# International Journal of Advanced Research (IJAR)

## ***Editorial Board Members***

**Dr. Mohamed Ahmed El-Esawi, Tanta, Egypt.**

**Dr. Subha Ganguly, India**

**Dr. Hazim Jabbar Shah Ali, University of Baghdad , Abu-Ghraib , Iraq.**

**Dr. Khalid Nabih Zaki Rashed, Dokki, Egypt.**

**Dr. Manzoor Khan Afridi, Islamabad, Pakistan.**

**Seyyed Mahdi Javazadeh, Mashhad Iran.**

**Dr. Muataz A. Majeed, INDIA**

**Dr Zakaria Fouad Fawzy Hassan, Egypt**

**Dr. KANDURI VENKATA LAKSHMI NARASIMHACHARYULU, India.**

**Dr. Mohammad Ebrahim, Iran**

**Dr. Malihe Moeini, IRAN**

**Dr. I. Anand shaker, India.**

**Dr. Magdy Shayboub, Taif University, Egypt**

**Dr. Ramachandran Guruprasad, India.**

**Dr. Alaa Kareem Niamah, Iraq.**

**Dr. Abdul Aziz, Pakistan**

**Dr. Gamil Sayed Gamil Zeedan, Egypt**

**Dr. Retsy D. Tomaquin, Phillipines**

**Dr. Abdolkarim Afroozeh, Iran**

**Dr. Ashwani Kumar Dubey, India**

**Dr. Madhusudan Tiwari, India**

**Dr. Mintu Ram Meena, India**

**Dr. P.MALYADRI, India**

**Mr. Fayziev Shokhrud Farmonovich, Uzbekistan**

**Mr. Jiban Shrestha, Nepal**

**Dr. MARIA CARMELA SPERANZA, USA**

**Mr. Rudrarup Gupta, India**

**Dr. Ashish Tripathi, India**

**Dr. Uma Vasant Datar, India**

**Prof.Dr. Amer A. Taqa, Iraq**

**Asst. Prof. Dr. Nipa Sriwarom Ouppara, Thailand**

**Dr Monika Kamboj, India**

**Dr. Mohamed Ahmed El-Esawi, France**

**Dr. SAMEERA G. NATH, India**

**Dr. Mrs. Shubhashree M.N., India**

<b>TABLE OF CONTENTS</b>		
<b>Volume 5, Issue 2, FEBRUARY 2017</b>		
<b>S. No.</b>	<b>Title of the paper</b>	<b>Page Numbers</b>
<b>1</b>	<b>Knowledge, attitude and practices of Saudi Men towards testicular cancer and testicular self-examination in The Western Region of Saudi Arabia.</b>	<b>1-6</b>
<b>2</b>	<b>DEVELOPMENT IN WOODS A SUSTAINABLE BUILDING.</b>	<b>7-13</b>
<b>3</b>	<b>EXPERIMENTAL AND THEORETICAL STUDY OF GOLD ADSORPTION ONTO POLYMERIC SORBENT.</b>	<b>14-20</b>
<b>4</b>	<b>HEAVY IONS REACTIONS WITH TWO NUCLEON TRANSFER.</b>	<b>21-24</b>
<b>5</b>	<b>MULTI FOCI OF COMMITMENT'S IMPACT ON KNOWLEDGE SHARING IN PAKISTAN'S ADVERTING AGENCIES.</b>	<b>25-32</b>
<b>6</b>	<b>DNA BARCODES OF THE PLECO (LORICARIIDAE, PTERYGOPLICHTHYS) IN THE CILIWUNG RIVER.</b>	<b>33-45</b>
<b>7</b>	<b>STRUCTURAL, ELECTRICAL AND THERMAL ANALYSIS OF <math>Y_{1-x}EuxBa_2Cu_3O_{7-\delta}</math> SUPERCONDUCTORS.</b>	<b>46-54</b>
<b>8</b>	<b>Postnatal developmental Histomorphological and histochemical study of the pancreas in the domestic cat (Felis Catus).</b>	<b>55-71</b>
<b>9</b>	<b>THE IMPLICATIONS OF SUSTAINABLE DEVELOPMENT PROGRAMMES ON ENVIRONMENTAL SUSTAINABILITY IN NIGERIA.</b>	<b>72-81</b>
<b>10</b>	<b>EFFECTS OF INVESTOR BASE ON VALUE OF STOCK OF CROSS LISTED FIRMS: A CASE OF CROSS LISTED KENYAN FIRMS LISTED IN THE NSE.</b>	<b>82-86</b>
<b>11</b>	<b>EVALUATION OF LIPID PEROXIDATION AND ANTIOXIDANT ENZYME ACTIVITIES IN TYPE 2 DIABETIC PALESTINIAN PATIENTS FROM THE GAZA STRIP.</b>	<b>87-93</b>

12	<b>STUDY OF COUPLE'S AWARENESS ABOUT THE RELATIONSHIP BETWEEN STREP THROAT AND RHEUMATIC FEVER IN THE WESTERN AREA OF THE KINGDOM OF SAUDI ARABIA.</b>	<b>94-104</b>
13	<b>Increasing the Competence of University Students' Learning Results in the Engine Elements Course by Benefitting the Machinery Tools in the Engineering Laboratory of Semarang State University<sup>10</sup>.</b>	<b>105-112</b>
14	<b>GLYCATED HEMOGLOBIN (HBA1C) IS A PREDICTOR OF DYSLIPIDEMIA IN TYPE 2 DIABETES NEPALESE PATIENTS.</b>	<b>113-121</b>
15	<b>PROBIOTIC CHEWING GUM TREATMENT OF PERIODONTAL DISEASE.</b>	<b>122-128</b>
16	<b>PROTOCOLE DE PREPARATION DE PLASMA RICHE EN PLAQUETTES.</b>	<b>129-133</b>
17	<b>LA BRULURE ET LE DIABETE : CORRELATION PHYSIOPATHOLOGIQUE ET THERAPEUTIQUE.</b>	<b>134-138</b>
18	<b>THE IMPORTANCE OF CLINICOPATHOLOGICAL FEATURES FOR DIFFERENTIATION BETWEEN CROHN'S DISEASE AND ULCERATIVE COLITIS.</b>	<b>139-146</b>
19	<b>THE IMPACT OF AMMONIUM BIFLUORIDE COMPLEX ON COLMATAGING FORMATIONS DURING THE PROCESS OF IN SITU URANIUM LEACHING.</b>	<b>147-154</b>
20	<b>PROVIDING PREVENTIVE ADVICE BY DENTAL HYGIENIST, AND PREVENTIVE METHODS OF ORAL DISEASES AMONG ADULTS, IN KINGDOM OF SAUDI ARABIA.</b>	<b>155-164</b>
21	<b>EVALUATION OF PARAMETERS THAT AFFECT MINIMUM MISCIBILITY PRESSURE DURING GAS INJECTION PROCESSES</b>	<b>165-173</b>
22	<b>EFFECT OF PREVIOUS PCI ON RESULTS OF CABG IN MULTIVESSEL DISEASE PATIENTS</b>	<b>174-180</b>
23	<b>HEPATOPROTECTIVE EFFECT OF NIGELLA SATIVA ON DIABETIC MICE.</b>	<b>181-188</b>
24	<b>REVIVAL AND REJUVENATION STRATEGY OF WATER BODIES IN A METROPOLITAN CITY: A CASE STUDY OF NAJAFGARH LAKE, DELHI, INDIA.</b>	<b>189-195</b>

25	<b>DENTAL PATIENTS PERCEPTIONS AND KNOWLEDGE ON TOOTH BLEACHING.</b>	196-206
26	<b>PROGNOSTIC SIGNIFICANCE OF SERUM CALCIUM LEVEL IN A SAMPLE OF EGYPTIAN PATIENTS WITH INTRACEREBRAL HEMORRHAGE.</b>	207-213
27	<b>Communication AND audiovisual: understanding the metapore.</b>	214-220
28	<b>INFLUENCE OF TEMPERATURE&amp;RELATIVE HUMIDITY ON THE SURVIVAL OF <i>Daphnis nerii</i>(LEPIDOPTERA: SPHINGIDIAE) AND ITS FOOD EFFICACY ON HOST PLANTIN ARID AND SEMI-ARID REGION.</b>	221-225
29	<b>ROLE OF DIFFERENT PULSE SEQUENCES FOR BETTER CONTRAST USING MAGNETIC RESONANCE IMAGING.</b>	226-232
30	<b>CONSERVATION OF BIODIVERSITY WITH PARTICULAR REFERENCE OF BUTTERFLY FAUNA OF GIR PROTECTED AREA, GUJART.</b>	233-237
31	<b>IDENTIFYING CHARACTERISTICS OF EFFECTIVE LEADERSHIP BASED ON VALUES OF LOCAL ETHNIC CULTURE: A COMPARATIVE STUDY.</b>	238-243
32	<b>THE IMPACT OF INSTITUTIONAL SUPPORT, TECHNICAL EXPERTISE, AND ATTITUDES TOWARDS THE ACCEPTANCE AND USE OF TECHNOLOGY IN EDUCATION BY FACULTY MEMBERS OF FORENSIC SCIENCES AT THE UNIVERSITIES OF RIYADH.</b>	244-254
33	<b>IDENTIFICATION OF ENVIRONMENTAL FACTORS ASSOCIATED WITH LEISHMANIA PARASITES IN MARSHLANDS OF IRAQ.</b>	255-259
34	<b>ON FIXED POINT THEOREM IN WEAK CONTRACTION PRINCIPLE.</b>	260-262
35	<b>RELATIONSHIP BETWEEN APPENDICITIS AND LIFESTYLE; DIETARY AND HYGIENE IN SAUDI ARABIA.</b>	263-269

36	<b>GAMMA-RAY TRANSMISSION COEFFICIENTS FOR COMPOUNDS OF SOME BIOMEDICALLY IMPORTANT ELEMENTS</b>	270-274
37	<b>PERFORMANCE ANALYSIS OF MODIFIED RSA AND RSA HOMOMORPHIC ENCRYPTION SCHEME FOR CLOUD DATA SECURITY.</b>	275-281
38	<b>A COMPARATIVE IN VITRO STUDY ON RETENTION AND STABILITY OF FOUR IMPLANT-SUPPORTED OVERDENTURE BASED ON IMPLANT LOCATION</b>	282-290
39	<b>A STUDY OF DIFFERENT PHENOTYPIC PRESENTATIONS OF POLYCYSTIC OVARIAN SYNDROME: AN INSTITUTIONAL EXPERIENCE</b>	291-296
40	<b>PREVALENCE OF MISUSE OF TOPICAL CORTICOSTEROIDS AMONG POPULATIONS IN WESTERN REGION OF SAUDI ARABIA.</b>	297-307
41	<b>THE CORPORATE IMAGE AND ITS IMPACT IN THE PURCHASE DECISION STUDY IN ORASCOM TELECOM CORPORATION DJEZZY BECHAR – ALGERIA.</b>	308-313
42	<b>LEVEL OF USABILITY OF THE MULTI FACTOR AUTHENTICATION PROCESS OF ONLINE BANKING: A USER EXPERIENCE STUDY.</b>	314-318
43	<b>A REVIEW ARTICLE ON AYURVEDIC/ HERBAL PLANT “ARUNA” (ACONITUM HETEROPHYLLUM).</b>	319-325
44	<b>A PROXIMAL LEFT MAIN BRONCHIAL INJURY ; A MANAGEMENT DILEMMA</b>	326-329
45	<b>BLEEDING PATTERN IN ABNORMAL UTERINE BLEEDING.</b>	330-332
46	<b>THE INHIBITORY EFFECT OF NEWLY SYNTHESISED GUAR EPOXY N-METHYL PIPERAZINE ON THE GROWTH OF PATHOGENIC BACTERIA AND FUNGI.</b>	333-341
47	<b>GC GLOBULIN GENE POLYMORPHISM: A CANDIDATE LOCUS FOR SUSCEPTIBILITY TO RHEUMATOID AND OSTEOARTHRITIS.</b>	342-344

48	A SURVEY ON TASK SCHEDULING MODEL IN CLOUD COMPUTING USING OPTIMIZATION TECHNIQUE.	345-348
49	EQUILIBRIUM ISOTHERM, KINETIC AND THERMODYNAMIC STUDIES OF THE ADSORPTION OF CONGO RED DYE ONTO ACTIVATED CARBON FROM SNAIL SHELL.	349-355
50	REVIEWING ON STREET ATTRIBUTES IN INFLUENCING SENSE OF PLACE AND PLACE ATTACHMENT.	356-365
51	USING ANTCOCONC: A CORPUS-BASED TOOL, TO INVESTIGATE AND ANALYSE THE KEYWORDS IN DICKENS' NOVEL 'A TALE OF TWO CITIES'.	366-372
52	SINGLE VISIT APEXIFICATION AND OBTURATION OF IMMATURE NECROTIC PERMANENT TEETH USING BIODENTINE – FOUR CASE REPORTS.	373-376
53	Relationship between Tacit Knowledge Sharing, Professionalism and Lifelong Learning in accruing Personal Competencies	377-386
54	Ocular Manifestations of Stevens-Johnson Syndrome	387-388
55	DHAM (TRADITIONAL FEAST OF MANDI IN HIMACHAL PRADESH) A COMPLETE FOOD WITH AYURVEDA PERSPECTIVE.	389-393
56	FOUNDATIONS AND IMPLICATIONS OF COMPETITIVE INERTIA IN AIRLINES BUSINESS: A STUDY OF THE NEPALI AIRLINES INDUSTRIES	394-399
57	SKIN CARE ROUTINE AMONG FEMALE MEDICAL STUDENTS AT KING ABDULAZIZ UNIVERSITY HOSPITAL (KAUH), JEDDAH, SAUDI ARABIA.	400-405
58	SIMLULATION FOR SEDIMENTATIONASSESSMENTACASESTUDYOF KUNAR RIVERINAFGHANISTAN	406-416
59	COMPARATIVE POTENTIAL EFFICACY OF DELTAMETHRIN (PYRETHROID) AND CARBOFURAN (CARBAMATE) ON TOXICITY AND BIOCHEMICAL PARAMETERS IN THE GONADS OF CHROTOGONUS TRACHYPTERUS BLANCHARD (ORTHOPTERA: ACRIDIDAE)	417-428

60	<b>THE PREVALENCE OF ANTIBIOTICS MISUSE AMONG SENIOR MEDICAL STUDENT AT UMM AL-QURA UNIVERSITY FACULTY OF MEDICINE, MAKKAH.</b>	<b>429-432</b>
61	<b>THE INVESTIGATION OF GRATIFICATION CRIME: AN ANALYSIS OF CRIMINAL LAW ENFORCEMENT IN INDONESIA.</b>	<b>433-440</b>
62	<b>PROGNOSTIC SIGNIFICANCE OF IMMUNOHISTOCHEMISTRY AND PROLIFERATIVE ACTIVITY IN COLORECTAL CANCER USING SURVIVIN, COX2, S PHASE FRACTION AND DNA PLOIDY.</b>	<b>441-453</b>
63	<b>INTERNATIONAL TRADE TAX REVENUE AND TRADE LIBERALIZATION, A CASE STUDY OF PAKISTAN.</b>	<b>454-460</b>
64	<b>TEACHING WRITING SKILLS USING SHORT STORIES.</b>	<b>461-464</b>
65	<b>IMPLEMENTATION OF ENVIRONMENTAL POLICY AND PLANNING: SUGGESTIONS AND RECOMMENDATIONS FOR ECO-FRIENDLY INDIA.</b>	<b>465-469</b>
66	<b>THE PREDICTIVE VALUE OF HEPATIC ELASTOGRAPHY IN DIAGNOSIS OF HEPATIC FIBROSIS IN PATIENTS WITH CHRONIC HEPATITIS C VIRUS INFECTION.</b>	<b>470-476</b>
67	<b>PHYSICOCHEMICAL AND MICROBIOLOGICAL CHARACTERIZATION OF SEWAGE SLUDGE FROM SETTAT CITY'S TREATMENT PLANT DOMESTIC WASTE WATER (MOROCCO).</b>	<b>477-482</b>
68	<b>CYTOGENETICS AND MOLECULAR GENETICS ON FEMALE INFERTILITY WITH SPECIAL EMPHASIS ON POLYCYSTIC OVARIAN SYNDROME</b>	<b>483-488</b>
69	<b>STUDIES ON PERFORMANCE OF DROUGHT TOLERANT GENOTYPES UNDER DROUGHT AND NORMAL CONDITIONS THROUGH MORPHO, PHYSIO AND BIOCHEMICAL ATTRIBUTES OF BLACKGRAM (VIGNA MUNGO L.) AND GREEN GRAM (VIGNA RADIATA L.)</b>	<b>489-496</b>

70	<b>INTERACTOME ANALYSIS OF PROTEIN KINASES, GERMINATION-RELATED AND HORIZONTALLY TRANSFERRED GENES OF NOSEMA BOMBYCIS USING STRING.</b>	<b>497-506</b>
71	<b>WOUND INFECTION IN DIABETES</b>	<b>506-511</b>
72	<b>PHYTOCHEMISTRY OF THREE INDIAN VARIETIES OF PUNICAGRANATUM AND VITAMIN-C STUDY BY HPLC TECHNIQUE</b>	<b>512-518</b>
73	<b>THE IMPACT OF COLLABORATIVE LEARNING TO THE ORAL PROFICIENCY AND SELF EFFICACY OF THE KOREANS LEARNING ENGLISH AS A FOREIGN LANGUAGE IN LSPU, PHILIPPINES.</b>	<b>519-523</b>
74	<b>THE GENETICS OF SYSTEMIC LUPUS ERYTHEMATOSUS IN SAUDI ARABIA</b>	<b>524-529</b>
75	<b>DESIGN OF HYBRID CONCENTRATED SOLAR AND WIND POWER PLANT FOR THE AUTONOMY OF ISLANDS.</b>	<b>530-538</b>
76	<b>ASSESSMENT OF ORAL HYGIENE HABITS AND KNOWLEDGE OF CARIES AMONG UNIVERSITY STUDENTS IN TAIF CITY.</b>	<b>539-548</b>
77	<b>FACTORS OF QUALITY STANDARDS IN THE TEACHING PROCESS IN HIGHER EDUCATION INSTITUTIONS AND ITS IMPACT ON THE STUDENTS SATISFACTION: A CASE STUDY OF A PRIVATE UNIVERSITY IN DUBAI</b>	<b>549-557</b>
78	<b>INVESTIGATIONS ON PHOTOLUMINESCENCE PROPERTIES OF NANOCRYSTALLINE ZNO PARTICLES SYNTHESIZED BY SOL-GEL ROUTE.</b>	<b>558-561</b>
79	<b>THE EFFECT OF ALKALOIDS, SAPONINS AND THYMOQUINONE OF NIGELLA SATIVA SEEDS ON BIOFILM PRODUCTION, MOTILITY, OUTER MEMBRANE PROTEINS AND LIPOPOLYSACCHARIDE OF SOME BACTERIA.</b>	<b>562-571</b>
80	<b>THE ROLE OF BANKING SUPERVISION IN ACHIEVING THE OBJECTIVES OF MONETARY POLICY</b>	<b>572-581</b>
81	<b>ACHILLES TENDON INJURIES AND REPAIR: AN OVERVIEW.</b>	<b>582-587</b>

82	<b>LIVER INVOLVEMENT IN SICKLE CELL TRAIT: A CASE CONTROL STUDY AMONG NEPALESE INDIGENOUS THARU COMMUNITY</b>	<b>588-593</b>
83	<b>COMPARISON OF sEMG SIGNAL OF CTS SUFFERERS AND NON CTS SUFFERERS</b>	<b>594-599</b>
84	<b>COMMUNITY HEALTH WORKERS PROFILE, KNOWLEDGE AND EXPERIENCE TOWARDS DEMAND CREATION FOR SKILLED MATERNAL HEALTHCARE SERVICES IN SIAYA COUNTY.</b>	<b>600-614</b>
85	<b>DNA Barcoding and Phylogenetic analysis of South Indian Curcuma species using chloroplast matK gene.</b>	<b>615-621</b>
86	<b>PREVENTING DISABILITY AND MORTALITY RELATED TODIABETES IN THE PRIMARY CARE SETTING.</b>	<b>622-624</b>
87	<b>THE MODERNIZATION OF MOWING-MACHINES USING THE SEGMENTED SHARP EQUIPMENT MOVING RECTILINEARLY.</b>	<b>625-629</b>
88	<b>RACE AND GENDER IN TONI MORRISON'S BELOVED.</b>	<b>630-637</b>
89	<b>DEVELOPMENT OF INTELLIGENT HYBRID ARCHITECTURE FOR AUTONOMOUS UAV.</b>	<b>638-653</b>
90	<b>AWARENESS ABOUT EPILEPSY IN CHILDREN AMONG SCHOOLTEACHERS IN RIYADH, KSA</b>	<b>654-662</b>
91	<b>INTRAORAL VENOUS MALFORMATION WITH PHLEBOLITHS – A CASE REPORT WITH REVIEW OF THE LITERATURE</b>	<b>663-666</b>
92	<b>HISTOPATHOLOGICAL STUDY OF OPHTHALMIC LESIONS.</b>	<b>667-672</b>
93	<b>PRELIMINARY PARAMETERS OF HEMATOLOGIC VALUES IN BARBARY SHEEP (AMMOTRAGUS LERVIA PALLAS, 1777).</b>	<b>673-679</b>
94	<b>TENDON SHEATH FIBROMA OF FORE FOOT A RARE CASE REPORT</b>	<b>680-684</b>
95	<b>AN ANTHROPOMETRIC PROFILE AMONG THE KORAGA TRIBE OF UDUPI DISTRICT, KARNATAKA STATE</b>	<b>685-689</b>
96	<b>ISOLATED CUNEIFORM TUBERCULOSIS A RARE CASE REPORT</b>	<b>690-693</b>

97	<b>COMPARISON OF EARLY RESULTS BETWEEN ON-PUMP AND OFF-PUMP CABG IN PATIENTS WITH PREOPERATIVE MILD TO MODERATE RENAL IMPAIRMENT.</b>	<b>694-707</b>
98	<b>SHORT TERM OUTCOME OF REDO MITRAL VALVE SURGERY: EMERGENCY VERSUS ELECTIVE.</b>	<b>708-715</b>
99	<b>Primary Cutaneous T-Cell Lymphoma (CTCL); Case Report &amp; Review of Literature</b>	<b>716-721</b>
100	<b>Protection of Key in private key cryptography.</b>	<b>722-724</b>
101	<b>PHARMACOKINETICS OF BIO-THERAPEUTICS: Rituximab</b>	<b>725-733</b>
102	<b>THE LEVEL OF AWARENESS OF DIABETIC FOOT AMONG PATIENTS WITH TYPE 2 DIABETES MELLITUS (T2DM) IN ALAHTSA, SAUDI ARABIA.</b>	<b>734-743</b>
103	<b>LANGUAGES IN CONTACT: THE INFLUENCE OF ARABIC ON MODERN ISRAELI HEBREW SLANG.</b>	<b>744-752</b>
104	<b>DEVELOPMENT, PILOTING AND EVALUATION OF A FRAMEWORK FOR INCREASING UTILIZATION OF SKILLED MATERNAL HEALTHCARE SERVICES: STUDY IN SIAYA COUNTY</b>	<b>753-768</b>
105	<b>PATENTING GENOMICS INNOVATIONS:POST-MYRIAD CHALLENGES AND POSSIBILITIES</b>	<b>769-773</b>
106	<b>ANALYTICAL MODELING OF COST EFFICIENT QUAD MATERIAL GATE ALL AROUND STACK ARCHITECTURE OF TUNNEL FET.</b>	<b>774-782</b>
107	<b>THE EFFECTIVENESS OF USING PADLET IN ESL CLASSROOM.</b>	<b>783-788</b>
108	<b>THE PERFORMANCE MANAGEMENT OF COMMUNITY SERVICE AND EMPOWERMENT THROUGH FARMERS' COMMUNITY LEARNING CENTRE FOR ECONOMIC EMPOWERMENT IN KANDRI VILLAGE, SEMARANG – INDONESIA.</b>	<b>789-798</b>
109	<b>SINGLE CRYSTAL GROWTH AND CHARACTERIZATION OF ZINC DOPED MAGNESIUM THIOUREA ACETATE CRYSTALS.</b>	<b>799-802</b>
110	<b>IS CONCENTRATION OF FOAM SCLEROTHERAPY CAN BE DETERMINED PRIOR TO PROCEDURE..?</b>	<b>803-808</b>

111	COMPARATIVE STUDY FOR THE ASSESSMENT OF TISSUE ENGINEERED OSTEOCHONDRAL GRAFT VERSUS AUTOGENOUS GRAFT IN CRITICAL SIZE DEFECT: AN EXPERIMENTAL STUDY ON THE TEMPOROMANDIBULAR JOINT OF DOGS.	809-817
112	A CASE OF A SHARED PSYCHOTIC DELUSION BETWEEN TWO SISTERS.	818-820
113	ANEURYSMAL SUBARACHNOID HEMORRHAGE AND ITS PRACTICAL IMPLICATIONS IN A PERIPHERAL SET-UP.	821-826
114	LEGAL CERTAINTY OF OWNERSHIP RIGHT FOR UNIT FLATS:A REVIEW ON THE SALE AND PURCHASE AGREEMENT	827-834
115	ELEVATED SERUM URIC ACID LEVELS- A RISK FACTOR IN ACUTE NON-EMBOLIC ISCHEMIC STROKE.	835-838
116	3D ULTRASONOGRAPHY DAIGNOSIS OF POLYPOID GALL BLADDER IN DOG.	839-842
117	SPECTROPHOTOMETRIC CHARACTERIZATION OF RUTHENIUM(II) POLYPYRIDYL COMPLEXES WITH PARA QUINONES IN AQUEOUS MEDIUM.	843-847
118	THE STUDY OF H-REFLEX EFFICACY IN DIAGNOSIS OF LUMBOSACRAL RADICULOPATHY.	848-852
119	Network Lifetime Extension scheme Using Multipath Routing in Flooding Attack Detection of Wireless Sensor Networks.	853-860
120	INTRAVENTRCULAR CENTRAL NEUROCYTOMA- A NEUROSURGICAL ENIGMA.	861-867
121	ROLE OF SERUM LACTIC ACID LEVEL IN DIAGNOSING MESENTERIC BOWEL ISCHEMIA WITH THE AID OF THE CT ANGIOGRAM.	868-880
122	HISTOPATHOLOGICAL STUDY OF TUBERCULAR ENDOMETIRTIS IN PATIENTS OF PULMONARY TUBERCULOSIS WITH CILINICAL CORRELATION IN A TERTIARY REFERRAL UNIT OF ODISHA.	881-885

123	<b>INFLUENCE OF AMINO ACID DOPANTS ON THE GROWTH AND PROPERTIES OF POTASSIUM HYDROGEN PHTHALATE SINGLE CRYSTALS FOR NONLINEAR OPTICAL APPLICATIONS</b>	<b>886-897</b>
124	<b>STUDY OF SERUM CALCIUM AND CREATININE LEVELS IN PREECLAMPTIC WOMEN BELOW 35 YEARS IN A TERTIARY CARE CENTRE IN SOUTHERN ASSAM , INDIA.</b>	<b>898-903</b>
125	<b>A RARE BRAIN TUMOUR- HYPOTHALAMIC PLEOMORPHIC XANTHOASTROCYTOMA IN A 11 YEAR OLD CHILD.</b>	<b>904-908</b>
126	<b>THE STATUS OF THE GENUS ROTALA L. (LYTHRACEAE) AND DESCRIPTION OF A NEW SPECIES FROM KERALA, INDIA.</b>	<b>900-914</b>
127	<b>THEORETICAL ASPECT OF SOCIAL COMPETENCE FORMATION IN TEACHING FOREIGN LANGUAGES</b>	<b>915-917</b>
128	<b>DIFFERENCE IN PERCEPTION OF AVOIDANCE STRATEGIES AGAINST SEXUAL HARASSMENT AMONG UNDERGRADUATE FEMALES STUDENTS IN WOMEN AND CO-EDUCATIONAL COLLEGE IN DELHI.</b>	<b>918-921</b>
129	<b>PREVALENCE OF INSOMNIA IN SAUDI GENERAL POPULATION.</b>	<b>922-927</b>
130	<b>Prevalence of hepatitis B and C among some high risk groups in Egyptian children attending Benha University hospital.</b>	<b>928-936</b>
131	<b>A STUDY OF AWARENESS REGARDING HOUSEHOLD FOOD INSECURITY, FOOD PRACTICES AND HEALTH RISKS AMONG THE RURAL WOMEN OF ALLAHABAD DISTRICT.</b>	<b>937-940</b>
132	<b>Development and evaluation of physico-chemical quality markers of opuntia and pineapple squash.</b>	<b>941-950</b>
133	<b>INVESTIGATION OF USAGE OF PHOTOVOLTAIC SOLAR CELL FOR POWER GENERATION WITH ENVIRONMENTAL IMPACTS.</b>	<b>951-963</b>
134	<b>IOT Based Environment Monitoring using Wireless Sensor Network.</b>	<b>964-970</b>

135	<b>SOLID WASTE DISPOSAL METHODS PRACTICED BY INHABITANTS OF A TYPICAL NIGERIAN RURAL COMMUNITY.</b>	<b>971-975</b>
136	<b>A STUDY ON A MULTI-MODALITY IMAGING SYSTEM IN A TERTIARY CARE HOSPITAL: A CASE ON CARDIAC IMAGING.</b>	<b>976-980</b>
137	<b>ROLE OF NANOTECHNOLOGY IN EPIRUBICIN FOR BREAST CANCER THERAPY IN TAIF CITY</b>	<b>981-1001</b>
138	<b>EVALUATION OF POST-OPERATIVE BITE FORCE IN MANDIBLE FRACTURES TREATED WITH OPEN AND CLOSED REDUCTION</b>	<b>1002-1008</b>
139	<b>KNOWLEDGE, ATTITUDE, AND BEHAVIOR AMONG MEDICAL STUDENT AT UMM- AL-QURA UNIVERSITY TOWARD EVIDENCE-BASED MEDICINE.</b>	<b>1009-1015</b>
140	<b>EFFECTIVENESS OF EDUCATIONAL INTERVENTION ON IMPROVING AWARENESS ABOUT OSTEOPOROSIS AMONG UNIVERSITY FEMALE EMPLOYEES.</b>	<b>1016-1023</b>
141	<b>EFFICACY OF TRANEXAMIC ACID IN REDUCING BLOOD LOSS AND BLOOD TRANSFUSION IN IDIOPATHIC SCOLIOSIS; A SYSTEMATIC REVIEW AND META-ANALYSIS</b>	<b>1024-1035</b>
142	<b>STOCHASTIC BEHAVIOUR OF A SYSTEM WITH PATIENCE TIME FOR REGULAR REPAIRMAN</b>	<b>1036-1040</b>
143	<b>HOW ODONTOBLASTS REACT ULTRA-STRUCTURALLY TO ORTHODONTIC INTRUSIVE FORCES.</b>	<b>1041-1052</b>
144	<b>RACE IN THE BLUESTEYE BYTONI MORRISON</b>	<b>1053-1061</b>
145	<b>HEPATITIS E VIRUS IN RENAL TRANSPLANT RECIPIENTS.</b>	<b>1062-1066</b>
146	<b>THE INFLUENCE OF THE ISLAMIC BUSINESS ETHICS AND SPIRITUAL INTELLIGENCE OF ISLAMIC LEADERSHIP AND PERFORMANCE MANAGER SHARIA BANK IN SURABAYA</b>	<b>1067-1073</b>
147	<b>BIODEGRADATION OF ORGANIC MATERIAL FROM PRODUCE WATER USING CONSORTIUM MICROORGANISM WITH STEP AERATION PROCESSING</b>	<b>1074-1078</b>

148	SCENARIO OF ANTI-KERATINOPHILIC ACTIVITY IN ETHNO-MEDICINAL PREPARATIONS USED BY SARANDA'S TRIBES.	1079-1088
149	JUVENILE MYOCLONIC EPILEPSY AND MIGRAINE: STUDY OF COMORBIDITY AND CLINICAL CO-OCCURRENCE.	1089-1095
150	ROLE OF KUDUMBASREE IN POVERTY ALLEVIATION IN KERALA.	1096-1104
151	OBSTRUCTIVE UROPATHY AND ITS TREATMENT	1105-1108
152	A MULTI DIMENSIONAL EFFECT OF PANCHAKARMA IN THE MANAGEMENT OF TRAUMATIC PARAPLEGIA – A CASE STUDY.	1109-1112
153	A CASE STUDY ON SOLITARY RECTAL ULCER SYNDROME TREATED WITH ERANDAMULADI BASTI FOLLOWED BY GUDAPICHU WITH JATYADI TAILAM.	1113-1116
154	SPIRITUAL MARKETING: A STRATEGY TO INCREASED NUMBER OF ISLAMIC BANKING CUSTOMER IN CIANJUR, WEST JAVA, INDONESIA.	1117-1121
155	ASSIGNING RANK AND WEIGHTAGES TO LANDSCAPE PARAMETERS TO WORK GROUNDWATER POTENTIAL - CASE OF MIDC, BUTIBORI, NAGPUR.	1122-1125
156	DENTAL MARKETING: YAY OR NAY? – A SURVEY.	1126-1138
157	EDUCATION –R.K.NARAYAN.	1139-1143
158	PEDIATRIC CASE OF ACCIDENTAL ORAL OVER DOSE OF METHOTREXATE.	1144-1147
159	TRANSFORMATION FROM MICRO FINANCING UNIT TO BANK: CASE STUDY OF BANDHAN, KOLKATA.	1148-1150
160	WEIGHT REGAIN AFTER SLEEVE GASTRECTOMY	1151-1157
161	VAGINAL MALIGNANT MELANOMA IN TREATED PATIENT OF CARCINOMA CERVIX- AN UNUSUAL CLINICAL ENTITY.	1158-1161
162	SERUM GALECTIN-4 (GAL-4) IN PATIENTS WITH GASTRIC ADENOCARCINOMA: ACTIVE PLAYER IN THE FIELD.	1162-1167

163	<b>EFFECT OF SOIL AMENDMENTS ON NI, CD AND PB DYNAMIC UNDER PADDY FIELD IRRIGATED WITH LOW WATER QUALITY.</b>	1168-1179
164	<b>ADSORPTION OF AMMONIA ONTO ACTIVATED CARBON PREPARED FROM RICE STRAW.</b>	1180-1196
165	<b>SYNTHESIS AND CHARACTERIZATION OF N3S2 DONORS MACROCYCLIC COPPER(II) COMPLEXES. CATECHOL OXIDASE AND PHENOXAZINONE SYNTHASE BIOMIMETIC CATALYTIC ACTIVITY.</b>	1197-1210
166	<b>BOMBAX CEIBA: KALPATARU, A TREE OF LIFE.</b>	1211-1214
167	<b>EFFECT OF ODD EVEN SCHEME TO COMBAT AIR POLLUTION IN NCT OF DELHI.</b>	1215-1222
168	<b>Modeling and forecasting GDP at current market price in Bangladesh: An Application of ARIMA model.</b>	1223-1232
169	<b>SKIN CARE IN SPINAL CORD INJURY PATIENTS: A PRACTICAL AND SCIENTIFIC APPROACH TO THE DEVASTATING PROBLEM.</b>	1233-1243
170	<b>Assesment of oral health knowledge, attitude and practice behaviour among Obstetricians- a questionnaire study.</b>	1244-1253
171	<b>USERS EXPERIENCES AND PERCEPTIONS ON MATERNAL HEALTHCARE SERVICES IN SIAYA COUNTY, WESTERN KENYA: A QUALITATIVE STUDY.</b>	1254-1267
172	<b>ASSESSMENT OF KNOWLEDGE, ATTITUDE AND PRACTICE TOWARD DIABETIC PATIENTS IN RIYADH CITY, 2016.</b>	1268-1278

#### Abstract

This paper reviewed the salient factors militating against quality of academic performance of secondary school students; A case study of secondary school students in Ondo State, Nigeria. Sequel to the findings, the following conclusions were made; Adequate use of library, conducive school environment, motivation of teachers, parental factors, and effective use of equipped laboratory were the factors militating against quality of academic performance of secondary school students in Ondo State, Nigeria. Consequently, it was recommended among others that; educational budgetary allocation should be increased both at federal, state and local government levels to finance both the federal and the state public secondary schools, regular payment of teachers salary, promotion of teachers and other emoluments should be made available and the salary scale of teachers should be equal to their counterparts in other fields like medicine. In addition, more infrastructural facilities should be provided by the government and nongovernmental organization to all secondary schools and books in the library should be up-to-date.

#### Introduction:-

In Nigeria public discussions frequently focus on educational standards. The public's unhappiness becomes more prominent following the annual release of the West African Senior School Certificate Examination results. Student outcomes do not match the government and parental investment. All stakeholders are concerned about why the system is turning out graduates with poor results. The most important factor in the effectiveness of schools and in the quality of a child's education are the competent teacher to teach effectively. The National Policy of Education states, "No Education system can rise above the quality of teachers in the system" (FGN, 2006). Ogunsaju (2004) states that the academic standard in all Nigerian educational institutions has fallen considerably below societal expectations. Blumende (2001) corroborated this view when he reported that the decline in the quality of education cannot be ignored by anyone who is aware of the significant role of education as an instrument of societal transformation and development. There is a need to focus on teachers' adequacy and competency in respect to their pedagogical practices and strategies and mastery of the curriculum and subject content (Chall & Popp, 1990; Stuart, 2004; Rodgers, 2001).

In Ondo state, education remains the largest industry and government contributes to ensures that funds, instructional

materials, seminar and teaching personnel are made available for the sectors. Government has also continuously encouraged secondary education by adopting the social and demand approach towards planning the sector and by subsidizing the senior School certificate examination (SSCE) fee in the state over a long period of time. An indication of government interest in the general education in the state reflected in the 1999 budgetary estimates of the state till date.

Of course, despite the efforts being made towards ensuring that citizens have equal educational opportunities, training opportunities as well as making other training facilities readily accessible to the users so as to improve students' academic performance in both internal and external examination, it has been observed by (Ajayi, 1998; Adepoju, 2002; Owoeye, 2000), that all is not well with the system as a result of the poor performance of students recorded in public examinations in the recent years. The persistent poor performance of secondary school students in public examinations such as the senior school certificate examinations (SSCE), national examination council (NECO) in Ondo State, Nigeria in recent times has made the developments of secondary education in the state a difficult task. Parents, guardians and other stakeholders in education industry have variously commented on the performances of secondary school students particularly in English language and mathematics (Adepoju, 2002). Researchers and stakeholders in education industry have in the recent past identified several factors as the causes of poor performance of students in public examinations. Among such factors identified are poor location of the school, incessant changes in government policies, closure of schools, which is contingent upon teachers' strike action, home-school distance, high student teacher ratio, inadequate supervision, monitoring and evaluation machinery, poor and non-conducive environment among others (Adepoju, 1995; 1998; 2002; 2003; Adeboyeje, Olaniyi Adepoju 2003).

### **Militating factors:-**

The following factors contribute positively to students' academic performance: adequate use of library, school environment, motivation of teachers, parental factors and effective use of equipped laboratory among others.

- a. **Parental factors:** Parental factor is one of the most important factor contributing to the academic performance of students. This factor is so important because students spent most of their life with their parents, Fan (2001) demonstrated that parents' educational aspiration for their children proved to be strongly related to students' academic growth. Research studies have found that parental educational level has a significant impact on child's learning, (Khan & Malik, 1999). Similarly, Schneider and Lee (1990) linked the academic success of the East Asian students to the values and aspirations they share with their parents, and also to the home learning activities in which their parents involve with them. In fact, all parents have desired to do something better for their children according to their available resources. But the extent and effectiveness of parental support depends on a variety of reasons, such as, ethnicity, family income, and home environment and their awareness about the importance of education.

Research studies indicated that socio economic status is correlated strongly with parents' educational ambition for their children. Khan, Khan and Zubairi (1999) stated that "interacting with and sharing the child's activities is affected by level of parents' education and income. In the families with low socioeconomic status, majority of the illiterate parents do not have understanding of the requirements of their children's education. Some poor parents make some arrangements for helping their children in studies and to do their home assignments, while others rely on school for the education of their children, as they do not have enough resources to spend extra money on home tuitions etc. This results into poor performance and academic achievement of their children. The findings of the study conducted by Okpala, and Smith (2001) also supports the view that economic circumstances are significantly correlated with academic achievement. Research studies indicated that the nature of the parental support change at different age levels of children. Gonzalez-Pienda et al. (2002) have found that parental support is likely to decrease as children move from primary to middle and then to high school grades. Similarly, a research study by Fan, (2001) showed that children also develop sense of responsibility and perform better as they grow older. The study indicated that those students whose parents had higher expectations for their children's academic achievement performed better from the beginning of their academic career and accelerated faster in their academic progress during the transition period of middle to high grades.

The children also seek emotional support from parents when they face some academic problems at school. Educated and sensible parents always encourage their children and give proper guidance in school related matters, but illiterate and economically deprived parents may act violently and thus upset their children more. Some parents also

helps their children to do assignment and give them less work to do at home, this gives the students the opportunity to spend more hours reading their books and conduct more research outside of what they were thought in the classroom. Research studies indicated that parental support in doing home tasks has significant effects in students' achievement, (Singh, Granville, Sandra, & Dika, 2002; Eilam, 2001). If parents are educated, and have better understanding of how to break a problem into parts, or know more effective motivational techniques, then they can help their children more effectively. A study conducted by Voorhis (2003) demonstrated that those students who reported more parental involvement in connection with daily homework, doing their homework assignments more regularly.

**b. Social environmental factors:** School facilities have been observed as a potent factor to quantitative education. The importance to teaching and learning with the provision of adequate instructional facilities for education cannot be over-emphasized. According to Akande (1985), learning can occur through one's interaction with one's environment. Environment here refers to facilities that are available to facilitate students learning outcome. It includes books, audio-visual, software and hardware of educational technology; so also, size of classroom, sitting position and arrangement, availability of tables, chairs, chalkboards, shelves on which instruments for practical are arranged (Farrant, 1991 and Farombi, 1998). According to Oni (1992), facilities constitute a strategic factor in organizational functioning. This is so because they determine to a very large extent the smooth functioning of any social organization or system including education. He further stated that their availability, adequacy and relevance influence efficiency and high productivity. In his words, Farombi (1998) opined that the wealth of a nation or society could determine the quality of education in that land; emphasizing that a society that is wealthy will establish good schools with quality teachers, learning infrastructures, such students may learn with ease thus bringing about good academic achievement. In their contribution, Ajayi and Ogunyemi (1990) reiterated that when facilities are provided to meet relative needs of a school system, students will not only have access to the reference materials mentioned by the teacher, but individual students will also learn at their own paces. The net effect of this will increase overall academic performance of the entire students.

According to Hallak (1990), facilities form one of the potent factors that contribute to academic achievement in the school system. They include the school buildings, classroom, accommodation, libraries, laboratories, furniture, recreational equipment, apparatus and other instructional materials. He went further to say that their availability, relevance and adequacy contribute to academic achievement. He however, quickly added that unattractive school buildings and overcrowded classrooms among others contribute to poor academic attainment. In another development, Aliyu (1993) as cited by Johnson (1998) found that there was no significant difference between students in secondary schools with and without adequate instructional facilities. However, he submitted that instructional facilities were indispensable to academic achievement of students in English Language, Mathematics, Biology and Geography while students could perform well in other subjects without adequacy of sophisticated instructional materials. He concluded that the effect of instructional facilities on students' academic achievement is more felt in pure and social sciences.

**c. Effect of libraries:** Library is an essential factor in teaching-learning process. It forms one of the most important and essential educational services needed for the success of the students. The main purpose of school library is to make books available to the pupils/students, at his easy convenience, all books, periodicals and other reproduced materials which are of interest and value to him but which are not provided or assigned to him as basic or supplementary textbooks. The importance of library has been demonstrated by the government when she expressed in the National Policy on Education (NPE) that every state Ministry needs to provide funds for the establishment of libraries in all her educational institutions and to train librarians and library assistants. As a resource, it occupies a central and primary place in any school system. It supports all functions of school-teaching and provides service and guidance to its readers. Fowowe (1988) stated that a library must be up-to-date and at the same time allow access to older materials. It must be properly supported financially to fund materials and services among others. While itemizing the types of libraries, Ola (1990) thought that secondary school library in whatever form, has replaced the traditional method of 'chalk and talk' in imparting knowledge to students and that its effect on academic performance need not to be over-emphasized. He therefore, concluded that a well equipped library is a major facility which enhances good learning and achievement of high educational standard. In his words, Farombi (1998) reiterated that school libraries may not be effective if the books therein are not adequate and up-to-date as its impact may only be meaningful if the library could be opened to the students always for a considerable length of time in a school day. With all the above mentioned

facts, it is sad to know that many schools operate without libraries (Shodimu, 1998) whereas Ogunseye (1986) had earlier noted that total absence of an organized school library would continue to spell dooms for thousands of secondary school students. This statement clearly implied that many schools operate without libraries and this situation had affected the academic performance of their students. Reporting the state of library in Lagos Secondary Schools, Shodimu (1998) submitted that the guidelines that each school should be provided with a library with 100 students seating capacity was not followed as most of the schools he sampled had seating capacity of less than 100 students.

- d. Effect of motivation:** Business Dictionary.com define motivation as activation of a contractor's physical and manpower resources for transfer to a construction site until the completion of the contract. It is generally assumed that motivation influences people's attitude and performance at work. Taylor and Vest (2002) asserts that pay is an important reward used in motivating the behaviour of employees. Teacher motivation is directly linked to the instructors' desire to take part in the pedagogical process and interest in sharing their knowledge with the students. It determines their involvement or non-involvement in the teaching activities. Teachers put educational philosophy and objective into the knowledge they transfer to their students. Meanwhile, they are the most important factor in a generation's education process, so it is important that they perform to the best of their abilities in the educational activity. Each country's authorities must pay attention to the factors that affect teachers' performance which has a direct effect on students' performance.

Teachers' motivation is influenced by a myriad of factors, including compensation, success in the classroom, their dedication to the profession, the training they receive, the prospect of promotion and career advancement. Compensation influences teacher education, but in many cases it is not the most or the only important factor. Teachers may be compensated through salaries, bonuses, training programs or special assistance such as shelter and transport support. If teachers are not paid, or if they are not paid on a regular basis, their motivation will be affected and they might start teaching irregularly or leave their jobs. Teachers' motivation is influenced by their working conditions too. An appropriate environment in which the teacher feels safe and healthy and has access to supportive resources and facilities will help teachers participate more in the process of teaching, management and administration. Moreover, teacher motivation is influenced by the number of hours the instructor has to work every week, the number of students in the classroom and at the same time by parents' involvement and support. Individuals are motivated by money, power or praise. As teachers can't motivate students by offering money or power, they should focus on praise. Some students are self-motivated and their actions are a result of their desire to face challenges. Teachers can praise, promote and encourage this personal trait by showing students their efforts are worthwhile and that they will benefit from them.

- e. Factor of laboratory:** Laboratory has been conceptualized as a room or a building specially built for teaching by demonstration of theoretical phenomenon into practical terms. Olaniyonu (1997) maintains that in secondary schools, the modern teaching of sciences will necessitate laboratories. In the words of Ogunleye (1997), one of the recurrent problems of teaching of science is that of large classes. He remarks that one of the objectives of teaching science in schools is to communicate the knowledge of science in schools and to ensure that students acquire the process skills of science. This cannot be effectively achieved unless students are exposed sufficiently to practical work and laboratory experimentation. Unfortunately, Ogunleye continued, that many secondary schools established over the years still remain without science laboratories while others have laboratories that are not sufficiently equipped. Similarly, Farombi (1998) argued the saying that "seeing is believing" as the effect of using laboratories in teaching and learning of science and other science related disciplines as students tend to understand and recall what they see than what they hear or were told, similarly Ogunniyi (1983) said that there is a general consensus among science educators that the laboratory occupies a central position in science instruction.

**According to Ango (1986) laboratory work:-**

- Stimulate learners' interest as they are made to personally engage in useful scientific activities and experimentation;
- Promotes that science is not only product or process;
- Affords the learners the basic skills and scientific method of problem solving;
- Knowledge obtained through laboratory work promotes long term memory, on similar objectives.

Soyibo (1990) said laboratory helps to provide a forum wherein the learner is given the exercise to subjects, his beliefs, ideas, statements, and theoretical propositions etc to some forms of experimental test.

Soyibo and Nyong (1994) has shown that school with well-equipped laboratories have better results in the school certificate science examinations than those that are ill-equipped. Corroborating this, Gana (1997) reiterated that students instructed entirely by the laboratory methods had higher attitudes scores but lower achievement scores than students instructed entirely by the traditional lecture or textbook mode. On the same topic, Yadar (2001) opined that no course in science and mathematics can be considered as complete without including some practical work. Thus practical work forms an important feature in any science and mathematics course (UNESCO, 2008), and lastly, Olainiyonu (1997) maintains that in secondary schools, the modern teaching of science will necessitate laboratories.

### **Conclusion and recommendations:-**

After a careful review of available literature, this paper concludes that library, school environment, motivation of teachers, parental factors, and lack of equipped laboratory were the major factors militating against quality of academic performance of secondary school students in Ondo State.

To this end, the paper recommends, among others, that:

- 1) The parents should take proper care of their children and bearing child without taking care off should be counted as punishable offence by government.
- 2) More infrastructural facilities should be provided by both the government and non-governmental organizations to fast-track the growth of educational system in the state.
- 3) Constructions of libraries in the schools and communities with E-learning facilities with current books should be embarked upon.
- 4) Regular payment of teachers salaries, promotions and other incentives should be embarked upon.
- 5) Standard laboratories with reagents and latest equipments should be build by both the Government and NGO across the secondary schools in the state.
- 6) More qualified teachers should be employed to solve the problem of shortage of teachers in various schools in the state and equipped with latest teaching techniques through in-service training.

Poly Cystic Ovary Syndrome, Binge eating disorder, Obesity, subfertility

#### Abstract

**Background:** Polycystic ovarian syndrome is a common female endocrine disorder and affecting up to one in five women of reproductive age between 15-49 years. The etiology of polycystic ovarian syndrome is uncertain, but a number of risk factors are associated with polycystic ovarian syndrome is subfertility, obesity, insulin resistance, cardiovascular disease and hormonal disturbance. Hormonal imbalance, behavioral and cognitive health is related to abnormal eating habit like binge eating. Binge eating disorder is characterized by eating large amount of food in a discrete time period and feeling out of control. About one third women of polycystic ovarian syndrome reported binge eating disorder.

**Objective:** To determine the association of binge eating disorder with polycystic ovarian syndrome in Civil Hospital of Karachi To determine the risk factors associated with polycystic ovarian syndrome in Civil Hospital of Karachi

**Methodology:** This case control study was conducted in civil Hospital Karachi. Data was collected by using a structured questionnaire with a sample size of 280 (140 cases and 140 controls). Data entry was done in EpiData software and was analyzed by using SPSS Version 21. Descriptive analysis was performed for socio demographic variables. Univariate analysis was done to determine crude association between independent and dependent variables by calculating odds ratio and 95% confidence interval. Multivariable analysis was performed to eliminate the confounder

**Results:** About 280 women (140 cases and 140 controls) were enrolled into the study. The Univariate analysis showed that polycystic ovarian syndrome among overweight women (BMI 25-29.9) was 2 times more (OR=2.0, 95 % CI=1.41-3.56, pvalue= 0.01) and among obese women (BMI  $\geq$ 30) was 12 times more (OR=12.1, 95 % CI=5.03-29.24, pvalue= $<$ 0.001) as compared to control (normal BMI18.5-24.9) women kilogram per meter square , polycystic ovarian syndrome among binge eating disorder score ( $\geq$ 17) was found 4 times more (OR=4.3, 95 % CI=2.42-7.88, pvalue= $<$ 0.001) as compared to control non binge eating score ( $<$ 17) women . Multivariate analysis showed polycystic ovarian syndrome among obese (BMI  $\geq$ 30) was found ten times more (AOR=10.4, 95 % CI=4.11-26.4, pvalue= $<$ 0.001) as

**Corresponding Author:- Sadia Rashmeen.**

Address:- Sadia Rashmeen, Postgraduate student of Master of Public Health, Dow University of Health Sciences, Karachi.

compared to control (normal BMI 18.5-24.9) women and polycystic ovarian syndrome among women with binge eating disorder score ( $\geq 17$ ) was found seventeen times more (AOR=17.8, 95 % CI=1.29-24.63, pvalue=0.03) as compared to non-binge eating score.

**Conclusion:** Our study concluded that binge eating disorder is significantly associated with polycystic ovarian syndrome. Results will help health care provider making good health choices for preventing and managing not only binge eating disorder but also women having polycystic ovarian syndrome with binge eating disorder.

## **Introduction:-**

Polycystic ovarian syndrome is a common female endocrine disorder, affecting up to one in five women of reproductive age between 15-49 years<sup>1,2</sup>. The global prevalence of polycystic ovarian syndrome is 3-7%<sup>3</sup>, in the developed countries prevalence is 4-12%<sup>1</sup>, and in Pakistan its prevalence is 52 %<sup>4</sup>. The clinical features are menstrual disorder with an ovulation, clinical and/or biochemical features of hyperandrogenism and the presence of polycystic ovaries in ultrasonography<sup>5</sup>. The etiology of polycystic ovarian syndrome is uncertain, but a number of risk factors were associated with polycystic ovarian syndrome are subfertility, obesity, insulin resistance, cardiovascular disease and hormonal disturbance<sup>6</sup>. Hormonal disturbance lead to behavioral and emotional health condition is related with abnormal eating behavior like binge eating<sup>7,8</sup>.

Binge eating disorder is characterized by eating large amount of food in a discrete time period and out of control<sup>9</sup>. The remission of binge eating in diagnosed binge eating disorder is reported as 67% in a 12 year follow-up study<sup>10</sup>. Binge eating can lead to other serious physical health problems and death<sup>7</sup>. There is an important role of polycystic ovarian syndrome in the pathogenesis of binge eating disorder<sup>11</sup>. Polycystic ovarian syndrome patients have reduced the secretion of cholecystokinin and changes in insulin sensitivity and androgen levels which lead to abnormal appetite regulation and tendency to binge eating<sup>12</sup>. About one third women of polycystic ovarian syndrome reported binge eating disorder.<sup>13</sup> Therefore polycystic ovarian syndrome symptoms become worse when polycystic ovarian syndrome diagnosed with binge eating<sup>13</sup>.

Binge eating disorder is also associated with Obesity<sup>14</sup>. The risk of obesity is also higher in women with polycystic ovarian syndrome as compared to healthy controls<sup>15</sup>. The healthy controls and polycystic ovarian syndrome women had found a linear correlation with body mass index<sup>16</sup>. Body mass index of polycystic ovarian syndrome women were strongly correlated with type 2 diabetes mellitus<sup>17,18</sup>. Risk of developing type 2 diabetes mellitus is increased in polycystic ovarian syndrome women as compared to non-polycystic ovarian syndrome (control) women<sup>19,20</sup>. About fifty to seventy five percent of women with polycystic ovarian syndrome occurred type 2 diabetes mellitus<sup>21</sup>. Family history of type 2 diabetes mellitus particularly with obesity both increase risk of type 2 diabetes mellitus in polycystic ovarian syndrome women<sup>22</sup>.

Women with polycystic ovarian syndrome are increased risk of anovulation infertility. Infertility was important characteristic of polycystic ovarian syndrome defined by Stein and Leventhal<sup>1</sup> and is one of the common presenting complaints<sup>23</sup>. The infertility burden is increasing among the women with polycystic ovarian syndrome<sup>24</sup>. Infertility due to an ovulation affected 75% of women with polycystic ovarian syndrome<sup>25</sup>. Women with polycystic ovarian syndrome were reported 50% primary infertility and 25% reported secondary infertility<sup>26</sup>. In Pakistan, this type of research study had not been conducted that's why this study was undertaken to explore the relationship between polycystic ovarian syndrome and binge eating disorder. The data from this study can be helpful for future research studies.

## **Objectives:-**

To determine the association of binge eating disorder with polycystic ovarian syndrome in Civil Hospital of Karachi  
To determine the risk factors associated with polycystic ovarian syndrome in Civil Hospital of Karachi

**Rationale Of The Study:-**

In Pakistan, this research study had not been conducted that's why this study was undertaken to explore the relationship between polycystic ovarian syndrome and binge eating disorder while a same pilot study was done at Stavanger university hospital with a small sample size and this study was used appropriate sample size. Data of this study provide information of binge eating disorder developing the risk of polycystic ovarian syndrome. Early evaluation of individual with binge eating disorder will improve eating pattern and will reduce binge eating. This study explored association should help to decrease serious health outcomes related to it and lower spending on its medical treatment

**Methods And Materials:-****Sample Description:-**

The sample size was calculated by using openEpi version 3. The sample size of the study was calculated on the basis of references (Proportion of binge eating among polycystic ovarian syndrome group = 20% and Proportion of binge eating among control group = 8.3%) taken from study conducted at University of Oslo<sup>27</sup> Sample size was calculated 280 (140 of case and 140 of control)

**Criteria For Sample Selection:-**

Sample selection was made through following selection criteria:

**Inclusion Criteria:-**

The study included, cases those who fulfilled the Rotterdam diagnostic criteria for polycystic ovarian syndrome mentioned in operational definition, non-pregnant and non-lactating, married or single of reproductive age 15-49 years of age and willing to participate in the study

**Exclusion Criteria:-**

The study excluded, operated cases of polycystic ovarian syndrome, women with any psychiatric problem or using psychiatric medications, women with sign and symptoms of hypothyroidism (my edema), women with sign and symptoms of Cushing syndrome, women with another gynaecological problem and women who refuse to participate

**Research Design:-** A Case control study

**Methods:-****Sample Technique:-**

Non Probability Consecutive sampling technique was used. Consecutively all the participant (case and control) was included while duration of study and fulfilling inclusion criteria

**Duration Of Study:-**

This study was completed in 7 month after approval of BASR.

**Source Of Data:-**

Polycystic ovarian syndrome case and control group women were selected from gynae. OPD in civil hospital Karachi

**Tool For Data Collection:-**

The data was collected by administering questionnaire for assessment of eating behavior among the women with polycystic ovarian syndrome and women in control group by used binge eating scale (BES) was used.<sup>35</sup>

**Instrument:-****Binge Eating Scale (Bes)<sup>9, 28, 29</sup>**

The binge eating scale (Gormally, Black, Daston and Rardin, 1982)<sup>9, 28</sup> is gold standard for binge eating disorder and internal Consistency is 0.89, sensitivity 84.6%, specificity 94.9 %<sup>29</sup>. The questionnaire is based on behavioral characteristic (e.g. large amount of food consume) and feelings or cognitive and (e.g. guilt or shame). It consists of 16 items, eight items describe the behavior characteristic and eight describe cognitive or feeling characteristics. Each item contains three to four response options that statement reflects a range of each characteristic measure. The total score range from 0-46. A cut off value point 17 was used. The individuals were characterized in two groups. These

groups were described as; no binge eating (score < 17) and binge eating (score  $\geq 17$ ). Analysis of each item (0-3), 0 indicates no binge eating problem, 1-3 indicate binge eating problems.

**Human Subjects:-**

**CASE:-**

Participants who was diagnosed for polycystic ovarian syndrome condition according to the selection criteria was selected from gynaecological outpatient department of civil hospital

**Control:-**

The participant who was normal on ultrasound investigation and free from polycystic ovarian syndrome symptoms

**Data Collection:-**

**Study Setting:-**

The study was conducted in the gynaecological outpatient department (OPD) of Civil Hospital Karachi

**Study Population:-**

Women attended the gynae. OPD of civil hospital Karachi

**Ethical Consideration:-**

The study was approved by Institutional Review Board (IRB) of Dow University of Health Science. Informed consent was obtained from those who were willing to participate in the study after explaining the study purpose.

**Procedure Of Data Collection:-**

Data was collected after obtaining the permission from concerned hospital authorities. The structured interview was conducted by using binge eating scale in polycystic ovarian syndrome women (cases) and normal women (control). Prior to the study the participant was seated in comfortable area and informed consent was obtained from both the cases and controls. The data was collected by the investigator herself both from the cases and control groups from gynae OPD of civil hospital Karachi. Cases were collected from gynae. Opd of civil hospital whose fulfill Rotterdam criteria (above mention in operational definition) and control was also selected in same setting population. The questionnaire was translated into Urdu and if other language participant participated so interpreter was helped with (i.e. her relative or any other same language person available at that time) who was translated in her language and got appropriate answers of question.

**Statistical Analysis:-**

Data entry was done on EpiData software. Data was double entered for removing the missing value or check error rate which should be <0.001. Cleaning and coding of the data was done prior to analysis Using Statistical package for social science (SPSS) version 21. Descriptive Analysis was carried out for socio demographic variables. Mean and Standard Deviation for age, height and weight was calculated. Frequency and percentage was calculated for age, BMI, age at marriage and household income marital status, education, addiction, ethnic group, family history of PCOS, menstrual irregularity, subfertility, obesity, history of diabetes, family history of diabetes and binge eating disorder.

For Inferential statistics the sample was divided into two groups: those having PCOS and those did not have PCOS. These two groups were compared according to socio-demographic variables and variables related to binge eating disorder by means of odds ratio and 95% confidence interval , p-value  $\leq 0.05$  was taken as significant. Univariate analysis was run to determine crude association by odds ratio between independent and dependent variable. Association between risk factors and the outcome was determined by logistic regression analysis. Adjusted odds ratio and then 95% confidence interval was calculated to eliminate the confounders.

**Results:-**

**Sociodemographic Characteristics:-**

The socio demographic characteristics of study participants are presented in Table 1 (a), (b).

**Table 1 a:-** Socio demographic characteristic of study participants (n=280).

S. No.	Characteristics	Mean	Standard Deviation (SD)

<sup>c</sup> Obesity classification according to the recommended of the WHO (class I(high)30-34.9,class II (very high)35-39.9,class III(extremely high)>40)				

The mean height of study participants was  $1.56 \pm 0.07$ . The mean weight of study participants was  $64.7 \pm 9.56$ . The study participants mean age was  $27 \pm 4.34$  and 83.2% were range of 15-30 years of age. The body mass index showed 30% normal (18.5-24.9), 3.2 % underweight ( $< 18.5$ ), 47.5% overweight (25-29.9) and 19.3% obese ( $\geq 30$ ) kilogram per meter square. Just half 52.5% unmarried and 47.5% were married. The age at marriage of study participants (n=136) less than equal to 25 years was 64.7% and greater than 25 years of age was 35.3%. Regarding no of children 34.3% had equal and less than 2 children and 65.7% were greater than 2 children. The 32.1% were illiterate and majority of study participants had education 1 to 10 years of schooling was 55.4%. Those having monthly house hold income less than equal to 10,000 Pakistani rupees were 45.7% where as those having greater than 10,000 were 54.3%. About 38.9% of study participants were used addiction and among these 80.7% used smokeless addiction (niswar, pan, gutka, others). The study participants having family history of polycystic ovarian syndrome were 22.9%. The study participants with family history of diabetes were 22.9% while the study participants 100% were non-diabetic. Only 5.4% study participants were exercise daily. The study participants having binge eating ( $\geq 17$ ) were 27.1% while 72.9% were non-binge eating ( $< 17$ )

#### Scoring:-

The score of binge eating among polycystic ovarian syndrome and non-polycystic ovarian syndrome is summarized in Table 2.

**Table 2:-** Binge Eating Scores , Frequency(n) and percentages(%) in PCOS(n=140) and Non-PCOS(n=140).

"Non-polycystic ovarian syndrome.

S.No.	Characteristics	Total scoring	PCOS <sup>o</sup> (Cases)		NON-PCOS <sup>o</sup> (Controls)	
			Frequency (n)	Percentage (%)	Frequency (n)	Percentage (%)
1	<b>Binge Eating *</b>	$\geq 17$	57	40.7	19	13.6
2	<b>Non Binge Eating **</b>	$< 17$	83	59.3	121	86.4
<sup>o</sup> Polycystic ovarian syndrome, *binge eating scale scores ( $\geq 17$ ), **non-binge eating scale scores ( $< 17$ ),						

In patients with polycystic ovarian syndrome 40.7% had score  $\geq 17$  and in non-polycystic ovarian syndrome women only 13.6% has score  $\geq 17$  according to binge eating scale. In polycystic ovarian syndrome 59.3% had score  $< 17$  and in non-polycystic ovarian syndrome 86.4% has score  $< 17$  according to binge eating scale

#### Unadjusted Odd Ratio:-

The odds of having polycystic ovarian syndrome among overweight women (BMI 25-29.9) was found 2 times more (OR=2.0, 95 % CI=1.41-3.56, pvalue= 0.01) and among obese women (BMI  $\geq 30$ ) was 12 times more (OR=12.1, 95 % CI=5.03-29.24, pvalue=<0.001) more as compared control (normalBMI18.5-24.9) women kilogram per meter square. The odds of having polycystic ovarian syndrome among illiterate women were found 2 times more (OR=2.26, 95 % CI=1.05-4.87, pvalue=0.03) as compared to control women greater than ten years of schooling. The odds of having polycystic ovarian syndrome among monthly household income less than ten thousand was reported 2 times more (OR=2, 95 % CI=1.11-2.87,pvalue=0.01) as compared to control women who had monthly income more than ten thousand Pakistani rupees. The odds of having polycystic ovarian syndrome among addictive who reported 2 times more (OR=2.28, 95 % CI=1.39-373, pvalue=0.001) as compared to control(non-addictive) women. The odds of having polycystic ovarian syndrome among smokeless addictive (niswar, pan, gutka, others) was reported 6 times more (OR=5.9, 95 % CI=2.08-17.06, pvalue=0.001) as compared to control (smoke addiction) women. The odds of having polycystic ovarian syndrome among those who had family history of polycystic ovarian syndrome were 2 times more (OR=1.76, 95 % CI=1.006-3.13, pvalue=0.04) as compared to control women who did not have polycystic ovarian syndrome history in their family. The odds of having polycystic ovarian syndrome among those who had family history of diabetes was found 2 times more (OR=2.1, 95 % CI=1.18-3.75, pvalue=0.01) as compared to control women who did not have family history of diabetes. The odds of having polycystic ovarian syndrome among binge eating score ( $\geq 17$ ) were reported 4 times more (OR=4.3, 95 % CI=2.42-7.88, pvalue=<0.001) as compared to control non-binge eating score (<17) women.

While other variables results were not statistically significant difference in age, underweight, marital status, age at marriage, no of children, one to ten year of schooling and exercise. ADJUSTED ODD RATIO

After adjusting other variables the odds of polycystic ovarian syndrome among obese (BMI ≥30) were reported ten times more (AOR=10.4, 95 % CI=4.11-26.4,pvalue=<0.001) as compared to control (normal BMI 18.5-24.9) women kilogram per meter square. The odds of having polycystic ovarian syndrome among monthly household income less than ten thousand was found seven times more (AOR=7.3, 95 % CI=1.35-39.9,pvalue=0.02) as compared to control women who had monthly house hold income more than ten thousand Pakistani rupees. The odds of having polycystic ovarian syndrome among smokeless addictive (niswar, pan, gutka, others) was reported nine times more (AOR=9.2, 95 % CI=1.13-75.4, pvalue=0.03) as compared to control (smoke addiction) women. The odd of having polycystic ovarian syndrome among binge eating disorder score (≥17) was found seventeen times more (AOR=17.8, 95 % CI=1.29-24.63, pvalue=0.03) as compared to control non-binge eating score (<17) women

**Discussion:-**

The socio demographic variables including age, education and family history of polycystic ovarian syndrome in our study was not statistically significant in women having polycystic ovarian syndrome. The house hold income and smokeless addiction (niswar, pan, others) in our study was reported statistically significant in women having polycystic ovarian syndrome. In contrast to another study conducted in Germany where socio demographic variables in fifty women having polycystic ovarian syndrome and fifty healthy controls were not statistically significant<sup>30</sup>. Given this study finding showed that some socio demographic variables increasing the risk of developing polycystic ovarian syndrome

In accordance with our result reported obesity and polycystic ovarian syndrome was statistically significant. Another study conducted in United States of America among the polycystic ovarian syndrome patients in tertiary care center reported obesity increased the risk of developing polycystic ovarian syndrome<sup>31</sup>. Many same other studies were conducted in Greece and Spain had similar results<sup>32,33</sup>. A study in Pakistan showed that high percentages of affected polycystic ovarian syndrome women were found to be obese<sup>34</sup>. Our result thus indicated that obesity increases risk of developing of polycystic ovarian syndrome.

In our study was reported that binge eating disorder was associated with polycystic ovarian syndrome. A study conducted in United Kingdom among the 230 women reported that binge eating disorder in women having polycystic ovarian syndrome was not significant because of poor selection criteria<sup>28</sup>. Another study conducted in Stavanger university hospital showed that among 25 polycystic ovarian syndrome women and 24 control (healthy) women with polycystic ovarian syndrome 16% reported moderate and 4% severe binge eating disorder but the result from this study could not be found association of polycystic ovarian syndrome and binge eating syndrome<sup>27</sup>. This study finding will help to reduce the risk of developing of polycystic ovarian syndrome and may help through life style modification prevent from binge eating disorder and its developing complications.

**Limitations:-**

Limitations of the present study was included,

- The study was conducted in one hospital so the result could not be generalized to whole population
- It is a case control study and recall bias is inherent in case control designed. This study may encountered recall bias

**Strength And Weakness Of The Study:-****Strength:-**

- This study determined multiple factors associated with polycystic ovarian syndrome
- This study validated scale for binge eating disorder and questionnaire for socio demographic data was used
- The study protocol was approved by Institutional Review Board (IRB) of Dow university of health sciences
- Adjustment of sample size from previous study through reliable software of open EPI version 3
- Used Urdu translation of questionnaire for understanding and got appropriate answers

**Weakness:-**

- In this study was used consecutive technique for selection of participants

**Conclusion:-**

Our study concluded that binge eating disorder is significantly associated with polycystic ovarian syndrome. Results will help health care provider making good health choices for preventing and managing not only binge eating disorder but also women having polycystic ovarian syndrome with binge eating disorder

**Recommendations:-**

This study recommended that,

- Early evaluation and management of binge eating disorder in young girls to reduce the risk of developing polycystic ovarian syndrome
- It will prevent by followed long term consequences e.g. diabetes and cardiovascular disease and non-communicable diseases are also a big burden in our part of world
- Advice life style modification among women with similar problem and will improve her social functioning and quality of life

- This study will also help in public health programs, making strategy for binge eating prevention in health policy of Pakistan and can be reduce social burden of binge eating disorder

#### Abstract

**Introduction:** Preconception care is recognized as a critical component for both maternal and child health promotion. Preconception care may help to reduce the mortality and morbidity rates. Preconception is the integral part of antenatal care because it helps to reduce potential risk, promote healthy pregnancy and fetal outcome and improve readiness for pregnancy. It is designed for maintenance of health before pregnancy and to those who had previous problem with pregnancy.

**Methods:** The descriptive cross sectional study was carried out among 55 reproductive age women visiting the Gynecological/Obstetric OPD of National Medical College Teaching Hospital, Birgunj with the objective to find the knowledge on preconception care by using pretested structured interview schedule. The collected Data were analyzed by using SPSS and MS Excel.

**Results:** The study concludes that the majority 69.09% of reproductive age women had moderate knowledge regarding preconception care. There was significant association of knowledge regarding preconception care with occupation (P value 0.025) and area of residence (P value 0.021) of the reproductive age women, whereas there was no association seen with the age, education, types of family, religion, no. of children and family monthly income.

**Conclusions:** The finding suggests that education and information booklet and various mass media should be developed to increase the level of knowledge on preconception care among reproductive age women.

#### Introduction:-

Pregnancy is a unique, exciting and often joyous time in a woman's life, as it highlights the woman's amazing creative and nurturing powers while providing a bridge to the future. (Evert, 2005)

Preconception care is the set of preventive, promotive and curative interventions given to the women before pregnancy with an intention of healthy mother and baby. Preconception care is designed for preventive measures, health maintenance and health promotion before pregnancy.

**Corresponding Author:- Singh B.**

Address:- Associate professor National Medical College Nursing Campus, Birgunj, Nepal.

The aim of preconception care is to prepare your body for pregnancy, birth and beyond. This preparation ideally should occur at least four months prior to trying to fall pregnant. (Naish and Roberts, 1998)

There is evidence that health problems (like nutritional problems such as anemia and obesity, vaccine preventable diseases such as rubella) and problem behavior (like tobacco and alcohol, risk factors i.e. genetic conditions) can contribute to poor maternal and child health outcomes.

World Health Organization reports that more than half of all maternal deaths occur in Sub-Saharan Africa and nearly a third occur in South Asia ( Dovey, 2015) .Everyday in 2015, about 830 women died due to complications of pregnancy and childbirth.

By seeking the health care facilities and utilizing the family planning method, unplanned pregnancies can be prevented. Later gestational complications like pre eclampsia, macrosomia etc, it is found that preconception care is associated with improved outcome.

The objectives of the study were to assess the level of knowledge on preconception care and to find out the association between knowledge on preconception care with the selected demographic variables of reproductive age women.

### Materials & Methods:-

The descriptive cross sectional study was carried out among 55 reproductive aged women visiting Gynaecological/Obstetric OPD of National Medical College Teaching Hospital, Birgunj, Nepal. The sample size was determined on the basis of correct proportion of knowledge on preconception care which was found to be 15.42% as per the study conducted by Gautam and Dhakal (2015). Non probability sampling technique was adopted to select the women for data collection. The total 55 women of reproductive age were interviewed from 2073/5/23-2073/6/7 by using pretested structured interview schedule (Bhojpuri Version) which was developed in consultation with nine experts in respective fields. Knowledge score were categorized as adequate level (>75% of the total score), moderate level (50-75% of the total score) and inadequate level (<50% of the total score). The data were compiled and analyzed by using SPSS and MS Excel.

### Results:-

The findings revealed that more than one third 36.36% of reproductive age women were of 20-24 yrs of age, maximum 45.45% of them were illiterate, majority 74.54% of them were housewife, majority 67.27% of them belonged to joint family, more than half 60% belonged to Hindu religion, 30.90% of women had two children in number, majority 69.09% of them had monthly family income(in NRS) 5,000-25,000, more than half 50.9% of women reside in urban area and more than one third 36.36% of women got information from radio/television.

Data shown in table 1 shows that majority of women were having moderate level of knowledge regarding preconception care. Data shown in table 2 shows the significant association of knowledge regarding preconception care with the occupation (p=0.025) and area of residence (p=0.021) of the reproductive age women

**Table 1:-** Frequency and Percentage of Knowledge Level of Reproductive Age Women Regarding Preconception Care.

n=55

Knowledge level	Frequency	Percentage
Adequate knowledge	6	10.91
Moderate knowledge	38	69.09
Inadequate knowledge	11	20

**Table 2:-** Association of Knowledge Regarding Preconception Care with Selected Socio-Demographic Variable  
n =55

Demographic Variables	$\chi^2$ value	Degree of freedom	Asymptomatic Significant (two sided)
Age	36.248	36	0.457
Education	56.423	48	0.189
Occupation	54.393	36	0.025*
Type of family	15.886	12	0.197
Religion	20.750	36	0.980
No of children	40.466	36	0.280
Family monthly income (in NRS)	43.583	36	0.180
Residence	23.942	12	0.021*

**Discussions:-**

The findings of this study revealed that more than one third 36.36% of reproductive age women were of 20-24 yrs of age, maximum 45.45% of them were illiterate, majority 74.54% of them were housewife, majority 67.27% of them belonged to joint family, more than half 60% belonged to Hindu religion, 30.90% of women had two children in number, majority 69.09% of them had monthly family income(in NRS) 5,000-25,000, more than half 50.9% of women reside in urban area and more than one third 36.36% of women got information from radio/television.

The findings of the study showed that more than two third 69.09% of reproductive age women were having moderate knowledge level regarding preconception care. Present study findings are in congruent with the similar study conducted by Gautam and Dhakal (2015) in Tulsipur municipality of Dang district, Nepal, among 227 reproductive age women to assess the knowledge on preconception care among reproductive age women. The study showed that reproductive age women have average level of knowledge regarding preconception care.

There was significant association of knowledge regarding preconception care with occupation and place of residence among reproductive age women. The result of the study was supported by quantitative study conducted at Saradha College of education, Salem and Gover Arts College for women to assess the level of knowledge regarding preconception care. The total sample was 100. The sample was collected by non- probability convenient sampling technique. The study showed that there was significant association of knowledge regarding preconception care with the area of residence.

**Conclusion:-**

A descriptive cross-sectional study was conducted to assess the knowledge on preconception care among reproductive age women. In this study, total number of 55 reproductive age women was selected to assess the knowledge on preconception care. Majority 69.09% of the reproductive age women had moderate knowledge. The results showed that the knowledge level regarding preconception care was independent with age, education level, religion, type of family, no. of children, monthly income whereas was dependent on occupation and residence.

The findings of the study suggest more education and information should be needed to increase the level of knowledge regarding preconception care. Education to the women and couples about preconception care and promoting contraceptive use reduces the rapid and unplanned pregnancies. Education can be given in the health care setting, community as well as through different mass Medias.

**Acknowledgement:-**

I would like to express my deep gratitude to all the women of reproductive age who gave their consent to participate in study. I would also like to extend thanks to my research guide as well as the Hospital Director of National Medical College Teaching Hospital

#### Abstract

**Background:** Hepatitis C virus (HCV) is a global health problem especially in Egypt. Hepatitis B virus (HBV) is a major cause of chronic liver diseases especially cirrhosis and hepatocellular carcinoma. HBV incidence is markedly reduced after mass vaccination programs application.

**Objectives:** to detect HCV and HBV seroprevalence among some high risk children with molecular confirmation of viremia by real-time PCR for seropositive cases.

**Materials and methods:** A comparative cross sectional study was conducted on 5 groups of Egyptian children attending Benha University Hospital (diabetes mellitus, thalassemia, hemodialysis, previously exposed to surgery and healthy children). All children were subjected to full history taking, physical examination and laboratory investigations including HCV antibodies by 4<sup>th</sup> generation ELISA, HBsAg, HBsAb using ELISA, liver function tests and CBC, HCV and HBV viremia detection by real-time PCR for ELISA positive subjects.

**Results:** HCV seropositivity was detected in 5%, 15%, 30%, 50% and 10% for healthy, diabetic, thalassemia, hemodialysis and previously exposed to surgery, respectively. As regard HBV, only a hemodialysis case was positive for both HBsAg and HBV-DNA. Low social class, blood transfusion, frequent intravenous injection, previous surgery and previous hospitalization are major risk factors for HCV transmission.

**Conclusion:** The study revealed high HCV seropositivity prevalence among the studied high risk groups. PCR should be done for all HCV seropositive cases to confirm the presence of viremia.

**Corresponding Author:- Mona El-Awady.**

Address:- Public Health Department, Faculty of Medicine, Benha University, Benha, Egypt.

**Introduction:-**

Chronic viral hepatitis B (HBV) and C (HCV) infections represent a substantial healthcare burden worldwide with significant global morbidity and mortality; up to 1 million annual deaths are attributable their sequelae including cirrhosis and hepatocellular carcinoma (HCC) [1].

HCV infection has an overall prevalence of 1-3% with 3-4 million new cases every year [2] and 200 million carrier individuals worldwide [3]. Two billion persons have been infected with HBV worldwide and more than 350 million persons have chronic infections [4]. HBV infection and incidence has been markedly reduced after mass vaccination programs [5]. HCV seroprevalence in Egypt has been 14.7 in the year, 2008 [6].

HCV is mainly transmitted by parental route; however about 10% of cases are sporadic without well-defined transmission routes. HCV has rarely been transmitted by transfusion of blood products since the introduction of organ and blood donor screening by antibody testing in 1991 [7].

Intravenous drug users (IDUS) injections and shaving by community barbers have been major risk factors [8]. HCV is suggested to be associated with diabetes mellitus (DM) due to frequent injections [9].

In the last decade, HCV antibodies (HCV-Ab) prevalence in thalassemia varied among countries including Egypt from 12.5 to 100% [10]. HCV-Ab prevalence in Egypt among hemodialysis patients was 35% which may be due to shared dialysis machines, repeated blood transfusion, nosocomial routes, surgery, and multi-dose drug vials [11].

Major surgery also contributes to HCV transmission. HCV viremia prevalence in major surgery was reported to be 8% [12].

**Objectives:-**

Our study aimed to detect hepatitis C virus and hepatitis B virus seroprevalence with subsequent detection of HCV-RNA and HBV-DNA in seropositive cases among some high risk groups of Egyptian children.

**Subject and method:-**

This cross sectional study was conducted at the Pediatric Department of Benha University Hospital over the period from 2015 to 2016 upon 100 Egyptian children (6-17 years); 20 apparently healthy children, 20 diabetes mellitus (DM) children on insulin therapy, 20 thalassemia children on regular blood transfusion, 20 chronic renal failure children on regular hemodialysis and 20 children with previous surgery (P surgery).

Patients with clinically suspected or known chronic liver or metabolic diseases were excluded.

**Ethical considerations:**

A written informed consent was obtained from children' guardians before participation. Also, an approval from the Research Ethics Committee in Benha faculty of medicine was obtained. The study agreed with the Helsinki Declaration of 1975 that was revised in 2000.

All children were subjected to predesigned questionnaire including age, sex, residence and socioeconomic status using Fahmy and Elsherbini score [13] and exposure to some risk factors associated with HCV transmission, thorough clinical examination and laboratory investigations.

**Sampling:**

Venous blood sample (5ml) was collected from every subject. Two ml were put on EDTA of which 1ml was used for CBC, while the other ml was centrifuged to separate plasma for HBV-DNA virus load quantitation. Three ml blood were centrifuged to separate serum and was kept at (-20oC) until further biochemical investigations.

**Laboratory investigations:**

CBC was performed by Symex XS-800I cell counter [14]. Liver function tests including serum aspartate amino transferase (AST) [15]; serum alanine aminotransferase (ALT) [15] and total and direct bilirubin were done by biosystem A15 auto-analyzer [16]. HCV-Ab by Innostest HCV-Ab IV ELISA kit (Innogenetics GmbH, Hanover, Germany) [17].

HBs-Ab by ETI-AB-AUK-3 ELISA kit (DiaSorin, Saluggia, Italy) [18] and HBs-Ag by SURASE B-96 (TMB) ELISA kit (Medical Technology Promedt Consulting GmbH, Germany) [18] were also performed with absorbance reading on ELISA reader TECAN Infinite F50 (Singapore). According to international standards anti-HBs  $\geq 10$  IU/L, was considered protective against HBV infection [19]. Weak response to HBV vaccine after full vaccination dose was defined as 10-100 IU/L while strong response were at a level  $>100$  IU/L [20].

Determination of HCV-RNA and HBV-DNA viral load was performed for ELISA positive cases only.

#### **Determination of HCV-RNA viral load:**

QIAamp Viral RNA mini Kits were used for viral RNA extraction from 145 $\mu$ l serum by Qiacube automatic extractor (Qiagen, Germany), then absolute reverse transcription (RT)-PCR quantitation using artus HCV RG RT-PCR Kit with 10 $\mu$ l RNA template (Qiagen, Germany) following the manufacturers' instructions. A standard curve was generated using 4 quantitation standards (Qs) on StepOne real-time PCR system (Applied Biosystems, USA).

#### **Determination of HBV-DNA viral load:**

Viral DNA extraction from 200 $\mu$ l plasma by Qiacube automatic extractor using QIAamp DSP virus kit (Qiagen, Germany), then quantitative PCR was performed using Artus HBV PCR kit (Qiagen, Germany) following the manufacturers' instructions on StepOne real-time PCR system using 20 $\mu$ l DNA template. A standard curve was generated using 5 Qs on StepOne real-time PCR system (Applied Biosystems, USA). Qs are defined as IU/ $\mu$ l. Result (IU/ml) = result (IU/ $\mu$ l) x elution volume ( $\mu$ l) / sample volume (ml) for either HCV- or HBV-viral load.

#### **Statistical analysis:-**

Collected data were tabulated and analyzed using SPSS version 20 software (SPSS Inc; Chicago; ILL Company). Quantitative data were expressed as mean $\pm$ standard while categorical data were presented as number and percentage. The difference between two means was statistically analyzed using the student t test. Chi square and Z tests were used as tests of proportion. Each high risk group data were compared to that of the healthy group as a reference group. p value $<0.05$  was significant.

#### **Results:-**

This study included 100 children; 22% of them were HCV seropositive, 51% were male, 50% were below 12 years, 77% were from rural residents and 29% were of low social class.

Table (1) showed non-significant difference between seropositive and seronegative HCV children regarding sex and residence. The majority of seropositive children (81.8%) were of age group (12-17y) versus 41% of the seronegative. Most seropositive HCV children (63.6%) were of low social class while only 13.6% were of high social class versus 19.2% and 28.2% respectively of the seronegatives. These differences were statistically significant (p $<0.01$  for both).

Risk factors like blood transfusion, frequent IV injection, previous surgery, previous hospitalization, ear piercing, community barber shaving, exposure to blood (p $<0.01$  for all) and birth attendant's delivery (p $<0.05$ ) were statistically significantly higher among seropositive HCV children compared to the seronegatives.

Laboratory investigations; serum AST and ALT were significantly increased among seropositive HCV patients but insignificant other tests (hemoglobin, leucocytes, platelets, total bilirubin and direct bilirubin) compared to the seronegatives.

Table (2) showed non-significant difference as regard sex and residence in the studied groups but significant increased age in hemodialysis and social class in the previous surgery group compared to the healthy children (p $<0.05$ ).

Risk factors; frequent IV injection and previous hospitalization and abdominal pain complaint described statistical increase in DM compared to controls (p $<0.01$  for both).

As regard thalassemia and hemodialysis children; risk factors like blood transfusion, frequent IV injection, previous surgery, previous hospitalization, exposure to blood and complaining of abdominal pain, dark urine, yellow sclera and easy fatigue described statistical increase compared to controls (p $<0.01$  for all).

As regard the previous surgery group; frequent IV injection, previous surgery, previous hospitalization and abdominal pain complaint showed high statistical increases ( $p < 0.01$  for all) and statistical increase in HCV family history ( $p < 0.05$ ) compared to controls.

HCV seropositivity prevalence was 15%, 30%, 50% and 10% and HCV viremia was 5%, 25%, 50% and 10% for DM, thalassemia, hemodialysis and previous surgery groups respectively compared to 5% in the controls with statistically significant increase in thalassemia and hemodialysis ( $p < 0.01$  for both).

Only one hemodialysis case was positive for HBs-Ag and HBV-DNA. As regard the child immune state against HBV immunization (HBs-Ab), the negative immune state children were 48%, the weak responders were 25% and the strong responders were 27%. There was non-significant difference in the high risk studied groups compared to the controls.

### **Discussion:-**

HCV infection is a serious medical challenge that is complicated by severe liver disease, including fibrosis, cirrhosis, and HCC [21]. Egypt is considered one of the highest HCV prevalence [4]. HBV is a main reason of chronic liver disease; especially cirrhosis and HCC [5].

Our study revealed that HCV prevalence among controls was 5% that agreed with Barakat and Elbashir, who reported 5.8% for HCV seroprevalence in healthy children, with 4.4% HCV viraemia [22]. Our study showed increased HCV seropositivity among males (54.5%), rural areas (90.9%) and low class (63.6%), this agreed with Mohamoud et al., who reported higher HCV prevalence in males [23], also in agreement with Mostafa et al., who demonstrated higher prevalence in rural areas [24].

In this study, blood transfusion was found in 50% of seropositive children. The Egypt Demographic and Health Survey (EDHS) in 2008 estimated that blood transfusion was identified in 24.3% of the HCV positive cases in a nationwide sample [6], a result that agreed with our study.

In many countries the main drive of HCV incidence and prevalence is intravenous drug using [25]. Surgical including dental procedures were statistically highly significant in this study. HCV transmission in Egypt is primarily associated with inadequate infection control during dental and medical care procedures [26]. Kalil et al. stated that various medical procedures even if minor contribute to HCV susceptibility [27]. Barakat and Elbashir reported that history of previous blood transfusion, circumcision for boys by informal health care providers, surgical intervention, and dental treatment are the most significant risk factors for HCV infection [22].

As regard diabetic group our study reported that, the prevalence of anti-HCV positivity was 15%. El-Karakasy et al. reported a lower rate of anti-HCV of 3.6% among diabetic children attending Cairo Children University Hospital in Egypt [28]. In this study there was highly significant increase in both IV injection and previous hospitalization in DM compared to the healthy. Children with T1DM are usually hospitalized for either diet education (a week) or monitoring and diabetic control (several weeks) they perform self-monitoring of blood glucose by finger puncture many times daily. Particular HCV risk factors in DM include using shared spring-triggered finger-stick device for blood glucose monitoring or contaminated multi-dose insulin vials with the risk of patient to patient transmission [29].

As regard thalassemia in the present study, HCV seropositivity prevalence was 30% similar to a study by Din et al. in which HCV prevalence in thalassemia was strikingly increased as up to 49% [30], and was also similar to another study done in Iran which reported 15.7% to 63.8% for HCV prevalence in thalassemia [31]. All thalassemia patients in this study were subjected to common risk factors such as blood transfusion, exposure to previous surgery, frequent IV injections and previous hospitalization. These risk factors for HCV transmission in thalassemia were highly significant compared to the healthy. Both seropositive and seronegative patients of this group received blood transfusion so we couldn't confirm that blood transfusion was the main risk factor for HCV transmission in thalassemia especially after implementation of blood donors screening, this agrees with a study by Alavian et al. which reported that the risk of HCV transmission has decreased significantly after the introduction of routine anti-HCV screening of blood donors in developed countries and that the main risk factor for acquiring HCV infection before that was blood transfusion [32].

Another study reported that HCV is transmitted primarily by direct contact with infected blood and transfusion of blood products and intravenous and percutaneous drug use [33]. Nemati et al. reported that shaving by community barbers, unsafe injections by health care providers, tattooing and ear piercing, known to be associated with HCV infection [34], but in our study all except IV injection were non statistically significant.

In the current study, HCV seropositivity in hemodialysis was 50%, a similar result was reported by Abed et al. [35] and was nearer to that reported by the Egyptian Renal Registry which reported 49% to 64% for HCV prevalence in Egypt [36]. Bastiani et al. reported 10.17% for HCV prevalence in dialysis which was lower than our result [37]. This study reported that blood transfusions, intravenous injection, previous surgery, previous hospitalization, exposure to blood are significant risk factor for HCV transmission in hemodialysis compared to the healthy. In contrast, another study by Zhao et al. reported no evidence of patient-to-patient HCV transmission in their hemodialysis centers [38]. Halle et al. evidenced that HCV seroprevalence rate in hemodialysis was 11.8% and it was associated with longer duration on dialysis [39].

As regard children previously exposed to surgery in this study, HCV seropositivity rate was 10% and prior hospitalization, prior surgery and IV injection were statistically highly significant compared to the healthy. This agreed with Masood et al. who studied 387 patients admitted for elective surgery. After screening they found that 6% of patients enrolled in their study were positive for both HBV and HCV. HBsAg was positive in 6.5% of patients while 11.3% were positive for HCV. They found that the reuse of contaminated syringes, contaminated surgical instruments and blood products were risk factors. They concluded that HBsAg and anti-HCV prevalence in hospitalized surgical patients was very high. They suggested routine preoperative screening for HBV and HCV [40]. Chaudhry et al. also conducted another study among patients reporting in surgical outpatient department of Fauji Foundation Hospital Rawalpindi during 2006, they screened 2056 patients and found 2.8% and 7.56% for HBV and HCV seropositivity respectively with male predominance in both the groups [41].

As regard prevalence of viremia in seropositive cases, the present study reported 100% for the healthy, 33.3% in diabetes, 83.3% in thalassemia, 100% in dialysis and 100% in the previously exposed to surgery. El-Karakasy et al. reported rates of HCV-RNA positivity by PCR among children with positive HCV-Ab by ELISA as 40% [28]. The decreased frequency of PCR positivity than that of seropositivity by ELISA could be attributed to the following: HCV-Ab positive subjects in absence of HCV-RNA positivity could be attributed to either HCV infection clearance while the patient remains HCV-Ab positive or a false positive ELISA test [42]. HCV-RNA presence in serum is a dependable indicator of ongoing viral reproduction and infectivity where follow-up of infected cases is necessary [43].

RT-PCR is the gold standard technique for the diagnosis of HCV infection, allowing serum HCV-RNA determination; however, obstacles such as technical difficulties, expenses and unavailability may prevent it from being used as a screening test on a large scale of patients on a regular basis [44].

As regard the laboratory investigations among seropositive and seronegative patients in our study there was no significant difference as regard to CBC but there was significant increase in liver enzymes among HCV seropositive than seronegative children. Our result agreed with Bhattacharya et al. who found that HCV can cause asymptomatic infection [45]. Persistently elevated ALT levels were recorded in several Egyptian pediatric and adult studies and consequently, HCV infection is not always benign in Egyptian children [46].

Regarding HBV seropositivity, only one hemodialysis child was positive for HBs-Ag and HBV-DNA viral load. HBV infection has been markedly reduced after mass vaccination programs [5]. In our study, negative HBs-Ab titre group (seroprotected) represented 48%; higher than that of Eldesoky et al. which was 40.5% of the healthy vaccinated children in the age group from 3 to 13 years [47], but similar to the result of Khashaba et al., that was 46.2% among 91 screened preschool children [48]. Meanwhile positive HBs-Ab titre group represented 52% which were near the results of Jafarzadeh and Montazerifar which reported that 47.9% of Iranian children had protective level of HBs-Ab  $\geq 10$  mIU/ml at 10 years interval after primary vaccination [49] and that of Khashaba et al. who reported that 53.8% were seroprotective [48]. HBV infection has been documented in hemodialysis patients who have not maintained anti-HBs concentrations  $>10$  mIU/ml [50].

Table 1: Socio-demographic data, risk factors and laboratory investigations of the studied children as regard HCV seropositivity.

### Conclusion:-

The present study revealed that the HCV seropositivity prevalence in apparently healthy children was 5% and a significant high prevalence of HCV seropositivity in thalassemic children (30%) and hemodialysis children (50%) was reported. HCV seroprevalence in diabetic children was 15% and in children previously exposed to surgery was 90%. Risk factors as blood transfusion frequent IV injections, previous hospitalization and exposure to blood were the most common for HCV transmission. PCR should be done for all HCV seropositive cases to confirm viremia.

### Recommendations:-

There must be greater efforts for prevention of hepatitis B and C in Egypt including:

- 1- Strict emphasis on infection control measures in hemodialysis and hematology units.
- 2-Routine investigations every 6 months for early detection and treatment of infected persons
- 3-All children must be vaccinated against hepatitis B with confirmation on booster doses.
- 4- Molecular screening for blood donors must be done.
- 5- Confirmation on having personal instruments for each individual.
- 6- Replacement of injections with oral medications if possible.

### ACKNOWLEDGMENT:-

Great thanks to all included children and their guardians for participation in the current study and many thanks to the Molecular Biology Unit, Faculty of Medicine for technical support.

**Introduction:-**

The Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) is an Indian job guarantee scheme, enacted by legislation on August 25, 2005. The scheme provides a legal guarantee for one hundred days of employment in every financial year to adult members of any rural household willing to do public work-related unskilled manual work at the statutory minimum wage of 123 per day. The Central government outlay for scheme is Rs.40,000 crore in Financial Year 2010-11. This act was introduced with an aim of improving the purchasing power of the rural people, primarily semi or un-skilled work to people living in rural India, whether or not they are below the poverty line. Around one-third of the stipulated work force is women. The law was initially called the National Rural Employment Guarantee Act (NREGA) but was renamed on 2 October 2009 as Mahatma Gandhi National Rural Employment Guarantee Act .

During Phase I, this act was notified in 200 districts (most backward) of 27 States with effect from February 6, 2006 and then extended to additional 130 districts in the financial year 2007-08 under Phase-II. The remaining 274 rural districts have been notified under the NREGA with effect from April 1, 2008 under Phase III. In February 2006 under Phase-I this scheme was started in most literate district of Punjab, i.e., Hoshiarpur. In the year 2007, under Phase-II three more districts, Amritsar, Jalandhar and Nawanshehar, were also covered under this scheme. In fact, Punjab state did not have any earlier experience of implementation of employment generation programme. In many districts, the administration was finding it difficult to implement this programme. The administration has involved such agencies or themselves prepared district MGNREGA plans. The concerned agencies have constituted expert teams which interact with the concerned officials, assessed physical and financial achievements, problems, prospects and challenges associated with the task. This task involves estimation of number of job seekers village-wise, type of work to be done, work sites, facilities to be created at work sites, conversion of physical targets into monetary targets and other associated requirements. The activities identified in Punjab are like digging of ponds, de-silting of ponds, afforestation on common and waste land, land development of common and waste land, drainage of water from water logged/flood affected areas, rural connectivity, strengthening of road berms, minor irrigation works, provision of irrigation of land owned by SCs, beneficiaries of Indira Awas Yojana, etc. It is obvious that although the state as a whole has been covered under NREGA. Other features, At least 50% of works will be allotted to Gram Panchayats for execution, A 60:40 wage and material ratio has to be maintained/no contractors and machinery is allowed. The Central Government bears the 100 percent wage cost of unskilled manual labour and 75 percent of the material cost including the wages of skilled and semi skilled workers, Social Audit has to be done by the Gram Sabha, Grievance redressal mechanisms have to put in place for ensuring a responsive implementation process, all accounts and records relating to the Scheme should be available for public scrutiny.

**Corresponding Author:- Shaveta Kaushal.**

By analyzing the figure of employment generation in all districts of Punjab it becomes clear that Roop Nagar has provided approximately 36 person days at an average to each person and provided employment, which is the highest in the state. In Roop Nagar 31350 people from 21226 households registered for the scheme and 21134 job cards were issued out of this 4622 people demanded employment and 4602 of them were provided with 165807 person days of work. In this district 163 families completed 100 days of employment during whole phase. Ferozpur lies at the bottom of the pool with a figure of approximately 13 days of work per person was provided. A sum total of 170951 people from 94957 households got registered for the scheme during the period 2006-2011 which is much greater than 31350 people registered at Roop Nagar, 94928 of them, which is almost every household was issued a job card but the number of people who demanded employment was much more less at 22059. A total of 21950 of these people were provided with 295528 person days of work and 45 families completed the 100 days of employment in this district.

#### **Funding of MGNREGA:-**

The funding of MGNREGS will be shared between both the central and state governments. The Central Government established Mahatma Gandhi National Rural Employment Guarantee Act at the central level and meet the cost of components such as, (i) 100 per cent wage expenditure of unskilled manual work, (ii) 75 per cent material cost and payments made to semi skilled workers, (iii) administrative expenses. The state meet the cost of (i) Unemployment allowances, (ii) 25 per cent of expenditure on material and payment made to the skilled and semi-skilled workers, (iii) administrative expenses.

Section 16 explains the role of the Gram Panchayat and mandates that atleast 50 per cent of the work in terms of cost has to be implemented through the Gram Panchayat. Thus the MGNREGA assigns a wide ranging role to PRIs right from registering of workers up to monitoring and social audit and responsibility for transparency and accountability on them, especially on the Gram Panchayat. The potential of MGNREGA to strengthen good governance at the local level mainly through its consistent information and accountability systems and transparent and participatory processes realized right in the beginning and acted on. The Gram Panchayat is assigned the major responsibilities of awareness building and environment creation to spread the message of NREGA, mobilizing and registering the job seekers, issue of job cards, preparation of projects and their approval, ensuring facilities to workers, making payments through banks and maintaining records.

The data on NREGA show that between February 02, 2006 and September 30, 2009, a sum of Rs. 192.25 crore was released against the total allocation of Rs. 850 crore. This comes out to be only 22.62 percent of the total allocation. When this scheme was extended from one district to four districts in 2007-08, the allocation was raised from Rs.50 crore to Rs. 300 crore, but the released funds were raised from Rs. 30.81 crore to just 37.08 crore. Similarly, when the scheme was extended to all the districts in 2008- 09, no increase in allocation of funds was made. The release of funds was not equivalent with increase in number of districts covered under the scheme. This amount was increased from 37.08 crore in 2007-08 to Rs. 73.16 crore in 2008-09, whereas the number of districts covered increased from 04 to 20 in 2008-09.

The lack of proper planning, low performance in employment generation, slow issue of job cards, identification and execution of works have led to low utilization of funds available under this programme. For instance, in the year 2008-09, the total availability of funds in Punjab under this programme stood at Rs. 114.85 crore, but the utilization level stood at 63 percent. The districts of Hoshiarpur, Amritsar, Nawanshehar, Bathinda, Muktsar and Gurdaspur spent a major share as well as a high proportion of available funds. But, the districts of Jalandhar, Ferozpur, Ludhiana and Patiala spent less than 30 percent of the available funds (Table:1). In year 2009-10, the financial performance deteriorated as the proportion of funds available and used fell from 56.30 percent compared to 63.0 percent in 2008-09. The districts of Jalandhar, SAS Nagar (Mohali) and Tarn Taran continue to show very low utilization of available funds even below 25 percent (Table: 2). It is also true that the proportion of spending on the wages fell from above 40 percent in 2008-09 to below 33 percent of the funds available in 2009-10. This again reflects poor picture on the functioning of NREGA programme in the state. Moreover, there are a lot of variations across the districts; some showing very high percentage of spending on the wages and others showing very low percentage of spending on the wages. This shows a tendency among powerful implementing personnel to divert funds for material costs where high scale pilferages are possible.

NREGA has been extremely useful from the social and economic perspectives. In fact, the largest part of possible benefits, especially in terms of the employment share, has gone to the weaker sections of society. In the year 2010-

11, the total availability of funds under this programme stood at Rs.226.91crore, but the utilization level increased to 73.08 per cent, which is more as compared to the last two years. Hoshiarpur, Amritsar, Bathinda, Muktsar and Gurdaspur spent a major share as well as a high proportion of available funds. But, the districts Nawanshahar, Kapurthala, SAS Nagar Mohali, Roop nagar spent less than 60 per cent of the available fund. It is interesting to note that in utilization of fund, situation of district Nawanshahar has deteriorated and of SAS Nagar Mohali utilization of fund improved surprisingly from 19.18 per cent to 55.89 per cent (Table:3).. The expenditure incurred under this programme is highly productive in nature. It is leading to creation of productive assets both through the labour and material costs. This Act has transforming the rural lives by improving living conditions, increasing sustainable agrarian activities and reduces distress migration. NREGA is also an opportunity to redefine the rural Indian women's identity in various ways; decision making, spending their wages independently or on their children's education and clearing debts, alleviate poverty and provide a social floor. These are going to increase both directly and indirectly the productivity of tangible and non-tangible assets in the rural areas and Optimum utilization of the human and economic resources of the villages.

Source:www.nrega.nic.in

This brings out that there is a further scope for improvement in functioning of NREGA, although the reduction in variations in the performance among different districts in the state. This could be done through systematic planning and its implementation through the Panchayati Raj Institutions. There is also need to create better awareness. Investments made under NREGA are expected to generate employment and purchasing power, improve the quality of life, raise economic productivity, promote women's participation in the workforce, strengthen rural infrastructure, reduce distress migration, and regenerate natural resources.

#### Deficiencies and Suggestions:

1. The Act is based on the fact that the workers would demand work as a right and the Panchayat or the Government would ensure that the person is provided with work within 15 days of receipt of such an application. If not, then unemployment allowances is to be provided but data reveals the fact that no unemployment allowances has been given.

2. Appropriate mechanisms are required, which allow Panchayats to enjoy the flexibility of the programme and encourage them take up works that are extremely important to build long term sustainable productive structures that may enhance the livelihood promotion capacity within the village. Panchayats should be allowed to involve external resource persons/agencies, duly recognised by the Government, for technical sanction of the project as well as evaluation of the work done so that the monopoly of the Government civil engineers may be diluted.
3. Panchayats need greater capacity building support to improve their knowledge and skills to keep their accounts, measurements of works, as well as maintenance their records, muster rolls, and conduct social audits.
4. The NREGA is a programme has immense potential to improve the Gap between urban and rural India and lead to rural development in terms of basic infrastructure like roads, in terms of agricultural productivity from irrigation works, and it provides a stable income for the workers, their income graph would be much smoother with the NREGA.
5. The 60:40 wage material ratio is unrealistic. Technically, also the cost of unskilled labour is never high as 60 per cent but the cost of material is always higher than 40 per cent. So there is need to change the Wage Material Ratio.
6. Funding of share between Centre and State i.e.75: 25 respectively. But data reveals that state couldn't have adequate fund to release and match with the funding of MGNREGA.

Household food insecurity, Health risk, Nutritional knowledge, Awareness program

#### Abstract

**Background:** The lives of rural women population are characterized by limited education, lack of knowledge pertaining to health aspects & also limited influence on decisions affecting their lives. Thus, awareness is one major factor for development of this group of population.

**Objective:** 1) To study the awareness regarding Household Food Insecurity, Food Practices and Health Risks among the rural women of Allahabad District aged between 18-25 years. 2) To assess the impact of Health and Nutritional Awareness Program on the awareness level of selected population.

**Material and Methods:** The data were collected through semi-structured questionnaire among 600 rural women from the villages belongs to Jasra and Chaka block of Allahabad district. Pre test was carried out before the exposure of awareness documentary followed by post test to assess the impact of health and nutritional awareness programme.

**Results:** The knowledge of rural women regarding health and nutrition aspects improved significantly after intervention. There was a considerable increase in the awareness levels of rural women with regard to knowledge of household food insecurity, food practices and various health risks among rural Indian women.

**Conclusion:** The informative & educable intervention definitely has a positive effect on awareness levels which would eventually encourage expansion of knowledge & positive health habits.

#### Introduction:-

Young population ranges from 18-25 years of age which includes adolescent and reproductive age women. This is a period of preparation for undertaking greater responsibilities including earn livelihood & healthy responsible parenthood. Future of the society depends on these young women as they form a great human resource for the society. Nutritional & health need of the young women are also more because of more requirements for growth spurt & increase in physical activity. Young women need more of all nutrient particularly calcium, iodine & iron. The need for more iron during this period is due to growth spurt, the onset of menstruation and need during the pregnancy (WHO, 2001).

**Corresponding Author:- Paul Virginia.**

Address:- Associate Professor, Department of Foods and Nutrition, Ethelind School of Home Science, SHIATS, Allahabad, Uttar Pradesh, India.

Within the family, compared to male, the women's health, nutrition, education & development are more neglected which has adverse effect on reproductive health. Young women face more problems than male in the family, largely due to socio-cultural factors. There are limited choices available for the future & girls are caught in the cycle of early marriage, pregnancy & childbearing (Cogswell *et al.*, 2003). Education regarding the nutrition & other health aspect during study period will help the young reproductive age rural women for their future life.

In spite of many efforts from different governmental & non governmental agencies focusing on different health aspects, this young population, especially the women, is deprived of the basic health care & awareness.

With the above background, the present study was formulated in order to see the awareness of reproductive age women in relation to health & to assess the effect of educational intervention on their knowledge levels in Allahabad District.

### Materials and Methods:-

This study was a cross sectional and descriptive study and 600 women were selected as unit of the study. The 3 villages of Chaka (Dandupur, Dhanuha, Sarangapur) and Jasra block (Semara, Kanjasa, Dalbabari) from Allahabad district were selected as area of the study and 100 respondents were randomly selected from each village as unit of study. The predesigned and pretested pro forma was used to elicit desired information. The Pre-Test questionnaire was filled by the respondents before the exposure of awareness documentary and Post-Test questionnaire was filled after the exposure with awareness documentary again by the respondents to assess the impact of nutritional awareness program. The data obtained was subjected to statistical analysis by using appropriate statistical techniques.

### Results and Discussion:-

**Table 1:- Awareness regarding Anaemia among the study Participants.**

S. No	Variables	Pre Test		Post Test	
		N	%	N	%
1.	<b>Aware of Anaemia?</b>				
	Yes	286	47.7	506	84.3
	No	314	52.3	94	15.7
2.	<b>Awareness regarding Symptoms of Anaemia?</b>				
	Yes	114	19	523	87.2
	No	486	81	77	12.8
3.	<b>Aware of Preventive Measures to be taken for Anaemia?</b>				
	Yes	246	41	518	86.3
	No	354	59	82	13.7
4.	<b>Are you aware about the Treatment of Anaemia?</b>				
	Yes	231	38.5	492	82
	No	369	61.5	108	18

The awareness regarding anaemia among the selected respondents was depicted in the Table-1. The observed data shows that only 47.7% respondents were aware about the condition of Anaemia and after the awareness program, the response for the same has been improves i.e. 84.3%. Correct response for the awareness regarding symptoms of anaemia was given by only 19% respondents before the education but after nutrition education, it was 87.2%. Most of the rural women were not aware about the preventive measures of the anaemia (59%) and available treatment for the anaemia (61.5). after the health and education program, response regarding both has been significantly improved i.e. 86.3% and 82% respectively. The observed data revealed that the majority of women were unaware about the term Anaemia and a very small group of women have the awareness regarding symptom, preventive measures and treatment of anaemia which may be resulted in the major health risks among rural Indian women (Patel *et al.*, 2013).

**Table 2:-** Awareness regarding Nutritional Management of Anaemia among the study Participants-

S. No	Variables	Pre Test		Post Test	
		N	%	N	%
1.	<b>Can Anaemia be treated by Iron Rich Foods?</b>				
	Yes	316	52.7	548	91.3
	No	284	47.3	52	8.7
2.	<b>Inclusion of Vitamin C helps in Iron Absorption?</b>				
	Yes	107	17.8	339	56.5
	No	493	82.2	261	43.5
3.	<b>Do you aware about Iron Rich Foods?</b>				
	Yes	241	40.2	561	93.5
	No	359	59.8	39	6.5
4.	<b>Do you aware about Vitamin C rich Foods?</b>				
	Yes	234	39	569	94.8
	No	366	61	31	5.2

The data regarding awareness about nutritional management of anaemia among the study participants was illustrated in the Table-2 in which the observations shows that about 52.7% women were aware that anaemia can be treated with the consumption of iron rich food and this percentage were improved (91.3%) after the exposure with awareness documentary. Among the selected women only 17.8% women were aware that vitamin C helps in the absorption of iron in the body, but after the education the response for the same has been significantly improved i.e. 56.5%. Most of the rural women were unaware about the iron rich foods (59.8%) and vitamin C rich foods (61%). But after the nutritional awareness program, the response regarding the both has been significantly improved i.e. 93.5% and 94.8% respectively. The observations shows that rural women were aware about role of iron rich food in treating anaemia and the iron rich foods into some extent but most of them were unaware regarding role of vitamin C in the iron absorption and the novel food sources of vitamin C. so this condition may leads to low level of serum iron due to poor absorption in the intestine even in the presence of iron rich foods in the daily diet (Pareek *et al.*, 2015).

**Table 3:-** Awareness regarding Indigenous Food Processing Practices among the study Participants.

S. No	Variables	Pre Test		Post Test	
		N	%	N	%
1.	<b>Aware of different Indigenous Food Processing Practices?</b>				
	Yes	133	22.2	456	76
	No	467	77.8	144	24
2.	<b>Aware of Nutritional Benefits of Indigenous Food Processing Practices?</b>				
	Yes	127	21.2	471	78.5
	No	473	78.8	129	21.5
3.	<b>Aware about different food products developed by Indigenous Food processing Practices?</b>				
	Yes	302	50.3	571	95.2
	No	298	49.7	29	4.8
4.	<b>Aware of role of Indigenous Food products in obtaining Household Food Security?</b>				
	Yes	513	85.5	374	62.3
	No	87	14.5	226	37.7

The data regarding awareness about indigenous food processing practices among the selected respondents were collected and gathered in the Table-3. The observations shows that only 22.2% rural women were aware about different indigenous food processing practices, but after the education program the response for the same has been significantly improved i.e. 76%. The correct response for nutritional benefits of the indigenous food processing practices was given only by 21.2% women before the nutritional awareness program but after the awareness it was 78.5%. Most of the rural women were unaware about the different foods prepared by using indigenous food processing practices (50.3%) and role of indigenous food products in obtaining household food security (85.5%). After the health and nutrition education program, the response for the both has been significantly improved i.e. 95.2% and 62.3% respectively. The obtained data revealed that most of rural population was unaware about the term indigenous food processing methods and their nutritional benefits (FAO, 2009), (FAO, 2013).

**Table 4:-** Awareness regarding Household Food Security among the study Participants-

S. No	Variables	Pre Test		Post Test	
		N	%	N	%
1.	<b>Do you aware about the term “Food Security”?</b>				
	Yes	47	7.8	229	38.2
	No	553	92.2	371	61.8
2.	<b>Do you aware about the major consequences of Household Food Insecurity?</b>				
	Yes	58	9.7	212	35.3
	No	542	90.3	388	64.7
3.	<b>Aware about different measures to combat Household Food Insecurity?</b>				
	Yes	37	6.2	194	32.3
	No	563	93.3	406	67.7
4.	<b>Aware of reasons behind higher percentage of Food Insecure Women in India?</b>				
	Yes	201	33.5	489	81.5
	No	399	66.5	111	18.5

The observation regarding awareness level of rural women of Allahabad district about household food security were gathered in the Table-4. The obtained data shows that a very low percentage of women were aware about the term Food Security which was improved to 38.2% after the exposure of the respondents with the awareness documentary. Majority of the women (90.3%) were unaware about major consequences of the household food insecurity but after the exposure with awareness material, the percentage was improved to 35.3%. Most of the selected women were not aware about the different measures to combat household food insecurity (93.3%) and reason behind the higher percentage of food insecure women in India (66.5%) but after the exposure with awareness material, the response for the both has been significantly improved i.e. 32.3% and 81.5% respectively. The observations revealed that there was a lack of awareness regarding food security and related aspects in the selected research area (Muro, et al., 2007).

### Conclusion:-

Based on the obtained data it can be concluded that among the selected respondents, women are aware about the term anaemia (47.7%) more than the symptoms (19%), preventive measures (41%) and treatment of anaemia (38.5%) while they were also aware about impotence of iron rich foods in the treatment of anaemia (52.7%) but having low level of awareness regarding iron and vitamin C rich foods (40.2% and 39% respectively). Most of the rural women were unaware about indigenous food and related processing techniques (22.2%) and very low level of awareness were recorded about the concept of food security and related aspects (7.8%). After the exposure with the health and nutrition education program, the response for each question has been significantly improved and this will may leads to better health and healthy life of the selected respondents.

### Recommendation:-

It can be concluded from the above study that educational intervention, if given in right manner, can bring out positive changes in its true sense & can modify or change the lives of people. This holds true more for the younger population as they are the future men & women who would promote growth & development of our nation.

#### Abstract

The most commonly encountered and accepted precancerous lesions in the oral cavity are leukoplakia, OSMF, Lichen planus. Oral leukoplakia causes no great discomfort, and it is rarely disfiguring. It is undiagnosed by patient and neglected by many clinician. Investigation and treatment of leukoplakia helps to prevent the patient from turning into malignancy.

Copy Right, IJAR, 2017., All rights reserved.

#### Introduction:-

The most commonly encountered and accepted precancerous lesions in the oral cavity are leukoplakia and erythroplakia<sup>(1)</sup>. Since the term leukoplakia was introduced by Schwimmer in 1877 it has been applied in many different ways. The most important variation is between those who use it in a clinical sense alone, and those who restrict the term to lesions that show, histologically, a significant degree of epithelial dysplasia: in other words, to lesions that presumably are more likely to become malignant<sup>(2)</sup>. Commonly, oral leukoplakia causes no great discomfort, and it is rarely disfiguring. Therefore, our main concern about this condition arises from the well-established observation that about 4% of patients with leukoplakia ultimately develop squamous cell carcinoma within the area of leukoplakia (Pindborg 1971), this progression often being on a very long time scale. However, this general figure conceals many variations, and special reference should be made to leukoplakia associated with the use of tobacco.<sup>(2)</sup> The site of involvement may also have a marked influence on the risk of malignant change. Of all leukoplakias, those of the floor of the mouth and the ventral surface of the tongue, and especially leukoplakia confined to those areas, seem to carry a very high risk of malignant change<sup>(2)</sup>.

#### Defination:-

**WHO (1978):** "A white patch or plaque that cannot be characterized clinically or pathologically as any other disease".

**Corresponding Author:- Nilofar Zaidi.**

Address:- PG student in dept of OMR. CSMMS Dental College and Hospital, Aurangabad.

**Warnakulasuriya et al.(1978):** “Leukoplakia should be used to recognize white plaques of questionable risk having excluded (other) known diseases or disorders that carry no increased risk for cancer”.

**First International Conference on oral leukoplakia. Malmo, Sweden :** “ A white patch or plaque that cannot be characterized clinically or pathologically as any other disease and is not associated with any physical or chemical causative agent except use of tobacco”.

#### **Etiology:-**

A number of locally acting etiologic agents, includes: Tobacco, Alcohol, Candidiasis, Electrogalvanic reactions, Herpes simplex and Papillomaviruses, Sunlight (specifically, ultraviolet radiation ).

These have been implicated as causative factors for leukoplakia. True leukoplakia is most often related to tobacco usage; more than 80% of patients with leukoplakia are smokers. The development of leukoplakia in smokers also depends on dose and on duration of use, as shown by heavier smokers’ having a more frequent incidence of lesions than light smokers. Cessation of smoking often results in partial to total resolution of leukoplakic lesions.

Smokeless tobacco is also a well-established etiologic factor for the development of leukoplakia; however, the malignant transformation potential of smokeless tobacco–induced lesions is much lower than that of smoking-induced lesions.

Alcohol consumption alone is not associated with an increased risk of developing leukoplakia, but alcohol is thought to serve as a promoter that exhibits a strong synergistic effect with tobacco, relative to the development of leukoplakia and oral cancer. In addition to tobacco, several other etiologic agents are associated with leukoplakia. Sunlight (specifically, ultraviolet radiation) is well known to be an etiologic factor for the formation of leukoplakia of the vermilion border of the lower lip. *Candida albicans* is frequently found in histologic sections of leukoplakia and is consistently (60% of cases) identified in nodular leukoplakias but rarely (3%) in homogeneous leukoplakias. The terms “candidal leukoplakia” and “hyperplastic candidiasis” have been used to describe such lesions. Human papillomavirus (HPV), particularly subtypes HPV-16 and HPV-18, have been identified in some oral leukoplakias. there is evidence that HPV-16 may be associated with an increased risk of malignant transformation.<sup>(3)</sup>

#### **Clinical features:-**

The incidence of leukoplakia varies by geographic location and patients’ associated habits. For example, in locations where smokeless tobacco is frequently used, leukoplakia appears with a higher prevalence . Leukoplakia is more frequently found in men, can occur on any mucosal surface, and infrequently causes discomfort or pain. Leukoplakia usually occurs in adults older than 50 years of age. Prevalence increases rapidly with age, especially for males, and 8% of men older than 70 years of age are affected. Approximately 70% of oral leukoplakia lesions are found on the buccal mucosa, vermilion border of the lower lip, and gingiva.<sup>(1)</sup> They are less common on the palate, maxillary mucosa, retromolar area, floor of the mouth, and tongue. However, lesions of the tongue and the floor of the mouth account for more than 90% of cases that show dysplasia or carcinoma.

Homogenous leukoplakia on left buccal mucosa & lateral border of tongue

**Figure:-** Diffuse leukoplakia on floor of mouth and left lateral border of tongue

#### **Clinical Subtypes:-**

Many varieties of leukoplakia have been identified.

**“Homogeneous leukoplakia”** (or “thick leukoplakia”) refers to a usually well-defined white patch, localized or extensive, that is slightly elevated and that has a fissured, wrinkled, or corrugated surface. On palpation, these lesions may feel leathery to “dry, or cracked mud-like.”

**Non homogenous** variety includes:

**Nodular (speckled) leukoplakia** which is granular in nature. The name refers to a mixed red-and-white lesion in which keratotic white nodules or patches are distributed over an atrophic erythematous background. This type of leukoplakia is associated with a higher malignant transformation rate, with up to two-thirds of the cases in some series showing epithelial dysplasia or carcinoma.

**“Verrucous leukoplakia”** or **“verruciform leukoplakia”** is a term used to describe the presence of thick white lesions with papillary surfaces in the oral cavity. These lesions are usually heavily keratinized and are most often seen in older adults in the sixth to eighth decades of life. Some of these lesions may exhibit an exophytic growth pattern.

**Proliferative verrucous leukoplakia (PVL)** was first described in 1985. The lesions of this special type of leukoplakia have been described as extensive papillary or verrucoid white plaques that tend to slowly involve multiple mucosal sites in the oral cavity and to inevitably transform into squamous cell carcinomas over a period of many years. PVL has a very high risk for transformation to dysplasia, squamous cell carcinoma or verrucous carcinoma. Verrucous carcinoma is almost always a slow growing and well-differentiated lesion that seldom metastasizes.

**Figure:-** Proliferative verrucous leukoplakia (PVL)

Leukoplakia begins as thin, gray, or gray white plaque that may appear somewhat fissured or wrinkled, & are typically soft & flat. They usually have sharply demarcated borders but occasionally blend gradually into normal mucosa.

This early stage is sometimes referred as 'preleukoplakia' but preferable designated 'Mild or thin leukoplakia'. Thin leukoplakia may disappear or continue unchanged but as time progresses as many as two thirds of such plaques slowly extend laterally & acquire a distinctly white appearance from a thick keratinized layer. They may become leathery to palpation & fissures may deepen, but there should be only a few, if any, localized nodule or surface projections. At this stage the lesion is severe often called 'homogenous or thick leukoplakia'.<sup>(4,5)</sup>

#### **L C P STAGING: (L - size C - Clinical P – Pathological:-**

Recently the Leukoplakia was graded according to size, clinical and pathological stages it is known as LCP Staging :

L x = Size not specified, L 1 = Less than 2cm, single/ multiple, L 2 = 2 to 4 cm, single/ multiple  
L 3 = More than 4cm, single/ multiple, C 1 = Homogenous, C 2 = Non homogenous  
P x = Not specified, P 0 = No epithelial dysplasia, P 1 = Distinct epithelial dysplasia

	<b>Pathological</b>	<b>Clinical</b>
STAGE 1	L1 P0	L1 C1
STAGE 2	L2 P0	L2 C1
STAGE 3	L3 P0	L3 C1
STAGE 4	L3 P1	L3 C

#### **Investigations:-**

The following investigation should be done to detect the lesion which includes biopsy, toluidine blue (tolonium chloride.), lugol's iodine solution, punch biopsy, exfoliative cytology, brush biopsy, chemiluminiscent illumination.

#### **Histopathology:-**

Specific microscopic characteristics of dysplasia include:

Drop-shaped epithelial ridges, Basal cell crowding, Irregular stratification, Increased and abnormal mitotic figure, Premature keratinization, Nuclear pleomorphism and hyperchromatism, and An increased nuclear cytoplasmic ratio.<sup>(4,5)</sup>

#### **Treatment:-**

**Nonsurgical treatments (Medical management) options for oral leukoplakia :**

##### **Carotenoids:-**

**Beta-Carotene :** The carotenoids are a group of extremely hydrophobic molecules with little or no solubility in water . Beta-carotene is a carotenoid commonly found in dark green, orange or yellowish vegetables, such as spinach, carrots, sweet potato, mango, papaya, and oranges . Beta-carotene is a vitamin A precursor. The only known effect of excessive beta-carotene intake is a state in which the skin becomes strongly yellowish, the so-called carotenodermy, which disappears in a few weeks after the reduction of consumption. While some authors have demonstrated the absence of side effects in patients that have received beta-carotene treatment, in other studies, the supplement diet based on beta-carotene caused headaches and muscle pain in some of the patients. The use of beta-carotene has been recommended in order to prevent oral leukoplakia and possibly oral cancer<sup>(5)</sup>. The potential benefits and protective effects against cancer are possibly related to its antioxidizing action. This function is accomplished through a ligation between beta-carotene and oxygen, which is an unstable reactive molecule, thus diminishing the damaging effects of free radicals<sup>(6)</sup>.

**Lycopene :** Lycopene is a carotenoid without provitamin A action. This is a fat-soluble red pigment found in some fruit and vegetables. The greatest known source of lycopene is tomatoes, which are widely employed in cooking. There is a positive relationship between lycopene consumption and a reduction in the risk of the development of degenerative diseases caused by free radicals, such as cancer and cardiovascular diseases. Lycopene has the uncommon feature of becoming bound to chemical species that react to oxygen, thus being the most efficient biological Antioxidizing agent.<sup>(7)</sup> In addition to its antioxidizing property, lycopene also has the capacity to modify intercellular exchange junctions, and this is considered to be an anticancer mechanism. Lycopene is better absorbed

in oil resin capsules and in tomato juice than in the form of raw tomatoes. No systemic significant toxic effect of lycopene has been observed and there is no evidence of side effects from the treatment with lycopene. Lycopene is a promising candidate in reducing cancer and chronic diseases in human beings; however, further research is needed to clarify its potential function in human health, according to the following criteria.

#### **Vitamins:-**

##### **L-Ascorbic Acid (Vitamin C):-**

L-ascorbic acid (L-AA), the so-called vitamin C, is found in citrus fruits such as kiwi, strawberries, papaya, and mango. The current US recommended daily allowance for ascorbic acid ranges between 100–120 mg/per day for adults. It has been suggested that a daily intake of at least 140 mg/day is required for smokers because they usually present a reduction of the L-AA concentration in serum leukocytes.<sup>(8)</sup> L-AA has antioxidizing properties and reacts with superoxide produced as a result of the cells' normal metabolic processes; this inactivation of superoxide inhibits the formation of nitrosamines during protein digestion and helps avoid damage to DNA and cellular proteins. L-AA toxicity does not occur, since vitamin is water-soluble and a decrease in absorption efficiency occurs when consumption exceeds 180 mg/day.<sup>(9)</sup>

##### **Retinoic Acid (Vitamin A):-**

The current definition of retinoid includes all the natural and synthetic compounds with an activity similar to that of Vitamin A. Vitamin A exists in the human body as various interconvertible compounds, notably retinal (essential for vision) and retinol, which is the most potent analogue and the main form of storage and transportation. Retinoic acid is obtained from carotene and animal products such as meat, milk, and eggs, which, while in the intestine, are converted, respectively, into retinal and retinol<sup>(10)</sup>. In the systemic use with dosage of 300.000 IU of retinoic acid (Vitamin A), a clinical resolution of the 50% has been demonstrated. In topical use with dosage range from 0.05% to 1% a clinical resolution from 10% to 27% has been obtained<sup>(11)</sup>.

##### **Bleomycin:-**

Bleomycin, a cytotoxic antibiotic, was first used for the treatment of neoplasms of the penis and scrotum, but has also been employed for squamous cell carcinoma of the head and neck region, oesophagus, and skin. The most commonly adverse effects are mucocutaneous reactions, which include stomatitis, alopecia, pruritic erythema, and vesiculation of the skin. The use of topical 1% bleomycin in DMSO was evaluated for the treatment of dysplastic OL.<sup>(12,13)</sup>

##### **Photodynamic Therapy:-**

Photodynamic therapy (PDT) is a noninvasive method for the treatment of premalignant lesions and head and neck cancers. The principle of PDT is a non thermal photochemical reaction, which requires the simultaneous presence of a photosensitising drug (photosensitiser), oxygen, and visible light. After a period to allow the photosensitiser to collect in the target tissue, the photosensitiser is activated by exposure to low-power visible light of a drug-specific wavelength. Illumination of the tumour by light at the activating wavelength results in the destruction of cells by a non free radical oxidative process. These reactive oxygen species may damage crucial cell components, such as structural proteins, enzymes, DNA, and phospholipids. PDT is a cold photochemical reaction, and the photosensitizing agents are of inherently low systemic toxicity. PDT damage heals mainly by regeneration rather than scarring. Due to the organ preserving principle of PDT, important structures are maintained with good functional and cosmetic outcome. Several photosensitisers have been developed during the past. Haematoporphyrin and haematoporphyrin derivatives were the first photosensitisers.<sup>(14)</sup>

##### **Surgical treatment:-**

A consensus considered that surgery is the 1st choice in the management of oral leukoplakia, but it has not been demonstrated that totally removing the lesion will exclude the malignant transformation.

The surgical treatment is a diagnostic tool which is used also in the evolution of oral leukoplakia as part of its surveillance. there are different surgical techniques: laser, scalpel, electrocauterisation and cryosurgery.

The **laser surgery** has been reported as most appreciated in the last 30 years . There are two main benefits of the laser: the haemostatic effect and the limited scars post treatment. This can be performed for extensive lesions. It also has reduced post operative discomfort but the main disadvantage is that the histological diagnosis of the excised area will be missing. Furthermore comparing different laser techniques, CO2 laser, neodymium: yttrium aluminum

garnet (NdYAG) laser, and potassium-titanyl-phosphate (KTP) there are differences in recurrence rates (34.2%, 28.9%, and 17 %) <sup>(15)</sup>.

**Electrocoagulation** can be used alone or as an adjuvant to scalpel surgery. It induces thermal damage in the surrounding tissues thus causing postoperative pain and edema and tissue scarring.

#### **Cryotherapy:-**

It is a method which permits the destruction of lesion tissue by freezing. It is carried out by either an “open” or a “closed” system. The open-system cryotherapy is the direct application of cryogen on the lesion using a cotton swab or by an open spray. The closed system of cryotherapy brings a greater degree of control with more complex and delicate apparatus. The main advantages of cryotherapy are the bloodless intervention, reduced risk of post-operative infection, and the lack of scarring <sup>(16,17)</sup>.

#### **Conclusion:-**

It is estimated that most of all cancers and cancer mortality worldwide are preventable through early detection, as it provides a greater chance of initiating early and successful treatment. Only sure way to avoid cancer is not to be born, but we can reduce our chances for cancer by a balanced approach to cancer prevention, early detection and effective early treatment. The main objective of secondary prevention is early detection of PMDs when they can be treated most effectively. PMDs are often undiagnosed due to lack of public awareness and due to lack of knowledge among medical professionals. Clinical appearance and diagnosis of a lesion is not adequate to determine its premalignant nature, as not all white lesions turn malignant. Diagnostic biopsy and histopathological examination should be considered for any mucosal lesion that persists for more than 14 days after obvious irritants have been removed.

Prognosis and patient survival is directly related to stage and grade of cancer at initial diagnosis.

Dentists and other health care professionals need to understand and play an important role in the early detection and diagnosis of oral cancer and potential malignant disorders as it can prevent the development of severe dysplasia of potential malignant disorders or provide a better prognosis for patients affected by oral cancer through an immediate treatment.

#### Abstract

**Background:** Since early detection is the key for a better prognosis in different types of malignancies, this paper was conducted to determine the level of knowledge, attitude and practice of testicular cancer and testicular self-examination among the population in the western region of Saudi Arabia.

**Materials and Methods:** This cross-sectional study was conducted in March 2016 at King Abdullah Sports City and Red Sea Mall Jeddah, Saudi Arabia, where 1600 male subjects aging 15 and above were interviewed, and the data were collected using a questionnaire.

**Results:** It was determined in this study that knowledge level about TC is extremely insufficient where 61.36% reported lack of knowledge about TC. It also showed how lack of awareness of TSE and poor health education can reflect on the knowledge and practice of TSE where only 16.88% were educated.

**Conclusion:** it is highly recommended to encourage and promote health education programs among the public regarding how common TC is in young males, as well as focus on the importance of practicing TSE regularly. It is also recommended that health care professionals should educate and periodically evaluate the role of such practices when it comes to early detection and better management of TC.

#### Introduction:-

Testicular cancer (TC), is the most common malignancy in men between 15 and 35 years of age, accounting for 20% cancer diagnosed in men within this age group [1]. Yet, it represents only 1% of all malignancy in men [2]. The international agency for research on cancer in 2012, produced an estimate of 55266 TC cases worldwide, with a next 5 years prevalence rate of 214666 cases [3].

Not many decades ago, TC's mortality rate reached 11% of all cancer related mortality, with a 5-year survival rate of 64% [4]. More recently, however, with the new diagnostic and therapeutic modalities at hand, a new dawn has emerged in terms of prognosis, making TC one of the most curable cancers in adults, with an overall survival rate reaching >95% in 10 years [5].

Early detection is becoming, the only way to improve outcomes in accordance with the current successful therapeutic algorithm.

Determinants of early detection and diagnosis of TC are two-fold, one: Knowledge and oncology awareness of the male population, especially the young sector, and two: Performance of regular monthly testicular self-examination (TSE) as one of the first signs of TC is often a lump or swelling in the testis [6].

Conflicting views are found in the literature about whether TSE should be encouraged to the public, as some suggest that the costs outweigh the benefits, both because of the relatively low incidence compared to other health concerns and because of the anxiety they feel such a focus would provoke [7]. In 1996, Best et al, conducted a study by providing information about TSE to 1,286 high school male students and compared them to a control group after 6 and 18 months. The comparison demonstrated that while the knowledge level increased significantly, the anxiety level did not [8].

Some medical associations, such as the American Urological Association recommend TSE for the early detection of TC [9]. The American cancer society (ACS) recommends that examining a man's testicles should be a part of general physical exam, as well as a cancer-related check-up. Regular TSE has not been adequately evaluated enough to establish that it indeed lowers the risk of TC mortality. Thus, the ACS does not recommend regular TSE for all men. Still, some recommend that all men examine their testicles monthly after puberty [10].

In Saudi Arabia, few studies have been conducted to assess level of awareness about TC and TSE, and as a result, no general recommendations nor acknowledged expert opinions in the country addressed the issue. Therefore, the present study was conducted to assess the knowledge level, attitudes and practices of the general population about TC and TSE in Saudi Arabia.

### **Methodology and Materials:-**

This is a cross-sectional study, which was conducted during March, 2016, in 2 public venues (King Abdullah Sports City, and Red Sea Mall) in Jeddah, Saudi Arabia. A total of 1600 randomly selected male subjects were interviewed by Medical Students.

Males above 15 years were interviewed. Exclusion criteria included the inability to perform TSE (e.g. bilateral undescended testis, hand motility disorders, etc.), and males with severe mental disability.

### **Data collecting tools:-**

A questionnaire was utilized to help collect data. It consisted of three sections. The first covered subjects' demographic characteristics. The second addressed questions regarding knowledge of TC, while the third addressed participants' knowledge, attitude and practices of TSE. All completed forms were anonymous.

### **Statistical analysis:-**

Levels of knowledge were calculated as total scores by setting different code systems to positive questions (Disagree = 0, Do not know = 1, Agree = 2) and negative questions (Disagree = 2, Do not know = 1, Agree = 0) then by transforming the scores into percentages and classifying into weak (<50%), average (50-75%), and high (>75%). Statistical analysis was performed with Statistical Package for Social Sciences (SPSS version 22.0).  $P < 0.001$  was set as statistically significant in comparison.

### **Results:-**

The demographic characteristics (Age, Marital Status, Education and Occupation) of the participants are shown in table 1.

Table (1):- The frequency and percentage of demographic characteristics (Age, Marital Status, Education and Occupation)		
	N	%
<b>Age</b>		
15-19	371	23.19
20-24	495	30.94
25-29	317	19.81
30-34	153	9.56
35-39	113	7.06
>40	151	9.44
<b>Range</b>		
Mean±SD	±	
<b>Marital Status</b>		
Single	1084	67.75
Married	483	30.19
Divorced	30	1.88
Widower	3	0.19
<b>Education</b>		
Middle School	112	7.00
High School	722	45.13
Under-graduate	724	45.25
Post-graduate	42	2.63
<b>Occupation</b>		
Student	597	37.31
Employed	767	47.94
Unemployed	236	14.75

**TC Knowledge:-**

61.36% of the interviewed males (n=978) did not know that it is possible to get TC. Less than 10% had received some form of education regarding TC (Table 2). With regard to the knowledge of risk factors for Testicular Cancer, table 2 shows responses reflecting the knowledge about symptoms and risk factors of TC.

Table (2):- The frequency and percentage of Risk Factors of TC and Symptoms of TC		
	N	%
<b>Risk factors of TC</b>		
Age	225	14.06
Prior trauma to the testis	611	38.19
Undescended testicle	299	18.69
Race and ethnicity	179	11.19
Family history of TC	470	29.38
Smoking	524	32.75
<b>Have you been educated on the risks of developing TC?</b>		
Yes	148	9.75
No	1452	90.75
<b>Symptoms of TC</b>		
Painless lumps on the testicle	377	23.56
Swelling and hardness of the testicle	839	52.44
Aching in the lower abdomen	364	22.75
Painful lumps on the testicle	439	27.44
Redness and itchiness of the scrotum	313	19.6
Nausea and fatigue	139	8.69

A general lack of knowledge was evident from the significantly high prevalence of answering "I don't know" to all three questions (P<0.001) (Table 3).

Table (3):- The frequency and percentage of response to the following questions:

Items		Agree	Disagree	Do not know	Weight	%	Chi-square	
							X <sup>2</sup>	P-value
<b>Do you think that TC has a cure?</b>	<b>N</b>	757	47	796	2310	72.1875	666.639	<0.001*
	<b>%</b>	47.31	2.94	49.75				
<b>If someone is diagnosed with TC, will he become infertile?</b>	<b>N</b>	452	280	868	1772	55.375	342.740	<0.001*
	<b>%</b>	28.25	17.50	54.25				
<b>TC can be prevented.</b>	<b>N</b>	737	144	719	2193	68.53125	426.624	<0.001*
	<b>%</b>	46.06	9.00	44.94				

#### Knowledge, attitude and practices of TSE:-

Table 4 highlights the responses of subjects about knowledge, attitude and practice of TSE.

Only 16.88% (n=270) stated that they had been educated regarding the benefits of TSE. Among those who received education, 54.98% gained this knowledge either at school or through a physician. More than 90% of the participant men had never performed a TSE.

Table (4):- The frequency and percentage of Knowledge and practice of TSE

	N	%
<b>Have you heard of TSE?</b>		
Yes	313	19.56
No	1287	80.44
<b>Have you ever been taught how to perform TSE?</b>		
Yes	161	10.06
No	1439	89.94
<b>Have you ever performed TSE?</b>		
Yes	182	11.38
No	1418	88.63
<b>Have often do you perform TSE?</b>		
Never	1449	90.56
Once a year	68	4.25
Every 6 months	32	2.00
Every 3 months	16	1.00
Every 1 month	15	0.94
Often (every week)	20	1.25
<b>Have you ever been educated on the benefits of TSE?</b>		
Yes	270	16.88

<b>If you have been educated, please indicate how this education was obtained?</b>		
No, I have not been educated	58	21.40
At school	57	21.03
By a doctor	92	33.95
Other	64	23.62

#### Discussion:-

This represents the first study; in Saudi Arabia to examine the knowledge, levels of practice and attitude towards TC and TSE. Several other studies have been conducted, in other countries, involving public audience [11], medical students [12], hospital technicians [13] and residents [14, 15] as subjects.

#### TC Knowledge:-

Our study subjects have shown significantly low levels of knowledge towards TC, where 93% have a weak level of knowledge. For example, 38.19% believed that prior trauma to the testis is a risk factor and 52.56% and 19.6%

believed that redness and itchiness of the scrotum is a symptom of TC. This lack of knowledge can be explained by the educational level of the majority of the subjects where 90.38% are either undergraduates or high school graduates ( $P < 0.001$ )

The percentage of subjects who has heard of TC in the current study is much lower than shown in another study that was conducted among technicians working in hospitals, which showed 63.6% having heard about TC. Given the fact that such subjects work in the health care field, a degree of higher awareness level is to be expected [13]. Furthermore, a different questionnaire was used to assess TC-related knowledge in the two studies

As for knowledge about the treatment and prevention of TC, a similar low level of knowledge was demonstrated. A significant percentage of subjects responded with "I don't know" to questions about likelihood of TC cure (49.75%) and prevention (44.9%).

#### **TSE Knowledge, Practice and Attitude:-**

The current study suggests a low level of knowledge about TSE among Saudi men, with 19.56% having heard about TSE, and only 11.38% having ever performed it. These results are in keeping with even lower TSE knowledge and practice levels which were previously reported among young European men and medical students [11, 12]

Among the 16.88% who were educated about TSE, 33.95% stated having received their education from a physician. These findings support the role of physicians in teaching TSE. Unfortunately physician's participation in patient TSE education has been variable in different reports. A study involving pediatric residents revealed a high prevalence of 40% who regularly engaged in teaching TSE to their patients [14]. However, an earlier study showed only 17.5% of physicians taught TSE to adolescent male patients on a routine basis [15]. Such an increase in prevalence of teaching is promising, but a similar study in our country is necessary to state a definite comparison.

#### **Conclusion:-**

The results of this study shows a great lack in knowledge level about TC. It also demonstrates how the lack of knowledge and awareness of TSE and poor spread of education are primary barriers to TSE. Given the excellent prognosis of TC when detected early, it would be advisable to direct attention towards public education programs. Furthermore, emphasis should be given to patient education regarding TC and TSE but healthcare professionals.

#### **Acknowledgments:-**

The study was supported by Batterjee Medical College, Jeddah, Saudi Arabia. The authors would like to acknowledge and thank Dr. Hawazn Motawa Head of Research Unit. Our huge gratitude to the data collectors who helped us conduct this study, Thanks to Ehab Mugharbal, Ahmad Hasan, Hassan Habis, Talat Alharbi, Mohammed Ghandoor, Yahya Alfarra, Basel Darweesh, Feras Meer, Mahmoud Chaker, Abdulwahab Bokhari and Manaf Alsaqaf.

##### Key words:-

Wood, as a green building.

#### Abstract

Timber from plantation, growth and conversion in to Wood's design with the innovation of glulam, cross laminated timber (clt) makes it flexible, suitable for a wide range of building types and applications, both structural and aesthetic. Wood can be used in many types of buildings, from single-family homes to multi-storey condominiums and offices, schools, health facilities, recreational centres and public gathering areas. It is suitable not only as a finish material, bringing warmth and natural beauty to interior and exterior applications, but as a structural material, offering a cost-effective way to meet building code.

