$$= \sum_{\substack{h_1 k_1 + \dots + h_r k_r \leq L \\ k_1, \dots, k_r = 0}} (-L) A(L; k_1, \dots, k_r) \frac{c_1^{k_1}}{k_1!} \dots \frac{c_r^{k_r}}{k_r!} \frac{(-1)^{q+r+\sigma-1}}{\Gamma(r-q)} \frac{d^r}{dz^r} \left\{ z^{\rho+\sigma-q+r-\sum_{i=1}^r k_i \delta_i - 2} \right. \\ \times I_{p_i+2, q_i+1; r}^{m+1, n+1} \left[ yz^{\mu+\nu} \left| \begin{array}{l} (2-\sigma-h_1 k_1 - \dots - h_r k_r + q, \nu), (a_j, e_j)_{1, n}; (a_{j_i}, e_{j_i})_{n+1, p_i}, (1-\rho-\sum_{i=1}^r k_i \delta_i, \mu) \\ (2+q-\rho-\sigma-\sum_{i=1}^r k_i \delta_i, \mu+\nu), (b_j, f_j)_{1, m}; (b_{j_i}, f_{j_i})_{m+1, q_i} \end{array} \right. \right] \right\}$$

In replacing of  $(q - r)$  by  $q$ , we may obtain again

$$= \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-\sum_{i=1}^r k_i \delta_i - 2} \sum_{\substack{h_1 k_1 + \dots + h_r k_r \leq L \\ k_1, \dots, k_r = 0}} (-L) A(L; k_1, \dots, k_r) \frac{c_1^{k_1}}{k_1!} \dots \frac{c_r^{k_r}}{k_r!} \\ \times I_{p_i+2, q_i+1; r}^{m+1, n+1} \left[ yz^{\mu+\nu} \left| \begin{array}{l} (2-\sigma+q, \nu), (a_j, e_j)_{1, n}; (a_{j_i}, e_{j_i})_{n+1, p_i}, (1-\rho-\sum_{i=1}^r k_i \delta_i, \mu) \\ (2+q-\rho-\sigma-\sum_{i=1}^r k_i \delta_i, \mu+\nu), (b_j, f_j)_{1, m}; (b_{j_i}, f_{j_i})_{m+1, q_i} \end{array} \right. \right]$$

**Special Case :** If we put  $r=1$  in the general call of multivariable polynomials given by Srivastava and Garg [1987] reduces to the polynomials given by Srivastava [1972] and I- function reduces into Fax’s H – function as follows :

$$(4.1) \quad {}_z W_\infty^q \left\{ {}_z W_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p, q}^{m, n} \left[ yx^\mu (x-z)^\nu \left| \begin{array}{l} (a_1, e_1)_{1, p} \\ (b_1, f_1)_{1, q} \end{array} \right. \right] \right\} \right\} \\ = \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-k-2} \sum_{k=0}^{[L, k]} \frac{(-L)_{hk}}{k!} A_{L, k} \times H_{p+2, q+1}^{m+1, n+1} \left[ yz^{\mu+\nu} \left| \begin{array}{l} (2-\sigma+q, \nu), (a_j, e_j)_{1, p}, (1-\rho-k, \mu) \\ (2+q-\rho-\sigma-k, \mu+\nu), (b_j, f_j)_{1, q} \end{array} \right. \right]$$

Replacing  $\nu$  by  $-\nu$  equation (3.3) correspond to the following result according as  $\mu > \nu$ ,  $\mu < \nu$  and  $\mu = \nu$ , i.e. for  $\mu > \nu$

$$(4.2) \quad {}_z W_\infty^q \left\{ {}_z W_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p, q}^{m, n} \left[ yx^\mu (x-z)^{-\nu} \left| \begin{array}{l} (a_1, e_1)_{1, p} \\ (b_1, f_1)_{1, q} \end{array} \right. \right] \right\} \right\} \\ = \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-k-2} \sum_{k=0}^{[L, h]} \frac{(-L)_{hk}}{k!} A_{L, k} \\ \times H_{p+1, q+2}^{m+2, n} \left[ yz^{\mu-\nu} \left| \begin{array}{l} (a_j, e_j)_{1, p}, (1-\rho-k, \mu) \\ (2+q-\rho-\sigma-k, \mu-\nu), (\sigma-q-1, \nu), (b_j, f_j)_{1, q} \end{array} \right. \right]$$

For  $\mu < \nu$

$$(4.3) \quad {}_z W_\infty^q \left\{ {}_z W_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p, q}^{m, n} \left[ yx^\mu (x-z)^{-\nu} \left| \begin{array}{l} (a_1, e_1)_{1, p} \\ (b_1, f_1)_{1, q} \end{array} \right. \right] \right\} \right\} \\ = \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-k-2} \sum_{k=0}^{[L, h]} \frac{(-L)_{hk}}{k!} A_{L, k} \\ \times H_{p+2, q+1}^{m+1, n+1} \left[ yz^{\mu-\nu} \left| \begin{array}{l} (\rho+\sigma-q+k-1, \nu-\mu), (a_j, e_j)_{1, p}, (1-\rho-k, \mu) \\ (\sigma-q-1, \nu), (b_j, f_j)_{1, q} \end{array} \right. \right]$$

and  $\mu = \nu$

$$\begin{aligned}
 (4.5) \quad & {}_zW_\infty^q \left\{ {}_zW_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p,q}^{m,n} \left[ yx^\mu (x-z)^{-\nu} \left| \begin{matrix} (a_1, e_1)_{1,p} \\ (b_1, f_1)_{1,q} \end{matrix} \right. \right] \right\} \right. \\
 &= \frac{(-1)^{q+\sigma-1} \Gamma(2-q-\rho-k)}{\Gamma(-q)} z^{\rho+\sigma-q-k-2} \sum_{k=0}^{[L,h]} \frac{(-L)_{hk}}{k!} A_{L,k} \\
 &\times H_{p+1,q+1}^{m+1,n} \left[ y \left| \begin{matrix} (a_j, e_j)_{1,p}, (1-\rho-k, \mu) \\ (\sigma-q-1, \nu), (b_j, f_j)_{1,q} \end{matrix} \right. \right].
 \end{aligned}$$

Finally writing  $-\mu$  instead of  $\mu$ , equation (3.3) yields the following results according as  $\mu > \nu$ ,  $\mu < \nu$  and  $\mu = \nu$  respectively.

For  $\mu > \nu$

$$\begin{aligned}
 (4.6) \quad & {}_zW_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p,q}^{m,n} \left[ yx^{-\mu} (x-z)^\nu \left| \begin{matrix} (a_1, e_1)_{1,p} \\ (b_1, f_1)_{1,q} \end{matrix} \right. \right] \right\} \\
 &= \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-k-2} \sum_{k=0}^{[L,h]} \frac{(-L)_{hk}}{k!} A_{L,k} \\
 &\times H_{p+2,q+1}^{m,n+2} \left[ yz^{-\mu+\nu} \left| \begin{matrix} (q-\rho-\sigma-k+1, \mu-\nu), (2+q-\sigma, \nu), (a_j, e_j)_{1,p} \\ (b_j, f_j)_{1,q}, (\rho+k, \mu) \end{matrix} \right. \right]
 \end{aligned}$$

for  $\mu < \nu$

$$\begin{aligned}
 (4.7) \quad & {}_zW_\infty^q \left\{ {}_zW_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p,q}^{m,n} \left[ yx^{-\mu} (x-z)^\nu \left| \begin{matrix} (a_1, e_1)_{1,p} \\ (b_1, f_1)_{1,q} \end{matrix} \right. \right] \right\} \right. \\
 &= \frac{(-1)^{q+\sigma-1}}{\Gamma(-q)} z^{\rho+\sigma-q-k-2} \sum_{k=0}^{[L,h]} \frac{(-L)_{hk}}{k!} A_{L,k} \\
 &\times H_{p+1,q+1}^{m+1,n+1} \left[ yz^{-\mu+\nu} \left| \begin{matrix} (2-\sigma+q, \nu), (a_j, e_j)_{1,p} \\ (2+q-\rho-\sigma-k, \nu-\mu), (b_j, f_j)_{1,q}, (\rho+k, \mu) \end{matrix} \right. \right]
 \end{aligned}$$

and for  $\mu = \nu$

$$\begin{aligned}
 (4.8) \quad & {}_zW_\infty^q \left\{ {}_zW_\infty^q \left\{ x^{\rho-1} (z-x)^{\sigma-1} S_L^h [x^k] \times H_{p,q}^{m,n} \left[ yx^{-\mu} (x-z)^\nu \left| \begin{matrix} (a_1, e_1)_{1,p} \\ (b_1, f_1)_{1,q} \end{matrix} \right. \right] \right\} \right. \\
 &= \frac{\Gamma(2-\rho-k-\sigma+q)}{\Gamma(-q)} \frac{(-1)^{q+\sigma-1}}{z^{\rho+\sigma-q-k-2}} \sum_{k=0}^{[L,h]} \frac{(-L)_{hk}}{k!} A_{L,k} \\
 &\times H_{p+2,q+1}^{m+1,n+1} \left[ yz^{\mu+\nu} \left| \begin{matrix} (2-\sigma+q, \nu), (a_j, e_j)_{1,p}, (1-\rho-k, \mu) \\ (2+q-\rho-\sigma-k, \mu+\nu), (b_j, f_j)_{1,q} \end{matrix} \right. \right].
 \end{aligned}$$

#### Abstract

**Background:** Bowel obstruction (BO) describes as "failure of passage of intestinal contents", it's common surgical emergency and a major cause of morbidity , during last twenty years there was a huge development in radiological techniques used to diagnose bowel obstruction . This study aimed to compare reliability between abdominal plain radiography and CT for detection of suspected cases.

**Method:**A retrospective study including 261 patients suspected SBO who underwent CT scan and abdominal x-ray in king Abdulaziz University hospital, during the period from May 2016 to November 2016.

**Results:**From 261 patients suspected BO,119 (45.6%) were male and 142 (54.4%) female, with mean age score  $56.3 \pm 17.7$ , 132 (50.8%) were presented as abdominal distension , follow by 129 (49.6%) abdominal pain, 69 (26.5%) as vomiting , 61 (23.4%) as constipation, and 11(4.2%) as diarrhea ,from the total number 78 (29.9%) cases reported as positive intestinal obstruction by CT , where 154 (59.4%) cases reported as suspected intestinal obstruction by x-ray .

**Conclusion:**The early precise diagnosis of bowel obstruction helps in decreasing the morbidity and mortality rate. Plain abdomen radiography is suitable technique in the emergency cases and follow up tool after operation , however CT scan is the more accurate technique.

#### Introduction:-

Bowel obstruction (BO) describes as "failure of passage of intestinal contents", (1)it's common surgical emergency and a major cause of morbidity which requires a correct diagnosis and rapid management . (2)It could be mechanical or paralytic in origin, it is classified in to two types; large and small intestinal obstruction where 60-80% of the cases had small bowel which is mechanical in nature in the majority of the cases. (3 , 4)

A multidisciplinary approach includes; familiarity of pathophysiology, clinical skills and the accurate imaging of choice are needed to reach the correct diagnosis, (5)majority of bowel obstruction cases diagnosed based on plain radiography and it has been the initial diagnostic test since it characterized by fast accessibility, easily to perform and low priced more over it has specific key features of BO. Although plain X-ray is the initial test, CT scan is the gold standard in diagnosing BO and added the advantage of detect the site and the cause of obstruction. Since imaging has a crucial role in management plan, the purpose of the study is to compare the reliability between

abdominal plain radiography and CT for detection the suspected cases clinically with obstruction, and to evaluate optimal radiological modality or identifying new criteria for early assessment, hence allow fast intervention. (1,3,4,5,6).

### Material and Methods:-

A retrospective study including 261 patients suspected SBO who underwent CT scan and abdominal x-ray in King Abdulaziz University hospital. Comparing CT scan and abdominal x-ray with a maximum time of 72 hours between each one for the accuracy of diagnosis. We reviewed the electronic files from hospital medical record. Data sheet items included personal data (age, gender, MRN), X-ray images had been reviewed for detection of 3 specific signs for each radiograph which were; air fluid number, paucity of gases and diameter of the largest bowel, where diameters guided by 3/6/9 rule. Each CT scan reviewed and confirmed by reports with focusing on: contrast administration route, the presence of obstruction, its sites and complications if present. The most important question was if there is an obstruction by CT, all specific signs of both CT and radiograph were taken. If the CT was non-diagnostic for intestinal obstruction, only x-ray specific signs were recorded.

### Result:-

This study included 261 patients suspected SBO, of which 119 (45.6%) were male and 142 (54.4%) female, with mean age score  $56.3 \pm 17.7$ . (Table 1)

**Table 1:-**Demographic data.

Variables	N	%
<b>Gender</b>		
Male	119	45.6
Female	142	54.4
Variables	Mean $\pm$ SD	Rang (min-max)
Age	56.3 $\pm$	(17-90)

The clinical presentation and radiology findings, 132 (50.8%) were presented as abdominal distension, followed by 129 (49.6%) abdominal pain, 69 (26.5%) as vomiting, 61 (23.4%) as constipation, 45 (17.3%) as intestinal obstruction, and 11 (4.2%) as diarrhea, from the total number 78 (29.9%) cases reported as positive intestinal obstruction by CT, where 154 (59.4%) cases reported as suspected intestinal obstruction by x-ray (Table 2)

**Table 2:-**Type of presentation:

Variables	N	%
<b>Type</b>

The x-ray findings showed the mean score of diameters was  $4.9 \pm 1.7$  rang (2.4-10.0) where 44.8% of the cases reported diameters measurement between 4.0-6.0 , the median score of air/fluid levels was 4 (0-6) where 19 (28.4%) cases reported air fluid level between 5.0-9.0 and 10 (13.9%) between 3.0-4.0 . More than two third of the patients (107 cases -69 %) reported no paucity bowel gases followed by 25 patients (16.1%) cases in all over the abdomen. (Table 4).

	No	10 (13.0%)	96 (52.7%)	

## Discussion:-

### Bowel obstruction:-

Bowel obstruction is a critical clinical condition and responsible of 20% of surgical intervention due to acute abdominal condition. (4)

The current study results showed that the most common symptoms was abdominal pain , abdomen distension and constipation , this consistent with the results of previous study , ( 1,4,7)The diagnosis of BO is a real challenging where it has variety in symptoms and signs regarding the nature of presentation (acute or subacute) , complete obstruction or partial , and if it is simple or there is complication such as strangulation or perforation. (3,5)

### Radiology modalities:-

During last twenty years , there was a huge development in radiological techniques used to diagnose BO , where the most important step is to choose the most suitable method to detect the medical condition and provide the correct diagnosis, (3,5) The current study focused on comparing between abdominal plain radiography and CT for detection BO, where from 260 patients suspected patients with BO, only 68 patients diagnosed with BO and confirmed by CT & abdominal plain radiography , 86 cases were suspected by radiograph and negative in CT, while 10 cases showed normal finding in radiograph but they were diagnosed as BO by CT , similar results were found in others studies where the authors reported that CT scan comparing with has higher sensitivity (93%) , specificity (100%) & accuracy (93%)while plain abdominal radiography could misdiagnosis 20% of the cases.(1,2,3,4)

### Abdominal plain radiography:-

Plain abdominal radiography was the first radiology technique used with physical examination to diagnose BO since 1920 , (5) with reliability level between 46-86 % , (1,5,6) this disparity in reliability between studies was due to several factors such as study design, picking participants , use of the term “non-specific bowel gas pattern,” , involved patients with recent abdomen surgery,(6)the result of current study consistent with previous study where 44% of the cases were diagnose by plain abdominal radiography.

Several studies conduct to evaluate the use of plain abdominal radiography as diagnostic tool of BO. These studies demonstrated the use of plain abdominal radiography as the primary evaluation tool in detecting BO among suspicion cases presented to ER ,(1,6,8)where the advantages of this technique are :lower cost, availability , easy access, high sensitivity in detecting high grade obstruction and the ability of using it to follow the progress after surgical intervention. (1,4,6,9,10),The main signs of BO in on abdominal radiographs were " distended small bowel loops of greater than 3 cm , paucity of air in the large bowel, collapsed colon, differential air-fluid levels, and thickened bowel wall", (1,5), the results of the current study agreed with previous study where more than tow third showed dilated more than 3 cm , more than half showed air fluid level longer than 2.5 cm and all 67 suspected cases with BO and performed plain abdominal radiography showed paucity abdomen ,

On the other hand several studies reported that performed plain abdominal is confusing & uncertain in detecting BO (5) where a few limitations were recorded on this tool: unable to detect cause unless in inguinal hernias, and gallstone ileus (5,11), the imagine could be normal in early obstruction and in low grade obstruction, (1,4,12) these limitations made researchers emphasize on the need to perform CT scan in the cases of high suspicion of BO even with negativradiography imagine. (1)

### **Computed tomography (CT):-**

In1979 CT scan was invention , since then it became one of the important radiology technique in diagnosis of BO.(5)CT scan could be categorized toroutine abdominal CT, CT enteroclysis (CTEc), and CT enterography (CTE). (6), Routine abdominal CT is the most commonmethod using in diagnosis of BO because it is fast and could be run without oral contrast where "the retained intraluminal fluid serves as a natural negative contrast agent"this mean it could be used with patients suffered from nausea and vomiting without fearing from contrast's aspiration . (3,6) however in the cases of partial obstruction oral contrast need to be given and in low grade partial obstruction CTE is preferred more than routine CT because it is provide better evaluation to BO . (3,6,13)

There are five major questions in BO cases where CT provide doctors with the answer of them which make it a valuable tool in diagnosis of BO: (Is there an obstruction in the bowel?, Where is the transition point (TP)?What is the cause?, What is the severity degree ?,Is it simple or complicated?). (2,4)

Bowel obstruction diagnosed by CT when "the small bowel is dilated to a caliber of more than 2.5 cm with a distinct point of transition and normal caliber bowel beyond". (5,14)

Regarding the question of transition point (TP) , it is look like a beak and specified by "identifying a caliber change between the dilated proximal and collapsed distal small bowel loops".(4,5,11,15)

Concerning the question of the cause of obstruction , The main causes of BO in this study were mechanical, neoplasm, and idiopathic , where the evaluation of transition point is essential to identify the real cause , (3)similar results were found in India study the main cause were Intestinal adhesion and tumor (1269), and in Pakistan study were adhesions 29 (40%), neoplasm 12 (17 %) and hernias 7 (10%). (2970), where adhesions reported mostly in patients with history of previous abdomen surgery and it responsible of 60-80% from small BO cases. (1,16)

Determination of severity degree of BO either it is complete or partial rely on 3 factors: " distal collapse, proximal bowel dilatation, and the transit of contrast", (4)If the oral contrast material pass through TP to the collapsed distal bowel this mean partial obstruction, if there was minimal contrast in the distal loops this mean high grade, while if there was adequate contrast flows across the transition point this mean low grade. (2,3,17)

In the case of simple BO the blood flow continue in order, (4)on the other hand there are several serious complications of BO(perforation, ischemia, closed loop obstruction and Strangulation) threaten life in the case of delay diagnosis , (1,3,4), in the current study only 8 cases reported complication 2 as ischemia and 6 as perforation . Each of this complication has different presentation in CT image which helped in diagnosing and differentiate between these medical condition, CT signs of strangulations are " poor or no contrast enhancement of bowel walls , target sign , mesenteric vasculature engorgement, and mesenteric congestion ", (5,18)while in closed-loop obstruction the signs are " distended bowel with radial mesenteric vessels with medial conversion ", in ischemia cases CT signs are "thickened intestinal walls and poor flow of contrast material into a section of bowel ",(1)and in necrosis and perforation, the main signs are " pneumatosis intestinalis, free intraperitoneal air, and mesenteric fat stranding ". (1)

However as all other radiology modalities there are few limitations of CT scan , (3,5)superficial lesions cannot precisely be seen, which make the diagnosis of low-grade or sub-acute obstructions difficult and need to be combine with contrast study particularenteroclysis(5,19).Also the high dose of radiation is consider a big limitation in using CT scan specially between children, pregnant women and patients inflammatory bowel diseases (IBD) who need for recurrent imaging examination , however the new generation of multidetector CT (MDCT) scan combining with pediatric protocols showed significant influence in decreasing the radiation dose.(19,20,21,22,23)All of these limitations led the researcher to emphasize on the fact that CT scan is not a first line method to diagnose BO and it

should use only in equivocal cases where there is no previous history of surgery or hernias and there is a high suspicion of complication. (1,3)

### Conclusion:-

The early precise diagnosis of bowel obstruction helps in decreasing the morbidity and mortality rate. There are many radiology modalities help in the diagnosis where each modality has advantages and limitations . Plain abdomen radiography is suitable technique in the emergency cases and following after operation , however CT scan is the more accurate technique . Further studies need to be conducted to compare between these two technique and other modalities to provide more information to help doctors and radiologist in choosing the appropriate technique regarding the situation.

#### Abstract

Nitrite Oxide (NO) is a molecular mediator of many physiological processes including: Vasodilation, Inflammation, Immunity & Neurotransmission. But we can't measure Nitrite Oxide formation Directly by Griess assay so we use one of its stable non-volatile breakdown products: the Nitrite (NO<sub>2</sub><sup>-</sup>). In our paper we look into different factors that may change the Nitrite Oxide Quantification in Griess Assay reaction for in-vitro application including: Culture Media (DMEM, RPMI, MEM and RPMI-F12) & Anticoagulants (Heparin and Enoxaparin). This is done by comparing the results from a control Griess Assay against a Griess Assay with either Culture media or Anticoagulant. From the results we conclude that a) Culture Media produce similar results to Calibration curve. B) Griess assay is effected by Heparin and Enoxaparin.

#### Introduction:-

Nitrite Oxide (NO) is a molecular mediator of many physiological processes including: Vasodilation, Inflammation, Immunity & Neurotransmission. A number of methods exist for measuring Nitrite Oxide in biological systems; one of these is Griess Assay. But we can't measure Nitrite Oxide formation Directly by Griess assay so we use one of its stable non-volatile breakdown products: the Nitrite (NO<sub>2</sub><sup>-</sup>). [1]

The Griess assay is a chemical analytical test that is used to measure the levels of Nitrite. The Assay based on a chemical reaction which uses sulfanilamide and N-1-naphthylethylenediamine dihydrochloride under acidic conditions. Sulfanilic acid is quantitatively converted to a diazonium salt by reaction with nitrite in acid solution. The diazonium salt is then coupled to NED, forming an azo dye that can be spectrophotometrically quantitated based on its absorbance at 540 nm. Thus it detects NO<sub>2</sub><sup>-</sup> in a several biological and experimental liquids such as plasma, serum, urine and tissue culture medium. [2]

**Figure.1:-** Principle of Nitrite Quantitation using Griess reaction. [1]

#### Objective:-

In our paper we shall look into different factors that may change the Nitrite Oxide Quantification in Griess Assay reaction for in-vitro application including:

1. Culture Media:DMEM , RPMI , MEM and RPMI-F12.
2. Anticoagulants including Heparin And Enoxaparin.

#### Method:-

Heparin and Enoxaparin (Low Molecular Weight Heparin ) will be used to determine if these have any effect on Griess assay.

#### To do our projects first we need to make a couple of solutions:-

Stock solution A ( 50 ml ) which is composed of :

1. 0.4 % NED.(200mg in 50ml).
2. 4% Sulphanilamide.(2g in 50ml).
3. 10% Phosphoric acid ( 6ml of 85% stock )

#### Solution B ( 15ml ) which is composed of:-

4. 3ml Stock Solution A.
5. 12ml MilliQ water.

#### Method for Traditional Griess Assay Curve:-

1. We Added 100  $\mu\text{l}$  of 5mM Sodium Nitrite to all wells of column 1 of a 96 well-plate.
2. Then we Added 100  $\mu\text{l}$  of MilliQ water media to each of all remaining wells.
3. After that we serially dilute (1:2) sodium Nitrite across the plate.
4. Add 100  $\mu\text{l}$  Solution B to all wells on the 96-well plate.
5. Finally we measured the absorbance at  $\lambda_{\text{abs}}=540\text{nm}$  ( or 570nm ) by using a plate reader .

#### Variations:-

Replace MilliQ water and add Culture Media / Heparin solution / Low Molecular weight Heparin in its place to detect changes.

**Figure 2:-** Representation of the 96 well-plate. Left is the highest concentration of Nitrate serially diluted to the right. Three rows were used and averaged to maintain lower chance error.[3]

For the results we shall compare culture media, heparin solution and enoxaparin solution to the Traditional Curve which is used as control.

**Results:-**

We will use graphs & Linear equations to represent the results. First, we will look at Traditional Curve which will be compared to the rest of the results. Then we will look at culture media & heparin results.

Initial results on Traditional curve showed that the absorbance on the spectrophotometer is not accurate at higher concentrations (1.5uM to be specific) and thus we have lowered the Concentration to 0.3125 to be the highest concentration of Nitrate to maintain accuracy.

**Graph.1:-** Traditional Calibration Curve, which will be used as control.

Graph. 2 & 3:- RPMI and DMEM Culture Media, There is small difference between them and Calibration Curve.

Graph 4 & 5:- RPMI-F12 and MEM Culture Media, still similar to previous results.

**Graph. 6 & 7:0-** Heparin and Enoxaparin, from analysing the graphs and trendlines we found that Griess Assay is prone to interferences with Heparin and Enoxaparin and gives altered results.

#### **Conclusion:-**

From the results we conclude that a) Culture Media produce similar results to Calibration curve. B) Griess assay is effected by Heparin and Enoxaparin and gives altered results.

##### Key words:-

Type 1DM, Pediatric, Adolescents,  
 Saudi Arabia, Systematic Review

#### Abstract

**Introduction:** Saudi Arabia is ranked the 7th globally in number of children with T1DM and the 5th regarding the incidence. T1DM sequelae in children and adolescents involve both acute complications such as hypoglycemia attacks, and diabetes ketoacidosis (DKA). Long-term complications microangiopathies in the retina and kidney as well as dyslipidemia were reported.

**Objective:** we aimed to shed more lights on T1DM among Pediatrics and Adolescent patients in Saudi Arabia in a systematic way.

**Methodology:** A systematic search of published literature that has addressed T1DM in pediatrics and adolescents was carried out via the internet, using the medical database MEDLINE/PubMed, supported by the US National Library of Medicine. All published articles containing the words "Type 1 Diabetes", "IDDM", "adolescents", "children", "pediatric", in combination with "Saudi Arabia" as part of their title, as a keyword or as a reference in their abstract have been collected. Only full publications and original articles were included in the review process

**Results:** out of 54 articles, 27 were selected for this review. The number of children with T1DM in KSA is 16,100 cases. The incidence rate is growing by 3% yearly and Saudi Arabia ranked as 5th in incidence rate. The growth in incidence is driven by environmental factors rather than genetics. The clinical presentation at diagnosis includes polydipsia, polyuria and weight loss with high incidence of DKA. T1DM is commonly associated with autoimmune thyroiditis and coeliac disease. Glycemic control is an area for improvement to reduce both the acute and long term complications. T1DM is associated also with disturbance of lung function, hepatopathy and vitamin D deficiency among T1DM population. Overall, the quality of life for patients and their families were impacted negatively.

**Conclusion:** in such a devastating disease, more epidemiological studies are needed to screen the environmental factors that trigger the autoimmune response. Awareness campaigns and continuous medical

education is of utmost importance to detect the disease earlier before development of DKA. Multidisciplinary approach by highly trained diabetes management team should be enforced to improve patients' outcomes.

### **Introduction:-**

Type 1 diabetes mellitus (T1DM) is caused by insulin shortage because of autoimmune disease destroying the  $\beta$  beta cells of the pancreas. Globally, there is a worrying growth of T1DM in pediatrics. The trend toward more children developing T1DM has continued and as of 2015, more than half a million children are estimated to be living with type 1 diabetes. Whilst T1DM is much less common compared to type 2, it is still increasing by around 3% every year, particularly among children. The reasons for this are still unclear, but may be due to variations in ecological risk factors or pattern of viral infections. Around 86,000 children develop T1DM yearly and when insulin is not available, the life expectancy for diseased children is very short. [1]

Saudi Arabia, a country of almost 30 million population of which 26% are under 14 years old, ranked the 7th globally in number of children with T1DM.[1] In 2008, Al-Herbish AS et al. reported 109.5/100000 prevalence rate in pediatrics and teenagers.[2] Other forms of autoimmune disorders, such as celiac disease (CD) and thyroiditis (AIT), may increasingly affects T1DM patients.[3,4] Moreover, T1DM sequelae in children and adolescents involve acute complications such as hypoglycemia attacks, and diabetes ketoacidosis (DKA). Long-term complications microangiopathies in the retina and kidney as well as dyslipidemia were reported. [5] In this review, we aimed to shed more lights on T1DM among Pediatrics and Adolescent patients in Saudi Arabia.

### **Material and Method:-**

A systematic search of published literature that has addressed T1DM in pediatrics and adolescents was carried out via the internet, using the medical database MEDLINE/PubMed, supported by the US National Library of Medicine. The review was conducted to the time of January 2017. The methodology followed by the researcher for the process of selection of articles is presented in. The researchers conducted a review process and the discordances were resolved by consensus. At a first stage, all published articles containing the words "Type 1 Diabetes", "IDDM", "adolescents", "children", "pediatric", in combination with "Saudi Arabia" as part of their title, as a keyword or as a reference in their abstract have been collected. The initial search retrieved 54 articles. A group of filtering conditions was adopted to confine the search results, excluding case reports studies or not original papers. Finally, at the end selection process, the remaining 27 articles were examined in details.

### **Results:-**

#### **Epidemiology of Type 1 Diabetes Mellitus in Saudi Arabia:-**

As per diabetes atlas 7th edition, 16100 children suffer from T1DM in Saudi Arabia. Such number ranks Saudi Arabia as 7th globally in terms of numbers and 5th in terms of incidence rate. [1] In 2008, results of nationwide epidemiological survey was published showing that out of 45,682 children and adolescents surveyed, 50 has been identified as having T1DM which brings the prevalence rate to 109.5/100,000. The distribution of prevalence as per region and age group was variable with almost equal gender distribution. [2] The incidence rate showed dramatic increase of numbers over 18 years' study (1990-2007) of children <15 years old in Saudi Aramco Medical Services Organization. In the 1st 9 years of the study the incidence was 18.05/100,000 and got doubled in the 2nd 9 years to reach 36.99/100,000. [6]

#### **Etiopathogenesis:-**

The exact etiology of type 1 diabetes is unknown. However, it is suggested that it develops in individuals who are genetically susceptible, who come in contact with certain environmental factors, which trigger immune mediated destruction of the  $\beta$ -cell mass. The interplay between genetics, environmental triggers and immunological response involve a balance between susceptibility and protective factors in each category. [7,8] Among Saudi population, Human Leucocytic Antigen class II DQB1\*0201/0202-DRB1\*04 genotype was recognized as inclining to T1DM (P = 0.0002; odds ratio = 0.67; 95% CI = 0.009-0.381). On the other hand, high frequency of the DPB1\*0401 may designate a protecting effect of this combination of HLA alleles against T1DM in Saudis. [9]

Despite genetics as a contributing factor to the incidence of Type 1DM, yet it cannot explain the alarming increase in the incidence. Perhaps the environmental factors or triggers like viral infections are changing and leading to this

leap in incidence. [6] In a community based cross sectional study involving 11552 mothers answering a survey about consanguinity, 6470 (56%) ladies had consanguineous marriage with no significant relation to T1DM (P=.92). [10]

Autoantibodies are responsible for the pathogenesis of T1DM namely islet cell antibodies (ICA), insulin autoantibodies (IAA) and glutamic acid decarboxylase antibodies (GAD). In a study involved 98 children with T1DM in Riyadh between 2000-2007 to identify the prevalence of autoantibodies per age group and correlate between their occurrence and the severity of presenting symptoms. Results showed that among the study population (age range 1-12 years, mean: 6.6 years, equal sex distribution) 49% presented with diabetic ketoacidosis (DKA). ICA, IAA and GAD were identified in 67%, 36% and 84.4% respectively. ICA was predominant in preschool children. Children who showed positivity for GAD and ICA but not IAA had more severe clinical presentation. [11]

#### Clinical Presentation of Type 1 Diabetes Mellitus in Saudi Arabia:-

Few regional studies reported the clinical presentation of T1DM in Saudi Arabia including patients from Riyadh region in 1991. [12] Eastern provinces in 2001. [13] Al-Medina region in 2004. [14] North West region in 2011,[15] and Riyadh region 2011. [16] The table below summarizes the key presenting symptoms and signs:

**Table 1:-Clinical presentation of Type 1 Diabetes Mellitus in Saudi Children and adolescents**

Region	Mean Age in years	Male : Female	Polydipsia	Polyuria	Weight loss	Abdominal Pain	DKA	Vomiting
			N (%)	N (%)	N (%)	N (%)	N (%)	N (%)
Riyadh 110 pts	5.9	51:59					74 67.0%	
Eastern 46 pts.	9	1:1.5	36 78.3%	31 67.4%	28 60.9%	10 21.7%	35 77%	10 21.7%
Al-Madina 230 pts	6.9	111:119	221 96.0%	222 96.0%	176 76.6%	118 63.4%	127 55.2%	42 35.3%
NorthWest 311 pts	6.7	152:159	304 98.0%	305 98.0%	108 34.7%		172 55.3%	
Riyadh 369 pts	12.4	175:194	310 88.8%	321 92.0%	292 83.9%	172 49.3%	174 49.9%	52 14.9%

pts = patients, DKA = Diabetic ketoacidosis

Over all, the cardinal signs and symptoms are polyuria, polydipsia and weight loss whereas diabetic ketoacidosis seems to be less frequent than it is used to be. The time elapsed from the onset of symptoms till presenting to the clinic was few weeks if not days.

#### Autoimmune diseases Associated with T1DM in Saudi Arabia:-

Autoimmune thyroiditis whether overt or subclinical was recognized in 14% of patients.5 Celiac disease was described in 5 publications with varying incidence among T1DM children ranging from 4.9% -21.2% depending on the screening test used and confirmatory biopsy done. [5,17-20]

#### Management of Type 1 Diabetes Mellitus in Saudi Arabia:-

Two studies from King Abdul Aziz University (KAAU) hospital described the glycemic control of T1DM in pediatrics and adolescents. [5,21] The protocol for management of T1DM in children at KAAU hospital was outline by the author below. [21]

#### Insulin Regimens and Self-Monitoring Blood Glucose (SMBG):-

T1DM children were stratified by age to either conventional insulin regimen for patients <6 years or intensive insulin regimen for children >6 years and all adolescents. Conventional insulin therapy refers to utilizing 2 injections of premixed insulin /day before meals and guided with SMBG, insulin dosage was adapted per the glycemic control attained. Intensive insulin therapy refers to receiving 3 injections of rapid or short acting insulin /day prior to meals combined with either basal insulin bolus, or insulin pump to compensate for basal insulin.

#### Diabetes Education and Physical Exercise:-

Appropriate diabetes education means participation in  $\geq 1$  educational session /month. Proper physical exercise should last for  $\geq 30$  minutes/day whether indoors and outdoors 3-4 times/week.

The first study, published in 2011, was retrospective single visit that evaluated the glycemic control among T1DM children and adolescents at KAAU hospital from 2006 to 2010. A total of 484 subjects (male=213, female= 271),

mean age was 12.5±4.1 years. 38.6% of the patients were pre-pubertal and 61.4% pubertal. The overall mean A1c was 9.4±2.4% and 31.4% achieved satisfactory A1c as per American Diabetes Association (ADA) guidelines. The glycemic control of T1DM children in this cohort was less satisfactory because of physical inactivity and patients' educational. The following table depict the main factors contributed to better glycemic control. [21]

**Table 2:-**Comparison of well and poorly controlled T1DM children and adolescents according to the ADA guidelines [21]

	Well controlled	Poorly controlled	p value
	(n=152)	(n=332)	
Age (years)	10.3±4.1	13.4±3.6	< 0.001†
Gender (female)	89 (58.6)	182 (54.8)	NS
A1c (%)	7.2±0.5	10.4±2.3	< 0.001
Duration of T1DM (years)	2.4±1.2	3±1.3	< 0.05
Insulin regimen (intensive insulin therapy)	120 (79)	314 (94.6)	< 0.05
Compliance to educational activities	128 (84.2)	10 (3)	< 0.001
SMBG≥4 times/day	102 (67.1)	85 (25.6)	< 0.05
No physical exercise	61 (40.1)	264 (79.5)	< 0.001
Exercise (1 to 2/week)	67 (44.1)	57 (17.2)	< 0.001
Exercise (3 to 4/week)	24 (15.8)	11 (3.3)	< 0.001
Values are expressed as patients count and percentages (%) or as mean ±SD; NS: non-significant			

Later in 2015, a published cross-sectional study had included 228 T1DM subjects attending at the KAAU Hospital, Jeddah, Saudi Arabia from Jan. 2013 to Jan. 2014. Subjects mean age was 10.99 years, and the A1c level was 8.8%. pre-pubertal age groups had significantly better glycemic control (p=0.01) compare to pubertal age group. Within this study cohort, acute sequelae included DKA in 65.4% of patients, and hypoglycemia in 68.9%. Long-term complications were detected in patients including macroangiopathic changes in the retina (4.4%), microalbuminuria (16.2%), and dyslipidemia (8.3%). [5]

#### Complications of T1DM in Children and adolescents:-

Microalbuminuria is a surrogate marker for diabetic nephropathy in T1 DM pediatric patients. Among 409 T1DM children and adolescents the prevalence of microalbuminuria was 11.3%. in patients with T1DM duration ≥2 years, post-pubertal, elevated blood pressure and overweight Microalbuminuria was significantly higher. [22]

#### Other associated conditions:-

##### Pulmonary function:-

Lung function was evaluated in a group of 52 (26 male and 26 female) volunteer T1DM children within age range from 8-14 years (mean 12.05 ± 1.42 years), mean duration of disease of 5.25 ± 0.47 years, and mean glycosylated hemoglobin of 11.27 ± 0.31%. Pulmonary function in children with diabetes showed significant lower mean values of actual lung function parameters forced vital capacity (FVC), peak expiratory flow (PEF), and maximum mid expiratory flow rate (MMEF) compared to their projected standards. [23]

##### Hepatopathy:-

In adults, liver disease among diabetics ranges from 17% to 100%. A pediatric study performed over one year starting Nov. 2008 to evaluate liver diseases among T1DM pediatric subjects. 22 patients (21%) out of 106 had positive signs of liver affection either hepatomegaly in 10 patients or hyperechogenic liver in 12 patients. Patients with hyperechogenic liver had poorer glycemic control. Upon achieving better glycemic control, hepatopathy was reversible in 60% of patients at 6 months' follow-up. [24]

##### Vitamin D Deficiency:-

In a prospective cross-sectional study evaluating vitamin D deficiency had included 100 Saudi children with T1DM and 100 healthy controls from the pediatrics' department of, Security Forces Hospital, Riyadh, KSA from Jun. to Sept. 2010. 25OHD mean levels were meaningfully lower in the T1DM children compared to the controls (36.7 ± 14.3 nmol/l versus 44.8 ± 14.1 nmol/l). Overall, 84% of the T1DM children, and 59% of the control children were vitamin D deficient. [25]

Another study investigated whether deficiency of vitamin D can impact glycemic control or cardiometabolic complications in T1DM patients KSA. 301 young patients with T1DM in Jeddah during 2010-2013 were enrolled. Only 26.2% of subjects had a satisfactory A1c level. 25-hydroxyvitamin D [25(OH)D] mean level was 35.15. In males, it was inversely associated with frequency of hypoglycemia ( $p < 0.01$ ), BMI ( $p < 0.05$ ), diastolic blood pressure ( $p < 0.05$ ), and triglyceride levels ( $p < 0.01$ ), while in females, it was inversely associated with current age ( $p < 0.05$ ), age at diagnosis ( $p < 0.01$ ), and triglyceride levels ( $p < 0.01$ ). [26]

#### **Health-Related Quality of Life (HRQoL) in T1DM adolescents and their families:-**

In a study involving 315 adolescent patients (12–18 years old) and their caregivers, HRQoL of T1DM and its effect on the caregivers were evaluated. Patients reported a collective mean HRQoL score of 64.8, while caregivers reported significantly lower scores of 60.3 ( $p = 0.003$ ). “Worry” subscale had the lowest scores reported by both adolescents and parents. [27]

In another group, 214 adolescents (13-18 years) with T1DM were surveyed to assess HRQoL at Diabetes Treatment Center, Prince Sultan Military Medical City, Riyadh, KSA from Jun. to Sep. 2013. Factors associated with at least one poor HRQoL parameter were Female gender, repeated daily injection, T1DM >7 years, DKA and adolescents with poor glycemic control. [28]

#### **Discussion:-**

This is the first review on T1DM children and adolescents in Saudi Arabia. Based on the data we have reviewed regarding the prevalence and incidence of T1DM in KSA we can notice a tremendous increase in the incidence year after year that cannot be explained by genetic factors or high prevalence of consanguinity only and most probably environmental factors and triggers have a principal role in the pathogenesis of T1DM. In comparison to other Arab countries the variability in incidence can be explained by, in addition to infections, other environmental factors particularly change in nutritional habits, including high meat consumption, vitamin D deficiency, low breast-feeding and high intake of nitrites in processed meat might be playing a role as the highest incidence is mainly seen among rich countries. [29]

The cardinal signs and symptoms for T1DM were polydipsia, polyuria and weight loss. There is a trend towards decreased presentation with DKA however in comparison to data from United Kingdom showing DKA among newly diagnosed T1DM is almost 26%. [30] More effort is needed to diagnose T1DM earlier before development of DKA perhaps in the form of awareness campaigns and continuous medical education.

Several factors are affecting metabolic control among pediatric and adolescent age groups including age of patients, duration of the disease, compliance to SMBG physical exercise and educational activities. Hence a multidisciplinary approach is mandated to improve outcome in our patients. The interaction between poor diabetic control, prevalence of acute and long term diabetes complications, associated autoimmune diseases, associated conditions as well as insulin treatment impact the quality of life not only the patients but also their families and caregivers.

#### **Conclusion:-**

In conclusion, T1DM in pediatrics and adolescents is a devastating disease and more epidemiological studies are needed to screen the environmental factors that trigger the autoimmune response. Awareness campaigns and continuous medical education is of utmost importance to detect the disease earlier before development of DKA. Multidisciplinary approach by highly trained diabetes management team should be enforced to improve the outcome and prevent long term complications.

#### Abstract

Gold nanoparticles (AuNPs) was prepared via simple and green method by using polysaccharides as reducing and stabilizing agents at the same time. Hiren we used carboxymethylchitosan (CMCS) as a reducing agent for gold nanoparticle as well as capping agent. CMCS prepared based on our previous method by reacting chitosan with monochloroacetic acid in alkaline medium. AuNPs were prepared by using different concentrations of carboxymethylchitosan (0.2% w/v, 0.5% w/v and 1% w/v) at 100 °C for 1 hour. CMCS was characterized by using nitrogen content, carboxyl content and FTIR spectra. AuNPswas characterized by using UV spectrophotometry and TEM images. Finally, the cytotoxicity of the prepared AuNPs were evaluated using cell viability assay from MMT and IC<sub>50</sub> values compared with AuNPs prepared by chemical methods. The results shows that AuNPs have normal distributed with 15-25 nm particle size and its cytotoxicity was lowered when prepared by this green method and can use GNPs safely in contact medical treatment with skin.

#### Introduction:-

Metal nanoparticles preparation represents major area in nanoscale science and engineering to give unusual physical and chemical properties specially its catalytic activity, novel electronic and magnetic properties and their potential applications in bio nanotechnology[1, 2].

Metal nanoparticles generally prepared by chemical reduction of metal salts with chemical reducing agents such as citric acids, borohydrides, or other organic compounds[1, 3-5].These reducing agents cause cytotoxicity towards biological hazards. Green chemistry used to minimize or eliminate the waste and implement sustainable process [6].So that biological method used for prepare AuNPs.

Raveendran et al was the first team work used the green concept to prepare silver nanoparticles by using glucose as reducing agent and starch as capping agent [7]. Nanoparticles preparation via green method was evaluated from three aspects: solvent, reducing agent and capping agent[8].

Chitosan as inexpensive material with renewable sources used in several applications especially in cosmetics, pharmaceuticals, food and biotechnology [9, 10]. In the preparation of gold nanoparticles by using chitosan biopolymer, the  $\text{NH}_2$  groups used to stabilize gold nanoparticles [11, 12]. However precise control needed to avoid nanoparticles aggregations [11, 13]. Due to poor solubility of chitosan. Few papers found in the literature dealing with the direct application of chitosan and AuNPs nanocomposites.

Water-soluble chitosan derivative, O-carboxymethylchitosan (CMCS), not only has good solubility in water but also has unique properties (chemical, physical and biological) e.g. high viscosity, biodegradability, biocompatibility and low cytotoxicity. Herein chemical modification perform only on OH groups to form  $\text{OCH}_2\text{COOH}$ , which retain  $\text{NH}_2$  groups accessible for reaction i.e., O-CMCS has both COOH and  $\text{NH}_2$  groups used to stabilize AuNPs so that O-CMCS used as capping agent as well as reducing agent [14].

In the present study, we used simple and green method for gold nanoparticles preparation using carboxymethylchitosan as reducing agent and capping agent at the same time. No other chemical substances needed for the reduction process. We used aqueous solution in this process to avoid environmental hazards. UV spectrophotometry and TEM imaging used to characterize the prepared AuNPs. Finally, we evaluated the cytotoxicity of these nanoparticles compared with the AUGPs prepared by common chemical reduction.

## Experimental:-

### Materials:-

Chitosan (CS) (Aldrich, viscosity 1860cps, degree of deacetylation 79.0%). Sodium hydroxide (Modern Lab chemicals), monochloroacetic (Fluka), are used without further purification. Auric-chloride ( $\text{HAuCl}_4$ ) purchased from Aldrich and used without further purification, USA. All other chemicals and reagents were of analytical grade, and were used without further purification.

### Methods:-

#### Preparation of Carboxymethylchitosan:-

The carboxymethylation of chitosan (CMCS) was prepared as reported in our previous work [15, 16].

#### Preparation of Gold Nanoparticles (AuNPs):-

Gold nanoparticles were prepared by reduction of sodium citrate method as mentioned where [17, 18] with some slight modifications as follow: gold (III) chloride stock solution (1%) used to prepare 15mM, 20mM and 25mM respectively, followed by heating to  $95^\circ\text{C}$  under stirring on magnetic stirrer with heater. To this boiling solution add tri sodium citrate (1.5% w/v), and continue stirring until give red colour. Then we stored this solution at  $4^\circ\text{C}$  to be ready for use.

#### Finishing of Fabrics with Gold nanoparticles:-

The prepared gold nanoparticles (AuNPs) were applied on washed and dried fabrics using pad-dry-cure method.  $30 \times 30$  cm of fabrics were immersed in the gold nanoparticles (AuNPs) (0.005 -0.5 g/ml) solution containing acrylate binder (1%) for 30 min., and then it was passed through a padding mangle with 100% wet pick-up for all of the treatments. Then the fabrics were dried at  $80^\circ\text{C}$  for 5 min., followed by thermo-fixation for at  $140^\circ\text{C}$  for 3 min. Finally, samples washed and dried to be ready for characterization and antibacterial evaluation.

#### Characterizations of Gold Nanoparticles (AuNPs):-

- Fourier transform infrared (FT-IR) spectra of the samples were recorded by using an FT-IR spectrophotometer (Nexus 670, Nicolet, USA) in the region of  $4000\text{--}400\text{cm}^{-1}$  with spectra resolution of  $4\text{ cm}^{-1}$ .
- UV-vis spectroscopy of AuNPs were record on Shimadzu (UV-2450) to confirm the presence of AuNPs in the reaction medium at range 510–560 nm.
- Shape and size of gold nanoparticles (AuNPs) were investigated using JEOL, JXA-840 electron probe microanalyzer, Japan.
- The UV-protection factor (UPF) demonstrates the ratio of sunburn-causing UV measured without and with the protection of the fabric. The UPF of untreated and finished fabric samples (size  $3\text{ cm} \times 3\text{ cm}$ ) was determined according to the Australian/New Zealand standard (AS/NZS 4399-1996: Sun protective clothing-Evaluation and classification) using UV-Shimadzu 3101 PC spectrophotometer at wavelength of 280–390 nm, which includes the UVB (280–320 nm) and the UVA (320–400 nm) according to the following equation:

$$UPF_i = \frac{\sum_{\lambda=280}^{400} E_{\lambda} \times S_{\lambda} \times \Delta\lambda}{\sum_{\lambda=280}^{400} E_{\lambda} \times S_{\lambda} \times T_{\lambda} \times \Delta\lambda}$$

where:  $E_{\lambda}$  = relative erythemal spectral effectiveness,  $S_{\lambda}$  = solar spectral irradiance,  $T_{\lambda}$  = average spectral transmission of the specimen, and  $\Delta\lambda$  = measured wavelength interval (nm). Regarding UV-protection categories, fabrics are classified to good, very good, and excellent if their UPF values range from 15 to 24, 25 to 39, and above 40 (40+) respectively.

- SEM and EDX of the treated fabrics was studied using a scanning electron probe micro analyzer (type JXA 840A)–Japan. Surface morphologies were imaged at different magnifications, using 30kV accelerating voltage.

The tests were carried out at the Central unit for analysis and scientific services at National Research Center.

### Evaluation of cytotoxicity of AuNPs:

Cytotoxicity of the prepared AuNPs on A-549 cells were evaluated via cell viability test using MMT method (3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide) and determination of values of  $IC_{50}$  [19, 20].

### Results and Discussion:-

#### Preparation of Carboxymethylchitosan:-

The carboxymethylation of chitosan proceeds by two step consecutive reaction and is accompanied by an undesired side reaction. In the main reaction, the sodium hydroxide reacts first with the hydroxyl groups of chitosan to give alkali chitosan. The carboxymethyl groups are then formed in a SN2 reaction between the alkali chitosan and monochloroacetic acid (MCAA). The main reaction is given by:

The side reaction takes place and results in the formation of sodium glycolate from MCAA and sodium hydroxide.

The FTIR spectra of the prepared CMCSs is shown in Figure 1. In IR spectrum, the wide band at  $3420\text{ cm}^{-1}$  corresponds to the axial stretching of the O–H and N–H bonds. The peaks at  $2927\text{ cm}^{-1}$  and  $1639\text{ cm}^{-1}$  are attributed to the axial stretching of the C–H bonds and the symmetric stretching vibration of C=O in the –COOH groups, respectively. The latter peak, together with the peak at  $1420\text{ cm}^{-1}$ , which arose from the asymmetric stretching vibration of the –COO<sup>−</sup> group, confirm the substitution of carboxymethyl groups onto the chitosan chain. Two bands at  $1528$  and  $1513\text{ cm}^{-1}$  assigned to  $NH_3^+$ , indicate that the carboxymethylation occurred at OH positions. The peaks at  $1413$  and  $1377\text{ cm}^{-1}$  are related to the symmetric angular deformation of C–H bonds and C–N stretching vibrations (amide III band), respectively. The peak at  $1377\text{ cm}^{-1}$  did not increase significantly in the spectra of the CMCS, compared to the chitosan spectrum, which indicates that a significant amount of N-carboxymethylation did not take place. The stretching vibration of C–O in the CH<sub>2</sub>COOH group gives rise to the peak at  $1207\text{ cm}^{-1}$ . Peaks located in the range of  $1175$ – $878\text{ cm}^{-1}$  are the result of vibrations of C–O and C–O–C and some other bonds that comprise the polysaccharide chain [21].

**Figure 1:**-FTIR spectrum of chitosan (CS) and CMCS prepared by reaction of 5gmchitosan with 2.5M MCAA in the presence of 50% NaOH within 3hrs at60°C.

#### Characterization of the CMCS–AuNPs nanocomposite:-

Carboxymethylchitosan play an important role in the preparation of nanoparticles. Amino groups have been used as metal nanoparticles stabilizer [14, 22]. So that we suggest that free amino groups in O-CMCS could bind with gold nanoparticles to stabilize it. When chitosan used instead of O-CMCS to stabilize AuNPs aggregation of nanoparticles occurs due to chitosan insoluble in both neutral and alkaline medium [11, 14].

Figure 2 shows TEM images of the O-CMCS-AuNPs nanocomposites. It was observed that the AuNPs were encapsulated by O-CMCS and their size ranged from 15-25 nm. Unlike most gold colloid, few amount of non-spherical particles beside most spherical one was observed. These non-spherical particles seemed to be fabricated by gathered interference of two or three spherical particles during the nucleation process[14, 23].

**Figure 2:-**TEM images of O-CMCS-AuNPs nanocomposites.

Spectrophotometry is another important aspect for characterization of gold nanoparticles. With increase in particle size, the absorption peak shifts to longer wavelength and the width of absorption spectra is related to the size distribution range (Figure 2). Generally, gold nanospheres display a single absorption peak in the visible range between 510-550 nm, because of surface Plasmon resonance and show heavy absorption of visible light at 520 nm. This gives brilliant red color to Gold Nanoparticle (AuNPs), which varies according to their size. In present study

the absorption of gold nanoparticle was measured in single beam spectrophotometer and absorption maxima was noted at different wavelength (390-630 nm).

**Figure 3:-** UV/visible spectrum of gold nanoparticles

Figure 3 shows that the UV/visible spectrum of gold nanoparticles prepared by using carboxymethylchitosan as reducing agent as well as capping (stabilizing) agent with different gold salt concentrations (0.1, 0.2, 0.3 mM) and different O-CMCS concentration (0.15%, 0.2%, 0.5% and 1% W/V) to obtain the optimum condition and these results show that the optimum condition for preparing uniform AuNPs from O-CMCS at 0.2% CMCS and 0.2 mM HAuCl<sub>4</sub>.

#### Finishing of Fabrics with Gold Nanoparticles:-

We used 100% cotton (Sample 1) and 65:35 cotton: polyester (Sample 2) blend fabrics finished with the prepared gold nanoparticles (AuNPs) to be fabrics with new properties such as ultra violet protection (UPF). The results of the anti-UV efficacy of the untreated and AuNPs loaded substrates are shown in Table 1. It demonstrates that after treatment of fabrics with AuNPs results in a significant increase in their UV-protection function. The UV-protection property of the untreated cotton and Cotton/polyester substrates showed that they afforded poor protection, UPF < 20, against UV-radiation. The variation in protection value, expressed as UPF, between the cotton and Cotton/polyester, before and after post-treatment with AuNPs, is attributed to their differences in fabric construction [24].

**Table 1:-** Atomic absorption and UPF values of the fabrics treated with AuNPs

Description	Atomic Absorption (mg/dl)	UPF
(Sample 1) untreated	0.000	8.211
(Sample 2) untreated	0.000	10.281
(Sample 1) treated with 15 mM AuNPs	1.203	20.54
(Sample 1) treated with 15 mM AuNPs	0.970	31.35
(Sample 1) treated with 20 mM AuNPs	1.493	36.12
(Sample 2) treated with 20 mM AuNPs	3.841	48.31
(Sample 2) treated with 25 mM AuNPs	3.841	50.65
(Sample 2) treated with 25 mM AuNPs	3.630	61.23

Scanning electron microscope (SEM/EDX) analysis were shown in Figures (4), which shows the presence of Au nanoparticles in the fabrics. The surface morphology of the treated fabric with Au nanoparticles appears as smooth surface with deposit of the nanoparticles. It is clear that the prepared Au nanoparticles are more homogeneous and regular distribution on the surface and has higher intensity peaks, on the other hand the Au nanoparticles EDX analysis indicate that the content of Au (0.49, 0.29) (Au weight 0.91) and has lower intensity peaks [25].

The observation of the Au nanoparticles coating shows that the surface texture appears to have dense and low porosity (The choice samples were interlock). In case of ripe fabrics the nanoparticles coated the fibers and appears to be uniform in size.

The coated fabric with Au nanoparticles film was formed and firmed on the surface of the sample. It is evident that experimental and reaction conditions did not alter the morphology surface on using Au nanoparticles. The Au nanoparticles was strongly attached to the fibers due to very strong electrostatic or chemical interactions between the Au nanoparticles and the fabric [25].

**Figure 4:-SEM and EDX spectra cotton treated with AuNPs**

#### Cytotoxicity of GNPs suspensions:-

To study the effect of gold ions concentration present in AuNPs suspensions on their toxicity, A549 cells were treated for 24 h with three different batches of AuNPs suspension, which contained the same concentration of GNPs (1mM) in three GNP types. As shown in Table. Epiderm cell line selected for cytotoxicity test for Au NPs prepared from  $\text{HAuCl}_4$  solution.

#### Cytotoxicity evaluated using two protocols: EC50 and MTT:-

Table 2 shows that the  $\text{IC}_{50}$  of  $\text{HAuCl}_4$  (1 mM), gold nanoparticles prepared by citrate reduction and third with our method using carboxymethylchitosan (CMCS). However, its toxicity reduces in AuNPs treated with CMCS. In this study,  $\text{Au}^+$  decreased mitochondrial activity more than AuNPs with almost two fold difference in  $\text{IC}_{50}$  values as shown in Table 2, which agreed with previous studies of many researcher[25-28]

**Table 2:-** $\text{IC}_{50}$  A549 cell line after exposing to  $\text{HAuCl}_4$ , Au NPs (citrate reduction), Au NPs (CMCS reduction) (for 24 h)

Material	EC50,
$\text{HAuCl}_4$ (1 mM)	0.32µg/ml
Au NPs (citrate reduction)	0.21 µg/ml
Au NPs (CMCS reduction)	5.61 µg/ml

MTT assay used to measure the cell viability expressed in the decrease in mitochondrial activity (Table3). A reduction in mitochondrial function of A549 cells exposed to the three GNPs types prepared.

**Table 3:-**MTT Test (metabolic Activity of the Mitochondria):

Material	MTT expressed in viable cells	
	After 3hrs.	After 24 hrs.
$\text{HAuCl}_4$ (1 mM)	18.6	2.8
Au NPs (citrate reduction)	14.2	1.9
Au NPs (CMCS reduction)	84.5	76.2

#### Conclusion:-

- Gold nanoparticles (AuNPs) was prepared via simple and green method by using CMCS as reducing and stabilizing agents at the same time.
- CMCS prepared based on our previous method by reacting chitosan with monochloroacetic acid in alkaline medium.

- AuNPs were prepared by using different concentrations of carboxymethylchitosan (0.2% w/v, 0.5% w/v and 1% w/v) at 100 °C for 1 hour.
- CMCS was characterized by using nitrogen content, carboxyl content and FTIR spectra. AuNPs was characterized by using UV spectrophotometry and TEM images.
- The cytotoxicity of the prepared AuNPs were evaluated using cell viability assay from MMT and IC<sub>50</sub> values compared with AuNPs prepared by chemical methods. The results shows that AuNPs have normal distributed with 15-25 nm particle size and its cytotoxicity was lowered when prepared by this green method and can use GNPs safely in contact medical treatment with skin.

Attitude toward psychiatry, interns,  
 medical students,

#### Abstract

**Background:** Several studies worldwide reported negative attitude toward psychiatry from medical students and interns. Despite the increasing demand for psychiatry and mental health services, psychiatrists' numbers are still low, and the field of psychiatry is still attracting a lower number of medical students.

**Objective:** This study aims to measure the attitude of medical students and interns toward psychiatry in Umm Al-Qura University medical college, Makkah, Saudi Arabia.

**Method:** A Cross-sectional study. A web-based Attitude Toward Psychiatry (ATP-30) questionnaire was distributed among randomly chosen interns and 6th-year medical students, who had completed their psychiatry course and rotation, and to fourth and 5th-year medical students, who did not have any previous exposure to psychiatry.

**Results:** A total of 335 participants completed the survey, of which 168 were males, and 167 were females. Among them, only 53 are considering psychiatry as a career, while 193 did not, and 89 are not sure. The participants showed an overall positive attitude with the mean scoring of  $98.09 \pm 12.22$  on the ATP-30 questionnaire, with male participants showing more positive attitude ( $99.65 \pm 11.48$ ) than female participants ( $96.44 \pm 12.79$ ). The most neutral responses were about how facts in psychiatry are just vague speculations, how their undergraduate training in psychiatry was valuable, and that psychiatry cannot be taught effectively because it is so amorphous. Negative attitude was observed in the areas concerning the choice of psychiatry as a future career and viewing psychiatric hospitals as little more than prisons. Positive attitude toward areas on the validity of psychotherapy, viewing psychiatry as a respected branch of medicine, attention toward mental illness, and the humanity of the mentally ill. Significant differences based on gender were observed in the areas measuring attitude toward psychiatric patients, psychiatric illness, psychiatry, and psychiatrists. The prior exposure to psychiatry teaching and practice did not seem to affect the attitude.

**Conclusions:** Interns and students overall showed neutral to positive ATP. Proper evaluation and subsequent modification to the current

medical curriculum, with more clinical exposure and engagement with psychiatrists working in the field, may be needed to improve the attitude of interns and students toward psychiatry and mental illness.

### **Previous publication:-**

The abstract for this study was published on the website of the Journal of Psychology & Psychotherapy as it was presented in the 3rd International Conference on Psychiatry & Psychosomatic Medicine held on December 05-06, 2016 Dubai, UAE.

### **Introduction:-**

Mental health is an important parameter in measuring the wellbeing and quality of life of human beings, and the World Health Organization (WHO) defines it as a "state of well-being in which every individual realizes his or her own potential, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community"[1]. It's a common concern that psychiatry, psychiatrists, psychiatric illness and psychiatric patients are under a negative prejudice despite several facts including the increasing prevalence of mental illnesses in adult and pediatrics population which is estimated to be around 10% [1], it will be the leading cause of disability by 2020 (exceeding AIDS and heart attack) [2], it will also be among the top causes of economic burden (especially depressive disorders) [3], as patients with mental health problems represent around 20% of all visits to primary health care centers [4].

Psychiatry is attracting fewer medical graduates, with an associated shortage of qualified doctors in some high-income countries [8,34]. Attitudes toward psychiatry and mental illness among undergraduate medical students seemed to be key factors in determining their choice of psychiatry as a career and willingness to treat psychiatric disorders in clinical practice. The traditional beliefs toward psychiatry and mental illness tend to be deeply imprinted and are therefore not easily erased by modern education [6].

In Saudi Arabia, even though psychiatry and mental health have experienced a significant development in the past decades, the number of psychiatrists is still low (3.0 per 100,000) [5], and amongst them, the number of Saudi psychiatrists is even lower [6]. Also, a scarce number of newly qualified physicians intend to choose psychiatry as a future career [6].

Several articles explored the attitude of undergraduate medical students toward psychiatry, psychiatrists, and mental illness. In a systematic review done in 2013 by Lyons, in which 32 studies were selected and analyzed, only one of them is from Saudi Arabia; the results showed that overall medical students have a positive attitude toward psychiatry, but interest in psychiatry as a career is still low. Also, it revealed that the stigma toward mental illness had been raised as an influential factor in negative views that students have toward psychiatry [7].

The last published study from Saudi Arabia regarding this topic was by El-Gilany *et al.* in 2010 at Al-Hassa Medical College, where 56 of the fifth year male students during the 2007-2008 academic year were surveyed before and after psychiatry training. The study showed a favorable attitude expressed by students after they had some experience in the discipline. Also, the findings revealed that the common myths about psychiatry have significantly changed after the participants completed their training. This study was limited by a small sample size (54 medical students), and their focus on male students only.

The importance of conducting such studies that measure the attitude of medical students and interns toward psychiatry is that it well reflects, directly or indirectly, upon the quality of future health care as their beliefs and misconceptions will have an impact not only on future medical students but also on society as a whole.

### **The primary objectives of this study are to:-**

- Understand the attitude of medical students and interns toward psychiatry in general.
- To identify their attitude in major areas of psychiatry including psychiatric patients and illness, psychiatry as a career, psychiatric treatment and hospitals, and psychiatric knowledge and teaching.

**The secondary objective is to:-**

- Investigate gender differences, and to compare them if any.

**Material and Method:-**

This is a cross-sectional study, conducted at Umm Al-Qura University, college of medicine, Makkah, Saudi Arabia. A web-based Attitude Toward Psychiatry (ATP-30) questionnaire with basic sociodemographic information was distributed among randomly selected students. The randomization was insured by contacting the students whose serial numbers were obtained with the help of a web-based program at <https://www.randomizer.org>. A number of 418 medical students and interns were contacted. The population consisted of interns and 6<sup>th</sup>-year medical students, who had completed their psychiatry course and rotation, and 4<sup>th</sup> and 5<sup>th</sup>-year medical students, who did not have any previous exposure to psychiatry, from them a total of 335 completed the questionnaire (response rate 80.14 %). The ethical approval was sought from the Research Ethics Committee of the Faculty of Medicine, Umm Al-Qura University.

The ATP-30 is a five points Likert scale that records the responses of the subject (Strongly Agree, Agree, Neutral, Disagree, Strongly Disagree). The scale was originally designed and validated by Burra *et al.* [8], on a sample of Canadian medical students. Since that time, the scale has been used in multiple international studies to measure the attitude of medical students toward psychiatry worldwide, and it has proven to be a valid measure. Since the entire medical curriculum in Umm Al-Qura University was designed in English, and it's delivered to the students in English, it was safe to assume that there won't be a language barrier when we use the scale in its original English language as the students have had at least studied three years in English. The scale consisted of 30 statements, 15 of them were negatively stated with the other 15 were positively stated. The positively stated items (i.e., questions 4, 5, 9, 12, 14, 15, 18, 20, 23, 25, 27-29) were reversed by subtracting the score from 6. The instrument showed good internal consistency for this study (Cronbach's alpha = 0.810).

**Results:-**

The total responses received included 335 students and interns, from them 168 (50.14 %) were males, and 167 (49.85 %) were females. Among the respondents, 85 were interns, 84 were 6<sup>th</sup>-year medical students, 75 were 5<sup>th</sup>-years medical students, and 91 were 4<sup>th</sup>-year medical students.

The scores of the total sample are shown in Table 1, which are categorized based on subgroups and gender. The results show a significant difference when comparing males and females in the areas concerning psychiatric patient, psychiatric illness, and the areas measuring attitude towards psychiatrist and psychiatry. Overall, both males and females showed a positive attitude toward psychiatry; however, males showed a more positive attitude when compared to females. Although not shown in the table, no significant differences were found when the attitude of students from different years was compared ( $p$ -value = 0.122).

The responses to the statements that depict the ATP patients, psychiatric illness, psychiatrists, and psychiatry are shown in Table 2, in part 1: the first and third statements are indicative of a positive attitude, while the second and fourth statements are indicative of a neutral to a negative attitude. However, in part 2: all the statements are suggestive of a neutral to a negative attitude except statement number 6 and 11 which showed a positive attitude.

Table 3 statements are representing the responses of the ATP treatment, hospitals, psychiatric knowledge, and teaching, all of which showing a neutral to negative attitude, except statement number 3 and 8 in part 1 of this table. Table 4 shows the eleven statements having a significant difference based on gender, on which  $X^2$  with  $P < 0.05$  was applied for a statement to be significant.

Statement	Total		Mean	SD
	Positive	Rest (neutral+negative)		
<i>Part 1: Statements toward psychiatric patients and psychiatric illness (subgroup 1)</i>				
Psychiatric illness deserves at least as much attention as physical illness.	221	114 (60+54)	2.14	1.216
It is interesting to try and unravel the cause of psychiatric illness	164	169 (124+45)	2.44	1.065
If we listen to them, psychiatric patients are just as human as other people.	202	133 (74+59)	2.27	1.190
Psychiatric patients are often more interesting to work with than other patients.	94	241 (132+109)	3.07	1.089
<i>Part 2: Statements toward psychiatrists and psychiatry (Subgroup 2)</i>				
Psychiatry is unappealing because it makes little use of medical training.	116	219 (159+60)	3.25	1.016
Psychiatrists talk a lot but do very little.	134	200 (113+87)	3.25	1.145
I would like to be a psychiatrist.	61	273 (91+182)	3.63	1.266
On the whole, people taking up psychiatric training are running away from participation in real medicine.	73	262 (130+132)	3.27	1.064
Psychiatrists seem to talk about nothing but sex.	132	203 (130+73)	4.06	1.115
Psychiatry is a respected branch of medicine.	203	131 (70+61)	2.28	1.234
Psychiatrists tend to be at least as stable as the average doctor.	100	235 (178+57)	2.80	0.830
Psychiatrists get less satisfaction from their work than other specialists.	102	233 (143+90)	3.06	0.987
If I were asked what I considered to be the three most exciting medical specialties, psychiatry would be excluded.	123	212 (79+133)	2.95	1.317
At times it is hard to think of psychiatrists as equal to other doctors.	135	200 (115+85)	3.28	0.930
The practice of psychiatry allows the development of really rewarding relationships with people.	192	143 (96+47)	2.36	1.093

**Table 3:-**Scores in statements depicting ATP treatment, hospitals; psychiatric knowledge and teaching of ATP 30 (Subgroup 3 and 4)

Statement	Total		Mean	SD
	Positive	Rest (neutral+negative)		
<i>Part 1: Statements toward psychiatric treatment and hospitals (Subgroup 3)</i>				
Psychiatric Hospitals are little more than prisons.	94	240 (107+133)	2.82	1.162
It is quite easy for me to accept the efficacy of psychotherapy	134	200 (132+68)	2.72	1.017
The practice of psychotherapy is fraudulent since there is no strong evidence that it is effective.	237	97 (66+31)	3.37	1.040
With the forms of therapy now available, most psychiatric patients improve.	130	205 (149+56)	2.75	0.868
Psychiatric treatment causes patients to worry too much about their symptoms.	81	254 (132+122)	2.85	0.990
There is very little that psychiatrists can do for their patients.	158	177 (95+82)	3.30	1.010
Psychiatric Hospitals have a specific contribution to make to the treatment of the mentally ill.	101	234 (177+57)	2.84	0.852
In recent years psychiatric treatment has become quite effective.	158	177 (117+60)	2.63	0.912

<i>Part 2: Statements toward psychiatry knowledge and teaching (Subgroup 4)</i>				
Psychiatric teaching increases our understanding of medical and surgical patients.	147	188 (109+79)	2.69	1.119
The majority of students report that their psychiatric undergraduate training has been valuable.	57	278 (184+94)	3.14	0.844
Psychiatry has very little scientific information to go on.	126	209 (125+84)	3.21	1.013
favorable	162	173 (99+74)	2.59	1.099
Psychiatry is so unscientific that even psychiatrists can't agree as to what it's basic applied sciences are.	119	216 (161+55)	3.28	0.930
Most of the so called facts in psychiatry are really just vague speculations.	55	279 (205+74)	3.07	0.738
Psychiatry is so amorphous (unstructured) that it cannot really be taught effectively.	84	250 (180+70)	3.09	0.819

**Discussion:-**

The medical education in Saudi Arabia consist of 6 years of academic and clinical education, with the 1<sup>st</sup> year being part of the preparatory year of all health colleges, and 1-year mandatory medical internship after graduation. In Umm Al-Qura University, the exposure to psychiatry during this 6-years period is limited to only three weeks course in the 5<sup>th</sup> year, of which two weeks are devoted to classical teaching and one week only of clinical exposure for both inpatients and outpatients at psychiatric hospitals in the region. Regarding behavioral sciences, it has not been introduced formally as a separate subject -in contrast to other universities in Saudi Arabia- during the pre-

clinical years [6]. This lack of exposure to psychiatry and behavioral sciences may in part be a contributing factor to the low interest of medical students toward psychiatry as a career [10,7].

Table 1 shows the mean, SD, and range of scores, categorized based on subgroups and gender, which has shown a significant difference when comparing males and females in the areas concerning psychiatric patient, psychiatric illness, and the areas measuring attitude towards psychiatrist and psychiatry. Overall, both males and females showed a positive attitude toward psychiatry; however, males were more positive. In a systematic review done by Lyons published in 2013 [7], where 32 studies from 22 countries were reviewed, the majority of the studies found an overall positive students' attitude toward psychiatry; these results were comparable with ours, this was also noted in other studies conducted in other Arab countries. In two studies one done in Egypt by Shalaby in 2015 [9] and the other one in Bahrain by Al-Ansari and Al-Sadadi in 2002 [11], females showed more positive attitude than males, which is similar to the results found by Khan *et al.* in Pakistan in 2008 [12]. This is different from the results of this study, in which females were lagging behind males; Parikh *et al.* reported similar results in research done in India in 2014 [13].

Table 2 shows the responses to the statements that depict the ATP patients, psychiatric illness, psychiatrists, and psychiatry. In part 1: the first and third statements are indicative of a positive attitude (65.97 % feel that psychiatric illness deserves at least as much attention as physical illness, and 60.29 % feel that psychiatric patients are just as human as other people), while the second and fourth statements are indicative of a neutral to negative attitude (49.56 % feel that it is interesting to try and unravel the cause of psychiatric illness, and only 28.06 % feel that psychiatric patients are often more interesting to work with than other patients). Similar results were reported by some studies [13,14,15].

However, in part 2: 9 out of 11 statements showed neutral to negative attitude (65.37 % had neutral to negative attitude about the use of medical training in psychiatric practice, 81.49 % don't consider psychiatry as a future career (Figure 2), 69.55 % believe that psychiatry is less satisfactory than other branches of medicine, 63.28 % don't consider psychiatry to be an exciting speciality, 70.14 % think that psychiatrists are not as stable as other doctors, 78.20 % believe that psychiatrists are running away from real medicine, 59.70 % felt that psychiatrists talk too much and do little, and 59.70 % don't always think of psychiatrists as equal doctors), only two statements had positive attitude (60.59 % believe that psychiatry is a respected branch of medicine, and 57.31 % believe that practice psychiatry allows a rewarding relationship with people). These results point out toward a clear inconsistency between the overall positive attitude toward psychiatry and the possible choice of psychiatry as a future career. This pattern of disharmony has also been reported by other studies from different countries [16,17,18], while Shalaby's study has reported fewer inconsistencies among the Egyptian students' sample [9]. This indicates that students and interns do not view psychiatry as an intellectually challenging specialty and that psychiatrists are having low fulfillment rates and less rewarding and satisfactory outcomes since they are not able to provide a big help to the mentally ill as compared to the other medical specialties [18]. A number of possibilities could point to the reason behind this attitude; some studies have raised the stigma toward mental illness to be an influential factor in these negative views [19,20,21,22,23]. Other studies are pinning it on the poor-quality teaching of psychiatric curriculum and the limited exposure to clinical psychiatric settings [10,17].

Table 3 statements are representing the responses of the ATP treatment and hospitals in part 1, while psychiatric knowledge and teaching are in part 2. In part 1; the students and interns showed a neutral-to-negative attitude toward psychiatric hospitals (71.64%), with the majority (39.70%) agreeing that psychiatric hospitals are little more than prisons, while 31.94% were indecisive and only 28.05% disagreeing with this statement. On the other hand, the majority (52.80) were undetermined when it came to the psychiatric hospitals' specific contribution to the treatment of the mentally ill, while 30.15% had a favorable attitude in this matter and 17.05% did not think positively about it. In the statements that are concerned with psychiatric treatment, a generally-positive attitude (47.16%) was observed regarding the psychiatrists' ability to help their patients. When asked about psychotherapy, the majority (70.74%) looked at psychotherapy as an evidence-based practice rather than a fraudulent one (Figure 1), but only 40% felt that it is easy for them to accept the efficacy of psychotherapy. When it came to the other forms of psychiatric treatments, most of the students and interns (44.47%) were not determined about psychiatric patients' improvement with the now available forms of therapy, while 38.80% thought positively about it, and the majority (75.82%) had a neutral to negative attitude about psychiatric treatment causing the patients to worry more about their symptoms. However, the majority (47.16%) thought that psychiatric treatment had become more efficient in recent years. Two other studies by Melhiet *et al.* have reported similar results [25,26]. In part 2: The majority of students and intern had a

neutral attitude toward psychiatric knowledge, 62.38%, and 83.28% showed a neutral to negative attitude toward the scientific knowledge of psychiatry, and that most facts in psychiatry are just vague speculations, respectively. These results show that medical students and interns have a negative perception of psychiatry as an unscientific discipline and somehow different from other medical disciplines in terms of training and outcome [24], similar results were reported in an Australian study [25]. The emphasis on the biological aspects of psychiatric disorders has been proposed to play a positive role to enhance the attitude toward psychiatry [9,32], as well as the integration of psychiatry into the general hospital settings [33]. Similarly, the attitude toward psychiatric teaching was neutral to negative as well, 56.11 % do not think that psychiatric teaching increases their understanding of medical or surgical patients. Only 48.35 % acknowledged psychiatry as an important part of the curriculum, with the majority (62.38 %) didn't consider their undergraduate psychiatric training to be valuable, which may be due to the fact that 74.62 % believe that psychiatry is so amorphous that it cannot be taught effectively. Although not examined in this study, several studies have pointed to the positive effect of psychiatric clerkship or attachment among medical students and interns [27,28,29]. In a study done in Saudi Arabia [6], the students showed a favorable attitude after they have had some experience in psychiatry. A recent study conducted by Reddy *et al.* [30] in India, to investigate the effect of increasing the duration of psychiatry posting by 15 days, the students showed more favorable attitude when they had more exposure to psychiatric posting. However, psychiatry rotations influence on medical students might be limited when it comes to choosing psychiatry as a future career as evident by Shen *et al.* study [31].

Table 4 shows the eleven statements having a significant difference based on gender. Males had a more positive attitude in most of the statements especially considering psychiatry as a respected branch of medicine, the growing efficacy of psychiatric treatment in recent years, and with their attitude toward psychiatric patient and illness. However, females expressed a more positive attitude regarding choosing psychiatry as a future career, and that psychiatric treatment causes patients to worry too much about their symptoms.

Many studies have been conducted worldwide investigating the attitude of medical students and interns toward psychiatry. The results of these studies showed a lacuna in the knowledge and attitude toward the main psychiatric areas. However, this issue has not been addressed properly in Saudi Arabia with only limited number of studies. Therefore, it is suggested that a nationwide study with a larger sample size from different medical colleges and regions be conducted with the primary focus being the influencing factors for such attitude, with more elaborate and open-ended questions. Furthermore, more studies of the efficacy of the current psychiatric curriculum should be implemented to improve the existing teaching structure and subsequently the attitude toward psychiatry.

### **Conclusion:-**

Overall interns and students showed a neutral to a positive attitude toward psychiatry. However, a general lack of interest in psychiatry as a future career was observed. This lack of interest may be attributed to many factors, but a potential culprit is the poor-quality teaching of psychiatric curriculum and the lack of exposure to clinical psychiatric settings, in addition to the already existing stigma toward mental illness. Thus, undergraduate programs should focus on re-evaluating and subsequently modifying the current medical curricula, with more clinical exposure and engagement with psychiatrists and psychiatric patients to improve the attitude of interns and students toward psychiatry and mental illnesses.

#### Abstract

**Purpose:** Ultrasound [US] is an excellent noninvasive modality to evaluate thyroid nodules. Aim of our study was to characterize the thyroid nodules according to grey scale sonographic features into high suspicious, probably benign, benign aspects and normal thyroid using TIRADS scoring system and to characterize the thyroid nodule according to the sonographic features into a specific TIRADS stage and correlate the results with the histopathological examination findings wherever possible.

**Material And Methods:** The prospective study was carried out on 60 patients referred to Department of Radiodiagnosis, Rajindra Hospital, Patiala. All the patients were subjected to detailed history taking, clinical examination and routine laboratory investigations. All thyroid nodules were characterized according to the internal component [solid, mixed or cystic], the margins, echogenicity [hyperechoic, Isoechoic, hypoechoic, marked hypoechoic], evidence of calcification [microcalcification if less than 3mm and macrocalcification if more than 3mm with acoustic shadowing] and the shape [taller than wide if greater in anteroposterior dimension than in its transverse dimension and wider than tall]. Using the Modified Russ Classification, each nodule was classified into TIRADS categories [1, 2, 3, 4A, 4B and 5] based on ultrasound features. The patients were referred to Department of Pathology, Government Medical College Patiala and FNAC was done. The US findings were correlated with FNAC and data was analyzed statistically.

**Results:** Based on various ultrasound characteristics of thyroid nodules, TIRADS score was given to each thyroid nodule and then FNAC was done. The results of histopathology were correlated with ultrasound features and statistical analysis was done calculating sensitivity, specificity, positive predictive value and negative predictive value for each feature. The sensitivity and specificity for Irregular contours were 44.4% and 94.12%, for taller than wide were 22.22% and 100%, for microcalcification were 33.33% and 94.12%, for marked hypoechoic was 78 and 70.89% and for solid consistency were 89 and 70.5%. The risk of malignancy was found to increase from TIRADS 3 to TIRADS 5 in this study. All the cases [100%] of TIRADS 5 turned out to be malignant on histopathology.

**Conclusion:** Radiologists should be aware of usefulness of specific ultrasound features of thyroid nodules like Irregular contours, taller

than wide configuration, microcalcification, marked hypoechogenicity and solid consistency collectively taken as TIRADS for better differentiation of benign from malignant or potentially malignant lesions that warrant further diagnostic evaluation. The risk of malignancy was found to increase from TIRADS 3 to TIRADS 5 when different TIRADS categories were confronted with results of pathology and risk of malignancy was calculated.

### **Introduction:-**

Thyroid nodules are a commonly encountered clinical problem in daily practice. With the increased use of high resolution ultrasound during last two decades, the detection rate has gone up [1]. This is in parallel to increased incidence of thyroid cancer worldwide since malignancy comprises approximately 5% of all Thyroid nodules irrespective of size [2]. The initial evaluation of thyroid nodules should always focus on exclusion of malignancy [4]. The prevalence of non-palpable nodules has increased recently as a consequence of the increasing application of ultrasound [5]. Nowadays, the use of high technology US equipment may detect nodules as small as 2 to 3 mm, which raises the question of which thyroid nodules are clinically relevant for further evaluation [3]. Various ultrasound characteristics of thyroid nodules have proven to have predictive diagnostic value in suspicion of malignancy, with particular focus on which nodules should be subjected to US guided fine needle aspiration [FNA]. Thyroid US should always include evaluation of neck for abnormal lymph nodes. When abnormal lymph nodes are present, biopsy for cytology and thyroglobulin washout should be performed at the same time as the nodule biopsy [6]. Fine Needle Aspiration Cytology [FNAC] is considered the most reliable test for diagnosis of thyroid nodules. FNAC is recommended for palpable nodules, but the indication for this procedure in non-palpable nodules is a matter of controversy. Some clinicians recommend ultrasound guided FNAC while others consider that a clinical follow up [neck palpation] is sufficient in absence of history of familial thyroid cancer or head/neck irradiation [5]. Neck US has long been used to evaluate the size, character and location of thyroid nodules, monitor nodule growth and identify loco-regional lymphadenopathy. Many studies have classified specific US characteristics predictive of malignant nodules. For instance, current US characteristics that are strongly correlated with malignancy include intranodular vascularity, the presence of microcalcifications, a taller than wider pattern, hypoechogenicity and spiculated margins [7]. Although controversial, the current guidelines state that if any one of the above findings is observed, with the exception of increased intranodular vascularity, the nodule should be defined as suspicious for malignancy.

### **Materials And Methods:-**

In this prospective study, we considered 60 patients referred to Department of Radiodiagnosis, Rajindra Hospital Patiala. Prior permission regarding this study was taken from hospital authorities. The Thyroid was imaged with high frequency linear array transducer with the patient in supine position with neck extended by placement of a pillow beneath the shoulders. The number, location, size in three dimensions and characteristics of nodules were documented along with examination of neck adenopathy. Ultrasound was performed with Philips Envisor with a 5.5MHz probe. All the patients were subjected to detailed history taking, clinical examination, routine laboratory investigations and high resolution ultrasonography. All Thyroid nodules were characterized according to the internal components [solid, cystic, mixed], the margins, echogenicity, type of calcification if present [micro less than 3mm and macro if more than 3mm], the shape of the nodule [characterised as "taller than wider" [greater in anteroposterior dimension than in its transverse diameter and "wider than taller"]. Using the Modified Russ classification, each nodule was classified into TIRADS category [1,2,3,4A,4B,5] based on ultrasound features. The findings were correlated with FNAC. Then data was analyzed statistically.

### **Tirads Classification Algorithm:-**

The terminology of TIRADS was first used by Hogarth et al. They described 10 ultrasound patterns of thyroid nodules and related the rate of malignancy according to the pattern. The following categories were established:

TIRADS 1: Normal Thyroid gland

TIRADS 2: Benign conditions [0% malignancy]

TIRADS 3: Probably benign nodules [5% malignancy]

TIRADS 4: Suspicious nodules [5-80% malignancy]. A subdivision into 4a [malignancy between 5 and 10%] and 4b [malignancy between 10 and 80%] was optional.

TIRADS 5: Probably malignant nodules [malignancy 80%]

TIRADS 6: Category included biopsy proven malignant nodules.

**Tirads Classification Alogrithm**

<p><b>HIGH SUSPICIOUS ASPECTS</b></p> <ul style="list-style-type: none"> <li>• Taller than wide shape</li> <li>• Irregular or microlobulated margins</li> <li>• Microcalcifications</li> <li>• Marked hypoechogenicity</li> </ul>	<p>≥3 signs and /or adenopathy  <b>TIRADS 5</b>                  1 or 2 signs and no adenopathy  <b>TIRADS 4B</b></p>

**Figure 4:-** An ill defined taller than wide markedly hypoechoic nodule with micro calcifications.(TIRADS CATEGORY V)

### Results:-

Our study consisted of 60 patients with male to female ratio of 1:5.1. 16.67% were males and 83.33% were females. Purely solid nodules were seen in 23 [38.3%] cases. Solid nodules with cystic components were seen in 12 [20%] cases. Purely cystic nodules were seen in 25 [41.7%] cases out of 60. Hyperechoic nodules were seen in 14 [23.33%] cases whereas Isoechoic nodules were seen in 18 [30%] cases. Hypoechoic nodules were seen in 06 [10%] cases and marked hypoechoic nodules were seen in 22 [36.7%] cases. Sharp well defined margins were seen in 53 [88.3%] of cases. Poorly defined margins were seen in 07 [11.7%] of cases. Microcalcification was seen in 06 [10%] cases and macrocalcification was seen in 20 [33.3%] cases. No calcification was seen in 34 [33.3%] cases. Taller than wide shape of the nodules was seen in 02 [3.33%] of cases and wider than tall shape was seen in 58 [96.7%] cases. In our study on US, we diagnosed 52 nodules as benign and 8 nodules as malignant nodules. 15 [28.84%] of the benign nodules were solid and 08 [100%] of the malignant nodules were solid. 12 [23.07%] of the benign nodules were mixed while none of the malignant nodules was mixed. 25 [48%] of the benign nodules were cystic and none of the malignant nodules was cystic. On correlation of echogenicity of nodules on ultrasound with histopathological findings, 15 [28.3%] nodules were markedly hypoechoic and 07 of them turned out to be malignant while 14 [26.4%] were hyperechoic and none of them turned out to be malignant. On correlation of margins of nodules with histopathological findings 53 [94.64%] cases with well defined margins turned out benign on histopathology and 04 [100%] of cases having ill defined margins were found to be malignant. None of the malignant nodules showed well defined margins. On correlation of pattern of calcification and histopathology, microcalcification was seen in 03 [13%] of the benign nodules and 03 [100%] of malignant nodules. Macrocalcification was seen in 20 [87%] of benign nodules. None of the malignant nodules showed macrocalcification. Taller than wide configuration was seen in 02 [100%] of the malignant nodules and wider than taller configuration was seen in 58 [100%] of the benign nodules. Major ultrasound features suggestive of malignancy were analyzed with respect to TIRADS category. Sensitivity, specificity, positive predictive value and negative predictive value were calculated for each feature (Table 1). Diagnostic index of individual grey scale sonographic criteria for predicting malignancy in Thyroid nodules was calculated.

**Table 1:-** Ultrasound features and their statistical parameters

Ultrasound feature	True positive	False positive	True negative	False negative
IRREGULAR CONTOURS	04	03	48	05
TALLER THAN WIDE	02	00	51	07
MICROCALCIFICATION	03	03	48	06
MARKED HYPOECHOGENICITY	07	15	36	02
SOLID CONSISTENCY	08	15	36	01

The sensitivity and specificity for Irregular contours were 44.4% and 94.12%, for taller than wide was 22.22% and 100%, for microcalcification were 33.3% and 94.12%, for marked hypoechogenicity were 78 and 70.89% and for solid consistency were 89 and 70.5%.

**Table 2:-** Tirads Categories Of Various Nodules

TIRADS CATEGORY	NO OF NODULES AS PER TIRADS CLASSIFICATION
TIRADS 2	10
TIRADS 3	29
TIRADS 4A	12
TIRADS 4B	05
TIRADS 5	04

The different TIRADS categories were compared with the results of pathology and risk of malignancy was calculated. The risk of malignancy was found to increase from TIRADS 3 to TIRADS 5 (Table 3).

**Table 3:-** Tirads Categories And Risk Of Malignancy

TIRADS CATEGORY	PATHOLOGY		TOTAL	RISK OF MALIGNANCY [%]
	BENIGN	MALIGNANT		
TIRADS 2	10	00	10	00
TIRADS 3	28	01	29	3.4
TIRADS 4A	11	01	12	8.3
TIRADS 4B	02	03	05	60
TIRADS 5	00	04	04	100

**Table 4:-** Bar diagram shows number of nodules according to TIRADS categories and their characterization into benign and malignant.

TIRADS categories and diagnostic performance of ultrasound was analysed. Total cases of TIRADS 2,3,4A were 51 out of which 49 were benign and 2 were malignant. Total cases of TIRADS 4B and 5 were 9 out of which 7 were malignant. Out of 51 cases, 9 cases were malignant.

**Discussion:-**

In present study, 60 cases of nodular thyroid disease were studied by grey scale ultrasonography. We differentiated Thyroid nodules into highly suspicious, low suspicious, probably benign, benign nodules and normal thyroid as per TIRADS scoring system using grey scale scoring sonographic features viz internal components [solid, mixed or cystic], the margins, echogenicity, evidence of calcification and shape. Grey scale ultrasonography was the first investigation to be requested in all cases of thyroid swelling in our study because of it being noninvasive, simple and without radiation exposure. In our study, solid consistency as a predictor for malignancy had sensitivity of 70.5%, positive predictive value of 34.7% and negative predictive value of 97.3%. Study conducted by Aggarwal et al [11] showed that solid echotexture had sensitivity of 54.5% and specificity of 64.3%. Koike et al [12] got sensitivity of 83.4% and specificity of 81.8% of solid echotexture of malignant nodules. In our study hypoechoogenicity as criteria for predicting malignancy had sensitivity of 78%, specificity of 70.89%, positive predictive value of 31.82% and negative predictive value of 94.7%. Koike et al [12] got sensitivity of 95% and specificity of 51.4%. Raho et al [10] reported that hypoechoogenicity had specificity of 48.6% and sensitivity of 66.6%, positive predictive value of 34.4% and negative predictive value of 78.2%. Papini et al [10] could predict malignancy in thyroid nodules using hypoechoogenicity as criteria with sensitivity of 87.1%, specificity of 43.4% and positive predictive value of 11.4%. In our study, poorly defined Irregular margins had sensitivity of 44.4%, specificity of 94.12% and positive predictive value of 57.14%. Papini et al [10] reported Irregular margins as independent risk factor of malignancy with sensitivity of 77.5%, specificity of 85% and positive predictive value of 30%. Kim et al [9] had sensitivity of 55.51%, specificity of 83%, positive predictive value of 60% and negative predictive value of 80%. Sajjadih et al [15] had sensitivity of 42%, specificity of 71%, positive predictive value of 20%, negative predictive value of 87%, when irregular margins were considered. Moifo et al [16] showed sensitivity of 34.78% and specificity of 99.51%. In present study, microcalcification for predicting malignancy had sensitivity of 33.3%, specificity of 94.12%, positive predictive value of 50% and negative predictive value of 88.89%. In study conducted by Papini et al [10], sensitivity of microcalcification as a predictor of malignancy was 29% and Jason et al [13] showed specificity of 94.45%. Moifo et al [16] showed sensitivity of 30.4% and specificity of 98.8%. In present study, taller than wide for predicting

malignancy had sensitivity of 22.2%, specificity of 100%, positive predictive value of 100% and negative predictive value of 87.93%. In study conducted by Moifo et al[16] taller than wide for predicting malignancy had sensitivity of 4.35%, specificity of 100%, positive predictive value of 100% and negative predictive value of 94.87%. In our study probably benign US findings were seen in 51 patients and probably malignant US findings in 9 patients. Howarth suggested a malignant risk of less than 5% for TIRADS 3, 5% to 10% for TIRADS 4b and greater than 80% for TIRADS 5. Our findings were within this range suggested by Hogarth[8], Russ et al[17] and Moifo et al[16]. Another study conducted by Hong et al[18] concluded that the three sonographic features that are meaningful findings in the diagnosis of thyroid malignancy were the presence of microcalcifications, marked hypogeneity and a taller than wide shape. In a multimeter Korean retrospective study, the ultrasound features that were statistically significant for malignancy were hypoechogenicity, marked hypoechogenicity, nonparametric orientation, microlobulated or spiculated margin, an ill defined margins and the presence of microcalcifications.

**Table 5:-** Summary of statistical performance of major ultrasound features

**Table 6:-** Comparison of risk of malignancy in different TIRADS categories in present study with that of previous published studies

TIRADS CATEGORY	Risk Of Malignancy (%)	Risk Of Malignancy (%)	Risk Of Malignancy (%)
	Moifo et al (43)	Horvath et al (8)	Present study

TIRADS 3	2.2	<5	3.4
TIRADS 4A	5.9	5-10	8.3
TIRADS 4B	57.9	10-80	60
TIRADS 5	100	>80	100

**Conclusion:-**

Radiologists should be aware of usefulness of specific ultrasound features of thyroid nodules like Irregular contours, taller than wide configuration, microcalcifications, marked hypoechogenicity and solid consistency collectively taken as TIRADS for better differentiation of benign lesions from malignant or potentially malignant lesions that warrant further diagnostic evaluation. The sensitivity and specificity for Irregular contours were 44.4% and 94.12%, for taller than wide were 22.22% and 100%, for microcalcification were 33.3% and 94.12%, for marked

hypoechoogenicity were 78% and 70.89% and for solid consistency were 89 and 70.5%. The risk of malignancy was found to increase from TIRADS 3 to TIRADS 5 when the different TIRADS categories were confronted with the results of pathology and risk of malignancy was calculated.

#### Abstract

This Paper Presents The Ductile Characteristics Of Hybrid Ferro Cement Slab Incorporating Polypropylene Fibers And Gfrp Sheet. A Total Of 9 Slabs Have Been Tested Under Two Point Flexural Loading. The Size Of The Slab Is 1000 Mm (Length) X1000 Mm (Width) X 60 Mm (Thickness). The Parameters Studied in This Investigation Includes the Number of Weld Mesh Layers, Polypropylene Fibers i.e. (0.3%) And Gfrp Sheet. Two Point Loading Test Was Conducted On Slabs And Parameters Such As Ultimate Moment Capacity, Ductility Ratio And Crack Pattern Were Observed.

To Extend The Principles Of Reinforced Concrete Design By Using Continuous Steel Reinforcement As The Main Reinforcement To Satisfy Ultimate Stress Limit State And Fibers As A Secondary Reinforcement To Control Cracking And Satisfy The Crack Width Limit State In Service. To Use Polypropylene Fibers Instead Of Steel Fibers, Differently From Most Prior Investigations Were Used. To Study the Influence of Self-compactingconcrete Mixture Used Instead Of Conventionally Vibrated Concrete.

From The Test Results It Is Observed That The Compressive Strength At 28 Days Curing Of Hybrid Ferro cement Slab With Polypropylene Fibers Content Of 0.3% Is Increased By 6.34% With Compressive Strength Of Conventional Concrete Plain.

From The Studies It Is Observed That the Deformation at Ultimate Load Are High In Case Of Ferro cements With Polypropylene Fibers. The Stiffness Of The Specimens With Zero Layer Weld Mesh Is Lower Than That Of The Specimens With Two Layers And Three Layers Bundled. Further, There Is Reduction In Number Of Cracks With Increase In Fiber Content.

From The Test Results It Is Observed That The Ultimate Load Carrying Capacity In Three Layer Weld Mesh Hfs With 0.3% Fiber Content Is Increased By 25% In Comparison With Double Layer Weld Mesh Of Ferro cement Slab Without Gfrp Layer.

**Chapter1:-****Introduction:-****General:-**

Modern Structural Engineering tends to progress towards more economical structures through gradually improved methods of design and use of higher strength materials, such developments are particularly important in the field of reinforced concrete. The limiting features of ordinary reinforced concrete have been largely overcome by the development of Ferro cement, Ferro cement is a type of thin reinforced concrete section commonly constructed with hydraulic cement mortar reinforced with closely spaced layers of continuous and relatively small size weld mesh. In its role as a thin reinforced concrete product and as a laminated cement-based composite, the ferro cement has found its place in numerous applications both in new structures and in repair and rehabilitation of existing structures.

Compared with the conventional reinforced concrete, ferro cement is reinforced in two directions; therefore, it has homogenous-isotropic properties in two directions. Benefiting from its usual high reinforcement ratio, ferro cement generally has a high tensile strength and a high modulus of rupture. In addition, since the specific surface of reinforcement in ferro cement is one to two orders of magnitude higher than that of reinforced concrete, larger bond forces develop with the matrix resulting in average crack spacing and width more than one order of magnitude smaller than in conventional reinforced concrete (Shah and Naaman 1997, Guerra et al 1978). Other appealing features of ferro cement include ease of prefabrication and low cost in maintenance and repair. Based on the abovementioned advantages, the typical applications of ferro cement are water tanks, boats, housing wall panel, roof, formwork and sunscreen (Nimityongskul et al 1980 and Kadir 1997). The renaissance of ferro cement in recent two decades has led to the ACI design guideline "Guide for the Design, Construction, and Repair of Ferro cement" (ACI Committee 549-1R-88 1993) and publications such as "Ferro-cement Design, Techniques, and Application" (Bingham 1974) and "Ferro cement and Laminated Cementations Composites" (Naaman 2000), which provide comprehensive understanding and detailed design method of contemporary ferro cement.

However, the rapid development in reinforcing meshes and matrix design requires continuous research to characterize the new material and improve the overall performance of ferro cement. Instead of cement mortar, self-compacting micro - concrete is used in this study in order to eliminate the external vibration and to overcome the difficulties and problems in the construction process. As a laminated composite, Ferro cement often suffers from severe spilling of matrix cover and delimitation of extreme tensile layer even at high reinforcement ratio, resulting in premature failure. Therefore, consideration of serviceability rather than strength limit would dominate composite design. Thus far, steel meshes have been the primary mesh reinforcement for ferro cement, but recently adding discontinuous short fibre to cementitious matrix has become in use (Sivakumar and Manu Santhanam 2007), which could bring significant improvement in ductility and shear capacity as well as moderate increase in tensile strength turns to be a logical and reasonable solution to solve serviceability problems. When concrete cracks, the randomly oriented fibres arrest the micro cracking, thus improving the strength, ductility and convert its brittle characteristics to a ductile one. In this study, the addition of polypropylene fibres also enhances the flexural strength and Impact resistance of HF slabs.

The development of new technology in the material science is progressing rapidly. In recent two or three decades, a lot of research was carried out throughout globe for how to improve the performance of concrete in terms of strength and durability qualities. Consequently concrete has no longer remained a construction material consisting of cement, aggregate, and water only, but it has become an engineered custom tailored material with several new constituents to meet the specific need of construction industry. The growing use of concrete in special architectural configurations and closely spaced reinforcing bars have made it very important to produce concrete that ensure proper filling ability, good structural performance, and adequate durability. In recent years a lot of research was carried out throughout the world for how to improve the performance of concrete in terms of its most important properties that is strength and durability. Concrete technology has undergone from macro to micro level study in the enhancement in strength and durability properties from 1980's onwards. However till 1980's the research study related to flow ability of concrete to strength and durability did not draw lot of attention of the concrete technologists.

This type of study has resulted in the development of Self Compacting Concrete (SCC), a much-needed revolution in concrete industry. Self-Compacting concrete is highly engineered concrete with much higher fluidity without segregation and is capable of filling every corner of formwork under its self weight only. This SCC eliminates the need of vibration either external or internal for the compaction of concrete without compromising its engineering properties. Nowadays it is well known that the benefits of adding fibres to concrete.

Reduce cracks during plastic and hardening stage, reduce water seepage and protects steel in concrete from corroding and walls from dampening, Protects corner in precast slabs and concrete flooring. Increases abrasion resistance by over 40% there by increasing lift of roads, walkways, floors. Also reduces pitting of the floor.

A large number of civil infrastructures around the world are in a state of serious deterioration today due to carbonation, chloride attack, etc. Moreover many civil structures are no longer considered safe due to increase load specifications in the design codes or due to overloading or due to under design of existing structures or due to lack of quality control. In order to maintain efficient serviceability, older structures must be repaired or strengthened so that they meet the same requirements demanded of the structures built today and in future. Ferro cement over the years have gained respect in terms of its superior performance and versatility. Ferro cement is a form of reinforced concrete using closely spaced multiple layers of mesh and/or small diameter rods completely infiltrated with, or encapsulated in, mortar. In 1940 Pier Luigi Nervi, an Italian engineer, architect and contractor, used ferro cement first for the construction of aircraft hangars, boats and buildings and a variety of other structures. It is a very durable, cheap and versatile material.

#### **Hybrid Ferro Cement Slab:-**

Research efforts to improve materials and production processes used in ferro cement follow a number of parallel paths that deal with increasing strength, improving toughness, improving durability, increasing mechanical efficiency and decreasing material usage and production cost.

Ferro cement could be seen as a scaled down system of reinforced concrete construction with reinforcement distributed throughout the depth of the member. Improved elasticity, cracking, extensibility and impact characteristics are achieved by proper control of reinforcement parameters. While ferro cement can benefit from being considered an extreme boundary of reinforced concrete, it has and is still taking advantage from the rapid development in the field of composite materials including advanced laminated and hybrid composites and thus it must also continue to establish its own identity.

By concrete standards, ferro cement can be thought of a thin reinforced concrete construction with very high performance characteristic such as high tensile strength to weight ratio, ductility and impact resistance, these characteristics are required for earthquake prone area applications. For instance, a factory produced ferro cement element using self-compacting concrete .

Square weld mesh instead of woven wire mesh cost two to three times less than conventional ferro cement elements of equivalent performance. The increasing availability of fiber reinforced polymer is likely to lead further cost reduction. Applications of ferro cement in small size structures and structural elements have mushroomed in developing countries. In a way, Ferro cement is becoming an all-purpose material and its potential combinations with other materials is a testimony to its versatility. This may take the form of mechanized production of small size elements such as cement sheets and pipes to replace asbestos cement

The investigations by Naaman and Gurrero (1996) shows the addition of discontinuous fibres to the matrix of ferro cement can effectively increase its moment of resistance and significantly reduce the average crack spacing and width at ultimate loading and it also prevent the spalling of concrete. To improve the structural performance and reduce total cost of construction, a new ferro cement system performance is enhanced with polypropylene fibers, FRP laminates and which is termed as Hybrid Ferro cement system. Most of the past research work has focused on the potential use of ferro cement in structural applications as permanent formwork (Kadir 1997) secondary roofing elements, etc.

Very little research has been done on altering the inherent character and material properties of the ferro cement. This research work aims at to study the flexural response, deformation characteristics, ductile performance and energy absorption capacity under impact load of ferro cement slabs made up of self-compacting concrete and wrapped with GFRP sheets at the bottom face.

**Chapter2:-****Literature Review:-****History Of Development:-****Joseph-Louis Lambot of France, in 1852:-**

The initial definition of ferro cement can be drawn from a patent application submitted by Joseph-Louis Lambot of France, in 1852. The patent for “Ferro-cement”, which translates into “iron-cement”. His invention shows a new product which helps to replace timber where it is endangered by wetness, as in wood flooring, water containers, plant pots etc.,. The new substance consists of a metal net of wire or sticks which are connected or formed like flexible woven mat. He gave this net a form which looks in the best possible way, similar to the article he wants to create. Then he put in hydraulic cement or similar bitumen tar or mix, to fill up the joints.

**Fig 1:-**Lambot's first boat at Brignoles museum France (Source :Google images)

Lambot built two rowboats in 1848 and 1849, in length respectively about 3.6m and 3m (12 and 9 feet), 1.3m (4ft) wide and 38mm (1.5in.) thick, and disclosed his patent at the Paris exhibition in 1855 by showing one of the boats. The first boat is now at Brignoles museum in France as shown in Fig[1].

**Joseph Monier in 1867:-**

He is working independently of Lambot, started building for the city of Paris, France, flower pots and garden tubs made out of cement iron rods. Monier took a patent in July 1867, for “a system of movable casing and bowls made of iron and cement, applicable to horticulture”, Monier's work also can be considered as the origin of reinforced concrete.

**Dutch man, Mr. Boon in 1887:-**

He built a small craft of ferro cement, the Zeemeuw (or seagull) and several barges of reinforced mortar to carry ashes and refuse on water canals. The Zeemeuw was reported to be still operating at the Amsterdam zoo in 1968. It is currently displayed in the lounge of the Vereeniging Nederland Cement Industries office in Amsterdam. During the first world war, ships and barges were built with reinforced concrete, and this was again attempted during the second world war due to shortages of materials, particularly steel. In effect, ferro cement was forgotten and replaced by reinforced and prestressed concrete.

**Pier Luigi Nervi in 1940:-**

A noted Italian engineer – architect, revived the original concept of “ferro cement” by proposing that Ferro cement be utilized to build fish boats. He pointed out the distribution of reinforcing meshes in concrete produces a material with approximately homogeneous mechanical properties, capable of resting high impacts. Following some preliminary test on slabs, he showed that ferro cement possesses exceptional elasticity, flexibility, strength, and resistance to cracking. In 1943 ferro cement received the acceptance by the Italian Navy. Shortly after the second world war, Nervi demonstrated the potential of ferro cement by building a 165 ton motor-sailor Irene using a ferro cement hull of thickness 35mm(1.4 in.) which is slightly less than that of the wood hull The Irene entirely satisfactory.

Nervi continued his pioneering by using ferro cement in some architectural work applications, such as a storage warehouse and the roof the exhibition hall of Turin(1948). Most of these structures are still standing today. The boats and structures built by Nervi were appreciated only two decades later, time at which the durability and serviceability of ferro cement could ascertained by the profession.

Ferro cement finally achieved wide acceptance in the early 1960's for boat building the united kingdom, New Zealand, Canada and Australia. In 1968, the Fisheries Department of the Food and Agriculture Organization(FAO) of the United Nations started ferro cement boat building projects in Asia, Africa, and Latin America. Other countries followed, including the soviet union, China, and several countries in south-east Asia. In 1972, the US National academy of science formed a panel to report on the application of ferro cement in developing countries. One of the recommendation of the panel was to establish a worldwide centre to collect, process, and disseminate information on ferro cement. Subsequently, in 1976, the International Ferro cement Information centre was established at the Asian institute of Technology (AIT) in Bangkok, Thailand. In 1975, the American concrete institute formed committee 549, Ferro cement. In 1991, the International Ferro cement Society was established (under the leadership of R. Pama) with headquarters at AIT in Bangkok.

**Chapter 3:-****Experimental Programme:-****Objectives:-**

1. To extend the principles of reinforced concrete design by using continuous steel reinforcement as the main reinforcement to satisfy ultimate stress limit state and fibres as a secondary reinforcement to control cracking and satisfy the crack width limit state in service.
2. To use polypropylene fibers instead of steel fibers, differently from most prior investigations were used.
3. To study the influence of SCC mixture used instead of conventionally vibrated concrete.
4. To study the experimental tests on simply supported HF slabs, in order to determine the ductility factor under the two point loading.
5. To analyze the nonlinear behavior of HF slabs by determining the load deflection response for the slabs tested.
6. To arrive at the analytical equations for moment of resistance, load deflection profile up to serviceability limit. Ductility factor of HF slabs from the experimental investigations carried out.

**Advantages Of Ferro Cement Slabs:-**

The construction of Ferro cement slabs has been found attractive in many developing countries because:

- Ferro cement is made of materials that are readily available in most countries.
- Ferro cement is suitable for a wide range of construction techniques, ranging from self-help construction for housing and agricultural structures to highly prefabricated industrial processes.
- At the low end, ferro cement requires a low level of technology and common labor skill, because of its light weight, it does not require heavy construction equipment or plants.
- Ferro cement can be fabricated in any desired shape, it is particularly suitable for shells and free form shapes.
- Ferro cement is durable and resistant to the environment like concrete and masonry, it is non-flammable, it is less prone to corrosion than steel, it is not sensitive to humidity and unlike wood, does not rot, and has longer life than fiber reinforced plastics.
- Ferro cement can be easily maintained and repaired after damage.
- Ferro cement is cost effective.
- The skills for ferro cement construction can be easily acquired.
- Ferro cement construction is less capital-intensive but more labour intensive.

- Ferro cement qualifies in terms of using fewer resources and less energy, in being less polluting, and in generating less waste.

#### Disadvantages Ferro Cement Slabs:-

- It is difficult to fasten to ferro cement with bolts, screws, welding and nail etc.
- Large no of labors required.
- Cost of semi-skilled and unskilled labors is high.

### Chapter 4

#### Preliminary Tests:-

##### Tests on Cement:-

Ordinary Portland cement 53 grade conforming to IS 12269-1987 is used and there properties are as follows:-

Table 1:- Test on cement

SL.NO	Characteristics	53 grade	As per IS 12269-1987 for 53 grade
1	Consistency of cement	35%	-
2	Specific gravity	3.09	3.15
3	Initial setting time	56 minutes	>30 minutes
4	Final setting time	268 minutes	<600
5	Fineness of cement	2.3%	<10%
6	Compressive strength 3 days	28.2 N/mm <sup>2</sup>	27 N/mm <sup>2</sup>
7	Compressive strength 7 days	38.6 N/mm <sup>2</sup>	37 N/mm <sup>2</sup>

#### Sieve Analysis of fine aggregates:-

The aggregate consists of well graded fine aggregate (sand) that passes a 4.75 mm sieve.

Table 2: sieve analysis of fine aggregate

IS Sieve Size	Wt. Retained On sieve(gm)	Cumulative Weight retained	Cumulative % retained	Cumulative % passing	Requirement IS 383-1970
4.75mm	66	3.32	3.32	96.68	90-100
2.36mm	176	8.84	12.16	87.84	75-100
1.18mm	330	16.58	28.74	71.26	55-90
600µm	226	11.36	40.10	59.90	35-50
300µm	1144	57.49	97.59	2.41	8-30
150µm	40	2.01	99.60	0.4	0-10
Pan	8	0.4	100.00	0.00	
TOTAL	1990		281.20		

#### Quantity Calculation:-

Mix design is defined as quantity of material per cubic metre of mortar (cement, fine aggregates) as shown in below

- Calculate the dry volume of materials required for 1m<sup>3</sup> cement mortar. Considering voids in sands, we assume that materials consist of 60% voids. That is, for 1m<sup>3</sup> of wet cement mortar, 1.6m<sup>3</sup> of materials are required.
- Now we calculate the volume of materials used in cement mortar based on its proportions. Let's say, the proportion of cement and sand in mortar is 1:2. Then, the volume of sand required for 1:2 proportion of 1m<sup>3</sup> cement mortar will be  $1.6 \times 2 / (1+2) = 1.067 \text{ m}^3$ .
- Volume of cement will be calculated as  $1 \times 1.6 / (1+2) = 0.53 \text{ m}^3$
- Since the volume of 1 bag of cement is 0.0347 m<sup>3</sup>, so the number of bag of cement will be calculated as:  $0.53 / 0.0347 = 15.27$  bag

**Chapter 5:-****Materials:-****Constituents Of Ferro Cement:-**

Ferro cement is a composite thin element which is constructed of building materials wire mesh, cement, fine aggregate (sand) water, polypropylene fibre.

**Wire mesh:-**

One of the important constituents of ferro cement is wire mesh reinforcement. These generally consist of thin wires, (galvanized or un-galvanized) either woven or welded at their intersections. The mechanical properties of ferro cement depends on the type, quantity, Orientation and strength properties of mesh reinforcement. Different type of mesh reinforcement are available in the market, which are suitable of ferro cement construction. Some of them are listed below

(a) Square woven wire mesh

(b) Square welded wire mesh

(c) Hexagonal wire

(d) Expanded metal

1.Squarewoven mesh

2.Square welded mesh

3.Hexagonal wire mesh.

4. Expanded metal mesh

**Fig 2:-** Types of wire mesh(Source: Google images)

1. **Woven wire mesh** is fabricated simply weaving the galvanized wires into desired grid sizes without welding them at the intersection. The grids are generally square. The mesh wires are not perfectly straight and some amount of waviness exists.
2. **Hexagonal wire mesh** also commonly known as chicken wire mesh is fabricated from cold drawn wires of diameter varying from 22-26 gauges and woven into hexagonal patterns with mesh opening varying from 10mm to 25mm. This is the cheapest, easiest to handle and most commonly used in ferro cement construction.
3. **Expanded metal mesh** which is sometimes used in ferro cement construction, is formed by slitting thin gauge sheets and expanding them in a direction perpendicular to the slits to produce diamond shape openings. This mesh has inherent advantages like good mechanical bond and ease of placing.
4. **Welded wire mesh** is fabricated in rectangular or square pattern by perpendicular intersecting wires (generally 2-3mm diameter) made of low to medium
5. **Tensile strength** steel (which are much stiffer than hexagon or woven wire mesh) and welded together at the intersections. Now we are using this kind of meshes in preparing ferro cement slabs.

#### **Cement:-**

Ordinary Portland cement of 53 grade that is commercially available in the market is satisfactory for ferro cement construction. But the type of cement should be selected according to the need or environment in which the structure is built. However other type of Portland cement can be used like sulphate resisting cement for ferro cement construction in marine environment.

Portland pozzolana cement has also been recommended for ferro cement as it provides good resistance to sulphate attack also competitive in price compared with ordinary Portland cement.

#### **Sand:-**

Only fine aggregate is used in ferro cement, Coarse aggregate is not used in ferro cement. Normally, the aggregate consists of well graded fine aggregate (sand) that passes a 4.75 mm sieve; and since salt-free source is recommended, sand should preferably be selected from river-beds and be free from organic or other deleterious matter. Good amount of consistency and compatibility is achieved by using a well-graded, rounded, natural sand having a maximum top size about one-third of the small opening in the reinforcing mesh to ensure proper penetration. The moisture content of the aggregate should be considered in the calculation of required water.

#### **Water:-**

In ferro cement, the water used for mixing cement mortar should be fresh, clinched fit for construction purposes; the water of pH equal or greater than 7 and free from organic matter—silt, oil, sugar, chloride and acidic material.

#### **Admixtures:-**

In numerous admixtures available, chemical admixtures is best suitable for ferro cement because it reduces the reaction between matrix and galvanized reinforcement. Chemical admixtures used in ferro cement cement serve one of the following purposes like water reduction, improvement in impermeability, air entrainment, which increases resistance to freezing and thawing. Here we are using Polycarboxylate Ether (PCE 811).

Polycarboxylate Ether (PCE 811). 'Polycarboxylate Ether' this liquid is commonly used for the purpose of enhancing the fluidity of concrete it also plays a vital role in boosting the strength it exalt the plasticity as well. Polycarboxylate ether increases the strength of concrete in a drastic manner. This chemical gives construction industry innovation solutions and totally new opportunities which are completely related to the field of concrete manufacturing. This chemical provides high fluidity to concrete at less levels of water. It also retains slump for the long time period. With water reducing property it also gives very remarkable strength and high workability to concrete.

#### **Polypropylene fiber:-**

##### **Specific Gravity:-**

0.90 – 0.91 gm/cm<sup>3</sup>, Because of its low specific gravity, polypropylene yields the greatest volume of fibre for a given weight. This high yield means that polypropylene fibre provides good bulk and cover, while being lighter in weight. Polypropylene is the lightest of all fibres and is lighter than water. It is 34% lighter than polyester and 20% lighter than nylon. It provides more bulk and warmth for less weight.

**Applications:-**

- Rcc&Pcc like lintel ,beam, slab, column, flooring and wall plastering
- Foundation, tanks, manholes, cover and tiles.
- Roads and pavement
- Hollow block and precast

**Advantages:-**

- ❖ Reduce cracks during plastic and hardening stage.
- ❖ Reduce water seepages and protect steel in concrete from corroding and walls from dampening.
- ❖ Rebound loss reduced by 50-70%. Result in saving of expensive mortar, cement and sand.
- ❖ Time taken for plastering is reduced and work is completed faster.
- ❖ Protect corners in precast slabs and concrete flooring.
- ❖ Increase abrasion resistance by over 40% there by increasing life of roads, walkways, floors. Also reduces pitting of the floor.

**Properties of ferro cement composites (as per aci committee 549r-97):-**

- Wire diameter 0.5 to 1.5 millimeters
- Size of mesh opening 6 to 35 millimeters
- Maximum use of 12 layers of mesh per inch of thickness
- Thickness 6 to 50 millimeters
- Ultimate tensile strength up to 34 MPa
- Allowable tensile stress up to 10 MPa
- Modulus of rupture up to 55MPa
- Compressive strength up to 28 to 69Mpa

**Chapter6:-****Methodology:-**

The experimental program includes preparing and testing of hybrid ferro cement slabs using point load method.

**The variable parameters are as follows:-**

1. Number
2. Percentage of welded square mesh reinforcement.
3. Percentage of polypropylene fibres in mortar.
4. Number of FRP layer wrapping.

**Mix Proportion:-****Table 3:-** Mix proportions

Cement sand Proportion	1: 2
Water cement ratio	0.45
Polypropylene fibres	0.3% by weight of cement
super plasticizer	0.5% by weight of cement

**Variable Parameters:-****Table 4:-** Variable parameters.

S.I no.	specimens	Thickness in mm	Wire mesh	FRP layers	Polypro-pyline fibers
1	A0	60	0	0	0
2	A2	60	2	0	0
3	A3	60	3	0	0
4	B0	60	0	0	0.30%
5	B2	60	2	0	0.30%

**Test Specimens:-**

A total of 9 specimens of Ferro cement slabs were cast and are tested. All the specimens have a dimensions of 1000mm\*1000mm with a thickness of 60mm each. The thickness of slabs were kept constant and by varying numbers of layers of meshes, numbers of FRP layers and the slabs with and without polypropylene fibre totally accounts for 9 slab specimen. The specimens were designated as A0, A2,A3,B0,B2,B3,C0,C2,C3. Table4 shows the details of varying parameters used in ferro cement slabs in the present investigation work.

The supplementary specimens such as six numbers out of which three are with and another three without polypropylene fibres of size 70mm\*70mm cubes were cast along with the ferro cement slab and are tested for compressive strength.

The slabs were cast using self compacting micro concrete, which gets compacted due to its own weight any external vibration. This concept is used for the construction of ferro cement slabs in order to overcome the problems and difficulties in the construction process.

The use of SCC in the construction of ferro cement slabs facilitates the easy placing of mortar without requirement of skilled labors, vibrators and improving the quality and speed of manufacturing ferro cement products.

**Preparation Of Mortar:-**

Mortar was prepared by calculating the exact amount of cement sand and water. At the first the cement sand were dry mixed. For addition of water, initially 75% of water is added to the dry mix and mixed thoroughly.

Admixture such as super plasticizer with dosage of 0.5% by weight of cement is added with remaining 25% of water and its added to the mixer and is mixed thoroughly for about ten minutes and polypropylene fibre with dosage of 0.3% by weight of cement is added to the mixture and mixed properly, Finally the mortar is prepared.

**Fig 3:-** Morter mix

The mesh pieces were cut down according to the size of panel leaving a cover of 50mm on both side of mesh of size (900\*900mm) as shown in figure below

**Fig 4:-** Pieces of welded square mesh (spacing 20\*20mm, 1.2mm diameter)

#### **Properties Of Self Compacting Concrete:-**

The SCC flows alone under its dead weight up to leveling, airs out and consolidates itself thereby without any entry of additional compaction energy and without a nameable segregation. The SCC owns over three key characteristics which are listed below. These characteristics were made possible by the development of highly effective water reducing agents (super plasticizers), those usually based on Polycarp boxy late ethers. The mixture composition of SCC deviates from conventional concrete. The powder contents of SCC are normally lying (in some cases even considerably) above those of conventional concrete.

1. **Filling Ability:** Ability of to fill a formwork completely under its own weight.
2. **Passing Ability:** Ability to overcome obstacles under its own weight without hindrance. Obstacles are e.g. reinforcement and small openings etc.
3. **Segregation resistance:** Homogeneous composition of concrete during and after the process of transport and placing.

An idea of SCC is a material that flows into formwork and compacted under the influence of its own self-weight without vibration and additional processing. Realization of self-compacting as the key feature of fresh concrete enabled at the same time application of technologically higher quality material with improvement of economic building conditions.

#### **Uses And Advantages Of Self Compacting Concrete:-**

The main advantages of application of self-compacting concrete on site are as follows:

- No vibration of fresh concrete is necessary during placement into forms.
- Placement of concrete is easier.
- Faster and more efficient placement of fresh concrete is achieved. Total concreting time is reduced.
- Noise level on construction site is reduced.
- The number of working hours on the construction site can be increased and the night shift in urban zones is enabled.
- Energy consumption is reduced.
- Required number of workers on construction site is reduced.
- Safer and healthier working environment is obtained. Upon self-compacting concrete hardening in structures:
- High quality of placed concrete is achieved, regardless of the skill of the workers.

- Good bond between concrete and reinforcement is obtained, even in congested reinforcement.
- High quality of concrete surface finish is obtained with no need for any subsequent repair.
- With a better final appearance of concrete surface, smooth wall surfaces and flat floor surfaces that need no further finishing are obtained.
- Improved durability of structures is achieved.

**Casting:-**

A wooden mould of size 1000mm\*1000mm\*60mm were oiled before casting to avoid sticking of mortar. Firstly at bottom mortar is placed for about 6mm thickness and above this the wire mesh of size 900mm\*900mm to ensure minimum clear cover of 50mm on each side of the reinforcement is placed inside the mould care should be taken that the wire mesh should be strengthened to a plane surface by pressing with fingers and above this mortar is placed and another wire mesh is placed the procedure is continued for a three layer, two layer, and zero layer finally, the surface are being levelled to get a uniform surface finishes following fig 6 .shows casting slabs.

**Fig 5:-** casting slabs

#### **Design Parameters:-**

The arrangements of weld mesh used in this investigation were offive categories. Those are:

1. Placing a layer weld mesh across the cross section of slab attention zone with a clear cover of 3mm shown in Figure.
2. Placing the two layers of weld mesh across the cross section of slab at tension zone with a clear cover of 3mm and a spacing of 3mm between the layers shown in Figure.
3. Placing the three layers of weld mesh across the cross section of slab at tension zone with a clear cover of 3mm and a spacing of 3mm between the layers shown in Figure.
4. Bundling the two layers of weld mesh with binding wire and placing near bottom with a clear cover of 3mm shown in Figure.
5. Bundling the three layers of weld mesh with binding wire and placing near bottom with a clear cover of 3mm shown in Figure.

These specimens are designed to study the influence of arrangements of weld mesh on the flexural behavior of the ferro cement slabs.

The thickness of the slab also plays a major role in the flexural strength and in the ductility. Hence, for the proposed experimental study and 60 mm thickness were chosen. HF slabs polypropylene fibers (Ronald 1996) were added as secondary reinforcing elements to control cracking in the compression face. Two different number of GFRP layers were considered to wrap at the bottom face of the slab. They are: 1.Specimens with single layer of GFRP wrapping at tension zone 2. Specimens with two layers of GFRP wrapping at the tension zone.

#### **Curing And Application Of Gfrp Layers:-**

The specimens cast were left in the moulds for a period of 24 hours. After 24 hours Specimens were demoulded from the mould carefully and immediately placed under water in a curing tank and were allowed to cure under water for a period of 28 days.

After the period of 28 days, the ferro cement slabs were taken out of the curing tank, dried and out of nine slabs for three slabs such as C0, C2&C3 at the bottom surface of the slab is made rough using of wire brush. GP resin twice by weight of the FRP sheets is being applied using the brush on the bottom surface of the slab and the sheets are

pasted and are pressed along the edges of the slabs. FRP wrapped slabs are being kept for a period of 2 days and are allowed to get dried before the testing of slabs.

All the slabs were tested under monotonic loading in two point flexure to evaluate the following:

1. Deformation characteristics.
2. Ductility of Hybrid Ferro cement slabs
3. Modes of failure

**Fig 6:-** Application of GFRP layer.

#### **Chapter7:-**

##### **Instrumentation And Loading Procedures:-**

All the specimens were tested in a loading frame, which is fixed over a strong floor. The slabs were simply supported with an effective span of 800mm c/c. Two point loads were applied transversely at one third distances from support using a steel plate. Along with it, capacity proving ring was used for the load application. Dial gauge of sensitivity 0.01mm were used to measure the deflection of the slabs. The dial gauge were kept at mid span of the slab deflector meter to measure the deflection of the slab.

**Fig 7:-** Testing of slab specimens (structural lab)

The behavior of the slab was keenly observed from the beginning till collapse. The propagation of initial cracks due to the increase of load was also recorded. The loading was continued till the verge of collapse.

#### **Measurement Of Deflections:-**

The slabs were suitably instrumented for measuring deflection using dial gauge. Deflections under the loads of the central deflections were measured using One dial gauge. The dial gauge have a least count of 0.01 mm, it was held in position by stands fit with magnetic base. The readings were taken at closer intervals. Figure9 shows the deflector meter attached to the slab. The load was gradually applied by screw gauge with a proving ring of capacity 25 kN. As the applied load was increased, each test slab was carefully inspected visually for the first crack formation to estimate first crack strength. The value obtained was confirmed using the load-deflection plot, where the first - crack strength would correspond to a sudden (but small) drop in the load readings. After the determination of the first-crack strength, the specimen was tested to failure to obtain its ultimate strength.

#### **Ductility Performance:-**

The ability of a member to deform without a significant loss of its strength is known as ductility. One method of quantifying ductility is by using the ductility factor as defined by the ratio of ultimate deflection to the deflection at yielding of tensile reinforcement and Ductility Index, based on the failure state, where the failure load may be considered as equal to 85% of the ultimate load in the descending part of the load- deflection curve, is also of interest in some cases, especially in seismic design.

The displacement factor based on yielding of steel and ultimate stage are shown in Table: 9. it can be seen that displacement ductility factor varied from 0.38 to 2.15 for ferro cement slabs. From the test results, the slabs without the gfrp wrapping and fibre reinforcement exhibits lower ductility ratios. The gfrp wrapped slabs with 3 bundled layered reinforcement exhibits a higher displacement ductility ratio than those of fibre reinforced and conventional ferro cement slabs due to the fact that strengthening of tension zone on the slabs has better confinement which affect the ductility ratios.

The provision of gfrp layers in the tension zone and also the reinforcing of polypropylene fibres in the concrete has better confinement capacity than the conventional ferro cement slabs preventing the disintegration of concrete in the compression zone even after the concrete reaches failure thereby improving failure ductility. The number of bundleness reinforcement of wire mesh also has effect on the ductility ratios due to increase in the volume

**Discussions:-**

- 1 Table 5 shows that the compressive strength of hybrid ferro cement slabs without polypropylene fibres and with polypropylene fibres. From results it is observed that the compressive strength at 28 days curing of hybrid ferro cement slabs with polypropylene fibres content of 0.3% is increased by 6.34% with compressive strength of conventional concrete plain.
- 2 Table 6 shows the test results of ferro cement slabs specimen A0 with zero layer wire mesh in the absence of polypropylene B0 in the presence of polypropylene and in the absence of frpsheet.and C0 in the presence of polypropylene and Frp sheets.Graph1 shows the corresponding load deflection behavior of different three slabs from the test results it is observed that the ultimate load carrying capacity in flexure is 75% is more for B0 compared to A0 and 50% more for C0 compared to A0 slab.
- 3 Table 7 shows the test results of ferro cement slabs with double layer mesh the Graph2 shows the corresponding load v/s deflection behavior of HFS it is observed that the load carrying capacity is more in case of B0 and C0 compared to A0 in the same way Table 8 shows the test results of ferro cement slabs with three layer Graph3 shows the load deflection curve having more load carrying capacity of slab C0 compared to B0 ,A0 slabs.
- 4 From the test results it is observed that the ultimate load carrying capacity in three layer weld mesh HFS with 0.3% fibre content is increased by 25% in comparison with double layer weld mesh of ferro cement slab without GFRP layer.
- 5 By studying the crack patterns it is observed that the appearance of the first crack is slower in case of three layer weld mesh ferro cement slab with fibre and GFRP sheet in comparison with double layer weld mesh with 0.3% fibre content and without fibrous ferro cement slabs

**Chapter9:-****Conclusions:-**

1. The fibre reinforced ferro cement slabs shows a good load carrying capacity and Ductility characteristics. In the tension zone, concrete matrix crack occurs as fibre starts acting. The fibre carries the load across the crack, transmitting the load from one sided of the matrix to other and as the fibre is randomly distributed, the crack do not have very long paths, thereby loads bearing capacity of the \whole matrix is increased and multiple cracking is observed.
2. Increasing in numbers of layers from 2 to 3 significantly increases the load carrying capacity and ductility characteristics and capability to absorb energy of the slabs.
3. Presence of polypropylene fiber reduces the cracks and protects the corners of slab and increase the abrasion resistance, reduce the seepage of water.
4. Addition of super plasticizer will results in achieving self-compacting concrete and thus which reduce up to 6.34% of water. It also helps in placing of mortar which can easily flow by its own Wight without any vibration.
5. The compressive strength of cubes with presence of polypropylene fiber which increase about 6.34% as compared to conventional cube specimens.
6. The gfrp wrapped ferro cement slabs shows the higher ductility than that of the conventional ferro cement slabs due to the fact that, better confinement is being provided by the wrapping in the tension zone of the slabs. The wrapping acts as an external reinforcement and takes load in the tensile zone after the concrete fails.

**Future Scope:-**

1. Further investigation can be carried out by increasing the fiber content and also by using the different types of fibres such as steel fibres and carbon fibres.

### Abstract

Monogenic Disorders (MDs) are the single-gene associated disorders. Approximately 5000 types of these disorders have been known by now. These have been found most commonly in the developing countries, more specifically in the rural areas with the highest ratio due to the consanguineous marriages. The recessive or minor unexpressed disorder carrier gene also gets expressed within their offspring. Depending upon the global prevalence and other various characteristics of the monogenic disorders, these have been classified on the basis of their patterns of inheritance i.e. Autosomal or X-Linked. Likewise, Dominant or Recessive. Several common monogenic disorders have been discussed comprehensively with their etiology, features, effects, diagnosis and cure. Osteogenesis Imperfecta (OGI), Retinoblastoma (RB), Cystic Fibrosis, Thalassemia, Fragile X Syndrome (FXS), Hypophosphatemia, Hemophilia and Ichthyosis are included in the category of MDs and are discussed in detail. Most of the monogenic disorders are rare to happen even their causes are still unknown while some are quite common with known causes. Various diagnostic techniques and the treatment methods have been developed for them which have not been proved enough to treat the disorders by conventional approaches. Therefore, some recent and updated approaches are also being implemented in the field of treatment of these disorders that includes the Gene Therapy, Stem Cell Transplantation and Bone Marrow Transplant.

### Introduction:-

Gene is basically a specific length or segment of DNA containing some crucial information for the assembly of amino acids in an order to form a protein. The entire DNA compliment of cell or an organism is known as "Genome" (Alberts, B. et al., 2002; Dongen, J. 2015). It turns on within a cell for a specific time interval only in the case of need. It consists of various alternative forms known as "Alleles" ( Terao, C. et al., 2016), from whom only a single form can be expressed or inherited depending upon its potential of ruling over its partner form in a chromosome (Perry, S. et al., 2014). These alleles or gene may act in an abnormal way and said to be "Mutated" and leads to a "Genetic Disorder" (Bagheri, M. et al., 2015). These genetic disorders can be either Monogenic or Polygenic. Single-Gene or Monogenic Disorders can take place in an organism due to mutation or change in the single gene within a genome (Thornhill, A. et al., 2015). The gene either stops working or perform any unwanted or improper role. While the Polygenic disorders happen due to change or mutation in the multiple genes (Tao, J. et al., 2015).

Monogenic is actually the combination of two Greek words; Mono means “Single” and Genic means “Gene”. These are the disorders caused by the inheritance of the single mutated gene from parent to offspring known as “Monogenic disorders or Single-gene Diseases” [MDs] (Tuomi, T. et al., 2014). These disorders are categorized as “Autosomal” or “Sex-Linked” based upon their origin whether the mutation is in an autosome or in a sex chromosome. Further these disorders may exist because of the expression of an allele of a gene over the over i.e. “Dominant” or “Recessive” on the basis of the inheritance of the copy of the single mutated gene either from single parent or both (Kashyap, M. et al., 2015). Whereas, the Monogenic Disorders can also be further categorized as “X-Linked”, “Y-Linked” and “Mitochondrial” on the inheritance basis of any mutated gene because of mother (Antonarakis & Beckmann, 2006; Bamshad, M. et al., 2011). These disorders take place due to sex chromosomes. Though there are not much genes in the Y chromosome as it is too small, it does not show any monogenic disorder. Y-Linked disorders are often and polygenic. Most of the monogenic disorders are spontaneous and naturally occurring whereas, some are non-spontaneous and due to environmental changes (Yazdi, F. et al., 2015). There is a large figure of the monogenic disorders i.e. More than 5000 which includes most of the rare disorders along with some of the common ones. Most probably these disorders vary from cell to cell, though the entire genome of the organism is same among all the body cells (Fiorentino, F. et al., 2005; Harper & Sen Gupta, 2012). The global prevalence of this disease is 10/1000 at the birth and an estimate of 360 Million people are victims of monogenic disorders (Aslamkhan, M. 2015; Irfan-Maqsood, M. 2015).

Monogenic disorders [MDs] have always remained a common issue in the developing countries due to poor environmental factors and unnecessary mutations i.e. Pakistan, India, Afghanistan, Bangladesh and Sri Lanka from Asia. Our main focus is on the health issues regarding to the genetic disorders in Asian sub-continent (Kumar, D. 2012; Yamada, Y. 2006). The percentage of the monogenic disorders is too high in this particular area that includes Thalassemia, Osteogenesis Imperfecta, Hemophilia and Ichthyosis (Pemberton, T. et al., 2012; Ropers, H. 2007). A survey has been conducted recently in 2012, according to which the population of Pakistan is around 190 Million from which more than 65% of the population belongs to the rural or scattered areas and consanguinity has been observed in almost 80% of the cases which is one of the most common cause of the inheritance of genetic disorders from generation to generation (Halim, N. et al., 2013; Hussain, R. et al., 2001; Obeidat, B. et al., 2010). As the consanguineous individuals have at least one common ancestor somehow from any of their previous generations. Hence, there are more chances of the occurrence of any genetic disorder whose genes were present among consanguineous parents (Harlap, S. et al., 2008; Sheridan, E. et al., 2013) but were not expressed but now with the inbreeding, risk of disease in the descendant is 99% sure and can be proved lethal whether the parents are carrier of any dominant defective trait or of recessive, it leads to the congenital disorders and genetic disorders. These disorders affects in both way, genotypic and phenotypic (Bittles, A. 2012; Sandridge, A. et al., 2010; Warsy, A. et al., 2014).

The cause of several monogenic disorders is still unknown; various techniques have been introduced in order to diagnose these disorders at the genetic level over last 3 decades for the better understanding and consideration. As long as the new technologies like Next Generation DNA Sequencing [NGS] and DNA microarrays are being launched (McPherson, E. 2006; Yoo, H. 2010) and getting advanced day by day for the entire Genome [Gene or DNA] Analysis while the prenatal diagnosis has been proved as the conventional one, In contrast to that a number of a number of more monogenic disorders are being identifying (Cavalli, P. 2009; Pagon, R. 2002). Human Genome Project [HGP], a scientific research project, was presented in 2003 that gives the entire information about all the genes present in the human body regarding to their sequence and the functions. Hence, it has been proved very useful for the determination of the causes of disorders that are monogenic as well as polygenic (Antonarakis, S. 2001). In former studies, Mapping techniques have been used so far for the analysis of monogenic disorders. But due to some limitations, Massively Parallel Sequencing [MPS] Technology can also be used for studying the advances relevant to the genome analysis for the determination of monogenic disorders (Duncan, E. et al., 2014).

Monogenic disorders are also known as “Mendelian Disorders” as the concept of inheritance of the genetic characters along with the gene copies was introduced by the Father of Genetics, Gregor Mendel (Kosztolányi, G. 2011; Pembrey, M. 2010; Williams, S. et al., 2014). In order to study about the monogenic disorders inheritance patterns as described by the Mendel’s Law, we need to go either through the pedigrees of the characters being mutated within a species or by the help of various molecular techniques such as PCR and Sequencing (Pommerenke, C. et al., 2016) and after the detection of the disorder, the presence of the disorder has been confirmed. Now the struggle towards the remedy of these disorders should be made appropriately (O’Connor & Crystal, 2006; Wong & Chiu, 2010). Through the applied and advanced researches we came to know that almost all the monogenic disorders

are part of the coding regions “Exons” present within the human genome which encodes and controls almost all the body characters as well as functions (Valencia, C. et al., 2015). Hence, our main focus turned towards the exome of the body and the technologies used for the exome analysis are genotypic arrays and the exome sequencing. Just by analyzing the exome rather than the whole genome of an organism (Pommerenke, C. et al., 2016), we may perform experiments and get better results in less time than other sequencing techniques of the entire genome of an organism (Shigemizu, D. et al., 2015). Exome sequencing is basically the selective re-sequencing of a selective segment of the DNA which is doubtful as mutated (Nash, B. et al., 2015). With the help of exome sequencing, while studying a monogenic disorder which have been still unknown by cause and is newly discovered by the sequencing analysis, its certain perspectives get clear with its discovery due to the advancement in the field of genetics and technology (Lacey, S. et al., 2014). But still there is a large figure of the monogenic disorders whose causes are still unknown. It’s actually all about the complexity of the disorder which is either at a single site or sequence within a gene at a copy or at the certain sites or sequences within both the copies of gene [Dominant or recessive] (Lalonde, E. et al., 2010; Valencia, C. et al., 2015).

There was no possible cure of monogenic disorders up till now but these days, the advanced remedies are being used and processed further with the passage of time as they are not time consuming at all but these remedies require the experience and are expensive as well as at risk i.e. Stem cell treatment and transformation (Lida, Y. et al., 2014; Xie & Tang, 2016). These are at risk as the treatment is either on a possibility of being occurring in case transformation for any therapeutic cure or the failure if the vector does not hits the target properly. Whereas, the success rate of stem cell therapy is a bit higher as it is quite efficient that transformation technique and is comprised of the modifications being made in the body cell of patient itself or another healthy donor (O'Connor & Crystal, 2006).

#### Modes of Inheritance of Monogenic Disorders:-

In the Monogenic Disorders, the copy of a mutated gene or multiple copies are inherited and causes a characteristic phenotype of that gene by following the Mendelian Segregation patterns (Ahmed, N. et al., 2006; Chen, N. et al., 2014; Fountain, E. et al., 2016). The patterns of inheritance can be predicted in both cases of autosomes as well as sex chromosomes. They also describe whether the single copy of a gene is inherited and responsible for the cause or the both copies of respective gene are mutated i.e. Dominant and recessive (Lalonde, E. et al., 2010; Valencia, C. et al., 2015). Pedigrees can be drawn to study the family or ancestry record for distinguishing among the affected and wild type generations and individuals in a family line and their pattern of inheritance. [Fig. 1] shows the signs used in the pedigree for distinguish among males and females, affected and wild type (Chen, N. et al., 2014; Fountain, E. et al., 2016).

**Fig. 1:** Signs for Pedigree.

Some crucial modes of inheritance that help in the demonstration of monogenic disorders are as follows [Fig. 2];

1. Autosomal Dominant Inheritance
2. Autosomal Recessive Inheritance
3. X-Linked Dominant Inheritance
4. X-Linked Recessive Inheritance
5. Y-Linked Inheritance

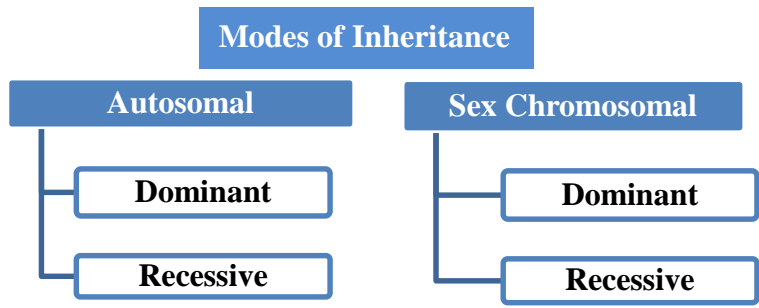

Fig. 2: Modes of Inheritance in Monogenic Disorders.

**Autosomal Dominant Inheritance:-**

The monogenic autosomal dominant inheritance takes place due to a single mutated autosomal gene present in any of the parents [Usually Heterozygotes] (Oleinikov, A. 2008; Pan& Weissman, 2002). As the mutation is on an autosome, hence both the males and females can be equally affected and the probability of the inheritance of the disorder is 50% due to the presence of a wild type and a mutated allele or gene copy in the child from each of the parents (Regalado, E. et al., 2011). Punnett square helps us in predicting the possible outcomes of the offspring from the single or both affected parents [Table. 1]. A copy of the gene is enough either to produce a wild type or a mutated offspring as the genes are Dominant Autosomal genes are represented as “A” while recessive ones are represented as “a”.

Table 1: Possible outcomes of Autosomal Dominant Inheritance

Parents	Affected Parent	
Normal Parent	A	a
a	Aa	aa
a	Aa	aa
Offspring	50% Affected	50% Normal

**A: If One Parent is affected**

Parents	Affected Parent	
Affected Parent	A	a
A	AA	Aa
a	Aa	aa
Offspring	75% Affected	25% Normal

**B: If Both Parents are affected**

Single dominant in their pattern and one of the parents is surely affected as well. They transmit from generation-to-generation randomly and can remain silent or unexpressed at any generation and again expressed at the other one (Cutting, G. 2010). Pedigree for the autosomal dominant inheritance patterns of the monogenic disorders is shown in [Fig. 3].

Fig. 3:- Pedigree for the Autosomal Dominant Inheritance.

**Autosomal Recessive Inheritance:-**

In Monogenic autosomal recessive inheritance, the single mutated autosomal gene copy from the both parents is inherited in the offspring [Homozygote] and the repressed or recessive characteristic of a trait is again expressed due to the similar gene copy of both the alleles (Gialluisi, A. et al., 2012; Jonker, M. et al., 2015).

In case of the recessive autosomal inheritance, both the genes present should be mutated. If any of them is wild type than they may be asymptomatic [Doesn't show any of the abnormal features or symptoms] and the individual would be the healthy one phenotypically but are still the carrier of that disease and are capable of passing the disease into the upcoming descendant generations if remain in consanguinity (Harlap, S. et al., 2008; Sheridan, E. et al., 2013). Such disorders can be observed in only single generation as they can be repressed by avoiding the consanguineous relations. The risk of inheritance of these disorders is high in the consanguineous parents. As if both are the carriers of the disorder then there is 25% possibility of the disorder in the child (Ahmed, N. et al., 2006; Gao, Z. et al., 2015; Henn, B. et al., 2016). Punnett Square helps us in showing the predicting outcomes of the offspring from the normal, affected or carrier parents [Table. 2].

**Table 2:** Possible Outcomes of Autosomal Recessive.

<b>Parents</b>	<b>Normal Homozygote</b>	
<b>Normal Heterozygote</b>	<b>A</b>	<b>A</b>
<b>A</b>	<b>AA</b>	<b>AA</b>
<b>a</b>	<b>Aa</b>	<b>Aa</b>
<b>All Normal Offspring</b>	<b>50% Homozygous Normal</b>	<b>50% Heterozygous Carriers</b>

**A: If One Parent is Carrier and other is Normal**

<b>Parents</b>	<b>Normal Heterozygous</b>	
<b>Normal Heterozygous</b>	<b>A</b>	<b>a</b>
<b>A</b>	<b>AA</b>	<b>Aa</b>
<b>a</b>	<b>Aa</b>	<b>aa</b>
<b>Offspring</b>	<b>75% Normal Carriers</b>	<b>25% Affected Homozygous</b>

**B: If Both Parents are Carriers**

<b>Parents</b>	<b>Affected Homozygous</b>	
<b>Normal Homozygous</b>	<b>a</b>	<b>a</b>
<b>A</b>	<b>Aa</b>	<b>Aa</b>
<b>A</b>	<b>Aa</b>	<b>Aa</b>
<b>Offspring</b>	<b>100% Heterozygous Carriers</b>	

**C: If one Parent is Affected and Other is Normal**

<b>Parents</b>	<b>Affected Homozygous</b>	
<b>Normal Heterozygous</b>	<b>a</b>	<b>a</b>
<b>A</b>	<b>Aa</b>	<b>Aa</b>
<b>a</b>	<b>aa</b>	<b>aa</b>
<b>Offspring</b>	<b>50% Heterozygous Carriers</b>	<b>50% Affected Homozygous</b>

**D: If One Parent is Affected and Other is Carrier**

Pedigree for autosomal recessive inheritance patterns of the monogenic disorders is shown in [Fig. 4].

**Fig. 4:** Pedigree for the Autosomal Recessive Inheritance

**X-Linked Dominant Inheritance:-**

The Mutation in the X-chromosomal gene of the sex chromosomes leads to numerous disorders which are said to be X-Linked Disorders. As the males contain only one X while the females contains 2 X-Chromosomes (Dobyns, W. 2006). Hence, the pattern of inheritance of the X-Linked dominant disorders is straight forward it will either produce the affected offspring or the normal ones at the possibility of 50% and the disorder transmits continually over the generations because the mutated gene is Dominant and it has to be expressed at each condition (Dobyns, W. et al., 2004; Rappaport, H. 2003).

The sons of affected father will not be affected further nor inherit the disorder whereas, the daughters would surely be the carriers or the affected ones and keep on inherit the disorder (Amberger, J. et al., 2015; Chong, J. et al., 2015).

Punnett Square helps us in showing the predicting outcomes of the offspring from the Normal and Affected parents [Table. 3]. Normal Chromosome is represented as “X” while the affected one is represented as “X’”.

**Table 3:** Possible Outcomes for X-Linked Dominant Inheritance

Parents	Affected Female	
Normal Male	X’	X
X	X’X	XX
Y	X’Y	XY
Offspring	50% Affected	50% Normal

**A: If Mother is Affected and Father is Normal**

Parents	Normal Female	
Affected Male	X	X
X’	X’X	X’X
Y	XY	XY
Offspring	50% Affected Females	50% Normal Males

**B: If Mother is Normal and Father is Affected**

Pedigree for the inheritance patterns of X-Linked Dominant monogenic disorders is shown in [Fig. 5].

**Fig. 5:** Pedigree for X-Linked Dominant Inheritance.

**X-Linked Recessive Inheritance:-**

The X-Chromosomal genes are mutated in the X-Linked recessive monogenic disorders which are not expressed as a characteristic trait under certain conditions of the heterozygote but can only be expressed in case of the homozygote or hemizygote [Gene with one allele at a loci instead of two] (Bamshad, M. et al., 2011). In X-linked recessive disorder, the hemizygotes are mostly the male ones as they consists of two different genes at different loci and are commonly affected as comparative to the female ones (Rappaport, H. 2003).

Though the females have an affected chromosome but there is an unaffected chromosome present as well and due to **Lyonization** process (Boulard, M. et al., 2016), only one chromosome is functional or active at a time. Hence, the female would be carrier of disease and is unaffected itself but have the ability to pass the disorder over the

generations in the offspring (Amberger, J. et al., 2015; Chong, J. et al., 2015). Punnett Square helps in showing the possible outcomes of the offspring from Affected, Normal and Carrier Parents [Table. 4].

**Table 4:** Possible Outcomes for X-Linked Recessive Inheritance.

Parents	Normal Female	
Affected Male	X	X
X'	X'X	X'X
Y	XY	XY
Offspring	50% Carrier Females	50% Normal Males

**A: If Mother is Normal and Father is Affected**

Parents	Carrier Female	
Normal Male	X	X'
X	XX	X'X
Y	XY	X'Y
Offspring	25% Carrier Females 25% Normal Females	25% Normal Males 25% Affected Males

**B: If Mother is Carrier and Father is Normal**

Parents	Carrier Female	
Affected Male	X	X'
X'	X'X	X'X'
Y	XY	X'Y
Offspring	25% Affected Females 25% Carrier Females	25% Affected Males 25% Normal Males

**C: If Mother is Carrier and Father is Affected**

Pedigree for the X-Linked Recessive Inheritance Patterns of the Monogenic Disorders is shown in [Fig. 6].

**Fig. 6:** Pedigree for X-Linked Recessive Inheritance

**Y-Linked Inheritance:-**

The gene on the Y- Chromosome is mutated which leads to the Y-Linked Genetic disorders. As the Y-Chromosome is much smaller in size and comprised of a few genes. Hence, there are very limited Y-Linked genetic disorders which are too rare as well (Amberger, J. et al., 2015), which mainly cause the fertility problems and are not usually inherited to the offspring but in some of the cases may be inherited but just affects the sons whereas, the daughters are entirely healthy as they does not carry any Y-Chromosome. Hence, it can be easily distinguished (Hadi, S. 2015). Pedigree for the Y-Linked Inheritance Patterns of the Monogenic Disorders is shown in [Fig. 7].

Fig. 7: Pedigree for Y-Linked Inheritance

**Frequency of Occurrence:-**

As Mentioned above, the differences among the modes of inheritance of the monogenic disorders are described in detail but their possibility of occurrence over their patterns of inheritance within the offspring of the normal, affected or the carrier parents (Ahmed, N. et al., 2006; Chen, N. et al., 2014; Fountain, E. D. et al., 2016) is described as below in [Table. 5]. The major frequencies of occurrence of the monogenic disorders distinguishing among autosomes and sex chromosomes are as follows;

Table 5: Frequency of Occurrence

	Autosomal Dominant	Autosomal Recessive	X-Linked
<b>No. of Mutations in Patients</b>	1	2	1
<b>Sex of Patients</b>	Both	Both	Usually Boys
<b>Risk of Affected Offspring</b>	1 on 2	Small	Small
<b>Risk of Affected Grandchild</b>	1 on 4	Small	1 on 8
<b>Risk of an Affected Sibling</b>	Small, if parents are Normal 1 on 2, If any Parent is Affected	1 on 4	Small, If mother isn't Carrier 1 on 4, if Mother is Carrier

**Classification of Monogenic Disorders:-**

The monogenic disorders [MDs] are very much in number therefore, they are classified into several categories on the cellular, organ and system basis whose origin is either case is actually a mutated gene. Some of the most common monogenic disorders (Antonarakis & Beckmann, 2006; Bamshad, M. et al., 2011) are mentioned in the [Table. 6] and all the perspectives of these disorders are discussed in detail, in this review article.

Table 6: Classification of Some Monogenic Disorders in Different Organs

Autosomal Dominant	
Osteogenesis Imperfecta	Retinoblastoma
Autosomal Recessive	
Cystic Fibrosis	Thalassemia
X-Linked Dominant	
Fragile X Syndrome	Hypophosphatemia
X-Linked Recessive	
Hemophilia	Ichthyosis

**Autosomal Dominant Monogenic Disorders:-**

**Skeleton: Osteogenesis Imperfecta:-**

Osteogenesis Imperfecta [OGI] is a congenital and heritable genetic disorder of abnormal bone or skeletal tissues formation which is either low in mass or weak enough to be fracture. The ratio of the disease at global incidence is about 1 per 10,000 of the individuals (Primorac, D. et al., 2001; Wekre, L. et al., 2011). Some ancient names were given to this disease (Chevrel, G. 2004; Madu & Olamijulo, 2013) are as follows;

- Brittle Bone Disease
- Glass Bone Disease
- Lobstein's Disease
- Porak & Durante's Disease

#### Etiology:-

OGI takes place due to the mutation in any of the collagen type-I encoding genes which is most of the whole body protein content among the connective tissues i.e. COL1A1 and COL1A2 genes (Byers, P. et al., 2006; Christian, C. et al., 2015). Serum albumin or Vitamin D deficiency is not related to OGI, this helps in distinguishing OGI from Osteomalacia (Chagas, C. et al., 2012). As in most of the skeletal disorders, these are the major causes but OGI is a congenital disorder which occurs due to autosomal dominant transmission (Shapiro, J. et al., 2013). The cytogenetic location of the Osteogenesis Imperfecta causing COL1A1 or COL1A2 gene is 7q21.3 (Marini, J. et al., 2014).

#### Classification of OGI:-

The classification of OGI was presented by Silience in 1976 on the severity of the disease basis that is categorized into four major types whereas; the latter ones are the sub-types of Type-IV OGI, as they are correlated. Some clinical features of all the types of OGI are represented in [Table. 7] which helps in distinguishing among them while the examination of disease (Marini, J. et al., 2014; Roughley, P. et al., 2003).

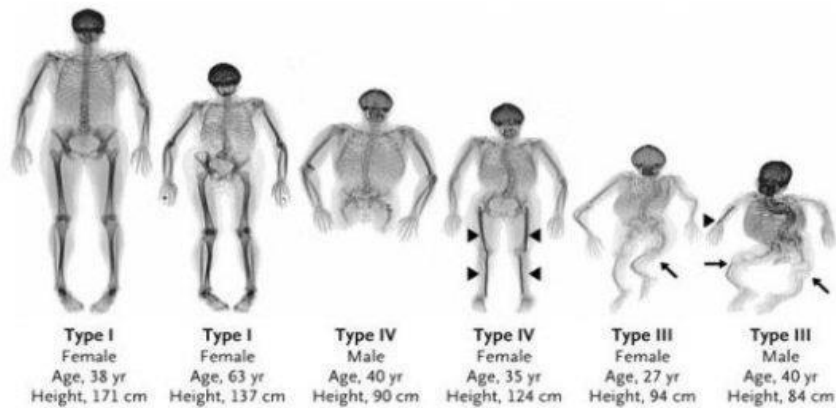

**Table 7:** Classification of Osteogenesis Imperfecta & its Clinical Features

Clinical Features of OGI					
Types	Characteristic	Deformity	Symptoms	Phenotype	References
<b>I</b>	Bone Fragility	No	Blue Sclera	Normal	(P. J. Roughley et al., 2003)
<b>II</b>	Lethal Perinatal Period	Severe	Undeveloped lungs & fractured ribs	Variable	
<b>III</b>	Dentinogenesis Imperfecta	Severe	White Sclera & short stature	Very Short	
<b>IV</b>	Fractures at birth	Moderate	Skeletal deformity & short stature	Variable	
<b>V</b>	Mesh-like Lamella appearance	Moderate	Hypeplastic callus & Interosseous membrane	Variable	(F. H. Glorieux et al., 2000)
<b>VI</b>	Fish-Scale like Lamella appearance	Moderate to Severe	Osteoid Accumulation & abnormal lamellation	Variable	(F. H. Glorieux et al., 2002)
<b>VII</b>	Due to autosomal recessive pattern	Moderate to Severe	Short humerus/femur	Variable	(L. M. Ward et al., 2002)

#### Diagnosis:-

OGI cannot be diagnosed at birth but at the age of walking or adulthood. The genetic analysis of the collagen type-I encoding genes has to be made at the first by keeping the clinical features of the disorder in sight (Marini, J. et al., 2014). Among all the clinical features, Scoliosis is the most common one which leads directly to the death due to the respiratory disorders (Dogba, M. et al., 2016; Dogba, M. et al., 2014).

Differential diagnosis of the disorder should also be made for avoiding the confusion of the similar symptoms of different diseases like, OGI is due to genetic mutation while other disorders might be due to vitamin D or calcium deficiency (Chagas, C. et al., 2012). Some skeletal disorders which resemble OGI may take place while performing the differential diagnosis i.e. Hypophosphatasia, Bruck Syndrome and Cole-Carpenter Syndrome (Henderson, B. et al., 2016). Bone biopsy in some cases may also show some abnormalities that help in the diagnosis (Cheung, M. et al., 2007; Glorieux, F. et al., 2000; Rauch, F. et al., 2013; Zeitlin, L. et al., 2006).

**Fig. 8:** Classification of Osteogenesis Imperfecta

#### **Treatment:-**

OGI can be treated by the help of medications or orthopedics in order to reduce the fracture rates and prevention from deformities. Medications involve Bisphosphonates, Neridronate and Estrogen (Alharbi, S. 2016) whereas; some therapeutic treatments of the disease are also available.

#### **Pamidronate Therapy:-**

It is a medical technique that is used to get relief from pain and provides enhancement in Bone Mineral Density [BMD] and vertebrae size. In contrast to this, it also favors the decrease in fracture incidence (Plotkin, H. et al., 2000; Van Dijk & Silience, 2014).

#### **Gene Therapy:-**

It is another approach for the OGI treatment by which the mesenchymal stem cells of the OGI patients can be taken, modified or transformed in vitro and re injected into the patient. This technique prevents the expression of mutant genes (Lindahl, K. et al., 2014; O'Sullivan, E. et al., 2014).

#### **Stem Cell Transplantation:-**

Bone marrow or its cells can be transplanted into the patient by taking up from a healthy donor in order to overcome the disease. This method provides best results even in the low concentrations and is the most recent one (Li, F. et al., 2010; Pauley, P. et al., 2014).

#### **Sight: Retinoblastoma:-**

Retinoblastoma is also a congenital disorder that is one of the most common intraocular tumors of the eye retina (Lakhoo & Sowerbutts, 2010; Shields & Shields, 2004). It is actually a rare disease. Its global incidence is about 1 in 17000 to 24000. 60% of the cases are observed to be occurred by the age of four years while remaining 40% of the cases occur at the early developmental stage in infants [Infancy] (Bakhshi & Bakhshi, 2007; Meel, R. et al., 2012).

#### **Etiology:-**

Retinoblastoma may be hereditary and sometimes non-hereditary as it happens due to the mutation in RB1 gene. The loss of any of RB1 alleles leads to the retinal cancer while, the loss of other allele would cause the development of the tumor within an individual (Barello, S. et al., 2016; Dimaras, H. et al., 2012; Luo & Deng, 2013; Selistre, S. et al., 2016). RB1 gene is a cell cycle negative regulator gene that has ability to repress the transcription and it is the first gene that have been cloned as tumor suppressor (Hanahan & Weinberg, 2011). The mode of disease transmission is autosomal dominant if inherited; one of the parents must also be affected to the presence of that dominant trait (Bakhshi & Bakhshi, 2007). The cytogenetic location of the Retinoblastoma causing gene is 13q14.2.

#### **Classification:-**

Retinoblastoma has been generally classified into 3 different categories;

1. Familial or sporadic
2. Bilateral or unilateral and
3. Heritable or non-heritable (Ghassemi, F. et al., 2014).

Former two categories are usually used for the clinical diagnosis. Therefore, the cases could be in the format of the combination of both the former categories i.e. unilateral sporadic, bilateral sporadic, unilateral familial or bilateral familial (Abramson, D. et al., 2003; Bartuma, K. et al., 2014). Approximately 2/3<sup>rd</sup> of these cases are unilateral while the 1/3<sup>rd</sup> of them are bilateral. The study of Retinoblastoma gets much easier with the latter one classified category i.e. Heritable or Non-Heritable (MacCarthy, A. et al., 2013; Mendoza & Grossniklaus, 2015). All of these categories are correlated. Bilateral and familial retinoblastoma has been found to be caused via germ-line mutation; therefore, it is a heritable cancer or tumor (Mohd Khalid, M. et al., 2015). In contrast to this, unilateral and sporadic retinoblastomas aren't heritable at all. Whereas, scarcely 10-15% of the cases has been detected having unilateral sporadic retinoblastoma via germ-line mutation. DNA testing of the suspected child helps in the identification of the cause whether it is heritable or not (Lakhoo & Sowerbutts, 2010; Shields & Shields, 2004).

