 and VMGG 012 -005 in greengram and VBN(Bg)4 and VBN(Bg)6 in blackgram are showed tolerance to drought. The correlation between the leaf proline content and soil moisture content was found to be negatively correlated at the same time correlation between chlorophyll Stability index (CSI) and soil moisture was found to be positively significant in both greengram and blackgram.

#### Introduction:-

Some of the existing ruling greengram and blackgram varieties have given minimum yield under water stress condition. To test verify the real fact of these varieties, the experiment was started with greengram and blackgram varieties. Water stress is abiotic factor affects plant's morphological, physiological and biochemical activities of the plant. Crop production is completely affected by periodical, regular and continuous droughts. Agriculture is the biggest consumer of water. Water is the main source involving for all activities of plant growth throughout the life of the crop plants. A complete Agriculture means which includes of seed to seed. Without soil seed will germinate

but without water seed will not germinate. Water is essential medium for seed germination, seedling growth, vegetative period of the crops, flowering and translocate assimilate throughout the body of the plants from roots to top of the plants and leaf to bottom of the plants (Kijne., 2006) Food productivity is decreasing involved various factor such as drought, extreme temperature, cold, heavy metals, or high salinity, severely impair plant growth and productivity worldwide. But only Drought, being the most important environmental stress, severely impairs plant growth and development, limits plant production and the performance of crop plants, more than any other environmental factor (Shao *et al.*, 2008). Accumulation of proline in plants is a well known tolerance mechanism to drought stress which acts as cellular osmotic adjustor and also protects and stabilizes essential cell components like protein, photosynthetic apparatus and detoxify Reactive Oxygen Species (ROS) etc. Pulse crops green gram (*Vigna radiata L.*) and black gram (*Vigna mungo L.*) are two most important protein sources that are grown in all over India as well as in Tamil Nadu. In addition, it also plays an important role in sustaining soil fertility by fixing atmospheric nitrogen. Therefore in the present experiment we tried to evaluate the various, morphological, physiological and biochemical changes taking place in selected pulse genotypes under drought stress and normal condition.

#### **Aims and objectives:-**

1. To study the greengram and blackgram genotypes under water stress and normal condition to test verify the reality of tolerance and confirmation through morphological, physiological and biochemical parameters
2. To observe the changes in these parameters during drought.
3. To study the overall effect of drought on yield components.

#### **Materials and Methods:-**

A total of six genotypes taken for this study, four genotypes already known for tolerant to drought and high temperature under normal cultivation at field level which are again test verify the real drought tolerance of the varieties under irrigated and drought conditions. The drought tolerant genotypes namely VRM(Gg)1 and VMGG012-005 in greengram and VBN(Bg)4 and VBN(Bg)5 in blackgram were imposed to drought and irrigated situation along with check varieties of Co 8 in greengram and Co 6 in blackgram. This trials was laid out during January- March 2016 at TNAU Agricultural Research Station Virinjipuram, Vellore. The seeds was sown in 4x3 m<sup>2</sup> plot, four irrigations were given as per the schedule of 1<sup>st</sup>, 7<sup>th</sup>, 25<sup>th</sup> and 40<sup>th</sup> DAS. During growth and reproductive periods no irrigation was given in drought imposed plot of both greengram and blackgram crops. The morphological characters were recorded in both condition of normal and drought imposed plots. The biometrical characters namely plant height (cm), No. of branches / plant, Length of branches (cm), No. of pods per plant, Pod length (cm), No. of seeds per pod, Hundred seed weight (g), Seed yield / plant (g) and Dry matter production were recorded. The 10 plants from each genotypes were taken for work out the mean.

#### **Soil Analysis:-**

The collected soils were processed and analyzed for soil pH, EC using standard methods at the beginning of the experiments. Soil moisture was recorded immediately after second day of irrigation at middle of the plot in each in the irrigated plot and as same day soil moisture was also recorded in drought imposed. Soil moisture content was determined by gravimetric method at regular interval.

#### **Plant morpho-physiological analysis:-**

##### **Leaf membrane stability index:-**

Membrane stability index (MSI) was determined according to the method of Premchandra *et al.*, 1990) as modified by (Sairam, 1997). Leaf materials (0.1 g) were thoroughly washed in running tap water at 40 °C for 30 min. After the expiry of the period their electrical conductivity was recorded by conductivity bridge (C1). Subsequently the same samples were placed in boiling water bath (100 °C) for 10 min and their electrical conductivity recorded as above (C2). MSI was calculated with the following equation:  $MSI = [1 - (C1 / C2)] \times 100$

##### **Leaf area index:-**

Leaves from 10 plants in each genotype were cut and leaf area was measured in cm<sup>2</sup> by green leaf area meter (OSK-Model GA-5).

##### **Plant biochemical analysis:-**

Chlorophyll-a, chlorophyll-b and total chlorophyll were determined. The carotenoid content were also estimated as per the procedure. Chlorophyll stability index was also calculated periodically using the following formula:  $(CSI \%) = (\text{Total Chlorophyll under stress} / \text{Total Chlorophyll irrigated condition as control}) \times 100$ .

**Proline:-**

Determination of free Proline was estimated using the method of Bates et al. (1973). Samples were homogenized in 10 mL 3% (w/v) sulfosalicylic acid, and proline was assayed by the acid ninhydrin method. The absorbance was measured spectrophotometrically at 520 nm. Proline was calculated based on  $\mu\text{M. g}^{-1}$  FW. The Leaf proline content was analysed at 20<sup>th</sup> DAS and 40<sup>th</sup> DAS. The obtained data were analyzed using the statistical package PASW statistics.

**Results and Discussion:-**

In the present study which included six genotypes for the experiment and three genotypes from each crop of blackgram and greengram. During the crop period temperature and rainfall were recorded (Table 1.a). Soil moisture content was analyzed at four stages of the varietal plots and every time samples were taken for analysis at second day after irrigation (Table 1.) at both the conditions of Irrigated (Table 2) and drought (Table 3). There is no rainfall received during the entire period of the crop growth.

**Effect of drought stress on plant growth parameters:-**

In the present study, plant growth parameters in terms of height and all biometric characters including leaf area were observed and are presented in Table 4, Table 5 and Table 6. Drought stress has been found to decline the almost all the morphological characters in both the crops as compared to those of irrigated ones. The plant height is reduced, most of the plants not having branches, even one or two plants having branches with shorter and unproductive, number of pods per plant, pod length and number of seeds per pod also much reduced. The hundred seed weight, single plant yield and dry matter production were reduced compared to irrigated condition. The susceptible genotypes of Co 8 in greengram and Co 6 in blackgram were much reduced in all the biometrical characters including leaf area compared to water stress tolerant genotypes which shows susceptible to water stress. This reduction in plant growth in terms of all quantitative characters are due to the loss of cell turgor which greatly suppresses cell expansion and cell growth thereby inhibiting the linear growth of shoot observed more in drought susceptible genotypes. Stress tolerant genotypes somewhat better than the susceptible genotypes towards yield. (Tahir and Mehdi 2001) and Kamara *et al.*, 2003.

CO6	-	0.59	5.2	7.6	-	0.53	3.5	3.1

Hence it can be inferred that the slow decline in this growth parameter might be due to lack of adequate moisture decreased day by day in plant root zone which can be evidenced from the positive correlation between soil moisture and height of the plant which is in confirmatory with the findings of earlier workers (Baroowa and Gogai 2012).

The reduction of leaf area was more prominent in all the varieties that faced longest period of water deficit (55 days). Even reduction in complete drought imposed situation and the tolerant genotypes has considerable yielding capacity been observed in the all four varieties when same situation imposed in the drought and susceptible genotypes completely lower in all the characters. But these drought tolerant varieties are having capable of the osmotic adjustment to cell alive to protect for longevity and maintain the cell turgor. In susceptible genotypes show reduction in cell division resulting in reduced cell number and stop cell elongation inhibiting leaf expansion. This study agreed with many authors, cell elongation of higher plants can be inhibited by interruption of water flow from the xylem to the surrounding elongating cells (Nonami, 1998). Drought caused impaired mitosis; cell elongation and expansion resulted in reduced growth and yield traits (Hussain *et al.*, 2008). This modification in leaf anatomy is one of the basic causes which lead to reduction in average leaf size under water limiting situation (Bhaswatee Baroowa and Nirmali Gogoi 2012.). Plant height is a function of cell division, enlargement and differentiation (Hussain *et al.*, 2008) and in redgram (Nam *et al.*, 2001 and Kavar *et al.*, 2007 and Sairam *et al.*, 1997 and Saliendra et al 1995, Kaiser *et al.*, 1981).

#### **Effect of drought stress on cell membrane stability:-**

The genotypes shows a considerable decrease in the membrane stability in the plants grown under drought stress condition as compared to the irrigated plants for both the crops (Table 7). Plants kept under more than 55 days of water deficit had the lowest membrane stability value compared to the plants grown irrigated condition. Among the genotype Co 8 in greengram and Co 6 in blackgram had very low membrane stability. The decrease in cell membrane stability was found to be more in greengram. The Membrane stability index was found to be positively correlated with soil moisture content for both black gram and green gram cultivars (Baroowa and Gogai 2012). The lower MSI of Co 8 greengram and Co 6 blackgram accompanied with the greatest seed yield loss of this genotype. While other had highest value of MSI with normal seed yield may indicate the underlying physiological mechanisms that contribute in water deficit tolerance. (Yeilaghi *et al.*, 2012).

#### **Effect of drought stress on biochemical parameters:-**

In the present study, chlorophyll-a and chlorophyll-b content of both blackgram and greengram plants showed a decreasing trend with the increasing duration of drought which proved that these photosynthetic pigments are sensitive to water deficit condition Table 7. A continuous decrease in chlorophyll stability index was observed during the drought period more in CO 8 greengram and CO 6 blackgram. Chlorophyll Stability Index (CSI) is an indicator of the stress tolerance capacity of plants. A higher CSI helps plants to withstand stress through better availability of chlorophyll by maintaining more dry matter production and higher productivity. The drop down of CSI in greengram was faster than that of blackgram (Kiani *et al.*, 2008) and (Baroowa and Gogai 2012) and Chaves (2002) and Cornic G.,Massacci, (1996).

The reduction in photosynthesis under water deficit stress can also be attributed to a decrease in chlorophyll content. Water deficit reduced the chlorophyll content in water deficit susceptible genotypes and increased in water deficit tolerant genotypes. These results are in agreement with those of other oilseed crop (*Sesamum indicum*) (Abraham *et al.*, 2008). Differences in leaf chlorophyll content can be as an indicator of plant vigor and its capacity for photosynthesis, strongly dependent on chlorophyll content (Carter and Spiering, 2002). The significant variation for

Chl a, Chl b and carotenoid content has also been reported by other researchers (Jonson *et al.*, 1993). and Sharma and Hall 1991 and Nam *et al.*, 2001 and kavar *et al.*, 2007 and Long *et al.*, 1994. and Kolyorea 1958. and Rahman and Ahmad 2004 and Zhang *et al.*, 2008.

\*Irrig: irrigated, Drgt: Drought, Chl: Chlorophyll

Proline accumulation helps in maintaining a better osmotic balance in plant cells suffering from water deficit. In the present study, more accumulation of proline was reported in leaf tissue with the increase in duration of drought stress (Table 8). Regular moisture supply through irrigation decreased the free proline content where as reverse the proline content is increased in leaf at water deficit condition. Varieties having different degree of drought resistance differ in their capacity to accumulate proline under stress. Resistant varieties like VRM(Gg)1 and VMGG012-005 in greengram and VBN(Bg)4 and VBN(Bg)6 in blackgram had accumulate higher level of proline under water stress. A similar trend was obtained by Ashraf and Ibram (2005), Ashraf and Foolad (2007) and Tawfik (2008) who found that osmoprotectants such as proline and glycine betaine (GB) were increased under drought stress. Ashraf and Foolad, 2007, Barrowa and Gogai 2012 and Bates *et al.*, 1973 and Sankar *et al.*, 2008 and Mohamadkhani and Heidari 2008 and Sundaresan and Sudhakaran, 1995.

### Conclusion:-

In the present experiment, it has been observed that both the pulse varieties namely VRM(Gg)1 and VMGG012-005 in greengram and VBN(Bg)4 and VBN(Bg)6 in blackgram were significantly somewhat better yielding capacity in water deficit condition by drought tolerance mechanism when compared to greengram variety Co 8 and blackgram variety Co 6 susceptible. These varieties withstand to all such characters of membrane stability, high proline and maintain cell turgor even highest degree of drought (55 days of water deficit). The varieties namely VRM(Gg)1 and VMGG012-005 in greengram and VBN(Bg)4 and VBN(Bg)6 in blackgram has having physiological and biochemical capability for drought tolerance in water stress condition.

### Abstract

*Nosema bombycis* infects *Bombyx mori* upon spore germination utilizing a characteristic mechanism to invade host cell. The uptake of microsporidian spore is either by spore-host interaction or by endocytosis. The molecular mechanism leading to such interactions is not well elucidated. The expansions of *N. bombycis* genome have acquired many horizontal genes and interact with protein kinases, involved in defense mechanism and cell cycle events. Present study aimed towards understanding these interactions as spore germination being vital process in pebrine infects silkworms through spore endocytosis. Using STRING - the molecular functions of all these proteins and its functional partners in the interactome were analyzed and annotated. Further, the protein-protein interactions network was analyzed to study the functional interaction partners that could decipher the mechanism triggering uptake of spore through endocytosis. A total of 50 proteins including protein kinases, horizontal transfer and germination related genes were studied emphasizing CDC28 activation of VPS34 which inturn mediated the activation of CDC10 leading to spore wall formation. In conclusion, results highlighted the most possible mechanism triggering endocytosis of microsporidia and functional contribution of protein kinases and genes involved in horizontal gene transfer to the *N. bombycis* germination and survival strategy.

### Introduction:-

Microsporidia have attracted much attention as they infect a variety of species ranging from protists to mammals<sup>1</sup>. Almost half of the reported genera of microsporidia use insects as primary hosts, and microsporidian infections usually have chronic and sublethal effects on their hosts. *Nosema bombycis*, the first named microsporidia species, is the causative agent of devastating pebrine disease in silkworm, *Bombyx mori*. *N. bombycis* infects silkworms both vertically (from mother to progenitor eggs) and horizontally (transovarially), damaging gut, malpighian tubules, silk glands and fat bodies causing larval inactivation and retarding the larval development and finally leading to silkworm death<sup>2</sup>. With the appropriate external stimuli trigger or direct contact with host cell, *N. bombycis* spore rapidly extrudes polar tube from the anterior end in a process called germination. Germination is the most important

and foremost step in the infection of silkworm by *N. bombycis*<sup>3</sup>. The invasion into the host cell is by the mechanism of polar tube extrusion<sup>4</sup>.

Comparative genomics of *N. bombycis* shows that the genome is astonishingly expanded as compared to the distantly related *N. ceranae* and this large genome size is due to the proliferation of host-derived transposable elements, horizontally transferred genes (HGT) from prokaryotes, and the production of segmental and tandem duplicates<sup>5</sup>. Based on the review of literature, 55 genes were identified to be involved in horizontal gene transfer, among these, 21 HGT genes had unknown function and 34 had predicted gene functions.

Further, protein kinases that form a large group of enzymes which transfer phosphate group from ATP to a number of proteins are involved in the mechanism of signal transduction leading to the *N. bombycis* infection<sup>6</sup>. These protein kinases are generally known to be involved in cell cycle events, cell proliferation, development, metabolism, signal transduction and stimulus to external signals. Genomic kinomes of *N. bombycis* revealed that there are 41 protein-kinases belonging to serine-threonine class<sup>7</sup>. Although there are studies that focused on actions of proteins derived from HGT and also germination related transcriptomics<sup>8</sup>, there are no clear studies that depict the involvement of protein kinases in association to germination. The computational studies of physical and functional interactions prediction generates more robust interactome as the interactions integrate to provide completely annotated information. In view of this, understanding the interactome helps in understanding the biological significance of spore invasion, thereby leading to infection. The present study analyzes the functional interactions of acquired horizontal proteins and *N. bombycis* genomic protein kinases with highly expressed proteins during germination.

### Methodology:-

The present investigation involves analysis of interaction of *N. bombycis* protein kinases, germination related proteins, horizontal transfer genes and infection mechanism during germination using the STRING software. . Among the fifty proteins, thirteen show specific expression during germination of *N. bombycis* spore, eighteen proteins acquired through horizontal gene transfer and nineteen protein kinases of *N. bombycis*. STRING database<sup>9</sup> provides critical assessment and integration of protein-protein interactions, including direct (physical) as well as indirect (functional) associations. All the proteins were queried in the query multiple search box with the interactions restricted to those available for *Encephalitozoon Cuniculi* as *E. cuniculi* is the closest microsporidian to *N. bombycis* as represented by Frankenhuysen et al.,<sup>10</sup> and the sequence information is available. The prediction analysis methods including activation, inhibition, binding, co-expression and gene fusion were utilized. The confidence score >0.9 were selected to obtain interaction network representing >90% confidence in the prediction to establish an interactome network representing the *N. bombycis* infection in silkworm leading to pebrine disease.

### Results and Discussion:-

A total of fifty proteins were analyzed to predict the protein interactions involved in germination of *N. bombycis* in silkworm (Table 1). Among these, forty proteins showed interactions atleast with one protein, whereas ten proteins did not interact. Fig. 1a represents overall protein-protein interaction network obtained in the present investigation. CDC28 was found to be the most interacting protein followed by Pho85 (ECU08\_0230), which are protein kinases. CDC28 showed 19 interactions in the network forming the node 1 and 17 interactions were with other protein kinases and remaining two interactions with proteins expressed during germination. On the other hand, Pho85 showed 18 interactions, which is represented as node 2 (Table 4) and 16 such protein interactions were other protein kinases and two interactions with proteins expressed during germination. These two major nodes indicate protein kinases form crucial back bone for the interaction of horizontal proteins and *N. bombycis* protein kinases and could be implicated in eliciting there by causing the infection upon germination of *N. bombycis* spores. The functional annotation of all the proteins queried for protein-protein interactions utilized in this study is listed in table 1.

Proteins in the proposed network are highly interactive among themselves than for a random set of proteins of similar size that would be expected from the drawn genome. These strong interactions suggest that these proteins are biologically connected to elicit a response upon a specific signal, as a group. However, there was no significant pathway enrichment observed in cellular component and KEGG pathways. *N. bombycis* HGT, germination and protein kinase gene set includes genes encoding basic cellular functions such as transcription, translation, DNA replication and repair, cell cycle control, protein folding/turnover, intracellular trafficking and key enzymes for glycolysis, pentose phosphate pathway, trehalose metabolism and chitin biosynthesis (Table 1).

The mode of infection is either through polar tube intrusion or endocytosis and their protein interactors<sup>3,4,11</sup>. In the present study, the potential candidate interactor *i. e.*, VPS34 (vacuolar protein sorting 34) represented the major node of 18 protein interactors (Fig. 2) and is known to be involved in sporulation. VPS34 is known to initiate the formation of a forespore membrane at each spindle pole body and extends to form the spore envelope, which further requires binding of CDC10 through the PtdIns(3)<sup>12</sup>. VPS34 converts phospho-inositol to phosphatidylinositol 3-phosphate, the key factor for sporulation and phosphorylates phosphatidylinositol to generate PtdIns(3)P (Fig. 3). Phosphatidylinositol 3-kinase is also vital for cytoplasm to vacuole transport (Cvt) and autophagy as a part of the autophagy-specific VPS34 PI3-kinase complex I. These proteins are involved in endosome-to-golgi retrograde transport as part of the VPS34 PI3-kinase complex II.

Microsporidia invades host cells in two different ways, the first way of invasion being ejection of spore polar tube and piercing into the host cell in its close proximity. The second mode, host endocytosis of the infective spore but the spore escapes the abjection by endocytic vacuole of the host by discharging its polar tube. However, spore endocytosis mechanism remains unclear and the potential molecular players involved are yet to be elucidated. CDC10 protein or septins are GTPases involved in cytokinesis and spore wall formation<sup>2,13</sup>.

We hypothesize that major interaction of CDC28, binding and thereby activating CDC10 is crucial by which the microsporidia gets the signal for its invasive entry into the host (Fig. 1b). Endocytosis invasion is known to happen in *Encephalitozoon* species. The GO biological placement predicts that CDC10 is localised to the membrane of *N. bombycis*. Septin 7 of *O. colligata* is also known to be localised in its exospore<sup>12</sup>. Alternatively, a surface septin could also facilitate infection by simply helping to keep the parasite in close proximity to the host cell surface. Further, the present interactome also reveals the binding, catalysis and activation of CDC28 by VPS 34 mediates the activation of CDC10. The activation of VPS34 indeed might be by binding of sugars, anions or small molecules (Fig. 3).

*N. bombycis* intracellular parasitic lifestyle is designed to have highly reduced metabolism instead of energy investing pathways to synthesize basic biological building blocks (e.g. amino acids, sugars, nucleotides, lipids) and cofactors (e.g. ATP, NAD<sup>+</sup>, NADP<sup>+</sup>). The presence of one such enzyme like Mannose-1-phosphate guanyl transferase 2 is the key for carbohydrate metabolism and mannosylation of structural and functional proteins in microsporidians. In Mannosylation of polar tube (PTPs) and spore wall proteins plays very important role in the parasitic lifestyle of *E. cuniculi*, possibly as virulence factors reported for several fungal pathogens<sup>14</sup>. However, the present interactome reveals that PTP3 does not interact with Mannose-1-phosphate guanyl transferase 2, indicating its involvement in carbohydrate metabolism rather than mannosylation (Fig. 2). This is best evident (Table 2) with the maximum observed gene count correlated with the functions like phosphorylation and cell cycle processes as far as the biological function was considered. Further, another enzyme, dUTPase is involved in conversion of dUTP to dUMP and pyrophosphate thereby adding on to the ATP stealing mechanism from the host cell. Like many parasites *T. hominis* has lost the ATP-expensive pathways for the *de novo* biosynthesis of inosine 59-phosphate and for uridine mono-phosphate, the starting points for the biosynthesis of purines and pyrimidines for DNA and RNA biosynthesis<sup>15</sup>. Probably, *N. bombycis* might have acquired dUTPase through HGT from bacterium in the predicted manner.

The absence of mitochondria in *N. bombycis* indicates that they require energy for survival in the host. However, it possess several energy synthesizing pathway enzymes which could compensate for the energy synthesis, which further is achieved by stealing ATP from the host cell. Our analysis also includes such energy synthesizing pathway enzymes *viz.*, glucose-1-phosphate isomerase and transketolase based on transcriptome data of Ma et al.,<sup>1</sup>. Glucose-1-phosphate isomerases thus inter converts glucose-6-phosphate to fructose-6-phosphate in glycolysis pathway. This Glucose-6-phosphate can also be utilized by pentose phosphate pathway to synthesize ribulose-6-phosphate and NADPH, which are the key energy molecules that contribute towards the survival of spore in the host cell.

Several studies show the presence of microsporidia hexokinases involvement in glycolytic pathway; but the absence of hexokinase is evident through transcriptome data<sup>8</sup>, furthered by distinctive absence of hexokinase activity in *Nosema gryllii*, in which activity of several glycolytic enzymes was detected in isolated pathogen cells<sup>16</sup>. Hexokinase catalyzes the first step in glycolysis and the pentose phosphate pathways. Therefore, microsporidia hexokinase activity within host cells could increase host synthesis of building blocks such as nucleotides, amino acids, and lipids, necessary for the rapid growth of parasites. Hexokinases are known to be present in microsporidians like *T. hominis*, *V. culicis* and *V. corneae*<sup>14</sup>. But the absence of hexokinase in our study is

compensated by the presence of Glucose-6-phosphate isomerase and transketolase. One of the interesting feature is *N. bombycis* has acquired phosphoglycerate mutase, which is another important enzyme during glycolysis and pentose phosphate pathways through horizontal gene transfer. In this analysis, there is strong triangular interaction between three enzymes (phosphoglycerate mutase, transketolase and glucose-6-phosphate isomerase) involved in energy synthesis. .

The genes acquired through HGT include enzymes involved in nucleotide synthesis (dUTPase, cytidylate kinase, uridine kinase, thymidine kinase). Further, the pathway analysis based on molecular functions revealed more number of genes participating in nucleotide binding, transferase and kinase activities (Table 3) thus implying its significance leading to elicit the infection upon endocytosis of spore by the host cell. CTP synthetase is the only nucleotide synthesis gene retained in the highly reduced genomes of the microsporidia<sup>14</sup>. The thioredoxin reductase acquired from (bacteria) interacts with thioltransferase, also acquired from bacteria suggesting that these defense proteins are involved in maintaining spore homeostasis and viability. These defense proteins might not interact with any germination expressed proteins. Fine example of role of defense proteins in microsporidia is presence of glutathione reductases and peroxidases, thioredoxin reductases and a superoxide dismutase in *T. hominis*<sup>17</sup>. Thymidine kinase, the pyrimidine salvage pathway enzyme interacts with phosphoglycerate mutase. Thymidine kinase acquisition as HGT is also found in the apicomplexan *Cryptosporidium*, from a bacterium<sup>18</sup>.

There is an indication that calcium/calmodulin binding at the spore surface may commence a signaling cascade that causes spore activation<sup>19</sup>. Further, it is of interest to note that *E. cuniculi* genome encodes five calmodulin-dependent kinases in its minimal set of 32 protein kinases which could potentially participate in such process<sup>7</sup>. The clear concept of activation of germination through signaling pathways however has not been elucidated but, indications of calcium/calmodulin binding at the spore surface may commence signaling cascade cause spore activation. We hypothesize that calmodulin dependent protein kinase (ECU03\_0630) interacting with ECU03\_1290, ECU08\_1620, CDC28, ECU08\_0230, MRK1, ECU02\_0550, ECU01\_1320 and CDC5 (Fig. 1c) could be the stimulant for the host cell to initiate endocytosis (Fig. 3), which further requires experimental validation. The present investigation predicts and emphasizes the possible molecular mechanism of spore uptake through endocytosis and also unravels the protein interactors involved in ATP stealing mechanism and defense mechanism of *N. bombycis*.

**Table 1:-** List of proteins queried in STRING with its functional annotations and the String protein code

Query sequence name	String Protein code	Annotation
Thymidine kinase	TK	Key function in synthesis of DNA
Sugar permease	ECU11_1870	Transporter of $\beta$ -galactosides
Deoxyuridine 5'triphosphate nucleotidohydrolase	ECU05_0280	Nucleotide metabolism
Thioredoxin reductase	ECU01_0680	Catalyze reduction of thioredoxin
Mevalonate kinase	ECU10_1510	Catalyze the rate-limiting step for the production of isopentenyl pyrophosphate
Extracellular serine proteinase	SPL2	involved in the degradation of proteins
Translation initiation factor E2B gamma subunit	ECU05_1360	mRNA-binding protein involved in translation elongation
2,3-bisphosphoglycerate phosphoglycerate mutase	ECU10_1060	synthesis of 2,3-bisphosphoglycerate
Cytidylate kinase	ECU03_1270	Pyrimidine metabolism
Molybdenum cofactor synthesis protein 3	ECU03_1290	Uncharacterized
Thioltransferase	ECU09_1375	Antioxidant defense system
Microtubule-associated protein 1A	ECU02_0130	Cell cycle protein
Nucleoporin NUP170	ECU06_0470	Nuclear pore complex proteins
Transketolase 1	ECU06_0120	Catalyzes d-xylulose to erythrose-4-phosphate
Glutamate NMDA receptor-associated protein 1	ECU07_0290	Ion channel protein
glucose-6-phosphate isomerase	ECU05_0650	Interconverts glucose-6-phosphate and fructose-6-phosphate
protein phosphatase PP2-A regulatory subunit A	ECU09_1490	Uncharacterized

mannose-1-phosphate guanylyltransferase	ECU11_0690	Fructose and mannose metabolism
Nuclear transcription factor Y subunit	ECU10_0260	Uncharacterized
Alanyl-tRNA synthetase	ECU02_1490	Catalyses the attachment of an amino acid to its cognate transfer RNA molecule
Protein peanut	CDC10	Predicted septin
60S ribosomal protein L6	ECU08_1790	Ribosomal protein
MADS domain containing protein	ECU07_1730	Uncharacterized
PTP3	PTP3	Sporoblast-to-spore polar tube biogenesis.
SPL2	SPL2	Degradation of proteins
CK2	CKA1	Casein kinases
PHO85	ECU08_0230	Regulates their perception of and response to stress from the environment
CRK7	CTK1	hyperphosphorylates the C-terminal heptapeptide repeat domain (CTD)
CDC2	CDC28	Required for entry into S-phase and mitosis
GSK	MRK1	Cell cycle regulation
PLK	CDC5	Protein kinase involved in mitotic exit. 'septum-promoting factor'
AUR	IPL1	Chromosome segregation during the later part of each cell cycle.
NEK	ECU11_1500	Cell cycle regulation
WEE	ECU08_1620	Negative regulators of mitosis
CDC7	CDC7-1	Initiation of DNA synthesis
HASPIN	ECU03_0890	Mitotic spindle positioning and mitotic arrest regulation
TTK	MPS1	Involved in the regulation of the onset of mitosis.
PEK	ECU02_0550	Cell cycle regulation
GEK	ECU01_1320	Protein kinase C
NUAK	ECU08_1480	SNF1-related protein kinase
CHK1	CHK1	Serine/threonine-protein kinase
KIN1	KIN1	Serine/threonine protein kinase involved in regulation of exocytosis
MKC	ECU03_0630	Calmodulin-dependent protein kinase
CK1-A	ECU03_0910	Casein kinase 1 homolog (involved in DNA repair)
ATM	ECU03_1100	Phosphatidylinositol-4-kinase catalytic subunit
RIO2	ECU09_1260	Cell cycle regulation

#### Introduction:

Foot infections are the most common problems in persons with diabetes. These individuals are predisposed to foot infections because of a compromised vascular supply secondary to diabetes. Local trauma and/or pressure (often in association with lack of sensation because of neuropathy), in addition to microvascular disease.

The spectrum of foot infections in diabetes ranges from simple superficial cellulitis to chronic osteomyelitis. Infections in patients with diabetes are difficult to treat because these patients have impaired microvascular circulation, which limits the access of phagocytic cells to the infected area and results in a poor concentration of antibiotics in the infected tissues. For this reason, cellulitis is the most easily treatable and reversible form of foot infections in patients with diabetes. Deep skin and soft tissue infections are also usually curable, but they can be life threatening and result in substantial long-term morbidity.

In terms of the infecting microorganisms and the likelihood of successful treatment with antimicrobial therapy, acute osteomyelitis in people with diabetes is essentially the same as in those without diabetes. Chronic osteomyelitis in patients with diabetes mellitus is the most difficult infection to cure. Adequate surgical debridement, in addition to antimicrobial therapy, is necessary to cure chronic osteomyelitis.

Patients with diabetes also can have a combined infection involving bone and soft tissue called fetid foot. This extensive, chronic soft tissue and bone infection causes a foul exudate and usually requires extensive surgical debridement and/or amputation.

Individuals with diabetes may also have peripheral vascular disease that involves the large vessels, in addition to microvascular and capillary disease that results in peripheral vascular disease with gangrene. Dry gangrene is usually managed with expectant care, and gross infection is usually not present. Wet gangrene usually has an infectious component and requires surgical debridement and/or antimicrobial therapy to control the infection.

Except for chronic osteomyelitis, infections in patients with diabetes are caused by the same microorganisms that can infect the extremities of those without diabetes. Gas gangrene is conspicuous because of its low incidence in

Address:-From Immunology and Medical Microbiology, College of Medicine, King Faisal University, Alhasa, Saudi Arabia.

patients with diabetes, but deep skin and soft tissue infections, which are due to gas-producing organisms, frequently occur in patients with diabetes. In general, people with diabetes have infections that are more severe and take longer to cure than equivalent infections in other people.

### Epidemiology:

-Here are recent estimates of the disease burden due to diabetes and projections for the future\*:

	2003		2025	
	Europe	Africa	Europe	Africa
Population				
-Total	872 million	667 million	863 million	1107 million
-Adult (20-79 years)	621 million	295 million	646 million	541 million
Diabetes				
-No. of people (20-79 years)	48.4 million	7.1 million	65 million	19million
-Prevalence (20-79 years)	7.8 %	2.4 %	7.8 %	4.3 %

\*Source:International Diabetes Federation and The International Working Group on Diabetes joint publication 2006

-People with foot ulcers\*:

- Developed countries: **15%** of people with diabetes get ulcers at least once in their lifetime.
- Developing countries: the prevalence is even higher at **20%**.

\*Source:International Diabetes Federation and The International Working Group on Diabetes joint publication 2005

-The diabetic foot affect individuals and society:

- Diabetic foot ulcers and their complications (explained later) are often painful. Patients often become dependent on others for mobility, suffer a loss of autonomy, reduced social function, and making depression common.
- The cost of diabetic foot management is **12-15%** of the total health care budget for diabetes in developed countries. This figure may as high as **40%** in developing countries\*.

\*IDF/IWG joint publication on diabetic foot.

### Pathophysiology:

Diabetic foot ulcers may have multiple causes, the prominent ones being;

- A. Peripheral neuropathy (nerve damage)
- B. Peripheral vascular disease (poor pedal blood supply)
- C. Trauma:
  1. Acute: any injury to the foot such as burns or cuts.
  2. Chronic: due to foot deformities(changes of foot shape that lead to ill-fitting shoes and, thereby, ulceration frequency)

### International:

Diabetic foot infections range from cellulitis to chronic osteomyelitis, and, globally, they are the most common skeletal and soft tissue infections in patients with diabetes.

### Mortality/Morbidity:

Mortality is not common, except in unusual circumstances. The mortality risk is highest in patients with chronic osteomyelitis and in those with acute necrotizing soft tissue infections.

### Race:

The incidence of diabetic foot infections is similar to that of diabetes in various ethnic groups.

### Sex:

No important sex differences exist.

### Age:

Diabetic foot infections most frequently affect elderly patients.

## Materials and Methods:

We have collected 10 D.M. Foot samples from inpatient of King Fahad Hospital Hofuf (KFHH) through swab touch and then had been planting in MacConkey's agar and Blood agar. Identified the bacteria was by VITEK 2 Systems (version:04.02), and then test the sensitivity of antibiotics was done.

## Results:

- All samples collected from D.M. foot.
- 4 samples were growing:

## Discussion and Conclusion:

### In sample No. 3:

*Staphylococcus hominis* (Bionumber:040000004220231) is harmless in human.

### In sample No. 3/2:

*Pasteurella pneumotopica* (Bionumber:0401200210000210) is an opportunistic organism prevalent in many commercial and research colonies of rodents. The incidence of clinical disease associated with this organism is low. In the presence of primary pathogens, this organism, like other opportunistic organism, potentiates the severity of disease.

*P. pneumotopica* belongs to the family of *Pasteurellaceae*, which also includes the genera *Haemophilus* and *Actinobacillus*. *P. pneumotopica* is a gram-negative short rod or coccobacillus. On primary culture the organism grows well on blood agar.

All efforts to detect *P. pneumotopica* must discriminate between *P. pneumotopica* infection and *P. pneumotopica* induced disease. Since rodents in many colonies are asymptotically infected with this agent (in their respiratory tract, conjunctivae or other sites) without demonstrable disease, its diagnosis as a primary pathogenic agent must necessarily be one of exclusion. Important to characterize the bacteriologic, mycoplasma and viral status of animals in which this diagnosis is considered to rule out other possible causative agents and disease processes.

**In sample No. 6:**

*Pseudomonas aeruginosa* (Bionumber:0043051243500252) remains one of the most important pathogens in nosocomial infections, with high associated morbidity and mortality.

In intensive care units, *Pseudomonas aeruginosa* (PA) ranks among the top five organisms causing pulmonary, bloodstream, urinary tract, surgical site, and soft tissue infections. Current treatments, primarily antibiotics that kill or inhibit the growth of this bacterium, have been associated with unacceptably high rates of morbidity and mortality. The development of agents that antagonize virulence factors represents a novel and potentially fruitful approach to the treatment of severe infections caused by PA.

Any attempt to therapeutically target virulence determinants must build upon a thorough understanding of host-pathogen interactions in PA infections. Interactions between PA virulence factors and the host immune response dictate the severity and type of infection. Depending on the environmental conditions and the immune status of the host, PA can be a quiescent colonizer, a cause of chronic infection, or a highly virulent invader during acute infections. For example, in the respiratory tract PA may cause fulminant and acute ventilator-associated pneumonia (VAP), be a colonizer in chronic obstructive pulmonary disease, or cause a chronic infection in cystic fibrosis (CF) patients, causing slowly progressive deterioration of pulmonary function. Bacterial surface factors such as flagella, pili and lipopolysaccharide as well as active processes such as the secretion of toxins, biofilm formation, and quorum sensing are virulence determinants that impact the outcome of PA infections. Interaction with the host immune system via soluble and cell surface receptors (e.g. toll-like receptors) controls signalling molecules (e.g. cytokines), modulates the host response, which impacts disease severity both by influencing the rate of bacterial clearance and by causing collateral damage to host tissues.

Given the growing problem of antimicrobial resistance in PA, improving therapy has been designated a priority by the Antimicrobial Availability Task Force of the Infectious Diseases Society of America.

Because of its resistance attributes, PA is the most common antibiotic-resistant pathogen isolated from VAP, with a significant attributable mortality, even with early and optimal therapy. Unfortunately, the multi-faceted resistance mechanisms possessed by PA have made the development of new antipseudomonal antibiotics challenging. Thus, there is a need for novel approaches for controlling these infections in the future.

Recent technological advances in areas such as genomics, proteomics and microscopy have led to rapid progress in our understanding of PA pathogenicity. Scientists are now pushing these discoveries through the translational pipeline in the hope of developing new therapeutic agents useful in the treatment of PA infections. While many PA virulence determinants are being actively targeted (Table 1), here we will focus on four: type III secretion, quorum sensing, biofilm formation, and flagella. We will highlight recent advances in our understanding of basic mechanisms underlying each of these virulence determinants and cite examples of how each is being targeted for therapeutic intervention.

**Table 1**

Virulence determinants of PA that have been targeted for therapeutic intervention.

Virulence Determinant	Type	References demonstrating role in pathogenicity*	Examples of therapeutic interventions	References demonstrating potential utility*	Furthest progress in translational efforts

Like people, PA bacteria behave differently depending on whether they are alone or in a crowd. They accomplish this by using an intercellular signalling process called quorum sensing (QS). In QS, small compounds called autoinducers are released by bacteria into the environment. Autoinducer concentrations are then sensed by neighboring bacteria to infer the density of the local bacterial population and to regulate gene expression accordingly. PA QS systems regulate about 350 genes (6% of the PA genome) and play a role in the regulation of a wide variety of processes including biofilm formation and production of numerous toxins. Given this regulatory breadth, it is not surprising that QS plays an essential role in virulence. Two primary QS systems were initially identified in PA, the *las* and the *rhl* systems. More recently a third QS system was identified in PA, referred to as the *Pseudomonas* Quinolone Signal (PQS). PQS is controlled by *las* system and itself regulates the *rhl* system, suggesting that it acts as link between the two systems.

Just as many environmental organisms synthesize antibiotics to gain an advantage over microbial competitors, some also produce enzymes that degrade the QS autoinducer signals of other species of bacteria. Recent evidence suggests that mammalian cells too have developed such capabilities. Paraoxonases (PONs) are mammalian enzymes that are capable of degrading PA autoinducer molecules and thereby have the potential to disrupt QS. Treatment of PA with PON-containing serum inhibited biofilm formation, which requires functional QS. Thus, these enzymes may play an important role in host defense against PA.

Numerous approaches have been successfully used to inhibit QS in culture and in vivo model systems (Table 2). For example, triclosan, an antimicrobial substance used in soaps, toothpaste, cleansers, and deodorants, has been shown to inhibit the synthesis of autoinducer. The anti-QS strategies of bacteria themselves have been exploited. Expression of bacterial enzymes that degrade autoinducers resulted in decreased production of QS-regulated toxins by PA. In another approach, natural and synthetic compounds have been screened for their utility in preventing the

interaction between the autoinducer and its receptor. Much effort has been directed towards furanones, compounds produced by marine macroalga with anti-fouling properties. Although naturally occurring furanones lacked substantial activity, modified furanone compounds inhibited QS and increased bacterial clearance in a mouse model of infection. Further investigations are necessary to determine whether these approaches will prove efficacious in inhibiting QS in human infections.

**Table 2**

Inhibitors of PA quorum sensing.

Class	Examples	Mechanism	References
autoinducer analogs	cyclopentanol, cyclopentylamide, and cyclohexanone compounds, tetrazole derivatives	block autoinducer receptor	(168–172, 104)
structurally unrelated autoinducer antagonists	4-nitro-pyridine- <i>N</i> -oxide, triphenyl compound	block autoinducer receptor	(173,174)
natural compounds	products from fungi (penicillic acid), marine macroalga (furanone derivatives), garlic, medicinal plants	decrease concentration of autoinducer receptor, unknown	(88–91, 101, 102 173, 175–178)
enzymes	AHL-lactonase, AHL-acylase	degrade autoinducers	(86,87)
antibiotics, metabolic compounds	azithromycin, triclosan, <i>S</i> -adenosylhomocysteine, <i>S</i> -adenosylcysteine, sinefungin	inhibit synthesis of autoinducer	(85, 179–180)

#### Abstract

**Background:** Aneurysmal subarachnoid hemorrhage is the most common cause of non-traumatic SAH. It's a challenging condition to treat. It involves methodical assessment and timely management of multiple factors which will have prognostic significance on the patients.

**Methods:** A brief overview of different types of aneurysms, risk factors, clinical signs and symptoms of SAH, the diagnostic and management protocol in a peripheral set up has been presented.

**Conclusion:** Sub arachnoid hemorrhage due to ruptured aneurysm is a neurosurgical emergency requiring prompt detection and timely referral to a Centre of neurosurgical expertise. Basic knowledge about the presentation of SAH is critical in the management of this condition at a peripheral set up.

Copy Right, IJAR, 2017.. All rights reserved.

#### Introduction:-

Sub arachnoid space lies between the arachnoid and pia mater of brain. All the major blood vessels supplying the brain lie in this space. Any bleeding in this area is defined as sub arachnoid haemorrhage. Worldwide trauma is the most common cause of SAH. Among the non-traumatic (spontaneous) causes of SAH, ruptured aneurysms are the most important cause of this condition, with high mortality rates. Awareness regarding the presentation and management is critical for quick diagnosis and management of SAH secondary to ruptured aneurysm in order to have good outcomes.

#### Causes of SAH:-

Causes of sub arachnoid haemorrhage
Trauma
Aneurysms
Arterio-venous malformation
Brain tumours
Cortical venous thrombosis
Coagulopathy
Vasculitis syndromes including Moya-Moya disease
Drug abuse : cocaine

### Cerebral aneurysms:-

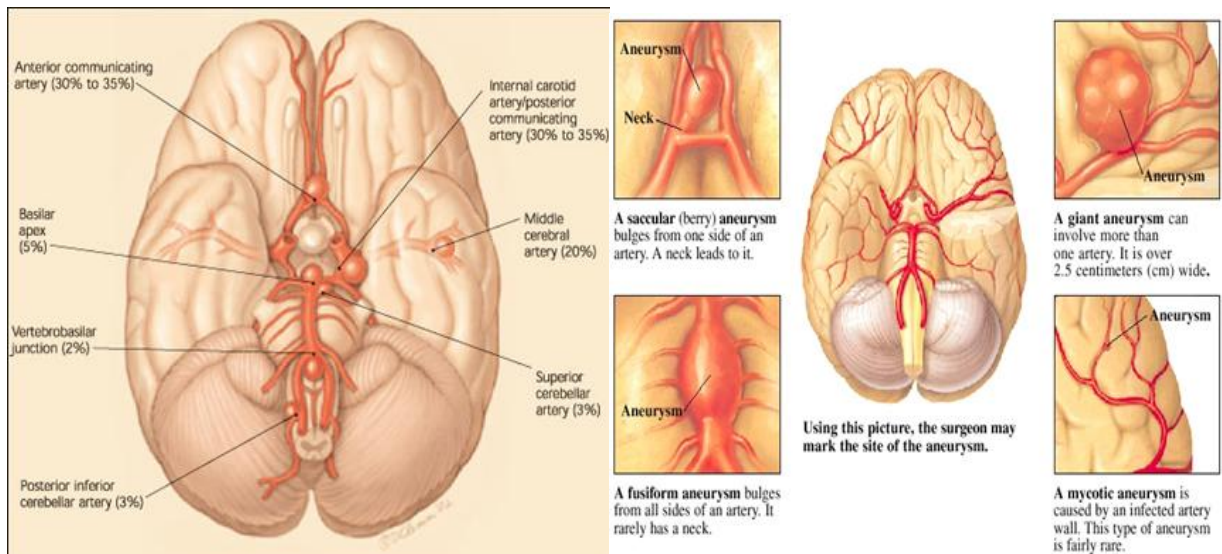

An aneurysm is an abnormal localized dilation of any vessel. Intracranial aneurysms are classified as saccular, fusiform, or dissecting. Approximately 90 percent are saccular (berry aneurysms). Saccular aneurysms are responsible for most of the morbidity and mortality caused by subarachnoid hemorrhage.

**Saccular aneurysms** develop from defects in the internal elastic lamina of cerebral arteries, rendering them less resistant to changes in intraluminal pressure. These changes most frequently develop at sites of vessel bifurcation, where blood flow is most turbulent and shear forces against the arterial wall are greatest. Saccular aneurysms most frequently form in the first- and second-order arteries originating from the cerebral arterial circle (Circle of Willis) at the base of the brain. Multiple aneurysms develop in 30 percent of affected patients.

**Fusiform aneurysms** develop from ectatic, tortuous cerebral arteries, most often in the vertebral-basilar system, and can reach several centimeters in diameter. Patients with fusiform aneurysms characteristically present with symptoms of cranial-nerve or brain-stem compression, but the symptoms are not commonly associated with subarachnoid hemorrhage.

**Dissecting aneurysms** are the result of cystic medial necrosis or a traumatic tear of an artery. Like dissecting aneurysms elsewhere in the body (e.g., dissecting aortic aneurysms), they form as blood courses through a false lumen while the true lumen is collapsed upon itself.

**Mycotic aneurysms**, also known as infective or microbial aneurysms, are rare inflammatory neurovascular lesions that account for 0.7–6.5% of all intracranial aneurysms. The term mycotic is a misnomer since most of these aneurysms are caused secondary to bacterial infection. These aneurysms are unique in their natural history and frequently develop at terminal arterial branches. They usually develop in patients with endocarditis and other infective conditions.

**Figure 1:-**showing common location of aneurysms and morphology

### Risk Factors:-

The most important risk factors for aneurysmal SAH are **hypertension** and **cigarette smoking**. Other risk factors include heavy alcohol use, and personal or family history of aneurysm, autosomal dominant polycystic kidney disease and other connective tissue disorders.

SAH can occur at any age, but it tends to happen at a younger age than other types of stroke. It has a peak incidence among persons 40 to 60 years of age, with a mean age of about 53 years. Women are affected about 70% of the time.

**Clinical Signs and Symptoms of Subarachnoid Hemorrhage:-**

Subarachnoid hemorrhage can be easily diagnosed in patients who present with classical symptoms of thunderclap headache, vomiting and loss of consciousness than in patients who present in good condition.

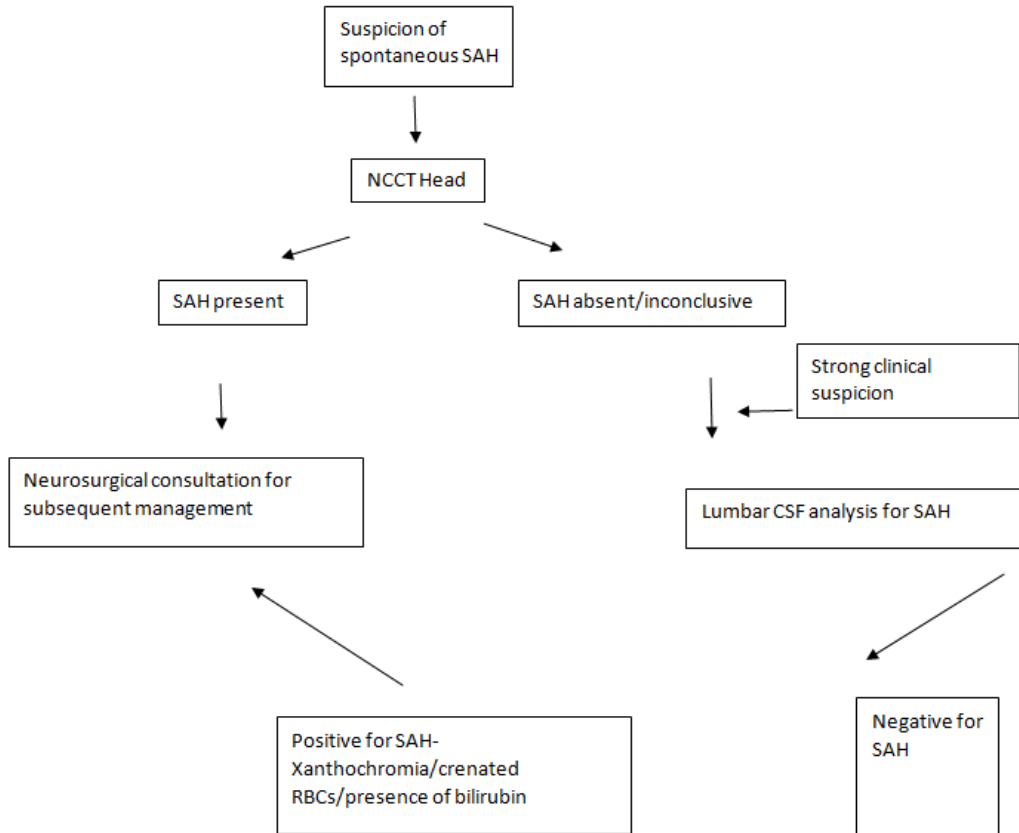

**Symptomatology of Sub arachnoid hemorrhage:-**

Patient experiences the <b>worst headache of his or her life</b>
<b>Recent warning or atypical headaches</b> (often severe, feel different to the patient, and may have lasted for days at a time; may occur days to weeks before the event)
Meningismus
Focal neurological deficits(III cranial nerve palsy in case ruptured posterior comm. artery aneurysm)
Syncope, change in consciousness, or altered mental status
Vomiting
Neck pain/stiffness

- Among patients who presented to the emergency department with sudden, severe headache, which the patients often called the worst headache of their lives, 15% had SAH
- Among patients with sudden, severe headache and a neurologic deficit, 25% were found to have SAH.
- Among patients with acute severe headache as the only symptom, 12% had SAH

Despite considerable advances in diagnostic, surgical and perioperative management, the overall outcome after SAH remains poor. Thirty-five percent of patients die within 3 months of the bleed (12% before receiving medical attention) regardless of medical and surgical therapy. In addition, approximately 40% of survivors will have residual neurological deficits including cognitive disturbances

**Diagnosis of sub arachnoid hemorrhage:-**

**CT Head:-**

It is investigation of choice in the diagnosis of SAH. SAH appears as hyperdensity(bleed) usually in the basal cisterns. It also helps in predicting the location of aneurysm.

**Lumbar CSF Analysis:-**

Ideally done at-least 6 hours after the ictus so that the RBC are lysed . Presence of xanthochromia and crenated RBCs are suggestive of SAH.

**MRI Brain:-** Few sequences like FLAIR help in the detection of blood. However MRI is not widely available.

**Cerebral Angiography:-**

CT Angiography or catheter angiography helps in knowing the location and morphology of the aneurysm which helps in the treatment of it.

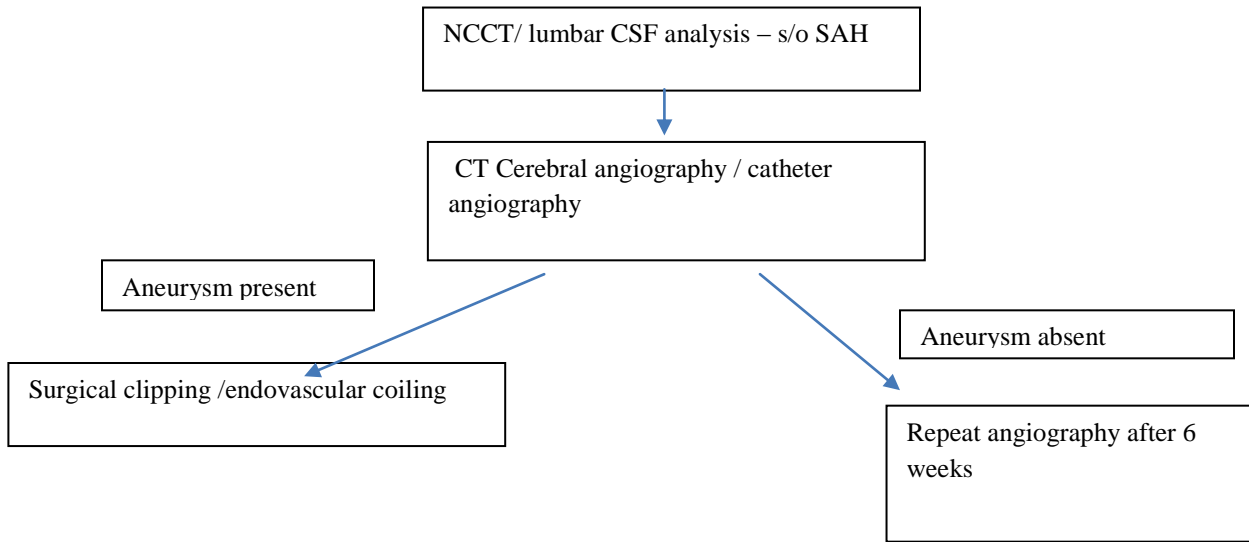

**Figure 2 (A):-** NCCT Head showing blood in the basal sub arachnoid cisterns(arrow) ; 2 (B) – CT Angiography showing rupture anterior communicating artery aneurysm(arrow)

**Management of SAH:-****Basic medical management**

- Monitor Vital signs, neurological assessment , fluid intake and output
- Bed rest until the aneurysm is obliterated
- Elevation of the head of the bed by 30 degrees
- Avoidance of unnecessary stimulation
- Graduated compression stockings or intermittent pneumatic compression devices on the lower extremities
- Adequate Analgesia
- Anticonvulsants for the treatment of seizures
- Anti-hypertensives to reduce blood pressure predominantly within the first 4 days after subarachnoidhemorrhage when the aneurysm is not obliterated
- External Ventricular drain in case of acute hydrocephalus
- Timely referral to a center of neurosurgical excellence

**Management of SAH at a neurosurgical center:-**

**Surgical management of Aneurysms:-**

Intracranial aneurysms can be managed by open cranial surgery (**Clipping of aneurysm**) or through endovascular route(**Coiling of aneurysm**). The selection of appropriate approach depends on various factors like morphology of aneurysm, location of aneurysm, ease of access and other factors.

**Figure 3:-**Intra operative picture showing (A)right ICA aneurysm and (B) clip being applied across the neck of aneurysm

**Figure 4:-** digital subtraction angiography(DSA) images showing a large aneurysm arising from the Basilar artery(A & B). Images C & D show the endovascular management with coils.

#### **Complications of SAH:-**

**Re-bleeding:**It is one of the dreaded complications following SAH due to ruptured aneurysm, carrying high mortality rates. The risk of re-bleed is highest in the first 24 hours of rupture and gradually decreases.

**Hydrocephalus:-**It is the dilatation of ventricles due to obstruction of flow of CSF either across the ventricle or in the sub arachnoid space. It may be acute in onset (usually due to intra-ventricular hemorrhage) requiring urgent ventricular diversion or chronic.\

**Vasospasm/DINDs :** It is one of the major complications following SAH occurring due to the spasm of vessels at the base of brain. It usually develops 5 days following rupture of aneurysm. it may lead to variety of focal neurological deficits depending in the vessel affected. It is traditionally managed by HHH (hypertension, hypervolemia, hemo-dilution) therapy.

**Focal Neurological Deficits:-** It is usually secondary to intra cerebral hemorrhage or due to vasospasm.

#### **Dyselectrolytemia**

#### **Conclusion:-**

Sub arachnoid hemorrhage due to ruptured aneurysm is a neurosurgical emergency requiring prompt detection and timely referral to a Centre of neurosurgical expertise. Basic knowledge about the presentation of SAH is critical in the management of this condition at a peripheral set up.

#### Abstract

Three Indian pomegranate varieties with different physiological properties have been studied for their phytochemistry and ascorbic acid content. Local varieties of *Punicagranatum* L. namely *Bhagwa*, *Ganesh* and *Mridula* were selected for analysis. The three parts of pomegranate viz. exocarp, mesocarp and seeds were separately processed as methanol extractions for various phytochemicals and HPLC analysis for Vitamin-C content. Flavonoids were found absent in the seeds of three varieties, whereas they were present in the exocarp and mesocarp of the same. On other hand, tannins were present in the seeds and absent in the exocarp and mesocarp of all varieties. Phycobilins were absent in all parts of *Ganesh* and mesocarp of *Mridula*. Out of all varieties, the mesocarp of *Ganesh* has high content of ascorbic acid with an area of 90.14% with a TP content of 4784.9µg/mg and TF content of 1.6364µg/mg. Out of three varieties, exocarp, mesocarp and seeds of *Ganesh* resulted with more ascorbic acid content.

#### Introduction:-

A multitude of organic molecules or phytochemicals, generally referred as secondary metabolites are synthesized by vascular plants. These phenolic compounds are synthesized during plant development and are plays vital roles in the plant life cycle (Stalikas, 2007). Based on metabolic utilization, the plant produces primary constituents which include sugars, proteins and chlorophyll, whereas secondary constituents include alkaloids, steroids, terpenoids, etc. (Dhawale, 2013). Various fruits and vegetables have been confirmed for their phytochemical properties which include oranges and green fruits and vegetables (carotenoids); Apples, citrus fruits, onions, soybeans and products (flavonoids); Green tea, wine, grapes, berries, whole grains and peanuts (Polyphenols); Cherries, citrus fruits (Terpenes). *Punicagranatum* is a fruit, highly grows in Mediterranean regions under drought conditions (Chakraborty Manodeepet *et al.* 2012). Pomegranates also showed many medicinal properties ranging from reduced oxidative stress, platelet aggregation (Aviram *et al.* 2000), antioxidant and antibacterial (Negi and Jayaprakasha, 2003) and antiviral (Zhang *et al.* 1995) activities.

Pomegranate can be separated into three major parts: peel, which includes exocarp, mesocarp and the edible portion, Seeds. The peel of pomegranates contains good levels of phenolic compounds including tannins and flavonoids

(Zhao *et al.* 2014). The edible plant parts are juice, pulp and seeds, which constitute around 65-75% of total fruit weight (Tehrani *et al.*, 2010). The taste of the juice and seeds vary among different varieties of pomegranate. The taste may be sweet, sour or sweet-sour. However, these portions are rich in sugars, minerals and various phenolic constituents (Mansour *et al.* 2014).

The present study aimed to study various phytochemical compounds present in the exocarp, mesocarp and seeds of three varieties of pomegranates: *Bhagwa*, *Ganesh* and *Mridula*. The main objectives of the study include to identify the phytochemical constituents present in all the parts of the three varieties and to analyze ascorbic acid content from the same.

### Materials & Methods:-

Twenty individual fruits from each variety were collected randomly from the local markets of Loni, Maharashtra separately to study the phytochemistry. *Bhagwa* is a fruit with orange-red fruit having peach-red colored seeds with sweet taste. *Ganesh* is a yellowish fruit with soft and pink colored seeds having sour-sweet taste. *Mridula* is a red fruit with red seeds and sour-sweet taste (Fig. 1).

The fruits were collected separately in wooden boxes and stored at the Laboratory of Biotechnology, P.V.P. College, Loni. The exocarp, mesocarp and seeds were isolated manually and they were dried in hot air oven at 50°C until they dried completely. The dried plant materials were grinded by using a house-hold mixer grinder. The Soxhlet procedure for methanol extraction is performed (Akkiraju *et al.* 2016) and collected the extracted powder separately from each part of three varieties of pomegranates (Fig. 1). These powders are then subjected to various studies of primary Phytochemical compounds viz. test for saponins, proteins, carbohydrates, amino acids, glycosides and secondary Phytochemical compounds viz. test for alkaloids, flavonoids, vitamin-C, anthraquinones, phycobilins and tannins. The presence or absence of the mentioned compounds and HPLC analysis for ascorbic acid were performed according to Akkiraju *et al.* (2016).

### Results:-

The triplicates of tests performed for the identification of different phytochemicals was tabulated (Table 1). The saponins, alkaloid, carbohydrates and ascorbic acid were found present in all the parts of *Bhagwa*, *Ganesh* and *Mridula*. Glycosides, proteins, amino acids and anthraquinones are absent in all the parts of all three varieties. The flavonoids were present in exocarp and mesocarp of three varieties, but found absent in the seeds. The tannins were absent in the exocarp and mesocarp of all three varieties and resulted positive in seeds. Phycobilins were positive in all the parts of *Bhagwa* and negative in all parts of *Ganesh*. In *Mridula*, exocarp and seeds have phycobilins, but mesocarp does not possess them.

Ascorbic acid analysis by HPLC was performed and the results were obtained (Fig. 2a, b, c; Table 2). The same has revealed ascorbic acid peaks and compared with the standard. The chromatogram for the exocarp, mesocarp and seeds showed peaks confirming the quantity of Vitamin-C. The mesocarp of *Ganesh* has showed the peak within a retention time of 3.9167 min, whereas the exocarp of *Mridula* showed the highest RT (4.3833 min.). The maximum peak area was identified for the exocarp of *Mridula* with an area of 84335.227 mV\*s with an area% of 81.79%, where it showed a significant TP value of 456.1 and TF value of 0.5469. The least area peak area was observed for the seeds of *Ganesh* with an area of 1144.852 mV\*s with an area% of 40.72%. In respect to area%, Mesocarp has a maximum area% of 90.14% and minimum was for the seeds of *Mridula* with 30.17%. The maximum number of Theoretical Plates (TP) was observed for the mesocarp of *Ganesh* with 4784.9 and the minimum was found in the exocarp of *Mridula* with a TP of 456.1. The exocarp of *Ganesh* has a maximum TF value (1.75) and the same of *Mridula* has a minimum TF value (0.5469).

**Discussion:-**

Evaluation of total phenolic contents, antioxidant activities and presence of vitamins in pomegranate were previously reported and discussed. Elfalleh *et al.* (2012) showed that the methanolic extracts to study alkaloids, flavonoids and tannins were suitable for phytochemical screening, which is supported by this current study. However, we found the difference among three varieties of pomegranates in respect to flavonoids and tannins. Alkaloids were present in all the varieties and studied through methanol extractions. We found that flavonoids and tannins were oppositely present among the varieties. In all the varieties, exocarp and mesocarp contained flavonoids, but seeds contained only tannins. Bhandari *et al.* (2012), while performing the phytochemical screening with peel and seeds, revealed the presence of glycosides in peel (Chloroform) and seeds (Ethanol). However, in the current study, we found no glycoside content in any part of any variety. This may be due to methanol extraction. The same authors reported the absence of flavonoids in seeds, which is supported by our study. In respect to saponins and alkaloids, we observed them in all varieties and their parts, where as, these authors were not able to find the same in peels. These authors reported tannins in peels, where as we found tannins only in seeds. Chebaibiet *al.* (2013) showed the absence of alkaloids in peel extracts, where as our results showed alkaloids presence in the peel extracts. They found tannins and glycosides in peels, where as we found absence of the both in peels.

Anahita *et al.* (2015) evaluated antioxidant vitamin i.e. ascorbic acid from pomegranate juice and seed and concluded that a combination of both seed-juice have high phenolic compounds and vitamin-C. In the current study, the mesocarp of *Ganesha* showed high content of ascorbic acid (90.14%). It indicates that, mesocarp can be a complementary source for vitamin-c supplement.

**Conclusion:-**

The presence of various phytochemicals in pomegranate can promote the essential constituents in alimentary purposes. We found variation in phytochemical constituents among different varieties of pomegranates available in India. We found that the seeds of these varieties does not contain flavonoids, but are rich of tannins. These varieties showed absence of glycosides. Neither a single variety nor any part of these varieties showed glycoside's presence. We also found alkaloids in seeds. In respect to ascorbic acid, out of all the parts and varieties, the mesocarp of *Ganesha* showed high content of ascorbic acid.

**Acknowledgements:-**

The authors are thankful to P.V.P. College of Arts, Science and Commerce, Loni, for providing the essential facilities to conduct the laboratory experiments.

#### Abstract

An autoregressive integrated moving average (ARIMA) model is useful to analyze time series data either for better understanding or for forecasting future points in the series. The ARIMA model is useful even when the data show evidence of non-stationarity, where an initial differencing step is applied to remove the non-stationarity. In this study, it is tried to find out the trend in GDP at current market price of Bangladesh using Box-Jenkins approach for ARIMA model based on the GDP at current market price data of Bangladesh from 1989-90 to 2014-15. Initially, evidence of non-stationarity was found in the data using the Dickey-Fuller test and the non-stationarity was removed by taking first differences. Then using the model selection criteria, AIC, ARIMA (0, 2, 1) model has been selected and it has been used to forecast GDP at current market price of Bangladesh up to 2026-27. It is hoped that the forecasts would be useful for researcher and policy makers.

#### Introduction:-

Most of the expert and economists favor high and efficient government planning because they think that it ensures and contributes to enlarging GDP. Planning is one of the main components of public budget. Investment is one of the main components of aggregate demand. Its plays an important role of economic growth (Ahmed, *et.al.* 2010). Public investment is fully conducted by the government. By development plan, the government can improve economic situation of the country. Currently, we observed that government budget and private investment simultaneously plays great role to rapid economic growth. Both the public and private investments are required to boost up real GDP at current market price (main part of public investment) has a big share compared to private investment (Mahi, *et.al.* 2015). Bangladesh is small country but over populated. Its economy is rapidly improving based on market price. Most of the indicators of development show their positive reaction since 1971. According to Wikipedia, Bangladesh has made significant strides in its economic sector performance since independence in 1971 (Wikipedia). The economy has improved vastly after 1990s. Most of the characteristics of public investment are present in GDP at current market price. So we can consider the maintenance current market price as the public investment. Though public investment is organized in different ways but the aim and objects are same for all countries. Finally, we can infer that GDP at current market price is the public investment in our country [Wikipedia]. Gross domestic product (GDP) is a monetary measure of the market value of all final goods and services produced in a period (quarterly or yearly). Nominal GDP estimates are commonly used to determine the economic performance of a whole country or region, and to make international comparisons. Nominal GDP per capita does not, however, reflect differences in the cost of living and the inflation rates of the countries. Therefore, using a GDP

**Corresponding Author:-BiplabBiswas.**

Address:-Department of Statistics, Bangabandhu Sheikh MujiburRahman Science and Technology University, Gopalganj.

PPP per capita basis is arguably more useful when comparing differences in living standards between nations (<http://en.wikipedia>). In 1993 India adopted an exchange rate system in which the exchange rate is determined by the supply and demand in the inter-bank foreign exchange market. The adoption of this floating flexible regime had not freed the Reserve Bank of India, the central bank of India, from intervening in the foreign exchange market (Branson, 2002). As the thinness of the Indian foreign exchange market as well as large transactions can cause excessive volatility, Reserve Bank of India pursues an explicit policy of intervention in the spot market and also undertakes both forward and swaps transactions in support of its exchange rate objectives (World Bank, 2001).<sup>72</sup> ASA University Review, Vol. 3 No. 2, July–December, 2009 (Delurgio, 1998). In 2000 Pakistan has abandoned her 'exchange rate band regime' and adopted a sort of floating exchange rate system. Though Pakistan experienced with her exchange rate band regime in 1998 and 1999 high exchange rate volatility and was bound adopted fixed peg for a brief period, however, with the adoption of the floating system the volatility increased. The State Bank of Pakistan was forced to intervene in foreign exchange market, which takes the form of outright sales of foreign exchange, swap transactions and supply of foreign exchange to banks to cover certain bulky imports (World Bank, 2001) (Krugman, 2000). In 2001 Sri Lanka adopted the free floating exchange rate regime. Immediately after the float, the exchange rate volatility arose sharply and caused massive depreciation of the Lanka rupee in spite of putting precautionary foreign exchange regulations in combination with the introduction of the float. Sri Lanka has with the free float a set of guidelines for dealing in the foreign exchange market and intervention by the central bank (World Bank, 2001) (Bukhari, et.al. 2007). In the backdrop of the discussion so far, it is intended to look at the performance of the exchange rate policy of Bangladesh and its impact on inflation and growth rate of GDP. In Bangladesh perspective, importance of GDP at current market price is relatively high compared to other developing country. Due to low infrastructure, the returns of GDP are not satisfactory and still not clear (Mahi, 2015). It is very important to know whether GDP and economic growth are related to each other especially in Bangladesh perspective or not. For any economy like Bangladesh, GDP is the vital factor of the development. From the above discussion, it is clear to us many study was conducted to forecast some economy variables by using time series model in respect of Bangladesh but now it is needed to study about GDP. The vital objective of the study is to select the better model and forecasting GDP on overall economy of Bangladesh.

#### **Source of data and Methods:-**

The data is collected from different editions of Statistical Yearbook published by Bangladesh Bureau of Statistics (BBS). The editions are: (i) Statistical Yearbook of Bangladesh-1975 (ii) Statistical Yearbook of Bangladesh-1990 (iii) Statistical Yearbook of Bangladesh-2000 (iv) Statistical Yearbook of Bangladesh-2010. There are a lot of sectors that impact our GDP; Current market price is one of them. In order to, find out the probable relationship between economic growth and Current market price by using auto-regressive and moving average models and other statistical method. This study analyzes the Modeling and forecasting GDP at current market price of Bangladesh. We know that, the general purpose of ARIMA method is to know more about the proper relationship between some explanatory variable. We use annual data for the period from the fiscal year 1989/90 to 2014/2015. We will use secondary data that are collected from different sources. All data are time series data. All variables are measured in millions of us dollar in core in taka. Bangladesh is also not different from like other developing countries. Some data are clearly vague such as same data but from different sources are inconsistent. That's why, careful attention was implied during self-complied period. Here, data are to be used in this analysis will be standard and reliable because of all sources of data are well known, recognized, widely used and accepted by government and others. So, data, which will be used in this study, must be reliable.

#### **Autoregressive Integrated Moving Average (ARIMA) model:-**

To develop the Box and Jenkins (1972) method for analyzing stationary univariate time series data. The Box-Jenkins methodology for ARIMA models differences the series to stationary and then combines the moving average with autoregressive parameters to yield a comprehensive model useful for forecasting. The underlying goal is to find an appropriate formula so that the residuals are as small as possible and exhibit no pattern. Box-Jenkins forecasting models are based on statistical concepts and principles and are able to model a wide spectrum of time series behavior.

#### **Augmented Dickey-Fuller Test (ADF Test):-**

The Augmented Dickey-Fuller Test (ADF Test) is used to determine the stationarity of the data. The ADF test is used to test for unit root [9]. The null-hypothesis for an ADF test:  $H_0: \gamma = 0$  vs  $H_1: \gamma < 0$ , Where  $H_0$ : is the null hypothesis (has unit root) and  $H_1$ : Does not have unit root,  $\gamma$  is the estimated coefficient. The testing procedure for

the ADF test is the same as for the Dickey–Fuller test but it is applied to the model. A random walk with drift and trend is represented as;

$$\Delta y_t = \alpha + \beta_t + \gamma y_{t-1} + \delta_1 \Delta y_{t-1} + \dots + \delta_{p-1} \Delta y_{t-p+1} + \varepsilon_t \quad (1)$$

Where,  $\alpha$  is a constant,  $\beta$  the coefficient on a time trend and  $p$  –the lag order of the autoregressive process. Imposing the constraints  $\alpha = 0$  and  $\beta = 0$  corresponds to modeling a random walk and using the constraint  $\beta = 0$  corresponds to modeling a random walk with a drift. The test statistics,  $\tau = \frac{\gamma}{\sigma_\gamma}$ , Where:  $\gamma$  is the estimated coefficient and  $\sigma_\gamma$  is the standard error in the coefficient estimate. The test statistics value  $\tau$  is compared to the relevant critical value for the Dickey Fuller Test. If the test statistic is less than the critical value, we reject the null hypothesis and conclude that no unit-root is present. The ADF Test does not directly test for stationarity, but indirectly through the existence (or absence) of a unit-root. Decision rule: If  $t^* >$  ADF critical value,  $\implies$  not reject null hypothesis, i.e., unit root exists. If  $t^* <$  ADF critical value,  $\implies$  reject null hypothesis, i.e., unit root does not exist. Using the usual 5% threshold, differencing is required if the p value is greater than 0.05.

#### Formulation of ARIMA Model:-

ARIMA( $p, d, q$ ) Completely ignores independent variables and assumes that past values of the series plus previous error terms contain information for the purposes of forecasting. The integers refer to the Auto regressive (AR), Integrated (I) and Moving Average (MA) parts of the data set respectively. The ARIMA models are applicable only to a stationary data series, where the mean, the variance, and the autocorrelation function remain constant through time [8]. Autoregressive process AR presses a dependent variable as a function of past values of the dependent variable. An  $p$ th order process is of the form:

$$y_t = \alpha + \phi_1 y_{t-1} + \phi_2 y_{t-2} + \dots + \phi_p y_{t-p} + \varepsilon_t \quad (2)$$

Where;  $Y_t$  is the stationary depended variable being forecasted at time  $t$ .  $y_{t-1}, y_{t-2}, \dots, y_{t-p}$  is the response variable at time lags  $t-1, t-2, \dots, t-p$  respectively,  $\alpha = \mu(1 - \phi_1 - \dots - \phi_p)$ .  $\phi_1, \phi_2, \dots, \phi_p$  are the coefficients to be estimated.  $\varepsilon_t$  the error term at time  $t$  with mean zero and a constant variance. Using the backshift operator, we can write the AR( $p$ ) model as;

$$(1 - \phi_1 B - \phi_2 B^2 - \dots - \phi_p B^p) y_t = \phi(B) y_t = \varepsilon_t \quad (3)$$

The moving average model of order MA( $q$ ) is defined as;

$$y_t = \varepsilon_t + \theta_1 \varepsilon_{t-1} + \theta_2 \varepsilon_{t-2} + \dots + \theta_q \varepsilon_{t-q} \quad (4)$$

Where;  $q$  is the number of lags in the moving average and  $\theta_1, \theta_2, \dots, \theta_q$  are parameters to be estimated the moving average operator is given by;  $\theta(B) = \theta_1 B + \theta_2 B^2 + \dots + \theta_q B^q$ . To create an ARMA model, we begin with an econometric equation with no independent variables  $Y_t = \beta_0 + \varepsilon_t$  and add to it both the AR process and the MA process.

$$y_t = \beta_0 + \phi_1 y_{t-1} + \phi_2 y_{t-2} + \dots + \phi_p y_{t-p} + \varepsilon_t + \theta_1 \varepsilon_{t-1} + \dots + \theta_q \varepsilon_{t-q} \quad (5)$$

$\beta_0 + \phi_1 y_{t-1} + \phi_2 y_{t-2} + \dots + \phi_p y_{t-p}$  is the AR( $p$ ) and  $\varepsilon_t + \theta_1 \varepsilon_{t-1} + \dots + \theta_q \varepsilon_{t-q}$  is the MA( $q$ ) process. Where,  $\phi_s$  and  $\theta_s$  are the coefficients of the autoregressive and moving average processes respectively. The integrated ARMA or ARIMA model is a broadening class of ARMA model which includes a differencing term. A process is said to be ARIMA( $p, d, q$ ) if

$$\nabla^d y_t = (1 - B)^d y_t \quad (6)$$

Is an ARMA( $p, q$ ). This is generally written as;  $\phi(B)(1 - B)^d y_t = \theta(1 - B) \varepsilon_t$ . A first- differenced GDP at current market price series is of the form:  $GDP_t = (\nabla GDP_t) = GDP_t - GDP_{t-1} = \Delta GDP_t - \Delta GDP_{t-1}$ . Thus ARIMA( $p, d, q$ ) model may be specified as:

$$GDP_t = \beta_0 + \phi_1 GDP_{t-1} + \phi_2 GDP_{t-2} + \dots + \phi_p GDP_{t-p} + \varepsilon_t + \theta_1 \varepsilon_{t-1} + \theta_2 \varepsilon_{t-2} + \dots + \theta_q \varepsilon_{t-q} \quad (7)$$

Where,  $GDP_t$  is the differenced GDP at current market price series of order  $d$ , and  $\phi, \beta$ , and  $\theta$  are the parameters to be estimated. Shumnay & Stoffer (2011). The equation must assume stationarity before applying to a time series. In case of non-stationarity successive differences are taken until the series is stationary. In practice the differences are rarely more than two. The aim of this methodology is to find the most appropriate ARIMA( $p, d, q$ ) model and to use it for forecasting. It uses an iterative six-stage scheme: (1) A priori identification of the differentiation order  $d$  (or choice of another transformation) (2) A priori identification of the orders  $p$  and  $q$  (3) Estimation of the parameters, ( $\phi, \beta$  and  $\theta, \delta^2 = Var \varepsilon_t$ ) (4) Validation (5) Choice of a model (6) Prediction.

**Selection of best model:-**

When a model is identified, the work is to estimate the AR and MA parameters to fit the time series that is being modeled. For ARIMA model, the method of least squares and the method of maximum likelihood can be used. The method of maximum likelihood finds the values of the parameters, which maximizes the likelihood. To find a tentative model, the pattern in the ACF and PACF are considered which are summarized by Markridakis et al (1998). Spikes at lag 1 *top*, and cuts off to zero in PACF indicates  $AR(p)$  model. Again, Spikes at lag 1 *toq*, and cuts off to zero in ACF indicates  $MA(q)$  model. To select the best model among the plausible model, the Akaikeinformationcriterion (AIC) can be used, which is given by

$$AIC = -2\log L + 2m \tag{8}$$

Where,  $L$  is the maximum likelihood,  $m$  is the number of parameters estimated in the model. The model with the minimum AIC is to be chosen.

**Analysis and results:-**

**Time series plot:-**

At first the data are plotted, where the variable is the GDP at current market price of Bangladesh. The following figure 3.1 shows the time plot of the variable.

**Figure: 3.1:-** Time plot of GDP at current market price of Bangladesh

From the figure 3.1, it is seen that the data are showing an upward trend that is the data is non-stationary. As a result, to achieve stationarity differencing is needed.

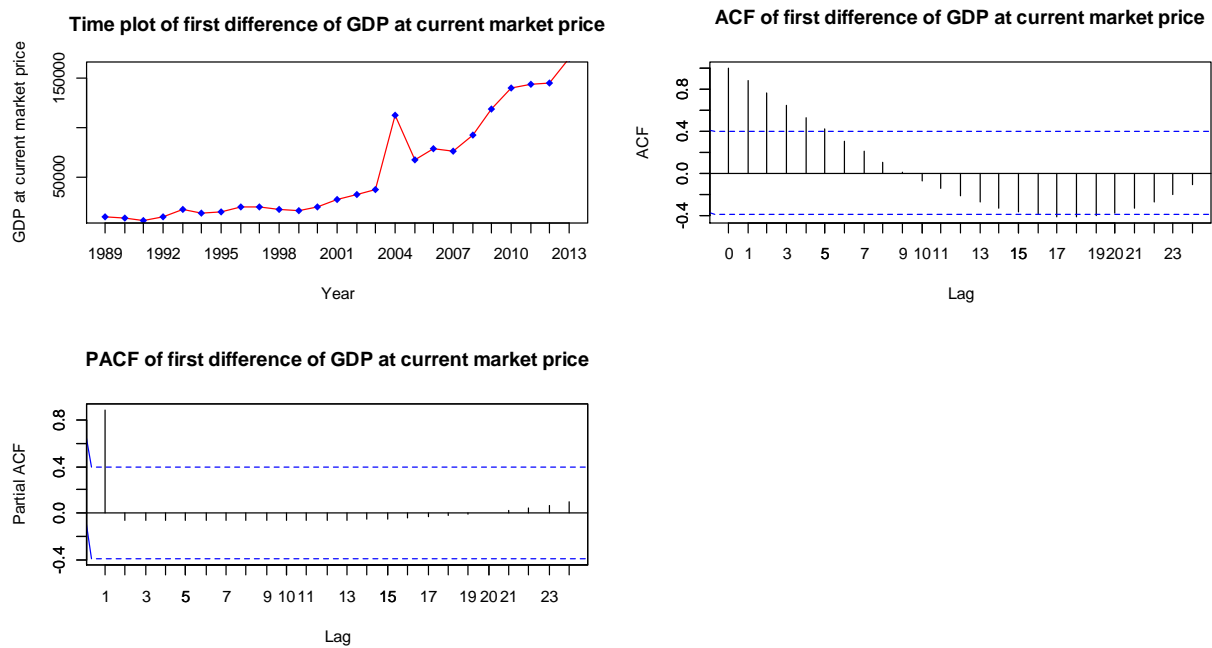

**Checking and obtaining stationarity:-**

Before taking any difference, it is convenient to examine stationarity by using auto-correlation function (ACF) and partial auto-correlation function (PACF) graphs or by using different tests like augmented Dickey-Fuller test or L-Jung-Box test. The following figure shows the ACF and PACF plots of GDP at current market price of Bangladesh.

**Figure: 3.2:-** ACF and PACF of GDP at current market price of Bangladesh.

Here we see that, the ACF plot shows a slowly decreasing and for several lags. Thus the result shown by ACF and PACF are that the data is non-stationary. Stationarity can also be checked by several statistical tests. **Augmented Dickey-Fuller (ADF) test about unit root or stationarity:** A statistical test to check stationarity of a time series dataset is ADF test. Here, the null and alternative hypothesis is given by  $H_0$ : Data is non – stationary versus  $H_1$ : Data is stationary. For lag order 3, the calculated Dickey-Fuller test statistics is -1.3251 and the p-value is 0.6489. As a result, the null hypothesis cannot be rejected at 5 percent level of significance. Thus the test concludes the series is non-stationary. **White noise test for checking independence (L-Jung-Box test):** If the data are correlated or not, then we can use the L-Jung-Box test. Here, the null and alternative hypothesis is as:  $H_0$ : Data points are independent of one-another Vs  $H_1$ : Data points are correlated. For 52 degrees of freedom, the test shows the calculated Chi-squared statistic is 18.4972 and the p-value is 1.702e-05 which is less than .01. So, at 5 percent level of significance, the conclusion is, dataset is not independent. Since the GDP at current market price of Bangladesh is non-stationary, here differencing is used to achieve stationarity. At first, the first difference has been taken and the data is again checked whether it is stationary or not. The following plot shows the time plot of after taking first difference of the GDP at current market price data of Bangladesh.

**Figure: 3.3:-** Time plot, ACF and PACF of first difference of GDP at current market price

From the above time plot, it is seen that non-stationarity in mean is achieved. Where the ACF plot shows only five spikes fall outside the confidence limits. Again in the PACF plot only one spike falls outside the confidence limits, which are the indications of stationarity. But, to become assured, the statistical tests are applied.

**White noise test for checking independence (L-Jung-Box test):** Hypothesis:  $H_0$ : Data points are independent of one-another Versus  $H_1$ : Data points are correlated. For 52 degrees of freedom, the test shows the calculated Chi-squared statistic is 16.6605 and the p-value is 4.47e-05. So, at 5 percent level of insignificance, the conclusion is, dataset is not independent, because the null hypothesis can be rejected. Since the first difference of GDP at current market price of Bangladesh is non-stationary, here second differencing is used to achieve stationarity. Then, the second difference has been taken and the data is again checked whether it is stationary or not. The following plot shows the time plot of after taking second difference of the GDP at current market price data of Bangladesh.