Copy Right, IJAR, 2017.. All rights reserved.

#### Introduction:-

##### Wood:-

Along with stone, clay and animal parts, wood was one of the first materials worked by early humans. Microware analysis of the Mousterian stone tools used by the Neanderthals show that many were used to work wood.

Wood is an organic, hygroscopic and anisotropic material. It's thermal, acoustic, electrical, mechanical, aesthetic, working, etc. But wood has some disadvantages too.

##### General feature of a tree body:-

As vascular plants, trees are organized into three major organs: the roots, the stems, and the leaves. The leaves are the principal photosynthetic organs of higher vascular plants. They are attached by a continuous vascular system to the rest of the plant so that free exchange of nutrients, water, and end products of photosynthesis (oxygen and carbohydrates in particular) can be carried to its various parts.

##### Seasoning of Wood:-

Seasoning is the process of removing the moisture content from wood to minimize structural problems when used in construction or to provide less smoke and more uniform combustion when used as firewood.

##### Different Ways of Seasoning Wood:-

i. Air Seasoning: The traditional method for drying wood, air seasoning is also the longest, taking six to nine months. To air season wood, stack logs or planks outside on pallets in such a manner that air can circulate vertically and horizontally through the timbers. The raised pallets also keep wood away from vegetation and damp ground. Plank and log ends are often wrapped or sealed to prevent excessive moisture loss through these areas. Protect the drying wood from the elements with an overhead canopy.

**Corresponding Author:- Alhaji Kasir Lawan.**

Address:- Dept. of Architecture Ramat polytechnic Maiduguri, Borno State.

**ii. Kiln Seasoning:** The most common and effective commercial process for drying wood is kiln seasoning, which accelerates the process of removing moisture through the use of external energy. Drying takes two days to one weekend, depending on the type of wood. Two methods, progressive and compartmental, are used for kiln seasoning. In a progressive kiln, timber enters at one end and travels on a trolley through chambers with different air conditions to progressively dry the wood. This method produces a constant flow of seasoned timber. Wood seasoned via the compartmental process remains in a single building where it is subjected to a program of varying conditions until the moisture content is removed. This process is used for hard-to-dry or expensive wood.

**iii. Solar Kiln:** This method combines the speed of kiln seasoning with the low energy of air drying. Solar kilns have single-thickness windows on the south side of the structure that work as collectors to trap the sun's energy. Heat collectors, made from black metal are attached near the top of the window sashes. Various methods force the heated air to circulate through the kiln to dry the wood. Some solar kilns have insulation to retain heat at night. This process takes approximately twice as long as traditional kiln seasoning. Because of its gentle nature, it is well suited to producing wood for furniture fabrication.

**iv. Microwave Seasoning:** Microwave seasoning uses pulsed energy directed into timbers to drive out moisture in a manner that will not cause seasoning degrade. This method also provides advantages such as high speed and high quality and is well suited for seasoning lumber, blocks, veneer, chips, paper and wood-based composite materials. Areas in the wood with the most moisture absorb the most energy resulting in even temperature during the drying process and uniform moisture content. These factors enhance quality and reduce timber checking and warping.

#### Cross section of a tree trunk:-

**i. Annual or growth rings:** These indicate rapid growth resulting in thin walled fibre or smaller proportion of the denser wood.

**ii. Bark:** the outer layer, corklike and provides protection to the tree from knocks and other damage.

**iii. Bast:** the inner bark carries enriched sap from the leaves to the cells where growth takes place.

**iv. Cambium:** layer of living cells between the bast and the sapwood.

**v. Crown:** the branches and leaves that provide its typical summer shape.

**vi. Heartwood:** mature timber, no longer carries sap, the heart of the tree, and provides the strength of the tree.

**vii. Medulla ray:** (rays) food storage cells radiating from the medulla.

**viii. Pith or medulla:** the centre of the tree, soft and pithy especially in the branches.

**ix. Sapwood:** new growth, carries the raw sap up to the leaves.

**x. Trunk:** main structure of the tree, produces the commercial timber.

**xi. Root structure:** Absorbs water and minerals from the soil.

#### Hardwoods and Softwoods:-

There are two main groups of timber producing trees used commercially; softwoods and hardwoods.

**i. Softwoods:** Softwoods are coniferous trees and the timber is not necessarily 'soft'. They are 'evergreen'. (The larch is an exception) Their general characteristics are: i. Straight, round but ii. Slender, tapering trunk.

**ii. Hardwoods:** Hardwood trees are broadleaf and generally deciduous. The general characteristics are: i. Stout base that scarcely tapers but divides into branches to form a wide, round crown. ii. The leaves are broad and may have single or multi lobes. Fig 2 shows three trunk.

The tree trunk showing growth rings

**Fig 1.3:-** Represent tree trunk showing growth ring. Source: Geoff's Woodwork

**Conversion of timber:-**

As soon as possible after felling the tree should be converted into usable timber. There are two main methods of converting timber: Through and through (or Plain or Crown sawn) which produces tangential boards and Quarter Sawn which produces radial boards.

Through and through produces mostly tangentially sawn timber and some quarter sawn stuff. (Fig 1.5) Tangential timber is the most economical to produce because of the relatively less repetitive production methods. It is used extensively in the building industry.

**Fig 1.4:-** through and through produces mostly tangentially. Source: Geoff’s Woodwork.

There are other ways but they are all variations of tangential and radial cuts to obtain the best or most economical boards for the use it is to be put.

Tangential boards (crown, plain or flat sawn) are used extensively for beams and joists. See fig 1.5 below.  
 Radial boards (radial, figured or quarter sawn) are typically cut on 'the quarter' and produce a pattern of the medullary rays especially in quartered oak. See fig 1.5 below

Crown sawn is obtained by sawing tangentially to the annual rings. See fig 1.5 below.  
 Rift sawn is the cut which falls between crown and true quarter sawn. See fig 1.5 below  
 Quarter sawn boards are radial cut from the centre of the tree. See fig 1.5 below

**Fig 1.5:-** Showing methods of conversion of a timber. Source: Geoff’s Woodwork.

**Fig 1.6:-** shows method at which timber conversion has taken place. Source: Geoff's Woodwork  
**Types of Woods Processed:-**

### 1. Hard Wood

**i. Oak:** Oak is the most widely used hardwood. There are more than 60 species of oak grown in the U.S., which can be separated into two basic varieties; white and red. Properties: Oak is a heavy, strong, light colored hardwood. Uses: It is used to craft outdoor furniture and decorative carvings. Redwood burls have a "cluster of eyes" see fig 2.1.

**Fig 2.1** showing sample of oak wood. Source: hooved signs

**ii. MAPLE:** Properties: Maple is so hard and resistant to shocks that it is often used for bowling alley floors. Its diffuse evenly sized pores give the wood a fine texture and even grain. Burls, leaf figure, and birds-eye figures found in maple are used extensively for veneers. See fig 2.2 below. Uses: Maple is used extensively for colonial furniture, making.

**Fig 2.2** showing a sample of maple wood. Source: hooved signs

**iii. MAHOGANY:** is a tropical hardwood indigenous to South America, Central America and Africa. Properties: Mahogany is strong, with a uniform pore structure and poorly defined annual rings. It has a reddish - brown color and may display stripe, ribbon, broken stripe, rope, ripple, mottle, fiddleback or blister figures. Uses: Mahogany is used extensively in the crafting and furniture making see fig 2.3 below.

**Fig 2.3** showing a sample of mahogany wood. Source: hooved signs

**iv. CHERRY:** Cherry is grown in the Eastern half of the U.S. It is sometimes called fruitwood. The term fruitwood is also used to describe a light brown finish on other woods. Properties: A moderately hard, strong, closed grain, light to red-brown wood, cherry resists warping and checking. It is easy to carve and polish. Uses: Cherry veneers and solids are used in a variety of styles. See fig 2.4 below.

**Fig 2.4** showing a sample of cherry wood. Source: hooved signs

**v. WALNUT:** Walnut is one of the most versatile and popular cabinet making woods. It grows in Europe, America and Asia. There are many different varieties. Properties: Walnut is strong, hard and durable. Uses: used in all types of fine cabinet work. See fig 2.5 below

**fig 2.5** showing a sample of walnut wood. Source: hooved signs

**vi. ROSEWOOD:** Very hard and has a dark reddish brown color. It is fragrant and close grained. It is hard to work and takes high polish. Used in musical instruments, piano cases, tool handles, art projects, veneers and furniture. See fig 2.6 below.

**Fig 2.6** showing a sample of rose wood. Source: hooved signs

**vii. TEAK:** True teak is indigenous to Southeast Asia, but similar wood species also grow in Africa. Properties & Uses: Teak is a yellow to dark brown hardwood which is extremely heavy, strong and durable. See fig 2.7 below

**Fig 2.7** showing a sample of rose wood. Source: hooved signs

#### **SOFTWOODS**

**i. HICKORY:** There are 15 species of hickory in the eastern United States, eight of which are commercially important. Properties: Hickory is one of the heaviest and hardest wood. See fig 2.8

Fig 2.8 showing a sample of hickory wood. Source: hooved signs

**iv. CEDAR:** Several species of cedar grow in the southern United States, Central and South America. Properties & Uses: Cedar is a knotty softwood which has a red-brown color with light streaks. Simple cases and storage closets are also constructed from this light, brittle wood. See fig 2.12 below

**Fig 2.13** showing a sample of cedar wood. Source: hooved signs

v. **REDWOOD:** Indigenous to the Pacific United States. Properties & Uses: It is used to craft outdoor furniture and decorative carvings. Redwood burls have a "cluster of eyes" figure. See fig 2.14 below

**Fig 2.14** showing a sample of red wood. Source: hooved signs

vi. **BIRCH:** There are many species of birch. Properties & Uses: Birch is a hard, heavy, close grained hardwood with a light brown or reddish colour. See fig 2.15 below.

**Fig 2.16** showing a sample of birch wood. Source: hooved signs

vii. **BEECH:** The American beech is a single species which grows in the eastern half of the United States. Properties & Uses: Beech is a hard, strong, heavy wood with tiny pores and large conspicuous medullary rays, similar in appearance to maple. Uses: used for frames, a variety of bent and turned parts. See fig 2.17 below.

**Fig 2.17** showing a sample of beech wood. Source: hooved signs

viii. **IRCH:** There are many species of birch. The yellow birch is the most commercially important. European birch is fine grained, rare and expensive. See fig 2.18 below

**Fig 2.18** showing a sample of irch wood. Source: hooved signs

#### **Application of Wood as a Building Material:-**

**i. Quick to Build: Saves Money:** Some wooden home manufacturers can construct a 100m<sup>2</sup> wooden house, on site within 7 days. When compared with brick, stone or concrete, wood constructions certainly do save time, and inherently with that come savings in labour. Wood-framed houses enable easy modifications during and after the building process and it's because of the ease, versatility and cost effectiveness which makes it such a popular and inexpensive choice. Insulated concrete form homes (ICF) can be costly, troublesome and time consuming to alter post builds.

#### **ii. Environmentally friendly**

Houses made from trees are sustainable, renewable and environmentally friendly. Did you know that wooden structures absorb and store atmospheric CO<sub>2</sub>, even taking into account haulage, is carbon neutral (in fact, it's the only carbon neutral construction material). Mature trees actually use absorb less carbon than younger, faster growing trees, therefore it could be beneficial in the battle on climate change to cut the older trees, use them in construction and plant new carbon munching trees in their place.

**iii. Mechanical Properties & Working Properties:** Wood, although light has a remarkably high tensile strength. Let's take wood which has a tensile strength of 0,6/cm<sup>3</sup> and the specific gravity is 100 N/mm<sup>2</sup>, as well as steel which has a tensile strength of 7,89/cm<sup>3</sup> and the specific gravity is 500 N/mm<sup>2</sup>.

When it comes to how workable wood is, few things can surpass it. Wood can be whittled in beautiful and creative ways, which can make for almost magical designs. The accuracy and finish that can be achieved with wood can help carve an ordinary design into something extraordinary. Further to that, wood is fairly easy to maintain and to repair.

**iv. Safe, Light, Sturdy & Durable:** One of the many reasons why wood is still used today, despite huge strides in engineering excellence, is its durability weight and safety. Wood has a little bit of give in it which means it can bend slightly, which is a property which bricks don't have. Therefore, if the foundations shift slightly, the wooden home can flex and move with the change rather than crack. Even the smallest shift in the foundations of a brick house will cause cracks to appear in the mortar (not a good look). They are cheaper to rebuild if destroyed by a hurricane.

**v. Wood a Versatile and Innovative Way to Build:** Wood is the building material of the future—versatile, beautiful, and durable. Wood is being used in new and exciting ways to build taller multi-storey structures. Large public buildings like arenas, gymnasiums, office buildings, and apartment complexes can be constructed from wood. New wood products, like Cross Laminated Timber and Glulam, are changing the face of construction, allowing taller wood buildings.

**vi. Building Wooden Skyscrapers:** The use of Cross Laminated Timber (CLT) is opening up new possibilities for using wood in non-residential, multi-storey buildings. Developed in Europe in the 1990s, CLT is an engineered wood panel typically consisting of three, five or seven layers of dimensional lumber. Kiln-dried boards are layered perpendicular to one another and then glued. This cross lamination provides dimensional stability, strength and rigidity. A recent study conducted on behalf of the Canadian Wood Council concluded that CLT is feasible for 12 stories or more.

In November 2012, the International Code Council approved a code change to expand the use of cross laminated timber through the building code's heavy timber construction classification.

**vii. Providing Strong and Beautiful Structure:** Glulam makes efficient use of wood by bonding smaller pieces of dimension lumber together to form larger beams and columns. Used in place of concrete for beams and columns, Glulam can bring innovation and beauty to both commercial and residential buildings.

### Conclusion:-

Wood is the building material of the future. New wood products, like Cross Laminated Timber and Glulam, are changing the face of construction, allowing taller wood buildings.

low-content gold, copper ore, copper concentrate, waste copper, PSTDT-polymer.

#### Abstract

Polystyrene-azo-thiazandithion-2,4 (PSTDT) polymer was used to increase the gold content for analysis of waste copper, copper ore and concentrate. The optimum conditions of the sorption capacity of sorbent,  $[H^+]$ , temperature and time dependence enrichment of gold content were examined to increase analysis efficiency by using treatment of PSTDT polymer. The molecular structure of PSTDT polymer with gold were successfully determined using by FT-IR and theoretical calculations.

#### Introduction:-

The atomic absorption spectroscopy (AAS) method is usefully for determination of low-content precious elements in biological (Olmedo et al., 2013), and geological samples (Hoffman., et al 1998). One of the precious metals is gold. Comparison of different gold recovery methods as amalgamation, cyanidation was investigated previously (Hylander et al., 2007). Hoffman et al. (Hoffman., et al 1998), described the gold analysis in geological samples by fire-assaying methods which includes instrumental neutron activation, AAS, graphite furnace-atomic absorption or inductively coupled plasma emission mass spectroscopy. The functional polymers can be used for determination of low-concentration gold in ores and minerals by using AAS such as silicon organic adsorbent PSTM-3T (Pozhidaev et al., 2013). The PSTM-3T polymer also had been investigated for removal of copper and chromium ions from aqueous solution (Narantsogt et al., 2014). PSTM-3T polymer includes thiocarbamide functional group which forms the metal complexes.

The Erdenet Mining Corporation (EMC) is one of the largest copper and molybdenum mining and processing factories in the world that located on the northern of Mongolia. The copper is concentrated by using flotation method of sulfide minerals. The concentration of gold in waste copper, copper ore and copper concentrate has been determined by using the AAS in Central Laboratory of Chemistry of EMC which method is not efficiency. The enrichment of precious metals is very useful for recovery and analytical chemistry. Monitoring the gold concentration in waste copper, copper ore and concentrate is important for mining. In recent, the polymer compound is treated into ores to increase the concentration of plate and precious metals. One of the polymer is the polystyrene-azo-thiazandithion-2,4 (PSTDT) which firstly synthesized by Basargin et al (Basargin et al., 1995). The PSTDT polymer can be selectively determine the low-content gold samples by using enrichment method. In this present work, we determined the gold content in waste copper, copper ore and concentrate of EMC.

## Materials and Methods:-

### Materials:-

Poly-styrene-azo-thiazandithion-2,4 (PSTDT) polymer (Astralabor, Russia) was used to determine the gold content in waste copper, copper ore and concentrate. The PSTDT polymer (Fig. 1a) is not dissolve in water, acid, base and organic solvents that includes nitrogen and sulfur atoms at ortho-position which forms a stable chelate complex with gold. Gold atom substitutes a hydrogen atom of imine group and connects with sulfur atom by coordination bond (Fig. 1b) (Pozhidaev et al., 2013). Standard solution and certified reference sample were used 1 mg/ml gold solution (ACROS Organics) and 0.211 ppm gold content (OREAS 13b), respectively.

### Optimum condition gold adsorption

In order to define the optimum condition as temperature (20 °C, 50 °C and 100 °C), time (5–30 minutes) and HCl (0.5, 1.0, 1.5 N), HNO<sub>3</sub> (0.5, 1.0, 1.5 N) affecting to the gold adsorption, 25 mg PSTDT with 500 ppb gold standard solution were taken for 100 ml solution and stirred on the magnetic mixer. Gold contents in the solution were measured by spectrophotometry (MAPADA V-1600PC) to form the color complex with rodasol-XC. Adsorption efficiency of the gold was calculated as following equation:

$$R = \frac{q_a - q_f}{q_a} \times 100\% \quad (1)$$

Where,  $R$ ,  $q_a$ , and  $q_f$  are the adsorption efficiency (%), concentrations (ppb) of the gold in the standard solution and filtrate solution, respectively.

### A. Sorption capacity of sorbent

The solutions of gold with concentrations of 5, 10, 15, 20, 25, 30, 35, 40, 45, 50 and 55 ppb were prepared from the standard solution to determine the maximum amount of gold per adsorbent. 50 mg PSTDT added into each solutions at optimum condition then filtrate solutions were analyzed to adsorption efficiency. Sorption capacity of sorbent is calculated following equation:

$$SCS_{Au} = \frac{(C_0 - C) * V}{m} \quad (2)$$

Where,  $C_0$ ,  $C$  -gold concentration in initial and remained solution, respectively,  $V$  -50 ml standard solution,  $m$ - 50 mg sorbent

**Fig. 1:** Representation of molecular structure of PSTDT polymer (a) and PSTDT-Au (b). The optimized structures of PSTDT (c) and PSTDT-Au (d) with Mulliken atomic charges for selected atoms. Sulfur, nitrogen, carbon, hydrogen, and gold atoms are shown by yellow, blue, dark grey, light grey and yellow, respectively.

**Determination of gold content in samples:-**

Experimental procedures were applied to gold determination can be broadly divided into three stages as the sample decomposition, enrichment and analysis stages which were summarized as a scheme in Figure 2

*Sample decomposition stage* Samples were calcinated at 650 °C then were dissolved in nitric acid and were evaporated the solution. The powder had been calcinated at 450 °C to form the copper oxide. The formed oxide was dissolved in solution of  $\text{H}_2\text{SO}_4 : \text{H}_2\text{O}_2$  (3 %) with ratio 1 : 10. The excess solution of hydrogen peroxide was added and boiled the solution then was added NaCl and KI with concentration of 10 % to separate the gold, platinum, silver and palladium. This procedure was repeated twice. The precipitate was filtered and calcinated at 600 °C. The precipitate was dissolved in “Aqua regia” solution and evaporated then dissolved in 1 N hydrochloric acid. (A solution).

*Enrichment stage* 50 mg sorbent( PSTDT) were added into “solution A” to enrich the gold in the optimum condition by mixing. After the formation of chelate complex, the solids were filtered and were calcined at 550 °C then dissolved in 100 ml hydrochloric acid (1 N) then filtrate.

*Analysis stage* The sample burned by air-acetylene flam at 2125 - 2400 °C and measured the gold content at 242.7 nm wavelength using flame atomic absorption spectroscopy (FAAS) (Perkin Elmer AAnalyst 800).

Fig. 2:- Scheme of experimental procedures for determination of gold content.

**Frontier-Transform Infrared (FT-IR) spectroscopy:-**

The chemical bond frequencies of functional groups of polymer before and after treatment of sample were analyzed by using Frontier-Transform Infrared (FT-IR) spectrophotometer (IRPrestige-21, Shimadzu, Tokyo, Japan). The powdered samples were mixed with KBr and made the pellets. The FT-IR spectra were obtained with frequency range of 4000 – 400  $\text{cm}^{-1}$ .

**Computational method:-**

The optimization and frequency calculations of PSTDT and PSTDT-Au (Fig. 1c and d) complex were carried out using density functional theory (DFT) with Becke three parameter method (Becke, 1993), (Becke, 1988) and (Lee Yang Parr et al., 1988), correlation exchange with 6-31G(d) (Hehre et al., 1987) and LanL2DZ basis sets by Gaussian09 program. (Barone et al., 2009) 6-31G(d) basis set was applied for H, C, N, and S atoms, and LanL2DZ was applied for Au cation. Spin multiplicity of PSTDT and PSTDT-Au complex was singlet and doublet, respectively. All the convergent precisions were the system default values, and the all calculations were carried out

on the standard lab-level workstations with AMD Opteron 285 dual core CPU. Data visualization was carried out using Gauss View 03 (Frish et al., 2007).

### Result and Discussion:-

Firstly, the adsorption optimum conditions of the sorption capacity of sorbent,  $[H^+]$ , temperature and time dependence of PSTDT polymer for gold adsorption were established as  $<45 \text{ mg/g}$ ,  $1 \text{ N}$ ,  $20 \text{ }^\circ\text{C}$  and  $15 \text{ min}$ , respectively (Fig. 3 and Fig. 4).

Fig. 3:- Time dependence of adsorption efficiency for the different acids.

Fig. 4:- Adsorption efficiency of PSTDT polymer depends on the gold concentration.

Table 1 shows that the determined gold contents in copper ore, copper concentrate and waste copper by using our chemical treated (CT) flame atomic absorption spectroscopy (FAAS) to compare with assay analysis (AA) FAAS and inductively coupled plasma (ICP) mass spectrometry (MS) methods. The gold contents in copper concentrate and waste copper by using CT-FAAS were higher than by using ICP-MS method which mean that the low-content gold determination is enriched by the PSTDT polymer are higher efficiency in analysis of copper industry.

**Table 1:-** The Comparison of Gold Content by Using Different Methods of Chemical Treatment (CT), Assay Analysis (AA) Flame Atomic Absorption Spectroscopy (FAAS) and Inductively Coupled Plasma (ICP) Mass Spectrometry (MS).

Samples	Gold content, ppm		
	CT-FAAS	AA-FAAS	ICP-MS
Copper ore	0.004	NA	0.005
Copper concentrate	0.048	0.040	0.044
Waste copper	0.005	NA	0.002

The functional groups of PSTDT polymer before and after treatment of gold samples were identified using FT-IR experiment and the spectrum is shown in Fig. 5.

**Fig. 5:-** FT-IR spectra of PSTDT polymer before (red) and after (blue) treatment of gold sample and their difference (green).

In Fig. 5, the observable IR signals for PSTDT polymer were 1521.8 and 3375.4  $\text{cm}^{-1}$  for N-H, 1348.2  $\text{cm}^{-1}$  for C-N (Table 2).

**Table 2:-** The Comparison of Theoretical and Experimental Frequencies of PSTDT and PSTDT-Au. The Percentage of Relative Deviation of Model in Different Frequencies is Shown In Parenthesis.

Groups	Wavenumbers, [1/cm]					
	PSTDT	Exp.	$\Delta$ [%]	PSTDT-Au	Exp.	$\Delta$ [%]
N-H	3518.5	3375.4	-4.0	-	-	-
	1514.6	1521.8	0.5	-	1525.7	-0.3
C-N	1367.9	1348.2	-1.5	1487.7	1348.2	-10.3
	1292.8	-	-	1268.6	1348.2	5.9

The intensities at these wavenumbers were decreased after the treatment of PSTDT to copper samples. The differences of the intensities of -NH group are shown in the figure which means that the gold was adsorbed onto PSTDT polymer. The -CS group shows the important for the sorption of the metal (Narantsogt et al., 2014) therefore the vibration intensity of C-N bond was decreased in Fig. 5. The IR signals were similar with the group frequencies (Coates., 2004) vice versa the frequencies do not shown for PSTDT polymer after treatments of the gold sample. It shows that the gold atom substituted the hydrogen atom of imine group and connected with sulfur atom by coordination (Fig. 1b) Pozhidaev et al., 2013). The theoretical calculations were carried out by B3LYP method with 6-31G(d) basis set and optimized PSTDT polymer and PSTDT-Au structures are shown in Fig. 1c and d with Mulliken atomic charges for selected atoms. After the Au adsorption "a" bond length, "α" and "β" bond angles were increased (Fig. 1c and d). Au-S and Au-N bond lengths are 2.338 Å and 3.089 Å, respectively, which are similar results with previous report. In this study, the frequency calculations of optimized structures of PSTDT polymer and PSTDT-Au (Fig. 1c and d) were investigated using the B3LYP method with 6-31G(d) basis set to compare the experimental IR results.. In theoretical calculations, the values for N-H bond frequencies have relative deviation less than 4 % and the deviations of values for C-N bond frequency are 1.5 % (Table 2). Calculated frequencies of CN bond in PSTDT-Au were 1487.7  $\text{cm}^{-1}$  and 1268.6  $\text{cm}^{-1}$  and deviated by 10.3 % and 5.9 % from experimental value of PSTDT polymer. The experimental IR spectrum of PSTDT-Au system had shifted intensities of CN bond vibration. The theoretical frequency result of NH bond disappeared on IR spectrum of PSTDT-Au structure and N=N bond intensity was increased from IR spectrum of PSTDT (Fig. 6).

**Fig. 6:-** Calculated IR spectra of PSTDT (a) and PSTDT-Au (b). IR spectrum of PSTDT-Au between  $200\text{ cm}^{-1}$  and  $500\text{ cm}^{-1}$  (b, inset).

The calculated frequencies of Au-S were  $314.3\text{ cm}^{-1}$  and  $356.8\text{ cm}^{-1}$  (Fig. 6b). N=N bond characteristic was dramatically changed and indicated in HOMO orbitals (Fig. 7a and c). LUMO orbitals are shown in Fig. 7b and d where Au-S bond had partial occupation of LUMO orbital. The theoretical frequency values are in good agreement with experimental values, the same as previous reports (Narantsogt et al., 2014), (Pousti et al., 2013). Finally, the PSTDT polymer is a good enrichment of gold content to use the analysis of gold in copper samples.

**Fig. 7:** HOMO (a and c) and LUMO (b and d) orbitals of PSTDT and PSTDT-Au, respectively.

#### CONCLUSION:-

The low-content gold determination in samples of copper industry was clearly examined using CT-FAAS, FT-IR and theoretical calculations. The optimum conditions of the sorption capacity of sorbent,  $[\text{H}^+]$ , temperature and time dependence of PSTDT polymer for gold adsorption were  $<45\text{ mg/g}$ ,  $1\text{ N}$ ,  $20\text{ }^\circ\text{C}$  and  $15\text{ min}$ , respectively. The analysis efficiency of gold determination was increased after treatment of PSTDT polymer. The chemical interactions and molecular structure of PSTDT polymer with gold were successfully determined using by FT-IR and theoretical calculations.

#### ACKNOWLEDGMENT:-

#### Abstract

Patenting gene and its nucleotide sequence has been a controversial subject since the release of working draft of the Human Genome Project. A number of US Supreme Court judgments pronounced in the recent past and accordingly revised patent examination strategies of the United States Patent and Trademark Office (USPTO) created a huge confusion in the field of biotechnology.

The present article explores the volatile nature of judicial decision-making in modern biotechnology arena and attempts to analyze and gauge the practical impact of the landmark judgment of *Association for Molecular Pathology v. Myriad genetics Inc.* The present article also reveals how the *Myriad* judgment changed the USPTO's long-standing practice of granting patents on isolated DNA molecules and set a new patent-eligibility standard for genes and DNA related innovations.

The present article also endeavors to investigate the challenges and possibilities of patenting isolated proteins, sequence homology and protein three-dimensional structure based innovations in post-*Myriad* US patent regime.

#### Introduction:-

After the release of working draft of the Human Genome Project, the US Patent and Trademark Office (USPTO) received a number of letters from stakeholders including the then NHGRI<sup>1</sup> director Francis Collins arguing a revision of its acceptability norms for gene and DNA sequence related patent applications. In 2001, USPTO issued a guideline raising the bar on patent-eligibility standard for DNA related patent applications stating that identification of gene sequence alone is not patentable, but that discoveries directed to genes isolated from their natural environment might be patentable if they possessed "specific, substantial and credible utility".<sup>2</sup> USPTO specifically clarified in its revised guidelines that even if a gene was discovered from its natural source but "isolated" and "purified" from other molecules naturally associated with it would be patent-eligible as long as the requirements of title 35 of the US code were met. And in such cases questions whether the gene is an invention or discovery will not

arise even if the isolated gene in question has a nucleotide sequence similar to its natural counterpart.<sup>3</sup> However, USPTO has always been of the opinion that purified state of synthetic gene is different from those of the naturally occurring compounds. Hence, there is no objection in granting patents for such genes as ‘composition of matter’ or ‘a matter of manufacture’.<sup>4</sup> Patent applications directed to isolated gene never faced unavoidable challenge at the USPTO, however, the scenario dramatically changed in 2013 when the US Supreme Court invalidated three disputed patents of Myriad Genetics Inc. related to BRCA gene. The *Myriad* judgment has not only set a new interpretation standard for §101 but also created an uncertain environment for future patent applications related to genes and DNA molecules. The present article investigates the adverse effect of *Myriad* judgment caused to gene or DNA based future patent applications and possibilities of patenting other genomics innovations in post-*Myriad* American patent regime.

## Landmark Court Decisions And Changing Patent-Eligibility Jurisprudence in Modern Biotechnology Arena:-

### 2.1 The US Supreme Court Judgment On Gene Patenting And Legal Uncertainty

In patent ecosystem, it is a well-observed phenomenon that even a brilliant discovery or a breakthrough innovation does not by itself is patent-eligible unless they meet the statutory requirements<sup>5</sup>. This fact becomes more prominent when the real world experience of genomic technology is brought to Courts in the form of actual cases. In 2013, a landmark judgment of the US Supreme Court completely changed the scenario of gene patenting in America. The US Supreme Court’s ruling on *Association for Molecular Pathology v. Myriad genetics, Inc.* altered the USPTO’s thirty years old practice of granting patents on isolated genes and DNA molecules<sup>6</sup>. In *Myriad* case, the observation of the US Supreme Court was completely different from the observation once had in *Parke-Davis & Co. v. H. K. Mulford Co.*, an age-old landmark case on adrenaline patent dispute. It was then noted by the Supreme Court that compounds “‘isolated’ from nature are patentable even if it were merely an extracted product without change; there is no rule that such products are not patentable.” Surprisingly, the US Supreme Court completely undermined the long history of natural product patenting and relied heavily on the *Mayo v Prometheus*, a process-patent litigation, to decide *Myriad*’s disputed patents directed to genomic DNA. The controversial patent dispute between Mayo Collaborative Services and Prometheus Laboratories was related to diagnostic test and method of determining appropriate dose of thiopurine metabolite for the treatment of patients suffering from autoimmune diseases. The US Supreme court held in that patent dispute that giving drugs to patient, measuring metabolites for that drug etc. as claimed in US patent No. 6,355,623 and 6,680,302, were not allowable as they were close to *natural law* exception of the US patent statute. Though the *Prometheus* patent dispute was not entirely relevant for *Myriad*’s human gene patenting issue, however, it influenced the US Supreme Court to a large extent which led to rejection of nine claims directed to genomic DNA of three disputed patents.<sup>7</sup> The Court clarified its position stating that “a naturally occurring DNA segment is a ‘product of nature’ and not patent eligible merely because it has been isolated”. The Supreme Court’s decision in *Myriad* is not only an unexpected departure from a long-standing affirmation of isolated DNA patenting but also raises obvious questions regarding the volatile nature of judicial decision-making in the modern biotechnology arena.

In *Myriad* litigation, the US Supreme court set a new patent-eligibility standard applicable for all future patent applications related to gene or DNA sequence. The “new and useful...composition of matter”-requirements as set forth in §101 or claiming naturally occurring phenomena (*natural law*<sup>8</sup> *exception*) will be judged based on the

<sup>3</sup>*Id.*

<sup>4</sup>*See infra* 16.

<sup>5</sup>*Funk Brothers Seed Co. v. Kalo Inoculant Co.*, 333 U.S. 127.

<sup>6</sup>The Federal Circuit pointed out in *Myriad* Case that the USPTO has issued patents directed to DNA for almost thirty years. The FC also pointed out that 2,645 patents claiming “isolated DNA” has already been issued by the USPTO.

<sup>7</sup> Claims 1,2,5,6 and 7 of US patent No. US 5,747,282; Claim 1 of US patent No. US 5,693,473 directed to BRCA-1 gene and Claims 1, 6 and 7 of US patent No. US 5,837,492 directed to BRCA-2 gene.

<sup>8</sup> As described in MPEP §2106, in addition to the terms laws of nature, physical phenomena, and abstract ideas, judicial exceptions have been described using various other terms, including natural phenomena, products of nature, natural products, naturally occurring things, scientific principles, system that depends on human intelligence alone, disembodied concept, mental process and disembodied mathematical algorithms and formulas, for example. The exceptions reflect the judicial view that these fundamental tools of scientific and technological work are not patentable.

primary enquiry—whether the claimed invention is meant for creating “incentives that lead to creation, invention, and discovery or impeding the flow of information that might permit, indeed spur, invention”.<sup>9</sup> In this regard, the US Supreme Court observed that a delicate balance is required to be maintained in order to arrive at a rational conclusion. The Court further clarifies that the synthetic DNA fragments e.g. exons-only DNA fragment or cDNA is patent-eligible like before<sup>10</sup>, even if the nucleic acid sequence of the synthetic DNA molecule is similar to that of the naturally occurring gene codes for the same protein.

### Challenges and Possibilities In Genomics Innovations:-

Though the magnitude of *Myriad* judgment is huge, however, it is not a blanket prohibition for patenting all DNA/gene sequence of human origin or any other origin, but for those DNA/genes that are *merely* “isolated” from natural environment and do not show *markedly different* characteristics (as established in *Diamond v. Chakrabarty*) in terms of modification in the nucleic acid chain.

Immediately after the *Myriad* judgment, USPTO again changed its examination strategy towards gene-related innovations. According to a memorandum<sup>11</sup> issued by the USPTO on 13<sup>th</sup> June 2013, patent examiners were instructed to reject all product claims directed to naturally occurring DNA molecule whether it was isolated or not.

#### 3.1 Nucleotide sequence-based innovations

DNA sequence information represented by A, T, G, and C alone is not a patent-eligible subject matter under the US patents law as it is nothing more than a typical nucleic acid sequence information.<sup>12</sup> However, according to *Myriad* interpretation standard of §101, *markedly different* DNA fragment or gene described by nucleic acid sequence in the form of A, T, G and C is patent-eligible provided they meet the utility requirements as set forth in the current US patent statute.

Similarly, ESTs<sup>13</sup> are also patent-eligible under the current US patents law if they meet the criteria of utility, novelty and non-obviousness. Moreover, the *Myriad* judgment further strengthened the patent-eligibility of EST as the Supreme Court has completely acknowledged patent eligibility of cDNA.<sup>14</sup>

A reasonably favorable environment is also expected for nucleotide homology-based innovations. There is no specific rule in the United States for DNA sequence homology based patent applications. Therefore, it is most likely that USPTO will continue to assess such patent applications based on their own technical merits. According to general practice, the USPTO accepts homologous DNA sequences (both nature and the degree of homology) of genes or fragments thereof as a patent-eligible subject matter as long as they satisfy other criteria, e.g. sufficiency of disclosure, credible utility etc. The USPTO has a coherent approach for sequence homology related broad claims. Claims reciting whole nucleotide genus is also allowable in a single patent application on the condition that the representative nucleotide species are adequately described in the specification. Though protection of whole nucleotide genus sometimes leads to cross-species patent coverage because of the fact that some homology/percent identity claims encompasses a large number of macromolecule variants which may belong to entirely different species<sup>15</sup> or orthologs, however, USPTO does not raise any unavoidable objection in accepting them. Additionally, DNA homologs are not considered to be non-patentable *merely* because of the reason that the function and utility of the claimed DNA homologs have asserted through bioinformatics method analyzing sequence homology with prior-art nucleic acid sequence found in public databases.<sup>16</sup>

<sup>14</sup> *Supra note 9.*

<sup>15</sup> Letter from Eli Lilly and Co. to USPTO, COMMENTS OF ELI LILLY AND COMPANY ON THE REVISED INTERIM WRITTEN DESCRIPTION GUIDELINES 132 (USPTO).

<sup>16</sup> *supra note 2*, at 1096

### 3.2 Amino acid sequence-based innovations

USPTO has a non-stringent practice regarding the acceptability of protein homology-based claims. Amino acid sequence disclosed for a single species is considered to be a *representative of the genus* because all member amino acid sequence have at least certain degree of percent identity with the parent genus and therefore obtaining patents on this subject matter does not involve major challenges as long as the description of representative amino acids fulfills enablement requirements stipulated in §112 of U.S.C. 35.

According to recent USPTO guideline<sup>17</sup> issued on March, 2014, claims directed to proteins are close to judicial exceptions i.e. natural phenomena or natural product. Therefore, proteins are not patent-eligible under §101 unless they are *significantly different*<sup>18</sup> from the judicial exception regardless of the use of words like, “isolated”, “recombinant”, or “synthetic” etc. in claims reciting a protein. Similar to DNA sequence, amino acid sequence of a protein or peptide alone is not patent-eligible unless it is *markedly different* (in terms of addition, deletion or substitution of amino acid(s)) from the naturally occurring protein molecule<sup>19</sup>.

In advent of major breakthroughs in bio techniques, functional genomics products, e.g. therapeutic proteins produced by recombinant DNA (rDNA) technology have been successfully used worldwide including in the USA to treat a wide range of diseases for which there was no cure using pharmaceutical drugs.<sup>20</sup> Proteins/peptides are considered to be potential drug candidate for various practical reasons which include target specificity, non-interference with other biological processes of the human body etc. Because of these useful characteristics, researcher’s principle objective always focused on producing synthetic protein/peptide molecules that are structurally (both in terms of amino acid sequence information and three-dimensional conformation) similar to those found in human body<sup>21</sup> for example, Humulin®.<sup>22</sup> Although these man-made variants of structurally resembling molecules are often confused with the molecules found in nature and contested during prosecution, however, patenting these therapeutic macromolecules should not face any additional challenge in post-*Myriad* US patent regime because of the fact that the Court’s observations on isolated genomic DNA will certainly have some limits and will not necessarily be applicable for isolated proteins or peptides and encoding amino acid sequence thereof. Any adverse impact to isolated protein patenting can also be ruled out in view of the *Prometheus* judgment. In *Mayo Collaborative Services v. Prometheus Labs, Inc.*, the Court stated that “all inventions at some level embody, use, reflect, rest upon, or apply laws of nature, natural phenomena, or abstract idea,” and “too broad an interpretation of this exclusion principle could eviscerate patent law”.<sup>23</sup> In addition to that, in *Myriad*, the Court had no observation regarding patent-eligibility of isolated proteins and USPTO has no specific guidelines in this regard either. Hence, it can be said that isolated proteins/peptides of natural origin or their recombinant variants are still patent-eligible under §101 of the US patent law.

### 3.3 Structural Genomics Innovations

Besides patenting isolated therapeutic proteins and amino acid sequence based innovations, it is also evident that trends of protecting structural genomics innovations have been increased significantly around the world. Three-dimensional structural information of protein is always proved to be crucial; naturally, protection of this spatial information has great value for bio technology industry. According to a report on the comparative study<sup>24</sup> conducted

---

<sup>17</sup>MEMORANDUM from Deputy Commissioner for Patents Examination Policy to Patent Examining Corps., 2014 Procedure For Subject Matter Eligibility Analysis Of Claims Reciting Or Involving Laws Of Nature/Natural Principles, Natural Phenomena, And / Or Natural Products (USPTO Mar. 4, 2014).

<sup>21</sup>*Id.*

<sup>22</sup>Humulin® is a polypeptide hormone manufactured by Eli Lilly &Co. from a non-disease-causing laboratory strain of *Escherichia coli* bacteria, is the world’s first recombinant DNA drug approved by the FDA. Structurally, this rDNA originated insulin is indistinguishable from pancreatic human insulin designed to save millions of lives around the world suffering from diabetes.

<sup>23</sup>10-1150 Mayo collaborative services v. Prometheus laboratories, Inc. (03/20/2012), (US 2012).

<sup>24</sup> Trilateral Co-operation between EPO, JPO and USPTO was set up in 1983 with the objectives including improvement of the quality of patent examination process, improving quality of incoming applications, solving

by trilateral patent offices, inventions that claim protein three-dimensional structural coordinates fall under the category of “information contents” which is further interpreted as nothing more than “mere presentation of information or abstract ideas”. Therefore, innovations related to this technological field are not patent-eligible under §101.

However, protein three-dimensional structures represented by spatial arrangements of atoms or structural coordinate data are considered to have technical effect as long as they are used in an *in silico* or bioinformatics screening method to generate chemical compounds. In 1999, USPTO granted a patent in this area for the first time for an invention directed to the use of structural coordinates of interleukin-1 $\beta$  converting enzyme (ICE) and mutants thereof to screen and design potential drug candidate. Since then a number of patents have been granted by the USPTO, e.g. patent No. US6,490,588 and US6,329,184 to name a few for inventions directed to protein three-dimensional structure and their use in structure-based-drug-design (SBDD).

The patent-eligibility standard has certainly been raised for gene-related innovations in light of a number of Supreme Court judgments<sup>25</sup> and revised USPTO guidelines; however, there has been no sign of increase in the number of rejection of patent applications from 2012 until now. Patent prosecution history of post *Myriad* era suggests that USPTO has been issued patents for genomics innovations after a thorough patent-eligibility assessment under § 101; naturally, that process led to a substantial increase in the issuance of office action until grant.

### Conclusion:-

It was initially estimated that the material consequence of the Supreme Court judgment in *Myriad* patent litigation would be far-reaching. However, it seems that the practical impact of this judgment to gene related future patent applications will not be severe as anticipated. The trend of filing patent applications at the USPTO and issued patents in the area of gene or DNA related innovation is still maintaining its usual momentum. Most importantly, no significant irregularity in this regard has been noticed in post-*Myriad* patent regime.

However, in light of revised patent practice of the USPTO, chances of obtaining patents is certainly higher for those genomics innovations that are more restricted to non-naturally-occurring nucleotides, such as cDNA or nucleotides of man-made variants. On the other hand, isolated proteins and its recombinant variants including their encoding amino acid sequences should not face any additional challenge at the USPTO as the breadth of *Myriad* judgment is limited to isolated genomic DNA or genes of human origin. Inventions directed to sequence homology or percent identity is likely to be assessed based on their individual technical merit and scope of the invention, like before. Whereas, other genomics innovations, e.g. innovations directed to protein 3D structures and their applications in drug discovery (SBDD) are less susceptible to any direct impact of *Myriad* judgment. Though spatial information of protein itself is far beyond any patent protection, however, protection for the use of such structural information in the production of useful products will continue to be allowable under the useful and credible utility doctrines until any specific guidelines in this regard is issued by the USPTO in contrary to present examination practice.

Finally, it can be said that the Supreme Court decisions and USPTO guidelines issued in various occasions since 2012 certainly elevated the standard of subject matter eligibility of biotechnology innovations. However, the overall patent granting scenario in biotechnology domain has not been changed significantly in post-*Myriad* era except the fact that there has been an increase in the number of office action till the grant of each biotechnology patent application.

#### Introduction:-

The two nucleon transfer reactions have been taken on great importance ,because they are very sensitive to nuclear spectroscopy, heavy ion transfer reactions are valuable tools for getting precise spectroscopic information's [1 , 2]. The right framework in which the reaction be treated is Distorted Wave Born Approximation ( DWBA) ,or Coupled Channel Born approximation (CCBA) methods [3,4] with inclusion the nuclear recoil. Two nucleon transfer reactions induced by heavy ions had been widely considered [5] by using DWBA with nucleon –nucleon interactions which include both attraction and repulsion.

In the present study ,the differential cross section of heavy ion reaction with two proton pickup reaction have been calculated in The  $^{64}\text{Ni}(^{16}\text{O}, ^{14}\text{C})^{66}\text{Zn}$  reaction at 56 Mev of  $^{16}\text{O}$  projectile energy, analysis concentrated on g.s. ,first  $2^+$  ,first  $3^-$  excited levels. The  $^{64}\text{Ni}(^{16}\text{O}, ^{14}\text{C})^{66}\text{Zn}$  are studied by Mermaz [7] by using coupled channel Born approximations and distorted wave born approximation calculations and he conclude that the relative intensities among various states are better reproduced by CCBA than DWBA calculations , the present work is like Memaz study using DWBA but the optical potential model was taken to be folded for the real part of optical potential , the phenomenological optical potential are often successfully used to describe the heavy ion elastic scattering data ,the use of folding model allows us to predict potential and eliminate the ambiguities which appear with the phenomenological potential. Folding model gives better interpretation as a basic physical ingredients the nuclear densities folded with a nuclear interaction in correct way. The calculated angular distributions are fitted with the experimental data.

#### The differential cross section of heavy ion reaction with nucleon

##### Transfer:

The differential cross section of heavy-ion reaction with two nucleons pickup  $A(b,a)B$  where  $A$  is the target  $B$  is the residual nucleus , $b$  is the projectile  $A=B + c$  , and  $a = b + c$  , and the  $c$  is the two – proton cluster, is given by the expression:

$$\frac{d\sigma}{d\Omega} = \frac{m_{aB} m_{bA} K_{aB}}{(2\pi\hbar^2)^2 K_{bA}} \frac{1}{2S_b + 1} \sum_{LM} |T_{fi}|^2$$

**Corresponding Author:- M. Zaky.**

Address:- Physics Department, Faculty of Science, Cairo University, Cairo, Egypt.

Where  $m_{bB}, m_{bA}$  are the reduced masses of pair (a, B), (b, A) respectively, and the matrix element  $T_{fi}$  represent the DWBA transition amplitude that has the form :

$$T_{fi} = \sum_{L_{cB} L_{cb} N_{cB} N_{cb}} B_{cB} \beta_{LM}$$

Where:

$$\beta_{LM} = \frac{(-1)^L}{\sqrt{2L+1}} \int dr_{bA} dr_{aB} X^*(r_{bA}) f_{LM}(\mathbf{r}_{cB}, \mathbf{r}_{cB})$$

$$f_{LM} = \sum_{\Lambda \bar{\Lambda}} (-1)^{L_{cB} + \Lambda} \{ L_{cB} \Lambda L_{cb} | LM \rangle \Phi_{\Lambda}^*(r_{cB}) V(\mathbf{r}_{cB}) \Phi_{\bar{\Lambda}}(\mathbf{r}_{cB})$$

$$B_{cB} = i^L \sum_{L_c} \left( \frac{2J_a + 1}{2L_c + 1} \right)^{\frac{3}{2}} (-1)^{L_{cB} + L_c - J_B} U(I_B L_{cB} J_a L_{cb}; L_c L) A_{cB}^* A_{cb}$$

The dependence on kinematics and the reaction mechanism is contained in the factor  $\beta_{LM}$ , where  $f_{LM}(r_{cB}, r_{cB})$  is the finite-range form factor. The spectroscopic dependence lies in the factor  $B_{cB}$ , and the two spectroscopic amplitude  $A_{cB}, A_{cb}$  contained therein. and  $V(r)$  is nuclear optical model potential in form of Wood-saxon, this form is given as :

$$V(r) = \frac{-V_0}{1 + \exp\left\{\frac{r - R_v}{a_v}\right\}} + \frac{-W_0}{1 + \exp\left\{\frac{r - R_w}{a_w}\right\}}$$

Where, the parameters  $V_0, R_v$  and  $a_v$ , are the strength, radius and diffuseness of the real potential, while the parameters  $W_0, R_w$  and  $a_w$ , are the strength, radius and diffuseness of the imaginary part which are determined by fitting scattering reaction of the corresponding interaction of two heavy ions.

**Numerical calculations and result and discussion and conclusion:-**

The differential cross section has been numerically carried out for  $^{64}\text{Ni}(^{16}\text{O}, ^{14}\text{C})^{66}\text{Zn}$  reaction at 56 Mev, in the frame work of the exact finite-range distorted wave Born approximation, and the real double -folded potential used in an optical model analysis of elastic scattering data. The potentials were calculated by convoluting the M3Y effective nucleon - nucleon interaction [8], the necessary parameters of the optical potential are shown in table (1). here the results obtained for the differential cross section are shown in figure(1), figure(2) and figure(3).

**Table ( 1 ) : Optical potential parameters used in DWBA calculations**

Reaction	$E_{lab}$ (Mev)	$W_0$ (Mev)	$a_w$	$R_w$	$r_c$	Ref.
$^{16}\text{O} + ^{64}\text{Ni}$	56 Mev	20	0.283	1.311	1.25	7

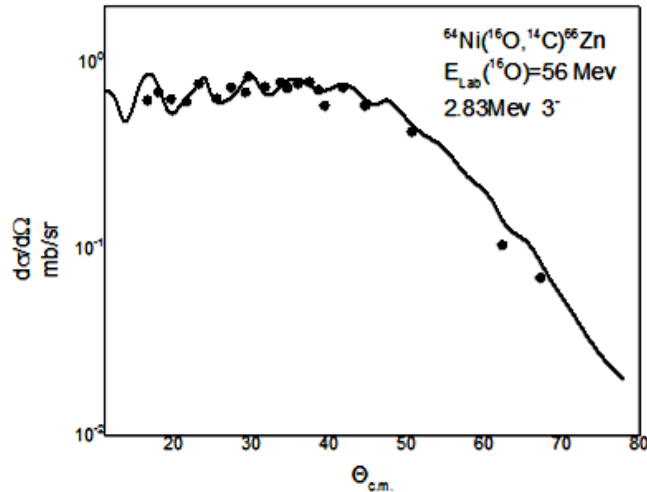

**Figure 1:-** The differential cross section  $^{64}\text{Ni}(^{16}\text{O},^{14}\text{C})^{66}\text{Zn}$  reaction at 56 Mev incident energy leading to  $^{66}\text{Zn}$  ground state .The solid curve is the present calculation and the dots are the experiment data taken from reference (9).

**Figure2:-** The differential cross section  $^{64}\text{Ni}(^{16}\text{O},^{14}\text{C})^{66}\text{Zn}$  reaction at 56 Mev incident energy leading to  $^{66}\text{Zn}$  at 1.040 Mev  $2^+$  state .The solidcurve is the present calculation and the dots are the experiment data taken from reference (9)

**Figure3:-** The differential cross section  $^{64}\text{Ni}(^{16}\text{O}, ^{14}\text{C})^{66}\text{Zn}$  reaction at 56 Mev incident energy leading to  $^{66}\text{Zn}$  at 2.830 Mev  $3^-$  state. The solid curve is the present calculation and the dots are the experiment data taken from reference (9).

The shape of all angular distributions are in a good agreement with the experimental data except that the angular distribution for transition  $2^+$  states, it seem to be several degrees forward of the DWBA curve. In conclusion in this study despite the better shape of angular distributions with a little difference in the shape of angular distributions calculated by DWBA using the double-folding model for the real part of optical potential and the previous calculations without using the folded model, the CCBA calculations (8) which include multiple processes are more suitable than DWBA they give better a greement with experimental data, and the double-folding potential are found to be appropriate to reproduce the cross-section and capable of producing realistic prediction of the angular distribution.

### Abstract

Desertification this scourge that threatens the whole world, especially Africa and dry and semi-arid areas in Asia and the Americas, In Africa were victims of drought and desertification in Somalia in 2012 only a quarter of a million victims of men, women and children, The United Nations estimates that desertification costs accounted for half of the costs that the world loses from the annual production for the whole world, so it has to be effective and pause to stop this scourge, which came on everything and everybody.

This study was conducted in the Babylon province, located between longitudes  $43^{\circ} 42' - 45^{\circ} 50'$  east and latitudes  $32^{\circ} 7' - 33^{\circ} 8'$  north on the sand dunes area which is located towards the east of the province of Wasit province, these dunes formed by more than 50 years ago and remained in a state of constant motion without taking any previous procedures, the idea, as processed the first time the year 2014 was the preparation of this study to demonstrate the role of the control and treatment of area 913 square kilometers of these dunes in scattered areas.

The results showed that the soil analyzes of tissues soil of the area is alluvial loamy with the proportion of medium salinity and tissues sand dunes loamy, Using visual satellite Land sat 7 for the years 2001, in 2006, Land Sat 8 2014 and Quick bird 2012 afternoon that there are eleven site for these dunes, the degree of desertification of the region, according to the world rankings is the kind of moderate and desertification in which the production at least 10%-15%, and that can be controlled at the present time using windbreaks through the use of resistant varieties environmental and climatic conditions as well as the use of spray-axial and fixed irrigation systems also cultivate various crops of wheat, barley, corn and other, this could prove to be effective both fenders crops or whether there was a follow-up, maintenance and continuing to work for a period of not less than ten years.

### Introduction:-

Desertification affects the lives of one billion in more than one hundred countries under rain-fed and irrigated agriculture systems (3.6) billion hectares where he loses the world (10) million hectares per year of land desertification and annual productivity losses, according to statistics from the nineties of the twentieth

**Corresponding Author:- Hussein K. Eulewi Salah A. Khadim Bushra A. Hamza.**  
 Address:- College of En. Sci. Directorate of Bab. En. Agri. Dep. of Babel, Al- Qasim Green Uni.

century exceeded 42 billion dollars, while the United Nations estimates that the costs of activities to combat desertification prevention, repair and rehabilitation of the land will not cost only half of this Annually in addition to the social problems associated with desertification and danger migration from the countryside to the city and the cross-border migration and others.

Desertification is known, according to the United Nations Convention of 1994 to combat desertification is exposed land degradation in arid, semi-arid and dry sub-humid, leading to the loss of plant life and biodiversity in, and lead to the loss of topsoil and then the loss of the ability of the land for agricultural production and support of animal and human life, is the sand dunes of the most dangerous results of desertification due to its negative effects on all vital aspects of life, Valaoasf dust and sand are hinting harmful, these storms pollute the environment and affect human health and agricultural production as damage physiological processes of plants (breathing, assimilation photosynthesis, pollination and flowering).

The poor soil and water management and climate factors harsh changed largely agricultural land to soil wasteland covered with sand from wind erosion and sand dunes, and the longer the problem of desertification in Iraq, especially the sedimentary easy in central and southern Iraq, most of the agricultural land, as it was the emergence of salt and cracked agricultural land degradation natural vegetation and sand dunes are moving.

Phenomenon has been exacerbated in the last two decades significantly as a result of practice is correct in the exploitation of natural resources (plant, soil, water), as irrigation methods is Almqguenh logging and Alhjert, overgrazing and agriculture in the territory unsecured rain depending on rain and caused by the military machine of destruction of class the surface of the soil, which made it vulnerable to erosion and that we observe through sand storms that have become familiar in recent years (Mustafa & Eulewi 2013).

In the area of our research, there is an important point to be taking all their aspects, namely the region's vulnerability to sandy dunes of the kind semicircular For over the past fifty years and which are lengths between 40-50 meters and heights on average between 1 to 3.5 meters and may increase in some places (data Division cultivate the Nile 2014), and these values compared to a few countries of the world as it rises up, for example, 300 meters, the dunes semicircular most dangerous and its impact on the environment, agriculture and public facilities with the most difficult to install vital means, as it cannot grow plants on them, either due to reveal its roots and uprooted and either cover the plants, due to the speed of movement and the movement of sand dunes from its place and rapid loss of moisture due to perpetual motion constituent her which does not allow the growth of vegetation, Dunes of sand grains made up by 59% and the few remaining percentages represent granulated silt and some organic detritus Other, and ranges from the size of grains of sand between 0.02 to 2 mm and is composed chemically of the same chemical components of the rocks from which arose, the dunes are either homogeneous or heterogeneous, and color either be light yellow to the presence of metal quartz and the lack of organic material, or reddish-brown and the presence of iron oxides .

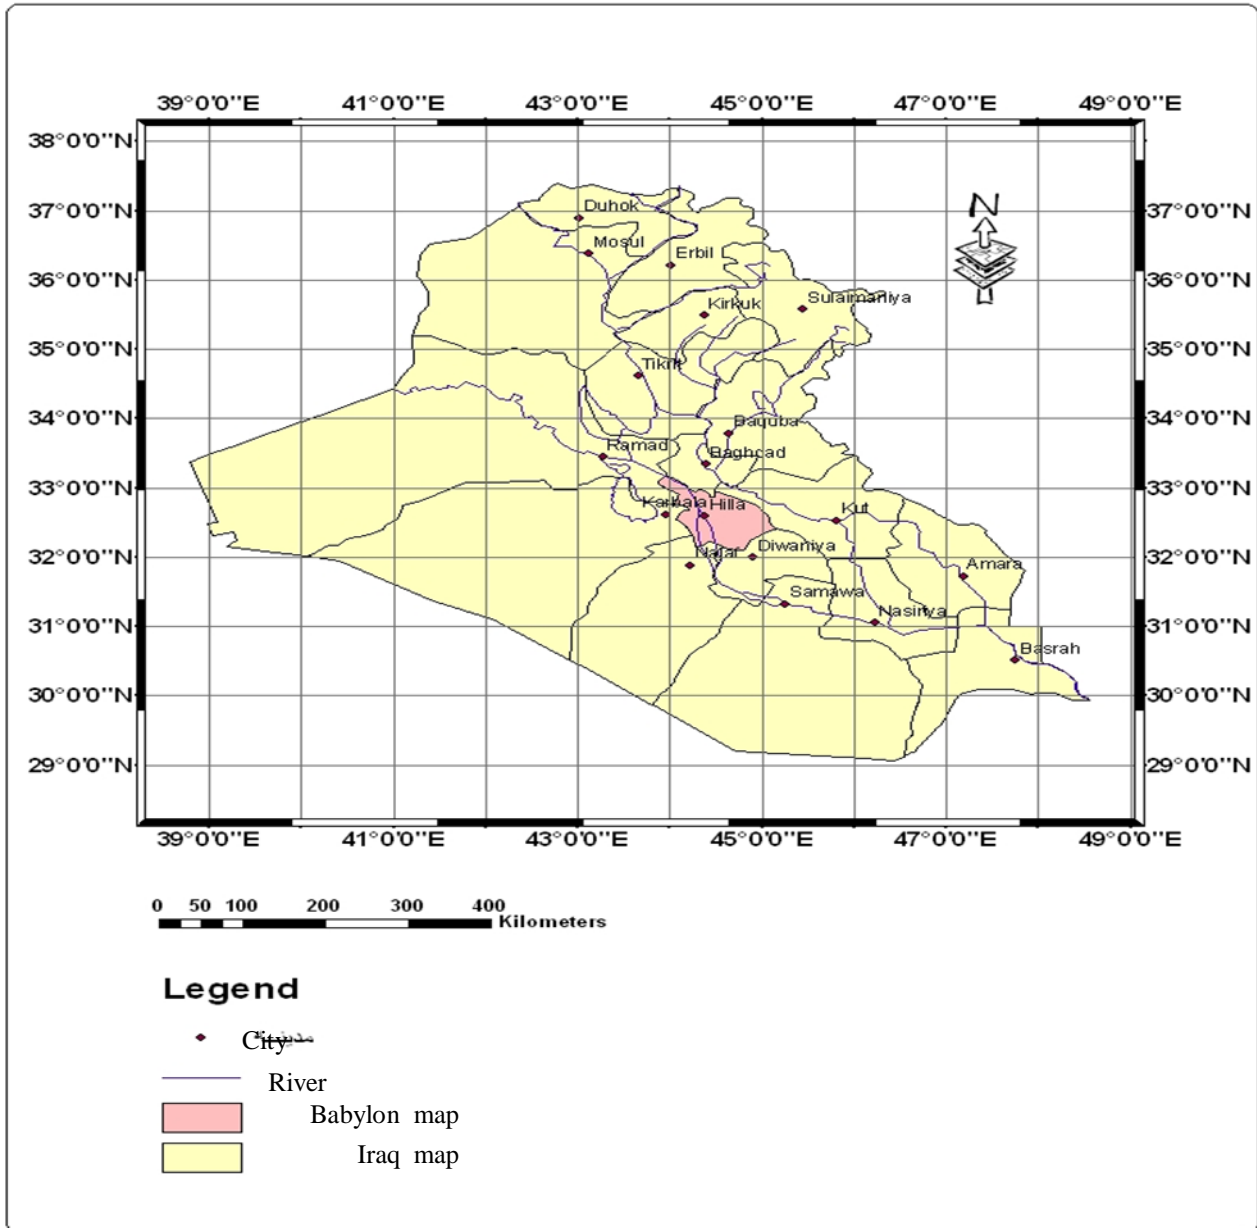

#### **The aim of the study:-**

1. Identify the sand on the map of the province of Baby londune sites and calculate the area and evaluated in terms of influencing the present and future.
2. Identify the best way to address the mand the expense of speculative costs necessary for this treatment and for the purpose of coverage of projects to combat desertification and restore their effectiveness as productive agricultural land.

#### **Materials and methods of work:-**

##### **Location:-**

Babil province, lies between latitudes 32 7-33 8 north and between longitudes 4342-4550 in the east, and is bordered to the east and the Was it province, to the west of Karbala and Anbar, either from the north bounded by Baghdad and south of Najaf and Qadisiyah, and Babil province represents the northern part of the region Euphrates in Iraq and the area accounted for 1.2% of the total area of Iraq (Figure 1).

**Fig.1:-** Babylon province geographical location for Iraq.

#### **The climate :**

The climate is characterized by a climate of Babylon province by observing two main summer and winter, as it extends the summer from May to September, while the winter shall be between November to February, with varying degrees of heat between these two chapters, as it recorded the highest average temperatures in July and August It is 42.6, 40.2 respectively, while lower average temperature in winter was in January and February and were 10.9, 13.2 respectively, the annual total of rain falling on the province 98.5mm and the highest amount of rain fall to be in November(15.5mm), January(16.2 mm)and January(20.8 mm), while the highest rate of relative humidity record was in January is 70% (Encyclopedia of Hilla, cultural, 2012).

#### **Soil of the site:-**

Soil preservation are sedimentary, as made up of different layers Texture between loamy slimy to loamy mud slimy, with the difference installation of metal within the soil section where we find soft material (clay and silt) close to the

surface with the appearance of coarse sand particles to the rear and then followed by fine sand with the topography of the site flat in general.

#### The field work:-

has been done several site visits for two months from February to April / 2015 brought some samples of each of the sites between the sample 3-5 for each site, whether a sample or sample dunes untapped agricultural soil and close to the dunes site was conducted the necessary tests her in the laboratories of the Faculty of Agriculture / University denominator green and these analyzes are the values of pH, tissues and soil salinity of the soil and other tests have been immobilization as shown in table 1.

#### laboratory work:-

Used in the study range of programs for the purpose of display, storage and processing of digital data and satellite images from remote sensing, which are used in environmental studies and drawing Applied maps and these programs are :

- Arcgis / INFO and includes a range of programs is the most important program of the Arc Map and Arc Catalog program, - If the program Arcmap 10.2.1 adopted to deal with satellite images of the moon Landsat years (2001.2006 and 2014) in a manner Category Observer (super classification) , The program adopted Arc Catalog 10.2.1, Sort Alboleikonat own Btaos dunes Satellite images taken in 2014 , Then the program adopted Arc Map 10.2.1 Once again relegated to the province on the map.

- ERDAS Imagine 9.2 : This program supports the work of the mosaic of satellite images .

#### data that have been adopted in the study:-

-Satellite images of the satellite Landsat 7 Taken during 2001 and 2006 Where it was used for the movement of sand dunes Within the study area through the comparison between years (2001 - 2006 - 2014).

-Satellite pictures of the satellite quickbird taken in the world in 2012.

-Satellite images of the satellite Landsat 8 taken in 2014.

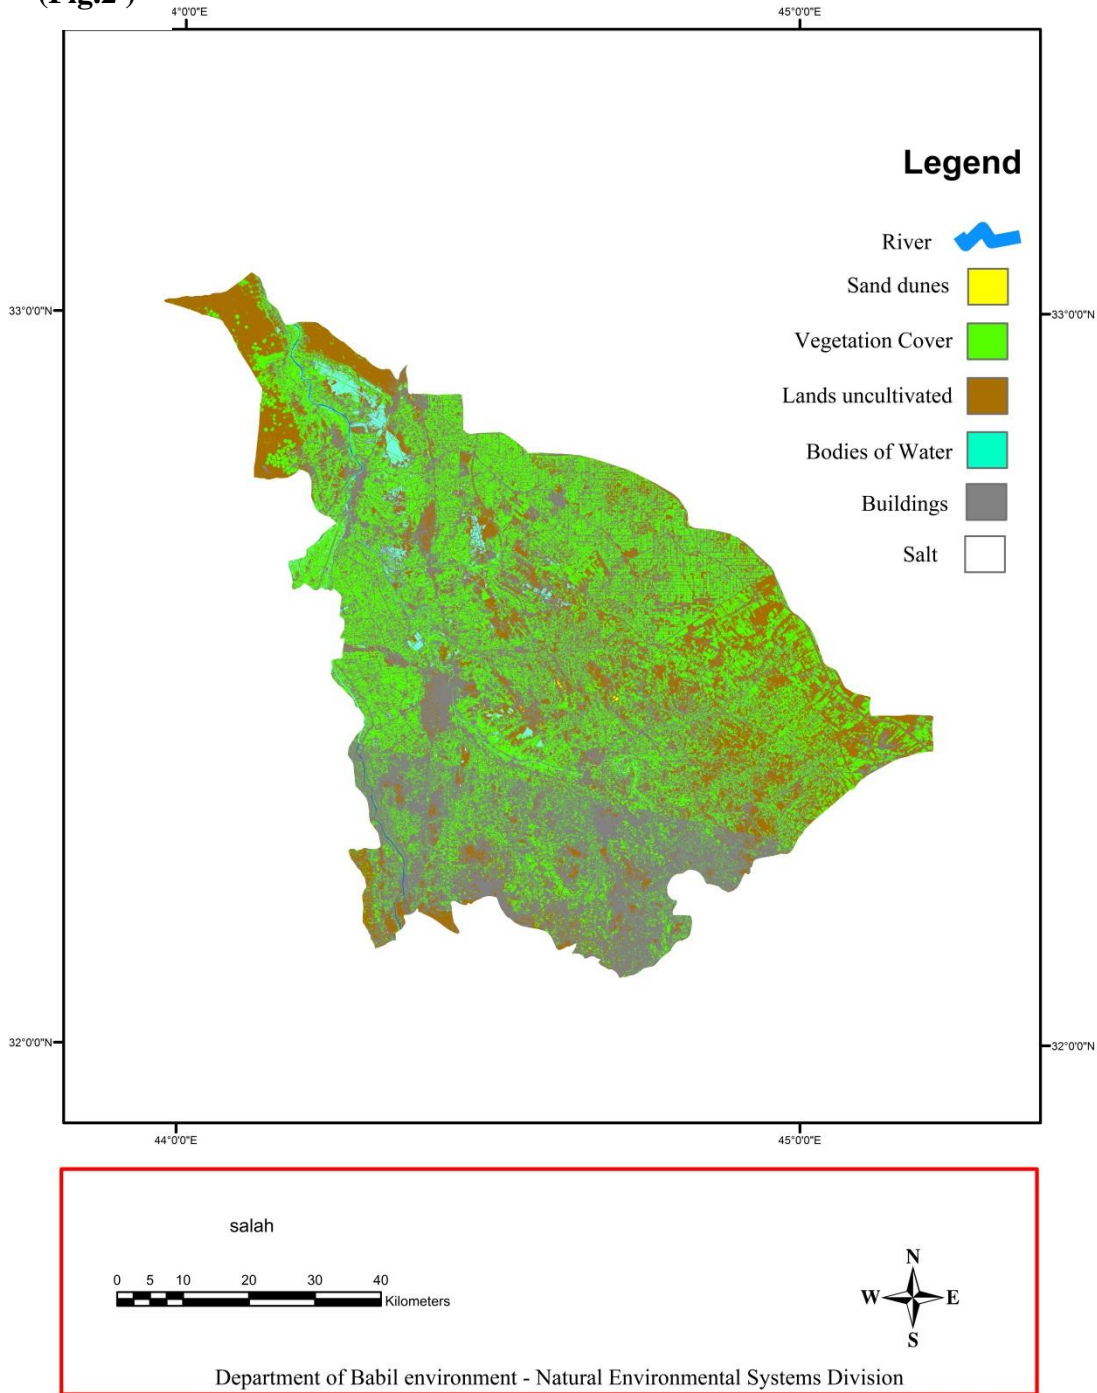

. It was then a comparison between the desertified areas of sites that have been marked in the satellite images of the satellite Landsat captured in 2014 With satellite images of the satellite quickbird 2012 with a high-precision surveying Through the comparison between the two types of images (Directorate of Babylon environment data 2015) The distinction eleven locations desertified areas of condition (sand dunes) within the province of Babylon, Seven places them within hand Midhtah and three within the Nile hand the site atheist As the total area (913 Donem) (Agriculture Department data Babel 2014) As it is shown in Figure 2 .

**Table (1):-** Data for samples

Babil Governorate visible satellite Landsat8 taken in 2014

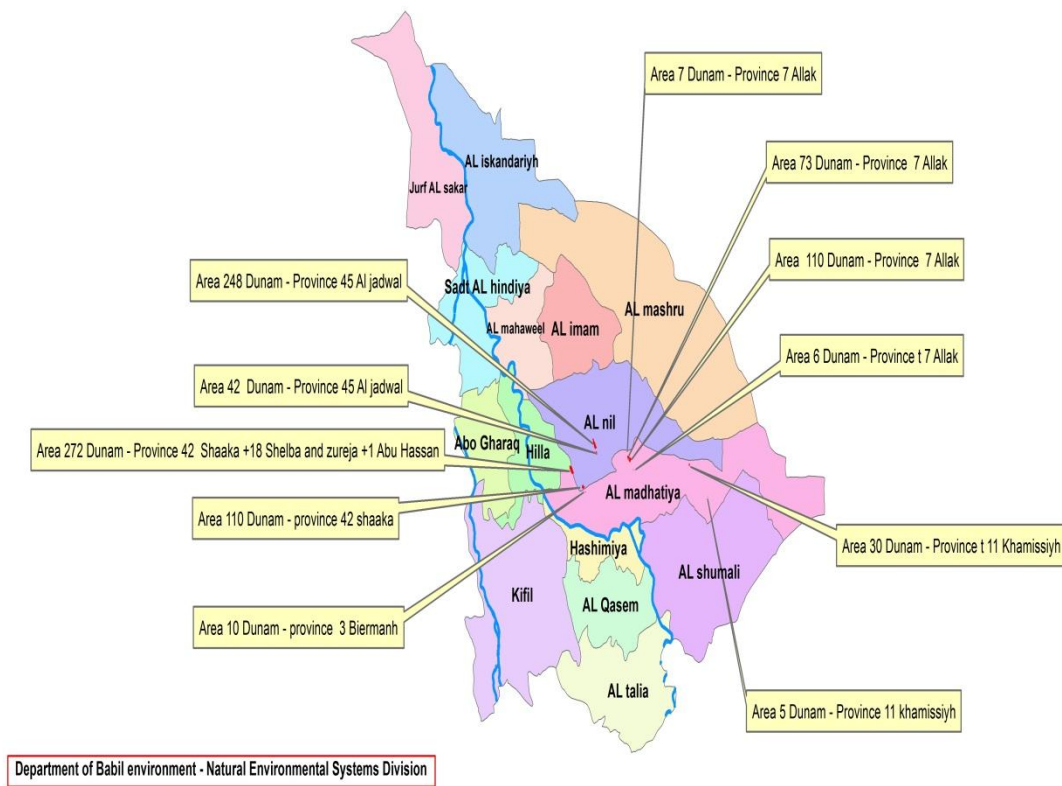

(Fig.2)

**Results and discussion:-**

Sand dunes have been identified sites by satellite images Identifying areas of these sites, a body Taos or hills with different heights , It can be described shaped dunes two of these sites under the terms of MidhtahBalrasah , What dunes form in the rest of the other sites are eleven crescent number locations within the province of Babylon, Seven places them within hand Midhtah and three within the Nile hand, he site is located ten atheist in the region between

the Nile hand and spend Center ,Where the total area (913 Donem) , And that the section of this land agrarian reform and other private properties sectionformat format, It is land reclaimed water scarcity factor has led to the left by the peasants for many years without cultivation, Which led to its transformation into a state of desertification, Note that observed during the visit, the presence of adjacent agricultural land available with a water quota planted crops (wheat, barley and water melon) , In light of the results obtained from the analysis of samples can say that the region's soil (Agriculture soil), It is loamy alluvial type With PH neutral and values of Ecsmall to medium The tissues soil sandy dunes are loamy and values PH neutral With values (Ec) Medium, With the rise in the region above sea level between the (28-44) m (Figure 3) .

**Fig .3)( Map sand dunes of the Governorate of Babylon, (Iraq)**

According to the United Nations classification of desertification, there are four degrees or classes of cases of desertification, namely: -

- desertification light: a case of damage or destruction of the very light in vegetation and soils do not result in a significant impact on the ability of biological environment.
- desertification moderate: a case of the average damage to vegetation resulting be small dunes or small grooves in the soil as well as soil salinization, which reduces the production rate of 10-15% has been up to 25%.
- desertification severe: a proliferation of shrubs and grasses is desirable in the pasture at the expense of the desired species and undesirable results in increased activity of erosion which affects the vegetation and reduce production by up to 50%.
- desertification very severe: a build up huge sand dunes naked active and configure many of the canyons and valleys and salinization of the soil and results in soil degradation which is the most dangerous in the types of desertification.

In light of the above values of global rating can say where the region that are studied within Category II (moderate desertification), as the dunes of the region, whether small dunes were intermediate or an effect one way or another crept through and cover crops planted near wheat and barley crops, with some salinity in the region and the output of both ground water which rises in the winter, or through the abandoned land unused and that the lack of water, especially in the spring and summer, So we must take appropriate action in a timely manner before you escalate this phenomenon and take other areas difficult to control in the future as well as measures to increase with the cost over time, and actions to be taken for the purpose of treatment according to what is included in the disclosure of speculative, table 3 below are as follows:

1. Conducting settlement processes and modification, especially sand dunes below an altitude about 1:00 m.,if it mixed with soil and use to grow and it is phased out, the dunes, which increases the height of 1m. can be transferred to low or low-altitude areas, and thus it will also be phased out.
2. The provision of water to share these spaces through an incision sub-tables For the purpose of delivering water to irrigation and modern irrigation which will be installed for watering of these spaces and to spray the axial and fixed irrigation systems.
3. Cultivation of land mentioned in the first paragraph, some important strategic crops like wheat, barley and maize a period of not less than ten years, especially since there is a section of sprinkler irrigation systems used by some farmers in the regionProclaimed before a period of five years or less (Figure 3).
4. Planting trees (winds battering ram) next to the sand dunes site wizard by three parallel lines and the length of the line depends on the light dune movement within the region (Table 2), so this line leads into effect in stopping the advance of the dunes, the distance between the line and another line 10 m.,the distance between the seedling and the another seedling within the same line (2-3) meters by species to be selected from that (*Casuarinaequisetifolia*, *Tamarix articulate*, *Azaclirachtaindica* , *Salix matsuda*, *AcciacycolopsOther* ), So grown toward perpendicular to the direction of the prevailing winds (north-west) These types have benefits is to stop sand encroachment, Sand also contribute to improving the environmental conditions and climate zones such as reducing pollutants and reduce temperatures,It is also a national treasure in the future in terms of utilization of timber in various fields, and the following tracks proposed the coordinates for the first line of the fenders, to be taken after every line and at a distance 10 m., among other lines and last, according to the distances and dimensions dunes and undeveloped areas beyond the line.

### Recommendations:-

1. must achieve a meeting of peasants who will adopt the project that for the peasants on the project and ensure that consent is given by referral as this has a great importance is in the success of the project through the peasants cooperation with the implementing agency.
2. vowed peasants within the project area to continue the cultivation of agricultural land that will be addressed through the project, a period of not less than ten years in order to ensure that the desertification of the land again after the success of the treatment process.
3. vowed peasants within the project area perpetuation windbreaks which is cultivated through the project and in the stage after the completion of the project.
4. accelerate the completion of land reclamation projects of others Reclaimed and the completion of land reclamation almost reclaimed Considering that personal dune sites in this study is basically the land is reclaimed It has been turned into this advanced stage of desertification Because left by the peasants without cultivation because of the scarcity of irrigation water.
6. search for alternative sources of irrigation water in areas agricultural that the water quota were not available by surface water through the use of competent companies to dig wells with the support and awareness of the importance of farmers and the acquisition of modern irrigation Instead of the old means of irrigation in areas where water quota available to them.
7. Activating the role of remote sensing and geographic information systems whether in monitoring the movement of dunes of the region and other areas or follow the modern techniques of this information In the treatment of dunes and stop the movement of desertification, which is as juvenile has to be stopped.

#### Introduction:-

“Knowledge” and “Knowledge Management” is considered as key ingredient of success in today’s business organizations such as Professional Service Firms (PSF) (Alvesson 2004). If a PSF wants to flourish it has to work upon the mantra of knowledge acquisition and sharing among the people of an organization. Knowledge-intensive organizations should influence their separate knowledge assets through knowledge distribution to generate shared knowledge possessions. Knowledgeable employees have the power to control Knowledge sharing. Knowledge economies are emerging phenomenon, in this scenario attaining and sustaining knowledge is key to gain a competitive edge (Neuman, 2000). Regrettably, knowledge management is difficult job due to multi-faceted form of the borders, cultures, procedures and firm structures involved (Nonaka & Takeuchi, 1995).

A knowledge resource is explained by “know-what” or “know how”. Knowledge should be shared at collective level instead of individual to benefit the firm. The practice of knowledge sharing is, nonetheless, governed by the members of staff. Prior research indicates employee attitudes/behavior, i.e. their commitment level, is vital to this employee govern and their successive knowledge obtaining and knowledge providing (Lin, 2007; Hislop, 2003).

Commitment of employee plays a vital role in knowledge sharing among them and ultimately effect success of any project. Employee Commitment to firm, team members, occupation and Client has the impact on knowledge sharing. The effect of worker commitment on know-how distribution behavior is specifically vital in modern organizations, such as Professional Service Firms (PSFs). Employee’s willingness plays its role in knowledge sharing; willingness is driven by the level of commitment with external and internal institutions with which an employee interacts. Prior research expose the higher client commitment may limit employee’s team and organization commitment. (Swart et al,2014)

This editorial pulls on observed data from PSF (Advertising Agencies across Pakistan) to ask: ‘How do multi foci of commitment; including organization, profession, team and Client commitment of employee may influence their knowledge distribution behavior within their firm?’ thus, it creates two offerings to present works:

1. It inspects the numerous kinds and multi centers/foci of worker loyalty to the firm
  2. It studies “2” kinds of knowledge distribution: knowledge giving and knowledge gaining within the firm.
- In order to deliver a successful project, commitment of a team member/employee is very important, whether it is an organizational commitment, professional commitment, team commitment or client commitment. Higher the

commitment is higher will be the positive results. Advertising agencies cannot deliver a successful project to its client unless its project team is committed. No idea will be successful until or unless it is shared by its team members. No research has been done on the influence of different kinds and multi foci of commitment on knowledge sharing and project success in Pakistan.

It is to express here this study is previously conducted by Swart et al in 2014 in different work setting where this study is conducted in Pakistan which will assist in generalizing the findings of previous study.

There is no work or literature or industrial analysis of advertising agencies has been done before by any researcher in Pakistan. This research has been done on above mentioned phenomenon on advertising agencies.

#### **Literature Review:-**

There are numerous definitions of project, in 2012 Schwalbe defined project as a temporary endeavor undertaken to create a unique product or service. Whereas, number of researches being conducted on the subject of "Project success". Baccarini (1999) emphasized the subsequent features of project success as under:

- a) The success of project management is a measure of time; cost and quality are secondary to the higher product success objectives of goal and purpose. Therefore, a project that is a project management disappointment is supposed as a successful project because the greater-level goal of product accomplishment is happened.
- b) Project management success can affect the accomplishment of victory of the project. Worthy project management promise project success and is capable stop project failure. Good project management techniques find out the loopholes and try to fix it as they occur. However, poor project management cost a lot by decrease market shares, profitability etc.
- c) Success of the project can also be affected by time. We can only get to know about this when project final product has been utilized after numerous years of completion of the project. We can get to know about the project management success on longtime basis.

Professional Service Firms are defined as Knowledge concentrated firms (Alvesson,2004). Whereas, knowledge could be defined as "know-how" based on surrounded experiences, standards, info and professional instinct that offers an outline for assessing and combining new know-how and information. In organizations, it commonly goes into inserted in papers or warehouse and also in firm's agendas, schedules, and duties" (Davenport, 1998). Knowledge could be classified into two main categories a) explicit knowledge; that could be readily codified and expressed in words and b) tacit knowledge; it is based on experience that cannot be readily translated into words. PSFs' competitive advantage is based on tacit knowledge and knowledge workers of firm (Sewart, 2011). Tacit knowledge of knowledge workers assists PSFs in client services and solution. Knowledge exists at both individual and collective level of the firm; it is only beneficial for the firm if it being shared among the members of the firm (Davenport, 1998).

Knowledge sharing plays a crucial role in planned management arena, where know-how is considered for example "the supreme strategically-important resource which [organizations] possess," and a primary basis of worth making, (Spender, 1996; Teece, 1997). A phenomenon of knowledge sharing is directed by the employees; which makes it interpersonal communication trend (Empson,2011).

Various investigators propose that the present economic scenery is surely finest well-defined as a 'knowledge economy'. In today's economy, Knowledge, or know-how, is the foundation of acquisition and upholding a competitive advantage. Knowledge resources have been extensively known to be the main carters of organization reasonable benefit. Specialists have proposed that the capability to continuously form, abolish, and reconstruct new resource mixtures that are cherished by clients/Clients and secure against definite competitors is serious and critical. This capability has been well-defined as a dynamic competency/capability (Teece, 1994).

Previous researches suggest employee commitment towards the organization plays a substantial role in willingness to share tacit knowledge with team members (Hislop, 2003). This attitude of willingness is dependent on element of trust among the members and commitment of an employee. It is interpreted that lower level of trust and commitment may lead to the reluctance to share tacit knowledge (Lin,2007). "Organizational commitment may significantly impact the enthusiasm of employees to share their know-how"(Scarborough, 2000). It is repetitively stated that organization's biggest asset is "Knowledge" it possess but it's not individual level based collective level know-how creates a difference (Alvesson, 2005).

Knowledge sharing is bi-directional phenomenon; knowledge gaining and providing. This transition of providing and gaining is based on interpersonal activity; in this transition shared knowledge could be interpreted differently by the receiver and provider as per their own knowledge and context in which knowledge is shared (Watzlawick,1976). An individual integrates his new knowledge with the one he already has, this process of integration is referred to as representational re-description (Karmiloff-Smith,1992).

Previous research suggests that when knowledge is shared within the firm it triggers synergy among the resources which assist in gaining competitive advantage and maximizing human capital of the firm. Firm is dependent on human capital; knowledge workers in delighting firm's clients and it helps firm in securing success (Swart,2014). Recent studies have revealed that employee commitment is not within the organization attitude it could go beyond boundaries of organization. Previous researches have classified employees' commitment into two levels; micro and macro level. Micro level of commitment's foci includes; commitment towards management, team and customers (Becker, 2009). Whereas, macro level's foci include organization, profession, unions and employees' career (Vandenberghe, 2009).

Organizational Commitment (OC) is not a latest subject of study; excessive research has been done in this area. There are three types of organizational commitment;

- a) Affective commitment; where employee's feelings are attached with an organization and there is an emotional bond.
- b) Continuance commitment; employee is attached with the organization because of economic reasons as organization is paying him well.
- c) Normative Commitment; in this case employee feels his moral obligation to stay with the organization and perform his chores (Meyer & Allen, 1991).
- d)

The second significant focus of commitment is Team commitment (TC). Research suggests that team commitment plays an adequate role in PSFs context, by creating synergy among the members in order to transfer and integrate up to date knowledge to satisfy clients at its best (Swart,2007). There is no doubt in an organization employees interact more with their team members in comparison to the other colleagues (Redman and Snape, 2005).

Past research has examined the correlated relationship between commitment and employees' profession. Employees having high professional commitment are the one who invest more on their knowledge base and career development to stay competitive (Greenwood & Empson, 2003). In PSFs, employees have to share knowledge to polish their skills and maintaining the external professional networks.

In relevance to the other foci of commitments a little less is done in the field of client commitment (Vandenberghe, 2009). In PSFs context employees' interaction with clients is frequent and they have to satisfy them through knowledge they possess.

An individual who is having high commitment towards any particular focus, there is possibility his willingness to knowledge sharing towards other focus may decrease; if he has high commitment towards clients he could be unwilling to share knowledge within the organization.

This study explores how employee commitment towards different foci has impact on the willingness of knowledge sharing at work? Previous research suggests that organizational commitment is positively correlated to the willingness attitude to share knowledge (Hislop,2003). It leads to first hypothesis of the study:

*H1: Different types of employee commitment to the firm/organization are positively associated to knowledge sharing with coworkers in the organization (in Projects).*

An employee who is devoted to their professional development and committed towards that is likely to be reluctant to share their knowledge with members of the organization (Alvesson, 2004).

*H2: Different types of employee commitment to the Occupation/Profession are positively associated to knowledge sharing with coworkers in the organization (in Projects).*

Prior research states that trust and commitment among the team members leveraged the willingness behavior of members to share knowledge with each other but limit it to share with rest of the members of the organization (Newell & Swan, 2000), it leads to third hypothesis of the study;

*H3: Different types of employee commitment to the project team are positively associated to knowledge sharing with coworkers in the organization (in Projects).*

In general, prior research in this domain says that synergy between all foci of commitment; organization, profession, team and client can play a positive role to share knowledge and in gaining a competitive edge (Vandenbergh, 2009). This prompt to the last hypothesis of the study;

*H4: Different types of employee commitment to the Client are negatively associated to knowledge sharing with coworkers in the organization (in Projects).*

### Research Methodology:-

This is a hypothesis testing based correlation study. The research is designed with an aim to study the impact of employee commitment with the organization, team, profession and client to knowledge sharing, as they apply in the Advertising Agencies of Pakistan. To gather the data survey methodology was used on the basis of questionnaire. Details of questionnaire adaptation are mentioned in a table 1 below. 223 respondents were surveyed from different advertising agencies' project teams in the three major cities of Pakistan which include; Islamabad, Lahore and Karachi. This paper has used SPSS and applies (frequency, alpha, correlation, and regression).

**Table 1:-** Questionnaire Adaptation

Variables	Adaptation
Kind of Commitment	Meyer and Allen's (1991)
Foci of Commitment	Klein (2009)
Dimension of continuance employee commitment	Stinglhamber (2002)
Knowledge Distribution	Wilkesmann (2009)

### Results and Analysis:-

In this study 22.4% respondents were female and 77.6% were male. Among the respondents 48.4% were having 0-5 years' experience, 40.4% were of 6-10 years and 11.2% were those who were having 11 years above experience. Position based classification of respondents is: 17.9% were Project Managers, 9% were Project Coordinator, 57.4% were Project team members and 15.7% falls in the support staff category. Following table describing correlation among the variable under study;

**Table 2:** Correlation among all the study variables

		OC	PC	TC	CC	KS
OC	Pearson Correlation	1				
	Sig. (2-tailed)					
PC	Pearson Correlation	.863**	1			
	Sig. (2-tailed)	.000				
TC	Pearson Correlation	.760**	.762**	1		
	Sig. (2-tailed)	.000	.000			
CC	Pearson Correlation	.799**	.804**	.745**	1	
	Sig. (2-tailed)	.000	.000	.000		
KS	Pearson Correlation	.764**	.722**	.792**	.663**	1
	Sig. (2-tailed)	.000	.000	.000	.000	

\*\* Correlation is significant at the 0.01 level (2-tailed).

OC (Organizational Commitment) PC (Professional Commitment) TC (Team Commitment) CC (Client Commitment) KS (Knowledge Sharing).

*Hypothesis testing and finding*

Result against the H1; different types of employee commitment to the firm/organization are negatively associated to knowledge sharing with coworkers in the organization (in Projects) is depicted in the table below:

**Table 3: Hypothesis 1; Regression Model**

Model	R	R Square	F	Std. Error of the Estimate	Sig.	$\beta$ Value
1	.764 <sup>a</sup>	.584	310.477	.661	.000	0.787
a. Predictors: (Constant): OC						
b. Dependent Variable: KS						

Correlation is abbreviated as “R” which is 0.764 in the above table which shows there is a positive relationship between organizational commitment and Knowledge sharing. The table above shows that R Square (Regression) is 0.584 (F=310.477,  $p < .000$ ).

The regression results show that the explained variation in the knowledge sharing is 58.4% explained by the given variables i.e. R square is 0.584

Unstandardized  $\beta$  value .787 ( $p < 0.000$ ) signifies that for every unit change in the independent variables (Organizational Commitment), the dependent variable is positively affected by .787 units. Hence we will reject the null hypothesis. H1 is accepted; organization commitment affects the Knowledge Sharing and ultimately affects project success

Result against the H2; Different types of employee commitment to the Occupation/Profession are positively associated to knowledge sharing with coworkers in the organization (in Projects) is depicted below:

**Table 4: Hypothesis 2; Regression Model**

Model	R	R Square	F	Std. Error of the Estimate	Sig.	$\beta$ Value
1	.722 <sup>a</sup>	.521	240.280	.710	.000	.746
a. Predictors: (Constant): PC						
b. Dependent Variable: KS						

Correlation is abbreviated as “R” which is 0.722 in the above table which shows there is a positive relationship between Professional commitment and Knowledge sharing and is significant at the 0.01 level. The table above shows that R Square (Regression) is 0.521 (F=240.280  $p < .000$ ).

The regression results show that the explained variation in the knowledge sharing is 52.1% explained by the given variables i.e. R square is 0.521

Unstandardized  $\beta$  value .746 ( $p < 0.000$ ) signifies that for every unit change in the independent variables (Professional Commitment), the dependent variable is positively affected by .746 units. Hence H2 is accepted; Professional commitment affects the Knowledge Sharing and ultimately affects project success.

Result against the H3; Different types of employee commitment to the project team are positively associated to knowledge sharing with coworkers in the organization (in Projects).

**Table 5: Hypothesis 3; Regression Model**

Model	R	R Square	F	Std. Error of the Estimate	Sig.	$\beta$ Value
1	.792 <sup>a</sup>	.627	371.324	.626	.000	.936
a. Predictors: (Constant): TC						
b. Dependent Variable: KS						

Correlation is abbreviated as “R” which is 0.792 in the above table which shows there is a positive relationship between team commitment and Knowledge sharing. The table above shows that R Square (Regression) is 0.627 (F=371.324  $p < .000$ ).

The regression results show that the explained variation in the knowledge sharing is 62.7% explained by the given variables i.e. R square is 0.627

Unstandardized  $\beta$  value .936 ( $p < 0.000$ ) signifies that for every unit change in the independent variables (Team Commitment), the dependent variable is positively affected by .936 units. Hence H3 is accepted; team commitment affects the Knowledge Sharing and ultimately affects project success.

Results of H4; Different types of employee commitment to the Client are negatively associated to knowledge sharing with coworkers in the organization (in Projects) are depicted in table below;

**Table 6:** Hypothesis 4; Regression Model

Model	R	R Square	F	Std. Error of the Estimate	Sig.	$\beta$ Value
1	.433 <sup>a</sup>	.188	51.058	.924	.000	.714
a. Predictors: (Constant): CC						
b. Dependent Variable: KS						

Correlation is abbreviated as "R" which is 0.433 in the above table which shows there is a weak relationship between client commitment and Knowledge sharing. The table above shows that R Square (Regression) is 0.188 ( $F=51.058$   $p < .000$ ).

The regression results show that the explained variation in the knowledge sharing is 18.8% explained by the given variables i.e. R square is 0.188

Unstandardized  $\beta$  value .714 ( $p < 0.000$ ) signifies that for every unit change in the independent variables (Client Commitment), the dependent variable is affected by .714 units. Hence we will reject H4; which is resulted in client commitment affects the Knowledge Sharing within the organization.

### Discussion:-

Employee motivation and commitment derives success and failure of Knowledge management. (Galletta, 2003) states that inspiration and obligation plays a vital role in fruitfully implementing Knowledge Management Systems (as antecedents).

Above results and answers have significant implications for concept and for exercise. Study investigation has donated to the inadequate but increasing investigation on relationship among worker commitment and knowledge distribution (Hislop, 2003; Lin, 2007). This research has established on the various kinds (Meyer and Allen, 1991) and foci of worker commitment to comprehend the impact on know-how sharing behavior

**Table 7:** Hypothesis summary

HYPOTHESES	DECISION
H1: Different types of employee commitment to the firm/organization are positively associated to knowledge sharing with coworkers in the organization (in Projects).	Accepted
H2: Different types of employee commitment to the Occupation/Profession are positively associated to knowledge sharing with coworkers in the organization (in Projects).	Accepted
H3: Different types of employee commitment to the project team are positively associated to knowledge sharing with coworkers in the organization (in Projects).	Accepted
H4: Different types of employee commitment to the Client are negatively associated to knowledge sharing with coworkers in the organization (in Projects).	Rejected

Affective employee commitment to the project team and its members and the occupation is positively associated to knowledge sharing behavior. This shows emotive commitment with team-and-professional working (Becker, 2009) enlightens the know-how distribution behavior.

Normative employee commitment (i.e.; a feeling of obligation to the organization) is a further vital impact on knowledge distribution behavior. This behavior can be enhancing by rewards and other mediums of motivation.

Continuance employee loyalty to the customer is weakly associated to knowledge distribution or sharing behavior. Team members are less expected to part their know-how with project colleagues when they pursue to become customer and business experts and want to endure to work with a certain customer/client. These experts have established highly customer focused know-how that may be hard to share with other experts in the project.

### **Conclusion & Implications:-**

The goal of this study is to examine the impact of different kinds of employee commitment (affective, normative and continuance commitment) and foci of commitment (organization, professional, customer and project team) on knowledge sharing. This study has examined organization affective commitment, organization normative commitment and organization continuance commitment, same goes with other foci of commitment. An investigation result evidently shows that the numerous kinds and foci of worker commitment are connected to organizational knowledge distribution behavior.

Project managers should try to motivate their team members in order to increase their commitment to organization, profession and team particularly so that they share their specialized knowledge within the organization. This will ultimately give competitive advantage and will result in greater chances of project success.

This investigation has been able to inspect the types of employee loyalty and also various foci of commitment within the project. This delivers that there is a link among each kind and foci of commitment and two directional know-how distribution behaviors. Research showed that foci that are proximal (i.e. team and profession) generate emotive commitment, which impacts on know-how distribution, while more distal foci, such as the firm, will tend to rely on normative to support know-how distribution behavior.

Lastly, it has showed that firms will be confronted with strategic knowledge management challenges when inspiring very robust customer commitment that indications to the growth of customer oriented knowledge, which desires to be stable with the ability to leverage this know-how inside the firm. This will eventually influence on the competitive ability of the firm, which consequences from the combined effects of knowledge distribution.

Results of analysis revealed that almost all different types and multi-foci of commitment have an influence on knowledge distribution behavior with colleagues in the firm. As knowledge sharing increases chances for project success increases. Knowledge is vital and beneficial on the collective level. Therefore, the analysis leads to interpretation that, knowledge is a vital resource as we are living in a knowledge economy. Commitment on various levels increases knowledge sharing behavior that will ultimately lead to project or organization success.

In future this study could be done with the higher sample size; Future investigator could do comparative analysis in terms of different industries as this study is based on the Advertising Agencies projects only. Future studies can also study some moderating and mediating effect on the relation of commitment and knowledge sharing. Potential researchers can also check the impact of different variables from a new perspective or different perspective that differentiate the more successful organization than the less one. This perspective could be leadership quality, rewards, and likewise impact on a knowledge sharing or other management practices impact.

### Abstract

Emerging pollutants are a modern day threat to water quality and security globally. These pollutants are largely as a result of pharmaceuticals and chemical compounds from personal care products that get washed through the sewerage system back into the environment. The long term effects of these compounds are not fully understood but have exhibited in some cases acute effects in aquatic flora and fauna. Science in many respects have caught up with rapid testing of water quality for these compounds however treatment processes in water works are lagging behind despite the many available method that effectively remove these compounds, namely advanced oxidation processes as reviewed.

### Introduction:-

By 2025, 1800 million people will be living in countries or regions with absolute water scarcity and two thirds of the world population could be under stress conditions (UNDP, 2006). This figure may seem unbelievable but put in perspective the impending crisis is very much possible when one considers the fact that in 1900 the global population was two billion, this figure was exceeded to six billion in 2000 and is on a trajectory of nine billion by 2050. An ever increasing population is always a threat to the environmental sustainability and natural resources such as freshwater. Rising global populations and growing industries, advances in technology and medicine have resulted in the production of new chemical compounds more than ever before in the history of the planet with many of their effects left unknown or slow to discovery. Modern day advances in rapid testing analytical instruments we are now able to detect once undetectable agents that pose a threat to the planet's dwindling water resource. Agents such as low concentrations of emerging contaminants in natural and drinking waters pose a real threat as they undermine water quality and have shown to have detrimental effects on aquatic biota as it was discovered that a significant amount of these compounds were present especially in surface water environment.

Water quality is a global issue. According to UN estimates, the world produces 1500km<sup>3</sup> of wastewater annually. That much waste or 'used' water represents more than six (6) times the volume of freshwater in all the world's rivers combined (UN WWAP, 2003). This becomes more worrisome and a threat to life as we know it when two and a half billion people have no means to proper sanitation (UNICEF, 2009) which means, a large volume of the waste produced goes untreated or improperly disposed. Seventy per cent of these people live in Asia. In china for example, with its rapid economic growth and urbanization, still 70% of its household wastewater goes untreated and end up in in the natural environment which means gallons of emerging contaminants are finding their way into the seas, rivers, aquifers and lakes.

Emerging pollutants (EP/EC) are defined as any synthetic or naturally occurring chemical or organism that is not usually monitored in the environment with potentially known adverse ecological and human health effects (Czech and Bikirowka, 2013). In contrast to other known aquatic pollutants, little is known about them and therefore lacks effects strength

**Corresponding Author:- Geasean J. Johnson.**

(Barcelo and Ketrup, 2004; Burger and Moolan, 2006; Jiao and Cheng, 2008), and or negatively affect hormone synthesis and metabolism (Rice et al., 2003; Ying et al., 2004; Bradlow et al., 2005). Emergent pollutants that have adverse effects in ways like those mentioned are referred to as Endocrine Disrupting Compounds (EDCs) and have been characterized as a cause of reproductive disturbance in humans and wildlife (Hayes et al., 2002; Samir et al., 2006; Campbell et al., 2006).

Classes of Emerging Contaminants	Major sub Classes	Sub-classes	Examples	Sources
PPCPs	Pharmaceutical	Antiepileptic	Carbamazapine, <b>primidone</b>	WWTP
		antibiotics	Roxithromycin	WWTP
		Antiseptic	Triclosan	WWTP
		anti-inflammatories	Ibuprofen	WWTP
	Personal care products	Polycyclic mucks	HHCB	WWTP
		UV protection screens	BP2 BP3	WWTP
	Synthetic hormone	ethinylestradiol		WWTP

**Table 1:-** Classification of emergent compound.

		(EE2), DES		
<b>EDCs</b>	Industrial compounds	Phenolic compounds	sufacants	WWTP, run off
		phthalates	(DEP, DBP, DMPs)	WWTP, run off
		Fire retardants	Brominated fire retardants	textile, paint, fabric industry
		PCBs		steel industry
	Harmones	atural and synthetic	estrone	
	Heavy metals		mercury, cadmium, lead	mining and mettallurgy
<b>Pesticides</b>	Organochlorine		Aldrin	agricultural run off
	Organophosphate		ethion	agricultural run off
	Cabamate		Benomyl	agricultural run off
	Triazines		Simazine, cyanazine	agricultural run off
	Pyrethroids		bifenthrin	agricultural run off
	Chlorophenoxy Herbicides		triclopyr	agricultural run off

The main issue with these emergent compounds is that they have the ability to pass through conventional wastewater treatment plants without detection and removal. There is therefore an urgent need to build on present scientific knowledge and to create technologies that are adequately able to detect and monitor these pollutants as well as to remove them from waste water systems efficiently and economically. The first report of pharmaceuticals in wastewater treatment plant was published by Hignite and Azarnoff, 1977. Since then there has been an upward trend in the research of emergent contaminants, their effects, detection and classification in water science and management. Sauve and Desrosiers, (2014), in a review of emergent contaminants introduced three broad definitions of how these pollutants may be considered. Emergent contaminants, by the French scientists, were explained as pollutants that appeared only recently due to an increase in new chemicals such as pharmaceuticals and personal care products, pollutants that have been in the natural system for a period of time but has recently raised concerns or a new perspectives of the concerns of known contaminant. For this review three (3) pharmaceuticals and their occurrence and fate in the environment were discussed. Table 1 outlines the major classifications of ECs with examples. The review also discusses recent studies on advanced water treatment methods that have been proven to effectively degrade ECs.

Emergent pollutants enter water ways as most pollutants do, through point or non-point sources as depicted in the schematic diagram, fig 1 One of the most prevalent sources has been waste water treatment plants (Huang et al., 2003). This is because of the surreptitious nature of the compounds that allows them to pass through unnoticed and untreated by conventional treatment methods (Muller et al., 2010; Petrovic et al., 2013; Czajka and Londry, 2016). Since this discovery researchers have been in earnest to develop effective methods to remove these harmful compounds from waste water treatment plants so as to prevent them from getting into the environment. Bolong et al., (2009) reviews some of these advanced methods in details some of which will be explored in later sections of this review.

There have been an assortment of methodologies used to determine the presence and quantity of these emerging pollutants in various biological environments/matrices which have allowed researchers to fully grasp the persistence, quantity and quality of these active agents in natural and manmade systems. Psychotic drugs have been screened from matrices such as blood and urine using GC-MS and LC-MS methods. (Subramanian et al., 2008). Vanderford and Synder (2006) identified the anxiolytic drug, meprobamate in treated and untreated surface water sources by applying LC-MS/Ms. With applied HPLC-MC/MS, Reh et al., (2013) were able to obtain the quantity of forty four organic micro pollutants (OMP) in groundwater in parts of Germany. Some of these trace pollutants tend to be more persistent than others in the environment and may be found in various concentrations depending on the media and other factors.

Fig 1: schematic diagram showing the flow of ECs into different system and media.

#### The Effects of Emerging Pollutants:-

The science around the effects of these surreptitious chemical compounds is not as conclusive as one might imagine, as such there is much need for more research geared towards investigating the toxicity of emerging contaminants such as pharmaceuticals and personal care products (PPCPs) in the aquatic environment. Pharmaceuticals, medicinal drugs, are purposefully designed to be effective in target hosts, in relatively small dosage, for human or animal treatment. This may explain largely why these compounds are found in miniscule quantities in various media when compared to other chemical pollutants. The threats of these compounds or rather the threats of their activate ingredients on non-target species still elude scientists and is feared that the possible subtle and gradual effects caused by the contaminants may be misunderstood as natural changes and therefore go undetected or undetectable. The presence of multiple pharmaceuticals in the environment also raises the question of joint toxicity which would result in a high toxic effect (Kortenkamp et al., 2007). The presence of antibiotic compounds in wastewater and water may also give rise to resistant microbes as Guardabassi et al., 2002; Miranda and Castillo, 1998 suggest. Data on the cause of certain cancers have indicated that these kinds of compounds can be assimilated by humans into tissues and can easily pass though cell membranes and avoid detection of the body to carry out designed physiological effects.

Pascoe et al., (2002) in a published study investigated the toxicity of 10 drugs, ibuprofen, paracetamol, acetylsalicylic acid, amoxicillin, bedroflumethiazide, furosemide, atenolol, diazepam, digoxin and amlodipine using cnidarian *Hydra vulgaris*. The investigation revealed that the substances did not have any acute toxicity to the organism at concentration up to  $1.0 \text{ mgL}^{-1}$ , however, three of the drugs did in fact have some retardation effect on polyp regeneration at  $10 \text{ ugL}^{-1}$ . These drugs were diazepam, digoxin and amlodipine. Lange et al., (2001) reported on the adverse effect of EE2 on fish which resulted in a feminizing effect. According to Kidd et al., (2007), an affect like that may result in population crash. Pharmaceuticals and personal care products may affect organisms in various ways, it is therefore the daunting task of figuring out how the compounds individually or jointly may adversely affect the systems of aquatic animals. A widely studied effect is the disruption of the endocrine system where these pollutants interfere the production, transport and balance of hormones necessary for growth, development and species to species interaction, see table 2.

Table 2: EDC and documented effects.

Endocrine Disrupting Compounds	Health effects
Bisphenol A (BPA) — used in epoxy resin and polycarbonate plastics (in food and drink packaging) — used in epoxy resin and	<i>Proven to have estrogenic effects in rats and hormonal effects which increase breast cancer risk in human Reported to act as anti-androgen that causes feminising</i>
Estrone and 17- $\beta$ estradiol (steroidal estrogens) and 17- $\alpha$ ethynylestradiol (synthetic contraceptive) — contained in contraceptive pills	<i>Cause feminization which observed for fish in sewage treatment</i>
Antibiotics (such as penicillin, sulfonamides, tetracyclines)	<i>Shown to cause resistance among bacterial pathogens, that lead to altered microbial community structure in the</i>
Polychlorinated biphenyls (PCBs) — used in electrical equipment (capacitors and transformers)	<i>nature and affect higher food chain The metabolites able to mimic estradiol (female hormone) and cause carcinogenic.</i>

#### **Florfenicol and Thiamphenicol:-**

Florfenicol and Thiamphenicol are anti biotics used commonly to treat animals and used as chemotherapy drugs to control diseases. They are both often used to treat livestock and aquatic species with infections such as pneumonia in cattle, and furunculosis in salmon. These drugs like most emerging contaminants, end up in the environment through excrement, having been metabolized in the animal. Both drugs are a part of a larger group of phenicols called Chloramphenicol which in many countries are banned in agriculture due to its serious side effects on humans. The chemical names for Florfenicol and thiamphenicol are Acetamide, 2,2-dichloro-N-[1-(fluoromethyl)-2-hydroxy-2-[4-(methylsulfonyl)phenyl]ethyl]-[R-(R\*,S\*)]- and 2,2-dichloro-N-[(1R,2R)-1,3-dihydroxy-1-(4-methylsulfonylphenyl)propan-2-yl]acetamide. Lu et al., (2015) discuss the acute toxicity of the pharmaceuticals, Florfenicol (FF) and Thiamphenicol (TAP) and their intermediates, an issue previously seldom addressed. The researchers experimented on the effects of the antibiotics on the marine bacterium *Vibrio fischeri*. The experiment revealed that acute toxicity was slightly increased as a result of the production of the drugs intermediates. This combined effect of parent drug and products generated during degradation was also observed in other studies Bonnemoy et al., 2004; Zhu et al., 2014. The inhibition rate, the measure of the pharmaceuticals toxicity in this case decreased eventually after 60 minutes of the reaction considerably but not substantially below the initial toxicity. The toxicity of FF and TAP was also observed on several species of algae by Lai et al., (2009) and resulted in conclusive evidence to suggest the drugs retarded the growth of the aquatic organisms though in varying degrees.

#### **Primidone:-**

Wastewater in many water scarce countries is being reclaimed and used to augment the lack of access to freshwater in areas of the economy such as agriculture. In those instances treated waste water is used for irrigation of farmlands as seen in countries such as China where established guidelines for the quality of reclaimed water (US EPA, 1992; Chang et al., 1996) do not always consider trace pollutants such as pharmaceuticals and EDCs. As a result the release of these pollutants into the environment has been continuous without a clear understanding of the ecological and health risk associated to their accumulation. The United States Geological Survey has reported the presence of PPCPs in surface and sub terrain waters that are influenced by wastewater in a 2002 nationwide study of emerging pollutants in water. The study found that 80% of the sites investigated tested positive for pharmaceutical compounds (US EPA, 1992; Koplín et al., 2002). Chen et al., (2011) A survey of 43 EDCs and PPCPs in Hebei, China revealed that nine (9) including Primidone was detected in soils irrigated by wastewater. Primidone is increasingly being considered as a good indicator for wastewater influence in surface and groundwater systems Guo and Krasner, (2009).

Primidone is commonly used as antiepileptic drug with an empirical formula of  $C_{12}H_{14}N_2O_2$  and corresponds chemically to 5-ethylidihydro 5-phenyl-4,6(1-H,5H) pyrimidine-dione and has a molecular weight of 218.25. It is metabolized in the livers of animals to form two main metabolites; phenylethylmalonamide (PEMA) and phenobarbital (El-Masri and Portier, 1998). The chemical compound was introduced in clinical use in the 1950 and its metabolite, phenobarbital as early as 1912. Primidone passes through the human system usually 65% unchanged and is released into the environment commonly as urine through wastewater treatment plants. There have been numerous investigations which indicate the occurrence of primidone in surface and groundwater. An investigation by Drewes et al., identified the antiepileptic drugs carbamazepine and primidone as the most dominant in well treated effluents on North American and European treatment plants. Pharmaceutical often finds its way into aquifers and other sub terrain water systems when "treated" effluent is used for irrigation and aquifer recharge in countries

where the commodity is scarce. Outdated practices in the early parts of this century saw much of the developed world treating wastewater by applying it to agricultural lands. Even though over time percolation did treat the wastewater to some extent, organic pollutants persistent in nature found themselves into groundwater systems and eventually drinking water throughout Berlin (Ginzel et al., 1995). Primidone was among the list of psychotic compounds detected in aquifers that are situated below former agriculture/sewage farms. In other instances ground water becomes contaminated by personal care products and pharmaceuticals by landfill leachates (Linde, 1992; Herberer and Stan, 1997; Peschka et al., 2006; Massmann et al., 2008b; Richter et al., 2008b; Hass et al., 2012a) and as farm run offs as these compounds are applied as medicine to farm animals or in the form of pesticides and feed additives.

#### **Advanced Oxidation Processes:-**

Advanced oxidation processes (AOPs) refer to a group of chemical-oxidative methods that have the ability to produce powerful hydroxyl radicals. In this section the processes ozonation, Fenton's Reagent, heterogeneous photo catalysis, ultra-sonic irradiation along with oxidants such a hydrogen peroxide, calcium peroxide will be reviewed as methods used to remove emerging contaminants from water based matrices. Conventional wastewater treatment plants are designed to remove contaminants such as biocidal and or non-biodegradable chemicals, solids and pathogens through chemical and physical processes. Advances over the decades in water treatment technologies have improved physical and chemical processes to adequately remove organic compound that may be dispersed in solution to even combat chemical compounds in trace quantities that were not once considered hazardous, the chemical processes are mostly oxidative chemical processes. Membrane technology, adsorption have also been technically broadened to challenge emerging contaminants. Engineers are now looking towards advanced oxidation processes as a necessary component to the water treatment process if the threat or the fear of the unknown long term impacts of PPCPs may have on humans and the environment. AOPs have been known to improve overall removal efficiencies of contaminants and was previously used as to attain the highest quality of treated water. Advanced oxidation treatment technologies are broadly defined as aqueous phase oxidation methods that are based on the generation of intermediaries of free radicals (Comninellis et al., 2008). Despite the high performance quality and efficiency of these methods be it the use of chemical oxidants such ozone,  $H_2O_2$ , metal catalysts,  $CaO_2$  or a combination of the aforementioned and energy. It is important to note that AOPs are used as enhancers in water treatment rather than a complete replacement of the conventional methods. Photooxidation can be largely considered as the inducing of oxidation by the use of light which commonly occurs by the loss of electrons from a species as a result of photoexcitation or the reaction of other chemical compounds by light. The principle is among the leading degeneration process and happens when organic materials are exposed to air and light (Sai et al., 2014). Chemical oxidation involves the use of oxidants to aqueous waste streams to convert organic pollutants to  $CO_2$  and  $H_2O$  and can be made more efficient if oxidants are applied to waste streams in the presence of UV light. Direct use of oxygen as the oxidizing agent on organic compounds is not practiced as it requires high energy and has a very slow reaction time. In many applications of photo chemical oxidation, hydrogen peroxide, ozone are used as the photoactive oxidants for effective and safe degeneration of contaminants. Fluorine, a known oxidant, despite its high potential is not used during water treatment because of its high toxicity.

#### **Ozonation:-**

Ozonation or ozonisation is the inclusion of Ozone ( $O_3$ ) into water to produce reactive oxygen species which are capable to degrade a wide range of organic compounds and microorganisms (Rice and Netzer, 1982; Masschelein, 1991; Langlais et al., 1991).

Ozone is prepared by applying energy to oxygen and because of its relative instability is usually generated on site of the treatment plant for immediate use. Exposure to water allows ozone to undergo a decomposition similar to other chemical oxidants to form intermediaries, free radical, which are more powerful in oxidizing (Wang et al., 2004). The combination of Ozone and UV has been technically broaden throughout the years and is even more widely used to remove a wide range of pollutant from water. The degradation of pollutants usually occur directly by ozone or by the radicals it produced during rapid decomposition though the radicals are much more potent (Munter, 2001). This known oxidative ability of ozone and radical generation, makes it among the most widely tested advance processes in research for its capacity and efficiency in removing more persisting compound and pharmaceuticals. Quinones et al., 2015, demonstrated the degradation rate of emerging compounds by ozonation and a combined system of photocatalytic oxidation. The experiment showed the emerging contaminants, acetaminophen, antipyrine, biphenol A, caffeine, metoprolol, and testosterone, to be readily degraded by ozone. Authors, Camel and Bernard give a comprehensive review of the main uses of the oxidation process in treatment of surface and groundwater for consumption (Camel and Bernard, 1998).

**Hydrogen Peroxide:-**

Hydrogen peroxide is a naturally occurring metabolite of many organisms which usually decomposes to form oxygen and water. It is also produced naturally when sunlight interacts with water in the environment. Industrially  $H_2O_2$  is manufactured by the anthraquinone process developed by BASF. The application of the peroxide is numerous. According to Hage et al., 2005, approximately 60% of hydrogen peroxide produced is used in the paper manufacturing industry and it is generally seen as a safe antimicrobial agent and is used in many developing countries for wound treatment (Rahman et al., 2010; Velding et al., 2014). The chemical compound has been studied in combination with UV radiation as an effective method in treating water that has been contaminated by various emerging pollutant that usually go about undetected. This natural occurring combination is among the most powerful photo degradation methods for pollutant removal. It has been used to treat easily oxidized contaminants and much harder oxidized ones such as hydrocarbons and pesticides (Metz et al., 2011a; Metz et al., 2011b).

The application of hydrogen peroxide as a photo oxidant has a number of benefits such as its thermal stability, availability and its ability to be stored on site. The oxidant is able to generate two hydroxyl compounds per molecule as shown in equation 1 (Lengrini et al., 1993; Mandal et al., 2004).

The use of hydrogen peroxide and UV has been the more conventional advanced oxidation processes along with ozone. The use of this process to remove contaminants have been well documented throughout the literature.

**Calcium Peroxide:-**

Though hydrogen peroxide is commonly used to provide oxygen there are a few disadvantage to its used, some of which were outlined by Cassidy and Irvine, (1999). One such disadvantage includes its rapid and uncontrollable release of oxygen. Solid oxygen sources such as calcium peroxide has been found to release oxygen much slower than direct application of  $H_2O_2$ . The oxidative properties of calcium/ magnesium peroxide have exhibited promising degradative potential for the controlled decontamination of soil polluted with pollutants such as hydrocarbons (Bogan et al., 2003; Ndjou' ou and Cassidy, 2006).

Calcium peroxide is a powerful oxidizer and was investigated to be a potentially efficient oxidizer than the other versatile metabolite,  $H_2O_2$  (Northup and Cassidy, 2008). The efficiency of  $CaO_2$  was demonstrated by researchers to degrade tetrachloroethylene ( $C_2Cl_4$ ) and 2, 4, 6- trinitrotoluene (Arienzo, 2000). Calcium peroxide described by Ma et al., 2007 as a white/yellowish solid peroxide with a high energy covalent bond is made by the addition of hydrogen peroxide to calcium hydroxide and then dried to produce a solid.

The use of Calcium peroxide as an oxidative agent in waste activated sludge of persistent compounds was investigated by Zhang et al., 2015. The scientists concluded that the release of OH radicals were the dominant forces of degradation. In other studies the solid peroxide is used to treat contaminated soil and groundwater (Goi et al., 2011; Xu et al., 2011). The use of Calcium peroxide and UV as a single treatment process is currently being studied to remove emerging pollutants, Primidone, Cabamazepine, Florfenicol and Thiamphenicol from water on a lab scale by the authors of this review.

**Fenton Reagent:-**

Fenton's reagent ( $H_2O_2/Fe^{2+}$  or  $Fe^{3+}$ ) is an advanced chemical oxidation process used in water treatment. It was discovered by Henry John Horstman Fenton in 1846, (Fenton, 1846) and is acknowledged to be an excellent technology in removing pollutants from waste water efficiently and safely (Lee et al., 2008; Wang et al., 2008). The basis of Fenton's reaction is the production of powerful oxidants; radical species, when ferrous salt and hydrogen peroxide are combined. The ferrous iron ( $Fe^{2+}$ ) generates hydroxyl radical ( $\cdot OH$ ) by catalyzing  $H_2O_2$  as depicted in (equations 3-7).

Fenton's reagents have been paired with UV irradiation and found to be more efficient in the degradation of pollutant in solution (Ruppert et al., 1993; Pignatello et al., 1994). This pairing is referred to as photo-Fenton reaction or photo assisted Fenton Reaction. 'Dark' Fenton reaction as referred to by , to imply the application of the Fenton's reagent in the absence of irradiation for removal of contaminants, has a disadvantage in that the oxidation process is slowed down as the Fe<sup>2+</sup> is converted to Fe<sup>3+</sup> (equation 8).

The Fenton Oxidation processes has been exploited for its efficiency in a number of ways since its discovery for degrading organic and some inorganic pollutants. Ma and Zhou, (2009) used the process to reduce organic pollutant in leachate at a landfill site (Ma and Zhou, 2009). The technique has was demonstrated by Rashed et al., 2004, to degrade phenol and formaldehyde in different water matrices. The oxidative process has an overall disadvantage in that its sensitivity to pH change above 4 results in precipitation of ferric hydroxides.

### **Heterogeneous Photocatalysis:-**

Heterogeneous photocatalysis may be defined as the assistance of photoreaction process by a catalyst. This advance process has been applied in the purification of air and water containing persistent organic and inorganic compounds and can be traced back traced back to the 1970s when Fujishima and Honda discovered. One of the most widely used and highly effective catalysts is TiO<sub>2</sub> because of its high potential to oxidize organic and inorganic compounds from solution via redox processes. The metal catalyst is also very stable chemically, nontoxic and relatively affordable. Cesaro et al., described the mechanism of heterogeneous photocatalysis as the transfer of electrons from the valence to the conduction band as a result of light irradiation. Electrons (e<sup>-</sup>) and positive charges or holes (H<sup>+</sup>) are generated. Both these charge carriers are strong oxidants are therefore able to oxidize H<sub>2</sub>O<sub>2</sub> molecule to form hydroxyl radicals (equation 9). Holes can also directly oxidize organics as summarized by equation 10. Photocatalyst such as TiO<sub>2</sub> basically hones UV energy to breakdown contaminants.

Heterogeneous photocatalysis is considered one of the newest advanced oxidation processes and therefore its full scale application is not wide spread due to its technical and economic associations. There have however been increasing scientific work geared towards improving the efficiency of this particular AOP over the years for water treatment. Borges et al., investigated the use of heterogeneous photocatalysis on the removal of emerging pollutants, paracetamol as the model molecule. The authors concluded that TiO<sub>2</sub> resulted in photocatalytic activity for removing the compound from waste water. Forty two per cent of the EC was removed after 8 hours of exposure (Borges et al., 2015)

**Ultrasonic Irradiation:-**

Another advanced oxidation process being exploited and studied for increase efficiency and economical large scale application for removing emerging contaminants from wastewater streams is Ultrasonic Irradiation. The fascination with the catalytic effect of high energy frequencies (15 KHz- 1 MHz) started in 1927 when Richards and Loomis reported on the chemical transformation ultrasound effected. But what are the underlying principles of this technique? Ultrasonic irradiation results in multiple reaction pathways during the degradation of pollutants. These pathways include, pyrolysis, hydroxyl radical reactions (Thompson and Doraiswamy 2000). When applied to liquid an event called electrohydraulic cavitation occurs. This cavitation goes through a series of events which ends with the implosion of microbubbles which then releases large amount of energy (Gogate, 2002). This extreme change in conditions results in direct or indirect chemical alterations.

There have been a number of work which attempted to use the oxidative process in removing emerging contaminants, such as pharmaceuticals from solution. Hoffman et al., demonstrated the efficiency of sonochemical for the degradation of p-nitrophenol, carbon tetrachloride, parathion, p-nitrophenyl acetate and trinitrotoluene. The study concluded that the method is effective for the rapid destruction of the organic compounds due to the extreme temperature and pressure and formation of powerful hydroxyl radicals (Hoffman et al., 1996)

**Comparison:-**

Advanced oxidation processes are grouped on the basis of their aqueous phase oxidation mechanism that results in hydroxyl radicals which then breaks down pollutant into biodegradable intermediaries or completely. An important commonality and drawback to among AOPs is the relatively high cost of reagents and high cost of energy as may be the case with energy intensive processes such as sonochemical irradiation and photocatalytic methods, especially when compared to biological- primary and secondary techniques. The treatment however do have for the most part their individual advantages and disadvantages, some of which will be discussed in this section.

So far the use of AOPs to optimize the removal of pollutants; microorganisms and inorganic micro-pollutants, has proven successful and is used especially in cases where treated water is to meet the highest grade, usually for consumption. Advanced oxidation process have been increasingly being used in streams that have concentrations of ECs and or an assortment of their metabolites. There are a number of challenges AOPs faced on large scale removal of contaminants. Challenges such as matrix composition- natural organic matter, dissolved and suspended solids, temperature and pH (Oppenlander, 2003). These parameters may have restricting effect on the type of AOP used and its efficiency. The Fenton reaction as discussed in earlier sections is very pH specific and is debilitated by conditions above the pH of 4 since iron, an important limiting factor is precipitated as the pH increases. Degradation rates of pollutant is increased when Fe (II) ion is in high concentration. Ultra-violet irradiation aided processes such as UV/H<sub>2</sub>O<sub>2</sub>, UV/CaO<sub>2</sub>, UV/Fenton and heterogeneous photolysis depend on UV transmittance (UVT). The processes efficiency can be hampered significantly if the UVT is not optimum. One of the main disadvantages of UV/H<sub>2</sub>O<sub>2</sub> processes as explained by Naddeo et al., is the small molar extinction coefficient of hydrogen peroxide and the strong dependence of photolysis on the pH conditions of the media (Andreozzi et al., 1999).

The mechanism of generating free radicals is what primarily distinguishes AOPs from other treatment methods. Photocatalyst is the term used to refer to UV or solar aided AOP processes and is often used to optimize the degradation process. In instances where natural solar energy is not used, energy consumption maybe lead to high energy cost. Esplugas et al., presented an energy cost evaluation of UV/H<sub>2</sub>O<sub>2</sub>, O<sub>3</sub> and Fenton and estimates for reagents used in his experiment. The costs were calculated based on the degradation of phenol at two intervals. From the authors estimate, photocatalysts and UV were notably more expensive than the other AOPs evaluated. Sonolysis or ultra-sonar irradiation's major disadvantage is its energy consumption as well and also its limited use for large volume (Naddeo et al., 2013). The processes especially when paired with other methods can be effective in degrading micro pollutants and may reduce cost (Naddeo et al., 2009; De bel et al., 2009; Landi et al., 2010)

**Conclusion:-**

Advanced oxidation process are not intended in any way to replace the conventional water and waste water treatment processes but instead to augment some of the shortfalls and to improve the efficiency of water works. AOPs have a unique ability to remove emerging pollutants by powerful oxidants and can be made economical depending on the methods applied. This versatility continues to allow scientists to improve upon existing knowledge to discover more affordable but effective combinations. Emerging pollutants are an increasing problem in a growing world where water security is crucial to economies and growth. The study of the effect of emerging pollutants are

lacking and therefore provides a myriad of opportunity for future research in terms of identification of new pollutants, their effects and development of economical but effective treatment processes. Advanced oxidation process provides a promising solution to offset the likely effects of emerging contaminants on environment.

**Introduction:-**

Knowledge and attitudes surrounding reproductive health carry profound meanings for women and men in every society and affect the quality of life in fundamental ways. Knowledge of sexual attitudes and behaviors is important to family planning researches, policy makers, and service provider.

In our country and many other countries the parents, teachers, Health care workers are unable to provide education about sexual and reproductive health, either because they have no enough information or they feel discomfort about the subject or due to the false belief that providing such information will encourage sexual behavior

The purpose of this study is to explore reproductive health knowledge and attitude among AlQassim University students.

**Methods:-**

A cross sectional study, data was collected through Self administrated structured questioners to a random sample of male students from 3 randomly selected colleges, from which about 300 students will be involved, and data regarding their knowledge and attitude of reproductive health was collected

**Results:-**

288 respondents with a mean age of 21.5 years were enrolled, all of them were male, and 65.5% were from Buraydah, 16.5 from Unizah.44% were from College of English, 55.6 from Pharmacy and Engineering colleges. Regarding the appropriate time of marriage 44% choose to marry after 25 of age, 42.7% between 21 to 25 of age, and 13.2% before the age of 20. About premarriage test 98.3 have good knowledge about its importance, 90% of them think it should be mandatory and 60% of them know it's important in the prevention of Inherited diseases. Asking about contraceptive methods 46.9% think physician consultation is important before the use of any contraceptive methods, 19.1% will use contraceptive pills, 19.6% will use condom and 14.6% don't want to use any contraception.

About Appropriate Number of Children to have 20.5% wish to have 1-3 children, 52.4% to have 3-5 children, and 27 % more than 5 children. 61.5 % think that children care will be affected by increasing number of children, 71.5% by marrying multiple wives and 63 % by wife work.

**Corresponding Author:- Najeeb alsalameh**

About 39% of the students would like to have their first child after one year one marriage, 51.4% after 2 years and 9% after more than 2 years. The space between children 60% chose 2 years as appropriate 25% more than 2 years and 14% one year.

**Conclusion:-**

Reproductive health knowledge and attitudes were different from students to student but in general there were areas of agreement and areas of disagreement. The students have good knowledge regarding reproductive health with some areas which need improvement.

#### Abstract

Advances in cancer therapy have resulted in significant improvement in long-term survival for many types of cancer but have also resulted in untoward side effects associated with treatment. One such complication that has become increasingly recognized is the development of cardiomyopathy and heart failure. The anthracyclines are arguably one of the most active groups of chemotherapy agents in oncology. Echocardiography has been employed to measure left ventricular ejection fraction as chemotherapy progresses, and once decreases in function are identified, chemotherapy dosage or frequency is modified, or the chemotherapy is stopped.

**Purpose:** To detect the side effects of the chemotherapeutic agents on the cardiac function and to estimate the incidence and the features of subclinical cardiotoxicity induced after conventional treatment with doxorubicin-based chemotherapy for lymphoma and breast cancer patients

**Patients and Methods:** This observational non controlled cross sectional study conducted in order to identify the clinical and Echo-Doppler signs of cardiovascular affection induced by Anthracyclines-based chemotherapy in female patients with breast cancer and lymphoma.

Echocardiograms were performed before and 6 cycles after initiation of therapy with anthracyclines. Clinical cardiomyopathy was defined by the presence of clinical signs of congestive heart failure (CHF) and decrease of left ventricular ejection fraction (EF). Cumulative dose of doxorubicin, diabetes, dyslipidemia, older age were evaluated as potential risk factors for the development of cardiac dysfunction.

**Results:** Cardiotoxic side effects developed in about one fourth of cancer breast patients and also lymphoma patients after Doxorubicin therapy. These toxicity were in the form of dilated cardiomyopathy (8.7%) in breast cancer patients and (8%) in lymphoma patients, pulmonary hypertension (7.3%) in breast cancer patients and (4%) in lymphoma patients, diastolic dysfunction (10%) in breast cancer patients and (12%) in lymphoma, mitral regurgitation (12%) in breast cancer patients and (8%) in lymphoma patients and abnormal ECG changes (13%).

The most evident risk factors for the development of cardiotoxicity is the cumulative dose, advanced age, Diabetes Mellitus, Dyslipidemia and hypertension. Anthracycline induced cardiomyopathy is related to number of received cycles of doxorubicin. A change in the left ventricular dimensions and functions (systolic and diastolic) as determined by echocardiography, may be an indicator of developing cardiotoxicity.

**Conclusion:** chemotherapy induced cardiomyopathy is a serious complication of cancer therapy rendering the timely identification of high-risk patients the key to reducing this risk. A unified acceptable definition of chemotherapy induced cardiomyopathy adopted by cardiologists and oncologists must be developed.

### **Introduction:-**

Advances in cancer therapy have resulted in significant improvement in long-term survival for many types of cancer but have also resulted in untoward side effects associated with treatment. One such complication that has become increasingly recognized is the development of cardiomyopathy and heart failure. Whether a previously healthy person from a cardiovascular perspective develops cancer therapy-related cardiac dysfunction or a high-risk cardiovascular patient requires cancer therapy, the team of oncologists and cardiologists must be better equipped with an evidence-based approach to care for these patients across the spectrum. Although the toxicities associated with various cancer therapies are well recognized, limitations to our understanding of the appropriate course of action remain. ( *bloom et al, 2016* )

The anthracyclines are arguably one of the most active groups of chemotherapy agents in oncology. Commonly used anthracycline antibiotics include doxorubicin, daunorubicin, and epirubicin. They have proven activity against a spectrum of malignancies, including lymphoma,

gastric cancer, small cell lung cancer, sarcomas, and breast cancer to name a few. ( *von hoff et al, 1982* )

Anthracycline are not only some of the most effective, but also the most toxic, chemotherapeutic agents. Their use is associated with a dose-dependent, progressive, dilated cardiomyopathy. To date, there is no specific laboratory or imaging approach to proactively identify patients who will develop anthracycline-induced cardiotoxicity.

Echocardiography has been employed to measure left ventricular ejection fraction as chemotherapy progresses, and once decreases in function are identified, chemotherapy dosage or frequency is modified, or the chemotherapy is stopped ( *Steinherz et al, 1991* )

### **Study design:-**

prospective ,observational cross sectional study

### **Aim of the study:-**

To identify the clinical and Echo-Doppler evidences of cardiovascular toxicity induced by Anthracyclines –based chemotherapy

### **Patients and Methods:-**

This observational non controlled cross sectional study conducted in order to identify the clinical and Echo-Doppler signs of cardiovascular affection induced by Anthracyclines–based chemotherapy in female patients with breast cancer and lymphoma

Patients were selected from those attending National cancer institute and other specialized hospitals during the period from July 2014 to august 2016.

**Inclusion criteria:-**

150 women in different age groups who had breast cancer and 50 patients who had lymphoma. All received Doxorubicin –based chemotherapy, according to the following regimen:

most of breast cancer patients had received **FEC** (fluorouracil 500 mg / m<sup>2</sup>, epirubicin 100 mg /m<sup>2</sup> and cyclophosphamide 500 mg /m<sup>2</sup>), and **FEC -T** regimen and lymphoma patients had received **CHOP** (cyclophosphamide 750 mg /m<sup>2</sup>, doxorubicin 50-100mg /m<sup>2</sup>, vincristin 1.4 mg/m<sup>2</sup>, prednisone) according to type of lymphoma

Their baseline clinical and echocardiographic studies were essentially normal.

**Exclusion criteria:-**

Cardiac diseases: Ischemic heart disease, valvular, congenital heart disease or cardiomyopathy before initiation of chemotherapy.

**Methods:-**

*All patients included in the study were subjected to the following:-*

1. Full history taking: with special interest to determine the risk factors for CAD as hypertension, diabetes mellitus, smoking, dyslipidemia and positive family history of ischemic heart disease.
2. General clinical examination including pulse and blood pressure measurement.
3. Local cardiac examination for assessment of the presence of cardiac murmur, any additional heart sound (e.g. 3rd or 4th heart sound).
4. Echo-Doppler examination using General Electric system Vivid-5 machine with S3 probe. It was done to all patients before starting chemotherapy. The echocardiogram was performed with the patient breathing quietly and lying in the left lateral position. M mode, 2-D and Doppler examinations were done.

**Echo-Doppler evaluation included:-**

Transthoracic conventional echo Doppler was done in all standard views at all accessible windows.

\* 2-D guided M- Mode at the level of the mid left ventricle was obtained and the following measurement was made according to the guideline of the American Society of Echocardiography (*Cheitlin et al., 2003*).

(1) Interventricular septum thickness (IVST), left ventricular posterior wall thickness (LVPWT), end diastolic dimension (EDD), end systolic dimension (ESD), aortic root diameter (AO), and left atrial diameter (LA), Left ventricular function assessment by calculating percent fractional shortening (%FS) and ejection fraction (EF) as follows:

Fractional shortening (FS) was calculated using M-mode LV dimensions in diastole (LVDD) and systole (LVSD):

$FS (\%) = 100 \times (LVDD - LVSD) / LVDD$  (*Cheitlin et al., 2003*).

Ejection fraction (%) was calculated according to the following:

Systolic and diastolic volumes were calculated using the area-length method if the LV is symmetric, but the biplane modified Simpson's rule (4- and 2-chamber views) was used if there is a wall motion abnormality. The ejection fraction (EF%) was calculated according to the following equation:

$EF (\%) = 100 \times \text{diastolic volume} - \text{systolic volume} / \text{diastolic volume}$  (*Cheitlin et al., 2003*).

(2) Wall motion abnormalities (hypokinesia, akinesia, dyskinesia and aneurysm) were searched.

(3) Evaluation of valvular structure and function especially the presence of mitral regurgitation (*Weyman et al., 2007*).

(4) Evidence of pulmonary hypertension (PASP > 30) as estimated through measurement of the tricuspid regurgitant peak velocity (V<sub>max</sub>). If the signal varies, we consider the highest value. In absence of pulmonary stenosis and organic tricuspid regurgitation, the pulmonary artery systolic pressure is equal to: (V<sub>max</sub>)<sup>2</sup> X 4 + right atrial pressure. The right atrial pressure (RAP) was estimated from the diameter and effect of inspiration on the diameter of inferior vena cava as follows:

- Normal diameter (< 2 cm) with collapse or decrease > 50%, the RAP = 5 mmHg.

- Normal diameter (2 cm) with decrease < 50%, the RAP = 10 mmHg.

- Dilated (> 2 cm) with decrease < 50%, the RAP = 15 mmHg.

- Dilated with dilated hepatic veins + no change, the RAP = 20 mmHg. (*Kircher et al., 1990*).

## (5) Doppler assessment of LV diastolic function.

Indices of LV diastolic function obtained from standard transmitral diastolic Doppler signals.

These indices were derived from pulsed Doppler examination guided by color flow with the sample volume placed between the level of the mitral annulus and the tip of the opened mitral leaflets in the apical four chamber view. Measured and calculated Doppler parameters of diastolic function included: early diastolic velocity (E velocity), E-deceleration time, late diastolic velocity (A velocity) and ratio of early to late velocities (E/A) (Nagueh et al., 2009).

**Diastolic function was categorized according to the following:**

- ❖ Normal diastolic function: when the E/ A ratio  $\geq 1$  and E – deceleration time  $< 250$  msec.
- ❖ Grade I diastolic dysfunction ( abnormal relaxation ) when the E / A ratio  $< 1$  and E – deceleration time  $> 250$  msec .
- ❖ Grade II diastolic dysfunction ( pseudo – normal ) when the E / A ratio 1-2 and deceleration time between 150 – 200 msec .
- ❖ Grade III diastolic dysfunction ( Restrictive Pattern ) when the E / A  $\geq 2$  and the deceleration time  $< 150$  msec. (Thomas et al.,2006)

**Follow-up:**

Patients were followed up for 6 cycles with a monthly visit for clinical assessment of the symptoms and signs of cardiac affection.

**Statistical methods:-**

Data was analyzed using IBM SPSS advanced statistics version 22 (SPSS Inc., Chicago, IL). Numerical data were expressed as mean and standard deviation or median and range as appropriate. Qualitative data were expressed as frequency and percentage. Chi-square test or Fisher's exact test was used to examine the relation between qualitative variables. For not normally distributed quantitative data, comparison between two groups was done using Mann-Whitney test (non parametric t-test). Analysis of variance (ANOVA) with repeated measures was used to compare three consecutive measures of numerical variables. While for qualitative data comparison between more than two consecutive measures was done using Cochran test. All tests were two-tailed. A p-value  $< 0.05$  was considered significant. (Bacchieri, Della. 2007).

**Results:-**

This is observational non controlled cross sectional study included 200 patients admitted to National cancer institute and other specialized hospitals for receiving chemotherapy most of patients had breast carcinoma (150 patients ) and the others had lymphoma (50 patients ).

The age ranged between 30 to 60 years with a mean age of  $43 \pm 8.2$  years. forty six patients (23%) were hypertensives , forty patients (20%) had Diabetes Mellitus, eleven patients (5%) had dyslipidemia and twelve patients (6%) had +ve family history cardiac problem

The results of the current study regarding clinical examination before and after chemotherapy showed that the mean HR before chemotherapy was 75 and after 77 , systolic blood pressure before was 121 and after 123 and diastolic blood pressure before was 70 and after 78 as in

**Table (7)** showed that there is no significant difference between the different echocardiographic parameters before and 6 months after chemotherapy except for the incidence of mitral regurgitation in 18 (12%) in patients with breast cancer and 4 (8%) in lymphoma patients , the incidence of diastolic dysfunction which occurred in 15 (10%) in breast cancer patients and 6 (12%) in lymphoma patients , incidence of increased LV dimensions in 13 (8.7%) in breast cancer patients and 4 (8 %) in lymphoma patients ,, incidence of decline in EF is 10(6.7%) in breast cancer patients and 4(8 %) in lymphoma patients incidence of pulmonary HTN in 11( 7.3 %) in breast cancer patients and 2( 4 %) in lymphoma patients.

**Table (7):-** Results of echocardiographic study before and 6 months after chemotherapy

Type of Complication	Complication Rate in BREAST CANCER PATIENTS No ( % )	Complication Rate in In LYMPHOMA PATIENTS No ( % )	COMPLICATION RATE IN ALL CASES
Dilated Cardiomyopathy	13 (8.7%)	4 (8%)	17 ( 8.5 %
Pulmonary hypertension	11 (7.3%)	2 (4%)	13( 6.5% )
Mitral regurgitation	18 (12%)	4 (8%)	22 ( 11 %)
Diastolic Dysfunction	15 (10%)	6 (12%)	21 ( 10.5 %)
Low EF	10 ( 6.7 %)	4 ( 8% )	14 ( 7% )

**Table (8):-** Incidence of Cardiac Complications after chemotherapy

	Before N = 200	After N = 200	P value
EDD (Mean ± SD) (Cm)	4.2 ± 0.3	4.4 ± 0.6	> 0.05
ESD (Mean ± SD) (Cm)	2.9 ± 0.5	3.0 ± 0.6	> 0.05
PWT (Mean ± SD) (Cm)	0.8 ± 0.1	0.9 ± 0.1	> 0.05
SWT (Mean ± SD) (Cm)	0.77 ± 0.1	0.82 ± 0.1	> 0.05
RVDD (Mean ± SD) (Cm)	1.3 ± 0.4	1.34 ± 0.3	> 0.05
LAD (Mean ± SD) (Cm)	3.3 ± 0.5	3.4 ± 0.4	> 0.05
Ao. (Mean ± SD) (Cm)	3.1 ± 0.35	3.3 ± 0.4	> 0.05
EF% (Mean ± SD) (Cm)	64.6% ± 5	63.3 ± 5.9	< 0.05
FS% (Mean ± SD) (Cm)	37.8 ± 7.1	36.0 ± 6.8	< 0.05
Mitral Regurgitation (n (%))*	0	22 (11%)	< 0.05
Diastolic dysfunction (n (%)**)	0	21(10.5%)	< 0.05
Pulmonary hypertesion(n %)		13(6.5 %)	< 0.05

the current study showed that dilated cardiomyopathy developed in 17 patients (8.5%), pulmonary hypertension occurred in 13 patients (6.5%), significant mitral regurgitation in 22 patients (11%), diastolic dysfunction in 21 patients (10.5 %), and low EF in 14 patients (7 %) The total number of patients who developed one or more cardiac complication was 52 (26% ) i . e . about one fourth of cases .