Unilateral Sporadic

Bilateral Familial

Fig. 9: Classification of Retinoblastoma

#### Genetic Advancement of Retinoblastoma:-

As the major cause of the disease is the absence of the RB1 gene which turns the retinal cells into malignant and leads to 'Retinoma' that is the precursor of Retinoblastoma. Retinoma has been found occasionally in 5% of the individuals (Dimaras, H. et al., 2008; Rushlow, D. et al., 2013). On the other hand, it has also been detected in 16% of the enucleated cause. Non-dividable retinoma represents the RB1 gene loss along with the low genetic instability i.e. an additional allele on 1q chromosome contains a motor protein KIF14 and an apoptotic regulator MDM4. Dividable retinoma represents high genetic instability (Bowles, E. et al., 2007; Thériault, B. et al., 2014) having extra oncogene copies KIF14, DEK, E2F3 and MYCN with the loss of CDH11, a tumor suppressor gene (Marchong, M. et al., 2010).

As, all the tumors are linked with the body cell changes and requires the entire genome sequencing for the identification of the changes or mutations which are responsible for the cause of malignancy. These oncogenes have the tendency to enhance tumor growth, aggressiveness, resistance to therapy and metastasis (Hudson, T. et al., 2010)

**Table 8:** Risk of occurrence of Retinoblastoma in siblings & offspring of affected individuals

Subjects	Probability of Disease %
<b>RB1 gene mutation carriers</b>	90
<b>Offspring of Affected individual</b>	45
<b>Sibling of Affected individual (if either parent is affected)</b>	45
<b>Sibling of Affected individual with bilateral disease</b>	2
<b>Sibling of Affected individual with unilateral disease</b>	1

#### Diagnosis:-

Entire history, physical examination, external ocular inspection, slit lamp bio-microscopy and indirect ophthalmoscopy with scleral indentation are usually required for the precise diagnosis of a suspected child having retinoblastoma. The site of all the tumors and their number would be determined while going specifically towards the retinal tumors (Shields, C. et al., 2015). Biopsy is rarely required in such cases. Some additional diagnostic

studies have been proved quite beneficial for the confirmation of the retinoblastoma. Fluorescein angiography, Ultrasonography and computed tomography help in the demonstration of intraocular tumors along and also detect the calcium content in the mass (Lakhoo & Sowerbutts, 2010; Shields & Shields, 2004).

About 5-10% retinoblastomas don't represent any intrinsic calcification. There are numerous diseases that resemble the retinoblastoma in infants (Shields, C. et al., 2013). In about 50% of the cases patients shows the symptoms of retinoblastoma at initial stage but latter it doesn't seems to be retinoblastoma due to its simulating conditions. Pseudo-retinoblastomas are actually the most common that involves persistent hyperplastic primary vitreous, ocular toxocariasis and coats disease (Shields & Shields, 2004). Such confusions can be overcome by the differential diagnosis. Hence, the confirmation of the tumor located is necessary to be diagnosed prior to the treatment. Genomic analyses and microarray expression studies are the convenient techniques for the detection of the disease (Thériault, B. et al., 2014; Villegas, V. et al., 2014).

#### **Treatment:-**

The major purpose of curing the retinoblastoma is the salvation of the vision and to reduce the long-lasting adverse effects of the therapy. The advancement in the therapy has increased the success rate for the survival from almost 30-95% within last 60 years against the non-metastatic retinoblastoma while the uncured retinoblastoma can be lethal (Bakhshi & Bakhshi, 2007; Meel, R. et al., 2012). Enucleation, chemotherapy and external beam radiation therapy (EBRT) are the major therapies for the treatment of substantial diseases (Bakhshi & Bakhshi, 2007).

**Enucleation** is used often for the treatment of localized retinoblastoma but is risky as the cost is the loss of eyesight in some cases (Shields & Shields, 2004). Besides its adverse psychological and physiological effects, it is also associated with some long-lasting native effects i.e. contraction of socket, discharge from orbit and extrusion of implant. Therefore, some relatively noninvasive focal ophthalmological therapies are needed (Bakhshi & Bakhshi, 2007). Approximately 65-75% unilateral sporadic retinoblastoma can be cured with Enucleation (Epstein, J. et al., 2003).

**EBRT**- External beam radiation therapy is a mode of treatment of retinoblastoma by delivering whole eye irradiation. As retinoblastoma is a radiosensitive tumor. It may affect the mid-face growth in 90% patients. Radiation can harm the retina, lens and optic nerve that is difficult to manage (Shields, C. et al., 2013). EBRT usually cause 35% risk of the secondary tumors in the patients with germ-line RB1 gene mutation. It often leads to the loss of eyesight as well (Epstein, J. et al., 2003).

**Chemotherapy** has always been a significant mode of all the possible curing methods that does not cause any adverse effects (Shields, C. et al., 2004; Shields, C. et al., 2004). Many drugs like Cisplatin, Adriamycin, Carboplatin, Idarubicin, Etoposide and Cyclophosphamide are being used for the treatment of retinoblastoma. This approach can be used in the treatment by 3 means i.e. Micrometastatic Retinoblastoma, Intraocular Retinoblastoma or Overt Dissemination (Bakhshi & Bakhshi, 2007).

#### **Autosomal Recessive Monogenic Disorders**

##### **Metabolism: Cystic Fibrosis**

The most common autosomal inherited recessive monogenic disorder of the glandular epithelial cells present within the human body is cystic fibrosis. Approximately 2000 variations in that gene have been recognized by now (Cleveland, R. et al., 2009). Nearly 70,000 cases have been reported every year on the basis of multi-systemic metabolic disorder (Scott, A. 2013).

##### **Etiology:-**

Cystic fibrosis occurs due to the mutation or change in the CFTR gene i.e. cystic fibrosis trans-membrane conductance regulator, which regulates the mucous and sweat production from the exocrine secretory glands. The mutation of the CFTR leads to various defects in the functioning of CFTR glycoprotein (Hoffman & Ramsey, 2013; Jones & Helm, 2009). The cytogenetic location of the cystic fibrosis causing CFTR gene in the human genome is 7q31.2.

##### **Classification:-**

Cystic fibrosis has been classified into different categories on the mutation severity basis in the CFTR gene (Messick, J. 2010).

**Table 9:** Classification of Mutations in CFTR

Class	Mutations
<b>I</b>	Defective Production of CFTR Protein
<b>II</b>	Changes in CFTR Protein Maturation
<b>III</b>	Defective Regulation of CFTR Protein
<b>IV</b>	Decreased Chloride Conductance
<b>V</b>	Decreased No. of Functional CFTR Proteins
<b>VI</b>	Instability of CFTR Proteins

Class I, II & III are related to the insufficiency of the pancreas along with the CFTR improper expression and functioning as they are much severe while class IV, V and VI are related to the sufficiency of the pancreas and are relatively less severe (Cleveland, R. et al., 2009). In contrast to these classifications, cystic fibrosis can also cause the respiratory as well as the non-respiratory.

**Diagnosis:-**

Cystic fibrosis can be easily diagnosed with the help of some biochemical testing and genotyping techniques and biopsy of the patient can also be examined. As the disease shows the various effects upon the different body organs hence, it may cause the confusion in the detection and confirmation of the disease so in that case the differential diagnosis of the suspected diseases can be examined altogether over a single test and the results would confirm the presence of the disorder (Nelms & Sucher, 2015; Scott, A. 2013).

**Fig. 10:** Organs at risk of Cystic Fibrosis

**Treatment:-**

Cystic fibrosis can be commonly cured by the help of the antibiotic therapy as it play a vital role in the reduction of the inflammatory response that occurs in the result of some chronic bacterial infection (Cohen-Cyberknoh, M. et al., 2013; Elizur, A. et al., 2008). The antibiotics like ibuprofen, glycerin, azithromycin and amphotericin B act as the anti-inflammatory agents (Wiehe & Arndt, 2010). Chest imaging i.e. High resolution computerized tomography [CT] Scan and the standard chest radiography are also being used for a purpose that is the evaluation of the lung status in the inflammatory stage of the body as it is an organ that is at the high risk of getting disease (Ashlock & Olson, 2011; Zemanick, E. et al., 2010). Hence, the anti-inflammatory therapy has been introduced in order to treat the lung disease that comes up as the resultant of the cystic fibrosis (Elizur, A. et al., 2008). The treatment of that disease is a huge challenge as it is a cost effective scenario as well as the treatment burden is also unbearable (Hoffman & Ramsey, 2013; Jones & Helm, 2009).

**Blood Cells: Thalassemia:-**

The most common of the autosomal inherited recessive congenital monogenic disorders is Thalassemia these days. It is an analog of inherited anemia. WHO has reported that approximately 60,000 births take place suffering from the major thalassemia disease on the yearly basis (Aydinok, Y. 2012). Thalassemia is one of the major global public health issues of the socio-economic importance in many countries of the Asia (Fucharoen & Winichagoon, 2002).

It has been assumed that in the upcoming decade, figure of the Thalassemic births would come around a Million. Out of which 95% of the cases would be from Asian regions (Cunningham, M. 2008; Vichinsky, E. 2005; Weatherall, D. et al., 2006; Weatherall & Clegg, 2001).

**Fig. 11:** Effect of Thalassemia on RBCs

**Etiology:-**

Thalassemia is actually a class of disorders that happen due to the improper synthesis or the lack of the globin chains of hemoglobin i.e.  $\alpha$ ,  $\beta$ ,  $\gamma$  and  $\delta$  present within the RBCs and performs various body functions (Fucharoen & Winichagoon, 2002). These changes occur due to the mutation of the Hemoglobin alpha [HBA] or Hemoglobin Beta [HBB] gene that regulates the synthesis of hemoglobin and the mutation in  $\alpha$ -gene leads to the  $\alpha$ -Thalassemia while the mutation in the  $\beta$ -gene leads to the  $\beta$ -Thalassemia (Cunningham, M. 2010; Hong, C. et al., 2013). The cytogenetic locations of these genes within the human genome are 16p13.3 and 11p15.4.

**Classification:-**

The classification of the Thalassemia has been made on the basis of the clinical significances which are mentioned as follows;

1. Severe Thalassemia [Thalassemia Major]
2. Thalassemia Intermedia
3. Asymptomatic Thalassemia [Thalassemia Minor] (Fucharoen & Winichagoon, 2002)

**Table 10:** Clinical Features of Thalassemic Patients

Syndromes	Severity	Hb Level [g/dl]	Mortality Rate
<b>Thalassemia Major</b>	Severe anemia	≤6	High
<b>Thalassemia Intermedia</b>	Mild anemia	7	Moderate
<b>Thalassemia Minor</b>	Asymptotic anemia	≥9	Low

**Diagnosis:-**

Thalassemia shows some signs and symptoms that are alike the condition of the Iron deficiency. Therefore, in order to get rid of the confusion of these disorders diagnosis, some tests like Red Blood Cell Distribution width [RDW], Mean Corpuscular Volume [MCV] (Muncie & Campbell, 2009), Peripheral smear, bone marrow aspirate, hemoglobin electrophoresis, serum ferritin & lead level, family history and differential diagnosis can be examined. All the results of these tests would be relatively lower than that of the iron deficiency condition (Cook, J. 2005; Goddard, A. et al., 2011).

**Treatment:-**

The major common remedies against the thalassemia that has been proves successful to some extent are as follows;

**Blood Transfusion** - The patients suffering from the high severity of this syndrome i.e. thalassemia major tend to need the blood transfusions on the proper schedule throughout the life in order to maintain the blood Hb-level that declines due to the improper globin synthesis and to promote the normal growth (Klein, H. et al., 2007; Olivieri & Brittenham, 2013; Rund & Rachmilewitz, 2005; Sornjai, W. et al., 2016).

**Endocrinopathy** - Growth hormone therapy has been recommended as a variable successful treatment for the  $\beta$ -thalassemia but it is an often used approach (De Sanctis, V. 2002; Delvecchio & Cavallo, 2010).

**Bone Marrow Transplant** - It is the most successful approach of the cure for the thalassemia major, as the precursor of the RBCs i.e. hematopoietic stem cells can be replaced with some healthy ones and ultimately the production of the healthy erythrocytes takes place (Rund & Rachmilewitz, 2005; Sornjai, W. et al., 2016).

**X-Linked Dominant Chromosomal Monogenic Disorders:-****Mental Retardation: Fragile X Syndrome:-**

Fragile X Syndrome [FXS] is one of the most rarely occurring congenital X-Linked dominant chromosomal monogenic disorders. This disorder is the cause of learning disability and mental retardation that could be of any stage from mild to moderate and then to the severe in people throughout globe (Garber, K. et al., 2008). Its global prevalence is nearly 1/4000 in males and 1/8000 in the females (Klusek, J. et al., 2014; Sabaratnam, M. 2006; Sabaratnam, M. et al., 2003).

**Etiology:-**

FXS usually occurs due to the unexpressed FMR1 gene which encodes the fragile X mental retardation protein [FMRP]. The inexpression results because of the addition of GGG repeats within the 5'-UTR of the gene (Santoro, M. et al., 2012). The cytogenetic location of the FMR1 gene within the human genome is Xq27.3. FMR1 is one of the genes to be cloned for the first time that are related to the human intelligence (Garber, K. et al., 2008).

**Diagnosis:-**

FXS can be easily diagnosed by the help of fairly expressed phenotype of the infant. Besides this, the occurrence of the FXS can be confirmed by various genotyping technologies, Southern blot, PCR, microarray and differential diagnosis. The step towards the cure of the disorder can be taken when the cause is known (Hill, M. et al., 2010; Sabaratnam, M. 2006).

**Fig. 12:** Fragile X Syndrome

**Fig. 13:** Autism & Mental Retardation by FXS

#### **Treatment:-**

The possible cure for the Fragile X syndrome is based upon the medications that favors the mental relaxation by causing the impulsions, hyperactivity and distractions in the mind (Berry\_Kravis & Potanos, 2004). Selective Serotonin reuptake inhibitors [SSRIs], Ampakine and some other relevant drugs can be proved useful as they are effective against the conditions like anxiety and aggression etc. (Berry-Kravis, E. et al., 2006; Berry\_Kravis & Potanos, 2004; Garber, K. et al., 2008).

#### **Bone: Hypophosphatemia:-**

Hypophosphatemia is an X-linked dominant chromosomal genetic disorder. It refers to the disorder that leads to the depletion in the phosphate level in the blood serum. It is usually uncommon in the population (Brunelli & Goldfarb, 2007; Felsenfeld & Levine, 2012). As phosphate is an essential component for many body pathways that includes the plasma pH maintenance, cellular signaling, skeletal development, bone mineralization, structure of nucleotide and membrane composition (Bacchetta & Salusky, 2012).

#### **Etiology:-**

The major cause of the hypophosphatemia is the mutation in phosphate regulating endopeptidase gene [PHEX] that regulates the phosphate level in the serum (Bacchetta & Salusky, 2012). Its cytogenetic location within the human genome is Xp22.11.

**Classification:-**

Hypophosphatemia has been classified on the basis on its affecting duration period as well as the severity. It is mentioned as below;

- 1. Acute Hypophosphatemia
- 2. Chronic Hypophosphatemia

Acute Hypophosphatemia is actually due to nosocomial infections and can be significantly morbid as well as mortal and chronic hypophosphatemia is an inborn genetic disorder that promotes the skeletal disorders in the children [rickets] as well as in adults [Osteomalacia] (Felsenfeld & Levine, 2012). While on the severity basis, the hypophosphatemia can be categorized as;

**Table 11:** Phosphate Levels in different Hypophosphatemia Stages

Hypophosphatemia Severity	Phosphate Level
Mild	2-2.5 mg/dL
Moderate	1-1.9 mg/dL
Severe	1 mg/dL

**Diagnosis:-**

The hypophosphatemia can be easily diagnosed by the help of its unique signs and symptoms that includes the poor oral intake, increased renal loss and intracellular phosphate redistribution (Boateng, A. et al., 2010; Marinella, M. 2005; Ornstein, R. et al., 2003).

**Fig. 14:** Rickets due to Hypophosphatemia

**Fig. 15:** X-Ray view of the Rickets

**Treatment:-**

The treatment of the hypophosphatemia involves the approaches by which the phosphate depletion can be fulfilled or restored. Direct phosphate oral supplementation, vitamin D intake and the medications like Cinacalcet, Dipyrimadole and Calcitonin helps in treating this disorder. The salts of phosphates can also be used as the supplements for electrolyte balancing (Geerse, D. et al., 2010; Imel & Econs, 2012; Marinella, M. 2005).

**X-Linked Recessive Sex Chromosomal Monogenic Disorders:-****Bleeding: Hemophilia:-**

Hemophilia is also a common congenital X-Linked recessive sex chromosomal monogenic bleeding disorder (Caviglia, H. et al., 2015). It has been classified as hemophilia A and hemophilia B due to same outcomes but different causes of the disorder (Jayandharan, G. et al., 2012; Kaufman & Powell, 2013; Rodriguez & Hoots, 2010). As the disorders are X-Linked, it affects the males at the most and females can also be the carriers despite of being affected (Plug, I. et al., 2006). The global prevalence of the hemophilia A is 1/5000 in males and of the hemophilia B is 1/30000 in males (Stonebraker, J. et al., 2010; Stonebraker, J. et al., 2012).

**Etiology:-**

Hemophilia usually occur due to the lack of factor VIII [F8], in case of hemophilia A or factor IX [F9], in case of hemophilia B (Carcao, M. 2012; Peyvandi, F. et al., 2016). The cytogenetic location of these genes within the human genome is Xq28 and Xq27.1 (Bowen, D. 2002). Both of these genes play a role in the coagulation of blood normally.

**Diagnosis:-**

Hemophilia can be diagnosed by the genotyping technologies and via simple blood test for the factors on unit calculation. The prevalence of hemophilia generally gets disturbed by avoiding the mild cases from the count. As it do not usually diagnosed because of its less fatality rate as compared to the moderate and the severe types. This disorder reduces the life span of the patients as well as the prevalence (Bhat & Cabey, 2014; Carcao, M. 2012; Peyvandi, F. et al., 2016).

**Treatment:-**

Various adjunctive therapies have been discovered for the possible cure of the hemophilia including anti-fibrinolytic agents. Prophylaxis is another most successful approach for the cure of hemophilia and is the most ancient one that is being used since last 50 years (Feldman, B. et al., 2006; Gringeri, A. et al., 2011). Gene therapy and the stem cell transplantation are the most recent one approach in the field of the treatment of this very severe, inherited, monogenic and congenital disorder (Chuah, M. et al., 2013).

**Fig. 16:** Effect of Hemophilia on body cells

**Skin: Ichthyosis:-**

Ichthyosis is basically a group of skin related disorders that are X-linked recessive sex chromosomal inherited in pattern (Vahlquist, A. et al., 2008). It is most frequent in affecting the males completely whereas the females can also be the carriers of the disorder. It generally leads to the scaling and dryness of the skin with some prominent spotting.

The global prevalence of the ichthyosis is approximately 1/6000 in males (Fernandes, N. et al., 2010; Oji & Traupe, 2009).

#### **Etiology:-**

The major cause of the ichthyosis is the mutation in the steroid sulphatase [STS] enzyme. 1,2. Deletion mutations within the gene usually leads to the ichthyosis while almost complete deletion of the gene has been observed in the 90% of the affected individuals (Fernandes, N. et al., 2010).The cytogenetic location of the STS gene within the human genome is Xp22.31 (Vahlquist, A. et al., 2008).

**Fig. 17:** Effects of Ichthyosis on body

#### **Diagnosis:-**

The genetic and biochemical testing are the most concise diagnostic ways of the ichthyosis (Fernandes, N. et al., 2010).There is a great confusion in the identification of the disorder due to its similar related classified disorders i.e. ichthyosis vulgaris, lamellar ichthyosis and bullous ichthyosis but their causes varies as they are autosomal dependent dominant as well as recessive (DiGiovanna & Robinson-Bostom, 2003). Hence, the differential diagnosis and the prenatal diagnosis are the most reliable approaches for the detection and confirmation of the disorder in order to take the step towards the appropriate treatment including southern blot (Reed, M. et al., 2005), in-situ hybridization (Chen, H. 2006; Lebo, R. et al., 2013) and PCR (Sugawara, T. et al., 2000), the most commonly used techniques of the molecular biology (Vahlquist, A. et al., 2008).

#### **Treatment:-**

The ichthyosis can be proved lethal while going from mild to the severe stage. The possible cures for getting rid of these disorders include topical therapy, by hydration and lubrication, use of keratolytic agent for enhancement of the skin hydration and the systemic treatment for proper skin functioning i.e. sweat production (DiGiovanna & Robinson-Bostom, 2003).

#### **Future Prospects:-**

As the monogenic disorders are the most common issues of the society that are usually resulting from the consanguinity can be overcome by applying the precautionary measures to the social acts i.e. marriages. The genetic analysis of the individuals can be performed before performing such acts for avoiding such complications in future. Various detection methods and the possible treatments have been established against these monogenic disorders furthermore, some high throughput technologies are being implemented in this field of health for the fulfillment of the need of treatment. Prenatal diagnosis has also been proved a reliable technique of the diagnosis till now but also causes confusions while the diagnosis with some other resembling diseases. Therefore, the advancements are also

being made in the field for solving that problem. In the upcoming decade there is a possibility of gradual decrease in the monogenic disorders if preventive measures are done properly. Besides this, if the situation persists then there is equal possibility of the continuous increase in these disorders.

Several biomedical health related organizations are working on the genetic disorders, monogenic as well as polygenic, for the welfare of mankind. Along with the comprehensive study of these disorders, the public awareness is also being delivered so that the people must know about the complications while developing any decision. The fate of their offspring can be diagnosed whether it is normal or mutated. Recombinant DNA Technology and the techniques of Genetic Engineering are supposed to be beneficial for the most efficient cure of these abnormalities.

Galectin-4, gastric cancer, validity.

#### Abstract

**Introduction:** Galectin-4 is one of a  $\beta$ -galactosides binding proteins family that recognize a variety of glycan-containing proteins at the cell surface and are overexpressed in various tumors, including gastric cancer. Galectin-4 overexpression as well as changes in their subcellular distribution has been associated with gastric cancer progression and poor prognosis. It may provide diagnostic molecular markers for gastric cancer as well as clues for developing therapeutic targets on individual basis.

**Aim of the study:** To detect the levels of GAL-4 in the sera of healthy people and patients with gastric cancer and also, to investigate the validity of using GAL-4 as a specific diagnostic marker of gastric cancer.

**Patients and methods:** 25 gastric cancer patients were included in this study. They were among patients who attending the Endoscopy Department, during the period from September 2015 to March 2016. In addition, 15 apparently healthy people were chosen as a healthy control group. For these two groups, serum level of GAL-4 using ELISA technique was carried out.

**Results:** There was a statistically significant difference in serum level of GAL-4 among gastric adenocarcinoma patients in comparison to healthy controls ( $p \leq 0.001$ ), using receiver operating characteristic curve (ROC) area, serum GAL-4 has high area under the curve (0.924) with a cut off value equal to or above 0.42ng/ml which was associated with the highest sensitivity (100%).

**Conclusions:** Serum levels of GAL-4 were significantly higher in patients with malignant gastric adenocarcinoma which may confirm a possible role of this marker in the pathogenesis of the disease, furthermore the highest sensitivity and best accuracy obtained from serum GAL-4 was by using a cut off values equal to or above 0.42ng/ml. So, GAL-4 may be promising new diagnostic tools especially at early stages and among patients at high risk.

### Introduction:-

Gastric cancers are one of the most frequent fatal malignancies in the world (1) and have a wide pathological and biological variety (2). However, accurate molecular pathways of gastric carcinogenesis and clinical progression are yet to be clarified. So that, a comprehensive proteins expression profile of gastric cancers is necessary to provide a diagnostic molecular markers for gastric cancer as well as to clue for developing therapeutic targets on individual basis (3).

Despite a major decline in incidence and mortality over several decades, stomach cancer is still has a 10-fold variation in incidence between populations at the highest and lowest risk. The incidence is particularly high in East Asia, Eastern Europe, and parts of Central and South America, and it is about twice as high among men than among women; It is estimated about 21,600 men and women (13,230 men and 8,370 women) will be diagnosed with it and 10,990 men and women will die from gastric cancer in 2013 (4,5). Galectins are a group of proteins that bind  $\beta$ -galactosides through evolutionarily conserved sequence elements of the carbohydrate recognition domain (CRD) (6, 7, 8), as galectins are expressed by different immune and inflammatory cells, therefore, they can affect and regulate different responses produced by the host against tumors. In addition, galectins are released by tumors and can modulate a variety of inflammatory responses (9, 10) either by amplification of the inflammatory responses, including regulation of leukocyte survival and function or activation of homeostatic signals to shut off immune effector functions. Like many other cytokines and growth factors, galectins may exhibit a 'double-edge sword' effect depending on many different intrinsic factors like microenvironment (11, 12). Moreover some galectins released by the tumor might help the tumor to avoid the immune surveillance (13).

### Patients and Methods:

This study involved 25 cases with gastric cancer were included in the study. Their age ranged between 34 to 77 years with a mean of  $60.4 \pm 10.7$  years ( $\pm$  SD). On the other hand a total of 15 healthy controls were included in the study. Their age ranged between 32 to 76 years with a mean of  $53.6 \pm 10.9$  years ( $\pm$  SD). Those patients were diagnosed clinically, radiologically, cytologically, and histopathologically, they were among patients who attending the Endoscopy Department, during the period from September 2015 to March 2016. Also, 15 apparently healthy persons were chosen as a healthy control group. For these two groups, serum level of GAL-4 using sandwich ELISA technique was carried out.

Galectin-4 (Gal-4) ELISA KIT (Antibodies-Online.Com): The kit was a sandwich enzyme immunoassay for in vitro quantitative measurement of GAL-4 in human serum, plasma & other biological fluids (14).

Statistical analysis was done using SPSS (Statistical Package for Social Sciences). The majority of the outcome quantitative variables were non-normally distributed. Such variables are described by median and interquartile range. Statistical significance of differences between averages for parameters of normal distribution was assessed using the Student's t-test, and the difference in median of a quantitative non-normally distributed variable between 2 groups was assessed by nonparametric Mann-Whitney test.

The statistical significance, direction and strength of linear correlation between 2 quantitative variables, one of which being non-normally distributed was measured by Spearman's rank linear correlation coefficient. P value less than the 0.05 level of significance was considered statistically significant (15).

### Results:-

The ranges, median and mean value of serum GAL-4 in blood of gastric cancer patient and control groups are shown in table 1; there was a statically significant difference in the serum level of GAL-4 between gastric adenocarcinoma patients and healthy controls ( $p < 0.001$ ), as shown in (table 1 and figure 1).

**Table 1:-** The ranges, median and mean values of serum GAL-4 in blood of gastric cancer patients and control groups.

Serum Galactin-4					
Case-control comparison	N	Range	Median	Mean rank	Interquartile range
Controls	15	(0.22 - 1.7)	0.50	9.90	(0.28 - 0.61)
Cases (Gastric Adenocarcinoma)	25	(0.46 - 41.41)	2.97	26.86	(0.85 - 16.96)

**Figure 1:-** Differences in median values of serum GAL-4 between 2 study groups.

As shown in (table 2 and figure 2) the large area under the ROC curve for galectin-4 (0.924) which was significantly higher than (0.5) area.

**Table 2:-** ROC area for galectin-4 as a predictor.

	AUC	P
Serum Galactin-4	0.924	<0.001

**Figure 2:-** ROC curve showing the trade-off between sensitivity (rate of true positive) and specificity (rate of false positive) for galectin-4 when used as a predictor test for advanced gastric adenocarcinoma.

The cut-off value of serum GAL-4 associated with highest sensitivity (100%) was equal to or above 0.42 ng / ml. Testing negative at this cut-off value (serum level < 0.42 ng/ml) would exclude a possible diagnosis of gastric adenocarcinoma with 100% confidence (NPV “negative predictive value”=100%). The cut- off value associated with highest specificity (100%) was set at equal to or above 2.07 ng /ml; this cut-off value has an average sensitivity (56%). Testing positive at this high cut-off value (obtaining a serum GAL-4 concentration of 2.07 and above ng/ml) would establish a diagnosis of gastric adenocarcinoma with 100% confidence in any clinical context (any pretest

probability). The optimum cut-off value of serum GAL-4 in the context of case-control differentiation is the cut-off value that can classify tested subjects into gastric adenocarcinoma cases and control groups with the highest accuracy possible. The optimum cut-off value was set at equal to or above 0.63 ng/ml, therefore the sensitivity was 92% and specificity was 80% at this cut off value.

**Table 3:-** The validity parameters of galectin-4 when used as test to predict cases with advanced gastric adenocarcinoma differentiating them from healthy controls.

Positive if $\geq$ cut-off value	Sensitivity	Specificity	Accuracy	Matthew's correlation coefficient	PPV at pretest probability =		NPV at pretest probability = 10%

### Discussion:-

The study showed that the median serum GAL-4 was significantly higher among gastric cancer patients in comparison to healthy controls ( $p < 0.001$ ). These findings were in agreement with a study conducted by Barrow et al (2011) who reported that the concentrations of free circulating galectins-2,-3,-4and-8 were all markedly increased in the blood circulation of patients with gastrointestinal tract cancer and, in particular, those with metastasis. The presence of these galectins promotes cancer cell adhesion to vascular endothelial cells by interaction with the Thomsen-Friedenreich (TF) disaccharide on cancer associated mucin protein-1 (MUC1) (16). Furthermore, a series of experimental and clinical data demonstrated a correlation between galectins expression and tumor progression and metastasis. Galectins function inside the cells in both carbohydrate dependent and in dependent manners and can regulate signal transduction as well as epithelial morphogenesis via an effect on centrosome biology (17). This study showed that serum GAL-4 was associated with high validity when used as a predictor test for advanced gastric adenocarcinoma. The high validity is evident from the large area under the ROC curve (0.924) which is significantly higher than (0.5) area associated with an equivocal test. In order to study the validity of serum GAL-4 in differentiating between gastric cancer patients from healthy controls, the present study showed that in a patient with serum GAL-4 equal to or above 0.42ng/ml (cut off value) one can establish the diagnosis of gastric cancer with 62.5% confidence (PPV) in a clinical situation where the present probability of tumor is 50%, or 93.8% confidence (PPV) in a clinical situation with high pretest probability (90%). Testing negative at this cut off value would exclude a diagnosis of gastric cancer with 100% confidence (NPV) in a clinical setting were the primary diagnosis of tumor is of small probability (10%pretest probability). In another words, if a physician has a(50%) clinical suspicion about a patients as a case of gastric mass and send them for testing serum level of galectin-4 and the result was positive, this test gives 62.5% confidence for a physician to establish the diagnosis, but if that physician has 90% clinical suspicion about the patient to be a case of gastric cancer and the result of serum level of galectin-4 was positive, these results give a 93.8% confidence for the physician to establish the diagnosis; while if a physician suspicion was 10% for a patient to be a case of gastric cancer and want to exclude the diagnosis for the tumor, serum galectin-4 negative result can give 100% confidence to exclude the diagnosis. A subject with serum

concentration of GAL-4 less than 0.63 ng/ml is considered as compatible with normal value (negative test) while a value of 0.63 ng/ml and above is considered abnormally high (positive test for gastric adenocarcinoma), within the working range of the test (0.42 – 2.07 ng/ml). Testing negative at the optimum cut-off value would exclude a possible diagnosis of gastric malignancy with 98.9% confidence in a clinical context, when gastric cancer is highly unlikely on clinical bases (pretest probability is 10% only), Testing positive at the optimum cut-off value would establish the diagnosis of gastric adenocarcinoma with 82% confidence in a clinical context of equal odds pretest probability for gastric adenocarcinoma; when the pretest probability of having this disease is increased to 90% (high clinical suspicion) having a positive test would be almost diagnosis raising the confidence in the diagnosis of gastric malignancy to 97.6%.

The mechanism for the increased circulating galectins in patients with gastric cancer is unclear. Members of galectins family are expressed by many types of human cells including epithelial, endothelial and immune cells including monocyte, macrophage and lymphocytes (16). The expressions of galectins in immune cells are heavily influenced by inflammatory regulator and also by differentiation and activation (18, 19). Many pro-inflammatory cytokines including TNF- $\alpha$ , IL-1, IL-8, and GM-CSF are up regulated in cancerous conditions and their presences may cause the immune cells to secrete more galectins in the blood stream (16, 20).

Finally, targeting the actions of circulating galectins in the bloodstream of gastric cancer patients may represents a very promising therapeutic strategy for preventing metastasis (21).

coir fiber, Rubber fiber & ductility

#### Abstract

Background/Objectives: To evaluate the suitability of short rubber fiber, coir fiber & PP as a reinforcing agent in cement concrete/ mortar. Methods/Statistical analysis: Based on basic properties data of material a mix design for M<sub>20</sub> grade concrete taking a weight fraction of cement is 1%. For this work 12nos of cube (150 mm \* 150 mm \* 150 mm) and 12nos of beam (700mm \* 150 mm \* 150 mm) were casted by using different fiber proportion of polypropylene fiber, coir fiber & rubber fiber in the laboratory; and for the compared study with the HFRC one set of control specimen were cast. Findings: All the cube specimens were tested by UTM and beam specimens were also tested in UTM by using two points loading as per IS 516-1959. The test result shows that the hybrid of 1% with PP, CC & RF combination specimens improves compressive strength & flexural strength as compared with control specimen. Applications/Improvements: The hybrid fiber reinforced concrete can be used in non-structural components like Walls & Surfaces of Septic Tank, Water Storage Tanks and Dams, Sports Grounds, Industrial, Residential Floors, Warehouses & also used in severe earthquake area etc. The major contribution of fibers in crack resistance and crack control, improve the ductility of concrete.

#### Introduction:-

The design of a durable and economical fiber reinforced concrete for construction purpose is a technically challenged in developing countries like India. It has a potential to be used as a secondary reinforcing agent to overcome the inherent deficiencies in cementitious materials. Currently, different types of fibers are used included steel, glass, polymers, carbon & natural fibers. From the economical consideration have restricted to use of carbon fiber in cementitious composite due to corrosion & non-economic performance. Since the unreinforced concrete has adequate strength for much structural application but is relatively brittle materials. The addition of fibers in concrete has been used to overcome that problem. Factors affecting properties of FRC are fiber types, geometric forms, surface condition, mix proportion and age of curing period.

For a hybrid, more than two different fibers are mixed with a concrete matrix to produce a composite material. Use of both synthetic and natural fiber can give potential advantages in improving the performance of concrete matrix. HFRC can be useful in a variety of activity in the field of civil engineering. Hence, this experiment proves the feasibility of HFRC with required grade of the concrete matrix with a weight of cement fraction of 1% in various construction fields in future.

Previously straw, horse hair was used as reinforced brick & reinforced plaster respectively. Now- a-days asbestos fiber are being used with OPC to produced water resisting sheet.

From the study of HFRC of S.Sarangi& A.K. Sinha can be found out that combination of both coir fiber and PP fiber with mix proportion of CC 0.25 PP 0.75 gives a compressive strength & flexural strength of 40.98 Mpa & 14.339 Mpa respectively at the age of 28 days.

F.PachecoTorgal& S. Jalali proposed a review on tire rubber wastage based concrete matrix & recommended for a concrete structure located in areas of several earthquake risks and also used for a dynamic load like structure (railways sleeper).

Dr. T. Ch. Madhavi found from her review study that, Polypropylene fibers reduce the water permeability, plastic, shrinkage, and settlement and carbonation depth. Using excess amount of PP fiber in concrete gave poor workability, which can be counteracted by adding HRWR admixture even if at w/c ratio of 0.3.

### **Materials Used:-**

In this experimental study cement, fine aggregate, coarse aggregate, coconut coir fiber, polypropylene fibers were used.

#### **Cement:-**

Portland Slag based Cement (Brand-UltraTech) conforming to IS 455:1989. Test results are shown in Table 1

#### **Fine Aggregate:-**

Clean and air dry river silica grained sand locally available was used. Sand passing through IS 4.75mm sieve [IS: 383:1970] was used as sample specimens. The test result of FA is presented in Table 2

#### **Coarse Aggregate:-**

Locally available crushed granite stone of 20mm is used for this experiment. Test results on coarse aggregate are given in Table 3

#### **Polypropylene Fiber:-**

Fine fibrillated polypropylene monofilaments named as "Fiber Guard"; supplied by M/S Bajaj Reinforcement LLP Nagpur, Maharashtra, India was used. The various properties of Polypropylene fiber are given in Table 4

#### **Coconut Coir Fiber:-**

Brown clean coconut coir fiber was collected from a local market. Properties of coconut coir fiber are presented in Table 5

#### **Rubber (Tyre) Fiber:-**

Scrap rubber is collected from near tyre resoling center. Cleaned and air dry tyre particles are used in this experiment. Properties of rubber fiber are shown in Table 6

#### **Water:-**

Portable drinking water for mixing & curing,

#### **Mix Design:-**

A design mix has been adopted as per IS10262:2009 for M<sub>20</sub> grade concrete. Mix proportion details are shown in Table-7

### **Experimental Methodology:-**

#### **Compressive Strength Test:-**

It is determined by using the compressive testing machine as specified IS 516-1959. Cubes of 150 mm size were subjected to a uniformly rated compressive load of 140 Kg/cm<sup>2</sup> per minute until failure at ageof 28 days. Average of three is taken. Test results are shown in graph-1

**Flexural Strength Test:-**

Plain concrete also having a negligible tensile property as compared to compressive strength. Flexural strength value is very much similar to the tensile strength of the material. Here flexural strength test is done by using two points loading frame method in UTM is considered. According to Indian standard, a beam of 700 mm \* 150 mm \* 150 mm was cast in cast iron form work. After de-moulds allowed the beam for normal (submersed in a water bath) curing at room temperature for an age period of 28 days. By using two points loading method, applied a uniform load rate of 400 Kg / Min. & noted down the ultimate fracture load and by computing can find out the flexure strength of the concrete. Averages of three sample test results are. The beam set up in machine and cross-section of hybrid fiber reinforced beam is shown in Figure 2 and 3 respectively.

$$\text{Flexural strength} = 3/2 (pl/(bd^2))$$

b: Breadth of the tested beam (mm)

p: Ultimate cracking load (N)

l: Length of the support span(mm)

d: Depth of the tested beam(mm)

Test results are shown in graph-1

**Results and Discussion:-**

Results of compressive strength and flexural strength test for M<sub>20</sub> grade concrete mix with 0%(PCC), RCC, PP (0.10% to 0.40%), CC (1%to 10%), TR(5% to 17%) with hybrid mix of{ (PP 0.30% CC 0.50% TR 0.20%),( PP 0.25% CC 0.40% TR 0.25%) & (PP 0.33% CC 0.33% TR 0.33%) } are shown in the Grahp-1.

**Graph1:-** Compressive & Flexural Strength

**Fig 1:-** Cubes in CTM.

**Fig 2:-** Beam is set for testing.

**Fig 3:-** C/S of beam after failure

**Conclusion:-**

From the all types of mix proportion PP0.25 CC0.40 TR0.35 gives a satisfactory strength with increased 17.38% as compared to plain concrete. But, from the analysis study of the flexural strength at 28 days of the entire specimen found that uses of RCC give more strength as compared to others. As reinforcement is a corrosion material. So, PP 0.35% achieved 52.12% of the strength i.e. (PFRC). However, a hybrid of all the three fiber gives 19.43% more strength as compared to normal (Ref) concrete specimen. Therefore, concluded that use of a hybrid form of the entire material can increase the structural & mechanical quality of the concrete which is economical & eco-friendly. Henceforth it can be used as construction materials.

#### Abstract

Spanish novelist Eduardo Mendoza has recently won the 2016 Cervantes Prize for *La verdad sobre el caso Savolta*. It is the Spanish-speaking world's highest literary honour. He has been awarded for bringing a new narrative style to Spanish fiction. The novel is about the industrial, social and economic changes the city of Barcelona saw during the 19th and 20th centuries. Since this fiction appeared to me as a classical text, this work proposes to see this novel from a Marxist perspective. Examining these novels in the light of Marxist theory facilitates a greater comprehension of the texts and enhances the understanding of Barcelona.

#### Introduction:-

After the decline of feudalism in Spain and other European countries, a new class had emerged. This new class was of merchants and industrialists. They were called the Bourgeoisie class. The twentieth century Barcelona witnessed the development of the bourgeoisie that built and managed the factories and considerably increased the population of the working class. Capitalism became the dominant mode of production in Barcelona and has maintained its eminence since then. Along with industrialization, the process of urbanization was also very fast and influenced the lives of the people of Barcelona. The urban experience under capitalism was forming a different consciousness among the people and I would like to quote Marx here who said that "It is not the consciousness of men that determines their being, but, on the contrary, their social being that determines their consciousness." (Parkin, 1979, p.27)

*La verdad sobre el caso Savolta* is about the development of Barcelona in the 20th century. This work reflects exactly what was happening in the cities of Spain with urbanization and modernization. *La verdad sobre el caso Savolta* deals with Barcelona and Javier Miranda, the protagonist of the novel who is also the main witness in a New York court case concerned with the life insurance of his former boss, Paul-André Lepprince, who died in an incident in the Savolta factory. The proofs of the court and memories of Miranda give us detail about the life of Barcelona between the years 1917 and 1919. They were full of social tensions, anarchist rebellions marked by class conflicts. After Miranda moved to Barcelona from Valladolid, he met Paul-André Lepprince, a French businessman who after arriving in Barcelona in 1914 becomes rich and ranks among the upper class of Barcelona acquiring authority of the arms factory. He does this by marrying Maria Rosa Savolta, the daughter of the main shareholder of the Savolta factory. Miranda unknowingly becomes Lepprince's puppet and marries Maria Coral, Lepprince's another girlfriend so that he can continue his relationship with her despite his marriage with Maria Rosa Savolta. After the other shareholders of the Savolta plant are killed, Lepprince gains almost exclusive control over the business, which

**Corresponding Author:- Anurag Bhagat.**

Address:- Research Scholar, Centre of Spanish, Portuguese, Italian & Latin American Studies, Jawaharlal Nehru University New Delhi .

brings him huge wealth due to the First World War and the secret sale of arms on both sides of the conflict. However, anarchist rebellions, general work strikes and the end of the war caused the demise of the plant Savolta and Leppince. Before Leppince could be declared bankrupt, an anarchist agitation ended his life, burning the factory along with him.

### **Analysis:-**

This novel deals with a long history of Barcelona's industrial development. The city has also witnessed the development of both the bourgeoisie and workers socialist movements. In order to understand exactly how this historical novel deals with the questions of Spanish society, I intend to see the content of the novel from the perspective of Marx.

According to the article of 6th October 1917 that was published on the newspaper *La voz de la justicia* of Barcelona, the writer clearly shows two pictures of Spain. On one hand he is very happy to mention that there is freedom of press, constitutional guarantees, universal adult franchise and the nation is civilized. On the other hand he says that his land has entered into dark ages as there is exploitation of worker by the powerful. The workers who are illiterate, who are not able to understand the present situation are the victims of the capitalism which has started expanding in the city. The capitalist society does not address the problems of the workers. It does not work to create awareness among workers so that they know their rights. The custody of social justice is held by the ruling class which exploits the workers in factories like that of Savolta factory in order to earn profit. According to Marx, the worker is not free since he is forced to work for the capitalist in order to survive. All he can do is exchange one form of 'wage slavery' for another. Marx refers to the dominant ideas of each epoch as 'ruling class ideology'. Such ideology is a distortion of reality, a false picture of society. It binds members of society to the contradictions and conflict of interest which are built into their relationships. As a result they tend to accept their situation as normal and natural, right and proper. In this way a 'false consciousness' of reality is produced which helps to maintain the system. Marx says that

"the ideas of the ruling class are, in every age, the ruling ideas; i.e. the class which is the dominant material force in society is at the same time its dominant intellectual force. The class which has the means of material production at its disposal, has control at the same time over the means of mental production, so that in consequence the ideas of those who lack the means of mental production are, in general, subject to it." (Bottomore, 1971, p.51)

As there is exploitation in the society the words like equality and freedom are illusions. The employer-employee relationship is not equal. It is an exploitive relationship. Pajarito de Soto also believes that freedom and equality exists only upto a certain limit. The workers have to protest for getting these rights. Their working condition is deplorable, the salaries are not adequate. So, Pajarito de Soto says that "la misión de todos y cada uno de nosotros no es luchar por la libertad o el progreso, en abstracto, que son palabras huecas, sino contribuir a crear unas condiciones futuras que permitan a la humanidad una vida mejor en un mundo de horizontes amplios y claros." ("the mission of each and every one of us is not to fight for freedom or progress, in summary, these are hollow words, but to contribute to create future conditions in the world that will enable humanity to live a better life of broad and clear horizon"; Mendoza, 1975, p.124). However, the real democracy lies from the fact that there is political freedom, equality and the rule of law. These principles must be reflected in all the citizens of country so that they live a dignified life.

The class division was clearly visible from the fact that in order to maintain their privileged position in the society, the state machinery would do any kind of injustice or suffering to others. For example by inflation the poorest would suffer the most as their salaries remain constant. As also mentioned in the novel "Y así ocurrió lo que viene aconteciendo desde tiempo inmemorial: que los ricos fueron cada vez más ricos, y los pobres, más pobres y miserables cada vez." ("And so it has happened since immemorial time that the rich were getting richer, and the poor were getting poorer and miserable every time"; Mendoza, 1975, p.45). According to Karl Marx, in all stratified societies, there are two major social groups, a ruling class and a subject class. The power of the ruling class derives from its ownership and control of the forces of production. "Alienation occurs because capitalism has evolved into a two class system in which a few capitalists own the production process, the products, and the labor time of those who work on them." (Ritzer, 1988, p.22)

The ruling class who are also rich exploits and oppresses the subject class who are in most of the cases are poor. As a result, there is a basic conflict of interest between the two classes. The various institutions of society such as the legal and political systems are instruments of ruling class domination and serve to further its interests.

From a Marxian perspective, systems of stratification derive from the relationships of social groups to the forces of production. From a Marxian view, a class is a social group whose members share the same relationship to the forces of production. Thus during the feudal epoch, there are two main classes distinguished by their relationship to land, the major force of production. They are the feudal nobility who own the land and the landless serfs who work the land. Similarly, in the capitalist era, there are two main classes, the bourgeoisie or capitalist class which owns the forces of production and the proletariat or working class whose members own only their labour which they hire to the bourgeoisie in return for wages. This situation can be seen from the following sentences.

Cortabanyes tenía razón cuando me desengañaba: los ricos sólo se preocupan de sí mismos. Su amabilidad, su cariño y sus muestras de interés son espejismos. Hay que ser un necio para confiar en la perdurabilidad de su afecto. Y eso sucede porque los vínculos que pueden existir entre un rico y un pobre no son recíprocos. El rico no necesita al pobre siempre que quiera lo sustituirá. (“Cortabanyes was right when I was disillusioned, the rich only care about themselves. Their kindness, affection and signs of interest are mirages. You have to be a fool to trust in the endurance of your affection. And that happens because the links that can exist between a rich and a poor are not reciprocal. The rich does not need the poor whenever he wants to replace him”; Mendoza,1975,p.160)

Nemesio Cabra gomez criticizes the working conditions in a very different way and says that the conduct of people is the cause of the poverty which harms and makes the wives and children ill and unhappy. The misery, the famine, the illiteracy and the pain that the people receive is actually not because of them but because of the ruling class ideology. It is this group which oppress you, exploit you, betray you and if necessary, they kill you. Nemesio says that he knows the names of illustrious persons who have the red hands of blood of the workpeople but one cannot see them, because white suede gloves cover them. Gloves brought from Paris and paid with your money. You think that they pay you for the work that you do in these factories, it's a lie. They pay you so that you do not die of famine and could keep on working from sunrise to sunset. The money or the profit they will not give it to you as this is the true nature of a capitalist society. The author expresses this situation through a Greek statue in the novel which says “El hombre pobre y trabajador se halla oprimido por el que es rico y no trabaja.” (“The poor and hardworking man is oppressed by the one who is rich and does not work”; Mendoza,1975,p.397). Here the working class is oppressed by the powerful but there is also another kind of oppression, which is like passing on the oppression that the man has suffered, oppressing in turn the female. This female has no relief as she suffers from famine, the cold and the misery that causes the bourgeois development. In the earliest form of human society, the land and its products were communally owned.

From a Marxian perspective, the relationship between the major social classes is one of mutual dependence and conflict. Thus in capitalist society, the bourgeoisie and proletariat are dependent upon each other. The wage labourer must sell his labour power in order to survive since he does not own a part of the forces of production and lacks the means to produce goods independently. However, the mutual dependency of the two classes is not a relationship of equal or symmetrical reciprocity. Instead, it is a relationship of exploiter and exploited, oppressor and oppressed. In particular, the ruling class gains at the expense of the subject class and there is therefore a conflict of interest between them.

One crucial characteristic of capitalism, according to Marx, is that it exploits individual workers. Following Ricardo, Marx adopted a labour theory of value. This theory held that the value of any good depended upon the amount of labour spent producing it. Marx provided a second, and similar, perspective on surplus value. He noted that the essence of capitalism was to take money and use this money to buy things (labour and machines). Marx held that the appropriation of surplus value by the owners of the capital constitutes exploitation. (Chaudhary,2006,p.557)

In the Savolta factory, which was privately owned we could see that as Lepprince belonged to the ruling class, his privileged position inside the company was allowing him to carry out the thefts with a minimum risk as he had ownership of the equipments. On the other hand as the business was doing well, the problems related to the working condition were witnessed.

Los obreros estaban quejosos: se veían obligados a trabajar en ínfimas condiciones un número muy elevado de horas a fin de producir el ingente volumen de armamento que los acuerdos secretos de Lepprince exigían sin que sus emolumentos experimentaran el alza correspondiente. (“The workers were complaining: they were forced to work in deplorable conditions with high number of hours in order to produce the enormous volume of armament that Lepprince had agreed to provide without increasing their emoluments”; Mendoza,1975 p.415)

The whole idea was to pay the workers less and make them work more. There were attempts of strike and “El Hombre de la Mano de Hierro”, knew how to settle similar situations but Leppince did not want anyone to intervene as the investigation would reveal his illegal activities. Marx says that capital, as such, produces nothing. Only labour produces wealth. Yet the wages paid to the workers for their labour are well below the value of the goods they produce. Since they are non-producers, the bourgeoisie are therefore exploiting the proletariat, the real producers of wealth. Marx maintained that in all class societies, the ruling class exploits and oppresses the subject class.

In the industrial capitalist society there is dehumanization of worker and his living conditions become deplorable. The productive labour is the primary, most vital human activity. According to Marx, man is essentially a creative being who realizes his essence and affirms himself in labour or production, a creative activity carried out in cooperation with other and by which the external world is transformed. The process of production involves transformation of human power into material objects or ‘objectification’ of human creative power. In other words, in the production of objects man ‘objectifies’ himself, he expresses and externalizes his being. However, if the objects of man’s creation come to control his being, then man loses himself in the object. The act of production then results in man’s alienation. This occurs when man regards the products of his labour as commodities, as articles for sale in the market place. The objects of his creation are then seen to control his existence. They are seen to be subject to impersonal forces, such as the law of supply and demand, over which man has little or no control. In Marx’s words, ‘the object that labour produces, its product, confronts it as an alien being, as a power independent of the producer’. In this way man is estranged from the object he produces, he becomes alienated from the most vital human activity, productive labour. “In the *Economic and Philosophic Manuscripts of 1844*, Karl Marx identified four types of alienation that occur to the worker labouring under a capitalist system of industrial production.” (Flew,1984, p.10) According to Marx, alienation manifests itself in four ways: Firstly, the worker is alienated from the product of his labour, since what he produces is appropriated by the capitalist and the worker has no control over it. Secondly, the worker is alienated from the act of production itself because all decisions as to how production is to be organized are taken by the capitalist. In fact, work becomes a commodity to be sold and its only value to the worker is its saleability. The labour therefore is not voluntary but forced, it is *forced* labour. Thirdly, in addition to the fact that wage labour alienates man from his product and his productive activity, which distinguishes him from animals, he also becomes alienated from his people. The capitalist system stratifies man, destroys the human qualities and renders man to a state worse than animal. No animal has to work for its survival at other’s bidding while man has to do that in a capitalist system. Fourthly, the form of wage labour prevalent in the capitalist society also leads to social alienation. Consequently, man ultimately becomes alienated from that which is a product of his actions i.e the society. In other words, the worker in a capitalist system is also socially alienated, because social relations became market relations, in which each man is judged by his position in the market, rather than his human qualities. In the novel we can observe similar case when Mendoza writes “En modo alguno. El campesino vive en contacto directo con la naturaleza. El obrero industrial ha perdido de vista el sol, las estrellas, las montañas y la vegetación.” (“In any way. The peasant lives in direct contact with nature. The industrial worker has lost sight of the sun, the stars, the mountains and the vegetation”; Mendoza,1975,p.34). Alienation is therefore the result of human activity rather than external forces with an existence independent of man.

When there is exploitation of workers by the ruling class, there is an increase in solidarity among their own social group. The workers go on strike and at this stage its members have class consciousness and class solidarity. Members of the working class are class in itself as they share the same relationship to the forces of production. Marx argues that a social group only fully becomes a class when it becomes a class for itself. At this stage its members have class consciousness and class solidarity. Class consciousness means that false class consciousness has been replaced by a full awareness of the true situation, by a realization of the nature of exploitation. Members of a class develop a common identity, recognize their shared interests and unite, so producing class solidarity. The final stage of class consciousness and class solidarity is reached when members realize that only by collective action can they overthrow the ruling class and when they take positive steps to do so. This positive step is reflected in the novel as the workers always go on strike. “Los obreros sólo saben hacer huelgas y poner petardos, ¡y todavía pretenden que se les dé la razón! La huelga es un atentado contra el trabajo, función primordial del hombre sobre la tierra; y un perjuicio a la sociedad. Sin embargo, muchos la consideran un medio de lucha por el progreso.” (“The workers only know strikes and firecrackers, and they still claim to be right! The strike is an attack on work, the main function of man on earth, and a prejudice to society. However, many consider it a means of struggle for progress”; Mendoza,1975,p.99).

To tell the truth, the situation of the country in the year 1919 was the worst anyone had ever faced. The Factories were closed, unemployment had increased and the people left their fields and started moving towards the City in order to feed their children. People came through the streets with hunger and thirst, by dragging their poor belongings demanding work, asylum, food and tobacco. The condition of children and women of all ages were pathetic. The trade unions and civil societies had started protesting along with strikes and attacks, the rallies took place in cinemas, theatres, squares and streets, the masses were raiding the bakeries. With several movements, either the life of people was going to change or become worst. Nobody could predict what would be the future of the nation. The writer mentions in the novel that “En las paredes aparecían signos nuevos y el nombre de Lenin se repetía con frecuencia obsesiva.” (“New signs appeared on the walls, and Lenin's name was often obsessively repeated.”; Mendoza,1975,p.185) Marx believed he could observe the process of polarization in nineteenth-century Britain when he wrote, “Society as a whole is more and more splitting into two great hostile camps bourgeoisie and proletariat”. (Marx,1888,p.7). Now the battle lines were clearly drawn, Marx hoped that the proletarian revolution would shortly follow and the communist utopia of his dreams would finally become a reality. But it did not happen.

It is often argued that Marx's view of history is based on the idea of the dialectic. From this viewpoint any process of change involves tension between incompatible forces. Dialectical movement therefore represents a struggle of opposites, a conflict of contradictions. Conflict provides the dynamic principle, the source of change. The struggle between incompatible forces grows in intensity until there is a final collision. The result is a sudden leap forward which creates a new set of forces on a higher level of development. The dialectical process then begins again as the contradictions between this new set of forces interact and conflict, and propel change. However Marx rejects this priority that Hegel gives to thoughts and ideas. He argues that the source of change lies in contradictions in the economic system in particular and in society in general. As a result of the priority he gives to economic factors, to 'material life', Marx's view of history is often referred to as 'dialectical materialism'. Since men's ideas are primarily a reflection of the social relationships of economic production, they do not provide the main source of change. It is in contradictions and conflict in the economic system that the major dynamic for social change lies. Class conflict forms the basis of the dialectic of social change. Social change is not a smooth, orderly progression which gradually unfolds in harmonious evolution. Instead it proceeds from contradictions built into society which are a source of tension and ultimately the source of open conflict and radical change. In Marx's view, “The history of all hitherto existing society is the history of the class struggle”. (Adoratsky,1938,p.76) The conflict presented a violent picture of Barcelona as men armed with bars of iron, hardware and forceful objects moved around the city. The Telegraph stopped working. The strikers cut electricity and there was a chaos in the city. Most of the people were unemployed during this time and therefore their participation was obvious, at least few of them could raise flags in order to prove their commitment towards the struggle. In la plaza de pueblo one could see the image of Lenin painted on the walls.

Los obreros se reunían a diario y pasaban la jornada tomando el sol a la puerta de la taberna, discutiendo y filosofando y haciendo circular bulos sobre los acontecimientos revolucionarios acaecidos en otras localidades. A la caída de la tarde se organizaban mítines en los cuales los socialistas y los anarquistas se insultaban recíprocamente. Al término de los mítines, los oradores y sus oyentes se congregaban ante la iglesia y apostrofaban al cura, acusándole de usurero, corruptor de menores y soplón. (“The workers gathered daily and spent the day sunbathing at the door of the tavern, discussing philosophizing and circulating pamphlets about the revolutionary events that took place in other locations. In the evening, meetings were organized in which the Socialists and the Anarchists debated with each other. At the end of the meeting, the speakers and their listeners congregated before the church and apostrophized the priest, accusing him of usurer and corrupt practices.”; Mendoza,1975,p.393)

### **Conclusion:-**

After analyzing *La verdad sobre el caso Savolta* we can say that Mendoza portrays different types of images in his novel, images that a capitalist society can offer such as corruption, class hierarchy, alienation, anomie, social divisions, inequalities and on the other side solidarity. Through his work, Mendoza has reflected some of the results of urbanization and capitalism. It can be said that under capitalism the world is moving towards an unequal and unjust society.

In today's democratic societies, the relationship between the capitalist and the worker is defined as an equal exchange. Emphasis on words such as freedom and equality in capitalist society, illustrated by phrases such as 'free market', 'free democratic societies' and 'the free world'. All these are illusions. The ideology of the ruling class produces 'false class consciousness', a false image of the nature of the relationship between social classes. Members

of both classes tend to accept the status quo as normal and natural and are unaware of the true character of exploitation and oppression. In other words, the members of both social classes are largely unaware of their true situation.

Now we can say that capitalism dictates the world today. The growth of Barcelona brings changes only in a few individuals while others suffer because capitalism only favours some people. Only a few contractors, capitalists have benefited from this trend. Thus, industrialization is the false opportunity, saying that industrialization will bring new opportunity and will transform every individual is a trap. It only brings more corruption that benefits the rich and exploits the poor, which is the true nature of capitalism.

Any activity, without broad avenues of transparency, accountability and good governance, actually leads to inequality and corruption, resulting in the misery of the people. If a capitalist is not able to control and balance the mechanism and competition in the market, it may lead to concentration of wealth in a few powerful hands. Barcelona, like other big cities of India, did not have any regulatory mechanism, transparency, and accountability. The intention to win more and more without the transparency of the system only leads to an unfair society. The free market system has a natural tendency to increase the concentration of wealth, because the rate of return on property and investment has been consistently higher than the rate of economic growth. The world is moving towards an unequal and unjust society with the effects of capitalism on every corner. There is very little chance that capitalism would reverse the increase in inequality. Governments can initiate changes now, by adopting a global tax on wealth, to prevent inequality and poverty contribute to economic or political instability around the world. Eduardo Mendoza tries to reach us through his different visions of Barcelona. In the novel, he has shown us the complex nature of the city and its social implications but the most important question that comes up here is the following. For whom is the city? The experience under capitalism and industrialization is definitely an ongoing process in which some may win and some may lose.

Upper GI bleeding ,Endoscopy

#### Abstract

Upper gastrointestinal bleeding(UGIB) is one of the surgical emergencies<sup>1</sup>.The etiological spectrum of gastrointestinal bleeding is diverse and variable from one geographical area to another. Earlier barium meal used for study of UGIB which has its own drawbacks . Now upper GI scopy used as diagnostic too<sup>2</sup>1.

**Aims And Objectives:-** Study the endoscopic evaluation and management of upper gastrointestinal bleeding in our college(ks hegde hospital)

**Methods:-** A cross sectional study of 100 cases of upper GI bleeding who are admitted in justice K S Hedge Charitable Trust between October 2014 to October 2016

**Results:-** A Total of 100 patients who underwent upper GI scopy during the period. The patients range in age from 18 to 80, Mean age is 50.5 years .Median 52 years.Out of 100 patients lesions found in 95% patients. Majority of patients are presented with haematemesis (76%) .Oesophageal varices secondary to alcoholic cirrhosis of liver were the most frequent cause of upper GI bleeding followed by PUD. Cirrhosis is the main etiological factor of upper GI bleed in this study (p value – 0.0001) . Esophagus is the most common site of bleeding in this study.In the present study, endoscopic management was the one of the main modality of treatment in 40% of the total patients, consisting of banding (40%). Rest of the patients (57%) were managed conservatively with medical therapy, 3% of the patients were treated surgically.

##### Conclusion:-

- Endoscopy is essential in the initial evaluation and management of upper gastro intestinal bleeding. In this study UGI endoscopy provided accurate diagnosis in 95% of Patients.
- The most common cause of UGI bleeding was oesophageal varices secondary to cirrhosis of liver with portal hypertension. Therapeutic endoscopy was useful in 40% of patients. No complications were encountered during after Endoscopy.
- UGI endoscopy serves its best role in the diagnosis of UGI bleeding and in therapeutic

**Introduction:-**

In modern surgery, Esophago-gastro-duodenoscopy (EGD) is an important tool to visualize the upper part of the gastrointestinal tract up to the duodenum<sup>1</sup>. It is considered a minimally invasive procedure since it does not require an incision into one of the major body cavities and does not require any significant recovery after the procedure (unless sedation or anaesthesia has been used)<sup>3</sup>. Endoscopy is useful in assessing a variety of pathologies. It is used not only as a diagnostic but also a therapeutic tool. Various procedures like variceal band ligation, sclerotherapy, biopsy and hemostasis of bleeders can be achieved in the same sitting. It has indeed become a cost effective and reliable tool to modern surgery.

**Aims And Objectives:-**

Study the endoscopic evaluation and management of upper gastrointestinal bleeding at KS Hegde hospital, Deralakatte, Mangalore.

**Methodology:-****Source of Data:-**

The patient admitted in our KS Hegde hospital with the history of any upper gastrointestinal bleed from will be taken up for the study

**Study period:-** October 2014 to October 2016

**Sample size:-** 100 cases

**Study method:-** Descriptive cross sectional study

**Statistical analysis:-** Collected Data was analysed by frequency ,percentage, Statistical analysis was derived by performing binomial, chisquare test and Fischer exact test

Pvalue of <0.05 was considered to be significant

**Method Of Collection Of Data:-**

- As soon as the patient is admitted a detailed history regarding nature of bleeding whether it has ceased at the time of admission and the time since the onset will be recorded.
- The patients will also be interrogated regarding symptoms of nausea, vomiting, dysphagia, regurgitation, heart burn, abdominal pain, appetite, weight gain or loss and recent changes in bowel habits prior to the bleed.past history of ingestion of drugs over the preceding 48 hrs and frequent ingestion over the preceding months will be enquired about and previous histories of cardiovascular, respiratory, liver diseases will be thoroughly evaluated
- habit of consumption of alcohol by the patient
- Examination of the abdomen for any area of tenderness, palpable masses, ascites and rectal examination will be carried out.
- Based on clinical data obtained a provisional diagnosis will be made.
- These patients will be then submitted to oesophagogaastro duodenoscopy using a fiberoptic instrument

**Inclusion Criteri:-**

All types of upper GI Bleeds admitted in KSHEMA Hospital

**Exclusion Criteria:-**

Age below 18

Patients who are not willing

**Results:-**

**Table 1:-** Disturbtion Of Endoscopic Findings.

Endoscopic findings	cases	%
Abnormal	95	95
Normal	5	5

**Binomial test,p =0.0001 HS**

**Figure 1:-** Disturbtion Of Endoscopic Findings

In this out of 100 cases, 95% patients shows abnormality in endoscopic findings, WHICH IS STATISCALLY HIGHLY SIGNIFICANT COMPARED TO 5% Patients there are no findings found.

**Table 2:-** Disturbtionof Endoscopic Findings According To Causes

DISEASE	TOTAL	FREQUENCY
VARICES	48	48%
DUODENAL ULCER	11	11%

### Discussion:-

Upper GI bleeding is one of the emergency conditions to admit in surgical intensive care unit. Upper GI scopy is the important procedure to evaluate all kinds of upper GI bleed.It is done by standard gastroenterologist to subside diagnostic error .

In this study the commonest cause of upper GI bleed was esophageal varices seen in 48% of the patients and was secondary to cirrhosis with portal hypertension. But study conducted by Crook<sup>5</sup> et al shows the peptic ulcer disease as commonest cause of upper GI bleed, other causes were extra hepatic portal hypertension.

In the present study consisting of total 100 patients major were presented with upper GI bleed. In this study males were 77%, whereas females were 23%. The median age was 31-40. In study conducted by Hyasinta Jaka<sup>4</sup> et al majority were males 73% and females 26.6% and median age was 52 years .

In the present study alcohol was commonest precipitating factor for cirrhosis of liver and remained as main etiology of upper GI bleed In this study cirrhosis of liver is main cause of upper GI bleed(P value-0.0001). This study shows the value of endoscopy in upper GI bleed as not only a diagnostic tool but also helped in therapeutic intervention especially in patients with variceal bleed. In the present study, endoscopic management was the one of the main modality of treatment in 40% of the total patients, consisting of banding (40%). Rest of the patients (57%) were managed conservatively with medical therapy, 2% of the patients were treated surgically. whereas, in the study done by Hyasinta Jaka et, al; majority of the patients (60.8%) were treated conservatively and endoscopic and surgical treatments were performed only in 30.8% and 5.8% of cases respectively

Most of the non-variceal bleeding in upper GI was amenable to conservative medical management.

This study highlights the value of endoscopy both as a diagnostic and therapeutic tool in the management of all upper GI bleed.

In this study stomach is common site of bleeding followed by esophagus and duodenum., In study made by Libyan<sup>6</sup> esophagus is most common site of bleeding.

### Conclusion:-

- Endoscopy is essential in the initial evaluation and management of upper gastro intestinal bleeding.
- In this study UGI endoscopy provided accurate diagnosis in 95% of Patients
- The most common cause of UGI bleeding was oesophageal varices secondary to cirrhosis of liver . Therapeutic endoscopy was useful in 40% of patients. No complications were encountered during / after Endoscopy.
- The most common site of bleeding is stomach in my study
- UGI endoscopy serves its best role in the diagnosis of UGI bleeding and in therapeutics.

##### Key words:-

Antibiotics, awareness, misuse, upper respiratory tract infection.

#### Abstract

**Background:** Excessive use of antibiotics among general public is a topic of global concern. The present study aimed to assess the awareness and causes of antibiotics use and misuse in patients with upper respiratory tract infections.

**Methods:** This cross-sectional hospital-based survey was conducted in the Primary Care Department, College of Medicine, King Saud University Riyadh, Saudi Arabia during the period Jan 2014 to Dec 2015. In this study, a well-established self-administrated questionnaire was randomly distributed to the patients suffering from URTI visiting at King Khalid University Hospital, Riyadh, Saudi Arabia. The questionnaire consisted of 3 parts: demographic variables, knowledge, beliefs and behaviors toward antibiotic use and misuse. Descriptive statistics were used for the analysis of data. Out of 420 collected responses, we included 400 and the remaining 20 were excluded.

**Results:** The results show that 45.5% of participants used antibiotics without prescription ( $p=0.050$ ) and 10.8% used it over a pharmacist's advice ( $p=0.030$ ). 17.3% participants forced the physicians to prescribe antibiotic and 22% patients stopped taking antibiotics when they felt better ( $p=0.007$ ). Moreover, 45% had the antibiotic stocks at home in case of emergencies. In addition, 16.8% were ignoring the instructions when taking antibiotics ( $p=0.004$ ). 12% of the participants denied that an antibiotic could cause an allergic reaction ( $p=0.054$ ) and a similar percentage of participants (12%) believed that the effectiveness of the treatment would not be affected if a full course of antibiotic is not completed ( $p=0.029$ ). 7.2% of the participants with high educational level believed that all antibiotics do not cause side-effects ( $p=0.002$ ) and 17.8% of them believed that if symptoms were improving the antibiotic course can be interrupted without completing ( $p=0.037$ ).

**Conclusion:** It is concluded that misconceptions exist about the use and indications of antibiotics. Lack of knowledge regarding antibiotic resistance and risks associated with use of antibiotics was prevalent. It is suggested that more interaction is required between physicians and patients, and involvement of both print and electronic media to improve the antibiotics knowledge and practices among community and

### **Introduction:-**

Upper respiratory tract infections are the most prevalent infectious diseases in many societies and are one of the major reasons that patients visit the primary care clinics especially during the winter. Both bacteriological and viral microorganisms are etiological factors contributing to the development of upper respiratory tract infections<sup>1</sup>. However, most of them are caused by viruses, in which antibiotics are not needed<sup>2,3,4</sup>. Respiratory system conditions are the most common cause for antibiotics prescription<sup>5,6</sup>. Several studies showed that physicians practice in prescribing antibiotics in such cases could be related to the physician response to the patient pressure<sup>7,8,9</sup>. In addition, over-prescription practices have been attributed to vague diagnosis and the fear of inadequate level of health care. Antibiotics misuse in cases where no definite clinical benefits from them can lead to adverse effects<sup>10,11,12</sup>. The likelihood of antibiotics misuse by the public can be linked to the widespread glitches in the information about antibiotics. The general lack of knowledge and the poor awareness among the public with regard to the proper use of antibiotics and its indications have been documented.

There is a common public's misunderstanding such as the use of antibiotics can help in faster recovery and in the prevention of further illnesses in common conditions like upper respiratory tract infections<sup>13,14</sup>. The knowledge, attitudes and behaviors differ from one community to another. Limited literature is available from the Middle East Region addressing such topics<sup>14-15</sup>. However, still there is a great gap in the knowledge to understand the proper use of antibiotics. Therefore, this study aims to assess knowledge, attitudes and beliefs regarding antibiotics use and its effectiveness for upper respiratory tract infections in Riyadh, Saudi Arabia.

### **Research Methodology:-**

**Study Design:** This cross-sectional hospital-based survey was conducted in the primary care department, King Khalid University Hospital, College of Medicine, King Saud University Riyadh, Saudi Arabia during the period Jan 2014 to Dec 2015. King Khalid University Hospital is one of the largest and leading university teaching hospitals, located in the capital city of the Kingdom of Saudi Arabia. The hospital provides primary, secondary and tertiary health care services to all citizens over the country and from Gulf region.

The targeted population was adults from 16 years of age and above. A total of 420 well-structured English language questionnaires were distributed, 400 patients suffering from URTI completed the questionnaires were included while the remaining 20 were excluded due to incomplete filling or double answers, giving a response rate of 95.24% among them 48% were males and 51% were females.

The questionnaire was formed based on the questions taken from previous studies and edited to suit the objectives<sup>2, 14, 16, 17</sup>. A pilot study was conducted to test the validity of the questionnaire. The final version of the questionnaire contained 33 questions divided into four main parts. The first part was about demographic features. The second part was designed to assess recent antibiotics usage in the last year, the reason of the usage, and whether it was used with or without a prescription. The third part contained eleven statements with (Yes–No–Not sure) options to assess participant general knowledge and attitude about antibiotics. Statements included role of antibiotics, harmful effects of antibiotics and completion of treatment course. The fourth part was designed to evaluate the behaviors toward antibiotics use. This part consisted of nine statements about the antibiotics usage in common cold, patient's expectation from the physicians, patient's compliance, sharing and keeping antibiotics for emergency cases and others. Responses were taken also in (Yes–No–Not sure) pattern. One additional question was asked about the participants' source of information about antibiotics. Options were (from the doctor–pharmacist–internet- media-relatives and friends). A written consent was taken from all respondents before answering the questionnaires. Participants' anonymity was assured by assigning each participant with a code number for the purpose of analysis only. No incentives or rewards were given to participants. Data collection was conducted by research team from December 2013 to February 2014. Collected data were tabulated and analyzed by using SPSS software version 21 (SPSS Inc Chicago, IL). The prevalence of antibiotic use, misuse and its awareness were determined by comparing outcome measures. Numerical variables were reported as the mean±standard deviation. The statistical significance was defined as p-value <0.05.

**Ethical approval:** Study was approved by the Institutional Review Board, Department of Family and Community Medicine, College of Medicine, King Saud University, Riyadh.

## Results:-

**Demographic characteristic of respondents:** A total of 420 questionnaires were distributed at the primary care clinic, 400 completed questionnaires were included while the remain 20 were excluded due to incomplete filling or double answers, giving a response rate of 95.24% among them 48% were males and 51% were females. Participants were compared according to their demographic parameters: age, nationality, marital status, educational level, employment status, antibiotics usage per year, and recent antibiotics usage within one year (Table 1). Among the respondents, 37.5% were in the age group of 26-35 years ( $p=0.320$ ), 62.5% were married ( $p=0.057$ ), 57.5% were well educated (College or University) ( $p=0.000$ ), and 46% were employed ( $p=0.000$ ). About 70.3% of the individuals used antibiotics recently ( $p=0.578$ ) and 46% used 2-4 times per year ( $p=0.408$ ). Respiratory illnesses were the third highest cause of the use of antibiotics, other causes are shown in Figure 1. Data on respondent's knowledge, behavior and attitude towards antibiotics use are presented in Table 2.

**The impact of age on use of antibiotics:** 45.5% of participants were using antibiotics without prescription ( $p=0.050$ ) and 10.8% using the antibiotics over a pharmacist's advice ( $p=0.030$ ). 17.3% of all age groups had forced the doctor to prescribe antibiotic, 6.3% of them were between 26-35 years ( $p=0.014$ ). Furthermore, respondents who stopped taking antibiotics when they felt better were higher in the age group of 26-35 years, with a given percentage of 22% out of 51.7% ( $p=0.007$ ). Moreover, 45% of all age groups agreed on keeping the antibiotic stocks at home in cases of emergencies, with a higher percentage in the age group between 16-35 years ( $p=0.010$ ). In addition, 16.8% were found to be ignoring the instructions on the label when taking antibiotics ( $p=0.004$ ). (Table 2).

**The impact of gender on use of antibiotics:** In order to further explore the influence of gender in relation with the respondent's knowledge, attitude and behavior regarding usages of antibiotics. Knowledge and belief results were less remarkable than behavioral. 12% of the participants denied that antibiotics could cause an allergic reaction ( $p=0.054$ ). A similar percentage of participants (12%) among them 6.3% were males and 5.8% were females believed that the effectiveness of the treatment would not be affected if a course of antibiotic was not completed ( $p=0.029$ ). On the other hand, behavioral questions' results revealed that 7% of male participant out of 10.3% obtained antibiotics without prescription ( $p=0.042$ ) and the same percentage was recorded for male getting antibiotics over a pharmacist's advice. Moreover, males and females who took antibiotics when they suffered with common cold represented 24.6% and 19% respectively ( $p=0.014$ ). However, 10.3% of male and 7% of female enrolled in the study used to force the doctor to prescribe to them antibiotics when they felt sick ( $p=0.043$ ). The majority of both genders showed significant result in keeping antibiotic stocks at home in case of emergency (44.9%) ( $p=0.006$ ) and also using the leftover antibiotics for a respiratory illness (9%) ( $p=0.001$ ) (Table 3).

**The impact of educational level on use of antibiotics:** The analysis of educational levels' indicated that 7.2% of the participants with high educational level (College and University) believed that all antibiotics do not cause side-effects ( $p=0.002$ ). Furthermore, 17.8% of them considered that if their symptoms were improving they could interrupt the course of the antibiotic without completing it ( $p=0.037$ ). As a result, their percentage was the highest among all educational levels in stopping the intake of the antibiotic after feeling better (41.3% out of 51.7%) ( $p=0.012$ ). (Table 4).

Regarding antibiotics misuse prevalence, we calculated the percentage of behavior-related questions, 30.61% of the study participants' showed misuse toward antibiotics. (Figure 2). Figure 1 shows the causes of use of antibiotics among the participants were the relief of inflammation 24%; while 22% used the antibiotics for the relief of fever. Respiratory illness took the third place with a percentage of 21%, pain came after with a value of 10%. Urinary tract infection, skin diseases and wound showed percentage of 7%, 4% and 2% respectively. Furthermore, figure 2 shows that participants' sources of information about antibiotic were primarily doctors followed by pharmacists. The other sources were Internet, relative and friends, media, and finally the news and magazine (Fig 2).

**Table 1:-Demographic characteristic of the participants**

Parameter	Frequency	Percent %	Male	Female	P value
<b>Age (years)</b>					
16 – 25	83	20.8	11.8%	9%	0.320

### Discussion:-

Antibiotics misuse can lead to a wide range of adverse consequences. The patients' knowledge and beliefs about antibiotics can dramatically affect the way they use these medications. Therefore, it is necessary to assess the extent of patients' knowledge in order to reach the right interventions, which in turn guide the patients' behaviors and usage toward these drugs<sup>14</sup>. This study demonstrates that the majority of the participants were using antibiotics frequently from two to four times per year. Furthermore, 281 (70.3%) of respondents had recently used antibiotics within the last year. In addition, the percentage reported in this study was even higher than the percentage reported by a study conducted in Oman by Jose et al.,<sup>14</sup> in which only 66% of the respondents had used antibiotics recently within the last year<sup>14</sup>. The causes for using antibiotics varied from one respondent to the other with higher percentages given to reason for inflammation (24%), fever (22%), and respiratory illness (21%). In terms of knowledge, 55.8 % of participants agreed that antibiotics could be used to treat viral infections compared to 46% as reported by Curry et al., 2006<sup>10</sup>. This confirms the lack of knowledge of the participants and their inability to recognize the differences between bacteria and viruses related diseases. The reason behind this can be due to the use of the word "germs" when counseling and seeking a medical advice instead of using the words "bacteria" or "viruses"<sup>2</sup>. Moreover, the majority of respondents believe that antibiotics can also be used to relieve pain and fever. While, when the participants questioned directly about their behaviors toward antibiotics, 79.3 % had a correct behavior in disagreement to the statement about "I usually force my doctor to prescribe me antibiotics when I get sick". Nevertheless, 56.3 % were expecting their doctors to prescribe them an antibiotic when suffering from common cold. This can be attributed to the large number of prescriptions for antibiotics in respiratory viral infections, which in most of the cases are self-limiting. This leads to the impact on the general belief that such medicines are effective against these diseases. Consequently, such incorrect belief contributes to the raising of the expectations that antibiotics are inappropriate treatment for common colds<sup>2</sup>. The findings in current study have shown that the vast majority of participants (74.3%) were more aware that if an antibiotic's full course was interrupted, the effectiveness will decrease in comparison with Oh et al., 2011 where 71.1% only had correct answer<sup>2</sup>. However, 51.8% agreed that they would stop using antibiotics when they start feeling better. This showed the inadequacy of knowledge wherein most people do not understand the real cause and the actual significance of completing the antibiotic's full course<sup>2</sup>. The results of this study showed the need of an urgent intervention by educating people through annual campaigns about antibiotics' uses, and the importance of compliance. Moreover, it is important to clarify the differences between bacteria and viruses, causes of common colds, and how to alleviate their symptoms apart from antibiotics' usage. The analysis of awareness based on demographics showed significant correlation between misuse and three main factors which are age, gender, and educational level. It was found that those in the age group between 26-35 years were behaving incorrectly more than the other age groups. Furthermore, it had been shown that after the age of 35 with each additional increase in the age, individuals become more aware and tend to have a more positive attitude toward antibiotics. As a result, this guides us to direct these campaigns to this age group in particular and the other age groups in general. Moreover, in this study females seemed to be behaving better than males in several ways like in using antibiotics without prescriptions, keeping stocks, and using leftover antibiotics. We can attribute this result to the females' nature where they are more careful and practical than men when it comes to their lives<sup>18</sup>. As reported, there is correlation between misusing antibiotics and high educational level (College and University).

When the participants questioned directly about their source of information about antibiotics, physicians were occupying the first place followed by the pharmacists. Therefore, it is also important to alert physicians to educate people about the rational uses of antibiotics, its adverse consequences, common cold etiology, and its management. In addition, pharmacists should be willing to refuse any selling of an antibiotic without prescription. Moreover, health officials can set policies to limit these actions globally.

**Strengths and limitations:**The strengths of this study are represented in several aspects. It was conducted in a tertiary care hospital that provides services to all citizens coming from different regions in Saudi Arabia. The questionnaire was distributed equally between both genders. However, there are some limitations in the present study. First of all, there was a high percentage of participants with high educational level (College and University) this could be due to shortage in the number of options provided in the questionnaire where diploma degree holders were not included. As a result, participants who hold diploma may choose "College and University" option. Therefore, increasing the number of options would have defined another representative. Second, recall bias might affect the results as some of the questions depended on recalling. Moreover, the results depended on the honesty and the understanding of the respondents, as it was a self-reported questionnaire. Even though King Khalid University Hospital attracts large number of citizens coming from different regions, this study can be generalized to the capital city Riyadh as Kingdom of Saudi Arabia has different culture in various regions. Furthermore, it would be a supporting study to future researches conducted in other regions as health related studies and policies supporting each other. Finally, we recommend starting a large-scale research covering the whole nation in order to represent the data optimally.

### **Conclusion:-**

It is concluded that, misconceptions exist about the use and indications of antibiotics in the community. This study highlights the need to educate patients regarding antibiotic use and the consequences of misuse. Which diseases actually require antibiotics, why full daily doses must be respected, risk of keeping part of a course for future uncontrolled use and need of a prescription for getting antibiotics from the pharmacist are some of the issues to be discussed with the patients. The majority of participants who show misuse were from age group 26-35, that makes them the main target for future awareness and educational programs to improve the knowledge, attitude and behavior toward antibiotic uses. Interaction is required between physicians and patients and involvement of both print and electronic media may help to improve the antibiotics knowledge and practices in community and consequently control the antibiotics misuse.

### **Recommendations:-**

The community needs well-planned educational campaigns to raise the awareness of antibiotic uses and its adverse effects. Moreover, we recommend that similar studies should be held in different regions in Saudi Arabia. In addition, it is important to have a standard policies regarding antibiotics' selling, wherein getting any antibiotic without prescription should not be allowed. Furthermore, since the majority of participants get their information from their doctors, educating patients by physicians about antibiotic uses, its role in treating etiologies of upper respiratory tract infections and its adverse effects will have a great impact on patients' knowledge and behavior. Major changes in prescribing practice supported by a national information campaign would be beneficial to reduce patient's expectation from antibiotics and to raise awareness about antibiotic resistance.

### **Acknowledgments:-**

The authors are thankful to the Deanship of Scientific Research, King Saud University, Riyadh, Saudi Arabia for supporting the work through research group project (RGP-VPP 181). We are also thankful to Dr. Raju K Mandal for his valuable suggestions regarding the questionnaire and Dr. Philip Feeley for his assistance in statistical analysis.

**Disclosure:** The funders had no role in study design, data collection and analysis, decision to publish or preparation of the paper.

Arabic Literature, Science Fiction,  
Industrial-technological revolution,  
Translation, Canonical Literature, Non-  
canonical literature.

#### Abstract

Science fiction literature is a somewhat new and less recognized field in the Arabic literary polysystem. The science fiction (SF) genre entered Arabic literature through translations of Western SF works. Nonetheless, we can see elements and sources of SF in classical and folk Arabic literature. In addition, the industrial-technological revolution in the twentieth century served as a catalyst for the growth of this genre.

From the moment it emerged, SF literature faced two types of criticism. The first viewed it as non-canonical, cheap, a sub-category of detective literature, popular and having no value. The second group of critics, diametrically opposed to the first, saw SF fiction as canonical literature that should be engaged with, critiqued and researched.

In recent years, we can see that diametrically literature has begun to establish itself and assume a position in the Arabic literary polysystem. We are witnessing a trend that is changing the approach to diametrically literature and beginning to recognize it as a canonical literary genre accepted by the academic establishment, meriting attention, research and criticism.

#### Introduction:-

The beginnings of modern Arabic SF can be attributed to two processes. The first is the renaissance of the classical Arabic literary heritage, the “neo-classical movement”. This movement originated at the end of the nineteenth century and drew from classical literary genres, imitated them and adopted their writing style—e.g., in the manner of *Maqāma*, the stories of *ʿAlf Layla wa-Layla* (*One Thousand and One Nights*), and classical Abbasid poetry at its peak. The most prominent works of this stream were: Muḥammad al-Muwayliḥī, Jurjī Zaydān, Ḥāfiẓ ʿIbrāhīm and ʿAḥmad Shawqī. The second stream, which began with the translations of European literature into Arabic and was influenced by it, commenced in the nineteenth century when the Arab and Western worlds reconnected (the accepted date for historians is Napoleon’s conquest of Egypt in 1798). Among others, intellectuals from Lebanon and Egypt, who having learned a number of European languages, started translating Western literature into Arabic. Very quickly, Arabic writers began following the styles of the translated works and composing plays, novels and short stories. The first pieces written in Arabic were mainly pale imitations of what existed in French and English. Nevertheless, by the middle of the nineteenth century, writers and playwrights began producing original work in which they engaged in issues relevant to the society in which they lived.

The most prominent writers in this stream who left their mark on modern Arabic literature are: Jubrān Khalīl Jubrān, Michael Nuʿayma, Muṣṭafā al-Manfalūfī, Muḥammad ʿUṯmān Jalāl, Jabrā ʿIbrāhīm Jabrā, Tawfiq al-Ḥakīm and

Ṭāhā Ḥyṣṣayn. The Arabic novel developed and reached artistic maturity in the work of the Egyptian writer Najīb Maḥfūz (winner of the 1988 Noble Prize for Literature), much of which dealt with the world of his native city, Cairo. Maḥfūz focused in particular on the lives of the lower classes; yet, he also described the internal world and conflicts of the Egyptian intellectual. His short stories reflect the realism characterizing the lives of many of Cairo's residents. At the same time, his work is suffused with the universal truths of Man's nature.

In the 1940s, SF books and stories began appearing in Arabic literature. SF literature entered Arabic literature through translations of Western SF literature, though some researchers see the roots of Arabic SF drew from classical and folk Arabic literature. Further, SF literature grew and developed under the influence of the industrial-technological revolution, which reached the Arab world in the 1950s.

### Definition:-

James Gunn believes that 'defining SF is like measuring the properties of an electron: you may think you're measuring a solid object, but it's really a wispy cloud. Even its name leads to disputes. Jules Verne called what he wrote *voyages extraordinaires*, and H. G. Wells called it *scientific romance*. When Hugo Gernsback created the first true science-fiction magazine in 1926, he called what he intended to publish *scientifiction*, and he came up with the phrase "science fiction" only after he lost control of *Amazing Stories* in 1929 and created *Science Wonder Stories*. Robert A. Heinlein suggested that *speculative fiction* was a more appropriate designation. Abbreviations such as "sci-fi" (liked by the media but not by most fans, who use it to describe bad science-fiction movies) and "SF" (preferred by most readers) further complicate the issue.' (Gunn and Candelaria, 2005: ix)

Samuel R. Delany, insist that, 'like poetry, SF is impossible to define. Others have pointed out that genre titles are booksellers' conveniences, telling them where to put books when they arrive—and equally, of course, book buyers' conveniences, telling them where to look for the books they want when they go shopping. Brian W. Aldiss defined SF as 'a hubris clobbered by nemesis.' John W. Campbell: 'SF is what SF editors publish.' The fall-back position, epitomized by Damon Knight when he said: "SF is what we mean when we point at it," is that we know it when we see it. And even if we can't define it to everyone's satisfaction, the effort helps us clarify our thinking about the genre (quoted in Gunn and Candelaria, 2005: x).

*The Oxford English Dictionary* defines SF as 'imaginative fiction based on postulated scientific discoveries or spectacular environmental changes, frequently set in the future or on other planets and involving space or time travel'. Adam Roberts sees the terms of this basic dictionary definition are instructive: 'imaginative fiction' differentiates SF from 'realist' fiction, in which there is some attempt at a literary verisimilitude that reproduces the experience of living in the world we recognise as ours (Roberts, 2000: 2). Darko Suvin defined SF as 'a literary genre whose necessary and sufficient conditions are the presence and interaction of estrangement and cognition, and whose main formal device is an imaginative framework alternative to the author's empirical environment.' (Suvin, 1979: 8-9). Damien Broderick concludes that the SF is a 'species of storytelling native to a culture undergoing the epistemic changes implicated in the rise and supercession of technical-industrial modes of production, distribution, consumption and disposal.' (Broderick, 1995: 155)

James Gunn concludes that 'the attempt to define SF, moreover, is like the attempt to measure electrons in another way: you can determine the location but you can't also determine the momentum every attempt changes one or the other. The difficulty with identifying science fiction and proceeding from that to definition is that SF isn't just one thing. It has no recognizable action, like the murder mystery, or recognizable milieu, like the western, or recognizable relationship, like the romance. It is about the future except when it is about the past or the present. It can incorporate all the other genres: one can have a science-fiction detective story, a science-fiction western, a science-fiction romance, and, most commonly, a SF adventure story. It is best characterized by an attitude, and even that is hard to define. It is the literature of change, the literature of anticipation, the literature of the human species, the literature of speculation, and more.' (Gunn and Candelaria, 2005, x- xi).

In Arabic literature research, SF is usually defined as literature that deals with phenomena beyond our everyday reality, given that this literature describes scientific and technological discoveries that have yet to be realized in reality, especially regarding space, time travel, life on other planets and encounters with extraterrestrials. Accordingly, SF is a genre that is concerned with the responses of humans to improvement and progress in the fields of science and technology. The underlying premise of SF literature is the concept of focusing on predicting the future, with the emphasis on possible technological-scientific developments. Hence, we can see that its creators

write of time travel, the likelihood of world war three, the invasion of Earth by extraterrestrials, battles with strange beings, epidemics of dangerous bacteria, the ominous implications of genetic engineering, humans being ruled by robots and machines, etc. (see, e.g., Muştafā, 2007; Wahbī, 1974; Yāsīn, 2008)

### **The roots of SF in Arabic literature:-**

Chronologically, we can delineate five sources that spurred the growth and development of SF literature in the Arab world.

### **Arabic folk literature:-**

Robert Scholes sees ‘the tradition that leads to modern SF as a special case of romance. For this tradition always insists upon a radical discontinuity between its world and the world of ordinary human experience. In its simplest and most ancient form this discontinuity is objectified as another world, a different place—Heaven, Hell, Eden, Fairyland, Utopia, the Moon, Atlantis, Lilliput. This radical dislocation between the world of romance and the world of experience has been exploited in different ways. One way has been to suspend the laws of nature in order to give more power to the laws of narrative, which are themselves projections of the human psyche in the form of enacted wishes and fears. These pure enactments are the root of all narrative forms, whether found in “realistic” or “fantastic” matrices.

There is another way to exploit the radical discontinuity between the world of romance and that of experience, and this way emphasizes cognition. The difference can be used to get more vigorous purchase on certain aspects of that very reality which has been set aside in order to generate a romantic cosmos. When romance returns deliberately to confront reality it produces the various form of didactic romance or fabulation that we usually call allegory, satire, fable, parable, and so on— to indicate our recognition that reality is being addressed indirectly through a patently fictional device.

Fabulation, then, is fiction that offers us a world clearly and radically discontinuous from the one we know, yet returns to confront that known world in some cognitive way. Traditionally, it has been a favorite vehicle for religious thinkers, precisely because religions have insisted that there is more to the world than meets the eye, that the common-sense view of reality—“realism”—is incomplete and therefore false.’ (Scholes, 2005, 206)

According to a number of Arab researchers (see, e.g., ‘Abd al-Fattāh, 1993; Khurshid, 1994; ‘Azzām, 1994), the miracles and the Jinns (genies or spirits) described in *‘Alf Layla wa-Layla* (see, e.g., *‘Alf Layla wa-Layla*, 1998, V. 1, 30-35, V. 4, 58, 225) and in folk biographies such as *Sīrat ‘Alī al-Zaibaq* (2004) and *Kitāb al-Tījān fī Mulūk Ḥimyar* by Ibn Hishām (2008) , constitute the basis for modern Arabic SF literature. In other words, the roots of SF are embedded deep in Arabic folklore. Researchers claim that the concept of Jinns (genies) and their actions, the phenomenon of metamorphosis, the adventures of Sinbad, the idea of disappearance/reappearance and other supernatural phenomena are the basis upon which SF literature was constructed and from which it emerged.

These same researchers assert that the use of energy, nuclear power and knowledge of electronics in SF today is equivalent to the stories of the Jinn with supernatural power in folk literature and the dangers and crises faced by Sinbad in his travels and his use of tricks and ruses to escape these dangers. Similarly, the Jinn with his supernatural power—as in his ability to time travel, to organize and wage war—in folk literature is the same as today’s hero in SF movies. The researchers claim that the flying carpet that appears in *‘Alf Layla wa-Layla* (*One Thousand and One Nights*) is the equivalent of a spaceship or modern day airplane; the wondrous teakettle is comparable to an electric lamp; the crystal ball through which the witch sees the world is today’s computer; the phenomenon of metamorphosis described in mythology, folklore and *One Thousand and One Nights* by virtue of which an entity (sorcerer, witch) can change its form and become a different being, is seen today in SF stories such as Mary Shelley’s *Frankenstein*. Shelley’s hero, Dr. Frankenstein, takes body parts and pieces of skin from dead people and successfully imbues life into them to create a being. In *One Thousand and One Nights*, the sorcerer changes people into animals (a donkey, dog or cow). Today, in SF films, we see werewolves. We can distinguish other phenomena, which appear in Arabic folk literature, e.g., the ability to disappear that enables the hero to disappear by donning a hat or ring. This theme appears today in SF stories such as H. G. Wells’ *The Invisible Man*. And just as the authors of folk stories dived deep into the waters of seas and oceans, described and controlled them, today SF is engaging with the same subjects (see, e.g., Verne, 1998; Sharīf, 1977).

**Classical Arabic literature:-**

In keeping with the assumption that SF is based, essentially, on imagination, the description of futuristic fictionalized adventures, historical facts taken to imaginary horizons, the development of ideas and existing trends in scientific, technological, economic and artistic fields and their implications for the future of humankind, the presentation of unknown worlds and travel to strange planets, it is easy to distinguish the foundations in the imagination-rich Arabic literature. For example:

- a) *Al-Futūḥāt al-Macciyya* Ibn 'Arabī (1165-1240),
- b) *'Ārā'fī 'hl al-Madīna al-Fāḍila* by 'Abū Naṣr al-Fārābī (870-950),
- c) *Risālat al-Ghufrān* by 'Abū al-'Alā' al-Ma'arrī (973-1058),
- d) *Risālat al-Tawābi' wal-Zawābi'* by Ibn Shuhayd (992-1058),
- e) *Ḥay bin YaqZān* by Ibn Ṭufayl (1100-1185),
- f) *'Ajā'ib al-Makhlūqāt* by al-Qazwīnī (1208-1283).

Thus, for example, Ibn 'Arabī in his book, *al-Futūḥāt al-Macciyya (The Meccan Revelations)*, described a world that exists in a sesame seed. His world has people, land, gardens, animals and all types of metal. Anyone can enter this world, move about in it and talk to its people, stones or trees. Ibn 'Arabī also described groups of people with the ability to travel from one place to another at the speed of light. Further, he described the prophet Elijah who can walk on water, cross great distances with only two or three strides and fly in the sky on a flying carpet (Ibn 'Arabī, 1972: 257-261, 265-268; Ibn 'Arabī, 1985: 182-184). Likewise, he portrayed people that can change their form and take on another form and thereafter return to their original form. He also described a holy stone around which people turn, with which they converse, ask it to grant wishes, and give advice and information in all kinds of areas, and it answers them and fulfills their wishes (Ibn 'Arabī, 1972: 267). In addition, Ibn 'Arabī wrote of a sea made of dust, yet having the characteristics of water. The stones are drawn to and connect with each other, on their own, in the way that metal is attracted to a magnet, and in this way a ship is built. People board this ship and travel at the speed of light. These same people can walk on water without sinking (Ibn 'Arabī, 1972: 260-268). The same image appears in modern SF. For example, the same descriptions appear in the novel *al-Sayyid min Ḥaql al-Sabānikh* (1987) (*The Man in the Spinach Field*) by the Egyptian writer Ṣabrī Mūsā, and in the novel *al-Ṭūfān al-'Azraq* (1976) (*The Blue Flood*) by the Moroccan writer 'Aḥmad al-Biqālī, as well as other novels. In these novels, the holy stone has been replaced by an electronic brain that people turn to and pose questions and it provides answers and information and helps them solve problems and clarify issues. This same brain contains all human knowledge, thinks and records, prophesizes and predicts people's future, forecasts their illnesses, gives them medicine for their illnesses, explains their feelings to them and teaches them the right way to behave (al-Biqālī, 1976; Mūsā, 1987).

The same theme appears in numerous short stories. For instance, *Ḥub fī al-Qarn al-Wāḥid wal-'Ishrīn* (1987) (*Love in the Twenty-First Century*) by Ra'ūf Waṣfī, his hero turns to the electronic brain and asks it for help and direction in how to cope with problems and issues related to his lover.

It is important to note that the literary researchers, Alexei Panshin and Cory Panshin, noted the similarity between the descriptions in the story by Ibn 'Arabī and the descriptions appearing in Fredric Brown's *What Mad Universe* (1949) and *Waldo* (1942), a short story by Robert Heinlein (Panshin & Panshin, 2005, pp. 219-223).

Brian Stableford sees that 'the concept of a *utopia* or "Ideal State" is linked to religious ideas of Heaven or the Promised Land and to folkloristic ideas like the Isles of the Blessed, but it is essentially a future-historical goal, to be achieved by the active efforts of human beings, not a transcendental goal reserved as a reward for those who follow a particularly virtuous path in life. The term was coined by Thomas More in *Utopia* (Latin edition 1516; trans. 1551). It can be argued that all utopias are SF, in that they are exercises in hypothetical Sociology and political science. Alternatively, it might be argued that only those utopias which embody some notion of scientific advancement qualify as SF.

The scientific imagination first became influential in utopian thinking in the seventeenth century: an awareness of the advancement of scientific knowledge and of the role that science might play in transforming society is very evident in Francis Bacon's *New Atlantis* (1626) and Tommaso Campanella's *City of the Sun* (1637).

It was left to a school of French philosophers during the second half of the eighteenth century to become the first strident champions of the idea that moral and technological progress went hand in hand. L S Mercier's pioneering

euchronian novel, *L'an deux mille quatre cent quarante* (1771) proposed that the perfectibility of mankind was not only possible but inevitable, with the aid of science, mathematics and the mechanical arts.' (Stableford, 1995, 1260)

Other researchers (e.g., Scholes & Rabkin, 1977: 173-174; Hillegas, 1979; James, 2003) see utopian literature as a literary genre upon which SF developed. Utopia was the source of inspiration for many SF writers such as H.G. Wells, Jules Verne, Aldous Huxley, Isaac Asimov, Arthur C. Clarke, Ivan Yefremov, Edward Bellamy, and James Blish. The researchers also noted that many modern SF novels contain utopian elements.

In his book, *'Ārā' fī 'Ahl al-Madīna al-Fāḍila (On the Perfect State)*, al-Fārābī tried to describe an ideal utopian state in social, economic and political terms. His state is based on science, wisdom and philosophy, and all its citizens enjoy equal rights, justice and a high standard of living (al-Fārābī, 1998). The same descriptions appear in the novel *al-Sayyid min Ḥaql al-Sabānikh* (1987) (*The Man from the Spinach Field*), by the Egyptian writer Ṣabrī Mūsā. He portrayed a utopian state governed by a team of scientists, and wise and talented men (technocrats). This world has justice and social organization that ensures fair distribution among all its citizens of work, food, lodging and studies. There are no illnesses or wars. There is no crime or punishment. Robots help prepare food and run the households. The government allocates property equitably. Citizens work at jobs they enjoy, that benefit everyone and that leave them free time to dabble in the arts and sciences. The institution of marriage has disappeared. There is a laboratory that produces children from test tubes (in vitro fertilization). The government decides how many children are to be produced, in line with its needs.

Equality is reached through scientific-technological and robotic development that enable a high standard of living. The state laws are clear and guarantee equal rights and obligations for all citizens, and every citizen has the right to express his opinion and has free will when voting.

#### **The industrial-technological revolution:-**

An examination of the historical background behind the growth of SF in Arabic literature reveals a link between the industrial-technological revolution and the history of its development. The age of scientific discoveries and social changes fed this literary genre's growth. On the foundations of the scientific and industrial revolution, a number of writers began writing fictional books and stories whose subjects were inspired by scientific ideas and technological inventions. The interest in technological innovations and in subjects related to space and supernatural phenomena increased significantly in the 1950s in the Arab world. The reality of the lack of original literature to supply the demand, literature that would deal appropriately with these types of subjects, led to translations into Arabic. These dealt with the typical subjects of SF such as the existence of life on other planets and the possibility of making contact with them. Western writers, most prominently Arthur C. Clarke and Isaac Asimov, filled the very important role of introducing Arab readers to SF. In this context, their engaging with the link between scientific progress and space research, and the emergence and development of SF should be particularly noted (see, e.g., Asimov, 1960; Asimov, 1964; Asimov, 1979; Asimov, 1980; Clarke, 1973).

The link between the industrial-technological revolution and the literature has been discussed in a number of studies and in several papers translated into Arabic. One book that was translated, received especially broad recognition and made a substantial impact was that written by the Russian critic Valentina Ivashova, *al-Thawra al-Tuknūlūjiyya wal-'Adab* (1985) (*The Technological Revolution and Literature*). He dealt with the immense progress in science and technology in different fields and its impact on literature. In addition, its author discussed the tendencies of many writers to deal with the most modern scientific developments and the predictions that anticipated these developments.

At the end of the 1950s and at the beginning of the 1960s, books and papers in Arabic that dealt with the industrial-technological revolution and space began appearing. These increased Arab readers' awareness of SF significantly. Albeit these books focused on science and not literature, they still mentioned science fiction books and the most important SF writers, and included summaries of the most famous Western novels as well as discussions related to the mutual relations between SF and the technological revolution. Thus, for example, Muḥammad 'Awaḍ' Allāh, in the book *al-Faḍā' wa-Shuḥub* (1973) (*Space and the Comets*), discussed the relations existing between scientific facts and literature and the writers that take scientific facts and weave them into a literary story.

SF literature itself also entered the literary polysystem of Arabic literature by virtue of Arab writers who had scientific knowledge about space and supernatural phenomena. These people were involved in translating Western

SF books and stories. Later, these same writers began creating original SF literature. Among these are: Ra'ūf Waṣfī, Maḥmūd Muṣṭafā and 'Anīs Maṣṣūr. The series, 'Aghrab min al-Khayāl' (*Stranger than What You Could Imagine*), (five volumes) by Rājī 'Ināyat, was the one that succeeded more than any other in making Arabic readers aware of important and modern developments in the field of SF such as miracles, supernatural phenomena, space, theories of time, other civilizations, electronic brains and other essential subjects in SF (see, e.g., 'Ināyat, 1980; 'Ināyat, 1983; 'Ināyat, 1984).

We cannot explain the development of this literature in Arabic without discussing the influence of the features of the period and the changes that occurred in it. Arab researchers agree that the spread of SF literature ensued as a result of the technological progress that reached the urban areas during this period and following the industrial-technological revolution when atomic science and study of space abounded. Further, the application of a number of revolutionary discoveries such as the existence of inherited genes also contributed to the impact of SF literature.

#### **The translation enterprise:-**

Translations of Western SF books, short stories etc. were a critical feature in the introduction of the genre into Arabic literature. The translation enterprise of Western SF began in the 1940s. It can be classified into four types:

#### **Translations of short stories:-**

At the beginning of the 1960s, short SF stories written by the most important Western writers were translated into Arabic. The translations appeared in Egyptian magazines such as *al-Hilāl*, 'Ibdā', *al-Fikr al-Mu'āṣir*, *al-Qāhira*, *al-Jadīd*, Kuwaiti magazines such as 'Ālam al-Fikr and *al-'Arabī*, and Lebanese magazines such as *al-'Adīb* and *al-'Ādāb*. The stories of Arthur C. Clarke, Isaac Asimov, Ray Bradbury, Damon Knight, H. G. Wells, Varlin Strongin, Bertram Schindler and others were translated. An examination of the Arabic text, however, shows that some translations were very far from being faithful to the original and that they omitted sentences and even full paragraphs (see, e.g., Asimov, 1978; Bradbury, 1986).

#### **Translations of novels:-**

From the beginning of the 1940s, SF novels were translated into Arabic. The first novels to be translated were two of H. G. Wells' books, *The Invisible Man*, which was translated and published in 1940 in Egypt, and *The Food of Gods and How It Came to Earth*, which was translated and published in 1947, also in Egypt (Wells, 1940; Wells, 1947). The latter translation was reprinted in Damascus in 2001. Another famous and important novel that was also translated for the first time in 1956 was George Orwell's *Nineteen Eighty-Four*, which was actually translated and published six times in the Arab world by six different publishers. Other novels that were translated were those of Arthur C. Clarke, Karel Čapek, Aldous Huxley etc. The translation enterprise continues today. Thus, for example, Clarke's *Rendezvous with Rama* was published in Cairo in 2010.

In parallel, articles and papers appeared in newspapers and journals that dealt with translated novels and other Western literary works. For example, there were papers that discussed and reviewed the novels of Kurt Vonnegut, *Player Piano*, *Cat's Cradle*, and *God Bless You, Mr. Rosewater*, of Roger Zelazny, *This Immortal*, of Ray Bradbury, *Fahrenheit 451*, of Anthony Burgess, *A Clockwork Orange* and *Earthly Powers*, and others, were published.

#### **Translations of scientific books and papers:-**

Another element that had a significant role in bringing SF literature into the world of Arabic readers was the translations of papers, research studies and books dealing with this literature, how it emerged, and central schools of thought and writers. Through these studies, Arabic readers became cognizant of the growth and development of SF and to associate SF with the scientific-technological revolution. Likewise, with the exposure to some Western writers and their work, Arabic readers learned about the subjects and content of SF literature and its place in the literary system.

*The Strength to Dream: Literature and Imagination* (1962) by Colin Wilson is believed to be the first book to be translated into Arabic and it had enormous impact on the entry and diffusion of SF into the Arab world. The first translation of the book appeared in 1966 and was followed by four other editions, the last one in 1981 (Wilson, 1966). Other books that were translated into Arabic and that also had great influence were *Histoire de Roman Moderne* (1962) by René Marill Albérès, translated in 1978, and *La Science-fiction* (1983) by Jean Gattégno, translated in 1990. Translation of books dealing with SF continues today. Thus, in 2011, *Science Fiction and*

*Philosophy: From Time Travel to Superintelligence* edited by Susan Schneider (2009), was translated in Egypt (Schneider, 2011).

In addition, in the 1980s, scientific papers by top Western critics were translated and published. For example: Robert Scholes, *The Roots of Science Fiction* (1976); Darko Suvin, *On the Poetics of Science Fiction* (1976); Mark R. Hillegas, *The Literary Background to Science Fiction* (1979).

These papers were published in Egypt in the journal *al-Fikr al-Mu'āṣir, al-Qāhira, al-Jadīd*. They discussed SF literature, and through them, Arabic readers were exposed to topics such as the history and development of the genre, the link between the genre and the scientific-technological revolution and astrophysics and the relation with other genres such as fantasy, utopia, and life on other planets. Further, these papers also mentioned SF writers and books and included abstracts of famous Western novels (see, e.g., Hillegas, 1980; Scholes, 1986).

A close look at Arabic journals today will show that they are still publishing translated articles dealing with SF. For example, in 2007, *Fuṣūl* (71), an Egyptian periodical, published three papers by Veronica Hollinger, Istavan Csicsery-Ronay Jr. and Donald M. Hassler.

#### **Anthology translations:-**

Another factor that helped introduce SF into the world of Arabic readers was the translation of anthologies that included pieces by Western SF writers and examples of their work. The first anthology to be translated was one edited by Edward Morgan Forster, which was translated in 1961, in Cairo. The second such book was an anthology edited by Robert Silverberg, which was translated in 1986, also in Cairo. This anthology included nine short SF stories that won the Nebula Prize and the biographies of the writers of these stories (Forster, 1961; Silverberg, 1986).

#### **Biographies:-**

A pivotal type of text that strongly influenced the entry of SF literature into the Arab world was **biographies**. From the 1960s on, biographies of Western SF authors began appearing in the Arab world, in newspapers and in periodicals. Included among these were biographies of Jules Verne, George Orwell, Aldous Huxley, Ray Bradbury and H. G. Wells, which appeared in journals such as *al-Fikr al-Mu'āṣir, al-Jadīd, 'Ālam al-Fikr, al-'Arabī, al-'Ādāb* and others. Some biographies included short excerpts of the subject's writings as well as reviews of their work. Some of these newspapers and periodicals devoted special columns to the subject of SF literature. These often dealt with a certain book that was presented to the reader and whose main subject matter and content were described briefly. Some of these books were translated afterwards into Arabic (see, e.g., Sharīf, 1975; Sharīf, 1976).

#### **The position of SF literature in the Arab world:-**

The 1970s and 1980s were characterized by a gradual shift from being based solely on translated SF to the writing of original texts by Arab authors. An examination of the history of SF shows that this genre, from the moment it emerged, confronted two types of critics. There were critics who called it cheap, popular literature with no value and grouped it with detective novels and non-canonical literature. The second type of critics saw this genre as a form of legitimate literature belonging in the canon and believed that it should be read and critiqued.

The former critics who did not see any redeeming value in SF literature felt that it lacked maturity and reflected an inferior type of writing style. They identified lacuna such as weak and minor plots, underdeveloped characters not delineated sufficiently, a dark and even absurd style, a purposeful appeal to a broad, uneducated public in order to stimulate its senses and imagination and a move away from serious literature and from the noble arts so as to get closer to literature intended to entertain. Other critics, when it first began penetrating the world of Arab literature, also responded negatively. They saw it as a literary genre without value and belonging to the realm of popular literature and detective novels. They even claimed that it was neither scientific nor intellectual. SF novels were accused of not providing enough tools to analyze human behavior and lacking depth and purpose. SF literature was presented, as such, as fit only for entertainment purposes, arousal and making money. As a result, it was considered undeserving of serious research and criticism (Farrāj, 1983; Maḥmūd, 1983; Snir, 2000; Qāsim, 1993; 'Abd al-Fattāḥ, 1993).

In contrast, the latter group of critics (Sharīf, 1983; al-'Ānī, 1986; 'Abd al-Malik, 1989), described SF as a literary-artistic art form having a universal value that makes it worthy of being related to and seriously evaluated in the same

way that other literature is treated. The assertions of this group of critics were based on the premise that SF has within it a way of thinking that is likely to help humankind solve many of its problems. SF was presented, accordingly, as a literary genre dealing with a number of human issues and that satisfactorily realizes the hopes and aspiration of humankind. Further, it demonstrates the existence of an advanced society, is a means for teaching children and youth values, develops one's imagination, thinking and ability to draw conclusions, and is a warning and a prognosticator of might happen in the future. The position of SF devotees and those who recognized its value has, in the past few years, been supported and accepted by critics and literary agents by virtue of the increase in the number of writers and readers of SF as well as in the number of research studies and papers that have been published on the subject and that included criticism and evaluation.

When it first entered the Arabic literary polysystem, SF was met by disregard on the part of the official establishment and critics. Most research into Arabic linguistics that dealt with Arabic literature ignored the existence of Arabic SF literature. Most anthologies of the world's best SF stories that were published snubbed this literary genre in the Arab world and did not mention Arabic SF authors or give examples of their work (see, e.g., Aldiss & Lundwall, 1986; Asimov et al. 1985 ; Broderick & Di Filippo, 2015; Pringle, 1985).

In the official cultural institutions of the Arab world, the perception that asserts that SF is a type of **cultural invasion** by Western culture predominated and still holds sway today. Critics maintain that this cultural invasion has three main objectives: 1. To undermine the foundations of the Islamic nation and its language; 2. To enable Western culture to supplant Arabic culture; and 3. To prevent the Arab world from rebuilding its real self by ensuring it remains subservient (Snir, 2000).

Despite the scorn heaped on SF literature and the disregard of the critics from the official cultural institutions, we can discern a change in the last few years, which is being expressed by a new tone of respect and esteem SF literature and recognition of it as a serious literary genre worthy of the attention of artists and critics. The official establishment has begun, even if only slowly, to recognize this literary genre as meriting consideration and evaluation as given to other literary genres. Thus, for example, we can find academic research and university papers that discuss this literary genre.

#### Examples:-

- ❖ We can find studies and papers on the subject in the Egyptian journal *'Ibdā'* and *Fuṣūl* (see, e.g., al-'Abid, 2007; 'Abdullāh, 1989; al-Jayyār, 1984; al-Jayyār, 1987; Muṣṭafā, 2007 ).
- ❖ The Syrian journal, *Majallat al-khayāl al-'ilmī* (*The Science Fiction Journal*), has been in print since 2008. It publishes, in addition to SF papers, papers on other topics such as space, physics, chemistry, natural science and more.
- ❖ In 2001, a doctoral dissertation at Cairo University.
- ❖ In 2007, a doctoral dissertation at the University of Haifa.
- ❖ In 2008, a graduate thesis at Damascus University in Syria.
- ❖ In 2011, a doctoral dissertation at Georgetown University, Washington, DC, USA (Boutz, 2011).
- ❖ In 2007, the publication of the book, *al-Khayāl al-'ilmī wa-Tanmiyat al-'Ibdā'* (*Science Fiction and the Development of Creation*) ('Abū Qūra & Salāmi, 2009).
- ❖ In 2009, the publication of the book, *Tanmiyat al-Taḥkīr al-'Ibdā' ī Fī al-'Ulūm wal-Riyāḍiyyāt bi-'Istikhdam al-Khayāl al-'ilmī* (*Development of the Work in Sciences and Mathematics through Science Fiction*) (Shawāhīn, et al. 2009).
- ❖ Since 1986, six books in Arabic that discussed the development of SF in the Arab world have been published (see, e.g., al-Tallāwī, 1990; al-Shārūnī, 2000).
- ❖ At the end of the 1990s, in Egypt, the publication of two series of books aimed at children and adolescents.
- ❖ Similarly, we are witnessing a steady increase in the number of writers and readers in the Arab world. For example, in Egypt, we have writers in Arabic such as Ṣabrī Mūsā, Ra'ūf Waṣṣfī, Nihād Sharīf, Muṣṭafā Maḥmūd, in Syria Ṭālib'imrān, Līnā Kīlānī, Diyāb 'īd, in Tunisia al-Hādī Thābit, in Algeria Muḥammad Dhīb, in Morocco Muḥammad al-Ḥabābī, 'Aḥmad al-Biqālī, in Kuwait al-Ṭība 'Ibrāhīm, and in Lebanon Qāsim Qāsim.
- ❖ We are also seeing Arab authors writing in foreign languages; for example:
- ❖ Ebnou, Moussa Ould. (1990). *L'Amour Impossible*. Paris: Éditions L'Harmattan.
- ❖ Ebnou, Moussa Ould. (1994). *Barzakh*. Paris: Éditions L'Harmattan.
- ❖ In addition, we can find books and papers in foreign languages that discuss SF in the Arab world; for example:

- ❖ Barbaro, Ada. (2013) *La fantascienza nella letteratura araba*. Collana: Lingue e Letterature Carocci.
- ❖ Snir, Reuven. (2000). The emergence of science fiction in Arabic literature. *Der Islam*, 77(2), 263-285.
- ❖ Snir, Reuven. (2002). Science fiction in Arabic literature: Translation, adaptation, original writing and canonization. *Arabic Language & Literature*, 2, 209-229.
- ❖ Qader, Nasrin. (2002). Fictional testimonies or testimonial fictions: Moussa Ould Ebnou's Barzakh. *Research in African Literatures*, 33 (3), 14-31.
- ❖ Nuruddin, Yusuf. (2006). Ancient black astronauts and extraterrestrial Jihads: Islamic science fiction as urban mythology. *Socialism and Democracy*, 20(3), 127-165.

#### Conferences focusing on SF, its development and position, are also being held; for example:-

- The 1<sup>st</sup> Science Fiction Conference in the Arab World, Damascus, 2007.
- Science Fiction and Islam Conference, Boston, 2012.
- Science Fiction Conference, Morocco, 2012.
- Science Fiction Conference, London, 2013.

#### Summary:-

SF is a literary genre concerned with describing fictional futuristic stories in the fields of science, technology, genetic engineering, time travel, life on other planets, encounters with extraterrestrials and their implications for the future of humankind.

SF literature appeared in Arabic at the beginning of the 1940s through translations of Western SF literature. It simultaneously drew from classical and folk Arab literature for its inspiration. Some Arab critics and literary researchers viewed it as non-canonical literature, cheap, popular and worthless, while others saw in it canonical literature deserving consideration and research.

In the last few years, we can discern that SF literature has begun to establish its position in the Arabic literary polysystem. Thus, for example, we can find studies, articles and academic papers that discuss this genre and an increase in the number of writers and readers and serious conferences being held about this genre.

#### Abstract

**Background:** Sickle Cell Anemia (SCA) is a chronic inherited form of haemolytic anemias. The estimated prevalence of SCA trait carriers in Saudi Arabia is 4.2%. Patients manifest with frequent infections and recurrent Vaso-Occlusive Crisis (VOC). Hydroxy Urea (HU) is used to modulate the severity of SCA phenotype, and for treating painful VOCs. This study aims to explore the perceptions of SCA patients on HU, and other clinical and biomedical manifestations.

**Methods:** A prospective comparative study, conducted in Jeddah. Patients were classified into two groups; (10) patients in the study group on HU, and (8) others in the control group on other treatments.

**Results:** The study included (18) patients, (12) females and (6) males, aged between (8-36) years. While the group on HU had slightly lower Hb levels ( $7.95 \pm 1.3$  Vs  $8.44 \pm 1.3$ ), the controls had lower MCV levels. Platelets, Reticulocytes and WBCs were lower for the HU group. Except for Alkaline Phosphatase (ALP), liver function indices were higher for the study group. A significant association was detected between low ALP and using HU. Six patients on HU said: "they felt better after using HU", and felt that "their need for blood transfusions decreased after using HU". Patients noticed a decrease in admissions after using HU, and the average number of admissions was (3) per patient.

**Conclusion:** Patients on HU experienced some improvement, some stability of their hematologic parameters, and reduced hospitalization. More studies should be conducted to understand the benefits and risks of HU use in SCA patients.

#### Introduction:-

Sickle Cell Anemia (SCA) is a chronic inherited form of haemolytic anemias. The abnormal form of Haemoglobin (i.e. HbS) polymerize Red Blood Cells (RBCs) into the deformed characteristic sickle shape, leading to functional disturbances and hemolysis. <sup>(1-3)</sup> SCA is a recognized global burden world-wide. It is particularly common in Sub-Saharan Africa, South and Central America, southeast Asia and the Mediterranean countries. <sup>(4-7)</sup> The Saudi National Premarital Screening Program estimated the prevalence of sickle cell trait carriers to be (4.2%), with (0.26%) of the screened population already suffering from sickle cell disease, <sup>(8-9)</sup> with higher rates in some regions. <sup>(10)</sup> In Saudi Arabia, SCA is more prevalent in the Eastern, Western, and Southwestern provinces.

SCA is attributed to many serious complications such as strokes, retinopathies, priapism, splenic infarctions, renal and hepatic failures, pulmonary hypertension, and acute chest syndrome. <sup>(11-12)</sup> Patients usually manifest with chronic haemolysis, frequent infections and recurrent Vaso-Occlusive crisis (VOC). The latter is characterized by severe acute pain in the abdomen and /or extremities, and can result in organ damage as result of progressive vasculopathy and acute infarctions. <sup>(13-15)</sup>

The treatment of SCA can vary between countries according to the available resources and disease prevalence. Treatment options include rehydration and blood transfusion to correct anemia, vaccinations and prophylactic antibiotics to reduce and prevent infections, as well as pain management to reduce the burden of painful crisis and improve the functioning abilities of patients. <sup>(16-18)</sup> Hydroxy Urea (HU) is a urea analogue which inhibits DNA synthesis in the S-phase of cell cycle. <sup>(19)</sup> It is used to modulate the severity of SCA phenotype, and for the treatment of painful crisis. The benefits of HU in sickle cell disease were evaluated in a number of studies, some of which facilitate the wider use of HU, and others highlighted some of its adverse effects. <sup>(20-25)</sup>

Although the condition is widely prevalent in Saudi Arabia, research around SCA management and the use of HU remains limited. In this study, we explore the perception of SCA patients admitted with VOC on the use of HU, and any accompanying clinical or biomedical changes.

### **Materials and Methods:-**

This prospective comparative study was conducted at King Abdulaziz University Hospital (KAUH) in Jeddah, in the western region of Saudi Arabia. Ethical approval was obtained from the Ethical and Technical Committee at KAUH, along with all other administrative approvals. We recruited patients over a one year period, starting June 2011 to May 2012, and targeted known SCA patients who were admitted to KAUH for the management of VOC. Prior to participation in this study, informed consent was obtained from adult patients, and from the guardians when children were involved.

### **Patient Characteristics:-**

The study's population consisted of SCA patients admitted suffering from an acute VOC. As per the diagnostic protocol followed by Department of Haematology at KAUH, patients in VOC are those experiencing an episode of acute pain in the abdomen and/or extremities, with other signs of increased or exacerbated hemolysis. In order to assess patients' condition, including disease phenotype and severity, the following investigations are requested at the time of admission; Complete Blood Count (CBC), Blood Film (BF), Haemoglobin Electrophoresis (HbE), Sickle Solubility test, Liver Function Tests (LFTs) including serum bilirubin, and Renal Function Test (RFTs) namely serum creatinine. Patients were invited to participate in the study irrespective of their age, gender, previous history or current treatment regimen. The latter is often decided by the attending hematologist after discussing treatment options with the patient.

Eighteen patients were recruited, and all were known to carry the Hb (SS) phenotype. According to the treatment used patients were classified into two groups; a study group and a control group. The study group included (10) patients, all were on an escalating dose of HU starting at 10 mg/kg/dose, and up to 35 mg/kg/dose. The remaining (8) patients were enrolled in the control group, and were prescribed other treatments.

### **Data collection:-**

In order to use the most appropriate tool, a literature search was undertaken in the search of relevant questionnaires. We've considered studies focusing on: (a) the prevalence of HU use in a country or region; (b) the indications, age group, dosing and regimen, route of drug administration, maximum tolerated dose, minimum effective dose and (c) monitoring for efficacy and side effects. We compared these tools against each other, and to our study's objectives. We developed a questionnaire that was tested and validated prior to data collection. The questionnaire was designed to collect the following information: date of birth, nationality, number of VOCs, hospital admissions and blood transfusions, and for those on HU, their perceptions on their appreciated health, their compliance, and any side effects (including: drowsiness, nausea, vomiting and diarrhea, constipation, mucositis, anorexia, stomatitis, bone marrow toxicity and/or infections).

### **Management protocol:-**

Patients in the study group were prescribed HU, while the control group were on different medications including paracetamol, bruffin and folic acid as well. Prior to commencing treatment, patients were oriented on the adverse

effects of HU and its monitoring protocol. All female patients within reproductive age were advised against pregnancy, and were strongly advised to use suitable contraceptives during the trial period. All male subjects were counselled regarding the effects of HU on spermatogenesis, and when feasible sperm cryopreservation was recommended before commencing the HU treatment. All patients received the recommended vaccines, including Haemophilus Influenza, Neisseria meningitis, Hepatitis B and influenza, and were on penicillin prophylaxis.

For the study group: all (10) patients were started initially on an oral, daily, (10) mg/kg dose of HU. This dose was increased at a rate of (5) mg/kg/week, as long as the hematologic indices remained within acceptable range, and given that the patient showed no evidence of adverse effects. The maximum dose of HU reached per patient was between (25) to (35) mg/kg/day. All patients remained on HU for six to nine months, and was only discontinued when adverse events were reported, the latter included symptoms such as hair loss, gastrointestinal upset and rash, or disturbance of their blood indices; Hb drop to (6) g/dl, platelet count <80,000 or a neutrophil count <2,500. Regarding monitoring, patients' hematological profile including Hb, Fetal Hemoglobin (HbF), MCV levels, neutrophil and platelet counts were measured every two weeks in the first month, and then once per month until the end of the study period. Moreover, features of organ damage were monitored by assessing several parameters, including but not limited to: LFTs (liver damage); creatinine levels (chronic renal failure); pitted red cells (spleen damage); transfer factor (chronic sickle lung disease); intelligence quotient (IQ) and changes in neuro-psychometric tests (neurological damage), Priapism, leg ulcers and any other appreciated toxicity or adverse effects.

#### **Statistical analysis:-**

Data were analyzed using a standard IBM Statistical Package for Social Sciences (SPSS) version 19.0; SPSS, Inc., Chicago S. Descriptive analysis was used to summarize patient characteristics in frequencies and percentages for categorical variables, while continuous variables were presented by means and standard deviations (SD). The student *t-test* was used to compare statistical differences between the two group. A p value below ( $P < 0.05$ ) was considered statically significant.

#### **Results:-**

The study included (18) diagnosed SCA patients, (12) females and (6) males. Their ages ranged between (8 – 36) years, and with a mean age of (29) years. Patients were randomly assigned into two groups, a study group including (10) patients, and the remaining (8) were enrolled in the control group. The following parameters were measured and compared for the two groups:

#### **Hematological Profile:-**

Regarding their hematological profile, those on HU reported slightly lower Hb levels when compared to the controls ( $7.95 \pm 1.3$  Vs  $8.44 \pm 1.3$ ), yet they had higher MCV levels ( $88.25 \pm 14.3$  Vs  $78.78 \pm 12.77$ ). (**Table 1**) Platelets, Reticulocytes and WBCs were all lower for the study group. A significant difference was detected between the two groups, suggesting an association between being on HU and having lower hematological indices. ( $P < 0.001$ ) (**Table 1**)

#### **Measures of organ damage:-**

Except for Alkaline Phosphatase (ALP) levels, all other liver function indices, including total protein, albumin, serum bilirubin and other enzymes' levels, were found higher for the study group. (**Table 2**) When tested, no significant difference was detected. However, a significant association was found between low ALP and using HU. Serum creatinine levels were ( $41.79 \pm 11.37$ ) for SCA patients on HU, and ( $35.75 \pm 9.37$ ) in the SCA patients not taking HU. Elevated serum creatinine levels was strongly associated with the use of HU. ( $P < 0.001$ ). (**Table 2**) All other monitored parameters showed no differences between the two groups.

#### **Self-assessment of HU use:-**

We investigated in depth patients' perceptions on HU, and asked the study group to self-assess their management. Regarding compliance, Patients were asked to describe their use of HU, exactly as prescribed by their attending hematologist. We asked them to choose between "seldom", "sometimes" and a "regular" use. A majority of (6) patients (60%) reported regular use, while (2) described their use to be "sometimes" and the last (2) as "seldom". In order to assess the effects of HU, Patients were also asked to describe how they felt after using HU. Again 6 (60%) of patients who took HU said that: "they did feel better after using HU", while the other (4) patients (40%) said "they did not". (**Figure 1.A**) This was again reflected when patients were asked to estimate their need for blood transfusions while using UH. They chose between "much less need", "less need", "the same need" or "the need for

more transfusions”, and (60%) of patients expressed that their need for blood transfusions has improved, and became less after using HU. (Figure 1.B)

We recorded the number of admissions for major care of each patient during the last six months. All patients acknowledged to notice a decrease in the number of admissions, specifically in the number of VOC they had experienced while being on HU. In fact, out of the total patients in the study group, (4) were never admitted during the study period. The remaining (6) were admitted for different reasons, with an average of (3) admissions/patient. Only few patients reported scattered side effects including minimal bleeding, hair loss, and gastrointestinal symptoms.

### Discussion:-

This prospective study aimed to assess the usefulness of HU in the management of SCA patients, along with patients’ perceptions on HU. One limitation that should be acknowledged is the few number of patients recruited during the short study period. As HU is widely known among our community as an anti-cancerous agent, used solely by cancer patients, many patients refused to join this study. Moreover, within the recruited group some patients were noncompliant to HU dose, after appreciating some unwanted side effects, and this might have affected their perceptions on HU.

Comparing the two groups above, most patients on HU admitted to feel better after using it, yet some of their hematological indices were slightly lower than the controls. Although Hb levels were lower in the group using HU, their MCV levels were higher, all the remaining parameters were decreased and the latter was found associated with the HU treatment. These results correspond to reports from other international groups, one example is a clinical trial in Belgium among pediatric SCA patients. <sup>(26)</sup> In the latter study, those on HU also had higher MCV levels and lower reticulocytes and WBCs counts. <sup>(26)</sup> Similar results were also reported from the HUSOFT trail among infants, in order to explore HU toxicity. <sup>(23)</sup> Unlike our group, infants on HU showed increased levels of Hb, Fetal hemoglobin, but again being on HU was found associated with decreased reticulocytes, WBCs, and platelets counts. <sup>(23)</sup>

Regarding measures of organ damage, elevated serum creatinine was associated with the use of HU in our sample, yet the effects of HU on renal function remains controversial as reported by other studies. <sup>(24)</sup> On the other hand, proteins levels and liver enzymes were found slightly higher in the study group, but we did not find any significant difference between the two groups, and accordingly we could not attribute these changes to HU. Despite the latter, decreased ALP levels were found associated with the use of HU, and since several globally working guidelines recognize ALP as the prime marker to increase during sickle cell crises, <sup>(27)</sup> it is rational to assume that ALP decreased levels in our study group can indicate a decrease in VOCs experienced by these patients.

The latter was further augmented when we questioned patients about their admissions for major care. Four patients were never admitted during the study period, and the rest had an average number of (3) admissions per patient, the latter was considered an improvement by the patients themselves. These matched findings of other studies. The number of admissions was significantly reduced in patients using HU in the Belgian study, <sup>(26)</sup> the “BABY HUG” trail, <sup>(24,28)</sup> and in a nine-year follow up study. In fact, the latter concluded that their patients on HU were of less morbidity and mortality because of elevated HbF levels and less frequent VOCs. <sup>(29)</sup> Clinical improvements associated with HU were also related to the decreased need for blood transfusions. Most patients described their need for blood transfusions to be “less”, and although blood transfusion remains superior to the use of HU in SCA management, more local studies must be conducted to weigh HU use in the management of SCA patients against the other measures.

Despite the self-appreciated improvements among our study group, adverse events were still reported during this relatively short study period, and this highlighted the importance of monitoring patients while on HU. There is a limited number of studies which focused specifically on HU use in Saudi Arabia, studying both its benefits and risks. There is also an apparent absence of updated local guidelines governing the use of this drug among SCA patients. More context-based, age-disaggregated studies are needed to answer similar questions, inform policies and regulate the use of HU.

**Table (1):- Hematological profile of patients**

Characteristics	Study Group (on HU)	Control Group	P-Value
Hb (g/dL)	7.95 ± 1.3	8.44 ± 1.3	0.018
MCV	88.25 ± 14.3	78.78 ± 12.77	<0.001
Platelet	407 ± 155	478.34 ± 177	<0.001
Reticulocytes	0.21 ± 0.75	0.22 ± .110	---
WBC	12.20 ± 3.861	18.15 ± 8.799	<0.001

**Table (2):- Measures of Organ Damage**

Parameter	Study Group (on HU)	Control Group	P-Value
Total Protein	78.17 ± 5.661	75.08 ± 6.803	---
Serum Albumin	37.41 ± 3.51	35.80 ± 7.72	---
Bilirubin	51.59 ± 52.49	44.34 ± 31.62	---
ALT	57.70 ± 35.90	48.03 ± 23.00	---
ALP	121.36 ± 52.15	204.56 ± 24.88	<0.001
AST	53.61 ± 26.51	49.48 ± 21.94	---
Gamma-GGT (GGT)	55.75 ± 32.850	53.71 ± 45.627	---
Serum Creatinine	41.79 ± 11.37	35.74 ± 9.37	<0.001

**Figure (1):- Patients’ perceptions on the use of HU:**

**Conclusion:-**

HU use in SCA cases presenting with VOC was associated with appreciated improvement, stability of hematologic parameters, and reduced hospitalization. More studies should be conducted to understand the benefits and risks of HU use among local SCA patients.

#### Abstract

**Introduction:** Ramadan is the ninth month of the Muslim calendar and the daylight fasting that accompanies it is one of the five pillars of Islam. Fasting during Ramadan is obligatory for all healthy adult Muslims, although exemptions exist for people with serious medical conditions, elderly, and children.

**Method:** This cross-sectional survey study was done during a period from 10 June to 1 December 2016, A questionnaire design in Arabic language (national language of KSA) was distributed among eastern regions Saudi population through social media (as Facebook, twitter and what's up). A total of 110 participants (known case of DM = 39, healthy = 71), aged from 15-60 years.

**Result:** One hundred ten (110) participants shared in our study. Their mean age was 30 SD that ranges from 20-60 years. They were classified according to age into 3 age group. Group 1 (younger than 20 years) group 2 (20-40yrs) group 3 (older than 40yrs). Most of them was healthy, only 39 participants was affected by DM. They were subdivided according to their level of Education and knowledge about DM into have enough information and don't have enough information.

**Discussion:** In this study, we are interested to evaluate the role of health-care educator during Ramadan, include Campaigns, social media, medical staff in the Saudi population specifically the population of eastern region.. In 2015, the number of people living with diabetes globally was estimated to be 415 million, with a 55% rise expected by 2040 [2]. The number of patients with diabetes in the Middle East and Africa – a region where a high proportion of inhabitants are Muslim – is predicted to more than double by 2040. A similar increase is expected in South East Asia, another area where Islam predominates (2).

**Introduction:-**

Ramadan is the ninth month of the Muslim calendar and the daylight fasting that accompanies it is one of the five pillars of Islam. Fasting during Ramadan is obligatory for all healthy adult Muslims, although exemptions exist for people with serious medical conditions, elderly, and children.

Pre-Ramadan education provides a base to diabetic patients about the importance of diet and exercise, and that regular glucose monitoring is essential to avoid complications..

Education of medical staff, including physicians, nurses and pharmacist, is also needed..

However, Ramadan can result in an extra burden of calories. After, the meal taken when the fast is broken at sunset often turns into a celebration, with huge volumes of food laden with sugar and carbohydrates. Regional variations exist in the timings of meals during Ramadan and physicians need to understand regional and cultural differences to advise the patient accordingly (1).

Because of the metabolic nature of the disease, patients with diabetes are at particular risk of complications from marked changes in food and fluid intake (1). Potential health hazards include hypoglycemia, hyperglycemia, dehydration and acute metabolic complications such as diabetic ketoacidosis DKA (11).

Fasting during Ramadan may provide enduring benefits. Indeed, Ramadan can provide an opportunity for a better lifestyle, facilitating weight loss and smoking cessation (12).

Most diabetic patients prefer fasting during Ramadan to earn the reward of Allah..It's also a good time to control blood sugar and loss weight.

The month of Ramadan can precipitate dramatic changes in meal schedule, sleep patterns and circadian rhythms (1).even though that fasting Muslims tend to avoid consulting their doctors (13)

Therefore, patients with diabetes, and in particular those with T1DM, should seek medical advice before deciding to proceed with Ramadan fasting (1).

**Objective:-**

in this study Our aim here is to the assessment the role of education programme including Campaigns, social media, text messages and medical staff for diabetic patients during Ramadan about physical activity, meal planning, glucose monitoring, hypoglycemia, dosage and timing of medications.. Education, communication and accessibility are all critical to the success in reduce complication of diabetic patients during Ramadan. With the correct guidance, many people with diabetes can fast safely.

**Method:-**

This cross-sectional survey study was done during a period from 10 June to 1 December 2016, A questionnaire design in Arabic language (national language of KSA) was distributed among eastern regions Saudi population through social media (as Facebook, twitter and what's up). A total of 110 participants (known case of DM = 39, healthy = 71), aged from 15-60 years. Some of the participant were interviewed randomly..The questionnaire included the role of education programme, Campaigns, social media and medical staff for diabetic patients during Ramadan about physical activity, meal planning, glucose monitoring, hypoglycemia, dosage and timing of medications, The questionnaire answered anonymously and in private..

**Result:-**

One hundred ten (110) participants shared in our study. Their mean age was 30 SD that ranges from 20-60 years. They were classified according to age into 3 age group. Group 1 (younger than 20 years) group 2 (20-40years) group 3 (older than 40years)

Most of them was healthy, only 39 participants was affected by DM. They were subdivided according to their level of Education and knowledge about DM into have enough information and don't have enough information.

**Table 1:-** Awareness of the study population about the healthy life style of DM patients during Ramadan and the role of publicize education programme

Age group		N	%
Age group	Under 20	4	3.6
	From 20-40 years	75	68.2
	Above 40 years	28	25.5
1) Are you diabetic?	Yes	39	35.5
	No	71	64.5
2) Do you have enough information about diabetes?	No	39	35.5
	Yes	71	64.5
3) Have you Attended events to raise awareness about diabetes for the month of Ramadan and benefited from their publications?	No	74	67.3
	I don't care	11	10.0
	Yes	25	22.7
4) Have you benefited from social media in dealing with diabetes in Ramadan?	No	50	45.5
	Yes	60	54.5
5) Have you consulted your physician before Ramadan to take advices and instructions and make the required check-ups, if necessary?	No	74	67.3
	Yes	32	29.1
6) Have you prepared a food plan in preparation for the month of Ramadan with your doctor?	No	74	67.3
	Yes	32	29.1
7) Does your family members take into account that you are diabetic when preparing breakfast and Suhoor?	No	56	50.9
	Yes	46	41.8
8) Do you examine diabetic levels several times a day in the month of Ramadan?	Sometimes	29	26.4
	I do not	46	41.8
	I do it	29	26.4

Table 1 demonstrates the sociodemographic distribution of the studied population according to their age. There's a significant difference in the level of education between difference between age group, (20-40) group much more educated than other age groups..

**Table 2:-** shows Chi-Square test of the studied groups age, affection and level of education and awareness about DM

	Df	chi square value	p-value
1. age * Are you diabetic?	3	9.186	<b>0.027</b>
5. age * Have you consulted your physician before Ramadan to take advices and instructions and make the required check-ups, if necessary?	6	12.892	<b>0.045</b>
2. Are you diabetic? * Have you Attended events to raise awareness about diabetes for the month of Ramadan and benefited from their publications?	2	24.151	<b>0.000</b>
4. Are you diabetic? * Have you consulted your physician before Ramadan to take advices and instructions and make the required check-ups, if necessary?	2	26.933	<b>0.000</b>
5. Are you diabetic? * Have you prepared a food plan in preparation for the month of Ramadan with your doctor?	2	9.863	<b>0.007</b>
6. Are you diabetic? * Does your family members take into account that you are diabetic when preparing breakfast and Suhoor?	2	5.745	<b>0.057</b>
7. Are you diabetic? * Do you examine diabetic levels several times a day in the month of Ramadan?	3	44.984	<b>0.000</b>
9. Are you diabetic? * Do you know what the best time for exercises in Ramadan is?	3	11.945	<b>0.008</b>
10. Are you diabetic? * Do you think that the Tarawih prayers are useful for diabetics?	3	22.815	<b>0.000</b>
14. Are you diabetic? * In your opinion, what is the best way to increase the awareness of the community about diabetes?	6	17.159	<b>0.009</b>

Age is the only parameters that shows significant correlation P value.

Table 2 shows the role of publicize education programme that increase awareness Including campaigns, posters in public places such as local libraries, supermarkets, mosques and community centers , social media and medical staff to decrease complication of fasting in DM patients. An evaluation of result revealed poor levels of knowledge as the majority of respondent provided the wrong answers. Only one-fourth of study respondents were able to give correct answer about healthy life style of DM patients during Ramadan.. The information and advice that the patients received in that programmes provided additional knowledge for the patients to continue their diabetes self-management and to take responsibility for their care beyond the month of the Ramadan fast.

Regarding the role of education programme, 22%of the patients had attended structured education previously. 67% didn't attend..

54% use social media and have benefit from programme about DM , 45%don't use it . Regarding the medical staff ,29% manage their healthy lifestyle during Ramadan with their doctor ,67% don't do it ..

Table 2 shows the awareness level of the studied population to risk factors, recommendation and management of complication during fasting.

Structured diabetes counseling before Ramadan includes educating patients, health care providers, and patient's families.. provide education for the patients and families to get ready for change lifestyle pattern during Ramadan,41% of family take care to prepare of healthy diet for their DM patients during Ramadan ,while 50% ignore that issue..

Counseling has to be provided by the health care provider to the patient to prevent complication, So that patients welcome to fast Ramadan in stable and healthy regimen..29% of patient's take advise from their doctor before Ramadan , while 67% ignore that issue..

The misconceptions were in relation to physical activity during fasting (27%) .

Blood glucose monitoring was done by 26% of participants, were they regularly monitoring their blood glucose at home by Self-Monitoring of Blood Glucose..

Symptoms of feeling of hypoglycemia was correctly answered by 83% of subjects..

### **Discussion:-**

In this study, we are interested to evaluate the role of health-care educator during Ramadan, include Campaigns, social media , medical staff in the Saudi population specifically the population of eastern region.. In 2015, the number of people living with diabetes globally was estimated to be 415 million, with a 55% rise expected by 2040 [2]. The number of patients with diabetes in the Middle East and Africa – a region where a high proportion of inhabitants are Muslim – is predicted to more than double by 2040. A similar increase is expected in South East Asia, another area where Islam predominates (2). Most Muslim majority countries are in less-developed regions of the world, and developing countries are disproportionately affected by diabetes [2,3,4]. Therefore, Ramadan has a major impact on the management of diabetes in the Muslim population..

Fasting during Ramadan has a number of physiological effects on both homeostatic and endocrine processes. In patients with diabetes, these changes and the type of medication being taken to treat the condition can be associated with the development of complications such as hypoglycemia and hyperglycemia (4).

Fasting with diabetes poses significant risks. Most of the research on fasting and diabetes surrounds Ramadan, the annual Islamic observance that requires fasting from sunrise to sundown for 29 or 30 days. A commentary published in 2010 in Diabetes Care developed in collaboration with the American Diabetes Association (ADA) focused on fasting during Ramadan, though many of the issues it raises are relevant to other types of fasting as well. It says that “most often, the medical recommendation will be not to undertake fasting” if you have diabetes..

A study that include 110 participants , found that 71 percent of people with have enough information about diabetes mellitus and 39 percent of people don't have enough information .

"Anybody with diabetes needs to first talk to their doctor about going on a fast," says Early, and some experts recommend a pre-fasting medical assessment to help ensure safety include medication, nutrition, and hydration into account 32 percent of people Carried it, while 74 percent So neglected.. Educational campaigns that target the general public should aim to raise awareness of the issues and misconceptions that surround diabetes and Ramadan fasting and emphasize the importance of maintaining good diabetes management during fasting. In addition to medical advice, religious regulations should be included (1)

Between 61.4 and 92.9% of healthcare professionals felt that people with diabetes needed to improve various self-management activities; glucose monitoring (range, 29.3-92.1%) had the biggest country difference, with a between-country variance of 20%(10).. It is also of educational value as it provides patients with feedback on the effect of lifestyle changes such as food and exercise on glucose control (3). Regularly monitoring blood glucose during fasting is key to avoiding health emergencies, 29 % of people did it regularly, while 46% of people didn't do it at all, 29% of people did it at sometimes.

It is worth reemphasizing that fasting for patients with diabetes represents an important personal decision that should be made in light of guidelines for religious exemptions and after careful consideration of the associated risks following sample discussion with the treating physician. Most often , the recommendation will be to not undertake fasting. However, patients who insist on fasting need to be aware of the associated risks and be ready to adhere to the recommendations of their health care providers to achieve a safer fasting experience. Patients may be at higher or lower risk for fasting-related complications depending on the number and extent of their risk factors .

During Ramadan, there is a dramatic change in dietary patterns for fasting Muslims compared with other months of the year. Health issues may arise due to improper eating habits and reduced physical activity (5)

The diet during Ramadan should not differ significantly from a healthy and balanced diet. It should aim at maintaining a constant body mass. In that study, 46% of individuals who fast maintain their healthy diet during the month, while 56% of individuals didn't maintain their healthy diet..

Ingesting of large amounts of foods rich in carbohydrate and fat, especially at the sunset meal, should be avoided .

Diabetic patients with regular exercise habits showed a 2.8-fold increased chance of outcome improvement compared with those who did not exercise regularly(6)..Normal levels of physical activity may be maintained 74% of individuals did their exercise after breakfast by one or two hour. However, excessive physical activity may lead to higher risk of hypoglycemia and should be avoided, particularly during the few hours before the sunset meal. If Tarawaih prayer (multiple prayers after the sunset meal) is performed, then it should be Correspond to amount of diet which was consumed . In some patients with poorly controlled type 1 diabetes, exercise may lead to extreme hyperglycemia

### **Strengths & Weakness:-**

KSA is a large country previous studies was concentrated on the capital population. Our study strength points is that this study was carried out in a new region in KSA. And it investigated people awareness about this disease and the role of health care to management of diabetes during Ramadan..

Our weak relative point small sample size, and the way of collecting data by social media can be less accurate. But some of the questionnaire was filled by direct contact with participant..

### **Conclusions:-**

We face an enormous burden of diabetes in the Saudi country, but our understanding of managing diabetes during the month of Ramadan/fasting is still far from perfect

Lifestyle and religious activities can have implications when managing patients with diabetes. During Ramadan, it can be very Difficult for the health professional and the individual to control patient's blood sugar level within accept level and avoid hypoglycemia.

Diabetes education helps to overcome certain barriers to diabetes care. Making easy and low cost access to the recommendation in management of diabetic patients during Ramadan is necessary to avoid its complication and to support people with diabetes to fast during Ramadan

With the Diabetes education, including the use of point-of-care (POC) glucose testing, take healthy diet and do regular exercise, readiness to break the fast in case of hypoglycemia resulted in fewer episodes of complications.

Although few recent large scale studies, including randomized trials, have been conducted with diabetes patient, there is need for more well-designed research with appropriate controls

#### Abstract

Effective credible and sustainable internal control system plays an important role in any private business entity; besides ensuring achievement of core objectives achievement of organizations, effective and credible internal control adherence reinforces and improves the confidence of both current and prospective internal and external corporate customers. Therefore, the aim of this paper is to examine, describe and compare in a qualitative way how effective credible and sustainable internal control systems impact on the corporate customer trust, confidence, value and loyalty and to evaluate the effective internal control system's role in institutionalizing management policy in embracing customer value and awareness.

#### Introduction:-

Internal control is a process affected by management and designed to provide reasonable assurance regarding the achievement of objectives in the following categories: Effectiveness and efficiency of operations; Reliability of financial reporting and Compliance with applicable laws and regulations. Effective internal control helps an organization achieve its operations, financial reporting, and compliance objectives. It is a built-in part of the management process (i.e., plan, organize, direct, and control). Internal control keeps an organization on course toward its objectives and the achievement of its mission, and minimizes surprises along the way (International Standard for Auditors – ISA No. 315).

Internal control promotes effectiveness and efficiency of operations, reduces the risk of asset loss, and helps to ensure compliance with laws and regulations as well as ensures the reliability of financial reporting (i.e., all transactions are recorded and that all recorded transactions are real, properly valued, recorded on a timely basis, properly classified, and correctly summarized and posted). According to International Standard for Auditors (ISA 400- Internal Control environment), Internal control can provide only reasonable assurance - not absolute assurance regarding the achievement of an organization's objectives. Effective internal control helps an organization achieve its objectives; it does not ensure success. There are several reasons why internal control cannot provide absolute assurance that objectives will be achieved: cost/benefit realities, collusion among employees, and external events beyond an organization's control.

In his document “Corporate Customers” Michael Munkumba defines customer as closed and open types. Closed customer is “Any person who is buying goods or services for money” and open system approach defines a customer as “All those utilizing an organization’s products and services” (Michael Munkumba, 2010). The first definition has a weakness of looking only at one aspect of customer; the buyer, where as the open system introduces both internal

and external customers with the following implications: Customers have to be categorized as they certainly have different requirements; customers need different ways of managing them and emphasis has to be made on relationship building for both internal and external customers. Organizations on the other hand evaluate themselves by measuring customer, trust, confidence, loyalty and satisfaction with their products or services. As organizations evolve, the measurement of customer satisfaction and the related parameters across the entire organization becomes imperative. The first step is for an organization to implement effective policies that aligned to its objectives for tracking customer trust, confidence, loyalty and satisfaction {Gangdhar (Ganges) Bhardwaj o., [www.Isigma.com/members/Ganges](http://www.Isigma.com/members/Ganges), October 2016}.

Up to 1980s, organizations were more important, their focus was internal, highly centralized and products were designed, refined, honed and then offered to the market – all these are done without consultation by and large with customers (Michael Munkumba, 2001). This focus shifted in a paradigm form when Tom Peters/Walterman and Drucker made very loud noise that woke the world up. The reverberations those noises new no bounds, as a result forced the focus to shift from the internal to external, especially to the customers; (Tom Peters – Liberation Management, 1985 and Thriving on Chaos, 1987).

In the new paradigm, service excellence is imperative for business success and the situation became tops-curved and the business purpose became “create a core customer” and a new slogan was born in the 1980s; *Delight the Customer*. This became a reality because if you are good to your customer, they will keep coming because they like you. If they like you, they will spend more money; if they spend more money you want to treat them better and if you treat them better they will keep coming back.

Customer Value Management was started by Ray Kordupleski in the 1980s and discussed in his book, *Mastering Customer Value Management*. A customer value proposition is a business or marketing statement that describes why a customer should buy a product or use a service. It is specifically targeted towards potential customers rather than other constituent groups such as employees, partners or suppliers. Similar to the unique selling proposition, it is a clearly defined statement that is designed to convince customers that one particular product or service will add more value or better solve a problem than others in its competitive set.

In the February, 2012 issue of the *TIM Review*, the author described customer value and how it is *delivered* to customers (Shanker, 2012). In this article, the focus is on *creating* customer value, particularly in the context of businesses that generate revenue using open sources assets. From a marketing theory perspective, customer value refers to customers’ perceptions of what they receive, in return for what they sacrifice (Zeithaml, 1988). There are two aspects to customer value: desired value and perceived value (Woodruff, 1997). Desired value refers to what a customer desires in a product or service. Perceived value is the benefit a customer believes he or she received from a product after it was purchased. Customer value propositions are formulated by assessing the current market offerings, identifying what customers want, and then developing solutions that meet the market need for a product or service (Anderson et al., 2006).

An effective control environment must incorporate the following principles: 1) Integrity and ethical values, 2) Commitment and competence, 3) Attention and oversight provided by Board of Directors or audit committee, 4) Management philosophy and operating style, 5) Organizational structure, 6) Manner of assigning authority and responsibility, and 7) Human Resources policies and procedures (ISA 400, Internal Control Environment).

According to International Standard for Auditors No. 400, an effective control environment is an environment where competent people understand their responsibilities, the limits to their authority, and are knowledgeable, mindful, and committed to doing what is right and doing it the right way. They are committed to following an organization's policies and procedures and its ethical and behavioral standards. The control environment encompasses technical competence and ethical commitment; it is an intangible factor that is essential to effective internal control. The central theme of internal control is (1) to identify risks to the achievement of an organization's objectives and (2) to do what is necessary to manage those risks. Another way of saying this is that Risk Assessment is the process of setting objectives; prioritizing and linking those objectives; and identifying, analyzing, and managing risks relevant to achieving those objectives (ISA 315 & 400).

Goal setting is the first component of effective customer confidence. Or trust management. The individuals and team customer service goals should be aligned with the organization’s customer service goals that are established through

carefully crafted organization's procedures and belief. Setting appropriate individual and team standard goals is extremely important for effective customer confidence and trust management. Research has revealed that if goals are too low or too high, the motivation and commitment level of employees become low. (Conellan and Zenke, 1993). Also the research has revealed that; specific hard goals result in higher performance than vague or easy goals, or no goals at all. It further explains that specific hard goals that are accepted by employees result in higher performance than easy goals (Locke and Latham, 1984).

It has been confirmed through relevant research, that feedback regarding individuals past performance does not lead to improved further performance, unless the feedback leads to or is accompanied by a goal for improved performance. In their research on performance session, Locke and Lathan found out that people who are given feedback perform no better than those who receive no feedback. However, when goal setting takes place as a result of the feedback, performance improves.

Locke and Latham, 2012 noted that goals direct individual's thought by means of three major factors: Goals direct a person's thoughts and actions; Goals guarantee energy expenditure, and Hard goals that are accepted by employees increase that employee's performance in achieving the desired goal (Locke and Latham, 2012) When employees or individuals are involved in setting of goals, the chances of accepting the set goals by them increase, even though employees involvement alone does not improve performance. (Locke and Latham, 2012). Customers are found both outside and inside the organization. The employees are internal customers where as those who buy or will buy from the organization are external customers. Providing high quality internal customers (employees) service can improve the ability of an organization to satisfy the external customers. Internal customer service is needed to meet the expectations and requirements for success of those people inside the company so that they can delight customers in the market place; (Azzolini and Sheiiaber, 2000). Organizations with excellent external and poor internal customer services are lucky and often performing on the edge of acceptability.

Asking customers what they want is the most important part of goal setting for customer service standards, both at management level and individual/group level (Connellan and Zemke, 1993). Society is always taken by surprise at any new examples of common sense, (Ralph Waldo Emerson, 2002). The good news is "You have no choice", no organization big or small is secure, (Peters, 2000)

There is a new Platinum Rule outside there: "Do to the customers what they want you do to them and not what you would like to be done to you because wants of customers are never the same", the competition is absolutely cut-throat and it is all time; at the global level, national level, and industrial level. The fight is for the heart and mind of the customer. There is an epidemic disease: quality customer service, any organization that does not catch it will not survive. In the light of this paradigm common sense demand that every organization should put the customer at the centre of all it does, to spend as it were, a day in the life of a customer. (Michael Munkumba. 2002).

Using the Servqual survey mechanism and the resulting matrix, it is possible to evaluate and rate the impact of effective internal control on customer satisfaction and loyalty in private business corporations. **Satisfaction rating: How effective internal control affects customers' satisfaction/confidence** – This was aggregated by question or dimension. Table 2 shows a satisfaction rating gathered within a single question;

**Figure 1:** Table 3 shows a satisfaction rating aggregated from responses to all questions within a single dimension.

**Table 2:-** Sample Satisfaction Rating at the Survey Question Level

Please Rate How Well the Product Met Your Requirements					
Response options (1 = Poor, 5 = Excellent)	1	2	3	4	5
Number of responses	5	0	8	23	22
Percent of responses	8.6	0	13.8	39.7	37.9

**Table 3:-** Sample Satisfaction Rating at the Dimension Level.

Reliability/Satisfaction					
Response options (1 = Poor, 5 = Excellent)	1	2	3	4	5
Number of responses	12	7	11	25	45
Percent of responses	20.7	12.1	19	43.1	77.6

Trust has been a widely studied concept both by itself but, most importantly, as a component of the quality of relationships. In psychology and interpersonal communication, trust has been one of several dimensions identified in relationships. It also has been studied extensively in business management and organizational communication sometimes as a single concept but, again, most often as a component of relationships (Katie Delahaye Paine Copyright, 2003). Kate, 2003 contends that in psychology and communication, the emphasis has been on interpersonal relationships among spouses, friends, relatives, and the like. In business management and organizational communication, emphasis has been on relationships among managers and between managers and other employees. Only recently have public relations researchers began to use similar concepts to study organization-public relationships. The International Association of Business Council, (IABC) document 2010, Measuring Organizational Trust, and the Institute for Public Relations Guidelines for Measuring Relationships both contain extensive bibliographies that will be useful to any organization seeking to implement a trust measurement program; (Katie Delahaye Paine Copyright, 2003).

In his document; Guidelines for Measuring Trust in Organizations, Katie Delahaye Paine, gives a wide perspective of the definition of Trust/confidence. He states that it is universally agreed that trust is a multi-dimensional concept. It is: *Multi-level*; trust results from interactions that span co-worker, team, organizational and inter-organizational alliances; *Culturally-rooted*, trust is closely tied to the norms, values and beliefs of the organizational culture, *Communication-based*, trust is the outcome of communications behaviors, such as providing accurate information, giving explanations for decisions and demonstrating sincere and appropriate openness; *dynamic*, trust is constantly changing as it cycles through phases of building, destabilization and dissolving; *Multi dimensional*, trust consists of multiple factors at the cognitive, emotional and behavioral levels, all of which affect an individual's perceptions of trust/ or confidence. Trust and confidence has been one of several dimensions frequently included in measurement of relationships. Since its measurement is intrinsic to measurement of relationships, it may be concluded that trust dimensions include: *Competence*, the belief that an organization has the ability to do what it says it will do. It includes the extent to which the customers see an organization as being *effective*; that it can compete and survive in the marketplace, *integrity*-The belief that an organization is fair and just. *Dependability/Reliability*; the belief that an organization will do what it says it will do; that it acts consistently and dependably

Katie Delahaye Paine explains that, trust measurement and evaluation involves assessing the success or failure of much broader efforts an organization makes to improve and enhance the relationships that organizations maintain with key constituents and customers. More specifically, trust Measurement is a way of giving a result a precise dimension, generally by comparison to some standard or baseline and usually is done in a quantifiable or numerical manner. It seeks to answer questions such as: Have the behaviors, programs and activities we implemented changed what people know, what they think and feel about the organization, and how they actually act (as exhibited by protests, votes and purchases); Have the actions or behaviors of my organization had an impact on the trust that our constituencies feel towards our organization?; Have those public relations and communications efforts that we initiated to build trust had an impact—that is, "moved the needle" in the right direction and, if so, how can we support and document that with research? (Katie Delahaye Paine, 2003).

Customer loyalty is both an attitudinal and behavioral tendency to favor one brand over all others, whether due to satisfaction with the product or service, its convenience or performance, or simply familiarity and comfort with the brand. Customer loyalty encourages consumers to shop more consistently, spend a greater share of wallet, and feel positive about a shopping experience, helping attract consumers to familiar brands in the face of a competitive environment. (PR Loyalty Solutions, 2011) To understand customer loyalty one must recognize that there are different types and degrees of loyalty. There is monogamous loyalty and there is polygamous. There are also behavioral and attitudinal aspects. In a world where your competitors are only a click away, customer loyalty really is the new marketing. Today's customers have access to an endless amount of information about your business including how credible an organization is run, and research shows that customers are ready and willing to stop dating around and stick with companies who go above and beyond to create a fantastic customer experience through effective basic policies and controls. When customers feel taken care of and feel comfortable relating with your company because the company has a name and can be vetted for credibility, they are more inclined to buy from you again. Since studies have shown that it costs 6 to 7 times more to acquire a new customer than keep an old one, outpacing your competition depends upon having a loyal tribe of happy customers. (PR Loyalty Solutions, 2011).

We live in a world of polygamous, not monogamous loyalty. For example, a person might shop at Nakumatt, Uchumi Super Market and Naivas Ltd and unfailingly shop at all three. The person is then loyal to them, but not to

others, and yet 100% loyal to none. In their book *Loyalty Myths*, Keiningham et al. (2005) suggest that “loyalty can in part be thought of as the probability a customer will purchase a brand on any particular purchase occasion. The objective of businesses, and therefore loyalty programs, should be to make the organization’s share of customer loyalty as high as possible. According to Dowling and Uncles (2000) from Australia, “‘polygamous loyalty’ is a better description of actual consumer behavior than either brand switching (a conscious once-and-for-all change of allegiance to another brand) or promiscuity (the butterfly tendency to flit from brand to brand without any fixed allegiance).”