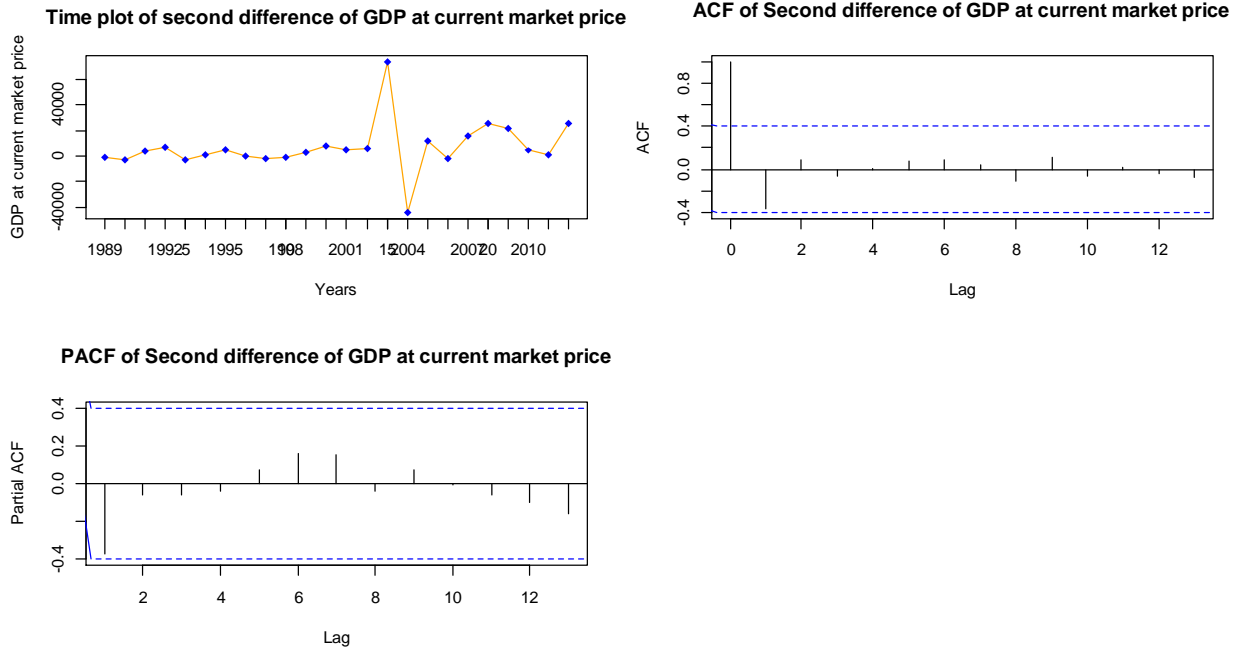

Figure: 3.4:- Time plot, ACF and PACF of second difference of GDP at current market price

From the above time plot, it is seen that stationary in mean is achieved. The ACF plot shows that only one spikes fall outside the confidence limits. Again in the PACF plot have no any spike falls outside the confidence limits, which are the indications of stationarity. But, to become assured, the statistical tests are applied. **White noise test for checking independence (L-Jung-Box test):** Hypothesis:  $H_0$ : Data points are independent of one-another Versus  $H_1$ : Data points are correlated. For 52 degrees of freedom, the test shows the calculated Chi-squared statistic is 3.2491 and the p-value is 0.07146 which is less than .01. So, at 5 percent level of significance, the conclusion is, dataset is independent, because the null hypothesis cannot be rejected.

**Determining an appropriate ARIMA model:-**

Among the different plausible models, the best model can be selected by using the Akaike Information Criterion (AIC). Here, the model with the minimum AIC will be selected as the appropriate model. Table 3.1 shows the AIC values for different combinations of p and q, that is, for different ARIMA (p; d; q) models.

Table 1:- AIC values for different ARIMA (p; d; q) models

ARIMA (p, d, q)	Values of AIC
ARIMA (0, 0, 1)	722.86
ARIMA (0, 1, 1)	615.79
ARIMA (0, 2, 1)	547.01
ARIMA (0, 2, 2)	548.12
ARIMA (0, 2, 3)	550.11

From the above table, we can find that ARIMA (0, 2, 1) model is appropriate for the GDP at current market price data of Bangladesh, since it has the minimum AIC (547.01).

**Estimation and diagnostic checking:-**

We can find that, ARIMA (0, 2, 1) is the best model for the data. Here, the ARIMA model includes no autoregressive and one moving average coefficients with two differences. Thus, we can write the ARIMA model is as  $(1 - B)^2 y_t = (1 + \theta_1 B) e_t$ . That is,  $\nabla^2 y_t = e_t + \theta_1 e_{t-1}$ , Where,  $\phi$ 's be the autoregressive coefficient and  $\theta$ 's be the coefficient for moving average. Now, the parameters have to be estimated using the maximum likelihood method. Following table gives the maximum likelihood estimates of the parameters and significance of the parameters.

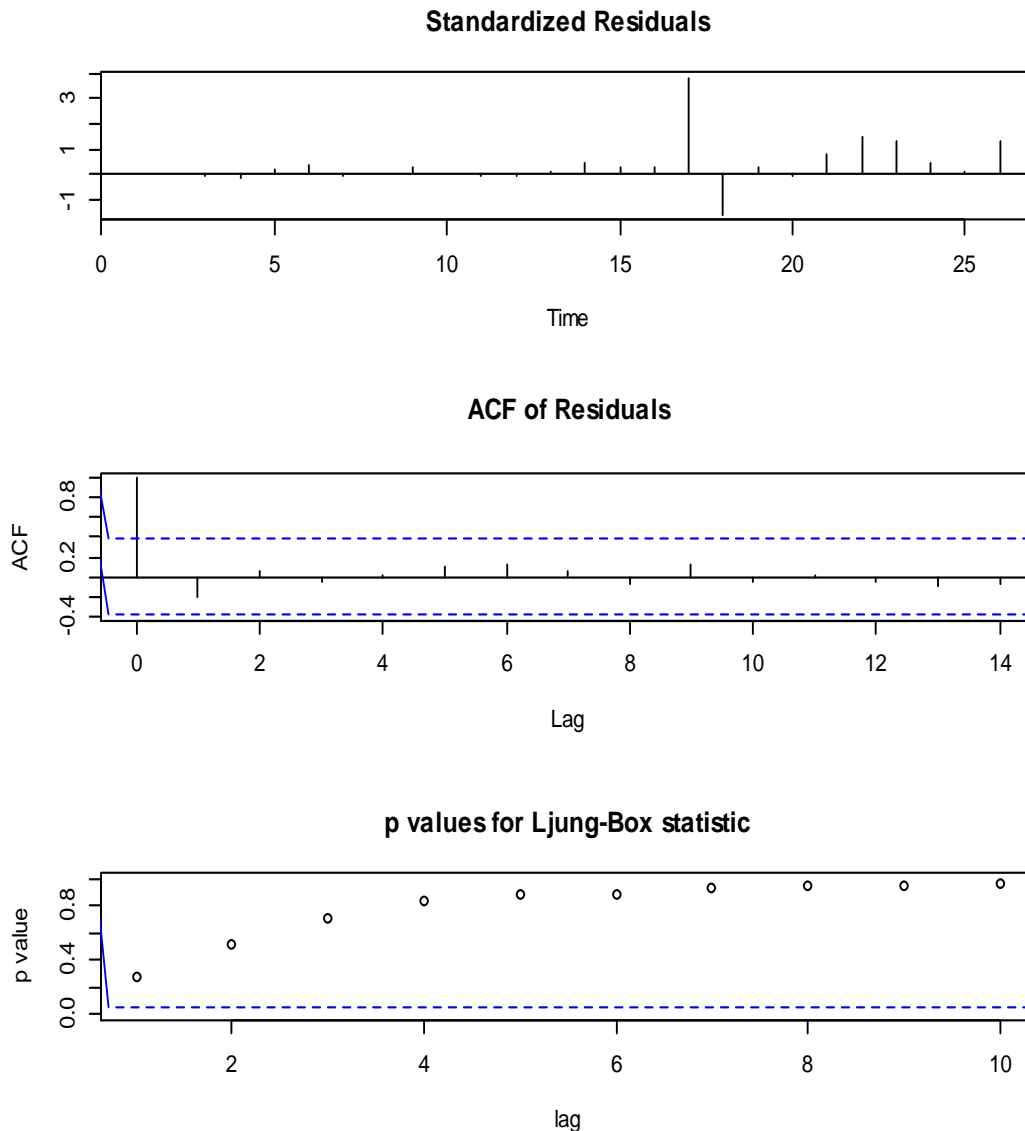

**Table 2:** The estimate and significance levels of the parameters of *ARIMA (0, 2, 1)* model

Parameter	Estimate	Standard error	p-value	Decision
$\theta_1$	-1.0000	0.1121	0.001	Significant

Here, the diagnostic checking can be started by checking whether the errors are white noise or not. The assumption of independence of residuals can be checked by L-Jung-Box test.

**L-Jung-Box test for checking independence of residuals:-**

Hypothesis: $H_0$ : The residuals are independent of one-another Versus  $H_1$ : The residuals are correlated. For 1 degree of freedom, the test shows the calculated Chi-squared statistic is 4.8824 and the p-value is 0.02713. So, at 5 percent level of significance, the null hypothesis cannot be rejected. Hence, it can be said that the residuals are independent of each other. Following plot shows the standardized residuals, ACF of residuals and p-values for L-Jung-Box statistics taking different lag values that is the diagnostic plot for the model.

**Figure 3.5:-** Diagnostic plot for *ARIMA (0, 2, 1)* model

From this plot, the independence assumptions of residuals are also satisfied since none of the ACF values of lag 1 or more is significant. The plot also shows the large p-values for L-Jung-Box statistics for different lag values which is also the evidence of independent residuals.

The normal q-q plot is the following:

**Figure: 3.7:-** Q-Q plots for the residuals of ARIMA (0, 2, 1) model

Finally, the q-q plot shows that the residuals are almost normal.

**Forecasting:-**

At the starting of the forecast, we have found the forecasted values which were included in our data by using our fitted ARIMA model. Then the initial forecasts obtained from the ARIMA model was for differencing series of the GDP at current market price data. To obtain the forecasts valid for the original series second differencing has been taken. The point forecast with 95% confidence interval of yearly total GDP of Bangladesh for the years 2015-2016 to 2026-2027 (next twelve years) using selected model is given in table 3.

**Table 3:**Forecast of total GDP for next twelve years

Time periods	Point forecasts	95% Confidence intervals
2015-16	1679054	(1639464, 1718644)
2016-17	1844508	(1762103, 1926912)
2017-18	2009961	(1876525, 2143398)
2018-19	2175415	(1983717, 2367113)
2019-20	2340869	(2084442, 2597296)
2020-21	2506323	(2179273, 2833373)
2021-22	2671777	(2268659, 3074895)
2022-23	2837231	(2352959, 3321502)
2023-24	3002684	(2432472, 3572897)
2024-25	3168138	(2507449, 3828827)
2025-26	3333592	(2578107, 4089077)
2026-27	3499046	(2644632, 4353460)

The plot of the forecast values with the 95% confidence intervals is shown in figure 3.8

**Figure:-**Forecasts with 95% confidence intervals

Here, the red line indicates the forecast values for next twelve years and the two orange and blue lines indicate the 95% confidence intervals for those forecasts.

### Discussion and Conclusions:-

The objectives of this study were to model the GDP at current market price data of Bangladesh and to forecast it for next twelve years using that model. To achieve the objectives, Box-Jenkins approach to ARIMA model has been used. The data was the GDP at current market price of Bangladesh for the years 1989-90 to 2014-15, Taka in core was used.

Initially, non-stationarity and dependency was found in the data by augmented Dickey-Fuller and the L-Jung-Box tests. This non-stationarity was removed first by taking first differencing and then second differencing. Using the model selection criterion AIC, ARIMA (0, 2, 1) model was selected. The parameter of this model has been estimated using the maximum likelihood method and all the parameters were found to be significant assuming normal distributions of the estimators. The assumptions made on normality and independence of the residuals was checked using different plots and tests and all the results were satisfactory. The plot comparing the actual values of the data and the fitted values using the model shows very much close fit. Then the model was used for forecasting purposes.

The forecast for the original series has been obtained by taking second differencing of the initial forecasts which were obtained for the first difference data. At last the forecasts for GDP at current market price of Bangladesh with the 95% confidence interval for twelve years along with the data has been shown in a plot and it is found that the upward trend in GDP at current market price will still continue for this period and our study conclude that Bangladesh will promote his position from developing countries to high income country with appropriate time or our forecasted time.

### Limitations:-

In this study, the model has been established by using ARIMA approach only. Other types of time series models such as ARCH, GARCH and SV models were not considered. The study has been done based on the secondary data. So, the limitations of secondary data remain in the study.

**Acknowledgement:-**

This study is conducted based on secondary data of Gross Domestic Product (GDP) of Bangladesh. We have taken data from different editions of Statistical Yearbook published by Bangladesh Bureau of Statistics (BBS). So, we have to give a special thanks to the authority of BBS for providing the data.

#### **Abstract**

Motivation is a powerful and effective variable in the second language acquisition (Liu M. 2007). Hence, in the learning of the second language, motivation is affected by numerous language related factors like culture, community; learner factors such as self-efficacy, causal attribution, goal orientation and the learning situation; and the learning situation about the teacher, the teaching method, the syllabus, among others.

Every year, Changwon Moonsung University, the partner of Laguna State Polytechnic University in Korea, send students to participate in a one-month Intensive English Language Proficiency Course in LSPU, as part of the international academic collaboration of two universities.

As expected, upon arrival in LSPU, these Korean students could scarcely use the English language orally due to lack of ability to carry out the task, and inadequate confidence to cope with the challenges associated with language learning.

But after a few days of rigid English language exposure, observable changes take place. Hence, during the learning process, it is necessary for learners to have strong sense of confidence within them as they make efforts to learn a foreign language in a short period of time.

After one month, this study revealed the significant impact or effect of collaborative learning to the oral proficiency and self-efficacy level of the Koreans learning English as a foreign language in Laguna State Polytechnic University.

#### **Introduction:-**

Korean people's difficulty in learning English as a means of communication could be attributed to a number of factors. One, is the fact that in many developing countries like Korea, the system of education utilizes mother tongue based education model in which initial instruction begins in children's mother tongue. Another is the dialectal differences which exist for each language which makes it difficult for Koreans to pronounce various phonemic sounds. These are some of the major considerations why the Korean nationals have difficulty in learning English which is now one of the widely used means of communication in the world's businesses, economics, science, and education to name a few.

**Corresponding Author:-Florhaida v. Pamatmat.**

**Address:-**Director, International & Local Affairs, Laguna State Polytechnic University, Laguna, Philippines.

Another consideration as pointed out by Yap (1981), is the fright of an individual and his defect in pronunciation of words clearly and correctly, which are the primary reasons why in front of people, Korean English learners appear to have shaky voice, inferiority and other manifestations of anxiety.

However, to become abreast with the advancement of the world of technology, to become competent members of the world community, and to be “in” in the world of professionals, learning English has become not only a must but a passion among majority of the Korean people.

These are the reasons why many students from Changwon Moonsung University participate in the Intensive English Language Proficiency Course offered by Laguna State Polytechnic University. It is because they believe that one-month in LSPU may profoundly contribute to the improvement of their English proficiency, and may enhance their self-efficacy. They would like to take advantage of the environment of people who do not only understand English but are confident of using English as a means of communication. Also, learning collaboration with the Filipino learners contribute greatly in the advancement of their communication skill.

This study on collaborative learning is heavily rooted in Vygotsky’s views that there exists an inherent social nature of learning which is shown through his theory of zone of proximal development. Often, collaborative learning is used as an umbrella term for a variety of approaches in education that involve joint intellectual effort by students or students and teachers. Thus, collaborative learning is commonly illustrated when groups of students work together to search for understanding, meaning, or solutions or to create an artifact or product of their learning. Collaborative learning activities can include collaborative writing, group projects, joint problem solving, debates, study teams, and other activities. The approach is closely related to cooperative learning methodology.

### **Methodology:-**

This study is experimental in design. The independent variable is the method of instruction in terms of collaborative learning in different learning areas in English such as reading, speaking, listening, writing, and vocabulary development. The dependent variable comprised of the pre-evaluation and post-evaluation of the Korean students’ self-efficacy level. The evaluation is an individual proficiency assessment and a questionnaire to assess the students’ self-efficacy level.

The population consisted of 19 Korean exchange students from Changwon Moonsung University. They were pre-selected in Korea and were part of the Student Exchange Program between Laguna State Polytechnic University and Changwon Moonsung University, Korea.

Pre-evaluation language proficiency examination was undertaken to the foreign students prior to the collaborative learning experiences.

There were lectures and activities in various learning areas in English such as reading, speaking, listening, writing, and vocabulary development. 19 Koreans were involved in class which grouped with Filipino students (college level) during the execution of lessons from the discussion part, to clarification of ideas and evaluation.

Post-evaluation language proficiency examination was undergone after four weeks of classroom collaborative interactions.

The self-efficacy level of the Korean students was measured utilizing a questionnaire.

When implementing collaborative learning, the concept and the learning structure were explained to the students emphasizing on the key elements of the collaborative process. The students were instructed to cooperate and listen carefully to teacher’s instruction/comments/suggestions. Every student was given opportunity to contribute his/her ideas/opinions.

Groups were formed using self-selection, hence, each Korean student had a Filipino partner. As cited by Fui Fong Ho and Hong Kwen Boo (2007) from Johnson & Johnson (1993) cooperative learning is structuring smaller groups (two or three) so that students work together to maximize their own and each other’s learning. In this study, there were 19 Korean students and 19 Filipino students that make up a class of 38 students.

The instruments used in this study was developed by the writer patterned on the English Proficiency Test (Fulcher-Hasselgren Data-Based Fluency Scale). The Language Proficiency Assessment was designed to measure the students' fluency, listening comprehension, grammar, pronunciation and vocabulary among others. To measure the self-efficacy, a set of self-efficacy questionnaire mainly focused in rating their confidence level weredistributed and answered by the Korean students.

#### Analysis and Interpretation of Data:-

**Table 1:-**presents the Mean Scores and Standard Deviation, including the Remarks in the Pre-test and Post-test to measure the Koreans' Proficiency Level.

**Table 1.** The Mean Scores of the 19 Korean Students in the Oral Proficiency Test

16.	2.50	0.55	3.67	0.82	ML	ML
17.	4.17	0.75	4.33	0.82	HL	VHL
18.	4.33	0.52	4.50	0.55	HL	HL
19.	2.83	0.41	4.67	0.82	ML	HL
<b>Over All</b>	<b>3.43</b>	<b>1.10</b>	<b>4.24</b>	<b>1.0</b>	<b>Moderate Level</b>	<b>High Level</b>

The table reflects that in the pre-test mean scores for the English proficiency level among the 19 Korean students, an average mean score of 3.43 was obtained with a standard deviation of 1.10 and a remark of Moderate Level; for the post-test mean scores, there was an obtained overall average mean of 4.24, a standard deviation of 1.0 and a remark of High Level. The results show an increase in the English proficiency level of the foreign students after the one-month Intensive English Language Proficiency Course from moderate level to high level.

The data reflects further a minimum increase in the proficiency level which could be attributed to the short period of time studying the English language through collaborative learning approach with the Filipino students.

**Table 2:-**presents the Pre-test Mean Scores of the 19 Korean Students per Item in the Oral Proficiency Test

Item	Pre-test Mean Score	Pre-test Standard Deviation	Verbal Interpretation
1. Fluency	3.47	0.81	High Level
2. Listening	3.47	1.10	High Level
3. Comprehension	3.02	0.92	Moderate Level
4. Grammar	3.58	0.96	High Level
5. Pronunciation	3.58	0.96	High Level
6. Vocabulary	3.05	1.25	High Level
<b>Over All</b>	<b>3.43</b>	<b>0.97</b>	<b>High Level</b>

Table 2 reflects the Pre-test Oral Proficiency Result per area of competency. It is depicted from the table that fluency, listening, grammar, pronunciation, and vocabulary obtained mean scores of 3.47, 3.47, 3.58, 3.58 and 3.05

respectively, with a verbal interpretation of high level while comprehension obtained a mean score of 3.02 with a standard deviation of 0.97 and verbal interpretation of moderate level.

According to Nunan (2009), the language proficiency of individuals including the structure, and measurement continue to be controversial in language testing. Normally, a speaking proficiency test is given to assess three important elements of the English such as pronunciation, grammatical structure and vocabulary, hence, Fulcher Hasselgen Data-Based Fluency Scale intends to evaluate nine(9) areas of speaking such as accent, pronoun confusion, fluency, initiation and sustaining of conversation, listening comprehension, grammar, vocabulary, question formation, and prepositions. The test aims to determine at a highest level, the speakers ability to demonstrate confidence, expand and support utterances and respond quickly to a given subject.

**Table 3 presents the Post – test Mean Scores of the 19 Korean Students per Item in the Oral Proficiency Test**  
**Table 3.** Post-test Mean Scores of the 19 Korean Students per Item in the Oral Proficiency Test

Item	Pre-test Mean Score	Post-test Standard Deviation	Verbal Interpretation
1. Fluency	4.26	0.81	High Level
2. Listening	4.11	1.10	High Level
3. Comprehension	4.21	0.92	High Level
4. Grammar	4.42	0.96	High Level
5. Pronunciation	4.42	0.96	High Level
6. Vocabulary	4.0	1.25	High Level
<b>Over All</b>	<b>3.78</b>	<b>0.97</b>	<b>High Level</b>

The table reflects that in the post-test mean scores of the 19 Korean students per item in the oral proficiency test, an overall mean score of 3.78 was obtained with a verbal interpretation of high level in all items.

**Table 4 presents the Self-Efficacy Level of the 19 Korean Students**

**Table 4.** Mean Scores of the 19 Korean Students in Self-Efficacy Level

Korean Students	Self-Efficacy Mean Score	Self-Efficacy Standard Deviation	Verbal Interpretation
1	4.67	1.03	VHL
2	3.93	0.83	HL
3	3.80	0.45	HL
4	3.60	0.50	HL
5	4.60	1.09	VHL
6	4.60	1.14	VHL
7	4.00	1.05	HL
8	4.60	1.05	VHL
9	2.87	2.87	ML
10	3.33	1.77	ML
11	3.73	1.97	HL
12	2.80	2.58	ML
13	3.13	2.57	ML
14	2.87	2.87	ML
15	3.47	2.97	HL
16	3.40	3.25	ML
17	4.64	3.23	VHL
18	3.93	3.70	HL
19	3.79	3.95	HL
<b>Over All</b>	<b>3.87</b>	<b>0.97</b>	<b>High Level</b>

The table explains that with respect to self-efficacy in terms of self-confidence, the 19 Korean students obtained an overall mean score of 3.87 and a standard deviation of 0.97 which is verbally interpreted as high level. This means that the Korean students possess ability to complete tasks and reach goals, hence those with high self – efficacy can successfully engage and complete course-specific academic tasks and can show better academic performance than those with low self-efficacy.

Self-efficacy has something to do with the learner's opinion, about his ability to carry out the task, and the degree to which the learner thinks he has the ability to cope with the training challenges according to Arnold (2000). Learner's self-efficacy influences his choices of the language learning activities and the amount of effort exerted. Those with low sense of self efficacy in second language acquisition regard difficult learning tasks as a threat to dignity; they dwell on their deficiencies and the barriers that they encounter rather than concentrate on how to finish the tasks successfully. Consequently, they are inclined to lose faith in their abilities and are likely to give up the learning tasks. In contrast, learners with strong sense of self-efficacy encounter tough tasks with confidence and will sustain efforts in the face of failures. Therefore, those with high self-efficacy are generally high achievers.

**Table 5:-Presents the Correlation Results with T-tests**

Correlations r	
	Self-Efficacy
Pre-test	0.5483
Post-test	0.3484
Correlated T-test	
Pre-test	2.6225
Post-test	1.4868

It can be gleaned from the table that the oral proficiency tests (both pre-test and post-test) exhibit different relationships with the self-efficacy of the Korean students. The post-test resulted in an r-value of 0.5483 denoting a high positive correlation, while the pre-test resulted in an r-value of 0.3484 denoting a moderately small positive correlation. Based on the critical r value obtained at  $18 - 2 = 16$  degrees of freedom at 5% confidence level which is 4683, the post-test has a significant relationship while the pre-test has no significant relationship at 95% significance level.

These results may mean that after the one-month of collaborative learning, the Korean students acquired more self-efficacy with respect to confidence, hence they become more confident in using the English language for classroom interactions and for conversational or social interactions as well.

### Conclusion:

Based on the findings, the one month collaborative learning has significant relationship to the oral proficiency and self-efficacy of the Korean students, therefore the hypothesis stating that the one month Intensive English Language Proficiency Course focused on collaborative learning has no significant relationship with the oral proficiency and self-efficacy of the Koreans is rejected.

### Recommendations:-

1. Since the one month collaborative learning has significant relationship with the oral proficiency of the students, it is recommended that more innovative and creative collaborative activities be utilized not only in the teaching of the foreign students but also in the teaching of English to Filipino students.
2. The duration of the program can also be extended and more studies can be conducted utilizing other variables that are not yet investigated.
3. Teachers should provide more instructional materials that are fresh and effective to further enhance the teaching of Intensive English Language Proficiency Course.

#### Abstract

**Background of the problem:-** Osteoporosis affects around 200 million female in the world and 34% of Saudi female suffer from it. Measuring the extent of the community's awareness especially in target groups is the beneficial way to reduce the prevalence.

**Objectives:** Assess the baseline knowledge about osteoporosis among female employees, to implement health education program and to evaluate the effectiveness of health education program.

**Method:** An educational intervention study carried out in three phases' assessment, education, and evaluation. To measure the change in the knowledge by comparing the change between the pre and posttest group. Questionnaire was collected from 112 female employees in the college of Administration and Business at Princess Nourah bint Abdulrahman University.

**Result:** There was a significant improvement in the level of knowledge in the posttest in all what is related to the planned educational program about osteoporosis was ( $p \leq .001$ ) except for diagnosis ( $p = .116$ ). The mean total knowledge score has significantly increased in the posttest ( $41.6 \pm 3.83$ ).

**Conclusion:** The educational intervention program about osteoporosis was effective. The knowledge improved and the aim was successfully achieved.

**Recommendations:** In this intervention study the majority of the participants were educated and employees aged between 21-30 years old. However, the most beneficial way to reach the effectiveness of the educational program is through the most affected group in women at menopausal stage, unemployment house wives with different background.

#### Introduction:-

Osteoporosis is one of the important health problems due to the global spread, there are around 200 million women in the world suffer from it.<sup>[1]</sup> Osteoporosis is known as silent disease, most affected individuals are not diagnosed or treated and remain asymptomatic, bones become weaker and more likely to break, from a minor fall or even from simple actions, like sneezing or bumping into furniture.<sup>[2,3]</sup> Osteoporosis affects both men and women at any age, but

**Corresponding Author:- Eman M. mortada.**

Address:-PhD in public health and preventive medicine, Assistant Professor in health sciences department, Health and rehabilitation sciences college, Princess Noura Bint Abdelrhman University.

older women (postmenopausal) are more susceptible to the higher risk.<sup>[4]</sup> It has major socioeconomic burden, causing loss of work days and income among adults who are still active in the work place. Moreover, huge direct costs for medical, hospital and surgical care. Therefore, rising indirect costs that result when patients lose their independence and require nursing care either at home or in institutions.<sup>[5]</sup>

Regarding previous study conducting in Saudi Arabia which revealed that femoral fractures yearly cost \$1.14 billion,<sup>[6]</sup> but this has not necessarily been translated into more effective management of osteoporosis health education campaign, which needed to fill the gap between the high prevalence and the drain of health care resources. If there are lacking in knowledge and good application subsequently, the preventive health education is needed to ameliorate knowledge and motivating healthy behaviors. Without doubt the Ministry of Health efforts on improving health awareness of osteoporosis is significantly obvious and taking its course over the past years. However, there's still significantly high prevalence percentage that we cannot marginalized it, according to study conducted among Saudi female, the prevalence of Osteoporosis is 34%. Although the treatments and prevention methods are safe, available, affordable and it effectiveness to reduce the risk of fractures, there is still need to find the loophole in order to detect if there is need for further efforts or further health campaigns that targeting specific population to reduce this percentage. Based on barzanji et al "There is a limitation regarding some studies that indicate women knowledge irrespective of age about osteoporosis risk factors".<sup>[7]</sup> Therefore, measuring the extent of the community's awareness, especially in target groups is the beneficial way to reduce the prevalence. Also, it is important and necessary to measure the progress and possibility efforts that will provided through the whole society.<sup>[8]</sup>

**Research question:-**

Is the health education program effective in improves awareness of osteoporosis among Princess NourahBintAbdulrahman University employees?

**Hypothesis:-** Health education will improve awareness of osteoporosis among Princess NourahBintAbdulrahman University employees.

**The Objectives of the study are to:-**

- Assess the baseline knowledge about osteoporosis among female employees at Princess NourahBintAbdulrahman University.
- To implement health education program for female employees at Princess NourahBintAbdulrahman University.
- To evaluate the effectiveness of health education program

**Methodology:-****Study Design, sitting and duration:-**

An educational intervention study. At Princess Nourahbint Abdulrahman University, from April- September to December 2016

**Study population:-**

The study was on female employees at princess NourahbintAbdulrahman University.

**Inclusion and exclusion criteria:-**

This study only included Saudi (teaching and administrative staff) after excluding those who refuse to participate as their participation was voluntary.

**Sampling technique:-**

A Multi-stage cluster sampling technique was used. Different stages were conducted to select the sample, in the first stage one college was selected randomly by simple random sampling. At the 1<sup>st</sup> stage, the Sciences colleges were randomly selected out of the three main categories (humanities collages, health colleges, and sciences colleges) at Princess Nourah Bint Abdulrahman University. Then in the 2<sup>nd</sup> stage, the college of business and administration was randomly selected out of the four Sciences colleges (college of sciences, college of computer and information science, college of business and administration, college of art and design) included in the sciences colleges as illustrated in figure 1

**Sample Size:-**

A total sample size of 120 teaching and administrative female employees calculated in this study by using an open epi calculator.<sup>[9]</sup> The following parameters were used to calculate the required sample: 95% confidence level, 80.0% power of the test assuming that the change of knowledge can reach up to 25%, according to the findings from the pilot study. Then the sample was doubled to be  $51 \times 2 = 102$ , in addition to 15% expected non response from the participants so the final sample = 120. They were from the college of Administration and Business at Princess Nourah Bint Abdulrahman University. After removing the incomplete filled questionnaire, the remaining sample number became 112

Figure 1:- Sampling technique

**Study Tools:-** A different tools used to achieve the objectives, which are:

**Questionnaire:-**

A self-administrated anonymous Arabic questionnaire, designed using a standard questionnaire, then modified to suit Saudi culture (The Impact of Osteoporosis Continuing Education on Nurses' Knowledge and Attitudes.)<sup>[10]</sup> Pilot testing of the questionnaire was carried out on 20 females not included in the study. It was performed as an initial step for the study to check the easiness of the questionnaire and the time needed to complete it. Some modifications in some questions were done after the pilot study. The final version covers the following items **Personal information** included Nine questions, **Knowledge:** Assess their current knowledge about osteoporosis, with four questions includes (background, sources of information, magnitude problem estimation...etc.). **Risk factors** (Smoking, family history, early menopausal ...etc.). **Manifestations:** Two questions about **Complications and Diagnosis.** **Dietary Requirements:** Three questions about (Recommended daily calcium, source of daily calcium...). Questions about **Sun Exposure** (produce vitamin D, exposing to sunlight, recommended time ...etc.). Three questions includes assessing **Physical activity:** (type of exercise, duration and frequency). For all the previously mentioned items the responses were either (Yes/No/I don't know).

**Intervention tools:-**

The tools used displays the main item that was covered in health education message, knowing that it was carried out in Arabic and it was guided by the items asked in the questionnaire which were:

1. **Poster (roll up panel):** covered the main outlines of the questionnaire in brief through pictures and small sentences.
2. **Booklet:** also covered the main outlines of the questionnaire in more details with pictures and verity of tables that shows detailed daily requirement of calcium, vitamin D, sun exposure and physical activity. To motivate

the participants and to increase their cooperation, motivations rich in calcium and vitamin D was attached with the booklets.

- Lecture:** covered the overall idea of the questionnaire which contained seventeen slides that took around fifteen minutes with the opportunity for the participants to ask oral questions. The lecture conducted into different days and different times to take the most advantages of involving more participants.

#### Data Collection phases:-

The data collection strategy performed in the form of three phases in three weeks, one week for each phase. The first phase was the assessment phase took place in the first week was the pretest phase via the questionnaire and took about 7 to 9 min to be completed after obtaining the informed consent from the females. Followed by the next phase in the second week, which was the intervention program by conducting the health education sessions aided by booklet, poster and lecture. Finally, post-test used in the evaluation phase to compare the effectiveness of the educational intervention through the same questionnaire that carried out in the first phase.

#### Statistical Analysis:-

The data was presented and analyzed by SPSS 23<sup>[11]</sup> using descriptive and analytical statistics. McNemar test was used to assess the significant difference between post and pretest results. The main outcome was to measure the change in the knowledge by comparing the change between pre and posttest by using paired T test. Level of significance assessed at  $p < .05$ .

#### Ethical Approval:-

Ethical approval was taken from the ethical committee at health and rehabilitation sciences collage. As well as, from the dean of business and administration college. Informed consent was attached with the questionnaires to explain the objective and importance of the study, in addition to explaining the phases of the research confirming that their participation or drop out is voluntary. Knowing that the confidentiality of their information is secure by using anonymous coding of the questionnaires.

#### Results:-

**Table 1:-** Frequencies and Percentage for Personal Information of Saudi Female Employees at Princess NourahBintAbdulrahman University

After excluding incompletely filled questionnaires(8), a total of 112 Saudi female employees took a part in the study. The participants were from the college of Administration and Business. Forty percent of the participants were aged between 21- 30 and they were the highest percent group. More than half (53.6%) of the respondents were from

Prevention	1.74±	0.74	1.97±	0.49	.003*
Dietary Awareness	4.54±	2.07	6.77±	1.45	.000*
Sun Exposure	2.25±	0.88	1.94±	0.81	.001*
Physical Activates	0.54±	0.66	2.32±	0.85	.000*
Diagnosis	1.59±	0.90	1.70±	0.86	.116
DEXA Indication	3.06±	1.23	4.13±	0.83	.000*
Total	26.16±	4.21	41.64±	3.83	.000*

Table 2 presents the mean and standard deviation about the level of knowledge in pretest and posttest. The mean knowledge was found to be positively correlated ( $p \leq 0.001$ ) between their knowledge and in general knowledge category as well as in non-modifiable risk factors, modifiable risk factors was, manifestations, complication, dietary awareness, sun exposure, physical activity and DEXA indication where it was. The mean and standard deviation in the pretest was  $0.90 \pm 0.73$ ,  $2.32 \pm 1.35$ ,  $4.19 \pm 1.44$ ,  $3.04 \pm 1.84$ ,  $1.99 \pm 0.95$ ,  $4.54 \pm 2.07$ ,  $2.25 \pm 0.88$ ,  $0.54 \pm 0.66$  and  $3.06 \pm 1.23$ . While it becomes  $2.29 \pm 0.75$ ,  $5.24 \pm 0.85$ ,  $6.21 \pm 1.09$ ,  $6.17 \pm 1.05$ ,  $2.91 \pm 0.78$ ,  $6.77 \pm 1.45$ ,  $1.94$

$\pm 0.81$ ,  $2.32 \pm 0.85$  and  $4.13 \pm 0.83$  respectively in the posttest. In the same hand the mean and standard deviation of the prevention found to be moderate with ( $p = .003$ ) and it was  $1.74 \pm 0.74$  in the pretest and became  $1.97 \pm 0.49$  in the posttest. However, a negative correlation was found between their level of knowledge in the pretest and posttest and the diagnosis category ( $p = .116$ ) it was  $1.59 \pm 0.90$  in the pretest and became  $1.70 \pm 0.86$  in the posttest.

### Discussion:-

The aim of this research was to reduce the osteoporosis rate due to lack of awareness among Saudi females. An intervention study was carried out where a designed self-administered questionnaire was used in order to collect data. The current study included a total number of 112 female employees. As regards the main source of information about osteoporosis, it was revealed that the internet was the main source of information among the majority (78.6%) of the studied women, while specialists were ranked as the second source of information was less than one third (28%). This was in agreement with what was reported in many studies carried out among (Egyptian, Turkish, American, Bruneian, Indian and Singaporean women) the mass media was rated as the main source of information in (54.2%, 53%, 55%, 70%, 74% and 76.4%) of the studied women respectively.<sup>[12-19]</sup> This result ought to raise consideration toward the content of the health messages incorporated into broad communications in media programs, articles and advertisements.<sup>[19, 20]</sup>

According to a study conducted in Texas that analyzed the data by using one-tailed t-test shows that there was a significant increase in the general knowledge of osteoporosis from the pre to the post ( $p = .000$ ). Additionally, the mean and standard deviation of the pretest was  $6.89 \pm 3.30$  while it became  $9.96 \pm 2.65$  in the posttest when compared<sup>[21]</sup> a paired-test was calculated in a study conducted in the United States of America and the results revealed that there was a statistically significant increase in knowledge scores in both groups. For women with a family history of osteoporosis the pretest mean was 12.66 (SD = 1.57), while it became 25.83 (SD = 5.19) in the posttest. The women without a family history of osteoporosis had a highly significant difference in posttest scores with the mean of 26.11 (SD = 2.67), while it was 12.11 (SD = 2.02) in the pretest.<sup>[22]</sup> According to a study carried out in California State discussing the knowledge of osteoporosis risk factors, among 49 older adults, included 41 females and 8 males with ages ranging from 78-98 years. The osteoporosis knowledge mean number of correct responses was 8 (SD = 4) out of 20 possible questions.<sup>[23]</sup> However, in this study the data was analyzed by using paired t-test and revealed that there was a similar significantly increasing as in the previous one in the mean of the knowledge level ( $P < .0001$ ). The pretest mean and standard deviation was  $26.16 \pm 4.21$  and changed to be  $41.64 \pm 3.83$  in the posttest.

There is a negative correlation between the study conducted in the Unaided States of America that discuss the benefits-exercise among the participant without family history of osteoporosis and the current study. The revealed results in the previous study was  $26.0000 \pm 2.74874$  in the pretest and become  $26.7368 \pm 5.50598$  in the posttest ( $p = .630$ ).<sup>[22]</sup> While the physical activity mean and standard deviation in this study was  $0.54 \pm 0.66$  in the pretest and change to be  $2.32 \pm 0.85$  ( $P < .0001$ ).

There is a positive correlation between the previous study and the current study in relation to the dietary awareness were it was  $4.54 \pm 2.07$  in the pretest and became  $6.77 \pm 1.45$  in the posttest. Compared to the previous study that indicates calcium benefits were it was  $23.6842 \pm 2.05623$  in the pretest and became  $26.0000 \pm 2.66667$  in the posttest.<sup>[22]</sup> On the other hand, a study carried out among 42 women who participated in an 8-week educational intervention. There was statistically significant regression equations were found for all pre intervention intentions related to calcium. Posttest intervention calcium intake significantly increased to  $821 \pm 372$  mg/day ( $P < .0001$ ).<sup>[24]</sup>

There was a dramatically increased in the mean at the non-modifiable risk factors where it was  $2.32 \pm 1.35$  in the pretest and increased to be  $5.24 \pm 0.85$  in the posttest. As well as among the modifiable risk factors where it was  $4.19 \pm 1.44$  in the pretest and increased to be  $6.21 \pm 1.09$  in the posttest. However, comparing to a study conducted in Lublin Voivodeship reveals that varied scores between the pretest and the posttest. The level of knowledge about osteoporosis risk factors estimated as an average were it was ( $M = 59.78$ )<sup>[25]</sup>

There is a negative correlation regarding the disease complication where it was  $1.99 \pm 0.95$  in the pretest and increased to be  $2.91 \pm 0.78$  in the posttest ( $P < .0001$ ). Compared to the seriousness of the disease among the participants without family history of osteoporosis where it was  $16.2105 \pm 3.32631$  in pretest and became  $15.8421 \pm 5.06911$  in the posttest ( $p = .702$ )<sup>[22]</sup>

**Conclusion:-**

The educational intervention program about osteoporosis was effective. The knowledge improved and the aim were successfully achieved. Preventing osteoporosis and its consequences considered as an important argument in the drive to encourage people to follow a healthy lifestyle. Knowledge of disease process, risk factors, and what can be done specifically for prevention and management may better prepare participants to make behavioral change required for successful participatory disease management. Commonly based providing osteoporosis educational programs and screening by knowledgeable health care team should be personalized and comprehensive in order to determine bone health decision. Preventing osteoporosis in women should be a useful strategy in preventing later health and socioeconomic consequences. This should aid in building and directing further modalities for the prevention and treatment of osteoporosis in Saudi Arabia.

**Recommendations:-**

1. Further research should focus on osteoporosis methods of diagnosis, to increase their awareness about it
2. In this intervention study the majority of the participants were educated and employees aged between 21-30 years old. However, the most beneficial way to reach the effectiveness of the educational program is through the most affected group in women at menopausal stage, unemployment or housewives with different backgrounds.
3. Controlling the quality of health information provided through the mass media is a must, as it is the main source for health information for the public as revealed by the current study results. Moreover, nutritional education should also emphasize on the importance of preventing osteoporosis should also motivate women to adopt a healthier lifestyle.
4. Health care providers' role in providing information regarding osteoporosis should give special care to women of osteopenia or premenopausal in order to increase awareness and protection methods as well as enhancing different communication channels should be provided in order to reach the biggest sector of the population.

**Abstract**

Systemic Lupus Erythematosus (SLE) is a complex multisystem autoimmune disorder. It is characterized by the production of autoantibodies that react against its own tissues, which may lead to immune-complex mediated end organ involvement. There are more than 30 genetic loci in different ethnic backgrounds that have been associated with the risk of developing this disease. The high level of consanguinity in the Saudi population is a risk factor for developing the disease. On the other hand, it provides an opportunity to identify the genetic variations that are associated with the disease. Applying Genome Wide Association Studies (GWAS) and exome sequencing would help to identify these variations. This review provides an opportunity to outline the genetics of Systemic Lupus Erythematosus in the Saudi population.

**Introduction:-**

Systemic Lupus Erythematosus (SLE) is a complex multisystem autoimmune disorder. It is characterized by the production of autoantibodies that react against its own tissues, which may lead to immune-complex mediated end organ involvement. SLE can affect almost any part of the body and it can range from mild to severe. The most common clinical features are kidney diseases, thrombotic problems and skin diseases. SLE is associated with wide range of autoantibodies, which could help in the diagnosis and monitoring the progress of the disease. The complexity of this autoimmune disease with the diverse clinical manifestations makes the progress of understanding the pathogenesis of SLE quite challenging. Despite these challenges, it has been reported that there are several factors that have roles in the development of SLE such as genetic susceptibility, gender, age, hormonal and environmental factors. (Hersh et al., 2016; O'Neill & Cervera, 2010; Smith & Gordon, 2010)

Based on many epidemiological studies, there are marked differences in the incidence of SLE, which mainly based on the features of the studied populations. (Pons-Estel, Alarcon, Scofield, Reinlib, & Cooper, 2010) In Europe, it is estimated to be 2.2 cases per 100,000 per year while in the US it is estimated to be 7.6 per 100,000 cases per year. (Lopez, Mozo, Gutierrez, & Suarez, 2003) The worldwide prevalence ranges from 10 to 150 per 100,000 per year. (Cervera et al., 1999; Fessel, 1974) These variations are due to the difference in the ethnic groups, as it appears to be higher and more severe in the non-European ancestry. (Borchers, Naguwa, Shoenfeld, & Gershwin, 2010; Sanchez et al., 2012) These differences among ethnic groups are due to the variation in the genetic components that is related to the ethnicity, which leads to the variation in the phenotypic expression of SLE among the individuals who have different genetic background.

Address:-Department of Pathology, School of Medicine, Umm Al-Qura University, Mecca, Saudi Arabia.

For the past few years, significant progress has been done to understand the role of genetics in the pathogenesis of the disease. These studies investigated the mechanism of the disease, the occurrence, the inflammatory process and the reversible organ damage. Despite these studies, there are still significant gaps to understand the pathogenesis of the disease. (Pons-Estel et al., 2010) One of the best methods to understand the genetic roles in the development of the disease is using familial aggregation, which has been reported in many studies in SLE patients.

In Saudi Arabia, many studies emphasize the prevalence of SLE in the Saudi population. The largest study included 624 patients, 551 of these patients have Saudi genetic background. The overall of the clinical and the laboratory investigations were similar to the other populations such as the European population. However, the average age of onset was relatively lower comparing to the age of onset in different groups, which is often associated with a high risk of genetic role in the development of the disease. (Al Arfaj & Khalil, 2009; Heller, Ahmed, Siddiqi, Wallrauch, & Bahlas, 2007; Qari, 2002)

The aim of this review is to outline the predisposing factors of SLE in the Saudi population, and to highlight the relationship between the high level of consanguinity and its role in increasing the risk of the development of SLE. In addition, it will provide an overview of the genetic diagnostic methods applied to increase the efficacy of determining the high-risk variations.

#### **Genetic Pathogenesis of Systemic Lupus Erythematosus:-**

The autoantibodies in SLE are directed against the nucleic antigens. It occurs due to abnormalities in the innate immune system, which includes the toll-like receptors beside the malfunctioning of the T-helper, IgG autoantibodies and the gene expression pattern of type-1 interferon. All these elements would have a critical role in developing the production of the autoimmune response. Another studies emphasized the apoptosis process in the pathogenesis of the current disease. (Moulton, Lo, & Tsokos, 2012; Shin, Lee, & Kang, 2011; Tsokos, 2011)

Based on the findings of many studies, there is strong evidence that Lupus is a non-Mendelian complex inheritance and that there is a main role of the polygenic contribution to its pathogenesis. For the past few years, over 30 genetic loci have been identified in different ethnic backgrounds that have been associated with the risk of developing the disease. (Gateva et al., 2009; Guerra, Vyse, & Cunnigham Graham, 2012; Harley et al., 2008; Hom et al., 2008; Moser, Kelly, Lessard, & Harley, 2009; Ramos et al., 2011; Yang et al., 2010) Some of these genes have important roles in the immune system including T-cell regulations, B-cell differentiation and production of antibodies and dendritic cells in the antigen presentation process. Some of these genes are identified by certain Single Nucleotide Polymorphisms, SNP's that are located in certain genes. For example; the *IRF5* gene, which is mainly, involved in the expression of type 1 interferon. (Graham et al., 2006; Guthridge et al., 2012) The *STAT4* gene, which is an important transcription factor that has a role in the TH<sub>1</sub>, or TH<sub>17</sub>, which are associated with the autoimmunity. (Remmers et al., 2007; Shin et al., 2011) Although, some of these genes are common with autoimmunity disorders, they appear to be more specific with the Lupus especially with certain genetic variations located in these determined genes. (Ramos et al., 2011)

Also, many recent studies have shown that the high frequencies in certain genetic variations that are specific in genetic populations are associated with lupus phenotype. For example; certain genetic variations in the *ETS1* and *WDFY4* genes were found to be specific in the East Asian populations but not in the European populations. (Alarcon et al., 1999; Alarcon et al., 2002; Chung et al., 2009; Richman et al., 2010; Richman et al., 2012; Yang et al., 2010)

#### **Consanguinity and the development of lupus:-**

Generally, it appears that populations with high rate of consanguinity are more susceptible to genetic diseases. Consanguinity increases the overall frequency of inherited diseases including many complex phenotypic diseases such as SLE. The decrease in the heterozygosity due to the impact of the consanguineous marriages leads to increase in the uncommon genetic variations relatively to the other populations groups. (Bittles & Black, 2010; Rudan et al., 2003) In Saudi Arabia, it has been estimated that the prevalence of consanguinity is 52 % with 39.3 % are in first cousin marriages. (al-Abdulkareem & Ballal, 1998; El-Mouzan, Al-Salloum, Al-Herbish, Qurachi, & Al-Omar, 2007) Another important factor is high inbreeding coefficient due to polygamy, which is common in the Saudi population. In one of my published studies, using data from the Human Genome Diversity Panel (HGDP), the inbreeding coefficient was very high ( $F_{is} = 0.038$ ) comparing to the other population groups. (al-Abdulkareem & Ballal, 1998; Tian et al., 2009) Also, there are two different studies in Kuwait and Qatar that investigated the genetic substructure of the population of the Arabian Peninsula. The results of these two studies support our findings that the

Saudi population has a very small west-African contribution similar to the HGDP.(Hunter-Zinck et al., 2010; Mohammad, Xue, Evison, & Tyler-Smith, 2009; Nassir et al., 2009) For the reasons stated above, especially the findings in Qatar, it is extremely important to consider the genetic variation in the subgroups as it play a critical role in the development of the genetic diseases such as SLE.

#### Genetics and Molecular Diagnosis:-

Genome Wide Association Studies (GWAS) method has successfully identified many of the risk alleles for many complex genetic diseases. Basically, this method assesses the association between the genetic variations and the phenotype of interest such as lupus. The challenge for this method requires a large well-characterized sample for the disease, advanced genotyping technology and advanced data managing system.(Guerra et al., 2012; Iwamoto & Niewold, 2016)

For the past few years, the success of exome-sequencing technology has achieved an important advancement. Exome sequencing is highly effective in the process of the high-throughput genetic analysis. This is accomplished by using a set of “exome capture” techniques that specifically target all the exons in the genome. This is due to the nature of the DNA and the coding regions in the human genome, which represents about 1% of the whole genome. This would allow us to approach and determine the genetic variations very easily in a cost effective approach comparing to the whole genome sequencing. (Do, Kathiresan, & Abecasis, 2012; Manolio et al., 2009)

In complex genetic disease such as SLE, determining the genetic susceptibility is quite challenging due to the rare variants with the large genotyping effects. GWAS has successfully identified multiple susceptible genes. However, these genes do not provide any valuable insights to the pathogenesis of the disease other than the additive proportion of the hereditary risk. Therefore, it is important to consider other methods in determining the rare variant that have a significant association with the complex genetic diseases. (Fernandez et al., 2007; Iwamoto & Niewold, 2016; Mohan & Putterman, 2015; Williams et al., 2016)

In SLE, it is extremely important to consider rare variants for the genetic studies for many reasons. First, there are several family studies that have determined that there are certain deficiencies in the complement system (C1q, C2 and C4) that are linked to the SLE phenotype. Another study reported a mutation in the FAS ligand gene that is associated with the SLE. Also, there is another study that has reported a rare mutation in the *TREX1* gene that is highly associated with the SLE development. Lately, a recent study in the Saudi population reported that there is a rare loss-of-function mutation in the *DNASE1L3* gene that is associated with the recessive familial form of SLE. The later mutation was identified in several families using an autozygome analysis. (Al-Mayouf et al., 2011; Hannema et al., 1984; Lee-Kirsch et al., 2007; Meyer, Hauptmann, Tappeiner, Ochs, & Mascart-Lemone, 1985; Rynes, 1982; Wu et al., 1996)

Therefore, it is extremely important to consider each genetic variation in a population especially for complex genetic diseases such as SLE. Also, it is crucial to consider the social behavior that has an effect in the genetic modifications such as the high rate of consanguinity in the Saudi population. Such information would help to understand the pathogenesis of the disease overall and in the Saudi population in particular. It would help to provide new methods for therapies in addition to stratifying the populations based on the genetic variations for more effective therapeutic interventions.

##### Key words:-

Capsule endoscope, celiac disease, retention

#### Abstract

The capsule endoscope was introduced to the market over a decade ago. It is considered an addition to the diagnostic armamentarium for many gastrointestinal (GI) diseases including GI bleeds, Crohn's disease, celiac disease, and surveillance of familial polyposis syndromes. The procedure is safe but retention is the most common complication. Here in this report a case of celiac disease and capsule endoscope retention which caused complete small bowel obstruction requiring emergent surgical intervention. The patient made full recovery.

#### Introduction:-

Investigations for GI diseases have been developed over the years with better accuracy and less invasiveness. Capsule endoscopy (CE) was introduced in 2001 (1). The indications for its use have broadened over the years. CE carries some potential complications. The most common is retention which usually is asymptomatic. The retention duration varies as demonstrated in several reports. Interventions to retrieve the retained capsule depend on the degree of symptomatology of the patient and the underlying disease.

#### Case Report:-

We present a case of a 16-year-old male with a known case of celiac disease (CD). He presented to our emergency room with abdominal pain and distention for 2 days duration. Upon questioning it was revealed that he was admitted several weeks earlier in another hospital for investigation of his weight loss and abdominal pain. The results of his investigations were not conclusive at that time. Therefore, he was scheduled for capsule endoscopy. The procedure took place 3 weeks before his current presentation. The patient had the impression and misconception that the capsule endoscope could stay for long time without a problem. He was demonstrating a picture of a complete intestinal obstruction, abdominal pain, abdominal distension, and obstipation. Results from a systemic exam were unremarkable. An abdominal exam revealed a scar from a diagnostic laparoscopy done 2 years earlier to treat his CD. On physical examination, a diffusely distended abdomen with hyperactive bowel sounds were elicited. The patient showed no evidence of hernia. The results from his laboratory investigations were within normal ranges apart from iron deficiency anemia. An abdominal x-ray showed a retained capsule endoscope in the small bowel (Figure 1). A computed tomography (CT) scan of the abdomen with double contrast confirmed this finding (Figure 2). Due to his previous surgery with the expectation of extensive adhesion, we elected to go for an exploratory laparotomy which revealed a dilated small bowel with a grossly diseased ileal segment around 60 cm proximal to the ileocecal junction. The bowel wall was thick and erythematous with areas of multiple strictures (Figure 3a). The capsule endoscope was impacted between 2 stricture points. Enterotomy and complete extraction was achieved (Figure 3b).

Address:-Department of Surgery, King Fahad Hospital of the University, University of Dammam.  
 Dammam, Saudi Arabia.

The patient tolerated the procedure well and had an uneventful post-operative course. He was referred to his original hospital to complete the investigations and further management.

### Discussion:-

The capsule endoscope was introduced to the market over a decade ago. Currently three companies manufacture it: PillCam SB, Given Imaging Ltd., Yokneam, Isreal;

Olympus EndoCapsule from Olympus, Tokyo, Japan and OMOM capsule endoscope from Jinshan Science and Technology Group, Chongqing, China. The capsule size is a 26 by 11 mm containing a battery-powered, complementary metal oxide silicon imager (CMOS), a transmitter antenna and four light emitting diodes. It takes 2 images per second through a transparent plastic dome of the capsule (2,3). Once swallowed, it is propelled through the intestine by peristalsis. The spectrum of capsule endoscopy indication has increased over the last few years. The main indication so far is for obscure gastrointestinal bleeding accounting for 70-80% of the cases. The diagnostic yield approaches 80%. Crohn's disease involves small and large bowel in 45% of the cases, 25% and it is usually confined to small bowel primarily the ileum (4). Damage from non-steroidal anti-inflammatory drugs (NSAID) can also be diagnosed by the capsule endoscope which reveals the mucosal damage. It has to be emphasized that this lesion, mainly ulcerations, can present in 10% of healthy individuals. Small bowel tumors are rare comprising only 1-3% of all GI malignancies can be as well diagnosed by the endoscopic capsule (5). Increased reporting has increased the incidence to 6-9% of all GI malignancies. Surveillance became an established indication especially in familial polyposis coli (FAP) & PeutzJegher syndrome (3). Other indications in rare clinical syndromes include: undetermined colitis, small bowel transplant graft versus host disease, protein losing enteropathies, primitive lymphangiectasia (in pediatric population), Whipple's disease, and irritable bowel syndrome. Capsule endoscope has been indicated in celiac disease as adjunct to the gold standard gastroscopy with duodenal biopsy (4). However, it can be a suitable procedure in patients with high suspension who may be unable or unwilling to undergo the traditional endoscopy. The procedure is indicated to rule out malignant neoplasms associated with celiac disease namely, primary enteropathy-associated t-cell lymphoma (EATL). It is also indicated to rule out other known complication such as ulcerative jejunitis. The time frame for capsule endoscope evacuation varies among patients but 2 weeks is generally accepted (6). The longest retention in the literature was 2 years (2). Thereafter, intervention by medical or invasive means such endoscopy, laparoscopy or laparotomy as in our case can take place especially if the patient is symptomatic. Retention is reported in 2% of cases and usually asymptomatic but perforations have been reported as well (7). The highest risk of retention is reported in patients with chronic NSAID use, extensive Crohn's enteritis, abdominal radiation injury, prior abdominal surgery, prior small bowel resection, and in our case celiac disease (8). This case address 2 issues: 1st the emphasis on patient education and complete understanding of the process of diagnosis with the expected time frame as well as the patient's full awareness of potential red flags and complications; 2nd, the relative contraindication for capsule endoscope use in stricture-forming diseases such as CD. Some groups, however, used this relative contraindication as a guide to stricture causing chronic obstruction to resect the narrowed segment.

**Figure 1:-** Plain abdominal x-ray showing the endoscopic capsule in the small bowel.

**Figure 2:-** CT scan of the abdomen with IV & oral contrast confirming the location of the endoscopic capsule

**Figure 3a:-** Intra-operative picture showing the grossly diseased segment of the ileum with points of strictures.

**Figure 3b:-** The extraction of the endoscopic capsule

### **Conclusion:-**

Capsule endoscopy is considered an investigative modality for many GI diseases. The risk of retention has to be considered on an individual basis. Patient education cannot be overemphasized to prevent delayed type of retention and bowel obstruction consequently.

#### **Abstract**

Renewable energy sources can offer isolated communities the chance for employment to regulate their energy use in a manner that best suits their needs. This paper presents the simulation and thermodynamic evaluation of a stand-alone hybrid power plant using renewable energy sources and storage technologies exclusively. Here, the proposed system includes Vienna rectifier for the wind system in order to reduce voltage stress on semi conductor devices and switching losses. The analysis shows that the evaluated hybrid concentrating solar-wind power plant is a reliable alternative for satisfying the fluctuating electricity demand. The output stable and controlled autonomous performance using the complementary character of solar and wind energy, combined with energy storage is verified by simulating using MATLAB Simulink.

#### **Introduction:-**

Generally islands have the most carbon-intensive primary energy supply, because of its strong dependency on oil and lignite. 55% of the domestic energy demand is met with oil, approximately 99% of which is imported. For the oil energy needs of the islands alone, the country spends more than 500 million Euro a year, in order to generate electricity at local power plants. The relatively high cost of electricity of isolated areas and non interconnected islands increased the competitiveness and encourages the wider incorporation of renewable energy technologies that may, in other cases, seem economically subaltern to business-as usual energy solutions. With this in mind and accounting for the high potential of the country in renewable sources, it is expected that appropriate energy policies could contribute significantly to the economic recovery of islands.

Today, producing electrical power by renewable sources such as wind, solar and wave are becoming very important since the demand of electrical energy is increasing promptly and the fossil fuel sources are restricted. Among these renewable sources, wind is highly preferred and wind conversion systems technology already plays an important role in power production. Since power is proportional to the cube of wind speed, the location of wind turbine becomes important. Therefore, building offshore wind farm is a good alternative to extract maximum power due to high average wind speed. With this wind speed we have added Concentrated Solar Power (CSP) plant to form the hybrid system. The addition of the CSP system would create a hybrid project that maintains or improves the power output.

In this paper Vienna rectifier is used in the wind system for Power Factor Correction and to reduce power quality problems. The switching losses, number of MOSFET's are reduced by using Vienna rectifier. The efficiency of the system is improved. The output efficiency and the accuracy of the system is analyzed and verified by simulating the proposed system using MATLAB Simulink.

### **Related Works:-**

Kolar, J.W.; Ertl, H.; Zach, Franz C., The development of guidelines for the practical application of a new power module (IXYS VUM25-E) realizing a bridge leg of a three-phase/switch/level PWM (VIENNA) rectifier system with low effects on the mains was discussed. The inner circuit structure of the power module was formed by a bidirectional bipolar switch and of two free-wheeling diodes. In the first stage, the switching losses of the power MOSFET and of the free-wheeling diodes are determined by measurement in dependency on the switched current for characteristic values of the junction temperature. The isolated driving stage of the MOSFET was designed for minimum switching losses considering the occurring switching over voltages and the ringing between the parasitic components. The conduction losses of the semiconductor elements are calculated directly via simple analytical approximations of the mean and rms values of the device currents. Based on the proficiency of the dependency of the main loss contributions of the semiconductors of the power module, the operating parameters such as mains voltage, output voltage, heat sink temperature and switching frequency and the maximum allowable mains current amplitude was calculated [1].

R Rajesh, M.; Singh, B., presented the power quality improvement in the midpoint converter based switched reluctance motor (SRM) drive using a Vienna rectifier. A conventional bridge rectifier with midpoint converter based SRM drive yields very high level of harmonics content and low power factor at ac mains. They proposed Vienna rectifier with midpoint converter fed SRM drive that improves the power factor at ac mains with low current harmonics. It also provides constant dc link voltage and balanced capacitor voltages [2].

A. Rajaei, M. Mohamadian, and A. Y. Varjani, presented the improved factors, such as higher efficiency and improved total harmonic distortion by the use of Vienna rectifier as generator-side converter of wind energy conversion system (WECS) consisting a permanent-magnet synchronous generator (PMSG) compared to the traditional back-to-back inverter. The direct torque control (DTC) of the generator in WECS includes fast torque response, insensitivity to PMSG model and associated parameters, elimination of rotor position sensor, and reduced computations. The effects of Vienna rectifier voltage vectors on PMSG torque and stator flux are derived, and DTC of PMSG by the Vienna rectifier is implemented, considering the constraints imposed by the Vienna rectifier [3].

H. Chen and D. C. Aliprantis, discussed about the topology consisting of a squirrel-cage induction machine combined with a Vienna rectifier for a wind energy conversion system. It is energy efficient compared to a traditional six-switch two-level converter. This topology can have higher reliability, due to reduced blocking voltage stress across the semiconductors [4].

C. Qiao and K. M. Smedley, presented about unified constant-frequency integration controller for a three-phase star-connected switch three-level rectifier. It is based on one-cycle control and is simple and reliable. It does not require multipliers to scale the current reference according to the output power level and the input voltage sensor is eliminated. It employs constant switching frequency modulation that is desirable for industrial applications. This controller can be operated on sensing either the inductor currents or the switching currents., The cost is further reduced, if the switching currents are sensed because switching currents are easier to sense comparing with inductor currents [5].

M.A. Barik and H.R. Pota, presented the effects of integration of renewable energy sources (RES) in a microgrid in grid connected and islanded operation. To analyze the complementary feature of renewable energy penetration into microgrid, a fixed speed wind turbine equipped with squirrel cage induction generator (SCIG) and a grid connected solar system with maximum power point tracker (MPPT) are used. They also compared the effect of wind and solar penetration separately as well as jointly [6].

S.H. Madaeni, R. Sioshansi and P. Denholm, estimated the capacity value of concentrating solar power (CSP) plants with thermal energy storage (TES) in the southwestern U.S. Our results show that incorporating TES in CSP plants deliberately increases their capacity value. While CSP plants without TES have capacity values ranging between

60% and 86% of maximum capacity, plants with TES can have capacity values between 79% and 92%. They demonstrated the effect of location and configuration on the operation and capacity value of CSP plants [7].

R. Sioshansi and P. Denholm analyzed the potential benefits of locating wind and concentrating solar power (CSP) plants in the southwestern U.S. Using a location in western Texas as a case study, it is manifest that such a deployment strategy can improve the capacity factor of the combined power plant and the associated transmission investment. This was because of two synergies between wind and CSP: 1) the negative interaction between real-time wind and solar resource availability and 2) the need of low-cost high-efficiency thermal energy storage in CSP. The economic tradeoff between transmission and system performance is eminently sensitive to CSP and transmission costs [8].

J. Usaola, discussed about the CSP technology, which will most likely develop in some parts of the world in the near future which has been already exploited in certain countries, such as the USA and Spain, where subsidy policies are granted to support its development. The possibility of storing the received thermal energy and usage of the energy later is an effective constraint. This storage allows CSP plants to smooth the power generation and to schedule it independently of the instantaneous solar resource. These plants may be considered as dispatchable, and can be easily and efficiently integrated to the grid [9].

Keith E. Holbert, presented about the electricity generation using renewable energy, particularly solar power which has been increased considerably in recent years. Solar energy resources in the southwestern U.S. are the best in the world. A significant number of solar thermal generating stations using parabolic concentrators or central receivers are commonly preferred. Concentrating solar power (CSP) plants require condenser cooling, which is provided using water resources. To ensure sustainability of solar-electric facilities in the Southwest, requirements for CSP units to utilize dry cooling may be prudent [10].

Maria Dicorato, Giuseppe Forte, Maria Giovanna Pisani, Enrico De Tuglie, discussed the available technologies for energy production from solar source. Concentrating Solar Power could give a significant contribution to develop a more sustainable energy system. The work is about to investigate a Concentrating Solar-Trough plant, having nominal power equal to 100 KW. And exploiting linear parabolic collectors, to produce electric energy by means of Organic Rankine Cycle Turbine. In particular, a model to estimate solar radiation on a sun-tracking surface is preferred, in order to minimize the angle of incidence and thus maximize the incident beam radiation [11].

S. Alekhya, D. Aarti, Raghavender Kulkarni., attempts a heat energy storage for power generation in which a Molten Salt is preferred for Thermal Energy Storage for Concentrating Solar Power systems. In this method numerous large, flat, sun-tracking mirrors, known as heliostats are used which focuses sunlight onto a receiver at the top of a tall tower. A heat-transfer fluid heated in the receiver is used to produce steam, which in turn, is used in a conventional turbine generator to produce electricity. Some power towers use water/steam as the heat-transfer fluid. Solar power tower convert sunshine into clean electricity. The gained thermal energy can be used for molten salt, which saves the energy [12].

### Hybrid Generation System:-

Fig. 1. Block diagram of proposed system

The proposed system block diagram is shown in the Figure 1. Hybrid renewable energy system is used as the input source. In the wind system Vienna rectifier is preferred in order to reduce losses and ripples to improve the Power Factor. Then the battery storage system is to store the energy. By optimization technique the power is injected to the grid on high demand time and for fluctuation compensation.

### A. Concentrating Solar Power plant

In Concentrating Solar Power (CSP) technique sun's Direct Normal Irradiation (DNI) is concentrated to produce heat of temperature about 400°C to 1,000°C. This heat is then used to generate electricity by the traditional process of steam cycle, or combined cycle, or Stirling engine. Based on the process of collecting and concentrating solar radiation, the CSP can be identified into four major technologies:-

1) **Parabolic Trough:** Long, curved mirrors pivot is preferred concentrate sunlight onto the tubes filled with a heat transfer fluid, commonly oil or water, whose steam rotates a power- generating turbine. These systems are the mostly used CSP technology and have operated in the United States since the 1980s. Optimal capacity size is 150- 250 MW that is enough to power 44,000 homes, although 80 MW is the largest plant size nowadays. In alternate, one U.S. Company, Sopoty Inc., has created a "Micro CSP" system that uses a scaled- down parabolic system for generation on rooftops.

2) **Linear Fresnel Reflectors (LFR):** Still in the demonstration stage, LFR systems operates like parabolic trough systems but uses flat mirror strips instead of curved mirrors. Although less efficient than other CSP systems, has cheaper cost of flat mirrors lowers with initial investment cost.

3) **Dish/Engine:** Mirrored dishes track the sun and concentrates the heat onto a for power generation unit that has a heat- responsive fluid powered engine. Stirling engines, the most common type of engine for this system, do not require the vast water cooling system needed for steam engines because its engine is powered by the expansion- contraction of hydrogen gas as it is heated and cooled. The newest systems have 31.5 percent sun- to- grid energy conversion efficiency, the highest among CSP plants. However, they have a smaller production capacity of 0.003- 0.025 MW. The first commercial deployment of a dish/Stirling system array is planned for 2010.

4) **Power tower:** Fields of flat mirrors concentrates sunlight onto a central receiver which is filled with a heat- transfer fluid, most often molten salt, which can trap thermal energy for long periods. These systems focus heat at higher temperatures than other conventional CSP systems, improving its conversion efficiency. A 20 MW power tower system came online in April 2009 outside Seville, Spain, and the early Solar Two demonstration plant, a 10 MW facility that operated from 1996- 1999 in Barstow, California, had a storage tank which provided three hours of electricity when the sun was not shining.

**Fig. 2.** Technologies for concentrating solar radiation: left side parabolic and linear Fresnel troughs, right side central solar tower receiver and parabolic dish

### B. Wind Power Plant:-

A wind energy conversion system or wind energy harvester is a machine that, powered by the energy of the wind, produces mechanical energy that can be used to directly power machinery to power an electrical generator for making electricity.

#### 1) Schemes for Wind Power Generation:

Based on the speed and frequency, generally following schemes are identified:

1. Variable Speed Constant Frequency Scheme (VSCF)
2. Variable Speed Constant Frequency with Dual Output(VSCF with DO)
3. Variable Speed Variable Frequency Scheme(VSVF)

#### 4. Dual Speed Constant Frequency Scheme (DSCF)

Among all these schemes the preferred scheme for the proposed system is Variable Speed Variable Frequency Scheme.

##### 2) Variable Speed Variable Frequency Scheme:

This scheme is suitable for loads that are frequency insensitive such as heating load.

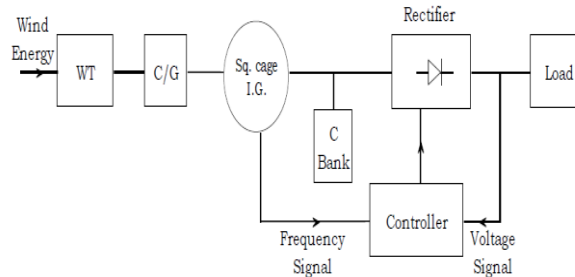

Fig. 3. VSVF Scheme

Depending upon the wind speed, squirrel cage Induction Generator produces power at variable frequency. Such generators are charged by Capacitor-bank. The magnitude and frequency of the generated emf relies on the wind turbine speed, excitation capacitance and load impedance.

If the load demands constant dc voltage, output of generators is converted into D.C using chopper controlled rectifiers. Feedback system can be used to monitor and control to get desired performance.

**a) Lower Power Demand on Start:** If power is proportional to current-times-voltage, then power needed to excite an AC motor across the line is extremely higher than with an Adjustable Speed AC Drive. This is possible only at start, since the power to run the motor at load would be equal if it were fixed speed or variable speed. The issue is that some distribution systems are at their limit, and demand factors are fixed on industrial customers, which charges them for surges in power that could strip other customers or tax the distribution system during peak periods. These demand factors would not be a typical issue with an Adjustable Speed AC Drive.

**b) Controlled Acceleration:** An Adjustable Speed AC Drive starts at zero speed and accelerates competently on a customer-adjustable ramp. On the other hand, an AC motor started across the line is a dreadful mechanical shock both for the motor and connected load. This shock will increase the wear and tear on the connected load, and also the AC motor. Some applications, such as bottling lines, cannot be started with motors, but must be started empty to avoid breakage.

**c) Reduced Power Line Disturbances:** Starting an AC drive across the line, and the consequent demand for seven-to-eight times the motor full-load current, places an excessive drain on the distribution system which is connected to the motor. Typically, the supply voltage sags, with the amplitude of the sag and dependent on the size of the motor and the capacity of the distribution system. These voltage distortions can motive sensitive equipment connected on the same distribution system to trip offline due to the low voltage. Items such as computers, sensors, proximity switches, and contactors are voltage sensitive. Adjustable Speed AC Drive reduces this voltage sag, since the motor is started at zero voltage and ramped up.

**d) Adjustable Torque Limit:** Use of an Adjustable Speed AC Drive can preserve machinery from damage, and protect the process or product An example would be a machine jam. With an AC motor connected, the motor will continue to rotate until the motor's overload device opens An Adjustable Speed AC Drive, can be set to restrict the amount of torque so the AC motor never exceeds this limit.

**e) Energy Savings:** Centrifugal fan and pump loads operated with an Adjustable Speed AC Drive minimizes energy consumption. Centrifugal fans and pumps follow a variable torque load profile, which has horsepower proportional to the cube of speed and torque varies with proportional to the square of speed. As such, if the speed of the fan is cut in half, the horsepower needed to run the fan at load should be cut by a factor of eight  $(1/2)^3 = 1/8$ . Using a fixed

speed motor would need some type of mechanical throttling device, such as a vane or damper; but the fact remains that the motor would still be operating full load and full speed (full power). Energy savings can be sufficient to pay back the capitalized cost in a matter of a couple of years (or less), depending on the size of the motor.

**f) Elimination of Mechanical Drive Components:** Using an Adjustable Speed AC Drive can avoid the need for expensive mechanical drive components such as gearboxes. Because the AC Drive can function with an infinite variable speed, it can distribute the low- or high-speed required by the load, without a speed-increasing or reduction devices between the motor and load. This eliminates maintenance costs, as well as reducing floor-space requirements.

### C. Vienna Rectifier:-

The Vienna rectifier was introduced in 1993 by Prof. Johann W. Kolar. It is a three phase, three levels and three switch rectifier; it is kind of PWM (Pulse Width Modulation) rectifier with controlled output voltage. The topology of the Vienna Rectifier comprising of a boost DC\DC converter with a three-phase diode bridge rectifier. Fig.3 illustrates this rectifier circuit.

**Fig. 4.** Vienna rectifier

As Fig. 4, shows the output capacitor is split in two parts with two equal values ( $C_1$  and  $C_2$ ). Across each capacitor, two voltage sources  $+V_0/2$  and  $-V_0/2$  exists. Therefore three different voltages ( $+V_0/2$ ,  $0$ ,  $-V_0/2$ ) available here. The DC bus voltage is assumed to be a constant dc voltage and can be connected to a conventional six switch inverter.

The input current for each phase will be defined by the voltage applied across the corresponding inductor  $L_N$ . The input voltage of the rectifier is by the switching state and also the input current direction. The input inductors ( $L_N$ ) charge when the switch is on and there is an increase in current in the inductor, and when the switch is off the inductors discharge through the positive or negative diode which depends on the current flow direction. The existence of an input inductor creates a current source at the input while the capacitors create output voltages.

### D. Energy Storage:-

Wind power turbines have operational constraints over very high and very low speeds. When the power generated exceeds the demand, excess energy can be stored to be used at other times.

- Excess energy can be efficiently stored in storage batteries in the form of chemical energy.
- Excess energy can also be stored in water power storage as mechanical energy. Wind power plant (WPP) along with Hydroelectric power plant (HPP), when the power generated ( $P_g$ ) exceeds the power demand ( $P_d$ ), helps to partly switch hydro power plant output to Pumping motor (PM) to pump water from an reservoir at the bottom of the dam to main reservoir.

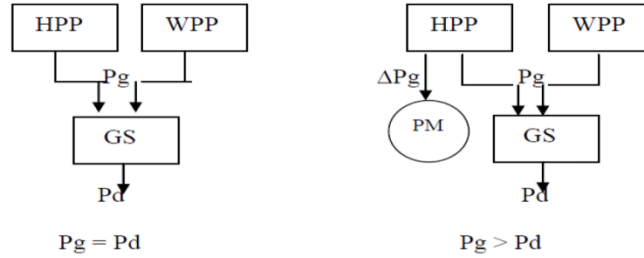

Fig. 5. Energy Storage

**Simulation Module:-**

The hybrid power plant proposed in this paper includes a concentrating solar power (CSP) plant including thermal storage with wind energy coupled with electricity storage.

Fig. 6. Simulation Module of the Hybrid System

The simulation module of the proposed system is shown in Fig. 5. Here Wind system and Concentrated Solar Power (CSP) plant is used as the input source for the system. The sub systems are shown below with simulation results.

**A. Wind System Simulation Module:-**

Fig. 7. Simulation Module of Wind System

Fig. 6. shows the Wind system, where the Vienna rectifier is added to the wind system for reduce the switching losses and voltage stress on power semiconductor devices.

Here the maximum power from the wind system is tracked using MPPT tracking. And accordingly the Vienna rectifier is operated. Fig. 7 shows the simulation module of the Vienna rectifier.

Fig. 8. Simulation Module of Vienna Rectifier

**B. CSP simulation module:-**

**Fig. 9.** Simulation Module of Solar Power System

As discussed above this plant works on solar heat power. The heat is transferred to electricity by some processes as mentioned above. The simulation module of the CSP system is shown in Fig. 9.

**Fig. 10.** Simulation Module of CSP

**Simulation Results:-**

The simulation module is designed using MATLAB Simulink and the output results are verified. The simulation result waveforms are shown in the below figures.

**Fig. 11.** Wind system output voltage and current waveform

**Fig. 12.** Output Voltage and current waveform with Vienna rectifier

**Fig. 13.** Output DC voltage waveform

**Fig. 14.** CSP output voltage and current waveform

**Fig. 15.** Output waveform of the proposed system

### Conclusion:-

In this paper the efficiency of the conventional system is improved by including Vienna rectifier in wind system. Here, maximum losses are reduced and power factor is improved. This system is a promising alternative in locations where the extension of the electrical grid is difficult or not economical, where the cost of electricity is high, or where the electricity generation is associated with significant harmful emissions. The efficiency and the stability of the system are verified by simulating the proposed system by using MATLAB Simulink.

Oral hygiene habits, oral hygiene behaviors, knowledge of caries, tooth brushing, caries.

#### Abstract

**Background:** Obtaining a baseline information of the oral hygiene habits and knowledge of caries is essential and it will help in establishment of adequate preventive programs and proper allocation of available dental services. Therefore, the aim of the present study was to examine self-reported oral hygiene habits and caries knowledge of Saudi students in Taif University.

**Methods:** A cross-sectional study was conducted in Taif University. A self-reported, anonymous and structured questionnaire was distributed to a random sample of 600 students (n=600; Male (M) =300, Female (F) =300) from different colleges. The questionnaire included two sections, one section for assessing the oral hygiene behavior (Q1-Q11) and another to assess the knowledge of caries (Q12-Q20). The students were requested to remain in the classroom after the lecture to answer the questions. The participation was voluntary and the answers were anonymous. The data was collected and then analyzed using Statistical Package for Social Sciences (SPSS, v.21) software to calculate the frequency distribution and percentage.

**Results:** The male and female responses are presented in tables to show the distribution frequency of each question. In addition, the overall percentages of total students' responses are presented in figures. Results of the first part of the questionnaire show that 47.5% (41.21% of males, 53.94% of females) practice good oral hygiene behavior. Conversely, 52.5% of students (58.79% of males and 46.06% of females) practice incorrect behavior. The results of the second part show that 45.04% of the students (47.11% of males, 42.96% of females) have correct knowledge about caries. In contrast, 54.96% of students (52.89% of males, 57.04% of females) lack that knowledge about caries.

##### Conclusion:

The findings of this study indicate that more than half of the students practice incorrect oral hygiene behaviors and lack the basic knowledge about caries and its related information, so this direct us to the importance of conducting oral health promotion programs to raise the

### **Introduction:-**

Oral health is an important component of general health and overall quality of life <sup>[1]</sup>. The two most common oral diseases; caries and periodontal disease, continue to be highly prevalent in most regions of the world <sup>[2]</sup>. Behavior plays a major role in the prevention of both diseases in adequate oral hygiene habits and compliance with regular preventive dental visits essential for their control <sup>[3]</sup>. Self-preventive measures for the removal of bacterial dental plaque through adequate use of the toothbrush and dental floss have been demonstrated to reduce the prevalence of caries <sup>[4, 5]</sup> and periodontal diseases <sup>[6, 7]</sup>. Similarly, compliance with regular preventive dental examination and prophylaxis visits have been documented as essential for the prevention and early diagnosis of oral diseases <sup>[8-9]</sup>. Self-preventive oral health behavior and oral hygiene habits are influenced by several factors including patient motivation, attitude, and value system <sup>[10-11]</sup>. Consequently, differences in oral hygiene habits have been shown to be related to culture and geographic region <sup>[12-13]</sup>. For instance, while 73–83% of school children in Norway, Germany, Sweden, Denmark, and Austria brushed their teeth twice daily <sup>[12]</sup>, such tooth brushing frequency was reported by only 19–46% of patients in Lithuania, Saudi Arabia (Riyadh), and Japan <sup>[13-14]</sup>.

Until today, limited information is available on the oral hygiene habits of Saudi adults, so obtaining a baseline information of the oral hygiene habits and knowledge of caries is essential and it will help in establishment of adequate preventive programs and proper allocation of available dental services. Therefore, the aim of this study was to examine self-reported oral hygiene habits and caries knowledge of Saudi students in Taif University.

### **Materials and Methods:-**

A cross sectional study was conducted in Taif University. A self-reported, anonymous and structured questionnaire was distributed to a random sample of 600 students (300 males and 300 females) from different colleges. The students were requested to remain in the classroom after the lecture to answer the questions. The participation was voluntary and the answers were anonymous. The study protocol was approved by the review committee of the Faculty of Dentistry in Taif University. The questionnaire used in this study covered two aspects as follow:

The first part of the questionnaire (Q1-Q11) covered oral hygiene behavior: (Tooth brushing frequency, time spent for brushing, replacement of toothbrush, cleaning of tongue, use of dental floss, use of mouthwash, purpose of visiting dentist, frequency of eating candies, frequency of having soft drinks, frequency of smoking, use of sugar with tea and coffee).

The second part (Q12 – Q20) covered oral health knowledge: (Role of sugar bacteria, saliva, soft drinks and fresh juices in getting decay, role of fluoride in toothpastes, importance of preserving the teeth from extraction, ability of teeth to regenerate, role of milk bottles to develop decay in children).

The data were collected and then analyzed using Statistical Package for Social Sciences (SPSS, v.21) software to calculate the frequency distribution and percentage.

### **Results:-**

The questionnaire included two sections, one section for assessing the oral hygiene behavior and another to assess the knowledge of caries. The self-reported oral hygiene behavior of male and female are presented in table (1). In addition, the overall percentages of total students' responses are presented in figure (1):

Q1: 53.3% of males (n=160) and 15% of females (n=45) brush their teeth once a day, 28.7% of males (n=86) and 60% of females (n=180) brush their teeth twice a day, 10% of males (n=32) and 23.3% of females (n=70) brush more than two times a day and 7.3% of males (n=22) and 1.7% of females (n=5) never brush their teeth.

Q2: 43.3% of males (n=130) and 23.3% of females (n=70) spend only around 30 seconds for brushing, 51.3% of males (n=154) and 65% of females (n=195) spend 2-3 minutes for brushing, 5.3% of males (n=16) and 11.7% of females (n=35) spend more than 3 minutes for brushing their teeth.

Q3: 20% of males (n=60) and 21.7% of females (n=65) replace their tooth brush every month , 43.3% of males (n=130) and 60% of females replace their toothbrush every 3 – 4 months , 17.3 % of males (n=52) and 15% of females (n=45) replace their toothbrush every 6-8 months and 19.3% of males (n=58 ) and 3.3% of females replace their toothbrush every year or never replace it .

Q4: 57.7% of males (n=170) and 58.3% of females (n=175) clean their tongue every day , 13.3% of males (n=40) and 23.3% of females (n=70) clean it once a week , 7.3% of males (n=22) and 0% of female (n=0) clean it once a month and 23% of males (n=68 ) and 18% of females (n=55) don't clean it .

Q5: 10% of males (n=30) and 25% of females (n=75) use the dental floss once a day , 6% of males (n=18) and 6.7% of females use it twice a day ,4% of males (n=12) and 1.7% of females (n=5) use it more than two times a day and 80% of males (n=240) and 66.7% of females (n=200) don't use the dental floss .

Q6: 16.7% of males (n=50) and 41.7% of females (n=125) use the mouthwash once a day, 11.3% of males (n=34) and 11.7% of females (n=35) use it , 2% of males (n=6) ) and 0% of female (n=0) use it more than two times a day and 70% of males (n=210) and 46.7% of females (n=140) don't use it.

Q7 : 50% of males (n=150) and 41.7% of females (n=125) visits the dentist when severe pain presents , 25.3% of males (n=76) and 41.7% of females (n=125) visit the dentist when the pain start , 8.7 % of males (n=26) and 8.3 % of females (n=25) visit the dentist for periodic examination and 16% of males (n=48) and 8.3 % of females (n=25) don't visit the dentist at all .

Q8: 36.7% of males (n=110) and 53.3% of females (n=160) have candies and biscuits multiple times during the day , 33.3 % of males (n=100) and 31.7% of females (n=95) have candies and biscuits once a day , 15.3 % of males (n=46) and 6.7 % of females (n=20) have candies and biscuits once a week and 14.7 % of males (n=44) and 8.3% of females (n=25) rarely have biscuits and candies .

Q9: 36.7% of males (n=110) and 26.7 % of females (n=80) have soft drinks multiple times during the day , 28.7% of males (n=86) and 26.7% of females (n=80) have soft drinks once a day , 23.3% of males (n=70) and 26.7% (n=80) have soft drinks once a week and 11.3% of males (n=34) and 20% of females (n=60) rarely have soft drinks .