### Discussion:-

Anthracyclines are among the most widely used chemotherapeutic agents ,and have been shown to be effective in a wide range of tumors in particular breast cancer and lymphoma.their clinical effectiveness however may be thwarted by the development of cardiotoxicity that negatively affects patients outcomes,and seriously limits their oncologic therapeutic opportunities ( **Smith et al.,2010 and Vandalen et al .,2007** )

Chemotherapy induced cardiotoxicity in cancer patients may causes serious consequences not only in patients with existing cardiovascular disease but also in patients with good prognosis , this cardiotoxicity may eventually cause severe morbidity leading to premature death (**Svoboda et al .,2012**)

The most clinical presentation of cardiotoxicity is dose dependent cardiomyopathy leading to chronic heart failure , frequently occurring after administration of chemotherapy including anthracyclines (**Yeh et al., 2004** )

Such cardiotoxicity results in a permanent loss of cardiac myocytes and a progressive reduction in cardiac function. Initially, damage to the heart is subclinical; however, increasingly impaired cardiac function can result in clinical heart disease, with serious cardiac injury resulting in congestive heart failure.(**Kilickap et al., 2005** )

Early detection of subclinical anthracycline cardiotoxicity , and ultimately the prevention of clinical congestive heart failure , is a continuing challenge in clinical practice.

This prospective clinical trial aimed at identifying the clinical and echocardiographic signs of cardiovascular toxicity induced by anthracycline containing regimens among patients with breast cancer and lymphoma. For this purpose, one hundred women with breast cancer who underwent mastectomy and fifty patients with Hodgkin and non-Hodgkin subjected to FEC (fluorouracil, epirubicin and cyclophosphamide), CHOP (cyclophosphamide, doxorubicin, vincristin, prednisone) and respectively (anthracycline containing regimens) were used in this study. Their baseline clinical and echocardiographic examinations (before starting chemotherapy) were essentially normal. They were followed-up clinically for 6 months with repeated echocardiographic study done at the end of the follow-up period.

The mean age in our study was  $43 \pm 8.2$  years ranged from 30-60 years this was concordant with **Jensen et al., 2002** who reported that the incidence of congestive heart failure is greater with old patients compared with younger age and discordant with **Peinf et al., 2004** who reported that the incidence of anthracycline induced cardiomyopathy increases with young age.

In our study diabetes is important risk factor associated with chemotherapy, it is present in 20% of patients, this was concordant with **lioyd et al., 2006**, and discordant with **danesi et al., 1999**.

In our study, diastolic blood pressure increased significantly, that was concordant with **Shakir et al., 2009**, and discordant with **Mellstedt et al., 2003**.

In our study the incidence of symptomatic heart failure is 7%, this was concordant with **Keefe et al., 2001** and also von hoff et al., 1979, and discordant with **Borrow et al., 1983**.

The results of the current study regarding clinical examination before and after chemotherapy showed that Dyspnoea and murmur of mitral regurgitation developed in 14 (7%) and 22 (11%) cases respectively after chemotherapy this was concordant with **Shakir et al., 2009** who reported that an incidence of clinical heart failure and cardiomyopathy was 5 to 20% which is nearly similar to that recorded in our study.

In the current study The incidence of abnormal findings in the ECG developed in 26 patients (13%). Consistent with these results, **Dresdal et al., 1983** who reported that the incidence of ECG changes was 12-14%.

Additionally, **Frishman et al., 1997** concluded that the ECG abnormalities due to anthracycline therapy may present as non-specific ST and T wave changes, T wave flattening, decreased QRS voltage and prolongation of Q-T interval. They added that sinus tachycardia is the most common rhythm disturbance. they reported that the incidence of the ECG changes in their study was 20-30% compared to only 14% in the present study.

The results of the present study regarding the echocardiographic findings before and after chemotherapy showed that there is no significant increase in cardiac chambers cavity dimensions and significant decrease in the LV systolic function (EF% and FS%).

twenty two patients (11%) developed mild to moderate mitral regurgitation while twenty one patients (10.5%) developed diastolic dysfunction this was concordant with **Kruiipicke et al., 2002** who did not show significant changes of M-mode derived LV end diastolic and end systolic dimensions, also was concordant with **Gabrielsen et al., 2002** who reported that there was significant decline in mean ejection fraction after chemotherapy, the mean diastolic left ventricular dimension did not significantly change.

This was discordant with **Singal et al., 1998** who reported that end systolic dimension increased significantly after completion of chemotherapy.

In our study the incidence of chemotherapy induced cardiomyopathy was 8.7% in breast cancer patients with cumulative dose of doxorubicin 600-800mg/m<sup>2</sup> and 8% in lymphoma patients with cumulative dose 400-600mg/m<sup>2</sup>. this was concordant with **Salvaterelli et al., 2015** and **Von Hoff et al., 1979**, it was discordant with **Swain et al., 1997** who reported that the incidence of chemotherapy induced cardiomyopathy at dose of 550 mg/m<sup>2</sup> was 26%.

### Conclusions and Recommendations:-

- ❖ Cardiotoxic side effects developed in about one fourth of cancer breast patients and also lymphoma patients after Doxorubicin therapy. These toxicity were in the form of dilated cardiomyopathy (8.7%) in breast cancer patients and (8%) in lymphoma patients, pulmonary hypertension (7.3%) in breast cancer patients and (4%) in lymphoma patients, diastolic dysfunction (10%) in breast cancer patients and (12%) in lymphoma, mitral regurgitation (12%) in breast cancer patients and (8%) in lymphoma patients and abnormal ECG changes (13%).
- ❖ The most evident risk factors for the development of cardiotoxicity is the cumulative dose, advanced age, Diabetes Mellitus, Dyslipidemia and hypertension.
- ❖ anthracycline induced cardiomyopathy is related to number of received cycles of doxorubicin.
- ❖ anthracycline analogues have shown some benefit in reducing cardiotoxicity when compared with doxorubicin alone.
- ❖ A change in the left ventricular dimensions and functions (systolic and diastolic) as determined by echocardiography, may be an indicator of developing cardiotoxicity; So, monitoring such changes should be frequent during treatment and regular thereafter, throughout the patient's lifetime.
- ❖ It is recommended that other studies should be done on a larger scale and for a longer follow up period to shed more light on this important issue.

### **Abstract**

Strategic leadership must have the ability to manage through others and influence them, and the Strategic leadership competencies, through its dimensions (Strategic thinking competencies, leadership competencies), helps the managerial leaders of an organization to perceive and interpret their role in enhancing the organization's core competency. For this reason, we may assume that Strategic leadership competencies have an impact on core competency in an organization. The aim of this study is to explore the impact of Strategic leadership competencies dimensions (Strategic thinking competencies, leadership competencies) on core competency in AlManaseer Group Company. For this purpose, a questionnaire was developed to collect data from the study population which consists of 50 employees. This is aimed at testing the hypotheses and achieving the objectives of the study. The most important results that the study achieved were that there was a statistically significant impact of business intelligence with its dimensions (data warehousing, data mining, and direct analytical processing) in technical creativity. The most important recommendations of the study were the necessity of organizations dependence on modern technology in order to develop their works. Thus, this is because this technology is recognized by its high accuracy on a completion of the work, as well as deepening the concept of technical creativity which gives them a competitive advantage in the market.

### **Introduction:-**

Business organizations face a challenging future that characterized with uncertainty, high risks, high competitiveness, and speed of technology advents. Markets are becoming more diverse and complex than ever with globalization. Sustain at highly competition, business organizations require not only to possess new talent employees and Intellectual Capital but also to engage them to achieve strategic goals (Irtaimeh, et al., 2016).

Therefore, leaders and managers should be aware and alert if they want to achieve growth and profit targets. As environmental turbulence increases, strategic issues and options become more sensitive to their development. It would enable a better understanding of capability needed to respond to various levels of environmental turbulence.

**Corresponding Author:- Hani J. Irtaimeh.**

Address:- Management Department, Business and Finance School, World Islamic Science & Education University (WISE), Amman, JORDAN.

In turbulent environments, strategic leadership becomes more important than ever to steering their businesses during the intensified competition and thus the quality of leadership is critical (Joyce, 2012). In the late 1980s, many social science researchers have gone on a debate whether leadership could make a difference in organizations while some others suggested that study of leadership has reached a culminating point. Moreover, leadership plays a pivotal role inside organizations concerning its strategic orientation (and Options).

Nowadays, the study of leadership has been rebranded again as that would make them able to lead and steer the organization during the tough situations. In the era of global markets, organizations start to widening up and diversifying their operations to compete locally, regionally, globally, and internationally for successful growth and survival; therefore, strategic leaders require certain competencies such as strategic thinking, strategic vigilance, change management, and shared values & a clear vision (Norzailan, Yusof, & Othman, 2016).

**Research Problem & Aims:-**

***Problem Statement:-***

Strategic leadership literatures have identified long lists of competencies relating to leadership for effective management. Admittedly, the dynamic and rapidly evolving environment produce increasing uncertainty, complexity, and higher competition, hence, organizations suffer from lacking highly skilled leaderships. As long as complicated situations emerging, leaders should learn effectively how to manage and lead strategic plans that are requiring supplemental critical skills and competencies regardless of the level of leadership involved and thus adding more competencies to their profiles. Notwithstanding, many strategic leadership missed their direction and failed to keep organization on the right path. Therefore, the strategic leadership competencies and the particular core competencies required will be investigated in this study.

***Aims of Study:-***

Smart and professional leaders in all cases require competencies in unique technical and personal skills. An investigation into the nature and impacts of the most critical of these leadership competencies required for strategic leadership is the focus of this study. It will highlight the impact of strategic leadership competencies on core competencies of the organizations which reflect on performance as a whole. This paper also studies strategic leadership competencies in the context of an economic turmoil which has posed great challenges for Jordan's organizations.

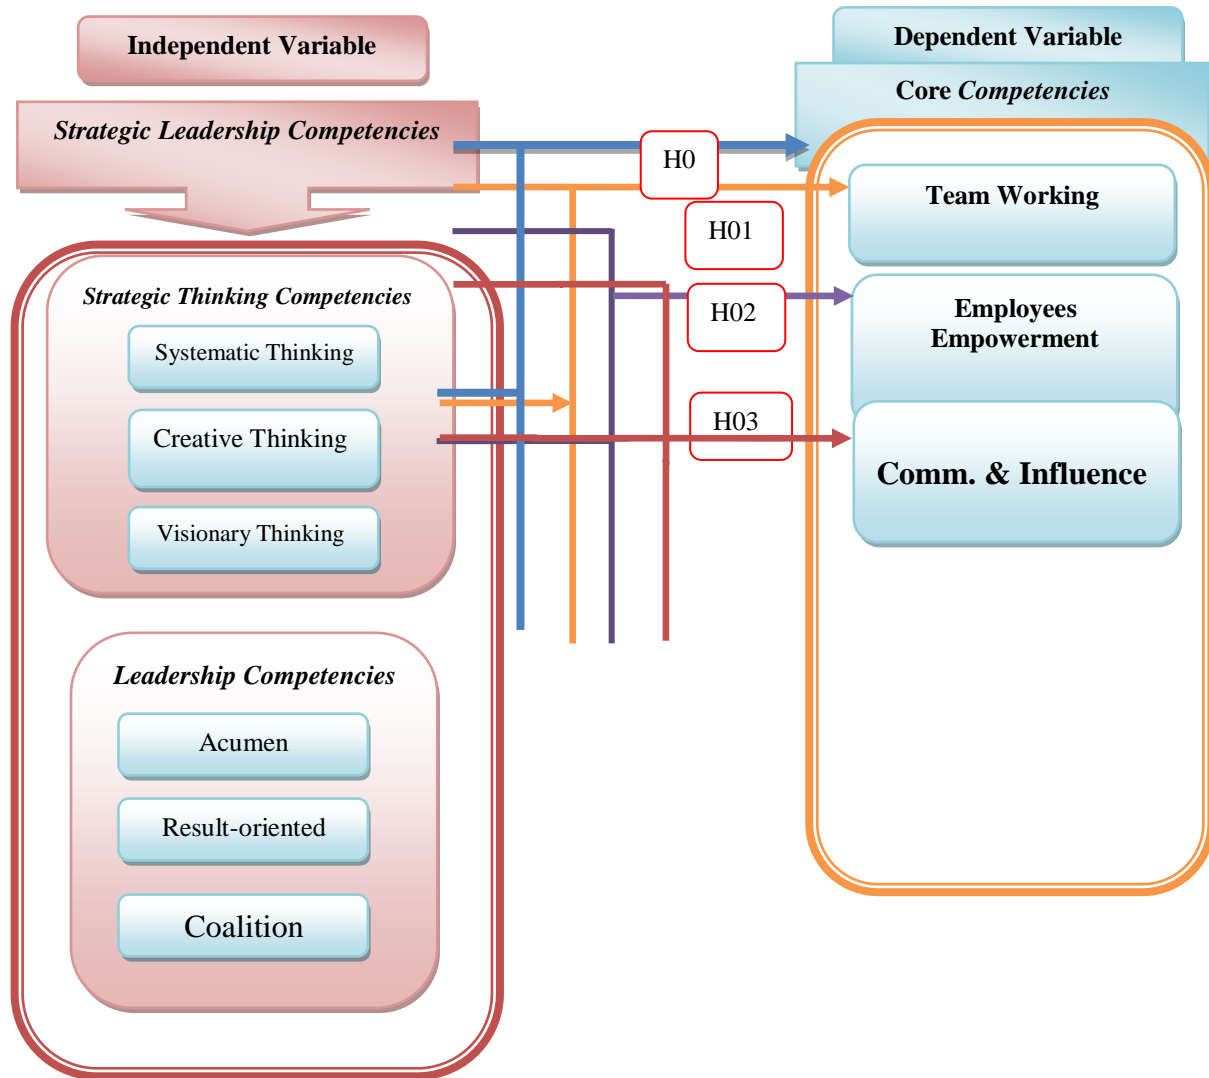

***Research Questions:-***

Towards realizing the broad objective, this study will provide answers to the following questions:

1. What are the competencies required for effective strategic leadership?
2. Which of the competencies required for effective strategic leadership are core?
3. Is level of experience a factor in identifying the core competencies?
4. Are the core competencies identified for traditional leadership adequate for effective strategic leadership?

**Research Model:-**

The study adopted the following study model of the study variables relationships, shown in Figure (1).

**Figure (1):-** the model prepared by the researcher supported in building the following sources: The independent variable (Strategic Leadership Competencies): (Moon, 2013; Overby & Suvanujasiri, 2012; Das et al, 2011). The dependent variable (core competencies): (Shaykhli and Kubaisi, 2011).

**Study Hypothesis:-**

The study has one main hypothesis and three sub hypothesis, as following:

H0: *“The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn’t significantly and positively affect the core competency in AlManaseer Group at  $\alpha \leq 0.05$ ”.*

H01: *“The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn’t significantly and positively affect the Team Working in AlManaseer Group at  $\alpha \leq 0.05$ ”.*

H02: *“The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn’t significantly and positively affect the Employees Empowerment in AlManaseer Group at  $\alpha \leq 0.05$ ”.*

H03: *“The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn’t significantly and positively affect the Comm. & Influence in AlManaseer Group at  $\alpha \leq 0.05$ ”.*

**Literature Review:-****Previous Studies:-**

Mapetere, Mavhiki, Nyamwanza, Sikomwe, & Mhonde (2012) conducted a study to explore the link between active leadership involvement and strategy implementation success in State-Owned-Enterprises in Zimbabwe. The study revealed that a relatively low leadership involvement in strategy implementation leading to partial strategy success. Leadership has been failing to role model the ideal behavior necessary for successful strategy implementation. The absence of a well-crafted strategic vision and the lack of communication were also identified. The study concluded that leadership should be able to craft a vision for any strategic program, design effective communication strategies as well as to role model behavior changes that are consistent with new strategies.

Al-Zoubi (2012) examined the impact of leadership competencies on competitive advantage in the Jordan Telecommunication Industry (JTI). A survey was administered over the middle line managers including supervisors and team leaders. The study found that leadership competencies had a significant impact on Jordanian Telecommunication Companies as well as a strong relationship exists between leadership competencies and competitive advantage.

Moreover, Eldakak (2014) discussed the essential leadership skills and competencies during the crises facing the organizations and how to deal with them effectively. His study consternates on the competencies that should each strategic leadership have them to manage the situations more effectively and achieve the targets.

Hirschi & Jones (2009) demonstrated that strategic leadership has clarity of vision and ability to develop competencies required to attuned organization goals and thus they understand their market and resources well. The results show that the characteristics and skills of strategic leaders play a dominant role in their ability to see the big picture, embedding these into daily business is crucial. Also it found that national culture, competitiveness and market development affect strategic leadership. Eventually, strategic leadership is associated with business success and a lack of strategic leadership may find companies losing focus in the long term.

Maarten & Mikhail (2010) explore the building strategic leadership competencies in global firms working at the Russian business environment after post-communist regime as contributors to successful corporate growth. A serious breakdown faces most companies related to cultural diffusion with visible gaps between typical behaviors and perceived managers' values. They admitted that to achieve strategic success by better understanding the link between strategy and anticipated managers' behaviors, leadership competencies must be considering analysis of Leadership Growth Profile (LGP). Consequently, they observed that leadership competencies are contingent in their nature. Not surprisingly, Wan (2013) agreed with Maarten & Mikhail (2010) point of view about that the context is very important where leaders can enhance and execute their competencies based on their core competencies. Thus, nowadays empowering leaders are more acceptable than ever by their followers to bring greater organizational success.

Norzailan, Yusof, & Othman (2016) proposed that strategic leaders develop three key and distinctive competencies needed to run their duties in the turbulent environment to get competitive advantage, these competencies are strategic thinking, managing policies, and change management. They concluded that these competencies are achievable through a training programs and the training program should accommodate three important elements; deliberate practice, experience density and reflective learning, which are a part of the triangle that supports the development of strategic leadership competencies. As long as these supporting the accumulated competencies of leaders, organizations will obviously possess knowledgeable and professional strategic leaders with core competencies available for more strategic success.

**Leadership & Strategic Leadership:-**

Leadership is an engine for organizations to struggle for growth and survival. Finding good and excellent leaders have always been a crucial issue for all sorts of organizations (Trapp, 2014). Mainly, strategic leadership can be found at all levels of organization, at the top level where business units are formulated, at the middle level where the main strategy top down translated into different business unit strategies (regional, global, and international), and at the departmental level where strategic goals are translated into reality and executing them.

Strategic leadership is a complex form of leadership in organizations. It means that the leader must have the ability to manage through others. Being a strategic leader requires the ability to anticipate, envision, maintain flexibility,

and empower others to create strategic change as necessary. Strategically thinking, a strategic leadership is mandatory to run the ongoing change through continuous improvements to employees and processes used, in other words, their main role is to keep and sustain organizational resources and capabilities while searching for another extended resources that support its strategic goals. Strategic leadership must be alert and carefully make balance between analytics and process development and human dimension.

By and large, the harmonized team leaders and employees that understand common tools, framework, and templates for success, is a very promising future for the organization to start smoothly and grow up very fast. Concretely, the new era of the 21st century requires different leaders to contribute more to their organizations; those leaders face tremendous pressure and challenges such as building peoples' ability to innovate, inspiring others to perform harder, stimulating their high potentials, and understanding of rapidly changing technological advancements. Therefore, leaders require more skills, knowledge, capabilities, abilities, and competencies that would certainly achieve organizational strategic goals.

#### **Competence Vs. Competency :-**

The term of competency has various definitions and it was originated at McClelland works in 1973 used it as replacement to intelligence tests (McClelland, 1973). The term is closely related to ability but there is different between the meanings of synonymous words. Ability usually refers to the able to do something and need special talents while competency refers to the experience or expertise. Noteworthy, competence doesn't equal to competency, the latter is behavioral-based which related to individual characteristics and personality while the first is skill-based that can be trained and practiced. McClelland developed certain competencies for each position based on behavioral interviews with employees and top management (Northouse, 2004).

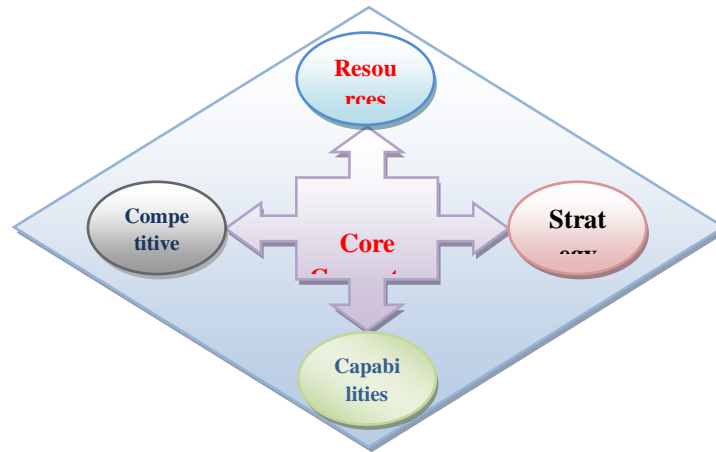

#### **Core Competencies & Leadership Competency:-**

The concept of core competencies was developed by Gary Hamel and C. K. Prahalad (1990) to explain that organizations can easily face the challenges to sustain their strategic position (Prahalad & Hamel, 1994 and 2001; Wikipedia, 2016). It can be defined as "a harmonized combination of multiple resources and skills that distinguish a firm in the marketplace" (Schilling, 2013). Gallon, Stillman, & Coates (1995) defined it as "an aggregates of capabilities, where synergy is created that has sustainable value and broad applicability". Moreover, Coyne, Hall, and Clifford (1997) defined core competencies as "a combination of complementary skills and knowledge bases embedded in a group or team that results in the ability to execute one or more critical processes to a world class standard". Hence, Core competencies are the set of skills which are crucial to a business, for them to gain a competitive advantage in their market.

The term "core competencies" was introduced to Baldrige Glossary Definition on late 2007 which define it as an organization's areas of greatest expertise. An organization's core competencies are those strategically important capabilities that are central to fulfilling its mission or a distinctive competence that provides a firm a competitive advantage in its industry (Baldrige Glossary Definition, 2007). Core competencies frequently are challenging for competitors or suppliers and partners to imitate. Absence of a needed core competency may result in a significant strategic challenge or disadvantage in the marketplace. Core competencies may involve technology expertise, unique service offerings, a marketplace niche, or particular business acumen (e.g., business acquisitions). Core competencies focus on an organization's internal capacities and deep proficiencies that enable a company to deliver unique value to customers. Core competencies also contribute substantially to the benefits a company's products offer customers (Nair, 20104). The distinguishing characteristic of an organization's core competencies are that they develop overtime and represent the continual accomplishment of a firm's critical success factors over time. Another distinguishing characteristic of a core competency is that it's hard for competitors to copy or procure (Rigby, 2015: 24).

By using Hamel and Prahalad core competency model, organizations can capable of developing unexpectedly and surprisingly new products that are matching Porter's cost-leadership strategy and faster than their rivals. Hamel and Prahalad model focuses on a combination of specific, collaboration, integrated and applied knowledge, skills and attitudes (Marino, 1996; Lawson, 1999), it consists of four core competencies (Figure 2); **resources** that requires for developing skills and technologies, **capabilities** the various possibilities to build up core competencies, **competitive advantage** the challenge to acquire and develop largest market share of core products, and **strategy** to develop largest market share of finished products (Van Vliet, 2011).

Figure 2

By researcher depending on Hamel and Prahalad model

A company's competitiveness derives from its core competencies and core products (the tangible results of core competencies). Core competence is the collective learning in the organization, especially the capacity to coordinate diverse production skills and integrate streams of technologies. It is also a commitment to working across organizational boundaries. Organizing around core competencies requires a radical change in corporate organization. The first step requires identifying core competencies, which meet these three requirements: they provide potential access to a wide variety of markets, make a contribution to the customer benefits of the product, and are difficult for competitors to imitate. The next step is to redesign the architecture of the company and provide an impetus for learning from alliances and a focus for internal development (Prahalad & Hamel, 1990).

As a result, effective leaders require competency in core skills. Expertise in core competencies associated with leadership roles typically enable a person to lead others, develop personnel, create a productive environment and get results. Successful organizations develop a competency model that shows the skills, attitudes, behaviors and knowledge required for their leaders and provide training that helps personnel further their careers. Additionally, senior leaders typically provide coaching and mentoring to less-experienced personnel to ensure leadership succession. Therefore, organizations seek to build a leadership competency model which basically divided into three levels:

- 1- Core Competencies at the base level, these are the personal skills required by leadership which is an essential for the foundation of competent leaders. It includes but not limited to basic communications, negotiation, teamwork, creative problem solving, interpersonal skills, manage client relationship, self-direction, flexibility, building necessary relationships, financial skills, business acumen.
- 2- Leadership Competencies at the middle level, grasping these competencies form a basic structure of separating leaders from bosses. Without these competencies, leaders are not any longer leaders. It is cannon in front of new cutting edge of technological menace. Leadership competencies include leadership abilities (role model, stimulating morals, and building trustiness), visioning process, create and lead teams, assess situations accurately and quickly, foster conflict resolutions with win-win situation, project management, employee involvement strategies, coach and train peers and subordinates.
- 3- Professional Competencies at top level, these are the skills and knowledge required by leaders to direct the systems and processes that leader control. These are including adult learning, instructional design, rapid design, and instructions.

### Research Design and Methodology:-

#### Research Design:-

For this study, a descriptive quantitative methodology was chosen to allow us to generate conclusions and results that can be generalized. The methodology is a formal and systematic process that makes use of numerical data in making deductive conclusions. This is achieved with the aid of a structured questionnaire. The questionnaire was drafted to obtain statistically useful information about the strategic leadership competencies required to enhance organization's core and critical competencies across different industries and positions. The questionnaires were administered by distributing and handing out to the respondents to be completed and collected back for subsequent analyses.

**Target Population:-**

The target population for this descriptive study is people occupying top management posts and middle management in AlManaseer for Industrial & Trading Group. The focuses of this study are leaders irrespective of specialization. A well-structured questionnaire was used to obtain data from individuals that fall within the target population in the selected companies.

Cross tabulation and correlations will be used to associate between the variables, which in this case, are the strategic leadership competencies and core competencies required for effective strategic organizational executions.

**Methodology:-****Population and Sample:-**

The population for this study consists of AlManaseer for Industrial & Trading Group chosen because it has a strong brand name and it is implementing accelerated growth strategy in the different companies belongs to this group in Jordan.

AlManaseer Group consists of 27 subsidiaries of the Group parent company, the study sample included all administrative leaders, and thus the size of the sample (180) as director of the occupants of managerial positions in the group AlManaseer companies. **6.3.2 Data Collection and Instrument.**

The study used a questionnaire for collection data of study. A survey instrument that had a (1-5) Likert scale was designed and developed in line with earlier studies to be fitted for Carrefour environment, and it consisted of three main sections; Section 1 focused on Demographical Variables; gender, age, educational background, experiences, and position, while the section 2, focuses on strategic leadership, eventually Section 3

Emphasized on core competencies. 180 questionnaires were distributed on AlManaseer Group director. Only 168 were returned with a ratio of 93.3% and 162 were valid to statistically analysis.

**Instrument Validity and Reliability:-**

The instrument (questionnaire) was sent to a professional as well as specialists in the strategic management and strategy to test the face validity of the instrument; they did small corrections and split some items into two or three items to measure all the variables comprehensively. Other type was to test the internal consistency and stability of questionnaire, is conducting a pilot sample of 20 managers to assess the simplicity and clarity of all items, the results was as simple as clear to understand. Meanwhile, researchers used Cronbach Alpha to test the reliability of the questionnaire, and it is considered adequate if it is exceed 0.70 according to (Sekaran & Bougie, 2010, 290).

However, as depicted in table 1, the results of Alpha coefficients of the concerned variables were registered acceptable where the coefficients are above 0.70. Therefore, the instrument were suitable and consistence for implementing the study.

**Table 1.** Cronbach's Alpha

<i>Variable</i>	<i>No. of Items</i>	<i>Cronbach Alpha</i>	
<b>Strategic Leadership Competencies</b>	<b>30</b>		
<b>Strategic Thinking Competencies</b>	<b>15</b>	<b>0.903</b>	
<b>Systematic Thinking</b>	5	0.837

<b>Total</b>	<b>45</b>		

**Findings:-**

In order to exploring the impact of independent variable(s) on dependent variable(s), a regression analysis was used. The hypothesis testing results are as follow:

**H0:** “The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn’t significantly and positively affect the core competency in AlManaseer Group at  $\alpha \leq 0.05$ ”.

**Table (2).** Regression Results of Strategic Leadership Dimension and ore Competencies

Dependent variable	R	R <sup>2</sup>	Statistic F	Sig F.	Regression coefficients				
					independent variable	$\beta$	Std error	t-statistics	Sig.
Core competencies	0.794	0.626	135,97	0.000	strategic thinking competencies	0.037	0.058	0.629	0.531
					Leadership competencies	0.772	0.064	12.088	0.000

\* The effect is statistically significant at the level of ( $\alpha \leq 0.05$ )

Table (2) explores the regression analysis of hypothesis; results revealed that the Strategic Leadership is significantly affects the Core Competencies at  $P \leq 0.05$ . ( $R^2 = 0.626$ ,  $t = 12.088$ ) which implies that the Strategic Leadership explains 62.6% of the variance of Core Competencies while the rest related to other factors not included in the model. In addition, if the leadership competencies is remarkably nurtured by 1 point, this will lead to effective to follow Core Competencies by 77.2%, in the other hand the result shows that the dimension strategic thinking competencies has not significant effect on the core competencies this shown at the table above, but the total effect the Strategic Leadership is significant, this leads to reject the null hypothesis that saying “The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn’t significantly and positively affect the core competency in AlManaseer Group at  $\alpha \leq 0.05$ ”, and accept the alternative hypothesis of affirming the effect.

**H01:** “The dimensions of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) don’t significantly and positively affect the Team Working in AlManaseer Group at  $\alpha \leq 0.05$ ”.

**Table (3).** Strategic Leadership Dimension (Strategic Thinking Competencies, Leadership Competencies) and Core Competencies

Dependent variable	R	R <sup>2</sup>	Statistic F	Sig F.	Regression coefficients				
					independent variable	$\beta$	Std error	t-statistics	Sig.
Team working	0.76	0.571	108.293	0.000	strategic thinking competencies	0.183	0.066	2.694	0.008
					Leadership competencies	0.627	0.073	9.217	0.000

As depicted on the table (3), results revealed that there is a positive correlation between Strategic Leadership and Team Working where the correlation coefficient (R) is equal to 0.76. Additionally, ( $R^2$ ) is explained 57.1% of the variance in Team Working and 42.9% related to other factors not listed in this study.

This confirms that Strategic Leadership with its two dimensions have a positive and significant effects on Team Working where the value of ( $F = 108.293$ , Sig. 0.000).

Regarding the dimensions of Strategic Leadership, strategic thinking competencies, Leadership competencies, table (3) shows that there are a significant and positive correlations with Team Working as the correlation coefficients of ( $R = 0.76$ ) respectively. Notably, the two dimensions of Strategic Leadership explain 18.3%, and 62.7%, of Team Working respectfully, while other factors related to non-listed in this study. Finally, the t-value is showing the significant and positive effect of these dimensions on dependent variable (Team Working). Supporting this is the Beta coefficient ( $\beta = 0.183$ , 0.627) respectfully. By and large, from these results, it can be concluded that Leadership

and its dimensions has a positive and significant relationships and effects on Team Working which are not supported our null hypothesis hence we reject it and accept the alternative hypothesis of affirming the relationships and effects. H02: “The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn't significantly and positively affect the Employees Empowerment in ALmanaseer Group at  $\alpha \leq 0.05$ ”.

**Table (4).** Strategic Leadership Dimension (Strategic Thinking Competencies, Leadership Competencies) and Employees Empowerment

Dependent variable	R	R <sup>2</sup>	f-statistics	Sig F.	Regression coefficients				
					independent variable	$\beta$	Std error	t-statistics	Sig.
Employees Empowerment	0.727	0.522	88.97	0.000	strategic thinking competencies	0.138	0.074	1.919	0.057
					Leadership competencies	0.629	0.081	8.761	0.000

\* The effect is statistically significant at the level of ( $\alpha \leq 0.05$ )

As shown on the table 4, results revealed that there is a relationship between Strategic Leadership and Employees Empowerment where the correlation coefficient (R) is equal to 0.73. Additionally, (R<sup>2</sup>) is explained 52.2% of the variance in Employees Empowerment and 47.8% related to other factors not included in the model.

This confirms that Strategic Leadership with its two dimensions have a positive and significant effects on Employees Empowerment where the value of (F=88.97, Sig. 0.000).

Regarding the dimensions of Strategic Leadership, strategic thinking competencies, Leadership competencies, table (4) shows that there are a significant and positive correlations with Employees Empowerment as the correlation coefficients of (R=0.73) respectively. Notably, the two dimensions of Strategic Leadership explain 7.4%, and 62.9%, of Employees Empowerment respectfully, while other factors related to non-listed in this study model. Finally, the t-value is showing the significant and positive effect of these dimensions on dependent variable (Employees Empowerment). Supporting this is the Beta coefficient ( $\beta=0.138, 0.629$ ) respectfully. By and large, from these results, it can be concluded that Leadership and its dimensions has a positive and significant relationships and effects on Employees Empowerment which are not supported our null hypothesis hence we reject it and accept the alternative hypothesis of affirming the relationships and effects.

H03: “The dimension of Strategic Leadership (Strategic Thinking Competencies, Leadership Competencies) doesn't significantly and positively affect the Comm. & Influence in ALmanaseer Group at  $\alpha \leq 0.05$ ”.

**Table (5).** Strategic Leadership Dimensions (Strategic Thinking Competencies, Leadership Competencies) and Comm. & Influence

Dependent variable	R	R <sup>2</sup>	f-statistics	Sig F.	Regression coefficients				
					independent variable	$\beta$	Std error	t-statistics	Sig.
Comm. & Influence	0.63	0.39	52.395	0.000	strategic thinking competencies	0.182-	0.094	-2.237	0.027
					Leadership competencies	0.733	0.103	9.034	0.000

\* The effect is statistically significant at the level of ( $\alpha \leq 0.05$ )

As shown on the table (5), results revealed that there is a correlation between Strategic Leadership and Comm. & Influence where the correlation coefficient (R) is equal to 0.63. Additionally, (R<sup>2</sup>) is explained 39% of the variance in Comm. & influence and 61% related to other factors not included in the model.

This confirms that Strategic Leadership with its second dimensions Leadership Competencies has a positive and significant effect on Comm. & Influence where the value of ( $F=52.395$ , Sig. 0.000) and instead the strategic thinking competencies has negative significant effect on Comm. & Influence. Regarding the dimensions of Strategic Leadership, table above shows that the Leadership competencies has significant and positive correlations with Comm. & influence as the correlation coefficients of ( $R=0.63$ ) respectively. Notably, the dimensions of strategic thinking competencies has opposite effect (-18.2%) which means 1 point increasing in strategic thinking competencies leads to decreasing 18.2% in Comm. & Influence, and in the other hand Leadership Competencies significant and positive effect on Comm. & Influence ( $\beta=0.733$ ) respectfully. while other factors related to non-listed in this study. Finally, the t-value is showing the significant effect of these dimensions on dependent variable (Comm. & Influence). Supporting this is the Beta coefficient ( $\beta = -0.182, 0.733$ ) respectfully. By and large, from these results, it can be concluded that Leadership and its dimensions has a significant relationships and effects on Comm. & Influence which are not supported our null hypothesis hence we reject it and accept the alternative hypothesis of affirming the relationships and effects.

### Conclusion & Recommendations:-

The results of this study showed a statistically significant impact for strategic leadership (Strategic Thinking Competencies, Leadership Competencies) on core competencies; a statistically significant impact of Leadership Competencies on core competencies; conversely there is not statistically significant impact Strategic Thinking Competencies on core competencies (we can explain this result; that strategic thinking is a process of intellectual and implicit Knowledge which it may not appear in the minds of managers, but appear on their actions and thus can miss the direct impact); a statistically significant impact of Strategic Thinking Competencies on (team working, communication & influence), conversely there is not statistically significant impact Strategic Thinking Competencies on employees empowerment. A statistically significant impact of Leadership Competencies on (team working, employee's empowerment, & communication & influence).

AlManaseer Group should give more importance to core competencies. That's because it is so critical to build the competitive advantage and reinforce and strengthen its competitive position.

AlManaseer Group should evaluate the core competencies; periodically and continuously in order to rebuild the critical resources which are the pillars of core competencies and in line with the requirements and conditions of strategic thinking and leadership competencies, and to ensure the achievement of its competitive advantages, through:

- activate employee's empowerment at different managerial levels, and to consider the ideas provided by employees from the lower level as input to the upper level.
- The diversification of the tools used in the communication between the strategic leadership and employees, and that may have a role in influencing and directing employees to strengthen the competitive advantages and thus achieve the strategic objectives of the organization..
- Activate the cooperation both in problem solving or knowledge sharing across the tangible and moral intensives depending on team working.

#### Abstract

Pleco (*Pterygoplichthys sp.*) is an invasive freshwater species belong to Loricariidae Family and comes from Costa Rica, Panama, South America. Distribution of pleco spread throughout the freshwater of the world. One of the habitats in Indonesia is the Ciliwung river and along the river with high abundance. Until now there has been no research results related to molecular identification of the fish especially from Ciliwung river. Therefore, it is necessary to know the molecular analysis of DNA to identify pleco from Ciliwung river by using the technique of DNA barcoding gene CO1. The methodology consisted samples preparation, DNA extraction, DNA quantification, gene CO1 amplification, and DNA base sequence reading. Results identification using gene CO1 barcodes with a length of 650bp fragment showed that pleco from Ciliwung river has a 100% similarity with *Pterygoplichthys pardalis* species. There are transversion substitution nucleotide at nucleotide in positions 306 (C→T), 339 (G→A), 387 (C→T), and 471 (T→C), but this should not affect the amino acid sequence changes in pleco from Ciliwung river.

#### Introduction:-

##### Background of the Study:-

Pleco (*Pterygoplichthys sp.*) is an invasive freshwater species including Family Loricariidae and comes from Costa Rica, Panama, and South America. Distribution of Pleco spread from the tropic district until to Indo-Pacific (Yu & Quailing 2014). The research result from Wu et al. (2011) states that there are three species of Pleco are most abundant in the world that is *Pterygoplichthys pardalis*, *P. disjunctivus*, *P. multiradiatus*. Two of these species are found in Indonesia, namely the species *P. pardalis* and *P. disjunctivus*.

The originate habitat Pleco are rivers, lakes and creeks (Nice et al. 2012). One river in Indonesia which becomes habitat Pleco is Ciliwung river. According to Ratmini (2009) Pleco found along the Ciliwung river with high abundance.

The abundance of Pleco in Ciliwung river for Pleco have a high level of adaptation in a polluted environment and the body of Pleco covered with plates of hard scales (Rachmatika & Wahyudewantoro 2006). Therefore, Pleco didn't have predators and be a competitor in obtaining food on the river ecosystem (Haiti 2007), so the species is considered to have contributed to decline in fish endemic ecosystem species Ciliwung river ecosystem (Kusumah 2011).

Results of Hadiaty research (2011) shows the data rate of loss the species endemic from Ciliwung river in 2009 reached 92.5% of the initial number of about 187 species and decreased to 20 species, including five species of which is the introduction of fish species. This type of that fish is lost in the waters of the Ciliwung river is betutu fish and Balidafish (Wowor 2010)

Morphological diversity and genetic information of an organism is very useful for the characterization of the type, the development, distribution by the time and space. Characterization, development and distribution of populations are needed to determine the step of conservation, management and sustainable utilization. The level of diversity among the population, especially genetic diversity can be used as a step to estimate the level of risk of extinction and the abundance of an organism (Singkam et al., 2011). One of the method to analyze the genetic diversity is molecular detection.

Molecular detection method was developed to analyze the genetic diversity of a species. *Polymerase chain reaction* (PCR) is a molecular detection method of *in vitro* without the use of living organisms to amplify a specific territory of a strand DNA. The reaction is limited by the primer pair (short oligonucleotide) using DNA polymerase enzyme and dNTPs as a number (Widowati 2013). The result of PCR is used to stage a reading strand bases in analyzing phylogenetic kinship.

One of the methods in tracing the phylogenetic relationships of a species commonly did is see the resemblance of mitochondrial DNA (mtDNA). Many studies related phylogenetic studies both invertebrate and vertebrate animals used mtDNA CO1 as the gene sign or genetic barcode (Maramis & Warouw 2014). DNA barcoding is a molecular technique to identify species using differences in nucleotide sequence from standardized gene regions (Hubert et al. 2003). DNA *barcoding* is based on fragments of mtDNA gene *Cytochrome Oxidase I* (COI), which serves as a 'barcode' for identifying species (Ward et al., 2005).

CO1 genes of the mitochondrial genome are a gene that is often used as standard sign genes in animal identification. The superiority of CO1 gene is to have a universal primer solid, so as to identify the 5' end from the most groups of animals. CO1 gene also has the highest molecular evolutionary compared with other genes in the mitochondria, thus having a low intraspecific variation and interspecific in height between adjacent taxa (Hajibabaei et al. 2006) Until now there has been no research results related molecular identification of the originate from of Pleco Ciliwung river. Therefore it is necessary for the molecular analysis of DNA Pleco from Ciliwung river originate using DNA *barcoding* techniques.

#### **Objectives and Benefits Research:-**

This study was conducted to identify Pleco (*Pterygoplichthys sp.*) As a molecular marker gene CO1, knowing the genetic diversity, and the identification of changes in the nucleotide sequence Pleco in the Ciliwung river Section of South Jakarta. The results are expected to be a source of information and databases for the genetic diversity of Pleco (*Pterygoplichthys sp.*) in the Ciliwung river.

#### **Methodology:-**

##### **The time and place of study:-**

The study was conducted in August 2015-June 2016 include sampling of Pleco and molecular analysis. Sampling of Pleco conducted in August-November 2015 around Ciliwung of Rindam Jaya to Bidaracina (Figure 1). Furthermore, molecular analysis performed in March-June 2016 in the Laboratory of Genetics and Development Research Institute of Ornamental Fish Aquaculture, Ministry of Maritime Affairs and Fisheries, Depok.

**Figure 1.** Location of sampling of Rindam Jaya - Bidaracina

(Source: Google Maps)

#### **Sample Preparation:-**

Decision fin muscle tissue as a source of DNA is done in Laboratory of Biology, University of Al Azhar Indonesia (UAI). The fins are used is the tip of the dorsal fin, pectoral and pelvic fins. Samples were cut using scissors and weighed 5-10 mg, then put into a 1.5  $\mu$ L micro-tubes containing 70% alcohol. Samples were then stored for 1-2 days before being moved into micro-tubes containing 1.5  $\mu$ L of absolute alcohol. Molecular analysis includes extraction, quantification, amplification, visualization, and the reading strand of DNA bases performed in the Laboratory of Genetics and Development Research Institute of Ornamental Fish Aquaculture, Ministry of Maritime Affairs and Fisheries, Depok.

#### **Extraction:-**

DNA extraction performed on 28 samples of fish using DNA *GsyncGeneaideExtraction kit*. The extraction method followed the procedures issued by the company, involves the separation of the network, the destruction of cells, DNA binding, washing, and removal. Phase separation of the network is done by taking about 5-10 mg samples were cut into 1.5  $\mu$ L micro tube and then added 200  $\mu$ L GST Buffer and 20  $\mu$ L proteins K. Further samples of homogenized by vortex and incubated for 24 hours at a temperature of 60<sup>0</sup>C.

Phase cell destruction is done after incubation of samples with the addition of 200  $\mu$ L GSB back Buffer and incubated for 20 minutes at a temperature of 200C. Further samples were centrifuged for 2 min at 15000 g to separate the supernatant with pellets. Supernatant is taken and separated into a new micro tube.

The next stage is the binding of DNA by adding 200  $\mu$ L of absolute alcohol in the supernatant and homogenized. Samples were then transferred on *column tube* 2 mL and the *collecting tube* which then centrifuged at 15 000 g for 1 minute. The liquid solution *column tube* is disposed and then *collecting tube* was transferred to a new tube.

Washing stage by adding 400  $\mu$ L of *Wash Buffer* in *column tube* and centrifuged at 15,000 g for 30 seconds. The solution liquid to the *collecting tube* was removed and reassembled. For the drying process is done centrifugation at 15,000 g for 3 min. Column phase of displacement by moving the tube into a new micro tube and added 100  $\mu$ L *Nuclease Free Water (NFW)* that has been heated at 60 ° C after that silenced for the last 3 minutes and centrifuged at 15,000 g for 30 seconds to get the DNA.

**Quantification of DNA:-**

DNA quantification is done using a spectrophotometer *Gene Quant* with standard volume of 80  $\mu\text{L}$  NFW containing 2  $\mu\text{L}$  of sample DNA extraction results.

**DNA amplification:-**

Fish amplification using the primers F1 (51- TCA - ACC - AAC - CAC - AAA - GAC - ATT - GGC - AC -31) and R1 (51- TAG - ACT - TCT - GGG - TGG - CCA - AAG - AAA - TCA -31) (Ward et al., 2005).

**Table 1:-** The PCR program

Step	Temperature ( $^{\circ}\text{C}$ )	Time
Inisiasi	94	5 second
Denaturasi	94	30 second
Anneling	52	30 second
Elongasi	72	30 second
Post-elongasi	72	5 second

The PCR process is carried out as many as 35 cycles. Components PCR 50  $\mu\text{L}$  consists of nuclease free water (NFW) as much as 11  $\mu\text{L}$ , *forward* primer F1 and *revers* R1 respectively of 2  $\mu\text{L}$ , master mix 25  $\mu\text{L}$  (containing dNTP, buffer and taq polymerase), and the DNA samples of 10  $\mu\text{L}$ ,

**Visualization:-**

Visualization of DNA using agarose gel (1.5%) with *peq green dyes* DNA and *RNA dye*. The result of extraction with the addition of *loading dye* was electrophoreses in 1  $\mu\text{L}$  and a DNA sample as much 5  $\mu\text{L}$ . Electrophoresis was performed on the current strength of 100 volts for 30 minutes and then photographed using a gel doc with UV rays of a wavelength of 302 nm.

**Readings strand bases|:-**

Readings strand bases conducted on 13 samples from 28 samples are amplified namely with sample numbers 6, 7, 9, 13, 15, 17, 20, 21, 22, 24, 25, 26, and 28. Selection of sequencing refers to the pattern of the abdomen. The pattern of abdominal Pleco fish in the study were classified into three (A = black spots, B = lines are not interrupted, and C = a combination of the pattern of black spots and black lines).

Readings base strand done using *ABI'S Sequens Scanner*. Sequencing the form of DNA sequences which are then read and analyzed using MEGA 7.0. Further aligned with the access number listed in the NCBI *GenBank* by BLAST to obtain the identification of the species of the sample (Maramis&Warouw 2014).

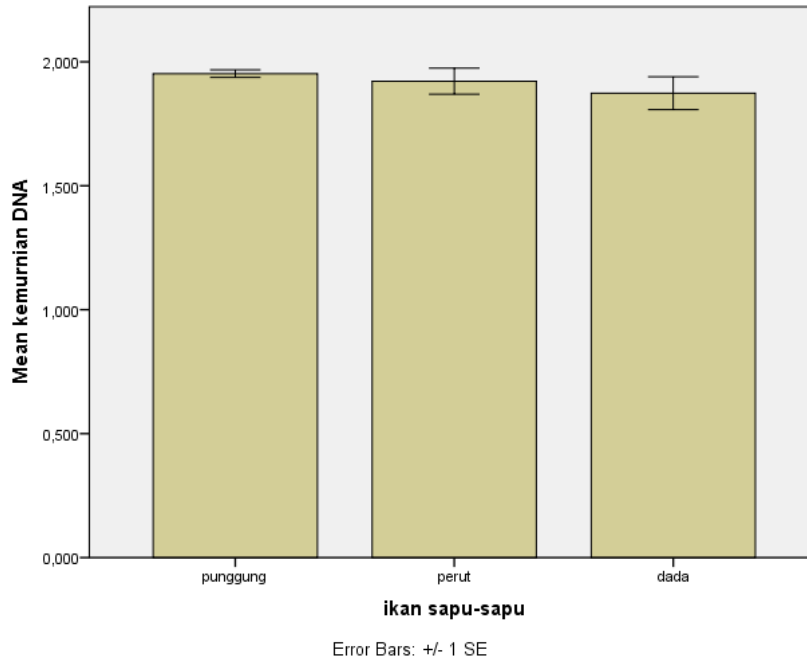

**Results And Discussion:-****The concentration and purity of DNA Fish Pleco fishoriginate from Ciliwung River:-**

The results of the measurement of DNA concentration of fish samples ranged between 36-484 ng /  $\mu\text{L}$  and purity index value (A260 / A280) on average is worth 1.96 (Appendix 1). DNA concentration is the number of DNA (pg) in the sample ( $\mu\text{L}$ ). The number of DNA concentration in a sample is determined by the activity of organ samples and expressing certain genes in an organ (Tiara et al. 2014). DNA purity is a purity level of DNA samples obtained from the A260 / A280 (Sambrook and Russell 2001).

Measurement of DNA concentration using a *Gene-Quant* has a principle wavelength spectrophotometer with 260 $\lambda$ . A beam of UV light passed through a sample of a specific wavelength to see the purity and concentration of DNA. This is done to measure the purity, DNA concentration, protein concentration, and absorbance. Absorbance value is the value measured using a wavelength of 260, so that the absorbance value is the reference number of the DNA concentration (Tiara et al. 2014).

Extraction of DNA can be obtained from muscle tissue and blood. Muscles on the fins are a system of organs that have a central role in the movement of fish. Striated muscle groups are named according to the place of attachment, such as enforcement muscle dorsal fin and pectoral fins towing muscle (Rahardjo et al. 2010). The use of fin muscle tissue as a source of the DNA showed that the muscle tissue of fish fins Pleco fish can be a good source of DNA for molecular analysis.

Based on *one way* ANOVA statistical test showed that the source of the DNA of the dorsal fin, pectoral and pelvic fins have DNA purity values were not significantly different (Figure 2). Significance probability value of 0.541 which means  $> 0.05$  showed no significant difference between types of fins are used as a source of DNA (Appendix 2). According to Newson (2013) if the significance value of  $< 0.05$  means that there are significant differences among the treatments.

**Figure 2:-** The average value of purity DNA from several types of fins

DNA purity Pleco fish originate from Ciliwung river has a value of purity ( $A_{260} / A_{280}$ ) an average of 1.9 so that it can be expressed as pure DNA. DNA is said to be pure if it has a purity index of 1.8 to 2.2 (Aryahiyah 2014; Wardani & Sari 2015). DNA which has a purity value of less than 1.8 indicate the presence of protein contamination, and if the DNA has a purity value of more than 2.0 indicate contamination of RNA. This can occur because of the absence of additional RNase enzyme that works to degrade RNA. Protein contamination can be caused by lack of protein degradation in the washing step (Aryahiyah 2014). In the process of isolation of DNA, protein is a contaminant that must be degraded (Sambrook & Russel 2001).

#### **Visualization the Results of DNA Extraction Pleco originate from Ciliwung river:-**

Visualization of the extracted DNA Pleco fish on a 1.5% agarose gel shows that DNA can be clearly seen (Figure 3). This is consistent with the concentration and purity of DNA was good so the quality of the electrophoresis results is clearly visible on a 1.5% agarose gel. Electrophoresis using a marker size of 100 bp.

**Figure 3:-** Results of DNA extraction Pleco fish(M = Marker; 6,7,9,12,13,15,20,21,22,24,25,26 = No. Sample fish) Electrophoresis is the movement of electrically charged substances due to the influence of an electric field (Wardani& Sari 2015). DNA molecules including negatively charged compounds so that the process of electrophoresis, DNA migrate toward the positive pole. DNA molecule migration velocity depends on the concentration of the gel used, the size of the molecules being analyzed, as well as the power supply voltage is supplied. Agarose gel used to separate, identify, and purify DNA fragments. The movement of DNA fragments in agarose gels is strongly influenced by the composition and solubility of the ion electrophoresis buffer. If the concentration of ions is very little the electrical conductivity is very small and DNA migration becomes slow. Excessive ion concentration will result in the gel melts and denatured DNA. DNA electrophoresis technique also requires *loading buffer*. This *buffer* works to increase the sample density that is at the bottom well and gives color to the DNA fragment to facilitate observation of the process of electrophoresis (Sambrook&Russel 2001).

#### CO1 gene amplification Fish Pleco fishoriginate fromCiliwungRiver:-

CO1 gene amplification product Pleco fishoriginate fromCiliwungRiver is clearly visible on a 1.5% agarose gel. This indicates that the Primer F1 and R1 successfully amplify the COI gene Pleco fishfishoriginate fromCiliwungRiver in fragment length of 650 bp (Figure 4).

**Figure 4.** Results of CO1 gene amplification Pleco fish(M = Marker; 13,14,15 = positive control; 6,7,9,13,15,20,21,22,24,25,26,28 = No . Samples of Pleco fish fromCiliwungriveroriginate)

F1 primer and R1 have managed to amplify the gene CO1 Pleco fish with long 615 bp fragment (Yu &Quilang 2014). In research Jumawan et al. (2011) F1 primer and R1 succeeded in amplifying the gene CO1 Pleco fish with long fragment of 650 bp. Research Bijukumar et al. (2015) using the primers F1 and R1 CO1 gene amplification produces fish with long Pleco fish 565 bp fragment. Hajibabaei& McKenna (2012) states that the gene CO1 barcodes can be done with a length of 454-650 bp fragment of 650 bp and a total length of CO1 gene fragment for DNA barcoding.

#### CO1 gene readout strand BasaPleco fishoriginate fromCiliwungRiver:-

Based on the reading strand of the COI gene base 13 fish samples Pleco fishCiliwungriveroriginate from obtained sequences with a length of 680 bp fragment (Figure 5). According Hajibabaei et al. (2007) Long sequences are still within the limits of the standard barcode for animals.

**Figure 5:-** Ektogram reading strand of DNA bases Pleco fish originate from Ciliwung river before cutting (680 bp)

The nucleotide sequences of 13 samples of Pleco fish originate from Ciliwung River then compared with the nucleotide sequences in GenBank NCBI (National Center for Biotechnology Information). It aims to determine the similarity of the reading strand fragments to the data base GenBank using BLAST (Basic Local Alignment Search Tool) on megablast-high similarity (Table 3).

**Table 2.** Comparison of similarity between the base strand 13 fish samples Pleco fish originate from Ciliwung river with NCBI GenBank Data

No.	Code Pleco	Identities (%)	Data Base genbank	Code genbank
1	CIL 017-A	100%	<i>Pterygoplichthys pardalis</i>	JF769358.1
2	CIL 007-C	100%	<i>Pterygoplichthys pardalis</i>	JF769358.1
3	CIL 013-C	100%	<i>Pterygoplichthys pardalis</i>	JF769358.1
4	CIL 026 -C	100%	<i>Pterygoplichthys pardalis</i>	JF769358.1
5	CIL 028-B	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
6	CIL 025-C	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
7	CIL 024-C	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
8	CIL 022-A	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
9	CIL 021-C	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
10	CIL 020-C	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
11	CIL 015-A	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
12	CIL 009-B	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1
13	CIL 006-C	100%	<i>Pterygoplichthys pardalis</i>	JF769357.1

Results blast on NCBI genbank indicates that nucleotide sequence Pleco fish originate from Ciliwung river showed an average value of 100% identification accuracy with *Pterygoplichthys pardalis* species (Table 3). This suggests that the originate from of the Pleco fish from Ciliwung river is one species. Hubert et al. (2003) similarity of identity with an average of 97% shows the same species.

Research Bijukumar et al. (2015), Yu & Quilang (2014) and Jumawan et al. (2011) phylogenetic similarity identity Pleco fish showed the same up to 100%, so that the CO1 gene can produce a high resolution for identification of the species as a standard barcode. According to Yu and Quilang (2014) the species *P. Pardalis* and *P. disjunctivus* is probably the same species or synonyms and have a low genetic diversity. Distinguishing morphological characters are dark lines continuously on *P. disjunctivus*, whereas in *P. pardalis* have dark spots (Chavez et al. 2006). Research Bijukumar et al. (2015) shows the similarity of 100% and 0% genetic distance between species *P. pardalis*, *P. disjunctivus* and *P. ambrosetti*. These results suggest that differences in the pattern of the abdomen is not the main character to identify fish species Pleco fish.

**Variations Nucleotide and Amino Acid Fish Pleco fishoriginate fromCiliwungRiver:-**

The composition of the nucleotide Pleco fishoriginate fromCiliwung river is A = 26.23%, T / U = 30.60%, C = 26.18%, and G = 16.99%. For the process of translation into amino acids ururan cutting 11 bp fragment or to find the start codon AUG (ATG). After cutting with a nucleotide variation obtained nucleotide fragment length 653 bp. Furthermore nucleotide positions can be analyzed to determine the location of the transition and tranversi substitution. There transversion nucleotide substitution in fish samples Pleco fishoriginate fromCiliwung river as much as 4 points namely to nucleotide position 306 (C→T), 339 (G→A), 387 (C→T), and 471 (T→C) ( Figure 6).

**Figure 6-** Variations in the nucleotide composition and changes in nucleotide variations Pleco fish originate fromCiliwung river (1 = position information to the nucleotide-306, 2 = position of nucleotides to 339, 3 = to the nucleotide position 387, 4 = all nucleotide position 471)

The analysis shows that there are different variations of the arrangement of nucleotides in Pleco fishoriginate fromCiliwungriver. Differences in the nucleotide arrangement causes the Pleco fishoriginate fromCiliwung river splits into two on the construction of phylogenetic clade (Figure 7). Therefore, the fourth point of nucleotides serves as the main characteristics of each *clade* and distinguishing nucleotide sequences between individuals. Ubaidillah and Sutrisno (2009) states that if the DNA sequence emerges from a common ancestor sequence, the sequence will gradually separate offspring through nucleotide differences due to mutations or point mutations.

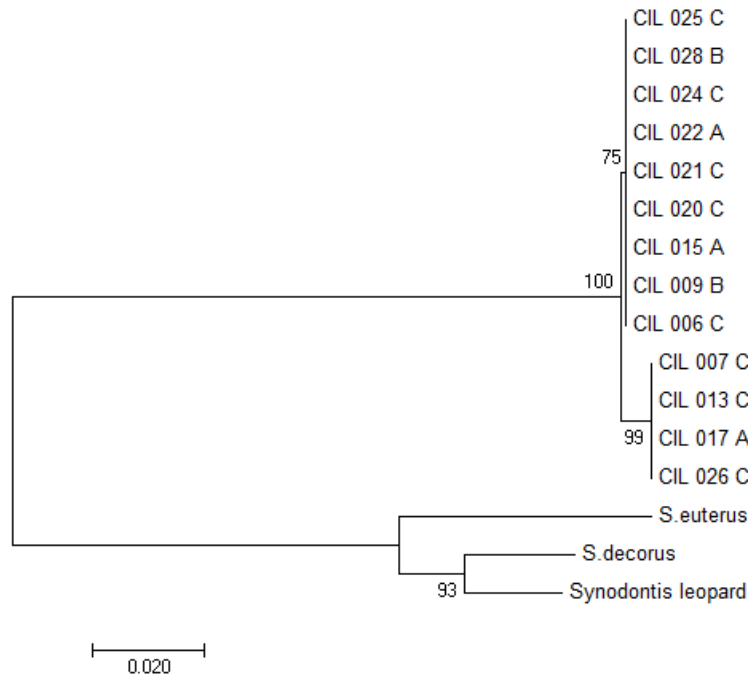

Nucleotide sequence variation along the 653 bpPlecofishoriginate fromCiliwung river ported 217 amino acid sequences. Changes nucleotide variation on four nucleotide positions (306, 339, 387, and 471) did not affect the changes of amino acid variation. Nucleotide variation occurs in nucleotide position to 306 (TAC→TAT) which translations the amino acid position 102 (Y) that is Tyrosine, all nucleotide position 339 (GGG→GGA) translates to the amino acid position 113 (G) is Glycine, to nucleotide position 387 (TCC→TCT) translates to the amino acid position 129 (S) is Serine, and all nucleotide position 471 (TTT→TTC) translations the amino acid position 157 (F) is *Phenylalanine* (Appendix 3).

Changes in the nucleotide variation four positions do not change the amino acid sequence translated. According to Lynch and Jaryl (1993) amino acid sequence changes occur more slowly in CO1 gene so that accuracy in phylogenetic. The substitution of base pairs (*base-pair substitution*) is the turn of one nucleotide and partner with

another pair of nucleotides. Some substitution called silent mutations (*silent mutation*) from an excess of genetic code. That's not influential the amino acid sequence translated. In other words, nucleotide mutations do not change the amino acid translation of the same. Some codons can translate the same amino acids if there is a difference in the third base of the triplet codon (Campbell et al., 2008), as in the TTT and TTC codon that translates the same amino acid that is *Phenilalanine* (F).

#### Construction Phylogenetic Fish Sweep broom:-

The results of phylogenetic construction Pleco fish originate from Ciliwungriver and *out group* genus *Synodontis* (*Synodontisdecoratus*, *S.euterus*, and *S.leopard*) showed genetic distance apart. Plecofish originate from Ciliwungriver is divided into two *clade* this is due to changes in the four nucleotide variations (Figure 7).

**Figure 7.** Construction of phylogenetic Pleco fish originate from Ciliwungriver with NJ-bootstrap 1000x (649 bp) According Mahardika and Parede (2008) the method most commonly used method is the *Neighbor-Joining* (NJ). The branching pattern of phylogenetic tree based on the distance matrix is formed between the pair populations. Long branches of the phylogenetic tree describes the number of nucleotide substitutions in the form of DNA polymorphism. Skala is located under a phylogenetic tree showing the size of the distance between sequences. Numbers located on the branches of the phylogenetic tree shows the value *bootstrap* (Mahardika&Parede 2008). *Bootstrap* value in fish samples Pleco fish showed a value of 100%. Bootstrap analysis was conducted to test the validity of the construction of phylogenetic trees. Phylogenetic trees giving information about the classification of the population based on evolutionary relationships. In the reconstruction of phylogenetic trees, the molecular data more widely used because it is considered more stable in the process of evolution compared with the morphological data (Dharmayanti 2011).

Figure 8. Construction of fish genetic distance Pleco fishoriginate fromCiliwungriver

Fish genetic distance Pleco fishoriginate fromCiliwung river is 0.0-0.03 (Figure 8). This suggests that the genetic distance were lower in Pleco fishoriginate fromCiliwungriver, so the Pleco fishoriginate fromCiliwung river is the same species. According to Hebert et al. (2004) and Ward et al. (2009) said that the genetic distance of more than 0:03 can show different types. This is evident with the genetic distance Pleco fishoriginate fromCiliwung river with out group genus *Synodontis* has a genetic distance of 0:18 to 0:20 (Figure 10).

**Conclusion:-**

Pleco fishoriginate fromCiliwung river had been identified using DNA *barcodes* CO1 on a fragment length of 650 bp. The nucleotide sequences Pleco fish aligned on NCBI genbank showed an average value of 100% identification accuracy with *Pterygoplichthyspardalis* species. There transversion nucleotide substitution at nucleotide position to 306 (C→T), 339 (G→A), 387 (C→T), and 471 (T→C), but this should not affect the amino acid sequence changes in Pleco-baby fish originate fromCiliwung river.

##### Key words:-

Total Knee Arthroplasty, osteoarthritis, varus.

#### Abstract

**Objective:**The aim of this study is to evaluate the results of knee arthroplasty in cases of osteoarthritis with sever varus deformity.

**Subjects and Methods:**This study is prospective study was conducted involving 20 patients who underwent primary posterior stabilized total knee arthroplasty due to osteoarthritis with sever varus deformity.

**Results:**Using Knee Society Scoring(KSC) system reveals that, the average post-operative score was 94.3 (range from 80 to 97 ) compared with average pre-operative score 17.5(range from 0 to 22).

**Conclusion:**Total knee arthroplasty in osteoarthritic patients with sever varus deformity gives the best solution in managing pain, deformity, improve walking and improve range of motion.

#### Introduction:-

Knee replacement surgery is one of the most successful surgeries in orthopedics. Hundreds of thousands of these operations are now carried out every year worldwide with excellent results. Knee replacement becomes necessary when the knee joint has been damaged from any cause and the resulting pain cannot be satisfactorily be controlled by other means. The usual problem that can end up in the need for total knee replacement is chronic arthritis (Sandesh et al., 2015).

Varus deformity is predominantly the commonest deformity in candidates for total knee arthroplasty. This deformity possibly underlies pathomechanics that led to the progression of the arthritic process, and may compromise the outcome of the arthroplasty itself. Obtaining a well positioned and stable prosthetic construct with restoration of the normal mechanical axes of the limb and joint line have been shown to have an important bearing on the final outcome of knee replacement operations (Elsebaei, 2001)

Varus deformity is defined by any preoperativetibiofemoral angle less than naturally occurring anatomic valgus (Laskin, 1996).

#### Patient And Methods:-

This study was carried out in Orthopedic Surgery Departments, Faculty of Medicine, Zagazig and Ain Shams University in the period between April 2014 and October 2016, a prospective study was conducted involving 15 patients with 20 knees who underwent primary total knee arthroplasty due to sever varus osteoarthritis.

**Corresponding Author:- Alaa Mostafa El-ngehy.**

Address:- Professor of orthopedic surgery, Faculty of Medicine, Zagazig University, Egypt.

We included patients with primary degenerative varus osteoarthritis with tibio-femoral angle more than 15 degrees (more than 20 degrees varus malalignment) with average preoperative tibio-femoral angle of 26.2 degrees (range from 22 to 41 varus), aged above 50 years with the mean age at time of surgery is 65.4 (ranging from 58 to 74 years) and their deformities are totally articular i.e. wear and erosion of the medial compartment of the joint.

The group of patients included 1 male (7%) and 14 females (93%). Five patients had the right knee replaced, five patients had the left one, while five patients had bilateral total knee replacement 2 of them were done bilateral simultaneous at the same setting. All patients had flexion knee deformity. Fifteen (75%) knees had mild flexion deformity (less than 15°) while five (25%) knees had moderate flexion deformity (15° - 30°).

The diagnosis was primary varus osteoarthritis in all the cases (100%) and any patient with knee arthritis rather than primary severe varus osteoarthritis with deformity more than 20 degrees varus malalignment, inflammatory arthritis (e.g. Rheumatoid arthritis), post-traumatic O.A. knee, extra-articular deformity, and other general contraindications of arthroplasty was excluded.

Pre-operative clinical, laboratory and radiological assessment of the patients was done. Knee Society Scoring (KSS) system was taken to each patient pre and post-operative. Follow up for two years was done.

Prophylaxis against D.V.T., proper antibiotic coverage must be taken in consideration.

#### **Operative Technique:-**

In our study 13 patients were given epidural anesthesia, 2 patients spinal anesthesia. Tourniquet was applied in all patients.

Midline skin incision was used with avoidance of skin undermining (Belleman et al, 2008).

The main approach which was performed in the present study was the medial para-patellar approach in seventeen knees (85%). While three knees (15%) were done by the subvastus approach.

We used the sequential medial release, after initial dissection of the soft tissues along the medial joint line, including the deep medial collateral ligament, osteophytes were removed from the medial distal femur and proximal tibia.

The distal femur was cut at 5-7° valgus to the femoral shaft axis using intramedullary instrumentation (perpendicular to the mechanical axis of the femur). Like the femoral resection, resection of the proximal tibial surface is based on the height of the intact lateral bone surface. A maximum thickness of 8-10 mm cut is removed from the medial tibial plateau perpendicular to the mechanical axis of the tibia, which often leaves a large bony defect on the medial side of the tibia that was reconstructed either by bone graft or metal augmentation with or without use of long stem tibial component.

Metal augments were done in uncontained (steeply defects) defects more than 10 mm (done in 7 cases). They are either ½ wedges (3 cases) or ½ blocks (4 cases) (according to the geometry of the defect). In cases of complex reconstruction of tibial defects, long stem tibial component was used to unload the deficient metaphyseal bone (12 cases).

Bone grafts were used in reconstruction of contained defects usually without fixation (done in 3 cases). Or uncontained defects 5- 10 mm using special technique for its fixation (done in 3 cases).

Technique of bone grafting in management of the tibial defect.

## Results:-

### Clinical results:-

#### Knee Society Score:-

At last follow up, the average **Knee Society Score (KSS)** was 94.3 (range from 80 to 97) compared with average pre-operative KSS of 17.5 (range from 0 to 22). Seventeen (85%) knees had excellent results (85 to 100 points), three (15%) knees had good results (70 to 84 points), No knees had fair results (range 60 to 69 points) or poor results (<60 points).

#### Knee Function Score:-

At the last follow up, the average **Knee Function Score (KFS)** was 88.5 (range from 83 to 94) compared with average preoperative knee function score of 17.8 (range from zero to 26). Three (15%) knees had excellent results (85 to 100 points), twelve (60%) knees had good results (70 to 84 points) and four knees (13.33%), two (10%) knees had fair results (range 60 to 69 points) and one (5%) knee had poor result (less than 60).

#### Post-operative range of motion:-

At last follow up, the average post-operative range of motion was 100.4° (range from 0-120°). There was one knee (5%) with maximum range of above 110, eighteen knees (90%) flexion between 80 and 110 degrees, and one knee (5%) with range below 80 degrees. In comparison to the pre-operative range of motion the average was 87.3°. Fifteen knees (75%) were in the range between 80-110 degrees, zero knees with range above 110 degrees and 5 knees (25%) were below range of motion of 80 degrees.

#### Pain score:-

At last follow up, fifteen knees out of twenty (75%) had no pain (score 50). Five knees (25%) had very mild or occasional pain (score 45), No other knees in the study had pain on stairs or walking.

## Radiological results:-

### Limb alignment (Tibio-femoral Angle):-

The average post-operative tibio-femoral valgus angle was 6.8 degrees (range from 4 to 11 valgus), compared with average pre-operative tibio-femoral angle of 26.2 degrees (range from 22 to 41 varus). Eighteen knees (90%) had a valgus angle within 5-10 degrees, while one knee (5%) had excessive valgus angle of more than 10 degrees and one knee (5%) had valgus angle less than 5 degrees.

**Complication:-**

In this study, three knees had complications (15%).

**Complications and its ratio:-**

Complication	Case No.	Number	%
Superficial skin infection	5	1	5%
Partial patellar tendon rupture	12	1	5%
Fissure fracture of med. tibial condyle	2	1	5%

AP & Lat. views of both knees: **A:** pre-operative **B:** immediate post-operative.

**Discussion:-**

Varus deformity is predominantly the commonest deformity in candidates for total knee arthroplasty. Obtaining a well positioned and stable prosthetic construct with restoration of the normal mechanical axes of the limb and joint line have been shown to have an important bearing on the final outcome of knee replacement operations.

At last follow up, the average **Knee Society Score (KSS)** was 94.3 (range from 80 to 97) compared with average pre-operative KSS of 17.5 (range from 0 to 22).

**Sandesh et al,(2015)**reported in their study improvement of the mean preoperative knee society score i.e. knee and function scores were 29.45(range:15-52) and 26.50(range: 10-40) respectively to 84(range: 60-92) and 79.5(range: 70-90) respectively.Their results were coincided with the present study results.

**Mullaji et al,(2005)**reported in their series improvement of the mean knee society score from 22.8 preoperatively to 99.1 postoperatively and the function knee score from 22.8 to 72.1. Their results were coincided with the present study results.

**Dixon et al,(2004)**also reported that the KSS increased from a mean of 24 (range from 0 to 43) to a mean of 94 (range from 78 to 100). The FS improved from a mean of 34 (range, 0 to 70) to a mean of 85 (range, 45 to 100).With their results were highly coincided with the present study results.

**Merrill et al, (2004)**reported improvement of the preoperative knee score for the severe deformity from 44.5 to 87.8 with significant improvement.

**Tenny et al(1991)**reported that in their study the mean post-operative knee society score was 89. Sixteen knees (59%) in the varus deformity group were rated excellent and 11 knees (41%) good. There were no fair or poor results. Their results were also go hand in hand with the results of the current study.

There is marked improvement of deformity either in coronal plane or in sagittal plane.The average post-operative tibio-femoral valgus angle was 6.8 degrees (range from 4 to 11 valgus), compared with average pre-operative tibio-femoral angle of 26.2 degrees (range from 22 to 41 varus) . Eighteen knees (90%) had a valgus angle within 5-10 degrees, while one knee (5%) had excessive valgus angle of more than 10 degrees and one knee (5%) had valgus angle less than 5 degrees.

There is marked improvement in pain sensation either at rest or during work.Improvement of walking distance post-operatively occurs.

**Conclusion:-**

Proper pre-operative evaluation of the patients clinically and roentgenographically is mandatory.

There was no statistically difference in the mean KSS and FKSS post operatively between age groups.

Epidural or Spinal anesthetics(unless contraindicated) are the better options to avoid the risk of general anesthesia and maximize the period of analgesia, so faster regain of ROM postoperatively.

Subvastus approach is better than medial para-patellar approach as it gives the chance for early post-operative rehabilitation as well as it minimize patellar complication. On the other hand, it is better to be avoided in obese patients with short patellar tendon and also in patients with severe fixed varus deformity especially is accompanied by flexion deformity.

Referencing distal femoral resection and proximal tibial cut (measured resection technique) from the intact lateral surfaces has the advantage of restoration of the normal joint line, preserving bone stock for future revisions and avoiding the increase in lateral laxity.

Sequential medial soft tissue release must be performed to provide adequate stability without over releasing.

PCL must be released in severe fixed varus deformity especially if accompanied by flexion deformity.

Patients with severe degrees of varus OA are more likely to have medial tibial bone defects and must be reconstructed by either bone grafts or metal augments and in the same time uploading the tibial surface by long stem to distribute about 1/3 of the load stresses to the diaphysis.

Meticulous closure of the arthrotomy and preservation of part of the medial meniscus remnant attached to the medial capsular sleeve for adequate closure of the medial structures, proper determination of the joint level for future revisions.

Patients with mild degrees of flexion deformity show much improvement in the KSS compared to those with severe degrees of flexion deformity.

Locked long tibial stems could be used in managing concomitant tibial fractures.

Postoperative maintenance of full extension is the first priority. Strengthening exercise, and increase range of movement is started as rapid as possible. In non complicated cases, walking using a walker from second day post-operative can be started. Walker must be used for one month. Proper anticoagulant, antibiotic, and analgesics must be given to patient.

 X-ray Diffraction XRD

#### Abstract

(Y,Eu)-Ba-Cu-O samples were prepared by solid state method of heat treatment for obtaining single phase materials. The relationship between Y-Eu substitution and the superconducting properties of  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  ( $0.0 \leq x \leq 0.9$ ) solid solution have been studied. DC resistance measurements showed that Eu substitution was affected the normalized resistance and  $T_c$  values. X-ray diffraction analysis showed that the main phase in the prepared (Y-Eu)-Ba-Cu-O samples was the orthorhombic phase. The samples were tended to form plate type of single crystals with preferential orientation in c-direction. The crystallite size of the prepared samples was calculated from X-ray diffraction patterns using Scherer's equation and has a value of 21nm for pure YBCO and that of Eu content up to 0.9 samples. Thermal analysis of (Y,Eu)-Ba-Cu-O system were performed by means of TG and DTA. The oxygen content was estimated from TG-analysis and it was found to decrease with increasing Eu-content. DTA showed three-regions which were classified as follows:

- (1) Exothermic peak as a result of chemically bonded dehydration temperature.
- (2) Endothermic peak due to tetragonal orthorhombic transformation temperature.
- (3) Exothermic peak which was related to melting temperature.

#### Introduction:-

Since the discovery of YBCO, a high temperature superconductor (HTS) has gathered a lot of attention because of its potential in many applications such as levitated systems, magnetic shields, electronics and communications [1]. It is known that the properties of YBCO superconductors are improving by replacing Y with other light rare earth elements [2]. Recently, considerable attention has been devoted to the superconducting properties of LRE123 systems [3-6], (where LRE: light rare earth elements like Nd,Sm,Eu and Gd). Generally unlike Y123 which forms only a stoichiometric compound, light-rate-earth elements form a solid solution in LRE123 systems and this solid solution leads to a variation in superconducting properties.

(LRE)Ba-Cu-O superconductors have revealed promising performance, such as high  $T_c$ ,  $J_c$  and irreversible magnetic fields than in Y-Ba-Cu-O [7-8].

$Y_{1-x}Sm_xBa_2Cu_3O_{7-\delta}$  and  $Y_{1-x}Nd_xBa_2Cu_3O_{7-\delta}$  solid solution superconductors have been reported [9]. In the present work a detailed study has been performed for the  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  system. The crystal growth and the superconductivity of the prepared samples are studied by DC resistance, thermal analysis (TG-DTA) and X-ray diffraction (XRD) techniques.

### Experimental Work:-

#### Samples Preparation

Samples with nominal composition of  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  ( $x = 0.0, 0.1, 0.3, 0.5, 0.7$  and  $0.9$ ) were prepared through a solid state heat treatment method using high purity powders ( $\geq 99.99\%$ ) of  $Y_2O_3$ ,  $Eu_2O_3$ ,  $BaCO_3$  and  $CuO$ . The mixture of starting materials was calcined in alumina crucibles, firstly at  $900^\circ C$  for 24hr, secondly at  $920^\circ C$  for 60hr, then grounded, pressed into pellets and finally treated by a heat cycle as follows:

- Heated from room temperature to  $920^\circ C$  and kept at this temperature for 12hr in air.
- Cooled from  $920^\circ C$  to  $680^\circ C$  in 4hr with following  $O_2$ .
- Kept at  $680^\circ C$  for 10hr with  $O_2$  flowing.
- Cooled from  $680^\circ C$  to  $400^\circ C$  in 4h in air.
- Kept at  $400^\circ C$  for 10hr in air.
- Cooled from  $400^\circ C$  to room temperature in the furnace.

The preliminary test of Meissner effect showed that all samples are superconductors at liquid nitrogen temperature (77K).

#### Samples Characterization:-

The characterization of the prepared samples was carried out by:

- 1- Electrical DC resistance measurements for  $T_c$  determination by the standard 4-probe method with silver contacts.
- 2- X-ray diffraction (XRD) for phase identification by X'pert type Philips Diffractometer2000 with a wavelength of ( $Cu - K\alpha$ ,  $\lambda = 1.54056 \text{ \AA}$ ).
- 3- Thermo-Gravimetric technique (TG): the temperature variation of weight loss was measured by TGA-50H, detector by using about 11-15mg of samples of  $YEu(x)Ba-Cu-O$  in a Pt-cell and the atmosphere was air. The cooling rate was  $20^\circ C/min$  in the temperature range from  $800^\circ C$  to  $25^\circ C$ .
- 4- Differential thermal analysis (DTA): A Shimadzu DTA-50 was used for DTA measurements with a cooling rate of  $20^\circ C/min$  for all samples with mass 0.01mg, the atmosphere is nitrogen with rate flow 20 ml/min in the temperature range from  $1200^\circ C$  to  $25^\circ C$ .

### Results and Discussion:-

The normalized resistance to the value at 300K were recorded for  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples. All samples have superconducting behavior as shown in Fig (1). The transition temperature  $T_c$  at zero resistance was evaluated for the prepared samples and was varied from 92K to 84K depending on Eu content.

Eu ions are in a trivalent state  $Eu^{3+}$  at regular occupying  $Y^{3+}$  sites and also can substituted at  $Ba^{2+}$  sites [10]. The variation in  $T_c$  was attributed to the double substitution of  $Eu^{3+}$  at both  $Y^{3+}$  and  $Ba^{2+}$  sites with different probabilities. X-ray diffraction (XRD) patterns of the prepared samples were illustrated in Figs (2,3). The pure YBCO has orthorhombic 1-2-3 structure which is responsible for superconducting phase. The characteristic peaks of this phase were indexed and it was obtained that the strongest peaks are (013) and (103). The relative intensities of (001) and (hkl) planes were affected due to Eu substitution in YBCO as shown in Figs (2,3) and table (1). This was due to the preferential orientation in c-direction. The (003), (005) and (006) planes were grown due to the fast growth rate in a, b directions and slow growth rate along c-direction. In the Y(Eu)BCO samples, the resulting X-ray patterns were affected for instance, the lines (003), (005) and (006) were amplified while the lines (013) and (103) were depressed. The samples of Y(Eu)BCO system were tended to form plate type of single crystals with orthorhombic phase. X-ray diffraction analysis was confirmed that the main phase in  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples was the orthorhombic structure.

The unit cell parameters were affected as indicated in table (2) due to Eu substitution in Y-sites and explained as follows:

- 1-For Eu contents in the range ( $0.1 \leq x \leq 0.5$ ), the unit cell volume was decreased.

**Note:** ionic radius of  $Ba^{2+}$  equals  $1.42\text{ \AA}$ , for  $Y^{3+}$  equals  $1.019\text{ \AA}$ , and that of  $Eu^{3+}$  equals  $1.066\text{ \AA}$  [10]. The decrease in the unit cell volume was due to  $Eu^{3+}$  substitution at  $Ba^{2+}$  sites in addition to original  $Eu^{3+}$  substitution at  $Y^{3+}$  sites.

2-In the range ( $0.5 \leq x \leq 0.9$ ) for the  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples, the lattice parameters a, b and c were increased and so the unit cell volume was increased for these samples. This result was due to  $Eu^{3+}$  substitution at  $Y^{3+}$  sites were more probable and  $Eu^{3+}$  substitution at  $Ba^{2+}$  sites was minimized in this range of Eu contents.

The crystallite size (t) of the prepared samples was calculated from X-ray analysis using Scherer's equation [11]:-  
 $t = (0.9\lambda / \beta \cos \theta)$

Where  $\lambda$  is the X-ray wavelength,  $\beta$  is the peak width at half maximum and  $\theta$  corresponds to the peak position. The calculated crystallite size (t) value of 21nm for pure YBCO and samples of Eu content up to 0.9.

Fig (4) showed TGA curves recorded in the temperature range from 25°C to 800°C in air for  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples with x values ranging from x =0.0 to x = 0.9.

The initial weight was taken as a standard value. The variation of initial weight value was plotted as a function of temperature. It was noted that the oxygen content of the  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples were decreased with increasing Eu content (x). The oxygen content was decreased from 6.95 for x =0. 0 to 6.83 for x = 0.9.

The differential thermal analysis DTA for the prepared samples were recorded with a cooling rate 20°C/ min. Figs (5,6) showed DTA for  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples which can be classified into three-regions:

1-First region: Exothermic process at temperature  $T_1$  ranging from 200°C to 280°C as a result of loss of chemically bonded water dehydration and dissociation of hydroxides.

2-Second region: Endothermic process at temperature  $T_{t \rightarrow 0}$  and was varied from 570°C to 800°C. This is due to tetragonal orthorhombic transformation for  $Y_{1-x}Eu_x$ 123 superconductors.

3-Third region: Exothermic process at  $T_m$  related to the melting temperature and have values ranging from 975°C to 1025°C. The results of DTA were summarized in table (3).

### Conclusion:-

- 1-  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  samples tending to form plate type of single phase with preferential orientation in c-direction and the crystallite size of these samples equal to 21nm.
- 2- The oxygen content was estimated from TG analysis and it was found to decrease with increasing Eu content.
- 3- Unlike Y123 which forms only one a stoichiometric compound, the light rare earth element like Eu substitution in Y sites form a solid solution of  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  and each sample has a unique superconducting transition and also has a unique TG and DTA thermal behavior.
- 4- It was found that the melting temperature ( $T_m$ ) of the  $Y_{1-x}Eu_xBa_2Cu_3O_{7-\delta}$  composites was increased in samples contained the two different rare earth elements Y and Eu.
- 5- The mixture of the two different rare elements Y-Eu was very uniform and all samples showed a superconducting phase with a sharp transition and orthorhombic structure which is necessary for the presence of superconducting phase.

#### Abstract

**Objective:** The present study was conducted to investigate the histomorphological and histochemical postnatal developmental changes established in the pancreas of the domestic cats. **Methodology:** the study conducted on three different postnatal ages that were one week (suckling kittens), 4-6 weeks (weaned immature cats) and adult of one year and up cats. Macromorphometric measurements of pancreas were conducted and listed in tables. Histological sections prepared and stained by general and special stains. **Results:** Gross findings revealed that the pancreas of cat was of compact type, of two lobes connected by small central part. Critical macromorphometric changes observed at 4 weeks aged cats. The organ drains the pancreatic secretion toward the duodenum via main pancreatic duct.

Exocrine portion more developed after birth than the endocrine portion; however both were faced developmental changes. The parenchyma provided with well duct system even in kitten. Ducts were surrounded by smooth muscle fibers invested in the connective tissue. Endocrine portion showed in kittens predominant  $\alpha$  cells. Critical changes occurred at 4 weeks of age caused an increase of the number of  $\beta$  cells so that the ratio of  $\alpha / \beta$  was changed. In adult cats the percentage of  $\beta$  was predominant. In all studied ages of cats, the findings revealed the presence of well developed autonomic innervations represented by the presence of large autonomic ganglion, intramural ganglia and large sized Pacinian corpuscles. **Conclusions:** It could be concluded that pancreas was not fully developed at birth and weaning period caused critical development.

#### Significance of the study:

The significance of the current findings can be categorized into two criteria. First of all, it was first investigation focused on the development of the pancreas postnatally of the domestic cats in veterinary field. The second criteria, as the pancreas of the cats showed morphological similarities to those of human especially the presence of Pacinian

corpules, presence and distribution of  $\alpha$  and  $\beta$  cells in the islets of Langerhans, such findings will be beneficial for public health and animal health and welfare.

## Introduction

The pancreas is considered an organ associated with digestive tract. It is responsible to produce enzymes conveyed into the lumen of the duodenum to aid the digestion. The organ also considered endocrine organ because it produces some metabolizing hormones. It is considered mixed gland which have the capacity to produce enzymes and hormones aid in the digestion. The function of both exocrine and endocrine portions of pancreas is therefore controlled and coordinated through both neural and hormonal regulators<sup>1</sup>.

Histologically, it is constructed from compound, tubuloacinar acini forming exocrine portion as well as endocrine part represented by the Islets of Langerhans. The pancreatic islet produces mainly insulin, glucagon hormones which play role in glucose metabolism<sup>2</sup>.

Cats are commonly suffered pancreatitis and tumors in both pancreas and duodenum. They were usually affected by obstruction of the pancreatic duct in the exocrine portion associated with the inflammation of bile duct and adenocarcinoma of the duodenum. The obstruction of the duodenum cause subsequently crohn's disease in the animal. The latter characterized by dehydration, loss of appetite, loss of body weight, abdominal pain, vomiting and diarrhea<sup>3-4</sup>.

In cats, pancreatitis recorded as a common disease in this animal species in which statistically significant higher prevalence of chronic pancreatitis observed in the left lobe of pancreas in cats severed gastrointestinal disease<sup>3</sup>.

There is paucity of work on the histomorphological study of pancreas in the domestic cat and to our knowledge there is no local study up to date investigated the postnatal developmental histomorphological changes of the pancreas in the local domestic cats. According to the above reasons the current study was conducted to study the histomorphological and Histochemistry of the pancreas of the domestic cats at three different postnatal ages, that were one week (suckling kittens), 4-6 weeks (weaned immature cats) and adult of one year and up cats.

## Materials and Methods:

### Cat's collection and study design:

Clinically healthy pregnant queens were collected by hunting method and caged in the animal house till their delivery to obtain at least twelve kittens from them. Six kittens of one week of age were removed from their mothers and euthanized and these considered the first group representing suckling kittens. Other six kittens were left for not less than four weeks. These cats were euthanized and considered the second group as they represent post-weaned premature group. Six adult healthy cats of one year and up were hunted and kept under supervision in cages for one week and then euthanized as they were considered the third adult group.

### Preparation of specimens

Each of the selected kitten, premature or adult cats were euthanized prior to its dissection by intra-cardiac injection of over dose of sodium pentobarbital (100 mg/kg)<sup>5</sup>. After that, the animal was fixed to be dissected on a dissecting board. The abdominal wall opened to view the abdominal viscera, then the duodenal loop was pointed out and the organ location and relationship with other digestive organs was photographed in situ. The topography and shape of the organs was studied and documented with aid of digital camera.

### Histological procedures

The pancreas glands were removed post dissection and washed by normal saline. They were cleaned from debris and fat tissues each was divided into three anatomical parts, body (very small area), right and left lobes. Halves of these parts were fixed in 10% buffered formalin for 72 hrs, each part was trimmed and cut into slices of 1 cm thickness and the other halves were fixed in Bouin's solution for subsequent histochemical staining. Subsequent to fixation, serial sections were prepared in 6 micron thickness and were stained with Hematoxylin and eosin (H&E), Masson trichrome (MTC) and Gomori's method for pancreatic Islet cells<sup>6</sup>.

### Micromorphometric measurements:

The tissue sections were analyzed using Olympus light microscope. Sections were photographed and analyzed by Dino-eye piece camera provided with Image software.

Micromorphometric data collect on the pancreatic tissue in which the following analysis were conducted such as percentage of parenchyma tissue to whole pancreatic tissue per 1 mm<sup>2</sup> at different post-natal ages, densities of islets per each mm<sup>2</sup> to whole pancreatic tissue at different post-natal ages and percentages of  $\alpha$ ,  $\beta$  and  $\delta$  to the sum of Islet's cells at different post-natal ages. Size of islet's of Langerhans were considered small if less than 50  $\mu$ m, medium if between 50 to 75  $\mu$ m and large if more than 75  $\mu$ m<sup>7</sup>. The data on macromorphometric and micromorphometric were presented in tables.

### **Statistical analysis:**

Statistical calculations were carried out with the SPSS 15.0 for windows software package. All numerical values were expressed as the mean  $\pm$  standard error (SE). For comparisons of developmental parametric changes for all ages the statistical significance was assessed by ANOVA. The significance level was set at  $p < 0.05$ .

### **Gross Findings:**

Gross examination showed that pancreas of cats was formed of three parts that were right lobe, body and left lobe (Fig. 1). The organ was of compact type of pancreas with gross obvious lobulation (Fig. 2B). The body was very small nearly square-shaped part (cm in adult) situated beside the first duodenal flexure where it form a notch traversed by the portal vein (Fig. 1). In fact the entrance of this vein considered good demarcation to the body part of the pancreas. The body connected to both right and left lobes without distinct demarcation. The right lobe of pancreas extended as ribbon shaped thin compact structure downward from the body adjacently to the mesenteric border of the descending duodenum and shortly continues with the ascending duodenum. It was adherent at its distal end to prominent regional lymph node (Fig. 1). Both right lobe and duodenum were held together by the duodenal mesentery in the abdominal cavity. The left lobe of pancreas extended from the body to the left side of abdominal cavity till the spleen and left kidney. The lobe was held by the mesentery and enforced toward the stomach by the third duodenal flexure, beginning part of the jejunum and the distal colon.

The gross findings revealed the presence of one main duct in the cat. Fine dissection revealed the presence of large branch centrally located in the core of each lobe of the organ (Fig. 3). Both branches were joined at the body just beside the first duodenal flexure to form the main pancreatic duct. Shortly this duct (2-3 cm) united with the common bile duct before it open into the lumen of the duodenum through the duodenal papilla. This papilla was situated nearly 4 to 5 cm away distal to the duodeno-pyloric junction (Fig. 2A).

Macromorphometric data of the pancreas such as length, weight of lobes was listed in table 1. The measurements of kitten's pancreas revealed that both length and weight of the right lobe were higher than those of the left lobe. The relative lengths of the left and right lobes were 40.79% and 59.21%, respectively. Whereas the relative weights of the left and right lobes were 33.33% and 66.67%, respectively.

These measurements were critically changed post 4 weeks of age in the pancreas of post weaned cats in which the relative lengths of the left and right lobes were 44.32% and 55.68%, respectively. Whereas the relative weights of the left and right lobes were 40.71% and 59.29%, respectively. The data showed marked changes in the left lobe measurements compared to those of the right one.

In the adult cats, the measurements of relative length and weight were not significantly changed when compared with the 4 weeks aged cats, as they were 43.21% and 56.78% for lengths of the left and right lobes, respectively and 40.26%, 59.73% for weights of the left and right lobes, respectively.

### **Microscopic findings:**

#### **Capsule:**

Light microscopic findings revealed that the pancreas in cat at different postnatal ages was suspended together with the duodenum by the duodenal mesentery (Fig. 4). The latter was found microscopically formed of loose connective tissue richly supplied by blood vessels. In fact, absence of true connective tissue capsule and the organ was enclosed by very thin membrane from which many septae were formed and separating the different sized lobules of the organ. The density of the connective tissue fibers was observed surrounding the blood vessels and branches of duct system such as small and large interlobular duct as well as the main duct (Fig. 5, 6 and 7).

### **Exocrine portion:**

#### **A. Parenchyma:**

This part was found constructed by numerous small and nearly rounded functional secretory units which may be called acini. These units were collected together forming numerous lobules which were separated from each other by very thin interlobular spaces filled with sparse and fine connective tissue fibers (Fig. 5). The connective tissue fibers

were observed in those areas which enclosed the running intercalated ducts, small intra-lobular ducts, small and large interlobular ducts (Fig. 6). Each of the secretory acini was constructed of several pyramidal-shaped cells characterized by rounded basally located nuclei and acidophilic cytoplasm filled with zymogene granules. Their nuclei were possessed small darkly stained nucleoli (Fig. 8A). Myoepithelial cells were detected adjacent to the periphery of these acini which were characterized by their flattened shape and darkly stained cells (Fig. 8B). Most of the acini were showed prominent lumen and the light microscopic examination revealed in some of them a group of cells arranged around their lumina. The latter cells are called centroacinar cells (Fig. 8). In fact, these cells are considered the first part of the duct system to carry out the products of these functional secretory units. The zymogene granules which filled the apical part of the cytoplasm were stained red post staining with H&E. Post-staining with Masson's Trichrome stain the surrounding stromal connective tissue was stained blue, characteristically those regions around blood vessels and running ducts (Fig. 5, 7). All the above stains were showed post staining of the pancreatic sections the presence of different size of structures called Islet's of Langerhans (Fig. 6). Some of these islets were just few cells gathered and embedded between the acini.

In age of one week, micromorphometric measurements showed that the ratio of parenchyma tissue (exocrine tissue) to whole tissue was 54.26 %. The data revealed that the interlobular stroma and spaces were obviously largest in the pancreas of one week kittens compared to those recorded at 4 weeks of age and adult cats. The interlobular stroma and spaces were decreased by age progress. As a result the ratio of parenchyma tissue / whole tissue of the pancreas was increased significantly into 78.67% and 81.37% at 4 weeks and adult cats, respectively. In another speaking, the density of acini was increased into 81.37% in adult cats, whereas, the interalobular and interlobular connective tissue stroma were diminished by age progress (Table 2).

In age of 4 weeks, critical changes were recorded in the exocrine pancreatic tissue ended with numerous acini and well developed duct system represented by intra-lobular and interlobular duct branches as well as increased the ratio of acini / whole tissue. The acini were characterized by well stained zymogene granules. In fact, according to such changes, the pancreas is not fully developed in the newly born kitten at the first week of age.

Changes in adult cats were indicated densely packed lobules of acini units associated with well developed duct system accompanied with well developed endocrine part represented by Islet's of Langerhans. The histological data of exocrine portion showed no different features between right and left lobes of pancreas.

### **B. Stroma:**

The stroma of the pancreas was constructed by the presence of loose connective tissue which was initiated from the thin capsule and extended into the interior of parenchyma, separating it into many lobules. The connective tissue that found around ducts and blood vessels was prominently thickened and condensed. At one week aged kittens, the stroma between lobules was loose and of extensive distances between pancreatic lobules. In the next ages, 4 weeks aged weaned cats and adult cats, these spaces between lobules were decreased due to extensive increase of acini and in another aspect it showed the presence of dense irregular connective tissue (Fig. 5).

### **C. Duct system:**

Microscopic findings revealed the presence of prominently developed duct system in the pancreas even at one week aged kittens. It initiated by the formation of centroacinar cells. The latter were group of cells existed around the lumina of the secretory acini of the exocrine portion. The convey secretions toward other small canals to which they were connected called interalobular intercalated ducts. These ducts were small and lined by somewhat flattened simple cuboidal epithelial cells surrounded by many secretory acini. The intercalated ducts were converged together with other similar ducts forming ducts with larger diameters that were observed interalobular ducts running in the thin connective tissue separating the acini (Fig. 6). They were lined by simple cuboidal epithelial cells with rounded centrally located nuclei. In turn, these small ducts were converged together to form different sized interlobular ducts lined by low columnar to typical simple columnar epithelial cells (Fig. 15).

Large interlobular ducts (Fig. 7, 9, 10) from different parts were collected together to form larger ducts and subsequently the main duct of pancreas. The larger and main ducts were characteristically showed folds extended into the interior of their lumina. In fact, these features were absolutely specific to the main duct of the cat's pancreas. The simple columnar epithelium remains lining these latter branches of the duct system. At age of one week kittens and subsequent ages, most of these ducts were filled with secretory substances in their lumina. Post applying MTC, ages of 4 weeks and adulthood, the light microscopic examination to sections stained by MTC stain, revealed well

developed connective tissue supported the interlobular ducts, larger ducts as well as the main duct. The stain significantly stained the undulating smooth muscle fibers found intermingled between collagen fibers of the surrounding connective tissue. The blood vessels were numerous and accompanied the duct system at all studied ages of cats (Fig. 9, 10).

#### **D. Pacinian corpuscles:**

Prominently, pancreases of kittens and subsequent ages revealed the presence of Pacinian corpuscles distributed in different sites of the organ. They were lamellar corpuscles with oval-cylindrical in shape and have different sizes, but most of them were large considerably in size. They possessed one axon and they were entirely wrapped by a layer of connective tissue forming concentric lamellae including fibroblasts and fibrous connective tissue (Fig. 11).

#### **E. Ganglion of pancreas:**

Pancreas of one week kittens and those of subsequent ages were showed the presence of large parasympathetic ganglion. It was found adherent to the left lobe of the pancreas. The ganglion cells were large in size with rounded nuclei and small nucleoli. Their cytoplasm showed prominent missal granules. The ganglion cells were surrounded with many small darkly stained glial cells. Many small intramural parasympathetic ganglia were also detected positioned between acini and some were found in the interlobular septa surrounded with numerous blood vessels (Fig. 12).

#### **Endocrine portion:**

Endocrine portion which was resided by the presence of Islet's of Langerhans in the pancreas was developed in two directions that were enlargement of each developed Islet and by the increase of their cellular constituent. The number of the existed  $\alpha$ ,  $\beta$  and  $\delta$  was changed and their ratio inside each Islet was changed with the progress of age.

In the pancreas of kittens, few medium sized Islet's of Langerhans were identified, whereas there was large number of very small sized islets which were constructed by a collection of few cells (6-15 cells) intermingled between acini units of the pancreas parenchyma. Mean of islet number /mm<sup>2</sup> of whole pancreas was 0.35 (Table 3). Post staining with Gomori's trichrome stain, cells of Islets were stained faint blue and other red in color. Those of blue color were representing  $\beta$  cells which were larger in size with prominent nucleus and nucleoli. They were existed mostly in the periphery of the Islet's of Langerhans. Those cells of red color representing the  $\alpha$  cells which were smaller in size and distributed mostly in the interior of Islets (Fig. 13). At this age, pancreatic Islets comprised nearly equal number of these two types of cells but the number of  $\alpha$  cell was slightly higher than that of  $\beta$  cells (Table 3). Accordingly, the percentage of  $\alpha$  to the sum of Islet's cells was 59% and the percentage of  $\beta$  to the sum of Islet's cells was 40%, whereas the percentage of  $\delta$  to the sum of Islet's cells was 1% (Table 4).

In pancreas of 4 week aged weaned cats, microscopic examination revealed the presence of large number of both medium sized and large Islet's of Langerhans. The existence of small sized Islets was also detected. Mean of islet number /mm<sup>2</sup> of whole pancreas was 2.30. The percentage of  $\alpha$  to the sum of Islet's cells was decreased to 51.78 (Table 3) but the percentage of  $\beta$  to the sum of Islet's cells was increased up to 47.62%, whereas the percentage of  $\delta$  to the sum of Islet's cells was 0.60% (Table 4).

The number of cellular types was changed with no changes in their interior distribution as described in the previous age of cats (Fig. 13). The shapes of large Islets were mostly irregular, whereas, the medium sized and small Islets tend to be rounded or oval in shape. The large Islets tend to be positioned at the periphery of pancreatic lobules, whereas, the medium sized one were positioned in the interior of lobules. The small Islets were located between group of acini and some of them were just few cells approximately less than 10 cells.

In pancreas of adult cats, the microscopic findings revealed numerous Islet's of Langerhans with different sizes. Numerous small Islets were observed embedded between acini and few medium and large sized Islets (Fig. 14). The distribution of Islets was still as same as those observed in the previous mentioned ages. Mean of islet number /mm<sup>2</sup> of whole pancreas was 2.52 (Table 3). However, number of  $\beta$  cell was elevated causing critical change of ratio between it and the  $\alpha$  cell. The percentages of  $\alpha$ ,  $\beta$ ,  $\delta$  to the sum of Islet's cells was 26.88%, 72.72 % and 0.40%, respectively (Table 4).

## Discussion:

The pancreas of cat was found one of solid compact type compared to other animal species where it was found of diffused or mesenteric type of pancreas. In fact such compact type also recorded previously in some animal such as hamster, dogs, monkeys and humans<sup>8</sup>. Whereas, differently was found diffused in animals such as rabbit<sup>7</sup>, mouse<sup>8</sup>, Wister rats and Sprague–Dawley rats<sup>9</sup>.

Current remarks coincided with previous findings mentioned before as the gross anatomy of the cat's pancreas was similar to those of other commonly used laboratory and animal species such as rat, mouse, guinea pig and dog by exhibiting clearly defined right, body and left lobes<sup>10-11</sup>.

Similarly to some species such as pig and ox the right pancreatic lobe was found closely related to the wall of the descending duodenum<sup>12</sup>, whereas, differently to the rabbit's pancreas in which the right lobe found related to the ascending duodenum<sup>7</sup>.

The body part of the cat's pancreas was well characterized by the passage of the portal vein through it which was considered previously in some references as a good vessel marker to this part of the organ<sup>13</sup>.

Present findings revealed the presence of main pancreatic duct and absence of the accessory pancreatic duct in the domestic cats. The duct runs towards the proximal part of the descending duodenum and opened into duodenal lumen commonly with the bile duct. These findings were parallel with those found previously in different species of rabbit<sup>7, 10, 14</sup>. The presence of main pancreatic duct in domestic cats was similarly recorded in the other laboratory species such as mice, rats, guinea pigs and hamster<sup>9, 15-17</sup>. Similarly to the cat pancreas, the main duct was recorded in sheep and goats but differently these animals have also accessory duct<sup>18</sup>.

Macromorphometric data revealed critical changes at 4 weeks of age. In fact, this age represent critical period in the life of animal in which fed changes post weaning time was made which required parallel changes in the digestive function of these animals. Actually, previous references postulated that the weaning is a critical period for the young mammals, because the digestive processes are maturated intensively in association with change of the feeding manners<sup>19-21</sup>.

Microscopic findings were showed the presence of myoepithelial cells surrounding the acinar units of the pancreas. They appeared adherent to the basement membrane of the acini. These cells were found in the kittens and subsequent older ages. They were not observed around the intercalated and interlobular ducts. Similarly, in other animal species such as local rabbits these cells were found also around the acini<sup>7</sup>.

Critical morphological changes were detected in the pancreas of 4 weeks aged cats which was currently fixed as post weaning period of life of this animal species. This period was very important during which the animal started mixed feeding. Similarly, in the local rabbits,<sup>7</sup> recorded critical developmental changes in the exocrine and endocrine portions of the pancreas during post weaning period of the animal.

Findings related to the duct system showed characteristic histological construction. The data revealed the presence of well developed duct branches even in one week aged kittens. Noticeably, the interlobular ducts, larger ducts and main duct were showed the presence of smooth muscle fibers running in the surrounding connective tissue of these ducts. The presence of such feature appeared prominent in the pancreas of all studied ages of cats in the present study. Previous records<sup>22</sup> mentioned also in ox pancreas that the interlobular ducts and the main duct were surrounded by lamina propria which contains smooth muscle fibers.

The current data recorded that the duct system in cat was started by simple epithelium which was simple squamous and ended at the main excretory duct with simple epithelium i.e. simple columnar epithelium columnar. The lining epithelium of all branches of duct system revealed absence of goblet cells which was recorded in many animal species other than cats.

The presence of such muscle fibers indicated heavy exocrine production in this animal so the contraction of these muscle fibers tends to assist rapid conveyance of substances to their target organ which is the proximal part of the duodenum.

The interlobular ducts, larger ducts were showed characteristic feature which was the extended folds of epithelium into the lumina of these ducts. Moreover, in the main duct, the folds were protruded into the lumen of the duct. Current study believed that such feature aid to provide extensive surface epithelium and so subsequently increase the alkaline production which may act to decline the acidity of digested food in the duodenum caused by the stomach acidity. The presence of such morphological adaptation may be due to the feed behavior of animal as a carnivorous species.

The global changes in the size and number of Islet's of Langerhans at both 4 weeks aged cats and adult cats as well as the changes in the ratio of beta and alpha cells indicated not fully developed endocrine portion of the pancreas at birth of these animal species. The data showed critical changes at 4 weeks of age which representing the period of food intake changes by the animal.

However, recorded data indicated delayed development of endocrine portion compared to the exocrine portion of the pancreas, because at one week aged kittens, observations showed more developed exocrine portion than the endocrine one. In fact, exocrine portion revealed the formation of well developed duct system associated with the acinar units, whereas, only small group of cells were embedded in between acini were recorded as a cells of endocrine portion of the pancreas in kittens.

Characteristically, all parts of duct system were lack to goblet cells in their lining epithelium in all studied ages of cat's pancreas. It was different feature from those present in other mammalian pancreas. Noticeably, the lining epithelium remains simple in nature from first initiated part till the end of main duct. It was also different from those recorded in pancreatic ducts of other species such as the rabbit in which the main duct possess simple columnar epithelium with goblet cells.

The presence of autonomic ganglia inside and outside pancreatic tissue was also documented recently in the pancreas of the rats <sup>23</sup>. These ganglia were detected as a group of cells between acini of the parenchymal tissue and interlobular connective tissue or as large ganglion adjacent to pancreatic lobule.

Prominently, pancreases of kittens and subsequent ages revealed the presence of Pacinian corpuscles that were distributed in different sites of the pancreas and such feature was not present in some mammalian species. They were noticeably observed in the pancreas of all studied ages of cats. Their sizes sometime appeared equal to pancreatic lobules or even larger. The presence of these structures was also documented previously in the pancreas of human <sup>24</sup>.

Figures:

Fig. 1. Pancreas and duodenum of adult cat in situ. It showed the followings: left lobe (yellow arrows) , right lobe (black arrows), body (red rectangle) of pancreas traversed by portal vein (red arrow), descending (green arrow) and ascending duodenum (white arrow), right kidney (red star), hepatic lobes (yellow stars), stomach (black arrow).

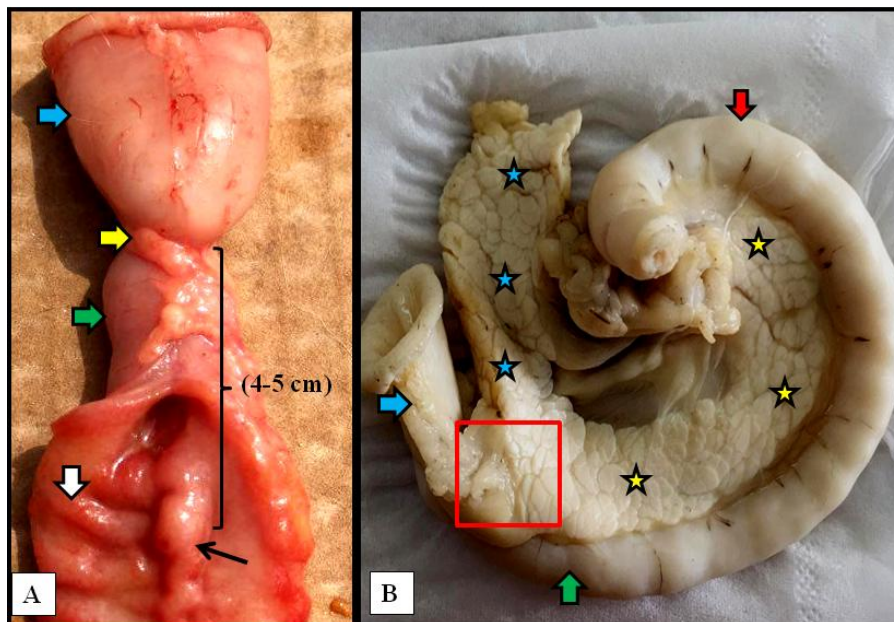

Fig. 2. A: Duodenal papilla (black arrow) inside the lumen of proximal part of the duodenum (green arrow). It showed its orifice (white arrow) around 4 to 5 cm distally to the duodeno-pyloric junction (yellow arrow), circular folds (red arrows). Blue arrow represents the pylorus. B: Dissected pancreas and duodenum of cat. It showed descending duodenum (green arrows), ascending duodenum (red arrows), left lobe (blue stars) and right lobe (yellow stars) of pancreas, pylorus (Blue arrow).

Fig. 3. Main pancreatic duct of the cat in situ. left (yellow arrows) and right (black arrows) branches of the main duct (blue arrow) were united just parallel to the proximal part of duodenum distally to duodeno-pyloric junction (blue star), for short distance it joined the bile duct (white arrows) before its entrance into the duodenum. Yellow stars represent hepatic lobes.

Fig. 4. Descending duodenum (A) and adjacent right lobe (B) of pancreas in one week aged kitten carried together by the mesentery (red arrow). Duodenum showed mucosa (blue star), submucosa (yellow star), Auerbach's plexuses (yellow arrows) between inner and outer layers of tunica muscularis (double head arrow). Pancreas showed lobules (white stars), interlobular duct (green arrow) and blood vessels (white arrow). H&E, X40 (A), X100 (B).

Fig. 5. Left lobe of pancreas of adult cat. It showed dense interlobular connective tissue stained blue (yellow arrows) around blood vessels (black arrows) and interlobular ducts (red arrows) as well as fine intralobular connective tissue fibers intervening between acini (red stars). Masson's Trichrome stain, X40, X100 (magnified rectangle)

Fig. 6. Right lobe of pancreas of adult cat. It showed intercalated duct (white arrows), intralobular ducts (black arrows), small (red arrows) and large interlobular ducts (yellow arrow), blood vessels (green arrows) and Islet's of Langerhans (blue arrows) embedded in the pancreatic lobes (yellow stars). H&E, X100

Fig. 7. Left lobe of pancreas of 4 weeks weaned cat. It showed main pancreatic duct lined by simple epithelium (white arrow), surrounded by connective tissue (yellow arrows), smooth muscle fibers (red arrows) and pancreatic lobules (yellow stars). Masson's Trichrome, X100 (small rectangle), X400

Fig. 8. A: Right lobe of pancreas of 4 weeks weaned cats. It showed acini (yellow arrows) with centroacinar cells in the lumen (blue arrow), intralobular connective tissue surrounding acini (red star) and intercalated duct (green arrow) lined with simple cuboidal epithelium. B: Pancreas of adult cat showed myoepithelial cell (black arrow) around an acinus (yellow arrows), centroacinar cells (blue). H&E, 1000

Fig. 9. Pancreas of adult cat. It showed large interlobular duct (yellow arrow) intervening between acini (yellow stars). The duct is surrounded by connective tissue (blue star) in which undulating smooth muscle fibers are found (black arrows) and blood vessels (red arrows). Masson's Trichrome, X400, X100 (small rectangle).

Fig. 10. Right lobe of pancreas of adult cat. It showed the right branch of the main duct into which opened many large interlobular ducts (blue stars). It is lined by simple columnar epithelium (red arrow) with the underneath connective tissue (red stars) which showed smooth muscle fibers (yellow arrows). Yellow stars represent the pancreatic acini. Masson's Trichrome, X100, X40 (small rectangle).

Fig. 11. Right lobe of pancreas of adult cat. It showed Pacinian corpuscle inside pancreatic lobules (red arrow). Isle's of Langerhans (yellow arrows) are present inside the lobules (yellow stars). Interlobular connective tissue (blue stars) and many intralobular (blue arrow) and interlobular (Black arrows) ducts are present. H&E, X40

Fig. 12. Intramural ganglia in pancreas of one week (A) and 4 weeks (B) cats. It showed ganglion cells with large nuclei and nucleoli (yellow arrows) surrounded by small neuralgia cells (blue arrows). Many blood capillaries present (white arrows) and acini (blue stars). Gomori's Aldehyde trichrome, X400

Fig. 13. Islet's of Langerhans of one week aged kitten (A), 4 weeks aged weaned cat (B), medium sized islet of adult cat (C), large sized islet of adult cat (D). It showed  $\alpha$  (red arrows),  $\beta$  (yellow arrows) and  $\delta$  (blue arrow). Many blood vessels present inside and outside the islet (white arrows), and acini (blue stars). Gomori's Aldehyde trichrome, X1000

Fig. 14. Left lobe of pancreas of adult cat. It showed large (red arrow), medium (blue arrows) and small (black arrows) Islet's of Langerhans present in pancreatic lobules (yellow stars). H&E, X100

## Conclusions:

It could be concluded that pancreas in domestic cat was not fully developed at birth and the organ showed developmental morphological changes promptly post 4 weeks of age. The current findings can be categorized into two criteria. First of all, attention should be taken by both owners of cats and veterinarians on the management and feeding program particularly post weaning period of the animals to avoid nutritional diseases and insure their vaccine programs and subsequently caused animals raised with well health condition. The second criteria, as the

pancreas of the cats showed morphological similarities to those of human so that we can consider cats a good model or voluntaries to conduct pharmaco-physiological attempts against some diseases such as diabetes mellitus.

#### Abstract

Herbals have been used for centuries to prevent and control disease. Herbal extracts are effective because they interact with specific chemical receptors within the body and are in a pharmacodynamic sense than drugs themselves so usage of herbal extract averts many patients from many side effects that generally come with traditional medicines. Propolis gained a popularity in the field of Dentistry because of its antimicrobial, anti-inflammatory, healing, anesthetic and cariostatic properties. The aim of the current study was to evaluate the histological response of a healthy rabbit pulp to direct pulp capping with propolis compared to calcium hydroxide. Twelve male rabbits were selected, their dental pulps were intentionally exposed by using low speed round bur on labial surfaces of permanent central incisors. Split mouth technique was used for applying the capping material to control and experimental groups. Each group was subdivided into three subgroups, four rabbits for each, where rabbits were sacrificed after 1, 2 and 4 weeks from capping time respectively. Teeth were dissected after animal scarification and prepared for histopathologic and histochemical evaluation using Hematoxylin\_ Eosin (HE) and Trichrome stains. The results showed that 25%, 50% and 25% of dental pulps capped with calcium hydroxide showed mild, moderate and severe inflammatory response respectively, while in propolis group 75% and 25% showed slight to moderate inflammatory response respectively. As regard hard tissue formation in response to capping materials, in calcium hydroxide group half of the cases showed moderate deposition and other half showed marked hard tissue deposited at fourth week of follow up period. While in propolis group there was a marked deposition in 75% of cases and moderate deposition in 25% in the other. Conclusion propolis proved to have less intense inflammatory response and better quality dentin bridge formation.

**Introduction:-**

Protection of the dentin-pulp complex consists of the application of one or more layers of specific material between the restorative material and dental tissue to avoid additional challenge to the pulp tissue caused by operative procedures, toxicity of restorative materials and bacteria penetration due to microleakage. Protection of the dentin pulp complex has also the function to recover pulp vitality (Briso et al., 2006).

Several materials have been suggested for capping dental pulps, however calcium hydroxide is the gold standard for pulp capping (Accornite et al., 2005), the hydroxyl group is considered to be the most important component of Ca (OH)<sub>2</sub> as it provides an alkaline environment, which encourages repair and active calcification. The alkaline pH induced not only neutralizes lactic acid from osteoclasts, thus preventing dissolution of the mineral components of dentine, but could also activate alkaline phosphatase that plays an important role in hard-tissue formation. The pH necessary for the activation of this enzyme varies from 8.6 to 10.3. Alkaline phosphatase separate phosphoric esters, freeing phosphate ions, which then react with calcium ions to form a precipitate, calcium phosphate, in the organic matrix. This precipitate is the molecular unit of hydroxyl apatite which is believed to be intimately related to the process of mineralization (Estrela et al., 1999).

Calcium hydroxide initially bactericidal then bacteriostatic, promotes healing and repair, stimulates fibroblasts, neutralizes low pH of acids, stops internal resorption, inexpensive and easy to use, but also has some disadvantages as does not exclusively stimulate dentinogenesis, associated with primary tooth resorption, may dissolve after one year with cavosurface dissolution, may degrade during acid etching, degrades upon tooth flexure, marginal failure with amalgam condensation and does not adhere to dentin or resin restoration (Mustafa et al., 2012).

Mineral Trioxide Aggregate (MTA) is similar to calcium hydroxide, including its antibacterial and biocompatibility properties, high pH, radiopacity and its ability to aid in the release of bioactive dentin matrix proteins. There are some differences between MTA and calcium hydroxide, first, MTA comes in two colors, white and grey. The grey version is due to the addition of iron. Another significant difference is the fact that MTA provides some seal to tooth structure (Luketic et al., 2008).

However there are several disadvantages with MTA, it has shown high solubility, demonstrating 24% loss after 78 days of storage in water, and prolonged setting time of approximately 2 hours and 45 minutes so pulp capping with MTA should be done in a two-step procedure, placing a temporary restoration to allow the MTA to set before placing the permanent restoration. One gram of MTA powder costs approximately the same as 24 grams of calcium hydroxide base/catalyst paste, making MTA much more cost (Fridland and Rosado, 2005).

Glass ionomer has the ability to bond chemically with tooth structure, so it can prevent the diffusion of potentially toxic materials through dentin to the pulp. Glass ionomer also provides an excellent bacterial seal and shows good biocompatibility when used in close approximation but not in direct contact with the pulp (Costa et al., 2003).

Glass ionomer was also tested as dental pulp capping material. Nascimento et al., (2000) evaluated the response of human pulps after capping with calcium hydroxide and resin modified glass ionomer. It was found that resin modified glass ionomer caused a moderate to intense inflammatory reaction with a large area of necrotic zone and lack of dentin bridge formation, while calcium hydroxide allowed pulp repair and complete dentin bridging around the pulp exposure. These results suggested that resin modified glass ionomer is not suitable to be used in direct pulp capping for mechanically exposed human pulps.

Propolis has antibacterial, antifungal, antioxidant and anti-inflammatory properties (Koru et al., 2007), these biological properties are related to its chemical composition of flavonoids, phenolics, and aromatic compounds (Park et al., 1998).

The method of extraction and type of solvent can change the chemical composition of propolis extract. Commercial products such as tablets, capsules, ampoules, and syrups are prepared with ethanolic extract of propolis. Methanol is only used for research purposes (Xu et al., 2009).

Therefore, the aim of this study was to evaluate the histological response of a healthy rabbit pulp to direct pulp capping with propolis compared to calcium hydroxide.

**Materials and method:-**

Twelve male rabbits weighed 2.5 Kg were selected for this study. Pulp capping procedure were performed, in which two opposing quadrant in each rabbit were assigned for each medicament (split mouth technique). Pulp were capped either with propolis (control group) or calcium hydroxide (experimental group).

**Ethical regulation:-**

The research was approved by the research ethics committee, Faculty of Dentistry, Minia University.

**Experimental procedures:-**

Animals were anesthetized by intra-muscular injection in the quadriceps femora muscle using 3.3cm of Xyla-ject solution, and then the working field was disinfected by 2% chlorohexidine solution and dried by cotton rolls. Dental pulps were intentionally exposed by using low speed round bur and coolant on labial surfaces of permanent central incisors. One central incisor was capped with calcium hydroxide and the other with propolis.

**Capping materials:-**

1- Calcium hydroxid (Dycal, Dentsply).

2- Propolis (Imtenan): the powder was mixed with 70% ethyl alcohol to a thick consistency on a paper pad with the aid of plastic spatula, the mix was placed on the exposure site by means of small ball burnisher and was allowed to set (setting time 3 min.)

Cavities were sealed with glass ionomer cement (Riva) after setting of capping materials.

**Animal care:-**

After completion of dental procedure, the animals were taken care of according to the protocol of Canadian Council on Animal Care and in coherence with the Three Rs (replacement, reduction, reinforcement) of animal ethics (Fenwick et al., 2011).

**Animal scarification:-**

Four rabbits in each group were sacrificed at 1, 2, 4 weeks respectively. Then the upper jaw was removed and the capped teeth were dissected.

**Histological evaluation** (Passcoe and Gatehouse, 1986):

- ❖ *Fixation of the tissue:* The specimens were put immediately in fixative 10% formalin for 48- 72 hours.
- ❖ *Washing:* After adequate fixation in 10% formalin solution, the specimens were washed under running tap water overnight to remove the excess of the fixative.
- ❖ *Decalcification :*Decalcifications of the specimens were carried out using 20% formic acid buffered with sodium citrate for 10 weeks.
- ❖ *Dehydration:* Water was removed from the tissue gradually by putting it in ascending grades of Ethyl alcohol; 50%, 70%, and 90% then in absolute alcohol.
- ❖ *Clearing:* Since paraffin and alcohol are not miscible, the tissue was put in xylene (clearing agent) which is miscible with both alcohol, and paraffin. It also made the tissue translucent.
- ❖ *Infiltration and embedding :*When xylene was completely replaced the alcohol in the tissue, the specimens became clear, they were embedded in dish filled with melted paraffin then removed from the dishes with a warm forceps and placed in the a box of melted hard paraffin, the bottom of which was the surface of cutting.
- ❖ *Cutting:* The paraffin embedded specimens were serially cut with microtone in a buccolingual plane parallel to the tooth vertical axis through the cavity preparation and the pulp into sections of 5 microns thickness showing the deepest part of the cavity and the underlying pulp .
- ❖ *Mounting:* A short length of paraffin ribbon was floated in a pan of warm water (about 20°C). The prepared slide was slipped under the ribbon and then lifted from the water with the ribbon, which contained the tissue sections arranged on its upper surface. The slide was placed on a constant temperature drying table which was regulated to about 37-42°C, so that the sections adhered to the slide. The slide was then allowed to dry on this table.

**The staining technique:-**

- A) **Haematoxylin and eosin staining:** to evaluate inflammatory response according to the following scores:
- B) **Trichrome stain :**to evaluate and score tissue fibrosis

**Statistical method:** Data entry and analysis were done with I.B.M. compatible computer using the software SPSS for windows version 13. The significance level was set at  $P < 0.05$

**Table 1:-** Scoring system of inflammatory cell response.

Characterization	Grade
Absence of inflammation or mild inflammatory response limited to the capping site.	0
Slight to moderate inflammation below the capping site but limited to the coronal portion of the radicular pulp.	1
Moderate inflammation evident below the capping site and extended to the middle one third of the pulp.	2
Severe inflammation affecting the whole pulp (including partial necrosis)	3
Pulp necrosis	4

**Table 2:-** Scoring system of tissue fibrosis

Characterization	Grade
Normal collagen fibers distribution	0
Mild fibrosis	1
Moderate fibrosis	2
Sever fibrosis	3

**Table 3:-** Scoring system of hard tissue formation; dentin bridge (Parolia, et al 2010)

Characterization	Grade
Absent	0
Mild hard tissue deposition beneath the exposed area or partially formed hard tissue	1
Moderate hard tissue deposition beneath the exposed area	2
Heavy hard tissue deposition beneath the exposed area	3

## Results:-

### I- Histopathological evaluation of specimens:

#### 1- Calcium hydroxide: (Control group)

##### 1. a - After one week of application of its application:

The initial reaction of the pulp to the capping material in most of specimens was a superficial layer of necrosis just beneath the material. This necrosis was followed by a weak inflammatory reaction [grade (0)] in 25% of specimens, which is characterized by the presence of dilated blood vessels and few inflammatory cells, and slight inflammation limited to coronal portion beneath the capped site grade (1) inflammatory cell response in 75% of specimens.

##### 1. b- After two weeks of application:-

25% of specimens showed grade (1) inflammatory response, 25% had moderate inflammation extended to the middle third of the pulp; grade (2) inflammatory response and the other 50% showed severe inflammation extended along the pulp tissue with partial necrosis; grade (3) inflammatory response.

##### 1. c- After four weeks of application:-

25%, 50% and 25% of specimens showed grade 1, 2 and 3 inflammatory responses respectively.

#### 2- Propolis group: (Experimental group)

##### 2. a- After one week of application:-

There was a mild inflammatory reaction grade (0) inflammatory cell response in 75% of specimens, and the other 25% showed grade (2) inflammatory cell response.

##### 2. b- After two weeks of application:-

There were 50% of specimens showed grade (1) and the other 50% had grade (2) inflammatory cell response.

##### 2. c- After four weeks of application:-

Grade (1) and grade (2) inflammatory tissue response respectively were evident in 75% and 25% of specimens respectively.

### Histochemical evaluation of specimens:-

#### 1- Calcium hydroxide: (Control group)

##### 1.a) After one week of application.

All pulps (100% of specimens) had no fibrosis grade (0) tissue fibrosis.

**1.b) After two weeks of application:**

50% of specimens showed mild fibrosis grade (1), while 25% had moderate fibrosis grade (2) and the other 25% showed severe fibrosis grade (3) tissue fibrosis.

**1.c) After four weeks of application of capping material:**

75% of specimens showed grade (1) and 25% of specimens had grade (2) tissue fibrosis.

**2- Propolis (experimental group):**

**2.a) After one week of application :**

100% of specimens had grade (0) tissue fibrosis.

**2.b) After two weeks of application:**

Half of the specimens showed grade (1) tissue fibrosis and the other half exhibited grade (2) tissue fibrosis.

**1.c) After four weeks of application:**

50% of specimens showed grade (1) and the other 50 % grade (0).

**Evaluation of hard tissue formation (dentin bridge):**

**1-Calcium hydroxide (control group):**

**1.a) After one week of application.**

25% of specimens showed a thin layer of partially calcified dentin matrix, grade (1) hard tissue formation, just beneath a superficial layer of necrosis formed below the applied material and the other 75% had no evidence of hard tissue formation, grade (0).

**1.b) After two weeks of application:**

75% of specimens showed grade (1) and 25% had moderate hard tissue deposition beneath the capping material, grade (2).

**1.c) After four weeks of application:**

50% of specimens showed grade (2) and 50% revealed heavy hard tissue deposition beneath the capping site, grade (3).

**2- Propolis group (experimental group)**

**2.a) After one week of application.**

Thin layer of partially calcified dentin matrix, grade (1) was seen in only 50% of specimens, other specimens showed no evidence of hard tissue formation.

**2.b) After two weeks of application.**

50% of specimens showed grade (1), while the other 50% had grade (2).

**2.c) After four weeks of application.**

25% of specimens showed grade (2) and 75% showed grade (3).

**Discussion:-**

The clinical criterion is inadequate for evaluation of the long-term prognosis for teeth treated by pulp capping. It is impossible to clinically diagnose teeth in which healing is complicated by inflammation. Therefore, a critical evaluation of pulp capping results can only be made histologically (Woehrlen, 1997).

Many studies have indicated that calcium hydroxide compounds are the gold standard for pulp capping in human teeth, despite its limitations (Accornite et al., 2005), propolis have antibacterial, antifungal, antiviral, antioxidant and anti-inflammatory properties, Therefore the current study aimed to compare one of natural product "propolis" to gold standard "calcium hydroxide" as pulp capping of rabbit teeth.

The animal model selected in the present study was rabbits because their pulp tissues are comparable with that of human (Belduz et al., 2010), using split mouth technique so that both medicaments tested in the same animal in alternate sides of the mouth.

The follow up period was short term extended only 4 weeks this because rabbit teeth grow or erupt continuously, these growth or eruption is held in balance by dental abrasion from chewing a diet high in fiber (Konigswald and Golenishev, 1979). Several previous studies used comparable follow up periods (Haddad et al., 2003 and Sabir et al., 2005).

Results of the current study revealed that, specimens capped with propolis exhibited less inflammatory reaction compared to calcium hydroxide at all follow up periods. This finding goes in accordance with Sabir et al, (2005), Parolia et al, (2010), Ozorio et al, (2012), Ahangari et al., (2012) who found that propolis delay the inflammatory response. The delay of inflammatory response with propolis could be related to its anti-inflammatory property. Flavonoids and caffeic acid present in propolis are known to play an important role in reducing the inflammatory response by inhibiting the lipoxygenase pathway of arachidonic acid. Also, propolis as an antimicrobial agent could break down bacterial cell wall, cytoplasm and prevent bacterial cell division (Khayyal et al., 1993).

On the other hand study of Esmeraldo et al., (2013) found that green propolis extract produced intense inflammatory infiltrate and necrosis in root canal pulp tissue after 24, 72 hours and 7 days compared to calcium hydroxide. Difference may be attributed to difference in the studied animal, the current study was on rabbits while study was on rat, also within the second study, teeth were protected with a fragment of absorbent paper soaked with the solution so this inflammation may be stemmed from a reaction to the foreign body (absorbent paper) rather than propolis itself.

As regard to fibrosis, after one week of capping procedure, both groups did not show any signs of fibrosis [grade (0)], while after two weeks of capping procedure in calcium hydroxide group there were varies degree of tissue fibrosis 50%, 25% and 25% of specimens showed grades (1), (2) and (3) tissue fibrosis respectively, compared to 50% grade (1) and 50% grade (2) tissue fibrosis in propolis group. After four weeks of application, 75% of specimens in calcium hydroxide group showed grade (1) fibrosis and the other 25% showed grade (2) fibrosis , while in propolis group half of specimens had grade (0) and the other half had grade (1, denoting a better recovery in propolis group.

When hard tissue formation was evaluated, the results supported by previous study conducted by Paloria et al., (2010) who found percentage of specimens exhibited hard tissue bridges after 15 days are equal in calcium hydroxide and propolis group, while after 45 days 100% of specimens capped with propolis showed dentine bridge formation compared to 83% of specimens capped with calcium hydroxide. The dentin bridge formed in response to propolis was better in quality than calcium hydroxide, it was thicker and continuous. The same finding was reported by Ahangari et al., (2012) who stated that propolis not only stops inflammatory reaction, infection and pulp necrosis but also induce formation of high quality tubular dentin through stimulation of stem cells.

Dentin formation following pulp capping is known to involve differentiation of odontoblast-like cells that form reparative dentin and biosynthetic activity by surrounding primary odontoblasts. Both phenomena require interaction between extracellular matrix molecules and growth factors such as transforming growth factor (TGF)- $\beta$ 1, a growth known to be important for odontoblasts-like cell differentiation (Tziafas et al., 2000). Indeed, propolis is capable of stimulating the production of (TGF)- $\beta$ 1 (Ansoerge et al., 2003).and synthesis of collagen by dental pulp cells (Scheller et al., 1978).

Therefore, within the limitation of the current study propolis showed less intense inflammatory reaction and better dentin bridge formation compared to calcium hydroxide, suggesting its use as a possible alternative to calcium hydroxide.

### **Conclusion:-**

Propolis was superior to calcium hydroxide in terms of less intense inflammatory response and better quality dentin bridge formation.

### **Recommendations:-**

1-Propolis can be suggested as a possible alternative to calcium hydroxide as pulp capping material.

2- Further studies are required to

- a) Evaluate an alcohol free Propolis mix.
- b) Compare Propolis with other pulp capping materials.
- c) Evaluate ability of Propolis for hard tissue formation (dentinogenesis) in vivo.

**Fig 1:** A photomicrograph of rabbit dental pulp after four weeks of application of capping materials:  
a) Propolis group: showing slight dilatation of blood vessels in the coronal portion of the pulp.  
b) Calcium hydroxide group: showing moderate dilatation of blood vessels in coronal and middle thirds

**Fig 2:** Photomicrograph of rabbit dental pulp after four weeks of application of capping materials:  
a) Propolis group: showing mild fibrosis.  
b) Calcium hydroxide: showing moderate fibrosis.

**Fig3:** Photomicrograph of rabbit dental pulp after four weeks of application of capping materials:

- a) Propolis group: showing heavy hard tissue deposition beneath the capping material.  
 b) Calcium hydroxide group: showing moderate hard tissue deposition beneath the capping material.

#### Abstract

Fruits and vegetables are important constituents of the diet and provide significant quantities of nutrients, especially vitamins, sugars, minerals and fiber. The fruit and cladodes of prickly pear provide interesting sources of functional compounds, such as fiber, hydrocolloids, pigments, minerals, and vitamins with antioxidant properties, such as vitamin C. Ananas comosus (pineapple) is a tropical plant with edible multiple fruit consisting of coalesced berries, also called pineapples, and the most economically significant plant in the Bromeliaceae family. The squash was developed with the optimization of the concentrations of prickly pear (5-25 %) and pineapple (0-25 %) juice. The developed fruit squash was subjected for evaluation of physico-chemical markers. Results showed significant differences ( $p < 0.05$ ) among the treatments for all the chemical components of the squash blends analyzed except for titrable acidity, TSS and SO<sub>2</sub> which did not show significant differences between the treatments on total soluble solids (TSS) in the range of 45 - 460 brix, pH 3.8 to 4.1, titrable acidity (% citric acid) 1.45 to 1.49, total sugars 35.3 to 37%, reducing sugars 15.2 to 16.8%, ascorbic acid 6.5 to 10.5 mg/100g and SO<sub>2</sub> 348 to 350 ppm were observed in different juice blended squash treatments. The highest TSS (460Brix), total sugars (37%), reducing sugars (16.8%) was observed in T3 prickly pear and pineapple juice blended ratio (15:10). The high acidity (1.48%) and ascorbic acid (10.9 mg/100g) were witnessed in T5 prickly pear : pineapple (5:20%) fruit juice blended squash; whereas high SO<sub>2</sub> content was seen in pure prickly pear squash (T1) and lowest pH (3.8) was seen with the squash blended prickly pear: pineapple (15:10%) fruit juices i.e T3. The study concludes that, prickly pear and pineapple facilitates in the development of functional fruit squash with minor changes in physico-chemical markers and superior sensory attributes.

#### Introduction:-

Fruits and vegetables are important constituents of the diet and provide significant quantities of nutrients, especially vitamins, sugars, minerals and fiber. Daily consumption of fruits and vegetables reduce the risk of cancer, heart disease, premature aging, stress and fatigue primarily due to the integrated action of oxygen radical scavengers such as  $\beta$ - carotene and ascorbic acid plus calcium and dietary fiber (Sáenz, et al., 2000).Pimienta, et al., (1990) reported

**Corresponding Author:-S. ChennaKesava Reddy.**

Address:-Department of Home Science, S.V University, Tirupati-517502, AP, India.

that due to the perishable nature of the fruits and vegetables they require immediate processing to avoid post-harvest losses (20-25%)

*The Opuntia ficusindica (L) Mill* is a xerophyte popularly known as prickly pear plant in English. Prickly pear fruit has a similar nutritional value like other fruits, although it has much higher soluble solids content than many popular fruits such as apple, apricot, cherry, melon, peach and plum (Pimienta, 1990; Sepúlveda and Sáenz, 2000). This characteristic makes prickly pear fruit suitable for processing by concentration or dehydration, taking advantage of the reduced water activity and increased sugar content as a means of preservation.

Most of the sugars present in the prickly pear fruit are reducing types, with around 53 % glucose and the remaining is fructose (Rodríguez *Et al.*, 1997). The contents of protein (0.21–1.6 g [100 g]<sup>-1</sup>), fat (0.09–0.7 g [100 g]<sup>-1</sup>), fibre (0.02–3.15 g [100 g]<sup>-1</sup>) and ash (0.4–1.0 g [100 g]<sup>-1</sup>) are similar to other fruits (Pimienta, 1990; Sepúlveda and Sáenz, 2000; Rodríguez *et al.*, 1997; Muñoz de Chávez *et al.*, 1995). The calorific value of prickly pear fruit pulp varies between 31 and 50 kcal (100 g)<sup>-1</sup>, which is comparable with other fruits such as apples, oranges, peaches and pears.

The fruit and cladodes of prickly pear provide interesting sources of functional compounds, including fiber, hydrocolloids (mucilage), pigments (betalains and carotenoids), minerals, (calcium and potassium) and vitamins with antioxidant properties, such as vitamin C. These compounds are valued for their contribution to a healthy diet and also as ingredients for designing new foods (Sáenz, 2004). These compounds can be included in a new range of foods known as functional foods, which are as foods or beverages that provide physiological benefits. They enhance health, help to prevent or treat disease and/or improve physical or mental performance with the addition of one or more functional ingredients or using appropriate biotechnologies (Sloan, 2000).

The pineapple (*Ananas comosus*) is a tropical plant with edible multiple fruit consisting of coalesced berries, also called pineapples, and the most economically significant plant in the Bromeliaceous family. In a 100 gram serving, raw pineapple is an excellent source of manganese (44% Daily value (DV)) and vitamin C (58% DV), but otherwise contains no essential nutrients in significant content. It is an excellent source of antioxidant, vitamin C which is required for the collagen synthesis in the body. It contains micronutrients and it protects against cancer and this micro-nutrient break up blood clots is beneficial to the heart.

There are various methods of preservation of food including thermal processing, fermentation, pickling, dehydration, freezing etc. The technology for preservation also varies with type of products and targeted market. The processing of fruit as squash enhances the raw edible quality of fruit as well as its shelf life by the selection of appropriate fruit drink processing conditions.

Squashes are sweetened juice of fruits containing minimum prescribed quantity of pulp. As per Indian Standards, squash should contain at least 25 per cent (by volume) of fruit juice. The squashes are consumed after dilution by drinking water in 1:3 ratio. These beverages contain added flavors and permitted class II preservatives. Since preservatives are added in adequate quantities, the shelf life of squashes is fairly longer at room temperature.

The present study was carried out for the development of fruit squash with prickly pear and pine apple fruits. The standardized and development of squash with different concentrations of pear and pine apple fruits and evaluation of the physico-chemical and sensory attributes.

## **Materials & Methods:-**

### **Prickly pear juice:-**

Mature ripe fruits were collected from the experimental plot during April-May. Spines over the surface of the fruit were picked, peeled washed cut into slices and seeds were removed. The slices are crushed with an electric blender/mixer to get pulp. The pulp was heated up to 80°C and passed through a 1/32 inch nylon sieve to remove excess fiber and coarse pulp particles. Finally obtained juice was analyzed for TSS, PH, Titrable acidity, ascorbic acid and was used for preparation of blended fruit squash.

### **Pineapple juice:-**

Mature ripe fruits purchased from the local market were peeled, washed, cut into slices and crushed into pulp with electric blender/mixer. The crushed pulp was heated to 80°C and passed through a passed through a 1/32 inch nylon

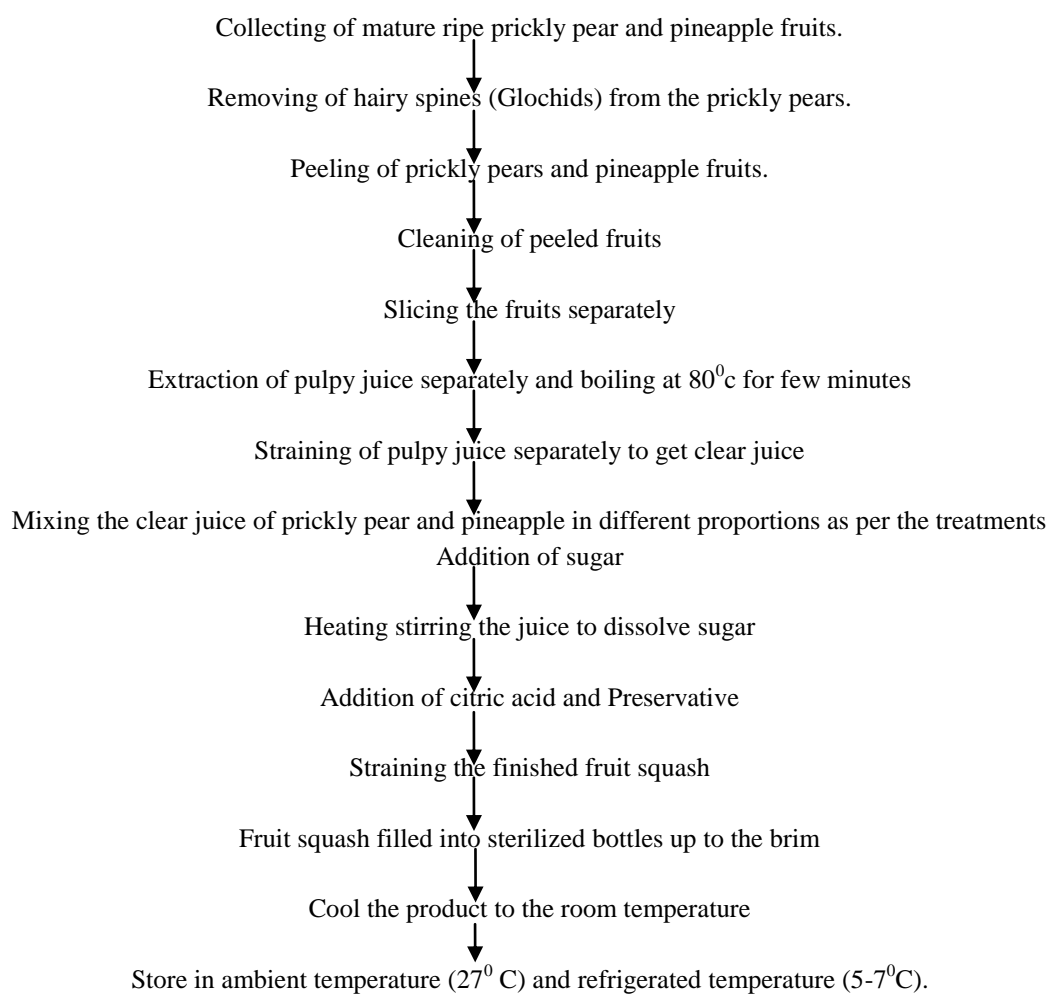

sieve so as to remove excess fiber and coarse pulp particles finally obtained juice was analyzed for TSS, PH, Titrable acidity, ascorbic acid and was used for preparation of blended fruit squash.