In the past, many scholars defined loyalty in behavioral terms. If a person made most purchases in a given product category from one supplier, regardless of the reason, the person was defined as loyal. As Kumar and Shah from the University of Connecticut’s School of Business (2004) point out, “a majority of existing loyalty programs follow these measures to reward behavioral loyalty. That is, the more you spend with the company, the more rewards you earn”. This is exhibited by main Super Markets in Kenya, when you buy you earn points or with Safaricom Ltd, you earn “Bonga” points. A second element of loyalty is attitudinal loyalty. Like behavioral loyalty, attitudinal definitions have existed for a long time. This second element of loyalty focuses on how strong the psychological commitment or attachment is to the brand. By itself, it too has limitations. For example, how loyal are people who rave about a product and promote it to their friends, but then for whatever reason fail to buy it regularly themselves? In the opinion of many scholars, as a minimum, an adequate definition of customer loyalty includes the history of actions plus feelings and intentions toward the brand or commercial relationship. Loyalty action and talk (i.e., promotion to others) are both valuable to businesses, but in different ways.

Why does customer loyalty matter? The answer to this important question is as simple as “rewards of great service”. A variety of research shows that today’s customers place a priority on receiving great service. A 2011 report (<http://about.americanexpress.com/news/pr/2011/csbar.aspx>, Oct.16, 2016) published by American express revealed that 3 out of 5 customers were willing to give up a former favorite brand in order to have a better service experience. Even more telling are the results of the 2010 ‘Right Now Customer Experience Impact report’, which revealed that 9 in 10 Americans are willing to spend more with companies they believe provide excellent customer service (<http://www.slideshare.net/RightNow/2010-customer-experience-impact-Oct. 18, 2016>). There is usually high cost of bad service, ‘News of bad customer service reaches more than twice as many years as praise for a good service experience’. (White House Office of Consumer Affairs, 2010). Bad service really scare customers away from your business. Consumer Reports surveys have shown that nearly 91 percent of customers will not do business with you a second time if you botch the first encounter.

White House Office of Consumer Affairs, 2010 research uncovered that two-thirds of customers have walked out of a store/ or Super Market when they felt the service was subpar and that the amount of customers willing to immediately abandon a business reached nearly 70 percent when it came to poor service on the phone, conclusively showing that customers are willing to shut you out if you do not provide the quality of service they expect.

The worst part is that one may not know how much of an impact your poor quality of service is having before it is too late. For every one customer who bothers to complain, nearly 26 others remain silent and just vote by foot – just walk away probably to your competitors.

**Figure 2:-** Impact of quality service and internal control on customer loyalty and confidence

**Source:** Report published by American express, 2011; 2010 'Right Now Customer Experience Impact report'; White House Office of Consumer Affairs, 2010

**KEY:** Loyalty 4: Customers (91%) who would not do business 2<sup>nd</sup> time if 1<sup>st</sup> was poor and poor control  
 Loyalty 3: Customers (90%) who would spend more with corporations believed to have excellent services and effective internal control  
 Loyalty 2: Customers (70%) willing to abandon on-going business on learning that the corporation have poor services and poor internal controls  
 Loyalty 1: Customers (60%) willing to abandon former favorite brand corporation on learning that the corporation have poor services and poor internal controls

Effective internal control will emphasize on a policy that will be based on credible research and development on the customer service; confidence and loyalty. The advent of social media has created the belief that you must constantly engage customers or risk losing the sale, but the data says that it is not true, because how do you connect with customers that want limited engagement? Many marketing campaigns are designed entirely around moving products. What if instead using credible organization research policy changes the perception so that the campaign is designed around moving people? A Corporate executive Board (CeB) study published by the Harvard Business Review, which included 7,000 consumers across the United States, United Kingdom and Australia, showed that loyalty to brands is almost impossible to achieve without one key element: shared value, "Of those consumers who said that they had a strong brand relationship, 64% cited shared values as the primary reason". (<http://hrb.org/2012/05/to-keep-your-customer-keep-it-simple/ar/1>)

Shared values are by far the largest driver of brand loyalty. According to the CeB, who researched the topic of brand loyalty for more than a year, consumers everywhere stated that they were loyal "not to companies, but to beliefs." Most customers are not particularly loyal to any one business, but they are loyal to what the business stands for, as reflected in its management as shown through effective internal control. "We saw that emotional attachments to brands certainly do exist, but that connection typically starts with a 'shared value' those consumers believe they hold in common with the brand." (Aaron Lotton, CEB.) (<http://www.executiveboard.com/marketing-blog/author/alotton>). Connecting with your customers on a personal level as an organization is crucial as that will retain customer loyalty. Since research has shown that a majority of customers do not care about having a close relationship with a brand, it makes sense that those who do care more deeply about the things organization stand for than how often organization engages with them. The only thing that is going to enhance this type of relationship is the knowledge that your business is on the same team as them. These customers will want to see that you share their beliefs and that you incorporate those beliefs into how you conduct business, hence importance of effective and credible internal control system.

Customer value can be summarized in one central question that all organizations must align to their internal control philosophy and ask frequently: “What do customers really want and how do we meet their demands?” or in other words, “What do customers really value?” Professor Art Weinstein, in his customer value theory, or what he terms “superior customer value”, says that: Customers would want businesses to overwhelm and surprise them by going above and beyond the ordinary to meet their needs and wants (Weinstein, 2012). This means delivering above and beyond on every value-point of the customer value spectrum in terms of four components: service, quality, image, and price. Weinstein (2012) calls these the “The Essence of Customer Value” (p. 6).

Weinstein (2012) regards customer value as best defined from customers’ perspectives as tradeoffs between benefits received from offers versus the sacrifices including money, stress, and time to obtain products and services or these offers. Describing the SQIP (S-Q-I-P) approach, Weinstein (2012) states that value is expressed in many ways as a combination of service (S), product quality (Q), image (I) and price (P). Customer value encompasses the total experience of the customer regarding the organization credibility, its products and services, purchase and post-purchase services and customer support, as well as the overall impact of the interaction between consumer and product, the benefits conferred and how these affect well-being and are perceived by influential others (Duncan, 2005; Kerin, Hartley and Rudelius, 2009).

Customer value has become a mandate for business leaders and managers as companies lose other core and distinctive competencies in the current rapidly changing and highly competitive global economy. Customer value creation is no longer an activity or process relegated to marketing and sales departments and specialists; it is an organizational-wide philosophy like Total Quality Management (TQM) that requires each member of the organization to play an active role in adding value to the customer experience. The organization must essentially take a marketing orientation approach backed by value driven management (VDM) philosophy and attitude (Pohlman and Gardiner, 2000). The strategic and overall importance of customer value can be summarized in ten (10) salient points made by Professor Art Weinstein in his book, Superior Customer Value: Strategies for Winning and Retaining Customers (Third Edition, 2012):

(1) Designing and providing superior customer value are the keys to successful business strategy in the 21st century. (2) Value reigns supreme in today’s marketplace and market space. (3) Customers will not pay more than a product is worth and will reward excellence. (4) A customer-centric culture provides focus and direction for the organization, ensuring that exceptional value will be offered to customers. (5) Designing and delivering superior customer value propels organizations to market leadership positions in today’s highly competitive global markets – absolute advantage. (6) Providing outstanding customer value has become a mandate for management. (7) In choice-filled arenas, the balance of power has shifted from companies to value-seeking customers. (8) Managing customer value is even more critical to organizations in the new service and information-based economy. (9) Firms not providing adequate value to customers will struggle or disappear – customer value is a key ingredient in building competitive advantage. (10) Today’s customers are quite smart and sophisticated and are looking for companies that (1) create maximum value for them based on their needs and wants, and (2) demonstrate that they value their business (Weinstein, 2012). Designing and delivering superior customer value will help organizations develop winning and retention strategies in an environment where competition has eroded other bases for differentiation and market leadership.

Riding on the famous quote: *"If you cannot measure it, you cannot improve it."* - Lord William Thomson Kelvin (1824-1907). As one of the measurements of the performance of the Quality Management System, the organizations shall monitor information relating to customer perception as to whether the organization has met customer requirements. There is obviously a strong link between customer satisfaction resulting from confidence, trust and loyalty and customer retention. Customer's perception of Service and Quality of product will determine the success of the product or service in the market.

### **Conclusion:-**

The review established that it is fair to assume that entities that are not dormant have some controls in place however rudimentary. These controls need not be formal or formally documented; they just need to be appropriate for the entity concerned. Auditors (financial) are required to perform some work to evaluate the design and implementation of controls in order to assess control risk. However, auditors cannot allow an expectation that controls are operating effectively to have any effect on the nature, timing and extent of substantive procedures unless the operational effectiveness of the controls is tested. (<https://www.frc.org.uk/Our->

*Work/Publications/IFIAR/IFIAR-2014-Survey-of-Inspection-Findings.pdf*.- October 20, 2016). Customers are more than just avid and hard-to-please individuals patronizing your business. Businesses must come to understand that customers are their most valuable long-term strategic partners (Dr. McFarlane Winter 2013). Organizations must understand that customer value is not simply a tactic or short-term oriented endeavor; it is a way of doing business, and understanding the dynamics of business value drivers and how they interact to create profitability and success overtime.

The key to retention is customer satisfaction and high customer satisfaction comes from delivering superior customer value Weinstein (2012). Highly satisfied customers stay loyal longer, talk favorably about the organization, pay less attention to the competition, are less price sensitive, offer service ideas to the organization, and cost less to serve than new customers (Weinstein, 2012). This should also remind organizations of the 80-20 rule; essentially that 80% of sales comes from 20% of customers, and that this 20% of customers represents repeat customers who are loyal because of the exceptional customer value they perceive in your business. Organizations must now measure themselves by their ability to please customers, meet their expectations, and retain them. (*Guidelines for Measuring Trust in Organizations: By Katie Delahaye Paine, 2003*)

The evaluation for controls of information systems is largely based on the flow of information for significant transaction classes and processes that relate to key financial reporting areas which take place at the control activities level. Organizations evaluate themselves by measuring customer satisfaction with their products or services. As organizations evolve, the measurement of customer satisfaction across the entire organization becomes imperative. The first step is for an organization to implement a metric for tracking customer satisfaction. To develop a metric, an organization should explore these questions: Who are its customers? What type of survey should be administered to them? How will satisfaction be measured across the organization? This paper brings in to reality, the fact that businesses only exist because of customers alongside the fact that current business world is complicated and technical such that total loyalty is impossible to achieve. The only tool available is provision of quality and exemplary customer service.

##### Key words:-

Pseudoseizures, epilepsy PNES.

#### Abstract

**Background:** Pseudoseizures a disorder in which paroxysmal series of changed behavior are noticed, it misdiagnosed due to its similarity to true epilepsy.

**Case presentation:** A male patient of 22 years old with no medical illness admitted to emergency department with a history of repeated attack of involuntary movements affecting all four limbs, he has no medical or surgical history, his vital signs were recorded upon arrival, he experienced full examination and analysis, computed tomography, Electroencephalogram and Magnetic resonance image were performed on the patient.

Copy Right, IJAR, 2017.. All rights reserved.

#### Introduction:-

Pseudoseizures or Psychogenic Non-Epileptic Seizures (PNES) are disorders in which there are paroxysmal series of changed behavior that looks like epileptic seizures however it lacks organic causes such as dysfunction of central nervous system and the expected electro-encephalographical epileptic changes [1]. It is considered as somatoform disorder [2]. Pseudoseizures diagnosis can be suspected by physical examination, personal and psychiatric history [3], however the exact and accurate diagnosis of Pseudoseizures is still a challenge [4]. Its incidence was evaluated to be 6.5- 10.6 % in many studies [5-8] and 20 % of patients visiting the epilepsy centers [9]. One from 5 patients with apparently epilepsy referred to specialist centers was found to suffer no organic reason for seizures but mistaken for epilepsy this is due to diagnostic error [10], so we must focus on history and symptoms of the patient to avoid the mistakes.

#### Case Presentation:-

The patient was a 22 years old male works as a military officer in the National Guard, he was not known to have any medical illnesses, he was admitted on 5<sup>th</sup> February 2017 AD as a case of query seizures versus pseudo seizures. The patient presented to our emergency department then transferred to neurology department. The patient has history of repeated attack of involuntary movements affecting all four limbs with neck hyperextension for three days each event lasting around 30 seconds. There were no preceding symptoms by an aura. He was aware of

his surroundings during the event. There was no eye rolling, no tongue biting or loss bladder control (urinary incontinence). After each event he regained full consciousness and function. Trunk extension with opisthotonus movement with irregular arrhythmic asynchronous; jerky movement of all limbs with open eyes.

He initially presented to a different hospital where he stayed for two days then was discharged against medical advice. His systemic review was unremarkable. He was alcohol Consumer, his last drink was 3 days ago, also he was smoker (20 pack/year). He suffers from increased social pressure.

There was no past medical or surgical history and no history of drug or food allergy, he was not exposed to blood transfusion. The patient had an event which was witnessed by the neurology specialist. It was noted that the patient usually develops such event during physician rounds or visiting hours. Oxygen saturation was 96% during the event on room air, no dilatation or tachycardia were found and Plantars were downing. There was spontaneous recovery of consciousness without headache, vomiting or fatigue. There was no cranial nerve involvement, he has normal reflexes with intact motor and sensory functions, also cerebellar exam was normal and normal gait was found. According to Cardiovascular examination it was found that CVS: S1+S2+0, for chest examination it was found that B/L vesicular breath sound with no added breath sounds. Examining abdomen showed soft, Lax; no organomegaly and no palpable masses were felt.

His vital signs were as follow; T.: 36.2 C BP: 102/52mmHg P: 77bpm RR: 19breaths/min. spO2: 96% RA, RBS: 69 mg/dl. Electrocardiography(ECG) showed Sinus Rhythm, his blood tests were found as follow; for complete blood count (CBC) his white blood cell count was  $11 \times 10^9$  /L, platelets was  $211 \times 10^9$  /L, ANC 7.04, HGB 15.5m MCV 81 and MCH 28, his coagulation profile showed that prothrombin time (PT), INR, aPTT were 13.9 sec, 1.04, 32.5 sec respectively. By measuring kidney function tests, Blood urea nitrogen(BUN)= 3.01mmol/L, Creatinine (Cr)=79  $\mu$ mol/L, Na= 143 mmol/L, K= 4.1mmol/L, Cl= 106mmol/L, Ca= 2.3mmol/L, Mg= 0.8mmol/L, PO<sub>4</sub>= 1.1mmol/L. Liver function tests were; AST= 35 U/L, ALT= 29U/L, ALP= 110 U/L, Albumin= 38g/L, Amylase= 71 U/L, LDH =289 U/L. By estimation of Creatine kinase (CK) level=320U/L, CK-MB= 23 U/L, Prolactin = 314 nmol/ml, Thiamine level= 70 mmol/L, Vit B 12 level= 180 pg/ml, Venous blood gas = 155.

CT scan in brain was performed on patients' brain on the day of admission (5/2/2017) and it was normal. Electroencephalogram (EEG) was performed 9<sup>th</sup> February 2017 to find the problems related to electrical activity of the patients' brain, it was performed after giving 10mg IV midazolam as a sedative agent, results showed that it was essentially normal EEG recording during wakefulness, drowsiness and activating procedure demonstrating normal background with no abnormal focal slowing or epileptiform discharges, also there was no clinical or electrographic seizures. Excessive fast activities were noted which may be related to benzodiazepines that was given prior to this study.

Magnetic Resonance image (MRI) was performed 8<sup>th</sup> February 2017, the study was suboptimal to artifact produced by braces making evaluation of the images slightly difficult. There was no mass lesion or midline shift noted, hydrocephalus also was not found. Brain stem and both cerebellar hemispheres are unremarkable and both temporal lobes show normal signal intensity with no atrophic changes. We did not find cortical dysplasia or evidence of mesial temporal sclerosis also no diffusion restriction observed in diffusion weighted images. CP angle was unremarkable. Figures (1-3)

Fig.1.normal

Fig 2 .normal

**Fig.3.normal**

A dose of 1 g of Phenytoin was given to the patient and he was put on a regular dose of 100 mg IV TID and Thiamine dose of 500 mg for three days. Folic acid dose of 1mg PO OD was given to the patient, D50 of 50 ml was given after thiamine injection as a STAT dose. Keppra of 1 g PO BID was added after 2 days to optimize treatment if he was a true seizure patient. Also He was put on a placebo of 15 ml D5 water which he would stop his event after receiving the injection.

### **Discussion:-**

The description of paroxysmal alterations in behavior that looks like epileptic seizures is called pseudoseizures but lack any organic cause [9]. Pseudoseizures or Psychogenic Non-Epileptic Seizures (PNES) accounts for 17% to 30% of patients admitted to epilepsy units [1]. Patients of pseudoseizures are often alcoholism and suffer pressure of performance [9], our patient was alcohol consumer and suffers from increased social pressure. The patient has normal laboratory tests and physical examination. Diagnosis of Pseudoseizures must be precisely recognized because mistake in diagnosis can be harmful [9]. Actually it is very difficult to diagnose Pseudoseizures due to presence of overlapping in syndromes of real epilepsy with pseudoepilepsy [11]. There are many characteristics of Pseudoseizures including no tongue bite, absence of urinary incontinence, normal pupillary reflex and normal pupil size where, it is dilated in organic seizures, occurrence of event in all times, especially when the patient is awake among all the relatives, or persons related to the issue, and plantar reflex is always flexor [1,11]. In the present case almost all the previous conditions where exist with our patient, the patient did not suffer tongue biting and had no loss in bladder control, also there was no pupillary dilatation, the patient usually develops the events during physician rounds or visiting hours it was recorded that plantars were downing. All these indicate that this person was suffering pseudoseizures. He was suffering from repeated attack of involuntary movements affecting all his four limbs, but during the vent he was aware of his surroundings and he regained full consciousness and function after the event. Pupillary dilatation is not common, however it was observed a mild papillary dilatation [11], in the present case there was no papillary dilatation. Bladder incontinence is rare in Pseudoseizures [11], our patient did not loss bladder control. The time for seizure episodes ranged from 4 seconds to 19 minutes [11], in the present study the patients' neck hyperextension around 30 seconds every time.

Aura is unusual in pseudoseizures [9] this is what found in our patient who had no Aura. Serum prolactin concentration was found to be higher than 500 IU/ml in percent exceeding 90% of patients after a tonic-clonic seizure while it increases in 60% of patients after a complex partial seizure, prolactin does not increase after Simple partial seizures [10], in the present patient the Prolactin concentration was 314 nmol/ml. Electroencephalogram (EEG) may be normal in 30% of epilepsy patients [10], however it is important to be

performed during the seizures to establish a correct diagnosis [1]. In the present case, normal EEG was recorded which demonstrating a normal background with no abnormal focal slowing or epileptiform discharges. In our patient, his MRI showed no diffusion restriction in diffusion weighted images, no hydrocephalus or mass lesion or midline shift were noted. In conclusion we found that the present patient suffered Pseudoseizures, so misdiagnosis of Pseudoseizures is present due to similarity in some symptoms with true epilepsy.

#### Introduction:-

It is known that the sport a positive effect on physical and mental health, it strengthens the muscles of the body and the level of immunity in the body and therefore, through practicing the sport, we prevent a lot of diseases that affect our body , for example, the heart and lungs, as well as the bones.

The focus of our study in this research is the impact of practicing sports on the academic achievement of students at the College of Medicine and if it were so, does this impact positive or negative.

**Corresponding Author:- Yahya Omar Hazazi.**

Address:- Ministry of Higher Education, Al-Imam Mohammed Bin Saud Islamic University, College of Medicine Kingdom of Saudi Arabia.

Many studies have worked on high school students and middle us reflect the positive impact of exercise on academic achievement among these students and also has some international institutes do similar studies showed similar results we will review.

That medical students are more students busier study and educational attainment and what they are studying is very important because it relates to human life and the dangers surrounding it.

When logged in to lacquer ware medicine in any of the universities in the Kingdom or abroad, you find students from more students are busier because of scientific subjects taught and other organizing scientific conferences college and establish awareness days and other activates.

**Hypothesis:-**

the practicing sports helps in enhancement the student health and subscently lead to improvement of studyingperformance.

**Objectives:-**

The goal of this research is to find out if there are any relations between practicing sports and students GPA in Al-Imam medical college, Riyadh city at 2015.

**Material and method:-**

1-sample size:142 students

2-sample technique: Convenient Sampling

3-data collection methods:

The questionnaire will be send through all leaders of all medical students to distributed to all groups of medical students through emails.

4-data management and analysis plane:

Statistic software (SPSS) will be used to find out the result of this research.

**Discussion:-**

In previous study about the relation between high school athletic participation and academic performance conclude that as students' school-sponsored athletic participation increases, their academic achievement, based on tests and GPA, will be lower than those who did not participate.

In sport participation and academic performance from the national longitudinal study of adult cents health provide only limited evidence that sports participation leads to enhanced academic performance.

In a study grade point average of athletes and non athletes the results of the study determined that there was a significant difference in the GPA of athletes and non-athletes.

In this study we conclude that there is significant relation between GPA and practicing sports.

**Conclusion:-**

in this study conclude that student which participate in sports have higher GPA than other students. which they do not participate by the percentage of difference is about 1-2%

**Recommendation:-**

the population should practicing sports regularly to improve their physical health.-1  
2- the regular sport practicing may increase academic achievements.

### **Literature review:-**

1- Correlations between High School Athletic Participation and Academic Performance:

#### **Objectives:-**

This research study examines the correlation between high school students' school-sponsored athletic participation and their academic performance.

#### **Conclusion:-**

This study concludes that as students' school-sponsored athletic participation increases, their academic achievement, based on tests and GPA, will be lower than those who did not participate.

#### **Main finding:-**

This study was focused on two questions in order to evaluate any relationships. The first question asked —Is there a relationship between the amount of high school students' school-sponsored athletic participation and their academic performance,

The data showed a negative relationship between these two variables.

The second question this study asked was, —Does increasing the number of sports have a positive or negative correlation on the student's academic performance there is a negative correlation between the two.

3-a study in the grade point average of athletes vs. non-athletes:

**Objectives:-**

The purpose of this study was to analyze the grade point average of student athletes versus that of non-student athletes.

**Conclusion:**

The results of the study determined that there was a significant difference in the GPA of athletes and non-athletes.

**Main finding:-**

The maximum GPA for both non-athletes and athletes is 4.0. However, what the charts do not show is that the athletes actually had 4 students with 4.0 GPA and the non-athlete had only one.

The minimum GPA for non-athletes is 1.21 and the athletes' minimum was 1.79. The minimum for non-athletes was 0.58 lower than that of the athletes showing a significantly lower GPA minimum.

## IMPACTS OF INFORMATION AND COMMUNICATION TECHNOLOGY (ICT) IN LOGISTIC MANAGEMENT IN UNILEVER KENYA LIMITED.

**Maurice M. Opiyo.**

#### Abstract

ICT deals with the use of electronic computers and computer software to convert, store, protect, process, transmit and retrieve information, securely. Recently it has become popular to broaden the term to explicitly include the field of electronic communication so that people tend to use the abbreviation ICT (Information and Communications Technology (Greenwood, 1997). Due to the widespread adoption of the supply chain view by commercial enterprises all over the world, the business management providers are increasingly required to offer global logistics service packages to better satisfy customer needs. Information and Communication Technologies (ICT) play a key role in this process, assuring the linkages between chain participants as well as a more effective control of time, cost, and quality of the service rendered. Nevertheless, introduction of ICT is not equally distributed in the industry. In the case of manufacturing and production, crucial business links and interlinks lines seem to be comparatively slow in implementing ICT in comparison with parcel delivery companies or large freight forwarders.

The increasing importance of ICT for logistics as well as for the Supply Chain Management (SCM) presents business world with two alternatives: either to survive in a low-cost world of business providers or to pursue the expensive and problematic path of becoming value-added providers through an extensive use of ICT. Introduction of ICT in logistics provides management an integrated capacity of assurance and reliable communication advantage at every stage of operations, which encompasses activities like cargo tracing, answering customers complain, inquiry billing and information management (Baily 2005). The use of E-mail and other related bulk Short Message Services (EMS) that comes with the application and adoption of Information and Communications Technology provides quick and documented communications with customers and other important stakeholders. This as compared with manual operations besides providing customer value saves costs and time in operations a great deal

**Introduction:-**

Information and Communication Technology (ICT), as defined by the Information Technology Association of America (ITAA), is "the study, design, development, implementation, support or management of computer-based information systems, particularly software applications and computer hardware (Donald 1997). Information and Communications Technology (ICT) is an increasingly powerful tool for participating in global markets; promoting political accountability; improving the delivery of basic services; and enhancing local development opportunities. But without innovative ICT policies, many people in developing countries - especially the poor - will be left behind. ICT deals with the use of electronic computers and computer software to convert, store, protect, process, transmit and retrieve information, securely. Recently it has become popular to broaden the term to explicitly include the field of electronic communication so that people tend to use the abbreviation ICT (Information and Communications Technology). It is common for this to be referred to as IT & T in the Australasia region, standing for Information Technology and Telecommunications (Greenwood, 1997).

In today's Supply Chain Management (SCM) practices, a successful strategy depends more on the performance of Third Party Logistics service providers (3PLs) (Kenneth, Brian, 2006). Accordingly, logistics providers play a key integrative role linking the different supply chain elements by the management of information flows connected with the entire delivery process of goods (Chopra, 2007). Information and Communication Technology is becoming one of the main drivers of change in the industry, posing new strategic challenges to logistics companies and management. Information and Communication Technology (ICT) developments are more and more influencing the transport and logistics service market and give rise to new organizational forms for these services. For example, the volume of electronic communication along the supply chain is fast growing together with the electronic exchanges of transport documentation, invoices, order instructions and payments (Trilog, 1999). This has created an increasing need to support customers supply chains requirements through an effective use of ICT (Meindl, 2007).

According to Saunders (1997), ICT in Logistics is the application of computer software and / or automated machinery to improve the efficiency of logistics operations. Typically this refers to operations within a warehouse or distribution center, with broader tasks undertaken by supply chain management systems and enterprise resource planning systems. The information systems applications in the field of logistics and supply chain management are not new, and have a long history dating back in the 1960s, when early Electronic Data Interchange (EDI) were first used; predating the use of computer power. An early example was maintenance of inventory records on ledger cards which at first were manually up-dated and later became semi-mechanically updated using magnetically encoded data. As such the computer has facilitated faster data processing and allowed significantly more data and information to be handled. It is not therefore outrageous to evaluate the impact of ICT on the Logistics Management of Unilever Kenya Limited.

The need to serve customers in a flexible and speedy manner has forced manufacturers and distributors to effectively exploit ICT by creating "global nervous system" that link a continuous flow of supply and demand information between suppliers and customers; (Kennet *et al.*, 1996). This has raised the level of information intensity in logistics and management as well as supply chain management services. In this perspective ICT has developed and have increasingly influenced the transport and logistics services industry, shifting the focus from a physical to a more electronic one and giving rise to new organizational forms for those services.

Previous studies revealed that growth in volumes of electronic communications along the logistics management and supply chain management, was expected to double by the year, 2005 thus electronic exchanges of transport documentation, invoices, orders instructions and payments are focused to grow 59% (Trilog, 1999). This has led to an increasing interest in assessing the effect of ICT on the transport and logistics industry.

According to Donald (1997), automated cranes (also called automated storage and retrieval systems) provide the ability to input and store a container of goods for later retrieval. Typically cranes serve a rack of locations, allowing many levels of stock to be stacked vertically, and allowing far high storage densities and better space utilization than alternatives. Further, automated conveyors allow the input of containers in one area of the warehouse, and either through hard coded rules or data input allows destination selection. Business Control software: provides higher level functionality, such as identification of incoming deliveries / stock and scheduling order fulfillment, assignment of stock to a large set of locations (Peter 2000).

Mobile technology; Radio data terminals: these are hand held or truck mounted terminals which connect wirelessly to logistics automation software and provide instructions to operators moving throughout the warehouse. Many also have in-built barcode scanners to allow identification of containers. Bar codes allow the automatic capture of data without use of the computer keyboard, which is slow and error prone. Software Integration software: this provides overall control of the automation machinery and for instance allows cranes to be connected up to conveyors for seamless stock movements (Lysons 1996).

According to Bailey (1978), Uneliver Kenya receives stock of a variety of products from suppliers and store these until the receipt of orders from customers, whether individual buyers (e.g. mail order), retail branches (e.g. chain stores), or other companies (e.g. wholesalers). Incoming goods are marked with barcodes and the automation system notified of the expected stock. On arrival, goods are scanned and thereby identified, and taken via conveyors, sortation systems, and automated cranes into an automatically assigned storage location. Automated Goods Retrieval for Orders: On receipt of orders, the automation system is able to immediately locate goods and retrieve them to a pick face location. Automated dispatch processing: Combining knowledge of all orders placed at the warehouse the automation system can assign picked goods into dispatch units and then into outbound loads (Bailey 1978).

### **Impacts of ICT on Management:-**

#### **Transparency/ or Accountability:-**

According to Lysons (1996) asserted that there are different tools available to coordinate effectively the supply chain. Technological tools constitute the most important management tools because these offer fast and convenient channels of communication within the organization and of the organization with its suppliers and customers. The predecessor of current technological channels of incoming and outgoing communication is the telephone, fax-machine and computers, which are still useful to modern businesses. However, these technological tools were enhanced by the internet and its unlimited potential for businesses. The internet provides a channel of communications that covers contract negotiations, buying and selling of products, monitoring of the transport of goods, payment of goods and services, coordination of internal tasks and a lot more benefits (Lysons, 1996).

#### **Record Keeping:-**

Stevens (1995) defines automation of records and documents as the storage and transmission of business documents via computer system. With the continuous implementation of ICT in various areas of logistics management which has reduced the manual way of keeping records and exchange of documents between the buyer and supplier in what is being termed as paperless trading. Automation of records and documents has resulted to e-business concept which relies on an automated business system.

Electronic business methods enable companies to link their internal and external data processing systems more efficiently and flexibly, to work more closely with suppliers and partners, and to better satisfy the needs and expectations of their customers. In practice, e-business is more than just e-commerce. While e-business refers to more strategic focus with an emphasis on the functions that occur using electronic capabilities, e-commerce is a subset of an overall e-business strategy ((Peter Baily 2005). Due to increased rise to paperless trading there has been need to implement the electronic data interchange (EDI) concept where partners are free to use any method for the transmission of documents. In the past one of the more popular methods was the usage of a bisync modem to communicate through a Value Added Network (VAN). Some organizations have used direct modem to modem connections and Bulletin Board Systems (BBS), and recently there has been a move towards using some of the many Internet protocols for transmission, but most EDI is still transmitted using a VAN. In the healthcare industry, a VAN is referred to as a "Clearinghouse". EDI and other similar technologies save a company money by providing an alternative to, or replacing information flows that require a great deal of human interaction and materials such as paper documents, meetings, faxes, email (Peter 2000).

According to Lysons (1996), business of keeping records in hard copy files should be a thing of the past, with the new technology that is available, every government office needs to automate, so to facilitate retrieval of supply chain information when needed, it can be made available in real time. Office automation refers to the varied computer software used to digitally create, collect, store, manipulate and relay office information necessary for accomplishing basic tasks and goals. The backbone of office automation is a LAN, which allows users to transmit data, e-mail.

**Distribution efficiency:-**

Occurs when goods and services are received by those who have the greatest need for them. This is made possible by use of Distribution Resource Planning (DRP) which is a method used in business administration for planning orders within a supply chain. DRP enables the user to set certain inventory control parameters (like a safety stock) and calculate the time-phased inventory requirements (Menon 2004).

The on-hand inventory at the *end* of a period. DRP has the following variables the backordered demand at the end of a period, the required quantity of product needed at the beginning of a period, the constrained quantity of product available at the beginning of a period, the recommended order quantity at the beginning of a period. For DRP to function the following information is required, demand in a future period, the scheduled receipts at the beginning of a period, the safety stock requirement for a period and the on-hand inventory at the beginning of a period (Ammer, 1986).

It is all inventory control and scheduling technique that applies the MRP principle and distribution environment integration, the special needs of distribution and a time face plan of events that affect inventory, it's the rates IT tool for controlling inventory to the distribution system of organization. DRP is guided by customer demand. It allocates inventory from the central warehouse to the various distribution centres based on demand patterns, safety stock provisions, order quantity, reorder level and average performance cycle length. DRP also coordinates the finished goods required across the distribution network, the success of this system depends on the accuracy of performance with respect to location and time of requirement across the system is necessary for system effectiveness (Stevens, 1995).

Logistics professionals need to make greater use of available technology to drive positive and efficient business results. Systems solution is driven by knowledgeable people who clearly understand the business challenge and apply technology appropriately to this challenge one side-effect of technology is that it provides a solid short-term solution but cannot adapt to future needs. System designers must carefully assess the functionality required to allow the company to grow over time and adapt to changing logistics requirements. Without systems flexibility, logistics executives will continuously request funding for new or customized systems, leading to the perception that logistics is just a cost center worse yet, a black hole of continuous investment (Peter 2000).

Despite the risks in the systems problems, information and operations systems for logistics management will continue to be vitally important in leveraging logistics to achieve a competitive advantage. Third party logistics providers within the last decade, there has been a direct positive correlation between the role of systems in improving logistics programs and the increasingly important role of third party providers (Bailey 1978). Organizations must continually invest in logistics systems to support their core business this allows shippers to avoid systems development efforts by tapping into tap an existing infrastructure. Many companies have flat or declining information technology budgets, and logistics systems are well down the priority list for corporate systems investments. There should be incentive that drives logistics providers to adopt and implement technologies that deliver an attractive ROI, or risk extinction (Hooligan 1988).

One of the most exciting tools for applying systems to logistics management and changing the way people work is the internet. The shared network of the World Wide Web can link supply chain systems and partners through one identical, user-friendly interface accessible by anyone with a web browser. This enables complete and seamless supply chain integration, while still allowing providers to develop the unique software required for their specific applications (Kumpe 1988).

Today the internet remains more promise than panacea, to catch up to early adopters of internet commerce by implementing applications that are too often long on technology, but short on real value. There need to recognize the need to logistics excellence. These can eventually be achieved by those who focus their time and energy on understanding the business challenge, then use information and operations systems as tools to continuously improve process (Kumpe 1988).

**Cost reduction:-**

One of the aims of each business is to reduce cost to the minimum so as to realize profit, e-procurement aims to reduce cost and enhance efficiency. An important part of many B2B sites, e-procurement is also sometimes referred to by other terms, such as supplier exchange. Typically, e-procurement Web sites allow qualified and registered users to look for buyers or sellers of goods and services. Depending on the approach, buyers or sellers may specify

costs or invite bids (Bailey1978).Transactions can be initiated and completed. Ongoing purchases may qualify customers for volume discounts or special offers. E-procurement software may make it possible to automate some buying and selling. Companies participating expect to be able to control parts inventories more effectively, reduce purchasing agent overhead, and improve manufacturing cycles. E-procurement is expected to be integrated with the trend toward computerized supply chain management (Peter 2000).

According to Peter Baily (2005), Electronic funds transfer or EFT refers to the computer-based systems used to perform financial transactions electronically. Some of the transactions performed include sale, refund, withdrawal, deposits, cash backs etc. EFT transactions require communication between numbers of parties. When a card is used at a merchant or ATM, the transaction is first routed to an acquirer, then through a number of networks to the issuer where the cardholder's account is held.

A transaction may be authorized offline by any of these entities through a stand-in agreement. Stand-in authorization may be used when a communication link is not available, or simply to save communication cost or time. Stand-in is subject to the transaction amount being below agreed limits. These limits are calculated based on the risk of authorizing a transaction offline, and thus vary between merchants and card types. Offline transactions may be subject to other security checks such as checking the card number against a 'hotcard' (stolen card) list, velocity checks (limiting the number of offline transactions allowed by a cardholder) and random online authorization (Hooligan1988).

### **Conclusion:-**

The impacts of ICT in logistic management are; transparency, record keeping, distribution efficiency and cost reduction. This was demonstrated by the study findings where average of 75% of the respondents were presented to have accepted yes. The level of ICT in logistic employed are ineffective and this negatively affects effectiveness and efficiency of logistic management activities. Information communication technology ensures transparency among employees when conducting logistic activities which provides information for holding employees accountable for their actions, ICT provides clear communication channels for employees in every stage of logistic. Computerization of record keeping ensures elimination of manual way of storage and transmission of documents across the logistic network which reduces overall cost of record keeping. Records and documents stored electronically ensure security and easier retrieval when required. ICT in logistic management aims to enhance distribution efficiency and information communications technology is an important factor for any organization to achieve efficiently their long-term goals. Information communications technology provides the tool for the efficient coordination of the different process links throughout the logistic network. The main aim of the organization integration of ICT with logistic activities is to reduce cost; ICT management, e-procurement aims to reduce the cost of procurement process; reduces the cost of storage and processing of documents, inventory

### **Recommendations:-**

Transparency should aim to hold employees accountable for any action they take in the line of their duty. Information communication technology should encourage transparency in the whole of logistic network; ICT should be made more effective to minimize malpractices in logistic management, enterprise resource planning system should be implemented so as to provide information in every stage of logistic management. Automation of records keeping eliminates the need to store documents manually; the security of documents is improved, unauthorized users are denied accessibility as computer are have passwords which restricts unauthorized users. To reduce the security risks of the documents stored electronically, there is need to back up records which are vulnerable to virus, Trojan attacks which crash computer systems and destroying logistic information.

ICT should aim to make logistic management activities as efficient as possible, Just in Time (JIT) system should be implemented in inventory management which will avail materials in just the right time, right place to make the right amount of products, distribution resource planning (DRP) should be implemented to ensure efficient distribution of materials. The management of should implement ICT infrastructure which is capable of reducing the cost in logistic management, all documents, records and inventory management should be computerized, e-procurement should be implemented to reduce the cost in procurement process, Distribution resource planning (DRP) should be implemented so as to reduce the cost of distribution of products.

Outsourcing, organizational performance, effects, Kenya

#### Abstract

The purpose of this study was to determine the effects of outsourcing on an organizational performance. Performance refers to how well or badly an individual or institution is doing in achieving its designated tasks (Ashby 2002). Managers want their organizations to achieve high levels of performance, no matter what mission, strategies, or goals are being pursued. Other specific objectives include productivity, costs and quality. It was established how productivity, costs and quality affect the performance of an organization. The review's findings established that outsourcing in the organization was not fully effective. It also showed that outsourcing had effects on productivity, costs and quality of goods and services produced thus subsequently affecting the performance of K.I.A (Kenya Institute of Administration) for instance. Bulk buying, procurement of approved goods and services, hiring qualified personnel and evaluation of the process to identify the best line of fit and identification of the best brand in the market, and checks to ensure goods and services procured are recommended.

#### Introduction:-

Heshmati (2003) in his survey points out that there is no general definition or measurement of outsourcing, he broadly describes it as a different kind of corporate action related to all subcontracting relationships between firms and the hiring of workers in a non-traditional jobs. Outsourcing may provide a viable strategy if firms aim to save on labour costs (Abraham and Taylor, 1996), exploit production differentials both within the services sectors and between services and manufacturing (Fixler and Siegel 1999), or take advantage of Globalization (Freenstra and Hanson, 1999).

Outsourcing is a strategic management tool that involve contracting of a company's non-core, non-revenue generating activities to a third party, commonly referred to as service provider. The process of outsourcing entails a long relationship between the supplier and the beneficiary, with a high degree of risk sharing (Corbett, 2004). The essence of outsourcing is to look for expertise to handle certain business functions outside the existing firm. The decision making process that management must undergo when considering outsourcing hinges on a "make or buy" philosophy. Outsourcing emerged from the moribund economy of the 1980s and 1990s, with emphasis on cutting costs driving the primary focus of successful firms. The renewed focus on outsourcing has mainly been driven by changes in information technology, communication and reengineering organizations (Embelton and Wright1998).

An organization's performance goals can only be achieved through its employees. An effective performance measurement and management system links individual and team work behavior to the organization's business

strategies, goals, and values. For achievement of its goals, it is essential for each employee to understand individual roles and responsibilities for goal achievement and there must be continuous dialogue between leaders and employees to set performance expectations, measure and analyze, and manage performance—three essential action steps that are interlinked and an ongoing in an organizational culture that successfully measures and account for performance. During the performance planning phase, the first phase of performance measurement, the organizational business strategy—including its mission, vision and objectives, and specific outcome required to achieve the overall strategy is defined. Goals and plans on how to measure achievement must be identified. In this step, outputs and measures are identified and requisite data collection and analysis process and procedure are developed and implemented.

Additionally, employees come to understand their individual roles and responsibilities with respect to performance measurement and are given the fundamental information, resources, competencies and motivation to ensure their successful execution. In the second phase measurement process—the measurement and analysis phase—data that informs areas of success and challenge for the organization are collected and are analyzed. Specific elements and factors that contributes success or challenge along with new/or modified information needs and lessons learned are identified. Once the performance data has been collected and analyzed, it must be effectively managed. The third phase of the process—performance management—is the phase in which solutions to address the identified challenges are developed and implemented, along with mechanisms to ensure the continuation of programme or organizational success. Additionally, performance measurement system and process may be modified as need to ensure that information collected through the performance measurement process is timely, relevant, and sufficient—steps that cycle back to performance planning (Poster, 2003).

Further, Smith (2000) asserted that most corporations believe that in order to compete globally and efficiently, cost must be rather than relying strictly on revenue growth. Therefore, organizations around the world are increasingly considering outsourcing as a strategic measurement tool which can be leveraged to allow focusing on their core competencies.

Heartman and Bengtsson (2007) point out that Business Process Outsourcing (BPO) gives tremendous help to companies to concentrate on the core areas of business. The most important factor in the growth of the BPO market worldwide today, is an increase in the number of enterprises that are reviewing their internal operations is an attempt to fully understand their true competencies. In this process companies are able to focus more on their core competencies to improve performance. Elmuti (2003) finally adds that those companies that are successful in outsourcing share the same success factors. These factors include clear understanding of their core activities, conducting adequate research and planning, and most importantly have developed clear objectives, goals and expectations of outsourcing activities. It is also essential that the right partners are selected based on a criteria like credibility, expertise and reliability.

A fundamental question to ask is whether outsourcing is value enhancing and, in particular, whether the firm that undertakes outsourcing shows higher profitability as a result. Essentially, this question renders down to the transactions cost question regularly posed to university undergraduates: should a firm manufacture its own input by some form of vertical merger or should it seek to obtain possibly more competitively priced inputs on the open market? While the viability of vertical mergers as determinant of profitability is comparatively well researched, less work has been undertaken on the viability of pursuing a less integrated strategy, namely of outsourcing inputs (Bhuyan, 2002).

Njihia (2005) affirmed that performance is an action or achievement considered in relation to how successful it is. It is the ability to operate effectively or to react quickly. Armstrong (2006) stated that performance is often defined simply in output terms—the achievement of qualified objectives. But performance is a matter of not only how people achieve, but how they achieve it. Performance means both behavior and results. Behaviors emulate from that performer and transform performance from abstraction to action. Not just the instruments for results, behaviors are also outcomes in their own right—the product of mental and physical effort applied to tasks and can be judged apart from results.

Outsourcing is subcontracting, a process such as product design or manufacturing, to a third party company. The decision to outsource is often made in the interest of lowering costs or making better use of time and energy costs, redirecting or conserving energy directed at the competencies of a particular business, or to make efficient use of

land, labour, capital, (information) technology and resources. It became part of the business lexicon in the 1980s. It is essentially a division of labour. It involves the transfer of management of day to day execution of an entire business function to an external service provider. The client organization and the supplier enter a contractual agreement that defines the transferred services. Under the agreement, the supplier acquires the means of production in the form of transfer of people, assets and other resources from the client. The client agrees to procure the services from the supplier for the term of the contract; business segments typically outsourced include information technology, human resources, facilities, real estate management and accounting (Oversby 2007)

Organizational performance is used in three time-senses-the past, present and the future, in other words, performance can refer to something completed or something happening now, or activities that prepare for new needs. Profitability, for example, is often regarded as the ultimate performance indicator, but it is not the actual performance. The actual performance occurred time back-first with decisions and then the actions that followed the decisions. Profit is therefore an indicator of previous performance. In this sense, performance is the outcome or 'end'.

There are behaviors that are associated with good or high performance, and then one must identify and assess them as they occur. These behaviors start with strategic planning process and continue into implementation, monitoring and assessment. In this sense, performance is the 'activity' or 'means' organizations are also interested in the predictors of performance-conditions and behaviors that have been shown over time to lead to better performance. In this sense, performance is a package of behaviors around strategic planning and programming ([www.strategic-conversation.com.au](http://www.strategic-conversation.com.au))

Robert S. Kaplan and David P. Norton (1992) introduced the balanced score card, a set of measures that allow for a holistic, integrated view of business performance. The scorecard was originally created to supplement "traditional financial measures with criteria that measured performance from three additional perspectives-those of customers, internal business processes, learning and growth (Kaplan and Norton, 1996,p. 75). By 1996, user companies had further developed it as a strategic management system linking long term strategy to short term targets. The development of the balanced scorecard method occurred because many business organizations realized that focus on one dimensional measure of performance (such as returns on investment or increased profit) was inadequate.

Too often bad strategic decisions were made in an effort to increase the bottom line at the expense of other organizational goals. The theory of the balanced scorecard suggested that rather than the focus, financial performance is the natural outcome of balancing other important goals. These other organizational goals interact to support excellent overall organizational preferences. If any individual goal is out of balance with other goals, the performance of the organization as a whole will suffer. The balanced scorecard system also emphasizes articulation of strategic targets in support of goals. In addition measurement systems are developed to provide data necessary to know when targets are being achieved or when performance is out of balance or being negatively affected. The Kaplan and Norton balanced scorecard looks at a performance refers to how well or badly an individual or institutions doing in achieving its designated tasks (Ashby, 2002). It may also be described as the end result of an activity but for an organization this would refer to how well it's achieving its mission, goals and objectives. It is the accumulated end result of all the organization's work processes and activities. Managers want their organization to achieve high levels of performance; no matter what mission, goals or strategies are being pursued. The first importance of measuring organizational performance is better asset management which refers to the process of acquiring, managing, renewing and disposing of assets as needed and of designing business models to exploit the value from the assets.

The second importance is of the increased ability to provide customer value. Customers will look elsewhere if they are not receiving value from an organization. Managers should therefore monitor how well they are providing customer value and they can do that when they measure performance. The third importance is on the impact on organizational reputation. Organizations strive to have a good reputation reflected to their customers, suppliers, competitors, community and others. The final importance is improved measures of organizational. Modern organizations must be able to learn and respond quickly i.e. they must be learning organizations. Organizational knowledge is that created by collaborative information sharing and social interaction that lead the organization members taking appropriate actions thus considered an asset (Robbins and Courtler, 2003).

The most frequent measures of organizational performance include organizational productivity, organizational effectiveness and industry rankings. Kaplan and Norton (1997) assert that productivity is an economic term that means output created in terms of goods and services produced rendered per resource unit. It is the overall output of goods or services divided by the inputs to generate that output. Robbins and Coutler (2003) add that organizational effectiveness as the measure of how appropriate organizations are in achieving their goals.

While outsourcing of services has received a lot of attention in the media and political circles in recent years largely because media reports seem to equate outsourcing with job losses (Wei and Amiti, 2004) or creation of jobs (Russell, 2007), this concept has made its accessibility to many organizations on a national and international level. Offshore outsourcing has provided many businesses with the opportunity to harvest the benefits of lowering labour costs in developing countries (Frayer *et al.*, 2000) and also exploiting the value of artificially manipulated foreign currencies, where the exchange rate is undervalued. Countries that have benefited on these outsourced programs include India, china and Latin America. According to Russell (2007), almost every organization applies the outsourcing concept in some way.

Typically , the function being outsource is considered non-core to the business. However, there exists instance where organizations have outsourced their core business (Bengtsson and Haartman, 2007). These authors have reported that in their studies about 50% of engineering companies outsourced manufacturing, a process that is viewed as a core business. This study also reported that outsourcing is more common among larger companies than smaller ones. Embelton and Wright (1998) add that large organizations are doing more extensive outsourcing than small to medium size firms especially for maintenance and repairs outsourcing MRO. The study also indicated that manufacturing organizations seem to do less outsourcing than other commercial enterprises. In this study, 80% of the firms doing substantial and extensive outsourcing of MRO had revenues of over \$5 billion. For strategic items, only 15% of the companies reported moderate to extensive outsourcing activity. More than half of this group is composed of companies with \$5 billion or more in annual revenue.

Outsourcing entered the business lexicon in 1980s since then many organizations have embraced this concept with major interest if reducing costs and also focusing on the core competencies which would contribute greatly to performance of their companies. According to Automated Data Processing (2007), 100% of Canadian executives surveyed agreed that outsourcing allows their companies to focus on their core competencies, 89% of these respondents also identified payroll as the best candidate for business process outsourcing in an endeavor to reduce costs.

In Kenya, the organizations that have adopted the concept of reengineering of their process have mainly done so in an effort to reduce costs. In an interview with some key players in the manufacturing process in Nairobi (March 2007), they asserted that outsourcing of processes had greatly contributed to the good performance of their organizations. This achievement was mainly attributed to cost reduction, enhanced focus on core business and increased flexibility and efficiency of their process, this confirms their reports in literature (Elmuti, 2003).

According to Johnson & Scholes (2007), many managers find the process of developing a useful set of performance indicators for their organizations difficult. One reason for this is that many indicators give only a useful but partial view of the overall picture. Also some indicators are qualitative in nature, whilst the hard quantitative end of assessing performance has been dominated by financial analysis. In an attempt to cope with this very heterogeneous situation, balanced scorecards have been used as a way of identifying useful but varied set of measures. Balanced scorecards combine both qualitative and quantitative measures, acknowledge the expectations of different stakeholders and relate an assessment of performance of different stakeholders and relate an assessment of performance to choice of strategy. Currently, outsourcing has taken many forms (Russell, 2007; Kakabadse and Kakabadse, 2002).

In Literature, the most common forms are information technology outsourcing (ITO) and business process outsourcing (BPO). Business process outsourcing encompasses call centre outsourcing, human outsourcing. These outsourcing deals involve multi-layer contact that can run into billions of dollars (Russell, 2007). Outsourcing is the practice of using outside firms to handle work done within a company and is a familiar concept to many entrepreneurs. Small companies routinely outsource their payroll processing, accounting, distribution and many other important functions often because they have no other choice. Many large companies turn to outsourcing to cut costs. In response, entire industries have evolved to serve companies outsourcing needs. But not many businesses

thoroughly understand the benefits of outsourcing. It is true that outsourcing can save money, but that is not the only reason to do it. As many firms discovered during the outsourcing mania of the early 1990s, outsourcing too much can even be a bigger mistake than not outsourcing any work at all. This creates the need to understand it well as to apply it. ([www.allbusiness.com](http://www.allbusiness.com)).

### **Effects of Outsourcing on Performance:-**

#### **Increased productivity:-**

Smith (2000) noted that organizations around the world are continuously considering outsourcing as a strategic management tool which can be leveraged to allow them to focus on their core competencies. Non-core processes should be outsourced allowing the organization to realize financial and competitive advantages by reallocating internal resources to focus on core competencies. Okafor (2005) established that the practice of outsourcing began simply as a cost cutting technique and developed to a core strategic activity aimed at enabling companies focus on their core business. This concentration on the core competencies leads to improved efficiencies and productivity. Elmuti, (2003) affirmed that traditional outsourcing emphasizes on tactical benefits like cost reduction but this has recently been replaced by productivity, flexibility, speed and innovation in developing business applications and access to new technologies and skills. Once an outsourcing of certain processes takes place, it becomes easier for the company to compare and evaluate the efficiency and effectiveness of services that are being delivered from outside to inside. This trend is leading to an increased keenness to outsourcing process that are considered non-core yet critical activities.

Russel, (2003) outlined that it is now clear for many outsourcing companies that what began 25 years ago as a cost cutting measure has evolved into an important way of achieving efficiency with the organizations. Over the years, there has been a change in the type of work that is being outsourced by firms. There has been a shift from single clerical type of work to more skilled, professional type of services. Several firms have developed different methods of achieving efficiency and productivity. Though what stands more are the generally accepted world class process improvement systems that are widely acceptable. Most of these process improvement systems employed by organizations are aimed at improving efficiency and productivity. This is because these systems eliminate defects: resolve respective quality and productivity issues. The first efforts of improving quality are usually on improving their process and hence productivity (Brecker Associates, 2007)

In Kenya Microsoft reported company growth due to the outsourcing of noncore services. This was through working with local service providers who gave it better control of its processes by working closely with companies within reach. This created local partnership and built efficiency. Despite the growing significance of outsourcing, there is a limited understanding of performance outcome of the firms that engage in outsourcing. Literature is abounding with contradictory information on the effect of outsourcing on the efficiency and productivity of the process. These differences are varied as the many types of operations (The Standard, May 16, 2007)

#### **Costs/value addition:-**

Russell (2007) pointed out that even when a business attempts to improve customer services or increase quality; it does so within the framework of cost reduction. In most professional Organizations typically have 10% or more profit opportunity hidden in their business that can be achieved through reduction of costs. These hidden profits can be trapped through outsourcing as a strategic tool in most organizations.

Ellram (1997) asserts that outsourcing not only impart an organization with the best practices, but also brings about greater level of integration among processes and technology. Good outsourcing drive high level of efficiency, hence improved profits.

When choosing suppliers or vendors, sourcing managers must compare options based on the supplier's impact on the total cost of ownership (TCO). Several other factors besides purchase price are included in TCO analysis. They may include: replenishment lead time, on-time performance, supply flexibility, delivery frequency, supply quality, inbound transportation cost, pricing terms, information coordination capability, design collaboration capability, exchange rates, taxes and supplier viability. There is a three step process to evaluate supplier using the total cost of ownership concept: Identify all activities to be captured in TCO, qualify cost drivers using activity-based costing and calculating the TCO of each supplier (Chopra and Meindl, 2007).

In many firms the understanding of concept of outsourcing stops at the process of cost cutting. Indeed, shareholders are still putting pressure on managers to cut costs. This pressure to cut costs and reorganize has been felt most strongly in vertically integrated companies. While the internal importance of these efforts has been evident, cost reduction is gaining increasingly more attention from companies as well. In addition, consultants and companies frequently use cost saving figures when discussing the success of the latest business initiative, including strategic sourcing. Outsourcing is not only based on cost advantage but also viewed as an integral part of creation of sustainable competitive advantage in today's business should possess a competitive advantage in order to compete effectively in the market place (Corbett, 2004).

#### **Quality improvement:-**

Elmuti (2003) reported that quality improvement was one of the top reasons why organizations undertake outsourcing projects. This supports previous findings (Quinn, 2000) that outsourcing was undertaken for purposes that have impact on the organization's bottom line, quality and other reasons. Corbett (2004) adds that poor quality of products and services are accepted by consumers because accountability systems regarding consumer or user feedback are limited. In order to maintain or increase quality many outsourcing firms employ quality management models such as Six Sigma, TQM and lean thinking. He adds that outsourcing increases productivity, quality services as well as substantially lowering the firm's and consumer costs. The ability to influence the quality of outsourced production or services depend on the consumers and producers.

The ability to influence the quality of the outsourced production/services depends on the relationship between the client and service provider. If not handled well the product quality suffers. In order to maintain high quality, it is important to employ quality management system. Outsourcing has contributed greatly to the enhancement of quality in organizations because this concept involves the process of concentration on core competencies, hence quality output (Robinovich *et al*, 1999)

Outsourcing leads to improved customer service in terms of efficient attendance of customer issues and faster document delivery to customers (Brown, 2007). Limited information is available on the effect of outsourcing on quality improvement on products and services in Kenya. Hence the need for this study.

#### **Critical review:-**

Although outsourcing is a bound with benefits to the organization there are several other disadvantages or constraints that companies must be aware of because they might affect their performance (Kendrick 2007) companies should therefore strive to minimize the potential effect these risks could bring into their business. It should also be noted that there may be other factors that determine the extent of success of outsourcing that may out of the control of the organization.

#### **Conclusion:-**

From the review, it is evident that outsourcing affects productivity, costs and quality and thus the performance of an organization. This has been reflected by the high response which favours the variables with regard to outsourcing and subsequently the organizations performance. It is noted that the following services are outsourced: cleaning services, software development, renovations, security and catering services. Outsourcing was also noted to lead to cost saving, receipt of quality goods and services, efficiency in the organization and competitive prices for the goods and services outsourced the said in the productivity of the K.I.A for example. Outsourcing was also noted to affect costs since it leads to reduced costs of spending, outsourced services were cheap to maintain and that the outsourced services are timely thus reducing the costs of spending. Outsourcing also affected quality of goods and services procured as it enabled procurement of up to standard and this in turn affected the performance of the organization.

#### **Recommendations:-**

Based on the review findings, the following recommendations apply:

#### **Improving on Outsourcing:-**

Based on this study it would be concluded that evaluation of the tenderers, monitoring of performance, transparency in bidding process, supervision of staff, the tendering process done by independent company and the auditing of the local purchase orders and vouchers for contracts had positive impact. This would improve the outsourcing process and therefore the performance of the organization.

**Improving on Productivity:-**

The analysis did suggest that competitive bidding, use of tenders to select suppliers, personnel involvement in the outsourcing process, price analyses and creation of awareness among staff should be enhanced and taken seriously so that the staff should be able to look at outsourcing as a cost cutting activity of the Institute and not as a way of taking over their jobs.

**Improving on costs:-**

The bulk buying, procurement of approved goods and services, hiring qualified personnel and evaluation of process to identify the best line of fit

**Improving on Quality:-**

The respondents suggested that there should be a clear policy that supports the current procurement Act within the Institute and the policy should be tied together with the Institute's outsourcing activities, before outsourcing, or putting open advertisement when requesting interested parties to bid for outsourcing services contracts, for the suppliers to buy and compete, giving specifications of outsourced services and goods, identification of the best brand in the market, and checks to ensure goods and services procured are of high quality.

**Suggestion for further research:-**

The study only focused on Kenya Institute of Administration. Further research should be done in the public sector and other organizations on the effect of outsourcing on the organizational performances. This will give a broader scope of the effects of outsourcing on organizational performances in the public sector

#### Abstract

**Background:** Migraine prevalence in KSA range from 2.5 to 5% according to a study conducted in 2010. Chronically affected migraine patients are more likely, than other headache patients, to overuse analgesics. Overuse of analgesics among patients with episodic migraine put them at great risk of getting chronic migraine. The Aim of this study is to determine whether students with migraine in Dammam and King Faisal universities overuse analgesics or not.

**Subjects and methods:** A cross sectional study was conducted in July 2016 among students with migraine in Dammam and King Faisal universities. Participants (n =195) completed a questionnaire to assess current migraine medication and how many days the medications are used per month.

**Results:** 143 (72.8%) students are using drugs to relieve headache once it has started. 12 (6.2%) students out of the total responders reported analgesia overuse. Panadol was the most commonly used medication by over users. 10 (83.3%) out of the 12 consumed it (P= .071). Panadol was followed by Ibuprofen that was taken by 5 (41.7%) overusers, followed by Aspirin which was taken by 2 (16.7%) of the overusers.

**Conclusion:** This study showed that small percentage of the participants were overusers. Even though most of the participants were from medical and medical related colleges, most of the overusers were from non-medical colleges. In general, Panadol was the most consumed drug by participants followed by Ibuprofen.

#### Introduction:-

Migraine is the third prevalent disorder worldwide affecting 11% of the population. Globally, it is the seventh leading cause of disability. Migraine prevalence in KSA range from 2.5 to 5% according to a study conducted in 2010. In general, another study conducted in Al-Khobar in February 2010 showed that headache syndromes were the most common neurological complaints in adult. In addition, it is found that mean headache-attributed lost work-days per person/year for migraine was 24.0 days in KSA. <sup>[1-3]</sup>

**Corresponding Author:-Ashraf Ahmed Zaher.**

Address:-Neurology department, King Faisal University, KSA-Mansoura University, Egypt.

Unfortunately, chronically affected migraine patients are more likely, than other headache patients, to overuse analgesics.<sup>[4]</sup> Each year, 2.5% of patients with episodic migraine (EM) develop new-onset chronic migraine.<sup>[5]</sup>

Overuse of analgesics among patients with episodic migraine put them at great risk of getting transformed migraine, progression from episodic migraine (<15 days/month) to chronic migraine. Analgesics overuse can cause medication overuse headache.<sup>[6]</sup> Medication overuse headache is a condition that can complicate any type of headache including migraine due to overuse of all kind of acute headache medications.<sup>[7]</sup> The Aim of this study is to determine whether students with migraine in Dammam and King Faisal universities overuse analgesics or not.

## **Subjects and Methods:-**

### **Study Design:-**

A cross sectional study was prepared to assess analgesics overuse among participants.

### **Study Area and population:-**

This study was conducted in July 2016 among students with and without migraine in Dammam and King Faisal universities.

### **Sampling procedure:-**

Sequential sampling was done. Sample collected through total coverage of the study population between 24<sup>th</sup> of July and 2<sup>nd</sup> of August 2016.

### **Questionnaire sheet:-**

A well-structured questionnaire was designed in English and Arabic languages, including biographical data; age, name of the university and college, year of study and gender. In addition, it includes questions about the characteristic symptoms of migraine and how many of them the participant is experiencing, was the participants with headache diagnosed by a physician and which type of headache was his/her diagnosis. In addition, the questionnaire contains questions about type of drugs used by participants to relieve headache and how many days the chosen drug/drugs is/are used per month. This questionnaire was distributed online using social media with a written briefing for the aim of the study.

### **Statistical Analysis:-**

The statistics were performed by using software program SPSS version 21. Data were presented as frequencies and percentages. Also, the chi-square test and t test were used for the comparison and to assess the possible associations between different variables.

## **Results:-**

During the study period, 218 university students participated in the questioner. Among the 218 responses that were collected, 23 were excluded because of incomplete informations. Finally, a total of 195 university students were enrolled in the study.

57 (29.2%) students are male and 138 (70.8%) are female with mean age  $22.18 \pm 1.95$  years. 95 (48.7%) students from King Faisal University and 100 (51.3%) from University of Dammam, 120 (61.6%) are studying in college of medicine and medical related colleges (including Dentistry, Applied Medical Sciences and pharmacy colleges) while 75 (38.4%) are studying in non-medical related colleges. 9 (4.6%) are studying in 1<sup>st</sup> year, 17 (8.7%) in 2<sup>nd</sup> year, 42 (21.5%) in 3<sup>rd</sup> year, 38 (19.5%) in 4<sup>th</sup> year, 36 (18.5%) in 5<sup>th</sup> year, 19 (9.7%) in 6<sup>th</sup> year and 34 (17.4%) in 7<sup>th</sup> year (medical interns).

Out of the 195 students, 158 (81%) stated that they have 2 or more headaches in last 3 months. From these 158 students, 129 (81.6%) have headache that limits their ability to work, study or enjoying life, 97 (61.4%) students want to talk to a healthcare professional about headache they have, 66 (41.8%) already consulted their healthcare professional about their headaches, and their physician told them what kind of headache they suffer from. Table 1 summarizes the frequency of diagnoses that students gave. The most common diagnosis was migraine where 38 students (9 males and 29 females) report it followed by headache due to stress in which 11 students (2 males and 9 females) and tension headache in which 7 students (3 males and 4 females) report them. 104 students (65.8%) out of the 158 felt nauseated or sick to stomach with headache, 111 (70.3%) experienced photophobia with headache, and

122 (77.2%) had headaches that limited their ability to work, study or do what they need to do for at least one day in the last 3 months.

Out from 195 students whom participated in the study, 143 (72.8%) students are using drugs to relieve headache once it has started. The most commonly used medications by students was Panadol (Paracetamol), which was consumed by 114 (79.7%) students followed by Ibuprofen which was used by 54 (37.8%) students. Table 2 summarizes the medications used by the students.

Students also asked regarding number of days per month they take medications to relieve headache. Results are shown in table 3. 12 (6.2%) students out of the total responders reported analgesia overuse according to the revised criteria of the International Classification of Headache Disorders 2<sup>nd</sup> Edition (ICHD-IIR) for medication-overuse headache. A medication over user was defined as a person overusing acute headache medication in terms of treatment days / month ( $\geq 10$  days/ month for ergotamine, triptans, and combination analgesics;  $\geq 15$  days/month for paracetamol, ASA, and NSAIDs) during the previous 3 months.<sup>[8]</sup> The mean age of the over users was  $22.833 \pm 1.337$  years ( $P = .231$ ). 8 of the over users (66.7%) are female while 4 are male (33.3%) ( $P = .747$ ). 9 (75%) are from non-medical colleges while 3 (25%) from medical and medical related colleges ( $P = .007$ ). Regarding the kind of headache in the over users, 3 (25%) of the over users have headache due to stress, 2 (16.67%) of them due to migraine, another 2 (16.67%) due to tension headache, 1 (8.33%) due to neck problem and 4 (33.33%) did not consult a healthcare professional about their headaches ( $P = .141$ ).

Panadol was the most commonly used medication by over users. 10 (83.3%) out of the 12 consumed it ( $P = .071$ ). Panadol was followed by Ibuprofen that was taken by 5 (41.7%) over users, followed by Aspirin which was taken by 2 (16.7%) of the over users.

**Table 1:-**Number of diagnosed students and their headache diagnoses

Diagnosis	Number of students	Percent
Migraine	38	57.6
tension headache	7	10.6
Cluster	3	4.5
Stress	11	16.7
neck problem	2	3.0
I don't remember	3	4.5
Other (e.g. sinusitis)	2	3.0
Total	66	100.0

**Table 2:-**Summary of medications used by students

Name of medication	Number of students using it	Percent
Aspirine, Aspro, Aspégic	13	9.1%
Dafalgan	3	2.1%
Panadol	114	79.7%
Panadol + Codéine	17	11.9%
Ibuprofen, Brufen, Nurofen	54	37.8%
Primpéran	1	0.7%
Motilium	1	0.7%
Imitrex	2	1.4%
MaxaltRelert	1	0.7%
Naramig	2	1.4%
Family recipe	8	5.6%
Varapamil	1	0.7%
Corticosteroids	1	0.7%
Ergotamine	1	0.7%
Propranolol	1	0.7%
Eletriptan	1	0.7%

**Table 3:-**Number of days per month in which medications are used by students to relieve headache

Number of days	Number of students	Percent
Less than one day per month	81	41.5
1-3 days per month	56	28.7
4-9 days per month	37	19.0
10-14 days per month	11	5.6
15 days or more per month	10	5.1
Total	195	100.0

**Discussion:-**

This is the first study to evaluate Overuse of analgesics among students with migraine in King Faisal and Dammam Universities. The present study demonstrate high consumption of paracetamol by participants. It is consumed by 114 (79.7%) students followed by Ibuprofen which is consumed by 54 (37.8%) students. These results are in agreement with another study conducted in Belgium between December 2009 and May 2010, shows that paracetamol is the most purchasing OTC analgesic by pharmacy customers. Low percentage were consider overusers<sup>12</sup> (6.2%) out of the total responders. In contrast to the previous study, there were high prevalence of medication overuse (24%) among pharmacy customers.<sup>[9]</sup> In addition, another study conducted in china shows that overuse of Acetaminophen-containing agents are common in Chinese patients with chronic Migraine. Those patients are found to have a longer duration of headache, more severe pain intensity and a higher frequency of elevated BP.<sup>[10]</sup>

**Conclusion:-**

This study showed that small percentage of the participants were overusers. Even though most of the participants were from medical and medical related colleges, most of the overusers were from non-medical colleges. In general, Panadol was the most consumed drug by participants followed by Ibuprofen.

**Study limitation:-**

The participants were not interviewed by neurologist to confirm the diagnosis.

#### Abstract

The care a newborn receives depends a lot on the knowledge, skills and attitude of the mother. This study aimed to assess the level of knowledge on new born care between primipara and multipara in selected hospitals of Tricity. A quantitative approach with descriptive, comparative research design was adopted. By purposive sampling technique 160 postnatal mothers were selected. Structured Interview Schedule was used to collect the data from postnatal mothers in civil hospital in the month of December. Study finding shows majority of the primipara mothers (96.2%) had average knowledge, 73.8% of multipara had good knowledge on newborn care.

#### Introduction:-

The birth of a baby is one of life's most wondrous moments. The first week of life is the most crucial period in the life of an infant. In India 50-60% of all infant deaths occur within the first month of life. Of these, more than half may die during the first week of birth. This is because the newborn has to adapt itself rapidly and successfully to an alien external environment. The risk of death is greatest during the first 24-48 hrs (PARK K 2005). The ideal basic needs for any newborn include breathing, warmth, cleanliness and mother's milk. Colostrum, the yellowish, sticky breast milk produced at the end of pregnancy, is recommended by WHO as the perfect food for the newborn and feeding should be initiated within one hour of birth (WHO) (UNICEF). Recent researches are concerned with topics of newborn care giving, maternal knowledge and practices because it facilitates growth and development, protection against infection and detection of any abnormalities. The study revealed that mothers' knowledge and practices were within good and satisfactory average scores in most of the studied items related to newborn care giving at home except breast feeding. Significant differences were found between primipara and multipara mothers for most of the studied topics related to different topics of newborn care giving (McMillan J S). The mother is the key person in maintaining the health status of her child.

#### Materials and Methods:-

A quantitative approach with descriptive, comparative research design was adopted. The study was conducted in Civil hospital, phase 6 and Liberty hospital, 3b2 Mohali. Sample of the study includes 80 primipara and 80 multipara within 7 days of their delivery who fulfill the inclusion criteria. By using non – probability, purposive sampling technique 160 antenatal mothers were got selected for the present study. Interview schedule with Structured Knowledge Questionnaire on Newborn care was used to collect the data.

Present study shows that majority of the primipara mothers (96.2%) had average knowledge, 2.5 % had poor knowledge & only 1.2% had good knowledge, whereas most of multipara (73.8%) had good & 26.2% had average and none them had poor knowledge on newborn care. Calculated chi-square test ( $\chi^2 = 90.067, 0.000, p < 0.05$ ) shows that multipara have more knowledge on newborn care than the primipara mothers. The supportive study on breast feeding shows that the average knowledge scores was 70.90%.

Present study also shows that the multipara have higher knowledge on breast feeding (  $t = -10.680, 0.000; p < 0.05$  ), eye care (  $t = -7.707, 0.000; p < 0.05$  ), thermoregulation (  $t = -8.494, 0.000; p < 0.05$  ), immunization (  $t = -9.336, 0.000; p < 0.05$  ) than the primipara. One more supportive study to assess the level of knowledge of postnatal mother on new born care where as Primipara mothers had comparatively more knowledge on newborn health (mean % score: 72.13) than multipara mothers (mean % score: 7.38).

Present study findings shows that there is an association between the level of knowledge and religion, mode of delivery and source of information. The supported study shows that there was statistically significantly association between knowledge of newborn care with socio demographic variable (3.92) and there was no association found between knowledge score when compared to age, occupation, type of family and religion.

Constitutional Rights, Customary Law  
 People, Civil Rights, Coastal Area

**Abstract**

A claim of State to the sea territorial ownership as a right to control the State, its purpose for the greatest prosperity of the people, but can interact directly with civil rights to customary law people in the coastal areas. The potential for conflict is caused due to the conflict over the ownership of the natural resources management and its utilization in the coastal areas between customary law people and state. On one hand, the 1945 Constitution provides assurance, recognition and respect for the unity of customary law peoples and their traditional rights as constitutional rights. But on the other hand, the state must intervene in the natural resources management in the coastal areas, because sea has a public function, and allow anyone to exploit the sea for various purposes. This means that the need for legal recognition explicitly against the civil rights of customary law people in the coastal areas in natural resources management and its utilization. Thus, the authority of state to defend the people's interests, in line with the interests of customary law people rights to defend their civil for the survival of their lives in the future.

**Introduction:-**

Coastal and marine areas have a strategic meaning and important for the future of Indonesia as the largest archipelago state in the world. Indonesia as the largest archipelago state in the world, which has a long coastline of 81.000 km and about 22% of the total population of Indonesia inhabit coastal areas.<sup>1</sup> This includes the majority of customary law people living in the coastal areas, and the coastal areas that provided life from generation to generation for concerned customary law people alliance.

Accordingly, Indonesia is an example of a "large coastal nation" in the same category as Australia, the United States and Canada.<sup>2</sup> We have large-scale geographic issues such as a broad range of climates, ecosystems, community structures and diverse sociocultural groups. Distance and remoteness are significant factors for communication and

governance. Indonesia can also be seen, paradoxically, as a “small island nation” in the same category as the Philippines and Micronesia with small-scale issues.

The existence of customary law people has been recognized by the state that “the State recognizes and respects the unitary of customary law people and their traditional rights as long as they live and in accordance with the development of society and the principles of the Unitary Republic of Indonesia”.<sup>3</sup> This statement is the foundation for customary law people to claim their constitutional rights, so how should the state act to treat customary law people to gain recognition and respect for their traditional rights. In other words, the meaning contained in Article 18B paragraph 2 of the 1945 Constitution is a constitutional mandate that needs to be adhered by the government, to regulate the recognition and respect for customary peoples in legislation.

Besides customary law people have the right, in fact also have obligations to land and natural resources around them. Between the rights and obligations there must be a strong balance so as to form the management of the environment and natural resources that integrates the social, political, natural, cultural, and religious from the life of customary law people.<sup>4</sup> Soegiarto argues that, “beside the coastal areas as the center of activity is also can become the center of conflict or clash between the interests of one sector to others.”<sup>5</sup>

The tenure area (land and marine) including the natural resources therein should be managed in a sustainable manner. To be managed in a sustainable manner, then right to the tenure area need to be on the indigenous peoples based on customary law prevailing in the area. This is important because in their mind the indigenous peoples are bound in communal and religious-magical (*cosmic*). Such mind views everything in this life as a homogeneous unity, in which human life affect each other and are interdependent on each other. All are in a balance should always be maintained.<sup>6</sup>

The phenomenon that occurs associated with the ownership and natural resources management in the coastal areas still leaves internal conflicts between the state authorities and indigenous peoples. On the one hand, the state claimed that the management of coastal areas as domain of state, while on the other hand, the rights of customary law people to the tenure rights of coastal areas is a part that cannot be removed apart from the customary law life, and it is constitutionally recognized by the state.<sup>7</sup> The reality of civil rights in coastal areas has actually become the property of the customary law people, but its allocation is often claimed to be the property of the state. As described above, the issue of this research was to analyze the civil rights of the customary law people in the coastal areas in Indonesia.

### **Method of the Research:-**

The type of study was a normative research, with the object of study on the provisions of applicable law, both nationally and internationally, in order to answer the issues faced. The approaches used in this research were statute and conceptual.

### **Civil Rights in Normative Perspective: -**

Legal protection against the customary law people is closely associated with the right. According to George W. Paton,<sup>8</sup> that there are 4 (four) elements in any legal rights, which are: “(1) the holder of the right; (2) the act or forbearance to which the right relates; (3) the rest concerned (the object of the right); (4) the person bound by the duty.”

<sup>8</sup>George Whitecross Paton, *A Textbook of Jurisprudence*, 3rd ed., University Press, Oxford, 1964, p. 249

Rights are all things that must be obtained by any person who has been there since birth and even before birth. In the Indonesia's Dictionary a right has a sense of the right thing, property, ownerships, authority, power to do something (as determined by the Acts, rules, etc.), power is right on something or to demand something, degree or dignity.<sup>9</sup>

When talking about civil rights, then it is very closely related to the rule of law governing those rights. An understanding of civil rights is actually composed of two types of civil rights: *First*, the right is absolute, includes: a) The right of personality, for example: the rights to name, to honor, to life, liberty and so forth; b) The rights located in family law, that is rights and duties of husband and wife, the relation of parent and child; c) absolute right to the object, is called as the right of material. *Second*, the right is relative, that is, all rights arising from the engagement relationships that sourced in the agreement and law. This right is called as the rights of individuals.<sup>10</sup>

Absolute right of land ownership as an immobile object can be owned by humans, and are included in the category of material rights. "Article 499 of Civil Code/BW can also know the sense of objects as all things that can be owned or which may become the object of property rights".<sup>11</sup> The provision gives a description that everything that can be owned by human is object, so that cannot be had for example the sea, moon, stars and so on, not an object."<sup>12</sup>

Land tenure rights as in Act No. 5 of 1960 on the Basic Regulation of Agrarian (BAL) contains several levels of land tenure, namely: 1) Right of Indonesia nation; 2) Right to control of the State; 3) Tenure rights of customary law people; 4) Individual rights. Explained that the right to control the state set out in Article 2 of the BAL, the authority contained in the right to control of the state is a public authority, so that this right is not similar as the concept of the domains imposed by the Dutch colonial government.<sup>13</sup>

Customary rights as a part of civil rights owned by the customary law people, as stipulated in Article 3 of the BAL, according to BoediHarsono that customary rights is "a series of authorities and duties of a customary law people relating to the land located within the territory. The subject of the customary rights are customary law people, both territorial (living in the same area) and genealogic (bound by ties of blood). Thus, the customary rights land that has been occupied by the customary law people since long time ago it is part of state-owned land. Thus, the argument of BoediHarsono provide an understanding that the customary rights of indigenous peoples are not categorized as belonging to the customary law people.

Civil law especially Indonesian agrarian law illustrates that in fact "there is no inch of land at the Indonesian state is what is called *res nullius* or no mans' land."<sup>14</sup> While in a customary law perspective looked for the principle of *res nullius* as communal land ownership and it is not transferable to the individual. Humans as right users in its relation to the rights of state, then Civil Code, Article 1, explains, "Enjoyed civil rights cannot depend on state rights".<sup>15</sup>

The customary rights of sea or marine tenure in Maluku are related to the concept of ownership. An understanding of the marine tenure when linked to the marine tenure in Maluku province, the concept of ownership is reflected in the "marine tenure region" which in the aspect of boundaries shows the boundaries of tenure region is unclear. In other words, the rights of marine tenure as a concept of ownership by the customary law people are clearly exist and be recognized. However, differences in the perception of boundaries of marine tenure area are based on a different understanding between the peoples of each region (*customary villages*) is a matter that cannot be denied.<sup>16</sup>

Although according to the law, every human being is a bearer of rights without exception, but there are restrictions. Elements that limit for the right is: a) Citizenship;<sup>17</sup> b) Residential;<sup>18</sup> c) Position;<sup>19</sup> d) Behavior and deed;<sup>20</sup> e) Gender; f) the condition of absenteeism (Article 463 of the Civil Code).<sup>21</sup>

#### **Customary Law People as Constitutional Guarantees: -**

The term of “indigenous peoples” is a common term used in Indonesia, whereas in the science of law and theory are formally known as “customary law people.”<sup>22</sup>The sense of indigenous people and customary law people in this paper is same its meaning. The State recognizes and respects the unity of indigenous peoples and their traditional rights as long as they live, and in accordance with the development of society and the principles of the Unitary State of the Republic of Indonesia, which is regulated by law.<sup>23</sup>So, through the constitution, the State recognizes and respects the unity of indigenous peoples and the rights attached to it as the living law.

Recognition of the unity of indigenous peoples should be respected and upheld by the state, due to the fact that the lives of indigenous peoples in Indonesia have existed long before the state there.<sup>24</sup> The state should provide protection of the rights inherent in customary law peoples, such as marine tenure rights in the coastal areas. Hence, in the 1945 Constitution, states that “The cultural identity and traditional community right must be respected in accordance with the period and civilizations.”<sup>25</sup> Therefore, according to Asshiddiqie on the categories of indigenous people can be said to be still living in reality, as follows:

1. The communities are still indigenous, the tradition is still practiced, and available records on that tradition;
2. The communities are still indigenous and also their traditions exist, but the records are not available;
3. The communities are not indigenous anymore, but their tradition is still practiced and also provided adequate records;
4. The communities are not indigenous anymore, and also not available records about it, but their tradition is still alive in practice.<sup>26</sup>

Definition of customary law people according to Act No. 1 of 2014 on the amendment of Act No. 27 of 2007 on the Management of Coastal Areas and Small Islands were “the coastal communities group for generations living in a particular geographical area because of their ties the ancestral origin, the existence of a strong relationship with the coastal resources and small islands, as well as their value system which determines the economic system, political, social, and legal.”<sup>27</sup> While, the meaning of coastal area as transition regions between terrestrial and marine ecosystems are affected by land and marine changes.

The scope of regulation of coastal areas and small islands includes the transition between the terrestrial and marine ecosystems are affected by changes in land and marine, towards the land covering the sub-district administration area and towards the marine covering as far 12 (twelve) miles measured from the coastline. Samik Wahab argued

<sup>17</sup> Only Indonesian Citizen who has the property right (See: Article 21 (1) UUPA).

<sup>18</sup> Only who living in the same sub-district with the position of agricultural land as the owner (See: Article 10 (2) UUPA).

<sup>19</sup> For a judge and other law officials are not obtaining the goods that still in a case.

<sup>20</sup> See, Article 49 and 53 of Act No. 1 of 1974, in which regulate the provisions that the power of parent and guardian may be evoked with the court’s decision and in this case is very neglected duties as parent/guardian behave badly.

that, “the coastal area that will cover all areas inland were still influenced by processes related to the marine and toward the marine are still influenced by processes that occur on the inland.”<sup>28</sup>

In general, civil rights for the customary law people may be right is absolute, in which the right to respect for recognized the existence of the customary law people, the right to live and to have a decent living in their area, and also the absolute right of an object/material already has for generations, such as customary rights consist of land, water and natural resources. Furthermore, Bushar Mohammed,<sup>29</sup> said the object of customary rights includes: land; water (such as: river, lakes, beaches and its waters); the plants that live in the wild (fruit trees, trees for timber or firewood, and so on); and free-living wild animals in the forest.

Depart from the construction, this means that among the civil rights of customary law people that inhabit coastal areas may be customary rights on the mainland and in coastal marine waters. If it can be described civil rights to those that can be managed by customary law people, civil rights in the sea waters may be; fish, sea cucumber, shellfish, seaweed, reef, beach sand, gravel, and mangroves. While, the civil rights of customary law people in the mainland may be; land/forest, fruit trees, trees for timber or firewood, and wild animals. Utilization of civil rights in the form of natural resources, conducted to maintain the viability of customary law people that inhabit coastal areas.

In fact, at historical level, the rights of customary law people in coastal areas are already there all along, but needs to be reinforced by the rule of law, so that there is legal certainty which protects the interests of customary law people in the coastal areas. And needed the customary law people be given the rights and duties under the law, which must be met related to the use and management of coastal areas, in which the rights of customary law people were:

- (a) Get access to coastal waters parts that have been given a permit of location and use it;
- (b) Propose a traditional fishing area in the Zoning Plan for Coastal Areas and Small Islands (RZWP-3-K);
- (c) Propose the territories of customary law people in RZWP-3-K;
- (d) Perform the management of coastal resources and small islands is based on customary law and not contrary to the provisions of the legislation;
- (e) Get the benefits of the implementation of the management of coastal areas and small islands;
- (f) Get information regarding the management of coastal areas and small islands;
- (g) Propose reports and complaints to the competent authorities for losses to them with regard to the implementation of the management of coastal areas and small islands;
- (h) Declare an objection to a management plan that has been declared within a certain period;
- (i) Report to law enforcement officers for alleged pollution, contamination, and/or destruction of coastal areas and small islands is detrimental to life;
- (j) Propose a complaint to the court against various problems of coastal areas and small islands is detrimental to life;
- (k) Obtain compensation; and
- (l) Get assistance and legal aid to the problems faced in the management of coastal areas and small islands in accordance with the provisions of the legislation.<sup>30</sup>

The duties of customary law people in the management of coastal areas and small islands are to:

- (a) Give information regarding the management of coastal areas and small islands;
- (b) Maintain, protect, and preserve the coastal areas and small islands;
- (c) Inform report the occurrence of hazards, pollution, and/or damage to the environment in coastal areas and small islands;
- (d) Monitor the implementation of the plan of management of coastal areas and small islands; and/or
- (e) Implementing the program of the management of coastal areas and small islands as agreed at the village level.

Also, the legislation provides duties for governments to take the customary law people in the management of coastal areas, that:

- (1) Government and local government are obliged to empower communities to improve their welfare.

<sup>28</sup>A. Samik Wahab.(1998).*Perubahan Pantai dan Kajian Pembangunan Pantai Utara Jawa Tengah*.(Report). LPM Gadjah Mada University, p. 37

<sup>29</sup>Bushar Muhammad. (1983).*Pokok-pokok Hukum Adat*. Jakarta: Pradnya Paramita, p. 109

<sup>30</sup>See Article 60 paragraph (1) Act No. 1 of 2014 on the Amendment of Act No. 27 of 2007 on the Management of Coastal Area and Small Islands

- (2) Government and local government shall encourage business activity of communities through capacity building, provision of access to technology and information, capital, infrastructure, market guarantees, and other productive economic assets.
- (3) In order for community empowerment, the government and local governments realize, develop, and increase awareness and responsibility in:
  - (a) Decision-making;
  - (b) Implementation of management;
  - (c) The partnership between the community, business, and government/local government;
  - (d) The development and implementation of national policies in the field of environmental;
  - (e) The development and implementation of preventive and proactive efforts to prevent a decrease in the carrying capacity and the capacity of coastal areas and small islands;
  - (f) The use and development of environmentally friendly technologies;
  - (g) Supplying and dissemination of environmental information; and
  - (h) Awarding to those who contributed in the field of management of coastal areas and small islands.
- (4) Further provisions concerning the guidelines for community empowerment regulated by the regulation of the minister.<sup>31</sup>

The reason the issuance of provisions regarding guidelines for community empowerment is regulated by the Regulation of the Minister of Marine Affairs and Fisheries of the Republic of Indonesia Number 40/Permen-KP/2014 concerning participation and communities' empowerment in the management of coastal areas and small islands, by give attention to the dynamics of participation and communities empowerment in the coastal areas. The purpose of this minister's regulation as basis and reference for the Ministry, local government, stakeholders and the public to realize participation and community empowerment in the management of coastal areas and small islands (PWP-3-K). With the aims to improve the effectiveness and sustainability in utilization of coastal areas and small islands; to improve the capacity and independence of the community to participate in PWP-3-K; to assure and protect the public interests in utilize coastal resources and small islands in a sustainable manner; and to strengthening the values of local wisdom to support the nation-building process in PWP-3-K.<sup>32</sup> That is, the customary law people have authority to use and manage natural resources in the coastal areas.

Abrar Saleng,<sup>33</sup> provides insight into the relationship of similarities and differences between customary rights with the right to state's control, namely:

- a) Subject, for customary rights is the legal community, not individuals, while for the right to state's control is the state.
- b) Object, for customary rights are land, water and natural resources (limited) in their territory, while the right to state's control is more widely, because in addition to all natural resources that exist in the territory of Indonesia, also the branches of production which are important for the state and dominate the life of many people.
- c) Content, for customary rights is a series of authorities and responsibilities includes: rule, giving way use of natural resources and maintenance, while the right to state's control are a number of authorities and public duties which include the setting, maintenance and monitoring of the use and utilization of all potential natural resources and the branches of production for the welfare of the people.
- d) Implementer, for customary rights is the Head of Law Alliance or Customary Chief, whereas for the rights of state's control is Government of the Republic of Indonesia.

A result of research by Professor R.Z. Titahelu,<sup>34</sup> against customary law people and the local communities that inhabit coastal areas and small islands in Maluku in managing natural resources on land and coastal and marine, have rules more or less is similar. Titahelu concluded that:

<sup>31</sup>See Article 63 paragraph (1) Act No. 1 of 2014 on the Amendment of Act No. 27 of 2007 on the Management of Coastal Area and Small Islands

<sup>32</sup> See Article 3 the Minister's Regulation of Marine and Fisheries Affairs of the Republic of Indonesia No. 40/Permen-KP/2014 on Participation and Communities Empowerment in the Management of Coastal Area and Small Islands

<sup>33</sup>Abrar Saleng. (2004). *Hukum Pertambangan*, Yogyakarta: UII Press, p. 52

<sup>34</sup>Ronald Z. Titahelu. (2014). *Aneka Masalah Masyarakat Hukum Adat Dalam Pembangunan*. Yogyakarta: Deepublish, p. 32-33

- 1) The coastal and marine resources in coastal villages and small islands, in some places used for living or for commercial purposes, while in others only used to sustain life only.
- 2) Recognition of government for the local/traditional management is important for people to achieve prosperity and environmental sustainability. Government recognition of community rights over the natural resources management (traditional fishermen or coastal community rights and natural resource management) should be legalized.
- 3) The rights of communities and authorities for natural resources management is a right that is not based on the administration of the state.
- 4) Recognition has more meaning for declarative statement rather than constitutive. More importantly, the recognition of the government should give effect to the public confidence that people have the capacity themselves to improve their lives better by practicing the local/traditional management to the natural resources around them.
- 5) Recognition of government affects the sense of local/traditional peoples in which they have ability to improve the living standards of their own to manage the resources around them. Legal recognition by the government is necessary.
- 6) It has consequences for community's lives. Traditional or local management is a reflection of the communities' condition, although for some conditions may change, because the community has dynamic life as they develop of current circumstances.

Titahelu's research emphasizes two key ingredients, that is: *First*, the people's right to manage the coastal and marine resources around them because it is assumed that they have ability to improve the living standards of their own; *Second*, the government's recognition of the rights of community is a requirement for people to achieve prosperity and sustainability of the environment.<sup>35</sup> This indicates a positive meaning that the development of people's political oversight in the utilization of natural resources, particularly in the coastal and marine resources does not come about through good will of the government solely.

In general, RohminDahuri<sup>36</sup> describing about coastal and marine environment as a source of "*common property resources*", so it has the function of public/public interest; sea is an "*open access*", allowing anyone to take advantage of ocean space for various purposes; sea is "*fluid*", where resources (marine) and *hydro-oceanography* dynamics cannot be partitioned; the coastal is a strategic area because it has the topography is relatively easy to develop and have a very good access (by utilizing the sea as movement "*infrastructure*"); the coastal area is rich in natural resources, both in the mainland and waters, which is needed to meet human needs.

Based on the statement above, it can be explained that there are differing ideas about the concept of coastal area management, that on the one hand the management of coastal and marine areas to allow anyone to take advantage of ocean for various purposes. On the other hand, argued that the interests of open access that make the coastal area as a resource that is not clear its tenure, so it is said that access to this resources is not regulated and open to anyone. Then, because the sea or marine as a common property resources has a public function in the public interest, and allow anyone to take advantage of ocean for various purposes, making the state should intervene in the natural resources management in the coastal and marine areas, for the achievement of equality and justice for all people, especially for local people or local customary law people.

The authority of State to control natural resources in Indonesia, stipulated in the 1945 Constitution of the Republic of Indonesia, describes that "earth and water and natural resources contained in it are controlled by the State and used for the greatest prosperity people".<sup>37</sup>Based on this statement, then the formulation of the meaning of State's control rights is to the natural resources management. According to P.M. Faiz,<sup>38</sup>state through the government has authority to decide on the use, utilization and rights to natural resources to regulate, administer, manage, and supervise the management and utilization of natural resources. Therefore, the natural resources that are important to

<sup>35</sup> *Ibid.*, 33-34

<sup>36</sup> RohminDahuri. (2003). *Paradigma Baru Pembangunan Indonesia Berbasis Kelautan*, (Scientific Oration), Institut Pertanian Bogor, Indonesia, p.15

<sup>37</sup> Article 33 paragraph (3) of the 1945 Constitution.

<sup>38</sup> Pan Mohammad Faiz, *Penafsiran Konsep Penguasaan Negara Berdasarkan Pasal 33 UUD 1945 dan Putusan Mahkamah Konstitusi*, <http://jurnalhukum.blogspot.com/2006/10/penafsiran-konsep-penguasaan-negara.html>, accessed on 15 December 2014.

the State and dominate the people, as it relates to the public utilities and public services, must be dominated by State and run by the government, where those resources should be enjoyed by the people in fairness, affordability, in an atmosphere of prosperity and general well-being are fair and equitable.

The principle of *res publicae in publicousu*, enabling the State to get authority to determine the use and utilization of resources in the public interest, it can be found in the form of State has the right to control the land, that “the State can perform a legal relationship such as individual objects with human as owner. Legal relation with the land included in the category of objects or land that used for public (*res publicae*). Thus, public roads and likes belong to the State”.<sup>39</sup>

#### **The Problem of Right Proprietary to Manage Coastal Area:-**

Neil Meyer,<sup>40</sup> a professor who is an expert in the field of agriculture, economics and rural sociology at the University of Idaho argues that “the problem of coastal areas and the development and management of which was never completed due to the system of *open access* that developed without any reinforcement by the State for the benefit of the coastal community. State’s intervention that makes all coastal area, marine, including small island as objects of state ownership so that its arrangements managed by the State.”

In conceptual can be said, the dualism of rights proprietary to manage the coastal area, which is between the State and the customary law people. Related to that, AbrarSalengargues their relationship is actually the similarities and differences between customary rights with the rights of State’s control are:<sup>41</sup>

- a) Subject, for customary rights is the legal community, not individuals, while for the right to state’s control is the state.
- b) Object, for customary rights are land, water and natural resources (limited) in their territory, while the right to state’s control is more widely, because in addition to all natural resources that exist in the territory of Indonesia, also the branches of production which are important for the state and dominate the life of many people.
- c) Content, for customary rights is a series of authorities and responsibilities includes: rule, giving way use of natural resources and maintenance, while the right to state’s control are a number of authorities and public duties which include the setting, maintenance and monitoring of the use and utilization of all potential natural resources and the branches of production for the welfare of the people.
- d) Implementer, for customary rights is the Head of Law Alliance or Customary Chief, whereas for the rights of state’s control is Government of the Republic of Indonesia.

Thus, the central- and localgovernment and the legislature as well as the unity of indigenous peoples in this case the agency has authority to recognize, justify and accept the rights of customary law people, need to understand several aspects, as follows:<sup>42</sup>

*First*;the authority for the territories of customary law people. Customary law people know very well their territory with clear boundaries obtained through a long historical process. Therefore, indigenous people need to communicate their communal land to surrounding communities, governments, and other parties by using similar language (media). This implementation can be to use a map, where in making a map is conducted in participative and in a simple technique, so that themap will be an effective tool to discuss the overlap of a region in their authority. The clarity of authority over the territory of customary law people can be done by agreement and acknowledgment by the surrounding community. Furthermore, requires explicit recognition from the government to the territory of customary law people was not transferred to another party, while ensuring the forest resources can be utilized. Clarity form of the customary law people’s authority can be done in the form of legal recognition of the customary law people by State Land Agency. In the case of the territory of customary law people first be given before the

<sup>39</sup> E. Algra. (1985).*Inleiding tot het NedherlandsPrivaatrecht*, W.E.J. TjeenkWillink, Zwolle, achtiendedruk, p. 121; WinahyuErwiningsih.(2009).“PelaksanaanPengaturanHakMenguasai Negara atas Tanah Menurut UUD 1945”, *JurnalHukum*,Special Issue: 118-136

<sup>40</sup>As cited on WALHI, Briefing Paper Harling, 2014, *DampakPolitikRejimKorporasiTerhadapSumberDayaPesisirdanPulau-Pulau Kecil di Indonesia DiTengah SituasiPerubahanIklimdanKrisisPangan Nasional*.

<sup>42</sup>BesseSugiswati.(2012).“PerlindunganHukumTerhadapEksistensiMasyarakatAdat Di Indonesia” *JurnalPerspektif*,17(1): 31-43.

decree is published, it can be negotiated by the parties concerned (customary law people in the territory, right giver and right recipient).

*Second*, it is the authority of customary institutions. The authority of a territory of customary law people is needed to prevent dual-recognition or recognition for a territory that is not its authority. In this case, there are several possibilities that can be done: 1. Recognition of the existence of indigenous peoples by the indigenous people themselves and from surrounding community about their institutional authority; 2. Recognition of the existence of indigenous peoples by the judiciary based on court decisions; 3. Recognition of the existence of indigenous peoples by a Council of Indigenous Peoples are elected by the indigenous peoples themselves.

*Third*, the authority on the pattern forest resource management. Management pattern that carried out by customary law people in general is based on the existing indigenous knowledge and grow in the community with all norms that regulate limitations and sanctions. This pattern is developing very dynamically in accordance with the times. Generally, these dynamic nature does not explicitly define the form of natural resource management; such as forest, farm or agricultural, so it requires sufficient understanding by local governments on these patterns.

The basic character of the rights proprietary of indigenous people over natural resources has the meaning of joint ownership or communal, so the characteristic of right collectivity of indigenous people over customary rights sourced from the concept of natural law with judicial nature, it means the judicial nature the natural law would lose its meaning, thus there are some juridical nature inherent in the natural law, as follows:<sup>43</sup>

- a) Applicability of the natural laws does not depend on enforced or not the rules of natural law by the authorities.
- b) Natural law is the direction of the attitudes and human nature.
- c) The rules of natural law would apply even if no orders from the authorities to enforce the natural law.
- d) Applicability of the natural law in spite of the enactment of positive law.
- e) Natural law is the supreme law of human, so that the enactment of legislation in the positive law cannot exclude the existence of the rules of natural law.
- f) Natural law applies anywhere and anytime.
- g) The rules of natural law are discovered by human's mind and rational.
- h) The basics of natural law derived from the legal norms and morals.
- i) There is an opinion stating that the rules of natural law are nothing other than the shadow of a concept of utilitarianism thought and moral principles.
- j) There is also the theory of traditional character, namely natural law theory of positive law.

Based on the understanding above, it should the meaning of civil rights to the customary law people in coastal areas becomes clear that is these rights should not be ruled out with the rules of existing positive law.

### **Conclusion:-**

The proprietary of civil rights of indigenous people in coastal areas to be so important, because the right proprietary to manage and utilize the natural resources in coastal areas already exist and belong to the customary law people before this State exist. Thus, the utilization of coastal and marine areas that are *open access* need to be reviewed, arguing there should be a boundary, because basically coastal areas it is the property of a unity of customary law people that inhabit coastal areas. This means that the management and utilization in coastal areas that are intended for anyone to be able to manage it, must be known and received permission from the local customary law peoples. Hence, needed a rule of law are clear and explicit to prevent the conflict of authority between the State and the proprietary of civil rights of customary law people in the coastal areas.

#### **Abstract**

The aim of this study was to determine the maximum bite force prior and post rehabilitation in completely and partially edentulous patients rehabilitated with either complete denture, removable partial denture, fixed partial denture or implants in comparison with the control group in 75 patients belonging to each group who were randomly selected after clinical examination. A total of 75 patients made up the study population. The study was carried out with the aim of measuring the maximum bite force using the bite force meter. Comparison was made amongst the bite forces of control group with that of the study groups. Implants followed by fixed partial denture group exhibited an excellent increase in pre to post rehabilitation stages with its values evenly distributed between the genders across all the study groups. Further, a greater bite force was exhibited in fully dentate patients (controls) in the overall study. Higher bite forces were elicited in patients rehabilitated with implants and is considered as the most effective mode of rehabilitation with maximum bite force in comparison with the other rehabilitation methods.

#### **Introduction:-**

Mastication is a highly coordinated neuromuscular function involving purposeful movements of the jaw and continuous modulation of force, representing a function that matures with growth as the teeth erupts. It is characterized by complex movements of the stomatognathic system structures, most importantly the mandible, which varies depending on the foods ingested, resulting in manipulation of a food bolus, salivation, and associated oscillatory movements of the head. The loss of teeth, and consequently, prosthodontic rehabilitation poses new challenges to the stomatognathic system, which alters masticatory function. Relatively little is known about the extent to which chewing differs between dentate subjects and completely or partially edentulous patients treated in various ways.<sup>6,14,15,19,28,41.</sup>

**Corresponding Author:- Dr. Amrita Patnaik.**

Address:- Postgraduate student, Department of Oral and Maxillofacial Surgery, GITAM Dental College and Hospital, Visakhapatnam.

Edentulism is defined as the loss of permanent teeth and is believed to be caused by dental caries, periodontal disease, trauma and others. It is an indicator of both population health and the functioning and adequacy of a country's oral health care system and is associated with low education level and poor socioeconomic status.<sup>1,2</sup>

The advances in the medical sciences have led to people living longer. Along with the increased life expectancy, there is a desire to live to the fullest with an esthetic appearance and functional rehabilitation. The patients who have lost their teeth are looking for custom made treatment modality in prosthetic rehabilitation. This helps in providing adequate masticatory, phonetic and esthetic function, simulating the natural dentition that does not jeopardize the remaining teeth,<sup>41</sup> thereby ranging from a complete coverage single crown or a long span fixed dental prosthesis to a full mouth rehabilitation.<sup>5</sup> Loss of teeth can be equated to an amputation, and gaps in the teeth are perceived as physical imperfections akin to missing body parts.<sup>9</sup>

Adult patients with varying severity of tooth loss can be rehabilitated by different types of fixed or removable constructions which are retained by the remaining natural teeth or dental implants, or in cases of edentulism, are supported directly by the oral mucosa.

At present, there exists three main methods which are used individually or in combination in order to replace lost teeth. The three methods are as follow:

1. A removable denture, which the patient can insert or remove.
2. A bridge retained by the natural teeth abutting the gap and which bears the replacement teeth.
3. Implants which are anchored in the jawbone and support a removable denture or fixed tooth-replacements.

Bite force is an important element of masticatory system.<sup>23</sup> The bite force is the ratio of the distance from the jaw joint which is the fulcrum or pivot point to the point of application, i.e. the biting versus the distance from the jaw joint to the muscle attachment which is the force required to close the jaw. This force results from the action of the jaw elevator muscles (in turn determined by the central nervous system and feedback from muscle spindles, mechanoreceptors and nociceptors) modified by the craniomandibular biomechanics.

Masticatory performance is a cumulative contribution of various factors like bite force, severity of malocclusion, occlusal contact area, body loss of teeth, restorations, facial forms and other motor activities. Maximum bite force indicates the functional state of the masticatory system.<sup>7</sup> Bite forces are correlated to diet, cranial design and are considered to be the key determinant of the masticatory function.

Factors including bite force and occlusal contact area, suggest that higher the bite forces and the larger the occlusal areas, the more efficient the mastication is. Bite force has also shown to be affected by a number of physiological and morphological variables such as craniofacial morphology, age, gender, periodontal support of the teeth, height and body weight, tempo-mandibular disorders pain, and dental status.<sup>29</sup>

Other variables reportedly affecting the bite force are the type of recording devices, technique employed to measure the bite force, position of the sensor in the oral cavity, patient position, unilateral or bilateral measurements and magnitude of mouth opening during measurements.<sup>4</sup>

### **Patients and Methods:-**

After obtaining the ethical clearance, subjects for the present study were selected amongst the patients who reported to the outpatient department of Oral and Maxillofacial Surgery, GITAM Dental College and Hospital, Visakhapatnam from June 2014 to March 2015 to evaluate the pre and post rehabilitation bite forces in completely and partially edentulous patients.

Details of the patients were recorded at the beginning. Bite forces prior and post rehabilitation were recorded. All selected patients were informed about the experimental nature of the study. Their cooperation was solicited. The effective mode of rehabilitation was determined on the basis of pre and post rehabilitation bite forces.

Bite force measurements were made using indigenous Bite Force Meter in 75 individuals belonging to different age groups. Follow up was done post rehabilitation. The maximum bite forces were assessed in the control group. Pre and Post rehabilitation bite forces were recorded in the study group which comprises complete denture, removable partial denture, fixed partial denture and implants.

The bite force meter consisted of a Wheatstone bridge assembly, instrument amplifier and a digital panel meter. An adjustable button is incorporated on the instrument for resetting the instrument reading to zero, at the start of each recording. This electronic device was connected to the bite force pads. The bite force pads were placed in the posterior 1<sup>st</sup> molar region on both right and left sides of the jaw. This was accomplished by instructing the subject to bite on the pads as the subjects were asked to remain seated with the head upright, looking forward, and in an unsupported natural head position throughout the trial refraining from extraneous movements. The force applied is seen on the bite force meter display. The high precision load cell and electronic circuit provided precise measurements.<sup>10</sup>

### Results:-

In the present study, the most common age groups that the subjects underwent rehabilitation procedures were between 35-53 years. The mean age group was 43 years.

There was a significant increase in the post rehabilitation bite forces in males and females on both right and left side when compared to the pre rehabilitation bite forces in all the groups. However, the group comprising removable partial denture indicated a significant decline in the post rehabilitation bite forces in comparison to pre rehabilitation bite forces.

		leftafr	293.0387	15	43.53010	

Higher bite forces were recorded from patients who were rehabilitated by fixed partial denture whereas the bite forces from the patients who were rehabilitated with Implants were found to be the highest.

**Discussion:-**

As a result of rehabilitation of tooth loss, the patient's oral function gets restored and eventually the patient regains the prerequisite conditions for participating in social activities again.<sup>1,2</sup> Specific improvements are described such as enjoyment of food, clarity of speech and attractive facial expression. Single tooth loss can be treated by a tooth-retained bridge, a resin-bonded retained bridge or an implant-retained crown. Few studies have shown that the survival of implant-retained crown constructions is over 90 percent and the risk of bone loss (>2mm) around the implant is small. Patients with more extensive tooth loss can be treated with tooth or implant-supported bridges. Around 95 percent of implant-supported bridges can be expected to survive after 5–10 years.<sup>5</sup>

Patients with long periods of edentia often lose more mandibular bone than those with a shorter period of edentia. Denture wearing is also very important in alveolar ridge resorption as the number of lower dentures worn is related with the period of edentia and alveolar ridge resorption. The individuals who wear their complete dentures continuously throughout the day and night, have more resorptive changes in the jaws when compared to those who wear dentures daily. The high success rate and consequently the widespread use of dental implants for prosthetic rehabilitation have led to revision of numerous aspects of the original treatment protocols.<sup>3</sup> The aim of this report was to evaluate the patients' livelihood with varying degrees of tooth loss and their response to the type of rehabilitation with the perseverance oral quality of life that the currently available methods of rehabilitation have after 5, 10 and 15 years according to its efficiency.

Maximum bite force is a useful indicator of the functional state of the masticatory system and the loading of the teeth, and its recordings can be performed in a relatively simple way in the clinic or the department.<sup>22</sup> A measuring device, essentially a bite force meter, is directed to a particular location, a bite point source of a specific tooth among the whole dentition and the bite force is measured.<sup>10</sup>

Comparison of bite forces between males and females on both right and left sides was done in the control group. The highest bite force was recorded on left side of females which was around 398 N. The left side of control group individuals was more significant when compared with the other groups. The right and left posterior regions did not show any significant difference in bite force. The mean bite force was around 350N on the right and 364N on the left side of the jaw. Few studies have shown that increase in the maximum bite force values was seen at the dentate side when compared to the rehabilitated side.<sup>8</sup> There may be hormonal differences that contribute to the composition of muscle fibers in both males and females. However the age factor has got relatively a small influence on the bite force.<sup>4</sup>

Comparison of pre and post rehabilitation bite forces on right and left side of the jaw was done in all the study groups that comprised of complete denture, removable partial denture, fixed partial denture, and implants group.

In complete denture group, the pre rehabilitation bite forces was around 10N on right side and 12N on the left side that showed no statistical significant increase whereas post rehabilitation bite forces was around 22N on right side and 23N on left side that showed a statistical significant increase on the left side of the jaw when compared across all other groups. Hence, many studies have stated that, the stomatognathic system behaves functionally depending on the type of oral rehabilitation.<sup>5</sup>

In removable partial denture group, there was a mild difference between the pre and post rehabilitation bite forces in the study group. Pre rehabilitation bite forces was around 216N on right side and 196N on left side where as post rehabilitation bite forces was around 130N on right side and 185N on left side. Post rehabilitation, bite forces were higher on the left side of females. Although studies on the influence of gender on maximum bite force have shown that in young adults, the females showed greater values when compared to males. Patients with mandibular anterior or posterior natural teeth have greater resorption of the edentulous maxilla than patients with mandibular complete dentures or patients with natural teeth. Hence studies have concluded that the cause of resorption of maxillary and mandibular bony structures was due to removable partial denture and mostly seen in removable partial denture wearers.<sup>3</sup>

In fixed partial denture group, the pre rehabilitation bite forces was around 105N on right side and 99N on left side where as post rehabilitation bite forces was around 142N on both left and right side as well. Thus, no statistical significance was elicited in both the pre and post rehabilitation stage. Higher bite force values were recorded in females on the right side post rehabilitation. It is believed that female adults between 13 and 20 years of age exhibit

a greater muscle thickness<sup>19</sup> whereas males have a gradual increase in muscle thickness that eventually occurs over time.<sup>39</sup> Many studies have proven that the occlusal force would be higher on the preferred chewing side and no statistical significance of occlusal force was found in relation to the quadrants.<sup>15</sup> As masticatory performance was mainly affected by occlusion factor the greater areas of contact and near contact provided better occlusal stability (tooth alignment and molar bite force) which helped in allowing the masticatory function to be more efficient.<sup>27</sup>

In the implant group, the pre rehabilitation bite forces was around 263N on right side and left side as well, whereas the post rehabilitation bite forces was around 296N on the right side and 293N on left side. The pre as well as post rehabilitation stages exhibited an excellent increase in the bite force when compared across all the groups. A statistically significant difference was seen between males & females post rehabilitation on the left side for implant group. On comparing across the other rehabilitatory groups, higher bite force values were elicited in the implant group individuals. Several studies have concluded that, higher bite force and masticatory efficiency was seen in individuals rehabilitated with implants and single crowns. An improved function was seen in those individuals rehabilitated with implant supported mandibular over denture when compared to those rehabilitated with conventional complete dentures.<sup>5,20</sup> The biting efficiency was affected by the postoperative occlusal plane angle.<sup>23</sup> A positive correlation was found between muscle function and tooth position in few studies.<sup>28</sup> The biting force measured for the ipsilateral and the contralateral pair of teeth has always shown higher values in the posterior pair of teeth.<sup>41</sup> A minimum period of twelve weeks is required for the tissues to adapt to a new vertical dimension as the bite force measurements were found to give consistent readings after twelve weeks.<sup>22</sup> A High score of satisfaction and quality of life has been found in patients rehabilitated with implant supported prosthesis.<sup>5,13</sup>

### Conclusion:-

Implants exhibited the maximum bite force in comparison with all the other groups, due to which it stands as one of the most successful and effective mode of rehabilitation. Thus it can be advised that tooth or teeth loss can be rehabilitated with either implant or implant based treatment options as it achieves the same bite force as the natural teeth.

**Abstract**

Kanhoji Angria was a diplomat of uncommon ability. He was regarded as the second Founder of the Maratha navy. He undoubtedly re-established Maratha prestige at sea. He defied the joint efforts of the English, the Portuguese's and the Sidis, and in his wars by land and sea. He had given evidence not only of good seamanship but also wise diplomacy. He offered significant competition and damage to the European powers who fought with Angria at sea, would later claim that he was pirate, but they deliberately ignored that he had been appointed an admiral in the Maratha navy by its legitimate leaders.

**Introduction:-**

After Shivaji's death the Marathas passed through a great crisis. During the stormy days of Sambhaji and Rajaram most of their older leaders passed away. At one time it appeared that the nascent Maratha power might be crushed out by the Mughal empire. But the unusual crisis brought a number of young men of exceptional energy and ability to the fore front, and the new leaders not only saved the newly founded kingdom from imminent extinction but added to its power and prestige both land and Sea. While Balaji Vishwanath, the founder of the Peshwa family, was gaining Shahu's confidence, the Chief Command of the Maratha fleet had already passed to Kanhoji Angria, the founder of a family which made it self feared and respected by all the sea powers of the coast, Indian and European.

Kanhoji's origin was obscure; of his early career little of nothing is known A Portuguese Viceroy states that he started life as a humble servant of other Hindus in the island of Versova<sup>1</sup>. According to the official history of his family, Kanhoji was a Maratha Kshatriya by birth and the original surname of his ancestors was Sankpal. The new name of Angria was supplied by the Village of Argarvadi, where the family had long resided. Tukdoji Father of Kanhoji, had served under Shivaji<sup>2</sup>. His Son Kanhoji had naturally followed in the footsteps of the father When Rajaram sought refuge in Jinji he was accompanied by the Commander-in-chief of the navy Sidoji Gujar, and Kanhoji was appointed as in-charge of Suvarna. Durg. Here he distinguished himself against the Sidis of Janjira who had reconquered their lost possessions on the mainland and was appointed Subhedar of the Armada by Rajaram with the title of Sarkhel. Earlier Kanhoji made himself known in many a Skirmish with the Siddis. by 1703 he had attained so much importance that ceatano de Mello e Castro, Viceroy of Goa, addressed a friendly letter to him, sent him some presents and permitted the merchants chaul to purchase a vessel which Kanhoji had probably captured as a prize and was anxious to dispose of with Shahu's home coming the loyalty of the Maratha nobility was divided between the parties of Tarabai and Shahu Kanhoji threw his lot with Tarabai. Kanhoji as Tarabai's man, took the forts of Rajmachi, Tunga-Tikona and Dhanagad and Threatened to march on Poona and Satara. But Balaji Vishvanath Bhat handled the Circumstances and brought Kanhoji into Shahu's camp without having to shed drop blood. In the treaty concluded between Shahu and Kanhoji, the latter obtained ten Seas-forts and Sixteen land-forts.

By this treaty, Kanhoji, received territory worth Rs. 34 Lakhs revenue<sup>3</sup>. He was now free to deal with the sea-powers who often questioned the sovereignty of the Matatha over the sea.

The Maratha navy had been an active unit for nearly forty years when Kanhoji succeeded to the chief command. As the admiral of the Chhatrapati had every right to levy tariff to force ships of all nations to purchase his passport, and to negotiate with any power he liked. His aims and objects were well known and clearly defined. The Maratha merchantmen were to be protected from the pirates who infested the Malabar coast, Maratha subjects were to be protected against the depredations of the Sid and the Sovereignty of the sea was to be secured for the Maratha state. It was however, no easy task and Kanhoji had to contend against no less than five rivals, the Sidi of Janjira, The Savants of Wari, the English of Bombay, the Dutch at Vinguar and the Portuguese of Goa. It was Kanhoji's duty to drive them back. But the Maratha fleet consisted of no more than eight or ten small vessels, as we learn from Conde de Fricira, when Kanhoji was called upon to assume its command<sup>4</sup>. Hence there was need of money for additional ships and for the enlistment of more men for the army and money could be obtained only by exercising the sovereignty of the sea and compelling alien traders to purchase, Kanhoji's Cartaz. All these rights had to be executed by the simple rule of might. If the Siddis, the Phiragis and the Topikars acquired territory, carried on trade, and ruled the waves on the authority of their distant Sovereigns, how could Kanhoji's right in these matters be questioned when he had the sanction of the Chhatrapati. The English and the Portuguese in addressing Kanhoji as a pirate have simply betrayed their hatred for one who challenged their authority.

#### **Kanhoji and the Siddis:-**

After Sambhaji's death, the calamity which befell the Marathas was the proper opportunity for the Siddis to extend their Sway over Konkan. They recovered a number of places which they had lost to Shivaji. Raigad, the capital of the Marathas, Mandargad, and Ratnagiri were also occupied by the Mughal officers. Their occupation of the ports off Rewash and Thal impeded the movements of the Maratha Ships at Kolaba and in the pen river. In that dire hour it was Kanhoji Angre who by his daring exploits kept the Maratha flag flying over Kolaba and Khanderi. He forced the Siddis and the Mughal Subhedar to share with him half a revenue of certain place which they had taken possession<sup>5</sup>. In 1697 when Kanhoji shifted his headquarters to Kolaba, the Siddis as well as the English were very much disturbed because he proved to be a challenge for these powers. In 1698 the Siddis attacked Kolaba similarly their attempt to take Kolaba and Khanderi in 1701 ended in failure.<sup>6</sup> A concerted attack on the Angrian territory by the Portuguese, the Siddis and others was foiled by Balaji Vishwanath<sup>7</sup> in 1714. The treaty between Shahu and Kanhoji greatly disturbed the Siddis as it transferred a number of places belonging to the former to Kanhoji's Jurisdiction. In 1725, fresh dissensions had taken place between Kanhoji and Siddis, who appeared before Kolaba with a large fleet of twelve pals, two frigates and one hundred Gallivats.<sup>8</sup> It is quite impossible that Kanhoji should have been ignorant of the intended invasion, for reason unknown to us. The Maratha Admiral considered it unsafe to face the Siddis on the Sea, and as was usual in that age. Silver served to avert the danger when steel offered little or no remedy. By experience Kanhoji had learnt that an attack on Janjira without the aid of the land power was hazardous.

#### **Kanhoji and the Portuguese:-**

Wavering behavior of the Siddis had greatly disturbed the Portuguese Kanhoji was also very much perturbed by the continuous struggle with the Siddis. Driven to despair he asked the help of the Portuguese which was readily given. An alliance<sup>9</sup> was formed between Kanhoji and the Portuguese against the Siddis in 1701. Till 1708, peace existed between Kanhoji and the Portuguese. But no sooner was the Mughal menace over than Kanhoji threw this friendship to the winds and started seizing Portuguese ships.

When exactly Kanhoji first challenged the Portuguese supremacy of the seas we do not know. In 1708, Kanhoji captured some Portuguese ships. In retaliation, the latter marched on Cheul but were defeated by the overwhelming number of the Marathas, 2000 against 400 of their own. Kanhoji fought two manchuas-of-war belonging to the Portuguese fleet of the north. He burnt one and captured another with 27 Portuguese. They were all put to the sword, according to a Portuguese official account, except one captain who purchased his life and liberty by paying a ransom of 12,000 Xerafins.<sup>10</sup> Many merchantmen sailing under Portuguese colours shared the same fate and contributed to Kanhoji's coffers. In 1712, during the Viceroyalty of Rodrigo da Costa, Kanhoji attacked the merchant fleet sailing for the ports of the north.

He fell upon the frigates with his pals, dismantled the Portuguese flagship, and captured no less than forty Parangues. This was a great blow to Goa, for a large number of its citizens lost all the capital they had invested in this

mercantile enterprise. The next year the merchant fleet was better convoyed, but Kanhoji did not hesitate to attack two pals but at last the Angria's fleet had to retire with much loss<sup>11</sup> However the possession of the Portuguese on the Bombay coast had been isolated and the Angria was in position to cut off their communications by land and sea. In 1713, he attacked a frigate of 34 guns that had just landed a Portuguese force at Chaul. In this combat also the Angria's fleet, though numerically superior, was discomfited, the Viceroy resolved to take the offensive and sent Antonio Cardim froes with a fairly numerous flotilla to reduce Kolaba. Having sailed with six pals and some Gallivats, he blockaded the port. The Angra, who was not inclined to hazard a naval action, responded by hauling his fleet a shore out of range of the Portuguese guns and leaving froes to continue his ineffectual blockade. Three Months later the Portuguese Captain was forced to depart by the receipt of news of the arrival of the Arab fleet at Surat.<sup>12</sup> The next in 1718 near Karwar, the Angra fleet was defeated with heavy losses.<sup>13</sup> Kanhoji recognized that his strength lay mainly in the Sea. The possession of the coast, was essential not only for the maintenance of uninterrupted communication between different ports, but also its revenue on which the navy, as in Shivaji's days, ordinarily depended. He therefore, received from Shahu Rajmachi and other places and the important island of Renery.<sup>14</sup> He acknowledged Shahu's Supremacy and concluded treaty with him in the latter part of 1713 or in the earlier months of 1714. After that the Angria's fleet rode the sea boldly, Seizing merchantmen of all nationalities which had omitted to purchase his passports, and the Portuguese found themselves powerless to circumscribe his activities of all their possessions on the coast, Chaul suffered most; for the main source of its income was the volume of dutiable commerce which suffered heavily from Angria's interference. As a result of it in 1721, the English formed an offensive and defensive alliance with the Portuguese against him. In 1721 an Anglo Portuguese Combined army reached the gates of Kolaba on the 21<sup>st</sup> of September. Attempts to pound the walls by erecting batteries were foiled as the labourers were panic stricken by the Angrian army. At this stage a force of 6,000 horses under Bajirao I, sent by Sahu stopped the war. It would have been a sheer folly to fight with so vast an army and the Portuguese Viceroy<sup>15</sup> concluded a treaty of peace with Bajirao on 12<sup>th</sup> January 1722.

#### **Kanhoji and the English:-**

Ever since Kanhoji made Kolaba the main station of admiralty the English were ill at ease. They become all the more restless when the island of Khanderi passed under his Command. Kolaba and Khanderi were within a couple of hour's sail from Bombay. Khanderi could easily keep a watch on the English vessels entering Bombay waters. It was dangerous for the trade and peace of Bambah.

It was the studied policy of the English to regard the enemies of Kanhoji as their friends. They were therefore, determined to give all possible aid to the siddis as foil to the Angria. With regard to the practice of the English to allow their friends to fly their flags and thereby avoid the purchase of passports was never accepted by Kanhoji. He also contended that outside the ports, beyond some specified limit he was free to deal with any vessel as he pleased.

In 1702, Kanhoji captured near Calicut a merchantship with its English crew as it was without his passport. In 1706, the Marathas and the Angers captured three English ship of which the Diamond had 12 guns. In 1712, Kanhoji Seized a yacht of the Bombay Governor along with the Anne of Karwar. But then he decided to come to terms with the English and sent a messenger to Bombay in February 1713 with proposals for peace, offering to deliver the captured vessels if an Englishman of credit was sent to Kolaba. The Governor and Council proposed the following terms.

1. Kanhoji was to return to the English to ships which he had seized from them and their people.
2. He was neither to molest the English ships nor those of their merchants.
3. He was not to molest ships of any nationality entering into the English harbor or insight of it (between Mahim stakes and Khanderi)
4. Kanhoji was to allow the English merchants to come to his ports on payment of due customs.
5. The English promised that they would not allow any ship to sail under their colour except that of their subject
6. The English granted Kanhoji the liberty to trade in their Bombay port on payment of regular customs<sup>16</sup>.

According to this treaty, Kanhoji returned the two English ships he had taken. But the peace did not last long. In 1717,, the ship 'Success' belonging to the English broker Govardhandas was captured by Kanhoji . When talks regarding its recovery were in progress another ship Robert fell a victim to Kanhoji's aggressing. He refused to return the ships. Within a couple of months from the Robert incident Kanhoji made prize of yet another ship the otter. These excesses of his goaded the English to the point of desperation and they detained at Mahim a shibar belonging to Kanhoji. At last on 17<sup>th</sup> June 1718 war was declared against Kanhoji. The nationality of the three captured ship was a highly controversial question. The owners if the ship were not English, but the cargo belonged

to English subjects, and Kanhoji contended that they were not entitled to exemption from the ordinary rules of passports. He wrote to captain Cornwall that the ships belonging to Bombay, Bengal or Madras. Shall not be molested by him that if the English will freight on country shipping they must expect that he will make price of them<sup>17</sup>. The real ground of contention was that the English had to load foreign boats with their goods and demanded for these boats the same immunity to which ships of undoubted English nationality were entitled. Kanhoji was unwilling to grant this demand which would have meant financial loss to him. The English led expeditions against Khanderi, Kolaba and Gheria without success<sup>18</sup>. In 1720, the English lost their ship charlotte to Kanhoji, and the next year they entered into an alliance with the Portuguese against their common enemy. This joint attack failed miserably, The ill-success of the Anglo-Portuguese expedition undoubtedly contributed to Kanhoji's prestige, and he was soon free to seek his enemies at sea. He continued to make prize of the English ships whenever he could. On 14 March 1722, his fleet, consisting of four pals and twenty Gallivats, had attacked two English pals between chaul and Rajapore. One of the two English vessels was burnet and the other was put to light. About the same time Angria captured a big English ship richly laden with coins and valuable goods. But his success was by no means uniform for one of his ships, surrendered to the English near Hennery sometime between March and October.<sup>19</sup> In October 1722, Kanhoji sailed from Kollba, leaving his eldest son incharge of the government. The last three or four years of Kanhoji's life were probably quiet and uneventful. In 1725 he went to satara to pay his respects to his sovereign and liege lord and died at Kolaba on 20<sup>th</sup> June 1729.

### Conclusion:-

Kanhoji Angre, following Shivaji's policy, boldly rode the sea capturing ships which sailed without his passes. The Portuguese and the Siddis had to respect his right on the sea. Kanhoji allowed English ships to enter his ports on payment of the usual customs. This term Speaks for his equality at sea what often led to heated controversy and war was the granting of a flag by the English to ship which did not belong to them or to their subjects. Kanhoji was unwilling to make more concessions to the English. He was prudent enough not to offer any additional offence to the Portuguese. Conde de Ericeira tells us that Kanhoji did not give Portuguese subjects any trouble during the terms of his Viceroyalty. One enemy at a time was enough for him. The Maratha navy had not yet emerged from the primitive galley stage. The seamen had, indeed, learnt to, make skilful use of their sails, but their fighting fleets were inferior as compared to contemporary Europe. They didn't take efforts to moderate nary. As a result of it the Maratha nary progressed satisfactorily up to a certain stage and then further improvements stopped.

##### Key words:-

OSMF, Kawaldharan, Jesthamadha siddha tail, mukharog.

#### Abstract

- OSMF is a complex, irreversible, highly potent pre-cancerous condition, which is characterised by juxta -epithelial inflammatory reaction and progressive fibrosis of sub mucosal tissue.
- In modern science, many medicinal and surgical treatments available having no satisfactory result with irreversible results.
- As the disease OSMF exactly cannot be equated with any *mukhrogas* in Ayurveda but can be managed according to Ayurveda.
- So to look for alternative treatment and proves efficacy of ayurvedic treatment, this study was carried out.

Copy Right, IJAR, 2017.. All rights reserved.

#### Introduction:-

Oral sub mucous fibrosis is a chronic disease of oral cavity which is common in patients who are chewing betel-nuts in the Indian subcontinent<sup>1</sup>. It is characterised by the progressive build-up of constricting bands of collagen in the cheeks and adjacent structures of mouth which can severely restrict the mouth opening and tongue movement as well as cause problem with speech and swallowing<sup>2</sup>. In modern science various medical and surgical treatment modalities have been used, but results are not satisfactory.

In Ayurveda, this disease is not mentioned clearly in *mukhroga*, but some scattered symptoms can be correlated with OSMF such as.

1. *'krichchan vivrinoti mukham*<sup>3</sup> (difficulty in opening mouth)
2. *Mukhdaha*<sup>4</sup>, *ushna*<sup>5</sup> (burning sensation in mucosa).
3. *Mukhantergat vrana*<sup>6</sup> (ulceration of oral mucosa).

It seems to be to *vata-pitta* dominant chronic *sarvasarmukhroga* and many local treatment modalities like *Gandush*<sup>7</sup>, *kawaldharan*<sup>8</sup> and *pratisaran*<sup>9</sup> are mentioned by our *Aacharyas* which have great potential. Hence taking all considerations, this study was planned to deal this crippling disease.

#### Prevalance:-

In India, the prevalence increases over the past four decades from 0.03% to 6.42%<sup>10</sup>.

**Case study:-**

A 45yrs old female patient, Hindu by religion, came to OPD with complaints:-

1. Burning sensation in mouth (*mukhdaha*)
2. Unable to eat spicy food (*katu ras asahishnuta*)
3. Dryness in mouth (*mukh shushkata*)
4. Unable to open mouth

**Since 2-3 months:-**

Patient had taken allopathic treatment for above complaints but does not get relief, so she came to hospital for alternative treatment. Patient was thoroughly examined and detailed history was taken.

NoH/O – any major illness like HTN/ DM/ Chronic.

H/O- Pt. had habit of betel quid since 10-15 yrs.

**On Examination:-**

1. General condition-Fair, Afebrile
2. *Dehbhar*(weight)-60kg
3. *Deh prakriti-vata Kapha*
4. .Pulse – 68/min      BP-130/80mm of Hg.

**Local Examination:-****Oral cavity:-**

1. Lip – Dry, blackish discoloration.
2. Mouth opening- Restricted, measures 2 finger tight.
3. Tongue- Ulceration seen at tongue margin.
4. Oral mucosa- Discoloration(pale white).
5. Pharynx- Posterior pharyngeal wall congestion.
6. No tonsil hypertrophy.

Rest WNL.

By observing symptoms and signs, the disease was confirmed to-“OSMF” As per *Ayurvedic text*<sup>11</sup>- *Dosh: vat-pitta*  
*Dushya: mansa*.

**Assessment Criteria:-****Table no.1:-** Subjective criteria.

	0	1	2	3
1. <i>Mukhdah</i> (Burning sensation in mouth)	Nil	On taking spicy food	On taking normal food	continue
2. Ulceration In mouth	Nil	Mild	Moderate	Severe
3. Colour of oral Mucosa	Pink Normal	Red or deep pink	Pale white	Blanched White

**Table no 2:-** Objective Criteria : Inter incisal distance (mouth opening) -

0	1	2	3
Normal complete opening	Three finger tight	Two finger tight	One finger tight

**Investigations:-**

<u>Blood</u> - <u>Value</u>		<u>Urine</u> - <u>Value</u>
Hb% - 9.5gm%	Alb. - Nil	
TLC - 7600/cumm	Sugar - Nil	
ESR - 10mm	Micro. - NAD	
BSL(R) - 98mg/dl		

**Treatment Modality And Observations:-**

- According to *Ayurvedic* text,OSMF symptoms and signs can resembles with *vata-pitta* dominant chronic *sarvasaramukhroga*,so decided to give “*Jeshthamadsiddhatailkawaldharan*” *Jeshthamadh siddha tail*<sup>12</sup> –
- Prepared by –*samanya sneha siddhi kalpana*. *Kalka dravya - Jeshthamadh kalka* -10gm. *Sneha dravya –Tiltail* -40ml. *Liquid - Jeshthamadh kwath* -160ml.

Time of kawaldharan :Twice a day1. At morning and 2. At evening

**Duration:-** 1 month

**Assessment After treatment:-**

Assessment Criteria	Before treatment	After Treatment
1. 1. <i>Mukhdah</i> (Burning sensation in mouth)	2	0
2. Ulceration In mouth	2	0
3.Colour of oral Mucosa	1	0
4.Mouth opening	2	1

**Result and Discussion:-**

In above case study,patientgot relief from signs andsymptoms of OSMF.

*Jeshthamadh* having *vata-pittaghna* and *vranaropan* and *shodhan karya*<sup>13</sup>.

- According to modern research,*Jeshthmadh* contain liquorice which have properties like anti-inflammatory,anti-microbial,analgesic and immune modulatory.
- The compound glycyrrhizin plays key role in healing ulcers of mouth.
- As well as *til-tail*<sup>14</sup> having *vrana sandhan* and *sukshma*<sup>15</sup> properties(enters minute channels).
- Thus by doing *Jeshthamadh kawaldharan*,oral mucosa get nourishes by increasing blood circulation and tissue vascularity.
- It also gives physiotherapy,which needed for stretching the mucosal bands.

**Conclusion:-**

- The present study proves that,*Ayurvedic*medicine has great potential and ensures the regain of the oral mucosa to normal and healthy.
- It is effective in subsiding the symptoms and signs of OSMF in same extent without any adverse effect.
- This drug can be taken as a alternative medicines for patients of OSMF for better compliance.

##### Key words:-

LQ45, blue chip stock, time series data, two LQ45's criteria, interpolation, least square method, polynomial, extrapolation, relative RMSE.

#### Abstract

Given time series data of 43 LQ45's monthly stocks price during the period January 2013 to December 2013; this research interpolates the data into best polynomials as many the stocks, with each RMSE (root mean square error) representing degree of investment risk. The polynomial also is used to extrapolate (i.e. to predict) the next months stock price during the period January 2015 to January 2016; finally the prediction prices is compared with the 13 monthly actual prices and their RMSE (root mean square error) are computed. The computations are run in MATLAB (Matrix Laboratory) programming language implementing the curve fitting procedure based on least square method. The important results of computations are following: (1) degree of polynomials are in the range [28, 97] of maximum 100, with average 73.7209, (2) relative RMSE of interpolation (RMSE-i) are in the range [0.2248%, 2.6804%] with average 0.6719%, (3) relative RMSE of extrapolation (RMSE-e) are in the range [2.1838%, 56.9015%] with average 11.5455%. The average of relative RMSE-e is small enough; it means that the risk for 13 months investment during the period January 2015 to January 2016 is small enough. The value of relative RMSE-e also explains why a stock is removed from or still in LQ45 index, and this is valid for 40 of 43 stocks.

#### Introduction:-

Trend of stock price changing, i.e. the time series of the price, is interesting information for investor in investing his or her money in the stock; the others information that should be considered is performance of the associated company which is shown by its financial report, cash flow, and equity changing (Brigham, 2004; Xiao, 2014; Jianfeng, 2014). The expected (or predicted) stock price at certain future time, which is a continuum of the trend, can be derived from the time series using some prediction technique such as interpolation (curve fitting) one; this predicted price has some uncertainty that represents the risk of investment in the stock.

In this paper, the time series data is monthly stock price one of LQ45 index, released by IDX (Indonesian Stock Exchange). IDX has about twenties indexes such as LQ45 Index, Kompas100 Index, Jakarta Islamic Index, and InfoBank15. Some of the indexes consist of blue chip stocks, i.e. the stocks with stable return, issued by well-known and well-established companies having small liability and high liquidity (Investopedia, 2016). The monthly time series data can be interpolated to get the best polynomial, i.e. the one of certain degree with minimal relative RMSE

**Corresponding Author:- Asep Juarna.**

Address:- Departemen of Informatics, Gunadarma University, Jakarta-Indonesia.

(root mean square error); this relative RMSE represents the risk of investment in the stock. The polynomial actually is an extrapolator to get the prediction price of the stock, together with its relative RMSE, at certain future months.

The objective of the research is *to investigate validity of one year stock price prediction*, especially of 43 blue chip stocks which are member of LQ45 index defined in period of February 2015 - July 2015<sup>1)</sup>, here validity means degree of accordance of the prediction values and the actual ones, also to investigate why a stock is removed from or still in LQ45 index. The monthly data are the prices during the period January 2013 to December 2014. This historical data is interpolated to get the best polynomial for each stock; the chosen polynomial is the best one, i.e. the polynomial with certain degree over interval [1,100] having minimal relative interpolation-RMSE (RMSE-i). Each chosen polynomial is then used to extrapolate the stock price during the period January 2015 to January 2016; the resulted stock price is then compared with its actual data and the relative extrapolation-RMSE (RMSE-e) is determined; *the relative RMSE-e shows the validity of prediction* which in turn gives guidance for investor to keep track of his or her investment in the stock.

## Research Methodology:-

### LQ45 Index:-

Many blue chip stocks are member of famous indexes in IDX like LQ45, however not all member of LQ45 are blue chip stocks. A stock is member of LQ45 at a period if it fulfills the following “two LQ45’s criteria” (Fakhrudin, 2006):

#### for the first 30 stocks:-

- listed in IDX at least for 3 months
- the biggest 30 stocks in regular market trading

#### For the next 15 stocks:-

- part of 25 active stocks with the greatest number of trading days in regular market,
- then, part of 20 stocks with highest transaction value and frequency,
- finally, part of 15 stocks with biggest market capitalization

Membership each stock in LQ45 is evaluated every February and August. In August 2015, for example, two stocks with (in this research) codes “05” and “06” (ANTM, Aneka Tambang (Persero) Tbk, and CTRA, Ciputra Development Tbk, respectively) are removed from LQ45 and replaced by SRIL (Sri Rejeki Isman Tbk) and WTON (Wijaya Karya Beton Tbk), while in February 2016 stocks “17” (EXCL, XL Axiata Tbk), “23” (ITMG, Indo Tambangraya Megah Tbk), and WTON (Wijaya Karya Beton Tbk), are replaced by ANTM (Aneka Tambang (Persero) Tbk), HSMP (PT HM Sampoerna Tbk), dan MYRK (PT Hanson International Tbk) masuk (Febri, 2016; Kabar, 2016). Note that WTON is not one of 43 stocks under consideration in this research.

### Least Square Method:-

Given  $m$  pairs data  $(x_i, y_i)$ ; least square method constructs polynomial of degree  $n$ , i.e.  $p_n(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$ , i.e. to get the coefficients  $a_0, a_1, a_2, \dots, a_n$ , with following “least square procedure”:

- compute  $\sum_i x_i, \sum_i x_i^2, \sum_i x_i^3, \dots, \sum_i x_i^{2n}$
- compute  $\sum_i y_i, \sum_i x_i y_i, \sum_i x_i^2 y_i, \sum_i x_i^3 y_i, \dots, \sum_i x_i^n y_i$
- construct the following linear system:

$$\begin{pmatrix} m & \sum_i x_i & \sum_i x_i^2 & \cdots & \sum_i x_i^n \\ \sum_i x_i & \sum_i x_i^2 & \sum_i x_i^3 & \cdots & \sum_i x_i^{n+1} \\ \sum_i x_i^2 & \sum_i x_i^3 & \sum_i x_i^4 & \cdots & \sum_i x_i^{n+2} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \sum_i x_i^n & \sum_i x_i^{n+1} & \sum_i x_i^{n+2} & \cdots & \sum_i x_i^{2n} \end{pmatrix} \begin{pmatrix} a_0 \\ a_1 \\ a_2 \\ \vdots \\ a_n \end{pmatrix} = \begin{pmatrix} \sum_i y_i \\ \sum_i x_i y_i \\ \sum_i x_i^2 y_i \\ \vdots \\ \sum_i x_i^n y_i \end{pmatrix} \Leftrightarrow MA = B \quad (1)$$

<sup>1)</sup> Two of 45 stocks, i.e. SILO (Siloam International Hospital Tbk) and SSMS (Sawit Sumbermas Sarana Tbk), do not included in this research because of incompleteness data.

4. solve the linear system for  $A = [a_0, a_1, a_2, \dots, a_n]^T$ , where  $X^T$  is transpose matrix of  $X$ .

In MATLAB environment the 3-rd and 4-th steps are executed in two following instructions:

$$1. \text{ assign } M = \begin{pmatrix} m & \sum_i x_i & \sum_i x_i^2 & \dots & \sum_i x_i^n \\ \sum_i x_i & \sum_i x_i^2 & \sum_i x_i^3 & \dots & \sum_i x_i^{n+1} \\ \sum_i x_i^2 & \sum_i x_i^3 & \sum_i x_i^4 & \dots & \sum_i x_i^{n+2} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \sum_i x_i^n & \sum_i x_i^{n+1} & \sum_i x_i^{n+2} & \dots & \sum_i x_i^{2n} \end{pmatrix}, B = \begin{pmatrix} \sum_i y_i \\ \sum_i x_i y_i \\ \sum_i x_i^2 y_i \\ \vdots \\ \sum_i x_i^n y_i \end{pmatrix}$$

2.  $A = M \setminus B$

In this research the input is matrix  $M$  of size  $24 \times 43$  where the cell of  $i$ -th row and  $j$ -th column holds the prices of  $i$ -th month of  $j$ -th stock; the matrix is shown by Table 1.

**Table 1:-** Format of the monthly price data of 43 stocks for 2 years

Month	Price of Stock-1	Price of Stock-2	.....	Price of Stock-43
$x_1 = 1$	$y_{1,1}$	$y_{1,2}$	.....	$y_{1,43}$
$x_2 = 2$	$y_{2,1}$	$y_{2,2}$	.....	$y_{2,43}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
$x_{24} = 24$	$y_{24,1}$	$y_{24,2}$	.....	$y_{24,43}$

**Computation Algorithm:-**

Let “dt1314.mat” be MATLAB file that holds matrix  $M$  of size  $24 \times 43$ , i.e. the prices of 43 stocks during the period January 2013 to December 2014, and “dt156.mat” MATLAB file that holds matrix  $M1$  of size  $13 \times 43$ , i.e. the prices of 43 stocks during the period January 2015 to January 2016; this algorithm construct 43 best polynomials, one for each stock, and so on, an finally compute each relative-RMSE-i and relative-RMSE-e:

**Compute relative-RMSE-i and get the degree deg of the best polynomial:-**

for stock  $j = 1$  to 43 do

1.  $x_j = [1:24]$ ,  $y_j = dt1314(1:24,j)$
2. for degree of polynomial  $n = 1$  to 100 do
  - a. construct matrix  $S$  and vector  $B$  of equation (1) in Section 2.2
  - b. solve the linear system  $SA = B$  for  $A = [a_0, a_1, \dots, a_n]$
  - c. for  $i = 1$  to 24, compute interpolation price  $y_{j,int} = a_0 + a_1x + a_2x^2 + \dots + a_n x^n$
  - d. compute relative RMSE-i(n) between  $y_j$  and  $y_{j,int}$
3. find the minimum relative RMSE-i(n) and get the degree deg of that best polynomial

**Compute relative-RMSE-e for the best polynomial of degree deg:-**

for stock  $j = 1$  to 43 do

1.  $x_j = [1:13]$ ,  $y_j = dt156(1:13,j)$
2. for  $i = 1$  to 13, compute extrapolation price  $y_{j,ext} = a_0 + a_1x + a_2x^2 + \dots + a_n x^d$
3. compute relative RMSE-e between  $y_j$  and  $y_{j,ext}$

**Result and Discussion:-**

Main outputs of computation of every stock are: degree deg of the best polynomial, the relative RMSR-i, the relative RMSR-e, the curves of interpolation and extrapolation. Following are the statistic of the output:

1. The interval of degree of the best polynomials is [28, 97] with average 73.7209.
2. The interval of the relative RMSE-i is [0.2248%, 2.6804%] with average 0.6719%.
3. The interval of the relative RMSE-e is [2.1838%, 56.9015%] with average 11.5455%.

The average of relative RMSE-e of all 43 stocks is small enough; it indicates that *investment in the stocks on average is save enough*. The complete statistic is shown in the Table 2.

Table 2 also tells more information like follow. As is stated in the previous section, two stock namely “05” and “16” are removed from LQ45 on August 2015 while “17” and “23” are removed on February 2016; Table 2 shows that the relative RMSE-e of the four stocks are, respectively, 29.7395%, 7.3793%, 9.4617%, and 48.2903%. The relative RMSE-e of stocks “01” and “23” give a reason why the two stocks are removed. However the relative RMSE-e of the two rest actually are small enough, below the average, so, in these cases, the relative RMSE-e is not sufficient to become the reason of the removing; there is other reason, of course, to make the “two LQ45’s criteria” are hold, and the reason is beyond the scope of the research. Also relative RMSE-e analysis fails to explain why stock “39” still in LQ45 index.

**Table 2:-** Degree of the best polynomial (deg), relative RMSE-i (%), and relative RMSE-e (%) of each of 43 stocks. Average(deg) is 73.7209, average(relative RMSE-i) is 0.6719%, and average(relative RMSE-e) is 11.5455%. The bold text indicate the removed stock fro LQ45.

**Figure 1:-** Stock “23” (ITMG, Indo Tambangraya Megah Tbk) has the smallest degree of interpolation, i.e. 28, but its relative RMSE-e almost 50%. This stock is removed from the LQ45 in February 2016.

Figure 2:- Stock “18” (GGRM, Gudam Garam Tbk) is the stock having the largest degree of polynomial and relative RMSE-e less than 5%. This stock is saved in LQ45 in February 2016.

Figure 3:- Stock “17” (EXCL, XL Axiata Tbk) has smallest relative RMSE-i and relative RMSE-e small enough, below 10%. However this stock is removed from LQ45 in February 2016.

Figure 4:- Stock “39” (TLKM, Telekomunikasi Indonesia (Persero) Tbk) has largest both relative RMSE-i and relative RMSE-e; however this stock save in LQ45 in February 2016.

Figure 5:- Stock “6” (ASII, Astra International Tbk) has smallest relative RMSE-e. This stock is save in LQ45 in February 2016.

Figure 6:- Stock “5” (ANTM, Aneka Tambang (Persero) Tbk) has large relative RMSE-e. This stock is removed from LQ45 in August 2015.

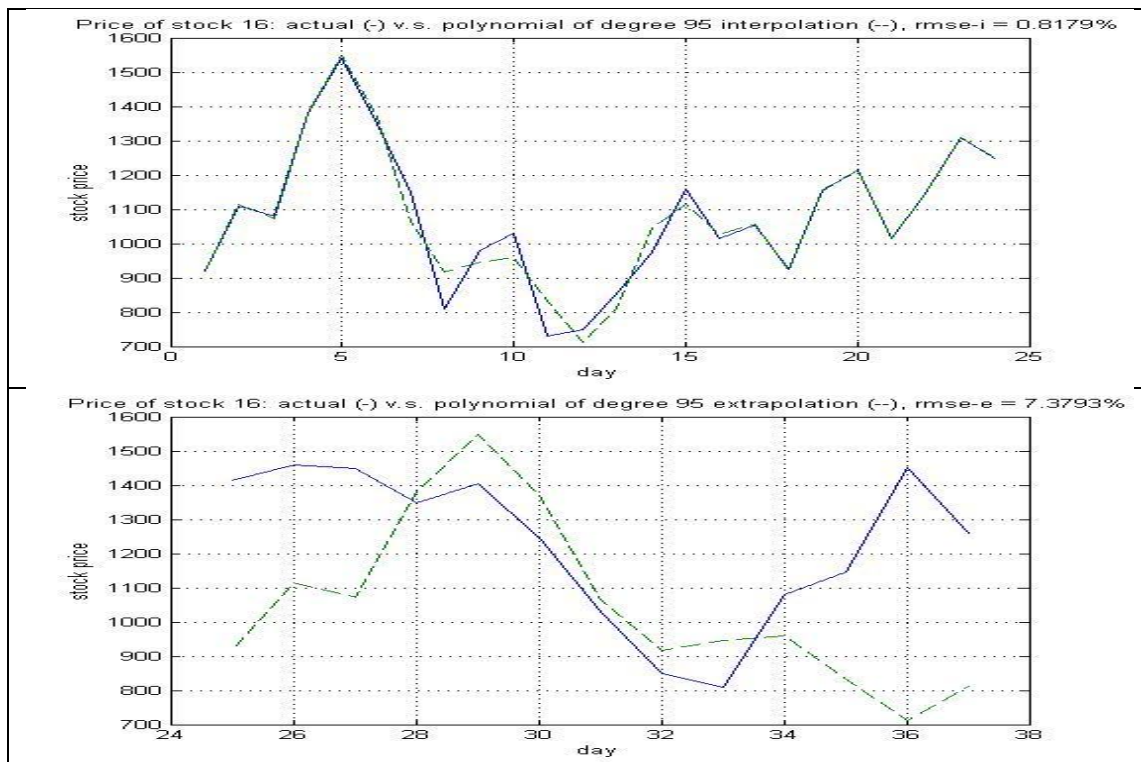

Figure 7:- Stock 16 (CTRA, Ciputra Development Tbk) has relative RMSE-e large enough. This stock is removed from LQ45 in August 2015.

Figure 1 until 7 shows seven selected stocks with variation of degree of the best polynomial, value of relative RMSE-i, and value of relative RMSE-i, represent all of 43 stocks. Figure 1, Figure 2, Figure 5, Figure 6, and Figure 7 show the stocks of which their relative RMSE-i determine their membership in LQ45 while Figure 3 and Figure 4 has anomaly in the sense of value of relative RMSE-i.

### Conclusion:-

1. The average of relative RMSE-e of all 43 stocks is small enough; it indicates that *investment in the stocks for 13 months on average is save enough*.
2. With the average of relative RMSE-e which is 11.5455%, 40 of 43 stocks can be explained why a stock is removed from LQ45 or still save in it, i.e. because the RMSE-much larger than the average or about the average, respectively.

#### Abstract

Searching for articles of interest on publication sites can be difficult and time-consuming. Sometimes it takes lot of efforts to find the most relevant article because of which the reader loses interest completely. Recommender systems help the users find articles of their interest with personalized suggestions. In this paper, Hybrid Recommender System is implemented which is a novel combination of content-based filtering, collaborative filtering, trending article algorithm and user persona and recommend articles considering all the possible factors. User short-term interest is catered by suggesting trending articles while long-term interest is catered by observing what kind of content the user prefers to read and by finding out similar users and recommend what they are reading. The model makes the recommendation based on tags assigned to each article and knowledge of articles read by each user. This model doesn't require ratings of articles by each user as generally users usually don't rate article after reading them as compared to giving rating to movies after watching. The model built takes into consideration many aspects including the trend emerging at current time as well the interest of the user, the time period, geographical location, browsing history etc. then make recommendations accordingly.

#### Introduction:-

Articles in huge numbers are published every day across different categories. The information portal sites include articles of categories like stock markets, finance, banking, insurance, entertainment, social feeds etc.

Web sites are deploying recommendation systems for suggesting articles to users according to their taste. A key part of the news is that user has a long-term interest in certain categories and short-term interest in recent happenings. The short-term interest of user about some recent event can be dealt by recommending the trending article of that time on the basis of view counts of articles within a particular timeframe. As far as the long-term interest of the user is concerned, the recommendation can be done on the basis of user behavior and preferences. For this purpose, content-based filtering and collaborative filtering techniques are used to generate the recommendation.

**Corresponding Author:- Shailendra Singh Kathait.**

Address:- Valiance Solutions, A-75, Sector-58, Noida, Uttar Pradesh, 201301, India

Content-based filtering finds articles which are similar on the basis of tags assigned to each article. Each article is assigned weights on the basis of term frequency and inverse document frequency of each tag. After which user probability of reading an article is calculated. On the other hand, collaborative filtering uses the correlation between the articles on the basis of the ratings given to article by different users.

The disadvantage of content-based filtering is that it leads to over-specialization that is the recommended article is similar to already read article and may not be useful for the user. This method does not use the interaction information between users to generate recommendations.

Collaborative filtering relies on past preferences or rating correlation between users. However, this technique can lead to bad prediction if the article is unpopular and very few users have given feedback about them.

To overcome these difficulties, a hybrid model is proposed that takes into account all the possible aspects that contribute towards making the most relevant recommendation to the user.

**In this paper, we have developed a hybrid intelligent model, in which users are suggested articles on the basis of following factors:-**

**Directional Variables:-**

1. Trending Articles for a particular time period
2. Reader's interest (based on browsing history)
3. Geographical Location
4. Time Period
5. Reader's specifications (gender, age etc.)
6. Reader's behavior.
7. Other Parameters like time of log-in etc.

Considering all the above mentioned aspects and applying appropriate filtering, the most relevant recommendation is generated.

**Related work:-**

The related work done in this either uses collaborative filtering or content-based filtering for recommendations. The other factors that contribute to the recommendations is ignored, as a result of which irrelevant recommendations are made in many cases. For example if the geographical location of the reader is not considered, then he'll be recommended articles of a different nation, to which he has nothing to do. In our project, we made use of all the possible information of the user as well as of the articles to make recommendations. The most appropriate and relevant tags were assigned to the articles that considered all the data that can be extracted from the articles and summarized it. All the user attributes are considered to make the most suitable recommendation of his interest.

In Item-Based Collaborative Filtering Recommendation Algorithms [1], only collaborative filtering approach is used for recommendations that only considers the article's similarity irrespective of trending articles and other parameters.

In Personalized News Recommendation Based on Click Behavior [2], again the user behavior is considered and on the basis of past browsing history, the recommendations are made.

In Content based recommender systems [3], the ratings given by the reader is considered as an important parameter in-order to make appropriate recommendations. The interests of the reader that do not give rating to the article are left unconsidered in this case.

In order to build an intelligent system, all the possible parameters should be considered along with their weights (impact factors), that generates the most relevant recommendation for the user.

**Information Retrieval:-**

For the purpose of the recommendation of articles, a lot of data on user's reading habit and clicks counts of the article have to be extracted beforehand. In this paper, article attributes such as click counts (number of times

article is read), time-stamp (time at which article is read), article tags (different genres which tells what the article is talking about, for e.g. an article can have tags such as Stocks, Finance, Markets, Demonetization, Sports etc.) are known.

The Intelligent System developed by us was for a leading publishing house of Asia. The publishing house provided data that consisted of the following information:

1. Articles' Content
2. Articles' Ratings
3. User browsing history
4. User details
5. Article's Tags

The tags were assigned to the articles by implementing an unsupervised algorithm that assigned the most relevant tag to the articles. The algorithm implemented segmentation of Chinese characters, removal of stop words, preparation of dictionary, implementing TF-IDF concept and finally multi-stage tagging that generated the relevant tags for articles.

The information on user reading habit was provided in the form of articles read by different users. The sample dataset containing attributes of articles is shown in Table 1, dataset containing attributes of users is shown in Table 2, and dataset containing details of user is shown in Table 3.

User-ID	Login time	Articles read
U1	Male	A1,A7
U2	Female	A100
U3	Male	A12,A3

**Table 1:-** Article Attributes

Article-ID	Tags	Time of publishing	Click-count
A1	Finance, Stocks, Economy	3 <sup>rd</sup> January 2017	678
A2	Wine, Finance, Trading	8 <sup>th</sup> March 2012	8753
A3	Sports, Basketball	6 <sup>th</sup> April 1992	5300

**Table 2:-** User Attributes.

User-ID	Gender	Age	Location
U1	Male	30	G1
U2	Female	31	G2
U3	Male	45	G3

**Table 3:-** User Specifications

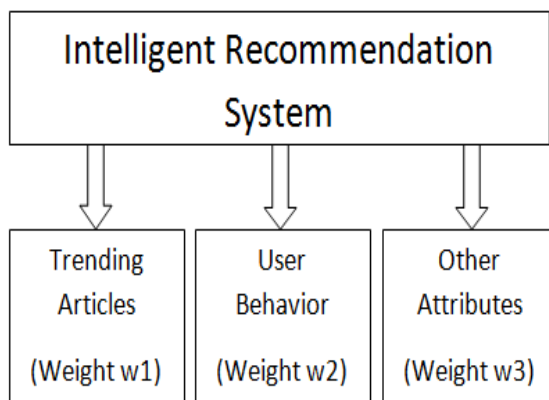

### Proposed Methodology:-

Hybrid Recommender System (HRS) suggests articles to user considering the short-term as well as the long-term interests. The different techniques that Hybrid Recommender System uses are as follows [4]:

1. For short-term interest of the user, trending articles are recommended.
2. For long-term interest of user, articles are recommended on the basis of articles read by user.
3. Other important parameters (user attributes) are considered to make recommendations.

### The following different approaches are used for the purpose of recommendation:-

- a. Content-based filtering.
- b. Item-Item Collaborative filtering.
- c. User-User Collaborative filtering.

**Figure 1:-** Recommender System Block Diagram

### **Recommending Trending Articles:-**

Recommending trending articles imply recommending the latest trending articles that has got maximum views in a given time-frame and are the most trending topics of interest. The following methods were used for recommending trending articles to the user:

Firstly, on the basis of the views (click-count) and time of publishing of the article, the trending article of last months, 30 days, 7 days, and 1 day was selected for recommendation. The first step in this is the categorization of the articles. The articles are categorized in to different categories like Business, Art, Entertainment, Education, History etc. This categorization is done on the basis of tags of articles. After the categorization is completed, the time-frame for which the trending articles will be selected is decided, that varies from category to category. For example, for the “News” category, the trending article of last 1 or 2 day is selected, for entertainment, the trending article of last 30 days can be selected, for stock market, the trending article of last 1 or 2 hour will be a relevant recommendation. The final recommendation is built after sorting of the selected categorized articles for a given time-frame, on the basis of click-counts (number of views of article) and determining article which has highest click counts in each category in given time-frame. The time-frame chosen can be last 3 months, last 30 days, last 15 days, last 7 days, last 1 day, last 1 hour etc. This technique recommends articles to users which can cater to their short-term interest.

The trending articles in Twitter as well as in other networking sites was determined for recommendation.

The trending article was further determined on the basis of user behavior. This is done by observing user's hourly, daily and weekly interests, that is, the type of article user reads at a particular time of the day, on weekdays and weekends etc. For example, if user watches news at night on weekdays, and entertainment articles on weekends, then the recommendation at these instances (that is at night on weekdays and on weekends) is built around news and entertainment. Similarly other behavior of users is observed and recommendations are built on the basis of this. In the same manner, user-user matching can also be implemented, that is recommending articles read by 1 user at a particular instant to other user that has read one or more articles in common with the 1st user but has not read other articles read by 1st user.

The trending articles obtained in step-1, step-2 and step-3 are taken and are assigned some weights ( $w_1$  to articles from step-1,  $w_2$  to articles from step-2 and  $w_3$  to articles from step-3),  $w_2$  chosen to be maximum and  $w_3$  minimum. On the basis of these weight-ages, number of recommendations and the order of these recommendations is developed.

### **Content-based filtering of Articles:**

A content-based filtering system selects items based on the correlation between the content of the items and the user's preferences as opposed to a collaborative filtering system that chooses items based on the correlation between people with similar preferences [4][5]. A genre matrix is built in which each row tells which tags a specific article contains. It can be compared as specific row of the genre matrix signifying an article 'A001' is a

k-dimensional vector, where each dimension corresponds to distinct tags and 'k' is the total number of tags in document. The dimension of matrix is  $m * k$ , where m is number of articles and k is number of distinct tags in all the m articles. A sample Article-Genre matrix is shown in Table 4.

**Table 4:-** Article Genre Matrix

Article	Chemicals	Equipment	Wine	Trading	Finance
A1	1	1	0	0	0
A2	0	0	0	0	1
A3	0	0	0	0	1
A4	0	0	0	0	1
A5	0	0	0	0	1

Another matrix 'IsRead' is built which tells whether a particular user has read the particular article or not. This matrix is given in Table 5. The dimension of the matrix is  $n * m$ , where n is the number of users and m is the number of articles. The 'User Profile' is generated from 'Genre' and 'IsRead' matrix by taking their matrix multiplication. This generated user profile gives the information of inclination of user towards particular tags. Thus each row of user profile signifies specific user's interest in various tags. The user profile matrix is  $n * k$  dimensional matrix, where n is number of users and k is number of distinct tags. The greater score of any tag against specific user signifies that the user has interest in that tag or article containing that tag as compared to article containing different tag. A sample user profile is shown in Table 6.

**Table 5:-** User Article 'Is-Read' Sample.

User-Article ID	A1	A2	A3
U1	0	1	1
U2	1	0	0

**Table 6:-** User Profile

User-ID	Automobile	Share	Wine	Finance
U1	9	5	6	10
U2	16	1	12	9
U3	12	0	0	7

For recommending articles to test user, a dot product of k-dimensional vector in user profile  $U_i$  and k-dimensional vector in genre matrix  $M_i$  is taken for test user and each article. This assigns a score to all article for particular user entirely on the basis of the tags of the article. The higher score is generated for articles which contains tags towards which test user is more inclined. The articles are sorted on the basis of score and the top articles are recommended.

**Score:** The score of every article  $m_i$  for given test user  $u_i$  is given by (1):  

$$\text{Score}(U_i, M_i) = u_i \cdot m_i \tag{1}$$

Where  $u_i$  and  $m_i$  are the k-dimensional vectors from user profile and article-genre matrix and k is the total number of distinct tags.

**Item-Item Collaborative Filtering:-**

Item-based collaborative filtering uses interaction between users to recommend articles. In the algorithm, the similarities between different items in the data-set is calculated by using one of the similarity measures, and then these similarity values are used to generate recommendation for users [6][7]. The similarity value between any two articles is measured by observing all the users who have read both the article. The similarity measure used in this paper is Pearson (correlation) based similarity. This measure is based upon how much the articles read by common user for pair of articles deviate from average times each article is read. The Pearson similarity score between article  $M_i$  and article  $M_j$  is given by (2).

$$sim(i, j) = \frac{\sum_{u \in U} (M_{u,i} - M_i)(M_{u,j} - M_j)}{\sqrt{\sum_{u \in U} (M_{u,i} - M_i)^2} \sqrt{\sum_{u \in U} (M_{u,j} - M_j)^2}} \quad (2)$$

The similarity score between any two pair of articles is calculated by calculating Pearson correlation score between the respective columns of article in user-article 'IsRead' matrix[8].