Q10: 18% of males (n=54) and 3.3% of females (n=10) smoke multiple times during the day, 1.3% of males (n=4) and 3.3% of females (n=10) smoke once a day, 0.67% of males (n=2) and 0% of female (n=0) and 80% of males (n=240) and 93.3 % of females (n=280) rarely or never smoke.

Q11: 24.7% of males (n=74) and 35% of females (n=105) use one spoon with tea or coffee , 50% of males (n=150) and 40% of females (n=12) use two spoons of sugar with tea or coffee , 20% of males (n=60) and 15% of females (n=45) use three spoons or more with tea or coffee and 5.3% of males (n=16) and 10% of females (n=30) don't use sugar with tea or coffee .

The second section of the questionnaire assessed the knowledge about caries among males and females as presented in table (2). In addition, the overall percentages of total students' responses are presented in figure (2):

Q12: 65.3% of males (n=196) and 86.7% of females (n=260) consider sugar as the main factor for decay, 15.3% of males (n=46) and 5% of females (n=15) think the opposite and 19.3% of males (n=58) and 8.3% of females (n=25) don't know if sugar is responsible or not.

Q13: 20% of males (n=60) and 31.7% of females (n=95) think that fluoride is added to toothpastes to give it a good taste, 40% of males (n=120) and 33.3% of females (n=100) know that fluoride isn't added for enhancing taste and 40% of males (n=120) and 35% of females (n=105) don't know what is the purpose of adding fluoride.

Q14: 86.7% of males (n=260) and 88.3% of females (n=265) know that bacteria has a role in developing decay and 5.3% of males (n=16) and 3.3% of females (n=10) think that bacteria has no role in developing decay and 8% of males (n=24) and 8.3% of females (n=25) don't know if bacteria is involved in the process or not.

Q15: 59.3% of males (n=178) and 41.7% of females (n=125) know that saliva has a protecting action against decay, 17.3% of males (n=52) and 13.3 % of females (n=40) think that saliva has no role against decay and 23.3% of males (n=70) and 45% of females (n=135) don't know if saliva has a protecting action or not.

Q16: 20% of males (n=60) and 41.7% of females (n=125) think that extraction of the tooth is the best way to treat it, 64% of males (n=192) and 45% of females (n=135) know that isn't right and 16% of males (n=48) and 13.3% of females (n=40) don't know if extraction is the best solution or not.

Q17: 32% of males (n=96) and 53.3% of females (n=160) think that teeth can regenerate again if care is taken, 46.7% of males (n=140) and 30% of females (n=90) know that's not true and 21.3% of males (n=64) and 16.7% of females (n=50) don't know if teeth has the ability to regenerate or not.

Q18: 46.7% of males (n=140) and 68.3% of females (n=205) think that soft drinks cause decay because they contain gases, 25.3% of males (n=76) and 16.7% of females (n=50) know that's not right and 28% of males (n=84) and 15% of females (n=45) don't know if soft drink is causing decay because of gases or not.

Q19: 22.7% of males (n=68) and 33.3% of females (n=100) know that children are at risk of developing decay from milk bottles, 43.3% of males (n=130) and 36.7% of females (n=110) think not and 34% of males (n=102) and 30% of females (n=90) don't know if milk bottles increasing the risk or not.

Q20: 14% of males (n=42) and 11.7% of females (n=35) know that fresh juices can harm our teeth, 67.3% of males (n=202) and 71.7% of females think that fresh juices will not harm our teeth and 18.7% of males (n=56) and 16.7% of females (n=50) don't know if fresh juices will harm our teeth or not.

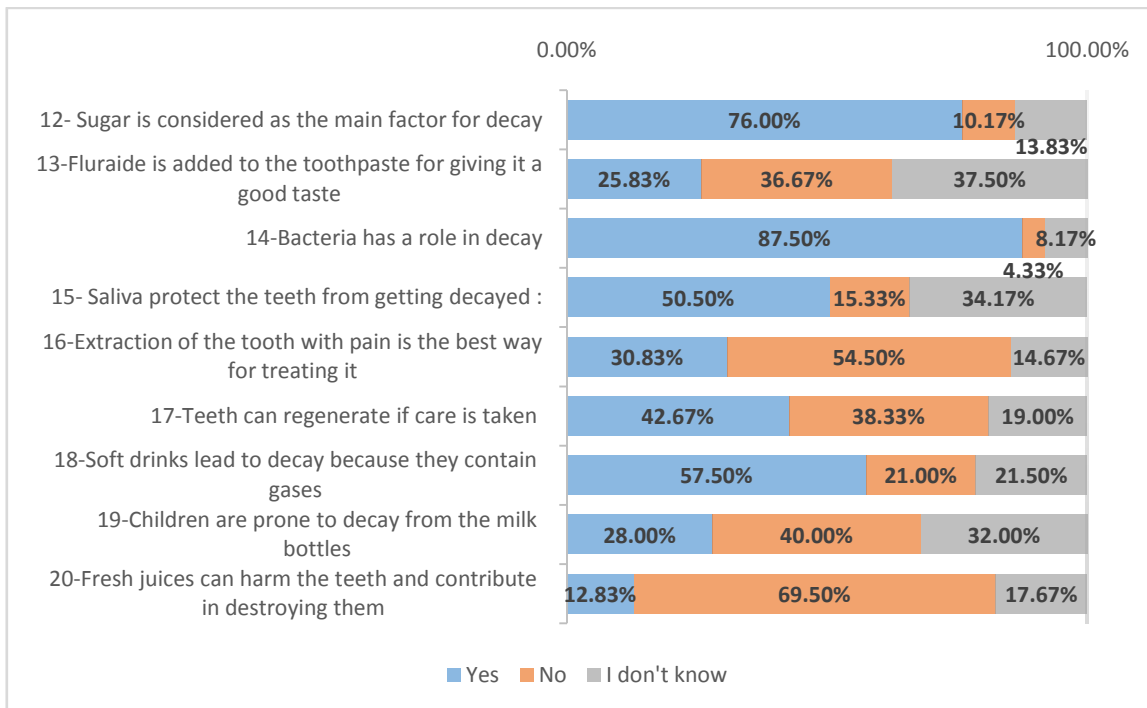

Figure 2:- Percentage of total students' responses regarding knowledge about caries

The data in figure 3 shows the percentage of good behavior and incorrect behavior among Taif university students. The good behavior included : (brushing twice or more daily , spending 2 -3 minutes while cleaning the teeth , replacing the toothbrush every 3-4 months , cleaning the tongue once or more daily ,using dental floss once or more daily , using mouthwash , visiting the dentist for periodic examination , reduced frequency of eating candies and biscuits and drinking soft drinks , non-smoking , using not more than one spoon of sugar with tea or coffee ).

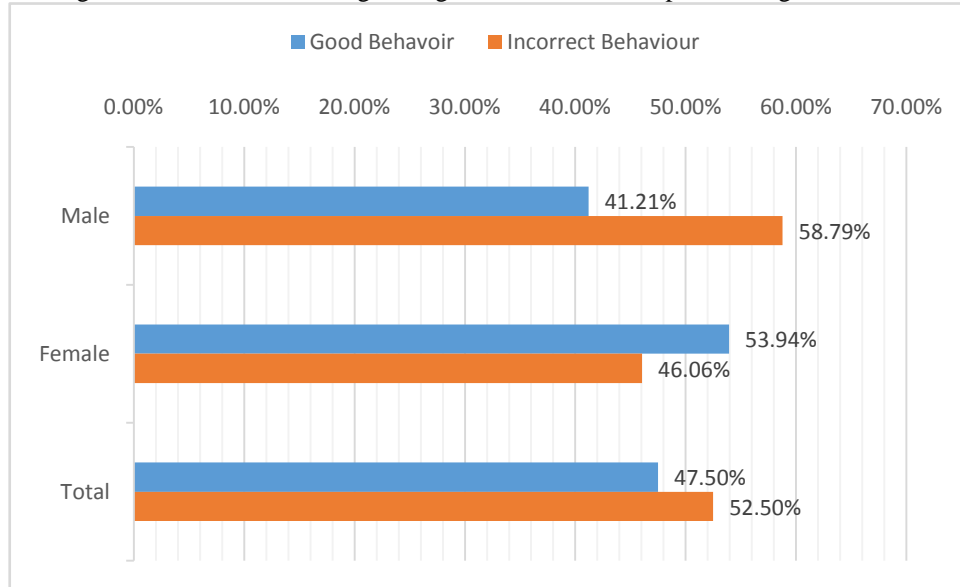

Figure 3:- The oral hygiene behavior among Taif university students

The data in figure 4 shows the percentage of Taif University students who have the correct knowledge about caries compared with people who lack that knowledge. The knowledge assessed include: ( The role of sugar and bacteria in developing caries , the protective role of saliva and fluoride , the importance of preserving teeth from extraction , ability of teeth to regenerate , role of milk bottles to develop decay in children )

Figure 4:- The knowledge about caries among Taif university students

**Discussion:-**

This research presents; to the best of our knowledge, new data as no researcher has investigated the oral hygiene behavior or the knowledge of caries among students in Taif University or even among population in Taif. The first part of the questionnaire revealed a huge negligence on the using of mouthwashes and dental floss as 73.33% of the

sampled student (the males more than the females) don't include the use of dental floss in their oral hygiene routine, but it's still better compared to a study reported 89% who don't use the dental floss in Denmark<sup>[15]</sup> and 83.2% in Iran [16]. Also about 58.33% of the sampled student (the males are more than the females) don't use a mouthwash. Regarding tooth brushing about 44.33% of the sampled students follow the international guidelines that indicate brushing at least twice a day, and our result is in the range of other studies which reported such tooth brushing frequency by 19–46% of patients in Lithuania, Saudi Arabia(Riyadh), and Japan<sup>[13-14]</sup>. It's also noticed that women had higher odds of brushing teeth twice a day than men and that is parallel with other findings<sup>[17-18]</sup>; 34.17% brush their teeth once a day and 17% brush more than two times a day. A minor percent (approximately 9%) of sampled students do not use the toothbrush on a daily basis and we should consider them without hesitation. The behavior of visiting the dentist for periodic examination is minimum as most of the samples students (more than half) only visit the dentist when severe pain presents or when the pain starts, this finding is similar to another literatures which found that about 60% of the subjects paid no attention to signs of caries if there was no pain<sup>[19]</sup>. The consumption of candies and biscuits is more in female) than in males (about half of females consume them multiple times during the day). However, the males drink soft drinks and soda more than the females (about one third of males). In total, this study indicates high consumption of sugar which disagrees with results of Zhu *et al*<sup>[19]</sup>. Our findings also show that smoking in males is more than in females obviously with only about one fifth of males practicing this unhealthy habit. The use of extra sugar with tea or coffee is unhealthy and it is considered as a factor for developing caries and other health problems; however, more than the half of sampled students use extra sugar which also contrast the results of Zhu *et al*<sup>[19]</sup> and that should be taken into consideration. Lastly, figure 3 shows that more than half of the samples students practice incorrect oral hygiene methods (with the females practice less incorrect behavior than males). This noticed good oral hygiene behavior among women has been reported in various studies<sup>[15,20,21]</sup>. This may be because women have flexible daily routine<sup>[22]</sup> which is suggested to promote higher teeth cleaning behavior. Also, women are more motivated to follow oral hygiene behavior that might be due to the esthetic value which they care about.

The second part of the questionnaire revealed that majority of sample students know that sugar and bacteria are responsible for caries which is a positive aspect. Although half of the sample student think that saliva has no role in protection against decay or do not know if it has a role or not. Also the majority of sampled students think fluoride is added for taste or do not know if it is for taste or not. There is also lack of knowledge about the cause soft drink causing decay, the harmful effect of fresh juices on the teeth and the importance preservation of teeth in the majority of sampled students (more than half). Also, majority of sampled students (about two thirds) think that teeth can regenerate or do not know if it can or not. Finally, figure 2 shows that more than the half of sampled students lack the correct knowledge (females lack knowledge more than males) which does not coincide with a research that suggest females were having relatively more oral health-related knowledge<sup>[23]</sup>.

The results of the present study emphasize the need of oral health promotion programs to be conducted to increase the awareness and motivate the people to practice the correct and last current oral hygiene behavior by explaining the importance of preserving the teeth and illustrating the oral diseases that could develop if the recommendations are not followed.

#### **Limitation of the study:-**

This study is giving baseline information about oral hygiene behavior and knowledge among males and females but it does not take into consideration the effect of other variables such as the socio-demographic factor and the economic status of each subject. Another limitation is that this study just gives information regarding University students only and that necessitate the need for conducting more comprehensive study including large population samples.

#### **Conclusion:-**

The findings of the present study indicate that more than the half of students practice incorrect oral hygiene behaviors and they lack basic knowledge about caries and its related information, hence, this directs us to the importance of conducting oral health promotion programs to raise the awareness and motivate students to practice the ideal and correct oral hygiene behavior for the prevention from oral diseases.

### Abstract

**Background:** Spinal cord injury subjects the patients to multitude of complex problems which have bearing on physical, mental, psychological and social aspects of the individual. It leaves the patients crippled for various aspects and mobilization being the important one which is severely impaired. Among all the problems, skin care constitutes an important aspect.

**Methods:** Various comprehensive aspects of skin care like Grading of decubitus ulcers, preventive methodologies and management is reviewed.

**Conclusion:** Skin care in Spinal cord injury patients is an important aspect of the rehabilitation process. It plays a pivotal role in maintaining the well-being of spinal cord injury patients. It involves simple common sense steps which the patients or the care givers can adapt and make it a daily routine to ensure the integrity of the neurologically impaired skin. Timely observation and action are the keys to the approach.

### Introduction:-

A pressure sore (or bed sore) is an injury to the skin and tissue under it. Sitting or lying in the same position will begin to cut off the flow of blood to that area, blocking oxygen and vital nutrients from maintaining healthy tissue<sup>1,9</sup>.

**Definition of decubitus ulcer:** Pressure sores will also be referred to as pressure ulcers or decubitus ulcers. Breach in the continuity of epithelium and underlying tissue due to prolonged pressure on the skin. Prolonged pressure reduces blood supply and essential nutrients and oxygen supply to underlying tissues eventually resulting in skin breakdown<sup>9,12</sup>.

### Susceptibility<sup>1,4,14</sup>:-

1. Decubitus ulcers are common in patients with spinal cord injury with paraplegics and quadriplegics.
2. Reason: loss of sensation, loss of muscle function, reduced blood supply, poor nutrition, abnormal postures resulting from spasticity, pressure from external devices like prosthesis or wheel chair.
3. Spinal cord injury patients have reduced capacity to reposition or shift their body postures in bed or on wheelchair resulting in pressure sores. Hence they need periodic daily assessment of vulnerable areas to look for any skin changes.

**Corresponding Author:- Sachin S. Shabadi.**

Address:-Post graduate in M.Ch Plastic Surgery, Government Medical College, Kottayam, Kerala, India.

Skin care is an integral part of management of patients with spinal cord injury patients. People with spinal cord injury living life in a wheelchair are at greater risk of skin damage like pressure sore areas due to loss of feeling and reduced sensation to parts of their body. Combined with loss of muscle function, poor circulation and often poor nutrition people with spinal cord injury often develop pressure sores. Left unattended these can quickly become life threatening<sup>2,8,11</sup>.

While both vulnerable, people with quadriplegia and tetraplegia are more susceptible than those with paraplegia due to the reduced capacity and strength in upper limbs to reposition or shift their body weight in a wheelchair or bed. It's important to check skin on a daily basis in order to reduce the risk of developing problems such as pressure sores<sup>3,7</sup>.

#### **Characteristics of Neurologically impaired skin<sup>4,6,10</sup>:-**

1. Reduced elasticity and tensile strength
2. Reduced resistance to ischemia, physical insult ( friction,heat, rub etc..)
3. Muscle atrophy
4. Reduced sensation
5. Altered maintenance of constant body temperature
6. Impaired reflex vascular changes below the level of lesion

#### **Signs of impending bedsores<sup>13,15,19</sup>:-**

- Reddened areas
- Damp soft white areas
- Rashes, pimples, blisters, bumps
- Cuts, bruises, scrapes, scratches, insect bites
- Hard lumps beneath the skin surface
- Marks from seams or elastic binding
- Dry flaky skin

#### **Stages<sup>12,16,18</sup>:-**

Damage from a pressure sore will range from slight discoloration of the skin (stage 1) to open sores that go all the way to the bone (severe).

**Stage 1:-** Skin is not broken but is red or discolored. The redness or change in color does not fade within 30 minutes after pressure is removed.

**Stage 2:-** The epidermis or topmost layer of the skin is broken, creating a shallow open sore. Drainage may or may not be present.

Fig 2:-

**Stage 3:-** The break in the skin extends through the dermis (second skin layer) into the subcutaneous and fat tissue. The wound is deeper than in Stage Two.

Fig 3:-

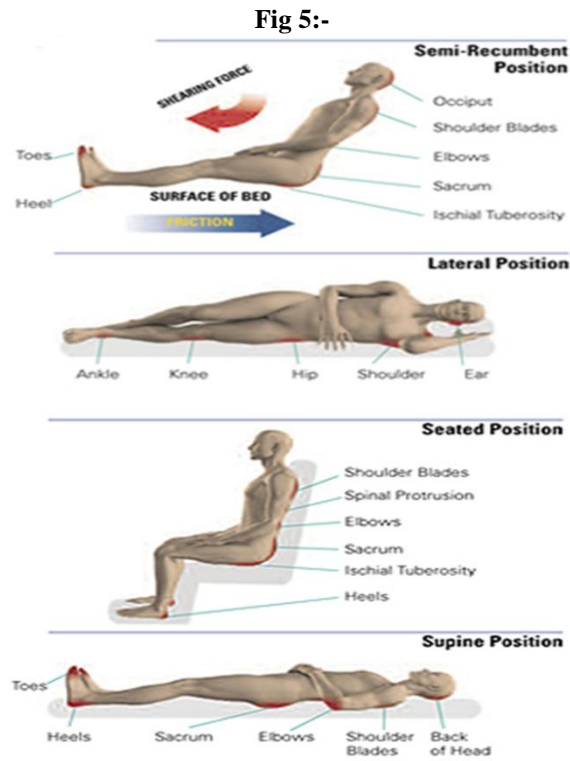

**Stage 4:** The breakdown extends into the muscle and can extend as far down as the bone. Usually lots of dead tissue and drainage are present.

Fig 4:-

Susceptibility zones<sup>20</sup>:-

In recumbent posture, following pressure points are vulnerable:

In wheel chair bound patients, following pressure points are vulnerable:

**Principles of decubitus ulcer prevention<sup>11,26,30</sup> :-**

1. Risk assessment
2. Skin inspection
3. Pressure relief
4. Continence management
5. Skin care hygiene
6. Nutrition
7. Environmental evaluation
8. Equipment prescription
9. Exercise regimen
10. Education
11. Seeking advice

**Risk assessment tools<sup>23, 27</sup> :-**

1. Waterlow index
2. Braden index
3. Norton index
4. NSW pressure sore prediction score
5. Waterlow index has highest predictive value in SCI patients. (Wellard and Lo, 200).

Of all these indices, Waterlow pressure ulcer preventive policy is most practical and hence generally followed.

**Fig 8:-**

**Methods of taking care of skin in spinal cord injury patients<sup>25,28,30</sup>:-****Nutrition:-**

The diet should consist of plenty of protein foods, fresh fruits, vegetables and liquids. In cases with existing pressure sores, the diet should be rich in proteins: lean meats, dairy foods and legumes; carbohydrates: breads, cereals; vitamins: A,B6,C,E and minerals: Zinc and iron.

**Circulation:-**

With a lack of air circulation, feeling and movement daily skin care is very important in order to avoid infections, sores, and irritations. The skin is served by a large number of blood vessels, and adequate circulation is needed to maintain skin health. Following measures are needed to ensure healthy blood supply to the skin:

- **To avoid Smoking** - Nicotine in cigarettes causes blood vessel constriction and prevents blood, oxygen and nutrients from flowing to the body tissues.
- **Edema, or swelling** caused by fluid collecting in the tissues, usually occurs in a part of the body that is not moved frequently and is below the level of the heart (i.e., the feet, legs and hands). Skin over areas of edema becomes thin and pale and injures easily because of poor circulation. Edema can be prevented by elevating the limbs frequently, performing regular Range of Motion (ROM) exercises and wearing compressive stockings.
- **A massage technique** similar to squeezing a tube of toothpaste can be used to work the fluids out of the fingers and feet. After a couple of minutes massage the swelling should begin to subside.
- **Anemia:** Oxygen is essential for skin health, and is carried by red blood cells. A decrease in their number means less oxygen gets to the skin, which means that skin cells may become unhealthy or even die. Anemia should be evaluated and treated.
- **Vascular Disease**, or a narrowing of the blood vessels, can be caused by diabetes, smoking, high blood pressure or elevated cholesterol. The result is decreased blood flow to the skin. Work closely with your health care provider to manage conditions that can lead to vascular disease and cause skin problems.
- **Diabetes:** Diabetes damages the blood vessels and nerves. Wounds and sores can become infected easier and heal at a much slower rate. Its mandatory to perform the skin inspections more closely, paying special attention to any reddening of the skin as they can become dangerous faster than those who do not have diabetes.
- Avoiding using soaps labeled "antibacterial" or "antimicrobial." These tend to reduce the skin's acidity, which acts as a protection from infection.
- Keeping the skin clean and dry. Washing with soap and water daily is recommended.
- **Skin folds or creases** (as in the groin area and underarms) need washing more frequently -- twice a day, morning and bedtime. Rashes can easily form in these areas because of increased moisture and warmth. Increasing the air circulation to these areas to help prevent rashes can be accomplished by positioning the arms and legs so the skin surfaces are separated. For example, using the "frog" position to air the groin area.
- **Rashes** can be caused by tapes, soaps, fabrics or other irritants. Total body rashes may result from food or drug allergies. Early treatment is necessary to avoid skin excoriations.
- Avoiding using items that may dry the skin -- for example, harsh soaps or alcohol based products such as lotions. (A good non-drying lotion to use is Alpha Keri.)
- **Lubricating** dry skin with moisturizing creams or ointments (such as Eucerin or Aquaphor). Using care in applying creams over bony areas is necessary since they may soften the skin and promote skin breakdown.
- **Soiled skin** can break down easily. Urine and stool have irritants in them and should be cleaned up immediately to prevent weakening and breakdown of the skin surface.
- Avoiding using **talccum powders**, as they may support yeast growth. They can also "cake up" and keep moisture in, causing skin breakdown.
- **Calluses** may form on feet and hands. These can be removed by soaking frequently in warm water and towelling briskly to remove dead skin. Using moisturizing creams to help soften calluses.
- **Finger and toe nails** require special care. Soaking them and rubbing them gently with a towel to remove dead skin decreases the chance of hangnails forming. Nails are easier to cut after soaking; it is necessary to cut them straight across to avoid ingrown nails, and keep them short for safety.
- Preventing skin injuries and positional padding.
- **Skin inspection<sup>32,36</sup>:**

Inspecting the skin daily is extremely important as pressure sores and infections could occur very quickly. Skin should be inspected at least once a day. Areas that need special attention are the groin area, behind knees, the areas around the ankles and elbows, and posteriorly hips and tailbone areas should be checked carefully.

The only way to know if skin is healthy and intact is to look at it regularly. In areas where sensation (feeling) is decreased, skin inspection is essential and should become a habit. Planning it as a part of regular routine -- like after a shower, before dressing in the morning or after undressing in the evening.

If patients are unable to see some parts of your body, using a mirror or teach another person to check the skin is recommended. Long handled mirrors and other specially designed mirrors are available. Checking all bony prominences or areas where the bones protrude slightly below the skin.

**Fig 9:-**

Following things to be looked for: Any reddened areas, rashes, cuts, bruises, scrapes, or indentations from seams or elastic binding. Check also for blisters, bumps, insect bites, dry flaky skin or pimples. Checking toenails for any redness or pus formation around the end of the nail.

#### **Pressure releases<sup>33,37</sup>:-**

1. Appropriate body postures is a relatively simple and effective way
2. Use of draw sheets to reposition the patients should be avoided. Material slide sheets made of slippery material should be used to turn the patients
3. Prompt change of soiled linen
4. Repositioning every 2 hours . Intervals are reduced in cases with early signs of damage.
5. Alternating air mattresses during sleeping hours

In both bed and wheelchair, changing position according to skin tolerance is beneficial. Pressure releases in a wheelchair can be done by pushing straight up, leaning side to side, bending forward over knees, reclining the seat of electric wheelchair or having someone tilt the back in manual chair.

It is always better to use wheelchair cushion. In bed, body parts can be padded with pillows to keep bony prominences free of pressure.

#### **Pressure relief surfaces<sup>2,15,26</sup>:-**

- Special equipment like wheelchair, mattresses, cushions, commode, shower chair, toilet seating, sling, slide board, car seat, lounge chairs etc require periodic review and maintenance at regular intervals.
- These special equipment should be used on expert prescription and after trial to suit the need.
- Manufacturer recommendations should be followed strictly to avoid damage to the skin by using harsh and domiciliary materials.

#### **Check list for wheel-chair management<sup>38,40</sup>:-**

1. Proper placing of cushions as per instructions.
2. Proper inflation of air cushions
3. Appropriate recommended cushion cover.
4. Correct placement of vulnerable areas with added paddings
5. The height of footrests should be appropriate. Raising the height increases chances of seating pressures.

6. Periodic expert seating reviews .

**Pressure management cushions<sup>1,6,10</sup>:-**

1. Appropriate material recommended by the manufacturer should be used.
2. The material should be 4 way stretch which is loose but neatly fitted over the cushion
3. Not to use: towels, sheepskin, pillow cases, sheets as they do not stretch and increase the chances of pressure sores.

**Repositioning technique<sup>4,8,9</sup>:-**

**Rule of 30:-**

- Head end of bed should be elevated no more than 30 degrees
- Laterally inclined position of 30 degrees
- Hips and shoulders 30 degrees inclined from supine
- Support with pillows and wedges to maintain 30 degrees

**Fig 10:-**

**Return to seating protocol<sup>22,24</sup>:-**

- Returning to seating protocol should begin as early as possible to avoid posture related vascular changes.
- Seating protocol promotes to increase skin tolerance and psychological benefits.

**Continence management<sup>29</sup>:-**

1. Urinary/ fecal incontinence have implication on integrity of skin due to maceration, excoriation caused by the presence of moisture and pH of the soilage.
2. Use of absorbent briefs and gentle cleansing of skin in case of soiling
3. Avoiding use of plastic and draw sheets as they interfere with pressure redistributing surfaces.(Mac Donald 2001) (O'Connor 2006).

**Skin care hygiene (Thomas et al 2001 protocol)<sup>30,34</sup>:-**

1. Controlling humidity
2. Avoiding extreme temperatures
3. Applying moisturizers to dry skin
4. Avoiding massage to reddened areas and bony prominences.
5. Controlling moistures.
6. Regular shower
7. Avoid excessive hot water and harsh cleansing agents, excessive force and friction while cleaning.
8. Monitor skin between toes for splits and fungal infections
9. Nail care and inspection for ingrowing toe nails.
10. Correct shoe size: one size larger to compensate gravitational edema
11. Perianal care : cleaning with normal saline and avoiding harsh solutions, effective cleaning and thorough drying.

**Environmental evaluation<sup>36,40</sup>:-**

- Poikilothermic: unable to regulate their own body temperature thereby taking environment temperatures.
- Both spasm and excessive sweating resulting from excess cold and hot environment respectively can increase ulcer development
- Home, work and vehicle environment should be controlled to protect the skin

**Temperature<sup>27,32</sup>:-****Extremes of temperature call for extra caution in protecting the skin:-**

Heat -- Avoiding sunburn by covering up or using sun-block. Its wise to avoid heating pads or electric blankets and close proximity to fireplaces or heaters .

Cold – its necessary to dress warmly to prevent frostbite if patients are out in cold weather for long periods of time. Dressing in layers of clothing will provide extra warmth.

Fever -- Skin tolerances can change due to the increased body temperature that occurs with a fever.

**Equipment prescription<sup>34</sup>:-**

Extreme weather conditions and high altitudes will alter the consistency of cushions and mattresses. This must be considered while selecting the cushions and mattresses.

Expert prescription on equipment : wheel chair cushions, mattresses, commodes, slings etc. it is necessary to trial each piece to suit the needs of each individual.

**Exercise Regimen<sup>32</sup>:-**

- Regular exercises should be tailored to the individual and prescribed.
- Patients as well as care givers' participation is vital in promoting the exercise regimen.

**Advantages of exercises:-**

1. Maintenance of skin integrity
2. Increase strength of muscles
3. Improve cardio-vascular endurance
4. Prevents fatigue and deconditioning
5. Psychological benefits

**Body weight<sup>12</sup>:-**

Too much -- Being overweight can cause increased pressure on bony prominences. Delayed healing may occur because there are fewer blood vessels in fat tissue.

Too little -- Excess pressure over bony prominences may occur because there is less padding (muscle and fat) over these surfaces. In addition, underweight persons may lack the proper nutrition to maintain healthy skin.

**Clothing<sup>16</sup>:-**

Proper fit is important. Avoiding sitting on seams and back pockets and always checking the skin carefully after wearing new shoes or clothing.

Too loose -- Lose clothing can form wrinkles that put pressure on the skin.

Too tight -- Overly tight clothing can hinder circulation.

**Alcohol<sup>18</sup>:-**

Over-indulgence in alcohol -- or any other drug -- may interfere with attention to the personal care needs. For example, while under the influence patient might forget to turn himself or be too weak to transfer himself properly.

**Stress & Depression<sup>22</sup>:-**

Stress and depression can have a similar effect by causing patients to lose interest in their personal care and pay less attention to their skin and general health.

**Spasticity<sup>26</sup>**

Spasticity may cause the arms and/or legs to bump against an object, or to fall off from armrest or footrest, and get injured. Spasms may cause skin to rub against something (for example, the sheets on the bed), which could produce an open sore.

**Education<sup>1,2</sup>**

Education to nursing staff, patient, care takers and family is of pivotal importance to recognize the importance of skin care and their responsibility for the overall success of pressure sore preventive initiative.

A range of social support, financial support, psychological distress, cognitive impairment and substance abuse have all been found to compromise preventive measures.

**Immediate actions for pressure sores<sup>2,8,10</sup>**

1. All pressure areas should be freed for 24 hours depending on site of pressure
2. Assess wound
3. Equipment review
4. Commence appropriate wound management by consulting health care professionals.
5. Antibiotic therapy if indicated
6. Relevant investigations
7. Surgical treatment: Debridement and dressings.

**Conclusion**

Skin care in Spinal cord injury patients is an important aspect of the rehabilitation process. It plays a pivotal role in maintaining the well-being of spinal cord injury patients. It involves simple common sense steps which the patients or the care givers can adapt and make it a daily routine to ensure the integrity of the neurologically impaired skin. Timely observation and action are the keys to the approach.

#### Abstract

The concept of home-ownership with a system of co-ownership (*condominium*) in Indonesia known as the flats. This research aims to analyze the legal force of Sale and Purchase Agreement and to review the legal protection of buyer for the unit flats. The type of study was juridical-empirical, a study based on library research, as well as field research. The outcomes of the research indicate that the Sale and Purchase Agreement as a basis of unit flats ownership is not evidence that can provide legal certainty for buyers/consumers, because in practice, not carried out in accordance with the Act on Unit Flats. The responsibility of development actors to give legal certainty to buyers of unit flats is the fulfillment of obligation of the development actors with the delivering of freehold title for unit flats. The lack of regulation of concerning the sale and purchase agreement leads to the weak of legal protection for unit flats buyer in obtaining legal certainty for unit flats ownership.

#### Introduction:-

The 1945 Constitution of the Republic of Indonesia (hereinafter referred to as "The 1945 Constitution") has provided guarantees to every person to live in prosperity inner and outer, residing and get a good and health living environment and as a basic human need.<sup>1</sup> The fulfillment of these basic needs become an obligation for the government to provide facilities in the provision of adequate housing for every citizen of Indonesia.

The development of population is increasing overtime it certainly related to the need for the availability of adequate housing. While, available land for housing need never grow. Anticipating the need for the availability of such housing, the government then makes the concept of home ownership with a system of co-ownership (*condominium*), known as flats. The system of home ownership with the concept of condominium is a solution in the provision of housing, especially in urban areas whose population continues to increase with an effective land use.

The concept of housing, in Indonesia later obtained a legal basis for the establishment of Act No. 16 of 1985 on the Flats was later amendment by Act No. 20 of 2011 on the Flats (hereinafter abbreviated UURS). In the considering of letter "b" UURS stated that the State is responsible for protecting all Indonesian citizens in the implementation of housing through flats eligible for life that is healthy, safe, harmonious and sustainable throughout Indonesia.

**Corresponding Author:-Andi Batari Anindhita.**

Address:-Graduate School, Hasanuddin University, Jln. PerintisKemerdekaan KM. 10, Tamalanrea, Makassar, South Sulawesi, Indonesia.

Government's liabilities emphasizes in UURS is certainly not only to ensure the availability of flats eligible, but must be accompanied by the provision of legal certainty over the ownership of the units flats by the owner of the unit flats.

In the context of contract law, the agreement that occurs in the relation of sale and purchase legal creates rights for achievement and obligations for fulfill the accomplishment. According to Christine Jolls<sup>2</sup>, contracts have traditionally been regarded as means by which individuals may commit themselves to specified courses of conduct. However, a contract is not a means by which the parties collectively may achieve such commitment. Contract law permits parties to modify contractual terms by mutual agreement.<sup>3</sup> Contracts are individual commitments, but nothing more; both parties' commitments are only as strong as their contracting partners' desire to hold them to their original promises.

Legal certainty in the ownership of flats, especially on unit flats by the owner must be a hope for every owner the flats, so that they can obtain legal protection of ownership, so it can utilize the ownership of flats well. For example, flat owners can ensure their flats to raise capital in business activities. Legal certainty of unit flats ownership can be realized with the issues of flat certificate as proof of ownership legality. Based on Article 1234 of the Indonesian Civil Code, this achievement may be giving something, do something and not do anything. What is something here depends on the parties to a legal relationship, what will be given, what will be done or should not be done. Words "something" can be in the form of material (tangible) and can be in the form of immaterial (intangible).<sup>4</sup>

In the pre-research by the author, the circumstances occurring in at least one flats in Jakarta,<sup>5</sup> namely Flats "W". Based on preliminary research through interviews<sup>6</sup> with some buyers/consumers of flats explained that they complained of the legal uncertainty for the ownership of unit flats earned solely on the Sale and Purchase Agreement (hereinafter abbreviated as SPA). Based on their explanation, that since buying unit flats based SPA the flats in 6 (six) years ago, the development actor do not provide certainty of time on the SPA is conducted in the presence Land Deed Official (hereinafter abbreviated as PPAT) as a basis for rights transfer over the unit flats for them can be done the delivery of Freehold Title on unit flats as the basis for a strong proof of ownership to the buyer/consumer. Though the construction of flats in the tower has been completed, even many of the buyers/consumers are making payments of unit flats in cash or by credit, until the installment is completed but never performed Sale and Purchase Certificate or giving Freehold Title of unit flats had bought.

This situation will conflict with one of the purpose of unit flats ownership as stated in Flats Act, which is about to provide legal certainty in the ownership of flats.<sup>7</sup> The legal certainty<sup>8</sup> for flat ownership at least can be used as the basis to be able to take legal actions against unit flats them, as it can easily be resold or can be used as loan collateral in the Bank.

### Method of the Research:-

The type of study was juridical-empirical, a study based on library research, as well as field research. This research was conducted in Jakarta on Flats Development Actors "W", "X", "Y", the Regional Office of the National Land Agency of Jakarta, Jakarta Provincial Governors' Office and the Office of Notary.

The population in this research is the Development Actors/Business Performers on the Flats in Jakarta, Buyer/Consumer of Unit Flats, Head of the Regional Office of the National Land Agency of Jakarta, Jakarta

Provincial Government and Notary. The technique of sampling was purposive sampling,<sup>9</sup> by considering that only meets the specific criteria in accordance with the purpose of the research is used as a sample.

The data obtained in this research were primary and secondary data, it will be analyzed qualitatively and presented descriptively, by elaborating, explaining and describing the legal protection is reflected through the legal certainty provided to buyer/consumers of unit flats for unit flats purchases through Sale and Purchase Engagement Agreement.

## Results and Discussion:-

### A Review of Sale and Purchase Agreement as Basis for of Unit Flats Ownership:-

The definition and scope of the Sale and Purchase Agreement (SPA) normatively is not found in the Flats Act. Flats Act is not specifically regulate the characteristics of the SPA, and in fact there is no further explanation of what is meant by the SPA in Flats Act in Indonesia. SPA is only referred to in Article 42 and 43 of Flats Act, as a legal instrument against the sale and purchase of unit flats to the development actors who have not completed all the facilities and the building of flats to be sold it. SPA in Article 42 of Flats Act set conditions on the procedure of sale and purchase of unit flats that unfinished construction namely the seller as development actors can do marketing before construction of flats. Furthermore, in Article 42 paragraph (2) stipulated that in terms of marketing is done before the construction of flats as described in paragraph (1), development actors must have at least 5 (five) things:

- certainty of space allocation;
- certainly rights to land;
- certainty of tenure status of flats;
- permitting the construction of flats; and
- guarantee for construction of flats from insurance corporation.

Then in Article 42 paragraph (3) determined that in terms of marketing is done before the construction of flats completed as referred to in paragraph (2), then everything that is agreed by development actor and/or binding marketing agent as the Sale and Purchase Engagement Agreement (SPA) for the parties.

Based on the analysis of author on the provision of Article 42 paragraph (1), (2) and (3) of Flats Act above, the instrument of SPA in sale and purchase of unit flats cannot just be done, if it does not meet all the requirements specified in the Flats Act. The provisions of Article 42 paragraph (2) of Flats Act are requirements that must be met by development actors before marketing. According to author, the requirement must be met cumulatively; so that the SPA may have binding force is strong.

Apart from the two article in Flats Act, orders for further guidance on the SPA was not found in Flats Act, so what and how SPA referred to in new Flats Act, do not have special characters. SPA arrangements prior to the enactment of new Flat Act found in the Decree of the Minister of People Housing No: 11/KPTS/1994 on Guidelines for the Sale and Purchase Engagement of Unit Flats. Decree of the Minister is declared valid because not been revoked or amendment by new regulations under the provisions of Flats Unit.

In the annex to the Decree of Ministerial provides that the SPA is a sale and purchase agreement by message or preliminary purchase agreement which then will be set forth in the Sale and Purchase Certificate of Unit Flats. Thus, the SPA as a form of agreement on matters agreed between development actors as the seller and the buyer of unit flats that binding formal-juridical on both parties, although the character of SPA theoretically still at the stage of *pre-contractual* or pre-selling contract, because SPA has contained rights and obligations between the purchaser or consumer with development actors/business actor.

However, based on the analysis of literature data, the binding force of SPA is largely determined by the character of SPA provided by Flats Act. This means, the legally binding force of SPA is determined by the fulfillment of the requirements set out in a limited manner in Article 43 paragraph (1) and (2) of Flats Act. Thus, according to the author, although SPA has met the requirements for the validity of an agreement, but if SPA was created not qualify under Article 43 paragraph (1) and (2) of Flats Act, the SPA does not have strong binding legal force.

---

9 Bambang Sunggono. (2006). *Metodologi Penelitian Hukum*, PT. Raja Grafindo Persada, Jakarta, pages. 44-45

Theoretically, an agreement on a particular issue that made consciously by those who made it, whether made orally or in writing, that they meet the provisions of Article 1320 of the Civil Code on the validity of the terms of the agreement, then the agreement is binding on the parties. Terms of validity of agreement in question are:

- agreed to those who bound themselves;
- skills of the parties to make an engagement;
- a certain thing;
- lawful cause

The first and second requirement (a and b) referred to as the subjective condition because both of those conditions must be met by the subject of the law, while the third and fourth is referred to as objective conditions for these two conditions to be met by the object of the agreement. Differences both requirements associated with *nieteg or null and ab initio* and *vernietigbaar = voidable* of an agreement. If the objective requirement in this agreement is not fulfilled, the agreement is null and void or agreement from the beginning has been canceled, the law presumes the agreement never existed. If the subjective requirement is not met then the agreement can be canceled or the whole of the agreement have not been canceled or not the court, the agreement in question was still valid.<sup>10</sup>

In relation to the SPE made between development actors/businesses actor with buyers/consumers, can be analyzed based on the provisions of Article 1320 of the Civil Code, then the signing of the SPA by the parties as set forth in the SPA between Development Actors in this case Development Actors "W" and "X" with the buyers/consumers,<sup>11</sup> indicating that it has fulfilled the elements agreed for those that bind himself.

Someone said give consent or agreement (*toestemming*) if he did want what was agreed. Based on the analysis of data from interviews with respondents were 20 (twenty) peoples, all respondents stated that they wanted the signing of SPA. Badruzaman<sup>12</sup> explains the definition of agreed as a condition of the will of approved (*overeenstemmendewilsverklaring*) between the parties. The statement of parties offering called bid (*offerte*), whereas the statement of parties accepting offering called acceptances (*acceptatie*).

Based on the provision, in relation to the results of interviews by the author<sup>13</sup> found the conclusion that they consciously have the intention to buy the unit flats which is then signing the deed of SPA, as shown in Table 1.

**Table 1:-** Data on statement of intent of respondents in SPA on Development Actors "W" and "X" of Flats

Development Actor	Statement of Intent		Amount	Percentage
	Read and Signed	Not read and Signed		
W	0	10	10	50%
X	10	0	10	50 %
Total			20	100%

Source: Primary data, 2016 (Edited)

Data on Table 1 shows that all the respondents on Development Actors "W" claimed that the SPA was signed not read beforehand. Although not read, but the SPA was signed, then in formal judicial, statement of intent of the parties have stipulated in the SPA, it meaning that the parties have agreed to bind himself in agreement with the intended object of unit flats, although 10 (ten) respondents of flats "W" recognizes that the contents of SPA were not read, and only informed that the SPA is evidence that the respondent has bought the flats.

Such conditions corresponding to the recognition of the Head of PPPSRS Mr. Be,<sup>14</sup> that based on complaints from buyers of unit flats on Development Actors "W", they are only required to sign without reading the contents of the

13 Analysis of questionnaire for 10 (ten) respondent of development actor "W" and 10 (ten) respondent of development actor "X", that distributed on October 2016 in Jakarta.

SPA in advance, as well as SPA previously should not be taken home to be studied prior to signature, but development actors "W" only provides an opportunity for buyers/consumers see SPA shortly before signed on the same day.

In such conditions, must all respondents do not understand the contents of the SPA, as well as recognition of the respondents listed in Table 2. However, the development actor "X" of all respondents (100%) admitted that the SPA was read in advance by the Notary before they are asked to sign it. However, when asked if they understood the contents of the SPA, it turns out there are 2 (two) of 10 (ten) of respondents or 20% did not understand the details of the SPA, as shown in Table 2.

**Table 2:-** Data on respondent's knowledge on SPA of flats of development actors "W" and "X"

Development actor	Understand the content of SPA	Do not understand the content of SPA	Amount	Percentage
W	0	10	10	100%
X	8	2	10	100%
Total			20	100%

Source: Primary data, 2016 (edited)

The data in Table 2 shows that 100% of respondents in Development Actors "W" do not understand the contents of SPA because it does not read out in advance or no explanation is given by the Development Actors and respondents were only asked to sign it. All respondents (100%) on the Development Actors "W" just know that with the signing of the SPA, they have obtained flats that would be his/her and understood as his/her own. SPA for them has been considered as proof of ownership of the flats.

Based on a review of the requirement related to the validity of the binding force agreement SPA as the basis for the acquisition of flats, then all requirements referred to in Article 1320 of the Civil Code are nominally fulfilled. However, when reviewed based on the contents of the SPA, the Development Actors "W" made under hand, tend to weaken the position of the buyer/consumer. Because the deed of SPA had been prepared in advance or prepared in a standard contract model, so buyers/consumers only sign to the contents of deed. It is recognized by all respondents on Development Actors "W" 10 peoples (100%) that they are only required to sign the deed of SPA (See Table 1).

It can happen, because in practice, the SPA is an agreement made unilaterally by development actors/businesses actor in the form of raw agreement contain standard clauses, which can certainly allegedly contained clauses that may favor or favor the perpetrators of such development. Clauses in raw agreements can only be made in such a way and can even be made is not clear and firm with the aim to protect the interests of development players from certain obligations, or instead they refrain from clauses that can bind to and guarantee the rights of the buyer or consumers that could potentially harm the buyer or consumer.

In fact, from the principle of the law of treaties (agreement), agreements must be made in good faith. The principle of good faith is a principle known in the law of agreement, more details on the provisions on good faith is governed by Article 1338 paragraph (3) of the Civil Code, that the agreement must be made in good faith. Good faith is also not only refers to the good faith of the parties, but should also refer to the values that developed in the community, because the assessment of a will can be good or bad derived from *living law* or law in the community. With such meanings are made in good faith as a universal social force that govern social relations between them.<sup>15</sup>

The limited arrangement to the SPA in Flats Act and implemented by Development Actors are not based on the fulfillment of the principles in the agreement and consumer protection, can lead to legal uncertainty and tend to harm the buyer/consumer. While in reality, the SPA is a way of buying and selling of flats which must be carried out by development actors/businesses actor, for giving a great business opportunity and a way of marketing that is more easily attract buyers.

14 Interview on 12 October 2016 in Jakarta.

### Legal Protection against Flats Buyer Based on Sale and Purchase Agreement:-

In theoretical, legal protection implies a meaning protection derived from the legal provision and/or any laws made by a State or on the basis of the peoples' agreement to regulate the relationship between the individual and the government that is considered to represent the peoples' interests. Relating to the legal protection of buyer/consumer of flats on the basis of SPA may refer to Salim H.S<sup>16</sup> that the legal protection as an effort or form of service provided by the law to the subject of law and matters became a protected object. In this case, the form of services provided by Flats Act in providing protection for the interests of buyers in the acquisition of flats by using SPA instrument, so that the buyers of flats can enjoy the rights granted by the law, namely the ownership of flats.

SPA as legal instruments in the process of sale and purchase of flats that regulated in Flats Act expected to be a strong legal instrument as basis for the acquisition of flats, so it can provide legal protection to the buyer/consumer, but it turned out to be based on research results state the expected does not materialize, because SPA apparently not be grounds for them to raise it to the Sale and Purchase Agreements for further obtained the Freehold Title as proof of ownership rights to the flats.

Based on data analysis of questionnaire to 20 (two) twenty respondents from 2 (two) development actor, it turns out all respondents (100%) argued that SPA is proof of ownership of flats. On the contrary, they admit that SPA they have not yet as basis for demanding their rights to obtain legal certainty in the form of Freehold Title that has been bought in cash. That is, until now SPA they have not been able to be increased to the Certificate of Sale and Purchase henceforth as basis for the issuance of Freehold Title of flats. Such conditions corresponding to the results of an interview<sup>17</sup> with Mr. A as *Legal Staff* on Development Actors "W", that SPA of flats from buyers who have paid cannot be processed the Certificate of Sale and Purchase because main certificate on behalf development actor have not been published to date. In addition, the requirements that have been agreed in the SPA that the signing of Certificate of Sale and Purchase will be made if the flats have been fully developed.

In relation to the reasons given by Mr. A as *Legal Staff*, by comparing the statement of the Head of Land and Land Registration of BPN Jakarta Andi Tenrisau that Development Actors "W" has not entered a registration application of Freehold Title of flats, so what has been agreed in the SPA that the Certificate of Sale and Purchase will be made if the main Freehold Title of flats has been issued on behalf development actors, not enabling to be realized and it will only be a reason for development actors to evade responsibility. Data from the questionnaire on knowledge about the SPA can be seen in Table 3.

**Table 3:-** Data on respondents' knowledge on the Position of SPA as proof of ownership of flats

Development actor	Understand the Position of SPA	Do not Understand the Position of SPA	Amount	Percentage
W	0	10	10	100
X	0	10	10	100
Total		20	20	100

Source: Primary data, 2016 (edited)

The data in table 3 shows that the respondents do not understand the position of SPA in Flats Act, because in their understanding, when it had signed the SPA then they already feel they are receiving legal protection of his/her rights as a buyer of flats. The form of legal protection that they expect is to obtain legal certainty of ownership in the form of Freehold Title of flats. In Flats Act, legal certainty of flats ownership by the issuance of freehold title of flats as proof of ownership of flats. Freehold Title of flats will be strong evidence for the flats owner and can be used as collateral.

Based on the analysis of author, especially against the legal norms that regulate the SPA in Flats Act, it can be concluded that the arrangements of SPA that are limited in Flats Act cannot provide legal protection to the buyer/consumer, for the arrangement of SPA in Flats Act is only as administrative requirements. While, the position of SPA as proof of buying and selling on flats are not confirmed.

16 Salim HS. (2014). *Penerapan Teori Hukum pada Penelitian Tesis dan Disertasi*. PT. Raja Grafindo Persada. Jakarta. page. 262

17 Interview on 11 October 2016.

Based on the results of study found that not all development actors do marketing has completed the administrative requirements set out in Flats Act, as in Development Actors "W". Based on interview with Andi Tenrisau<sup>18</sup> as Head of Right to Land and Land Registry of National Land Agency Jakarta that the ownership of land for construction of flats by Development Actors "W" is unclear because until now the Development Actors "W" are not yet signed the petition right, Though the requirement of land ownership status for the construction of flats should be clearly defined in Article 43 paragraph (2) of Flats Act.

Buyer/consumer is protected by UUPK particularly concerning the rights of consumers, among others, set forth in Article 4 of the right to obtain compensation and/or reimbursement, if the goods and/or services received are not in accordance with the agreement or not as it should be. In addition, development actors/businesses actor burdened with the obligation under Article 7 UUPK to be good faith in conducting its business activities, as well as provide the correct information, clear and honest about the condition and guarantee of the goods and/or services and explain the use, repair and maintenance.

Clearly, UUPK stipulates the purpose of the enactment of UUPK among others set forth in Article 3 letter (d), to create a consumer protection system contains elements of legal certainty and transparency of information and access to information. However, the provision of Article 3 of UUK does not materialize in the research by the author. Because the data is based on questionnaires to 20 respondents, it turns out all (100%) of the respondents had paid in cash their flats, but development actors not provide time certainty for the issuance of Freehold Title. In this condition, according to Lili Rasjidi and WyasaPutra,<sup>19</sup> the legal protection is not able to provided by the law, but legal protection is actually output from the workings of the law believe the theory of interest of fairness, expediency and legal certainty in an effort to provide public services. That is, when the SPAis set as a legal instrument in sale and purchase of flats, then it should have the legal character of the SPAwere made should be more concrete, in order to provide legal certainty.

In theoretical, the form of legal protection is divided into two forms, namely:<sup>20</sup>*First*, the protection is preventive.*Second*, the protection is repressive. Preventive protection is legal protections that are precautionary. Protection provides the opportunity for people to submit his/her complaint before a decision the government receives in definitive. So that legal protection is intended to prevent disputes and it great significance for the acts of government that is based on freedom of action.<sup>21</sup> While the legal protections that are repressive function to complete the event of a dispute.

The government in legislation or policies made should provide solutions in order to provide protection to the buyers/consumers who buy flats and has fulfilled all its obligations as a buyer. Moreover, the nomenclature of SPAare accommodated into new Flats Act is not accompanied by any further settings, according to the authors provide arrangements vagueness that result in the absence of the protection afforded by the State Government in this regard to the buyer of flats. Ideally, sale and purchase based on the SPA can only be done when it has to meet the requirements of Article 42 and Article 43 Flats Act, but the practice many development actors/ businesses actor that conduct development and marketing and selling of flats though not meet all the administrative requirements specified in Flats Act.

In relation to the legal protection provided by the government, the authors argues that arrangements or regulation granted by the government to the buyer/consumer of flats that purchased by sale and purchase agreement do not reflect the absence of legal protection, both preventive and repressive. This is evident from the absence of further regulation of Flats Act that governing specifically the time limit should be observed by development actors/business actors to improve the status of SPAfor subsequent Freehold Title issued on flats.

### Conclusions:-

Sale and Purchase Agreement (SPA) as a basis of flats ownership is not evidence that can provide legal certainty for buyers/consumers, because in practice, not carried out in accordance with the Flats Act. The responsibility of development actors to give legal certainty to buyers of flats is in the fulfillment of obligation of the development

18 Interview on 14 October 2016 at Regional Office of National Land Agency of DKI Jakarta

21 Salim HS. (2014). *Op.Cit*. Page 264

actors with the delivery of Freehold Title of flats after the buyer completes the entire payment and other costs that have been agreed in the SPA. The lack of regulation of the SPA in Flats Act causing the weak of legal protection to the buyer in obtains legal certainty for flats ownership. In relation to the provision of legal protection to the buyer of flats, then the instrument of SPA needs to be revisited in its existence in Flats Act in order not to become a tool for development actors to ease marketing but ignore the rights of buyer/ consumer to obtain legal certainty.

#### Abstract

Radio frequency identification (RFID) always has a significant area of academic research over the last few years. The current paper presents a literature review of academic journal articles that were published on the subject after year 2000. Several case examples have been analyzed with the particular focus on RFID applications, its potential and future opportunities, particularly during disaster and rescue applications. It is hoped that the review will be a useful resource for researchers interested in RFID research.

#### Introduction:-

The primary focus of emergency management is the avoidance, control, management, and elimination of inherent losses when disasters occur. With the high number of natural and manmade disasters, researchers have emphasized on all aspect of disaster including preparedness, mitigation rescue, and recovery. Disasters can be very different in their distinctiveness on severity, the impact of homes, businesses, public structures, and human life or any combination of the above [1].

Tracking human beings and objects have been considered as a primary component for researchers and scientists, especially during the disaster and rescue operations. Different Automatic Identification(Auto-ID), Technologies such as Sensors, Barcodes, Smart Cards, Optical character recognition (OCR), Biometric procedures-BP, Pattern analysis, Radio frequency identification (RFID) and Geographical information systems (GIS), have been used for tracking procedures. Detailed study of these technologies shows that they are often more resource demanding and their performance become questionable during the unfavorable conditions such as in emergencies. For instance, to implement GIS in disaster management, each site has to be identified, added to the suitable database and sited on the map. This takes more time and workforce during the development phase, as well as for maintenance phase [2]. The limitation of OCR systems is that they have failed to become globally popular because of their high price and complicated readers they require, in comparison with other ID procedures [3].

RFID can work well for tracking as well as authentication, automation and information management [4-6]. It is a contact-less, cost-effective and reliable technology. Therefore it can be used successfully where contact-less tracking and identification is required. RFID constitutes of a tag made up of a microchip at one end and a reader on the other, whereas both are connected with antennas. A reader sends out electromagnetic waves such that they are received by a tag antenna [7-9].

**Methodology:-**

This study was an unsystematic review in which the literature search was carried with the help of available literature, journals, books and proceedings and also searches engines available at Google, Google Scholar. We searched and analyzed the keywords such as Radio frequency identification, RFID application, disaster victim identification, disaster rescue and recovery. It was aimed to review the current research and development in the field of RFID application in disaster rescue operations. A taxonomic framework is also compiled to classify literature for quick content analysis and identify future direction of research.

**Finding and analysis of review:-**

RFID technology has exploited in the healthcare and hospitality [10], power facilities [11-12], urban planning and construction [13-14], parking and traffic control system [15-19], transportation [20] sectors. This facilitates early identification of potential problems and thus helping in preventing them from escalating into bigger problems. However, the need of planning during a disaster and emergency response has been flagged by various researchers [21-23]. Effective disaster management depends on the information systems and technologies which could play a significant role in making appropriate decisions at any stage of natural disasters and improving information dissemination and communication among of all stakeholders during response and recovery operations [24]. Various information communication technology (ICT) tools, such as geographical information system (GIS), remote sensing, RFID, GPS, building black box, radio communication media, and social media are available for use in disaster recovery [25-28].

**Various facets of RFID technologies in disaster and its applications in rescue operations:-**

The difficulties in identifying Disaster victim identification (DVI) during tsunami catastrophe was discussed by Meyer et. al., 2006 [29]. They suggested that placement of radio frequency identification device (RFID) microchips inside victim bodies provided a practical solution to problems of body tagging and attribution in the DVI setting encountered by the Austrian DVI team in Thailand in early 2005.

Pate [30] in his state of art technology review in Identifying and Tracking Disaster Victims identified the failure of the country to enough track casualties of Hurricane Katrina had been recognized as a noteworthy shortcoming of social and nearby calamity readiness arranges. This gap has urged government and private enterprises to acknowledge that current work-based tracking frameworks are unequipped for overseeing data amid a large-scale catastrophe. In light of this need, endeavors are under the approach to growing new advances including RFID technologies that permit moment access to personality and area data amid crisis circumstances.

The challenges in finding the causalities in seismic tremor in Japan's Niigata Prefecture were noted by M. Daito and N. Tanida [31]. The quake brought about a wired system detachment. The frameworks' breakdown was because of the huge number of clients who were stressed over the security of their relatives. The same circumstance happened amid Hurricane Katrina in the USA. This work gives careful consideration to a fundamental and guaranteed calculation for finding casualties utilizing RFIDs. To begin with, it discloses strategy to affirm the area of casualties. Second, it clarifies a strategy for pinpointing the position of casualties using trilateration. At last, it introduces simulation results.

The urban disaster response and recuperation were discussed by Peña-Mora *et al.*, 2008 [26] through a comprehensive cutting edge survey of different technological advances. This survey was a part of the CP2R venture (Collaboration Framework for Preparedness against, Respond to and Recovery from eXtreme Events (XEs) including necessary physical base) which has concentrated on enhancing the coordinated effort between the major performing artists that ought to be required in various strides of readiness against (i.e., before disaster), reaction (i.e. amid calamity) and recuperation (i.e., after disaster). The work presumed that developing Information and Communication Technologies using RFID can assume an essential part in a disaster readiness, reaction, and recuperation forms. Nam, 2009 [32] presented building up an expert system as a GUI project to decode radio frequency identification codes for modeling and simulation of natural disasters using virtual environment of disasters.

Badpa et al. 2013 [33] emphasized the effect and importance of Knowledge Management System in Disaster Management through RFID Technology Realization. They studied the various disasters, especially quakes in Iran. This work recommended Radio Frequency Identification System can be utilized in disaster victim identification and

framing disaster management strategies in coordination with Oracle as Data Base Management System with a devoted system framework.

The exploration work of Beruvides, 2014 [1] emphasized on potential uses for the RFID innovation in emergency management. The paper was focused on crisis administration (man-made or natural) and found that emergency management includes the avoidance, services, control, and disposal of intrinsic misfortunes when disasters happen. Vijtech et. al. 2016 [34] studied on Ultra High-Frequency Radio Frequency Identification device tag design for disaster management. The Ultra High Frequency (UHF) Radio Frequency Identification device (RFID) label plan as a piece of RFID confinement framework principally assigned for mass disasters. The configuration of RFID label considers numerous setbacks in a range of hundreds square meters, human body impedance, battery lifetime, maximal yield power, safe epitome and so forth. Results demonstrate the composed RFID label model is reasonable for application in a disaster management.

Healthcare and disaster supply chain have becoming a more critical and popular research issues recently. The current issues both healthcare and disaster supply chain, especially in natural disaster case, was studied by Syahrir, I., and Vanany, I. (2015) [35]. Research that integrates both healthcare and disaster supply chain is a relevant issue to develop a model framework in order to have the capability in handling humanitarian relief operations during natural disasters including focused on inventory management and controls for medical needs in the event of a natural disaster (eg earthquakes, floods, epidemic disease outbreaks, landslides, etc.). Use information technology such as RFID was highlighted more widely in the healthcare and disaster supply chain system in responding to the problem of interference supply chain at the time of the disaster.

Daito, M., and Tanida, N. (2008) [31] in their study on Agent-based simulation approach for disaster rescue using active RFID found that after the 2004 earthquake in Japan's *Niigata* Prefecture, there were many difficulties finding the victims. The earthquake caused a wired network disconnection. Also, fixed-phone and cell-phone service systems crashed due to the rapid increase in the volume of communications. The systems' collapse was due to a large number of users who were worried about the safety of their relatives. The same situation happened during Hurricane Katrina in the USA. Reflecting on these situations, the Japanese Ministry of Internal Affairs and Communications is trying to adopt several methods to correct these communications problems. Authors recommended that a predominant goal of one of the methods is most likely to find victims using RFIDs (Radio Frequency Identification) with computer sensors. They suggested that the RFID process would have to be incorporated in the following ways: 1) by scattering sensor devices from helicopters when a large-scale disaster such as an earthquake occurs, 2) by making RFIDs self-organized into a network, and 3) by making the self-organized network pinpoint the position of victims. The researchers pay specific attention to a simple and assured algorithm for discovering victims using RFIDs by the method to confirm the location of victims then pinpointing the position of victims using trilateration and simulation results.

The paper on emerging technologies to support urban resilience and disaster recovery by Peña-Mora *et al.*, 2008 [26] presented a comprehensive state-of-the-art review of various emerging technologies to support urban disaster response and retrieval. The review was undertaken as a part of the CP2R project (Collaboration Framework for Preparedness against, Respond to and Recovery from eXtreme Events (XEs) involving critical physical infrastructure) which has focused on improving the collaboration between the main actors that should be involved in different steps of preparedness against (i.e., before disaster), response (i.e. during disaster) and recovery (i.e., after disasters). Technologies reviewed include the application of Radio Frequency Identification (RFID) based techniques for formative assessment, field responders mobility and disaster site data collection, Geospatial Information System (GIS) for optimal resource optimization from disaster site were discussed. The paper concluded that emerging ICTs (Information and Communication Technologies) can play a pivotal role in disaster preparedness, response and recovery processes. The need for further exploitation of convergence and synergy between various technologies and their application to support existing disaster response processes is also discussed.

Dorasamy *et al.*, 2013 [36] in their review of Knowledge management systems in support of disasters management highlighted that the successful management of emergency situations requires proper planning, guided response, and well-coordinated efforts across the emergency management life cycle. It was suggested that emergency management efforts benefit from well-integrated knowledge-based emergency management information systems (EMIS). It was found that only limited work has been done in three EMIS-knowledge management system (KMS) subdomains: (i)

definition, (ii) use, and (iii) methods. Second, only limited research has been done in embedding roles in KM systems.

Ganz *et al.*, 2015 [37] introduced the DIORAMA based system that provides situational awareness for urban search and rescue operations in both indoor and outdoor settings, significantly improving the operations' efficiency. Using a Smartphone, DIORAMA enables the responders to triage patients with active RFID tags and to mark the locations of trapped patients and points of interest (e.g. fire, chemical spill, collapse buildings). Also, the tagged patients' location will be automatically tracked and updated on the interface. The incident commander can also interact with the responders on-site using the DIORAMA interface either on a Smartphone or a tablet. The DIORAMA system uses active RFID technology as well as visual analytics tools.

Hasanzadeh, S., and Sarkari, M. (2014) [38] argued that RFID can be useful technology that can be used in emergency situations. In the model offered by Badpa and his colleagues this technology had a major role in coordination, which can be done in an emergency situation. Dorasamy and his colleagues' research showed that if some recommendations offered by them is considered in KMS designing, it can be more useful in support of emergency situations. And finally, Li and his colleagues' research show that establishing broad connection between different parts of a community including various organizations and peoples can make a useful database that its' knowledge and resources can be used when a disaster occurs.

Nam, 2009 [39] in his paper presented an expert system as a user interface program to decode radio frequency identification codes for simulation and modeling of natural disasters. The entire developed environment for the expert system is intended to integrate all subtasks as a standard user interface program to simulate and report the damages due to the catastrophic disasters. To perform the simulation as a part of the entire system, the expert system reads in RFID codes to provide the desired information about the damages due to the catastrophic disasters based upon the available fields.

Ingrassia *et al.*, 2012 [40] demonstrated the applicability and the reliability of a radio frequency identification (RFID) system to collect data during a live exercise. In their study, a rooftop collapse of a crowded building was simulated. Fifty-three volunteers were trained to perform as smart victims, simulating clinical conditions, using dynamic data cards, and capturing delay times and triage codes. Every victim was also equipped with a RFID tag. RFID antenna was placed at the entrance of the advanced medical post (AMP) and emergency department (ED) and recorded casualties entering the hospital. Results showed 100% accuracy in tag reading or data transfers.

Ahmed, A., and Sugianto, L. (2012) [41] in their papers addresses the impacts of RFID (radio frequency identification) adoption on the performance of emergency management organizations. They studied that what are the effects of RFID adoption on the performance of emergency management operations? They found that the impacts of using RFID technologies reduced response time, efficient tagging and tracking, compatibility, reduced labor cost, and robustness. The empirical findings in these studies indicated that five key factors influencing the decision to adopt privacy, compatibility, standardization, implementation, and locatability.

The role of the RFID technology in an earthquake to rescue victims was studied by Akbari, B., and Ajami (2015) [42]. They found in their review that organizational resources and technical structures such as hardware and software are essential requirements in the redesign of electronic projects, especially in disaster response. The RFID makes the prevention of the human error of Medicine, easy, and fast access to medical staff, equipment, medicine. It is cost effectiveness. All of these factors cause to increase the quality and quantity of care in the healthcare sector. The study also helps define the concept of "Tracking victims via RFID" (regarding both advantages and barriers) as the new technology in the present age.

Chatfield *et al.*, 2010 [43] studied the E-Government Challenge in Disaster Evacuation Response and emphasized on the role of RFID Technology in Building Safe and Secure Local Communities. The potential high impact and strategic value of integrating RFID into e-government development and government's comprehensive natural disaster management policy for improved preparedness, response, recovery, and mitigation, very little has been written in the e-government literature regarding the adoption, use, and impact of RFID in building safe and secure local communities for citizens and businesses.

The role of the RFID technology in an earthquake to rescue victims was studied by Akbari, B., and Ajami, S. (2015) [42]. They found that organizational resources and technical structures such as hardware and software are essential requirements in the redesign of electronic projects. The RFID makes the prevention about the human error of Medicine, easy, and fast access to medical staff, equipment, medicine. The advantages of RFID cited by researchers includes reduce time; cost, error, facilitate medical and supportive data recording by using RFID in the process of victims tracking. The significant barriers highlighted in this study by Akbari, B., and Ajami[42] was the inability to read wet Tags; Tags and reader interaction, safety and security concern, the high initial cost for tag and hardware, ethical and moral dimension to tagging human.

Daito, M., and Tanida, N. (2008) [31] revealed that RFID could play a predominant role to find victims with computer sensors. They suggested that the RFID method would have to be incorporated in the following ways: 1) by scattering sensor devices from helicopters when a large-scale disaster such as an earthquake occurs, 2) by making RFIDs self-organized into a network, and 3) by making the self-organized network pinpoint the position of victims. They also highlighted the importance of field-testing as a necessity to confirm the effects. The summary of the review is presented in table 1.

**Table:-** Summary of RFID review.

<b>Particulars related to RFID</b>	<b>Major area of RFID application</b>	<b>Abstract</b>	<b>Reference</b>
The adoption of RFID technology in the retail supply chain	Recent improvements with respect to selection of RFID innovation in retail inventory network.	This innovation to retailers are plot as opposed to Bar Coding	[44]
Implantation of radio frequency identification device (RFID) microchip in disaster victim identification (DVI)	Practical solution to problem of body tagging.	The position of RFID microchips inside casualty bodies gave a down to earth answer for issues of body labeling and attribution in the DVI	[45]
VIRE: Active RFID-based localization using virtual reference elimination	RFID for indoor area detection.	The proposed methodology can defeat the above downsides without extra cost	[46]
A framework for disaster management system and WSN protocol for rescue operation	Information collection framework for disaster mitigation and rescue operation.	This proposed structure and contrast the execution of the convention and that of SENDROM framework convention.	[47]
Identifying and Tracking Disaster Victims: State-of-the-Art Technology Review	Identification and tracking of disaster victims.	Proposed approach to grow new advances that permit moment access to personality and area data amid crisis circumstances.	[30]
Agent-based simulation approach for disaster rescue using active RFID	Strategy to affirm the area of causalities.	This work gives careful consideration to a basic and guaranteed calculation for finding utilizing RFIDs	[36]
Review of Emerging Technologies to Support Urban Resilience and Disaster Recovery	Radio communication and social media for use in disaster recovery.	The work presumes that developing ICTs can assume a urgent part in a disaster readiness, reaction and recuperation forms.	[26]
Lightweight cryptography in radio frequency identification (RFID) systems	Lightweight cryptographic arrangements in RFID	Study investigates of the best in class distinguishes the requirement for lightweight cryptographic arrangements reasonable for these extremely obliged gadgets	[48]
Development of an Expert	Expert system as a user	Proposed master framework	[40]

System as a User Interface for an RFID Application	interface program.	peruses in RFID codes considering the end goal to give the sought data about the harms.	
Implementable Privacy for RFID Systems	RFID innovation to track development of items.	A configuration strategy for building private frameworks from these building blocks	[49]
What benefits can be brought forward by adopting RFID in emergency management	Impacts of RFID adoption on the performance of emergency management.	This work will help the crisis administration associations to better manage the crisis operations	[41]
E-government challenge in disaster evacuation response: the role of RFID technology in building safe and secure local communities	Role of RFID in building safe and secure local communities.	This work presents an audit of the review and a field contextual investigation	[43]
A relationship investigation was performed between the two techniques plotting the matched RFID and manual times	Data collection in a live mass casualty through RFID and manual system.	Data collection in a live mass casualty incident simulation: automated RFID technology versus manually recorded system	[50]
Findings show that 5 key variables affecting the choice to receive are security, standardization, compatibility, implementation and locatability.	Significance of RFID in Emergency management.	Potential of RFID in Emergency Management: Task-Technology Fit Perspective	[41]
This study proposes an structure for the improvement of a philanthropic crisis stock administration	Inventory management framework for emergency relief operations.	An RFID-based inventory management framework for efficient emergency relief operations	[51]
The proposed model means to concentrate on learning, human and innovation related issues of Emergency Coordination Center	Effect and importance of Knowledge Management System in Disaster management through RFID.	Effects of knowledge management system in disaster management through RFID technology realization	[33]
This study had performed examination of Flood Prediction procedures taking into account GIS utilizing Ad hoc remote Sensor Network Architecture	Flood prediction and disaster risk analysis.	Flood Prediction and Disaster Risk Analysis using GIS based Wireless Sensor Networks, A Review	[52]
This study exhibits two decade's audit of works relating to the use of learning driven frameworks in backing of crisis administration	Knowledge management system in support of disasters management.	Knowledge management systems in support of disasters management: A two decade review	[37]
It show a novel separation hopping convention in	Innovative separation hopping.	Privacy in RFID and mobile object	[53]

light of diagrams that is amazingly low-asset expending			
This work, subsequent to calamity administration, asses learn about the calculated application model of the KMS application in a disaster administration.	KMS application in disaster management.	Evaluation of Knowledge Management Systems application in Disaster Management	[39]
This work presents past examination and applications that show new potential uses for the RFID innovation in emergency management	Primary focus of emergency management.	An Analysis of the Potential and Actual Utilization of the RFID Technology in Emergency Management	[1]
Proposed work is to counteract cloning and falsifying of tags in view of RF Fingerprinting	RFID based signal acquisition.	RFID Signal Acquisition and Identification	[54]
The composed RFID label model is reasonable for application in a disaster management	Disaster management centric RFID tag designs.	UHF RFID tag design for disaster management	[35]
This work is a preparatory report of an examination on medicinal services and calamity store network	Healthcare and disaster supply chain.	Healthcare and Disaster Supply Chain: Literature Review and Future Research	[36]
The labeled patients' area will be naturally followed and overhauled on the interface	Smartphone and RFID tag based rescue.	Urban Search and Rescue Situational Awareness using DIORAMA Disaster Management System	[38]
This literature survey characterizes the idea of "tracking casualties by means of RFID" as the new innovation in the present age	Role of RFID in earthquake to rescue victims	Radio frequency identification and rescue victims in earthquake	[42]

### Conclusion:-

The adoption of RFID technology hailed as one of twenty-first century's greatest contributions in the retail supply chain, healthcare and hospitality, power facilities, urban planning and construction, parking and traffic control system, transportation sectors is significant. Recently Radio frequency identification (RFID) gains an important area of academic research with focus on disaster preparedness and rescue operations. However, from the above literature review, it can be concluded that standardization of hardware, software, network protocols and reading devices of RFID can play vital role during disaster and rescue applications including disaster victim identification.

#### Abstract

The objective of this study was to assess oral health knowledge, attitude and practice behaviour among obstetricians in Mangalore city, Karnataka. A total of 135 participants responded to a self constructed questionnaire consisting of open and closed ended questions. The data was analyzed by applying descriptive & inferential statistical analysis. Level of significance was kept at 5% ( $p=0.05$ ). Results have shown that the obstetricians with the lack of knowledge and time (8.1%, 11.0%) regarding outcomes of poor oral health respectively were less likely to refer for comprehensive oral care services for pregnant patients (25.7%  $p=0.991$ ). Obstetricians working in private hospitals showed significantly higher mean attitude score (59.1%,  $p=0.014$ ) towards the referral of expectant mothers to dentists or periodontists regularly as compared to academicians (38.1%) and post graduates (30.0%). 87.0% ( $p=0.068$ ) of obstetricians strongly recommend the need for dental treatment prior to conception. Majority of the obstetricians considered in the present study showed adequate knowledge, attitude and practice behaviour but there is a gap between knowledge and practice ( $r=0.432$ ,  $p=0.000$ ).

#### Introduction:-

Oral health is an integral component of general health [Shah et al.2013]. Pregnancy is a delicate condition involving complex physical and physiological changes [Balla et al.2013]. Oral tissues are known to be affected by pregnancy with the most frequent and greatest changes occurring in the gingival tissues. Studies have shown that there is a relationship between pregnancy and periodontal status with a variability in the frequency of periodontitis among pregnant women, ranging from 35% to 100%. [Patil.S et al.2011, Ifesanya JU et al.2010, Wandera M et al.2009, Piscoya MD et al 2012, Vogt M et al.2012, Wu YM et al.2013, Dhaliwal et al 2013]. Pregnant women may be more susceptible to periodontal disease, since higher concentration of estrogen and progesterone can induce hyperaemia, edema, bleeding in periodontal tissues and increased risk of bacterial infection [Russell et al.2008].

Obstetrician due to frequent contacts with family are in an ideal position to provide guidelines for improving oral health.

**Corresponding Author:- Maha Musthafa.**

Address:- Yenepoya Dental College, Mangalore.

earlier than dentist [Balla et al.2013]. Thus it is essential for these specialists to be aware of the infectious nature of oral diseases and its associated risk factors to make appropriate decisions regarding timely and effectively. Increasing the involvement of obstetrician during pregnancy care visits can actually play an important role in improving the oral health of their patients and thereby reducing adverse pregnancy outcome. Therefore, the present study was designed to assess the knowledge, attitude and oral health practices among Obstetricians. It is assumed that results obtained from this study will open new frontiers in the management of oral diseases during pregnancy.

### **Materials and Methods:-**

There is no universally accepted or recommended index/ inventory to measure dental health attitude and behavior. The data was collected on the attitude and behavioral aspects which was derived from a series of open and closed end questionnaires. The Hiroshima University- Dental Behavioral Inventory (HU-DBI) questionnaire developed by Kawamura has been regarded as useful for assessing patient's perceptions and oral health behavior and is widely used all around [Dagli et al.2005].

This is a cross sectional study with a sample consisting of 145 Obstetrician from Mangalore city, Karnataka with a population of approximately 600,000 and is a reputed center for education with five medical colleges, four dental colleges and twenty five private hospital centers. Questionnaire consisted of self constructed open and close ended questions. Participation in the survey was voluntary. Besides, confidentiality was also maintained about the personal record. Obstetricians who were not willing to participate in the study and who did not respond/gave back the questionnaire during the stipulated time period were excluded from the study. Prior to data collection ethical approval was obtained from Institutional ethical committee, Yenepoya University, Mangalore, Karnataka.

### **Questionnaire design:-**

- The questionnaire was prepared by the principal investigator in consultation with other authors. Reliability of the questionnaire was assessed using cronbach's alpha internal consistency coefficient.
- A study specific questionnaire consisted of 27 questions which were divided into four parts.
- Personal data, their personal dental care histories, details relevant to professional practice.
- Knowledge about changes in oral health during pregnancy and their effect on pregnancy outcomes (1-9 scale).
- Attitude towards the oral health and pregnancy outcomes (10-18 scale).
- Their own practice behaviour to implement their knowledge (19-27 scale).

The question scale numbers 11,12 and 23 are open ended questions. [Personal oral care questions such as reason for visiting the dentist by the Obstetrician, how often they used to visit dentist and reason for not checking the oral cavity of expectant mothers respectively]. The questionnaires were handed to the subjects either in the clinics, colleges or the hospitals where they worked. The questionnaire was either collected the same day or next day. The filled responses were then transferred to the microsoft excel sheet for appropriate statistical analysis.

### **Statistical analysis**

Sample size of 97 subjects was obtained based on the formula by assuming 50% of the obstetricians aware with 95% confidence interval and 10% allowable error. However in the present study we could able to collect data from 135 subjects. The data was analyzed by applying descriptive & inferential statistical analysis. The cronbach's alpha value for closed end question was 0.93 and for open ended questions was 0.6345.

Analysis was carried out using SPSS package version 23. Pearson's Chi Square test was used to check the difference in knowledge, attitude and practice among Obstetricians. A Karl Pearson's correlation co-efficient is used to assess the hypotheses that there is a positive linear relationship between the variables, a negative linear relationship between the variables, or no linear relationship between the variables. Kruskal Wallis test was used to compare the variables between the groups. But the difference was not significant, So Posthoc analysis was not performed. Level of significance was kept at 5% ( $p= 0.05$ ).

### **Results:-**

#### **A. Basic characteristics:-**

Table I shows the distribution of Obstetrician and their demographic characteristics. A total of 135 responses were collected from 145 Obstetricians (93.10% response rate) which included private practitioners (32.4%), academicians (30.9%) and post graduates (36.8%). Their average number of years of experience as an obstetricians was 9.23 years.

**Table I-Basic characteristics of the participants**

Age	Percent (%)
24-30	33.1
31-40	34.6
41-50	20.6
51-60	11.8
Total	100
<b>Gender</b>	
Male	32
Female	104
Total	100.0
<b>Years in practice</b>	
5 yrs and below	52.2
6-10yrs	24.3
11-20yrs	15.4
Above 20yrs	8.1
Total	100.0
<b>Work sector</b>	
Academicians	30.9
Post graduates	36.8
Private	32.4

**Knowledge:-**

Table (II) shows their responses to the various questions regarding their knowledge about oral health. We found that Obstetricians with the lack of knowledge and time (8.1%, 11.0%) regarding outcomes of poor oral health respectively were less likely to refer to comprehensive oral care services for pregnant patients (25.7%,  $p=0.528$ ). 11 respondents in the study stated that gum disease does not affect the health of expectant mothers. Obstetricians who underwent regular dental examination themselves were slightly more attentive to report that they referred pregnant patients to dentists.

There was no co-relation between Obstetrician's experience and knowledge ( $P= 0.69$ ). There was significant co-relation between Obstetrician's self reported knowledge and routine referral to a dentists ( $P= 0.00001$ ).

**Table II-frequency distribution of knowledge regarding oral health**

Questions	Academicians(%)	Pg(%)	Private(%)	Total(%)	P value
1. Are you aware of a speciality in dentistry called periodontology?	No	7.1%	8.0%	11.4%	0.762
	Yes	92.9%	92.0%	88.6%	
2. Do any changes in dental health occur during pregnancy?	No	2.4%	2.0%	.0%	0.608
	Yes	97.6%	98.0%	100.0%	
3. Do you think gum disease can affect health of expectant mothers?	No	11.9%	10.0%	2.3%	0.528
	Yes	88.1%	90.0%	97.7%	
4. Do you think dental referral is important for expectant mothers?	No	11.9%	14.0%	6.8%	0.991
	Yes	88.1%	86.0%	93.2%	
5. Do you advice expectant mothers to undergo routine dental check up?	No	26.2%	26.0%	25.0%	0.941
	Yes	73.8%	74.0%	75.0%	
6. Can dental treatment be delivered at anytime during	No	81.0%	78.0%	79.5%	0.195
	Yes	19.0%	22.0%	20.5%	

pregnancy?						
7. Do you think periodic scaling causes harmful effects to teeth and gums in expectant mothers?	No	50.0%	46.0%	31.8%	42.6%	0.326
	Yes	50.0%	54.0%	68.2%	57.4%	
8. Does the pregnancy increases the tendency for gums to bleed or swell?	No	7.1%	8.0%	15.9%	10.3%	0.973
	Yes	92.9%	92.0%	84.1%	89.7%	
9. Can poor oral health be one of the causes for preterm labor and low birth weight in expectant mothers?	No	16.7%	18.0%	16.3%	17.0%	0.195
	Yes	83.3%	82.0%	83.7%	83.0%	

**Attitude:-**

The frequency distribution of dental attitude among study participants are shown in table (III). Obstetricians working in private hospitals showed significantly higher mean attitude score (59.1%,  $p=0.014$ ) towards the referral of expectant mothers to dentists or periodontists regularly as compared to academicians (38.1%) and post graduates (30.0%).

**Table III- frequency distribution of dental attitude regarding oral health**

Questions	Academicians(%)		Pg(%)	Private(%)	Total(%)	P value
	No	Yes				
10. Have you been to a dentist?	No	21.4%	16.0%	13.6%	16.9%	0.614
	Yes	78.6%	84.0%	86.4%	83.1%	
13. Do you feel expectant mothers should maintain good oral hygiene?	No	7.1%	4.0%	4.5%	5.1%	0.7751
	Yes	92.9%	96.0%	95.5%	94.9%	
14. Do you insist the expectant mothers should maintain good oral hygiene?	No	16.7%	14.0%	11.4%	14.0%	0.778
	Yes	83.3%	86.0%	88.6%	86.0%	
15. Do you refer expectant mothers to dentists/periodontists regularly?	No	61.9%	70.0%	40.9%	58.1%	0.014
	Yes	38.1%	30.0%	59.1%	41.9%	
16. Would you consult or take advice from dentists/periodontists if you notice gum disease in expectant mothers?	No	26.2%	22.0%	18.2%	22.1%	0.670
	Yes	73.8%	78.0%	81.8%	77.9%	
17. Do you think expectant mothers require oral health supervision by dentists/periodontist in all the trimesters?	No	21.4%	18.0%	29.5%	22.8%	0.399
	Yes	78.6%	82.0%	70.5%	77.2%	
1118. Do you feel dentists/periodontist should be included in prenatal care team?	No	19.0%	18.0%	20.5%	19.1%	0.955
	Yes	81.0%	82.0%	79.5%	80.9%	

**Practice behavior:-**

The frequency distribution of practice behaviour regarding oral health in Obstetricians are summarised in table(IV). 69.6% ( $p=0.073$ ) of the respondents think that the examination of oral cavity should be integral part of prenatal care while 30.4% think it is not necessary. Lack of time is the major factor which made 69.6% of Obstetricians refrain from checking oral cavity of expectant mothers. Comparison of mean knowledge, attitude and practice scores among gender and age group of Obstetricians did not show any statistical significance ( $p>0.05$ ).

However, Obstetricians with 20-25 years of experience showed higher mean attitude score towards prevention of oral diseases as compared to the others and the difference was statistically significant ( $p < 0.05$ ).

**Table IV-frequency distribution of practice behaviour regarding oral health**

Questions	Academicians(%)		Pg(%)	Private(%)	Total(%)	P value
19. Do you ask expectant mothers whether they use toothbrush and toothpaste regularly?	No	55.6%	62.5%	66.7%	60.9%	0.905
	Yes	44.4%	37.5%	33.3%	39.1%	
20. Do you examine whether the expectant mothers visited dentists/periodontist on your advice?	No	66.7%	50.0%	83.3%	65.2%	0.429
	Yes	33.3%	50.0%	16.7%	34.8%

	Yes	88.9%	87.5%	100.0%	91.3%	
25. Do you advice professional cleaning for expectant mothers as a part of prenatal care?	No	33.3%	25.0%	33.3%	30.4%	0.918
	Yes	66.7%	75.0%	66.7%	69.6%	
26. Have you used any of the available dental education aids to educate expectant mothers on oral health?	No	66.7%	75.0%	66.7%	69.6%	0.918
	Yes	33.3%	25.0%	33.3%	30.4%	
27. Do you think it is necessary to get dental problems treated prior to conception?	No	33.3%	.0%	.0%	13.0%	0.068
	Yes	66.7%	100.0%	100.0%	87.0%	

Level of knowledge, attitude and practice score regarding oral health care among Obstetricians have been shown in Figure 1, Figure 2 and Figure 3.