#### Optimization and preparation of Squash:-

The clarified fruit juices of prickly pear and pineapple were mixed in different proportions and sample codes are represented in below Table 1.

**Table:-1** Sample codes for the optimization of prickly pear and pine apple fruit squash.

Treatment	Prickly pear juice (%)	Pineapple juice (%)
T1	25	0
T2	20	5
T3	15	10
T4	10	15
T5	5	20

**Fig: 1:- Flow chart for preparation of prickly pear fruit squash**

**Fig: 2** Images of fruit squash developed with prickly pear and pine apple

### Analytical methods:-

#### Moisture:-

Estimation of moisture content and total solids was carried out five times. Fruit pulp (10 g) placed in an evaporating dish and dried at 105 °C in an oven at constant weight. The moisture content was determined using following equation.(Askar 1981).

$$\% \text{ moisture content} = [(\text{initial weight} - \text{dried weight})/\text{initial weight}] \times 100.$$

#### TSS:

Total soluble solids (TSS) of different pulp, juice and products was measured with hand refractometer (ERMA, Japan) and expressed as °Brix at room temperature. Before taking the reading the refractometer was tested for error with distilled water (Ranganna, 1994).

#### pH:

P<sup>H</sup> of juices and products was determined by using Digital pH meter (model-EQ-610, Equip-Tronics, Ahmedabad, India) (Anonymous, 1996).

#### Titration acidity:

Titration acidity was determined by diluting 5-10g of sample with distilled water then 10 ml of sample was taken in a 100ml volumetric flask and the volume was made up with distilled water. From this 10ml of aliquot was taken in a 100ml conical flask and titrated against 0.1N sodium Hydroxide (NaOH) solution using one (or) two drops of phenolphthalein indicator. Total titration acidity was expressed as percent citric acid (g/100ml of sample) (AOAC 2005)

$$\text{Acidity \% (As citric acid)} = \frac{\text{Titer value} \times \text{Normality of NaOH} \times 64 \times 100}{\text{Volume of Sample taken} \times 1000}$$

#### Total sugars:

The total sugar content was determined by the anthrone reagent method (Plummer, 2006). The fruit juice was prepared as described in 3.3.3.2 and transferred 1.0 ml of filtered juice to the 10 ml volumetric flask, and diluted to 10.0 ml with distilled water, having strength 100µl/ml, labelled as stock solution. Stock solution (0.1 ml) was transferred into 10 ml volumetric flask, and diluted to 10 ml with distilled water, having strength 10µl/ml. The anthrone reagent was prepared right before analysis by dissolving 0.2 g of anthrone (0.2%) in 100 ml of concentrated sulfuric acid, protected from light and used within 12 h. Anthrone reagent (4.0 ml) was added

cautiously to each tube containing 1.0 ml of standard solutions of glucose (10 – 100 µg/ml) and test solution (10µl/ml).

Tubes were then placed 10 min at 5 °C. Subsequently, tubes were boiled 5 min on constant boiling water bath. After heating, allowed to cool at room temperature for 15 min. The absorbance of the colored solution was measured at 620 nm against reagent blank. Readings were taken in triplicate. Spectrophotometric response was compared to a standard calibration curve of glucose, and total sugar content was expressed as g/100 ml of glucose. (AOAC 2005).

#### **Reducing sugars:-**

Weigh accurately an amount of sample such that after dilution the solution contains about 0.6% reducing sugars. Transfer the sample quantitatively to a 500 ml volumetric flask with the aid of hot water, cool to room temperature, dilute to volume and mix thoroughly. Pipette 25.0 ml of standardized mixed Fehling's Solution into a 200 ml Erlenmeyer flask and add a few glass beads. Add the sample solution by means of the burette to within 0.5 ml of the anticipated end point (determined by preliminary titration). Immediately place the flask on the wire gauze of the titration assembly, and adjust the burner so that the boiling point will be reached in about 2 min. Bring to boil and boil gently for 2 min. As boiling continues, add 2 drops of methylene blue indicator and complete the titration within 1 min. by adding sample solution drop wise or in small increments until the blue color disappears when approaching the end point, allow about 5 sec, reaction time between additions of sample solution. (AOAC 2005).

$$\% \text{ Reducing Sugars} = (500 \text{ ml}) (0.1200)(100) / (\text{Sample Titer, ml})(\text{Sample Wt., g})$$

#### **Ascorbic acid (Vitamin C):-**

Vitamin C was determined by using the procedure as outlined by Food Analysis Laboratory Manual Chapter 7 Vitamin C Determination by Indophenol Method-9 and (AOAC2005).

10 g of each of the samples with the exception of fruits was accurately weighed and ground using mortar and pestle with an additional of 20 ml of metaphosphoric acid and acetic acid. The mixture was further ground and strained through muslin and the extract was made up to 100 ml with the metaphosphoric-acetic acid mixture. 5 ml of the metaphosphoric acid-acetic acid solution was pipetted into three of the 50 ml Erlenmeyer flask followed by 2 ml of the samples extract. The samples were titrated separately with the indophenol dye solution until a light rose pink persisted for 5s. The amount of dye used in the titration were determined and used in the calculation of vitamin C content.

#### **Sulphur dioxide (So<sub>2</sub>):**

Sulphur dioxide content of the sample was distilled in the presence of acid in an inert atmosphere and absorbed by iodine which converts sulphurous acid to sulphuric acid and titrated against standard thiosulfate solution. The free and combined So<sub>2</sub> expressed in parts per million (PPM). (Askar 1981).

#### **Sensory evaluation:**

Sensory evaluation test carried out according to Nadir et al., (2005).Taste, color, texture, odor and overall acceptability of prickly pear fruit products of squash were assessed using ten panelists of Department of Home science, S.V University, Tirupati, India.

#### **Statistical analysis:**

Obtained data was subjected for statistical analysis by Duncan multiple range test (DMRT) for testing the significance, described by Dhamu and Ramamoorthy (2012).

#### **Results & Discussion:-**

The *Opuntia ficus indica* or prickly pears are spiny and pear shaped fruits. These fruits are emerging nutraceutical fruits with high therapeutic values. These xerophyte can be an alternative crop for drought prone areas.

#### **Formulation and development of prickly pear fruit products:**

The one of the main objective of the study was development of fruit products with prickly pear (PP). The quality of fruit products depends on the pulp quality. Prickly pear pulp contains less solids and more moisture. Hence the pulp is watery which will not suitable for the quality standards of the products like squash and bar. Blending of other

fruits will be desirable, for prickly pear squash preparation. A fruit with no colour and pleasant aroma is required, so that it will not interfere into the colour of prickly pear. Pineapple was selected to blend with prickly pear, because it has no colour and have pleasant aroma.

Fresh prickly pear fruits obtained from experimental plot and fresh fruits of pineapple obtained from local markets were utilized for preparation of blended fruit products squash. These fresh fruits pulp were analyzed for physico-chemical parameters.

**Table: 2** Physico-chemical parameters of prickly pear and pineapple fruit pulp.

Fruit pulp	Moisture (%)	TSS ( <sup>o</sup> Brix)	P <sup>H</sup>	Acidity (% Citric acid)	Total Sugars (%)	Reducing sugars (%)	Ascorbic acid (mg/100g)
Prickly pear	86.0±1.00	13±1.00	6.2±0.10	0.12±0.01	11.7±0.10	9.2±0.12	26.0±1.18
Pineapple	87.0±1.00	15±0.95	5.0±0.15	0.40±0.01	13.5±0.15	10.1±0.06	38.0±1.00

All values means± Standard deviation of data

The mean percent of moisture content of prickly pear and pineapple pulp was 86.0 and 87.0%, the mean TSS – 13 & 15<sup>o</sup>Brix, the mean P<sup>H</sup>-6.0 and 5.0 the mean acidity (TA)-0.12 & 0.40%, the mean total sugars (TS)-11.7 & 13.5, the mean reducing sugars (RS)-9.0 & 10.1% and the mean ascorbic acid content was 26.0 & 38.0mg/100g respectively (Table 2).

Pineapple fruit contain high amount of TSS (15<sup>o</sup> brix), total sugars (13.5%), reducing sugars (10.1%) and acidity 0.40% while P<sup>H</sup> being low (5.0). This is followed by prickly pear TSS (13<sup>o</sup>brix), total sugars (11.7%), reducing sugars (9.2%), ascorbic acid (26.0 mg/100g). Bose et al; (1986) reported that papaya pulp contains 90.7 % moisture 9.5 % carbohydrates, 10 mg ascorbic acid per 100 g pulp and 0.5% protein, and the pineapple pulp contains 84.4% moisture, 15.7 % carbohydrates, 0.6 % protein and 63mg ascorbic acid per 100 g pulp.

Wide range of chemical constituents in prickly pear fruit pulp has been reported by several authors. Samahy et al (2007) reported the chemical characteristics of both orange yellow and red prickly pear pulp. Both have high P<sup>H</sup> (6.2, 6.14), TSS (13.5, 11.25 <sup>o</sup> Brix), total sugars (8.5%, 8.7%) reducing sugars (8.5%, 8.3%) on fresh weight basis, crude protein (4.6%, 5.3%), crude dietary fibre (1.40%, 1.44%), pectin (2.4%, 2.44%) and ash (2.39%, 2.27%) on dry weight basis.

Similar chemical parameters of prickly pear fruit pulp were also recorded by Askar and EL-Samahy (1981). Saenz and Sepulveda (1995) reported higher TSS of 17.0% constituted 53% glucose and fructose, ascorbic acid (40mg/100g), P<sup>H</sup> (5.3 -7.1), proteins (0.21-1.6%) fat (0.09-0.7%), fibre (0.02-3.15%) and ash (0.4-1%). Sepulveda and Saenz (1990), reported the technological characteristics of prickly pear fruit pulp for TSS (12-17%), pectin (0.17-0.19 mg/100g), Vitamin -C (4.6-41.0 mg/100g as ascorbic acid) and moderate colour values. Whereas Saenz, Sepulveda and Moreno (1995), Saenz and Sepulveda (1999) reported technological characteristics of green cactus pear (prickly pear) pulp for P<sup>H</sup> (5.9 -6.2), acidity as % citric acid (0.03 -0.04), TSS (12.8-14.5%), Vit.C (20.0-31 mg/100g), viscosity (119.2m Pa°s) and higher colour values. Sepulveda and Saenz (1999) also reported the technological characteristics of orange cactus pear fruit pulp for P<sup>H</sup>-6.1, TSS (<sup>o</sup>Brix)-14.8%, very low acidity (0.043%), reducing sugars (13.2%), total sugars (14.8%), pectin (0.04%), Vit-C (24 mg/100g) ash (0.26%, viscosity 45.0 mPa°s and moderate colour value whereas orange cactus pear pulp containing comparatively high TSS and low pectin and viscosity than green cactus pear and purple cactus pear pulp. The TSS, acidity, reducing sugars of the present study is along with them. The ascorbic acid content of the three fruit pulp is also in agreement with above studies.

#### Physico-chemical quality characteristics of squash:-

The fruit squash is a non-alcoholic concentrated syrup used in beverage making. It is usually fruit-flavored, made from fruit juice, water, and sugar or a sugar substitute. To standardize the prickly pear and pineapple squash, five different variations of blending of prickly pear and pineapple treatments i.e T1 (25:0%), T2 (20:5%), T3 (15:10%), T4 (10:15%) and T5 (5:20%) in the ratios respectively, to standardize the best composition. The five samples were

analyzed for physico-chemical parameters and subjected to subjective evaluation to know the acceptance. The results are presented in Fig. 2, 3, 4 & 5.

The mean TSS of five treatments i.e T1, T2, T3, T4 and T5 was 45.0, 45.0, 46.0, 45.0 and 46.0<sup>0</sup>Brix, the mean P<sup>H</sup> values is 4.0, 4.1, 3.9, 3.8 and 4.0, the mean acidity is 1.49, 1.47, 1.46, 1.45 and 1.48 %, the mean total sugars values are 35.6, 36.0, 37.0, 35.3 and 36.0 %, the mean reducing sugars values are 16.3, 16.6, 16.8, 15.2 and 16.0%, the mean ascorbic acid values are 6.5, 7.6, 8.6, 9.4 and 10.5 mg/100g respectively.

Potassium metabisulphate (stock solution 200g KMS dissolved in 1 ltr of distilled water = 1 ml of KMS stock solution will give 10 ppm of sulphur dioxide (So<sub>2</sub>) to 10 ltrs of juice solution) were added as preservative to increase the shelf life of the squash. The quality parameter So<sub>2</sub> (Sulphur dioxide) can be maintained up to 500 ppm (as per FSSAI standards). In the present samples the So<sub>2</sub> was analyzed, the T1, T2, T3, T4 and T5 contain 350, 348, 349, 350 and 348 ppm respectively, which is within the permitted levels of the FSSAI (Food Safety Standards Authority of India).

Results showed significant differences among the treatments for all the chemical components of the squash blends analyzed except for titrable acidity, TSS and So<sub>2</sub> which did not show significant differences between the treatments on 'Initial' days of storage. TSS in the range of 45 to 46<sup>0</sup> brix, P<sup>H</sup> 3.8 to 4.1, titrable acidity (% citric acid) 1.45 to 1.49, total sugars 35.3 to 37%, reducing sugars 15.2 to 16.8%, ascorbic acid 6.5 to 10.5 mg/100g and So<sub>2</sub> 348 to 350 ppm were observed in different juice blended squash treatments. The highest TSS (46<sup>0</sup>Brix), Total sugars (37%), reducing sugars (16.8%) was observed in T3 prickly pear and pineapple juice blended ratio (15:10). The high acidity (1.48%) and ascorbic acid (10.9 mg/100g) were witnessed in T5 prickly pear : pineapple (5:20%) fruit juice blended squash; whereas high So<sub>2</sub> content was seen in pure prickly pear squash (T1) and lowest P<sup>H</sup>(3.8) was seen with the squash blended prickly pear: pineapple (15:10%) fruit juices i.e T3. The ascorbic acid content was however found to be high in squash blends with increase in the proportion of pineapple juice from 5 to 20% in the present study. This may be due to high ascorbic acid content of pineapple juice (38 mg/100g) comparatively than prickly pear juice (26 mg/100g).

**Fig:2:-** Physico-chemical analyses- TSS, TS, Acidity and reducing sugars of prickly pear squash

Fig:3:- Physico-chemical analyses-P<sup>H</sup> of prickly pear squash.

Fig:4:- Physico-chemical analyses-Ascorbic acid of prickly pear squash.

Fig:5:- Physico-chemical analyses-Sulphur dioxide (So<sub>2</sub>) of prickly pear squash.

**Sensory evaluation of prickly pear squash:**

Sensory evaluation was carried out by a panel of 10 judges for appearance, taste, flavor, colour, consistency (mouth feel) and appearance on a 10 point scale where 1-2 poor, 3-4 fair, 5-6 good, 7-8 very good and 9-10 excellent (Askar 1981). The mean for each sensory attribute was computed for comparison and the overall acceptability scores were obtained by the summation individual sensory scores and means were computed for comparison.

The sensory characteristics taste, consistency (mouth feel) and appearance did not exhibit significant differences between the juice blends of the fresh squash tried, whereas the sensory parameters flavor, color and overall acceptability showed significant differences between the different juice blended fresh squash treatments (Table 3)

**Table: 3:-Sensory characteristic evaluation of prickly pear squash**

	% of fruit juice blends		Sensory characteristics					
	Prickly pear	Pineapple	Taste	Flavor	Colour	Mouth feel	Appearance	OAA (50)
<b>T1</b>	25	0	8.3±0.30 <sup>a</sup>	8.2±0.20 <sup>ab</sup>	9.2±0.10 <sup>a</sup>	8.2±0.40 <sup>a</sup>	8.0±0.30 <sup>a</sup>	8.36±0.08 <sup>ab</sup>
<b>T2</b>	20	5	8.3±0.10 <sup>a</sup>	8.6±0.30 <sup>ab</sup>	8.6±0.30 <sup>ab</sup>	8.4±0.30 <sup>a</sup>	8.2±0.30 <sup>a</sup>	8.42±0.08 <sup>ab</sup>
<b>T3</b>	15	10	8.6±0.20 <sup>a</sup>	8.8±0.40 <sup>a</sup>	8.4±0.20 <sup>b</sup>	8.8±0.20 <sup>a</sup>	8.5±0.50 <sup>a</sup>	8.62±0.07 <sup>a</sup>
<b>T4</b>	10	15	8.1±0.10 <sup>a</sup>	8.0±0.20 <sup>b</sup>	8.3±0.20 <sup>b</sup>	8.6±0.40 <sup>a</sup>	8.4±0.50 <sup>a</sup>	8.28±0.07 <sup>b</sup>
<b>T5</b>	5	20	8.0±0.20 <sup>a</sup>	8.0±0.30 <sup>b</sup>	8.1±0.20 <sup>b</sup>	8.5±0.30 <sup>a</sup>	8.3±0.20 <sup>a</sup>	8.11±0.01 <sup>b</sup>

- Each value is a mean of three replicates.
- Means were tested for significance following Duncan's multiple range test (DMRT) described by Dhamu and Ramamoorthy (2012).
- Means having same letter within the each property are not significantly different at  $P \leq 0.05$  (n=3).
- Means having different letters within the each property are significantly different at  $P \leq 0.05$  (n=3).

Results of the sensory characteristics evaluation of fresh prickly pear squash and its blends with pineapple juice revealed that the squash blend T3-15:10% prickly pear and pineapple juice scored high sensory values for taste (8.6), flavor (8.8), consistency (mouth feel) (8.8) and appearance (8.5) and overall acceptability score (8.62) and followed by T2-20:5% prickly pear and pineapple juice blended squash and pure prickly pear squash T1-25% juice and T2-20:5% prickly pear and pineapple juice with overall acceptability scores of 8.36 and 8.42 respectively (table-23). The other squash blends T4-10:15% and T5-5:20% prickly pear and pineapple juice blends had comparatively low scores for all the sensory characteristics including the overall acceptability 8.28 and 8.11 respectively (Table 3).

**Conclusion:-**

Fruits and vegetables are important constituents of the diet and provide significant quantities of nutrients, especially vitamins, sugars, minerals and fiber. Results showed significant differences ( $p < 0.05$ ) among the treatments for all the chemical components of the squash blends analyzed. The highest TSS (46°Brix), Total sugars (37%), reducing sugars (16.8%) was observed in T3 prickly pear and pineapple juice blended ratio (15:10). The high acidity (1.48%) and ascorbic acid (10.9 mg/100g) were witnessed in T5 prickly pear : pineapple (5:20%) fruit juice blended squash; whereas high So<sub>2</sub> content was seen in pure prickly pear squash (T1) and lowest P<sup>H</sup>(3.8) was seen with the squash blended prickly pear: pineapple (15:10%) fruit juices i.e T3. The study concludes that, prickly pear and pineapple facilitates in the development of functional fruit squash with minor changes in physico-chemical markers and superior sensory attributes.

##### **Key words:-**

Sustainable Development, Environmental Sustainability, Nigeria, MDG 7, and Environmental Security.

#### **Abstract**

Human security and sustainable development all over the world hinges on successful environmental sustainability. Nigeria was a signatory to Agenda 21 in 1992 and has been introducing policies in its systems which include laws that serve the three tier governments (Federal, States and Local Governments) in its bid to achieve environmental sustainability. These laws and policies serves as instruments for environmental protection, planning, prevention and pollution control.

This study analyses the state of Nigeria environment before the inception of the Millennium Development Goal MDG 7 which was to ensure environmental sustainability and examines what happens after the programmes took off and ended. It examines sustainable practices in Nigeria that supports and encourages environmental sustainability. It identifies challenges to the achievement of environmental sustainability in the MDG 7 programmes. It also classifies the emerging environmental issues in the country. At the end, it advocates forward strategies in the achievement of environmental security in Nigeria.

#### **Introduction:-**

The discussion of environmental sustainability filters through nearly all political, social and economic discusses world over because of its importance to sustainable development and human security. The importance of the discussions and its processes is assumable essential and agreeable all over the world through different world bound programmes and agencies since the boarders of nations could not hold globally for environmental change. Therefore, workable and achievable sustainable development programmes are imperative for environmental sustainability in every society.

Since man will continue to depend on its environment for consumption, utilization and socioeconomic relationships makes the processes of environmental sustainability for every society vital for the preservation of the entire world and its life components. Therefore the achievement of environmental sustainability is paramount to environmental security, economic development and human advancement.

Environmental sustainability involves making decisions that will be of interests to the universe by protecting and preserving the environment so that the nature will continue to support human life and other living organisms. The processes of environmental sustainability thrive mainly on workable sustainable policies that are globally advocated and supported and midwife by nations. Nigeria as a nation since the 1980's has consciously in diverse ways

supported global environmental sustainability with the adoption of policy framework for environmental sustainability at different times.

#### LEGAL AND POLICY FRAMEWORK FOR ENVIRONMENTAL POLICIES:-

The sustainable development deliberations and agendas of the 1990s, including the 1992 Earth Summit<sup>1</sup> is prime to the current direction for environmental sustainability. Agenda 21 (a product of the Earth Summit) is essential in encouraging environmental sustainability. Agenda 21 emphasizes the existence of synergies between the principles of environmental security and sustainable development to foster environmental sustainability

Thereby, the endorsement of eight MDG (Millennium Development Goal) goals in the year 2000 was in the aftermath of the Earth summit in 1992 held at Rio, Brazil (Nigeria was a signatory to Agenda 21). The kick off of MDG 7 programmes afterward encouraged and influenced the initiations and further adoptions of sustainable environmental policies in Nigeria and other nations of the world with the aim of ensuring and achieving environmental sustainability focusing on the targeted year 2015.

Earlier in 1989, Nigeria enacted its own National Policy on Environment. The Federal Republic of Nigeria and some of its state governments also promulgated some national environmental laws to encourage environmental sustainability prior to the kick of MDG 7 programmes. These laws serve as instrument for environmental protection, planning, prevention and pollution control. Such includes

- i. Federal Environmental Protection Agency act, Cap 131, Vol. IX p.6303, 1988
- ii. National Environmental Protection (Management of Solid Hazardous Wastes): Regulations, 1991.
- iii. National Environmental Protection (Effluent Limitation): Regulations, 1991.
- iv. National Environmental Protection (pollution and Abatement in Industries and Facilities Producing Waste) Regulations, 1991.

#### NIGERIA ENVIRONMENT AT A GLANCE:-

The table 1 below depicts MDG 7 targets, indicators, what was on ground before the inception of MDG 7 in 2000 and what happens after the programme took-off.

**Table 1:- Nigeria Environment at a Glance**

Targets	Indicators	Before MDG (i.e. year 2000)	After year 2000
<b>Integrate the principles of sustainable development into country policies and programs and reverse the loss of environmental resources</b>	<b>1.</b> Proportion of land area covered by forest (FAO)	Forested area was 14 per cent of the land area in 2000 (MDG Nigeria, 2010).	1. The current forested area in Nigeria is 9.5 percent of the percentage of land (UN Data, 2014).
	<b>2.</b> Ratio of area protected to maintain biological diversity to surface area (UNEP-WCMC)	Conservation area was about 2,155,740 ha while the Games and Wildlife sanctuaries is made up of 1,030,621ha (Olufemi and Ameh, 1999)	Conservation areas, Game and Wild life sanctuaries are still retained.
	<b>3.</b> Energy use (kg oil equivalent) per \$1 GDP (PPP) (IEA, World Bank)	Energy use (kg oil equivalent) per \$1 GDP (PPP) 2000-2004 was 721 (The World Bank, 2014)	Energy use (kg oil equivalent) per \$1 GDP (PPP) 2000-2009 was 721(The World Bank, 2014)
	<b>4.</b> Carbon dioxide	Carbon dioxide emissions	Carbon dioxide emissions

<sup>1</sup>Dankelman, I. (2013). On the Road to Sustainable Development: Promoting Gender Equality and Achieving Climate Change. In UNDP (2013). Powerful Synergies: Gender Equality, Economic Development and Environmental Sustainability. United Nations Development Programmes (UNDP).

	emissions per capita (UNFCCC, UNSD) and consumption of ozone-depleting CFCs (ODP tons) (UNEP-Ozone Secretariat)	metric tons per capita in 2000 is 0.6 (Trading Economics, 2014 citing World Bank Indicators)	metric tons per capita in 2010 is 0.5 (World Bank, 2014) while Nigeria achieved the Montreal Protocol for the phase out of CFC in 2010 (Daily Independent, 2014).
	5. Proportion of population using solid fuels (WHO)		117.8 million people uses non-solid fuel which include firewood, charcoal and other such cooking sources (PM News Nigeria, 2013) citing World Bank Report
<b>Halve, by 2015, the proportion of people without sustainable access to safe drinking water and basic sanitation</b>	1. Proportion of population with sustainable access to an improved water source, urban and rural (UNICEF-WHO)	50 percent of the population has access to improved drinking water (WSMP Nigeria, 2008).	57percentpopulation has access to improved drinking water in 2012 (OSSAP/MDG, 2014).
	2. Proportion of population with access to improved sanitation, urban and rural (UNICEF-WHO)	26 percent of the population used improved sanitation facilities in 1990 and 30% in 2006 (WSMP Nigeria, 2008).	33.7 percent in 2012 of the population used improved sanitation facilities in 2012
<b>Have achieved by 2020 a significant improvement in the lives of at least 100 million slum dwellers</b>	Proportion of households with access to secure tenure (UN-HABITAT)	69.6% Nigerians lives in Slums in 2000 (UN-Habitat, 2014)	62.7% lives in slums in 2009(UN-Habitat, 2014)

#### **SUSTAINABLE ENVIRONMENTAL PRACTICES IN NIGERIA:-**

Nigeria still maintains its Conservation areas and Games reserves in different parts of the country to protect its biologically diverse environments. This includes National Parks such as Kanji Lake, Old Oyo, Cross River, Gashaka-Gumti, Yankari and Chad Basin. It also has Games and wildlife sanctuaries which include Alawa, Dagida, Kwale, Ologbo, Sambisa, Udi-Nsukka etc. The conservation area is about 2,155,740 ha while the Games and Wildlife sanctuaries is made up of 1,030,621ha<sup>2</sup>

The MDG programmes serve as major interventions in areas of safe drinking water and sanitation in urban and rural areas all over the nation. These were done with constructions of dams, water schemes by providing safe water through borehole (hand pumps and solar panels water schemes boreholes) and constructions of VIP toilets in urban and rural areas in different parts of Nigeria.

In 2010 through Resolution 64/292, the United Nations General Assembly declared access to safe and clean drinking water and sanitation as a fundamental human right<sup>3</sup>. This is on the basis that access to safe and clean drinking water and sanitation is essential for human dignity.

MDG 7 programmes progress reports showed increased in the population of people that have access to safe and drinking water and sanitation in Nigeria but the increments witnessed seems slow but encouraging. The report of WHO/UNICEF in 2008 which was a Joint Monitoring Program for water supply and sanitation in Nigeria shows that only 50 percent of the population has access to improved drinking water whose sources included household connections, public stand pipes, boreholes, protected wells and springs in 1990 (WSMP Nigeria, 2008). This report

<sup>2</sup>Olufemi A.O. and Ameh C.E (1999). Forest Resource Situation Assesment of Nigeria. EC-FAO Partnership Programme(1998-2002)

<sup>3</sup> The human right to water and sanitation. <http://www.un.org/waterforlife> assessed online November 29, 2014

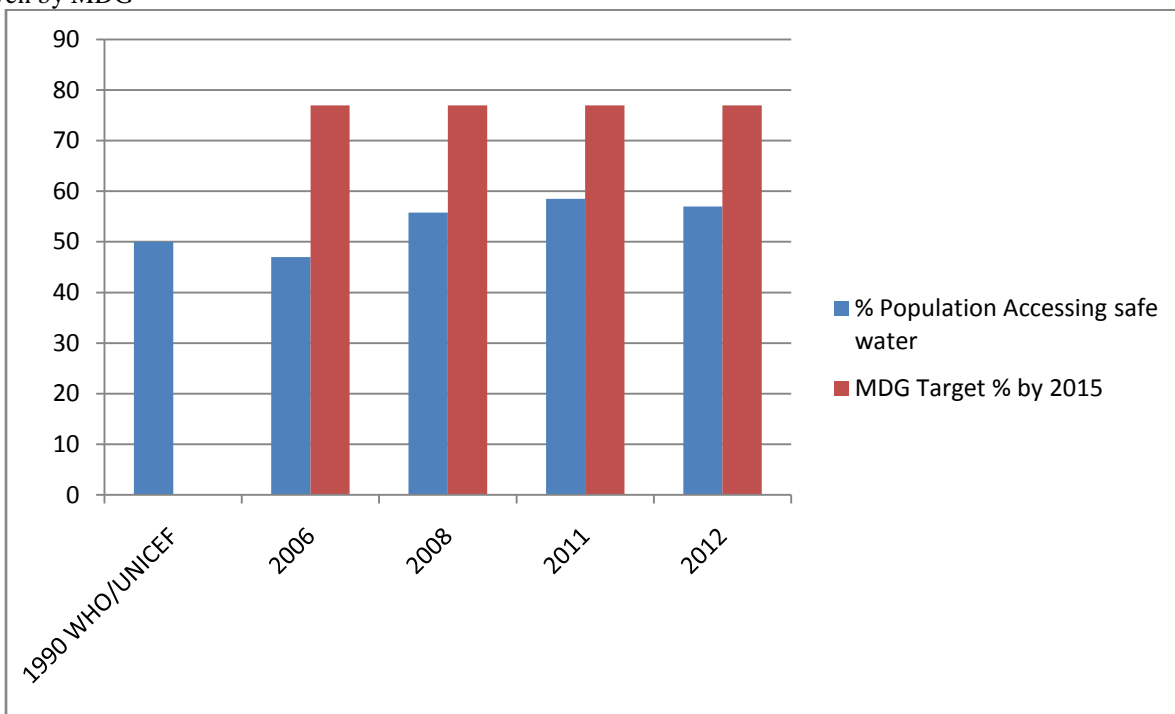

showed that as at 2006 the population of people that has access to improved-drinking water was 47 percent. While the OSSAP/MDG (Office of the Senior Special Assistance to the President on Millennium Development Goals) data of 2014 gave the population of people in Nigeria that had access to safe drinking water in 2008 as 55.8 percent, while it was 58.5 percent in 2011 and 57 percent in 2012. This is against the expected target of 77 percent by 2015<sup>4</sup>. The table 2 below extrapolated from the WHO/UNICEF Joint Monitoring Program for Water Supply and Sanitation report of 2008 (WSMP Nigeria, 2008) and OSSAP/MDG data to show the percentages of people in Nigeria having access to drinkable water between the year 1990 and 2012.

**Table 2:-** Percentage of Population having Access to Drinkable Water in Nigeria between 1990 and 2012

Year	1990	2006	2008	2011	2012
% of Population drinkable water	50%	47%	55.8%	58.5%	57%

(Source: OSSAP/MDG, 2014 and WSMP, Nigeria, 2008)

The diagram below compares the percentage of population of Nigeria having access to drinkable water to the target given by MDG

**Figure 1:-** Percentages of Population Accessing Safe Drinking Water (WHO/UNICEF Joint Monitoring Programmes for Water Supply for 1990 and 2006 and OSSAP/MDG DATA-2008, 2011 and 2012) Compared with 2015 expected MDG Target

There has also been progress though slow in the percentage of population that has access to improved sanitation. The 2008 WHO/UNICEF report of a Joint Monitoring Program for water supply and sanitation in Nigeria reported that 26 percent of the population used improved sanitation facilities in 1990 and 30% in 2006 (WSMP Nigeria,2008). While the OSSAP/MDG reported that 31.2 percent of the population used improved sanitation in 2008, while 33.7 percent in 2012 as against the expected 69.5 percent target of 2015<sup>5</sup>. This is represented in a table 3 below.

**Table 3:-** Percentage of Population Using Improved Sanitation between 1990 and 2012

<sup>4</sup> The source of the Data is OSSAP-MDG in UNDP in Nigeria. Retrieved online <http://www.ng.undp.org>

<sup>5</sup> ibid

Year	1990	2006	2008	2012
% Population with improved sanitation	30	36	31.2	33.7

(Source: OSSAP/MDG, 2014 and WSMP Nigeria, 2008)

The Figure 2 below compares the percentage of population with improved sanitation with the expected MDG target of 2015

**Figure 2.** Percentages of Population that Used Improved Sanitation (WHO/UNICEF/WSMP Joint Monitoring Programmes data for 1990 and 2006 and OSSAP/MDG DATA-2008 and 2012) compared with 2015 expected MDG Target.

When safe water delivery and sanitation were enhanced, there must have been corresponding enhancements of some other MDG goals that lean on them. Therefore, poverty reduction will be enhanced (MDG goal 1), school enrolment will be increased (MDG goal 2), women and girls dignity enhanced (MDG goal 3), child mortality will be reduced (MDG goal 4), pregnant mothers will be prevented from diseases (MDG goal 5) and HIV/Aids patients will be prevented from being susceptible to opportunistic diseases such as water borne diseases (MDG goal 6).

## CHALLENGES TO THE ACHIEVEMENTS OF ENVIRONMENTAL SUSTAINABILITY IN NIGERIA

### Inability to Enforce Environmental Laws:-

The inability of the Federal Government of Nigeria to enforce its environmental laws is a bane to the achievement of environmental sustainability in the country. For example, there have been enabling laws and policies guiding against gas flaring, the Federal Government of Nigeria has not the political will to end gas flaring (flaring of gas started since the discovery of oil about fifty years ago) even with its negative environmental consequences.

The Minister of Environment of Nigeria, Laurentia Laraba Mallam said if the gas that is being flared is annexed it could meet 40 percent of Nigeria energy needs (ThisDay Live, 2014). Gas flaring contributes to global warming (i.e. climate change), causes environmental pollution and ecological disturbances and destructions. Environmental pollution due to gas flaring may lead to health challenges of residents around the flaring spots. It affects the growth of vegetation around flaring spots and leads to contaminations of surrounding water bodies thereby affecting the survival of fishes and other aquatic life (Ubani and Onyejekwe, 2013). The Niger Delta women of Nigeria still lament for the environmental degradations that is due to gas flaring and other unsustainable practices. This could be viewed in line with the following quotation

“We are farmers, fisherwomen and hunters. With all the flaming and pumping of oil into our swamp areas, the oil companies have denied us every living thing. Today, we have no hope, while they are making billions of naira with

our gifts from God. They don't care or hear our cry; they only throw tear gas on us, beat us, and drive us out of our land" (Ihayere, Ogeleka and Ataine (2014 p.17 citing Singh et al., 1995; Sagay, 2001; Akpan, 2003).

The government of Nigeria gave a deadline of the year 2008 for gas flaring. Though, Nigeria now piped liquefied natural gas from its petroleum to some industrial estates in Lagos, Ota and Agbara for electric power supply from its oil installations. Nevertheless, there has not been an end to this environmentally unsustainable practice of the petroleum industries

#### **Project Duplication and Site:-**

Politician interference in identification of project site and location has affected the placement of project in appropriate site/location where it will have more impact on its community. This hijack or influence of project to the political leaders in government preferred site or location instead of considering the peoples need is a gimmick used by the politicians to attract political patronages or gains. This makes the projects at times not to be assessable to the expected users. Projects such as water and VIP (Ventilated Improved Pit) toilets were sometimes sited and located in places without consideration of its community's choice for location and site. At the end the project were many times located and sited far from its expected users. For example, water borehole project that is sited far from the expected users will increase the travel time of women and girls whose cultural roles are always to fetch water for the family. There were communities where the projects allocated to their communities by the MDG program had been in existence through other national or state partnership programmes such as European Union, other agencies or one of the three tiers of government. This duplication of project robs other areas in the same community that may have needs for the project thereby hindering the focus of MDG.

#### **Project maintenance:-**

Lack of maintenance of some of the existing projects such as water boreholes in mostly rural areas was a hindrance in the achievements of MDG 7 programmes. For instance, water bore holes constructed by the MDG in some areas that developed faults or malfunctioned after put to use for sometimes by the people were later abandoned due to the need of minor repairs.

#### **Conflicts and Security issues:-**

The Security situation of the North Eastern parts of the country affected the implementation of the MDG 7 programmes in the Nigeria North Eastern States.

### **EMERGING ISSUES IN NIGERIA ENVIRONMENT:-**

#### **Climate Change, Natural Resources and Biodiversity:-**

Nigeria natural resources have been threatened by climate change and unsustainable approach to its management. Thereby, biodiversity loss being witnessed in different areas could be adduced to global change and over use of the nature resources. Women in most parts of the world especially in the third world could be seen as being closer to nature and its resources than its male counterparts.

Thereby, harm to nature may equals harm to women, because of this pervasive perception that women are closer to nature<sup>6</sup>. Even though this report agrees with Jackson (1993), that the closeness to nature by women may not be inherent but a socially constructed relationship with natural resources which varies for different groups and for individual women during the course of a lifetime. Even though women are close and at most times responsible for the use of the nature resources but in practicality most of them have no control over it because of culture and traditions of their societies.

Most of the culture and traditions in many parts of Nigeria makes women to be closer to the environment than their male counterpart. The cultures and traditions at most times delineate care giving responsibilities to the female than the male. Women manage natural resources daily in their roles as farmers and household providers<sup>7</sup>. Thereby, they have direct contact with the natural environment as they collect essential items like fruits, vegetables, medicinal

<sup>6</sup> See Beauvoir (1988), Brown and Jordanova (1982), MacCormack (1980) and Othner (1974) cited by Jackson C (1993). *Doing What Comes Naturally? Women and Environment in Development*. World Development, Vol. 21, No12 pp. 1947-1963

<sup>7</sup> FAO (2014). *Understanding the Gender Dimensions of Natural Resources Managemnt is a Starting Point for Reversing Environmental Degradation*. [Http://www.fao.org/gender](http://www.fao.org/gender)

herbs, fuel wood, fodder, water etc. for their every day and family needs<sup>8</sup>. Hence, negative impacts on the environment may affect them than their male counterparts.

#### **Nigeria Forests and Women:-**

Record is showing that desertification is spreading and the forested area is falling in Nigeria. The area of forest fell from 14 per cent of the land area in 2000 to 12.6 per cent in 2007, against the target of 20 per cent by 2015 (MDG Nigeria, 2010). The current forested area in Nigeria is 9.5 percent of the percentage of land (UN Data, 2014).

Forest is important for environmental sustainability because of its huge ability as carbon sink and unique water shedding properties while deforestation contributes to global greenhouse gas emission. The existing gender roles that exists in societies reflects in different ways men and women use forests such that forests meet women livelihood and cultural needs of their families and communities through gathering of forests products such as fuel wood, folder for animals<sup>9</sup>. It has other very important cultural and traditional role to Nigeria women. The women activities in the forest include trading in herbal medicine (Fasola, 2003). Thereby, the reduction in the percentages of forest to land will affects the activities of women their by impacting negatively on their livelihood.

#### **Slums Development in Nigeria and Women/Girl Child:-**

Increase in the numbers of shanties and slums in Nigeria are slowing down the processes of achievement of environmental sustainability in the country. In the developing world, 33 percent of the urban population lives in slums, with sub-Saharan Africa having 62 per cent of its urban population living in slums (UN-Habitat, 2013). 90% of the entire global population growth between 2000 and 2025 of 1.7 billion people is expected to take place in urban areas of developing countries<sup>10</sup>.

Urban society is expected to be a decent society with improved livelihood. Nigeria has been witnessing unprecedented rapid urbanization for some time now. The urban population growth rate of Nigeria is estimated as 3.8 percent between 2010 and 2015 while the urban population as at 2013 is 50.9 percent (UN Data, 2014). As in most global south nations, Nigeria rapid urbanization is accompanied slums development. Residents of the slums are mostly poor and deprived as compared to other residents in an urban society.

The UN-Habitat in the “2013 State of the World Cities” document enumerated the urban slum population at mid-year by major area in Nigeria as 26,549,000 in 1990, 31,538,000 in 1995, 36,951,000 in 2000, 42, 783,000 in 2005, 45,195,000 in 2007 and 47,612,000 in 2009. The data shows that the urban population at mid-year continually increased from the 1990 to 2009. While, the data of UN-Habitat (2013) also shows that the proportion of urban population living in slum area is decreasing in Nigeria. The following table depicts the UN-Habitat (2013) data

**Table 4:- UN-Habitat (2013) Proportion of Urban Population Living in Slum Area**

<b>Year</b>	<b>1990</b>	<b>1995</b>	<b>2000</b>	<b>2005</b>	<b>2007</b>	<b>2009</b>
<b>Proportion%</b>	77.3	73.5	69.6	65.8	64.2	62.7

The problems of most slums settlement in Nigeria is the lack of governmental presences (basic life improving amenities are not provided in several slums). Such include the non availability of safe water for consumption and sanitation and health facilities. Other environmental components that have been put in place to propelled sustainable development parameters are mostly not seen in slums and squatters where they are essential in increasing the level of their livelihood.

The number of slums increased in Lagos mega-city, the Nigeria economic hub from 40 to 100 (Akiyode citing UNDP, 2003 and Adelakan, 2009). Most slums in the highly urbanized coastal towns like Lagos mega-city are situated in flood prone environment. Water security is not adequate in most of the slums when they are mostly not connected to government pipe borne water. Government health facilities including hospitals and primary health care centers (PHC) are mostly not found in slums and squatters. Thereby, residents of slums are predisposed to health challenges.

<sup>8</sup> There is resemblance in Nigeria and Bangladesh experiences as highlighted by Jahan M (2008). The Impact of Environmental Degradation on Women in Bangladesh: An Overview. Asian Affairs, Vol. 30, No. 2: 5-15, April-June, 2008

<sup>9</sup> Gender@UNFCC (undated). Preservation of Tropical forests. Retrieved from <http://www.gendercc.net> on December 5, 2014

<sup>10</sup> According to Brockerhoff, cited in Lundqvist, J., Appasamy, P. and Nellyyat, P. (2003). Dimension and approaches for third World city water security. *Phi. Trans. R. Soc Lond doi: 1098/rstb.2003:1382*

There is a relationship between gender and inhabitation. The women and girls are cultural constructed to care for the family. Thereby, hindrances to decent living affect the female folks than its male counterparts. Water insecurity or lack of to safe water and sanitation which is common to the slums as mentioned earlier has more impacts on the women folks. Health implications or challenges in home that may be caused by negative environmental consequences in slums are affective to the female folks than their male counterparts because the female folks have been placed by the culture as society care giver.

#### **Water Shortage and Inadequate Sanitation in Nigeria and Women/Girl Child:-**

Shortage of drinkable water and sanitation may engender public health challenges which at many times have gender implications. Consumption of unsafe water may leads to diseases which include diarrhea and typhoid fever. Safe water is essential for the survival of young children. The achievement of MDG goal 4 which emphasised the reduction in child's mortality was not achievable because of the inadequacy of safe water and sanitation in some places. For instance, 97,000 mothers lose a child yearly to diarrhoea caused by lack of unsafe water and poor sanitation (WaterAid, 2013). Thereby about 18% of deaths of children under five years old are linked to diarrhea<sup>11</sup> which could be avoided with safe supply and improved sanitation.

WaterAid (2013) in its document *"Keep your promises on sanitation and water"* reported that 68 percent of women in Nigeria lacked safe toilets thereby increasing the risks of illness, shame, harassment and violence. In its survey across five slums in Lagos, Nigeria, it realized that one in five had first or second hand experience of verbal harassment and intimidations, or had been threatened or physically assaulted in 2012 when going to toilet.

Traditionally and culturally, household chores relating to fetching of water for the family are assigned to women and the girls. The National Gender Policy of the Federal Republic of Nigeria (2006) lamented that daily, women must travel long distances (as far as 2 km in many rural areas in Nigeria), facing hot and dusty weather conditions, to gather water while additional time is expended as women must often wait in queues at wells and other water gathering sites in order to gain access to water. "Women and girls who must spend hours a day seeking water cannot spend that time at school or in income-generating activities"<sup>12</sup> For example, in Billeri, Bauchi State of Nigeria where it takes so long to draw water from the 150 metre deep thereby making children to have little time to go to school that is located far from the community (BNRCC, 2011).

#### **Global Environmental Change in Nigeria and Women:-**

Nigeria like every other nation in the world is in the riddle of global environmental change and environmental degradations. Nigeria was ranked sixth among the countries (193 countries were rated) that are most vulnerable to the effects of climate change in a 2013 Climate Change Index<sup>13</sup>. Its natural resources are being threatened and distorted by global climate change. "It is increasingly evident that women are at the centre of the climate change challenge. Women are disproportionately affected by climate change impacts, such as droughts, floods and other extreme weather events, but they also have critical role in combating climate change" (Daily Trust, 2013 citing UNFCC).

While there have been unsustainable managements of its nature capitals and environmental components. The unsustainable approaches coupled with global environmental change which include climate change have sometimes initiated negative environmental conditions in different parts of the country. These included flooding, erosion, biodiversity loss and water insecurity.

Excessive flood is becoming normal occurrences in some parts of Nigeria during the yearly raining season. It has in many times affected lives and properties in different parts of the country. For example, flooding caused by the

<sup>11</sup> Vanguard 2014, Vanguard Nigeria Newspaper. Nigeria May Miss MDG Target for Water, Sanitation –UNICEF on July 08, 2014. <http://www.vanguardngr.com> assessed 25, November 2014

<sup>12</sup> This statement was in the press releas by Mr. Oluseyi Abdulmalik on behalf of WaterAid Nigeria and titled International Women's Day , WaterAid Working to Inspire Change on Water Sanitation for the 2014 International Women's Day (It can be seen in ThisDay Nigeria Newspaer, March 13, 2014.

<sup>13</sup> This report is by the British Risk Consultancy Maplecroft. Its evaluation included exposure to extreme climate-related events; the sensitivity of populations in terms of health, education, agriculture dependence and available infrastructure and adaptive capacity of the countries to combat the impacts of climate change. Punch (2013). Nigeria Ranks Sixth in the Climate Change Index. Punch Nigeria Newspaper, November 4, 2013. Retrieved online <http://www.punchng.com> on November 27, 2014.

overflowing of Goronyo dam in Sokoto State in the North western Nigeria led to the displacement of people from their home in Sokoto, Kebbi and Jigawa states between June and August 2010 while Ibadan city in the South Western part of Nigeria witnessed a disaster through flooding due to torrential rains in few hours which led to submerging of many houses with more than fifty people unaccounted for and several families loses both in human and material (Akiyode, 2013 citing Fagboun, 2011).

International Panel on Climate Change (IPCC) identified Nigeria Coastline as low lying coast that is susceptible to flooding (Adelakun, 2009). Flooding may be exacerbated by climate change. Thereby, there has been risk of flooding and erosion around the highly populated southern coast. For example, in the recent years, there has been recurrence flooding in the metropolitan Lagos city which is a lagoon corridor in the coastal area of Nigeria especially during the yearly raining seasons.

Ugwu and Ugwu (2013) in a paper on “*Gender, Flood and Mental Health*” surmised that performing reproductive responsibilities in a flood disaster camps and keeping a continual vigilant eye on young children, even as they cry for food in such helpless situations, are emotion- provoking and stress- laden. In this research paper the writers quoting flood victims at Igga Camp-Enugu State, Nigeria where some of the women have this to say:

“Since we came here (flood camp) we are faced with myriad of problems; such as looking after our children, lack of clean water, poor toilet facilities as we have to use „bush system“; no drugs or mosquito nets to shield us from mosquito bite, and above all, one of us delivered of a baby boy without the assistance of any midwife or traditional birth attendant.”

#### **Conflicts, Insecurity in Nigeria and Girl Child”:-**

The entire north eastern section of Nigeria has been in crisis for some time now which has made development impossible. Thus, programmes designed to ensure environmental sustainability in this region are hampered. A reserved forest which supposedly a plus to environmental sustainability in the North Eastern region, the Sambisa Forest has been the abode or enclave of Boko Haram insurgency. Over 100 Chibok school girls in Borno State in the North East of Nigeria kidnapped by the Boko Haram terrorist group in the night of April 14, 2014 were taken to the Sambisa forest by their abductors.

#### **Conclusion:-**

Environmental degradation and poverty are intrinsically related. Therefore poverty reduction and pro-poor growth will encourage environmental sustainability and sustainable development.

Local action should be encouraged through building of local capacity on the importance of environmental policies and concerns in order to ensure environmental sustainability. This could be done through regular environmental education in every locality and media broadcast. Also, non-governmental organizations (NGO) should initiate environmental sustainability sensitization projects and programmes that are grassroots oriented in different parts of the nation intimating the populace with the importance of sustainable environment to human and its society.

There is need for enforcement of sustainable environmental policies. Climate change is a threat multiplier. Thus, it is important that Nigeria government ends gas flaring in the Niger Delta region (gas flaring contributes to greenhouse gases and global warming). Thereby, aligning with environmentally sustainable policies will show the nations full commitment to the principle of environmental sustainability and sustainable development.

In order to have an inclusive programme, there should always be a gender consciousness stakeholders need assessments in every locality before projects and programmes are sited. This will encourage the engendering of the projects and programmes which supports its sustainability.

#### Abstract

The experiment was conducted to see the hypothesis of reducing the impact of irrigation water contaminated with heavy metals using some soil amendments and its effect on rice yield. A site was selected near kafr El sheikh governorate, Egypt. Due to water shortage in this area farmers are forced to use low water quality for irrigating his paddy field. This experiment investigated the effect of six soil amendments { rice straw (RS), rice straw compost (RSC), rice husk (RH), rice husk compost (RHC), rice husk biochar (RHB) and wood-dust biochar (WDB)} in addition to control on the growth of rice (cv. Giza 178) and heavy metals dynamic in paddy soil that was irrigated with low water quality. The best results were from the application of RHB that increased grain yield, and decreased Ni, Cd and Pb concentrations in straw and grain. The other soil amendments under study also increased the grain yield, and effectively decreased the Ni, Cd and Pb concentrations in straw and grain. Concentrations of Ni, Cd and Pb in grain and straw were dependent on the available of them in soil. The mean value of CEC of soil under RHB was highest. Among the soil amendments the heavy metals concentration in straw and grain were ranged as follow; RHB < WDB < RH < RHC < RSC < RS < control. Finally RHB or WDB can be considered as a by-product material for application under paddy field irrigated with low water quality.

#### Introduction:-

Conventional water resources in Egypt are limited to the Nile River; groundwater in the deserts and Sinai, and precipitation. Each resource has its limitations on use. These limitations relate to quantity, quality, space, time, and/or use cost. The Nile is the main and almost exclusive source of fresh water in Egypt. Egypt relies on the available water stored in Lake Nasser to meet needs within its annual share of water, which is fixed at 55.5 Billion Cubic Meters (BCM) annually by agreement with Sudan in 1959 that is not sufficient to meet the water requirements of the agricultural land in Egypt. In Egypt, the total agriculture land amounts to 8 million feddan (1 feddan = 1.04 acre), which represents 3.8% of the whole area of the country. The most important crops are wheat and berseem in winter, cotton, rice and maize in summer. Water is becoming an increasingly scarce resource and planners are forced to consider any sources of water which might be used economically and effectively to promote

further development. The potential for irrigation to raise both agricultural productivity and the living standards of the rural poor has long been recognized. This potential is even more pronounced in the north part of Egypt, such as Kafe El Shiekh, El Behera, Dakhliya and Domiata regions where there is fresh water shortage for agricultural production. Also, more than 70 percent of the total rice cultivation area is found in these regions (Rice National Campaign, 2012). Rice is an important cash crop of these regions. Its water requirement is more than any other crop. However, due to the shortage of canal water, the farmers use underground as well as surface water. Therefore, the urban soils of the country are often irrigated with treated wastewater for growing crops to compensate the Nile water shortage. As a result of the use of wastewater for irrigation, trace metals have accumulated in agricultural soils. The connection between soil and water contamination and metal uptake by plants is determined by many chemical and physical soil factors as well as the physiological properties of the crops. Soils contaminated with trace metals may pose both direct and indirect threats to plants: Direct, through negative effects of metals on crop growth and yield, and indirect, by entering the human food chain with a potentially negative impact on human health. Even a reduction of crop yield by a few percent could lead to a significant long-term loss in production and income. Some food importers are now specifying acceptable maximum contents of metals in food, which might limit the possibility for the farmers to export their contaminated crops. Therefore the protection of soils from trace metal pollution is essential for maintaining a good soil and food quality. Once soil is contaminated, it is difficult and expensive to decontaminate it (Bjuhr, 2007). Heavy metals are terribly released into the environment because of the rapid industrial growth in various sectors and have created a major global threat. The industrial wastewaters originated from metal plating, mining activities, smelting, battery manufacture, tanneries, petroleum refining, paint manufacture, pesticides, dye manufacture, printing and photographic industries etc. are often detected with the heavy metals like cadmium, zinc, copper, nickel, lead, mercury and chromium (Rangab hashiyam *et al.*, 2013; Kadirvelu *et al.*, 2001; Williams *et al.*, 1998). The management of heavy metals is of special concern due to its recalcitrance and persistence nature of existence in the environment (Fenglian and Wang, 2011). Wastewater use in irrigated crop production is a highly complex issue, with opportunities and risks and agronomic, economic, ethical and human and ecosystem health dimensions. Wastewater influenced production systems are characterized by an enormous variability in bio-physical and socio-economic conditions and the true complexity is generally poorly understood except for a few reported case studies (Scott *et al.* 2003). Recognizing as a preamble that the agronomic dimension of soil, water and crop management is crucial for understanding and optimizing wastewater irrigation, this study focuses on agronomic aspects of wastewater influenced irrigated rice production systems in Egypt where wastewater influenced irrigation is common in some cultivated rice areas. Although some of them, such as Fe, Zn, Mn and Cu etc., are essential at the low level, other metals, like Cd, Cr, Pb and Ni, are toxic and may pose a great threat to plants, animals and humans through the food chain (Costa, 2000). High contents of heavy metals in soils would increase the potential uptake of these metals by plants. Therefore, a detailed risk assessment of heavy metal accumulation in agricultural lands is required for application of inorganic fertilizers, organic wastes and byproduct materials to soils in order to ensure the safe crop production (Papafilippaki *et al.*, 2007). Heavy metals in soils may be present in several forms with different levels of solubility as follows: (i) dissolved (in soil solution), (ii) exchangeable (in organic and inorganic components), (iii) structural components of the lattices in soils and (iv) insolubly precipitated with other soil components (Zalidis *et al.*, 1999; Aydinalp and Marinova, 2003). Usually, only the first two forms are able to be absorbed and utilized by plants. Therefore, plant uptake of a metal is mainly dependent on the metal mobility and availability in soils. The application of material substances such as soil amendments (EPA, 2011), Biochar (Zhang, 2009), calcium carbonate, and manganese oxide (Chen *et al.*, 2009) has successfully mitigated soil heavy metal contamination, and significantly reduced the contents of available heavy metals in soils, as well as the uptake by plants, mostly due to the adsorption phenomena by some soil amendment. Organic materials such as green manure, animal excrement, Biochar and peat can also actively remedy heavy metal contaminated soil by transforming heavy metals from soluble and exchangeable fractions to fraction associated with organic matter (OM), carbonates fraction, and residual fraction, which are unavailable to plants (Shuman, 1999; Walker *et al.*, 2003). Soil amendments can be used to address two primary categories of problems at contaminated sites: (1) contaminant bioavailability and phytoavailability; and (2) poor soil health and ecosystem function (EPA, 2011). The objective of this study was to investigate the effects of some by-product materials such as Biochar, rice husk and rice straw on the bioavailability and the uptake of Ni, Cd and Pb by rice in a paddy soil that was irrigated with low water quality.

## **Materials and methods:-**

### **Soil amendments preparation**

Biochars used for this experiment were produced by pyrolysis the rice husk and wood dust at 420 °C with the absence of oxygen in International Trade and Marketing Company, Kaha, Al kaliobia governorate. The production

information of the biochar was given in detail by Pan et al. (2011). In brief, rice husk and wood dust were collected and air-dried. Pyrolysis process was performed in a vertical kiln at 400–450 °C, converting 35% of the biomass to biochar with the absence of oxygen. Compost was prepared at the Central Laboratory for Agriculture Climate through mixing both rice straw and husk by cow manure for 120 days up to maturity. Rice straw was chopped up to 2-3 cm before application either for composting or for direct soil application. The basic properties of all soil amendments in this experiment were given in Table 1.

*Rice husk(RH); Rice husk compost (RHC); Rice straw(RS); Rice straw compost(RSC); Rice husk biochar(RHB); Wood-dust biochar(WDB)*

#### Experimental setup:-

The experiment was carried out during the year 2015 and 2016 at the farm of at farm of Sakha Agricultural Research Station, Kafr el sheikh city (31o N, 31.1o E). The study area is located at the north pat of Egypt. Due to fresh water shortage in this region, most of the agricultural lands are using drainage water for irrigation. six soil amendments { rice straw (RS), rice straw compost (RSC), rice husk (RH), rice husk compost (RHC), rice husk biochar (RHB) and wood-dust biochar ( WDB)} in addition to control. The amount of soil amendment applied (Chun et al., 2004; Yuan et al., 2011) was calculated based on the plot area (as shown in table 2), and the amendments were incorporated into a 20 cm depth of soil. All plots were irrigated from Drainage Canal Eight located at Sakha Research station, Kafr El Shiekh, the canal water usually derived from both industrial and Sewage water as characterized in table 3.

Rice cultivar Giza 178 (*Oryza sativa*) was cultivated under the six treatments as mentioned above. The treatments were arranged in to strip plot design with four replications. Each plot about 50m<sup>2</sup> area. A basal dose of phosphorus was applied at the rate of 36 Kg P h<sup>-1</sup> and zinc was added at the rate of 24 Kg Zn ha<sup>-1</sup> as ZnSO<sub>4</sub> in dry soil. Nitrogen fertilizer was split-applied as a Urea at the rate of 150 Kg ha<sup>-1</sup>; 2/3 of N dose was incorporated before flooding and 1/3 was applied at the panicle initiation stage. The rice seeds were sown in the last week of April for the nursery. After 25 days, 4-6 plants per hill were transplanted at a spacing of 20x20 cm. Crop was harvested, in the last week of September, from each treatment within an area of 5 m<sup>2</sup> to determine the yield (ton ha<sup>-1</sup>).

#### Sampling and chemical analysis:-

Soil texture was determined by the pipette method (Soil Survey Laboratory Staff, 1992). Soil organic matter was measured by the modified Walkley and Black method as described by Allison. Total N was measured using Kjeldahl method (Bremner and Mulvaney (1982). Water-soluble phosphorus was determined colorimetrically by a spectrophotometer and the contents of water-soluble Ca, Mg, Na, and K were determined using an atomic absorption spectrophotometer (AAS). The pH was measured in a saturation paste, and the electrical conductivity of the saturation extract ( ECE) was measured using an electrical conductivity meter (Page et al., 1982). The CEC was extracted with 1M NH<sub>4</sub>OAC (buffered at pH 7.0), and exchangeable base concentrations were measured using AAS (Shimatzu). Irrigation water samples were collected through the growing season to determine the chemical analysis as shown in Table 4. Samples of shoot and grain of rice plant were selected for determining heavy metals concentration. At harvest time, Five hills of mature rice

\*Olsen et al., 1954

plants from each plot were also sampled. The sampled plants were washed with tap water and deionized water in the order, then separated into straw and grains, oven-dried in an oven at 80 C° to constant weight and the grains were milled into powder for measurement of heavy metal content. Thereafter, the samples were ground into powder form to pass a 1mm-sieve and digested with a mixture of sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) and hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) at 240 to 260 C° for 5 hours. The concentrations of heavy metals (Ni, Cd and Pb) were determined using the AAS. Soil samples also were taken from paddy soil (0-30 cm) for determining available Nickel (Ni), Cadmium (Cd) and Lead (Pb) according to methods given in Handbook by Soltanpour (1985) and Page et al. (1982). The same procedure without samples was used as blank. Three replications were conducted for each sample. Plant metals uptakes were calculated based on biomass and metals contents in plants.

For analysis of available heavy metals in soil, air-dried soils were extracted by a die thylene-triamine-penta acetic acid (DTPA) extract using an AAS. A hundred ml of 0.05m DDTPA per 10 g of soil was shaken for 3 hours at room temperature, and then the solution was filtered (14) (Page et al., 1982). Metal contents in the supernatant liquid were measured with a flame atomic absorption spectrometry (FAAS). The same procedure without samples (blank) was used as control. The bioaccumulation factors were calculated as the ratios of metals concentrations in brown grain to the concentration in 0-20 cm paddy soils (Rezvani and Zaefarian, 2011).

The plant's ability to accumulate metals from soils can be estimated by the following equation (Modified from Manahan 1992):

$$FB = \frac{CP}{CS}$$

Where: FB = bioaccumulation factor;

CP = metal's concentration in plant organs (grain);

CS = metal content in soil

### Statistical analysis

Data were statistically analyzed by ANOVA test and L.S.D using a statistical analysis GenStat program and the soil amendments were compared for heavy metals concentration in straw, grain and soil using the least significant difference (LSD) test at 5% level of significance.

**Table 4:** Soil pH, Eh, EC under different soil amendments

### Results and discussion:-

#### Effects of amendments on soil pH, CEC, Eh

The results of soil analysis of some soil chemical properties after harvest are shown in Table 4. The soil properties increased significantly with the application of soil amendments. There is no significant difference between RHB and WDB for soil pH, Eh, and CEC. The increase in soil CEC showed that fairly large amounts of exchangeable cations

*Rice husk(RH); Rice husk compost (RHC); Rice straw(RS); Rice straw compost(RSC); Rice husk biochar(RHB); Wood-dust biochar(WDB)*

were introduced by soil amendments application. Also the increase of soil pH under pots amended with RHB or WDB could be due to the higher pH in Biochar itself in addition to slow discharge of NH<sub>4</sub> which was stored in porous of Biochar from fertilizer application during the season. The Lowest soil Eh under pot amendment with RSC, RS may be attributed to the low oxidation condition compared to the other soil amendment under study. A chain of reactions is initiated upon soil flooding leading to reduced (low) soil redox potential (Eh, mV) conditions. These reactions include physical, chemical and biological processes that have significant implications for wetland plants (Gambrell and Patrick, 1978; Gambrell et al., 1991). Physical processes include restriction of atmospheric gas diffusion in the soil leading to the depletion of soil oxygen and the accumulation of carbon dioxide due to accumulation of organic matter (Jackson and Miller, 2000, Greenway, 2006). Shortly after flooding, with organic matter application the limited supply of oxygen in soil pore spaces is depleted rapidly by roots, microorganisms, and soil reductants (Ponnamperuma, 1972). This process leads to oxygen depletion and reduction in soil oxidation reduction potential (Eh) followed by a chain of soil chemical changes. The processes that follow include denitrification, reduction of iron, manganese and sulfate, and changing soil pH and Eh (Gambrell et al., 1991).

For the soil amendments of RSC, RHC and RS, the soil pH was increased in both seasons. This may be attributed to the release of NH<sub>4</sub> in the process of decomposition of organic matter during the growing season; Therefore, biochar as a soil amendment can improve soil quality by increasing soil Eh, pH, and CEC, under flooding condition. The soil pH and CEC values of different soil amendments followed the order: RHB>WDB>RHC>RH>RSC>RS. Regarding to soil Eh the order; RHB>WDB>RH>RHC>RSC>RS. The concentrations of available Cd, Ni and Pb in the soil decreased consistently with the application of soil amendments (Table 4), suggesting that these amendments reduced the bioavailability of the three heavy metals under study. Compared with the control, the application of RHB, WDB, RHC and RH significantly lowered the concentrations of available Cd, Ni and Pb in both seasons. However, only slight decreases in the concentrations of available Cd, Ni and Pb in both seasons were observed in the treatments of RS and RSC. In general, the concentrations of available Cd, Ni and Pb in both seasons of different amendments followed the common order: RHB>WDB>RHC>RH>RSC>RS>CO which reversed the order of the soil pH except for RS treatment. It can also be concluded that with the application of soil amendment usually resulted in a significant lower concentration of available Cd, Ni and Pb than with no soil amendment application. Soil available Cd, Ni and Pb in both seasons were significantly affected by the soil pH (Fig.1), and the correlation between them can be described by the following regression equations (Eq.(1))

*For Cd*

$$y = -17.404x + 10.888 \quad (R^2 = 0.9296 \quad P < 0:01)$$

**For Ni**

$$y = -1.0915x + 11.34 \quad (R^2 = 0.3314 \quad P < 0:01) \quad (1)$$

**For Pb**

$$y = -2.5236x + 13.809 \quad R^2 = 0.9758 \quad P < 0:01$$

Where,  $Y$  represents the concentration of available Cd, Ni or Pb in soil ( $\text{mg kg}^{-1}$ ),  $X$  represents the soil pH. Several studies have proved that the soil pH is an important

**Figure 1:-** Correlation between soil pH and the heavy metal under study ( the data is average of two years).

factor controlling the mobility of heavy metals in soils (Wallace *et al.*, 1974; Jackson and Miller, 2000). Besides the soil pH, there are other factors such as CEC and Eh that may also affect the bioavailability of heavy metals particularly under flooding soil condition. The properties of the soil amendments as well as the undergoing cations exchange were related to the decrease in the available Cd, Ni or Pb in the soil. For example, Biochar can release OH<sup>-</sup> and consequently able to hydrolyze heavy metals cations ( $\text{Cd}^{2+}$ ,  $\text{Ni}^{+}$  and  $\text{Pb}^{2+}$ ) to Cd-OH<sup>+</sup>, Ni-OH or Pb-OH which can be adsorbed tightly by soil or Biochar itself, and can thus decrease the availability of these heavy metals (Prasad, 1995). On the other hand, organic amendments such as RSC and RHC enhance the adsorption of heavy metal by soil through forming stable complexes with heavy metal ions, and then decrease their mobility and extractability (Piccolo, 1996; Naidu *et al.*, 1997; Chen, 2000). In this study, the soil pH and the concentrations of available Cd, Ni or Pb in the soil in the Biochar treatments were all lower than the other soil amendments under study. This may be attributed to the enhanced heavy metal adsorption and sorption owing to the large specific surface areas, rich with fiber carboxyl acids groups, and strong ion exchange capacity in Biochar treatment (Wang *et al.*, 2007).

In general, the mobility and availability of heavy metals are controlled by adsorption and desorption characteristics of soils (Krishnamurti *et al.*, 1999). The adsorption and desorption of heavy metals have been demonstrated to be associated with soil properties, including pH, organic matter content, CEC, oxidation reduction status, the contents of clay minerals, calcium carbonate, Fe and Mn oxides (Kashem and Singh, 2001; Antoniadis *et al.*, 2008; Usman *et al.*, 2008). Although the Eh values under biochar treatments are not the main significant factor affecting the heavy metal availability compared with other soil amendments under study, the availability of heavy under study decreased under biochar application. A high proportion of carboxyl acids as well as other acidic oxygen groups may also provide biochar many of the desirable properties of humic acid which is an important component of soil organic matter. The relatively high concentration of acidic groups can allow the formation of chelates with metal ions and help to bind positively charged ions to the surface of the carbon. When the surface density of carboxylic acid groups is very high, chelates with metal ions can almost completely immobilize potentially toxic metal compounds. The results obtained by Valdes (2002) indicate that total acidic groups on carbonaceous material can reach at least 2 meq  $\text{g}^{-1}$  with half the acidic groups being carboxyl groups. The acidic nature of oxidized biochars means that they may be well suited for retention of basic ions such as ammonium or other cation compounds (Kastner, 2009).

**Effects of soil amendments on Ni, Pb and Cd dynamic:-**

Metal uptakes in total and the aboveground plant biomass were calculated and listed in Figure 2. As a result of increased metals concentrations in the aboveground, metals uptakes in rice plant were mostly higher in RS treatment compared with other soil amendments under study. For the uptakes in aboveground organ of rice, uptakes of Cd, Ni and Pb were almost the same under both RHB and WDB in both seasons. From Table 5 also, it can be estimated that the reduction of heavy metal concentrations in straw compared to the control are as follows ; Cd ranged from 16.70 to 33.00 % and 12.40 to 35.30 % and Ni ranged from 6.21 to 44.20% and 8.13 to 31.5% and Pb ranged from 7.00 to 16.40% and 12.6 to 14.30 % in both years respectively. On the other hand, there is no significant different between the concentrations of the heavy metals in rice straw amended with RHB and WDB which are also recorded the lowest values of concentration compared with other soil amendments under study, implying that the application of RHB or WDB may result in higher effect on reducing Ni, Cu and Cd uptake by rice plant. The decrease of Ni, Cd and Pb concentrations in grain and straw of rice was related to the change of Ni, Cd and Pb fractions in soil. Castaldi et al. (2005) found significant decrease of Cd concentrations in root and shoot of white lupine after the addition of compost and

lime; they also found that compost and lime decreased the Cd fraction extracted with H<sub>2</sub>O and Ca(NO<sub>3</sub>)<sub>2</sub> and increased the residual fraction of Cd. Narwal and Singh (1998) also reported that pig manure and peat decreased the concentration of DTPA extractable Cd (available) in soil, but increased Cd in residual fraction. In the present study as shown in Table 6, the concentrations of available Ni, Cd and Pb under the soil amendments decreased by 14.45-55.50 % and 17.39-30.43% for Cd and 8.03-24.08% and 9.94-28.06% for Ni, and 17.71-34.00% and 13.22-25.42% for Pb in both years respectively. Furthermore, soil adsorption capacity also affected the uptake of heavy

metals by plants. For example, organic amendments can increase the absorption and immobilization of these metals in soil, and therefore decrease the uptake of these metals by rice (He and Singh, 1993).

Table 7 shows that the RHB and WDB treatments decreased the concentration of the heavy metals in grain in both years. However, the heavy metals concentrations in rice grain recorded the highest values under RHC, RSC, Rh and

RS. This may be because either the adsorption more of some available heavy metals on RHB and WDB than other the soil amendments or due to their function group or specific surface area. In addition, the decrease of Ni, Cd and Pb concentrations in grain and straw of rice in the treatments of amendments application may be partially attributed to the dilution effect caused by the significant increase of rice yield. The heavy metals concentration in rice grain under the soil amendments followed the same order: RHB < WDB < RH < RHC < RSC < RS < control. The concentrations of the heavy metals in rice grain were lower than those in straw regardless of the sources of amendments.

Bioaccumulation factors of metals under different soil amendments were listed in Table 8. It indicated that grain accumulated more metals under RSC, RHC and RS and accumulated fewer metals under RHB and WDB. Compared with control, there are high significant different between soil amendments for bioaccumulation in rice grain in both years, although there is no significant different found between RHB and WDB in both years.

Heavy metals in soils affect yield after their uptake and accumulation in tissues. Moreover, the accumulated heavy metals could severely harm human health through the food chain (Sorrell, 1999; Pezeshki, 2001). International Agency for Research on Cancer (IARC) has reported that Cd and Pb were believed to be carcinogens for humans (Van Wijck et al., 1992; Laskov, 2006). In the present study,

**Fig. 3:** Grain yield as affected by soil amendments ( the data is average of two years).

grain yield of rice had no differences between all soil amendments under study except RS treatment (figure 3). the grain yield of rice under the soil amendments followed the order: RHB > WDB > RHC > RSC > RH > RS > control. these results mean that soil amendments were able to promote grain yield obviously except RS.

It is concluded that the application of amendments induced rice growth, and significantly increased the yield of rice grain. Soil pH was increased and the bioavailability of Ni, Pb and Cd was decreased significantly consistent with amendments application. The availability of Ni, Cd and Pb were significantly affected by the soil pH, and the soil adsorption capacity also affected the bioavailability of the heavy metals under study. The available Ni, Cd and Pb in soil were significantly correlated to the soil pH. Rice husk biochar demonstrated the best efficiency among all the

amendments in this study; it increased grain yield and decreased the concentrations of Ni, Pb and Cd in rice straw and grain. Application of these amendments also increased the grain yield, yet reduced the heavy metals concentrations in rice straw and grain below the tolerance limits of Ni, Pb and Cd in foods. However, the heavy metals concentrations in rice grain under soil amendments are not exceeded the limit. It is mentioning here the concentration of the studied heavy metals in straw or grain of rice is less the permissible limits as reported by El Sharkawi, et al., 2012. Based on these results, either RHB or WDB could be recommended to remediate the contaminated soil irrigated with low water quality.

Value of Stock, Investor base.

#### Abstract

This paper sought to investigate the effect of investor base on the value of stock of Cross-Listed Firms in the NSE. The study used an explanatory survey design. The target population comprised of all the seven cross listed Kenyan firms listed in the NSE namely: Equity bank, KCB, Kenya airways, Jubilee insurance, Centum Investment Ltd, Nation Media Company and the EABL. A census sampling technique was employed in selecting the companies from which the data was collected from in an effort to ensure that all the companies targeted were used to form the sample size. The researcher used documentary analysis as the main data collection method. The data was obtained through analysis from company's annual reports, internet and NSE journals. The data collected was analyzed using descriptive methods and inferential statistics. The study found out that an increase in the investor base (trading volume) and a decrease in price noisiness could have had an effect on stock value positively. It was concluded that cross listed firms acquired a considerable amount of assets after cross listing an aspect attributed to the increase in operations as a result of the popularity and an increase in market share acquired by the company.

#### Introduction:-

A stock that tends to trade at a lower price relative to its fundamentals (i.e. dividends, earnings, sales, etc.) is considered undervalued by a value investor. Common characteristics of such stocks include a high dividend yield, low price-to-book ratio and/or low price-to-earnings ratio. Firm value refers to the total economic value of a company, reflecting the value to be allocated to the company's shareholders and debt holders. It is calculated by adding the company's Equity Value and total net debt, (Dickinson, 2004).

Globally with the advent of globalization initiatives and deregulation of the financial landscape in the past decade, there has been a surge in cross-border listings by firms. In 2006, nearly 4700 firms cross listed on overseas exchanges globally, with the number of new foreign listings of around 1000 for that year (Hargis, 2008). Popular locations for foreign listing included the UK, the US and Japan. A decade later, the number of cross-listed firms had declined to 2837 firms in 2006, while the number of new foreign listings fell to 299, nearly a third of the 1997 levels. The financial performances of these companies have been able to improve as a result of cross listing. These

companies have been able to improve and broaden their shareholders base and gained a greater financial strength that has made them to increase their capital (January, 2003).

Regional cross-listings in sub-Saharan Africa have been associated with expansion and the setting-up of operations in the host countries. In almost all cases, firms are large with a strong base in their home countries, and they first established operations in their host countries before deciding to cross-list. Many cross-listings are undertaken to expand operations in the host countries. Almost all the firms that are cross-listed (about 98 percent or 42 out of 43) have set up operations in the host countries. For example, Ecobank Transnational has operations in the Cote D'Ivoire the home country and in Ghana and Nigeria, the host countries; Investec and Pelerin have operations in South Africa and Botswana; and the 28 firms that are cross-listed in South Africa and Namibia have an operational base in both countries. Cross-listing in sub-Saharan Africa has been generally accompanied by an initial public offering and/or secondary market listing. These cross listed firms have enjoyed reduced cost of capital through an improvement of the firm's information environment. Some of these firms like Investec have been able to cross-list on markets with stringent disclosure requirements such as the New York Stock Exchange and have signaled their quality to outside investors. For the years that these firms have cross listed there has been improved available information to potential customers and suppliers due to an increased media attention and higher quality of accounting information. As a result of the foregoing, there has been an improved financial performance in these companies, (Patel, 2006).

Kenyan firms that have cross listed have been able to bring foreign investors nearer to potential investors. These investors include those from the East African community and other African countries and elsewhere in the rest of the world. For example, East African Breweries, with Kenya as the home country, has a subsidiary Uganda Breweries Ltd in Uganda, its host country of cross-listing. Jubilee Insurance of Kenya has subsidiaries in Uganda and Tanzania; Kenya Airways owns 49 percent of Precision Air of Tanzania. Through cross listing the Kenya Airways and Jubilee Insurance have been able to gain more liquidity and greater ability to raise capital. However, many investors have complained of poor investor protection coupled with high cost of investment and some investors have been reluctant to further investment the country, (Bonnier, 2009). This paper therefore sought to study the effects of investor base on the value of stock of a firm.

#### **Literature review:-**

Although managers may be motivated by such considerations as the improved prestige, image and visibility of their company to customers and investors (Mittoo, 2001), the primary financial objective of a foreign listing is a reduction in the company's costs of capital and, accordingly, improved corporate valuation. Existing empirical evidence on this issue is provided by three groups of studies that use different methodologies: 1) studies that explicitly examine the changes in the cost of capital after cross-listing, 2) studies that examine the valuation multiples of cross listed firms relative to those of firms that do not cross-list using cross-sectional analysis, and 3) studies that examine changes in stock price around the announcement of cross-listings and/or around the cross-listing event using the time-series framework, (Mittoo, 2001).

Studies from the first group report that cross-listing in the US by non-US firms is associated with a significant reduction in the cost of equity capital (Abee, 2006). In addition, Aggarwal, (2002) shows the reduction in the cost of equity is sustained over a long period of time following the cross-listing event. At the same time, there is no evidence on the changes in the cost of capital after cross-listing in host markets other than the US.

The second group of studies, the cross-sectional studies, estimate the valuation premium of cross-listed firms using valuation multiples, most often Tobin's Q17, and report that non-US firms that cross-list in the US experience significantly higher valuations compared to firms that do not cross-list (Aggarwal, 2005). However, Bayar (2005) shows that corporate valuation increases significantly before and during the year of cross-listing and declines afterwards. Such evidence questions the causality of the relationship between cross listing and firm valuation. Several studies also compare the valuation premium from cross listing in the US and in the UK. However, the findings are conflicting. Thus, Huang (2001) find significant valuation premiums for US cross-listings that are persistent over time, while they find no premiums in valuation for UK cross-listings. The authors interpret these findings as consistent with the theory that a stock exchange listing in the US 'has unique governance benefits for foreign firms' (Huang, 2001).

Finally, the third group of empirical studies, the event studies, focuses on the impact of cross-listing on shareholders' wealth and report that, on average, cross-listing in the US results in significant positive abnormal

returns both around the announcement of the decision to cross-list and around the cross listing event itself, (Salva, 2003).

However, such evidence primarily concerns cross-listings in the US, while the market reaction to cross-listing on a foreign market other than the US has received significantly less attention in the literature. Concerning cross-listing in the UK, prior studies find positive abnormal returns (Aggarwal, 2005). In addition, Huang (2001) reports permanent valuation gains from cross-listing on various host markets and suggest that cross-listing in the US does not offer unique valuation benefits.

Overall, empirical evidence on the effects of international cross-listings arrive at the general consensus that cross-listing in the US has a positive impact on shareholders' wealth. Evidence on the wealth effects of foreign listings in other markets is limited and inconclusive. In addition, significant changes in international capital markets discussed above have potentially altered the net benefits of cross-listings in different markets. Moreover, there is an ongoing debate in the literature on the sources of value creation around cross-listings. Conventional wisdom has been that cross-listing is a way to overcome investment barriers and make shares accessible to foreign investors (Mittoo, 2001). Accordingly, the reduction in the cost of capital is the result of the increased shareholder base and wider risk sharing (Miller, 2000). In the late 1990s, however, despite the increased integration of national capital markets, the number of cross-listings continued to grow and the valuation benefits from cross-listing continued to be significant.

### Methodology:-

The paper used an explanatory survey design. Explanatory research design helps to explain the cause and effect relationship of the study, data collection method and selection of subjects, (Patton, 2000). The target population comprised all the seven cross listed Kenyan firms listed in the NSE namely: Equity bank, KCB, Kenya airways, Jubileeinsurance, Centum Investment Ltd, Nation Media Company and the EABL. The study employed census sampling technique in order to come up with the companies to be studied since it was only cross listed companies required. The researcher used documentary analysis. The data was obtained through analysis from company's annual reports, internet and NSE journals.

A secondary source of data was employed in the data collection process; a documentary analysis guided the researcher obtain information from NSE reports from 2001 to 2010. Secondary data is mainly gathered from existing literature (reports, seminar papers, books, research journals, magazines, publication among others), the internet and past research information.

The data collected was analyzed using descriptive methods and inferential statistics. Descriptive methods were used to analyze the data where frequencies and proportions were used in interpreting the results. Inferential methods such as Pearson test of association was used to show the relationship between cross listing and value of stock. The regression model was used to compute the overall effect of the changes in the value of stock for the cross listed firm. ANOVA and correlation were used to indicate the effect of the factors hypothesized to influence the value of stock.

### Results and Discussion:-

The paper sought to establish how investor base affected the value of stock for the 7 cross listed companies before and after cross listing. This was in an effort to determine the companies that had cross listed.

#### Effect of Investor base on the value of Stock

One-Sample Test							
Test Value = 7.5211							
		T	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
						Lower	Upper
EABL	Before	14.572	2	.202	1.91509	1.6545	2.1757
	After	17.679	2	.110	2.07547	1.8427	2.3082
EQTY	Before	12.072	2	.125	1.11321	.9304	1.2960
	After	35.203	2	.001	1.97170	1.8606	2.0828
KCB	Before	35.968	3	.124	1.81132	1.7115	1.9112
	After	14.735	3	.254	2.00943	1.7390	2.2798

KQ	Before	20.402	3	.124	2.08491	1.8823	2.2875
	After	34.709	3	.003	3.16038	2.9798	3.3409
NMG	Before	40.527	3	.254	3.14151	2.9878	3.2952
	After	29.533	3	.874	2.61321	2.4378	2.7887
JUBILEE	Before	23.686	2	.125	2.08491	1.9104	2.2594
	After	44.652	2	.354	3.20755	3.0651	3.3500
Centum	Before	52.222	1	.254	3.99057	3.8390	4.1421
	After	25.967	1	.321	2.85849	2.6402	3.0768

Among the data sets that were collected only two companies' indicated a significant effect after they had been cross listed on the stock exchange. This companies were the Equity bank  $p = 0.001$  and the KQ airline ( $p = 0.003$ ).

This significances after the cross listed companies were considered outliers in relation to the industry values and as such the study did not take much significances to the changes in the investor bases in this two companies.

This was interpreted to mean that there were insignificant changes in the investor bases both before and after the cross listing process. This could have been attributed to the company principles on the acquisition of more capital for operation.

### Regression Model:-

Coefficients					
Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		Std. Error	Beta		
1	3.201	0.213	0.003	3.389	0.001
0.254					
Investor base	0.123	0.108	- 0.001	0.259	0.054

a. Dependent Variable: Value of Stock

Further testing on the regression model indicated there exists no significant relationship between the investor base of a cross listed firm and the value of stock. Research results accept the hypothesis. ( $\beta = - 0.001$ ,  $p < 0.054$ ). The regression results showed the effect of the investor base of a cross listed firm with a beta coefficient of -0.001, the effect is not significant at ( $p=0.054$ ).

### Conclusion and Recommendation:-

The study found out that investor base has no direct relationship with the value of stock. A cross listed company will only will only attract more investors if the company it reduces its stock minimum trading unit. A reduction in the minimum trading unit greatly increases a firm's base of individual investors and its stock liquidity, and is associated with a significant increase in the stock price. Companies that cross list therefore need to reduce their stock minimum trading units if they are to positively influence the value of their stocks. A decrease in price noisiness affect stock value positively through an increase in the investor base (trading volume). It is therefore recommended that Cross listed company's should ensure their financial statement reflect a strong financial position and good performances to influence investor decisions.

Adsorption isotherm; ammonia; rice straw; modeling.

#### Abstract

Many techniques were proposed for removal of ammonia as hazardous pollutant. Adsorption of ammonia from aqueous solutions onto activated carbon (prepared from rice straw as agricultural waste by calcination then activation with sodium hydroxide) was studied in batch reactor. Comparison of linear least-squares and trial-and-error non-linear methods of widely used isotherms (Langmuir, Freundlich, and Redlich-Peterson) was examined.

Results manifest that adsorption rate increases with temperature for calcination and activation. Maximum adsorption capacity of prepared activated carbon is  $96.4 \text{ mg.g}^{-1}$ . Langmuir and Freundlich models provide a good fitting of data, with  $R^2$  range 0.7:0.98. Non-linear Freundlich model is the best representation.

#### Introduction:-

Different governments adopted new regulations in order to control pollutant emissions. Among them, ammonia is considered an important health hazard because it is poisonous if inhaled in great quantities (breathing levels above 50-100 ppm) while it can cause eyes, throat and nose irritation in lesser concentrations. Actual ammonia emissions are generated mainly from the fertilizer manufacture industry, coke manufacture, fossil fuel combustion, livestock and poultry management, and refrigeration methods. Among all these sources, fertilizers production accounts for about 90% of total ammonia emissions (Gonçalves et al., 2011).

Many techniques have been proposed in the literature for the removal of  $\text{NH}_3$  in industrial effluents. These include absorption by solution, reaction with other gases, ion exchange using polymeric resins, separation using membranes, thermal treatment, catalytic decomposition and adsorption by porous solids which are economically convenient for high concentration pollutants (Pezet et al., 1988; Blonigen, et al., 2003; Blonigen et al., 2005; Yunlong et al., 2015; Jared et al., 2016).

Some of these techniques (e.g. thermal combustion) are they become economically unviable for diluted waste streams. For these special cases adsorption on porous solids (e.g. activated carbons, zeolites, and so on) can be an excellent approach (Huang et al., 2008; Kim, and Park, 2007; Le Leuch, and Bandosz, 2007; Park and Jin, 2005; Petit and Bandosz, 2009; Zawadzki et al., 2003; Bernal, et al., 1993; Bandosz and Petit, 2009; Grant et al., 2012).

Among the different porous solids described in the literature, activated carbons exhibit certain advantages such as a high "apparent" surface area, a highly developed porous structure in order to adapt it for a special application, in addition to its simplicity and economy in configuration and operation.

**Corresponding Author:-Hoda M. Abdel Ghany.**

Address:-Chemical Engineering Department, Minia University, Minia, Egypt.

Ammonia removal has been also described in the literature for metal-modified (Fe, Co, Cr, Mo and W) activated carbons (Le Leuchet al., 2007; Petit, and Bandosz, 2009; Bandosz, and Petit, 2009).

Le Leuch and Bandosz at 2007 reported that activated carbons with supported metals on the surface can be used for the removal of ammonia pollution and their capacity depends on the nature of the metal deposit and its acidity. Activated carbons usually exhibit non-polar surfaces adsorb polar compounds (e.g.  $\text{NH}_3$ ), and the amount and the nature of the oxygen surface groups present on the carbon surface, i.e. acidic groups, are responsible for the total amount adsorbed of a basic molecule such as ammonia (Kim and Park, 2007).

Rice is the world's second largest cereal crop after wheat, however, it produces large amounts of crop residues. Only about 20% of rice straw was used for purposes such as ethanol, paper, fertilizers and fodders and the remaining amount is either removed from the field, in situ burned, piled or spread in the field, incorporated in the soil, or used as mulch for the following crop. In Egypt, burning of rice straw causes air pollution called the "Black Cloud". Rice straw is unique relative to other cereal straws in being high in silica and lignin (Ementanet al., 2012)

It has been reported that it is inappropriate to use the coefficient of determination of a linear regression analysis for comparing the best-fitting solution of different isotherms. As linear regression has produced very different outcomes so non-linear method may be a better way to obtain the parameters (Yuh-Shan, 2006; Xunjun, 2015)

In this study, adsorption of ammonia on activated carbon (prepared from rice straw as agricultural waste) from aqueous solutions has been studied in a batch reactor and a comparison of the linear least-squares method and a trial-and-error non-linear method of three widely used isotherms (the Langmuir, Freundlich, and Redlich-Peterson) were examined.

### Materials:-

Nessler reagent, Ammonium chloride ( $\text{NH}_4\text{Cl}$ ), Sodium hydroxide (NaOH 96%) and Hydrochloric acid (HCl - 36%) were purchased from (El-Nasr pharmaceutical chemicals, co).

### Adsorbent:

In the present work the rice straw was used as adsorbent and collected from the byproduct of rice industry.

### Adsorbate:

The adsorbate used in this study was a synthesized solution from ammonium chloride using distilled water as a solvent to prepare different concentrations of ammonia solution ranging from 10 to 350 mg/l.

The ammonia solution was prepared by the standard Nesslerization method ("APHA; 1989). In this method we add two droplets of Rochelle salt solution until the ammonium solution becomes clear. Then 1 ml of Nessler reagent is added to the ammonium chloride solution to obtain a yellow colored ammonia solution.

### Apparatus:

The prepared concentrations of ammonia were measured using a spectrophotometer (shimadzu, inc. Kyoto, Japan model UV-1601).

Drying furnace (Tecnimedia Italy) and a shaker (Julabo labor tech GMBH-7633 steel batch/west Germany) were used.

### Experimental:-

All experiments were carried out at room temperature ( $25 \pm 2^\circ\text{C}$ ) unless otherwise stated in the study of thermodynamic properties of the adsorption process.

Two series of batch experiments were performed to study adsorption isotherm in agitated glass bottles of 50 ml. The first was to investigate the ammonia adsorption on rice straw from aqueous solutions at different calcination temperatures  $400^\circ\text{C}$  and  $700^\circ\text{C}$  compared to raw rice straw and the second used calcinated rice straw treated with sodium hydroxide at different temperatures 25, 40, 50, and  $60^\circ\text{C}$ .

Preliminary experiments using fixed amounts of adsorbent (0.1 g) were added to the bottles containing adsorbate of the same concentrations, shaken in a reciprocating shaker and centrifuged to remove the adsorbent showed that such equilibrium was established within about 3h contact time (Figure (1)).

Fig.1:-Effect of temperature on equilibrium time for ammonia adsorption using rice straw.

Ammonia adsorption  $q$  ( $\text{mg.g}^{-1}$ ) was calculated by using the following equation:

$$q = \frac{(C_o - C_t) \times V \times 17 \times 1000}{m} \quad (1)$$

Where  $m$  is the mass of rice straw (g),  $C_o$  is the initial ammonia concentration and  $C_t$  is the ammonia concentration ( $\text{mol. L}^{-1}$ ) at time  $t$ , 17 is the molecular weight of ammonia, and  $V$  is the volume of aqueous ammonia solution (L).

**Results and Discussions:-**

4.1. Effect of rice straw calcination temperature on ammonia adsorption

Experiments were carried out using the same initial ammonia concentrations from 10 to 350 ( $\text{mg.dm}^{-3}$ ), rice straw dose of 0.1(g) to investigate the effect of calcination temperature on ammonia adsorption.

Fig.2:- Percentage removal of ammonia by adsorption onto raw and calcinated rice straw at different temperatures.

The results shown in Figure (2) depicts that the rate of uptake of ammonia is rapid in the beginning and that over 80, and 70 of ultimate adsorption are completed within 60 min for the 700 and 400°C calcination temperature, respectively compared to 60% for the raw rice straw at room temperature.

Figure (3) also demonstrates that ammonia adsorption increases with calcination temperature. After 60(min) operation, the ammonia adsorption increases from 84 for raw rice straw to 90.6 and 98( $\text{mg.g}^{-1}$ ) as the temperature of calcination of rice straw reached 400 and 700°C, respectively. The increase in uptake with rise in temperature of calcination is due to the fact that the reaction rate between ammonia and the surface oxygen functional groups on the calcinated rice straw increases with temperature.

**Fig.3:-**Experimental isotherm of ammonia onto raw and calcinated rice straw at different temperatures.

Furthermore, the diffusivity of adsorbate through the external laminar layer into the micropores of the adsorbent also increases with temperature as diffusion is an endothermic process.

Also it can be suggested that some water molecules (bonded by strong hydrogen bonds with surface groups located at entrances to pores) can desorb from rice straw calcination temperature increases, which results in more pores open to  $\text{NH}_3$ .

#### 4.2. Effect of treatment of calcinatedrice straw with sodium hydroxide at different temperatures on ammonia adsorption.

The explanation can be expressed as follows:

Firstly, the mass-transfer between the liquid bulk and the surface of rice straw increases with the temperature in the aqueous solution. Secondly, the diffusivity of ammonia also increases with temperature. Thirdly, the ammonia on the surface of rice straw in equilibrium with the ammonia in the solution may increase with its temperature in the solution.

In Figure (5), it is very clear that with increase in temperature the actual number of active sites or adsorption sites per gram of adsorbent increase proportionately with adsorbate uptake.

This can be attributed to increased total adsorbent surface area due to availability of more adsorption sites.

Fig.4:-Adsorption isotherm of ammonia onto prepared activated carbon at different temperatures.

Fig.5:-Percentage removal of adsorption of ammonia onto prepared activated carbon at different temperatures.

4.3. Adsorption Isotherm Models  
 4.3.1. Langmuir Isotherm

Langmuir equation is based on a theoretical model and assumes that the maximum adsorption corresponds to a monolayer saturated with adsorbate molecules on the adsorbent surface that is energetically homogeneous(Langmuir,1916). Langmuir isotherm constants are calculated from the following linearized form:

$$C_e/q_e = 1/ K_L + (a_L/K_L)*C_e \quad (2)$$

where  $a_L$  and  $K_L$  are Langmuir constants determined from the slope ( $a_L/K_L$ ) and intercept ( $1/ K_L$ ) of the plot, where ( $K_L/a_L$ ) and  $a_L$  are indicative of maximum adsorption capacity ( $mg.g^{-1}$ ) of adsorbent and energy of adsorption, respectively, while  $C_e$  is the remaining concentration of adsorbate after equilibrium ( $mg.dm^{-3}$ ) and  $q_e$  is the amount adsorbed at equilibrium ( $mg.g^{-1}$ ).

From the data shown in Tables(1) and (2), Langmuir isotherm curves can be given by plotting  $C_e/q_e$  against  $C_e$  (Figures(6) and (7)).

**Table 1:-** Langmuir constants for the adsorption of ammonia onto rice straw calcinated at different temperatures.

Rice straw (ammonia Conc. $C_0=0-200 \text{ mg.dm}^{-3}$ )	slope	intercept	$K_{L1}$	$a_{L1}$	$r^2$	$K_L/a_L$

**Fig.6:-**Langmuir plots for the adsorption of ammonia onto rice straw calcinated at different temperatures.

**Fig.7:-**Langmuir plots for adsorption of ammonia onto prepared activated carbon at different temperatures.

“S” type of adsorption isotherm is sigmoidal-shaped and thus has got a point of inflection. It is always a result of at least two opposite mechanisms. Compared to the “L” and “H” isotherms, the “S” class occurs less frequently (Dana et al., 2014).

Figure (6) demonstrates that the adsorption isotherm is in good agreement with the Langmuir adsorption equation however it has S-shape type of isotherm so the Langmuir plot is better represented by two consecutive straight lines. The highest value of  $97.93(\text{mg.g}^{-1})$  is obtained for  $(K_L/a_L)$  and a value of 0.38 is obtained for  $a_L$  (correlation coefficient 0.99) for the adsorption of ammonia onto rice straw calcinated at  $700^\circ\text{C}$  in the ammonia initial concentration range of  $(150-350) (\text{mg.dm}^{-3})$ .

The Langmuir plots in Figure (7) are represented by two consecutive straight lines with good correlation coefficients between 0.77 and 0.99. The highest value of maximum adsorption capacity in the ammonia initial concentration range of  $(10-80(\text{mg.dm}^{-3}))$   $25.25 (\text{mg.g}^{-1})$  is obtained with (correlation coefficient 0.95) for the adsorption of ammonia onto rice straw treated with NaOH at  $60^\circ\text{C}$ .

However, for the ammonia initial concentration range  $(100-300(\text{mg.dm}^{-3}))$ , the highest adsorption capacity is  $96.15 (\text{mg.g}^{-1})$  obtained for the adsorption of ammonia onto rice straw treated with NaOH at  $25^\circ\text{C}$ .

The Langmuir constant,  $a_L$ , is related with the affinity of the adsorbent for the adsorbate. Low values of  $a_L$  suggest a high affinity of rice straw for the ammonia.

#### 4.3.2. Freundlich Isotherm

Freundlich isotherm assumes that the uptakes of adsorbate occur on a heterogeneous surface by multilayer adsorption and that the amount of adsorbate adsorbed increases infinitely with an increase in concentration (Freundlich, 1906).

The Freundlich isotherm is expressed as:

$$q_e = K_F * C_e^{(1/n)} \quad (3)$$

where  $K_F$  and  $n$  are constants of Freundlich isotherm incorporating adsorption capacity  $(\text{mg.g}^{-1})$  and intensity, while  $C_e$  and  $q_e$  are the remaining concentrations of adsorbate after equilibrium  $(\text{mg.dm}^{-3})$  and the amount adsorbed at equilibrium  $(\text{mg.g}^{-1})$ , respectively. Taking logarithm from the Eq. (3), a linearized form of Freundlich isotherm can be represented as follow:

$$\log q_e = \log K_F + (1/n) \log C_e \quad (4)$$

A Freundlich isotherm curve for the adsorption of ammonia on rice straw calcinated at different temperatures can be given by plotting  $\log(q_e)$  against  $\log(C_e)$  (Figure (8) and (9)). It can be noticed that the plots can be better fitted by two consecutive lines, this is in correspondence with the S-isotherm shape.

Fig .8:-Freundlich plots for adsorption of ammonia onto raw and calcinated rice straw at different temperatures.

Fig.9:-Freundlich plots for adsorption of ammonia onto prepared activated carbon at different temperatures.

From the data shown in Table (3), the Freundlich isotherm constants give the highest value for adsorption at calcination temperature 700°C.

However, for the adsorption of ammonia onto prepared activated carbon at different temperatures, the high values of  $K_F$  showed a high feasibility of adsorption and  $n$  (intensity of adsorption) values between 1 and 7.4 represent a favorable adsorption. So adsorption is favorable in the ammonia initial concentration range (200-350) ( $\text{mg}\cdot\text{dm}^{-3}$ ) (Table (4)).

**Table 3:-**Freundlich constants for the adsorption of ammonia onto rice straw calcinated at different temperatures.

60	41.33	7.407	0.7563

#### 4.3.3. Redlich-Peterson isotherm

The Redlich-Peterson isotherm contains three parameters and is a hybrid of the Langmuir and Freundlich isotherms (Redlich and Peterson, 1959). The numerator is from the Langmuir isotherm and has the benefit of approaching the Henry region at infinite dilution.

$$q_e = (K_{RP} * C_e) / (1 + B * C_e^a) \quad (5)$$

The Redlich-Peterson isotherm may be rearranged to a linear form.

$$\log [(K_{RP} * C_e / q_e) - 1] = \log B + a_{RP} \log C_e \quad (6)$$

It has three isotherm constants namely  $K_{RP}$ ,  $\beta$  and  $a_{RP}$  ( $0 < a_{RP} < 1$ ) which characterize the isotherm. Its limiting behavior is summarized as follows:

When  $a_{RP} = 1$ , the Langmuir form results. On the other hand when ( $K_{RP}$  and  $a_{RP}$ ) are much greater than unity, the Freundlich isotherm results. And when  $a = 0$ , the Henry's law results.

The three isotherm constants were determined by using trial and errors method to obtain the best value of  $K_{RP}$  which yields the maximum value of the coefficient of determination,  $r^2$  using the solver add in the Microsoft excel sheet.

Table (5) represents the Redlich-Peterson constants for the adsorption of ammonia onto rice straw calcinated at different temperatures. However the best values of constants gave very low correlation coefficients  $r^2$  between 0.3 and 0.7 so we cannot take this form in our consideration.

**Table5:-** Redlich-Peterson constants for the adsorption of ammonia onto rice straw calculated at different temperatures.

Temp.(°C)	B	A <sub>RP</sub>	r <sup>2</sup>	K <sub>RP</sub>
25	0.0317	0.6117	0.3227	1.2
400	1.04	0.2667	0.304	5.11
700	0.233	0.639	0.686	6

#### 4.4. Selection of optimum adsorption isotherm

The analysis of the isotherm data is important to develop an equation which accurately represents the results and which could be used for design purposes. The most common isotherms applied in solid/liquid systems are the theoretical equilibrium isotherm, Langmuir (Langmuir, 1916), the best known and most often used isotherm for the adsorption of a solute from a liquid solution; the Freundlich (Freundlich, 1906), the earliest known relationship describing the adsorption equation and the Redlich–Peterson (Redlich and Peterson, 1959), the earlier presented, containing three parameters isotherm.

#### Linear Method:-

Linear regression was frequently used to determine the most fitted model throughout the years and the method of least squares has been frequently used for finding the parameters of the models. However, transformations of non-linear isotherm equations to linear forms implicitly alter their error structure (Jared et al., 2016).

In recent years, several error analysis methods, such as the coefficient of determination, the sum of the errors squared, a hybrid error function, Marquardt's percent standard deviation, the average relative error and the sum of absolute errors, have been used to determine the best-fitting isotherm (Ratkowsky, 1990; Ho YS., et al., 2002; Allen et al., 2003; Zvezdelina et al., 2013; Srivastava and Syed, 2011; Foo and Hameed, 2010).

In addition to this, the better fit of model was checked by coefficient of determination ( $r^2$ ), residual root mean square error (RMSE), and Chi square ( $x^2$ ) values were evaluated through the following equations:

$$\text{RMSE} = \sqrt{\frac{1}{N-p} \sum_{i=1}^m (q_{\text{exp}} - q_{\text{mod}})^2} \quad (7)$$

$$X^2 = \sum [(q_{\text{exp}} - q_{\text{mod}})^2 / q_{\text{mod}}] \quad (8)$$

Where  $q_{\text{exp}}$  is the experimental concentration of adsorbate on adsorbent,  $q_{\text{mod}}$  is the calculated concentration of adsorbate on adsorbent obtained from model,  $N$  is the number of points in the experimental design, and  $p$  is the number of parameters to be determined.

The value of coefficient of determination,  $r^2$ , represents the percentage of the variability of the regression line between the predicted values and the actual values and may vary from 0 to 1; a perfect fit gives a coefficient of 1.

On the other hand,  $x^2$  is basically the sum of the squares of the differences between the experimental data and the data obtained from the models divided by the corresponding data obtained from the models (Eq. (8)).

Smaller values of RMSE and  $x^2$  and high values of correlation indicate a better fit of model (Srivastava and Syed, 2011) (Tables (6); and (7)).

Table (6) indicated that the theoretical Langmuir presentation gives the lowest values of the error tests;  $x^2$  and RMSE and highest value of Correlation coefficient  $r^2$  so it gives the best fit of isotherm data for the adsorption of ammonia onto rice straw calculated at 700°C.

**Table 6:-** Isotherm constants of different isotherm models for the adsorption of ammonia onto rice straw calcinated at 700°C. (hint: the best numbers are highlighted).

Isotherm	$r^2$	$\chi^2$	RMSE
Freundlich at $C_o$ (0-200 mg.dm <sup>-3</sup> ) $K_F = 0.95$ , $n = 0.75$	0.98	21.58	16.49
Freundlich at $C_o$ (200-350 mg.dm <sup>-3</sup> ) $K_F = 70.08$ , $n = 7.46$	0.67		
Freundlich non linear $K_F = 13.8$ , $n = 2.39$	0.82	66.12	17.32
Langmuir at $C_o$ (0-200 mg.dm <sup>-3</sup> ) $K_L = 1.414$ , $a_L = -0.0205$	0.69	<b>4.83</b>	<b>4.11</b>
Langmuir at $C_o$ (200-350 mg.dm <sup>-3</sup> ) $K_L = 37.31$ , $a_L = 0.381$	<b>0.99</b>		
Langmuir non linear $K_L = 4.53$ , $a_L = 0.036$	0.82	33.32	12.27
Redlich-Peterson $K_{RP} = 6$ , $B = 0.233$ , $a = 0.639$	0.69	52.06	19.71
Redlich-peterson non linear $K_{RP} = 7$ , $B = 0.7$ , $a = 0.5$	0.97	109.38	23

**Table 7:-** Isotherm constants of different isotherm models for the adsorption of ammonia onto rice straw activated with NaOH at 60°C. (hint: the best numbers are highlighted)

Isotherm	$r^2$	$\chi^2$	RMSE
Freundlich at $C_o$ (0-100 mg.dm <sup>-3</sup> ) $K_F = 5.13$ , $n = 0.87$	<b>0.97</b>	<b>15.26</b>	<b>7.52</b>
Freundlich at $C_o$ (100-300 mg.dm <sup>-3</sup> ) $K_F = 41.33$ , $n = 7.41$	0.76		
Freundlich non linear $K_F = 20.77$ , $n = 3.4$	0.82	62.44	15.81
Langmuir at $C_o$ (10-100 mg.dm <sup>-3</sup> ) $K_L = 3.9$ , $a_L = 0.154$	0.95	320.81	25.86
Langmuir at $C_o$ (100-300 mg.dm <sup>-3</sup> ) $K_L = 2.15$ , $a_L = 0.022$	0.97		
Langmuir non linear $K_L = 10.93$ , $a_L = 0.125$	0.82	24.43	9.37
Redlich-Peterson $K_{RP} = 6.03$ , $B = 0.6$ , $a_{RP} = 0.5$	0.3	235.74	26.95
Redlich-peterson nonlinear $K_{RP} = 13.7$ , $B = 0.25$ , $a_{RP} = 0.9$	0.56	31.41	11.74

However according to Table (7) for the adsorption of ammonia onto rice straw activated with NaOH at 60°C, the theoretical Freundlich presentation gives the lowest values of the error tests;  $\chi^2$  and RMSE and highest value of Correlation coefficient  $r^2$  so it gives the best fit of this isotherm data.

#### 4.4.2. Non-linear Method

In the case of the non-linear method, a trial-and-error procedure, which is applicable to computer operation, was developed to determine the isotherm parameters using an optimization routine to maximize the coefficient of determination between the experimental data and isotherms in the solver add-in with Microsoft's spreadsheet, Microsoft Excel. The abilities of three widely used isotherms, the Freundlich, Langmuir, and Redlich-Peterson isotherms to model the equilibrium sorption data were examined (Foo and Hameed, 2010).

From Figure (10) it seems that the best fit was obtained by Langmuir as compared with other isotherms because the Langmuir theoretical isotherm obtained from linear calculations and Langmuir model isotherm obtained from non-linear method were both closer to the experimental isotherm.

**Fig. 10:-** Plot of theoretical and non-linear isotherms for the adsorption of ammonia onto rice straw calcinated at 700°C.

Also the Langmuir constants obtained by non linear method were closer to those obtained from theoretical linear calculations, (Table (6)).

So the predicted equations that can best fit this isotherm according to Langmuir theoretical calculations are:

$$q_e = \frac{1.41 C_e}{1 - 0.021 C_e} \quad (9)$$

For the initial ammonia concentration ranges [(10-200)( mg.dm<sup>-3</sup>)].

$$q_e = \frac{37.31 C_e}{1 + 0.38 C_e} \quad (10)$$

For the initial ammonia concentration ranges (200-350(mg.dm<sup>-3</sup>)).

And the predicted equation that can best fit this isotherm according to Langmuir non linear modelis:

$$q_e = \frac{4.53 C_e}{1 + 0.036 C_e} \quad (11)$$

This equation is applied for the initial ammonia concentration ranges (10-350(mg.dm<sup>-3</sup>)).

Figure (11) shows the adsorption of ammonia onto rice straw activated with NaOH at 60°C, the best fit was obtained by the Freundlich theoretical isotherm obtained from linear calculations as it is the closest plot of the experimental data.

**Fig.11:-**Plot of theoretical and non-linear isotherms for the adsorption of ammonia onto rice straw activated with NaOH (prepared activated carbon) at 60°C.

So the predicted equations that can best fit this isotherm according to Freundlich theoretical calculations are:

$$q_e = 5.13 C_e^{1/0.87} \quad (12)$$

For the initial ammonia concentration ranges (0-100 (mg.dm<sup>-3</sup>)).

$$q_e = 41.33 C_e^{1/7.41} \quad (13)$$

For the initial ammonia concentration ranges (100-300 (mg.dm<sup>-3</sup>)).

And the predicted equation that can best fit this isotherm according to Freundlichnon linear modelis:

$$q_e = 20.77 C_e^{3.4} \quad (14)$$

#### 4.5. Thermodynamic Parameters

Thermodynamic parameters, such as change infree energy ( $\Delta G$ ), enthalpy ( $\Delta H$ ), and entropy( $\Delta S$ ) that describe ammonia uptake by rice straw can be estimated by considering the equilibrium constants under the several experimental conditions<sup>30</sup>.Equilibrium constant for the adsorption reactionof ammonia on rice straw,  $K_c$ , is defined asfollows:

$$K_c = \frac{C_{AE}}{C_e} = \frac{(C_o - C_o)}{C_e} = \frac{(C_o)}{C_e} - 1 \quad (15)$$

Where  $C_{AE}$  is the adsorbed amount of adsorbate atequilibrium,  $C_o$  the initial concentration of adsorbate(mg/dm<sup>3</sup>),  $C_e$ the equilibrium concentration of adsorbate(mg/dm<sup>3</sup>).

The change in the Gibbs free energy for a reactionis expressed as:

$$\Delta G^\circ = -RT \ln K_c \quad (16)$$

Where R is the gas constant (8.314 J/mol.K) and T is temperature (K).

Moreover, using the relationship,

$$\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ \quad (17)$$

$\ln K_c$  can be expressed in Eq. (18).

$$\ln K_c = \frac{\Delta S^\circ}{R} - \frac{\Delta H^\circ}{RT} \quad (18)$$

Thus, if the equilibrium constants for an adsorption reaction at different temperatures are known, the standard enthalpy and entropic changes for adsorption can also be estimated from the slope and intercept of a linear plot of  $\ln K_c$  versus  $1/T$  (Figures (12; 13)).

$\Delta H^\circ$  and  $\Delta S^\circ$  are obtained from the slope and intercept of van't Hoff plot of  $\ln K_c$  versus  $1/T$ .

**Table 8:-** Thermodynamic parameters for the adsorption of ammonia onto rice straw calculated at different temperatures.

Temperature(°C)	T	$K_c$	$\Delta H$ (KJ.mol <sup>-1</sup> )	$\Delta S$ (J.K <sup>-1</sup> .mol <sup>-1</sup> )	$-\Delta G$ (KJ.mol <sup>-1</sup> )
25	298	0.639			3.98812
40	673	2.125	5.08	13.4	9.01312
700	973	2.57			13.03312

**Table 9:-** Thermodynamic parameters for the adsorption of ammonia onto prepared activated carbon at different temperatures.

Temperature(°C)	T	$K_c$	$\Delta H$ (KJ.mol <sup>-1</sup> )	$\Delta S$ (J.K <sup>-1</sup> .mol <sup>-1</sup> )	$-\Delta G$ (KJ.mol <sup>-1</sup> )
25	298	1.857			22.21014
40	313	2.774	20.66	74.6	23.32914
50	323	3.951			24.07514
60	333	4.263			24.82114

In Tables (8; 9) A positive value of  $\Delta H^\circ$  indicates that the adsorption process is endothermic in nature and negative values of  $\Delta G^\circ$  show the spontaneous adsorption of ammonia on the rice straw. Positive  $\Delta S^\circ$  shows the increased randomness of the solid/solution interface during the adsorption of ammonia on the rice straw.

**Fig.12:-** Van't Hoff plot for the adsorption of ammonia onto rice straw calculated at different temperatures at initial  $\text{NH}_3$  concentration 20 ( $\text{mg.dm}^{-3}$ ).

**Fig.13:-**Van't Hoff plot for the adsorption of ammonia onto prepared activated carbon at different temperatures at initial NH<sub>3</sub> Concentration 20 mg/dm<sup>3</sup>.

### Conclusions:-

Adsorption of ammonia on rice straw from aqueous solutions has been studied. The following specific conclusions can be made from the experimental results:

1. Temperature is advantageous to the adsorption of ammonia on the rice with temperature. The adsorption isotherm follows the type S-shape.
2. The ammonia adsorption on rice straw increases with the temperature of calcination of rice straw in the aqueous solutions. The values of  $q_e$  increased with an increase in temperature of calcinations from room temperature to 700°C.
3. The ammonia adsorption on rice straw treated with sodium hydroxide increases with the increase in temperature from 25 to 60°C.
4. The Langmuir equilibrium isotherm model is found to provide a good fitting of the adsorption data especially in the ammonia initial concentration range of (200-350 (mg.dm<sup>-3</sup>)) with  $r^2$  of 0.99.
5. The maximum adsorption capacity obtained from the Langmuir equilibrium isotherm model is found to be 97.9(mg.g<sup>-1</sup>) for the adsorption of ammonia onto rice straw calcinated at 700°C in the ammonia initial concentration range of (200-350(mg.dm<sup>-3</sup>)). However it was 68.97(mg.g<sup>-1</sup>) in the ammonia initial concentration range of (10-200 (mg.dm<sup>-3</sup>)) at the same temperature.
6. For the activation of calcinated rice straw with NaOH at different temperatures the maximum adsorption capacity is found to be 25.25(mg.g<sup>-1</sup>) at 60 °C in the ammonia initial concentration range of (10-200(mg.dm<sup>-3</sup>)) with  $r^2$  of 0.95. However it was 96.15(mg.g<sup>-1</sup>) at 60°C in the ammonia initial concentration range of (200-350(mg.dm<sup>-3</sup>)) with  $r^2$  of 0.96 compared to 17.19 (mg.g<sup>-1</sup>) maximum adsorption capacity of original activated carbon reported by Xiang et al.,(2008).
7. From the Freundlich isotherm, the highest values of  $K_F$  and  $n$  were 70.08 and 7.46, respectively obtained for the adsorption of ammonia onto rice straw calcinated at 700°C proved its high favorability of adsorption in the ammonia initial concentration range (200-350(mg.dm<sup>3</sup>)).
8. The highest values of  $K_F$  and  $n$  were 5.13 and 0.87, respectively obtained for the adsorption of ammonia onto calcinated rice straw treated with NaOH at 60°C in the ammonia initial concentration range (10-200(mg.dm<sup>3</sup>)). However they were 41.33 and 7.41, respectively obtained for the adsorption of ammonia onto rice straw treated with NaOH at 60°C in the ammonia initial concentration range (200-350 (mg.dm<sup>3</sup>)) proved its high favorability of adsorption at this temperature.
9. Of all studied conditions the best one is the adsorption of ammonia onto rice straw calcinated at 700°C as it gives the highest value of Freundlich constants and the maximum adsorption capacity according to Langmuir constants.
10. Thermodynamic parameters such as  $\Delta G^\circ$ ,  $\Delta H^\circ$ , and  $\Delta S^\circ$  for adsorption reaction are estimated. A positive value of  $\Delta H^\circ$  indicates that the adsorption process is endothermic in nature and negative values of  $\Delta G^\circ$  show the

spontaneous adsorption of ammonia on the rice straw. Positive  $\Delta S^\circ$  shows the increased randomness of the solid/solution interface during the adsorption of ammonia. The same result was reported by Xianget al.<sup>29</sup> for the adsorption of ammonia onto activated carbon.

#### Abstract

Increase in speed is achieved by shrinking the dimensions of MOSFET's. But scaling of parameters leads to short channel effects which degrade the device performance. The predominating problems associated with SCE's are change in threshold voltage, drain-induced barrier lowering (DIBL) and sub threshold leakage current. SCE's causes degradation of sub threshold slope and increase in drain off-current.

Among the different possible solutions, TFETs are chosen to be the potential candidate because of its immunity against the SCEs, low leakage current and CMOS compatible technology.

In order to incorporate the advantages of Surrounding Gate (SG), Quad Material Gate (QMG), Gate Stack Architecture (GSA) and Tunnel Field Effect Transistor (TFET), novel device architecture has been proposed known as Quad Material Gate All around Stack Architecture - Tunnel Field Effect Transistor (QMGAASA- TFET).

Materials used:

Oxide1: TiO <sub>2</sub> (Titanium dioxide)	Oxide2: HfO <sub>2</sub> (Hafnium dioxide)
Oxide3: SiO <sub>2</sub> (Silicon dioxide)	Oxide4: ZrO <sub>2</sub> (Zirconium dioxide)
Metal1: Gold	Metal2: Silver
Metal3: Aluminum	Metal4: Copper

#### Introduction:-

The **Tunnel Field-Effect** transistor (TFET) is a new type of transistor. Even though its structure is very similar to a Metal-Oxide-Semiconductor Field-Effect Transistor (MOSFET), the fundamental switching mechanism differs, making this device a promising candidate for low energy electronics. TFETs switch by modulating quantum tunneling through a barrier instead of modulating thermionic emission over a barrier as in traditional MOSFETs.

The field-effect transistor was first patented by Julius Edgar Lilienfeld in 1926 and by Oskar Heil in 1934. The **field-effect transistor (FET)** is a transistor that uses an electric field to control the shape and hence the electrical conductivity of a channel of one type of charge carrier in a semiconductor material. FETs are also known as **unipolar transistors** and as they involve single-carrier-type operation. The FET has high input impedance.

**Fig 1: - Symbols for n-channel and p-channel FET**

This fourth terminal serves to bias the transistor into operation. The device consists of an active channel through which charge carriers, electrons or holes, flow from the source to the drain. The conductivity of the channel is a function of the potential applied across the gate and source terminals.

#### Types:-

The channel of a FET is doped to produce either an n-type semiconductor or a p-type semiconductor. The drain and source may be doped of opposite type to the channel, in the case of enhancement mode FETs, or doped of similar type to the channel as in depletion mode FETs. Field-effect transistors are also distinguished by the method of insulation between channel and gate. Types of FETs include:

- The **JFET** (junction field-effect transistor) uses a reverse biased p–n junction to separate the gate from the body.
- The **MOSFET** (metal–oxide–semiconductor field-effect transistor) utilizes an insulator (typically  $\text{SiO}_2$ ) between the gate and the body.

#### Operation of fet:-

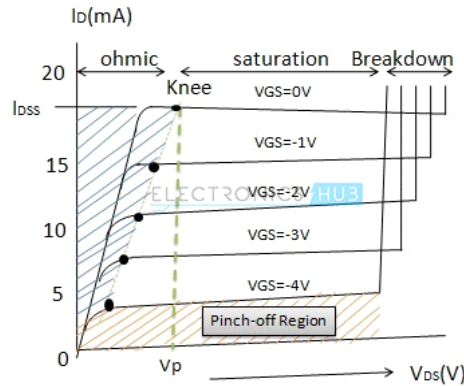

With no external Gate voltage ( $V_G = 0$ ), and a small voltage ( $V_{DS}$ ) applied between the Drain and the Source, maximum saturation current ( $I_{DSS}$ ) will flow through the channel from the Drain to the Source restricted only by the small depletion region around the junctions.

If a small negative voltage ( $-V_{GS}$ ) is now applied to the Gate the size of the depletion region begins to increase reducing the overall effective area of the channel and thus reducing the current flowing through it, a sort of “squeezing” effect takes place. So by applying a reverse bias voltage increases the width of the depletion region which in turn reduces the conduction of the channel.

Since the PN-junction is reverse biased, little current will flow into the gate connection. As the Gate voltage ( $-V_{GS}$ ) is made more negative, the width of the channel decreases until no more current flows between the Drain and the Source and the FET is said to be “pinched-off” (similar to the cut-off region for a BJT).

It is essential that the Gate voltage is never positive since if it is all the channel current will flow to the Gate and not to the Source, the result is damage to the JFET.

The characteristics curves example shown above shows the four different regions of operation for a JFET and these are given as:

**Fig2:- V-I characteristics of FET**

- **Ohmic Region** – When  $V_{GS} = 0$  the depletion layer of the channel is very small and the JFET acts like a voltage controlled resistor.
- **Cut-off Region** – This is also known as the pinch-off region where the Gate voltage,  $V_{GS}$  is sufficient to cause the JFET to act as an open circuit as the channel resistance is at maximum.
- **Saturation or Active Region** – The JFET becomes a good conductor and is controlled by the Gate-Source voltage, ( $V_{GS}$ ) while the Drain-Source voltage, ( $V_{DS}$ ) has little or no effect.
- **Breakdown Region** – The voltage between the Drain and the Source, ( $V_{DS}$ ) is high enough to cause the JFET's resistive channel to break down and pass uncontrolled maximum current.

**Structure of tfet:**

The basic TFET structure is similar to a MOSFET except that the source and drain terminals of a TFET are doped of opposite type (see figure).

**Fig3: TFET Structure**

**Symbol of TFET:**

**Fig4: Symbol of N-TFET and P-TFET**

**Device operation:-**

The device is operated by applying gate bias so that electron accumulation occurs in the intrinsic region. At sufficient gate bias, band-to-band tunneling (BTBT) occurs when the Conduction band of the intrinsic region aligns with the valence band of the P region. Electrons from the valence band of the p-type region tunnel into the conduction band of the intrinsic region and current can flow across the device. As the gate bias is reduced, the bands become misaligned and current can no longer flow.

**5.1 BAND-TO BAND TUNNELING:-**

Tunneling is a quantum mechanical process where electrons move through potential energy barriers. Band-to-band tunneling is the effect when electrons travel from the valence band to the conduction band (or vice versa) through the forbidden energy band gap.

**Fig5: Energy band diagram showing band to band tunneling**

**Types of tfet's:-**

Below device structures of Silicon based double gate N-channel TFET and P-channel TFET with a body thickness of 7 nm. This are called P+- I - N+ structure. The dielectric medium for the gate can be SiO<sub>2</sub> (relative permittivity, =  $\epsilon_r = 3.9$ ) or HfO<sub>2</sub> (Hafnium Oxide) ( $\epsilon_r = 21$ ). The HfO<sub>2</sub> dielectric used in this case has a thickness of 1 nm and the channel length of the device is 30 nm for both the structures. The source and drain are heavily doped regions with channel being intrinsic. The N-type TFET consist of a source region which is P+ and has a boron doping

concentration of  $1 \times 10^{20} \text{cm}^{-3}$ . The N+ drain region has a phosphorus doping concentration of  $1 \times 10^{20} \text{cm}^{-3}$ . Similarly, the p-type TFET consists of N+ source region doped with phosphorus doping concentration of  $1 \times 10^{20} \text{cm}^{-3}$ . Its P+ drain region has a boron doping concentration of  $1 \times 10^{20} \text{cm}^{-3}$ .

Fig6: Cross sectional view of N-type TFET

Fig7: Cross sectional view of P-type TFET

**CONSTRUCTION OF QMGAASA TUNNEL FET:-**

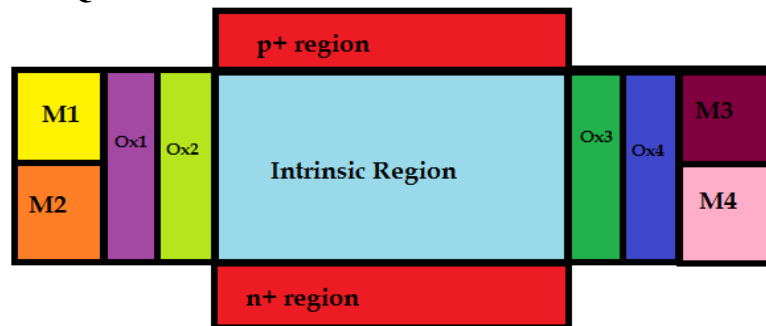

Fig 8: QMGAASA TUNNEL FET

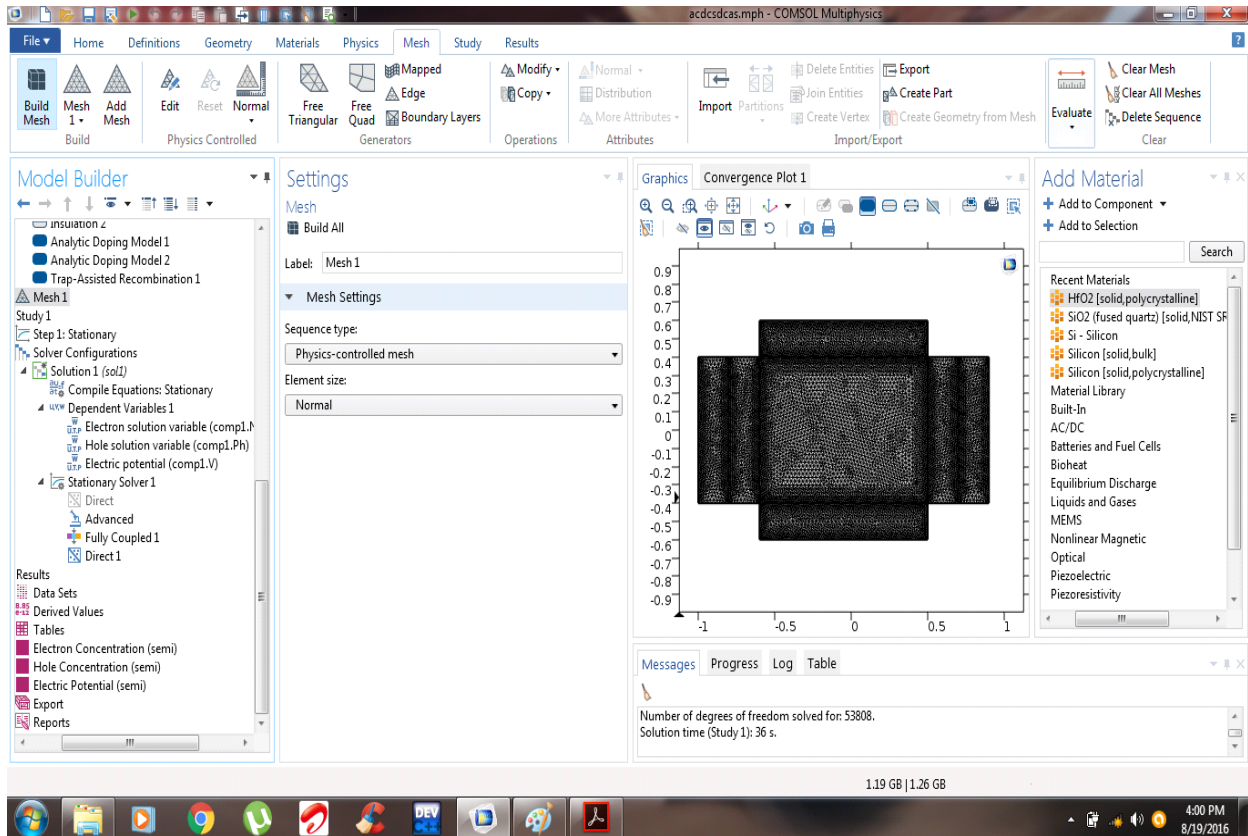

TFETs are chosen to be the potential candidate because of its immunity against the SCEs, low leakage current and CMOS compatible technology. Various device structures such as Double Gate, Pi Gate, Triple Gate, Omega Gate, Surrounding Gate, Gate Stack structures have been proposed to overcome the scaling limitations and to increase the device performance. Among these structures Surrounding Gate offers higher packing density, steep sub threshold characteristics and higher current drive.

Quad Material Gate Architecture has also been investigated as one of the possible solution for reducing short channel effects. In this design four different metal gate electrodes are used having different work functions. Due to this work function difference carrier transport efficiency is increased thereby suppressing the short channel effects. Steady downscaling of device dimensions leads to reduction in voltage level as well as the gate oxide thickness. This causes an increase in static power consumption, which can hamper the circuit operation. In order to overcome the above limitations intensive stress has been made for the use of four gate oxides among which two have high K dielectric value and the other two oxides have comparatively less dielectric value namely SiO<sub>2</sub>, HfO<sub>2</sub>, TiO<sub>2</sub>, ZrO<sub>2</sub> to prevent direct tunneling leakage current. As we are using two high K dielectrics and two normal dielectric oxides the device is cost efficient. This new structure is called as Gate Stack Architecture.

In order to incorporate the advantages of Surrounding Gate (SG), Quad Material Gate (QMG), Gate Stack Architecture (GSA) and Tunnel Field Effect Transistor (TFET), novel device architecture has been proposed known as Quad Material Gate All around Stack Architecture - Tunnel Field Effect Transistor (QMGAASA- TFET). In this work, a 2-dimensional analytical model is presented to examine the impact of the structure on various device characteristics.

## RESULTS AND DISCUSSION:-

## Final result

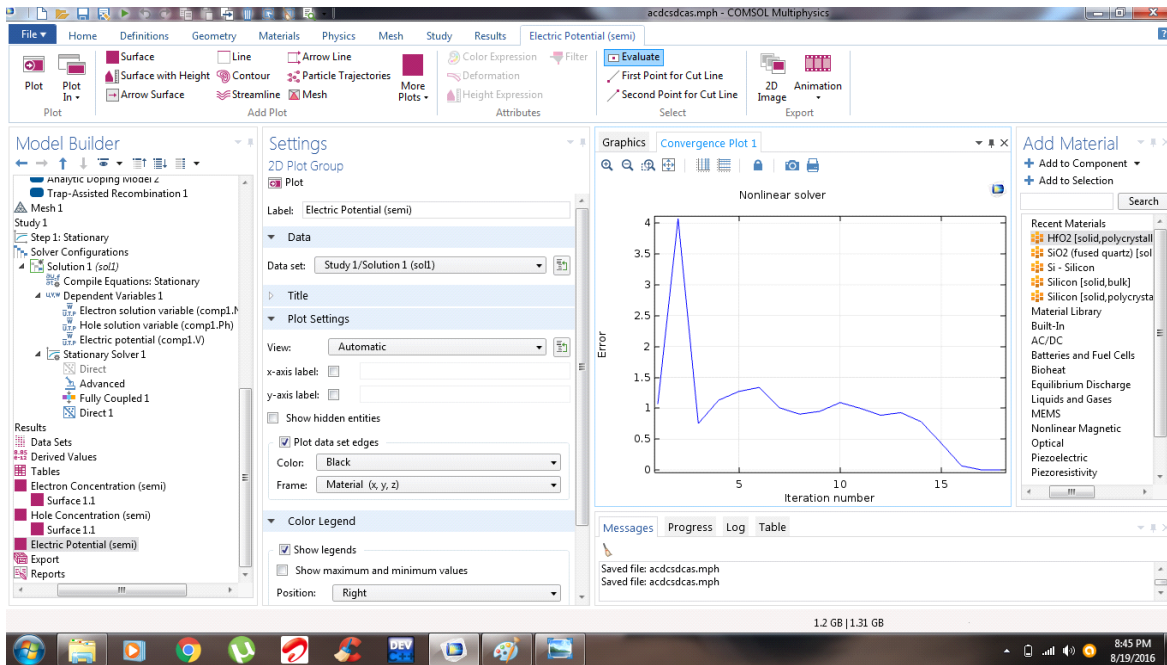

Fig 12. Plot showing electric potential of QMGAASA of TFET

## CONCLUSION:-

TFETs are used in digital circuit implementation due to their low sub-threshold loss and low voltage operation. It was observed that TFETs have steep sub-threshold swing ( $< 60$  mV/decade) compared to MOSFETs which is the primary reason behind low sub-threshold power loss. The reason behind the steeper sub-threshold slope is band-to-band tunneling transmission. However, TFETs have a higher gate to drain capacitance compared to a MOSFET. For a 30 nm N type TFET it was observed that the  $C_{gde}$  equals 3.2 fF compared to a MOSFET which has 0.15 fF in saturation region. This results in higher overshoots during dynamic operation of gates.

A TFET based 6T-SRAM was implemented and verified using Cadence. The read and write operation was observed to be satisfactory.

Thus it has been demonstrated that incorporation of Quad Material Gate All Around electrode design along with Gate Stack Architecture leads to an improvement in short channel immunity and hot carrier reliability thereby ensuring better carrier transport efficiency which results in better performance.

### Abstract

In this paper the authors have shown the other aspect of photovoltaic cells. A burning issue in the energy sector is to find out the appropriate alternative resource of power generation, due to the rising rate of consumption and price of fossil fuels and the environmental problems caused by the conventional power generation methods, among all the available alternatives non-conventional resources, photovoltaic cell can be considered the most essential and sustainable source for power generation. But this paper discusses about the comparative picture between the utilization of photovoltaic cells and the production of photovoltaic cells related with the environmental aspects.

Copy Right, IJAR, 2017.. All rights reserved.

### Introduction:-

It is widely recognized that photovoltaic solar energy conversion has the potential to become a major energy source in the next century. Although photovoltaic solar energy (PV) is clearly a renewable energy source, the question whether it is also a "sustainable technology" needs more careful consideration. The potential environmental risks and the energy requirements of (the components of) a PV system should be investigated over its entire life-cycle in order to answer this question. If such analyses are made before large-scale implementation of the technology has started, potential bottlenecks can be identified so that R&D priorities can be set accordingly to reduce or eliminate the bottlenecks beforehand. As a result of such an environmental assessment it might be decided for instance to start investigations on alternatives with regard to cell materials, production technologies or module encapsulation techniques. To conduct a series of studies on potential environmental and safety risks for a number of solar cell technologies. The objective of the studies is to identify potential bottlenecks for each technology and to formulate ensuing recommendations with regard to the photovoltaic policy. In the study the potential environmental effects of PV modules are investigated for their entire life-cycle that is from raw material mining through module production and utilization to module decommissioning and, possibly, recycling. It was agreed that four different types of solar cells would be investigated in these studies, namely:

- 1) **Multicrystalline silicon** cells (mc-Si; also called semi-or polycrystalline silicon);
- 2) **Amorphous silicon** cells (a-Si);
- 3) **Cadmium telluride** cells (CdTe);
- 4) **Copper indium selenide** cells (CuInSe<sub>2</sub>; also shortened to CIS);

The studies concerning the above-mentioned cell technologies are discussed in three separate headings. In this report we will present a summary of the method of approach and the obtained results for all four cell types. It should be noted, however, that the methodology and the scope of the analyses has developed in the course of the discussion..

In our own studies which form the basis for this summary report we have tried to integrate results in the framework of the Life Cycle Assessment (LCA) methodology and to extend the scope towards future technologies which seem probable for large-scale module production. In order to understand the sensitivity of the results with respect to possible future developments, we will draw up three different sets of assumptions concerning the future status of the technology for each cell type. These sets of assumptions will be called A,B and C case technology. In this paper the B case represents the most probable technological status at the time of large-scale deployment. The A case reflects the status of present-day commercial production technology. Finally, the C case represents an more optimistic view on future technology. As already indicated, this discussion will be limited to a life-cycle assessment of solar cell modules. In this paper we will first introduce briefly the method of environmental Life Cycle Assessment and further define the goal and scope of our assessment study. Subsequently, we will discuss the most important assumptions concerning module and cell characteristics, production methods, etc. Next, some results are presented, among which the expected emissions to the environment and the energy requirements. Finally we will draw some conclusions concerning potential environmental bottlenecks of PV modules.

#### **Life Cycle Assessment:-**

##### **LCA goal:**

In this study we want to investigate the environmental bottle-necks which might arise when PV modules are deployed on a large scale for energy supply. A consequence of this objective is that production levels of the order of GWp's per year should be considered rather the current MWp production level. As a reference one can keep in mind that a yearly solar cell production of more than 10 GWp/yr will be required to sustain a PV capacity that can contribute 5% to current electricity supply.

##### **LCA Method:-**

In the Analysis we made use of the method of environmental Life Cycle Assessment (LCA), a methodological framework for the analysis of environmental aspects of product life-cycles, which has evolved over the past few years. In such a LCA the material and energy flows for the entire life cycle of a certain product are surveyed and analyzed with special attention to possible environmental hazards. For this purpose the product life cycle is divided into a number of processes, each of which is described by the typical product input and output flow, secondary material inputs, energy input, process yield, water and air emissions, solid waste production and the output of reusable (secondary) materials. By chaining a number of relevant processes into a product life cycle and accounting all material flows through these processes it becomes possible to assess the total impact on the environment and on energy and raw material resources for the entire product life cycle. One consequence of our study objective is that we will have to make projections about the technological status of future production processes. Because this necessarily involves major uncertainties we will distinguish three cases: the A case reflecting the status of present-day commercial production technology, the B case representing the most probable technological status at the time of large-scale deployment, and finally the C case representing an optimistic view on technology development. For the B case technology we assume implementation within the next 10 years, while the time frame for the (possible) realization of C case technology is 15 years. Regarding our assessment method it should further be noted that in a full Life Cycle Assessment a certain procedure is followed involving a number of steps, such as: definition of LCA goal and scope, drawing up of the inventory table of environmental interventions and classification and evaluation of these interventions. For the purpose of this study where we consider future production technologies not all of the prescribed LCA steps are relevant or practicable, because of lack of data etc. For these reasons our studies cannot claim to be "full" LCA studies, in which the majority of the material flows is inventoried and the environmental impacts are evaluated. For example in our first study on CdTe and CIS modules, we restricted the material flow analysis to the elements Cd, Te, Se, and In and did not consider any auxiliary material usage. The main reason for this was the lack of detailed information on (future) production processes for these module types. Also at that time the methodological framework for Life Cycle Assessments had not yet been fully developed so that the terminology and reporting format in our study deviates from the standards which later evolved for LCA studies. In the amorphous silicon study and the multicrystalline silicon study we had access to more detailed data on production technology which allowed us to take into account most material flows. Also we adhered more closely to the "standards" regarding LCA terminology and study set-up. Still, we decided not to perform an analysis of environmental impacts after our investigation of material flows, because: 1) there are insufficient data to allow a reliable impact evaluation for all emitted substances and 2) emission estimates for the future technology cases (B and C case) are often too uncertain to make reliable impact evaluations for these cases.

### LCA scope and the functional unit:-

The scope of our material flow analysis is restricted to *direct* material inputs only, which means that the production of for example glass or aluminium is outside our *system boundary* and is not considered in our analysis. The scope for the analysis of energy requirements, however, is broader and includes also the energy use for the production of glass and aluminium and for the production of capital equipment. In the energy analysis auxiliary materials which are used in relatively small quantities (e.g. solvents, etchants, hydrogen, argon) were not taken into account, mainly because energy data are unavailable for most of these products. Figures 2.1 and 2.2 illustrate the definition of the system boundaries for the materials and energy analyses for the example of mc-Si technology. The scope definition given above implies that the non-energy related emissions from the production of aluminium and glass are not accounted for in this study. Such aspects, however, should be investigated in relation to module mounting technology. The functional unit for our Life-Cycle Assessment, that is the unit of end-product to be considered, we have defined as 1 square meter of *cell* area, manufactured in a commercial scale production process. If needed, corresponding values per m module area can be derived by applying the cell/module area ratio. The photovoltaic efficiency will refer to the total area stabilized energy conversion efficiency of the *cell* as it is encapsulated in the module (encapsulated cell efficiency).

System boundary for the energy analysis in the case of mc-Si technology

### Figure 2 System Boundary Flow for Energy Analysis

#### 3 Major assumptions

#### Multi-crystalline silicon modules:-

##### Cell, module and process characteristics:-

Multicrystalline silicon (mc-Si) technology is one of the major technologies for production of solar cell modules and this type of modules presently has a share of some 25% of the PV module market. Present-day mc-Si modules are generally composed of 36-40 interconnected solar cells, where each solar cell consists of a silicon wafer with a surface area of about 10x10 cm and a thickness of 0,2-0,3 mm. Multicrystalline silicon solar cell technology is closely connected to the older *mono* crystalline solar cell technology (which is still the most important technology with a 60% market share). The main difference between multi-and monocrystalline silicon solar cell manufacturing is found in the crystallization process, while less important differences may be encountered in the solar cell processing itself (e.g. passivation). To a large extent, however, the material flows and emissions found in multicrystalline silicon technology will also be found in mono crystalline silicon technology. Therefore the results of our study on multicrystalline silicon will probably also give an fair indication of the environmental aspects of monocrystalline silicon technology. In our study we assume the encapsulated cell efficiency for mc-Si to improve from A to B and C case from 13% to 16% and 18% respectively, a development which is to be achieved by introducing new technologies and solar cell features. In tables 3.1 and 3.2 an over view is given of the most important differences between the cases. The life cycle of a multicrystalline silicon PV module starts with the mining and refining of silica (quartz). Silica is reduced with carbon and the reduction step is either followed or preceded by a purification step. For the A and B case we depart from the process developed by Union Carbide Corp.

in which SiCl<sub>4</sub> is hydrogenated and subsequently distilled to semiconductor grade (sg) silane. This silane can then be converted to solid polycrystalline silicon, or it can be used as source gas for amorphous silicon solar cell production. Subsequently the high purity polycrystalline silicon is melted and cast into large blocks of multi-(or semi-)crystalline silicon. The blocks are portioned into ingots, which are subsequently sliced into wafers. The wafers are processed into solar cells by etching, texturing, formation of the emitter layer, application of back surface layer and contacts, passivation and deposition of the antireflective coating. Finally the solar cells are tested, interconnected and subsequently encapsulated and framed into modules. The application of a back surface layer and the passivation step are omitted in the C case. The general trend in the expected future developments is towards improved energy and material efficiency. This can be seen in higher process yields for high purity silicon production, casting, portioning and material production, in the usage of thinner wafers, in lowering of the metal coverage factor in contact formation, in the reduction of contouring and wafering losses and in the reduction of process energy requirements. The most influential differences regarding energy and material requirements are the usage of thinner and larger wafers and reducing portioning and wafering losses in B and C case, and the development of a production process for solar grade silicon in the C case.

Solar cell process yield <sup>2</sup>	95%	95%	95%

- 1) process developed by Union Carbide Corporation to produce solar grade silane/silicon for cell processing only, not for Si production and wafering.

#### Module Use:-

Negligible material inputs and/or emissions are expected during the utilization phase of the module (only from occasional washing). Significant emissions due to fires are not expected from mc-Si modules. In this phase the

module will produce electrical energy, the amount of which depends on module efficiency and location. Module lifetimes of resp. 15, 25 and 30 years are assumed for the three cases.

**Module decommissioning:-**

At the end of the module lifetime the PV system will be decommissioned and the resulting waste will have to be disposed in a responsible way. Options for recycling of the silicon wafer have been investigated but are at this moment not commercially available. Because there is hardly any data available on the technology of mc-Si module recycling I did not consider this in our study.