For a test user for whom we want article recommendation, similarity score of all the articles corresponding to every article read by user is added up and top-N article after sorting is recommended to the test user. This method is iterated for each user to generate the recommendation for each user. For user U1, similarity score of read articles A1, A2 and A3 given in Table 7 is added up column wise to get the score of each article. The following score is given to each article after adding up A1: 2.5, A2: 2, A3: 2, A4: -2.5, A5: -2.5. As the unread articles A004 and A005 get negative score imply that they are not similar and hence not recommended.

**Table 7:-** Similarity Scores

	A1	A2	A3	A4	A5
A1	1	0.5	1	-1	-1
A2	0.5	1	0.5	-0.5	-0.5
A3	1	0.5	1	-1	-1
A4	-1	-0.5	-1	1	1
A5	-1	-0.5	-1	1	1

#### **User-User Collaborative Filtering:-**

User-User collaborative approach applies the same idea as that of item-item collaborative filtering, but it calculates the similarity between users rather than calculating similarity score between articles [9]. A Pearson's correlation matrix of users is built based on 'IsRead' matrix i.e. on the basis of m-dimensional vector of two users in IsRead matrix, where m is total number of articles. The similarity is calculated between rows of User-Article 'Is read' matrix in Table 5. The similarity score obtained is shown in Table 8.

It is calculated using the same Pearson similarity equation (2).

**Table 8:-** User-User Correlation Matrix.

User	U1	U2	U3
U1	1	0.667	-1
U2	0.667	1	0.667
U3	-1	-0.667	1

On the basis of similarity score of users, top-N similar users of test user is generated. The articles read by all these similar user is used for building recommendation to test user. The articles read by similar user of test user for the purpose of recommendation to test user can be sorted in order by popularity using click counts of article.

#### **Other Attributes Filtering:-**

**The recommendations obtained from the aforementioned methods are further filtered on the basis of following factors:-**

1. Geographical location
2. Date and Time
3. User Attributes (Age, Gender etc.)

#### **Observations and Results:-**

The different recommendations generated using A,B,C,D are further assigned different weights and then the overall recommendation is generated considering all the possible factors. The weights to each article obtained through different steps are assigned according to "Design of Experiments" principle.

**Table 9:-** Weighted Recommendation Table

Recommendations	Weight
Step-A recommendations	0.42
Step-B recommendations	0.42
Step-C recommendations	0.08
Step-D recommendations	0.08

The final recommendation is made on the basis of the obtained weights for each recommendation obtained using the proposed algorithm.

The response rate obtained in case of Hybrid system is much better as compared to that obtained in case of collaborative and content-based filtering individually.

Response rate is given by (3):

$$\text{Response Rate} = \frac{\text{No. of relevant recommendations}}{\text{Total no. of recommendations}} \quad (3)$$

The number of relevant recommendations included the number of articles (from the set of recommended articles) that were read (clicked) by the user.

In order to test our hybrid model and make comparison, the experiment was performed for 100 users. A set of these 100 users was taken, and all the data related to the user was considered. The user attributes were collected as well as the articles read by user was found out. After this we made 5 recommendations each using content-based filtering, collaborative filtering and the using the hybrid model. Then we observed the clicks by user within next 24 hours span of time.

In order to obtain a comparison a design of experiments model was constructed and following steps were implemented:

1. Firstly the recommendations were generated by applying content-based filtering on the articles and then the response rate was calculated. This was done by observing the number of articles (from the set of recommended articles), that was read (clicked on) by the user.
2. Secondly the response rate was calculated by generating recommendations on the basis of collaborative filtering.
3. Finally the response rate was calculated for the recommendations generated on the basis of the Hybrid model and the result obtained in all the 3 cases was tabulated in Table 10.
4. For the 5 recommendations made in case of content-based filtering, the user clicked on 2 recommendations giving response rate of 40%.
5. For the 5 recommendations made in collaborative filtering, the user clicked on 2 recommendations again giving response rate of 40%.
6. In case of hybrid model, the user clicked on 4 recommendations out of 5 made, giving the highest response rate of 80%.
7. The similar procedure was followed for all the 100 users and average response rate was calculated for each category, the results are tabulated in Table 10.

**Table 10:-** Comparison Table.

Approach	Response Rate
Content-based	0.44
Collaborative	0.48
Hybrid Model	0.85

**Conclusion:-**

The model proposed in this paper is a hybrid one, that has made improvements in different sections for generating overall relevant recommendations, taking into account all the factors that can contribute to the same. In this paper, implicit feedback of user for an article is used, which observes action of users whether or not user has read that article. If user gives an explicit feedback such as rating an article, liking an article or sharing an article, it would generate better recommendation as compared to implicit feedback. Another way of tracking user behavior is by storing the time spent by user on every article that he read.

Also, if there exist term frequency of every tags, TF-IDF (Tag Frequency-Inverse Document Frequency) method can be used. In this method, weights of each article according to frequency a particular tag in that article and IDF (inverse document frequency) which tells how frequent that tag has occurred in all articles. The product of k-dimensional vector of user profile and k-dimensional weights of each article is calculated to generate similar article based on content. In the method of collaborative filtering, Pearson correlation matrix is used for calculating similarity between articles and between users. As the variable is dichotomous, other methods of similarity such as Jaccard-Needham, Yule, and Kulzinsky give a better result as compared to Pearson correlation coefficient [9].

The exclusion of the articles for recommendation that has already been read by user also varies according to the category of the article. There can be some articles that the user will want to read more than once for example if it is a lengthy article, or some historical one or else of deep interest or Education related and need to read more than once for grasping completely.

#### Abstract

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Contrast media are increasingly used in diagnostic imaging procedures. This result in the rising incidence of iatrogenic renal function impairment caused by the exposure to CM, a condition known as "contrast-induced nephropathy" (CIN). Patients with an acute deterioration in renal function after contrast administration are at risk for chronic kidney disease as well as renal failure requiring dialysis. Radiographic CM is responsible for 11% of cases of hospital-acquired renal insufficiency, the third most common cause of renal failure. There is need to study the differential affect of contrast media in different patient population especially in diabetics and hypertensive's. The result of the study may share light on incidence of CIN, its prognosis and identification of risk factors in study population.

#### Aims & Objectives:-

1. To study the effect of contrast agents on renal function based on serum creatinine and creatinine clearance in patients without a pre-existing renal disease.
2. To evaluate the effect of contrast agents on renal functions based on serum creatinine and creatinine clearance in patients with diabetes who are well controlled on medications.
3. To evaluate the effect of contrast agents on renal functions based on serum creatinine and creatinine clearance in patients with hypertension who are well controlled on medications.

#### Materials & Methods:-

After prior approval from institutional ethical clearance committee, the study is conducted in department of pharmacology, D Y Patil University in the patients who are going for use of contrast media and CT scan of renal system.

#### Study design:-

It is a prospective longitudinal comparative study conducted in patients assigned in three groups controlled, diabetic and hypertensive.

**Corresponding Author: - Dr. Ravindraa Patil.**

Address: - Department of Pharmacology DYPMC, Kolhapur.

**Inclusion criteria:-**

- All patients without a pre-existing renal disease
- Diabetic patients well controlled with oral medications
- Hypertensive patients well controlled with oral medications.

**Exclusion criteria:-**

- Un co-operative patients
- Patients with pre-existing renal disease if creatinine more than 1.6 mg%.
- Patients allergic to contrast media
- Pregnant patients

**Data collection:-**

Patients who would be satisfying inclusion and exclusion criteria and willing to give informed consent would be included for the research. History would be taken as per the data recording sheet, investigations would be done to assess contrast induced nephropathy and before the procedure blood urea levels and serum creatinine levels would be measured then patient would be injected low osmolar nonionic contrast media intravenously in the dose of 1.5 ml/kg body weight. After the 48-72 hrs procedure repeat creatinine and creatinine clearance would be measured.

**Result and Conclusion:-**

Study is going on and patients are included as per the criteria. Data would be analyzed and part of the study would be presented at the time of presentation.

**Abstract**

Thousands of years ago originated in India and in present day age, awareness was observed in health and natural remedies along people by yoga and pranayama which has been proven and effective method for improving health in addition to prevention and management of diseases, with increases scientific research in yoga. Its therapeutic aspects are also in explode. Yoga is reported to reduce stress and anxiety, improves autonomy function by triggering neuro hormonal by supersession sympatric activity and even, ow-a-days several reports suggested yoga is beneficial for physical health of cancer patients , such global reorganization of yoga also testifies to India's growing culture influence.

Today, yoga beginning a subject of various interests as gained worldwide popularity. It can serve as an applied science in a number of fields such as education, physical education and sports. Health and family welfare , psychology and medicine and also one of the valuable means for the development of human resources for better performance and productivity, however, there exists controversy in accepting yoga as medicine and therapy because it has generally believed that yoga is a spiritual science having emancipation as goals and hence cannot be treated only as a therapy.

4. Brahmacharya- No lust or sexual activity within marriage .
5. Aparigraha- Don't collect things that are not necessary.

**Niyam:-**

Five ethical guidelines regarding moral behavior towards others.

1. Sauch- clearliness
2. santosh- contentment
3. Tapsya- sustained practice
4. Svadhyay – self study
5. Ishvara prindhan- surrender to god.

**Asana:-**

Practice of yoga postures.

**Ayampran:-**

Practice of breathing exercises.

**Pratyahar:-**

Withdrawl of the senses, meaning that the exterior world is not a distraction from the interior world within oneself.

**Dharana**

Concentration , the ability to focus on something uninterrupted by external or internal distraction.

**Dhyana:-**

Meditation.

**Samadhi:-**

Bliss building upon dhyana, the transcendence of the self through meditation. The merging of self with the universe.

**Strain:-**

- The wear and tear our bodies experience.
- The state of threatened homeostasis.
- Stressors cause imbalance.
- Body tries to balance.
- Yoga can be great help balance the imbalance.

**Stressors:-**

- Can be positive and negative.
- Positive stressors can help compel us to action, can result in a new perspective. Eg. Birth of a new baby, a job promotion.
- Negative stressor can result in feeling of distrust, rejection, anger etc. eg. Loosing a job.

**Clinical significance of yoga:-**

- Reduced stress
- Spiritual growth
- Sense of well being
- Reduced anxiety and muscle tension
- Increased strength and flexibility
- Slowed aging
- Sound sleep
- Improve many medical condition
- Lower heart rate
- Lower blood pressure
- Allergy and asthma symptom relief
- Smoking cessation help

**Strain and healthcare providers:-**

- Providing care to others is a rich and rewarding experience.
- Often feel improved self esteem and confidence.
- No wonder they live under tremendous stress.
- Continuous exposure to suffering.
- Decreased sleep and food.
- Long hours of work.
- Constant worry about law suits.

**How yoga can help:-**

- Practicing yoga can be a best thing a provider can do for himself/ herself.
- Doing simple pranayam(breathing technique) in breaks can calm their mind.
- Practicing yoga for ½ hr. a day can make their body fit to take care of others.
- Yogic thought process will teach not to work only for money.

**Conclusion:-**

- A body with a stressful mind cannot be healthy body.
- Off course , to do so , first they need healthy body without a stressful mind.
- Yoga helps the mind to become clear and pure and clear mind is not affected by strain.

##### Key words:-

share solution, earning per share.

#### Abstract

Stock split solution is one of the capital restructure forms which was executed by a company caused split effect, that is a company execution which caused the rise of stock amount which spread proportionally more than the rise of company wealth. The research purpose is to analyze finance performance and the expensive share cost in the decision of stock split. Emiten which was included sample clasified to two, namely one executed stock split in the term of Januari 2011-December 2012 and one did not execute share solution in the term. The number of sample emitten is 13 emitten cosisted of 6 emiten which executed stock split, have net profit data, earning per share (EPS), price to book value (PBV), and price to earning ratio (PER). Analysis device was ANOVA. The research result showed that there was no significant difference finance performance between company which executed share solution and company did not execute stock split, and no significant differenece expensive share price between company which executed stock split and company which did not execute stock split.

#### Background:-

Competitive conditions currently require companies to constantly develop the company through certain strategies. This is to support the improvement of performance and maintain the existence of the company in the community. One of the efforts to become the bigger and stronger company is through expansion. The company as an entity, generally, oriented towards achieving maximum profit. The right and good setting the management of capital structure will help the course of the activity. Capital structure has an important role for the company both in a critical condition and in a healthy condition to finance its operations. The decision to increase or decrease the capital structure carries different consequences on the profit of companies in the future (Smith, 1990). The company's ability to achieve the maximum profit is only enabled if the company's performance is getting better. Investors or potential investors will be interested in return (rate of profit) expected for the future relative to the risk of the company, and the benefits can compensate for the additional risk that arises (Myers, 1984). The increased performance of the company is expected to maximize the wealth of shareholders, in this case there are two approaches in describing the purpose of shareholder wealth maximization into more detailed objectives, namely through the risk-sharing approach and the liquidity-profitability approach (Hampton, 1989). Capital market, in its operation, provides the opportunity for a company that has grown well to issue securities. In this case the company will get additional funds from the public for the company's development as well as to improve the company's capital structure. The increase of financial funding sources will increase the company size, the larger the size of the company will be more and more

alternatives the company can choose in order to optimize its performance. Large-scale enterprise has several advantages. First, the securities of large companies reflects the assets easily traded so that more liquid and have low risk (Crutchley and Hansen, 1989); second, the size of a large company happens due to the process from time to time that reflect the success of the company's performance in the past and are also useful as an indicator on the performance of the company in the future so that the relatively lower risk of bankruptcy; third, large companies have economies of scale that allow it to operate more efficiently.

### **Matherials And Methods:-**

Stock split can be meant as splitting a sheet of stock into several sheets of shares. Stock split resulted in the increase in the number of shares outstanding without a sale and purchase transactions that change the amount of capital, the price per share is equal to  $1/n$  of the price before splitting. With the stock split, the number of shares increased through a reduction in the value of shares proportionally. The main purpose of stock splits is to put stock in a more attractive trading range, which is expected to attract more buyers (Van Horne and Wachowicz, 2012). Action of stock split takes effect for investors, because they will feel as though become more prosperous due to they hold shares in more number, so the stock split is actually an act of a company that does not have economic value (Ikenberry *et. al.*, 1996). YulongMa *et al* (2000), Tawatnuntacahai and D'Mello (2002) stated that the company make a stock split was due to anticipation of a decrease in earnings volatility. Although theoretically the stock split had no economic value, but many events of stock split in the capital market gives an indication that the stock split is an important tool in the capital markets practice, which is used by management to establish a market price of shares of the company. David, O'hara, and Saar (2001), Griffin (2010), and Tabibian (2013) stock split of the company can deliver value to the company, while investors see the stock split positively as a good investment. The announcement of a stock split is considered as a signal given by the management to the investment or potential investment that the company has performed well and has good prospects in the future (Aigbe *et al*, 1995, and Brealey *et. al.*, 2007).

Ikenberry *et. al.* (1996) found evidence that the stock split resulted in the re-arrangement of share price at the lower range, so the company conducts a stock split due to view that its stock price is too high. In other words, the stock price that too high is the impetus for company to conduct stock split. Hua and Ramesh (2013), Jennifer Koski (2007) said that the volatility decreases after the stock split carried out, in particular, for the lower stock price, finally there is a significant correlation between changes in the amount of change in the volatility of trading after the stock split. Vafeas(2001) stated that the stock split was preceded by their small income significantly, and has a significant relationship of incomes rise after the stock split that benefits the market participants. While Jain and Robani (2014) stated that if the company conduct stock split when economic conditions are in crisis, then the market reaction will be negative and decreased if compared to the normal economic conditions. Marwata (2001) found that the differences in financial performance and in level of expensiveness of share price measured the net income and earnings per share are not higher if compared to those of companies that do not do stock split.

### **Variable used in this analysis are:-**

#### ▪ Financial Performance

It is the financial data that the company had achieved in a certain period of time. The financial performance of companies that perform the stock split and the company does not do a stock split is measured by:

- Net Profit or Earnings after Tax(EAT) is an annual net profit of the period ended in December 31 of year before the stock split done. The variable data is measured in rupiahs unit.
- Earning per share (EPS) is a ratio used to measure a profit level of the company. The results of the calculation of this ratio can be used to estimate the increase or decrease in the stock price of a company on the stock exchange. The EPS used is the EPS at the end of the period prior to the stock split carried out.

$$EPS = \frac{\text{Net Profit}}{\text{Number of Shares}}$$

#### ▪ Expensiveness of stock price is the nominal price of shares traded on the capital market. Expensiveness stock price of the company conducting stock split and the company do not do a stock split is measured by:

- Price to Book Value (PBV) is a price ratio calculated by dividing the current stock price and the book value, the book value itself is a ratio calculated by dividing total net assets(asset-debt) to the total shares outstanding. PBV used is the PBV of end year before the stock split year.

$$\text{Book Value} = \frac{\text{Total Equity (Asset-Debt)}}{\text{Number of Shares Outstanding}}$$

$$PBV = \frac{\text{Stock Price}}{\text{Book Value}}$$

- Price to Earnings Ratio (PER) is the ratio of the price which is calculated by dividing the current stock price by the earnings per share (EPS) is a ratio that indicate show much profit is obtained by investors or share holders of pershare. PER used is the end year PER before the stock split year.

$$PER = \frac{\text{Stock Price}}{\text{EPS}}$$

**The dependent variables:-**

Stock split is the replacement of the number of shares outstanding by the number of new shares, without changing the total nominal value. Stock split is aqualit ative variable, so in this test the variable is categorical, namely:

- a. For companies that perform the stock split it will be rated 1.
- b. For companies that do notdoastocksplitit will be rated0.

**Sampling Method:-**

The populationstudiedwas takenfrommanufacturingcompanies thatgo publicin Indonesian Stock Exchange. Selection ofthe sample usedisissuerslistedonthe Jakarta Stock Exchangeat 31 December 2012wereincluded in thegroupofmanufacturing industry. Issuersincluded in the samplearegroupedinto two, namelythose who conducted thestocksplitintheperiodofJanuary 2011to December2012andthosewhodid not doa stock splitintheperiod.The number of issuerswhobecamea sample were of13issuerswhichconsists of6issuers thatdostocksplitwhichhavedataofnet profit, EPS, PBVandPERduringJanuary 2011-December 2012and7issuers thatdidnotperformthe stock split,randomlyselectedbycriteriaofissuers thathavedataofnet profit, EPS, PBVandPERduringthe study period.

**Data Analysis:-**

Testing was done bycomparingthevarianceand the averageofthe two groupsusingindependentsamplettest(t testfortwo independent samples) which includetesttheLevenetest.To find attestortcount it can bedone by means of:

$H_{0Ai}$  : Bothvariancesamples(net profit, EPS, PBV, andPER) areidentical(variance samples of companies that dostocksplitandthat do not dostocksplitis the same).

$H_{1Ai}$  : Bothvariancesamples(net profit, EPS, PBV, andPER) are notidentical(variancesamples of companies that dostocksplitanddo not do thestocksplitisdifferent).

Where : if the probability > 0,05 then  $H_{0Ai}$ accepted and  $H_{1Ai}$ rejected

If the probability < 0,05then  $H_{0Ai}$ rejectedand  $H_{1Ai}$ accepted

To carryoutthedifferent testof two averagesby F testis usedthe following formula:

$$F_{count} = \frac{\text{Mean Square Between Groups}}{\text{Mean Square Within Groups}}$$

**Results And Discussion:-**

**Test of Data Homogeneity:-**

The testusedis thetestofhomogeneityofvariancethatis by Levene test, fromthe calculation results is obtainedasfollows:

**Table 1:- Test of Homogeneity of Variances**

	Levene Statistic	df1	df2	Sig.
Net profit (X1)	2.590	1	18	.125
EPS (X2)	1.470	1	18	.244
PBV (X3)	.245	1	18	.627
PER (X4)	.206	1	18	.655

**Source:** Data processed

The calculation results in the table above for the financial performance which consists of net profit and earnings per share have the probability value or the significance greater than 0.05. This means that the data of the variables of net profit and earnings per share have the uniform or equalvariances. Expensivenessofstock pricewhichconsistsofprice to book valueandprice earnings ratiohasaprobabilityorsignificancegreaterthan0.05, whichmeansthatthedataofthe price to bookandprice-earnings ratio variables havethesamehomogeneity.

**Hypothesis Testing:-**

Hypothesis testing in this study used the different test of two averages for the samples that disjoint. The research result shows the values as presented in the table below:

**Table 2:- Hypothesis Testing Results**

Variables	Mean		F value	$\rho$ value
	Do not dostock split	Performstock splits		
Net profit	216085.21	69114.50	0.443	0.514
EPS	74.0714	48.333	0.101	0.757
PBV	4.3621	1.9350	0.512	0.483
PER	23.37	9.225	0.343	0.565

**Source:** Data processed

Based on the table 2 above, it was found that the mean of net profit of the companies that do not conduct a stock split is greater than the mean of the companies that conduct a stock split. F value = 0.443 with probability ( $\rho$  value) of 0.514 is for a net profit, due to the probability value greater than 0.05 then it can be stated that there is no significant difference between the net profits of companies that perform the stock split and the companies that do not perform the stock split.

The value of earnings per share of companies that do not conduct a stock split is greater than the earnings per share of companies that perform the stock split, of the calculation of F value = 0.101 with the probability ( $\rho$  value) of 0.754, due to the probability value ( $\rho$  value) greater than 0.05 then it can be stated that there is no significant difference between the earnings per share of companies that do a stock split and companies that does not perform the stock split.

Based on the table 2 above, the mean of price to book value of the companies that do not do the stock split is greater than companies that perform the stock split. From the calculation of F value = 0.512 with the probability ( $\rho$  value) of 0.483, due to the probability value ( $\rho$  value) greater than 0.05, it can be stated that there is no significant difference between the price to book value of companies that perform the stock split and companies that do not do stock split.

Based on the table 2 above, mean of the price earnings ratio of companies that do not conduct a stock split is greater than companies that perform the stock split. From the calculation of the F value it is obtained F value = 0.343 with the probability ( $\rho$  value) of 0.565, due to the probability value ( $\rho$  value) greater than 0.05, then it can be stated that there is no significant difference between the price earnings ratio of companies that conduct a stock split and companies do not conduct stock split.

Stock split has become a tool used by management to establish the market price of company shares. Stock split is the splitting of a number of shares into more number of shares with a reduction of nominal price of per share proportionally. According to signaling theory, a stock split is an effort to give a signal about the owned information by management about the financial condition of the company, so it can be hypothesized that companies that perform the stock split had the better financial performance than companies that do not do a stock split, this meant that companies with not good condition cannot perform stock splits. The market will respond positively if the signal giver is credible, therefore, the company must demonstrate its credibility.

The first hypothesis states there is a difference in net profit after tax between companies that carry out the stock split and companies do not do a stock split. Based on the test results, this hypothesis is not verified.

The second hypothesis states that there are differences in earnings per share (EPS) between companies that carry out the stock split and companies do not do a stock split. Based on test results, this hypothesis is not verified. These results do not support the signaling theory that explains that the stock split was an effort to give a signal about the owned information by management about the financial condition of the company, so it can be hypothesized that the companies that do the stock split have better performance than companies that do not do stock split. But in this study did not be proven that the companies that did stock split had better financial performance than companies that did not do stock split. These results are consistent with the research conducted by Marwata (2001) which concluded that the financial performance of companies that do stock split and companies that do not do stock split is indifferent. The stock price is too high (over price) causes less active shares traded, given the stock split, the share price becomes too

high, so that will more investors who can afford to buy the shares, the more the investors numbers would increase the liquidity of shares in the exchange.

The third hypothesis states that there is a difference of price to book value (PBV) between companies that carry out the stock split and companies do not do a stock split. Based on test results, this hypothesis is not verified.

The fourth hypothesis states that there is a difference of price earnings ratio (PER) between companies that carry out the stock split and companies do not do a stock split. Based on test results, this hypothesis is not verified. The results of this study do not support the theory of trading range hypothesis in explaining the occurrence of stock split. Theoretically, a stock split occurred due to stock prices are considered too expensive, so the stock split is an effort to drive the stock price at a specific range that is not too expensive, so it can be hypothesized that the companies that perform stock splits have the price that relatively more expensive than companies that do not perform stock splits.

### Conclusions:-

From the analysis and hypothesis testing above, it can be concluded as follows:

a. For financial performance

- There is a difference in net profit between companies that carry out the stock split and companies do not do the stock split is not verified.

- There is difference in earnings of per share between companies that perform the stock split and companies that do not do a stock split is not verified.

b. Expensiveness of share prices

- There is difference of price to book value (PBV) between companies that carry out the stock split and companies that do not do stock split is not verified.

- There is difference in price to earnings ratio (PER) between companies that perform stock split and companies that do not do stock split is not verified.

From the analysis results and conclusions above, the the suggestions can be submitted are as follows:

1. This study does not escape from the limitations, where the period of observation only covers the period consisting of the two financial statements alone. Further research should be encouraged to further expand the observations samples or periods of financial statements, so that the research results better reflect the performance and level of stock prices expensiveness in real.
2. Some things to consider to develop this research is the need to extend the observation period of studies in several periods before the splitting is done, tests performed on various industrial objects to expand the research observations.

#### Abstract

Orbital cellulitis is considered as an ocular emergency which needs urgent evaluation and proper quick action to save the patient vision or even life

The aim of this report is to present a case about orbital cellulitis with the presence of multiple risk factors as sinusitis and ocular intervention and how to approach such patients

#### Introduction:-

Orbital cellulitis is an inflammation of the soft tissues of the eye socket posterior the orbital septum,It most commonly occurs when bacterial infection spreads the adjacent paranasal sinuses or other nearby structures such as the face , eyelids or the lacrimal drainage system through the blood streamAlso , It can be caused by a direct trauma to the orbit ,in which traumas may introduce an infectious materials into the orbitother causes were reported such as direct inoculation of the orbit from surgery or Hematogenous spread from bacteremiaOrbital cellulitis is an ocular emergency that not only threatens vision but also can lead to life-threatening complications if left untrated such as cavernous sinus thrombosis, meningitis, and brain abscess.'Careful history taking and physical examination must be done for fast disease recognition and proper management

#### Case Report:-

86 years old Female presented to our hospital ER , complaining of right eye Pain , Redness and Swelling of the eyelid for 3 daysIt was gradual in onset , Progressed rapidly within these 3 days with significant decrease of vision .

Regarding her Past history the patient is Known hypertensive for long time on antihypertensive medication with regular follow ups in PHC .

Also ,she reported History of chronic arthritis .

Regarding her Past ocular history , she was diagnosed with nasolacrimal duct obstruction in a previous visit and She underwent right syringing probing in our hospital 5 days prior to the admission .

**Corresponding Author:-Dr. Fatima al.mulhim.**

Address:-Ophthalmology Resident , Aljaber Eye And ENT Hospital, Kingdom Of Saudi Arabia.

**The patients Clinical findings were as follows:-**

Her Vision in the Right Eye was counting fingers at 2 METERS and the left eye 0.5 both without correction  
Intraocular pressure was normal in both eyes Right eye examination revealed Upper and lower eyelid tender swelling along with conjunctival congestion and Chemosis.

There was also Non axial proptosis pushing the globe slightly outward and downwards with restriction of ocular movements in all directions .

**On slit lamb Anterior segment examination:-****Right Eye:-**

There was Grade 1 RAPD  
Immature cataract

**Fundus:** WNL

**Left Eye:-**

Anterior segment-  
Immature cataract

**Fundus:** within normal level

**The patient was admitted to the hospital:-****Investigations:-****CT-scan:-**

Axial and coronal CT scan was done with and without contrast done , revealed sub periosteal abscess in the upper medial wall of the orbit originating from the ethmoid sinus which showed signs of sinusitis.

**The patient was given the following Treatment:-****Medical treatment in the form of:**

Injection IV Ceftriaxone 1 gm BID  
Ciprofloxacin Eyedrops q4 hourly  
Chloramphenicol Eye ointment HS  
Tablet Brufen 400 mg BID  
Tablet Ranitidine 150 mg BID

**After the CT scan results came, Surgical treatment started:-**

The sub periosteal abscess was drained under general anesthesia through the caruncular approach and the pus was sent for culture and sensitivity.

A swab was also taken.

Postoperative treatment:

Injection IV Ceftriaxone 1gm BID  
Injection Vancomycin 500mg q6hrs  
Injection Flagyl 500mg TID  
Tab Prednisolone 50 mg PO OD  
Tab Brufen 400 mg BID  
Tab Ranitidine 150 mg BID

**Postoperative picture:-****1<sup>ST</sup> post operative day**

the general condition of the patient improved

Vision: counting fingers 3 meters

The pain was relieved

The lid edema and the chemosis were reduced

The ocular movements had improved

Right eye examination revealed Upper and lower eyelid tender swelling along with conjunctival congestion and Chemosis .

CT Scan without contrast revealed sub-periosteal abscess in the upper medial wall of the orbit originating from the ethmoid sinus which showed signs of sinusitis

### Discussion:-

Displacement of the globe may be due to an increase in the orbital contents. the orbit has rigid bony walls except its anterior wall , such displacement usually manifests predominantly as forward protrusion of the globe which is called proptosis , which is the hallmark of orbital disease.

orbital cellulitis may due to an injury perforating the orbital septum.

The Inflammation process can be noticed within the first 48-72 hours after injury, it may be delayed for several months if retained orbital foreign body.

Some orbital cellulitis cases were reported after surgical procedures, such as orbital decompression, DCR, blepharoplasty, squint surgeries, retinal surgery, and glaucoma surgery.

The diagnosis of orbital cellulitis is usually based on clinical findings with the aid of radiological findings sometimes

Usually , The presence of orbital signs such as proptosis, pain during eye movements , ophthalmoplegia, optic nerve involvement as well as fever and high WBC count confirm the diagnosis. Age, medical history , the presence of trauma and the mechanism of injury play an important role in determining the causative organism of orbital disease. Staphylococcus species, Streptococcus species and Bacteroides species are the most common organisms detected in adult orbital cellulitis , while unvaccinated children can present with sequelae from Haemophilus influenzae. To be noticed , some organisms can be detected In all age groups with specific conditions , for example , dental abscess with mixed, aggressive aerobic and/or anaerobic infection must be considered if a suggestive history is elicited. Gram-negative rods are likely to be the causative organism recovered in abscesses

secondary to trauma. Fungal infections, including mucormycosis/zygomycosis and aspergillosis , especially in diabetic or immunocompromised hosts.

Age of the patient	Microbiology results	Surgical management
Less than 9	No growth or one anaerobic microorganism	Not indicated
From 9 to 14	Mixed aerobic and anaerobic microorganism	Possible
More than 14	Mixed or only anaerobics	Indicated

### Conclusion:-

Orbital cellulitis due to Subperiosteal abscess is a well-described infectious process that affects the bones supporting the globe. It can cause rapid clinical deterioration of the bone and intracranial extension. Careful clinical monitoring, serial ophthalmologic examinations and comparative radiologic screening of persons must be done , followed by prompt and appropriate treatment. Thses details are necessary to decrease the risk of complications, such as permanent vision loss, cavernous sinus thrombosis and cerebral abscesses.

Orbital cellulitis is considered as an ocular emergency which needs urgent evaluation and proper quick action to save the patient vion or even life.

#### Abstract

Hemangiomas are considered to be benign tumors of infancy which show a rapid growth phase marked by endothelial cell proliferation, followed by gradual involution. On the other hand, vascular malformations are structural anomalies of blood vessels without endothelial cell proliferation. The pathophysiology of these lesions is still shroud in mystery. One etiologic hypothesis speculates that cells are “embolized” from the placenta. Another suggests that hemangiomas result from somatic mutations in a gene mediating endothelial cell proliferation. Recent data suggest an endothelial progenitor cell as the source of origin of the tumors. It has been speculated that hypoxia, either systemically (e.g., due to placental insufficiency) or in a specific “niche” area of poorly perfused tissue stimulates endothelial progenitor cells to proliferate inappropriately. The fetal endothelial cell precursor cells, possess specific histochemical markers (GLUT-1, Lewis Y Antigen, merosin), similar to those on placental blood vessels. Abnormal levels of matrix metalloproteinases (MMP-9) and proangiogenic factors (VEGF, b-FGF, and TGF-beta 1) play a crucial role. Genetic errors in growth factor receptors have also been shown to affect development of hemangiomas. Recent discoveries concerning hemangioma pathogenesis provide both an improved understanding and more optimal approach to workup and management like corticosteroid or propranolol therapy. Important detrimental associations can be seen with hemangioma, such as significant structural anomalies. Standards of care have dramatically changed evaluation and management of hemangiomas. Herein, we have briefly discussed the factors that contribute to the formation of hemangiomas and vascular malformations in general along with their management.

#### Introduction:-

Vascular anomalies are congenital lesions of abnormal vascular development. Previously referred to as vascular birthmarks, vascular anomalies are now classified based on a system developed in 1982 by Mulliken and Glowacki that considers histology, biological behavior, and clinical presentation of these entities. <sup>(1)</sup> A primary distinction is made between a vascular tumor, which grows by cellular hyperplasia, and a vascular malformation, which represents a localized defect in vascular morphogenesis. <sup>(2)</sup>

**Corresponding Author: - Dr. Snehanjan Sarangi.**

Address: - Oral & Maxillofacial Pathology, Dental Surgeon, Chanditala Rural Hospital, Hooghly, West Bengal.

Both vascular tumors and malformations may occur anywhere on the body. In brief, hemangiomas are vascular tumors that are rarely apparent at birth, grow rapidly during the first 6 months of life, involute with time and do not necessarily infiltrate but can sometimes be destructive. Vascular malformations are irregular vascular networks defined by their particular blood vessel type. In contrast to hemangiomas, they are present at birth, slow growing, infiltrative, and destructive. <sup>(3)</sup>

Hemangiomas are categorized into two types: “infantile” or “congenital.” The rare “congenital” hemangioma is less understood and present at birth. Congenital hemangiomas either rapidly involute (rapidly involuting congenital hemangioma (RICH)) over a very brief period in infancy or never involutes (noninvoluting congenital hemangioma-NICH). <sup>(3)</sup>

The pathogenesis of hemangioma-one of the key and fascinating aspects; is still not properly understood. Although growth factors and hormonal and mechanical influences have been postulated to affect the abnormal proliferation of endothelial cells in hemangioma, the primary, causative defect in hemangiogenesis remains unknown and no genetic alteration has been implicated.

The dearth of molecular details is striking, considering the growing list of germline mutations in genes causing specific inherited syndromes involving vascular malformations, including hereditary hemorrhagic telangiectasia ,cutaneous venous malformations, cerebral cavernous malformations, and hyperkeratotic cutaneous Capillary-venous malformation. <sup>(4)</sup>

Although many of these lesions resolve spontaneously without concern, a significant proportion leads to function threatening and cosmetically disfiguring consequences. For functionally significant or potentially deforming lesions, timely intervention is important to minimize the possibility of a poor outcome and permanent scarring. Many important and management-altering discoveries have occurred regarding hemangiomas in the past decade. <sup>(5)</sup>

The goal of timely recognition and therapy is to minimize or eliminate long-term sequelae. Standards of care have dramatically changed evaluation and management of hemangiomas. New modalities, such as oral propranolol, provide the caregiver with better therapeutic options, which can prevent or minimize medical risk or scarring. <sup>(6)</sup>

Here, we are presenting the various theories involving the pathogenesis of hemangiomas with a view to enrich its treatment and management modalities.

### **Overview of Hemangioma:-**

Vascular tumors and malformations may occur anywhere on the body. In brief, hemangiomas are vascular tumors that are rarely apparent at birth, grow rapidly during the first 6 months of life, involute with time and do not necessarily infiltrate but can sometimes be destructive. Vascular malformations are irregular vascular networks defined by their particular blood vessel type. In contrast to hemangiomas, they are present at birth, slow growing, infiltrative, and destructive and persist throughout the life of the patient. Due to their complexity, a multidisciplinary approach is frequently necessary in managing these lesions and includes a team of specialists in pediatric otolaryngology, dermatology, hematology, interventional radiology, surgery, orthopedics, and sometimes psychology. <sup>(7)</sup>

### **Pathophysiology:-**

The pathophysiology associated with the unique natural history of these lesions, with initial rapid proliferation followed by gradual involution and regression, has not been completely elucidated.

One theory suggests that hemangioma endothelial cells arise from disrupted placental tissue imbedded in fetal soft tissues during gestation or birth. Histochemical markers of hemangiomas, such as GLUT-1, Lewis Y antigen, FcyRII, and merosin have been shown to coincide with those found in placental tissue. This is further supported by the fact that they are found more commonly in infants following chorionic villus sampling, placenta previa, and preeclampsia. <sup>(8)</sup> A different theory arose from the discovery of endothelial progenitor and stem cells in the circulation of patients with hemangiomas. <sup>(9)</sup> The development of hemangiomas in animals from stem cells isolated from human specimens supports this theory. However, infantile hemangiomas most likely arise from hematopoietic

progenitor cells (from placenta or stem cell) in the appropriate milieu of genetic alterations and cytokines.<sup>(10)</sup> Abnormal levels of matrix metalloproteinases (MMP-9) and proangiogenic factors (VEGF, b-FGF, and TGF-beta 1) play a role in hemangioma pathogenesis.<sup>(11)</sup> Genetic errors in growth factor receptors have also been shown to affect development of hemangiomas.<sup>(11)</sup> It has been speculated that hypoxia, either systemically (e.g., due to placental insufficiency) or in a specific “niche” area of poorly perfused tissue stimulates endothelial progenitor cells to proliferate inappropriately.<sup>(12)</sup>

**IHs are vascular tumors that involve the proliferation of benign endothelial like cells that possess histochemical markers (GLUT-1, Lewis Y antigen, FcγRII, and merosin); these markers are also present on placental blood vessels.**<sup>(13)</sup> The immunohistochemical profile differentiates infantile hemangiomas (IH) from other vascular birthmarks or tumors. Hemangiomas display high levels of immunostaining for the GLUT1 glucose transporter<sup>(14)</sup>, a surface protein that is highly expressed in most embryonic and fetal endothelial cells but is lost in most tissues except at the blood-tissue barriers, including micro vessels in the central nervous system and the placenta.

#### **Various theories regarding pathogenesis of hemangioma:-**

**The placental theory** is attractive because it would explain the programmed life cycle of infantile hemangioma (IH). Subsequent to North's discoveries regarding the histochemical similarities of IH and placenta,<sup>(4)</sup> Barnes et al noted that placenta and hemangioma have high levels of genetic similarity when compared with other vascular tumors and normal structures. Waner et al noted that IH tend to develop along embryonic fusion lines of the facial placodes.<sup>(15)</sup> Piecing these 2 seemingly disparate facts together, Mihm et al suggested that hemangioma might represent “benign metastases” originating from the placenta or other cells that proliferate in areas of low oxygen tension, such as the “end artery, vascular dead end” sites occurring in embryonic fusion planes.<sup>(8)</sup> Pittman et al were unable to detect the presence of maternal-fetal chimerism in lesional tissue, but this does not rule out the possibility of the placental origin of hemangioma tissue because the placenta is predominantly fetal in origin.<sup>(16)</sup> Embolic placental endothelial cells could reach fetal tissues from chorionic villi through right-to-left shunts characteristic of the normal fetal circulation. The embolus might possess a single endothelial cell or only a small number of endothelial cells.<sup>(17)</sup>

It has also been hypothesized that **immature endothelial cells and pericytes**, which coexist in the late stages of fetal development, perhaps maintain persistent proliferative properties for a period of time postnatally, leading to the development of IH.<sup>(18)</sup> However, Boye et al demonstrated the clonality of IH cells, making it less likely that a disparate group of cells serve as the source of this tumor.<sup>(17)</sup>

**Hypoxia** has been proposed as a driving factor for the pathogenesis of vascular proliferation in general. Vascular proliferation may be a homeostatic attempt to normalize hypoxic tissue. Epidemiologic findings support this hypothesis, given that factors that are thought to be linked to hypoxia, such as low birth weight and advanced maternal age, are overrepresented in hemangioma populations.<sup>(12)</sup> Another supportive finding is the association of IH with retinopathy of prematurity, a condition known to be linked to ischemia.<sup>(19)</sup> GLUT-1, present on IH tissue, is a facilitative glucose transporter that is an important sensor for hypoxia.<sup>(20)</sup>

The growth of IH likely **involves angiogenic peptides**, such as vascular endothelial growth factor (VEGF) and basic fibroblast growth factor, which induce proliferation of blood vessels. Receptors for these growth factors are also crucial in endothelial cell regulation, and a misbalance of VEGF receptor- 1 expression with consequent hyperactivity of VEGF-receptor-2 function has been noted in IH tissue.<sup>(21)</sup> The suppressive effect of glucocorticoids may be mediated through VEGF-A. Additionally, insulin like growth factor-2, which stimulates angiogenesis, is upregulated in proliferating but not involuting blood vessels.<sup>(22)</sup>

**Endothelial progenitor cells (EPCs) are vascular stem cells** with the capacity to contribute to postnatal vascular development. There is now compelling evidence that these EPCs play an etiologic role in the development of IH. A subset of progenitor cells isolated from IH tissues, which possess the surface markers CD34+ CD133+, are of particular interest. These EPCs have been shown to differentiate into endothelial cells in vitro<sup>22</sup> and are increased 15- fold in IH compared with controls.<sup>7</sup> Cultured EPCs from patients with IH stain positively for known hemangioma markers GLUT1, CD32, and merosin.<sup>(23)</sup>

**Boye and colleagues show how the Cell autonomous defects in hemangioma take place-** In an experiment, endothelial cells they isolated from hemangiomas exhibit enhanced proliferation and migration, in keeping with the rapid growth of the vascular lesion in the neonate. However, there was one surprise: In the presence of the angiogenic inhibitor endostatin, migration of these cells was not inhibited but rather stimulated, suggesting a radically altered cellular phenotype. One possible explanation, favored by the authors, is that a precursor endothelial cell had undergone a mutation in a gene regulating angiogenesis, resulting in clonal expansion.<sup>(17)</sup>

**Several mediators of EPC trafficking and vasculogenesis,** such as VEGF-A and hypoxia inducible factor-1 alpha (a transcription factor that regulates the formation of new blood vessels by EPCs), were found to be elevated in blood and IH specimens taken from children with proliferating IH.<sup>(24)</sup>

A major breakthrough occurred when Khan et al were able to **successfully inject CD133+ EPCs from human hemangioma tissue** into immunodeficient mice. These mice then developed GLUT1 vascular tumors, which recapitulated the development of human IH, providing investigators with the first viable IH animal model. These studies highlight the importance of CD133+ EPCs in the pathophysiology of IH and provide a means of testing putative therapies in this animal model.<sup>(25)</sup>

The pathogenesis of Arterio venous hemangiomas originates with **fetal endothelial cell precursors.** During development, one or few of these cells lose their **ability to produce or secrete platelet derived growth factor(PDGF) and transforming growth factor beta 1 (TGF  $\beta$ 1)**, which are required to recruit adventitial cells around developing vessels. Consequently, the daughter cells and eventually the vessels that arise from these original cells develop as single cell lined vessels (arteriole, venule, vein etc). During pre-puberty there is usually insufficient pressure to cause these structurally unsupported vessels to expand and produce symptoms. However, beginning at 10 years age, the maturity of the cardiovascular system and the increased systemic pressure causes these single cell lined vessels to expand. As the vessel expands, it creates turbulence and a negative pressure that alters the localized hemodynamics of the blood flow to feed blood into the expanded lumen and can recruit new feeder vessels. This process is known as Black-hole phenomenon. The earlier in fetal development, that the loss of growth factors such as PDGF and TGF $\beta$ 1 occur, the larger the vascular territory that will be involved.<sup>(26)</sup>

Hemangiomas pose other perplexing questions that will only be answered as the events that initiate hemangiogenesis are elucidated. For example, the strong gender predilection of hemangioma toward female over male infants (3:1 or more) **suggests hormonal effects** in hemangiogenesis. In addition, the anatomical predilection for the head and neck region of juvenile hemangioma must be explained. Perhaps most intriguing from a therapeutic stand point is the spontaneous involution of the lesion. This distinguishing characteristic has been shown to **be due in part to apoptosis of the endothelial cells**, but the trigger for this process remains unknown.<sup>(27)</sup>

### **Management:-**

Although most hemangioma proliferates and involute without functional impairment, a significant minority requires some form of intervention. It is important to consider the psychological as well as medical impact of hemangioma, particularly when located on the face. Many central facial lesions leave residual scars or structural deformities, which may have lifelong effects. In the past, treatment options for hemangioma were limited and their potential side effects considerable. Although most hemangioma do not pose significant risks, and careful observation is still the appropriate management option for many lesions, the introduction of relatively safer topical and systemic agents now allows earlier and easier intervention in appropriate cases.<sup>(28)</sup>

Until recently, intralesional and systemic corticosteroids, which were the mainstay of treatment in cancer chemotherapy, has been proven efficacious for life-threatening hemangioma but also has limited use due to the strong vesicant qualities of the drug, with need for central line access for chronic administration as well as potential peripheral mixed sensory-motor neurotoxicity.<sup>(29)(33)</sup> In recent years, propranolol therapy has become increasingly more useful in the management of hemangioma that require intervention. Leaute-Labreze et al first fortuitously discovered the efficacy of b-blockers for the treatment of hemangioma in 2008.<sup>(30)</sup>

Theories regarding propranolol's mechanism of action include an initial capillary vasoconstrictive effect, suppression/blockade of growth factors with induction of apoptosis of endothelial cells and blockade of GLUT1 receptors. CD34+ endothelial progenitor cells in hemangioma express factors influencing the renin-angiotensin system.<sup>(31)</sup> Because the renin-angiotensin system can stimulate angiogenesis, Itinteang et al suggested

that propranolol's inhibitory effect on the renin-angiotensin system might account for propranolol induced involution.<sup>(32)</sup>

Angiogenesis inhibitors are theoretically a natural choice for the treatment of hemangiomas. Sirolimus (also known as rapamycin), an inhibitor of mTOR, negatively affects cell proliferation and metabolism as well as angiogenesis. Lasers such as flashlamp pulsed dye lasers have also been used.<sup>(34)</sup>

Occasionally, selective embolization techniques followed by surgical excision is the optimal therapeutic intervention. The goal is to obstruct or reduce the blood flow to the lesion-so that it can be excised with minimal blood loss. For this, various embolization techniques, such as 100% alcohol, polyvinyl alcohol beads or sodium morrhuate can be used.<sup>(35)</sup>

### Summary and Conclusion:-

Recent discoveries have led to an improved understanding of the pathogenesis and clinical behavior of IH. The best scientific evidence to date supports the hypothesis that IHs originate from a subset of endothelial progenitor cells (CD133+) that are stimulated and proliferate under hypoxic conditions. These cells theoretically "hone" to areas of relative hypoxia, such as embryonic fusion planes.<sup>(36)</sup>

Whatever mechanisms are identified in hemangiogenesis, we have come a long way from the descriptive phase of hemangioma research. The intriguing data of Boye and colleagues suggest one mechanism for hemangioma formation and bring the field a step closer to understanding the molecular etiology of this common tumor.<sup>(17), (37)</sup>

Newer treatment options for hemangioma may well pose less risk for the patient, allowing the practitioner to intervene in a relatively safe, and more timely manner. Propranolol is now first-line therapy for many practitioners, and it is hoped that future studies will confirm its efficacy and safety. Pulsed dye and other laser modalities may be useful as adjunctive or "mopup" therapy. Other antiangiogenic agents may prove to be more effective in the future. The risk-benefit ratio of any therapy must be scrutinized, keeping in mind that "watchful waiting" may often be appropriate, but timely intervention is sometimes crucial in minimizing long-term sequelae such as functional deformity or permanent scars.<sup>(38)</sup>

Treatment of vascular anomalies is complex and often involves multiple disciplines and therapeutic options. Referral to a vascular anomalies team is recommended when considering therapy for "problematic" hemangiomas and vascular malformations.

Thus, the entire gamut of pathogenesis of hemangioma with a view to enrich its treatment modalities is discussed herewith.

#### Abstract

Urbanization and industrialization has given rise to large quantities of solid wastes. Due to resource crunch or inefficient infrastructure, not all of this waste gets collected and transported to the dumpsites. Phytoremediation is energy efficient, aesthetically pleasing method of remediating sites with low-to-moderate levels of contamination and it reduces the mobility of heavy metals and prevents migration to the groundwater and soil of the dumpsite. The present study involves study of uptake of heavy metals by the plant *Vetiveria zizanioides* (L.) Nash., and estimation of the Phytoremediation Indices of Transfer factor, Bioconcentration factor, Translocation factor and Translocation Index. Hence in the present study, an attempt has been made to analyze the uptake of metals present in the dumpsite wastes from Ambernath dumpsite (Maharashtra State), which are amended with garden (Control) soil on Vetiver. There is an increasing trend of uptake and accumulation of Cadmium (Cd), Chromium (Cr) and Zinc (Zn), with increasing ratio of control soil to dumpsite soil (Cr>Zn> Cd). The low values of Transfer factor, Bioconcentration factor and translocation factors (<1), indicates that Vetiver is a hypoaccumulator for all selected heavy metals. The higher transfer factor values when compared to the lower translocation factor values indicates that the accumulation of metals is in the order of root>leaves.

#### Introduction:-

Open dumpsite approach as solid waste disposal method is a primitive stage of solid waste management in many parts of the world. It is one of the most poorly rendered services by municipal authorities in developing countries as the systems applied are unscientific, outdated and in-efficient. Solid waste generation is a continuously growing problem at global, regional and local levels (Rode, 2011). With increase in the global population and the rising demand for food and other essentials, there has been a rise in the amount of waste being generated daily by each house- hold. This waste is ultimately thrown into municipal disposal sites and due to poor and ineffective management, the dumpsites turn to sources of environmental and health hazards to people living in the vicinity of such dumps. The present study involves study of uptake of heavy metals by *Vetiveria zizanioides* (L.) Nash., commonly known as Vetiver. These plants may are capable of accumulating many of these metals due to their quick growth, deep roots and tall aerial organs (Manios et.al, 2003). An attempt has been made to analyze the uptake of metals present in the dumpsite wastes from Ambernath dumpsite in Thane District, which are amended with garden

(Control) soil on Vetiver. The three metals Cadmium, Chromium and Zinc are studied for their initial concentrations in the dumpsite soil. *Vetiveria zizanioides* (L.) Nash was then exposed to these soils. Pollutants especially metals deposited on land usually enter the human body through the medium of contaminated crops, animals, food products, or water. Also, the dumpsite has smelly and unhealthy conditions. These conditions are worse in the summer because of extreme temperatures, which speed up the rate of bacterial action on biodegradable organic material. Disposal sites can also create health hazards for the neighborhood. In a number of health surveys a wide range of health problems, including respiratory systems, irritation of the skin, eyes and nose, gastrointestinal problems, psychological disorders, and allergies, have been discovered.

### Materials and Methods:-

The Sampling of solid waste is done by 'Cone and Quarter' method at the site from different locations of the dumpsite. The soil is then air dried of from solid waste. The soil is then sieved through 0.5 mm sieve. 3 replications of one month old vetiver plant is made and acclimatized for one month. Pruning is done to 20 cm and 10 cm slips respectively. The different ratios are prepared as Control soil: Landfill waste soil (C:L), i.e.1:1, 1:2, 1:3 and 1:4 respectively, along with 100 % each of garden and landfill waste soil respectively. Metal Analysis is performed by standard procedures prescribed (APHA, 1998; Behera 2006; Maiti 2003).

Following factors are estimated:

**i. Transfer Factor =**

$\frac{\text{Concentration of metal in root/leaves}}{\text{Concentration of metal in soil}}$

Concentration of metal in soil

**ii. Bio Conc. Factor =**

$\frac{\text{Conc. of metal in plant tissue (roots+leaves)}}{\text{Concentration of metal in soil}}$

Concentration of metal in soil

**iii. Translocation Factor =**

$\frac{\text{Metal concentration in leaves}}{\text{Metal concentration in root}}$

Metal concentration in root

**iv. Translocation Index =**

$\frac{\text{Metal conc. in leaves ( mg/gm) X 100}}{\text{Metal conc. in roots (mg/gm)}}$

Metal conc. in roots (mg/gm)

**Discussion:-**

**Effects of Dumpsite:-**

The negative effects are most commonly placed into two distinct categories: atmospheric effects and hydrological effects.

**Atmospheric Effects:-**

According to the EPA, the methane produced by the rotting organic matter in unmanaged landfills is 20 times more effective than carbon dioxide at trapping heat from the sun. Not only does methane get produced by the various forms of rotting organic matter that find their way into landfills, but household cleaning chemicals often make their way here as well. The mixture of chemicals like bleach and ammonia in landfills can produce toxic gases that can significantly impact the quality of air in the vicinity of the landfill.

**Hydrological Effects:-**

Landfills also create a toxic soup of industrial and home-cleaning chemicals. People throw away everything from industrial solvents to household cleaners in landfills, and these chemicals accumulate and mix over time. A more immediate concern is for the welfare of the wildlife that comes into contact with these chemicals, and it is not uncommon for animals to suffer inconceivably painful deaths resulting from chemical contamination (Zu et al, 2005). The three most important are toxins, leachate and greenhouse gases.

**Toxins:-**

Many materials that end up as waste contain toxic substances. Over time, these toxins leach into our soil and groundwater, and become environmental hazards for years. Electronic waste is a good example. Waste such as televisions, computers and other electronic appliances contain a long list of hazardous substances, including mercury, arsenic, cadmium, PVC, solvents, acids and lead. It's called Methylmercury and it is a highly toxic agent. In nature, methylmercury forms in aquatic systems when anaerobic organisms (organisms that don't need oxygen) feed on it. Unfortunately, landfills often imitate the same conditions. The result can be concentrations of methylmercury in our environment up to 100 times the normal levels (as was the case with a landfill in Florida). That's pretty toxic. Methylmercury is a bioaccumulant, which basically means it builds up in our food chain, and it's most commonly ingested by eating fish. Methylmercury is so dangerous; it can even impede the development of a child's nervous system. E-waste is a very toxic problem. A mixture of different chemicals goes into making electronics, and these leach into our soil and groundwater as the products degrade. Some of these chemicals are lead brominated flame retardants, antimony oxide, cadmium and beryllium. They all end up in our environment and potentially affecting our public health.

**Leachate:-**

Leachate is the liquid formed when waste breaks down in the landfill and water filters through that waste. This liquid is highly toxic and can pollute the land, ground water and water ways.

**Greenhouse gas:-**

When organic material such as food scraps and green waste is put in landfill, it is generally compacted down and covered. This removes the oxygen and causes it to break down in an anaerobic process. Eventually this releases methane, a greenhouse gas that is 21 times more potent than carbon dioxide. The implications for global warming and climate change are enormous. Methane is also a flammable gas that can become dangerous if allowed to build up in concentration. Composting your food scraps and green waste in a compost bin eliminates many of these problems.

**Health Effects of Dumpsite:-**

A few studies that have attempted to measure certain chemicals in blood and urine of populations near waste sites have generally not found increased levels of volatile organic compounds (VOCs) (Hanar et al. 1996) mercury (Reif et al. 1993), or PCBs (Stehr et al. 1998). Landfill sites may be a source of airborne chemical contamination via the off-site migration of gases and via particles and chemicals adhered to dust, especially during the period of active operation of the site. Very little is known about the likelihood of air exposure from landfill sites through landfill gases or dust. At some of the sites described below, low levels of volatile organic chemicals have been detected in indoor air of homes near landfill sites (Clark 1982, Goldman 1985) in outdoor air in areas surrounding sites (Deloraine 1995, Zmirou 1994) or in on-site landfill gas.

**Conclusions:-**

The tolerance of Vetiver to the selected three heavy metals at various concentrations in control soil and in landfill waste amended soils, reveals the survival potential at high toxic heavy metal range.

Vetiver accumulates large range of selected heavy metals in roots with low translocation to leaves. The order of metal uptake is roots>leaves.

The risk of biomagnification of the metals through the food chain can be reduced using vetiver system at the landfill sites as the Metal Removal Efficiency in the range of 70- 88%, TF<1, and BCF<1, thus indicating the reduction in metal toxicity of the soil at the site, by adoption of exclusion strategy and suitability of the plant for phytostabilization.

The important implications of these findings are when vetiver is used for the rehabilitation of landfill sites contaminated with high levels heavy metals namely, Cadmium, Chromium, and Zinc, its leaves can be safely grazed by animals or harvested for mulch as very little of these heavy metals are translocated to the leaves (Ghosh 2005).

Thus from the present study it can be concluded that *Vetiveria zizanioides* (L.) Nash, owing to its good metal removal efficiency from the landfill waste soils and uptake of metals, can be used as an ecotechnological tool to manage the problem of solid waste at landfill site.

Research into the health effects of landfill sites is relatively immature, and further research could improve our current understanding. Future studies of landfill sites would greatly benefit from a more interdisciplinary approach, drawing from the fields of landfill engineering, environmental sciences, toxicology, and epidemiology.

Johnson. B.L, et al, 1997, in a recent review of toxicological hazards of Superfund waste sites, conclude that although a large body of toxicological research is under way to assess the toxicity of chemicals commonly contaminating the environment surrounding waste sites, equally significant work is still to be done before these chemicals have adequate toxicity profiles that can be used by health and risk assessors.

##### Key words:-

Pseudoexfoliation syndrome, Manual Small Incision Cataract Surgery, Intraoperative Complications and Postoperative Complications.

#### Abstract

**Background And Objective:** Pseudoexfoliation syndrome is an age-related systemic disease manifesting itself primarily in the eyes which is characterized by the accumulation of microscopic granular amyloid-like protein fibres. Studies have shown that these patients have higher rates of intraoperative complications compared to the patients without the condition. This study was undertaken to determine and compare the intraoperative complications in Pseudoexfoliation patients with Normal patients in cataract surgery.

**Methods:** It's a hospital based Prospective observational study of 100 patients, 50 patients having Pseudoexfoliation syndrome and 50 patients without Pseudoexfoliation syndrome attending department of Ophthalmology, D. Y. Patil hospital and Research Institute, Kolhapur, between May 2014-April 2016.

**Results:** The average age of patients was 66 years, with male predominance and with a higher incidence of bilateral involvement. 13 (26%) patients with Pseudoexfoliation syndrome had intraoperative complications while 4 (8%) patients without Pseudoexfoliation syndrome had intraoperative complication. Among all complications, the incidence among patients with Pseudoexfoliation syndrome and patients without Pseudoexfoliation syndrome were 6 (12%) and 2 (4%) for Zonular dehiscence, 4 (8%) and 1 (2%) patient for Posterior Capsular Rent and 3 (6%) and 1 (2%) patient for Vitreous loss respectively.

**Conclusion:** Inadequate mydriasis is one of the major preoperative complication with Pseudoexfoliation syndrome which has a bearing on the intraoperative complications. With proper preparation, Small Incision Cataract Surgery can be performed in this group of patients. In conclusion, with appropriate preoperative, intraoperative and postoperative care the risks of complications can be minimized and favorable outcomes can be achieved in cataract surgery with Pseudoexfoliation syndrome.

#### Introduction:-

Pseudoexfoliation Syndrome is an age related generalized disorder involving abnormal production or turnover of extra-cellular matrix in ocular tissues, orbital tissues, skin and visceral organs. The exact etiopathogenesis of this condition and chemical composition of the material still remains unknown.

In the eye, Pseudoexfoliation syndrome is characterized clinically by small white deposits of material in the anterior segment, most commonly in the pupillary border and the anterior lens capsule. The most consistent diagnostic feature is three distinct zones of Pseudoexfoliation material seen on the lens capsule after full dilatation.

Additional subtle clinical signs that help in early diagnosis are loss of pigment from peri-pupillary area producing trans illumination defects, insufficient mydriasis, and pigment dispersion into anterior chamber after mydriasis, deposition of melanin over trabecular meshwork and Schwalbe's line. The existence of posterior synechiae without any other cause and hemorrhage in the iris stroma after mydriasis are also suggestive of Pseudoexfoliation syndrome. Deposition of material on the zonular fibres weakens it leading to Phacodonesis, subluxation and dislocation of lens. The presence of secondary open angle glaucoma is known as glaucoma capsulare. This glaucoma has more serious clinical course and worse prognosis than primary open angle glaucoma, often not responding to medical therapy and requiring early surgical intervention. An increased incidence of nuclear cataract is seen. Pseudoexfoliation syndrome frequently goes undiagnosed leading to unexpected problems in management and during surgery. Therefore, making the diagnosis often requires a careful slit-lamp examination after pupillary dilatation.

Due to involvement of virtually all structures by Pseudoexfoliation material, patients have a significantly greater risk for a variety of complications during cataract surgery. Poor mydriasis, pigment dispersion, combined with Phacodonesis and zonular dialysis predisposes to posterior capsular rupture and vitreous loss. Intra operative modifications like sphincterotomy can lead to post-operative irregular pupil and iris pigment dispersion.

Possible pre-operative, intra-operative and post-operative measures to avoid or minimize these complications include an increased awareness of Pseudoexfoliation syndrome, a careful slit lamp examination after full pupillary dilatation, adequate control of intra-ocular pressure pre-operatively, avoidance of iris manipulation, adequate pupillary dilatation, use of heparin coated intra-ocular lenses, use of capsular tension ring in selected cases and judicious use of steroids post-operatively.

### **Materials and Methods:-**

A total number of 100 cases (50 patients with Pseudoexfoliation and 50 normal patients as control) attending D. Y. Patil Hospital Kadamwadi Kolhapur fulfilling the inclusion and exclusion criteria will be studied. Inclusion criteria followed were: 1) Patients 50 years and above of age belonging to either sex diagnosed to have cataract with Pseudoexfoliation on the basis of slit lamp examination before and after pupillary dilatation. 2) Patients above 50 years of age belonging to either sex diagnosed to have cataract without Pseudoexfoliation on the basis of slit lamp examination before and after pupillary dilatation. Exclusion criteria for the study was: 1) Patients less than 50 years of age. 2) Patients with traumatic cataract. 3) Patients with history of exposure to intense infrared lights i.e. glass blowing. 4) Patients with eye diseases other than Pseudoexfoliation or early cataract. 5) Patients with Diabetes Mellitus.

Pre-operative evaluation was done which included: 1) Visual acuity testing for distance and near using Snellen's distant chart and near vision chart respectively. 2) Refraction and correction where required. 3) External ocular examination. 4) Slit lamp bio microscopic examination for evidence of the following findings: Pseudoexfoliation material in the pupillary margins, Morphological alterations of the cornea, Anterior chamber depth and pigment dispersion in the anterior chamber, Iridodonesis, Presence of posterior synechiae, Zones of Pseudoexfoliation on the anterior surface of the lens capsule, Phacodonesis or frank subluxation/dislocation of lens, Measurement of pupil size before and after dilatation of pupil and Pupillary reactions. 5) Intraocular pressure using Goldmann tonometer. 6) Gonioscopy with Goldmann three mirror lens in all patients with Pseudoexfoliation syndrome. 7) The pupils were then dilated with a combination of 10% phenylephrine and tropicamide 1%, 1 drop was instilled every 5 minutes over a 15 minute interval. 8) This was followed by slit lamp examination for measuring pupil dilatation, examination of lens capsule for central and peripheral zones of Pseudoexfoliation material deposition and evaluation of lens for the type of cataract. 9) Fundoscopy. 10) Lacrimal patency test. 11) Keratometry. 12) A-scan and Intraocular lens power calculation by SRK-2 formula.

Other investigations included urine examination for detection of sugar and albumin. All patients were given systemic antibiotics (tablet ciprofloxacin 500mg b.d.) on the preoperative day. On the day of surgery pupils were dilated adequately using instillation of 1% tropicamide and 10% phenylephrine eye drops every 10 minutes before surgery. Selected Patients who had high intraocular pressure were given intravenous mannitol 20% one gram per

kilogram bodyweight and oral Acetazolamide 250 milligram 2 times a day depending on level of intraocular pressure preoperative day and also 1 hour prior to surgery.

### Results:-

In this study of 100 cases, we studied many different parameters in patients with Pseudoexfoliation syndrome and control group. The age distribution (as seen in Table 1) shows 6 (12%) patients of age group 50 – 59 years, 37(74%) patients of age group 60 – 70 years and 7 (14%) of age group 71- 80 %. The average age of patients was 66.28 years and about 37 (74%) of patients were above 60 years of age. 30 (60%) were males and 20 (40%) were females. 31 (62%) of the patients had clinical bilateral involvement of Pseudoexfoliation syndrome and 19 (38%) had unilateral involvement. 36(72%) of the patients had Pseudoexfoliative materials present on the pupillary margin, 9 (18%) of the patients had pseudoexfoliative materials present on the iris surface, 2(4%) of the patients had Iris Atrophy, 1(2%) of the patient had Iridodonesis and 2 (4%) of the patients had posterior synechiae in this study group.

Out of the 50 patients, 43(86%) of the patients had open angles and 7(14%) of the patients had narrow angles as compared to patients without Pseudoexfoliation syndrome, 49 (98%) had open angles and 1(2%) patient had occluded angle. 18(60%) had peripheral zone, 12(40%) had both peripheral zone and centralzone and none of them had only centralzone. 19(38%) of the patients had Mature Cataract and 31(62%) of them had Immature cataract with Pseudoexfoliation syndrome compared to 16(32%) of the patients had Mature Cataract and 34(68%) of the patients had immature cataract without Pseudoexfoliation syndrome

The intraocular pressure distribution in patients with and without Pseudoexfoliation syndrome. 28 (56%) of the patients had sufficient mydriasis, and 22(44%) of the patients had insufficient mydriasis as compared to patients without Pseudoexfoliation syndrome 48 (96%) of patients had sufficient mydriasis, and 2(4%) of the patients had insufficient mydriasis(as seen in Table 2a and b). 13 (26%) of the patients with Pseudoexfoliation syndrome had intraoperative complication while 37 (74%) patients did not have any complications. 4 (8%) of the patients without Pseudoexfoliation syndrome had intraoperative complication while 46 (96%) patients did not have any complications. (as seen in Table 3a and b) While comparing the intraoperative complications in patients with and without Pseudoexfoliation syndrome it shows statistically significant difference ( $p < 0.05$ ).

As seen in table 4, 6(12 %) of patients had Zonular dehiscence while this complication was seen in 2(4%) patients without Pseudoexfoliation syndrome, 4(8%) of the patients had Posterior Capsular Rent while 1(2%) patient without Pseudoexfoliation syndrome had this complication and 3(6%) of the patients had Vitreous loss while 1(2%) patient without Pseudoexfoliation syndrome had this complication.

All patients were implanted with intraocular lens after employment of various surgical modifications like, Sphincterotomy, Synecholysis and Posterior Capsular Ring. Out of the total 50 patients, 8(26.67%) patients who had one intraoperative complications, 5(62.5%) of them had insufficient mydriasis and 3(37.5%) of the patients had adequate mydriasis. 6 patients (12%) had sphincterotomy, 5 patients(10%) had synechiolysis and 2 (4%) underwent both during cataract surgery. 2(4%) patients had capsular tension ring.

### Discussion:-

This study consisted of 50 eyes of 50 patients with Pseudoexfoliation syndrome and 50 eyes of 50 patients without Pseudoexfoliation syndrome who underwent manual small incision cataract surgery. The average age of patients was 66.28 years and about 37 (74%) of patients were above 60 years of age. Pseudoexfoliation syndrome usually occurs between 60 to 80 yrs, the average age being 70 yrs. Studies regarding the sex distribution of Pseudoexfoliation syndrome are conflicting. Women have predominated in some series while other studies have found equal or greater prevalence in men. In this study, males were more affected than females. 31 (62%) of the patients had clinical bilateral involvement of Pseudoexfoliation syndrome and 19 (38%) had unilateral involvement. A review of literature comparing the frequency of monocular versus binocular involvement in various series is not conclusive.<sup>1</sup>

36(72%) of the patients had Pseudoexfoliative materials present on the pupillary margin, 9 (18%) of the patients had pseudoexfoliative materials present on the iris surface, 2(4%) of the patients had Iris Atrophy, 1(2%) of the patient had Iridodonesis and 2 (4%) of the patients had posterior synechiae in this study group. A study by Ritch Schlotzer.

Scherhardt<sup>2,3</sup>(2001) stated that deposits of Pseudoexfoliation material on the iris sphincter and pupillary margin are seen in 84% patients. Thus, the most prominent and consistent clinical finding is the Pseudoexfoliation material at the pupillary border. 20 (40 %) had peripheral zone, 30 (60 %) had both peripheral zone and central zone and none of them had only central zone. The peripheral zone of pseudoexfoliation material is a consistent finding and the central zone is not always apparent.<sup>4</sup>Tarkkanen found the central zone absent in 18% of cases in his study while Ritch, Schlotzer – Scherhardt found it absent in 20– 60% of their cases. 9(30%) of the patients had Mature Cataract and 21(70%) of them had Immature cataract.<sup>5,6</sup>All of them, i.e. 100%, had Nuclear Cataracts. Cortical Cataract was present along with advanced nuclear cataract and none of the patients had isolated cortical cataract. Seland et al have reported a higher incidence of nuclear cataract in eyes with pseudoexfoliation syndrome with fewer cortical cataracts.<sup>7</sup>Hietanen J et al have also reported nuclear cataract to be the predominant type of cataract in Pseudoexfoliation syndrome.

Out of 50 patients in the present study group 37 (74%) of the patients had IOP in the range 10- 20 mm Hg, 12 (24%) of the patients in the range of 21-30 mm Hg and 1(2%)of the patient had IOP more than 30 mm Hg as compared to

50 patients without Pseudoexfoliation syndrome, 46(92%) of the patients had IOP in the range 10- 20 mm Hg, 3(6%) of the patients in the range of 21-30 mm Hg and 1 (2%) of the patient had IOP more than 30 mm Hg. Overall 17 patients who had raised IOP were managed by either by giving intravenous Mannitol 20% one gram/kilogram body weight over a period of 30 minutes to one hour, along with oral acetazolamide 250 milligrams twice a day on preoperative day and intravenous Mannitol 20% one gram/kilogram body weight given one hour prior to surgery or only oral acetazolamide 250 milligrams twice a day for 3 days.

In other studies, with pseudoexfoliation syndrome, 20% had glaucoma and increased IOP at the time of diagnosis, as compared to our study where 17% of patients had raised IOP. This underscores the need for careful follow-up in patients who have pseudoexfoliation syndrome. Pseudoexfoliation syndrome accounts for 15-20% of cases of open angle glaucoma.

1(2%) of the patients had iridodonesis. This is because the iris in Pseudoexfoliation syndrome is more rigid due to vascular compromise and various other changes like deposition of Pseudoexfoliation material, Atrophy, Loss of iris stroma.

As part of management of rigid undilating pupil, 6 patients (12%) had sphincterotomy, 5 patients (10%) had synechiolysis and 2 (4%) underwent both during cataract surgery. 2(4%) patients had capsular tension ring. Alfaite et al in their study of 31 eyes of Pseudoexfoliation syndrome undergoing ECCE noted a statistically significant increase (p value <0.01) in the need to perform sphincterotomies. Kuchle et al noted 3.4% of their 76 patients to require surgical Synechiolysis and/or mechanical dilatation of pupil intraoperatively.<sup>13</sup>

Amongst 50 patients with Pseudoexfoliation syndrome 13(26%) had intraoperative complication while 37 (74%) patients did not have any complications compared to 4 (8%) of the patients without Pseudoexfoliation syndrome had intraoperative complication while 46 (96%) patients did not have any complications. 6(12 %) of patients had Zonular dehiscence while this complication was seen in 2(4%) patients without Pseudoexfoliation syndrome, 4(8%) of the patients had Posterior Capsular Rent while 1(2%) patient without Pseudoexfoliation syndrome had this complication and 3(6%) of the patients had Vitreous loss while 1(2%) patient without Pseudoexfoliation syndrome had this complication.

### **Conclusion:-**

Small incision cataract surgery in eyes with Pseudoexfoliation syndrome is associated with an increased incidence of complications both preoperatively and intraoperatively. Inadequate mydriasis is one of the major preoperative complications in eyes with Pseudoexfoliation syndrome which has a bearing on the intraoperative complications like posterior capsular rent and vitreous loss. Adequate surgical modifications such as Sphincterotomy and/or Synechiolysis in these eyes with inadequate mydriasis reduce the intra operative complications. These pupil enlargement procedures are advocated during cataract surgery.

All though cataract surgery in Pseudoexfoliation syndrome is challenging, if the surgeon is aware of the condition preoperatively and pays meticulous attention to the surgical technique, a good outcome can be expected.

#### Abstract

Briquette cooking stoves are the new generation cooking stoves, which can be used to replace the conventional LPG cooking system that is generally used in corporate hostels, hospitals, restaurants, jails, function halls, caterers. And the Briquettes are used as economic fuel in stoves and as an alternative fuel for industrial boilers, furnaces and other industrial applications. Biomass briquettes, mostly made of green waste and other organic materials, are commonly used for electricity generation, heat and cooking fuel. These compressed compounds contain various organic materials, including rice husk, biogases, ground nut shells, municipal solid waste, and agricultural waste. The composition of the briquettes varies by area due to the availability of raw materials.

#### Introduction:-

Biomass is a renewable and carbon neutral energy source. In times of rising energy cost, petroleum and gas reserves diminishing, and a world focus on environmental impact, alternative energy forms have become increasingly important. It makes sense to use energy resources that are readily available, plentiful, renewable and sustainable. Biomass provides one of the most environmentally friendly energy sources to meet the world's growing energy needs. Due to the increasing need for alternative fuel, briquettes have come into existence as an affordable and economical alternative to traditional forms of fuel such as charcoal and wood. They are suitable for cooking and water heating in households, and for use in drying; firing ceramic products, powering boilers to generate steam, and fuelling gasifiers.

Briquette is the substitute of firewood and so trees are saved and problems like soil erosion and desertification are prevented. It improves health by providing a cleaner burning fuel. It creates micro enterprise opportunities like making the briquette machine from locally available materials, supplying the materials, making the briquettes and selling and delivering the briquettes.

Many concessions are offered by the government.

Worldwide biomass currently provides more than 10 percent of our energy needs. Biomass may become an increasingly important energy source rising to 30 percent globally by 2050.

**Statement Of The Problem:-**

The mission of the Harvest Fuel Initiative is to facilitate the market-based approach to the large-scale and widespread use of efficient technologies and sustainable solid biomass fuel alternatives that can help alleviate poverty, improve health, and protect the environment. Today's world high quality products that socially and economically benefit low and middle-income households and organizations looking for energy and cost saving solutions need to be focused. More than two billion people use bio-fuels such as wood, crop residue, and dung as their primary energy source for domestic needs such as heating and cooking. Bio-fuels are carbon neutral sources of renewable energy, but, the inefficient burning of wood is responsible for a significant fraction of global black carbon. Solutions such as solar stoves and ovens have great limitations regarding low energy, blackout times, and size.

The briquette cooking stove is a wonderful invention that has saved the cooking time for millions of people and organization. It has become a prestigious product in the new era of modernization. A large percentage of world population continues to use biomass in traditional cook stoves for cooking needs, low efficiency and high emissions from this result in adverse health and socio-economic impact. Though improved cook stoves have been developed, the environmental impact was not reduced. So, there is a need for a new innovation which can be accomplished with the help of the briquette cooking stove. Hence, the study is taken up.

**Objective Of The Study:-**

The main objectives of the study is to analyse the consumer attitude towards briquette cooking stove.

**Scope Of The Study:-**

The scope of the study is to analyse the consumer preference of briquette cooking stove among the hotels in Madurai city. The study encompasses and analysis of the level of satisfaction, reason for preferring and also the reason for switching over.

**Research Design and Methodology:-**

The study includes only primary data. The data have been collected from 100 respondents through questionnaire method in Madurai city on the basis of convenience sampling method.

**Frame work of analysis:-**

Percentage analysis, ANOVA, Chi-square test, Garrett's Ranking Technique, Intensity value is used to analyze the primary data.

**Type of fuel previously used:-**

In earlier days, people used various types of fuel for their heating and cooking processes. The types of fuel previously used are analysed by using Garrett's Ranking techniques and given in Table 1.

**Table 1:-** Type of fuel previously used.

Type of fuel	Ranks							Garret's Score	Mean Score	Rank
	1	2	3	4	5	6	7			
Fire wood	15	23	21	23	9	3	6	5671	56.71	2
Charcoal	10	9	19	18	29	13	2	5107	51.07	3
Groundnut Shells	7	4	13	24	17	22	13	4516	45.16	5
Cashew Shells	7	21	16	10	20	13	13	4935	49.35	4
Cow dung	31	22	12	10	13	7	5	5968	59.68	1
Kerosene	6	13	11	10	9	36	15	4390	43.9	6
Liquid Petroleum Gas	23	8	8	6	3	6	46	4385	43.85	7

**Source:** Primary data

From table 1, it is noted that, cow dung has become the first type of fuel used previously and is proved with the garret's score of 59.68. Firewood is the second fuel mostly used by the respondents (Garrets score 56.71). The third fuel cited by the respondents is the charcoal (Garrets score 51.07). Cashew shells have got the fourth rank (Garrets score 45.16). Groundnut shells and kerosene has got the fifth and six ranks respectively. Liquid petroleum gas has been cited lastly by the respondents with the garret score (43.85).

**Reasons for switching over to briquette cooking stove:-**

Briquettes are a common type of solid fuel, largely replacing sodas of raw peat as a domestic fuel. These briquettes consist of shredded peat, compressed to form a virtually smokeless, slow burning, easily stored and transported fuel. Although often used as the sole fuel for a fire, they are also used to quickly and easily light a coal fire. Biomass briquettes are made from agricultural waste and are a replacement for fossil fuels such as oil or coal, and can be used to heat boilers in manufacturing plants, and also have applications in developing countries. Biomass briquettes are a renewable source of energy and avoid adding fossil carbon to the atmosphere. The reasons for switch over to briquette cooking stove are presented in Table 2

**Table 2:-** Reasons for switching over to briquette cooking stove

Reasons	Ranks					Garret's Score	Mean Score	Rank
	1	2	3	4	5			
Reduce cooking time	7	53	31	5	4	5711	57.11	II
No fly ash	6	8	14	36	36	5374	53.74	IV
Reduce cooking fuel cost	75	16	2	3	4	7061	70.61	I
Safety	1	10	23	32	34	5281	52.81	V
Easy to handle	11	13	30	24	22	5473	54.73	III

Source: Primary data

From Table 2, it is inferred that, briquette cooking stove reduces cooking fuel cost is the first reason represented by the respondents with the garret's score of 70.61. Secondly, the respondents switch over to briquette cooking stove as it reduces cooking time (garrets score 57.11). The third reason cited by the respondents is the easy handling of briquette stove (garrets score 54.73). The respondents have given the reason of No fly ash (garrets score 53.74) as the fourth reason. Safety is chosen as the fifth reason felt by the respondents with garret's score of 52.81.

**Sources of information:-**

Sources are the main thing which can give information about everything or anything. Information search is one of the important process of consumer's buying decision. Sources are nothing but the elements through which one can get the information for satisfying themselves. The sources of information about the briquette cooking stove are given in Table 3

**Table 3:-** Sources of information

Sources of information	Ranks				Mean Value
	1	2	3	4	
Advertisement	11	25	24	15	3.26
Agents	21	24	31	24	2.73
Focus groups	25	29	16	30	2.89
Pamphlets	41	12	18	29	3.16
Neighbors	27	16	12	24	2.96

$H_0$ – There is no significant relationship in ranks assigned by different respondents regarding the sources of getting information about briquette cooking stove.

Since the calculated value of  $\chi^2$  (2.345) at 5 percent level of significance (d.f=3) is greater than table value (9.49) the alternative hypothesis is accepted. Hence it is concluded that there is no significant relationship between sources of getting information about briquette cooking stove.

**Size of briquette cooking stove:-**

Briquette cooking stoves are new generation cooking stoves which are used to replace the conventional cooking stoves. The biomass briquette cooking stoves which are considered an economic fuel is available in small, medium, and large size. Table 4 shows the size of briquette cooking stove.

**Table 4:-** Size of briquette cooking stove

Size of briquette	Number of respondents	Percentage
Small	42	42
Medium	29	29
Large	29	29
Total	100	100

**Source:** Primary data

From the Table 4 it is inferred that 42 per cent of the respondents use small size briquette stoves. Almost, 29 per cent of the respondents equally use medium and large size briquette cooking stoves.

#### **Relationship between the income and the size of briquette cooking stove.**

To find out the relationship between the income and the size of briquette cooking stove Chi-square test is applied. Table 5 shows the income and the size of briquette cooking stove.

**Table 5:-** Income and size of briquette cooking stove

Income	Size of briquette cooking stove			Total
	Small	Medium	Large	
Up to 20,000	35	12	2	49
20,000-40,000	7	12	19	38
40,000-60,000	0	5	5	10
Above 60,000	0	0	3	3
Total	42	29	29	100

**Source:** Primary data

**H<sub>0</sub>:** There is no significant relationship between the income and the size of the briquette cooking stove.

Since the calculated value of  $\chi^2$  (46.421) at 5 percent level of significance (d.f=6) is greater than table value (12.6) the null hypothesis is rejected. Hence it is concluded that there is a significant relationship between the income and the size of the briquette cooking stove.

#### **Relationships between occupation and size of briquette cooking stove.**

To find out the relationship between the occupation and the size of briquette cooking stove Chi-square test is applied. Table 6 show the occupation and size of briquette cooking stove.

**Table 6:-** Occupation and size of briquette cooking stove

Occupation	Size of briquette			Total
	Small	Medium	Large	
Households	11	4	1	16
Canteen	27	9	8	44
Restaurants	4	10	11	25
Mess / Catering	0	6	9	15
Total	42	29	29	100

**Source:** Primary data

**H<sub>0</sub>:** There is no significant relationship between the occupation and the size of briquette cooking stove.

Since the calculated value of  $\chi^2$  (31.385) at 5 percent level of significance (d.f=6) is lesser than table value (12.6) the alternative hypothesis is rejected. Hence it is concluded that there is a significant relationship between the occupation and the size of briquette cooking stove.

#### **Relationship between the daily schedules of cooking process and the size of briquette cooking stove.**

To find out the relationship between the daily schedule of cooking process and the size of briquette cooking stove Chi-square test is applied. Table 7 shows the daily schedule of cooking process and the size of briquette cooking stove.

**Table 7:-** Daily schedule of cooking process and size of briquette cooking stove

Daily schedule of cooking process	Size of briquette cooking stove			Total
	Small	Medium	Large	
Morning	14	4	1	19
Afternoon	11	11	6	28
Evening	0	2	1	3
Night	1	2	0	3
All	16	10	21	47
Total	42	29	29	100

**Ho:** There is no significant relationship between the daily schedule of cooking process and the size of briquette cooking stove.

Since the calculated value of  $\chi^2$  (21.070) at 5 percent level of significance (d.f=8) is greater than table value (15.5) the null hypothesis is rejected. Hence it is concluded that there is a significant relationship between daily schedule of cooking process and the size of the briquette cooking stove.

#### Frequency of usage:-

Consumers use briquette stove according to their needs and requirements depending upon the nature of application. Table 8 shows the frequency of usage.

**Table 8:-** Frequency of usage

Frequency of usage	Number of respondents	Percentage
Regularly	66	66
Once in a few days	10	10
Festivals	15	15
Occasionally	4	4
Functions	5	5
Total	100	100

**Source:** Primary data

From table 8 it's obtained that, 66 per cent of the respondents are using briquette cooking stove regularly. Nearly 1.5 percent of the respondents use the briquette stove during festivals seasons. The percentage of respondents using the stove once in a few days is 10. Only 5 per cent of the respondents use briquette cooking stove during the functions and 4 percent of the respondents are occasional users.

#### Size and frequency of usage:-

To analyse the relationship between the size of briquette cooking stove and the frequency of usage one way ANOVA is applied.

**Table 9:-** Size and frequency of usage

Size	Frequency of usage					Total
	Regularly	Once in a few days	Festivals	Occasionally	Functions	
Small	24 (36.4)	6(60)	6(40)	4(100)	2(40)	42
Medium	20 (30.3)	4(40)	4(26.7)	0(0)	1(20)	29
Large	22(33.3)	0(0)	5(33.3)	0(0)	2(40)	29
<b>Total</b>	<b>66</b>	<b>10</b>	<b>15</b>	<b>4</b>	<b>5</b>	<b>100</b>

**Source:** Primary Data.

**Ho:** There is no significant relationship between the size and the frequency of usage.

**Table 9**

Sources of Variance	Sum of Squares	Degree of freedom	Mean Square	F
Between group	2.541	2	1.270	1.270 F = ----- 1.357
Within group	131.619	12	1.357	= 0.936
<b>Total</b>	134.160	14		

Since as the calculated value (0.936) is less than the table value of f for  $v=2$   $v_2=12$  at 5% level of significance (3.88), so the null hypothesis is accepted. Therefore it is inferred that, there is no significant relationship between the size and the frequency of usage briquette cooking stove.

#### Relationship between the occupation and the frequency of usage

To find out the relationship between the occupation and the frequency of usage Chi-square test is applied. Table 10 shows the occupation and the frequency of usage of briquette cooking stove.

**Table 10:-** Occupation and frequency of usages

Occupation	Frequency of usages					Total
	Regularly	Once in a few days	Festivals	Occasionally	Function	
Households	13	2	0	1	0	16
Canteen	27	5	6	3	3	44
Restaurants	15	3	5	0	2	25
Catering	11	0	4	0	0	15
Total	66	10	15	4	5	100

**Source:** Primary data

**H<sub>0</sub>:** There is no significant relationship between the occupation and the frequency of usage of briquette cooking stove.

Since the calculated value of  $\chi^2$  (11.947) at 5 percent level of significance (d.f=12) is lesser than table value (21.0) the null hypothesis is accepted. Hence it is concluded that there no a significant relationship between the occupation and the frequency of usage of briquette cooking stove.

#### Benefits brought by briquette cooking stove.

The negative impacts are reduced by using improved cook stoves and fuels. Briquette cooking stoves bring change to the environment and changes to the users. The benefits are shown in Table 11.

**Table 11:-** Benefits

Benefits	Ranks					Mean Rank
	1	2	3	4	5	
Meals ready earlier	41	26	17	11	5	2.13
Do not have to watch the fire	16	15	26	22	21	3.17
Less chance for injuries	33	24	18	23	2	2.37
Fewer respiratory diseases	6	22	22	18	32	3.48
More time to do other activities	4	13	17	26	40	3.85

**Source:** Primary data

**H<sub>0</sub>-** There is no significant relationship in ranks assigned by different respondents regarding the benefits that are brought by briquette cooking stove.

Since the calculated value of  $\chi^2$  (85.424) at 5 percent level of significance (d.f=5) is greater than table value (11.1) the null hypothesis is rejected. Hence it is concluded that there is a significant relationship in ranks assigned by different respondents regarding the benefits that are brought by briquette cooking stove.

#### Reasons for preferring briquette cooking stove:-

Briquette cooking stove support sustainability and is a viable alternative to the stoves. These stoves are specially designed and are named for durability and can with stands 300kgs of weight. Depending on the holding capacity of

briquettes are prepared from the minimum to the maximum. As it is eco-friendly it is free from fumes. Briquette cooking stoves are available at affordable prices depending on the needs of the consumers. The reasons for the preference of briquette cooking stoves are shown in table 12.

**Table 12:-** Reasons for preferring briquette cooking stove

Reasons	Rank					Intensity value	Rank
	1	2	3	4	5		
Affordable price	3	3	3	53	38	180	III
Attractive models	7	3	15	38	37	174	V
Energy saving	1	4	16	59	20	207	I
Nature saving	-	8	7	52	33	190	II
Eco friendly	2	2	4	57	35	179	IV
Durability	-	1	8	46	45	165	VI

**Source:** Primary data

Table 12 it is understood that energy saving is the first reason cited by the respondents with the intensity value of 207. Nature saving have got the second rank with the intensity value of 190. The respondents have considered affordable price as the third reason. Eco-friendliness and attractive models are the fourth and the fifth reason expressed by the respondents. Durability has got the six ranks with the intensity score of 165.

#### **Relationship between the income and the reasons for preferring of briquette cooking stove.**

As the income is the significant determine, to find out whether the income has any influence on the reasons for preferring briquette cooking stove, the income and the reasons for preferring briquette cooking stove is given in Table 13

**Table 13:-** Income and reasons for preferring briquette cooking stove

Income	Reasons for preferring			Total
	Low	Medium	High	
Up to 20,000	5	38	6	49
20,000-40,000	8	24	6	38
40,000-60,000	1	7	2	10
Above 60,000	1	2	0	3
Total	15	71	14	100

**Source:** Primary data

**Ho:** There is no significant relationship between the income and the reasons for preferring the briquette cooking stove.

Since the calculated value of  $\chi^2$  (4.025) at 5 percent level of significance (d.f=6) is lesser than table value (12.6) the null hypothesis is accepted. Hence it is concluded that there is no significant relationship between income and reasons for preferring of briquette cooking stove.

#### **Relationship between the occupation and the reasons for preferring of briquette cooking stove.**

To find out the relationship between the occupation and the reasons for preferring of briquette cooking stove Chi-square test is applied. Table 14 shows the occupation and the reason for preferring of briquette cooking stove.

**Table 14:-** Occupation and reasons for preferring briquette cooking stove

Occupation	Reasons for preferring			Total
	Low	Medium	High	
Households	0	13	3	16
Canteen	4	34	6	44
Restaurants	9	12	4	25
Mess /catering	2	12	1	15
Total	15	71	14	100

**Source:** Primary data

**Ho:** There is no significant relationship between the occupation and the reasons for preferring briquette cooking stove.

Since the calculated value of  $\chi^2$  (14.226) at 5 percent level of significance (d.f=6) is greater than table value (12.6) the null hypothesis is rejected. Hence it is concluded that there is a significant relationship between the occupation and the reasons for preferring of briquette cooking stove.

### **Suggestions:-**

- ❖ Campaign can be organised by the manufacturer to bring awareness about the reduction in cooking fuel cost.
- ❖ Small size specially made briquette cooking stoves are available and the households can be encouraged to use such stoves for their daily cooking.

### **Conclusion:-**

A detailed analysis of the respondents shows the general attitude in relation to their choice of briquette cooking stove and highlighted reasons for preferring briquette cooking stove. In the near future people may prefer to use fumeless , eco-friendly briquette cooking stoves for their daily use.

Public transportation system, economy, traffic

#### Abstract

Malang is a college city and inhabited of approximately 1 million dwellers, dominated by productive ages. The domination of the productive age makes the movement of people in Malang is quite active. The thing is, Malang is not provided adequate public transportation system to support the movement of people. The available systems which are still use are the old systems which developed in the 90s. It affected on the surge of private vehicles as a mode of transportation. The effects of private vehicles use are the traffic jam, inefficient fuel consumption, health problems, the increase of accidents number, and the high-cost economy. Therefore, Malang needs to develop better public transportations, which can resolve the problems. Moreover, the development of public transportation system needs to consider several problems which may arise such as the refusal by public transportation entrepreneurs that already exist, the drivers or people who feel aggrieved. Then the development must be sustained, accommodate the needs of stakeholders, and involves all of them. The expectation is, with the better public transportation system, Malang will become a comfortable city, healthier, safer, and the economic is increasing.

#### Introduction:-

Malang is located in mountainous areas with varied contour and a total area of 252.1 km<sup>2</sup>. In Figure 1, Malang is the center of Malang Raya which included the city of Malang, Malang regency and Batu. As the central region, Malang is known as the city of education with more than 62 Universities and Academy schools, and hundreds of elementary, junior, and high school of public and private. It affects the rate of population growth in Malang and the people mobility.

As we see the development of the population in Malang during 2000 is inhabited by approximately 756.982 residents with the growth rate of the population of 0.86% per year since 1990. About 317.283 people or 42% are in the age between 20 to 49 years which have high mobility rate. Though the population distribution in each sub-district is considerably high, ranging from 126,000 to 182,000 (Statistics, 2008). The number of Malang population grew to 820.243 in 2010 and projected to reach 845.973 in 2014, with a growth rate of 0.31% between 2010 and 2013 and 0.64 in 2013 and 2014 (Statistics, 2012) (Statistics, 2015). Nevertheless, it is not the absolute number, because the total students in both public and private universities in Malang, has reached approximately 300.000

**Corresponding Author:- Roedy Susanto.**

Address:- Magister of National Defense, Brawijaya University.

which the majority are not Malang natives. It gives a huge contribution towards the level traffic jam in Malang, especially as the center region, a lot of comer work in Malang.

Now the transportation needs in Malang are facilitated by the government, even the facilities in the road and public transportation. However, from year by year, there is a tendency that the use of private cars as the main transportation has increased. As shown in Figure 2, In 2007 the number of private vehicles are 255.485, and increased to 279.606 in 2008, then to 291.404 in 2010, to 463.785 in 2014, and become 487.859 in 2015. In each of period, the number of motorcycles has always been a majority in comparison with the car about 5:1. In Figure 2, it illustrates the public transportation, the total is 2.758 in 2007, decreased to 2.466 in 2008, then slightly up to 2,527 in 2010, increased again to 2,659 in 2014 and eventually fell to 2,606 in 2015 (Statistics, 2008) (Statistics, 2013) (Statistics, 2015). Furthermore, based on the interview result with the Department of Transportation, in 2016, from 2.606 vehicles, only 70% of them are active, while the rest are not operating due to regulatory and feasibility reasons. Based on the existing data, it may indicate that the concern towards the public transportation has not been the main priority. Instead of increasing the number of fleets, the fact is if it compares in between 2007 and 2015 the fleets are decreased. Another problem is, the road length and the type of class road in Malang are tend to remain constants. For comparison, in 2007 the length roads of Class I was 29.77 km and the roads in good condition are 119,7 km, while in 2014 the roads of class I reminded 29,77 and roads in good condition are 137.3 km (Stats 2008) (Statistics, 2015).

Figure 1:- Local Map of Malang (source: maps.google.com).

Figure 2:- The growth rate of private vehicles and public transportation.

Along with these conditions, then the government is unavoidably obliged to organize a transport system which effective and efficient. Based on the explanation above, it requires a study of the development strategy in public transportation system in Malang. This paper will explain the condition of public transportation in Malang, from law and public policy of public transport perspective, the impact of public transportation, the stakeholder's need and recommendation of the development plan.

**Existing Public Transport Systems in Malang:-**

The public transportation in Malang is a minivan called microbus (mikrolet) with passenger capacity of 11 up to 14, see Figure 3 as an illustration. There are two sit positions in a microbus, the first is one chair next to the driver, while the rest sitting face to face behind the driver chair as illustrated in Figure 4. The small size of the microbus allows it to sneak to narrow streets in Malang but the small room capacity for passengers make the loading and unloading process quite difficult and it makes the microbus inefficient as mass transit. Another disadvantage of microbus is related to the passengers' safety and comfort.

**Figure 3:-** Public transportation in Malang (Microbus/Mikrolet).

**Figure 4:-** Microbus seats layout

In accordance with the rules of government, public transportation can be managed by state-owned enterprises, region-owned enterprises, joint-stock company, and a cooperative only. In Malang, the management of public transport is coordinated by several cooperatives owned by Department of Cooperatives. Under these cooperatives, there are microbus owners who employ drivers to run the microbus.

The supervision of the functions of microbus is conducted periodically by the Department of Transportation of Malang. Elements such as comfort and roadworthiness are examined through this supervision. Types of the test conducted are such as gas superficial, lamps, side slip, head light, brake, and speedometer. According to Sugianto et al., 2013, Department of Transportation of Malang already has professional staffs and adequate equipment. Meanwhile, the problem is there are no enough workers, so the testing process tends to delayed. The delayed of this

testing process resulted in microbus touts who attempt to quicken and manipulate the test process. This issue will definitely harm the users of public transportation and others drivers in terms of comfort and safety.

In Malang, the microbus divided into 25 routes, where each route connects a terminal with another terminal or certain area with another area. The path of each route may intersect each other, so the changing of the path may occur. The presence of terminals is intended as a place for microbus and public transport users. However, sometimes the development of infrastructure such terminals are not considered properly which resulted in the minimum providing of benefits. Take example the construction of Hamid Rusdi terminal which not functions properly because of its location which quite far from settlements and public service area. Furthermore, Hamid Rusdi terminal is indicated as one of traffic jam causes in other areas (Adhitama& Hanafi, 2014).

To provide the guarantee of comfort, aside from periodic testing, Malang government also seeks to improve the condition of existing microbus. It is secured by the Regional Regulation no. 5 of 2011 on the rejuvenation of public transport. This is reasonable because the public transportation which operates is from 90's era, it is not convenient to use and the operational cost tends to high. Nevertheless, the process of rejuvenation did not take place until today because the financing is fully borne by the owners of public transport and it is disadvantaging them economically (Putri, 2013).

Under these conditions, for the purposes of the development of public transport in Malang, it is necessary to do a comparative study to determine the condition and the proper strategy. One of the studies which can be used a reference is the development of marine transportation system in Nusa Peninda, where their development objectives are to facilitate tourism activities in Bali and increasing the income of local people. In order to success in the development, it is necessary to involve local people and relevant institutions, infrastructure development, network, and transport support (Adnyana, 2016).

Furthermore, another study which can be used as a reference is a research by Rahma, 2013, about the performance of Department of Transportation of Malang and its functions as a regulator, facilitator, and evaluator of public transport systems, as well as the support factors and inhibiting factors of public transport in Malang. In the research, the evaluative and quantitative studies were conducted in order to get feedback from people about the level of satisfaction and dissatisfaction toward the performance of provided parameters.

Another similar study in a more comprehensive analysis is The Characteristics of the development challenge of public transportation in the Federal Capital Territory (FCT), Nigeria (Femi, 2012). Problem encountered in the FCT is the lack of government participation in performing the managerial function of the transport system. In the study, is advisable to establish a special authority to regulate the transport system in the FCT.

#### **Finding:-**

In the development of the public transportation system, the replicated on many factors is needed such from law, public policy, the impact of public transport, social and societal. All these factors are critical for ensuring the development plan made can be carried out smoothly without any conflict and other obstacles. The following is a discussion of these factors.

#### **The Warranty Law of Public Transport System:-**

Due to the traffic jam problem in Malang, serious efforts of Central and Local Government are crucially needed in the attempt to develop and plan the public transportation for mobilization of citizens. One of the efforts which already realized by the Central Government through Regulations No. 22 year 2009 until this time only in terms of signs for existed system settings which are about stations, the registration for public transports, and its treatment. There are no special instructions for plan and development toward the better way. Likewise, Malang Government did the similar efforts by means of Malang City Local Regulation No. 9 year 2006 which is replaced by Malang City Local Regulation No. 5 year 2011. The regulation only covers about the definition of public transportation, the requirements, and responsibility of its executant, transport procedures, and the responsibility of Government only on the surveillance level and taking action on any possible violation. In that regulation, Local Government does not indicate anything about how public transportation in Malang City will be developed.

The Warranty Law is vitally needed in order to provide certainty of the implementation of the developed public transportation. In that law, instruction related to the development of public transportation system which fulfills the

principle of punctuality, low-cost, and has high certainty is being proposed. The pattern of Malang public transportation development is indeed has to consider the condition of Malang Raya and all the involved stakeholders. Direct adoption of deemed successful system in other cities such as Jakarta and Surabaya is uncertain of success if it is applied in Malang.

#### **The Transportation Policy in Malang City Analysis of Public:-**

As explained previously, public transports in Malang are subject to regulation defined in Local Regulation No.5 year 2011 about transportation in street with public motor vehicles. The regulation is organized into 2 parts, 13 chapters, and 32 subsections, and filled with signs and rules about:

1. Executant and public transportation service,
2. The permit of transportation business,
3. Routes,
4. Opening, modification, nullification of routes,
5. Driver liability,
6. Rights and obligations of passengers,
7. Technical requirements and roadworthy,
8. Provision of Retribution,
9. Surveillance,
10. Criminal provision,
11. Transitional provision,
12. Closing provision,

In this regulation, there are no explanations related to the plan and development of public transportation in Malang. It is mostly about the procedures of public transports management and penalties which will be given if rules are violated. Modes of arranged transportation are also limited to public transports with the maximum capacity of 8 passengers. Rights and obligations of both passengers and drivers are just set up a little. Ironically in that regulation, no warranty towards the rights of passengers is stated, because of the existed penalties are only on the matter of licensing administratively, incompatibility of vehicle condition by means of regulations. Whereas Government only steps in just to keep an eye on and assigns punishment if a violation happened. The government has no rights on settings and development on that regulation.

Furthermore, basically, Local Government through Department of Transportation has already stated Strategic Plan (Renstra) year 2014-2018 in which it is refined with Strategic Plan Alteration (Renstra) year 2014-2018 (Perhubungan, 2015), and one of the discussion is about public transportation. In this regard, Department of Transportation has identified the possibility of service development in form of mass transports like a city bus, school bus along with the increase of public transport safety factor. Moreover, management of traffic engineering and highway facility in every District in an attempt to make the highway users feel comfortable and safe has been planned as well. However, there is no strategic and tactical plan about how the development will be done and how the safety will be increased. The program of Department of Transportation related to public transports only covers the improvement of public transport service which involves:

1. Quality improvement of safe and comfortable service,
2. The improvement of coordination towards public transport businessman / Organda (Organization for public transport),
3. Socialization on public transport businessman on route,
4. Socialization on public transport drivers and pedicaps (becak),

Along with this condition, it can be predicted in coming years, the traffic conditions and public transport service will not have any improvement. Therefore, Local Government needs to realize the importance of development in this sector.

#### **The Impact Analysis of Public Transport System:-**

Nowadays, it can be said that the availability of public transport system in Malang does not fulfill the needs of transport maximally. It affects the increase of number and user of private vehicles as the main transportation. The direct consequences of this problem are the more severe traffic jam and the emergence of problems in safety sector.

Traffic jam is a common issue which happened these recent years. The effort of government in the attempt to fix the quality and highways area will not be able to compensate the growth of private vehicle users. The direct consequence of this condition is in the environment problem, where the quantity of fuel consumption will always increase and the quality of life of society will go down. Traffic jam is also influenced by the driving characteristic of two-wheeled vehicle users which are dominated by young population. Indiscipline of this group towards the traffic regulations is frequently worsening the traffic jam. Another factor which is not directly linked to the public transport system but contributed in traffic jam is the lack of availability of pedestrian. People tend to use private vehicle rather than walking for short distance transport for safety reason.

In safety sector, there is an issue of thuggery which associated with the parking area. The number of vehicles which increase every year is not balanced with the adequate parking area. This cause the parking of private vehicles placed along the roadside which impact on the highway area. Parking areas along the roadside are generally managed by non-government parties that dominate particular areas illegally. As an illustration, illegal parking in Malang is shown by Figure 5.

**Figure 5:-** Illegal Parking

The issues that exist today will be addressed with little conflict by a good public transport system. Firstly, the good public transportation will reduce the number of private vehicles. This will have a positive impact on environmental issues and reduce stress levels of people because of the traffic jam. Secondly, the decreasing number of private vehicles will reduce parking problems. It is possible that the area of the highway which decreases because of illegal parking will not occur again and the issue of safety which causes by the seizure of parking territory will be resolved.

#### **Needs Analysis of the Stakeholders:-**

The needs of stakeholders need to be considered with the aim to develop public transport policy in Malang. Malang is a unique city, in contrast with other major cities in Indonesia. Today, Malang has approached the concept of a metropolitan city which needs different considerations in developing the public transportation. The needs of stakeholders such Government, entrepreneurs, public transport drivers, and the users of public transport will be explained below.

#### **Government of Malang needs:-**

Based on the Strategic Plan 2014 - 2018 Department of Transportation (Transportation, 2015), Malang faces traffic problems that quite complicated. The details of these problems are:

1. The rapid population growth.
2. The traffic jams in almost every roads.
3. High air pollution due to the large volume of vehicles.
4. Parking structuring which uncontrolled and less secure.
5. The undisciplined drivers.
6. Supporting facilities of the highway are inadequate.
7. Roads that not increase, while the number of vehicles increases rapidly.
8. Low coordination between SKPD (Work Unit area) which associate with the transportation.
9. Limited budget funds of the development and provision of facilities and infrastructure.

In this case, we can conclude that the most important needs of Government of Malang which relate to the development of public transportation are:

1. Availability of integrated plan of public transportation development which can guarantee the people needs on public transportation.
2. The conducted development must consider the stakeholders needs so that there will be no party that feels aggrieved.
3. The development costs should be minimized, yet can provide effective and efficient results.

#### **The needs of entrepreneur and the driver of public transportation:-**

Public transport entrepreneurs are the owners of public vehicles which have a business license and appropriate route which compatible with the type of the public vehicles. In general, the driver can be included as the stakeholder because they work as employees of public transports entrepreneurs or the entrepreneurs may double as a driver too. Thus, the needs of public transport entrepreneurs and their drivers in the development of the public transportation system are:

1. The guarantee of business so that the income of the entrepreneurs of public transportation will not be disrupted.
2. The guaranteed job for drivers so that the income can be guaranteed as well.
3. Entrepreneurs of public transport need to be involved in the rejuvenation of public transportation or even the provision of new transportation modes.
4. The ease in administrative matters.

With the fulfillment of these requirements, then the possibility of rejection of the new system can be minimized.

#### **The Needs of Public Transport Users:-**

The people needs of public transportation are quite simple, which is convenient, on time and predictable, fixed path and cheap. If those requirements can be fulfilled, it is possible that the private vehicle users will switch to public transport.

The concern in Malang is the cost of public transportation which relatively high is indicated as the cause of the switching users from public transportation to private transportation. Today, public transport fare is Rp. 4.000,- for one route, so the return trip would cost Rp. 8.000,-. However, if the public transport users must change some routes, then the cost of round trip could reach Rp. 16.000,- or more. The use of private vehicles such as motorcycles are definitely cheaper, with the same expenditure can be used for two or more roundtrip.

Another need is on time and predictable schedule. In general, the public transport depart from the origin terminal to the destination terminal with two patterns, leaving with full of passengers or no passengers at all. For vehicles which depart in full of passengers, they will wait until the vehicle completely filled with passengers at the origin terminal without specified time limit. While the vehicle which departs with small occupancy will run on low speed for transporting the passengers along the way. Sometimes they will also stop at a certain location to wait for passengers and this cause on uncertainty on travel time and it is impossible to predict the travel time.

Another problem faced by users of public transport is, there is no guarantee of the availability of public transportation and arrive at the destination. At certain hours, public transportation decided to not operating because of the passengers is minimum. Public transportation may also do not pass the proper path in order to save the fuel and avoid the traffic jams or even because unwilling to take passengers to the destination terminal for the same reason.

The switching of public transportation users to private vehicles might also cause by the convenient factor. Some factors such as small size and difficult in access make public transportations give a less comfortable feeling.

#### **Result and Discussion:-**

By doing an analysis of the condition about the constant availability of roads while the number of private vehicles users is increased rapidly and the number of public transportations which tend to decrease, then in the future, Malang will certainly be trapped on the chaos traffic system. Before that problem occurs, it is better for the Government of Malang to start to make a plan for the development of public transportation which can mobilize the people quickly in large number yet low cost. Be aware that the current modes of transportation are inadequate and cannot fulfill the needs of people. Indeed the development is expensive, yet needs to find an effective way which involves all the stakeholders so that the usage of government funds can be minimized. Besides, the government of

Malang and also the regional council of Malang are obligate in making rules & laws to ensure the implementation of plan of the public transportation developments.

Another important thing that should be considered is the participations of the owners of public transportation and the drivers in the development's plans. Hopefully, the development will not make drivers lose their job and their income while the owners lose their business, and even better if the development could increase their income. Basically, the increasing of income is not an impossible thing because the potential of public transportation users is in massive number. The policy which involved the public transportation owners and the drivers could avoid the disapproval and social problem.

All of this means nothing if the needs of public transportation users are not accommodated as well. When the users satisfied with the quality of the service, where they can predict the duration of the trip, the punctuality, departure, and the arrival, the cost and also the convenient, then it is clear evidence of the governments' successes. Another success indicator is if the number of public transportation users could rapidly increase and the number of private vehicle users is decreased along with the decreasing of traffic jam ratio.

Therefore, the two scenarios that could be done in order to implement the development of public transportation successfully as well as satisfy all of the stakeholders are:

**Scenario 1:- Types of public transportation nowadays:-**

1. Private transportation revitalization, so all 2.606 minibuses could be operated
2. Adding of vehicles in every path
3. Extra subsidies for rejuvenation of vehicles
4. Adding of vehicles might result in decreasing of drivers' income, so there should be a subsidy for free hours.
5. The subsidy given is for on time public transportation on the departure and the arrival. It is important to give guarantee of duration for users.
6. There must be users' cost subsidy, so they will attracted to use public transportation
7. It is necessary to consider about the price for the duration trip rather than the amount of route which is used. For example, price for 2-hour trip is Rp. 4.000, if the public transportation users move the route within those 2 hours, there will be no additional cost. This idea could be use in electronic recording and payment system.
8. It is necessary to implement the application such as, Near Angkot (Hariyanto, 2015) which used by the users for monitoring public transportation that they want to use. Toward this application, the users could choose which route they want, see the amount of passengers, and monitoring its position. Meanwhile, the drivers may see the position of their passengers. Further, this application could be use as performance report of public transportation.

**Scenario 2: Type of public transportation which modified into bigger capacity:-**

1. There must be infrastructure which support the new type of transportation  
It is necessary to prepare a fixed bus stops and special system that can guarantee the passengers load and unload in the specified the bus stops.
2. The public transportation owners are associated in a company with share investment system, so that they could see their involvement in public transportation business
3. It is necessary to do data collection of drivers and make them as the employee of the company. This idea will advantage in reducing all sorts of upheavals that may arise and provide solutions on their income source.
4. The new transportation modes should have fixed schedule and also able to provide certain duration trip and departure.
5. The cheap cost should be the main priority, the convenient of the passengers and also sufficient quantities of passengers

The transportation modes which not expensive is a medium bus with 28 passengers or a bigger bus with 40 passengers. Better if using the Bus with electrical power like a tram, because it does not produce gas emissions.

**Conclusion:-**

Today, the government of Malang does not have plans to develop the public transportation system yet. Whereas in the short future, the traffic jam in Malang could be worst because the increasing of private vehicle users while the number of roads are constant. Therefore, the government of Malang needs to make a strategic plan to develop the public transportation which is boosted by regional regulations which binding. In the implementation, this

development must consider the needs of all stakeholders and involved all stakeholders. There are two suggestions development, those are; maintain or remodel the types of the transportation. Yet both of it have the same goals which are given the service guarantee toward public transportation users as well as involved the owners of public transportation and the drivers also. All in all, this idea will solve the traffic jam in Malang as well as avoid the possibilities of conflict.

#### Abstract

Virgin 20 years old patient 46 kg 156 cm BMI 19kg/m Has Regular cycle with monarch at 13 year old her medical and surgical history free family history she has diabetic mother the patient came complaining of dull aching abdominal pain and progressive enlargement for 7 months ago complain also from diarrhea no history of weight loss no urinary symptoms or abnormal discharge local examination shows large pelvi abdominal fixed slightly tender mass about 34 week in size.

*Copy Right, IJAR, 2017,. All rights reserved.*

#### Pelvi abdominal ultrasound:-

Large heterogeneous pelvi abdominal mass..partially cystic 21×16 cm mostly ovarian ..with minimal ascites

Uterus is average sized with homogeneous echo pattern and focal lesion ..both ovaries can't assessed

#### MRI:-

Shows Large Pelvi Abdominal Mass With Solid/Cystic Component With Calcification Extending Ascites. No Pelvic Lymphadenopathy

#### Laboratory investigation:-

CA125=81.58u/ml it is high

So patient is planned for exploratory laprotomy .

Exploratory laprotomy midline incision and left adnexectomy done with intact capsule. Mass was adherent to uterus and colon

Then peritoneal implantation were excised biopsy, small biopsy from right ovarian tissue was sent for histo pathology with the dissected mass [Possibility Of Malignant Ovarian Mass Lesion Germecelltuumor]

#### Histo pathology Examination:-

Malignant Germ Cell Tumor Of Ovary – Dysgerminoma

#### Pathological staging:-

Stage [ IA ]

#### Management:-

With This IA STAGE Ovary – Dysgerminoma No Need For Any Chemotherapy Or More Surgical Treatment, Only For Closely Observation.

#### Abstract

Small and Medium scale Enterprises (SMEs) play an important role in promoting inclusive growth in the contemporary economy of Sri Lanka. However, the growth and expansion of SMEs are controlled by some unknown factors and those are yet to be revealed. Hence, the main objective of this study was to recognize the factors that influence the growth of SMEs in Sri Lanka. The present study was based on a sample of fifteen SMEs which may have positive or negative growth in sales. The study revealed that the growth of SMEs is constrained by financial inadequacy, the lack of access to new technology, and regulations imposed by the government. Moreover, it was revealed that the level of education of the owner of the enterprise has a direct impact on the growth of SMEs.

*Copy Right, IJAR, 2017, All rights reserved.*

#### Introduction:-

Small and Medium scale Enterprises (SMEs) make up a large part of many economies. They are considered as the backbone of an economy given the fact that in some economies SMEs contribute to more than 50% of Gross Domestic Product (ACCA, 2010). Particularly in the European Union, SMEs constitute 99.8% of all firms and employ around 76 million people representing around 67.4% of total employment in 2010 (Ayyagari et al. 2011). In the US, SMEs constituted more than 50% of the non-farm private GDP and created 75% net new jobs in the economy (ACCA, 2010). Therefore, it is clear that SMEs play an important role in promoting inclusive growth in countries.

The issue of whether small businesses can be considered as beneficial to economic growth must be examined from several different perspectives. As the theory of scale of economies emphasizes, large-scale firms enjoy advantages derived from their economies of scale in production and also from having crossed the threshold of innovative activities, thereby predicting that the resultant increase in the share of large-scale firms will drive economic progress. According to this conventional wisdom which originated back in the days of the industrial revolution, only large firms can meet the requirements of scale efficiency, thus outperforming small firms. It is therefore hypothesized that there is no room for SMEs in those economies pursuing growth, and their future role is expected to diminish (ACS, 1996).

Although precise, up-to-date data are difficult to obtain, estimates suggest that more than 95% of enterprises across the world are SMEs, accounting for approximately 60% of private sector employment (Ayyagari et al. 2011). Japan has the highest proportion of SMEs among the industrialized countries, accounting for more than 99% of total enterprises (EIU, 2010). According to the Ministry of Micro, Small and Medium Enterprises of India, 13 million SMEs were operating in India by 2008, equivalent to 80% of all the country's businesses (Ghatak 2010). In South

Africa, it is estimated that 91% of the formal business entities are SMEs (Abor and Quartey, 2010). Estimated data for the 27 countries in the European Union (the EU-27) for 2012 also illustrate the importance of SMEs.

The contribution made by SMEs does vary widely between countries and regions. Nevertheless, they play a particularly key role in high-income countries and sometimes even in low-income countries, making significant contributions to both GDP and employment (Dalberg, 2011). They are also major contributors to innovation in economies, partly through collaboration with the larger corporate sector. SMEs that become embedded in the supply chains of larger businesses can be spurred on to improve their own human and technological capital (ACCA, 2010), thus improving their own productivity and performance.

The contribution of SMEs to economic fundamentals nonetheless varies substantially across countries: from 16% of GDP in low-income countries (where the sector is typically large but informal) to 51% of GDP in high-income countries. History and legal tradition can also play a very important role for the development of SMEs. For instance, countries that were in the former Soviet Union tend to have disproportionately small SME sectors, even when controlling for per capita income (Ayyagari et al. 2003).

In developing countries, by contrast, over 90% of all firms outside the agricultural sector are SMEs or micro-enterprises. These firms produce a considerable part of the GDP. In Morocco, for example, 93% of industrial firms are SMEs accounting for 38% of the production, 33% of investment and 30% of exports. The contribution of SMEs is considerably higher in South Africa. The estimated 91% of the formal business entities in South Africa that are SMEs contribute 52–57% to the GDP. In Ghana, SMEs are even more prominent in the local economy, representing about 92% of Ghanaian businesses and contributing about 70% to Ghana's GDP (Abor and Quartey, 2010). Overall, statistics can sometimes mask the particular contribution made by individual sectors. For example, in 2006/7, the contribution made by micro and small businesses to India's GDP was only around 6%. Even so, manufacturing SMEs accounted for around 40% of industrial output, and 40% of all exports (Ghatak, 2010). Similarly, the United States International Trade Commission (2010) reports that SMEs contributed to roughly 50% of the US private nonagricultural GDP in 2004, a share that had remained relatively stable from 1998 to 2004. The service sectors are by far the most important contributors, accounting for 79% of SMEs' contribution to GDP. When compared with larger businesses, SMEs' contribution to output tends to be lower per firm because they tend to be more labour intensive than larger firms and concentrated in service sectors. They therefore typically achieve lower levels of productivity, though they do contribute significantly to employment (Wymenga et al. 2011). SMEs' greater labour intensity means that job creation entails lower capital costs than in larger firms (Liedholm and Mead, 1987) which is particularly important for developing countries and economies with high unemployment. Moreover, SMEs are generally more common in rural areas than larger businesses. Especially in developing countries, SMEs thus provide much-needed employment in rural areas. SMEs can in fact become the engines that sustain growth for long-term development in developing countries. When growth becomes stronger, SMEs gradually assume a key role in industrial development and restructuring. They can satisfy the increasing local demand for services, which allows increasing specialization, and furthermore, support larger enterprises with services and inputs (Fjose et al. 2010).

#### **Literature:-**

Chaston (1995) reported on a 'networking model' for the promotion of the survival and growth of SME sector firms in the UK. The model had been transferred from the Danish Technological Institute, and involved the concept of inter-firm cooperation through the creation of trading networks of SME sector firms. The absence of large firms to initiate and develop the 'trading network' structure was seen as a barrier to the development and growth of firms in the SME sector. O'Gorman (2001) reports on research into the sustainability of growth in SME sector firms and explores the debate between the strategic choice of entrepreneurs which explains SME growth and the industry structure. The author then goes on to consider the cases of two companies in the same industry sector, cash and carry food wholesaling. These companies served the Irish market and their growth and development over a period of 20 years were compared. The study concludes that the strategic choices of entrepreneurs and industry structures are complex and that interaction between the two variables results in combinations that may produce sustained growth. Sparkes and Thomas (2001) investigated the importance of internet developments to the Welsh agro-food sector and concluded that because of peripheral location on the 'Celtic fringe' (some areas in Europe are known as the 'Celtic fringe'), the development and growth of the industry will depend on the ability to take up the marketing opportunities presented by internet technologies. The paper concludes by calling for intervention and support of mechanisms that ought to be deployed in order to enable the industry to appreciate the marketing benefits of adopting e-commerce marketing solutions.

Choeke and Armstrong (2000) reported on the initial results of a study aimed at investigating the reasons for organizational growth and business success in the SME sector. This work eventually focused on the issue of organizational culture as a factor influencing performance and growth. Empirical evidence is reported from samples in Northwest England and Scotland. The authors' conclusions include suggestions that this research may point to the need to revisit the policy agenda and refocus the nature of advice and assistance initiatives to take into account the influence of organizational culture on SME growth and development.

McLarty (1998) looks at a particular individual case study and examines the characteristics of a successful retail company that have enabled it to enjoy success. The paper concludes that the presence of a marketing approach characterized by marketing planning, the correct marketing mix, the firm's strategic approach and in particular, value chain management have led to the firm's financial success. Within the paper, it is noted that the growth and success is also characterized by reduced turnover per employee and reduced sales per square meter.

Vickers and North (2000) examine the role of a particular intervention, regional technology initiatives on SME sector firms in the English regions. The aim of these initiatives was to enable innovation and technology transfer in the regions and thereby encourage economic development. The initial ideals involved long term strategic partnerships for innovation and technology transfer. However, the reality was that many SMEs really wanted short-term problem solving assistance rather than to avail themselves of long term innovation and technology transfer opportunities. Thus, a number of researchers have reported on work in the SME sector and have sought to diagnose the extremely important areas that SME managers may look to for success. Policymakers have also been involved in interventions to encourage SME development and growth. This activity has been a widespread and global phenomenon.

#### **Small and Medium Enterprises in Sri Lanka:-**

SMEs encompass establishments operating in agriculture, mining, manufacturing construction and service sectors. However, its relative significance in the national economy cannot be estimated due to lack of information. With respect to SMEs however the existing database is more reliable and hence it is possible to give some indication of the size of the sector on comparative basis.

Although SMEs in Sri Lanka contributed an estimated 40% to the GDP during the period from 2010 to 2012, it is likely that the potential negative impact on GDP growth stemming from the high borrowings in SMEs was significant (CBSL, 2012). Sometimes high borrowings are a consequence of high growth in business. As a result of high borrowings, during 2010 and 2011, the Sri Lankan economy grew by 8% and 8.2 % respectively and that was the highest GDP growth rates recorded in over three decades. During that period, loans to SMEs grew by 68.3% in 2011 (CBSL, 2012). Such an increase in borrowing needs to be supported with equity to make sure growth is sustainable but it was not the case in Sri Lanka. As a result of high borrowings, during the 2010-2011 period, the growth records of Sri Lankan SMEs were lagged. According to the Sri Lankan Enterprise Survey, the growth rate of Sri Lankan SMEs was 2.9% and it is very low compared to the world 5.2 % (Hettiarachchi, 2013). Many investigations into SMEs prove that high proportions of new ventures have closed down during their first years of life. This indicates that these firms were not able to maintain the position with their environment or never achieved it. So, it is clear that even though business owners start their ventures with the best of intentions and work long, hard hours, some of the businesses survive but others fail.

There is no recently conducted industrial survey to identify the strengths, weaknesses, threats and opportunities of SMEs. The Department of Census and Statistics of the Ministry of Finance and Planning has been conducting annual industrial surveys but it has not covered the establishments with less than 5 persons engaged. Subject to that limitation, the most recently conducted industrial survey dates back to 1997. According to the Annual Survey of Industries (1998) conducted by the Department of Census and Statistics of Sri Lanka, the majority of establishments stem from small businesses but their contribution to the economy is very low (about 6%). On the other hand, there are only 2% of large scale establishments and their contribution is much higher which accounts to more than 50% of output. Therefore, it is clear that although there are large numbers of SMEs in Sri Lanka, their contribution to the national economy in terms of output and share in employment has been very low. It is essential to recognize the contribution of SMEs in other developing and developed countries to come up with a proper conclusion.

Therefore it is clear that in other developing or developed countries, the SME sector contributes to a large proportion of the country's GDP whereas in Sri Lanka it has not achieved its anticipated results. Hence, it is clear that there is a

need for the future improvement of this sector in Sri Lanka and it is also essential to identify the ways to harness the full potential of this sector.

Unfortunately, there is no commonly accepted definition for SMEs. Different countries use different parameters to define SMEs such as number of employees, amount of capital invested, amount of turnover, etc. Different definitions are also used by different organizations within the same country to define SMEs for different purposes and this is common in Sri Lanka as well. Table 1 shows definitions of SMEs in Sri Lanka by different authorities.

**Table 1:-** Definitions of SMEs in Sri Lanka

Institution	Criterion	Medium Scale	Small Scale
Sri Lanka Standards Institution (SLSI)	No. of Employees	Between 50 - 249	Less than 50
Industrial Development Board (IDB)	Value of Machinery	Between Rs. 4 Million to 10 Million	Less than Rs. 4 Million
Ministry of Industry, Tourism and Investment Promotion	Value of fixed assets other than land and buildings	Up to Rs. 16 Million	Less than Rs. 16 Millions
Federation of Chambers of Commerce and Industry of Sri Lanka	Capital employed	Between Rs.2 Million to 20 Million	Less than Rs. 2 Million
Ministry of Small and Rural Industries	Total Investment	Between Rs. Million 20 to 50 Million	Between Rs. 1 Million to 20 Million
Ceylon National Chamber of Industries	i) Value of assets other than buildings and lands. ii) No. of employees	Between Rs. 4 Million to Rs. 20 Million Between 10 -50	Less than Rs. 4 Million Less than 10
Sri Lanka Export Development Board (EDB)	i) Capital investment excluding lands and building ii) Annual export turnover	More than Rs. 40 Million More than Rs. 100 Million	Less than Rs. 20 Million Less than Rs.100 Million
World Bank (for Sri Lankan country studies and loan programmes)	No. of employees	Between 50-99	Less than 1- 49
Dept. of Census and Statistics	No. of Employees	More than 25 (Year 2000) More than 10 (Year 2003/04)	Less than 25 (Year 2000) Less than 10 (Year 2003/04)
Task Force for SMEs Development in Sri Lanka (2002)	Asset Value excluding land and buildings value	Not exceeding more than Rs. 50 Million	Not exceeding more than Rs. 20 Million
Sri Lankan Apparel Industry, Task force on five year strategy (2002)	i) Export value ii) No. of Employees	Rs. 101 Million to 250 Million 1 - 100	Rs. 0.25 Million to 100 Million 101 - 250
The Dept. of Small Industries	i) Capital investment ii) No. of Employees	Between Rs. 25 – 5 million Between 100 - 50	Less than Rs. 5 Million Less than 50 employees

**Source:**Dasanayaka, S.W.S.B.(2009).*Measuring the Informal Economy in Developing Countries.*

SMEs are considered as the heart of the economy. Therefore many successive Sri Lankan governments have taken steps to develop this vital sector. However, when analyzing the present contribution of this sector to the national economy it seems that it has not produced the desired results. The reasons for this have been identified by conducting several surveys. The banking survey of the SME market in Sri Lanka (2006-07) of the International Finance Corporation (IFC) listed five principal constraints of the SME factor. They were (a) difficulties in obtaining finance (b) absence of technical and management skills (c) marketing constraints (d) inadequate infrastructure facilities for production and (e) outdated technology. According to the survey, one of the most common constraints to growth was the requirement of banks of collateral when providing credit facilities.

It concludes that the main reason for the lack of growth in SMEs is the shortage of capital due to a number of reasons such as the lack of access to banking facilities, the lack of knowledge on banking procedures and the inability to provide guarantees. Hence, this investigation will analyze the capital structures of SMEs and the factors influencing the growth of SMEs in Sri Lanka. By examining the problems associated with the development of this sector, this study will also attempt to identify the measures that can be taken to mitigate the identified problems.

## **Methodology:-**

### **Measuring the Growth:-**

The growth of SMEs can be measured in various ways. In accordance with government policy research as well as many management and economic sources, growth is measured in terms of increase in the number of employment in the SME sector. This measure has been of the most relevance to many government policy makers since SME growth has been seen as an important way of reducing unemployment. Nevertheless, owners and managers of SMEs are usually interested in financial performance rather than in employment growth. This can be measured by the growth of sales or turnover growth and profitability.

Various measures of profitability can be used such as absolute profitability, profitability per employee, profitability as a percentage of turnover or percentage change in profitability. Profits are necessary for survival in the long run in a competitive environment, but SME management may choose not to grow. Long-term profitability derives from the relations between cost and revenue. It is a necessary but insufficient condition for growth. Revenues may be held up by entry barriers and costs pushed down by management skills. A low-profit firm will lack the finance for expansion, but a high-profit business may conclude that when taking into consideration the risks of expansion, its rewards are inadequate. In a 'life style' SME, an owner may trade profitability today against profitability tomorrow. Dynamic pricing or sequential investment projects may initially require lower profits in order to obtain higher future pay-offs from greater market penetration. Therefore profit performance must be standardized against the size of the operation or the resources employed.

In this research used a measure of SME growth which is percentage change in SME turnover. Other measures of firm growth that could be used are market share, percentage change in employment, return on capital employed and measures of productivity. Growth can also take the form of personal development of managers and employees, technology innovation and professional recognition.

### **Population and the Sample:-**

The population of this study is based on SMEs in different sectors such as food, garments, metal and machinery etc. in the Gampaha District in the Western Province of Sri Lanka. The Western Province was chosen for this study since it has a large number of SMEs. The survey sample includes 100 enterprises. As the study is only related to the small and medium sized category, the enterprises that belong to the large category were excluded. The sample was selected with the use of the stratified sampling method.

### **Data and Sources of Data:-**

An amalgamation of primary and secondary data used in the analysis. Primary data were collected through a questionnaire and face to face informal interviews with SME owners. Secondary data were collected through research articles, Census and Statistics Department publications, debt financing institutions, CBSL annual reports and the internet.

### **Analytical Tools and Techniques:-**

Statistically testable hypotheses were developed to test the independence and the correlation of variables which have identified as the influential variables on the growth and expansion of SMEs by the previous studies. Thus, it is important to have a knowledge of the statistical methods used in prior researches in this area in order to select the most effective method to be used in the above study.

### **Variables and Definitions of Variables:-**

The factors affecting the growth of SMEs have been identified by the previous research. The variables and definitions of those variables are given below.

*Size of the firm:* Firm size is determined by the number of employees of a firm. Small enterprises have been defined as those with fewer than 20 employees. Medium size enterprises comprise of 20-99 employees.

*Age of the firm:* The number of years in business has been identified as an important variable in previous studies as it determines the credit-worthiness of the business. The information required by the lenders at the time of granting credit may be limited for younger firms due to the lack of an established track record. Hence, the transaction costs associated with lending to younger firms are likely to be relatively high. Furthermore, the younger firms may not be able to offer collaterals acceptable to the banks as those firms have not accumulated sufficient fixed assets.

*Sector:* The sectors were classified into five categories namely food, garments, metal and machinery, non-metallic and plastic materials and textiles. If a business does not fall into one of the above categories it can specify its business.

*Ownership type:* Firms were classified into six organizational types in the survey: sole proprietorships, partnerships, private-held limited company, and publicly-listed company, cooperative and other.

*Location:* Location is classified based on the distance to the capital city.

*Sales value:* The growth of sales value is considered as a variable which shows the growth of SMEs. It identifies the growth of SMEs by analyzing the sales value of last two consecutive years of the business. If there is a positive growth in sales = 1; a negative growth in sales = 0.

*Availability of audited financial statements:* If the firm has audited financial statements = 1. If the firm does not have audited financial statements = 0.

*Capital requirements:* The funding of the business is evaluated under this variable. Financial feasibility of the business will be addressed.

*Level of Education of the owner:* Education of the principle owner is redefined by categories from (a) to (d), corresponding to whether the owner has not completed secondary school, vocational training, a university graduate degree and/or postgraduate degree. Education may be proxy for unobserved managerial ability.

*Entrepreneur's experience and skills of the employees:* The variable is measured by considering the number of years of business experience they possess in the previous business and the current business at the time of the survey. If the entrepreneur is well experienced he/she will be more successful in analytical and management skills. Skilled employees are essential for a business to be effective and efficient. This will lead to a positive growth in the business.

*Technology:* Technology is the key to sustain any business in the long run. If a business produces innovative products in a well-timed manner, current customers will have faith in the business and more customers will be attracted to the business.

*Availability of raw materials:* This variable identifies the obstacles encountered when obtaining raw materials such as tariffs, import duties, etc. When the business is compelled to incur a large cost to obtain raw materials this will have a direct impact on the sales value of the business.

*Competition:* The business needs to identify its competitive rivalry. It will have a positive as well as a negative impact on the growth of SMEs. If the competition is high, businesses will try to improve themselves in order to meet the competition. However, high competitiveness will impact on the quality of the product and as a result, the businesses will lose their customers in the long run. Therefore the competition has a direct impact on the sales value of the business.

*Support of the government:* If the government is willing to improve the SME sector in the country and has already taken initiatives to develop this vital sector, it will clearly lead to a positive growth of SMEs

*Networking:* Entrepreneurial networks are defined in this study as entrepreneurs' personal relationships with external parties. The networking ability in this study was measured by their participation in networks such as business association and/or chamber of commerce. If a business is a part of a network it will get more up-to-date information about the industry.

### Data Analysis and Results:-

Statistically testable hypotheses are formulated to express the possible relationships between the growth of SMEs and the factors identified.

- Hypothesis 1. H<sub>O</sub>: Technology does not have an impact on the growth of SMEs  
H<sub>A</sub>: Technology does have an impact on the growth of SMEs
- Hypothesis 2. H<sub>O</sub>: Financial constraints do not impact on the growth of SMEs  
H<sub>A</sub>: Financial constraints have an impact on the growth of SMEs
- Hypothesis 3. H<sub>O</sub>: Education level of the owner does not have an impact on the growth of SMEs  
H<sub>A</sub>: Education level of the owner does have an impact on the growth of SMEs
- Hypothesis 4. H<sub>O</sub>: Purchase of raw materials does not have an impact on the growth of SMEs  
H<sub>A</sub>: Purchase of raw materials does have an impact on the growth of SMEs
- Hypothesis 5. H<sub>O</sub>: Age of the company does not have an impact on the growth of SMEs  
H<sub>A</sub>: Age of the company does have an impact on the growth of SMEs
- Hypothesis 6. H<sub>O</sub>: Competition rivalry does not have an impact on the growth of SMEs  
H<sub>A</sub>: Competition rivalry does have an impact on the growth of SMEs
- Hypothesis 7. H<sub>O</sub>: Years of experience as an entrepreneur do not have an impact on the growth of SMEs.  
H<sub>A</sub>: Years of experience as an entrepreneur does have an impact on the growth of SMEs.

#### *I. Technology and growth in sales*

The Pearson Chi-Square statistic (11.484) with a significant value of 0.001 is below the alpha level (0.05). This suggests that a statistically significant relationship does occur between the technology and growth in sales. Therefore, Hypothesis 1, which is the null hypothesis, is rejected.

#### *II. Fulfillment of capital requirement and growth in sales*

The Pearson Chi-Square statistic (5.529) with a significant value of 0.19 is below the alpha level (0.05) which suggests that there is evidence to prove that there is a significant relationship between the capital requirement fulfillment of the SME and the growth in sales. As a result we can reject the null Hypothesis 2.

#### *III. Level of education of the owner and growth in sales*

As might be expected, firms with educated owner-managers are more likely to grow presumably due to their knowledge in the strategies. The value of the Chi-Square statistic is 3.233. This indicates that this value is less than the tabulated value and thus, it is not significant. The significant value is 0.072 and it is higher than the alpha value (0.05). This indicates that there is no relationship between the level of education of the owner and the growth in sales. Therefore the hypothesized relationship (Hypothesis 3) is accepted.

#### *IV. Obtaining raw materials and growth in sales*

Somewhat surprisingly, it was found that there is no significant association between obtaining raw materials and growth in sales because the Pearson Chi-Square statistic is 0.134 and the significant value is 0.714 which is much higher than the alpha value (0.05). Hence the Hypothesis 4 is accepted.

#### *V. Age of the company and growth in sales*

The result of this survey suggests that there is no relationship between the age of the firm and the growth in sales as the Pearson Chi-Square statistic is 0.603 and the significant value is 0.438 which is higher than the alpha value (0.05). Therefore, null Hypothesis 5 is accepted. However, according to the literature review, more mature firms have a significant influence over the growth of sales of the firm.

#### *VI. Competition rivalry and growth in sales*

Hypothesis 6 states that "competition rivalry does not impact on the growth of sales". According to the Pearson Chi-Square, the variable is statistically not significant with a Chi-Square statistic of 0.010 with a significant value of 0.919 which is higher than the alpha value (0.05). Hence, Hypothesis 6 is accepted.

#### *VII. Years of experience as an entrepreneur and growth in sales*

The Pearson Chi-Square statistic is 0.719 and the significance value is 0.714 which is higher than the alpha value (0.05). Hence, Hypothesis 7 which indicates that there is no relationship between the experience of the entrepreneur and the growth in sales is accepted with a 95% confidence level, it can be concluded that the technology and financial constraints have a direct impact on the growth of sales whereas other factors such as the education level of

the owner, issues in obtaining raw materials, age of the company, competition rivalry and the experience as an entrepreneur do not have an impact on the growth in sales of the enterprise.

#### **Correlation analysis:-**

The correlation analysis is also used to recognize the possible relationships between the growth of SMEs and the identified independent variables. The results of the correlation analysis are as follows:

Considering the growth in sales and the required technology, the coefficient of correlation is 0.875. It shows that the two variables have a strong positive correlation with each other. The fulfillment of required amount of capital and the growth in sales have a correlation coefficient of 0.607. It indicates that the two variables have a positive correlation with each other. The coefficient of correlation between the level of education and the growth in sales is 0.464. The correlation between these two variables is a weak positive correlation. According to the correlation analysis, coefficient of correlation between the growth in sales and the raw materials is -0.094. It shows that these two variables have a weak negative correlation with each other. Similarly, the variables of growth in sales and the age of the company shows a weak negative correlation (-0.200). The two variables, growth in sales and competition rivalry confirms a weak positive correlation (0.026). The coefficient of correlation between the growth in sales and the years of experience as an entrepreneur is -0.094. This result implies that these two variables have a weak negative correlation but it is somewhat unrealistic.

#### **Case Studies:-**

##### **Case Study – I: *Diligent Products and Solutions*:-**

Mr. and Mrs. Fernando are not just partners in business, but in life too. The husband-wife duo operate a major business line called *Diligent Products and Solutions*. Being an MBA holder Mr. Fernando has been involved in many careers. However, he has always had a flair for drawing. He realized that he could convert this skill into a part-time profitable business by creating personally-designed furniture to suit for the international market. His wife was supportive of this decision and helped him to make his dream a reality.

For over a decade they have been able to successfully deliver their products to their loyal customers. In the earlier stages, the company was going through difficulties. However, later on, the duo were able to recover from this unfortunate situation and as a result, they are now one of the leading businesses in the industry. *Diligent Products and Solutions* has maintained a steady growth throughout the past years even though the owners have taken out a few loans with high interest rates.

However, the company's financial statements are not audited. Mr. Fernando says;

*“Because it's a family business and I, myself is involved in the business there is no point of auditing. Also, auditing leads to the compulsion to pay taxes such as VAT, etc. Hence, I don't audit my financial statements”.*

He believes that the reason for his success is the relationship he has with his workers. He finds it easy to find skilled workers due to this close relationship. He says;

*“Attitudes of the workers matter a lot”.*

Currently, he does not have new technology but he admits that he has all the required technology within the company. Furthermore, he has a website to promote his products and through that he has been able to expand the customer base. His major concern is about the raw materials. Timber is obtained from the Timber Cooperation. However, the quality of the timber is questionable. Further, he explains that at times due to the restrictions imposed by the government on the transportation of timber they have to bribe some of the dealers. Caster wheels and other equipment which are needed to develop the timber product have to be imported from agents. Consequently, there is a problem of obtaining raw materials when the company is in need and also result in high cost.

The company faces no competition as it depends only on contacts. Hence Mr. Fernando believes that the company can handle the capacity to meet the demand its own. When asked about the secret to their success he pointed out;

*“It is about making the right product available at the right time, as well as at the right place”.*

Over time, their business has evolved and expanded across other categories such as providing strategic business solutions to private companies.

**Case Study – II: ShelloCosmetics Company Private Limited:-**

Mr. Vipula Gunarathne, the owner of *Shello Cosmetics Private Limited* shared his success story with us. Being a graduate from the University of Kelaniya with experience in Australia regarding chemicals, he decided to get into the cosmetics industry. For more than a decade he has been successful in his business because of top quality products at a standard price and good presentation of the products. As he is well-educated, the financial statements of the company are audited.

The capital requirement for the company has been fulfilled by loans. The company has to allocate 10% from the monthly total income to settle down the loan interest and other capital requirements. He admits sometimes it takes up time to pay the due amount on time because it is difficult to collect money from the clients who bought goods on credit. Thereby he uses jewelry pawning, credit cards etc. to pay the due amount.

*Shello Cosmetics* has been able to acquire completely new technology during past few years which has paved the way for it to be a leading company in the industry. He says;

*“We have the required technology but we do not have knowledge in some areas, for instance, advertising. So we are looking forward to improving our knowledge in such areas”.*

The main problem the company faces is obtaining raw materials. Mr. Gunarathne says;

*“Sometimes we only need very small quantities of certain chemicals but we cannot import the exact quantity we need due to government regulations”.*

He further explained that due to the lack of advertising skills and poor market conditions, the company might be affected adversely in the future. However, currently the company is one of the leading cosmetics companies in Sri Lanka. It aims to grow further in the future.

**Conclusion:-**

The growth of Sri Lankan SMEs are closely associated with a number of factors. The present study revealed that some factors have adversely affected the growth of SMEs in Sri Lanka. Financial inadequacy is a factor which has significantly constrained the growth and expansion of the SME sector in Sri Lanka. The lack of access to new technology is another vital factor which has limited the growth and expansion of SMEs. However, access to new technology is directly linked to the availability of financial resources. Government regulations on imports and exports, particularly imposed duties and restrictions on certain raw materials also act as limitations on the growth and expansion of SMEs. This study also revealed that the level of education of the owner of the enterprise has a direct impact on the growth of SMEs. Moreover, this study revealed that the majority of Sri Lankan SMEs have little access to the international market and serve only the domestic market which in turn has had a negative impact on the expansion of SMEs.

North Aral Sea, SYNAS Project, recovery, environmental impact, social impact

#### *Abstract*

The Aral Sea was once the world's fourth largest inland body of water, but has been forever altered by the USSR irrigation policies to reclaim the desert for cotton farming by rerouting the Amu Darya and Syr Darya rivers. The lake shrunk to a quarter of its original size in a few decades, creating an environmental and public health disaster. However, the completion of the Kok-Aral dam in 2005 (the first phase project) has yielded some positive results in recovery of the Northern Aral Sea recently. Local economies, long dependent on the water, were making a comeback. The second phase recovery project began in late 2012. The city of Aralsk has suffered most from a receding Aral Sea. The construction of a dam to raise the water to 46 m level in Saryshiganak bay will alleviate this problem. Environmental and social impacts of the second phase recovery project have been studied in this work, and the results have showed that further recovery of fish population, biodiversity, aquacultures, wildlife, fishery industry and local climate is expected after its completion. Implementation of this project will result in the increase of the total area of the Small Aral Sea, and as a result, increase the volume of water lost by evaporation from its surface to equalize the gain and loss parts of the water balance, stabilizing salinity. This will stop further freshening of the sea and associated adverse changes in its fauna.

#### **Introduction:-**

The intensive use of the Syrdarya water resources resulted, that the Aral Sea between 1960 and 2012 lost 85 % of its area and 92 % of its volume.

The consequences of the crisis: as a result of directional falling levels of the Aral Sea since 1987, the pond was divided into two independent areas: the northern (Small) and southern (Big) Aral sea. More than 48 000 km<sup>2</sup> of the former sea bottom completely dried up (figure 1, table 1) (Micklin, 2003). Ecosystems of the Delta of the Syrdarya river transformed and degraded (Ogar, 2006).

Address:- UN – Tongji Institute of Environment for Sustainable Development, Tongji university, Shanghai 200092, China.

**Table 1:-** Shallowing and increasing salinity of the Aral Sea.

The parameters of the Aral Sea	
for 1960:	for 2014 (North Aral Sea):
Area– 68 000 km <sup>2</sup>	Area – 8 300 km <sup>2</sup>
The volume– 1064 km <sup>3</sup>	The Volume – 75 km <sup>3</sup>
Salinity – 10 ‰	Salinity – 79 ‰

**Shrinking of lake systems.** Monitoring observations with the use of remote sensing techniques and performance of instrumental observations allow to assess the real situation of the state of the deltaic lakes, including their water content: in 1967 the average water availability of lake systems were 339,2 km<sup>2</sup>, during extreme environmental situations in the Aral Sea area lake systems decreased from 306,2 km<sup>2</sup> (1981) to 245,0 km<sup>2</sup> (1989) (Budnikova, 2006; Dukravets, 1991).

**Degradation of soil and soil cover.** The main factor of soil cover degradation in the Kazakh part of the Aral Sea region and intensification of desertification processes is the regulation of the flow of the Syrdarya river. As a result, continuing the trend of reformation of water and salt regime in the delta natural complexes, increasing area of saline soils in irrigated areas, growing areas of new land within the former seafloor (Popov, 1984; Karajanov, 2004). The modern Delta of the Syr Darya river is characterized by heavy reclamation conditions, stagnant groundwater with a wide range of salinity (from 2 to 100 g/l), heavy mechanical composition of alluvial deposits (Kornienko, 1983). Periodic flooding of the wetland soils of present Delta contributes desalinization, but in a limited area (Demeeva, 2015). The main indicator of the tightening of environmental tensions in the Aral Sea region of Kazakhstan is a progressive growth of the saline soil areas within the Delta, and due to the desiccation of the former sea bottom (Karajanov, 2014) (figure 2).

**Figure 2:-** Secondary salinization of irrigated lands (Kazakh part of Aral Sea)

**Desertification.** The process of desertification in the Aral Sea, as in any other arid region, flows stadial. At the initial stage (60s and 70s) signs of desertification were evident, but poorly manifested, and the process was still potentially reversible. In the second stage (after the 80s) degradation of the natural resource potential of the region has become critical and the process of desertification is irreversible (Borovskiy, 1981; Akiyanova 2006).

**Changes in the bird population.** In the early 60s the Aral Sea was inhabited by over 300 species of birds (nesting – 173 span – 123, accidental types of - 23), by the beginning of 2000s the avifauna of Kazakhstan the Aral Sea has lost about 70 species (Berezovsky, 1982; Kovalenko, 2005).

**Changes in the fishery of the Aral Sea and reservoirs.** The Aral Sea was once the third largest fishery water body of the USSR. In 50s and 60s 40-50 thousand tons was extracted, in 1980 – not more than 2,5 thousand tons. Since 1988, the sea has lost its fishery value (Karimov, 1997; Balymbetov 2005). The commercial fishing industry that developed during the first half of the twentieth century ended in the early 1980s as the indigenous species providing the basis for the fishery disappeared owing to rising salinity and loss of shallow spawning and feeding areas. Tens-of-thousands were thrown out of work because of the loss of the fishery and associated activities and employment in these occupations today, although increasing because of the project to revitalize the Small (northern) Aral is still only a tiny fraction of what it was (Micklin, 2014).

In the frame of the inter-state co-operation of five Central Asian countries and “Program on the Aral Sea saving” in Kazakhstan a series of the measures, have been initiated, among which the «Syrdarya Control and the Northern Aral Sea» Project occupies a central focus. The phase 1 of the Project has already shown impressive results. The Kazakhstan Government is implementing the second phase project to restore the Small Aral Sea.

By the direct instructions of the President of Kazakhstan Nursultan Nazarbayev, one of the major projects initiated by the International Fund for Saving the Aral Sea (IFAS), is the project “The Syr Darya Control and North Aral Sea” (SYNAS-1) - the first phase (The project SYNAS-1, 2003-2010). The main idea of the President of the Republic of Kazakhstan N.Nazarbayev was to improve the environmental and socio-economic situation in the Northern part of the Aral Sea, where the main population of the Aral Sea region of Kazakhstan (Kipshakbayev, 2010).

To maintain the integrity of the Northern Aral Sea, the 13 km Kokaral Dike was constructed to separate the Northern Aral Sea from the South Aral Sea. Completion was in August 2005.

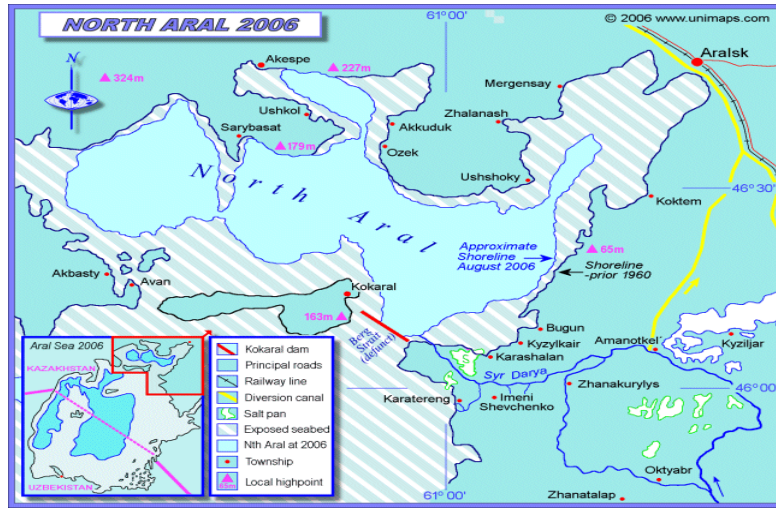

Figure 3:- The location of the Kokaral dam (Phase 1)

There have been several attempts to block the Small Aral Sea by a dam, so the water could not go away, but they were unsuccessful — the stormy waves of the lake destroyed the dam. The situation changed after the construction of Kokaral dike. In two years, the Small Aral Sea is almost completely filled with water, the sea got closer to Aralsk city, climate has changed dramatically for the better.

Table 2:- Changes of indicators of the North Aral Sea after the construction of Kokaral dike (Aladin, 2011)

Indicators	1970	1988	2003	2004	2007	2008	2009	2010	2011
The water level, m	53	40	30		42	42	42	42	42
The volume, km <sup>3</sup>	82			15,6				27,1	
The surface area, thousand km <sup>2</sup>	6,118		2,55			3,3			
Salinity, ‰	8-13	30		23	11-14		12	17	9

**Project Outcomes:-**

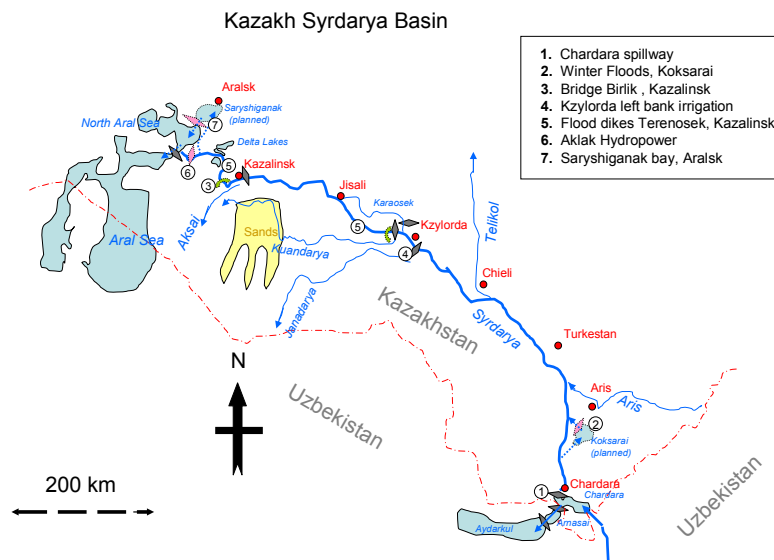

The Phase 1 Project has already shown impressive results:

- Eliminated the threat of extinction of the Northern part of the Aral sea;
- Raised the water level of the Small sea from 39.90 m BS to 42 m BS;
- Increased area of sea from 2414 to 3262 km<sup>2</sup>;
- Increased the volume of water in the Small sea from 15.6 to 27.1 km<sup>3</sup>;
- The Sea became closer to the city of Aralsk from 75 to 17 km;
- Reduced the level of mineralization of the Northern Aral sea from 23 to 17 g/l;
- Restored several lake basins in the area of 20-30 hectare, which gave the opportunity to further develop the fisheries activities;
- Created favorable conditions for reproduction of commercial and valuable species of fish (restored 13 species previously extinct, the volume of the catch increased from 0.4 to 5.0 thousand tons) (Water Feature Stories, 2008).

In 2005, during the visit of objects of SYNAS-1 by President N. Nazarbayev was given high evaluation and significance of technical installations of project, and was proposed to continue work on the stabilization and improvement of ecological and socio-economic situations in the Aral sea. The "The Syr Darya Control and North Aral Sea" (SYNAS-2) project is to continue the SYNAS 1 successful development of the Kazakh Syrdarya Basin in terms of improving living conditions for its inhabitants, improve safety, and to improve environmental conditions (The project «SYNAS-2»).

The proposed SYNAS-2 would be designed to improve further the environmental and economic conditions along the Syr Darya and the NAS. It would build on the work done under SYNAS-1. This would be achieved by focusing more on integrated water resources management in the basin, which would require a number of structural interventions and strengthening the institutional and management capacity for integrated water resources management in the basin.

**The aim of the SYNAS-2 project** is to increase the bandwidth of the lower part of Syr Darya, sustainable water supply and rehabilitation of the Delta lakes, as well as strengthening the capacity of the government in the field of river basin management that should be implemented in two stages. The first phase of the project, consists of 6 components, component names and places where they will be implemented activities are listed in figure 4.

**Figure 4:-** Map-scheme of location of the SYNAS 2

The Feasibility Study «Complex of structures in Saryshiganak bay» is part of the second stage of the "Northern Aral Sea" development. It foresees the flooding of the significant part of Saryshiganak bay and brings water back to the city of Aralsk, considerably improving the microclimate and ecological situation in the coastal area and in Aralsk. Creation of navigable access to the Northern Aral Sea allows to use partially the existing harbor, shipyard and fish processing industries, to organize commercial fish catch in the whole Northern Aral Sea, to create new working places, to improve social-economic level of the population.

**Site location:-**

Saryshiginak Bay is situated at the northern extremity of the Aral Sea between N 46 and 47 degrees and E 61 and 61 degrees 30. The dam will be constructed near the northern limit of the existing North Aral Sea, where the east and west banks are only separated by a short distance. The Bay will be supplied with water by means of a canal fed by an intake on the right bank of the Syrdarya river some 20 km upstream Aklak weir.

**Table 3:-** Description of the principal dimensions of new dike in Saryshiganak Bay

Principal dimensions	
length	10.7 km;
maximum height	8 to 9 m (to be confirmed by site survey);
crest level	48.4 m;
crest width	10 m;
downstream slope	1v:2h (with a 4 m wide berm at level 43.5 m);
fill volume	620,000m <sup>3</sup> .

**Objective of this paper:** to study the social and environmental impacts of the second phase “Syrdarya Control and Northern Aral Sea (SYNAS)” Project designed to elevate the water level in Saryshiginak Bay by filling the reservoir formed after construction of a new dam across the entrance to the Bay with the diverted water from Syrdarya River. This study will summarize some of the research findings made by scientists from different disciplines after completion of the Feasibility Study “Complex of Structures in Saryshiganak bay”.

**Research Methodology:-**

In the first step the appraisal of the proposed projects effects on the targeted communities was carried out as appraisal of various stakeholder categories *opinions and perceptions* as regards the projects socio-ecological effects. This type of participatory research was selected because it allows to:

1. forecast public support or opposition to decisions that will have been made on the projects,
2. refine public education strategy in the cases where misunderstanding and distortion of information as regards the proposed projects are detected, and
3. refine the projects at the feasibility study and implementation stages to better meet the affected stakeholders groups needs and reduce costs and potential temporary or permanent negative impact.

The analysis was carried out as a series of interviews with pre-determined categories of stakeholders. People were interviewed on the projects that

1. they have comprehensive technical knowledge of,
2. would affect their life and work conditions in an immediate way, or
3. are recurring discussion points at the political and social agenda locally and nationally.

A distinctive feature of this analysis was that the surveyed stakeholders’ collective or individual opinions were not ascribed weights that would have reflected respondents’ technical expertise, status in the hierarchy of authority either official or unofficial, income, education, or other socio-economic characteristics. All the obtained information constituted an array of arguments that were supportive or critical of every individual project from a socio-economic perspective. Only in the final analysis matrix weights were assigned to categories of socio-economic indicators.

**Socio-Economic and Ecological Analysis:-****SYNAS-II Project Social-Economic Appraisal Matrix:-**

One hundred six respondents were surveyed. All opinions expressed by the interviewed stakeholders were classified as either

- “Red”, i.e., arguments against a project in relation to a particular indicator,
- “Yellow”, i.e. arguments that delineate conditions under which a project may be supported, otherwise it should be rejected, or
- “Green”, i.e. arguments in support of a project.

Subsequently a number of distinct “green”, “yellow” and “red” arguments were counted per each indicator. Further weights of “green”, “yellow” and “red” arguments were calculated as a ratio of a number of arguments in each category to a total number of all arguments per individual indicator.

Obtained numbers for the safety indicator were multiplied by 2, while numbers for the political gain indicator were divided by 2. Numbers on the remaining indicators were not weighted. Total project rank was calculated as a sum of the all indicator numbers.

The projects that received only positive scores could be considered as most socially urgent and relevant. No controversy over their goals or proposed implementation schemes was elicited.

Goals of the projects that received a mix of positive and negative scores were not highly contested. However disagreement as regards their implementation and intended and unintended consequences were elicited. Further consultations, negotiations and public awareness activities may be needed.

Projects that received equal positive and negative or predominantly negative scores need revision, awareness raising campaign, lobbying, and new in-depth expert discussion.

The following opinions were collected and categorized according to five themes. The colours green, yellow and red indicate respectively recorded support, ambivalent opinion or opposition.

**Table 4:-** Socio-economic appraisal matrix

Indicator	People, livelihoods and agricultural lands safety	Enhancement of income generation opportunities	Ecological rehabilitation, creation, enhancement of human health	Revival of traditional habitats, emotional and moral renaissance	Impact on Kazakhstan's political and economic development prospects and its role in Central Asia
The complex of dam structures in the Saryshiganak bay, provision of water to Aralsk harbour	0 1 (106/106) 0  +1x2=2	0.8 (85/106) 0 0.2 (21/106)  +1	0.66 (70/106) 0 0.33 (36/106)  +1	0.66 (70/106) 0.33 (36/106) 0  +1	1 (106/106) 0 0  +1x0.5=0.5

**Comment:-**

$$2+1+1+1+0.5=+5.5$$

Overall, this project has an incontestable moral and political value both at the local and at the national and international level. Material gains for the affected population may also be significant.

**Results and Discussion.****Social impact of the project:-**

Filling up the Northern Aral Sea has become an integral part of the Aralsk district life. After the SYNAS-I people have believed that the once impossible task of the revival of the NAS may turn into real and feasible projects. Therefore no one opposed this idea and the line that the Aral Sea needs to be revived at all costs has become a guiding principle.

Major direct beneficiaries of this project will be people in the Aralsk District. First of all the environment will be affected in a positive way. Climate will get milder due to the replenishment of the Saryshiganak bay and this will positively impact people's health. There will be more rains and less dust storms. Environmental effect of the construction of the Saryshiganak bay dam, however, was perceived as arguable for the Kazalinsk district. The Small Sea will be replenishing while the Large Sea will further desiccate, while salt and sand winds blow from the dry bottom of the Large Sea. It is these winds that cause respiratory system diseases.

Material gains would be substantial. Turning Aralsk into a port would attract investments into the city. Second, replenishment of the NAS will lead to the increase in fish catch. This will stimulate fish factories revival in Aralsk. Processed fish will go up in price compared to raw fish.

The boat fleet will be revived to transport fish to Aralsk. Sea transport is a cheaper alternative to the transport by land. Jobs in the fish processing, fleet and fleet maintenance sectors will be created. A canal that would start before the river delta and become a shortcut between Syrdarya and the presently desiccated Saryshiganak bay has an added value as it presents the surrounding villages with a supplementary water reservoir as a pond for cattle and water

supply for melon cultivation. However those who live around the river mouth may not enjoy this revival to the same extent as the population of Aralsk itself and the surrounding villages.

Most benefits of the project in the opinion of the interviewed stakeholders concerned renaissance of the entire Aralsk district. Return of the sea and the subsequent improvement of the employment situation and investment climate would lighten the atmosphere in the city and empower people. Those who have never left the area regardless of the government's invitation to resettle would be morally satisfied. Those who have left Aralsk will be happy to return once jobs and other income generation opportunities present themselves should the replenishment of the NAS progress. Replenishment of the Aral Sea would reduce stress over the loss of the traditional habitat, social and economic decay and struggle for survival that have become a background for those who used to live off the sea.

Aral Sea is at the core of identity of people who've been living there for generations. Return of the sea would strengthen distinct collective identity and foster patriotism. Fame of Aral fishermen and fish factories will be restored. Professional cadre is still there, ready to work and train new specialists. Political gains are clear. Replenishment of the NAS is a test for the ability of the President to keep his promises.