Figure(1) illustrates level of knowledge among obstetricians

Fig (2) illustrates level of attitude among obstetricians

Fig (2) illustrates level of practice among obstetricians

Co-efficient correlation between knowledge, attitude and practice behaviour is illustrated in table (V). A linear positive co-efficient correlation between knowledge and attitude ( $r=0.55$ ,  $p=0.01$ ), attitude and practice ( $r=0.34$ ,  $p=0.027$ ) was observed in academicians, post graduates and private practitioners but a negative co-relation was observed between knowledge and practicing academicians ( $r=0.27$ ,  $p=0.039$ ) and private practitioners ( $r=0.35$ ,  $p=0.019$ ).

### Discussion:-

This study was undertaken to assess knowledge, attitude and practices among Obstetricians regarding oral health of expectant mothers which reveals an adequate knowledge and attitude among Obstetricians but a considerable amount of difference between knowledge and practice behaviour was observed. The advantage of a questionnaire study is that, it allows information to be collected and analyzed easily and it also allows the concerned specialist to express freely their perception on oral health care.

In the present study it was observed that most of the Obstetricians had good knowledge, attitude and practice behaviour regarding oral health in expectant mothers however, there still exist minor misconceptions amongst Obstetricians regarding provision of dental treatments during pregnancy. This is of importance to the dentists as it acts as a barrier for them in providing the most appropriate treatment to their pregnant patients. Such misconceptions should be clarified in order to stop compromising on the quality of dental care due to unnecessary fears developed among patients. This conclusion is similar to the study done by Shah et al (2013). In our study about 59.1% of private practitioners were very particular about referring expectant mothers to dentists or periodontists when compared to academicians(38.1%) and post graduates(30.1%). This may be due to the fact that they remained in continuous contact with the recent advances and new facts coming to light on the topic. Continuing education programs may also have had some role to play in the difference in knowledge levels. Studies conducted by Shenoy et al(2009) reveals that about 62% of the post graduates referred their patients to dentists and 38.3% referred to periodontists which was much higher referral than our study. Another study by Rocha et al(2011) presented a situation in which the highest percentage of Obstetricians refer their patients to other professionals is when they are concerned with their oral health status(88.2%). 55% of the Obstetricians in the study conducted by Shenoy et al agreed that periodontal disease in expectant mothers may lead to preterm low birth weight babies whereas, in the present study 83.0% of the Obstetricians were aware of the fact because most of the studies revealed a direct relationship between periodontal disease and adverse pregnancy such as preterm birth, preterm prelabor rupture of membranes, pre-eclampsia and post-cesarean endometritis (Crowther CA et al. 2005]

Obstetricians with 20-25 years of experience had better knowledge than the other group. This can be due to combination of experience and knowledge by continued learning process towards oral health during Obstetrician care. No difference of knowledge among female and male gynaecologists was noted. Obstetricians with more than 40 years of age were having good attitude, this may be because they face number of cases in their routine practices and updated knowledge.

During pregnancy hormonal changes can cause exacerbation of periodontal or gingival clinical characteristics especially swelling and bleeding [Rocha et al.2011]. In our present study 89.7% of respondents said that pregnancy increases the tendency for swelling and bleeding from gingival but it is a well known fact that most of the physicians do not look into the mouth of the pregnant women due to lack of training [Wender EH et al.1992,Cunningham G et al. 2000] and because busy Obstetricians have no time to look into patients mouth unless patients have complained about this change [Singh S et al .2011,Varun S et al. 2014] . Rocha et al (2011) surveyed and found out that more than 90% of Obstetricians expected these changes during pregnancy.

Obstetricians who are undergoing regular dental visits more recently showed greater interest in recommending the same for their patients ( $p < 0.001$ ). It can be suggested that such an attitude shows that the health care of patients is a reflection of the attitudes of Obstetricians toward their personal oral health. In this sense, it is also relevant to stress the importance of self-care to each member of the healthcare team, since they are the disseminators of knowledge to those under their care.

Regarding pregnancy guidelines, it was strongly suggested to include dental visits as an integral part of antenatal check ups [Patil et al.2013]. The introduction of mandatory dental examinations for women in early stage of pregnancy should motivate dentists to introduce a new approach of preventive services which result in closer cooperation with Obstetricians in order to reduce the prevalence of delivery of pre-term low birth weight babies

[Stupak A et al. 2013]. Professionals involved in prenatal care should discuss the importance of oral health with pregnant women and refer patients to dental treatment when necessary [Al-Habasneh et al.2008]. In our study 69.6% of Obstetricians carried out oral health examination of their patients. This is in accordance with the study done by Patil et al and Shah et al who observed that about 39% of Obstetricians performed oral examination of expectant mothers during the first trimester and 65% recommended every 6 months interval.

Limitation for the oral examination during antenatal visits is due to lack of time and lack of demand for the service. In our study about 31% of practitioners refrained from oral examination due to lack of time and higher percentage (44.5%) was seen in academicians compared to private practitioners(25.7%) and post graduates(16.7%).

Preconception and antenatal knowledge and habits reduces the oral diseases in expectant mothers [offenbacher et al.1996,Lyndon-Rochelle et al. 2004]. To best of our knowledge no reported literature added the necessity of dental treatment prior to conception but in our study 87.0% of respondents were aware of the importance of dental problems treated prior to conception and an 100% agreement by post graduates and private practitioners. It can be due to the fact that hormonal changes taking place during pregnancy render the women more susceptible to plaque accumulation and gingival inflammation [Singla N et al.2013] and it has been observed that phase I therapy in pregnancy patients with chronic periodontitis reduced adverse periodontal outcome such as preterm low birth weight, still births etc [Tarannum F et al 2007, Schwendicke F et al.2015,Reddy BV et al.2014 ]

It has been found out that dental treatment can be rendered at any time during pregnancy (Wasylo et al.1998,American dental association.1999, Lee et al.1999) but due to the morning sickness experienced by most pregnant women during the first trimester and great deal of risk of postural hypotension during the third trimester, second trimester of pregnancy is the ideal period of delivering efficient dental care [Kumar J et al .2009]. In our study only 20.6% opined that dental treatment can be delivered at any time during pregnancy.

Obstetricians exhibited relatively lower practice score of 59.38% towards prevention of oral diseases. However, Obstetricians working in private sector showed significantly higher mean practice score indicating that they practiced prevention of oral diseases relatively better than post graduates and academicians. This could be due to the time constraints, as large number of patients seeking care in hospitals make it difficult for the Obstetricians to focus on the issues related to the oral health. Other possible barrier may be lack of understanding of oral health care during pregnancy[Bassey et al.2010].

In our study there is a negative correlation between knowledge and practice among academicians(  $r=0.269$ ,  $p=0.039$ ) which shows that they have adequate knowledge about oral disease prevention in expectant but certain factors are refraining them to implement it.

The highlights of the study were the participation of the majority of the Obstetricians in the Mangalore city and the categorisation of the study groups into academicians, private practitioners and post graduates aided in assessing their practice behaviour. The major shortcoming of the study is the restriction of the study population to a specific area hence the results of the study should be generalised with caution. Therefore further randomised controlled clinical trials has to be carried out. Some of the Obstetricians refrained from the study due to lack of time, interest or conflict with their busy schedule.

### **Conclusion:-**

Majority of the Obstetricians considered in the present study showed adequate knowledge, attitude and practice behaviour but there is a gap between knowledge and practice. Since our study shows moderate practice behaviour, it should be emphasized that knowledge and attitude cannot make it certain that it will be implemented effectively. And it is necessary that specialists should keep their knowledge updated. They should be encouraged to refer the patients for oral health examination. A multidisciplinary team that includes the Family Physician, Obstetricians and Dental practitioner should assume an active role in providing health education to pregnant women which can significantly decrease the possibility of oral diseases. Oral health education can be included in the medical curriculum to emphasize a positive attitude towards oral health.

All authors have no conflicts of interests to declare.

**Key words:-**

Higher Educational institutes, service quality standards, student satisfaction, United Arab Emirates.

**Abstract**

The United Arab Emirates is becoming a hub for quality in teaching in the higher education institutions. There are two types of these institutions, such as those which are under the private programs and the ones which are under the government programs. A private university in Dubai is going to be taken as a case study for its reputation as one of the centres of excellence in higher education in the region. This study examines the quality standards in the teaching process in higher education institutions and its impact on the student satisfaction in private institution of Dubai. The questionnaires used to collect quantitative information. The questionnaires were distributed to 50 male and female students of Private Universities in Dubai aged between 20 to 40 years and the Statistical Package for Social Sciences was used for data analysis. The study found that students at Private Universities in Dubai have high satisfaction levels because the institution offers courses that impact on the students with right skills and knowledge. However, the university's IT infrastructure underdeveloped hence the need to invest more resources in upgrading the system. By doing so, the institution will attract students from the region and other parts of the world.

The study recommends policy to enhance high quality standards in the Teaching Process in Higher Education Institutions such that managers and administrative executives should consider enhancing the academic and institutional status the University with regard to the highlighted determinants of teaching quality education as well as the different student dimensions of quality.

**Introduction:-**

The growth of the United Arab Emirates higher education sector has improved in the last two decades and became one of the highest international institutions of higher education in the world. Since the 1960s, the United Arab Emirates is rated among the world's rapidly developing and wealthiest countries in the world.

As the establishment of the first university in the region in 1977, education in these institutions was in English (Witte, 2015). For that reason, students in these education institutions study both English and classical Arabic languages which leads to many challenges for teachers to teach complex content. Moreover, many students graduate from public high schools do not advance their education. To motivate such students, most institutions offer

foundation programs for students entering these institutions to enhance their competencies in core subjects such as math, English, Arabic, and IT before starting their academic studies (Witte, 2015).

Recent studies believe that the quality of education in higher education institutions in the United Arab Emirates has improved in the past few years following the federal Ministry of Higher Education involvement through improving the education quality standards. And today, there are more than 70 private institutions of higher education in the United Arab Emirates licensed by related government agencies such as the Ministry of Higher Education and hence an increase in the numbers of enrolled learners from 52,926 students to 128,279 (Witte, 2015). This research tries to establish the efforts of a private university in Dubai towards providing quality in teaching and its impact on the students' satisfaction.

### **Literature Review:-**

Higher education in the Arab world has experienced a number of major developments such as the expansion of previously established universities, increased numbers of students, public and private sector enthusiasm for investing in higher education, and the emergence of new disciplines and styles of learning. By noting these developments, sector leaders have recognized a need to support the application of quality standards in higher education to ensure the quality and final outputs of universities (Bashour, 2005). The sustainability of these countries owned private institution in Dubai against the public owner universities is as results of their service qualities which meet up with expectation of the residences in Dubai. Rendering the expected value in competitive business environment in concentration of quality of service is an important element for business success, and experts concur that the most powerful competitive tool currently reshaping marketing and business strategy is service quality (Eraghi&Atharnejad, 2012).

### **Student satisfaction:-**

Owston, York & Murtha (2013) define student satisfaction as the desirous outcome of a job or task striving to meet the individual's esteem. Student satisfaction from teaching quality education at the universities plays an integral part in determining the accuracy and originality of the system. In this case, the satisfaction of the students denotes the level of grooming their mentality, course knowledge, and skill development. Students' satisfaction from teaching quality education is, therefore, the resultant outcome of the University's educational and administrative coherent performance of the system.

Moreover, the institutions that facilitate UAE's learning environment make student motivated or more satisfied from completing their studies. For that to happen, the individual institution must have proper educational utility infrastructure accumulated with academic and essential parameters of professional development. For example, students are more motivated, performer better, and become loyal to their universities if their institution has basic educational facilities with effective training and teaching staff. Improved student satisfaction, motivation, and impartiality directly depend on the teachers' performance outside and inside the classroom. Therefore, the students' evaluation of their course performance is related their instructors and methodology used in teaching. That also determines the students' successful completion and educational development of their studies because they believe that instructors with the highest intellectual ability as better teachers and reliable. We can deduce that students' satisfaction is largely dependent on quality standard. Teachers' reasonability, coordination, excellence, and ability are salient factors to be considered in ensuring standard for good higher institution. Since educational programs are coordinated for them by their instructors or teachers (Owston, York & Murtha, 2013).

### **Perceived Service Quality:-**

The perceived quality of service refers to the students' justification for the approach adopted in teaching quality by their lecturers and course instructors. For students to perceive the services as excellent, they must be of standardized output and better. Educational excellence in the universities depends on the service quality (Owston, York & Murtha, 2013). Students also perceive the institutional service as being standardized and offered in a quality education environment if the University provide them with appropriate infrastructural and learning facilities and intellectual faculty to ensure they retain confidence and interest in the organization. Administrative and academic efficiency of the University, therefore, plays a major role in the motivation of the student. That happens through the institution's professional development, training and feedback for the student's mental development, transparency in the evaluation of the student, teachers' intellectual ability, and organizational harmony (Owston, York & Murtha, 2013).

The quality of the University service in education further encompasses medical facilities, security systems, updated and well-managed libraries, class facilitation and sitting arrangements and decoration coupled with multimedia as well as the cooperation of the administrative staff. Support services also contribute to their educational development and support (Owston, York & Murtha, 2013).

In conclusion, we can say that both administrative and academic aspects of a University are significant in determining the students' performance, development of quality assurance and organizational image. Hence, the students' satisfaction is associated with the performance of a University's knowledge advisor, ability to get desired classes, instructor excellence, overall quality instruction, knowledgeable faculty, secure and safe campus, approachable advisor, worthwhile investment in paid tuition, availability of advisor, reasonable and clear requirements for major, unbiased and fair faculty, adequate computer labs, and access to information (Austin et al., 2014).

#### **Research Significance and Problem:-**

The significance of this research emerged from the importance of sustainable knowledge economy in which participation in providing quality standard education for higher education institution ensure student satisfaction thus enhance economic growth in the country (Coates, 2009), introduces continuous improvements to educational institutions' services, and adapts these improvements to achieve substantial improvements in service quality (Hafeez et al., 2011). The motivation for this study emanated from the administration of higher institution in UAE, which appropriate policies with regards to quality standard of the service rendered has been a major concern. Accordingly, the study problem can be demonstrated by answering the following questions and investigating the following hypotheses:

#### **Research Questions:-**

Q1: What is the relationship between oversight bodies and agencies determine teaching quality education on student satisfaction in higher education institutions of UAE.

Q2: To what extent has AACSB's Hiring Standards affected teacher Qualifications in higher education institutions of UAE

Q3: To what extent has university hiring standards affected teachers' qualification in higher education institutions of UAE

Q4: What is the association between Teachers' qualification and presence of AACSB Hiring standard in higher education institutions of UAE

Q5: What is the relationship between Private Universities Hiring Standards and AACSB are not in ensuring student satisfaction in higher education institutions of UAE

Q6: To what extent has the five dimensions of service quality viz: assurance, empathy, responsiveness, tangibles, and reliability influenced students' satisfaction in higher education institutions of UAE.

#### **Research Hypotheses:-**

The hypothesis as per Turner (2015) is the most suitable guess a researcher can make based on the planned study.

The study's hypotheses are:

H1: There is no significant relationship between oversight bodies and agencies determine teaching quality education on student satisfaction in higher education institutions of UAE.

H2: AACSB's Hiring Standards does not have any significant impact on the teacher Qualifications in higher education institutions of UAE

H3: There is no significant effect of university hiring standards on teachers' qualification in higher education institutions of UAE

H4: Teacher qualification has no significant association to the presence of AACSB Hiring standard in higher education institutions of UAE

H5: Private Universities Hiring Standards and AACSB are not significantly related in ensuring student satisfaction in higher education institutions of UAE

H6: There is no significant linkage between students' satisfaction and the five dimensions of service quality viz: assurance, empathy, responsiveness, tangibles, and reliability in higher education institutions of UAE.

**Methodology:-****Underpinning Theory for Quality Standard and Student Satisfaction:-**

The study adopted Herzberg's theory of job satisfaction to theorize the impact of quality standard in teaching process on student satisfaction in Private Higher Education Institutions in Dubai. In applying Herzberg's theory to this study, desired classes, instructor excellence, overall quality instruction, knowledgeable faculty, secure and safe campus, approachable advisor, worthwhile investment in paid tuition, availability of advisor, reasonable and clear requirements are directly related to the student satisfaction and may be considered motivators or satisfiers (e.g. growth and achievement).

While the absence of desired classes, instructor excellence, overall quality instruction, knowledgeable faculty, secure and safe campus, approachable advisor, worthwhile investment in paid tuition, availability of advisor, reasonable and clear requirements may lead to dissatisfaction, For example, fair and equitable rules and policies are expected at a higher educational institution. It is only in the absence of fairness in availability of those salient factors that the student experiences dissatisfaction. The more, standard and desired classes, instructor excellence, overall quality instruction, knowledgeable faculty, secure and safe campus, approachable advisor and availability of advisor, the higher the quality of standard rendered and thus, the increase in satisfaction of the students.

**Source of Data and Sample:-**

The chapter on collecting quantitative data is used for researching and analyzing questionnaires used to collect quantitative information. The questionnaires were distributed to 50 male and female students of Private Universities in Dubai aged between 20 to 40 years. The coping strategies adopted and the questions asked strived to elicit participants' perspective regarding the quality of teaching in the university and subsequently, the impact it has on the students' level of satisfaction (Pickard, 2012). Specific questions were developed to establish the students' view purposely to enhance the situation. The selected respondents had diversified cultural and educational backgrounds since some of them came from foreign countries like Syria, Russia, Lebanon, Iran, Asia, Europe, India, and Emirates among others.

**Data Analysis Method:-**

The following methods and statistical indicators were used for statistical analysis and hypothesis testing:

1. Frequencies and percent for study sample distribution breakdown.
2. Means and standard deviations to indicate concentration levels or dispersion of sample responses regarding statements related to the application of service quality standards and student satisfaction.
3. T-test for independent variables to investigate whether there is a difference in the sample's attitudes toward service quality application in the universities and to ascertain the participants' attitudes toward their own satisfaction with university service quality (H1-H6).
4. Regression test to determine the effect of independent variables on dependent variables (H1-H5)
5. Reliability analysis to ensure the instrument reliability of Cronbach's alpha coefficient (H6)

**Findings and Discussion:-**

The survey established that 50% and above of the participants gained appropriate skills and knowledge at the university under study and that the teaching approach adopted by the institution was relevant to their expectations.

**Respondents' demographic profile:-**

Respondents' age:-

The researcher asked respondents to write their age limits when answering the questions asked in the questionnaire. The diagram below depicts the participants' response.

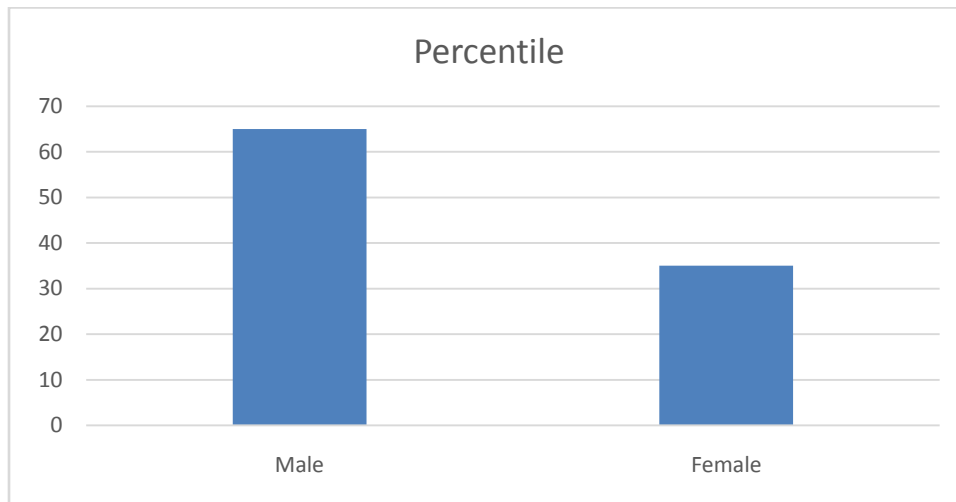

**Figure 4.2.1:- Respondents' age**

The figure indicates that 25% of the respondents were aged between 20-24 years, 40% between 25-29 years and 20% fell in the age bracket of 30 to 34 years. About 15% of the participants were aged between 35-39 years. The findings further established that a huge chunk of Private Universities students was below the age of 35 years constituting approximately 85% of the total student population. On the other hand, students aged above 35 years were less attracted to the institution since they were representation by 15% only.

#### **Distribution by gender:-**

The questionnaires also tasked respondents to show their gender when answering questions. The diagram below show what the outcome of the survey indicated.

**Figure 4.1.2:- Distribution by gender**

The chart shows that male students represented 65<sup>th</sup> percentile as opposed to the 35<sup>th</sup> percentile of their female counterparts. The results indicate that the research was not gender-balanced because the variation between the male and female respondents was at 30 percentile. The big variance in gender representation is a further indicator that the student population at Private Universities was male dominated because the institution is science-oriented. Given that most female students detest studying science courses, it could be the reason for the huge variance in gender representation.

**H2: Questionnaire Questions on the Determinants of Teaching Quality Education****Teacher Education Accreditation:-**

AACSB-accreditation may be the reason behind high standards of teaching at Private Universities and UAE in general. This is because AACSB has high-quality teaching standards it has established under which all universities and other institutions of higher learning prescribe to.

**Table 4.2.1:-** Relating Teacher Qualification and AACSB Accreditation

Beta Coefficient	% of Teachers that are well-qualified	% of Teachers who are well-qualified in English	% of Math Teachers who are well-qualified	% of out-of-field math teachers	% of out-of-field English Teachers
AACSB's Accredited Universities	.43*	.48*	.35*	-.38*	-.38*

\*P&lt;.05

\*\*P&lt;.01

The percentage of AACSB-accredited universities is negatively correlated at a significant level with that of out-of-field math and English teachers. The reason may be due to the fact that AACSB-accredited universities must demonstrate high teaching standards in their respective fields particularly in science fields as per the case of Private Universities. There may be other institutional policies that may lead to quality teaching at Private Universities and other related institutions other than guidelines set by AACSB and subsequently supporting and leading to recruiting high-quality teachers.

As indicated in table 4.2.2, the extent to which university supervised by AACSB particularly Private Universities maintain high recruitment standards highly predict (P<.001) of the uncertified teachers' percentage. It also well indicates a strong correlation between fully certified teachers and new ones.

**Table 4.2.2:-** H2:Correlations between AACSB's Hiring Standards and Teacher Qualifications

AACSB Hiring Standards	
% of Newly Certified Teachers	.29**
% of all newly certified teachers	.32**
% of uncertified newly certified teachers	-.52***
% of all uncertified teachers	-.65***

\*P&lt;.05

\*\*P&lt;.01

\*\*\*P&lt;.001

**Table 4.2.3:-** H3: Relationship between University Hiring Standards and Teacher Qualifications

Beta Weight/Variable	% uncertified new teachers	% uncertified all teachers	% fully certified new teachers	% full certified all teachers
University hiring standards****	-0.501 (-3.18)**	-0.637 (-4.74)***	0.338 (2.15)*	0.394 (2.51)*
Professional Board Standards	-0.081 (-.49)	-0.172 (-1.72)		
% students in poverty	-0.107 (-0.50)	0.173 (0.95)	-0.062 (-0.26)	-0.147 (-0.63)
% LEP students	0.046 (0.24)	0.106 (0.64)	0.375 (2.03)	0.227 (1.24)
% minority students	-0.104 (-0.41)	-0.353 (-1.67)	-0.111 (-0.42)	0.124 (0.57)

\*P&lt;.05

\*\*P&lt;.01

\*\*\*P&lt;.001

\*\*\*\* Is the percentage university teachers as a criteria for recruitment, graduation from an approved institution of education program, full certification, and a university minor or major degree certificate in the course to be taught.

The findings indicate that university teaching standards are both a local and state job. Taking a quasi-professional teaching scenario, we find a complex interplay between the procedures adopted by Private Universities and the standards set by AACSB sometimes in violation of and sometimes in accord with government or state requirements.

AACSB enforce standards of teachers recruited in higher institutions. However, they do in an inviolable way to that of other professionals including lawyers and doctors. While other professionals embrace the use of professional standards boards established in UAE as the enforcement and standard-setting body. Based on the level of autonomy and authority used to measure the characteristics, UAE has bodies mandated to manage and administer teaching standards in the region.

As indicated in table 4.2.4, there is a significant relationship between AACSB's recruitment standards and teacher qualification. In table 4.2.5, there is a huge relationship between uncertified and certified teachers and the establishment of AACSB. Therefore, the connection between the two is working because of the pressure the university is getting from AACSB to employ qualified teachers.

Sometimes universities and other institutions of higher learning recruit uncertified teachers due to bureaucratic and cumbersome hiring procedures, efforts to minimize salary costs, lack of recruitment incentives or effort, or patronage. AACSB has the power and authority to ensure all universities including Private Universities recruit certified and qualified teachers to ensure teaching quality education.

**Table 4.2.4:- H4; Correlations (Pearson r) of Teacher Qualification and Presence of AACSB**

% universities demanding graduation from accredited teacher education institutions	0.26*
% of Universities demanding a minor or major degree in the course to be taught	.31**
% uncertified teachers	-.26*
% fully certified teachers	.20*
% new fully certified teachers	.22*
Weeks needed for teaching students	.24*

\*P<.05 \*\*P<.01

**Table 4.2.5:- H5:Relationship between Private Universities Hiring Standards and AACSB**

	Private Universities Hiring Standards
AACSB	.412 (2.50)**
% Poor Students	.131 (.57)
% Students LEP	-.428 (-2.19)*
Minority Students	.068 (.27)

\*P<.05 \*\*P<.01

The link between AACSB and teacher hiring practices or education may be very important but are somehow modest (correlations ranging 0.2 to 0.3). This indicates that there are other factors contributing to teaching quality education in higher institutions of learning and Universities in Dubai in particular. It is a fact that Private Universities are in position and does develop and implement high teaching standards without being pressured by AACSB. AACSB's existence has led to high recruitment standards of teachers at Private Universities and in the UAE's education sector in general.

#### **Effects of Teaching Quality Education in the Universities:-**

##### **Data Collection and Research Instruments:-**

Five dimensions of quality teaching were adopted in this study including (assurance, tangibility, reliability, empathy, and responsiveness). These elements were subsequently used in five points Likert scale whereby 5 strongly agree and 1 strongly disagree. Respondents, like I said, were randomly sampled.

##### **Reliability Test:-**

Reliability test strives to yield consistent results through free measure. This indicates the consistency and stability with which the instrument used in the exercise measures the worthiness of the adopted measure. The coefficient reliability that is close to 1.0 indicates the measure is better while those close to 0.80 are good. Acceptable values fall within 0.70 while those within 0.60 and below are poor. The researcher used Cronbach's alpha reliability analysis method to test all the constructs for consistency reliability. The used values are as put in the table below.

Participants' confidentiality was also assured. The findings indicated that all the constructs exceeded the 0.70 thresholds meaning the constructs' scales of measurement used in the study were consistent and stable (Pedhazur&Schmelkin, 2013).

**Table 4.3.2:-** H6: Reliability Test based on Cronbach's Alpha

Construct	Number of Items	Alpha
Customer Satisfaction	50	.874
Empathy	40	.732
Tangibles	45	.848
Reliability	40	.756
Responsiveness	40	.732
Assurance	50	.829

#### **Pearson Correlation Coefficient:-**

Pearson's correlation coefficient (r) measures the relationship between two research variables. Besides Standard and mean deviations between independent and dependent variables, the researcher further strives to establish the closeness between one variable to the others. The strength of association or correlation between the dependent and independent variables is required in any study (Pedhazur&Schmelkin, 2013).

In this case, the researcher wants to know the significance of the correlation between the identified variables. Correlations may vary from 1.0 to +1.0. Regarding information, the acceptable conventional level is significant of  $p=.5$  in any social study like this one. A true significant variable correlation is between 95 times out of 100 (Pedhazur&Schmelkin, 2013). This indicates that 95 times out because it would mean that the researcher's findings are only 5% unreliable. According to our mean values, students' satisfaction is based on the five dimensions, assurance, empathy, responsiveness, tangibles, and reliability. If the universities are offering education that is at their expectations, they are likely to be satisfied. If the education is beyond their expectations, they will be very satisfied. Alternatively, the students will be extremely satisfied if they are offered education that is more than their expectations.

Variables	International Students		Local Students	
	Mean	SD	Mean	SD
Student Satisfaction	4.13	1.01	4.26	1.03
Empathy	3.29	.712	3.48	.732
Tangibles	3.32	.734	3.36	.724
Reliability	3.44	.862	3.42	.882
Responsiveness	3.49	.704	3.44	.734
Assurance	3.76	.717	3.32	.727

Pearson Correlation was used in this research. Results for empathy indicate that international students' mean is 3.29 while that of their local counterparts is 3.48. This shows that private universities students confirm that the institution offers empathy education service and was more satisfied as opposed to their international counterparts. Tangibility mean at 3.36 for local students and 3.32 for international ones indicate that the local students are more satisfied with the university's tangible service. Reliability mean for local students is 3.43 while for international ones is 3.44. This shows that international students at Private Universities were more satisfied compared to their local counterparts because they believe the institution is offering reliable service. The responsiveness of the local students is 3.44 while for the international students is 3.49. This means regarding the institution's ability to offer responsive services, the international students are more satisfied as opposed to their local counterparts. About assurance, the local Private Universities students are 3.32 while that of international ones is 3.76 indicating international learners were more satisfied with the service assurance of the university.

#### **Conclusion:-**

The study strived to explore teaching quality education in higher institutions of learning particularly at Private Universities. The research indicated that the student's satisfaction level is dependent on many aspects including the learning environment and the quality of teaching at the University. Students want institutions where there are well experienced, learned, and qualified faculty to cater for their professional and academic needs. They want teachers with reasonability, liberty, expertise, and knowledge that is up to the mark. The teachers' teaching attitude must also

be friendly and the methodology of executing the task and course appropriate. The institution must also have a good learning environment and be well equipped to guarantee an excellent education. The student's security and access to information among other elements fundamentally determine their level of satisfaction in the Universities as well.

Private Universities is a Center for excellence given that it offers courses that are in high demand in the labor market. The institution is well facilitated both by infrastructure and staff service. Students at Private Universities have high satisfaction levels because the institution offers courses that impact on the students with right skills and knowledge. However, the university's IT infrastructure underdeveloped hence the need to invest more resources in upgrading the system. By doing so, the institution will attract students from the region and other parts of the world.

The study recommends policy to enhance high quality standards in the Teaching Process in Higher Education Institutions such that managers and administrative executives should consider enhancing the academic and institutional status the University with regard to the highlighted determinants of teaching quality education as well as the different student dimensions of quality perception. They should adhere to the requirements, standards, and necessities of quality education based on the students' demand. That includes ensuring the university has reliable facilities as well have the administrative staff ability to have empathy among other factors mentioned in the discussion.

#### Abstract

**Background:-** Breast and colon cancers are the most types of cancer in Egyptian patients. Radiation and chemotherapy have undesirable side effects, so the drugs are used instead. Venoms have been used as folk medicine since ancient times.

**Purpose and aim:-** This study examines the anticancer potential of Egyptian snake (*Naja haje*), scorpion (*Leiurus quinquestratus*) and bee (*Apis mellifera*) venoms then compared to a synthetic anticancer drug 5-Flurouracil (5-FU).

**Methods:-** The cytotoxicity activity of tested venoms was determined using SRB assay. Antioxidant potential was determined by the evaluation of the variation in MDA, NO. and GSH content. RNA was extracted to evaluate the expression of P53, Bcl2 and Bax genes using semi-quantitative RT-PCR analysis after 24hrs. treatment.

**Results & Discussion:-** MCF-7 cells were more sensitive than Caco-2 cells to tested venoms while 5-FU was more toxic to both cell lines. The *Naja h.*, *Leiurus q.* and *Apis m.* venoms had IC<sub>50</sub> as 3.5, 27.8 and 2.5 µg/ml with MCF-7 cell line and 20, 32.3 and 14 µg/ml with Caco-2 cell line respectively. The *Naja h.* venom had apoptotic effect against MCF-7 and Caco-2 cell lines through the elevation of p53 and depletion of Bcl-2 gene expression with increasing NO. and decreasing in GSH contents. The *Leiurus q.* venom had apoptotic effect against MCF-7 and Caco-2 cell lines through the elevation of Bax and depletion of Bcl-2 gene expression with elevation in NO. level. The *Apis m.* venom had apoptotic effect against MCF-7 and Caco-2 cell lines through the elevation of p53 and Bax with depletion of Bcl-2 gene expression and increasing NO. and decreasing in GSH contents. While 5-FU was toxic through depletion of Bcl-2 gene expression and increasing NO. level.

**Conclusion:-** Finally, it can be concluded that snake (*Naja h.*), scorpion (*Leiurus q.*) and bee (*Apis m.*) venoms had anticancer

potentials on human breast and colon cancer cells and this is positively related to the antioxidant profile and apoptotic gene expression.

### Introduction:-

Cancer has characterized features as an accelerated cell proliferation and uncontrolled growth of a set of abnormal cells which has insufficient apoptosis and metastasis ability (**Jain, 2014**). Breast cancer is the second most common cancer worldwide and, by far, the most frequent cancer among women with an estimated 1.67 million new cancer cases (11% of all cancers) followed by colon cancer incidence was estimated 1.4 million (9.7% of all cancers) diagnosed in 2012 (**Ferlay et al., 2015**).

The use of traditional drugs is declining and naturally extracted drugs are used instead. The bioactive molecules in animal venoms have stimulated new pharmaceutical discoveries (**Harvey, 2014**). Several pharmacological anticancer applications have been found in many venomous animals, such as snakes, scorpions, bees, spiders and frogs (**Gomes et al., 2010**). Captopril and Escozul medicines are derived from snake and scorpion venoms are used to treat cancers (**Bryan, 2009; Lorenzo et al., 2012**).

The medical value of venoms is important because of its complex bioactive components that are characterized by its high degree of specificity. Up till now, a number of studies have investigated the effects of snake, scorpion and bee venoms as an effective tool in cancer therapy development (**Vyas et al., 2013; Ortiz et al., 2015; Zheng et al., 2015**).

Snake venom is a complex mixture of bioactivity peptides and proteins that have cytotoxic, antitumor and apoptotic effect on different cancer cells (**Corrêa et al., 2002; Son et al., 2007; Song et al., 2012; Badr et al., 2014**). Collectively, these studies outline a critical role in biotherapy of cancer for these components of snake venom like Atropin from *Crotalus atrox*, Kaotree from *Naja naja kaouthia*, Trigramin from *Trimeresurus gramineus*, Rhodostomin from *Calloselasma rhodostoma* and Contortrostatin from *Agkistrodon contortrix* (**Swaim et al., 1996; Lipps, 1999; Zhou et al., 2000; Yeh et al., 2001**).

Scorpion venom is a complex mixture of salts, nucleotides, biogenic amines, enzymes, mucoproteins, as well as peptides and proteins. Due to the medical relevance of scorpion venoms have been applied in traditional medicine, mainly in Asia and Africa for thousands of years (**Goudet et al., 2002; Shao et al., 2007**). Thus far, some studies have focused on some components of scorpion venom that have an antitumor effect like Bengaline from *Heterometrus bengalensis*, Iberiotoxi from *Buthus tamulus*, Margatoxin from *Centruroides margaritatus*, Chlorotoxin from *Leiurus quinquestriatus* and Neopladine 1 and 2 from *Tityus discrepans* (**Galvez et al., 1990; Debin et al., 1993; Garcia-Calvo et al., 1993; D'Suze et al., 2010; Gupta et al., 2010**).

The medical use of bee venom has been known since ancient times due to its healing properties. It can be seen in many religious texts including the Quran, Bible and Veda. The first injectable form of bee venom is developed by Dr. Franz Kretsky (1928) from Austria (**Kim, 2013**). Mellitin and apamin are the most important peptides in bee venom that have an antitumor effect (**Zhou et al., 2013**).

P53, BCL-2 and BAX are proteins play important role in the control of apoptosis. P53 is a protein which plays a critical role in the intrinsic apoptosis pathway activation. Bcl-2 may act upstream of the p53 pathway. The induction of Bax mRNA and protein were found to be stuck in the presence of Bcl-2. The cross-like between Bcl-2, p53 and Bax genes is a significant determinant of drug-induced apoptosis (**Fesik, 2005; Giménez-Bonafé et al., 2009**).

An important therapeutic strategy was suggested to use antioxidant inhibitors and/or reactive oxygen species (ROS)-generating compounds to generate apoptosis in cancer cells (**Haddad, 2004**). ROS stimulate cell death by inducing apoptosis through provide lipid peroxidation and DNA damage. The end product of lipid peroxidation reacts with deoxyadenosine and deoxyguanosine in DNA leading to DNA fragmentation (**Marnett, 1999; Barrera et al., 2008**). GSH depletion affects apoptosis sensitivity by the activation of death signals (caspases 3,8 and 9) and leads to overexpression of Bax and P53 and inhibition of Bcl-2 expression (**Higuchi, 2004; Franco and Cidlowski,**

2009). High concentration of NO. induces cell apoptosis while lower concentration can be antiapoptotic (Nicotera *et al.*, 1995; Dimmeler *et al.*, 1997).

So this work aims to evaluate the possible anticancer effects of some natural venoms of *Naja h. Leirus q.* and *Apis m.*, compared to a synthetic anticancer drug (5-FU). The evaluation parameters include cell viability, the expression of some genes related to apoptosis by semi-quantitative RT-PCR technique and oxidant/antioxidant system analysis.

### Material and Methods:-

5-Fluorouracil, 250mg/ 5mL from EBEWE Pharma Company was diluted in RPMI-1641 media (BioWhittaker™ Classical Media, Lonza) to prepare test concentrations.

### Preparation of venoms:-

Dried snake venom of Egyptian cobra *Naja haje* and scorpion venom of the deathstalker *Leirus quinquestriatus* were kindly supplied from Sera plant VACSERA, Dokky, Giza, Egypt and bee venom of Egyptian bee *Apis mellifera* was supplied from Economic Entomology and Pesticides Department of Faculty of Agriculture Cairo University, Giza, Egypt. Both were dissolved in 2.5mL sterile double distilled water to contain 10mg/mL and sterilized using 0.22 m syringe filter (Millipore-USA) and serially diluted in RPMI-1641 media (BioWhittaker™ Classical Media, Lonza) to the needed concentrations (Gajski *et al.*, 2014).

### Cell lines and culture conditions:-

MCF-7 (Human breast cancer cell line, HTB-22) and Caco-2 (Human colon cancer cell line, HTB-37) and trypsin 0.25% were provided by VACSERA - Cell Culture Unit, Dokky, Giza, Egypt. These cell lines were originally supplied from the American Type Culture Collection (ATCC). Cells were seeded at a density of  $2 \times 10^5$ /ml and routinely cultured in RPMI-1641 medium in tissue culture flasks (Griener, Germany). This medium was supplemented with 5% fetal bovine serum plus 1% penicillin-streptomycin and 1% non-essential amino acids. Then the flasks were incubated at 37°C in a humidified chamber and 5% CO<sub>2</sub> atmospheric condition. When the cells reached confluent monolayer, the cells were trypsinized according to (Masters, 2000).

### Cytotoxicity using sulphodiamine-B assay (SRB):-

MCF-7 and Caco-2 cells were seeded at the density of  $4 \times 10^4$ /mL into 96-well cell culture plates (Nune, USA) in the growth medium. After the confluence of cells, they were treated with different concentrations of test venoms and 5-FU (0.01, 0.1, 1, 10 and 100 µg/ml) as a reference anticancer drug. At 48 h, cells were treated for 1 h with 100 µL of 10% TCA at 4°C and stained with 0.4% (W/V) SRB in 1% (V/V) acetic acid. The optical density was measured at 570 nm after reformation of the dye in 10 mM Tris base (Sigma-Aldrich, USA) using ELIZA reader (Dynatec medical products, England) according to (Houghton *et al.*, 2007). TCA, SRB and acetic acid were purchased from (Sigma-Aldrich, USA).

$$\text{The Viability percentage \%} = \frac{\text{O.D. of treated cells}}{\text{O.D. of untreated cells}} \times 100$$

The half-maximal growth inhibitory concentrations were calculated using (Sigma Plot software).

### Morphological changes:-

Morphological changes were detected 24hrs.post MCF-7 and Caco-2 cells treatment with different test venoms and 5-FU IC<sub>50</sub> values. Cells were investigated using inverted microscope (Leica, Germany) at 20 X magnification.

### RT-PCR (Reverse Transcriptase Polymerase Chain Reaction):-

The primer sequences of the oligonucleotides used for PCR were (Table 1) as follows: GAPDH, sense: 5' CAA GGT CAT CCA TGA CAA CTT TG 3', antisense: 5' GTC CAC CAC CCT GTT GCT GTA G 3'; P53, sense: 5' TCA GAT CCT AGC GTC GAG CCC 3', antisense: 5' GGG TGT GGA ATC AAC CCA CAG 3'; BAX, sense: 5' ATG GAC GGG TCC GGG GAG CA3', antisense: 5' CCC AGT TGA AGT TGC CGT CA3'; Bcl2, sense: 5' GTG AAC TGG GGG AGG ATT GT 3', antisense: 5' GGA GAA ATC AAA CAG AGG CC 3'. Total RNA was extracted by using RNeasy® Mini Kit (QIAGEN®) according to manufacturer's instruction. Total RNA (2µg) was applied for the synthesis of cDNA with QuantiTect® Reverse Transcription Kit (QIAGEN®). PCR was performed in a DNA Thermal Cycler (Applied Biosystems) using QuantiTect SYBR Green PCR Master Mix. The melting curve analysis of the PCR products was performed by StepOne™ Real-Time Systems software V.2.2.2.

**Biochemical evolution:-****Oxidative stress marker:-**

The cells were treated with the IC<sub>50</sub> concentration of venoms and 5-FU for 24h. After 24hrs. post treatment, the cell suspensions were centrifuged. The cell pellets were suspended with PBS (BioWhittaker™ Classical Media, Lonza) and moved into reaction tubes.

**Nitric Oxide (NO):-**

NO. level was measured as total nitrite concentration with Griess method (Green *et al.*, 1982). Griess reagents (1:1) of Sulfanilamide and NEDD were added one by one

**Table 1:-** primers used in RT-PCR assay.

The gene	Primer sequences	Annealing temperature
GAPDH	F: 5' CAA GGT CAT CCA TGA CAA CTT TG 3'	48 °C
	R: 5' GTC CAC CAC CCT GTT GCT GTA G 3'	53 °C
P53	F: 5' TCA GAT CCT AGC GTC GAG CCC 3'	53 °C
	R: 5' GGG TGT GGA ATC AAC CCA CAG 3'	51 °C
Bax	F: 5' ATG GAC GGG TCC GGG GAG CA3'	55 °C
	R: 5' CCC AGT TGA AGT TGC CGT CA3'	49 °C
Bcl-2	F: 5' GTG AAC TGG GGG AGG ATT GT 3'	49 °C
	R: 5' GGA GAA ATC AAA CAG AGG CC 3'	47 °C

F: Forward strand and R: Reverse strand

one, mixed and left 10 min in dark at 25°C. The absorbance of the supernatant was measured photometrically at 540 nm.

**Malondialdehyde (MDA):-**

Lipid peroxidation was measured by the thiobarbituric acid assay (Draper and Hadley, 1990), which measures the production of MDA. 10% trichloroacetic acid was added to cell suspension. The tubes were placed in a water bath and kept at 95 °C for 15 min. After cooling, the suspensions were centrifuged at 3000 rpm for 10 min. 0.67% thiobarbituric acid was added. The tubes were placed in a water bath and kept at 95 °C for 15 min. After cooling, the absorbance of the supernatant was measured photometrically at 532 nm.

**Antioxidative enzymes (Reduced Glutathione GSH):-**

The procedure to estimate the reduced glutathione (GSH) level was according to (Ellman, 1959). The suspended cells were added with sulfuric acid and mixed well. Tubes were left for 10 min at 25°C. The addition of tungstate solution was followed by mixing for 5 min and centrifugation for 20 min at 860 rpm. After 30-60 seconds of the addition of Tris buffer and DNTB reagent to the clear supernatant, the solution colors were measured at 412 nm.

**Statistical Analysis:-**

For statistical comparison of results from different experiments, data were analyzed using one way ANOVA and T-test at significance level (P < 0.05) using Graphpad Prism 5 (Graphpad software, USA)

**Results:-****Cytotoxicity by sulphodiamine-B assay (SRB):-**

MCF-7 cells was treated with venoms derived from *Naja h.*, *Leiurus q.* and *Apis m.* and 5-FU as a standard anticancer drug using 0.01, 0.1, 1, 10 and 100 µg/ml for 48 hours compared with a control of untreated cells. Data recorded revealed that viability percentage and concentration were related. The cytotoxic effect 5-FU wasn't significantly related to the effect of *Leiurus q.* venom (P > 0.05). In the meantime, there was a significant correlation between the effect of 5-FU and the effect of *Apis m.* and *Naja h.* venoms (P > 0.05). Also, there was a non-significant difference in the cytotoxicity of venoms namely *Apis m.* and *Naja h.* (Table 2). Regarding Caco-2 cell, data revealed that the viability percentage was concentration dependent. There was a significant difference of venoms toxicity compared with in MCF-7 cell line due to the difference between effects of test venoms in both cell lines (P > 0.05). Except in case comparison between *Naja h.* and *Apis m.* venoms, the viability was the least in *Naja h.* venom compared with others (P < 0.05) (Table 3). The data recorded revealed the toxicity of test venoms showing a variable reactivity which was cell line and concentration dependent. The IC<sub>50</sub> of *Apis m.* venom is non-

significantly toxic in comparison with *Naja h.* venom ( $P > 0.05$ ) while both were significantly toxic compared to the *Leiurus q.* venom recording  $IC_{50}$  values of 2.5, 3.5 and 27.8  $\mu\text{g/ml}$  for MCF-7 (Table -1). At the same time, the  $IC_{50}$  of test venoms to Caco-2 cells showed that there was a significant toxicity of *Naja h.* venom to both *Apis m.* and *Leiurus q.* venoms by 20, 32.3 and 14  $\mu\text{g/ml}$  respectively. 5-FU as a positive control showed a significant toxicity to both cell-lines than test venoms recording  $IC_{50}$  values of 0.5 and 2.6  $\mu\text{g}$  in case of MCF-7 and Caco-2 respectively (Table 4).

The  $IC_{50}$  values of 5-FU, *Naja h.*, *Leiurus q.* and *Apis m.* venoms was summarized in (Table 3). Data recorded showed that 5-FU as chemotherapeutic agent has a highly cytotoxic effect on both MCF-7 and Caco-2 cells more than venoms as bio-therapeutic agents. *Naja h.*, *Leiurus q.* and *Apis m.* venoms had a medium, low and high cytotoxic effect on both MCF-7 and Caco-2 cells respectively.

**Table 2:-** Percentage viability of MCF-7 cells post 48 hrs. treatment *Naja h.* venom, *Leiurus q.* venom and *Apis m.* venom and 5-FU relative to concentration.

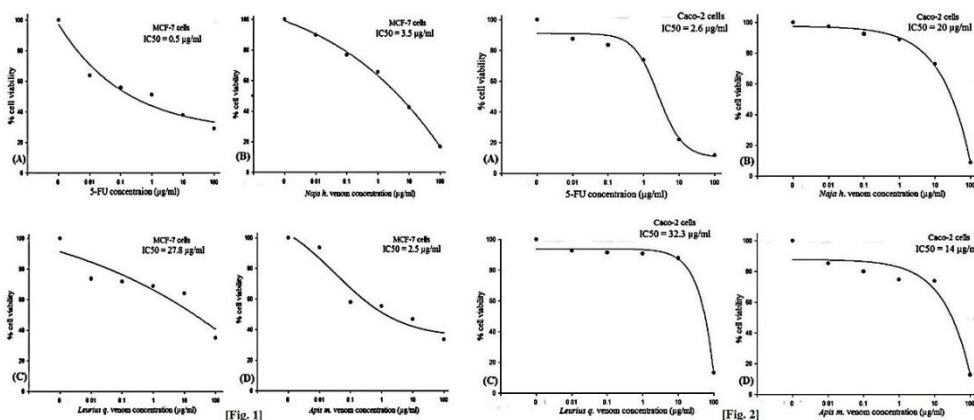

Concentration ( $\mu\text{g/ml}$ )	Percentage viability of MCF-7 cells treated with			
	<i>Naja h.</i>	<i>Leiurus q.</i>	<i>Apis m.</i>	5-FU
0	100	100	100	100
0.01	89.67 $\pm$ 7.58	73.74 $\pm$ 8.82	93.64 $\pm$ 0.36	63.87 $\pm$ 1.5
0.1	76.77 $\pm$ 0.68	71.94 $\pm$ 8.11	57.98 $\pm$ 1.3	55.82 $\pm$ 1.8
1	65.54 $\pm$ 2.94	68.8 $\pm$ 1.83	55.34 $\pm$ 1.16	51.14 $\pm$ 1.44
10	42.54 $\pm$ 9.57	64.2 $\pm$ 3.4	46.94 $\pm$ 0.21	37.94 $\pm$ 1.99
100	16.72 $\pm$ 0.85	35.13 $\pm$ 1.97	33.49 $\pm$ 2.19	29.17 $\pm$ 0.95

Data obtained from triplicate results of three experiments and shown as mean  $\pm$  standard deviation (SD).

**Table 3:-** Percentage viability of Caco-2 cells post 48 hrs. treatment *Naja h.* venom, *Leiurus q.* venom and *Apis m.* venom and 5-FU relative to concentration.

Concentration $\mu\text{g/ml}$	Percentage viability of Caco-2 cells treated with			
	<i>Naja h.</i>	<i>Leiurus q.</i>	<i>Apis m.</i>	5-FU

Data obtained from triplicate results of three experiments and shown as mean  $\pm$  standard deviation (SD).

**Figure 1:-** Survival curve of MCF-7 cells 48 hrs. post treatment with different concentrations of venoms and anticancer drug: (A) 5-FU, (B) *Naja h.* venom (C) *Leiurus q.* venom. and (D) *Apis m.* venom.

**Figure 2:-** Survival curve of Caco-2 cells 48 hrs. post treatment with different concentrations of venoms and anticancer drug: (A) 5-FU, (B) *Naja h.* venom (C) *Leiurus q.* venom. and (D) *Apis m.* venom.

**Table 4:-** IC<sub>50</sub> of 5-FU, *Naja h.*, *Leiurus q.* and *Apis m.* venoms treatment for 48 hrs.

Treatment	IC <sub>50</sub> (µg/ml) for 48 hrs.	
	MCF-7	Caco-2
<i>Naja h.</i> venom	3.5	20
<i>Leiurus q.</i> venom	27.8	32.3
<i>Apis m.</i> venom	2.5	14
5-FU	0.5	2.6

**Morphological changes:-**

Untreated MCF-7 and Caco-2 cells were well adhered and homogeneously distributed in the culture field exhibiting an epithelial shape with distinct boundaries. Morphological changes of MCF-7 and Caco-2 cells treated with IC<sub>50</sub> concentrations of *Naja h.*, *Leiurus q.* and *Apis m.* venoms and 5-FU for 24 hrs. were obvious whereas cells lost their characteristic appearance and started showing gradual cell shrinkage, cell rounding and detaching from the surface of tissue culture flasks. Finally it was followed by cell swelling and rupture leading to destruction of the cell sheet. It was demonstrated in Caco-2 more than MCF-7. These morphological changes were obvious in the (Figures 3 and 4).

**Figure 3:-** A photograph shows the effect of IC<sub>50</sub> concentration of venoms and 5-FU on MCF-7 cells, non-treated MCF-7 cells (A) and MCF-7 cells treated with 5-FU (B) and MCF-7 cells treated with *Naja h.* venom (C) and MCF-7 cells treated with *Leiurus q.* venom (D) and MCF-7 cells treated with *Apis m.* venom (E) for 24 hrs.

**Figure 4:-** A photograph shows the effect of IC<sub>50</sub> concentration of venoms and 5-FU on Caco-2 cells, non-treated Caco-2 cells (A) and Caco-2 cells treated with 5-FU (B) and Caco-2 cells treated with *Naja h.* venom (C) and Caco-2 cells treated with *Leiurus q.* venom (D) and Caco-2 cells treated with *Apis m.* venom (E) for 24 hrs.

**Effect of *Naja h.*, *Leiurus q.* and *Apis m.* venoms on apoptosis related genes:-**

Regarding the anti-cancer potential of test venoms and the positive control drug it was recorded that P53 gene in MCF-7 and Caco-2 cells treated with the *Naja h.* and *Apis m.* venoms showed a variable significant up regulation of P53 gene post 24 hrs. cell treatment recording elevation rate in the order of 100 % in MCF-7 and 51.9% in Caco-2 for *Naja h.* venom, 50 % in MCF-7 and showed insignificant gene expression recording 15.5% in Caco-2 for *Apis m.* venom. While, *Leiurus q.* venom showed non-significant up regulation of P53 gene compared with its value in non-treated cells by 30% in MCF-7 and non-significant down regulation by 15% in Caco-2. As compared to a synthetic anticancer drug, (5-FU) showed down regulation in the order of 60% and 18.8% in MCF-7 and Caco-2 respectively and compared with negative untreated cell control (Fig. 5).

In the meantime the second pro apoptotic gene (Bax) showed a significant up regulation post MCF-7 cells treatment with *Naja h.* and *Apis m.* venoms recording 30% for both venoms compared to its value in negative cell control. While, *Leiurus q.* venom showed somewhat lower significant up regulation of Bax gene by 10% compared to

negative control cells. However 5-FU drug showed a highly significant down regulation of target gene by 90% compared to non-treated cells (Fig. 5). It was noticed that there was an undetected expression rate in Caco-2 cells treated with *Naja h.* venom followed by the lowest expression rate post cellular treatment with 5-FU 0.09% compared to untreated cells. While, the up regulation rate of Bax gene was significant up regulated in *Leiurus q.* and *Apis m.* venoms treated cells recording 9% and 3.4 % respectively when compared to non-treated cells.

Regarding the Antiapoptotic gene(Bcl2): it was noticed that the Bcl-2 gene was significantly down regulated in both MCF-7 and Caco-2 cells post 24 hrs treatment with *Naja h.*, *Apis m.* and *Leiurus q.* venoms. When MCF-7 cell line was treated for 24 hrs with *Naja h.*, *Apis m.* and *Leiurus q.* venoms and 5-FU, the Bcl-2 gene down regulation rate was significant 40%, 30%, 20% and non-significant 10% respectively ( $P < 0.05$ ). While its down regulation rate was 35%, 88.84% and 97.8% when Caco-2 cell line was treated for 24 hrs. with *Leiurus q.*, *Naja h.* and *Apis m.* venoms and 5-FU respectively ( $P < 0.05$ ) (Fig 5).

**Table 5:-** Expression of Pro and Antiapoptotic genes in test venoms treated cells compared with 5-FU as a positive control and non-treated cells as a Negative control using RT-PCR.

Treatment	P53		Bcl-2		Bax	
	MCF-7	Caco-2	MCF-7	Caco-2	MCF-7	Caco-2
<i>Naja h.</i> venom	2	1.519	0.6	0.7	1.3	---

#### Evaluation of MDA, NO. and GSH in cells and media:-

The data recorded of *Apis m.* venom treated MCF-7 cell line revealed that there was a significant increase in MDA level ( $p < 0.001$ ) by 18.18%, while *Leiurus q.* venom showed significant decrease by 26.27%. whereas *Naja h.* venom and 5-FU had highly significant decrease of MDA level ( $P < 0.001$ ) by 48.49% and 45.46% respectively, compared to

the control. MDA level was significantly decreased post MCF-7 cell culture media treated with *Naja h.* and *Leiurus q.* venoms ( $p < 0.001$ ), while *Apis m.* venom and 5-FU showed highly significant decrease compared to the control. In the meantime, the MDA level in Caco-2 cell line showed significant ( $p < 0.001$ ) increase by 42.27% and 36.08% and 65.98% post treatment with *Leiurus q.*, *Apis m.* venoms and 5-FU respectively, while *Naja h.* venom showed a significant ( $P < 0.001$ ) decreased MDA level recording 35.05% compared to the control respectively. MDA level was significantly decreased post Caco-2 cell culture media treated with *Apis m.* and *Leiurus q.* venoms ( $p < 0.001$ ), while *Naja h.* venom and 5-FU showed highly significant decrease compared to the control.

There was no change in the NO. level in MCF-7 cells post *Leiurus q.* venom treatment. Whereas *Apis m.* venom had a non-significant increase of NO. level in MCF-7 cells by 6.77% and *Naja h.* venom and 5-FU showed significant increase in NO. level ( $p < 0.001$ ) in the MCF-7 cells by 10.9% and 9.77% respectively compared to the control. In the MCF-7 cell media *Leiurus q.* venom, 5-FU, *Apis m.* and *Naja h.* venoms showed highly significant increase in NO. level ( $p < 0.001$ ) recording 48.8%, 42.8%, 39.2% and 30.8% respectively compared to the control. While in the case of Caco-2 cells treatment with test venoms it was recorded that *Naja h.* venom and 5-FU had no change in NO. level while *Leiurus q.* venom showed significant decreased value of NO. level recording 8.7% ( $p < 0.001$ ), whereas *Apis m.* venom showed a significant elevation in NO. level recording 17.03% ( $P < 0.001$ ) compared with its values in control cells. Moreover in the Caco-2 cells media treated with 5-FU, *Naja h.*, *Leiurus q.* venoms showed highly significant increase in NO. level ( $p < 0.001$ ) recording 19.18%, 11.95% and 5.97% respectively compared to the control. On the other hand *Apis m.* venom showed non-significant ( $p < 0.001$ ) decrease in Caco-2 media by 8.18%.

GSH level showed a non-significant elevation in MCF-7 cells treated with 5-FU by 13.03% while *Naja h.*, *Leiurus q.* and *Apis m.* venoms recording 19.91%, 17.25% and 10.88% ( $P > 0.001$ ) respectively. In the MCF-7 cell media 5-FU, *Apis m.* and *Naja h.* venoms showed significant decrease in GSH level recording 26.2%, 28.14% and 41.86% ( $P > 0.001$ ) respectively. While *Leiurus q.* venom showed a significant increase in GSH level in media ( $p < 0.001$ ) by 36.18%.

In the meantime the GSH level in Caco-2 cell line had a significant ( $p < 0.001$ ) increase in *Leiurus q.* venom treated cells recording 15.42%. While, *Apis m.* venom and 5-FU had non-significant decrease by 3.25% and 2.42% respectively and *Naja h.* venom had a highly significant decrease recording 49.46% ( $p < 0.001$ ) compared to the control. Also, GSH insignificantly decreased post Caco-2 cell media treated with *Naja h.* venom recording 5.13% ( $p > 0.001$ ). While *Leiurus q.* venom showed significant decrease in GSH level by 21.53% ( $P < 0.001$ ). On the contrary, there was a significant elevation of GSH level detected post cell treatment with 5-FU as

**Figure 5:-** Evaluation of p53, BAX and Bcl2 mRNA expression levels 24h Post MCF-7 and Caco2 cells treatment with IC<sub>50</sub> of *Naja h.*, *Leirius q.* *Apis m.* and 5-FU.

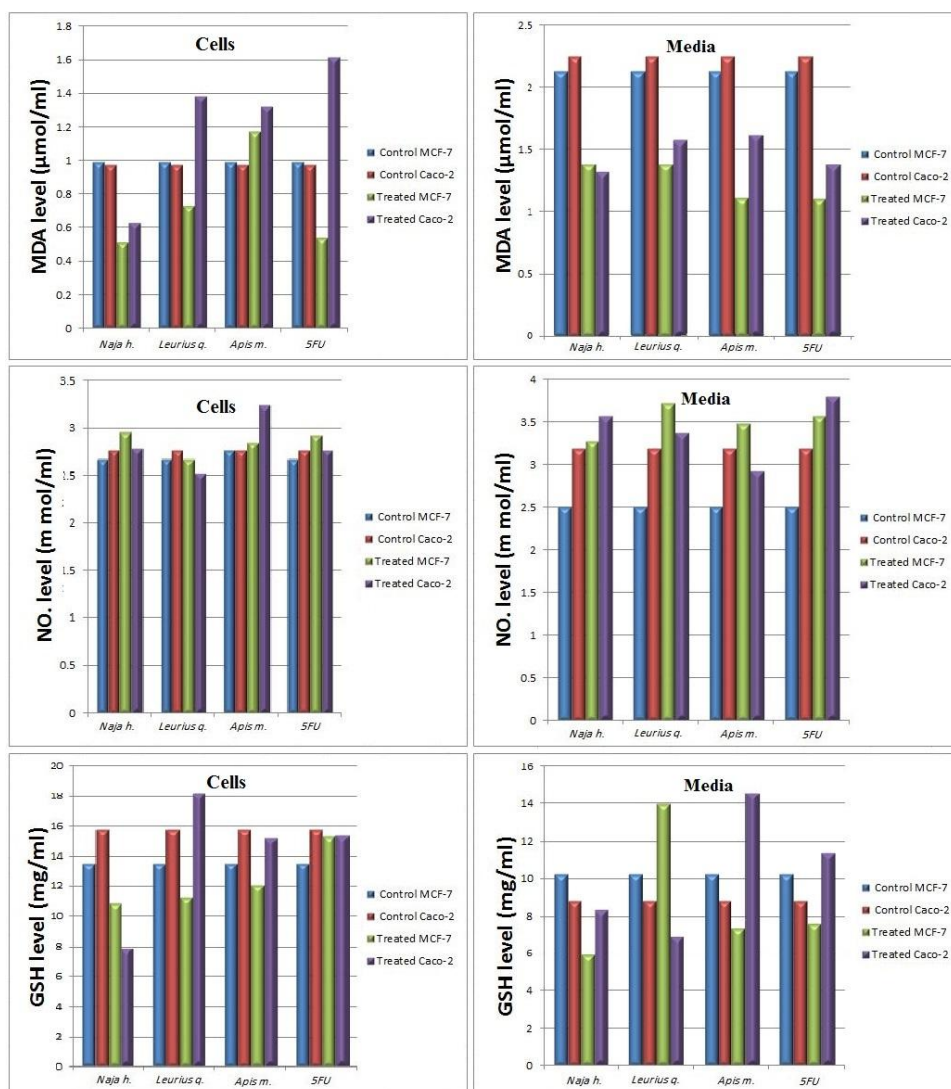

well as *Apis m.* venom recording 29.27% and 65.49% respectively (p < 0.001) compared to the control.

### Discussion:-

Cancer is primarily a genetic disease and is one of the most reasons of death worldwide. Cancer has wide enormous chances to be controlled. There is a vital need to discover a better treatment because of its fast spreading rate in the present era. Recently a significant movement has been made in the direction of understanding suggested hallmarks of cancer growth and treatment. Anticancer drug development from natural resources is offered all over the world.

Venoms of several animal species including snakes, scorpions and bees as well as their biochemical derivatives have shown therapeutic potential against cancer as Captopril and Escozul (Bryan, 2009; Lorenzo *et al.*, 2012). In the near future, these molecules may become well-known anticancer drugs.

In the present study, we traced the apoptotic pattern and anti-proliferation factors to evaluate the probable mechanism of action of *Naja h.*, *Leiurus q.* and *Apis m.* venoms on breast and colon cancer cells. This is done by evaluating the anticancer potentials through measuring the pro-apoptotic and anti-apoptotic genes and related antioxidants profile in treated and non-treated cells compared to the effect of 5-FU as a synthetic anti-cancer drug. Compatible with previous studies, animal venoms have a cytotoxic and anti-proliferation effect on cancer cells (Zargan *et al.*, 2011<sub>b</sub>; Zargan *et al.*, 2011<sub>c</sub>; Park *et al.*, 2011; Ebrahim *et al.*, 2016).

**Figure 6:-** Bar diagram showing the levels of MDA, NO. and GSH in the MCF-7 and Caco-2 cells and media treated with *Naja h.*, *Leiurus q.* and *Apis m.* venoms and 5-FU exposure for 24 hrs. Data are represented the mean  $\pm$  SE.

In another study, *Naja h.* and *Apis m.* venoms and their derivatives showed cytotoxic anti proliferative effect on breast and lung cancer cell lines (El Sharkawi *et al.*, 2015). Another important finding is *Leiurus q.* venom inhibits the proliferation of breast and prostate cancer cells (Omran, 2003). In addition, the Al-Asmari *et al.* study reported that colon and breast cancer cells are sensitive to *Leiurus q.* venom (Al-Asmari *et al.*, 2016a).

Variation in the cytotoxic concentration between the three venoms may be attributed to the variations of venom constituents. In the present study data regarding the morphological findings accompanied with reduction in cell viability was in accordance with data reported by (Akbari and Javar, 2013) assuring that 50% of MCF-7 cells proliferation has been inhibited by 0.38 µg/ml of 5-FU after 48 hours. Also, a study conducted by (Gomez-Monterrey *et al.*, 2013) reported that the proliferation of human colon cancer cells in response to 5-FU, showed that the IC<sub>50</sub> of 5-FU on Caco-2 cell line after 48 hours is 46 µM/ml, which is equal to 5.9 µg/ml. The difference between the results of this study and the previous studies may be due to the difference in evaluation protocols, and species and habitat of used animal as a source of venom.

It is known that oxidative stress occurs as a defense mechanism which is imbalanced by free radicals. This imbalance can be caused by either increased free radical formation or decreased antioxidant capacity (Birben *et al.*, 2012). The mitochondria plays a key role in cell apoptosis and ROS production. ROS have critical actions on both DNA and proteins. The increasing level of ROS causes receptors activation as Fas receptor. ROS oxidize the mitochondrial pores and disrupt the mitochondrial membrane potential that leads to cytochrome C release, mitochondrial membrane lipid peroxidation, membrane fluidity reduction, membrane lipid degradation and *etc.* (Simon *et al.*, 2000).

GSH is one of the main intracellular antioxidants with several biological functions. One of its important functions is to protect against ROS-caused oxidative damage. Also, MDA level provides other marks of oxidative stress association in venom toxicity. Moreover nitric oxide level which is elevated in cancer cells has antitumor activity, but at a lower concentration it stimulates tumor growth (Jenkins *et al.*, 1995). So, this study provides evidence supporting the theory that GSH, NO. and MDA play an important role in genotoxicity of venom treatment.

Regarding the anticancer activity of test venoms based on the elevated or unelevated levels of antioxidant, our data was in agreement with others. For example in Al-Quraishy *et al.* study, it showed that rats injected with *Naja h.* venom had a significant increase of the NO. level in serum and liver tissue by 42.97% and 49.23% respectively (Al-Quraishy *et al.*, 2014). Similar observation was reported by (Dkhil *et al.*, 2014) that *Naja h.* venom increased the NO. level in kidney tissue by 82.2%. Snake venom of *Walterinnesia a.* was found to have an increasing effect on NO. level in breast and prostate cancer tissues by 130% and 100% respectively (Badr *et al.*, 2013). The mechanism of how snake venom increases the nitric oxide concentration was thought to be by up regulating of iNOS gene expression (Al-Quraishy *et al.*, 2014; Dkhil *et al.*, 2014). Al-Asmari and co-workers found that different snake venoms could cause apoptosis in colon and breast cancer cell lines through increasing ROS (Al-Asmari *et al.*, 2016b). Dkhil *et al.* found that *Naja h.* venom induced renal toxicity to rat kidney tissue through decreasing GSH content by 41.02% and through the reduction of GR, GST, and GPx genes expression (Dkhil *et al.*, 2014). In another research, the reduced GSH in liver tissue of envenomed rats with LD<sub>50%</sub> of *Naja h.* venom is due to reduction of GR expression (Al-Quraishy *et al.*, 2014). *Naja h.* venom induced significant increase in lipid peroxidation in the liver and kidney tissues, but not in the heart tissue (Moneim *et al.*, 2015). On the opposite view, *Naja h.* venom induced high lipid peroxidation with LD<sub>50%</sub> to rat kidney and liver tissues and serum by 78.54%, 18.8% and 34.54% respectively (Dkhil *et al.*, 2014; Al-Quraishy *et al.*, 2014).

Also, *Leiurus q.* venom showed a variable effect in antioxidant level and our data was compatible with others. According to Zargan and his team studied the *Odontobuthus d.* venom on MCF-7 cell line and found that 50µg/ml and 100µg/ml scorpion venom increased the NO. level. Also, its concentration in supernatant is increased by 31.23% and 47.95% respectively, when compared to control. In another study of Zargan team but on SH-SY5Y cell line, found that the scorpion venom increased the NO. concentration in supernatant by two fold or four fold by 50µg/ml and 100µg/ml. Another research of this team found that the venom of scorpion *Androctonus c.* (50µg/ml) increased the NO. concentration in supernatant of MCF-7 and SH-SY5Y cell lines by 38.89% and 324.26% respectively (Zargan *et al.*, 2011a; Zargan *et al.*, 2011b; Zargan *et al.*, 2011c). In previous studies, the mechanism of how scorpion venom increases the extracellular nitric oxide concentration is still unknown. Scorpion venom of *Odontobuthus d.* decreased the GSH level in human breast cancer cell line MCF-7 (Zargan *et al.*, 2011b). Envenomed rats with *Leiurus q.* venom had an elevated GSH level in heart and lung tissues (Fatani *et al.*, 2006).

Human lung cancer cell line (NCI-H358) treated with *Androctonus a.* venom showed a significant decrease in GSH level by 16.66 % (Béchohra *et al.*, 2016). Envenomed rats with *Leiurus q.* venom had an elevated MDA level in heart tissue but no change in lung tissue (Fatani *et al.*, 2006). Human lung cancer cell line (NCI-H358) treated with *Androctonus a.* venom showed a significant increase in MDA level (Béchohra *et al.*, 2016).

Most previous studies described that bee venom decreased the NO content and NOS mRNA expression as in BV-2 cell line study (Han *et al.*, 2007). The bee venom has a critical role in increasing the intracellular Ca<sup>++</sup> (Tu *et al.*, 2008). Ca<sup>++</sup> has a role in NO. production as described previously. Furthermore this study of bee venom had neuroprotective effects in mice brain; bee venom neutralized the GSH level in brain tissue (Khalil *et al.*, 2015). And Melittin; the most predominant component of bee venom, slightly reduced the GSH levels in human peripheral blood lymphocytes (Gajski *et al.*, 2012; Gajski *et al.*, 2016). By studying bee venom neuroprotective effects in mice brain was found that bee venom increases the MDA levels in brain by 77.7% (Khalil *et al.*, 2015). Bee venom increased the MDA levels in human peripheral blood lymphocytes by 37.21% (Gajski *et al.*, 2012). Also melittin increased the MDA levels in HPBLs cells (Gajski *et al.*, 2016).

Besides, it was reported that 5-FU induced endogenous nitric oxide in BEL-7402 human liver carcinoma by 173%. *In vivo* and *in vitro* studies of 5-FU induces the expression of iNOS that might be by induction of cytokines (Yin *et al.*, 2007). On the other hand, 5-FU had no effect on nitric oxide production in the DLD-1 colon cancer cell line but also inhibited the cell ability to express NOS mRNA (Jin *et al.*, 1996). In patients with colorectal cancer, GSH levels in plasma and erythrocytes decreased and the lipid peroxidation levels increased after 5-FU treatment (Koçer and Naziroğlu, 2013). In patients with breast cancer, the GSH levels increased and the lipid peroxidation levels decreased after 5-FU treatment (Suhail *et al.*, 2012).

Fighting tumor cells by most anticancer strategies now used in clinical oncology, for example, chemotherapy, radiation, gene therapy or immunotherapy, has been linked to activation of apoptosis signal transduction pathways in cancer cells such as the intrinsic and/or extrinsic pathway. Venoms that have anticancer effect may induce apoptosis by extrinsic and/or intrinsic pathway (Jo *et al.*, 2012; Song *et al.*, 2012). The intrinsic signaling pathway of apoptosis has reported a non-receptor mediated stimuli and production of intracellular signals that act directly on targets within the cell. The stimuli that initiate the intrinsic pathway produce the intracellular signals may be radiation, oxidant agent and toxins. This stimuli depends on the change in the inner mitochondrial membrane and the release of a pro-apoptotic protein such as cytochrome C that activates caspases especially caspase 9 (Fulda and Debatin, 2006).

The control and regulation of apoptotic mitochondrial pathway occurs through members of the Bcl-2 family proteins that can either be pro-apoptotic or anti-apoptotic. The tumor suppressor protein p53 has a critical role in regulation of the Bcl-2 family Proteins (Adams and Cory, 2007). The tumor suppressor gene p53 is activated in the nucleus by DNA damage or oxidative stress. The resulting increase in p53 level leads either to the induction of the cell cycle arrest or apoptosis that suppress the tumor growth (Kruiswijk *et al.*, 2015). Bcl-2 is an anti-apoptotic protein that prevents cell death and apoptosis whereas BAX is a pro-apoptotic protein that stimulates apoptosis (Adams and Cory, 2007).

In agreement with the present study, initiation of apoptosis is explained by up regulation of both p53 and Bax genes expression and down regulation of Bcl-2 gene expression. In other studies, snake venom from *Vipera lebentina turnica* induced apoptotic cell death of human lung cancer cells via increasing of caspase 3, Bax, p21 and p53, but decreasing cIAP and Bcl-2 expressions (Lee *et al.*, 2015). The East-Asian scorpion *Buthus martensi Karsch* on human prostate cancer cells has an apoptotic effect by stimulating the expression of p27 and Bax while decreasing cyclin E and Bcl-2 (Zhang *et al.*, 2009). Bee venom inhibits the cell growth and apoptosis of the human ovarian cancer cells through the inhibition of STAT3 and Bcl2 proteins and increasing pro-apoptotic proteins including caspase-3, 8, and Bax (Jo *et al.*, 2012).

The mRNA expression of apoptosis related genes in MCF-7 cells treated with *Apis m.* venom were more affected than these in Caco-2 cells. In MCF-7, P53 and Bax mRNA expression were increased by 50% and 30% respectively but Bcl-2 mRNA expression was decreased by 30%, when compared to untreated cells. In Caco-2, P53 and Bax mRNA expression were increased by 15.5% and 3.4% respectively but Bcl-2 mRNA expression was decreased by 88.84%, when compared to untreated cells. In the study of bee venom neuroprotective effects in mice brain, it was found that bee venom increases the mRNA levels of caspase-3, Bcl-2 and Bax genes in brain tissues of mice (Khalil

*et al.*, 2015). Furthermore bee venom induced apoptosis in human breast cancer MCF-7 cells, human cervical epidermoid carcinoma Ca Ski cells, human Lung NCI-H1299 cells, human leukemic U937 cells and human bladder cancer TSGH-8301 cells through increasing in P53 and Bax expression and decreasing in Bcl-2 expression (**Jang et al.**, 2003; **Ip et al.**, 2008a; **Ip et al.**, 2008b; **Ip et al.**, 2012). Also, Melittin up regulated the mRNA levels of TP53 (1.4-fold), caspase-7 (2.36-fold), Bcl-2 (2.95-fold) and Bax genes (3-fold) in human peripheral blood lymphocytes (**Gajski et al.**, 2016).

In agreement with the present study, initiation of apoptosis is explained by up regulation of both p53 and Bax genes expression and down regulation of Bcl-2 gene expression. In other studies, snake venom from *Vipera lebetina turnica* induces apoptotic cell death of human lung cancer cells via increasing of caspase 3, Bax, p21 and p53, but decreasing cIAP and Bcl-2 expressions (**Lee et al.**, 2015).

It was reported by (**Ayman et al.**, 2017) that *Cerastes cerastes* venom showed anti-cancer potential against both prostate (PC3) and colon (Caco-2) cancer cell lines and their potential was significantly elevated under the effect of BCG derived PPD protein in a concentration dependent way. Besides, it was reported by (**Abd-Elrahem et al.**, 2017) that propolis, PLA2 and *Apis m.* venom showed anticancer potential in a variable way proving that anticancer activity is P53 gene pathway dependent. Also, it was recorded by (**Ayman et al.**, 2017) and (**Abd-Elrahem et al.**, 2017) that The main phase of cell cycle arrest was G2/M in both cancer cell lines, with a minor S-phase arrest. According to our study results, there is an increase in ROS level in human colon cancer Caco-2 cells more than human breast cancer MCF-7 cells in response to *Apis m.* venom treatment. The elevated ROS level is through increasing of NO. and MDA levels and decreasing of GSH level. GSH, NO. and MDA are well-established signs of oxidative stress and these results might have a role in bee venom cytotoxicity and apoptotic effect. These results are compatible with previous studies that observed bee venom treatment induced ROS production in human cervical epidermoid carcinoma Ca Ski cells (**Ip et al.**, 2008b), human bladder cancer TSGH-8301 cells (**Ip et al.**, 2012) in addition to an increase in hydroxyl radicals and hydrogen peroxides production in human melanoma A2058 cells (**Tu et al.**, 2008). While in mice, bee venom induced an elevation in serum MDA and NO (**Prado et al.**, 2010) and an elevation in brain MDA and a decrease in brain GSH (**Khalil et al.**, 2015). Also, previous studies that described the mode of action of bee venom in cancer treatment found that bee venom induced apoptosis in cancer cells (breast, cervical, prostate and ovarian) through many factors. These may be through ROS production, dysfunction of the mitochondrial membrane potential, suppression of the activated NF- $\kappa$ B, release of cytochrome C from mitochondria, increase in the levels of caspases as caspase-3,8,9, activates DRs as DR3, DR4 and DR6 and increases in the levels of Fas, p53, p21, iNOS, COX-2 and Bax, but decreases in the level of Bcl-2 and STAT3 genes expression. Also Bee venom induces cell cycle arrest and necrosis in some cells (**Ip et al.**, 2008a; **Ip et al.**, 2008b; **Park et al.**, 2011; **Jo et al.**, 2012 ; **Ayman et al.**, 2017; **Abd-Elrahem et al.**, 2017).

Regarding our data concerning the mRNA expression of apoptosis related genes of MCF-7 treated with *Leiurus q.* venom that was more sensitive than these of Caco-2, our result was in agreement with **Alyan et al.** study that studied the effect of a safe concentrations of crude and pure *Leiurus q.* venom on MCF-7 and Caco-2 cell lines. This study found that *Leiurus q.* venom had no effect on caco-2 cells but showed a slight effect on mcf-7 apoptosis related genes (**Alyan et al.**, 2014). While Scorpion venom of *Rhopalurus j.* had dissimilar effect on different cancer cell types. Cervix adenocarcinoma cells (Hela) treated with scorpion venom had a significant increase in p53 and bax expression but Bcl-2 depletion. Also, Scorpion venom has an effect on lung carcinoma cells (A549) through a significant decrease in p53 and bcl-2 but no change in Bax expression (**Díaz-García et al.**, 2013).

Furthermore MCF-7 cells treated with *Naja h.* venom were more sensitive than these of Caco-2 in the mRNA expression of apoptosis related genes. MCF-7, P53 and Bax genes were up regulated by 100% and 30% respectively but Bcl-2 mRNA expression was down regulated by 40%, when compared to untreated cells, while in Caco-2 cells, P53 mRNA expression was increased by 51.9% while Bcl-2 mRNA expression was decreased by 30%, compared to untreated cell control. On the other hand there is no expression in Bax mRNA. MCF-7 cells that was treated with safe concentration of *Naja h.* venom had no effect on the apoptotic related genes. On the other hand, Caco-2 cells had an effect on P53 and Bax and no effect on Bcl-2 (**Alyan et al.**, 2014). Also, *Naja h.* venom up regulated Bax but down regulated Bcl2 protein levels in liver, heart, and kidney tissues (**Moneim et al.**, 2015).

5-FU treated MCF-7 cells showed a down regulation in Bcl-2 and P53 gene expression by 10% and 60% respectively. MCF-7 treated with IC<sub>50%</sub> of 5-FU induced apoptosis by slightly down regulation of Bcl-2 with slight up regulation of P53 genes (**Hernández-Vargas et al.**, 2006). Also, the effect of 5-FU on Caco-2 cells down

regulated P53, Bcl-2 and Bax by 18.8%, 97.8% and 99.91% respectively. In the study that evaluated the apoptosis in various colon cancer cell lines treated with 5-FU, 5-FU induced the lowest Bax expression and not changing in regulation of mutant P53 but a variation in Bcl-2 expression pattern (Nita *et al.*, 1998). Also, it was reported by (Chan *et al.*, 2008) that 5-FU could induce apoptosis in absence of p53 in colon cancer cell lines.

The above results suggest that the half lethal dose (IC<sub>50</sub>) of snake (*Naja h.*), scorpion (*Leiurus q.*) and bee (*Apis m.*) venoms had anticancer potentials on human breast and colon cancer cells and this is positively related to the antioxidant profile and apoptotic gene expression. Hence, we concluded that tested venoms possess many bioactive substances, especially peptides and proteases that bind with high affinity to physiological targets and can be trapped for therapeutic purposes in the near future.

Finally, it can be concluded that snake (*Naja h.*), scorpion (*Leiurus q.*) and bee (*Apis m.*), venoms have anticancer potentials on human breast and colon cancer cells and this is positively related to the antioxidant profile and apoptotic gene expression.

#### Abstract

**Background:** Tranexamic acid is a synthetic lysine-analogue antifibrinolytic that competitively inhibits the activation of plasminogen to plasmin, it's a well-documented blood sparing agent. However, its routine use in idiopathic scoliosis surgery is poorly documented. The objective of this meta-analysis was to determine TXA's efficacy in reducing blood loss and blood transfusion in idiopathic scoliosis surgery.

**Methods:** Five databases (*MEDLINE, PUBMED, WEB of SCIENCE, EMBASE and The COCHRANE CENTRAL REGISTER of CONTROLLED TRIALS*) were searched to identify the relevant randomized controlled trials, prospective cohort control, and retrospective controlled trails regarding the TXA efficacy in idiopathic scoliosis surgery. Mean differences (MDs) of blood loss and blood transfusions in TXA-treated group compared to control and/or placebo group were extracted and combined using random-effect meta-analysis model.

**Results:** A total of 7 studies comprising 426 patients were included in the meta-analysis of blood loss according to the pre-defined selection criteria. TXA-treated group had an overall significantly ( $p < 0.005$ ) less volume of blood loss (ES (MD) = 727.71 mL; CI=281.86 – 1173.56 mL). 6 studies comprising 346 patients were included in the meta analysis of blood transfusion, the TXA-treated group had an overall significantly ( $p < 0.001$ ) less transfusion volume (ES (MD) = 268.30 mL; CI= 105.19 – 431.44 mL).

**Conclusion:** Patients treated with TXA had a significantly lower blood loss and lower rates of allogeneic blood transfusion than the control group. Further investigation is required regarding the safety of TXA before it can be generalized in the use of idiopathic scoliosis surgery.