**Amorphous silicon modules:-**

**Cell, module and process characteristics:-**

Amorphous silicon (a-Si) solar cell technology is very different from crystalline silicon cell technology, in that the amorphous silicon cell consist of a very thin layer of amorphous (i.e. non-crystalline) material. The low requirement of cell material and the possibility of large-area cell manufacturing processes, makes a-Si technology a potential candidate for production of low-cost modules. Furthermore with a-Si there is the possibility of cell stacking, an approach in which two or three different a-Si solar cells are stacked into a tandem or triple structure. And which may ultimately lead to a higher conversion efficiency. Mainly because of their relatively low efficiency a-Si modules have only a modest market share of about 14% at present. Our A case and B case definitions for the amorphous silicon technology are both Based on a tandem cell structure, be it with differing i-layer thicknesses (see table 3.3). For the C case I assume a triple-junction structure Based on a-SiC/ a-Si/ a-SiGe. The a-Si layers are deposited on a glass substrate by way of the Plasma Enhanced Chemical Vapour Deposition with a material utilization rate which increases from 15 to 70% (table 3.4). In all three cases the front-side contact layer consists of tin oxide doped with fluorine and deposited by CVD, while the back-contact consists of a sputtered or evaporated aluminium layer. The silane source gas for a-Si deposition is produced by the same process from Union Carbide Corp. which was assumed for the mc-Si technology. Module encapsulation is changed from two glass sheets for the A and B case (2 x 3 mm resp. 2 x 2 mm), to one 2 mm glass sheet with a sprayed-on back-side foil in the C case. Module use Considerations for the module utilization phase are similar as for mc-Si.

**Module decommissioning**

After decommissioning the a-Si module can be disposed as solid waste without problems as all module components (including metals) are inert or relatively harmless. Recycling of the glass or reuse of the glass sheet plus SnO<sub>2</sub>-layer is possible in principle. However, to maintain comparability with other considered module types I have not considered the effects of these recycling options.

**Major process characteristics for a-Si module Table 3.3**

	A case	B case	C case

**CdTe and CIS modules:-****Cell, module and process characteristics**

Cadmium telluride (CdTe) and copper indium selenide ( $\text{CuInSe}_2$ ; also: CIS) solar cells are two other representatives of thin-film solar cell technology, which is characterized by the use very thin layers of cell material ( $<50 \mu\text{m}$ ). For CdTe and CIS modules also good prospects exist for low-cost production processes and for efficiency enhancement by way of cell stacking. Production technology for CdTe and CIS solar cells is much less established than for mc-Si and a-Si. CdTe modules are produced only on a small scale while CIS cells have up to now not been produced on commercial basis. Specific data about production technology are therefore scarce. For this reason I have limited our investigation of CdTe and CIS technology to assessment of the material flows for Cd, Te, In, and Se and to an analysis of the energy requirements. Table 3.4, 3.5 and 3.7 summarize the main cell and module characteristics that we have assumed for CdTe respectively CIS modules. Note that, in deviation of the assumption for a-Si modules, and in deviation of our original study, I have maintained the back glass cover for the C case CdTe/CIS module. Reason for this is that lower emissions of heavy metals, especially in fires and in waste dump sites are expected from modules with a back glass cover.

**Table 3.7:- Module characteristics for CdTe and CIS technology.**

		A case	B case	C case
Module structure:				
-front glass (mm)		3	2	2
-EVA (mm)		0.5	0.5	0.5
-back glass (mm)		3	2	$2^1$

ratio				
Module		9.4	14.1	16.9
efficiency(%)				
Module life time (yr)		$15^3$	$25^3$	30

Regarding the production technology I assume for deposition of the CdS and CdTe layers in the CdTe cell that the electrode position process will be employed, with material utilization factors of 90 to 99% (table 3.8). For the CIS cell first the CdS layer is sputtered, while the CIS layer is prepared by physical vapor deposition of copper and indium followed by selenization (reaction with  $\text{H}_2\text{Se}$  gas).

**Table 3.8:- Major production process characteristics for CdTe and CIS technology.**

		A case	B case	C case
CdTe cell	material	0.90	0.95	0.99
	utilization			
	(Cd,Te)			
CIS cell	material	0.60	0.70	0.80
	utilization			
	(Cd,In,Se)			
Process yield	1	0.60	0.70	0.80
Cd emission to air ( $\text{mg}/\text{kg}$ ) <sup>2</sup>		500	100	50
Se,Te, In emission to air ( $\text{mg}/\text{kg}$ ) <sup>2</sup>		5000	1000	500

**Note: 1) cell/module production only 2) emission in mg per kg:-**

The environmental impacts from the mining of Cd, In, Se and Te, materials which are all produced as a by-product of zinc or copper mining, have been calculated as a fraction the total impact of the mining process. Based on the economic value of by-product and main product these fractions were set at respectively 2.5%, 0.2%, 0.2% and 0.36%. The B case emission rates for Cd were based on emission data of a cadmium production facility in The India. Because emission control for Se, Te and In will probably be less strict I have assumed emission rates for these substances to be a factor 10 higher.

**Module use**

During use of the modules there is a risk that they will be involved in a fire. This is especially the case for modules installed on the roof of a building. Emission of a certain fraction of cell material in CdTe and CIS cells may then occur. Although acute health risks from these emissions are improbable, the overall environmental impacts still need consideration. Therefore an estimate of the fire risks and A to C case assumptions for the emitted fraction have been made (table 3.9). Different other routes for human exposure to Cd, Te or Se during the use of CdTe and CIS modules have also been investigated. but in all cases the risks are found to be small.

**Table 3.9:** Assumptions on emissions from module use and decommissioning for CdTe and CIS technology.

				A case	B case	C case
fraction of cell material released						
during fire1:						
-Cd,Te				0.10	0.75	0.05
-Se				1.00	0.75	0.05
fire risk (yr)				$10^{-4}$	$10^{-4}$	$10^{-4}$
fraction	of	decomm	modules	0.10	0.02	0
entering waste incineration						
fraction of heavy metals emitted				0.0015	0.0015	0.0015
to air from waste incineration <sup>3</sup>						
fraction	of	decomm	modules	0	0.03	0.01
going to household dump site <sup>4</sup>						
fraction of heavy metals emitted				0.001	0.001	0.001
to water from waste dump						

**Module decommissioning**

In view of the heavy metal content of CdTe and CIS modules separate collection of decommissioned modules seems advisable. However, it is probable that a small fraction of the modules will still end up in household waste which may either be incinerated or disposed of at a landfill site. In each case a certain emission of the heavy metals to the environment will result. Relevant assumptions to estimate these emissions are given in table 3.7. Although recycling of CdTe and CIS modules is subject of investigations, there is not sufficient data to consider the effects of a possible recycling process at this time.

**Energy analysis:-****Introduction:-**

In this chapter, we will analyze the Gross Energy Requirement (GER) of the considered solar cell modules. A GER value gives the total amount of primary energy incorporated in a product, as a result of all the production processes necessary to manufacture it, including the heating value of the product (if relevant). The energy required in a specific process step is called the Process Energy Requirement (PER). This PER can be separated into a direct and an indirect part where the first value gives the electrical and fuel energy which is consumed in the production process itself, while the indirect PER represents the "overhead" amount of energy consumption due to for example lighting, heating and ventilation. So cumulation of all PER values for the subsequent steps in a production process and summation with the product's heating value results in the GER value of the product. and our analysis of module GER values I will distinguish the following contributions: the Gross Energy Requirement of the input materials (GER input), the Process Energy Requirements (PER) and the Gross Energy Requirement of the capital goods (GER capital). Energy required for the production of the input materials like glass or EVA is also taken into account. In the B and C cases a 10% resp 20% autonomous reduction on the Process Energy Requirements is assumed for commodities like glass, EVA and aluminium. Although energy requirements will generally be a mix of thermal (fuel) and an electrical energy all results will be presented here in thermal energy units. For the conversion of

thermal energy units (kWh<sub>th</sub>) to electrical energy units (kWh<sub>e</sub>) a factor of resp. 0.39, 0.42 and 0.45 was used, reflecting the expected improvements in average conversion efficiency of the electricity supply. The Energy Pay-Back Time (EPBT) for the different cases will also be presented. This EPBT will be calculated for a PV system under Indian irradiation conditions (1000 kWh/m<sup>2</sup>/yr) and "global average" irradiation (1700 kWh/m<sup>2</sup>/yr). Furthermore I assumed a yearly Performance Ratio (a measure of system performance) of respectively 0.75, 0.80 and 0.85 for the A, B and C case. Appendix A gives an overview of energy production data per m<sup>2</sup> module area in the different cases. Note that energy pay-back times are given for frameless modules only because Balance-of-system components like support structures etc. are not evaluated in our studies and because framing requirements are dependent on the method of installation of the modules.

### Material flow analysis:-

#### Introduction:-

For all four cell types I have analyzed material flows and estimated emissions due to module production. In these analyses I have considered only direct material inputs, so the production of commodities, like aluminum and glass, and capital goods was not taken into account. A comprehensive overview of all material requirements and emissions is impossible in the context of this summary report, therefore I will highlight a few notable aspects per cell type, beginning with the issue of resource depletion. **5.2 Resource depletion** In order to evaluate resource depletion impacts I will estimate the material requirements if 5% of the current world electricity production is supplied by means of one specific type of solar cell modules (B case variant). This would mean that 13 GWp of solar cell modules have to be produced annually. The corresponding material requirements will be compared with current production levels and estimated reserves. As no recycling technologies are currently available for solar cell modules, the effect of recycling of resource materials will not be considered here.

#### mc-Si modules:-

Quartz sand, the primary feedstock material for production mc-Si cells, is very abundant so on this point resource availability will probably never be an issue. One point of concern, however, is the consumption of silver for the contacts. It was estimated that about 50 g of silver is required per m<sup>2</sup> cell area, so that supply of 5% of electricity consumption would require 4 kton of silver per year or 30% of the current silver production (table 5.1). So reduction of silver use in the contacts is of importance. Probably a reduction of silver use will also be pursued for reasons of cost reduction. In fact, the silver requirement in our C case mc-Si modules is only 7% of the B case requirement.

#### CdTe and CIS modules:-

For production of B case CdTe modules about 60 ton/ GWp of both Cd and Te is required. In view of current production levels and estimated reserves (table 5.2) the supply of cadmium will not be a bottleneck. The supply of tellurium, however, may become a problem if CdTe modules are to contribute significantly to the world electricity supply. Te is mainly produced as byproduct of copper, and as such the production capacity may be limited to 400 ton maximum. For B case CIS module production about 70 ton of indium and 125 ton of selenium is needed. Current indium production is very small (140 ton/y) and the maximum production capacity as a by-product of zinc winning may be limited to 1000 tons. Also the reserves may be depleted within a few years if CIS modules are to supply 5% of the world electricity production. Selenium supply, on the other hand, will be much less problematic. The resource requirements for the A and C case CdTe and CIS modules can be found by multiplication with a factor 5 resp. 0.35. In view of these resource considerations recycling of the metals in CdTe and CIS modules will become a point of major importance if these module types are to be implemented on a large scale.

**Table 5 :-** Resource material requirements for PV module production.

Cell type	resource material	Requirement for 5% electr. Prod. by PV (kton/y)
mc-Si	Si	120
mc-Si	Ag	4
a-Si	Si	0.3
CdTe	Cd	0.8
CdTe	Te	0.8
CIS	In	0.9

**Emissions to the environment:-****General remarks:-**

For all module types the material balance is dominated by the bulk type materials used for module encapsulation (glass, EVA). Also waste emissions consisting of rejected order commissioned modules form an important contribution (in mass terms). For the thin film type of modules (a-Si, CdTe, CIS) the emission of tin to the water resulting from the TCO deposition process, is a point of attention. With respect to different cases one may remark that, going from A to C case, the general trend for increased material efficiency will mostly lead to decreasing emissions per unit cell area. Furthermore emissions on energy-basis, which are more relevant in comparisons with other energy technologies, will of course benefit from the increasing cell performance.

**mc-Si modules:-**

Environmentally relevant substances which may be released in multicrystalline silicon PV module production are fluorine, chlorine, nitrate, isopropanol, SO<sub>2</sub>, CO<sub>2</sub>, respirable silica particles and solvents. Emissions of (non-energy-related) CO<sub>2</sub> and SO<sub>2</sub> from mc-Si module production are mainly caused by the carbothermic silica reduction process. Standard measures, like the use of low-sulphur fuel and desulphurization of flue gases can may significantly reduce the SO<sub>2</sub> emissions. Most other process emissions seem relatively small and will have little or negligible environmental impact. Possible exceptions are the water-borne Cl- and F-emissions resulting from neutralizing etching and texturing solutions and flue gases. Compared on an energy basis the Cl- and F-emissions for the B case module are estimated to be resp. 89,000 and 1,500 kg/TWh, which is of the order of 20-25% of the equivalent emissions of a coal-fired electricity plant. Some attention may be necessary for emission of solvents or other volatile organic compounds from various process steps, among others from metal paste firing and -possibly - module lamination. These emissions will depend highly on processing conditions and control measures. Also care should be taken to prevent accidental emissions of CF<sub>4</sub>, because this gas has a very high Global Warming Potential. The possibilities for reuse of production waste, e.g. silicon wafers and silicon carbide, should be investigated. The differences between respective cases for mc-Si modules are not remarkable, although emissions will decrease somewhat due to increased material efficiency.

**a-Si modules:-**

Apart from the remarks made above with respect to (thin-film) modules in general there are little or no significant emissions to be expected from a-Si module production, use and decommissioning. The emissions from the silane production process contribute only very little to the total emissions and can be neglected. Regarding the comparative emissions of the three a-Si cases I can conclude that the trends toward improved material utilization and low Ir glass content of the module which may be expected from current R&D efforts, will also contribute to a further reduction of the environmental impacts of a-Si module production. In total, I can say that for the assumed system boundaries and assuming proper emission control measures large-scale production of a-Si modules will not result in any serious environmental emission.

**CdTe and CIS modules:-**

As stated above I have only considered the material flows of the heavy metals contained in CdTe and CIS modules. A first point to note in this respect is that CdTe or CIS modules contain only a relatively small amount of heavy metals, for example B case CdTe modules contain ca. 6 g of cadmium per m<sup>2</sup> module area. By comparison, a single NiCad penlight battery contains 2.5 g of cadmium. If I consider both products as an energy supplier (although NiCads are obviously not a real energy source) then I find that the amount of cadmium contained in the B case CdTe module is about 0.001 g per kWh supplied (0.006 g/kWh for the A case), while the NiCad battery requires about 5 g Cd per kWh supplied. For our assessment of environmental emissions I will focus on the estimated emissions of cadmium resp. selenium to the atmosphere which are summarized in tables 5.2 and 5.3. I can see that in the B case the emissions mainly occur in the resource mining (and refining) and in the module utilization phase. From A to C case the emissions differ by roughly a factor of 10, reflecting the uncertainty regarding emission rates for future technology cases. Emissions of selenium are considerably higher than for cadmium because of less stringent emission control measures. It should be noted that there is some uncertainty in the assumptions underlying the emission estimates for the module utilization and decommissioning phases. Also it is important to note that the risks of cadmium (or selenium) releases to the environment from the utilization and decommissioning phases are very much dependant on the type of encapsulation that is chosen for the module. Experimental tests suggest that releases from modules with a double glass encapsulation are considerably lower than for modules without a glass cover at the backside. Unfortunately CdTe modules which are presently offered on the market often do not have a back glass cover

**Table 5.2:-** Atmospheric cadmium emission from the life cycle of CdTe modules and from coal-fired electricity generation.

energy				

In order to put these emission estimates into perspective I can compare them with the emissions of cadmium and selenium from coal-fired electricity generation which has been estimated at 0.6-10 g/GWh resp. 70 g/GWh for a modern coal plant in the India. For a plant Based on coal gasification technology, however, emissions are lower, namely 0.06-1g/GWh for Cd and 60 g/GWh for Se. I can therefore conclude that the atmospheric Cd emissions for the B case CdTe module of 0.5 g/GWh (0.9 g/GWh in the India) are lower than those of a modern coal power plant, but may be higher than for a coal gasification power plant. With regard to CIS modules the B case Se emissions to the air are significantly lower than Se emissions both from conventional coal plants and from coal gasification plants. An important point to note in this respect is that coal-fired plants have many more emissions(a.o. SO<sub>2</sub>, NO<sub>x</sub>, Cl, F, B, Cr, Hg, Pb) which are often larger than the Cd or Se emissions. For CdTe or CIS modules, on the other hand, cadmium respectively selenium will be one of the few environmentally relevant emissions. A second way to put the results above into perspective is to compare the estimated emissions with the total emissions of Cd or Se from all existing economic activities. Consider for example situation where 5% of the current Indian electricity production would be generated by B case CdTe or CIS modules. The resulting Cd and Se emissions from this activity. would then be 3.5 kg/yr respectively 60 kg/yr, which is equivalent to 0.2% resp. 0.6% of the current total emissions of Cd and Se in the India. The evaluation whether emissions as estimated above may be acceptable for society or not remains a difficult problem and in the end it is a political choice. However, it seems to us that the results above give no reason for immediate concern, although it would be good if the range of uncertainty could be reduced.

#### **Module decommissioning and recycling options:-**

After their useful lifetime the solar cell system will be dismantled and resulting waste streams will have to treated in a responsible manner. In this section we will consider some issues of module waste management and discuss recycling possibilities.

#### **mc-Si modules:-**

Mc-Si modules consist mainly of glass (78 wt. %), with smaller fractions of EVA (10 wt.%),polyester (7%) and silicon (4 wt. %) all rather harmless materials. However, small amounts of silver (0.4 wt. %) and copper (0.3 wt.%)

for the A case module are also in the module waste in concentrations which are just below the threshold value for "Dangerous Waste" (0.5 wt%) according to Indian environmental regulations. As yet there is no commercial process available for recycling of mc-Si modules. Recycling of the module cover glass should be possible if methods are developed to separate it from the EVA and other module components. Recycling of module glass with adherent EVA will meet some restrictions (see below under a-Si modules). Methods for reclaiming the silicon wafers from a (rejected) module have been investigated, but to our knowledge they are not commercially applied up to now.

#### ***a-Si modules:-***

a-Si modules consist mainly of glass and can therefore be used as feedstock for secondary glass production (glass recycling). Recent experiments have shown that the only restrictions are the modules should mainly be used for production of coloured packing glass and that the fraction of module waste in the total feedstock should remain below 10%. These restrictions, however, would not pose any serious limitations on future a-Si module deployment. Also it has been demonstrated that it is technically possible to re-use a glass substrate (including the TCO layer) after etching off the a-Si and back contact layers from an *anon-encapsulated* module. This approach may be interesting for the reprocessing of rejected modules in a module production plant.

#### ***CdTe/CIS modules:-***

The heavy metal content of CdTe and CIS modules would require them to be treated as "Dangerous Waste" under the existing regulations in India. On the other hand, at least one type of commercially available CdTe modules has been shown to meet the proposed EC regulations for waste disposal in land fill sites. The heavy metal content of CdTe/CIS modules makes them less attractive as feedstock for secondary glass production. One viable option for disposal is to feed the modules into non-ferrous smelters. Although no estimates are available at this time, it would seem that the total volume of module waste which can be disposed of in this way is rather limited, so that it is probably not a long-term solution. If large scale deployment of CdTe or CIS modules is considered then the recovery of the heavy metals from the module waste will probably be required, from the viewpoint of both waste management and resource management. It appears that hydrometallurgical methods offer the prospects for such a metal recovery process, although effective extraction of the metals from an encapsulated module may be problematic. Also the low concentration of metals would probably lead to added cost for the recycling process.

#### **Conclusions:-**

From our analyses we conclude that for the immediate future and within the considered system boundaries there are no reasons for concern regarding the material requirements and emissions of solar cell modules. Only if large scale deployment of modules -with annual production levels of several GW's -becomes probable there are some points which need closer attention, namely:

- \* resource depletion of silver (mc-Si modules);
- \* resource depletion of indium (CIS modules)
- \* waste management and recycling possibilities for decommissioned modules (mc-Si, CdTe, CIS);
- \* cumulative fire-induced emissions from CdTe and CIS modules.

Although there is still a considerable range of uncertainty in our emission estimates the risks from cadmium or selenium use in CdTe respectively CIS modules seem acceptable in comparison with some existing products or services like NiCad batteries or coal-fired electricity production.

#### **6 Health and safety risks:-**

In this topic we will shortly review occupational health and safety risks and external safety risks. Public health risks are not discussed here because they are a consequence of the emissions discussed in the previous chapter. Moreover, the estimation of public health risks from emission data was not part of our study scope because it is a very complex task. We will focus here on risks resulting from module production. One general point of attention for module installation and use are the electrical shock hazards. However, with a proper design of the electrical lay-out so that dc voltages are either kept below 110 V or higher voltages are properly shielded, no serious risks should result.

#### **mc-Si module:-**

No serious health and safety risks are expected for workers involved in mc-Si module production. Exposure to etchants like HF, HNO<sub>3</sub> and HCl and exposure to silane or other hydrides poses a moderate risk, which should be controllable within normal safety procedures. External safety risks seem small for mc-Si module production, only

the storage of silane should be performed with the proper safeguards (see under a-Si below). Silane use is, however, much smaller than for a-Si module production.

#### **a-Si modules:-**

Silane, the primary feedstock gas in a-Si module production, is a highly flammable gas which may ignite spontaneously in air. Because self-ignition does not always occur, large gas clouds may build up which can cause a severe explosion. Proper control measures are therefore necessary to prevent these situations. There is a review on various control measures for storage and handling of hazardous gasses in a-Si module production facilities. However, no detailed risk analysis are known of installations where silane and the other hydrides are handled in the amounts needed for a 10-50 MWp PV production capacity. Therefore, reliable statements on the safety risks of large-scale a-Si production facilities cannot be made with the available data.

#### **CdTe and CIS modules:-**

First of all one should note that CdTe and CIS contain only little toxic material. Moreover the toxicity of *ingested* CdTe appears to be relatively low because of its low solubility. Obviously, the exposure to cadmium of workers in a module production plant should be kept as low as possible. Current practices in such plants have proven to be more than sufficient in this respect, so there appears to be no reason for concern about occupational health risks if proper measures have been taken. Recent studies have furthermore shown that there is negligible risk of dangerous exposure to cadmium from a stock of CdTe modules during a fire. This should also rule out acute health risks due to fires in roof-top PV installations. Regarding selenium the exposure limits for air-borne material are a factor 10 higher than for cadmium compounds so it should be relatively easy to keep occupational Se exposures at acceptable levels. Furthermore the toxicity of elementary selenium appears to be moderate (upto now toxicity data on CuInSe<sub>2</sub> itself are very limited); therefore the main health risk from CIS appears to be exposure to SeO<sub>2</sub> which may be formed at temperatures above 350 C. A major risk factor of CIS module production can be the use of hydrogen selenide, which may be used as a feedstock gas in the CuInSe<sub>2</sub> deposition process. An accidental release of 25 kg (=one typical gas container) of H<sub>2</sub>Se can lead to dangerous exposure levels in an 40 m x 3000 m area. However, there are alternative CIS deposition methods available which do not require the use of H<sub>2</sub>Se.

#### **Conclusions:-**

The only significant risks regarding occupational health and safety and external safety are found in the storage and handling of explosive and/or toxic gasses, i.e. silane in a-Si production and H<sub>2</sub>Se in certain CIS deposition processes. With proper safety measures in place silane risks seem to be well manageable, but still the issue of silane storage at large-scale a-Si module production facilities (>10 MWp/yr) remains a point of attention. Regarding CIS module production it is advisable to avoid deposition methods involving the use of hydrogen selenide gas.

The environmental aspects of four major solar cell technologies have been reviewed with special attention for future expected technology developments. Cell technologies investigated are multicrystalline silicon (mc-Si), amorphous silicon (a-Si), cadmium telluride (CdTe) and CuInSe<sub>2</sub> (CIS). The following aspects are considered: energy requirements and energy pay-back time, material requirements and resource depletion, environmental emissions, waste handling, possibilities for recycling of modules, occupational health and safety and external safety. Although the energy pay-back time of the present-day mc-Si and a-Si modules is relatively high, around 4 to 4.5 years for frameless modules under Indian irradiation conditions, this pay-back time is still considerably shorter than the expected technical lifetime of the module (15-30 years). Moreover, very good prospects exist for reduction of energy requirements by future technology developments, resulting in energy pay-back times below 1.5 years for all module types (under Indian irradiation conditions; below 1 year for global average irradiation). It is remarkable that thin film technologies (a-Si, CdTe, CIS) do not score significantly better (in some cases even worse) as wafer-Based mc-Si technology. This mainly caused by the superior efficiency of mc-Si cells. Note that frames and support structures can add substantially to the energy requirements and may double the energy pay-back time of the total PV system (compared to modules only). Therefore serious attention is necessary for designs of array support structures which have a low energy requirement. From our analyses of the material flows we conclude that for the immediate future (and within the considered system boundaries) there are no reasons for concern regarding the material requirements and emissions of solar cell modules. Only if large scale deployment of modules -with annual production levels of several GW's -becomes probable there are some points which need closer attention, namely:

- \* resource depletion of silver (mc-Si modules);
- \* resource depletion of indium (CIS modules);
- \* waste management and recycling possibilities for decommissioned modules (mc-Si, CdTe, CIS);
- \* cumulative fire-induced emissions from CdTe and CIS modules.

Although there is still a considerable range of uncertainty in our emission estimates the risks from cadmium or selenium use in CdTe respectively CIS modules seem acceptable in comparison with some existing products or services like NiCad batteries or coal-fired electricity production. Regarding occupational health and safety and external safety the only significant risks are found in the storage and handling of explosive and/or toxic gasses, i.e. silane in a-Si production and H<sub>2</sub>Se in a certain CIS deposition process. With proper safety measures in place silane risks seem to be Ill manageable, but use of hydrogen selenide gas should be avoided. Finally, table 7.1 presents a qualitative comparison of these cell types on the aspects mentioned above. we can see that there is not one single cell type that scores good or excellent on all considered aspects, although future a-Si technology, seems to be the most "environmentally friendly" technology, with mc-Si as a good second. CIS and CdTe score less Ill because of problems related to the use of heavy metals, some of which are rather scarce. However, these problems should not be considered as a major bottle-neck for the immediate future. Therefore they should not be used as a reason for ruling out one or more of the considered solar cell technologies from further R&D efforts.

Table 7.1: Qualitative comparison of the investigated solar cell technologies. *Present* respectively *future* indicates the assumed technology status with regard to module production, emission control technology and recycling. Scores for present technology are Based on the A case results described in previous chapters, while scores for future technology are Based on both B case (70%) and C case results (30%). Note that effects of increasing production volumes, leading for example to increasing emissions, are *not* considered between present and future technology.

#### Cell Characteristics for CDTe Technology

	A--Case	B--Case	C-Case
CdS layer(μm)	0.2	0.15	0.1
CdTe layer(μm)	4	2	1
Efficiency(%)	10	15	18
. Cell Characteristics for CIS Technology .			
	A--Case	B--Case	C-Case
CdS layer(μm)	0.1	0.05	0.1
CuInSe <sub>2</sub>	4	2	1
layer(μm)			
Efficiency(%)	10	15	18

All in all we conclude from our investigations that -at least for the immediate future -there are no major bottlenecks from environmental point of view for the considered solar cell technologies. However, during module production substances are used which may be harmful for workers, the public or the environment. Therefore manufacturers should take proper measures to avoid harmful exposures or emissions .Points which deserve further attention both from manufacturers and researchers are: the energy requirements of modules (and module frames and supports), the use of heavy metals, gas safety issues and module recycling possibilities.

#### Abstract

The Internet of Things (IoT) provides a virtual view, via the Internet Protocol, to a huge variety of real life objects, ranging from a car, to a teacup, to a building, to trees in a forest. Its appeal is the ubiquitous generalized access to the status and location of any “thing” we may be interested in. The Internet of Things (IoT) is the network of physical objects, devices, vehicles, buildings and other items which are embedded with electronics, software, sensors, and network connectivity, which enables these objects to collect and exchange data. WSNs are integrated into the “Internet of Things”, where sensor nodes join the Internet dynamically, and use it to collaborate and accomplish their tasks. Wireless sensor networks (WSN) are well suited for long-term environmental data acquisition for IoT representation. This paper presents the functional design and implementation of a complete WSN platform that can be used for a range of long-term environmental monitoring IoT applications.

Copy Right, IJAR, 2017., All rights reserved.

#### Introduction:-

The future Internet, designed as an —Internet of Things| is foreseen to be —a world-wide network of interconnected objects uniquely addressable, based on standard communication protocols| [1]. Identified by a unique address, any object including computers, sensors, RFID tags or mobile phones will be able to dynamically join the network, collaborate and cooperate efficiently to achieve different tasks. . Including WSNs in such a scenario will open new perspectives. Covering a wide application field, WSNs can play an important role by collecting surrounding context and environment information. Key enablers for the IoT paradigm are : RFID and WSN. RFID is well known and established for low-cost identification and tracking. WSNs bring IoT applications richer capabilities for both sensing and actuation. In fact, WSN solutions already cover a very broad range of applications, and research and technology advances continuously expand their application field. However, the sheer diversity of WSN applications makes increasingly difficult to define —typicall requirements for their use in IoT applications [2]. The generic WSN platforms can be used with good results in a broad class of IoT environmental monitoring applications. However, many IoT applications (e.g., those in open nature) may have stringent requirements, such as very low cost, large number of nodes, long unattended service time, ease of deployment, low maintenance, which make these generic WSN platforms less suited.

#### Related Work:-

WSN environmental monitoring includes both indoor and outdoor applications. The later can fall in the city deployment category (e.g., for traffic, lighting, or pollution monitoring) or the open nature category (e.g., chemical hazard, earth-quake and flooding detection, volcano and habitat monitoring, weather forecasting, precision agriculture). The reliability of any outdoor deployment can be challenged by extreme climatic conditions, but for the

open nature the maintenance can be also very difficult and costly. Recent advances in wireless communications and electronics have enabled the development of low-cost, low-power, multi-functional sensor nodes that are small in size and communicate undeterred in short distances. These tiny and generally simple sensor nodes consist of sensing units, data processing, and communicating components [3], [4], [5]. A large number of such nodes deployed over large areas can collaborate with each other.

To be cost-effective, the sensor nodes often operate on very restricted energy reserves. Premature energy depletion can severely limit the network service [4]– [7] and needs to be addressed considering the IoT application requirements for cost, deployment, maintenance, and service availability. Open nature deployments [8]–[12] and communication protocol developments and experiments show that WSN optimization for reliable operation is time-consuming and costly. It hardly satisfies the IoT applications requirements for long-term, low-cost and reliable service, unless reusable hardware and software platforms [13] are available, including flexible Internet-enabled servers to collect and process the field data for IoT applications. This paper contributions of interest for researchers in the WSN field can be summarized as: 1) detailed specifications for a demanding WSN application for long-term environmental monitoring that can be used to analyze the optimality of novel WSN solutions, 2) specifications, design considerations, and experimental results for platform components that suit the typical IoT application requirements of low cost, high reliability, and long service time, 3) specifications and design considerations for platform re-usability for a wide range of distributed event-based environmental monitoring applications, and 4) a fast and configuration-free field deployment procedure suitable for large scale IoT application deployments.

Figure 1. WSN application in Agriculture

Figure 2. WSN application in Surveillance System

Wsn Applications:-

The wide wireless sensor network application field can be divided into three main categories according to [3]: Monitoring space, monitoring objects and monitoring interactions between objects and space. Example for first Category is Environment monitoring. WSNs are deployed in particular environments including glaciers, forests, and mountains in order to gather environmental parameters during long periods. Temperature, moisture or light sensor readings allow analyzing environmental phenomena, such as the influence of climate change on rock fall in permafrost areas [14].

Structural monitoring is one of the possible illustrations of second category. By sensing modes of vibration, acoustic emissions and responses to stimuli, mechanical modifications of bridges or buildings indicating potential breakages of the structure may be detected. Monitoring interaction between objects and space is the combination of both previous categories and includes monitoring environmental threats like floods and volcanic activities [15]. By extending application area of WSN, we can apply WSN to medical field for health monitoring. Figure 1 - 4 shows various application areas for WSN, such as agriculture, military, medical field, surveillance using fire detection, etc.

Figure 3 WSN in Medical Field

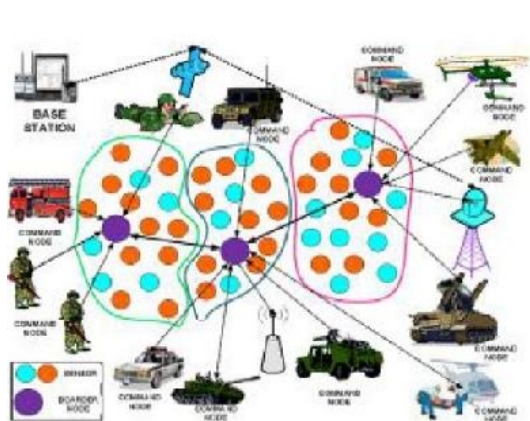

Figure 4. WSN application in Military

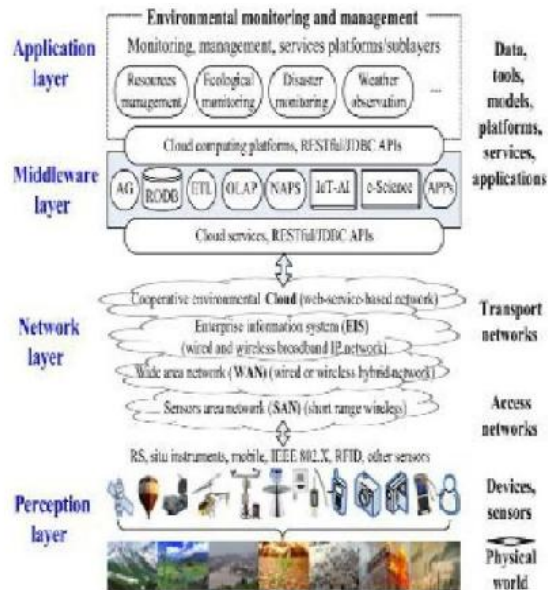

Figure 5. Proposed System Diagram

**IoT Environmental Monitoring Requirements:-**

WSN data acquisition for IoT environmental monitoring applications is challenging, especially for open nature fields. These may require large sensor numbers, low cost, high reliability, and long maintenance-free operation. At the same time, the nodes can be exposed to variable and extreme climatic conditions, the deployment field may be

costly and difficult to reach, and the field devices weight, size, and ruggedness can matter, e.g., if they are transported in backpacks. Most of these requirements and conditions can be found in the well-known application of wildfire monitoring.

### **Proposed System:-**

The proposed architecture of the system for environmental monitoring and management based on IoT contains four layers: perception layer, network layer, middleware layer, and application layer. Figure 5 shows all the layers of proposed system.

### **Perception layer:-**

The perception layer is mainly used for collecting data and other information of detailed factors of physical world (targets or tasks) in environmental monitoring and management, usually including real-time datasets, models/methods, knowledge, and others. The real-time data collection based on IoT is related to multi-sensors.

### **Network Layer:-**

The network layer performs basic functions of data and information transmission as well as the interconnection of systems and platforms. The network layer mainly consists of access networks and transport networks. Access networks are short-range wireless networks, usually consist of Sensors Area Network (SAN), 2G, 3G, WiFi, and ZigBee are common components to support the connection of things. In transport networks, various Wide Area Networks (WANs) of wired or wireless hybrid network are usually subsystems of EIS with wired and wireless broadband IP network, and EISs could be connected to the cooperative environmental cloud with Web service-based global network transport protocols [HyperText Transfer Protocol/ Transmission Control Protocol (HTTP/TCP) and Constrained Application Protocol/User Datagram Protocol (CoAP/UDP)], and Internet Protocol version 4/Internet Protocol version 6 (IPv4/IPv6) are common technologies or standards for the transport networks.

### **Middle layer :-**

The middleware layer is a set of sub-layers for the management of data, software/tools, models and platforms, and interposed between the network layer and the application layer. Interactions between components, interfaces, applications, and protocols were implemented by representational state transfer (RESTful) APIs or Java database connectivity (JDBC) APIs.

### **Application layer :-**

The application layer provides the functions of storing, organizing, processing, and sharing the environment data and other information obtained from sensors, devices, and Web services, as well as the functions of taking professional applications in environmental monitoring and management, such as resources management. The application layer is the top level and represents the final task of IIS for environment decision management and planning service. Perception layer: The perception layer is mainly used for collecting data and other information of detailed factors of physical world.

Network layer: The network layer performs basic functions of data and information transmission as well as the interconnection of systems and platforms. Here LAN is used for transmitting or receiving the data.

Application layer: Application layer does the work of middle layer also. The layer is responsible for interaction of data to n fro from network layer and is also responsible for processing of the data received for environmental management.

Application involves the usage of 3 sensors 1. Temperature sensor 2. Light sensor 3.dry/wet sensor. The data from the sensors are collected and processed using a processor and is send to the authorized person's email through Internet.

### **Components**

#### **a. ARM11**

: The ARM1176JZF-S processor incorporates an integer core that implements the ARM11 ARM architecture v6. It supports the ARM and Thumb™ instruction sets, Jazelle technology to enable direct execution of Java bytecodes, and a range of SIMD DSP instructions that operate on 16-bit or 8-bit data values in 32-bit registers.

### **The ARM1176JZF-S processor features:-**

Provision for Intelligent Energy Management

(IEMTM). TrustZone™ security extensions

High-speed Advanced Microprocessor Bus Architecture (AMBA) Advanced Extensible Interface (AXI) level two interfaces supporting prioritized multiprocessor implementations. An integer core with integral EmbeddedICE-RT logic .

- An eight-stage pipeline .
  - Branch prediction with return stack .
  - Low interrupt latency configuration .
  - Internal coprocessors CP14 and CP15 .
  - Vector Floating-Point (VFP) coprocessor support .
  - External coprocessor interface .
  - Instruction and Data Memory Management Units (MMUs), managed using MicroTLB structures backed by a unified Main TLB .
  - Instruction and data caches, including a non-blocking data cache with Hit-Under-Miss(HUM) .
  - virtually indexed and physically addressed caches
- 64-bit interface to both caches .
- Level one Tightly-Coupled Memory (TCM) that you can use as a local RAM with DMA .
  - Trace support.
  - JTAG-based debug.

#### **ARM1176JZF-S architecture with Jazelle technology**

The ARM1176JZF-S processor has three instruction sets:

- the 32-bit ARM instruction set used in ARM state, with media instructions
- the 16-bit Thumb instruction set used in Thumb state
- the 8-bit Java bytecodes used in Jazelle state.

#### **AT 89C2051 Microcontroller Features**

- Compatible with MCS®-51 Products
- 2K Bytes of Reprogrammable Flash Memory •2.7V to 6V Operating Range
- Fully Static Operation: 0 Hz to 24 MHz •Two-level Program Memory Lock •128 x 8-bit Internal RAM
- 15 Programmable I/O Lines •Two 16-bit Timer/Counters
- Six Interrupt Sources •Programmable Serial UART Channel •Direct LED Drive Outputs
- On-chip Analog Comparator •Low-power Idle and Power-down Modes •Green (Pb/Halide-free) Packaging Option

#### **LM35 Precision Centigrade Temperature Sensor**

: LM35 converts temperature value into electrical signals. LM35 series sensors are precision integrated-circuit temperature sensors whose output voltage is linearly proportional to the Celsius temperature. The LM35 requires no external calibration since it is internally calibrated. . The LM35 does not require any external calibration or trimming to provide typical accuracies of  $\pm 1/4^{\circ}\text{C}$  at room temperature and  $\pm 3/4^{\circ}\text{C}$  over a full  $-55$  to  $+150^{\circ}\text{C}$  temperature range.

**Figure 6** PCB Board for the Proposed Project

#### **LDR - Light Dependent Resistor:-**

: LDRs or Light Dependent Resistors are very useful especially in light/dark sensor circuits. Normally the resistance of an LDR is very high, sometimes as high as 1,000,000 ohms, but when they are illuminated with light, the resistance drops dramatically.

**Moisture sensor:-**

Soil moisture sensors measures the water content in soil.

A soil moisture probe is made up of multiple soil moisture sensors. One common type of soil moisture sensors in commercial use is a Frequency domain sensor such as a capacitance sensor. Another sensor, the neutron moisture gauge, utilize the moderator properties of water for neutrons. Cheaper sensors -often for home use- are based on two electrodes measuring the resistance of the soil.

**RASPBERRY PI:-**

The Raspberry Pi has a Broadcom BCM2835 system on a chip (SoC),which includes aARM1176JZF-S 700MHz processor (The firmware includes a number of "Turbo" modes so that the user can attempt over clocking, up to 1GHz, without affecting the warranty), VideoCoreIV GPU, and was originally shipped with 256 megabytes of RAM, later upgraded to 512 MB. It does not include a built-in hard disk or solid-state drive, but uses an SD card for booting and long-term storage. The Foundation's goal was to offer two versions, priced at US\$25 and US\$35.

Figure 7. Raspberry PI

**Application Server:-**

The main purpose of a WSN application server is to receive, store, and provide access to field data. It bridges the low power communication segments, with latency-energy tradeoffs, and the fast and ubiquitous end user field data access (by humans or IoT applications).

The full custom server software has the structure shown in Fig. 8. It provides interfaces for:• field nodes (gateways);• the operators and supervisors for each field;• various alert channels;• external access for other IoT systems.

Figure 8:- Application Server Interfaces.

Two protocols are used to interface with the field nodes (gateways) for an energy-efficient communication over unreliable connections: normal and service (boot loader) operation.

**Conclusion:-**

WSNs are traditionally considered key enablers for the IOT Paradigm. However, due to the widening variety of applications, it is increasingly difficult to define common requirements for the WSN nodes and platforms. All

aspects of the WSN Platform are considered and discussed are Platform structure, flexibility and reusability, optimization of the sensor and gateway nodes, optimization of the communication protocols for both in-field and long range, error recovery from communications and node operations, high availability of services at all levels, applications server reliability and the interfacing with IOT Applications. Of particular importance of this discussion are IOT Requirements for low cost, fast deployment and long unattended service time. All platform components are implemented and support the operation of a broad range in the application sector discussed and also in indoor and outdoor field deployments with several types of sensor nodes built using the generic node platforms presented.

#### Abstract

Learning and working together on a wall is what a Padlet might look like for those who has tried this digital pinboard. This multimodal production tool is simple yet powerful to support teaching and learning. This study investigates the effectiveness of using Padlet in improving students' learning in English grammar. The data was collected by the means of pre-post tests and questionnaire survey. 30 students at University Sains Islam Malaysia were participated in this study. The data was analyzed using both descriptive and inferential analysis. The result from pre-post tests indicated a significant improvement in students' performance. The result from survey also showed high preference and participants' positive attitude towards using Padlet as a means for learning grammar. The findings indicated that the use of Padlet is effective in enhancing students' performance in language learning.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Grammar is one of the fundamental aspects needed in learning a language. Sufficient knowledge of English grammar contributed much in two main aspects in English – writing and speaking (Valentine &Repath-Martos, 1997). For a second language learner, writing with the right grammar might be one of the concerns the students faced. For this to be improved, the use of strategies might be helpful. One of the most widely implemented strategies in teaching and learning nowadays is by integrating technology.

The world today drowns us in an ocean of technological tools and gadgets. In education, without exception, technology already became a part of teaching tools as well as a support for learning. Looking closely in language learning, implementing technological tools and apps might be a good approach to scaffold learning. In this respect, in particular in grammar learning, educators can integrate the use of technology to assist students and to polish their understanding on grammatical concept. One of the technologies that can be used is Padlet, an online virtual website application where anyone can work on an idea or do activities together anytime anywhere.

#### Literature Review:-

##### Web 2.0 Technologies in Education :-

For a vast development of technologies introduced in education claiming their effectiveness for learning, a number of studies have been done to see whether the integration of these tools could promote active learning for students and a support for teaching (Bower, 2015, Yunus, Kiing&Salehi, 2013). This is particularly looking at the booming of Web 2.0 applications such as Blendspace, Slideshare, Padlet, Voki and Storybird. Web 2.0 technologies offer a platform to establish a learning network, collaborate and share information to engage students with their learning

**Corresponding Author:-MunirahHaris.**

(Boyd, 2007; McLoughlin & Lee, 2007; Brown, 2010; Amelia A. Rahman Sidek & Melor Md. Yunus, 2012). Shih's study (2011) investigated the effect of integrating Web 2.0 technology in language learning. The findings revealed a significant improvement in students' performance particularly in writing. This paper will focus on one of Web 2.0 tools – Padlet.

#### **Padlet: A Virtual Wall:-**

Padlet features an 'online wall' web-based where ideas are collating via virtual post from the users (Shield, 2014). This tool offers enormous benefits to its users without the need to have an account. Users can create unlimited walls, invite others to collaborate on their walls, customize and set privacy on their Padlets merely by using a free account (Fiester & Green, 2016; Miller, 2016). Users can also add links, images, text, documents and video files in their wall and move them round freely like sticky notes on the wall. Sign in up for an account will be beneficial for teachers as they can manage their classroom interaction and performance. An email will be sent to notify the teacher each time a student responded to the teacher's wall (Wood, 2016).

In classroom setting, Padlet works well with activities such as brainstorming, discussion and project work (Stannard, 2015). Students can learn through Padlet anytime anywhere with any internet-enabled devices such as smartphone, tablet, and computer with internet connection. There is no software needed to be downloaded to use Padlet. Students can then share their works on Facebook, Google+, e-mail or even embedded the URL into their blog (Wood, 2016). Previous studies on Padlet mostly covered the usefulness of Padlet to support collaborative activities (Dembo & Bellow, 2013; Fuchs, 2014; Ellis, 2015). However, there is very little research that has been done on the effectiveness of Padlet in enhancing students' language performance in classroom. Therefore, the present study was designed and conducted for this sole purpose.

This study was designed to investigate the effectiveness of using Padlet for grammar learning in English language classroom. In order to achieve the purpose of this study, the following research questions were addressed:

- a) Does using Padlet is effective for enhancing students' performance in language learning?
- b) What is the students' perception and attitude towards using Padlet in classroom?

### **Methodology:-**

#### **Study Design:-**

This study was a pre/post-test experimental design. The respondents were introduced to the use of Padlet during their grammar lesson and were given few tasks on Subject-Verb Agreement (SVA). Pre- and post-tests were given to the students to evaluate their current understanding of the SVA concept as well as their performance before and after using Padlet. The students were also asked to complete a questionnaire survey at the end of the post-test.

#### **Participants:-**

The participants of this study were 30 first-year undergraduate students at Universiti Sains Islam Malaysia (USIM). They came from diverse majors including Islamic Finance, Islamic Study, and Business. They were currently enrolled in an English course as part of the university requirement courses. The course was designed to prepare the students before they sit for Malaysian University English Test (MUET). The class met once a week and took two hours for each session. All the participants are native speakers of Bahasa Melayu and learning English as their second language. As far as their English proficiency was concerned, they have a relatively wide range of proficiency level from low to high. Most of them were at low intermediate level of English proficiency and their use of English was mainly limited to the classroom context. All the participants owned a smartphone and have active connectivity with the internet.

#### **Instruments:-**

One of the instruments used in this study was Pre/Post-Test. The test was adapted from OWL English website using the link <http://OWL/SubjectVerbAgreement/>. The pre-test was given to the participants as a means to diagnose their current understanding of one part of English grammar – Subject Verb Agreement (SVA). After few weeks of learning SVA using Padlet, the participants were then asked to redo the test again. This time, post-test questions were given to the participants. The items were the same one with pre-test but have been purposely rearranged from the original number of arrangement in order to see their performance.

Another instrument used in this study was questionnaire survey. The questionnaire items were adapted from Izyani & Mohamed Amin Embi's (2016) study to identify students' views and attitude on using Padlet in language learning.

The questionnaire items were provided with four-point Likert scale. The participants were required to respond on each item based on the given rating scale: Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The rating scale was presented in even number considering the issues of the existence of middle category (i.e. 'Neither Agree Nor Disagree', 'Indifferent' or "Neutral") that will prevent the participants for making the real choice (Dörnyei, 2003). The participants will be given further explanation if they did not understand any item of the survey. The reliability of was calculated using Cronbach Alpha which was 0.97 representing good internal consistency.

For the instructional material, the researcher used the usual syllabus planned by the course lecturer. However, instead of using slides and whiteboard, the lesson used Padlet as the means of teaching and learning. The students were just started their learning in Grammar component after completing their speaking component in their previous class. Following their syllabus, Subject-Verb Agreement (SVA) was their first topic for the grammar component.

#### **Data Analysis and Procedures:-**

Before they started their lesson on SVA, the participants were given a pre-test as a diagnostic tool to see their understanding of this grammar aspect. Following the pre-test, the participants were taught about SVA using Padlet. The learning took 5 weeks and all the lessons and activities were all delivered via Padlet. At the end of the lessons, they were asked to sit for the post-test to assess their performance. A questionnaire survey was also distributed right after the post-test. All the data collected were analyzed through descriptive and inferential statistics. Descriptive methods using frequency, percentages, means, and standard deviation were used for analyzing the pre- and post-tests. A bar graph was presented to illustrate the score performance. Statistical method using t-test analysis of variance was also been used in order to answer the research questions.

#### **Results:-**

The purpose of this study is to investigate the effect of using Padlet in learning English grammar for ESL students in Malaysia.

#### ***The effectiveness of using Padlet to enhance students learning:-***

The data was computed and the pre/post-test scores were compared in terms of frequency, percentages, mean and standard deviation. Table 1 shows the results of the pre-test and post-test scores of the group.

SVA	N	Mean	Std. Deviation	Std. Error Mean
Pre_Test	30	13.97	2.606	.476
Post_Test	30	15.07	2.258	.412

**Table 1.** Result of the Pre-test Scores and Post-test Scores of the group.

As shown in Table 1, the mean scores for pre-test is 13.97 and 15.07 for the post-test.

This means scores indicated a significant improvement in students' score after integrating Padlet in their grammar learning. This analysis can be supported by the percentages of differences in score performance as indicated in Figure 1 below:

**Figure 1:** Pre/Post Test Score's Performance

Based on the result, out of 30, 18 students scored higher marks in their post-test compared to their pre-test. This number makes about 60% percentages of students who performed better after incorporating Padlet in their grammar learning. On the other hand, 30% obtained lower marks for the post-test and 10% showed no changes in their scores performance. With the percentages of performance, there is a significant improvement depicted to show the effectiveness of using Padlet in enhancing students' performance in learning grammar.

To support the above descriptive analysis, paired t-test was conducted to find out any statistically significant differences in this study and the result is as shown in Table 3.

Paired Samples T-Test									
	Paired Differences	t	df	Sig. (2-tailed)					
					Mean	SD	Std. Error Mean	95% Confidence Interval of the Difference	
								Lower	Upper
Pre_Test - Post_Test	-1.100	2.103	.402	-1.922	-.278	-2.735	29	.011	

**Table 2:-** Dependent sample t-test results for the Pre/Post-test of the group.

The t-test results indicate a significant difference between the mean scores before and after using Padlet in grammar learning ( $t = -2.735$ ,  $p > 0.011$ ). Overall, the differences in scores indicate that the use of Padlet is effective enough in improving students' performance in grammar learning. This finding is parallel with other previous studies which showed the effective usage of Padlet in learning (Dembo & Bellow, 2013; Fuchs, 2014; Ellis, 2015).

#### **Students' perception and attitude towards using Padlet in classroom:-**

The questionnaire items have been analyzed and the data was calculated in percentages. The result can be referred in Table 3 below:

Item	Strongly Agree	Agree	Disagree	Strongly Disagree
<b>Learning language via Padlet is a good idea.</b>	18.4%	78.9%	2.6%	0.0%
<b>My interaction in Padlet messaging was clear.</b>	10.5%	36.8%	52.6%	0.0%
<b>My interaction in Padlet messaging was understandable.</b>	5.3%	60.5%	34.2%	0.0%
<b>It was easy for me to become skilful in discovering information via Padlet.</b>	10.5%	50.0%	39.5%	0.0%
<b>Learning English language using Padlet is</b>	21.1%	63.2%	15.8%	0.0%

<b>convenient for me.</b>				
<b>Padlet is convenient for academic engagement purposes.</b>	13.2%	65/8%	21.1%	0.0%
<b>Padlet allows me to academically engage with peers and lecturers at any time and any place.</b>	15.8%	73.7%	10.5%	0.0%
<b>I found that Padlet is useful in my language learning.</b>	21.1%	63.2%	15.8%	0.0%
<b>Using Padlet was effectively improved my language learning.</b>	13.2%	57.9%	28.9%	0.0%
<b>My performance in language learning was improved by the used of Padlet.</b>	5.3%	55.3%	39.5%	0.0%
<b>My performance in English writing has improved by the used of Padlet.</b>	15.8%	50.0%	34.2%	0.0%
<b>Interaction via Padlet helped me to become active in language activity.</b>	21.1%	63.2%	15.8%	0.0%
<b>In future, I will use Padlet in learning English language.</b>	7.9%	81.6%	10.5%	0.0%

**Table 3:-** Students' perception and attitude towards using Padlet in classroom.

The findings in Table 4 indicated that majority of participants favored incorporating Padlet in learning grammar. Most of the items received a higher weightage in 'Agree' column whereas there is no vote in the 'Strongly Disagree' column. Looking closely in terms of attitude and perception on using Padlet in grammar learning, Table 4 showed that in general, more than 50% of participants have positive attitudes towards Padlet. 97.3% agreed that learning language via Padlet is a good idea. 79% agreed that Padlet is convenient for their academic engagement purposes and 84.3% found that Padlet is useful for their language learning, Even though they favor the use of Padlet, 52.6% disagree that their interaction in Padlet messaging was clear. This can be explained as it was the first time for majority of them to use Padlet. Thus, even though they like it, it still taking time for them to get to know the tool and communicating using it for learning grammar. In terms of their performance, 60.6% agreed that their performance in language learning was improved by the used of Padlet while 84.3% agreed that the interaction via Padlet helped them to become active in language activity. Overall, most participants regarded Padlet as an effective means for learning language and 89.5% participants will use Padlet in their language learning in the future.

### **Discussion and Conclusion:-**

From the analyses of pre/post-test and questionnaire results, it can be concluded that there is a significant improvement in students' performance when integrating Padlet in their grammar learning. Also, the participants favored the use of Padlet and found it useful for their language learning. Some students found that it is their interaction in Padlet messaging was unclear due to the fact that it was their first time learning via Padlet. This should be an aspect to be considered by researcher. Issues in digital competency and technical aspect of the tool can disrupt learning process since students need to explore how to use this tool and may take some time to familiarize it before using it for their learning (Redecker, Ala-Mutka, Bacigalupo, Ferrari & Punie, 2009). Overall, Padlet provides a platform for students to actively participate in their learning. Students' engagement in learning established through collaboration and sharing ideas using Padlet. This will help students to be aware of their own learning and thus improve their performance in learning language. The findings of the present and the previous studies support the effectiveness of Padlet in learning. Therefore, Padlet is as one of the Web 2.0 technologies that should be promoted and utilized as a means to support students' language learning. For future suggestion, further studies can be done on Padlet to other parts of English grammar such as tenses and nouns or to a larger extent of other language skills such as speaking and writing.

### **Acknowledgement:-**

We gratefully acknowledge the support and generosity of the academic coordinators, lecturers and the students at Universiti Sains Islam Malaysia without which the present study could not have been completed. Special thanks to Universiti Kebangsaan Malaysia.

#### Abstract

**Background and Objective:** Diabetes mellitus is a group of metabolic disorders associated with increased oxidative stress and free radical production that play important roles in diabetic pathogenesis and complications. The present study was aimed to evaluate lipid peroxidation and antioxidant enzyme activities in patients with type 2 diabetes in comparison with normal healthy individuals.

**Material and Method:** Lipid peroxidation and antioxidant enzymes: Malondialdehyde (MDA), glutathione peroxidase (GSH-Px), glutathione reductase (GR), glutathione-S-transferase (GST), reduced glutathione (GSH) and lipid profiles were determined in 40 males of type 2 diabetic patients, in addition to 10 males of healthy controls matched for age and BMI. Descriptive, statistical comparisons, and correlations were performed using the SPSS program, significance was considered when  $P$  value  $< 0.05$ .

**Results:** The MDA, GR, and GST concentrations were significantly increased in type 2 diabetic patients compared with the healthy controls group. While significant reduction in the activities of GSH and GSH-Px were reported in type 2 diabetic patients compared with the healthy controls group. Significant positive correlations between oxidative stress status (MDA and GST) and lipid profiles (especially total cholesterol, LDL-C, triglyceride and VLDL-C) were found in type 2 diabetic patients.

**Conclusion:** Our study revealed an increase lipid peroxidation coupled with decrease antioxidant enzymes in type 2 diabetic Palestinian patients from the Gaza Strip.

#### Introduction:-

Diabetes mellitus is a group of metabolic disorders characterized by hyperglycemia (Lin and sun, 2010) resulting from insulin resistance (IR) and fall of functional pancreatic  $\beta$  cells. Chronic hyperglycemia causes serious complications for diabetic patients, such as damage, dysfunction, and failure of various organs, especially the eyes, kidneys, nerves, heart, and blood vessels (Expert Committee on the Diagnosis and Classification of Diabetes Mellitus, 1997, 2003). According to the World Health Organization (WHO), more than 220 million persons worldwide had diabetes; 90% of them are diagnosed with type 2 diabetes (WHO, 2009). In 2005, 1.1 million people worldwide died from diabetes and the WHO estimates that the number of deaths may double between 2005 and

2030 (WHO, 2009). The reasons for this global rise are the growth of aged population, increasing trends towards obesity, unhealthy diet, and sedentary lifestyle (Bagust *et al.*, 2001; Cowie *et al.*, 2008). This condition requires medical treatment and a number of lifestyle changes.

Diabetes mellitus is associated closely with increased oxidative stress and free radical production (Bonfont-Rousselot *et al.*, 2000). Oxidative stress reflects an imbalance between the formation of free radical oxygen and antioxidant defense system in the body (Rahimi *et al.*, 2005). Oxidative stress plays an important role in the pathogenesis of diabetes and its complications (Johansen *et al.*, 2005; Rahimi *et al.*, 2005). In the diabetic condition, oxidative stress, through the production of reactive oxygen species (ROS), impairs glucose uptake in muscle and fat (Rudich *et al.*, 1998; Maddux *et al.*, 2001) and decreases insulin secretion from pancreatic  $\beta$  cells (Matsuoka *et al.*, 1997).

Several diabetic complications are associated with overproduction of ROS and accumulation of lipid peroxidation products (Palanduz *et al.*, 2001), which is potentially harmful because it's uncontrolled, the self-enhancing process causes disruption of membranes, lipids, and other cell components.

There is not much data available about the relationship between oxidative stress and diabetes in Palestinian type 2 diabetic patients at Gaza strip. Therefore, the aim of the present study is to evaluate oxidative stress by measuring lipid peroxidation and antioxidant enzymes in patients with type 2 diabetes as compared to healthy controls, also to determine the correlations between the pro-oxidant (lipid status) and antioxidant parameters in studied subjects.

### Materials and Methods:-

*Subjects:* The current study was conducted on 40 males patients with type 2 diabetes. The patients were chosen from those attending the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA) health centers in Gaza Strip. Clinical examination was done for all patients to exclude any diabetic complication such as neurologic, cardiac, kidney, and eye complications. All patients were on oral hypoglycemic agents Metformin. Ten healthy subjects (10 males) matching the average age and socioeconomic status were selected randomly as a control group. The healthy subjects were chosen randomly from those working at UNRWA health centers. Clinical examination was also done for all healthy subjects to exclude any health problem that may they suffer from. None of the patients or control subjects reported any intake of dietary supplements such as vitamins or minerals, at least in the last year before launching the study.

*Measurements:* Weight, height, waist circumference (WC), waist hip ratio (WHR) and blood pressure were measured for each subject then the body mass index was calculated as following:  $BMI = \text{Body weight (Kg)} / \text{height (m}^2)$  (Bray, 1987).

*Blood samples and biochemical parameters:* Blood samples were collected from each subject after an overnight fasting (at least 8-12 hours). Glycosylated hemoglobin (HbA1c) was measured by a direct enzymatic method (Goldstein *et al.*, 2004). Serum MDA was measured by thiobarbituric acid assay (Satoh, 1978). Serum GSH, GR, GST and GSH-Px activities were measured by the method of Beutler *et al.*, (1963), Goldberg *et al.*, (1983), Habig *et al.*, (1974) and Paglia *et al.*, (1967) respectively, by using Biodiagnostic kit. Fasting blood glucose level, urea, creatinine, uric acid, alanine aminotransferase (ALAT) and aspartate amino transferase (ASAT), triglycerides, total cholesterol and high density lipoprotein cholesterol (HDL-C) levels were measured by using Diasys kit.

Low density lipoprotein cholesterol (LDL-C) was estimated by the equation of Friedewald *et al.*, (1972).  $LDL-C = [\text{Total cholesterol} - (\text{Triglyceride}/5 + \text{HDL-C})]$ .

### Statistical Analysis:-

Statistical Package of social science (SPSS) version 22 was used for analysis of data. Data was summarized as mean  $\pm$  standard deviation (SD) and compared between type 2 diabetic patients and healthy controls subjects. Pearson's correlations were also performed to define correlations of individual parameters. All statistical tests were two-tailed.  $P$  values  $\leq 0.05$  were considered statistically significant.

**Results:-**

The descriptive characteristics of the type 2 diabetic patients and healthy control subjects are shown in Table 1. The type 2 diabetic group significantly differed from the healthy control group in fasting blood glucose level ( $88.15 \pm 3.31$  vs.  $158.82 \pm 5.07$ ,  $P < 0.05$ ) and HbA1c% ( $5.53 \pm 0.13$  vs.  $8.43 \pm 0.214$ ,  $P < 0.05$ ).

**Table 1:-** Comparison of descriptive characteristics and glycemc status between healthy control and type 2 diabetic subjects.

Variables	Healthy control N (10 M) Mean $\pm$ SD	Type 2 diabetic patients N (40M) Mean $\pm$ SD	P-value
Age (years)	50.10 $\pm$ 2.16	51.02 $\pm$ .86	>0.05
W.C (cm)	113.70 $\pm$ 4.18	106.82 $\pm$ 1.194	> 0.05
WHR	0.98 $\pm$ 0.03	0.99 $\pm$ 0.01	>0.05
BMI (kg/m <sup>2</sup> )	32.79 $\pm$ 1.42	30.96 $\pm$ 0.69	>0.05
Systolic	117.00 $\pm$ 2.13	120.19 $\pm$ 1.100	> 0.05
Diastolic	77.00 $\pm$ 2.13	78.59 $\pm$ 1.382	> 0.05
FBG (mg/dL)	88.15 $\pm$ 3.31	158.82 $\pm$ 5.07	< 0.05
HbA1c (%)	5.53 $\pm$ 0.13	8.43 $\pm$ 0.214	< 0.05

BMI, body mass index; FBS, fasting blood glucose; HbA1c, glycosylated hemoglobin. WHR, waist hip ratio;  $P < 0.05$  is significant.

The lipid profiles of the type 2 diabetic patients and healthy control subjects were shown in Table 2. The diabetic subjects had significantly increase ( $P < 0.05$ ) in serum triglyceride, ( $138.45 \pm 14.66$  vs.  $237.08 \pm 9.74$ ), VLDL-C levels ( $27.69 \pm 2.93$  vs.  $47.33 \pm 1.95$ ) and HDL-C ( $45.30 \pm 1.37$  vs.  $39.37 \pm 1.13$ ) compared with healthy control subjects.

**Table 2:-** Lipid profile in healthy control and type 2 diabetic subjects.

Variables	Healthy control N (10 M) Mean $\pm$ SD	Type 2 diabetic patients N (40M) Mean $\pm$ SD	P-value
TC (mg/dl)	194.22 $\pm$ 6.67	213.57 $\pm$ 4.72	>0.05
TG (mg/dl)	138.45 $\pm$ 14.66	237.08 $\pm$ 9.74	< 0.001
HDL-C (mg/ dl)	45.30 $\pm$ 1.37	39.37 $\pm$ 1.13	<0.05
LDL-C (mg/dl)	121.23 $\pm$ 5.41	126.79 $\pm$ 4.52	>0.05
VLDL-C (mg/dl)	27.69 $\pm$ 2.93	47.33 $\pm$ 1.95	< 0.001

TC, total cholesterol; TG, triglycerides; HDL-c, high density lipoprotein; LDL-c, low density lipoprotein; VLDL-c, very low density lipoprotein.  $P < 0.05$  is significant.  $P < 0.001$  is highly significant.

The concentrations of MDA, GR, GST were found to be highly increased in type 2 diabetic patients, ( $P < 0.05$ ) ( $2.56 \pm 0.20$  vs.  $4.30 \pm 0.21$ ), ( $13.73 \pm 0.33$  vs.  $21.08 \pm 0.55$ ), ( $351.28 \pm 17.63$  vs.  $508.44 \pm 11.756$ ) respectively, in contrast GSH-Px and GSH activity were significantly decreased in type 2 diabetic patients, ( $P < 0.05$ ) as compared to healthy control subjects ( $738.81 \pm 26.38$  vs.  $514.32 \pm 15.83$ ), ( $41.00 \pm 1.41$  vs.  $26.93 \pm 0.846$ ) respectively as shown in Table-3.

**Table 3:-** Oxidant and antioxidant parameters in healthy control and type 2 diabetic subjects.

Variables	Healthy control N (10 M) Mean $\pm$ SD	Type 2 diabetic patients N (40M) Mean $\pm$ SD	P-value
MDA (nmol/mL)	2.56 $\pm$ 0.20	4.30 $\pm$ 0.21	< 0.05
GR (U / L)	13.73 $\pm$ 0.33	21.08 $\pm$ 0.55	< 0.05
GST (U/L)	351.28 $\pm$ 17.63	508.44 $\pm$ 11.756	< 0.05
GSH-Px (mU / mL)	738.81 $\pm$ 26.38	514.32 $\pm$ 15.83	< 0.05
GSH (mg/dL)	41.00 $\pm$ 1.41	26.93 $\pm$ 0.846	< 0.05

GSH-Px, glutathione peroxidase;GR, glutathione reductase;GSH, reduced glutathione; GST, glutathione -S-transferase;MDA, malondialdehyde.

There is no significant difference in liver and kidney functions parameters in type 2 diabetic patients when compared with healthy control subjects. Table-4.

**Table 4:-**Liver and kidney functions parameters in healthy control and type 2 diabetic subjects.

Variables	Healthy control N (10 M) Mean $\pm$ SD	Type 2 diabetic patients N (40 M) Mean $\pm$ SD	P-value
ALAT (mg/dl)	20.48 $\pm$ 1.32	23.52 $\pm$ 1.29	> 0.05
ASAT (mg/dl)	19.40 $\pm$ 0.85	18.80 $\pm$ 0.82	> 0.05

### Discussion:-

In the present study, the patients with type 2 diabetes had shown elevation of HbA1c comparing to their age-matched healthy individuals. It has been reported that various proteins, hemoglobin and LDL, undergo non-enzymatic glycation in diabetes (Klein., 1995). The rate of glycation is proportional to the concentration of blood glucose (Sheela *et al.*, 1992). In addition, HbA1c has been found to be increased over a long period of time in diabetes (Bunn *et al.*, 1978). Free radical increases proportionally with increased glycation rate (Gupta *et al.*, 1997). So, the measurement of HbA1c is very sensitive index for glycemic control (Jain *et al.*, 1989).

In the current work, we found that patients with type 2 diabetes were presented with low HDL-C and high triglyceride levels. This result is compatible with the previous studies (Howard, 1987; Taskinen., 1992; Yoshino *et al.*, 1996). The insufficient amounts of anti-atherogenic and antioxidative effects due to the low level of HDL-C, is a key feature for oxidative stress status (Hansel *et al.*, 2004). The reduced HDL-C level is often accompanied with high level of triglyceride (Lamarche *et al.*, 1996), which is in agreement with the present study. In type 2 diabetes, the increased secretion of apolipoprotein B (apoB) as a result of fatty acid synthesis in the liver (Duvillard *et al.*, 2000; Krauss *et al.*, 2004), a protein identified as a key component of the VLDL which induced an increase in plasma level of triglyceride and reduce level of HDL-C. Moreover, the elevation of free fatty acid and glucose in type 2 diabetes may decrease the activity of lipoprotein lipase, a pivotal enzyme in the removal of these lipoproteins from the circulation, and control the triglyceride-rich lipoproteins and HDL-C particles (Kastelein *et al.*, 1999).

The present study showed significant increases in MDA, GR, GST, and significant decreases in GSH and GSH-Px levels in patients with type 2 diabetes as compared with the control, which is an indication of marked oxidative stress. The increase of oxidative stress in diabetes mellitus was explained by several mechanisms. These mechanisms fall into two general categories first; Increased production of ROS, second; decreased antioxidant defenses. In diabetes, glucose auto oxidation and glycation products, non-enzymatic protein glycosylation, and changes in antioxidant defense systems can increase production of ROS (Baynes 1991; Inouye *et al.*, 1999; Bonnefont-Rousselot *et al.*, 2000; Courderot-Masuyer *et al.*, 2000; West, 2000). Increased production of ROS as well as reduced antioxidant defense mechanisms have been suggested to play a role in type 1 and type 2 diabetic patients (Mahboob *et al.*, 2001).

A significant increase in MDA was observed in patients with type 2 diabetes as compared with the healthy individuals. MDA, the end product of lipid peroxidation and acts as a marker of balance between pro-oxidant and antioxidant. This balance is a disturbance in diabetic patients. As a result, there is a high level of MDA present in the serum of patients with type 2 diabetes. This result is in agreement with the finding of (Griesmacher *et al.*, 1995; Beaudeux *et al.*, 1995; Pasaoglu *et al.*, 2004; Ozdemir *et al.*, 2005). Hyperglycemia may increase of ROS and lipid peroxidation production that is dependent in the redox potential of non-enzymatic antioxidant (glutathione) and decreased enzymatic antioxidant defense system.

The decrease in GSH-Px activity and the increase in GR activity were significant in patients with the type 2 diabetes as compared to the healthy individuals. These results are similar with the results of previous studies (Kumawat *et*

*et al.*, 2005). The low activity of GSH-Px could be directly explained by the low content of GSH found in patients with the type 2 diabetes since GSH is a substrate and cofactor of GSH-Px. Enzyme inactivation could also contribute to the low GSH-Px activity. GSH-Px is a relatively stable enzyme, but it may be inactivated under conditions of severe oxidative stress. Inactivation of this enzyme may occur through glycation governed by prevailing glucose concentration (**Rahbani-Nobar et al.**, 1999). The increased activity of GR may be a compensatory response to oxidative stress. The changes in GSH-Px and GR activities found in this study may be considered as an adaptation of antioxidant defense against the increased production of ROS.

GSH dependent enzyme activities, such as GSSH-Px,  $\gamma$ -glutamyltranspeptidase, and GST were changed in diabetes (**Ballatori et al.**, 2009). The results showed that patients with the type 2 diabetes had lower GSH concentrations in erythrocytes (RBCs) than observed in the healthy individuals. This result is similar to the finding of **Livingstone et al.**, (2007). The present results showed that GST activity was increased significantly in patients with type 2 diabetes than in the healthy individuals. In RBCs, decreased GSH as well as increased serum total GST levels may be due to a compensatory mechanism of the antioxidants to defend the oxidative stress in diabetic conditions.

Positive correlation between MDA, total cholesterol and LDL-C, as well as positive correlation between GST, triglyceride and VLDL-C were found in patients with the type 2 diabetes. Positive correlations between GSH-Px and LDL-C in healthy individuals could indicate possible association between high lipid concentrations leading to accelerated lipid peroxidation and potentially increased the reduction of the organic hydroperoxides as a consequence of increased activity of GSH-Px. No such correlation was found in patients with the type 2 diabetes, while these were other significant correlations between GSH-Px and triglyceride in the healthy individuals.

### Conclusions:-

It was concluded that the Palestinian patients with the type 2 diabetes are presented with a significant increase in lipid peroxidation coupled to a significant decrease in the antioxidant mechanism. The study suggests the evaluation of antioxidant levels as a useful marker in the prevention of the diabetic complications.

 barium swallow

#### Abstract

Esophageal webs are infrequently reported with epidermolysis bullosa. We are presenting two cases of epidermolysis bullosa with symptomatic esophageal webs and typical dermal and skeletal features. Esophageal webs were reported on barium swallow examination and retrospectively correlated with physical and lab findings to establish the diagnosis of epidermolysis bullosa.

#### Introduction:-

Webs are amongst the most common esophageal structural abnormalities and most of them are asymptomatic but they can produce progressive dysphagia. An esophageal web is a 1-2 mm thick, shelf like extension of normal esophageal mucosa and submucosa that can occur anywhere along the length of the esophagus but is typically located in the anterior wall of the cervical esophagus. [1] Webs are seen in 5—15% of patients undergoing barium swallow study for the evaluation of dysphagia. [2] Although most proximal esophageal webs are considered idiopathic several associations have also been described. Commonly they are observed in Plummer Vinson syndrome, but they are also associated with rare skin disorders such as epidermolysis bullosa (EB) or other bullous diseases. [2] The overall incidence and prevalence of the disease is 8 per one million population in United States [3] and 32 in 1 million in Northern Ireland. However prevalence rates in Middle East population is unknown. [4]

Here we are presenting two cases of epidermolysis bullosa and its association with symptomatic esophageal web formation with typical skeletal and skin features, but no family history. These cases were primarily diagnosed on barium swallow examination.

#### Case I:-

A boy aged 14, presented with complaint of progressive dysphagia for solids for past five years with recurrent episodes of sticking of food at cricoid level, no history of regurgitation of food or hematemesis was given. There was no history of caustic ingestion. At the time of birth he had few blisters on extremities and had history of recurrent blistering of skin with even minor trauma. Blisters were itchy and rupture easily leaving a reddened skin which heal with scarring. His parents had consanguineous marriage but had no family history of such skin diseases nor did he had any significant surgical history. Physical examination revealed generalized scarred skin secondary to ruptured blisters, including perineal region. There was clubbing of hand nails while toe nails were small with loss of big toe nails. There were contractures in hands leading to flexion of fingers. Some atypical skeletal features were also observed including small ears, pointed fingers and long wide palms giving appearance of claw hands. Small tongue with inability to protrude forward. Few superficial oral ulcers were found but there was no angular glossitis

or dental carries. His hemoglobin level was 10 g/dl (range 12-14 g/dl). A barium swallow was performed which showed two esophageal webs one at C4 and another at C7 with little hold up of contrast proximally. Endoscopy was suggested. He was diagnosed with epidermolysis bullosa on clinical grounds and was treated with different anti allergies and antibiotics; no immunosuppressant therapy was given. (Figure 1).

Figure 1:-

**Case II:-**

Second patient was a middle aged male presented with history of difficulty in swallowing for past 10 years gradually worsening. Only able to take soft diet for past 5 years. His birth history revealed presence of blisters on skin and limb deformity at time of birth. Spontaneous blistering stopped after age of 20 years and now occurs rarely only after trauma. No biopsy was done and he did not receive any immunosuppressant therapy as well. His parent had consanguineous marriage. His three other siblings also had history of blistering of skin but it was mild, not associated with skeletal deformity and resolved spontaneously with time by age 15 to 20 years. On physical examination he also had scarred skin with fixed flexion at right wrist joint congenitally and flexion at metacarpophalangeal joints of both hands. Clubbing discoloration and deformity of nails of hands and feet. He gave history of oral soreness but no oral ulcers appreciated on examination. His hemoglobin level was 8 g/dl (range 12-14 g/dl). Skin biopsy for definitive diagnosis was advised but not performed due to affordability issue. He underwent barium swallow examination which showed multiple segments of circumferential smooth narrowing involving cervical esophagus and upper dorsal esophagus due to esophageal webs. (Figure 2).

Figure 2:-

### Discussion:-

Epidermolysis bullosa acquisita (EBA) is a well-defined, blistering disorder of the skin associated with autoantibodies to type VII collagen<sup>[5, 6]</sup> Esophageal involvement of EB was first described in 1929, including spectrum of manifestations, such as, diffuse inflammatory changes; disordered motility; bullae, ulcers, and mucosal scarring; webs; strictures; traction hiatal hernia and gastroesophageal reflux; complete obstruction of esophagus and perforation of esophagus. Webs are considered one of the earlier and milder manifestations. Dysphagia is reversible when caused by bullae or webs and permanent when due to strictures.<sup>[7]</sup>

Blistering of mucosa in epidermolysis bullosa is produced by minor trauma, but the actual mechanism behind this is not completely known. Presumably trauma from hot or rough foods causes separation of the esophageal epithelium from the lamina propria. Since the proximal third of the esophagus is the narrowest and least distensible, this might account for it being the most commonly affected segment. The distal third is the next most commonly involved, possibly because it is subject to both reflux gastric juice and pulsations of the heart and aorta.<sup>[8]</sup> Repeated blistering and healing probably results in fibrosis and stricture formation. As in our case blistering was improving with age but dysphagia caused by esophageal web was more troublesome for the patient. In a previously done case series of four patients by Marsden et al, it was observed that radiological examination is usually helpful when esophageal involvement is suspected. Radiological evidence of narrowing and irregularity of the upper third of the esophagus was present in all four patients of their study, while dysphagia severe enough to seek medical assistance was experienced by only two cases. Perhaps if all patients with epidermolysis bullosa were subjected to a routine barium swallow examination then esophageal involvement might be found to be more common than has been suspected.<sup>[8]</sup>

Our two patients remained un-diagnosed and were not given any immunosuppressant agent, therefore we can presume that early diagnosis and commencement of immune suppressive therapy could have prevented esophageal wear and tear and improve quality of life.

Nevertheless, barium swallow examination proved to be a diagnostic tool in our two cases, leading to early diagnosis of esophageal involvement and prompt treatment. It saved the patients from more advanced and debilitating condition of dysphagia due to esophageal stricture formation, complete obstruction or perforation.

#### Abstract

**Objectives:** The aim of the study to assess the family habit and status related to the factors associated with the development of the rheumatic fever and be aware about it.

**Methods:** The Type Of The Study Is Cross Sectional, It Will Include Collection Of Data From The Community's To Measure Their Awareness About Sore Throat And Its Relation To Rheumatic Fever. The Data Will Be Collected In The Western Area Of Kingdom Of Saudi Arabia, By Distributing A Form To The Families Which Included Questions About The Awareness Based On The Literature Review.

**Results:** This Study Was Applied On (407) Husbands And Wives From Different Cities In Western Area Of Kingdom Of Saudi Arabia. Most Of Them Were Female 260 (63.9 %) And 147 (36.1) Were Male.

**Conclusion:** We Conclude That The Parent Who Lived In The Eastern Region Of Saudi Arabia Need To Be More Educated Regarding The Sore Throat And Its Complication To Reduce The Incidence In The Future. This Could Be Done By Conducting Many Voluntarily Campaigns To The Family, Educative Accounts In The Social Media, Distribution Of Leaflet To The Parents.

#### Introduction:-

A Sore Throat Is Frequently The Primary Indication Of A Cold. In Any Case, A Sore Throat Usually Improves Or Cures After A Day Or Two. Other Cold Manifestations, For Example, A Runny Nose And Clog May Take After The Sore Throat. Strep Throat, Which Is A Contamination Because Of Streptococcus Microorganisms, Is Another Reason For Sore Throats And Tonsillitis. With Strep Throat, The Sore Throat Is More Serious. (1)

In United States The Frequency Of An Intense Rheumatic Scene Taking After Streptococcal Pharyngitis Is 0.5-3% . (2)

Acute Rheumatic Fever (ARF) And Its Sequelae Remain The Leading Cause Of Cardiovascular Disease In Children And Young Adults Especially In Developing Countries. It Represents A Major Public Health Problem Causing A Lot Of Suffering To The Patient And Their Families. (3)

In Western Locale In Saudi Arabia Rheumatic Heart Disease Was 24 For Every 10,000 Schoolchildren (6-15 Years) Higher In Country Ranges And In Females And 34% Is The Bearer Rate Of Beta-Hemolytic Streptococci. (2) Around The World, Rheumatic Heart Disease (Rhd) And Its Confusions Result In Around 233 000 Passings Every Year. The World Wellbeing Association (Who) Appraises That Around 16 Million Individuals Are At Present Influenced By The Disease. The Dominant Part Of Rhd Cases Happen In Africa Where Commonness Rates Are As High As One In 10 Individuals In A Few Groups. (4)

Consistently, Around 15 Million Individuals Are Influenced, 200,000 Bite The Dust, And 100,000 Get To Be Disabled.(5)

We Have Proven From Past And Current Activities, Founded In Different Parts Of The World, That Far Reaching Programs Joining Mindfulness Raising, Observation, And Anticipation Can Control RHD As Well As Make A Worldwide RHD Plan And Develop A Stage For Cooperation. (6)

Starting Here, We Do A Poll To Assess Awareness About Rheumatic Fever To Know Degree Of Awareness In Group As A First Study In Kingdom Of Saudi Arabia Done To Know The Couple's Awareness About Rheumatic Fever.

### **Methodology:-**

The Type Of The Study Is Cross Sectional, It Will Include Collection Of Data From The Community's To Measure Their Awareness About Sore Throat And Its Relation To Rheumatic Fever.

The Data Will Be Collected In The Western Area Of Kingdom Of Saudi Arabia, By Distributing A Form To The Families Which Included Questions About The Awareness Based On The Literature Review And Who Recommendation.

The Questions Include Ages, Number Of Children, City, Financial Status, And General Information About The Disease.

The Ethical Approval Will Be From The Research Committee In The College Of Medicine, Taif University.

### **Results:-**

The Aim Of The Study To Assess The Couple's Awareness About Sore Throat And Its Relation To Rheumatic Fever. This Study Was Applied On (407) Husbands And Wives From Different Cities In Western Area Of Kingdom Of Saudi Arabia. ( Table 1 ) .Most Of Them Were Female 260 (63.9 %) And 147 (36.1) Were Male (Graph 1). The Age Of The Studied Group Was Above 18 Years ( Distribution Of Age Will Be Shown On The Graph Below ( Graph 2 ) .

Education Level Of The Studied Group Is Shown On Table (2) 71.5% (291) Of The Studied Group Were Having University Or Higher Education, 22.4% (91) Were Having Secondary School Education, 4.2% (17) Were Having Intermediate School Education, While 2.0% (8) Were Having Primary School Education. Works Areas Of The Studied Group Were 37%(151) Were Not Working, 33% (133) Were In Educational Field, 13% (52) Were Health Care Workers , 8% (34) Were In Army Field , 7% (27) Were Private Sector And 2% (10) Were General Work Or Business(Graph 3 ) .

Monthly Income Of The Studied Group Is Shown On Table (3) 45.2% (184 ) Were More Than 10000 SR, 27.8% (113) Were 5000-10000 SR , 19.2% (78) Were Between 2000-5000 SR, 7.9% (32) Were Less Than 2000 Sr. 88.5% (360) Of All Studied Group Had Children While 11.5% (47) Did Not Have Children (Graph 4). 38.33% (156) Of All Studied Group Had More Than Three Children, 19.17% (78) Had One Child, 15.72% (64) Had Three Children While 15.32% (62) Had Two Children (Graph 5).

86.4% (352) Have The Children Previously Had Sore Throat While 13.6% (55) Did Not Have (Graph 6). 71.7% (292) Of All Studied Group Went To A Doctor To Treat His/hers Infected Child With Sore Throat, 9.34% (38) Did Not Do Anything And 5.4% (22) Home Remedies (Graph 7). 86.2% (351) Of All Studied Group Had An Infected Child With Sore Throat While 13.8% (56) Did Not Have An Infected Child With Sore Throat (Graph 8). 31.2% (127) ) Of The Studied Group Were Believe That The Cause Of Sore Throat Is Virus , 11.5 (47) They Did Not

Know, 10.1% (41) Bacteria, 2.9% (12) Dry Throat, 2.7 % (11) Allergy, 0.2 % (1) Gastroesophageal Reflex Disease, 0.5 (2) Tumors, 33.2% (135) Some Of Them While 7.6% (31) Were Believe All Of Them Can Cause The Sore Throat (Graph 9). 33.9% (138) Were Believe That There Is A Relationship Between Sore Throat And Some Heart Diseases, 14.3% (58) Were Believe That There Is No Relationship Between Sore Throat And Some Heart Diseases While 51.8% (211) They Did Not Know (Graph 10).

45.5% (185) Of All Studied Group Were Think That The Best Treatment For Sore Throat Has A Relationship To Prevent Heart Disease, 6.1% (25) Think That The Best Treatment For Sore Throat Has No A Relationship To Prevent Heart Disease While 48.4% (197) They Did Not Know (Graph 11 ) . 15.5% (63) Of All Studied Group Had Family Member Or Friend Diagnosed With Rheumatic Fever While 84.5% (344) Did Not Have (Graph 12 ) . 45.7% (186) Of All Studied Group Believe That The Age From 5 To 15 Years Old Are More Affected Of Rheumatic Fever, 21.6% (88) Believe That The Age More Than 36 Years Old Are More Affected, 17.2% (70) Less Than 5 Years And 15.5% (63) Believe That The Age From 16 To 35 Years Old Are More Affected (Graph 13). 14.0% (57) Of All Studied Group Think That Fever, Pain In The Joints, Involuntary Movements, Rash On The Body, Protrusions In The Skin Are Signs Some Of Heart Disease, 15.7% ( 64) Did Not Think , 70.3% (286) They Did Not Know (Graph 14 ) . 16.7% (68) Of All Studied Group Were Know That To Treatment A Patient Who Had A Rheumatic Fever, Has To Follow A Course Of Antibiotic (Mostly By Injections) For A Five To Ten Years Old If His Case Affecting The Heart While 83.3% (339) They Did Not Know (Table 4).

The Cities Of The Studied Group( **Table 1** ).

City	Frequency	Percent
Jeddah	129	31.7
Laith	4	1.0
Makkah	57	14.0
Qanfatha	5	1.2
Rabig	3	.7
Taif	209	51.4

Affecting The Heart With Antibiotic Treatment A Patient Who Had A Rheumatic Fever (Table 4).

Treatment With Antibiotic	Frequency	Percent
No	339	83.3
Yes	68	16.7

**Discussion:-**

Confusions Of Strep Throat Are Uncommon Yet Can Happen, Particularly If Strep Throat Is Not Appropriately Treated With Antibiotics Now And Again Because Of A Strep Disease, The Body's Safe Framework Will Assault Solid Tissues, Bringing About Complexities, For Example, Rheumatic Fever.<sup>(7)</sup>

Rheumatic Fever Can Bring About Long Haul Confusions In Specific Circumstances. A Standout Amongst The Most Common Confusions Is Rheumatic Coronary Illness. Kids Who Experience The Ill Effects Of Long Haul Harm Identified With Rheumatic Fever Might Be Qualified For A Specialized Curriculum And Other Related Administrations.<sup>(8)</sup>

The Quality Of Our Review Is The Main Overview In The Kingdom Of Saudi Arabia Do To Know The Couple's Mindfulness About Rheumatic Fever, In Our Insight .

Constraints In Our Review Incorporate Utilization Of An Online Overview That May Prompt To Determination Inclination And Not All Couples Can Be Utilize Web. Consequently, We Couldn't Sum Up Our Discoveries To All Couple's .

**Conclusion:-**

We Conclude That The Parent Who Lived In The Western Region Of Saudi Arabia Need To Be More Educated Regarding The Sore Throat And Its Complication To Reduce The Incidence In The Future. This Could Be Done By Conducting Many Voluntarily Campaigns To The Family, Educative Accounts In The Social Media, Distribution Of Leaflet To The Parents.

**Acknowledgment:-**

We are a group of doctors from different cities who shared together in finishing this research under supervision of Dr. Mamdouh Arif Nasser Alshareef hoping that it will be benefit in the medical field.

#### Abstract

Interactions between man and his environment have led to generation of wastes that pose problem of management and disposal. Failure to adopt appropriate disposal methods is followed by risk of infectious diseases. This study reports a survey involving a sample of 300 respondents drawn from a population of 3,427 rural inhabitants using the cluster sampling procedure. Two research questions were raised for the study that aimed to determine the solid waste disposal practices of typical Nigerian rural inhabitants. Instrument for data collection was the questionnaire designed by the researchers and contained 4 response options and used to elicit information from the respondents through interview schedule. Validity of the instruments was established through the judgment of three health educators and the reliability index value yielded 0.86 using the split half method and Spearman Brown correlation statistic. Data was analyzed on item-by-item basis using mean. It was found that the respondents disposed their refuse using all the refuse disposal methods highlighted by the researcher, but the once used very often by the rural inhabitants were open or uncontrolled burning, indiscriminate dumping on the ground and in the river. Implications of the practice for human health were articulated. The researchers recommended among other things that rural health extension workers should increase their enlightenment of the inhabitants on the need to adopt proper and suitable waste disposal methods.

#### Introduction:-

Management of wastes, especially, the solid type remains a cardinal element in the protection and promotion of public health. The continuous interaction between man and his physical, social and psychological environment has led to the generation of wastes that pose problem of management and disposal. This is followed by the risk of infectious diseases as a result of failure to adopt appropriate disposal methods. Waste according to Basavanthappa (2008) applies to unwanted or discarded waste matter. Also waste can be described as the unwanted solid-state materials originating from diverse environment. This means that waste is anything that is no longer useful and needs to be got rid of. The practice of getting rid of the wastes has been perceived as disposal (Basavanthappa, 2008, Park, 2011 and Obionu, 2015). Solid waste disposal therefore is the act of getting rid of solid-state materials that

Address:- Department of Health and Physical Education, Enugu State University of Science and Technology (ESUT) Enugu, Nigeria.

have been rejected as being useless and no longer wanted or needed. Suitable disposal methods are desired because of the variations in the types of waste generated in different places. This is evident in the views of Obionu (2015) who observed that a typical Nigerian solid waste could be classified into vegetable wastes; animal wastes; and mineral wastes. Consequently Otujo and Awokoya (2014) stated that one of the greatest threats to public health is improper disposal of waste, the presence of wastes poses serious health problems especially when such wastes are given less attention or left unattended to in terms proper disposal or management.

Similarly, methods adopted in the disposal of the wastes generated could also vary according to the locations. This is why it has become necessary that solid waste disposal methods adopted by the inhabitants of typical Nigerian rural community are determined. These unwanted solid-state materials are known to be disposable through various acceptable methods. Such methods according to different authorities (Akinsola, 2006, Lucas and Gilles, 2009 and Obionu,2015) are: controlled tipping; composting; incineration; berging; indiscriminate dumping; burying; pulverization; and recycling. Controlled tipping is the practice of piling wastes at a place and covering them with sand daily as against indiscriminate dumping of wastes anywhere without control and care. While incineration is burning the wastes in a large container, compositing is heaping the wastes in a pit for months with periodic turning. Berging is dumping the wastes inside water body such as sea or river. Pulverization is crushing the wastes with intention of either to convert into useful materials or burying.

Nonetheless, a typical Nigerian rural community may be faced with the environmental challenges of solid waste disposal. Following the obvious consequences of not being on top of solid waste challenges as a result of adopting unsuitable waste disposal methods, the need to determine the methods practiced by inhabitants of a typical Nigerian rural community has become needful. Practice according to Hornby (2001) is a thing that is done regularly as custom or habit. In the present study the methods regularly adopted by rural inhabitants in the disposal of solid waste will be determined.

Focusing such studies more on the rural area of Nigeria where well over 80 percent of Nigerians live (Ezedum (2002),Ani and Ezeugwu, 2014) may even be more rewarding. Furthermore, the Federal Environmental Protection Agency (EPA) and the State Environmental Sanitation Authorities in Nigeria, appear to have their focus on urban areas, thereby neglecting the rural areas. For instance, the desired impact of the monthly environmental sanitation exercise is hardly extended to and felt in the rural areas. Also In a similar study by Ani and Ugwuoke (2015), they found that there was a low level of provision of human waste disposal facilities in the rural community where the study was conducted. This development leaves the inhabitants of rural areas with the potentiality of being exposed to waste disposal related infectious diseases.

One of such typical Nigerian rural communities is Obioma in Udi Local Government Area of Enugu State. The community is organized into five villages and nineteen wards with undulating topography and the majority of the inhabitants who may be made of female subsistent farmers sharing different levels of education and ages. Whether these characteristics of the community could influence the choice of disposal methods therein is yet to be determined by this study. It is in view of this that Obionu (2015) held that the choice of a method for disposal of refuse would depend on the physical characteristics of the locality such as topography, character and quantity of the waste. Be that as it may, the broad objectives of any waste disposal method are to eliminate hazard to man; to prevent pollution of natural environment and; to salvage materials of economic value (Lucas and Gills, 2009). For these desired objectives to be achieved, especially in a rural area of a developing country, appropriate disposal methods have to be adopted. This is why the researchers specifically intend to:

- 1) determine the solid waste disposal methods of the inhabitants of a typical Nigerian rural community
- 2) find out the solid waste disposal methods often used by the inhabitants of a typical Nigerian rural community

The following research questions guided the study

- 1) What are the solid waste disposal methods adopted by the inhabitants of a typical Nigerian rural community?
- 2) What solid waste disposal methods are often used by the inhabitants of a typical Nigerian rural community

### **Methods:-**

The survey research design was adopted for the study. Three thousand four hundred and twenty seven (3,427) inhabitants (NPC, 2007) of Obioma community formed the population for the study. Cluster sampling procedure was employed in drawing the sample. Each village of Aba, Ameke, Umunugwo, Oluku and Amachalla was regarded as a cluster. Six respondents were selected from each of the ten households that were purposively drawn from each

cluster. The purpose was to control for the households that have up to six members with respondents' characteristics.

Instrument for data collection was a 16- item questionnaire with four response options. The respondents were required to indicate the disposal methods used and how often they dispose their solid wastes using the outlined methods of solid wastes disposal. Validity of the instrument was established through the judgment of three experts and the reliability for internal consistency was determined using test re-test method. The correlation coefficient index value yielded .86 using Spearman Brown correlation statistic .Data was collected personally by the researchers with the help of two research assistants, using interview schedule technique. Data collected from 300 inhabitants who responded to the questionnaire were analysed item-by-item using mean. The response options were assigned weights of 4, 3, 2, and 1 accordingly. Mean responses of 3.00 – 4.00 were regarded as strongly agree or very often; 2.00 – 2.99 were regarded as agree or sometimes, 1.00 – 1.99 were regarded as seldom or disagree while below one were regarded as never practiced or strongly disagree.

### Results:-

**Table 1:-** Mean Responses of the Inhabitants' on Solid Waste Disposal Methods used (n = 300).

S/N	Waste Disposal Methods	X	SD	Interpretation
1	Controlled Tipping	2.14	1.02	Agree
2	Composting	2.43	1.07	Agree
3	Open or uncontrolled Burning	2.22	0.84	Agree
4	Berging or throwing inside river	2.96	0.73	Agree
5	Indiscriminate Dumping	3.00	0.98	Strongly agree
6	Burying	2.52	0.89	Agree
7	Pulverization	1.96	0.78	Disagree
8	Recycling	1.88	0.72	Disagree
9	Incineration	1.58	0.64	Disagree
	<b>Grand Mean</b>	<b>2.30</b>	<b>0.85</b>	<b>Agree</b>

Data in Table 1 show a grand mean score of 2.30 which indicates that inhabitants agree that they dispose their solid wastes. Data in the Table also reveal that item 5 attracted mean score of 3.00 meaning that the inhabitants strongly agree that they dispose their refuse indiscriminately. Also in the table, it was shown that the respondents agreed that they dispose their solid waste by control tipping, composting, open burning, berging and burying. However, the Table shows that items 7, 8 & 9 attracted mean scores of 1.96, 1.88 & 1.58 respectively. This implies that the inhabitants disagree with disposing their solid wastes by pulverization, recycling and incineration.

**Table 2:-** Mean Responses on Solid Waste Disposal Methods often used by the inhabitants of a typical Nigerian rural community (n = 300).

S/N	Waste Disposal Methods	X	SD	Interpretation
1	Controlled Tipping	1.62	1.02	Sometimes
2	Composting	2.14	1.07	Sometimes
3	Incineration	2.22	0.84	Sometimes
4	Bergin or throwing inside river	3.16	0.73	Very often
5	Indiscriminate Dumping	3.46	0.98	Very often
6	Burying	2.52	0.89	Sometimes
7	Pulverization	1.16	0.78	Never
8	Recycling	1.38	0.72	Never
9	Incineration	1.25	0.42	Never
	<b>Grand Mean</b>	<b>2.10</b>	<b>0.88</b>	<b>Sometimes</b>

Data in Table 2 show a grand mean score of 2.10 which indicates that inhabitants sometimes dispose their solid wastes. Data in the Table also reveal that items 4 and 5 attracted mean scores of 3.16 and 3.46 meaning that the inhabitants practice throwing of waste inside river and indiscriminate dumping of refuse very often. Also in the table, it was shown that the respondents sometimes dispose solid waste by control tipping, incineration, composting and burying. However, the Table shows that items 7, 8 & 9 attracted mean scores of 1.16, 1.38 & 1.25 respectively.

This implies that the inhabitants never practiced pulverization, recycling and incineration as methods of disposing their solid wastes.

#### **Summary of Findings:-**

1. Rural inhabitants agreed that they dispose their wastes
2. Waste disposal practices often adopted by rural inhabitants were mainly indiscriminate dumping on the ground and sea, burying and open burning.

#### **Discussion:-**

The purpose of this study was to determine the solid waste disposal methods of the inhabitants of a typical Nigerian rural community. The findings showed that typical Nigerian rural inhabitants dispose their solid wastes by mainly dumping them indiscriminately, burning them, throwing inside river or sometimes burying. A typical Nigerian solid waste is composed of leaves, food items, paper, cartons, rags, plastic and polythene, tins, broken bottles and glasses (Obionu, 2015). Majority of them are dry refuse which may promote fire disaster if not properly disposed. Given this background of the methods adopted by rural inhabitants, exposure to health hazards of enormous dimension is highly imminent. This is because it has been warned that indiscriminate dumping of refuse would lead to fire outbreak and injuries, especially to children playing around and also cause flooding by blocking drainage channels.

In addition to these, it is known that improper solid waste disposal would lead to offensive conditions such as bad smells, fly mosquito breeding and proliferation of other hazardous vectors and vermin. However, the finding that these rural inhabitants dispose waste indiscriminately was not surprising to the researcher. This is because, Akinsola (2006) had earlier observed that uncontrolled dumping of waste was commonly used in rural tropical communities where there was either no facility for proper disposal or that control measures were lacking, however it is not a positive development because it is expected that their ought to be an improvement in the waste disposal practices of the people going by the efforts on the ground by various health and environmental agencies in ensuring that there is improved environmental sanitation in Nigeria.

The implication of the finding is that, the objective of eliminating hazard to man; and preventing pollution of natural environment through proper waste disposal would become a mirage in the rural communities. Furthermore, poor sanitary environmental-related diseases will be promoted and optimal health status may reduce. This finding is in agreement with Lucas and Gilles (2009), Otujo and Awokoya (2014) who had observed that failure to manage and dispose waste properly exposed people to increased risk of infectious disease. It is the suspicion of the researchers that, the burying that is sometimes practiced by the inhabitants is limited to the disposal of the dead. Disposing the dead by burying is a generally adopted method especially among the Christians and Moslems. The burning found to be practiced by these inhabitants is generally seen as having its demerits. Apart from the danger of disease spread, it contributes to ozone layer depletion, atmospheric pollution, and global warming; hence there is need for improved waste disposal practices by the rural dwellers.

#### **Conclusion:-**

Based on the findings of the study, the following conclusions are made:

- (1) Rural inhabitants dispose their solid waste.
- (2) Solid waste disposal practices of rural inhabitants are indiscriminate dumping and dumping inside river.
- (3) These methods adopted by the rural dwellers expose them to increased risk of infection and diseases.
- (4) Possibilities abound that the rural inhabitants may not have optimal health as a result of improper waste disposal.

#### **Recommendations:-**

- (1) Rural health extension workers should increase their enlightenment of the inhabitants on the need for proper and suitable waste disposal methods.
- (2) Supervision and enforcement of the monthly environmental sanitation exercises in the country should be extended to the rural areas.

#### Abstract

We are living in an electronic age. The whole world is taking a new turn with every fraction of time. It has given birth to globalization. The world has been contracted and concise at a tip. There are a lot of new means of communication which have made our life so simple and easy going. Mobile phone can be seen as the most used present day phenomenon in this fast growing time. Mobile phone is a revolutionary step in the field of tele-communication. The objective of this paper is to study the relative preferences of influencing factors and satisfaction of rural and urban consumers regarding durable goods for mobile.

Copy Right, IJAR, 2017,. All rights reserved.

#### Introduction:-

Consumers play very important role in the economy. They are largest economic group in any country and present day activities are done because of consumer only. Consumers are the pillars of the economy. Consumers in India are very heterogeneous in composition, following different religions, speaking different languages, using different products and services and adhering closely to their tradition. The Indian economy has ushered in a new era, wherein the country's per capita income in recent years has increased. Due to this, the share of essential items likes food, clothing, electricity and fuels, footwear in total average annual per capita consumption expenditure has reduced whereas the share of durable goods has increased, which reflect the changing preferences of consumers. The increase in share of expenditure on durable goods shows change in buying decision of consumers in favor of durable goods. The share of durable goods such as refrigerator, cars or mobile phones usually continues to be increases in this duration. But the courage of brands now shifts most in mobile phones. The consumers influence on brands, quality and new features. Thus there is to understand the factors which influence the consumers while purchasing durable goods like Mobile.

#### Objective Of The Study:-

To study the relative preferences of influencing factors and satisfaction of rural and urban consumers regarding durable goods for mobile

#### Research Methodology:-

The study has been based on primary data. Primary sources have been used to acquire the necessary information from respondents by survey method. A sample of 200 respondents, 150 respondents from urban area (Bhiwani City)

**Corresponding Author:- Nisha.**

Address:- Research Scholar, Dept. of Economics, M.D.U, Rohtak.

and 50 respondents from rural area (Siwani Khera village) from Bhiwani District have been selected on the basis of convenience sampling. Four durable goods Mobile have been selected for the study. The study explained five main factors (Price, Quality, Style, Functions and Brand Name) which influencing consumers while purchasing durables. The study also examines brand of durables and sources of information used by rural and urban consumers and also, satisfaction of rural and urban consumers for their durables. The primary data was collected through structured questionnaire. The data has been tabulated, analyzed and interpreted with the help of some necessary and statistical tools simple percentage, mean score, Analysis of Variance.

### Present Scenario Of Mobile Phones:-

One of the most astonishing explosions in modern consumer culture is undoubtedly the mobile. People see their phone as a reflection of themselves and their status; they use it to communicate how they are feeling and to improve their everyday experience of life. Mobiles present an exciting opportunity to establish how technology developed for communication with others could have an increasingly prominent impact on the subjective configuration of the self. It could be contended that the mobile—a technological tool initially designed simply as means of communication—has had an impact beyond its function; it has become a fashion accessory, a prosthetic extension of and delineation of the self, a symbol of economic status and power. The mobile phone market in India is expected to grow by 4% to 250 million units this year and can see more handsets available for less than Rs 5,000, a research report has said. "An examination of the present scenario, coupled with an analysis of historical trends tells us that the market for India mobile handsets will settle around 250 million units in 2016, a 4 per cent growth compared to 2015," the report, India Mobile Handsets Market, by Cyber Media Research (CMR) said. The Smartphone segment grew at an annual average rate of 32% to about 95 million in 2015 from 77 million a year ago. The report said it expects 4G shipments to cross 50 million units in 2016. The CMR researchers also noted that average selling price for a Smartphone in 2013 was Rs 13,000 (when 41 million units were sold), which has come down to Rs 10,700 by the end of 2015.

### Result And Discussions:-

**Table -1:-** Brand of Mobile used by the Rural and Urban Respondents.

Sr. No.	Brand Used	No. of the Respondents	
		Rural	Urban
		No. (%)	No. (%)
1	Nokia	17 (34%)	60(40%)
2	Apple	0 (0%)	05(3.33%)
3	Samsung	16 (32%)	50(33.3%)
4	Motorola	05 (10%)	10(6.66%)
5	Others	12 (24%)	25(16.6%)
Total		50(100%)	150(100%)

Source: Field Survey

From the above table 1, it is inferred that in a sample of 50 respondents in rural area, 34% respondents used Nokia followed by 32% Samsung, 10% Motorola and 24% other brand of Mobile. In urban area in a sample of 150 respondents 40% respondents used Nokia followed by 3.33% Apple, 33.3% Samsung, 6.66% Motorola, 3.33% LG and 16.6% others brand of Mobile. Thus both in rural and urban area Nokia and Samsung are mostly used brand of Mobile.

### Mean Score Analysis:

**Table-2:-** Mean Score of Factors while purchasing Mobile phone by Rural and Urban Respondents.

Factors Influencing	Rural	Urban
Price	2.86	2.42
Quality	3.82	4.26
Style	1.96	2.56
Functions	3.16	2.86
Brand Name	3.30	2.90

Source: Field Survey

Mean score of factors regarding Mobile is given in table-2 which shows that both Rural and Urban respondents have shown highest preferences towards quality while purchasing Mobile with mean score 3.82 and 4.26 followed by

brand name 3.30 and 2.90. Rural respondents given lowest preference given to style with mean score 1.96 while urban respondents given to price with mean score 2.42. Thus quality and brand name are the preferred factors both in rural and urban area.

**Table-3:-** Results of ANOVA showing difference in the mean score of influencing factors of Rural and Urban Respondents in case of Mobile.

Factors		Sum of Squares	df	Mean Square	F	p-value
Price	Between Groups	7.042	1	7.042	3.066	.081
	Within Groups	454.713	198	2.297		
	Total	461.755	199			
Quality	Between Groups	7.482	1	7.482	7.608	.006
	Within Groups	194.713	198	.983		
	Total	202.195	199			
Style	Between Groups	13.802	1	13.802	8.415	.004
	Within Groups	324.753	198	1.640		
	Total	338.555	199			
Functions	Between Groups	3.227	1	3.227	2.298	.131
	Within Groups	278.053	198	1.404		
	Total	281.280	199			
Brand Name	Between Groups	6.000	1	6.000	3.375	.068
	Within Groups	352.000	198	1.778		
	Total	358.000	199			

Source: Field Survey

ANOVA table-3 is generated to unearth the differences in the mean score of influencing factors on rural and urban respondents in case of Mobile. Table-shows that analysis of variance does not show significant difference in the mean score of rural and urban respondents regarding 'Price Consciousness', 'Functions Consciousness' and 'Brand Consciousness' but shows significant difference regarding 'Quality Consciousness' and 'Style Consciousness' in case of Mobile.

### Conclusion:-

The forgoing study revealed that now in era of science and technology the whole market is depends upon the consumer behaviour. But there is difference in the preference and knowledge of brands in rural and urban area. Due to the open market condition, many foreign companies have entered into the Indian market with advanced technology. This has led to change in life style of our Indian consumers' that has in turn resulted in a challenge to our existing Indian companies to reconsider their strategies of production and marketing. On the other hand Product characteristics include quality, price, style (design), brand name, functions (features) and packaging of the product. Thus while purchasing the products, consumers may be influenced by various attributes, since each consumer may prefer different sets of attributes, the researcher is interested in identifying the level of influence of each attribute while they purchase the durable products. The result of the study indicated that Mobile used by most of the rural and urban respondents was Nokia followed by Samsung. It was found that highest preference was given to quality and lowest preference to price by both of the rural and urban respondents while purchasing Mobile. In case of Mobile, it was found that there was no significant difference between mean score of rural and urban respondents regarding 'Price Consciousness', 'Functions Consciousness' and 'Brand Consciousness' but found significant difference in 'Quality Consciousness' and 'Style Consciousness'. It indicates that urban consumers were highly quality and style consciousness compare to rural consumers.

laboratorium-based engineering learning.

#### **Abstract**

The study was to find the improvement on the competence of university students' learning results in the Engine Elements Course in the topic of Shaft Planning and Calculation. The competencies that would be improved were knowledge, analysis, calculation results and cumulative learning results. In order to achieve the objective of the study, the researcher implemented a quasi-experiment method by selecting 49 university students to be given lesson and be tested. There are three types of learning stages. The first stage consisted of theoretical study and test. Then, the second stage consisted of laboratory study and test. Last but not the least, the third stage consisted of laboratory observation and test. The analysis that the researcher performed in the stud was the Partial Least Square (PLS) analysis in order to identify the differences from one test to another. From the results of the study, there were three aspects which results improvement might be measured, namely knowledge (A), analysis (B) and calculation results (C). The learning results improvement between knowledge A1 and knowledge A2 was 3.5% and between knowledge A2 and knowledge A3 was 1.1%. Then, the learning results improvement between analysis B1 and analysis B2 was 40.0% and between analysis B2 and analysis B3 was 10.5%. Next, the learning results improvement between calculation results C1 and calculation results C2 was 59.4% and between calculation results C2 and calculation results C3 was 46.1%. Altogether, the improvement on the learning results competency between P1 and P2 was 25.6% and between P2 and P3 was 14.89%.

#### **Introduction:-**

Learning is a process that cultivates a set of values that have been consumed by the students and that have been taken from multiple sources. According to Arief Sadiman (2002)<sup>1</sup>, learning sources might be classified into five categories namely: human, books/library, mass media, natural environment and educational media. In other words, learning sources refer to every single matter that might be used as a place where the teaching materials might be attained or where the origin of an individual's learning process might be attained. The engineering laboratory might also serve as an educational media that assists the teachers in enriching the learning participants' insight. In

**Corresponding Author:- Murdani.**

explaining an object, a lecturer might take his or her students to a laboratory. By the looking at the objects in the laboratory, these objects might serve as learning sources.

Learning medium as an assisting tool serve to ease the way in achieving the teaching objectives. The statement is based on a belief that the teaching-learning process with the assistance of the media may improve the learning participants' learning activities within a long period of time. In other words, the learning participants' learning activities that are assisted by the learning medium will result in better learning process and results. Ali Imron (2002)<sup>2</sup> provides limitation regarding media, namely medium refers to any form and material that has been used for delivering message or information. In addition to serving as a system of delivery or introduction, media that has been derived from the word mediator, according to Azhar (2002)<sup>3</sup>, is a cause or a tool that interferes two parties in order to provide peace among the two parties. With the term mediator, the media shows its role or function namely to regulate an effective relationship between two main parties in the students' learning process and the learning content. If the media deliver instructional messages or information, or if the media contain the teaching intentions, then the media will be regarded as teaching media.

According to Azhar (2003)<sup>3</sup>, there are three main levels in the learning mode namely direct experience (enactive level), pictorial experience (iconic level) and abstract experience (symbolic level). Such experience level in attaining the learning results is depicted as a process of communication. The materials that the teachers want to deliver and that the students demand, until the students master all of the materials, are known as messages. The teachers as the source put the messages into certain symbols (encoding process) and the students as the retriever will interpret these symbols in order to understand these symbols as messages (decoding process). Learning by using double senses (the vision and the auditory) will gain more results compared to learning by only using the vision or the auditory. The comparison on the learning results between the vision and the auditory has significant difference. Approximately 90% of an individual's learning results are attained by the vision and only 5% of those are attained by the other senses<sup>12</sup>. On the other hand, Arief Sardiman (2002)<sup>1</sup> predicts that the students attain 75% of their learning results from the vision, 13% of their learning results from auditory and 12% of their learning results from other senses.

In a learning process, two most important elements are the teaching methods and the learning media. The selection of certain teaching methods will influence the type of appropriate learning media. Several aspects that should be given attention in selecting the media are: the learning objectives, the learning contexts, the lesson types and the students' characteristics. All of these aspects are expected to be mastered by the students after the learning process has occurred. Skinner (1998)<sup>4</sup> state that there are four functions of learning media, especially the visual learning media, namely the attentive function, the affective function, the cognitive function and the compensatory function. The four functions might support one to another so that they will strengthen one to another in the learning process. Then, according to Jujun (2003)<sup>5</sup>, learning media might meet the three main functions namely to motivate interest or action, to provide information and to give instruction. Learning media might also be implemented for individual, group or hugh group of listeners. Saiful Sagala (2001)<sup>6</sup> states the benefits of using learning media in the students' learning process as follows: the learning media will draw more attention, the learning materials will have clearer meaning, the teaching methods will be more various and the students might display more learning desire. From the opinions of several experts, the researcher might conclude several practical benefits from the use of learning media, namely to ease and to increase the learning process and results. From the perspective of learning theory, multiple conditions and psychological principles that should be considered in selecting and in using the learning media are related to the improving the students' motivation.

An effective teaching is the result of good learning plan; therefore, the learning media that will be used in the teaching process should also have good planning. Several aspects that should be considered by the teachers in selecting the learning media for the class activities are: the selected media are easy to use, the selected media might provide better explanation, the selected media might draw the students' interest and attention and the selected media might lead to the more structured and organized presentation. The consideration is expected to meet the needs in achieving the objectives that have been formulated.

Competence, on the other hand, refers to the capacity of performing certain jobs that include the aspects of knowledge, skills and attitudes. Therefore, competence might be improved. According to Spencer & Spencer (1990)<sup>7</sup>, Essential competencies as the foundation of knowledge and skills need by everyone; these can be developed through training and are relatively easy to identify. From the statement, the researcher might conclude that the competencies of an individual might be developed through training programs. Tjutju Yuniarsih (2008)<sup>8</sup> states that

the knowledge competencies and the skill competencies are relatively easy to develop and the learning and training programs are the most effective ways for developing these competencies. Therefore, learning programs, training programs and the combination of both programs in the working place will be the main key for developing and improving the competencies.

The Engineering Elements Course is a course that will be the foundation of engineering shaft planning. Therefore, the explanation of engineering shaft will be better if it is assisted by the object. Based on the learning experiences, the researcher found that many university students have not understood that object that will be planned. The same findings might also be seen in the results of a test conducted in 2015: only 20% of the students had been able to achieve the limit of the already formulated competencies. Since the competencies have not been achieved in accordance to the expectation, the lecturers should benefit the existing engineering laboratory as the learning media for Engineering Elements Course especially in the shaft planning.

Based on the explanation, the engineering laboratory might be used as the learning medium in order to improve the university students' learning results in the Engineering Element Course especially in the shaft planning. In addition, the engineering laboratory might also be used for increasing the size of influence so that the lecturers might improve the competencies on the learning results.

### Research Methods:-

The study made use of quasi-experiment approach by taking all of the Engineering Education Study Program students who took the Engineering Elements Course in 2015 as the respondents and the number of the respondents were 49 people. The study took place in the Department of Engineering Semarang State University and the study was conducted in the classroom and in the laboratory. The classroom session was related to learning the theory all aspects that had been related to the shaft planing. Then, the laboratory session was related to learning all types of shafts, the forces that worked on the shaft, the materials that should be used and the allowed positioning and tolerance. All tests were conducted after the session had ended.

In order to gain the accurate data regarding the unclear problems for the students, there should be several personal approaches and these approaches might be conducted by increasing the number of consultation sessions for the students whose test results had been less than the already determined criteria (under 75). All of the data from the test results were analyzed by means of Partial Least Square (PLS) program in order to measure the improvement on the test results and several factors that influenced the improvement.

### Results And Discussion:-

#### Competence Improvement on the Test Results:

##### Test Results:

The test results were the reflection of the competence achievement that had been attained from the test on each learning stage. In each learning stage, there were three components that had been assessed namely knowledge (A), analysis (B) and calculation results (C). The final score consisted of  $A + B + C$  and the results of summation would be divided by three; the final score will be the final result for each learning process. The conclusion of the test results in the Learning Stage I might be seen in the following Table 1:

**Table 1:-** Learning Stage I (P1) Test Results.

Score	A1	B1	C1	P1
Mean	83	56	37	59
Total	4075	2775	1835	2915
Min	80	30	25	45
Max	90	80	55	75

From Table 1, the researcher might state as well that from the Learning Stage I results (P1) the mean score was 59 and the total score was 2916 with 45 as the lowest score and 75 as the highest score. From the test results in the first stage there were only 5 students (10%) who had been able to achieve the minimum passing grade that had been determined. The achievement above the minimum passing grade was heavily supported by the A1 score, which referred to the score of knowledge.

Learning Stage II (P2) Test Results.

**Table 2:-** Learning Stage II (P2) Test Results.

Score	A2	B2	C2	P2
Mean	86	76	59	74
Total	4245	3755	2905	3625
Min	80	70	40	65
Max	90	85	70	80

The conclusion of the Learning Stage II results might be seen in the following Table 2.

From Table 2, the researcher might conclude that from the Learning Stage II (P2) results the mean score was 74 and the total score was 3625 with 65 as the lowest score and 90 as the highest score. From the second test, there were 20 students (40%) who had been able to achieve the minimum passing grade that had been determined.

Learning Stage III (P3) Test Results.

**Table 3:-** Learning Stage III (P3) Test Results.

Score	A3	B3	C3	P3
Mean	86	84	83	85
Total	4235	4130	4105	4155
Min	80	80	80	80
Max	95	95	95	95

The conclusion on the Learning Stage III (P3) test results might be seen in the following Table 3.

From Table 3, the researcher might conclude that from the Learning Stage III (P3) test results the mean score was 84 and the total score was 4155 with 80 as the lowest score and 95 as the highest score. From the third test all of the students (49 = 100%) might achieve the minimum passing grade that had been determined.

Improvement on the Competence Test Results

There were three aspects that might be measured in terms of test result improvement namely knowledge (A), analysis (B) and calculation result (C). The improvement on the competence test result was attained twice, namely the improvement on the Second Learning Stage (P2) test results from the First Stage Learning Stage (P1) test results and the improvement on the Third Learning Stage (P3) test results from the Second Learning Stage (P2) test results. Improvement on the Learning Stage I (P1) Competence Test Results and the Learning Stage II (P2) Competence Test Results on the Aspect of Knowledge (A1 and A2).

**Table 4:-** Improvement on the A1 Knowledge Test Results and A2 Knowledge Test Results.

Test	N	Mean	Standard Deviation	- T Statistics
A1	49	83	3.636	1.101-
A2	49	86	3.444	-

In Table 4, the researcher found that the mean score of A1 knowledge test was 83 and the mean score of A2 knowledge test was 86. The T-Statistics = 1.101 and this score was smaller than T-table = 1.69. These findings show that there had been improvement on the knowledge test results but the improvement was not significant and the improvement had been marked by the increasing test results in A2 from A1 and by the T-count that had been smaller than the T-table. The improvement in overall was 3.5%.

Improvement on the Learning Stage II (P2) Competence Test Results and the Learning Stage III (P3) Competence Test Results in the Aspect of Knowledge (A2 and A3).

**Table 5:-** Improvement on the A2 Knowledge Test Results and A3 Knowledge Test Results.

Test	N	Mean	Standard Deviation	T Statistics
A2	49	86	3.444	0.76
A3	49	87	5.103	-

In Table 5, the researcher found that the mean score of A2 knowledge test was 86 and the mean score of A3 knowledge test was 87. The T-Statistics = 0.76 and the score was smaller than T-table = 1.69. Thereby, the researcher might conclude that there had been improvement on the knowledge test results but the improvement was not significant and the improvement had been marked by the increasing test results in A3 from A2 and by the T-Count that had been smaller than the T-table. The improvement in overall was 1.1%.

The Improvement on the Learning Stage I (P1) Competence Test Results and the Learning Stage II (P2) Competence Test Results in the Aspect of Analysis (B1 and B2).

**Table 6:-** Improvement on the B1 Analysis Test Results and B2 Analysis Test Results.

Test	N	Mean	Standard Deviation	- T Statistics
B1	49	56	15.730	12.34
B2	49	76	4.256	-

In Table 6, the researcher found that the mean score of B1 analysis test results was 56 and the mean score of B2 analysis test results was 76. The T-Table = 12.34 and the score was bigger than T-table = 1.69. These findings showed that there had been significant improvement on analysis test results and the improvement had been marked by the increasing mean score of test results in B2 from B1 and by the T-count that had been bigger than the T-table. The improvement in overall was 40%.

Improvement on the Learning Stage III (P3) Competence Test Results from the Learning Stage II (P2) Competence Test Results on the Aspect of Analysis (B3 from B2).

**Table 7:-** Improvement on the B3 Analysis Test Results from the B2 Analysis Test Results.

Test	N	Mean	Standard Deviation	- T Statistics
B2	49	76	4.256	9.63
B3	49	84	4.208	-

In Table 7, the researcher found that the mean score of B2 analysis test results was 76 and the mean score of B3 analysis test results was 84. The T-Statistics = 9.63 and the score had been bigger than the T-table = 1.69. Thereby, the researcher might conclude that there had been significant improvement on the test results and the improvement had been marked by the increasing B3 test results from B2 test results and by the T-count that had been bigger than the T-table. In overall the improvement was 10.5%.

Improvement on the Learning Stage II (P2) Competence Test Results from the Learning Stage I (P1) Competence Test Results in the Aspect of Calculation Results (C2 from C1).

**Table 8:-** Improvement on the Test Results of C2 Calculation Result from C1 Calculation Result.

Test	N	Mean	Standard Deviation	- T Statistics
C1	49	37	8.173	12.30
C2	49	59	9.895	-

In Table 8, the researcher found that the mean score of C1 was 37 and the mean score of C2 was 59. The T-Statistics = 12.30 and the score was bigger than the T-table = 1.69. These findings showed that there had been significant improvement and the significant improvement had been marked the increasing test results of C2 from those of C1 and by the T-count that had been bigger than the T-table. In overall the improvement was 59.4%.

Improvement on the Learning Stage III (P3) Competence Test Results and the Learning Stage II (P2) Competence Test Results on the Aspect of Calculation Results (C3 from C2).

**Table 9:-** Improvement on the Test Results of C3 Calculation Result from C2 Calculation Result.

Test	N	Mean	Standard Deviation	- T Statistics
C2	49	59	9.895	21.33
C3	49	83	4.273	-

In Table 9, the researcher found that the mean score of C2 as 59 and the mean score of C3 was 83. The T-Statistics = 21.33 and the score had been bigger than the T-table = 1.69. Thereby, the researcher might conclude that there had been significant improvement and the significant improvement had been marked by the increasing test results of C3 from C2 and the T-table that had been bigger than the T-count. In overall, the improvement was 46.1%.

Improvement on the Learning Stage II (P2) Cummulative Competence Test Results from the Learning Stage I (P1) Cummulative Competence Test Results.

The results of Learning Stage (P) competence test was a score that had been consisted of knowledge (A) score plus analysis (B) score plus calculation result (C) divided by 3 ( $P = (A + B + C)/3$ ).

**Table 10:-** Improvement from the Learning Stage II (P2) Competence Test Results from the Learning Stage I (P1) Competence Test Results.

Test	N	Mean	Standard Deviation	- T Statistics
P1	49	59	9.199	7.15
P2	49	74	4.998	-

In Table 10, the researcher found that the mean score of P1 test results was 59 and the mean score of P2 test results was 74. The T-Statistics = 7.15 and the score had been bigger than the T-table [= 1.69]. These findings showed that there had been improvement on the learning stage cumulative test results and the improvement had been marked by the increasing mean score in P2 from P1 and by the T-count that had been bigger than the T-table. In overall, the improvement was 25.6%.

Improvement on the Learning Stage III (P3) Cummulative Competence Test Results from the Learning Stage II (P2) Cummulative Competence Test Results.

**Table 11:-** Improvement on the Learning Stage III (P3) Cummulative Competence Test Results and the Learning Stage II (P2) Cummulative Competence Test Results.

Test	N	Mean	Standard Deviation	- T Statistics
P2	49	74	7.211	4.331
P3	49	85	1.523	-

In Table 11, the researcher found that the mean score of P3 competence test results was 74 and the mean score of P2 competence test results was 85. The T-Statistics = 4.331 and the score had been bigger T-table = 1.69. These findings showed that there had been significant improvement on the cumulative competence test results and the significant improvement had been marked by the increasing mean score of P2 from P2 and the T-count that had been bigger than the T-table. In overall, the improvement was 14.89%.

### Discussions:-

The learning activity that the researcher conducted was direct observation toward the object that would be planned. By directly observing the object that would be planned, the students had better comprehension and increasing competence. This finding was in accordance with the statement of Azhar (2003)<sup>3</sup> that the main level of learning mode had been the direct experience (enactive level). Learning by means of vision would cause the students to retrieve more learning materials. Furthermore, Saiful Sagala (2002)<sup>6</sup> stated that the attainment of learning results through the vision of an individual might approximately be 75%. Thereby, the results of the study had proved the studies conducted by the experts.

Two most important elements in the learning process were the teaching methods and the learning media. Both aspects were related from one to another and the selection of certain teaching methods would influence the appropriate learning media. In the learning activities that had been conducted, the students were invited to the engineering laboratory in order to observe the object that would be planned. The students apparently were very interested with what they saw in the engineering laboratory, namely the engine shaft; then, they asked the functions of the engine shaft and how to plan and to design the shaft. From the situation, the researcher might infer that the teaching methods and the learning media that had been implemented might draw the interest, might provide better information and might send very beneficial learning messages. The statement was in accordance with the statement of Jujun (2003)<sup>5</sup> that good learning media should be able to meet the main three functions namely to motivate interest or action, to provide information and to give instruction. The teaching method that had been selected was also in accordance with the statement of Saiful Sagala (2001)<sup>6</sup> who stated that the benefits of learning media in the teaching-learning process were: the learning media would draw more attention, the teaching materials would provide better meaning, the teaching methods would be more various and the students might display greater learning desires. From the results of the study regarding the engineering laboratory-based learning process the researcher found many situations that had been in accordance with those of other studies and, therefore, the researcher might conclude that the practical benefit of using learning media had been to ease and to improve the learning process and results. From the perspective of learning theory, multiple conditions and psychological principles that should be considered in selecting and in using the learning media were the ones that would increase the students' motivation.

The competence improvement on the university students' learning results in the study was also in accordance with the results of a study by Eka Ariyani (2009)<sup>9</sup>, which concluded that the learning of ecosystem and biodiversity through the laboratory practice-based learning process might significantly improve the critical thinking capacity of the university students with the moderate category. Furthermore, the results of a study by Ketut Suma (2009)<sup>9</sup> also stated that the inquiry-based learning had been more effective in increasing the content of Physics and the reasoning capacity of teacher-candidate students in the moderate level.

In overall, the results of the study showed that there had been competence improvement in the learning results of the university students after the students directly observed the object that would be planned. The competence improvement was proved by the improvement on the mean score of the test that had been conducted.

The results of the study were also in accordance with those of a study by R. Mursid (2013)<sup>9</sup>, which concluded that the development of product-oriented competence-based practical learning model might improve the learning results of university students in the Engineering Technology Course. Then, the results of the study were also supported by those of a study by M. Wahyudi (2014)<sup>9</sup>, which stated that the demonstration learning might improve the results of engine regular service practice for the vocational high school teachers in the automotive engineering departments under the training and education program of vocational competence in P4TK BOE Malang. The researcher found that the practical course should be supported by the appropriate use of learning media in order to improve the competence of learning results. Rabiman (2014)<sup>9</sup> stated that the selection of appropriate learning media might improve the learning results of university students in the Department of Engineering, Sarjanawiyata Tamansiswa University, Yogyakarta. The improvement on the competence of test results was not apart of the implementation of the modul that had been appropriate to the context that would be studied. As having been stated by Wijanarka et al. (2014)<sup>9</sup>, the results of implementing the CAD/CAM software modules might improvement the theoretical competencies and the practical competencies of the vocational high school students in Yogyakarta. In overall, the results of the study also stated that the overall learning process that had been conducted should be supported by innovation in order to improve the competence of the learning results.

Based on the overall results of the study regarding the use of laboratory for providing clear information in the learning process, the researcher found that the overall learning process might improve the competence of the students' learning results. It was the overall learning process that had been suitable to the results of the study that had been conducted, namely the overall learning process that made use of the tools and the objects in the laboratory so that the learning process would be more interesting and would provide better materials that would be taught in the learning process.

#### **Limitations:-**

In conducting the study, the researcher encountered several limitations namely the abundant number of university students, the laboratory that had not been designed, the laboratory room that had not been sufficient and the tools and objects that had not been sufficient. The university students were too many to serve as the respondents so that they exceeded the capacity that had been in accordance with the learning standard (20 students). Then, the laboratory had not been designed in accordance with the standards of engineering tools and objects placement and operation. Next, the laboratory room had not been sufficient in terms of placement and operation. Last but not the least, the engineering tools and objects had not been sufficient as well in terms of amount and quality standard. In conducting the study, the researcher provided opportunity for the university students to ask all matters that they had not understood. Thereby, the university students might attain more detailed explanation from the lecturer and the data gathering activity might be conducted correctly and appropriately.

#### **Strengths:-**

The learning plan and the learning test might cause the learning development of the university students to be more directed and the researcher might immediately find the weaknesses on the students' consideration in planning and in calculating the engineering elements. In addition, the researcher might also identify the improvement in each step of university students' considerations and these considerations would be evaluated by the researcher in order to define the appropriate solution. From the statements, it was apparent that all of the competence elements that the university students had, both the ones in the form of knowledge and of analysis, might be evaluated in depth and in details. Thereby, the university students' strengths and weaknesses in the thinking process might be identified immediately.

**Conclusion:-**

From the results of the study, the researcher would like to conclude that there are three aspects that might be measured in identifying the improvement on the competence results, namely knowledge score (A), analysis score (B) and calculation result score (C) altogether with the learning results score. The improvement on the A1 and the A2 knowledge competence test results has been 3.5% and has not been significant. The improvement on the A2 and the A3 knowledge competence test results has been 1.1% and has not been significant as well. Then, the improvement on the B1 and the B2 analysis competence test results has been 40% and has been significant. The improvement on the B2 and the B3 analysis competence test results has been 10.5% and has been significant as well. Next, the improvement on the C1 and the C2 calculation result competence test results has been 59.4% and has been significant. The improvement on the C2 and the C3 calculation result competence test results has been 46.1% and has been significant as well. Altogether, the improvement on the P1 and the P2 learning competence test results has been 25% and has been significant. The improvement on the P2 and the P3 learning competence test results has been 14.84% and has been significant as well.

Based on the study that has been conducted, the researcher would like to suggest that all of the analytical and calculation-involving engineering courses should make use of real objects in order to provide better explanation for the university students.

Empowerment, smart home farmers, empower the local economy, agro-eco-tourism village Kandri.

#### Abstract

The aim of this study was to evaluate the performance management of community service and empowerment in UniversitasNegeri Semarang (UNNES) in empowering farmers' community learning center to strengthen local economy in Kandri village in Semarang, Indonesia. This study employed an evaluation method using Context, Input, Process and Product Evaluation (CIPP). The study site was in the Kandri village - Indonesia. The subjects were farmers, youngsters joining community learning center group, officials of the village, the culinary and handicrafts industry, as well as students who took the community service and empowerment program in UniversitasNegeri Semarang. The object of the study was the performance management of community service and empowerment program in UniversitasNegeri Semarang in empowering farmers' community learning center to strengthen local economy in Kandri village in Semarang, Indonesia. The results showed that the community service and empowerment program in UniversitasNegeri Semarang which was Education for Sustainable Development (ESD), in the field of sustainable education, training, and mentoring could empower community learning center for farmers and strengthen the local economy in Kandri village -Indonesia. The results of this study KKN-PPM indicated that community service and empowerment program in UniversitasNegeri Semarang could improve the performance of community learning center. This model can increase the competitiveness of future graduates, the quality of human resources and industrial products of Kandri village as the university model village.

#### Introduction:-

The empowerment of farmers has been conducted by many countries. Esbern (2003)<sup>[1]</sup> and Hansen (2004)<sup>[2]</sup> showed the importance of farmer empowerment. The empowerment of farmers through increased resources can lead to increased economy<sup>[3]</sup>. Furthermore, government's policy supports the accelerated success of agriculture<sup>[4]</sup>,<sup>[5]</sup>. Indonesian government has established community learning center in Kandri village in Semarang-Indonesia as a one stop service place for farmers in meeting all the needs of farmers related to farming activities. The farmers' community learning center has the several objectives as follows, (1) increasing the growth domestic product (GDP), (2) reducing poverty and unemployment (3) accelerating the development of rural infrastructure (4) reducing the

Address:-Senior researcher at UniversitasNegeri Semarang-Indonesia.

environmental impacts with a focus of increasing the farmers' income through a partnership with industrial sector (funding, technology and the quality of human resources)

Community learning center is located in the Kandri because the most of the inhabitants work as farmers. Table 1 displays the profile of the Kandri village with the more than 50% of its inhabitants work in the agricultural sector either as farmers and land owners or as peasants. (BPS Semarang, 2015).

The operational pattern of the community learning center is to build human and natural resources. The operational pattern of the community learning center was applied through a pattern of "100 Hectares BUSINESS". Intensive assistance activities were carried out in the community learning center, ranging from farming activities until the marketing of the products with minimal cost of goods sold (COGS) or even above market price. The commodities of this pattern consist of rice, maize and soybeans. The 100 ha business patterns is a "label" for the realization of the land area determined by the readiness of facilities and infrastructure in the community learning center.

The development of animal husbandry and health was conducted through a regional approach / region/cluster, and a systemic approach of agribusiness on the community learning center. The agribusiness system was formed using the upstream, cultivation (on-farm), the downstream and support sub-system as well as an institutional approach based on sustainable local resources, while maintaining environmental sustainability and balance of the ecosystem.

The animal husbandry development using pattern of integration in the environmentally friendly agriculture system is a very important strategy in realizing the welfare of the community learning center and rural communities. With the right technological innovations, plant waste can be changed into a source of fiber feed ingredient for ruminants. Using LEISA approach (Low External Input Sustainable Agriculture), each hectare of agricultural land can produce cattle feed to maintain a 2-3 cows /ha. Cattle husbandry becomes a composting plant with plant waste as its raw materials, which in turn, the compost is used as organic fertilizer for plants.

M. Dhamale *et al.*<sup>[6]</sup> explains that farmers in most regions of the world complain about the difficulties in the medical expenses for their livestock. Consequently, it is necessary to increase the results of livestock husbandry with low production costs through the integration of livestock husbandry with food crops, plantations and industrial tree plantations to be developed both technically, economically and socially. One of the benefits of this pattern is that there is not wasted materials<sup>[6]</sup>, as well as the use of proper and efficient innovation such as the sophisticated technology<sup>[5]</sup>. This approach positions the cow as a processing of agricultural waste into compost, while the calves are bonuses as the results of raising cattle properly. On the micro level, the pattern of crop-livestock integration system works to improve the structure, chemical texture and microbiology of the soil, while on the macro level, the pattern strives to increase agricultural productivity, which can ultimately increase the income and welfare of farmers<sup>[5]</sup>.

The community learning center program can ideally improve the economic level of Semarang citizens, especially those of village Kandri. However, the results of the survey in the village Kandri showed that standard of living is still low (Table 2). This condition is corroborated by the data on the table 3 about the average expenditure per capita per month which is still below the poverty line.

There are many factors causing the high poverty and low spending per capita per month below the poverty line in the Semarang city including the weak performance of various institutions / agencies that houses education and training for farmers as the performance of the community learning center. The results of the analysis concluded that performance management of the community learning center has not yet optimal. There are some problems with the management system of the community learning center. In addition, based on data from the preliminary study, the performance of the community learning center is shown on Table 4.

The data in Table 4 shows about the urgency to revitalize the performance of the community learning center. Universitas Negeri Semarang (UNNES) as a government educational institution was called to improve performance of the community learning center. Community service and empowerment of UNNES deployed twenty nine students to Kandri village for 45 days to improve the performance of RPP.

The purpose of this study was to evaluate the performance management of Community service and empowerment of UNNES in the community learning center to empower farmers to strengthen the local economy in Kandri -

Indonesia. The evaluation was conducted on performance management Community service and empowerment of UNNES in empowering farmers to care for the preservation of the environment and be aware of the potential resources that could be developed. The programs of Community service and empowerment was expected to increase the economy of the villagers in Kandri.

Kirkpatrick and Kirkpatrick (2006: 17)<sup>[7]</sup> supports that there are three reasons why it is necessary to evaluate the program, namely: (1) to show the existence and the amount of money spent on the achievement of goals and objectives of the programs, (2) to decide whether the activity will be continued or discontinued, (3) to gather information on how to develop future programs

The activities of community service and empowerment of UNNES were structured to empower the society temporarily and sustainably. The method of Education for Sustainable Development (ESD) was used to solve various problems in community learning center. ESD activities included education and training for farmers for the development of the community learning center program on an ongoing basis. Farmers in the village Kandri were expected to capture and develop mindset covering the triple bottom line which was the interplay between economic, social, and environmental.

The method of empowering community learning center through community service and empowerment included the development of the empowerment of law, engineering, economics, agriculture, fisheries, and culture for the farmers who were the members of the community learning center, and the village community in Kandri-Indonesia. With education as the basis, it was expected to be a good step to cope with and even sustain Kandri village as a village who was aware of all the natural resources that have the potential to be developed, and can be created as the destination of Argo - ecotourism.

### **Research Methods:-**

This study employed an evaluation study on the activities of community service and empowerment of UNNES. The evaluation model used in this study was Context, Input, Process, and Product evaluation (CIPP) developed by Stufflebeam in 1967 at Ohio State University. The focus of this study was on the performance management community service and empowerment of UNNES in community learning center for farmers to empower economic sector of farmers in Kandri village, Semarang-Indonesia. The complete design of the study is shown in Figure 1.

The population of the study consisted of farmers in Kandri village joining the community learning center, community leaders, and students participating in the community service and empowerment with the total of 97 people. 30 people were taken randomly as the samples of the study.

Questionnaires and observation sheet were used to collect the data. The questionnaires were used to measure whether the performance management community service and empowerment was able to strengthen the local economy of Kandri village in Semarang-Indonesia. While, the data from the observation sheet were used as supporting data. Furthermore, the data were tabulated, and analyzed with descriptive techniques to interpret the performance management component such as context, input, process, and product of the community service and empowerment.

### **Results And Discussion:-**

Various literatures in the field of performance management system and management control system are increasingly recognizing the need for fundamental study on the more coherent theoretical foundations<sup>[8]</sup>. The researchers suggest that the theory is used as the contextualization of the findings for the more systematic development of knowledge in various fields (Chapman, 1997).

Some scientists have taken a broader approach by incorporating various topics such as managing by values, participatory empowerment and management<sup>[9]</sup> or the performance of the organization and leadership, or creating a shared vision of organizational goals, emphasizing the need to provide excellence in leadership and management components to achieve organizational goals<sup>[10], [11]</sup>.

Confirmed by Hadromi (2016)<sup>[12]</sup> management started from needing analyzing, planning, organizing, supervising, and evaluating Table 5 up to 8 illustrates the performance management of community service and empowerment in

2016 in Kandri village, Semarang, Indonesia. Specifically, this study focused on economic empowerment of rural communities through farmers' empowerment using community learning center in Kandri village as Argocotourism.

### **The Context components of the performance management of community service and empowerment in community learning center to strengthen local economy;**

Concerning the economic challenges faced by many countries around the world, then idea of nurturing entrepreneurship has become an important goal for the government. Training and assistance have been conducted on the context indicators to improve the performance of the community learning center. Biron, Farndale, and Paauwe (2011)<sup>[13]</sup> has argued that training to enhance the skills, knowledge, and abilities. The training becomes important to increase employee productivity which ultimately affects the organization's performance and effectiveness<sup>[14]</sup>

Furthermore, there is a relevance between the performance of the organization and entrepreneurship to the economic development which has been highlighted by many studies<sup>[15]</sup>. The implementation of community learning center was right on target. The activities that have been implemented could meet the problems faced by the Kandri community with the score between 2.67 sd. 3.67 and the mean score was 3.15. Hezlett and Gibson (2005)<sup>[16]</sup> corroborates that mentoring and training can improve human resources. In this case, human resources increase through mentoring and training which has been conducted on the activities of community service and empowerment. Furthermore, Cooney,(2009)<sup>[17]</sup> examines that the entrepreneurship development system was located in the Appalachian region of the USA and identified four main dimensions of skills: (1) Technical skills - the skills required to produce a business product or service; (2) Managerial Skills required for the daily management and administration of companies; (3) Entrepreneurial Skills - effectively improve the economy; (4) Personal Maturity skills - which include self-awareness, accountability, emotional skills, and creative skills. These skills have been delivered in the activities of community service and empowerment. Therefore, they increased the performance of community service and empowerment and strengthen the economy of the people or farmers who were members of the community service and empowerment.

### **The input components of performance management in community learning center in empowerment of farmers to strengthen the local economy;**

29 students were involved in the community service and empowerment. All of these students have been through the selection according to the needs and issues to be addressed in Kandri. Jimoh. and Danlami (2011)<sup>[18]</sup> state that the quality of human resources affects the organization's performance. The students just like employees were the most important asset in the activities of the community service and empowerment program because they contributed to the growth and success of the program<sup>[19]</sup>. Furthermore, Danish and Munir(2006)<sup>[19]</sup>, Saif, Malik, and Awan<sup>[20]</sup> concludes that in an era characterized by rapid and continuous change, the knowledge must be maintained to enable the organization to become productive and responsive to the stakeholders' needs. Various literature shows that the proper application of some human resource management (SDM) allows employees or in this study, the students joining the community service and empowerment program were more committed to carry out their tasks better<sup>[21]</sup>,<sup>[22]</sup>. Human resource management is essential for organizational success because the quality of human capital is important.