Although no serious opposition to this project was expressed, there were voices that called for a more careful and less euphoric approach to this project. First, the dam construction is a high risk enterprise. Should the dam be washed away or destroyed there would be a catastrophic flood. Therefore careful calculations and perfect implementation are of key importance. Second, selection of the start of the channel into the Saryshiganak bay is vital because there is a danger that water from the lakes such as Tushibas would spill into this channel. An alternative is to reconstruct old natural channels that once connected the lakes with the sea.

As regards climate change sceptics say that the area of the Saryshiganak bay is not large enough to affect climate change.

Replenishment of the Saryshiganak bay would not make any difference for Kazalinsk rayon.

Overall, this project has an incontestable moral and political value both at the local and at the national and international level. Material gains for the affected population may also be significant.

#### **Ecological Section:-**

The project encompasses a cutoff dike of maximal 10.7 km length at Saryshiganak Bay with a maximum height of 9 m, an adduction canal of about 46 km length with a discharge capacity of 50 m<sup>3</sup>/s which would take off from the Tushibas Lake near Bugun village. Various water levels in the bay have been investigated between 45 m and 50 m. A complete restitution of the ancient Aral Sea water level in the bay of about 50 m will not be possible, as not enough gradient will be available from Syrdarya for the necessary transport length. While lower water level covers only part of the lake and the highest water level would almost reach Aralsk harbour, the costs for increasing the dam height becomes disproportional high, and vice versa, low water levels would increase disproportionately the access canal length and depth. A feasible compromise seems to be 46 m operational water level. The envisaged water level will require dredging to realize a navigable access to Aralsk harbour for ships up to a draft of 2 m.

**Figure 5:-** Saryshiganak project area with dam (orange), supply canal and access canal to Aralskharbour (blue) and flooded area (transparent) Remark: The flooded area was taken from an bathymetric map which was not entirely exact as the satellite image shows (Phase 2)

Inflow to Saryshiganak lake will be by diverting flows from the Syr darya, through Tushibas lake and via a 46 km canal to a discharge point at the east side of the lake. The project would bring the gulf back to the town of Aralsk the former main port and transshipment point at the northern end of the Aral Sea.

The reservoir created would have near fresh water salinities of 2–3 g/l. Locks would be installed at the dam allowing passage of fishing and cargo boats from the main part of the Small Aral to the gulf and vice versa. This would allow fishing vessels direct access to unload their catch at the newly rebuilt and quite modern fish processing plant in Aralsk.

As an alternative the increasing of the new Kokaral dike by 4 m to achieve a raise of the water level in the entire NAS up to 46 m was considered during the pre-feasibility study. This option would require significantly more water (more than the annual 3 km<sup>3</sup>) which is currently not sufficiently available from the Syr darya River which would cause long times for filling the entire NAS. However, a further increase in the level of the NAS to 46 m would require about USD 92 million investments in dike construction and additional considerable investments in upgrading of irrigation infrastructure along the Syr darya River in order to save more water to reach the NAS.

### **Environmental Impacts:-**

#### **(a) Impacts on the hydrology of the river system:-**

The water supply for the Saryshiganak Bay will be realized by withdrawal from the Syr darya River via Lake Tushibas and a canal of 45 km length and 50 m<sup>3</sup>/s discharge capacity from the northern edge of Lake Tushibas. The annual withdrawal for covering the losses due to evaporation, losses through the sluice and infiltration from the canal will be 0.556 km<sup>3</sup>. The impact on the Syr darya River system, by reduced runoff and – depending on the timing of withdrawal – changing of the flood dynamics concerns the river course downstream from the canal supplying the Lake Tushibas, in effect the last few kilometers. The water supply will be ensured by the Aklak weir (upstream water level at summer 53.5 m asl. During winter, the same operational level needs to be assured for feeding Saryshiganak bay and assuring sufficient head for hydropower production.

**Figure 6:-** Pictures of the North Aral Sea before (below) and after (top) construction of the Kokaral dam (April 2005 and April 2007 comparisons)

Images showing the recent flooding of already about 50% of the Saryshiganak Bay area to be rehabilitated under the project. Consequently, as project impact only evaporation losses from additional water surface should be calculated.

The impact on surface waters is not very significant for the Syrdarya River and the NAS. On the Lake Tushibas the impact concerns the maintenance of a maximum water level during the times of water supply to the bay. In what extent this will change the current hydrological conditions needs to be studied. It is positive for the Saryshiganak Bay, which will be revived as a water body of 593.6 km<sup>2</sup> with a volume of 1.76 km<sup>3</sup>. The construction of the Kok-Aral dike already caused the reestablishment of a water surface area of roughly estimated one half of the surface of the Saryshiganak Bay. Due to the withdrawal the annual inflow into the NAS and consequently into the Large Aral Sea (LAS) will be reduced by 0.23 km<sup>3</sup>, i.e. the evaporation losses from the additional water surface of the bay. The water released through the ship lock and infiltration water from the supply canal flow into the NAS. Against the backdrop of the highly negative water balance of the LAS of several km<sup>3</sup> per year, the reallocation of this water amount to a part of the Aral Sea - where its positive impact is considerable higher and sustainable – is acceptable.

In the vicinity of the re-established water body of the Saryshiganak Bay the ground water table will increase but remain below the level of the 1960s. Infiltration losses from the canal can cause local ground water table increase in the shore areas of the NAS.

#### **Impacts on water quality:-**

The project will have no impact on river water quality. During the construction period water pollution can occur from used machinery. This pollution has to be minimized by observing the required standards for machinery and transportation means. The pollution of the Syrdarya River water will be the determining factor for the water quality

in the Saryshiganak Bay. In contrast to the situation prior to the drying out when the Saryshiganak Bay was without freshwater inflow and thus belonged to the comparably saline areas it will now become a fresh water lake.

The flooding of the Saryshiganak Bay and the spillage of water through the sluice into the NAS from the north will improve the mixing of the NAS water of high salt content with fresh water from the Syrdarya. On the other hand, salt accumulation and toxic substances at the dry seabed in the bay will become dissolved and moved into the NAS. The proximity of the city of Aralsk to the re-established bay, the operation of the rehabilitated harbour and an increase of ship traffic can cause pollution of the Aral Sea by domestic and industrial sewage.

Desalinization of the Saryshiganak bay water will be achieved fairly rapidly. It should be mentioned, that during the drying out process, no residual salt pans accumulated in the bay, but that the waters retired towards the main body of the NAS, without leaving excessive salt incrustations. The relation between a high volume (1.76 km<sup>3</sup>) of fresh water (max 1.8 g/l salt) brought to the bay and the comparatively small amount of salts accumulated in the Solonchak layers (max 5 % within a depth of 0.5 m on a surface of 594 km<sup>2</sup>) on the dried out lake bottom will create and maintain a lake, whose salinity will be about 10 g/l, a concentration which is lower than in the NAS and which will gradually decrease with the yearly water exchange. This will impact positively on the distribution of commercially higher priced sweet water fish species.

At present the high salinity of the ground water in most wells of the NAS area limits its utilization as drinking water. The unknown patterns of ground water salinity and their relation to the Aral Sea level make a prediction of impacts on well drinking water difficult. A deterioration of ground water quantity and quality in the context of the drying of the sea is reported from the villages in the proximity of the former shoreline. Thus the rehabilitation of the water body will most likely have a positive impact.

#### **Impacts on atmospheric air :-**

From the rehabilitation of the water body a positive impact on the local climate in the vicinity is expected. This concerns higher air humidity and a less continental temperature regime. The dry Aral seabed, in particular in the Saryshiganak bay is considered being the major denudation source of frequent salt dust and sand storms in Aralsk and the region. The flooding of a considerable area, including the most critical substrates with high salt content should lead to a mitigation of these problems.

#### **Impact on soils:-**

The impact on soils includes flooding of dry seabed, which is considered positive. The areas of former seabed, which will remain open are mostly sand substrates which are well covered by vegetation. Further impacts on soils are the effects of construction of canal, dam and access road, including opening of borrow pits. The source of material for dam construction has been identified directly to the east of the damsite. Impacts should be minimized by restricting the area and mitigated by allowing a re-cultivation or a protected self-regeneration of borrow pits. The utilization of the excavated material from the canal for construction of the dam should be considered. The canal would be along the former seashore in largely sandy substrates. This can cause problems with infiltration losses.

**Impacts on biodiversity:-**

The project will have the major effect of restoring in a large extent of the former landscape before drying out of the bay. Significant areas of dry seabed will however remain as the water level will be still 4 m below the level of the 1960s. The impact of the construction of the dam and the supply canal will be local by character. When constructing the canal the material could likely be used for dam construction and thus the creation of dams along the canal be avoided.

The restoration of the Saryshiganak Bay will cause the flooding of vegetation established since the drying out. This vegetation consists of typical representatives of the psammophilous desert vegetation and in the lower parts of salt tolerating plants. In the area of canal and road construction and at the borrow pits for the dam construction the natural vegetation will locally be destroyed. The affected areas are not significant (few hundred hectares). The restoration of the lake ecosystem in the bay is considered positive impact by far outweighing the loss of secondary desert vegetation on the dry seabed and comparable small sections of desert vegetation outside. Among the fish, economically more attractive fresh water species will prevail. However it should be recognized that the flooding via a canal will cause conditions, which are in terms of water chemistry, significantly different from the former brackish water and the new developing ecosystems will thus differ from the previous ones.

During the detailed design studies, analysis should be done on how to populate the Saryshiganak bay fastest with fish. The present owners of fishery rights in Tushibas lake might prevent the most obvious path, directly by canal inflow from the fingerlings released from Tastak and Koszhar hatcheries on Syrdarya. For fish population and fish migration it would be important to have at least a temporary passage allowed. This can be achieved for instance by electric fish repellent structures at the Tushibas canal intake. Although not as effectively, fish could also travel via the locks and to a lesser extent via the bottom outlet in and out of the Saryshiganak bay. Initial fish population could also be realized by transport of fingerling by tanker trucks to the lake sites.

The Saryshiganak Bay is a part of the proposed Important Bird Area "Small Aral Sea". The most important species are water related birds as e.g. White and Dalmatian pelican and ferruginous duck. Those species may profit from the increase of the lake. However the raising of the water level can as well adversely affect waterfowl species because of changes of the water chemistry impacting on the fodder basis and distribution as well as extent of shallow areas with loamy substrates. The water body of the Saryshiganak Bay will in most areas reach the sites with steeper slopes and sand soils with higher vegetation. This will significantly reduce shallow water and salt marsh areas. Species breeding in areas with shallow waters or on flat places with sparse vegetation as diverse waders, among them the endangered steppe pratincole, white-tailed plover, Kentish plover or lark species, including the rare Asian short toed lark may lose breeding sites. The loss of shallow water areas will likely as well affect numerous migratory birds resting there. The construction of the Berg Strait dike and the raising level of the NAS already caused the loss of extensive feeding and resting areas in the region of the Syrdarya Estuary. The impact of the raising NAS level has been documented in the final monitoring report of Scott Wilson (2007). Unfortunately the Saryshiganak Bay was not included in the monitoring sites of Scott Wilson and the data basis on birds in this specific area is scarce.

The project has a positive impact on the ichthyofauna by increasing the fish habitats and reducing the salinity in sections of the NAS as described above. At the moment it cannot be predicted if the fish fauna of the area would be rehabilitated by immigration via the supply canal or if a fish ladder at the dam should be considered. The fish ladder could be combined with a spillway for release of fresh water into the NAS.

**Table 5:-** Future fish catch in the NAS and Saryshiganak bay

Location	Surface km <sup>2</sup>	Quantity of fish caught (t)						Gross margin (1000US\$)					
		Years						Years					
		1	2	3	4	5	6	1	2	3	4	5	6

NAS fish catch forecast corrected	3164	1910.00	3633.00	5356.00	7079.00	8802.00	10525.00	637.00	1211.63	1786.27	2360.90	2935.54	3510.17
Saryshiganak Bay	594	350.00	1930.00	3510.00	5090.00	6670.00	8250.00	139.54	769.47	1399.39	2029.32	2659.25	3289.17
<b>Total</b>	<b>3758</b>	<b>2260.00</b>	<b>5563.00</b>	<b>8866.00</b>	<b>12169.00</b>	<b>15472.00</b>	<b>18775.00</b>	<b>776.54</b>	<b>1981.10</b>	<b>3185.66</b>	<b>4390.22</b>	<b>5594.78</b>	<b>6799.34</b>

Gross margin per ton of fish US \$/t

NAS: 333.51

Saryshiganak: 398.69

Scientists estimates that creation of a large fresh water reservoir in the bay will create additional fishing grounds and the accelerated desalination will increase the productivity of valuable fish species of low salt tolerance in the NAS. This will outweigh the further reduction of flounder catches caused by the reduced salinity.

The benefits of construction are calculated based on the expected growth of fish catch in the Sea and Saryshiganak bay as well as on the expected improvement of population health at the territories adjacent to the Sea.

- Growth of fish catches in Saryshiganak bay will be based on a growth from 350 tons to 8250 tons per year within six years, assuming a gross margin per tonne of qualitatively more valuable fish of US \$ 399.
- Growth in Northern Aral Sea will be based on a growth from 1910 tons to 10 525 tons within six years, assuming a gross margin per tonne of fish of US \$ 333.

Despite of some predictable negative impacts on the current biodiversity at the dry seabed the overall impact of the restoration of parts of the former sea area is considered overly positive. The development of new biocenoses will start immediately with the restoration of the water body. The impact on biodiversity needs to be further studied in the frame of the detailed design study.

#### **Impacts on human environment:-**

The expected reduction of salt dust in the air and potential improvement of the quality of ground water used as drinking water in villages close to the sea will have a considerable positive impact on human health. The restoration of a water body in the bay dry for decades will have a positive mental effect on the local population.

**Worst case scenario:-**

The worst case scenario would be the failure of the dam similarly to the previous Kok-Aral dike. This has to be prevented by an appropriate construction design and execution. The volumes to be released from Saryshiganak bay would be absorbed by the NAS and the existing NAS dam spillway. In the worst case, in which the water level of the NAS would rise to an unacceptable level, the earth fuse plug in the NAS dike will fail and release the water without further damage to human lives or property to the Main Aral Sea. The upstream slope must be protected from erosion by wave attack. With a maximum fetch of 40 km and a design sustained wind speed of 30 m/s (equivalent to the 1 in 1000 year event), it is estimated that the average height of the resultant waves could be 1 m and the 1 in 100 wave would be 2.1 m. To sustain the force of such waves the mean stone diameter should be 0.7m. Further it is crucial for the stone protection to be bedded on coarse highly permeable gravel of a suitable grading overlying a sand filter material. The downstream slope will be protected, where it is vulnerable to wave attack from the NAS, by the coarse material of the downstream cofferdam. A spillway of 45 m<sup>3</sup>/s capacity is required to ensure the embankment cannot be overtopped.

**Conclusion about the environmental impact:-**

The project has positive impacts in terms of hydrology, air, landscapes and human environment. The evaluation of impacts on biodiversity requires further assessment. So far positive as well as negative aspects are expected, with the positive aspects likely dominating. No clearly negative environmental impacts have been identified.

**General Conclusion:-**

An important contribution to redress the economic and ecologic effects of the drying out of the Aral Sea has been the SYNAS I building of the North Aral Sea dike and the achievement of an operational water level of 42 m. A further step taken by SYNAS II is the raising of the water level to 46 in Saryshiganak bay, so that fishery can again reach Aralsk city, albeit with the help of a dredged canal. The measure will be achieved by a dam of 10.3 km length and an adduction canal of 46 km length from Syrdarya through Tushibas lake.

The creation of a lake in Saryshiganak bay at a working level of 46 m to bring back water to the city of Aralsk is an object of highest national priority. Great hopes have been placed on the World Bank financed activities of the SYNAS projects to improve living conditions in the declared zone of environmental and economic disaster. The closing of the Kokaral dike (Phase 1) and the raising of the water level to 42 has shown the effectiveness of this initial measure. The next step (Phase 2) the raising of the water level to 46 m is universally expected and acclaimed. Great benefits in terms of fishery catch and transport improvement, boatbuilding, fish processing and the subsequent creation of business and job opportunities will provide a great impetus to the economic revival of the region. Other positive effects are related to improvement of environmental conditions and health. The improvement achieved comes at the cost of a high investment in 46 km of canal in ground material, which may make lining necessary, the dam of 10.3 km length and additional hydraulic infrastructure. In common economic terms, taking account of only tangible or monetary benefits, the project only provides an unsatisfactory return to capital investment.

Still, taking account of the many intangible and not valued benefits, the realization of project can be recommended without restriction as an important state-borne infrastructural measure.

#### Abstract

In the present work, our investigation is to study the optical and thermal properties of the binary mixture of nematic and cholesteric compounds namely, 2-cyanonaphthalen-6-yl 4-(3, 7-dimethyloctyloxy)-benzoate (CNDOB) and cholesteryl nononate (CN), which exhibits different liquid crystalline phases of Cho-SmA-SmC-SmC\*-SmE phases and it is obtained sequentially when the specimen is cooled from isotropic phase. These phases have been characterized by using X-ray and optical texture studies. The temperature variation of electrical conductivity and helical pitch of the cholesteric phase has been discussed.

#### Introduction:-

Liquid Crystals are a state of matter that is intermediate between the crystalline solid and amorphous liquid. Liquid crystals are flow like ordinary liquids and also exhibit anisotropy in their optical, electrical, magnetic properties like crystals. They are also called as mesophases because of their intermediate nature. Liquid crystalline materials are broadly classified as thermotropics and lyotropics. In thermotropics, the phase transition is mainly controlled by temperature: whereas in lyotropics, apart from temperature: phase transitions are controlled by the concentrations of molecules. On the basis of molecular arrangement, thermotropics are further classified into three main types namely, nematic, smectic and cholesteric. Nematics are characterized by orientational order while smectics have an additional positional order. Cholesterics are similar to nematics but, chiral in structure.

The cholesteric phase is regarded as twisted nematic wherein the molecules are orientationally ordered, but at the same time they are rotationally disordered with respect to long axis [1-3]. It is well known that, if a small percentage of cholesteric liquid crystals added to nematic, it results in the helical direction and pitch of the phase increases. When the pitch is comparable to wavelength of light the phase become iridescent because of the selective reflections of light. The recent studies on the mixture of cholesteric and nematic liquid crystals reveals that the mixture exhibits frustrated blue phase, twisted grain boundary phase, tilted phase, cholesteric phase and quasi crystalline phase[4-6]. Because of the tremendous potentialities of the liquid crystals in the field of display device technology, we have proposed the studies on the optical and thermal properties of mixture of cholesteric and nematic liquid crystals. Optical, thermal and X-ray studies have been carried out to understand the intermolecular interactions and the name of the induced smectic phases exhibited by the mixture.

**Experimental section:-**

In the present investigation, we have been considered the binary mixture of liquid crystalline materials, namely: cholesteryl nononate (CN) and 2-cyanonaphthalen-6-yl 4-(3,7-dimethyloctyloxy)-benzoate (CNDOB). The chemicals are purified twice with benzene. Mixtures of twenty different concentrations of CN in CNDOB were prepared and were mixed thoroughly. These mixtures of various concentrations of CN in CNDOB were kept in desiccators for a long time. The samples were subjected to several cycles of heating, stirring and centrifuging to ensure homogeneity. The phase transition temperatures of these concentrations were measured with the help of Leitz-polarizing microscope in conjunction with a hot stage. The samples were sandwiched between the slide and cover slip and were sealed for microscopic observations. The X-ray broadening peaks were obtained at different temperatures using JEOL diffractometer. The density and refractive indices in the optical region are determined at different temperatures by employing the techniques described by the earlier investigators [7, 8]. Electrical-conductivity measurements of the mixture at different temperatures were carried out using digital LCR meter and a proportional temperature control unit.

**Results and Discussions:-****Phase Diagram:-**

The partial phase diagram of given molecules is a very important method to determine the stability of liquid crystalline phase at different temperatures for different concentrations. The partial phase diagram in the present case is as shown in Figure 1. This clearly illustrates that, the mixtures with concentrations ranging from 5% to 85% of CN in CNDOB exhibit Cholesteric SmA, SmC, SmC\* and SmE phases sequentially when the specimen is cooled from its isotropic melt. But the mixtures with concentrations ranging from 10% to 65% of CN in CNDOB show only SmC\* phase in addition to the above phases respectively at different temperatures. [9].

**Optical Texture Studies:-**

For the purpose of optical texture studies, the sample was sandwiched between the slide and cover glass and then the optical textures were observed using Leitz-polarizing microscope in conjunction with hot stage. The concentrations ranging from 10% to 65% of the given mixture are slowly cooled from its isotropic melt. The genesis of nucleation starts in the form of small bubbles and slowly grow radially, which form a spherulitic texture of cholesteric phase with large values of pitch and texture is as shown in Figure 2(a) [10-12] at temperature 94 °C. On further cooling the specimen, the cholesteric phase slowly changes over to focal conic fan shaped texture, which is the characteristics of SmA phase and is as shown in Figure 2(b) at temperature 80 °C. On further cooling the specimen, SmA phase changes over to schlieren texture of SmC phase, which is as shown in Figure 2(c) at temperature 65 °C. The SmC phase is not stable and then changes over to SmC\* phase, which exhibits radial fringes on the fans of focal conic textures, which is characteristic of chiral SmC\* phase. Further cooling the specimen, the chiral SmC\* phase changes over to the crystalline SmE phase, which remains up to room temperature and then it, becomes crystalline phase.

**Conductivity Measurements:-**

Electrical-conductivity measurements help in getting better idea on the phase behavior with temperature. An abrupt increase or decrease of electrical-conductivity with temperature relates to the phase behavior of the lyotropic and thermotropic systems [13]. The temperature variation of electrical-conductivity for the sample of 40% CN in CNDOB is shown in Figure 3. The changes were observed in electrical-conductivity, the values correspond to liquid crystalline phase transition of thermotropic and lyotropic systems, respectively, at different temperatures and they were also identified by optical texture studies. It was observed that, the electrical-conductivity shows changes as we move from 96.5°C→90.5°C, 90.5°C→70°C, 70°C→60°C, and 60°C→51°C, 51°C→48°C which correspond to phase transitions Ch→SmA, SmA→SmC, SmC→SmC\*, SmC\*→SmE and SmE→Cryst phases respectively. This type of behavior is generally observed in hexagonal, cubic and lamellar phases of lyotropic and thermotropic systems [14, 15]. These abrupt changes cannot be throughout if only due to change in the orientation of molecules. They can be attributed to changes in the dimension of disk along with changes in orientation.

**Helical Pitch Measurements In Smectic And Cholesteryl Layers:-**

The helical pitch measurements were performed on the cholesteric phase following the well-known Grandjean–Cano wedge method [16, 17]. The given mixture was taken in a wedge-shaped cell treated for homogeneous alignment. The two glass plates formed a small angle at the wedge. The mixture was cooled slowly (0.2°C min<sup>-1</sup>) from isotropic cholesteric to smectic phase, which induces an array of equidistant Grandjean–Cano lines. The pitch of cholesteric phase was determined by measuring the distance between the Grandjean–Cano lines as a function of temperature. As the temperature was lowered the mesophase changes from cholesteric to smectic phase and the

spacing between the lines are increased, indicating that the pitch in the cholesteric phase is also increasing. The temperature variation of pitch for the mixture of 40% CN in CNDOB is shown in Figure 4. From this figure, it is evident that, the variation of pitch from cholesteric to smectic phase is smooth and continuous. But gradually, the value of pitch increases from 0.17 to 0.19 mm upon cooling the sample from cholesteric to smectic phase. The value of the pitch increases steeply and reaches a maximum of 0.34 mm at the cholesteric to smectic phase transition. In this study, we have noticed that, the sequence is Iso→Cho→SmA→SmC→SmC\*→SmE on cooling. Most of the data about the helical pitch are available in literature [18]. The pitch is continuous at the cho→smectic transition in spite of a rather energetic transition. It increases on cooling to smectic phase and diverges on approaching the SmA, SmC, SmC\* and SmE phases. This divergence is related to the second order nature of the transition. It exhibits a steep decrease, close to cholesteric phase which is usually the characteristics of second-order SmA, SmC, SmC\* and SmE phase transitions.

### X-Ray Studies:-

To understand the change in layer spacings in SmA and SmC phases with respect to temperature, X-ray diffractometer traces were taken. The traces obtained for the mixture of 40% CN in CNDOB at different temperatures correspond to SmA and SmC phases. It is observed that as the temperature increases the layer spacing also increases in SmC phase. But in SmA phase the layer spacing's are almost constant. These variations are as shown in Figure 5 [15, 16].

Figure 4:- The temperature variations of pitch for the mixture of 40% CN in CNDOB.

Figure 5:-Variation of layer spacing with temperature for the sample of 40% CN in CNDOB.

### Conclusions:-

In light of the above results, we have drawn the following conclusions. The binary system of given mixture exhibits an unusual sequence of phases showing the formation of cholesteric, SmA, SmC, SmC\* and SmE phases in different concentrations of CN in CNDOB. The phase behavior is discussed with the help of phase diagram. The X-ray results also lend support to the above observations. Changes in the values of electrical conductivity with temperature suggest that the size of aggregated molecules goes on increasing and the electrical conductivity is also increasing, while the mixture is cooled from the isotropic phase. The pitch of cholesteric phase is continuously increasing at the transition from cholesteric to smectic phase transition. But, it is very interesting to see that it increases on cooling to smectic phase, which evidently diverges on approaching the SmA, SmC, SmC\* and SmE phases respectively at different temperatures.

#### Abstract

A data features selection and organization scheme is presented for future event predictions using historical event data. Most of the reported event prediction methods use data features in the form of time series. The proposed approach uses simple data feature statistics. First an event is defined based on historical event data features for all discrete time instances, then all events are ordered chronologically and divided into N time- windows with an overlapping interval. The probabilities (relative frequencies) for occurrence of all sequences of two events are calculated for each time-window and stored in a 3D input feature matrix. A prediction technique is trained using probabilities from one time-window to learn to predict probabilities for the next time-window. Once the prediction technique is iteratively trained for all N time-windows of the training data, it is used to predict future probabilities. The accuracy is calculated by comparing with the known test data probabilities. The proposed approach is tested for fault prediction in telecommunication networks using various Artificial Intelligence Techniques.

#### Introduction:-

This paper presents a scheme of feature selection and organization of historical event data, useful for future event predictions. The future event is a personal event in the life of a person or nation or trend in economic markets or climate [1]. The accuracy of the prediction depends on the quality and amount of historical event data available and if some kind of correlation is present in the data. The main premise of this paper is that good prediction accuracy depends on finding good patterns in historical event data and good patterns are better found when proper event data features are selected and properly organized. Therefore the same historical event data can be organized and looked at differently resulting in different prediction accuracies [2].

The first step is to select problem domain specific data features that uniquely define distinct events. These unique events are chronologically organized into overlapping time- windows with each time-window representing a state of the historical event data within the bounds of the time-window. The probabilities (relative frequencies) of occurrence of all possible sequences of two events within each time-window are calculated and stored in a three dimensional (3D) feature input

Matrix such that two dimension (time-window) contains probability of occurrence of sequence of events and the third dimension is chronological organization of time-windows. Therefore probabilities within a time-window

**Corresponding Author:- Farrukh Arslan**

Address:- Distributed Multimedia Systems Lab, Department of Electrical and Computer Engineering, School of Engineering, Purdue University, West Lafayette, IN, 47907, USA.

represent local event correlations and changes from window to window represent global event correlations. Please note that we use the term probability for relative frequency.

The historical event data used, for this paper, is the historical alarm log of a telecommunication system. The historical alarm log is first preprocessed to remove duplicates and insignificant alarms. Then based on alarm properties, unique events are identified and the probabilities of occurrence of all possible sequences of two events are calculated per overlapping time-window and stored in a 3D matrix. The 3D matrix is used as input to train a prediction technique, so that the prediction technique learn to produce probabilities of occurrences of all sequences of 2 events for the next window for any given window in the training set. The trained prediction technique is used to predict the probabilities of all event sequences for a future window. The set of predicted probabilities in the future time-window are compared with a set of pre-calculated probabilities of the test data to calculate prediction accuracies. False positives and negatives are considered for the calculation of these accuracies. The proposed approach of using the 3D matrix is unique, novel and is a simple method that provides accurate future fault predictions. The prediction results of 4 prediction techniques: Artificial Neural Network (ANN), Support Vector Machine (SVM), Kalman Filter (KF) and Hidden Markov Model (HMM). Please note that although the problem domain discussed contains fault events in telecommunication systems, the proposed 3D input feature matrix can be calculated for any problem domain and discussion presented is applicable to historical event data from any problem domain.

The rest of the paper is organized in 4 sections: The first covers some reported prediction techniques relevant to this paper, the second describes the proposed 3D matrix, the third presents prediction results for the 4 prediction techniques and the last section is the conclusion.

#### **Event Prediction Techniques:-**

Here some event prediction works are discussed. One such technique is used to predict traffic while also incorporating weather parameters [3]. Stationary Wavelet Transform (SWT) is used in conjunction with ANN. SWT is used to separate out approximation and details components from traffic and precipitation time series data. ANN is used to predict these components and then recombined using an inverse SWT. This SWT-ANN model is applied on real traffic and weather data for better accuracy than ANN alone, due to the feature processing of the data by the SWT.

Another technique predicts rain rates, to alleviate wireless signal attenuation, using conditional Gaussian Distribution of rain rate [4]. The historical data consists of rain rate and rain attenuation measurements with samples taken per second. Conditional occurrences of rain rate values are modeled, in a time series, using a Gaussian Distribution. The data (rain rate) at one instance is conditional on data (rain rate) in the previous instant. This model is successfully used to predict rain rates in 2008 from data of 2005-2007.

A multivariate reconstructed phase space (MRPS) is proposed to extend the univariate reconstructed phase space [5]. The premise is that multivariate data sequences are better than univariate data sequences for finding temporal patterns in dynamic data. The argument is that dynamic data contains sequences that are anomalously generated by hidden states and a univariate method will miss out on local trends and shifts. A real life application, of this method, is to detect causes of sludge bulking treatment plants.

Another application is to predict blood glucose concentration using meal information in addition to regular glucose readings [6]. Although the history of glucose concentration values can predict future glucose levels, the glucose levels also depend on food and medicine intake and physical exercise intensity. Therefore capturing of relations between glucose levels and meal intake, in a time series, can provide better predictions of future glucose levels. An ANN model predicts sum of 2 values, one is glucose prediction by a linear predictor and second is estimation of error in the first prediction. The error estimation is done on the basis of current prediction error, trend of prediction error, actual glucose measurement, glycemic trend and carbohydrate intake. The addition of food intake data has made glucose prediction much more accurate especially after and before a meal.

The work described in [7] is closer to our problem domain anomaly (fault) detection in operational networks such as customer care logs, system events, network alarms etc. All of these contain a lot of information about system health and performance. A time series prediction is an ideal choice for detection of anomalies in the system in operation. In the reported Tiresias system, heavy hitters (faults) are detected in real time using data hierarchy

present in operational logs. The dataset used is acquired from a broadband provider and consists of customer care logs and Setup box crash event logs. The input time series contains classification information and date-time stamp of a particular dataset. The classification is done using a hierarchical tree where nodes identify dataset weight of a category and time unit in which that data has been recorded. A sliding window concept is used to partition the data in time units. Arrival of new data adds more windows and older windows may be deleted to keep data from increasing too much. A separate seasonal analysis is done, using Fourier Transform and Wavelet Transform, to automatically choose seasonal parameters. The seasonal forecasting is done using Holt-Winters forecasting model.

The approach described by C. Xu et. al. is similar to the proposed approach [8]. Event sequence semantics are used in a Support Vector Regression (SVR) based predictive model. A semantic vector is defined that contains factors that affect the probability of occurrence of an event and weights for these factors. The time wise ordered events are partitioned in to Basic Windows (BWs) with interval T between BWs. For each BW, a standardized semantic vector is formed based on the sequence of events in BW and factors affecting the sequence of events. Now this se-mantic vector is used in the predictive model rather than the events. A hierarchical clustering algorithm is presented that uses a "Confidence" calculation (a measure of likelihood of one event following another event) instead of probability of occurrence of one event after another. The hierarchical clustering algorithm groups semantic vectors of similar semantics such that center of each group replaces all original semantic vectors and the frequency of the center is the total frequencies of all se-mantic vectors in the group. An event data dependent similarity threshold values decide number of groups. Furthermore a measure of "semantic distance" between event sequences is defined for the clustering algorithm. Different number and size of groups are formed using the similarity threshold and the semantic distance. A SVR based predictive model is built using the groups formed by the clustering algorithm. Experimental results are presented to show the general capability to predict events. A few papers are related to the domain of fault prediction using various prediction techniques [9] [10]. Here one approach uses hybrid fuzzy systems for stock price predictions [11].

The research covered above is a small sample of various novel and unique techniques reported for event prediction. As with the above event prediction techniques, most of the reported techniques use highly complicated algorithms and data processing techniques. Although various ways are suggested on how to augment the historical dataset to improve prediction accuracy, a significant effort is needed in order to evaluate the benefits of proper data organization and features. The work presented in this current paper suggests a simpler way of event data feature calculation and organization, for high prediction accuracies.

### **The Proposed 3d Data Feature Matrix:-**

In current event prediction techniques, the historical event data is considered in terms of one or more time series with data points at a certain time as one event e.g. weather or stock prices and other related factors on a particular day. Alternatively, rather than using time series, it is proposed to use some simple statistics available in the historical event data for future event prediction. For example, instead of using univariate (e.g. the price of a single stock) or multivariate time series (e.g. number of related and unrelated stock prices along with other relevant associated parameters), one can also define some unique state of the stocks as an event and then calculate the proposed feature input matrix. Another example is that of predicting the spread of a contagious disease by defining a unique event using number of affected patients and other information about the patients i.e. relationships between patients and demographics. Therefore it is proposed that a prediction technique may provide better prediction accuracies if first an appropriate event, based on data features, is defined and then event based statistics are used. In the predictive model, first find local patterns in the parameters of each event based on overlapping time-windows and then use a prediction technique (e.g. ANN) to learn how these parameters change from time- window to time-window. For every historical datum, an appropriate (optimal) time-window and overlap interval size can be found that best captures these local and global trends thus increasing the accuracy of the prediction technique.

The proposed input feature matrix is used to predict future impending faults in a telecommunication system using historical alarm log. Alarm management is an essential part of the FCAPS of the Telecommunication Management Network (TMN) standard and all telecommunication networks provide alarms management in one form or other [12]. These alarms are reported by the network constituent network elements and contain system health information in chronological order. For this paper, historical logs of three months of alarms from a telecommunication company are used. These alarms have been collected by an element management system

from the transmission unit of an operational telecommunication network. Here some definitions are in order:

1. Feature (or Parameter): is a unique property of an alarm e.g. equipment, severity
2. Unique Event (UE): is a unique combination of alarm features (parameters) e.g. equipment type, severity, slot and rack no. It should be noted that a UE is not necessarily an alarm of the telecommunication system.
3. Sequence of Unique Events (SUE): is a consecutive occurrence of two UEs. For example one UE A followed by another UE B in time. A and B can be same or different.
4. Probability of Occurrence of a SUE (POS): is the probability of occurrence of a SUE. POS is basically number of occurrences of an SUE divided by total number of SUEs
5. Time-window (TW): is a partition of historical event data by a time interval. A TW is defined by date-time bounds and may contain *m* SUEs. For example a TW of one month can be from April 1, 2014:00:00 to April 30, 2014:00:00 and contains *SUE1, SUE2, ..., SUE*
6. Overlapping Interval (OI): is the overlapping between TWs. There will be *N* TWs where *N* depends on the size of TW and OI. TW is a multiple of OI, therefore  $TW = OI$  means no overlap between TWs and  $TW = 2 * OI$  means 50% overlap
7. Input Feature Matrix (IFM): is a three dimensional matrix containing *N* TWs. IFM is used as an input to a prediction technique e.g. ANN.  $IFM = \{TW_1, TW_2, \dots, TW_N\}$
8. Training Data: is the portion of historical event data used for training of a prediction technique
9. Test Data: is the portion of historical event data used for calculation of false and true positives in prediction accuracies.

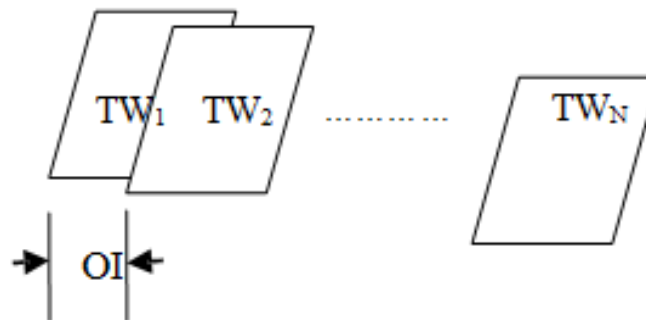

Fig. 1:- N Time-windows (TW) with Overlapping Interval (OI)

Fig. 1 shows that chronologically ordered UEs are divided into *N* equal size TWs with a predefined OI. Larger TW contains more UEs and smaller OI results in more time- windows. The POS for all SUEs are calculated for each TW. This calculation of POS, per TW, is organized in the form of a two dimensional matrix. This 2D matrix basically records the probability of occurrence of one UE against another UE (see table I & II below).

Historical Alarm Data.

Alarm	Alarm	Severity	Probable Case	Managed
42193	Link	Major	ALM_IMA_LINK_LCD	EMS

Managed Element	Rack	Shelf	Slot	Reason	Date
PTP	1	1	7	Loss of Signal	12/09/2013:4:27

Fig. 2:- A typical Telecommunication Alarm

The alarm data used is acquired from three months of alarm logs from the transmission network of a telecommunication company. In three months about 45 hundred thousand alarms are generated and take 10 Giga Bytes (text) of disk space. Fig. 1 shows a typical alarm format containing information about date-time of alarm occurrence, network equipment information, severity level and probable cause. The historical alarm log is preprocessed to remove redundant and insignificant alarms. After pre-processing, all UE are found using alarm features and given a UE Identification Number (UEIN).

**Table I:-** Unique (Alarm) Events partitioned in *N* TWs. This 3D matrix is used as an input to train a prediction technique.

Alarm Type ID	Severity Level ID	Probable Cause ID	Managed Object ID	Alarm Reason	Unique Event
1	1	7	57	Unknown	1
1	1	57	4251	Unknown	2
1	2	3	2	Loss Of Signal	3
1	2	3	20285	Loss Of Signal	4
1	2	3	45616	Loss Of Signal	5
1	2	28	192	Loss Of Signal	6
2	2	5	46071	Equipment Malfunction	7
2	2	174	19662	Equipment Malfunction	8
2	2	174	19663	Equipment Malfunction	9
3	2	102	19610	External IF Device Problem	10

**Prediction Algorithm:-**

**Fig. 3:-** shows how a prediction technique (PT) is trained starting with the  $i^{th}$   $TW_i$  to predict POS values in the  $i+1^{th}$   $TW_{i+1}$ . The POS values contained in  $TW_i$

Table I shows an example of 10 of these UEs for the three months alarm log. The first 5 columns in table I are the alarm features that are used to select the UEs and last column is the index given to a particular UE. These preprocessed, chronologically ordered UEs are partitioned into TWs according to TW and OI size parameters.

**Table II:-** 10x10 Pos Matrix

	1	2	3	4	5	6	7	8	9	10
1	0.1	0.8	0.2	0.1	0.5	0.7	0.1	0.9	0.6	0.1
2	0	0	0.2	0.3	0.4	0.6	0.7	0.4	0.1	0.8
3	0	0.6	0.6	0.1	0.7	0.9	0	0.8	0	0
4	0.3	0.5	0	0.8	0	0.7	0	0.6	0	0.6
5	0.5	0	0.8	0	0	0.1	0.9	0	0.1	0.8
6	0.4	0.1	0.6	0.3	0.4	0	0.8	0.3	0	0
7	0.9	0.4	0.8	0	0	0	0.1	0	0.8	0.8
8	0.3	0.2	0.6	0.5	0.9	0.6	0.8	0.4	0.8	0.8
9	0.5	0.4	0.6	0.7	0.4	0	0.8	0	0.6	0.6
10	0.6	0.2	0	0.7	0	0	0.1	0	0	0

Table II shows a 10x10 POS matrix for all the UEs in table I of an  $i^{th}$  TW. In this case the value in cell (i, j) is the

probability of occurrence of sequence of  $UE_j$  happening after  $UE_i$ . For instant  $(3, 2) = 0.2$  means sequence of  $UE_C$  happening after  $UE_B$  has a probability of occurrence 0.2 within that  $TW$ . The probability calculations of occurrence of  $SUE$  are done for all  $N$   $TWs$  and that forms the proposed 3D data feature matrix. Therefore this 3D matrix contains  $UE$  sequence occurrence statistics for the whole historical data.

$POS$  values of  $PTW_{i+1}$ . Calculated  $POS$  values of  $TW_{i+1}$  are compared with predicted  $POS$  values of  $PredTW_{i+1}$ . If mean square error (MSE) is acceptable (denoted by '=' in the figure) then index is incremented to repeat for the next  $TW$ , otherwise the prediction technique parameters are adjusted until MSE is acceptable. For example starting with first set of  $POS$  values in  $TW_1$ , the prediction technique is trained to predict values for set of  $POS$  of values in  $TW_2$ . Now prediction technique is trained to predict set of  $POS$  values in  $TW_2$ . Similarly prediction technique is iteratively trained for all  $TWs$ . The prediction technique training is stopped when MSE from all  $TWs$  is below a predefined threshold. Please note that the prediction technique parameter adjustment is incremental from  $TW$  to  $TW$  and the finally trained prediction technique is based on the local (adjacent  $TWs$ ) as well as global ( $TW$  to  $TW$  for the whole training period) correlations. Once training is completed, the corresponding trained prediction technique is saved and is ready for prediction of alarm sequences in the future  $TW$ . A number of experiments are done on the training data to find optimal prediction technique parameters e.g. for ANN these parameters are learning rate, number of hidden layers, number of neurons in each layer and maximum number of epochs. The prediction technique is used to predict  $POS$  values in a future  $TW$ . All the  $SUEs$  with high  $POS$  are checked to see if any contains a  $UE$  with severity equal to "Critical". A  $UE$  having a severity equal to "Critical" is by definition a fault and must be reported. Furthermore other  $SUE$  are also useful for prediction of noncritical  $UEs$  and overall health of the system.

### Fault Prediction Results:-

The overall historical alarm data is divided into training dataset and test dataset. The test dataset size depends on the number of  $TWs$  (size of overlapping interval  $OI$ ). The  $POS$  values are also calculated for all the  $TWs$  of prediction dataset. The trained prediction technique is used to predict  $POS$  values in the prediction dataset and accuracy calculations are done using

The predicted  $POS$  values and actual  $POS$  values of the prediction dataset. The accuracy calculations are done using the following 2 parameters:

**Accuracy:-** It is defined as the ratio of correct predictions to the total possible prediction cases.

**Accuracy = (No. of true positives + No. of true negatives) / Total No. of Unique Events that can be predicted \* 100**

Here the true negative mean the number of  $UEs$  that are neither predicted nor are present in original future window. Accuracy provides an idea about how well our system is predicting the  $UEs$ . There is another factor which must be taken into account in testing a prediction.

**False Positive Rate:** It is defined as the ratio of false positive cases to Total number of Negative cases.

**False Positive Rate = No. of False Positives / (No. of True Negatives + No. of False Positives) \* 100**

Note that the denominator is basically the  $UEs$  that are absent in the predicted window. False Positive Rate is the measure of penalty due to over prediction. If accuracy of a technique is good but False Positive Rate is too high then it means that  $UEs$  are predicted but do not actually occur.

The three months alarm data is divided into training and prediction datasets on a 70:30 (percent) basis. The training datasets are used to train the prediction system using four techniques: Artificial Neural Network (ANN), Support Vector Machine (SVM), Kalman Filter (KF) and Hidden Markov Model (HMM). A number of experiments are performed using all of the four prediction techniques. The prediction technique is trained using the alarm characteristics ( $POS$ ) of a window as input and the alarm characteristics ( $POS$ ) of future window as output. Once the prediction system is trained, Accuracy and False Positive Rates are calculated for all the training examples and are averaged to get a mean value.

Now the rest of the 30% prediction windows are totally unknown to the predictor. A number of prediction experiments are performed and evaluated. The Accuracy and False Positive Rates are averaged over all the

prediction experiments. This is to evaluate how well the fault prediction system performs for unknown data. That is why some techniques that have performed well for training data, show poor results for unknown data predictions, whereas other prediction techniques that have relatively poor performance for training data, show good unknown data prediction results. Note that this process is done repeatedly for various TW and corresponding OI values.

The optimum OI values for each TW value have also been obtained after thorough experimentations. The detail analysis of these optimal parameters will be reported elsewhere. For different TW and OI, Table III and IV show average Accuracy values and Table V and VI show False Positive Rate values for the training and prediction datasets.

**Table III:-** Percentage Accuracy For The Training Dataset.

TW	OI	Prediction Technique			
		ANN	SVM	KF	HMM
4 hrs	2 hrs	78.25	98.92	73.14	70.5
10 hrs	5 hrs	76.26	98.86	70.91	69.1
2 days	1 day	69.77	98.97	65.76	56.0
4 days	2 days	67.91	99.37	59.75	51.4

**Table IV:-** Percentage Accuracy For Unknown Prediction Dataset

TW	OI	Prediction Technique			
		ANN	SVM	KF	HMM
4 hrs	2 hrs	54.67	66.67	93.33	54.34
10 hrs	5 hrs	54.67	58.67	93.67	58
2 days	1 day	54.34	54.67	93.76	41.67
4 days	2 days	50.34	56.67	88	48

**Table V:-** Percentage False Positive Rates For Training Dataset.

TW	OI	Prediction Technique			
		ANN	SVM	KF	HMM
4 hrs	2 hrs	1.826	2.04	1.45	4.5
10 hrs	5 hrs	1.76	1.578	1.106	7.78
2 days	1 day	2.86	1.907	1.22	20.09
4 days	2 days	5.48	1.136	1.29	16.93

**Table VI:-** Percentage False Positive Rates For Unknown Prediction Dataset

TW	OI	Prediction Technique			
		ANN	SVM	KF	HMM
4 hrs	2 hrs	31.3	36	8	55.67
10 hrs	5 hrs	46	38.67	7.34	53
2 days	1 day	39.6	5.76	0.00	34
4 days	2 days	46	8.67	16.34	33.34

The above tables (III and IV) show that for training data, SVM clearly shows best predictions for all four window sizes.

But we have to decide which technique outperforms others when it comes down to random and unknown test data windows. Table V shows that for prediction data, KF is the best prediction technique. Although it has been only the third favorite of the four techniques in case of training data, KF gives best prediction accuracies for various cases of random test data windows. False Positive Rate from table VI also confirms that the lowest False Positive Rate for training as well as prediction datasets is shown by KF, almost for all four window sizes. Next best choice is SVM. The reason behind KF performing best in unknown data case is that KF does not have the tendency to get as much over trained (during the training phase) as other techniques.

Furthermore from the four tables III, IV, V and VI, the best performance is for a TW = 10 hours and OI = 5 hours. Therefore for the given alarm data, it is recommended to use TW of 10 hours and OI of 5 hour. It should be noted that after experiments the optimal values of TW and OI can be found for any historical event data for any problem domain. The same is true for finding out the optimum prediction technique for a problem. Please note that the individual detail of ANN, SVM, KF and HMM parameter tuning and optimization are omitted due to conference paper size constraints and will be reported in an extended version of this paper.

### **Conclusion:-**

A simple statistical approach, as an alternate to more complex time series based approaches, is presented for future events prediction. After selection of appropriate problem domain based features, Unique Events (UEs) are defined and historical event data is partitioned into overlapping Time- windows (TWs). For each TW, Probabilities of Sequence of Unique Events (POS) values are calculated and stored in a three dimensional (3D) Input Feature Matrix (IFM). The 3D IFM contains local (within a TW) and global (TW to TW) correlations and a prediction technique is better able to predict future events. The proposed event prediction technique is applied to the domain of telecommunication alarms and future faults are predicted using three months of transmission system alarm log of a telecommunication company. Various experiments are done using different TW and OI values for four prediction techniques to find optimal TW and OI values.

Although the results show highly accurate results, we are not claiming that the proposed 3D input matrix will always produce the same level of prediction accuracy for all types of data. Our premise is that the highly accurate results are due to the calculated POS values and then used in the form of the proposed 3D IFM. Intuitively we feel that the proposed 3D input matrix should produce optimal prediction for any data. Although a lot of experimentation is needed with different prediction algorithm and in different problem domains to really validate the proposed approach. Such an effort is currently underway and detailed results will be reported in the future.

Translation, translator's style, stylistic features, type and token ratio, Leech and Short's checklist of style markers

#### Abstract

The aim of the present article is indicating to what extent the Iranian translators of J. D. Salinger's 'The Catcher in the Rye' could preserve the style of the author and also to find out whether the style of the translators of Salinger's 'The Catcher in the Rye' literary work had any effect in their translation. Since the researchers could not find any established model in translation or translator style, they went through a fundamental research and designed a first-hand framework to practice. The stylistic features of the source book were explored from the most famous and reliable critics in the authentic English sources and formed the corpus of this study along with their corresponding translations by Ahmad Karimi and Mohammad Najafi. The researchers conducted a careful comparative content analysis of both the source text and target texts exploiting Leech and Short's checklist of style markers and then through careful analysis of the findings, they found that Najafi has preserved 75.61% of the stylistic features of the ST while Karimi has preserved 43.09% of the stylistic features of the ST. the researchers applying binominal tests and chi square measurements, could not find any significant difference between the style of the translators when translating the context and cohesion features of the source text, but a significant difference in translating the lexical categories, grammatical categories and figures of speech. Considering the style in general, they applied type/token ratio. The result indicated a significant difference in preserving the author's style and Najafi could do a better job in this regard.

#### Introduction:-

Literary translation comprises a significant part of the literary life of every country and impacts its culture in many ways. Therefore, it is crucial to study translation product and process closely. One of aspects of a literary work is its style. In the past it was believed that translators should not have their own style and must reproduce the style of the author. But scholars have started to admit that it is impossible to reproduce the ST author's style, and translators' trace can be tracked in a translation by studying style. To pinpoint the style of the translators, the researchers chose the most famous work of J. D. Salinger and two Persian translations of it to see to what extent the translators have followed the style of the author and what proportion of the product's style belongs to the translator himself. So the following questions were raised:

**Corresponding Authors:** 1) Forouzan Dehbashi Sharif Assistant Professor of Islamic Azad University Central Tehran Branch.  
 2) Azam Zahedi-Anbardan Master of Arts student, English Translation Studies Department.

Q1: To what extent could the Iranian translators of J. D. Salinger's '*The Catcher in the Rye*' preserve the style of the author?

Q2: Is there any significant difference between the styles of the Iranian translators of Salinger's '*The Catcher in the Rye*' literary work?

Based on the second question, the researchers proposed the following null hypothesis:

H0: There is no significant difference between the styles of the Iranian translators of Salinger's '*The Catcher in the Rye*' literary work.

### Significance of study:-

During the past decade many studies have been carried out to investigate translators' styles. To name a few we can refer to: Charlotte Bosseaux's (2004) comparison of Virginia Woolf's "The Waves (1931)" and two French translations published in 1937 and 1993. Bosseaux explored the translators' use of deixis, modality and transitivity in relation to their effect on narratological structures. Gabriela Saldanha (2004) set out to examine standardization patterns in translations, and ultimately investigated the use of split infinitives as a feature indicative of a translator's style. Mikhail Mikhailov and Miia Villikka (2001) compared Finnish translations of Russian fiction. They apply authorship attribution methods and look at vocabulary richness, frequent words, etc., their analysis of some lexical items and their Finnish equivalents revealed some patterns of preferred use by the individual translators. Marion Winters (2004), working with a parallel corpus composed of the German translations of F. Scott Fitzgerald's *The Beautiful and the Damned* (1922), pursued to identify the translators' style or "thumb-print" (Baker 2000:245) by looking at loan words, code switches and modal particles using WordSmith Tools and Multiconcord. Baker is the major scholar who undertook the task of studying "whether the individual literary translator can plausibly be assumed to use a distinctive style of their own, and if so how we might go about identifying what is distinctive about an individual translator's style" (Baker, 2000: 248). The present study is distinct from other researches in this area as it aimed at investigating translator style by comparing the target texts with the source text and against each other, to see the characteristic behavior of each translator when translating stylistic features outlined by Leech and Short (1981), that is, lexical categories, grammatical categories, figures of speech and cohesion & context, in other words, how they dealt with them.

### Literature Review:-

The most challenging branch of translation is literary translation, where literary text – as an "expressive" text type by Reiss (1977/1989) – involves a set of typical features. According to Jones literary texts are in a written form, fictional, and canonical, and they have an aesthetic function, focusing on the expression of emotions, with poetic language, implicit meanings, heteroglossia, and deviations (Jones, 2009, in Baker and Saldanha eds. 2009: 152).

According to Huang, X. (2011), (1) literary texts are characterized by rhetorical and aesthetic value, which is the essence expected to be captured and maintained in a literary translation; (2) in literary translation the form interlinks with the content; while in non-literary translation the content may be considered detachable from the form or structure; (3) literary translators' choices of wording are highly dependent on the target language (TL) and culture while literary texts are solidly rooted in the source language (SL) and culture; (4) a consideration of the target audiences is another important issue in literary translation. Literary translation always has a readership which is likely to be quite different from the one the writer originally had in mind; and (5) literary translation is a complicated act, and to this effect, there is no definite correct translation yet there is a proper or an appropriate translation according to certain criteria or from a certain perspective.

Translation is an artistic communication between the author, the translator, and the reader, and the selection of words by the translator is a core act in the process of translating as communication (Huang, X., 2011). Translation is a communicative act, and literary translation is especially an artistic communication. "Literature is both the condition and the place of artistic communication between senders and addressees, or the public" (Bassnett, 2002: 83). In this communication process, the translator has first to read, comprehend, and interpret the source text, then to represent it in a different medium. Selection is a core act in the process (Huang, X., 2011).

The noun style has a long history and wide range of meanings. Style derives from the Latin word *stylus* meaning stake or pointed instrument for writing, and modern meanings are an extension of this. The most relevant meaning provided by the Oxford English Dictionary is: "The manner of expression characteristic of a particular writer (hence of an orator) or of a literary group or period; a writer's mode of expression considered in regard to clearness,

effectiveness, beauty, and the like” (quoted in Hawthorn, 2000: 344). Abrams (1993: 203) defines style as “the manner of linguistic expression in prose or verse – it is how speakers or writers say whatever it is that they say”. Here how – which is emphasized by Abrams – refers to the technique or craft of writing, his definition emphasizes the linguistic approach of style.

Stylistics – more strictly known as literary stylistics or linguistic stylistics – is a linguistic approach to style or an approach that focuses on the linguistic properties of a writer’s style of a literary text (Huang, X., 2011). Influenced by the Russian formalists and the scholars of Prague School, literary stylistics holds that “Style could be more fully accounted for by text-immanent linguistic explanation and less effectively by means of interdisciplinary approaches” (Carter and Simpson, 2003, p. 2).

Literary texts have a hard-to-define “added value”, carried by the particular way in which they exploit lexis, grammar, pragmatics, and so on; this added value has everything to do with the text’s *style* (Huang, X., 2011). According to Leech and Short (1981:38): (1) Style is a way in which language is used: i.e. it belongs to *parole* rather than to *langue*. (2) Therefore style consists in choices made from the repertoire of the language. (3) A style is defined in terms of a domain of language use (e.g. what choices are made by a particular author, in a particular genre, or in a particular text).

According to Bell (1991): “Translation is the expression in another language (or target language) of what has been expressed in another source language, preserving semantic and stylistic equivalence” (p. 5). Such a view assumes that a translation must be ‘as good as’ an original and that translators are seen as ‘good’ translators when their work is transparent and does not show its own style (Bosseaux, 2004). Translators are therefore expected to reproduce the style of the original as closely as possible. However, this way of looking at translation has rightly been questioned by translation scholars such as Baker (2000) and Hermans (1996), since it seems impossible to produce a text without leaving one’s imprint on it.

Scholars working in the field of translation have paid particular attention to the style for some time now. Formulating a unified definition of what style exactly is, however, remains problematical. It remains both elusive and ambiguous in nature, and the investigation is still unsystematic. Boase-Beier, at the beginning of her book *Stylistic Approaches to Translation*, points out that:

From the earliest writings about translation, such as those of Cicero or Horace, style has often been mentioned but, as Snell-Hornby (1995: 119) notices, its role has rarely been systematically explored. Yet style is central to the way we construct and interpret texts. (Boase-Beier, 2006: 1)

The comments on style in many translation studies works tend to be ad hoc and impressionistic, and the notion of “style” in those comments is deemed as an abstract and obscure spirit or sense (Huang, X., 2011). Dryden, in 1680 referred to the style, or something similar to it, as the “genius” of a text; Pope spoke grandiosely of the “spirit” and “fire” (Lefevre, 1992: 64, in Boase-Beier, 2006: 11) of the text; Denham spoke of its “spirit” (Robinson, 2002: 156, in Boase-Beier, 2006: 11); Schleiermacher spoke of the need to pay attention to “the spirit not only of language but also of the original author” (Robinson, 2002: 233, in Boase-Beier, 2006: 11).

Jean Boase-Beier (2006) clearly underlines the importance of style in literary translation. She believes literary translation “can be seen as the translation of style because it is the style of a text which allows the text to function as literature” (2006: 114). Boase-Beier (2006) stresses the importance of choice, not only for the original author, but also for the translator. The main concern here is to investigate the impact of choices made by the translator on the reading and interpretation of the target text (Lance Hewson). Boase-Beier (2006) claims that stylistics supplies a more varied perspective of a reading and translation and informs translators’ decisions.

Style was long a primary concern in the pre-linguistics period of translation studies. It has often been approached from two perspectives: firstly, style is the result of choices; secondly, style is the author’s or is ST oriented (Huang and Chu, 2014). In general, translators are often taken as “writers” with limited freedom, because “translators are more concerned with questions of options than with servitudes”, and “grammar is the domain of servitudes whereas options belong to the domain of stylistics, or at least to a certain type of stylistics” (Vinay and Darbelnet 1995[1958], 16). This indicates that from the perspective of the translator, style in translation is closely related to the linguistic options taken by translators (Huang and Chu, 2014). However, since it is always maintained that style in

translation belongs only to the author and a translator should not have his or her own style, the task for a translator is nothing but to imitate the author's style (Huang and Chu, 2014).

In the pre-linguistics period, "loyalty" or "faithfulness" served as one of the key conceptual tools in discussing translations. A translator was forbidden to have his or her own style. To achieve the same stylistic effect of the ST in the TT was one of the ways to attain faithfulness in translation (Huang and Chu, 2014). The ST or the author is placed in the central, sacred position. Style, in the philological period of translation studies, was also taken as a yardstick to make an assessment of the translation (Huang and Chu, 2014). For instance, according to Tytler (1978, p. XXXVI as cited in Huang and Chu, 2014), in good translations, "the style and manner of writing should be of the same character with that of the original". Again, the style, more specifically the author's style, is considered to be something sacred in translation. Successful transfer of the ST style is the focus of attention of almost all translators. It appears that discussions about style in translation in the pre-linguistics period were mostly ST oriented (Huang and Chu, 2014).

Style is also a topic in linguistics-oriented translation studies. Nida and Taber (1969: 12) mention style in their definition of translation: "Translation consists in reproducing in the receptor language the closest natural equivalent of the source language message, first in terms of meaning and secondly in terms of style." According to the above definition, style in translation "reproduces" the ST style. However, in their further exposition, we can find that their "style" is a combination of (1) genre, such as poetry, prose, etc.; (2) text type, such as "narrative", "expository", "argumentative"; (3) author's style – for instance, "the fast-moving, brisk style of Mark", "the much more polished and structured style of Luke", etc.; and (4) rhetorical devices, such as plays on words, acrostic poems, rhythmic units. Nida indicates that the style is still the ST style or the author's style (pp. 13-14).

Within the field of translation studies of the style of the translator have received scant and sporadic attention. Translation has long been viewed as a derivative rather than a creative activity, i.e. the translator should faithfully maintain the original style of the source text rather than have their own style (Baker, 2000). However, it is acknowledged that in any translation there are inevitably traces of the translator. Translators have been discussed in regard to the visibility of the translator or the translator's voice in the target text by Venuti (1995) and Hermans (1996). However, Venuti's (1995) call for greater visibility for the translator is driven by cultural or ideological concerns; he does not really focus on style in relation to how such visibility manifests itself in the translation. Venuti's concern stays on the level of the translator's strategy of a foreignizing or domesticating approach. Hermans (1996) accounts for the translator's presence in the text on occasions of open interventions. He states that a translator may be present in a text to a greater or lesser extent, depending on the translator's strategy. Parks (1998) also looks at style in translation, but he actually describes the style of the author and in which way and to what extent the author's style is captured by the translator, and the problems the translator faces when translating (the author's style). Folkart (1991: 393- 398) argues that the translator's trace will always be present in the target text, a view also shared by Hermans (1996: 27-30).

The assumption that the translator cannot and should not have a style of their own is questioned by Baker who contends that "We may well want to question the feasibility of these assumptions, given that it is as impossible to produce a stretch of language in a totally impersonal way as it is to handle an object without leaving one's fingerprints on it" (Baker, 2000: 244). Mona Baker (2000) attempted to study "a literary translator's style" systematically using corpus tools, partly derived from Leech and Short's descriptions of style in English fictional prose. According to Winters (2005) Baker's definition of style reaches beyond Herman's open interventions. As well as use of metalanguage such as foot-/endnotes and prefaces/afterwords, it also includes non-linguistic features, such as the selection of material to translate (Winters, 2005). It is concerned with the translator's actual use of language as a kind of "thumbprint" which is always present, no matter what translation strategy is applied (Baker, 2000). Baker is concerned with what Leech and Short (1981: 14) call "forensic stylistics", i.e. linguistic habits that are beyond the conscious control of translators (Winters, 2005). Overall, she is interested in one translator's characteristic use of language, as compared to another translator's profile of linguistic habits (Baker, 2000).

Bassnett (1996: p. 22) stressed the need for reassessing the role of the translator by analyzing his/her intervention in the process of the linguistic transfer, when she argues "once considered a subservient, transparent filter through which a text could and should pass without alteration, the translation can now be seen as a process in which intervention is crucial". The myth of translation as a secondary activity with all the associations of lower status implied in that assessment can be dispelled once the extent of the pragmatic element of translation is accepted, and

once the relationship between author/translator/reader is outlined (Bassnett, 2002). A diagram of the communicative relationship in the process of translation, presented by Bassnett (2002), shows that the translator is receiver and emitter at the same time, the end and the beginning of two separate but linked chains of communication.

According to Boase-Beier (2006), "because the recreative process in the target text will also be influenced by the sorts of choices the translator makes, and style is the outcome of choice (as opposed to those aspects of language which are not open to option), the translator's own style will become part of the target text." (p. 1)

The most recent method of studying translator style has been the use of corpora using technological advances. The first published study that uses corpus methodology to compare the style of two translators is Baker (2000). She applied linguistic software WordSmith Tools for the quantitative research and analyzed key features such as type/token ratio, average sentence length and reporting structures in detail (Huang, 2011).

#### Style markers:-

In Leech and Short's *Style in Fiction*, a practical checklist of stylistic features is offered, "showing how the apparatus of linguistic description can be used in analyzing the style of a prose text" (Leech and Short, 1981: 74). While not exhaustive in itself, the list serves a heuristic purpose: it enables us to collect data on a fairly systematic basis. The list (Leech and Short, 1981: 75-82) is split into four categories and subdivisions as in Table 2.2:

Lexical Categories	Grammatical Categories	Figures of Speech	Context and Cohesion
General	Sentence type	Grammatical and lexical schemes	Cohesion
Nouns	Sentence complexity	Phonological schemes	Context
Adjectives	Clause types	Tropes	
Verbs	Clause structure		
Adverbs	Noun phrases		
	Verb phrases		
	Other phrase types		
	Word classes		
	General		

The investigations of the researchers showed that only a few researches have been done in Iran on translator style using corpus tools. Mehdi Kafil (2012) investigated translator's style in rendering literary texts by analyzing Daryabandari's translations in the light of the universals of translation, i.e. explicitation, simplification and normalization. He selected three well-known American novels and their Farsi translations, then randomly selected 40 sentences from each novel and their Farsi translations and examined them based on universals of translation. His findings showed that that the translator's thumbprint was evident in the translations through the application of the universals of translation and that he had his own unique style. His other finding was that Daryabandari had applied normalization as the most frequent stylistic feature in his translations.

Zahra Moshfegh (2013) addressed the issue of visibility or invisibility of the translators in three translations of Virginia Woolf's *Mrs. Dalloway* (1925), the focus of this study was limited to Woolf's style, i.e. free indirect discourse. She, also, used Baker's (1996) translation universals, namely, explicitation, simplification and normalization, to investigate the extent to which the translators of this novel were visible in their translations, and to determine how they manifested themselves on their translations of free indirect discourses. She found that the three translators almost always took different strategies in translating free indirect discourses.

During the past decade many studies have been carried out to investigate translator style throughout the world. Charlotte Bosseaux (2004) compared Virginia Woolf's *The Waves* (1931) and two French translations published in 1937 and 1993. Bosseaux explored the translators' use of deixis, modality and transitivity in relation to their effect on narratological structures. Gabriela Saldanha (2004) set out to examine standardization patterns in translations, and ultimately investigated the use of split infinitives as a feature indicative of a translator's style. Mikhail Mikhailov and Miia Villikka (2001) compared Finnish translations of Russian fiction. They applied authorship attribution methods and looked at vocabulary richness, frequent words, etc., their analysis of some lexical items and

their Finnish equivalents revealed some patterns of preferred use by the individual translators. Marion Winters (2004 and 2004a), working with a parallel corpus composed of the German translations of F. Scott Fitzgerald's *The Beautiful and the Damned* (1922), sought to identify the translators' style or "thumb-print" (Baker 2000:245) by looking at loan words, code switches and modal particles using WordSmith Tools and Multiconcord.

The researchers chose *The Catcher in the Rye* by J. D. Salinger to conduct this study. Jerome David Salinger is an American author born in New York in 1919. His most important work, *The Catcher in the Rye* (1951), established him as a leading author. According to James E. Miller "No writer since the 1920's – the era of Fitzgerald and Hemingway – has aroused so much public and critical interest" (as cited in Ohmann&Ohmann, 1976, p. 15). The hero of the book, Holden Caulfield, became a prototype of the rebellious and confused adolescent searching for truth and innocence outside the "phony" adult world, and the book itself came to be seen as "a kind of 'Bible' for a generation that wanted to revolt and didn't quite know how" (Brashers 1964: 212). Other works by Salinger are the short story collection *Nine Stories* (1953) and the novels *Franny and Zooey* (1961), *Raise High the Roof Beam, Carpenters and Seymour: An Introduction* (both 1963).

*The Catcher in the Rye* was first published in America on July 16, 1951. The first reviews of *Catcher* were far from unanimous, and although the novel was praised by many as a literary piece of work, the language in *Catcher* shocked many. "[Critics] have often remarked – uneasily – the 'daring,' 'obscene,' 'blasphemous' features of Holden's language" (Costello, 1959: 173). However daring, obscene or blasphemous it might have been regarded as, the language in *Catcher* was a true and authentic rendering of New York teenage colloquial speech (Costello, 1959: 172). The *New York Times*, on July 16, 1951, rolled out the red carpet: "Holden's story is told in Holden's own strange, wonderful language by J. D. Salinger in an unusually brilliant first novel..." (in Burger). The *Christian Science Monitor* on July 19, 1951, was less enthusiastic: "Holden's dead-pan narrative is quickmoving, absurd, and wholly repellent in its mingled vulgarity, naïveté, and sly perversion" (in Longstreth). But however much the reviewers disagreed over the merits of the novel; it was chosen as the midsummer selection of the Book-of-the-Month Club and made the best-seller list in the *New York Times*. Suddenly, *Catcher* had become "the most popular book of the 50's" (Brashers 1964: 212).

George R. Creeger in a review on *The Catcher in the Rye* states telling a story involves style; in *The Catcher* Holden is both the witness of and participant in the book's action; he is also its narrator, thus the style of the book is his style – the way in which he talks (as cited in Belcher and Lee, 2013). Salinger ran the risk in limiting himself to the vernacular of a prep school adolescent, of simple monotony. His style has genuine counterbalancing virtues such as spontaneity, freshness, immediacy, and vitality. Salinger's style in *The Catcher in the Rye* is colloquial and slangy, sounding a lot more like a real seventeen-year-old talking straight to you than an accomplished adult author (Costello, 1959).

### **Methodology:-**

To study the style of translators, the researchers chose two translations of *The Catcher in the Rye* by J. D. Salinger as their source material, the first translation rendered by Ahmad Karimi (1966/2014) and a well-known translation by Mohammad Najafi (1998/2014 2<sup>nd</sup> ed.). The corpus of this study was comprised of 124 examples (consisting of 139 sentences) of stylistic features indicating the style of Salinger based on the views of Donald P. Costello (1959), Heiserman and Miller (1956), S. N. Behrman (1951), and Donald Barr (1957), and their translations by the two Iranian translators. The corpus is presented in the appendix (Appendices 1-3).

The present research is a corpus-based descriptive comparative study which applied both the qualitative and quantitative research methods. Therefore, the researchers embarked on outlining the stylistic features of the ST and the treatment of the translators with those features. The present study is not a classical one-to-one bilingual comparative study, but a two-to-one study that compares the two target texts with each other, and with their shared source text.

### **Theoretical Framework:-**

Theoretical framework of this study has two parts: the first one clarifies the literary style which would be traced based on the theories of Leech and Short (1981) presented in table (1). The following table lists their checklist of style markers; the second one is an innovative empirical based on the views of Donald P. Costello (1959), Heiserman and Miller (1956), S. N. Behrman (1951), and Donald Barr (1957) tabulated in table (2).

**Table 1:-** Leech and Short's checklist of style markers.

Main Categories	Subdivisions
Lexical categories	General, nouns, adjectives, verbs, and adverbs
Grammatical categories	Sentence type, sentence complexity, clause types, clause structure, noun phrases, verb phrases, other phrase types, word classes, and general
Figures of speech	Grammatical and lexical schemes, phonological schemes, and tropes
Context and cohesion	Context and cohesion

**Table 2:-**Salinger's stylistic features in *The Catcher in the Rye*.

Stylistic Features of The Catcher in the Rye	Remarks
Two major speech habits of Holden	1- 'and all', 'or something,'/or anything': to end thoughts; to generalize
	2- "I really did," "It really was": to reinforce his sincerity and truthfulness; reveal his age
Other speech habit	'if you want to know the truth.': after personal affirmations
Vulgarity, obscenity, and divine name	For God's sake, God
	for Chrissake; Jesus; Jesus Christ: only when he feels the need for a strong expression; emotional situations
	Goddam: Holden's favorite adjective (an emotional feeling toward the object: favorable; or unfavorable; or indifferent)
	Damn: used interchangeably with goddam; no differentiation in its meaning is detectable
Other crude words	Ass: part of the body; a trite expression; an expletive
	Hell: Adjective; as the second part of a simile: 'hot as hell', 'cold as hell', 'sad as hell', 'playful as hell', 'old as hell', 'pretty as hell'
Other crude words	Bastard: a strong word reserved for things and people Holden particularly dislikes
	Sonuvabitch: he uses it only in the deepest anger
Slang	Crap: Foolishness; messy matter; miscellaneous matter; animal excreta; adjective: anything generally unfavorable; to be untrue; to chat
	Crazy: both trite and imprecise
	to be 'killed': emotionally affected either favorably or unfavorably; high degree of emotion
	Old: uses it only after he has previously mentioned the character
Adjectives and adverbs	Boy
	constant repetition of a few favorite words: lousy, pretty, crumby, terrific, quite, old, stupid
Trite figures of speech	Holden's most common simile: 'as hell': unrelated to a literal meaning & unimaginative; e.g. 'like a madman', 'like a bastard'
Repetitious and trite, but effective vocabulary	Piling up trite adjective upon another; e.g. 'he was a goddam stupid moron.'
Good comic effect	Funny constant repetition of identical expressions
Original figures of speech	Inspired, dramatically effective, and funny; e.g.: 'He started handling my exam paper like it was a turd or something'
Adaptability of language	turn nouns into adjectives, with addition of a -y: 'perverty,' 'Christmasy,' 'vomity- looking,'
	a versatile combining ability; e.g.: 'She sings it very Dixieland and whorehouse, and it doesn't sound at all mushy'
	use nouns as adverbs; e.g.: 'She sings it very Dixieland and whorehouse, and it doesn't sound at all mushy'
Using many words which are above	'Ostracized,' 'exhibitionist,' 'unscrupulous,' 'conversationalist,' 'psychic,' 'bourgeois.'

basicEnglish	
Conscious choice of words	to communicate to his adult reader
Humor	Writing on more than one level: 'They give guys the ax quite frequently at Pency'
Habit of direct repetition	'She likes me a lot. I mean she's quite fond of me'
Interpreting slang terms	'She killed Allie, too. I mean he liked her, too'
Conscious of his speech	Many of his comments to the reader are concerned with language
Grammar	Most common rule violations: misuse of lie and lay
	careless about relative pronouns, the double negative, the perfect tenses, extra words, pronoun number, pronoun position
	relative 'correctness: always intelligible, 'correct' in many usually difficult constructions
	uses many 'hyper' forms
Sentences	Spoken language; Faulty structure; Many fragments; Repetitions
Speech	Vocal; italicized (to imitate the rhythms of speech)
Conclusion	Informal, colloquial, teenage American spoken language

To achieve the purposes of the study, the researchers followed a step by step procedure as follows:

1. Read the original texts and the translations
2. Found the literary critical comments on the style of The Catcher in the authentic sources
3. Listed the stylistic features highlighted by critics and tabulated them
4. Traced and Identified the Persian equivalents
5. Adopted Leech and Short's checklist to categorize features
6. Tabulated the ST and TTs according to the checklist
7. Used online contents to check vocabulary and slang
8. Checked whether the style features were preserved or not
9. used online corpus tools to investigate the selected parts, calculated type/token ratio,
10. used Spss.21 software to calculate frequency, percentage and apply binominal test and Chi-square test to test different aspects of the null hypothesis

### Qualitative Data Analysis:-

#### Lexical categories:-

Based on the checklist of Leech and Short lexical categories consist of the following subdivisions: general, nouns, adjectives, verbs, and adverbs. The examples matching the above category are outlined below:

#### Teenage colloquial spoken language:-

According to Costello (1959) the language of The Catcher in the Rye is an authentic artistic rendering of a type of informal, colloquial, teenage American spoken language; it is strongly typical and trite, yet often somewhat individual; it is crude and slangy and imprecise, imitative yet occasionally imaginative, and affected toward standardization by the strong efforts of schools.

Example: 'she didn't give you a lot of horse manure about what a great guy her father was.'

T1(Karimi): هیچ وقت درباره این که پدرش چه آدم بزرگی است فیس و افاده نمی فروخت

T2(Najafi): راجع به مهم بودن باباش شر و ور نمییافت

Karimi's translation is more formal and his rendition is closer to written language than spoken. While Najafi's translation is more informal, trite and closer to the spoken language.

#### Trite repetitive vocabulary:-

Repetitious and trite as Holden's vocabulary may be, it can, nevertheless, become highly effective. For example, when Holden piles one trite adjective upon another, a strong power of invective is often the result:

Example 1: 'because he was a goddam stupid moron'

T1: که پسر بیشعور و کله بوکی است

واسه این ... به احمق کودنه: T2

Najafi has been succeeded in piling upon adjectives "احمق کودن", without splitting them. In the second example, both translators have chosen only one word for the three adjectives, only Najafi has displaced one of the adjectives at the end of the sentence.

#### Using the more vulgar terms:-

Her mother was married again to some booze hound,

T1: مادرش دوباره زن به عرق خور دائم‌الخمر شده بود.

T2: مادرش با این مرتیکه سگ مست ازدواج کرد

Translation of Najafi is vulgar, while Karimi's is more decent.

#### Using many words which are above basic English:-

An intelligent, well-read (I'm quite illiterate, but I read a lot'), and educated boy, Holden possesses, and can use when he wants to, many words which are many a cut above Basic English.

Example: The whole team ostracized me the whole way back on the train.

T1: موقع برگشتن توی قطار همه اعضای تیم مرا بایکوت کردند.

T2: تو راه برگشت هیچ کدوم بچه ها تحویل نگرفتند.

Karimi's translation is closer to ST.

#### Rich and colorful slang:-

Holden's speech is also typical in his use of slang. Holden uses over a hundred slang terms, and every one of these is in widespread use.

Example: It was on the crappy side, though.

T1: گو اینکه باز هم نزدیک به افتضاح بود.

T2: ولی باز مزخرف بود.

Both translators have maintained the connotation intended by the writer.

#### Turning nouns into adjectives, with the simple addition of a -y:-

It is very easy for Holden to turn nouns into adjectives, with the simple addition of a -y: 'pervery,' 'Christmasy,' 'vomity- looking,' 'whory-looking,' 'hoodlummy-looking,' 'show-offy,' 'flitty-looking,' 'dumpy-looking,' 'pimpy,' 'snobby,' 'fisty.'

Example: a few whory-looking blondes.

T1: چند زن موطلایی که می‌خورد خیابانی باشند.

T2: چن تا دختر موبور که شبیه خانومای خراب بودن

In both examples the translators have maintained the ST connotation.

#### Divine name:-

The Divine name is used habitually by Holden only in the comparatively weak for God's sake, God, and goddam. The stronger and usually more offense for Chrissake or Jesus or Jesus Christ are used habitually by Ackley and Stradlater.

Example: He wanted you to think he'd come in by mistake, for God's sake.

T1: میخواست فکر بکنم که اشتباهاً به اتاق من آمده است.

T2: میخواست فکر کنی اشتباهی اومده تو؛ آقا رو تو رو خدا!

Karimi has opted to omit divine names altogether, but Najafi has translated them.

#### Grammatical categories:-

Based on the checklist of Leech and Short grammatical categories consist of the following subdivisions: sentence type, sentence complexity, clause types, clause structure, noun phrases, verb phrases, other phrase types, word classes, and general. The examples matching the above category are outlined below:

#### Using 'if you want to know the truth' after affirmations:-

Holden uses 'if you want to know the truth.' after affirmations, just as he uses 'It really does,' but usually after the personal ones, where he is consciously being frank:

Example: I have no wind, if you want to know the truth.

T1: اگر حقیقتش را بخواهید من چندان نفسی ندارم.

راستشو بخوای خیلی نفس ندارم. T2:

In the above example both translators have translated if you want to know the truth, but both of them have placed it at the beginning of the sentence.

### Using "I really did"/"It really was" at the end of statements:-

Salinger gave Holden an extremely trite and typical teenage speech, overlaid with strong personal idiosyncrasies. There are two major speech habits which are Holden's own, which are endlessly repeated throughout the book. It is certainly common for teenagers to end thoughts with a loosely dangling "and all," just as it is common for them to add an insistent "I really did," "It really was." But Holden uses these phrases to such an overpowering degree that they become a clear part of the flavor of the book.

Example 1: I ignored him. I really did.

T1: محلس نگذاشتم.

T2: تحویلش نگرتم. جدی میگم.

Example 2: It was nice of him to go to all that trouble. It really was.

T1: آقای آنتولینی جدا بزرگواری کرد که این همه خودش را به ناراحتی انداخت. واقعا بزرگواری کرد.

T2: نهایت لطفش بود که این همه خودشو به زحمت میانداخت. جدی میگم.

In the first example, Karimi has decided to omit I really did. But Najafi has thought of it using "جدی میگم". For the second example, Karimi has repeated the verb and Najafi has used the same "جدی میگم".

### Using 'and all', 'or something/or anything' to end statements:-

Holden's 'and all' and its twins, 'or something,' 'or anything,' serve no real, consistent linguistic function. They simply give a sense of looseness of expression and looseness of thought. Donald Barr, writing in the Commonweal, finds this tendency to generalize, to find the all in the one.

Example: he's my brother and all.

T1: دی بی برادرم است.

T2: که برادرمه و از این حرفا.

Karimi has omitted and all but Najafi has translated it as "و از این حرفا".

### Careless about relative pronouns, the double negative, extra words, pronoun number, and pronoun position:-

He is careless about relative pronouns ('about a traffic cop that falls in love'), the double negative ('I hardly didn't even know I was doing it'), the perfect tenses ('I'd woke him up'), extra words ('like as if all you ever did at Pency was play polo all the time'), pronoun number ('it's pretty disgusting to watch somebody picking their nose'), and pronoun position ('I and this friend of mine, Mal Brossard').

Example: I hardly didn't even know I was doing it.

T1: اصلاً نمیفهمیدم که چه کار دارم میکنم.

T2: وقتی شیشه ها رو میشکوندم خودمم چیزی حالیم نبود.

Both translators have translated the above instances in correct Persian structure. Only, Najafi's translation is closer to spoken language.

### Use of many 'hyper' forms:-

More remarkable, however, than the instances of grammar rule violations is Holden's relative 'correctness.' Holden is always intelligible, and is even 'correct' in many usually difficult constructions. But then Holden is educated. He has, in fact, been over-taught, so that he uses many 'hyper' forms.

Example: She'd give Allie or I a push.

T1: به من یا الی سقله‌های می‌زد

T2: گاهی با دست می‌زد بهمون

Hyper form denotes to referring to persons together, for example, Mr. Smith and I. In English usually they bring I after a name or a pronoun. But Persian is flexible and can displace words easily. Najafi has omitted the structure.

### Spoken language:-

The book is more in terms of spoken language than written language. Holden's faulty structure is quite common and typical in vocal expression; a student who is 'good in English' would never create such sentence structure in writing. A student who showed the self-consciousness of Holden would not write so many fragments, such as afterthoughts, or such repetitions.

Example: 'It has a very good academic rating, Pency'

T1: در آنجا سطح معلومات شاگردها خیلی بالاست.

T2: پَنسی میون همه مدرسها مقام تحصیلی خیلی خوبی داره.

Karimi has omitted the afterthought. And Najafi has brought it at the beginning of the sentence.

### Figures of speech:-

Based on the checklist of Leech and Short lexical categories consist of the following subdivisions: grammatical and lexical schemes, phonological schemes, and tropes. The examples matching the above category are outlined below:

### Using italics to make the words read with the same emphasis as spoken:-

When he wants to emphasize, Salinger has tried to imitate the rhythms of speech using italics.

Example: I practically sat down on her lap, as a matter of fact.

T1: بلند شدم رفتم پیشش و روی مبل پهلویش نشستم

T2: راستش اصلا نشستم تو بغلش.

Karimi not only has thought of nothing for the italics, he also has decided to replace it with another word. In the case of Najafi, as we don't use italics in Farsi, he has used "راستش اصلا" to reproduce the emphasis.

### Most common simile: 'as hell':-

Holden's most common simile is the worn and meaningless 'as hell'. A thing can be either 'hot as hell' or, strangely, 'cold as hell'; or 'sad as hell' or 'playful as hell'; 'old as hell' or 'pretty as hell.' Like all of these words, hell has no close relationship to its original meaning.

Example 1: but they're also touchy as hell.

T1: اما در عین حال بیاندازه زودرنج و عصبانی مزاجند.

T2: ولی عین چی حساسن.

Example 2: You take somebody old as hell.

T1: شما بعضی از این اشخاص خیلی پیر را در نظر بگیرید.

T2: آدم به این پیری...

In the first example, Karimi has translated the simile as adjective and as adverb in the second example, but Najafi has reproduced the simile in both translations.

### Trite figures of speech:-

Even Holden's nonhabitual figures of speech are usually trite: 'sharp as a tack'; 'hot as a firecracker'; 'laughed like a hyena'; 'I know old Jane like a book'; 'drove off like a bat out of hell'; 'I began to feel like a horse's ass'; 'blind as a bat'; 'I know Central Park like the back of my hand.'

Example 1: sharp as a tack.

T1: یک حرف واقعا حساسی

T2: به چیز تیز عین پونس

Karimi has translated the simile as adverb "واقعا", while Najafi has translated it as a simile.

### Original figures of speech, which are inspired, dramatically effective and funny:-

Some of his figures of speech are entirely original; and these are inspired, dramatically effective, and terribly funny.

As always, Salinger's Holden is basically typical, with a strong over-lay of the individual.

Example: That guy Morrow was about as sensitive as a goddam toilet seat.

T1: این پسره ارنست مارو همان اندازه حساس بود که يك تِيَالِه پهن.

T2: این پسره مورو همون قدر حساس بود که کاسه توالِت.

Both translators have reproduced the figures of speech, Karimi has opted to replace the image.

### Context and cohesion:-

Based on the checklist of Leech and Short context and cohesion categories consist of the following subdivisions: context and cohesion. The examples matching the above category are outlined below:

### Constant repetition of a few favorite words and identical expressions:-

Repetition or avoidance of repetition is one of stylistic features related to the cohesion of the text. Holden's choice of adjectives and adverbs is indeed narrow, with a constant repetition of a few favorite words: lousy, pretty, crummy, terrific, quite, old, stupid--all used, as is the habit of teenage vernacular, with little regard to specific meaning.

Example: He wrote this terrific book of short stories, *The Secret Goldfish*.

T1: او همان کسی است که مجموعه داستانی به اسم "ماهی قرمز پنهان" نوشته:

T2: همون باباییه که این مجموعه محتشر داستان کوتاهاو نوشته: ماهی طلایی اسرار آمیز:

In the above example, Karimi has opted to omit the adjectives, but Najafi has translated them.

### Repetition of the word "and":-

The sentence structure of the writing is quite simple and it is not written in the style of an adult. He talks like a child and uses 'and' repeatedly to connect his sentences.

Example: And I got pretty run-down and had to come out here and take it easy.

T1: و مجبور بشوم بیایم اینجا و خودم را بزنم به سیم آخر.

T2: و مجبور شدم بیام این جا بیخیالی طی کنم.

Karimi has translated two 'and's out of the three, while Najafi has translated only one.

### Habit of direct repetition:-

Another major habit of Holden is direct repetition. Sometimes Holden stops specifically to interpret slang terms, as when he wants to communicate the fact that Allie liked Phoebe: 'She killed Allie, too. I mean he liked her, too'.

Example: She can be very snotty sometimes. She can be quite snotty.

T1: فیبی بعضی وقتها بجه خیلی مزخرفی میشود. واقعا مزخرف.

T2: گاهی حسابی بد عنق میشه. حسابی نحس.

Both translators have tried to reproduce the repetition, but with some small changes

### Protagonist addresses the reader directly using 'you':-

According to checklist of Leech and Short one of the stylistic features, which reveals the context, is how the narrator addresses the reader and what pronouns are used. Holden addresses his adult reader directly using 'you': Often Holden seems to choose his words consciously, in an effort to communicate to his adult reader clearly and properly.

Example: If you really want to hear about it.

T1: اگر واقعا میخواهید در این مورد چیزی بشنوید

T2: اگه واقعا میخوای قضیه رو بشنوی،

In addressing the reader, Karimi's translation is formal, while Najafi's translation is informal.

### Using old after he has previously mentioned the character:-

Using descriptive phrases like "old lawyer" to substitute for the repetition of an earlier "Mr. Jones" is a stylistic feature related to cohesion. Holden appends this word *old* to almost every character, real or fictional, mentioned in the novel, from the hated 'old Maurice' to 'old Peter Lorre,' to 'old Phoebe,' and even 'old Jesus.' The only pattern that can be discovered in Holden's use of this term is that he usually uses it only after he has previously mentioned the character; he then feels free to append the familiar old.

Example: I said old Jesus probably would've puked if

T1: من به او گفتم اگر حضرت مسیح ... هیچ بعید نبود که عیش بگیرد.

T2: گفتم اگه مسیح ... حتما بالا میآورد؛

In the first example, Karimi has opted to use the word "حضرت" for old, but Najafi has no solution for it and has omitted it.

## Quantitative Data Analysis:-

### Descriptive statistics:-

#### The frequency of the stylistic features:-

The researchers presented the frequency and the percentage of the stylistic features of the ST used by each translator in tables (4-1) and along with the related graphic presentation of the obtained data in figure(4-1).

**Table 4.1:-** Frequency of the stylistic features of the ST in TTs

Style	Total	T1 Frequency		T2 Frequency	
		Preserved	Not preserved	Preserved	Not preserved
Lexical Categories	49	17	32	39	10
Grammatical Categories	30	14	16	20	10
Figures of Speech	23	8	15	18	5
Context and Cohesion	21	14	7	16	5
	123	53	70	93	30
	Percent	43.09	56.91	75.61	24.39

The above table shows the frequency of preservation of the stylistic features of the ST in TTs. As it can be seen of 49 lexical categories in the ST, Karimi (T1) has preserved 17 and Najafi 39. For grammatical categories also of total 30, Karimi has preserved 14 and Najafi 20. For figures of speech, Karimi has preserved 8 out of 23 while Najafi has preserved 18. About context & cohesion, Karimi has preserved 14 and Najafi has preserved 16 from the total of 21. On the whole, Karimi has preserved 43.09% and had his own style in 56.91%. While Najafi has preserved 75.61% and departure from ST writer's style in 24.39%.

#### Inferential statistics: Testing null hypothesis:-

H0: "There is no significant difference between the styles of the Iranian translators of Salinger's *The Catcher in the Rye*."

#### Lexical categories

The number of examples in this category is 49. From 49 examples, T1 preserved 17 and T2 preserved 39. Using binomial (49, 0.5), we get 0.01 for T1 and 0.99 for T2. This results show that we can NOT reject the null hypothesis for T1. Thus, we can state that T1 has failed to preserve the lexical features of the style of the author. However, we can reject the null hypothesis for T2. Thus, with 95% certainty we can state that T2 preserved the Lexical style of the author.

**Table 4.2:-** Binomial Test of the preserved and not preserved lexical categories in T1 and T2

		Category	N	Observed Prop.	Test Prop.	Exact Sig. (2-tailed)
Lexical T1	Group 1	0	32	.65	.50	.044
	Group 2	1	17	.35		
	Total		49	1.00		
Lexical T2	Group 1	1	39	.80	.50	.000
	Group 2	0	10	.20		
	Total		49	1.00		

#### Grammatical Categories:-

The number of examples in this category is 30. From 30 examples, T1 preserved 14 and T2 preserved 20. Using binomial (30, 0.5), we get 0.42 for T1 and 0.97 for T2. This results show that we can NOT reject the null hypothesis for T1. Thus, we can state that T1 has failed to preserve the grammatical style of the author. However, we can reject the null hypothesis for T2. Thus, with 95% certainty we can state that T2 preserved grammatical style of the author.

**Table 4.3:-** Binomial Test of the preserved and not preserved grammatical categories in T1 and T2

		Category	N	Observed Prop.	Test Prop.	Exact Sig. (2-tailed)
GrammaticalT1	Group 1	1	14	.47	.50	.856
	Group 2	0	16	.53		
	Total		30	1.00		
GrammaticalT2	Group 1	1	20	.67	.50	.099
	Group 2	0	10	.33		
	Total		30	1.00		

#### Figures of Speech

The number of examples in this category is 23. From 23 examples, T1 preserved 8 and T2 preserved 18. Using binomial (23, 0.5), we get 0.05 for T1 and 0.99 for T2. This results show that we can NOT reject the null hypothesis for T1. Thus, we can state that T1 has failed to preserve the Figure of Speech style of the author. However, we can reject the null hypothesis for T2. Thus, with 95% certainty we can state that T2 preserved the Figure of Speech style of the author.

**Table 4.4:-** Binomial Test of the preserved and not preserved figures of speech categories in T1 and T2

		Category	N	Observed Prop.	Test Prop.	Exact Sig. (2-tailed)
fig.speechT1	Group 1	0	15	.65	.50	.210
	Group 2	1	8	.35		
	Total		23	1.00		
fig. speech T2	Group 1	1	18	.78	.50	.011
	Group 2	0	5	.22		
	Total		23	1.00		

**Context and cohesion:-**

The number of examples in this category is 21. From 21 examples, T1 preserved 14 and T2 preserved 16. Using binomial (21, 0.5), we get 0.97 for T1 and 0.99 for T2. This results show that we can reject the null hypothesis for both T1 and T2. Thus, with 95% certainty we can state that both T1 and T2 preserved Context and Cohesion, as stylistic features of ST.

**Table 4.5:-** Binomial Test of the preserved and not preserved context and cohesion categories in T1 and T2

		Category	N	Observed Prop.	Test Prop.	Exact Sig. (2-tailed)
Context&CohesionT1	Group 1	1	14	.67	.50	.189
	Group 2	0	7	.33

Context&CohesionT2	Group 1	1	16	.76	.50	.027
	Group 2	0	5	.24		
	Total		21	1.00		

**Type/token Ratio:-**

As it was mentioned earlier in this research, the type/token ratio is "a measure of the range and diversity of vocabulary used by a writer or in a given corpus". It is the ratio of different words to the overall number of words in a text or collection of texts (Baker 2000: 250). A high type/token ratio means that the writer uses a wide range of vocabulary and a low one means that she or he draws on a more restricted set of vocabulary items.

**Table 4.6:-** The frequency of applied types and tokens in different stylistic categories of the source text and T1 and T2

Type and token analysis	Lexical Categories			Grammatical Categories			Figures of Speech			Context and Cohesion		
	ST	T1	T2	ST	T1	T2	ST	T1	T2	ST	T1	T2
Sentence count	58	52	56	34	34	34	24	23	24	23	26	26
Token count (excluding numbers)	462	439	332	298	255	218	226	192	194	214	196	177
Type count (unique tokens, excluding numbers)	224	298	235	140	178	154	124	140	146	121	140	133
Average sentence length	7.97 words	8.44 words	5.93 words	8.76 words	7.50 words	6.41 words	9.42 words	8.35 words	8.08 words	9.30 words	7.54 words	6.81 words
Type/token ratio	0.48	0.68	0.70	0.47	0.69	0.71	0.55	0.73	0.75	0.57	0.71	0.75

Figure 4.2:- the frequency of applied types and tokens in different stylistic categories of the source text and T1 and T2

Table 4.8:-The comparative study of applied type/token ratio

Categories	Style analysis	Type/token ratio
Lexical	ST	0.48
	T1	0.68
	T2	0.7
Grammatical	ST	0.47
	T1	0.69
	T2	0.71
Figures of Speech	ST	0.55
	T1	0.73
	T2	0.75
Context & Cohesion	ST	0.57
	T1	0.71
	T2	0.75

Figure 4.3:- The comparative study of the applied type/token ratio

A high type/token ratio means that the writer uses a wide range of vocabulary and a low one means that she or he draws on a more restricted set of vocabulary items. The type/token ratio of the ST is lower than the TTs in all four categories. And as mentioned before, Salinger's style in *The Catcher* is a simple, repetitious one. Therefore, as the type/token ratio of Najafi's translation is lower than Karimi's translation in all four categories, again we can argue that Najafi has preserved the style of the author more than Karimi and Karimi has opted for a style more far from the ST.

**Table4 9:-** Chi-Square test statistics of type/token ratio

	Type/token ratio	Token count	Type count
Chi-Square	1.333 <sup>a</sup>	.000 <sup>b</sup>	3.000 <sup>a</sup>
df	9	11	9
Asymp. Sig.	.998	1.000	.964
a. 10 cells (100.0%) have expected frequencies less than 5. The minimum expected cell frequency is 1.2.			
b. 12 cells (100.0%) have expected frequencies less than 5. The minimum expected cell frequency is 1.0.			

Considering type and token we can observe that there is a significant difference between the style of the translators, the obtained chi-square for the ratio of type and token and the number of tokens is significantly greater than the critical value at the confidence levels of  $\alpha= 0.05$  and  $\alpha= 0.01$  for the related degree of freedom so using the inferential statistics considering type/token ratio, the researchers can reject the null hypothesis .

### Conclusion:-

The purpose of this study was to find out to what extent the Iranian translators of J. D. Salinger's 'The Catcher in the Rye' have preserved the style of the author and if there was any significant difference between their styles in translating the book. based on the views of Donald P. Costello (1959), Heiserman and Miller (1956), S. N. Behrman (1951), and Donald Barr (1957) and using the theoretical framework of this study considering Leech and Short's checklist of style markers, four categories of lexical categories, grammatical categories, figures of speech and context & cohesion were selected to analyze the style of the writer in the source book and the translators in the translated versions.

Qualitative analysis of the translations of Karimi and Najafi showed that, in lexical categories, of 49 examples Karimi had preserved 17 stylistic features of the ST while Najafi had preserved 39 features. Karimi's translation is more formal and written speech than spoken. While Najafi's translation is more informal, trite and closer to spoken speech. Najafi has been more successful to reproduce the ST structure, for example when piling adjectives upon each other. When translating vulgar terms, which are one of the main stylistic characteristics of Salinger in The Catcher, Najafi has tried to maintain the vulgarity, while Karimi has used more decent wording. Sometimes even Karimi has opted to change the author's connotation. Also, Najafi has tried to make up for constructs not usual in Persian by choosing more colloquial Persian structures. Overall, Karimi has opted to omit more than Najafi. For grammatical mistakes in the ST, both translators had no solution.

Analysis of grammatical categories showed that Karimi had preserved 14 stylistic features of the ST out of 30 and Najafi had preserved 20 features. Here again Karimi's main strategy was to omit, but Najafi has thought of equivalents.

For the figures of speech categories Karimi had preserved 8 stylistic features of the ST out of 23 and Najafi had preserved 18 features. Phonologically speaking, Najafi's translation of phonological schemes is closer to the ST, he has used spoken speech to reproduce the phonological schemes of the ST. When translating similes, in some cases, Karimi has changed the structure to adjective or adverb, while Najafi has tried to reproduce the simile.

For the context and cohesion categories Karimi had preserved 14 stylistic features of the ST out of 21 and Najafi had preserved 16 features. Again Karimi has opted to omit repetitions more while Najafi has translated them. They have maintained other context and cohesion features of the ST.

Regarding the second question of the study, the statistical analysis of the data revealed that there was no significant difference between the translators when translating the context and cohesion features of the ST. Meanwhile there was a significant difference between them when translating the lexical categories, grammatical categories and figures of speech.

The current study is also in line with the finding of Baker (2000) who believes one obvious difference between two translators concerns the overall type/token ratio. In simple terms, type/token ratio is a measure of the range and diversity of vocabulary used by a writer, or in a given corpus. According to the results illustrated in table 4.10, the type/token ratio of the ST is lower than the TTs in all four categories. And as mentioned before, Salinger's style in The Catcher is a simple, repetitious one. Therefore, as the type/token ratio of Najafi's translation is lower than

Karimi's translation in all four categories, again we can argue that Najafi has preserved the style of the author more than Karimi and Karimi has opted for a style more far from the ST.

Behaviour, Cockatiel, Budgerigars,  
 diurnal hours, family variety.

#### Abstract

This study was conducted to study the effect of diurnal hours of the day on some maintenance behaviour of psittaciformes birds as cockatiel and blue Budgerigars. A total number of apparently healthy thirty nine birds (14 birds budgerigars and 25 birds cockateil aged from (12 month up to 10 years) belonged to the zoo at zagazig city, Sharkia governorate were housed in 2 large cages and aviaries. During the experiment, the duration and frequency of observed maintenance behaviour were recorded. From the obtained results, that there was a significant differences ( $P \leq 0.05$ ) of feeding time of Cockatiel in relation to the diurnal effects. As the feeding behaviour time and frequencies were increased at mid day than other times of the day. The sleeping behaviour and the time staying in the cage of cockatiel were increased with dusk and late afternoon and the differences were highly significant ( $P \leq 0.01$ ). There were a non significant differences of sexual and social bond of budgerigars with in the total day hours. Form this study, can mentioned that the family variety play an important role in change some behavioural patterns and habits of the ornamental birds as flying, walking and sleeping behaviour according to body mass of each bird family.

#### Introduction:-

The most common pet bird is the budgerigar, they has a good creatures that are very adaptable and friendly. They are sociable and like to have a group. The males are to be easier to tame and teach to talk. Budgerigars are long-lived birds with a life span of 7-10 years and with low purchase cost (Nicol and Pope, 1993). Domesticated budgerigars come in large range of colours are always green with a yellow area and live in huge flocks. They originate from Australia and their name means song parrots. The hen have brown or white core but the male is blue (Gebhardt- Henrich and Steiger, 2006).

Budgerigars are one of the most commonly kept pet birds and are of the used as laboratory animals (Isenbugel, 1999). Most organisms have a clocks in their brain that regulate the timing of biological processes and daily behaviour, these clocks are known as circadian rhythms. They allow maintenance of these processes and behaviour relative to 24 hour day / night cycle (Kolmos and Davis, 2007). Budgerigars also known as the common pet parakeet or shell parakeet and in formally nicked name is the budgie from order psittaciformes, family psittacidae (Melopsittacus undulatus) (Marshall, 2013) are small size, cheap in cost and ability to mimic human speech. The

cockatiel also known as quarrion and is a bird that is a member of cockatto family of genus Nymphicus, order psittaciforms family cocatuidae species, Nymphicus hollandicus (Cockatiel, 2008).

### **Material and Methods:-**

#### **Birds used and management:-**

Thirty nine birds (14 birds budgerigars and 25 birds cockatiel aged from 12 month up to 10 years) belonged to the zoo at zagazig city, Sharkia governorate were housed in 2 large cages each one (2.5 length breadth x 2.5 m height) as, well as, 5 aviaries (5 cm x 5 cm ) for rest and sleep, all cages had two perches .

Each cage had been large enough to ensure plenty of room to spread it's wings and flutter about easily. The bird prefer natural perches to fly and climbing about it and they are suitable for its small feet. Bird cages sand paper is best for the base. Temperature of the cage was about 17-24°C in light, draught-free place at about shoulder height as ,well as, avoiding direct sun light or heat.

cleanliness is important to the birds, health, so that sand paper needs changing daily. Food was offered on bottom of the cage.

#### **The Feeding:-**

The feed for healthy and happy budgerigars is important to provide it with correct amount of food to provide lots of variety according to (WOAW, 2014),60% of cockateil and budgie's diet as bird seeds food as sorghum of sun flower seeds, cooked rice, seedling grasses and whole meal bread, 10% of it's diet is fresh vegetables as peas, carrots and sweet potato, 5% of its diet should be fruits as apple. Do not feed the budgie sun flower seeds only, his will make it very sick and fat (Enkerlin- Hoeflich, 1995).

**Water:** should be provided with fresh water every day it has been given to the birds at least once or twice a day.The cage and all equipment has been cleaned once a day with mild disinfectant.

#### **Observation technique:-**

The behavioural observations were done using a focal sample technique, Video taping, camera and additional lamps were setup. The behaviour of the cockateil and budgerigars was recorded and analysed using the soft ware observers (observation sheet) according to (Gebhardt- Henrich and Steiger, 2006). Behavioural observations in both cages were recorded at 6 minutes interval through 3 hour observation period /week for each group for three months (experimental period) from January 2016 till march 2016, which represented the different diurnal hours as early morning (8-9 A.M), mid day(1-2 P.M) and afternoon (5-6 P.M).

The following behavioural activities, feeding, manipulation are object and feeding on the bottom, flying, climbing at the bar, preening, walking on bottom mounting on the perch at least once forward and back, Jumping , social bond, sexual bond, lifting the wings, rubbing head, back against perches, stretching wing. The frequency and duration were measured for all status, while for events only the frequency was determined.

#### **Statistical Analysis:-**

Results were statistically analyzed by use one way ANOVA according to (Snedecor and Cochran, 1989).

### **Results:-**

#### **Behaviour of Cockatiel in different diurnal hours:-**

The obtained results in table (1) revealed that there was a significant differences  $P (\leq 0.05)$ . of feeding time of Cockatiel in relation to the diurnal effects. As the feeding intake was increased at mid day than early morning and afternoon as following  $(340.00 \pm 47.25, 519.00 \pm 85.50$  and  $224.00 \pm 38.35)$  sec. respectively The feeding frequencies were nearly three times in all day times. There were a non significant differences of flying, standing, walking behaviour (time and frequencies) with in different day times. The sleeping behaviour and the time staying in the cage of Cockatiel were increased with late after noon  $(603.67 \pm 96.83$  sec.)and the differences were highly significant  $P (\leq 0.01)$ . There were a non significance differences of sexual and social bond and vocalization of Cockatiel with in the day hours.

**Comfort behaviour of Cockatiel in different diurnal hours:-**

The frequency of preening and feather shaking ( $15.33 \pm 3.17$  &  $13.33 \pm 1.20$ ) of Cockatiel in **Table (2)** not affected by diurnal factors, although it increased with dusk. Shaking of head was increased with late afternoon ( $19.66 \pm 1.76$ ) while rolling was increased at mid of day hours ( $21.33 \pm 3.38$ ) and the differences were highly significant  $P (\leq 0.01)$ .

**Behaviour of Budgerigars in relation to different diurnal hours:-**

**Table (3)** showed that there were a non significant differences of the feeding behaviour of budgerigars according to the diurnal factors, although the flying time was highly increased with early hours of the day light ( $372.67 \pm 26.74$  sec.) and the differences were highly significant  $P (\leq 0.01)$ . The standing time of budgerigars was at lowest level with late afternoon ( $434.67 \pm 146.85$  sec.) while the sleeping was at highest level at late afternoon ( $1627.70 \pm 192.68$  sec.) and the differences were highly significant  $P (\leq 0.01)$ . There were a non significance differences of sexual and social bond of budgerigars with in the day hours.

**Frequencies of comfort behaviour of Budgerigars in different diurnal hours:-**

Regarding to **(table 4)** there were a non significant differences of preening behaviour of budgerigars in relation to diurnal factors, although it increased with early morning and dusk. Shaking head was increased with late afternoon ( $24.00 \pm 4.72$ ) and the differences were highly significant  $P (\leq 0.01)$ . The frequency of rolling was increased early morning ( $15.33 \pm 1.76$ ) and the differences was significant  $P (\leq 0.05)$ .

**Maintenance behaviour of Cockatiel and Budgerigars in relation to family variation:-**

Concerning the different behavioural patterns of ornamental birds according to family variation in **table(5)** there were a non significant differences of the feeding behaviour between Cockateil and Budgerigars while there were a highly significance differences  $P (\leq 0.01)$  of flying frequency ( $15.00 \pm 1.42$ ) and walking behaviour ( $429.11 \pm 42.05$  sec.) as it increased with budgerigars. There were a non significant differences of sexual bond and social bond between Cockatiel and Budgerigars.

**Discussion:-**

Circadian rhythms are most important factor that affect the behaviour of the ornamental birds, it controlled by mean of endogenous diurnal clock. As the feeding time was increased at mid day than early morning and afternoon. These results were in agreement with (Wikelski et al., 2008). In contrast (Lincoln et al., 2006; Holberton and Able 1992; Heideman and Bronson, 1994; Loudon, 1994) as they stated that circadian factors weakly affect the behaviour of birds as, well as, it's displaying of endogenous and exogenous characters expect of one rhythms that persist for many years under persistent light-dark schedules with changing a day length. The circadian hours have great varieties in seasonal behaviour occupy the habit of birds in different geographical and environmental sites (Nelson et al., 2001; Newton 2007). Parrots feeding behaviour are increased only twice a day once in early to mid-morning and once in late afternoon (Enkerlin – Hoeflich, 1995) and bird did not attempt feeding behaviour during middle of day and may make up missed feedings.

The feeding frequencies were nearly three times in all day times. These results differ than that obtained with (Koenig 1999) who reported that Parrots ingestive behaviour from four to five feeding times to their nest per day excessively at midday hours. The birds have two ingestive behaviour per day except in absence of major mid day temperature stress they can consume more feeding times per day (Snyder et al., 1999). There were non significant differences of flying, standing, walking behaviour (time and frequencies) with in different diurnal hours. The birds behave as rolling behaviour by poachers that have been totally eliminated from many areas as, well as, can from climbing from tree to another in some seconds with lesser degree of human impacts conservations. Flying behaviour occupies largest amount of waking hours after feeding as maintain the feathers in good conditions and also regulate the body temperature (Cech et al., 2001). Repetitive flying from perch to perch represents a stereotypic movement and associated with inferior housing management and reduced welfare (Garner et al., 2003 and Mason, 1991a).

Sleeping behaviour and the time staying in the cage of Cockatiel were increased with late after noon. The obtained results were similar to that obtained with Ayala – Guerrero (1989) who found that sleeping between 7 P.M. and 7 A.M. as, well as, they moving to the cage for sleep near to 12 hour of night time sleep, they provided with a quiet, dark sleeping area, ideally separate from their day time living area. Sleep and rest occupy the most time of 24 hour on day, the activities that take up greatest portions of their waking day are feeding and grooming (Grooming and other comfort behavior are major behavioural activities for parrots of all species (Rattenburg, 2000). In tropical and semi-tropical regions, their days normally roughly 12 hours of light and 12 hour of dark (Forshaw, 1989). In contrast, during middle of the day parrots will have a period of quiet time in form of sleeping and drowsiness (Wirringhous et al., 2001).

There were a non significance differences of sexual and social bond and vocalization of Cockatiel with in the day hours. In contrast. (Kondo et al., 2006; Gwinner and Diltami, 1990) they stated that the most obvious expressions of circadian rhythm include change in reproductive behaviour and become restlessness under constant caged conditions. Social pair bonding and dominance rank increases the social status of ornamental birds with in group size (Gill, 1995). Social pair bonding and sexual behaviour during perching in close contact all preening and solicitation of all preening (Garnetzke – Stollmann and Franck, 1991).

The preening and feather shaking frequencies of Cockatiel not affected by diurnal factors, although it increased with dusk. Head shaking was increased with late afternoon while rolling was increased at mid of day hours. These results were in agreement with that obtained by (Gill, 1995; Crowell- Davis 2001).

Concerning the feeding behaviour of budgerigars, it did not affected by the diurnal factors, although the flying time was highly increased with early hours of the day light. These obtained results were agree with Rowley (1990) who stated that parrot morning time occupy for flying and feeding for the day, after feeding they rest or stand in perches or nesting area. The standing behaviour of budgerigars was at lowest level with late afternoon while the sleeping was at highest level at mid day. Birds compensated for the smaller distance between the perches by flying more frequently (Wyndhem 1980 a,b). Budgerigars feeding behaviour was higher on the ground as naturally behaviour in the wild (Gebhardt-Henrich and Steiger, 2005). All birds regained their flying abilities after being in aviary for a couple of days (Benz, 1982). The body weight and flying behaviour of budgerigars were significantly influenced by the of browsing and could effect the welfare of birds (Wedel, 1999).

Cage staying time and sleeping were at highest level at late afternoon and the differences were highly significant. Budgerigars almost visit the cage as it's natural behaviour and excessively where lay the eggs may reach to 9 to 16

days (**Talkbudgies–Breeding, 2013**). Avian behaviour and physiology are affected by many levels of biological rhythms which important for sleep / wake cycle . Budgerigars spent 38% of 24 hour day in period of slow wave sleep between 7.00 P.M. and 7.00 A.M. This sleep behaviour is due to endogenous circadian rhythms (**Ayala – Guerrero et al., 1987**).

There were a non significance differences of sexual and social bond of budgerigars with in the day hours, although the sexual behaviour of budgerigars and vocalization were increased with late afternoon. These results were in agreement with that obtained by **Spoon (2003)** who mentioned that vocalizations comprise an important aspect of parrot sexual behaviour of Budgerigars and Cockatiels.

Regarding to preening behaviour of budgrigars, it not affected by diurnal factors although it increased with early morning and dusk. Shaking head was increased with late afternoon. Rolling was increased early morning and the significance was significance. Female budgerigars do not seem to be adapted to adlibitum feeding and consume more food than optimal amount than male (**Schnegg et al., 2007**) and the male did not significantly gain body mass due to their greater flying activity or a smaller feed intake. Individual uses it's beak to groom anther birds in important behaviour for maintain of pair bond. Grooming behaviour in parrots includes scratching with feather, stretching beak rubbing feather shaking important for communication of the bird flock (**Wirminghous et al., 2001**). The behave signs of affection to their flock mates by preening and feeding one anther than make a sex bond (**Michael and Cooper 1981; The wild bugerigars, 2006**).

Concerning the different behavioural patterns of ornamental birds according to family variation, the feeding behaviour didn't affected by family variation between Cockateil and Budgerigars , while flying and walking behaviour were increased with budgerigars . The obtained results go hand by hand with **Wedel (1999)**. The body mass of budgerigar was lighter than Cockatiel so help them in flying and walking. The sleeping was increased with Cockatiel due to larger body mass than budgerigars. These results were similar to that obtained with (**Wirminghous et al., 2001**). There were a non significant differences of sexual bond and social bond between Cockatiel and Budgerigars, as the cort ship was the same in cockatiel and Budgerigars (**Spoon, 2003**).

### Conclusions:-

The results in this work suggested that we should make a comparative studies of behaviour of different ornamental birds of different families into different diurnal hours for enhancing the conservation of this species in a number of respects.

### Acknowledgements:-

Iam grateful to all staff members belonged to the zoo at zagazig city, Sharkia governorate for supplying me with all the informations expressed behaviour of ornamental birds.

#### Abstract

The purpose of this research is to analyze the portfolio using CAPM and APT models to predict stock returns LQ 45 in BEI. The issues raised in this study were: 1) Which combination of companies that produce optimal portfolio using the CAPM model; 2) Which company combination that produces an optimal portfolio by using the APT model; 3) How is the comparison of optimal portfolio by using Jensen's Index on the model of CAPM and APT models. Beta in this study using simple linear regression analysis method to the CAPM model and multiple linear regression model for APT. The independent variables in this model is LQ 45, while the dependent variable is the market risk premium, exchange rate, SBI, inflation and GDP. To determine the optimal portfolio return is analyzed using a model CAPM and APT models, whereas for portfolio performance measure used Jensen's index. On the other hand to know the difference between the CAPM model with the APT model used t test. The sample used in this study as many as 31 companies are determined by the criteria 1). Companies listed in the LQ 45 in BEI. 2). The company is listed in the LQ 45 actively traded 2 consecutive years from January 2010 to December 2011. The results of this study indicate that there are significant differences between Jensen's Index on the model of CAPM and APT models. With Jensen's Index score APT model larger than the CAPM model.

#### Introduction:-

In the stock market almost all investment contain elements of uncertainty or risk. Investors do not know with certainty the results to be obtained from its investments. In such circumstances it is said that these investors face risks in its investments. Given this risk, the investor will suffer or benefit that is not as expected, resulting in the emergence of irregularities, divergence is often called the uncertainty (uncertainty). In theory it is said that a portfolio of high risk will provide high returns as well (high risk, high return), so the greater the risk will be greater the return that would be acceptable, and vice versa. But not all investors agree with the statement, and the main desire of investors is to minimize risk and increase the cost (minimize risk and maximize return). So that they will look for a portfolio that has the lowest possible risk to the optimum return.

Model balance (analysis tools) will help the understanding of how to determine the relevant risk of an asset, as well as the relationship of risk and expected return on an asset when the market is in equilibrium. Two kinds of balance popular models that can be used in predicting exchange for shares (return) is expected is the Capital Asset Pricing Model (CAPM) and the Arbitrage Pricing Theory (APT). Both models are popular because of the ease of application as well as the assumptions underlying these two models.

Markowitz's portfolio theory put forward in 1952 (Arzac and Bawa, 1977), known as the Markowitz model, it provides a way how to invest efficiently and optimally. By forming the optimal portfolio. The purpose of forming the optimal portfolio is to fulfill the principles of investing. "Obtaining yield (return) at the desired level with minimum risk". To minimize the risk, there should be diversification in investing, is to establish a portfolio or to invest funds not only in one asset alone but to several asset. The problem is how large a proportion of the funds must be invested in each asset in order to obtain the desired level of yield with minimum risk. Bring Arzac research and use two parameters CAPM by behavioral approach safety- first on the return and risk, which found that safety-first approach implies a cautious attitude towards risk, portfolio choice and balance of the market comparable to that implied by the approach of expected utility. Black (1974) suggests that the estimator for the portfolio only the  $R_t - R$ . It is exactly the same as tests used for capital asset pricing model, using the world market portfolio to calculate this is consistent with the notion that taxes are what cause the world capital asset pricing model does not continue smoothly.

CAPM (Capital Asset Pricing Model) is a theory that tries to explain how an asset is determined by the market price, or how to determine the level of profit that is deemed worthy of an investment. Sharpe (1964) analyze how the links between return an asset ( $R_i$ ) with the market portfolio return ( $R_m$ ) is. By making a simple regression equation in which the dependent variable his return an asset and its independent variable return of the market portfolio will be determined how or the relationship between the return of the market portfolio with the return of certain assets. Cornell Research (1979), was able to show that the CAPM can be used to detect the investor excel in the world of asymmetric information, but they do not arouse demonstration CAPM as a practical tool for measuring performance.

APT (Arbitrage Pricing Theory) is an alternative model of CAPM to assess the financial asset. The financial model developed by Ross (1976) have emerged based on the idea that the financial markets are competitive, the arbitrage will make two assets that share similar characteristics, such as equally (riskless) or without taking the risk of giving expectations of return of the same. APT basically uses the idea also that two investment opportunities that have the same identical characteristics can not be sold at different prices (the law of one price). When assets are sold with the same characteristics different prices there will be a chance to do arbitrage, buying valuable assets cheap and sell at a higher price at the same time so as to obtain profit without risk.

APT model emphasizes that the level of expected return (expected return) is heavily influenced by macro-economic factors and not by the unique risks. We can assume that there are factors in arbitrage pricing as specific portfolios tend to be affected by the influence of joint (common influence). If the expected risk premium of each portfolio will be proportionate to the market beta portfolio, the APT and CAPM will give the same result.. Based on the description above, where it is known that the CAPM and APT models have strengths and weaknesses of each to determine which rewards portfolio shares (return) the most optimal and profitable for investors. The authors are interested to analyze the portfolio by using both models to compare measurement models that can be known where the most optimal as an asset assessment tool that can assist investors in selecting a portfolio decision making. In the APT model of macro-economic factors used in this study is inflation, gross domestic product, interest rates and the exchange rate against the US dollar (exchange rate).

#### **The author's intent in doing this Research are:-**

1. Determine the combination of companies which produce optimal portfolio using the CAPM model.
2. Knowing which combination of companies that produce optimal portfolio by using the APT model.
3. Determine the optimal portfolio performance comparison using Jensen's Index on the model of CAPM and APT models.

#### **Literature Review:-**

##### **Capital Asset Pricing Model:-**

Capital Asset Pricing Model (CAPM) is a model for determining the price of an asset (Sharpe, 1964). This model bases itself on equilibrium. Mathematically CAPM formula is as follows :  $E(R_i) = R_f + (R_m - R_f) \beta_i$

**Arbitrage Pricing Theory:-**

Approach Arbitrage Pricing Theory (APT) states that the expected return on an asset is a linear function of various macro-economic factors and the sensitivity of changes in any factor beta coefficient expressed by each of these factors (Ross, 1976). APT is the equations :  $E(R_i) - E(R_0) = \lambda_1 \beta_{i1} + \dots + \lambda_k \beta_{ik}$

**Index Jensen's:-**

Index Jensen's is also known as unique return expressed as alpha ( $\alpha$ ). If alpha = 0 means no unique return, if the alpha has a positive value, the fund's investment performance was better than the market index (ZalmiZubir, 2011: 259).

Jensen's measure:

Alpha = average return-expected return

**Methods:-**

The method used in the preparation of this research is descriptive and associative, ie data obtained are collected, processed, and analyzed mainly for the SBI interest rate, the rupiah against the US dollar, inflation, GDP, the risk premium market and the stock price on the company -the company listed as LQ45 shares in the Indonesian stock Exchange. This research was conducted using documentary data of Indonesia Stock Exchange period January 2010 to December 2011 (historical research or documentary research).

The population used in this study is LQ 45 listed in the Indonesia Stock Exchange. While the sample is determined by using purposive sampling method, which is intended to achieve certain limits or goals expected from this research. For that set of samples with the following criteria: The company whose shares including the shares are actively traded on an ongoing basis and is LQ 45 in Indonesia Stock Exchange 2010-2011 period.

**This study uses multiple methods of data collection are as follows:-**

1. Research Library (Library Research)
2. Research literature that research done by studying the literature related to the issues discussed authors in this study.
3. Field Research (Field Research) Field research is research conducted directly on the object of research, in order to get the data in relation in the field of research. This data collection can be done by means of observation and documentation.

**Data Analysis Techniques:-**

The analysis tool that authors use the quantitative analysis. Quantitative analysis is the analysis used by using the calculation of the figures, by comparing the value of E (R) CAPM model and the value of E (R) APT model, then do different test on the index Jensen's ( $\alpha$ ) CAPM model with index Jensen's ( $\alpha$ ) APT model using T-Test Paired Samples Test (Output Program SPSS version 17:00). Technical analysis of the data in this study through several stages, among others:

**Model CAPM:-**

1. Determining the estimation period (estimation period) that will be used in research. This study period from January 2010 until December 2011.
2. Calculate the real return ( $R_i$ ) on shares in companies LQ 45 by the formula:

$$R_{it} = \frac{P_{it} - P_{it-1}}{P_{it-1}}$$

3. Calculate market return ( $R_m$ ) is the return obtained from the ratio of stock index LQ 45 actively traded by the formula:

$$R_{mt} = \frac{LQ45_t - LQ45_{t-1}}{LQ_{t-1}}$$

4. Determining the regression model to find  $\beta$  shares of each company by the equation:  $R_m - R_f = X$  and  $R_i - R_f = Y$ .

5. After  $\beta$  shares of each company is known, then calculated the expected return of each company and created a line of SML. The formula used is:

$$E(R) = \Delta R_f + (\Delta R_m - \Delta R_f) \beta_i$$

6. Determine the combination of portfolio based on shares of companies whose line is above the SML.  
7. Determine the portfolio return ( $R_p$ ) any combination of the portfolio by the formula:

$$R_p = \frac{R_{i1}}{\sum R_i K_P} \times R_{i1} + \frac{R_{i2}}{\sum R_i K_P} \times R_{i2} + \dots + \frac{R_{in}}{\sum R_i K_P} \times R_{in}$$

8. Determining the regression model to search for any combination of  $\beta$  stock portfolio CAPM model with the equation:

$$\begin{aligned} R_m - R_f &= X \\ R_{p1} - R_f &= Y_1, R_{p2} - R_f = Y_2, \dots, R_{pn} - R_f = Y_n \end{aligned}$$

After  $\beta$  shares of each company is known, then the expected return is calculated every combination of portfolio CAPM model with the following formula:

$$E(R) = R_f + (R_m - R_f) \beta_i$$

#### Model APT:-

1. Determining the estimation period (estimation period) that will be used in research. This study period from January 2010 until December 2011.  
2. Calculate the real return ( $R_i$ ) on shares in companies LQ 45 by the formula:

$$R_{it} = \frac{P_{it} - P_{it-1}}{P_{it-1}}$$

3. Calculate market return ( $R_m$ ) is the return obtained from the ratio of stock index LQ 45 actively traded by the formula:

$$R_{mt} = \frac{LQ45_t - LQ45_{t-1}}{LQ_{t-1}}$$

4. Determining the regression model to find  $\beta$  shares of each company by the equation :  $R_m - R_f = X$  dan  $R_i - R_f = Y$ .  
5. e. After  $\beta$  shares of each company is known, then calculated the expected return of each company and created a line of SML. The formula used is:

$$E(R) = \Delta R_f + (\Delta R_m - \Delta R_f) \beta_i$$

6. Determine the combination of portfolio based on shares of companies whose line is above the SML.  
7. Determine the portfolio return ( $R_p$ ) any combination of the portfolio by the formula :  $R_p = \frac{R_{i1}}{\sum R_i K_P} \times R_{i1} +$

$$\frac{R_{i2}}{\sum R_i K_P} \times R_{i2} + \dots + \frac{R_{in}}{\sum R_i K_P} \times R_{in}$$

8. h. Determining the regression model to search for any combination of  $\beta$  stock portfolio APT model by the equation:

$$\begin{aligned} R_m - R_f &= X_1, I - R_f = X_2, \text{Kurs} - R_f = X_3, \text{PDB} - R_f = X_4 \text{ dan} \\ R_{p1} - R_f &= Y_1, R_{p2} - R_f = Y_2, \dots, R_{pn} - R_f = Y_n \end{aligned}$$

9. After  $\beta$  shares of each company is known, then calculated the expected return any combination of APT model portfolio with the following formula:

$$E(R_p) = R_f + (R_m - R_f)\beta_i + (I - R_f)\beta_i + (\text{Kurs} - R_f)\beta_i + (\text{PDB} - R_f)\beta_i$$

**Index Jensen's:-**

2. Calculating the index Jensen's model portfolio CAPM and APT model by using the following formula  

$$\alpha = R_i - E(R)$$
3. Calculating the average (average) from the calculation of Jensen's index ( $\alpha$ ) model of CAPM and APT model, then the calculation results be ranked from the largest to the smallest.
4. Regression Jensen's Index value ( $\alpha$ ) on the CAPM and APT models with T-Test Paired Samples Test to compare the significance between  $\alpha$  CAPM model with the APT model.

**Result and Discussion:-**

An Overview of Research Object

LQ-45 Index is an index composed of 45 stocks with liquidity (liquid) is the highest, which are selected by multiple selection criteria. In addition to an assessment of liquidity, the selection of these stocks also considers market capitalization. LQ-45 index was first launched on February 24, 1997. Today the basis for the calculation is July 13, 1994 with a base value of 100. All issuers listed on the Stock Exchange are classified into nine industry sectors according to the classification established BEI, named JASICA (Jakarta Industrial Classification). Nine (9) sectors contained in the incoming BEI LQ-45 index in 2010 and 2011 that were in line SML and is ranked top 3 in each sector according to its capitalization, among others:

**Agriculture sector:-**

PT. Astra Agro Lestari Tbk.

PT. Astra Agro Lestari Tbk (the "Company") was established on October 3, 1988 under the name. Suryaraya horizon, based on Deed 12 Notary RukmasantiHardjasatya, SH, in the company's articles of association, the scope of activities of the company is engaged in the plantation sector, trade, manufacturing, transportation, consulting and services.

PT. Perusahaan Perkebunan London Sumatra Tbk.

PT. Perusahaan Perkebunan London Tbk. (Company ") was established by Act No. 93 Notary RadenKadiman on December 18, 1962, and amended by Act No. 20 dated September 9, 1963. The Company is engaged in the plantation located in Sumatra, Java, Kalimantan and Sulawesi with the main product of crude palm oil and rubber, and a small amount of cocoa, tea and seeds.

**Property and Real Estate Sector:-**

PT. LippoKarawaciTbk.

PT. KarawaciTbk is single Reksakencana based on Deed 223 Notary MisahardiMilawarta SH, on October 15, 1990 in Jakarta. The Company is engaged in the field of urban development, development of large-scale integrated, malls, healthcare, restaurants, infrastructure and property, and portfolio management.

**Mining sector:-**

PT. Adaro Energy Tbk.

PT. Adaro Energy Tbk. (Formerly PT. Padang Karunia) was established by Act No. 25 on July 28, 2004 before Notary SukawatySumadi, SH, in Jakarta. In accordance with article 3 of the articles of association of companies engaged in trade, services, industry, transportation of coal, workshop activities, mining and construction.

PT. Indo TambangrayaTbk.

PT. Indo TambangrayaTbk. (The "Company") was established by Act No. 13 Notary Benny Kristianto, SH, on September 12, 1987, and approved by the Ministry of Justice of the Republic of Indonesia in Decree No. C2 640.HT.01.01.TH'89 dated January 20, 1989. The main activity of the company is mining, with investment in subsidiaries, and marketing services to the related companies.

PT. International Nickel Indonesia Tbk.

PT. International Nickel Indonesia Tbk., Was established on July 25, 1968 by Deed No. 49 compiled by Eliza Pondaag, a Notary in Jakarta. The main holding company is Vale S.A., a company registered in Brazil. The company's main activity is the exploration and mining, processing, storage, transportation and marketing of nickel and associated mineral products.

**Basic and Chemical Industry Sector:-**

PT. Holcim Indonesia Tbk.

PT. Holcim Indonesia Tbk. ("Limited") was established within the framework of the Foreign Capital Investment Law No. 1, 1967, as amended by Law No. 11 1970 based on Deed 53 dated June 15, 1971 before Notary Abdul Latief, SH, and from 1 January 2006 the company changed the name of PT. Semen Cibinong Tbk. into PT. Holcim Indonesia Tbk. The scope of this company is engaged in the operation of a cement plant and associated activities in the cement industry and to invest in other companies.

**Miscellaneous Industry Sector:-**

PT. Astra International Tbk.

PT. Astra International Tbk. (The "Company") was established in 1957 as PT. Astra International Incorporated, and in 1990 the company changed its name to PT. Astra International Tbk. Headquartered in Sunter, Jakarta. The scope of activities of companies engaged in general trade, industrial, mining, transportation, agriculture, construction, consulting and services.

**Trade in Services and Investment sector:-**

PT. United Tractors Tbk.

United Tractors ("UT" or "Limited") was established on October 13, 1972, as a heavy equipment distributor in Indonesia. The company went public and listed its shares on the Jakarta Stock Exchange on 19 September 1989. In addition to being a distributor of heavy equipment in Indonesia, UT also plays an active role in the field of coal mining and coal mining business.

**Financial sector:-**

PT. Bank Central Asia Tbk.

PT. Bank Central Asia Tbk. ("Bank") was founded with the name of the Company NV Commerce and Industrie Semarang Knitting Factory on October 10, 1955. The name has been changed for some time, the latest changes on May 21, 1974, namely PT. Bank Central Asia in front of the Notary RidwanSuselo. The head office of PT. BCA is located in Jakarta and two branch offices in Singapore and Hong Kong.

PT. Bank MandiriTbk.

The Indonesian government set up the Bank (the "Bank") on October 2, 1998, as part of the bank restructuring program in Indonesia. In July 1999, four (4) other banks, Bank BumiDaya, Bank Dagang Negara, Export-Import Bank Indonesia and Bank Pembangunan Indonesia joined Bank Mandiri.

PT. Bank Rakyat Indonesia Tbk.

PT. Bank Rakyat Indonesia Tbk. ("Limited") was formally established by the Act. No. 21 in 1968, but the roots of its history can be traced back since 1895. BRI went public in November 2003, and now the government has 56.8% of the shares issued and the remainder is owned by the public. BRI is famous for its focus on financing, Micro and Small and Medium Enterprises (SMEs).

**Sector Industrial Goods and Consumption:-**

PT. Unilever Indonesia Tbk.

PT. Unilever Indonesia Tbk. (The "Company") was established on December 5, 1933 with Lever Zeepfabrieken N.V name based on Deed 23 by Notary AH. Van Ophuijsen in Batavia. The company name was changed to PT. Unilever Indonesia by Deed No. 171 dated July 22, 1980 by notary KartiniMuljadi, SH, and then on June 30, 1997 based on Deed 92 company changed its name to PT. Unilever Indonesia Tbk., A notarized MudofirHadi, SH, in Jakarta. The Company is engaged in manufacturing, marketing, and distribution of consumer.

PT. Indofood SuksesMakmurTbk.

PT. Indofood SuksesMakmurTbk. (The "Company") was established on August 14, 1990 under the name. PanganjayaIntikusuma based on Deed 228 Notary Benny Kristianto, SH, in Jakarta. PT. Indofood SuksesMakmurTbk., Operates in all stages of food manufacturing from the production of raw materials, processing, to distribution of the retailer to the consumer.

PT. Kalbe Farma Tbk.

PT. Kalbe Farma Tbk. (The "Company") was established within the framework of Law on Domestic Investment No. 6 of 1968 and Act No. 12 in 1970, based on Deed 03 dated September 10, 1966 in presence of Notary Raden Imam Soesetyo Prawirokoesoemo in Jakarta. The company's main activity is the production, development and distribution of pharmaceutical products (human and veterinary).

#### Infrastructure Sector, Utilities and Transportation:-

PT. JasaMarga Tbk.

PT. JasaMarga Tbk. (The "Company") was established based on Government Regulation No. 04 1978 on the Establishment of Investment and State-Owned Company (Persero) in the field of management, maintenance and development of toll roads.

PT. Indika Energy Tbk.

PT. Indika Energy Tbk. (Formerly PT. IndikaIntiEnergi) was established by Act No. 31 dated October 19, 2000 before the Notary Hasan AlYani Ali Amin, A.H., in Jakarta. The scope of activities of the company are in the field of trade, construction, transportation, mining and services.

#### Results of Testing Requirements Analysis Data:-

Optimal portfolio

Outline Security Market Line (SML) describe the overall market return to long systematic risk (the risk can not be diversified away) or Beta. With these criteria results obtained from the company's stock 22 9 sector, then pursued again with a selection system that shares a big 3 ratings (sectors) based on market capitalization. That was selected 17 stocks of companies included in the criteria for the establishment of an optimal portfolio as shown in the figure below:

Figure 1:- Outline Security Market Shares LQ line 45 2010-2011

Figure 1 above shows the Security Market line is a line that shows the relationship between risk ( $\beta$ ) with the rate of profit. Where the upright axis is  $E(R_i)$  (expected return) and the flat axis illustrates the beta ( $\beta$ ) of each company. SML line drawn from a point  $R_f$  (risk free) cutting line  $R_m$  (market return) at  $\beta = 1$ . There are 9 industrial sector with 31 stocks of companies from all sectors of the incoming LQ 45 period of 2010 and 2011. In the image can be viewed from 31 LQ 45 after made the Security Market line then that position is above the line SML there are only 22 stocks. And the selection is again entering the top 3 rankings by market capitalization per sector then acquired 17 shares of nine sectors.

**Table 1:-** Stocks are selected for a combination of optimal portfolio

No	Code	Name	Sector	Symbol
1	AALI	Astra Agro Lestari Tbk.	1	A
2	LSIP	PP London Sumatera Tbk.	1	B
3	LPKR	LIPPOKarawaciTbk.	2	C

Sector 2 = Property and Real Estate				
Sector 3 = Mining Sector				
Sector 4 = Basic and Chemical Industry				
Sector 5 = Various Industries				
Sector 6 = Trade in Services and Investment				
Sector 7 = Financial Sector				
Sector 8 = Industrial Goods and Consumption				
Sector 9 = Infrastructure, Utilities and Transportation				

In this study to determine the combined portfolio writer used a tree diagram that is a way to describe the nature of a hierarchical structure in graphical form. Tree (tree diagram) a specific type of diagram that has a network topology (relationship) is unique (AdhiDarmawanSutjiadi, 2003). Each stock companies get the opportunity, and equal opportunities to represent the sector in the combined portfolio, resulting from the 17 stocks incorporated in 9 sectors industry produces 108 combined portfolio as shown in the following table.

**Table 2:-** The combination of company shares

No	Combination	No	Combination	No	Combination	No	Combination
1	A, C, D, G, H, I, J, M, P	28	A, C, D, G, H, I, J, M, Q	55	B, C, D, G, H, I, J, M, P	82	B, C, D, G, H, I, J, M, Q

**Index Jensen's (α) model CAPM dan model APT:-**

Calculating Jensen's portfolio index by using the following formula:

$$\alpha = R_p - E(R)$$

After E (Rp) of each combination is obtained then the value of the portfolio Jensen's index (α) of the model CAPM and APT model can be calculated by using the formula above the monthly period so that we will get the value of α portfolio of 108 combinations. Then α portfolio value each combination calculated the mean (average) of its α, so that there is only one (1) α within 1 (one) combined portfolio, and as a result there will be as many as 108 α on the combined portfolio. To determine the return combinations where the most optimal portfolio can be seen from an index value of Jensen's (α) of each of the combined portfolio, the greater the value of α, the greater the return portfolio. Jensen's Index (α) the top 10 of the 108 combined portfolio CAPM and APT models shown in the following table.

**Table 3:-** Jensen's Index (α) top 10 CAPM model.

No	Code	Combination	Indeks Jensen's (α)
1	77	B, C, E, G, H, I, K, O, P	0.025107
2	80	B, C, E, G, H, I, L, O, P	0.024153
3	104	B, C, E, G, H, I, K, O, Q	0.023378
4	76	B, C, D, G, H, I, K, O, P	0.023085
5	107	B, C, E, G, H, I, L, O, Q	0.022453
6	79	B, C, D, G, H, I, L, O, P	0.022161
7	68	B, C, E, G, H, I, K, N, P	0.021502
8	103	B, C, D, G, H, I, K, O, Q	0.021385
9	74	B, C, E, G, H, I, J, O, P	0.021249
10	78	B, C, F, G, H, I, K, O, P	0.021093

**Table 4:-** Jensen's Index ( $\alpha$ ) top 10 models of APT

No	Code	Combination	Indeks Jensen's ( $\alpha$ )
1	80	B, C, E, G, H, I, L, O, P	1.208032
2	25	A, C, D, G, H, I, L, O, P	1.207309
3	85	B, C, D, G, H, I, K, M, Q	1.190167
4	26	A, C, E, G, H, I, L, O, P	1.140713
5	100	B, C, D, G, H, I, J, O, Q	1.139271
6	54	A, C, F, G, H, I, L, O, Q	1.131452
7	55	B, C, D, G, H, I, J, M, P	1.112528
8	105	B, C, F, G, H, I, K, O, Q	1.090122
9	46	A, C, D, G, H, I, J, O, Q	1.071981
10	101	B, C, E, G, H, I, J, O, Q	1.070365

From Table 3 and Table 4 illustrates Alpha ( $\alpha$ ) is showing the difference between the actual investment returns with the expected investment returns or the benchmark for the level of market risk (beta) specific. On top ranking calculation results showed that the alpha value of 0.025107 CAPM model, which is a positive alpha value and meaning describe portfolio performance is good or feasible to do investment. While the alpha value of 1.208032 top APT model, demonstrating the value of alpha is positive and that means investment or portfolio performance in good standing and eligible to do investment.

#### Different test by using T-Test Paired Samples Test:-

To find out if there is a difference between Jensen's Index APT model with CAPM model used Jensen's t test. Based on calculations using the T-Test Paired Samples Test (Output Program SPSS Version 17:00) as set forth in the following table:

**Table 5:-** Data Test Result Differences Index of Jensen's t APT model with Jensen's Index CAPM model.

		Paired Differences				
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference	
					Lower	Upper
Pair 1	Jensen_APT - Jensen_CAPM	.531223	.374122	.035999	.459857	.602589

The data indicate that Jensen's Index APT model was higher than Jensen's Index CAPM model with a number of differences in the average standard deviation of 0.53223 to 0.374123. Total average score of Jensen's Index APT model is 0.542808, while the total score of the average Index of Jensen's model of CAMP is 0.011585.

#### Conclusion:-

##### Based on the results of the discussion can be drawn conclusions as follows:-

1. The combination of the company that produces the optimal portfolio by using the CAPM model is PP London Sumatra Tbk, LIPPOKarawaciTbk, Indo TambangrayaTbk, Holcim Indonesia Tbk, PT Astra International Tbk, United Tractors Tbk, Bank MandiriTbk, Kalbe FarmaTbk and JasaMargaTbk , with an Index score of Jensen's CAPM model by 0.025107.
2. The combination of the company that produces the optimal portfolio by using the APT model is PP London Sumatra Tbk, LippoKarawaciTbk, Indo TambangrayaTbk, Holcim Indonesia Tbk, PT Astra International Tbk, United Tractors Tbk, Bank of the Republic of Indonesia Tbk, Kalbe FarmaTbk and JasaMargaTbk, with an Index score of Jensen's APT model by 1.208032.
3. The results of this study showed no significant difference between Jensen's index CAPM model with Jensen's index APT model, where Jensen's index APT model was higher than Jensen's Index CAPM model with a number of differences in the average standard deviation of 0.53223 to 0.374123. Total average score of Jensen's index APT model is 0.542808, while the average score of Jensen's index CAPM model is 0.011585.

#### Abstract

Personal income tax base in India is very low as compared to other emerging and developed nations. During the year 2010-11 the total returned filed was about 3.3% of the total population of India whereas the ratio of returned filed by Singapore was 39%, USA 46%, and New Zealand 75%. Taxation serves the purpose of promoting economic development by curbing consumption, increasing the incentive to save and invest and transferring resources from the hand of the public to the government for investment and public finance purposes. Initiative on widening of Tax base should be honest and vigorous one so that the entire potential tax payers comes under its purview which in turn shall contribute to national tax revenue. So, there is a need for creating transparent, friendlier and less discriminatory administrative system. In light of the above the relationship and trend among personal income tax, corporate Tax, indirect and GDP are analysed and it is suggested for Expansion of Scope for Presumptive Taxation, Discourage Cash Economy/ Encourage Cashless economy, Tax on Agriculture Income, Imposition of more Tax on High Net Worth Individuals, Imposition of Property Tax, Gradual Reduction/Withdrawal of Various Subsidies And Exemptions and Expanding the Tax Base.

#### Introduction:-

Resource is the critical factor for every economy whether developed or least developed. Resource mobilisation is key to not only to the country but also for corporate and to all stake holders at large. It means collecting the funds from various internal and external sources for financing and executing development plans. The importance of resource mobilisation in emerging or under developed countries lies in curtailing consumption and augmenting savings for an accelerated investment in the interest of community. It is essential for the purpose of removing maladjustment between supply and demand of goods and services in order to avoid inflation and balance of payment difficulties.

Taxation serves the purpose of promoting economic development by curbing consumption, increasing the incentive to save and invest and transferring resources from the hand of the public to the government for investment and public finance purposes. It also reduces economic inequalities and mobilising economic surplus.

In India, additional taxation refers to additional resource mobilisation by levying additional taxes or through changes in the tax base and greater efforts at tax collection and by raising the administered prices of goods produced by public enterprises. Additional taxation has been one of the key sources of financing the expenditure during the five year plans.

No doubt the country needs larger tax revenue for financing its development plans but there are certain limitations to increase the tax revenue at a faster rate than in national income. The share of direct taxes in total tax revenue declined from 37% in 1950-51 to 14% in 1984-85. Gradually the share has increased from 14% in 1984-85 to 51% in the year 2014-15. But still the share is quite low in comparison to the existing international scenario. This indicates more dependence on indirect taxes. Indirect taxes raise prices which lead to inflationary consequences. The lower middle income groups and poorer sections of the society are being reduced to abject poverty with the reduction in their purchasing power due to increased indirect taxes. On the other hand, the burden of direct taxes has been declining on the upper middle and higher income groups. They are becoming better off. The scope for raising additional revenues through mere changes in the tax rates is limited. Moreover, the main drawback of higher taxation is that it leads to tax evasion thereby leading to creation of black money. There is considerable scope for reducing tax evasion, rationalising tax laws, streamlining tax administration and widening the tax base in the urban sector and tapping the surpluses of the affluent section of the farming community in rural sector of India.

So far as indirect taxes are concerned, there is the need for an adjustment and rationalisation of tax rates and GST is a step in this direction. Greater efforts are needed to explore ways of raising revenues by tapping rural income of large farmers and large land holders.

### **Objectives, Review Of Literature And Research Methodology:-**

The personal income tax base in India is very low as compared to other emerging and developed nations. The relevance of the study emanates from the fact that the contribution of indirect tax in total tax revenue collection in India is quite high in comparison to international scenario. This study aims to ascertain the tax structure, the ratio of direct taxes and indirect tax in total tax revenue collection, and impact of present tax system on lower income group and poor section of the society.

We try to explore the findings some of the studies. Gupta (2009) clarified in the trends in personal income tax reforms have a favourable impact on the growth of personal income tax. Nagaraj (2010) did a comparative study of direct tax revenue to GDP in developed and developing countries in the year 2008. It was 11% for India and the ratio was 42.9%, 43.1%, and 36.4% in Australia, France, and Germany respectively. Reason of Low ratio is due to collection of maximum tax from middle income group individuals. The major reasons for tax evasion are exorbitant rate, complex and complicated tax structure and inefficient and corrupt government administration. Wadhwa and Pal (2012) has found that the causes of tax evasion are high tax rates, corruption in public sector units, multiple tax rates and inefficient tax authorities. It has been suggested that reduction in tax rates, simplifications of tax laws, removal of loopholes in the tax system and to some extent proper processing of information available the under the annual information return can be best tool for improving Indian tax compliance. Dey (2014) pointed out that the structural shift in composition of tax revenue of central Government from indirect taxes to direct taxes. This can be considered as a positive development on the assumption that direct taxes are more equitable in impact and pro-poor as compared to indirect taxes. The Tenth Report of Public Accounts Committee (2014-15) shows that the numbers of tax payers in financial year 2006-07 were 313 lakhs and it increased to 335.80 lakhs by 2010-11. It shows an uptrend of 7.3 % and average annual growth of @ 1.8%. The direct tax collections was Rs. 2,30,181 Crore and Rs. 4,45,995 Crore during the same period and it shows an overall uptrend of 93% and average annual growth of @ 23.33%. Third Report of TARC (2014), and FICCI (2015) gave various reasons for declining tax payer base. The important cause for declining tax tax payer base are change in basic exemption limit, grant of additional exemption, huge unorganised sector, and culture of large scale cash transaction. There is huge gap between number of working company as per ROC Records (10.17 lakhs) and corporate tax payers registered with IT department (7 lakhs). The report suggested for wider tax base to achieve fiscal consolidation and higher tax GDP ratio, to meet the fiscal target of growth in tax collection, to enable government to undertake planned investment in infrastructure and other areas for growth and development of country, and to lower the burden of the existing tax payer. The NIPFP (2015) report indicates that the difference between potential and actual return filed is very high. The suggestion is to widen the tax base by increasing in penalty rate or reduction in tax which results in burden on people to file return, and reduction in tax rate will bring more persons in to tax regime. Fiscal Policy Strategy Statement (Fiscal policy in 2016-17) clarified that the effort of the Government has shifted from curtailing expenditure to generating higher revenues for

reducing the fiscal deficit and to raise additional resources to implement Government policy priorities. To achieve this, the Government policy is oriented broadly in favour of minimizing exemptions and broadening the tax base for a higher tax to GDP ratio.

The data collected from the secondary sources and simple growth trend and different ratio are being used for the analysis.

#### **Importance Of Direct Taxes Over Indirect Taxes In A Developing Or Under Developed Economy:-**

Taxation is the main source of revenue. Its classification into direct and indirect taxes is very essential because of their effects on production, distribution and consumption are different. In advanced countries of the world, the major part of their total tax revenue (about 70%) comes from direct taxes and about 30 percent in the form of indirect taxes. In contrast developing or under developed countries have to heavily rely on indirect taxes for revenue collection. Here indirect taxes account for 70 to 80 percent of the total revenue collection.

Direct taxes is paid entirely by those persons on whom they are imposed, and it cannot be shifted to others whereas indirect taxes which are later shifted to others by paying initially by those on whom they are imposed. Direct taxes are progressive in their rates which implies that higher incomes are taxed heavily and lower incomes lightly. The principle of equity which says that broader shoulder should bear a heavier money burden of a tax is satisfied. Direct taxes can be and are taxed according to the "ability to pay" of the tax payers. It, thus, satisfy the equity principle. On the hand indirect taxes are regressive in nature which will remain constant irrespective with the level of income and are equal for all. Elasticity in direct taxes implies that more revenue is collected by the government through direct taxes as the incomes of the people increases because larger income segments are taxes automatically at higher rates. It helps in collecting larger revenue. Direct taxes satisfy the cannons of economy convenience and certainty. They are economical in collection and administration hence the revenue rises without any corresponding addition to cost of collection. Direct taxes are paid directly to government. So there is no scope for any leakage. Though the direct taxes pinch the tax payer, the direct tax payers are more attentive towards the utilisation of their funds. People become more conscious of their rights and obligations. Thus there is a great chance to improve the educative value and civic consciousness. Direct taxes bring flexibility in their rates from time to time to avoid their adverse effect on willingness and ability to work, save and invest. Exemptions and concessions are used as tools to avoid the adverse effects of direct taxes on production, distribution and consumption.

#### **Data Analysis And Findings:-**

##### **Direct Tax (Data Analysis):-**

If a tax is intended to be paid by the person whom it is imposed is called direct tax. Direct taxes are imposed on receipts of income. Direct taxes are of various types like corporate tax, income tax wealth tax, property tax etc. Out of them corporate tax and income tax are major contributors to the revenue of the Government.

**Table No 1:-**

<b>Contribution Of Direct Taxes &amp; Indirect Taxes To Total Tax</b>				
<b>(Rs. In Crores)</b>				
<b>Financial Year</b>	<b>Direct Tax</b>	<b>Indirect Tax</b>	<b>Total Tax</b>	<b>Direct Tax to Total Tax (%)</b>
2000-01	68,305	1,19,814	1,88,119	36.31%
2001-02	69,198	1,17,318	1,86,516	37.10%
2002-03	83,088	1,32,608	2,15,696	38.52%
2003-04	1,05,088	1,48,608	2,53,696	41.42%
2004-05	1,32,771	1,70,936	3,03,707	43.72%
2005-06	1,65,216	1,99,348	3,64,564	45.32%
2006-07	2,30,181	2,41,538	4,71,719	48.80%
2007-08	3,14,330	2,79,031	5,93,361	52.97%
2008-09	3,33,818	2,69,433	6,03,251	55.34%
2009-10	3,78,063	2,43,939	6,22,002	60.78%
2010-11	4,45,995	3,43,716	7,89,711	56.48%
2011-12	4,93,987	3,90,953	8,84,940	55.82%
2012-13	5,58,989	4,72,915	10,31,904	54.17%
2013-14	6,38,596	4,95,347	11,33,943	56.32%
2014-15	6,95,792	5,43,215	12,39,007	56.16%
2015-16	7,42,295	7,11,885	14,54,180	51.05%

(Source: IT Department, Govt. Of India)

In Table-1 data shows the contribution of Direct Taxes to Total revenue. In the year 2000-01 the contribution of direct taxes to total taxes stands at 36.31% and this ratio has an increasing trend till 2009-10. There has been substantial increase in ratio in 2009-10 which stands at 60.78% in spite of the effect of global slowdown. The declining trend of direct tax to total revenue, in principle is not suggested for a developing country. If the direct tax to total tax declines it implies the growth of indirect tax to total tax. The increasing ratio of indirect taxes to total tax adversely affects the purchasing power of lower income group and poor people. That leads to more disparity in the poor and richer.

Figure 1:-

As the Figure-1 show, initially in 2000-01 the direct taxes are less than indirect tax. This trend continues till the mid of 2007-08. After 2007-08 the direct taxes ratio to total tax is started growing. In the year 2009-10 the direct tax is maximum level. The trend remained at higher side as compare to indirect to total tax ratio.

Table No- 2

Direct Tax Collection				
(Rs. In Crores)				
Financial Year	Corporate Tax	Personal Tax	Other Direct Tax	Total
2000-01	35,696	31,764	845	68,305

(Source: IT Department, Govt. Of India)

The Direct tax consists of corporate tax, personal tax and other direct tax. In the year 2000-01, the corporate tax and personal tax variance is small. The ratio of corporate tax increased gradually from Rs. 35,696 crore to Rs. 4,54,419 crore during the period 2000-01 to 2015-16. In contrast to that the personal tax increased in a slower rate i.e. from

Rs. 31,764 crore in 2000-01 to Rs. 2,86,801 crores during the same period. The other direct tax is not increasing in a constant pace; its trend is volatile as the data shows.

Figure 2:-

From the direct tax collection figure (Figure -2), it show that corporate tax is growing more in proportion to personal tax. The other direct taxes are stagnant. From the year 2008-09 the collection of all taxes, except other direct taxes are increasing in a better pace as compared to the period 2000-01 to 2007-08. In developed countries, the personal tax is more in comparison to corporate tax collection.

Table No 3:-

Personal Tax Ratios (Rs. In Crores)					
Financial Year	Personal Tax	Total Direct Tax	Personal Tax to Total Direct Tax (%)	Total Tax (Direct + Indirect)	Personal Tax to Total Tax (%)
2000-01	31,764	68,305	46.50%	1,88,119	16.89%
2001-02	32,004	69,198	46.25%	1,86,516	17.16%
2002-03	36,866	83,088	44.37%	2,15,696	17.09%

2014-15	2,65,772	6,95,792	38.20%	12,39,007	21.45%
2015-16	2,86,801	7,42,295	38.64%	14,54,180	19.72%

(Source: IT Department, Govt. Of India)

Table No. - 3 is shows the ratio of personal taxes with total tax collection and total direct taxes during 2000-01 to 2015-16. Personal direct taxes to total direct taxes are decreasing. Initially, in 2000-01 the personal taxes collection is about to 46.50% of total direct taxes collection, but in consequent period it declined and by 2015-16 it was only 38.64% of total direct taxes collections. In contrast to that the ratio of personal income taxes to total taxes

collections were increased up to 2007-08 in increasing rate but after that it fluctuated and grew unevenly. In 2015-16 it declined to 19.72% of total tax revenue. During the last 16 years personal tax collection has multiplied by 9 times whereas direct taxes and total tax revenue has multiplied by 10 times and 7 times respectively. It implies personal tax contribution in total direct tax revenue declines.

Figure 3.1:-

The figure 3.1 shows all three types of taxes are growing from 2000-01 to 2006-07. Due to the global slowdown and various scams took place in India the profit of various companies are adversely affected. So, during 2006-07, the all three types of taxes were affected adversely. After taking various measures by regulators the economy survived and started growing and gave positive result.

Figure 3.2:-

The figure 3.2 give the idea regarding the ratio of personal tax to total direct tax is in downward trend which denotes collection higher corporate tax in total direct tax. More dependence on corporate tax collection adversely affects the industries. This de-motivates the corporate in the economy. Personal tax to total tax ratio shows a very slow growth or we can say almost remain stagnant. The contribution of personal tax in both direct and total tax should be strengthened for an emerging economy.

Table No. 4:-

Corporate Tax Ratios (Rs. In Crores)					
Financial Year	Corporate Tax	Total Direct Tax	Corporate Tax to Total Direct Tax (%)	Total Tax (Direct + Indirect)	Corporate Tax to Total Tax (%)
2000-01	35,696	68,305	52.26%	1,88,119	18.98%
2001-02	36,609	69,198	52.90%	1,86,516	19.63%
2002-03	46,172	83,088	55.57%	2,15,696	21.41%
2003-04	63,562	1,05,088	60.48%	2,53,696	25.05%
2004-05	82,680	1,32,771	62.27%	3,03,707	27.22%
2005-06	1,01,277	1,65,216	61.30%	3,64,564	27.78%
2006-07	1,44,318	2,30,181	62.70%	4,71,719	30.59%
2007-08	1,93,561	3,14,330	61.58%	5,93,361	32.62%
2008-09	2,13,395	3,33,818	63.93%	6,03,251	35.37%
2009-10	2,44,725	3,78,063	64.73%	6,22,002	39.34%
2010-11	2,98,688	4,45,995	66.97%	7,89,711	37.82%
2011-12	3,22,816	4,93,987	65.35%	8,84,940	36.48%
2012-13	3,56,326	5,58,989	63.74%	10,31,904	34.53%
2013-14	3,94,678	6,38,596	61.80%	11,33,943	34.81%
2014-15	4,28,925	6,95,792	61.65%	12,39,007	34.62%
2015-16	4,54,419	7,42,295	61.22%	14,54,180	31.25%

(Source: IT Department, Govt. Of India)

The Table- 4 data help us to interpret corporate tax to direct tax and total tax. In 2000-01 the corporate tax is 52.26% of total direct tax revenue. But gradually it increased and by 2010-11 it reached to 66.97%. After that it started declining, by 2015-16 it is 61.22%. The corporate tax to total tax is 18.98% in 2000-01. It increased by 20.36% in 2009-10. Once again it started declining and come down to 31.25% in 2015-16. The authority should take steps to bring down the much dependency on corporate tax to direct tax.

Figure 4:-

Corporate tax to total direct tax shows an uptrend during the period 2001-02 to 2010-11 as shown in figure-4, after that it shows declining trend till 2015-16. Corporate tax to total tax shows an upward trend during the period 2001-02 to 2009-10, after that it declined. By, 2015-16 corporate tax to total direct tax and total tax is 61.22% and 31.25% respectively.

Table No 5:-

TRENDS OF VARIOUS TAXES AND GDP DURING 2000-01 TO 2015-16						
Financial Year	Trends of Corporate Tax (%)	Trends of Personal Tax (%)	Trends of Total Tax (Direct + Indirect) (%)	Trends of Total Direct Tax (%)	Trends of Indirect Tax (%)	Trends of GDP Current Market Price (%)
2000-01	1.00	1.00	1.00	1.00	1.00	1.00
2001-02	2.56	0.76	-0.85	1.31	-2.08	8.50

2009-10	585.58	318.19	230.64	453.49	103.60	207.15
2010-11	736.75	360.45	319.79	552.95	186.87	265.02
2011-12	804.35	435.77	370.42	623.21	226.30	328.55
2012-13	898.22	535.44	448.54	718.37	294.71	381.04
2013-14	1,005.66	664.66	502.78	834.92	313.43	440.11
2014-15	1,101.61	736.71	558.63	918.65	353.38	496.53
2015-16	1,173.02	802.91	673.01	986.74	494.16	545.33

(Source: IT Department, Govt. Of India)

In Table No. 5 taking 2000-01 as base year by 2015-16 the growth rate of various taxes is shown. In respect to corporate tax the growth is highest in comparison to all other taxes. Its growth is near 1,173 % and indirect tax is grown with least that is by 494.16%. The personal tax grew by 802.91%.

Figure 5:-

Here 2000-01 is the base year. The figure shows the growth of various ratios and GDP from base year. From 2009 onwards direct taxes trends getting steeper which is not supporting to an economy like India. Total Taxes trends above the GDP which indicates that the government is not replacing new avenues for revenue like royalty, tax on agriculture income, property taxes etc.

**Tax To Gdp Ratio (Analysis):-**

The Tax-to-GDP ratio is the ratio of tax collected compared to national gross domestic product (GDP). Some countries seek to increase the tax-to-GDP ratio by a certain percentage to tackle deficiencies in their budgets.

**Table No. – 6**

Different Taxes To Gdp Ratio				
Financial Year	Corporate tax as % of GDP	Personal tax as % of GDP	Direct tax as % of GDP	Indirect tax as % of GDP
2000-01	1.70%	1.51%	3.25%	5.70%
2001-02	1.60%	1.40%	3.03%	5.14%
2002-03	1.88%	1.50%	3.38%	5.39%
2003-04	2.31%	1.50%	3.81%	5.39%
2004-05	2.55%	1.52%	4.10%	5.27%
2005-06	2.74%	1.72%	4.47%	5.40%
2006-07	3.36%	1.99%	5.36%	5.62%
2007-08	3.88%	2.41%	6.30%	5.60%
2008-09	3.79%	2.13%	5.93%	4.79%
2009-10	3.79%	2.06%	5.85%	3.78%
2010-11	3.89%	1.91%	5.81%	4.48%
2011-12	3.58%	1.89%	5.48%	4.34%
2012-13	3.52%	2.00%	5.53%	4.68%
2013-14	3.48%	2.14%	5.62%	4.36%
2014-15	3.42%	2.12%	5.55%	4.33%
2015-16	3.35%	2.11%	5.47%	5.25%

(Source: IT Department, Govt. Of India)

The Table No – 6 shows the ratio of various tax to GDP ratio. In 2000-01 the indirect tax to GDP ratio i.e. 5.70% is highest in comparison to other taxes. In subsequent period Indirect tax to GDP ratio declining up to 2009-10. After that it uptrend once again and reach to 5.25%. Corporate tax to GDP ratio is 1.70% in 2000-01 and reached to 3.89% in 2010-11 at highest level during 2000-01 to 2015-16. But after that it declining and reached to 3.35%. The personal tax to GDP ratio reached to the peak level 2.41% during the same period. After 2007-08 it declined up to 2011-12. It is noticed that the personal tax to GDP ratio is volatile. Direct tax to GDP ratio was 3.25% in 2000-01, except 2001-02 and it moves upward till 2007-08. Though both personal and corporate tax ratio declined in 2008-09 hence direct tax to GDP ratio also declined.