#### Introduction:-

Idiopathic scoliosis is the commonest type of spinal deformity confronting spinal surgeons.<sup>i</sup> With an insidious onset, relentless progression, and a deadly end result. Scoliosis represents a disturbance of the well organized twenty five member intercalated series of spinal segments. It is, at times, grossly oversimplified as mere lateral deviation of the spine, when in reality, it is a complex three-dimensional deformity.<sup>ii</sup> Two-dimensional imaging systems (plain radiographs or X-ray) remain somewhat limiting, and scoliosis is commonly defined as greater than 10° of lateral deviation of the spine from its central axis.<sup>iii</sup> Once active intervention is indicated, surgical treatment to achieve solid

bony fusion is the treatment of choice.<sup>iv</sup> It is well known that one of the main concerns regarding patients undergoing major operative procedures is the risk of increased perioperative bleeding<sup>v</sup> and major morbidity and mortality rates are associated with intraoperative blood loss and transfusion, thus the use of antifibrinolytics and other measures to control bleeding is crucial. In response to large volumes of blood loss, patients will face an increase in the need of blood transfusion as well as other measures such as intraoperative blood salvage, hemodilution, and controlled hypotension<sup>vi</sup>. Tranexamic acid is a synthetic lysine-analogue antifibrinolytic that competitively inhibits the activation of plasminogen to plasmin; at high concentrations it non-competitively blocks plasmin, thus tranexamic acid inhibits the dissolution and degradation of fibrin clots by plasmin<sup>vii</sup>. It has been implicated in major surgical specialties including cardiac surgery<sup>viii</sup>, trauma<sup>ix</sup> and total knee arthroplasty<sup>x</sup>. Over the last decade, the use of pharmacological approach to control blood loss has highly been promising and recommended<sup>xi</sup>. The use of TXA in spinal surgery has been studied and documented<sup>xii</sup>, but the literature still lacks strong data studying its effectiveness in major spinal procedures. Scoliosis in particular, adolescent idiopathic scoliosis to be specific has a strong impact on patients undergoing scoliosis correction surgery whether it involves posterior or anterior spinal fusion. The procedure itself is not quite simple, in which the surgeon might have to face many objectives and difficulties whether they are intraoperative or postoperative which might include postoperative infection, spinal cord injury, and blood loss associated with major spinal instrumentation and its corresponding procedures. In a retrospective analysis that involved 340 patients and aimed to predict the operative blood loss during spinal fusion of adolescent idiopathic scoliosis, the estimated blood loss was  $907 \pm 775$  mL for posterior spinal fusion,  $323 \pm 171$  mL for anterior spinal fusion, and  $1277 \pm 821$  mL for combined procedures<sup>xiii</sup>, which emphasize that the blood loss in spinal fusion to correct adolescent idiopathic scoliosis cannot be neglected nor underestimated. The objective of this meta-analysis is to determine if the antifibrinolytic tranexamic acid is effective in reducing the amount of blood loss and allogeneic blood transfusion in patients with idiopathic scoliosis undergoing spinal fusion in order to correct the deformity.

## **Methods:-**

### **Study Design:-**

We conducted a meta-analysis and systematic review according to predefined guidelines provided by the Cochrane Collaboration. Five databases (*PUBMED*, *MEDLINE*, *COCHRANE CENTRAL REGISTER of CONTROLLED TRIALS*, *WEB of SCIENCE* and *EMBASE*) were searched to identify the relevant randomized controlled trials (RCTs), prospective cohort control (PCC), and retrospective control trials regarding the effectiveness of TXA in idiopathic scoliosis surgery.

### **Search Strategy and Data Source:-**

Interrelated randomized controlled trials (RCTs), prospective cohort control, and retrospective control trials were distinguished in the MEDLINE and EMBASE, PUBMED, WEB of SCIENCE databases and the COCHRANE CENTRAL REGISTER of CONTROLLED TRIALS from January 1960 through December 2016. Key words used in the search included “antifibrinolytics”, “tranexamic acid”, “cyklokapron”, “aprotinin”, “trasyol”, “epsilon aminocaproic acid”, “amicar” and, “spinal curvatures”, “kyphosis”, “scoliosis”, “lordosis”, “anterior fusion” “posterior fusion”, “randomized controlled trial”, and “comparative study”, “prospective” and “retrospective”.

### **Inclusion and Exclusion Criteria:-**

All the studies were included in accordance to all criteria included mutually based on criteria from 1 to 5 as follows; (1) randomized controlled trials, prospective cohort control and/or retrospective control; (2) subjects who underwent spinal fusion including cervical, thoracic and lumbar scoliosis correction surgery irrespective of anterior or posterior approach; (3) the route of intervention was TXA intravenous (IV) administration in the treatment (experimental) group, accompanied with matched control group and (4) the primary outcome measures should include one of the following outcomes: volume of total blood loss reported outcomes including intraoperative, postoperative, and total blood loss (primary outcomes); and (5) the outcomes that were described included the number of patients receiving blood transfusion, volumes of transfusion packed cells.

### **Studies should be excluded if they:-**

(1) had no interventions of which was described above; (2) studies that included patient with a history of coagulation disorder or recent intake of anticoagulation drugs (one month). (3) Patients with severe cardiopulmonary, renal, and hepatic dysfunction and (4) did not contain any of the outcomes mentioned above (5) involved procedures in idiopathic scoliosis patient other than primary deformity correction.

**Literature Search Results:-**

The internet literature search on TXA yielded a total of 88 studies; PubMed (n=25); Medline (n=24); Cochrane Central Registered Controlled Trials (n=18); EMBASE (n=15) and Web of Science (n=16). Of these 88, only 25 articles were found to be relevant articles on scoliosis corrective surgery regardless of approach. Although all 25 studies were relevant, only 7 were selected for data extractions. The remaining 19 studies did not meet the inclusion criteria and/or did not contain the required information.

**Data Extraction:-**

Eligible articles were reviewed independently by 2 investigators. The titles and abstracts of the references were read. Any disagreement on a controversial study was settled by discussion and consensus with a third author. The collected data included the first authors' name, publication date, region/ethnicity, genotyping method and the total number of cases and controls.

**Bias Risk Assessment:-**

The included studies were assessed for risk of bias by 2 independent researchers and a managing reviewer. Methodological domains were graded individually according to (1) study's design; (2) specific to randomization sequence; (3) adequacy of the methods; (4) level of accuracy of the measurements of blood volumes; (5) appropriateness of the statistical tests used for reporting results. The included studies were graded accordingly (A) adequate = methods were reported and appropriate; (B) inadequate = methods were reported but inappropriate; or (C) unclear = methods were not reported. In addition, all efforts were made to ensure the implementations of Cochrane guidelines for literature search.

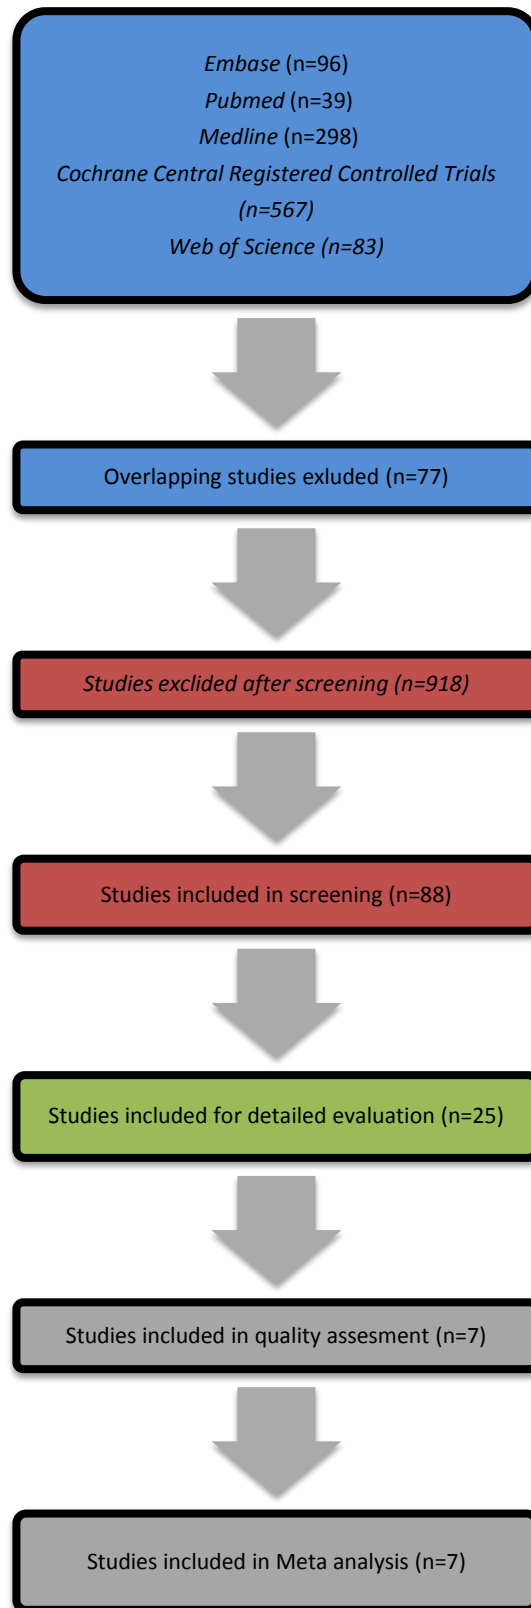

**Statistical Analysis:-**

The effect size (mean differences - MD) of blood loss and blood transfusions in TXA-treated group compared to control and/or placebo group were extracted and combined using random-effect meta-analysis. Heterogeneity parameters (I<sup>2</sup>, r<sup>2</sup> and Q<sup>2</sup>) were used to evaluate the variability among studies relative to the overall effects size. Forest-Plot was generated to display the range of each study relative to the overall range of the model.

**Results:-**

After full text review of the relevant 25 studies, only 7 qualified studies were used in the meta-analysis for blood loss. (*Neilipovitz et al., 2001; Navil et al., 2005; Kaabachi et al., 2007; Grant et al., 2009; Yagi et al., 2012; Bobby et al., 2015; Vinicius et al., 2015*).

Additionally, 6 studies (*Neilipovitz et al., 2001; Navil et al., 2005; Grant et al., 2009; Yagi et al., 2012; Bobby et al., 2015; Vinicius et al., 2015*) were included in the final analysis for blood transfusion. The basic gender and anthropometric characteristics of the studies are involved in this meta-analysis presented in Table (1), Graph (1) and Graph (2).

**Meta-analysis for Blood Loss Volume (BLV):-**

For intraoperative blood loss, a total of 7 studies comprising 426 patients were included in the meta-analysis according to the pre-defined selection criteria, described in the methods section. (Table 1) summarized the characteristics and weight effect of the 7 studies included for blood loss (BLV).

**Table 2:-** Studies Profile, Effect Size, Confidence Intervals and Weight for Blood Loss (MBL).

Study (Author&Yr)	Control		TXA		MD	Confidence Interval		Weight
	N	MBL	N	MBL		LL	UL	
Neilipovitz, 2001	18	2703	22	2453	250	-623.734	1123.734	10.81
Navil, 2005	21	2085	23	1230	855	301.848	1408.152	14.40
Kaabachi, 2007	40	2346	40	1529	817	374.214	1259.786	15.64
Grant, 2009	11	1372	15	688	684	-64.316	1432.516	12.16
Yagi, 2012	63	1079	43	613	466	346.818	585.182	18.26
Bobby, 2015	35	3889	55	1826	2063	1205.244	2920.536	10.98
Vinicius, 2015	19	1407	21	1097	310	91.979	526.421	17.72

As shown in (Table 2), all studies’ profile for both TXA and control groups included effect size (MD), upper and lower limits of the confidence intervals (CI) and weight. Graph (3) illustrated the Mean blood loss in both control and TXA. Clearly observed overlap in Forest’s Plot among the CI’s for all studies that indicated generalized homogeneity (Figure 1). The overall model results indicated that the effect size of blood volume loss was 727.71mL with confidence interval (CI) ranged from 281.86 – 1173.56 ml which was significant (p<0.005), implying that the use of TXA caused a substantial reduction in blood loss volume during operation. The model also displays a 95% CI for the between-studies variance estimate implying perfect overlap, hence the observed scatter is due to sampling error, and the null hypothesis is rejected. It can be concluded that the true effects of TXA in all studies are identical. This was also true as I<sup>2</sup> = 90.34% (Table 3), implying more than 90.34% of the proportion of blood loss volume reduction inducted by TXA, treatment effect (Table 3).

**Meta-analysis for Blood Transfusion:-**

For post-surgical blood transfusions, a total of 6 studies comprising 346 patients were included in the meta-analysis according to the pre-defined selection criteria, mentioned in the methods section. (Table 4) summarized the characteristics and weight effect of the 6 studies included for blood loss. Graph (4) also summarizes the mean blood transfusion. As can be seen from (Table 3), all studies' profile for both TXA and control groups that included

sample size, mean blood transfusion volume (BTV), effect size (MD), upper and lower limits of the confidence intervals (CI) were overlapped as observed in Forest Plot (Figure 2) and that indicated generalized homogeneity. The overall model results indicated that the effect size of blood volume transfusion (BVT) was 268.30 mL, with confidence interval (CI) ranged from 105.51 – 431.41 ml which was significant ( $p < 0.001$ ), implying that the use of TXA induced substantial reduction in blood transfusion postoperatively. As observed from Forest Plot (Figure 2), an overlap among all the CI's of all studies exists. The observed scatter is due to sampling error, and the true effects of TXA in all studies are identical. This is also true as  $I^2 = 72.27\%$ , implying more than 72.27% of the proportion of blood transfusion reduction induced by TXA, treatment effect (Table5).

**Discussion:-**

This study is ultimately a step forward to generalize the use of Tranexamic Acid in spinal surgery, scoliosis reduction. The results showed positive outcomes and significant differences in terms of blood reduction and transfusions, potentially making TXA the drug of choice. Despite its effectiveness, studies on its prophylactic use in scoliosis surgery are limited. Subsequently, not one article has yet been published in Saudi Arabia. Questions arise on the role of TXA in perioperative blood reduction and postoperative allogeneic transfusion. Having said that limitations can be found in this study due to the inclusion of retrospective studies. However, similar benefits of blood loss reduction and transfusion under the use of TXA have been documented in various surgical specialties such as in total knee arthroplasty<sup>xiv</sup> and radical surgery<sup>xv</sup> to that of spine surgeries. In addition, adverse effects play major role when selecting a drug. David T. Neilipovitz et al.,<sup>xvi</sup> evaluated the risks in a randomized-control trial revealing no cases of clinical thrombotic events or hemodynamic instability. Another study showed the safety of TXA use in scoliosis surgery upon postoperative examination detecting no clinical evidence of deep venous thrombosis<sup>17</sup>. Subsequent to these two studies, numerous other studies support its perioperative safety as shown in the studies included in our meta-analysis (Table 6). Another point to add is the presence of co-morbidity. Patients with preexisting renal or hepatic disorders, bleeding diathesis, or coagulation abnormalities are most commonly excluded from studies due to their vulnerability and susceptibility to adverse events. On the other hand, safe use of TXA can be achieved in variant situations such as adjusting the dosage for patients with renal insufficiency<sup>18</sup>.

When weighing the risks and benefits, dose regimens should be taken in consideration. Not having an established optimal dose can be quite challenging. In high dose versus low dose study, the group of patients on a loading dose of 50mg/kg and a maintenance dose of 5mg/kg/h had a lower estimated blood loss than those who were on a loading dose of 10mg/kg and a maintenance dose of 1mg/kg/h by P=0.01 difference.<sup>19</sup> Nevertheless, high doses of drug raise great concern regarding toxicity, and to which extent of increase can the drug safely be administered. In a TXA study of different dose regimens, Jing-Ming Xie et al.,<sup>20</sup> declared that a loading dose of 100mg/kg with a maintenance dose of 10mg/kg/h, double of which mentioned in the previous study, showed no signs of renal toxicity, seizures, DVT, or MI upon assessment. Conclusively, TXA is a safe drug though an optimum dose is greatly recommended for exploration. Further to be considered is the etiology of the disorder, secondary scoliosis, neuromuscular or congenital etiologies, manifested greater blood loss tendency than that of idiopathic etiology, though the mechanism behind the increase bleeding is undetermined<sup>21</sup>. With such variables, study's results may be

deviated. To illustrate, various measures should be taken in order to minimize the high amount of blood loss experienced in patients' with Duchenne Muscular Dystrophy undergoing posterior spinal fusion such as deliberate hypotension technique and patient positioning, yet with the use of TXA, minimal of 740ml blood reduction and 2135ml maximum is to be expected<sup>21</sup>. Which happens to make TXA the advanced management of neuromuscular scoliosis.

Moreover, hospitals' protocols on autologous blood transfusion, hemoglobin level, and the use of cell saver can bias the study's results. In Ho Yong Choi et al.,<sup>22</sup> study on the effectiveness and safety of TXA in spinal deformity surgery, same blood transfusion guidelines were used for both TXA group and control group, allogeneic transfusions were preformed to maintain hemoglobin level between 7-8 mg/dl. In some institutions, anesthesia protocols are standard in scoliosis surgery which leads to limitations in the study<sup>23</sup>. As well, in randomized-control trials, patients' demographic data such as age, gender, body mass index, medical history vary between the two groups contributing to alteration in the results, but such differences are minor and of little or no clinical relevance. Furthermore, Scoliosis surgery is based on medical criteria. Skeletal maturity, degree of curvature, and progression of the curvature are included when considering the surgery<sup>24</sup>. However, patients as young as 8 years old may undergo idiopathic scoliosis surgery. Hence, introducing a drug for study in a vulnerable age group can be demanding leading to limited studies of TXA in spine surgery. More emphasis on its safety and significant efficacy on both patients and hospitals is crucial. According to the CRASH 2 trial<sup>25</sup>, TXA administration is remarkably cost-effective in low, middle, high income settings directly, and indirectly by reducing the cost of additional hospital stays. In other circumstances, economical saving by decreasing the costs of treatment for allogeneic transfusions' side-effects is promising.

When covering the intraoperative aspect of TXA use, surgeons' and anesthesiologists' preferences are taken into account. In surgery for instance, intraoperative transfusion is based on the surgical team's decision such when hemoglobin level reaches 7.0g/dl or less<sup>26</sup> and the TXA dose to be administered is under the anesthesiologist's preference. David T. Neilipovitz et al.,<sup>16</sup> study conducted a short questionnaire at the end of the surgery that was completed by the attending surgeon rating the level of surgical difficulty on a visual analogue scale of 0 (no difficulty) to 10 (extremely difficult) and the operative conditions in term of bleeding, 0 (negligible bleeding) to 10 (massive bleeding). The results were similar for both TXA group (n=22) and the control group (n=18)<sup>16</sup>. However, upon perspectives, results may respectfully fluctuate. One of the most significant advantages health practitioners will face with the use of TXA is the decline in number of cases of blood-borne infections and immunologic reactions associated with blood transfusions as such cases present to be challenging for surgeons. In our results, a notable reduction of blood transfusion was seen in patients treated with TXA, that happens to make TXA a deal breaker when measuring the consequences. From anesthesia's point of view, it has been addressed that the use of TXA with regional and general anesthesia has no complications<sup>27</sup>. In fact, the use of TXA with epidural anesthesia followed 65% of reduction in blood loss<sup>27</sup>. It is clear that TXA plays a tremendous role in the decline of perioperative blood loss and allogeneic transfusions. Thus, this meta-analysis will help guide future scoliosis management and further study exploration on its use in spine surgeries.

**Table 6:-Post-Surgical Risks**

No.	Author	Post-surgical Risk
1	Neilipovitz, 2001	Safe procedure
2	Navil, 2005	Safe procedure
3	Kaabachi, 2007	No data regarding risks

5	Yagi, 2012	No interoperative complications
6	Bobby, 2015	Safe procedure
7	Vinicius, 2015	Not mentioned

### **Conclusion:-**

Although the number of the patients of each of the study included in this meta-analysis is relatively small, tranexamic acid has been shown to effectively reduce blood loss and blood transfusion in idiopathic scoliosis correction surgery. Further multi-center double blinded randomized control trials involving a larger number of patients is required to confirm the efficacy and safety of tranexamic acid in idiopathic scoliosis surgery.

#### Abstract

ZnO nanoparticles (ZnO-NPs) were synthesized using sol-gel method. The structural and optical properties were investigated by X-ray diffraction (XRD), scanning electron microscopy (SEM), and photoluminescence (PL). In this study, the effects of annealing temperature on photoluminescence (PL) of ZnO-NPs were studied. ZnO was annealed at various temperatures between 500 and 800 °C. The X-ray diffraction (XRD) results demonstrated that grain size increased with increase of annealing temperature. The average size of the nanoparticles was determined by SEM as well as XRD data and found to be 50 nm after annealing at 800 °C. As the annealing temperature increased from 500 to 800 °C, the intensities of both UV peak and that of green luminescence (GL) enhanced monotonously. The enhancement in the UV peak intensity is attributed to the decrease of grain boundaries and surface states; whereas, the remarkable improvement in the GL is assigned to the out-diffusion of oxygen from the sample up to 800 °C. It supports that GL is induced by the singly ionized oxygen vacancies. These oxygen vacancies are saturated due to the finiteness of the defects at 800 °C.

#### Introduction:-

ZnO is a promising material for short-wavelength photonic devices since it has a large direct band gap of 3.36 eV, and a large exciton binding energy of 60 meV, all of which are advantageous for light-emitting diode and low-threshold optical pumped laser applications at room temperature. ZnO nanostructures, as well as ZnO films, have gathered considerable attention because they have a wide range of high technology applications like surface acoustic wave filters [1], photodetectors [2], light emitting diodes [3], photodiodes [4], gas sensors [5], and solar cells [6]. ZnO is also receiving a lot of attention because of its antibacterial property and its bactericidal efficacy has been reported to increase as the particle size decreases [7]. However, there is a compromise in the development of a method for preparing low cost ZnO-NPs on a large scale and with high crystalline quality for optoelectronic application. Recently, several new ways have been developed to synthesize ZnO-NPs, such as the sonochemical method [8], oxidation process [9], sol-gel synthesis [10], a polymerization method [11], precipitation [12,13], solvothermal and hydrothermal methods [14-16], CVD [17,18], laser ablation [19] and sol-gel-combustion [20]. In general, the preparation of nanoparticles is a complicated process, and a wide variety of different variables may affect the properties of the final product. Some important variables have distinct effects on the properties of the final product, while others may have only minor effects. In the case of preparation of nanoparticles such as ZnO-NPs, it is very important to obtain a narrow size distribution of the final product, and to be able to control the morphology

of the ZnO-NPs. This paper reports the synthesis of ZnO nanopowders through sol gel process. The as-grown ZnO-NPs were annealed at various temperatures to improve the crystalline quality and nanoparticle sizes. The structural properties and morphology of the synthesized and annealed ZnO-NPs were characterized by X-ray diffraction (XRD) and scanning electron microscopy (SEM) measurements, respectively. Low temperature photoluminescence (PL) spectra were used to investigate both the optical quality and property of the annealed ZnO-NPs. This is a key aspect for studying the applications of ZnO film in the UV region.

#### Experimental Procedure:-

The ZnO nanopowders (NPs) were grown from sol-gel method. The sol was prepared using zinc acetate dehydrate [ $\text{Zn}(\text{CH}_3\text{COO})_2 \cdot 2\text{H}_2\text{O}$ ; 0.18 M] as the starting material, methanol as the solvent, and citric acid ( $\text{C}_6\text{H}_8\text{O}_7$ ) as the stabilizer. The precursor solution was mixed thoroughly with a magnetic stirrer in 80 °C water bath until the formation of a sol. The sol was preheated in a furnace at 80 °C for 10 h to evaporate the solvent and remove the organic residuals. The powders obtained from the dried sol were then annealed at different temperatures (500, 600, 700 and 800 °C for 3 h at ambient air.

#### Results and Discussion:-

The XRD patterns of the as-synthesized ZnO nanoparticles and those annealed at temperatures of 500–800 °C for 2 h are shown in Fig. 1. Several significant peaks are shown. By comparing with the JCPDS No. 36-1451, the three pronounced diffraction peaks at about  $2\theta = 31.8^\circ$ ,  $34.5^\circ$ , and  $36.3^\circ$  are identified, respectively, as the (100), (002), and (101) peaks of ZnO. The results confirm the hexagonal wurtzite structure of the calcined ZnO NPs. By further increasing the calcination temperature, the three pronounced peaks showed enhanced intensity with reduced full-width at half-maximum (FWHM). It means that crystalline quality was improved and nanoparticle size was increased with annealing temperature. The results show improved crystalline quality of ZnO-NPs by raising the calcinations temperature. The average particle size in the calcined ZnO-NPs was estimated by the Scherrer's relation. The approximate size of the as

Fig. 1. XRD pattern of ZnO-NPs prepared at different calcinations temperatures of (a) 500 (b) 600, (c) 700 and (d) 800 °C.

**Fig. 2** SEM image of ZnO-NPs after annealing at 800 °C

grown particles is close to 200 nm. The average particle size of ZnO annealed at 500, 600, 700, and 800 °C has been estimated to be about 18, 22, 30, and 52 nm, respectively. The observation shows that by increasing the annealing temperature the crystalline quality and particles size of ZnO-NPs can be increased. The morphology and powder size of the annealed ZnO nanoparticles were studied by SEM. as shown in Fig. 2. The PL spectra from ZnO Fig. 3, consist of a UV emission band and a visible broadband emission. The UV emission is usually attributed to exciton recombination, while the visible luminescence is mainly due to point-like structural defects related to deep-level emissions, such as zinc vacancies, oxygen vacancies, interstitial zinc and interstitial oxygen.

**Fig.3** PL spectra of ZnO nanoparticles annealed at 500, 600, 700 and 800 °C

**Conclusions:-**

ZnO nanoparticles were prepared using the sol-gel method. Sol-gel synthesis is inexpensive process and can be used for wide range of materials. XRD analysis at room temperature shows single phase formation of the sample with hexagonal crystal Symmetry and the crystalline quality was found to be enhanced by annealing temperature. After annealing at 800 °C the mean particle size estimated was found to be around 50 nm using Scherer's formula and SEM analysis shows the particle size to be 70 nm. A sharp, strong and dominant UV emission with a suppressed green emission has been observed which confirms that the synthesized ZnO nanoparticles have good optical properties with low defects. This is a very promising step towards simple, low-cost and high quality synthesis of ZnO nano-powders.

#### Abstract

We sought to estimate the radiation dose and associated exposure parameters in the multiphase abdomen - pelvic scan of Multidetector Computed Tomography (MDCT) studies in clinical practice.

This was a retrospective cross sectional study describing radiation dose associated with main exposure parameters in diagnostic multiphase abdomen - pelvic scans performed on 152 consecutive patients by two different sixteen (16) slice CT scanners. Patient information, exposure parameters of CTDI<sub>(volume)</sub>, DLP, kVp, mAs and pitch were recorded for every phases of abdomen- pelvic study from dose report of MDCT scanners.

Patient age range from 18 to 87 years. Overall CTDI<sub>(volume)</sub> median was 63.8 (±10.4)mGy for multiphase abdominal-pelvic scan with scanner A while it was 35.4 (±15.6)mGy for scanner B. Effective dose for patients in multiphase abdomen - pelvic CT scan range from 8.2 mSv to 58 mSv. Median effective dose for patients, who underwent multiphase abdomen- pelvic scan with scanner A and B were 38.5 (± 8.2) mSv and 21.3 (± 8.6) mSv respectively. Median value of exposure parameters of mAs, kVp and pitch were 150 (±29.7), 130 (±15.3) and 1.3 (±0.1) respectively in scanner A. In scanner B; they were 60 (±14.5), 120(±0)and 1(±0). The median effective dose for patients between multiphase abdomen-pelvic scan of both MDCT, a significant difference ( $P<0.05$ ) was observed. Multiphase abdomen – pelvic scan of clinical study shows significant variation of effective dose with reference level of phantom studies (8-14 mSv) and it is highly depend on type of vendors.

#### Introduction:-

Computed tomography (CT) is useful for diagnostic purposes of abdominal and pelvic diseases and is one of the most important radiological examinations undertaken worldwide [1], [2]. Approximately 3 million scans were performed annually in the United States in 1980, and by 2008 that number had grown to 67 million[3]. CT allows

physicians to diagnose the injuries and diseases which are related with abdominal and pelvic regions more quickly, safely and accurately than alternative more invasive or less sensitive imaging techniques[2],[3]. In general a CT examination of the abdomen and pelvis includes transaxial images from above or level of the dome of the diaphragm to the just below the ischial tuberosities [4]. In certain cases, it may be appropriate to limit the area exposed and focus only on the area or organs of concern in order to limit the radiation dose. This is especially advised in patients with multiple CT studies and follow-up examinations [4],[5].

Optimizing abdominal CT examination technique requires the supervising physician to develop appropriate CT abdominal protocols based on careful review of the patient history and clinical indications, as well as all relevant imaging studies when available [6],[7]. This optimization process may include determining whether CT examinations of the abdomen, pelvis, or both are necessary. Normally abdominal or pelvic CT examinations may be performed with multiple acquisitions, which include non-contrast, contrast injection of arterial and venous phases. Further according to the pathological condition delay phase also will be included [7-9].

Even though the risk to an individual patient may be small, the increasingly large number of people are exposed, coupled with the increasingly high exposure per CT examination, could transform into many cases of cancer resulting directly from the radiation exposure from CT. The Effective dose from CT is much higher than effective dose in conventional radiography; greater use of CT has resulted in a concurrent increase in the medical exposure to ionizing radiation. Studies of occupational exposure to radiation have provided some direct estimates of the risk at lower doses for adults. Undergoing 2 to 3 abdominal CTs over a person's lifetime can increase the possibilities to develop cancer [10-14]. Relatively fewer data describe how much radiation is received through the most common types of CT examinations for abdomen-pelvic area when applied in clinical practice, as most published studies focused on phantom studies.

Previous literature estimates the radiation dose for an abdomen - pelvic CT to be equivalent to 100 to 250 two view chest series (Anterior posterior and lateral) [15-18]. It is impractical to directly measure the radiation dose absorbed by individual patients even when the radiation emitted by a machine is precisely known. Instead, radiation exposure may be quantified using various methods. Modern multidetector CT scanners (MDCTs) provide two dose parameters that both became available by the scanner manufacturers: the Volume CTDI (CTDI<sub>vol</sub>) measured in mGy, and the dose-length product (DLP) measured in mGy-cm [19], [20]. The total amount of radiation delivered to a standardized phantom is represented by the DLP, which is the product of (CTDI<sub>vol</sub>) and the scan length. Organ doses in CT should well below the threshold for the induction of deterministic effects. CT examinations should be performed only when a net patient benefit is anticipated. Further, the amount of radiation used should always be kept as low as reasonably achievable (ALARA) [21-23]. According to the phantom studies typical effective dose limit of abdominopelvic examination is 8–14 mSv [24].

Higher numbers of MDCT scanners are observed in government and private hospitals in Srilanka, sixteen slices CT scanner is common trend and have higher numbers among MDCT scanners, based on we planned to investigate patient effective dose during multiphase abdominopelvic scan in MDCT [25].

## **Materials and Methods:-**

### **Study Design:-**

This was a retrospective cross sectional study describing radiation dose associated with main exposure parameters in diagnostic multiphase abdomen - pelvic scans performed on 152 consecutive patients by two different sixteen slice CT scanners between January 5<sup>th</sup> and October 5<sup>th</sup>, 2015. Data was collected only from patient who underwent to the multiphase abdomen- pelvic CT examination at one of the hospital in Srilanka. CT data was divided into routine non-contrast phase, contrast triple phase (non- contrast, arterial and venous phases) and multiphase abdomen - pelvic scan (non-contrast, contrast triple and delay phases). Demographic information of patient' age, sex and radiation factors kVp, mAs, pitch, DLP and CTDI<sub>(volume)</sub>, in non-contrast and contrast phases of arterial, venous and delay were recorded from automatically generated dose report from each scanners after the scan is completed. Each hospital use same generation of MDCT but from different vendors.

**Table 1:-** Selection of exposure parameters.

MDCTs	Exposure parameters	Phases	Min	Max	Median
		(n)			
A	kVp	317	85	210	130 ( $\pm 15.3$ )
	mAs	317	75	225	150 ( $\pm 29.7$ )
	Pitch	317	0.8	1.5	1.3 ( $\pm 0.1$ )
B	kVp	302	120	120	120
	mAs	302	60	119	60 ( $\pm 14.5$ )
	Pitch	302	1	1	1

Multiphase abdominal scans performed by same radiological technologist and same time it was interpreted by one particular specialized radiologist. Automatic tube current modulation (ATCM) did not apply for all abdomen – Pelvic scans since it compromising image quality.

#### Calculation of the Effective Dose:-

It is impractical to directly measure the radiation dose received by an individual patient even when the radiation emitted by a MDCT is precisely known. Instead, there are various methods can be used to measure radiation exposure. In our study we used the “effective dose” to quantify the radiation exposure associated with each MDCT multiphase abdomen- pelvic scan; this is one of the most frequently reported measurements. Furthermore, effective dose allows comparison of distribution of radiation dose among individual who referred to the multiphase abdominal – pelvic scan. . The effective dose defines that, the amount of radiation to the exposed organs and each organ’s sensitivity to developing cancer from radiation exposure. Radiation parameter of DLP in MDCTs is combined with the conversion factor  $K$  to translate into the effective dose. Abdomen- pelvis region conversion factor ( $K$ ) is  $0.015 \text{ mSv mGy}^{-1} \text{ cm}^{-1}$ .

$$\text{Effective Dose} = \text{DLP} \times K (\text{Abdomen-pelvis})$$

#### Results:-

##### Demographic Information of Patient:-

Every recorded data is analysed by commercially available Miniab statistical software. Among 152 consecutive patients from both MDCTs, 78 patients were from scanner A while 74 were from scanner B. Mean age of patients from scanner A was  $58.94 (\pm 15.1)$  years and it ranged from 18 – 86 years. In scanner B mean age was  $55.5 (\pm 15.7)$  years; it ranged from 14 – 87 years. Main reasons for multiphase CT examination were due to suspected liver and renal neoplasm, pancreatitis or hepatitis, suspected renal stones or obstructions.

##### Comparison of kVp, mAs and Pitch among MDCTs:-

Many parameters influence to radiation dose in MDCTs. Among these factors kVp, mAs and pitch have a significant contribution to radiation dose which may be changed according to the type of the patient and type of the exam protocol in abdomen- pelvic examination.

A total of 619 phases were performed in 153 patients, 51.21% (317/619) phases received from scanner A while 48.79 (302/619) phases were recorded in scanner B. Some patients received two or more delayed phases from both MDCTs according to disease condition or medical consultant referral. Median value of main exposure parameters of mAs, kVp and pitch were 130 ( $\pm 15.3$ ), 150 ( $\pm 29.7$ ) and 1.3 ( $\pm 0.1$ ) respectively in scanner A. For scanner B; they were 120, 60 ( $\pm 14.5$ ) and 1 respectively. Specially kVp and pitch factors were not changed during multiphase abdominal- pelvis scan with phases for a patient as well as among the patients in scanner B. Overall kVp, mAs and pitch range from 85, 60 and 1 to 210, 225 and 1.5 respectively in both MDCT scanners in multiphase abdominal- pelvis scan.

##### Comparison of Median CTDI (volume) in MDCTs:-

Scanner B had lower median CTDI (volume) value in every phase of multiphase abdomen – pelvis scan than scanner A. Recorded lowest CTDI (volume) was 26.50 mGy. Scanner B had maximum CTDI (volume) for Abdomen – pelvis scan in non-contrast phase, was 23.2 mGy while A had 22.4 mGy. There was a significant difference between the mean and median values in routine contrast and multiphase abdomen-pelvis scan of scanner A. this is due to wide adjustment of exposure parameters between scans.

**Distribution of Median Effective Dose Received By Patients:-**

All phases patient who underwent abdominal–pelvic scan by scanner A received higher median effective dose than patient with scanner B. Minimum effective dose received in patients in non-contrast phase was 2.0 mSv in scanner B , the maximum effective dose was 14.8 mSv in scanner A. The minimum effective dose received by the patient was 6.8mSvand which was from the scanner B. The maximum effective dose received by the patient was 43.4mSv and it has from the scanner A. In multiphase abdomen - pelvic phase maximum effective dose was observed among patients with scanner A, was 58.0 mSv while minimum was observed with canner B, 8.2mSv. Overall median effective dose for patients among both MDCTs differfrom 21.3mSv to 38.5 mSv.

Two tail *t- sample* test performed to check whether any significant differences between the median values of effective dose of patients in every phases, among both MDCTs. It revealed the both scanner median effective dose showed significant difference in any phases ( $P>0.05$ ). Patient received higher amount of effective dose by scanner A than scanner B in every phases of multiphase abdomen- pelvis scan.

**Table 2:-** Variation of CTDI (volume); mGy among scanners

	Number of Patients (n)		CTDI (volume); mGy		
			Median (±SD)	IQR	Min-Max
A	78	NC - phase	16.7 (±3.5)	2.4	5.4 - 22.4
		Triple phase	47.6 (±9.1)	7.6	16.8 - 68.4
		Multi-phase	63.8 (±10.4)	9.7	32.8 - 90.8
	74	NC - phase	8.2 (±4.2)	6.3	1.9 - 23.2
		Triple phase	26.2 (±11.3)	18.2	19.4 - 58.0
		Multi-phase	35.4 (±15.6)	24.2	26.5 - 81.1

**Table 3:-** Variation of Effective Dose; mSv among the scanners

MDCTs	Patients (n)	Phases	Effective Dose; mSv		
			Median (±SD)	IQR	Min-Max
A	78	NC - phase	10 (± 2.5)	2.8	3.4 - 14.8
		Triple phase	29.5 (± 6.4)	7.5	13.5 - 43.4
		Multi-phase	38.5 (± 8.2)	9.5	18.6 - 58.0
B	74	NC - phase	5.25 (± 2.8)	2	2.0 - 18.3
		Triple phase	14.6 (± 6.2)	10.3	6.2 - 40.4
		Multi-phase	21.3 (± 8.6)	9.4	8.2 - 57.3

**Figure 01:-** Distribution of effective dose

Figure 02:- Effective Dose versus mAS

**Discussion:-**

The motivation for this study was the anecdotal observation that large number of multiphase abdomen – pelvis scans performed on the patients. In our study we depicted that higher and more variable calculated effective dose than references level of phantom studies (8-14 mSv).

Our calculated median effective dose for patients from both MDCTs A and B were 38.5 ( $\pm$  8.2) mSv and 21.3 ( $\pm$  8.6) mSv respectively, it showed significant difference with phantom studies ( $P > 0.05$ ). Thus, this value depend on where and which MDCTs used to scan an individual with the specific technical parameters used to perform that particular scan. While some of these variations may be clinically indicated to accommodate patients of different size or specific to the clinical question that was being addressed, The variation in effective dose was dramatic and of greater magnitude than widely considered acceptable, particularly considering that the patients were already stratified within relatively well-defined clinical groups.

The doses we documented may be higher than typically reported for following the main reasons. First, we estimated radiation doses received by patients in clinical practice, whereas many previous studies have assessed the dose received in idealized settings on phantoms. Study parameters applied in phantoms may differ substantially from those used in actual clinical settings. Second, most prior work described experience in a single type of MDCT study, where the specific instructions for conducting studies may be standardized. We studied patients in clinical practice, who underwent imaging for a range of clinical indications. For example, a common clinical indication for a multiphase abdomen-pelvic CT scan is suspected renal cancer in a patient.

Other researchers also concluded that calculated effective dose showed considerable variation and different compared to phantom studies [1]. As well we observed through our study according to the type of MDCTs patient will receive various amount of effective doses from abdomen-pelvic scan of MDCT. Mainly it depends on the main exposure parameters kVp, mAs and pitch and the type of scanner.

We conducted our study only on sixteen slice multi detector computed tomography while prior researchers' have not mentioned the type of MDCT scanner, they generally quoted as MDCT. Effective dose for abdomen-pelvic region primarily depend on the type of imaging technique that radiological technologists used to obtain consistent acceptable diagnostic CT images and type of MDCTs.

We noticed radiologic technological technologist performed two or more delay phase scan on abdomen-pelvic region on some patients. This is one of the reasons for high variation values of CTDI<sub>(volume)</sub> and calculated effective dose also. Although the retrospective nature of this study did not allow us to investigate the reasons behind the performance of multiphase abdomen- pelvic scan relay with dose limits according to the international guidelines. We suspect that a lack of focus on performing protocols based dose restriction or automatic mA or kVp modulations were not applied by the radiological technologist during the scan procedure.

There is a possibility that CT may cause more adverse effect than its strength in diagnosing the disease conditions with respect to screening of Multiphase abdomen- pelvic scan conducted in asymptomatic persons [25]. In contrast, CT is generally considered to have a very favorable risk to benefit profile among symptomatic patients.

The patients' exposure to radiation through medical imaging needs to be reduced specially in CT, and we believe that three general approaches should be taken. First, CT examination protocols and techniques should be optimized and standardized to limit the radiation associated with individual scans. This would include standardizing protocols across the hospital and among radiological technologist.

Second, Physicians who recommend the CT scan and radiological technologist who perform the scan should reduce the unwanted multiple series of scan within each examination. Every radiological technologist should possess the knowledge or special training regarding to the implementation of the dose reduction strategies according to the MDCTs types, for example, for certain CT study types, dose reduction techniques can reduce the dose by 50% or greater [26] and encouraging participation in accreditation programs such as that offered by international professional associations. Creating specific standards for CT examinations and requiring adoption would lead to a reduction in median and outlier doses, however in practice, these guidelines have not been widely embraced, perhaps because no regulatory component is associated with their use.

The third approach is to reduce exposure according to the evidence based practice. A good record keeping methods according to the standard regulations will improve the knowledge related to the dose reduction. Picture archiving and communication system (PACS) enable the radiologist and radiological technologist to review the previous record related with CT images and to improve their knowledge.

Our study also has several weaknesses. Our cohort was insufficiently small to understand the reasons for the variation of the dose associated with each individual patient, including the radiological technologist's experience, the availability of physicians to check the studies in real time that might lead them to add or subtract additional series, geographic variation, type and specific dose-reduction or dose modulation algorithms available or used. Patients' body mass index (BMI) is the main factor which will determine how much radiation dose they will receive during the CT examination. However in our study we did not measure the BMI of each patient.

Our work highlights the need for large national studies to understand how these factors contribute to variation in radiation dose. Similarly, we did not access the quality of the CT images through specialized image processing software to check whether they have same image quality or not. We predicted that image quality will be the same because same radiological technologists and radiologist have been worked with both MDCTs.

The methods we used to assess radiation dose may be reliable. We presented "effective dose," calculated using the scanner-provided DLP measurement, because this is simple to calculate, straightforward, and reliable and thus can be used as an easy starting point to begin to record patient-level exposure. Although different metrics yielded slightly different estimates and these methods are based on assumptions of patient size that may not be applicable to all patients, this method is highly concordant with other methods of estimating dose [28].

### Conclusion:-

A significant difference in median effective dose was observed between the two scanners for patient who underwent multiphase abdomen-pelvic scan. Multiphase abdomen – pelvic scan of clinical study shows significant variation of effective dose with reference level of phantom studies (8-14 mSv) and it is highly depend on type of vendors.

#### Abstract

This paper tries to find out the implications of trade liberalization on international trade tax revenues and its macroeconomic implication on Pakistan economy. The theoretical approach of trade reforms and its impact on the direction of change of revenue is ambiguous because of its dependence on the productivity of 'trade tax revenues'. By using the data of twenty five years, the paper first establishes the productivity of 'trade tax revenues' in Pakistan, then by an econometric analysis exploration of the relationship between trade revenues and trade liberalization in Pakistan is done. It was observed through our analysis that there is high productivity of trade tax revenues, further, our results show a positive and significant relationship between trade liberalization and collection of trade tax revenue. To support this relationship, a second test of Granger's causality is also performed which confirm the causal relationship between trade tax revenues and trade liberalization. It was suggested that supportive macroeconomic policies are prerequisite for successful trade liberalization.

#### Introduction:-

Chylous ascites is a rare condition characterized by an intra-abdominal accumulation of a milky-appearing fluid that contains high amount of triglycerides<sup>1</sup>. The incidence of chylous ascites is scarce with only one case reported in 20,000 cases admitted in a hospital<sup>1</sup>. To the best of our knowledge the literature is lacking any reported cases in adult from our country and that is due rarity of the condition and probably underreporting.

We report this case as it is the first case we have encountered in our hospital which is a large secondary/tertiary hospital over the last 15 years and because of difficulty in reaching diagnosis and difficulty in management.

#### Case Report:-

A 61-year-old Saudi male known case of diabetes mellitus, hypertension, Creutzfeldt - Jakob disease (diagnosed in USA in 2012) and dementia. He's bedridden on PEG tube and tracheostomy for the last 4 years. He was brought to the emergency department by his family with history of undetectable low BP by their home electronic BP meter. He also, had fever and loose watery stool for 2 days prior to admission.

He had no drug allergies. He was a non-smoker, non-alcoholic and has no history of liver or heart diseases.

He was admitted to ICU on Nov 15th as a case of sepsis/septic shock secondary to urinary tract infection/gastroenteritis, to Rule out MERS-CoV (Middle East respiratory syndrome Coronavirus) and H1N1.He

**Corresponding Author:- Almubarak N M.**

developed acute kidney injury, respiratory failure put on mechanical ventilation. Later on, he developed Multi-organ dysfunction syndrome on the 27<sup>th</sup> of Nov which was managed accordingly with broad spectrum antibiotics and vasopressors. He improved gradually.

During the course of his illness the gastroenterologist was consulted for a possible leak from the PEG tube site. On examination the day of consultation, vitals were: Temp 36.5, Pulse 92, BP 123/49, RR 23 on mechanical ventilation through tracheostomy, O<sub>2</sub> sat 97%. Generally, the patient was contracted, opening eyes but not responsive not communicating. His baseline GCS was 4/15 for the last 4 years.

No jaundice, pallor, or lymphadenopathy. Chest was clear bilateral vesicular breathing. Cardiovascular examination normal. No LL edema and no signs of DVT.

Abdomen was Soft, lax and distended, with no scars or dilated veins. There was large ascites.

PEG tube Ex: The tube site was above and left to the umbilicus, there is erythema around it with greenish-yellowish discharge coming freely and with pressure. There was no pus. The PEG tube moves freely to the inside and out and to right and left.

Ascetic tapping was performed and 6 liters of ascetic fluid were drained initially, then the GI consultant was again contacted during the night by ICU. They thought that any feeding given to the patient through the PEG tube was coming out through the ascetic tube drain. The gastroenterologist came to assess the case and possibility of migration of the PEG tube to the peritoneal cavity. Gastrografin dye given through the tube confirmed its presence in the stomach with no leak, also Methylene blue give through the tube did not appear in the ascetic fluid drain that support tube is intact with no leak.

**Lab Test:-**

**Complete Blood Count (CBC):-**

WBCs 9.79x10<sup>3</sup>/μL, HGB 9 g/dL, Platelet Count 242x10<sup>3</sup>/μL, MCV 79.5 fL, MCH 25.2 pg.

**Basic Screen:-**

NA 149 mmol/L, K 4.3 mmol/L, CL 120mmol/L, HCO<sub>3</sub> 19 mmol/L, BUN 13.4 mg/dL, CR 94 mmol/L, Random Glucose 15.4 mmol/L.

**Renal Profile:-**

GFR 76 mL/min, Adjusted Calcium 2.21 mmol/L, Phosphate 1.11 mg/dL, Magnesium .98 mEq/L, Uric Acid 317 μmol/L.

**Liver Profile:-**

Total Bilirubin 9.9 umol/L, Total Protein 42 g/L, Alkaline Phosphatase 82 IU/L, AST 15 IU/L, ALT 14 IU/L, ALB 27 g/L.

**Coagulation Profile:-**

PT 14.4 sec, INR 1.5, PTT 39.9 sec.

**Coronary Risk Profile:-**

Cholesterol 1.33 mmol/L, Triglyceride 0.70 mmol/L, HDL 0.35 mmol/L, LDL 0.57 mmol/L.

**Ascetic Fluid:-**

appearance was turbid, milky. The analysis showed RBCs 111x10, WBCs 3889x10, lymphocyte 2%, monocyte 3%, Segs 95%, LDH 647 U/L, Triglyceride 9.58 mmol/L (848mg/dl), albumin 18 g/L, total protein 35 g/L, amylase 42 U/L, cholesterol 1.17mmol/L and culture revealed no organisms.

Cytology report: Negative for malignant cells. TB PCR was negative. Adenosine deaminase was negative. TB culture negative.

Echo: Showed EF of 55-60%, RVSP 52 mmHg, normal biventricular systolic function, Mild LVH with impaired relaxation, trivial mitral regurgitation. Mild to moderate tricuspid regurgitation and trivial pericardial effusion.

Abdominal and pelvic CT scan showed no definitive contrast leakage at the gastrostomy site and no pneumoperitoneum. Bowel wall thickening involving part of the jejunum and the left recto-sigmoid area with mild abdominal ascites. In addition it showed small left pleural effusion and diffuse bony osteopenia.

Colonoscopy: Showed large diffuse ulcerations at the recto-sigmoid area. Rest of the colon was normal. Multiple biopsies and cultures taken.

The biopsies showed large bowel-type mucosa with benign ulceration, with no evidence of granulomas, dysplasia or malignancy.

With the above investigations there's no clear identified cause for the chylous ascites. It was decided to perform a diagnostic laparoscopy and peritoneal biopsy to rule out tuberculosis and malignancy but because of the patient's general condition and vegetative state the surgeon and family did not agree for the procedure. The patient was managed conservatively and started on octreotide 100 mcg subQ every 8 hrs, plus trial of Orlistat and medium chain fatty acid diet with repeated paracentesis in case of increase abdominal distension. It was noticed that re-accumulation of fluid is becoming less.

Patient stayed in the ICU for 6 weeks receiving broad spectrum antibiotic and supportive care.

He improved gradually, weaned of ventilator and kept on O<sub>2</sub> through tracheostomy tube. His general condition stabilized and return to the base line status transferred to step down ward. Finally he was taken home to be cared-of by his special nurse with tracheostomy and O<sub>2</sub>, PEG tube and Foley catheter to be followed by home health care team accordingly.

### Discussion:-

Chylous ascites is a rare condition defined as an intra-abdominal accumulation of a milky-appearing fluid<sup>1</sup>. It was first identified by Morton in 1691<sup>2</sup>. Thereafter the first acute case was admitted by Renner in 1910<sup>3</sup>. The characteristic feature of chylous ascites is the presence of high fat (triglyceride) content in the ascetic fluid, usually greater than 110 mg/dl<sup>1</sup>. The incidence of chylous ascites is scarce with only one case reported in 20,000 cases admitted in a hospital<sup>1</sup>. However, the incidence of this condition is increasing with time due to prolonged lifespan of patient with malignancies and due to vigorous cardiothoracic and abdominal procedures<sup>2</sup>. Regardless, there have not been many cases reported until this given day.

From our country there has been no reported case in adult. We have seen one case in patient with liver cirrhosis (not reported). There has been one report of infantile intestinal lymphangiectasia and chylousascites<sup>4</sup>. We think the discovered cases are underreported.

There are a wide variety of conditions that can lead to chylous ascites. Causes of chylous ascites can be categorized into two main groups traumatic and non-traumatic. Traumatic causes include surgically-induced chylous ascites for example, retroperitoneal lymphadenectomy, peritoneal dialysis catheter placement, Nissen fundoplication, and pancreaticoduodenectomy<sup>5</sup>. Abdominal aortic aneurysm repair procedure accounts for more than 80% of the post-operative Chylous ascites cases<sup>6</sup>. And non-surgically induced chylous ascites like in case of radiotherapy<sup>7</sup>. Non-traumatic causes comprise some congenital conditions like Kippel-Trenaunay syndrome, primary lymphatic hypoplasia and lymphangioma<sup>8</sup>. According to a recent reported case, appendicitis can be a cause for the development of Chylous ascites<sup>9</sup>.

Liver diseases like cirrhosis can frequently give rise to chylous ascites. Furthermore, cardiac diseases like congestive heart failure, gastrointestinal conditions like small bowel volvulus, intestinal malrotation and celiac disease can contribute to chylous ascites. Tuberculosis and filariasis are the commonest infectious causes. Inflammatory disorders like pancreatitis, fibrosing mesenteritis, sarcoidosis, systemic lupus erythematosus and nephrotic syndrome can induce chylous ascites as well<sup>6</sup>.

According to a recent study, abdominal malignancies, liver cirrhosis and tuberculosis are the most common encountered contributors for this condition<sup>8</sup>.

Our patient's clinical condition did not allow extensive investigations partly due to patient's factors since he has poor general condition, bedridden in vegetative state for 4 years and partly due to family issues as they don't like to expose the patient to any more invasive procedures like laparoscopy and lymphangiography. However the patient has almost satisfactory investigations to rule out cardiac, liver, malignant or infectious causes. There has been no history of trauma since he did not undergo any invasive procedure.

Filariasis is very rare in our region and there hasn't been any cases reported. Patient didn't have any risk factors to get filariasis.

People with this condition present with progressive, painless abdominal distention which occurs over weeks to months, according to the primary cause. A non-specific pain could be the only presenting complaint<sup>8</sup>. Ascites can cause dyspnea owing to the high intra-abdominal pressure. Other clinical features include edema, weight gain, anorexia, weakness, lymphadenopathy, night sweats, early satiety, fever and other characteristic of the underlying disease. Physical examination could reveal ascites with positive fluid wave and/or shifting dullness, pleural effusions, lower extremity edema, lymphadenopathy, cachexia, temporal wasting, abdominal masses, hernias and other stigmata of the underlying illness<sup>1,10</sup>.

Since our patient was in vegetative state and bed ridden, the ascites was noticed late when it became large.

The diagnosis is mainly based on the analysis of ascetic fluid and paracentesis. Chylous ascites is characterized by its odorless milk-like appearance, alkali bacteriostatic nature, specific gravity of more than (1.012), sterile culture and resisting putrefaction, positive fat staining and ether test<sup>11</sup>. The serum to ascites albumin gradient should be calculated to determine if the ascites is related to portal hypertension or other causes<sup>12</sup>. The triglycerides level in chyle is greater than that in plasma, typically 2-8 times the plasmalevel<sup>13</sup>.

**Table 1:-** Characteristics of Chyle

Chyle content	2.5-7 g/dl
Triglycerides	>200 mg/dl
Cholesterol	Ascites: serum <1
Total solids	>4%
Cell count	>500 (predominantly lymphocytes)
SAAG	<1.1

SAAG: Serum ascetic fluid gradient

Gram staining, lactate dehydrogenase, amylase, lipase cytology, culture, glucose and ascetic fluid for cell count should be performed as well<sup>3,14</sup>.

In addition Adenosine deaminase activity (ADA), culture and tuberculosis smear when Tuberculosis is suspected<sup>15</sup>. In our case the tuberculosis PCR, culture and adenosine deaminase all were negative that make abdominal tuberculosis unlikely. Cytology was also negative in two occasions.

The initial ascetic tap result with high neutrophils count suggested superadded acute bacterial peritonitis which has been treated. The culture was negative because the patient had been on broad spectrum antibiotics prior to the tapping.

Other diagnostic tools include laparotomy, lymphangiography, lymphoscintigraphy and computed tomography<sup>1</sup>. In our case we were unable to proceed for invasive diagnostic procedures because of the patient's clinical condition, in addition the surgeon and family reservations.

Looking at the major causes of chylous ascites we think that our patient has idiopathic chylous ascites since no obvious cause could be identified after doing most of the necessary investigations.

The main stay of therapy is treating the underlying cause, especially in infectious, malignant or inflammatory causes. Regardless, conservative management is usually effective for most patients. It consists of stopping the patient's oral nutrition, administering somatostatin analog, diuretic and diet therapy with medium-chain triglycerides (MCTs) and administration of total parenteral nutrition (TPN), alone or in combination<sup>16</sup>. These measures are directed to decrease chyle formation and enhance nutritional states<sup>17</sup>. Paracentesis is both diagnostic and therapeutic method in chylous ascites management. In the face of various certain disadvantages and complications, among the non-operative management plan, a frequently done paracentesis is routinely included to lessen abdominal distention<sup>18</sup>. Urgent exploration is compulsory in some acute presentations<sup>19</sup>. Peritone-venous shunting could be the ultimate choice if the case is unqualified for surgery and not responding to non-operative options<sup>20</sup>.

In the present case a definite cause has not been identified therefore we opted to treat him conservatively, initially he has been tried on octreotide and Orlistat. Later on medium chain fatty acid diet was introduced. He showed some improvement but upon transfer from ICU to step down the medications were mistakenly not continued therefore, the ascetic fluid recollected. However the initial effect has been satisfactory. The actual effect of the treatment will need to be observed and follow up for a while.

### Summery:-

We are reporting a rare case of chylous ascites that had initially been mistaken as a leakage of PEG tube into the peritoneum. There was no identifiable cause in this case after performing almost most possible investigations that could make it idiopathic.

This case demonstrates that in occasions there are uncontrollable factors which lead to major limitations in reaching the diagnosis and completing ideal management for such cases.

Laposcopic cholecystectomy,  
 Bupivacaine

#### Abstract

Pain is defined as “an un-pleasant sensory and emotional experience associated with actual or potential tissue damage”. Laparoscopic cholecystectomy is now an established form of treatment for patients with symptomatic gallstones. Recent studies have shown that patients may experience considerable pain after laparoscopic cholecystectomy. The various methods used with variable success are NSAID'S, infiltration of wound with local anesthetics and intermittent intramuscular narcotics. In Laproscopic Cholecystectomy after removal of gall bladder from the abdominal cavity using an endobag the position of the patient was made supine and 0.25% of 10 ml bupivacaine was instilled in the gall bladder fossa under direct laparoscopic control in Group A patients while Group B patients did not receive any such solution. Group A showed less intensity of pain with time duration as compared to Group B. A descriptive analysis of the VAS pain scores was in table 1. Statistically significant stepwise decrease in pain score at 4 hrs, 8 hrs, 12 hrs and 24 hrs were found in Group A and B. Intraperitoneal bupivacaine for laparoscopic cholecystectomy in a dose of 10 ml of 0.25% rather than using a higher dose reduces pain in the initial postoperative period and also in first 24 hrs, it is easy to administer with no adverse effects and may become a routine practice for this procedure.

#### Introduction:-

Pain is defined as “an un-pleasant sensory and emotional experience associated with actual or potential tissue damage”.<sup>1</sup> From this definition it is clear that pain is a multi-modal entity and is the end result of diverse input conditioned by the individual's constitution and prior experience.<sup>2</sup> Postoperative pain remains one of the most prevalent problems in healthcare today and pain control is a topic of current interest.<sup>3</sup>

Laparoscopic cholecystectomy is now an established form of treatment for patients with symptomatic gallstones. Although thought to result in less postoperative pain, recent studies have shown that patients may experience considerable pain after laparoscopic cholecystectomy.<sup>4, 5</sup> The various methods used with variable success are NSAID'S<sup>6</sup>, infiltration of wound with local anesthetics<sup>7</sup> and intermittent intramuscular narcotics<sup>8</sup>. Narchi et al observed reduction in postoperative shoulder pain in minor gynecological surgery after intraperitoneal instillation of local anesthetics<sup>9</sup>. With the possibility that a similar beneficial effect might be achieved in laparoscopic cholecystectomy a number of studies were carried out with variable results<sup>4, 5, 10, 11</sup>. Keeping in view the variable results obtained by Bupivacaine is used to control postoperative pain after laparoscopic procedures. In many studies

0.125 % to 0.5% bupivacaine is used intraperitoneally<sup>12</sup> or in the wound<sup>13</sup> but with conflicting result. While in others, the use of intraperitoneal bupivacaine is found safe and effective. This technique for relieving postoperative pain is easy to perform in patients undergoing laparoscopic cholecystectomy.<sup>14-20</sup>

This study was conducted to see the efficacy of instillation of 10 ml 0.25% bupivacaine intraperitoneally after removal of gall bladder in gall bladder fossa for post-operative pain relief after laparoscopic cholecystectomy and then to apply the same for the future laparoscopic cholecystectomies.

### Material & Methods:-

The study was conducted in Department of General surgery, in a multispeciality hospital at Lucknow from August 2013 till June 2014. Sampling technique is non-probability purposive. After the approval of local ethical committee a study was done on 120 patients undergoing Laparoscopic Cholecystectomy. Written and informed consent was taken from all the patients. The method of using Visual Analogue Scale was explained to the patients pre operatively. Same surgical team performed all the surgical procedures. Laparoscopic cholecystectomy was completed with the standard four-port technique and carbon dioxide pneumoperitoneum. Patients with mucocele, empyema and patients in whom drain was placed, were excluded from the study. After removal of gall bladder from the abdominal cavity using an endobag the position of the patient was made supine and 0.25% of 10 ml bupivacaine was instilled in the gall bladder fossa under direct laparoscopic control in Group A patients while Group B patients did not receive any such solution.

Simultaneously, each group was assessed for intensity of pain at rest through Visual Analogue Scale at 4, 8, 12 and 24 hrs after surgery. All the patients were discharged 24 hours post operatively. The consumption of analgesics was also recorded. All the assessments were performed by a single observer (post graduate on duty) who was blinded to the group allocations. Data regarding mean pain score was collected through structured performa. Data was analyzed at SPSS version 15.0. Baseline data (intensity of pain) was first analyzed through VAS after 4 hrs after surgery. The intermediate readings were at 8 and 12 hrs and final assessment at 24 hrs after surgery. Paired t test were applied to assess the data. The results were concluded significant when p-value less than 0.05 (p < 0.05).

### Results:-

A total of 120 patients planned for elective cholecystectomy were included in this study divided in two groups. All were adult males and females. The gender distribution between two groups showed non-significant difference (Fishers Exact Test = 0.325 with P = 0.16). Overall male to female ratio was 1:3.7. Mean age (years) of Group A was 45.04 ± 13.85 ranging from 25 to 70 years while in Group B it was 44.86 ± 15.07 ranged from 20 to 65 years. The difference in age between two groups was found statistically insignificant (t = 0.068, P = 0.95). Weight (kgs) between two groups was found statically insignificant (t = 0.24, P = 0.81). In Group A mean weight was 57.87 ± 8.65 kgs and in Group B it was 58.23 ± 7.56 kgs. ASA Status I was more frequent in both groups as compared to Status II. Status I were 59.2% whereas Status II were 40.8% in Group A. In Group B, ASA Status I were 69.4% and Status II was 30.6%. There is no statistical difference in frequency distribution of two groups in ASA status (Fishers Exact Test = 0.40, P = 0.25).

Group A showed less intensity of pain with time duration as compared to Group B. A descriptive analysis of the VAS pain scores was in table 1. Statistically significant stepwise decrease in pain score at 4 hrs, 8 hrs, 12 hrs and 24 hrs were found in Group A and B as shown in figure & table below.

Variables	Group	N	Mean	SD	t-value	p-value
Age	Group - A	60	45.04	13.85	t = 0.068	0.95*
	Group - B	60	44.86	15.07		
Weight (kg)	Group - A	60	57.87	8.65	t = 0.24	0.81*
	Group - B	60	58.23	7.56		
VAS at 4 hrs	Group - A	60	2.09	0.87	t = 17.0825	< 0.0001 <sup>#</sup>
	Group - B	60	4.98	0.98		
VAS at 8 hrs	Group - A	60	1.67	0.57	t = 13.8519	< 0.0001 <sup>#</sup>
	Group - B	60	3.56	0.89		
VAS at 12hrs	Group - A	60	0.89	0.34	t = 20.0391	< 0.0001 <sup>#</sup>
	Group - B	60	2.88	0.69		
VAS at 24hrs	Group - A	60	0.22	0.48	t = 13.14	< 0.0001 <sup>#</sup>
	Group - B	60	1.98	0.92		

\*Statistically insignificant #statistically significant

**Figure:** -A statistically significant difference was seen in VAS after 4,8,12 and 24 hrs of laparoscopic cholecystectomy.

### Discussion:-

Although minimally invasive surgery characterized by reduced pain, it is not painless. Patients undergoing laparoscopic cholecystectomy suffered considerable pain on the day of surgery frequently requiring narcotic analgesics. Local infiltration of analgesia had been used successfully in combination with General anesthesia for breast surgery, facial cosmetic operations and body contouring procedures.

In the early post operative period visceral pain accounts for the most of the pain experienced after laparoscopic cholecystectomy.<sup>5</sup> Local anesthetics induced anti nociception by acting on the nerve membranes. These analgesics interventions need to produce a sufficiently dense and long duration of blockade for them to block the transmission of noxious afferent information from the periphery to the spinal cord and brain.<sup>6</sup>

There is little evidence with regard to which type of LA is most effective because limited data are available for drugs other than bupivacaine. Bupivacaine itself (or levobupivacaine) is an excellent choice for intraperitoneal LA because of its long duration of action.<sup>7</sup> The originality of this trial was the instillation of 0.25% of 10 ml bupivacaine intraperitoneally only after the removal of gall bladder in the gallbladder fossa. At trocar site or incisional site no local anesthetic was instilled, as many studies did not support port site local anesthetic infiltration of wound.<sup>21, 22</sup> Clinical studies of intraperitoneal bupivacaine had inconsistent results. Few authors have found a statistically significant difference with the use of local anesthetics<sup>10, 20, 23-25</sup> others could not repeat these results.<sup>26, 27</sup> Furthermore in a few studies that have found a statistically significant difference with the use of bupivacaine, the difference between the average pain scores was less than 1 in a scale of 10.<sup>23, 25</sup>

Narchi et al found intraperitoneal local anesthetics to be more effective in reducing pain up to 48 hrs postoperatively in patients undergoing diagnostic laparoscopy<sup>9</sup>. Subsequent studies failed to demonstrate the beneficial effect of intraperitoneal instillation of local anesthetics in patients undergoing laparoscopic cholecystectomy<sup>4, 5, 10, 12</sup>.

Utilizing 20 ml of either 0.25% bupivacaine or 0.5% lignocaine, Rademaker et al failed to demonstrate any reduction in postoperative pain.<sup>4</sup> A possible explanation of the failed effect given by them was the small amount of

local anesthetics used as compared to Narchi et al. Also instillation of local anesthetics in the supine position prevented its flow over the coeliac plexus and phrenic nerve endings.

Joriset et al studied the characteristics of pain after laparoscopic cholecystectomy and the effect of intraperitoneal instillation of 80 ml of 0.125% bupivacaine with adrenaline<sup>5</sup>. They found that visceral pain accounts for the major discomfort experienced in early postoperative period whereas shoulder tip pain becomes the main complaint on the second day. The intensity of shoulder pain in their study was less than the study of Narchi et al probably because of careful emptying of carbon dioxide pneumoperitoneum. The author felt that because of existence of several components of pain, its relief will depend on therapy for each of these components. In addition an anatomic intraperitoneal flow directs local anesthetics away from cholecystectomy wound and therefore cannot attain sufficient concentration to block the nociceptive input from abdominal wall incisions. Keeping in view the importance of positioning while instilling the local anesthetic, Scheinin et al administered 100 ml of either 0.15% plain bupivacaine or with adrenaline in 20 degree head down tilt maintained for 20min.<sup>11</sup> They found no relief of pain after laparoscopic cholecystectomy. The lack of analgesic efficacy can be attributed to the lower concentration of bupivacaine used and more extensive and longer duration of surgery compared to gynecological laparoscopies.

Studies done previously used 20 ml of 0.5 % Bupivacaine had also shown similar results as ours.<sup>28,29</sup> In our study a statistically significantly low VAS was seen in Group A using 0.25% of 10 ml Bupivacaine as compared to Group B using no intraperitoneal anesthetic agent instillation.

### Conclusion:-

Intraperitoneal bupivacaine for laparoscopic cholecystectomy in a dose of 10 ml of 0.25% rather than using a higher dose reduces pain in the initial postoperative period and also in first 24 hrs, it is easy to administer with no adverse effects and may become a routine practice for this procedure.

#### Abstract

**Objectives:** The aim of the study to assess the family habit and status related to the factors associated with the development of the rheumatic fever and be aware about it.

**Methods:** The Type Of The Study Is Cross Sectional, It Will Include Collection Of Data From The Community's To Measure Their Awareness About Sore Throat And Its Relation To Rheumatic Fever. The Data Will Be Collected In The Western Area Of Kingdom Of Saudi Arabia, By Distributing A Form To The Families Which Included Questions About The Awareness Based On The Literature Review.

**Results:** This Study Was Applied On (407) Husbands And Wives From Different Cities In Western Area Of Kingdom Of Saudi Arabia. Most Of Them Were Female 260 (63.9 %) And 147 (36.1) Were Male.

**Conclusion:** We Conclude That The Parent Who Lived In The Eastern Region Of Saudi Arabia Need To Be More Educated Regarding The Sore Throat And Its Complication To Reduce The Incidence In The Future. This Could Be Done By Conducting Many Voluntarily Campaigns To The Family, Educative Accounts In The Social Media, Distribution Of Leaflet To The Parents.

#### Introduction:-

A Sore Throat Is Frequently The Primary Indication Of A Cold. In Any Case, A Sore Throat Usually Improves Or Cures After A Day Or Two. Other Cold Manifestations, For Example, A Runny Nose And Clog May Take After The Sore Throat. Strep Throat, Which Is A Contamination Because Of Streptococcus Microorganisms, Is Another Reason For Sore Throats And Tonsillitis. With Strep Throat, The Sore Throat Is More Serious. (1)

In United States The Frequency Of An Intense Rheumatic Scene Taking After Streptococcal Pharyngitis Is 0.5-3% . (2)

Acute Rheumatic Fever (ARF) And Its Sequelae Remain The Leading Cause Of Cardiovascular Disease In Children And Young Adults Especially In Developing Countries. It Represents A Major Public Health Problem Causing A Lot Of Suffering To The Patient And Their Families. (3)

In Western Locale In Saudi Arabia Rheumatic Heart Disease Was 24 For Every 10,000 Schoolchildren (6-15 Years) Higher In Country Ranges And In Females And 34% Is The Bearer Rate Of Beta-Hemolytic Streptococci. (2) Around The World, Rheumatic Heart Disease (Rhd) And Its Confusions Result In Around 233 000 Passings Every Year. The World Wellbeing Association (Who) Appraises That Around 16 Million Individuals Are At Present Influenced By The Disease. The Dominant Part Of Rhd Cases Happen In Africa Where Commonness Rates Are As High As One In 10 Individuals In A Few Groups. (4)

Consistently, Around 15 Million Individuals Are Influenced, 200,000 Bite The Dust, And 100,000 Get To Be Disabled.(5)

We Have Proven From Past And Current Activities, Founded In Different Parts Of The World, That Far Reaching Programs Joining Mindfulness Raising, Observation, And Anticipation Can Control RHD As Well As Make A Worldwide RHD Plan And Develop A Stage For Cooperation. (6)

Starting Here, We Do A Poll To Assess Awareness About Rheumatic Fever To Know Degree Of Awareness In Group As A First Study In Kingdom Of Saudi Arabia Done To Know The Couple's Awareness About Rheumatic Fever.

### **Methodology:-**

The Type Of The Study Is Cross Sectional, It Will Include Collection Of Data From The Community's To Measure Their Awareness About Sore Throat And Its Relation To Rheumatic Fever.

The Data Will Be Collected In The Western Area Of Kingdom Of Saudi Arabia, By Distributing A Form To The Families Which Included Questions About The Awareness Based On The Literature Review And Who Recommendation.

The Questions Include Ages, Number Of Children, City, Financial Status, And General Information About The Disease.

The Ethical Approval Will Be From The Research Committee In The College Of Medicine, Taif University.

### **Results:-**

The Aim Of The Study To Assess The Couple's Awareness About Sore Throat And Its Relation To Rheumatic Fever. This Study Was Applied On (407) Husbands And Wives From Different Cities In Western Area Of Kingdom Of Saudi Arabia. ( Table 1 ) .Most Of Them Were Female 260 (63.9 %) And 147 (36.1) Were Male (Graph 1). The Age Of The Studied Group Was Above 18 Years ( Distribution Of Age Will Be Shown On The Graph Below ( Graph 2 ) ).

Education Level Of The Studied Group Is Shown On Table (2) 71.5% (291) Of The Studied Group Were Having University Or Higher Education, 22.4% (91) Were Having Secondary School Education, 4.2% (17) Were Having Intermediate School Education, While 2.0% (8) Were Having Primary School Education. Works Areas Of The Studied Group Were 37%(151) Were Not Working, 33% (133) Were In Educational Field, 13% (52) Were Health Care Workers , 8% (34) Were In Army Field , 7% (27) Were Private Sector And 2% (10) Were General Work Or Business(Graph 3 ).

Monthly Income Of The Studied Group Is Shown On Table (3) 45.2% (184 ) Were More Than 10000 SR, 27.8% (113) Were 5000-10000 SR , 19.2% (78) Were Between 2000-5000 SR, 7.9% (32) Were Less Than 2000 Sr. 88.5% (360) Of All Studied Group Had Children While 11.5% (47) Did Not Have Children (Graph 4). 38.33% (156) Of All Studied Group Had More Than Three Children, 19.17% (78) Had One Child, 15.72% (64) Had Three Children While 15.32% (62) Had Two Children (Graph 5).

86.4% (352) Have The Children Previously Had Sore Throat While 13.6% (55) Did Not Have (Graph 6). 71.7% (292) Of All Studied Group Went To A Doctor To Treat His/hers Infected Child With Sore Throat, 9.34% (38) Did Not Do Anything And 5.4% (22) Home Remedies (Graph 7). 86.2% (351) Of All Studied Group Had An Infected Child With Sore Throat While 13.8% (56) Did Not Have An Infected Child With Sore Throat (Graph 8). 31.2%

(127) ) Of The Studied Group Were Believe That The Cause Of Sore Throat Is Virus , 11.5 (47) They Did Not Know, 10.1% (41) Bacteria, 2.9% (12) Dry Throat, 2.7 % (11) Allergy, 0.2 % (1) Gastroesophageal Reflex Disease,0.5 (2) Tumors, 33.2% (135) Some Of Them While 7.6% (31) Were Believe All Of Them Can Cause The Sore Throat (Graph 9). 33.9% (138) Were Believe That There Is A Relationship Between Sore Throat And Some Heart Diseases, 14.3% (58) Were Believe That There Is No Relationship Between Sore Throat And Some Heart Diseases While 51.8% (211) They Did Not Know (Graph 10).

45.5% (185) Of All Studied Group Were Think That The Best Treatment For Sore Throat Has A Relationship To Prevent Heart Disease, 6.1% (25) Think That The Best Treatment For Sore Throat Has No A Relationship To Prevent Heart Disease While 48.4% (197) They Did Not Know (Graph 11) . 15.5% (63) Of All Studied Group Had Family Member Or Friend Diagnosed With Rheumatic Fever While 84.5% (344) Did Not Have (Graph 12) . 45.7% (186) Of All Studied Group Believe That The Age From 5 To 15 Years OldAre More Affected Of Rheumatic Fever, 21.6% (88) Believe That The Age More Than 36 Years Old Are More Affected, 17.2% (70) Less Than 5 Years And 15.5% (63) Believe That The Age From 16 To 35 Years Old Are More Affected (Graph 13). 14.0% (57) Of All Studied Group Think That Fever, Pain In The Joints, Involuntary Movements, Rash On The Body, Protrusions In The SkinAre Signs Some Of Heart Disease, 15.7% ( 64) Did Not Think , 70.3% (286) They Did Not Know (Graph 14) . 16.7% (68) Of All Studied Group Were Know That To Treatment A Patient Who Had A Rheumatic Fever, Has To Follow A Course Of Antibiotic (Mostly By Injections) For A Five To Ten Years Old If His Case Affecting The Heart While 83.3% (339) They Did Not Know (Table 4).

**Table (1 ):-** The Cities Of The Studied Group

City	Frequency	Percent
Jeddah	129	31.7
Laith	4	1.0
Makkah	57	14.0
Qanfatha	5	1.2
Rabig	3	.7
Taif	209	51.4

The Graph (2):- Show The Age Distribution Of The Studied Group.

Table (2):- Education Level Of The Studied Group Is Shown On.

Education Level	Frequency	Percent
Intermediate School	17	4.2
Primary School	8	2.0
Secondary School	91	22.4
University Or Higher Studies	291	71.5

The Graph (3):- Show Works Areas Of The Studied Group.

**Table (3):-** Monthly Income Of The Studied Group.

Monthly Income	Frequency	Percent
Less Than 2000	32	7.9
2000-5000	78	19.2
5000-10000	113	27.8
More Than 10000	184	45.2

**The Graph (4):-** Showing The Percentage Of Couples Have Children In The Studied Group.

**(Graph 5):-** Show The Number Of Children Of The Studied Group

(Graph 6):- Show Percentage Have The Children Previously Had Sore Throat In The Studied Group.

(Graph 7):- Show What To Did To Treatment Of Sore Throat In The Studied Group.

The Graph (8):- Showing The Percentage Of Couples Have Had An Infected Child With Sore Throat In The Studied Group.

The Graph (9):- Showing The Causes Of Sore Throat That The Studied Group Believe

**The Graph (10):-** Show The Best Treatment For Sore Throat Relationship To Prevent Heart Disease In The Studied Group.

**Graph (11):-** Show The Think Of The Studied Group.

(Graph 12):- Show Family Member Or Friend Diagnosed With Rheumatic Fever In The Studied Group

(Graph 13):- Group Of Ages Are More Affected Of Rheumatic Fever In Believe Studied Group

(Graph 14):- Show The Think Of The Studied Group About The Some Signs Of Heart Disease.

Table (4):- Treatment A Patient Who Had A Rheumatic Fever Affecting The Heart With Antibiotic.

Treatment With Antibiotic	Frequency	Percent
No	339	83.3
Yes	68	16.7

**Discussion:-**

Confusions Of Strep Throat Are Uncommon Yet Can Happen, Particularly If Strep Throat Is Not Appropriately Treated With Antibiotics, Now And Again Because Of A Strep Disease, The Body's Safe Framework Will Assault Solid Tissues, Bringing About Complexities, For Example, Rheumatic Fever.<sup>(7)</sup>

Rheumatic Fever Can Bring About Long Haul Confusions In Specific Circumstances. A Standout Amongst The Most Common Confusions Is Rheumatic Coronary Illness. Kids Who Experience The Ill Effects Of Long Haul Harm Identified With Rheumatic Fever Might Be Qualified For A Specialized Curriculum And Other Related Administrations.<sup>(8)</sup>

The Quality Of Our Review Is The Main Overview In The Kingdom Of Saudi Arabia Do To Know The Couple's Mindfulness About Rheumatic Fever, In Our Insight .

Constraints In Our Review Incorporate Utilization Of An Online Overview That May Prompt To Determination Inclination And Not All Couples Can Be Utilize Web. Consequently, We Couldn't Sum Up Our Discoveries To All Couple's .

**Conclusion:-**

We Conclude That The Parent Who Lived In The Eastern Region Of Saudi Arabia Need To Be More Educated Regarding The Sore Throat And Its Complication To Reduce The Incidence In The Future. This Could Be Done By Conducting Many Voluntarily Campaigns To The Family, Educative Accounts In The Social Media, Distribution Of Leaflet To The Parents.

**Acknowledgment:-**

We are a group of doctors from different cities who shared together in finishing this research under supervision of Dr. Mamdouh Ari Nasser Alshareef hoping that it will be benefit in the medical field.

#### Key words:-

*Nigella sativa*, bacteria, thymoquinone, alkaloids, saponins, antimicrobial, anti-cancer.

### Abstract

Alkaloids, saponins and thymoquinone of *Nigella sativa* are active against both Gram-positive and Gram-negative bacteria. Subinhibitory concentrations of these constituents were tested for their effect on biofilm production, motility and the expression of the proteins and the lipopolysaccharides of the outer membrane of Gram-negative bacteria. While all the three tested constituents reduced the biofilm formation by *E. coli*, only saponins and alkaloids reduced the biofilm formation in *K. pneumoniae* and *Sal. Typhimurium*. Nonetheless, alkaloids, saponins and thymoquinone, enhanced the biofilm formation in *P. aeruginosa* and *Sh. flexneri*. On the other hand, thymoquinone inhibited the motility of *Escherichia coli*, *P. aeruginosa* and *Sal. Typhimurium*. There were changes in the level of expression of seven and three outer membrane proteins of *E. coli* and *P. aeruginosa*, respectively. Amongst these changes in *E. coli*, the amounts of OmpF apparently decreased and those of OmpA increased. Also, three outer membrane proteins of *P. aeruginosa* were affected by the phytochemicals including OmpF. The expression of the latter was increased by alkaloids. Electron microscopy revealed some morphological changes in *S. aureus* and *P. aeruginosa*. It may be concluded that thymoquinone, alkaloids and saponins affect several pathogenesis mechanisms in both Gram-positive and Gram-negative bacteria.

### Introduction:-

For centuries, *Nigella sativa* L. (Family *Ranunculaceae*) seeds have been traditionally used in bakery as pungent appetizer and aromatic, and folk medicine in the Middle East, Eastern Europe, Asia, and Africa, as thermogenic, diuretic, expectorant, purgative, stimulant, sudoriferous, sedative, carminative and for many other diseases in different (1, 2). Muslim communities, in particular, considered *N. sativa* seeds as one of the most important prophetic medicinal plants because its healing effects were referred to by the Prophet Muhammad (Peace be upon him) (3).

*Nigella sativa* seeds contain different pharmacologically active constituents like alkaloids, saponins and essential oil (4). These constituents have been investigated for their pharmacological effects both *in vitro* and *in vivo* (5,6). They have been demonstrated to enhance the immune system (7), and to have galactagogue, carminative, laxative

(2), anti-inflammatory (8), anti-cancer (9,10) antimicrobial (11-15), anti-parasitic (16), antioxidant (17), hypoglycemic (18) activities.

The different extracts of *N. sativa* seeds were found to possess broad-spectrum antimicrobial activity against bacteria, viruses and fungi (19). This broad-spectrum of antimicrobial activity may be attributed to their effect on the key biochemical elements of microorganisms (20).

Extracts of *N. sativa* were found to inhibit both Gram-positive and Gram-negative bacteria. Water extracts of the seeds were active against *Staphylococcus aureus* (21, 22). Diethyl-ether, Methanol and chloroform extracts of the seed of *N. sativa* inhibited the growth of *Escherichia coli*, *Helicobacter pylori*, *Bacillus subtilis* and *Streptococcus fecalis* (23,24).

The antibacterial activity of crude extracts and phytochemicals of *N. sativa* have also been found to be active against multi-drug-resistant bacteria, including both Gram-positive bacteria like *Staphylococcus aureus* and Gram-negative bacteria like *Pseudomonas aeruginosa* and *Escherichia coli* (15, 25, 26).

Some purified constituents of *N. sativa* have also been tested for their antibacterial activity. The first reported constituent which possessed an anti-bacterial activity was the phenolic fraction of *N. sativa* oil (13). The essential oil of *N. sativa* and some of its components like thymoquinone and hydrothymoquinone were found to be lethal to fungi, Gram-positive and Gram-negative bacteria (27-31). The antibacterial activity of alkaloids and saponins, of *N. sativa*, were evaluated both qualitatively and quantitatively (15, 32, 33).

In a previous study, we demonstrated the antibacterial activity of alkaloids, saponins and thymoquinone of *N. sativa* seeds on a wide range of antibiotic sensitive and resistant bacteria (15). In this report, we investigated the effect of these active constituents on slime production, motility, outer membrane proteins and lipopolysaccharide.

## **Materials and Methods:-**

### **Bacteria and chemicals:-**

The six pathogenic bacteria used were *Escherichia coli* ATCC 35218, *Salmonella enterica* serovar Typhimurium ATCC 14028 (*Sal. Typhimurium*, *Pseudomonas aeruginosa* ATCC 27853 (*P. aeruginosa*), *Klebsiella pneumoniae* (*K. pneumoniae*), *Shigella flexneri* (*Sh. Flexneri*) and *Staphylococcus aureus* (*S. aureus*) were clinical isolates of the culture collection of the Department of Microbiology, College of Pharmacy, Taif University. Thymoquinone and organic solvents were purchased from Sigma-Aldrich.

### **Extraction of alkaloids:-**

Powdered seeds of the plant were extracted with 70% methanol. The extract was evaporated under reduced pressure, dissolved into distilled water and acidified with 3% hydrochloric acid. The solution was extracted with petroleum ether. The acidic solution was made alkaline with 25% ammonium hydroxide (pH 9-10) and then extracted with chloroform. The combined chloroform extracts were dried to get the crude *N. sativa* alkaloids (34).

### **Extraction of saponins:-**

Powdered seeds of the plant were defatted with n-hexane. Further extraction was performed with 70% methanol. After evaporation of the methanol under vacuum, the crude residue was acidified with 5% hydrochloric acid and left overnight in the refrigerator. The precipitate was extracted with chloroform: methanol (75:25), to get crude saponins (35).

### **Biofilm production (36):-**

Thymoquinone, saponins and alkaloids of *N. sativa* were two-fold serially diluted with a minimum medium (M9) to give series of concentrations in sterile 96-well polystyrene microtitration plates. Each series of dilutions was inoculated with  $10^4$  CFU/ml of the tested bacteria and incubated at 37°C for 18 hours. Bacteria suspension was aspirated and wells were washed-buffer saline (pH 7.5), ethanol, and stained with 0.1% crystal violet for 30 min. Wells were rinsed with water and filled with ethanol for 30 min and their contents were transferred to another microtiter plate. Plates were read at 595nm using an ELISA reader.