Furthermore, the facilities and infrastructure have been improved during the community service and empowerment program (table 6). Farmers' community learning center was impeded in developing its program in case of limited means or the infrastructure. Provisions, at all (2013)<sup>[23]</sup>, Eliasu, al all (2016)<sup>[24]</sup>, Akinfolarin (2015)<sup>[25]</sup>, corroborate that the inadequacy of infrastructure and facilities, especially buildings, have led to unproductive learning environment in the system of polytechnic Nigeria. Therefore, the facilities and infrastructures become strategic support organizational performance. The community service and empowerment have given two production tools for farmers in the community learning center, namely: (1) vacuum press, and (2) panic presto. Furthermore, these tools functioned in producing processed products in the community learning center to be sold to the consumer, or to the tourists.

The completeness of the equipment helped the training process. The completeness of facilities and infrastructure enhanced the understanding capacity of training material for trainees. The completeness of the facilities and infrastructure required the budget availability to support the goal achievement of the community service and empowerment activities. Shardeo (2015)<sup>[26]</sup>, Mohamed and Tirimba (2015)<sup>[27]</sup>, Provisions, al all (2013)<sup>[23]</sup> argue that the budget can be a parameter to measure the achievement of the program. Furthermore, budget control can ensure

whether or not the actual results community service and empowerment program is positive or negative according to the overall policy objectives.

**Component process of the community service and empowerment performance management in farmers' community learning center to strengthen the local economy;**

The implementation of community service and empowerment was carried out by applying a management function, which began with the planning, implementation, and evaluation. The performance evaluation of community service and empowerment drew attention to be measured. Management performance evaluations reflected the instances where the performance of the individual or entity were measured in relation to the others Gathai, at all. (2012)<sup>[28]</sup> to eliminate the distortion caused by uncontrollable factors (Table 7).

Gathai, at all. (2012)<sup>[28]</sup> shows that the benefits of the performance management evaluation which functions positively from a number of executive projects that have been available to them, while Shammot(2014)<sup>[29]</sup> concludes that the high administrative costs of evaluation performance management lead to their low adoption in executive contracts.

**The products component of community service and empowerment of performance management in farmers' community learning center to strengthen the local economy.**

The community service and empowerment has facilitated and empowered concerned citizens on environmental preservation and were aware of the potential resources that could be developed. The programs were expected to improve the economy of the citizens.

The activities of community service and empowerment were arranged not only to provide a temporary community empowerment, was also based on the Education for Sustainable Development method (ESD), which was used to overcome the various problems (Table 8). ESD activities included education for sustainable program development as an educative and effective medium by deploying students into the midst of the people that would capture and develop the balanced mindset including triple bottom line in the interrelationship between economic, social, and environment. This concurs with Shammot(2014) stating that there are supervisor effects which support the team's success in this case, the community service and empowerment team in the implementation of training.

Furthermore Shaheen, (2013)<sup>[30]</sup> concludes that strategic training and development are tools to improve the performance of the organization effectively. The community learning center was expected to identify the training needs of members. The training program was designed to assist members of community learning center optimally and was actualized to achieve the organizational objectives

Salah (2016)<sup>[31]</sup> argues that the training and development might mean the same thing for many people because they both lead to increased productivity of individuals in an organization, but there are some significant differences.

The methods of community empowerment in the community service and empowerment program included the development of the law, engineering, economics, agriculture, fisheries, and culture empowerment, as well as the empowerment of SMEs of KampungTelo and farmers' community learning center. Education as a basis, in a long-term, is expected to be a good step to cope with and even sustain Kandri village as the village which is aware of the many natural resources that have the potential to be developed, and Village Kandri as argo-ecotourism destination.

**Conclusion:-**

From the results of data analysis, it can be concluded that the community service and empowerment program has been able to improve the performance of the farmers' community learning center and the economy. It would increase the realization of village Kandri as Argo-eco-tourism destination. In particular, the community service and empowerment program of UNNES was able to (1) develop a Village Kandri as a tourist area which is both physically and non-physically sustainable, (2) increase the participation of community in Village Kandri in decision-making, implementation, monitoring and evaluation of the development of tourism village, (3) the realization of a community in a village which is economically independent and able to manage its own territory based on potential, needs and interests of Kandri area, and (4) realization of ecotourism that can be managed by people of Kandri and was supported by SMEs in the field of culinary and handicraft, infrastructure and qualified human resources to realize the village Kandri as an Argo-eco-tourism destination.

<https://semarangkota.bps.go.id/linkTableDinamis/view/id/50>**Table 4:-** the Problems of Community Learning Center Performance

No	Activities/Production of Small Scale Industry	The Production Problems in Community Learning Center
1.	The cow and goat husbandry	The knowledge of farmers about the health of the husbandry is weak, the maintenance of cage, the resources of the animal feed, culinary products from milk is weak.
2.	Fish cultivation: cat fish, gourami	The knowledge of farmers about the fish cultivation, the maintenance of cage, the limited area in Gunungpati, the resources of the animal feed, fishery products is weak.
3.	Farmers' Training	The Trainer with weak resources, unscheduled training, low farmers' motivation to join the training, the model plant was not well – maintained.
4.	Handcraft and Souvenir Training	The trainer with weak resources, unscheduled training, low farmers' motivation to join the training,
5.	Screen printing training	The tools required for the training was still limited, the monotonous pattern of the screen printing required development by the small scale industry in Kandri to characterize Kandri such as Kreo Cave, monkeys, and Jatibarang Dam.

**Table 5:-**The performance data of the community service and empowerment on contex components

No	Contex Components	Score	Explanation
1.	The purpose of community service and empowerment can meet the needs of Kandri village	3.53	Very good
2.	The deployment of students joining community service and empowerment is right on the target	3.67	Very good
3.	The community service and empowerment supports the improvement of economy of the Kandri village people	2.80	good
4.	The implementation of community service and empowerment was right on target	3,00	good
5.	community learning center required improvement of resources	3.23	good
6.	The performance of community learning center was still weak	2.67	good
	The average of contex components	3.15	good

**Table 6:-** Performance data the community service and empowerment program the input component

No	The input components	Score	Explanation
1.	The human resources of the students joining the community service and empowerment meet the needs of the community learning center.	3,40	good
2.	sufficient resources to support the community service and environment are available	3.33	good
3.	The facilities of the community learning center can support the community service and empowerment program	3.17	good
4.	The people joining the community learning center are able to understand the training and the education conducted by community service and empowerment.	3.50	Very good
5.	The materials of training in the community learning center can meet the needs of the stakeholders.	3.37	good
6.	The budget is able to realize the purposes of the community service and empowerment.	3,36	good
	the average score of the input components	3.49	good

**Table 7:-** The component of performance management process of community service and empowerment in farmers' community learning center to strengthen local economy.

5.	There was an increase of fishery technique for the community as the target of community learning center.	3.30	good
6.	There was an increase of human resources for the community joining community learning center with regard to the farming technique.	3.30	good

7.	There was an increase of human resources for the community joining community learning center with regard to the results of the crops and animal husbandry into the marketable food products.	3.20	good
8.	There was an increase of human resources for the community joining community learning center with regard to the handcrafting technique.	3.50	Very good
9.	There was an increase of human resources for the community joining community learning center with regard to the screen printing technique.	2.97	good
10.	There was quality and quantity improvement in the facilities of community learning center.	3.47	Very good
11.	There was economic improvement for the people joining community learning center.	3.63	Very good
12	Mean Score	3.30	good

The success of the community service and empowerment performance is supported by the opinion of Lawani, Moore (2016) [32]. Lawani, Moore (2016) [32] argue that the activity starts from the beginning and the end within a specified time and uses a certain amount of budget and resources to complete tasks with clear objectives indicating that the main mission of the project is to combine individual tasks into a single, integrated conglomerates, which is useful for people or customers. The sustainability plan of the community service and empowerment is expected to provide a comprehensive and significant impact on each aspect. In this regard, the community service and empowerment should be able to adopt the usefulness of the process into three main stakeholders.

#### Abstract

**Objectives:** The increased need for optimizing the use of imaging modalities in the hospital setting has led to the introduction of numerous applications in various disciplines to meet health objectives. One medical discipline that depends on imaging is cardiology, which uses a full-fledged multi-modality picture archiving and communication system (PACS) solution. This research explores how healthcare professionals are using this PACS solution, as part of a transformational process in the healthcare system in general.

**Methodology:** A qualitative study was conducted on the PACS solution system at King Khalid University Hospital (KKUH) during the month of December 2013. The study used a semi-structured interview protocol to understand how cardiologists and technicians at the King Fahad Cardiac Center (one of the research centers in KKUH) interact with this system.

**Results:** Three out of 10 cardiologists (33.3%) and four technicians were interviewed during the visit. Responses were then analyzed using thematic analysis. Themes analyzed were clinical benefits of the system and challenges of using the system.

**Conclusion:** An overall positive experience was reported by the participants in the study. The system has not only increased the quality of the care provided at the center but also provided fast and effective access to patient-imaging data from anywhere in the hospital. Moreover, the system helped clinicians to perform research on patients' data. Several recommendations to optimize the use of this system include combining it with a lab order system to augment the clinical decision-making process and addressing the managerial issues.

#### Introduction:-

The increased need for optimizing various imaging modalities in the hospital setting has led to the introduction of numerous applications in different disciplines to meet that objective. One of the medical disciplines that depends on imaging is cardiology, which uses a full-fledged multi-modality picture archiving and communication system

Address:- Department of Medicine, King Saud University, Riyadh, Saudi Arabia.

(PACS) solution. The system can be present in either a single workstation or it can be a fully integrated multiple-work station system. The general aim of this system is to improve clinical workflow by providing a single access point for advanced clinical applications, multi-modality images and reports <sup>(1)</sup>. It is integrated with advanced tools for numerous modules related to cardiovascular imaging, including echocardiography, catheterization, electrophysiology, cardiovascular X-ray, nuclear medicine, computed tomography (CT), magnetic resonance imaging, and electrocardiography <sup>(2)</sup>. At present, only echocardiography and catheterization modalities are covered by this system at the Kind Fahad Cardiac Center at the King Khalid University Hospital (KKUH) where this study was conducted

The King Fahad Cardiac center, established in 2002, serves patients with heart disease. It is also a research and teaching hospital for heart disease and related conditions. Most of the hospital's research and treatment requires the echocardiography modality provided by the PACs system as it is less invasive and uses lower levels of radiation than other technologies. The cardiology PACS solution was introduced to KKUH in 2011, and took two years to become fully implemented.

After wide implementation of the multi-modality cardiology PACS solution, major improvements in quality and care were observed, but few studies have been done to assess outcomes. In one study done on the PACS system in Denmark back in 2013, participants found the system convenient and easy to use, improving clinical outcomes <sup>(3)</sup>. Another study done in 2008 showed excellent results obtained by the system in viewing the heart mitral valve leaflets through a trans-esophageal Echocardiogram (TEE) <sup>(4)</sup>.

Following the growing trend of computerization of healthcare systems, numerous hospitals around the world have moved towards efficiency-based electronic systems with the objectives of delivering cost-effective, high-quality healthcare. Hence, there is a need for more extensive studies to assess the results of using such systems. This is a preliminary study on healthcare providers' experience of using multi-modality cardiology PACS at King Khalid University hospital.

### **Methodology:-**

This a qualitative study was conducted on the use of the multi-modality cardiology PACS solution in King Fahad Cardiac Center during the month of December 2013. The study used semi-structured interview protocol that was developed by Zakaria et al <sup>(5)</sup> to explore this issue in depth. The interview protocol contains background information on the system (including its organizational background); clinical and educational uses; how it has benefited overall healthcare quality versus problems reported; how it is operated in general; and who the original developers, main users, and maintainers of the system are.

The target population is the cardiologists and technicians of the King Fahad Cardiac Center in KKUH. These professionals meet the purpose of the study, due to their direct use of this system and their experience with using this system. A visit to King Fahad Cardiac Center in KKUH was undertaken in December 2013. This center has a total of 12 cardiologists and 20 technicians who use this system on a daily basis. The participants' responses were recorded and analyzed using thematic analysis. Participants' responses were coded and themes and subthemes were generated from the data. All ethical considerations were taken into account by ensuring participant's anonymity, and patients' information for the attached images was kept confidential.

### **Results and Observations:-**

Three cardiologists out of a total of 10 (33.3%) and four technicians were available at the time of the interview. The sample size is small due to the specificity of those who have constantly used the system since its implementation. However, the depth of data obtained make up for the small number of interviewees who can be representative to the rest of the hospital's staff.

### **System Background:-**

The functionalities of the system can be summarized as (1) statistics and comparative studies; (2) documentation, storage, and retrieval of images; (3) reporting of certain cases and; (4) use for educational purposes. PACs is a vendor-based system, developed and maintained by Philips Company.

Cardiologists are the main users. Multiple PACs stations are situated around the hospital for convenience. Secondary users are technicians and nurses of the cardiology department only. External parties (such as physicians from other departments and medical students) can use and access the systems but with limited access and solely for getting information.

### Theme 1: Clinical Benefits:-

Clinical benefits of this system that were mentioned were in the diagnosis of heart diseases, along with reporting and storage of radiological images. The system has also helped with comparing different images of the same patient or different cases at the same time. Furthermore, the system helped with increasing the Key Performance Indicators (KPIs) of the organization, which are metrics used to assess the factors that are necessary for institutional success. As for educational benefits, any faculty member at the King Saud University College of Medicine, with access to the system can import the images to be used in lectures and demonstrations. In addition, this system provides statistics and comparative studies for cardiac sciences and research.

Participants also reported the ease of use that was observed immediately after its implementation. The technician first performs the required modality (Echocardiography/Cath) in the clinic, after which he uploads the image to the system. Then, the treating physician logs in to the system and enters the patient's ID (see Image 1). To look up a certain item, he double-clicks on the relevant image, which is attached to a full report of the procedure (Image 2). Finally, he can either contact the technician for more images (e.g. Doppler) or he can compare a new image with a patient's previously archived images (up to five years) and report findings (Images 3 & 4).

Image 1:- Main Search Interface

Image 2:- Medical Report Review Interface

Image 3- Radiological Imaging Review Interface #1

Image 4- Radiological Imaging Review Interface #2

### Theme 2: Challenges Using the System:-

Regarding managerial issues, those encountered were: (1) Limited storage space for the images and (2) a lack of local technical support from the vendor. The organization proposed addressing these issues by (1) expanding the hard drive capacity from time to time and (2) by appointing and training members of the local IT department to solve some of the technical difficulties that may arise. Those measures have yet to be implemented, however.

### Discussion:-

As the results suggest, this system has led to improvements in the overall accessibility and efficiency of the clinical workflow. Currently, there are numerous and diverse electronic systems that serve to augment the administrative functions for any given health institute; these are collectively known as Health Information Systems (HIS). Al-Ali et al. performed a survey study in Qatar back in 2013 to assess and describe the current state of Hospital Information Systems in large hospitals, and to establish a baseline or reference point. This study showed that all Qatari public hospitals and four out of six private hospitals use some form of a Hospital Information Systems (HIS) and/or Hospital Management System (HMS). Radiology Information Systems (RIS) and Laboratory Information Systems (LIS) were also commonly deployed HIS components. On the other hand, Electronic health records (EHR) and Pharmacy Management Systems (PMS) were absent or underused<sup>(6)</sup>.

However, because there is an accelerated implementation and growth of HIS to enhance the safety and quality of care delivered, the process of implementation and optimization of an HIS requires a pre-intervention baseline from which comparisons pertaining to performance and impact can be elicited. Furthermore, since the benefits the PACS would deliver are influenced by the acceptance of users, further knowledge of their concerns and acceptance rates is needed. This has also been shown in a few other studies found in the literature. One study that was done in 2012 looked at the usage of the PACs system at a university hospital in Jeddah, Saudi Arabia to assess the level of acceptance among staff in the radiology department. In this study, users found PACS to have improved the quality of their work in providing better patient care. Though technologists had lower ratings than did clinicians/radiologists, acceptance level was not found to be influenced based on gender, age, or length of experience using the PACS. Before implementing a PACS system, however, the health organization must consider their system users' acceptance and whether they will adapt to the new system<sup>(7)</sup>.

In addition, some articles in the literature have reported on a newer form of web-based PACS, which are more attractive than conventional, server-based systems. One 2013 article showcased that the web-based cardiology PACS allowed for better interoperability, broader access, remote accessibility to data and images, and reduction in IT burdens. In addition, having one system that combines all the separate workstations in one place allows the cardiologist and support staff to conduct their daily duties from a single point of entry. Staff may handle and manage all cardiac imaging modalities and related reports, echocardiograms (ECG), procedural reports and prior exams from any computer with Web access. Moreover, it allows for new workflows, such as doing rounds using a tablet rather than a clipboard, and gives more freedom of mobility to the cardiologist and technician. However, a limitation of this system might be the need for special software to be installed to permit access to data using a web

browser. This will need to be addressed as many physicians now expect to be able to use mobile devices such smart phones and tablets to access data and images<sup>(8)</sup>.

### **Conclusions and Recommendations:-**

In summary, the findings of this qualitative study showed that the system not only improves the quality of services provided by the Cardiac Center but also provides fast and effective access to patient imaging data from anywhere in the hospital. In addition, it decreases medical errors and time needed for treatment decisions. The system also helps with performing research and gathering statistics on patients' data.

We recommended that the Center provide restricted access for students interested in cardiology coupled with a simple education and training program. Limited access for consultations by other organizations could be offered as part of inter-institutional collaboration. Additionally, yearly updates and maintenance for the PACs system in King Fahad Cardiac Center should be conducted; this could be optimized by a visit from a local company representative to address technical issues. Finally, the center should combine a lab order system with the imaging system for more efficient decision-making.

### **Acknowledgements:-**

This study was supported by the Deanship of Scientific Research, Research Chairs at King Saud University. We extend our thanks to all those who helped in our study, namely the Medical Informatics and e-learning unit, the Medical Education department, and the College of Medicine and its dedicated staff.

Type 2 diabetes mellitus, HbA1c, dyslipidemia, cardiovascular disease, hyperglycemia.

#### Abstract

**Background:** Type 2 diabetes mellitus (T2DM) have an increased prevalence of dyslipidemia. Dyslipidemia is characterized by high cholesterol (TC), high triglyceride (TG), high LDL cholesterol (LDL-C) and decrease HDL cholesterol (HDL-C) and is major risk factor for cardiovascular disease in T2DM. HbA1c serve as a gold standard indicator of glycaemic status over long term.

**Aim:** The study aimed to investigate the correlations between lipid profile parameters, as well as the glycated hemoglobin (HbA1c) values of Nepalese population with type 2 Diabetes mellitus (T2DM).

**Material and Methods:** This was a cross sectional, retrospective study of 140 T2DM patients (81 male and 59 female) who had visited department of Internal Medicine, Manmohan Memorial Community Hospital were included in this study. Venous blood samples were collected for fasting plasma glucose, HbA1c and serum lipid profile from all subjects in the morning after at least 8 hours fasting by using methods following standard operating procedures (SOPs). The statistical analysis was done by SPSS.

**Results:** There is alteration in the serum levels of FBS, total cholesterol (TC), triglycerides, LDL cholesterol (LDL-C) and HDL cholesterol (HDL-C) were noted in patients with T2DM. The HbA1c was found to be significant correlation with FBS, TC, TG, and LDL-C but there was no significant relation noticed with HDL-C. Values of HbA1c >6.5 % showed significant correlation with TC, LDL-C, TG, LDL-C/HDL-C and TC/HDL-C ratio, as compared to patients with HbA1c ≤ 6.5% (p<0.05).

**Conclusion:** In conclusion, our study demonstrates that in Nepalese with type 2 diabetes mellitus, dyslipidemia is more common. To reduce the burden of morbidity and mortality from different complications, it necessary to control diabetes and lipid levels in diabetic patients and

## **Introduction:-**

The diabetes mellitus is becoming more and more prevalent in every corner of the globe and a projection for the future is alarming. Type 2 Diabetes Mellitus (T2DM), a metabolic disorder characterized by the hyperglycemia and disturbances of carbohydrate, lipid and protein metabolism due to insulin resistance or relative insulin deficiency. The chronic hyperglycemia of diabetes results in macrovascular complications including heart disease and stroke and microvascular complications including nephropathy, neuropathy and retinopathy [1]. Furthermore, abnormal serum lipids- dyslipidemia, characterized by increased triglycerides level, high low density lipoproteins and low high density lipoproteins [2] are likely contribute to the risk of coronary artery disease, cerebrovascular disease, peripheral vascular diseases and associated with greater risk of morbidity and mortality [3]. It has remained a major concern of healthcare professionals from long time due its strong association with cardiovascular diseases (CVD) [4]. Several factors are likely to be responsible for diabetic dyslipidemia: insulin effects on liver apoprotein production, regulation of lipoprotein lipase (LpL), actions of cholesteryl ester transfer protein, and peripheral actions of insulin on adipose and muscle [5, 6]. In each year, about 5% of all deaths are caused by diabetes globally [7]. This risk, however, can be reduced by good management and control of hyperglycemia as well as dyslipidemia [8].

According to American Diabetes Association (ADA), Glycated Haemoglobin (HbA1c) more than or equal to 6.5% is considered diabetes [9] and it is routinely used marker for long term diabetic control preceding 8-12 weeks of time. As HbA1c functions as an indicator for the mean blood glucose level, it is now considered as an independent risk factor in diabetic patients [10]. Several observational studies demonstrated that a higher HbA1c level was associated with increased risks of cardiovascular diseases and deaths [11, 12]. Furthermore, an elevated level of HbA1c is now considered as an independent risk factor for cardiovascular disease in any subject with or without diabetes. For each 1% increase in HbA1c level increases the risk of CVD by 18% and positive association between HbA1c and CVD has been demonstrated in non-diabetic patients even within normal range of HbA1c. At present HbA1c is the best alternate marker we have for setting goals of treatment [13].

Diabetes complications and control trial established that strict control of diabetes reduces micro vascular complications and glycated hemoglobin as gold standard investigation of diabetes control [14]. If hyperlipidemia is detected early in the course of diabetes mellitus, it will reduce the risk for cardiovascular and cerebrovascular diseases. Lifestyle changes such as diet and exercise are very important in improving diabetic dyslipidemia, but often pharmacological therapy is needed [15, 16]. Keeping in view the large number of type 2 DM patients and poor knowledge of the subject, most patients are prone to develop multiple lipid disorders. Therefore, this study was aim to find out the association between HbA1c (glycemic control) and serum lipid profile in Type 2 Diabetic patients attended at Manmohan Memorial Community Hospital, Kathmandu, Nepal.

## **Materials and methods:-**

### **Patients' characteristics;**

One hundred and forty Type 2 diabetes patients were enrolled in the current study. They were selected from the outpatient clinics of Internal Medicine department, Manmohan Memorial Community Hospital. Patients' consent was obtained according to the regulations of Nepalese Ministry of Health and study design was approved by the local ethics committee.

Furthermore, fasting (at least 8 hours) venous blood samples were collected from the selected patients. Then, serum was analyzed for fasting blood sugar, lipid profile panel- Total cholesterol, Triglyceride, HDL-cholesterol and LDL-cholesterol, and HbA1c.

For defining Diabetes Mellitus, American Diabetic Association (ADA) was used whereas for defining dyslipidemia, the reference levels were used as per National Cholesterol Education Programme (NCEP) Adult Treatment Panel III (ATP III) guideline according to which hypercholesterolemia is defined as TC>200mg/dl, hypertriglyceridemia as TAG>150mg/dl, high LDL-C when the value exceeds 100mg/dl and low HDL-C when the value is below 40mg/dl. And presence of any one of abnormalities in serum lipid concentration it was defined as dyslipidemia. Glycated haemoglobin more than 6.5% is taken as abnormal as per ADA guideline.

**The Inclusion criteria for all participants:**

Type 2 Diabetic patients of age between 30-70 years were only included in the study.

**The exclusion criteria:**

Those patients under lipid lowering therapy and having diabetic complications and endocrinopathies such as Thyroid disorders were excluded from the study.

**Statistical analysis:**

The study data was analyzed by using SPSS program to compute descriptive parameters including mean and frequencies, and inferential statistics was used including student's t test to test the significance of the differences between the mean values of two continuous variables and Chi-square test ( $X^2$ ) test the difference in proportions categorical variables between two groups. The level of confidence ( $P < 0.05$ ) was considered as cutoff value for significance.

**Results:-**

Diabetic (study group) 140 subject (81 male and 59 female) were enrolled in this study. The mean age of the males was  $53 \pm 15$  years (range 10-84) and  $54 \pm 15$  years (range 22-87) for females with no statistical significant difference,  $P = 0.911$ . Fasting Blood Glucose (FBG), Hemoglobin A1c (HbA1c), Triglycerides (TG), Total Cholesterol (TC), High Density Lipoproteins (HDL) and Low Density Lipoproteins (LDL) were studied to assess the association of diabetic condition with the lipids profile.

**Table1:** Comparison of studied parameters between gender types within study group.

Parameters	Male (n=81)	Female(n= 59 )	P- value
<i>Age, years</i>			
Means $\pm$ SD	$53 \pm 15$	$54 \pm 15$	0.911
Range	10-84	22-87	
<i>FBS</i>			
Means $\pm$ SD	$169.9 \pm 62.7$	$168.8 \pm 41.6$	0.910
Range	90-372	90-279	
<i>HbA1c</i>			
Means $\pm$ SD	$7.96 \pm 2.7$	$7.66 \pm 1.9$	0.433
Range	4.7-18.0	5.1-12.5	
<i>TG</i>			
Means $\pm$ SD	$181.1 \pm 60.1$	$185.1 \pm 65.8$	0.714
Range	55-310	100-329	
<i>TC</i>			
Means $\pm$ SD	$216.7 \pm 48.8$	$214.2 \pm 44.9$	0.752
Range	110- 301	145-301	
<i>HDL</i>			
Means $\pm$ SD	$36.6 \pm 5.7$	$38.7 \pm 5.6$	0.014
Range	27- 48	27-53	
<i>LDL</i>			
Means $\pm$ SD	$144.2 \pm 44.1$	$138.4 \pm 41.3$	0.430
Range	39- 221	63- 216	
P value based on Student's t-test: significant at ( $p < 0.05$ )			

**Table1** shows the statistics of biochemical parameters computed for males and females which point out that the results were found to be FBG ( $169.9 \pm 62.7$  and  $168.8 \pm 41.6$ ,  $P = 0.910$ ), HbA1c ( $7.96 \pm 2.7$  and  $7.66 \pm 1.9$ ,  $p = 0.433$ ), TG ( $181.1 \pm 60.1$  and  $185.1 \pm 65.8$ ,  $P = 0.714$ ), TC ( $216.7 \pm 48.8$  and  $214.2 \pm 44.9$ ,  $P = 0.752$ ), HDL ( $36.6 \pm 5.7$  and  $38.7 \pm 5.6$ ,  $P = 0.014$ ), HDL ( $36.6 \pm 5.7$  and  $38.7 \pm 5.6$ ,  $P = 0.014$ ) and LDL ( $144.2 \pm 44.1$  and  $138.4 \pm 41.3$ ,  $P = 0.430$ ) respectively with statistical significance only in HDL parameter.

**Table 2:-** Percentage of abnormal parameters values and association with gender within study group.

Parameters	Male (n=81)		Female(n=59)		X2	P- value
	Normal	Abnormal	Normal	Abnormal		
FBS	20	61(75%)	9	50(85%)	1.85	0.173
HbA1c	16	65(80%)	8	51(86%)	0.92	0.336
TG	27	54(67%)	19	40(68%)	0.02	0.888
TC	37	44(54%)	34	25(42%)	1.94	0.162
HDL	28	53(65%)	22	37(63%)	0.11	0.740
LDL	10	71(88%)	8	51(86%)	0.04	0.832
<i>P value based on chi square test (p &lt; 0.05) significant</i>						

**Table 2** shows that percentage of abnormal result within study group for male and female was found to be FBS (75% and 85%, P=0.173), HbA1c (80% and 86%, P=0.336), TG (67% and 68%, P=0.888), TC (54% and 42%, P=0.162), HDL (65% and 63%, P=0.740), LDL (88% and 86%, P=0.832) respectively, with no statistical significance difference.

**Table 3:-** Percentage of abnormal parameters values and association with age within study group.

Parameters	Less than 40 year		More than 40 year		X2	P- value
	Male	Female	Male	Female		
FBS	15(33%)	9(18%)	46	41	0.70	0.401
HbA1c	11(20%)	8(16%)	54	43	0.03	0.858
TG	13(32%)	9(23%)	41	31	0.03	0.858
TC	11(33%)	6(24%)	33	19	0.01	0.926
HDL	10(23%)	7(19%)	43	30	0.0	0.995
LDL	16(29%)	9(18%)	55	42	0.44	0.509
<i>P value based on chi square test (p &lt; 0.05) significant</i>						

**Table 3** shows that percentage of abnormal result within study group for male and female base on the age category (< 40 year and > 40 year). For the less than 40 years the result shows that FBS (33% and 18%, P=0.401), HbA1c (20% and 16%, P=0.858), TG (32% and 23%, P=0.858), TC (33% and 24%, P=0.926), HDL (23% and 19%, P=0.995), LDL (29% and 18%, P=0.509) respectively, with no statistical significance difference. The association between less and more than 40 years between gender types was depicted in (**figure 1, 2**).

**Table 4:** Correlation between HbA1c and studied parameters within study group.

Parameters	Person correlation (r)	P- value
FBS	0.731	< 0.001
TG	0.250	0.003
TC	0.373	< 0.001
HDL	-0.341	< 0.001
LDL	0.382	< 0.001

*P value based on chi square test (p < 0.01) significant*

**Table 4** shows the correlation result between HbA1c and studied parameters within study group. All the results indicate there was positive relationship with statistical significance except a negative correlation between HbA1c and HDL. The correlation between HbA1c, HDL and LDL is depicted in (**figure 3, 4**).

**Table 5:-** Biochemical parameters according to patients glycemetic control.

Parameters	HbA1c		P- value
	<6.5% (n=45)	≥ 6.5 % (n=95)	
FBS	134.6±25.3	186.8±57.0	0.001
TG	165.9±59.1	190.8.0±62.6	0.004
TC	199.3±40.8	223.3±48.0	0.025
HDL	38.1±5.3	36.9±6.0	0.229
LDL	128.0±38.9	148.2±43.3	0.009
TC/HDL	5.4±1.8	6.3±2.1	0.013
LDL/HDL	3.5±1.5	4.2±1.7	0.017
<i>P value based on chi square test (p &lt; 0.05) significant</i>			

**Table 5** The patient’s data were categorized on the basis of HbA1c  $\leq 6.5\%$  and  $\geq 6.5$ . It was found that patients having HbA1c  $\geq 6.5\%$  have higher all the parameters and showed statistically significant ( $p < 0.05$ ) except HDL levels compared to patients having HbA1c  $\leq 6.5\%$ .

**Figure 1:-** Association of abnormal result with < 40 years diabetic patients’ gender

**Figure 2:-** Association of abnormal result with >40 years diabetic patients’ according to gender

Figure 4:- Correlation between HbA1c and LDL.

### Discussion:-

Type-2 diabetes mellitus (T2DM) is a well-known risk factor for the development of cardiovascular disease, cerebrovascular disease and peripheral vascular disease. Lipids play a vital role in the pathogenesis of diabetes mellitus. Alterations in lipid and lipoprotein profile contribute to atherosclerosis in T2DM [17]. Dyslipidemia is a metabolic abnormality that is frequently associated with diabetes mellitus and both of them play important predictors that can progress to coronary artery disease (CAD) and may even be a prerequisite for CAD, occurring before other major risk factors come into play. [18].

Its prevalence is variable, depending on the type and severity of diabetes, glycaemic control, nutritional status, age and other factors. Glycaemic control is directly related to lipid metabolism. Therefore, in this present study, we have

evaluated the pattern of lipid profile parameters in the patients with T2DM along with their correlation with HbA1c. The results of this study clearly showed that there is alteration in the serum levels of FBS, TC, TG, LDL-C and HDL-C were noted in patients with diabetes, which are well known risk factors for cardiovascular diseases among patients when compared to the normal values. However, the levels of HbA1c, FBG, TC, TG and were LDL-C not affected by patients gender as neither of these parameters differed significantly between male and female diabetic patients. Some of the previous studies showed that the results of lipid profile in female diabetic patients had significantly higher levels of LDL, and TC, which is in contrary with our report [19].

In addition, no such age-related differences were found in women but the frequency of normal HDL-C values in women was significantly higher than in men. Generally, the results from this study have been in accordance with one of the previous research [20]. This may reflect better adherence to diabetic management by females as well as the known higher HDL cholesterol in females due to gender effect particularly estrogen effect during reproductive age. However, our finding is contrary with the similar studies reported earlier [21, 22]. Hyperlipidemia in females may be attributed to the effects of sex hormones and body fat distribution, leading the differences in altered lipoproteins.

In addition, we have analyzed the percentage of abnormal parameters values and association with gender and age within study group. We have noticed that male group has more number of abnormal parameters than female albeit there was no any statistically significant difference between the groups. We also categorized our test results in two groups, age >40 years and <40 years and analyzed the abnormal parameters in these groups and found that more number of abnormal parameters noticed among both genders in age group >40 years. It seems that type 2 diabetic patients of > 40 years of age are slightly more vulnerable in this respect compared to the < 40 age group. However, study done by Al Lawati et al [8], reported that the younger Omani type 2 diabetics exhibited worse glycemic state compared to older patients.

Glycosylated hemoglobin (HbA1c) is the main indicator which is used for evaluation of glycemic control in diabetes mellitus. The high values of HbA1c were associated with an increased risk of complications in patients with type-2 diabetes mellitus. Apart from classical risk factors like dyslipidemia, elevated HbA1c has now been regarded as an independent risk factor for cardiovascular disease in subjects with or without diabetes [23]. A highly significant correlation between HbA1c and FBS, TG, TC, LDL-C and HDL-C were observed in this study, which is in agreement with the findings of several other investigators who also reported significant correlations between HbA1c and individual blood lipid [24, 25]. A significant correlation between HbA1c level and lipid abnormalities were also noted and suggested importance of control of diabetes and control of lipids in Chinese study [26].

In previous studies, the degree of impaired glycaemic control was defined by different HbA1c cut off values. According to American Diabetes Association (ADA), glycated haemoglobin (HbA1c) more than or equal to 6.5% is considered diabetes. So, we have analyzed our parameters on the basis of cut off value 6.5%.

Significant correlation between HbA1c and various circulating lipid parameters and significant difference of lipid parameters in two groups (<6.5% and >6.5%) of glycated hemoglobin were observed. In addition, patients with high HbA1c ( $\geq 6.5\%$ ) exhibited significant increase in FBS, TC, TG, LDL-C, TC/HDL and LDL/HDL ratio in comparison to patients with normal HbA1c (< 6.5%), which is consistent with the findings reported by Hammed et al. [27]. Khan *et al.* reported that HbA1c screening not only reflected glycaemic control, but predicted serum lipid profiles in diabetic patients as well [28]. However, there was no significant difference noticed in HDL levels. Diabetic patients with poor glycaemic control exhibited a significant increase in TC/HDL-C and LDL-C/HDL-C ratios. The reason maybe because that the change of ratios is earlier than individual lipid, especially in patients with normal blood lipid. Improving glycaemic control can substantially reduce the risk of cardiovascular events in diabetics. It has been estimated that reducing the HbA1c level by 0.2% could lower the mortality by 10%. [7].

### Conclusions:-

It was concluded from the results of this study that HbA1c can be used as a predictor of dyslipidemia in type 2 diabetes mellitus in addition to as glycemic control parameter. HbA1c measurement helps to control diabetes mellitus and helps to identify dyslipidemia and will help for the better management of diabetes in preventing cardiovascular diseases due to dyslipidemia.

HbA1c can be used as a good indicator of glycemic control as well as a predictor of lipidemic state in type 2 diabetics.

bone height - osseointegration- bone morphogenetic protein (BMP)- human

#### Abstract

Dental implants had become an integral treatment modality in prosthetic dentistry. Implant prostheses have shown dramatic improvements in masticatory performance, esthetics, and patient satisfaction. Recently, the applications of molecular and nanoscale-based biological substances as bone morphogenetic proteins, peptides, and stem cells in association with calcium phosphate coatings always play an essential role in enhancing the osseointegration of dental implants and shortening the time period for implant integration. Hypothetically, oral implants' surfaces covered with a bone inductive agent such as a BMP may stimulate regional bone development and osseointegration in sites of poor bone quality or in need of augmentation. Objectives were to evaluate the effects of bone morphogenetic protein surface coating of dental implant in improving the osseointegration in human. The search was done at Cochrane Central Register of Controlled Trials (CENTRAL), PubMed. Only English papers were to be included. Most recent search: october 2016. The Selection criteria were Randomized controlled clinical trials (RCTs) including patients with dental implant coated with bone morphogenetic protein (BMP) surface coating against dental implants without bone morphogenetic protein (BMP) of surface coating. The outcome measures considered were: osseointegration, implant stability, and implant failure. Chief results: We found that there was no randomized controlled or controlled clinical trials. Conclusions: in this research area, there is utmost need for RCTs to evaluate the role of bone morphogenetic protein surface coating of dental implant in enhancing the osseointegration in human (clinical studies).

#### Background: -

Dental implants had become an integral treatment modality in prosthetic dentistry. Implant prostheses have shown dramatic improvements in masticatory performance, esthetics, and patient satisfaction. The placement of dental implants and the insertion of implant-supported prostheses have been found to substantially reduce bone loss in the edentulous jaw, as well as promote bone deposition distal to implants. (1)

**Corresponding Author: -Nourhan Ahmed Ragheb.**

Address: - Department of Prosthodontics, Faculty of Dentistry, Kafr El-Shiekh University, Egypt.

Because the time frame to achieve full osseointegration, in addition the physiology and composition at the bone implant connection, is mainly related to the implant surface, there is a necessity to establish surfaces modifications that will lead to a predictive improvement of implant-to-bone response.(2)

Such modifications, whether surface topographical or surface chemical, have been successful in accelerate osseointegration at early implantation times which may shorten the total treatment period.

Recently, the applications of molecular and nanoscale-based biological substances as bone morphogenetic proteins, peptides, and stem cells in association with calcium phosphate coatings always play an essential role in enhancing the osseointegration of dental implants and shortening the time period for implant integration.(3)

**The BMPs are dissoluble**, small molecular weight transmembrane glycoproteins that found as dimers linked by a disulfide bond within natural bone. Due to there is only a little quantity of active protein/kg bone, extraction of adequate amounts would demand a large quantity of bone, making this process very difficult and expensive. (4) BMPs are growth factors that naturally found within the bone matrix and act as pleiotropic organizer of chemotaxis, mitosis, differentiation, excitation of extracellular matrix formation, bound to matrix components, conservation of phenotype and apoptosis. In addition, they play a role in regulation of bone volume, skeletal organogenesis and the Regeneration of bone after a fracture.(5)

Hypothetically oral implants' surfaces covered with a bone inductive agent such as a BMP may stimulate regional bone development and osseointegration in sites of poor bone quality or in need of augmentation. (6)

The consequences of BMP-2 and its application on dental implants' osteoconductivity had been evaluated by (Liu et al, 2007)<sup>(7)</sup> by using a bare titanium surface or with a calcium-phosphate covered implant. They found that the method of application bone morphogenetic protein (BMP-2) was greatly affects the osteoconductivity of dental implant surfaces.

(Kim et al, 2015)<sup>(8)</sup> used recombinant human bone morphogenetic protein-2 (rhBMP-2)-loaded pedicle screws to formulate a new hypothesis of bone-to-bone biological lock .

(Yoo et al, 2014)<sup>(9)</sup> had examined if plasma-sprayed hydroxyapatite implant surfaces dipped in protein solution prior to dental implant installation in order to cover the implant surface with rhBMP-2 onto by immersion in protein solution before implant placement may lead to greatly enhance the process of bone formation . **They concluded** that the mixture of plasma-sprayed calcium-phosphate implant surface and rhBMP-2 coating remarkably improve the osseointegration, which certified the postulated hypothesis.

#### **Biological Function of BMP: -**

- BMPs are growth factors that naturally found within the bone matrix and act as pleiotropic organizer of chemotaxis, mitosis, differentiation, excitation of extracellular matrix formation, bound to matrix components, conservation of phenotype and apoptosis.
- In addition, they play a role in regulation of bone volume, skeletal organogenesis and the Regeneration of bone after a fracture. (5)
- BMP-2 has been the most inclusively studied of any of the BMPs.
- The jobs of the protein have been resolved in fracture healing, bone defects and different spinal fusion models.(5)
- Expression is regenerative with the differentiation of chondroblasts and osteoblasts from mesenchymal stem cells, proposing that it might be an inducer of bone formation and chondrogenesis.(5)
- Meantime, more than 40 agents of the mutated growth factor beta 1 (TGF- $\beta$ ) family were known that they have a great part in differentiation and growth of matters.(10)
- In addition, BMP-2 is considered as one of the growth factors that have osteoinductive properties; others include BMP-4, BMP-6 and BMP-7.(10)
- From all of these advantages, it could be important for implant's patients, clinical researchers, and society to investigate the effectiveness of bone morphogenetic protein surface coating of dental implant in improving the osseointegration in human, as the recombinant human bone morphogenetic protein (rhBMP-2) dental implant coating was approved to be used safely in human

**Objectives: -**

The main objective of this review is to estimate whether the bone morphogenetic protein coating of dental implant's surface can enhance the osseointegration in human.

Moreover, to investigate if the bone morphogenetic protein coating of dental implant can improve the osseointegration better than non-bone morphogenetic protein surface coating of dental implant in human studies.

**PICO: -**

- **Population:** edentulous patients (partial or complete)
- **Intervention:** bone morphogenetic protein surface coating of dental implant
- **Control:** non-bone morphogenetic protein surface coating of dental implant
- **Outcome:** - osseointegration
  - Implant stability
  - Implant failure
- **Study design:** randomized clinical trial (RCTs)

**Methods: -****Inclusion Criteria for selecting studies: -****Included studies:**

- The studies were Randomized controlled clinical trials (RCTs) which may be parallel studied or split mouth design without time limiting frame of these studies.

**Types of participants: -**

- The patients could be male or female with no age limit.
- The Patients could be partially or completely edentulous.
- The dentulous areas can be found at maxilla or mandible
- The edentulous spaced could be anteriorly or posteriorly.
- The super structure could be fixed or removable prosthesis.
- The loading may be immediate or delayed.

**Types of interventions: -**

Dental implants with or absence of the growth factor (bone morphogenetic protein (BMP)) surface coating

**Types of outcome measures: -**

- Assessment of the osseointegration through calculating the bone height around the dental implant at each follow up period in each group
- Evaluation of stability of dental implant, where primary or secondary implant stability are pre-requisite for successful osseointegration and subsequent success of implant treatment
- Implant failures which could be identified through detecting the mobility of dental implant that may be caused by marginal bone loss around the installed implant.

**Search procedure for the included studies: -**

For identification of included studies, there were some databases used in search process.

**Databases used in searching: -**

- The latest electronic search was performed on 14 October 2016 by using PubMed- NCBI data base, and Cochrane Library for the Controlled Trials.

**Language selected: -**

The articles with English language only selected during the search strategy.

**Hand searching: -**

hand searching was made through electronic search in different journals and screening the references of relevant papers and reviews.

Data extraction

- Literature search resulted in 37 studies in PubMed and 5 studies on Cochrane data base. the first step of filtrating studies was performed through title and /or abstract with the resultant of zero studies retrieved from PubMed and Cochrane data base

The subsequent data should be registered for each clinical study:

- ❖ publication year, originating country, environment and origin of study funding.
- ❖ participants' information including demographic data and inclusion criteria.
- ❖ the type of intervention's details and information.
- ❖ Detailed information of the outcomes measured, incorporating method of evaluation and time interval

#### PRISMA 2009 Flow Diagram: -

#### Gathering and analysis of data: -

All the studies selected according to the criteria of search strategy were screened by titles and abstracts independently by two authors to decide whether these selected studies followed up the inclusion criteria. In addition, in case of insufficient available information about the studies in title and abstract, a report was made about the status of each study to be checked by the two authors independently to make a clear decision about them. In case of disagreements, the discussion was the appropriate solution in this condition but if this way is not worked, a third author was invited to give the final decision. After that, the quality of each selected study was evaluated, then a table of exclusion studies was made with clarifying the cause of this exclusion.

#### Quality assessment of the included studies: -

- ❖ The evaluation was done according to standard criteria:
- ❖ The first one was the Allocation concealment which may be: adequate concealment or un clear or inadequate one.
- ❖ After that, evaluation of follow up period, if all patients complete the whole study period or there was a drop out. In this case, a clear explanation for this drop out should be given, as it was evaluated as follow:
- ❖ The answer was yes, in case of the presence of clear explanation for drop out.
- ❖ The answer was no, in case of absence of explanation.
- ❖ The studies were to be gathered in groups after analyzing the data of each one in to these categories:
- ❖ If all evaluation criteria were present, this study was considered as low risk of bias.
- ❖ If one or more of the evaluation criteria were not completely explained, this study was considered as moderate risk of bias
- ❖ If one or more of the evaluation criteria were absent, this study was considered as high risk of bias

#### **Data composition: -**

For the estimation of the influence of an intervention, the risk ratios were used with 95% confidence interval for all selected studies. The mean difference with 95% confidence interval were used to continuous outcomes. After screening the types of participants, outcomes and interventions, the clinical heterogeneity was assessed. A planned subgroup analysis for methods of applying bone morphogenetic protein (BMP) coating on the implant surface and sub group analysis for various types of bone morphogenetic protein (BMP). For only studies which had the same outcome measures, assessment methods, and comparisons, the meta analyses were made. The random effect model was used to collect the risk ratio for dichotomous data. In addition, it was used to collect the mean differences for continuous data present. The  $I^2$  test was used to test and quantify the amount of heterogeneity between the studies. The influence of randomization may be evaluated by using sensitivity analysis.

#### **Results: -**

Regarding the studies' description, assessment of risk of bias in the included studies, and the influence of the intervention, it was found that there was no published randomized controlled clinical trials (RCT) or controlled clinical trials after searching in to different data bases.

#### **Discussion: -**

It was so disappointed not to find a randomized controlled clinical trial or even controlled clinical trials to compare and evaluate the effect of bone morphogenetic protein surface coating of dental implant in improving the osseointegration in human. Several published animal studies have become available. We are also ongoing to publish randomized clinical trial (RCT) including 10 patients, they are divided into two groups **Group (I)**: Five patients had received two conventional titanium implant coated with Bone morphogenetic protein (BMP) installed in the inter-foraminal area. **Group (II)**: Five patients had received two conventional titanium implant surface installed in the inter-foraminal area. with a 1-year follow up from Egypt, Cairo University, Faculty of Dentistry.

In this section, we introduce a summary about some of the animal studies performed by using bone morphogenetic protein coating of dental implant's surface with different techniques and types to guide the clinical researchers in this field, and the evidence extracted from this review was limited as there was no randomized clinical trials in this research field.

(Liu et al, 2005)<sup>(11)</sup> had tested kinetics and histomorphometry of bone development in combination with BMP-2 coating of dental implant by using a rat model. The models were divided into one experimental and three control groups. They concluded that the incorporation of BMP-2 with calcium phosphate coatings could enhance the bone development in vivo with excellent degree strength and even with low concentration of the given dose. In addition, the ability to withstand this action was high as its activity may last for large period of time.

The consequences of BMP-2 and its application on dental implants' osteoconductivity had been evaluated by (Liu et al, 2007)<sup>(7)</sup> by using a bare titanium surface or with a calcium-phosphate covered implant. They found that the method of application bone morphogenetic protein (BMP-2) was greatly affects the osteoconductivity of dental implant surfaces.

(Ramazanoglu et al, 2011)<sup>(12)</sup> had tested the influence of recombinant human bone morphogenetic protein-2 in single and double delivery techniques and recombinant human vascular endothelial growth factor (rhVEGF165) from dental implants coated with biomimetically octa-calcium phosphate on osseointegration. These implants were installed into frontal skulls of nine domestic pigs. **They concluded** that the combination of coating implants with BMP-2 and VEGF could enhance the bone volume density in the area surrounding the implants, although there was not bone implant contact observed in this condition.

(Kim et al, 2015)<sup>(8)</sup> used recombinant human bone morphogenetic protein-2 (rhBMP-2)-loaded pedicle screws to formulate a new hypothesis of bone-to-bone biological lock.

(Yoo et al, 2014)<sup>(9)</sup> had examined if plasma-sprayed hydroxyapatite implant surfaces dipped in protein solution prior to dental implant installation in order to cover the implant surface with rhBMP-2 onto by immersion in protein solution before implant placement may lead to greatly enhance the process of bone formation. **They concluded** that the mixture of plasma-sprayed calcium-phosphate implant surface and rhBMP-2 coating remarkably improves osseointegration, which certified the postulated hypothesis.

The effects of bone morphogenetic proteins (BMPs) in cellular functions in adult and postnatal animals have been investigated in recent years. Most of these animal studies recommend to use the BMP as surface coating for dental implant. Moreover, bone morphogenetic protein as surface coating for dental implant is considered to be a new surface coating technique for dental implant. For these reasons, it is important to plan good standard randomized clinical trials (RCTs) to evaluate the influence of bone morphogenetic protein coating for dental implant, this is a very important step to produce trustable evidence about its effectiveness in improving the bone formation. In addition, different techniques for BMP application and mode of coating delivery should be properly tried and tested in vivo studies.

## Conclusions: -

### Clinical suggestions:

There were no published randomized controlled clinical trials or controlled clinical trials, thus the good evidence is difficult in this case to recommend the clinician to use the bone morphogenetic protein surface coating of dental implant in improving the osseointegration in human. It seems that bone morphogenetic protein surface coating might improve the osseointegration depends on the technique used for application of coating on to the implant surface, however, these results depend on animal studies. Thus, we don't recommend to use bone morphogenetic protein as surface coating for dental implant till a strong and reliable evidence developed.

### Research suggestions:

Although, the bone morphogenetic protein surface coating for dental implant is relatively a new coating technique, the absence of randomized clinical trial on this point is so depressed, as its effect in improving the osseointegration in human still doubtful. For this reason, we advise the researchers to pay attention to this research point to help in generating reliable and strong evidence base decision. In addition, different techniques for BMP application & release should be tried.

#### Abstract

**Background:** Periodontitis is defined as an inflammatory disease of the supporting tissues of the teeth caused by specific microorganisms or groups of specific microorganisms, resulting in progressive destruction of the periodontal ligament and alveolar bone with pocket formation, recession, or both. The clinical feature that distinguishes periodontitis from gingivitis is the presence of clinically detectable attachment loss.

**Aim of the study:**Comparative study the effect of probiotic s as chewing gum in patient with periodontal disease.

**Methods:**In thisstudy, 20 patient with periodontal disease (chewing gum with probiotic supplement group)(test group) and 20 patient(chewing gum) (control group) both received treatment in periodontal department of dentistry college by means of scaling and polishing , the (test group) in addition received probiotic chewing gum in order to study its effect and compare it with the( control group).

**Result:**Probiotic chewing gum users demonstrated less amount of plaque than in the (control group), and less gingival inflammation in the study group than in the control group.

**Conclusion:**Probiotic chewing gum has more effect on the periodontal tissue health, by decreasing the amount of plaque and gingival inflammation with adjunct scaling when compared to the control group.

#### Introduction:-

The first studies of the use of probiotics for enhancing oral health were for the treatment of periodontal inflammation.<sup>43</sup> Patients with various periodontal diseases, gingivitis, periodontitis, and pregnancy gingivitis, were locally treated with a culture supernatant of a *L. acidophilus* strain. Significant recovery was reported for almost every patient. There has been significant interest in using probiotics in treatment of periodontal disease recently, too. The probiotic strains used in these studies include *L. reuteri* strains, *L. brevis* (CD2), *L. casei*Shirota, *L. salivarius* WB21, and *Bacillus subtilis*. *L. reuteri* and *L. brevis* have improved gingival health, as measured by decreased gum bleeding<sup>(1, 2, 3)</sup>. The use of probiotic chewing gum containing *L. reuteri* ATCC 55730 and ATCC PTA 5289 also decreased levels of pro-inflammatory cytokines in GCF,<sup>(3)</sup> and the use of *L. brevis* decreased MMP (collagenase) activity and other inflammatory markers in saliva.<sup>(2)</sup> With *L. casei*Shirota and *Bacillus subtilis* no difference in test and control groups in gingival bleeding or measured plaque index was observed, but the use of *L. casei*Shirota decreased PMN elastase and MMP-3 activities in GCF, and gingival inflammation was lower in the group consuming the probiotic product, as measured by MPO activity after a four-day period of experimental gingivitis.<sup>(4)</sup>*B. subtilis* seemed to reduce the number of periodontal pathogens.<sup>(5)</sup> Use of tablets containing *L.*

**Corresponding Author:-Alaomranali.**

Address:- Amer abdulrahman alshikhdaheer msc PhD, microbiology.

*salivarius* WB21 has been shown to decrease gingival pocket depth, particularly in high-risk groups such as smokers, and also affect the number of periodontal pathogens in plaque.<sup>(6,7)</sup>

Again, although encouraging results have been observed, most studies have been fairly short. Furthermore, in some studies the observed differences were quite small, though statistically significant.

Some probiotic *Lactobacillus* and *Streptococcus* strains seem able to colonize the oral cavity of some people during the time that products containing them are in active use. However, both in vitro and in vivo evidence indicate that the differences between various probiotic strains, products, and also host individuals are obvious.<sup>16,2</sup> *L. rhamnosus* GG and two different *L. reuteri* strains have been reported to colonize the oral cavity of 48–100% of volunteers consuming products containing them.<sup>2</sup>

At least some of the probiotic bacteria used in various probiotic products may colonize the oral cavity during the time they are in use; thus, the effects of probiotic bacteria in the oral cavity are important to understand. Probiotic bacteria seem to affect both oral microbiota and immune responses. On the other hand, the extent to which bacteria in food or in food ingredients can influence relatively stable oral microbiota is difficult to predict. Thus, both research to unravel the mechanisms of possible probiotic action and long-term clinical trials are needed if probiotics are to provide a new scientifically proven means of preventing or treating oral diseases,<sup>2,3</sup>

### Material And Method:-

Across-sectional survey of forty patient divided in to two group(test group),chewing gum with probiotic and( control group) chewing gum without probiotic( probiotic chewing gum prepared in college of agriculture department of food science .the test group was composed of twenty subject and control group was composed also of twenty subject .the patient was selected from periodontal department in collage of dentistry-university of Baghdad .the subjects for the study were selected randomly and they were in good general health and were not using any medications and the subject we take contain male and female patient we carried out a careful examination of patient using the plaque index (PI)(silness and loe in 1964),gingival index (GI)(loe, 1967) of those patient a comparison analysis. We usedSPSS statistics for analysis and Microsoft excel 2013 for figures.

### Method:-

After doing scaling and polishing for test group subjects asked them to use probiotic chewing gum(with lactobacillus acidophilus probiotic) two time daily 10 minute during one week and examined the subject during the first and second visit to make comparison analysis . While control group was done scaling and polishing askedthem to chew sugar free chewing gum two time daily for 10 minute during one week, and made comparison analysis. A thorough periodontal examination was carried out under good artificial light ,and parameter selected for the study were carefully record .plaque index , gingival index all were measured using these specific index and record on case sheet design for this study .

Informed consent was obtained from all the subjects before starting periodontal examination.

### Clinical examination:-

#### Plaque index:-

The plaque index (loe and silness,1963)was created for the assessment of the plaque accumulation on the basis of 0 to 3 the criteria are:

Scores	Criteria
0	No plaque
1	A film of plaque adhering to the free gingival margin and adjacent area of the tooth cant be seen by naked eye.
2	Moderate accumulation of soft deposit within the gingival pocket or the tooth and gingival margin can be seen by naked eye.
3	Abundance of soft matter within the gingival pocket and Or on the tooth and gingival margin

#### Gingivalindex :-

The gingival index (loe1967)was created for the assessment of the gingival condition and records qualitative changes in the gingival .it records the gingival and interproximal tissue separately on the basis of 0 to 3.the criteria are :

Scores	Criteria
0	Normal gingival
1	Mild inflammation –slight change in color and slight edema but no bleeding on probing
2	Moderate inflammation –redness ,edema ,glazing bleeding on probing
3	Sever inflammation –marked redness and edema, ulceration , with tendency to spontaneous bleeding

**Instrument:-**

**Result:-****Plaque Index and gingival index:-**

The following table and figures summarized the descriptive statistics of group A and B regarded plaque index (PI) and gingival index(GI).

**Table 1:-Descriptive of group A(test group)**

	Base line		Week1	
	Mean	SD	Mean	SD
PI	1.3	0.033	0.7	0.018
GI	1.2	0.03	0.6	0.015

**Figure 1:-Descriptive statistic of group A(test group)**

As we see in the figure (1) there are high differences between PI and GI of test group between first and second week

**Table2:-t-test between weeks(test group)**

	t-test	P-value	Sig
PI	3.862	0.029	S
GI	4.36	0.028	S

Now if we see the descriptive statistic of subject group B(see figure 2) we also see a result similar to group A also there are high differences between the first and second week.

**Table3:-Descriptive of groups B(Control)**

	Week1		Week2	
	Mean	SD	Mean	SD
PI	1.3	0.033	0.9	0.023
GI	1.1	0.028	0.8	0.02

**Figure 2:-Descriptive statistic of group B(control).**

If we compared between the result of group (A) and (B) we will found the following result (see figure 3).

**Table 4:-Descriptive of groups by weeks.**

	Base line				Week1			
	GroupA		GroupB		GroupA		GroupB

### Discussion:-

Probiotics can be defined as living microbes, or as food ingredients containing living microbes, that beneficially influence the health of the host when used in adequate numbers.<sup>1</sup>

In figure (1) the (20) patient (groupA) and make scaling to them after that we record the plaque and gingival index then give to them probiotic chewing gum. After one week we record (GI,PI) index we see high difference between the first and second week, this agree with (Wetman et al, 2009).

In figure (2) the same experience another (20) patient (group B)but give them just chewing gum, after one week we also see difference in (GI,PI) index between the first and second week due to mechanical plaque control.

In figure (3) we compare between group A(chewing gum) and group B(control), the chewing gum patient show slightly higher decrease in plaque index and gingival index between the first and second week than the controlled patient, this agree with (Hojo et al., 2007).

In table 5 shown that there are significant deference between two group and that agree with many research that the probiotic can defense the bacterial plague and enhance the oral hygiene which is the ability of lactobacillus acidophilus to fight the biofilm in oral cavity. Della Riccia DN, Bizzini F, Perilli MG, Polimeni A, Trinchieri V, Amicosante G, et al 2007., . Mayanagi G, Kimura M, Nakaya S, Hirata H, Sakamoto M, Benno Y, et al.2009.

Some probiotic *Lactobacillus* and *Streptococcus* strains seem able to colonize the oral cavity of some people during the time that products containing them are in active use. However, both in vitro and in vivo evidence indicate that the differences between various probiotic strains, products, and also host individuals are obvious.<sup>26,44,57,58</sup> *L. rhamnosus* GG and two different *L. reuteri* strains have been reported to colonize the oral cavity of 48–100% of volunteers consuming products containing them.<sup>44,58–60</sup> In addition, *S. salivarius* K12, used for treating oral malodor, temporarily colonizes the oral cavity for a short time after use.<sup>61</sup> Furthermore, consumption of a mixture of seven different *Lactobacillus* strains increased the number of salivary *Lactobacillus* counts, although the identities of the strains in the saliva were not determined.<sup>41</sup>

Patients with various periodontal diseases, gingivitis, periodontitis, and pregnancy gingivitis, were locally treated with a culture supernatant of a *L. acidophilus* strain. Significant recovery was reported for almost every patient. There has been significant interest in using probiotics in treatment of periodontal disease recently, too. Improved gingival health, as measured by decreased gum bleeding. The use of probiotic chewing gum containing *L. reuteri* ATCC 55730 and ATCC PTA 5289 also and Use of tablets containing *L. salivarius* WB21 has been shown to decrease gingival pocket depth, particularly in high-risk groups such as smokers, and also affect the number of periodontal pathogens in plaque.<sup>7,8</sup> Again, although encouraging results have been observed, most studies have been fairly short. Furthermore, in some studies the observed differences were quite small, though statistically significant. Table 6 show that the chewing gum increase the salivary flow and the pH of the saliva and that also in agreement with many study<sup>40,41</sup>. which decrease the gingivitis by washing the mouth from materia alba and plaque .

#### Abstract

Le PRP est une thérapie cellulaire facilement accessible. C'est une thérapie cellulaire autologue contenant de nombreux facteurs bioactifs qui sont impliqués dans la cicatrisation des plaies, la réparation des tissus, et la régénération tissulaire.

L'industrie pharmaceutique ne cesse d'innover en matière de méthode de préparation, vu les intérêts économiques énormes que constitue « le phénomène » PRP. Cependant, la compréhension des différences dans les préparations PRP est essentielle lors de l'interprétation des résultats d'études cliniques.

Nous proposons un protocole de prélèvement simple et peu onéreux pour l'obtention du PRP, le but de ce travail est de décrire les différentes étapes de ce protocole et ainsi démontrer son efficacité.

Par conséquent, étant donné que peu de standardisation a été faite à ce jour, il existe toujours une controverse sur les avantages cliniques de la PRP. Des études prospectives et randomisées sont nécessaires pour évaluer l'efficacité des préparations normalisées de protocoles.

#### Introduction:-

Plasma riche en plaquettes (PRP) est un volume de plasma de sang autologue ayant des niveaux de plaquettes au-dessus de la concentration dans le sang périphérique. La concentration de plaquettes peut fournir une plus grande quantité de plusieurs facteurs de croissance bioactifs pour favoriser la cicatrisation.

Les méthodes employées sont diverses, le choix de la méthode doit prendre en considération la qualité globale des plaquettes, des résultats et des coûts. Le taux initial moyen de plaquettes sanguines est de  $200\ 000 \pm 75\ 000$  / pi et les plaquettes sont in vivo une demi-vie d'environ 7-10 jours.

Les plaquettes activées, au contact de l'endothélium exposé à l'intérieur des plaies ou des tissus endommagés, sont connues pour libérer dans la plaie beaucoup de facteurs, y compris le facteur de croissance dérivé des plaquettes (PDGF), le facteur de croissance transformant (TGF), le facteur de croissance endothéliale vasculaire (VEGF), analogue à l'insuline facteur de croissance (IGF) et le facteur de croissance épidermique (EGF). Tous ces facteurs vont préparer le terrain pour la cicatrisation des tissus qui implique des processus qui se chevauchent, complexes, ses facteurs interviennent dans l'hémostase, l'inflammation, la prolifération et le remodelage tissulaire.<sup>1</sup>

Des études prospectives et randomisées seront nécessaires pour évaluer l'efficacité des préparations normalisées de PRP dans la cicatrisation des plaies.

La première étape vers cette normalisation devrait être la production de PRP la plus rentable, la plus simple qui le rendrait ainsi accessible à plusieurs centres de traitement et donc à un nombre plus important de patients. Ceci permettra de faciliter le développement et la conception d'études cliniques<sup>2</sup>.

Dans l'ensemble, la technique de préparation de PRP que nous décrivons dans cet article peut être mise en œuvre par le personnel médical, sans formation spécialisée supplémentaire. Les opérateurs étant sensibilisés à tous les risques liés à la récolte, le transport, le traitement, et l'injection ou l'application du PRP.

#### Le Protocole Prp:-

- ❖ Prélèvement à faire au flacon sous vide et non à la seringue : Pour éviter les turbulences lors du prélèvementsanguin (éviter les cathéters et les aiguilles fines de 18 et 20 G)
- ❖ L'abord veineux au pli du coude : Privilégier les veines du bras (Cubitale, Céphalique et Basilique) : Veines de la main trop étroites: prélèvement compliqué par l'utilisation d'une aiguille de taille importante.
- ❖ Enlever le garrot juste après l'abord veineux, pour éviter l'hémolyse et l'activation des plaquettes
- ❖ Volume de sang prélevé: maximum 20 mL en circuit fermé dans des tubes citratés de 5ml
- ❖ Temps de centrifugation: 5 minutes (*fig 1*)
- ❖ Vitesse de centrifugation: 1500 tours/min pour rayon 10 à 13 cm (à adapter en fonction du rayon de la centrifugeuse) (*fig 2*)
- ❖ Volume de PRP obtenu: 5 à 8 ml. (*Fig 3*)
- ❖ La durée totale de la procédure ne doit pas dépasser **30 minutes** car les facteurs de croissance sont libérés progressivement : 70% sont libérés dans les 10 minutes après activation et 95-100% sont libérés au bout d'une heure.
- ❖ Utilisation ou non d'activateurs :
  - L'activation par la thrombine provoquerait dans certains cas une réaction immunitaire susceptible d'endommager d'avantage les tissus lors de la réaction inflammatoire.
  - L'activation dite 'in-vivo' permettrait d'éviter la formation de tissu cicatriciel au profit d'un tissu semblable au tissu d'origine.
- ❖ Récupérer le PRP directement dans des seringues de 1 cc LuerLock de préférence à l'aide d'aiguille intramusculaire, cela a pour but de minimiser les turbulences et donc de déclencher l'activation prématurée des plaquettes. (*fig 4*)

#### Discussion:-

Lorsque le sang anti-coagulé est centrifugé, trois couches apparaissent. Ceci est dû à des différences dans la densité des constituants du sang: la couche profonde est composée de globules rouges, la couche intermédiaire contient des plaquettes et des leucocytes, et la couche supérieure est constituée de plasma pauvre en plaquettes. La partie inférieure de la couche médiane est aussi appelée couche leucocytaire, qui est riche en leucocytes<sup>3</sup>.

Les principales variables prises en compte lors de l'optimisation de la technique et qui jouent un rôle important dans la préparation du PRP incluent l'agent de collecte, le choix ou non d'utiliser un agent d'activation (tels que la thrombine), et les protocoles de concentration. Ceux-ci doivent être adaptés en fonction de la qualité, de la stabilité des éléments cellulaires et en fin de compte du choix d'un anticoagulant capable de préserver, le mieux possible, la fonctionnalité, l'intégrité et la morphologie des plaquettes.

Quand aucun anticoagulant n'est utilisé, les plaquettes peuvent être réactivées par la contrainte mécanique de la centrifugation.

<sup>3</sup>Dragoo JL, Braun HJ, Durham JL, et al: Comparison of the acute inflammatory response of two commercial platelet-rich plasma systems in healthy rabbit tendons. *Am J Sports Med* 2012; 40: pp. 1274-1281

Le Citrate est un anticoagulant approprié pour la préparation de PRP si les tubes appropriés sont disponibles (stériles, non pyrogènes)<sup>4</sup>. Il a été récemment montré que le PRP non activé utilise des plaquettes en tant que système de délivrance de médicament à libération prolongée, présentant le meilleur effet sur la cicatrisation<sup>5</sup>.

Il a aussi été démontré qu'il n'est pas nécessaire d'avoir des valeurs de plaquette à plus de trois fois la normale, il paraît que des concentrations trop élevées du taux de plaquette peut avoir un effet toxique. L'obsession à chercher à concentrer le taux de plaquette par des centrifugations itératives peut même prématurément les plaquettes<sup>6</sup>.

**Figure 3:-**Résultat obtenu après centrifugation.

**Figure 4:-**Prélèvement du PRP au ras du culot globulaire et obtention des seringues prêtes à l'emploi.

**Conclusion:-**

Le PRP est une thérapie cellulaire facilement accessible. C'est une thérapie cellulaire autologue contenant de nombreux facteurs bioactifs qui sont impliqués dans la cicatrisation des plaies et la réparation des tissus, ne nécessitant que peu de manipulations pour obtenir le produit final. Cependant, la compréhension des différences dans les préparations PRP est essentielle lors de l'interprétation des résultats d'études cliniques<sup>7</sup>.

Par conséquent, étant donné que peu de standardisation a été faite à ce jour, il existe toujours une controverse sur les avantages cliniques de la PRP. Des études prospectives et randomisées sont nécessaires pour évaluer l'efficacité des préparations normalisées de protocoles de PRP.

Lorsque les thérapies cellulaires sont impliquées dans la clinique, il est important de garantir la qualité du composant cellulaire. En outre, les coûts élevés et la nécessité de disposer d'un équipement spécialisé pour préparer le PRP ont gravement réduit l'utilisation de plaquettes autologues<sup>8</sup>.

Les méthodes de préparation du PRP simples ne nécessitant pas des équipements coûteux aideraient à accumuler des données cliniques et à faciliter l'introduction de la thérapie cellulaire dans la pratique médicale.

#### Abstract

In recent years, open innovation has been changed to one of the issues regarded by innovation management. Product development and design (PD&D) organization is a capacity and capability which is able to take an action to convert idea to the product in its own processes. One of the most important management decisions in development and design cycle is to make a decision about this issue that how employees are organized and grouped and how their relationship would be. In this paper, investigating organizational structure and form of PD&D organizations which have an especial importance have been taken into consideration. In the following, owing to the open innovation approach, these organizations are investigated and proper strategies are propounded and then organizational structure proportioned to product lifecycle is proposed.

#### Introduction:-

Today, by curtailing lifecycle of goods and their applied technologies, innovation issue has found an increasing importance in the commerce [1]. But in today's dynamic and developed environment, innovation is not being done in organizations, but also it has dissimilated beyond the organization's borders. Therefore, organizations are looking for knowledge, information and external partners as the valuable resources of innovation. Recently, a change has been observed from innovation traditional model which is fundamentally focusing on internal development and research toward open innovation [2].

One of the factors which collapse close innovation logic can be pinpointed as increase in replacement of skilled and experienced people, stepped-up trend of academic education, increasing role of private venture capitalists, continuous increasing of customers' and suppliers' knowledge as well as curtailing technology lifecycle [3]. In contrast, close innovation which considers success dependent on exerting control and asks organizations to create ideas by their own; then develop themselves; fabricate; take to the market; hand out; finance and provide after selling services [3]. Open innovation asks the organization to employ external ideas like internal ideas [4]. Henry Chesbrough defines open innovation as "Open innovation is a pattern based on this assumption that if companies intend to promote their technology level, they can and must take an advantage of external technological ideas like their internal ideas and use diverse internal and external ways toward market" [3].

**Corresponding Author:- Mehdi Nikfarjam.**

Address:- Asst. Prof. Department industrial engineering, Islamic Azad University North Tehran Branch, Tehran, Iran.

Fast-paced changes and development in technology area, increase in innovation costs, increasing competitiveness in introducing new products to the market and curtailing lifecycle of products and technologies will lead to enhance in organization's needs to interact with the environment and external beneficiaries via opening organization's borders in order to interact innovative ideas [5]. Reduction in cost and time of new product development, increasing product quality, creating new income resources derived from selling waste technologies not used by the organization and also founding spin-off companies are effects which are resulted through following this approach [6].

In virtue of today's world changes and developments and inevitability of employing open innovation approach, organizations ought to take some strategies by profiting from opportunities created by this view in order to use benefits created by it. That's why; detecting necessities to implement open innovation can be considerably helpful for organizations.

Mortara et al (2009) in a dissertation have studied how to implement open innovation in giant multinational companies. According to their enquiry, changing structures, skills, stimuli and control methods is aiding organization with creating open innovation-supportive culture [7].

Chiaroni et al (2010) have investigated structural changes in transiting from the close innovation to open innovation in four Italian enterprises. In keeping with Rmnakys and Bdyan (1999) which have studied organizational change literature have arrived at this conclusion that open innovation as an organizational change process is carried out via sequences of freezing out-move-institutionalization which are 3 fundamental phases of changing. According to their research, in a travel from close innovation to open innovation, 4 underlying dimensions which are involved are: networks, organizational structure, and evaluation process and knowledge management system [8]. Parid et al (2011) have introduced 3 key areas which have been regarded by organizations in order to exert open innovation. These three areas are: people, process and technology [9]. Ades et al (2013) have investigated conducting open innovation in organizations of nach VRA, IBM and Siemens. According to their study, implementing open innovation in the organization requires development of activities to resolve necessity requirements to exert open innovation. These requirements are: organization's culture, dexterity of people involved in activities related to open innovation and their motivation to achieve pertinent results via applying open innovation [10]. Based on the carried out studies in this area, detected requirements to be transited from close innovation to open innovation in PD&D organizations are: Processes, Organizational structure, Networking as well as KM system. In this paper, studying structure and organizing PD&D organizations with open innovation view and crucial factors of organizations' success have been taken into consideration.

#### **Bases of architecture structure of PD&D organizations:-**

Organizational key challenges are to compromise distinction and integration. Creative activities required organizational structures and managerial systems are different with operational activities whereas development of new products and implementing new activities need integrity of creativity and expertise in technology in tune with production capabilities, marketing, budgeting, distribution and customer support. Gaining such integrity is hard. Fulfilling competitive advantage in elaborate and unpredictable environment of business necessitates this issue that company compile economies of scale along with entrepreneurial flexibility, innovation along with cost efficiency and globalization along with a real responsiveness. This issue creates new challenges for organizational structure designs and management systems whereas an integrated approach to formulate and implement strategy owing to their reciprocate dependencies have been propounded. Basis of structure architecture of each organization has to be the mission and tasks assigned to each organization. Since in this paper, structure architecture of product development and designing company is approached, it is necessary to firstly scrutinize the task of product design and development organization.

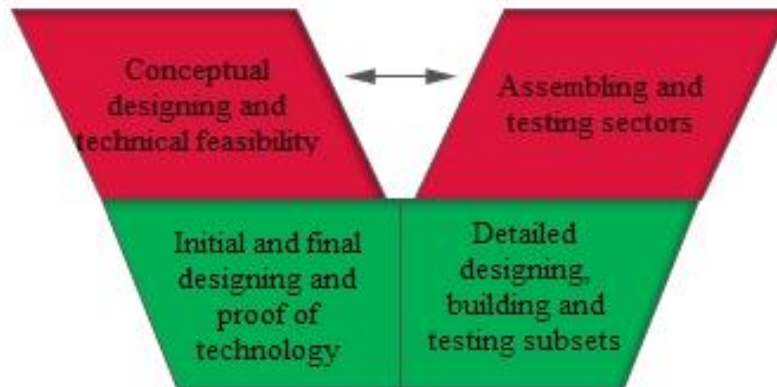

PD&D organization undertakes the mission of fulfilling the system from an idea to the initial sample or criterion sample. In another word, PD&D organizations have the duty to receive requirements of the senior PD&D organization (Employer) and by exerting all of capacities of supplier network in and out of the organization, fulfill the product which meets respective need. Accomplishing a product is feasible through conducting design project. Designing project has some steps and architecture of designing process tailored to each company is different.

#### **Designing process:-**

The main purpose of this process is to profit from external knowledge. This process helps with creating organization's relationship with external people or organizations by aiming to achieve technical and scientific competencies in order to progress organization's innovation [11].

To architect designing process, there are various models and approaches such as waterfall, spiral and V models and so on which are applied tailored to complexity level of product and readiness level of development and design team. Proportionated to these conceptions, it is offered that V model has been considered for PD&D. In the following pic, V model has been formed for the steps of project lifecycle. On this basis, in this paper, structure of PD&D organizations is architected in a way that simultaneously implements both implementation process of PD&D project (The first mission) and engineering designing process (The second mission).

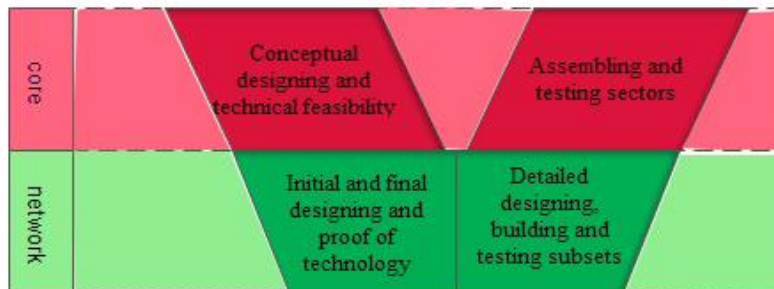

**Fig 1:-** V model proposed for steps of PD&D project

#### Structures of PD&D organizations:-

To manage organization's external knowledge successfully, it is required to assign organizational structure which facilitates achieving external knowledge and its integrity with organization's innovation process. Such structure is required also for proposing organizational internal ideas to the organizational external environment. Organizational structure required for applying open innovation includes: organizational unit, open innovation-supportive organizational roles and education and stimuli tailored to open innovation [12]. Structure of PD&D organization has to be firstly responsive to project lifecycle activities. Moreover, requirement relevant to product lifecycle also has to be considered. At the first step, the structure needed for PD&D organization to accomplish implementation process of designing project is architected. In fig 2, steps of product designing project and their relationship with open innovation approach (Outsourcing) have been portrayed.

#### These steps are:

1. Macro designing and technology feasibility
2. Conceptual designing and technical feasibility
3. Initial and final designing and proof of technology
4. Detailed designing, building and testing subsets.
5. Assembling and testing sectors
6. Integrating product and final tests.

**Fig 2:-** The relationship between designing steps of the conception of open innovation view

**PD & D organizational units:-**

Open innovation practices are carried out by organizational units. Thus, creating independent business unit of open innovation to simplify and make effective knowledge process from external players to internal ones is very crucial. Also, creating business development unit and allocating adequate resources and skills is mostly requiring effective exploiting of owned technologies [13]. Organizational units can be centralized (All projects is managed by centralized control units), decentralized (Each unit has a sector related to the project for itself) or hybrid (A combination of centralized and decentralized) [14]. Due to this issue that there is a wide range of diverse organizational units which are potential can be involved in open innovation, 7 organizational units which are important for implementing innovation are: research and development, process and product development, marketing, production management, supplies, subsidiaries (Contractors) and human resource management [15].

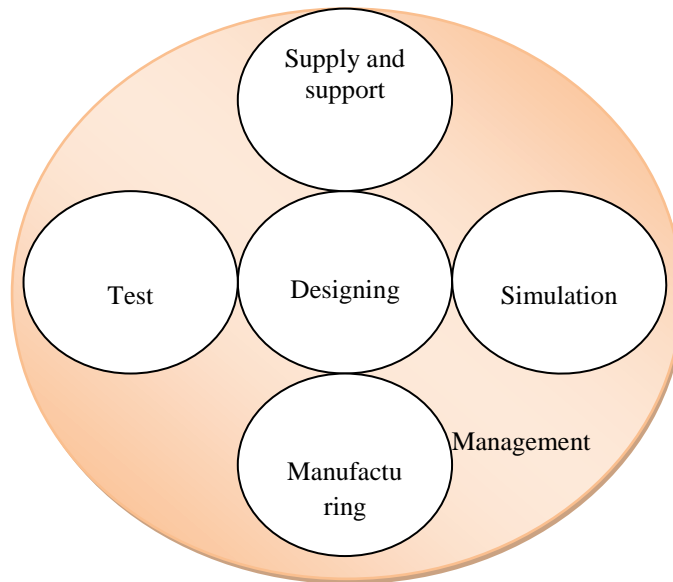

By pondering in designing steps, it can be found that it can be taken an action to break down steps of product designing project so that each activity can be placed in a technical area. Activities can be classified into technical categories including product engineering, manufacturing engineering and test engineering. Another distinction which makes a statement is this issue that activities are based on technology or product. This distinction is in fact the same as the area of outsourcing mission. In this dissertation, based on our underlying approach, activities of core area are serviced from tasks of PD&D organizations and activities of network area are serviced from companies out of the organization. In summary, the results of this classification are brought in the following. Technical area of each activity has been inserted in the bracket and its relationship to the project steps has been inserted in the arc:

1. Technical feasibility and conceptual designing (1) [System];
2. Initial designing (2-A) [technology];
3. Proof of technology (2-B) [technology];
4. Final designing (2-C) [technology and system];
5. Detailed designing of subsystems (3-A) [Technology];
6. Building subsystems (3-B) [Technology];
7. Subsystems test (3-C) [Technology];
8. System assembly (4-A) [system];
9. System test (4-B) [system];

Thus to cover steps of project lifecycle, the following units have to be placed in PD&D organizations. Role of each unit based on open innovation view is as the following:

- ❖ Product designing unit: This unit has responsibility for doing 2-A and 1. Receiving 2-A step from contractors is undertaken by this unit. In other steps, it is playing the role of observer and corroborant.
- ❖ Manufacturing unit: This unit undertakes 4-A activities. Receiving 2-B, 3-A and 3-B from contractors is done by this unit. In other steps, it is playing the role of observer and corroborant.
- ❖ Simulation and test unit: This unit has responsibility for doing 4-B. Receiving 2-B and 3-C from contractors is undertaken by this unit. In other steps, it is playing the role of observer and corroborant.
- ❖ Technical support and supply unit: Receiving support and supply requirements of subsets from contractors in step 3-C is undertaken by this unit. Also, accomplishment and rendering requirements of product support and supply for employer in step 4-B is undertaken by this unit too.

In fig 3, a model of units of PD&D organizations has depicted. The main axis of a project is designing unit which is accounted as the heart and center of innovation in the organization. What has surrounded all activities of a project and will lead to retain integrity of all activities is governance and management area of PD&D organization. By exerting structure of DSM designing matrix, interfaces related to the practices pertinent to different units of PD&D organizations can be scrutinized and in compliance with organization's mission, it can be formulated.

**Fig 3:** Working branches of PD&D organizations

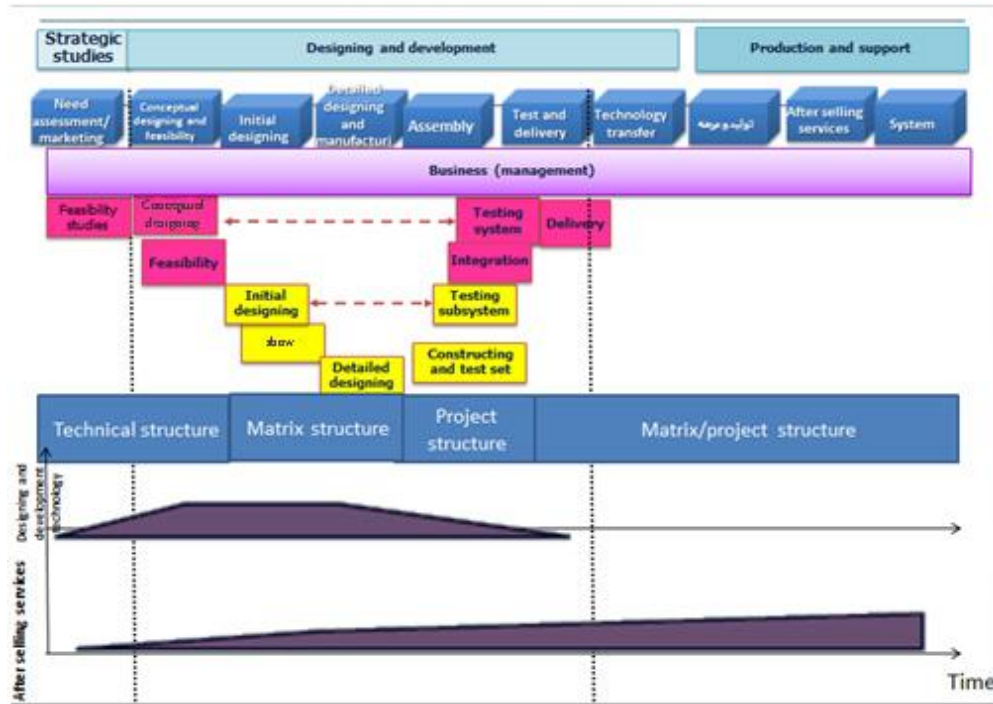

Networking provides collaborative and interactive space. Evidences show that PD&D organizations with open innovation view require creating a vast network of inter-organization communication with some of external roles especially universities and research institutes, suppliers and users [13].

Creating a heterogeneous network of diverse partners also suppliers, customers, consultants, opponents, universities as well as public and private research institutes enhance innovation performance of an organization, because networking approach toward innovation will lead to synergy [15].

Features of innovation networks can be detected by 2 variables of quest vastness and quest depth. Quest vastness indicates the number of external resources or research channels in which PD&D organizations are dependent on. Quest depth is the rate that organization receives information from different external resources or research channels [16].

Organizational structure is a method or path in which organizational activities are divided, organized and coordinated [17]. Structure is an outcome of a combination of the relationship between organizational elements which forms the existence philosophy of activities [18]. Organizational structure enunciates levels existed in administrative hierarchy and determines control domain of managers or supervisors. Also, organizational structure determines people who are working in different departments in the group and grouping or classifying departments which are existed in the whole of organization. Plus, this organization's structure encompasses designs of the systems by which activities of all departments are coordinated and integrated and thereby effective relationship system in the organization will be guaranteed [19].

Another important point which has to be considered in structure architecture is fulfilling conception of concurrent engineering and conception of design for product lifecycle. Hence, it is necessary that plus project lifecycle, product lifecycle and its pertinent requirement are also considered. After expressing required strategies to cover organizing's requirements pertinent to project steps, it is turn to consider required arrangements for designing structure. In basic research step, strategy specific for technical structure has to be adopted, because there is also a need there for low coordination and relatively high flexibility and in engineering development step, project structure is drawn, because need for coordination is reaching the highest point and need for flexibility is diminishing. Requirement for using matrix structure is arisen for product development step. That's why; here there is a need for high coordination and relatively high flexibility. Also in phases of engineering services and production, technical or matrix structure can also be applied. Selecting organizational structure is the function of the management needs rate for coordination and flexibility. In fig 4, the place of designing project lifecycle in product lifecycle, structure and organizing PD&D organization have been displayed.

**Fig 4:-** The place of designing project lifecycle in product lifecycle and human resource and time allocation

Totally, none of the structures can be known as problem- solving of all sorts of PD&D organizations and then, contingency approach in choosing appropriate structure for each organization is recommended.

### Conclusion:-

Organizing design and development organization is not a simple issue but also it is a complex and considerable issue. Organizations have to be able to fast convert each idea in their process to the product. Each organization must have an appropriate structure owing to product lifecycle in order to have reaction ability and proper responsiveness to customer needs in the certain time. By this approach and picking out V method for PD&D, designing process time in complex products has been diminished more than 40% and designing risk and product development have got close to zero.

It is recommended that for forthcoming researches, W model is investigated and organizational structure and project underlying activities due to the model and open innovation view is studied and researched.

#### Abstract

La brûlure chez le patient diabétique constitue un motif fréquent d'admission au service de chirurgieplastique et des brûlés de l'Hôpital militaire d'Instruction Mohammed V de Rabat. Nous rapportons une série de 11 cas de brûlures survenues chez des patients diabétiques en un an. Les complications dégénératives du diabète sont mises en cause directement à la survenue de la brûlure chez six cas. Le délai moyen de consultation est de sept jours. Les brûlures siègent aux membres inférieurs chez neuf cas. Quatre patients furent admis en décompensation acido-cétosique. La gravité de la brûlure est due à son caractère profond sous-estimé, par le patient et son entourage, cela a pour conséquence un retard à la consultation et donc de la prise en charge en milieu spécialisé. En fait la brûlure siège le plus souvent aux extrémités inférieures. Les lésions dégénératives dues au diabète sont responsables de la survenue de la brûlure et de sa gravité. La neuropathie diabétique est souvent mise en cause dans la survenue de la brûlure et du retard de consultation. Cela rend impérative une prise en charge thérapeutique pluridisciplinaire impliquant chirurgiens plasticiens, réanimateurs et endocrinologues.

#### Introduction:

Les patients diabétiques constituent une population à risque élevé de brûlure grave, de ce fait le diabète devrait faire parti des scores de gravités de la brûlure.

La neuropathie diabétique est une complication fréquente du diabète, et son incidence augmente avec l'âge. La forme clinique la plus fréquente est la polyneuropathie «en chaussette» avec perte de la sensibilité nociceptive des pieds et de toute la microcirculation. Elle doit être recherchée systématiquement par l'examen clinique<sup>1</sup>.

Sa prévalence est estimée à 50% chez les diabétiques dont la maladie évolue depuis plus de 20 ans, et également à 50% chez les diabétiques âgés de plus de 65 ans<sup>2</sup>.

**Corresponding Author:-A. Khales.**

Address:-Service de chirurgieplastique, réparatrice et des brûlés, Hôpital Militaire d'Instruction Mohammed V Rabat Maroc.

De ce fait, ces troubles sensitifs expliquent le retard de consultation de cette population de brûlés qui sous estime la gravité de la brûlure et chez qui la lésion est souvent plus profonde et plus délétère.

Ce travail a pour but de rappeler l'intérêt de la prévention et de la sensibilisation de la population diabétique aux dangers de la brûlure, ainsi que de mettre en évidence la corrélation entre le diabète et les circonstances de survenue de la brûlure, son évolution et la difficulté de sa prise en charge thérapeutique.

#### **Patients et résultats:**

Nous rapportons une série de 11 cas de brûlures survenues chez des patients diabétiques en douze mois du 01 janvier 2016 au 31 décembre 2016.

Nous avons inclus dans ce travail les brûlures domestiques survenues dans un contexte d'automédication de trouble neurosensoriel lié au diabète, surface cutanée brûlée inférieure à 20%.

Les complications dégénératives du diabète sont mises en cause directement à la survenue de la brûlure chez six cas. Le délai moyen de consultation est de sept jours. Les brûlures siègent aux membres inférieurs chez neuf cas. Quatre patients furent admis en décompensation acido-cétosique.

Après prise en charge médicale des patients et correction de leurs troubles hydro électrolytique et métabolique. Le traitement chirurgical a consisté en une excision des placards de nécrose. Cinq de nos patients ont eu recours à une greffe de peau (75% semi-épaisse; 25% peau totale) tandis que les deux autres ont bien évolué sous pansement quotidien.

L'oxygénothérapie hyperbare a été indiquée chez tous les patients ainsi qu'une antibiothérapie guidée par les données de l'antibiogramme (prélèvements bactériologiques systémiques devant toute brûlure).

Tous les patients ont été adressés en endocrinologie à leur sortie du service pour une prise en charge adéquate du diabète.

#### **Discussion:**

La gravité de la brûlure est due son caractère profond sous estimé par le patient et son entourage, cela a pour conséquence un retard à la consultation et donc de la prise en charge en milieu spécialisé. En fait la brûlure siège le plus souvent aux extrémités inférieures. Les lésions dégénératives dues au diabète sont souvent des facteurs aggravant la survenue de la brûlure et son évolution<sup>3</sup>.

La brûlure chez les diabétiques présente des caractéristiques différentes de la population non diabétique et que la fréquence de ces brûlures augmente chez cette population. Ainsi, les patients diabétiques sont habituellement des patients susceptibles de faire des complications, à cause de la forte présence des dommages vasculaires de la microcirculation surtout chez les patients indisciplinés, ces troubles affectent des organes multiples : rein, rétine, nerf périphériques et peau. Aussi, le diabète est bien connu pour être associé à une capacité curative diminuée et à une susceptibilité accrue à l'infection, surtout chez les patients mal suivis et qui ont une glycémie à jeun très élevée. Les polyneuropathies diabétiques sont très fréquentes. Il s'agit le plus souvent de polyneuropathies sensitives. Leur topographie est habituellement distale, bilatérale et symétrique, le plus souvent «en chaussette», plus rarement en gant, et exceptionnellement thoracoabdominale<sup>4</sup>.

Les manifestations subjectives sont de deux ordres<sup>5</sup>:

- les douleurs: fréquentes, volontiers exacerbées la nuit;
- plus souvent, il s'agit de paresthésies et de dysesthésies (fourmillements, démangeaisons, sensation de froid ou de chaud).

D'ailleurs la brûlure survient souvent suite à ces symptômes le patient essaye par une source de chaleur : bouillotte, barbecue traditionnel ou radiateur électrique de « traiter » ses paresthésies et cela provoque souvent la brûlure.

L'étude de la brûlure chez les patients diabétiques permet de constater que la durée d'hospitalisation et de cicatrisation est nettement supérieure par rapport à la population non diabétique, avec un risque accru d'infection et un grand nombre d'interventions chirurgicales à types de pansements et puis de couverture par greffe de peau.

La prise en charge de ce type de brûlure nécessite avant tout l'amélioration de la qualité de prise en charge thérapeutique du diabète. La prévention de ce type de traumatisme est un élément indispensable de cette prise en charge.

Ce travail souligne l'importance des programmes d'éducation de la population diabétique afin de diminuer la mortalité et la morbidité ainsi que le coût et le séjour en milieu hospitalier.

Le patient diabétique subissant une brûlure a besoin d'une attention particulière et d'une surveillance plus importante à la recherche des signes d'infections et de décompensation du diabète.

La prise en charge par l'endocrinologue doit se faire dès l'admission du diabétique brûlé pour prendre en charge le déséquilibre glycémique antérieur à la brûlure et anticiper sur un éventuel trouble glycémique survenant à la suite de la brûlure.

#### Abstract

**Background:** Inflammatory bowel disease (IBD) consists of two specific gastrointestinal disorders: ulcerative colitis (UC) and Crohn's disease (CD). Despite their distinct natures, these two diseases share many similar etiologic, clinical and pathological features, as a result, their accurate differential diagnosis may sometimes be difficult. Correct diagnosis is important because surgical treatment and long-term prognosis differ from UC and CD.

**Aim:** This study aims to study the characteristic clinicopathological features which help in the differential diagnosis between UC and CD, and assess the disease activity in ulcerative colitis.

**Materials and methods:** This study was carried out on 50 selected cases, referred to the department of pathology, Alnoor Specialist Hospital. The cases included 27 cases of UC and 23 cases of CD. All the cases were examined using H&E and immunohistochemically for bcl-2 expression.

**Results:** Characteristic features of UC include: decrease in mucous content, irregular villous surface, crypt distortion, and cryptitis, whereas the main cardinal histopathological features seen in CD were: epithelioid granuloma, transmural chronic inflammation, absence of mucin depletion, irregular surface, or crypt distortion. 3 cases of UC were found to be associated with dysplasia. UC mucosa contains fewer Bcl-2+ cells compared with CD mucosa.

**Conclusion:** This study using multiple parameters such clinicopathological features and Bcl-2 expression as studied by immunohistochemical stain, helped to gain an accurate differentiation between UC and CD. Furthermore, this work spotted the light on the activity and different grades of UC which could be important for the prediction of relapse.

#### Introduction:-

Inflammatory bowel disease is an idiopathic disease caused by an immune response. Two types of IBD are present, ulcerative colitis (UC) and Crohn's disease (CD). To establish a diagnosis of IBD, exclusion of other causes of

**Corresponding Author:- Ghada E. Esheba.**

**Address:-** Associate Professor of Pathology; Department of Pathology, Faculty of Medicine, Tanta University, Egypt.

Inflammation will be done first and then the signs and symptoms, blood tests, radiological studies, macroscopic and microscopic examination of biopsies will be used to differentiate between CD and UC (1).

The intestinal inflammatory processes in IBD are triggered by genetic susceptibility in a patient who has environmental factors, defect in the intestinal epithelial tight junction barrier function, and dysfunction of innate and adaptive response pathways, especially the T cell response. The adaptive immune response in CD has long been considered to be driven by the response of Th1 cells. On the other hand, UC has been associated with an unconventional Th2 cells response. Furthermore, Th17 cells have been involved in the gut inflammatory response in IBD(2,3).

The common presenting complaint of IBD is chronic diarrhea with or without blood or mucus. Bloody stool, is more typical of UC. Other symptoms are abdominal pain, weight loss, fever, fatigue and sweat. Most common extraintestinal symptoms are peripheral arthritis, aphthous ulcer, ankylosing spondylitis and erythema nodosum (4,5).

Ulcerative colitis may lead to one or more of the complications such as fulminant colitis, severe bleeding, toxic megacolon, perforation and an increased risk for the development of malignancy. Perianal diseases such as fistulae, skin tags, or anal fissures are complications of Crohn's disease occur in 35% of patients (5,6).

The use of serological markers such as antibodies to *Saccharomyces cerevisiae* may help in differentiating UC from CD; (ASCA) is present in 40% to 80% of patients with CD while the anti-neutrophil cytoplasmic antibody (pANCA) is detected in nearly 75% of patients with UC(7,8).

In an abdominal plain film, a narrowed terminal ileum (Kantor's string sign) is a characteristic finding of CD in upper GI with small bowel follow-through, while in UC, it is important to evaluate colonic distention to rule out toxic megacolon. Barium enema demonstrates lead pipe appearance that is an indication of chronic UC characterized by loss of haustrations and shortening & narrowing of colon. Abscess formation and fistula on abdominal computed tomography are associated with CD(9).

CD may affect any area within the gastrointestinal tract while UC affects the rectum and extends to the colon in a continuous fashion. The endoscopic features in CD are characterized by fat wrapping, thickening of the intestinal wall, ileum involvement and other features such as skip lesions, cobblestoning, confluent deep linear ulcers, aphthoid ulcers, deep fissures, fistulas and strictures. On the other hand, the endoscopic features in UC are not characteristic but mainly include erythema, mucosal vascular congestion, loss of apparent vascular pattern in mild inflammation and clear demarcation between inflamed and normal areas. Granularity, mucosal erosions and mucosal friability can be seen in advanced cases. While Spontaneous bleeding and ulceration located in the inflamed mucosa will be present in severe cases (10,11).

For estimating the histological activity of ulcerative colitis, Geboesscore is used. (Table 1) (12).

The Management of IBD depends on the severity of disease (4). Medications include, steroids, immunosuppressive agents, aminosalicylates and anti-inflammatory drugs (7). Mild cases are treated by anti-inflammatory drugs orally or as enemas. Severe cases can be treated with immunomodulator or immunosuppressant medications either orally, by an IV infusion, or a subcutaneous injection (4). Infliximab is used for moderate to severe CD and UC for preservation of remission, also when managed by immunomodulators and mesalamine is failed.(13).

Surgical management has a role in improving quality of life but still there is probability of recurrence of the disease after surgery (5). Surgical options are indicated if medical treatment failed or in UC or CD associated with neoplasia(14). Also, if there is any complication such as: perforation, abscess, malnutrition and intestinal obstruction.(5).

IBD's patients have a higher risk for developing colon cancer later on (6). Patients with UC have higher mortality rate than those with CD.(15).

### Materials and methods:-

This study was carried out on 50 selected cases, referred to the department of pathology, Alnoor Specialist Hospital during the period between 2010-2015. In all cases, the diagnosis was made from the clinical history, endoscopy, and radiological features which were obtained from the accompanying clinical sheets, and confirmed by microscopic examination.

The collected cases were sent as colonoscopy specimens (41 cases) or surgically removed by colectomy (9 cases). The cases include 27 cases of UC and 23 cases of CD.

### Methods:-

For every case, the following data were recorded: age, presenting symptoms, site of involvement, gross pathology, and microscopic picture.

The specimens were fixed in 10% formol saline and embedded in paraffin. The paraffin blocks were serially sectioned at 4-5 microns and stained by:

1. Hematoxylin and Eosin (H&E).
2. Immunohistochemical staining of Bcl-2: Four  $\mu\text{m}$  thick sections were cut from routine paraffin embedded blocks then deparaffinized in xylene, and hydrated in graded alcohols. Immunostaining was performed with the Dakoautostainer. The positive cells (mucosal T cells) were approximately measured and expressed as mild, moderate, or marked expression.

### Statistical analysis:-

Data were analyzed using SPSS version 12.0.0 for Windows (SPSS Inc., Chicago, IL). Scale variables were presented as the mean  $\pm$  standard deviation (mean  $\pm$ SD) or percentages as appropriate.

### Results:-

#### Clinical characteristic:-

The current study included 27(54%) cases of UC and 23(46%) cases of CD.

In UC, 15 cases (55.6%) were females while the remaining 12 cases (44.4%) were males.

The age and sex of the patients were summarized in table 2.

The differences in age and sex between UC and DC were not significant.

**Table 3:-**

Disease	Age range	Mean age	Sex
Ulcerative colitis	23-59	38.84 $\pm$ 14.26	Female 15 (55.6%)
			Male 12 (44.4%)
Crohn's disease	20-60	35.25 $\pm$ 7.93	Female 10 (43.5%)
			Male 13 (56.5%)

The main clinical manifestations in UC were diarrhea, rectal bleeding, abdominal pain, and some patients complained of extraintestinal symptoms such as arthritis as well. On the other hand, patients with CD were mainly presented by diarrhea, abdominal pain and anal complications such as fissures.

Colonoscopic examination in UC revealed multiple pleomorphic ulcers in 11 (40.7%) cases with evident diffuse or focal erythema. Mucopurulent exudate was present in 6 (22.2%) cases. The mucosa was atrophic and no ulcers could be detected in the remaining cases. Pseudopolyposis was detected in 2 (7.4%) cases. While in CD, colonoscopic examination showed erythematous plaques and discrete ulcers (1-5 mm in diameter) in 11 (47.8%) cases. Evident skip lesions were detected in 9 (39.1%) cases, while rectal sparing was found in all examined cases.

### Histopathological study:-

#### Ulcerative colitis

The different grades of UC were summarized in Table 3 and were shown in Fig.2.

**Table 3:-** Different grades of UC in this study.

Grades	Number of cases
0.3	1 (3.70%)
1.3	2 (7.41%)
2A.2	2 (7.41%)
2B.2	2 (7.41%)
2B.3	1 (3.70%)
3.1	2 (7.41%)
3.3	4 (14.81%)
4.1	3 (11.11%)
4.3	4 (14.81%)
5.4	3 (11.11%)
Low grade dysplasia	2 (7.41%)
High grade dysplasia	1 (3.70%)

In grade 0.3, we found severe abnormalities in the crypts structure, including crypt branching, crypt distortion and villous appearance.

In grade 1.3, we found marked increase of chronic inflammatory cells infiltration in the mucosa.

In grade 2A.2 of UC, we found moderate increase of eosinophils in lamina propria. While in grade 2B.2, there was moderate increase in neutrophils. And in 2B.3 it was a marked increase.

In grade 3.1 of UC, we found that less than 5% of the crypts to be infiltrated by neutrophils. While, in grade 3.3, we found that more than 50% of crypts were infiltrated.

In grade 4.1 of UC, there was excess of neutrophils in parts of the crypts and the crypts showed a severe form of structural abnormalities. And in grade 4.3, there was prominent crypt atrophy. Also, multiple crypt abscesses were found which were formed of acinar structure containing neutrophils and pus cells.

In grade 5.4 of UC, we found multiple superficial mucosal ulcers.

In this study 2 (7.4%) cases showed low-grade dysplasia and one (3.7%) case showed high grade dysplasia, the histopathological features seen in low-grade dysplasia were: nuclear hyperchromasia associated with pleomorphism and Mucin vacuoles were distributed and located in the basal part of cytoplasm which called "dystrophic goblet cells".

In high grade dysplasia, the following features were seen: enlarged hyperchromatic nuclei, marked nuclear stratification with crowding, loss of nuclear polarity, marked architectural disarray and decreased mucin production.

### Immunohistochemical study:-

Examination of sections stained immunohistochemically for the antiapoptotic Bcl-2 protein revealed mild expression of the Bcl-2 protein and this indicate that UC mucosa contains few number of Bcl-2+ cells.

**Crohn's disease:-**

All cases in this work showed transmural inflammation in the form of chronic inflammatory infiltrate (lymphocytes, macrophages, plasma cells and giant cells) affecting all the layers up to the serosa.

Non caseating granuloma (submucosal and subserosa) formed of epithelioid cells and few giant cells were seen in 14 (60.9%) cases. Dilatation of lymphatic channels was detected in 5 (21.7%) cases. Fissuring ulcer was present in 2 (8.7%) cases. Focal crypt abscess was seen in 3(13%) cases. Transmural lymphoid aggregates were present in 2(8.7%) cases. Submucosal nerve fiber hyperplasia was evident in 4 (17.4%) cases. 2(8.7%) cases exhibited architectural alteration with patchy neutrophils, mucin depletion and damage in the crypt epithelium. Fig. (3)

**Immunohistochemical study:-**

Examination of sections stained immunohistochemically for the antiapoptotic Bcl-2 protein revealed marked expression of the Bcl-2 protein and this indicate that in CD there is a defect in apoptosis which in turn lead to prolongation of T cell survival and contribute to their accumulation in the mucosa.

**Fig.(2):-** (A) UC showing crypt distortion, and irregular villous surface., (B) UC showing crypt abscesses within a disorted crypts, (C) UC showing crypt atrophy together with a dense chronic inflammatory infiltrate of the lamina propria, (D) UC showing low grade dysplasia with distorted architecture, increased N/C ratio, and decreased mucus production.

**Fig.(3):-** (A) CD showing dense inflammation and the presence of granuloma, (B) Higher magnification showing typical granuloma formed of epithelioid cells, giant cells, and many lymphocytes.

**Discussion:-**

Although Crohn's disease and ulcerative colitis have been fully described in several studies, continue to present a problem in the differential diagnosis from the clinical as well as the histopathological point of view. The two diseases share many clinical and histopathological features and the discriminating characteristics are often ill defined.

Our purpose in this study was to study the characteristic clinicopathological features which help in the differential diagnosis between UC and CD, and assess the disease activity in ulcerative colitis. Because a better knowledge of the evolution of the microscopic features would be helpful in the treatment for patients with IBD according to the diagnosis and disease extent, severity and activity. Knowledge of disease activity could also be important for the prediction of relapse and for follow up of patients with dysplasia periodically to avoid development of cancer.

In the recent years, Time trend analysis showed statistically significant increases in the incident of IBD over time. In 2012, the prevalence of IBD in Asia and Middle East was 6.3 per 100,000 person-years. Molodecky et al., (2012). (16).

The current work was carried out on 41 adequate endoscopic biopsies and 9 surgical resection specimens. The cases were categorized as follows: 27 ulcerative colitis and 23 Crohn's disease.

In this study, it was found that the mean age of patients of ulcerative colitis was 38.8, with slight female's predominance (56%). This was in agreement with Cotran, (1999) who recorded that the onset of disease peaks between the ages of 20 -25 years, and women are affected more often than men are. Similar findings were also obtained by Seldenrijk, (1991) and Berre et al., (1995) who found that the mean age for UC was 40 years and 39 years respectively, but the opposite was detected for sex predominance as they found that men were affected more often than women. (17,18,19).

As regard the complaint, the main complaints were diarrhea and abdominal pain (76% both), followed by rectal bleeding (56%), and only 8% of patients complained of extraintestinal symptoms such as arthritis. These findings were in accordance with Seldenrijk, (1991). (18).

Concerning colonoscopic examination 56% of cases showed ulceration, pseudopolyposis was detected in 38% of cases, while edema and hyperemia was found in 32% of cases. Barium enema examination revealed ulcers in 48 % of cases, spasm (12%), narrowing (35 %), and pseudopolyposis (20 %), while it was free in 4 % of cases. These findings were supported by Langmead, (2002). (20).

In this work, 27 cases were diagnosed as ulcerative colitis out of them, 1(3.7%) case was diagnosed as grade 0.3, 2 (7.4%) cases as grade 1.3, 2 (18.5%) cases as grade 2A.2, 2 (7.4%) as grade 2B.2, 1(3.7%) case as grade 2B.3, 2 (7.4%) cases as grade 3.1, 4 (14.8%) cases as grade 3.3, 3 (11.1%) cases as grade 4.1, 4 (14.8%) cases as grade 4.3, 3 (11.1%) as grade 5.4, 2 (7.4%) cases with low grade dysplasia and 1 (3.7%) case with high grade dysplasia.

Nearly similar results were obtained reported before in the literature (11,12,21,22). Tsang, (1999) reported that there are major and minor criteria for the diagnosis of UC, the major ones were: patchy mucosal inflammatory infiltrate, basal plasmacytosis, neutrophils overrunning mucosa, crypt abscesses, cryptitis, crypt distortion and villiform surface, while the minor criteria were: decreased goblet cells, and Paneth cell metaplasia.(23).

Theodossi, et al. (1994), suggested that a decrease in mucous content, an irregular or a villous surface, crypt distortion, diffuse crypt abscesses, and cryptitis are predictive of ulcerative colitis rather than of Crohn's disease. (24).

In the current work, Bcl-2 staining of UC mucosal T cells showed mild expression of the Bcl-2 protein and this indicated that UC mucosa contains few numbers of Bcl-2+ cells. These findings were also detected by Kenji Ina et al., (1999). (25).

In the current study two cases showed low-grade dysplasia, and one case showed high-grade dysplasia, the histopathological features seen in low-grade dysplasia were decreased intracellular mucin, nuclear hyperchromasia and pleomorphism, irregular nuclear membranes, and loss of nuclear polarity. In high-grade dysplasia, the following features were seen: enlarged hyperchromatic nuclei, marked nuclear stratification with crowding, marked loss of nuclear polarity, marked architectural distortion, and marked hyperchromasia and pleomorphism. These figures were consistent with those obtained by Neumann et al., (2011).(26).

In Crohn's disease, the age of predilection was between 22-64 years with a mean of 43.8. Females were affected more than males (60%). This was in agreement with Cotran, (1999) who recorded that the peak age of detection are the teens and twenties with a minor peak in the 5<sup>th</sup> and 6<sup>th</sup> decades, and females were affected slightly more than males.(17).

Clinically most cases were represented by diarrhea (65%), abdominal pain (70%), and 20% of patients complained of anal complications such as fissures. These findings were consistent with those of Robert, (1998).(27).

Endoscopically, all cases revealed rectal sparing; discrete mucosal ulceration was detected in 45% of cases, 35% of cases showed pseudodiverticulosis, but skip lesions were detected in 55% of cases only. These findings were coincided with Quinn, et al., (1994). (28).

Histopathological examination revealed transmural inflammation in all cases, preserved crypt architecture, which was seen in 80% of cases, microgranuloma in 40% of cases, dilatation of lymphatic channels (35%), maintenance of goblet cell population (80%), ulceration (65%), isolated giant cells (35%), excess of histiocytes (65%), Focal crypt abscess (25%), and lymphoid aggregates in 65% of cases. While the distinctive feature of CD non caseatingepitheloid granuloma could be detected in only 45% of cases. These results were in keeping with the previously published data (6,8,10,12,19,26,29,30). On the other hand, these findings were not compatible with those of Tsang (1999), who recorded that crypt abscesses and cryptitis are major features of CD, while crypt distortion (usually milder than in UC) is a minor feature.(23).

Examination of sections stained immunohistochemically for the antiapoptotic Bcl-2 protein revealed moderate expression of the Bcl-2 protein and this indicate that in CD there is a defect in apoptosis which in turn lead to prolongation of T cell survival and contribute to their accumulation in the mucosa. Kenji Ina et al., (1999) obtained nearly similar results and concluded that the number of Bcl-2+ cells can be taken as a discriminating factor between UC and CD. (25).

Tontini, (2015) reported that the gold standard for microscopic differentiation between Crohn's disease and ulcerative colitis should be established by collecting two biopsies from at least five sites along the colon.(31)

In conclusion, this study using multiple parameters: histological features and Bcl-2 expression as studied by immunohistochemical stain, was a trial to gain an accurate differentiation between Crohn's disease and ulcerative colitis. According to these parameters, we were able to distinguish between 50 cases of IBD, 27 cases of UC with different grades, 1 case of UC with dysplasia and 23 cases of CD.

#### Abstract

A new series of hexa-, and five- coordinated copper(II) complexes, having the molecular formulae of [CuLX]X H<sub>2</sub>O, **1**, **2**, **3** (X = Cl<sup>-</sup>, Br<sup>-</sup>, NO<sub>3</sub><sup>-</sup>) and [CuL]X<sub>2</sub> nH<sub>2</sub>O, **4**, **5** (X = AcO<sup>-</sup> and ClO<sub>4</sub><sup>-</sup>) respectively and L is pentadentate pyridine based ligand have been synthesized. Structural characterization of these newly synthesized compounds was achieved by several physicochemical methods including elemental and thermal analysis (TGA and DTG), electrical molar conductance, magnetic moment measurements and spectral investigations such as IR, UV-Vis and ESR. The spectral and magnetic measurements in addition to the electrolytic conductance results demonstrated the octahedral and square-pyramidal stereochemistries for the hexa, and five coordinated copper(II) chelates respectively. Catechol oxidase and phenoxazinone synthase biomimetic catalytic activity of the inspected copper(II) chelates was studied and the results obtained indicated that, the catalytic reactivity is markedly depends on the structural properties of these newly synthesized copper(II) complexes.

#### Introduction:-

Functional models of the metalloenzymes that activate molecular oxygen possess great potential as catalyst for specific oxidation reactions and as guides for the development of efficient small molecule catalysts [1]. Since, the oxidation of organic substrates with molecular oxygen under mild conditions is of great interest for industrial [2] and synthetic processes both from an economical and environmental [3] point of view, most of the focus of ongoing biomimetic and bioinspired synthetic approaches is on reproducing some structural and/or functional feature of the title enzymes. The synthesis and reactivity studies of transition metal complexes, as functional model compounds for metalloenzymes with oxidase activity, are of particular interest for the development of bioinspired catalysts for oxidation reactions.

The potential role played by copper ions in the active sites of a large number of metalloproteins has stimulated efforts to design and characterize copper complexes as models for providing better understanding of biological systems and for assisting in the development of new homogeneous catalysts for selective oxidation. Particularly, the

coordination chemistry and reactivity of copper complexes involving nitrogen–sulfur donor ligands has received considerable attention as models [4]. In particular the  $\text{CuN}_2\text{S}_2$  chromophore is present in blue copper proteins such as plastocyanin [5] and copper(II) chelates of SNNS ligands have been found to have antineoplastic activities and to interact with biological systems [6].

Oxidase or dehydrogenase enzymes catalyze the oxidation of substrate by employing dioxygen as a hydrogen acceptor e.g. copper containing oxidase, e. g. catechol oxidase and phenoxazinone synthase. Catechol melanin, a black pigment of plants, the black color of banana and black sugar, is a polymeric product formed by the oxidative polymerization of catechol [7]. Another type of catechol oxidase, this copper(II) protein isolated from photogenic materials, only catalyzes the oxidation of catechol to quinones without acting on tyrosine [8,9]. Catechol oxidase forms the third member of  $\text{Cu} / \text{O}_2$  group which belongs the type III copper protein [10,11]. Catechol oxidase in contrast to tyrosinase, catalyze exclusively the oxidation of catechol to the corresponding *o*-quinones without acting on monophenols [12]. This reaction is of great importance in the medical diagnosis for the determination of hormonal catecholamine (adrenaline, noradrenalin and dopamine).

Related to catechol oxidase is phenoxazinone synthase, it is a type 2 copper containing oxidase (subunit molecular mass 88000 3.7 Cu per subunit) [13] is naturally found in the bacterium *Streptomyces* antibiotics and has been cloned and over expressed in *S. lividians* [14]. It is an oligomeric multicopper oxidase, catalyses the oxidative coupling of two molecules of an *o*-aminophenol to form the phenoxazinone chromophore. This reaction constitutes the final step in the biosynthesis of actinomycin and is a complex six-electron oxidative condensation.

In continuation of our earlier work in the area of copper(II) chemistry we describe here in this contribution the synthesis and characterization of a new series of copper(II) complexes containing the pentadentate neutral pyridine base ligands, as potential structural and functional models for the active sites of both catechol oxidase and phenoxazinone synthase.

## **Experimental:-**

### **Materials:-**

All chemicals used were of analytical grade. The benzoyl hydrazine, hydrazine hydrate 95%, 2,5-dibromo methylbenzene and 2,6-dibromo methyl pyridine were purchased from Aldrich. 2,3-Dibromo methyl quinoxaline was synthesized based on the method reported in literature [15]. Phenyl triazole was prepared according to the modified method described below.

### **Preparation of phenyl triazole:-**

$\text{CS}_2$  (0.15 mole) was added drop wise to an ice cold solution of KOH (9.12 gm, 0.16 mol) in absolute ethanol (200 ml) containing benzoyl hydrazine (0.1 mol). The reaction mixture was diluted with ethanol (150 ml) and stirred for 2h at room temperature. Dry ether (200 ml) was added and the resulting solid K-salt precipitate was collected, washed with ether and finally dried.

A solution of the latter K-salt (0.05 mol) and hydrazine hydrate 95 % (0.5 mol) was heated under reflux with stirring for one hour. 5 ml of water was then added and the reaction mixture was neutralized with concentrated hydrochloric acid. The solid obtained upon neutralization was collected and crystallized from acetic acid to give colorless crystals of phenyl-triazole (mp. 214-216 °C).

### **Preparation of the pyridine based ligand (L) :-**

To a solution of phenyl triazole (50 mmol) in aqueous ethanol (50 ml) containing KOH (50 mmol) the appropriate dibromo compounds (25 mmol) was added. The reaction mixture was heated under reflux for 1 h. The solvent was then removed in vacuum and the remaining solid was collected and crystallized from DMF to give colorless crystals of the product ligand pyridine based ligand L.

### **Synthesis of copper(II) complexes 1-5:-**

An equimolar amount of copper(II) salt in 25 ml ethanol was added drop wise to a 25 ml hot ethanolic solution of the organic ligand (L). The reaction mixture was stirred for half hour at room temperature. The resultant reaction mixture was further stirred under reflux for one hour during which time colored products precipitated. After that, the volume of the solution of the reaction mixture was reduced, then filtered and the isolated solid was washed with ethanol and ether and finally dried in *vacuum* over CaO at room temperature for several days.

**Physical measurements:-**

IR spectra were recorded using KBr disks in the 4000-200  $\text{cm}^{-1}$  range on a Unicam SP200 spectrophotometer. The electronic absorption spectra were obtained in DMF solution with a Shimadzu UV-240 spectrophotometer. Magnetic moments were measured by Gouy's method at room temperature. ESR measurements of the polycrystalline samples at room temperature were made on a Varian E9 X-band spectrometer using a quartz Dewar vessel. All spectra were calibrated with DPPH ( $g = 2.0027$ ). The specific conductance of the complexes was measured using freshly prepared  $10^{-3}$  M solutions in electrochemically pure DMF at room temperature, using an YSI Model 32 conductance meter. The thermogravimetric measurements were performed using a Shimadzu TG 50-Thermogravimetric analyzer in the 25-1000  $^{\circ}\text{C}$  range and under an  $\text{N}_2$  atmosphere. Elemental analyses (C, H, and N) were carried out at the Micro analytical Unit of Cairo University.

**Oxidase biomimetic catalytic activity:-**

A mixture of 1.0 ml of studied substrate 3,5-di-*tert*-butyl catechol (3,5-DTBCH<sub>2</sub>) or 2-aminophenol (2-APH) solution (30 mM) in methanol and 1.0 ml of copper complex solution ( $\sim 3$  mM) in methanol was placed in a 1 cm path length optical cell containing 1.0 ml of methanol in a spectrophotometer. The final concentration of reaction mixture is catechol or 2-aminophenol (10 mM) and complex (1 mM). The formation of 3,5-di-*tert*-butyl-quinone (3,5-DTBQ) was followed by observing the increase of characteristic quinone absorption band at 400 nm and for 2-amino-3H-phenoxazine-3-one (APX) at 433 nm.

**Results and discussion:-****Synthesis and characterization of L and copper(II) complexes:-**

The reported ligand L (Figure 1) was prepared as previously reported in the experimental section and characterized by IR, elemental analysis, and UV-Vis spectra. Reaction of the present pyridine based ligand, L with copper(II) salts ( $\text{CuX}_2$ ;  $\text{X} = \text{Cl}^-$ ,  $\text{Br}^-$ ,  $\text{NO}_3^-$ ,  $\text{AcO}^-$  and  $\text{ClO}_4^-$ ) in a 1:1 ratio in ethanol gives a new series of copper(II) complexes having the molecular formulae of  $[\text{CuLX}]\text{X}$  ( $\text{X} = \text{Cl}$ ,  $\text{Br}$ ,  $\text{NO}_3$ ) and  $[\text{CuL}]\text{X}_2$  ( $\text{X} = \text{AcO}$  and  $\text{ClO}_4$ ). The elemental analyses are consistent with the proposed molecular formulae that show the ratio of metal/ligand is 1:1. The molar conductivities of  $10^{-3}$  M solutions of these copper(II) chelates in DMF at 25  $^{\circ}\text{C}$  are measured and the data obtained are listed in Table 1. These electrolytic conductance results reveal that the halogeno and nitrate copper(II) complexes have molar conductivity values in the range 63.67 – 88.16  $\Omega^{-1} \text{mol}^{-1} \text{cm}^2$ , which indicates their ionic nature and they are considered as 1:1 electrolytes [16]. These molar conductance values indicate the hexa coordinate formulation of these halogeno and nitrate copper(II) complexes in an octahedral structure. On the other hand the acetate and perchlorate complexes exhibit molar conductance values of 143.85 and 149.19  $\Omega^{-1} \text{mol}^{-1} \text{cm}^2$ , respectively demonstrating that they are 1:2 electrolytes and suggest the five-coordinate formulation of these complex species. Thus the pyridine based ligand L must act as a neutral pentadentate chelating ligand in complexation to copper(II) ion. On the basis of the elemental analyses, and the molar conductance measurements the complexes were assigned the compositions shown in Table 1.

**Thermal analysis:-***Thermal decomposition (TGA and DTG) studies:-*

The thermal decomposition studies on the synthesized copper(II) complexes have been carried out so as to corroborate the information obtained from their molar conductance and spectral studies about the statuses of water molecules present in these complexes, as well as to know their general decomposition patterns. Due to the explosion nature of the perchlorate anion the perchlorate complex was ruled out from the thermal studies. The decomposition stages, temperature ranges, maximum decomposition peak  $DTG_{max}$ , percentage mass losses of the decomposition reactions together with their theoretical percentage mass losses and the assignments of decomposition moieties are given in Table 2, which reveals the following findings.

The thermograms (TG and DTG curves) of the hydrated copper(II) complexes  $[CuLCl]Cl \cdot H_2O$ ,  $[CuLBr]Br \cdot H_2O$ ,  $[CuLNO_3]NO_3 \cdot H_2O$  and  $[CuL](AcO)_2 \cdot H_2O$ , show a similar decomposition patterns. Three successive overlapped and unresolved degradation stages within a temperature range 60 - 700 °C are observed. The first stage of thermal decomposition starts at 65 °C and is marked with a regular loss in mass up to 120 °C. The initial mass loss for the complexes varies from 2.53 to 3.15 %, and agrees well with the theoretical expected mass loss of 2.60 – 3.63%. This is mainly due to the dehydrate removal of the out sphere water molecules (the adsorbed, crystalline or lattice water). The maximum rate of mass loss occurs at a temperature range of 85 - 105 °C as indicated from the DTG peaks. The activation energy of this thermal dehydration step is 14.06 – 30.25  $kJmol^{-1}$  (Table 3). This ease of desolvation suggests the weak interaction of and indicates that water plays little or no role in the lattice forces and occupies crystal voids.

The second stage of mass-loss reveals that the formed anhydrous complex species are then further decomposed within the temperature range 110 – 280 °C, with DTG maximum peaks at 140 - 240 °C range. This process corresponds to the volatilization of the loosely bonded non-coordinated electrolytic counter anions with a mass loss of (6.12 – 17.10 %) in accordance with the calculated values of (5.57 – 17.23 %). The energy values of activation of this stage lay in the range 25.23 – 75.24  $kJmol^{-1}$  (Table 3).

The third stage involves a significant mass loss extending in the temperature range from 190 to 675 °C with  $DTG_{max}$  peaks at 250 - 620 °C range ascribed to the exothermic removal of the axially coordinated counter anions namely,  $Cl^-$ ,  $Br^-$  and  $NO_3^-$  in addition to the complete burning of the organic ligand molecule in successive steps, leaving behind metal oxide as the final product of the thermal pyrolysis of the complex molecule. A good agreement between the experimental and calculated values is reported for the mass loss (Exp. 63.94 - 77.63 %; Calcd. 63.81 - 78.38 %), and the associated activation energy values are in the range 30.95 – 65.85  $kJmol^{-1}$ . Further horizontal constant curve may be due to the presence of metal oxide residue in the remaining part. The total loss of weight agrees well with the corresponding calculated data and the final product is anhydrous CuO. For all complexes, the metal content, determined from the oxide residue, was found to be satisfactory agreement with values calculated on the basis of the suggested composition formulae based on the analytical data.

Table 2. Thermogravimetric analysis of copper(II) complexes

*Complex	Temperature °C	$DTG_{max}$ °C	% Weight loss Found (Calcd.)	Species formed
1	75 – 110	85	3.15(2.82)	$[CuL^1Cl]Cl$
	110 – 280	240	6.12(5.57)	$[CuL^1Cl]$
	280 – 530	280, 500	77.63(78.38)	CuO

	280 – 675	225, 620	68.00(67.56)	CuO

\*Complex details are as listed in Table 1.

**Thermal Kinetic Studies:-**

The thermodynamic parameters of the decomposition processes of the inspected copper(II) complexes, namely, activation energy ( $E_a$ ), enthalpy ( $\Delta H$ ), entropy ( $\Delta S$ ), and Gibbs free energy change ( $\Delta G$ ) were evaluated graphically by employing the Coats-Redfern equations [17] and the data obtained are given in Table 3.

The data in Table 3 show that, the values of the activation energies of the investigated copper(II) chelates reflect the thermal stability of these complexes. The activation energy values ( $E_a$ ) of the removal of the electrolytic non-coordinated counter anions are lower than the subsequent stages of thermal degradation of these complexes. This finding indicates that the electrolytic counter anions are loosely bond to copper(II) center and confirms the presence of one of the two counter anions outside the coordination sphere. In contrary the activation energy values ( $E_a$ ) associated to removal the non-electrolytic coordinated counter anions are higher than that reported for decomposition stage of electrolytic counter anions. This results demonstrate incorporation two types of counter anions in complex molecule and confirm the suggested compositional formulae of these copper(II) chelates. The  $\Delta G$  values of the thermal decomposition of the present copper(II) complex species increase for the subsequently decomposition stages due to increasing the values of  $T\Delta S$  from one step to another. This observed trend in the values of  $\Delta G$  reflects that the rate of the removal of the counter anion ligands is lower than that of the precedent organic ligand. This finding may be ascribed to the structural rigidity of the original complex molecule as compared to the resultant intermediates formed during the thermal pyrolysis processes.

On the other hand the activation energy values of the first stage which describes dehydration (surface or lattice water) are lower than that of the subsequent stages of thermal degradation of these complexes. This may attributed to the less steric strain in the intermediate compounds obtained after the first stage of the thermal pyrolysis. It is noteworthy to note that the removal of the electrolytic counter anion and the crystalline or surface water content of the complex molecule have lower  $\Delta H$  values than the removal of coordinated counter anion and the organic moiety of the coordinated ligand to yield the CuO as a final product.

**IR spectral studies:-**

The most relevant IR bands and proposed assignments for the organic ligand and its copper(II) complexes are listed in Table 4. All compounds under study give normal infrared spectra with vibrations characteristic for the ligand system and the counter anions present in the complex molecule. The IR spectra of the inspected complexes are compared with the free ligand in order to determine the coordination sites that may be involved in chelation. In the IR spectrum of the free ligand the significant bands are observed at  $3247 \text{ cm}^{-1}$  for  $\nu(\text{NH}_2)$ ,  $1440 \text{ cm}^{-1}$  for ring skeletal vibrations  $\nu(\text{C}=\text{C})$ ,  $765 \text{ cm}^{-1}$  for  $\nu(\text{C}-\text{S})$ ,  $1554 \text{ cm}^{-1}$  for  $\nu(\text{C}=\text{N}_{\text{pyridine}})$  and  $\delta(\text{NH}_2)$  at  $1240 \text{ cm}^{-1}$ . Upon complexation these bands are shifted to higher or lower wave numbers in the spectra of complexes. The shift in band position of these characteristic functional groups is an indication of the participation of nitrogen atoms of both the primary amine, and the pyridine ring in addition to the two sulfur atoms of the ligand system in coordination to the copper(II) ions [18]. However, the IR spectra of all complexes are very similar and besides what has been noted above, exhibit medium to strong bands at *ca.*  $1565 - 1579 \text{ cm}^{-1}$  as expected for the high energy ring vibrations of the coordinated pyridine. The bonding of the pyridine nitrogen atom is also shown by the presence of bands at  $1010-1035 \text{ cm}^{-1}$  and  $630 - 668 \text{ cm}^{-1}$  attributable to the ring breathing frequency and the low energy pyridine ring vibrations, respectively

[19]. Therefore, from the IR spectra, it is concluded that the reported ligand behaves as neutral pentadentate in all the complexes and coordinates to the metal ion *via* the pyridyl nitrogen, the two nitrogen atoms of the primary amine groups and the two sulfur atoms of the ligand system. The low frequency bands in all the complexes in the region  $535 - 570 \text{ cm}^{-1}$  and  $421 - 455 \text{ cm}^{-1}$  are assigned to  $\nu(\text{Cu-N})$  and  $\nu(\text{Cu-S})$ , respectively and provide a compelling evidence for the presence of metal– nitrogen and metal- sulfur bond in the complexes molecules [20,21]. For all complexes medium to strong bands present in the region around  $4500 \text{ cm}^{-1}$ , assignable to  $\nu(\text{OH})$ , clearly confirm the presence of surface or lattice water. Since vibrational modes such as wagging, twisting and rocking activated by coordination to the metal have not been found in the expected ranges, it appears that coordinated water is not present. These results are consistent with the thermogravimetric studies, using TG and DTG techniques; in fact this water is lost in the  $60 - 110 \text{ }^\circ\text{C}$  range.

The appearance of a broad absorption band centered on  $4500 \text{ cm}^{-1}$  in the spectra of these hydrated complexes, indicate the presence of lattice water. The band at  $3247 \text{ cm}^{-1}$  is assigned to the amino group stretching vibration in the free ligand. The presence of stretching vibration of the water molecules in the spectra of these complexes renders it difficult to confirm the participation of the amino group in chelate formation of these hydrated complex species. The participation of the  $\text{NH}_2$  group is inferred and confirmed by clarifying the effect of chelation on the in-plane bending,  $\delta(\text{NH}_2)$  vibration. The shift of this band, from  $1240 \text{ cm}^{-1}$  in the free ligand L, to  $1219 - 1229 \text{ cm}^{-1}$  in the spectra of these hydrated complexes indicates the participation of the  $\text{NH}_2$  group in complex formation [18].

In addition to showing the characteristic bands due the coordinated organic ligand the spectra of the present copper(II) complexes also show the characteristic frequencies of the counter anions (electrolytic and nonelectrolytic) incorporated in the complex molecule. Regarding the nitrate complex the asymmetrical stretching frequency for the nitrate ion  $\nu_3$  are observed at  $1304 \text{ cm}^{-1}$  and  $1418 \text{ cm}^{-1}$  and the  $\nu_1$  vibration at  $841 \text{ cm}^{-1}$ . These results signify a monodentate mode of nitrate binding [22]. Moreover two strong bands at  $1420 - 1430$  and  $1306 - 1312 \text{ cm}^{-1}$  at a separation of  $114 - 118 \text{ cm}^{-1}$  indicate that the nitrate is bound in monodentate fashion [22]. On the other hand the weak band observed at  $725$  and  $720 \text{ cm}^{-1}$  may be assigned to  $\nu_2$  of the uncoordinated nitrate ion. These spectral features suggest that this nitrate complex contains both the non-electrolytic coordinated monodentate nitrate ligand and the electrolytic nitrate ion [18,23].

The spectrum of the perchlorate complex exhibits the strong, unsplit absorption band, centered at  $1085 - 1104 \text{ cm}^{-1}$ , characteristic of non-coordinated perchlorate. The non-coordination and the electrolytic ionic nature of the acetate ion was inferred from the strong bands occur at  $1680$ ,  $1258$  and weak band at  $412 \text{ cm}^{-1}$ . These results are in harmony with the electrolytic conductance measurements of the complexes in DMF at  $25 \text{ }^\circ\text{C}$  where the molar conductance values for the perchlorate and acetate complexes lie in the range characteristic of 1:2 electrolytes. For the hexa-coordinated halogeno complexes, the non-electrolytic halide ion exhibits weak absorption band far infra red region characteristic of the axially coordinated halide ion [25].

On the basis of the above discussion the general structures have been proposed for the present copper(II) complexes as shown in Figure 1.

#### Electronic absorption spectra:-

The electronic absorption spectra of the inspected ligand and its copper(II) complexes were recorded in DMF solution and the results obtained are given in Table 5. The spectrum of the present ligand (L) exhibits two major peaks. The first one peak at  $34482 \text{ cm}^{-1}$  is assignable to  $\pi \rightarrow \pi^*$  transitions of the aromatic ring. The second band at  $30769 \text{ cm}^{-1}$  is attributed to the  $n \rightarrow \pi^*$  transition of the  $-\text{C}=\text{N}-$  function in pyridine ring of this ligand system [26].

In the high energy region, the electronic absorption spectra of a  $10^{-3} \text{ M}$  solution of the newly synthesized copper(II) complexes in DMF show two major absorption bands in the range  $34482 - 34105, 29171 - 28069 \text{ cm}^{-1}$  range for the first and second peaks respectively in addition to a shoulder at  $25188 - 26315 \text{ cm}^{-1}$  range. The first peak is assigned to  $\pi \rightarrow \pi^*$  intraligand transitions. This band is at some what the same frequency in the free ligands L, which tells us that these transitions are not significantly affected by chelation. The extensive  $\pi$  conjugation present in these ligand systems clearly creates an environment for this type of intraligand  $\pi \rightarrow \pi^*$  transitions [27]. On the other hand the second band is corresponding to the  $-\text{C}=\text{N}-$  group in pyridine ring showed an observable shift to longer wavelength on going from ligand to complex, indicating coordination of ligand to metal enter through the azomethine moiety [28]. The detected shoulder at the range of  $25188 - 26315 \text{ cm}^{-1}$  could be due to  $\text{Cu(II)} \rightarrow$  ligand charge transfer (MLCT) transitions [29a]. The observed band in the  $26306 - 27472 \text{ cm}^{-1}$  region is assigned to  $\text{S} \rightarrow \text{Cu}^{\text{II}}$  (LMCT) transition. The presence of the  $\text{S} \rightarrow \text{Cu}^{\text{II}}$  (LMCT) band in the spectra of all complexes is strong evidence that coordination of the reported ligand to the metal ion occurs *via* the sulfur atom [29b]. Such LMCT bands are quite common in the electronic spectra of related copper(II) complexes containing sulfur donors [30].

The electronic absorption spectra of the investigated hexacoordinated copper(II) complexes, **1**, **2** and **3** at  $10^{-3} \text{ M}$  of complex concentration in DMF show one d-d band at around  $550 \text{ nm}$  in the form of one broad band envelope which can be assigned to  ${}^2\text{E}_g \rightarrow {}^2\text{T}_{2g}$  transition of an octahedral geometry. Though in cases where the  ${}^2\text{E}_g$  and  ${}^2\text{T}_{2g}$  states of the octahedral copper(II) ion ( $d^9$ ) split under the influence of the tetragonal distortion the three transitions  ${}^2\text{B}_{1g} \rightarrow {}^2\text{E}_g$ ,  ${}^2\text{B}_{1g} \rightarrow {}^2\text{B}_{2g}$ , and  ${}^2\text{B}_{1g} \rightarrow {}^2\text{A}_{1g}$  are expected [31], their very close energies could have made them appear as an one broad band envelope. To overcome this difficulty we used saturated solution of metal complexes for measuring the electronic absorption spectra in the low energy region i. e. in the visible and the IR region. Therefore, we have succeeded to detect three d-d bands at wave number ( $\text{cm}^{-1}$ ) ranges of  $20278 - 21418$  and  $16989 - 17723$  and a shoulder band at  $14061 - 14184 \text{ cm}^{-1}$  range corresponding to the above said transitions,  ${}^2\text{B}_{1g} \rightarrow {}^2\text{E}_g$ ,  ${}^2\text{B}_{1g} \rightarrow {}^2\text{B}_{2g}$  and  ${}^2\text{B}_{1g} \rightarrow {}^2\text{A}_{1g}$  respectively in a distorted octahedral geometry (Table 5).

For the inspected hexacoordinated copper(II) complexes, since the planner field and one of the axial field are constant in all these copper(II) complexes, the change in the d-d band's frequency should be due to nature of the other donor set of the axial field. The electronic absorption spectral features of these six coordinate copper(II) complexes reveal that the position and intensity of the d-d bands are sensitive to the nature of the counter anion occupies the axial plane of the octahedral stereochemistry. Thus, the relative energies of the d-d transition will depend upon the extent of the axial ligand-metal interaction. For a given ligand L, the data in Table 5 show that the increasing energy order of the d-d band lies in the sequence:  $\text{CuLNO}_3 < \text{CuLBr} < \text{CuLCl}$  and reflects the decreasing order of the Lewis-acidity of the central copper(II) ion. This finding suggests that the strength of the metal-axial counter anion ligand bond increases in the order of  $\text{NO}_3 < \text{Br} < \text{Cl}$ .

The data in Tables 5, show that, the electronic absorption spectral features for the inspected five-coordinated copper(II) complexes **4** and **5** are similar. Three weak bands appearing in the low energy visible region at  $15057 - 15317, 17104 - 17384$  and  $20755 - 20982 \text{ cm}^{-1}$  ranges may be attributed to the d-d transitions of the copper(II) ion in the square-pyramidal environment ( $\text{C}_{4v}$ ) [32]. In the square - pyramidal copper(II) complexes the plausible d-orbital energy level scheme (idealized symmetry group  $\text{C}_{4v}$ ), is  $dx^2-y^2 > dz^2 > dxy > dxz, dyz$ . Accordingly, for the investigated perchlorate and acetate copper(II) complexes the higher energy band of the d-d transitions can be

assigned to  $d_{xz}$ ,  $d_{yz} \rightarrow dx^2-y^2$ ,  $d_{xy} \rightarrow dx^2-y^2$  while the lower energy band to  $dz^2 \rightarrow dx^2-y^2$ . These spectral parameters are in consistence with the other copper(II) complexes in the five-coordinate square-pyramidal stereochemistry [31,33,34]. This finding is further confirmed from the results of the ESR spectra.

### ESR spectra and magnetic moment measurements:-

As further structural characterization tools, the magnetic moment measurements and the ESR spectra studies have been used to confirm the geometry of the reported copper(II) complexes. Copper (II) ion belongs to the  $3d^9$  and  $S = 1/2$  system [35,36]. The room temperature magnetic moments and details of the polycrystalline ESR spectra of the studied copper(II) complexes are listed in Table 6. The observed magnetic moments of the investigated copper(II) complexes lie in the 1.95 - 2.12 BM range, corresponding to one unpaired electron [35,36] and in consistence with the mononuclear monomeric structure of these complexes. Based on these normal magnetic moment values, there seems to be no exchange interaction between the copper(II) ions in the solid state of these copper(II) chelates. This fact finds support from the ESR spectral data which give G values in the range  $5.3825 - 6.9749 > 4.0$  [37].

The EPR spectra of the inspected copper(II) complexes in the polycrystalline state at 298 K were recorded in the X-band region, using 100 KHz field modulation and the g factors;  $g_{\parallel}$  and  $g_{\perp}$  values were quoted from the spectra relative to the standard g-marker DPPH ( $g = 2.0023$ ). The spectra are interpreted in term of an effective spin of  $S = 1/2$ , and the various ESR parameters  $g_{\parallel}$ ,  $g_{\perp}$ , G and  $g_{av}$  computed from these spectra are given in Table 6. The spectra of most complexes show one signal at  $g_{av} = 2.0920 - 2.1276$  and no hyperfine structures were observed. This finding may be attributed to the strong dipolar interaction between the copper(II) ions in the unit cell. However, the spectra of the present six and five coordinate complexes species are anisotropic, having parallel and perpendicular features.

The ESR spectra of the investigated hexa-coordinate copper(II) complexes **1-3** show a considerable tetragonal distortion occurs, which changes the symmetry of  $O_h$  to  $D_{4h}$ . According to the Jahn-Teller thermo, a tetragonal distortion reduces the symmetry from  $O_h$  to  $D_{4h}$  [36] is expected for all hexa-coordinate copper(II) complexes and this results in an anisotropy of the g-tensor. For the six coordinated copper(II) complexes under study the coordinated donors are not identical, where the coordination chromophore is  $N_3S_2X$  therefore, only static distortion can occur [36]. However, the solid state EPR spectra of these complexes, recorded at ambient temperature were found to be anisotropic with g-values,  $g_{\parallel} = 2.2040 - 2.2748$  and  $g_{\perp} = 2.0326 - 2.0425$  (Table 6). The spectra are axial in nature and  $g_{\parallel} > g_{\perp} > 2.0023$ , indicating that  $dx^2-y^2$  is the ground state, which is characteristic of a distorted octahedral geometry [38]. The value of  $g_{\parallel}$  is greater than  $g_{\perp}$  (Table 6) indicating a tetragonal distortion, corresponding to elongation along the four-fold symmetry Z axis. The  $g_{av}$  value calculated from the relation:  $g_{av} = 1/3(g_{\parallel} + 2g_{\perp})$  was found to lie in the range 2.0920 - 2.1196. The deviation of the  $g_{av}$  from that of the free electron (2.0023) is due the covalent nature [39]. This covalent planar bonding like other complexes of sulfur and nitrogen donor ligands is supported by a  $g_{\parallel}$  values of 2.2040 - 2.2748 range as suggested by Kivelson and Neiman [40]. The parameter G has been calculated by using the expression [41]:  $G = (g_{\parallel} - 2)/(g_{\perp} - 2)$ . The value of G reflects the exchange interaction between copper centers in the polycrystalline complex. According to Hathaway et al. [42] values of G less than 4 indicate considerable exchange interaction in the solid complexes while values of G larger than 4 are typical of negligible exchange interactions, which is the case in the copper(II) complexes under investigation.