**Figure 6:-**

The figure-6 shows that the personal tax-GDP ratio remained low throughout 2000-01 to 2015-16. It implies that personal incomes tax contributes very less to the economy as compare to other taxes. It is an unpleasant scenario for an emerging economy. It widens the gap between poor and rich. In this case Government should either widen the tax base or increase the tax rate. But as Kelkar report suggests increasing the tax rate will lead to tax evasion, and window dressing, so widening the tax base is required. Corporate tax to GDP is just 3.25% in 2000-01 but it increased to 5.47% by 2015-16. In case of indirect tax to GDP ratio the rate is higher as compare to other tax ratios. More dependent on indirect tax leads to reducing the purchase power of the common man. So the indirect tax rate should be moderate. As suggested by Kelkar committee report GST should be brought as soon as possible for rationalising indirect taxes which should be associated with reducing subsidies and indirect tax rate. Subsidies are not reaching the needy. If subsidy is required to be given the DBT (Direct Benefit Transfer) should come into picture at every case as it happened with fertiliser and domestic cooking gas case brought by Government of India

#### International Experience (Brics):-

India is the fastest growing nation in 2015-16 and one of the emerging economies in the world. Every country wants to keep good relation with India. The relationship may either in bilateral or multilateral. India is member of various multilateral institutions. BRICS is the collaboration of Brazil, Russia, India, China and South Africa. These countries are emerging countries as like as India. So a comparison of tax to total revenue is done from 2000 to 2015 for better picture.

**Table No.- 7**

Share Of Income Tax To Total Revenue (Brics Countries)					
Year	Brazil	Russia	India	China	South Africa
2000	NA	8.3	11.3	12.4	42.3
2006	18.7	8.8	20.4	24.5	40.8
2007	19.4	9.5	23.6	23.3	43.3
2008	20.5	10.4	21.3	24.3	44.4
2009	19.9	12.2	20.5	22.6	46.6
2010	NA	11.2	20.7	21.3	43.9
2011	NA	9.6	20.1	22.0	41.3
2012	NA	9.6	20.2	21.7	43.3
2013	NA	10.2	21.4	22.4	44.4
2014	NA	10.1	19.9	22.8	46.6
2015	NA	10.6	NA	22.5	NA

(Source: BRICS\_Joint\_Statistical\_Publication\_2016)

The share of income tax to total revenue ratio amongst BRICS countries shows that Brazil, China and South Africa contributes higher in comparison to India. South Africa maintains the income tax share in total revenue with around more than 40% which is good for any economy. In South Africa Income tax to total revenue in the year 2000 was 42.3%. Year by year it increased and reached 46.6% in 2014. Whereas China, India and Brazil maintain their income tax to total revenue near around 20%. Among them China has 22.5% share of income tax to total revenue in 2015. India has 19.9% in 2014. Russia's income tax ratio in total revenue is around 10.6% in 2015.

**Figure 7:-**

In comparison with other BRICS countries India's ratio of income tax to total revenue is lower than South Africa and China and higher than Brazil and Russia. South Africa's income tax share in total revenue is increasing; it is also the case of China. Except these two countries other three countries ratio is uneven. Taking the background of

Russia and China which are socialist (Communist) economy and later on liberalised, it is natural the share of income tax to total revenue would not rise at a faster rate. In case of South Africa the ratio is quite high and it is presumed that perhaps individual income tax contributes more towards the resources for development.

#### Effective Assesses And Tax Base Analysis:-

Tax base means number of tax payers come into a particular income regime and accordingly tax slabs are fixed. As per the tax slab the assessee pay tax. In India, currently three types of tax slabs existed i.e. 2.5 lakhs to 5 lakhs (5% slab), more than 5 lakhs to 10 lakhs (20% slab) and more than 10 lakhs (30% slab).

**Table No 8:-**

Comparison Of Number Of Effective Assesses With Personal Tax Collection						
Financial Year	Individual Effective Assess	Growth of no of Individual Assesses	Trend of Individual Assesses	Personal Tax Collection (In Crore)	Growth of Personal Tax collection	Trend of Personal Tax Collection
2000-01	206,62,926		0.00%	31,764		0.00%
2001-02	237,34,413	14.86%	14.86%	32,004	0.76%	0.76%
2002-03	259,35,556	9.27%	25.52%	36,866	15.19%	16.06%
2003-04	266,24,224	2.66%	28.85%	41,386	12.26%	30.29%
2004-05	247,92,990	-6.88%	19.99%	49,268	19.05%	55.11%
2005-06	273,70,659	10.40%	32.46%	63,689	29.27%	100.51%
2006-07	293,55,248	7.25%	42.07%	85,623	34.44%	169.56%
2007-08	308,68,243	5.15%	49.39%	1,20,429	40.65%	279.14%
2008-09	301,01,260	-2.48%	45.68%	1,20,034	-0.33%	277.89%
2009-10	313,84,084	4.26%	51.89%	1,32,833	10.66%	318.19%
2010-11	408,83,558	30.27%	97.86%	1,46,258	10.11%	360.45%
2011-12	443,46,852	8.47%	114.62%	1,70,181	16.36%	435.77%
2012-13	490,33,288	10.57%	137.30%	2,01,840	18.60%	535.44%
2013-14	486,63,680	-0.75%	135.51%	2,42,888	20.34%	664.66%

(Source: CBDT & IT Department, Govt. Of India)

The table no.- 8 data shows that individual assesses are growing 135.51% during 2000-01 to 2013-14 financial year. Whereas, the total direct personal tax collection grew by 664.66%. The growth of number of individuals effective assesses has been doubled during this period. During the year 2010-11 the total returned filed was about 3.3% of the total population of India whereas the ratio of returned filed by Singapore was 39%, USA 46%, and New Zealand 75%. Since the returned filed ratio in India is very low, widening of direct tax base is required to include more people to come into the tax base.

**Table No. 9:-**

Comparison Of Growth Effective Corporate Assesses With Collection Growth						
Financial Year	Company Effective Assess	Growth of no of Companies	Trend of no of Companies	Corporate Tax Collection (In Crore)	Growth of Corporate tax collection	Trend of Corporate tax collection
2000-01	3,34,261	0	0	35,696	0	0

(Source: IT Department and Finance Ministry, Govt. Of India)

The corporate assesses were 3,34,261 in 2000-01 and by 2013-14 financial year their numbers uptrend to 7,14,419. It means around 113.73% growth in number of corporate tax assesses. In relation to that the corporate tax collection has grown by 1005.66%. It indicates that a few number of companies are paying large amount of tax. Again as on March 2011, the total companies at work as per records of Registrar of Companies is 7,14,555 where as 5,96,377 companies have filed their Income tax return which means about 1,18,178 companies has not at all filed the return even though they are statutorily bound to file Income Tax Return.

**Table No 10:-**

<b>Tax Base Of Individual Assesses For Assessment Year 2014-15</b>				
Range (in INR)	No of Returns (In Lacs)	Percentage of No of Returns (%)	Sum of Gross Total Income (in Crore INR)	Percentage of Sum of Gross Total Income
>0 and <=5,00,000	275,62,563.00	75.49%	7,37,756.00	12.82%
>500,000 and <= 10,00,000	65,09,561.00	17.83%	8,10,008.00	14.07%

Source (Income Tax Return Statistics-2014-15, CBDT, Govt. Of India)

**Figure 8:-**

In zero to 5 lakhs income slab consisting of 2.76 crores nos of assesses which constitutes around 75% which represents that the major effective tax assessee are in low income group. In 5 to 10 lakhs slab consisting of 65 lakhs nos of assesses which constitutes around 18% which means around 93% of effective assesses is having income below 10 lakhs and the balance 7% which is around 7 lakhs assesses is having income of more than 10 lakhs. In contrast to that around 17.87 lakhs passenger car have purchased during the financial year 2013-14. This gap indicates that the practice of non-compliance of tax is very high in India as compared to BRICS countries and many developed and emerging economies.

Figure 9:-

The gross total income shows that 16% of total income lies with 0.13% population. 1.47 lakh assesses are above 50 lakh income category their ratio in total income is 34%. There is miniscule of tax return in India i.e. around 89 lakh assesses out of 130 crore population are above the 5 lakhs income category which is less than 1% of total population. Hence there is a huge gap to increase the tax base to bring more people into the tax bracket..

### Suggestions:-

1. **Expansion of Scope for Presumptive Taxation:** Presumptive taxation involves use of indirect means to ascertain tax liability, which differ from the usual rules based on the taxpayer's accounts. Various presumptive taxation methods are in use including reconstruction of income, percentage of gross receipts, asset based taxation, industry specific methods, methods based on outward signs of life style, etc. Argentina and Mexico have adopted the asset based taxation method. Ghana applies a minimum tax based on an individual's profession or trade. France and Belgium use a contractual method based on an advance agreement between the taxpayer and tax administration to base the tax liability on estimated income instead of actual income. In Israel and France, extensive work has been done to establish prevailing profit rates in various business activities. Presumptive of tax base should be extended to other tax fields.
2. **Discourage Cash Economy/ Encourage Cashless economy:** The cash economy is a major handicap in the Indian economic system. Large-scale transactions are understood to take place in cash. Cash plays an important role in generation of black money. It has always been a facilitator of black money since transactions made in cash do not leave any audit trail. Unorganised sectors have remained under-taxed or untaxed. It has given rise to a large cash economy which comprises mainly the unorganised sector that tends to include small businesses, as well as high net-worth individuals. With Cashless economy the tax base shall start widening with the inclusion of the entire sector under tax net.
3. **Tax on Agriculture Income:** Only state government can impose/levy tax of agricultural income. This may be revisited on the light of introduction of GST- a new approach to levy of tax and again it shall help in compensating the loss incurred by state and the obligation by Central to state. The principle should be in line with ability to pay i.e. the richer farmer should not be an exception to universally recognised principles.
4. **Imposition of more Tax on High Net Worth Individuals:** Direct personal taxes are imposed for equity, peace, and balanced growth in the society. To fulfil this, it is essential to tax more to higher net worth individuals and use it in developmental activities where all stake holder of the society will get its benefit.

5. Imposition of Property Tax: If better service delivery requires more resources, where can they be found? Perhaps the greatest immediate scope for revenue comes from the property tax. Property tax as a share of own revenue is above 50 per cent in Kanpur and Lucknow, but it is less than 15 per cent in Bhopal and Ranchi. So, the problem is not necessarily that Urban Local Bodies cannot raise resources because they are prevented from doing so. The major factors contributing to poor realisation from property tax are the poor assessment rate, weak collection efficiency, flawed methods for property valuation, loss on account of exemptions, and poor enforcement. In an exercise done for the Survey an attempt has been made to assess the property tax potential of Bengaluru and Jaipur using the latest satellite-based imagery. The results estimate that currently Bengaluru and Jaipur are collecting no more than 5 to 20 per cent of the property tax potential. Put differently, cities could increase their resources five to twenty fold. All efforts must be directed at realising potential of property taxes.
6. Allowance of various Deductions and Rebates: Under Direct Tax various Deductions and Rebates can be provided and this can be availed only on Filing of Tax Returns: From various findings and with our observation we see that many people are getting deductions, rebates and subsidies without filling tax returns. Government should make mandatory provision in this regard that those who want to get rebates or subsidies or deductions should file the returns give an affidavit in the assessment year.
7. Gradual Reduction/Withdrawal of Various Subsidies And Exemptions: Many good persons are frustrated with the way government gives subsidies and allowing exemptions to the unwanted people, those who actually want to take just advantage of this type of schemes. So Government must abolish all exemptions and subsidies and in place of that give soft loan and scrutinise in a scientific and , systematic way regularly so that chances of misuse shall be minimum.
8. Expanding Tax Base: In assessment year 2014-15, 4.87 crore people filed return which is less than 4% of total population. Domestic tax evasion is more concern than chasing black money abroad and is a testimony of India's failure to broaden its tax net. No of Salary Assessee having Income of more than 10 lacs is 11 lacs. India still have plenty of citizens who go out and buy expensive cars and jewellery but are not willing to pay the taxes to government on Income they earn. The sad fact is that all of us are too used to the freebies.
9. Inclusion of Unorganised and Rural Income under the expanded tax base: If we look at the unorganised or rural enterprises, we can see that many of them either do not know about the tax or do not want to pay tax. It is essential for an emerging economy like India to include them into the tax base. It is possible through awareness and investigation. If we can knock these sections then India's GDP as well as growth will be stronger by small contributions from this sector.
10. Reform in Tax Administrators: In India it is assumed that, why should pay so much tax, let's give some amount to government and some tax assessment officer and rest is our pocket. For example if a person is taxable income of 25 lakh for 2016-17 assessment year, then his tax liability is around 5.93 lakh. In place of showing taxable income of 25 lakh he shows a profit of 15 lakh and tax liability is 2.83 lakh. If scrutiny incurred then he pay 50000 to the tax assessment officer and rest 1.6 lakh remained with the tax payer. So government should dismiss such officers and seize all the property of that tax officer. The judiciary also must support and take strong actions so that no one will think about such embezzlement. This is possible only by bringing necessary reforms and transparency in tax administration which will help building of trust between tax assessee and tax administration

### **Conclusion:-**

There has been a good start by the present Government in widening the tax base through tax reforms both in direct and indirect taxes. At execution level the initiative should be honest and vigorous one so that the entire potential tax payers comes under its purview which in turn shall contribute to national tax revenue which shall further enable the Government to spend in providing basic social security measures and it shall also help in developing a healthy tax infrastructure in line with developed countries where the direct tax collection is lion share to total revenue. So, there is a need for creating transparent, friendlier and less discriminatory administrative system. Further there is also a need to educate the people about Indian tax law and create such an environment in which they pay their due taxes, do not evade the tax and feel proud in discharging their duty to pay the taxes. The rural India should be connected to the main stream if large farmers and land holders are brought under the tax net.

#### Abstract

The deleterious effects of synthetic plastics and their products have become a major concern for researchers. Bioplastics or plastics produced by the microorganism is a promising replacement for the conventional synthetic plastics. Polyhydroxyalkanoate a biologically produced biodegradable substance that has characteristic properties similar to that of conventional plastics. Polyhydroxyalkanoates are secondary metabolites of microorganisms which are produced under stressful conditions. In this work, four different samples were collected. These strains were then morphologically and biochemically characterized. The strains producing polyhydroxyalkanoates from each sample were identified by Sudan Black staining. A 48-hour culture of these strains was harvested and alkali lysis method was used to isolate polyhydroxyalkanoate and polyhydroxyalkanoate was quantified. Sample 2 had the highest polyhydroxyalkanoate accumulation % (95.65%). The method used for the production and isolation of polyhydroxyalkanoate was cost effective and ecofriendly.

#### Introduction:-

Synthetic plastics are one of the greatest inventions of mankind and have been developed into a major industry and have become an essential part of our day to day life. They are designed in such a way that they are suitable for constant and long lasting performance causing them to be inert to natural and chemical breakdown. The durability of the disposed plastic had caused many serious environmental problems.

As dependence on synthetic plastics and their endless products have resulted in waste accumulation and greenhouse gas emission, recent technologies are more focusing on developing a bio-green substituent for plastic that exerts negligible side effects on the environment.

Polyhydroxyalkanoate (PHA), a biologically produced biodegradable substance which has similar characteristics of plastic have become a main focus for the research in finding a substituent for plastic. The PHA is the only bioplastics completely synthesised by the microorganism. PHA is the linear polyesters that are produced by bacterial fermentation of sugars or lipids which can be converted into CO<sub>2</sub> by microorganisms. They can be either thermoplastics or elastoplastic with the melting point ranging from 50 - 180 °C.

Address:- Vijaya College, Department of Microbiology, R.V.Road, Basavangudi, Bangalore.

PHA production is increased by the excess of carbon source and limiting the nutrients like nitrogen, phosphorous, sulphur, magnesium, iron etc (minimal media). It is secondary metabolite produced under stressful conditions. PHA is typically produced as a polymer of 103-104 monomers, which accumulates as inclusions of 0.2-0.5 micrometer in diameter.

PHA have rich properties depending on the structures over 150 different PHA monomers are reported homopolymers, random copolymers and block copolymers of PHA can be produced depending on bacterial species. PHA is thermoplastics, biodegradable, biocompatible, optically active and non-permeable.

As PHA can be used the field of packaging, medicine and much more, and due to cost-effectiveness & environmentally friendly properties, it is the promising alternative to the conventional plastics.

## Materials And Methods:-

### Materials

Samples, all the reagents used were obtained from SDFCL(Indian), Ranbaxy(Indian) and Fine Chemicals Ltd(Indian)

### Sampling

Four samples were collected from different places to isolate the PHA-producing bacteria.

**Table 1:- samples**

Sample – 1	Sludge (Chamrajpet)
Sample -2	Sewage (Jnana Bharathi)
Sample – 3	Yeast Granules
Sample -4	Forest soil (Wayanad)

### Isolation of Bacterial Strains:-

Isolation of bacterial strains was carried out by serial dilution of the samples in saline solution followed by plating of the samples onto nutrient agar media. The samples were then incubated at 37°C for 48 hours.

### Colony Characteristics:-

Once a bacterium has been obtained in pure culture, it has to be identified in order to study them [13].

### Gram Staining:-

Gram staining [2, 4, & 9] is one of the techniques employed to analyse the bacteria and to classify them in order to study them.

### Biochemical Test:-

For the biochemical characterization of the isolates biochemical tests [6, 10, 15, 17, 20, 21, & 22] were done for each isolate.

Motility of the bacteria was observed by hanging drop slide [11, 12, & 19]. This experiment is helpful in observing both motility and general shape of living bacteria.

### Screening of Bacterial Strains for PHA Accumulation by Sudan Black Staining.

Bacterial strains were screened for the accumulation of PHA by Sudan black staining [3 & 18]. Sudan Black stain is a dye that is soluble in fat and insoluble in water and thus accumulates in fat globules of the cell. It is used for staining neutral lipids and triglycerides and some lipoproteins. Thus Sudan Black stain is used to identify PHA granules as they are fat globules.

### Culturing of Micro-organisms in Minimal Media:

As PHA is a secondary metabolite and is produced under stressful conditions, it is very much necessary to culture the microorganisms in a minimal nutrient media [1, 7, & 24]. Minimal media is an unbalanced culture media which contain an excess of carbon sources but a very limited amount of oxygen, nitrogen, phosphorous, sulphur, or magnesium. This minimal media will provide the suitable conditions for active PHA production by the cells.

The bacterial strains identified to produce PHA by Sudan black staining were inoculated into the minimal nutrient media. 15 ml of each sample was directly inoculated into 50 ml of minimal media. Whereas in the case of yeast two granules (0.5g each) of dry yeast were inoculated. The samples were incubated for 48 hours.

#### Examination of Samples by Spectroscopy:-

The optical density of PHA produced by each sample was obtained by spectroscopy [16]. UV – Visible spectroscopy is an important technique to determine the formation and stability of PHA.

#### Extraction of PHA

The cells were harvested from a 48-hour culture by filtering using Whatmann filter paper. The filtrate was allowed to dry in the Petri plates overnight in the incubator. The dry cell mass was later scraped and weighed. 0.25 mg of all the samples were further used for the extraction of PHA. We used the method of alkali hydrolysis [14] for the extraction of PHA.

Dried biomass of 0.25 mg was suspended in 1.25 ml of water and pH was set (between 8 to 11) using 25% v/v ammonia solution. They were then incubated for 10 minutes at 50°C. It was further centrifuged at 6000 rpm for 10 minutes and washed with acetone. It was further dissolved in chloroform and filtered. The chloroform layer containing PHA was evaporated and dried overnight.

#### Quantification of PHA

It is very important to know the quantity of PHA in the different samples collected [7 & 25]. The bacterial culture was centrifuged at 6000 rpm to obtain the cell pellet and dried to estimate the dry cell weight (DCW) in units of g/L. Residual biomass was estimated as the difference between dry cell weight and dry weight of PHA extracted. This was calculated to determine the cellular weight and accumulation other than PHA's. The percentage of intercellular PHA accumulation is estimated as the percentage composition of PHA present in the dry cell weight.

Residual biomass g/L = DCW g/L - dry weight of extracted PHA g/L.

PHA accumulation (%) =  $\frac{\text{dry weight of extracted PHA g/L}}{[\text{DCW g/L}]} \times 100$

After 48 hours incubation at 37°C. The culture was collected and centrifuged at 10,000 rpm for 15 minutes and lyophilized.

The addition of methanol and water and vortexing the pellet and then centrifugation at 10,000 rpm for 15 minutes. Methanol is added to lyse the cells and to dissolve PHA. Water is added for separation of PHA in lipid solvent completely.

#### Results:-

##### Colony Characteristics:-

Bacterial colonies were characterised by colony Gram staining, characterization and biochemical tests. (Table 2 & table 3)

**Table 2:-** streak plate colony characteristics after 24 hours of incubation.

Sample number	Form	Margin	Elevation	Color	Light transmission
1	round	Smooth	convex	White	Translucent
2	irregular	Wavy	flat	White	Transparent
3	round	Smooth	Convex	Creamy	Opaque
4	irregular	Wavy	umbonate	White	Opaque

**Table 3:** Gram staining & Biochemical characteristics

Biochemical Test	Sample1	Sample2	Sample 3	Sample4A
Gram staining	-	+	-	-
Shape	Cocci	Bacilli	Cocci	Cocci
Motility	Motile	Non-motile	Non-motile	Motile

Examination of Samples by Spectroscopy, Extraction and Quantification of PHA

Optical density of PHA granules obtained from each sample was obtained using spectroscopy.

**Table 4:-** Optical density and absorption maxima of samples

SAMPLE	MAX WAVELENGTH (nm)	OD
1	281.19	1.317
2	283.19	2.215
3	283.19	0.380
4	282.74	0.556

All the samples showed absorption maxima at 280nm which confirms the presence of PHA.

**Graph 1:-** SAMPLE 1 UV - Visible Spectroscopy**Graph 2:-** Sample 2 UV – Visible Spectroscopy

**Graph 3:- SAMPLE 3 UV – Visible Spectroscopy**

**Graph 4:- SAMPLE 4 UV - Visible Spectroscopy**

**Graph 5:- PHA accumulation % in each sample**

The PHA accumulation was found to be maximum in sample 2 followed by sample 1, 3 and 4.

### Discussion:-

PHA is a secondary metabolite produced by the various microbes present in nature. It can be of various types such as PHB, PHV, PHH and PHO [5]. The property of PHA being a biodegradable polymer makes it stand out of the crowd. But its high production cost compared to petrochemical - based plastics takes a back seat. Thus, during fermentation of microbes the biomass is produced in excess for the extraction of PHA. The aim is to find an easy and economic technique for the large scale production of PHA. Many common chemical methods using solvents have been used [8 & 23]. In certain cases, surfactants are used to recover the highly pure form of PHA. Out of the various novel techniques, alkali hydrolysis is a promising one as this proves to be comparatively simple and efficient. Various alkalis like sodium hydroxide, potassium hydroxide and ammonium hydroxide with varied pH can be used. It's important to note the effectiveness of the alkali in the digestion of non-PHA material without any distortion to the PHA. Retention of the properties of PHA depends on the technique of extraction. The efficiency of the production of PHA by microbes plays an important role in extraction. The microbes are isolated from various sites and are cultured in the minimal media. The minimal media induces the production of PHA in excess. The cells are then lysed and quantified for the PHA content. Sample 2 (sewage water) is the most promising source of PHA-producing bacteria (95.65%) compared to the other samples studied. Also highest accumulation is observed in waste containing samples. Therefore in future for large scale production, waste material can be utilized as PHA-producing bacteria's source.

### Conclusion:-

Bioplastics can replace petroleum based plastics primarily due to its biodegradability. It is more convenient to use bioplastics as they do not lead to the pollution of the environment and can be used widely to decrease the level of pollution. The production source of bioplastic is better in waste containing samples which is significant for commercial production.

### Acknowledgement:-

We thank a large number of open sources and related projects that critically facilitated this work. We thank Department of Microbiology, Vijaya College, R.V. Road, Bangalore for supporting us throughout for successful completion of our work. And finally we thank the almighty, sources of all knowledge, understanding and wisdom. For him we owe all that we have and all that we are.

Response of Irregular RCC buildings, Soft-storey Drift & Displacement, Effect of Shear Walls on Soft-storey, Location of Shear Walls.

#### Abstract

A structure is “regular” if the distribution of its mass, strength, and stiffness is such that it will sway in a uniform manner when subjected to ground shaking – that is, the lateral movement in each storey and on each side of the structure will be about the same. Regular building configurations are almost symmetrical (in plan and elevation) about the axis and have uniform distribution of the lateral force-resisting structure such that, it provides a continuous load path for both gravity and lateral loads. A building with absence of symmetry and has discontinuity in geometry, mass or load resisting elements is called irregular. These irregularities may cause interruption of force flow and stress concentrations. Asymmetrical arrangements of mass and stiffness of elements may cause a large torsional force because the centre of mass does not coincide with the centre of rigidity. In this study L-shape plan of G+7 storey reinforced concrete building have been selected. The models are analyzed in two phases, in First Phase the building is analyzed without shear walls and soft-storey in Ground floor and Second Phase the same building is analyzed with shear walls and having soft-storey in Ground floor. In the Second Phase also the shear walls are added to the model in two different cases, to study the best location of shear walls in the building. The models are analyzed by STAAD. Pro V8i SS6 software using IBC-2012<sup>(9)</sup> code (International building code 2012), by Linear Static Method. As the IBC-2012 Draft Code (Afghanistan Building Code-2012) is used for structures in Afghanistan, so the IBC-2012 code has been selected for analysis. The aim of this paper is to study the effect of shear walls on soft-storey and compare the response of irregular building having shear walls with irregular buildings without shear walls. The results are summarized on basis of the response of building.

#### Introduction:-

A weak storey is defined as one in which the story's lateral strength is less than 80 percent of that in the storey above. The storey lateral strength is the total strength of all seismic resisting elements sharing the storey shear for

**Corresponding Author: -Mohammad Noor Jan Ahmadi**

Address: -Assistant Professor, Civil Department, Engineering Faculty, Shaikh Zayed University, Khost, Afghanistan.

the direction under consideration, i.e. the shear capacity of the column or shear walls or horizontal component of the axial capacity of diagonal braces. Inadequate strength of frame columns usually make storey weak. A soft storey is one in which the lateral stiffness is less than 70% of that in the storey immediately above, or less than 80% of the combined stiffness of the three stories above (see Fig.1.1). The important characteristics of a weak or soft storey consist of a discontinuity of strength or stiffness, which occurs at the second storey connections. This discontinuity is caused by lesser strength, or increased flexibility, the structures results in large deflections in first storey of the structure, which in turn consequences in concentration forces at the second storey connections. The result is a connection of inelastic actions.

In reinforced concrete building in addition to slabs, beams and columns the vertical plate-like reinforced concrete wall is called shear wall, which is constructed from foundation level and continues throughout the building height and shear walls act like vertically oriented wide beam which carry lateral loads to the foundation of building. During past earthquake the buildings which are properly designed and detailed with shear walls have shown very good resistance to the seismic loads. In most earthquake prone countries, like USA, New Zealand and Chile shear walls buildings are common choice. In addition shear walls can be constructed easily, since the detailing of reinforcement is straight forward and its placing at site is easy. Shear walls are effective due to construction cost and minimizing the damage of earthquake in structural and non-structural elements of the building.

In this study L-shape plan of G+7 storey reinforced concrete building have been selected. The models are analyzed in two phases, in First Phase the building is analyzed without shear walls and soft-storey in Ground floor and Second Phase the same building is analyzed with shear walls and having soft-storey in Ground floor.

Fig. 1:-Stiffness Irregularities-Soft Storey

In a study of a residential building of G+15 irregular high-rise building without shear wall and with shear wall was considered to compare lateral loads, torsion effects and storey drifts. In comparison, it was summarized that the lateral forces are decreasing if the shear walls are located in proper location of frame and the values of lateral forces are minimum<sup>(5)</sup>. Eccentricity cause torsion in structures and structural in case of large torsion the elements or the entire structure may be deflect beyond its lateral deflection limit. If the adjacent buildings are not separated from each other properly, so torsional irregularity may cause pounding. If strength of structural elements increase on weak direction or decrease on strong direction, the effects of torsion on structures can be prevented. The best solution is that the structural systems should be designed without irregularities including torsional irregularity<sup>(8)</sup>. With refuse area beams, mass irregular building deflection will be more than without mass irregular building. The mass irregular building moment is 67% more than without mass irregular building. The size of member and amount of reinforcement increase in building that have mass irregularity<sup>(4)</sup>.

#### Irregular and Regular Classification of Structures:-

Structures can be classified due to various structural irregularities. Such classification shall be based on their structural configurations. Generally structures irregularities as per IBC-2012 (ASCE-7-10) code are defined as under.

**Horizontal irregularity:** -Horizontal irregularities are divided into five categories.

1. (a) Torsional Irregularity: Torsional irregularity is exist, where the maximum storey drift, computed including accidental torsion with  $A_x = 1.0$ , at one end of the structure transverse to an axis is more than 1.2 times the average of the storey drifts at the two ends of the structure. Torsional irregularity requirements in the reference sections apply only to structures in which the diaphragms are rigid or semi-rigid.

1. (b) Extreme Torsional Irregularity: Extreme torsional irregularity is exist, where the maximum storey drift, computed including accidental torsion with  $A_x = 1.0$ , at one end of the structure transverse to an axis is more than 1.4 times the average of the storey drifts at the two ends of the structure.

2. **Reentrant Corner Irregularity:** Reentrant corner irregularity is defined to occur where both plan projections of the structure beyond a reentrant corner are greater than 15% of the plan dimension of the structure in the given direction.
3. **Diaphragm Discontinuity Irregularity:** Diaphragm discontinuity irregularity is defined to exist where there is a diaphragm with a sudden discontinuity or variation in stiffness, including one having open area more than 50% of the gross enclosed diaphragm area, or an alteration in effective diaphragm stiffness of more than 50% from one of the next storey.
4. **Out-of-Plane Offset Irregularity:** Out-of-plane offset irregularity is that to present where there is a discontinuity in a lateral force-resistance path, such as an out-of-plane offset of at least one of the vertical elements.
5. **Non-parallel System Irregularity:** Non-parallel system irregularity is exist, where vertical lateral force-resisting elements are not parallel to the major orthogonal axes of the seismic force-resisting system.

**Vertical Irregularity:** -Vertical irregularities are divided into five types.

1. (a) **Stiffness-Soft Storey Irregularity:** Stiffness-soft storey irregularity is defined, if a storey lateral stiffness is less than 70% of the storey above or less than 80% of the average stiffness of the three stories above.
1. (b) **Stiffness-Extreme Soft Storey Irregularity:** Stiffness-extreme soft storey irregularity is defined, if a storey lateral stiffness is less than 60% of the storey above or less than 70% of the average stiffness of the three stories above.
2. **Weight (Mass) Irregularity:** Weight (mass) irregularity is defined where the effective mass of any storey is more than 150% of the effective mass of an adjacent storey. Generally roof is lighter than the floor below is not to be considered.
3. **Vertical Geometric Irregularity:** Vertical geometric irregularity is defined, where the horizontal dimension of the seismic force-resisting system in any storey is more than 130% of adjacent storey.
4. **In-Plane Discontinuity in Vertical Lateral Force-Resisting Element Irregularity:** In plane discontinuity in vertical lateral force-resisting elements irregularity is if there is an in-plane offset of a vertical lateral force-resisting element which causing in overturning demands on a supporting column, beam, slab, or truss.
5. (a) **Discontinuity in Lateral Strength-Weak Storey Irregularity:** Discontinuity in lateral strength-weak storey irregularity is that, where lateral strength of a storey is less than 80% of the above storey. The storey lateral strength is the total lateral strength of all seismic-resisting elements that sharing the storey shear for the direction under consideration.
5. (b) **Discontinuity in Lateral Strength-Extreme Weak Storey Irregularity:** Discontinuity in lateral strength-extreme weak storey irregularity is where the storey lateral strength is less than 65% of the storey above. The storey strength is the total strength of all seismic-resisting elements that sharing the storey shear for the direction under consideration.

**Details of RCC Buildings Selected for study:-**

In this study L-shape plan of G+7 storey reinforced concrete building have been selected. The models are analyzed in two phases, in first phase the building is analyzed without shear walls and soft-storey in Ground floor and second phase the same building is analyzed with shear walls and having soft-storey in Ground floor. The plan of Building is shown in Fig. 2. The data for analysis of the selected building is given in the Table 1.

Not: All Dimensions are in cm.

Fig. 2:-Plan of G+7 Storey RCC Buildings

Table 1:- Data for the Building

Live load	4.0 kN/m <sup>2</sup> at typical floor 1.5 kN/ m <sup>2</sup> on terrace
Floor finish	1.0 kN/ m <sup>2</sup>
Water proofing	2.0 kN/ m <sup>2</sup>
Terrace finish	1.0 kN/ m <sup>2</sup>
Seismic zone	3 <sup>rd</sup>
Important factor	1
Type of soil	Medium
Storey height	Typical floor: 3m, GF: 3m, and height of column from base to Ground floor level: 2m
Floors	G.F. + 7 upper floors
Columns size	400mm*400mm
Beams size	400mm*500mm
No. of Columns	32
Slab thickness	100mm
Thickness of all masonry Walls	230mm
Parapet wall height	1.2m
Grade of concrete	M35 for plinth columns and ground floor columns, M30 from first floor to the 7 <sup>th</sup> floor columns, M30 for all other components
Grade of steel	Fe 415 HYSD
Floor Area	423.3 sqm

The horizontal spectral response acceleration for 0.2 second period (5 percent of critical damping) is for Khost Province in Figure 311.4.1-1 of ABC-2012 code (Afghanistan Building Code-2012) is 60% ( $S_s=0.6g$ ) and horizontal spectral response acceleration for 1.0 second period (5 percent of critical damping) is for KhostProvince in figure 311.4.1-2 of ABC code is 25% ( $S_1=0.25g$ ).

The storey numbers are given to the portion of the building between two successive grids of beams. The storey numbers are defined as follows:

Portion of the building	Storey No.
Foundation top to first floor	1
First Floor to second floor	2
Second floor to third floor	3
Third floor to fourth floor	4
Fourth floor to fifth floor	5
Fifth floor to sixth floor	6
Sixth floor to seventh floor	7
Seventh floor to roof	8

### Analysis of Models:-

Since in these days in most multi-storey building the ground floor is considered for parking, or the height of ground floor columns is more than the above storeys, for this to study the effect of soft-storey in seismic areas, therefore in this study Ground floor is selected as soft-storey. In plinth level of Ground floor, tie beams are not considered, so the column height for Ground floor increase than upper storeys and the lateral stiffness of this floor decreases.

### Calculation of Stiffness:-

The lateral stiffness of the storey is calculated, to know that the Storey-1 (Ground floor) is soft-storey or not. As Ground floor column height is 5 m and the upper each storey height is 3m, so the stiffness of Ground floor (Storey-1) and First floor (Storey-2) are calculated.

### Stiffness of Ground floor (Storey-1):-

Stiffness of storey column is calculated as below,

$$K = \frac{12 EI}{L^3}$$

where, E = Elastic modulus of concrete

I = Moment of inertia of column

L = Height of column.

For M30 grade of concrete E,

$$E = 5000 \sqrt{f_{ck}} = 5000 \sqrt{30} = 27386 \frac{N}{mm^2} = 27386 \times 10^3 kN/m^2$$

For M35 grade of concrete E,

$$E = 5000 \sqrt{35} = 29580 \frac{N}{mm^2} = 29580 \times 10^3 kN/m^2$$

Moment of inertia of column,

$$I = \frac{1}{12} bd^3 = \frac{1}{12} \times 0.40 \times 0.40^3 = 0.002133 m^4$$

Total number of columns of Ground floor is 32 and all the columns are same size and column height is 5m. The grade of concrete in these columns is M35.

$$\text{Stiffness of Ground floor} = 32 \times \frac{12 \times 29580 \times 10^3 \times 0.002133}{5^3} = 193825.198 kN/m$$

**Stiffness of First floor (Storey-2):** Total number of columns of is 32, all the columns are same size and its height is 3m. The cross section dimensions of First floor columns are same as Ground floor column, but grade of concrete in from First floor to Roof of building is M30.

$$\text{Stiffness of first floor} = 32 \times \frac{12 \times 27386 \times 10^3 \times 0.002133}{3^3} = 830781.69 kN/m$$

The stiffness of Ground floor is 23.33% of stiffness of First floor, so the stiffness of Storey-1 is less than 60% of the stiffness Storey-2. As per Table 12.3.2, clause 12.3.2 of ASCE-7-10, "an extreme soft-storey is one in which the lateral stiffness is less than 60 percent of that in storey above or less than 70 percent of the average stiffness of the three storeys above". So the selected model has soft-storey in Ground floor.

For analysis, these selected G+7 reinforced concrete framed buildings are modeled and analyzed by STAAD. Pro V8i SS6 software according to the given data using IBC-2012 code and load combinations are prepared according to

the IBC-2012 code. The analysis is performed in two phases, in First Phase the model is analyzed without shear walls and Second Phase, it is analyzed with shear walls. Also in Second Phase the shear walls are added in different location of the plan to the irregular building and analyzed the models. The results of the models with shear walls & having soft-storey in Ground floor are compared with the results of model without shear walls and having soft-storey in Ground floor.

As shear walls are added in two different cases. In First Model, four shear walls are considered, two in left corner and two in the opposite right corner and this case the shear walls are arranged in such that two shear walls are located along X-direction and other two shear walls are located along Z-direction, therefore the stiffness of shear in both directions is same (see Fig. 3 (a) ). In Second Model, the same size four shear walls are added as in First Model, but in this case the shear walls arranged in four corners, that two shear walls are positioned along X-direction and two shear walls are arranged along Z-direction and the stiffness of shear walls in both direction is equal (see Fig. 3(b) ). Thickness of shear walls is 220 mm and the length of shear walls is shown in Fig. 3 below.

(a) Model-1 (b) Model-2

Fig. 3:- Location of Shear Walls in L-shape Building.

(a) Model-1

(b) Model-2

Fig. 4:- 3D of Models with Shear Walls.

Fig. 5:- Selected Beams Fig. 6 Selected Columns.

**Result and Discussion:-**

The results of model without shear walls and having soft-storey in Ground floor are compared to the results of models with shear walls and having soft-storey in Ground floor. Also the locations of shear walls are studied in two cases, for selecting the best locations of shear walls in L-shaped RCC Building.

**Total Seismic Weight & Base Shear:-**

It is clear that the total seismic weight and base shear due to the self-weight of shear walls will be increased as compared to the model without shear walls and total seismic weight and base shear are shown in Table 2 below.

**Table 2:-**Total Seismic Weight&Base Shear of Buildings

Description	Without Shear	With Shear Wall	
		Model-1	Model-2
Seismic Weight (kN)	30704.5	33260	33260
Base Shear in X-direction (kN)	1397	1729	1729
Base Shear in Z-direction (kN)	1397	1729	1729

**Storey Displacement and Storey Drift:-**

The displacement and storey drift significantly decrease, when add shear walls to the models.

From the Fig. 7 & Fig 8, it is observed, that displacement & storey drift of models with shear walls is lesser than model without shear walls. Between the two cases, in Model-1 displacement and storey drift is lesser than Model-2. The soft-storey drift by adding shear walls to the building is decreased significantly and it decrease more than 50% in Model-1.

**Fig. 7:-** Maximum Storey Displacement.

**Fig. 8:-** Maximum Storey Drift

**Maximum Moment and Shear Force in Beams:-**

For the models one interior beam in each floor has been selected and the selected beams have been shown in Fig.5. Moments and shear forces in selected beams are compared. The centre to centre span length of selected beam is 4.98 m.

Fig. 9:- Max.Envelope Moments in Beams

Fig. 10:- Max.Envelope Shear Forces in Beams.

From Fig. 9, it is observed, that in Model-1 moments of beams show decreasing in all storeys as compared to model without shear walls, but in Model-2 moments of beams show decreasing in soft-storey and near to soft-storey, but in upper storeys they show increasing. In Fig. 10, shear forces of beams in Model-2 also decrease in soft-storey and near to soft-storey, but in upper storeys they increase when it is compared with models without shear walls. The shear forces of beams in Model-1 show decreasing in the lower storeys, but in the above storeys they have about equal values to the beams of models without shear walls.

**Maximum Moment in Columns:-**

For the model one interior column in each floor has been selected and the selected columns have been shown in Fig.6. From Fig. 11, it is cleared, that moment ( $M_z$  &  $M_y$ ) of columns generally in both models decrease significantly as compared to the models without shear walls.

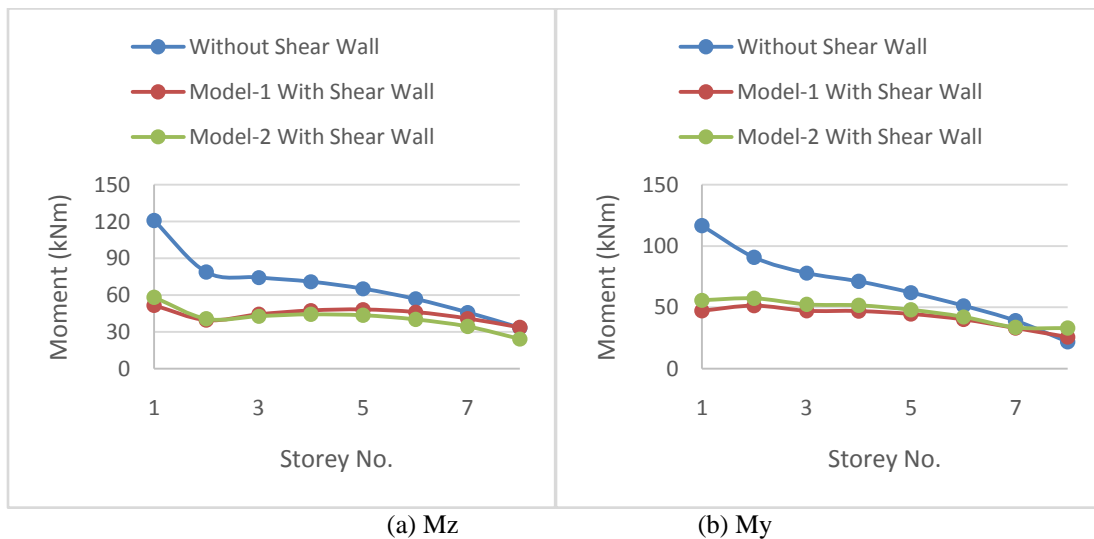

Fig. 11:- Maximum Envelope Moments in Columns

**Comparing Support Reactions:-**

The selected columns support reactions of models without shear walls are compared with the models having shear walls and the results are shown in Table 3 below.

**Table 3:-**Maximum Envelop Support Reactions

Description	Without Shear	With Shear Wall	
		Model-1	Model-2
Fy (kN)	2804.8	2759.1	2746.6
Fx (kN)	45.53	19.27	21.85
Fz (kN)	45.08	18.86	21.96
Mx (kNm)	116.6	47.25	55.94
Mz (kNm)	120.77	51.81	58.16

Support reactions (see Table 3) of Model-1 and Model-2 show significantly decreasing as compared to the models without shear walls.

### Conclusion:-

In this study L-shape plan of G+7 storey reinforced concrete building have been selected. The models have been analyzed in two phases, in First Phase the building has been analyzed without shear walls and soft-storey in Ground floor and Second Phase the same building has been analyzed with shear walls and having soft-storey in Ground floor. In the second phase also the shear walls were added to the model in two different cases, to study the best location of shear walls in the building. The results are concluded as under:

1. It is observed, that displacement, storey drift, moments and shear forces in beams, moments in columns and support reactions decrease of the building with shear walls and having soft-storey in Ground floor as compared to the buildings without shear walls and having soft-storey in Ground floor.
2. By adding shear walls to irregular building, generally the effect irregularities like soft-storey drift, displacement and moments & shear forces in beams and moments in columns of soft-storey decrease significantly as compared to the other storeys.
3. The soft-storey drift by adding shear walls to the building is decreased significantly and it decrease more than 50% in Model-1.
4. Stiffness of shear walls in both directions and location of shear walls are very important, if the shear walls are added in proper location and have equal stiffness in both directions, it will be more effective.
5. In L-shape that four shear walls were added to the model in two different cases (see Fig. 3), the location of shear walls in Model-1, in which two shear walls were arranged in left side corner and two shear walls were added in right side opposite corner was better than Model-2.

#### **Abstract**

“The life is like sport. The lord is the greatest sportsman. The purpose of the study was to analysis of achievement motivation and aggression among attacker, setter, and libero player at inter collegiate level volleyball players. It was hypothesized that there will be a significant of achievement motivation and aggression among the attacker, setter, and libro player at inter collegiate level volleyball players. A total of 90 inter collegiate level consist of attacker setter and libero are selected. Selected as a random, they were divided in to 3 equal groups (30 from attacker, 30 from setter and 30 from libero) The research scholar reviewed the available scientific literature, books, journals, periodicals, and magazine and research papers pertaining to the study. Taking into consideration of the importance of these variables and the feasibility criteria for these following variables were selected for the investigator. 1. Achievement motivation 2. Aggression The data that were collected form the subjects were treated statistically. To find out the significance difference among the attacker, setter and libero with their achievement motivation and aggression for that Analysis of Variance (ANOVA) was used to find out any significant difference among the group. In view of the formulation of hypotheses the following results were emphasized based on the analysis of data The result of the study shows that there has no significant difference in the achievement motivation among attacker, setter, libero between these variables have better in achievement motivation. The result of the study showed that there has significant difference in the aggression among attacker, setter & libero at inter collegiate level men volley ball players Because volley players need very quick movement for receiving and attacker the ball every second they keep on moving place to place quickness is a prime necessity in the modem volley bale both in attack and defence. That is the reason attacker, setter and libero player hove more aggressive in game.

**Introduction:-**

Sport has become one of the most widely practiced human activities Whether as professionals of amateurs, regularly or occasionally, millions of people now engage in the various forms of physical and sporting activity available in the European Union. In addition to its health benefits, sport plays an important economic and social role. It contributes to social integration and inclusion, plays a part in the process of non-formal education, promotes intercultural exchanges and creates. "The life is like sport. The lord is the greatest sportsman. He plays without thinking of winning or losing". Physical Education is an integral part of total Education. It is an education through physical Fitness, Social Fitness, moral fitness and emotional fitness for an individual to develop not only a good physique but also help in develop desirable social qualities. The word 'Sports' occasionally denotes either to a pleasant part time or somewhat hazardous recreation. Today sports are considered as international discipline as it develops international understanding and universal brotherhood. Sports develop national character and also it provides to fullest self expression to man and it is one of the fundamental needs. RAMA DASS (2003):Conducted a study on a comparative study on self concept and achievement motivation between physical education and education student students. Mukta Rani Rastogi's self concept scale was used to quanti self concept and M.L.kamelsh sports achievement motivation test questionnaire was used. The purpose of the study was analysis the self concept and achievement motivaton between physical education and education students. To achieve this purpose a totally 30 subjects from physical education and education. Their age group is between 20 to 25 years, the 't'-ratio was used the results of the study was the level of the self-concept between physical education students was higher than education students, the level of achievements motivation between physical education students was higher than education student.

**Sports:-**

The word 'Sports' occasionally denotes either to a pleasant part time or somewhat hazardous recreation.

**Sport Psychology:-**

Sports psychologist is the scientific study of people and their behaviours in sport. The main job of a sports psychologist is to recognize how participation in sport exercise and physical activity enhances a person's development. Sport psychology is a specialization within psychology that seeks to understand psychological/mental factors that affect performance in sports, physical activity and exercise and apply these to enhance individual and team performance.

**Motivation:-**

Ask any person who is successful in whatever he or she is doing What motivate him/her, and very likely answer will be "goals". Goal Setting goals, is extremely important to motivation and success.

**Aggression:-**

Aggression refers to any behaviour that is hostiles, destructive and/or violent. Generally, aggressive behaviour has the potential to Inflict injury or damage to the target person or object. Example of aggressive behaviour include physical assault, throwing objects, property destruction, self harming behaviours, and verbal threats.

**Volley Ball:-**

Volleyball is a typical American game. It was invented by "William,G,Moran" Physical Director of Holyoake YMCA Mass, U.S.A. in the year 1895.he wanted to introduce a game to the members of his YMCA with a view to provide a suitable recreational game less strenuous then that of Basket Ball. There was at the time, a game called "Minton" in which at worsted yarn ball was batted back and forth over a 7 foot net with help of a racket. Morgan modified this game by eliminating the racket and worsted yarn ball and experimented with an inflected basketball bladder, which was batted with the hands on over the net. He introduced this game in his gymnasium and he called this game as 'Mintonette'. Since the basketball bladder was not conducive for proper play, a new ball devised though the help of a sports company. Dr.A.T.Haisteds of spring Field College, gave the application of "Volley Ball" to this game, since the idea of the play was to volley the ball to and fro over the net.

**Statement Of The Problem:-**

The purpose of the study was to analysis of achievement motivation and aggression among attacker, setter, and libero player at inter collegiate level volleyball players.

**Hypothesis:-**

It was hypothesized that there will be a significant of achievement motivation and aggression among the attacker, setter, and libero player at inter collegiate level volleyball players.

**Delimitation:-**

The present study was delimited in the following aspects.

1. The study will be restricted to 30 attacker, 30 setter, 30 libero players.
2. The age limit of the subject will be limited to the range of 18 to 25 years.
3. The study was restricted to two psychological variables namely achievement motivation and aggression were analyzed.
4. Only standardized questionnaire was measured the psychological variables.
  - a. Anandakumar inventor for aggression
  - b. M.L.Kamalesh questionnaire for achievement motivation.

**Limitation:-**

The limitation of the present study is as follows.

1. The food habits, other regular habits and life style are not controlled.
2. The regular activities of the students will not be controlled.
3. Family background of the subject will not be considered.
4. Environmental factors, which contribute to the mental ability of the players, were not taken into consideration.
5. The response of the subject to the questionnaire might not be honest in all cases and this was recognized as a limitation.

**Significance of The Study:-**

1. The study will be helping the players to find out psychological factors.
2. The study will help the coaches.

**Definition of Terms:-****Aggression:-**

“Defines aggression as the intentional response a person makes to inflict pain or harm on another person”

**Achievement Motivation:-**

Achievement motivation is an effective arousal state directing behaviour in an achievement oriented activity cognitively appraised as potentially satisfying.

**Attacker:-**

An offensive shot where a player returns the ball to the opponent's court. Normally this is done in a manner where the attacker hits the ball above the height of the net in a downward direction toward the floor.

**Setter:-**

Setters have the task for orchestrating the offense of the team. They aim for second touch and their main responsibility is to place the ball in the air where the attacker can hit the ball into the opponents' court in the easiest way possible. They have to be able to operate with the hitters with variety and break up the enemy's block. Setters need to have swift and skilful appraisal and tactical accuracy, and must be quick at moving around the court.

**Libero:-**

“Lee beh rob” –Lee—means to act against the wind from same side of the two part and dictionary word.

**Methodology:-****Selection Of Subjects:-**

A total of 90 inter collegiate level consist of attacker setter and libero are selected. Selected as a random, they were divided in to 3 equal groups (30 from attacker, 30 from setter and 30 from libero)

**Selection of Variables:-**

The research scholar reviewed the available scientific literature, books, journals, periodicals, and magazine and research papers pertaining to the study. Taking into consideration of the importance of these variables and the feasibility criteria for these following variables were selected for the investigator.

1. Achievement motivation
2. Aggression

**Psychological Variables:-**

Achievement motivation laws measured by using questionnaire.

**Achievement Motivation:-**

Motivation was measured through achievement motivation questionnaire prepared by M. L.Kamlesh. Achievement motivation was given to all investigation; the computed questionnaire was scored as follows.

For items 1,3,4,9,10,11,12,13,16,17 and 20 the despondence answer "a" scored two points: if he answer "B" scored only zero points.

For items 2, 5, 6, 7, 8, 14, 15, 18, and 19 the despondence answer "b" is scores 2 points, if he answer "a" scored only zero points.

The larger the score, higher the achievement motivation of the subject

**Aggression:-**

To measure the aggression Anandakumar aggression scale prepared by crafty was used.

Aggression was given to all investigation, The computed questionnaire was scored as follows.

For items 1,4,5,6,9,12,14,16,18,21,22,24, and 25 answer "yes" he scored two point. In the answer "no" get zero point.

For items 2,3,7,8,10,11,13,15,17,19,20, and 23 answer "no" he scored two point. If he answer "yes" zero point.

( The copy of questionnaire was given in appendix-II )

**Statistical Techniques:-**

The data that were collected from the subjects were treated statistically. To find out the significance difference among the attacker, setter and libero with their achievement motivation and aggression for that Analysis of Variance (ANOVA) was used to find out any significant difference among the group.

**Analysis and Interpretation Of Data:-**

After the data had been collected, it was processed and tabulated using Microsoft Excel - 2000 Software. The data collected on achievement motivation and aggression from three types of players (Attackers, Setter and Libero) at inter collegiate men Volleyball players. Then the data were analyzed with reference to the objectives and hypotheses by using differential statistics including One way ANOVA followed by unpaired t-test and Pearson's correlation coefficient technique by using SPSS 16.0 statistical software and the results obtained thereby have been interpreted.

Hypothesis: There is no significant difference between three groups of players (Attackers, Setter and Libero) at inter collegiate men Volleyball players respect to achievement motivation scores.

To achieve this hypothesis, the one way NAOVA test was applied and the results are presented in the following table.

**Table:** Results of ANOVA test between three groups of players (Attackers, Setter and Libero) at inter collegiate men Volleyball players respect to achievement motivation scores

Source of variation	Degrees of freedom	Sum of squares	Mean sum of squares	F-value	P-value
Between groups	2	86.67	43.33	3.4596	0.0358*
Within groups	87	1089.73	12.53		
Total	89	1176.40			

\*  $p < 0.05$  From the results of the above table it can be seen that, the three groups of players (Attackers, Setter and Libero) at inter collegiate men Volleyball players differ statistically significant respect to achievement motivation

scores ( $F=3.4596$ ,  $p<0.05$ ) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the attacker players have significant higher achievement motivation scores as compared to Setter and Libero players at inter collegiate men Volleyball players. The mean of achievement motivation scores are also presented in the following figure.

Sub Hypothesis: There is no significant difference between Attackers and Setter players at inter collegiate men Volleyball players respect to achievement motivation scores.

To achieve this hypothesis, the t- test was applied and the results are presented in the following table.

**Table:** Results of t-test between Attackers and Setter players at inter collegiate men Volleyball players respect to achievement motivation scores

Players	Mean	SD	t-value	p-value
Attacker player	30.4667	3.3501	2.0303	0.0469*
Setter player	28.8000	2.9989		

\*  $p<0.05$  From the results of the above table it can be seen that, the Attackers and Setter players at inter collegiate men Volleyball players differ statistically significant respect to achievement motivation scores ( $t=2.0303$ ,  $p<0.05$ ) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the attacker players have significant higher achievement motivation scores as compared to Setter players at inter collegiate men Volleyball players. The mean of achievement motivation scores are also presented in the following figure.

Sub Hypothesis: There is no significant differences between Attacker and Libero players at inter collegiate men Volleyball players respect to achievement motivation scores.

To achieve this hypothesis, the t- test was applied and the results are presented in the following table.

**Table:** Results of t-test between Attacker and Libero players at inter collegiate men Volleyball players respect to achievement motivation scores

Players	Mean	SD	t-value	p-value
Attacker player	30.4667	3.3501	2.3904	0.0201*
Libero player	28.1333	4.1666		

\*  $p < 0.05$  From the results of the above table it can be seen that, the Attackers and Lebero players at inter collegiate men Volleyball players differ statistically significant respect to achievement motivation scores ( $t=2.3904$ ,  $p < 0.05$ ) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the attacker players have significant higher achievement motivation scores as compared to Lebero players at inter collegiate men Volleyball players. The mean of achievement motivation scores are also presented in the following figure.

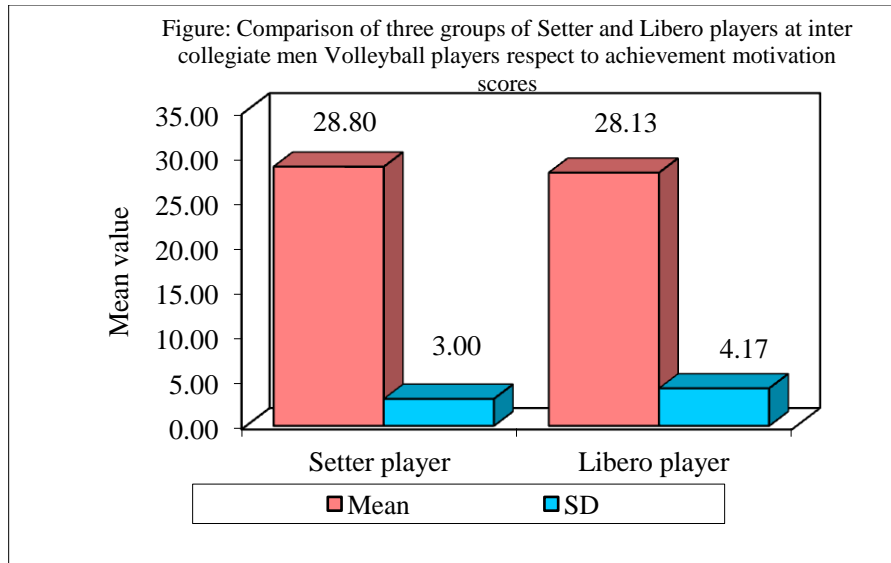

Sub Hypothesis: There is no significant differences between Setter and Libero players at inter collegiate men Volleyball players respect to achievement motivation scores.

To achieve this hypothesis, the t- test was applied and the results are presented in the following table.

**Table:** Results of t-test between Setter and Libero players at inter collegiate men Volleyball players respect to achievement motivation scores

Players	Mean	SD	t-value	p-value
Setter player	28.8000	2.9989	0.7113	0.4798
Libero player	28.1333	4.1666		

From the results of the above table it can be seen that, the Atta Setter and Libero players at inter collegiate men Volleyball players do not differ statistically significant respect to achievement motivation scores ( $t=0.7113$ ,  $p > 0.05$ ) at 5% level of significance. Hence, the null hypothesis is accepted and alternative hypothesis is rejected. It means that, the Setter and Libero players at inter collegiate men Volleyball players respect to achievement motivation scores have similar achievement motivation scores. The mean of achievement motivation scores are also presented in the following figure.

Hypothesis: There is no significant difference between three groups of players (Attacker, Setter and Libero) at inter collegiate men Volleyball players respect to aggression scores.

To achieve this hypothesis, the one way NAOVA test was applied and the results are presented in the following table.

**Table:** Results of ANOVA test between three groups of players (Attacker, Setter and Libero) at inter collegiate men Volleyball players respect to aggression scores

Source of variation	Degrees of freedom	Sum of squares	Mean sum of squares	F-value	P-value
Between groups	2	297.60	148.80	9.6898	0.0002*
Within groups	87	1336.00	15.36		
Total	89	1633.60			

\* $p < 0.05$  From the results of the above table it can be seen that, the three groups of players (Attackers, Setter and Libero) at inter collegiate men Volleyball players differ statistically significant respect to aggression scores ( $F=9.6898$ ,  $p < 0.05$ ) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the attacker players have significant higher aggression scores as compared to Setter and Libero players at inter collegiate men Volleyball players. The mean of aggression scores are also presented in the following figure.

Sub Hypothesis: There is no significant differences between Attacker and Setter players at inter collegiate men Volleyball players respect to aggression scores.

To achieve this hypothesis, the t- test was applied and the results are presented in the following table.

**Table:** Results of t-test between Attacker and Setter players at inter collegiate men Volleyball players respect to aggression scores

Players	Mean	SD	t-value	p-value
Attacker player	30.8000	1.8644	2.8827	0.0055*
Setter player	28.0000	4.9827		

\*p<0.05 From the results of the above table it can be seen that, the Attackers and Setter players at inter collegiate men Volleyball players differ statistically significant respect to aggression scores (t=2.8827, p<0.05) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the attacker players have significant higher aggression scores as compared to Setter players at inter collegiate men Volleyball players. The mean of aggression scores are also presented in the following figure.

Sub Hypothesis: There is no significant difference between Attacker and Libero players at inter collegiate men Volleyball players respect to aggression scores.

To achieve this hypothesis, the t- test was applied and the results are presented in the following table.

**Table:** Results of t-test between Attacker and Libero players at inter collegiate men Volleyball players respect to aggression scores

Players	Mean	SD	t-value	p-value
Attacker player	30.8000	1.8644	5.2290	0.0000*
Libero player	26.4000	4.2149		

\* p<0.05 From the results of the above table it can be seen that, the Attackers and Lebero players at inter collegiate men Volleyball players differ statistically significant respect to aggression scores (t=5.2290, p<0.05) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the attacker players have significant higher aggression scores as compared to Lebero players at inter collegiate men Volleyball players. The mean of aggression scores are also presented in the following figure.

Sub Hypothesis: There is no significant differences between Setter and Libero players at inter collegiate men Volleyball players respect to aggression scores.

To achieve this hypothesis, the t- test was applied and the results are presented in the following table.

**Table:** Results of t-test between Setter and Libero players at inter collegiate men Volleyball players respect to aggression scores

Players	Mean	SD	t-value	p-value
Setter player	28.0000	4.9827	1.3428	0.1846
Libero player	26.4000	4.2149		

From the results of the above table it can be seen that, the Atta Setter and Libero players at inter collegiate men Volleyball players do not differ statistically significant respect to aggression scores ( $t=1.3428$ ,  $p>0.05$ ) at 5% level of significance. Hence, the null hypothesis is accepted and alternative hypothesis is rejected. It means that, the Setter and Libero players at inter collegiate men Volleyball players respect to aggression scores have similar aggression scores. The mean of aggression scores are also presented in the following figure.

Hypothesis: There is no significant association between achievement motivation and aggression scores of all players i.e. Attacker, Setter and Libero at inter collegiate men Volleyball players

To achieve this hypothesis, the Karl Pearson's correlation coefficient technique has been applied and the results are presented in the following table.

**Table:** Results of correlation coefficient between achievement motivation and aggression scores of all players i.e. Attacker, Setter and Libero at inter collegiate men Volleyball players.

variables	Correlation coefficient between achievement motivation with		
	Correlation coefficient	t-value	P-value
Aggression scores	0.2880	2.8208	0.0059*

\*  $p < 0.05$  From the results of the above table, it can be observed that, a significant and positive relationship was observed between achievement motivation and aggression scores of all players i.e. Attacker, Setter and Libero at inter collegiate men Volleyball players ( $r=0.2880$ ,  $p < 0.05$ ) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the achievement motivation scores are increases or decreases with increase or decrease in aggression scores of all players.

Hypothesis: There is no significant association between achievement motivation and aggression scores of Attacker players at inter collegiate men Volleyball players

To achieve this hypothesis, the Karl Pearson's correlation coefficient technique has been applied and the results are presented in the following table.

**Table:** Results of correlation coefficient between achievement motivation and aggression scores of Attacker players at inter collegiate men Volleyball players

variables	Correlation coefficient between achievement motivation with		
	Correlation coefficient	t-value	P-value
Aggression scores	0.0707	0.3749	0.7106

From the results of the above table, it can be observed that, a non-significant and positive relationship was observed between achievement motivation and aggression scores of Attacker players at inter collegiate men Volleyball players ( $r=0.0707$ ,  $p > 0.05$ ) at 5% level of significance. Hence, the null hypothesis is accepted and alternative hypothesis is rejected.

Hypothesis: There is no significant association between achievement motivation and aggression scores of Setter players at inter collegiate men Volleyball players

To achieve this hypothesis, the Karl Pearson's correlation coefficient technique has been applied and the results are presented in the following table.

**Table:** Results of correlation coefficient between achievement motivation and aggression scores of Setter players at inter collegiate men Volleyball players

variables	Correlation coefficient between achievement motivation with		
	Correlation coefficient	t-value	P-value
Aggression scores	0.2031	1.0975	0.2818

From the results of the above table, it can be observed that, a non-significant and positive relationship was observed between achievement motivation and aggression scores of Setter players at inter collegiate men Volleyball players ( $r=0.2031$ ,  $p > 0.05$ ) at 5% level of significance. Hence, the null hypothesis is accepted and alternative hypothesis is rejected.

Hypothesis: There is no significant association between achievement motivation and aggression scores of Libero players at inter collegiate men Volleyball players

To achieve this hypothesis, the Karl Pearson's correlation coefficient technique has been applied and the results are presented in the following table.

**Table:** Results of correlation coefficient between achievement motivation and aggression scores of Libero players at inter collegiate men Volleyball players

variables	Correlation coefficient between achievement motivation with		
	Correlation coefficient	t-value	P-value
Aggression scores	0.3617	1.9998	0.0451*

\* $p < 0.05$  From the results of the above table, it can be observed that, a significant and positive relationship was observed between achievement motivation and aggression scores of Libero players at inter collegiate men Volleyball players ( $r=0.3617$ ,  $p < 0.05$ ) at 5% level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the achievement motivation scores are increases or decreases with increase or decrease in aggression scores of Libero players at inter collegiate men Volleyball players.

### **Discussion on Findings:-**

In view of the formulation of hypotheses the following results were emphasized based on the analysis of data. The result of the study shows that there has no significant difference in the achievement motivation among attacker, setter, libero between these variables have better in achievement motivation.

The result of the study showed that there has significant difference in the aggression among attacker, setter & libero at inter collegiate level men volley ball players. Because volley players need very quick movement for receiving and attacker the ball every second they keep on moving place to place quickness is a prime necessity in the modern volleyball both in attack and defence. That is the reason attacker, setter and libero player have more aggressive in game.

### **Summary:-**

The purpose of the study was to find out whether there was any significant difference in achievement motivation aggression for the Inter collegiate level attacker, setter, libero of the volley ball players. In order to achieve the purpose of the study 90 selected men volley ball players only.

To assess the level of aggression inventory questionnaire was used and the data were collected from the subjects.

To assess the level of achievement motivation the sports achievement motivation questionnaire designed and validated by Mr. Kamlesh was used. The data were collected from the subjects.

The collected data were put into statistical analysis. The level of significance was set at 0.05 level to find out the significance difference between means one way analysis of variance was used.

### **Conclusion:-**

On the basis of the interpretation of the data the following appropriate conclusions are drawn from the study.

Attacker players have significant higher achievement motivation scores as compared to setter and Libero players at inter collegiate men volleyball players. ( $F=3.4596, p<0.05$ )

Attacker players have significant higher aggression scores as compared to setter and Libero players at inter collegiate men Volleyball players. ( $F=9.6898, p<0.05$ )

### **Suggestions:-**

1. Similar study may be conducted taking to the other psychological variables.
2. Similar study may be conducted for school, state, national and university level volley ball players.
3. Similar study may be conducted among different sports and games.
4. Similar study may be conducted among female volley ball players.
5. Similar study can be conducted among different age groups in different disciplines.

##### Key words:-

Bus body building, heavier bus bodies, spurious materials, and non-uniform construction.

#### Abstract

The design of the bus body depends largely upon the performance requirements under various types of loading, operating and the road conditions. Nowadays for the passenger buses there are many local producers which construct vehicles based on local needs. The big challenges found in the bus body building companies are applying spurious materials, heavier bus bodies; non-uniform construction and absence of code of practice for bus body design and approval. In the competitive to stay these producers comply with the same requirements of their international counterparts without access to latest computation facilities. This paper explores the existing problems in the industry and proposes the right solution to optimize the bus body manufacturing. To achieve the expected research goals, the researcher randomly selected one hundred fifty locally manufactured buses. The tools used are; statistical analysis, Pareto chart/diagram, cause and effect analysis, field observation and literature survey.

#### Introduction:-

##### Automobile Body Building in Ethiopia:-

Ethiopia imports automobiles, buses/coaches, trucks, equipment's/machineries and spare parts from abroad. It does not manufacture automotive products. Some companies only assemble and build bodies of buses and dry and wet cargo on chassis imported with cab. The automotive industry is serving the transportation of freight and passenger. This study is concerned with the investigation of the major problems and challenges existing in passenger bus body building sector.

The bus body building industry will have huge contribution to the growth of the national economy if it is well addressed and supported with attractive incentives.

The major areas the contribution can be felt easily along:

- Job creation
- Saving foreign currency
- Technology transfer and progress

The major problems observed in the local bus body building sector are absence of national standard, lack of adequate testing tools/ machines, shortage of skilled manpower and shortage of advanced machines to manufacture

different internal and external structures to be manufactured from different materials (metallic and nonmetallic) and limitation of some advanced lightest materials like composites and plastics.

During service, any vehicle is subjected to loads that cause stresses, vibrations and noise in the different components of its structure. This requires appropriate strength, stiffness and fatigue properties of the components to be able to stand these loads. On top of that, quality of a vehicle, as a system, which include efficient energy consumption, safety, and provision of comfort to the user are highly desired.

Companies construct bus body on most popularly used Isuzu models like NPR, NQR and FSR series for commercial intercity passenger transportation purposes. Local bus body manufacturers started body building by making 'wuyiyit', a locally manufactured taxi body structure, on Toyota, Nissan, and Peugeot model pick up vehicles.

*It was noticed that the vehicle manufacturers sell their products in the form of drive away chassis and the body design and building is being done by way side body builders who employ poor design, poor quality products, spurious materials and parts, with no uniformity in the construction, resulting in large amounts of fatal accidents, reduced product life, reduced vehicle performance, poor safety and comfort for the passengers. The cabins and seats have cramped designs which do not provide safety and comfort to the driver. Body designs offer extreme heat, vibration, noise, poor comfort and protection. Wood is being used in the construction of the body to a large extent. Of late some reputed body builders have brought in improved bus designs in the market but still a lot has to be done.*

Hence the paper addresses on selected areas to investigate the major challenges in the bus body manufacturing companies and suggests scientific ways to optimize the process.

#### **Planning of Bodies, selecting chassis and Vehicle Modifications:-**

When designing vehicle bodies in addition to a user-friendly and maintenance friendly design, the careful choice of materials and, in consequence, the associated corrosion protection measures and of great importance.

In order to ensure safe operation of the vehicle, it is essential to choose the chassis carefully in accordance with the intended use. Planning should therefore consider the following items in particular and adapt them to the intended use wheelbase, engine, axle, maximum permissible gross vehicle weight and position of the center of gravity [1].

Before carrying out any work on the body or modification work, the delivered vehicle must be submitted to a check to verify whether it fulfills the necessary requirements.

Before starting work, the body builder must check whether:

- ❖ The vehicle is suitable for the planned body
- ❖ The chassis model and equipment are suitable for the operating conditions intended for the body.

#### **Purpose and Requirements of Vehicle Body Structures:-**

The purpose of the bus body structure is to maintain the shape of the vehicle and to support the various loads applied to it and to carry the passengers and/or payload in a safe and comfortable manner. The structure usually accounts for a large proportion of the development and manufacturing cost in a new vehicle programme, and many different structural concepts are available to the designer. It is essential that the best one is chosen to ensure acceptable structural performance within other design constraints such as cost, volume and method of production, product application [1].

The structural requirements of any vehicle structure can be summarized as follows:

- a. The structure must be sufficiently stiff to withstand the static loads and dynamic loads without excessive deformation
- b. The structure must be sufficiently strong to withstand many cycles of the applied loading without suffering from fatigue or other forms of material failure
- c. The structure should deform in such a manner under impact load conditions so as to minimize the risk of injury to the occupants and other road users

Assessments of the performance of a vehicle structure are related to its strength and stiffness. A design aim is to achieve sufficient levels of these with as little mass as possible [2].

In the event of collision, the body must be capable of transforming as much kinetic energy as possible into deformation work while minimizing deformation of the vehicle interior [3].

Sheet steel of various grades is customarily used for the vehicle body structure. Sheet thickness from 0.6 to 3mm with most pieces being between 0.8 and 1.0mm thick. Due to the mechanical properties of steel with regard to stiffness, strength, economy and ductility, alternative materials for the vehicle body structure are not yet available. High strength, low alloy (HSLA) sheet steel is used for highly stressed structural components. The increased strength of these components allows their thickness to be reduced.

The light weight construction a priority-Low weight construction of vehicles is a top priority at DaimlerChrysler. Besides aluminum, magnesium, ceramics and carbon-reinforced plastics extremely light materials now include high strength steels, said Pollman. Components made of these new high- tech materials are up to 60% lighter than those made of conventional steel, the use of which will decline substantially.

Developing the materials and production technologies that open up these materials for the design of motor vehicles is one of the most important core technologies at DaimlerChrysler. *Low weight materials can increase performance, quality and driving pleasure.* Moreover, they can improve environmental soundness while reducing costs. Know-how regarding materials and production technologies is a key competitive factor [2] [4].

The strength requirements which must be met by the seats in a collision pertain to the seat cushion and backrest, the head restraints, the seat adjustment mechanism and the seat anchors (pertinent regulations: FMVSS 207,202; ECE-R 17,25;RREG 74/408,78/932 and others). One component of active safety is seating comfort. Seats must be designed such that vehicle occupants with different body dimensions do not suffer from driving fatigue.

Strength analysis for individual parts and body areas which are subject to specific stresses caused by factors such as restraints systems or trailer loads, detailed examinations are carried out with the aim of providing proof of sufficient strength or of reducing unacceptable stresses by modifying the design[5].

#### **Modern Advanced Lightweight Materials, Weight and Vehicle Performance:-**

Reducing the loads (weight, rolling and air resistance and accessory loads) on the vehicle, thus reducing the work needed to operate it; The loads on the vehicle consist of the force needed to accelerate the vehicle, to overcome inertia; vehicle weight when climbing slopes; the rolling resistance of the tires; aerodynamic forces; and accessory loads. In urban stop-and-go driving, aerodynamic forces play little role, but rolling resistance and especially inertial forces are critical. In steady highway driving, aerodynamic forces dominate, because these forces increase with the square of velocity; aerodynamic forces at 90 km/h are four times the forces at 45 km/h. Reducing inertial loads is accomplished by reducing vehicle weight, with improved design and greater use of lightweight materials[6].

A 10% weight reduction from a total vehicle weight can improve fuel economy by 4–8%, expending on changes in vehicle size and whether or not the engine is downsized. There are several ways to reduce vehicle weight; including switching to high strength steels (HSS), replacing steel by lighter materials such as Al, Mg and plastics, evolution of lighter design concepts and forming technologies. The amount of lighter materials in vehicles has been progressively increasing over time, although not always resulting in weight reductions and better fuel economy if they are used to increase the size or performance of the vehicle. In fact, the average weight of a vehicle in the USA and Japan has increased by 10–20% in the last 10 years (JAMA, 2002; Haight, 2003), partly due to increased concern for safety and customers' desire for greater comfort [7].

Steel is still the main material used in vehicles, currently averaging 70% of curb weight. Aluminum usage has grown to roughly 100 kg per average passenger car, mainly in the engine, drive train and chassis in the form of castings and forgings. Aluminum is twice as strong as an equal weight of steel, allowing the designer to provide strong, yet lightweight structures. Aluminum use in body structures is limited, but there are a few commercial vehicles with all Al bodies (e.g., Audi's A2 and A8). Where more than 200 kg of Al is used and secondary weight reductions are gained by down-sizing the engine and suspension – more than 11–13% weight reduction can be achieved. Ford's P2000 concept car11 has demonstrated that up to 300 kg of Al can be used in a 900 kg vehicle.

The use of plastics in vehicles has increased to about 8% of total vehicle weight, which corresponds to 100-120 kg per vehicle. The growth rate of plastics content has been decreasing in recent years however, probably due to

concerns about recycling, given that most of the plastic goes to the automobile shredder residue (ASR) at the end of vehicle life. Fiber reinforced plastic (FRP) is now widely used in aviation, but its application to automobiles is limited due to its high cost and long processing time. However, its weight reduction potential is very high, maybe as much as 60%. Examples of FRP structures manufactured using RTM (resin transfer method) technology are wheel housings or entire floor assemblies. For a compact size car, this would make it possible to reduce the weight; of a floor assembly (including wheel housings) by 60%, or 22 kg per car compared to a steel floor assembly. Research examples of plastics use in the chassis are leaf or coil springs manufactured from fiber composite plastic. Weight reduction potentials of up to 63% have been achieved in demonstrators using glass and/or carbon fiber structures (Friedrich, 2002).

Aside from the effect of the growing use of non-steel materials, the reduction in the average weight of steel in a car is driven by the growing shift from conventional steels to high strength steels (HSS). There are various types of HSS, from relatively low strength grade (around 400 MPa) such as solution-hardened and precipitation-hardened HSS to very high strength grade (980–1400 MPa) such as TRIP steel and tempered martensitic HSS. At present, the average usage per vehicle of HSS is 160 kg (11% of whole weight) in the USA and 75 kg (7%) in Japan. In the latest Mercedes A-class vehicle, HSS comprises 67% of body structure weight. The international ULSAB-AVC project (Ultra-Light Steel Auto Body – Advanced Vehicle Concept) investigated intensive use of HSS, including advanced HSS, and demonstrated that using HSS as much as possible can reduce vehicle weight by 214 kg (–19%) and 472 kg (–32%) for small and medium passenger cars respectively. In this concept, the total usage of HSS in body and closures structures is 280–330 kg, of which over 80% is advanced HSS (Nippon Steel, 2002).

### Methods and Materials:-

Different options available to carry out the study and gives reasons why a particular method was selected at different stages of the project. The research is intended to answer the following questions;

- ❖ What are the main methods which can be implemented to reduce the weight of the buses during body modification?
- ❖ Are there any proper rules and regulations (national standard code of practice for bus body building, design and approval) set by the respective bodies to control the process.
- ❖ What measures should be taken to improve the bus interior structure to make the bus comfortable and safe for occupants.

To address these research questions, the following steps are carried out during different phase of the study:  
Statistical analysis of the data collected from the Transport Authority.

- ❖ Literature survey
- ❖ Close observation of the procedures practiced in the bus body building units.
- ❖ Pareto chart analysis to pin point the potential causing factor.
- ❖ Cause and effect analysis of the problem.
- ❖ Recognize how different groups benefit from the study

### Research Method:-

The method used when collecting, processing and analyzing the gathered information can be either quantitative or qualitative research method.

The nature of the present study requires both quantitative and qualitative information to obtain best results and to propose important recommendation. Both kinds of methods have also been used to support conclusions made in this thesis. Mixing qualitative and quantitative research methods is called triangulation method. While most researchers develop expertise in one style, the two types of methods have different, complementary strengths and when used together can lead to a more comprehensive understanding of a phenomenon.

### Data Collection Techniques:-

Depending on the research perspective and strategy chosen, the researcher must choose methods for collecting data. The data or information collected by the researcher can be either primary, i.e. the researcher collects the material himself, or secondary, i.e. already documented material are being used as a data source, which can be done in either quantitative or qualitative way. In this thesis, both the primary and secondary data are used.

**Weight Distribution Concepts:-**

The gross vehicle weight rating (GVWR) and the gross axle weight rating (GAWR) of each incomplete vehicle are specified on the cover of its incomplete vehicle document in conformance to the requirements of the federal motor vehicle safety regulations [8][9]. The final stage manufacturer is responsible to place the Gross Vehicle Weight Rating and the Gross Axle Weight Rating of each axle on the final vehicle certification label. The regulation states that the appropriate rating “shall not be less than the sum of the unloaded vehicle weight, rated cargo load, and 150 pounds times the vehicle’s designated seating capacity” [8][9].

Unloaded vehicle weight means the weight of a vehicle with maximum capacity of all fluids necessary for operation of the vehicle, but without cargo or occupants.

During completion of this vehicle, Gross Vehicle Weight Rating and Gross Axle Weight Rating may be affected in various ways, including but not limited to the following:

- a. The installation of a body or equipment that exceeds the rated capacities of this Incomplete Vehicle.
- b. The addition of designated seating positions which exceeds the rated capacities of this incomplete vehicle.
- c. Alterations or substitution of any components such as axles, springs, tires, wheels, frame, steering and brake systems that may affect the rated capacities of this incomplete vehicle.

The following formula is used to assure compliance with the regulations. Chassis curb weight and GVW rating is located below in each vehicle section. Always verify the results by weighing the completed vehicle on a certified scale.

Gross Vehicle Weight(GVW) = Curb Weight of Chassis Weight of added body components, accessories or other permanently attached components + Total weight of passengers, and all load or cargo[8].

**Gross Axle Weight Rating:-**

The gross vehicle weight is further restricted by the gross axle weight rating (GAWR). The maximum GAWR for both front and rear axles is listed in each Vehicle Section. Weight distribution calculations must be performed to ensure Gross Axle Weight Rating is not exceeded. Always verify the results by weighing the completed vehicle on a certified scale.

Note: Although the front gross axle weight rating (FGAWR) plus the rear gross axle weight Rating (RGAWR) may exceed the gross vehicle weight rating (GVWR), the total GVW may not exceed the respective maximum Gross Vehicle Weight Rating.

The variation in the Gross Axle Weight Ratings allows the second stage manufacturer some flexibility in the design of the weight distribution of the attached unit [9].

**Weighing the Vehicle:-**

Front and rear Gross Axle Weight Ratings and total Gross Vehicle Weight Rating should be verified by weighing a completed loaded vehicle. Weigh the front and rear of the vehicle separately and combine the weights for the total Gross Vehicle Weight Rating [9]. All three weights must be less than the respective maximum shown in figure 1[8].

**Center of Gravity:-**

The design of the truck body should be such that the center of gravity of the added load does not exceed the guidelines as listed in each Vehicle Section. If the body is mounted in such a way that, the center of gravity height exceeds the maximum height of the center of gravity designated for each model, the directional stability at braking and roll stability at cornering will be adversely affected. A vertical and/or horizontal center of gravity calculation must be performed if a question in stability arises to ensure the designed maximum height of the center of gravity is not violated [9].

**Weight Distribution:-**

A truck as a commercial vehicle has but one purpose. That purpose is to haul some commodity from one place to another. A short distance or a long distance, the weight to be hauled, more than any other factor, determines the size of the truck. A small weight requires only a small truck; a large weight requires a large truck. A simple principle, but it can easily be misapplied. In any case, selecting the right size truck for the load to be hauled will ensure that the job

will be done and that it will be able to be done with some degree of reliability and within the legal limitations of total gross weight and axle gross weights [9].

Not only must a truck be selected that will handle the total load, but the weight must also be properly distributed between the axles. This is of extreme importance from both a functional and economic aspect. If a truck consistently hauls less than its capacity, the owner is not realizing full return on his investment and his operating costs will be higher than they should be. If the truck is improperly loaded or overloaded, profits will be reduced due to increased maintenance costs and potential fines resulting from overloading beyond legal limitations.

Careful consideration must be given to distribution of the load weight in order to determine how much of the total, including chassis, cab, body and payload, will be carried on the front axle and how much will be carried on the rear axle, on the trailer axles and the total.

Moving a load a few inches forward or backward on the chassis can mean the difference between acceptable weight distribution for the truck or an application that will not do the job satisfactorily [8].

Every truck has a specific capacity and should be loaded so that the load distribution is kept within gross axle weight ratings and the truck's gross vehicle weight rating or gross combination weight rating (GCWR).

Improper weight distribution will cause problems in many areas like Excessive front end wear and failure, if center of payload is nearer to front end suspension, rapid tire wear when the weight on a tire exceeds its rating capacity, rough and erratic ride if the center of the payload is directly over or slightly behind the rear axle, the lack of sufficient weight on the front axle will create a bobbing effect, very rough ride, and erratic steering, hard steering when loads beyond the capacity of the front axle are imposed upon it, unsafe operating and conditions, high maintenance costs when a truck is overloaded, a dangerous situation may exist because minimum speeds cannot always be maintained, directional control may not be precise and insufficient braking capacity can cause longer than normal braking distance, Improper weight distribution and overloading cause excessive wear and premature failure of parts.

In this way, maximum payloads may be carried without exceeding legal limits. If the body is too long for a wheelbase, the center of the body and payload is placed directly over the rear axle. This places the entire payload on the rear axles, resulting in overloading the rear tires, rear axle springs and wheel bearings and potentially exceeding the rear axle legal weight limit. The front axle is then carrying no part of the payload and is easily lifted off the ground when going over rough terrain, creating a very rough ride and temporary loss of steering control. If the body is too short for the wheelbase used, frame stress may be increased and may result in excessive loads on the front axle. Excessive front axle loads increase wear on the kingpins and bushings, wheel bearings and steering gear. Excessive front axle loads also overstress the front axle, springs, tires and wheels. All of these contribute directly to higher maintenance costs and hard steering, both of which are undesirable. Weight distribution analysis involves the application of basic mathematical principles to determine the proper positioning of the payload and body weight in relation to the wheelbase of the truck chassis. It is much less expensive to work all of this out on paper, make mistakes on paper and correct them there than to set up the truck incorrectly and either have it fail to do the job or, much worse, fail completely. It is important to become familiar with the dimensions of the truck, as these will be needed to perform the necessary calculations [8] [9].

Figure 1 Weight distributions (Truck Isuzu NPR)

**Glossary of Dimensions:-**

- BBC – Bumper to back of cab
- BA – Bumper to axle
- WB – Wheelbase
- CA – Cab to axle
- AL – Overall length
- AB – Axle to back of cab
- AF – Axle to end of frame
- BOC – Back of cab clearance
- FH – Frame height
- CE – Cab to end of frame

**Weight Distribution Formula:-**

Figure 2 weight distribution of modified midi bus

- D* – Distance C.G. of body is ahead of rear axle
- F* - Distance C.G. from point of C.G to front axle
- WB* – Wheelbase
- W* – Weight of body plus payload
- W<sub>f</sub>*– Portion of *W* transferred to front axle
- W<sub>r</sub>*– Portion of *W* transferred to rear axle

**Basic Formulae:-**

$$(W \times D = W_f \times WB) \text{ and } (W = W_f + W_r)$$

$$W_f = \frac{W \times D}{WB} \dots\dots\dots 1$$

$$D = \frac{W_f \times WB}{W} \dots\dots\dots 2$$

$$WB = \frac{W \times D}{W_f} \dots\dots\dots 3$$

$$W = \frac{W_f \times WB}{D} \dots\dots\dots 4$$

$$W_r = \frac{W \times F}{WB} \dots\dots\dots 5$$

$$F = \frac{W_r \times WB}{W} \dots\dots\dots 6$$

$$WB = \frac{W \times F}{W_r} \dots\dots\dots 7$$

$$W = \frac{W_r \times WB}{F} \dots\dots\dots 8$$

**Recommended Weight Distribution % of Gross Vehicle Weight Conventional 2 Axles:-**

Figure 3 weight distribution % of gross vehicle weight by axle (Isuzu motors)

**Calculation of Center of Gravity:-**

In this case we have the following data to calculate the center of gravity of Isuzu NPR series

**Note:** The body manufacturer can provide the body length and weight, or actual measurements of the body may be taken with a tape [5].

The following Table 1 compares the dimensions of original truck to the modified bus.

Table 1 Comparisons of the truck and the bus

No	Dimensions	Isuzu NPR 66L	Modified NPR 66L midi bus
1	Model name	NPR 66L	NPR 66L
2	WB mm	3365	3365
3	FOH mm	1085	1100
4	ROH mm	1505	2300
5	OAL mm	5995	6765
6	GVW kg	6300kg	> 6300kg
7	Windshield	Laminated uniform and curved	Not curved & two pieces

**Center of Gravity for Chassis-Cab Mass:-**

Weight on Front Axle,  $W_f=1535$  kg

Weight on Rear Axle,  $W_r = 775$  kg

Total weight,  $W = 2310$  kg

Center of gravity,  $D = ?$

$$D = \frac{W_f \times WB}{W}$$

$$D = \frac{1535 \text{ kg} \times 3.365 \text{ m}}{2310 \text{ kg}} = \mathbf{2.236 \text{ m}}$$

Therefore, the center of gravity, D of the chassis–cab mass is 2.236 meters ahead of rear axle.

**Center of Gravity of Truck:-**

The following original equipment manufacturer (OEM) dimensions should be considered before calculating the center of gravity. These are:

Table 2 Original Equipment Manufacturer specification

Wheel base (WB)	3365mm
Front Overhang (FOH)	1085mm
Rear Overhang (ROH)	1505 mm
Overall length (OAL)	5995mm
Gross Vehicle Weight	6300 kg
Desired weight on front axle	25% of GVW
Desired weight on rear axle	75% of GVW

Source: Isuzu NPR 66/66-2 manual 2007

Desired % of weight on front axle is 25% of W

$$W_f = 0.256 \times 6300 \text{ kg} = 1575\text{kg}$$

Desired % of weight on rear axle is 75% of W

$$W_r = 0.75 \times 6300 \text{ kg} = 4725\text{kg}$$

Gross Vehicle Weight, W = 6300kg

Then center of gravity, D is equal to

$$D = \frac{1575 \text{ kg} \times 3.365 \text{ m}}{6300 \text{ kg}} = \mathbf{0.84\text{m}}$$

Table 3 Dimensional deviations during modification

Original truck		Modified bus
Wheel base (WB)	3365mm	3365mm
Front Overhang (FOH)	1085mm	1100mm
Rear Overhang (ROH)	1505 mm	2300mm
Overall length (OAL)	5995mm	6765
Gross Vehicle Weight (GVW)	6300 kg	> 6300kg e.g.8140kg
Desired weight on front axle	25% of GVW	
Desired weight on rear axle	75% of GVW	

**Center of Gravity of Bus with Full Passengers:-**

Tare weight = 5440kg, considering the severe case from the table 1

Payload of passengers 25 passengers + 1 driver + 1 co-driver = 27

Payload = 27 × 100 kg per passengers = **2700 kg**

Gross Vehicle Weight (GVW) = Payload + Tare weight of Bus

$$GVW = 2700 \text{ kg} + 5440 \text{ kg} = \mathbf{8140 \text{ kg}}$$

During bus bodies building the following dimensions are modified.

$$W_f = 0.25 \times 8140 = 2035 \text{ kg}$$

$$W_r = 0.75 \times 8140 = 6105 \text{ kg}$$

$$\text{Thus, } D = \frac{2035 \times 3.365}{8140} = 0.84\text{m ahead of the rear axle}$$

During body construction, the rear over hang was increased by lengthening the chassis by welding. This further shifts the center of gravity to move very close to the rear axle.

If the body is too long for a wheelbase, the center of the body and payload is placed directly over the rear axle. This places the entire payload on the rear axles, resulting in overloading the rear tires, rear axle springs and wheel bearings and potentially exceeding the rear axle legal weight limit (*Isuzu motors limited 2007*).

Moving a load a few inches forward or backward on the chassis can mean the difference between acceptable weight distribution for the truck or an application that will not do the job satisfactorily (*2007 Series, Chevrolet and GMC N-Series Isuzu GM USA*).

When there is the possibility that axle loads will exceed existing weight laws and regulations, careful weight distribution is necessary to provide a correct balance between front and rear axle loads and total load within legal limitations.

**Rear Overhang Limit:-**

Rear over hang must not exceed the 60% of the wheelbase [10]. Thus the sample measurement of bus rear overhang is 2300mm which is larger than 60% of wheelbase (3365mm) .This shows that the weight distribution on the rear wheels extremely larger than the recommendations of the manufacturer.

**Weight Deviation from Specification:-**

Tare weight of the 150 modified buses registered by transport authority (TA) from the years 2010 to 2012 collected. The weight data of buses randomly selected are 150 buses in the three years of which 50 midi buses in each year. The Ethiopian Transport Authority, allows the passengers to have a right to use the bus with the 25 kilograms of luggage and the passenger average weight is 75 kilograms [11].

These are summarized as follows:

- Tare weight of a bus after modification  $\leq 3800\text{kg}$
- Weight one passenger = 75 Kg +25kg = 100kg.

As the performed investigation, the tare weight of locally manufactured bus bodies from the years 2010-2012 was 4197.4 kg, 4177.4 kg, and 4197.4 kg respectively, which is much greater than the allowed maximum tare weight limit which is  $\leq 3800\text{kg}$ .

Figure 4(a) Tare weight in the year 2010

Figure 4(b) Tare weight in the year 2011

Figure 4(c) Tare weight in the year 2012

Figure 4(a), (b) and (c) the graphs show that TW is >3800kg

The average of the tare weight 2010-2012 from the arbitrarily selected sample size of 150 midi buses, the average of each year is 4197.4, 4177.4, and 4197.4 kg respectively. The average of the three years is greater than the specified range of weight.

**Reasons for the Overweight of Modified Buses:-**

**Absence of Code of Practices for Bus body building design and Approval:-**

The mandatory requirements for buses are intended to bring together the Standards, procedures, specifications and transport regulations for the purpose of regulating and determining the rules for the manufacture, construction and registration of a bus in the country.

The Transport authority should examine and check the mandatory requirements and periodically amend them in accordance with the safety, engineering and ecological standardization. An important part in consolidating the mandatory requirements is based on many years of testing, manufacturing and operating buses in the country, findings of road accident investigations etc., whose purpose is to lead to raising the level of comfort and safety for the passenger and road transport.

In view of this, committees of experts should be convened, to represent various bodies dealing with buses, which include representatives of the Vehicles Department in the Ministry of Transport, representatives of local bus manufacturers, public transport cooperatives and bus importers. The purpose of preparing code of practice leads to improvement of the structure of a bus, passenger safety and comfort, technological progress, the bus owners and insurance companies due to reduced cost of maintenance, reduced property and life loss.

So the following table 4 shows the weight of the problem in the industry from highest contributor to the least contributor depending on the feedback collected from different groups of people concerned in the sector like supervisors, transport officials, technicians, body builders, and passengers. According to the respondents 46% said the main problem is absence of national standard or code for bus body building and no continuous follow up the builders.

Table 4 Major reasons for defects in bus body building

N0	Category	100%
1	No National Standard	46
2	No well Organized Bus Body design	36
3	Shortage/No Advanced Machines	8
4	Poor material selection	6
5	Operators Skill	3
6	Poor/ No Workshops	2

### Cause Analysis Tools:-

#### Pareto Charts Analysis:

The main problems shown in table 4 are analyzed according to Pareto chart below.

A Pareto chart is a bar graph. The lengths of the bars represent frequency or cost (time or money), and are arranged with longest bars on the left and the shortest to the right. In this way the chart visually depicts which cause is more significant [12] [13].

It is used when analyzing data about the frequency of problems or causes in a process and when there are many problems or causes and you want to focus on the most significant.

Thus, the Pareto chart shows the greatest solution can be obtained or the problem of the bus body building can be solved by preparing the national standard for all bus body building industries and continuous follow up, and checks during and after modification.

Figure 5 Pareto chart analysis for the most significant Causes of the problems.

If the bus body building code is prepared with appropriate scientific rules and regulation and continuous check-up followed, the existing problems are reduced by 45.5% as indicated in chart shown in figure 5 [12].

If the problems related with bus body builders are obtained solution, the problems are further reduced by 81.2 % and finally solving problems related to bus owners we can achieve better results [13].

### Cause-and-Effect Diagram Analysis

The Cause and Effect diagram also known as the "fishbone" or "Ishikawa" diagram after its creator Kaoru Ishikawa is used to systematically list all the different causes that can be attributed to a specific problem (or effect). A cause-and-effect diagram can help identify the reasons why a process goes out of control or it is a common tool used for a cause and effect analysis, where you try to identify possible causes for a certain problem or event [14].

The cause and effect diagrams give a fast and comprehensive overview of how a single quantity depends on other quantities. Common categories in a Fishbone Diagram are: Machine (equipment), method, manpower, material, environment, Management (policies), maintenance [14].

The chart in figure 6 identifies multiple potential causes for the problem at hand. The "bones" of the normal potential "cause" categories include people, methods, machinery, and materials. As problem situations vary, this tool has the added benefit of being able to creatively identify different elements to better fit the individual situation.

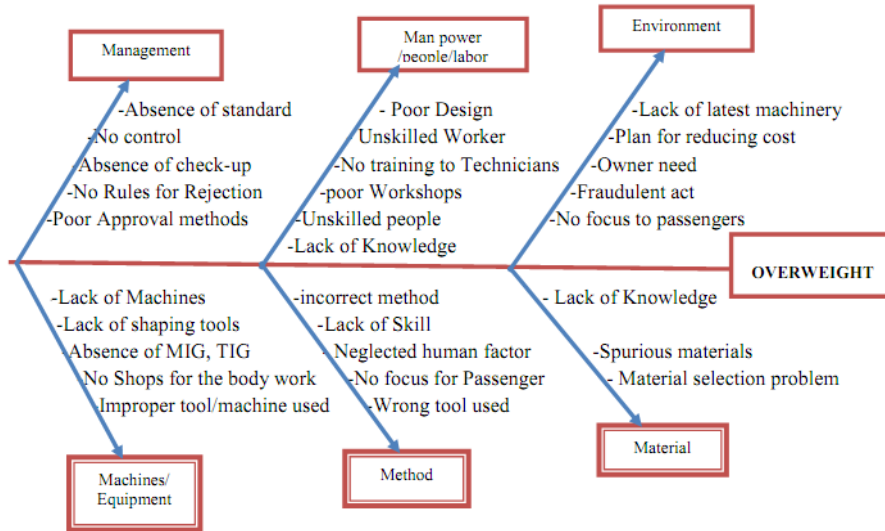

Figure 6 Fishbone or Cause-and-effect diagram

**Comparison of the Structures of Body Frame Work:-**

**Mounting Frame as Floor assembly:** A mounting frame with continuous longitudinal members is not required if the body floor assembly can assume the mounting frame function. The longitudinal members can also be integrated in the body. If the mounting frame longitudinal members are intersected by the chassis members, the connection between the longitudinal and cross members must be rigid and resistant to torsion and bending.

Figure 7 Longitudinal members are intersected by the chassis members to resist torsion & bending (sprinter, 2007)

The floor assembly of locally built buses is greatly different from the shown in figure 8.

Figure 8 Floor assembly of locally modified midi bus (Source: field survey)

**Self-Supporting Bodies**

A mounting frame with continuous longitudinal members is not required if the body floor assembly must have the same mounting frame function.

Self- supporting bodies must have the same characteristics as specified mounting frame. The body floor assembly must have the same rigidity and moment of resistance as a mounting frame.

Figure 9 Body design spacing maximum 600mm

Figure 10 Roof structure of locally made (field photo)

Figure 11 Framework of locally Made (Field photo)

The safest roof structures are shown in the figure 12. These body structures are very strong, stiff and provide more safety and comfort to the bus occupants (sprinter 2007). The roof structure must be tested for strength and stiffness, to reduce the life fatalities during the bus roll-over accidents.

Figure 12 Best framework of body design (Sprinter, Dec, 2007)

Comparing figures 7, 9, and 12, with locally built bus bodies shown in figures 8, 10, and 11 the following summary concludes:

Locally built buses should follow the following important guides to obtain strong structures to resist torsion and bending loads and to guarantee passengers safety.

- The pillars should be round hollow sections extending from the right side chassis to roof structure and then to the left chassis without welding to get self-supporting bodies and have the same rigidity. The stress is uniformly distributed among the structures.
- In locally modified buses the pillars or posts are rectangular hollow sections (RHS) which are cut into pieces each of 2 meters long. These structure minimum welded in four places to make side and roof structures. The welded surface stress distribution is concentrated on the welded section.

#### **Mandatory Tests on the bus:-**

From the values of the measurements taken it is obvious that the measurements are deviated from the given standard values of the minimum requirements.

To conclude the above all analysis result the following photograph is a strong witness for little or no consideration of passengers' safety and comfort, poor material joining and assembling techniques.

The other most important idea is the body must be tested to the following to measure the stiffness and strength to increase the safety for the bus occupants. Figure 13 shows the vehicle body structure conditions during rollover accident. The bus structures completely disintegrated and passengers are thrown out the bus interior, which results in increase in life fatalities instead of minimizing risks [15][16].

Each bus should be tested for the following tests in order to ensure stiff and strong structures should be used to ensure to provide reliable safety, comfort and durable structure for the bus owners and passengers [12][16].

- Vehicle Roll over test:** While the vehicle need not be in a fully finished condition, it shall be representative of production vehicles in respect of the mass of the vehicle in running order, center of gravity and distribution of mass as declared by the manufacturer.
- Joint Strength Test:** Each body panel joint shall be capable of holding the body panel to the member to which it is joined when subjected to a force of 60% of the tensile strength of the weakest joined body panel.
- Vehicle Stability Test:** The stability of a vehicle shall be considered to comply with the requirement if the angle at which overturning occurs is greater than 28 degrees from the horizontal (acceptance criteria).
- Impact Strength for Bumpers:** the front and rear bumpers of the vehicle shall meet the requirements prescribed in relevant standard as and when notified.
- Water Test:** every vehicle must be tested for water or rain test to prevent the entry of rain or leakage to the bus interior [12] [16] [17].

**f. Roof Strength Test:** should be performed to reduce fatalities during vehicle rollover accident.

*Figure 13 Rolled over bus and body structures response during accident (source: field photo)*

**Conclusions:-**

Absence of proper national standard/code of practice for bus body building design and approval to regulate and control the builders allowed the builder to follow their own experience. Thus, setting and implementing the rules for the body builders corrects the existing challenges and helps to manufacture quality products which are economical, safe and comfortable. In addition, proper design which includes complete technical specifications, general drawings of bus structure along with complete dimensions, its components, seats, interior/ exterior fittings, electrical systems, wiring harness, photometric items and other accessories along with complete details of materials used, their specification, manufacturing tolerances shall be provided.

The vehicle performance parameters like; the power, speed and fuel consumption greatly affected by the overweight. Using lightest material like High Strength Steel (HSS), Acrylonitrile Butadiene Styrene (ABS), Polyvinyl-Chloride (ABS-PVC), Composite Body Solutions (CBS), Fiber Reinforced Plastics (FRP), mineral wood the weight can be reduced. Plastics have gained wide usage as transit vehicle liners because highly suitable components can be economically produced, usually at reduced weight [18].

#### Abstract

The exposure to radiation from medical procedures has become a topic of recent public and scientific discussion. Strict adherence to the radiation exposure guidelines is mandatory when using X-rays for disease detection in order to minimize its harmful effects.

**Aim:** The main aim of this study was to assess radiology health workers' knowledge, practices, and attitudes of radiation protection precautions in Makkah City, Saudi Arabia.

**Subjects and methods:** Descriptive cross section research design was used in the conduction of this study in different governmental and private hospitals. Random sample 283 radiology health workers were participated in this study. One standardized questionnaire was used.

**Results:** The majority of studied participants had good knowledge, practices, and attitudes regarding radiation protection precautions in Makkah City, Saudi Arabia.

**Conclusions:** The present study's findings revealed that, the highest percentages of study participants were aware about radiation protection precautions in Makkah City, Saudi Arabia.

**Recommendations:** Designing and implementing a comprehensive training program to all healthcare workers as doctors, nurses and all personnel contact with radiology area. Replication of the study on larger sample and different healthcare workers will be beneficial to decrease health hazards associated with radiation.

#### Introduction:-

Radiation protection is the science and art of protecting people and the environment from the harmful effects of ionizing radiation. It is also described as all activities directed towards minimizing radiation exposure of patients and personnel during x-ray exposure (Elamin, 2013). The objective of radiation protection is to define how one can

protect individuals, their descendants and the human race against the potential risks of ionizing radiation (*UcheEze, et al., 2013*).

Radiography (also called radiologic technology) includes conventional x-ray imaging as well as additional imaging modalities such as fluoroscopy, mammography, ultrasound (US), computed tomography (CT), magnetic resonance imaging (MRI), nuclear medicines (NM) and radiation therapy (RT). Radiography is an essential diagnostic tool of modern medicine. Within a hospital, radiologists, radiology and nuclear medicine technicians, and others involved in the performance of x-ray and computed tomography (CT) scan examinations, have an increased risk for radiation exposure than the general hospital population (*Salama, et al., 2016*).

Treatment of a patient depends on the accurate and precise production of radiographic images and successful interpretation of these images. Various injuries and conditions can be treated when the exact diagnosis is known to the physician. Therefore, a radiographer must be well educated and trained to achieve this goal. A highly qualified and skilled radiographer is a significant member of the health care staff. He could provide appropriate services using imaging techniques, and evaluates radio-graphs of technical quality (*Alaamer, 2012*).

Despite the recent wide radiation applications in medicine, it can be hazardous if not properly handled. A careful balance between the benefits of enhancing human health, and the risks related to the radiation exposure of radiographers, patients, and the public, has to be involved in the practice of diagnostic and interventional radiation. X-rays have the potential for damaging healthy cells and tissues. After interaction of ionizing radiation with biological tissues through various mechanisms, the ions caused by such interactions can affect normal biological processes. Improper protection against high exposures of ionizing radiation can lead to death, cancer, skin burn, cataract, and radiation infertility (deterministic effects) (*Adejumo et al., 2012*).

In addition, although the low dose of radiation exposure may cause no observable damage, the probability of chromosomal damage in the germ cells, with the consequence of mutations giving rise to genetic damages (stochastic effects), can make such doses significant for large populations. Accordingly, the need for radiation protection exists, in all medical facilities and for all radiation equipment types (*Johnston et al., 2011*).

The characterization of medical applications, in terms of occupational exposures, is sometimes done by reporting an average annual individual dose for all exposed and/or measurably exposed workers. In practical radiation protection, this approach is, however, meaningless, as individual doses in the medical field differ substantially. During the evaluation of dosimetric data one needs information about the distribution of the yearly doses. When individual monitoring is used as a tool in practical radiation protection, it is important to know if the order of magnitude of the individual dose is defined by the nature of the procedure, the individual workload, the level of radiation protection measures, or the methodology of the assessment (*Covens, et al., 2007*).

Occupational exposure is the result of radiation exposure at work, and personal dosimetry is an important tool to ensure compliance with regulatory or generally accepted dose limits. Radiation safety is the main health issue of concern to health-care facilities. Ionizing radiation is a known carcinogen at high doses, and clinical symptoms are known to be associated with the chronic low-dose exposure. The use of ionizing radiations in medicine is expanding rapidly due to the introduction of new ionizing radiation oriented diagnostic and therapeutic practices. Radiographic imaging is extremely valuable as a diagnostic tool in medicine, but ionizing radiation also carries well-known potential risks (*Salama, et al., 2016*).

Radiation exposure poses hazards for healthcare providers as well as patients, and it may have somatic and genetic effects. Monitoring of radiation doses received by staff in radio-diagnostic centers is of great importance to the radiographers in their effort to protect themselves, patients, and the general public from the untoward effect of excessive radiation (*Salama, et al., 2016*).

The as low as reasonably achievable (ALARA) principle, which emphasizes utilizing techniques and procedures to keep exposure to a level as low as reasonably achievable, should be followed to minimize the risk of radiation exposure to medical professionals. Personnel shielding options (e.g., two-piece wraparound aprons, thyroid shields, and eye protection) should be used to effectively attenuate scattered x-ray levels (*Greenlee, et al., 2011*).

**Significance of the study:-**

Legislations for X-radiation protection of the environment and workers in industries and health care in developing countries are either nonexistent or unimplemented because of lack of concern, inadequate manpower, and logistics (Agbor and Azodo, 2017). The exposure to radiation from these diagnostic X-rays exerts adverse effects on humans, and these effects are classified as deterministic and stochastic effects. In order to protect the employees against occupational exposure to radiation, appropriate technical education and training suitable for effective protection of tools and equipment should be provided. These measures must be in accordance with national regulatory codes. So, this study aimed to assess the awareness of radiation protection precautions among radiology health workers in Makkah City, Saudi Arabia.

**Aim of the study:-**

The main aim of this study was to assess radiology health workers' knowledge, practices, and attitudes of radiation protection precautions in Makkah City, Saudi Arabia.

**Subjects and Methods:-****Research design:-**

A descriptive cross section study design was used in the conduction of this study, during the period from December 2016 to February 2017.

**Setting:-**

The study was conducted in different government and private hospitals, in Makkah city, Saudi Arabia.

**Subjects of the study:-**

Random sample (283) of radiology health workers were selected for this study from previously mentioned setting. Out of 400 questionnaire only 283 were completed. The response rate were (70.75%) selected.

**Tool of data collection:** A structured questionnaire was designed for data collection by researchers based on review of literature. It included four parts.

**First part :** included socio-demographic data of the study subject as age, gender, Nationality, marital status, Type of hospitals, Duration of Employment (years), Average working hours/day and which department you work in?.

**Second parts:** Included knowledge about radiation protection, Response of radiographers to radiation safety compliance. It composed of 4 statements.

**Third part:** Revealed the practice of radiation protection, applicability & convenience of radiation protection policies, procedures & PPE (Personal Protective Equipment). It composed of 5 statements.

**Fourth parts :** Comprised of attitude, assessment of the work place safety requirements. It included 7 statements.

**Ethical consideration:-**

Before any attempt to collect data, an official approval to conduct the study was obtained from all hospitals included in the study. This was done by sending letters containing the aim of the study from King Faisal Hospital in Taif city to ethical research committee in all hospitals. Each participant was notified about the purpose of the study, the right to refuse to participate in the study. Anonymity and confidentiality of the information gathered was ensured.

**Statistical analysis:-**

Data were revised, coded, entered, analyzed and tabulated using SPSS version 19. Both descriptive statistics (frequency, percentage, mean and standard deviation) P value less than 0.05 was considered significant.

**Results:-**

**Table 1:** This table represented socio-demographic characteristics of studied sample, as evident from the table, most of participants (51.9%) were female, nearly about two thirds of study participants (59.0%) were Saudi, and (63.3%) of study participants were married. The majority of study participants (85.9%), worked in government hospitals. Regarding working hours, the majority of study participants (81.6%) worked about 6-9 H/Day. Concerning departments, nearly about one third of study participants (36.0%) worked in General x-ray. The age of study participants were  $32.5 \pm 7.2$ .

**Table 2:** Revealed participants' knowledge about radiation, this table showed that (96.8%) of participants were aware about the radiation hazards, (73.1%) of participants were aware about radiation safety standards, (97.9%) of participants knew the importance of radiation safety and (88.3%) knew about wearing Personal Protective Equipment (PPE) during any imaging.

**Table 3:** Demonstrated participants' practices about radiation. This table revealed that most of participants have the Lead aprons and lead gloves in their department with percentage (82.7% and 73.5% respectively), while, the percentage of use is (68.2%), the integrity of checking periodically was (65.4%) and most of participants (68.9%) answered more than 2m about the distance from radiological device without protection during the procedure (meter).

**Table 4:** Illustrated participants' attitudes about radiation. This table demonstrated that, (65.0%) of participants have the personal monitoring records, it is checking periodically (59.7%) and it does not recorded high reading with (65.4%), (67.1%) of participant have Environmental monitoring records with percentage (67.1%), (92.2%) have a safety written policy in their department, (94.3%) of participants answer yes about the lead plaster/lead lining of walls and doors and if there is a safety warning signs with percentage (94.3% and 97.2% respectively).

**Table (1):-** Socio -demographic Characteristics of Studied Sample (N=283).

Socio –demographic Data	N	%	Total	
<b>Sex:</b>				
Male	136	48.1%

In your department, is there a safety warning signs ?	275	97.2%	8	2.8%	283 100%

### Discussion:-

This cross-sectional descriptive study included 283healthcare workers, with the aim of assessing radiology health workers' knowledge, attitudes and practices of radiation protection precautions in Makkah City, Saudi Arabia. The results of the present study showed good knowledge, attitude, and practice for radiation protection, This is better than what was reported in a similar study in Tehran Province (Iran) which found knowledge of radiation protection issues among radiographers in that country to be poor(*Shohreh, 2015*), but it was consistent with study reported in Lagos (Nigeria) which foundRadiographers in Lagos, Nigeria, exhibited a very good understanding of the issues pertaining to radiation protection (*Cletus, 2013*).

In this study, the maximum age of participants is 54 years old, with the employment of 6 years and the minimum is 21 years old, with the employment of 1 year.The female is represented 51.9% and the male 48.1%, most of participants were Saudi with percentage 59.0% and the non-Saudi formed 41.0%, the participants ranging between married, single and divorce with percentage 63.3%, 28.6% and 8.1% respectively.Most of participants were working in governmental hospitals by 85.9% percentage and the private hospitals represented 14.1%.The highest rate of work for participants was 6-9 Hours\Day in general x-ray with percentage 81.6% and 36.0% respectively.

Regarding knowledge about radiation safety we observed that; the majority of study subjects were aware about radiation hazard and safety; whereas 96.8% of participants were aware about radiation hazards and the awareness about importance and standard of radiation safety is 97.9%, 73.1% respectively, this study' result wasconfirmed by *Paolicchi, et al.,(2016)* who reported that almost all participants (95 %) showed an awareness of the need to communicate to the patient the possible risks related to radiation exposure. But this study was disagree with *Melaih, and Mishah(2008)*who revealed that the nurses in general don't have enough knowledge about radiation safety and protection principles.

The participants wearing Personal Protective Equipment during examinations by percentage 88.3%,this result was not coincided with (*UcheEze, et al., 2013*)who mentioned that only 50% of respondents were observed to wear radiation dosimeters during the period studied.

Regarding the practice about radiation, there are lead aprons in the departments by percentages 82.7% and it were using with 68.2% , This result is coincided with *Elamin, (2013)*who mentioned all the hospitals either governmental or private have lead rubber aprons. All the governmental hospitals had gonadal shield although none is using them on a routine basis,in study reported by (*UcheEze, et al., 2013*)who indicated that in particular, gonad shields were available in all the centers studied but were either deliberately or inadvertently ignored in government hospitals.

It is mandatory, according to International Commission on Radiological Protection(ICRP) radiation safety standards for gonads shields to be used for the protection of the gonads when the pelvis is not part of the anatomical area being examined. Their use is more essential when women of child bearing age in whom early cyesis is suspected come for x-ray examinations. Most of the radiology departments have lead gloves by percentage 73.5% and it were using with 53.7%, table3, this result disagreed with *Ahmed et al., (2015)* they said: only (22.7%) use lead gloves and this behavior will protect the radiographers themselves.

Replacing a lead apron averts an increase in dose due to defects in the apron. Therefore, the replacement cost of the lead apron is the amount spent to avert the dose due to a defective lead apron, (*Kent, 2001*). In this research the integrity was checking periodically by percentage 65.4% and did not checking by 34.6%, this result was not consistent with, *Oyar, et al., ( 2012)* who revealed that considering the use of radiation protection aprons in clinics, we have seen that personnel are not aware of the importance of preservation and storage conditions, and for this reason, they do not heed the rules for using, preserving and cleaning aprons.

Radiation dose rates increase or decrease according to the inverse square of the distance from the source. Understanding the inverse square law can help personnel in decreasing their exposure to scattered radiation. The inverse square law states that exposure at a distance from a point of radiation is inversely proportional to the square of the distance, (*Erica et al., 2011*) in this research the distance from radiological machines in the most departments are more than 2m by percentage 68.9%, this result was confirm by *Abdellah et al., 2015* who indicated that the 28 physicians (35%) were standing at a distance of two meters or less from source point without protection.

Related to attitude of radiation, 65.0% of participants have personal monitoring records and it is checking periodically by 59.7%, this result was confirm with Rania M. et al, (2015) they said: (98.7%) of the staff have periodical radiation dose check from their TLDs (wearing TLDs during their work hours), also in the research written by *Meenakshisundaram, et al.* who mentioned that about 200 radiation workers are issued Thermo Luminescent Dosimeters (TLD) every month and their dose records are well documented in a computerized dose management system with a feature to view the dose history of an individual at any given time.

According to the ALARA (As Low As Reasonably Achievable) principle, it is possible to considerably lower the dose of ionizing radiations during tests. *Asl, et al., (2013)* stated that the study results showed 34.6% of this monitoring recorded high reading while 65.4% did not recorded high reading. Almost; all the x-ray departments have lead lining the wall and door and have safety written policy by percentage 94.3%, and 92.2% respectively. The radiology departments using the safety-warning signs by percentage 97.2%, this result was agree with *Dehaghi, et al., (2015)* who reported that according to the obtained results, 71% of the described radiology departments generally used warning signs, 67.1% of the radiology departments have environmental monitoring records, this result not coincided with *Elamin,(2013)* who concluded that the results of this study reveals low personal and environmental radiation monitoring by hospitals in Khartoum State as only (20.7 %).

#### **Limitation of the study:-**

The most remarkable limitation of the present study was that all data in this study was obtained through cross-sectional, self-report surveys, which could lead to common method variance Therefore, it is suggested that these results be used cautiously.

#### **Conclusions:-**

The present study's findings revealed that, the highest percentages of study participants were aware about radiation protection precautions. The majority of studied participants had good knowledge, practices, and attitudes regarding radiation protection precautions in Makkah City, Saudi Arabia.

## Recommendations:-

**Based on the findings of this study, the following recommendations are proposed:**

1. Designing and implementing a comprehensive training program to all healthcare workers as doctors, nurses and personnel contact with radiology area.
2. Replication of the study on larger sample and different healthcare workers will be beneficial to decrease health hazards associated with radiation.

#### Abstract

Commodities have played a major role in shaping the international economy by affecting the lives and livelihoods of people. Particularly, in India Shortage of critical commodities sparked huge public outcry and social unrest. Price volatility which arises from bad weather irregular production and harvests as well as from swings in demand and supply is one of the key problems associated with commodity. Volatility evokes not only yield risk but also price risk for both producers and consumers of the commodity. To manage these price volatility derivative products i.e. commodity futures are being used by farmers, consumers, firms, exporters, importers etc. to reduce the price risk.

Commodity derivative market particularly, commodity futures is recognized as one of the important instrument that has been devised to achieve price risk management. In this context, an attempt has been made in the paper to evaluate the hedging effectiveness of commodity derivative market in the management of price risk with reference to the raw jute derivative market in India. The study utilized daily futures price and spot price data of Raw Jute provided by National Multi Commodity Exchange (NMCE) during the period 2010-14. Trend of spot and future prices in raw jute was analyzed by using descriptive statistical measures. To analyses the hedging effectiveness of the raw jute futures contract minimum variance hedge ratio has been used. Empirical evidence suggests variation in spot and futures prices of raw jute are higher however, an equal trend is found between the variations of spot and futures prices. The results of this study are useful for various stakeholders' of agricultural commodity markets such as producers, traders, commission agents, commodity exchange participants, regulators and policy makers.

#### Introduction:-

Since 19th century trading in Commodity Futures has been in existence in India with organized trading in cotton, through the establishment of Bombay Cotton Association Ltd. in 1875. Over a period of time, various other commodities were allowed to be traded in futures Exchanges. Though, India is a commodity based economy where

two-third of the total population depend on agricultural commodities, surprisingly has an under developed commodity market. Since commodity “futures” trading was permitted by government in 2003 by lifting prohibition against futures trading and granting recognition to electronic exchanges namely National Multi Commodity Exchange of India (NMCE), Multi Commodity Exchange of India (MCX), National Commodity and Derivatives Exchange (NCDEX) as national multi commodity exchanges, the commodity derivative market in India has witnessed exceptional growth. In addition to the above exchanges the other major commodity exchanges operating now in India are Indian Commodity Exchange Limited (ICEX), Ace derivative and commodity exchange Limited (ACE) and Universal Commodity Exchange (UCE).

The primary economic function of futures markets is the hedging or risk sharing function and the secondary functions include price discovery function, financing function, liquidity function and price stabilization function (Somanathan, 1998). The argument of risk minimization through hedging primarily conditioned upon the movement of spot and futures markets together, so that losses in one market can be compensated by gains in other market. In fact, the existence of higher price volatility in the spot market provides a room for the operation of commodity derivative market to hedge against the price risk. Thus, an element of the price risk management in the commodity derivative market is expected to stabilize spot prices of the essential commodities. In order to manage price risk efficiently, it is enviable to control both price risk and basis risk<sup>1</sup>. An un-hedged producer or investor faces price risk in the spot market while a hedged investor or producer faces basis risk. When the basis risk is low, hedging can be used as an efficient instrument, but while basis risk is as large as price risk then hedging cannot be used as an effective instrument for mitigating business risk. In this case it is not profitable for producer or investor to enter into the derivative market. If the basis is close to zero in the maturity month then futures price converges to the spot price and there is no such business risk (Naik and Jain, 2002; Lokare, 2007; Commission for Agricultural Cost and Prices, 2008).

Jute is a natural fiber with golden and silky shine and hence called the golden fiber. It is the cheapest vegetable fiber procured from the skin of the plant's stem and the second most important vegetable fiber after cotton, in terms of usage, global consumption, production and availability. It has high tensile strength, low extensibility and ensures better breath ability of fabrics. The British East India Company was the first jute trader in India. After the fall of British Empire in India during 1947, most of the Jute Barons started evacuate India, leaving behind the industrial setup of the Industry. Then most of the jute mills were taken over by the Marwari businessmen. India is the largest producer with a share of 66% of the world' total production and West Bengal is the largest producing state in the country accounting for 71% of the national production. Therefore, it can be undoubtedly summarize that jute sector plays an important role in the economy of the country. However, the sector has been beset with several problems, including small and marginal growers with low bargaining power, inadequate institutional credit facility, imperfection in marketing structure, low productivity, competition from the synthetics, high labour costs, repeated industrial unrest, obsolete machinery, stagnating exports, all of which have led to prevalent sickness in the jute industry. Furthermore, with variation in the behaviour of weather, jute crop is potentially influenced by such weather vagaries. Instability in raw jute production dovetailed with little holding capacity of farmers generally gives rise to erratic price movement in raw jute both during intra-season and inter-seasons. Moreover, the Indian jute market is often guided by the existence of different price system i.e. spot, futures and government administered minimum support prices. So, the millions of families who are dependent on cultivation of jute especially in Eastern India often face price volatility in raw jute market.

Not many studies have been conducted in India after introduction of futures specifically on agricultural commodities. It is also safe to assume that the agricultural commodities spot market still continues to fragmented and inefficient. The futures market provides a unified price at national level acts as a bench mark for regional market. Jute being a cash crop cultivated and produced mostly in eastern India. Acreage for cultivation gets reduced year by year as the farmer do not realize the best of prices, as reported and adds to the distress sale.

In light of the above facts this study wants to examine the raw jute market and jute prices from 2010 to 2014. This also brings the fact that a few studies have been conducted on the jute with special reference to its futures and it provides a better scope to study the future market of jute.

The outline of the paper is as follows. The next section briefly reviews the related literatures and discusses the contribution of this study. Section III explains about the meaning, nature, production, and spot market prices of raw

---

<sup>1</sup> The difference between future price and spot prices are called Basis.

jute in Indian context and also the various regulatory bodies associated with the Indian jute industry. Section IV describes about jute futures market in Indian context and how the futures market can be used for hedging the spot exposure. Section V covers the sources and properties of the data, hypothesis along with the research methodology and its limitations. While the sixth section shows the empirical results of the applied tools. In the final section, it summarizes the main findings of the study in form of conclusion.

### **Review of Literature:-**

Since the introduction of futures in Indian commodity market there are numerous studies have been conducted in the ascertainment of whether the price information is reflected in the spot market or in its underlying futures market under various interval of time. There have been both supporting and contrary views on impact of derivatives trading. The following are brief reviews of some of the research papers that have been done nationally and internationally to study the price risk management efficiency of commodity futures market.

**Chan (1992), Garbade and Silber (1983), Oellermann et al. (1989), Feeder cattle and Schroeder and Goodwin (1991), Zhong et al. (2004), Zapta and Fortenberry (1997)** tested the relationship between spot and futures prices and concluded that in the beginning the futures market captures the new information and then transfer happens to the spot market. They also explained that the futures market is the main source of market and futures market helps in price discovery. By supporting the explanation, Tan and Lim (2001), Tse (1999) propounded that futures market influences the cash market and vice versa.

**Brockman and Tse (1995), Zapata et al (2005), Roy (2008)** used econometrics technique such as Co-integration, Vector Error Correction Model (VECM) etc. and concluded that the physical market of the commodities follows the commodity futures market hence, futures market drives the price discovery.

**Thomas and karande (2001)** studied the price discovery process of castor seed futures traded on the regional exchanges of the Ahmadabad and Mumbai and concluded that there is no lag and lead relationship between the spot and futures prices of castor seed traded at Ahmadabad market and spot market dominates the Mumbai futures market.

**Gopal and Sudhir (2002)** in their study propounded that Indian agriculture commodity futures market is not fully competent for risk management and price discovery in the same time blamed poor management, infrastructure and logistics for the inefficiency of the market

**Lingareddy, Tulsii (2008)**, in his paper named 'Expert committee on commodity Futures: Agreements and Disagreements' explained that futures trade in India has increased the price volatility of largely traded commodities like urad, chana and wheat during periods of excess liquidity and in contrast, other commodities like soya oil futures trading has led to a reduction in volatilities and better price discovery. They concluded that futures trading in agricultural commodities are beneficial for only those commodities that fulfill the basic selection criteria for futures trading.

**Kumar Sunil (2004)** in their study they have taken five Indian agricultural commodities and to examine the price discovery phenomenon applied Johansen Co-integration technique. It concluded that the Indian agriculture commodity futures is inefficient and it unable to absorb the spot market information.

**Jose, k Sharon (2005)**, in his article titled "Forecasting Future basis levels in Commodity Futures" and **Mahalik et al. (2009) Shihabudheen and Padhi (2010), Ranajit and Asima, 2010, Srinivasan (2012), Gurbandini and Roy (2008)**, explained commodity futures contracts helps to hedge the commodity price risk which in turn helps in avoiding uncertainty of future cash flows so commodity futures can be used as an efficient price discovery vehicle.

**Jose, k Sharon (2005), Kaul, Sanjay, (2007)** their empirical evidences explains that introduction of derivatives does not destabilize the underlying market, but the literature strongly suggests that the introduction of derivatives tends to improve liquidity and information of the market.

A study by **Indian Institute of Management, Bangalore, (2006)** with regard to gram, sugar, guar-seed, wheat, urad, and tur states that these commodities witnessed higher price increase in the Post Exchange period as compared

with the pre-exchange period. It concludes that changes in the fundamentals were important in causing the higher post-futures price rise, with government policies also contributing. Therefore, the role of futures remains unclear.

**The study by Sahi, G.S, (2006), R. Salvadi and P. Ramasundaram, 2008** the study suggests that excessive speculative activity in futures market which is not driven by those who manage price risks in physical trade. Their results showed the inefficiency of agricultural commodity futures market in terms of price discovery due to the non integration of futures and the spot market.

By examining efficiency of Indian commodity futures market **Samal, G.P and Swain, Anil (2015)** concluded that there was a long-term relationship existed between futures and spot prices for cotton, turmeric and castor seed during the calendar year 2013. Further, causality test proved that futures markets have stronger ability to predict subsequent spot prices for cotton, turmeric and castor seed during the same period.

From the literature review, it is observed that there is enormous amount of literature on the concerned subject considering the world-wide commodity market. However, it is comparatively less in case of price risk management in agricultural commodities, especially in raw jute. In the same time it is found out that there is enormous amount of literature on efficiency in information flow between the two markets i.e. Spot and the Futures, Co-integration between both the markets. The study relating to Jute has not made. Hence, the study is taken up. In such circumstances, this study carries a significant importance to re-look on the price risk management efficiency of agricultural commodity market in India.

### Spot Market of Jute- In Indian Context:-

Jute is the cheapest and the strongest of all natural fibers also considered as the fiber of the future. According to world's production of textile fibers Jute is the second largest after cotton. Particularly India, Bangladesh, China, Thailand, south Asian countries and Brazil are the leading producers of raw Jute and also the main producers of White jute and dark jute. Jute is extensively used in the manufacture of different types of packaging fabrics, carpet backing, mats, bags, decorative fabrics, chic-saris, soft luggage's, footwear, greeting cards, molded door panels, tarpaulins, ropes and twines etc. and also other types of consumer products.

India is the largest producer of jute goods in the world, while Bangladesh is the largest cultivator of raw jute. Eastern Indian states v.i.z. West Bengal, Bihar, Assam, Tripura, Meghalaya, Odisha and Uttar Pradesh are the major cultivator of Jute. In India West Bengal alone produces approximately fifty percent of total raw jute. In India 4000,000 families are involved in the cultivation of raw jute. There are 76 jute mills and provides employment opportunity nearly to 1, 37,679 people. Several thousand other people are engaged in several jute related diversified goods also. The state seed corporation of Andhra Pradesh and Maharashtra produces more than 90 percent of jute seeds so, India is self-sufficient in the jute seed production.

Jute, being a natural fibre, is biodegradable and eco-friendly and it has many advantages over synthetics. It also enjoys the advantages like low extensibility, high tensile strength, lusture, moderate heat and fire resistance and long staple lengths. Recently Indian Jute Industries Research Association (IJIRA) has developed Hydrocarbon free jute bags and food grade jute bags of international standard. Now these bags have great demand throughout the world for packing food stuffs. There are many varieties of jute but according to general utility purposes some of the important varieties are the following:

- ✦ Hessian Or Burlap - these are plain woven fabric of 5 to 12 ozs./ yard, and used for making cloths and bags.
- ✦ Sacking – these qualities are made from lower grades of fiber and weighing from 12-20 ozs./yard popularly known as 'heavy goods'. In all types of bags these qualities are used.
- ✦ Canvas - it is the finest jute product and woven of the best grades of fiber used as a protection from the weather.
- ✦ Jute Yarn And Twine – it has varying weights and thickness these are consumed by the jute mills themselves in fabrics. It has variety of applications such as sewing, tying, packing pipe joints, cable binding etc.

There are many regulatory and development organizations associated with the jute industry for its sustainable development. The International Jute Study Group (IJSG) which is an intergovernmental body set up by the UNCTAD to promote the international trade by developing new markets, developing sustainable and qualitative new jute products and providing a platform for active participation among private sectors globally. In India under the National Jute Board Act, 2008 a statutory body was set up called National Jute Board (NJB) that functions under the

Ministry of Textiles, Govt. of India and has started its operation with effect from the 1 April 2010. The two organizations i.e. Jute Manufactures Development Council (JMDC) and National Centre for Jute Diversification (NCJD) are merged with the NJB. It functions with the objective of promoting standardization of raw jute and jute goods, developing entrepreneurship in jute sector by organising entrepreneurial development programmes, modernizing jute industry etc. Other organizations like Indian Jute Industries Research Association (IJIRA), Central Research Institute for Jute & Allied Fibers (CRIJAF), Jute Manufactures Development Council (JMDC), Indian Jute Mills Association (IJMA), Gunny Trades Association (GTA), Institute of Jute Technology (IJT), Office of Jute Commission (Ministry of Textile) and many more were established to strengthen the sector. Further in the year 2005 the govt. of India framed the national jute policy with the objective of improving the quality of jute, increasing its export, producing and exporting the jute goods which confirms the international standard, utilizing the advanced technology in production, improving the working environment of the jute industry and providing fair emoluments to the workers which are conducive for their reasonable quality of life etc.

So far as the pricing of the raw jute is concerned the Government of India every year determines the Minimum Support Price of various grades of raw jute with the consolation of Commission for Agricultural Cost and Prices (CACAP). This year Government has increased the Minimum Support Price (MSP) of raw jute of TD-5 grade from Rs. 2300 per quintal (100 Kilograms) to Rs. 2400 per quintal for the 2014-2015 seasons i.e. an increase of 4.34 percent over last year's. Government also fixes the MSP for grades of raw jute. Jute Corporation of India (JCI) acts as a nodal agency of the govt. for undertaking price support operations.

#### Minimum Support Prices of Jute of TD-5 (a tossa variety grown in Assam) Grade in India.

Crop Year	MSP Per 100 Kgs	Price Increase	% of Price Increase	Crop Year	MSP Per 100 Kgs	Price Increase	% of Price Increase
2014-15	2400	100	4.34%	2002-03	850	40	04.94%

#### Jute Futures Market and Hedging Effectiveness - In Indian Context:-

As mentioned earlier price volatility is one of the key problems associated with commodities. To manage these price volatility derivative products like Commodity futures can be used. Commodity Futures contracts are standardized forward contracts that are transacted through a recognized commodity exchange. In futures contracts underlying's are standardized in quality, quantity and location but leaving price as the only variable factor. Modern futures agreements began in Chicago in the 1840s. The following are some of the salient features of commodity futures:

- ✚ Commodity Futures contracts always traded on an organized exchange such as NCDX, MCX, NMCE etc. in India and NYMEX, LME, COMEX etc. internationally. These exchange provides a ready, liquid market in which futures can be bought and sold at any time
- ✚ Quality, quantity, and delivery date, of the underlying are predetermined by the exchanges and different exchanges have their own standard.
- ✚ The minimum price variation which is standardized for every contract called tick size and it also may vary from exchanges to exchange.
- ✚ Commodity Futures exchanges use clearing house which acts as a guarantor for both the parties against counter party risk by keeping margin money. It gives the guarantee for execution and delivery of the contracts held till

maturity.

- ✦ In order to avoid counter party risk, both the parties' deposits some amount of money with the clearing house called margin money. Generally there are two types of margin money v.i.z. initial margin and maintenance margin.
- ✦ On daily basis profit and loss on each transaction is determined which is called mark to market or making to market. On daily basis the profit is credited and the loss is debited in the margin money account of the trader for which it is called daily reconnected forwards.
- ✦ Its Proper regulation ensures fair practices in these markets. Previously commodity futures market was regulated by the forward market commission (FMC) but after the merger of FMC with SEBI now it is coming under the purview of SEBI.

Futures market provides many advantages directly and indirectly as the primary objectives of any commodity futures exchange are price discovery and an efficient price risk management. Based on inputs regarding demand and supply equilibrium, weather forecasts, expert views and comments, inflation rates, Government policies, market dynamics, hopes and fears, hedgers' trades at commodity futures exchanges facilitates determining the fair value of a commodity. Secondly the futures market provides the platform to the hedgers for price risk management. By taking an equal but opposite position in the futures market, participants like farmers, processors, merchandisers, manufacturers, exporters, importers etc are used it to hedge their spot exposure. Thirdly the importers and exporters can hedge their price risk and improve their competitiveness by making use of futures market. Fourthly, futures contracts will enable predictability in domestic prices which helps the manufacturers to smooth out the influence of changes in their input prices. Otherwise the manufacturers are required to keep sufficient financial reserve to met the adverse price changes which could have been utilized for making other profitable investments. Fifthly, the quality certificates that are issued by the exchange-certified warehouses where farmers kept their standardized produce, have the potential to become the norm for physical trade. Last but not the least commodity futures market needs modern warehousing, quality and grading testing centers that leads to development of infrastructures which paves the way of economic development of a country.

Despite of the above benefits there are also some loop holes of the futures market. First the low margin requirement may encourage to the speculative activity among the participants which leads to unnecessary risk taking as a result the potential for losses is also increases. Participation of large number of farmers is also imperative for an efficient commodity futures market but bringing the farmers into the mechanism by creating awareness among them is also challenging. Some also argued that the delivery based settlement is the most critical part of the commodity futures for which the speculators those trade in a exchange without having the underlyings squares up their position before the contract period approaches. Others have the view that trading in futures are just for experts for general people it's a risky business. But enormous studies suggest that futures can be used as an important instrument for price risk management.

So far as the participants of the future market are concerned, they can be broadly divided into three types v.i.z. hedgers, speculators and arbitrageurs. Hedgers are the commercial producer enters into futures market for hedging their spot exposure whereas speculators predicts the direction of prices and makes profit by using the futures market. When price differential prevails between the two market arbitragers makes money by simultaneously buying and selling the same commodities in different markets. Hedgers transfers the risk of adverse price movement by foregoing the profit potential where as speculators accepts that risk with objective of making money by predicting the future price movement for All the above participant makes the futures market efficient and speculators brings equilibrium between the two market which makes price discovery process more efficient in the futures market.

Risk arises due to unanticipated and unfavorable movement of the price. Risk can't be completely eliminated but can be reduced by using different strategies and techniques. Commodity futures is one of the most important technique among the available alternatives. Unfavorable price changes in the commodity cash market can be hedged by using commodity futures. In the context of future trading hedging is the process of taking a position in futures market to protect the value of spot positions. There are different concepts of hedging such as Perfect Hedge, Carrying charge Hedging, Discretionary Hedging, Anticipatory Hedging, Long Hedge, Short Hedge, Cross Hedging etc.

**Research Methodology:-**

The study utilized secondary data source viz. daily historical closing spot and futures price of raw jute transacted in National Multi Commodity Exchange (NMCE) during 2010-14. Thus, the data collected is for a period of five years from 2010 to 2014. The data are collected from the home page of National Multi Commodity Exchange of India i.e. www.nmce.com

Trend of spot and futures prices in raw jute was analyzed in the study by using descriptive statistical measures like mean, standard deviation and coefficient of variation. For empirical analysis of raw jute futures market in India the following methodology has been applied are as follows:

To identify the minimum variance hedge ratio, we first rewrite the cash flows in terms of prices changes i.e.  $S^T - S$  and  $\Delta F = F^T - F$  denote the change in spot and futures prices respectively over the hedging horizon. Now it is required to add and subtract quantity QS to obtain;

$$Q S^T - Q S + Q S - H(F^T - F) = Q (S^T - S) - H (F^T - F) + Q S$$

$$Q \Delta S - H \Delta F + Q S \text{ ----- Eq.- 1.1}$$

Now let  $h = H/Q$  denote the hedge ratio. The cash flow (1.1) can be expressed in terms of hedge ratio as

$$Q [\Delta S - h \Delta F] + Q S \text{ ----- Eq. 1.2}$$

We want to pick  $h$  to minimize the variance of this quantity. It should be noted that the last term QS is a known quantity at the time hedge is put on, so it contributes nothing to the variance. From (Eq.1.2) the variance of the hedged cash flow comes from the three sources<sup>2</sup>:

- ✚ The variance of spot price changes  $\Delta S$ . Denote this quantity by  $\sigma^2 (\Delta S)$ .
- ✚ The variance of futures price changes  $\Delta F$ . Denote this quantity by  $\sigma^2 (\Delta F)$ .
- ✚ The co variance between these quantities, denoted cov.  $(\Delta S, \Delta F)$ .

Using this notation the variance of hedged cash flow (1.2) is

$$\text{Var} [Q (\Delta S - h \Delta F)] = Q^2 \text{Var} (\Delta S - h \Delta F)$$

$$= Q^2 [\sigma^2 (\Delta S) + h^2 \sigma^2 (\Delta F) - 2h \text{Cov.} (\Delta S, \Delta F)] \text{ ----- Eq. - 1.3}$$

The presence of the  $h^2$  term ensures that the last term is U- shaped as a function of  $h$ . to identify the point of minimum variance, we have to take the derivative of Eq.-1.3 with respect to  $h$  and set it equal to zero. This yields-

$$2h \sigma^2 (\Delta F) - 2 \text{Cov.} (\Delta S, \Delta F) = 0 \text{ ----- Eq.1.4}$$

Or  $h \sigma^2 (\Delta F) = \text{Cov.} (\Delta S, \Delta F)$ . Thus the variance minimizing value of  $h$  is :

$$h = \text{cov.} (\Delta S, \Delta F) / \sigma^2 F \text{ ----- Eq. - 1.5}$$

To express  $h$  in terms of the correlation  $P$  between  $\Delta S$  and  $\Delta F$ , note that by definition

$$\rho = \text{Cov.} (\Delta S, \Delta F) / \sigma(\Delta S) \sigma (\Delta F) \text{ ----- Eq.1.6}$$

Thus  $\text{Cov.} (\Delta S, \Delta F) = \rho \sigma (\Delta S) \sigma (\Delta F)$ , SO  $h$  can also be written as

$$h = \rho (\sigma \Delta S) / (\sigma \Delta F) \text{ ----- Eq.-1.7}$$

Where,  $h$  = Minimum Variance Hedge Ratio

$\Delta S$  = Change in spot price during a period of time equal to the life of the hedge

$\Delta F$  = Change in futures price during a period of time equal to the life of the hedge

$\sigma \Delta S$  = Standard deviation of change in spot price.

$\sigma \Delta F$  = Standard deviation of change in futures price.

$\rho$  = co-efficient of correlation between  $\Delta S$  and  $\Delta F$ .

If  $\rho = 1$ , and  $\sigma \Delta F = \sigma \Delta S$  then,  $h = 1$ . In this case, the futures price mirrors the spot price perfectly. If  $\rho = 1$  and  $\sigma \Delta F = 2 \sigma \Delta S$ , then the hedge ratio  $h$  will be 0.5. In this case, the futures price always changes by twice as much as the spot price. So, the proportion of variance which is eliminated by hedging is called hedge effectiveness.

As stated earlier minimum variance hedge ratio or risk minimizing hedge ratio  $h$  is the multiplication of ‘ $\rho$ ’ with the scaling factor. ‘ $\rho$ ’ denotes the correlation between  $\Delta S$  and  $\sigma \Delta F$  and the ‘scaling factor’ denotes the ratio of  $\sigma \Delta S$  to  $\sigma \Delta F$ . when hedging a given quantity of an asset we have to multiply  $h$  by the number of units of the spot good per the

<sup>2</sup>Das,Sundaram. (2013), “Derivative: Principles and Practice’ ’Tata McGraw-Hill Publishing Company Limited, New Delhi, p- 107.

number of unites covered by a futures contract<sup>3</sup>. Number of futures contracts to trade to have a risk minimizing hedge will be

$$=h \frac{\text{quantity of the cash assets to be hedged}}{\text{quantity of the asset underlying one futures contracts}} \text{----- Eq.-1.8}$$

For instance - if  $h=0.7$  and one futures contract covers 100 unites, then for hedging 800 unites, the risk minimizing number of futures contracts required to sell is 5.6(i.e.  $0.7*800/100$ ).

#### Hypothesis of the Study:-

Ho: Indian Raw Jute Futures market manages price risk efficiently

H1: Indian Raw Jute Futures market does not manage the price risk efficiently.

#### Limitations of the study:-

The important limitations of the study are as follows:

- ✦ The research work is completely based on secondary data which is collected from the websites of National Multi commodity Exchange.
- ✦ The secondary data of raw jute futures and spot prices are collected only from one commodity derivative exchange. i.e. NMCE.
- ✦ The third limitation of the project is regarding period of data i.e. only five years (2010-2014) data are taken for the purpose of study.

#### Empirical Finding and Discussion :-

##### Trends of Spot and Futures Prices of Raw Jute:

Before analyzing the trend of futures price and spot price, it is necessary to understand the concept of types of market. As the delivery date of a futures contract is approached, the futures price converges to the spot price of the underlying asset. In other word when the delivery period is reached, the futures price equals or is very close to the spot price. In such a case the market is known as a perfect market. But if the futures price is more than the spot price at the time to maturity then, it is known as a normal market and if the futures price is less than the spot price at the time to maturity, it is known as an inverted market. The hedger is advised to enter into the derivative market in case of a perfect market.

The spot and future prices of raw jute by using daily data over a period of last five years (2010-14) is presented in table 1 and its diagrammatic illustration is given in figure 1 . The spot price of raw jute, which was quoted at Rs. 3109.85 per quintal in 2010, decreased to Rs.2441.58 in 2012 and then rose to Rs. 3034.01 in 2014, registering an up and down trend over the period. The coefficient of variation around the annual mean price of raw jute has at first gone up from 9.02 in 2010 to 20.60 in 2012. Thereafter, the variation exhibited a decreasing trend and reached at 4.47 in 2014. Interestingly, the downward trends in prices are also associated with smaller standard deviations, resulting in lesser coefficient of variations during 2013-14. Over the whole five year period (2010-14), there is a lower variation in the spot prices of raw jute and the coefficient of variation is found to be around 12.23 percent. In case of futures price, coefficient of variation is recorded at 12.33 percent over the last five years. Thus, the futures price shows a more or less same extent of variation in comparison to spot price of raw jute. A year-wise analysis suggests that in most of the years, coefficient of variation lies below 10 per cent in spot and futures prices of raw jute. The only exception is found in the years 2011 and 2012.

**Correlation between Change in Spot and Futures Price of Raw Jute:-**

The Table-2 clearly depicts throughout the year 2010 the co-relation between change in spot and futures of raw jute remains above 80% except for the month Dec., March and August touching 90% which are the lean seasons, so in these period prices normally farmed up. The harvest season starts from Sept. to Nov. end and the price falls during this period because most of the jute small farmers cultivating jute bring the jute in the market as they don't have the space to store off and further these marginal farmers needs money badly. Even at times it leads to distress sell.

In Oct. and Nov. of each year the co-relation is very high because of supply factor. The correlation was more than 60 times in between 0.75 to1.0 in harvesting period, and Oct. of every year there is a strong correlation found between the prices i.e. nearer to 90 percentages. The traders enter the spot and also probably to protect the price rise, enter the futures simultaneously. Hence, bringing a strong correlation between both the returns. Supply continues till Jan. and from March onwards the supply gets reduced normally. From April to Aug. which is the sowing season normally the farmers don't hold the stock and it is the traders who are found mostly in spot and futures. In harvesting season though there is a positive co-relation between spot and futures the returns are very less in both the prices. In the beginning of the harvesting month (Sept.) the returns are higher because the traders take position in both the spot and futures simultaneously. Hence market remains volatile due to the expectation of new arrivals. In true sense from Jul. to Aug. is the lean season, here also returns are higher. July is equally far from sowing and harvesting, so this is the month which gives better returns to trader and big farmers who holds stock. In the month of May returns are not good in the same time the correlation between the returns were very poor i.e. 80 times the correlation was below0.75. This trend is found in every year.

So the futures and spot market takes cues from the production cycle. The market seems to the spot reflects to the futures and in other way futures do reflects the spot. Though the market is not hundred percent efficient it moves increasingly towards efficiency.

**Volatility of Spot and Futures Market:-**

Standard deviation measures the variation in spot and futures prices. From Jan. to Apr. the variation in spot return is more than the variation of futures return indicates that the supply is more in the spot and the farmers bring the stock to the market. From May on wards till sept the supply from the farmer’s side get reduced and bringing volatility in the spot market and these are the lean seasons. From Oct. to Jan. which is the harvesting season the futures remains more volatile than the spot and the price is normally discovered by the futures market during this period.

In majority cases the trend in volatility of futures and spot indicates that the price is discovered during the harvesting season with futures higher volatility than the spot and in lean season the trend get reversed.

**Ratio of Standard Deviation of Change in Spot to Change in Futures:-**

The ratio indicates the variation between spot and futures prices. From Oct. on wards when the harvesting seasons starts not only the co-relation between the change in spot and change in futures remains high but also spot prices varies more than the variation in the futures prices resulting a higher ratio of standard deviation of change in spot to standard deviation of futures. It simply depicts the volatility in spot is more than the volatility in futures prices basically due to supply factor. Particularly in this harvesting month of every year the ratio remains 100 times in between 0.75 and 1.25. This trend sustains till Jan. end of every year. Feb, Aug and Sept. are the periods coming between sowing and harvesting season shows a very low ratio. This kind of trend is found in all the years.

In the year 2011, 92 times the ratio was between 0.75 to 1.2. The year 2014 shows lowest ratio i.e. only 50 times the ratio was between 0.75 to 1.25.

**Analysis of minimum variance hedge ratio:-**

The most important function of the futures market is enabling investors to hedge exposures i.e. to reduce the riskiness of cash flow associated with spot market commitments. A hedge is said to be perfect when the basis is riskless at the time of terminating hedge, this only ensures a certainty cash flow from the hedge. But perfect hedge is a theoretical phenomenon due to various factors perfect hedge is not practically possible. The first factor which doesn't let the perfect hedge model practically possible is the commodity mismatch. Standardization is the most important characteristic of futures contract. Standard grade underlying of the futures contract may not be the same as the grade of the assets being hedged. As a result the futures price  $F^T$  may not coincide with  $S^T$ , the time T spot price of the assets being hedged. So the basis  $F^T - S^T$  is in nonzero. This is what the basis risk caused by commodity mismatch or grade mismatch.

The second factor is delivery date mismatch. Though futures contract have standardized delivery period, so the available futures contract may not coincide with the investors' date of market commitment. Even if there is no commodity mismatch, but due to delivery period mismatch of the commodity the basis will be nonzero. So the presence of basis risk implies that cash flow can't be made completely riskless by hedging. Risk can be reduced by hedging. First, it is need to measure the risk. As usual the risk of cash flow can be measured by its variance. Variance is a good first approximation of risk. So here we will identify the hedge that will lead to the least cash flow variance among all possible hedges. This is called minimum variance hedge.

It is already earlier mentioned that hedging is nothing but an offsetting of risk. In hedging we offset the exposure of spot with futures. In other word we are trying to offset the effect of spot price movement with price movement so that the resulting cash flow has minimum risk. For offsetting the exposure of spot with futures it is inevitable to take into consideration the movement of both spot and futures prices to cancel the effect of one by other. This is called correlation between spot and futures prices. The higher the degree of correlation greater the co-movement and the easier to offset the risk. So when there is perfect co- relation between the movement of spot and futures prices, then offsetting the exposure of spot with futures is also perfect. So we obtain a riskless hedge.

For this purposes hedge ratio is taken by the investors or hedgers. The hedger ratio simply measures the number of futures position taken per unit of spot exposure. It is earlier mentioned that optimal hedge ratio is the hedge ratio of unity i.e. one for one. It means for offsetting one spot exposure you should go for equal futures position. But in practice in the presence of basis risk, it is not generally optimal to hedge exposure one to one but variance minimizing hedge ratio which we called minimum variance hedge ratio.

Minimum variance hedge ratio has two important aspect one is co- relation between the change in spot and futures prices and the other one is ratio of standard deviation between the change in spot and futures prices. Thus minimum variance hedge ratio is the co-relation ' $P$ ' multiplied by the scaling factor i.e.  $(\sigma \Delta S) / (\sigma \Delta F)$ .

To understand the minimum variance hedge ratio we have to go to the deep. It is earlier mentioned that minimum variance hedge ratio has two aspect i.e. ' $P$ ' and 'scaling factor'. Let's take the first factor ' $\rho$ ' which signifies the Co-relation between the change in spot and futures prices. If co-relation is zero, then there is no offsetting of risk at all from hedging using futures. In this case any hedging activity will increase the overall cash flow risk by creating cash flow uncertainty from the second source i.e. the futures position. Thus the optimal hedge ratio will becomes zero. As co-relation increases, however greater offsetting of risk is facilitated, so we want to use a higher hedge ratio to take advantages.

Now let's take the second important factor i.e. 'scaling factor'. The first question arises here is: why scale the co-relation by the ratio of standard deviation? As we know the objective of hedging is nothing but offsetting the exposure of spot by using futures. Suppose the typical move in futures prices is twice the size of typical move in spot prices. Then other things remaining equal the size of the futures position used for hedging should be only half of the size of the spot exposure. This typical price movement of both spot and futures are measured by their respective standard deviations. When  $\sigma \Delta F$  is more than the  $\sigma \Delta S$ , then less number of futures contracts are required to hedge the higher number of spot contracts, keeping all other things same. In other word keeping other factors constant, if  $\sigma \Delta S$  is less than the  $\sigma \Delta F$  then with less number of futures contract positions can be able to hedge the higher number of spot contracts exposures and vice-versa. When  $\sigma \Delta S$  is equal to the  $\sigma \Delta F$  then keeping the effect of ' $P$ ' value constant hedging ratio will be one. Minimum variance hedge ratio increases as the co-relation increases or in other word variance of cash flow under the minimum variance hedge ratio will be lower when co-relation is

higher, higher correlation implies a superior ability to offset cash flow risk by hedging<sup>4</sup>. In the limit, when correlation is perfect, the minimized cash flow variance will become zero.

Minimized variance will not be zero except in the trial case where  $\rho = \pm 1$  i.e. when the  $\Delta S$  and the  $\Delta F$  are perfectly co-related either negatively or positively. But futures and spots are perfectly co-related only when there is no basis risk, so if basis risk is present there is always some residual uncertainty even after hedging. By concluding the above discussion we can say that higher the  $\rho$  value more is the hedge ratio and vice-versa, when all other factors remain constant. And higher the  $\sigma \Delta F$  than the  $\sigma \Delta S$  then lesser number of futures contracts can be able to hedge a larger number of spot contracts position. The detail analysis of minimum variance hedge ratio of raw jute is given below:

Table No-6 depicts the hedge ratio of different years on month wise which is calculated by taking the daily change in prices of spot and futures. It is very clear from the table that when harvesting season starts i.e. from Oct. onwards till Jan. end the hedge ratio remains high. In this period more than 60 times the hedge ratio remains between 0.75 to 1.25. In the month of Oct. it remains high with the expectation of new arrivals and when actually supply comes to the market it also becomes high. The reverse is found in sowing seasons. In harvesting season the co-relation between the change in spot and futures increase and the variation in change in spot becomes more than the variation in change in futures resulting a high minimum variance hedge ratio. Particularly this kind of trend is found in every year.

Figure 6:-

Source: NMCE Daily Data

#### Number of Futures Contracts Required to Trade to have a Risk Minimizing Hedge.

As stated earlier minimum variance hedge ratio or risk minimizing hedge ratio 'h' is the multiplication of 'p' and the 'scaling factor' of change in spot and futures prices. When hedging a given quantity of an asset, multiply 'h' by the number of unites of the spot good per the number of unites covered by a futures contract<sup>5</sup>. For example- 800 unites are to be hedged, one futures contract covers 100 unites and hedge ratio is .7, then the risk minimizing number of futures contracts to take position is 5.6 (i.e.  $.7 \times 800 / 100$ ). The Table-8 shows that the number of futures contract position required to take at NMCE for raw jute (GRADE-TD4, West Bengal) to have a risk minimizing hedge, if you have 1000MT of spot exposure. The standardized raw jute futures quantity traded at NMCE is 10MT, for three month expiry. The following calculation is made by assuming we have 100MT of raw jute (GRADE-TD4, West Bengal) spot exposure.

The number of contracts required to trade in futures to offset the spot exposure remains more than 60 times between 70 to 120 in harvesting periods which is nearer to one. And again from jun. to Aug. it also follows the same pattern. This trend is found in every year. But the periods which arises in between harvesting and sowing seasons i.e. March, Aug, and Sept. the market was not efficient i.e. far away from optimal hedging number. So it can be concluded that the market is not efficient but moving increasingly towards efficiency.

**Table 8:-** Number of Futures Contracts Required to Trade to have a Risk Minimizing Hedge

### Concluding Remarks:-

Empirical evidence suggests a wide variation in spot and futures prices of raw jute over a period of five years (2010-2014). However no such variation is established in between the movement of spot and futures prices of raw jute. In fact the extent of fluctuation in both spot and futures market are found to be the same. The result is further supported by the monthly minimum variance hedge ratio indicating that the market is increasingly moving towards efficiency. In such an efficient market structure futures can be used as an instrument of hedging to offset the spot market exposure. A lower basis risk in comparison to spot price risk, as established in the study would provide an additional advantages for the hedger to enter the derivative market.

#### *Abstract*

**Background:** Ovarian cryopreservation is a relevant approach to fertility preservation, even though it is an invasive and still experimental procedure. Graft's vulnerability for ischemia and reperfusion injury before the neovascularization is the most important factor to determinate the viability of transplanted tissue, therefore in order to reduce this injury, many techniques were described as remote ischemic pre-conditioning (R-IPC) and early administration of N-acetylcysteine (NAC). The aim of this study was to evaluate the effects of remote ischemic preconditioning and N-acetylcysteine on autologous ovarian transplant in rats.

**Materials and Methods:** 25 female *Rattus norvegicus* (Wistar) were distributed into five experimental groups (n=5): (1) control (CG); (2) ovarian transplantation (GTx); (3) ovarian transplantation + R-IPC; (4) Ovarian transplantation + NAC and (5) Ovarian transplantation + R-IPC + NAC. On the 15<sup>th</sup> post-operative day, blood was collected from inferior vena cava for estradiol and progesterone serum analysis and ovarian grafts were removed for histopathology.

**Results:** Estradiol levels between groups showed no statistical difference, however treatment with R-IPC promoted higher progesterone levels. Ovarian graft morphology indicated that NAC treatment increased secondary follicles and promoted atretic follicles as observed in transplant group. R-IPC treatment reduced atretic follicles.

**Conclusions:** NAC and R-IPC treatments showed protective effects regarding follicles preservation and ovarian function.

#### **Introduction:-**

The side effects and long-term consequences of chemotherapy and radiation on fertility should not be ignored, cumulative risk of premature ovarian failure can be 60% higher after alkylating chemotherapy [1]. Many diagnostic methods and treatments for cancer may involve combinations of surgery, alkylating chemotherapy, radiotherapy, and transplantation of bone marrow, which offer negative impacts on ovarian function, such as fibrosis [2], affecting

the patient's fertility. Thereafter, ovarian protection reserve and prevention of infertility became the primary quality of life issue for patients [3].

Mature oocyte and embryo banking are generally recommended before cancer treatment for fertility preservation in women. American Society for Reproductive Medicine has confirmed its safety, however, gamete or zygote banking is not a feasible option for prepubertal girls or fertile women who cannot delay therapy [4]. Thus, ovarian tissue cryopreservation is one relevant approach, even though this procedure is invasive and still experimental for young patients, requiring laparoscopic surgery [5].

Currently, it is known that graft's vulnerability for ischemia and reperfusion injury before the neovascularization is the most important factor to determinate the viability of transplanted tissue. Even though the reperfusion benefits are unquestionable, the reintroduction of oxygen in a ischemic environment initiate a complex chain of events that culminate in additional tissue injury, among which are highlighting the migration, adhesion and leukocyte activation and production of oxygen free radicals [6]. This process constitutes the main obstacle for ovarian transplant, this injury may occur after transplant, resulting in follicular death mass [7].

Many techniques were described as ischemic preconditioning (PreC) and postconditioning (PosC) which consist in short cycles of ischemia and reperfusion before or after a major ischemia period. These procedures have also been applied, successfully, in other organs as gut, myocardial and liver. These cycles can also be applied in distant organs and tissues undergoing ischemia index, and this is known as remote pre (rPreC) and post (rPosC) conditioning, that also obtained success to reduce the reperfusion trauma in many organs [8-10].

Likewise, the early application of N-acetylcysteine (NAC) is related to beneficial effects in ovarian graft preservation [11]. This substance is a tiol of low molecular weight derivated of cysteine and acts removing reactive oxygen species, in addition to improving nitric oxide activity and regulating microcirculation [12].

Thereby, there are some literature reports about PreC and NAC positive effects on preservation of ovarian graft. Thus, the aim of this study was to evaluate the effects of remote ischemic pre-conditioning and N-acetylcysteine on autologous ovarian transplant in rats.

## **Methods:-**

### **Animals:-**

25 female Wistar rats (Evandro Chagas Institute), were used at the age of 120 days and weighing 250-350g. The rats were kept under constant temperature (20-22°C) in a room with controlled lighting (12/12 hours of light/dark cycle) and received water and food ad libitum. Procedures were approved by Ethics Committee on Animal Use of Pará State University (UEPA), Protocol No. 32/2015.

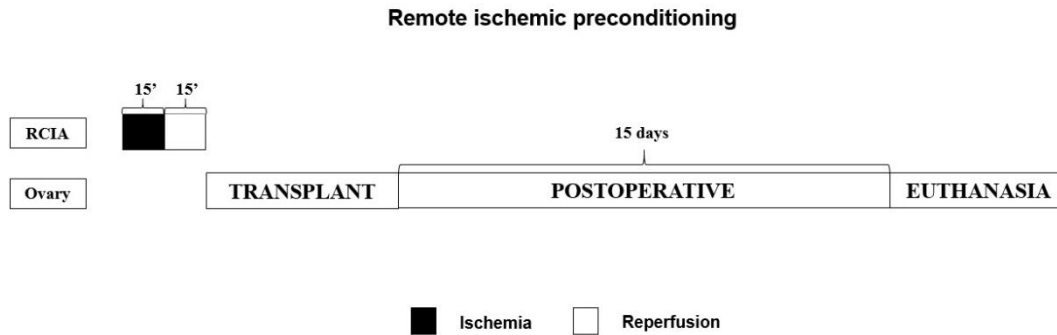

### **Experimental Protocol:-**

Rats were anesthetized by intraperitoneal injection of ketamine hydrochloride (70mg/kg) and xylazine (10 mg/kg). Then, they were placed on an electric heating pad to prevent hypothermia. Procedures were performed under surgical microscope (DF Vasconcellos 900, Brazil) set to a 10x magnification.