**Effect of some constituents on swarming and motility of bacteria (37):-**

Bacteria were grown onto swarming or swarming plates containing subinhibitory concentrations of *N. sativa*: Plates were incubated overnight at 30°C and zones of swimming or swarming were measured and compared to those of control plates.

**Effect on outer-membrane proteins(38):-**

Log phase bacteria treated with sub-inhibitory concentrations of some constituents of *N. sativa* were harvested and sonicated. Debris was harvested by centrifugation and membranes were collected by high-speed centrifugation. Inner and outer membranes were separated by differential solubilisation and with sarkosyl and subjected to SDS-PAGE

**Purification of lipopolysaccharide:-**

Log phase bacterial cells were lysed at 100°C with SDS in presence of glycerol and  $\beta$ -mercaptoethanol. Lysed cells were treated with proteinase K at 60°C for 1 hr(39), subjected to SDS-PAGE (40).

**SDS-PAGE:-**

Components of different fractions were separated by the SDS-PAGE as described before. Briefly, proteins were stacked in 4.5% acrylamide and separated in 12.5% acrylamide. Gels were run at a constant current of 20 mA per gel, and proteins were visualised with Coomassie blue (40) or silver stain (39, 41).

**Electron microscopy:-**

Bacterial cells grown at a sub-lethal concentration of the purified constituents were fixed with 2.5% glutaraldehyde and were negatively stained with 2% (w/v) phosphotungstic acid in 0.1 M sodium phosphate buffer (pH 6.5)(42). Bacteria were examined by transmission electron microscope (JEM, Japan).

**Statistical Analysis:-**

All determinations were carried out in triplicates and the statistical analyses were carried out using SPSS 13.0 and Microsoft Excel programs

**Results:-**

Biofilm formation by *S. aureus*, *P. aeruginosa*, *E. coli*, *K. pneumoniae*, *Sh. flexneri* and *Sal. Typhimurium*, was investigated in presence and absence of the thymoquinone, saponins and alkaloids (Table 1). Biofilm production by *S. aureus* was not very much affected by the three active constituents of *N. sativa*. On the other hand, while biofilm production by *E. coli*, was reduced, its production by *P. aeruginosa* and *Sh. flexneri* was enhanced (Table 1). The percentage of production of biofilm by *E. coli* was 19-85% compared to the control. On the other hand, biofilm production was 210-235% and 117-240% increased as compared with the control in the case of *P. aeruginosa* and *Sh. flexneri* respectively (Table 1). In the cases of *K. pneumoniae* and *Sal. Typhimurium* there was an enhancement of biofilm production by thymoquinone and a reduction of production by both alkaloids and saponins at 1/2 MIC (Table 5).

**Table 1:-** Effect of some active contents of *N. sativa* on biofilm production by different types of bacteria (in M9 medium)

Constituent	Conc.	Bacteria					
		<i>Staph. aureus</i>	<i>Pseudomonas aeruginosa</i>	<i>Escherichia coli</i>	<i>Klebsiella pneumoniae</i>	<i>Shigella flexneri</i>	<i>Salmonella Typhimurium</i>
% biofilm production compared to control							
Thymoquinone	1/2 MIC	101.6	125.3	29.9	125.3	235.0	153.4
	1/4 MIC	103.7	112.7	85.1	154.1	240.0	88.6

	1/4 MIC	104.6	125.3	39.4	102.6	117.7	74.7

The effect of thymoquinone and saponins on swimming capacity of three motile bacteria (*P. aeruginosa*, *E. coli*, and *Sal. Typhimurium*) was investigated (Table 1). While thymoquinone inhibited the motility of the tested bacteria, saponins enhanced it (Table 2). The diameters of zone of swarming of untreated bacteria, were 11, 8, and 20mm for *Ps. aeruginosa*, *E. coli* and *Sal. Typhimurium* respectively, while their respective swarming diameters in presence of ½ the MICs of saponins were 22, 20 and 50mm (Table 2).

**Table 2:-** Effect of phytochemicals on swimming of bacteria

Constituent	Conc.	Bacteria		
		<i>Ps. aeruginosa</i>	<i>E. coli</i>	<i>Sal. Typhimurium</i>

<i>Pseudomonas aeruginosa</i>	86	NC	+	NC
	80	-	NC	-
	33 (OprF)	NC	+	NC

\*NC, no change; -, decrease in amounts; +, increase in amounts

The changes of the apparent level of expression of some outer membrane proteins of *E. coli* and *P. aeruginosa* exposed to 1/2 MICs are shown in figure 3 and table 3. Changes in the levels of expression of seven proteins in *E. coli* and three proteins in *P. aeruginosa* were observed and

Thymoquinone caused an increase in the expression of 3 proteins in *E. coli* and a decrease in 3 others. On the other hand, it caused an apparent decrease in the amount of a protein which has a molecular weight of 80 kDa in *P. aeruginosa* (Table 3). Alkaloids cause an increase in the level of 4 proteins and a reduction in one protein in *E. coli* and an increase in the level of expression of two proteins one of which was OprF in *P. aeruginosa* (Table 3). Saponins increased the level of expression of 4 proteins and reduced two in *E. coli* and reduced the level of only one protein in *P. aeruginosa* (Table 3).

Thymoquinone, alkaloids and saponins affected the expression of lipopolysaccharides in *E. coli* and not *P. aeruginosa*. As shown in figure 4, there was a decrease in the amount of high molecular weight LPS in *E. coli* treated with thymoquinone, alkaloids and saponins.

**Fig 4:** -Effect of *Nigella sativa* active constituents at 1/2 MIC concentrations on lipopolysaccharide of *Escherichia coli*. Mw, molecular weight markers; TQ, thymoquinone; Alk, alkaloids; Sap, saponins.

*S. aureus*, *E. coli* and *P. aeruginosa* as treated with thymoquinone, saponins and alkaloids, were examined for changes in their morphology. While no apparent changes in the morphology of *E. coli*, (data not shown), some changes were observed in both *P. aeruginosa* and *S. aureus*. Thymoquinone and alkaloids caused *P. aeruginosa* cells to become more elongated and thinner compared to the control (Fig. 1). This was more apparent in the case of thymoquinone. On the other hand, *S. aureus* exposed to saponins at sub-inhibitory concentration suffered from protoplasting and some cells suffered from the retraction of their cytoplasmic contents away from the cell wall as shown in Fig 5B.

**Fig. 1:-** *Pseudomonas aeruginosa* after growth for 24 h in M9 (A) and in M9 containing subinhibitory concentration of thymoquinone (B), alkaloids (C), and saponins (D).

Fig. 2:- *Staphylococcus aureus* after growth for 24 h in M9 (A) and in M9 containing saponins at subinhibitory concentration (B).

### Discussion:-

The saponins, alkaloids, and thymoquinone were previously reported to be inhibitory to different types of bacteria even though they might be multi-drug resistant clinical isolates (15, 32). In this study, we investigated the effect of subinhibitory concentrations of saponins, alkaloids, and thymoquinone of *N. sativa* on some pathogenesis mechanisms of some Gram-positive and Gram-negative.

In this study, *S. aureus*, *P. aeruginosa*, *E. coli*, *K. pneumonia*, *Sh. flexneri* and *Sal. Typhimurium*, were grown at  $\frac{1}{2}$  and  $\frac{1}{4}$  the MICs of thymoquinone, saponins and alkaloids and were tested for their capability of forming biofilms.

Biofilms are formed on surfaces of living tissues, medical devices and contact lenses, etc. (43). Biofilms help bacteria to survive and withstand hostile conditions on surfaces and contribute to the persistence of chronic infections (44). Several studies have been performed to find natural antimicrobial agents that influence microbial biofilm formation (45-48).

While there was a reduction in the ability of *E. coli* to produce biofilms by the three tested constituents, only saponins and alkaloids were capable of reducing biofilm formation by *K. pneumoniae* and *Sal. Typhimurium*. On the other hand, biofilm formation was enhanced in *P. aeruginosa* and *Sh. flexneri* and was indifferent in the case of *S. aureus*.

The induction of biofilm formation, in *P. aeruginosa*, and the failure to reduce biofilm formation in *S. aureus*, contradicts with Chaieb, *et al.*, (49), who reported a reduction in biofilm formation by both *S. aureus* and *P. aeruginosa* treated with thymoquinone. However, it should be mentioned that the inhibition detected was at concentrations higher than their reported MICs. Therefore, while thymoquinone caused inhibition of biofilm formation at concentrations 22 and >512, for *S. aureus* and *P. aeruginosa* respectively, the MICs reported were 8 and >512 respectively (49).

Motility plays a key role in the colonisation of surfaces by bacteria (50,51). In this study, thymoquinone inhibited the motility and swarming of *Escherichia coli*, *P. aeruginosa* and *Sal. Typhimurium*. In a previous study, tannins of cranberry fruit and the hydrolysable tannin in pomegranate were reported to inhibit swarming motility but did not block swimming or twitching motilities (51). Sub-inhibitory concentrations of alkaloids like piperine of black pepper and reserpine of snakeroot, decreased bacterial swarming and swimming motilities (52). Tannic acid and epigallocatechingallate were found to block swarming motility in *Pseudomonas aeruginosa* (53).

Motility plays a key role in the colonisation of surfaces by bacteria (51, 54). In this study, thymoquinone inhibited the motility and swarming of *Escherichia coli*, *P. aeruginosa* and *Sal. Typhimurium*. In a previous study, tannins of cranberry fruit and the hydrolysable tannin in pomegranate were reported to inhibit swarming motility but did not block swimming or twitching motilities (51).

*Escherichia coli*, *P. aeruginosa* and *S. aureus* treated with a sub-inhibitory concentration of thymoquinone, alkaloids and saponins were examined under transmission electron microscope for morphological changes. Thymoquinone and alkaloids caused cells of *P. aeruginosa* to become thinner and elongated, compared to the

control. Though, the morphological changes might be attributed, to their effect on penicillin-binding proteins, however, this is not necessary because quinolone antibiotics, which do not bind to penicillin-binding proteins, affect the morphology of *E. coli* (55).

*S. aureus* exposed to saponins at a sub-inhibitory concentration suffered from protoplasting and retraction of the cytoplasmic contents away from the cell wall. Morphological changes of *S. aureus* exposed to aqueous extracts of green tea (56) or extracted catechingallates (57) have been reported in *S. aureus*. Methanolic extract of a soft sponge, *Haliclona* sp., caused internal shrinkage of methicillin-resistant *S. aureus* and *B. subtilis* cells which finally collapsed after prolonged exposure to the extract (58).

There is evidence that several outer membrane proteins are involved in adherence of bacteria to mammalian cells (59-61). In this study, the effect of thymoquinone, alkaloids and saponins at 1/2 MICs on the outer membrane proteins was examined. There were indeed apparent changes in the levels of expression of seven and three proteins in *E. coli* and *P. aeruginosa* respectively. While in *E. coli* OmpF outer membrane protein apparently decreased in amounts by treatment with the three constituents, OmpA increased.

On the other hand, three outer membrane proteins of *P. aeruginosa* were affected by the tested phytochemicals one of which was OprF. The expression of the latter was increased by the treatment with alkaloids. Recent studies have shown that the expression of 5% of bacterial promoters may be affected by sub-inhibitory concentrations of antibiotics (62). Likewise, it seems that phytochemicals like thymoquinone, alkaloids and saponins affect the expression of bacterial promoters.

The effect of phytochemicals on the expression of some bacterial proteins has been previously documented. Bioactive fraction 9EA-FC-B of *Acalyphawilkesianai* inhibited the production of MRSA by reducing the amount PBP2a in the matrix (63). Proteomic analysis of bacterial expression profiles following exposure to flower extracts of *Melastomacandidum* affected the expression of four proteins in *E. coli* and one protein in *S. aureus* (64).

In this study, alkaloids and saponins were found to reduce the amounts of high molecular weight Lipopolysaccharide (LPS) in *E. coli*. LPS is a main outer membrane component of Gram-negative bacteria (65). It causes pathophysiological effects such as fever, leucopenia, leucocytosis and Shwartzman reactivity (65). It is also involved in the attachment to host cells and it is important for the virulence and pathogenesis of many bacterial species, including *Pseudomonas aeruginosa*, *Salmonella* species, and *Escherichia coli* (66-68).

LPS is associated closely with the OmpF protein of the outer membrane (69). The low expression of OmpF caused by alkaloids and saponins might have a role in the decreased in the detected amounts of high molecular weight LPS. LPS are essential for the pathogenesis of bacteria. It is an important mechanism to evade complement activation (70). This implies that alkaloids and saponins could affect the pathogenesis of *E. coli*.

### Conclusion:-

Thymoquinone, saponins and alkaloids of *N. sativa* at subinhibitory concentrations affect motility, biofilm formation and the expression of some proteins and LPS of the outer membrane of bacteria. This presumably would affect the pathogenesis of bacteria.

#### Abstract

The present paper presents analysis of a two unit redundant system with the concept of regular repairman and patience time. As regards to repairing of the system, it has to be wait for repair due to unavailability of repair facility after common cause failure. The analysis is carried out using the supplementary variable technique and Laplace transformation for evaluating reliability measures such as availability, reliability, mean time failure, mean time to repair and expected number of visits by the repair facility.

#### Introduction:-

Agnihotri, Satsangi and Agarwal (1995), Chandrashekar (1996), Kumar and Garg (1991), Wang (2002) and many authors engaged in the field of reliability theory analyzed many engineering systems with the assumptions that only available regular repair facility completes the repair of the failed unit without considering the time factor taken by the repair facility to complete its repair. Ram, Singh and Varshney (2013) investigated the reliability of a standby system under human failure but it is quite reasonable to fix an amount of time known as patience time i.e. if the regular repair facility is able to complete the repair of the failed unit within the patience time then it is okay otherwise an urgent call should be send for expert repairman who is very costly and specialist for repair. The expert repairman takes a random amount of time to become available and repair the failed unit with the help of regular repairman. Keeping this view, the present paper analyse a two unit redundant system with the concept of regular repairman and patience time. Using regenerative point techniques with Markov renewal process the following reliability characteristics of interest which are useful to system designers are obtained.

- Transition and steady state transition probabilities
- Mean Sojourn times in various states
- Mean time to system failure (MTSF)
- Point wise and steady state availability of the system
- Expected busy period of the repairman in  $(0, t]$
- Expected number of visits by the repairman in  $(0, t]$

#### Model Description and Assumptions:-

1. The system consists of only two non-identical units in which first is operative and the second unit is kept as warm standby.

**Corresponding Author:-Mukesh Kumar.**

Address:-Department of Mathematics, Institute of Applied Sciences and Humanities, GLA University, Mathura, India.

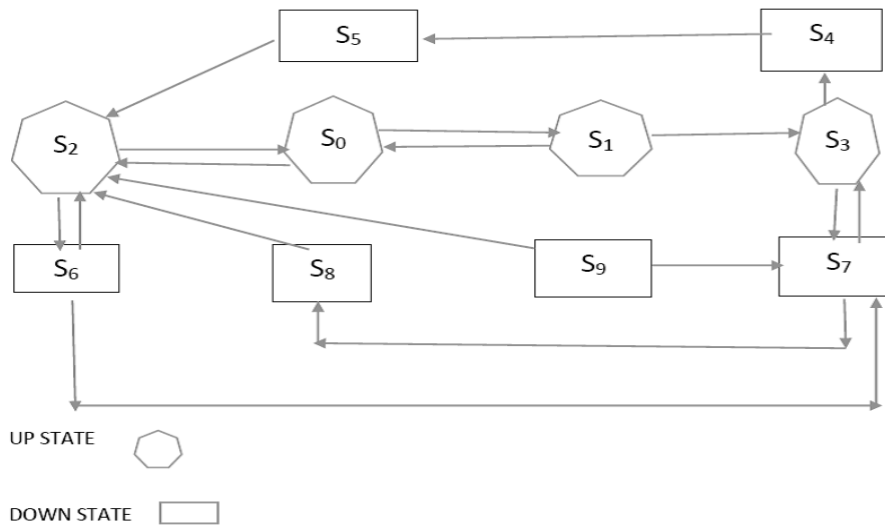

2. First unit gets priority over second unit for both operation and repair.
3. A single repair facility known as regular repairman is available in the system for both the units.
4. There is a patience time for regular repairman i.e. if the regular repairman is unable to repair the failed priority unit within patience time then an urgent call is send to expert repairman. Expert repairman is very costly which takes a random amount of time to become available. The expert repairman repairs the failed unit with the collaboration of regular repairman. The concept of patience time is applicability only for priority unit.
5. The failure time distribution of both the units are negative exponential. Also rate of completing patience time for regular repairman and rate of availability of expert repairman are negative exponential.
6. The repair time distributions of the failed unit by the regular and expert repairman are general.

**Notation and Symbols:-**

$N_0$	:	Normal unit as operative
$N_5$	:	Normal unit kept as warm standby
$F_{wr}$	:	Failed unit waiting for repair by regular repairman
$F_{rr}$	:	Failed unit under repair by regular repairman
$F_{RR}$	:	Repair of failed unit by regular repairman is continued from earlier state
$E_{UC}$	:	Expert repairman is under urgent call
$F_{re}$	:	Failed unit under repair by expert repairman
$F_{RE}$	:	Repair of failed unit by expert repairman is continued from earlier state
$\alpha$	:	Constant rate of first unit
$\beta$	:	Constant rate of second unit
$\gamma$	:	Constant rate of completing patience time
$\delta$	:	Constant rate of time to available expert repairman
$f(\cdot), F(\cdot)$	:	pdf and cdf of time to repair of first unit by regular repairman
$g(\cdot), G(\cdot)$	:	pdf and cdf of time to repair of second unit by regular repairman
$h(\cdot), H(\cdot)$	:	pdf and cdf of time to repair of first unit failed by expert repairman
$m_1, m_2, m_3$	:	Mean time for repair

The possible states of the system are here under using the notations and symbols above:

<b>Up States</b>	:	$S_0 \equiv (N_0, N_s)$	$S_1 \equiv (F_{rr}, N_0)$	$S_2 \equiv (N_0, F_{rr})$
		$S_3 \equiv (E_{UC}, N_0)$	$S_4 \equiv (F_{re}, N_0)$	
<b>Down States</b>	:	$S_5 \equiv (F_{RE}, F_{wr})$	$S_6 \equiv (F_{rr}, F_{wr})$	$S_7 \equiv (E_{UC}, F_{rr})$
		$S_8 \equiv (F_{re}, F_{wr})$	$S_9 \equiv (F_{RR}, F_{wr})$	

**Transition Probabilities:-**

Let  $T_0 (= 0), T_1, T_2, \dots$  be the epochs at which enters the states  $S_i \in E$ . Let  $X_n$  denotes the state entered at epoch  $T_{n+1}$  i.e. just after the transition of  $T_n$ . Then  $\{T_n, X_n\}$  constitutes a Markov-renewal process with state space  $E$  and

$$Q_{ik}(t) = \Pr [ X_{n+1} = S_k, T_{n+1}-T_n \leq t | X_n = S_i ] \tag{4.1}$$

is semi Markov over  $E$ . The stochastic matrix of embedded Markov chain is

$$P = p_{ik} = \lim_{t \rightarrow \infty} Q_{ik}(t) = Q(\infty) \tag{4.2}$$

By simple probabilistic consideration, the non-zero elements of  $Q_{ik}(t)$  are:

$$Q_{01}(t) = \int_0^t \alpha e^{-(\alpha+\beta)u} du = \frac{\alpha}{\alpha+\beta} [1 - e^{-(\alpha+\beta)t}]$$

$$Q_{02}(t) = \int_0^t \gamma e^{-(\alpha+\beta)u} du = \frac{\beta}{\alpha+\beta} [1 - e^{-(\alpha+\beta)t}]$$

and similarly, other elements are  $Q_{10}, Q_{13}, Q_{19}, Q_{20}, Q_{26}, Q_{34}, Q_{37}, Q_{40}, Q_{45}, Q_{62}, Q_{67}, Q_{73}, Q_{78}, Q_{82}, Q_{92}, Q_{97}$  and

$$Q_{12}^{(9)}(t) = \int_0^t \beta e^{-\beta u} e^{-\gamma u} \bar{F}(u) \cdot du \int_u^t dH(x)/\bar{F}(u) = \frac{\beta}{\beta+\gamma} [\int_0^t dF(x) - \int_0^t e^{-(\beta+\gamma)x} dF(x)]$$

$$Q_{42}^{(5)}(t) = \int_0^t \beta e^{-\beta u} \bar{H}(u) \cdot du \int_u^t dH(x)/\bar{H}(u) = \int_0^t dH(x) - \int_0^t e^{-\beta x} dH(x) \tag{4.3}$$

Taking limit as  $t \rightarrow \infty$ , the steady state transition  $p_{ij}$  can be obtain from equations in (4.3)

i.e.  $p_{ik} = \lim_{t \rightarrow \infty} Q_{ik}(t)$  (4.4)

Thus,

$$\begin{aligned} p_{01} &= \frac{\alpha}{\alpha+\gamma}, p_{02} = \frac{\beta}{\alpha+\beta}, p_{10} = f^*(\alpha + \beta), p_{13} = \frac{\gamma}{\beta+\gamma} [1 - f^*(\beta + \gamma)], \\ p_{19} &= \frac{\beta}{\beta+\gamma} [1 - f^*(\beta + \gamma)], p_{20} = g^*(\alpha), p_{26} = 1 - g^*(\alpha), p_{34} = \frac{\delta}{\beta+\delta}, p_{37} = \frac{\beta}{\beta+\delta}, \\ p_{40} &= h^*(\beta), p_{45} = 1 - h^*(\beta), p_{62} = f^*(\gamma), p_{67} = 1 - f^*(\gamma), p_{73} = g^*(\delta), \\ p_{78} &= 1 - g^*(\delta), p_{82} = 1, p_{92} = f^*(\gamma) \text{ and } p_{97} = 1 - f^*(\gamma). \end{aligned} \tag{4.5}$$

From these probabilities, we can have following relations:

$$\begin{aligned} p_{01} + p_{02} = 1 = p_{10} + p_{13} + p_{19}, p_{20} + p_{26} = p_{34} + p_{37} = 1, p_{40} + p_{45} = 1 = p_{62} + p_{67} \text{ and} \\ p_{73} + p_{78} = p_{82} = p_{92} + p_{97} = 1 \end{aligned} \tag{4.6}$$

**Mean Sojourn Times:-**

The mean time taken by the system in a particular state  $S_i$  before transiting to any other state is known as mean sojourn time and is defined by

$$\mu_i = \int_0^\infty P[T > t] dt \tag{5.1}$$

where  $T$  is time of stay in state  $S_i$  by the system.

We assume that so long as the system is in state  $S_i$ , it will not transit to any other state. Therefore mean sojourn time  $\mu_i$  in state  $S_i$  are:

$$\mu_0 = \int_0^\infty e^{-(\alpha+\beta)t} dt = \frac{1}{\alpha+\beta}, \mu_1 = \int_0^\infty e^{-(\beta+\gamma)t} \bar{F}(t) dt = [1 - f^*(\beta + \gamma)] \text{ and similarly,}$$

$$\mu_2 = \frac{1}{\alpha} [1 - g^*(\alpha)], \mu_3 = \frac{1}{\beta+\delta}, \mu_4 = \frac{1}{\beta} [1 - h^*(\beta)], \mu_6 = \frac{1}{\gamma} [1 - f^*(\gamma)], \mu_7 = \frac{1}{\delta} [1 - g^*(\delta)],$$

$$\mu_8 = \int_0^\infty t \cdot h(t) dt \text{ and } \mu_9 = \frac{1}{\gamma} [1 - f^*(\gamma)] \tag{5.2}$$

The mean sojourn time in state  $S_i \in E$  in the occurrence of non-generative state can also be contributed as:

$$m_{ij} = \int_0^\infty t \cdot q_{ij}(t) dt = q_{ij}^*(0) \tag{5.3}$$

Therefore,

$$m_{01} = \frac{\alpha}{(\alpha+\beta)^2}, m_{02} = \frac{\beta}{(\alpha+\beta)^2}, m_{10} = \int_0^\infty t \cdot e^{-(\beta+\gamma)t} f(t) dt, m_{13} = \gamma \cdot \int_0^\infty t \cdot e^{-(\beta+\gamma)t} \bar{F}(t) dt$$

$$m_{19} = \int_0^\infty \beta \cdot t \cdot e^{-(\beta+\gamma)t} \bar{F}(t) dt, m_{20} = \int_0^\infty t \cdot e^{-\alpha t} g(t) dt, \dots, m_{26}, m_{34}, m_{37}, m_{40}, m_{45}, m_{62}, m_{67}, m_{67}, m_{73}, m_{78}, m_{82}, m_{92}, m_{97} \text{ and finally}$$

$$m_{12}^{(9)} = \frac{\beta}{\beta + \gamma} \left[ \int_0^\infty t \cdot f(t) dt - \int_0^\infty t \cdot e^{-(\beta+\gamma)t} f(t) dt \right]$$

$$m_{42}^{(5)} = \int_0^\infty t \cdot h(t) dt - \int_0^\infty t \cdot e^{-\beta t} f(t) dt \tag{5.4}$$

Hence,

$$m_{01} + m_{02} = \frac{1}{\alpha+\beta} = \mu_0, m_{10} + m_{13} = \mu_1, m_{20} + m_{26} = \mu_2, m_{34} + m_{37} = \mu_3,$$

$$m_{40} + m_{45} = \mu_4, m_{62} + m_{67} = \mu_6, m_{73} + m_{78} = \mu_7, m_{82} = \mu_8, m_{92} + m_{97} = \mu_9 \tag{5.5}$$

**Mean Time to System Failure (MTSF):-**

The mean time to system failure (MTSF) can be obtained by E (T) given below by using Laplace Stieltjes transform of the relations for the distribution function  $\pi_i(t)$  of the time to system failure with starting time  $S_0$

$$E(T) = \frac{d}{ds} \pi_0(s)|_{s=0} = \frac{D'_1(0) - N'_1(0)}{D_1(0)} \tag{6.1}$$

Where

$$N_1 = \mu_0 + m_1 p_{01} + m_2 p_{01} p_{13} p_{34} + p_{01} p_{13} \mu_3 + \mu_2 (p_{02} p_{12}^{(9)} + p_{01} p_{13} p_{34}) \tag{6.2}$$

and

$$D_1 = 1 - p_{01} p_{10} - p_{01} p_{13} p_{34} p_{42}^{(5)} - p_{01} p_{12}^{(9)} p_{20} - p_{02} p_{20} - p_{01} p_{13} p_{34} p_{20} \tag{6.3}$$

**Availability analysis:-**

System availability is defined as

$A_i(t) = P_r$  [Starting from state  $S_i$  the system is available at epoch  $t$  without passing through any regenerative state]

$M_i(t) = P_r$  [ Starting from up state  $S_i$  the system remains up till epoch  $t$  without passing through any regenerative state]

Hence, obtaining  $A_i(t)$  by using elementary probability argument, we get

$$\begin{aligned} A_0(t) &= M_0(t) + q_{01} \odot A_1(t) + q_{02} \odot A_2(t) \\ A_1(t) &= M_1(t) + q_{10} \odot A_0(t) + q_{12}^{(9)} \odot A_2(t) + q_{13} \odot A_3(t) + q_{17}^{(9)} \odot A_7(t) \\ A_2(t) &= M_2(t) + q_{20} \odot A_0(t) + q_{26} \odot A_6(t) \\ A_3(t) &= M_3(t) + q_{34} \odot A_4(t) + q_{37} \odot A_7(t) \\ A_4(t) &= M_4(t) + q_{40} \odot A_0(t) + q_{42}^{(5)} \odot A_2(t) \\ A_6(t) &= q_{62}(t) \odot A_2(t) + q_{67} \odot A_7(t) \\ A_7(t) &= q_{73}(t) \odot A_3(t) + q_{78} \odot A_8(t) \\ A_8(t) &= q_{82}(t) \odot A_2(t) \end{aligned} \tag{7.1}$$

Where  $M_0(t) = e^{-(\alpha+\beta)t}$ ,  $M_1(t) = e^{-(\beta+\gamma)t}$ ,  $M_2(t) = e^{-(\alpha)t} \cdot \bar{G}(t)$ ,  $M_3(t) = e^{-(\beta+\gamma)t}$ ,

$$M_4(t) = e^{-(\beta)t} \cdot \bar{H}(t) \tag{7.2}$$

Taking Laplace transform of the equations (7.1) and solving for point wise availability by omitting the arguments ‘s’ for brevity, the steady state functioning availability of the system, when the system starts operation from the state  $S_i$ , we get

$$A_0(\infty) = \lim_{t \rightarrow \infty} A_0(t) = \lim_{s \rightarrow 0} A_0^*(s) = \frac{N_2(0)}{D_0(0)} = \frac{N_2}{D_2} \tag{7.3}$$

$$\text{where in terms of } M_0^*(0) = \mu_0, M_1^*(0) = \mu_1, M_2^*(0) = \mu_2, M_3^*(0) = \mu_3, M_4^*(0) = \mu_4 \tag{7.4}$$

$N_2$  and  $D_2$  can be easily obtained.

**Busy Period Analysis:-**

Let  $W_i(t)$  be the probability that the system is under repair by repair facility in the state  $S_i \in E$  at time  $t$  without transiting to any regenerative state. Therefore,

$$\begin{aligned} W_1(t) &= \bar{F}(t) = W_6(t) \\ W_2(t) &= e^{-\alpha t} \bar{G}(t) \\ W_3(t) &= e^{-(\beta+\delta)t} \\ W_7(t) &= e^{-\delta t} \bar{G}(t) \end{aligned} \tag{8.1}$$

Let  $B_i(t)$  be the probability that the system is under repair at time  $t$ . We obtain the following recursive relations among  $B_i(t)$ 's:

$$B_0(t) = q_{01}(t) \odot B_1(t) + q_{02}(t) \odot B_2(t) \text{ and similarly for } B_1(t), B_2(t), B_3(t), B_4(t), B_6(t), B_7(t) \text{ and } B_8(t).$$

Taking Laplace transform of the equations (8.1) and solving the equations by omitting the argument for brevity we get the fraction of time for which the repair facility is busy in repair as

$$B_0(t) = \lim_{t \rightarrow \infty} B_0(t) = \lim_{s \rightarrow \infty} B_0^*(s) = N_3(0)/D_3'(0) = N_3/D_3 \tag{8.2}$$

where  $N_3 = \mu_0 + p_{24} \mu_4$  and  $D_3$  is same as  $D_2$  in (4.3).

**Expected number of visits by repair facility:-**

Let  $V_i(t)$  be the expected number of visits by the repair facility in  $(0, t]$  given that the system initially started from regenerative state  $S_i$  at  $t = 0$ . The following recurrence relations among  $V_i(t)$ 's can be obtained as:

$$\begin{aligned}
 V_0(t) &= Q_{01}(t)[1 + V_1(t)] + Q_{02}(t)[1 + V_2(t)] \\
 V_1(t) &= Q_{10}(t)V_0(t) + Q_{12}^{(9)}(t)V_2(t) + Q_{13}(t)V_3(t) + Q_{17}^{(9)}(t)V_7(t) \\
 V_2(t) &= Q_{20}(t)V_0(t) + Q_{26}(t)V_6(t) \\
 V_3(t) &= Q_{34}(t)V_4(t) + Q_{37}(t)V_7(t) \\
 V_4(t) &= Q_{40}(t)V_0(t) + Q_{42}^{(5)}(t)V_2(t) \\
 V_6(t) &= Q_{62}(t)V_2(t) + Q_{27}(t)V_7(t) \\
 V_7(t) &= Q_{73}(t)V_3(t) + Q_{78}(t)V_8(t) \\
 V_8(t) &= Q_{82}(t)V_2(t)
 \end{aligned} \tag{9.1}$$

Using Laplace Stieltjes transform of the above equations and omitting the argument 's' for brevity, we can get the number of visits per unit of time when the system starts after entrance into state  $S_0$  as:

$$V_0 = \lim_{t \rightarrow \infty} [V_0(t)/t] = \lim_{s \rightarrow 0} s \tilde{V}_0(s) = N_5/D_5 \tag{9.2}$$

Where  $N_5 = (1 - p_{26}p_{62})(1 - p_{37}p_{73}) - p_{26}p_{67}p_{72} - p_{26}p_{67}p_{73}p_{34}p_{42}^{(5)}$  and  $D_5$  is same as in (4.3).

With the help of this study we concluded that the performance of the manufacturing system can be improved by improving the procedures on considering patience time, proper training of employees and proper maintenance of the system. The results derived in this paper are valuable in a study of improving the reliability of the systems and additionally they can be extensively used in many engineering disciplines.

#### Abstract

Parenting a differently abled child is not an easy task. Such parents experience variety of stress related issues. For this difficult task parents especially mothers' require every help and possible encouragement. Parents and siblings should experience variety of extreme adjustments to adapt to the presence of a disabled child. Analysis have shown that families which can cope successfully with a differently abled child are able to mobilize their internal and external means of support to tackle efficiently with the special needs of their child. This review article highlights the parenting stress associated with differently abled children which may indirectly influence their approach towards seeking dental care.

#### Introduction:-

Parents play an important role in child's life, influencing their social, emotional, and academic development and adjustments. Parents also play an important role in supervising and maintaining their health care needs including oral hygiene and dietary habits. It has been reported that parents with good oral health knowledge can be responsible in sustaining favorable oral health of their children<sup>1-3</sup>. But the question is – "Is that enough just to educate parents and expect them to begin changing their daily oral hygiene routine, especially in parents of disabled children – Are they in a state to provide the necessary health care??"

Just educating parents about oral hygiene maintenance may not be adequate. Children who are normal advance from one stage of development to the next and their parents perceive them with satisfaction. When behavior of the child diverge from the ideal standards, family problems may develop<sup>4</sup>.

Differently abled child's birth is an unanticipated tense event which disturbs the entire family and will impair family development. Parents go through intense stress which may be emotional, psychological, social etc<sup>5</sup>.

Attractive, smart, graceful, sophisticated and athletic children are expected by most of the parents. Parents of differently abled child not only grieve for the loss of unfulfilled expectations but frequently encounter colossal

burden on their emotional and financial assets have excessive stress and reduced level of comfort as compared to the parents of normal children<sup>5,6</sup>.

Parenting behavior is influenced by many factors and one such aspect is parenting stress. Parenting stress can be described as excess anxiety and tension specifically related to the role of a parent and to parent-child interactions<sup>7</sup>. Plethora of evidence is there that additional amount of emotional stress is experienced by parents of children with retardation. It is reported that parents of mentally and physically challenged children are more upset, socially secluded and confined in their parental roles in comparison with parents of children with normal behaviour<sup>8</sup>. Increased levels of stress across all sections in parents of children with developmental disorders have been reported by Beckman<sup>9</sup>. It is reported that behavioral and developmental disability was linked with excessive parenting stress than medical disorder <sup>10</sup>.

It is documented that parental stress and adaptation rely upon the kind of disability, the family's coping facilities, conventional and unconventional supports in the society. Parent's previous psychological make up, accessibility and standard of professional assistances, marital interaction, religious perspectives, attitudes, number of members in the family also affects family adaptation. The quantity of assistance the parents obtain from companions, family members and professionals, regulates the self-resolution and intellectual performance of the parents<sup>6,11</sup>.

#### **Type of stress:-**

The nature of stress and areas of stress in parents of the mentally challenged have been studied extensively<sup>12-15</sup>.

- a. Care stress
- b. Social stress - poor social relationships and lack of holidays or free time
- c. Emotional stress
- d. Financial stress –Families with low income is reported to be correlated with increased stress because of insufficient facilities.

#### **Factors affecting stress:-**

1. **Mothers' vs Fathers** - The mothers experience higher stress than the fathers when it comes to daily care, emotional and social stress as mothers are usually directly involved in child care. Father's stress is attributed from disturbed behavior and decreased leisure time. Regarding financial stress, there were no differences between the parents<sup>15</sup>.
2. **Siblings** - Effect on siblings such as that of adjustment creates stress on both the parents but absence of normal siblings in the family of mentally challenged children does not make significance difference in stress experienced by the parents<sup>16</sup>.
3. **Gender of the child** - Gender and age of the child influences the stress in parents. Tangri and Verma<sup>17</sup> report higher stress in parents of female retarded children. When the child with disability is female, marital stress among parents is also seen and affinity is compromised <sup>18</sup>.
4. **Age** - Lower age of the mentally challenged individual is associated with an increase in stress.<sup>14,19</sup> Lesser the parents age higher is the parental stress, probably due to reduced experience and restrictions involved<sup>20</sup>.
5. **Severity of retardation:** It is observed that parents of severe and profoundly retarded children have higher stress<sup>21</sup> but in Indian scenario parents of mildly retarded group also exhibit higher stress<sup>13</sup>.
6. **Educational level of parents** - Educational level of parents does show clear influence on parental stress and higher stress is reported in educated group, which may be due to the additional social stress involved<sup>22</sup>. Prabhu<sup>23</sup> found that mental retardation is not considered as a serious problem especially in the agricultural communities, which may due to impaired sense of competence, less restrictions in their lifestyles, etc. Higher stress among educated parents may exist because of increased expectations of their children, higher sense of humiliation, annoyed at incapable of not being able to rehabilitate the state of the child and more limitations on their community and professional actions<sup>24-25</sup>. Increased stress was encountered in parents who worked as professionals and managers as compared to parents who were employed as laborers and assistants. Impaired sense of ability, limitations put on other lives, insufficient social assistance and depression can be the reasons <sup>26</sup>.
7. **Support and resources** - The studies reveals that knowledge on the value of informal support by extended family is inconsistent. Parents in joint families have support from grandparental and other family members thus reducing parental stress<sup>27</sup>. But it has been reported that family support can be a troublesome because of more behavior issues or excessive demands. Family adaptation has been encouraged and a decrease stress has been found by the assistance from the spouse and nearby relatives<sup>28</sup>. Most of the parents in India do not use

formal resources such as social support groups or family counselling due to the disgrace linked to disability and the harm to the family's prestige and this may further increase the stress.

#### **Burden reported 29-32:-**

The kind of burdens reported by family members vary from

- a. Difficulties in transportation of the child to the place of service delivery
- b. Management of behavior problems
- c. Disruption of their daily routine
- d. Economic, physical and social burden.

#### **Parental Coping mechanisms:-**

Trust in God, spirit and self-belief to the external aids such as assistance from family members, relatives, professionals, and Governmental policies are various coping resources<sup>33</sup>. Parenting stress is found to be reduced by religious coping<sup>34,35</sup>. It is also intriguing to be aware that music and television has been used by the parents to decrease the stress of handling with the situation.

#### **Conclusion:-**

Stress may also interfere in parent's ability to provide good oral health care. It is therefore necessary not only to educate parents but also to understand, assess and counsel parental stress related issues. Most of the time importance is given only to the difficult areas associated with children with special needs such as soft diet high in carbohydrates, lack of muscle movement and coordination making it difficult to effectively brush the teeth predisposing these children to a higher risk for dental caries and gingival disease etc, but the parental stress is totally ignored.<sup>36</sup>

Formation of dental teams with knowledge, empathy and providing education keeping in mind the associated stress involved, is what parents need. The dental community has to increase its effort for providing full support to parents and these children in the form of continuous encouragement apart from providing oral health education and dental care facilities.

##### Key words:-

Organic amendments, Sodic soil,  
 Growth indices, Productivity, Sodicity

#### Abstract

Soil degradation due to salinization and sodication in arid and semiarid region is of global concern and studies on management of such soils can provide pragmatic solutions. In this study, we used different organic and inorganic amendments to investigate their likely effects of sodic soil properties (pH, electrical conductivity; EC, exchangeable sodium percentage; ESP) and productivity (growth and seed production) of two vegetables crops Spinach (*Spinacia oleracea*) and the Pea (*Pisum sativum*). We have selected a patch of sodic soil (sodicity: pH 9.04, EC 1.05 dSm<sup>-1</sup>, ESP 78.5) divided into six blocks and each block with eight unit plots (total 48 unit plots). Dietary crops were grown with eight different amendments of chemical fertilizers and organic manures (Control, T1; NPK, T2; farmyard manure (FYM), T3; vermicompost (VC), T4; NPK+VC, T5; FYM+VC (1:1), T6; FYM+VC (1:2), T7; FYM+VC (2:1), T8). The combined use of FYM and VC showed approximately 5.97, 41.9 and 48% respective decrease in soil pH, EC and ESP and 33.2, 78.3, 29.5 and 152 increase in soil nitrogen, phosphorus, potassium and soil organic carbon (OC), respectively. This decrease in soil sodicity and the increase in soil fertility showed significant increase at  $P < 0.05$  in crops' different morphological growth parameters and growth indices such as the relative growth rate (RGR), root shoot ratio (RSR), leaf weight ratio (LWR) and leaf area ratio (LAR). We also observed a remarkable increase in seed yield of spinach and pea by 186 and 72.35 % in organic amended soil. The study reveals that combined use of FYM and VC in sodic soil might be adopted as alternate farming technology to diminish the unproductive effect of sodicity in the Indian agricultural economy.

## Introduction:-

Land degradation has now become a burning issue at a global level as its spatial distribution varies from 1 billion ha to over 6 billion ha (Gibbs and Salmon, 2015). Deforestation, accelerated soil erosion, lost of biodiversity pollution, lost of soil fertility and the accumulation of salt on the soil surface are some major causes of degraded land (Keesstra, 2007; Dai et al., 2015; Eskandari et al., 2016; Kasem and Mohamed, 2016; Prosdociami et al., 2016; Rodrigo et al., 2016). Salt induced land degradation is one of very important issues as affecting the status of food, productivity as well as health along the planet (Wicke et al., 2011; Ivits et al., 2013; Murtaza, 2013). According to recent data, the world salt affected area (saline  $397 \times 10^6$  and sodic soils  $434 \times 10^6$  ha) may lead about 27.3 \$ billion current annual economic losses and  $441 \text{ ha}^{-1}$  \$ inflation-adjusted cost at global level (Qadir et al., 2014). In case of India, this scenario is more critical as India (329 Mha geographical area) with only 2.4 % world land area, supports 18% and 15% world human and livestock population respectively and provide employment for 54.6% Indian people (Bhattacharya, 2015). India has INR 10714 annual potential losses and INR 7737 annual actual losses  $\text{ha}^{-1}$  due to 3.77 Mha acidic soils of 6.73 Mha salt affected land area. With respect to crops in Rice about a 33 % yield reduction in slight and 57% in moderate acidic soil is reported (Dwivedi and Qadar, 2011). However, 45% in slight and 100% yield loss is noted for wheat crop (Sharma et al., 2010; Thimmappa et al., 2014).

Application of slow release fertilizers, biological nutrient sources, organic matter management, natural predators, crop rotations and manual weed control are some key characteristics of organic farming to maintain agriculture sustain. In 2013 India occupies about 1.18% (5,10,000 ha) organic agricultural land 15<sup>th</sup> world position which in 2014 become 7.20,000 ha (1.64%) with 11<sup>th</sup> rank in the world (FiBL, 2016). Based on extensive research it has been scientifically and undoubtedly established, that organic farming systems are most productive, environment-friendly system, sustain natural resources and agriculture and reducing the impact of agriculture on the atmosphere. In this direction a lot of patches of literature based on reclamation of sodic soil with organic amendments using various agricultural crops such as cereals, millets, pulses except dietary vegetable crops are existing in the last five years (Walpola and Arunakumara, 2010; Cha-um and Kirdmanee, 2011; Diacono and Montemurro, 2015; Drake et al., 2016; Mbarki et al., 2016). Thus this study reflects whole picture of growth pattern through relative growth rate (RGR), relative shoot ratio (RSR), leaf weight ratio (LWR), leaf area ratio (LAR), plant biomass and productivity status of common Indian dietary crops such as *Spinacia oleracea* (leafy vegetable) and *Pisum sativum* (fruit vegetable) along with sodic soil properties which is very significant in direction to overcome the losses of agricultural economy due to salt affected soil in India as well as vegetable crop cultivation in sodic soil.

## Materials and Methods:-

### The study area:-

A large area of sodic soil was selected as the study field in Babasaheb Bhimrao Ambedkar University, campus Lucknow ( $26^{\circ} 50'21''$  N,  $80^{\circ} 55'23''$  E and 126 m above sea level) during year 2014 – 2016. The meteorological data of the study area were obtained from the Indian Meteorological Department (IMD), Amausi, Lucknow (3 km away from the experimental site) during the study period. On this basis an average annual rainfall during the last five years was measured as  $789.4 \pm 100$  mm, the minimum-maximum temperature varied from  $19.2 \pm 1.08^{\circ}\text{C}$  to  $40.1 \pm 0.16^{\circ}\text{C}$ , and the average annual relative humidity was recorded as  $60.7 \pm 2.01\%$ .

### Experimental Design:-

The experiment was designed with eight soil amendments. (1) T1, Control (without amending soil); (2) T2, NPK (a synthetic fertilizer with recommended dose); (3) T3, FYM (farmyard manure); (4) T4, VC (vermicompost) (5) T5, NPK + VC; (6) T6, FYM: VC (1:1); (7) T7, FYM: VC (1:2); (8) T8, FYM: VC (2:1). Synthetic fertilizers (NPK) were used as per established recommended practices at the rate of  $40 \text{ kg ha}^{-1} \text{ y}^{-1}$  for N,  $20 \text{ kg ha}^{-1} \text{ y}^{-1}$  for P and  $15 \text{ kg ha}^{-1} \text{ y}^{-1}$  for K. FYM and VC were used @  $30 \text{ t ha}^{-1}$  and  $5 \text{ t ha}^{-1}$  respectively. Soil without any amendment was taken as a control (C) for data comparison with other treatments. All amendments were applied in the study area as a randomized complete block design (18 x 18 m) with six blocks (18 m x 3 m). Each block was again divided into eight plots (2 m x 2 m) and hence there were 48 (6 x 8) unit plots. The distance between two adjacent blocks and plots were 1 m and 0.5 m, respectively. The eight treatments were randomly assigned to each plot within the individual blocks with a separate randomization for each block.

### Soil sampling and Analysis:-

Random soil samples from 0-25 cm depth was collected in triplicate form from each block of sampling sites with the help of an auger before and after the amendment application and before and after the cultivation of the crops at 15

days intervals from 2014-2016. Soil pH and conductivity (EC) were analyzed by pH and conductivity meter respectively. Phosphate – P and total Nitrogen – N were determined by the Olsen's sodium bicarbonate method (Mackereth, 1963) and Micro-Kjeldahl distillation assembly (Misra, 1968), respectively. Available potassium  $K^+$  was estimated with the help of a flame photometer. Exchangeable sodium percentage was calculated as follows: ESP = (exchangeable sodium concentration (cmol/kg)/cation exchange capacity (cmol/kg))  $\times$  100. The titrimetric method (wet digestion method) was used for determination of soil organic carbon (OC).

#### Vegetal sampling and analysis:-

Two dietary vegetables such as Spinach (*Spinacia oleracea* L.) and the Pea (*Pisum sativum* L.) were selected as experimental test crops. These vegetables are among the most important/common dietary vegetables of north India because of their high nutritional values. Seeds of test crops were sown uniformly in differently amended sodic soil plots. After cultivation six random plant samples were taken at 15 day intervals of each crop for plant analysis. Before analysis, plant samples should be properly washed with tap water to remove the dust. To study the effect of different amendments on crop growth variables, four different growth indices such as a relative shoot ratio (RSR), relative growth rate (RGR), leaf area ratio (LAR) and leaf weight ratio (LWR) was computed. For computation of these indices formulae given by Hunt (1982) were used.

$$RGR (g g^{-1} d^{-1}) = \frac{\ln W_2 - \ln W_1}{t_2 - t_1}$$

$$LAR (cm^2 g^{-1}) = \frac{\text{Leaf Area}}{\text{Total Biomass}}$$

$$LWR (g g^{-1}) = \frac{\text{Leaf Dry Weight}}{\text{Total Biomass}}$$

$$RSR (g g^{-1}) = \frac{\text{Root Dry Weight}}{\text{Shoot Dry Weight}}$$

Where,

$W_1$  = total plant dry weight at time  $t_1$  (initial)

$W_2$  = total plant dry weight at time  $t_2$  (final)

ln = natural logarithm

#### Statistical analysis:-

All the obtained data were subjected in IBM SPSS statistics 21 for the measurement of mean, standard error, range, variance  $P \leq 0.05$  as significant, followed by a post hoc Tukey test. All the graph designing and regression analysis employed to determine the relationship between the ESP, OC and crop yield was accomplished using Sigma Plot 11.0.

### Results and Discussion:-

#### Physico-chemical properties and soil nutrient status as influenced by organic Amendments:-

After about 4.5 months of application of organic amendments soil pH, EC and ESP (an important indicator of sodicity) were decreased significantly from 0.11% – 5.97 %; 9.5 – 41.9% and 3.56 – 48.0% respectively in soils amended together with FYM and VC in comparison to control (Table I). The highest decrease in soil pH, EC and ESP were observed in FYM and VC (T8) treated plots. The soil nutrients N, P, K and SOC contents were significantly higher in organic amendments sodic soils than soils amended with chemical fertilizers (T3; NPK amended soil) and control soil. The highest soil nutrients were observed in FYM and VC treated plots (T8). The increased values were N (2.62% - 33.2%), P (3.69% – 78.3%), K (2.72% - 29.5%) and OC % (16%-152%) in comparison to pre harvest values. Various physico-chemical properties of used organic amendments such as FYM and VC were also analyzed and given in Table II.

Reduction of pH in sodic soil on the application of organic amendments is likely due to higher production of  $CO_2$  and organic acids in soil followed by solubilization of  $CaCO_3$  and sodicity neutralization is well reported (Ansari, 2008; Rai et al., 2010; Shaimaa et al., 2012; Rehman and Nath, 2013) but this phenomenon found more efficient here with the application of FYM and VC in 2:1 ratio may with their some acidic pH values in this study (Table II). Reduction at the level of 41.5% of EC in organically amended sodic soil may attribute to improved physical

properties of soil as well as an increased leaching process with the resourceful coupling of FYM and VC in T8 treatment (Kahlowan and Azam, 2003; Shaimaa et al., 2012; Wang et al., 2014). After harvesting, ESP reduction was 48% in experimental soil leads to increase organic carbon content and humic acid in soil. These contents in turn reduce redox potential and increase the replacement of  $\text{Na}^+$  to  $\text{Ca}^{++}$  leaching (Ansari and Ismail, 2008; Wang et al., 2014; Diacono and Montemurro, 2015). Thus, these results indicate that organically amended soil have efficient potential to reduce the sodic effect of soil in the direction to make them fertile. Moreover FYM and VC in 2:1 may act as boosting element to reduce the dispersion effect of soil to improve the soil structure which facilitates the growth of microbial population in sodic soil.

Available N, P, K (primary macronutrients) and OC are the fertile soil indicator. Use of biological nutrient resources, organic matter management and slow release fertilizer are key functions of organic amendments which might be the results of high level of micro and macronutrients in T8 (FYM+VC, 2:1) (Ros et al., 2003; Clark et al., 2007). On the other hand, production of organic acid and products of mineralization during decomposition solubilizes the insoluble compounds also and enhances the N, P and K availability in soil (Bhandari et al., 1992; Rahman and Nath, 2013). On account of literature, organic amendments promote the high binding ability of micronutrients as well as their slow release (Cooperband, 2002; Withers and Bailey, 2003) in the atmosphere which enhance the OC% in organically amended soil.

**Table 1:-** Physico-chemical properties of sodic soil as influenced by organic amendments in sodic soil. Values are in means and range. Values in parenthesis represent % increase (+) or decrease (-) with respect to pre-harvest values over 2014.

T8	5.94	186.9	7.67	72.35

**Effect of organic amendments on dry matter allocation pattern:-**

Dry matter distribution in between root and shoot in Spinach and Pea crops under organic soil amendments in sodic soil is shown in Figure 1. The dry matter allocation is more than 70% in the shoot than root in both the crops which is statistically significant in different soil amendments ( $p \leq 0.01$ ). In Spinach, shoot biomass distribution was increased from 0.76 g/plant in control to 2.37 – 2.70 g/plant in organically amended soil grown crops (FYM and VC i.e., T6, T7 and T8) in comparison to NPK amended grown crops (1.02 -1.08 g/plant) which is very significant as their high nutritional value in the daily diet. In case of pea, dry mass allocation was maximum in T8 treated grown crops (4.02 g/plant) which is approx double than chemically amended grown crop. Therefore, this biomass percentage increase in combination of FYM + VC in acidic soil is very effective in view of soil fertility as well as economic agriculture in salt affected soil.

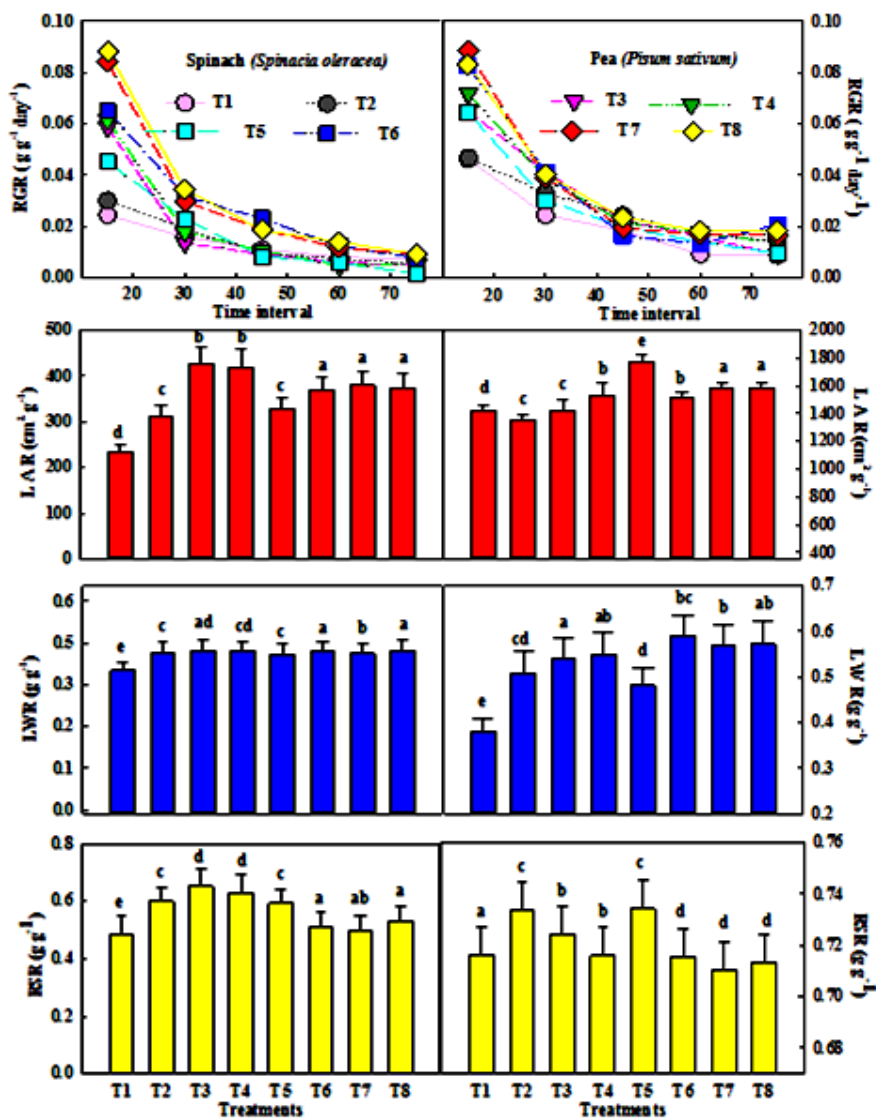

**Figure 1:-** Dry matter distribution in root and shoot parts under the influence of different amendments in sodic soil in Spinach and Pea crops. Values are means (n=6). T1=control; T2=NPK; T3=FYM (farmyard manure); T4=VC (Vermicompost); T5=NPK+VC; T6=FYM+VC (1:1); T7=FYM+VC (1:2); T8 =FYM+VC (2:1).

Adequate amount of nitrogen in soil and their availability in soil to uptake are different views of biomass allocation in plants. On account of Harris (1992), high level of nitrogen promote, shoot growth while phosphorous stimulates root growth. As in this study amount of phosphorus in preharvest soil as well as in using amendments were lower than nitrogen, which may attribute to higher shoot biomass than root. Organic amendments on soil not only enhance the amount of NPK in soil as well as increase their availability in the form of slow release in the soil is more than other used treatments (Khalilzadeh et al., 2012; Singh and Agarwal 2007) which may leads the maximum shoot dry biomass in T6, T7 and T8 in comparison to control and NPK treated sodic soil.

#### **Growth Indices in terms of RGR, LAR, LWR and RSR as influenced by organic amendments:-**

Relative growth rate, RGR is the total dry weight increase in comparison to initial dry weight in unit time interval. In both crops, RGR is reduced with increasing plant age in all the treatments (Figure 2). In spinach, crop grown under T8 treatment have the highest RGR value ( $0.02 - 0.082 \text{ g g}^{-1} \text{ day}^{-1}$ ) followed by T7 and T6 i.e., other combinations of FYM and VC. Meanwhile in case of pea the maximum RGR was found in T7 ( $0.046 - 0.088 \text{ g g}^{-1} \text{ day}^{-1}$ ) in comparison to other FYM and VC combinations and control treatment. To analyze the allocation of biomass between leaf and plant dry weight, LWR (leaf weight ratio) is considered. In Spinach leaf weight ratio indicated not much significant variation in different treatments and found high in T8 ( $0.378-0.429 \text{ g g}^{-1}$ ), however in

pea maximum LWR (0.378-0.590 g g<sup>-1</sup>) was reported in T6 with significant increase in comparison to T1 (Figure 2). To evaluate amount of leaf area per unit total mass LAR (leaf area ratio) is a valuable factor. Highest LAR was noticed in T3 (426 cm<sup>2</sup> g<sup>-1</sup>) and T4 (420 cm<sup>2</sup> g<sup>-1</sup>) in spinach with the trend of T3>T4>T7>T8>T6>T5>T2>T1. However in pea LAR was maximum in T5 (1777 cm<sup>2</sup> g<sup>-1</sup>) followed by T8>T7>T4>T6>T1>T3>T2 (Figure 2). Root shoot ratio (RSR) is ratio of distribution of plant biomass in root and shoot. In this study, maximum RSR was reported in T3 (0.716 g g<sup>-1</sup>) followed by T4, T2, and T5 in spinach crop. On the other hand in pea, highest RSR was reported in T6 (0.754 g g<sup>-1</sup>) with the trend of T2>T3>T1>T4>T8>T7>T5 (Figure 2).

**Figure 2:-** Effect of soil amendments on growth indices of spinach and pea crop. Values are mean (n=6). Means in on each bar followed by different letters are significantly different (LSD at 0.05). T1=control; T2=NPK; T3=FYM (farmyard manure); T4=VC (Vermicompost); T5=NPK+VC; T6=FYM+VC (1:1); T7=FYM+VC (1:2); T8 =FYM+VC (2:1).

Adequate amount of nitrogen in soil and their availability in soil to uptake are different views of biomass allocation in plants. On account of Harris (1992), high level of nitrogen promote shoot growth while phosphorous stimulates root growth. As in this study amount of phosphorus in preharvest soil as well as in used amendments were lower than nitrogen which may attribute to higher shoot biomass than root. Organic amendments in soil not only enhance the amount of NPK in soil as well as increase their availability in form of slow release in soil is more than other used treatments (Khalilzadeh et al., 2012; Singh and Agarwal 2007) which may leads the maximum shoot dry biomass in T6, T7 and T8 in comparison to control and NPK treated sodic soil.

Highest relative growth rate of pea and spinach in FYM and VC combinations such as T7 and T8 is attributed with positive and significant correlation of RGR with LWR in both spinach ( $r = 0.6612$ ,  $p < 0.0001$ ) and pea ( $r = 0.555$ ,  $p < 0.0001$ ). The result is also attributed in the study of Riccardi et al., 2014. In case of the Leaf weight ratio (LWR), T6, T7 and T8 due to the highest soil fertility improvement of FYM and VC biomass of the plant is also high which leads to higher LWR. LWR shows significant positive correlation with RGR. In spinach and pea, leaf area ratio was noticed highest in T3 or FYM and T5 NPK+VC amended grown vegetables respectively. In both the amendment T3 and T5 plant biomass is low in comparison to T6, T7 and T8 due to slow effect of organic amendment, however the high leaf area has already reported in NPK treatment (Gairola et al., 2009). Thus, increased leaf area and reduced plant biomass lead to highest LAR. The root shoot ratio is a photosynthetic translocation between above and below ground parts. Soil fertility is directly proportional to the reduced root shoot ratio (Harris, 1992; Fageria and Moreira 2011). The lowest root shoot ratio was found in organic amended soil in both crops explain its own efficient fertility potential.

#### Effective combination study of FYM and VC in terms of yield:-

The effects of organic amendments on vegetable crops were also considered in terms of economic yield (Table III). For this purpose fresh weight of edible components was taken as the response variable. Economic yield shows an increase from 86.96 to 186.96 % in organically amended grown spinach vegetable in comparison to 50.72 % to 71.98 % in chemically amended crop. The similar yield pattern was found in case of pea also although the maximum yield was reported in T7 amendment i.e., 76.73% in pea.

In yield of spinach and pea, the highest yield in T8 and T7, respectively, may be attributed to the significant effect of increased organic carbon and decreased ESP after application of a combination of FYM and VC in acidic soil. A linear regression equation was also plotted (Figure 2) which clearly indicates the reclamation effect of organic amendments to reduce the sodicity of soil. In fact, due to the higher production of  $\text{CO}_2$  and humic acids in vermicompost application introduce a drop in redox potential and the replacement of exchangeable  $\text{Na}^+$  ions by  $\text{Ca}^{+2}$  ions leaching out of the root zone (Ansari, 2008). It reduces the level of ESP and increase SOC. Therefore a significant increase in crop yield was reported.

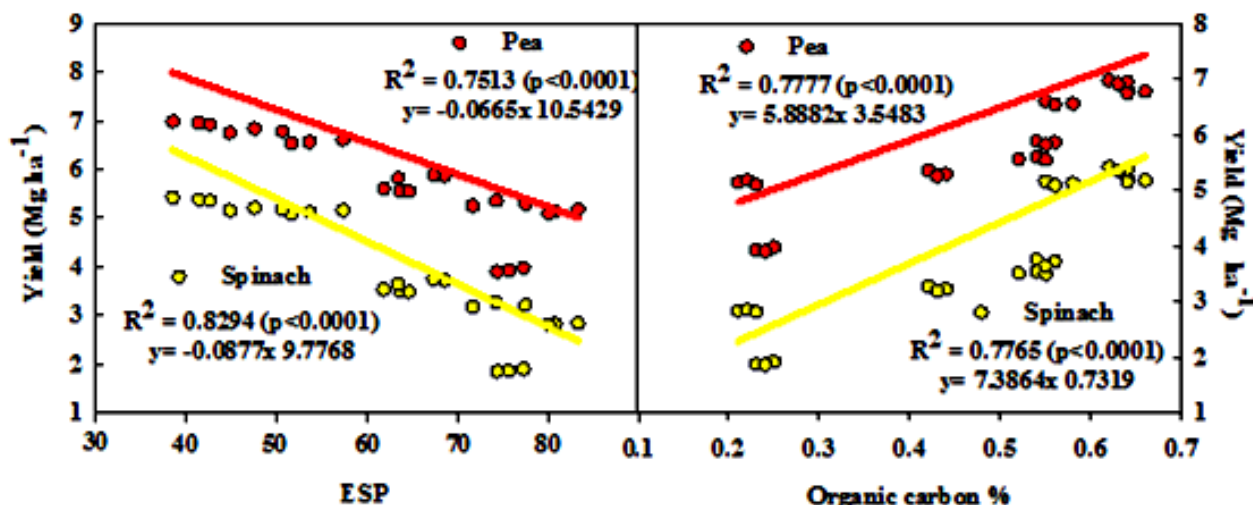

Figure 3:- Correlation coefficient between ESP and OC% with economic yield in Spinach and Pea crops.

#### Conclusions:-

The study concludes that combined use of organic amendments of farm yard manure and vermicompost significantly decreases the soil sodicity and increased soil fertility. These changes in sodic soil properties have a profound effect on crop productivity and therefore such combinations of organic amendments can be promoted to enhance the crop productivity on widely distributed sodic soils in India and other arid and semiarid regions in the world.

#### Abstract

This paper emphasizes on the present situation of women in agriculture and suggests possible roadmaps to mainstream women in development process. Women's contribution in any economy is inevitable. Their roles vary region to region, work to work, state to state, and country to country. The poor tribal farmers that make use of low cost renewable inputs family and community labour for solving the food crises through their traditional practice or traditional wisdom which need documentation make the future agricultural sustainable practices. According to Swami Vivekananda "There is no chance for welfare of the world unless the condition of women is improved". The poor tribal are practices own ideas and own traditionally agricultural wisdom though the people had changed their cultivation pattern from traveller's cultivation to settled cultivation, but some of the practices have remained unchanged among many group of farmers. The poor tribal or valleys tribal are practices own ideas through their cultivators land like a jhoom cultivation, traveller cultivation and mixed cultivation. On This paper identified that women agricultural labourers are practiced on their own cultivators land i.e. highest in sowing, weeding, picking, threshing and transplanting.

#### Introduction:-

Agricultural labourers constitute the most neglected class in India rural structure. Their income is low and employment irregular. Since they possess no skill or no training, they have no alternative employment opportunities. Socially a large number of agricultural labourers belong to scheduled castes and scheduled tribes. Therefore, they are a suppressed class. They are not organised and they cannot fight for their rights. Because of all these reasons their economic lot has failed to improve even after four decades of planning. According to the national commission on labour "an agricultural labourer is one who is basically unskilled and unorganised and has little for its livelihood, other than personal labourer. The classification of agricultural labourers can be divided into four categories i.e. (i) landless labourer, who are attached to the land lords. (ii) Landless labourers, who are personally independent and who work exclusively for others. (iii) Petty farmers with tiny bits of land who devote most of their time working for others. (iv) Farmers who have economic holdings but who have one or more of their sons and dependents working for other prosperous farmers. The main features, characterizing Indian of Agricultural labourers i.e. agricultural labourers are scattered, agricultural labourers are unskilled with lack training, next is unorganised sectors mean-agricultural labourers are not organised like industrial labourers, they are illiterate and ignorant. Another is low

social status mean- most agricultural labourers belong to the depressed classes, which have been neglected for ages, they are low caste and depressed classes have been socially handicapped and they had never the courage to assert themselves. In some parts of India, agricultural labourers are migratory, moving in search of jobs at the time of harvesting (*Padhi, K: 2007*).

The status of women in a society is a signification reflection of the level of social justice in that society. Women’s status is often described in terms of their level of income, employment, education, health and fertility as well as their roles within the family, the community and society. In tribal communities, the role of women is substantial and crucial. They constitute about half the total population but in tribal society women are more important than in other social groups, because they work harder and the family economy and management depends on them. Even after industrialization swamped the tribal economy, women continued to play a significant role. Collection of minor forest produce is done mostly by women and children. Many also work as labourers in industries, households and construction, contributing to their family income. Despite exploitation by contractors and managers, tribal are more sincere and honest than non-tribals. The tribal women face problems and challenges in getting a sustainable livelihood and a decent life due to environmental degradation and the interference of outsiders. Tribal women have adjusted themselves to live a traditional life style in the local environment and follow occupations based on natural resources.

Tribal women known for their deep association with the forests are an economically active lot but nevertheless, they suffer disproportionately more from illiteracy, poverty and social abuse. Tribal women are found to be lagging in most development indicators, their occupations largely agriculture based, their integration with the forest related economic activities at low level and their manufacturing enterprise in need of modernization (*Ghosh,N:2007*). The tribal people’s dependence on the forests is well studied and noted for its intensity and immeasurability. The tribal women are spend considerable time, collecting fuel wood, lac, honey, silk cocoon, medicinal herbs and fruits as part of their domestic chore but since they also often sell the surplus if possible, the border between household and commercial motivation becomes extremely porous (*Arnold.,J.E.M: 1994*). Over 80% of tribals work in the primary sector against 53% of the general population. About 45% are cultivators against 32.5% of the general population. A tribal women can participates actively in all agricultural operations including, ploughing, digging, sowing, manuring, transplanting, weeding, harvesting, and preparing the granary, threshing, winnowing and storing food grains. In agriculturally back ward areas, tribal women are forbidden to touch a plough and cannot dig the ground but in all other agricultural operations, women participate actively and traditionally these are a female’s job. Processing of food grain is exclusively a women’s job. Every morning tribal women dehusk millet and paddy in husking levers and then clean the grains and cooks them. They not only save money, but also earn it, unlike females of other communities. Tribal women work as men’s partners in agriculture, yet their status remains the same. Tribal women work very hard for the livelihood of the family but live a poor life, in spite of their many contributions in the house and on the farm. Tribal women are important for the improvement and progress of tribals. They are the pivot

of tribal agriculture, performing many household and agricultural jobs (Awais, M., et al: 2009). Swaminathan, the famous agricultural scientist describes that it was woman who first domesticated crop plants and thereby initiated the art and science of farming. While men went out hunting in search of food, women started gathering seeds from the native flora and began cultivating those of interest from the point of view of food, feed, fodder, fibre and fuel. Women have played and continue to play a key role in the conservation of basic life support systems such as land, water, flora and fauna. They have protected the health of the soil through organic recycling and promoted crop security through the maintenance of varietal diversity and genetic resistance. That women play a significant and crucial role in agricultural development and allied fields including in the main crop production, livestock production, horticulture, post harvest operations, agro/ social forestry and fisheries. The nature and extent of women's involvement in agriculture, no doubt, varies greatly from region to region. Even within a region, their involvement varies widely among different ecological sub-zones, farming systems, castes, classes and stages in the family cycle. But regardless of these variations, there is hardly any activity in agricultural production, except ploughing in which women are not actively involved. Studies on women in agriculture conducted in India and other developing and under developed countries all point to the conclusion that women contribute far more to agricultural production than has generally been acknowledged. Recognition of their crucial role in agriculture should not obscure the fact that farm women continue to be concerned with their primary functions as wives, mothers and homemakers. It may not be out of place to mention here that considering their dual responsibilities within and outside the home, it would be in the fitness of things that more and more in the village training is organized for rural farm women to suit their convenience with due realization that institutional training is important in its own place. In order that farm women get a fair deal at the hands of change agents, one of the remedial measures that needs to be undertaken is to induct a sizeable number of well trained women personnel in training and extension programmes of agricultural development agencies at all levels and more so at the grass-root level. (Lal, Roshan., et al: 2011).

The comparison between the women agricultural labourer of so many different situation brought out the following difference. We found in Odisha seasonally different from all district women agricultural labourer. During summer session in Cuttack district, the women agricultural labourer mostly got employment for harvesting sugarcane, bond work, work in betel farm and harvesting groundnut. In Dhenkanal district women agricultural labourer were engaged for collection of fuel, for kendu leaves and bidi making, collection for palm leaves mat making and brass handcraft as caste professional and another making in cow-dung cake preparation for household cooking purpose. But in Gajapati district women agricultural labourers were engaged the comparison between the following districts. Women agricultural labourers were engaged collection for fuel, collection mahuli flower, plantationing turmeric and engaged in rice harvesting.

In rainy season, majority of women agricultural labourers were more than 80% in irrigated and more than 70% in non-irrigated were employment in transplantation for most be 24-60 days respectively. In both the situation more than 80% of women agricultural labourer were engaged in weeding. At the time of rainy season they did different type of part time activities like moping clayhoure, fuel collection, winning of milled rice, rearing animals, cow-dung cake preparation, calf rearing and cleaning cow-shed without any wage (Mishra, S: 2009). The economy of schedule tribe area is primarily subsistence oriented and based upon a combination of agricultural, forestry, wage labourer and the key role of farm women in crop husbandry, animal husbandry, fishery, forestry and post harvest activities and kitchen gardening in homestead land, inadequate attention both from scientific and administrative sides is given for the training of farm women (Hans, A: 2014). The work done report a majority of the women, in the state of Odisha is unnoticed and unaccounted. As per the 2001 census, women work participation rate in Odisha is 41 percent against national average of 39 percent. This major segment of the state's resources, however, is absorbed in the unorganised sector that is plagued with poor or irregular wages, no structured work environment, and no labourer union to voice the issues of the women workers. As most of them are engaged in work that fall in the unpaid category, the work goes unrecognised. These poor women have no alternative than to resort to poor wages and simultaneous exploitation and marginalisation (Satapathy, S. S: 2014).

**Table 1:- All Agricultural labourer by sex- 2011 census (In Percentage)**

All Agricultural labourer by sex- 2011 census (In Percentage)			
Person	India	Odisha	Gajapati district
Total	30.0	38.42	52.12
Male	24.9	29.25	39.54
<b>Female</b>	<b>41.1</b>	<b>57.78</b>	<b>66.33</b>

\*Census of India-2011, Directorate of census operation Odisha.

The table-1 and figure-1 shows all agricultural labourers by sex-wise in 2011 census. We define i.e. India women agricultural labourers in 2011 census were 41.1 percentages but in Odisha women agricultural labourers were 57.78 percentages out of total Odisha agricultural labourers. In Gajapati district total agricultural labourers by sex-wise as 52.12percentage but in this years women agricultural labourers are more than all women agricultural labourers i.e. India and Odisha. The Gajapati district women agricultural labourers are 66.33 percentages.

**Table 2:-** Tribal Sex Ratio in Gajapati District- 1961-2011

Tribal Sex Ratio in Gajapati District- 1961-2011						
Years	1961	1971	1981	1991	2001	2011
Sex Ratio	1020	1034	1029	1015	1007	1023

**Sex Ratio:** Sex Ratio is the primary variables that are necessary for almost all classification related to population characteristic. Sex ratio (females per 1000 males) is an important indicator to study the gender balance among the tribal in Gajapati district. The Gajapati district tribal Sex Ratio among shows from 1961 to 2011 census, i.e. 1020, 1036, 1029, 1015, 1007 and 1023 district tribal sex ratio respectively (See table-2&figure).

**Table 3:-** Occupational categories of Respondents (in per cent)

Occupation	Male	Female	Total
Agri- farmers	76.9	-	33.3
Daily wage workers	23.07	97.05	65
Housewives	-	2.94	1.66
Total	99.97	99.99	100

Figure- Occupational categories of Respondents (in per cent)

Table 3 reflects occupational structure of respondent. Among men 77 per cent are agricultural farmer and 23 per cent are wage labourer. From among our women respondent, 97 per cent are daily worker and 3% are housewives. But this daily wage worker among female also constitute agricultural workers (See table 3 & figure).

**Table 4:-** Occupational categories of family members (in per cent)

Occupation	Male	Female	Total
Agri-farmers	79.4	31.42	56.75
Daily wage workers	15.33	45.71	27.7
Job holders	5.1	1.42	3.37
Housewives	-	21.42	10.13
Total	100	100	100

Our study area reflects occupational categories of family members. Among men 79 per cent are agricultural farmer and 15 per cent are wage labourer. From among our women respondent, 46 per cent are daily worker, 31% are agricultural farmers and 21 percent are housewives. But this daily wage worker among female also constitute agricultural workers (See table 4 & figure).

**Summary:-**

Agricultural labourer under comes small farmers, who process very little land and therefore, has to devote most of their time working on the lands of others as labourers. Share croppers are those who, while sharing the produce of the land for their work, also work as labourers. Tenants are those who not only work on the leased but also work as labourer. Despite their importance to agricultural production women face severe handicaps. They are in fact, the largest group of landless labourers with little real security in case of break-up of the family owing to death or divorce; inheritance laws and customs discriminate against them land reform and settlement programmes usually

give sole title and hence the security needed for obtaining production credits to the husband. Agricultural development programmes are usually planned by men and aimed at men. Mechanization, for example alleviates the burden of tasks that are traditionally men's responsibility, leaving women's burdens unrelieved or even increased.

Odontoblasts, TEM, tooth intrusion, orthodontic force.

#### Abstract

**Background:** The purpose of orthodontic treatment is to move teeth as efficiently as possible with least damage to teeth and their supporting tissues. Previous studies have revealed that varying degrees of force magnitude, frequency, and duration of orthodontic forces express extensive macroscopic and microscopic changes on dental tissues.

**Aim of the work:** The present work aimed to investigate the ultra-structural changes that might occur to odontoblasts in response to light and heavy intrusive orthodontic forces.

**Materials and Methods:** Twenty-four vital maxillary first premolars from orthodontic extraction cases were allocated in three groups. Control group: premolars were not subjected to any force. Group I: light intrusive force was applied. Group II: heavy intrusive force was applied. Extraction was done after three weeks of force application. Coronal and radicular pulpal tissues were examined by transmission electron microscope (TEM).

**Results:** Control, TEM revealed common cellular features regarding coronal and radicular odontoblasts. Evidence of affection of the odontoblasts could be manifested in both experimental groups as they expressed varies degrees of nuclear alterations, chromatin condensation, cytoplasmic organelles affection and loss of cellular junctions.

**Conclusions:** Intrusive orthodontic force can induce ultra-structural changes in odontoblastic cells. Heavy intrusive have greater impact on odontoblastic cells than light force. Generally, radicular cells are more affected than coronal cells by the same magnitude of the intrusive force. Both coronal and radicular odontoblastic cells can transform into multinucleated odontoclastic cells under the influence of heavy intrusive orthodontic force. Light intrusive force could induce odontoclastic differentiation of radicular odontoblastic cells.

**Introduction:-**

The purpose of orthodontic treatment is to move teeth as efficiently as possible with least damage to teeth and their supporting tissues. Long ago, Orban and Bhaskar, 1976 stated that orthodontic forces had no effect on dental pulp but since then, several studies have evaluated the impact of orthodontic forces on dental tissues. These tissues, when exposed to varying degrees of orthodontic force magnitude, frequency and duration of mechanical loading, express extensive macroscopic and microscopic changes (Krishnan et al., 2006). Then, it was confirmed that the magnitude of applied force does not need to be excessive; even small forces of short duration of around 4 hours may be adequate to evoke cellular responses (Gajapuradal et al., 2016).

Orthodontic forces are capable of stimulating the whole vascular system in the dental pulp, in the form of circulatory vascular stasis to necrosis (Andreassen et al., 2007). It was found that there is an increase in expression of sensory neuropeptides, such as Substance P (SP) and calcitonin gene-related peptide, in dental pulp following orthodontic force application in rats (Yamaguchi and Kasai, 2007).

A wide variety of morphological changes have been documented histologically, in response to orthodontic force, affecting both the inner and outer layers of the pulpal tissue. The majority of these changes are deleterious in nature. The odontoblast expressed varying degrees of vacuolization, degeneration, distortion, separation and elongation (Stenvick et al., 1970), (Mostafa et al., 1991), (Shigehara et al., 2006) and (Ramazanzadeh et al., 2009). These alterations have been more pronounced in the coronal pulp tissue (Villa et al., 2005). It is proposed to be compensated by osteopontin release which stimulates differentiation of new odontoblasts, thereby helping repair of any tissue damage (Shigehara et al., 2006). These deleterious pulpal changes were more noticeable in older patients, possibly due to a reduction in the size of the apical foramen, with concurrent constriction of apical vessels. Therefore, fortunately, younger patients, who are more susceptible to orthodontic treatment, could be at less risk (Hamilton et al., 1999).

Although tooth intrusion is a special and critical type of orthodontic tooth movement, it was thought in the past that intrusion is clinically impossible to occur (Proffit et al., 2012). Now, intrusion is thought to have the greatest impact on internal root resorption (Harris et al., 2006). Internal root resorption is the progressive destruction of radicular dentin along the middle and apical thirds of the canal walls as a result of odontoclastic cells activities or due to "strangulation" of the pulp by occluding the apical blood supply (Veberiene et al., 2009). From a histological perspective, internal root resorption is manifested in one form that is purely destructive, internal (root canal) inflammatory resorption, and in another, that is accompanied by repair, internal (root canal) replacement resorption that is featured by the deposition of metaplastic bone/cementum-like tissues adjacent to the sites of resorption (Patel et al., 2010).

Ramazanzaeh et al., 2009 reported no statistically significant difference between the effect of extrusive and intrusive orthodontic tooth movements on the dental pulp except for the presence of more fibrosis in the extrusive force cases. Recent histological study (Lazzaretti et al., 2014) concluded that orthodontic intrusion force caused vascular changes in the pulpal tissue and also increased the presence of fibrosis and the number of pulp calcifications after 21 days.

According to the done database search, there is relatively little data in the literature regarding the odontoblastic response, especially ultra-structurally, to different magnitudes of intrusive orthodontic tooth movement.

**Aim of the work:-**

The present work aims to investigate the ultra-structural changes that might occur to odontoblasts in response to light and heavy intrusive orthodontic forces. This could help orthodontists to evaluate pulp response to orthodontic forces of different magnitudes, and accordingly case prognosis.

**Materials and Methods:-**

Twenty-four vital and sound maxillary first premolars, from orthodontic male patients (15-22 years old) treated in the Department of Orthodontics, Faculty of Dental Medicine for Girls, Al-Azhar University, Cairo, Egypt, were included in the study. All of the included premolars were selected to be minimally malposed, out of any occlusal trauma and were planned for extraction during comprehensive orthodontic treatment. All cases were selected to be Angle's class I dento-alveolar bimaxillary protrusion with minimal crowding. All patients had good oral hygiene, no previous orthodontic treatment, no history of dental trauma, no missing permanent teeth (with exclusion of 3<sup>rd</sup>

molars), no serious inflammatory systemic or oral conditions. The patients were instructed to stop taking any anti-inflammatory drugs 1 month before bonding till extraction.

The study proposal was approved by the Research Ethics Committee (REC), Faculty of Dental Medicine for Girls, Al-Azhar University, Cairo, Egypt. An informed consent was signed by the patient or his guardian after treatment and research procedures were explained to him/her.

#### **Grouping:-**

Only one premolar from each patient was included in the study and randomly allocated in one of three groups (n=8 for each). First is the control group, in which the maxillary first premolars were not bonded and extracted just prior to the leveling and alignment stage. Second, Group I, in which light intrusive force was applied to the test premolars. Third, Group II, in which heavy intrusive force was applied to the test premolars.

#### **Appliances and loading:-**

All patients were treated with synergy low friction straight wire (LFSW) appliances with 0.022" slot (Rocky Mountain Orthodontics RMO Corp., Colorado, USA ).

In Group I, the test premolars were not bonded until the 0.012" NiTi initial archwire (Ortho Technology, Inc., Florida, USA) was fully engaged in all other bracket slots. Then, the bracket of the test premolar was bonded in a position which allows the bracket slot to be 1mm occlusal to the archwire level and parallel to it. At the same session, the archwire was forcefully engaged in the slot of the newly bonded bracket giving light intrusive force as measured clinically. Measuring the force was done before bonding of the test premolar by deflecting the archwire segment between canine and second premolar brackets 1 mm occlusally using a wire tucker. Then a force gauge dynamometer (White Oak Orthodontic Products, Pennsylvania, USA) was used to measure the force generated due to wire recoil on unloading.

In Group II, the test premolars were not bonded until a 0.16" x 0.22" NiTi archwire (Ortho Technology, Inc., Florida, USA) is passively engaged in all bracket slots. At this time, the bracket of the test premolar was bonded, the archwire was activated and the produced force was measured exactly as in Group I but the generated intrusive force was much higher in Group II.

In both Group I and Group II, the test premolars were a traumatically extracted after 3 weeks of intrusive force application.<sup>9,16</sup>

#### **Preparation of the specimens for transmission electron microscopy (TEM):-**

##### **Preparation and fixation: -**

Immediately after careful extraction of each tooth, a sharp horizontal split was done using chisel and hammer into coronal and radicular parts. These parts were instantly immersed in a mixture of 2.5% glutaraldehyde and 10% formaldehyde (F/G solution) in a labeled jar for each group. After 5 minutes, the coronal and radicular tooth parts were further split vertically. The coronal and buccal radicular pulpal tissues (subgroups a and b respectively) were collected re-immersed in the fixative solution for 24 hours. After that, the extirpated pulpal specimens were prepared according to (Bancroft and Stevens, 2008) for electron microscopic examination. From each part, cross sections (1 mm thick) were cut and washed several times in phosphate buffer solution with pH 7.2-7.4. The specimens were post-fixed in 1% osmium tetroxide for one hour, and washed again in phosphate buffer. The specimens were loaded in ascending concentrations of ethyl alcohol for complete dehydration. The specimens were embedded in (EPON 812) in flat rubber moulds to obtain the specimen blocks. Semi-thin sections were cut with a diamond knife, mounted on glass slides and stained with 1.0% toluidine blue for light microscopic examination. The area of interest, peripheral odontoblastic zone, was selected for ultra-thin sectioning. The cut sections were stained with uranyl acetate and lead citrate to be examined with transmission electron microscope (Joel Ltd., Tokyo, Japan). Then, the specimens were thoroughly examined and reported.