The one-electron paramagnetic of the five-coordinated copper(II) complexes  $[\text{CuL}](\text{CH}_3\text{COO})_2$  (**4**) and  $[\text{CuL}](\text{ClO}_4)_2$  (**5**) display axial X-band EPR spectral features that are characteristic for an essentially square pyramidal geometry giving  $g_{\parallel}$  and  $g_{\perp}$  values of 2.2504 - 2.2913 and 2.0359 - 2.0458 range respectively, at 293 K. Both  $g_{\parallel}$  and  $g_{\perp}$  values are within the range expected for square pyramidal or tetragonal copper(II) complexes. The fact that  $g_{\parallel} > g_{\perp}$  is consistent with a  $dx^2-y^2$  ground state for what is probably a distorted square pyramidal

disposition of atoms about the central copper ion [43]. Here also the  $g_{\parallel}$  value is less than 2.3, indicating the covalent character of M–L bonds [40]. For these complexes the value of  $G$ -factor is greater than 4, suggesting that there is no interaction between the copper centers. The small separation between the  $g_{\parallel}$  and the  $g_{\perp}$  lines indicates that the unpaired electron on copper may be significantly delocalized into the ligand system. A pathway for electron delocalization is provided by the pyridine entity directly linked to the copper ion by the nitrogen atom through overlap of d orbitals of copper with the N system of pyridine.

Table 6. ESR spectral parameters and magnetic moment values of copper(II) complexes

*Complex	$g_{\parallel}$	$g_{\perp}$	$g_{av}$	$G$	$\mu_{eff}$ (BM)
1	2.2748	2.0425	2.1196	6.4650	2.12
2	2.2110	2.0326	2.0920	6.4723	2.04
3	2.2040	2.0379	2.0932	5.3825	1.95
4	2.2913	2.0458	2.1276	6.3602	1.97
5	2.2504	2.0359	2.1074	6.9749	2.05

\*Complex details are as listed in Table 1.

### Oxidase Biomimetic Catalytic Activity:-

There is a continuing interest in the biomimetic catalytic activity of the transition metal complexes, which may serve as structural and functional models for various metalloenzymes [44]. In the modeling approach metalloenzymes are regarded as metal complexes embedded in the protein structure. It is therefore convenient to investigate the low molecular mass complexes with the objective of obtaining structural information on the reactivity patterns transferable with the same reservation to the enzyme [45]. We are interested in the modeling of the metalloenzymes catechol oxidase and phenoxazinone synthase. These enzymes play vital roles in the metabolism of the aromatic compounds.

#### Catechol oxidase biomimetic catalytic activity:-

Catechol oxidase is a copper type two enzyme catalyzes the aerobic oxidation of catechol to the corresponding light absorbing *o*-quinone. The two-electron oxidation of 3,5-di-*tert*-butyl catechol (3,5-DTBC<sub>2</sub>) to the light absorbing 3,5-di-*tert*-butyl quinone (3,5-DTBQ) was investigated since this is the reaction that the copper-containing enzyme catechol oxidase catalyzes (Figure 3).

Fig. 3. Catalytic aerobic oxidation of 3,5-di-*tert*-butylcatechol

The catechol oxidase biomimetic catalytic activity of the reported copper(II) complexes was evaluated by determining the turn over rate (amount of 3,5-DTBQ produced per min per mg of catalyst) by making use of molar absorbance value of  $\epsilon = 1900 \text{ M}^{-1} \text{ cm}^{-1}$  in methanol and the obtained results are given in Table 7. As we can see in Table 7, all the inspected complexes catalyze the aerobic oxidation of 3,5-DTBC<sub>2</sub> to the corresponding light absorbing 3,5-DTBQ with the oxidase like catalytic activity varying from a relatively high for **3** to a moderate for **4** and **5** and a low for **1** and **2** complexes. These results demonstrate that, the catalytic activities depend strongly on the nature of both the counter anion incorporateities in the complex molecule and the stereochemistry of the metal chelate. There are a number of factors that could help to elucidate the difference in the catalytic activities of the present catechol oxidase functional models. These include:

- (a) The redox potential of the couple Cu<sup>I</sup>/Cu<sup>II</sup> in the investigated copper(II) complexes during the catalytic cycle.
- (b) The Lewis acidity of the copper(II) center created by nature of the coordinated ligands system.
- (c) The geometry imposed by the coordinated ligands on the copper(II) ion.
- (d) The degree of lability of the sixth donor atom of the hexa-coordinated complex species. Some of these factors will be considered sequentially.

**Geometrical considerations:-**

The surprising oxidase like catalytic activity of the inspected coordinatively saturated hexacoordinated copper(II) complexes may be ascribed to conformational changes in solution. The hexa-coordinate complexes are highly unstable in their ground state due to: (a) the excessive build-up of electron density on the central copper(II) ion (six donating atoms), (b) the Jahn–Teller effect. According to the Jahn–Teller theorem, the hexa-coordinated copper(II) complexes are usually associated with a tetragonal distortion reducing the symmetry from  $O_h$  to  $D_h$  [46]. Consequently we suggest that the axially coordinated counter ion could be forced to get away from the octahedral environment and the coordination number would decrease from six to five. This suggestion find support from the electrical conductivity results in solution (Table 1) which showed that the conductance values of examined complexes are higher than that required for 1:1 electrolytes and lower than that expected for 1:2 electrolytes. Such conformational changes will provide one open site for coordination of the substrate or any reacting species during the oxidation catalytic cycle.

However, the data in Table 7 demonstrate that the five coordinate complexes **4** and **5** exhibit catalytic activity higher than the octahedral halogeno complexes **1** and **2**. The octahedral complexes are coordinatively saturated, and thus have no vacant coordination sites, which can be utilized to bind any reacting species during the catalytic process. Due to the reasons (a) and (b) mentioned above, the reported copper(II) chelates should dissociate in solution to form more stable five coordinate complexes with an available coordination site for the substrate binding. The ability of such coordinatively saturated complexes to dissociate and consequently the energy of dissociation is one of the key factors in imparting catalytic properties to these complexes. On the other hand, the five coordinate square pyramidal complexes already have a vacant coordination site for the substrate binding and thus need no energy for ligand dissociation as in the case of the octahedral complexes.

However the results here show that octahedral complexes can be effective catalysts and that geometrical effect is only one facet of the complexes activity.

**Correlation with the six donor lability:-**

Several studies on catechols oxidation demonstrated that, the degree of lability of the axial donor atom has an effect on the rate of catalysis [47]. In addition it has been shown that electron transfer from catechol to copper(II) can begin only after catechol and the copper(II) species form a copper(II) catecholate intermediate [48]. Our premise is that the ease of dissociation of the sixth coordinated counter anions ligands ( $X = Cl, Br$  and  $NO_3$ ) greatly affects the ability of these hexa-coordinate complexes to catalyze this oxidation process. We assume that prior to oxidation, dissociation of the sixth donor will occur so that a vacant coordination site will be available for the binding of the catechol. Dissociation of the sixth donor counter anion ligand is the spark of the oxidation process so the safe binding of catecholate to copper(II) should be attainable. Therefore, greater the binding ability of the donor counter anion ligand (X) the larger the energy required for the dissociation of the sixth donor X and consequently the slower the reaction will proceed if this step is part of the rate determining step of the reaction. According to the previous studies the coordinating ability of the nitrate ligand is lower than the chloro and bromo ligands. Consequently the lability of the nitrate ligand will be greater than the chloro and bromo donors. This explanation may clarify the superiority of hexacoordinated nitrate complexes as compared with the analogous hexacoordinated halogeno complexes.

When TEA was added to a solution in which the copper(II)-catalyzed oxidation of 3,5-DTBCH<sub>2</sub> was in progress, a remarkable increase *ca.* three fold was found in the oxidation rate (Table 7). There is a kinetic factor, which account for this dramatic increase of the catalytic activity on addition of TEA. This marked effect of TEA on the rate of the catalytic oxidation reaction was previously reported for other catechol oxidase functional models catalyze the aerobic oxidation of catechol [49].

Table 7. Catechol oxidase like catalytic activity of copper(II) complexes

*Complex	**3,5-DTBQ $\times 10^{-2}$ (m mol L <sup>-1</sup> )	TR $\times 10^{-1}$ h <sup>-1</sup>	3,5-DTBQ $\times 10^{-2}$ (m mol L <sup>-1</sup> )	TR $\times 10^{-1}$ h <sup>-1</sup>
1	88.53	147.55	32.36	53.9
2	92.52	154.42	32.68	54.4
3	164.83	274.71	72.57	120.9

5	114.25	190.41	67.48	112.4

\*Complex details are as listed in Table 1, \*\*these data are obtained in presence of TEA

**Phenoxazinone synthase biomimetic catalytic activity:-**

Related to catechol oxidase biomimetic catalytic activity is the ability of the reported copper(II) complexes to promote the oxidation of *o*-aminophenol (OAP) to 2-amino-3*H*-phenoxazine-3-ones (APX) as shown in Figure 4.

**Fig 4:** The aerobic catalytic oxidation of *o*-aminophenol (OAP) to 2-amino-3*H*-phenoxazine- 3-ones (APX)

The present series of copper(II) complexes exhibit promising catalytic activity towards the oxidative dehydrogenation of *o*-aminophenol (OAP) at room temperature in the presence of  $O_2$  in methanol. This system can be regarded as a functional model of phenoxazinone synthase which is involved in the biosynthesis of Actinomycin D (AD) a naturally occurring antineoplastic agent from the *o*-aminophenol derivative. The catalytic measurements were carried out by the spectrophotometric monitoring of the increase in the concentration of the strongly absorbing 2-amino-3*H*-phenoxazin-3-one product (APX) at 433 nm. 2-aminophenol has no absorption in the visible region. The time sequence of the increase in the 400-440 nm band characteristic of the oxidation product (APX) of 2-aminophenol initiated by copper(II) complex **3** at ambient temperature is shown in Figure 5 as a representative of the catalytic aerobic oxidation of (OAP).

**Fig. 5.** UV/Vis spectral changes recorded for the reaction of complex **(3)** with 2-aminophenol (0.05 M) in methanol at 296 K; spectrum obtained several milliseconds after mixing of the reactants in the stopped-flow; inset is the kinetic trace at 433 nm

The phenoxazinone synthase biomimetic catalytic activity of the reported copper(II) complexes was evaluated by using the turn over rate (TR) expression, (TR = the amount of APX produced per mmole of catalyst per min. (Table 8) by making use of molar absorbance value of  $2.23 \times 10^4 \text{ M}^{-1} \text{ cm}^{-1}$  and the results obtained are presented in Table 8.

Although (APX) is produced for all the synthesized copper(II) chelates, the rate at which it is produced varies from one complex to another. The data in Table 8 demonstrate that, the rate of oxidation of *o*-aminophenol is markedly dependent on both the counter anion incorporated in the complex molecule and the stereochemistry of the metal chelate. Similar to that reported above for catechol oxidase like activity the candidates copper(II) complexes exhibit the same order of reactivity towards the oxidative dehydrogenation of 2-aminophenol. The observed variation in the catalytic activity of the present copper(II) complexes can be correlated with structural features of the inspected copper(II) chelate. This finding is similar to what was reported for catechol oxidase mimetic catalytic activity for the present series of copper(II) complexes.

Similar to the catechol-containing systems a much more dramatic increase (*ca.* 2.88 – 4.28 fold) was found for the oxidation rate when TEA was added to a methanolic solution in which the copper(II) catalyzed oxidation of *o*-aminophenol. In methanol solution *o*-aminophenol is mainly present in its protonated form OAPH. Due to the presence of TEA in the reaction medium, *o*-aminophenol may be predominantly present in the non-protonated form OAP<sup>-</sup>. In analogy to catechol, TEA deprotonates OAPH to OAP<sup>-</sup>, and the kinetic activity of OAP<sup>-</sup> presumably is the spark for initiation of the oxidation catalytic cycle.

Table 8. Phenoxazinone like catalytic activity of copper(II) complexes 1-5

Complex*	APX ( $\mu\text{ mol L}^{-1}$ )**	**TR $\text{h}^{-1}$	APX ( $\mu\text{ mol L}^{-1}$ )	TR $\text{h}^{-1}$
1	84.78	14.13	28.40	4.79
2	77.10	13.00	24.68	3.88
3	137.36	37.79	47.86	9.97
4	99.26	19.54	16.8	5.80
5	125.21	20.74	43.47	7.24

\*Complex details are as listed in Table 1; \*\*these data are obtained in presence of TEA. The turn over rate (TR) is the amount of APX produced per min per mg of catalyst.

#### Abstract

The causes of performance degradation geotechnical wells during ISL of uranium and detail researched the chemical sedimentations from uranium deposits. Identified effective complex of chemical reagents, which can remove sedimentations during sulfuric acid leaching of uranium. Performed laboratory research on samples of sediments and proved the concentration of the composition complex chemicals reagents. Demonstrated effective impact on permeability of the host rock during ISL of uranium.

#### Introduction:-

In situ leaching (ISL) of ores with natural permeability involves replacing the pore fluid in the rock layer with the solvent, which interacts with the solid and liquid phases of rocks. As a result, various physical and chemical processes occur in the bowels of the earth [1]. The long-observed operation of geotechnical wells that were used for exploitation of uranium deposits by ISL method exhibits the decrease in their productivity over time. One of the main productivity loss causes can be attributed to the increase in hydraulic resistance and reduced filtration in rock layers due to colmatation formation stemming from precipitation of dissolved substances in the process solutions, or mechanical movement of particles of the ore-bearing horizon, and gas excretions.

Mechanical colmatation is the result of clogging of water filter orifices by sand, clay, gravel and blockage of the pore channels by mechanical suspension. Sand and clay precipitate only partially, sometimes completely overlapping the filter. Clogging of filter and formation zones created by drilling fluids containing clay particles can also be attributed to a mechanical colmatation [2]. Thus, the swelling of clay mineral in an aqueous medium and alteration of the pore space of the formation structure can be observed.

Chemical, ion exchange and gas colmatation types are caused by changes in the chemical composition of ground layer waters during ISL as a result of impact from application of chemical materials. The presence in water of dissolved calcium, magnesium and iron cations and the violation of the balance of carbon dioxide lead to the formation of sparingly soluble precipitation [3]. The allocation of carbonate sediments in the filter zone occurs intensively, however when remove the intensity of the precipitation decreases. During the reaction of leaching solutions with the host rock in the liquid phase, the accumulation of a number of the major rock-forming minerals (besides ore) occurs. The amount and kinetics of the transition of these elements into productive solutions depends on the type of lixiviant, end concentration, redox potential, temperature, solubility of the rock-forming

minerals and the size of the active surface of the mineral particles which in turn largely determines the intensity of mass transfer in the solution –solid system.

The purpose of the laboratory work has been reduced to the selection of chemical reagent, capable of changing the balance of the system and transferring of insoluble in a sulfuric acid treatment compounds into a liquid phase, or convert solid colmatants into easily soluble compounds. The technology that is heavily used in the oil and gas industry was taken as the basis for this work. Specific acid treatment ore-bearing rocks with a special solution are used for cleaning the pore spaces, creating new solutions movements channels and improvement of the available sizes, as well as the dissolution of clays in the near wellbore area [4].

The analytical work for the selection of the formulation of the most effective solution was conducted on the samples of colmatant and ore-bearing rocks. Ammonium bifluoride ( $\text{NH}_4\text{HF}_2$ ) and surfactants for loosening colmatant were used as additives to the sulfuric acid solution.

The ammonium bifluoride was selected due to its ability to exchange reaction with mineral acids (sulfuric, hydrochloric, nitric acid) and the formation of hydrofluoric acid.

where – HAn ( $\text{H}_2\text{SO}_4$ ;  $\text{HCl}$ ;  $\text{HNO}_3$ ).

Hydrofluoric acid, resulting from the reaction, easily reacts with siliceous and aluminosilicate compounds, which are an integral part of the ore-bearing rocks and of precipitation of bridging:

As a result, the dissolution of colmatant and parts of clastic sand takes place, generally increasing the effective porosity ore array block. This hydrofluoric acid is fully utilized due to the large amount of silica contained in the sands. Results of laboratory investigations indicate the possibility of using ammonium bifluoride as an additive in a sulfuric acid solution for effective chemical treatment technology wells [5,6].

Reagents included in ammonium bifluoride complex.

500 ml of 2% ammonium bifluoride solution is combined with 50 ml of a 2% solution sulfoaminovoy acids (CAA) and sodium tripolyphosphate (STPP) and mixed with 100 ml of 10% hydrochloric acid HCl. This mixture of chemicals is conventionally denoted by the CBF. The reagents that are used for the preparation of a fluoride complex for processing colmatant are described below:

Common inhibited hydrochloric acid (HCl) 31, 27, 24% concentration. Comes in tanks. Shipping and handling is carried out by means of special acid equipment. The storage is performed in rubberized containers within bund areas.

Hydrochloric acid (HCl) - a solution of hydrogen chloride in water, emits smoke on air, forming a mist. Hydrochloric acid vapors strongly irritate the respiratory tract and mucous membranes. Prolonged exposure to hydrochloric acid vapor may cause respiratory tract catarrh, as well as the opacification of eye cornea. Skin contact causes irritation and burns.

Ammonium bifluoride ( $\text{NH}_4\text{F} \cdot \text{HF} + \text{NH}_4\text{F}$ ). Its acidity in terms of hydrofluoric acid is 25%, reagent density 1.27 g /  $\text{cm}^3$ . Despite the fact that the use of ammonium bifluoride requires an increased consumption of hydrochloric acid to prepare a working solution (same part HCl participates in the conversion reaction of ammonium bifluoride in HF), reagent is especially useful in remote areas, because it can be stored and transported by conventional methods. Ammonium bifluoride is supplied in polyethylene bags nested in four-five-layer paper bags, weighing not more than 25 kg. Ammonium bifluoride is stored in covered warehouses, protecting it from moisture penetration. Material is a toxic agent. At higher concentrations in the air accepted limit by (0.2 mg /  $\text{m}^3$ ) may cause a violation of the central nervous system, disease bone tissue, eye, skin.

Surface active agents (surfactants) such as disolvan, sulphonol, prevotsell, progol. Sulphonol comes in double kraft bags, and the other surfactants are transported and stored in steel drums. Liquid surfactants (disolvan, prevotsell) are dissolved in ethyl alcohol, thus are toxic and easily flammable.

Sulfuric acid  $H_2SO_4$  is a strong dibasic acid, exhibiting the highest degree of sulfur oxidation. Under normal conditions, the concentrated sulfuric acid is a heavy, oily, colorless and odorless liquid with sour, "copper" taste. Sulfuric acid can also be represented as a mixture with water, or with sulfur trioxide  $SO_3$ . Sulphuric acid and oleum are highly corrosive substances. By inhalation of these substances, they cause shortness of breath, cough.

Hydrofluoric acid (HF) 40% has concentration density of 1,15g / cm<sup>3</sup>. Transportation and storage of hydrofluoric acid must be carried out in plastic containers. Hydrofluoric acid - hydrogen fluoride solution in water, emits smoke in the air, forming mist. Hydrofluoric acid vapors strongly irritate the respiratory tract and mucous membranes, prolonged exposure to hydrofluoric acid vapor may cause respiratory tract catarrh, blurred cornea of the eye. Skin contact can cause severe burns [7].

Laboratory experiments have shown that the most effective colmatant mixture composition is a solution of 10% sulfuric acid or hydrochloric acid with the addition of ammonium bifluoride 2-2.5% by weight.

Colmatant phase composition was monitored by X-ray diffraction analysis, which was carried out on the X-ray diffractometer X'Pert MPD PRO (PANalytical). Shooting conditions:  $CuK_{\alpha}$  - radiation, Ni - filter,  $U=30$  kV,  $I=10$  mA, the rotational speed of 1000 pulses/s, the time constant  $\tau = 5$  s,  $2\theta = 10^{\circ} - 90^{\circ}$ . Intensities of diffraction maxima were evaluated on a 100 point scale as a percentage of the highest line. The processing of experimental data and the interplanar spacings were performed according to the Wulff-Bragg formula. Phase analysis of the chemical composition of bridging materials were determined according to X-ray crystallographic data of the international community.

JEOL 6510EX electron microscope was used to acquire images of the surface sediments with high (up to 0.4 nm) spatial resolution, as well as for information about the composition, structure and other properties of the near-surface layers of the micro-diffractions. The method is based on the principle of interaction of the electron beam with the object under study.

The physico-chemical analysis results discussion.

The goal of the study was to evaluate the dissolving ability of different chemicals of varying sediment concentrations in controlled laboratory settings. Then, select the optimal chemical composition based on the analysis results.

For the pilot study the sedimentation from the interior surface of the submersible pumps from four fields located in the Syrdarya uranium ore province. Dried precipitates №1 is a dust-like mixture with the presence of large homogeneous formations and sand particles. Dried precipitates №2 is a white powder with beige spots.

For physical and chemical analysis purposes the samples of colmatant were ground in an agate mortar to a powder. The powder was examined by x-ray analysis. Stable reflection X-ray radiograph colmatant №1 (Fig. 1) shows a high crystallization sediment-chemical compounds. Analysis of the values of interplanar distances confirms the existence of feldspar particles, silica-alumina complex ferrous and plaster. Amorphous state is noticeable due to weak reflection of X-rays.

**Figure 1:-** The XRD pattern colmatant to chemical treatment.

The X-ray diffraction of colmatant in Table 1 shows the quantitative chemical and mineralogical composition of colmatating objects. The data in Table 1 show that colmatant is majorly based (about 70%) on a chemical compound (CaSO<sub>4</sub> · 2H<sub>2</sub>O), mineral - gypsum. The remainder of the colmatant comprises from gibshit rock-forming minerals, anorthite and amphibole (3%, 20%, 7%, respectively).

**Table 1:-** Chemical composition colmatant №1

Reference code	The name of composition	Chemical formula	Content [%]
00-036-0432	Gypsum	CaSO <sub>4</sub> · 2 H <sub>2</sub> O	70
01-075-1690	Gibshit	Ca <sub>3</sub> Al <sub>2</sub> ( Si O <sub>4</sub> ) <sub>1,53</sub> (OH) <sub>5,88</sub>	3
01-087-1616	Anorthite	Ca( Al <sub>2</sub> Si <sub>2</sub> O <sub>8</sub> )	20
01-081-1135	Amphibole	( Ca <sub>5,76</sub> Mg <sub>0,24</sub> ) ( Al <sub>4,44</sub> Fe <sub>0,48</sub> Si <sub>2,08</sub> O <sub>16</sub> ) Cl <sub>2,76</sub>	7

These results prove satisfactory matching to published data of interplanar spacings with the experimental values<sub>experimental</sub> and line radiographs (Appendix A1 и A2).

Drip method was used to determine dissolving properties of ammonium bifluoride and mineral acids in processing precipitations. The №1 sample was treated with the composition complex of ammonium bifluoride, №2 sample was processed by solvent composition of 12% hydrochloric acid, №3 sample was subjected to the treatment of 12% sulfuric acid. During processing a marked penetration of fluids precipitate to varying degrees with a slight change in the amount and color of colmatating object. The drying of processed materials is held at room temperature under a fume hood at atmospheric conditions. After drying, precipitates were triturated in an agate mortar to study phase composition of treated samples. The results of X-ray analysis of the sample №1 (Figure 2) showed the polycrystalline nature of the crystallization of the samples, as well as changes in the crystal chemical and mineralogical composition compared to the original colmatant.

**Figure 2:-**colmatant №1 diffractogram after chemical treatment.

Characteristics of spectral reflections of the X-ray radiograph (Figure 2) remainsimilar in their colmatant diffraction patterns to those before the processing (Fig. 1).This is explained by the fact that all the minerals in the composition of colmatant is of isistructuralcrystallizationtype. Table 2 shows the quantitative phase and mineral composition data of colmatants after chemical processing with ammonium bifluoride.

**Table 2:-** Chemical composition colmatant after chemical treatment.

	Reference code	The name of composition	Chemical formula	Content [%]
	01-085-1569	Granite	$\text{Ca}_{2.83} (\text{Al}_{5.66} \text{Si}_{10.34} \text{O}_{32}) (\text{H}_2\text{O})_{7.1}$	13
	01-073-2041	Gelit	$\text{Ca}_2 (\text{Al} (\text{AlSi}) \text{O}_7)$	4
	01-074-1559	Andradite	$(\text{Ca}_{2.97} \text{Mg}_{.02} \text{Mn}_{.01}) (\text{Fe}_{1.99} \text{Al}_{.01}) (\text{Si}_4)_3$	2
	01-072-0467	Orthosilicate	$\text{Ca Al}_2 \text{Si}_2 \text{O}_8 (\text{H}_2 \text{O})_4$	38
	01-089-8754	Grossular	$\text{Ca} (\text{Al}_4 \text{Si}_2 \text{O}_{11})$	1
	01-072-2375	Epidote	$\text{Ca}_2 \text{Al}_2 \text{Fe Si}_3 \text{O}_{12} (\text{O H})$	5
	01-089-7304	Pirop	$(\text{Mg}_{0.92} \text{Fe}_{0.05} \text{Ca}_{0.03})_3 \text{Al}_2 (\text{Si O}_4)_3$	5
	00-041-1479	Clinozoisite	$\text{Ca}_2 \text{Al}_3 (\text{Si O}_4) (\text{Si}_2 \text{O}_7) \text{O} (\text{OH})$	32

The resultsofX-rayanalysisofthesample №1 showedthe dissolution ofcolmatagingschemicalcompoundof gypsumaccording to thechemicalreaction:

The reaction products are strong electrolytes ( $\text{CaF}_2$ ,  $\text{H}_2 \text{SO}_4$ ) which dissociate into ionsin aqueous solution. Calcium cationsareinvolved in the formation the minerals of different composition (Table 2), showing that increase in the amounts of calcium containing minerals.Solutions of the fluoride ions react with siliceous and aluminosilicate compounds. Sulfuric acid acts as a leaching agent.

Study of the surface colmatantusing scanning electron microscope (Figure 3) shows the frame structure of the mechanism, with a complex association of groups of atoms and molecules, as well as the lack of gaps between the lateral planes, proving close-packed nature of the crystallization colmatagings chemical compounds.

Figure 3:- Image colmatant surface before processing.

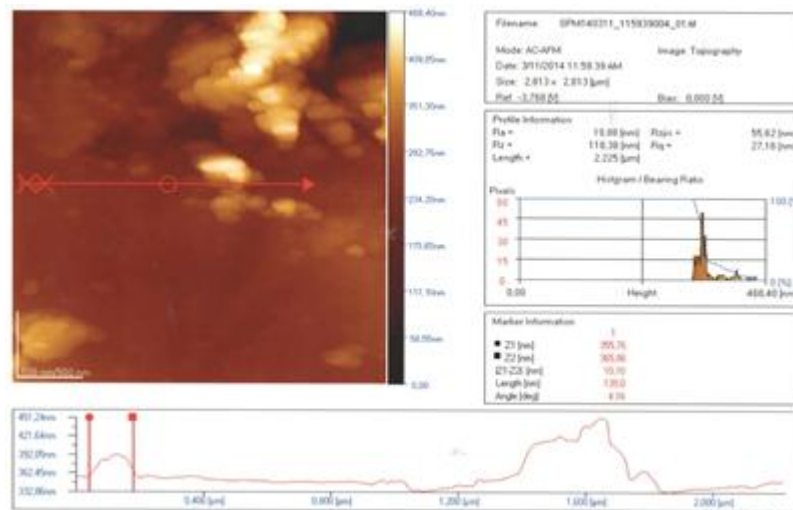

Figure 4:- Topography of the colmatant surface prior to treatment.

Figure 4 shows a picture of the surface microdiffraction colmatating objects. The profile of the histogram shows that the surface is formed by polymerization of silicate to the skeletal structure, which represents an infinite body-tallies framework of SiO<sub>4</sub> tetrahedrons and AlO<sub>4</sub>, in the cavities of which there are other ions, as a result of the drying process, they can turn into a clay and various kinds of silica. Structure without rupture, solid, formation of voids and cracks were not observed.

Post chemical processing (complex of ammonium bifluoride, 12% hydrochloric acid and sulfuric acid) drying and preparation of colmatant samples was performed at room temperature for 24 hours. The results of electron diffraction studies (Figure 5) showed a change in the morphology of the surface of the colmatant. As the result, new chemical formations are being composed within colmatating substance. Chemical formations can be described as smears, with discontinuous streaks and cracks.

**Figure 5:-** Image of the colmatant surface after chemical treatment.

**Figure 6:-** Colmatant surface topography after chemical treatment.

Microdiffraction of colmatant surface after chemical treatment is shown on Figure 6. The surface histogram profile shows a surface discontinuity in a region varying from 200 nm to 300 nm, which proves the structural transformation of colmatant, as well as changes in the chemical composition of the sediment-systems.

Investigation and analysis of laboratory experiments shows that chemicals differently affect the colmatating sediments, depending on the composition and concentration. However, the ammonium bifluoride's effect is strong. According to the electron diffraction, the complex of ammonium bifluoride is the most workable, effectively dissolving the gypsum and producing the maximum depth of a deepening in the sample by destroying the crystal structure colmatant. Thus, the ammonium bifluoride shows better characteristics compared to the solution of 12% hydrochloric or sulfuric acid.

The dissolving capabilities of the tested solutions are directly depended on the chemical composition of colmatating formations and quantitative characteristics of sediment-rock. Its main component, gypsum, is a product of the chemical process of sulfuric acid leaching, its content is 70% by weight of the colmatant. Laboratory studies have shown the effectiveness of ammonium bifluoride usage as an additive in sulfuric acid solutions that are effective for carrying out chemical treatments of colmatant. The complex of ammonium bifluoride - 10% solution of sulfuric acid or hydrochloric acid with the addition ammonium bifluoride 2-2.5% by weight was developed. X-ray

diffraction and electron analysis revealed the complete dissolution of the main colmatant element – gypsum. As the result of chemical processes new formations were observed. Changes were found in the surface morphology and in the formation of voids and cracks of colmatant. To sum up, the ammonium bifluoride complex can be successfully used as a chemical reagent for treating geotechnological wells during their regeneration.

#### **Abstract**

**Purpose:** study to assess the performance of dental hygienists for their role at providing preventive advice to patients and assess preventive methods of oral diseases among adults in kingdom of Saudi Arabia.

**Methods:** A self-administered questionnaire was conducted electronically through social media websites and WhatsApp application. This study include randomly selected (658) participants from all kingdom of Saudi Arabia population.

**Results:** 51.5% visit private dental centers. 41.5% reported that dental hygienists had never talk to them. 46% usually commitment the advices of dental hygienists related to their teeth and oral health. 44.2% agreement that using miswak obviates using toothbrush and toothpaste. 91% believe that they can't use another family member's brush. 55.3% aren't smokers. 21% suffer bad mouth smell usually. 35.5% use toothbrush for other purposes as tongue cleaning or massage their gum.

**Conclusion:** There is shortening by dental hygienists in providing preventive advice to patients. Moderate awareness and practice of prevention methods among adults in kingdom of Saudi Arabia.

#### **Introduction:-**

Optimal oral health care is attained when all members of the oral health care team work effectively together (1). As the public's oral health care needs change, the scope of practice in which oral health care providers can practice adapts to accommodate those changes. It is important to periodically evaluate the utilization of all members of the oral health care team to ensure the changing scope of practice is effective in providing for the public (2). Dental hygienists are highly educated professionals who complete rigorous training and meet strict standards of competency and practice (3). Dental hygienists have a specific scope of clinical procedures they provide to their patients. They assess a patient's condition in order to offer patient-specific preventative and educational services to promote and maintain good oral health.

The use of therapeutic methods assists their patients in controlling oral disease, while providing tailored treatment plans that emphasize the importance of behavioral changes (4). The complex professional role of the dental hygienist is often misunderstood other healthcare professionals (5). Furthermore, how the dental hygienist is utilized in the general dental practice is highly variable (2). Although clinical responsibilities vary based on individual state's scope of practice rules and regulations, the dental hygienists' role as a prevention specialist is constant throughout

regions. Dental hygienists are trained to assess risk, educate and help patients manage and reduce risk for oral diseases (6).

Oral health is an integral element of general health and wellbeing. Good oral health enables individuals to communicate effectively, to eat and enjoy a variety of foods, and is important in overall quality of life, self-esteem and social confidence (7). Recent decades have witnessed improvement in the oral health status in developed countries attributable to changes in dietary habits, improved oral hygiene habits, and widespread availability and use of fluorides (8, 9). In addition, improved awareness related to oral health has been reported in developed countries and is cited as being partly responsible for better oral health (10, 11). However oral diseases, particularly dental caries and periodontal disease, remain a public health challenge (12). Changing patterns in the global diseases have been linked to changing lifestyles that include diet, use of tobacco, and consumption of alcohol. Changes in these lifestyle factors have a significant impact on oral health. Therefore, oral diseases qualify as a major public health concern (13). Oral diseases affect a significant proportion of the world's population and exact a heavy toll in terms of morbidity and mortality (14). A range of diseases and conditions can be classified as oral diseases including dental caries, periodontal diseases, oral cancers, noma, dental erosion and dental fluorosis (15). It has also become clear that causative or risk factors in oral disease are often the same as those implicated in the major general diseases (16). Oral disease is one of the four most expensive preventable chronic diseases, and in most cases these dental diseases are preventable (17). Inadequate knowledge of available preventive methods is related to non-adoption of preventive practices (18). Adoption of preventive practices and use of preventive modalities is a key message in most health education campaigns (11).

Given the importance of the role of dental hygienists as dental professionals, and the importance of oral diseases preventive means in maintaining the oral health and avoid oral diseases in general. Inadequate data is available about performance of dental hygienists for their role at providing preventive advice to patients and preventive methods of oral diseases among adults in KINGDOM OF SAUDI ARABIA. Researcher conducted this study to assess the performance of dental hygienists for their role at providing preventive advice to patients and assess preventive methods of oral diseases among adults in KINGDOM OF SAUDI ARABIA.

#### **Aims:-**

- To assess the performance of dental hygienists for their role at providing preventive advice to patients in KINGDOM OF SAUDI ARABIA.
- And assess preventive methods of oral diseases among adults in KINGDOM OF SAUDI ARABIA.

#### **Material and methods:-**

Across-sectional was study conducted by researchers, using a questionnaire consist of twenty seven multiple-choice questions divided in to three main domains. The first domain include demographic questions dealing with age, gender, and nationality. While second domain include questions dealing with assessing the scope to which the specialist dental duties. And the third dealing with preventive procedures that carried out by the participants to maintain their oral health. This study include (658) participants from all KINGDOM OF SAUDI ARABIA population, they were selected randomly, and answered the questionnaire electronically through social media websites and WhatsApp application.

#### **Statistical methods:-**

The statistical analysis program (SPSS v.22) was been used in the study in data entry and analysis, with the use of necessary statistical methods to achieve the objectives of the study. The following statistical methods were used:

- Frequencies.
- Percentages.
- Diagrams.
- Chi Square test.

#### **Population & Sample of the Study:-**

The study population includes all KINGDOM OF SAUDI ARABIA population, the sample was (658) randomly chosen persons, they answered the electronic questionnaire through social media websites and WhatsApp application, 87.5% of them were males, while 12.5% of them were females. Most of them were Saudi.

And according to their ages; 72.9% of their ages were between (20 -40) years old, while 24.2% of them were more than (40) years old, and 2.9% of them were less than (20) years old. The next table illustrates that.

**Table (1):-** Personal data for the study sample. (N= 658).

Personal Data		Frequency	Percent
Gender	Male	576	87.5
	Female	82	12.5
Age	Less than 20 year	19	2.9
	From 20 - 40 year	480	72.9
	More than 40 year	159	24.2
Nationality	Saudi	637	96.8
	Non-Saudi	21	3.2

**Diagram (1):-** Personal data for the study sample.

**Results:-**

**Table (2):-** shows the participants’ distribution according to their commitment to the visits dates of oral health to follow up gum infections.

	Frequency	Percent
Yes	87	13.2
No	351	53.3
Sometimes	220	33.4
Total	658	100.0

We notice that more than half of the participants don’t commit to the visits dates of oral health and following gum infections.

**Table (3):** shows the participants distribution according to the type of the dental center they visit.

	Frequency	Percent
Private	339	51.5
Governmental	129	19.6
Private & Governmental	190	28.9
Total	658	100.0

We notice that more than half of the participants have the oral health care in private centers, while 19.6% of them visit governmental centers.

**Table (4):-** shows the participants' distribution according to whether the oral health specialist have talked to them or not.

	Frequency	Percent
Yes	205	31.2
No	273	41.5
Sometimes	180	27.4
Total	658	100.0

We notice that 41.5% of the participants haven't talked to their specialist about their oral health, while the others have talked to their oral health specialist about that. The next table shows the participants (who had a talk with their oral health specialist about some cases which it is supposed to be spoken by a specialist oral and dental health of the patient, and the extent of doing so) distribution.

**Table (5):-** shows the participants' distribution according to having a talk with their oral health specialist about some cases which it is supposed to be spoken by a specialist oral and dental health of the patient, and the extent of doing so. (N = 385)

The question	Yes		No		Sometimes		P-value
	#	%	#	%	#	%	
Did your oral health specialist explain the causes of gum infections and how they relate to following the different methods of keeping oral health in a good case?	179	46.5	96	24.9	110	28.6	0.000**
Do your oral health specialist teach you the right and suitable way to brush your teeth?	178	46.2	134	34.8	73	19.0	0.000**
Do your oral health specialist explain the impact of smoking and tobacco types on the oral and dental health?	176	45.7	157	40.8	52	13.5	0.000**
Do your specialist teach you the necessity and how to use the dental floss?	114	29.6	208	54.0	63	16.4	0.000**
Do your oral health specialist explain the role of fluoridated toothpaste to keep the oral health in a good case?	131	34.0	168	43.6	86	22.3	0.000**
Do your oral health specialist explain the impact of oral diseases on your body and your heart?	108	28.1	229	59.5	48	12.5	0.000**

\*\* Chi square test significant at the 0.01 level.

We conclude from the previous table that 46.5% of the participants who had a talk with their oral health specialist, he explained the causes of gum infections and how they relate to following the different methods of keeping oral health in a good case, and 46.2% of them were taught about the right and suitable way to brush your teeth, 45.7% of them said that the impact of smoking and tobacco types on the oral and dental health was explained to them by the specialist.

While we find that 43.6% of the cases weren't taught the right and suitable way to brush their teeth, and 54% of them weren't told by their oral health specialist about the necessity and the way to use the dental floss, also 59.5% of them didn't have the impact of oral diseases on their body and heart explained.

**Diagram (2):-** shows the participants commitment extent in following the specialist's advices related to their teeth and oral health.

**Table (6):-** shows the participants distribution according to whether their dentists advised them with special toothpaste for teeth sensitivity if it happened after cleaning.

	Frequency	Percent
205	31.2	205
453	68.8	453
658	100.0	658

We notice that 60% of the participants' dentists didn't describe them special toothpaste for teeth sensitivity if it happened after cleaning.

**Table (7):-** the participants' distribution according the dentist advice about the number of time they should brush their teeth a day.

	Frequency	Percent
Once before sleeping	41	6.2
Twice, when getting up and before sleeping	286	43.5
After every meal	129	19.6
He didn't advise me to do that	202	30.7
Total	658	100.0

We notice that 43.5% of the participants were advised to brush their teeth twice a day, once before sleeping and once after getting up.

**Table (8):-** the participants' distribution according the dentist advice about the time they should replace their toothbrushes.

	Frequency	Percent
When the bristles begin to fade out	62	9.4
After 3-6 months of use	135	20.5
After flue infection or any infectious disease	20	3.0
He didn't tell me about that	441	67.0
Total	658	100.0

We notice that 67% of the participants weren't told about the suitable time to replace their toothbrushes, while 20.5% of them were advised to replace it after (3- 6) months of using it.

**Table (9):-** shows the participants distribution according to their agreement that using siwaak obviates using toothbrush and toothpaste.

	Frequency	Percent
Yes	291	44.2
No	265	40.3
I don't know	102	15.5
Total	658	100.0

We notice that 44.2% of the participants belief that using swiaak obviates using toothbrush and toothpaste, while 40.3% of them didn't believe so.

**Table (10):-** shows the participants distribution according to whether they believe that they can use another family member's brush in the case of losing theirs.

	Frequency	Percent
Yes	21	3.2
No	599	91.0
I don't know	38	5.8
Total	658	100.0

We find that 91% of them told that they believe that it is wrong to use others toothbrushes in case they lost theirs.

**Diagram (3):-** shows the participants' distribution according to whether the suffer teeth sensitivity after cleaning them.

We notice that 42% of the participants don't suffer teeth sensitivity after cleaning them, while 33% of them suffer from that, and 25% of them sometimes suffer from that.

**Table (11):-** shows the participants' distribution in terms of doing some special oral hygiene and preventive measures.

The question	Yes		No		Sometimes		P-value
	#	%	#	%	#	%	
Do you use special toothpastes for sensitivity?	169	25.7	361	54.9	128	19.5	0.000**
Do you periodically check your gum's health state (inflammation, bleeding and inflation or landing that causes tooth sensitivity)?	114	17.3	383	58.2	161	24.5	0.000**
Do you follow the specialist instructions to use mouth rinse or antiseptic oral solution?	224	34.0	229	34.8	205	31.2	0.481

\*\* Chi square test significant at the 0.01 level.

We conclude from the previous table that 54.9% of the participants don't use special toothpastes for sensitivity, 58.2% of them don't periodically check their gum's health state (inflammation, bleeding and inflation or landing

that causes tooth sensitivity, also we notice that 34.8% of them don't follow the specialist instructions to use mouth rinse or antiseptic oral solution, while 34% of them do, and 31.2% of them rarely follow the specialists instructions to do that.

**Diagram (4):-** shows the participants worry extent when they visit the dental clinic:

We notice that 44% of the participants don't feel worried when visiting the dental clinic, while 34% of the do, and 19% of them sometimes feel worried when visiting the dental clinic.

**Table (12):-** shows the participants' distribution in terms of smoking and mouth cleaning habits.

The question	Yes		No		Sometimes	
	#	%	#	%	#	%
Do you smoke or use any tobacco types?	249	37.8	364	55.3	45	6.8
Do you suffer any bad mouth smell?	138	21.0	284	43.2	236	35.9
Do you use toothbrush for other purposes as tongue cleaning or massage your gum?	230	35.0	320	48.6	108	16.4

We notice that 55.3% of the participants are not smokers and don't use any other types of tobacco, also we conclude that 43.2% of them don't suffer any mouth bad smell, while 35.9% of them sometimes suffer from bad mouth smell, and 21% of them already suffer from bad mouth smell.

Also we notice that 48.6% of the participants don't use their toothbrushes for other purposes, while 35% of them do.

**Discussion:-**

Oral health is an integral part of overall health and well-being. And oral disease is one of the four most expensive preventable chronic diseases (17). Dental hygienists are trained to assess risk, educate and help patients manage and reduce risk for oral diseases (6). So dental hygienists, as the primary preventive specialists of the dental team (20).In these topics data is rather scarce, especially in Saudi Arabia. Accordingly, the study was conducted to assess the performance of dental hygienists for their role at providing preventive advice to patients and assess preventive methods of oral diseases among adults in KINGDOM OF SAUDI ARABIA.

The majority of participants at this study were males. While the bulk of the participants ranged in age from 20 - 40 year old. And the most common nationality was Saudi. More than half of participants visit private dental center. This is a point we need to stop and then find out the cause of direction of most dental patients towards private sector. If there is a failure in the government sector must be dealt with.

Based on our results the dental hygienists didn't their required duty at providing advices to their patients, and provide them with preventive methods to avoid oral diseases. Whereas 41.5% of participants reported that dental hygienists had never talk to them. While only 27.4% reported that dental hygienists talk to them sometimes.

Despite increased access to water fluoridation, widespread use of fluoride toothpaste, and health-promotion efforts, periodontal disease, remain a public health challenge(12).And many previous epidemiological studies estimated that the prevalence of adult gingivitis varies from approximately 50-100% for dentate patients (21). We found from participants whose reported that dental hygienists talk to them about 24.9% reported that dental hygienists didn't explain the causes of gum infections and how they relate to following the different methods of keeping oral health in a good case for them.

Despite dental professionals should encourage patients' self-confidence to brush and floss at recommended levels and discuss strategies that combat barriers to performance(22).from the participants who had spoken to dental hygienists, 34.8% reported that dental hygienists didn't teach them the right and suitable way to brush their teeth. While more than half reported that dental hygienists didn't teach them the necessity and how to use the dental floss. From the participants who had talk to dental hygienists, 40.8% reported that dental hygienists didn't explain the impact of smoking and tobacco types on the oral and dental health for them. Although the Smoking is a risk factor for poor oral health and oral diseases (23).

Daily tooth brushing with fluoridated toothpastes is important for preventing dental caries (24). However 43.6% reported that dental hygienists didn't explain the role of fluoridated toothpaste to keep the oral health in a good case. A large number of publications have suggested that oral infection, especially periodontitis, are a potential contributing factor to a variety of clinically important systemic diseases (25). its mean that good oral health is important not only to prevent oral disease but also to maintain good general health. However 59.5% reported that dental hygienists didn't explain the impact of oral diseases on their body and heart.

Generally only 10% didn't follow the specialist's advices related to their teeth and oral health.

Given that these percentages mentioned previously referto part from the participants who had spoken to dental hygienists not from all participants, If compared with the total number of participants, it will show the extent of the negligence of dental hygienists in providing advice to patients. Ghasemiet al., reported at their study in Iran that dentists' knowledge of and attitudes towards prevention should be improved and updated to enable and encourage them to provide their patients with preventive care (26).

Concerning awareness of prevention methods. Adequate awareness is a necessary enabling factor for self-care which can prevent and/or control many oral diseases (27). The results showed moderate and awareness practice of prevention methods among participants. While Al-Ansari found that preventive methods is not prevalent among Saudi adults.

44.2% of the participants belief that using miswak obviates using toothbrush and toothpaste. When used properly, the miswak is reported to be as effective as a toothbrush (29,30).The mode of transmission of cariogenic bacteria appears to be contact, either direct or indirect. Direct contact is commonly by kissing, so that oral flora is transmitted in saliva; indirect contact occurs via objects such as a cup, utensils, toothbrush, or even shared toys, which are contaminated with cariogenic bacteria (31,32,33).In this study the vast majority believe that they can use another family member's brush in the case of losing theirs.

34% of the participants feel worried when visiting the dental clinic, this finding close to Al-Dosari who found that 35% with dental fear in KINGDOM OF SAUDI ARABIA (34). In Australia, High dental fear affects approximately one in six Australian adults (35).

Smoking is a risk factor for poor oral health and oral diseases (23).One of the reports published about smoking status in Saudi Arabia suggests a wide range for the prevalence of smoking (2.4–52.3%) (36). In the present study, 37.8%were found to be currently smoking. This value is on the higher side of the range mentioned. Oral and dental health care of non-smokers has been found to be better than that of smokers (37).A direct correlation was found to exist between oral hygiene practices and oral hygiene conditions associated with halitosis (38). 21% of the participants suffer any bad mouth smell.

**Conclusion:-**

Dental hygienists didn't their required duty at providing advices to their patients, and provide them with preventive methods to avoid oral diseases. The results showed moderate awareness and practice of prevention methods among adults in KINGDOM OF SAUDI ARABIA.

**Recommendations:-**

- Conduct training for dental hygienists about the importance of and how to provide preventive advice to patients.
- Study the cause of the failure of the dental hygienists, in turn, to provide preventive advice to patients.
- Need to increase the awareness of smoke-related problems and target the smokers group with smoke cessation programs.

Minimum Miscibility, Homogenous Pressure, Peng Robinson, Fluid Composition, Recovery

#### Abstract

The application of (CO<sub>2</sub>) miscible gas displacement at a minimum miscible pressure causes the reduction of fluid viscosity and lowers the interfacial tension between the reservoir fluid and injected gas thereby enhancing maximum fluid recovery at the time when the reservoir energy is stunted.

There are usually parameters that affect the minimum miscibility pressure (MMP) in such way that gas and reservoir fluids are mixed together in single homogeneous phase. These parameters as discussed herein are analyzed using PVTi, Eclipse 300 simulation software. The software utilized Peng-Robinson equation of state model (PR3) to create an injection environment and analyze necessary parameters that affect MMP.

The simulation results showed that MMP increases as temperature increases and decreases as reservoir fluid composition moves from light to heavy fluid. Observations also showed that MMP increases with increase in mole percent of injected gas (CO<sub>2</sub>). It is therefore important to effectively analyze and control parameters affecting MMP in order to achieve maximum recovery of reservoir fluid, dependent on operators' discretions.

#### Introduction:-

Several schemes are usually considered and or adopted to improve oil recovery from reservoirs at times when the primary energy of the reservoir can no longer support economic recovery. The term 'Enhanced Oil Recovery' principally refers to the recovery of oil by any method beyond the primary stage of oil production through processes that help to increase the primary reservoir drive. These processes may include pressure maintenance, injection of displacing fluids or other methods, such as thermal techniques. Therefore, by definition, EOR techniques include all methods that are used to increase the cumulative oil produced (oil recovery) as much as possible.

In immiscible gas injection, flooding by gas is conducted below MMP. This low pressure injection of gas is used to maintain reservoir pressure to prevent production cut-off, and thereby increase the rate of production. The combination of light crude, relatively high reservoir temperature and relatively low reservoir pressure favours immiscible gas injection.

In miscible gas injection, the gas is injected at or above MMP, which causes the gas to be miscible in the oil. This study focused more on the miscible gas injection (Carbon dioxide injection).

It is well known that the amount of GHG (greenhouse gases) especially CO<sub>2</sub> in the atmosphere has resulted in climate change and global warming which are big concerns for human comfort in recent years. There are number of ways to reduce the amount of CO<sub>2</sub> in the atmosphere, one of which is CO<sub>2</sub> geological sequestration in oil reservoirs. Researchers have discussed that this method cannot only minimize the concentration of CO<sub>2</sub> in the atmosphere, but can also improve additional oil recovery by CO<sub>2</sub> flooding as a method of Enhanced Oil Recovery.

The main mechanisms of oil recovery by CO<sub>2</sub> injection has been identified as;

- Reducing viscosity of oil
- Swelling the crude oil
- Lowering the interfacial tension between the oil and the CO<sub>2</sub>/Oil phase in the miscible regions
- It also produces miscibility since it has lower MMP and solubility process.

The basic parameter for determining if Carbon dioxide injection can be applied for an oil field is its minimum miscibility pressure (MMP) which can be estimated through computations and experiments such as slim-tube experiments, mixing-cell experiments, rising bubble/falling drop experiments, and vanishing interfacial tension experiments. The MMP is the lowest pressure for which a gas can develop miscibility through a multi-contact process with a given reservoir oil at the reservoir temperature. Miscibility can be either be in form of first contact miscibility (FCM) or multi contact miscibility (MCM). First contact miscibility (FCM) refers to the state when the fluids reach miscibility with the first contact between them; while MCM refers to the state which fluids reach miscibility after several contacts.

Gardner in 1981; Holm and Josendal in 1982; Harmon and Grigg in 1988; Turek in 1988; Creek and Sheffield in 1993 had established that MMP depends on the composition of the crude oil and injected gas, and temperature of the fluids. In 2012, Yan further noted that pressures higher than minimum miscibility pressure achieves recovery expected to reach 100% in microscopic scale.

#### **Study Objective:-**

- The study aimed at investigating the parameters that affect the lowest pressure (minimum miscibility pressure) which gas (CO<sub>2</sub>) will be miscible when injected into a reservoir fluid for optimum fluid recovery while using PVTi software/ platform.

#### **Scope of Study:-**

Reservoir fluid properties and phase was established on PVTi platform

#### **Research Approach:-**

Generally, the injection of gas into the reservoir results in an increased production. However different parameters affect the rate of miscibility of gas with oil such as reservoir fluid composition, injection gas composition, temperature, density of the reservoir fluid and C+ mole weight. In this study, these parameters were evaluated to determine its effects on MMP.

#### **Fluid Characterization and Generation of PVT Tables:-**

To obtain the PVT properties of different hydrocarbons, PVTi software based on Peng-Robinson Equation of State Model was used. Multiple Equation of State (EOS) models exist defining the pressure, temperature and volume (PVT) relationship of fluids but Peng-Robinson equation of state model generates MMP at multi-contact miscibility. The PVT data was added to the main simulator for injection study experiment, i.e., Eclipse 300 as the simulation software package then PVTi as sub program for carrying out injection study.

Different gas compositions were used to perform these simulations at a multi-contact test. For each gas composition the simulations were performed with a specific temperature to obtain the effects of gas composition and temperature variation on MMP.

Different pure hydrocarbons were also used to perform injection study simulations at multi-contact to obtain the effects of reservoir fluid variation.

**Injection of gas into Reservoir Fluid at Different Temperature:-**

Gas was injected into the reservoir fluid in a multi contact miscibility test at different temperature to obtain the effects of temperature on MMP.

The properties of CO<sub>2</sub> and the hydrocarbon used in this simulation are shown in Table 1.0 below at temperature of 500° k, 450° k, 400° k, 380° k, 350° k, 330° k, 300° k, 250° k, 200° k, 150° k and 144°

**Table 1.0:-** Reservoir Fluid and Injected Gas Composition.

COMPONENT	RESERVOIR FLUID (MOLE %)	INJECTION GAS (MOLE %)								
		M1	M2	M3	M4	M5	M6	M7	M8	M9
CO <sub>2</sub>	38	32	56.5	64.5	72	76	85	92	98.5	100
C <sub>1</sub>	26	29.8	19.6	9.2	12.8	5.5	6.3	2.1	0.2	0
C <sub>2</sub>	3	22.4	12.5	18.8	4.1	6.5	2.1	1.1	0.2	0
C <sub>3</sub>	3	12.6	2.2	4.3	4	3.5	1.1	2.4	0.1	0
C <sub>4</sub>	3	3.1	6.2	2	4.1	2.5	3.5	1.4	0.5	0
IC <sub>4</sub>	3	0.1	3	1.2	3	6	2	1	0.5	0
NC <sub>4</sub>	3	0	0	0	0	0	0	0	0	0
IC <sub>5</sub>	3	0	0	0	0	0	0	0	0	0
NC <sub>5</sub>	3	0	0	0	0	0	0	0	0	0
C <sub>6</sub>	3	0	0	0	0	0	0	0	0	0
C <sub>7+</sub>	15	0	0	0	0	0	0	0	0	0

From Table 2.0, it can be seen that all the gases were injected at the same reservoir fluid and the resultant density of fluid, mole weight of fluid and concentration of CO<sub>2</sub> were tabulated and plotted to check the effect of these parameters on MMP as will be shown in the result.

#### Different Reservoir Fluid Simulated at Constant temperature and Injection Gas:-

Different pure hydrocarbons also were used to perform injection test at multi-contact miscibility to obtain the effects of reservoir fluid variation at constant temperature of 550° k. See Tables 3.0 and 4.0 below.

**Table 3.0:-** First Reservoir Fluid and Injected Gas Composition at Temperature of 550° k.

COMPONENTS	RESERVOIR FLUID MOLE %	INJECTED GAS MOLE %
N <sub>2</sub>	3.42	0.2
CO <sub>2</sub>	0.62	98
C <sub>1</sub>	38.2	0.6
C <sub>2</sub>	18.2	0.1
C <sub>3</sub>	16.1	0.4
IC <sub>4</sub>	3.62	0.7
NC <sub>4</sub>	2.42	0
IC <sub>5</sub>	1.32	0
NC <sub>5</sub>	2.50	0
C <sub>6</sub>	1.50	0
C <sub>7+</sub>	12.1	0

**Table 4.0:-** Second Reservoir Fluid and Injected Gas Composition at Temperature of 550° k.

COMPONENTS	RESERVOIR FLUID MOLE %	INJECTED GAS MOLE %

C <sub>7+</sub>	12.1	14.64	18.95	0

#### Results and Analysis:-

After the simulation runs and considering its sensitivity nature to temperature, injected gas composition, reservoir fluid composition and C<sub>7+</sub> mole weight the results obtained are as shown below;

**Effects of Temperature:**

**Figure 1:-** The Effect of temperature on MMP

From the graph, at temperature below 144°k and above 500°k the MMP is equal to zero or cannot be determined. At temperature of 330°k MMP have its maximum value of 247.7751psia. This thereforeshows thattemperature has great effect on MMP and can be altered in order to increase or decrease MMP.

**Effects of Injected Gas Composition:**

**Figure 2:-** The Effect CO2 Composition on MMP

There is an observed sudden drop of MMP at 76% mole concentration of CO2 and continuous increase until 100% CO2 concentration. It implies that at 100% concentration of injected gas, highest value of MMP is achieved.

**Effects of Mole Weight and Density:**

**Figure 3:-** The Effect of Fluid Mole Weight and Density on MMP

From the graph it shows that fluid mole weight and density have low effect on MMP, as both parameter increases as MMP increases.

**Effects of Reservoir Fluid Composition:**

**Figure 4:-**Effects of Reservoir Fluid Composition on MMP

Reservoir fluid injected ranges from crude with C1 of 38.2 to 75.6 mole percent which implies heavy fluid to more volatile or light fluid. This implied therefore that lighter fluid has higher MMP than heavy crude. There will be higher CO<sub>2</sub> displacement in lighter fluid.

**Effects of C7+ Mole Weight:**

**Figure 5:-** The Effects of C7+ Mole Weight on MMP

Figure 6:- The Combined Effect of Mole Weight of Fluid, Density and Injected Gas

### Conclusion:-

From this study, it has been established that:-

- ❖ Temperature has high effect on the minimum miscibility during CO<sub>2</sub> injection
- ❖ Composition of the injected gas affects the MMP
- ❖ Composition of the reservoir fluid affects the MMP
- ❖ C<sub>7+</sub> mole weight affects the MMP
- ❖ Density and reservoir fluid mole weight have row effects on MMP

#### Abstract

The number of percutaneous coronary interventions (PCI) prior to coronary artery bypass grafting (CABG) increased drastically during the last decade. Patients are referred for CABG with more severe coronary pathology, which may influence postoperative outcome.

**Methodology:-**Outcomes of 200 CABG patients were compared (mean follow-up: 3 months). Group I (n = 100) underwent primary CABG and group II (n = 100) had prior PCI before CABG.

**Result:-** Morbidity, were significantly higher in patients with prior PCI but no difference in mortality. Postoperative echo emphasize lower benefit from CABG in patents coming with recurrence CAD post PCI.

**Conclusion:-** With the growing evidence that previous PCI adversely influences the outcome of subsequent CABG, we may expect that prior PCI emerges as a risk factor in new outcome prediction and risk stratification models in cardiac surgery

#### Introduction:-

With technological advances and changes in clinical practice, the respective values of coronary artery bypass surgery and percutaneous coronary intervention needed to be reassessed. The SYNTAX randomized trial is an attempt to provide an evidence base to determine the best treatment option for patients in a real-world population seen by the surgeon and the interventional cardiologist in their daily practice. (1)

The previous comparative studies clearly demonstrated that there was no difference between the two therapeutic modalities regarding mortality and non fatal myocardial infarction but patients treated with stenting whether bare metal stent or drug eluting stent required more often repeating revascularization procedures related to restenosis (2, 3).

It is supposed that patients with a previous PCI are at higher risk for CABG, however, only a few studies are available and contradictory: some authors suggest that initial PCI may complicate the operation and may increase postoperative morbidity and mortality. Others describe no difference in postoperative morbidity and mortality. (4).

The objective of this study is Comparing the outcome of patients who undergoes primary CABG and those who had primary PCI as first line of treatment before CABG and come back for CABG due to instent restenosis.

## Patients and Methods:-

Two hundred patients underwent CABG in the period between May, 2009 and January 2011 in NHI (National heart institute), they were prospectively divided to two groups, Group I ( non stent group) and Group II ( stent group), Our study was built on the guidelines of STS database and Euro score calculation. Group I (n = 100) and group II (n = 100,) with mean number of stents 1.98, 51% of them were Drug eluting stents (DES)). The mean time between PCI and CABG was  $11 \pm 9$  months.

Patients with single vessel disease, combined CABG with other procedure except treatment of ischemic Mitral incompetence, redo CABG and emergency CABG as well as patients after PCI due to dissection or tamponade were excluded from the study to avoid there un predicted effect on the outcome of CABG.

Patients were evaluated by history and physical examination, routine labs, ECG, Carotid Doppler and duplex, study of their coronary angiography SYNTAX score was calculated.

Operative data included OPCAB versus on pump, type of myocardial preservation on pump, time of aortic cross clamp and extra corporeal circulation time, number of grafts, arterial and venous grafts and total or incomplete revascularization.

Post operatively data were inotropic supports (dose and duration), use of IABP, ventilation time, Perioperative MI, reopening for bleeding, arrhythmias and its type, post operative organ failure, signs and symptoms of heart failure, superficial and deep wound infection including dehiscent sternum, ICU and Hospital stay, in addition to mortality. This was followed by echo pre-operative and 3 months post operative Echocardiographic examination was conducted using a Wingmed Vivid 9 echocardiography device (GE Medical System, Horten, Norway).

Statistical analysis ; was done by collecting the data, revising and verifying it then it was edited on PC. Data was analyzed by Microsoft Office 2003 (excel) and Statistical Package for Social Science (SPSS) version 10.

## Results:-

Extracardiac arteriopathy, preoperative planned valvular surgery (repair or replacement), in addition to CABG (4 vs 0. P value = 0.043) were higher in the first group while unplanned CABG {patient was not admitted for CABG but the decision was made in hospital in a hemodynamically stable patient} (0 vs 8. P value = 0.004) and Previous MI (25 vs 69. P value = 0.00001) were higher in the second group.

Preoperative Coronary angiography showed no statistical difference in number of patients with left main disease or number of diseased vessels. The old therapeutic CA was studied also and showed that mean number of stents was 1.98, 51% of them were DES. 30% of the PCI group had multiple interventions.

SYNTAX score was calculated for group II before therapeutic CA and before surgery for group I and II preoperatively. The mean SYNTAX score for group II before stent was 10.96 but it increased to be 18.77 preoperatively which was not significant when compared to group I which was 20.69. Group II before stent had 92% low score, 8% intermediate score and 0% high score while pre operatively 72% were only low score, 24% intermediate score and 4% have become high score. On the other hand group I had 63% low score, 29% intermediate score and 8% high score. **(Table 1).**

Total revascularization is significantly higher in the non PCI group, where 79 patients were totally revascularized compared to only 50 patients in group B (P value=0.00001). **(Table 2).**

In fact hospital stay was longer for group II ( $9.30 \pm 3.80$  days vs  $11.23 \pm 3.80$  days) (P value 0.000595). Total morbidity was significantly higher in the second group than the first group (40 vs. 66 P value=0.001).. Mortality rate was the same between the two groups (7 vs 6 P value=0.774). **(Table 3).**

On comparing between preoperative echo and the post operative echo of each patient there were statistical significance towards group I in all criteria which included improvement of dimensions, and EF **(Graph1).**

**Discussion:-**

The interventional efficacy and relative benefits have been compared in several randomized and observational studies. However, patients who undergo successful myocardial revascularization may subsequently require repeat invasive cardiological or surgical intervention. (5).

When a patient is eligible for both procedures, PCI is often preferred than surgery. The initial choice of PCI is reinforced by the perception that patients can safely be referred to surgery after PCI. (6). However in the *SYNTAX study*, 3-year MACCE rates were significantly higher for PCI than CABG; this was mainly driven by higher incidence of the need to repeat revascularization in the PCI arm, in addition to increase number of MI among patients of PCI group, compared to CABG (1,7).

Patients in the PCI group showed higher CCS classification which may signify more clinical deterioration and the more severity of the lesions in the arteries post stenting. Also this may be due to the closure of collateral circulation which close after PCI and don't have enough time to reopen during stent thrombosis or restenosis, especially with DES patients, this theory may also emphasize the cause of increase numbers of MI in the PCI group also which was the same as other relative studies. (8,9).

Although the PCI group has higher incidence of previous MI, yet there was no difference between the two groups in the recent MI (within 30 days) before surgery and this was reflected on equal percentage between the two groups in critical preoperative state, but the PCI group has higher number of patients who underwent unplanned CABG. This may be due to the fear of progression of the chest pain to MI in the PCI group which was not the condition with the non PCI group. This also may be due to coronary stents specially DES which are causing arterial wall injury, leading to dysfunctional and denuded coronary endothelium with chronic inflammatory response and platelet and neutrophil adhesion, which in turn are causing adverse cardiovascular events.(7)

The non PCI group in our study showed higher percentage of patients having extra cardiac arteriopathy, this finding may be related to the older age of the non PCI group. This doesn't coincide with other studies which showed no significant difference between both groups. (7, 9, 10, 11)

Regarding the **pre operative echo** it was found that although the preoperative ESD and EF showed no difference yet the EDD was higher in the second group which indicates that previous PCI may have a hidden effect on the myocardium which was noticed by higher incidence of previous MI in the same group. By further evaluation of the preoperative EF by dividing it into good (more than 50%), moderately impaired (30-50%) and severely impaired (less than 30%), no difference was found between the two groups. There was no difference in the preoperative resting segmental wall motion abnormality also. Other studies found no difference between PCI and non PCI group regarding the EF nor RSWMA, ESD, EDD. (12).

Angiographically, some studies exclude left main disease (13), but in the present study patients with left main stenosis more than 50% were equal in both groups as well as mean number of diseased vessels ( $3.34 \pm 0.52$  vs  $3.28 \pm 0.45$ ). This is due to the fact that the study includes only multivessel disease patients, however all PCI group patients with left main stenosis had their left main stenosis post PCI, usually during the first year.

In this study there is approximately equal percentage in group II for DES and BMS, where 51% of them were DES and 49% were BMS, The use of DES didn't expand the time for the patients before needing subsequent CABG ( $11 \pm 9$  months) but on the contrary its closure with acute thrombosis increased the number of MACCE in the PCI group preoperatively. (14)

The two groups were found uniform regarding the mean Euroscore, and mean SYNTAX score (20.69 VS. 18.77) but on comparing the SYNTAX score of group II before stent with preoperative score, we found that it was only 10.96, which was nearly half of its preoperative score. This finding denotes that previous PCI worsen the SYNTAX score preoperatively and hence worsen the vessel more. This could be the effect of the previous PCI or simply a progression of the native disease.

The mean number of distal anastomoses was significantly higher in group I ( $3.12 \pm 0.73$ ) than in the PCI group ( $2.46 \pm 0.85$ ) and it was higher also for venous grafts ( $1.89 \pm 0.7$  vs  $1.39 \pm 0.90$ ) and arterial grafts ( $1.24 \pm 0.54$  vs  $1.07 \pm 0.33$ ).

Strangely, although the mean number of diseased vessels was equal preoperatively, the number of grafted vessels was higher in the non PCI group, this is due to higher number of non graftable vessels in the PCI group. This was also found in other comparative studies. (2).

These non graftable vessels are due to either propagation of post stent thrombosis to occlude the vessel totally, which is more common, or due to the propagation of atherosclerosis in previously diseased vessel left without intervention (less common). This made the anastomosis more challenging and risky for the surgeon. But it doesn't affect the choice of the surgical technique as OPCAB was equally used in both groups the same as other studies (15).

In spite the higher numbers of distal anastomoses in group I, There were no statistical difference between the two groups in the ACC time (69.49 minutes  $\pm$  24. vs 61.81 minutes  $\pm$  28.40) nor CPB time (102.07 minutes  $\pm$  29.79 vs. 91.47 minutes  $\pm$  41.49). This may be explained by the less maneuvers done on the vessels in group I such as endarterectomy and/or on lay patch anastomoses due to better target vessels as we noticed. (16).

Postoperative inotropes were found to be used more with the previous PCI group rather than group I, however for IABP usage, it was the same in both groups. The higher usage of inotropic support may be related to the lower incidence of total revascularization, higher preoperative EDD and higher incidence of preoperative MI. Other studies showed higher use of both inotropic support and IABP as well. (6, 10)

Overall morbidity was very high in the second group as other studies. (6, 9, 12, 13), the reasons for a higher post operative morbidity in the prior PCI group are not clearly understood however the PCI group patients were presented for surgery with more advanced symptoms and greater urgency. On further analysis of morbidity, the PCI group showed higher incidence of re-exploration, superficial and deep wound infection, but other postoperative parameters were the same in both groups.

Reopening for bleeding was due to the more number of unplanned CABG in group II, with continuous use of clopidogrel for long time preoperative (and till the operation in case of emergency operation). In the PCI group,

asprin was not discontinued until the morning of the operation as a precaution against total stent occlusion and perioperative MI (specially that 51% was DES).

The total hospital stay was longer for the PCI group but the ICU stay was not different. This was the contrary with other studies which had longer ICU stay but same hospital stay for group B. (9). The difference in the hospital stay in this study was due to the difference of the morbidity specially wound infection which prolong the hospital but doesn't affect ICU stay, but on the other hand mortality was almost the same between both groups and all of them were in hospital mortality (7 vs. 6). Other studies had the same results (14) while others stated that PCI group had higher mortality. (16, 17).

All the patients of the study were subjected to follow up for 3 months after the operation. During this period no MACCE happened for any patient of both groups, at the end of this period a postoperative echo was made.

We found that the non PCI group was better than the PCI group in all criteria which included improvement of dimensions, RSWMA.

#### **Study limitations:-**

The number of enrolled patients limits the explanatory power of our study. Selection of patients for both groups may introduce an underlying bias. We could not elaborate on the factors influencing the surgeons' decisions for number of grafts or conduit selection. It is plausible to study the long term outcome to complete the results of short term outcome.

Although focussing on the SYNTAX score give us better understanding for the severity of the coronary pathology, analysis of the types of the stents, methods of deployment may give more insight on the impact of PCI on subsequent CABG.

#### **Conclusion:-**

Patients with prior PCI presented for CABG with more severe CAD as evidenced by higher CCS classification score, higher incidence of previous MI, unplanned CABG, and higher mean EDD.

With the growing evidence that previous PCI adversely influences the outcome of subsequent CABG, we may expect that prior PCI emerges as a risk factor in new outcome prediction and risk stratification models in cardiac surgery.

#### **Recommendations:-**

Percutaneous Coronary revascularization should be carefully considered against the higher risk it provides for subsequent CABG. The guidelines for intervention should be strictly followed especially in patients with complex coronary lesions who have higher incidence to be referred for CABG.

Surgical scoring systems as EURO score should include an item for previous PCI especially if multiple as one of the factors that increases the risk of subsequent CABG.

#### Abstract

Diabetes mellitus is a major health problem for the people of the world. Diabetes is a chronic metabolic disorder resulting from a variable interaction of hereditary and environmental factors and it is characterized by abnormal insulin secretion or insulin receptor affecting  $\beta$  cells of pancreas. It is associated with a number of chronic complications including nephropathy, neuropathy, retinopathy and cardiovascular diseases. Diabetes mellitus affects a large number of people throughout the world and India also. Experts estimate that diabetic population will grow from 195 to 360 million by 2030 almost 4.5 percentage of the global population. Present study included histological and biochemical parameters of mice. Three groups of mice were prepared for comparative study on control, diabetic, and *N. sativa*. Diabetic models were prepared in mice by intraperitoneal administration of single dose of alloxan@120mg/kg b.w. Alcoholic extract of *Nigella sativa* was administered @100 mg/kg b.w/day for four and eight weeks. In diabetic group of mice glucose, creatinine, urea and SGPT were increased. Effective restoration was observed in glucose, SGPT, urea and creatinine of *N. sativa* administered diabetic group of mice. Liver also shows effective restoration in *N. sativa* administered group of mice. Thus, it is concluded from study that alcoholic extract of *N. sativa* restores glucose level to normal. *Nigella sativa* acts effectively on diabetes mice on biochemical and histological parameters.

#### Introduction:-

Incidence of diabetes is increasing worldwide at an alarming rate. Diabetes is on a rapid rise in developing nations<sup>1</sup>. People suffering with diabetes is projected to rise from 171 million in 2000 to 366 million in 2030<sup>2</sup>. The past two decades have seen an explosive increase in the number of people diagnosed with diabetes worldwide<sup>3</sup>. The World Health Organization has predicted that the diabetic patients will occur in the developing countries and increase 42% in the developed countries and 170% increase in the developing countries. The countries with the largest number of diabetes patients are India, China and United States<sup>4</sup>.

India has the largest number of people with diabetes in the world. Diabetes is a group of common metabolic disorders that share the phenotype of hyperglycemia<sup>5</sup>. Diabetic hyperglycaemia indicate that plasma levels of urea

and creatinine which are considered as perfect markers of renal dysfunction<sup>6</sup>. Adults with DM have cardiovascular disease death rates that are 2–3 times higher than adults without DM<sup>7</sup>.

Medicinal plants used in India has been practiced for more than 5,000 years. Medicinal plants used for prevention of disease, rejuvenation of our body systems, and extension of life span through lifestyle and natural therapies<sup>8</sup>. According to the WHO, over 80% of the world's population relies on traditional forms of medicine, largely plant based to meet primary health care needs.

*Nigella sativa* has been used for medicinal purposes for centuries *N. sativa* traditionally used for a variety of conditions and treatments related to respiratory health, stomach and intestinal health, kidney and liver function, circulatory and immune system<sup>9</sup>. *Nigella sativa* possess biological, pharmacological and biochemical actions, including antibacterial bronchodilator and anti-parasitic<sup>10</sup>. *Nigella sativa* oil has the ability to protect testis against oxidative stress possibly through antioxidant effects of its bioactive compounds<sup>11</sup>. After the treatment of *Nigella* which decreases the elevated lipid peroxidation, liver enzyme levels and increases the reduced antioxidant enzyme levels<sup>12</sup>. *Nigella* oils has gastro protective activity against gastric mucosal injury<sup>13</sup>.

Present study is designed to evaluate effect of *Nigella sativa* on histological and biochemical parameters of liver in diabetic mice.

### Materials and Methods:-

**Animals:** - The mice (*Mus musculus*) were reared in animal house. The mice were selected for the study was 12 weeks old with  $30 \pm 2$  gm body weight (b.w). The mice were housed at controlled environmental conditions  $22 \pm 2^\circ\text{C}$ , relative humidity  $50 \pm 10\%$ , and 12h dark-light cycle. All experimental were conducted as per the guidelines of CPCSEA (Committee for the Purpose of Control and Supervision of Experiments on Animals).

**Chemicals:** - Alloxan, purchased by Loba chem Pvt. Ltd., Mumbai was utilized for the experimental design.

**Medicinal plant used:** - Alcoholic seed extract of *Nigella sativa* is orally administered to diabetic group of mice. Fresh seed of *Nigella sativa* was purchased from herbal store in Patna, India.

**Study groups & sampling:-** The control group of six mice received distilled water orally. The 'treatment' groups (n=6) received alloxan 120 mg/kg b.w by intra-peritoneal method for diabetic model preparation. *Nigella sativa* (100 mg/kg/b.w/day) administered to diabetic mice orally through Gavage method. Mice were sacrificed after the scheduled treatment. Serum was collected for SGPT, glucose, creatinine and urea estimation. The Liver from all the mice were removed and washed three times in isotonic saline (0.85 v/w %) and fixed in neutral formalin for Light Microscope (LM) study.

### Results:-

Fasting level of glucose was observed in every group of mice. Level of glucose in control group was  $99.00 \pm 2.30$  mg/dl. In diabetic group it was  $201.3 \pm 12.55$  mg/dl. While it was  $135.0 \pm 3.46$  mg/dl and  $106.3 \pm 2.18$  mg/dl in *Nigella sativa* 4 weeks and 8 weeks administered group of mice (Graph: I).

Serum Glutamate-Pyruvate Transaminase (S.G.P.T) level in control group of animal was  $22.00 \pm 3.21$  U/ml. Diabetic group of mice S.G.P.T level was  $312.3 \pm 4.09$  U/ml. While it was  $255.0 \pm 3.78$  and  $192.3 \pm 7.44$  U/ml in *Nigella sativa* four weeks and eight weeks administered group of mice (Graph: II).

Level of Creatinine in control group of mice was  $0.74 \pm 0.06$  mg%. In group of diabetic mice creatinine level was  $1.97 \pm 0.04$  mg%. Creatinine level was  $1.71 \pm 0.01$  and  $1.42 \pm 0.02$  mg% in *Nigella sativa* four weeks and eight weeks administered group of mice (Graph: III).

Urea value in control group of mice was  $20.33 \pm 2.33$  mg/dl. While in diabetic group of mice was  $46.73 \pm 0.079$  mg/dl. Urea level was  $39.37 \pm 0.33$  and  $32.40 \pm 1.29$  mg/dl in *Nigella sativa* four weeks and eight weeks administered group of mice (Graph: IV).

In control group of mice, well-organized hepatic cells were observed. Distinct cytoplasmic and nuclear material was also observed. Central vein was well organized with its intact cell wall (Figure: 1). Liver of diabetic mice shows vacuolization. Clustered and multilobed nuclei were observed. Degenerated cytoplasmic materials were observed. Clustered nuclei were also shows on periphery on central vein (Figure: 2). Diabetic mice followed by four weeks of *Nigella sativa* administration shows vacuolization in hepatic cells. Clustered nuclei were shows in hepatic cells. Many vacuolated spaces were observed with degenerated central vein (Figure:3). Diabetic mice followed by 8 weeks of *Nigella sativa* administration shows restoration in nuclear material were observed to least extend. Restored cytoplasm was observed in liver cells. Least vacuolization were also observed (Figure: 4).

**Graph - I: Glucose level in serum of mice**

**Graph - II: SGPT level in serum of mice**

**Graph - III: Creatinine level in serum of mice**

**Graph - IV: Urea level in serum of mice**

**Figure 1:-** In control group of mice well organized hepatic cells were observed. Distinct cytoplasmic and nuclear material was also observed. Central vein was well organized with its intact cell wall. X 600.

**Figure 2:-** Liver of diabetic mice shows frequent vacuolization. Clustered and multilobed nuclei were observed. Degenerated cytoplasmic materials and Clustered nuclei were also observed on periphery on central vein. X 200.

**Figure 3:-** -Liver of diabetic mice followed by four weeks shows degenerated hepatic cell. Many vacuolated spaces were observed degenerated cytoplasm. Fragmented nuclear materials were observed. Vacuolization were also observed nuclear material of liver cells. X 600.

**Figure 4:-** Liver of diabetic mice followed by eight weeks of *N.sativa* administration shows many vacuolated spaces with degenerated nuclei of hepatic cells. Multilobed and vacuolated nuclear materials were observed. Central vein was also observed in degenerated condition. X 200.

### Discussions:-

Diabetic hyperglycemias induce certain biochemical parameter such as increased blood urea production in diabetes by enhancing catabolism of liver & plasma protein. Recent scientific investigations have also confirmed the efficacy of plant preparations, few of which are most effective against diabetes<sup>14</sup>. In diabetes, Oxidative stress was thought to be a result of free radicals generated during autoxidation of glucose<sup>15</sup>. In diabetes blood urea level increases & reason behind this is due to increased catabolism of both liver & plasma proteins. This elevation of plasma level of urea & creatinine is marker of renal dysfunction<sup>16</sup>. In our study we have observed in urea and creatinine level about threefold increases in diabetic group of mice.

Another study based on carbon tetrachloride induced rats has shown that CCl<sub>4</sub> treatment increased the lipid peroxidation and liver enzymes, and decreased the antioxidant enzyme levels and furthermore, *Nigella sativa* treatment decreased the elevated lipid peroxidation, liver enzyme levels and increased the reduced antioxidant enzyme levels<sup>17</sup>. In present study S.G.P.T increases 13 folds in diabetic group of mice. Hepatic cells were observed in degenerated condition with elongated and fragmented nuclear material. Many vacuolated spaces were also observed in cytoplasm of hepatic cells in diabetic group of mice.

NS alcoholic extract maintained the levels of AST, ALT and ALP close to normal against D -Galactosamine induced toxicity<sup>18</sup>. In present study *Nigella sativa* causes effective restoration in urea and creatinine level. S.G.P.T. level was restored effectively in *N. sativa* administered group of mice.

*Nigella sativa* causes effective restoration in malathion induced increases in AST, ALT, and lipid peroxidation. *Nigella sativa* also improvement role in liver function tests, lipid peroxidation, and antioxidant enzymes alteration induced by malathion<sup>19</sup>. *Nigella sativa* administered group of mice shows effective restoration in SGPT level up to normal. NS showed hepatoprotective effects against isoniazid induced hepatotoxicity in rabbits and there are no histopathological or biological abnormalities were observed<sup>20</sup>. *Nigella sativa* is efficient cytoprotective against CCl<sub>4</sub>-induced hepatotoxicity, possibly via inhibition of the production of oxygen free radicals that cause lipid peroxidation<sup>21</sup>. In present study *Nigella sativa* causes restoration in hepatic cells. Central veins and sinusoids were also restored effectively. Restoration is observed in both cytoplasmic and nuclear material.

### Conclusions:-

It is concluded from study that *N. sativa* acts effectively on SGPT level. Urea, uric acid and creatinine level were almost normal after *N. sativa* administration. It maintains normal morphology of hepatic cells with least vacuolization. *Nigella sativa* is effective cytoprotective agent on hepatocyte of diabetic mice as well as maintains biochemical parameters to normal level. It is evident from study that *Nigella sativa* acts well against diabetes.

#### **Abstract**

Urban Indian cities are facing a water crisis due to loss of watershed, increasing pollution levels, deteriorating water balance, encroachment, illegal constructions and a dire lack of groundwater recharge. Although there are sufficient polices and acts for protection and restoration of water bodies they remain insufficient and ineffective in the face of such complexities. To meet the rising demand for water augmenting and improving the health of water bodies is of utmost importance. Revival and rejuvenation of water bodies in cities is especially important from a public health perspective as they provide various ecosystem services that are required to manage microclimate, biodiversity and nutrient cycling. This paper looks at Najafgarh Lake, in South-West Delhi that occupied more than 300 km<sup>2</sup> in the 1960s and was a biodiversity hotspot. Currently it stands as a topographical depression brimming with overgrown grass and garbage. The lake's disappearance has stolen a chunk of Delhi's culture and its use as a dumping ground has raised health concerns for the local population. This can be countered by rejuvenating the Najafgarh Lake through rainwater harvesting and bio-intensive farming. Most of Delhi's precipitation falls during the monsoon in July and August and can be harvested using simple, locally adoptable and eco-friendly low-cost technologies such as creation of ponds. Implementation of community water management schemes with maximum people's participation is crucial to mitigate the ill effects of drought and urbanisation. Similar studies across India and the world lay precedent for such practices and can ameliorate the water shortages faced at a micro level.

#### **Introduction:-**

Urban Indian cities are facing a water crisis due to loss of watershed, increasing levels of pollution, deteriorating water balance, lowering of water table and a dire lack of groundwater recharge(Singh, 2012). Such issues have become a great concern in the Indian context which motivated the Indian Government's Twelfth Five Year Plan to launch a completely revamped programme on Repair, Renovation and Restoration (RRR) of water bodies(Shah, 2013).

**Corresponding Author:-Paridhi Rustogi.**

Address:-Department of Environmental Engineering, Delhi Technological University  
(Formerly Delhi College of Engineering), New Delhi 110042, India,

Water determines the full potential of any country (Samuel & Mathew, 1997). Optimum development and efficient utilization of water resources becomes paramount in a country like India which has an ever-rising populace and a seemingly insatiable water demand. The biodiversity of lake and pond ecosystems is increasingly threatened by anthropogenic activities – may it be due to industrialization by-products, pollution or urbanization (Christer & Hansson, 2002); which poses the question can development and sustainability coexist?

In 2001, the Honourable Court ordered a field survey to be conducted by INTACH in association with the several government agencies enjoying jurisdiction over the various water bodies of Delhi. The survey established that there were 508 water bodies in Delhi. Other surveys carried out by Government of National Capital Territory of Delhi (GNCTD) placed the number of water bodies at 629 and by Tapas along with Court Commissioner at over 900 (Govt. of NCT of Delhi, 2013).

The major issues faced by water bodies in the National Capital Territory (NCT) of Delhi are lack of action plans, encroachments and violations of laws, solid waste deposit and polluted water (Govt. of NCT of Delhi, 2013). Through an intensive revival strategy, these water bodies can be brought back to health. Further, through improvement of water quality and groundwater recharge using rainwater harvesting the native ecosystems of the area can be reestablished over time which is crucial for provision of ecosystem services and for the biodiversity of the area (Singh, 2012).

### **Literature Review:-**

Delhi has several surviving ancient structures like baolis (stepwells), small check dams and tanks that display the traditional wisdom of storing water where it falls. These days households are supplied water through technological networks leading to the decline of the old water storage structures (Roy, 2016). These facts when viewed along with a decrease in availability of water resources point to a systemic flaw that can be tackled in a manner of ways.

To ensure sufficient water its uses like municipal, industrial, and agricultural must be integrated into the overall water management of any region. Sustainability, public health, environmental protection, and economics are key factors of consideration. Further, increased storage of water in aquifers via artificial recharge is necessary to save water in times of water surplus for use in times of water shortage (Bouwer, 2002). The above information helps formulate an appropriate solution for Delhi's current scenario – by integrating traditional knowledge into the overall water management of the city.

### **Rainwater Harvesting:-**

Rainwater harvesting essentially means harvesting and storing water in days of abundance for use in lean days. Storing of rainwater can be done in two ways; (i) storing in an artificial storage and (ii) in the soil media as groundwater (Samuel & Mathew, 1997). Rainwater harvesting can be implemented as a viable alternative to conventional water supply or on-farm irrigation projects since any land anywhere can be used to harvest rainwater.

Water demand has increased tremendously globally and water bodies like ponds and lakes are reliable and economical solutions to provide water and provide ecosystem services - benefits people obtain from ecosystems like access to food and water; flood and disease control; cultural services such as spiritual, recreational, and cultural benefits; and supporting services such as nutrient cycling, that maintain living conditions on Earth (Alcamo & Bennett, 2003).

Further, ponds are reliable mechanisms to store water underground via artificial recharge of groundwater (Bouwer, 2002). Rainwater harvesting besides helping to meet the increasing demand for water, helps to reduce surface runoff, avoid flooding of roads, reduces groundwater pollution, improves quality of groundwater and reduces soil erosion (Ngaachan, 2005).

### **Rainwater Harvesting in India:-**

The practice of rainwater harvesting and reusing the stored water for domestic purpose has been prevalent in India since ancient times (Ministry of Water Resources, 2013; Samuel & Mathew, 1997). Historically in India, settlements grew around temples, and over time temples and tanks became nearly inseparable. Evidence of tank irrigation in Tamil Nadu dates back to the Sangam period of 150 BC to 200 AD, and by the early medieval period (750–1300), tank irrigation was thriving throughout the region (Van Meter, Basu, Tate, & Wyckoff, 2014).

Efficient management of water in traditional farming systems like Kattas and Surangams in North Kerala and Karnataka, Zabo system of Nagaland and Bamboo drip irrigation of Meghalaya and Apatani valley in Arunachal Pradesh can be found all through India (Narain & Agarwal, 1997), where rainwater harvesting and water resource management has been an integral part of communities since centuries.

Usage of rainwater harvesting in recent times in areas like North East India (Ngaachan, 2005) and Kerala (Samuel & Mathew, 1997) have shown immense potential for its applications in other parts of the country and proven its importance in ecosystem revival (Armar-Klemesu, 2000). In fact, rainwater harvesting in South Asia differs from the rest of the world as it has a history of continuous practice for at least the last 8000 years (Pandey, Gupta, & Anderson, 2003). Further an integrated perspective of traditional knowledge on adaptation strategies, such as the rainwater harvesting system is particularly useful to comprehend vulnerability and adaptation to environmental stresses at the local scale, which makes it appropriate for wide application in NCT of Delhi, which is an ecologically sensitive area.

Further, rainwater harvesting and storage are important mechanisms for adapting to climate change and are in use in parts of Africa that are currently experiencing high variability of rainfall (Boelee et al., 2013). Climate change stands to affect India adversely in the coming years due to our sizable population and rising demand for resources and hence revival and rejuvenation of water bodies in Indian cities is crucial.

#### **Rainwater Harvesting Potential of Delhi:-**

Delhi's groundwater occurs in confined and semi-confined conditions, with depths varying from 1 - 10 m below ground level (Jain, 2009). The average annual rainfall is approximately 714 mm (Kumar et al., 2015). However, recharge of ground water is limited due to decreased availability of permeable surfaces owing to urbanization and runoff diversion. As of 2011, the annual rainwater harvesting potential has been assessed at 900 billion liters per day (Jain, 2009).

The water consumption in Delhi has been rising over the past few years (Planning Department at Government of NCT of Delhi, 2011) and this can be associated with a rise in the population of the area. Of the 47.0% growth in population in Delhi between 1991-2001 migration constituted 18.7% (Census of India 2001, 2001) and this trend has been noted to continue as Delhi's population has been rising since. Increase in population places pressure on Delhi's natural resources and necessitates a strategy to provide more water storage.

**Table 1:-** Water Supply of NCT of Delhi (Source: Planning Department at Government of NCT of Delhi, 2012)

S. No.	Water Supply	2008 - 09	2009 - 10	2010 - 11	2011 - 12
1	Water Consumption (lakh K L)	13257	13671	15012	17220
1. a)	Domestic	11997	12413	13754	16242
1. b)	Commercial/Industrial	1260	1258	1258	978
2	Per capita consumption of water (L/day)	189	189	189	193

#### **Water Bodies of NCT of Delhi:-**

A large number of the traditional water bodies in the form of ponds, lakes, etc. have been encroached or have otherwise become defunct in the national capital (Jain, 2009). Between 1998 and 2009, 22.26 km<sup>2</sup> of Delhi's wetlands were lost (Singh, 2012), which intimately support the survival of water bodies. As of 2013, of the 1011 known water bodies across 10 districts, only 971 could be traced. 40 have been lost. South West Delhi, the area where Najafgarh lake used to be was found to have majority of the water bodies that could be traced – 264 in all. 35.8% water bodies were found to be dry, while 17.8% were found to be encroached, of which 58.3% were fully encroached. 12.4% were built upon, where one-third were illegal built upon (Govt. of NCT of Delhi, 2013).

Pilot projects in the region to revive water bodies have been tested, such as DDA-INTACH Project which was started in 2003 where New Delhi based non-governmental organization (NGO) Indian National Trust for Art & Cultural Heritage (INTACH), along with the Delhi Development Authority (DDA), which controls most of urban governance in the city, came up with a plan to revive HauzKhas Lake with treated sewage water. Treated water was taken from a nearby Sewage Treatment Plant (STP), cleaned further through biological processes, and was transported to the dry lake (Roy, 2016).

Field visits yielded the following observations: the project scored well on all three fronts viz. economic, environmental and social but there was scope for improvement particularly on the social front for which it was recommended that there should be better publicity of the environmental benefits of the project and enhancing environmental awareness, especially among the local community.

**Table 2:-** Distribution of the water bodies of NCT of Delhi (Source: Delhi Parks & Gardens Society, Department of Environment, Govt. of NCT of Delhi, 2013)

S.No.	District	Traceable	%	Non-Traceable	Total	%
1	East	50	5.15	3	53	5.24

### Najafgarh Lake:-

Despite a mention in the Delhi Gazetteer of 1883 and the Survey of India Map of 1911, currently the Delhi Government says that the Najafgarh Lake (Lat. 28°36'38.67"N, Long. 76°59'12.18"E, Alt. 216 m) no longer exists in Delhi. Prior to its draining post 1960s, Najafgarh Lake in South-West Delhi occupied more than 300 km<sup>2</sup> and was a biodiversity hotspot, home to various water birds and local wildlife. The fact that a vast lake ever existed here in the region came as a surprise to most residents of the area and the need for resurrecting it is not a popular topic of discussion.

**Fig. 1:-** Najafgarh Lake in Delhi (Map)

**Fig. 2:-** Status of Najafgarh Lake, as of 2016

### Status of Najafgarh Lake:-

Currently the lake stands as a topographical depression brimming with overgrown grass and garbage. As of 2015, the erstwhile lake like many other traditional water bodies has been removed off Delhi's map instead of reviving them (Jain, 2009). The lake's disappearance has stolen a chunk of Delhi's culture and its use as a dumping ground has raised health concerns for the local population who are migrants from neighbouring states of Delhi.

The land owned by Delhi Development Authority (DDA) has been loaned to the Government Girls Senior Secondary School (II) in Dharampura with intentions to convert it into a park. Despite erection of benches and swings and placement of a fence around the area the land suffers from poor maintenance. Pollution is rampant in the area and Najafgarh drain previously known as Sahibi River with its origination near Najafgarh lake is now one of the most polluting sources contributing the death of river Yamuna (Ratnani, Gurjar, Suruchi, & Manish, 2015).

Before introduction of the sewerage system, the lake used to be the outlet for the local communities' sewage. After the nearby area became connected to the sewerage system, the lake fell into disuse. Lowering of ground water table, encroachment and concrete constructions have led to the lake drying up due to absence of proper water resource planning and scientific management by involved authorities. Residents reported presence of fish up to 10 years back and placed the drying of the lake 5 years hence.

### Strategy for Rejuvenation of Najafgarh Lake:-

Rejuvenation of Najafgarh Lake will help accomplish the following objectives:

1. Environmental Education and Awareness: This effective management method is increasingly popular in conserving pond environments in urban areas (Christer & Hansson, 2002) and is essential to keep the lake protected after the revival and rejuvenation processes get completed. The project will help educate the local populace of the need to conserve existing water bodies.
2. Creation of a pond through rainwater harvesting (Ngaachan, 2005): Ponds can be created in a cost-effective manner and don't require a sizable initial investment. They play an important role in providing ecosystem services and help improve the life quality of residents around them.
3. Revival of the area's original wetland ecosystem through set-up of bio-intensive beds to help the growth of indigenous plants and trees: Local plants take easily to an area and do not require a lot of maintenance which makes them ideal for cultivation. They also help in improving the water and air quality of the area where they are planted (Gottschall, Boutin, Crolla, Kinsley, & Champagne, 2007).

The protection of the area can be accomplished by creating a water council. People's participation which focuses on the revival of traditional drainage systems, banning of construction activity and prevention of wastes entering the compound will help ensure the area remains protected (Griffin, 1999). Clear definition of the roles and responsibilities of the people in-charge and the maximization of people participation has been identified as one of the solutions to tackle institutional impediments to effective basin governance management with context to the Tonle Sap Lake in Cambodia and can also be implemented in this region (Sokhem & Sunada, 2006).

### Strategy and its Amenability to the area:-

Rainwater harvesting is considered an ideal solution to tackle water problems where there is inadequate groundwater supply or where surface resources are not sufficient as in the case of NCT of Delhi (Samuel & Mathew, 1997). The rainwater collected from the site was found to be bacteriologically pure and free from organic matter, as per the Drinking Water Standards followed in India (Bureau of Indian Standards, 2012).

Analysis of the water sample collected from site showed that it was nearly neutral and had TDS slightly above the permissible drinking quality limit of 500 mg/l. Other water parameters showed that the rainwater was amenable for harvesting and can be used for revival and rejuvenation of the lake without a lot of treatment.

**Table 3:-** Water Quality Parameters for Water Sample

S. No.	Water Quality Parameters	Trial 1	Trial 2	Trial 3	Mean	Standard
1	Electrical Conductivity ( $\mu$ S)	828	823	795	<b>815.33</b>	-
2	pH	7.31	7.33	7.33	<b>7.32</b>	<b>6.5 – 8.5</b>
4	Total Dissolved Solids (mg/l)	520	536	536	<b>530.67</b>	<b>500</b>
5	Dissolved Oxygen (ppm)	0	0	0	<b>0</b>	-

Date of Sampling: 20.05.2016

### Methodology:-

The amount of runoff that can be expected annually from a given watershed depends on many interrelated factors such as relief, soil infiltration, plant cover, and surface storage which can be identified after further research into the characteristics of the area. Site selection is a pre-requisite for creating a pond and the preexisting depression will be ideal for pond creation as maximum storage volume can be obtained with least amount of earth fill (United States Department of Agriculture, 1997). This also ensures maximum economy.

The methodology to prepare the area consists of three stages. The first stage focuses on preparing the site for the creation of the pond and the wetland development around the area. To do so the area needs to be cleared of the

garbage, the grasses need to be removed and the depression needs to be dug out in a uniform manner. Channels for the drainage system need to be set in the area after which the pond can be created.

The second stage focuses on the creation of the pond, for which the pond's boundary needs to be clearly demarcated and liners need to be laid on the bottom surface to limit the percolation losses. Connections between households around the area and the inlet of the pond need to be constructed. Further, recharge trenches around the pond need to be set up to recharge the ground water level of the area. The final stage will be the development of the wetland area around the pond for which bio-intensive beds can be used. Carefully selected native trees and plants can be planted, as they will help revive the area's biodiversity.

#### **Budget Plan:-**

The running, operation and maintenance costs of such a project are minimal. Once the initial construction is carried out, the pond ecosystem sustains itself through natural nutrient and water cycling (Gottschall et al., 2007). The costs associated with various rejuvenation components like digging and clearing the area, the pond construction, set up of the bio-intensive farm, awareness and education tools and the creation of the drainage system along with the rooftop piping are not cost-intensive as established through market analysis. The ecosystem services that this project will provide for the given area include cultural, recreational and environmental benefits such as water regulation, improvement in the water quality, etc. Further, such a project includes intangible benefits, which cannot only be viewed only from a monetary perspective. Therefore, the benefits of this project would far exceed the cost when viewed holistically.

**Table 4:-**Ecosystem Services Valuation (Source: The Value of the World's Ecosystem Services and Natural Capital, R.Constanza, 1997)

<b>Cost (INR) by Market Analysis</b>		<b>Benefit (INR)</b>	
Digging and Clearing Area	85,500	Ecological Services provided each year -Cultural -Recreation -Habitat -Water Supply -Water Regulation, etc.	9,38,159.26
Construction of Pond	60,000		
Bio-intensive Farm	10,000		
Awareness and Education Tools	15,000		
Drainage System + Rooftop Piping	1,50,000		
<b>Total Costs</b>	<b>(-)3,20,500</b>		<b>(+)9,38,159.26</b>

#### **Conclusion:-**

As new environmental threats are predicted to become threats to all freshwater systems, it is necessary to augment the water quantity available in urban cities through natural methods like rainwater harvesting. For a model like this to work, it is crucial for local people to collaborate with other stakeholders to successfully utilise resources and ensure the protection and conservation of green and blue spaces in cities. Further, implementation of integrated water resource management strategies are essential to maintain, augment and manage India's water resources. Reviving the Najafgarh Lake and rejuvenating it will help shape the future of the NCT of Delhi. Usage of rainwater harvesting to rejuvenate erstwhile waterbodies is unique as it not only recharges groundwater but also aids in enhancing the habitat and ecosystem of the area. Water bodies sustain all kinds of life forms and a project like this can be a medium through which the general populace can be educated about the need to revive water bodies. Such initiatives are easy to plan and implement and can spark an environmental revolution in urban cities which is the need of the hour.

Nanotechnology, Epirubicin, cancer,  
 Breast cancer, nanoparticle, multi wall  
 carbon nanotubes.

#### Abstract

**Background:** According to Breast Cancer Screening Programs in 26 Countries, 19.0% of females have breast cancer. The aim of our study is assessing the role of nanotechnology in breast cancer therapy. Epirubicin drug was selected as an example of the pharmaceutical nanosystem.

**Method:** A cross sectional study was conducted among 300 women in Taif city and the data were collected using a self-administered questionnaire. The questionnaire determines the knowledge of risk factors and the disease stages (breast cancer). The patients also interviewed to determine the duration, the response and the feeling of any harmful symptoms after using of Epirubicin in the therapy. The answers were scored; frequencies and percentages were used for describing data. Chi-square test and a P value of (0.05) were used to determine the significant association between the participants' variables.

**Results:** Most patients respondents were between 21 to above 70 years old. About 28.1% breast cancer patients discover the disease by the chance, while 46.9% by self-examination. 43.75% of breast cancer patients use Epirubicin drug. The effectiveness of therapy takes about 3 -9 months. 15.6% only have a serious common side effect and 18.7% have any side effect. Therefore the number of patients who accepted the therapy by Epirubicin was 78.6%

**Conclusion:** Participants had poor knowledge about the disease and management. Using Epirubicin had a good attitude in managing time and compliance of the disease. The nanoparticle system presented in Epirubicin drug considers the solving of most common patient incompliance.

#### Introduction:-

The body is made up of trillion of living cells. Normal body cells grow, divide to make new cells, and die in an orderly way (apoptosis). During the early years of person's life, normal cells divide fast to allow the person to grow. After the person becomes an adult, most cells divide only to replace worn-out or dying cells or to repair injuries<sup>(1)</sup>.

When an abnormal cell growth occurs with the potential to invade or spread to other parts of the body these cells are called cancerous cells Fig.1-

1. It's become a cancer cell because of DNA (Deoxyribonucleic acid) damage. When DNA is damaged the cell either repairs the

**Corresponding Author:-Jaamal Khlood.**

Address:-Department of Pharmacy, clinical Pharmacy, Taif University, Saudi Arabia.

damage or dies. In cancer cells, the damaged DNA is not repaired, but the cell doesn't die like it should. Instead, the cell goes on making new cells that the body doesn't need. These cells are called cancer cells. In most cases, the cancer cells form a tumor. Over time, the tumors can replace normal tissue, crowd it, or push it aside <sup>(2)</sup>.

Fig I-I:-Normal cell and cancer cell growth

Cancer remains one of the most common causes of mortality in the world. According to the Cancer Incidence Report Saudi Arabia 2010 and Saudi Cancer Registry cancer is one of the leading causes of death in KSA. About 13,706 cases of cancer patients were in KSA. The breast cancer is the most prevalence and the most common which ranked first by 27.4% Fig(I-II)<sup>(3)</sup>.

Fig I-II:-Mortality of cancer among KSA population,2010

And according to Breast Cancer Screening Programs in 26 Countries , 2012 : Organization , Policies , and Program Reach when screened 6200 in KSA ; 19.0 % of females have breast cancer <sup>(4)</sup>.

Breast cancer begins in the breast tissue that is made up of glands for milk production , called lobules , and the ducts that connect the lobules to the nipple . The remainder of the breast is made up of fatty , connective , and lymphatic tissues .

Breast cancer may be Ductal carcinoma in situ (DCI) or non-invasive breast cancer which they are abnormal cells. The atypical cells have not spread outside of the ducts into the surrounding breast tissue. Ductal carcinoma in situ is very early cancer that is highly treatable, but if it's left untreated or undetected, it can spread into the surrounding breast tissue (Fig.I-III) <sup>(5,6)</sup>.

(A) Normal duct (B) ductal carcinoma In Situ (DCIS)

**Fig I-III:-** Ductal Carcinoma In Situ.

Another type of breast cancer is invasive duct carcinoma which the cancerous cells broken through the ductal or glandular walls into surrounding breast tissue or spread to other parts of the body Fig. IV , It's consider the most pronounced type and it's dangerous on its stage.

**Fig I-IV:-** Invasive carcinoma.

Especially The prognosis of invasive breast cancer is strongly influenced by the stage of the disease. Cancer have many stages, Stage I; This is usually a small cancer or tumor that hasn't grown deeply into nearby tissues and hasn't spread to the lymph nodes or other parts of the body. It is often called early stage cancer, Stage II and III these stages indicate cancer or tumors that are larger in size, have grown more deeply into nearby tissue, and have spread to lymph nodes, but not to other parts of the body and Stage IV this stage means that the cancer has spread to other organs or parts of the body. It may also be called advanced or metastatic cancer. Fig(I-V)<sup>(7)</sup>.

**Fig I-V:- stages of breast cancer**

There are many factors that help in increasing the probability of the breast cancer disease. There are many studies to determine them, According to American cancer society risk of developing breast cancer increases as getting older. About 1 out of 8 invasive breast cancer are found in women younger than 45, while about 2 of 3 invasive breast cancer are found in women age 55 or older<sup>(8)</sup>.

About 5% to 10% of breast cancer cases are thought to be hereditary, meaning that they result directly from gene defects (called mutations) inherited from a parent. Breast cancer risk is higher among women whose close blood relatives have this disease, less than 15% of women with breast cancer have a family member with this disease.

This means that most (over 85%) women who get breast cancer do not have a family history of this disease. The probability increases as a woman with cancer in one breast has a 3 – to 4 – fold increased risk of developing a new cancer in the other breast or in another part of the same breast<sup>(9)</sup>.

According to American Institute for Cancer Research and World Cancer Research Fund lifestyle is the major cause of cancer related illness. This finding was expressed after examining people across the globe and looking at half a million cancer related studies. They found that Sixty percent of cancer can be attributed to lifestyle choices of smoking, poor diet and obesity.

Changes in hormone levels can interfere with this process and that can lead to cancer, the exposure to toxic chemicals in our daily lives from a wider range of sources can increase cancer risk, sunlight, radiation and infectious agent (bacteria, virus) can cause cancer, While the hereditary factors account a 6% of causes<sup>(10)</sup>.

**Cancer therapy:-**

Cancer treatment is currently a major focus of investigation which have many treatment options that include Surgery, Radiation therapy, Chemotherapy and Targeted therapy.

Treatment decisions are made by the patient and the physician after consideration of the optimal treatment available for the stage and biological characteristics of the cancer, the patient's age and preferences, and the risks and benefits associated with each treatment protocol.

Treatments like radiation and surgery are considered local treatments, they act only on the infected area such as the breast, lung, and prostate, However, they targeted the cancerous cells directly.

Because of that chemotherapy is the doctor's choice in case of spreading cancer.

Chemotherapy is one of the most common ways in cancer treatment. Chemotherapy is using specific chemical agents or drugs that are destructive to malignant cells and tissues in order to cure patients. Chemotherapy cannot differentiate between normal cells and cancer cells; which means the chemotherapy targets cell whether normal or cancerous cells. The later lead to harm the healthy cells which have a high rate of growth and multiplication include cells of the bone marrow, hair, GI mucosa and skin. These side effects may be because of cardiotoxicity and pulmonary fibrosis, Severity of side effects varies between drugs<sup>(11)</sup>.

There are other ways for treatment as exercise. Exercise is an effective intervention to improve quality of life, cardiorespiratory fitness, physical functioning and fatigue in breast cancer patients and survivors. Larger trials that have a greater focus on study quality and adverse effects and that examine the long-term benefits of exercise are needed for this patient group. Pre-to post-test analyses revealed that women who exercised had significantly less depression, state and trait anxiety over time compared to controls. After the crossover, the control group demonstrated comparable improvements in both depressive and state anxiety scores. Self-esteem did not change significantly. Subjects who received exercise recommendations from their physicians exercised significantly more than subjects who received no recommendation<sup>(12)</sup>.

Researchers worldwide have been searching for an optimal cancer treatment without afflicting significant morbidity. Recent advances in cancer cannot

chnology have raised exciting opportunities for specific drug delivery by an emerging class of nanotherapeutics that may be targeted to neoplastic cells only<sup>(13)</sup>.

The Nano sized drug delivery systems allow deposition of medications in the desired areas of the body as cancer cells. It helps in information of target therapy which improved the cancer therapy<sup>(14)</sup>.

Several nanoparticle technologies are currently progressed to clinical use. Currently, FDA approved some drug products employing this technology Table I-I.

**Table I-I:-FDA approved some drug products employing this technology**

Table 1: FDA-approved products utilizing nanotechnology			
Agent	Sponsor	Use/ Technology	Approval date
Megace ES	ParPharmaceuticals	Appetite stimulant/Elan's NanoCrystal technology	July 2004
Abraxane	APP	Breast cancer/Albumin-bound paclitaxel	January 2005
Doxil	Alza Corporation	Ovarian cancer and Kaposi's sarcoma/STEALTH technology	February 2005
Emend	Merck & Co.	Antiemetic for chemotherapy/Elan's NanoCrystal technology	March 2003
TriCor	Abbott Laboratories	Cholesterol-lowering/Elan's NanoCrystal technology	December 2004
Estrasorb	Novavax, Inc.	Severe vasomotor symptoms/Novavax's micellar nanoparticle drug-delivery platform	October 2003
Rapamune	Wyeth	Immunosuppressant/Elan's NanoCrystal technology	August 2000
Articoat	Smith & Nephew	Antimicrobial dressing/Silver-containing SIL-CRYST Nanocrystals	May 2005
SilvaGard	AcryMed, Inc	Antimicrobial (silver) surface treatment/SilvaGard	December 2005
Zirconium oxide	Altair Nanotechnologies, Inc.	Dental applications/Nano-sized zirconium oxide is strong and transparent to light, but opaque to x-rays	September 2003

One of these technologies is Carbon nanotubes. Carbon nanotubes are hexagonal networks of carbon atoms, 1 nm in diameter and 1–100 nm in length, as a layer of graphite rolled up into a cylinder. There are two types of nanotubes: single-walled nanotubes (SWNTs) and multi-walled nanotubes (MWNTs) as represented in Fig VI which differ in the arrangement of their graphene cylinders. These are small macromolecules that are unique for their size, shape, and have remarkable physical properties<sup>(15)</sup>.

Some distinct advantages of carbon nanotubes over other drug delivery and diagnostic systems were their very interesting physicochemical properties such as ordered structure with high aspect ratio, ultra-light weight, high mechanical strength, high electrical conductivity, high thermal conductivity, metallic or semi-metallic behavior and high surface area<sup>(16)</sup>.

Epirubicin is a drug depending on MWNTs, The Combination chemotherapy and Nanoparticle drug delivery are two areas that have shown significant promise in cancer treatment. Combined therapy of two or more drugs promotes synergism among the different drugs against cancer cells and suppresses drug resistance through distinct mechanisms of action. Nanoparticle drug delivery, on the other hand, enhances therapeutic effectiveness and reduces side effects of the drug payloads by improving their pharmacokinetics.

Multi-wall nanotubes (MWNTs) are coaxial assembly of SWNTs have diameter close to 5nm to 50 nm, The interlayer distance in MWNT is close to the distance between graphene layers in graphite<sup>(17)</sup> Fig (I-VI).

Epirubicin is an Anthracycline drug used for chemotherapy. It can be used in combination with other medications to treat breast cancer, Anthracyclines are considered to be among the most active available agents to treat breast cancer and have become core components of adjuvant regimens. Epirubicin-taxanes combinations are active in treating breast cancer and do not appear to be associated with any pharmacokinetic interactions.

According to table I-II Epirubicin Hydrochloride use MWNTs (Fig. I-VI-B) technology which are layers of graphite with an enormous surface area and an excellent electronic and thermal conductivity<sup>(18)</sup>.

**Table I-II:- Carbon Nanotube as DDS**

Type of nanotubes	Drug	Method of immobilization
MWCNTs	Cisplatin	Encapsulation <i>via</i> capillary forces
f-CNTs	Amphotericin B	Conjugated to carbon nanotubes
SWCNTs	Gemcitabine	Encapsulation
MWNTs	Epirubicin hydrochloride	Adsorption
MWCNTs@poly(ethylene glycol- <i>b</i> -propylene sulfide)	Doxorubicin	Adsorption
f-CNTs	Sulfamethoxazole	Adsorption
SWNTs-PL-PEG-NH <sub>2</sub>	Pt(IV) prodrug-FA	Covalent amide linkages
SWNTs	Cisplatin – EGF	Attachment to carbon nanotubes <i>via</i> amide linkages
MWCNTs	Dexamethasone	Encapsulation

MWCNTs multi walled carbon nanotubes; f-CNTs functionalized carbon nanotubes; SWNTs-PL-PEG-NH<sub>2</sub> amine-functionalized single-walled carbon nanotubes.

(a) Singlewalled(SWNTs)

(b) Multiwalled(MWNTs)

**Fig I-VI. Carbon nanotubes**

Epirubicin acts by intercalating DNA strands. Intercalation results in complex formation which inhibits DNA and RNA synthesis. It also triggers DNA cleavage by topoisomerase II, resulting in cell death. Binding to cell membranes and plasma proteins may be involved in the compound's cytotoxic effects. Epirubicin also generates free radicals that cause cell and DNA damage <sup>(19)</sup>.

Epirubicin is also involved in oxidation/reduction reactions by generating cytotoxic free radicals. The anti-proliferative and cytotoxic activity of Epirubicin is thought to result from these or other possible mechanisms. All these mechanisms improve its anticancer activity <sup>(20)</sup>.

Epirubicin Hydrochloride for Injection is an Anthracycline cytotoxic agent, intended for intravenous administration. Epirubicin Hydrochloride for Injection is supplied as a sterile, orange-red, lyophilized powder in single-dose vials containing 50 mg or 200 mg of Epirubicin hydrochloride. Each 50 mg and 200 mg vial contains 250 mg and 1000 mg inactive ingredient, lactose, respectively <sup>(21)</sup>.

Following intravenous administration, Epirubicin is rapidly and widely distributed into the tissues. Binding of Epirubicin to plasma proteins, predominantly albumin, is about 77% and is not affected by drug concentration. Epirubicin also appears to concentrate in red blood cells; whole blood concentrations are approximately twice those of plasma <sup>(22)</sup>.

Epirubicin is extensively and rapidly metabolized by the liver and is also metabolized by other organs and cells, including red blood cells. Epirubicin and its major metabolites are eliminated through biliary excretion and, to a lesser extent, by urinary excretion. Common side effects; Nausea, vomiting, diarrhea, abdominal pain, flushing, or skin/nail color changes may occur, Temporary hair loss. Serious side effects; bone marrow suppression; including leucopenia, thrombocytopenia and anemia, Myocardial toxicity; including heart failure<sup>(23)</sup>.

#### **Management:-**

- Measurements of CBC, ECG , Liver function test , serum creatinine , and electrolytes
- premedication with an antiemetic may be useful because Epirubicin is emetogenic .
- Infusion site must be monitored closely to prevent extravasations ; sever local tissue necrosis will result if extravasations occur .
- Monitor for acute nausea, vomiting, anemia, infection, bleeding, and cardiotoxicity<sup>(24)</sup>.

The aim of our study is to determine the prevalence of breast cancer in Taif city Also we study the risk factors which increase the prevalence of the disease. Most studies were done on Europe women. We do our study on Saudi women as all risk factors were variable. We also try to assess the role of nanotechnology in breast cancer therapy. Epirubicin drug was selected as an example of the pharmaceutical nanosystem which is very effective in breast cancer therapy .

#### **Methodology and Design:-**

##### **Purpose and Research objectives:-**

- The primary purpose is to determine the prevalence of breast cancer in Taif city.
- The secondary purpose is to determine the role of Nanotechnology in breast cancer therapy.
- The third is to determine the Efficacy of Epirubicin drug in breast cancer therapy.

##### **Setting:-**

The oncology and pharmacy departments of the hospital.

##### **Study design:-**

A cross-sectional study allocated for breast cancer female patient, to determine the role of nanotechnology in breast cancer therapy during the period from September 2014 till December 2015

##### **Settings and Duration:-**

The study was conducted in departments of oncology and pharmacy of the hospital. The study was carried out for over a year (From September 2014 till December 2015).

##### **Sample volume and selection:-**

A sample composed of 300 women in Taif city , ages was between 21 to above 70 years old

##### **Tool of data collection:-**

A structured questionnaire was designed for data collection by the researchers based up on review of literature. It includes three parts, The first part: the socio-demographic data, such as: age; residency, occupation, age at menarche, marital status; age of bearing the first baby and the age of married as the later increases the probability of breast cancer.

The second part; the way of discovering the disease and the risk factors increase the prevalence of breast cancer

The third part; type of treatment that patient has, like; radiation therapy, chemotherapy or surgery. Also the effect of using Epirubicin in her therapy or not was studied.

The role of nanotechnology in treatment appears by using Epirubicin as a model drug. We study the effectiveness of using this drug in enhancing the therapy, and reducing or inhibition any side effects from the therapy .

##### **Method:-**

we conducted cross sectional study, the data was collected from face to face interview and the patient files presented in oncology department or computerized in patients files of the hospital. Data also collected by asking nurses,

doctors and pharmacists. All are answered the questionnaire and their answers were collected. All data has been statistically analysis to specify a recommended answer.

#### **Ethical considerations:-**

Official permission on this study was obtained from the previous sponsors. Hospital , doctors , nurse and pharmacist were informed about the nature of the study. Oral consent obtained from doctors nurse and pharmacist who agreed to participate in the study. We accessed patients' files from the pharmacy department after an official permission.

#### **Inclusion criteria:-**

- Adult female no matter the nationality
- Female patients with breast cancer
- Age between 21 years and above 70 years.
- No matter any other disease condition
- Patient using Epirubicin in there therapy
- New or recurrence case
- Benign or malignant tumor .

#### **Exclusion criteria:-**

- Female patient under 21 years old
- Non-breast cancer patients
- Male cancer patient
- Pregnant and nursing women
- Patient who are not using Epirubicin in there therapy .

#### **Statistical Analysis:-**

All data in this study are expressed in the form of mean. Frequencies and percentages were used for describing data, chi-square test was used with a significance level of  $P < 0.05$  . Statistical analysis was used to determine the prevalence of breast cancer in Taif city, and role of nanoparticles in Epirubicin in breast cancer therapy by measuring the efficacy and harms of the drug.

#### **Research end point:-**

**The primary end point:-**was the effectiveness of the drug in the therapy

#### **Secondary end point:-**

1. Reducing the most common side effect
2. Frequencies of the patient hospital income

#### **Results andDiscussions:-**

This study aimed to assess the prevalence of breast cancer in

Taif city and to determine the role of nanotechnology in Epirubicin drug in breast cancer therapy. A cross sectional study was conducted among 300 women in Taif city. Data were collected using a self-administered questionnaire which included questions about the socio-demographic data, knowledge of risk factors that may cause the breast cancer, way of discovering the disease, kind of therapy that the patient received, use of Epirubicin drug in therapy, duration and response of therapy and if the patient feels any harms symptoms.

#### **The prevalence of the breast cancer in Taif city:-**

Three hundred participants were interviewed in this study. Males were excluded from that survey. The breast cancer was more predominant in female patients. Also the breast cancer patients only are included in the survey. Only 32 women have breast cancer in the period of the study September 2014 till December 2015 were take their medication in the hospital (From September 2014 and followed up the patient condition until December 2015 ). The percent of the breast cancer women is more than 10% in 15 months from September 2014 till December 2015. This result was approximately matched with the results of cancer centers survey which found that approximately 12.3 percent of women will be diagnosed with breast cancer at based on 2009- 2011 data. For this reason, the World Health Organization considered breast cancer, one of the most important causes of death in women <sup>(25)</sup> .

**Demographics:-**

**Sample distribution by agevariable:-**

There was a variation in the interviewed age group. The data were illustrated in table (1-A) and Fig. (1-A). The highest percentage of women with breast cancer are in the age group (41-50), they reached up to 31.3% while the lowest percentage was at the age group (>70%), which reached (9.4%). That indicates that women between age 41-

50 years old are more susceptible to the disease from others. Statistical analysis found that there was no significant increase in the risk observed in the adult age and younger age women. These results were in agreement with the previously reported by Ahmed in Jemal, 2007 et al and Shahbazi R, 2015 et al<sup>(26,27)</sup>

**Table 1-A:-** Sample distribution by age variable

Age	number of patients	Percent%
21-30	4	12.5 %
31-40	5	15.6 %
41-50	10	31.3 %
51-60	5	15.6 %
61-70	5	15.6 %
>70 years	3	9.4 %
total	32	100%

**Fig.(1-A )**Sample distribution by age variable

**Distribution of the sample by material status:-**

Table (2-A) and Fig. (2-A) show that the most of the respondents were remarried women, amounting to (68.8%) . From the results we suggest that married women are more susceptible to breast cancer than single ones. Croft L, 2014 et al also found that, those who are married have higher optimism scores than their unmarried ones<sup>(28)</sup> .

**Table 2-A:-**Distribution of the sample by material status

Marital Status	Number	Percent %
married	22	68.8 %
single	5	15.6 %
Absolute	1	3.1 %
Widow	4	12.5 %
total	32	100%

**Fig. (2-A)** distribution of the sample by material status

**Distribution of sample by variable profession**

Supreme percentage of women with breast cancer in the sample; 43.7% were housewives. The lowest percentage is students, reaching to 18.6 %, as shown in table (3-A) and figure (3-A). The lack of movement is likely to be an important factor in increasing breast cancer. Women have to go outdoors at least an hour a day because walking helps to renew the body's cells<sup>(29)</sup> .

**Table 3-A:-** sample distribution by variable profession

Occupation	Numbe	Percent %
student	6	18.7%
employee	12	37.5%
Housewife	14	43.75%
total	32	100%

Fig. (3-A) sample distribution by variable profession

**Sample distribution by number of pregnancies**

The results were shown in table (4-A) represent the effect of pregnancy on the prevalence of the breast cancer. The highest percentage of women with breast cancer in the study sample was with 1 to 5 times of pregnancy and breastfeeding regularity (37.5%). The mother after giving birth needs two years to recover her body from the effects of pregnancy and also increase the number of pregnancies reduce the incidence of breast cancer because in this case hormones would be at a constant level in the normal activity<sup>(30)</sup>. Except governing always ask for reducing the reproductive rate.

**Table 4-A:-** sample distribution by number of pregnancies

No. of pregnant times	No. of patients	Percent of
non	7	21.9
1 to 5	12	37.5
6 to 10	8	25
10 to 15	5	15.6
total	32	100

Fig. (4-A) sample distribution by number of pregnancies

**Age of married and bearing the first baby:-**

The older age of marriage and bearing the first have a greater effectiveness in causing the breast cancer. Both events at age 30 or older increase the risk up to 7.0 times relative to when both events occurred younger than age 20. Where as the corresponding risk was 1.4 times when age between 20-30 years. These results were in agreement with the previously reported result <sup>(31)</sup>.

**Table 5-A:-** Age of married and bearing the first baby.

	Age of married		Age of bearing the first baby:	
	No.	%	No.	%
<20 years	3	9.87	4	11.53
20-30 years	8	23.29	3	9.96
>30 years	21	66.84	25	78.51

**Fig. (5-A) Age of married and bearing the first baby**

**B-The way of discovering the disease and the risk factors increase the prevalence of breast cancer**

**Sample distribution by risk factors**

**Table 1-B:-** risk factors in breast cancer from the perspective of patients

cause	percent	number of patient
Age	40.6	13
hereditary	15.6	6
Cigarettesmoking	3.13	1
Changes in hormone levels	9.38	3
Toxic chemicals	9.38	3
radiation	6.25	2
diet/obesity	12.5	4
Total	100%	32

Fig. (1-B) sample distribution by risk factors .

We found in our questionnaire table (1-B); the risk of breast cancer increase by ageing (40.6%), the hereditary factors develop risk by (15.6%). It was reported that a family history of breast cancer had little effect on the risk in women with non-proliferative lesions.

However, the risk in women with atypical and a family history of breast cancer was eleven times that in women who had non-proliferative lesions without a family history <sup>(32)</sup>.

The change in hormone levels and the toxic chemicals increase risk by 9.38% only. Statistical analysis shows no significant difference between the results of both risks ( $p > 0.05$ ). While the changing in lifestyle considered a second cause of disease (12.5%). The increase of the body fatness increase the risk of breast cancer. There The World Cancer Research found that evidence increase the relative risk \postmenopausal breast cancer <sup>(33)</sup>.

because adipose-associated with the obesity increase the conversion of androgen to estrogen, mammary adipose tissue is thought to be an important source of local estrogen production. Estrogen is a potent mutagen for mammary cells, has long been implicated in the development of mammary tumors <sup>(34)</sup>. statistical analysis shows a clear significant difference ( $p > 0.05$ )

**1- personal history of breast cancer**

**Table 2-B:-** Recurrence of breast cancer.

Recurrence	percent	Patient no
Yes	40.6	13
No	59.4	19
Total	100	32

Fig. (2-B) Recurrence of breast cancer

Table (2-B) and figure (2-B) shows that the patient with a new cases of breast cancer is 59.4%; That means the lack of awareness of the breast cancer or increase the probability of the disease. The increment of the risk factor may be one of the main causes. The increase awareness of breast cancer risks and detection is necessary <sup>(35)</sup>.

**Time of Menstruation:-**

The early age of menstruation was one of the main causes of the breast cancer disease. As shown in table 4 patient who have menstruation before age 12 have a higher risk to get breast cancer <sup>(36)</sup>.

**Table 3-B:- Menstruation time .**

Menstruation	Percent %	PatientNo.
before age 12	56.25 %	18
after age 12	43.75%	14
total	100%	32

**Menopause time:-**

As shown in table (4-B) patient who have menopause after age 50 have a high risk to get breast cancer. By asking those women most of them take a hormonal replacement therapy. Importantly, breast cancer risk elevations appear to be higher among women who initiate treatment at the menopause, compared to women who do not have a menopausal treatment <sup>(37)</sup>. Menopausal hormone was a combination of reproductive hormones; estrogen and progesterone hormones. Reproductive hormones are thought to influence breast cancer risk by increasing cell proliferation, thereby increasing the likelihood of DNA damage, as well as promotion of cancer growth. Women should consider the increased risk of breast cancer associated with the use of estrogen and progesterone when evaluating treatment options for menopausal symptoms.

**Table 4-B:- Menopause time**

Menopause time	Percent %	PatientNo.
before age 50	40.6%	13
after age 50	59.4%	19
total	100%	32

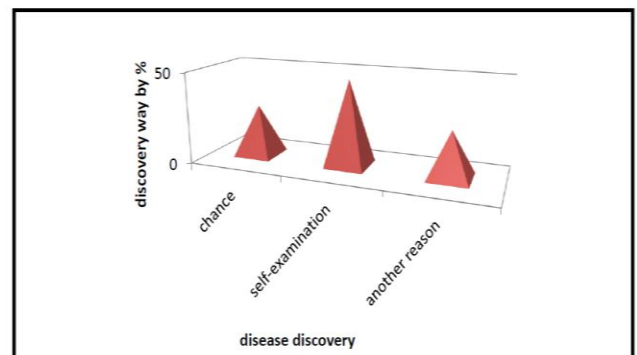

**fig. (4-B) Menstruation/Menopause**

**Discovery of The disease:-**

Table (5-B) shows that most common way of discovering the disease. The highest percentage of patient discover the disease by self-examination tests (46.9%). This indicates increasing the patients' awareness which as a great importance in the breast cancer screening. It also increases the healing rate <sup>(38)</sup>.

**Table (5-B) discovery of the disease**

discover the disease	number of	percent %
Chance	9	28.1
self-examination	15	46.9
Another reason	8	25
total	32	100%

**Fig . 5-B discovery the disease**

**The role of nanotechnology in the treatments:-  
Sample distribution by kind of therapy.**

**Table 1-C:-**Sample distribution by kind of therapy

kind of therapy	Percent%	PatientNo.
chemotherapy	31.25%	10
Targeted therapy	50%	16
Radiation therapy	9.38%	3
surgery	9.3%	3
Total	100	32

**Fig. (1-C) kind of therapy**

Fifty percent of patient have a targeted therapy which indicates the importance role of nanotechnology in breast cancer therapy table (1-C). A malignancy has become a serious threat to human health, and morbidity and mortality rates have been rising in recent years. Recent studies challenge and interesting is to develop effective therapy for cancer. <sup>(39,40)</sup>

**Sample distribution of the usage of Epirubicin and its influence in therapy.** Although the percentage of patient using Epirubicin in their therapy (43.75%) is less than who does not use it (56.25%) as shown in table (2-C) Table (3-C) but patients who influence a good effectiveness from Epirubicin HCl is 78.6%. the patients who have an appropriate therapy with Epirubicin HCl are only 21.4%.

**Table 2-C:-**Sample distribution by use of Epirubicin.

Use Epirubicin	PatientNo.	Percent %
Yes	14	43.75
no	18	56.25
Total	32	100

**Fig. (2-C) . Sample distribution by use of Epirubicin**

Influence of Epirubicin	PatientNo.	percentage of effect
effective	11	78.6 %
Inappropriate	3	21.4%
total	14	100%

**Table 3-C:-influence of Epirubicin**

**Fig. (3-C) influence of Epirubicin**

**The duration of using Epirubicin to give an effective therapy inpatients:-**

The influence and effectiveness of the medication starts within 3 months of starting treatment, some patients need only to 3 months to show the therapeutic effect of the medication they are 18.2 % but the most patients shows the therapeutic effect of the drug in 9 months 54.5 % as table (4-C) shows. The results were agreement with the previously reported by Baldini E. 2002, et al who found that using Epirubicin in breast cancer therapy especially in combination with cyclophosphamide reduce the duration of therapy upto 6 months<sup>(41)</sup>.

**Table 4-C:-Time that Epirubicin takes to give effect of in patients.**

Effective of therapy in/month	Number of patients	Percent %
4 months	2	18.2%
9 month	3	27.3%
14 months	6	54.5%
total	11	100%

**Fig. (4-C) effective of therapy in /month**

**Side effect of Epirubicin:-**

Epirubicin HCl depends in its nanoparticles form to targeting the cancerous cells so it's not effecting on normal cells; that's why the side effects present by 18.2 % as a serious while a 81.8 % is common side effects.

**Table 5-C:-Side effect of Epirubicin.**

Sideeffect	Number ofpatients	percent
common	9	81.8
Serious	2	18.2
Total	11	100

**Fig. (5-C)side effect of Epirubicin**

Generally chemotherapy targets cell whether normal or cancerous cells; which leads to harm the healthy cells which have a high rate of growth and multiplication include cells of the bone marrow. However; the reducing of the serious side effect and duration and the highly effectiveness of the drug can be related to its nonstructural. Using multiwall carbon nanotubes (MWCNTs) in Epirubicin drug which depend on adsorption ionization methods as antineoplastic agent help to be one of the most available drugs in treating breast cancer efficiently and effectively. It allows the medication to transport and target the drug to be effective Nano-carriers for anti-tumor therapies.

Epirubicin has a favorable safety profile and less side effect after short duration of the treatment. Several studies were done to identify the expanding role of Epirubicin in the treatment of breast cancer. These studies were matched with our study in the following point: first; Epirubicin has advancement in breast cancer treatment. After studying its effect across a range of subgroups of women with breast cancer including premenopausal and postmenopausal women, women with axillary lymph node-positive and -negative tumors, and women with either hormone receptor-positive or -negative tumors of Epirubicin have been observed.

As previously reported it is being equally effective and better tolerated than Doxorubicin in women with metastatic breast cancer and has generally improved relapse-free and overall survival compared with standard adjuvant therapies, including CMF.

Trials of Epirubicin-based regimens in the adjuvant setting are ongoing, and combinations with newer cytotoxic agents such as the Taxanes, Trastuzumab, and Bisphosphonates are also being explored in an effort to continue to improve outcomes for patients with breast cancer<sup>(42)</sup>.

Epirubicin also has potential advantage in increasing rate on breast-conserving surgery especially in combination with Paclitaxel. They enabled lumpectomy in a substantial proportion of women who were previously deemed to not be suitable candidates for breast-conserving surgery<sup>(43)</sup>.

Epirubicin is favorable in the case of the risk of developing congestive heart failure is low<sup>(44)</sup>.

Epirubicin is active in metastatic breast cancer patients who have previously received Anthracyclines treatment in the adjuvant setting<sup>(45)</sup>, in advanced breast cancer<sup>(46)</sup> and has marker efficiency of Epirubicin in primary breast cancer therapy<sup>(47)</sup>.

It improves disease-free and overall survival in node-positive breast cancer patients<sup>(48)</sup> and it is extensively and rapidly metabolized by the liver and also metabolized by other organs and cells, including red blood cells. Epirubicin and its major metabolites are eliminated through biliary excretion and, to a lesser extent, by urinary excretion. The results indicated the reduced its accumulation in the body<sup>(49)</sup> which lead to reducing the serious side effect.

#### **The study end point:-**

##### **Primary endpoint:-**

The effectiveness of the drug in the therapy was more than other chemotherapy. The drug rates were significantly higher with low duration.

##### **Secondary endpoint:-**

- Reducing the most common side effect occurs with all other chemotherapies.
- Frequencies of the patient hospital income were decreased because of fast progression in patient health in less duration.
- Effectiveness of the therapy was highly observed with patients treated with Epirubicin HCl drug

#### **Conclusion:-**

The present study aimed to assess the prevalence of breast cancer in Taif city, the risk factors cause the disease and the effectiveness of Epirubicin HCl drug in the treatment as an example of nanosystems drug by screening 300 women. From all the previous results we concluded that:

- More than 10% of the patients have breast cancer in period about 15 months indicating the highest probability of breast cancer diseases. Breast cancer considered one of the most important causes of death in women.
- Risk of breast cancer disease increased by aging; Since the samples of the study were taken for patients in 21 ages and above 70 years, and by comparing between patients in their age; we found that the risk of breast cancer increased by aging 40.6% as present in the study and highly distributed at the ages between 41 to 50 years old.
- The personal history of breast cancer increased the risk to develop a new lesion or recurrence to the first one, we record in this study a 46.9% patient has recurrence disease
- Breast cancer is the most prevalent among married women; we found in our distributed questionnaire the prevalence of breast cancer disease in married woman (68.8%).
- The lack of movement is one of the contributing factors and important to develop breast cancer; therefore housewives developed the highest risk of breast cancer 43.7%, and this risk decreased if she takes a walk at least for one hour in outdoors like student or employed who show the least distributed by 18.7 and 37.5% respectively.
- Increased number of births will reduce the risk of breast cancer; especially among women have 1 to 5 times of pregnancy and breastfeeding regularly (37.5%).
- If there is a family member having breast cancer this will increase risk of it; especially if he is a very close family member like a mother or sister.
- A longer lifetime exposure to the hormones estrogen and progesterone as a hormonal supplement therapy increases the risk of breast cancer. In this study that results appear in patients how started menstruating before age 12 by and those how continued through after 50 years old or who was using supplement hormonal therapy.
- Environmental chemical compounds found around us in cosmetics, personal care products and pesticides has low effect in increasing the risk of breast cancer.
- High-fat diets can lead to being overweight or obese, which is a breast cancer risk factor
- the patients who exposed to radiation because nature of their work enhanced risk of getting breast cancer, they are presented in this study by 6.25%.
- Cigarette smoking cause many cancer types one of it causing breast cancer in smoked patients or exposed to smoke, a 3.13% from patients in this study have breast cancer due to smoking even though the low percent.
- The high awareness of breast cancer and how to discover the disease, improve the early detection of the disease and enhance recovery chances. In this study 46.9% of patients discover the disease by self-examination.
- Highly awareness from doctors of using targeted drug in breast cancer therapy is very effective in managing the disease. In our study we found that a 50% patients use targeted drug in their therapy.

- Epirubicin is a special type of chemotherapy; due to its dependence on nanoparticles in its composition so it's preferred by doctors and patients in its use. This what we demonstrated in this study ; the percentage of patients who are using Epirubicin in their therapy is 43.75 %.
- The effectiveness of Epirubicin being between 3-9 months. As 54.5% patients have the therapeutic effect of the drug in 9 months.
- Epirubicin as a targeted cancer therapy has less toxic effect than traditional chemotherapy drugs because it's targeting on cancer cells more than normal cells. However, targeted cancer therapies can have substantial side effects, but because it's containing nanoparticles for targeting the cancerous cells we found that 81.8% patients have a common side effects, while 18.2 % was serious side effect.
- Epirubicin is an Anthracycline drug using Nanoparticle in the therapy which represents advancement in breast cancer treatment. In addition it is being equally effective and better tolerated than other chemotherapy, due to its dependence on nanoparticles for targeting the cancerous cells. This explains why it has the highest efficacy and the lowest side effects than other chemotherapy agents.

### Recommendation:-

- Spread awareness about breast cancer detection , and how it's important to discover the disease and increase effectiveness of therapy if the disease detected early.
- Work on the preparation of educational programs by radio, television, social media and other media on the risk factors that cause breast cancer so that people can prevent this disease early
- Encourage mothers to continue breastfeeding their children even after providing additional food because breastfeeding reduces the incidence of breast cancer.
- The role of health and media organizations around the initial actions of infected women and about how to note and examine any abnormal swelling through health education for the family.
- Encourage doing exercises or at least a walk in outdoors for one hour daily , because exercises and fresh air reduces risk of getting breast cancer
- Continuous checkup and self-examination for women having high risk to get breast cancer, e.g. family or personal history of breast cancer.
- Stay away from taking hormonal medications and contraception without consulting your doctors.
- Checkup the environmental chemical and make sure it's not carcinogenic factors especially in work area.
- Balancing foods and diet intake , to regulate the exercise and reducing the chances in getting breast cancer
- Protect people who work in the fields of radiation by:
  - Distance: the radiation intensity decreases as we move away from the source, and this means we should keep a suitable distance away from the radiation source.
  - Time: commensurate dose radiation directly proportional to the exposure time so it must perform work in the region where there is a radiation as soon as possible and efficiently.
  - Armor: The armor is a protective barrier placed around the radioactive source or a source of radiation device.
- Increase the awareness of doctors, healthcare providers and patients about the role of medications that contain nanotechnology in its composition e.g., Epirubicin drug and how it reduces the side effects and increase the effectiveness of the therapy.
- We should use a suitable simple and safe nanosystem preparation technique, method of preparation and the polymer among the various possible methods to produce nanoparticles with desired size range with targeting effect and depending on the physicochemical characteristics of a drug.
- Using of Epirubicin in treatment of breast cancer therapy for 3-9 months is recommended.

### Summary:-

This study has been done to assess the prevalence of breast cancer in Taif city and the role of Nanotechnology in Epirubicin drug in its therapy we done this study period from 21 Sep. 2014 to 25 Dec. 2015 by taking samples from patients presented to the hospital in 2014 only. By screening 300 women in Taif city presented to the hospital in 2014 then followed up the cases to Dec. 2015 and analysis the results statistically using SPSS to achieve the objectives of the research. We found that the patients who have breast cancer is 10.7 % in 32 cases. The highest percentage of women with breast cancer is in the age group (41-50). Married women are more susceptible to breast cancer than single women (68.8%). The highest percentage of women with breast cancer in the sample is housewives and the lowest percentage is students. Risk of breast cancer increases by ageing , family history and changing the hormone levels. High

awareness of breast cancer screening allowed to 46.9% of patient to examine themselves and helped them to discover the disease. Reducing the pregnancy age, marriage age and pregnancy numbers (1 to 5) and breastfeeding help in reducing the probability of breast cancer disease. Nanotechnology has great importance. Nanoparticles presented in the Epirubicin HCl shows high effectiveness and less side effects in a period between 3-9 months due to targeting the cancerous cells.

#### Abstract

**Aim:** The main aim of the study is to assess the perceptions and knowledge on tooth bleaching among patients visiting various dental health care centers in Riyadh. KSA

**Materials & Methods:** A cross sectional survey based study was conducted at four dental health care centres in Riyadh. The survey was based on face to face interview which utilized a structured questionnaire. The data obtained was analysed utilizing frequency distribution and chi square test.

**Results:** No statistically significant relationship was found between knowledge / perception regarding teeth bleaching and age ( $p= 0.250$ ), gender ( $p=0.189$ ), ethnic group ( $p= 0.966$ ), level of education ( $p= - 0.843$ ) or marital status ( $p= 0.552$ ). 80% of the subjects were dissatisfied with the appearance of their teeth, colour being the main reason. 70% of the dissatisfied patients stated that B1 – vita shade was the shade which they preferred. The main source of information regarding tooth bleaching was advertisements, while, the commonest method of tooth bleaching was bleaching toothpaste. 23% subjects didn't consider bleaching treatment safe.

**Conclusion:** Majority of the patients were aware about tooth bleaching as a treatment. Tooth color was the main reason for seeking bleaching treatment. Tooth color was the main reason for seeking bleaching treatment and shade B1 was the whitest and the most chosen color.

#### Introduction:-

Tooth discoloration is of two main types, namely, intrinsic tooth discoloration and extrinsic tooth discoloration. Intrinsic tooth discoloration usually occurs due to intake of certain teratogenic drugs such as tetracycline or exposure to high levels of elements such as fluoride and certain heavy metals during the phase of tooth formation (Hannig and Joiner, 2006; Alshara et al., 2014). While, extrinsic tooth discoloration occurs after the tooth formation and is usually caused by certain dietary products such as tea, coffee and social habits such as tobacco (Hannig and Joiner, 2006; Alshara et al., 2014).

Since tooth discoloration is directly associated with the esthetics of patients, thus, numerous studies have tried to evaluate the level of satisfaction of individuals in relevance to dental esthetics (Azodo and Ogbomo, 2014; Mehl et al., 2014, 2015). A study comprising of 235 Malaysian individuals showed that the 52.8% were dissatisfied with their dental appearance, while, 56.2% were not happy with their tooth color (Tin-Oo et al., 2011). Another study

conducted in Poland showed that 61.0% of the subjects were dissatisfied with the appearance of their teeth (Wisniewski et al., 2004). It is also important to observe the relationship of various factors with the individual's level of satisfaction in regards to dental esthetics. Thus, a New Zealand based study conducted on general dental practitioners (GDPs) showed that according to GDPs females were more demanding regarding tooth whitening as compared to males (Theobald et al., 2006). Similarly, a Hong Kong based study showed that age was an important predictor for increased demand of tooth whitening (Chan et al., 2013). Two other studies reported that general satisfaction with tooth appearance was influenced mainly by tooth color, followed by malalignment and caries. Therefore it was suggested that when planning treatment, dentists should consider, patient's esthetic objectives in addition to function, structure and biology. This can lead to a higher level of patient satisfaction (Gili R. Samorodnitzky-Naveh, 2007; Tin Oo et al., 2011).

Today the cosmetic dentistry has become an important part of restorative dentistry as the patients perception of teeth appearance is associated with their general health and well being (BA Matiset al, 2007). Recent advancement in restorative and esthetic dentistry has led to the emergence of various tooth bleaching agents (Dahl and Pallesen, 2003). The level of trustworthiness of these products has increased globally because of their application under professional care and supervision (Nora Nomay, 2016). In addition to that, these bleaching agents are considered to be the least invasive method to treat the discolored teeth (R Zekonis et al., 2003). This upscale in the demand of tooth bleaching is evident in an American study which showed a 300% increase in demand of bleaching agents amongst adults (Morley, 1999). The New Zealand based study on GDPs also showed that 77.8% of the patients desired dental bleaching (Theobald et al., 2006). Another study showed that the popularity of teeth whitening has increase many-fold with the availability of over the counter bleaching agents (Dimitrios Tortopidis et al., 2007).