The animals were distributed into five study groups (n=5): (1) control: animals subjected only to midline laparotomy and a 2cm incision over the inguinal fold; (2) ovarian transplantation (GTx); and (3) ovarian transplantation + R-IPC; (4) Ovarian transplantation + NAC and (5) Ovarian transplantation + R-IPC + NAC. On 15<sup>th</sup> postoperative day [11], animals were euthanized with a lethal dose of previously used anesthetics.

### **Remote Ischemic Preconditioning (R-IPC):-**

After tricotomy and polyvinylpyrrolidone iodine antiseptis, a medial laparotomy was made and the R-IPC was performed by clamping the common right iliac artery using a vascular microclamp for 15 minutes of occlusion and 15 minutes of reperfusion (Fig. 1) [13], before undergoing other procedures (oophorectomy and transplantation).

**Fig. 1:-** Representation of remote ischemic preconditioning. RCIA – right common iliac artery.

#### **Oophorectomy:-**

A bilateral exeresis of meso-ovarium was made between two 5-0 silk suture ligatures. After being freed from foreign tissue, the ovary to be transplanted was washed in physiological solution (0.9% NaCl).

#### **Autologous Transplantation of the Ovary:-**

After oophorectomy and washing with 0.9% saline solution, a 2cm incision over the inguinal right fold was made. The femoral vessels were identified and then the right ovary was fixed among those structures using 6-0 nylon thread with no vascular anastomosis, under a microsurgical microscope.

#### **Administration of N-acetylcysteine (NAC):-**

One hour before ovarian transplantation, animals were treated subcutaneously - along the dorsum - with 1200mg/kg of NAC [11]. The non-treated groups, namely controls, GTx and R-IPC were treated with 0.9% Sodium chloride solution at the same volume.

#### **Serum analysis:-**

On the 15<sup>th</sup> post-operative day [11], blood samples were collected from the inferior vena cava for estradiol and progesterone serum levels (tested with kits in a solid-phase, competitive, immunofluorimetry and radioimmunoassay, respectively)

#### **Histopathology:-**

Ovarian grafts were surgically removed from the inguinal region and fixed in 10% formaldehyde. The sections were dewaxed and gradually hydrated before being stained with hematoxylin-eosin. For histological evaluation, a protocol based on D'Acampora et al (2004) [14].

#### **Statistical analysis:-**

BioEstat 5.4 was used and to confirm normal distribution samples by Kolmogorov-Smirnov test. Data are expressed as means  $\pm$  SE. ANOVA with post hoc Student's paired T-test was applied to renal function and oxidative stress, whereas the histopathological parameters by Kruskal-Wallis with post hoc Newman-Keuls. Values of  $p < 0.05$  were considered statistically significant.

#### **Results:-**

All animals of R-IPC+NAC died within 24 hours after the procedure. The levels of estradiol hormone between groups showed no statistical difference (Fig. 2), however, progesterone plasma levels were significantly lower in both GTx ( $p < 0,05$ ) and NAC ( $p < 0,01$ ) when compared with controls group (Fig. 3). Therefore, the R-IPC has presented the most similar levels of progesterone when compared to controls.

Ovarian graft morphology indicated that NAC treatment promoted atretic follicles as transplant group and increased the number of secondary follicles (Fig. 4). Treatment with R-IPC promoted less atretic follicles, but primordial follicle, primary follicle, mature follicle and degenerated and functional corpora lutea were similar among groups.

**Table 1:-** Histological analysis according to groups. Kruskal-Wallis (Newman-Keuls) test; \*p<0.05 vs controls.

Parameters	Control	GTx	R-IPC	NAC	p-value

#### Discussion:-

Successful fertility preservation through ovarian graft transplantation depends mainly on rapid reestablishment of vascularization and perfusion to the graft. Decreasing post transplantation hypoxia will protect the primordial follicle reserve and ensure the highest chance for retrieving mature oocytes for in vitro fertilization [14].

Regarding transplantation site, several were described: retroperitoneum [13,16,17], kidney capsules [4], greater omentum [18], fat pad [19] and inguinal region[20], to transplant the graft next to larger vessels, in areas that promote better vascularization, is important to allow its viability. Therefore, in the present study the authors choose to perform the technique of autotransplantation to the inguinal region that, according to Ceschin et al (2004) [20], demonstrated functionality and viability in 100% of analyzed slices.

In the present study, the effects of NAC and R-IPC on rat ovarian tissue after heterotopic autotransplantation were investigated. The association of both treatments was unviable, leading to death of all five animals from R-IPC+NAC group, possibly, a collateral effect of an overdose of NAC, which has been associated in other studies with decrease in prothrombin index and anaphylactoid reactions [21]. Therefore, it has been demonstrated that NAC significantly inhibits the protective mechanism of pre-conditioning for organs such as the myocardium [22].

The results also indicated that treatment with R-IPC, significantly improved the hormonal levels of progesterone, although did not reach the same level found on control group. R-IPC leads to earlier re-initiation of ovarian activity and increases the number of cycles in fresh graft, which can be related to a compensatory effect after I/R injury during the transplant when growth factors are produced to establish graft angiogenesis. The established neovascularization may stimulate the graft to re-initiate its function [23] which justifies the findings.

Damous et al (2009) [16] when studying the effect of R-IPC on rat's estradiol serum levels after ovary transplantation concluded that R-IPC increased estradiol levels in most animals, reaching an average of 65 pg/mL. This data was not confirmed by the present study (graphic 1) because, according to Damous, this increase was seen 72 hours post transplantation returning to lower levels similar to the other groups at seven days. Therefore, as the euthanasia, in this study, was performed at the 15<sup>th</sup> day such increase had already ceased.

In addition, others studies demonstrated that 21 days after transplantation, serum FSH levels reaches the same as the fresh control [17], explaining why the serum estradiol levels were similar. However, Mahmoodi et al (2015) [12] postulated that the treatment with n-acetylcysteine actually improved estradiol concentration at the 28<sup>th</sup> post-operative day because of its anti-oxidant properties, these discordant results might be explained by the difference on treatment protocol used (lower doses administered for a longer period) or variations in hormone measurements induced by natural animal diversity or by environmental stress or handling, that could have led to inconclusive results.

As our study indicated, the number of follicles in the autografted groups compared with the control groups decreased considerably, which confirms previous reports [23,24]. This could be explained because in the first days of transplantation, granulosa cells and oocytes, particularly in developing follicles, undergo apoptosis as a result of ischemia and reperfusion injury induced by free radicals and lipid peroxidation. This can lead to the degeneration and atresia of follicles and disruption in folliculogenesis and oogenesis, which eventually decreases the ovary volume and size and also the number of follicles [12].

Meanwhile, treatment with NAC resulted in a higher number of secondary follicles compared with the GTx and R-IPC groups, through preventing initial tissue degeneration and follicle atresia as a result of its ability to delay or inhibit apoptosis of ovary cells in the time of hypoxia and also to reduce the ischemia-reperfusion injury through its antioxidant ability and increasing the glutathione reservoir [12].

Although the association of NAC and R-IPC was not possible in the study, this still represents an interesting result, as it will serve as an example so that such protocol will not be used in other researches, which creates possibilities for new studies with lower concentrations of NAC or reduced I/R time.

### **Conclusion:-**

NAC and R-IPC separately had protective effects towards follicles and ovarian function preservation. However, further examinations are needed to translate our results to clinical trials of human ovarian transplantation, along with suitable modifications as oral administration, which provide an easier route of administration in human patients.

#### Abstract

**Background:** In the last decade there has been a marked increase in the number of women requiring risk reduction mastectomy either before the development of breast cancer in high risk population or following the diagnosis of unilateral breast cancer. The breast surgeon and the oncologist are usually faced with difficult questions regarding the impact and the outcome of the various strategies that are used for risk reduction. This includes prophylactic mastectomy, close surveillance programs or chemoprevention. The outcome of these strategies and their effects on disease relapse and survival particularly prophylactic mastectomy either bilateral risk reduction mastectomy (brm) for primary prevention or contralateral risk reduction mastectomy (crrm) for secondary prevention remains challenging and an area of great interest.

**Methods and data sources:** a narrative literature review was performed using the available electronic database. This was intended to assess the available tools for risk assessment in addition to the impact of prophylactic mastectomy (bilateral in high risk individuals or contralateral in unilateral breast cancer patients) on the following:

1. Breast cancer risk reduction & outcome.
2. Decision making process in women at a high risk for bilateral or contralateral breast cancer.
3. Patients satisfaction and psychological status after surgery.

**Conclusion:** Risk reduction prophylactic mastectomy in the form of bilateral or contralateral mastectomy is considered one useful strategy in patients at a high risk of breast cancer or with patients with unilateral breast cancer respectively. This strategy is recommended in some national and international guidelines.

#### Introduction:-

Prophylactic mastectomy is defined as the removal of the breast in the absence of malignant disease. The aim is to reduce the risk of breast cancer occurrence either for primary or secondary prevention strategy (1).

Prophylactic mastectomy (PM) may be considered for women thought to be at a high risk for developing breast cancer, either due to a strong family history or in the presence of lobular carcinoma in situ or in known cases with BRCA1 or BRCA2 mutation or for those with TP53 (Li Fraumeni Syndrome), PTEN (Cowden syndrome, Bannayan-Riely-Ruvalcaba syndrome), CDH1, and STK11 or in those with a lifetime risk 20% or greater using risk assessment tools or in those patients who received radiation therapy to the chest between 10 and 30 years of age or finally in those with extensive mammographic abnormalities (extensive calcifications) where adequate biopsy or excision is impossible (2).Annex (1) & (2).

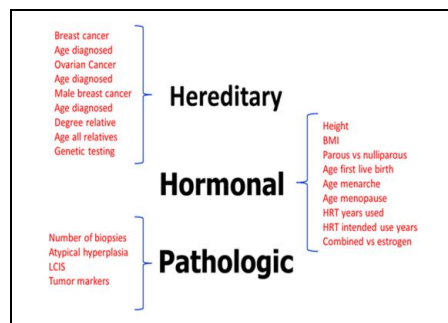

To be mentioned, Prophylactic mastectomy is generally considered investigational for other indications including but not limited to contralateral prophylactic mastectomy in women with breast cancer without any high risk criteria (3).LCIS is both a risk factor for breast cancer, including unilateral or bilateral cancer, and in some cases, it is a precursor for invasive lobular cancer.For those who develop invasive cancer, up to 35% may have bilateral cancer. Therefore, bilateral PM may be performed to eliminate the risk for development of breast cancer on the other hand; chemoprevention surveillance or oopherectomy are alternative risk reduction strategies. PMs are typically bilateral but can also describe a unilateral mastectomy as in patients who have previously undergone or are currently undergoing mastectomy in the opposite/contralateral breast for an invasive cancer (i.e.,CPM). The use of CPM has risen in recent years in the United States. An analysis of data from the National Cancer Data Base found that the rate of CPM in women diagnosed with unilateral stage I-III breast cancer increased from approximately 4% in 1998 to 9.4% in 2002 (4,5).

The discussion for PM is a complicated one. It includes risk-benefit analysis with estimation of the patient’s risk of breast cancer, typically based on the patient’s family history of breast cancer and other factors as well. Several models are available to assess the risk, this includes the Claus model, Gail and BRCAPRO models. Breast cancer history in first- and second-degree relatives is used to estimate breast cancer risk in the Claus model. The Gail model uses the following 5 risk factors: age at evaluation, age at menarche, age at first live birth, number of breast biopsies, and number of first-degree relatives with breast cancer. BRCAPRO considers hereditary and pathologic factors as well . Moreover, the choice of PM is based on patient tolerance for risk, consideration of changes to appearance and need for additional cosmetic surgery, and the risk reduction offered by PM versus other options (6,7). There is no standardized method for determining a woman’s risk of breast cancer that incorporates all possible risk factors. There are validated risk prediction models, but most of them are based primarily on family history (8,9). Figure 1, 2.However, some known individual risk factors confer a high risk by themselves. Annexure (3). See table 1 for more details.

- a) Lobular carcinoma in situ or
- b) A known BRCA1 or BRCA2 mutation or
- c) Another gene mutation associated with high risk, e.g., TP53 (Li-Fraumeni syndrome), PTEN (Cowden syndrome, Bannayan-Riley-Ruvalcaba syndrome), CDH1, and STK11 or
- d) High risk (lifetime risk about 20% or greater) of developing breast cancer as identified by models that are largely defined by family history or
- e) Received radiotherapy to the chest between 10 and 30 years of age.

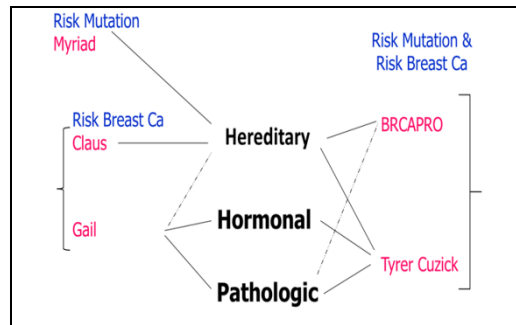

**Table 1:** List of factors known to indicate a high risk of breast cancer

A number of other factors may increase the risk of breast cancer but do not by themselves indicate high risk. It is possible that combinations of these factors may be indicative of high risk, but it is not possible to give quantitative estimates of risk. As a result, it may be necessary to individualize the estimate of risk, taking into account there numerous risk factors (10).

**Fig. 1:** Classification of breast cancer Risk Factors

Surgical options for prophylactic mastectomy include subcutaneous mastectomy (Skins or nipple sparing mastectomy) or total mastectomy, usually followed by breast reconstruction. Subcutaneous mastectomy is performed via an inframammary incision through which the breast tissue is resected, sparing the nipple-areolar complex. Historically, subcutaneous mastectomy was performed more commonly than total mastectomy, the latter procedure removes the majority of the breast tissue along with the nipple areolar complex through an elliptical skin incision. Given current nipple reconstruction techniques, total mastectomy is the preferred prophylactic procedure now a days. In both procedures a small amount of breast tissue is usually left. This can develop into cancer later. The tissue left behind is usually in the axilla, inframammary fold, and skin flaps. This issue must be clearly explained to the patient, the physician should reiterate that the risk of breast cancer, therefore, cannot be completely eradicated with prophylactic mastectomy (11,13).

**Fig. 2:** Assessment tools for Breast Cancer Risk

This review article is destined to evaluate the role of BRRM; CRRM in general as well as the complication of PM, in addition to the Psychological impact of the procedure as well as the survival and follow-up program after the risk reduction mastectomy.

### Methodology:-

In this article we reviewed the prevailing trends for using bilateral risk reduction mastectomy (BRRM) and unilateral risk reduction mastectomy (URRM) for primary and secondary prevention of breast cancer.

We electronically searched on PubMed, Medline, Medscape, Cochran, Health finder and Index databases of science Citations. Papers, bibliographies relevant studies published during the years of 2005 to 2015 are included in this review. The aim was to further define and clarify the following issues.

1. Current indicators for risk reeducation mastectomy prophylactic mastectomy (Bilateral or contralateral)
2. Risk assessment tools
3. Surgical techniques and its complications
4. Patient's satisfaction and psychosocial status after surgery
5. Outcome and survival results.

### Discussion:-

#### Bilateral Risk Reduction Mastectomy (BRRM):-

Prophylactic mastectomy (PM) is generally considered for patients with a family history of breast cancer. The Assessment largely focused on a 1999 retrospective cohort analysis which concludes that approximately 13 moderate-risk women should undergo PM to prevent 1 cancer. Furthermore for women at high risk of breast cancer, the reduction in the incidence of breast cancer ranged from 90% to 94%. The author concluded that 4 to 8 high-risk women would need to proceed with PM to prevent 1 occurrence of breast cancer (14).

A 2010 Cochrane review examined the impact of PM on mortality and other health outcomes. No Randomized controlled trials (RCTs) were identified. Thirty-nine observational studies with some methodological limitations were identified in the literature review. The studies presented data on 7384 women with a wide range of risk factors for breast cancer who underwent PM. Studies on the incidence of breast cancer and/or disease specific mortality reported risk reductions after bilateral PM, particularly for those with BRCA 1/2 mutations. The authors concluded that the available observational data suggested that bilateral PM reduces the rate of breast cancer mortality.

However, more rigorous studies (preferably RCTs) are still needed to confirm these findings; Furthermore, bilateral PM should only be considered among patients at very high risk of disease (15).

In 2014, the National Comprehensive Cancer Network stated that PM should only be considered in high-risk women, defined as having a BRCA1 or BRCA2 mutation or another gene mutation associated with increased risk (e.g., PTEN, TP53, CDH1, STK11), a compelling family history. It may also be considered in women with lobular carcinoma in situ (LCIS) or prior thoracic radiotherapy before 30 years of age. Also it is advisable in patients with additional genetic mutations that have been associated with a high rate of cancer include TP53 (Li Fraumeni syndrome) and PTEN (Cowden and Bannayan-Riley-Ruvalcaba syndromes) (16). NB: In patients who received prior radiotherapy to the chest between the ages of 10 and 30 years of age, the increased risk of breast cancer can reach almost 30% by age 55 years. Patients with incidental LCI are considered at an increased risk for breast cancer.

#### **Contralateral Risk Reduction Mastectomy (CRRM):-**

The potential impact of CPM on survival is related to its association with a reduced risk of subsequent primary breast cancer in the other breast (i.e., contralateral breast cancer [CBC]). The U.S. Surveillance, Epidemiology and End Results (SEER) database, annual rates of CBC were stable between 1975 and 1985, later on the rates declined about 3% per year. In 1990, the annual decline in CBC rates was seen in women with estrogen receptor-positive cancer, with no decrease in those with estrogen receptor-negative cancer. The investigators suggested that the decrease in CBC rates in estrogen receptor-positive cancer may be attributed in part to the wide use in adjuvant hormone therapies (17).

Molina-Montes et al published a systematic review on the risk of a second primary breast cancer in women with and without BRCA1 or BRCA2 mutations. Twenty studies were included; 12 retrospective cohort studies, 2 prospective cohort studies, and 6 case-control studies. The majority of studies included only women who had undergone genetic testing. A meta-analysis reported that the cumulative risk of a second primary breast cancer at 5 years after initial diagnosis was 14% (95% CI, 9% to 19%) in BRCA1 or BRCA2 mutation carriers and 3% (95% CI, 2% to 5%) in noncarriers. The Cumulative risks of a second primary cancer at 10 years after initial diagnosis was 22% (95% CI, 18% to 27%) in BRCA1 or BRCA2 mutation carriers and 5% (95% CI, 3% to 7%) in non-carriers (18).

#### **Complications of Prophylactic Mastectomy:-**

##### **Surgical Complications:**

Surgical Complications following prophylactic mastectomy may be immediate or delayed. Gabriel et al. reported a 5-year complication rate of 30% in 92 women undergoing prophylactic mastectomy and implant reconstruction. Immediate complications included necrosis of the skin, nipple-areolar complex (with subcutaneous mastectomy), infection, wound dehiscence, hematoma or seroma, and pain. Later complications include capsular contracture, implant rupture or leakage, asymmetry or unsatisfactory cosmetic outcome, and lack of sensitivity of the overlying skin (19).

Zion et al reported the experience of women who underwent prophylactic mastectomy and reconstruction with implants at the Mayo Clinic and subsequently required reoperation. Of 592 women who had bilateral prophylactic mastectomy and implant reconstruction, 52% required reoperation over a median follow-up of 14.2 years; 95% of these women had subcutaneous mastectomy. They also studied 502 women with a personal and family history of breast cancer who had undergone contralateral prophylactic mastectomy and reconstruction with implants along with therapeutic mastectomy for the affected breast. In this group, 39% required reoperation over a median follow-up of 8.8 years; 62% had subcutaneous mastectomy, and 38% underwent a total mastectomy. The Indications for reoperation were as follows. (a) Implant-related concerns (50% to 60%) includes, implant rupture or leakage or capsular contracture nodule excision (4% to 10%). (b) Non-implant-related aesthetic concerns (15% to 23%) like, revision of the scar or nipple-areolar revision (20).

In 2015, Silva et al published a large multicenter study including 20,501 women with unilateral breast cancer from the American College of Surgeons National Surgery Quality Improvement Program (NSQIP) database. A total of 13,268 (64.7%) women underwent unilateral mastectomy and 7233 (35.3%) had bilateral mastectomy. The analysis did not report on high-risk factors such as BRCA mutation status or family history. All women had breast reconstruction; a higher proportion of women who had unilateral mastectomy (19.5%) than bilateral mastectomy (8.9%) had autologous reconstruction; the remainder had implant-based reconstruction. The authors conducted analyses controlling for confounding variables (i.e. age, race smoking, diabetes, chronic pulmonary disease,

hypertension) and stratifying by type of implant. The rate of overall complications was significantly higher for women who had a bilateral versus unilateral mastectomy, regardless of reconstruction type. Among women with implant reconstructions, overall complication rates were 10.1% after bilateral mastectomy and 8.8% after unilateral mastectomy (adjusted odd ratio [OR], 1.20; 95% CI, 1.08 to 1.33). In women with autologous reconstructions, overall complication rates were 21.2% after bilateral mastectomy and 14.7% after unilateral mastectomy (adjusted OR=1.60; 95% CI, 1.28 to 1.99). The most common complication was reoperation within 30 days, followed by surgical site complications. Transfusion rates were also significantly higher ( $p<0.001$ ) in women with bilateral versus unilateral mastectomies who had either type of reconstruction. The rates of medical complications were relatively low approximately 1% of women who had implant reconstructions and 3% of women who had autologous reconstructions experienced a medical complication (ie, pneumonia, renal insufficiency or failure, sepsis, urinary tract infection, venous thromboembolism) and did not differ significantly for unilateral versus bilateral mastectomies. Several single-center studies have also found significantly higher surgical complication rates after bilateral than unilateral mastectomy (21).

Miller et al, in 2013 included 600 women with unilateral breast cancer, CPM remained associated with a significantly higher risk of any complication (OR=1.53; 95% CI, 1.04 to 2.25) and a significantly higher risk of major complications (OR=2.66; 95% CI, 1.37 to 5.19) than unilateral mastectomy. Eck et al in 2014 assessed 352 women with unilateral breast cancer, 94 (27%) women had complications, 48 (14%) in the unilateral mastectomy group and 46 (13%) in the bilateral mastectomy group.(15) The difference between groups was not statistically significant ( $p=0.11$ ), but this study may have been underpowered. They found a significant delay in adjuvant therapy after surgical complications. Women with complications waited longer before receiving adjuvant therapy than those without complications (49 days vs. 40 days,  $p<0.001$ ) (22).

#### **Psychosocial Issues:-**

In the literature, there are lots of accumulating data reported by questionnaire, Frost et al assessed long-term satisfaction as well as psychological and social function in 572 of 609 women (94% participation) with a family history of breast cancer following bilateral prophylactic mastectomy at the Mayo Clinic between 1960 and 1993. Family history of breast cancer was the most commonly cited reason for prophylactic mastectomy. The most frequent combination of reasons was family history, physician advice, and nodular breasts (23).

In the study, 74% of the women reported a diminished level of emotional concern regarding the development of breast cancer. The majority of women reported no change or even favorable response in regarding their emotional stability, degree of stress, self-esteem, sexual relationships, and feelings of femininity. However, 36% were unsatisfied with their body appearance after prophylactic mastectomy. The degree of satisfaction after prophylactic mastectomy was assessed by the following; body appearance, level of stress, implant-related problems, and the need for reconstruction after prophylactic mastectomy. To be mentioned the physician's advice as the primary reason for undergoing prophylactic mastectomy was associated with dissatisfaction. Stefanek et al. reported, it was found that cancer-related worry, prior breast biopsies, and subjective risk estimates were the most significant variables in the group undergoing prophylactic mastectomy. Women completing the procedure with strong support from families and friends (and those following formal risk counseling) were most satisfied with their decision (24)

Hatcher et al. in a prospective trial studied the psychosocial impact of bilateral prophylactic mastectomy through questionnaires and semi structured interviews. He assessed 143 women at increased risk of breast cancer who were offered bilateral prophylactic mastectomy. (79 women) accepted, (64 women) declined, and 11 others deferred making a decision. Follow-up interviews were conducted at 6 and 18 months. Psychological morbidity and anxiety were high before surgery and decreased significantly after surgery in the group that underwent a bilateral prophylactic mastectomy. On the other hand, it remained high in the group that opted for regular surveillance. The researchers noted that women who chose surgery were more likely to have undergone prior breast biopsies or genetic testing. After surgery, these women maintained a positive body image and reported few or no changes in sexual function. Furthermore, women who chose prophylactic mastectomy strongly believed that the procedure would significantly reduce their chances of developing breast cancer. Generally, the acceptors tended to report higher lifetime risks of developing the disease than the decliners. Hatcher et al. stressed on the importance of Genetic counseling. They reiterate that it is mandatory prior to making any decision regarding prophylactic mastectomy. This is to ensure accurate risk assessment and to inform the audience about their risk (25).

**Survival:-****Bilateral Risk Reduction Mastectomy:-**

**Mayo Clinic Study**—In an effort to quantify the risk reduction associated with prophylactic mastectomy, Hartmann et al. at the Mayo Clinic performed a retrospective cohort analysis of 639 women with a family history of breast cancer who had undergone prophylactic mastectomy between 1960 and 1993. Women were assigned retrospectively to either a moderate-risk group (425 women) or high-risk group (214 women) based on the extent of their family history of breast cancer. Follow-up was available for 99% of the cohort for a minimum of 2 years; median follow-up was 14 years (9,095 person-years). The investigators compared the total number of breast cancers observed among study participants with the total number predicted by the Gail model (for the moderate-risk group) and by a nested sister control study (for the high-risk group). The Gail model predicted that 37.4 women in the moderate-risk group would develop breast cancer by the median follow-up of 14 years. In the study, only four of these women developed the disease, representing an 89.5% reduction ( $P < .00001$ ) in incidence following prophylactic mastectomy. The Gail model also predicted that 10.4 women in the moderate-risk group would die of breast cancer, but, in fact, no deaths from breast cancer occurred in these women (26).

Regarding the high-risk group, 3 of the 214 women developed breast cancer after prophylactic mastectomy. From their sisters' experiences, 30 breast cancers were predicted in these high-risk women. Thus, prophylactic mastectomy was associated with a 90% reduction in the risk of breast cancer in high-risk women. Similarly, compared with the expected number of breast cancer deaths, prophylactic mastectomy in the high-risk group resulted in an 81% to 94% reduction in breast cancer mortality.

**Dutch Study**— This is a prospective study that evaluated 139 BRCA1 or BRCA2 carriers. All women were followed at the Rotterdam Family Cancer Clinic. None had a history of breast cancer. A total of 76 of these women accepted to undergo prophylactic mastectomy, and 63 remained under close surveillance. The mean follow-up was  $2.9 \pm 1.4$  years. No cases of breast cancer were observed in the prophylactic mastectomy group, compared to eight cases in the surveillance group (hazard ratio: 0; 95% confidence interval [CI]: 0-0.36). Out of the eight cases, four were interval cancers diagnosed between scheduled screening tests. Four of the cancers spread to the axillary lymph nodes, Seven were estrogen-receptor and progesterone-receptor negative. The interval from initiation of surveillance to the diagnosis of cancer ranged from 2 to 42 months. The researchers concluded that in women with a BRCA1 or BRCA2 mutation, at 3 years of follow-up, prophylactic bilateral total mastectomy reduced the incidence of breast cancer with a relative risk reduction of 100%, (absolute risk reduction of 12.7%) (27).

**Contralateral Risk Reduction Mastectomy:-**

A systematic review and meta-analysis of studies on CPM was published in 2014 by Fayanju et al. The authors searched for published studies that compared the incidence of CBC in women with unilateral disease who did and did not undergo CPM. Fourteen observational studies met eligibility criteria and were included in the meta analysis. In a meta-analysis of 4 studies, mortality from breast cancer was lower in the group that had CPM (relative risk [RR], 0.69; 95% CI, 0.56 to 0.85). Moreover, in a meta-analysis of data from 6 studies, overall survival (OS) was significantly higher in patients who underwent CPM ( $n=10,666$ ) than those who had no CPM ( $n=145,490$ ) (RR=1.09; 95% CI, 1.06 to 1.11). The authors also conducted a subgroup analysis by risk level in which all patients were BRCA mutation carriers and studies in which all patients had a family history of breast cancer (4 studies). Those were categorized as indicating higher familial/genetic risk. Together, the studies included 618 patients who had CPM and 1318 patients who did not. In a meta-analysis limited to these 4 studies, neither OS nor mortality from breast cancer differed significantly among women who had or did not have CPM. The relative risk of breast cancer mortality with and without CPM was 0.66 (95% CI, 0.27 to 1.64). Regarding the OS with and without CPM, the relative risk was 1.09 (95% CI, 0.97 to 1.24). The absolute reduction in the risk of metachronous breast cancer did not differ in women with and without CPM when data from all 8 studies were analyzed (risk difference [RD], -18.0%; 95% CI, -42.0% to 5.9%, but was significantly lower in women with CPM in the 4 studies exclusively enrolling women at increased familial/genetic risk (RD = -24.0%; 95% CI, -35.6% to -12.4%). The authors stated that the improvement in survival after CPM in the general breast cancer population was likely not due to a decreased incidence of contralateral breast cancer, but rather was secondary to selection bias (as CPM recipients may be otherwise healthier and have better access to health care than the other group who declined the procedure (28).

Kruper et al in a large dataset from the SEER database in 2014 studied CBC and survival outcomes. The investigators conducted a case-control analysis including 28,015 CPM patients and 28,015 unilateral mastectomy patients, matched on age group, race/ethnicity, extent of surgery, tumor grade, tumor classification, node

classification, estrogen receptor status, and propensity score. The investigators were not able to match for BRCA or other mutation status. When all matched patients were included, disease-specific survival (DSS) and OS were significantly lower in women who underwent unilateral mastectomy compared with CPM. For DSS, the hazard ratio (HR) was 0.83 (95% CI, 0.77 to 0.90); for OS, it was 0.77 (95% CI, 0.73 to 0.82). Presumably, CPM would increase survival by lowering the risk of CBC. The authors conducted another analysis excluding women diagnosed with CBC; the remaining sample was still large (25,924 women with unilateral mastectomy and 26,299 women with CPM). In the analysis excluding women with CBC, DSS and OS remained significantly lower in women who had unilateral mastectomy versus CPM. For DSS, the HR was 0.87 (95% CI, 0.80 to 0.94); for OS, it was 0.76 (95% CI, 0.71 to 0.81). The investigators suggested that the survival benefits found in CBC patients was not due to prevention of CBC, but instead to selection bias (e.g., healthier women choosing CBC). A limitation of the analysis was the inability to control for risk factors including gene mutation status, family history, and a history of radiotherapy to the chest between ages 10 and 30 years (29). In 2013, Yao et al evaluated OS after CPM by analyzing data from the National Cancer Data Base. The data were collected from 1450 Commission of Cancer-accredited cancer programs. The analysis included 219,983 women who had mastectomy for unilateral breast cancer; 14,994 (7%) of these women underwent CPM at the time of their mastectomy. The investigators did not report risk factors such as known genetic mutations. The 5-year OS rate was 80%. In an analysis adjusting for confounding factors, the risk of death was significantly lower in women who had CPM than in women who did not. The adjusted HR for OS was 0.88 (95% CI, 0.83 to 0.93). The absolute risk of death over 5 years with CPM was 2.0% lower than without CPM. In a subgroup analyses, there was a survival benefit after CPM for individuals aged 18 to 49 years and aged 50 to 69 years, but not for those 70 years or older. There was also a survival benefit for women with stage I and II tumors, but not for stage III tumors. Pesce et al. in 2014, focused on the subgroup of patients who were young (with stage I or II breast cancer. A total of 4338 (29.7%) of 14,627 women in this subgroup had CPM at the time of mastectomy. Median follow-up was 6.1 years. In a multivariate analysis controlling for potentially confounding factors, OS did not differ significantly among patients who underwent unilateral mastectomy and those who also had CPM (HR=0.93; 95% CI, 0.79 to 1.09). Moreover, among women younger than 45 years with estrogen receptor-negative cancer, there was no significant improvement in OS in those who had CPM versus unilateral mastectomy (HR=1.13; 95% CI, 0.90 to 1.42) (30).

**Follow-up after Prophylactic Mastectomy:-**It is very important to mention that Prophylactic mastectomy does not completely eliminate the risk of subsequent breast cancer. Hence, it is mandatory that women treated with this procedure undergo long-term follow-up, perform regular, monthly examination of the chest wall, and undergo annual clinical examination. Annual mammography should be strongly considered in women who have had subcutaneous mastectomy. This has been an area of controversy. Those in favor stress that the residual breast tissue warrants a thorough clinical and radiologic assessment to enable early detection of malignancy. However, those against annual mammography believe that the thin layer of the residual breast tissue can be easily palpated on clinical examination of the chest wall and that annual mammography does not provide any additional benefit (31).

**In Summary:-**

The following are the current practice guidelines and position statements to be taken in to consideration.

1. **National Comprehensive Cancer Network (NCCN 2016) :**“Risk-reduction mastectomy should generally be considered only in women with a genetic mutation conferring a high risk history for breast cancer, compelling family history, or possibly with LCIS [lobular carcinoma in situ] or prior thoracic radiation therapy at < 30 years of age. The value of risk-reduction mastectomy in women with deleterious mutations in other genes associated with a 2-fold or greater risk for breast cancer (based on large epidemiologic studies) in the absence of a compelling family history of breast cancer is unknown.”The guideline states: “the small benefits from contralateral prophylactic mastectomy for women with unilateral breast cancer must be balanced with the risk of recurrent disease from the known ipsilateral breast cancer, psychological and social issues of bilateral mastectomy, and the risks of contra lateral mastectomy. The use of a prophylactic contralateral mastectomy to a breast treated with breast-conserving therapy is very strongly discouraged.” Genes that confer more than 20% risk of breast cancer include BRAC1, BRCA2, ATM, CDH1, CHEK2, PALB2, PTEN, STK11, and TP53 (32).
2. **Society of Surgical Oncology (SSO) 2007 :**The Society of Surgical Oncology developed a position statement on PM in 1993 and updated it in 2007.The position statement states that bilateral PM is potentially indicated in patients with: Known BRCA 1 or 2 mutations or other genes that strongly predispose susceptibility to breast cancer,A history of multiple first-degree relatives with breast cancer history or multiple successive generations of breast and/or ovarian cancer, or Biopsy-confirmed, high-risk histology such as atypical ductal or lobular hyperplasia or LCIS. The position statement also stated that CPM may be potentially indicated in patients: With

high risk (as previously defined) of contralateral breast cancer, In whom surveillance would be difficult such as with dense breast tissue or diffuse indeterminate microcalcifications, or to improve symmetry (33).

3. **National Cancer Institute (NCI) 2012:**The fact sheet of NCI, issued in 2012 provided the following information: “Prophylactic surgery to remove both breasts (called bilateral prophylactic mastectomy) can reduce the risk of breast cancer in women who have a strong family history of breast and/or ovarian cancer, who have a deleterious (disease-causing) mutation in the BRCA1 gene or the BRCA2 gene, or who have certain breast cancer-associated mutations in other genes, such as TP53 and PTEN.” (34)

### Conclusion:-

Bilateral & contralateral risk reduction mastectomy is one risk reduction measure for patients at a high risk of breast cancer or contralateral cancer respectively. Accurate risk assessment by a trained genetic counselor is an obligatory first step, as many women overestimate their risk of breast cancer. It is a highly personal decision that must, therefore, be preceded by an in-depth discussion with the patient by a multidisciplinary team regarding the benefits of the procedure vs the potential surgical and psychological risks. In addition, it is imperative that these women be informed of alternative management options, including chemoprevention, increased surveillance, and prophylactic oophorectomy.

**Annex (1) :**The following personal and/or family characteristics suggest a high-risk individual who would be a candidate for genetic testing:

- a. Age onset of breast cancer  $\leq 50$
- b. Triple negative tumor (ER-PR-HER2-) and age  $\leq 60$
- c. Ashkenazi Jewish heritage and breast cancer any age
- d. Two or more primary breast cancers (cancers can be asynchronous, synchronous, bilateral, or multicentric)
- e. First-degree relative with breast cancer age  $\leq 50$
- f. Two relatives on the same side of the family with breast cancer and/or pancreatic cancer
- g. Family or personal history of ovarian cancer, fallopian cancer, or primary peritoneal cancer
- h. Male Breast Cancer
- i. Known mutation carrier in the family

**Annex (2):-**Patients without a personal history of Breast Cancer: Patients should be made aware that testing an affected relative first when available can be more informative than testing themselves since a negative result will not give them more insight into their family history. If an affected relative is not available, patients should be reminded of the limitations of testing. Ideally, a three-generation pedigree including maternal and paternal lineage should be obtained. This information can be used to guide the type of testing to be performed and the selection of patients who may benefit from further counseling with a CGC. Patients without a personal history of breast cancer meet criteria for genetic testing if they have the following history:

- a) First-or second-degree relative with early age onset of breast cancer  $\leq 45$ .
- b) Ashkenazi Jewish heritage and family history of breast cancer any age
- c) Two or primary breast cancers (cancers can be asynchronous, synchronous, bilateral or multicentric) in a single family member
- d) Two or more relatives on the same side of the family with breast cancer and/or pancreatic cancer
- e) Family or personal history of ovarian cancer, fallopian cancer, or primary peritoneal cancer
- f) Male Breast Cancer
- g) Known mutation carrier in the family

### Annex (3):-Risk Assessment Tools

In addition to National Comprehensive Cancer Network (NCCN) guidelines for identifying patients appropriate for genetic testing, there are numerous models and online calculators available to predict the likelihood of carrying a BRCA1 or BRCA2 mutation based on family and personal history. In general, patients with a 5-10% or greater likelihood of carrying one of these genes should be recommended to be considered for testing and/or genetic counseling.

#### Abstract

The tank is considered two degrees of freedom system with a large mass is located at the top of supported system or frame supported system. The behavior of tank under earthquake loading is greatly depending on the staging height and seismic zones. And also seismic forces dependent on staging height. Present studying is shown the effect of staging height on seismic behavior of R.C elevated rectangular water tank. The elevated water tank has 300 m<sup>3</sup> capacity, various staging height such as (6m, 9m, 12m, 15m, 18m and 21m) and also different seismic zones such as II, III, IV & V were studied in STAAD.pro analysis package and Excel sheet developed program. The spring mass model subjected two degrees of freedom as per IS 1893 (part2):2006 draft code. Analysis carried out by considering the liquid mass is divided into two parts consisting of the convective and impulsive masses. Parameter of studying such as maximum displacement, maximum base shear, maximum overturning moment, quantity of concrete and amount of reinforcement for different staging height and seismic zones. in the case of studying for finding out maximum base shear and overturning moment by using Excel sheet and maximum displacement, quantity of concrete and quantity of reinforcement with STAAD.pro analysis package were used and the result of the studying were plotted in the graphs.

#### Introduction:-

Water tank is an important and strategic structure and it should remain functional during earthquakes to overcome the water demand due to fire etc. Water tanks are different from the building, because the huge mass of water is located at the top of supporting system. During the earthquake the mass of water is considered two parts such as impulsive and convective liquid mass. The good understanding of the behavior of water tank during seismic activity is necessary in order to evaluate the forces exerted due to earthquake and response of water tank. in the case of elevated water tank resistance against earthquake force is largely dependent of the supporting system. Staging of the elevated water tank is considered to be the critical element subjected to the lateral forces (seismic forces). when the tank partially filled with water, the tank is subjected to horizontal seismic acceleration and sloshing waves generates which exerts hydrodynamic forces on wall and the base of water tank. to calculate these hydrodynamic forces spring mass model suggested as per IS 1893(part2) :2006 draft code can be used. in the case of water tank, behavior of tank

under hydrodynamic and hydrostatic forces are considered is greatly dependent on the configuration of staging its height and stiffness.

**Methodology:-**

In the present studying different staging height and seismic zones was considered for the same capacity of water and configuration of tank. The R.C elevated rectangular tank is selected with 300m<sup>3</sup> capacity and analysis in the II, III, IV&V seismic zones. Tank is analyzed by using Excel sheet developed program and STAAD.pro analysis package and performance with respect to maximum base shear, maximum overturning moment ,maximum displacement, quantity of concrete and quantity of steel are presented. Six different staging heights are considered for studying such as 6m, 9m, 12m, 15m, 18m and 21m.The foundation depths are kept same for finding out the effect of staging height on seismic behavior of elevated water tank.

**Table.1:-Analysis Data**

Soil type	Medium
Importance factor	1.5
Response reduction factor for SMRF	2.5
Seismic zones	II,III,IV &V
Size of columns	1.0m*0.8m
Size of tie beam	0.8m*0.5m
Height of staging	6m,9m,12m,15m,18m &21m
Depth of foundation	1.5m
Thickness of wall	0.32m
Thickness of base slab	0.32m

Fig. 2:-Elevation of Different Staging Height of Water Tank

Fig. 3:-Plan of Water Tank

### Analysis:-

Seismic coefficient analysis or equivalent static analysis was carried out and found out the response of the R.C elevated rectangular tank on the above models as shown before. The calculation procedure two spring mass models for every model are considered as per IS 1893( part 2):2006 draft code.And response of the elevated water tank (base shear, overturning moment and displacement) is summarized below. Comparison between each of the following models are made based on analysis results and plotted in graphical format.

For analysis of this studying were used STAAD.pro and Excel sheets, to find out the value of maximum base shear and overturning moment used Excel sheet as per IS 1893(part 2) :2006 draft code according the mentioned code two model masses model was made. Liquid mass is divided into two parts such as impulsive and convective mass.Analysis carried out and the value of maximum base shear and over turning moment were found out and plotted in the graphs. But for finding out the value of displacement was used the STAAD.pro package and found out the maximum displacement at the top of the water tank.

**Results and Discussion:-**

Maximum base shear, overturning moment and displacement with seismic coefficient static analysis are presented in the graphs as following .they are observed that maximum base shear, overturning moment and displacement increase as staging height and seismic zones is increased.

**GRAPH1:-** Variation of Moment in IV Seismic Zone and Different Staging Height

As the above graph is plotted as shown there is a gradual increased overturning moment as increase the staging height in IV seismic zone.

**GRAPH2:-** Variation of Moment in Different Sesimic Zones and Staging Height

As the above graph is plotted as shown there is a gradual increased the moment as increase in the different seismic zones. Also when the seismic zones are increased the values of moments between two staging heights are increased.

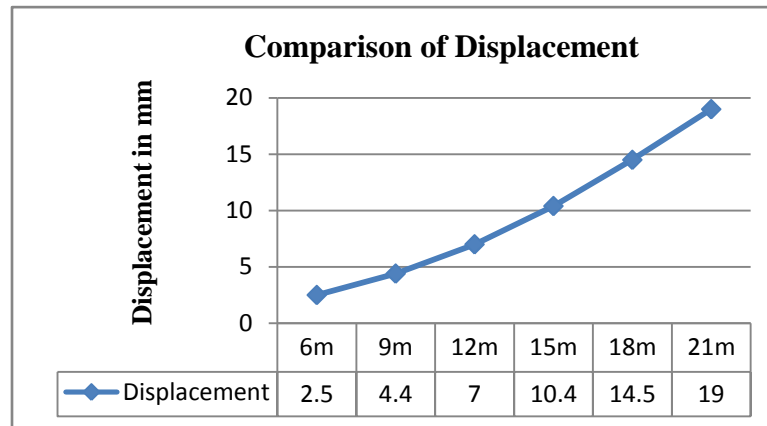

**GRAPH3:-** Variation of Base Shear in IV Seismic Zone and Different Staging Height

As the above graph is plotted shows there is a gradual increased base shear as increase the staging height in IV seismic zone.

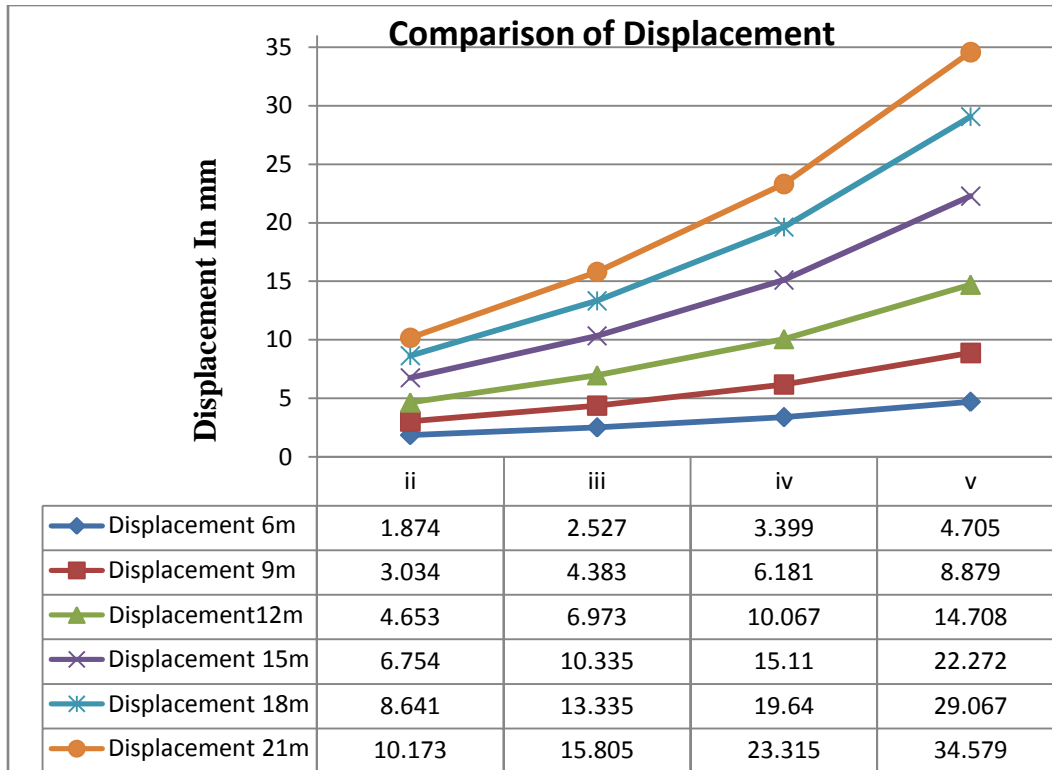

**GRAPH4:-** Variation of Base Shear in Different Seismic Zones and Staging Height

As the above graph is plotted shows there is a gradual increased the base shear as increase staging height in the different seismic zones. Also when the seismic zones are increased the values of base shear between two staging heights are increased.

**GRAPH5:-** Variation of Displacement in IV Seismic Zone and Different Staging Height

As the above graph is plotted shows there is a gradual increased displacement as increase the staging height in IV seismic zone. Displacement shows the requirement of enough columns and sufficient supporting system.

**GRAPH6:-** Variation of Horizontal Displacement in Different Seismic Zones and Staging Height

As the above graph is plotted shows there is a gradual increase in the displacement as increase in the different seismic zones. By increasing the height of the staging the displacement increase this value shows when increasing the staging height the column and supporting system need more and these columns and supporting systems are not sufficient.

**GRAPH 7:-** Variation of Concrete Quantity in IV Seismic Zone and Different Staging Height

As the above graph is plotted is shown there is a gradual increased quantity of concrete as increase the staging height in IV seismic zone.

**GRAPH 8:-** Variation of Concrete Quantity in Different Seismic Zones and Staging Height

As the above graph is plotted is shown the concrete quantity is remained constant, while the seismic zones are increased because the cross section of the structure is not changed.

**GRAPH 9:-** Variation of Displacement in IV Seismic Zone and Different Staging Height

As the above graph is plotted shows there is a gradual increased quantity of steel is increased the staging height in IV seismic zone.

**GRAPH10:-** Variation of Steel Quantity in Different Seismic Zones and Staging Height

As per the above graph is plotted shows there is a gradual increase in the quantity of reinforcement as increase the different seismic zones. By increasing the staging height the amount of steel is increased. Because we did not change the cross section of the structure therefore the earthquake forces also undergo by reinforcement.

**Conclusion:-**

The elevated water tank has 300 m<sup>3</sup> capacity, various staging height such as (6m, 9m, 12m, 15m, 18m and 21m) and also considered in different seismic zones such as II, III, IV & V were studied in STAAD.pro analysis package and Excel sheet developed program. The spring mass model is subjected to two degrees of freedom system as per IS 1893 (part 2):2006 draft code. The conclusions are made as per comparing of the results:

1. Base shear, overturning moment and displacement are increased with increasing the staging height and seismic zones. Because when the structure height is increased the mass and distance between the center of gravity and ground level is increased as per IS 1893 (part 2) :2006.
2. The values of the base shear and overturning moment are slightly become more. And also when the structure height becomes more the displacement values are proportional becoming more, because the structure comes flexible and displacement value shows the requirement of columns and sufficient supporting system.
3. Values of maximum base shear, maximum overturning moment and maximum horizontal displacement have been shown the Response of elevated water tank.
4. In the case of studying seismic zones such as II, III, IV and V are changed, the geometry of structure is remained constant therefore the quantity of concrete is not changed, but the reinforcement quantity is increased due to increasing seismic zones. Software able to provide the requirement of reinforcement to resist the seismic forces without any changing of the cross section.

Competence, Organizational  
Performance

### Abstract

Competitions happened in many different fields of Industry, both in manufacture and service areas, including education industries around the globe. Universities need to create people who are competitive and have capabilities to match with the need of the industries. Having understanding about an organizational service orientation became important to the most of service organizations. Few researches relating to the study of organizational service orientation showed there were positive relationship between organizational service orientation and organizational performance. This study reviewed diverse empirical literatures on organizational service orientation, strategic leadership and strategic competence and their effects on organizational performance. This study find that having a service orientation will give better performance for an organization. The ability of strategic leaders to have strategic competence will also increase organizational performance.

### Introduction:-

Nowadays competitions happened in many different fields of Industry, both in manufacture and service areas. Organizations need to have the right strategy to be able to survive and not only surviving but also expand in this highly competitive market for long term. The competitive challenges also effect education industries around the globe. Universities need to create people who are competitive and have capabilities that are match with the need of the industries. The ability of universites to improve their graduates quality through learning process become significantly important in recent years. Leaders at educational industries are expected to be more strategic in their leadership and lead their institutions to face the challenges. Universites are expected to be able to adopt the changes, develop and make improvement through their organization by creating their competitive advntges (Henderson & Ccoburn, 1994). The ability to create competitive advantages, will need strategic competence possessed by the universites' leaders. Baker et al. (1997) explained that strategic competence is "The accuracy/alignment between company business strategic and its external competitive environment." Strategic competence is defined as an ability to understand strategy (Fauré & Rouleau (2011). Strategic competence is the main key for an institution to support its competitive position. Davies (2006) explained that universities who have the focus strategically were those able to use strategic approaches and strategic processes (include strategic planning) and they also have strategic leadership skills.

Address:- Faculty of Economy, Pelita Harapan Surabaya University.

Other challenge faced by the universities, especially private universities, relates to the services they give to their students. Educations as part of the service industries need to pay attention to the services that they give to their customers. Nowadays, students not only feel enough if they will only get the education itself but they also want the universities provide and give services that will satisfy them. Private universities need to have standards in giving the services to the students and each level of all the departments need to have the same understanding to practice the same standard. Handriana (1998) explained that perception of the same service standard across the whole department and being understood by everyone inside the private university will produce service quality as the standard that they understand together. The same service standard can only be reached if everyone has the same perception toward the concept of service standard itself. It is part of the management responsibility to make sure that service standard desired is well communicated to all level in the organization. Lytle et al. (1998) explained the concept of organizational service orientation as a form of policies, practices and procedures to support and give reward for all behaviors that focus on service, to those who are able to give the best services. García et al. (2011) supported the work of Lytle that organizational service system has an influence toward job satisfaction. However, Little & Dean (2006) work did not support the work of Lytle et al. (1998). They found that organizational service orientation did not have significant impact toward service quality. Figure 1 shows the conceptual framework indicating the The effect of Organizational Service Orientation, Strategic Leadership and Strategic Competence on The Organizational Performance of Private Universities.

**Figure 1:-** Conceptual Research Framework

## Literature Review:-

### Higher Education:-

According to Indonesia Acts 2012 No 12 chapter 1(2), higher education is the level of education after high school, which include the programmes of diploma, bachelor, master, doctor, profession and specialist conducted by universities based on Indonesia cultures. Soehendro (1996) explained the basic foundations of universities in Indonesia consists of four functions:

1. Universities as a tool to produce labors that have specific qualifications to have productive functions in the society.
2. Universities as a tool to educate and train conceptors and researchers.
3. Universities as a tool to conduct learning process that is efficient, effective and productive ways.
4. Universities as a tool to pursue better life quality for the society.

Further, Soehendro (1996) explained that the functions attached to the universities are education, research and community service, when those functions are being conducted well will produce graduates. The graduates who will help the society through their knowledge and contribution.

### Organizational Culture in Services:-

Culture has playing an important role in the success of organization both financial and position in the market. Peters & Waterman (1982) in their book "In Search of Excellence" explained that each organization needs to have values and beliefs for it to survive and achieve success. Values and beliefs will influence organization policies and actions. Hofstede (1997) explained values as the center of culture in an organization. Values and norms were not something that we could observed directly, however we could see values and norms in practices, procedures and behaviors that

were moved by values and norms. Beitelspacher (2011) mentioned service culture as a culture that focused to the customers.

“Service culture should be meant as a customer–centric culture, which aims at exceeding customer expectations, and is strongly focused on providing superior customer value. Service culture will lead to better customer perception of service quality, as well as having a beneficial impact on customer market loyalty, repurchase intentions and customer satisfaction.”

When an organization tries to give the best service to the customers, even can do something beyond its customers expectation, then the action will bring customers’ loyalty (Beitelspacher, 2011). Parasuraman et al. (1996) defined service quality as service received by customers that has fulfilled the expectation of customers toward quality.

### **Organizational Service Orientation:-**

A concept about organizational culture which can described the ability of organization in giving excellent services to the customers is Organizational Service Orientation. Classical approach for quality management like TQM, in general is only focused on quality internally. TQM approach studies how the best activities conducted by the people inside the organization. Furthermore, other research about service quality mostly only consider the factor of service’s experience received by customers (Mukherjee & Malhotra, 2006). Very few discussions about service quality from customers perspectives. Organizational service orientation tried to see the quality of service not only based on the experience but also from the perspective of customers toward services. Organizational service orientation manifested in the behavior and attitude of employees that effect directly to the quality of service process given by customers. Lytle et al. (1998) in Urban (2012) defined organizational service orientation as:

“An organization–wide embracing of a basic set of relatively enduring organizational practices, policies and procedures intended to support and reward service–giving behaviours that create and deliver service excellence. At the visible level it is reflected by genuine attention to customer needs, as well as sharing, helping, assisting, and giving support to customers.”

According to Lytle et al. (1998), organizational service orientation consist of four areas of service, which are:

1. Service Leadership Practices.
2. Service Encounter Practices
3. Service System Practices
4. Human Resoure Management Practices

Further, Lytle et al. (1998) in Urban (2012) tried to explain more for those four areas of service. Leadership in theory of management science is the main and first requirement needed for the growth of an organization. Besides leadership, the ability of the organization to have strong vision and long-term orientation also factors for the successful of organization. Lytle et al. (1998) also explained about Service Encounter Field as:

“Customer treatment and staff empowerment. How a service provider looks after customers is the first and the most important predicator of the quality perceived. In the literature output there is a conformity of opinion that says that to get delighted customers it is required to allow direct contact staff to act with very unconstrained manners. Only in this case will employees be able to react flexibility to customers’ needs and provide superior service.”

Customers will have satisfaction if employees can have good relationship with customers and have the authority to act in order to fulfill the need of customers. Employees need to have empowerment from the organization to make decisions. All services given by the organization to its customers come from a system within the organization. According to Deming, an expert in quality management (1994), inside the system there should be a potential to fix the quality. Lytle et al. (1998) explained three areas related to Service System Practices, which are:

1. Service failure prevention and recovery practices
2. Service standard communication practices
3. High levels of service technology adaptation

The other important factor in Organizational Service Orientation is the factor of human resource. Literature about organizational behavior, especially the study that related to human resource management influence how service orientation is studied. Lytle et al. (1998) explained that

“An organization’s ability to produce external service quality is directly related to issues of internal service quality. These issues are typically studied in terms of employee attitudes, personalities, beliefs, and behaviors. Hiring, training, and rewarding service oriented behaviors have a direct and positive influence on service quality and organizational performance. Therefore, an organizational service orientation would involve a focus on service-oriented human resource management throughout the organization.”

Wahlers & James (1994) explained that accurate strategy in service quality is the important factor that will effect competitive advantage if planned and implemented correctly. Service quality is the confidence for the service received (Tjiptono, 2005). If private universities can create the right service quality as their strategy then they can create their competitive advantage. Costumer satisfaction is an aftersales evaluation, in which alternative chosen is giving the result as it is expected or beyond expectation to the customers (Tjiptono, 2005). Zeithaml in Chang & Chen (1998) showed that service quality has a very strong impact to the customers’ behavior, such as product loyalty, the willingness to pay more for the products and customers tend not to shift their preferences if they are happy with the services.

Homburg et al. (2002) and Walker (2007) also said that Organizational Service Orientation plays an important part for the success of the organization. Service orientation has a positive influence toward service quality given by the organization. Lytle & Timmerman (2006) explained that service orientation, like service quality image and organizational commitment, has an influence to return on asset for banking sectors. Yoon et al. (2007) also found that service orientation influenced the characteristics of performance such as repeat buying, positive word of mouth for health industry. Organizational Service Orientation also stated as “common denominator” for the attributes of educational services industry to be responsible for customer satisfaction (Walker, 2007). Organizational Service Orientation plays an important role to achieve business performance at service organization. If employees happy and satisfied with their job, they will give a better service to their customers (Garcia et al., 2011). Organizational Service Orientation effect service quality and customers loyalty that will lead to better financial performance (Urban, 2012). However, Little & Dean (2006) found that Organizational Service Orientation did not have any influence on the service quality at the telecommunication companies.

#### **Characteristics of Service Quality in The Universities;-**

Lupiyoadi & Hamdani (2006) explained four characteristics of service quality owned by universities, which are:

1. University is service organization, during the process of delivering the service will required supporting tools like: classrooms, chairs, tables, books and laboratories.
2. Service given will need the present of customers as users, where students as customers need to come to the institution to receive the service.
3. Receivers of service are people, so services at university is categorized as high contact system. Customers and suppliers will interact all the time for the process of delivering the service. Therefore, students as customers have to be part of the system.
4. The relationship with customers will be based on member relationship, where customers will become the member for a particular educational institution.

A good service quality for private universities will make students and society satisfy and they are willing to inform to others by having word of mouth promotion. When the service quality is good then automatically the number of applicants will increase. The improvement of service quality is expected to increase numbers of new students (Firmansyah et al., 2014). Gordon & Partington (1993) mentioned three criteria in measuring service quality, which were outcome-related, process-related and image-related criteria.

#### **Leadership:-**

Leadership has become an important topic in the literature to study organizational behavior. Lee & Chuang (2009) found that a great leader not only bring inspiration to his subordinates in improving efficiency, but also fulfill their need in the process to achieve organizational goal. Stogdill (1957) defined leadership as an individual behavior to lead a group to achieve the same target. Fry (2003) explained leadership as a strategy to lead by offering motivation that will build, improve staff’s potential to grow and develop. Sanders & Davey (2011) conducted the exposition for leadership theories based on their evolution concepts towards these categories leadership: trait theories, behavioral theories, contingency theories, transactional theories and contemporary (transformational) theories. The purpose was to identify main elements from effectiveness and leadership constructs and connected with effectiveness of

organization. Sanders & Davey (2011) said that those theories in general were able to explain the construct of effective leadership, however overall it was not found in the literature explicitly the connection that connected those theories into a model that link effectiveness of leadership and effectiveness of organization. Synthesis of leadership theories showed three important elements to build effective leadership, which are task focus, people focus and development focus (Sanders & Davey, 2011). Task focus involved the process to achieve goals of the group (purpose, objective and result). People focus included consideration, participation in decision making, care for the need of subordinates, justice, respect, trust, fair rewards. Development focus included the period needed to set new pattern adjusted to the condition where organization operated. Effectiveness organization considered as main tool to connect leadership theory with the construct strategic leadership and effectiveness of leadership need to be defined in the context of effectiveness of organization if it wanted to be considered as something strategic (Lear, 2012). Sanders & Davey (2011) used the term “meta-model” for strategic leadership because the framework that they used described several theories about strategic leadership and they tried to combine theories in a comprehensive paradigm that connect interpersonal relationship of those theories and the connectivity with effective leadership and effective organization. In meta-model, effectiveness organization used as the main measurement for effectiveness leadership.

### **Strategic Leadership:-**

Hitt et al. (2005) in Serfontein (2009) said that strategic leadership is assumed as a visioner leadership because he is willing to take a risk. Strategic leadership assumes that visioner leadership and managerial leadership can fill in each other and strategic leadership will combine both equally. Strategic leadership has a belief in the ability of strategic leader to change the organization in order to fulfill the changing environment where an organization operated (Rowe, 2001). Strategic leadership is a combination of synergy between managerial leadership and visioner. It is the ability to influence others to have the willingness to make daily decisions which leads to the organization’s ability for long term and at the same time stabilize the short term finances (Rowe, 2001). Boal & Hooijberg (2001) said that the core of strategic leadership involved the learning and changing process to have good managerial wisdom.

Strategic leadership at higher education will always involved the moral purpose of the organization, which is a question: ” why we do what we are doing now?”. The important key for leaders at private institutions who take the strategic role that they need to have a mindset change to move further from details operational activities perspective to develop a comprehensive and wide organizational perspective. Strategic leader at private institutions in three to five years, need to be able to see and identify their main theme for their long term development which they want to achieve. Then, plan backward those plans to their yearly plan (Davies & Davies, 2010). Davies (2006) said schools which were able strategically were those who could act effectively from education side in the short term, however they also have clear framework and able to process the framework into goal and moral vision expected by the organization both in medium and long run period. Nthini (2013) said that there was a high correlation between strategic leadership and customer satisfaction, return on investment, net profit margin and low employee’s turnover. An effective strategic leadership will lead to the improvement of organizational performance.

### **Personal Attributes of Strategic Leader:-**

Davies& Davies (2010) explained three characteristics of strategic leader:

1. Strategic leaders are strategic thinkers
2. Strategic leaders are strategic learners
3. Strategic leaders are values driven

Strategic thinking is a tool to develop a strategic perspective that see things from different perspective. Garratt (2003) gave explanation about strategic thinking as:

“Strategic thinking is the process by which an organisation’s direction–givers can rise above the daily managerial processes and crises to gain different perspectives...Such perspectives should be both future–oriented and historically understood. Strategic thinkers must have the skills of looking...forwards...while knowing where their organisation is now, so that wise risks can be taken while avoiding having to repeat the mistakes of the past.”

Strategic leader is also someone who will lead in learning. If a leader does not seeking new knowledge all the time then he will be considered fail to bring the organization to develop and the most important, he fails to become a model for others. Hughes & Beatty (2005) explained the learning process for the strategic leaders, which are:

1. Looking at the big picture–what can I learn from the broader environment?

2. Looking for patterns over time—how can I learn from data and find patterns in the data in order to extract useful information?
3. Looking for complex interactions—how can I synergise and learn from interrelationships?
4. Understanding what cause what—learning that it may be more complex than it seems!
5. Making time for reflection!

Strategic process also needs to have the base of values and beliefs. Bennis & Nanus (1985) in the classical view about vision explained that the creation of a vision and its meaning were the characteristics that shaped a leader. Bennis & Nanus explained that by focusing attention on a vision, the leader operated on the emotional and spiritual resources of the organization, on its values, commitment, and aspirations. Leaders often inspired their followers to high levels of achievement by showing them how their work contributes to worthwhile ends. It is an emotional appeal to some of the most fundamental of human needs—the need to be important, to make a difference, to feel useful, to be part of a successful and worthwhile enterprise. Brubaker (2005) explained that leader who can share his vision clearly and can be trusted will “Create a condition where others will feel inspired and have commitment toward something bigger from themselves.”

### **Competencies:-**

#### **Spencer & Spencer (1993) defined competencies as:-**

An underlying characteristic of an individual that is causally related to criterion-referenced effective and/or superior performance in a job or situation. Underlying characteristic meant “the competency is a fairly deep and enduring part of a person’s personality and can predict behavior in a wide variety of situations and job tasks”; causally related meant, “a competency causes or predicts behavior and performance”; and criterion-referenced meant “the competency actually predicts who does something well or poorly, as measured on a specific criterion or standard”

According to Robbins (2001) competencies are an individual capability to do various tasks in a job. Veithzal (2004) added that the whole ability of individual consists of two factors which are intellectual ability and physical ability. Intellectual ability is the ability of someone that is related to IQ and EQ or relate to the intelligence in knowledge and emotion. Veithzal (2004) explained seven dimensions that shape the intellectual ability:

1. Numeric ability: the ability to count quick and accurate
2. Verbal understanding: the ability to understand what he reads, hears and connect one word to another word
3. Conceptual speediness: the ability to recognize similarities and different visual quick and accurate
4. Inductive logic: the ability to recognize logic sequence in problems and then solve the problems
5. Deductive logic: the ability to use logic and examine the implication of an argument
6. Dimension visualization: the ability to visualize how an object will look like when the setting is changed
7. Memory: the ability to keep and recall back past experiences

Vathanophas &Thaingam (2007) explained the four basic characteristics needed for competencies:-

1. Knowledge, information owned by someone in a specific area
2. Skills, the ability to do physical and mental tasks
3. Traits, physical characteristics and consistent response for information and situation
4. Self-concept, include behavior, values or self-image

#### **Strategic Competence:-**

Sparrow & Hodgkinson (2006) defined strategic competence as an ability to get, store, repeat, interpret and act based on relevant information to be able to survive at the long term and for the benefit of the organization. Grant (1996) mentioned that competency represents the influence of characteristics organization and individual. Competence makes the organization proactively able to recognize signals that identify weaknesses in the organization to be changed. Trejo et al. (2002) tried to measure competence by using an approach that focus on resources owned by organization. Competence development in organization has taken form in several development models. The model that commonly used is system approach or strategic human resources management. Boyatzis (1982) used system approach to display competence role in the market sector. Boyatzis (1982) said that organization has to try to reach efficiency. To be able to reach efficiency, organization need to have competencies, job demand and consistent organizational environment. If the three factors didn’t support each other, it will make inefficiency occurred.

**Seija Ollila (2008) explained about strategic leadership as follow:-**

Competence is a combination of skills which an individual can use to complete the given task. In this quickly changing world, competence is the foundation of durable success and forward-looking possibilities. Competence is based on knowledge, know-how and attitudes, which are combined with cultural identity, shared visions organizational structure, and management processes

Organizational strategic competence will combined individual skill inside the organization with culture, vision, structure and management process within the organization. Durand (2000) defined competence as:

“A capability to act. New competence, which is tied to the changing requirements of the environment, is born in interaction with an individual and his/her working area. An organization tries to achieve the goals of building, exploiting and maintaining competence. Competence also refers to the willingness of an organization to maintain and coordinate organizational assets and capabilities to achieve the goals.”

Therefore, building up a capability for an organization is a process, in which the organization is able to change its resources and facilities and looking at the readiness of that capability to coordinate and arrange so that the new way will be achieved (Sanchez & Heene, 1997; Sanchez, 2001; Sanchez & Heene, 2004). Strategy as a concept define willingness, objectives and direction to achieve what the organization need. Strategic management needs a systematic thinking process, connecting all interactive relationships and sees things comprehensively. Main objective is making sure an organization future vitality (Porter, 1996; Kirjavainen & Laakso- Manninen, 2000; Hannus, 2004). When leadership has strong strategic competence, the organization will have a better performance (Lerner & Almor, 2002). According to Sanchez (2004) Strategic Competence-based Management is a management process where tangible and intangible assets will be coordinated for their usage according to the goal the organization wants to achieve. Ansoff (1984) and Butler et al. (1991) explained that in the process of making the strategies, culture values also influence and the process will also evaluate the current strategies and measure how the development of the new strategies. Knight (2001) explained about strategic competence as a function of main strategic such as: R&D, product quality development, marketing and distribution. Alhawari & Al-Jarrah (2012) defined strategic competence into four competencies, which are: (1) Shared vision (2) Cooperation (3) Empowerment (4) Innovation. Sveiby (1990) described competence of an organization into three main components:

1. Human Capital is the shared knowledge and competence that is connected to working tasks
2. Work Motivation and Ability
3. Commitment

Ollila (2008) explained about the competence in a way that easy to be understood in the concept of human resource, which was:

“The success of an organization is the consequence of human actions. In human capital, individual capacities make up one perspective. The social capital as a concept involves, beside human capital, a communal viewpoint which refers to the relations between human beings, customers, interest groups, management systems and norms. It is included in both the human and structural capitals and it can also be defined as a wider complex. When thinking about the societal consequences, trust and social capital are the key factors in communication, learning and innovations. The structural capital is the data which belongs to an organization and includes procedures, systems, technology, and organizational structure.”

**Organizational Performance:-**

Performance is a concept that is difficult to be disclosed explicitly because the performance concept is usually understood implicitly. Performance related to a specific concept will deliver specific approach or measurement (Firmansyah, 2014). Performance of private university is a result that should be able to measure. Performance for each individual in the private university influenced by the ability and willingness. According to Fishbein & Ajzen (1995) in Firmansyah (2014) and Gibson (1994), the concept of theory of attitude showed that each behavior conducted because of intention. Every behavior triggered by certain intention. Intention that was not supported by situation, mostly would not become an action. Therefore, individual effort was the trigger to create work behavior so that a meaningful performance was also created (Firmansyah, 2014). Organizational performance talks about the ability of the organization to achieve what is the purposes of the organization, like higher profit, product quality, increase of market share, better financial result and the ability to survive at a certain period of time by using the right strategy to act (Koontz & Donnel, 1993). According to Alwi (2009), measurement of employee performance is the

result of comparison between the actual and expected employee's performance. Dessler in Alwi (2009) explained several factors that can be used as tools to measure the performance of lecturers, those are:

1. Work quality, accuracy, appearance
2. Work quantity, number of outputs and contributions
3. Supervision needed, suggestion and improvement
4. Timely attendance
5. Consensus, maintenance of the facilities used

Further, McGrath & MacMillan (2000) and Teece et al. (1997) explained that there was a relationship between leadership style and organizational performance. Effective leadership behavior will facilitate performance increase at times when organization facing new challenges. Griffin (1987) described performance as organization being effective and shows level of productivity gained from the resources owned by the organization. According to Prieto and Revilla (2006) performance can be categorized into two which are financial and non-financial performance. Performance measurement needs to be done in more comprehensive method.

#### **Performance Measurement:-**

Organizational performance is an indicator that can be used to measure achievement from goals and outcomes. Result from the performance assessment should be able to measured and assess clearly. Kaplan & Norton (1996) explained that organizational performance has a broad concept and not only focus to profit or other financial performances. Modern business environment need different types of goal's orientation. New management approach is focused on stakeholder's perspective (Atkinson et al., 1997; Berman et al., 1999; Harrison & Freeman, 1999; Hillman & Keim, 2001; Sirgy, 2002; Riahi-Belkaoui, 2003; Tangem, 2004). The involvement of stakeholders is to make sure that organizational performance is will not only be looked at the financial indicator.

The first method used to evaluate individual performance and now being used widely at the universities, introduced by Armstrong & Baron (1998). Performance appraisal also known as merit rating. This method is an organization mechanism to measure the performance of individuals to make sure that each member of the organization doing what organization wants them to do. Hernaus et al. (2008) measure the organizational performance by looking at the stakeholder perspective that focused on four perspectives, which are: (1) Financial's view, (2) Employee's view, (3) Supplier's view, (4) Customer's view. Perspective used similar to the approach of balance scorecard introduced by Kaplan & Norton (1996). The difference between the two approaches is, Kaplan & Norton looked at Internal Business Process while Hernaus et al. (2008) approached it from the perspective of Supplier's view.

#### **Conclusion:-**

This paper analyzed the effect of Organizational Service Orientation, Strategic Leadership and Strategic Competence on the Organizational Performance at Private Universities in Indonesia. There were many studies have been conducted to measure the factors that affected organizational performance. Researchers have examined that even on the manufacture companies, the variable effected the increasing of performance not only product's quality but also services that the organization given to their customers. In order for the organization to give the excellent services, all the members of the organization must understand the important of service factor to their customers. Organization also needs to have leader who has a leadership skills that will enable him/her to think strategically and able to make strategic decision so what the organization wants toward service excellent will be achieved.

This paper showed that there is strong relationship between Organizational Service Orientation and Organizational Performance. Service orientation influenced the characteristics of performance such as repeat buying, positive word of mouth (Yoon et al., 2007). Organizational Service Orientation plays an important role to achieve business performance, especially at service organization. If employees happy and satisfied with their job, they will give a better service to their customers (Garcia et al., 2011). Research found that there was a high correlation between Strategic Leadership and customer satisfaction, return on investment, net profit margin and low employee's turnover (Nthini, 2013). An effective Strategic Leadership will lead to the improvement of Organizational Performance. There is also strong relationship between Strategic Competence with Organizational Performance. Research found when leadership has strong competence, it will lead to the increase of Organizational Performance (Lerner & Almor, 2002). This research wanted to add the previous studies related to the Organizational Service Orientation, Service Leadership and Service Competence toward the Organizational Performance on higher education organizations. Moreover as an organization in higher education, there will be more direct contact with customers, compare to the other organizations.

##### Key words:-

Hyperlipidemia, Medicinal plant  
*Rhinacanthus nasutus*, High fat diet.

#### Abstract

**Objective:** To evaluate the hypolipidemic effect of *Rhinacanthus nasutus* (*R.nasutus*) in high fat diet induced (HFD) hyperlipidemic rats.  
**Methods:** The methanol leaf extract of *R.nasutus* was tested for hyperlipidemic effect in the albino rats at the selected optimum dosage of 200 mg/kg body weight orally. Adult male albino rats of six numbers in each group were undertaken to study, and evaluated.  
**Results:** In group II animals, fed with high fat diet the activity levels of serum total cholesterol (TC), triglycerides (TG), low density lipoprotein (LDL), very low density lipoprotein-cholesterol (VLDL) were significantly enhanced when compared to normal rat. *Rhinacanthus nasutus* methanolic leaf extract (RNM) group III treated rats showed depleted levels of the lipid molecules.  
**Conclusion:** It could be concluded that the methanol leaf extract of *R.nasutus* exhibited a significant hypolipidemic effect on HFD induced hyperlipidemia in rats.

#### Introduction:-

Diseases of the cardiovascular system are the most common cause of death. Lifestyle changes have a significant impact on the health of the people. The modernization of societies appears to result in a dietary pattern that is high in saturated fats, refined sugars and is low in fiber content. (Brai, *et al.* 2007) [1]. It is now established that hyperlipidemia represents a major risk factor for the premature development of atherosclerosis and its cardiovascular complications. Hyperlipidemia is a disorder characterized by an increase in blood lipoprotein or cholesterol levels. Atherosclerosis is a common condition in both developed and developing countries and is recognized to be an inflammatory condition leading to the development of ischemic heart diseases, cerebrovascular diseases and peripheral vascular diseases. Cardiovascular diseases (CVD) account for 31% deaths worldwide in 2015(WHO 2015) [2]. The major risk factor of CVD is hypertension, hypercholesterolemia, diabetics and obesity. The death of UK people due to heart problems were 28 and 26, in male and females, respectively, in 2015. Hypertensive individual number in India is projected to increase two fold by 2025. (Kearney, *et al.* 2005) [3].

Hyperlipidemia contributes drastic threat towards the spread and expansion of atherosclerosis and coronary heart diseases (CHD). Significant increase of lipid profiles is responsible for the onset of CHD. Ischemic heart disease is a major risk factor in the pathogenesis of preoperative adverse cardiovascular events which lead to significant morbidity and mortality within the high risk surgical patient population.(Howard-Alpe,*et al.* 2006) [4]. Recent studies have shown that lipid associated disorders are not only attributed to the total serum cholesterol, but also to its distribution among different lipoproteins. The low density lipoproteins (LDL) are the major carriers of cholesterol

towards tissues having atherogenic potential, while the high density lipoproteins (HDL) carry cholesterol from peripheral tissues to the liver. HDL thus gives protection against many cardiac problems and obesity, although genetic factors recline behind these lipid disorders.(Sattivel.*et al*,2000) [5]. The treatment of hyperlipidemia depends on the patient's cholesterol profile. Many antihyperlipidemic agents like statins, fib rates, niacin, bile acids, ezitimibe etc. reduce cholesterol level in different conditions. (Durrington .*et al* 2003)[6].

Currently available hypolipidemic drugs have been associated with a number of side effects. The consumption of synthetic drugs leads to hyperuricemia, diarrhoea, nausea, myositis, gastric irritation, flushing, dry skin and abnormal liver function.(Speight.*et al* 1987) [7]. Only two drugs, orlistat and sibutramine, have been approved for long-term use in significantly obese patients by the U.S. Food and Drug Administration. The other drugs showed adverse effects including gastro-intestinal discomforts, flatulence, and diarrhea.

Since ancient times plants have been exemplary sources of medicine because they constitute raw materials as drugs for treating various ailments of human beings. So, there has been significant development in the fields of synthetic drug chemistry and antibiotics based on plant products isolation and characterization. During the last two decades, considerable changes have taken place in the medicinal system all over the world. Because of the general awareness of the widespread toxicity and harmful after-effects associated with the long term use of synthetic drugs and antibiotics, drugs from natural sources are being preferred.

According to the World Health Organization (WHO 1977) [8], a medicinal plant is a plant in which, one or more of its organs contains substances that can be used for the synthesis of useful drugs. This definition distinguishes those plants whose therapeutic properties and constituents have been established scientifically from plants that are regarded as medicinal but which have not yet been subjected to thorough investigation. The term herbal drug determines the part/parts of a plant used for preparing medicines (for example: leaves, flowers, seeds, roots, barks, stems, etc.).

Medicinal plants contain biologically active chemical substances such as saponins, tannins, essential oils, flavonoids, alkaloids and other secondary metabolites.( Harborne. *et al*, 1973, Harborne. *et al*,1996) [9,10], which have curative properties to almost all living organisms. These complex chemical substances has reported that plants also contain certain other compounds that moderate the effects of the active ingredients. The plant derived preparations have long been used as traditional remedies and in folklore medicine for the treatment of hyperlipidemia in many parts of the world.

Recently, the search for appropriate antihyperlipidemic agents have been again focused on plants because of less toxicity, easy availability and absorption in the body so that they may be better for treatment than currently used drugs. Traditional system of medicine like Ayurveda, Unani and Chinese prescribe numerous herbal drugs for CVD.

At present herbal hypolipidemics related to plants have gained importance to fill the lacunae created by herbal drugs because they are generally considered to be less toxic and less prone to side effects than drugs manufactured by chemical synthesis. The potential therapeutic and preventive benefits of plant-based medications have been the subject of extensive studies, and many natural constituents have been uncovered with significant pharmacologic activity, including agents with antiglycemic, hypolipidemic and antihypertensive properties.( Kumari, Son. *et al*, 2007) [11,12].

***Rhinacanthus nasutus (Linn) Kurz***, a medicinal plant, belongs to Acanthaceae family, is a shrub and is well known for its medicinal uses, commonly called as Nagamalli in Telugu. This plant is widely distributed in some parts of the subcontinent India and in the region of Southeast Asia and China. The plant is small, slender, shrub and 1-2 meter height. Various parts of this plant have been used for the treatment of eczema, pulmonary tuberculosis, herpes, hepatitis, diabetes, hypertension, skin diseases, ring worms, cancer, scurvy, leprosy and obesity. The plant leaves, roots and seeds also used as an antidote for snake bites.(Visweswara.*et al* 2010, Yesilbursad *et al*, 2005) [13-15]. In the present study, we investigated the effect of *R.nasutus* methanol leaf extracts on the reduction of cholesterol level in serum of wistar rats.

## Materials and Methods:-

### Plant material:-

The fresh whole plant of *Rhinacanthus nasutus* (Linn) Kurz were collected from Tirumala forest, Tirupathi, Chittoor (Dt) Andhra Pradesh, India, identified and authenticated by Department of Botany, SV University, Tirupati.

### Plant extracts preparation:-

The *Rhinacanthus* leaves were collected, washed through tap water and shade dried at room temperature and made powder using grinder. The powdered plant material was macerated with hexane, ethyl acetate, methanol and water, separately. The extract of each was then filtered with filter paper (Whatman No. 1) and the filtrates was kept under reduced pressure using rota evaporator at 40°C was concentrated and stored for further study at 4°C. Preliminary screening test of each extract powder was performed at dosages of 50, 100, 150, 200, mg/kg body weight of rat. Among the four extracts, methanolic extract found to contain much of hyperlipidemic activity. Hence, the methanol leaf extract was selected and tested for hypolipidemic effect in the wistar rats at the selected optimum dosage of 200mg/kg body weight and administered orally.

### Animals:-

Adult male albino rats of wistar strain weighing about 120±15g were purchased from Sri Venkateswara Enterprises, Bangalore. The animals were kept in polypropylene cages (six in each cage) at an ambient temperature of (25±2) °C and at 55%-65% relative humidity. A (12±1) h light and dark schedule was maintained in the animal house till the animals were acclimatized to the laboratory conditions. They were fed with commercially available rat chow (Hindustan Lever Ltd., Bangalore, India) and had free access to water. The experiments were designed and conducted in accordance with the ethical committee.

### Development of high fat diet fed rats:-

Rat was fed with two dietary regiment such as normal pellet diet (NPD) and high fat pellet diet (HFD). The rats were fed either with NPD or HFD (58% fat, 25% protein and 17% carbohydrate, as a percentage of total kcal) adlibitum respectively, for the initial period of 2 weeks. (Srinivasan. *et al*, 2004) [16]. The composition and preparation of HFD were made as per the method (Reed . *et al*, 2000).[17].

### Experimental Design:-

The studies were conducted in six groups as said below by taking six animals in each group.

Group 1: Control animals fed with normal diet.

Group 2: High fat prepared diet fed rats.

Group 3: Both HFD +RMLE 200mg/kg b.wt fed rats.

Group 4: Both HFD+Orlistat 25mg/kgb.wt drug as a standard fed rats.

Group5: RNMLE alone as plant product control.

Group6: Orlistat alone as drug control.

All feeding studies were made for six weeks of period. The dose material was suspended in distilled water and given orally using a gastric gavage.

### Collection of blood and preparation of serum samples:-

At the end of the experimental period, blood samples were collected from the retro orbital plexus in vials. The blood samples were allowed to clot for 10 min at room temperature and then centrifuged at 3500 xg for 15 min. The clear, non hemolysed serum samples thus obtained were collected and stored at -20°C until biochemical assays were carried out.

### Estimation of biochemical constituents of lipids in rats serum:-

The biochemical estimations were carried out in our lab by using the following methods. Serum total cholesterol CHOD-POD method [18], triglyceride GPO-POD method using ethyl-N-(3- sulfopropyl)-m-anisidine sodium (ESPAS) [19], serum high density lipoprotein, serum low density lipoprotein and serum very low density lipoprotein by CHO-Phospho method [20].

### Statistical Analysis:-

The results were expressed in mean ± standard deviation. Statistical analysis was carried out by using one way ANOVA as in standard statistical software package of social science (SPSS).

## Results:-

To study the hypolipidemic effect of the methanolic leaf extract of *R.nasutus* on the high fat diet induced male albino rats, the levels of serum total cholesterol (TC), triglycerides (TG), low density lipoprotein (LDL), serum high density lipoprotein (HDL) and very low density lipoprotein-cholesterol (VLDL-C) were analysed in experimental animals. In group II animals, the levels of serum total cholesterol, triglycerides, low density lipoprotein and very low density lipoprotein cholesterol were significantly elevated as compared to that of normal groups, when they were fed with HFD (Table 1). On the other hand the serum level of serum high density lipoproteins (HDL) were significantly depleted in the HFD fed rat.

In group- III *R.nasutus* (200 mg/kg body weight) supplemented later with HFD fed rat showed a significant depletion in the levels of total cholesterol, triglycerides, low density lipoprotein and very low density lipoprotein-cholesterol as compared to normal group (Table:1). The level of HDL was significantly augmented in plant extract treated group.

**Table 1:-** Effect of the methanolic leaf extract of *R.nasutus* on serum lipid profile levels (mg/dL), in HFD induced rat.

Group	Treatment	Total cholesterol mg/dl	Tri-Glycerides (mg/dl)	HDL-C (mg/dl)	LDL-C (mg/dl)	VLDL-C (mg/dl)
I	Control	88.2±4.29*	74.73±5.02*	42.32±4.62*	33.65±6.0*	13.81±1.65*
II	HFD	195.9±10.90*	109.2±8.25*	34.97±4.50*	141.5±13.20*	21.59±1.04*
III	RNM+HFD (200mg/kg)	154.28±10.81**	89.32±4.91**	43.27±4.69**	75.28±11.14**	17.32±0.95**
IV	Orlistat+HFD (25mg/kg)	107.1±10.62**	80.26±4.07*	45.07±4.71**	46.41±10.23**	14.53±0.92**
VI	RNM (alone)	77.25±6.75	125±5.72	47.5±3.25	58.0±8.38	11.5±1.01
V	Orlistat (alone)	69.32±4.72	98.2±3.52	40.3±2.6	42.9±9.3	10.52±1.06

Data represent mean±standard deviation (SD). Values are not sharing a common superscript (\*) differ significant at  $p \leq 0.05$ .

In group- IV the HFD+Orlistat administered, rats did not show any significant alterations in their levels as compared to that of normal animals. GroupV and GroupVI rats were of respective control of RNME and Orlistat, which showed almost equivalent values to normal rats.

The animals of normal and other treatments were weighed for weight gain at the starting of experiment and then to every two weeks till the 6th week of the experimentation. Using the electronic balance, body weight loss or gain of rats that were fed on experimental diets with or without RNM were shown in (Table 2).

**Table 2:-** Effect of *R.nasutus* and orlistat on body weight (grams) of rats fed with high fat diets

Data represent mean±standard deviation (SD). Values are not sharing a common superscript (\*) differ significant at  $p \leq 0.05$  RNM: Rhinacanthus nasutus methonolic extract.

The body weights of rats fed with HFD were significantly increased with time, and percentage increase was 151% for control, 178% for high fat fed diet rats, 151% for HFD and RNM rats, 157% for Orlistat treated with HFD, 88% with RNM alone, and 85% with Orlistat alone were in rats. In contrast, non-significant differences were observed in

rats. The increase in body weight was 21 to 27% higher in HFD rats than RNM or Orlistat treated animals which is almost equal to normal, and the loss weight in the presence of RNM and Orlistat alone was ranged from 63 to 66%. All these results are significant with  $P \leq 0.05$ .

## Discussion:-

### Dietary fat and other risk factors:-

Diet is a source of energy for growth and metabolic activities. Fat is an energy rich molecule used in diet after two macro molecules such as carbohydrate and protein, and fat is essential to maintain the integrity of cell and cell membranes. This molecule under normal conditions is essential and excess intake of it causes several problems to humans. The main ingredients of lipids are free fatty acids, triglycerides, cholesterol, phospholipids and lipoproteins. The lipoproteins may carry cholesterol and also have essential fatty acids. The animals feed containing more of lipids either be consumed during exercise or stored in cells. Because of storage of fatty materials in cells there is possibility to acquire lysosomal lipidosis and due to this storage, the liver and spleen shall be enlarged. These disorders are treated with medications by using compounds like Gabapentin, Carbamazepine, Orlistat, Statins etc. The plant products are also used as medications to treat hyperlipidemia and retain the physical characters.

*R. nasutus* a well known traditional medicinal plant, possesses diverse biological and pharmacological activities including reducing blood glucose and serum lipids. It has long been used to treat diabetes mellitus and related hyperlipidemia. Hypercholesterolemia, a high cholesterol diet caused oxidative stress which increase serum LDL levels to result in increased risk for development of atherosclerosis.( Chander. *et al* 2003) [21]. Cholesterol is synthesized in all animal tissue to produce various steroids and aldosterones. Increased amount of cholesterol leads to cardiovascular diseases particularly coronary heart disease (CHD) and coronary artery disease (CAD)( Aparna. *et al* 2003) [22]. In hyperlipidemia, cholesterol feeding has often been used to elevate serum or tissue cholesterol levels and assess hypercholesterolemia-related metabolic disturbances in different animal models. Ma Angeles. *et al* 1999) [23]. The humans premature death in India is due to hyperlipidemias and atherosclerosis.

In the present study, feeding of rats with energy rich feed has resulted in increased TC, TG and LDL cholesterol levels (Table.1). This model was used to study the potential of hypolipidemic effect of supplementations of *R. nasutus* that contained significant amounts of antioxidants properties. From this study, we found that the daily oral administration of *R. nasutus* supplement diet showed a positive result on significant reduction of total cholesterol levels in plasma after 6 weeks of administration. This result is in agreement with literature where depleted level of HFD fed hyperlipidemia found in the rats upon treatment of *R.nasutus* extract.

Low density lipoprotein is a atherogenic risk factor and plays a role in several steps of atherosclerosis. A decrease in oxidative stress and removal of LDL from oxidation might therefore be a strategy with great promise for prevention of atherosclerosis associated cardiovascular disease. The intense interest in this area results in part from the generally low toxicity of antioxidants and the hope that treatment with antioxidants might be additive with cholesterol lowering regimes. The increase of HDL on treatment of *R. nasutus* may serve HDL as directly anti-androgenic and it is believed to remove cholesterol from the developing lesions.

The HFD treated rats also showed an increase as 2 fold of cholesterol, 1.47 fold of triglycerides, 4.3 fold LDL-C and 1.56 fold of VLDL-C increase and 0.81 fold decrease of HDL-C. However the RNM mixed HFD showed 1.26 fold of cholesterol, 1.22 fold of triglycerides, 1.88 fold of LDL-C, 1.24 fold of VLDL-C decrease, and 1.23 fold increase of HDL-C in serum of blood (Table-1). Hence the mixture of RNM has potential to decrease various fat molecules and increase in HDL moiety.

The small particles less than chylomicrons are VLDL which are rich in triglycerides though to a lesser extent VLDL particles sizes vary widely, with a concomitant variation of the chemical composition. The larger particles are rich in triglycerides and in apo-c, and the smaller particles depletion of TG and surface materials result from the hydrolysis of VLDL by lipoprotein lipase activity. VLDL is the main carrier of triglycerides and it is less harmful than but still can damage the arterial lining. In the present study serum TG levels were significantly elevated in HFD rat. The excess of fat diet increased the TG level which is one of the causes of hardening of arteries. In conclusion, it could be said that the methanolic leaf extract of *R. nasutus* exhibited a significant hypolipidemic activity by increasing VLDL, HDL, and by decreasing TC, TG (free) and LDL in serum of blood.

**Conclusion:-**

Result of present study has revealed that the methanolic extract of *R. nasutus* leaves can improve the serum lipid profile in rats by decreasing serum TC, TG, LDL-C and increasing serum HDL-C, and thus improving the atherogenic index. These findings provide some biochemical basis for the use of leaf extract of *R. nasutus* as antihyperlipidemic agent because of its preventive and curative effect against hyperlipidemia. Further studies are required to gain more insight into the possible mechanism of action.

Transfer pricing, OECD Countries, Tax and Developing Countries.

#### Abstract

Transfer pricing is high on the agenda because globalization has lifted the level of cross-border trade between related entities to new heights. It is estimated that, worldwide, about 2/3 of all business transactions take place within a group. In the absence of Transfer Pricing legislation, both tax administrations and MNEs have only limited guidance they can refer to when determining transfer pricing in related-party transactions. However, we find that developing countries encounter particular problems when dealing with transfer pricing. Local tax administrations are often inexperienced with regard to transfer pricing and lack basic understanding in the field. The paper indicates that, despite strong affinity to the OECD standards, the scope of existing transfer pricing legislation or draft transfer pricing legislation is in part significantly broader as regards the definition of related parties than is outlined in the OECD Guidelines. From a transfer pricing policy perspective

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Transfer pricing is a main issue for multinational corporations (Chan and Chow, 1997) and it has been known as the number one challenge facing the world's leading companies (2010 Global Transfer Pricing Survey, Ernst and Young). Transfer pricing has also been as a major issue facing countries around the world, as they strive to retain the tax revenue from multinational corporations conducting business in their countries and step up their efforts in the enforcement of transfer policy legislation and regulations. Furthermore, the choice of transfer pricing methods and transfer pricing practices are very important considerations in the development of corporate strategy and in assessing the long-term sustainability of a multinational corporation (Gresik, 2001). Transfer pricing is a current, contentious issue for multinational corporations.

In principle a transfer price should match either what the seller would charge an independent, arm's length customer, or what the buyer would pay an independent, arm's length supplier (Smith, A. Chambers, I. Nichols, J. And Ying, Q. 2003). While unrealistic transfer prices do Although the OECD Model Tax Convention and the OECD Transfer Pricing guidelines recommend the use of the 3 'arm's length principle', strict application of the principle is often problematic in practice (Bartelsman & Beetsma, 2003). Transfer pricing is the major tool for corporate tax avoidance.

**Existing Guidance and Initiatives On Transfer Pricing Documentation: -**

Existing transfer pricing documentation rules can be divided into two groups. The first of these are the rules of individual countries. Such rules are adopted through local legislation or regulation and are enforced by local country tax administrations (Cernic, 2008). In some, but not all, countries, compliance with transfer pricing documentation rules is encouraged by adoption of a complementary penalty regime.

Some countries have a single set of transfer pricing documentation rules that are intended to comprehensively elicit the relevant transfer pricing information. Other countries segregate transfer pricing documentation rules from other information reporting requirements that may be relevant for transfer pricing purposes.

The aim of this documentation package ("the Package") is to allow taxpayers in PATA member countries (Australia, Canada, Japan and the United States) to create one set of transfer pricing documentation for multinational enterprise (MNE) that will satisfy the documentary requirements of each respective jurisdiction thus avoiding the imposition of penalties on the taxpayer for having insufficient transfer pricing documentation (Anderson and others. 2003).

**Evolution of Transfer Pricing: -**

This section aims to trace the history and the reasons for transfer pricing taxation regimes. It is important to note that transfer pricing essentially involves the application of economic principles to a fluid marketplace. Thus new approaches and techniques that help arrive at the appropriate transfer price from the perspective of one or more factors in the system continue to be developed.

The OECD Transfer Pricing Guidelines (OECD Guidelines) as amended and up dated, were first published in 1995; this followed previous OECD reports on transfer pricing in 1979 and 1984. The OECD Guidelines are recommendations addressed to enterprises operating in OECD countries (Cernic 2008). And have largely been followed in domestic transfer pricing regulations of these countries. Another transfer pricing framework of note which has evolved over time is represented by the USA Transfer Pricing Regulations (26 USC 482).

Parent companies of large MNE groups usually have intermediary or sub-holdings in several countries around the world (Buus and Brada, 2010) From a management perspective, the decision-making in MNE groups may range from highly centralized structures to highly decentralized structures with profit responsibility allocated to individual group members. Such group structures typically include

- Research and development (R&D) and services that may be concentrated in centres operating for the whole group or specific parts of the group;
- Intangibles, developed by entities of the MNE group; these may be concentrated around certain group members;
- Finance and "captive insurance companies which may operate as insurers or internal finance companies; and
- Production units, where the production or assembly of final products may take place in many countries around the world.

**The Methods of Transfer Pricing: -**

Advised to be used in OECD countries are (among others):

1. comparable uncontrolled price method.
2. comparable resale price method.
3. cost plus method.
4. profit split method.

Which in all cases directly or indirectly use a premise that the fair transfer price is on the level of price achieved at the market transaction, which are at marginal cost only in extraordinary cases (perfectly competitive market of the intermediate product).

The problem of transfer prices and their effect on the possibility of active fiscal policy is compelling, as (Bartelsman and Beetsma. 2003) show Nevertheless the number and size of possible tax evasions is greater at commodities, which are not standardized (not quoted), whereas at the commodities traded at the commodity exchanges the variance of transfer price and difference between transfer price and arms-length price is substantially smaller (Bernard, Jensen and Schott, 2006),

Even the measurement becomes a problem in this globalized world, because the size and number of transactions inside MNE is so large that it influences the benchmarks used for derivation of arms-length price (Eden and Rodrigues, 2004).

**The OECD Guidelines: -**

The OECD has made considerable efforts in offering an international standard for levelling the playing field in the area of TP. The members of the OECD, which are mainly developed countries but also include some developing countries, have agreed common methods and practices in the area of TP, which are outlined in the OECD Guidelines. In particular, the OECD Guidelines outline five methods to determine the arm's length nature of transfer prices:

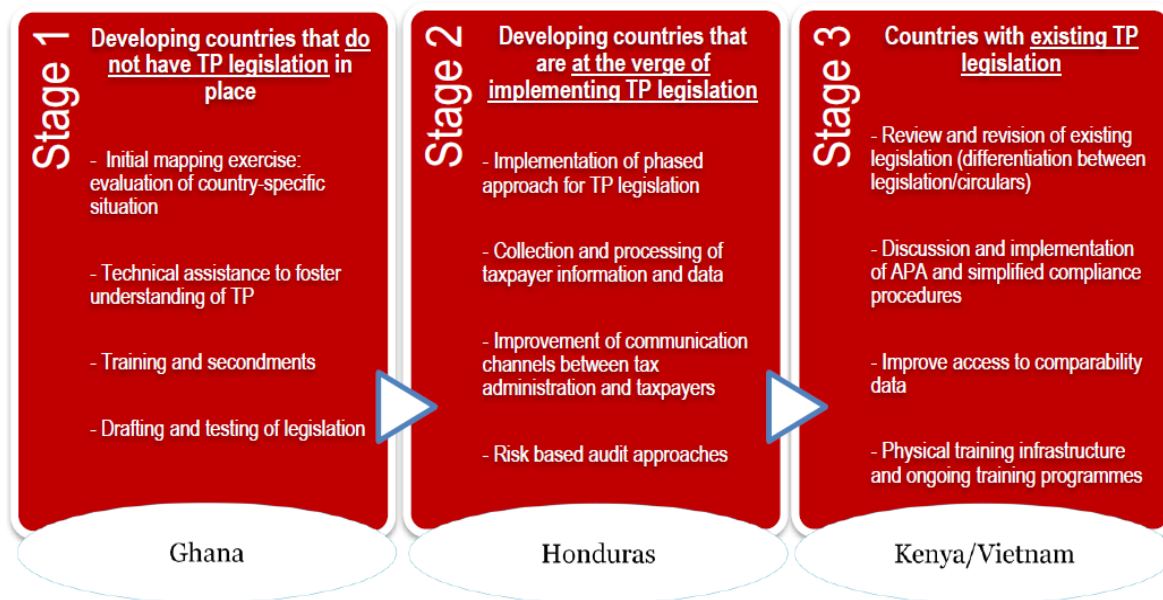

1. **Comparable Uncontrolled Price (CUP) Method:** This is based on the comparison of prices charged in a controlled transaction to the price charged in an uncontrolled transaction in comparable circumstances for comparable products and services.
2. **Resale price method (RPM);** which is based on the resale price at which a product purchased from a related party is sold to an independent enterprise. The transfer price of the inter-company transaction is calculated by deducting the resale price margin from the resale price in the uncontrolled transaction.
3. **Cost plus method (CPM);** which uses the costs incurred by the supplier of property/services in a controlled transaction. A mark-up taking into consideration the functions performed, risks assumed and assets employed is added to the costs to determine the arm's length price in the controlled transaction.
4. **Transactional net margin method (TNMM);** which examines the net profit margin relative to an appropriate base (e.g. cost, sales, assets) realized from a controlled transaction.
5. **Profit split method (PSM);** which is based on identification and appropriate split of the profit realized by related entities from a controlled transaction.

**A General Approach to Transfer Pricing Reform in Developing Countries: -**

Given the differing levels of progress in some countries by comparison with others, it is difficult to set down a one-size-fits-all approach. Accordingly, the costs of technical assistance programmer for different countries can vary significantly. A thorough analysis of the specific needs for each developing country with regard to its TP practices is necessary in order that available donor resources are used as efficiently as possible.

However, prior to donor support being provided, it should be analyzed at what stage of development the country is with regard to both the preconditions and TP-specific legislation (see Figure 1). Experience from other countries such as the USA, China and India show that the process of TP reform is lengthy and that it requires ongoing training and support

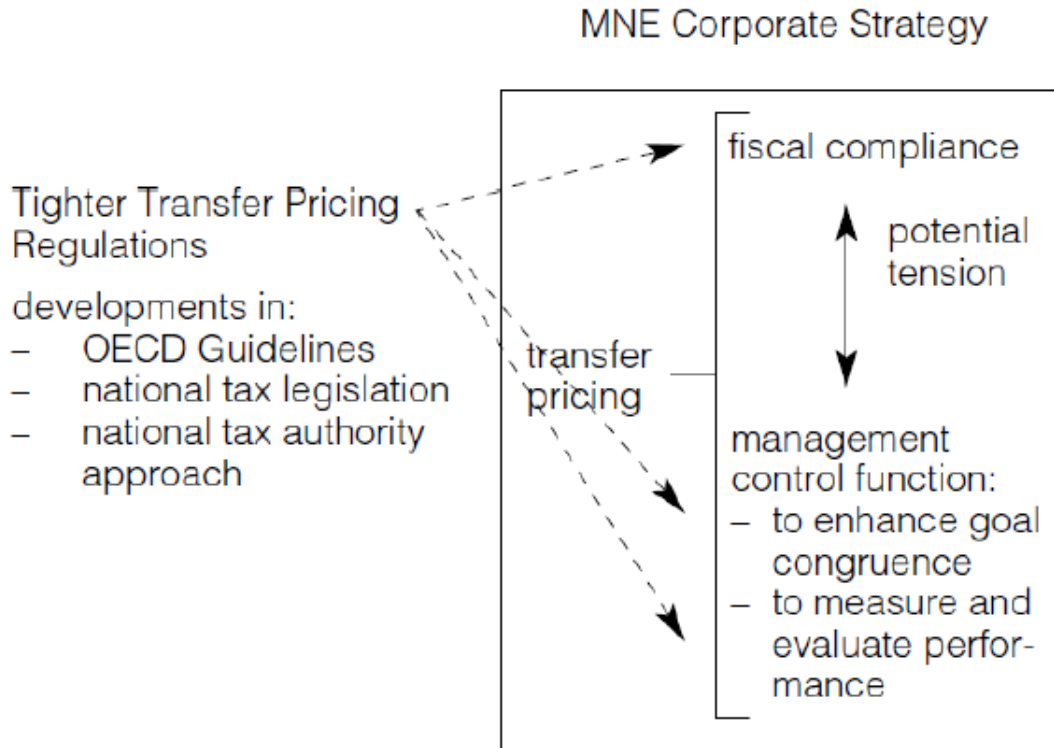

In general, developing countries without any kind of TP experience should be assisted in becoming acquainted with the arm's length principle on a high level. Based on this, a TP strategy should be developed that takes into account country-specific circumstances and outlines the different steps in introducing TP legislation. Special attention should be paid to the recruitment and training of specialized TP staff. Issues such as risk-assessment procedures for audit purposes and APA or simplified compliance procedures are equally important, but should form part of subsequent efforts

#### **Transfer Pricing and the Investment Climate: -**

The issue that has to be wrestled with is this—what is the fair price for those transactions, in particular (from the development perspective) when you bear in mind the real economic engagement of the multinational in a particular developing country, and where the multinational’s profits are truly being made. This finding provides more direct evidence that transfer pricing is occurring since it considers the direct relationship between the taxes faced by affiliates abroad and their actual intra firm trade transactions (Clausing, 2001). If transfer pricing does not reflect the true profits earned in that country, the country is unfairly deprived of funds and opportunities for development. And, of course, it is ultimately the people of that country who bear the costs, in food, water, health and education especially.

A study by Cools finds that “the empirical findings confirmed that, because of the real threat of audits and penalties, the tax requirements of transfer pricing play a prominent role in the multinational enterprise’s decision-making process” (see figure 1). As an increasing number of countries introduce transfer pricing legislation and increase the resources available to their tax administrations for transfer pricing audits (see below), the role of the tax requirements of transfer pricing will only increase.

(Cools, 2003).

#### **Transfer pricing developments in selected countries with established transfer pricing regimes:-**

##### **Australia: -**

On November 1, 2011, the Treasury released a consultation paper on proposed changes to Australia's transfer pricing rules intended to bring them in line with Australian and international developments (Australian Treasury 2011). The paper outlines the history of transfer pricing rules and proposes a number of areas for change. Suggested changes include the introduction of an arm's length standard that reflects international norms, interpretation of new rules in a manner that best secures consistency with guidance from the Organization for Economic Co-operation and Development (OECD) and application of the new rules on a self-assessment basis. On 22 November 2012 an expose draft was released that included draft legislation and explanatory memorandum (Australian Treasury 2012).

##### **United Kingdom:-**

In June 2008, Her Majesty's Revenue & Customs (HMRC) issued its "Guidelines for the Conduct of Transfer Pricing Enquiries," which included the creation of a specialized transfer pricing group, a transfer pricing review board, and a risk-based approach to transfer pricing enquiries. In late 2010, HMRC also issued guidance to its field teams on more extensive use of penalties in transfer pricing cases.

##### **United States:-**

The Internal Revenue Service (IRS) added 1,200 employees in 2009 to deal with international issues, with another 800 added through the end of 2010. The IRS has established a goal of achieving a staff of 120 transfer pricing economists, the largest number in its history. As part of its transfer pricing focus, in December 2009 the IRS announced a number of important changes, including creation of a transfer pricing practice, establishment of a transfer pricing council to coordinate transfer pricing reviews, and establishment of a tiered approach to targeting intercompany transactions based on their potential for abuse (Ernst & Young 2011).

##### **Conclusion: -**

a transfer price is used to determine costs. Setting transfer prices enables multinational corporations to attribute net profit or loss before tax among the countries where they do business. Developing countries have particular difficulty in obtaining reliable comparable data for the purposes of determining transfer prices. A wide range of actions is possible to assist in this regard, with some of these actions building on work already done by the OECD or other

stakeholders. Given the broad range of possible actions, further prioritization based on country needs and resource availability will be necessary.

Existing transfer pricing documentation rules can be divided into two groups. The first of these are the rules of individual countries. The second group of documentation rules and guidelines are those adopted by international organizations in an attempt to simplify and streamline the patchwork of local country rules. The OECD Guidelines are recommendations addressed to enterprises operating in OECD countries and have largely been followed in domestic transfer pricing regulations of these countries. The members of the OECD, which are mainly developed countries but also include some developing countries, have agreed common methods and practices in the area of TP, which are outlined in the OECD Guidelines.

The OECD Guidelines outline five methods to determine the arm's length nature of transfer prices. Applying the arm's length principle to review transfer prices set in transactions between associated enterprises often requires a comparison to be made between these prices and the prices set in similar transactions between independent enterprises in similar circumstances. In general, developing countries without any kind of TP experience should be assisted in becoming acquainted with the arm's length principle on a high level.

Finally, it can be concluded that transfer pricing is occurring since it considers the direct relationship between the taxes faced by affiliates abroad and their actual intra firm trade transactions. If transfer pricing does not reflect the true profits earned in that country, the country is unfairly deprived of funds and opportunities for development.

#### Abstract

Accumulation of synthetic plastics in the environment has become a worldwide problem. Polyhydroxy alkananoates (PHA) are biodegradable plastics, an alternative to petroleum-based synthetic plastics. In this investigation, the best known PHA, poly- $\beta$ -hydroxybutyrate (PHB) accumulating strains of *Lactobacillus plantarum* were isolated from various food and environmental samples using MRS agar medium. Among the 31 isolates, 22 strains were identified as *Lactobacilli* by comparing the biochemical profile with *Lactobacillus plantarum* MTCC6160. The *L. plantarum* strains were confirmed with 16S rRNA identification method and 11 among the 22 *Lactobacillus* strains were revealed the characteristic band at 735 bp. The partially amplified product was sequenced and the comparison of the sequence in NCBI BLAST obtained 94% similarity with the strain, *L. plantarum* IMAU70089. The isolated strains of *L. plantarum* was subjected to PHB production using nitrogen limited minimal medium (NLMM). The inclusion bodies were stained with Sudan Black B and the organism was also plated on Nile blue A medium, revealed the presence of a lipid material, which was confirmed as PHB by the analysis of molecular fragments by FTIR spectroscopy in comparison with reference material. In addition, the existence of *phbC* gene (578 bp) was identified, which encodes the enzyme, PHB synthase for accumulating PHB. This investigation confirmed that 1 mg of the cell dry weight constitutes the maximum of 40.4  $\mu$ g of PHB. This study revealed that *L. plantarum* has been recognized as a good candidate for PHB.

#### Introduction:-

Synthetic plastics produced from the petrochemical source are non-degradable and cause waste disposal problems leading to environmental pollution (Muller et al., 2001). Polyhydroxyalkanoates and their copolymeric derivatives have emerged as very attractive substitutes for synthetic plastics due to their complete

Corresponding Author:- J. Rathinamala.

Address:-Department of Microbiology, Nehru Arts and Science College, Coimbatore-641105. India.

biodegradability (Kumar and Prabakaran, 2006) and similar physical properties to synthetic plastics (Chee et al., 2010).

Polyhydroxyalkanoates comprise a large class of polyesters that is synthesized by many bacteria as an intracellular carbon and energy compound (Lee and Chang, 1994). PHBs are synthesized when the cells surrounding contains unbalanced growth conditions such as limited concentrations of oxygen, nitrogen, phosphorous, sulfur or trace elements like magnesium, calcium, ferrous and high concentrations of carbon.

PHB is a linear polyester of D (-)  $\beta$ -hydroxybutyrate and the best-known polymers of polyhydroxyalkanoates. Bacteria produce PHAs with average molecular mass up to  $4.0 \times 10^6$  Da with a polydispersity of around 2.0. Many organisms accumulate polyoxoesters of short carbon chain length hydroxyalkonic acids comprising of three to five carbon atoms called polyhydroxybutyrates.

More than 250 different microorganisms are reported to accumulate PHB. Only several of these such as *Alcaligeneseutrophus* (Kim et al., 1994), *Alcaligenes latus* (Yamane et al., 1996), *Azotobactervinelandii* (Page and Knosp 1989), methylotrophs (Kim et al., 1996), *Pseudomonas oleovorans* (Brandl et al., 1988) and recombinant *Escherichia coli* (Lee and Chang, 1994) are suitable for the production of PHAs to a high concentration with high productivity.

The major focus of many investigators is to make their production economically competitive with polypropylenes. Many soil and environmental microorganisms were estimated for the PHB production by many researchers, very less study were reported in *Lactobacillus*. Hence, this study is an attempt to reveal the percentage production of PHB in *L. plantarum* isolated from the food and environmental sources. These are capable of supplying rich protein and also they have the ability to accumulate some amount of PHB. Biosynthetic processes of producing polymers are often financially uncompetitive. Thus, research has focused on modifying microorganisms to improve product yields and increase substrate ranges. Many controlling factors need to be considered in an effort to modify metabolic fluxes responsible for bioplastic production.

The *phbC* gene is responsible for the production of PHB synthase in an organism apart from *phbA* and *phbB* which are responsible for the production of  $\beta$ -ketothiolase and acetoacetyl-CoA reductase respectively (Sharma et al., 2007). Identification of these genes is the confirmation of PHB production in the respective strain.

## Materials and Methods:-

### Sample collection:-

The food and environmental samples such as raw milk (n=6), pasteurized milk (n=6), butter (n=3), cheese (n=1), curd (n=6), buttermilk (n=3), grey water (n=4) and soil (n=2) were collected from various locations in Erode, South India in sterile screw cap tubes and processed within 3 h from the time of collection.

### Isolation and presumptive identification:-

The collected samples were serially diluted (tenfold dilution) and 0.1 mL of each dilution was plated on sterile de Man Rogosa Sharpe (MRS) medium by spread plate technique (Emmanuel et al., 2005). The plates were maintained under an aerobic condition at 30°C for 24-48 h. The purified cultures were preserved and maintained at -4°C in MRS agar slants.

The presumptive Identification of *Lactobacilli* was carried out based on the microscopic, cultural, and biochemical identification methods. *L. plantarum* MTCC 6160 (Microbial type culture collection, IMTECH, India) was used as reference strain in this study.

Isolates were identified microscopically on the basis of Gram staining, endospore staining, motility test, and phenotypically on the basis of Kovac's oxidase and catalase test, followed by a series of biochemical tests such as indole production, methyl red test, Voges-Proskauer test, utilization of citrate, reduction of nitrate to nitrite and H<sub>2</sub>S production, urease and carbohydrate fermentation.

### Extraction of genomic DNA:-

Aliquots of 1 mL of 24 h cultures grown in MRS broth were centrifuged at 6000 rpm for 15 min at 4°C in Eppendorf tubes. The supernatant was discarded and the pellet was suspended in 467  $\mu$ L of TE buffer (10 mM Tris

base and 0.5 mM EDTA), 30  $\mu$ L of 10% sodium dodecyl sulfate, 3  $\mu$ L of proteinase k and incubated at 37°C for 1 h. An equal volume (500  $\mu$ L) of phenol–chloroform (24:1) was added to the content and mixed gently. The tubes were centrifuged at 10000 rpm for 10 min at 4°C. The upper aqueous phase was transferred to a fresh Eppendorf tube. The DNA from the aqueous phase was precipitated by the addition of one-tenth the volume of 3 M sodium acetate and 330  $\mu$ L the volume of ice-cold isopropanol. The precipitated DNA was pelleted by centrifugation at 3000 rpm for 3 min at 4°C and the DNA was washed with 70% ethanol and the pellet was air dried.

#### **PCR amplification of 16S rRNA gene:-**

Unique primers were designed for the amplification of the genes coding for the 16S rRNA of *Lactobacillus plantarum*. Primers were designed from the conserved regions and searched for their uniqueness and specificity to the respective 16S rRNA gene from different *Lactobacillus plantarum* by basic local alignment search tool (BLAST). A 750 bp fragment from the *Lactobacillus plantarum* encoding 16SrRNA gene was identified by using a primer set. The amplification was performed with forward primer, 5'-TTCATCCGAATAACCC-3' and reverse primer, 5'-CGACAGTAACGGAGGT-3'.

The PCR reaction was performed in 25  $\mu$ L reaction volume containing 2 $\mu$ L of template DNA (20 ng  $\mu$ L<sup>-1</sup>), 1  $\mu$ L (1  $\mu$ M) each of forwarding primer and reverse primer, 12.5  $\mu$ L of PCR master mix (Fermentas, USA) contains 0.05 U/ $\mu$ L TaqDNA polymerase, reaction buffer, 4 mM MgCl<sub>2</sub>, 0.4 M of each dNTP (dATP, dCTP, dGTP and dTTP) and 8.5  $\mu$ L of nuclease-free water. The reaction conditions were as follows: initial denaturation at 94°C for 5 min, 30 cycles of amplification, each consisting of denaturation at 94°C for 1 min, annealing at 57.9°C for 1 min, elongation at 72°C for 1 min followed by a final extension at 72°C for 10 min.

The PCR products (10  $\mu$ L) were electrophoresed in 1.5% agarose gel for 2 h at 50V in the Tris-acetate-EDTA buffer. The size of the amplification products was determined by comparison with 100 bp DNA ladder (Helini biomolecules, Chennai). Amplified products under optimum conditions with expected size were purified using purification kit (Qiagen, India) and sequenced. The generated nucleotide sequences were subjected to further analysis.

#### **Screening of PHB producers:-**

A pure culture of Lactobacilli grown in 250 mL flasks containing 50 mL of nitrogen limited minimal medium (NLMM) comprised of the following (per liter); 3.8 g Na<sub>2</sub>HPO<sub>4</sub>, 2.65 g KH<sub>2</sub>PO<sub>4</sub>, 2 g NH<sub>4</sub>Cl, 0.2 g MgSO<sub>4</sub>, 2 g fructose and 1 mL trace minerals. Trace element solution contains (per liter): 5 g EDTA, 2.2 g ZnSO<sub>4</sub>, 5.4 g CaCl<sub>2</sub>, 5.6 g MgCl<sub>2</sub>, 0.05 g boric acid, 4.79 g FeSO<sub>4</sub>, 22.4 g (NH<sub>4</sub>)<sub>6</sub>MoO<sub>24</sub>, 1.6 g CoCl<sub>2</sub>, and 1.57 g CuSO<sub>4</sub>. The pH of the media was maintained at 7.0. The culture flask was kept in a shaker at 250 rpm at 37°C for 48 h. The PHB producers were screened microscopically for the presence of metachromatic granules by Sudan black B staining method (Burdon, 1946) and also by colony morphology by inoculating the isolated strain on nutrient agar medium supplemented with 1% Nile blue A (Ostle et al., 1982).

#### **Extraction of PHB:-**

The PHB was extracted from the 24-72h old cultures of *L. plantarum*. The bacterial cultures were harvested from 20 mL by centrifugation at 6000 rpm for 15 min. The cell pellet was dried at 40  $\pm$  1°C for 24 h and the dry cell weight was estimated. The cell pellet was suspended in 5 mL of sodium hypochlorite, 5 mL of chloroform and incubated at 30°C for 1 h. Then the incubated content was centrifuged at 1500 rpm for 15 min at room temperature. Three phases were obtained, the lower PHB containing chloroform phase was recovered without disturbing the other phases. Chloroform was evaporated and the PHB crystals on the walls of the tubes were collected and stored.

#### **Qualitative estimation of PHB:-**

The extracted PHB was estimated qualitatively by TLC. The extracted PHB was dissolved in chloroform and 50  $\mu$ L samples were loaded on the TLC plate and chromatogram was developed with a solvent system consisting of benzene and ethyl acetate (1:1). The resolved spot was visualized by exposing the dried plate to iodine vapor for 10 min. The R<sub>f</sub> value of the spot with greenish brown color was measured (Kumar and Prabakaran, 2006).

PHB was qualitatively estimated using FTIR spectrophotometer. The PHB from five different strains were selected randomly for analysis. (Kumar and Prabakaran, 2006). The pure form of PHB (1 mg) was thoroughly mixed with 15 mg KBr (Spectroscopic grade) and the treated pellet was dried at 100°C for 4 hrs. The FTIR spectrum of the compound was analyzed in the range of 400-4000 cm<sup>-1</sup> in a Perkin-Elmer (USA) model 1720 FTIR spectrometer.

**Quantitative estimation of PHB:-**

The production of PHB by *L. plantarum* was estimated as crotonic acid. The extracted PHB crystals were dissolved in 5 mL of chloroform and converted to crotonic acid by the addition of 5 mL of concentrated sulfuric acid and boiled at 100°C for 10min. Then the tubes were cooled to 25°C and the absorbance was measured at 235 nm using a UV-spectrophotometer and a standard graph were plotted with pure crotonic acid in the dilutions of 1-10 µg mL.

**PCR amplification of *phbC* gene:-**

The production of PHB in *L. plantarum* was confirmed by PCR amplification of *phbC* gene which encodes PHB synthase using the primers F1- 5' CGCAATCCCCTTGATAAG 3' and R1- 5' CGCTTTTCAGGATCAATGTC 3' (Labmate Asia, India). The amplification was performed in 20 µL reaction mixtures, containing 10 µL of PCR master mix (Fermentas, USA) contains 0.05 U/µL Taq DNA polymerase, reaction buffer, 4 mM MgCl<sub>2</sub>, 0.4 M of each dNTP (dATP, dCTP, dGTP and dTTP), 5 µL of nuclease-free water, 1.5 µL (1 µM) each of forward and reverse primer and 2 µL of template DNA (20 ng µL<sup>-1</sup>). The DNA amplification was performed using a thermal cycler (MJ Research, Model PTC 100 Watertown, Mass., USA). The amplification conditions were initial denaturation at 94°C for 5 min, 30 cycles of amplification, each consisting of denaturation at 94°C for 1 min, primer annealing at 52.3°C for 1 min, and elongation at 72°C for 1 min followed by a final elongation of 72°C for 5 min. Following amplification, the PCR products were subjected to horizontal agarose gel electrophoresis through 1.5% agarose gel supplemented with ethidium bromide solution (0.5 µg/mL). The size of the amplification products was determined by comparison with 100 bp DNA ladder (Helini biomolecules, Chennai).

**Results:-****Isolation and identification:-**

The distribution of Lactic acid bacteria was enumerated in each sample (n=31). The percentage incidence of *Lactobacilli* was analyzed and tabulated (Table 1). The microscopic identification confirmed the presence of Gram-positive rod, non-spore forming, and non-motile bacteria. On MRS agar plates *Lactobacilli* showed pure white, regular, and small (2 to 3 mm diameter) colonies. The *L. Plantarum* strains were identified by biochemical profiling by comparing with the MTCC6160. Among the 31 isolates 22 isolates were identified as *Lactobacilli* by biochemical profiling and 11 among the 22 *Lactobacilli* were confirmed to be *L. plantarum* by 16S rRNA identification method. The PCR amplification of 16S rRNA revealed the characteristic band at 735 bp for all the strains. The partially amplified product of one among the 11 isolates was sequenced and designated as *L. plantarum* H1 by comparing phylogenetically with the other *Lactobacillus* strains using public databases (Fig. 1). The comparison of the sequence in NCBI BLAST obtained 94% similarity with the sequence of the strain *L. plantarum* strain IMAU70089 16S ribosomal RNA gene, and their phylogenetic analysis positioned the strain nearer to *L. plantarum* (6Q131205).

**Screening for PHB producers:-**

The PHB accumulated in the cells was microscopically observed as blue stained metachromatic granules against the pink background of the cells and the colonies were observed as blue color in the Nutrient agar with 1% Nile blue A solution. Among the 11, 8 isolates were reported to be PHB producers using presumptive screening methods (Table

2). About 72.7 % of PHB producers among the strains of *L. plantarum* was reported based on Sudan Black B staining and Nile blue A method indicates a maximum probability of PHB in these strains.

#### Qualitative estimation of PHB:-

A single spot on TLC of extracted PHB granules indicates the purity of the molecule and the obtained  $R_f$  values of 0.81 is higher than the normal. The  $R_f$  value of the PHB molecule increases with its rate of polymerization and the decrease in therate of propanolysis(Panda et al., 2008). In this study, the sample is not processed by propanolysis, the value higher.

PHB samples of five strains were randomly selected for FTIR analysis. Comparison of the FTIR results with standard PHB revealed the similarity that exists in the functional group of the molecule. The IR analysis showed the presence of  $\text{CH}_2\text{-CH}_3\text{-C=O}$  methyl ester groups confirmed that the extract was PHB. The C-O bond shows thestrong and broadband at  $1047\text{-}1089\text{ cm}^{-1}$ . The bands found at  $1442\text{-}1488\text{ cm}^{-1}$  correspond to the asymmetrical C-H bending vibration in  $\text{CH}_3$  group, while the series of bands found between  $1000\text{-}1200\text{ cm}^{-1}$  correspond to the stretching of the C-O bond of the ester group. The values of C=O were observed between  $1626.05\text{-}1637.62\text{ cm}^{-1}$ . The values of C=O are slightly lower than the standard value 1712 and this may be due to polymerization of the molecules (Kadouri et al., 2002). The absorption band at and around  $3450\text{ cm}^{-1}$  corresponds to the terminal OH group (Fig. 2) (Table 3).

#### Extraction and Quantitative estimation of PHB:-

The overall dry weight of the cell was found to be 0.5-1.0 mg. The PHB accumulation of different strains of *L. plantarum* was estimated against the standard crotonic acid curve and the values were tabulated (Table 4). The PHB accumulated was found to increase with nutrient stress and varied considerably with the strains. After 24 h of nutrient stress, the concentration of PHB increased in all the strains. The strain produced PHB from a range between 0.2-8.8  $\mu\text{g/mL}$ . Highest accumulation of 8.8  $\mu\text{g/mL}$  was found in *L. plantarum* H and *L. plantarum* 12 and the lowest and negotiable concentration of 0.2  $\mu\text{g/mL}$  was produced in *L. plantarum* 05.

#### Confirmation of PHB producers by PCR Method:-

The isolates which accumulating the PHB in higher amount (LP01, LP02, LP03, LPH1 and LP12) were analyzed for the presence of PHB synthase encoding gene, *phbC* by PCR amplification using unique primers. The conserved sequence of *phb C* gene available in all the strains. The bands in the region of 585bp revealed the presence of *phbC* gene (Kadouri et al., 2002) and the ability of the strains to produce PHB. The amplified DNA products also revealed the minor diversification among the strains.

**Conclusion:-**

The wide difference between the rates of PHB production in same species indicates that there are several factors that influence the PHB production among the strains. The accumulation of PHB in *Lactobacillus* was not the highest among all the organisms but the *L. plantarum* produced a considerable amount of PHB and to be considered as a part in the choice of organisms for PHB production. The results conclude that nutrient stress conditions can be considered as an optimization parameter for PHB production in high yield. This investigation confirmed that 1mg of the cell dry weight constitutes the maximum of 40.4 µg of PHB.

#### Abstract

Rosemary (*Rosmarinus officinalis* L.), a spice and medicinal herb of Lamiaceae family with a characteristic aromatic smell, is widely used around the world and accepted as one of the spices with the highest antioxidant activity. The aim of this research was to identify and isolate the unknown saponins from the leaves of *R. officinalis* L. using HPTLC, HPLC, UV, FTIR and HR-LCMS techniques. The saponins were identified by High Performance Thin Layer Chromatography (HPTLC) and confirmed by HPLC. On the basis of spectral data analysis, the structure of the new saponin isolated by HPTLC from methanol extract of leaves of *R. officinalis* L. has been formulated by UV, FTIR and HR -LCMS spectral analysis as 1alpha-hydroxy-18-(4-hydroxy-4-methyl-2-pentynoxy)-23,24,25,26,27-pentanorvitamin D3/1alpha-hydr. This is a new saponin isolated from *R. officinalis* L. and being reported for the first time.

#### Introduction:-

*Rosmarinus officinalis* L.(Lamiaceae), Rosemary, is a perennial herb native to the Mediterranean region but is widely distributed in many parts of the world. It grows as a shrub or herbaceous plant with about 0.8 to 2m height (Atik bekkara *et al.*, 2007). This plant prefers dry and arid regions, hills and low mountains, calcareous, shale, clay and rocky substrates (El Amrani *et al.*, 1997). The herb *R. officinalis* L. has been used as a food spice and medicine since ancient times. The fragrance of the leaf has been said to enhance memory. Rosemary oil was applied to the skin to treat muscle and joint pain and taken internally to promote abortions. Its use since ancient times in traditional medicine is justified by its antiseptic (Bult *et al.*, 1985), antirheumatic (Makino *et al.*, 2000), anti-inflammatory, antispasmodic (Juhas *et al.*, 2009; Beninca *et al.*, 2011), antimicrobial and anti-hepatotoxic properties (Stefanovits-Banyai *et al.*, 2003). Its appreciation as a spice for seasoning and food preservation (Arnold *et al.*, 1997) is supported by a very high antioxidant activity (Wang *et al.*, 2008). This antioxidant activity of *R. officinalis* L. is due to its phenolic compounds including: carnosic acid, carnosol, rosmarinic acid and hydroxycinnamic acid ester (Inatani *et al.*, 1983). Aerial parts of *R. officinalis* L. are orally used to relieve renal colic and dysmenorrhoea (Gonzalez-Trujano *et al.*, 2007). Recent research shows that *R. officinalis* L. extracts possess strong anticancer properties (Vassiliki *et al.*, 2013).

Nowadays market demand of the plant is growing, as it is used in several medicinal products. *R. officinalis* L. is indigenous to South Europe and Asia but it is also cultivated in Mediterranean basin and India (WHO, 2007). It is

**Corresponding Author:- Asha D.**

Address:-Department of Botany, St. Teresa's College, Ernakulam, Kerala, India.

used as carminative, rubifacient, stimulant and as flavouring agent for liniments, hair lotions, inhaler, soaps and cosmetics (Kokate *et al.*, 2010). Rosemary leaves have many traditional uses based on their antibacterial and spasmolytic actions. Used orally for the treatment of dyspeptic complaints (British Herbal,1996), and in external applications for supportive management of rheumatic complaints and circulatory disorders (Blumenthal,1998). It is used as a cholagogue, diaphoretic, digestant, diuretic, emmenagogue, laxative and tonic (Bedevian,1994; Farnsworth, 2005) also used in the management of headache, menstrual disorders, nervous menstrual complaints, tiredness, defective memory, sprains and bruises (Hagers, 2003; Asia *et al.*,2013)

It is described in cases of congestion of the liver, inflammation of the gall bladder, gastric lavage, in some cases of jaundice, fatigue, physical and intellectual weakness following the diseases debilitating to the body, migraine, dizziness, palpitations, jittering, strikes, heartburn, carminative and as an antiseptic (Antoine, 1998). Many compounds have been isolated from *R. officinalis* L. including flavones, diterpenes, steroids, and triterpenes.

Saponins are natural high-molecular-weight glycosides of triterpene or steroids with a very wide distribution in the plant kingdom (Hostettmann and Marston, 1995). Saponins exhibits a range of biological activities (Oleszek and Marston, 2000) which include, anticholesterolemic (Oakenfull, 1981), anti-inflammatory, anti-parasitic and antiviral (Just *et al.*,1998; Traore *et al.*,2000). Saponins are also effective against drug-resistant cancer cells (Cheung *et al.*,2005). The great structural diversity of saponins, novel bioactivities which is relevant to the pharmaceutical industry, the challenges of identification, are now opening new opportunities or newer trends for exploitation of novel saponins. Hence the aim of the current investigation was to identify and characterize active saponins from the leaves of medicinally important plant *R. officinalis* L.

### Materials and Methods:-

The fresh plants of *R. officinalis* L. were collected from Ooty, Tamil Nadu, India. The plant materials were identified and authenticated by Dr. K.V. George, Emeritus Scientist (KSCSTE), Department of Botany, St.Berchmans College, Changanacherry, Kerala. The voucher specimen (Voucher No.N/PG/074) is deposited in the herbarium of New Udaya Pharmacy & Ayurvedic Laboratories, Cochin, Kerala, India.

### Sample preparation:-

About 10 gm of the powdered sample was taken in a thimble and extracted with 250 ml methanol in a soxhlet apparatus. The extract was then concentrated in a Rotary Vacuum Evaporator to a volume of 30 ml and stored in small air tight brown bottles. This methanolic extract was used for the screening and isolation of compound.

### High Performance Thin Layer Chromatography (HPTLC):-

HPTLC is a flexible, reliable, and cost-efficient separation technique ideally suited for the analysis of botanicals and herbal drugs. HPTLC studies were carried out using the method described by Wagner *et al.* (1996). Methanol extract of the selected plant was subjected to HPTLC (CAMAG, Switzerland) analysis. A Camag HPTLC instrument consisting of Linomat V automatic spotter equipped with a 100  $\mu$ L syringe connected to a nitrogen cylinder, Scanner-III, twin-trough developing chambers, and viewing cabinet with dual wavelength UV lamps (Camag, Muttenz, Switzerland) were used. Before analysis, HPTLC plates were cleaned by predevelopment with methanol and activated at 110°C for 5min for solvent removal. Plant extract were spotted on a silica gel 60F<sub>254</sub> (Merck, Germany) TLC plate. The plate was air dried and then developed by using the solvent system Chloroform: Acetic acid: Methanol: Water (6.4:3.2:1.2:0.8) (v/v/v/v) as mobile phase in a CAMAG- twin-trough glass chamber (20x10x4) previously saturated with mobile phase vapour for 20 minutes. After developing the plate, it was dried and scanned using Scanner 3 (CAMAG, Switzerland) at 275 nm using WinCATS software. Chromatograms were evaluated before and after spraying with Anisaldehyde – sulphuric acid reagent. After derivatization, plate was dried in hot air oven for 5 minutes at 105° C and viewed under UV at 366 nm.

### High Performance Liquid Chromatography (HPLC):-

High Performance Liquid Chromatography was used to analyse the isolated fraction obtained from HPTLC. Sample was dissolved in HPLC grade methanol in concentration of about 1-10 $\mu$ g/ml, 20 $\mu$ l of the solution was injected in the column RP-C18 and analyzed by PDA detector. The wavelength range was 250 - 500nm. Thermo HPLC system consisted of Quaternary gradient pumps (LC – 10ATvp), Photodiode Array (PDA) and detector (SPD – M10Avp) with built-in system controller. The analysis was performed on a 25 cm x 4.6 mm, 5  $\mu$ m particle size CNW, Athena C18-WP column. The data acquisition was done on Chrom Quest 5 software. The isolated compound from HPTLC was analyzed by using Methanol: Acetonitrile (95:5) as mobile phase.

**Characterization of isolated compound:-**

The isolated compound was characterized by UV, FTIR and HR-LCMS analysis

**UV Spectroscopy:-**

The absorbance of the isolated compound was read using one cm cell in a UV – Vis - NIR spectrophotometer (Varian, Cary 5000, Netherlands). The instrument have a spectral range of 175 nm to 3300 nm, wavelength accuracy of  $\pm 0.1$  nm (UV –Vis),  $\pm 0.4$  nm (NIR), wavelength reproducibility of 0.025nm and a limiting resolution of 0.05nm(UV-Vis), 0.2nm(NIR).The maximum range of absorbance of isolated compound in the methanolic solution was noted by comparing it against HPLC grade methanol as a blank. Separated components (1 mg each) were dissolved in methanol and recorded the spectrum in the range of 200 to 500 nm using a UV double beam spectrophotometer.

**Fourier Transform Infra Red spectrometer (FTIR):-**

FTIR analysis was carried out using Thermo Nicolet, Avatar 370 spectrophotometer system, which was used to detect the characteristic peaks and their functional groups. The spectral range was between 4000-400  $\text{cm}^{-1}$  and resolution was  $4\text{cm}^{-1}$  with KBr beam splitter, DTGS Detector and HATR Assembly for convenience of measurement. The finger print region extended between 400 – 1600  $\text{cm}^{-1}$ . The spectrum of the isolated compound was elucidated against a blank of HPLC grade methanol.

**High Resolution Liquid Chromatograph Mass Spectrometer (HR–LCMS):-**

Further structural analysis was aided with HR-LCMS (High Resolution liquid chromatography-mass spectrometry) with a mass spectrometer using High Resolution. Liquid chromatography coupled with mass spectrometry (LC/MS) is a powerful technique for the analysis of complex botanical extracts. HPLC is efficient in separating chemical compounds in a mixture, and MS provides abundant information for structural elucidation of the compounds. The LCMS analysis provides the molecular weight information for the components of the extract. MS dissociations give further structural information on the target compounds (Chen *et al.*, 2007). Therefore, the combination of HPLC and MS facilitates rapid and accurate identification of chemical compounds in medicinal herbs, especially when a pure standard is unavailable. The HR–LCMS analysis was performed using Agilent Technologies, USA, model 1290 Infinity UHPLC System, 1260 infinity Nano HPLC with Chipcube, 6550 iFunnel Q-TOFs. The mass range is between 50-3200 amu, resolution is 40000 FWHM, high mass accuracy typically less than 1ppm, sensitivity 1 pg. reserpine S/N 100:1, direct infusion for mass analysis (MS, MS /MS), binary nano HP- LC system with mass as detector. The analytical column was an octadecylsilane C18, 250 x 4.6 mm ID, 5  $\mu\text{m}$  particle size protected by a compatible guard column. For the characterization of isolated compound the HPLC method was same as that used in HPLC with CNW, Athena C18-WP column.

**Results:-****High Performance Thin Layer Chromatography (HPTLC):-**

HPTLC of methanol extract of *R.officinalis* L. was carried out to confirm its nature by analyzing TLC chromatograms and to isolate active saponin ingredients from the extract. TLC of methanol extract of *R. officinalis* L. revealed the presence of 5 compounds (corresponding to 5 spots) having R<sub>f</sub> values of 0.26, 0.42, 0.50, 0.59 and 0.68 respectively when a solvent phase of Chloroform: Acetic acid: Methanol: Water (6.4:3.2:1.2:0.8) was used (Fig:1). Compound having R<sub>f</sub> of 0.59 was most prominent and showed clear spot (orange spot) when sprayed using Anisaldehyde – sulphuric acid reagent. Hence, this particular spot was selected for further identification and purification.

**High Performance Liquid Chromatography (HPLC):-**

HPLC of isolated compound from the methanol extract obtained by HPTLC was carried out to confirm its nature by analyzing HPLC chromatograms. The sharpness of peak, its retention time (R<sub>t</sub> min), height and percent area were recorded. The HPLC chromatogram of isolated compound shown only one peak with prominent significant height 303889 and percent area (> 100%) at the retention time 3.372 (R<sub>t</sub> min) (Fig 2).

**Characterization of the isolated compound:-****UV & Fourier Transform Infra red Spectrophotometry (FTIR):-**

UV spectra displayed characteristic absorption band at 260 nm. Data of IR spectrum (KBr,  $\text{cm}^{-1}$ ) exhibited absorption in the range from 3374.61  $\text{cm}^{-1}$  to 662.59  $\text{cm}^{-1}$ . The functional group and the chemical bond

corresponding to each peak are tabulated in Table 1. The FTIR spectrum indicated the presence of C-H, O-H and C=O bonds in the isolated compound (Fig 3).

#### High Resolution Liquid Chromatograph Mass Spectrometer (HR-LCMS) :-

Thus from the FTIR and HR-LCMS chromatogram obtained, the chemical compound isolated from the aerial parts of *R. officinalis* L. is identified as a saponin compound with molecular formula:

1alpha-hydroxy-18-(4-hydroxy-4-methyl-2-pentynyloxy)-23,24,25,26,27-pentanorvitaminD3/1alpha-hydr.

### Discussion:-

In recent years, although technology and medicine have developed extensively due to decrease in natural richness and other drawbacks, some countries have made it obligatory to use natural products for many goals (Erturk *et al.*,2003). For this reason we have chosen an important medicinal plant *R. officinalis* L., which is a herb and spice with incredible medicinal properties. In the above studies, saponins were extracted from the plant by HPTLC and HPLC and UV, FTIR and HR-LCMS techniques were carried out to investigate unknown saponins present in the methanol extract.

Renukappa *et al.* (1999) have applied LC-NMR (liquid chromatography-nuclear magnetic resonance) and LC-mass and LC-coupled bioassay to determine two anthelmintic dammarane-type triterpenoidal saponins, significantly active against *Caenorhabditis elegans* from a crude fraction of *Bacopa monniera*. Earlier studies on the biological activities of saponins were limited to crude extracts containing saponins as well as other polar constituents. The advent of modern sophisticated methods of isolation and structure elucidation has attracted great interest of scientific community to study structure activity relationships (Garai,2014). Nyberg *et al.*(2003) also applied solid phase extraction followed by NMR and MALDI-TOF mass spectrometry on chromatographic fractions QH-A and QH- B of immuno adjuvant active saponins to identify 28 different saponins of *Quillaja saponaria*. Three new olean type triterpenoid saponins were isolated by 1D and 2D NMR and MS spectroscopic data from the aerial parts of *Eclipta prostrata* ( L.) by Xi *et al.* (2014). Zhang *et al.* (2002) identified a new saponin as a ginsenoside-Ro derivative containing a polyacetylene side chain by spectroscopic means including 1D and 2D NMR.

In conclusion, we can state that the present study revealed the presence of saponins in *R. officinalis* L. leaves which were confirmed by various characterization studies. Chemical markers are now applicable in many research areas, which include authentication of species, identification of adulterants, structure elucidation and purity determination of medicinal plants. So this isolated saponin can be used as a chemical marker in *R. officinalis* L. which can be exploited more in future. Hence an attempt was made to isolate, purify and characterize the unknown saponins which can be used as markers and can serve as a powerful tool for the standardization of the extracts.

### Conclusion:-

The methanol extract of *Rosmarinus officinalis* L.(Rosemary) revealed the structure of compound as 1alpha-hydroxy-18-(4-hydroxy-4-methyl-2-pentynyloxy)-23,24,25,26,27-pentanorvitamin D3/1alpha-hydr. and is found to be a Saponin moiety which can be used as marker compound. Further studies need to be conducted for its pharmacological activity.

#### Abstract

In Mexico, the Productive Organization Program for Indigenous Women (POPMI) seeks the empowerment of productive capacities in indigenous women. Our study analyzes POPMI outreach, focusing our attention on women beneficiaries who present a high degree of social exclusion and multidimensional poverty in the State of Veracruz. In the study area, the 542 indigenous women benefited in POPMI, presented a condition of multidimensional poverty and a degree of social exclusion: very high, high and medium, they represent only 22.19% of the total beneficiaries of this program In 2010, since at the state level a total of 2,243 indigenous women were cared for. The results show that the localities where the condition of multidimensional poverty and very high, medium and high levels of social exclusion have been excluded in the coverage of POPMI.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Recent studies have shown that the indigenous population has been subject to social exclusion, a situation that aggravates their situation of multidimensional poverty (Medel, 2106), making it difficult for them to become socially integrated, access the formal labor market, health services, Education and housing. (Tetreault, 2012; Rionda, 2010; Barba, 2009; Del Popolo et al., 2009; World Bank, 2004; Appasamy et al., 2003) indicate that the indigenous population is subject to social exclusion Due to factors such as: (i) their ethnic status; (ii) their gender status; and (iii) their multidimensional poverty condition. In Mexico, as part of a strategy to combat poverty, the federal government seeks to achieve labor insertion, generation of productive projects and income, access to credit, microcredit and organization for the production of indigenous women. The empowerment of their productive capacities in indigenous women. According to Braddotti (1998), the indigenous women's empowerment strategy seeks to generate the conditions for the construction of their human development and their communities, by increasing their productive capacities in order to achieve personal and community development, A situation that implies a redefinition in its power structure (Batliwala, 1997: 194) and of intragroups and intergroups. The empowerment of indigenous women is aimed at overcoming unfavorable conditions of multidimensional poverty,

gender and ethnicity that prevent access to social and market benefits. One of the strategies for combating poverty,<sup>1</sup> Which seeks to contribute to improving living conditions and social position in indigenous women, through the development of productive projects, providing them with training and economic resources for the operation of the same<sup>2</sup> Is the Productive Organization Program for Indigenous Women.

It should be noted that in accordance with the Rules of Operation of POPMI its scope of operation is defined in the following:<sup>3</sup>

1. In localities with 40% and more of indigenous population, and that show a high or very high marginalization, and are outside the municipal head offices;
2. In localities of interest and determined by the Planning and Consultation Unit under the National Commission for the Development of Indigenous Peoples (CDI).
3. In localities located in the municipalities that are in the National System for the Crusade against Hunger, with 40% and more of indigenous population and with a high or very high degree of marginalization.
4. In localities where an Indigenous Micro-regional Development Plan of the CDI has been developed.

Here we have to ask ourselves: What is the scope of POPMI as a strategy for the empowerment of indigenous women in places with multidimensional poverty and social exclusion? This article seeks to analyze the scope of the Productive Organization Program for Indigenous Women, focusing attention on indigenous women beneficiaries who present a high degree of social exclusion and multidimensional poverty.

The main objective of the present work is to identify scenarios in order to define lines of priority attention in support of the strategy for the empowerment of indigenous women in the State of Veracruz, as well as to provide information about the characteristics of indigenous women who were Beneficiaries in 2010, based on the analysis of the degree of multidimensional poverty and social exclusion.

#### **Empowerment of indigenous women in Mexico:-**

The first efforts to achieve the empowerment of women in rural Mexico have been through the support of civil associations, as documented (Olivares, 2006; Zapata et al., 2003 (2002), and in the literature (Martínez et al. In the public sphere, it is from the year 2004 when the Social Development Law is established, which defines, among others, the guideline on social development and assign responsibilities, rules of operation and definition of the target population that Is a beneficiary of the various social programs. In the case of POPMI, from 2004 onwards it emerged as a program with rules of operation and a guide for executing agencies.<sup>4</sup>

- According to the final report of the POPMI Evaluation of Consistency and Results 2007, the importance of the program was noted in the following areas:
- Nearly 40% of indigenous women benefiting from POPMI in 2007 and 2008 indicate that they have improved their living conditions compared to the initial year.
- By the end of 2009, it is estimated that at least 20% of the groups benefiting from indigenous women by POPMI since 2007 were still in operation.
- Of the total number of women organized and trained with an approved project in 2008, at least 30% have received training for the development of their project at the end of the year. Of the total of women's groups with

a project authorized in 2008, at least 40% received information and training for the development of their project and on issues of equity, gender, rights and interculturality "<sup>5</sup>

As a strategy, the POPMI aims to replace the status of indigenous beneficiary women traditionally considered as passive subjects by the active actors, as is the proposal of (Sen, 2003: 44), in this way, the value of networks Social, grassroots organization and cooperative productive schemes in support of indigenous women.<sup>6</sup> However, it is important to note that at present, the operation of federal social development programs and their impact on the empowerment of indigenous women has not been analyzed, through the direct benefit of the public resources applied in the localities Which present multidimensional poverty and social exclusion.

At the national level, in 2014, 46.2% of the population is in poverty, of which 9.5% are in extreme poverty. At the state level, in the year 2014 in State of Veracruz 58.0% of the population is located in a condition of poverty, which represents 4.4 million people; While extreme poverty represented 17.2%, or 1.3 million in extreme poverty.<sup>7</sup> It is important to note that the poverty condition is more evident in the indigenous population than in the non-indigenous population. In this way, in the year 2014, 73.2% of the indigenous population was found to be in poverty, while only 43.2% of the non-indigenous population is in this condition. From the information provided by CONEVAL, it can be observed that in the year 2014, the states that increased levels of poverty and extreme poverty are: Morelos, Veracruz, Oaxaca, State of Mexico, Sinaloa, Coahuila, Hidalgo, Baja California Sur.<sup>8</sup> The State of Veracruz's Poverty and Assessment Report 2014, of the 32 entities, ranked the seventh in percentage of the population in poverty and the fourth in percentage of the population in extreme poverty.<sup>9</sup> Therefore, it is located within the ten institutions with the highest poverty in the country, where in 186 municipalities out of a total of 212, that is, 87.7% are in poverty.

#### **Theoretical framework:-**

Social exclusion as a social phenomenon has been addressed by: Medel (2016); Tetreault (2012); Rionda (2010); Del Popolo et al. (2009); Barba (2009); Laparra et. to the. (2007); Hickey (2007); Sen and Kliksberg (2007); Subirats et al. (2004); Uquillas et al. (2003); Estivill (2003); Sen (2003); Cabrera (2002); Sen (2000); Barry (1998); Appasamy et al. (1996); Castel (1995); Renes (1993); Donzelot (1992).

#### **Social exclusion:-**

The concept of social exclusion has to do with the process through which individuals or groups are totally or partially excluded from the society where they live, being that this category refers not only to the lack of employment. In this sense Subirats *et al.* (2004: 17) recognize that social exclusion is related to employment and the welfare state. While with Donzelot (1992); Renes (1993); Castel (1995) recognizes that social exclusion is not a concept of economic theory, its central paradigm being: scarcity, situation that leads to raise the issue in terms of poverty / wealth, equality / inequality in the possession and use of the goods produced. Barry (1998) points out that there is an association between income dispersion and social exclusion, and that public policy can make the difference between the degree of inequality that manifests itself in social exclusion. In a broader sense Sen and

(2013) "Multidimensional Poverty, Indigenous Population and Social Exclusion in Mexico: A Look at the National Crusade against Hunger Program (SINHAMBRE 2013)" Retrieved from: [Http://www.academia.edu/7085028/Pobreza\\_multidimensional\\_poblaci%C3%B3n\\_ind%C3%ADgena\\_y\\_exclusi%C3%B3n\\_social\\_en\\_Mexico\\_Una\\_mirada\\_al\\_Programa\\_Cruzada\\_Nacional\\_contra\\_el\\_Hambre\\_SINHAMBRE\\_2013\\_](http://www.academia.edu/7085028/Pobreza_multidimensional_poblaci%C3%B3n_ind%C3%ADgena_y_exclusi%C3%B3n_social_en_Mexico_Una_mirada_al_Programa_Cruzada_Nacional_contra_el_Hambre_SINHAMBRE_2013_)

Klikberg (2007:27) consider that the set of deprivations or deficiencies not only corresponds to the material or economic aspect, but can also extend to other dimensions, that is, that limit the development of capacities in the people to lead a full and dignified life in the society in which they live, this set is what is called social exclusion. Finally, we agree with Hickey and du Toit (2007:3) in the sense that the phenomenon of social exclusion must recognize the perspective of class, ethnicity and gender, a situation that generates a multidimensional analysis of poverty, (2016a:134) proposes to integrate social exclusion as a missing dimension in the study and measurement of multidimensional poverty of Alkire-Foster (2007). For purposes of the present work, it is considered: **Definition 1. Social exclusion** is the "combination of various factors of social disadvantage or vulnerability that affect individuals and / or groups, which prevent or hinder access to mechanisms for development and social integration, as well as protection systems Social. "(Subirats et al., 2004: 19)

The phenomenon of social exclusion occurs both in the population living in poverty and in the one that does not have this condition. Estivill (2003: 20) points out in this regard that social exclusion and poverty are not equivalent. "You can be poor and not excluded and, conversely, not all the excluded are poor... although there is a broad circle in which poor and excluded people coincide." The measurement proposal is presented in Laparra et. Al (2007: 27) in pointing out that social exclusion is analyzed from the economic, political and social dimensions. In the economic dimension, social exclusion is manifested by the lack of access to the labor market and its normal salaries and wages, reflecting a decline in the share of consumption, a situation that generates poverty and economic deprivation. Cabrera, (2002: 84) refers that social exclusion is a social process of a structural character and that even in the presence of abundance, the limitation of access to goods and opportunities is observed. This is why (Sen and Klikberg, 2007) summarize that social exclusion reflects a set of deficiencies or deprivations, which is not only totally limited to the material or economic, but can extend to other dimensions that limit people's capacities to Lead a full, dignified and decent life in the society in which they live. In (Medel, 2016) a methodological proposal is presented for the estimation of the social exclusion index from the adaptation (Subirats et al., 2004: 19) and from the considerations of (Sen and Klikberg, 2007).

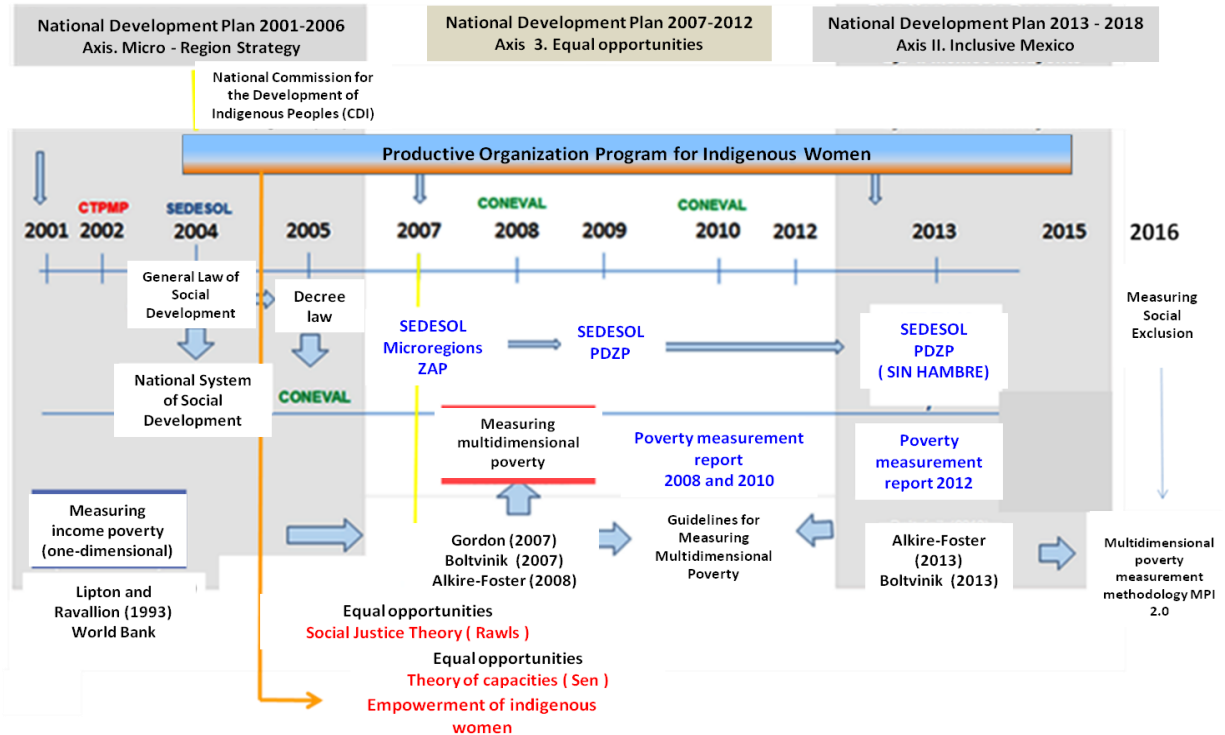

#### **Multidimensional Poverty:-**

In Mexico, poverty is a subject that has been extensively studied; however, the multidimensional poverty approach is relatively new. It is from (Sen, 2000: 3) that poverty is conceived as the deprivation of basic capacities and not only in terms of low income. In the logic proposed by Sen (Boltvinik, 2013: 25) defines poverty as a multidimensional process and Alkire-Foster (2007: 15) present a methodology that allows identifying two cuts, identified with the poverty line and deprivation In people identified as poor. In Mexico, the responsibility for determining the methodological criteria for the measurement of multidimensional poverty rests, by constitutional mandate in the Secretariat of Social Development (SEDESOL) supported by the National Council for the Evaluation of Social Development Policy (CONEVAL), which define To multidimensional poverty in the following terms: **Definition 2. Multidimensional poverty.** "A person is in poverty when he / she has at least one social deficit (in the six indicators of educational backwardness, access to health services, access to social security, quality and housing spaces, basic housing services and Access to food) and their income is insufficient to acquire the goods and services they require to meet their food and non-food needs. "<sup>10</sup>

As an institutional strategy that seeks to reduce vulnerability and increase the capacities of the poor and marginalized sectors, in order to promote human and sustainable development, in accordance with the National Development Plan 2001-2006, Based on the strategy that sought to promote the active participation of indigenous peoples in national development, in order to combat lags and marginalization respecting their uses and customs. The following Graph 1 shows the evolution of the multidimensional poverty approach and the empowerment of indigenous women in Mexico.

<sup>10</sup> See. CONEVAL. [Http://www.coneval.org.mx/Medicion/Paginas/Glosario.aspx](http://www.coneval.org.mx/Medicion/Paginas/Glosario.aspx)

(Doctoral thesis). Economy faculty. PhD in Public Finance. Universidad Veracruzana. Mexico.

### Empowerment:-

POPMI emerged in 2004, being the responsibility of the National Commission for the Development of Indigenous Peoples (CDI), its main objective is to promote and finance the implementation of productive projects for indigenous women, through the promotion of processes Which, in addition to providing them with employment and income alternatives, will have an impact on their living conditions and social position, thereby achieving empowerment. Friedman (1992: 12) states in the following terms: **Definition 3. Empowerment** "... is a process related to access and control of three types of powers: a) social, understood as access to the basis of productive wealth; b) the political, or access of individuals to the decision-making process, especially those that affect their own future; And c) the psychological, understood in the sense of individual potentiality and capacity." In recent years the priority of the Mexican State and one of its central objectives in social policy is the fight against poverty. In this way, one of the strategies seeks to achieve the empowerment of the population in poverty, and particularly, in indigenous women. There is now an academic debate on how to measure social exclusion and multidimensional poverty. In this sense, (Medel, 2016) presents the methodological proposal to incorporate as a relevant dimension in the study of multidimensional poverty to social exclusion, in order to seek an explanation of the current situation of multidimensional poverty, and in particular the one that is manifested in the localities of the State of Veracruz that register a high degree of presence of native speakers.

### Methodology:-

#### Definition of the area of study:-

The study area is the State of Veracruz in Mexico and corresponds to the localities with population that present a high degree of presence of native speakers, with a very high or high degree of social exclusion and multidimensional poverty in the Year 2010. A first survey of the area of study is determined by the incorporation in POPMI, thus identifying indigenous women who are beneficiaries of a program that seeks their productive empowerment in the State of Veracruz.

**Sources of information:-**

The level of consultation of information corresponds to that presented at the level of territorial integration and whose level of disaggregation corresponds to the localities of the State of Veracruz. The data source corresponds to that contained in the statistical information of the General Census of Population and Housing of the year 2010 issued by the National Institute of Statistics and Geography (INEGI), as well as the information for 2010 of the Productive Organization Program for Indigenous Women (POPMI) issued by the National Commission for the Development of Indigenous Peoples (CDI). The estimation of the degree of social exclusion and multidimensional poverty at the local level for the year 2010 is presented in (Medel, 2016b) below is a brief description.

**Index of social exclusion:-**

The index of social exclusion (ES) is constructed as a weighted sum of 16 variables. For its construction, the main component method is used and the coefficients of the first component are weights. The selection of the variables is an adaptation proposed by (Medel, 2016b) of (Subirats, 2004). The data source corresponds to the statistical information contained in the General Census of Population and Housing for 2010.

**Index of social exclusion:-**

The index of social exclusion (ES) is constructed as a weighted sum of 16 variables. For its construction, the main component method is used and the coefficients of the first component are weights. The selection of the variables is an adaptation proposed by (Medel, 2016b) of the (Subirats, 2004). The data source corresponds to the statistical information contained in the General Census of Population and Housing for 2010.

ID.	Key	Description
1	% 15y+ana	Percentage of population aged 15 years and over illiterate.
2	% 6a14nesc	Percentage of the population aged 6 to 14 years who do not attend school.
3	% 15y+basinc	Percentage of population aged 15 and over who have incomplete basic education.
4	% ssersalud	Percentage of population without right to health service.
5	% Vpt	Percentage of dwellings with ground floor.
6	% Vssersan	Percentage of households without health care.
7	% Vsagua	Percentage of private dwellings that do not have piped water.
8	% Vsdren	Percentage of inhabited private dwellings that do not have drainage.
9	% Vselec	Percentage of private dwellings inhabited that do not have electricity.
10	% Vslav	Percentage of private dwellings that do not have a washing machine.
11	% Vsref	Percentage of private dwellings that do not have a refrigerator.
12	% Pconlim	Percentage of population with disabilities.
13	% Pdesocup	Percentage of unoccupied population.
14	% GPLIm	Degree of presence of indigenous language.
15	% Ghacin	Degree of overcrowding in housing.
16	% Psrel	Percentage of population aged 5 years and over non-Catholic (includes non-religious).

In the estimation of social exclusion index the multivariate statistical technique is used using principal components. The information was processed with the application software Statgraphics Centurion XVII version 17.0.16 (32 bits) and XLSTAT Version 2015.4.01.22368.

**Social exclusion index** = 0.339966 \*% 15y + ana + 0.159867 \*% 6a14nesc + 0.313252 \*% 15y + basinc + 0.0631256 \*% ssersalud + 0.297299 \*% Vpt + 0.146342 \*% Vssersan + 0.150605 \*% Vsagua + 0.276032 \*% Vsdren + 0.321636 \*% Vselec + 0.386768 \*% Vslav + 0.414214 \*% Vsref - 0.00415242 \*% Pconlim - 0.00461739 \*% Pdesocup + 0.171148 \* GPLIm + 0.306127 \*% Ghacin + 0.0204543 \*% Psrel

Where the values of the variables in the equation have been standardized by subtracting their mean and dividing them by their standard deviations, this is shown in Graph 2.

**The multidimensional poverty index is constructed according to the Alkire-Foster method:**

Multidimensional poverty index =  $M_0 = H \times A$

**Where:**

H = The percentage of people who are poor, shows the incidence of multidimensional poverty.