#### **Results:-**

##### **The applied force:-**

The applied force due to archwire unloading in the light intrusive force group (Group I) ranged from 18 to 35 with a mean of  $26.25 \pm 5.18$  grams. In group II where heavier intrusive force was applied, the force was much higher and ranged from 86 to 122 grams with a mean of  $104.5 \pm 12.34$  grams (Table 1).

**Table 1:-** Descriptive statistics of the applied force (in grams) in Group I and Group II

	n	Mean	SD	SE	Median	Mode	Range	Min.	Max.
Group I	8	26.25	5.18	1.83	25.5	25	17	18	35
Group II	8	104.5	12.34	4.38	101.5	---	36	86	122

n: Number of cases      SD: Standard deviation      SE: Standard error

**Control group:-**

Transmission electron microscopic micrographs revealed common cellular features regarding coronal and radicular odontoblasts. They appeared columnar in shape with well-defined cell membrane. Odontoblastic nuclei are oval and most of them were basally situated. The nuclei showed normal chromatin distribution and dominance of euchromatin. There was distinct boundary between condensed and loose chromatin. Their nuclei appeared normal and surrounded by clear regular double nuclear membrane. Cytoplasmic organelles were clearly identified. Well developed strands of rough endoplasmic reticulum (RER) were arranged around the nuclei in the cytoplasm of odontoblasts. The electron-dense strands of RER are parallel to the long axis of the cell in the areas further from the nucleus (the supranuclear zone). Abundant mitochondria were detected in the odontoblastic cytoplasm especially in the apical region of the cells. Although they had a variety of shapes, each of them preserved its typical structure, which is a double membrane with internal cristae. Numerous junctions were seen subjacent to odontoblasts including tight junctions, desmosomes and gap junctions (Figures 1 and 2).

**Subgroup Ia:-**

Coronal pulpal odontoblasts attained some alterations with wide extracellular compartments. The cell membranes remained intact but ill-defined in most of the samples. Cell junctions between cell membranes were almost lost and wide extracellular compartments were markedly observed. Odontoblastic nuclei attained their normal regular double nuclear membrane with slight peripheral or central chromatin clumping in most samples. The cytoplasm was dark homogenous occupied with cytoplasmic organelles. Rough endoplasmic reticulum were numerous and apically situated in many specimens. Multiple mitochondria were detected in some of the specimens but they were swollen and lost their internal cristae (Figures 3-6).

**Subgroup Ib:-**

Electron micrograph of radicular pulpal tissue showed diversity of odontoblastic cellular and nuclear patterns. Cells showed wide range of different sizes. All possessed wide extracellular matrixes and complete loss of cellular junctions. Irregular cell membranes were a common finding in all specimens. Six specimens expressed single nucleus but with prominent chromatin condensation. Two other specimens showed multiple small pyknotic nuclei. Various stages of nuclear division were also detected. The cytoplasmic-nuclear ratio was variable among the specimens. The cytoplasm was dark homogenous with ill-defined organelles. Rough endoplasmic reticulum was ill-defined in most specimens. Multiple faint swollen mitochondria were detected in some of the specimens. Few small sized cytoplasmic electron-dense vesicles were detected in two specimens of this subgroup (Figures 7-10).

**Subgroup IIa:-**

Coronal peripheral pulpal cells showed few regular odontoblastic cells with regular configuration regarding their cell membranes and nuclei. Other cells showed regular outlines but associated with diffuse nuclear chromatin condensation and numerous para-nuclear electron-dense vesicles. Many odontoblastic cells were multinucleated and loaded with numerous intracytoplasmic electron-dense vesicles (Figures 11-14).

**Subgroup IIb:-**

Radicular odontoblastic cells expressed nearly the same ultrastructural pattern. All of the cells appeared shrunken with irregular cell membranes. Cellular junctions were ill-defined with moderate extracellular matrix. The common characteristic feature of all cellular element of this subgroup was multinucleation. Their cytoplasm was dark homogenous with ill-defined cytoplasmic organelles. Electron-dense intracytoplasmic vesicles vanished out in this subgroup. Monocytes obviously detected in the field in some specimens of this subgroup. It was characterized by electron-lucent cytoplasm with a moderately developed rough endoplasmic reticulum (figures 15-18).

**Discussion:-**

Successful orthodontic treatment depends on moving the teeth as efficiently as possible with no or least damage to teeth and their supporting tissues. This study investigated the effect of two magnitudes of intrusive orthodontic force

on pulpal odontoblasts in the human premolars after an interval of three weeks. The variables studied were two magnitudes of intrusive force (independent variable) and their effect on selected area of pulpal tissues, namely the odontoblasts which may accordingly have important clinical relevance.

It was of prime importance to study the effects of the intrusive forces on pulp tissue which is as normal and healthy as possible like in normal clinical conditions. Therefore, the inclusion criteria were set very carefully to select healthy young pupal tissue which is not affected by any disease, trauma or medicine as possible. Ethical considerations aimed to minimize patients' discomfort and damage to their teeth. So patients were allowed to take a pain killer with no anti-inflammatory effect (Paracetamol).

Regarding clinical application of intrusive force, it was set to resemble the force applied during leveling stage with 0.012" archwires and during finishing and detailing stage with the 0.016"x0.022" archwires. Hence, the brackets of the test premolars were bonded only 1mm occlusal to the archwire level which is a common malposition during both treatment stages. Although this mechanics may not apply pure intrusion and will be accompanied by little anticlockwise labiopalatal moment, this momental component seems to be much less than that expected during intrusion applied with cantilever arm from first molar to first premolar (Patel et al., 2010). The mean of applied light force (26.25 grams) was not far from the mean optimum intrusive force reported by (Proffit et al., 2012) for multirrooted teeth (20 grams), while the mean of the applied heavy force was much higher (104.5 grams).

The used bracket system was Synergy Low-Friction Straight Wire (LFSW) appliances with 0.022" slot (Rocky Mountain Orthodontics RMO Corp., Colorado, USA). Both the 0.022" slot and its design in Synergy brackets allow more archwire play especially at the mesial and distal ends of the slot. This makes the actually applied force very close to that measured by the dynamometer.

Extraction was done 3 weeks after intrusive force application. This period was reported by other workers (Ramazanzadeh et al., 2009) and (Lazzaretti et al., 2014) to be sufficient for the intrapulpal chronic inflammatory process to take place.

Extirpation of pulp tissue was selected, in order to minimize the effect of any external factors, such as decalcification, except the applied force. Immediate tooth splitting and immersion in the fixative after extraction was done, that ensured profound fixation and preservation of the tissues before any manipulation or dissection of pulp from dentin. Peripheral pulp tissues were dissected carefully to ensure presence of odontoblastic cell layer. Ultra-structural cellular details were optimally obtained by transmission electron microscope.

Evidence of affection of the odontoblasts could be manifested in all experimental groups as they expressed various degrees of nuclear alterations, chromatin condensation, cytoplasmic organelles affection and loss of cellular junctions. The degenerative changes and aspiration of odontoblasts, were reported by other researchers due to intrusive force application for 21 days (Stenvick et al., 1970), Mostafa et al., 1991), (Shigehara et al., 2006) and (Ramazanzadeh et al., 2009). Cells are constantly adjusting to the mechanical influences of their surroundings, starting a complex mechano-chemical feedback, which depends on mechano-transduction mechanisms. Whereas adhesion structures have been shown to play a central role in mechano-transduction, it now emerges that the nucleus may act as a mechano-sensitive structure (Nejma et al., 2016).

In all experimental groups, loss of odontoblastic orientation is noticed and evident by loss of cellular junctions and wide extracellular compartments. This could be attributed to the sensitivity of odontoblasts, and they are easily disturbed by changes in their external environment such as intrusive force. Application of orthodontic force, induce mechanical strain which could stimulate the cells and their associated extracellular matrix. This stimulation has the ability to regulate integrin expression, focal adhesion proteins, cytoskeletal organization, cell morphology, cell adhesion to extracellular matrices, cell proliferation, and cell differentiation (Masella and Meister, 2006).

When the extracellular matrix is stressed, isometric tension develops in the cells within the matrix. This isometric tension is equal in magnitude to the mechanical tensional force exerted upon them by the extracellular matrix, leading to changes in their cellular cytoskeleton and architecture with activation of cellular transcription factors (Masella and Meister, 2006) and (Cukierman et al., 2002).

This in turn influences the expression of genes involved in cell attachment, proliferation, differentiation, and apoptosis.

Loss of odontoblastic cells junctions of both coronal and radicular parts in all experimental groups indicated that both light and heavy intrusive orthodontic forces affect cellular junctions. This may go with (Gajapuradal et al., 2016) who reported that even small forces of short duration of around 4 hours may be adequate to evoke cellular responses.

Odontoblastic nuclear alteration was very interesting finding in this study. Under light intrusive force, coronal odontoblasts expressed normal nuclear membrane and signs of chromatin condensation. Although, most radicular odontoblasts expressed single nucleus but with prominent chromatin condensation, few cells showed multiple small pyknotic nuclei and various stages of nuclear division were detected. Also, cytoplasmic electron dense vesicles of different sizes detected in radicular cells.

Under heavy intrusive force, many coronal odontoblastic cells were multinucleated and loaded with some intracytoplasmic perinuclear electron-dense vesicles. On the other hand, most radicular odontoblasts were multinucleated with disappearance of perinuclear electron-dense vesicles.

Apparently, odontoblastic nuclei were mostly affected and nuclear division was seen in many electron micrographs of experimental groups, which suggests that the mechanical forces transmitted through the cell could result in internal remodeling of the nuclear architecture and chromatin arrangement. The results revealed that the effect of heavy intrusive force was greater than light force on odontoblastic cells. Furthermore, the impact of the transmitted force was greater on radicular rather than coronal cells that were demonstrated by complete nuclear division and odontoblastic differentiation into odontoclastic cells particularly in radicular portions. Apparently, odontoblasts transform and differentiate into multinucleated cells, which could be odontoclasts, when subjected to mechanical intrusive force.

Intracytoplasmic paranuclear electron-dense granules that were detected in some odontoblasts may indicate cellular activity prior to nuclear division. This explains why these granules were very few and small in subgroup Ib (few nuclear divisions), abundant in subgroup IIa (more nuclear divisions) and almost entirely absent in subgroups Ia and IIb (no nuclear division and completed nuclear division respectively). More investigations are required regarding that point.

Multinucleation of odontoblastic cells brings us about odontoclastic transformation and subsequent internal root resorption under the influence of intrusive force. Differentiation of odontoclasts in coronal pulpal highlight the idea of internal resorption could be elicited coronal in response to heavy intrusive force. This is in agreement with (Weiland, 2006) who concluded that the type and magnitude of orthodontic forces play a major role in root resorption. He also stated that continuous forces, as produced by materials with pseudo-elastic characteristics, seem to produce more resorption than discontinuous forces and the magnitude of the orthodontic force up to 200 cN is probably not decisive for root resorption.

Blood monocytes have been detected in close approximation to radicular differentiated odontoclasts at the site of heavy force. Furthermore, mononuclear cells were found adjacent to degenerating odontoclasts and resorbed enamel surface from which the odontoclasts had moved or detached in the transitional stage of shedding (Sahara et al., 2004). This might indicate completion of resorptive process in the radicular part under heavy forces.

Cytoplasmic organelles disruption was noticed throughout the experimental groups such as swollen mitochondria. This suggests that even under minimal intrusive force affection of cytoplasmic organelles occur.

We carried out this study in an attempt to discover whether, how and when orthodontic intrusion could be a cause for internal tooth resorption.

### Conclusions:-

Intrusive orthodontic force for three weeks interval can evoke serious ultra-structural changes in odontoblastic cells. Heavy intrusive have greater impact on odontoblastic cells than light force. Generally, radicular cells are more affected than coronal cells by the same intrusive force magnitude. Both coronal and radicular odontoblastic cells can transform into multinucleated cells under the influence of heavy intrusive orthodontic force. Even light intrusive force could induce few multi-nucleation of radicular odontoblastic cells.

**Recommendations:-**

1. Further investigations are needed using different techniques such as immunohistochemical and decalcified tooth sections to confirm the phenotype of the multinucleated cells and their effect on dentin.
2. Further studies are recommended using different periods of force application to investigate whether the force impact is transient or permanent on odontoblastic cells which might help in case prognosis.
3. Orthodontic intrusion must be performed with ultimate caution and full awareness of the applied force.

monetary policy, banking supervision, the exchange rate, the interest rate, the reserve requirement

#### Abstract

The safety of the national economy and the effectiveness of monetary policy of any country depend on the safety of the financial system and in particular the safety of banks as, it is one of the main pillars in the financial system for its compilation of national saving and its re-employment in the service of all the economic activities.

Hence this study comes to identify the importance of the supervision of the banking sector in order to keep the stability and efficiency of the banking system. This is to reach to safe and stable banking sector that keeps the rights of depositors and investors and ensures the safety of executing the monetary policy for the country and achieving its objectives

#### Introduction:-

Macroeconomic variables constitute the general framework of economic policies that achieve their goals through harmonious and consistent monetary and financial policies package. The transfer channels of the impact of monetary policy activation requires the completion of effective supervision of the banking sector respond to the latest international standards in the field of banking supervision, so as to ensure the central bank to exercise its role effectively in controlling the banking system and activating its role so as to ensure readiness to play its role in the transfer of the impact of monetary policy to the real economy sector, the banking sector in response to lower interest rates to expand their lending to secure the necessary funding for the investment sector is the basic and necessary and sufficient condition to achieve monetary policy to activate investment and increase employment and achieve economic growth and development.

#### Research problem:-

The banking system in Syria suffer of weakness supervision of the Central Bank on public and private banks due to the absence of a flexible legislative framework is able to intervene and compel the banks to oblige with the procedures intended to do, from this point should stand on concrete facts showing that the impact of supervision of the banks in achieving the objectives of monetary policy In Syria.

#### Research importance:-

The transfer channels of the impact of monetary policy in Syria activation requires the completion of effective supervision of the banks respond to the latest international standards in the field of banking supervision, so as to ensure the central bank to exercise its role effectively in the banking system, and activating its role so as to ensure it is ready to play its role in the transfer of the impact of monetary policy to the real economy sector.

**Corresponding Author:- Dr. Ghassan Farouk Ghandour..**

Address:-College of Financial & Administration-Department of Accounting & IT, Cihan University/ Sulaiymani, Kurdistan Region Government/Iraq.

**Research objectives:-**

This research aims to know the reality of banking supervision in Syria, and the supervision of the Central Bank of Syria, to determine the requirements that must be met to achieve the objectives of monetary policy and the transfer of its impact to the real economy sector. Moreover, this research aims to build financial and statistical models that help in measuring the impact of banking supervision in the economic variables.

**Research hypotheses:-**

The study deals in the period (2001 - 2010) is the stage of the Central Bank of Syria of adopting a policy of banking supervision, according to the latest international banking standards (the application of Basel), and thus will be testing a number of hypotheses which is:

1. There is no impact on Banking Supervision in Syria in the exchange rate.
2. There is no impact on Banking Supervision in Syria in the interest rate.
3. There is no impact on Banking Supervision in Syria in the development of reserve requirement.

**Research Methodology:-**

We will be relying of this research on the descriptive and analytical approach, as will study the relationship between banking supervision vocabulary and variables of monetary policy through the use of the software package statistical (SPSS) to analyze the results, depending on the method of least squares (OLS) in estimates different models.

**First: The role of the monetary authority in the banking regulation and supervision on him:-**

Most historical studies refer to the evolution of the monetary and banking systems, there are two main reasons for the establishment of central banks, the first regulate of monetary issuance process and control of money supply, and the second banking regulation and supervision, and contributes both to provide for the banking sector with stable environment, which ensures the safety of its operations.

And therefore can determine the role of the monetary authority in the banking regulation and ensure the safety and stability of the banking sector through two perspectives are perspective drawing of monetary policy and banking supervision perspective.

**The monetary function of monetary authority:-**

The central bank seeks to draw a clear-cut monetary policy contributes to increased GDP, and then raise the economic growth rate in coordination and cooperation with the government in order to maintain macroeconomic stability (Hankel, Holtkemper, 2008: p15), where it is considered an effective monetary policy regarding for adjust the changes in rates of economic growth (Bernank, Mishkin, 2001: p2), with the aim of influencing in the macroeconomic variables and achieve monetary and banking stability, which contributes to the achievement of the following general economic objectives (John B, 2000: p45):

- ❖ High growth rates.
- ❖ Complete use of resources.
- ❖ Stability of exchange rate.
- ❖ Equiponderate of payment balance.

As well as these goals are targets final have the intermediate objectives of three is the money supply, the interest rate, and the exchange rate, and through these intermediate objectives that, if it was used of monetary policy instruments, consistent with the requirements of the national economy can contribute to achieving the target goals of monetary policy (Bank of Japan, 1995: June)

In practice, it has become the responsibility of monetary policy primarily focused on achieving monetary stability, which contributes to the achievement of other objectives (Burdekin, Lorey, 1988: p41).

In this day's most of the economic trends focused on that price stability is the most important targets objectives of monetary policy (La monnaie, 1992: p21), so the trend today revolves around the concentration of the objectives of monetary policy on the prime objective is achieving price stability, particularly in the event of a conflict in the short term among other goals of monetary policy which confuses the monetary authorities (Fredric, 2004: P 414), It can be classified the instruments of monetary policy as follows:

**Direct instruments:-**

A direct instruments of monetary policy include decisions issued by the monetary authorities in the context of managing monetary policy and supervision of banks.

**Indirect instruments:-**

The indirect instruments of monetary policy in three main instruments are:

**The development of the reserve requirements:-**

Reserve requirements are one of the instruments used by the central bank to protect depositors' accounts in the event that the bank's risk on the one hand, as well as its importance to control the liquidity of the banks on the other.

**The discount rate:-**

The discount rate as the rate of interest charged by the central bank to meet the re-discount at commercial banks from securities and treasury bills or meet it by the loans (Weaver, 2009: 158). And the consequent change the discount rate change in market interest rates, which affect on the credit and thus on the money supply.

**Open market operations:-**

the open market operations have a significant impact on the players behavior within the financial market through the channel of expectations, where they are used as an indicator to predict the movements of interest rates in the short and medium term and predict of the changes of government bond prices and their impact on other securities prices, also plays a role predicting the direction of monetary policy and forecasting inflation or recession (Stanley, McConell, 2008: p261) and therefore can be said that open-market operations generate three types of effects in the money markets and capital, the first is the effect of bank reserves and the growth of the monetary base and money supply, and the second issue is to influence the security prices and interest rates the short-term at least, and the third is represented the impact of the economic expectations (Thomas, 1997, P.400).

**The supervisory function of monetary authority:-**

The goal of the banking stability is as important as monetary stability as monetary and banking stability are two sides of the same coin, central bank will not be able to achieve monetary stability if the banking sector is not stable. Often the central bank as a empowered with the function of supervision of the banking sector, where the competent authority at the central bank (Crocket, 2005, P2) to follow up the functions of banks and lay the standards that regulate banking operations and ensure the safety and efficiency of its work and maintain depositors' account and protect the banking system from falling into a crisis.

**The monetary authority between the monetary and supervisory functions:-**

There are many views about determine of the head of banking supervision authority, In this framework, the countries were divided into three main groups (Daniel, William, 1993, 1997):

**The first group:-**

The group of countries for which the central bank's on banking supervision, which is called the model of the Central Bank

**The second group:-**

The group of countries that are the supervisory bodies and specialized on Banking Supervision in cooperation with the Central Bank and Ministry of Finance.

**The third group:** the Group of countries that the Ministry of Finance or bodies and specialized only on Banking Supervision, and called on the second and third groups are the alternative model of Banking Supervision.

**Second:- The descriptive analysis of the impact of banking supervision in achieving the objectives of monetary policy in Syria:-**

The monetary policy in Syria has seen a remarkable development after decades of stagnation through their quest to move from the neutral point, to lay the foundations of an effective monetary policy stage meets the needs of a market economy, through the activation of supply and demand forces in the pricing process, and the pursuit of full competition as a necessary condition to achieve of a market economy system. Hence monetary authorities sought with the beginning of 2005 to establish a strong foundation for monetary policy to take an active role in

macroeconomic policies. Thus, in front of these arrangements and the foundations laid by the monetary authorities in Syria, we have to ask the following question:

### Is achieved monetary policy in Syria objectives aimed to?

We will depend on the answer to this question on the review of the key elements of business strategy of the monetary policy adopted by the Central Bank of Syria after the issuance of the Basic monetary Law, and through the study of intermediate objectives for monetary policy / exchange rate /, the study of monetary policy instruments used on a practical level / interest rate and reserve requirements /, and the effectiveness of each of them in achieving the target goal of monetary policy / inflation control and the stability of the general level of prices /.

**Table :-** The evolution of the elements of monetary policy in Syria during the period (2001-2010) %

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
inflation rates	0.81	0.6	7.45	4.17	7.41	10	4.5	15.15	2.8	4.4

### The impact of banking supervision in the exchange rate:-

The Figure (1) shows the evolution of each of the nominal exchange rate (Syrian pounds to the US dollar) and the inflation rates in the Syrian economy during the period (2001-2010).The figure (1) shows as follows:

This period knew relatively stable in the Syrian pound exchange rate against the US dollar, as the track the evolution of the exchange rate during this period refers to keep the exchange rate stable with a gradual rise in the value of the Syrian pound since the beginning of 2006 against the US dollar, we see from the figure Previous (1) a rise in the value of the Syrian pound against the US dollar (the exchange L / d of 50.90 L / d in 2001, the price fell to 46.90 L / d in 2010, to reach an average of 49.9 L / d), with reference to the Syrian pound has seen in previous years for 2010 gradually successive rises in value against the US dollar at a rate of (6.8%, 5.9%, 3.6%, 1.4%) during the years (2006.2007, 2008.2009), respectively, We explain the stability in the exchange rate during this period as a result of procedures taken by the Syrian government during this period, which was mutually made an emergency landing in response to emergency conditions, others were focus on the strategy of the monetary policy of the Central Bank of Syria of targeting the Syrian pound exchange rate in the medium term in order to achieve price the target goal of monetary policy adopted by Syria in the long-term work on price stability and control inflation.

In contrast, we see a down the rate of inflation in Syria from 10.03% in 2006 to reach 4.4% in 2010.

As can be seen from the figure (1) that there are relatively very weak consensus in the general direction of both inflation and exchange rate growth during this period, reflecting weak relationship between them, which is not shows importance of the exchange rate to control inflation.

**The Impact of banking supervision in the interest rate:-**

The Figure (2) shows the develop of each of the real interest rates (time deposits, and savings deposits) and the inflation rates in the Syrian economy during the period(2001-2010). The figure (2) shows as follows:

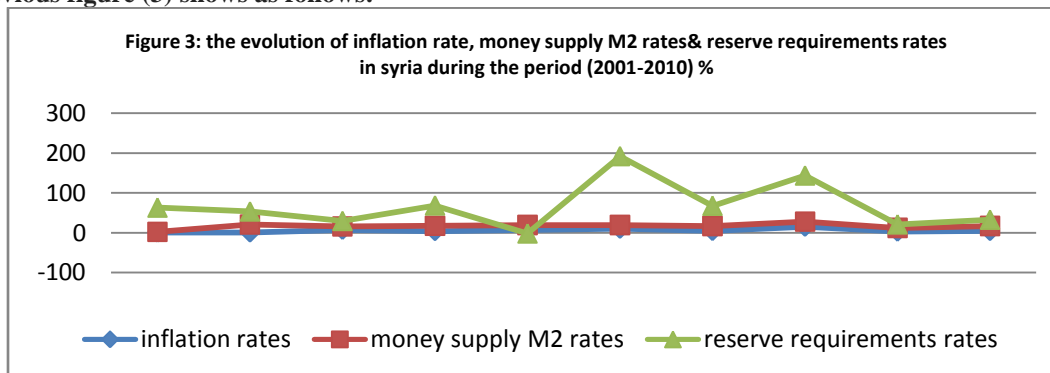

we observe the evolution of the real interest rate on time deposits it is clear that it was negative in the years (2003, 2006.2008) amounted respectively (-0.95%, -2.08%, -8.17%), while the evolution of the real interest rate on savings deposits it is clear that it was negative during the years (2003, 2005.2006, 2008.2010) amounted respectively (-0.45% -3.41% -5.03% -10.36% -0.05%), we can explain that as a result of irregular rises in inflation during this period.

here is a defect in the performance of monetary policy in Syria, and the weakness in their ability to use interest rates as a monetary policy instruments in achieving the objectives of monetary policy, but it used the interest rates as a instrument to achieve a general economic policy objectives, from during their quest to restructure deposits in favor of long-term deposits in order to increase the financing capacity of the banking sector in Syria in the long term, but these deposits become piling up at banks without hiring a result of the weakness of investment channels necessary to employ this surplus liquidity in banks.

**The Impact of banking supervision in the development of reserve requirements:-**

The Figure (3) shows the evolution of both the reserve requirements rates of growth, and the evolution of the money supply M2 growth rates, and the evolution of inflation rates in the Syrian economy during the period (2001-2010).

The previous figure (3) shows as follows:-

By tracking the evolution of the growth rates of the reserve requirement in Syrian pounds and foreign currency at the Central Bank of Syria, it is clear that it has seen a remarkable increase during the period studied were on average about 50%, equivalent to five times the average growth of the reserve requirement rate, as the growth of reserve requirements rate rose from 51% in 2004 to up to 173% -116% during the years 2006 to 2008 respectively, we can interpret that as a result of decisions taken by the monetary authorities in Syria during this stage that, Reflecting to a large extent the success of the decisions taken by the monetary authorities to raise the reserve requirement growth rates, but in return we observe the inability of monetary authorities in controlling the money supply growth rates

through the use of the reserve requirement policy, where the relationship is completely separate from the reserve requirement growth rates and the growth of the money supply during the period (2004-2008) as shown by Figure(3) in despite of previous decisions taken by the monetary authorities, and therefore the reserve requirement policy has not affected during the period(2004-2008)in controlling the money supply growth rates, which confirms the ineffectiveness of using this tool in controlling the money supply growth rates during the period of study.

Then the reserve requirement rate of growth returned to decline very significantly reduced during the years 2009-2010 to reach (9%, 16%), respectively, we can explain that as a result of decisions taken by the monetary authorities in Syria during these two years, which largely reflects the success of this decision to reduce the reserve requirement rates of growth, but in return we also observe that the monetary authorities were able to control rates money supply growth to some extent through the use of the policy of reserve requirement.

In contrast, inflation rates have witnessed a remarkable increase during this period to reach 10.3%, 15.15% respectively 2006-2008, then returned to decrease again during 2009-2010 also to reach 2.8%, 4.4%, respectively. As can be seen from Figure No. (3) earlier that there is a clear separate in the relationship between inflation and growth rates of reserve requirements in the period (2004-2008), having noted that with the rise in reserve requirements growth rates over the years 2006 to 2008 as mentioned previously, there was a contrast rise in inflation rates during the years 2006-2008, and then did not affect reserve requirements followed a policy at this stage in controlling high inflation.

As can be seen from Figure No. (3) that there is a clear break in the relationship between the inflation and the rates of the reserve requirements growth during 2009-2010, so that with low inflation rates in parallel with the decline in the growth of requirement reserve rates, however, this decline in inflation was caused by factors related to the economic policy of the government, it was not caused by monetary factors.

### **Third: The Empirical Result and hypotheses testing:-**

After that study, the analytical side of the impact of banking supervision in achieving the objectives of monetary policy in Syria, which has shown that there is a weak effect of the impact of banking supervision policy in the various components of monetary policy that contributes to achieving the target goals of it, remain these effects known to use some standard methods, so through the use of statistical software package (SPSS) to analyze the results, depending on the method of ordinary least squares (OLS) to estimate the coefficients of various models.

### **The first hypothesis: There is no impact on Banking Supervision in Syria in the exchange rate:-**

In order to measure the impact of banking supervision in Syria on the exchange rate will be depending on the model consists of the inflation rate as the dependent variable and the exchange rate growth as an independent variable in the period of study (2001-2010), and therefore the model is as follows:  $INF = \alpha + a EXCH + \epsilon$

INF: inflation, EXCH: exchange rate growth rate,  $\alpha$ : constant,  $\epsilon$ : random error.

a: model coefficient represents the partial regression coefficient of the independent variable (the exchange rate growth rate).

When applying the model on the Syrian economy during the period of study (2001-2010) the results were as follows:  $INF = 5.514 - 0.507 EXCH$

The model indicates that the value of coefficient of Pearson correlation between the inflation rate and exchange rate growth during the period of study (2001-2010) amounted to  $R = - 0.450$ , which is not significant and does not reflect statistical significance, because the  $SIG = P-VALUE = 0.192$ , which is greater than the level significance adopted in this study as  $\alpha = 0.05$ , though the value of the coefficient of determination  $R SQUARE = 0.203$ , so if exchange rate growth rate explains only 20.3% of the variation or difference in the rate of inflation.

The P-VALUE corresponding statistical coefficient t to the constant and variable coefficients was respectively:  $SIG = P-VALUE = 0.003$  for constant  $SIG = P-VALUE = 0.192$  for the variable exchange rate growth rate

It is smaller than the significance level  $\alpha = 0.05$  for constant coefficient, and for this we reject null hypothesis of this model since that at least one of regression coefficients /a/ and /b/ differ significantly from zero, indicating a moral calculated values and the quality of the estimated equation, shows importance of price growth rate exchange in effect at the rate of inflation.

The test F amounted to 2.031 at the level of 0.05 when compared to the spreadsheet value, we find that the calculated value is greater than the spreadsheet value, which shows that the moral estimated whole model, and the significant coefficient of determination, and then we find that the independent variable had a significant impact on the regression.

The Regression coefficient shows that the exchange rate growth rate higher by one unit will lead to a decline in the inflation rate by 0.507 units, these contrasts with economic theory, where he was supposed to raise in the exchange rate leads to higher inflation, not falling.

The explanation of this is a result of emergency conditions and political pressures experienced by Syria during this stage, although enable the monetary authorities to secure the stability of the Syrian pound exchange rate against the US dollar through the intervention of the Central Bank of Syria buy and sell foreign exchange, which explains why the contradiction above between the exchange rate and inflation.

**The second hypothesis: There is no impact on Banking Supervision in Syria in the interest rate:-**

In order to measure the impact of banking supervision in Syria on the interest rate will be relying on the model consists of the inflation rate as the dependent variable, and the real interest rate on time deposits and the real interest rate on savings deposits as independent variables during the period of study (2001-2010), and therefore the model is as follows:  $INF = \alpha + a \text{ INTERR-L} + b \text{ INTERR-S} + \epsilon$

INF: inflation. INTERR-L: the real interest rates on time deposits. INTERR-S: the real interest rate on savings deposits.

A and b: model coefficients and represent a coefficient of partial regression for independent variables (the real interest rate on time deposits, the real interest rate on savings deposits).  $\alpha$ : constant.  $\epsilon$ : random error.

When applying the model on the Syrian economy during the period of study (2001-2010) the results were as follows:  $INF = 6.548 - 0.647 \text{ INTERR-L} - 0.294 \text{ INTERR-S}$

The model indicates that the value of Pearson correlation coefficient between the rate of inflation and the real interest rate on time deposits, and savings deposits during the period of study (2001-2010) amounted to  $R = -0.981$ ,  $R = -0.968$ , respectively, a moral and reflect statistically significant because the value of  $SIG = P\text{-value} = 0.00$  for each, which is smaller than the significance level adopted in this study as  $\alpha = 0.05$ , though the value of the coefficient of determination of the model  $R \text{ SQUARE} = 0.972$ , so that the real rate of interest on both time deposits and savings deposits explains 97.2% of the variation or difference in the rate of inflation.

The P-VALUE corresponding statistical t to the constant and variable coefficients was respectively:

$SIG = P\text{-VALUE} = 0.000$  for constant  $SIG = P\text{-VALUE} = 0.022$  to the variable of the real interest rate on time deposits for

It is less than the significance level  $\alpha = 0.05$  for fixed coefficient, and the variable coefficient is real interest rate on time deposits, and for this we reject the null hypothesis for each of these coefficients, so they differ from zero, suggesting moral calculated values and the quality of the estimated equation, shows the importance of the real interest rate on time deposits in order to influence in the inflation rate.

While the P-VALUE corresponding statistical t to the variable coefficient is the real interest rate on savings deposits rate was  $SIG = P\text{-VALUE} = 0.152$ , which is greater than the significance level  $\alpha = 0.05$  For that accept null hypothesis for this coefficient, that is equal zero, indicating not the moral values calculated and not the quality of the equation, which is not shows importance of the real interest rate on savings deposits for influencing in the inflation rate. The test F value amounted to 121.471 at the level of 0.05 when compared to the spreadsheet value, we find that the calculated value is greater than the spreadsheet value, which is appropriate indicate that the regression is moral or that at least one of regression coefficients /a/ and /b/ differ significantly from zero.

The Partial regression coefficients show that the rise in real interest rates on time deposits increased by one unit price will lead to a decline in the inflation rate by 0.647 units, and the same applies if the real interest rate on savings deposits rose by one unit will lead to a decline less in the inflation rate by 0.294 units and this compatible with

economic theory which is supposed to result in higher real interest leads to decrease inflation. It compatible perfectly with the economic reality in Syria during the period (2001-2010), which saw the monetary authorities in Syria by moving the interest rate after stability for about two decades, and track the evolution of each of the real interest rate on time deposits and savings deposits and the evolution of inflation in Syria It will be seen that during the years in which the inflation rate knew a high rise reflected the negative real interest rates on time deposits and savings deposits rates up to a maximum of 2008 to \$ (-8.17%, -10.36%), respectively.

**The third hypothesis: There is no impact on Banking Supervision in Syria in the development of the reserve requirements:-**

In order to measure the impact of banking supervision in Syria on the evolution of the reserve requirement will be depending on the model consists of the inflation rate as the dependent variable and the rate of reserve requirement growth as an independent variable in the period of study (2001-2010), and therefore the model is as follows:  $INF = \alpha + a RESE + \epsilon$

INF: inflation. RESE: the growth of reserve requirements in Syrian pound and foreign exchange growth.  $\alpha$ : constant.  $\epsilon$ : random error.

a: model coefficient represents the partial regression coefficient of the independent variable (the reserve requirement rate of growth).

When applying the model on the Syrian economy during the period of study (2001-2010) the results were as follows:  $INF = 3.738 + 0.033 FORASS$

The model indicates that the value of Pearson correlation coefficient between the inflation rate and the rate of growth of reserve requirements during the period of study (2001-2010) amounted to  $R = 0.438$ , which is not significant and does not reflect statistically significant because the  $SIG = P-VALUE = 0.205$ , which is greater than the level of significance approved in this study, where  $\alpha = 0.05$ , though the value of the coefficient of determination  $R SQUARE = 0.192$ , so the growth of reserve requirement rate explains 19.2% of the variation or difference in the rate of inflation.

The P-VALUE corresponding statistical t to the constant and variable coefficients was respectively:  $SIG = P-VALUE = 0.095$  for fixed  $SIG = P-VALUE = 0.205$  for variable reserve requirement rate of growth

It is the largest of the significance level  $\alpha = 0.05$  For that accept null hypothesis for this coefficient, that is equal to zero, which shows not of moral values calculated and not the quality of the estimated equation, shows not importance of the growth of reserve requirements in effect in the inflation rate.

The test F amounted to 1.899 at the significance level of 0.05 when compared to the value spreadsheet, we find that the calculated value is greater than the spreadsheet value, which is explain that the moral estimated whole model, and the significant coefficient of determination, and then we find that the independent variable had a significant impact on the regression.

The Regression coefficient shows that an increase in the reserve requirements growth rates by one unit will lead to an increase in the inflation rate by 0.033 units, and this above to not proceed with economic theory, where it was supposed to rise in reserve requirements leads to control the money supply growth rates, which helps in reducing the rate of inflation and not increase it. We can explain this contrasts as a result enable the monetary authorities in Syria to control the money supply growth rates in some years of this period and through the use of the reserve requirement policy, which has seen many decisions during this period contributed to achieve the objectives of monetary policy in Syria in the short term to control money supply growth rates, but they did not contribute to enable the monetary authorities to achieve the objectives of monetary policy in Syria in the long term by controlling the inflation rates during this period, and it is also mainly due to the causes of inflation during this period not related mainly to monetary reasons, but to other factors relating to the economic policy of the government in addition to general economic conditions experienced by Syria during this period.

**Conclusions:-**

1. The creation of an efficient banking system, is capable of achieving the objectives of monetary policy and to ensure the stability of the banking, requires a regulatory system effective oversight and effective procedures on the banking sector, it aims to achieve the efficiency of the banking system.
2. There is no impact of Banking Supervision in Syria (the exchange rate, interest rate, and reserve requirements) during the period (2001-2010) according to:

The inability of monetary authorities during the period of study to control inflation and price stability as target goal in the long term, with the ability to achieve stability in the exchange rate as an intermediate objective of monetary policy as a result of central bank intervention to buy or sell, which contributes to control the rates of inflation in the Syrian economy, which has been unable to achieve the desired position because of the crises and emergency conditions experienced by Syria during this period, as well as government procedures aimed at liberalizing the exchange rate by shock and not gradually.

In despite of the policy of movement of interest rate by the monetary authorities during the period of study, but they were completely separate from changes in inflation rates during this period, which shows a deficit flaw in the performance of monetary policy in Syria during this period, and the inability to use the interest rate as a instrument to achieve objectives of monetary policy, but the use of interest rates to achieve a general economic policy of the government's objectives.

The inability of monetary authorities in Syria using the reserve requirement policy in controlling inflation during the period of study.

**Recommendations:-**

1. The supervisory authorities must carry out the review of decisions, and to ensure the continuing effectiveness of these decisions, and ensures application optimally, helping to strengthen the banking sector in Syria and increase its competitiveness.
2. the exchange rate unify policy requires the cancellation of controls on the exchange rate system gradually rather than liberation by shocked, and so by going to the flexibility in dealing in the foreign exchange market through the flotation system's reliance on a small scale in order to avoid the risks of sudden liberalization of the exchange market, this procedure corresponds to a thoughtful and conscious intervention of the Central Bank in the currency market to achieve the full liberalization of the exchange market, to meet the needs of the Syrian market of foreign exchange away from the intervention of the monetary authorities.
3. the policy of liberalization of interest rate must be gradually and consistent data Syrian economy, and in particular the structure of deposits and loans within the economy, especially that the liberalization of interest rates on loans along with the absence of open market operations will reflect negatively on the effectiveness of monetary market in Syria, as well as non-banking sector in Syria's ability to transfer the desirable impact of policy interest rate to influence the macro-economic variables because of the large value of the surplus liquidity has without financing.
4. We must follow up the development of the banking supervision process through the Central Bank of Syria's commitment to the principles of effective banking supervision, all the way to fully implement to ensure the preservation of a sound efficient system.
5. The strengthen of the independence of the Central Bank of Syria and resolve the entanglements between financial and monetary policies.

#### Introduction:-

The Achilles tendon (AT) is the strongest and thickest tendon in the body. It serves a fundamental function of linking the soleus and gastrocnemius muscles to the calcaneus bone to enable plantar flexion about the ankle joint. By virtue of its biomechanical homes, the AT affects the capability of numerous human motions<sup>(1)</sup>. An Achilles tendon injury results from a stretch, tear, or inflammation to the tendon connecting the calf muscle to the back of the heel<sup>(1)</sup>. These injuries can be painful and so abrupt that they have actually been understood to reduce charging expert football players in shocking style<sup>(1,2)</sup>. The most typical cause of Achilles tendon tears is a problem called tendinitis, a degenerative condition brought on by aging or overuse. When a tendon is weakened, trauma can cause it to burst<sup>(1,2)</sup>. Achilles tendon injuries are common in middle-aged who may not exercise regularly or take time to stretch effectively prior to an activity<sup>(3)</sup>.

Biopsies recovered at surgery have demonstrated degenerative changes in the majority of ruptured Achilles tendons<sup>(4)</sup>, suggesting that Achilles tendon ruptures could be defined as intense injury of chronically degenerated tendons. Rotator cuff disorders are the most common reasons for shoulder disability and are very common in the aging population<sup>(5)</sup>. Full-thickness rotator cuff tears exist in around 13% of people in their 50s<sup>(6)</sup>, 25% of people in their 60s and 50% of individuals in their 80s<sup>(5)</sup>. The etiology of rotator cuff tearing is likely and multifactorial a mix of age-related degenerative modifications<sup>(7)</sup> and micro/macrotrauma. Age, smoking cigarettes, family, and hypercholesterolemia history have actually been revealed to incline individuals to rotator cuff tearing<sup>(5)</sup>. Several

treatment and repairs options for Achilles tendon injuries, however in cases of postponed medical diagnosis the likely success of conservative management may be restricted by an absence of consistency of the tendon ends due to scarring and retraction. Surgical repair work is promoted <sup>(8)</sup>. Cases of chronic rupture of the tendoachilles by their very nature will not react to conservative treatment and for that reason will require repair making use of graft <sup>(9)</sup>.

### Objectives:-

We aimed by this recent study to overview the Achilles tendon injuries in different aspects, we intended to examine the causes and risk factors and diagnosis of this condition, However the main purpose of this study was to evaluate the treatment repair approaches to Achilles tendon injuries.

### Methodology:-

Computerized search of the literature in the MEDLINE, CINAHL, and EMBASE databases was conducted December, 2016. The MESH search terms for MEDLINE are: “Achilles tendon” AND “*tendon injuries OR tendinopathy*” Combined with “treatment OR repair”, with limits for English language and humans. the reference lists of all selected publications were inspected to obtain pertinent publications that were not identified in the electronic search. The gray literature, that included publications, posters, abstracts, and conference proceedings, was likewise hand browsed. Full-text short articles were retrieved if the abstract offered inadequate details to develop eligibility or if the short article passed the very first eligibility screening.

### Results:-

#### Clinical presentation of tendon injured patients:-

The patient usually presents with pain, failure to weight bear and a clear popping feeling or sound after an episode of activity during which they sustain a forced dorsiflexion of the ankle. The injury can also be sustained throughout eccentric contraction. The patient frequently describes the sensation of being kicked, shot or perhaps bitten on the back of the heel<sup>(10,11)</sup>. Intense Achilles tendon rupture can readily be discovered on health examination. Plantarflexion of the foot is naturally weak <sup>(11)</sup>. The Achilles tendon is best analyzed with the patient kneeling and the feet hanging over the edge of the chair. In this position soft tissues hang off the Achilles tendon like a tent pole and problems can be readily visualised (**Figure 1**)<sup>(10)</sup>. There is regularly a visible problem in the Achilles tendon. This is accompanied by swelling due to peritendinous haemotoma.

The flaw in the Achilles tendon is typically palpable with a level of sensitivity of 0.71 and specificity of 0.89. Maffulli compared the sensitivity and uniqueness of the principal medical tests developed to identify Achilles tendon rupture <sup>(12)</sup>. Particular tests consist of Simmonds or Thompsons' test with sensitivity of 0.98 and uniqueness of 0.93. Lesser recognized are the O'Brien and Copeland tests both with a sensitivity of 0.8. Early reports suggest that approximately 20% of Achilles tendon injuries can be missed by medical assessment alone <sup>(13)</sup>.

**Figure 1:-** View of the right and left Achilles tendon with the patient prone. The left is ruptured. The right Achilles tendon is well defined and soft tissues hang off it like a tent. The suspension of the soft tissues off the Achilles tendon is not visible on the left side as the tendon is ruptured. <sup>(10)</sup>

**Diagnosis of an Achilles tendon injury:-**

The accurate diagnosis of an Achilles tendon injury, such as Achilles tendinopathy and, to a lesser degree, Achilles tendon tear, is not always clear and uncomplicated<sup>(14,15,16)</sup>. The differential medical diagnosis of an Achilles tendon injury consists of but is not restricted to retrocalcaneal bursitis, ostrigonum, tarsal tunnel syndrome, posterior tibialis tendon rupture, arthritic conditions, plantar fasciitis, and stress fracture<sup>(16)</sup>.

Diagnostic ultrasound and magnetic resonance imaging (MRI) have actually traditionally been considered the requirement reference requirements to identify Achilles tendon injuries<sup>(14,15,16)</sup>. However, this screening can be pricey and might not lead to accurate medical diagnosis<sup>(17,18,19)</sup>. Because of restricted proof assistance, the American Academy of Orthopaedic Surgeons' scientific practice guidelines recommendation was undetermined relating to the regular use of MRI for identifying intense Achilles tendon tears<sup>(19,20,21)</sup>.

**Treatment (repair)of Achilles tendon injuries:-**

Although non-operative treatment can give satisfying results, current research studies have recommended that operative repair work of the AT may have advantages such as reduced ankle stiffness and calf atrophy, fewer cutaneous adhesions, and lower risk of trombophlebitis. For the purpose of this evaluation, it is important to highlight that non-operative treatment cannot avoid tendon lengthening<sup>(22)</sup>. In a meta-analysis conducted by Khan et al., including 12 randomized control trials and 800 patients, open surgery was related to lower risk of re-rupture than non-operative treatment however higher risk of other issues, particularly wound problems<sup>(23)</sup>. Surgical treatment appears to be the technique of option for youths, professional athletes, and delayed ruptures. There is no single, evenly accepted surgical method, and the choices include open repair, with or without enhancement, and percutaneous techniques. Minimally invasive and percutaneous techniques have actually been pointed out as valid healing options for AT ruptures. Khan et al. found that percutaneous surgical treatment was related to lower risk of complications than open surgery<sup>(23)</sup>. That strategy does not permit the surgeon to imagine the ruptured tendon ends and accomplish suitable tendon tensioning<sup>(24)</sup>. In addition, imaging research studies have reported that 100 percent of AT repaired by percutaneous strategy showed residual gap on MRI at 4 weeks postoperative<sup>(26)</sup>. New minimally invasive methods for AT repair may permit direct visualization of the two ends and have actually been reported satisfactory clinical results<sup>(24)</sup>.

**Surgical Factors Influencing Tendon Tension Repair:-**

Secure soft-tissue fixation is essential to numerous clinical applications, from direct tendon repair to tendon transfers to ligament and tendon reconstructions. It allows for early rehabilitation prior to biological recovery, which is vital to numerous procedures. Due to the fact that elongation of the graft might be associated with functional construct failure<sup>(26)</sup>, minimizing elongation of the sutured tendon construct is a vital element of soft tissue fixation.

Biomechanical characteristics of the tendon repair depend mainly on three factors: the quality of the tissue, the strength of the knot, and the strength of the stitch material itself. The quality of the tissue impacts the "coefficient of friction," which is the holding capacity of the suture within the tendon. This is an important idea due to the fact that the failure of the tendon repair work usually occurs due to pull-out of the suture material within the tendon; knot failing was also observed, while suture damage is unusual<sup>(27)</sup>. Suggestions to reduce tendon extending throughout Achilles tendon repair are summed up in (**Table 1**)<sup>(28)</sup>.

**Table 1:-** Summary of recommendations to reduce tendon lengthening during Achilles tendon repair<sup>(28)</sup>

1. Free proximal and distal adhesions
2. Use large caliber ( $\geq$ #2) non-absorbable braided suture materials (i.e. polyblend)
3. Use locking suture techniques (i.e. Krackow)
4. Sutures should be place at approximately 2.5 cm from the rupture site
5. Knots should be tied away from the rupture site (i.e. "gift-box technique")
6. Ependinous suture augmentation is recommended

**Suture Technique to better influence the tendon healing:-**

There are a variety of stitch methods described for grasping and holding soft tissues. When repairing tendons, the Kessler and Bunnell stitches are well-known for their holding power and are frequently used. In 1986, Krackow et al.<sup>(29)</sup> described a new locking stitch for fixing tendons and ligaments. The traditional Krackow stitch includes three or more locking loops put along each side of the tendon. Watson et al.<sup>(30)</sup> demonstrated that the Krackow locking repair is stronger than Bunnell and Kessler strategy, developing that the Krackow technique is the benchmark

biomechanically. Extra studies confirmed the exceptional pull-out strength of locking loop methods. McKeon et al.<sup>(31)</sup> found that load to failure is significantly increased by including a 2nd interlocking Krackow stitch positioned 90° to the first. They likewise reported that including more than 2 locking loops did not increase load to failure or regularly alter elongation. Using only 2 locking loops not only conserves important operative time however also avoids potential necrosis and injury of the tendon restricted by the loops of the stitch. Extra unnecessary stitch loops will add more links in the chain, more nonlinear sutures, and maybe increase the risk of extending through slippage.

The site where the knot is tied is also of value when thinking about tension restoration. When the knot is connected away from the rupture site, 2 different research studies have reported higher repair work strength. Jaakkola et al.<sup>(32)</sup> discovered that the triple bundle is almost three-fold stronger in tension than the Krackow locking loop; this distinction is generally due to the increased number of strands crossing the rupture site. Another consideration is that the knot was tied far from the rupture site in the triple bundle method, whereas in the Krackow strategy, the knot is connected at the rupture site. Having the knot at the rupture site might establish a tension riser on the stitch at the rupture site, and subsequent stress on the suture might lead to early failure at the knot. More recently, Labib et al.<sup>(33)</sup> tested a modification of the Krackow technique in which the knots of the stitch were tied over the cross-limb of the counter stitch ("gift-box" method) (**Figure 2**) and discovered that the load to failure increases more than two-fold. The authors thought about that the "gift-box" method is a simple a relatively fast method without constricting additional tissue during the repair work as reported in the "triple package strategy."<sup>(28)</sup>

**Figure 2:-** The "Gift-box" technique for Achilles tendon repair. Sutures are tied away from the rupture site (arrows).<sup>(28)</sup>

### Conclusion:-

Achilles tendon rupture is a serious injury for which the best treatment is still questionable. The surgeon needs to examine a patient's practical requirements thoroughly and treatment need to attempt an optimum restoration of tendon length, tightness, and tension. For that reason, in attempting to avoid excessive elongation of the tendon, which is related to a poor clinical outcome, there is consensus that personnel treatment is the preferred healing alternative for most of patients, specifically young athletes. Safe tendon repair work fixation is necessary to avoid gapping and permit a sped up rehab. Selection of the stitch material and knotting method is likewise important to prevent tendon repair separation.

#### Abstract

**Background:** Sickle cell trait is not usually regarded as a disease state because it may present several types of health complications that are either uncommon or mild and have not been thoroughly investigated. This article aims to describe the relationship between sickle cell trait (SCT) and liver function test (LFT) parameters in tharu community of western tarai region of Nepal.

**Method:** Sixty two (62) subjects divided into control subjects (n = 31) and heterozygous sickle cell patients (n = 31) were recruited for the study and were investigated for a liver function tests including the measurement of total protein, albumin, globulin, total bilirubin, direct bilirubin, indirect bilirubin, aspartate transaminase (AST), alanine transaminase (ALT) and lactate dehydrogenase (LDH) in both groups. Mean, Standard deviation, Students T test analysis were used for analysis of results.

**Result:** The serum total protein, globulin, total bilirubin, indirect bilirubin, aspartate transaminase (AST), alanine transaminase (ALT) and lactate dehydrogenase (LDH) were significantly higher in SCT patients than in controls, with P values of 0.014, <0.001, 0.003, 0.006, <0.001, <0.001 and <0.001 respectively. However, there were no significant difference in the mean value of albumin and direct bilirubin. There was strong correlation noticed between AST and LDH in the test group.

**Conclusion:** It appears that abnormal liver function tests in patients with sickle cell trait poses an uncertain threat for liver disease. The liver functions of the SCT patients were significantly compromised as compared to controls. Studies at molecular level are needed to understand the pathophysiology and progression of liver disease in sickle cell anemia. It is advisable that liver function tests be interpreted with caution in these patients.

**Introduction:-**

Sickle cell disease is stand out amongst the most common autosomal hereditary disorders, described by the presence of hemoglobin S (HbS). It is the most regular sort of hemoglobinopathy. The SCD can bring about various disorders that differ with respect to degree of anemia, recurrence of emergencies and in terms of survival [1]. So, the inconstancy in clinical seriousness from the virtually symptomless sickle cell trait to the conceivably lethal state of sickle cell anemia. Patients with SCD present with a broad range of phenotypic hemoglobin structures; they vary clinically from mild vaso-occlusive crises to severe clinical manifestations [2]. According to WHO data and statistics, SCD affects millions of people throughout the world. It is suggested that SCD is prevalent in malaria endemic areas because the sickle cell provides its carrier with resistance against malaria. It is most common among people whose ancestors come from Africa, Mediterranean countries such as Greece, Turkey, and Italy, the Arabian Peninsula, India and Spanish-speaking regions in South America, Central America, and parts of the Caribbean.

As with sickle cell disease, sickle cell trait is characterized by the inheritance of a single abnormal  $\beta$ -globin gene. Unlike sickle cell disease, however, the other  $\beta$ -globin chain is unaffected, enabling that chain to retain its functional and phenotypic properties. As such, those with sickle cell trait are generally mildly anemic or asymptomatic, reducing the likelihood of skeletal manifestation of the disease [3,4]. Traditionally, SCT has been viewed as a benign condition, a non-disease status, without any painful episodes that are characteristic of homozygous SCD. On a population basis, SCT has no discernible impact on life expectancy. There are more than 300 million carriers of sickle cell trait worldwide [5], with the highest prevalence of approximately 30% to 40% in sub-Saharan Africa. In Nepal, Tharu people are one of the oldest ethnic group indigenous to the Terai region. In 1990, WHO has reported that most of the Tharu communities in western region of Nepal are living with different hemoglobinopathies, SCD being commonest inherited disorder in this population.

Patients with sickle cell anemia/trait may experience the ill effects of an assortment of hepatic changes. The changes in the shape of red blood cells favors intravascular hemolysis and in this way impediment of the liver vascular bed, driving at last to tissue damage, yet more generally turns out as a result of the numerous transfusions that the patients require in their lifetime. Furthermore, hemolysis induces deposition of bilirubin causing intrahepatic cholestasis and cholelithiasis [6]. The incidence of liver disease in sickle cell disorders is difficult to ascertain despite being a component of the multiorgan failure that occurs in sickle cell disease [7]. This is because dysfunction of the liver in sickle cell disease is multifactorial [6] and the complications of hepatic dysfunctions are prominent and fatal in most of the cases [8].

Evidence of liver disease in sickle cell disease is obtained either from abnormal biochemical tests or postmortem liver biopsy specimen rarely an antemortem liver specimen. Abnormal liver function tests are noticed in patients with SCA, even in the absence of liver disease. So, this study therefore attempts to disclose the pattern of liver function tests (LFTs) in sickle cell trait patients in Tharu community of western tarai region of Nepal.

**Material and Methods:-**

Samples from 31 adult patients and 31 healthy controls of same age groups were taken from the tharu population of Phattepur, Baijapur and Binauna VDCs of Banke district were included in this study. The laboratory investigations were performed in the Laboratory at Bheri Zonal Hospital, Nepalgunj, Banke, and Swastika referral laboratory, Ramghat, Pokhara, Nepal. This study was carried out during 13 March to 18 March 2016. The study protocol was approved by the Institutional Ethical Committee. An informed written consent was obtained from all the study subjects who were enrolled in the study. Venous blood samples (5 ml) were subjected to complete blood count (CBC), hemoglobin electrophoresis and liver function test profile. SCT was confirmed by hemoglobin electrophoresis pattern. The estimation of biochemical parameters such as total protein, albumin, AST, ALT, ALP, total bilirubin and direct and indirect bilirubin in serum was done by Human laboratory test kits in a semiautomated (Biolab) analyzer with dedicated reagents.

**Statistical Analysis:-**

The study data was analyzed by using SPSS program to compute descriptive parameters including mean and frequencies, and inferential statistics was used including student's t test to test the significance of the differences between the mean values of two continuous variables and Chi-square test ( $X^2$ ) test the difference in proportions

categorical variables between two groups. The level of confidence ( $P < 0.05$ ) was considered as cutoff value for significance.

### Results:-

Total protein, bilirubin and some enzymes were selected as biochemical parameters to shed light on the liver functions tests in patients with sickle cell disease. Comparison of the biochemical parameters means were computed for study and control groups.

Table 1 shows the statistics of biochemical parameters computed for study and control groups which point out that (total proteins, albumin and globulins) results were found to be ( $7.6 \pm 0.7$  and  $7.3 \pm 0.5$ ,  $P = 0.014$ ), ( $4.1 \pm 0.5$  and  $4.3 \pm 0.3$ ,  $P = 0.085$ ) and ( $3.5 \pm 0.6$  and  $2.9 \pm 0.4$ ,  $P < 0.001$ ) respectively.

At the same time (total bilirubin, direct and indirect bilirubin) results were ( $0.9 \pm 0.2$  and  $0.7 \pm 0.3$ ,  $P = 0.003$ ), ( $0.2 \pm 0.1$  and  $0.2 \pm 0.1$ ,  $P = 0.161$ ) and ( $0.6 \pm 0.2$  and  $0.5 \pm 0.2$ ,  $P = 0.006$ ) respectively.

Also, enzymes results were AST ( $61 \pm 28.2$  and  $29 \pm 6.3$ ,  $P < 0.001$ ), ALT ( $62.9 \pm 40.4$  and  $32 \pm 6.3$ ,  $P < 0.001$ ) and LDH ( $790.3 \pm 291.4$  and  $303 \pm 57.9$ ,  $P < 0.001$ ).

Table 2 shows the abnormal results of biochemical tests which indicate that two biochemical tests out of nine tests performed within study and control groups (albumin and direct bilirubin) shows normal result, on the other hand, the statistically insignificant abnormality of result shown by total protein and total bilirubin with percent of (3.2%) and ( $P = 0.116$ ,  $P = 0.311$ ) respectively.

Conversely, statistically significant abnormality of results in study and control groups shown by globulin and indirect bilirubin (55% and 6.4%,  $P < 0.001$ ) and (39% and 3.2%,  $P < 0.001$ ) respectively.

Enzymes results also, show statistically significant abnormality which were AST (68% and 3.2%,  $P < 0.001$ ), ALT (71% and 6.4%,  $P < 0.001$ ) and LDH (100% and 68%,  $P < 0.001$ ). Statistically significant association of 5 abnormal biochemical tests with sickle cell disease is depicted in (figure 1).

Correlation was run to determine the relationship between LDH and other liver functions tests. There was only a positive correlation between LDH and AST, which was statistically significant ( $r = .378$ ,  $n = 31$ ,  $p = .031$ ). This correlation is depicted in (figure 2).

**Table 1:-** Statistics of biochemical parameters in study and control groups

Biochemical parameters	Study group (n= 31 )	Control group (n=31)	P- value
	Mean $\pm$ STD	Mean $\pm$ STD	
Total protein	7.6 $\pm$ 0.7	7.3 $\pm$ 0.5	0.014
Albumin	4.1 $\pm$ 0.5	4.3 $\pm$ 0.3	0.085
Globulin	3.5 $\pm$ 0.6	2.9 $\pm$ 0.4	0.000
Total bilirubin	0.9 $\pm$ 0.2	0.7 $\pm$ 0.3	0.003
Direct bilirubin	0.2 $\pm$ 0.1	0.2 $\pm$ 0.1	0.161
Indirect bilirubin	0.6 $\pm$ 0.2	0.5 $\pm$ 0.2	0.006
AST	61 $\pm$ 28.2	29 $\pm$ 6.3	0.000
ALT	62.9 $\pm$ 40.4	32 $\pm$ 6.3	0.000
LDH	790.3 $\pm$ 291.4	303 $\pm$ 57.9	0.000

**Table 2:-** Percentage of abnormal liver biochemical function tests and association between groups

Biochemical parameters	Study group		Control group		X2	P
	Normal	Abnormal	Normal	Abnormal		
Total protein	23	8(26%)	30	1(3.2%)	6.37	0.116
Globulin	14	17(55%)	29	2(6.4%)	17.07	0.000
Total bilirubin	28	3(10%)	30	1(3.2%)	1.07	0.311
Indirect bilirubin	19	12(39%)	30	1(3.2%)	11.77	0.000
AST	10	21(68%)	30	1(3.2%)	28.18	0.000
ALT	9	22(71%)	29	2(6.4%)	27.19	0.000
LDH	0	31(100%)	10	21(68%)	11.92	0.000

**Discussion:-**

This study was designed to evaluate liver function tests (Total protein, albumin, globulin, total bilirubin, direct bilirubin, indirect bilirubin, AST, ALT and Lactate Dehydrogenase (LDH)) in patients with sickle cell trait. To achieve this aim, 31 patient's samples and 31 controls were analyzed. The findings of this study demonstrates a significant association of serum total protein, globulin, total bilirubin, indirect bilirubin, AST, ALT and LDH between sickle cell trait patients and controls groups. However, serum albumin and direct bilirubin showed no statistically significant difference. So, our study shares similar findings with Gardner K *et al.* 2014 and Mahera MM *et al.* 2009 [9,10]. These findings suggest that a multifactorial etiology can exist for occurrence of liver disease in SCA patients

In this study, out of 31 patients 71% were having increased alanine transaminase (ALT) level as compared to levels with control group. The increased ALT levels observed in this study confirms by the results of a number of studies [11,12]. On the other hand, out of the 31 cases 68% of the patients have aspartate transaminase level above normal value and only 32% patients have serum AST value within normal range. So, our study is comparable with studies by Johnson *et al.* 1985 [13]. Taiwo Kotila *et al.* 2005 reported that 50% of the patients have aspartate transaminase level above normal limit [14].

It is well known that AST and ALT levels are commonly associated with 'Liver Function Test' (LFT) panel, but rather than assessing functions of the liver, the release of ALT and AST from liver cells to the bloodstream represents hepatocellular damage or death. The reason for deranged liver function appears to be the consequence of repeated vaso-occlusive episodes in sickle cell anemia or either due to widespread sickling within the sinusoid or due to extreme hemolysis [6]. Intrahepatic cholestasis is one of the fatal complications of sickle cell anemia. Sickling of red blood cells in hepatic sinusoids and their stasis may also cause serious damage to hepatocytes and Kupffer cells.

Another finding of this study was the higher LDH concentration observed in SCT patients. Our study revealed that 100% of the test groups were found the abnormal LDH value. Increased LDH have been reported in several previous studies of Sickle cell patients [15,16]. There is increasing evidence that lactate dehydrogenase (LDH) is a useful marker of intravascular haemolysis in adults with sickle cell anemia. It has emerged as the most useful marker of haemolysis-related complications of SCD. During vaso-occlusive episodes, LDH rises at least in part due to lysis of red cells but the increased LDH level is also due to lysis of cells from other organs.

Out of 31 cases total bilirubin and indirect bilirubin value above reference range were 10% and 39% of the test groups, which was statistically significant when compare with control groups. Gurkan E, *et al.* 2005 also reported hyperbilirubinemia in 13% of the patient [12]. Few studies report the elevation of bilirubin in sickle cell patients [17,18]. However, there was no significant association observed in direct bilirubin between the test and control groups. The difference in direct bilirubin levels is small and has been noted previously [13] and may represent haemoglobin load. Although there were no statistically significant differences, the levels are probably not of clinical relevance as the vast majority still fell within normal range. Derangement in concentration of bilirubin metabolizing enzymes in liver causes defective bilirubin metabolism that in turn result in increased serum bilirubin level. Hemolysis occurring in sickle cell disease is another reason for increased bilirubin level.

All the three patterns of proteins are altered in this study. A comparison of the serum protein values shows definite evidence of relative hyperproteinaemia as well as hyperglobulinaemia in test group. The total protein and globulin values in SCT were significantly greater than in normal, showing that the globulin fraction is largely accountable for the high total protein. The elevated gamma globulin is due to the extent of antigenic stimulation coming from the environment [19]. Whereas the albumin levels were not statistically promising in the test and control groups. This is in agreement with the work of Tripathi *et al.* 2011, who observed the low level of albumin in sickle cell disease patients [20] but in contrast with Famodu *et al.* 1987 who observed high level of serum albumin in sickle cell disease [21].

**Conclusions:-**

From above data and findings it could be concluded that liver functions of sickle cell trait patients is impaired. The most of the biochemical parameters of liver functions vary significantly from the normal subjects. So, sickle cell trait (SCT) patients are under the threat of hepatic dysfunction. On the basis of different biochemical parameters in

the SCT patients it could be concluded that the liver of such patients are under risk and suffering from various complications and indicating that prevention and treatment of liver related disorders should approaches for Sickle cell disease. Further studies in a large patient population across multiple institutions and countries are needed to confirm the results of our study and to better understand the exact factors involved in liver function that contribute to the increased risk of Sickle cell disease and how the effects are mediated at a molecular level.

#### Abstract

Repetitive strain injuries (RSI) are the nation's most common and costly occupational health problem, affecting hundreds of thousands of American workers, and costing more than \$20 billion a year in workers compensation. The common musculoskeletal disorders are associated with Abductor Pollicis Brevis (APB), often included in the list of the Repetitive Strain Injury (RSI), affecting as much as 5% of adult population. But in the majority of cases, the condition is idiopathic. In this paper, the health surveillance has been conducted on 66 Non-CTS Sufferers and 37 CTS Sufferers connecting rod manufacturing works. A study of the signals of the Abductor Pollicis Brevis (APB), muscle with different conditions such as rest position and different movements of hand has been carried out using surface-electromyography (sEMG). Experiments were performed on BIOPAC MP-45 instrument and independent two sample t-test outputs from SPSS analysis using sEMG signals obtained were analyzed for severity of the problem. So, Results reveal that non-CTS sufferers worker have better sEMG signal than CTS sufferers worker and are less prone to carpal tunnel syndrome.

#### Introduction:-

Repetitive Strain Injury (RSI) is a generic term and often used to describe work-related musculoskeletal disorders (Kemp et al., 2002). RSI is an umbrella term used to describe a number of specific musculoskeletal conditions, i.e. Carpal Tunnel syndrome (CTS), as well as 'diffuse RSI', which is more difficult to define. These conditions are often occupational in origin. Lack of adequate diagnosis or access to appropriate treatment can bring the conditions and sometimes leads to job loss and economic hardship (Gagne et al., 2010). RSI is the more commonly known term for a set of disorders called Work Related Upper Limb Disorders (WRULD'S). RSI covers a wide range of injuries to muscles, tendons and nerves. Usually hands, wrists, elbows or shoulders are affected but knees and feet may also suffers especially if a job involves a lot of kneeling or operating foot pedals on equipment.

The highest percentage of work injuries resulting from repetitive motion occurs in the manufacturing sector, where assembly-line works are common (Keller et al., 1998) RSI's must be treated at an early stage or a permanent disability could be caused which can cause a loss in term of compensation, productivity and number of working hours/days. Signs and symptoms vary, depending on type of jobs and which part of the body is affected. Initially,

**Corresponding Author:- Md. Sarfaraz Alam.**

Address:- Department of Design, Indian Institute of Technology Guwahati, Guwahati (India).

symptoms may only occur when the individual is doing the repetitive task - they will slowly go away when the person rests. Eventually, though, symptoms may be present all the time, if left untreated. The most common RSI signs and symptoms include: Tenderness in the affected muscle or joint, Pain in the affected muscle or joint, A throbbing (pulsating) sensation in the affected area, Pins and needles (tingling) in the affected area, especially the hand or arm, Loss of sensation in the hand, Loss of strength in the hand, Weakness, lack of endurance (Gagne et al., 2010). RSI is caused, by continuous repetitive and forceful work, hand or arm movements, i.e. hammering pushing, pulling, lifting or reaching movements, too fast or extreme workloads, long hours, lack of variety or breaks, awkward grips or positions, imperfectly designed equipment and/or poor working environments. Other synonyms for RSI include: Cumulative Trauma Disorder (CTD), Occupational Overuse Syndrome (OOS) and Repetitive Motion Syndrome (RMS). The more specific disorders are CTS, Tendonitis, and Tenosynovitis, Dupuytren's contracture, Epicondylitis or 'tennis elbow', Bursitis and a host of others. Of course, CTS is the most common problem brought on by repetitive hand motion.

### **Experimentation:-**

The study subjects were recruited from connecting rod manufacturing unit of a manufacturing industry. The population included all the unit workers irrespective of age, gender or ethnic group. All full-time workers with at least 6 months on the job were invited to participate in the study. Of the 113 eligible workers, 103 agreed to participate (91%) in the study. So a sample size of 103 workers was used (N = 103).

### **Surface electromyography:-**

The terms carpal tunnel syndrome, cumulative trauma disorders, ergonomic disorders, repetitive strain injuries and repetitive motion injuries all refer to the same disorder of the wrist and hand (Kumar et al., 2010). CTS is brought on by over-worked, over-strained muscles of arms and hands, resulting in a loss of nerve conductivity and possibly leading to muscle strength problems (Montgomery, 1995). Human skeletal muscle consists of hundreds of individual cylindrically shaped cells (called fibers) bounded together by connective tissue. In the body, skeletal muscles are stimulated to approach motor nerves that carry signals in the form of nerve impulses from the brain. The combination of a single motor neuron and all of the muscle fibers it controls is called a motor unit. When an increase in the strength of a muscle's contraction is necessary to perform a task, the brain increases the number of active motor units within the muscle (Okada et al., 2000).

Although the electrical impulse generated and conducted by each fiber is very weak (less than 100 micro volts), many fibers conducting simultaneously induce voltage differences in the overlying skin that are large enough to be detected by surface electrodes. The detection, amplification and recording of changes in skin voltage produced by underlying skeletal muscle contraction are called electromyography. The recording thus obtained is called Electromyogram. The APB (Abductor Pollicis Brevis) is a member of the thenar muscles and is often affected by muscle atrophy associated with CTS (Wunderlich, 1993). EMG signal means a collective electrical signal from musculoskeletal system, skeletal muscles which represent the electrical activity of muscles during contraction. In recent years, there has been a tremendous interest in introducing intuitive interfaces that can recognize the user's body movements and translate them in to machine commands. The EMG signal is stochastic in nature and it becomes difficult to quantify and interpret the processed signal. Nerves and muscles create electrical signals that deliver messages to and from the brain. Injuries and diseases can affect nerves and muscles, which can slow down the movements of these electrical signals. The two tests that are done more often to measure the speed and degree of electrical activity in muscles and nerves are EMG and Nerve Conduction Study (NCS). NCS is often done along with EMG. In NCS electrodes are taped to the skin along the nerve pathway. Then the nerve is stimulated with electric current. The electrodes will record how fast the signal is travelling. This test helps to determine the specific site of the injury to the nerves.

### **Analysis based on EMG signal:-**

Myoelectric signal represents the electrical activity of muscles and signal value is represented in micro volts obtained by surface electromyography (sEMG) technique. sEMG signals have been taken by BIOPAC MP-45 data acquisition unit. The MP unit is an electrically isolated data acquisition unit, designed for biophysical measurements. The MP45 receives power from the computer (USB port). The MP Unit has an internal microprocessor to control data acquisition and communication with the computer. The MP Unit takes incoming signals and converts them into digital signals that can be processed with the computer. There are analog input channels (two on MP45), one of which can be used as a trigger input.

In the present study, workers have been examined by the BIOPAC MP45 instrument. To take readings from the muscles of a subject three electrodes are used. Positions of three electrodes during sEMG data collection are shown in the Figure 1 and Figure 2.

**Fig. 1:-** Position of negative (white)

**Fig. 2:-** Position of ground electrode and positive (red) electrode

The negative electrode (white) is placed on APB muscle and positive electrode (red) is placed 6 to 10 cm away from negative electrode. The third electrode (black) is grounded. An EMG reading of APB muscle of dominant hand is recorded for 3 minutes (180 sec.) for a series of clenching first as hard as possible, and then followed by release. For analysis, the sEMG signals readings are taken from 140 seconds to 160 seconds from each worker. From the EMG data the values of Raw-EMG, Integrated-EMG and Root-mean square EMG are obtained. Raw-EMG i.e. the unprocessed signal of amplitude between 0-6 mV is measured from peak to peak and represents the amount of muscle energy measured. Raw-EMG signal i.e. the signals which is unprocessed form of the sEMG signals helps mostly in qualitative analysis. Integrated-EMG is calculation of area under the rectified signal. Values are summed over the specified time then divided by the total number of values. Values will increase continuously over time. It quantifies the muscle activity means it tells about the movement of hand through the electrical signal by which one can identify how well the APB muscle is working. Root-mean square EMG (EMG-RMS) values are calculated by squaring each data point, summing the squares, dividing the sum of squares by number of observations, and taking the square root and it represent the quantification of muscle activity.

The abductor pollicis brevis (APB) is a member of the thenar muscles and is often affected by muscle atrophy associated with carpal tunnel syndrome (CTS). The electrophysiological properties of the APB muscle are still not well understood. Reliable information about the physiological fatigue behavior of the APB muscle could be valuable to recognize changes in a pathologically altered muscle, as for instance in the case of CTS. However, to apply this information in a clinical setting it is essential to work with non-invasive diagnostic techniques whenever possible. Fortunately, considerable progress has been made in the past decades to develop non-invasive techniques to evaluate the performance of a muscle by recording and processing surface electromyograms (sEMG).

Based on literature it is clear that sEMG is a technique, which is used to check the performance of the APB muscle with the help of electrical signals. In this study, a comparison was done with the help of mean of sEMG signals between the CTS sufferers and non CTS sufferer workers in the manufacturing industry. The average root mean square values of the electromyogram signals were taken (Appendix 1).

The independent two sample t-test is used to check the statistical significance. The independent sample t-test is used because there are two separate samples of people which are to be compared. First sample is people who don't have CTS and second is who have CTS. There is no overlapping between the two samples.

The total number of workers is divided into two groups depending on the presence of CTS. Those who don't have CTS symptoms are assigned label '0' and those who have CTS symptoms are assigned label '1'.

Group 1 ('0' in the datasheet) has NO CTS.

Group 2 ('1' in the datasheet) has CTS.

The hypothesis assumed in the analysis is as follows:

- Null Hypothesis  $H_0$ : Mean RMS sEMG value for Group1 = Mean RMS sEMG value for Group 2.
- Alternative Hypothesis  $H_A$ : Mean RMS sEMG value for Group1  $\neq$  Mean RMS sEMG value for Group 2.

In the analysis, CTS is grouping variable and sEMG value is test variable. The group statistics for CTS sufferers and non CTS sufferers is shown in the Table 1.

**Table 1:-** Group statistics from SPSS

Group Statistics					
	CTS	N	Mean	Std. Deviation	Std. Error Mean
sEMG	Non CTS Sufferers	66	.07005718	.151573803	.018657445
	CTS Sufferers	37	.03012817	.038046400	.006254790

It can be concluded from Table 1 that mean RMS sEMG value for non CTS sufferers is more than mean RMS sEMG value for CTS sufferers. Now, it has to be checked whether there is any significant difference between the two values. Final results for independent sample test are shown in the Table 2.

**Table 2:-** Independent two samples t-test output from SPSS

Independent Samples Test											
		Levene's Test for Equality of Variances		t-test for Equality of Means							
		F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference		
										Lower	Upper
sEMG	Equal variances assumed	7.284	.008	1.572	101	.119	.0399	.0254	-.0104	.0903	
	Equal variances not assumed			2.029	78.638	.046	.0399	.0196	.0007	.0790	

### Result:-

From the result of F-test, it is clear that sig. (p-value) is found to be 0.08 which is less than 0.05. So the variances are not assumed to be equal and bottom row of the t-test will be used for analysis. As p-value (0.46) is less than 0.05, null hypothesis can be rejected and alternative hypothesis can be accepted.

Therefore it can be concluded that there is significant difference between the sEMG values of two groups of workers. Accepting alternative hypothesis means having CTS does affect the sEMG value of the workers. So Healthy workers have better sEMG signal and are less prone to carpal tunnel syndrome.

### Conclusion:-

In the present analysis it has been demonstrated that the people with a particular occupations, can identify their problem of CTS, deciphered by sEMG signals analysis. Comparison of sEMG signals (during expansion and contraction of APB muscle of different subjects) give indication of changes, not well understood so far. sEMG signals seem to have good repeatability but average validity in the analysis of some concrete relationships, due to lack of availability of standard data. So, this analysis it has been found that independent two sample t-test was used to analyze the sEMG signals of APB muscle which shows that non CTS sufferers have better sEMG signal than that of CTS sufferers and are more prone to potential CTS symptoms. Further there is scope of extending the work in different occupation, age groups, environmental conditions, and postures to analyze muscles conditions and identify the problems related to that.

#### Abstract

**Background:** Medical emergencies in dental offices poses a serious threat to the patient. Under these conditions it is paramount for the practising dentists to possess adequate knowledge regarding the diagnosis and management of the condition.

**Aim:** To evaluate the preparedness for medical emergencies at dental offices in chennai.

**Objective:** This study is done to assess the availability of the medical drugs and knowledge of medical emergencies among the dentists to handle a medical emergency .

**Materials And Methods:** A simple random sampling involving 150 dental graduates in chennai will be done. Self administered questionnaires will be issued to them and the data will be extracted using the SPSS software.

**Result:** It was found that about 99% enquired about the medical history of the patients, 34% conducted the required tests for vital signs assessment , 15% attended seminars and workshops , 65% could manage a medical emergency, 30% had adequate drugs and medicines , 30% could administer an intramuscular injection and 5% could administer and intravenous injection.

**Conclusion:** The results of this study show that the knowledge and attitude of dentists on medical emergencies in chennai is less .

#### Introduction:-

The quality of medical service plays an important role in improving the life expectancy of people by providing better health care. Dentists also play a very important role in this. As per a study which was conducted, half the people treated had a chronic illness. Hence, adequate knowledge on medical emergencies and their management is essential. [1]

At first, medical emergencies may panic the dentists but with sufficient knowledge and precautions, they become less alarming. Such incidents may not occur often, but the dentists should be trained for efficient use of equipments and management of the patient. [2]

The most common medical emergency faced by a dentist is the syncope after the administration of local anaesthesia during tooth extraction and endodontic treatment. According to a study, it was found that 60% of the medical

**Corresponding Author:- Keerthana Baskar.**

Address:- BDS student, Saveetha Dental College, Chennai – 600 077.

emergencies were syncope and the next being hyperventilation at 7%. [3] Preparation, prevention and management are the most important aspects for a dentist during treatments. Alterations on the treatment to be provided can be made when a dentist has a thorough look on the medical reports of the patient in case of any systemic health problems. This can prevent medical emergencies. [4]

### Materials and methods:-

A descriptive cross-sectional study was conducted involving 150 dental graduates in Chennai to evaluate the knowledge possessed and the ability to manage a medical emergency at the dental office. It also included the study of the availability of the necessary drugs during a medical emergency at the premises. The self-administered questionnaire consisted mainly of closed ended questions requiring a simple yes or no answer. An informed consent was taken from the participants of the study. The data was later extracted using the SPSS software.

### Questionnaire:-

1. Is the medical history of the patient enquired and recorded prior treatment ? Yes/No
2. Do you conduct the required medical tests for vital signs (Blood pressure, pulse, temperature etc ) prior to the commencement of the treatment ? Yes/No
3. Have you attended any seminar or workshop on the management and treatment of medical emergencies? Yes/ No
4. Can you manage a medical emergency at your dental office ? Yes/No
5. Are there adequate equipments and drugs for medical emergencies? Yes/No
6. Can you administer an intramuscular injection? Yes/No
7. Can you administer an intravenous injection? Yes /No

### Results:-

Questions	% of response
Is the medical history of the patient enquired and recorded prior treatment ? Yes / No	Yes-99% No-1%
Do you conduct the required medical tests for vital signs (Blood pressure, pulse, temperature etc ) prior to the commencement of the treatment ? Yes/No	Yes-34% No- 66%
Have you attended any seminar or workshop on the management and treatment of medical emergencies? Yes/ No	Yes-15% No- 85%
Can you manage a medical emergency at your dental office ? Yes/ No	Yes-65% No-35%
Are there adequate equipments and drugs for medical emergencies? Yes/ No	Yes- 30% No- 70%
Can you administer an intramuscular injection? Yes / No	Yes-30% No- 70%
Can you administer an intravenous injection? Yes / No	Yes- 5% No- 95%

*Response*

**Graph 1:-** Responses from the participants

It was found that almost all the dentists enquired about the medical history of the patient and had a record of it . When it comes to checking for the vital signs , only about a little more than one fourth did it. Most of the dentists believe in what the patients tell them regarding this. Only about 6% of the dentists had attended the workshops that were held on medical emergencies . About 95% of the dentists in the survey, were confident that they could manage a medical emergency if occurred at their dental office but only 30% had the necessary equipments . Administration of intramuscular injection could be done only by 30% and a very meagre number of dentists of about 5% could administer an intravenous injection.

### **Discussion:-**

At a dental office, the probability for the occurrence of a medical emergency is pretty less, but when there is an emergency , it could be nearly fatal also. Dentists should have the adequate knowledge to identify the patients who might be at risk to avoid a medical emergency situation. Dentists should be aware of the fact of that even during a dental treatment they might encounter a medical emergency if measures aren't taken at prior. [5]

The goal of the study was to evaluate the number of people who take measures such as recoding the medical history of the patient and checking for the vital signs in the patient to prevent medical emergencies during a dental treatment . This study showed that almost all the dentists enquired about the medical history of the patient and many of them also had it maintained as a record. The percentage of dentists who checked for the vital signs such as blood pressure, blood glucose temperature etc were quite less which accounted to only about 34% . Assessment of these vital signs is of utmost importance as they provide an indication such as during an infection, there might be an increase in the body temperature and also an increase in the oral temperature might be due to bacterial or viral infection. Hence, it is necessary to record them for the prevention of medical emergencies at the dental offices. [6] It is important that the medical signs be checked once at the dental office prior treatment and recorded and also updated on subsequent appointments .The patient's physician should be consulted in case the patient has medical complexities. Blood glucose level should be recorded in patients with diabetes. [1]

In a study conducted by sweta kumarasami et al., it was found that only 7.6% of the dentists had attended a workshop on handling medical emergencies but in our study it was almost double the population who had. In a study by Gupta et al., it was found that about 42.1% had attended. [7,8] The number of people who could handle a medical emergency in the present were more than half the population surveyed which accounted to about 65% which was comparatively lesser compared to the study by sweta kumarasami et al., which was about 85%. The others who

couldn't handle the situation call for emergency as they lack hands on experience but have adequate theoretical knowledge. [8]

The necessary equipments and drugs were available only at few dental offices , about 30%.

Most of the dental offices didn't have the proper aids which may be due to carelessness and ignorance about medical emergencies. In a study conducted by Gbotolorun et al., in Lagos also stated that the availability of medical emergency kits in dental offices was only in about 91.1% . [9] In the present study, the percentage of people who had attended a seminar or a workshop was only about 15% . Although , in a study conducted by Muller et al., it started that about 92% took part in a training programme for medical emergencies . [10]

Regarding the drugs available at the dental office for medical emergencies in a study by Gupta et al., showed that oral glucose was the medicament which was most frequently used followed by adrenaline. Diazepam and glyceryl trinitrate was available in less than 25% of the people surveyed.[7]

The basic life support among medical ,dental , nursing students and doctors were concluded to be very poor and had to be improved in a study conducted by Chandrasekaran et al., [11]

The knowledge on medical emergencies among dentists should be enhanced so that the dental office becomes a safer place for treatments . [12] Apart from the knowledge being gained, it is also important to know about the accepted and legalised treatments in the county. [13]

Although there is adequate theoretical knowledge among dentists, there isn't enough practise for them to handle a medical emergency which is the cause of lack of confidence among them. It's the duty of the dentist to manage a medical emergency at his office.

### **Conclusion:-**

From this study it can be concluded that the preparedness for medical emergencies in dental offices has been poor . Measures should be taken to improve the knowledge and attitude on medical emergencies. Dentists , being health care providers should take care of the necessary precautions to prevent emergencies.

#### Abstract

Winged bean (*Psophocarpus tetragonolobus* (L.) DC.) has been described as a wonder legume in the sense that virtually every part of the plant is edible and comprises a rich source of good quality of protein. However it possesses few drawbacks which obstruct the wide scale popularization among the farmers. In the present investigation, the seeds of winged bean of variety II-EC-178313 and 2I-EC-38825 were treated with two chemical mutagens namely Ethyl methane sulfonate (EMS) and Sodium azide (SA) to induce mutations. These treated seeds were sown in field to raise M<sub>1</sub> generation and the effects of EMS and SA on plant survival were observed. The survival of plants at maturity expressed as percent of control showed a gradual decrease with an increase in concentration of the two mutagens. The main objective of this study is to develop the improved varieties of winged bean by using the novel approach of mutation breeding.

#### Introduction:-

The winged bean (*Psophocarpus tetragonolobus* (L.) DC.) is the member of legume family i.e. fabaceae. It is also popularly known as Goa bean, four angled bean, four-cornered bean, Manila bean, Mauritius bean and Dragon bean and mainly cultivated in Papua New Guinea and Southeast Asia. It is considered to be a potentially important crop because of its high protein and oil contents. With the realization that this crop could be as important as a soya bean, particularly in the humid and tropical regions NAS (1981). Winged bean is a twining, perennial herbaceous plant that is characterized by its tuberous roots and its winged pod. Although the winged bean is perennial, it is most usually cultivated as an annual, because for pod and seed production. The chemical composition and the protein quality of the winged bean seeds which have increasing importance through out the world as a protein and energy-rich food crop. It contains all amino acids in sufficient quantity, with the exception of the sulphur containing amino acid. It is widely recognized by farmers and consumers particularly in Southern Asia for its variety of uses and disease resistance. It is nutrient rich and all parts of the plant are edible. Leaves can be eaten like spinach, flowers can be used in salads, and tubers can be eaten raw or cooked. It possesses excellent potential to become a major multiuse food crop in each and every part of the world. The other nutrients like vitamin A, vitamin C, calcium and iron were recorded from all parts of the winged bean, Hettiarachchy and Sri Kantha (1982).

The winged bean seeds are rich not only in protein, but in tocopherols which acts a antioxidants that facilitate vitamin A utilization in the body. In Malaya, winged beans are used as an effective remedy for Smallpox and as a cure for Vertigo. It is a potential food source for ruminants, poultry, fish and other livestock, Khan (1982). Though it

possesses several positive attributes, unfortunately it is neglected all over the world due to presence of antinutritional factors, long duration of crop, twining nature of crop and absence of market demands. Thus in the present work, the attempts have made to develop improved varieties of winged bean through the approach of mutation breeding.

### **Material and Methods:-**

The seed material of winged bean (*Psophocarpus tetragonolobus* (L.) DC.) variety namely II-EC-178313 and 2I-EC-38825 procured from National Bureau of Plant Genetic Resources (NBPGR), Regional Station, PKV, Akola (M.S.) was used in the present study.

### **Mutagens Used:-**

In the present work, the two chemical mutagens such as Ethyl methane sulfonate (EMS) and Sodium azide (SA) were used.

### **Details of Mutagenic Treatments:-**

The pilot experiments were conducted for determining the suitable concentration for further studies. Prior to mutagenic treatment seeds were immersed in distilled water for 6 hours. The presoaking enhances the rate of uptake of the mutagen through increase in cell permeability and also initiates metabolism in the seeds for treatment. Such presoaked seeds were later on immersed in the mutagenic solution for 6 hours with an intermittent shaking. Seeds soaked in distilled water for 12 hours served as control. The different concentrations used for the chemical mutagenic treatments were 0.05%, 0.10% and 0.15% for EMS and 0.01% , 0.02% and 0.03% for SA respectively. Immediately after the completion of treatment the seeds were washed thoroughly under running tap water. Later on they were kept for post soaking in distilled water for 2 hours. Further these treated seeds were sown in the field to raise M<sub>1</sub> generation, and this M<sub>1</sub> population was observed carefully to check the effect of EMS and SA on plant survival in both the varieties of winged bean. The number of plants reaching maturity in the field was noted and expressed as percentage of control.

### **Results and Discussion:-**

The survival of plants at maturity expressed as percent of control showed a gradual decrease with an increase in concentration of the two mutagens. In variety II-EC-178313 the survival ranged from 96.46% to 84.00% in EMS and 93.96% to 82.35% in SA treatments. As compared with this in variety 2I-EC-38825 the survival ranged from 95.00% to 90.51% in EMS and 92.24% to 81.90% after the SA treatments. (**Table-1 and 2**).

The highest survival values (96.46% and 95.00%) could be seen at 0.05% of EMS in variety II-EC-178313 and variety 2I-EC-38825 of winged bean respectively. The lowest survival values ( 82.35% and 81.90% ) were noticeable at 0.03% SA treatments in case of both the varieties of winged bean.

The extent of survival of plants is considered as one of the most reliable indices in evaluating the effect of any mutagen. In the present investigation, an inverse correlation was observed between concentration of EMS and SA survival in both II-EC-178313 and 2I-EC-38825 varieties of winged bean.

The researchers such as Sree Ramulu (1971) in Sorghum, Kaul and Bhan (1971) in rice, More (1992) in *Medicago sativa* and Giriraj and Deshpande (1996) in sunflower have reported reduced survival after mutagenic treatments, resulting in higher rates of lethality. Gaul (1964) proposed that the positive correlation between increasing mutagen dose and M<sub>1</sub> plant survival may be due to alterations at the physiological and cytological levels which leads to chromosomal and extra chromosomal injury.

According to Ashri and Levy (1974), the DA variety of peanut was more sensitive to chemical mutagens than TBR and Congo. They suggested that there were some factors within the embryo of Congo which enabled it to withstand the physiological injuries caused by DES. Hakande (1992) in winged bean reported intervarietal difference pertaining to survival of plants after mutagenic treatments. He further stated that it may be due to differential genotypic make up of the varieties.

In the present studies, an inverse correlation was observed between the survival of plants at maturity and the mutagenic treatments indicating the alterations caused at the physiological and cytological level by the latter.

**Table 1:-** Effect of EMS on survival of plants at maturity in  $M_1$  generation of *Psophocarpus tetragonolobus* (L.) DC.

Variety	Concentration	Survival of plants at maturity (% of control)	± S.E.
II-EC-178313	Control	-	-
	0.05%	96.46	1.20
	0.10%	93.51	0.88
	0.15%	84.00	1.15
2I-EC-38825	Control	-	-
	0.05%	95.00	2.64
	0.10%	93.27	0.57
	0.15%	90.51	1.15

± S.E. = Standard Error

**Table 2:-** Effect of SA on survival of plants at maturity in  $M_1$  generation of *Psophocarpus tetragonolobus* (L.) DC.

Variety	Concentration	Survival of plants at maturity (% of control)	± S.E.
II-EC-178313	Control	-	-
	0.01%	93.96	0.88
	0.02%	89.09	1.45
	0.03%	82.35	2.30
2I-EC-38825	Control	-	-
	0.01%	92.24	1.45
	0.02%	87.61	1.52
	0.03%	81.90	1.76

± S.E.= Standard Error

**Conclusion:-**

The survival of plants at maturity revealed reduced values with the enhancing concentration of both EMS and SA in II-EC-178313 and 2I-EC-38825 varieties of winged bean.

Skilled maternal healthcare services, community maternal healthcare, continuum of care, utilization, suggestions.

#### **Abstract**

**Background:** Proper utilization of maternal healthcare services greatly reduces maternal and newborn morbidity and mortality. However, utilization of such care is poor in Siaya County western Kenya. This study explored the user's experiences and perception of maternal healthcare services, and gathered suggestions for optimizing utilization of maternal healthcare services in Siaya County.

**Methods:** We conducted a cross sectional qualitative study from January to March 2015 in 8 selected community health units. Eight focus group discussions and 14 in depth interviews were carried out involving a total of 98 respondents.

**Results:** Our results determined that the major barriers affecting utilization of maternal healthcare services included inadequate awareness of availability of the services and their importance, limited availability of skilled maternal healthcare services, negative provider's attitude, maternal fears, weak facility-community linkage and no evidence of maternal healthcare continuum.

**Conclusion:** To bridge these gaps there is need to intensify awareness creation on available of skilled maternal healthcare services and their importance, avail 24 hours skilled delivery services, provide incentives to mothers and promotion of positive attitude amongst skilled providers. Important is also empowerment of community health volunteers (CHVs) to be able to identify pregnant mothers early through pregnancy testing at community and enhancing maternal healthcare continuum by providing evidence based community maternal health services.

#### **Introduction:-**

Utilization of skilled maternal healthcare services (during pregnancy, childbirth and post partum period) are amongst the major interventions aimed at reducing maternal and newborn mortality worldwide [1, 2]. Although since 1990, the world has seen a 44% decline in the maternal death ratio, still, 800 women die from preventable causes related to pregnancy and childbirth every day, with most of the deaths occurring among women of reproductive age in the

**Corresponding Author:- Obinge Elizabeth Omondi.**

Address:- Department of Public Health, School of Health Sciences, Jaramogi Oginga Odinga University of Science and Technology.

developing countries of the world [3, 4]. Previous studies have shown that a woman's lifetime risk of dying in pregnancy or childbirth in developed countries is 1 in 3700, the risk of dying in sub Saharan Africa is 1 in 38 which is about 1 (one) woman every two minutes[3] and for every woman who dies 20 or 30 encounter complications with serious or long-lasting consequences. These deaths and injuries are partly due to inadequate utilization and poor-quality maternal health care, -antenatal care, -skilled attendance at birth and postnatal care [5, 6] and are entirely preventable through increased utilization of skilled maternal healthcare services [3]. In addition these mortality have been associated with maternal education, maternal age and autonomy of the mother [7-9]. Several studies have shown that skilled birth attendants during labour, delivery and the early postpartum period can reduce significant number of maternal and newborn deaths through provision of timely obstetric and newborn care [10]. Owing to the central role of professional care at birth, skilled attendance was chosen as an indicator for monitoring progress towards maternal health MDG-5 of reducing maternal mortality ratio by three quarters between 1990 and 2015 [7].

Kenya was among the top ten countries that contributed to 58% of the global maternal deaths reported in 2013 [3]. Maternal mortality levels in Kenya have remained high (495 per 100,000 live births) [11] with slightly over 6,000 women dying every year due to pregnancy related conditions despite the launch of Safe Motherhood campaigns twenty years ago [12]. According to KDHS, 2014; the proportion of women attending antenatal clinic at least once in Kenya are 95%, four times as per WHO recommendation are 58% and postnatal care within two days of delivery at 51%. Moreover, unskilled persons attend to about 50% of deliveries by Kenyan women [12]. The low utilization of skilled maternal healthcare services has been attributed to cost of service, distance, quality of service, culture, birth order, living conditions of the mother, type of place or residence, level of education, wealth and weak healthcare infrastructure [10, 12-14]. Siaya County is one of the counties in Kenya with high maternal mortality ratio (MMR) that is above the national average of 495 deaths for every 100,000 live births, with most of these deaths being attributed to home deliveries and low utilization of skilled maternal healthcare services [11]. The high maternal mortality ratio in Siaya County has been mainly attributed to low use of maternal healthcare services [15]. Data from District Health Information Software (DHIS) 2014 indicate that the proportion of women attending at least one ANC visit are 85%, those attending four ANC visits are 45%, 52% receive skilled care during delivery while only 30% receive postnatal care within two days after delivery [11]. Consensus is now that the continuum of care for reproductive maternal and child health (RMNCH) includes the seamless and integrated service delivery for women and children throughout the life cycle-from pregnancy to delivery and the immediate postnatal and childhood period, and across all places of care [16]. In an effort to enhance maternal healthcare continuum and create demand for utilization of skilled healthcare services, Siaya County scaled up community health services in the whole County. However, despite massive investments in the strategy, some health indicators including maternal and child health have not yielded positive results due to low uptake of maternal healthcare services.

Although previous studies done in Siaya County associated low uptake of maternal healthcare with the following factors; Poor communication between health workers and women, cultural and religious beliefs, uncertainty about pregnancy, distance to health facilities and quality of ANC services among others [17, 18]. The 100% scale up of community health workers and services in Siaya County ought to have addressed most of issues mentioned above through regular interaction between CHWs and pregnant women at the household level and regular engagement with skilled health providers during review and dialogue meetings. However DHIS, 2014 shows that utilization of skilled maternal healthcare services in the county is still low, suggesting that there may be context-specific factors leading to low uptake of these services. Together these data indicate that there is need to identify barriers, understand the perception of service users and providers regarding those barriers and their suggestions for optimizing utilization of skilled maternal healthcare services, and to develop strategies to improve women's access to and utilization of delivery care services. Therefore, the present study aimed to explore how service users (mothers) and providers (health workers and members of health facility management committee) perceive barriers to skilled birth care and their suggestions on strategies for optimizing utilization skilled maternal healthcare services.

## **Methods:-**

### **Study site:-**

Siaya County is amongst the top ten Counties with the largest number of maternal deaths (691/100,000 live births) in Kenya which surpass the country maternal mortality rate (488/100,000 live births)[19, 20]. These deaths are due to causes directly related to pregnancy and childbirth. Although Siaya County has made efforts to implement many policies and strategies to increase utilization of skilled maternal healthcare services and reduce maternal deaths from preventable conditions the progress has remained slow[15]. The slow progress has been attributed to poor communication between health workers and women, cultural and religious beliefs, uncertainty about pregnancy,

distance to health facilities, quality of ANC services with low uptake of maternal health care services, and breaks in the continuity of care from preconception through antenatal, intra-partum and postnatal periods [21-23]. The County has 6 sub-counties, 179 sub-locations, 198 Community Units and 30 administrative wards. It has a total population of ~ 955,000 with inhabitants being predominantly of Luo ethnic extraction.

**Sampling strategy:-**

This study used a multi-stage simple random sampling method to select respondents. First 8 health facilities were selected from a sampling frame of all the health facilities (128) in the six sub-counties. Names of the health facilities per Sub County were drafted on pieces of folded paper and put in six boxes and thoroughly churned with each box having the names of all government health facilities per Sub County. One health facility was then randomly picked from each box. The health facility picked included Chianda Dispensary in Rarieda Sub County, Ligala Dispensary in Ugenya Sub County, Bondo Hospital in Bondo Sub County, Sikalame Health Center in Ugunja Sub County, Umalla Dispensary in Alego Sub County and Akalla Health center in Gem Sub County. Secondly, having had a target of 50 pregnant mothers per link health facility, it meant that for the study to achieve the recommended target of 400, an additional of 2 more health facilities had to be included. We thus placed all the remaining health facilities from the six boxes were placed in one box and thoroughly churned then two health facilities were randomly selected to add to the already selected six to make eight (8). The health facilities picked this time were Midhine and Gongo Dispensary all from Gem Sub County. The third stage involved identifying the community units linked to the selected health facilities. Those identified included; West Katweng'a Community Unit (CU) linked to Chianda Dispensary, Gongo CU linked to Gongo Dispensary, Ligala CU linked to Ligala Dispensary, Nyawita CU linked to Bondo Hospital, Umalla CU linked to Umalla Dispensary, Ndori CU linked to Akalla Health center, Midhine CU linked to Midhine Dispensary and Yiro West CU linked to Sikalame Health Center. It happened that Umalla Dispensary had two CUs linked to the facility (Umalla and Ulafu CUs) and thus Ulafu CU was also included in the study. Stage four involved identification of all the Community Health Volunteers (CHWs) from the selected Community Units to be key informant respondents to the study. Each CU has an average of 10 Community Health Volunteers (CHWs) and all accepted to participate in the study.

**Study population:-**

Study participants comprised service users and service providers. Specifically, a representative sample of 9 to 12 mothers within the reproductive age group in every selected community unit participated in the focus group discussions. Others included in the study as key informants were 14 skilled health providers working at the link health facilities, the health managers and the leaders in the community.

**Data collection:-**

We recruited eight field researchers to conduct FGDs in the community units (CUs). We developed separate guidelines for FGDs with health service providers and users, and all field researchers attended a two-day training session. To explore the social context, cultural issues, and concerns related to SBA utilization, we conducted eight focus group discussions (FGDs) and 14 in depth interviews involving a total of 98 respondents between from January to March 2015 in 8 selected community health units. During data collection, a focus group discussion guide and semi-structured key informant interview guide were used. Face to face in depth interviews were also conducted both at the health facilities and the communities. Each focus group consisted of 9 to 12 people which represent the ideal size of a focus group. The focus group discussions (FGD) were run by a facilitator with the responsibility to apply the appropriate working group techniques. The facilitator was required to provide equal opportunities for communication to all subgroups of patients and professionals. There were 8 target focus groups in total: one in each of the six sub counties in Siaya County. The women were asked to describe their perception of skilled maternal healthcare services. The women were asked about maternal healthcare services offered at the link health facility and the community. They were also asked about maternal healthcare continuum and utilization situation; suggestions for enhancing maternal healthcare continuum and suggest for optimizing utilization of skilled maternal healthcare services. The interviews were conducted in both the local language -Luo and English, using semi structured interview guide. During the interview follow up questions using probes were asked in order to acquire a deeper understanding when an explanation was unclear. The interviews lasted on average, 1 hour. All interviews were recorded, translated and transcribed verbatim in English.

**Table 1:-** Themes and categories of data analysis

themes	categories
1. Knowledge on maternal health	<ul style="list-style-type: none"> <li>• Awareness of availability of skilled maternal healthcare services</li> <li>• Awareness of importance of skilled maternal healthcare services</li> </ul>
2. Perception of barriers to utilization of skilled maternal healthcare services	Supply side barriers <ul style="list-style-type: none"> <li>• Availability of skilled maternal healthcare services</li> <li>• Access to skilled maternal healthcare services</li> <li>• Providers attitude</li> </ul> Demand side <ul style="list-style-type: none"> <li>• Availability of Community maternal healthcare services</li> <li>• Access to community maternal healthcare services</li> <li>• Status of maternal healthcare continuum</li> <li>• Mothers fears</li> <li>• Confirmation of pregnancy, labour and delivery time</li> <li>• Transport and cost</li> <li>• Availability of traditional birth attendants</li> </ul>
4. Perceived strategies to enhance continuum of maternal healthcare services	<ul style="list-style-type: none"> <li>• Improving health promotion/ education</li> <li>• Intensifying household visitations / follow up by CHWs (evidence based)</li> <li>• Improving physical access to services</li> <li>• Improving access to early pregnancy confirmation services</li> </ul>
5. Perceived strategies to optimize utilization of skilled maternal healthcare services	<ul style="list-style-type: none"> <li>• Improving awareness on importance of skilled maternal healthcare services</li> <li>• Improving availability of skilled maternal healthcare services</li> <li>• Improving access to skilled maternal healthcare services</li> <li>• Improving provider attitude</li> <li>• Improving health infrastructure and supplies</li> <li>• Provision of incentives to women (Nets, Mother baby packs etc)</li> </ul>

The key informant in depth interviews were also conducted to 14 health providers who were working at the link health facilities. The providers were asked about the maternal healthcare services that they provide at the health facility, the available innovations to increase utilization of skilled delivery services, suggestions for enhancing care continuum and optimizing utilization of skilled delivery services. The interviews were conducted in English. During the interviews, follow up information using probes in order to acquire deeper understanding when an explanation was unclear. The interviews lasted on average, 30 minutes.

#### **Data analysis:-**

The facilitators took note of the respondent characteristics; influence by other participants; context within which the comments were made; internal consistency – for example changes in opinion of influence by other participants; frequency and extensiveness; specificity of comments, such as personal experience or hypothetical situation; intensity of comments, like depth of feeling; relationship with other criteria. Therefore in the analysis of individual opinions, the opinions that changed due to group dynamics, as well as opinion of groups expressed on the basis of consensus, were identified. All recorded discussions were transcribed verbatim in full. The data analysis focused on developing coding categories where narrative information was organized according to emerging themes using thematic analysis [24]. During content analysis [25, 26], the researcher used a deductive approach to identify users and providers perception on accessing care according to the three delay models of 1) seeking care, 2) reaching and 3) receiving care. A fourth theme was also added based on the supply demand interface to describe perceived strategies to increase utilization of skilled maternal healthcare services (Table 1). We then added the content of the FGD notes according to the themes of analysis. Finally all data was organized thematically and summarized according to pattern of findings.

**Ethical considerations:-**

Before conducting each FGD, we explained the nature of the study, its rationale, and the extent of involvement expected from the participants. All respondents signed a written focus group consent form before participating in the FGD. A witness read the informed consent form to illiterate individuals, and those who consented to participate placed their thumbprint on the form, which was signed by the witness. The University of East Africa at Baraton Ethical Review Committee gave approval for this study (REC: UEAB/05/02/2015)

**Results:-****Knowledge on maternal health:-****Awareness of availability of skilled maternal healthcare services:-**

Women's awareness of the importance of skilled maternal health services during pregnancy, delivery and after child birth is important to enable them make informed decisions. Women need to understand that complications may occur without warning anytime during pregnancy, labour and even after having a normal delivery; hence it is safer to be in a setup where emergencies can be handled effectively. Information from the key informants revealed that antenatal care, skilled delivery services and postnatal care services were being offered in all the selected link health facilities. The findings showed that many women were aware that antenatal and skilled delivery services were available at their link health facility. However, very few knew that there were services being offered to women after deliver (Postnatal care).

Further probing as to whether they received any services after delivery revealed that apart from a few who could recall having been asked how they were fairing on after delivery, the majority knew that the services belonged to the baby. In six out of the eight focus groups, maternal healthcare services were reported to be irregular. In Ndori and Nyawita skilled maternal healthcare services were reported to be offered 24 hours a day, while in Ligala, West Katweng'a, and Yiro West, the participants reported that the skilled maternal healthcare services were being offered only during the day from Monday to Friday (8am to 5pm). The findings also revealed that in Marenyo and Gongo the services were not available during the weekends and nights. One 23 year old service user at Marenyo FGD said *"In our health facility, delivery services are offered only during the day but at night, there is no staff. The worst is over the weekend when the facility is closed"*. Further clarity from the health providers confirmed these findings and attributed them to shortage of staff and lack of staff houses within the health facility. One service provider said *"We are sometimes not able to give adequate information to the mothers because of staff shortage and too much work load"*

**Awareness of importance of skilled maternal healthcare services and risks in pregnancy:-**

Interestingly, though the majority knew about the availability of antenatal and skilled delivery services, the majority were unable to articulate the importance of the skilled services. In most of the focus groups, the participants were able to mention health education, weighing, checking of blood pressure, abdominal examination, checking of blood level (*signs of anaemia*) and treating the sick women. It was interesting to note that when asked to spell put the importance of specific services offered, most respondents were quite and did not want to explain, an indication of not being sure. Even when asked to explain why weighing was being carried out, the majority shared that it was done to check whether the baby was growing well.

Another finding was that many women knew the samples that were being tested during pregnancy like blood and urine. However, the majority were not sure about the key investigations that were being carried out. One 39 years old service user from Ligala focus group said *"To be frank, I am not sure of what is checked in the blood"*. However some indicated that it was done to check if they had enough blood, or for HIV test, or Malaria testing, with only two groups mentioning testing gonnorrhoea and sexually transmitted infections. In addition although participant mentioned that height was also being taken but they did not know the reasons why it was being taken. One 32 year old service user from Umalla Focus group said *"I don't know why it is done"* and the rest of the discussant were in agreement and were nodding.

In the opinion of key informants, awareness of skilled maternal healthcare services is usually emphasized during health education at the antenatal clinics and during household visitations by community health workers. The above findings showed that the women had inadequate knowledge on maternal health. The findings also revealed that there were hiccups in quality of user - provider interaction which was evident when women were unable to explain the exact care provided to them.

With regard to the knowledge on risks in pregnancy, Women are expected to have knowledge of the risks to enable them make informed decisions. The discussants were therefore asked to mention the danger signs to observe during pregnancy and after child birth. The findings revealed that the majority of the discussants were able to mention only a few danger signs in pregnancy. The responses were varied in all the discussion groups as no group was able to mention all the key danger signs. Those mentioned included: bleeding, headache, palpitations, lack of foetal movement and dizziness. It was noted that danger signs such as epigastric pain and drainage of liquor were not known to the women even though they are also life threatening. Although the majority knew that bleeding during pregnancy was a danger sign, there were varied responses on the amount of bleeding that was considered to be dangerous. Further probing showed that some participants thought that only severe bleeding was dangerous. One 30 year old service user from Gongo focus group said *"When you see bleeding that flows to the ground, know that you are in danger"*. These findings indicate that women understanding of danger signs were inadequate. The service providers revealed that this may be partly due to lack of proper education about danger signs by community health workers. One service provider from Bondo Hospital said *"I think the skilled providers do assume that CHWs have educated the mothers when this is actually not the case. Even the CHWs themselves need the education"*. These data indicate that there is a need to retrain the community health workers and women of reproductive age on pregnancy danger signs.

#### **Perception of barriers to utilization of skilled maternal healthcare services:-**

The study revealed that though the government had made several strides to address barriers to utilization of skilled maternal healthcare services, there were still many supply and demand side barriers that were effecting utilization of these services. Some of the barriers included:

#### **Supply side barriers:-**

##### **Service availability and access:-**

Availability of services was translated to mean that services were being offered 24 hours a day. The women identified the consistent service availability as the enabling factor for utilization of skilled maternal healthcare services. The study found out that service availability and access was a key issue in most of the discussion groups particularly shortage of skilled providers, and lack of night and weekend services which was cutting across in six (6) out of the eight (8) health facilities. Some participants shared that they could go to the health facility at night only to find the place closed. One 20 year old from Umala focus group said *"One day I went to the hospital at 2pm on Saturday after hiring a motorcycle and I was feeling headache but only to reach the facility and I found the gate closed. I had to request the motorcycle operator to take me to Siaya district hospital and when I reached there; my blood pressure was found to be very high. I was very frustrated and it was too expensive for me"*. Similarly, health service providers from Umala, Sikalame, Ligala and Chianda mentioned lack of 24 hours maternal healthcare services, lack of staff houses/ call rooms and negative provider attitude were the major barriers to skilled maternal healthcare services.

##### **Attitude of Providers:-**

In all the FGDs carried out, negative service providers' attitude was cited as a hindrance to utilization of skilled maternal healthcare services. Service availability depends on health workers attitude. An example of the poor attitude is illustrated by the following quote by an 18 year old service user from Nyawita focus group who said *"If you are unlucky to find those harsh ones, you will regret why you found yourself there"* and probed further to state why they she would regret she said *"Heh....Heh...., you can really be shouted at!"*. Contrary to the views of many discussants that the health staff had negative attitude, in Ligala focus group, a previous user of skilled health services was quick to tell her fellow discussants to stop generalizing that health staff have negative staff attitude because she had not had such experience despite having delivered her two children at the health facility.

#### **Demand side barriers:-**

##### **Awareness of availability of community maternal healthcare services:-**

Although the majority of participants reported being aware of some of the services being provided by community health volunteers (CHWs), further probing showed that they could not distinguish between services offered to all the general populace and those that are specific to maternal health. In seven (7) out of eight (8) focus groups, the discussants shared that the following services were being offered: health education on nutrition, hygiene and breastfeeding, testing for Malaria, treatment of malaria, testing for HIV and treatment of diarrhea were services being offered by community health volunteers. Some participants mentioned massaging of the abdomen and changing of the baby's position as also being done by traditional birth attendants (TBAs). Contrary to the views of

other discussants, in Yiro focus group, four participants were surprised to hear that there were maternal healthcare services being offered at the community. They said that they had never received any maternal healthcare services from the community health volunteers. Some women from Ligala focus group commented that *“May be some have been receiving these services, as we have never received any maternal healthcare services from CHWs”*

#### **Access to community maternal healthcare services:-**

Most of the discussants had not received any maternal healthcare services from the community health volunteers while for the few who acknowledged having received such services, they generally mentioned health education on importance of utilizing skilled maternal healthcare services but were not specific to issues such as education on danger signs in pregnancy, individual birth plan, nutrition of the mother and exercises among others which fall within the mandate of the community health volunteers. Moreover our study found out that for those who had received some form of community maternal healthcare services, none had records of the services provided at the household. All indicated that the records were with the community health volunteers. Differences in opinion between the providers and the mothers were found regarding the perception of community maternal healthcare services. Whereas in five focus groups mothers shared that they had never received any such services, the providers mentioned that the community maternal healthcare services were available.

#### **Status of maternal healthcare continuum:-**

With regard to continuum of care as described in *PNMCH, 2010 “Saving lives depends not only on high coverage but also on the quality of care delivered through the continuum”*. In order to establish the status of maternal healthcare continuum, discussants and interviewees were asked to share their experience in service continuity at the household level. Findings from the study showed that there was no evidence of networking between the skilled providers and the Community Health Workers (CHWs). The findings showed that there were no instances where a discussant was referred to the CHWs by skilled health providers for maternal healthcare continuum. Similarly, when key informants (*health providers*) were asked whether there are occasions where they referred women who need follow up to the respective CHWs, the majority said that they had not referred any case.

In trying to find out whether there was mechanism of knowing which health services had been given at the household level, it was established that there was no tool or booklet for documentation of health services provided at the household level for purposes of continuum of healthcare. One 24 year old service user from Yiro west focus group commented that *“What normally happens is that everyone who visits the household offer services they feel is appropriate without reference to what the other person did. In fact sometimes you even find two providers visiting you in a day with the same health information or services. Like one day a CHW came and gave me a net, after about 3 hours, another health provider working with CDC also came and gave me a net after sharing with me information on prevention of malaria in pregnancy. I had to take both because I had other people to give.”*

#### **Mother’s fears:-**

Fear of embarrassment, fear of being despised by the providers or being left alone among others. In one FGD it was revealed that being left alone during labour is one reason why women prefer to deliver at the traditional birth attendants (TBAs) place. The focus group discussions revealed that sometimes women end up delivering at home if they do not have the basic requirements needed because they fear being embarrassed. One 36 year old user at Gongo focus group said *“Imagine when you are wrapping your baby with rags and others are having new clothes? That’s why me I fear hospital delivery since at the TBAs place, nobody looks at you”*. Another 34 year old user at Ndori focus group said *“Sometimes you don’t have cotton wool and you plan to use pieces of clothes, you can’t carry them to the hospital, you fear embarrassment by the health providers and other women”*. Consistent with the above finding; a key informant (skilled health provider) from Akala health center confirmed that they do inform pregnant women to have individual birth plans which includes ; having at least two body wrappers, cotton wool or pads, a pair of gloves, warm baby wrappers, a cap and pair of socks, finances for upkeep, transport and Identifying Birth Companion.

Some of the women preferred home deliveries for fear of being left alone in labour ward. One 23 year old user at Yiro West focus group said *“My friend delivered alone in the health facility and the nurse came to assist after the baby was already out. The reason was that she was still attending to the outpatients”*. Although various negative experiences were shared in various focus groups, In Ligala focus group, one 33 year old women from Nyawita FGD said *“I have never experienced any negative experience shared above; I think some are just hearsay and we should*

not generalize. Skilled maternal healthcare services are what will save most women from complications or even dying”.

#### **Uncertainty about pregnancy:-**

Analysis of discussions from various focus groups revealed that the reason why women receive the recommended four (4) antenatal care visits is that they start antenatal visits when it is too late after being sure that they are pregnant. The discussants in most focus groups highlighted the need to have pregnancy tests kits availed to CHWs so that the services can be accessible for confirmation of pregnancy once periods are missed. One 19 year old service user at Marenyo focus group said *“I suggest that the CHWs are even given those pregnancy test kits to help women confirm pregnancy at home”*. A key informant at Bondo hospital also echoed similar sentiments that availing pregnancy testing services at the community would help in confirmation of pregnancy early and early initiation of ANC visits.

#### **Uncertainty about labour and time of delivery:-**

Some discussants shared that sometimes it’s about not knowing the expected time of delivery especially in the first pregnancy or when a one has not been attending the antenatal clinic. Some persevere and by the time they realize that they are in labour, the baby is out. An incident was shared in Ndori focus group that an adolescent who did not attend antenatal clinic and did not know that she was in labour ended up delivering at home alone and then bled to death. It is important that women should be encouraged to utilize skilled maternal healthcare services and CHWs trained on pregnancy danger signs. One 39 years old user in Ndori focus group said *“I think the CHWs should be trained on the signs of pregnancy so that they can identify the young girls who are pregnant and refer for confirmation”*

#### **Transport and cost:-**

In all the FGDs, it was mentioned that pregnant women rely on motorcycle as the main means of transport. However, a majority of the discussants indicated that at night the fares were comparatively high. One 28 year old user in Umala focus group said *“In our community, of late motorcyclists fear moving out at night as they risk being robbed of their motorcycles and since most of the deliveries occur at night, women end up delivering at home”*. While another 30 year old service user from Marenyo focus group said *“The use of motorcycles at night is also expensive because they overcharge and it is therefore not affordable”*. These data indicate that transport is a major barrier to utilization of maternal health services especially in rural communities.

#### **Availability of Traditional birth attendant’s:-**

Another barrier to utilization of maternal health services was the presence of TBAs also in the communities. This was found to be contributing to increased number of home deliveries in the study area. One 29 year old from Marenyo focus group commented that *“The fact that women have an alternative person within reach whom they know can conduct deliveries also make them to be opt for home deliveries”* The above findings show that various barriers still exist and they affect utilization of skilled maternal healthcare services

#### **Perceived strategies for enhancing maternal healthcare continuum:-**

For purposes of designing strategies which are evidence based, effective and acceptable to both the women and the providers; the participants were asked to give their suggestions on the interventions that would enhance care continuum and increase utilization of skilled maternal healthcare services. The findings show that the majority of the participants felt that the key interventions that could enhance maternal healthcare continuum and optimize utilization of skilled maternal healthcare services were health facilities to offer 24 hours skilled delivery services and providers to have positive attitude. Others in order of their strength included: 1) CHWs to intensify awareness creation on maternal healthcare and importance 2) Helping women to confirm pregnancy early to avoid delays due to uncertainty, 3) Provision of incentives to women who complete 4<sup>th</sup> antenatal care visits (Nets, Mother baby packs etc), 4) Developing ways of reminding women when clinic days are due and 5) Women to have birth companions (CHWs, TBAs or relatives).

#### **Perceived strategies for optimizing utilization of skilled maternal healthcare services:-**

Service providers suggested that in order to increase utilization of skilled maternal healthcare services. The followings need to be in place: Consistent availability of maternal healthcare services for 24 hours. The other suggestions which were cited in six focus groups and above included; Strengthen community-facility linkage and demand creation; Develop mechanisms for monitoring CHVs performance to ensure households information on

maternal health; Provision of incentives to mothers who perform well and early identification of pregnant mothers by carrying out household pregnancy testing for suspected cases. Others included building of staff houses to accommodate health providers within the health facility and staff to stay at the facility, recruitment of additional health providers to provide skilled maternal health services, Positive attitude from healthcare providers, Reorient TBAs on new roles and Renovation/ Construction of maternity units at the facility.

### **Discussion:-**

Increased utilization of skilled maternal healthcare services greatly reduced maternal morbidity and mortality [2, 27, 28]. This can be greatly improved through increased knowledge on maternal health services provided by skilled care providers [29]. However, one of the major barriers to utilization of skilled maternal healthcare service is lack of awareness of the importance of skilled maternal health services [30-33]. More importantly data reveals that although antenatal care, skilled delivery services and postnatal care services were being offered in all the link health facilities and many women were aware about these services, puzzling was that very few women knew about services being offered to women after delivery (Postnatal care). These data indicate there is a need to educate women about the importance of both antenatal and postnatal services provided in health facilities to increase the uptake of these services.

Lack of awareness about the importance of skilled maternal health services is another important barrier to utilization of these services [34]. A study in Tanzania revealed that the low utilization of skilled maternal health services was partly due to women not aware of the services available and the risk involved in traditional birth practices [35]. In Indonesia women use skilled maternal health services mainly due to childbirth complications [36]. This study shows although women knew that health education, weighing, checking of blood pressure, abdominal examination, checking of blood level and treating the sick women were some of the services provided as a component of skilled maternal health services, a majority thought that post-natal care services were for the baby. More importantly although a majority knew about the availability of antenatal and skilled delivery services they were not able to articulate the importance of the skilled services. These data indicate that women still do not understand the importance skilled maternal health services provided during antenatal and postnatal period despite importance of skilled maternal healthcare services being emphasized during health education at the antenatal clinics or during household visitations by community health workers. Overall these data indicate that there are challenges in the quality of user-provider interaction and there is a need to develop a more focused and interactive strategies to improve women literacy about the importance of skilled maternal health services. Indeed utilization of skilled maternal health services can be improved through a focused and sustained health education [37]. In Kenya, it was revealed that women who were exposed to media were more likely to uptake this services [38], suggesting that apart from skilled health providers and CHWs there is need for health education and promotion on skilled maternal health services through the media. In addition it has been shown that providing both males and their pregnant women with health education improve health behavior than educating women alone [39]. Women should therefore be empowered with detailed information of all available maternal healthcare services for them to make informed decisions [34]. It is also critical that information on benefits of skilled maternal healthcare service and the risks of not using these services should be propagated using all the available communication channels (during first interaction at the maternal healthcare clinic, during household visitations by CHWs and through community dialogue meetings). As recommended in [36]; the home visitations for postnatal care services will greatly benefit women and it should be emphasized to women that postnatal period is a crucial period where mother need specialized care to prevent unnecessary deaths [5, 40].

Inadequate availability of skilled birth attendants was found to be a major barrier to utilization of skilled maternal healthcare services in Siaya County [34, 41]. Although the findings showed that the availability of maternal healthcare services varied from facility to facility with six out of the eight selected health facilities offering limited maternal healthcare (either no night services or weekend services). The key informants attributed the lack of 24 hrs services to the shortage of staff houses within the healthcare facilities and shortage of skilled staff. Therefore, there is a need to invest in recruitment of more staff and building of staff houses within the health facility compound. Consistent with previous findings, negative provider attitude was identified as one of the barriers affecting utilization of skilled maternal healthcare services in the study area [16, 17]. Therefore, to increase utilization of skilled maternal healthcare services, health workers must be sensitized to be sensitive to women's situation and needs, so as to provide client friendly services to all women regardless of their status. Additionally, health workers must strive to provide quality skilled delivery services to women when who choose to deliver at the health facility as self deliveries deter women from using health facility in subsequent pregnancies [13, 42, 43]. As recommended by

[13], comprehensive health promotion through awareness-raising, appropriate education of healthcare workers and regular support supervision should be scheduled to improve provider communication and address burnout during service delivery to resolve critical issues that are likely to trigger negative responses from health providers [13]. Where necessary, women should be encouraged to come with supportive birth companions to address women's concern of being left alone during labour in some health facilities [44]. Other major barriers included fear of embarrassment of not having presentable clothing for the baby and self, uncertainty about pregnancy and uncertainty about labour, and high cost of transport at night. As suggested by users and providers in this study; these later issues could be addressed by increasing access to community maternal healthcare services, early identification of pregnancy mothers by use of pregnancy testing at the community and referring for initiation of 1<sup>st</sup> ANC and educating the mothers on the early signs of labour. Further exploration should be made on developing an application for motorcycle drivers to transport mothers for delivery with possible modification of their seats to make them more comfortable.

Continuum of care is needed throughout pregnancy, childbirth and the postnatal period in order to improve maternal and newborn health and reduce morbidity and mortality [45, 46]. Our data reveal that there is a weak health facility-community linkage with no evidence of maternal healthcare continuum which could be attributing to low utilization of skilled maternal healthcare services. The findings also showed that there were no evidence or records at the household level to show that there were maternal healthcare services provided at the household by community health volunteers. Therefore, to enhance maternal healthcare continuum, there is a need to develop the following: (1) A tool (household health visitors log book) for recording all healthcare services provided at the houses hold and for reference purposes (2) Strengthen the use of referral tools for forward and backwards referrals to enhance informational and management continuity (3) Provide files for individual CHWs at the link health facility where records of all CHWs activities and referral will be kept for reference and performance tracking. Of importance is also to develop and distribute maternal health education protocols/ counseling cards with key messages for CHWs reference during household visitations and intensify supervision [47-49].

As suggested by previous studies instead of investing in supply-increasing interventions only, policies aiming at increasing access and utilization should take on both a supply- and demand side approach [50-52]. As Kerber et al. 2007 put it; strengthened linkage between the community and health facility is important in increasing utilization of skilled health services [53]. Of interest is that most suggestions proposed by the maternal healthcare service users and providers as measures to increase utilization of skilled maternal healthcare services could be used to address most of the barriers discussed in the focus groups. The key strategies proposed included: Developing mechanism for follow up of women from conception until post delivery, Provision of incentives to women who complete 4<sup>th</sup> antenatal care visits (Nets, Mother baby packs), CHWs to be provided with tools/ maternal healthcare reference materials for health education, CHWs to be empowered to carryout pregnancy tests at the household for early identification of pregnant women, positive provider attitude and strengthening community-facility linkage. These suggestions could be used to address context specific causes of variable use of maternal healthcare if safe motherhood is to become a reality.

#### **Strengths and Limitations:-**

This study provides data on user's perception of skilled maternal healthcare services and suggestions for optimizing utilization which could inform policy makers to develop frameworks for optimizing utilization of skilled maternal health services. The sample selection methodology, the sample size and the inclusion of all samples from all the six sub counties in the County allows generalization of the results of this study [54]. The use of different of respondents increases the validity of the study [55].

Having one focus group in each sub county was limited by budget constraints and that could have influenced the number of established criteria. This limitation was offset by conducting a literature research with the aim of including all known important aspects. The number of participants in each focus group discussion was 9 to 12 participants this could have limited the confidentiality and anonymity of study participants because they all listened and interacted together. A large group would have limited the detail of some responses because participants feel a pressure to share airtime with others. Conversely, participants in a smaller group could feel an uncomfortable pressure to talk more than they would otherwise to cover up [56, 57]. However, this limitation was explained to the study participants before informed consent was obtained. Moreover, we reserved rooms in the link facilities to maintaining FGD confidentiality and enable study participants to talk freely and privately without others listening in.

**Conclusion:-**

This study found out that users perception influence utilization of skilled maternal healthcare services. Consistent with previous studies, inadequate awareness of availability of maternal healthcare services and importance, limited availability of skilled maternal healthcare services, negative provider attitude, and weak facility-community linkage negatively influence utilization of maternal healthcare services. Our results suggest the need to have programs understand the perspectives of service users and providers for evidence based context specific interventions. Concerted efforts should be geared towards intensifying awareness creation on available of skilled maternal healthcare services and importance, availing 24 hours skilled delivery services and promotion of positive attitude amongst skilled providers. Critical is also the empowerment of community health volunteers to identify of pregnant mothers early and refer, provide basic maternal education and healthcare services at the community and instituting mechanisms for regular mentorship of CHWs and performance tracking. This study also highlights the views and suggestions from insiders (users and providers) which are explicable and should be considered in designing context specific evidence based interventions.

**What is already known on this topic**

Many developed countries including Kenya are still struggling to meet the set millennium development goal 5 on improving maternal health by increasing utilization of skilled maternal health care services especially 4<sup>th</sup> antenatal care, skilled delivery and postnatal care services within 48 hours of birth. Experience over the past decade has shown that no single intervention is by itself sufficient to improve maternal and newborn health and reduce morbidity and mortality. What is needed is a continuum of care throughout pregnancy, childbirth and the postnatal period [58, 59]. Context specific, evidence based interventions are therefore needed to increase utilization of skilled maternal healthcare services.

**What this study adds**

The findings reveal that most women in Siaya County do not know about the availability and importance of postnatal care services, and that the majority also do not have access to community maternal healthcare services. Concerted efforts should therefore be geared towards intensifying awareness creation on postnatal care services and importance, availing 24 hours skilled delivery services, provision of incentives to mothers and promotion of positive attitude amongst skilled providers in order to increase uptake of skilled maternal healthcare services. Important is also empowerment of community health volunteers (CHVs) ) to be able to identify pregnant mothers early through pregnancy testing at community and enhancing maternal healthcare continuum by providing evidence based community maternal health services.

Community health workers, Demand creation, skilled maternal healthcare services, knowledge, perception

#### *Abstract*

**Background:** Community health workers (CHWs) are increasingly identified as a potential vehicle for creating demand and expanding access to maternal health care services. However, despite their engagement to create demand for skilled maternal healthcare services in Siaya County, utilization has remained low while mothers continue to die from preventable maternal conditions. The aim of this study was to assess the CHWs profile, knowledge and perception towards demand creation for skilled maternal healthcare services in Siaya County.

**Methods:** The study was a descriptive cross sectional study involving 123 community health workers. The study used both quantitative and qualitative data collection methods. Statistical tests including independent sample t-test, chi-square test, bivariate and multivariate logistic regression analysis were used to test the association between research variables.

**Results:** The results revealed that Married CHWs; (aOR=1.16, 95% CI: 3.21–3.27), Widowed (aOR=1.37, 95% CI: 4.32–2.74), those with secondary (aOR 1.12 CI: 4.33-4.58), Tertiary education (aOR 1.43 CI: 2.87-4.63), and those with  $\leq 100$  households (aOR 1.65 CI: 1.27-2.60) were more likely to create demand for skilled maternal healthcare services that their other counterparts. The majority of CHWs had inadequate knowledge on maternal health and danger signs.

**Conclusion:** Empowering Community health workers (CHWs) with adequate knowledge on maternal health would enhance their competency in maternal health while assigning fewer households would enable them intensify demand creation for skilled maternal healthcare services in Siaya County.

**Introduction:-**

Evidence has shown that utilization of skilled maternal healthcare during pregnancy, during delivery and postnatal period are key factors in reducing the risk of maternal death in both developed and developing countries (Graham, Moodley, & Selipsky, 2012; Wang et al., 2010; WHO, ICM, & FIGO, 2004), particularly in sub-Saharan Africa, where 99% of maternal deaths occur (WHO, UNICEF, UNFPA, & WB, 2012). Sadly, the use of maternal health services antenatal care, skilled care at delivery and postpartum is limited especially in Kenya where maternal mortality ratio (MMR) has remained high at about 365 per 100 000 live births (KDHS, 2014) with variations existing amongst Counties. As enshrined in the Kampala declaration and the Agenda for Global Action (Bhutta et al., 2010), Scaling up community health workers is one of the strategies for increasing access to healthcare services. Mounting evidence from previous studies and reviews have demonstrated the positive potential of community health workers in improving equitable access to care and that the services offered by CHWs have helped in the decline of maternal and child mortality rates (Bhutta et al., 2010; Lewin et al., 2010).

Health systems in many African and Asian countries currently utilize community health workers (CHWs) to deliver community healthcare services and create demand for skilled healthcare services at the health facilities; (Beam & Tessaro, 1994; Bhutta, Lassi, Pariyo, & Huicho, 2010; Haines et al., 2007). Previous findings revealed that knowledge is crucial in service delivery at community level and that coverage of home visits are positively correlated with knowledge levels of lay health workers (Agrawal, 2012). According to WHO 2006, Community health workers (CHWs) have the potential to be part of the solution to the human resource crisis affecting many countries. A study by (Crispin et al., 2012) found out that community health strategy is an effective approach to delivering community-based interventions.

In Kenya, the National Health Sector Strategic Plan 2 (KNHSSP 11) outlined interventions for improving the health indicators in Kenya including community health strategy whose aim was to deliver Kenya essential package of health (KEPH) to the Kenyan population with the community health workers (CHWs) as the main services providers at the community. Although the use of community health workers in Siaya County began after the Alma Ata declaration in 1970s, the engagement was further intensified in 2006 in line with the Kenya National Health Sector Strategic Plan 11 to reverse the poor health indicators in the Country (Ministry of Health Kenya, 2005; Ministry of Health Kenya, 2006). Siaya County being one of the top ten Counties in Kenya with the largest number of maternal deaths (691/100,000 live births) which surpass the Country (KDHS, 2014; MICS4, 2011), has made efforts to invest in community health services as a means to create demand and increase uptake of skilled maternal healthcare services. Moreover, due to shortage of skilled healthcare providers in Siaya County (C. G. o. Siaya, 2013), CHWs are central in mobilizing communities to engage in health prevention and promotion activities.

Owing to the shortage of skilled health care personnel in Siaya County and the desire to increase access to skilled healthcare services, the County Government invested in scaling up community health services in the whole county with a view to increasing access to healthcare services and intensifying demand creation for skilled healthcare services (M. o. H. Siaya, 2013). However, although some indicators have shown some improvement, utilization of skilled maternal healthcare services have remained low (Department, 2014; UNICEF, 2011). The proportion of mothers attending antenatal visits four times as per WHO recommendation still remain as low as 45% and postnatal care within two days of delivery at 30%. Moreover, unskilled persons attend to about 52% of deliveries by Siaya women (Software, 2014). Therefore as recommended by previous scholars, understanding how socio demographic factors affect CHWs effectiveness is of importance (Lehmann U, 2007).

The use of community health works in Siaya County began after the Alama ata declaration in 1978. However, after devolution of health services in 2013, the County government of Siaya has invested massively in community health services including payment of honoraria to all the community health workers (Department, 2014) in the county with an aim of enhancing their retention and motivation as recommended in previous reports (Bhattacharyya, Winch, Leban, & Tien, 2001; Glenton et al., 2010; Singh, Negin, Otim, Orach, & Cumming, 2015). It was envisioned that with the provision of the honoraria, the community health workers (CHWs) would be motivated to intensify demand creation for skilled healthcare services, refer pregnant mothers for skilled services and ultimately contribute to reduction of maternal mortality which has not been the case. However, although several trials have shown the efficacy of community health workers (CHWs) in reducing maternal and newborn morbidity and mortality (Bang, Bang, Reddy, Deshmukh, & Baitule, 2005; Tomlinson, 2014), this has not been the case in Siaya County (Software, 2014). The low uptake of skilled maternal healthcare services in Siaya County raises concerns about the implications of CHW efforts to increase demand for skilled maternal healthcare services. Taken together the above observations

and the need to identify the bottlenecks hindering the success of demand creation for skilled maternal healthcare services, it was necessary to carry out a study to unveil the dynamics affecting demand creation for skilled maternal health care services in Siaya County. Hence this study aimed at assessing the community health volunteer's profile, knowledge and perception towards demand creation for skilled maternal healthcare services in Siaya County.

#### **Community health services in Kenya**

In Kenya, the lay health workers hereby referred to as Community Health Workers (CHWs) are assigned to serve approximately 100 households (approximately 5000 people). They are members of the community identified by the community and trained on basic community health services module to serve the same communities they come from. After the initial training, they are also trained on technical modules based on the context of the intervention that they are assigned to undertake (MOH, 2006). With regard to demand creation for skilled maternal healthcare services, the CHWs are tasked to disseminate key messages to support safe pregnancy & delivery of a healthy new born, advocate for community leadership support for safe pregnancy and delivery of a healthy newborn, promote safe delivery through pregnancy monitoring and timely referral (Ministry of Health , 2006)

#### **Statement of the problem:-**

Studies have shown that community health workers (CHWs) referred to in this study as community health workers (CHWs) are a potential vehicle for creating demand and expanding access to maternal health care services (Lewin et al., 2010), and With the limited budget allocation for healthcare services in Siaya County, the personnel to serve the health care needs of the population cannot be met and thus it is critical that more cost effective delivery strategies are identified to optimize the use of the available health care services especially skilled maternal healthcare.

Even though Siaya county government has invested in community health workers (CHWs) as a measure to create demand for skilled healthcare services, very minimal gains have been realized with regard to demand creation for skilled maternal health services. It was envisioned that with the provision of the stipend to the CHWs would motivate them to further intensify demand creation for skilled healthcare and ultimately contribute to the reduction of maternal mortality. However, the uptake of skilled maternal healthcare services is still low in Siaya County (Siaya County Annual Performance Report and Plan 2015/16) thus calling for a study to identify the dynamics in demand creation for skilled maternal healthcare services in the county.

#### **Justification of the study:-**

Given the shortage of skilled providers in Siaya County, establishing the bottleneck affecting CHWs performance and identification of context specific evidence based strategies to intensify demand creation for skilled maternal healthcare services would go a long way in increasing uptake of maternal healthcare services which will lead to reduction of maternal mortality in Siaya County.

The findings of this study will equip policy makers, stakeholders and program managers with information for designing context specific evidence based intervention to increase utilization of skilled maternal healthcare services in Siaya County.

#### **Research Questions:-**

In order to achieve the objectives of this study, the following questions were formulated:

1. What are the effects of CHWs profile on demand creation for skilled maternal healthcare in Siaya County?
2. What the effects of knowledge of CHWs on demand creation for skilled maternal healthcare in Siaya County?
3. What are the effects of CHWs experience on demand creation for skilled maternal healthcare in Siaya County?
4. What are the context specific interventions for increasing demand for skilled maternal healthcare services in Siaya County?

#### **Research Objectives:-**

**General objective:** To determine the CHWs profile , knowledge and experience towards demand creation for maternal healthcare services in Siaya County.

#### **Specific objectives:-**

1. To find out the effects of CHWs profile on demand creation for skilled maternal healthcare in Siaya County
2. To determine the effects of knowledge of CHWs on demand creation for skilled maternal healthcare in Siaya County
3. To assess the effects of CHWs experience on demand creation for skilled maternal healthcare in Siaya County

4. To identify context specific evidence based interventions for increasing demand for skilled maternal healthcare services in Siaya County

## **Methods:-**

### **Study site:-**

The cross sectional study was conducted in Siaya County in selected community Units. Siaya County is one of the 47 counties that make the Republic of Kenya. It has 6 sub-counties, 179 sub-locations, 198 Community Units and 30 administrative wards. It has a total population of ~ 955,000. The predominant inhabitants are Luo speaking River Lake Nilotes. The study focused on assessment of CHWs knowledge and perception towards demand creation for skilled maternal healthcare within Siaya County.

### **Sample size Determination:-**

The sample size was determined using purposive sampling methodology whereby all the 123 CHWs serving within the community units linked to the selected health facility were given chance to participate.

### **Sampling procedure:-**

The study used a multi-stage simple random sampling method to select 123 respondents. The study was part of the baseline survey that was carried out to establish the status of utilization of skilled maternal healthcare services in Siaya County. As such, from a sampling frame of all health facilities per Sub County, the health facilities to be included in the study had been selected. The Community units were then selected on the basis of their link to the eight (8) selected health facilities followed by selection of community health workers (CHWs) from all the selected community units. At least one health provider drawn from the health facilities where the selected community units were linked participated as key informant.

### **Data Analysis:-**

Data was cleaned and entered into SPSS version 18 software for analysis. Descriptive statistics were computed and relationships and significant tests determined using Chi square and Odds Ratios (ORs). Statistical tests including independent sample t-test, chi-square test, bivariate and multivariate logistic regression analysis were used to test the association between research variables. Finally, multiple regression analysis was done to identify independent variables that were useful to demand creation for skilled maternal healthcare services. Qualitative data was analyzed using themes and used to back the quantitative data.

### **Ethical approval:-**

The study received approval from Baraton University of Eastern and Central Africa Research and Ethics committee. Another letter allowing the researcher to proceed with the field work was also received from Siaya County Health Research Committee.

## **Results:-**

The data used in this study was drawn from the population of 123 CHWs drawn from 8 community health units linked to 8 public health facilities in Siaya County. 14 Health providers of each facility also formed part of the study population. The sampled respondents were 123 CHWs (n=123) and 14 Health providers (n=14). The return rate from the 14 Health providers' respondents was 100%. Given that the questionnaires were administered personally by the researcher, it was noted that 100% of the questionnaires were appropriately filled while qualitative data were also obtained from the 14 key informants.

### **Profile of the respondents:-**

The first objective of the study was to assess the influence of CHWs profile on demand creation skilled maternal healthcare services in Siaya County. The findings are summarized below. Table 1 shows the percentage distribution of the CHWs respondents.

### **Age of the CHWs:-**

The results showed that the majority of the CHWs totaling to (74.8 %) were aged between 30-49 years each, while only 3.2% of them were aged below 30 years and the rest (10.57%) aged 50 years and above. The above results

revealed highly significant ( $p < 0.05$ ) positive relationship between age of the respondents and the maternal health services provision in Siaya County.

*“I think the mature age may be attributed to the fact that younger people still want income to develop themselves and they do shy away from this responsibility and they therefore leave the work to the adults population” (nurse – Akalla health centre)*

#### **Sex of the CHWs:-**

The exploratory data analysis revealed that more female CHWs (85.37%) took part in the study than their male counterparts (14.63%) giving a gender distribution ratio of about 1:3.

*“The majority of the CHWs are females because most people in the community view the role of CHWs to be mostly suitable for women” (Nurse at Sikalame dispensary).*

*“Most males engage in jobs that give them money because, in the community unit linked to the facility where I work, for several years the majority of the CHWs were females until the time when Millennium villages project came and the CHWs were being paid allowances of Ksh. 5000. Many young people especially the men got engaged in the CHWs work so as to earn money” (nurse – Midhine dispensary)*

#### **Marital status of CHWs:-**

The descriptive statistics on cross tabulations indicated that the majority of the CHWs in Siaya County are married at 88.62% while 1.63% and 9.76% of the respondents are single and widowed respectively. None of the respondents were separated. The results also indicated that female respondents were either married or widow at 85.37% whereas male respondents were either married or single at 14.63%. None of the female CHWs were single. Similarly, none of the male respondents were widow. The results revealed highly significant ( $p < 0.05$ ) positive relationship between marital status and the maternal health services provision in Siaya County.

*“The community members prefer selecting married women or widows who are grounded in the community to volunteer as CHWs because they are rooted in the community” (nurse – Umalla dispensary)”*

#### **CHWs level of Education:-**

The findings presented in table 4.1 established that most of the respondents (CHWs) at 54.5% were at secondary school level of education, followed by those with primary level of education (41.5%), those with tertiary level of education accounted for 4.1%. Moreover, the results revealed highly significant ( $p < 0.05$ ) positive relationship between level of education and the demand creation for skilled maternal health services in Siaya County.

*Sometimes it is difficult to teach the CHWs with education below secondary because most of the training materials are written in English and also the reporting tools are also in English” (nurse – Bondo hospital)*

The study also sought to establish the number of households covered by the CHWs. This was necessary since it showed the workload experienced by the CHWs in the community. The results showed that majority of the CHWs respondents at 69.92% covered between 101-150 households each followed by 29.27% of the CHWs respondents who covered less than 100 households. Moreover, 0.81% of the CHWs respondents only covered 100 households. The study established whether there is association between household covered and packages delivered to the mothers. The analysis revealed highly significant ( $p < 0.05$ ) positive relationship between household covered and packages delivered to the mothers.

*“Some of our CHWs have too many households that they cannot cover especially on monthly basis and they therefore sometimes avoid households visitations and so they are unable to know when a woman is pregnant until very late” (nurse – Ligala dispensary)*

*“Apart from having too many households to visit, they also have too many tasks to perform in those household making it too difficult for the CHV to manage even though they are willing to do the work” (nurse- Gongo dispensary)*

**Table 1:-** Summary of Socio – Demographic characteristics of respondents (N = 123) in Siaya County.

<b>Respondent Category</b>	<b>Total, n (%)</b>		<b>P value</b>
<b>Age of the respondents at interview</b>	<b>Female, (n %)</b>	<b>Male, n (%)</b>	<b>0.002</b>

Female	105 (85.37%)	1.24 (0.37–6.12)*	1.21 (0.42–7.63)*
<b>Marital status</b>			
Married	109 (88.60%)	1.21 (3.25–2.50)**	1.16 (3.21–3.27)**
Single	2 (1.6%)	1.00	1.00
Widow	12 (9.8%)	2.23 (5.41–8.13)**	1.37 (4.32–2.74)**
<b>Level of education</b>			
Primary	51 (41.5)	1.00	1.00
Secondary	67 (54.4)	1.23 (3.15–6.51)**	1.12 (4.33–4.58)**
Tertiary	5 (3.21)	2.05 (3.25–4.50)**	1.43 (2.87–4.63)**
<b>Number of Households covered by CHWs</b>			
100	1 (0.81%)	1.00	1.00
101 to 150	86 (69.92%)	1.00	1.00
Less than 100	36 (29.27%)	2.19 (2.99–2.61)*	1.65 (1.27–2.60)*

Findings of multivariate analysis of CHWs profile in table 2 above also showed that; female respondents (AOR=1.21, 95% CI: 0.42– 7.63) were 1.21 times more likely to create demand for the utilization of maternal healthcare services in Siaya County as compared to male respondents. The study further established how gender differences influence CHVs' MHS in Siaya County.

**Table 1.2.1:-** Descriptive statistics

	Gender	n	mean	std. deviation	std. error mean
MHS	Male	18	14.6	10.6759	1.1253
	Female	105	85.4	13.1855	1.4835

**Table 1.2.2:-** Independent t samples test

		MHS	
		equal variances assumed	equal variances not assumed
levene's test for equality of variances	f sig.	3.374 0.021	
t-test for equality of means	t	.104	.111
	df.	119	97.262
	sig.(2-tailed)	.002	.002
	mean difference	.027	.027
	std. error difference	.264	.246
	95% confidence interval of the difference	upper lower	.550 -.495

The above independent sample t-test in table 1.2.2 was done to compare demand creation for MHS between the genders of the CHWs. As shown in the table 1.2.1 findings were that the female CHWs had a higher mean of MHS score of 85.4, with a standard deviation of 13.1855 and standard error of 1.4835 than the male CHVs who had a mean of 14.6, with a standard deviation of 10.6759 and standard error of 1.125. Given that the Levene's Test for Equality of Variances was significant ( $p = .021 < .05$ ) we did not assume equal variances, this mean that the variances were significantly different; the assumption of homogeneity of variances was violated. Hence the readings of test statistics was taken from the row labeled Equal variance not assumed, indicating P Value  $< .05$ . Therefore the findings of the study indicate that on average the female MHS score ( $M=85.4$ ,  $SE=1.4835$ ), was significantly higher than the male MHS score ( $M= 14.6$ ,  $SE=1.125$ ),  $t(119) = 97.262$ ,  $p = .002$ . Hence from the results of the study, it was credible to conclude that gender has significant influence on demand creation for MHS in Siaya County.

The married respondents and widowed; (AOR=1.16, 95% CI: 3.21–3.27) and (AOR=1.37, 95% CI: 4.32–2.74) were 1.16 and 1.37 times respectively more likely to create demand for the utilization of maternal healthcare services in Siaya County as compared to the respondents who were single. In addition, the findings established that the respondents whose highest level of education was secondary (AOR=1.12, 95% CI: 4.33–4.58) and those with tertiary level of education (AOR=1.43, 95% CI: 2.87–4.63) were 1.12 and 1.43 times more likely to create demand for the utilization of maternal healthcare services in Siaya County as compared to those respondents whose level of education is primary. Moreover, the findings indicated that the CHWs respondents who covered less than 100 households (AOR=1.65, 95% CI: 1.27-2.60) were 1.65 times more likely to create demand for the utilization of maternal healthcare than those with more households.

#### **Effect of CHWs knowledge on demand creation for skilled maternal health care:-**

The second objective of the study was to establish the effect of knowledge on demand creation for skilled maternal healthcare. To address this research objective, questions were carefully developed; the first group were the questions seeking the knowledge of the CHWs and the second were the questions seeking to establish the effect of knowledge on demand creation for skilled maternal healthcare services.

**Knowledge on antenatal, postnatal care and maternal health danger signs;-**

On the knowledge on maternal health danger signs, the researcher designed questions to collect respondents view on the same. The Knowledge on danger signs was assessed using a question with 9 key danger signs on maternal healthcare. Knowledge scores for individuals were then categorised into adequate if it was equal to or above five, while anything below the five was rated as inadequate.

**Table 2:-** Knowledge on maternal healthcare services

Statements	Frequencies	Percentages
<b>When should a pregnant mother start receiving ANC</b>		
1= <16 weeks	37	30.6
2= 16-28 weeks	54	24.4
3= 28-32 weeks	23	18.7
4= 32-40 weeks	9	7.3
<b>When should a woman be visited after delivery</b>		
After:		
1=48 hours	82	66.7
2= 1 week	14	11.4
3= 1 month	11	8.9
4= 6 weeks +	16	13.0
<b>When did you last offer service to a pregnant mother or Postpartum mother at the HH</b>		
1= Last one month	85	69.1
2= 1-2 months ago	20	16.3
3= 3months +	18	14.6
<b>Knowledge of maternal health danger signs</b>		
Yes	39	31.7
No	84	68.3

Table 2 shows that only 30.6% of the CHWs knew when a pregnant mother should start receiving ANC (less than 16 weeks) while the remaining 69.4% did not know the correct timing. Furthermore, the CHWs who knew the exact time (within 48 hours) when a woman should be visited after delivery were 66.7% while the remaining 33.3% were on the opinion of one week and above. Moreover only 30.6% of the CHWs knew when a pregnant mother should start receiving ANC (less than 16 weeks) while the remaining 69.4% did not know the correct timing. Interestingly, the study also revealed that only 31.7% of the CHWs had adequate knowledge of the maternal health danger signs while 68.3% had inadequate knowledge of the danger signs.

*“The CHWs do not have adequate knowledge on maternal health although when they come to the health facility we do try to teach them” (nurse – Umala dispensary)*

**Trainings attended by CHVs:-**

All CHWs are required to undergo a basic training on community health strategy before being engaged in demand creation activities. The findings of this study however established that even though all the CHVs were expected to create demand for skilled maternal healthcare services, only 101 out of 123 had undergone the training. In order to establish whether the basic community health strategy has influence on demand creation for skilled maternal healthcare services, a multivariate analysis was done.

**Table 3:-** Trainings attended by CHVs

CHV's attendance of trainings	Yes, n (%)	No, n (%)	<b>0.003</b>
Community Health Strategy (CHS)	101 (82.1)	22 (17.9)	
Community Maternal Health Services (MHS)	58 (47.2)	65 (52.8)	
Community Case Management (CCM)	91 (74.0)	32 (26.0)	
Integrated Community Case Management (ICCM)	115 (93.5)	8 (6.5)	
Family Planning (FP)	58 (47.2)	65 (52.8)	

AValues in parentheses indicate % of total (n = 123). BIndicates row percentage. CIndicates Chi-square test of association between maternal health services provision and other group. Bold font indicates “significantly associated at  $p < 0.05$ ”.

According to the findings in table 3 above, majority of the CHWs at 93.5% have attended trainings on Integrated Community case management (ICCM) followed by 82.1% who had attended trainings on Community Health Strategy (CHS). In addition, trainings on Community Case Management (CCM) had been attended by 74.0% of the CHWs respondents while only 47.2% had attended trainings on Community Maternal healthcare services (MHS). The results revealed highly significant ( $p < 0.05$ ) between the CHV’s attendance of trainings and demand creation for skilled maternal health services in Siaya County.

#### Effect of training attended on demand creation for skilled maternal healthcare services:-

**Table 3.1:-** Multivariate logistic regression of trainings attended and demand creation for skilled maternal healthcare services

Variables	Yes, n (%)	Unadjusted odds ratio (95%CI)	Adjusted odds ratio (95%CI)
<b>Received Basic training on community health strategy</b>			
Yes	101 (82.01)	3.16 (4.21–2.87)**	2.24 (3.97–1.82)**
No	22 (17.91)	1.00	1.00

Furthermore, the findings of multivariate analysis above indicated that the CHWs had been trained on community health strategy (AOR=2.24, 95% CI: 3.97–1.82) were 2.24 times more likely to create demand for skilled maternal healthcare services in Siaya County as compared to those CHWs respondents who had not attended the training.

*“CHWs are trying their best although for effective mobilization of mothers for skilled maternal healthcare services, the CHWs should be trained on the maternal health module” (clinician – Akala dispensary)*

*“These CHWs have not been trained on the community maternal healthcare technical module and they are only relying on the scanty knowledge they received during the basic community strategy training” (clinician – Sikalame dispensary).*

Consistent with previous studies, the above findings also showed that for CHWs to be effective, they need to be properly trained in whatever intervention they are to implement, (Ashworth, 2006; Gallos et al., 2011; Senarath, Fernando, & Rodrigo, 2007)

#### CHWs experience in demand creation for skilled maternal healthcare services:-

The third objective of the study was to establish the CHWs experience on demand creation for skilled maternal healthcare.

**Table 4:-** CHWs experience in demand creation for skilled maternal healthcare services among the CHWs

Variables	Total, n (%)	P value
<b>Time serving as a CHV</b>		<b>0.0001</b>
Less than 1 year	9 (7.3)	
More than a year	114 (92.7)	
<b>Demand creation activities carried out by CHWs</b>		<b>0.0001</b>
Refer of women for skilled maternal health care	119 (96.7)	
Follow up of clients	90 (73.2)	
Community dialogue	31 (25.2)	
Action days	15 (12.2)	
<b>Frequency of visits to the health facility</b>		<b>0.002</b>
Weekly	71 (57.7)	
Monthly	10 (8.1)	
Whenever necessary	39 (31.7)	
Quarterly	3 (2.4)	

<b>Challenges faced by CHWs</b>		<b>0.005</b>
Negative staff attitude	95(77.2)	
Lack of Recognition	78 (63.4)	
Inadequate staff	98 (79.7)	
Lack of Technical support	81 (65.9)	
Inadequate meetings	61 (49.6)	
Inadequate resources (commodities)	101 (82.1)	
<b>Referral mechanisms for maternal health care services</b>		<b>0.0001</b>
Use referral notes	13 (10.6)	
Accompany the client	84 (68.3)	
Verbal referral	108 (87.8)	

AValues in parentheses indicate % of total (n = 123). BIndicates row percentage. CIndicates Chi-square test of association between maternal health services provision and other group. Bold font indicates “significantly associated at  $p < 0.05$ ”.

Experience contributes and enhances knowledge on demand creation. The study found that majority of the respondents at 92.7% cumulatively had taken more than a year offering demand creation services. The results revealed highly significant ( $p < 0.05$ ) positive relationship between the number of years that the respondents have taken to be CHWs and demand creation for skilled maternal health services in Siaya County.

*“One thing about most of our CHWs is that they have adequate experience. Some have been CHWs since I started working in this facility and I have worked for 8 years now” (nurse – Bondo hospital)*

With regard to demand creation services provided by CHWs, the findings showed that the services offered by CHWs at the community included; making referrals to the health facility, follow up of clients, community dialogue and action days which were accounted to by 96.7%, 73.2%, 25.2% and 12.2% respectively. The analysis revealed highly significant ( $p < 0.05$ ) positive relationship in the CHWs practice and demand creation for skilled maternal health services in Siaya County.

#### **Effect of CHWs experience on demand creation for skilled maternal healthcare services:-**

Multivariate analysis in table 4.1 below shows that, CHWs respondents who had taken more than one year serving as a CHV (AOR=1.79, 95% CI: 4.39–2.41) were 1.79 times more likely to provide maternal healthcare services in Siaya County as compared to those CHWs respondents who had taken less than a year serving as a CHV

**Table 4.1:-** Multivariate logistic regression of CHWs years of experience and demand creation for skilled maternal healthcare services

<b>Variables</b>	<b>Yes, n (%)</b>	<b>Unadjusted odds ratio (95%CI)</b>	<b>Adjusted odds ratio (95%CI)</b>
<b>Time serving as a CHV</b>			
Less than 1 year	9 (7.3)	1.00	1.00
More than a year	114 (92.7)	2.41 (2.51–3.41)**	1.79 (4.39–2.41)**

Similar to findings in other studies, the findings revealed a strong relationship between the challenges facing CHWs and their performance in demand creation for skilled maternal healthcare services (Iyer, 2013; Sanghvi et al., 2010). The findings above also concur with other findings which showed that shortages of commodities and necessary supplies affect CHWs performance (Beltman, 2013; Gebrehiwot, San Sebastian, Edin, & Goicolea, 2014; Javanparast, Baum, Labonte, & Sanders, 2011; Ndou, Van Zyl, Hlahane, & Goudge, 2013; Scott & Shanker, 2010).

#### **Discussions:-**

##### **CHWs Socio- Demographic Characteristics and demand creation for Maternal Health care Services:-**

The above findings are closely similar to findings of a previous studies which showed that the optimal age range of CHWs was 30 to 40years and that age, gender, marital status and education of CHWs had influence on performance (Crispin et al., 2012; Kok et al., 2015). Whereas the selection criterion for selection of CHWs in Kenya does not favour a particular gender, consistent with previous findings, this study also revealed that female community health workers are more engaged in the demand creation work than the males (Crispin et al., 2012; Viswanathan et al.,

2012). The results of this study are also in concurrence with previous studies which found out that females dominated the work of CHWs (Bang et al., 2005; Briend, Hasan, Aziz, & Hoque, 1989; Brown, R., Zumaran, & Miranda, 2006; Fauveau, Stewart, Khan, & Chakraborty, 1991; Hailu & Kebede, 1994).

Contrary to findings by (Crispin et al., 2012) that CHWs with lower literacy levels were able to satisfy and enable their clients effectively ; this study found out that compared to CHWs with lower literacy levels, those with higher level of education performed better. The findings on influence of workload on demand creation also conform to previous studies which indicated that for CHWs to be effective, they should cover certain optimal population size with an optimal range of services (Heunis et al., 2011; Kalyango et al., 2012; Prasad & Muraleedharan, 2007; Vichayanrat, Steckler, & Tanasugarn, 2013; Yan, Liu, Gruber, He, & Congdon, 2012)

#### **Effect of CHWs knowledge on demand creation for skilled maternal health care:-**

Knowledge of CHWs on maternal health was found to be varying greatly regarding different aspects of maternal health. Contrary to the recommendations from previous studies that CHWs should possess some basic knowledge with certain core skills to enable them execute their roles effectively (Haq, Iqbal, & Rahman, 2008; WHO, 2007), the findings showed that although the CHWs in Siaya County were expected to create demand for skilled maternal healthcare services, the majority had not been trained on maternal healthcare module. Consistent with previous findings, the low uptake of skilled maternal healthcare in Siaya County could be attributed to the knowledge gap amongst CHWs which could be compromising their ability to create demand for the skilled maternal healthcare services (Agrawal, 2012; Butawa, Tukur, Idris, Adiri, & Taylor, 2010; Chattopadhyay, 2004; Haq et al., 2008; Kok et al., 2015; Prata, Weirdert, Fraser, & Gessesew, 2013; WHO, 2007). As noted in (Kasl & Cobb, 2002), exposure to factors that prompt action and confidence in their ability to successfully perform an action influences peoples decisions and therefore the fact that the majority of the CHWs had inadequate knowledge on maternal health clearly indicates that they are also unable to coerce women to take up some important decisions on why skilled maternal health care is important.

#### **CHWs experience in demand creation for skilled maternal healthcare services:-**

The above findings also established that there were no schedules for facility visits and therefore each CHV decided individually on when to make a visit. Although 57.7% and 8.1% visited the health facility weekly and monthly respectively, the remaining 31.7% and 2.4% visited the health facility whenever necessary or quarterly respectively. The results on frequency of contact with the facility have revealed highly significant ( $p < 0.05$ ) positive relationship between frequency of facility visits and demand creation for skilled maternal health care services.

According to the above findings, it emerged that inadequate resource such as commodities is the greatest challenge faced by CHWs working with health providers at the link health facility. This was backed up by 82.1% of the CHWs respondents. Moreover, inadequate staff (79.7%) and negative staff attitude (77.2%) were also challenges faced by CHWs. Furthermore, lack of technical support was cited by 65.9% of the respondents while lack of recognition was cited by 63.4% of the CHWs. However, inadequate meetings was the least cited by 49.6% of the respondents. In addition, the results has established significant ( $p < 0.05$ ) positive relationship between the challenges faced by CHWs working with health providers at the link health facility and demand creation for skilled maternal health care services.

Although it is well stated in the community health services manual that CHWs should use referral notes, the findings of this study showed that there was no uniformity in ways in which CHWS do referrals for maternal health care services with only a small percentage using the recommended referral notes (10.6%) while the rest either accompanying the client (68.3%) or using verbal referral (87.8%). Moreover, there was a significant ( $p < 0.05$ ) positive relationship between the ways in which CHWS make referrals for maternal health care services and demand creation for skilled maternal health care services.

#### **Conclusion:-**

The findings of this study have shown very strong positive association between Knowledge, households covered (workload), CHWs practice and demand creation for skilled maternal healthcare services in Siaya County. In view of the above findings, strategies to increase demand creation for skilled maternal healthcare services are a priority for Siaya County. While initial basic training of CHWs on community health strategy may address the anticipated demand creation activities, over time the increasing scope of activities and tasks assigned to CHWs may lead to gaps in knowledge and incompetency in delivering specified tasks such as demand creation for skilled maternal

healthcare services. Therefore investment in ongoing training of CHWs in maternal health coupled with periodic mentorship and evidence based performance monitoring both at the health facility and the community would go along way in ensuring that CHWs have adequate knowledge and conform to set standards of practice while creating demand for skilled maternal healthcare services in Siaya County.

The evidence gathered by this study also suggests that individual work load has implication on performance and therefore reviewing the nature and workload of CHWs and instituting evidence based mechanisms for monitoring CHWs performance at household level would enhance their effectiveness in demand creation for skilled maternal healthcare services. The findings have implications on context specific evidence based programming for maternal health care in Siaya County and highlight the need for adopting multiple context specific interventions if utilization of skilled maternal healthcare services is to be optimized in Siaya County.

**Declarations:-****Acknowledgements:-**

Authors would like to acknowledge Department of Health, Siaya County, Skilled health providers and community Health workers in Siaya County, Research assistants, and all the participants who participated in this study.

**Ethical considerations:-**

Ethical clearance was obtained from Research Ethics Committee of University of Eastern Africa, Baraton, Eldoret (REC: UEAB /05/02/2015). The research assistants were trained on research ethics. Informed written consent from the study participants was obtained and the objective of the study was explained to them. Privacy and confidentiality of collected information was ensured at all levels.

**Consent to publish:-**

Consent to publish was obtained from Research Ethics Committee of University of Eastern Africa, Baraton, Eldoret (REC: UEAB /05/02/2015).

#### Abstract

The interspecific relationship between twenty one different *Curcuma* species was studied using MaturaseK gene (*matK*). Various *Curcuma* species are widely exploited for its medicinal, ornamental and other purpose. Floral plasticity in vegetative characters and developmental portion of inflorescence is widely utilized in morphology based classification which leads to erroneous conclusions makes DNA barcoding an essential tool for deciphering the correct identify and polylogenetic relationship between the species. The sequence of *matK* gene of *Curcuma* sp with no barcode gaps were cloned, sequenced and submitted in the Genbank and used for the phylogenetic study. The intra and interspecific divergence between the species assessed by using K2P of MEGA 6.0. The sequence alignments were performed using Clustal W, transition/transversion rates were predicted and phylogenetic tree was constructed using MEGA 6. Phylogenetic tree was designed to identify the ideal regions of *Curcuma* species for defining inter and intra-species relationships. The phylogenetic analysis using MEGA 6.0 provided two groups with the second group having two subclades. The study revealed the potential of *matK* gene as a good candidate gene for phylogenetic analysis of the genus *Curcuma*.

#### Introduction:-

The genus *Curcuma* L. (Zingiberaceae) comprises of 120 species, widely used is spices, medicines, dyes and as ornamental plants (Skornickova et al., 2007). It is distributed in Asia, Australia and South Pacific (Larsen, et al., 1998; Wu and Larsen, 2000; Ye, et al., 2008; Chen and Xia, 2010). Twenty species and one variety have been reported from South India (Sabu 2006). The taxonomic identification of the genus is difficult and displays certain systematic problems due to morphological variation at the intraspecific level. The flowering season of *Curcuma* species is short and the floral morphology has higher similarity among the species, but differs in colors and inflorescence positions (Bakhuizen van den Brink, Jr 1968; Burt, 1972). Phenotypic plasticity of the species can lead to wrong taxonomic treatment and identification of individuals. According to Kress et al., (2002), nuclear and plastid (ITS & *matK*) genes can be used for phylogenetic analysis of *Curcuma* (Zingiberaceae) species.

The constructed phylogenetic trees can be used to study the evolutionary history of living organism and also provide the evidence of climatic and geological history of the earth. A phylogenetic tree displays the relationship of taxonomic groups in a hierarchical order (Futuyma, 2005). Molecular phylogenetic methods are mainly used in the perspectives of biological systematics, and are used for a wide variety of application, such as community ecology

(Webb et al., 2002) proteomics, as well as inference of protein–protein interactions (Pazos and Valencia, 2001). Zheng and Xia (2010) used two sequences of ITS and *matK* to study the phylogenetic evolution of the tribe Zingiberaceae. Phylogenetic relationships between *Curcuma* species was studied using the cytological data (Chen et al., 1984) and RAPD fingerprinting (Xiao et al., 2000, Rajeshkumar et al., 2016). Ngambriabsakul et al., (2004) observed that *Curcuma* is a paraphyletic genus in which infrageneric relationships are more complicated.

For the identification of species variation DNA barcodes are being utilized (Hebert et al., 2003). They are small size DNA of the organelle or nuclear genome with high discriminatory power among the organisms. DNA barcodes have multifarious role in the identification of the plants having problematic taxonomic identity for biodiversity investigation, the identification of cryptic or polymorphic plant species, food adulterants and forensic sample etc .

The *matK* gene is one of the protein coding regions of plastid which is widely used to decipher the coding regions of DNA (Wolfe, 1991). This chloroplast gene is 1500 bp long, located within the intron of the *trnK* and codes for maturase like protein (Wolfe et al., 1992). This gene has high substitution rates within the same species and is a potential candidate to study plant systematics and evolution (Notredame, 2000). The polymorphism of chloroplast DNA regions comprising *trnK*, *matK* and intergenic *trnL-trnF* have been used to study the phylogenetic evolution of various plants species (Wolfe, 1987). Studies using *matK* gene are used to resolve intergeneric or interspecific relations among flowering plants, like Malpighiaceae (Cameron et al., 2001), Poaceae (Liang and Hilu, 1996), Cornaceae (Xiang et al., 1998), Nicotiana (Aoki and Ito 2000), Orchidaceae (Goldman et al., 2001; Salazar et al., 2003) and in many other angiosperms (Hiluet al., 2003).

This paper reports the elucidation phylogenetic relationships between 21 different species of *curcuma* by using the chloroplast *matK* gene sequence.

## Materials and Method:-

### Collection of Samples:-

Twenty one different *Curcuma* species including one variety were collected from different regions of South India. These plants were maintained in Department of Botany, University of Calicut, and the leaf samples were used for DNA extraction.

### DNA Isolation and Purification:-

Genomic DNA was isolated from fresh *Curcuma* leaves using modified CTAB method (Doyle and Doyle, 1987). Extraction buffer contained 2 % (w/v) CTAB, 1M Tris–HCl (pH 8), .5M EDTA (pH 8) and 5 M NaCl. The samples were powdered in liquid N<sub>2</sub> and the powder was transferred to pre-heated (65° C) CTAB buffer. 2% (w/v) of PVP was added at the time of homogenization. Proteinase K (10 mg/ml) and 2 % (w/v) β-mercaptoethanol were added to the extract and mixed well. Samples were incubated at 60°C for 60 min with frequent mixing. The extract was centrifuged at 4°C for 12 min at 12,000 rpm and the supernatant was collected in a new Eppendorf tube. Added equal volume of chloroform: isoamyl alcohol (24:1) to the supernatant and centrifuged at 4°C for 12 min at 12,000 rpm. The supernatant was extracted twice with equal volume of phenol: chloroform: isoamyl alcohol (25:24:1), followed by extraction with chloroform: isoamyl alcohol (24:1), and centrifuged at 12,000 rpm 4°C for 12 min. The supernatant was transferred to a fresh Eppendorf tube and one by third volume of chilled isopropyl alcohol was added, and incubated for one hour at -80°C. The sample was centrifuged at 4°C for 12 min. at 12,000 rpm and the pellet was dissolved in TE. 10µl of RNase was added to dissolve DNA sample. Incubated at 40°C for 30 min and added equal volume of chloroform: isoamyl alcohol (24:1) mixed well and centrifuged at 4°C for 12,000 rpm. The upper layer was transferred to a fresh Eppendorf tube and added chilled isopropyl alcohol and mixed well. The samples were incubated at -80°C for one and half hours and centrifuged at 4° C for 12 min at 12,000 rpm to pellet the DNA. DNA pellet was washed with 70 % (v/v) chilled ethanol and air dried at room temperature and re-dissolved in 20 µl TE buffer. This purified DNA was stored at -80°C.

### Quantitative and qualitative assessment of DNA samples:-

Quality and quantity of DNA samples were assessed using a nanodrop spectrophotometer (Thermo, USA). The samples were run on 1 % (w/v) agarose gel and visualized to assess the DNA quality using a gel documentation system.

### PCR amplification:-

The PCR reactions were conducted in a final volume of 25 µl containing 10x Buffer 2.5µl, Taq DNA Polymerase (1µl), dNTP mix (10mmol), MgCl<sub>2</sub>(50mmol), Forward primer (88.4nmol), Reverse primer (72.4nmol), Template