A = The average of the proportion of weighted deprivations suffered by the poor. It shows the intensity of people's poverty - the joint distribution of their deprivation, where:

Being thus

$$M_0 = \mu(g^0(k)) = \frac{\sum_{i=1}^n \sum_{j=1}^d g_{ij}^0(k)}{nd}$$

The multidimensional poverty index satisfies properties such as consistency by subgroups, dimensional monotonicity, focus on poverty and deprivation. Since it is desired to have a multidimensional poverty index to analyze the periods 2000 and 2010 which allows the comparability of information through different periods in time and taking into account that satisfying the homogeneity of the information, the data source corresponds to the General Census of Population and Housing 2000 and 2010.

**Study population.-** In 2010, out of a total of 12,162 localities analyzed at the state level, 49.95% were placed in multidimensional poverty, ie 6,075 localities. Within this group 2,274 localities showed in addition to the condition of multidimensional poverty, a degree of social exclusion with levels: very high, high and medium.<sup>11</sup>

**Be:-**

Tot\_Loc = Total locations in 2010 in the State of Veracruz (12,162 locations)

A first dimension of the study area is done by identifying the condition of multidimensional poverty (<sup>poor</sup> IPM)<sup>12</sup>

**Where:-**

<sup>Poor</sup> IMP = Multidimensional poverty index, where its "multidimensional poor" status is identified.

A second dimension, corresponds to the localities that show a degree of exclusion Very High, High and Medium.

**Where:-**

GES<sup>Very High, High, Medium</sup> = Degree of exclusion Very High, High, Medium

A third item corresponds to the localities benefited and that operated in the Productive Organization Program for Indigenous Women (POPMI).

**Be:**

% APOPMI<sub>loc</sub> = Level of coverage of POPMI to give attention to localities that are multidimensional poor and have a very high, high and medium degree of social exclusion.

**Where:**

% APOPMI<sub>loc</sub> = [(POPMI<sub>loc</sub> IPM Poor Multidimensional, GES<sup>Very High, High, Medium</sup>) / POPMI<sub>loc</sub>] x 100

**where:**

POPMI<sub>loc</sub> IPM Poor multidimensional, GES<sup>Muy high, High, Medium</sup>) = Locations that are multidimensional poor and have a very high, high and medium Degree of Social Exclusion.

<sup>11</sup> See. Medel-Ramírez C. (2016a) "Evaluation of the degree of social exclusion and multidimensional poverty in indigenous communities in the State of Veracruz: The case of the program of development of priority areas." *Op. Cit.*

<sup>12</sup> The multidimensional poverty index (MPI) corresponds to that developed by Alkire-Foster (2007) and the Oxford Poverty & Human Development Initiative (OPHI), an indicator that reflects the deprivation of households in different dimensions. In this sense, the MPI allows to observe patterns of poverty different from those of monetary poverty, reflecting different sets of deprivations. The estimates referred to here for 2010 incorporate as a relevant dimension, social exclusion. Section 3.4.1 Multidimensional Poverty Index at the Local Level for the State of Veracruz, In: Medel-Ramírez C. (2016a) "Evaluation of the degree of social exclusion and multidimensional poverty in indigenous communities in the State of Veracruz: The case of Program for the development of priority areas." *Op.cit.* Pp. 115-137.

**and:**

POPMI<sub>loc</sub> = Locations incorporated in the Productive Organization Program for Indigenous Women (POPMI) in 2010.

**Where:**

% APOPMI<sub>loc</sub> = [(POPMI<sub>loc</sub> IPM Poor Multidimensional, GES<sup>Very High, High, Medium</sup>) / POPMI<sub>loc</sub>] x 100

**Where:**

(POPMI<sub>loc</sub> IPM Poor multidimensional, GES<sup>Muy high, High, Medium</sup>) = Locations that are multidimensional poor and have a very high, high and medium Degree of Social Exclusion.

**and:**

POPMI<sub>loc</sub> = Locations incorporated in the Productive Organization Program for Indigenous Women (POPMI) in 2010.

According to information provided by the CDI, in 2010 POPMI operated in 55 municipalities out of a total of 212, covering 196 localities in the State of Veracruz benefiting 2,443 indigenous women, with a contribution of 20,128,492.60 pesos for projects aimed at empowerment Indigenous women.

**Results and Discussion:-**

In order to evaluate the scope of the POPMI, as a strategy of productive empowerment of indigenous women, in the State of Veracruz in 2010, localities showing conditions of multidimensional poverty and social exclusion, the following results are presented, see below Table 1.

**Table 1:-** Localities in the State of Veracruz of Ignacio de la Llave, according to condition of multidimensional poverty, exclusion and participation in the Productive Organization Program for Indigenous Women (POPMI), 2010.

/ 4 National Commission for the Development of Indigenous Peoples. Productive Organization Program for Indigenous Women (POPMI). 2010.

It stands out in the year 2010 of the 12,162 localities, 6,075 localities present a multidimensional poverty condition, which represents 49.95% of the total localities in the State.

In a first estimate, the number of localities in a multidimensional poverty condition with a degree of social exclusion: very high, high or medium is 2,274. In 2010, 197 localities of the State of Veracruz participated in the POPMI, of these only 47 localities present a condition of multidimensional poverty and very high, medium or high degree of exclusion; In the following municipalities: Chicontepec, Atlahuilco, Coxquihui, Filomeno Mata, Hueyapan de Ocampo, Iamatlán, Ixcatepec, Los Reyes, Mecatlán, Pajapan, Papantla, Santiago Sochiapan, Soledad Atzompa, Tehuipango, Temapache, Tequila, Texcatepec, Tezonapa, Tlaquilpa, Xoxocotla, Zongolica, Zontecomatlán de López and Fuentes. POPMI localities in a multidimensional poverty situation and also show a degree of social exclusion: very high, high and medium, represent 23.86% of the total number of localities that operated in the program in 2010 (Table 2).

**Table 2:-** Number of Indigenous Women Benefited in the State of Veracruz de Ignacio de la Llave, according to the condition of multidimensional poverty, exclusion and participation in the Productive Organization Program for Indigenous Women (POPMI), 2010.

Indigenous women participating in POPMI according to selected characteristics	Total
<b>1. Productive Organization Program for Indigenous Women (POPMI)</b>

/ 4 National Commission for the Development of Indigenous Peoples. Productive Organization Program for Indigenous Women (POPMI). 2010.

In 2010 2,443 indigenous women were beneficiaries in POPMI, of which 56.86% were in multidimensional poverty, that is, 1,389 indigenous women benefited in POPMI in 2010 were placed in a condition of multidimensional poverty (See Table 2). With regard to indigenous women who were in a situation of multidimensional poverty and who participated in POPMI in 2010, only 39.02% had a very high, high and / or medium degree of social exclusion, which corresponds to 542 indigenous women benefited. While 60.98% correspond to indigenous women who showed a low degree of social exclusion. Table 3 shows that the total amount applied in the program of 20,128,493.00 pesos, of which 11,241,656.00 pesos were channeled to localities in situation of multidimensional poverty, however, it is important to note that only 4,460,016.00 pesos were channeled for generation Of productive projects of indigenous women who present a condition of multidimensional poverty and very high, medium or high degree of social exclusion, a figure that represents only 22.16% for the population in vulnerable situations. It is also noted that 58.86% of the allocation of POPMI resources is allocated to the population of Nahuatl, 13.35%, for Totonaco speakers, 5.16%, Otomí speakers, 4.00%, Popoluca, 0.80%, Tepehua and Others with 17.83%. See Table 3 below.

Source: Own elaboration, based on the following information:

/ 1 National Commission for the Development of Indigenous Peoples. Productive Organization Program for Indigenous Women (POPMI). 2010.

/ 2 Medel- Ramírez C. (2016a) "Evaluation of the degree of social exclusion and multidimensional poverty in indigenous communities in the State of Veracruz: The case of the program of development of priority areas." Op. Cit.

In the following table 4, it is observed that the total resources allocated in the POPMI 20,128,493 pesos were distributed in localities in situation of multidimensional poverty the sum of 11,241,656 pesos, which represents 55.85%. Regarding the sum of resources allocated to POPMI to indigenous women who are placed in a multidimensional poverty condition, it is observed that 4,370,585 pesos were allocated to those that showed a high level of social exclusion, high and medium, as a whole Represented 34.59% of the resources allocated under this category. On the other hand, 6,871,071 pesos were allocated, that is, 61.12% were applied to the benefit of indigenous women who were placed in a condition of low social exclusion.

According to the social problems detected in the localities of origin of indigenous women benefited in POPMI in 2010, it is highlighted that of the total resources allocated in POPMI, 28.13% were allocated to indigenous women whose social problems identified correspond to the Economic area, in which 5,661,998 pesos were allocated. Of this last figure, 69.20% is destined in localities where a lack of employment or emigration was identified; and 19.08% went to localities where poverty or marginalization was identified.

**Table 4:-** Total amount allocated in the Program Productive Organization for Indigenous Women (POPMI) 2010 according to the condition of multidimensional poverty, social exclusion and social problems of economic area identified in the locality.

Characteristics of POPMI according to selected conditions	Total (Pesos)
<b>1. Productive Organization Program for Indigenous Women (POPMI). /1</b>	20,128,493
<b>2. Applied to locations in multidimensional poverty conditions: / 2</b>	
— Poor multidimensional	11,241,656
<b>3. Applied in localities in multidimensional poverty condition according to degree of social exclusion</b>	
— Very high degree of social exclusion	75,835
— Degree of high social exclusion	165,220
— Degree of average social exclusion	4,129,530
— Degree of low social exclusion	6,871,071
<b>4. Applied to localities in multidimensional poverty condition according to social problems of an economic nature detected in the locality: / 1/2</b>	5,661,998
— Lack of employment or emigration	3,917,972
— Poverty or marginalization	1,080,472
— Lack of road or transportation	364,579
— Drought, flood or adverse weather	130,000
— Lack of financial resources	93,140
— Irregularity or dispute related to land tenure	75,835

Source: Own elaboration, based on the following information:

/ 1 National Commission for the Development of Indigenous Peoples. Productive Organization Program for Indigenous Women (POPMI). 2010.

/ 2 Medel-Ramírez C. (2016a) "Evaluation of the degree of social exclusion and multidimensional poverty in indigenous communities in the State of Veracruz: The case of the program of development of priority areas." Op. Cit.

In 2010, the total number of indigenous women benefited in POPMI was 2,443; For its part, the number of indigenous women in multidimensional poverty and with a high level of social exclusion, high and medium, correspond only to 542 beneficiaries in POPMI in that year. See Table 5.

The resources granted by the POPMI were distributed mainly among indigenous women aged 30 to 39 years, which represents 27.09%; For its part, support for indigenous women aged 60 and over represented only 6.95%.

The next Table 5 shows the analysis of multidimensional poverty throughout the period 2000 and 2010, which correspond to 2,443 indigenous women beneficiaries in the POPMI program, classified according to the multidimensional poverty condition shown in the locality corresponding to the year 2010.

**Table 5:-** Number of Women benefited from the Program Productive Organization for Indigenous Women (POPMI) / 1 according to their condition of multidimensional poverty / 2, exclusion / 3 in localities of the State of Veracruz, from 2000 to 2010.

Evolution of the condition of multidimensional poverty	2000	2010	Estimate
Number of women benefited in localities that improved their condition of multidimensional poverty.	Poor multidimensional	Not poor multidimensional	619
Number of Women benefited in localities that worsened their condition of multidimensional poverty.	Not poor multidimensional	Poor multidimensional	504
Number of Women benefited in localities that maintain positive stability in their condition of multidimensional poverty.	Not poor multidimensional	Not poor multidimensional	424

Number of Women benefited in localities that maintain negative stability in their condition of multidimensional poverty.	Poor multidimensional	Poor multidimensional	885
Number of Women benefited in localities without comparability in the year 2000 to 2010.	Not comparable	Not comparable	11
Total of women benefited in POPMI.			2,443

Source: Own elaboration, based on the following information:

/ 1 National Commission for the Development of Indigenous Peoples. Productive Organization Program for Indigenous Women (POPMI). 2010.

/ 2 Medel-Ramírez C. (2016a) "Evaluation of the degree of social exclusion and multidimensional poverty in indigenous communities in the State of Veracruz: The case of the program of development of priority areas." Op. Cit.

/ 3 The degree of exclusion is considered very high, high and medium.

"Not comparable" means is not available for comparability 2000 to 2010.

Of these, 619 indigenous women benefited from the POPMI program were located in villages that show an improvement in their multidimensional poverty status, from a multidimensional poverty in 2000 to a multidimensional non-poor in 2010. From the localities that present this characteristic are the municipality of Cosamaloapan de Carpio when registering 65 indigenous women benefited in the POPMI followed by Chicontepec with 52, Uxpanapa and Coyutla with 47 each.

For its part, 424 indigenous women benefited in the POPMI were located localities that show a favorable position since in 2000 they were non-poor multidimensional and this condition is maintained in 2010. The municipality of Tatahuicapan de Juárez registered 53 indigenous women, Uxpanapa with 47, Coyutla with 42, Playa Vicente with 38 and Chicontepec with 33.

Of the 504 indigenous women who were beneficiaries of the POPMI program, locations were found that showed a deterioration since they were non-poor multidimensional in 2000 and in 2010 presented a multidimensional poor condition. The municipality of Chiconamel stands out, with 62 indigenous women benefiting from POPMI, Tlachichilco, Tehuipango and Hueyapan de Ocampo with 32; And Papantla with 27.

Finally, 885 indigenous women benefited in the POPMI are placed in an unfavorable situation since they presented a condition of poor multidimensional in the year 2000 and in the year 2010. The municipality of Papantla registered 100 beneficiary indigenous women, Soledad Atzompa with 77, Chicontepec with 58, Hueyapan de Ocampo with 53 and Mecatlán with 36.

In order to achieve a comparability between the years 2000 and 2010, 5 levels of qualification of the localities are identified according to their condition of multidimensional poverty: a). With positive qualification, they correspond to those localities that were identified as non-poor multidimensional, both in the year 2000 and in the year 2010; B). With a positive rating on the rise, they correspond to those localities that were identified as multidimensional poor in the year 2000 and as non-poor multidimensional ones in the year 2010; C). With negative qualification in decline, they correspond to those localities that were identified as multidimensional non-poor in the year 2000 and as multidimensional poor in the year 2010; D). With negative qualification, they correspond to those localities that were identified as multidimensional poor both in the year 2000 and in the year 2010; And e). Not comparable, they correspond to those localities that do not have information for comparability between the year 2000 and 2010. Thus, according to the information in Graph 3, the following is observed:

- 885 indigenous women benefited from the POPMI program were located in localities that show a negative condition with respect to their multidimensional poverty, that is, they correspond to localities that were identified as multidimensional poor in the year 2000 and that in 2010 maintained That condition.
- 504 indigenous women benefited were located in localities that show a declining negative condition with respect to their condition of multidimensional poverty, that is to say that they correspond to localities that were identified as non-poor multidimensional in the year 2000 and that in the year 2010 they were identified As multidimensional poor.

**Graph 3:-** Distribution of indigenous women beneficiaries in the POPMI program according to the locality's qualification regarding their condition of multidimensional poverty in the period 2000-2010.

**Source:**

/ 1 National Commission for the Development of Indigenous Peoples. Productive Organization Program for Indigenous Women (POPMI). 2010.

/ 2 Medel-Ramírez C. (2016) "Evaluation of the degree of social exclusion and multidimensional poverty in indigenous communities in the State of Veracruz: The case of the program of development of priority areas." Op. Cit.

- 619 indigenous women benefited were located in localities that show a positive condition on the rise with respect to their condition of multidimensional poverty, that is, they correspond to localities that were identified as multidimensional poor in the year 2000 and that in the year were identified as not Poor multidimensional in the year 2010.
- 424 indigenous women benefited were located in localities that show a positive condition with respect to their condition of multidimensional poverty, that is, they correspond to localities that were identified as multidimensional non-poor in both 2000 and 2010.
- And finally, 11 indigenous women benefited were located in localities that do not have information for comparability between 2000 and 2010.

**Conclusions:-**

The analysis of multidimensional poverty is an important factor in analyzing the distribution of federal public resources applied in the operation of the POPMI program, since it allows the identification of scenarios, based on information from the period 2000 to 2010, since it establishes Strategies for the empowerment of indigenous women, with the following lines of priority attention:

- a. Give attention to the 504 localities that worsened their condition of multidimensional poverty in 2010;
- b. Give priority attention to the 885 localities that present a negative stagnation in their condition of multidimensional poverty.
- c. Strengthen support for the empowerment of indigenous women in 619 localities that improved their condition of multidimensional poverty.
- d. Continue to promote support in the 424 localities that maintain positive stability in their multidimensional poverty situation.

**From the obtained results we conclude that:-**

1. Locations in the State of Veracruz where indigenous presence and multidimensional poverty and high levels of social exclusion have been excluded in the strategy proposed by the Productive Organization Program for Indigenous Women (POPMI) in the State of Veracruz.
2. The status of indigenous language speaker in localities with high or very high levels of marginalization, as well as high or very high rates of social backwardness are factors that condition a high rate of social exclusion, since the condition of The condition of having a high degree of indigenous presence (% GPLIloc) and having a social backwardness index (RS = high or very high) is a detonating factor to have a high social exclusion rate.
3. The fight against poverty, while recognizing its multidimensional character, examines the degree of social exclusion in localities with a high presence of indigenous language speakers, since the selection criteria in the rules of operation of the POPMI for the transfer of federal public resource applied in PDZP at localities level is exclusive.

4. The current social expenditure policy aimed at seeking the empowerment of productive capacities in the indigenous population; And increasing the capacities of indigenous women, who are placed in unfavorable conditions of both multidimensional poverty and social exclusion, does not solve the problem of social exclusion.

#### Abstract

**Background:** Preoperative anxiety is unpleasant feeling; it is considered to be normal event in patients waiting for surgery. Preoperative anxiety has adverse effects on patients, recovery and outcomes of operation. It can cause delay in recovery, post-operative pain and nausea, also it may cause increasing in anesthesia dose given to patients. There are many factors increase anxiety before surgery; one is the gender, where females experience more anxiety than males. Preoperative anxiety can be decreased by increasing awareness of patients about surgery nature, anesthesia and the development in surgery techniques.

**Aim:** The objective of this study is to measure preoperative anxiety and identifies certain patient characteristics that predispose to high anxiety, and describes the quantity and quality of anxiety that patients experience preoperatively.

**Methods:** This study was conducted on 190 patients post operatively. A visual analogue scale questionnaire containing 10 questions was used to record patients, answers.

**Results:** Patients experienced preoperative anxiety with different degrees and woman was more anxious than man.

**Conclusion:** Preoperative anxiety is very common in candidates of surgery.

#### Introduction:-

Surgery is associated with patient anxiety. Anxiety is known as unpleasant feeling which may leads to avoidance of patient to perform planned operation (Yilmaz et al, 2011). Anxiety is a result of anticipation of threatening event (Hernández-Palazón et al, 2015), here operation is the event. Patients consider that day of surgery is the most threatening day in their lives (Nigussie et al, 2014). The time prior to operation is critical and it is a provoking cause for anxiety for patients (Johnston, 1989; Domar et al, 1989). Preoperative anxiety is a tension secondary to many events such as surgery, disease and hospitalization (Yilmaz et al, 2011). Preoperative anxiety represents 11 % to 80% in adults (Maranets et al, 1999) it has higher effect on women especially young and it affects candidates of major surgery (Roomruangwong et al, 2012), patients without previous exposure to operations (Kim et al, 2010) and it differs according to type of surgery (Maranets et al, 1999). It was found that anxiety incidence in patients of cardiac surgery was 94% (Hernández-Palazón et al, 2015), while other studies (Navarro-García et al, 2011; Martin et

**Corresponding Author:-Abdullah S. Alqefari.**

Address:-GPs, College of Medicine, Jordanian University of Science and Technology (JUST), Riyadh, KSA.

al, 2004; Pochard et al, 1996; Underwood et al, 1993) reported that incidence rate of anxiety ranged from 20% to 35%. Preoperative anxiety ranges from 60-90% in western population (Saini et al, 2016). Most candidates of surgery experience preoperative anxiety (Johnston, 1989; Domar et al, 1989; Badner et al, 1990). Actually preoperative anxiety is not unusual reaction of patient waiting for surgery (Yilmaz et al, 2011). Once the surgery is planned and determined,

patients' anxiety begins and it increases by entering hospital (Klopfenstein et al, 2000). There are many factors that can affect the degree of patients' anxiety including prior exposure to surgery, age, gender and education (Badner et al, 1990). Anxiety cause changes in sympathetic, parasympathetic and endocrine stimulation (Matthias et al, 2012). Preoperative anxiety is related to many adverse events such as delayed jaw relaxation, autonomic fluctuations, coughing during induction of anesthesia, increased pain, nausea and increased risk for infection (Nigussie et al, 2014). Anxious and non-anxious patients respond variously to anesthesia. Larger doses of anesthesia and postoperative drugs are required for anxious patients (Jafar et al, 2012), also they may need to stay longer in hospital (Matthias et al, 2012) because they experienced delay in recovery as a result of anxiety (Nigussie et al, 2014). Prolongation of mechanical ventilation also was mentioned (Hernández-Palazón et al, 2015), for all these reasons it is important to measure anxiety for those patients waiting for surgery. Visual Analogue Scale is one of many ways to evaluate anxiety (Jafar et al, 2012). It is used to evaluate anxiety preoperatively and it is a useful and easy method to be applied, also it allows determination of anxiety level in different surgical patients [Kindler et al, 2000; Boker et al, 2002; Millar et al, 1995; Oddershede et al, 2014; Perks et al, 2009; Shafer et al, 1996]. So the aim of this study is to measure preoperative anxiety before operation and describes the quantity of anxiety that patients experience preoperatively using visual analogue scale.

### **Materials and Methods Subjects:-**

This cross sectional observational study was performed on 190 patients in the period from 20<sup>th</sup> January 2017 to 7<sup>th</sup> February 2017 from Yamama Hospital in Riyadh, an approval from the hospital was obtained to perform this study. This study was performed after operation, participants were asked to answer the questions they all agreed and welcomed. There was no exclusion in this study where all participants answered all questions.

### **Patient Questionnaire:-**

A scored visual analogue scale questionnaire containing 10 questions was established to record the answers of patients and quantify anxiety. The score scale ranged from 0 to 10, zero= no anxiety while 10= extreme anxiety. A very good reliability and internal consistency of the items in the questionnaire were obtained according to the Cronbach's alpha at 0.833.

### **Statistical analysis:-**

Data were analyzed by using Statistical Package for Social Studies (SPSS 22; IBM Corp., New York, NY, USA). Continuous variables were expressed as mean  $\pm$  standard deviation and categorical variables were expressed as percentages. The t-test was used for continuous variables. The Cronbach's alpha was used to assess reliability and internal consistency of the items in the questionnaire, the Cronbach's alpha was scored at 0.833. P-value <0.05 was considered statistically significant.

### **Results:-**

This study was conducted on 190 patients after performing their operations; the females were dominant in this study than males where the male number was 85 (44.74%) while female number was 105 (55.26%). The mean age of participants was  $33.10 \pm 9.81$ , most of them were Saudi 176 (92.63%) and only 14 (7.37%) were non Saudi. Most of individuals were from Urban areas 185 (97.37%) and high educational level 126 (66.32%) while those from rural areas were 5 (2.63%) only and secondary school education or less level was 64 (33.68%). The results of questions were represented by mean  $\pm$  SD. Anxiety scoring started from zero which means no anxiety ascending to reach 10 which mean the maximum anxiety, the mean of each question for this study did not exceed 5. In the present study, no awaking was the more concern in patients (mean =4.91) followed by fearing of physical and mental harm after operation (mean=4.78) then awareness during anesthesia (mean=4.58), the next concern was post-operative pain (mean=4.54), however the last fearing was being at mercy of medical stuff (mean=3.11), while post-operative nausea and vomiting (mean=3.97) was higher than waiting for surgery (Mean=3.56). The results of questionnaire are summarized in table 1 for all subjects and regarding sex.

**Table 1:-** Mean of each question in the questionnaire for all subjects and each gender

Item number	Statement	All subjects N=190	Male N=85	Female N=105	*P-value
		Mean(SD)	Mean(SD)	Mean(SD)	
Q1	waiting for the operation	3.56 (2.96)	3.12 (1.79)	3.92 (3.61)	<0.001
Q2	Being at the mercy of medical staff	3.11 (2.80)	3.00 (2.00)	3.19 (3.32)	0.047
Q3	Results of the operation	4.04 (3.18)	4.28 (2.76)	3.84 (3.49)	0.626
Q4	Postoperative pain	4.56 (2.84)	4.39 (2.36)	4.70 (3.19)	0.328
Q5	Discomfort after the operation	4.53 (2.75)	4.92 (2.17)	4.21 (3.12)	0.447
Q6	Postoperative nausea and vomiting	3.97 (2.92)	4.88 (2.71)	3.24 (2.88)	0.067
Q7	Not knowing what is happening	4.54 (3.09)	5.62 (2.82)	3.67 (3.04)	<0.001
Q8	Physical/mental harm after the operation	4.78 (3.91)	6.44 (3.67)	3.44 (3.59)	<0.001
Q9	No awakening from anesthesia	4.91 (4.06)	6.38 (3.82)	3.72 (3.87)	<0.001
Q10	Awareness during anesthesia	4.58 (3.78)	6.22 (3.74)	3.25 (3.27)	<0.001
Total score for all items out of 100		42.57 (23.60)	49.25 (22.27)	37.17 (23.36)	<0.001

\*P-value <0.05 was considered statistically significant.

An assessment for anxiety score was performed to investigate the anxiety level of patients before surgery. Severe anxiety at a range of 76-100 represents 58 (30.53%) of individuals in this study, while higher percent of persons experienced a moderate anxiety 72 (37.89%) at rang of 51-75 of scores, mild anxiety at arrange of 25-50 was in 60 (31.58%) of participants, all subjects suffered from anxiety with different degrees, table2.

**Table 2:-**Assessing Anxiety score of patients before surgery

Range of score	Interpretation of score	Frequency(%)	
76-100	Severe Anxiety	58	(30.53)
51-75	Moderate	72	(37.89)
25-50	Mild	60	(31.58)
< 25	None to slight	0	(0.00)

## Discussion:-

Anxiety is a usual reaction to stress and it is common in candidates for surgery (Jafar et al, 2012). It is known as preoperative anxiety. Preoperative anxiety is related to an alteration in neuroendocrine response which cause deleterious postoperatively (Ai et al, 2005; Pearson et al, 2005). Improving surgical outcome related to reducing preoperative anxiety (Roomruangwonget al, 2000). An ideal assessing tool for preoperative anxiety must be short, easy, reliable and accurate tool to measure anxiety. Visual Analogue Scale (VAS) questionnaire is valid to measure anxiety (Matthias et al, 2012) because it is short, easy, simple and reliable for the measurement of preoperative anxiety (Elkins et al, 2004; Kindler et al, 2000), for these reasons we used VAS in this study to assess anxiety. The most common reasons for preoperative anxiety are fearing of mistakes in operation that can harm patients, this reason represents 64%, fearing from not waking up and represents 58.4% and only 8% represents worrying about post-operative nausea and vomiting (Nigussie et al, 2014). Also waiting for operation, worrying about the physical and mental harm (Perks et al, 2009), fear of the surgery and postoperative pain (Caumo et al, 2001) are reported. In a study by Kindler et al (Kindler et al, 2000), they found that waiting for the operation, being at the mercy of medical staff, result of the operation and postoperative pain were the first to fourth respectively in order as causes of anxiety, however in our study these four reasons ranked in different order. No awaking, physical and mental harm after operation, awareness during anesthesia and post-operative pain were the top reasons of anxiety respectively in our patients, while being at the mercy of medical staff was the last one. The concern about not awaking was the first reason for anxiety in our study, this may be due to low level of awareness of patients about operation nature and the development in operation techniques. In a study of United States (Bondy et al, 1999), it was reported that the

preoperative anxiety was reduced by giving information to the patients about procedures. Kiyohara et al (2004) study showed that patients, who received information about the surgical procedure, had lower anxiety levels. Also a study in India (Vandana et al, 2009), reported the same results about developing less preoperative anxiety from patients who received information about surgery than those who were not informed, so providing patients with information about disease and operation will decrease preoperative anxiety. Awareness during anesthesia was one of the 4 top concerns causing anxiety, actually it was the third in order, so it is important to increase patient awareness about anesthesia technique and safety by visiting anesthesiologist before surgery to decrease their fearing. The last reason in the present study was being at the mercy of medical staff, while study by Kindler et al (2000) showed that last concern was awareness during anesthesia, this differences in results may returns to differences in culture, public awareness and education levels, although there is difference in ordering of anxiety reasons, preoperative anxiety still exist whatever its cause. In a study by Jawaid et al (2007) and MacClean et al (1990), they reported that patient's highest concern was post-operative pain, while in the present study its order was number four. The 7<sup>th</sup> concern in our patients was the results of operation, while in a study by Akinsulore et al (2015), this reason was the first in their patients and the third in Jawaid study (Jawaid et al, 2007). A study in Port Harcourt Teaching Hospital in southeastern Nigeria (Ebirim et al, 2010) and a study by Nigussie et al (2014), they found that Worrying about post-operative nausea and vomiting was the last concern of patients, this is near to our findings in the current study where this concern ranked the 8<sup>th</sup> one of 10 concerns. Many studies (Saini et al, 2016; Perks et al, 2009; Jawaid et al, 2007; Norris et al, 1967; Karanci et al, 2003) reported that female gender is one of many factors associated with preoperative anxiety. In a study by Yilmaz et al (2011), they reported that anxiety scores were higher among females than males. Additionally Jafar and Khan (2012) found that Females were more anxious than males with preoperative anxiety, these results are in agreement with ours. In the present study females experienced more anxiety than males (P-value < 0.001). However Nishimori et al (2002) showed that there is no association between gender and anxiety. Also another studies (Hernández-Palazón et al, 2015; Navarro-García et al, 2011) reported that there was no significant difference between males and females regarding the incidence of anxiety. Several studies (Matthias et al, 2012; Nishimori et al, 2002; Berth et al, 2007; Sirinan et al, 2000) mentioned that Females were more anxious about anesthesia than males, this in agreement with our study, where females had a fear of no awaking from anesthesia and awareness during anesthesia than males. By assessing anxiety in this study, we found that moderate anxiety was dominant in patients (37.89%) while mild anxiety was experienced by 31.58 % of our patients, severe anxiety represented 30.53 % of the individuals of this study. In study by (Kalkhoran et al, 2007), they found that 66.7% of patients had moderate anxiety. Other studies reported that surgical patients have moderate to severe anxiety (Karanci et al, 2003; Yardak et al, 2004; Akkas et al, 2004).

### Conclusion:-

In conclusion, preoperative anxiety is very common in candidates of surgery but with different degrees. Females are more anxious than males, so it is important to decrease patient anxiety before operation.

##### Key words:-

Mercaptosuccinic acid, 1, 10-phenanthroline, L-dopa, dimethylformamide, dielectric constant, protonation constants.

#### Abstract

The protonation constant values of mercaptosuccinic acid, L-dopa and 1, 10-phenanthroline were determined in dimethylformamide (0-60% v/v) at 303.0 K at ionic strength of 0.16 mol L<sup>-1</sup> using pH-metric technique. The protonation constants were calculated with the computer program MINQUAD75 and selection of the best fit models was based on the statistical parameters. The log K values were found to increase of the organic solvent content. The linear variations of the protonation constants with the reciprocal of the dielectric constant of the medium have been attributed to the dominance of electrostatic forces. Distribution of species, protonation equilibria and effect of influential parameters on the protonation constants have also been presented.

#### Introduction:-

Mercaptosuccinic acid (MSA) or thiomalic acid (HOOC-CH (SH)-CH<sub>2</sub>-COOH) is a dicarboxylic acid containing a thiol functional group (-SH group) instead of an -OH group in malic acid [1]. It is also used as a building block in the synthesis of novel polyanionic inhibitors of human immunodeficiency virus and other viruses [2], and as a starting material in the synthesis of isocysteine, an important non-proteinogenic amino acid in a potent peptide inhibitor of stromelysin [3]. In addition, sodium salt of the anionic Au (I) complex of 2-mercaptosuccinic acid is an effective anti-arthritis drug [4-9]. MSA is widely applied in industry and technology as corrosion inhibitor, electrolyte for electroplating bath, and components of bleach-fixing baths for photographic films and as an active material for depilatories and hair strengthening [10]. L-dopa (L-3, 4-dihydroxyphenylalanine) is a naturally occurring dietary supplement and psychoactive drug found in certain kinds of food and herbs, and is synthesized from the essential precursor to the neurotransmitters dopamine, norepinephrine (noradrenalin) and epinephrine (adrenaline). Dopa is used as pro-drug to increase dopamine levels in the treatment of Parkinson's disease [11, 12], since it is able to cross the blood-brain barrier whereas dopamine itself cannot. 1, 10-Phenanthroline (phen) is an organic compound. It is a bi-dentate ligand in coordination chemistry, it forms strong complexes with many metal ions. Phen, an N-donor ligand with planar aromatic rings is known [13-19] to form protonated species in acidic solution .i.e., H (phen)<sup>+</sup> and H(phen)<sup>2+</sup> in the pH range of 2.0-9.0, and H<sub>2</sub>(phen)<sup>2+</sup> at [H<sup>+</sup>] > 1 mol dm<sup>-3</sup>. Due to hydrophobicity of aromatic rings in phen, the solubility of the neutral species is low in water which remarkably increases in organic solvents and also in aqua-organic mixtures.

In this paper, the protonation constants of mercaptosuccinic acid, dopa and phen [20] have been determined pH metrically in aqueous solutions of dimethylformamide (dmf) which is a common solvent for chemical reactions.

## Experimental:-

### Chemicals and Standard Solutions:-

All the chemicals used in this investigation were of Analytical Reagent grade purity. Triple-distilled deionised water was used for the preparation of all the solutions. 0.05 M solution of mercaptosuccinic acid (Himedia), L-dopa (Himedia), 1, 10-phenanthroline (Merck, Germany) was prepared by maintaining 0.05 M nitric acid concentration to increase the solubility. Dimethylformamide (Merck, Germany) was used as received. 0.2 M nitric acid solution was prepared. 2.0 M sodium nitrate (Merck, Germany) was prepared to maintain the ionic strength in the titrand. 0.4 M sodium nitrate (Merck, Germany) was used as titrant. The acid and base solutions were standardized by standard methods. Thus, the concentration of the alkali was determined by titrating it with the standard oxalic acid and potassium hydrogen phthalate solutions, while the normality of nitric acid was determined using standardized sodium hydroxide and the primary standard borax solutions. In assessing the errors analysis of variance of one way classification (ANOVA) using the computer program COST [21]. The concentration of the carbonate-free sodium hydroxide solution was determined by titrating it against nitric acid solution using the gran plot method [22].

### Alkalimetric Titrations:-

The pH measurements proton-ligand system were carried out in the aqueous media containing varying compositions of organic solvent (dmf) in the pH range of 0-60% v/v maintaining an ionic strength of 0.16 M with sodium nitrate at  $303.0 \pm 0.1$  K using a digital pH meter ELICO (readability 0.01) with mechanical stirring carried by a teflon stirrer. The glass electrode was equilibrated in a well stirred dmf-water mixtures containing alkali to check the complete equilibration of the glass electrode. The calomel electrode was refilled with dmf-water mixtures periodically. Potassium hydrogen phthalate (0.05M) and borax (0.01M) solutions were used to calibrate the pH meter. In each titration, the titrand consisted of approximately 1mmol of nitric acid in a total volume of 50ml. The amounts of MSA, L-dopa, phen in the titrands ranged between 0.25 and 0.375, 0.50 mmols. The glass electrode was equilibrated in a well stirred organic solvent-water mixture containing inert electrolyte for several days. At regular intervals, the strong acid was titrated against alkali to check the complete equilibration of the glass electrode. The details of the experimental procedure and titration assembly used in our laboratory have been given elsewhere [23].

## Results and Discussion:-

### Best fit Model:-

The computer program SCPHD [24] was used to calculate the correction factor applied to pH meter dial reading to calculate approximate protonation constants of mercaptosuccinic acid, L-Dopa, and 1,10-phenanthroline. The best fit chemical model for each system investigated was arrived at using non-linear least-squares method in the initial refinement and reliable convergence of Marquardt algorithm [25]. The variation of stepwise constants was analyzed mainly on electrostatic grounds on the basis of solute-solute and solute-solvent interactions. The results of best fit models that contain the type of species and overall protonation constants of MSA, dopa, phen along with some important statistical parameters are given in Table 1. A low standard deviation in  $\log \beta$  indicates the precision of these parameters. The small values of  $U_{\text{corr}}$  (the sum of the squares of deviations in concentrations of ligand and hydrogen ion at all experimental points) corrected for degrees of freedom, indicate that the experimental data can be represented by the model. Small values of mean, standard deviation and mean deviation for the system confirm that the residuals are around a zero mean with little dispersion.

For an ideal normal distribution, the values of kurtosis and skewness should be three and zero, respectively. The kurtosis values in the present study indicate that the residuals form leptokurtic patterns. The values of skewness recorded in the table are between -1.66 and 1.14. These data evince that the residuals form part of a normal distribution; hence, least squares method can be applied to the present data. The sufficiency of the model is further evident from the low crystallographic R values. Thus, the statistical parameters show that best fit models represent the acid base equilibria of MSA, dopa, phen in dmf-water mixtures. The primary alkalimetric titration data were stimulated and compared with the experimental alkalimetric titration data, to verify the sufficiency of the model. The overlap of the typical experimental and simulated titrations data given in Figure 1 indicates that the proposed models correctly represent the experimental data collected from the refinements carried in the pH range of 2.0-12.0.

### Effect of systematic errors on best fit model:-

Any variation in the corrections of ingredients like alkali, mineral acid and the ligand effects the magnitude of protonation constants. Such parameters are termed influential parameters. MINQUAD75 does not have provision to study the effect of systematic errors in the influential parameters on the magnitude of protonation constant. In order

to rely upon the best fit chemical model for critical evaluation and application under varied experimental conditions with different accuracies of data acquisition, an investigation was made by introducing pessimistic errors in the concentrations of mineral acid, alkali, and ligand. The results of a typical system given in Table 2, emphasize that the errors in the concentrations of alkali and mineral acid affect the protonation constants with increased errors in the concentrations of the ingredients corroborate the appropriateness of the experimental conditions. Statistically the best chemical models that represent acid–base equilibria under study should have very low standard deviation in their protonation constant ( $\log \beta$ ) values that indicate the precision of the parameters. The increased standard deviation in protonation constants and even rejection of some species on introduction of errors confirms the correctness of the proposed models. This type of investigation is significant as the data acquisition was done under varied experimental conditions with different accuracies.

#### **Protonation Equilibria:-**

The stepwise protonation constants and number of equilibria can be determined from the secondary formation functions such as average number of protons bound per mole of ligand ( $nH$ ). The pH values at half integral of  $nH$  correspond to the protonation constants of the ligand and the number of half integrals in the pH range of the study corresponds to the number of equilibria. Thus, three half integrals (0.5, 1.5, and 2.5) versus pH in the case of MSA [figure 2(b)] and of dopa [figure 4(b)] conform the presence of three protonation–deprotonation equilibria. The maximum value of MSA and dopa in the formation curve figure 2(b) and 4(b) is three, which clearly shows that MSA and dopa has three bound protons per molecule and the half integral (0.5) of phen [figure 6(b)], emphasize the presence of one protonation-deprotonation equilibria in the pH range of present study.

The typical distribution plots figure [2(a),4(a),6(a)] produced using protonation constants from the best fit table 1, show the existence of  $LH_3, LH_2, LH$  and  $L$  species in case of MSA and  $LH_4^+, LH_3, LH_2^-$ , and  $LH^{2-}$  in dopa and  $LH^+$  in the case of phen.  $LH^+$  is the most predominant species in the case of phen [figure 6(a)] at a pH 3.5-11.0 and  $LH$  in case of MSA [figure 2(a)] at pH 2.0-9.0 respectively, and of dopa [figure 4(a)] it is  $LH_3$  at a pH range of 2.0-11.0.

#### **Effect of Solvent:-**

The reaction medium is one of the most important influencing factors in determining the equilibrium constants. The solvent effect on protonation constants could be explained on the basis of dielectric constant of the medium, solvent structure, preferential solvation and microscopic parameters. The variation of protonation constants or change in free energy with the organic solvent content depends upon two factors; electrostatic one, which can be estimated by Borns equation and non electrostatic one, which includes specific solute solvent interactions. When the electrostatic effects dominate the equilibrium proceeds, according to Borns equation [26], the energy of electrostatic interaction is related inversely to dielectric constant [27]. Hence, the logarithm of stepwise protonation constants ( $\log K$ ) should vary linearly as a function of the reciprocal of the dielectric constant of the medium. It is observed that in DMF media the  $\log K$  values of MSA, dopa and phen increase linearly as a content of organic containing pure water as a solvent [28-31] but small differences are possibly due to the different experimental procedures, temperature and different background electrolytes used. In this study the linear variation of  $\log K$  values as a function of  $1/D$  (figure 8) in mixtures shows that the dominance of electrostatic interactions. This linear increase can be attributed to ion association reaction, solute solvent interactions and solvent basicity (acidity) effects.

**Conclusions:-**

1. MSA has three dissociable protons which exists in  $LH_3$  form at low pH gets deprotonated with the formation of  $LH_2^-$ ,  $LH^{2-}$  and  $L^{3-}$  species successively, with increase in pH.
2. Dopa has three dissociable protons and one amino group which can associate with a proton. It exists as  $LH^{4+}$  at low pH and gets deprotonated with the formation of  $LH_3$ ,  $LH_2^-$  and  $LH^{2-}$  successively with increase in pH.
3. Phen forms  $LH_2$  at low pH and gets deprotonated with the formation of  $LH^+$  and  $L^{2-}$  with increase in pH.
4. The linear variation of log values of stepwise protonation constants with decreasing dielectric constant of the media confirms the dominance of electrostatic forces in the protonation-deprotonation equilibria of MSA.
5. The log values of protonation constants of dopa increase linearly with decreasing dielectric constant of dmf-water mixtures. This indicates the dominance of electrostatic forces in the protonation-deprotonation equilibria.
6. Phen exhibits linear trend indicating the dominance of electrostatic forces.
7. The effect of systematic errors in the influential parameters on the protonation constants shows that the errors in the concentrations of alkali and mineral acid affect the protonation constants more than those in the concentration of ligand solutions.

#### Abstract

Hydatid disease is parasitic infection caused by echinococcus granulosus (larvae of a tapeworm). It occurs usually in the Endemic Areas: Mediterranean countries, Middle East, Australia, Southern part of South America, New Zealand and intensive endemic in Central Asia particularly China and rarely in Northern Europe. It usually affects the liver, lung and there are a few cases of uncommon location in other parts of the body. It can be detected by US, CT, MRI. It is classified into 4 types based on the radiological appearance: **type 1** simple cyst with no internal architecture with or without hydatid sand or septal, **type 2** cyst with daughter cysts and matrix (**A**- round daughter cysts at periphery, **B**- larger, irregularly shaped daughter cysts occupying the entire volume of the mother cyst, **C**- oval masses with scattered calcification and occasional daughter cysts), **type 3** dead cyst with total calcification, **type 4** complicated cyst with rupture and superinfection. We report a rare case of a man with sub-hepatic large hydatid cyst with fat content with no clear biliary communication in CT imaging. CT imaging showed a large cystic non-enhancing lesion in the porta hepatica level extending down, compressing the pancreas, the inferior vena cava and displacing the stomach as well with fluid-fat level (-90 to -110 HU) and small globules of fat density within it. Only a few cases have been reported for hydatid cyst with fat globules within it. Only 1 report of 3 cases reported in 2012 described the presence of fat in the context of rupture of the hydatid cyst into the biliary tree and 1 case reported in 2016 with rupture of biliary radical into hydatid cyst.

#### Case report:-

Thirty three year old male patient with previous history of contact with animals presented to AL-Noor Specialist Hospital, Makkah, Saudi Arabia with abdominal pain and distention for 1 month in January 2017. Labs: hemoglobin:11.9 mean platelet volume:10.8 hematocrit:36.3 WBC:4.81 mean corpuscular volume:79.6 Eosinophils:9.6 monocytes :6.4 RBC:4.56 MCH:26.1 RDW-CV:15.2 total protein:9.8 blood glucose:88 urea:42 Echinococcal antibody :>1024 HCV Ab:negative Hbs Ag:negative.

CT imaging showed a large cystic non-enhancing lesion in the porta hepatica level extending down, compressing the pancreas, the inferior vena cava and displacing the stomach as well with fluid-fat level (-90 to -110 HU) and small

globules of fat density within it. Another cyst was noted above the urinary bladder which showed enhancing internal membranes. No calcification nor daughter cysts were detected. These CT findings were not very typical for hydatid cyst so we did MRI and it showed same previously described findings, evidence of water-lily sign in the sub-hepatic cyst and clear fat plane separating between the liver and the cyst. So the diagnosis of intra-abdominal multiple complicated hydatid cyst was made. The patient was managed conservatively with Metronidazole 500mg tablet, Ciprofloxacin 500mg tablet, Albendazole 400 mg tablet, Hydrocortisone 100 mg vial.

**CT of abdomen:**

**Show large cystic non enhancing lesion with small globules of fat density within it.**

**CT- show fat fluid level.**

MRI – Show water lily sign.

### Discussion:-

Hydatid disease is a worldwide disease involving the liver in 70% of cases, produced by *Echinococcus granulosus* (larvae of tapeworm). Diagnosis is based on radiological findings of different types of hydatid cysts. One of the rare findings is the presence of fat within a hydatid cyst. Three cases reported in 2012 described the presence of fat in the context of rupture of the hydatid cyst into the biliary tree, and one case reported in 2016 with rupture of a biliary radical into a hydatid cyst. This case describes a sub-hepatic large hydatid cyst with fat content and no clear biliary communication.

### Conclusion:-

A hydatid cyst with fat inside it is a rare finding. It can be due to the process of degeneration of the hydatid membrane or communication of the cyst with the biliary tree. Although it rarely happens, it can occur.

#### Abstract

**Introduction:** Several methods have been advocated for reconstructing maxillectomy defects. The use of an obturator prosthesis is one of them. Effective obturation of maxillary defects produces sufficient separation of the oral and nasal cavity to improve the quality and intelligibility of speech.

**Prodecure:** A patient aged 65years presented to Government Dental College and Hospital, Srinagar with the chief complaint of swelling in the right posterior region of palate. Patient was completely edentulous in both the arches. Clinical examination revealed a large granular swelling involving the right postero- lateral portion of hard palate and posterior alveolar ridge. Patient was referred to the Department of Prosthodontics for construction of maxillary obturator. Prosthodontic rehabilitation of the defect was organized into three stages of treatment. Firstly an immediate surgical obturator was fabricated which was placed after the surgical removal of tumour. After 2 weeks impressions were made and an interim obturator was fabricated. After 3 months of healing a patient was given a definitive prosthesis.

**Conclusion:** Quality of life of patients with maxillary defects can be improved with the provision of a properly designed obturator. The prosthetic obturator can restore mastication, swallowing, esthetic particularly the midface, resonance and speech. Patients with maxillofacial defects who undergo rehabilitation can resume their social habits in the normal way.

#### Introduction:-

The maxilla is a functional and esthetic keystone of the mid-face forming part of the mid-facial elements which are the orbit, the zygomatico-maxillary complex, the nasal unit and the stomato-maxillary complex<sup>1</sup>. Maxillofacial defects may be a result of congenital malformations, trauma or surgical resection of tumors. The primary objective of rehabilitating these defects is to eliminate the disease and to improve the quality of life for these individuals<sup>2</sup>. Malignant neoplasms of upper gingiva and hard palate nearly account for 1-5% of total occurrence in the oral cavity; two third of the lesions which involve these areas are squamous cell carcinomas<sup>3</sup>. Unfortunately they spread to adjacent structures, by the time they are diagnosed. The recommended treatment for these type of lesions are alveolectomy, palatotomy, partial/total maxillectomy, depending on the aggressiveness & location of the actual lesion, its histotype, patient's age and general health status. The post-surgical effect usually has serious consequences as it disturbs both form and function of normal stomatognathic system. Rehabilitation of these acquired maxillary defects can be accomplished by using various type of micro-vascularised flap or by prosthetic

means. Surgical reconstructions are usually considered when extensions of the defects are small. For larger defect, prosthetic rehabilitation seems to be a better alternative, since more risks are involved for survival of the graft<sup>4</sup>. Several methods have been advocated for reconstructing these defects. The use of an obturator prosthesis is one of them. Effective obturation of maxillary defects produces sufficient separation of the oral and nasal cavity to improve the quality and intelligibility of speech. It also enhances masticatory function, deglutition and esthetics. Prosthetic intervention should occur at the time of surgical resection and will be necessary for the remainder of the patients life<sup>5,6</sup>. This present report describes a prosthodontic rehabilitation of a patient with squamous cell carcinoma in the maxilla.

### Case Report:-

A patient aged 65 years presented to Government Dental College and Hospital, Srinagar with the chief complaint of swelling in the right posterior region of palate. Patient was completely edentulous in both the arches and presented a history of cigarette smoking from last 35 years. Clinical examination revealed a large granular swelling involving the right postero-lateral portion of hard palate and posterior alveolar ridge (Fig 1). An incisional biopsy was performed and the sample was sent for histopathological examination which revealed undifferentiated squamous cell carcinoma. Patient was referred to the Department of Prosthodontics for construction of maxillary obturator.

Figure 1:-

Figure 2:-

**Figure 3:-**

**Figure 4:-**

**Figure 5:-**

**Figure 6:-**

Figure 7:-

Figure 8:-

#### Procedure:-

The pre-operative impression was made using an irreversible hydrocolloid material (Zhermack) in a modified perforated stock tray. The impression was poured with dental stone to produce the cast. The cast was sent to the surgeon to delineate area of resection and an immediate surgical obturator was fabricated using clear auto polymerizing resin (Fig 2,3). In the operating room resection of the maxilla was done to remove the tumor (Fig4) and a surgical closure was attempted using the remaining and neighbouring soft tissues (Fig 5).

The defect was large and the available tissues were not sufficient to completely close the defect. The surgical obturator was inserted immediately after resection of the maxilla and held in position using sutures in the canine fossa region (Fig 5). After two weeks the clinical intra and extraoral examination revealed a good initial healing at the defect site. The extraoral suture was removed at the surgery department. The fabrication of an interim obturator was initialized. The usual steps in fabricating the conventional acrylic partial denture were followed. Surgical obturator served as a custom tray for impression making. Elastomeric impression material was used for recording the details of the defect site (putty polyvinyl silicone followed by a light body wash). Impression was beaded and boxed and poured for fabrication of cast on which an interim obturator was fabricated using heat polymerizing acrylic resin (Fig 6-8). Finally after a period of 3 months patient was provided with a definitive prosthesis.

#### Discussion:-

Rehabilitation of patients with acquired maxillary defects is relatively simpler than rehabilitation of defects in the mandible, and pleasing as well as accepted outcomes can be identified at the end of treatment. On the other hand, great efforts should be given in dealing with large defects to obtain the substantial requirements for retention and support of the prostheses<sup>7</sup>. Two primary objectives of maxillo-facial prosthodontists in carrying out rehabilitation is to restore the functions of mastication, deglutition, speech and to achieve normal oro-facial appearance<sup>8</sup>.

The aggressive nature and pattern of undifferentiated squamous cell carcinoma in the maxilla makes it difficult to remove completely, which explains the high recurrence rate of this type of tumor. For this reason, rehabilitation with

prosthetic obturator is preferred. Moreover, the economic factor plays an important role which should be taken into account during treatment decision. Our patient had a low financial income making it difficult for him to meet more advanced treatment modalities.

In this article Prosthodontic rehabilitation of the defect was organized into three stages of treatment. For each step a different type of obturator was fabricated. To start with a simplified version of the obturator in the form of an acrylic plate and gradually converting it to make the intermediate/definite obturator proved to be helpful in relatively faster adaptation of patient to such bigger prosthesis. Quality of life of patients with maxillary defects could obviously be improved with the provision of a properly designed obturator. The prosthetic obturator can restore mastication, swallowing, esthetic particularly the midface, resonance and speech. Patients with maxillofacial defects who undergo rehabilitation can resume their social habits in the normalway<sup>9</sup>.

### **Conclusion:-**

Rehabilitation of patients with oral-nasal communication comprises the same steps as those for making conventional prostheses, which does not exclude the need to observe the individuality of each case in the planning and the need to take additional care when taking impressions and installing the appliance. Rehabilitation of such patients provides the tools with which they can resume their daily life such as talking and eating properly.

#### Abstract

**Background:** Majority of the patients suffering from chronic post-surgical pain have the assumption that the surgeon made an error or that something went wrong. in this study we will focus on the risk-factors and other dimensions of chronic post-operational pain that could help reduce the number of patients afflicted by the illness.

**Objective :** to reduce the post operative pain , This paper will also focus on the risk-factors and other dimensions of chronic post-operational pain that could help reduce the number of patients afflicted by the illness.

**methodology :** This study used secondary data, which is data that is already collected and recorded by another person that is readily available from other sources

**Results :** Chronic post-operative pain remains a common occurrence . Enhancing the control of acute post-surgical pain is among the strategies that can go a long way in the forestalling of chronic post-operative pain

**Conclusion:** Chronic post-operative pain remains a common occurrence. In the past few decades, the research standard has markedly developed although much work still needs to get done, mostly in the areas of risk factors and mechanisms

#### Introduction:-

One of the first papers discussing chronic post-operative pain was by Crombie et al. (1998). it is important to note that the research standard with regard to outcomes was quite poor. An example of such a study was one research that was done with the aim of identifying the repercussions following a hernia surgery. The methodology section showed ways of performing a hernia repair but did not indicate the number of patients that were used as subjects in the study. The issue of pain was totally ignored in the study.

In the past decade, there have been many great papers and one of the important observations is that one study in the British Medical Journal that reviewed inguinal hernia. In Wallace et al. (1996), the researchers mention that chronic pain is among the most serious yet common issue that afflicts patients in the long term following the surgical repair of inguinal hernia. This study among others shows the acknowledgement of chronic pain as one of the important outcomes of surgery.

Address:- Department of king abdulaziz university student, Saudi Arabia.

Research from the recent past shows that there is a shift in emphasis from just counting the subjects in the study to actually examining the risk factors as well as the likelihood of prevention.

### **Objectives:-**

The purpose of this paper is not to do what other papers have tried to do in the past, but to use recent publications to show areas that are controversial and interesting. This paper will also focus on the risk-factors and other dimensions of chronic post-operational pain that could help reduce the number of patients afflicted by the illness.

### **Research Problems:-**

There are a number of problems that arise in the study of chronic post-operational pain. The first involves the definition or the original problem-definition (Turk et al., 1999). The following are some of the characteristics of chronic post-operational pain. First, the pain needs to be the outcome of a surgical procedure. Second, the pain must have lasted for not less than two months. Third, other things that could have caused the pain need to get excluded, such as persistent malignancy after a cancer surgery or persistent infection. Finally, the likelihood that this pain is a continuation of a pre-existent problem needs to be considered and an attempt made at excluding it. This is a grey area in surgery because the surgery itself may increase the effects of a pre-existing condition, causing a lot of pain.

If the numbers shown above are accurate, then pain clinics should get a huge number of such individuals. It remains critical to remember that research on the effects of surgery where prolonged pain is primarily under study find a greater incidence than cases where it is not. Could it be that patients fail to mention chronic post-surgical pain until they are asked or is it that such studies overestimate the incidence? In case the incidence of chronic post-surgical pain is as high as other studies portray it to be, then what happens to these patients? Could it be that they are suffering silently or receiving the appropriate primary care?

### **Mechanisms:-**

Very little is understood regarding the mechanisms of chronic post-surgical pain. Different pain syndromes result from different mechanisms even when considering the same operation. For example, after the amputation of the lower limb, patients may experience different kinds of pain such as stump pain, phantom pain or back pain. It is clear that majority of the syndromes are neuropathic and are the outcomes of changes to the nervous system following the injury. Surgery needs to be considered as an injury, but one that is performed for beneficial reasons.

### **Literature Review:-**

Majority of the patients suffering from chronic post-surgical pain have the assumption that the surgeon made an error or that something went wrong. Normally, this is not the case and it shows that educating patients on chronic post-surgical pain would go a long way in helping them deal with the problem. Patients who normally feel that the reason behind their chronic pain is the result of a mistake made during the surgery usually suffer from more distress and behavioral disturbance. Moreover, they respond poorly to medication while having low prospects of success with regards to future medications.

According to Turk and Okifuji (1999), patients who hold the belief that they got injured during the surgical procedure suffered from lower pain thresholds, deconditioning, lower tolerance and lower activity. Eliminating the behavior of assigning blame can assist doctors and patients. It looks like long-lasting pain following an operation remains inevitable in a certain number of instances such as an infection to a wound. If this is the case and chronic post-surgical pain gets discussed in an open environment and is made part of the information that patients receive just before surgery, the grief that comes later will be avoided.

One of the area that requires particular attention is injury to nerves. It normally is presumed that nervous injury is the outcome of many neuropathic post-operational syndromes of pain.. According to Richardson et al. (1999), there is a point prevalence of neuralgia that occurs after thoracotomy.

A number of papers written by Nottingham et al. (2008) looked at this issue. The initial paper demonstrated that individuals with rib retraction in the course of thoracotomy get damage to intercostal nerves. The damage arises at a number of stages and may be the result of dispersion of the ribs, which is the outcome of ischemia, pressure that is applied directly as well as broadening. The next study found that long-lasting pain was not only common, but also resulted in a high level of ill health.

Chronic pain was linked to pain that was more chronic and persistent and had substantial impacts on the lives of the patients.

The suggestion in this case is that there is a more serious etiology for pain that arises after thoracotomy that is neuropathic to intercostal nerves alone. With regard to the pain following a mastectomy, Carpenter (1999) argues that the risk factor that is generally accepted of impairment to intercostobrachial nerves mainly remains circumstantial. In the study by Carpenter (1999), two individuals who underwent a lumpectomy procedure with no external dismemberment developed post-mastectomy pain syndrome. The case was the same for four women whose intercostobrachial nerve got spared. Several studies done on breast surgery have looked at the ramifications of preservation of the intercostobrachial nerve.

In another study, which was a controlled randomized trial, Abdullah et al. (1998) looked at the effects of maintaining or sacrificing the intercostobrachial nerve in the course of axillary allowance. The researchers discovered that for several reasons, the possibility of preserving the nerve was nonexistent.

After twelve weeks, the symptoms deteriorated for the two groups, but mostly within the group that had their nerves preserved. There were also two individuals who suffered from sensory-loss objectively and, thus, had no symptoms. On the other hand, patients that had sensory symptoms lacked a sensory deficit in an objective manner. Moreover, other studies show similar outcomes (Tasmuth et al., 1996). In one research that involved 38 patients suffering from ipsilateral pain in their arms following a mastectomy. Vecht et al. (1993) found that eight individuals among the patients were found to have pain after the surgery.

Every patient underwent a dissection in the auxiliary node and the researchers found another eight causes in the rest of the patients. A study conducted to examine patients who went through axillary operation though without any chemotherapy or radiotherapy showed no signs of recurrence. However, seventy percent of patients reported numbness while only thirty percent said that they felt pain. According to Polinsky (1994), 81% of the patients that underwent an axillary operation said that they felt numb. On the other hand, only 22 to 32 percent said that they felt pain according to the type of surgery.

A study done to compare the psychophysical examination of patients suffering from pain following a mastectomy procedure and those who felt no pain after undergoing the same surgery, Gottrup et al. (2000) discovered that patients in either group had lowered sensitivity to pinprick and thermal stimuli. There was a reduction of the pressure-pain threshold within the pain group. However, the pain-free subjects did not experience any change. Gottrup et al. (2000) then concluded that repetitive stimulation using pinpricks in the area surrounding the scar resulted in an increase in the intensity of the pain.

The intensity of the pain was linked with impulsive intensity of pain. The fact that the surgeons avoid major nerve trunks is not sufficient reason to avoid chronic post-operational pain. Moreover, the sectioning of nerves does not always lead to chronic post-operational pain. It is impossible to conduct operations without causing injury to parts of the nerve system at a certain point.

#### **Risk Factors and Prevention:-**

Whenever one intends to forestall an event, they would like to understand the factors that contribute to its manifestation. It remains unnecessary to totally understand the causation. Apart from Anesthetics, John Snow also pioneered the field of Epidemiology.

#### **Methodology:-**

A systematic review was conducted using an electronic search of Google Scholar, Medline, Embase, and Scopus to identify studies evaluating Chronic post operative pain After choosing the relevant database, We included all types of study (Randomized Control Trials, descriptive and cohort studies). All the studies found based on the keywords and published between 1986 and 2013 and in English language were included in the review. In case the variables were incompatible with the core of this research paper, the papers were left out.

This would ensure that the findings and arguments of the authors quoted in this paper could be compared to find similarities and differences in the data... The researchers finally ended up with a set of 32 papers that met all the

above criteria and that were subsequently used to come up with the following findings, discussions and conclusions.

### **Findings and Discussion:-**

While it may be difficult to understand in detail what causes chronic post-surgical pain, it is possible to come up with strategies that lower its occurrence. It remains a mystery why among people who have undergone the same surgical procedure, some feel pain, while others feel no pain. The source of chronic post-operational pain is complicated. However, the thing that is known is that the chronic pain is related to injury as well as a function alteration. Nonetheless, psychological and social factors remain very crucial.

The occurrence as well as seriousness of serious pain following a surgical operation does not directly link to the magnitude of the procedure. According to Brandsborg et al. (2008), a number of research studies indicate that surgery in itself has a serious risk for causing long-term and chronic pain. This occurs after a serious procedure like a thoracotomy or amputation, but even following minor surgical operations as well.

The risk factors for chronic post-surgical pain can be classified into medical as well as patient factors. Every patient has a unique genotype, past experience, medical history, psychosocial circumstances and beliefs regarding the problem. Factors within the environment that act on the patient will include the anesthesia, type of surgery, perioperative analgesia as well as other treatments.

### **Demographic Factors:-**

When it comes to hernia repair and breast surgery, an increase in age appears to lower the risk of experience chronic post-surgical pain. With regard to breast surgery, for example, patients of a younger age tend to develop tumors that are larger than that of people in their advanced years. Younger patients tend to experience long-term postoperative pain. According to Smith et al. (1997), an incidence of chronic pain following a mastectomy was around 26 percent for individuals of at least seventy years of age, 40% for those between fifty and sixty-nine years and 65 percent for those between thirty and forty-nine years old.

### **Psychosocial Factors:-**

There exist numerous papers regarding the effect of psychological and social factors on chronic post-surgical pain.

A study conducted by Taenzer et al. (1986) points out that healthcare providers who wish to identify patient at risk who experiences chronic post-operative pain is advised to think of the typical emotions that the patient experiences and not what the patient feels prior to the operation. Tasmuth et al. (1996) also conducted a study where women who underwent breast cancer surgery found heightened levels of depression and anxiety prior to surgery compared to other healthy women. However, one year after the surgical procedure, the levels of anxiety among these women had returned to normal. However, in patients that experienced chronic post-surgical pain, depression was higher.

A study was conducted by Jess et al. (1998) on patients with laparoscopic cholecystectomy and discovered greater neuroticism levels after one year among patients who experienced chronic post-surgical pain.

Fear of surgery was connected to poor global recovery as well as the quality of life after six months. Nonetheless, the psychological factors which appear as risk factors in chronic post-surgical pain lack a similar association as acute pain. With regard to serious pain generally, the life quality is affected more through cognitive factors, mostly the catastrophizing of pain more than its intensity. There is a likelihood that psychosocial factors play an important role in chronic post-operational pain.

### **Preoperative Pain:-**

A number of studies on hernia surgery suggest that pain prior to the operation is a key risk factor for serious post-operational pain (Wallace et al., 1996; Poobalan et al., 2001; Poleshuck et al., 2006). According to Page et al. (2009), who conducted a properly-designed study on this topic, established that approximately 25 percent did not experience any pain at rest prior to their hernia repair. 50 percent of the subjects experienced mild pain while the others experienced pain that may be considered mild to moderate.

Some of the patients who did not experience any pain before the operation felt pain afterwards while 5 percent noted that their daily lives were worse twelve months after the surgical operation. In a study on post-amputation pain, Nikolajsen et al. (1997) established an association between pain prior to the amputation and a heightened risk of

phantom and stump pain in just three months following the operation. Keller et al. (2000) established that 48 percent of individuals under narcotic analgesics prior to thoracotomy felt chronic post-surgical pain and among these, only 5 percent were not under narcotics.

Kroner et al. (1989) established a correlation between phantom breast pain and pain prior to the operation. Pain intensity prior to the total hip replacement appears not to have any correlation with chronic post-operational pain.

#### **Serious Postoperative Pain:-**

Most studies show that there is a correlation between chronic post-operational pain and acute post-operational pain. The first study that established a link between chronic post-operative pain and acute post-surgical pain was done by Kalso et al. (1992). Richardson et al. (1999) indicated that acute post-surgical pain was linked to chronic pain following a thoracotomy operation. In a paper meant to study the risk factors of chronic post-operative pain, Katz et al. (2005) concluded that early post-surgical pain was the main factor which predicted pain in the long term.

#### **Surgical Factors:-**

Regardless of the fact that the size of the surgical procedure cannot be easily correlated with chronic post-operative pain, the type of operation as well as its performance has an effect on the occurrence of chronic post-surgical pain. Peters et al. (2006) established general chronic pain as well as poor outcomes in operations that lasted at least three hours.

#### **Prevention:-**

Due to the difficulty encountered in treating post-surgical pain, there is the need to focus on prevention. As at now, there is little evidence of strategies that prove effective. This shows that there is a need for further research. Nonetheless, there are two strategies.

#### **Effectively Managing Post-Operative Pain:-**

There is evidence that there exists a strong correlation between chronic post-surgical pain as well as acute postoperative pain. However, proof of a causative link is yet to be established. A patient may receive a good perioperative analgesia that should be part of the program in perioperative comprehensive care due to several medical, humanitarian and ethical concerns. As shown in the above paragraphs, the selection of the analgesic and anesthetic regimen that will best offer a recovery program that is free from surgery is still in development.

#### **Surgery as a Risk Factor:-**

When it comes to chronic post-operative pain, one of the important risk factors is surgery. As of today, the only known method that can help in the reduction of the number of chronic post-surgical syndrome cases is the reduction of the frequency of surgical procedures done. Considering phantom pain, for instance, the best case to lower its incidence would be through the prevention of amputation procedures. Amputations of the lower limb are usually the outcome of vascular disease that is related to smoking and diabetes.

Nikolajsen et al. (1997) concluded that the pain incidence following an operation for breast augmentation lies at 13 percent, alternating from 21 percent to 50 percent based on the type of operation. The study also established a 22 percent incidence in surgical procedures meant to do breast reductions. There are many adverts on cosmetic surgery. However, these adverts fail to mention that chronic pain is a complication of the surgical procedure.

#### **Conclusion:-**

Chronic post-operative pain remains a common occurrence. In the past few decades, the research standard has markedly developed although much work still needs to get done, mostly in the areas of risk factors and mechanisms. Enhancing the control of acute post-surgical pain is among the strategies that can go a long way in the forestalling of chronic post-operative pain. Nonetheless, there are numerous organizational, technical as well as cultural barriers that need to be overcome so as to make the suggested improvements. There is a need for educating medical professions as well as the general public on the problem. If patients as well as doctors learn about the risks, some patients may be deterred from undergoing unnecessary and inappropriate procedures.

Dental implants, Telescopic overdenture, Retention, Implant supported overdenture, Prosthesis retention.

#### Abstract

The aim of this study is to systematically evaluate and compare between implant-supported telescopic retained overdentures reinforced by framework made of different materials in terms of retention. Search was made in 3 databases including PubMed, Ebscohost and Google scholar, title and abstract were screened to select studies related to telescopic overdenture and measuring its retention. Articles which did not follow the inclusion criteria were excluded. Included papers were then read carefully for a second stage filter, this was followed by manual searching of bibliography of selected articles. The search resulted in 15 included papers. These studies aimed to study the impact of the manufacturing technique and the recently introduced variable materials of the telescopic crowns on the retentive forces.

#### Introduction:-

Patients with conventional denture mostly complain from poor denture retention and stability especially in the mandibular denture. Problems with complete denture prostheses arise from the inability to function with the mandibular prostheses. Reasons that affect successful use of a complete denture in the mandible include; the mobility of the floor of the mouth, alveolar ridge lined with thin mucosa, decreased support area and the mobility of the mandible.<sup>[1]</sup>

Implant-supported overdentures are an accepted and reliable treatment for edentulous jaws. Clinical studies have revealed high implant and prosthesis survival rates over observational periods of up to 10 years and a high level of patient satisfaction, as well as an improvement in quality of life compared to conventional dentures.<sup>[2]</sup>

Attachments used in conjunction with implants were found to enhance the retention, stability and support of overdentures. The commonly used attachment systems connecting overdentures and implants have included bars of different designs, studs and telescopic systems. The concept of implant retained telescopic overdentures has been shown to be effective in prosthesis stabilization with regard to horizontal forces in cases of advanced atrophy of the alveolar crest.

The focus of attention in implant dentistry is shifting from "survival" to "quality of survival." Highly aesthetic restorations are becoming important criteria for the definition of success, thus non-metallic materials are now available, which imply the use of new technology and all with the advantages of superior esthetics and reduced potential for allergic reactions.<sup>[3]</sup>

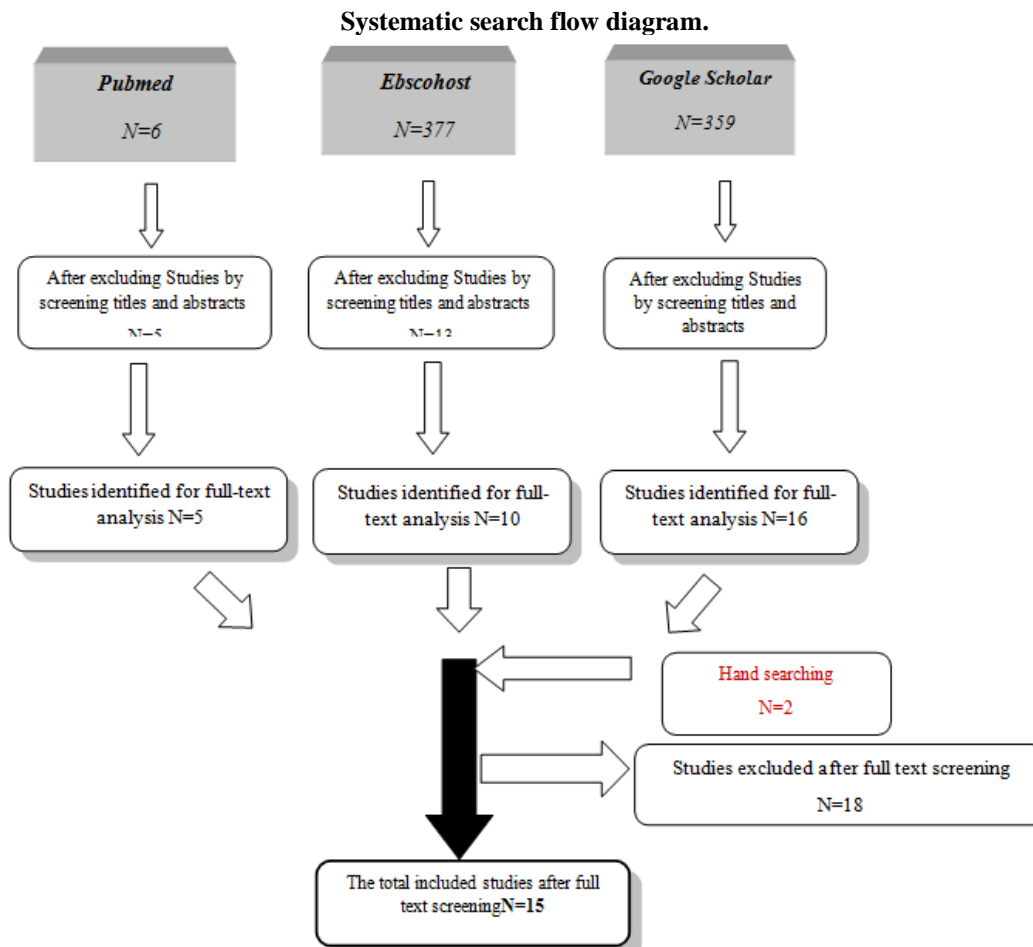

Our arising question will be in completely edentulous patient, will the material of telescopic implants overdenture have an impact on the retention?

## Materials and Methods:-

### Search Strategy:-

An Electronic Search of the literature was performed on PubMed, Ebscohost and Google scholar, using the following search terms :

1. Dental implants (Dental implants, Implants, Osseointegrated dental implants, Toothless overdenture, Implant supported overdenture, Osseointegrated implants)
2. Telescopic overdenture( Konus crown, Conus crown, Dental telescopic retainer, Dental telescope, Denture retention, Prosthesis retention, Denture prosthesis retention)
3. Retention (Retention denture, Denture dislodgment, Denture retentivity, Dental telescopic retainer, Denture retention, Prosthesis retention, Dental prosthesis retention, Dental prosthesis displacement)
4. Hand search was done on the bibliography of the included papers. Last hand search was performed on the 19th of February – 2017.

### Selection criteria:-

### Inclusion criteria:-

1. Completely and partially edentulous patient
2. Mandibular and maxillary telescopic overdenture.
3. In vivo and in vitro studies.

**Exclusion criteria:-**

- a. Medically compromised patient.
- b. Studies on animals.

**Study Selection:-**

Retrieved titles were all screened, and all papers that met the inclusion criteria were selected. Abstracts of all headings chosen were screened and obtained for inclusion criteria. After abstracts were screened, full text studies were retrieved for the selected papers. In case both the heading and the abstract of an article wasn't enough to obtain data needed to make a decision regarding inclusion criteria, full texts were retrieved. Full text papers meeting inclusion criteria were screened upon their methodology and results. Two reviewers performed the screening procedure.

**Results:-**

A total of 742 titles were identified by the electronic search. After initial titles and abstracts screening, 701 irrelevant articles were excluded and a total of 41 articles were selected for full-text screening, 2 additional articles were found through hand searching<sup>[4, 5]</sup>. After full text screening, 15 articles<sup>[4-18]</sup> were included in the present analysis.

The 15 articles included in this study were published in a period ranging from 2003-2016 except one article at 1996<sup>[8]</sup>. They differed widely with respect to methodology, study designs and outcomes. So the possibility of attempting a meta-analysis was eliminated.

The demographic data of the included articles were presented in (Table 1). The included studies showed the variability in the manufacturing method of the telescoping crowns (CAD/CAM milling, casting, electroforming, electroplating) as well as the difference of the materials of the primary and the secondary copings. The variable materials used in the following studies were zirconium, gold, PEEK (polyetheretherketone), titanium and cobalt chromium interchangeably. Surface roughness and the degree of taper were also revealed (Table 2).

The specifications of the copings beside the variation in the materials used between the primary and the secondary copings had an influence on the retentive forces during the follow up period (Table 3).

STUDIES	Methododology	ASESSEMENT
<b>Grossman AC et al.</b>	2 groups: 1- 2ry crowns made by galvanofarming technique with 0 degree 1ry crown 2- 1ry crown with 6 degrees	He measures retention which has an impact on the Oral Health Related Quality of Life (OHRQoL) with oral health impact profile (OHIP)
<b>Uludag B et al.</b>	A mandibular telescopic overdenture retained by electroformed 2ry copings with zirconia 1ry coping	
<b>Besimo C et al.</b>	2 groups The experiment is made on 40 specimens which are divided into 2 groups (20 each) in the first group the primary coping was made from gold while the second group made of pure titanium. Each twenty were divided into two equal groups. In the first group the cone angle was 5.5 degrees while the second group was 6.5 degrees. Five of the secondary copings were fabricated from Cr-Co and the other five from gold alloys. The secondary coping was placed on the inner coping with a force of 20 N which correspond to the average masticatory force. Insertion separation cycled was 10000. Saliva substitute was used.	Retention
<b>Bayer S et al 2011</b>	In vitro part: he used artificial saliva In vivo measurements were performed 4-6 weeks after the denture insertion. The attachment was cast into type IV gold alloy. The specifications of the secondary coping: 0.4-0.5 mm-sand blasted-further finishing of the inner surface was performed using burnishers with different levels of roughness. Tapering was 1-2degrees Before measurement the telescopic crowns were cleaned of adherent food or plaque. The point of measurement should not be located further than the distal surface of the second premolar. The retentive force was measured for the inical separation of the telescopic crowns approximately from the first 0.1 mm of separation	Retention
<b>Singh K &amp; Gupta N</b>	Maxillary right and left canine , mandibular right and left canine and mandibular right premolar- -Intentional RCT then long abutments were prepared 2-5 degrees, while short abutments parallel. -secondary coping with metalprojections (retention beads) for mechanical interlocking to denture surface.	
<b>Kwon H B &amp; Lee SH</b>	10 dies for double crowns were fabricated. Two kinds of inner crown were fabricated. Five inner crowns were fabricated for hybrid crowns and 5 others were made for conus crowns. Five inner crowns for hybrid crowns had a 3 mm parallel axial wall gingivally and a 3 mm inclined plane, which conformed to the outer contour of prepared teeth occlusally. Five inner crowns for conus crowns with heights of 6mm and	

	<p>a cone angle of 2 degrees were fabricated.</p> <p>An inner crown was placed into the holding apparatus of a universal testing machine , and the outer crown was placed onto the inner crown and connected to the holding apparatus of a universal testing machine.</p> <p>Compressive force was applied to the inner-outer crown assembly at a cross head speed of 100cm/min until full seating was achieved, and then tensile strength was measured at the same cross head speed. For all measurements, artificial saliva was introduced between the outer and inner crowns.</p>	
<b>Jin Yi Y &amp; Park C</b>	<p><b>1<sup>st</sup> group:-</b> When inner copings were luted to the abutments, it was found that excessive force was required for insertion and removal of the denture. The patient complained of the pain and difficulties of insertion and removal of a denture.</p> <p><b>2<sup>nd</sup> group:-</b> internal gaps were found both between the outer and inner crown of right first premolar, and between the residual ridge and free-end denture base . Even after relining procedure, fit and retentive force of retainers were still insufficient.</p>	Problems were experienced with overdenture especially those related to retention.
<b>Sakai Y et al.</b>	<p>-The average surface roughnesses of the smooth and rough surfaces of the inner crown were 0.1 and 1.5 <math>\mu\text{m}</math>, respectively; those of the outer crown were 0.1 and 1.2 <math>\mu\text{m}</math>, respectively. The 4 and 5° inner and outer crowns were prepared only with a smooth surface.</p> <p>- During measuring the retentive force the piston of the test machine applied a 100-N load on the test assembly, moved 2.5 mm upward to separate the outer crown at a separation speed of 50 mm/min, and then returned downward to insert the outer crown until 100-N load applied.</p> <p>- One thousand consecutive cycles of separation and insertion were performed at 10 cycles/minute. This test set-up permitted separation to be performed and evaluated in the axial direction only.</p>	This study evaluated the effect of surface roughness and tapered angle of cone crowns on retentive force.
<b>Mansour S et al.</b>	<p>1<sup>st</sup> case:- 6 implants in maxilla 3 implants in mandible to complete unilateral arch -One piece abutment (highly electroplated) and framework were milled into zirconium by a special CAD/CAM system then cemented as a 1ry coping.</p> <p>2<sup>nd</sup> case:- -combined teeth and implant -coping are milled with CAD/CAM then cemented</p>	The aim of this study was to present the application of all ceramic CAD/CAM milled zirconia one piece implant telescopic abutments in complex clinical situations.
<b>Gurbulak AG et al.</b>	<p>The maxillary right second premolar was prepared using commercially available models.</p> <p>-A tapered conus angle of 3° and a chamfer width of 1 mm were created using a parallelometer for the master metal die.</p> <p>-10 models were used for each group.</p> <p>- inner surfaces of the 1ry crowns and outer surfaces of the 2ry crowns were sandblasted with 110<math>\mu\text{m}</math> aluminum oxide particles for the evaluation of the initial retention force and weight. To simulate wear, specimens were inserted in specially designed wear equipment (The crowns were inserted and separated 3285 times in a horizontal direction,</p>	To measure an in vitro retention force of doubleconical crowns fabricated using primary galvanofforming and secondary casting techniques and those fabricated using primary casting and secondary galvanofforming techniques under simulated clinical

	<p>to simulate a patient's removal and replacement of the denture three times daily for 3 years.) The tests were performed in artificial saliva to lubricate the double crowns during the wear process.</p> <p><b>GROUP A</b></p> <ul style="list-style-type: none"> <li>❖ 1ry coping:- galvanoformed (gold)</li> <li>2ry coping:- non-noble (nickel chromium)</li> <li>❖ After the wear test retention <b>decreased</b> by 66%.</li> </ul> <p><b>GROUP B</b></p> <ul style="list-style-type: none"> <li>❖ 1ry coping:- non-noble (nickel chromium)</li> <li>2ry coping:-galvanoformed (gold)</li> <li>❖ Before the wear test it is three times higher in retention</li> <li>❖ After the wear test retention <b>increased</b> by 134%.</li> </ul>	<p>conditions before and after a wear test.</p>
<b>Riera JJG et al.</b>	<p>-Minimum milling height and taper would have to exceed 4 mm with a 2-degree taper for long-term stability. -The abutments (primary structures) and the Galvano-copings (secondary structures) were replaced on the master cast and a 1-mm coat of wax was placed on the external surface of the coping to provide a relief for cement.</p>	<p>Alternative prosthetic retentive means were assessed.</p>
<b>Bayer S et al.</b>	<p>The double crowns were fabricated from high-gold-content Type 4 alloys. The crowns had a preparation of 1–2°. A specifically designed measuring device was used. The retentive forces were measured with and without lubrication by a saliva substitute. The measured values were analyzed according to the type of tooth (incisors, canines, premolars, and molars). Thermoplastic material was filled into the primary telescopic crowns to provide an adequate retention on the inside of the crown. Spring-hard steel wires were provided with retention and fixed in position in the thermoplastic material. The wires were manually aligned parallel to the milling or withdrawal direction of the telescopic crown. The surfaces of primary and secondary telescopic crowns were cleaned with alcohol. The primary crowns were inserted into the secondary crowns using a ball plugger, which was pressed onto the Kerr material. The retention force was then measured by inserting the measuring stylus into the wire retention and by withdrawing the telescopic crown axially. Additionally, a comparison between lubricated and non-lubricated telescopic crowns was done.</p>	
<b>Stock V et al.</b>	<p>Retentive Force was measured in a pull-off test (20 pull-offs/specimen)</p>	<p>To measure an in vitro retention force of double conical crowns fabricated using different materials primary and secondary crowns with different taper (0, 1, and 2 degrees).</p>
<b>Turp I et al.</b>	<p>Samples were subjected to 10,000 insertion–separation cycles in artificial saliva and retention force was measured. X-ray diffraction and scanning electron</p>	<p>To evaluate zirconia as a substitute for gold alloy in primary crowns facing</p>

	microscopeanalysis were performed on the sample surfaces.	secondary crowns manufacturedwith different materials, in terms of long-term retention force changes, wear, and phase transformation.
<b>Pietruski J K et al.</b>	Experiment of 10.000 in-and-out cycles was performed using a new device which allows the retentive force to be measured in continuous way without necessity of moving the samples to another device.	To measure an in vitro retention force of double conical crowns fabricated using different materials primary and secondary crowns with different taper (2°, 4° and 6°).

Studies	Results	Histomorphometric Analysis
<b>Grossman AC. Et al.</b>	The difference in OHIP before treatment and 6 and 9 months later was significant (was better after treatment) The author mentioned that treatment planning should be based on objective factors including not only solid evidence for clinical performance but also patient satisfaction and OHRQoL.	-Patients in the Galvanoformed group rated the retention ( $P = .04$ ). -The difference between the groups was not significant at any time. With the exception of assessment of overall denturefunction in the Galvanoformed group,all other ratings had a median of 10,indicating a very high satisfaction of patients in both groups.
<b>Uludag B. et al.</b>	He mentioned that the electroformed crowns had a superior fit in comparison to conventional cast crown. Also he mentioned that the main advantage of zirconia copings lies in the elimination of the galvanic currents and thermal protection of the abutment teeth. However they are bulky compared to the conventional casted copings.	N/A
<b>Besimo C et al.</b>	The mean initial retentive force of the pure titanium telescopic crowns didn't differ statistically from the values obtained from samples with secondary crowns cast in a gold or a cr-co alloy. Retention increased in the pure titanium and gold unlike cr-co regardless of the angle. This is attributed to the mechanical adaptation at the interface between the inner and outer crowns. Such force characteristics might be the result of different physical properties of the various materials used ( elastic modulus) The delayed wear of the telescopic crowns might also have been associated with the low force used to seat the outer crown onto the inner crown	N/A
<b>Bayer S et al.</b>	The retention force measured intraorally is higher than the extra oral values measured	-The in vitro median value of 1.97 N to the in vivo median value of 4.70 N by the Mann-Whitney test showed a significant

		<p>difference(<math>p &lt; 0.0001</math>).</p> <p>-To compare the data of both groups, a Spearman test was performed. The result of the test showed a Spearman's <math>q = 0.5052</math>. This means that the values are highly correlated with each other.</p>
Singh K & Gupta N	<p>Tooth supported removable overdentures with telescopic crowns provide better retention, stability, support, stable occlusion, decrease in the forward sliding of the prosthesis and better proprioceptive reflexes allowing better control of mandibular movements which increase chewing efficiency and phonetics. Also the rate of the residual ridge resorption was decreased.</p>	N/A
Kwon H B & Lee SH	<p>The initial retentive force of double crown was affected by the type of the double crown system.</p> <p>Conus was better than the hybrid regarding the retention.</p>	<p>The average retentive force in group 2 (CONICAL), in which the hybrid outer crowns was used showed higher value than those of group 1 (HYBRID) (<math>p = .0198</math>).</p>
Jin Yi Y & Park C	<p>Insufficient or excessive retention in conical crown retained denture is common. Gap between inner coping and outer crown or removal difficulty, besides incomplete seating of denture found in conical crown-retained denture were assumed from the laboratory processing error occurred during coping transfer procedure from the mouth to the model. To prevent this problem, secure anchoring of inner coping and re-examination and milling of convergence angle was recommended on the master model from pick-up impression.</p>	N/A
SAKAI Y et al.	<p>-Regarding the effect of tapered angle on retentive force, the smaller the tapered angle of the cone crowns the greater the retentive force was.</p> <p>-The retentive force in the cone crown telescopic system is considered to be generated mainly by the residual elastic strain in the outer crown. This elastic strain occurs due to the deformation of the outer crown on the inner crown when occlusal force is applied firmly, and remains when the occlusal force is separated because of the existence of the inner crown.</p> <p>-The retentive force of the cone crown telescopic system is produced by not only residual elastic strain due to friction but also other factors such as the micro interlocking effect especially when it is metal to metal.</p> <p>-The wear resistance of gold alloy was 3.4 times greater than that of pure titanium, therefore the wear resistance of (titanium alloy with 6% aluminum and 7% niobium is) not better than that of gold alloy.</p> <p>-The experimental cone crown telescopic system was designed for dental implants. The greater retentive force of the cone crown telescopic system has been suggested to</p>	<p>The effects of tapered angle on retentive forces were analyzed by nested 2-way ANOVA, selecting combinations of tapered angle and number of cycles of insertion and separation, and Tukey's HSD test using statistical software.</p> <p>The significance level was set at 0.05.</p>

	bind implant to the abutments tightly; consequently, a secondary splinting effect could benefit the Osseointegration of immediately loaded implants.	
Mansour S et al.	It was demonstrated that there are applications of zirconia in implants dentistry while cementing of telescopic crowns to implants' abutments which is controversial to the one-piece milled telescopic abutments as an alternatives and economically treatment option. Longitudinal studies have to prove the success of this method.	N/A
Gurbulak AG et al.	<p>- The retention force of a telescopic crown is influenced by factors of abutment tooth preparation, such as taper angle, height, and marginal design, and also by factors associated with the fabrication process, such as milling speed, degree of cutter wear, polishing, casting technique, and setting method also the contact surface pressure ,surface roughness and the static frictional coefficient (SFC) have a great influence on the retention <i>thus</i> it could be controlled by changing the taper angle of the double crown and the thickness of the secondary crown.</p> <p>The reasons that group B is higher in retention after the wear test than group A is:-</p> <ol style="list-style-type: none"> <li>1-Galvanoformed crowns fit precisely to dental restorations and also improve marginal fitting due to the elastic deformation.</li> <li>2- Contact surface pressure and cone angle did not vary, but the difference in crown materials caused a variation in SFC. Retentive forces in conical double crowns are generated by the residual elastic strain in the secondary crown, which correlates with the SFC.</li> <li>3-Change in weight after the wear test.</li> <li>4-Smooth surface of 2ry coping (after the wear test) in group B increased contact unlike internal beads in group A.</li> <li>5-Plastic deformation occurring increased the actual contact area.</li> </ol> <p>As a conclusion secondary coping is more influential in the retention beside the advantages of the galvanofforming technique weremanifested in the secondary crown but not in the primary crown.</p>	In group A, the wear test had a significant influence on the retentive force ( $p < 0.05$ ), but wear produced no significant difference in weight ( $p > 0.05$ ). In group B, the wear test had a significant influence on the retentive force ( $p < 0.05$ ), and wear produced a significant difference in weight ( $p < 0.05$ ).
Riera JGG et al.	<p>-Prosthetic restoration of the edentulous maxilla with osseointegrated implants and a telescopic detachable prosthesis using Galvanic copings was presented as an alternative to traditional retention techniques for overdentures.</p> <p>-The use of basic parallel-milling techniques and electroforming permitted the fabrication of a prosthesis with significant retention and few moving parts, further minimizing potential maintenance.</p>	N/A
Bayer S et al.	<p>-No statistically significant difference between lubricated and unlubricated specimens was found.</p> <p>-The results indicate that retention force values of telescopic crowns, measured in clinical practice, are often much lower than those cited in the literature.</p> <p>-The measurements also show a wide range. Whether this proves to be a problem for the patient's quality of life or not can however only be established by a comparison of the presented results with a follow-up study involving</p>	<p>-The median retention force value was calculated for each telescopic crown and differentiated according to the type of tooth showed that the measurements do not differ significantly (Kruskal-Wallis test, <math>p = 0.6334</math>).</p> <p>-The statistical analysis was</p>

	measurement of intraoral retention and determination by e.g. oral health impact profile	performed by a Mann–Whitney test. It showed that there was no significant difference between the measurements with and without saliva lubrication (p=0.0506).
Stock V et al.	CoCr and ZrO <sub>2</sub> mainly adhere through friction and wedging, whereas galvanic crowns basically adhere by hydraulic adhesion. It can be assumed that the variation in the results is not only material related, but also especially related to the manufacturing techniques. The viscosity of the applied saliva, as well as the chamfer design, may influence the hydraulic adhesion and, thus, the retention force as well.	Cobalt Chromium CoCr and Zirconium dioxide ZrO <sub>2</sub> both present a high elastic modulus (200 GPa) and are rigid and stable (280 HV 10; 1200 HV 10). PEEK, in contrast, is soft and ductile (110 HV 5/20) and shows a low elastic modulus (4 GPa). Putting a CoCr or ZrO <sub>2</sub> secondary crown on a PEEK primary crown could lead to a strong wedging due to the flexibility of PEEK and the differences in elastic modulus. This could be a possible explanation as to why 2 degree tapered crowns show higher retention force values than 0 degree tapered crowns.
Turp I et al.	A more predictable and less excursive retention force can be obtained using a hard and rigid primary crown material like zirconia.	Zirconia (1,250 HV) is a harder material than the gold alloy (295 HV), the adaptation of the double crown takes place with the deformation of the secondary crown to fit the primary crown, without any wear on the primary crown. Therefore, the use of a hard and wear-resistant primary crown material against a less hard secondary crown material may be advantageous.
Pietruski J K et al.	It appears that the strength of this correlation is determined by the type of the material pair and also the coping fabrication technique.	Dispersion of retention values is similar in material combination casting alloy/electroforming as compared to casting alloy/casting alloy, but when cone angle was 2° or 4°, stability of retention force with the passage of time was higher in combinations with electroformed copings.

### Discussion:-

The cardinal aim of the review is to investigate how strong the value of retentive force of telescopic crowns in an implant-supported overdenture is in clinical practice.

In the field of the double crown technique, studies regarding PEEK on implants are scarce. Telescopic crowns on implants are effective in prosthesis stabilization with regard to horizontal forces in cases of advanced atrophy of the alveolar crest<sup>[4, 19]</sup>.

It was revealed that the variation in the results is not only material related, but also related to the manufacturing techniques<sup>[4]</sup>.

(PEEK) showed higher values of retention compared to (metal). In cases where the primary crown is made of metal and the secondary crown is made of PEEK and it was proven that the secondary crown is the determinant of the retentive forces<sup>[15]</sup>. Whereas the hardness of 1ry crown (metal) (455.88 HV) is more than that of the 2ry crown (PEEK) (110 HV), therefore, the use of a hard and wear-resistant primary crown material against a less hard secondary crown material is advantageous. Thus, the adaptation between primary and secondary crowns will be achieved by the changes in the fitting surface of the secondary crown<sup>[4, 5]</sup>.

Another potential explanation is that PEEK is a soft and ductile material that yields and adapts well. The adaption process resulted in a good marginal fit.

Persistence of retentive forces in conical crowns with the passage of time is higher in combinations of materials between the primary and secondary crowns<sup>[18]</sup>.

It was also claimed that the casting methods caused the formation of very minute microscopic casting beads on the internal and external surfaces of the primary and secondary crowns. Unfortunately, it is technically impossible to remove these casting beads from the surfaces of the cast crowns which apparently affect the retention by time<sup>[15]</sup>.

### Conclusion:-

Implant retained mandibular overdenture with telescopic attachments is a successful treatment option regarding the retention and improved overall function.

The retention force of a telescopic crown is influenced by factors of abutment preparation, such as taper angle, height, and marginal design, and also by factors associated with the fabrication process, such as milling speed, degree of cutter wear, polishing, casting technique, and setting method also the contact surface pressure, surface roughness in addition to the static frictional coefficient (SFC) have a great influence on the retention thus it could be controlled by changing the taper angle of the double crown and the thickness of the secondary crown.

The use of a harder and more wear-resistant primary crown material against a less hard secondary crown material is advantageous because the adaptation between primary and secondary crowns is increased by the changes in the fitting surface of the secondary crown. Unfortunately this conclusion is based on a limited number of articles, indicating the need for more clinically controlled randomized studies.

Violation of Sovereignty, Airspace,  
Foreign Aircraft

#### Abstract

State sovereignty in the airspace is complete and exclusive guaranteed by international law. This research is a normative or library research that examines the legal and enforcement arrangements sovereignty in Indonesian airspace. The results of the study are Aircraft entered Indonesian airspace without permission is a violation of Indonesia national law and international law. And as a sovereign state can take measures to preserve the sovereignty of their airspace in accordance with Indonesian national law and international law.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:

In article 5 of Law No. 1 of 2009 on Aviation that "the Republic of Indonesia full and exclusive sovereignty over the airspace of the Republic of Indonesia".As a sovereign state, the Republic of Indonesia has sovereignty fully and completely in the airspace of the Republic of Indonesia, in accordance with the provisions of the 1944 Chicago Convention on International Civil Aviation and the Convention on the Law of the Sea 1982 which has been ratified by Law No. 17 of 1985 concerning the Ratification of the United Nations Convention on the Law of the Sea.<sup>1</sup>

The provisions in this article only confirms the authority and responsibility of the Republic of Indonesia to regulate the use of airspace, which is part of the territory of Indonesia, while about the sovereignty of the Republic of Indonesia as a whole remain applicable provisions of the legislation in the field of national defense. In order to safeguard the sovereignty of the airspace of the Republic of Indonesia, to do the acquisition and development of technology so that the Unitary Republic of Indonesia can be as high as possible control of its airspace for the benefit of the widest possible for people, especially for the benefit of flight.<sup>2</sup>

Sovereignty is one element of the existence of a state. From the point of linguistic sovereignty can be interpreted as a highest authority of the Governmentstate, local, and so on. In the context of the science of statecraft, Parthiana said that sovereignty can be defined as the highest authority is absolute, complete, round and can not be divided and therefore can not be placed under the authority of another. However, in the process of further development, there has been a change in the meaning of state sovereignty.<sup>3</sup>

<sup>1</sup>Explanation of article 5 of Law No. 1 of 2009 on Aviation

<sup>2</sup>Explanation of article 5 of Law No. 1 of 2009 on Aviation

<sup>3</sup>Suryo Sakti Hadiwijoyo. 2011. *Perbatasan Negara Dalam Dimensi Hukum Internasional*, Yogyakarta: Graha Ilmu. p. 8

The sovereignty of a country is no longer an absolute or absolute, but in certain limits must respect the sovereignty of other countries, which is governed by international law. It is then known as Relative Sovereignty of State. In the context of international law, a sovereign state in essence must submit to and respect international law, as well as the sovereignty and territorial integrity of other countries.<sup>4</sup>

Management and defense issues in the border region are closely linked to the basic conception of the state as a sovereign entity, population and territory as well as the interpretation or perception of the threat. Thus, the management and defense of the border region can be considered as all efforts to realize the existence of a state that is characterized by protection of sovereignty, population and territory of the various types of threats. This conception is part of an understanding of the totality of the concept of 'national security' which in essence is "the ability of states to protect what is defined as core values, where achievement is a continual process, using all elements of power and resources that exist and embraces all aspects of life."<sup>5</sup>

Each state has a standard secure air space region closely. The national air space of a country entirely closed to foreign aircraft both civilian and military, and only with the permission of the state under the first place either through bilateral and multilateral agreements, the national air space can be entered or passed by foreign aircraft.

Violation of airspace is a condition, in which the aircraft of a country's civilian or military airspace entering another country without the prior permission of the state which he entered. Judging from several cases of cross-border violations in Indonesia are ordinary and not so threatening, but the Indonesian state must act decisively because the country's sovereignty is violated by another country. It is in fact on the ground a lot of violations of our air border areas by foreign nationals either of civilian aircraft and military aircraft.

Standard guarding the air space in Indonesia is still considered to be less due to several factors such as lack of technology owned by Indonesia, Weak radar system in Indonesia as well as the lack of the number of aircraft and defense equipment makes supervision Indonesian airspace to be not optimal.

Many foreign aircraft crossing the airspace of the Indonesian state without permission from the control tower located on land and most of the military aircraft belonging to another country in violation to fly all the way into Indonesian airspace.<sup>6</sup>

This issue becomes important warning about the security and sovereignty of the territory of Indonesia that could be threatened due to the many foreign planes passing Indonesian air territory without a permit to fly in advance of the government in this case the Air Force.

This research outlines as follows to explain: 1. Legal arrangements on airspace violations, 2. Enforcement sovereignty in the airspace of the Republic of Indonesia, 3. Barriers to enforcement Airspace Sovereignty in Indonesia.

### **Method of the Research:**

This type of research is a normative legal research. The study began with an inventory of legal regulations in both the international and national laws regarding the violation of sovereignty in the airspace. Furthermore, to determine sovereignty on the enforcement of foreign aircraft violating airspace Indonesian nation and obstacles to the enforcement of the country's sovereignty in the airspace of Indonesia conducted interviews with the parties in the Command Headquarters of the National Air Defense Sector II (Kosekhanudnas II) Makassar.

Data obtained both primary and secondary processed first and then analyzed using qualitative descriptive method, which the researchers explain, describe, and illustrate in accordance with the problems closely related to the study, and then draw a conclusion based on the analysis that has been done.

## Results and Discussion:

### Legal Arrangements Against Foreign Aircraft Infringing the Sovereignty Airspace:

Very strategic area air space for defense and security under the state has been realized by forming the 1919 Paris Convention on the regulation of aerial navigation. Article 1 of the Paris Convention in 1919 boosted by The 1944 Chicago Convention on international civil aviation asserted that each country has full and exclusive sovereignty over the air space over its territory. As is the territory is its land and territorial waters associated with controlled for sovereignty, absolute power, protection or mandate of a country. The State has exclusive jurisdiction and authority full to control the air space above its territory. Words full and exclusiveshows how much of a nation's sovereignty over its air space.<sup>7</sup>

The extent to which the country's sovereignty in the air space can actually be viewed horizontally or vertically. Horizontally country has sovereignty over the air space above the land and waters to its territorial sea. The air space above the contiguous zone, EEZ is already not under the sovereignty of the country under. Likewise for the air space over the high seas belong to all mankind. The limits of sovereignty over the air space vertically up to now unclear. This is because the absence of an agreement to which the height of the air space and start what height space begins.<sup>8</sup>

With the full and exclusive sovereignty of its state reserves the right to make the adjustment to flights in the air space. This arrangement is necessary so as the flight takes place safely and efficiently and orderly. In addition to the Paris Convention in 1919, other important legal instruments are the 1944 Chicago Convention on civil aviation. As the name implies, this convention is intended for civil aircraft, not for State Aircraft.<sup>9</sup>

Article 1 of the 1944 Chicago Convention, recognize the sovereign rights in the territorial airspace of a State, which reads:

The contracting States Recognize that every State has complete and exclusive sovereignty over the airspace above its territory.

Article 3 as the implementation of article 1 Chicago Convention, explains:

(a) This Convention shall be applicable only to civil aircraft, and shall not be applicable to state aircraft. (b) Aircraft used in military, customs and police services shall be deemed to be state aircraft. (c) No state aircraft of a contracting State shall fly over the territory of another State or land thereon without authorization by special agreement or otherwise, and in accordance with the terms thereof. (d) The contracting States undertake when issuing regulations for Reviews their state aircraft, that they will have due regard for the safety of navigation of civil aircraft.

In Chicago Convention Article 3a only stated that the convention does not apply to state aircraft / military aircraft, but no detailed explanation about it, only in the form of a statement negative. According Boer Mauna distinction whether a plane including civilian plane flight or state depending on their function rather than quality owner.<sup>10</sup>

In Article 3b of this convention only mentions that "Aircraft used in military, customs and police services shall be deemed to be state aircraft". This is not a definition but only a rebuttable presumption (iuris presumptio). Many types of activities other countries that use the air which is also owned by the state such as coastguards, search and rescue, medical services, mapping or geological survey services, disaster relief, and Government VIP transport, and others. Thus, according to Michael Milda, what otherwise Article 3b is not something exclusive and comprehensive.<sup>11</sup>

However in practice some elements that are generally used to categorize an aircraft as military aircraft are as follows: 1. design of the aircraft and its technical characteristics; 2. registration marks; 3. ownership: the fact that the

<sup>7</sup>Sefriani. *Pelanggaran Ruang Udara Oleh Pesawat Udara Asing Menurut Hukum Internasional dan Hukum Nasional Indonesia*. Jurnal Hukum Ius Quia Iustum No. 4 Vol. 22 Oktober 2015. p. 544

<sup>8</sup>*Ibid.* p. 544

<sup>9</sup>*Ibid.* p. 545

<sup>10</sup>Sefriani. *Op.Cit.* p. 545

<sup>11</sup>*Ibid.* p. 546

plane is owned by units of the military in certain cases not automatically could be proof that the plane was "used in military services"; 4. Type of operation, consisting of: the nature of the flight, documents Carried on board, flight plan, communications procedures, composition of the crew (military or civilian), Secrecy or open nature of the flight, etc.

Countries entitled to organize all kinds of activities that are above their airspace including defining areas that can be taken by civil and military flights. Flight status determination is also a determinant of the law enforcement in case of infringement. Offenses committed by civilian aircraft shall not constitute a responsibility of the state, if the breach is not directly or indirectly ordered by the state but rather delegated to the organizer or the owner of the aircraft. While the violations committed by the state or military aircraft, the state aircraft owners are responsible for the violations committed. Law enforcement against violations of airspace in accordance with applicable law in the country. In the event of a violation under the state can perform or ambush interception and forcing the plane to come down or landing at a base in accordance with the command of the country under. Violations of airspace of a country is a violation of national law and international law and international dispute resolution conducted in accordance with international law.

Basically the Indonesian national laws in line with international law that can be seen of which Article 5 of Law No. 1 of 2009 which states that "the Republic of Indonesia full and exclusive sovereignty over the airspace of the Republic of Indonesia", which adopted directly from Article 1 of the 1944 Chicago Convention.

In respect of the country's sovereignty over the airspace of the Republic of Indonesia, the Government has implemented the authority and responsibility for regulating the air space for the benefit of airlines, the national economy, national defense and security, social, cultural, and environmental air.<sup>12</sup>

Indonesian airspace own settings set by the government to establish areas where the air is prohibited and restricted. The authority to establish areas of prohibited and restricted air is under the authority of every sovereign state to regulate the use of their airspace, in the framework of the public safety, aviation safety, the national economy, the environment, defense and security.<sup>13</sup>

For sanctions against violators of the rule of Indonesian airspace governed by Article 401, 402 and 414.

**In Article 401 Reads:**

"Each person operating an aircraft Indonesian or foreign aircraft entering the airspace prohibited as referred to in Article 7 paragraph (2) shall be punished with imprisonment of 8 (eight) years and a maximum fine of Rp 500,000,000.00 (five hundred million rupiah). "

**Article 402 Reads:**

Each person operating an aircraft Indonesian or foreign aircraft that entered restricted airspace as referred to in Article 7 paragraph (4) shall be punished with imprisonment of three (3) years or a maximum fine of Rp 500,000,000.00 (five hundred million rupiah ).

**Article 414 Reads:**

Each person operating foreign aircraft in the territory of the Republic of Indonesia without the permission of the Minister referred to in Article 63 paragraph (2) shall be punished by imprisonment of five (5) years or a fine of not more Rp2.000.000.000,00 (two billion rupiah).

Harmony and firmness in law enforcement to air violators sovereign territory of Indonesia, which can be a deterrent effect, it would be very necessary. Indonesian Aviation Law does not regulate differences in the treatment of types of foreign aircraft violating sovereign territory of Indonesia. For civilian aircraft is clear that this type of aircraft should be subject to Indonesian law when in the territory of Indonesia. The aircraft can be sanctioned under Indonesian law. State under the right to make an interception, forced down, even the legal process of civil aircraft with air crews who violate the sovereign territory of Indonesia.

<sup>12</sup>Article 6 of Law No. 1 of 2009 about Flights

<sup>13</sup>Explanation of article 7 paragraph 1 of Law No. 1 of 2009 about Flights

By contrast, if the offense is the best that the state aircraft, especially foreign military aircraft entered the sovereign territory of the State of Indonesia. In international law the state aircraft has diplomatic immunity. State aircraft should not be investigated and examined by the investigation authorities, however, state aircraft, can be driven out by state aircraft Indonesia in this case the Indonesia air forces to exit the sovereign territory of the Republic of Indonesia. Violations committed this type of aircraft bore the responsibility of state and settlement using the dispute settlement mechanism under international law. According to international law dispute resolution can be done through peaceful or violent means. Under state security authorities in the framework of self-defense is entitled dispel such a plane, interception or even shoot down aircraft that foreign. Shoot down aircraft that foreign country in violation of the territorial sovereignty of the country under a form of legitimate means of violence perpetrated by the state under a foreign country if the plane was suspected of conducting activities that endanger national security vault. A peaceful solution can be done either through legal or political. Admission of guilt and an apology from the country of origin aircraft violating the country is one of the best form of accountability countries of origin when they did. Other forms of accountability are compensated for losses suffered under the state.

#### **Enforcement of State Sovereignty In Indonesia Airspace:**

The competent institution as enforcing air sovereignty is the Air Force National Army of Indonesian. It is stated in Law No. 34 of 2004 of the Indonesian Armed Forces, in the article

To implement the task implementation and enforcement of rule of law in the national air space, it takes the role of the National Air Defense Command (Kohanudnas). Because Kohanudnas has the capability of detection, identification and prosecution of the entire air vehicle that violated the airspace of the Republic of Indonesia. Meanwhile, in carrying out this task, Kohanudnas implement the **Air Defense Operations, both active and passive**.<sup>14</sup>

Basically the implementation of the Air Defense Operations divided into two namely **Active Air Defense Operations**, which includes the following activities:<sup>15</sup>

1. Detection: is the process of surveillance of air targets electronically and visually.
2. Identification is the process of determining the classification of each comrade air targets, air targets are not known or enemy air targets.
3. Repression: a follow-up of activities carried out by the identification of fighters ambushed for shadowing, dispels, forced landing and destruction.

While the **Passive Air Defense Operations**, includes:<sup>16</sup>

1. Danger preaching Air, aims to safeguard personnel and facilities against air strikes and increased readiness of all units in the face of air attacks.
2. Reduction due to attacks by air, these efforts made to regional security measure air strikes, rescue people and prevent the emergence of new dangers as a result of air strikes.

The process action carried out by warplanes assault as follows:<sup>17</sup>

1. Shadowing.
2. Intervention.
3. Force down.
4. Destruction.

For foreign civil aircraft violating airspace, carried out actions in accordance with Law No. 1 Year 2009 on Aviation of article 8 is: be warned and told to leave the area by the air traffic control personnel. In the case of warnings and

<sup>17</sup>Markas Besar TNI. 2003. *Buku tentang Pertahanan Negara Petunjuk Pelaksanaan OPSGAB TNI Tentang Operasi Hanud Nasional*. Jakarta. p. 19

orders are not obeyed, performed acts of coercion by the aircraft of the Republic of Indonesia. As well as inspected and investigated in accordance with the provisions of Indonesian law.

And for a military aircraft or a foreign country who violate the airspace of Indonesia, the Indonesian government in this case the Air Force can conduct air defense operations in the framework of self-defense which is entitled dispel such a plane, interception or even shoot down aircraft that foreign. Shoot down aircraft that foreign country in violation of the territorial sovereignty of the country under a form of legitimate means of violence perpetrated by the state under a foreign country if the plane was suspected of carrying out activities that threaten or endanger national security.

**Implementation Case Interception and Force Down aircraft Foreign air include:**<sup>18</sup>

- Interception in Bawean island between planes F-16, the Indonesian air force with F-18 US Air Force union.
- Force down in Manado, VH-RLS plane with pilot Paul Jacklin Greame and Mc Clean Richard Wayne, and imposed a penalty of 60 million rupiah.
- Force down in Pontianak, the plane containing three crews in order training (training) were identified as captain Tan Chin Kian (instructor, Singapore), Xiang Bohong (trainee, Chinese), and Zheng Chen (trainee, Chinese). And imposed a penalty of 60 million rupiah
- Force down in Kupang, private jet Saudi Arabian Airlines, captain pilot, Waleed Abdul Aziz and Abdullah Aziz Ibrahim; two co pilot, Mohammed Suliman and Mohammed Saud; two stewardess, Kaitouni Oulaya and Safa; as well as the passengers, namely Muhammed Dhafir, Sami Amadh, Muhammed Abdullah, Hussin Ali, Khalid Mushabbad, Atiah Ayed, and Domino Domingo. After inspection, the aircraft did not carry dangerous goods. Head of Information Lanud El Dance. And imposed a penalty of 60 million rupiah
- Force down in northern Borneo, the aircraft with callsign TS-3009 and TS-3011 with a pilot named James Petrick Murphy member US Navy Reserve. And imposed a penalty of 60 million rupiah.

Based on the cases of violation of the sovereignty of the airspace above it can be concluded that the Air Force can perform actions such as detection, identification and prosecution of the aircraft which breach the sovereignty of airspace Indonesia, for foreign civil aircraft which do not have the permission through Indonesian airspace then penalized in the form of administrative sanction, and pay a fine of Rp. 60,000,000 (sixty million rupiah). Whereas under Article 418 of Law 1 Year 2009 on Aviation mentioned, violation commercial flight unscheduled coming into Indonesia without permission fined a maximum of Rp.200,000,000.00. Fines were granted pursuant to the Decree of the Directorate General Air Transportation No. 195 of 2008 regarding Implementation Guidelines Approval Fly in Article 17. Fines Rp. Rp. 60,000,000.00 rated the Air Force is very small and is not comparable to the costs incurred for the country deploy fighter aircraft belonging to the Air Force (AU). According to TNI AU needed Rp.100,000,000.00 to 400,000,000.00 (one hundred million to four hundred million rupiah) for fighter aircraft Sukhoi be able to fly for an hour. As for the state aircraft or foreign military efforts are warning, interception and forced out of the territory and the sovereignty of the Indonesian government could send a Diplomatic Note to the country where their aircraft foul Indonesian airspace. However, if the warning and forced out the territory sovereignty of Indonesia not adhered even suggests actions that threaten or endanger national security and defense Indonesia, then to do the shooting and destruction of the aircraft.

**Barriers in enforcing sovereignty in the airspace of the country of Indonesia:**

In the monitoring of the airspace required vast Indonesian Defense System Main Equipment corresponding to an area of high and standard capacity. The Command Headquarters of the National Air Defense Sector II (Kosekhanudnas) in maintaining the sovereignty of airspace Indonesia operates 6 units of Radar, addition the National Air Defense Command (Kohanudnas) have Air Squadron 11 Wings 5 Lanud Hasanuddin consisting of a squadron of Sukhoi Su-30 MK2 and Su-27 SKM totaling 16 aircraft and escorting sky Indonesian air. But of all defense equipment owned by Kohanudnas especially Kosekhanudnas II Makassar, still far away with the minimum standards of military force should be owned by Indonesia. Then the next barrier is the human resources both in quantity and quality operate air defense equipment is still very limited due to the many personnel lack the advanced education technologies more renewable air defense.<sup>19</sup>

<sup>18</sup>Data The Command Headquarters of the National Air Defense Sector II (Kosekhanudnas II) Makassar

<sup>19</sup>Interview with Intelligence Assistant The Command Headquarters of the National Air Defense Sector II (Kosekhanudnas II) Makassar

**Conclusion:**

From the above results it can be concluded that the regulation of the air sovereignty violations committed by foreign aircraft as expressly provided in the 1944 Chicago Convention and Law No. 1 of 2009 on Aviation which states in its airspace sovereignty is recognized by international law. Every state entitled to organize all kinds of activities that are above their airspace including defining areas that can be taken by civil and military flights. Status of Flight is also a determinant of the law enforcement in case of violation. Enforcement sovereignty in the airspace of the responsibility of the Air Force by conducting air defense operations in the form of detection, identification, and prosecution. The limitations of the Main Tool defense capacity (Alutsista) owned by the Air Force who has not reached the minimum limit of the defense forces can be an obstacle to the enforcement of the rule of Indonesian airspace. As well as the quality and quantity of human resources who operate tools of defense also be a determining factor in any surveillance and defense operations Indonesian airspace.

 Esthetics.

#### Abstract

**Aim:** To evaluate coincidence of Facial midline with Dental midline and Maxillary midline with Mandibular midline in undergraduate students of Narsinhbhai Patel Dental College and Hospital, Visnagar.

**Materials and Methods:** A total of 200 Undergraduate students with the age range from 18 to 24 were selected randomly for the study. The patient having 2<sup>nd</sup> molar to 2<sup>nd</sup> molar present were included in the study. However patients having midline diastema, congenital or acquired defect were excluded. The patients were examined by 2 examiners to check if facial midline was coincide with dental midline and maxillary midline was coincide with mandibular midline or not.

**Result:** The results of the present study showed that 180 Patient's (90%) maxillary midline coincide with the facial midline. Among 20 patients, 14 patient's (70%) had facial midline shift towards right side and 6 patients had facial midline shift towards left side. 129 Patient's (64.5%) maxillary midline coincide with mandibular midline.

**Conclusion:** Maxillary midline is coincide with the philtrum and can be used as a guide for establishing Maxillary dental midline while fabricating fixed prosthesis or removable prosthesis. Maxillary midline is partly coincide with the mandibular midline.

#### Introduction:-

Smile is the first outline of your personality and it has been accepted that it is the best gift any one can give. The balance smile midline has great importance. The balance smile depends on the coincidence of facial and dental midlines respectively. The facial midline is defined by the landmarks such as nose, philtrum and chin aligned in a straight line. It should be in the center of face and should coincide with the dental midline. The dental midline is the mid sagittal line of maxillary and mandibular arches when teeth are in maximum intercuspation.<sup>1</sup>

Dental midline is the vital element in smile design and should be parallel to the long axis of the face. Furthermore it should be perpendicular to Incisal plane and perpendicular to papilla.<sup>2</sup> Establishing dental midline parallel to that of face is the initial step while fabricating fixed or removable prosthesis.<sup>3</sup> If it is in harmony with facial component it significantly contributes to the aesthetics of the face. This will give patient a feeling of symmetry and balance.

Complete dentures must be attractive and natural in appearance. An important consideration in arrangement of the anterior teeth is the matter of equilibrium. Dental midline is an imaginary line that will separate the two maxillary central incisors. During complete denture fabrication or fixed prosthesis, we consider the philtrum as a guide for midline of the maxillary incisors. The dental literature fails to disclose the data of any research considered to provide

information as to how nature position the natural anterior teeth in relation to the anatomic center line of the face.<sup>4</sup> So aim of the present study is to check the coincidence of facial midline to dental midline and also to check the coincidence of maxillary midline to the mandibular dental midline.

### Materials and Methods:-

A Total of 250 dentate patients were selected from Narsinhbhai Patel Dental College and Hospital, Visnagar, Gujarat. The standards for selection of participants include undergraduate students from first year to final year and interns with age range from 17 to 25 years. All of them had permanent dentition from 2<sup>nd</sup> molar to 2<sup>nd</sup> molar in maxillary arch. There was random selection for male and female participants, no fixed proportion was proposed. The patients with midline diastema and congenital or acquired maxillofacial deformity were excluded. The patients undergone any orthodontic treatment were also excluded in the study. A written informed consent was obtained from each selected participant.

All the participants were examined by 2 examiners separately. To avoid eye fatigue both the examiners examined 50 participants per day. The participants were observed to check if maxillary dental midline coincides with facial midline. The facial midline was inspected by marking points between mid-deepest part of the till middle of the anterior most part of chin including center of philtrum with the help of scale or dental floss.

As a part of the routine examination, a specially set form was filled out by the examiner. The form required that two questions to be answered:

1. Does the dental midline (between the maxillary central incisors) coincide with the facial median line (using the philtrum as the guide)?

Yes                      No

2. Does the midline of the maxillary teeth coincide with the midline of the mandibular teeth?

Yes                      No

### Results:-

200 undergraduate students were evaluated for coincidence of facial midline with dental midline at Narsinhbhai Patel Dental College and Hospital, Visnagar, S Gujarat and results were obtained as follows. Philtrum was the guide to check the coincidence of the midline. Data was analyzed with descriptive statistical test.

**Graph 1:-**Coincidence of Facial Midline with Dental Midline

Graph 1 showed Coincidence of Facial midline and Dental midline in patients in which among 200 patients 180 patient's (90%) facial midline coincide with the dental midline (Figure 1) and 20 patient's (10%) midline did not coincide with the facial midline (Figure 2).

**Graph 2:-**Coincidence of Maxillary Midline with Mandibular Midline

Graph 2 showed that 129 patient’s (64.5%) maxillary midline coincide with mandibular midline (Figure 3) and 71 patient’s (35.5%) maxillary midline did not coincide with mandibular midline (Figure 4).

**Table 1:-**Facial and dental shift of midline towards right and left

	FACIAL SHIFT		DENTAL SHIFT	
	Right	Left	Right	Left
Frequency	14	6	39	32
Percentage %	70	30	54.93	45.07

Table 1 showed that Midline shift of patients towards right and left side. It showed that for facial midline to dental midline shift is more toward right side than the left side. For Dental midline shift, more patients had midline shift towards right side than the left side.

**Table 2:-**Facial Midline shift in distance

Distance	Towards Right	Percentage %	Towards left	Percentage %
1mm	8	4	2	1
2mm	4	2	3	1.5
3mm	2	1	1	0.5

Table 2 showed facial midline shift with distance towards right and left side. It showed that facial midline shift more towards right side than left side.

**Table 3:-**Dental midline shift in distance

Distance	Towards right	Percentage %	Towards left	Percentage %
1mm	6	3	11	5.5
2mm	23	11.5	16	8
3mm	7	3.5	4	2
4mm	3	7.7	1	0.5

Table 3 showed Dental midline shift with distance towards right and left side. It showed that dental midline shift more towards right side than left side.

**Discussion:-**

Graph 1 showed that among 200 patients 180 patient’s (90%) facial midline coincide with the dental midline and 20 patient’s (10%) midline did not coincide with the facial midline. It indicates that almost all patients midline is coincides with the philtrum of the patients.

Graph 2 showed that 129 patients' (64.5%) maxillary midline coincide with mandibular midline and 71 patients' (35.5%) maxillary midline did not coincide with mandibular midline. It indicates that not all patients maxillary midline coincide with the mandibular midline.

Table 1 showed that among 20 patients, 14 patients (70%) had facial midline shift towards right side and 6 patients (30%) had facial midline shift towards left side. It indicates that more midline shifts noted towards right side than left side. Among 71 patients, 39 patients (54.93%) had dental midline shift towards right side and 32 patients (45.07%) had dental midline shift towards left side. It indicates that dental midline shift found more on right side than left side.

Table 2 showed facial midline shift with distance towards right and left side. It showed that towards right side among 14 patients, 8 patients' had midline shift of 1 mm, 4 patient had midline shift of 2 mm and 2 patients had midline shift of 3 mm. Towards left side among 6 patients 2 patients had midline shift of 1mm, 3 patients had midline shift of 2 mm and 1 patient had midline shift of 3 mm.

Table 3 showed Dental midline shift with distance towards right and left side. It showed that among 39 patients towards right side 6 patient showed midline shift of 1 mm, 23 patients showed midline shift of 2 mm, 7 patients showed midline shift of 3 mm and 3 patient showed midline shift of 4 mm. Towards left side among 32 patients, 11 patients showed midline shift of 1mm, 16 patients showed midline shift of 2 mm, 4 patients showed midline shift of 3 mm and 1 patient showed midline shift of 4 mm.

Facial symmetry is one of the facial aesthetic characteristic. Attractiveness of the face depends on alignment, symmetry and proportion of face. To achieve a balance smile while fabricating fixed or removable prosthesis is mandatory. The results of the present study are in agreement with the results obtained in the study conducted in city of Riyadh, Saudi Arabia.<sup>5</sup> They have found 88.10% subjects showing coinciding maxillary dental midline with facial midline. Similar results were obtained in another study done by Miller.<sup>6</sup>

**Figure 1:-**Facial midline coincide with Maxillary midline

**Figure 2:-**Facial midline not coincide with Maxillary midline

**Figure 3:-**Maxillary midline coincide with Mandibular midline

**Figure 4:-**Maxillary midline not coincide with Mandibular midline

**Conclusion:-**

With the limitation of this study it was concluded that

1. Maxillary midline is coincide with the philtrum and can be used as a guide for establishing maxillary dental midline while fabricating fixed prosthesis or removable prosthesis.
2. Maxillary midline is partly coincide with the mandibular midline.

#### **Abstract**

Oral and Maxillofacial Pathology today is viewed as a speciality of dental sciences, which addresses the diagnosis and treatment of the disease of the oral and peri-oral regions. As medical practice, it covers all aspects of diagnostic methods on solid or fluid tissues based on laboratory techniques. It also covers the methodologies to transmit diagnostic data in an interpretable way to other physicians directly involved with patient treatment. It also manages tissue banks for research or diagnostic purposes. Cellular therapies from tissue banks or blood banks are increasingly becoming part of Oral and Maxillofacial Pathology. The object of investigation in histopathology is the digital slide, which is accessible throughout the world with no time or geographical limits. It permits the digital modelling of routine histological and/or cytological slide and it also allows measurements by using image analysis or stereology software packages. The electronic slide can be viewed, examined and diagnosed on a computer connected to a microscope, a new interface in diagnostic histopathology. This article describes the possible uses of digital slides, future of Oral and Maxillofacial Pathology beyond slides which by improving communication could have a positive effect on the entire health care system that will redefine how pathology will be practiced and the role of the Oral and Maxillofacial Pathologist in India in the near future.

*Copy Right, IJAR, 2017., All rights reserved.*

#### **Introduction:-**

The four main aspects of applied medical information technology, which change the traditional systems of the entire health service are signal and data processing, digital modelling and interface optimisation. The information technology serving individual clinical specialties including Oral and Maxillofacial Pathology is changing at each of the four levels resulting in transformation of the communication paradigms.<sup>[1]</sup> Digital pathology systems offer Oral and Maxillofacial Pathologists an alternate, emerging mechanism to manage and interpret information. They offer increasingly fast and scalable hardware platforms for slide scanning and software that facilitates remote viewing, slide conferencing, archiving, and image analysis. Digital modelling of routine histological and/or cytological slide is increasingly being implemented for direct patient care.<sup>[2]</sup> Improvements in image quality, scan times, and image

viewing browsers will hopefully allow Oral and Maxillofacial Pathologists to more seamlessly convert to digital pathology, much like our Oral Medicine and Radiology colleagues.<sup>[3]</sup> Digital imaging in pathology has undergone an exponential period of growth and expansion catalyzed by changes in imaging hardware and gains in computational processing. Today, digitization of entire glass slides at near the optical resolution limits of light can occur in 60 seconds.<sup>[4]</sup> Conventional histopathology is rapidly shifting towards digital integration. Will microscopes (and Oral and Maxillofacial Pathologists) soon be obsolete? Or are we dealing with just another image modality that leaves the core of tissue diagnosis intact? <sup>[5]</sup> This article provides an overview of current digital pathology beyond slides.

### **Future Of Oral and Maxillofacial Pathology Beyond Slides:-**

This article explores trends within society and medicine which could significantly change Oral and Maxillofacial Pathology practice in India in near future the most important ones being advances in medical knowledge and advances in human technology.

#### **1. Advances in Medical Knowledge:-**

Disease is being understood increasingly in terms of molecular and sub-cellular processes which will have at least three major implications. The first and most promising will be the improvement to patient care as we can expect earlier diagnosis, more accurate prognosis and improved therapies as we better understand the disorders.<sup>[1-3]</sup> The second implication will be increasing specialisation of medicine. A third consequence will be the drive towards personalised medicine which could result in shift from routine slide workload to a more potential shift.<sup>[4]</sup>

#### **2. Advances in Human Technology:-**

The next trend to consider is the rapid development of technology. Diagnostic tests are being refined which reveal the genomic and proteomic features of disease. Emergent new technologies impacting Oral and Maxillofacial Pathology are- *Molecular Diagnostics at the histology level, Digital Diagnostics, Bedside diagnostics, Nanosensors, Pharmacogenomics.*<sup>[5]</sup>

Of these **Digital Pathology** will be most closely related for getting the most from the static image in the future. The current paradigm includes- Simple staining of histopathology sections (typically hematoxylin- eosin), IHC is used to identify expressed proteins by specific antibodies (one antibody per section).<sup>[6]</sup> The problems arise when multiple markers/sections are needed, the amount of tissue available may not be enough for all markers. The future new paradigm may include application of multiple antibodies on the same section, using Quantum Dot photoemitters attached to each antibody species.<sup>[7]</sup>

**Virtual Microscopy-Going beyond the microscope** are current technologies under rapid development which aim to create a digitized computer file from complete scanning of a stained tissue section.<sup>[8]</sup> The digitized file will be amenable to examination at any spot on a computer screen at different magnifications. This may replace the microscope as the basis for morphologic analysis of tissues.<sup>[3]</sup>

**Histology based proteomics** will provide a complete proteomics analysis connected to the histology of the tissue. This may form the practical applications for pathology practice as when in the recent future all proteins are mapped on standard mass, this approach will allow complete molecular determination of all proteins present in a section.<sup>[9]</sup>

**Concurrent mapping** a marker for endothelial cells and marker for a tumor marked together in different pseudocolors can determine vascular invasion of many oral lesions. *Salivaomics* technologies may contribute significantly in the identification of alterations in gene expression, transcription, protein coding and small molecules concentration, in biologic systems and may represent a novel and holistic approach in oral disease management including diagnosis, prognosis and monitoring.<sup>[3-5]</sup> Elevated levels of *circulating immune complexes (CIC)* in the sera of oral cancer patients suggest that it contributes in evaluating the degree of malignancy, and provide an approach for a more precise test to predict prognosis of the disease which are far beyond slides only.<sup>[10]</sup>

### **Advantages And Disadvantages Of Pathology Beyond Slides<sup>[2]</sup>**

#### **Advantages-**

- Facilitates rapid diagnosis.
- Cost effective.
- Helps leverage existing resources.
- Provides coverage for remote sites.

- Useful for remote frozen sections.
- Useful for immediate fine- needle aspiration evaluation.
- Potential to improve patient care.
- Secondary consultation.
- Ability to retain original material at the host institution.
- Decreased turnaround time to retrieve, deliver, and file glass slides.
- Less effort required by support staff to handle consults.
- More rapid than courier services.
- No risk of slide loss or damage.
- Portability of the telepathologist.
- Real-time consultation.
- Possibility of simultaneous collaboration (teleconferencing).
- More timely response for patients and family awaiting a secondary review.
- Eliminates the need for multiple recuts; 1 slide may be scanned and viewed by an entire class.
- Avoids the risk of broken, damaged, lost, or unsatisfactory slides.
- Eliminates the need and cost for microscopes.
- Access to a wider variety of cases.
- Teleconferencing to multiple sites.
- Portability.

**Disadvantages-**

- May overextend existing resources (i.e consulting / covering pathologist).
- Difficult to handle multiple time sensitive requests arriving at the same time.
- Some cases may still require the pathologist to review the glass slide.
- May take longer than glass slide review.
- Potential for downtime.
- System maintenance required.
- Review of multiple slides including special stains for difficult cases may be difficult to review.
- Billing may be difficult, especially with missing information.
- Technical failures are possible.
- Poor image resolution compared with glass slides.
- Initial setup costs.
- Does not precisely simulate real-life evaluation of diagnostic material.
- Review of multiple slides or special stains may be difficult.
- Access to computers, higher network bandwidth, and/or monitors required in teaching environments.

**Conclusion:-**

To conclude we may state that Oral and Maxillofacial Pathology may not be limited to slides only in the near future as the amount of information that can be extracted from minute tissue and fluid samples using complex, automated and miniaturized devices will continue to increase. Sophisticated computer-based algorithms will provide assistance in integration of all information. Lab and tissue- based diagnostics will be increasing their capability to provide a safe guide to therapy. Enhanced imaging capabilities will allow groups of pathologists to share information on tissue based diagnostics. Pathology practitioners, blending knowledge of histopathology, disease related molecular processes and lab diagnostics, will be the integrators of information related to the molecular, biochemical and cellular processes underlying the patient's disease, complications and symptoms which may be far beyond slides. *Will anybody ever, be able to do without us?The answer to this will always remain NO.*

##### Key words:-

Mechanism of burns, Burn causes,  
Traumatic burns, Saudi Arabian population.

#### Abstract

**Introduction:** Currently, studies investigated burn injuries and their causes in Saudi Arabia mainly focused on pediatric patients, while epidemiology of burns among the adult population required more exploration. Therefore, the purpose of this study was to investigate the pattern of burns and associated factors among both children and adults in one of the largest Saudi Arabian province.

**Methods:** This is a surgical audit type study included patients admitted with the burns to the surgical department of King Khaled Hospital in Al Kharj province of Saudi Arabia. The medical records of 60 patients with burn injuries, admitted from 2010 to 2015 inclusive, were reviewed for demographic factors, the pattern of burns, the severity of burn injuries and associated trauma injury severity score (ISS), the length of hospital stay, the types of burns, and the most common body locations. Descriptive statistics including frequencies, percentages, means, and standard deviations were demonstrated in tables and graphs. Inferential statistics were used to detect significant study associations. The P values less than 0.05 were considered significant.

**Results:** This study included 60 patients, where 57% were non-Saudis and the majority were adult males. The most affected body parts were the upper extremities followed by lower extremities and the head. The most common types of burns were hot liquid burns (43.3%), followed by flame burns (28.3%). The significant correlations were found between the mechanism of burn and patient's gender and age. The burns area was directly related to the length of hospital stay and correlated well to the age ( $p=0.037$ ).

**Conclusion:** The hot liquid burns are the most common types of burns followed by the flame burns. The hot liquid burns were commonly affecting Saudi nationality, children and female gender. The areas of burns are well correlated to the age of affected patients and the length of hospital stay.

#### Introduction:-

Burn defined as a traumatic injury, which occurs when skin or other underlying tissues are damaged by the mechanism of direct thermal, chemical, electrical or frictional exposure.<sup>1</sup> The type of burn is dependent on the age factor, where the most common burns in children are the results of direct hot fluid and skin contact, while flame exposure, electrical and frictional burns are most common among adults.<sup>2</sup> According to the depth of the injury, burns

are classified into four degrees, although most of the times the burn injury include more than the first degree. The first degree is defined by superficial or epidermal burn, which may be equal by the clinical presentation to the sunburn. The second degree constituted of partial burning of skin thickness. The third degree burn involves the full thickness of skin, while the fourth degree involves the underlying tissues or organs.<sup>3</sup>

The (World Health Organization) WHO estimated the global incidence of burn injuries to be 110/100,000 per year.<sup>4</sup> Saudi Arabia, as well as many other developing countries, is undergoing a period of changes in regards to transformation from non-communicable problems to the pattern of chronic diseases and trauma, which is more common for industrial communities.<sup>5</sup> Burns representing a common type of domestic trauma, that have been increased due to urbanization and introduction of technologies and complex electrical, and mechanical equipments to the daily live.<sup>6</sup>

In Saudi Arabia, the incidence rate of burns among children was shown by Alharthy et al. to be 494/100,000 per year. They found that 16% of children, attended hospitals with burns, had more than 10% of total body surface area (TBSA) involved. The most common causes of burns among Saudi children were the hot liquids burns followed by flame injuries.<sup>7,8</sup> This was supported by study conducted among children in Makah city, which found that majority of burn injuries were related to the direct hit exposure by high temperature fluids.<sup>9</sup> Only one study, conducted by Jamal et al., in Jeddah city, investigated a wide range of age groups in relation to the patterns of burns.<sup>10</sup> Thus, current study aimed to investigate the pattern of burns and associated factors among both children and adults in one of the largest provinces of Saudi Arabia based on the local trauma registry.

### Methods:-

This retrospective audit study design included patients admitted with all types of burns injuries in one of the teaching university affiliated hospital in the Kharj province of Saudi Arabia. The medical records of patients collected over the period of the last five years, presented and admitted to the surgical department with burn injuries, were reviewed for the collection of demographic factors, pattern of burns, length of the hospital stay, mechanisms of burns and parts of body locations with TBSA involved. The confidentiality of the patients was ensured through the anonymous data entry from medical records. The data were analyzed using descriptive statistics such as frequencies, percentages, means and standard deviations. The chi-square test was used to identify significant differences between demographical variables and causes of burns. The independent t-test was used to identify significant differences in groups of numerical variables. Pearson's correlation was used to identify the relation between the age of the injured with burns and the length of hospitalization. The *p* values less than 0.05 were considered as statistically significant.

### Results:-

Medical records of 60 patients were included in this study, showing that 56.7% were non-Saudis. All patients were exposed to different mechanisms of burn with various body parts and the total area affected. The majority of the patients (70%) were males and 30% were females respectively. Mean of age of burn victims was 21±15.5 ranging from 1 year to 64 years old. 25% of the patients with burns were under 5 years old children and near 38% were under the age of 16 years old, while the rest were adults as shown in Table 1.

**Table 1:-**Distribution of demographic factors.

DEMOGRAPHIC FACTORS		Patients (n)	%
Gender	Male	42	70.0
	Female	18	30.0
Nationality	Saudi	26	43.3
	Non-Saudi	34	56.7
Age groups	<5 years old	15	25.0
	5-10 years old	5	8.3
	11-16 years old	3	5.0
	>16 years old	37	61.7

The distribution of burns in this study demonstrated, that the majority (70%) of them had the second-degree burns followed by the third and first-degree burns in 16.7% and 13.3% respectively. The most affected body locations were the upper limbs (63.3%) followed by the lower limbs and the head, which accounted for 50%, and 46.7% respectively. This reflecting that many burn areas have affected more than one site in the body. The chest, neck, and

back areas were involved in 20%, 16.7%, and 15% of burns respectively, while the least affected sites were genitalia and abdominal areas. No burns were identified involving the pelvic area in this study. The majority of the patients had more than one location affected by burn injury and 68.3% had burn with >10% of TBSA was involved. There was no mortality reported. Table 2. (Graph 1)

**Table 2:-**Patterns and locations of burns among study subjects (n=60).

Classification, body parts and area of burns		Patients (n)	%
Degree of burn	I degree	8	13.3
	II degree	42	70.0
	III degree	10	16.7
Head		28	46.7
Neck		10	16.7
Chest		12	20.0
Abdomen		6	10.0
Genitalia		4	6.7
Back		9	15.0
Upper limb burn		38	63.3
Lower limb burn		30	50.0
TBSA%	≤10%	19	31.7
	>10%	41	68.3

The most common cause of burns was from contact with hot fluids (43.3%), followed by the flame burns (28.3%), electrical (18.3%), chemical (8.3%) and frictional burns (1.7%) respectively, as reflected in Graph 2.

The significant correlations were identified between the patient’s nationality, gender and age to the causes of burns. 69.2% of the Saudis were affected by hot fluids burns in comparison to 23.5% of non-Saudi (p = 0.001). A significantly higher percentage of women (77.8%) had hot fluids burns compare to men, where only 28.6% had burns related to hot fluid exposure. Children under the age of 5 had a significantly higher prevalence (93.3%) of hot fluids burns. No women had electrical or frictional burns and only one had chemical burn. The children and adolescents (< 16 years old) had a significantly higher prevalence (82.6%) of hot fluid burns in comparison to adult patients (Table 3, Graph 3). The mean length of stay was 7±5 days and ranging from 1 day to 1 month, depending on the severity of burn and TBSA. The correlation between TBSA and the length of hospital stay was significantly increased when the patients had more than 10% TBSA affected by burns (p=0.037).

**Table 3:-**Correlation between demographic factors and causes of burn.

Demographic factors		Causes of burn				
		Hot fluid	Flame	Electrical	Friction	Chemical
Nationality	Saudi	18 (69.2%)	6 (23.1%)	0 (0.0%)	1 (3.8%)	1 (3.8%)
	Non-Saudi	8 (23.5%)	11 (32.4%)	11 (32.4%)	0 (0.0%)	4 (11.8%)
Gender	Male	12 (28.6%)	14 (33.3%)	11 (26.2%)	1 (2.4%)	4 (9.5%)
	Female	14 (77.8%)	3 (16.7%)	0 (0.0%)	0 (0.0%)	1 5.6%
Age group	<16 years old	19 (82.6%)	2 (8.7%)	1 (4.3%)	0 (0.0%)	1 (4.3%)
	>16 years old	7 (18.9%)	15 (40.5%)	10 (27.0%)	1 (2.7%)	4 (10.8%)

### Discussion:-

The burns result not only a physical damage to the body surface, but also affecting the psychological well being of the affected patients. In addition, it has an very high impact on the socio-economic status in the community and large burden to the Health System of the society by the required medical and surgical treatments and long hospital stay.<sup>11</sup>

In modern communities, regardless of cultural and ethnic differences, children of young age mostly affected by the exposure of hot fluids and flames. However, increase in urbanization and industrial development leads to the higher incidence of burns related to advance technologies and exposure to high voltage electricity and work with complex mechanical equipment.

This study highlighted, that the majority of the patients (70%) were males, where about 38 % were under 16 years old. A Saudi study conducted by Mahaluximivala et al. found different characteristics of admitted patients with burns in AlQassim region, where 51% of patients were males and 41% where adults.<sup>12</sup> Their results showed that the most affected sites of the burns were the upper limbs followed by lower limbs and the head. This was in agreement with Gangemi et al., where upper limbs were also found the most common site followed by the lower limbs, then the head and the neck.<sup>13</sup>

The findings of our study demonstrate, that the TBSA was significantly related to the length of the hospital stay, when the patients had more than 10% of TBSA. The findings reported by Iranian study where the mean admission time was related to the burn size till, the peak of 60% were agreed with the present study findings.<sup>14</sup> However, Lari AR et al, found that the length of hospital stay was declined when the burn area became more than 60%, due to the increased mortality. In our study, the mean length of hospitalization was  $7 \pm 5$  days, which is less than reported by other Saudi studies conducted in pediatric patients<sup>9,15</sup> This could be attributed to a positive correlation found between pediatric age and shorter hospital stay, as children have tendency to stay in hospital less than adults.

In the present study, the most common cause of burns where burns caused by exposure to hot fluids (43.3%), followed by flame, electrical, chemical and mechanical exposure. This is in agreement with findings showed by the Saudi study of Mahaluximivala et al., when hot fluids burns where the most common mechanism of injuries causing the burns in 40% of cases, followed by flame burns.<sup>12</sup> The main contributory factor for this high prevalence of burns

related to hot fluids is the traditional Arabic costume of preparation coffee and tea drinks in social events and the family gathers. This can be supported by the fact that, a significantly higher number of Saudi patients were affected by hot fluids burns in comparison to non-Saudis.

In the present study, hot fluid burns were significantly more common among women than men, which could be attributed to the traditional role of women in cooking and food preparation. No women had electrical or frictional burns and only one had chemical burn, due to traditionally no or little contacts with outdoor activities in the Saudi community in contrast with men, which made them more susceptible to flame, chemical and electrical burns.

In this study the high prevalence for children under the age of 5 to have hot fluid burn could be explained by the presence of the young children around the kitchen area close to their mother's, where the boiling water or hot food in preparation could be easily exposed to. Similar findings reported by other Saudi and Kuwaiti studies where similar culture traditions are practiced.<sup>9,17,18</sup> In addition, a Turkish study found similar results for the high prevalence of burns among children. Due to the fast development of Saudi Arabia in relation to the buildings of the complex industrial infrastructure, we can see more injuries related to the electrical and mechanical burns. Also the high impact of the modernization in Saudi industries increasing the exposure of the working male population to chemicals and petroleum related products, which increasing chances for the flame burns. This explaining a relatively high volume of other causes of burns identified in our study.

Some limitations of this study include the short period of data collection due to the relatively recent trauma registries available.

### **Conclusion:-**

The hot liquids burns were the most common type of burn injuries followed by the flame exposure. Larger study is required for a more detailed look in relation to the outcome and correlations to the TBSA by various mechanisms of burn injuries.

### **Conflict of interest:-**

No financial support was received for conduction of this study, and the investigators stated no conflict of interests.

#### Introduction: -

Suspicion of the presence of pericardial effusion could be from the history, physical examination, electrocardiogram (ECG), and chest x-ray.

However, the clinical examination remains the first tool in the diagnosis of pericardial effusion.

In Dr. William Ewart's seminal paper "Practical Aids in the Diagnosis of Pericardial Effusion in connection with the questions as to the Surgical treatment" in 1896, he describes the clinical signs associated with pericardial effusion which includetriangular area at the tip of the left scapula which shows breath sounds and egophony associated with dullness.

We report a case of pericardial effusion which present the clinical and radiological basis for Ewart's sign.

#### Case Presentation: -

We present an 86 years old female who is known to suffer from Type II diabetes mellitus on Insulin mixtard, she also takes Perindopril 5 mg for hypertension. She presented with one-month history of breathlessness and cough associated with night sweats. No past medical history of TB or contact with TB. When examined in the ER she was found tachypnic (RR22) with pulse rate 85, small volume and BP 130/80 (nonpulsusparadoxus) and saturation of 92% in room air. Her chest examination showed: dullness left base posteriorly below the left scapula with Bronchial breathing (Ewart's Sign).

The Posterior Pericardial Patch of dullness and the posterior pericardial patch of tubular breathing and aegophony.

**Fig 1:-** CXR at presentation showing enlarged cardiac silhouette.

**Fig 2:-** CXR post Pericardiocentesis showing segmental atelectasis.

**Fig 3:-** CT chest with contrast showing the pericardial effusion , segmental atelectasis left lower lobe with effusion.Note the lymphadenopathy on CT.

**Cardiovascular System: -**

Muffled heart sound and JVP raised. No Lymph nodes were felt and her abdominal examination was unremarkable. TST: no reaction to 2TU PPD (Mantoux test). Bloods including TSH and autoimmune screen: TSH Normal, Urea 9.7 with Normal Creatinine and normal liver function test, CBC: WBC 8.1 Hb 12.7 and Platelets 215. ESR 61. Echocardiogram: massive pericardial effusion EF 50%RVSP 45 and thickened pericardium. Echo-free space 2.5 cm posterior and lateral .RV diastolic collapse. ECG showed small voltage QRS complexes with no acute ischemic changes. Chest x-ray (Fig 1&2) showed increased cardiac shadow. CT chest with contrast (Fig 3) showed pericardial effusion with mediastinal lymph nodes. Sputum analysis was negative for AFB.

Pericardiocentesis under echo guidance showed straw colored fluid. There were no malignant cells and it was lymphocyte rich fluid. The AFB stain, TB culture and TB PCR were negative. Pericardial window was done and the biopsy showed chronic inflammation. No granuloma

The patient was treated with oral prednisolone and Anti-TB medications for 6 months with improvement both radiological and clinical.

**Follow up study: -**

limited study with minimal effusion, follow up CXR shows resolution of the effusion.

Sign Number	Description of the Sign
First Sign	Increased Lateral Cardiac Dullness
Second Sign	Increase in the Absolute Dullness
Third Sign	Liver Depression
Fourth Sign	Dr Rotch's sign : dullness in the right 5 <sup>th</sup> Intercartilagenous space
Fifth sign	The lower angle of pericardial dullness points to the right
Sixth sign	The left lower angle of dullness. The relation of the apex beat to this angle
Seventh Sign	The first rib sign "feel with the finger the upper edge of the first rib as far as its sternal attachment".
Eighth Sign	<b>The Posterior Pericardial Patch of dullness.</b>
Ninth Sign	Tubular breathing below the right Mamma.
Tenth Sign	<b>The posterior pericardial patch of tubular breathing and agophony.</b>
Eleventh Sign	The secondary pleural effusions and the pulse in pericardial Effusion.
Twelfth Sign	The large and slapping pulse of pericardial effusion.

### Discussion and Conclusion: -

As rightly stated by Ewart and shown in our case there was at compression of the left lower lobe correlating with the clinical Ewart's sign. We found only three references in PubMed using "Ewart's sign" as a search word<sup>1-3</sup> beside Dr. Ewart paper<sup>4</sup>. The latest was in 2000 in relation to tuberculous pericardial effusion. It has been referred to as Bambergereger- Pins. Ewart's sign in the European Cardiology Society guidelines on pericardial diseases 2004. Despite the availability of echocardiography, clinical examination remains the first tool in the diagnosis of pericardial effusion.

#### Abstract

IoT is expected to incorporate very large number of diverse devices ranging from simple networked sensors to large servers. For internetworking and communication among these devices, a seemingly large number of protocols have to be developed owing to the variety and difference in the hardware characteristics of each of these devices. Further, each IoT device should have a mechanism to identify and isolate the different kinds of messages in such a network. India faces a lot of security problems in the home or offices while we are not present. This paper aims to describe a IoT based motion detection mechanism system using low cost computing devices. Now a day's cost is most important factor so this project is reducing the cost for motion detection system. The objective of this work is to capture an image when any intruder motion is detected in prevented or secured area. Due to hardware limitations of Raspberry pi, motion detection is implemented by comparing the last two consecutive images saved locally. Any changes identified are notified to the user by uploading all the images from the point of identification, to a cloud server and via email.

#### Introduction: -

The IoT means Internet of things. The internet of things interconnection between object or anything. The communication of IoT exchange the data over the network. Communication occurs without the machine to machine [1] interaction. In the new era, the all things are connected to internet of things. After the few years the internet of things interconnect with billions of devices. The IoT is used for many of the fields, Automobile, Agricultural, SecuritySurveillance, the internet of things is interconnecting to worldwide physical network. The main advantage of IoT is very low cost. The communication network has more complex and security issues are occurring.

**Fig 1:-** Internet of Things

The main aim of this work is to the IoT concept using cloud server [2] to transfer the images. The motive behind the work is to develop a motion sensing (image processing) algorithm for IoT device considering the resource limitation and storage space limitations of such device, Further, the whole cost of the system is designed to be low. The figure 1 shows internet of things, it inter- connect with whole world. In 2020 the most of the world things are interconnect with IoT device.

#### **Motion Detection: -**

The existing systems use motion detection kits that use motion sensors and Ethernet modules to send or receive data captured by the sensors. This requires an external server to process the data. The external server processes the data live streamed by the sensors. There is no local storage of the data in such systems and if the cloud server is insecure, sensitive data can be leaked. Further, present secure systems use heavy data encryption algorithms to securely upload the data to the server. This approach is impractical in IoT in common IoT devices due to the hardware limitations.

Present systems also require large cloud storage to store such data and can use up the home internet bandwidth. The cost of such implementations are high. So, ordinary home users need an alternate method to reduce the cost of implementation using IoT based security hardware - without loss in efficiency and use ability. Further the requirement of existing systems to be always connected to the cloud server can handicap the functionality of the security of the intruder alert/notification function of the system since any problems in connectivity to the remote server or problems in the server can hinder communication between the sensors and the user.

**Fig 2: -** Burglar detection based on frame comparison

#### **Raspberry pi: -**

Raspberry pi is a small size computer. it uses for low power processing. In this work we can use for latest version of raspberry pi, it known as model 3 B. Raspberry pi model 3 B have the following features:

Operating system	Raspbian, Fedora, Ubuntu MATE, Kali Linux, Debian
CPU	1.2 GHz 64/32-bit quad –core ARM cortex-A53
Memory	1GB LPDDR2 RAM at 900MHz
Storage	MicroSDHC
Bluetooth	4.1
802.11.b/g/n Wireless LAN	

Fig 3: -Raspberry Pi 3 Model B

**Proposed Work: -**

This proposed method uses the motion detection using low cost computing devices. In this work we have used raspberry pi 3 model B to connect logic tech c270 webcam to capture the intruding activities. The figure 3 shows the motion detection flow chart. Due to hardware limitations of Raspberry pi, motion detection is implemented by comparing the last two consecutive images saved locally. Any changes identified are notified to the user and all the images from the point of identification are uploaded to a cloud server and sent via email.

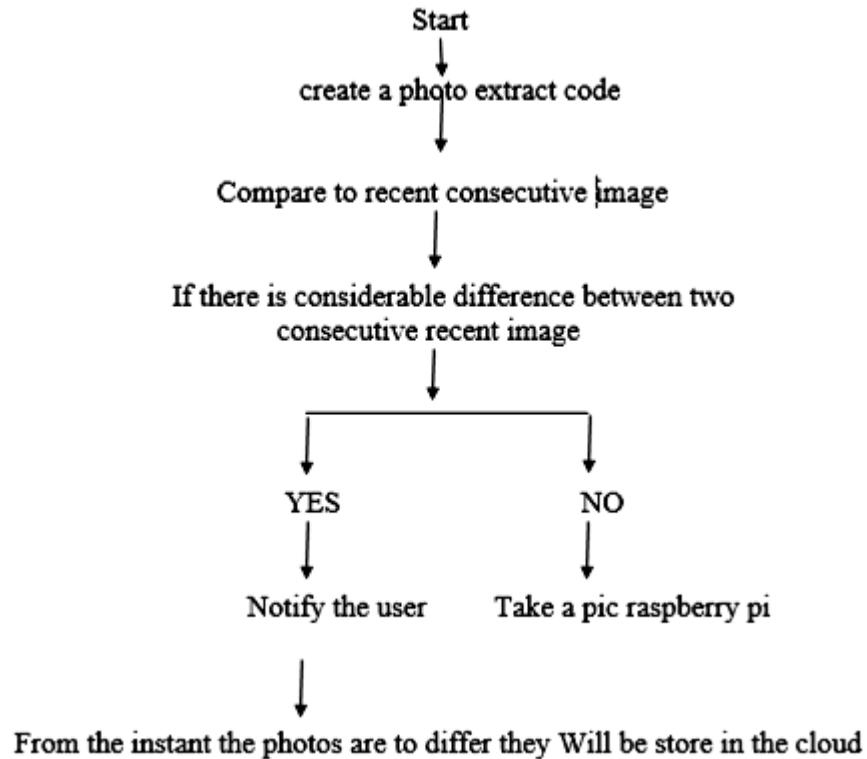

Fig 4: - Motion detection flow chart

In this work we can use the Gaussian Mixture Model algorithm [3][4]. This algorithm is generally used as a preprocessing stage in large image process project. The algorithm uses low resource. In addition to background subtraction, this also has ability to neglect small changes in the background such as changes in lighting condition etc which should not be perceived as motion. The segmentation approach also allows shadow [4] from the images to be removed.

**Implementation part is Divides in four-part: -**

- Representation of image as Gaussian Mixture Model.
- Background Subtraction.
- Image segmentation for motion detection.

- Image segmentation for motion detection Minimum area threshold.

**Fig 5:** - camera captured colour image to upload it to the user

#### **Representation of image as Gaussian Mixture Model: -**

The probability density function representation of every naturally occurring signal, including images, show clusters of data. This means that some regions of an image has more data than other regions A Gaussian Mixture Model is the mathematical model of the image as the weighted sum of Gaussian component densities. For example, this image can be mathematically modelled as the sum of 3 Gaussian distribution functions, the coefficients of each of the function being the weights.

#### **Background Subtraction: -**

For motion detection, the background needs to be separated from the foreground. Background subtraction or Foreground Detection is used to extract an images foreground for further processing and object localisation. The pixels which remain static between frames are considered as the background and the pixels which are displaced from frame to frame are considered as the foreground. The absolute value of the pixel intensity differences difference between frames is obtained by a simple subtraction.

#### **Image segmentation for motion detection: -**

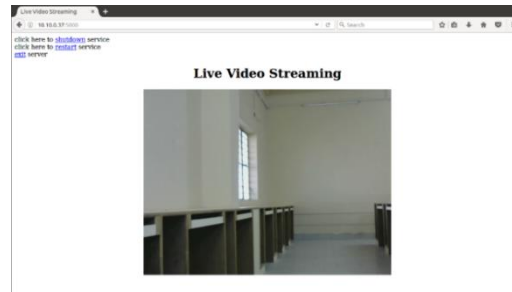

The goal of segmentation is to simplify and/or change the representation of an image. Our approach to image segmentation is to represent the background of the image as black (0) and the pixels where the motion is taking place in the image, called the foreground it represented in white (1). Finally, only regions where data is clustered are considered and unwanted data is removed.

#### **Image segmentation for motion detection Minimum area threshold: -**

If the contour area of the foreground segment is larger than our supplied minimum area called the threshold, motion can be considered to be detected. This method of comparing the foreground segment with that of the threshold area also helps to neglect any relatively small motion, like a paper moving in the breeze.

In this work, python script is used for motion detection. We can place camera in particular position and continuously monitor the area. If there is considerable difference between two consecutive [5] recent image the notification of motion detection is send to email and user phone as SMS. Through the website we can see the room from where ever we are and we can control raspberry pi

**Fig 6:** - Controlling raspberry pi remotely

### **Conclusion:** -

The motion detection less space to store the data. Data privacy and safe communication is also considered to be achieved in the new communication system. The motive behind the project is to develop a motion sensing (image processing) algorithm for IoT device considering the resource limitation and storage space limitations of such device, Further, the whole cost of the system is designed to be low. Using this project, we can identify intruder motion. Which help to secure the area.

 Anesthesia

#### Abstract

**Background:** Anesthesiology is a medical discipline and the specialist of this science is the anesthesiologist. The roles of anesthesiologists are not obvious to most of public, although their roles are very important and critical. The roles of anesthesiologists exceed the limitation of operating room, they have many roles preoperatively and postoperatively. More awareness about their roles is necessary. Patients may become more relaxed when they know their anesthesiologist and identify his role in their safety and success of their surgery.

**Aim:** The objective of this study is to assess the public knowledge about the role of anesthesiologist and to educate the public.

**Methods:** This study included 202 patients to answer 10 questions about their knowledge regarding anesthesiologist and anesthesia using simple and short questionnaire.

**Results:** Most of patients in this study had good knowledge about anesthesiologist and most percentages of positive answers were high. No association between awareness of patients and gender was found.

**Conclusion:** Patients had good and acceptable knowledge about the role of anesthesiologist.

#### Introduction:-

Anesthesia has developed after the first anesthesia was administered by TG Morton in 1846, it has a supportive role in performing advanced surgeries (Ribeiro et al, 2015). Anesthesiology is one of medical Science branches (Sable et al, 2016), it has been grown in the recent past years (Cooper et al, 1995), by development of monitoring system, new anesthetic agents and techniques (Khara et al, 2013), however it is behind the light, the knowledge about this specialty and the exact role of anesthesiologists is limited between public (Cooper et al, 1995). After the great advances in anesthesia field (Lee et al, 2014), now anesthesiologists play a very important role in peri-operative, the operating room, intensive care, trauma centers, pain management and on the code team (Lee et al, 2014; Prasad et al, 2014; Kadriet al, 2014), however they don't receive the deserved attention and their due regards between public (Prasad et al, 2014), this limited awareness of public about the anesthesiologist exceeds anesthesiologist's role in the operating room (Ribeiro et al, 2015), reaching to anesthesiologist's roles outside the operation room (Garry, 2001). This lack in public awareness about anesthesiologist's role is not new (Armitage, 1978). Many studies have reported a low public awareness about anesthesia and the role of anesthesiologists in both developing and developed countries (Swinhoe et al, 1994; Jathar et al, 2002). Patients think that the surgeon is responsible for tasks of anesthesia (Acosta-Martínez et al, 2016), 44.5% think so, while only 22% of them know that anesthesiologists were the providers of anesthesia

(Sable et al, 2016)but inanother report 42% of patients knew that the anesthetist was responsible for providing anesthesia(Naod et al, 2016)this still low percent. Actually patients don't know if the anesthesiologist is even a physician(Erdenet al, 2012), but it was reported that 67% ofsurvey respondents in a survey conducted in the United Kingdom during knew that anesthesiologist is a doctor(Keep et al, 1978),while this percent raised in 1933 to reach 81% and then dropped again in 1994 to 65%(Swinhoe et al, 1994; Hennessy et al, 1993).These results seems quite good, but in developing countries this percent is low (Hariharan, 2009).In Pakistanonly 56% of the patients hadknown that anesthesiologist is a physician (Khan et al, 1999). Here in Saudi Arabia 50 % of the patients had the awareness about the previous fact (Baaaj et al, 2006).Beside that other patients did not know thatanesthesiologists are responsible for monitoring their vital signs throughout surgery, only27.33% of the patients knewthat role.Also a limited number of patients had the knowledge aboutanesthesiologist's role in intensive care unit (ICU), painless labor and relief of chronic pain with percentage 7.33%, 12.67%and 4.67% respectively (Naithani et al, 2007).The reason for the poor knowledge may be related to anesthetists being busy in operating room and they have limited time to interact with their patients' pre & post-operatively(Naod et al, 2016).Not only is the role of anesthetists neglected by patients, but also by others such as administrative staff in the hospitals who did not see the importance of this specialty (Hariharan, 2009). The Audit Commission in Englanddid not realize any role for anesthesiologists outside the operating room (Plevvry et al, 1982)and in some universities all over the world,they see that there is no requirement for anesthesiologyto be taught for medical students (Cheunget al, 1999).A widehealth care awareness especially in developed countries has been taken place(Khara et al, 2013).Public awareness programs were arranged in developed countries for increasing public knowledge about the anesthetists(Khara et al, 2013;Prasad et al, 2014; ,Pandyaet al, 2016; Ahsan- Ul-Haq et al, 2004). October 16th is celebrated as Anesthesia Day worldwide (Prasad et al, 2014; Pandyaet al, 2016), this explains why the developed countries have high care awareness among the patients (Bhandary et al, 2016).It is important especially in our countries to spread the awareness and knowledge about anesthesiologists, so in this study we assess the public knowledge about the roleofanesthesiologists.