Limited studies of such nature have been conducted in Saudi Arabia. A study conducted in 2000 showed that 25.6% of the dental patients used saline and 10% used lemon as home based dental whitening agents (Almas et al., 1999). Another study was conducted recently in Saudi Arabia which assessed the attitude and awareness of tooth bleaching among general population attending shopping malls in Riyadh city, Saudi Arabia (Nora Nomay, 2016). Patient's perceptions and expectations from tooth bleaching must be assessed before the patients undergo the treatment. The expected outcome must be made clear to the patient as discrepancies between the patient's and dentist's perceptions of esthetic treatment needs have been reported (R Ahmad et al. 2005).

This study aims to assess the dental patient's perceptions and knowledge on tooth bleaching so that the discrepancies between the patient's and the dental surgeon's perception regarding tooth whitening are identified and a comprehensively better dental care is delivered to the dental patients.

### **Materials and Methods:-**

It was a cross-sectional survey based study. The samples were selected based on a two stage convenience sampling technique. The first stage comprised of selection of study sites. The study sites were Muneseyah campus of Riyadh Colleges of Dentistry and Pharmacy, Ministry Health Hospital (Eastern Branch), Sigal Clinics and Suleman Alhabib (Olaya branch) which are located in Riyadh (capital of Kingdom of Saudi Arabia). The second stage comprised of selection of subjects. The subjects were dental patients arriving in the above mentioned dental clinics. The sample size was 300. The subjects were interviewed face to face in the waiting area of the respective clinics. An informed consent was taken before interview. The interview was structured, based on a questionnaire which was available with the interviewer. The questionnaire was based on a study published by R Ahmad, E.H.Z.M. Ariffin, I. Vengrasalam, N.H.A. Kasim et al 2005 (R Ahmad et al. 2005).

The questionnaire had been modified and translated to meet the requirements of our study. The questionnaire comprises of three parts.

Part A is based on socio-demographic questions

Part B is based on patient's perception of their oral health

Part C is based on their knowledge of dental bleaching agents.

### **The questions of the questionnaire are as follows:-**

A :

Age : .... Gender : M/F Nationality : ..... Marital status : Married / Single

Occupation : ..... , Level of education : No education / Primary/intermediate/High school / University

B:

1-What do you think about your oral health?

Excellent. Good. Not good

2-Are you happy about your teeth appearance ?

Yes .No: why ?( Color, Appearance, Size, Decay)

3-Are you satisfied about your teeth color ?

Yes. No: so, which color you prefer? Shade?

4-Are you a smoker ?

No. Yes : which type : \*Cigarette \*Shisha \*Tobacco chewable \*Cigar \*Other .....  
how many times per day :

5-Do you drink tea or coffee ?

No. Yes. How many cups per day :  
C:

1. Have you heard about tooth bleaching? Yes. No.

2. How did you know about tooth bleaching?

dvrtisments articles dentist Family/friends

3. Have you ever tried using bleaching productsor undergone tooth bleaching treatment indental clinics?

No. Yes. Where? In-clinic. In-home

4. If yes in-home , which of the listed products you have used .

- a. Toothpaste :Synsodyne-true white , Colgate-optic white , Blanx-whiteShock other : .....
- b. 3D Crest white strips other : .....
- c. iWHITE Gel with trays other : .....
- d. Miradent Oxygen Whitening Pen other : .....
- e. Others.....

5. What are the reasons for using the bleachingproducts / treatment?

Coffee/tea Cigarette Stain Trail Improve esthetic

6. How long did you use the products / treatment before you noticed the results? Hours, Days, Weeks, Months

7. How often do you use the bleachingproducts / how often do you visit your dentistfor the bleaching treatment?

8. How would you rate your satisfactionregarding the results of using the bleachingproducts/ treatment?

Highly satisfied satisfied not satisfied Don't know

9. Do you think the bleaching products/treatment are safe?

Yes. No. why? ..... Not sure.

10. Do you intend to use any bleaching products/ treatment in the future?

Yes. No.

11. What do you think about the prices of these teeth bleaching treatment options?

Expensive.Reasonable.cheap

12. Would you recommend to your friends and family to use these bleaching products /treatment?

Interviewers were level 12 dental students. The average time of the interview was 10 minutes. The interview comprised of showing the patient Vita Shade Guide to aid them in selecting the desired shade for themselves. Statistical analysis was conducted by SPSS Version 20. Pearson chi square and Fisher's exact test were performed for statistics.

- Only 17% were satisfied
- Large majority selected B1 as their desired shade

The Vita Shade Guide that was shown to patients for shade selection.

**Results 7:-**

In our study, there was no statistically significant relationship between the patient’s knowledge / perception regarding teeth bleaching and age ( $p= 0.250$ ), gender ( $p=0.189$ ), ethnic group ( $p= 0.966$ ), level of education ( $p= 0.843$ ) or marital status ( $p= 0.552$ ) of the subjects.

**Results 8:-**

**Patients Knowledge about Bleaching treatments availability.**

98% of the patients knew that bleaching is a treatment option to improve dental aesthetics

Results 9:-

Pie Chart: Source of information for knowledge.

Results 10:-

Doughnut Chart: Satisfaction Level.

Those who had the knowledge about Bleaching treatments Only 50% from them had tried some type of bleaching treatment (of them 97% used whitening tooth pastes).

**Results 11:-****Reasons for bleaching**

85% for improving aesthetics followed by Tea/Coffee and Cigarette stains

**Reasons for bleaching :-**

	Frequency	Percent
Cigarette	4	3.7
Coffee/tea	9	8.3
Improve Esthetics	91	84.3
Trail	4	3.7
Total	108	100.0

**Results 12:-****Patients perceptions about safety of bleaching treatments**

- 49% considered it a safe treatment
- 23% did not consider it a safe treatment
- 28% were not sure about the safety of treatment

**Safety of dental bleaching:-**

	Frequency	Percent
Yes	53	49.1
No	25	23.1
Not Sure	30	27.8
Total	108	100.0

**Discussion:-**

In our study, there was no statistically significant relationship between the patient's knowledge / perception regarding teeth bleaching and age ( $p= 0.250$ ), gender ( $p=0.189$ ), ethnic group ( $p= 0.966$ ), level of education ( $p=0.843$ ) or marital status ( $p=0.552$ ) of the subjects.

This is in line with similar studies conducted in Malaysia, Sweden and China , which showed that the patient's knowledge and perception regarding teeth bleaching was not associated with age, gender, ethnic group or marital status of patient except for, the level of education of the patient (R Ahmad et al. 2005). However one Saudi study reported that female gender's perception about teeth bleaching is significantly higher than the male gender. (Nora Nomay, 2016). This reported difference may be because of the reason that her study was conducted with general population in shopping malls while our study was conducted in dental patients visiting different dental health care centers in Riyadh.

In our study, 80% of the patients were dissatisfied with the appearance of their teeth. This percentage is higher than other similar studies conducted in Saudi Arabia 67.4%, Poland 61% and two Malaysian studies 53.5% and 56.2%. (Nora Nomay, 2016; Tin Oo et al., 2011; R Ahmad et al. 2005; Wisniewski et al., 2004).

In our study, tooth color was the primary reason behind the dissatisfaction of the appearance of the teeth. This finding is again similar to some of the other studied conducted in Saudi Arabia, Malaysia and New Zealand. (Nora Nomay, 2016; Tin-Oo et al. 2011; Theobald et al. 2006). Amongst those who were dissatisfied, 70% stated that B1 was the shade which they preferred for their teeth (Based on Vita Shade Guide). B1 is the whitest shade in the Vita guide which shows that the patients perception of aesthetics is very different from that of the dental professionals, as the later considers many aspects like patient's skin tone/color, colors and shades of patient's other teeth and position of teeth in the oral cavity etc. This question was not asked in any of other similar studies published. 98% of the patients knew that bleaching is a treatment option to improve dental aesthetics. The result is comparable to other studies. Although it's a surprise that even as majority of the patients were not satisfied with the color of their teeth only 50% of them had tried some type of bleaching treatment. Amongst those who knew about the availability of bleaching agents, 42% comprised of those who got the information from advertisement, while, 30% got the information from dentist.

Similarly, another study showed that majority of subjects got knowledge of bleaching agents from advertisement (R Ahmad et al. 2005). It is therefore necessary for the dental professionals to educate their patients more effectively about the availability and benefits of various in office bleaching treatments. In our study, main reason for seeking dental bleaching was to improve the aesthetics.

Surprisingly, stains from tea/coffee and tobacco were only miniscule reasons, suggesting that, most of the patients do not perceive that bleaching can treat such stains. This information also must be delivered to the patients by the dental professionals. In our study, almost all the patients who were using bleaching agents had only tried the bleaching tooth pastes, most patients were not motivate enough to try other products like gels, pens and strips etc. While, in another study, majority knew about bleaching gel (R Ahmad et al. 2005). Therefore, further research needs to be done to ascertain why the patients do not choose other products.

In our study, those who used the bleaching toothpastes had high satisfaction levels (87%) which suggests that most of the commercial products available in the market are very effective. In contrast another study showed that only 13.3 % of the subjects were highly satisfied with the results obtained from bleaching agents (R Ahmad et al. 2005). The difference in the satisfaction level in between the two studies, might be due to the variability in products used by subjects. Further research can be conducted to compare the effectiveness of different products.

In our study, 17.7% of the respondents thought that bleaching products are safe to use, while, 1.6% of respondents in another study believed that bleaching products are safe to use (R Ahmad et al. 2005). In our study, 17% of the respondents stated that bleaching agents are expensive. 23.7% of the respondents stated that they would recommend bleaching treatment to others.

### **Conclusion:-**

- 80 % of the patients were not happy with the appearance of their teeth, the main complaint being the color.
- When given choice to select the desired shade large majority picked the shade B1 (The whitest shade!)
- Knowledge of bleaching among dental patients in Riyadh was not related to age, gender ethnic group, level of education or marital status .
- 98% of the patients knew that bleaching is a treatment option to improve dental aesthetics, and those who knew of them only 50% had tried some form of treatment.
- Bleaching toothpastes were the preferred method (97%) and it also showed very high satisfaction levels (only 8% were not satisfied)
- Patients do not prefer In-office bleaching treatments and/or other over the counter bleaching treatments.
- Dentists must consider educating their patients more comprehensively regarding the availability of in-house bleaching treatments.

#### Abstract

**Introduction:** Calcium (Ca), which is an essential factor for human life, could play a role in pathophysiology of spontaneous intracerebral hemorrhage (ICH). This prospective study was conducted to assess serum Ca level in a cohort of Egyptian patients with ICH and searching for a possible association between serum Ca and both of hematoma volume and short-term outcome after ICH.

**Patients and Methods:** This study was conducted at intensive care units (ICU) of neurology department, Zagazig University Hospitals, Egypt. We included ninety patients with spontaneous ICH. All patients were subjected to thorough history taking, general and neurological examination. National Institute of Health Stroke Scale (NIHSS) was done on admission to assess stroke severity. Initial Computed Tomography (CT) scans were done for all patients within the first 24 hours of admission to calculate the hematoma volume. Serum Ca level was measured on admission for all patients. Short-term outcome was assessed using the modified Rankin scale after one month of ICH onset.

**Results:** Among the ninety cases of ICH, (14.4%) had low serum Ca on admission. Patients with low serum calcium level had a significantly larger initial hematoma volume and higher scores on NIHSS in comparison to ICH patients with normal Ca level. Serum Ca was inversely correlated with hematoma volume ( $p < 0.001$ ), stroke severity ( $P < 0.001$ ) and stroke outcome according to modified Rankin scale.

**Conclusion:** low serum Ca level on admission was associated with large initial hematoma volume and unfavorable outcome in patients with spontaneous ICH.

#### Introduction:-

Spontaneous intracerebral hemorrhage (ICH) is considered as the most catastrophic stroke, it accounts for approximately 15- 20% of all cerebrovascular strokes<sup>1-2</sup>. Being associated with higher morbidity and mortality, it is considered a major public health problem and needs an effective therapy<sup>2</sup>. Accurate identification of predictors of outcome may help optimal beginning time for immediate intervention and management, which might influence early mortality following ICH. Earlier studies have investigated great associations between clinical, laboratory and

**Corresponding Author:- Nahed Shehta**

radiographic factors on one hand and outcomes in patients with ICH on the other hand<sup>3-4</sup>. One of these factors is the initial Large hematoma volume which could be considered as an independent predictor of mortality and poor neurologic outcome after acute ICH<sup>5</sup>.

Serum calcium (Ca) is an essential factor for human life, it plays a role in the pathophysiology of cerebral ischemia and influences the molecular pathways of ischaemic neuronal death<sup>6-7</sup>. Previous researchers<sup>6-8</sup> had reported an association between serum Ca level and ischemic strokes as it was observed that a high serum Ca level was associated with a small infarct size and less severe ischemic stroke<sup>7</sup>. In addition, Appel et al.,<sup>9</sup> observed that ischemic stroke patients with high Ca level had a favorable outcome in comparison to those with low Ca level. Moreover, others demonstrated in a previous study that individuals with high dietary Ca intake had a reduced stroke risk<sup>10</sup>.

Data from experimental studies showed an association between Ca levels and changes in bleeding and clotting time<sup>11-12</sup>, thus it was suggested that Ca could play a role in haemostasis in the setting of acute ICH<sup>13</sup>. Recently, few data were published on the relation between serum Ca level and the initial hematoma volume<sup>14</sup> as well as outcomes after ICH<sup>13-15</sup>. However, the underlying mechanisms are poorly understood<sup>14</sup>.

The aim of the current study was to assess serum Ca level in patients with primary ICH and searching for a possible association between baseline Ca level and both of hematoma volume and short-term clinical outcome.

### **Patients and Methods:-**

This study was conducted on 90 patients with primary intracerebral haemorrhage (ICH) who were admitted in Intensive Care Unit (ICU) and stroke Unit of Neurology Department, Zagazig University Hospitals during the period from July 2015 till April 2016. Patients were selected according to the following criteria: patients with ICH who were admitted within 24 hours of symptoms onset. Intracerebral haemorrhage was defined as a new and acute (< 24 hours) neurological deficit with compatible brain imaging showing the presence of intracerebral bleeding<sup>16</sup>. Patients with ICH secondary to trauma, tumor, vascular malformation, current use of anticoagulation and those with haemorrhagic transformation Excluded from the study.

All patients were subjected to the following: detailed medical and neurological history taking from either patients or relatives with stressing on stroke risk factors, complete general and neurological examination with assessing stroke severity using National Institute of Health Stroke Scale (NIHSS)<sup>17</sup> which was done on admission. Brain Computed Tomography (CT) scans was done within the first 24 hours of symptom onset to diagnose ICH and to calculate the volume of intracerebral hematoma. Hematoma volume was measured on the initial head CT scan with the use of the ABC/2 equation<sup>18</sup>, in which A is the greatest diameter on the largest hemorrhage slice, B is the diameter perpendicular to A, and C is the approximate number of slices with hemorrhage multiplied by the slice thickness.

Laboratory investigations including Complete Blood Count, blood glucose level, liver and kidney functions, lipid profile. Assessment of total serum calcium level was done on admission for all patients from venous blood samples. Low calcium level was considered when total serum calcium was less than 8.6 mg/dl according to the reference range of our laboratory. Informed consent from patients or their relatives about the study were obtained. This study was approved by the local ethical committee of Zagazig university hospitals.

Short term outcome was evaluated for the surviving patients after one month from ICH onset using modified Rankin scale<sup>19</sup> which estimates the patient disability with a score ranging from 0 to 6 patients with a score of 0-2 had a favorable outcome. Those with a score of more than 2 considered unfavorable outcome.

### **Statistical Analysis:-**

We used SPSS version 20 software package<sup>20</sup> for data analysis. Quantitative variables were expressed as mean  $\pm$  SD whereas qualitative variables were expressed as number and percentage. Comparison between groups was done using Chi-square test ( $\chi^2$  test) or Fisher exact for categorical variables and Student t-test for continuous variables. Correlations between continuous variables were assessed by Spearman correlation coefficient. P-value < 0.05 was considered significant.

**Results:-**

A total of ninety patients with a mean age of  $68.11 \pm 10.79$  years were included in this study, Fifty –six were men and thirty-four were women. According to the serum Ca level, we had two main groups: a group of ICH patients with low calcium level  $< 8.6$  mg/dl which included 13 patients (14.4 %). The other group consisted of patients with Ca level  $\geq 8.6$  mg/dl. Baseline demographic and clinical characteristics according to Ca levels were listed in Table 1. There was no significant difference between those with low and normal calcium level groups as regard sex, age or stroke risk factors. Mean hematoma volume was significantly higher in hypocalcemic than did the normocalcemic group ( $68.23 \pm 7.54$  versus  $24.07 \pm 19.52$  respectively). The mean NIHSS scores at admission was higher in those with low Ca level than normocalcemic groups denoting that patients with low serum Ca had a severe stroke and more neurological deficit ( $27.38 \pm 5.0$  versus  $12.23 \pm 7.06$  respectively).

There was a significant inverse correlation between serum Ca levels in all cases of ICH and the following: hematoma volumes ( $r = -0.778$ ,  $P < 0.001$ ); stroke severity ( $r = -0.698$ ,  $p < 0.001$ ); short-term outcome assessed by modified Rankin scale ( $r = -0.707$ ,  $p < 0.001$ ).

**Table 1:-** Demographic and clinical Characteristics of the studied patients:

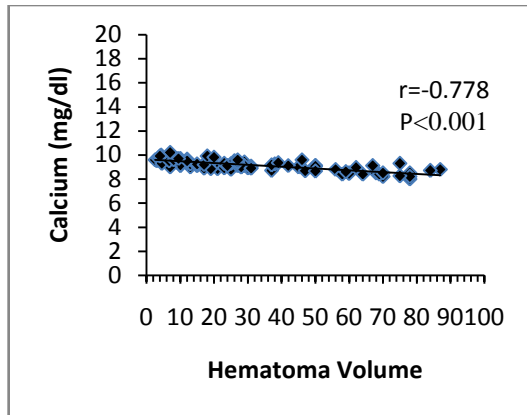

Variables	ICH with Ca $< 8.6$ (N= 13)	ICH with Ca $\geq 8.6$ (N= 77)	P- value

### Discussion:-

Primary ICH has been reported to be the most devastating form of stroke. It has no proved specific therapy to improve the outcomes according to the results of randomized clinical trials <sup>21</sup>.

Prognostic laboratory biomarkers have the potential to predict endpoints like complications, mortality, or poor functional outcome in the setting of ICH and therefore may enable preventive and therapeutic interventions <sup>22</sup>.

In the current study we investigated the relation between serum Ca level and both of the initial hematoma volume and the short-term outcome in the setting of ICH, as we included (90) patients who were presented with symptoms and CT evidence of ICH and admitted to ICU units of zagazig university hospitals within 24 hours of symptom onset.

This study demonstrated that patients with low Ca level had large initial hematoma volume than did those with normal serum Ca. Furthermore, On studying the correlation between serum Ca in patients with ICH and hematoma volume a significant inverse correlation was observed. Also, the stroke severity was significantly higher in the hypocalcemic than did the normocalcemic group according to the results of admission NIHSS scores. In addition, a negative correlation was observed between serum Ca level and stroke severity scores as assessed by NIHSS.

These findings were matched with the finding of Morroti et al., <sup>14</sup>, who conducted a cohort study of 2123 consecutive patients with ICH, 10.9% of their Patients were hypocalcemic and had a higher baseline hematoma volume than did those with normal serum Ca level. Also they observed a significant inverse correlation between serum Ca and baseline hematoma volume.

Similarly, in (2013) Inoue et al.,<sup>13</sup> conducted their study on 273 patients with primary ICH and classified their patients into four quartiles according to serum Ca levels. They reported an association between low serum Ca level on admission and initial hematoma volume in patients with acute ICH. Moreover, they demonstrated that the NIHSS scores were higher in patients with the lowest Ca quartile than did patients with the highest Ca quartile group.

Apart from these studies that concerned with ICH, there are similar observations published recently in support of the association between low Ca level and the extent of bleeding. Ho et al.,<sup>23</sup> found that hypocalcemia was associated with increased mortality among patients who were bleeding severely. Another recent study conducted by Ho and Yip<sup>24</sup> demonstrated a decreased clot strength in hypocalcemic patients who were either bleeding or at risk of bleeding and they suggested that hypocalcemia could worsen the existing coagulopathy.

Several mechanisms had been postulated to explain the association between low Ca and the extent of intracerebral hematoma. Inuo et al.,<sup>13</sup> stated that Ca is a cofactor in the coagulation cascade and involved in platelet activation, hence low Ca level is associated with large initial haematoma volume through impaired coagulation.

The second postulated mechanism is that Ca might play a role in vascular reactivity, as stated previously that hypocalcaemia could lead to higher blood pressure. As calcium in its normal levels was reported to induce vascular relaxation of isolated arteries through activation of calcium receptors in the perivascular nerves<sup>25</sup>. The last proposed mechanism that explains the association between Ca and ICH is that lower serum Ca could reflect a poor liver function as stated by Inuo et al.,<sup>13</sup> who observed in their study a higher percentage of ICH patients having poor liver function and hence poor coagulation resulting in the large hematoma volume.

The relation between serum Ca and stroke outcomes has been studied previously. It was observed that poor outcome in patients with ischemic stroke was related to lower serum calcium on admission<sup>6,8,26</sup>. Moreover, previously D'Erasmus and colleagues<sup>27</sup> recorded that low serum Ca was associated with in-hospital mortality among ischemic stroke patients. Furthermore, data from large epidemiological studies<sup>10, 28</sup> had showed that dietary calcium intake was associated with reduced mortality after stroke.

In the current study we assessed the relation between serum Ca and short term outcome after one month of stroke onset using modified Rankin scale, we observed that ICH patients who had a low serum Ca developed a high score on mRankin scale than did those with normal Ca levels. In addition, an adverse correlation was observed between serum Ca and modified Rankin scores that means patients with higher serum Ca at admission had an excellent outcome after ICH.

This result was matching with a study conducted by You et al.,<sup>15</sup> in (2015). They studied a total of 365 patients with primary ICH and assessed the relation between serum Ca on one hand and short and long-term outcomes on the other hand. They demonstrated that elevated admission serum Ca level was positively associated with excellent outcome at both discharge and three months after acute ICH.

In line with the current study, Appel and colleagues<sup>9</sup> had studied 784 consecutive patients with acute strokes including both ischemic and hemorrhagic types. They demonstrated an association between the baseline serum Ca level and stroke severity and outcome. In addition, they concluded that serum calcium concentrations could be considered as a marker of mortality in acute stroke patients.

The exact mechanisms that lie beneath the association between high serum Ca and favorable outcomes are unclear although several hypotheses were suggested. Foley et al.,<sup>7</sup> suggested that in the setting of neuronal injury that resulted during cerebral ischemia, a more calcium is shifted to the brain from the blood hence Ca could play a neuroprotective role by enhancing the antiapoptotic pathways. Any subtle increase in Ca in the extracellular space leads to activation of intracellular second messenger and initiation of the antiapoptotic mechanisms<sup>29</sup>. Previously, it was reported that moderate increase in Ca may promote the cell survival programs and potentiates resistance to hypoxia or ischemia through activated protein kinase B and mitogen activated protein kinase extracellular regulated protein pathways<sup>30-31</sup>. Another suggested hypothesis was that Ca had a role in maintaining the blood brain barrier integrity, as reported previously that low calcium levels disturb adhesion and tight junctions<sup>32-33</sup> resulting in cerebral edema which in turn leads to poor outcomes<sup>34-35</sup>.

**Conclusion:-**

Low Serum Calcium level in the setting of ICH is an indicator of large hematoma volume. There is an relationship between serum Ca level and short-term outcome in patients with ICH, hence serum Ca level could be one of the laboratory biomarkers of prognostic significance in the setting of primary ICH. Thus this study recommends starting modifying calcium levels of patients with ICH arriving in the emergency department as soon as possible to improve the clinical outcome.

 New Theory of Communication,  
 Metapore.

#### Abstract

The development of communication and information technology has resulted in a new spatiotemporal perception that determines new social, political and economic dynamics. The press has been part of this scenario as a boost for an ideal education. According to this logic, audiovisual can be comprehended way beyond daily limits, being more than just educative. This article shows the possibilities of this new horizon for an audiovisual educational understanding assuming that every audiovisual can be educative and more than that, these materials enable the individual the freedom to feel, think and incite new understandings adding teacher's and screenwriter's understandings. In a way to develop this logic, the article shows the relation between audiovisual and education seeing that the sensitive provides a new way of communication. Lastly, the metapore that is different from the classical method is showed as a way to comprehend audiovisual respecting the dynamics of these phenomena and how they work and develop all around the world.

#### Introduction:-

Audiovisual has been used as a way of providing an approaching feeling among the subjects involved in the teaching-learning process as well as facilitates the dissemination of concepts and simulations of several experiences and moreover, audiovisual allows different ways of thoughts as a communicative message through different forms. Audiovisual allows to imagine different ways of communicational message appropriation through different meanings and such potential has been even more intense in several contexts. The idea of an audiovisual education as a produced and used material to teach even if they have been used for noble purposes but they have been underutilized. This article shows that any audiovisual can be educative overcoming the assumed antagonism created between audiovisual education and non-audiovisual education.

This focus presupposes to comprehend that such assumption is connected with the occidental thought that rationalized the world and established dubious relations in order to comprehend the knowledge as a division between idea and fact, subject and object, soul and body. Trying to direct the eyes of an individual that was labeled as educative shows the first way to deny all the potential of these materials. These materials show their textures, folds, cracks as they are. From a phenomenological perspective that explanation means label and fit them in categories created by us (artificial act) and therefore, out of the object. Instead of this it is need to describe the phenomenon. Describe in this case means "approach the men perspective that they experience as well as the way it is showed to the conscience" (Carmo, 2004:22). It is needed to feel and be the perspective. Merleau-Ponty says that to have knowledge an individual must be sensitive, linking the subject and the object. It is needed to value the

 Brasil.

unconscious. Everything that existed as knowledge in our conscious passed through our perception first. The feeling does not follow the rules of the individual so unconscious acts predominate above the conscious. Before reflecting about everything it is good to realize, to think. First feel then open to the world. The thought is always before the lived experience and to feel it is necessary to ignore the rules, the preestablished scripts. Audiovisual presents the potential to reach and awake sensitivity and this way helps in the hard work of letting loose from senses externally preestablished. This happens because audiovisual as an art represents a way of freedom of looking and meaning and the individual can feel and know not because it is external from the other but because it is actually the other and it not possible to distinguish between psych and visible. In this perspective this approaching occurs through communication. Communication is much bigger than this, devoid of materiality. It is something that establishes with the alterity principle. According to this and implying that Communication – as science – reaches what Marcondes Filho (2011) calls majority, a specific space of communication and it is needed to admit that communication is only possible by achieving a fact that is featured through a break paradoxically able to introduce life in a relation because it implies a radical change in what it was and what becomes after this break.

The facts are unique and imply in natural situations that enable real freedom of movement. The construction of an audiovisual narrative in a metapore communication reflects in dynamic facts without previous scripts, only following the natural flow. From this perspective, audiovisual ends up being underutilized and educative methods did not have a value in favor of a wider and emancipatory education. This article shows the useful use of audiovisual under the perspective of communication as a break (Marcondes Filho, 2010).

### **Audiovisual and Education:-**

The wide potential of means of communication was too early recognized and used for several purposes from manipulative and persuasive advertising to direct target as education. This acknowledgment became more evident at first with the radio, then cinema and telecommunication consecrated the power of influence and persuasion of these means. In the beginning of the 20th Century, after the invention of cinema the movies started being used pedagogically in schools. From this moment, many researches started being developed to verify the pedagogical potential in movies that besides offering a new way to see the world also enabled new ways of learning (Wittich; Shuller, 1979).

As the time goes, it was clear that the problem was not in the materials, but in its educational context use. Two sides ended up appearing related to the participation of audio visual in teaching-learning process. The American side disseminated an intuitive conception, seeing that the main exponents, Wittich and Schuller, defended a sensorial feeling as a learning method and in this case stood out only the teacher. Audio visual materials need to be comprehended by the teacher (being teacher's resources but not necessarily students' resources). It is possible to research from Kieffer and Cochran (1962) because of their guides of audio visual techniques. Audio visual could be efficiently used if they were resignified by the teachers. The french side had in Robert Lefranc (1980) its main diffuser. In many aspects the French side was better than the American side, mainly by its self image study and its meaning methods. This tradition becomes evident when during a long time the Image Theory studies were focused on Roland Barthes' studies but this work did not overcome that the messages should be decoded by the teachers inside the classroom and a few space is allowed for the students. It is important to highlight Dieuzeide (1965) that put the teacher as a moderator allowing certain space for the apprentice.

Until then, being French or American side, the researchers comprehended that the messages were an abstraction process derived from sensation and perception. The audiovisual experts had this understanding about the image and received a lot of criticism. The image is not a copy – less precise – of the reality. This conception was getting even more clear as long as the means of communication were developing and the researchers overcame the passive recipient idea. The media messages started being a part of the students and demanded more studies about it. Audiovisual could be efficiently used in classrooms and the focus turned in the way or the mechanisms that make the learning possible through media messages.

In Brazil, the dynamic use of audiovisual as educative purposes were not different. According to Franco (2010), image projections with movement have already arrived in 1896. The integration between cinema and education were already in movement and it was needed a renovation in education, for example the “New School Movement” consolidated by the pioneers. In this context, this integration was seen as an important boost for the development and progress in Brazil. These movements wanted a fair and egalitarian for men and women and ended up creating

the National Institute of Educative Cinema (INCE)<sup>1</sup> in 1937. The INCE activities were closed in 1990 after several changes and initiatives that did not value the art and the culture.

The use of audiovisual in classroom (Brazilian context) was marked by the repetition logic and not necessarily by the potential of esthetic appropriation that these materials could offer. Audiovisual and the cinema were even more adapting as tools (technical sense) by the teacher and the students were supposed to learn the content showed. Trained teachers using these means of communication in classroom started being incentivated by many governmental, federal and municipal programs from the '90s when the internet enabled new social, cultural and economic dynamics. An esthetic appropriation continued being ignored to give place to a guided media insertion that Franco (2013) describes as a repetitive/accumulative paradigm. The context of contemporary societies imply changes in the way of learning and appropriation. According to the author, it does not exist a necessity of collecting knowledge and the current scenario (marked by connectivity) demands new abilities on selecting/articulating paradigms. This means to know how to search and select contents.

The Brazilian context exposed until here allows to comprehend the reasons that made audiovisual creativity in classroom be gone. The proposal of this use of language and its technological support had already followed by manuals that showed themes, running time, equipments and these rules blocked the cinematic creativity and turned out blockers and boring educative movies (Franco, 1988:46). The comprehension and the respect about the affective and sensorimotor (cinematic language) to associate with education themes were constantly ignored to give place to proposals that guided monological repetition of contents. Audiovisual in this case was just the support for the conservatism in classrooms. The intuitive particularities of the audiovisual language that would allow new appropriations and perceptions were summarily ignored. There may be added the early prejudice of many teachers that used these materials in educative contexts and did not exist public policy that incentivated the teachers to use these materials and only with them it would be possible to associate cinema and education.

Changing the discussion to the production of audiovisual it is possible to verify that mainly because of new technologies and high use of connectivity in Brazil that it has been led to an even more collaborative context. The emergency of new formats and contents not always contemplated with a good esthetic quality but with high access for example homemade videos on *Youtube* shows that there is a big curiosity to know what other people produce and because of that there are many websites that allow the users to upload their own content be them personal, educative or professional blogs.

It is interesting to learn the certain point where audiovisual communicates something. The exposed material above corroborates the idea that the biggest challenge of these produced materials is to find a way to rethink and comprehend this communicative phenomenon Buttons that respond to stimuli are daily classified as “interactive”, as though the single fact of signaling an action coincided with the complex process that entails the communication, therefore signal is not communication (Marcondes Filho, 2010).

### **Thinking about a new theory of communication:-**

Communication is much bigger than this, devoid of materiality. It is something that establishes with the alterity principle. According to this and implying that Communication – as science – reaches what Marcondes Filho (2011) calls majority, a specific space of communication and it is needed to admit that communication is only possible by achieving a fact that is featured through a break paradoxically able to introduce life because it implies a radical change in what it was and what becomes after this break. The facts are unique and imply in natural situations that enable real freedom of movement.

The construction of an audiovisual narrative in a metapore communication reflects in dynamic facts without previous scripts. This dynamic was expressed in *Chronique d'un été*<sup>2</sup> when Edgar Morin and Jean Rouch developed that showed a single question for different people. The answers and discussions were based on a metapore view. In

<sup>1</sup> “About the legacy left by the INCE, Franco (2010:14) says:” Unlike many renewing initiatives that last a few and close without traces, the INCE left a production of more than 500 movies about several themes and different formats with so many genius creations by Humberto Mauro and uncountable productions from other filmmakers”.

<sup>2</sup> *Chronique d'un été* (1960) documentar fulfilled in Paris by Edgard Morin and Jean Rouch and became a reference to what it is called “true cinema”.

this way, this logic entails a new scientific dynamic research polarized between objectivity and subjectivity, transmission and reception, signification and meaning (Marcondes Filho, 2010). Assuming this perspective implies to understand that communication occurs in a logical search to reach the sensible, the unique, the irreproducible of each experience.

In educative situations, audiovisual is usually useful to stimulate the learning and potentiate the communicational process. However, communication can be too far. The constant search for the “ideal format” created a situation that does not privilege the execution of effective communicational proposals but it privileges theories connected to technical progress. A lot of money has been spent in audacious technological projects that has not been influencing the reality of the people. There are a lot of materials that cannot even reach pedagogical objectives proposed because they ignore the basic meaning. It is needed to consider that there is an intangible point in the comprehension of this problem because it is important to identify the sensible and culminates in the necessity of causing a break. It is needed to touch and influence the individual in their cognitive-affective structure to establish a genuine communication and the conception of communication assumed by Marcondes Filho (2010) that when invoking the emitter/receiver the first is able to transmit signals that is going to be called communication from the receiver’s point of view.

A movie or an educative audiovisual movie can communicate something if it destabilizes the people and forcing them to reflect. In this way, besides allowing a renewing esthetic experience also enables the alterity exercise and its reorganization. Assuming this perspective presupposes that communication cannot be massified from a single and ample meaning and this meaning is related to a semiotic conception. It is discussed the meaning that link together with the communicational fact and this fact is unique and no human can transfer it because only the individual that experiences the communication is able to know the provoking amplitude that this act has caused.

### **Metapore and communication research:-**

Unlike the classical or traditional research, the research that assumes the communication as a fact that shows the necessity of rewriting the ways and revisits the themes as a function of a new context but especially as a function of the moment. Communication passes through this moment so the idea of preestablished methods and constantly applied do not fit in the perspective of audiovisual comprehension. This thought becomes more evident when it is possible to comprehend Marcondes Filho’s saying (2008:151-152) that communication must be felt, experienced and it is needed to participate to investigate it and this communication is history, sociology, anthropology therefore, something dead.

The “live” is precisely in the absence of a fixed, final, closed and aseptic method. The researcher needs to find ways of looking and studying the object. The comprehension of this object is in a context and how many times it is observed the same object, how many times it is needed to rebuild and rediscover distinct ways of observing. The mind must be open to the constant movements of the world and such movements are unique, irreproducible and likely of perceptions that are unique as well. In this logic, more than the reception of these contents by touchable means (typical vision of empirism) it is important to highlight the perception of the meaning defended by Merleau-Ponty and the perception is not a cold representation but still an existence fact with body characteristics. This perception is seen when the individual looks at the object and feels and becomes part of this object and the body notices the perception of the movement and the immobility keeps it confused, stunted, stuck (MERLEAU-PONTY, 1994).

When a person looks at the object it is showed that the person wishes this object and the sensations are linked to movements and every object influences the realization of a gesture. It is not a representatio but a creation, new possibilities of interpretation (Nóbrega, 2008:142). The work of art it is the local that enables a space for more intense perceptual perspectives and it is important to realize the visible and invisible notion. According to the philosopher the unoccupied spaces are important, seeing that they are part of the whole context and they are able to accelerate the curiosity.

To Merleau-Ponty, the objects, the things only exist when the individual notices it and the perception cannot be conceived according to Science. The perception is felt and there are no previous methods established, there is not a rule to be followed. The person notices and feels the way they want it therefore audiovisual will only exist if the person perceives it and this perception is only possible by seeing the sensible. To Merleau-Ponty there is no way to

observe the phenomenon from the outside and the perception is only seen as long as the individual becomes a part of this object and when it is not possible to separate them. The audiovisual has the ability to reach deeper layers and enables other ways of learning. The perception is unique and inalienable and it is possible to realize that every human being is able to conquer it by freedom of spirit.

Watching these movements presupposes to comprehend the communication as a break that leads to a qualitative boost. Audiovisual can be noticed when it is possible to communicate something, when you can touch the person and the researcher needs to comprehend and not to apprehend. Not everything can be comprehended because of the subjectivity. It is clear that the classical method conception does not offer mechanisms of apprehension, while the metapore imprisons, the metapore releases the researcher to feel and capture the fact. The metapore's researcher needs to get rid of a preestablished thought and be open to observe new movements, assuming the role of a world spectator (Dantas, 2012). This spectator is the world and it is surrounded by lines, vectors and unique sensations in unique situations. The body in this case needs to be open, unfinished to have conditions to be able to receive and allows new thoughts (MERLEAU-PONTY, 1994). This relation builds the object and not the contrary. The base is the communicational fact and can be comprehended by new characteristics and by ephemerality, movement and unpredictability.

If the meaning of metapore enables researches that were impossible without this view on the other hand imposes challenges from an uncontrolled object. "The object is neither known nor conceptualized; it does not remain for a long time; it is not stuck, parked or frozen; it does not show when it is going to happen again" (Marcondes Filho, 2008:1). Even so there are ways of operating the metapore, a terminology utilized to replace the method that entails a determined way that must be followed. The metapore functions by a space, passage that allows a communicational fact. The researcher does not focus on learning, capturing or dissecting but on experiencing and feeling it. The researcher does not have a specific method but operational formats that in essence guide the path of the researcher through the object. Their search is not the meaning but the sense that is only awake before a communicational break. The event that is the essential condition so that this occurs does not have a sense but it is felt when studying the event regardless of the duration. The researcher must accept this phenomenon (devoid methodological bonds). The sensibility, looking and opening to think are essential to go through a metapore's research and this researcher needs to have a great ability to describe and report the events. The language in this case can be an obstacle once not everything it is experienced can be expressed in words, texts, etc.

It is needed to be open to an instantaneous apprehension. This necessity resets the importance of intellectual intuition or "events that precede and succeed the sensitive intuition" (Marcondes Filho, 2010:254). It is up to the temporality of the metapore defined by the author as an "extended temporality marked by peaks of bliss". These peaks correspond to sensitive intuition and the turning moment, the moment of the occurrence of this phenomenon that justifies the statement of a genuine communication that enables the break and the impression of something that marks, forces, shocks and breaks the individual.

This transformation that shocks, forces can happen in the first moments of the event (like a strong emotion or even at the movies) and the effects will be felt in previous moments. In this case, the intellectual intuition processes afterwards, in a way that remains resonating in the subject and transforming after a movie for example. But in educative situations the meaning is different, because "the informations are exposed creating an intellectual intuition until a sensitive intuition that creates the sense, therefore the intuitive peak occurs in the end when the changes are expressed through persistence and continuity of the elements" (Dantas, 2012, p.12).

Audiovisual has the potential of enabling peaks of bliss in the beginning (while a movie) and in the end (while educative process). It is important and needed to investigate under a new view that allows to comprehend as more than just technical elements of teaching. Furthermore it is about an enlightenment and point of resistance to break the cold logic of production and broadcasting of these materials. In the 80s, Franco (1988) had already expressed how boring was the educative audiovisual and maybe this is the possibility of learning what establishes communication in these expensive materials, enabling another ways of noticing and effectively feel them in all

**Final considerations:-**

The investigation of the metapore consists in feeling, experiencing and recording. It is needed to let the sensible intuition touch the person and this marks the event so that there is an opening that allows the researcher to record elements that were ignored by the strict methodological logic.

For not having fixed steps, the different does not need (and must not) be ignored. On the contrary, it helps to understand the phenomenon. Study procedures of communicative events must halt the examination of its own occurrence. It does not exist a goal oriented to be achieved or path to be taken. Conceive the reason investigation through metapore and free the researcher to exercise the look and redemption of his own subjectivity. Knowledge is always temporary and the route is eternal. The land is flat, characterized by unique gathering of wires, lines and vectors into a single point of the existence of human beings. For this reason, unlike what proclaimed the classical theories, the communication is not something that can be transferred, shared and communed by everybody. There must be a specific moment of opening between them. That particular time cannot be frozen and it is possible to feel the other, grasp the ungraspable and overcoming the logic of the material body to achieve a deeper climax, eclipsing in the immaterial. The purpose of the identification of the event is not grasp or understand. It is to experience something radically new that is capable of providing qualitative leaps in the relationship, allowing to identify and describe an event which is possible to see and observe in a single occurrence.

During many years the potential of audiovisual (the cinema for excellence) for education was considered a hostage of educative appellation. This designation was (and in many countries are) connected to a produced material with specific purposes and followed by a manual or pedagogical strategies. This formatted and antiquated conception reveals proposals that confine you instead of releasing the human creativity.

It is important to highlight that in the Brazilian context Franco has been developing for 40 years the conception that any audiovisual can be educative independent of the formatted idea that was previously thought and closed. The educative aspect is in the unique relation that is established in the exhibition of the audiovisual corroborating with the idea that "what is educative is not a movie, the cinema. Educative is the moment of the connection between the movie and the spectator and the result of this interaction is going to depend on the condition, the psychological and emotional moment of this spectator" (Franco, 2013). While watching, the individual suffers transformations and this is educative and it does not matter how many times this movie will be watched because the work is always new, "the soul of a man and the society are revisited and reinterpreted in every exhibition" (Franco, 2013).

In this sense, audiovisual provides a discovery of the subject itself, a move that could culminate in a communicational event that entails a qualitative leap from the point of view to communicational education. Regarding to the research involving educational audiovisual, the proposed metapore enables an opening never before displayed: the researcher can be sensitive and understand the phenomenon, being the communication event during an exhibition or even during the production of an educative material. The transformation occurs to the producer and the the spectator of these materials as well so it is not a cold production or even chronologically dated seeing that "the great and eternal cinematographic work regardless of being older or futuristic films they have a philosophical tone because they make an individual stimulus to think and understand the past and the future" (Franco, 2013). Therefore, the author's statement establishes a direct connection with the ultimate goal of education that is to enable the men, clarifying the understanding of the past and future, envisioning and experiencing the freedom.

#### Abstract

Arid region is characterized by high temperature and high evaporative demand that has made survival of insects difficult. The lepidopterous fauna of India with particular reference to arid and semi-arid region is relatively diverse and has received a very little attention by the scientists. The knowledge of food efficacy of lepidopterous species in a particular ecosystem, pertaining to their life-stages and effect of abiotic factors, is essentially required for their effective conservation.

Lepidoptera normally feed on horticultural plants. The *Daphnis nerii* is a lepidopterous moth usually found on the host plant *Nerium oleander*. They defoliate the leaves, leaving veins and veinlets. An experiment has been laid down in the lab as well as in field condition, where *Nerium* leaves were provided to starving fifth instar larvae of *D. nerii* and the food efficacy were evaluated. The coefficient of digestibility (C.D.), the efficiency of conversion of ingested food to the body weight (E.C.I.) and the efficiency of conversion of digested food (E.C.D.) of *D. nerii* larvae, fed on the leaves of *Nerium oleander* were recorded as 80.43%, 13.21%, 15.01% respectively. The *Nerium oleander* is found as a most suitable host plant for the rearing of *D. nerii*. There are 4 to 5 overlapping generations in a year. There are five instar larvae. The incubation period is about 25 to 28 days. The pupal period lasts for 20 days.

The influence of abiotic factor like temperature and relative humidity on the survival of *D. nerii* has been studied. The most suitable period for *D. nerii* is from August to October with temperature ranges from 25° to 30°C and relative humidity ranges from 55 to 60 %.

#### Introduction:-

Hawkmoths (Sphingidae) are one of the few lepidopteran groups to have been well inventoried and documented on every continent (Kitching and Cadiou 2000). Backed by a wealth of information and their biology, life histories, and morphology, the Sphingidae have played significant roles in a variety of research programs. Examples include pollination biology (Inoue 1986, Kato et al. 1991, Willmott and Burquez 1996, Maad 2000, Ando *et al.*, 2001), biogeography (Holloway 1983) and conservation biology (Holloway 1991, Kitching 1996). The sphingid fauna of

India with particular reference to arid and semi-arid region is relatively diverse and has received a very little attention by the scientists.

The single family, Sphingidae is most diverse in tropical regions, but the large, fast-flying moths are familiar insects throughout the world (Daly et al., 1998). Sphingidae is a family of moths commonly known as Hawk Moth, sphinx moths and horn worms that includes about 1,200 species (Grimaldi & Engel, 2005). The hawk moths are medium to large-sized, heavy-bodied moths with characteristics of bullet-shaped bodies and long, blade-like wings.

Species of *Daphnis nerii* mainly feed upon oleander (*Nerium oleander*). *Nerium oleander* is a very toxic plant but *Daphnis nerii* is immune towards its toxicity. The adults feed on nectar of a variety of fragrant flowers like petunia, jasmine and honeysuckle. They are active in the night time, visiting the flowers after the sunset. They are common throughout the year; the monsoon season brings the increase in their population size. Summer months were the quiescent period of the reproduction of *Daphnis nerii*, and monsoon season promotes the reproduction activity, which was studied in detail (i) life history length (ii) Population index and the rate of development of life stages of *Daphnis nerii*. This knowledge is useful in the conservation management of the Lepidoptera: moth. Adults of *Daphnis nerii* breed throughout the year. Due to its habit as a strong flier, *D. nerii*, has been observed to have been migrated from one region to the other within a short span of time. The adult moth is one of the most beautiful patterned moths in the arid ecosystem. The studies were conducted during from 2010 -2011.

The rate of development of insects has a strong nutritional component. Food intake by larvae, as well as the quantity of food ingested, affects growth rate, development time, final body weight and survival (Slansky & Scriber, 1985). The larval instars are prolonged and the relative growth rate of insects is reduced (Carvalho, 1996). Besides an adequate level of ingestion of nutrients, assimilation and conversion of food into energy and biomass are also related to insect growth (Reese, 1978). The assimilation of ingested food (digestibility), as well as the ability to convert ingested and digested food into growth, was evaluated by means of bi-coordinate plots (utilization plots) associated with analyses of covariance developed by Raubenheimer & Simpson (1992, 1994).

Temperature is the most important environmental factor affecting poikilotherms and has a pervasive effect on physiological processes and on almost all aspects of organism's performance. Growth of caterpillars is strongly temperature dependent (Sharpe and DeMichele, 1977; Scriber & Slansky, 1981) and the degree of temperature dependence varies from species to species and optimal temperature for growth is also variable (Taylor, 1981).

The temperature- dependent developmental rate curve of an insect is an important feature of its life history (Taylor, 1981). Using degree – day accumulation to predict a wide variety of events such as egg hatch, adult emergence, or migratory flights may be feasible for pest management. Degree day accumulation needs knowledge of both insect developmental response to temperature and lower developmental threshold (Woodson and Jackson, 1996).

### Material and Methods:-

An extensive collection of larvae of *D. nerii* were made from *Nerium oleander* plants in and around Jodhpur, by hand during the course of these investigations. The larvae were brought to the Entomology laboratory in Arid Forest Research Institute, Jodhpur in small fine meshed wooden cages (20 x 20 x 15 cm.). The larvae were sorted out in laboratory and only those measuring about 80-85 mm (final instars) were utilized for investigation. The test larvae were starved for a period of 24 hours in order to prevent excretory deposition on excrementitious filaments. The larvae were kept at 28°C ± 2°C temperature and 56.0 % relative humidity. Whatever excretory matters were given out during this period, the same was removed and discarded. After 24 hours three batches of 10 larvae each were weighed and supplied with about 87.328 gm. (net weight) of *N. oleander* and allowed to feed on them for 24 hours. After this period food was withdrawn. Excrementitious matter produced subsequent to feeding was collected and its wet weight was determined. The weight of larvae was also recorded to determine gain in weight during the 24 hours period. The unconsumed leaves were weighed to find out the amount of leaf matter consumed.

The coefficient of digestibility (C.D.) was calculated as:

$$C.D. = \frac{\text{Dry wt. of food ingested} - \text{Dry wt. of excreta}}{\text{Dry wt. of food ingested}} \times 100$$

The efficiency of conversion of ingested food to body wt. (*E. C. I.*) is measure of the overall ability of an animal to grow on a given food. It was calculated as:

$$E.C.I. = \frac{\text{Dry wt. gained by animal} \times 100}{\text{Dry wt. of food ingested}}$$

The efficiency of conversion of digested food to body wt. (*E. C. D.*) is calculated as:

$$E.C.D. = \frac{\text{Dry wt. gained by animal} \times 100}{\text{Dry wt. of food digested}}$$

### Results and Discussion:-

The period of development from egg to adult emergence spanned over 24 (□ □ 5) days. The result obtained on the quantity of food eaten in relation to the gain in the body weight and quantity of excrement of produced is presented in the table 1.

The coefficient of digestibility (*C.D.*), the efficiency of conversion of ingested food to the body weight (*E.C.I.*) and the efficiency of conversion of digested food (*E.C.D.*) of *D. neri* larvae, fed on the leaves of *Nerium oleander* were recorded as 80.43%, 13.21%, 15.01% respectively.

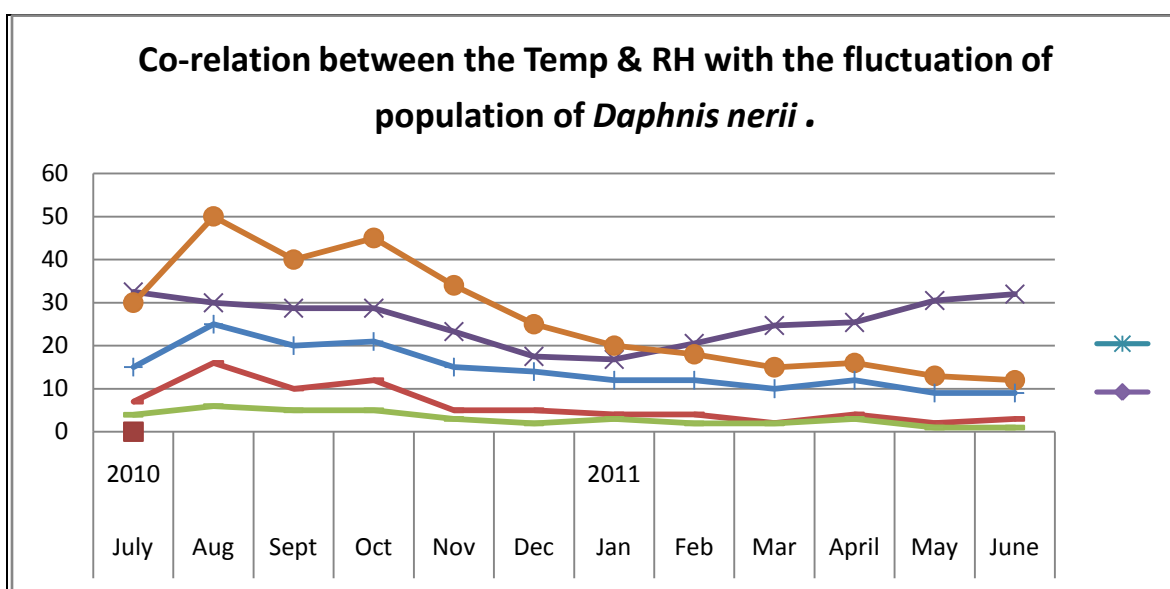

**Table 1:-** Food eaten in relation to the gain in the body weight

S.No.	Particulars	values
1.	Fresh Weight of leaves provided to batch of 10 larvae (gm.)	87.328
2.	Dry weight of leaves provided to batch of 10 larvae (gm.)	16.373
3.	Fresh weight of unconsumed leaves (gm.)	54.063
4.	Dry weight of unconsumed leaves (gm.)	09.836
5.	Fresh weight of consumed leaves (gm.)	29.536
6.	Dry weight of consumed leaves (gm.)	5.979
7.	Initial weight of batch of 10 larvae (gm.)	6.8
8.	Final weight of batch of 10 larvae after 24 hours (gm.)	7.59
9.	Weight gained by 10 larvae after 24 hours (gm.)	0.79
10.	Fresh weight of fecal matter excreted during 24 hours (gm.)	2.273
11.	Dry weight of fecal matter excreted during 24 hours (gm.)	1.170
12.	Dry weight of food digested	5.26

The assessment of the Population index and the rate of development of life stages of *Daphnia neri* in laboratory in relation to Temperature and Relative Humidity indicated that, all the life stages are evident during the entire year, with higher frequency during August – October. Development from egg hatch to the adult stage occurred at all temperature tested: survival declined above 30°C or below 25°C. There was a decrease in developmental time with increasing temperature for most life stage. The rate of development of these life stages leading to the formation of adults as studied in the laboratory is varies with the change in temperature and humidity as presented in table 2. The extreme of temperature had detrimental effect on immature growth and caused high mortality. The mortality was also caused by unable finishing larval stage, unable pupating or by deformed adults with misshapen wings, common during November – April and less common during May- June. All the life stages are evident during the entire year, with higher frequency during August – October. The rate of development of these life stages leading to the formation of adults as studied in the laboratory is also varies with the change in season, as it is maximum after monsoon season *i.e.*, during the month August – October and declines towards the month of May.

**Table 2:-**Population index and the rate of development of life stages of *Daphnis nerii* during 2010–11 in laboratory in relation to Temperature and Relative Humidity.

#### Abstract

This research study aimed to compare the image quality and contrast using different pulse sequences and to evaluate practical impact and efficacy of altering imaging parameters on image quality using magnetic resonance imaging. A tissue equivalent dosimeter gel system by using Xylenol orange dye with Fricke-Benzoic solution was developed and the gel system was irradiated using 6MV photons. Conventional spin echo (CSE), Fast spin echo (FSE), gradient recalled echo (GRE) and fluid attenuated inversion recovery (FLAIR) pulse sequences were used to analyze the effect of TR (repetition-time) and TE (echo-time) on contrast to noise ratio (CNR). The calculated percentage increase of contrast to noise ratio (CNR) for TR using pulse sequences CSE, FSE, GRE and FLAIR was 8%, 10%, 6% and 4% and the percentage decrease for TE is 3%, 4%, 5% and 11% respectively. The qualitative analysis include the effect of TR and TE on contrast to noise ratio according to which the increasing repetition time gives good contrast to noise ratio especially for conventional and fast spin echo sequence. It is better to keep echo time lower but this is an imperceptible parameter for contrast to noise ratio for T1-weighted images.

#### Introduction:-

MRI is a non-invasive method with diverse pulse sequences to measure doses in dosimeter gels and was first proposed by Gore et al in 1984.(Gore and Kang 1984) It is well known for its high contrast and ability to generate 3D images.(De Deene 2009) The basic factors considered to determine the image quality includes, spatial resolution, tissue contrast and signal to-noise ratio (SNR). Due to the co-dependency of these factors their simultaneous progress is complex.(Riddell, Richardson et al. 2014) Excellent tissue contrast relies on optimal selection of appropriate pulse sequences (spin echo, inversion recovery, gradient echo, turbo sequences and slice profile). Important pulse parameters are TR (repetition time), TE (time to echo), TI (time for inversion), and flip angle.(Yamada, Wisner et al. 2002) T1 and T2 weighted images depend on a good selection of TE. Tissues vary in their T1 and T2 times which are manipulated in MRI by selection of TR, TI and TE, respectively. A contrast-to-noise ratio (CNR) is a summary of both SNR and contrast. It is the difference in SNR between two relevant tissue types (A and B):

$$CNR = SNR_A - SNR_B$$

Recent developments in MRI technology have led to improvements in contrast and SNR by the optimization of imaging parameters to achieve best possible image quality.(Bucholz, Ghaghada et al. 2008) Due to the T1 and T2 relaxation properties in magnetic resonance imaging differentiation between various tissues in the body is possible.(Damadian 1971) Contrast of the image (pathological areas of the tissue) can be improved by the selection of one of the above parameters however with the possibility to reduce the MR image excellence by the effect of other parameters.(Bartusek and Smekal 2006)

In recent years different MRI techniques and pulse sequences have been reported for the clinical use which has the ability to enhance image quality and consequently improve diagnostic accuracy.(Li and Mirowitz 2003) Nevertheless pulse sequences with ideal optimum values for a specified body tissue are still intangible. This research work is an attempt in this direction in which different parameters affecting CNR in various clinical MRI sequences have been considered.

The Fricke gel dosimeter has been used as a reliable chemical radiation dosimeter for more than eighty years.(Maeyama, Fukunishi et al. 2014) Fricke gel dosimeters are tissue equivalent over a large range of photon energies (Sullivan, Adalsteinsson et al. 2006) having the ability to stabilize the spatial information of radiation induced oxidation and a step towards modern gel dosimeter.(Maeyama, Fukunishi et al. 2014) The aim of this study was to compare the image quality and contrast using different pulse sequences, and a quantitative evaluation of impact and efficacy of altering imaging parameters on image quality. Contrast to noise ratio is the focal point to be discussed in this work. The CNR is most likely the most decisive factor affecting image quality as it directly determines the eye's ability to distinguish regions of high signal from area of low signal.

### **Method and Materials:-**

In this research work a series of images were obtained to observe the effect of variation of imaging parameter TR and TE using spin-echo, fast spin echo, Gradient Recalled echo and Fluid Attenuated Inversion Recovery sequences on image quality. A dosimeter gel was prepared using Xylenol Orange dye with Ferrous-Benzoic solution for this purpose which was exposed to a beam of 6MV X-rays with field size  $5 \times 5 \text{cm}^2$ . The absorbed dose was 20Gy at its iso-centre. All the images were acquired with a matrix of  $256 \times 256$  and flip angle 120, FOV of  $200 \times 200 \text{mm}^2$ . For each scan four numbers of slices were obtained.

### **Results and Discussion:-**

#### **Conventional Spin Echo Images:-**

The scanning was performed with spin echo sequence with echo time (TE) of 12ms, repetition time (TR) of five different values as 400, 500, 600, 700 and 800ms, slice thickness of 4mm, and FOV was  $200 \times 200 \text{mm}^2$ .

The contrast between the area which was exposed to ionizing radiations and the area away from the beam target can be seen but it is not much clear. By analyzing the image while drawing different region of interest (ROI) in the slice at different positions as shown in the *figure (1a)* with equal area it was observed that the mean value of signal intensity in the area at the centre of the slice (the area which was exposed to radiations) was 883 whereas the mean value of signal intensity in the area away from the centre (the area at the ends) was observed to be 705.

The transverse slice of the image obtained with TR of 400ms and TE of 16ms is shown in the *figure (1b)*. The mean value of signal intensity calculated in the area of beam target and away from the beam target was 528 and 402 respectively. A good CNR can be obtained with a greater value of TR and less value of TE for a spin echo image as calculated in table ( I & II) respectively.

#### **Fast Spin-Echo Images:-**

The scanning was performed with fast spin-echo sequence with echo time 12ms and repetition time with five different values as 400, 500, 600, 700 and 800ms. Images were also taken with repetition time 400 and five different values of echo time as 12, 25, 37, 49 and 62ms.

The image of a transverse slice was obtained with sequence parameters, TR and TE to be 800 and 12ms respectively.

The contrast obtained from this image by selecting different ROI in the beam area and away from beam area showed the mean value of signal intensity to be 831 and 664. Another slice of image with sequence parameter TR of 400ms and TE of 37ms, the mean value of signal intensity calculated was 490 and 385 in the beam area and away from the target area respectively.

For fast spin echo the contrast to noise ratio obtained is inconsistent with spin echo for the choice of TR but there would be a careful attention would be taken for the choice of TE.

#### **Gradient-Recalled Echo Images:-**

The scanning was performed with Gradient recalled echo sequence with echo time 12ms and repetition time with five different values as 80, 90, 100, 110, and 120ms. Images were also taken with repetition time 80ms and five different values of echo time as 10, 12, 14, 16 and 18ms.

The image of a transverse slice was obtained with sequence parameters, TR and TE to be 120 and 12ms respectively.

By taking different ROI in the slice at the beam path and at a place far away from the beam path it can be clearly visualizing the contrast between these two areas. The mean value of signal intensity calculated at the centre of the slice was 399 and away from the centre were 317.

Another slice with sequence parameters TR of 80ms and TE of 18ms with signal intensity values 290 and 212 at the beam targeted area and away from beam area respectively, is shown in the *figure 3(a & b)*. A good CNR is obtained at higher value of TR in Gradient Recalled echo but for TE its behavior is unstable.

#### **Fluid Attenuated Inversion Recovery images:-**

The results from MR imaging performed by applying inversion recovery pulse sequence are given below. The same gel composition was used for this sequence also. A set of images of five TR values as 2000, 2100, 2200, 2300 and 2400ms was obtained with sequence parameters TE and TI of 12ms and 600ms respectively. The image acquired with maximum contrast was by applying TR of 2100ms and TE of 12ms. The mean value of signal intensity for the beam targeted area calculated was 316 and away from the beam area was 134.

Some images were acquired while applying inversion recovery pulse sequence with a set of five different values of TE as 12, 25, 37, 49 and 62ms. Repetition time and inversion time were chosen to be 2000ms and 600ms respectively. The maximum contrast obtained by applying parameters, TR of 2000ms, TE of 37ms and TI of 600ms having mean values of signal intensity as 341 at the beam path and 153 at the area away from the beam.

In CSE, however with the increase of TR, CNR increased between the tissues (from 38% from 400 to 800 (ms). In FSE, CNR is created between tissues and this ratio is comparable to CSE. Contrast between tissues is high as TR moves from 400 to 500 (ms) though CNR moves up 49 % from TR 400 to 800 (ms). With the moderate signal intensity difference amongst tissues 25-0 Gray the contrast between signal strengths is evident even at small TR 80 ms in GRE. CNR increased through 27% as TR increases from 80 120ms. Within FLAIR signal strength of tissues is relatively higher than CSE, FSE and GRE at all values of TR. There is 18% increase in CNR as TR is increased from 2000 to 2400 ms. FLAIR turns out higher CNR even at lesser value of TR 2000 (ms). CNR between tissues is almost alike at all values of TR and 27% increased CNR obtained from TR 2000 to 2400 (ms). The numerical difference between two small intensities can be well differentiated in FLAIR. CSE creates CNR with the variation of TE for tissues have trivial signal strength Signal strength decreased with the rise of TE but this decrease is not tremendous .We have average 3% decrease in the signal strength i.e. CNR. However more appropriate TE is desirable to produce excellent contrast between tissues. Choice of TE in FSE is analogous to CSE to develop contrast among tissues. Signal intensity 4% decreased from TE 25 to 62 msec. GRE the percentage decrease of CNR is 5% but FLAIR creates maximum contrast between tissues of minute signal intensity difference. FLAIR can be a good choice to differentiate tissues of infinitesimal signal intensity. There is 11 % average decrease in signal intensity with the selection of high value of TE.

### Conclusion:-

This research work demonstrate the impact of variation of key imaging parameters TR and TE on image quality for the frequently used pulse sequences CSE, FSE, GRE and FLAIR at diagnostic level. Inappropriate selection of parameters is able to build an insignificant image. This analysis showed that the role of TR and TE in T1-weighted images is crucial to maintain the image quality. With the choice of TR and TE in T1-weighted images CNR results of CSE and FSE are equivalent for the tissues of comparable signal intensities and for entities have moderate difference between signal intensities CSE provides remarkable contrast between tissues because of signal intensity difference is extremely high in T1-weighted study. FLAIR which is explicitly preferable for T2-weighted images also analyzed its importance in T1-weighted images. FLAIR gives better contrast to noise ratio at lower values of TR and higher values of TE. Results strongly suggested that it can also be used for diagnostic purpose with fine image quality of high T1/T2 weighted tissues in T1-weighted study as well.

#### Abstract

A detailed study on the butterfly species diversity was carried out during 2011 and 2014 using Pollard walk method in the Dry Deciduous Teak forest of Gir National Park in Junagadh District of Gujarat State, India to assess the protected species under various schedules of the Wildlife (Protection) Act, 1972.

#### Key words:-

Gir National Park, Indian Wildlife (Protection) Act 1972, Pollard walk, Species diversity.

Copy Right, IJAR, 2017, All rights reserved.

#### Introduction:-

India with only 2.3% of the total land mass has around 91,206 animal species comprising 7.43% of the total (Ramakrishna and Alfred, 2007). Taking cognizance of the alarming situation of the depletion of natural habitats, the Government of India took significant steps in establishing the Indian Board for Wildlife in 1952 followed by the Indian Wildlife (Protection) Act, 1972. India also became signatory to the CITES, IUCN and world-wide Fund for nature. The Government of India has so far protected more than 4% of the geographical area, with 99 National Parks, 513 Wildlife Sanctuaries, 41 Conservation Reserves and 4 Community reserves (Anonymous, 2008) with a forest cover of 20.64% (Anonymous, 2003).

The Government of India under Indian Wildlife (Protection) Act, 1972 provided protection to 452 species of butterfly in three Schedules (out of six) as in Schedule I, Part IV, 128 species of butterfly; in Schedule II, Part II, 305 species and in Schedule IV (Secs. 2,8,9,11 and 61), 19 species (Anonymous, 2003). Due to advancement in taxonomy, the names of species and their families changed. Sharma and Ramamurthy (2010) have updated the list of 452 butterfly species and their families as per Indian Wildlife (Protection) Act, 1972 updated. The export of butterflies (dead or alive) and decorative articles from them are prohibited. As per Section-40 (92) of the Act, no person can acquire, receive, to keep in control, custody or possession, any of the species included in the above schedule without previous permission in writing of the Chief Wildlife Warden or his authorized officer.

The available information on the conservation importance of Indian butterfly's species and sub-species is very meagre. Though, some earlier authors (Sharma and Ramamurthy, 2010 and Kunte, 2008) have published various accounts on the insects, to be included in the WPA, 1972. During the course of the present investigation, an attempt has been made to assess the protected species of butterflies of Gir National Park under various schedules of the Wildlife (Protection) Act, 1972.

#### Material and Methods:-

The survey was conducted during 2011-2014 using Pollard Walk on fixed transects as per the methodology adopted by Pollard and Yates (1993) in order to enumerate the butterfly species in ten different habitats of Gir PAs. Existing

patrolling paths were used as transects for surveys. All flying butterflies on these selected transects were recorded between 9.00 am to 4.00 pm.

For the purpose of collection of samples, a data sheet was designed following the techniques developed and adopted by Pollard and Yates, (1993) which is comprised with all the variables such as abiotic factors, GPS factors, host plants *etc.*(separately) , collected from each of the study - sites in Gir PA Gujarat.

### Results and Discussion:-

A total of 67 species belonging to all 42 genera, representing 4 families, have been recorded from GPA. The family Nymphalidae was found dominant with 15 genera and 23 species followed by family Pieridae representing 10 genera and 22 species. Family Lycaenidae is comprised of 14 genera and 16 species whereas Papilionidae with 3 genera and 6 species.

**Table 1:-** Distribution of butterfly species family- wise in GPA

S.No.	Family	Common Names	Genera	Species
1.	Pailionidae	Swallowtail butterflies	3	6
2.	Pieridae	White and yellow butterflies	10	22
3.	Nymphalidae	Brush-footed butterflies	15	23
4.	Lycaenidae	Blues, hairstreaks & gossamer-winged butterflies	14	16
		Total	<b>42</b>	<b>67</b>

The existing check- list containing 44 species of butterfly as presented by Kiran and Ahir (2005) from GPA has been updated to 67 species, thus 23 species has been added to the earlier recorded checklist which was comprised of only 44 species.

Among the 67 species recorded from GPA during the study of two years, four species of butterflies *Pachiliopta hector*, *Hypolimnasmisippus*, *Castaliusrosimon* and *Dendoryxepijarbas* are included Schedule -I and another four species namely *Charaxesfabius*, *Ceporanerissa*, *Euchrysopsnejus* and *Lampidesboeticus* are included under Schedule -II, while remaining only one species *Euploea core* comes under Schedule – IV as per Wildlife protection Act (1972).

**Table 2:-** List of butterflies with their status (Wild Life Protection Act- 1972) in GPA.

S.No	Family	Species	Status as WPA (1972)
1.	Papilionidae	<i>Pachiliopta hector</i>	Schedule – I (WPA- 1972)
2.	Nymphalidae	<i>Hypolimnasmisippus</i>	Schedule – I (WPA- 1972)
3.	Nymphalidae	<i>Charaxesfabius</i>	Schedule – II (WPA- 1972)
4.	Nymphalidae	<i>Ceporanerissa</i>	Schedule – II (WPA- 1972)
5.	Nymphalidae	<i>Euploea core</i>	Schedule – IV (WPA- 1972)
6.	Lycaenidae	<i>Euchrysopsnejus</i>	Schedule – II (WPA- 1972)
7.	Lycaenidae	<i>Castaliusrosimon</i>	Schedule – I (WPA- 1972)
8.	Lycaenidae	<i>Lampidesboeticus</i>	Schedule – II (WPA- 1972)
9.	Lycaenidae	<i>Dendoryxepijarbas</i>	Schedule – I (WPA- 1972)

While sampling in the GPA, eight species of butterflies e.g., *Graphiumnomius*, *Ariadne merione*, *Bybliailithiya*, *Paronivaleria*, *Tarucustherophrastus*, *Azanusjeasons*, and *Spindasisictis* were rarely encountered in a very less numbers and as such these species have been given a status of rare species in respect of GPA.

**Table 3:-** Status of rare - species in GPA as per the revised and updated check-list of GPA

S.No	Family	Species	Status in GPA
1.	Papilionidae	<i>Graphiumnomius</i>	Rare
2.	Nymphalidae	<i>Ariadne merione</i>	Rare
3.	Nymphalidae	<i>Bybliailithiya</i>	Rare

#### Abstract

The power of culture in each country is very influential in shaping the characters of people in organization especially leader. A good leadership will affect the organizational performance. This study aims to identify the values of local ethnic culture and its role in shaping characteristics of effective leadership in South Korea, Indonesia and New Zealand. The method was adopting qualitative method by analyzing literatures on local culture of Korean in South Korea, Bugis in Indonesia, and Māori in New Zealand. The study found that similar characteristics of the three local ethnic cultures are the basic characteristics in forming characteristics of effective leadership especially in the region of Asia Pacific.

Copy Right, IJAR, 2017., All rights reserved.

#### Introduction:-

Culture resides at multiple levels, from nations, civilizations, organizations to groups (Schein, 2004) and it is generally defined as “the enduring sets of beliefs, values, and ideologies underpinning structures, processes, and practices that distinguishes one group of people from another” (Walker & Dimmock, 2002, p. 16). Murray & Kluckhohn (1953) also stated that culture may offers a lot of potential life for an unforgettable experience to every human being. Therefore, Hofstede (1997) believed that culture as a software of mind of every people.

Each country has a clearly difference of culture and character which is obtained through a process of exploration and discovery of its identity (Hofstede, 2001). Hence, the cultural identity of the nation can affect the characters, attitudes and behavior of individual in society, especially the leaders.

The leaders are called as cultural heroes because leadership reflects the dominant culture of a country (Hofstede, 2001). Global world now requires the contemporary leaders to work across cultures and nationalities without compromising their own values (Katene, 2010). The leaders who have an excellent mindset, good behavior, holy life, elate, foresight and courage to make changes, will succeed in protecting and maintaining the social values of the cultural community as well as forming a great nation and civilization (Jusoh, 2009).

The cultural differences are mainly reflected in terms of its values (Hofstede, 1997). An anthropologist Kluckhohn (1967) defined "value" as a concept, explicitly or implicitly, the specificity characteristics or features of either individuals or groups, who want to influence the selection of the mode, meaning and the appropriate action. While

Rahim (2012) interpret "value" in all the standards which is used as decision-making, intangible, or abstract, such as customs, normative habits, moral, ethics, self-esteem, ideas, knowledge and so on.

The advantages of local culture's values in shaping the leadership can be considered among some of the world community. As with South Korea, a country that is able to generate and maintain its unique culture and traditions. Although the Western culture is strong enough to affect people's lives in South Korea, especially in urban areas, but the ethics-based culture of Koreans such as honesty, hold promise, appreciate and respect the elders are stillexist. In Indonesia, the implementation of local cultural traditions which indeed contain positive values has brought much success to the leadership both nationally and locally. Meanwhile, in New Zealand, the culture has been expanded through globalization. But in fact, even most of the population now are living in urban, a lot of their literatures and arts are still rural theme.

#### **Objective of the Study:-**

The purpose of this study is to identify the values of local ethnic culture and its role for shaping the characteristics of effective leadership in selected countries of Asia-Pacific region such as Korean in South Korea (East Asia), Bugis in Indonesia (Southeast Asia), and Māori in New Zealand (Oceania).

#### **Methodology:-**

In this study, qualitative method approach was adopted by analyzing the related literatures with the local ethnic culture of Korean, Bugis, and Māori.

#### **Findings:-**

##### **Leadership characteristics in Korean culture**

South Korea is among the countries in East Asia that the most attracted the world today. It includes as one of the attracted countries in the world which has shown and proven its success, particularly in the field of art, culture and technology. It is not surprising when the country is among the countries that are considered to be successful in business management. In business management, each elements of the organization certainly has the role, particularly the efficiency of its leaders. Upholding the spirit of hard work consistently is one of the factors of the success in South Korea.

Although South Korea is regarded as a country that is the most internationalized in Asia, but many Koreans who still maintain their traditional culture, the traditions, customs and cultural practices which still appeared very significant in business and government organizations (Lee, 2012). Traditional culture has been considered as the root of Korean cultural identity (Yim, 2002).

South Korea with almost 99 percent of the population are Korean ethnic (Rini, 2012), has the principles of cultural values that are still practiced everyday in society. Through these practices, the country managed to showcase the rich cultural heritage. One of the Korean culture principles which is very effective in their personality is *inhwa*. *Inhwa* refers to "harmony". *Inhwa* is one of fundamental values in Korean culture which very effective for the leadership in South Korea.

According to Widyahartono (2008), the Confucian influences practicing organizations in South Korea both in business and government. From Confucian beliefs, *inhwa* was drawn. *Inhwa* is one of Korean culture principles that emphasize the harmony among human (Lee, 2012). *Inhwa* showed the following characteristics:

1. Loyalty to a hierarchical structure.
2. Obedience, loyalty, love and gratitude to parents, especially the mother as a symbol of sacrifice and kindness who always unselfish.
3. The harmony within and between groups.
4. Leaders are role models.
5. Moral values are more appreciated than merely skill and competence.

On the whole organization in South Korea emphasizes the harmony among human, loyalty, cooperation, a sense of unity or solidarity, responsibility, dedication, hard work, creativity, originality, and personal development (Widyahartono, 2008). Korean people are very loyal to their parents, the elders, and the authority figures such as the kings, the leaders of the organization, and all the people in the highest position of hierarchical structure. Koreans usually like to give a positive answer and show reluctance by giving direct refusals to maintain a harmonious

environment as reflected of *inhwa*. In organizations, subordinated loyal to the leaders and the leaders is concerned with the welfare of subordinates. Leaders who base their leadership with *inhwa* is always willing to sacrifice to prioritize public interest over private interests alone. Here we see that the *inhwa* usually exist in an unequal rank (hierarchical structure), prestige and power. *Inhwa* also teaches the value at which each party has a responsibility to support the other party or people and make them happy. Therefore, Lee (2012) in his study concluded that by understanding and practicing the culture, customs and traditions of Korean, the effectiveness and success will be reached.

#### **Leadership characteristics in Bugis culture:-**

Indonesia, as one of eleven countries in Southeast Asia, has approximately thousands ethnicities. Each ethnic has pure cultures and traditions with positive values inside. This country which consists of 34 provinces, has characteristics are marked by the diversity of its local ethnic culture. One of them is culture of Bugis ethnic.

Bugis people or called as Buginese is the biggest population in the eastern area of Indonesia which originally comes from and largely stay in South Sulawesi province, Indonesia. They had a core and original culture that has existed since a long time ago until today that is called *siri'*. *Siri'* reflects the character and personality of Buginese (Hamid, 2003).

The concept of *siri'* is difficult to be translated into the other languages, including the Indonesian language. Although no single word is perfectly suitable and appropriate to translate and make sense of *siri'* but it was often interpreted generally as shyness and self-esteem (dignity) by most of society in South Sulawesi. Andaya (2004) also argued that aspects of shame and dignity in *siri'* culture must always be balanced and complementary. More described by Marzuki (1995) that aspects of shame and dignity in *siri'* are like two chemical components which are soluble and belong each other in compounds and melting together in symbiosis. Hence, Hamid (2003) stated that *siri'* is a system of attitudes that cause embarrassment when the honor or dignity has been dropped.

*Siri'* is abstract and very sensitive to the Buginese. It is ideology and symbol of cultural value that are applicable in all class of society (Fahmid, 2012). *Siri'* places human on the level of respect and noble position in the life of world (Abdullah, 1985). The higher of person's status and position in all kinds of organizations (e.g. family, society, company, government, etc.), the stronger of *siri'* attached to him/her (Hamid, 2003). Behaving well and properly, and also avoiding bad morals in social and law are a symbol of the establishment of *siri'*. Therefore, *siri'* demands honesty, loyalty, and discipline.

*Siri'* which is inherent in personality of Buginese already contains values, either generally or specifically. Hamid (2003) stated that, common values of *siri'* include: recognizing the equality of rights and obligations among people, wise and caring people, uphold humanitarian, brave stand for truth and justice, love and proud of nation, working hard. Meanwhile, specific values in *siri'* are emotional vocabularies which are tied to social community as something complex of tastes. Rahim (2011) concluded that the values embodied in *siri'* include: honesty, trustworthy or responsibility, fairness, intellectuality or intelligence, tactful, traditionalism, diligence or hard work (so as not poor), and bravery.

Bugis leadership is limited by the rules of the local wisdom (culture), especially the cultural values of *siri'*. Buginese were boosted by *siri'* to be a wise leader, persevere in the struggle, never give up when faced with a tough challenge, and must be fair and honest with everyone in any business (Abdullah, 1985).

#### **Leadership characteristics in Māori culture:-**

New Zealand is considered as the last island that inhabited by humans because of its remoteness. It is an island nation that located in the southwest of Pacific Ocean and the southeast of Australia.

New Zealand's native people are called Māori. The lives of Māori has been much influenced by traditional cultures from the earlier generations (Katene, 2010). At this time, Māori have been living together with the other ethnic groups in building modern New Zealand and advanced the concept of diversity. However, Māori is still developing its own distinct culture. Culturally, Māori people live communally, sharing, and strongly maintaining traditional values.

In Māori culture, leadership is determined by a combination of leaders who is legalized by collective input (Marsden, 1988). To understand the leadership of Māori in New Zealand society, it is necessary to understand the principles relating to the interpretation of traditional leadership. Leadership in Māori is still hierarchy and according to the class system, but traditional Māori society still expects that the leader is appeared of the group (Rito, 2006). Therefore, the community work together with leaders or their principals for the same purpose.

Katene (2010) argued that traditional and contemporary Māori leadership is characterized by leaders who share the vision, mission and actions agreed upon and respected for their loyalty and confidence of his followers, both individually and as a group through their inspiring leadership. Therefore, the future leaders of Māori that is needed is must be educated, politically wise, sophisticated, qualified, strong, committed to their people, and well-grounded in basic of Māori culture (New Zealand Te Puni Kōkiri, 1992).

One of the cultural values that form the basis of life for Māori is called as *wairua*. *Wairua* is interpreted as the spirit or soul. It is a cultural beliefs, practices and values that exist in daily life and cultural vitality that is embedded in the services and program of Māori (Kennedy et al., 2015). There are seven principles of *wairua* which include: 1) the feelings associated with it (*mauri*); 2) respect to others (*aroha ki te tangata*); 3) generosity and sharing with others (*manaaki ki te tangata*); 4) care (*kaitiakitanga*); 5) concern (*kia tūpato*); 6) cleaning spirit (*whakanoa*); and 7) knowledge, collective wisdom, and enlightenment (*mōhiotanga, mātauranga, and māramatanga*). Kennedy et al. (2015) expect the exploration experience in research will give support to other Māori's evaluators to reflect on how *wairua* woven into their culture responsive assessment practices.

Based on the traditional culture of Māori, New Zealand Te Puni Kōkiri (1992) identified the key elements in the leadership for leader of new Māori which are summarized as follows: 1) the strength of a leader reflects the strength of the group because a strong leader is within or close to his people; 2) a leader is the servant of people (servant leadership) which means people oriented leadership, mandate from people and responsible to the people, often seen among the people, serve the people, care for the people, and speak on behalf of the people; 3) a leader strives to ensure, enhance, and strengthen the integrity, continuity and development of Māori society and culture; 4) modern leader needs to consult frequently with the *iwi* (social organization unit in community fraternal of Māori) and dependant upon reliable information and advice; 5) leadership requires cooperation between traditional leaders and specialists.

Katene (2010) found that the leadership system of Māori is still relevant until today. Māori have built considerable capability and competitive advantage through leading and managing cultural diversity. The mark of leadership success for a Māori is providing leadership based on traditional principles while managing the interface (Mead, 2006). Therefore, Harmsworth et al. (2002) believed that the leaders of Māori who often occupy several positions, roles and different responsibilities are to meet the needs of culture and organization for the development of a sustainable future.

## Discussion:-

Based on our findings, it was identified the leadership characteristics contained in each local ethnic culture of Korean in South Korea, Bugis in Indonesia and Māori in New Zealand, as listed in Table 1.

**Table 1:-** Leadership characteristic of local ethnic culture (Korean, Bugis, Māori)

Korean South Korea	Bugis Indonesia	Māori New Zealand
loyalty	dignity	fairness (in sharing)
discipline	morality	generosity/caring
respect	honesty	traditionalism
morality	loyalty	cooperation
solidarity/cooperation	tactful/wise	servant (for people)
trustworthy	trustworthy/responsibility	intelligence
bravery (in sacrifice)	diligence (hard work)	responsibility (trustworthy)
intelligence	bravery	hard work
creativity	fairness	boldness/bravery
traditionalism (originality)	intellectuality/intelligence	honesty
fairness	traditionalism	integrity
dedication/diligence/hard work	discipline	

The list of leadership characteristics of three local ethnic cultures that has been shown by Table 1. particularly showing the similar characteristics such as: trustworthy, diligence (hard work), bravery, intellectuality (intelligence), fairness, and traditionalism. These six characteristics, as the result of comparison of the local ethnic culture in South Korea, Indonesia, and New Zealand, are the basic characteristics for shaping effective leadership. Each characteristic can be described as follow:

1. **Trustworthy** means responsible leader in carrying out the duties, interests and aims of the organization; using the power and authority to the decent and correct things according to the rules; and strengthen the loyalty and responsibility for people.
2. **Diligence** refers to a leader who is hard-working; diligent; enterprising; conscientious in carrying out his activities; and never feel tired or bored to seek knowledge and continue the studies.
3. **Bravery** mentions to a leader who is bold; fearlessness; bravely face the challenges as well as threats; will not withdraw in facing the adversity (not a coward); and volunteer their time, energy and material for common aims.
4. **Intellectuality** is also called as intelligence which means that a leader should be educated; has intellectual ability, mental capacity, and understanding; has balance of logic, emotional, and spiritual.
5. **Fairness** means leader who is not arbitrary; does not favor any party or person; putting things in the right places like the appointment of the expert officers in the field; keeping one's right or something like employees receive services and benefits commensurate with their sacrifices and performance in an organization.
6. **Traditionalism** refers to the upholding or maintenance of tradition which means that leaders establish an activity with positive values grounded indigenous cultural traditions to be adapted and implemented within the leadership without conflict with the related law.

Nurfitri et al. (2015) found that the basic values to be a leader are diligence, bravery, intellectuality, and fairness. However, to be an effective leader, the basic values of leadership must be developed. Each leader should not be satisfied and limited only with a common leadership, but must act more effectively to increase the level to become effective leader which then finally achieving best performance and can become successful leader. Therefore, the six characteristics (trustworthy, diligence, bravery, intellectuality, fairness, and traditionalism) as listed and described above are the initial and main values as leadership characteristics that must be held to be effective in leading an organization.

According to Likierman (2009), effective leadership is viewed through the achievement of organization. Meanwhile, Widodo (2008) believed that successful leadership is viewed through the achievement and maintenance of organization. Hence, it can be concluded that effective leadership is not necessarily successful leadership but successful leadership is certainly effective leadership. However, effective leadership is the key step before achieving the successful leadership.

### **Conclusions:-**

The most important characters of leadership may vary in different cultures and countries. The values of local ethnic cultures have given much influences in forming characteristics of leadership to be effective for reaching great performance. Finally, the great performance will produce the success of leadership as the main objective of every leader. The successful leadership reflects the successful organization where the leader leads.

Every culture has its unique characteristics which contains positive values that can be developed. Therefore, the other study can explore more about the uniqueness and distinctiveness of culture in each country especially that are considered as successful countries. Identifying the culture's characteristics, role and influence in every community life and especially in leadership is proposed to be studied, investigated and disclosed in greater depth continuously.

#### Abstract

A semi organic nonlinear optical single crystals of zinc magnesium thiourea acetate (ZMTA) were grown from slow evaporation technique at room temperature. The unit cell parameters were determined from single crystal X-ray diffraction studies. FTIR studies were performed to identify the functional groups present in the compound. The UV-Vis spectrum indicates the grown crystal has good transparency in the entire UV-Vis region spectrum suggesting the suitability of the material for NLO applications. The thermal studies show that the crystal is thermally stable up to 120°C. The relative second harmonic efficiency of the compound is found to be 1.64 times greater than that of KDP.

#### Introduction:-

In recent development of research in nonlinear optical phenomena are involved in scientific and industrial applications. The property of second harmonic generation are focused in electro optic modulation, optical switching and also it involves in the domain of optoelectronic and photonics. Especially organic and inorganic materials are given increasing attention due to its rapid technological advances in various fields, such as laser technology, fibre optics, telecommunication, optical computing and optical data storage technology [1-3]. To overcome the limitation of these materials, interests have been focused on semi-organic crystals. In which it leads to explore the combined properties of both inorganic and inorganic crystals like high damage threshold, wide transparency range, less deliquescence, higher mechanical strength and thermal stabilities are obtained for device fabrication [4, 5]. Recently effort has been made on metal complexes of thiourea and analogues. Inorganic matrix of thiourea molecules are an interesting material plays important role due to their large dipole moment and ability to form an extensive network of hydrogen bonds with metals [6, 7]. The NLO properties of some complexes of thiourea, such as bis (thiourea) cadmium sulphate (CTS) [8], potassium thiourea bromide (PTB) [9] and zinc thiourea sulphate (ZTS) have been reported elsewhere [10]. In the present investigation, the effect of Zinc doped MTA crystals have been studied using single crystal XRD, FT-IR, UV-Vis, thermal and microhardness of the grown crystals have been carried out. The NLO property of as grown crystal has been confirmed by Kurtz powder technique.

#### Synthesis and crystal growth:-

Single crystal of zinc doped MTA material was synthesized using AR grade of Thiourea, Magnesium acetate and Zinc acetate. Double distilled water was used as a solvent. Calculated amount of (3: 0.9: 0.1) the above materials were dissolved in 100 ml of water and stirred well using magnetic stirrer. Well defined single crystals of good transparency were harvested after a period of 15 days and shown in Fig.1.

Fig 1:- Photograph of ZMTA crystals

## Result and Discussion:-

### Single crystal XRD studies:-

The grown crystals were analyzed by single crystal X-ray diffraction to confirm the crystallinity and also to estimate the lattice parameters. From the single crystal X-ray diffraction data, it is observed that the ZMTA crystal is Monoclinic in structure. The morphology of the grown crystal seems to be different when compared with Zinc magnesium tris thiourea sulphate (ZMTS) and Magnesium doped tris thiourea zinc sulphate (TTMZS) [11, 12]. The calculated unit cell parameters are given below in Table 1 and their values are compared with the reported values.

Table 1:- Unit cell parameters of grown and reference crystals

Crystal systems	a(Å)	b(Å)	c(Å)	Volume (Å <sup>3</sup> )	Crystal structure
ZMTA	7.113	17.694	11.111	1363.9	Monoclinic
ZMTS	7.74	11.08	15.42	1337	Orthorhombic
TTMZS	15.57	6.315	5.549	545.4	Orthorhombic

Changes in the lattice parameters may be due to incorporation of dopant which causes the increase in volume. However, for ZMTA crystal, changes in the lattice parameters have been observed with respect to ZTMS and TTMZS crystals which confirm that the doped crystal exhibits different structure as that of parent material.

### Optical absorption studies:-

An optical absorption spectrum of ZMTA crystals were recorded in the wavelength range 200-800 nm using PerkinElmer Lambda 650 UV-Vis spectrometer and is shown in Fig. 2. The UV spectrum shows a wide transparency window with the lower cut off wavelength of grown crystal is 235 nm. Absence of absorption in the region between 260-800 nm is the essential property for the NLO material. The less absorbance behavior in the entire visible region also confirms the colorless nature of the crystal.

Fig 2:- UV-vis absorption spectrum of ZMTA crystal.

It is observed that the grown crystal has good transparency in the UV-Visible and IR region. While doping Zinc acetate with MTA crystal alter the lower cut off wavelength increase when compared to the reported values [11, 12].

**FTIR studies:-**

The FTIR spectrum of ZMTA crystal displayed in Fig.3 were recorded in the range of 400 – 4000  $\text{cm}^{-1}$ . The vibrations at 3378 and 3304  $\text{cm}^{-1}$  are reported as vibrations due to  $\text{NH}_2$  asymmetric stretching vibrations and the C–H stretching vibration is observed at 2349  $\text{cm}^{-1}$ . The peak at 1635  $\text{cm}^{-1}$  is due to N–H bending vibration [13]. The C=O stretching vibration is observed at 1571  $\text{cm}^{-1}$ . The peak at 1389  $\text{cm}^{-1}$  is reported as vibration due to C=S asymmetric stretching vibration [14]. The  $\text{NH}_2$  rocking vibration is observed at 1131  $\text{cm}^{-1}$  [11]. The absorptions at 931 and 475  $\text{cm}^{-1}$  are reported as the vibrations due to N–C–N symmetric stretching vibrations [11, 12]. The vibrations around 600 and 1030  $\text{cm}^{-1}$  are reported as clear conformation of presence of zinc acetate in the coordination sphere [15]. Based on the observations, it is confirmed that FTIR spectra indirectly establish the presence of zinc acetate in lattice of MTA crystal.

Fig 3:- FTIR spectrum of ZMTA crystal.

**TG/DTA studies:-**

TG/DTA curves of ZMTA crystal displayed in Fig.4. From the result, the crystal is thermally stable up to 120°C and it is observed that DTA curve show endothermic peak at 210 °C for ZMTA crystal. This value can be considered as the decomposition or melting point of the sample. From the result, it is noticed that ZMTA crystal has slightly less thermal stability than reported value of ZMTS crystal and it may due to decrease in bond energy caused by the incorporation of dopant's anion  $(\text{CH}_3\text{COO})_2^-$  in the lattice of the ZMTA crystal. The TG curve of ZMTA crystal show maximum weight loss occurs in the temperature range 120-348°C, which is due to the decomposition of the samples. The sharpness of the endothermic peak shows the good degree of crystallinity and purity of the sample. Further the absence of water in the molecular structure is confirmed by the absence of weight loss around 100°C.

Fig 4:- TGA-DTA curves of ZMTA crystal.

**Powder SHG Studies:-**

The second harmonic generation efficiency of grown crystal has been measured by Kurtz-Perry technique [16]. A Q- switched mode- locked Nd: YAG laser was used to generate about 0.68mJ/pulse at 1064 nm fundamental radiation. The second harmonic signal was confirmed from the emission of green radiation by the crystalline powder

sample. The result of SHG efficiency of the grown crystal is about 14.42 mV. KDP crystal was used as reference material in the SHG measurement. The ZMTA gives an SHG of 14.42 mV, while the KDP gave an SHG signal of 8.8 mV for the same input beam energy. The SHG relative efficiency of ZMTA crystal was found to be 1.64 times higher than that of KDP.

### Conclusions:-

Optically good quality ZMTA crystals were grown by slow evaporation technique. The presence of small amount of zinc acetate altered the unit cell parameters slightly when compared to reported value. The presence of functional groups was determined by FTIR analysis. The optical absorption studies show that the UV cut-off wavelength of grown crystal is 245 nm making it a suitable candidate for NLO applications. The TG/DTA studies show that the grown crystal is thermally stable up to 120°C. The SHG efficiency of ZMTA crystal is 1.64 times higher than that of KDP and it becomes a promising candidate for optoelectronic and photonic device applications.

#### **Abstract**

The institutional support is important for the effective implementation of technology based instruction (Farrell, 1999). The study aimed to find out the impact of the institutional support, technical expertise, and attitudes towards the acceptance and use of technology in education by faculty members of Forensic Science at the universities of Riyadh. The total sample of the study was 310 out of 984 which formed a very reliable sample according to sample calculations and equations. A questionnaire has been distributed and data was collected. The SPSS programme was used to find the ANOVA, Pearson, Linear regression method, and R-Square. The results show the availability of the institutional support for faculty teaching staff of Forensic Science towards the use of educational technology. The Pearson correlation is positive and statistically significant at the level of ( $> 0.01$ ) and this shows that the faculty members accept and use technology in education throughout the institutional support, technical expertise and attitudes. The study proposes that more effective training and more incentives might help faculty members to use technology in education.

#### **Introduction:-**

There are three key factors for successful integration of technology which are the will (attitude), skill (technology proficiency) and tool (access to technology tools). Regarding to the three factors, the attitude is recognized as essential, but skills appears to be the strongest of all (Agyeyi, & Voogt, 2010). Contrary that, most of teachers and faculty members in developing countries have been introduced to basic technology competencies that need pedagogical skill to use technology in instruction even if they have access to computers and internet (Sife, et al., 2007). Even though instructors are positive regarding the use of technology in education, most of academic staff lack enough knowledge to use technology in teaching. (Nihuka & Voogt, 2011). Generally, despite positive attitude of teachers and students towards technology use in education, it's important to recognize that there are other factors that can influence or affect the practice such as the institutional support, technical expertise and attitudes.

Mitrano (2011) pointed out that policies and plans within the institution provide framework for implementation of day to day activities. Institutional capacity to technological infrastructures is all about teachers and students' access to physical and technological resources to support technology-based instruction within a particular institution. The technologies may include websites, computers, mobile phones, internet, video, radio and television. Sife, et al.

(2007) stated that, in Tanzania's higher learning institutions, teachers and students have access to internet, computers, mobile technology like mobile phones, audio CDs and DVDs; however, that access is very limited. In contrast, in China, about 80% of higher learning institutions had access to computers and internet in the year of 2006. About 76.6% of offices, 42.2% of classrooms, 49.4% of dormitories of all higher learning institutions have connection to internet. It was found that almost every Normal University in China is operating in a dual mode system, of distance and conventional education (Guo & Cai, 2006) such that by 2004, there were 67 universities engaged in distance education plus one Open University in China. Thus infrastructures in these institutions contribute to effective technology instruction and can help to encourage and implement technology-based learning and instruction. Those infrastructures can play roles such as improving communication, uploading and downloading e-learning materials to create more flexible learning environment.

According to technical support, the crash of a computer results in interruptions (Jones, 2004). If there is lack of technical assistance, then the customary repairs of the computer will not be carried out resulting in faculty members not using computers in teaching or instruction. Consequently, if there is no technical support for faculty members, they become frustrated resulting in their unwillingness to use ICT (Tong & Triniada, 2005). Even though, lack of technical support discourages teachers from adopting and integrating technology in classrooms. Korte and Husing (2007) revealed that schools in Britain and the Netherlands have appreciated the significance of technical support to help teachers to incorporate technology into their teaching/learning processes. They argued that ICT support in schools can influence teachers to apply ICT in classrooms without wasting time troubleshooting hardware and software troubles. Though infrastructure support is essential, school technology leadership is a stronger forecaster of teachers' use of computer technology in instruction (Anderson, & Dexter, 2005). Wong and Li (2008) conducted a study on factors that affected transformational integration of ICT in eight schools in Hong Kong and Singapore. The study revealed that leadership promotion of collaboration and experimentation and teachers dedication to student-centred learning affected the successful ICT transformation. Organizations exemplified by executive involvement and decision-making, strengthened by ICT plan, can effectively adopt ICT integration curriculum.

There is shortage in studies that dealt with exploring the effectiveness of institutional support, technical expertise and attitudes in using technology in education by staff members of Forensic Sciences in the world. Steered by this fact, the researcher tried to explore how technology in education can be influenced by institutional support to benefit faculty members of Legitimate Sciences in Saudi Arabia.

### **Problem of the study:-**

The Curriculum domain has been widened with many adopted elements and the traditional concept of knowledge is no longer useful for the implementation of the curriculum elements through traditional pedagogies to enhance educational experiences (Attar, 2011). The role of the faculty member is no longer limited to lectures but he/she afford the responsibility to spread the knowledge by simplifying it for students. He/she need to deal with educational technology to achieve the interaction of the learners with the best that technology has to offer. So it becomes so necessary to upgrade the level of the faculty member scientifically, educationally, and professionally. It should so vital to improve his/her ability to deal with technology and employ them in the educational effectively to manage the process of education maintain a coherent, direct impact on his/her students since the faculty member beholds the most important success factors for university education (Mubarak, 2014; Salam, 2013; and, Mazen 2010; Al-Aqel 1432H; and Salim, 2004). The researcher did not find studies dealt with the fact or factors influencing the use of technology for the faculty members of Forensic Science Technology education. So, the current study attempted to identify some of the factors that affect their use of technology in education which include: Institutional support, technical expertise, and attitudes. Previous studies have shown the low level of technology use for faculty members in the educational process in the Arab region (Shayhob, Abdulghany, and Mohammad, 2014; Qahtany, 2012; Attar 2011). In addition to that, the researcher has many observations in the field of education during his academic studies. As well as, a survey which has been carried out and through this he found that there are still negative indicators towards the use technology by faculty members of Forensic Science signaling of their lack of experience or enough training sessions to use technology. Based on the above, the problem of the study is to identify the reality of the use of technology by faculty members of Forensic Science technology at the Universities of Riyadh, and the impact of some external factors on their acceptance and use. Therefore, the study sought to find out the impact of institutional support, technical expertise, and attitudes to accept and use technology in education through applying model a new model towards the acceptance and use technology called (UTAUT) after adding some factors to this model (Venkatesh et al., 2012).

**Justification of the study:-**

Technology has enriched the field education hugely; which made the developed countries so concerned and attentive towards believing in its benefits in the present and future as well.

There is a need to create positive impression among the members of the teaching staff of Legitimate Sciences towards the use of educational technology in the teaching and learning process which will reflect positively on the acceptance and use of technology.

The Forensic Sciences are so important, and there is a necessity of care about all contributions to provide the best of technology that help inculcate true religion and high values in the individuals of the nation, and to direct their conduct properly, and to highlight high responsibility for the community in serving the potential of the nation.

**Study question:-**

Based on the above, the problem of the study is to try to answer: What is the impact of the institutional support, technical expertise, and attitudes towards the acceptance and use of technology by faculty members of Forensic Science in education at the universities of Riyadh? The chief extracted question of the study can be summarized: what is the availability of institutional support for the use of technology by members of the teaching staff of Forensic sciences in education at the universities of Riyadh?

**The objectives of the study:-**

The main objective of the study was to identify the impact of institutional support, technical expertise, and attitudes towards the acceptance and use of technology by faculty members of Forensic Science in education at the universities of Riyadh. In order to facilitate the possibility of achieving the main goal, the researcher tried to explore quantitatively and qualitatively the availability of institutional support of members of the teaching staff of Forensic sciences in using technology in education at the universities of Riyadh.

**Importance of the study:-**

The importance of this study comes according to the importance of the use of educational technology adopted by many universities in the developed countries, as well as exploring the need of technology by Forensic Sciences. It is considered the first study dealing with the factors affecting the use and acceptance of technology by university members in education. The importance of the study has two domains:

A. Scientific importance can be achieved through the application of the model of (UTAUT) and its consequences in a developing country like Saudi Arabia. The researcher, according to the global data office, King Fahad National library, did not find any regional, Arab, or global layer model aiming to identify the factors that affect the acceptance and use of technology in education by Faculty members of Forensic Sciences. The study, therefore, aims to develop Faculty members of Forensic Sciences and to benefit from the scientific progress in the field of technology in education in order to cope with the use of modern technology in the educational process. Finally, the researcher hopes to find factors and variables that affect technology education.

B. Practical significance: This will provide effective solutions for the members of the Faculty of Forensic Sciences to use technology in education, whether by the members themselves, or those responsible for them at the Ministry of education and different departments of universities. Moreover, this study may enhance future policies to activate and support the use of technology by educational faculty members taking into account the factors that affect their use.

**Review of literature:-**

Srivastava and Lee (2005) maintained that the institutional support of senior management could be achieved by the clarification of the future vision for workers by and giving approval to proceed with the completion of a task or a new idea, and by providing the necessary resources for their task-completion. This material support includes spending money on what it takes to do the task under completion, and to evaluate the financial incentives of cash rewards. The moral support can be fulfilled by the approval and encouragement to perform a task and by providing verbal or written appraisal, such as certificates or letters of thanks and appreciation.

The operational definition of institutional support is to provide senior management to faculty members in various jobs and ranks in order to achieve the highest degree of the use of educational technology and its utilization, through

the provision of education technology innovations, and by giving material and moral incentives to ensure they use it to the fullest.

Definition of institutional support: According Srivastava and Lee (2005), the institutional support (senior management) is to provide and clarify the future vision of the workers, and to give approval for them to proceed in the completion of a task or a new idea by providing the necessary resources for their completed tasks. The material support includes spending money on what it takes to do the task under completion, and evaluate the financial incentives such as cash rewards or through moral support: such as encouragement to perform tasks verbally or in written, such as certificates of thanks and appreciation.

Young and Jordan (2008) defined the administrative institutional support is to value the time for the program information systems commensurate with its costs, and its expected outcomes, review plans, follow up results, to help overcome administrative difficulties relating to the integration of Information Technology and computers in the process of business management.

Subramanian and Lacity (1997) defined the administrative institutional support as the involvement of high managements in projects through the realms of three domains: a role model, presenting resources, and its participation in the project to achieve the intended goals.

The researcher thinks that the institutional support for technology in education is to provide departments and senior university officials or faculty members of various jobs or ranks with all that would push them to achieve the highest degree of the use of educational technology and its utilization through the provision of education technology innovations by giving material or moral incentives to ensure they use it to the fullest.

#### Study population:-

The population is defined by "all subjects of the phenomenon studied by the researcher. So the study population is all the individuals or objects who formed the subject problem" (Obeidat, et al., 2014). Based on the theme of the current study and its objectives the target community consists of all faculty members of Forensic sciences at Saudi universities in Riyadh (King Saud University, Islamic University of Imam Muhammad bin Saud, The Mujamea University, others). The members included teaching assistants or lecturers or doctors (assistant professors, associate professors, professor). The number of members of this community are (984) member of the Faculty of Legitimate Sciences, depending on the data contained in the websites of each University. They are distributed according to the following table:

**Table 1:-** Faculty subjects of Legitimate Sciences at Riyadh

Total	Mujamaa University	Islamic University of Imam Muhammad bin Saud	King Saud University
<b>984</b>	<b>104</b>	<b>735</b>	<b>145</b>

The study sample extracted from the community was summarized in Table 2. The total number of the study was 310 out of 984 which formed a very reliable sample according to sample calculations and equations as well.

**Table 2:-** Study Sample

#### Results:-

The institutional support items of the questionnaire answers the main question of the study. What is the on-going reality towards the availability of institutional support in the use of educational technology by members of the Faculty of Legitimate Sciences at Riyadh universities. The averages, deviations, and percentages of respondents' answers have been calculated in Table 3.

**Table 3:- Results of subjects' answers about the institutional Support towards technology in education**

Order	Stan. Devi.	Mean Aver.	Level Of Agreement					Statement	Item	
			S/D A	D/A	N	A	S/A			
2	1.05	3.72	10	34	64	128	74	F	The university provides technical assistance related to the use of educational technology	1
			3.2	11	20.6	41.3	23.9	%		
3	1.03	3.65	8	42	65	132	63	F	The University provides the resources necessary to use technology in Education.	2

1	1.05	3.73	10	34	61	131	74	F	The university organizes training sessions on how to use technology in education	5
			3.2	11	19.7	42.3	23.9	%		
<b>0.88</b>	<b>3.47</b>	The overall average of institutional support towards the use of technology in education								

Results extracted from Table 3 shows the consent of the respondents on all elements of the domain concerning the availability of the institutional support for faculty teaching staff of Forensic Science towards the use of educational technology. The arithmetic mean was (3.47) and the standard deviation was (0.88). As shown in the table the answers of members of the Faculty of Forensic Sciences towards the availability of institutional support regarding the use of educational technology, the views are divided in terms of degree of approval into two groups: (1) According to the arithmetic average, opinions which (Agree) are those views with arithmetic average of (3.41-4.20), namely, the university organizes ongoing training sessions on the use of educational technology which came in first with an average of (3.73), and the university provides ongoing technical assistance related to the use of technology in education was the second with an average of (3.72), then comes 'the University provides necessary resources for the use of educational technology' in third place with an average of (3.65).

There were also opinions which are divided (Neutral) with arithmetic average of (2.61-3.40), and according to this ranking, the university gives material incentives for uses of technology in education, with an average of (3.23), and the university provides ongoing moral incentives for uses of educational technology with an average of (3.06).

The general question was what is the impact of institutional support, technical expertise and attitudes towards the acceptance and use of technology in education by faculty members of Forensic Sciences at the universities of Riyadh? To find the impact of institutional support, technical expertise and attitudes towards the acceptance and use of technology in education by faculty members of Forensic Sciences at the universities of Riyadh, the researcher used Pearson correlation coefficient (Pearson Correlation) and he also used linear regression model to demonstrate the impact of institutional support, technical expertise and attitudes to accept and use of technology in education by faculty members of Forensic Science at the University of Riyadh. The results came as follows:

**Table 4: Pearson's correlation between the acceptance and use of technology in education by the members of the Faculty of Forensic sciences and all the institutional support, technical expertise and attitudes**

Pearson Correlation	Use and Acceptance Degree Domain
**0.179	Institutional support
**0.362	Technical expertise
**0.179	Attitudes

\*\* Significant at (0.01)

Table 4 shows that the correlation is positive and statistically significant at the level of ( $p < 0.01$ ) and this shows that the faculty members accept and use technology in education throughout the institutional support, technical

expertise and attitudes. It shows that the more the ongoing institutional support, technical expertise and attitudes increased, the more they accept and use technology in education by faculty members of Forensic Sciences. As can be seen from the table, the technical expertise is more closely related to institutional support and attitudes.

**Table 5:- Linear regression method between the acceptance and use of technology in education by of the members of the Faculty members of Forensic sciences and all the institutional support, technical expertise and attitudes.**

Statistics		Factors			
Statistical Value	Statistical Equations	Prop-Value	T-Value	Factor Value	Variable
0.15	$R^2$	*.010	2.60	0.91	Constant
0.72	S.E. of regression	*.025	2.26	0.11	Institutional support
17.52 (0.000)	F-test	** .000	5.73	0.39	Technical expertise
		.688	0.40	0.03	Attitudes

\*\*Significant at 0.01, \*Significant at 0.05

Table 5 shows the results of Linear Regression Model between the dependent variable, which is the acceptance and use of technology in education by faculty members of Forensic Sciences, and the independent variables, namely institutional support, technical expertise and attitudes as follows:

1. The value of determination coefficient of R Square was 0.15 which shows that the institutional support, technical expertise and attitudes explains (15%) of the differences that occur for the use and acceptance of technology in education by faculty members of Forensic Sciences.
2. The standard Error of the estimate was 0.72
3. That the value of (F) is 17.52, and that the calculated significance value was (0.000), and this argue that the linear assumed model demonstrate the validity of the linear model to represent the relationship between acceptance and use of technology in education by the members of the Faculty of Forensic Science as the dependent variable, and the institutional support, technical expertise and attitudes as explained variables.
4. For the test of the coefficient regression observed from the second column of Table 6 (the calculated Sig. value), it seems that:

A- For institutional support and technical expertise, the calculated significance was less than (5%). This indicates that institutional support and technical expertise towards the acceptance and use of technology in education by the members of the Faculty of Forensic Science Technology education are the most influential factors

B- For attitudes, the calculated value is greater than (5%). This indicates that the attitudes do not impact the acceptance and use of technology in education by the members of the Faculty of Forensic Sciences.

### Discussion of Results:-

The study addressed the institutional support, technical expertise and attitudes and their impact on acceptance and use of technology in education by faculty members of Forensic Sciences at the Universities of Riyadh in Saudi Arabia. The study is so focused to answer the main question: What is the impact of institutional support, technical expertise and attitudes to accept and use of technology in education by faculty members of Forensic Sciences at the Universities of Riyadh in Saudi Arabia?

One of the objectives of the study was to identify the different statistical significance in the responses of members of the Faculty of Forensic Sciences, attributable to the variables of personalities and career in association with the systematic objectives of the study, the theoretical and practical importance of the study, concepts and terminology of the study, and limits of human objectivity and spatial and temporal scales.

The new model of (UTAUT) was displayed throughout exploring its features, then clarifying of the amendments made in this study to the model from an Islamic perspective, and how the faculty members can use and accept the model of (UTAUT) from an Islamic and Arabic thought.

The researcher indicated that there is lack of direct studies addressing the factor of institutional support and its availability from the point of view of members of teaching staff of Forensic Science; except the study of Hassanein's (2011), which dealt with members of the faculty at the Sudanese universities on the whole. There are also differences in the results of the current study with the results of Hassanein's (2011). This study showed that distance education programmes in the Faculty of education in Sudanese universities lag behind the reality of technology in education in these programs, which means "weak" institutional support for the programmes of distance learning, with reference here to the different locations of the present study (Saudi Arabia) and of Hassanein's (Sudan), and to the different majors since the present study dealt with (Forensic Sciences) and Hassanein's with (Education).

There are statistically significant differences in the domain of institutional support for the use of technology in education, and technical expertise to use educational technology, and the ease of use of Technology in Education by faculty members of Forensic Sciences attributed to the variable of 'gender' in favor of non-Saudis, while no statistically significant differences in the rest of other domains.

The researcher believes that superiority of faculty members from other nationalities (non-Saudi nationalities) in the domains of the institutional support, technical expertise, ease of use and actual use is primarily referred back to individual differences between the respondents, in terms of taking advantage of the institutional support provided by universities, motivation in training on the use of educational technology, the functional diversity among the members of the Faculty, motivation in job rank, and fixed-term work. Aside of that, the process of qualifying faculty members of non-Saudis in their own country may be distinguished from the programs received by the faculty members of Saudi universities in Saudi Arabia in terms of the presence of courses in English while studying throughout general education or university education which is one of the strongest contributing factors in the use of technology. The technology, in other countries, adopt the English language in their programmes and their applications and they run them significantly, while rarely having these programs and applications in Arabic.

There are statistically significant differences in the domains of institutional support for the use of educational technology by faculty members of Forensic Science at King Saud University and Al Mujamma University in contrast to the members of the Faculty of Forensic Sciences at the Islamic University of Imam Muhammad bin Saud and other universities. There are also statistically significant differences in the domain of the actual use of technology in education for the favour of the members of the Faculty of Forensic Sciences in the University of King Saud and Al Mujamma University in contrast to the Islamic University of Imam Muhammad bin Saud, while there are no statistically significant differences in the rest of the domains attributable to the university to which he/she belongs to.

The researcher believes that the reason why the Faculty members of Forensic Sciences in King Saud University, and Al Mujamma university are more distinctive compared to members of the Faculty of Forensic Sciences at the Islamic University of Imam Muhammad bin Saud in the domains: institutional support, and actual use of educational technology dates back to the establishment of the deanship of special e-learning and distance education in the two universities, with the knowledge that there are deanships for e-learning and distance education at Islamic University of Imam Muhammad bin Saud, except that access to the tasks that the deanship and functions in the three universities, one can note that the deanships of e-learning at King Saud University and Al Mujamma are more active. Both deanships provide more services of e-learning than that at the Islamic University of Imam Muhammad bin Saud. This can be seen also through the websites of those universities.

In addition to that, there are development projects and services that are more diverse at the University of King Saud and Al Mujamma university, such as: the development of digital content, management system of online learning, virtual classroom, SMS, digital library, direct technical support, training courses in the field of smart boards, management of e-learning education, and many other areas (<http://ksu.edu.sa>). These services also attract the human cadres in the field of Information Technology and e-learning, whiteboard, interactive electronic projectors. The deanship of e-learning at Mujamma University has units of e-learning which seeks to spread the culture of e-learning, providing educational hardware in all faculties of the University along with many of other goals ([www.mu.edu.sa](http://www.mu.edu.sa)).

Therefore, after the comparison between the three universities in the present study, one can conclude that the institutional support in relation to the use of educational technology by Faculty members of Forensic Sciences in the

three universities, that there is a diversity of institutional support for the advantage of University of King Saud, and AL Mujamma University in contrast to the Islamic University of Imam Muhammad the Son Saud which limited its support to increase awareness about the importance of e-learning, preparing e-courses, the development of its content, and the observance of quality standards in e-learning and distance learning, contributing to strategic plans for e-learning, training faculty on the best use of technology in education ([www.imamu.edu.sa](http://www.imamu.edu.sa)).

It is already clear that the institutional support is effective and purposeful in these two universities; thus the impact is clear in the use of technology, and therefore the will to change is available, and policies supporting the use of technology are also available, as well as preparing the environment, and ongoing training may have the greatest impact towards the actual use of educational technology by members of the Faculty of Forensic Sciences at University of King Saud and Al Mujamma University. This is in harmony with Mazen;s (2010) who noted that management should include project management, resources, exchange systems, communication management, information management, and organizational sources. These areas can be enhanced by technology in education, along with using diverse means that care about multi-media in education, and educational innovation.

### **Conclusion:-**

To conclude, the results of the study showed a positive statistically significant correlation between the acceptance and use of technology in education by faculty members of Forensic Sciences and the institutional support, technical expertise and attitudes. The more practice on the ongoing institutional support and the technical expertise and attitudes, the more the staff accepts and uses technology in education. It turns out that technical expertise is more closely related to institutional support and attitudes towards the acceptance and use of technology in education by faculty members of Forensic Sciences. As shown by the results of the study that institutional support and technical expertise have spiritual influences towards the acceptance and use of technology by the members of the Faculty of Forensic Science. However, the attitudes do not impact the acceptance and use of technology by the members of the Faculty of Forensic Science.

The researcher explains these results in terms of a positive correlation between institutional support, technical expertise and attitudes on the one hand, and the acceptance and use of technology in education by faculty members of Forensic Sciences on the other hand. He noted that these factors affect each other dramatically. This leads to stratify the acceptance and use of technology in education. Moreover, each one of these factors play a key and essential role in this area. Thus, the institutional support as reported by (Srivastava & Lee, 2005), is to provide the future with a vision for workers, and to give them the approval to proceed with the completion of a task or idea and to also provide the necessary resources for their tasks, including providing material and moral support, and by reviewing the tasks, activities, and goals that are utilized by the three universities through the representative of the deanship of e-learning and distance education. One can perceive the amount of influential institutional support for faculty members to accept and use technology in education.

And finally can you explain the result related to the presence of the impact of the institutional support and technical expertise, while the attitudes have not influenced the acceptance and use of technology in education by the members of the Faculty of Forensic Sciences. The institutional support and technical expertise often come back to things which are perceptible for the individual, in terms of both material support, encouragement and appreciation, or in terms of practical experience that enhance human trust. The attitudes deal with the position of the individual towards a certain thing or a certain event or particular case either of acceptance or rejection as a result of experience (El-Demerdash, 1994). Therefore, attitudes, in nature, have not got the effect that support the institutional support and technical expertise. This does not mean to neutralize and minimize its impact, it is reported here that the researcher did not find studies that examined the relationship between the three factors: institutional support, technical expertise and attitudes, with the exception of a study by (Gogus, et al., 2012) which addressed the efficiency of the computer on workers. The results of the current study were in harmony with the results of (Gogus, A. et al., 2012) which showed an impact to the efficiency of using computers on 'intention to use' and not on 'the acceptance and use of technology' highlighting the importance of the intention on the acceptance of technology.

Evidenced by the results of the Open-ended question with respect to the material and moral incentives that encourage faculty members of Forensic Sciences in the use of technology, the respondents in the three universities under study: King Saud University, the Islamic University of Imam Muhammad bin Saud, and AL Mujamma have highlighted the importance of these incentives With regard to the relationship between institutional support and the use of educational technology, respondents have "neutral" attitudes in relation to the material and moral incentives

for staff members of Forensic Sciences, as the physical and moral incentives were classified in the current study under the factor of institutional support.

The second proposal, as shown from the results of key question was the attention to training; which shows the importance of training for members of the Faculty of Forensic Sciences, being an important factor in facilitating the use of educational technology. They provided their suggestions on some of the specifications and conditions during the process of training, including: flexibility in training commensurate with age, self-training and easy training addressing and dealing with some of technical malfunctions, and linking the training material with functional incentives. The researcher believes that the training process must take into account the previous specifications to be more effectual, as they stem from the needs of the faculty members themselves. This was in accord with the results of Salam's study (2013) and its recommendations in terms of the presence of statistically significant differences between the use of educational technology attributed to the variable 'training courses' offered to faculty members. While there were differences between the results of this study with the results of Al-Seif's (2009), there were no statistically significant differences regarding the variable of 'training' offered to faculty members in universities.

With regard to the proposal to provide special equipment of technology in education and providing technical support such as wireless connection to the internet, this underlines the importance of the availability of these facilities in achieving the optimal use of educational technology. This perhaps what was confirmed by the respondents and the members of the Faculty of Forensic Sciences expressing the degree of "often" in the 'use of e-mail', 'laptops' and 'software (word and excel) in the preparation of lessons', the degree of "sometimes" in 'using electronic programs', 'PowerPoint presentations', 'programs linked to smart phones to interact with students outside the University', and the degree of "rarely" in the 'use of the tablets', and finally the degree of "never" in relation to the 'use of the Smart Boards'.

On the other hand, the researcher believes that the previous proposal to provide the technical equipment confirms what is stated in the literature review about the benefits of using educational technology. Technology in education will increase the effectiveness of the learner's knowledge, enrich the teaching-learning process, assist teachers in the preparation of educational materials, compensate the lack of experience they have, promote learning through the development in the interests of learning, increase the positive engagement of the learner in self-learning, and save time and effort (Mujahed Mazen, 2010; Al-Qahtany, 2012; and Al-Harthy, 2013)

### **Recommendations:-**

The researcher proposes four educational technology support services that might be very helpful for university faculty members of Forensic Sciences, including

1. A faculty teaching/ learning excellence center that provides expertise on IT.
2. Sustained opportunities for faculty members to experiment with emerging learning/teaching technologies in instruction.
3. Training on incorporating students' use of mobile devices such as smart phones and tablets during class.
4. Special grants or incentives for innovative use of instructional technology.

Dahlstrom (2015) maintained that optimizing the use of technology in teaching and learning radically depends on the ability of the institutional and academic leadership to help faculty members develop their digital competence and then to continue to provide learning opportunities to keep their competencies up-to-date. Faculty members need ongoing digital literacy opportunities that enable them to better understand the educational technologies but also the social technologies that affect their everyday lives. 21<sup>st</sup> century students who expect engagement in their instruction and technology can arbitrate engagement. Faculty need to understand instructional technologies and the implications of media as part of their technological means in presenting their knowledge to their students. This is more than just training on a exact technology. It is, as the saying which maintains , 'the difference between giving a man a fish and teaching him how to fish, 'or the saying which goes as ' you can lead the horse to the stream but you cannot force it to drink'.

### **Acknowledgements:-**

The author acknowledges the profound gratitude of Allah (SWT) and the glorification of our Prophet Mohammad (PBUH). My gratitude goes to IIUM and all friends, especially my friend, Dr. Osama Abu Baha from Palestine for his generous contribution.

**Abstract**

In marshland there are several factors have been associated with a high risk of transmission of parasitic diseases. Environmental factors in Iraq marshlands play an important role in increasing chance of infection with *Leishmania* parasitic disease. It is an influence on the emergence and proliferation of *Leishmania* parasitic disease. The biological cycle and eco-epidemiological relationships among climatic, ecology, vector, reservoir and human are highly variable. This study about risk factors suggest that climatic and ecologic characteristics, and vector, reservoir and human behaviors together effect on the transmission pattern, vectors and reservoir infection, and prevalence of human infection. The biological cycle and eco-epidemiological relationships among climatic, ecology, vector, reservoir and human are highly variable. Iraqi southern marshes which form a triangle region bound by three major southern cities, Thi-Qar to the west, Maysan to the northeast and Basrah to the south. The three major marshes: Al-Hammar, The Central marshes and Al-Huwaiza marshes form the core of the marshlands of southern Iraq.

**Introduction:-**

The leishmaniasis are vector borne diseases, most infections of leishmaniasis are transmitted via vector a female phlebotomine sand fly bite. Dogs are most commonly infected with *L. infantum* (*L. donovani* complex) which is responsible for the viscerotropic disease in people (Slappendel and Ferrer, 1998). In many of the endemic areas, dogs are considered the major reservoir for human disease while in other regions people are the principal reservoir for further human spread. VL is caused by *L. donovani* and *L. infantum* in old world regions while *L. chagasi* is primarily responsible for visceral disease in the new world because *L. infantum* is the primary agent associated with canine leishmaniasis infections in dogs often are regarded as visceral even though they tend to cause both visceral and cutaneous. (Belding, 1965; WHO, 1996; WHO, 2000) The life cycle of *Leishmania* spp is commonly viewed as consisting simply of two different morphological stages: The intracellular amastigote in the vertebrate host including, man and some reptiles and the extracellular promastigotes in the invertebrate host is always a phlebotomine sand fly (WHO, 2000; 2010). Both stages are capable of replication multiplied by binary fission but not within the same host (Assaf, *et al* 2004; Chin 2000). Figure (1).

<http://www.parasitology/intest-protozoa.htm>.

### Geographical Distribution:-

Leishmaniasis is one among the six most important vector-borne diseases worldwide. The disease is endemic in warm tropical and subtropical climatic conditions and has been reported from 88 countries of the world, 66 of which being in the old world (Asia, Africa and Europe) and the remaining 22 in the new world, South and Central America (Paredes *et al.*, 2003; WHO, 2010). leishmaniasis was an endemic disease in Iraq (Herwaldt , 1999; Jarallah, 2009; Jarallah, 2014). About 1-1.5 million cutaneous leishmaniasis and 500000 visceral leishmaniasis new cases are estimated to occur annually worldwide. The leishmaniasis as a whole is prevalent in 12 million people out of 350 million people at risk. Globally, 57000 people die per year due to leishmaniasis, which has diverse clinical manifestations (WHO, 1990; WHO, 2000; WHO, 2010).

### Risk factors and transmission:-

The Leishmaniasis is vector-borne diseases, it has a worldwide distribution, ususally affects the poorest countries. Many foci of the various forms of human leishmaniais have been described in both the new and old world. The diseases are endemic when sutable mammalian reservoirs and phlebotomine vectors are present: both are necessary for the heteroxenous development of flagellated protozoan parasites of the genus *leishmania*. (Herwaldt, 1999; Desjeux, 2001). The studies about risk factors suggest that climatic and ecological characterics, and human, vector and reservoir behaviors together influence the transmission pattern of *leishmania*, vector borne disease (Cox, 2002; WHO, 2010). Figure (2).

### Climatic factors:-

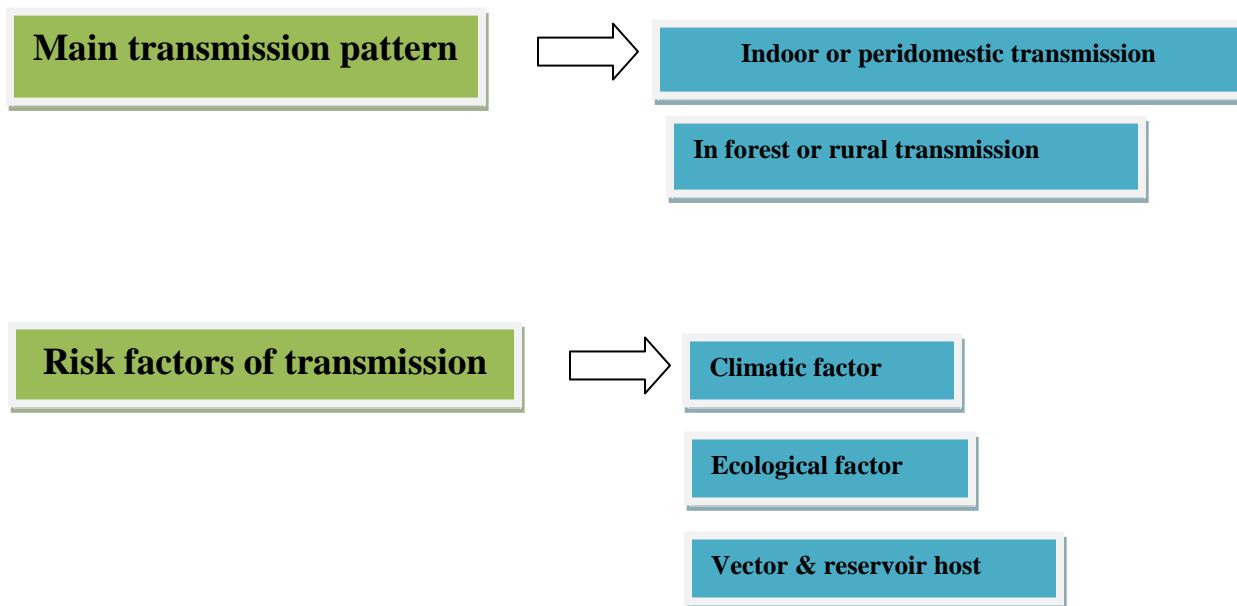

Vectors, pathogens, and hosts each survive and reproduce within certain optimal climatic conditions and changes in these conditions can modify greatly these properties of disease transmission. The most influential climatic factors for vector-borne diseases include temperature and humidity of the soil and vegetation which lead to a change in the composition and density of vector (Robertd and Janovy,1996; WHO, 2010). Temperature may modify the growth of disease carrying vectors by altering their biting rates, as well as affect vector population dynamics and alter the rate at which they come into contact with humans (WHO, 1984; WHO,2010).

**Ecological Factors:-**

Risk factor in the old world is the building of dams with corresponding new irrigation methods and new crops which provoked a sharp change in the reproduction patterns of the animal reservoirs (Desjeux, 2001) dams, can change the temperature and humidity of the soil and vegetation which lead to a change in the composition and density of sand fly species and a change in rodent species, the distribution and prevalence of various species of *Leishmania* parasites differs from region to region because of several environmental, social and geographical factors vegetation which lead to a change in the composition and density of sand fly species and a change in rodent species (Desjeux, 1996). Risk factors associated with the transmission of *Leishmania* infections have been demonstrated in several countries (WHO, 2010)

**Vector & reservoir hosts:-**

Human and wild canidae are the reservoir host of *Leishmania* parasite. The dog is the major reservoir of *L. infantum* in the Middle East and the Mediterranean region and *L. chagasi* in South America (Chin, 2000). Dogs are reservoirs for human infection (Baneth, 2006). Leishmaniasis can be transmitted with different methods such as, Vector – borne transmission. Most infections of leishmaniasis are transmitted via vector sand fly through the bite of infected female phlebotomine sand flies. Figure (3). Sand fly vectors are found in rural regions more than the urban regions that is due to need of sand fly to the organic material in the burrows of rodent and wild animals for the feeding their larvae. The better place for sand fly resting is the trunk of tree, debris (waste), mud-house (WHO, 1984; WHO,2010). The sand fly vector is mainly active during the night and the highest risk for contracting the disease from sandfly bites is therefore between dusk and dawn (WHO, 1990; TDR, 2004). In Iraq the Jackal is the principle reservoir (Jarallah, 2015). In other report that the black rat is the reservoir host for *L. tropica* while the domestic dogs are the reservoir host for *L. donovani* (Rahim and Tatar 1966 ; Sukkar, 1985; Marquardt, 2000). The risk factors are different if the transmission is (indoors or peridomestic) or outside the home in (forests or rural areas). In some endemic areas transmission around the home causes about 80% cases. Requires the parasites to be present in the peripheral blood of the donor, preferably asymptomatic, survive processing and storage in the blood bank, and infect the recipient. (Schreiber *et al.*, 1996 ; Singh, 1999).

**Figure 2:-** Diagram illustrate the transmission patterns and risk factor transmission for vector - borne diseases

**Figure 3:-** Leishmaniasis are transmitted via vector (Vector –borne transmission)

#### **Influence of environmental and climatic factors on disease risk:-**

The leishmaniasis are vector borne diseases, and are highly complex: they are usually zoonotic, a large number of *Leishmania* species infects human, the biological cycles and epidemiological interrelationship between vector, reservoir, humans, climate and ecology are highly variable (Magill, 1995; Singh, 1999). The distribution of leishmaniasis in Europe is significantly less than the distribution of the sand fly vectors. The occurrence of disease transmission within the range of the vectors depends on vector abundance vector survival, vector biting. Temperature and humidity are the two most important climatic factors for sandfly survival, development and activity (Alvar, 1997; WHO, 2010). Populations at risk include people living in rural and periurban areas where both sandflies and reservoir animals are prevalent (Magill, 1995). Sandflies are sensitive to sudden temperature changes and usually prefer regions with small differences between the maximum and minimum temperature (Desjeux, 2001). Sand fly survival can be reduced if the climate gets too hot and dry, even though the flies may rest in cold, humid place during the daytime (McCarthy *et al.*, 2001). The direct association between climate and leishmaniasis transmission, climate has indirect impacts by influencing the distribution of hosts, the local vegetation (important as resting sites and sugar sources) and the patterns of human exposure to sandfly vectors (TDR, 2004).

##### Key words:-

Banach contraction principle, weak contraction principle, Fixed Point Theorem, complete metric space etc

#### Abstract

The study of Fixed Point Theorem has been widely done in many fields. The Banach Fixed Point Theorem plays important role in this theory. It becomes milestone in the various paths in this field.

In this paper we have discussed existence and uniqueness of fixed point in more general conditions. The concept of weak contraction mapping over contractive metric space is discussed. In general, for a function  $f: X \rightarrow X$  to have a fixed point, weak contraction is not a sufficient condition for function.

Additionally function needs to be a compact to have a fixed point. Banach contraction principle is one of the directive theorems in the analysis of the result.

#### 1. Introduction:-

The concept of weak contraction principle was firstly noted by Alber and Guerre – Delabriere [3] but in Banach Space. Later Rhoades [5] generalised the result of Banach Contraction Principle as contraction as a special case.

The concept of weak contraction then further developed very interestingly by Boyd – Wong [6] in complete metric space.

#### 2. Preliminaries:-

##### Definition 2.1: Metric Space:

Let  $d: X \rightarrow X$  be the mapping then  $d$  is called metric on  $X$  if

- i)  $d(x, y) \geq 0$
- ii)  $d(x, y) = d(y, x)$
- iii)  $d(x, y) = 0$ , iff  $x = y$
- iv)  $d(x, y) \leq d(x, z) + d(z, y)$ , for  $\forall x, y \in X$

##### Theorem 2.1: Banach Contraction Theorem:

Let  $(X, d)$  be the metric space then  $f: X \rightarrow X$  is said to be a Lipschitz continuous if there exists  $\lambda \geq 0$ , such that

$$d(f(x_1), f(x_2)) \leq \lambda d(x_1, x_2), \forall x_1, x_2 \in X$$

Where  $\lambda$  is called Lipschitz constant

If  $\lambda \leq 1$  then  $f$  is called non expansive,

$\lambda < 1$  then  $f$  is called contraction mapping

Let  $f$  be a contraction mapping on complete metric space  $X$ , then  $f$  has unique fixed point  $x \in X$

**Corresponding Author:- Ashwinkumar Raosaheb Chavan.**

**Address:-** Department of Humanities and Applied Sciences, SIES Graduate School of Technology, Nerul <sup>2</sup>Department of Mathematics, D. S. M. College, Jintur

**Definition 2.2: Complete Metric Space:**

If every Cauchy's sequence in  $X$  converges to a limit  $x$  in  $X$ , then such metric space is called Complete Metric Space

**Definition 2.3: Identity Map:**

Let  $f: X \rightarrow X$  and  $n \in \mathbb{N}$ , then  $f^n$  is the  $n^{\text{th}}$  iterate of  $f$  ( $n$  times) then  $f^n$  is called identity map.

**Theorem 2.2:**

Let  $(X, d)$  be a metric space and  $f: X \rightarrow X$  be a mapping. If  $f^n$  is a contraction mapping then  $f$  has unique fixed point  $\bar{x} \in X$ , for some  $n \geq 1$ .

**Theorem 2.3: Weak contraction Principle:**

Let  $(X, d)$  be a metric space. Then  $f: X \rightarrow X$ , is a weak contraction if,

$$d(f(x_1), f(x_2)) \leq d(x_1, x_2), \forall x_1 \neq x_2 \text{ and } x_1, x_2 \in X$$

**Theorem 2.4: Boyd –Wong theorem:**

Let  $(X, d)$  be a complete metric space and  $f: X \rightarrow X$ . Define  $\psi: [0, \infty) \rightarrow [0, \infty)$  as right continuous map such that

$$d(f(x_1), f(x_2)) \leq \psi[d(x_1, x_2)], \forall x_1, x_2 \in X$$

Then  $f$  has unique fixed point  $\bar{x} \in X$ .

Moreover for any  $x_0 \in X$ , the sequence  $f^n(x_0)$  converges to  $\bar{x}$

**3. Main Result:-****Theorem 3.1:**

Let  $(X, d)$  be a compact metric space and  $f$  be a weak contraction on  $X$ . Then  $f$  has unique fixed point  $x \in X$  and  $f^n(x_0)$  converges to  $x$  for some  $x_0 \in X$

Proof: Let  $(X, d)$  be a compact metric space, then by Banach contraction principle

We have

$$f(\bar{x}) = \lim f(x_n) = \lim x_{n+1} = \bar{x}$$

If not, i.e.

$$f(\bar{x}) \neq \bar{x}, \text{ then}$$

$$d(\bar{x}, f(\bar{x})) = \min(x, f(x))$$

$$\leq d(f(\bar{x}), f(f(\bar{x})))$$

$$< d(\bar{x}, f(\bar{x})), \text{ which contradicts to the assumption.}$$

$$\therefore \bar{x} \text{ is unique fixed point of } f \text{ and so of } f^n(x)$$

Now let  $\bar{x} \neq x_0$  and define  $d_n = d(f^n(x_0), \bar{x})$

$$\text{Then } d_{n+1} = d(f^{n+1}(x_0), f(\bar{x}))$$

$$< d(f^n(x_0), \bar{x}) = d_n$$

Which implies that  $d_n$  is strictly decreasing. And now let  $y_k(x_0)$  be a subsequence of  $f^n(x_0)$

Which converges to  $y \in X$  then

$$\text{Define } r = d(y, \bar{x}) = \lim_{k \rightarrow \infty} d_{n_k}$$

$$= \lim_{k \rightarrow \infty} d_{n_{k+1}}$$

$$= \lim_{k \rightarrow \infty} [d(f(y_k(x_0)), \bar{x})]$$

$$= d(f(y), \bar{x}),$$

$$\text{but } y = \bar{x} = f(\bar{x})$$

$$= d(f(y), f(\bar{x}))$$

$$< d(y, \bar{x})$$

$$\therefore \text{subsequence of } f^n \text{ has a limit } \bar{x}$$

Since  $X$  is compact, it implies that  $f^n(x_0)$  converges to  $\bar{x}$

Which prove that imposing the condition of compactness of  $X$ , being a weak contraction of  $f$  becomes sufficient condition in order to have fixed point.

#### Abstract

Acute appendicitis (AA) is considered as one of the most common causes of surgical emergencies worldwide (1). The gold standard treatment for AA is Appendectomy (2). About 6% of the population during their lifetime, will suffer from acute appendicitis (3,4). Males suffer from acute appendicitis than females (8.6% and 6.7% respectively) (5,6). Acute appendicitis rarely causing death; with a mortality rate ranges from zero up to 2.4% (8). However, more attention has been directed for early diagnosis and intervention. A cross-sectional study was conducted to assess the relationship between appendicitis and lifestyle ; dietary and hygiene in Saudi Arabia. This study showed defects in Dietary life style for acute appendicitis patients including, low consumption of water, a significant decrease in the containment of fiber at the usual food.

#### Introduction:-

Acute appendicitis (AA) is considered as one of the most common causes of surgical emergencies worldwide (1). The gold standard treatment for AA is Appendectomy (2). About 6% of the population during their lifetime, will suffer from acute appendicitis (3,4). Males suffer from acute appendicitis than females (8.6% and 6.7% respectively) (5,6). Acute appendicitis rarely causing death; with a mortality rate ranges from zero up to 2.4% (8). However, more attention has been directed for early diagnosis and intervention.

Appendicitis secondary to hyperplasia of the appendiceal lymphoid follicles as a result of a bacterial or viral infection is the most common etiology of appendicitis in children. While the appendicitis as a result of fecal material or fecalith occurs more commonly in adults (14, 15). There are different factors are responsible for acute appendicitis perforation in different age groups and this can be explained by the difference in immune status and appendicitis aetiologies (8). The industrialized nations have registered increased happening of appendicitis, constipation, diverticulitis, irritable bowel syndrome (IBS), and colon cancer (16).

In the AA management, the key for successful management is early diagnosis and prompt surgical intervention (9). The late diagnoses of could lead to gangrene and perforation. The perforation occur within 8 - 24 hours in children, while it occur within 36 hours in young children and adolescents (8). Causes of delayed diagnosis include; home remedies, homeopathic, local doctors, quacks, and medical practitioners, (8).

The most common symptom of AA is abdominal pain. According to the National Institutes of Health, the pain begins typically near the belly button, and then it moves to the abdomen lower right side, usually along a period of (12 – 24) hours. The pain gets worse often if the patient moves around, coughs, takes deep breaths, or sneezes (10). There are many other diseases of gastrointestinal tract which mimic AA making it difficult in diagnosis. (11,12). Diagnosis difficulties arise in females at reproductive age , very young, and elderly patients because they are more possible to have an atypical presentation. They also have many other conditions may mimic acute appendicitis (13).

In spite of the fact that the acute appendicitis etiology and many etiologic factors have been subject of discussion and speculation, multiple factors are probably included in the disease pathophysiology are still unknown. These include non-specific factors, as well as bacterial, fungal, and viral infections and dietary regimens with low fiber (16). Therefore this study was conducted to assess the relationship between appendicitis and lifestyle ; dietary and hygiene in Saudi Arabia .

#### **Objectives:-**

- To describe the characteristics of the patient with appendicitis.
- To determine the relationship between appendicitis and life style (dietary and hygiene ).
- To determine the relationship between appendicitis and medical and surgical problems.

#### **Subjects and Methods:-**

A cross-sectional study was conducted to assess the relationship between appendicitis and lifestyle ; dietary and hygiene in Saudi Arabia . During the period from 1, August 2016 to 8, September 2016, in **the following** hospitals; King Fahad university hospital in Al- khobar, Dammam central hospital, Imam Abdurrahman Bin Faisal hospital ( Dammam National Guard), King Fahad specialist hospital in Dammam, king Fahad medical military complex, king Fahad central Hospital in Jizan, Abu Areash General Hospital, king Fahad general hospital in Medina, National Guard hospital Medina, National Guard hospital in Jeddah, Alansar hospital in Medina, Al-rass general hospitals in Qassium, Prince Sultan Armed force hospital in Medina, Qatif central hospital in Qatif, Dammam medical complex, King Khalid hospital, Hail general hospital, King Fahad medical city Qassium, king Fahad hospital in AlHassa, Bin Jalawi Hospital in AlHassa, Dammam medical center, King Fahad Medical City, king Faisal specialist hospital & research center, and King Abdul-Aziz hospital in Jeddah.

Data were collected by data collectors by means of personal interview with the sampled patients, after obtaining their consents and hospital approval to participate in the study, using a predesigned questionnaire. Each patient was interviewed separately, and confidentiality was assured. It has been to maintain the confidentiality of the information for each patient. The questionnaire designed by researchers, its contains four sections. The first section is about socio-demographic characteristics which includes Gender, Age (years), Marital status, Place of residence, Weight (kg), and Length (cm). Second section includes the questions regarding dietary life style. While third section to assess the hygiene life style. And Fourth section is including questions about chronic medical and surgical problems. The study included (923) patients whose diagnosed with appendicitis postoperatively and were attending certain hospitals in Saudi Arabia. The patients more 60 years old or less than 12 years were excluded. Collected data were coded and analyzed using statistical analysis program (SPSS v.22), in addition to using of necessary statistical methods to achieve the objectives of the study including frequencies, percentages, graphs, and chi-square test.

#### **Results:-**

Table (1) shows the appendicitis patients distribution according to their personal data, as 59.4% of them were males, while 40.6% of them were females.

Their ages were distributed according to the following age groups, 39.2% of them were between (18- 25) years old, 25.9% of them were less than (18) years old, while 22.1% of them were between (26- 35) years old.

And their distribution according to their marital status; most of them were not married with a percentage of 64.4%, while 35.6% of them were married.

And according to their weights; 41.4% of them had weights less than (60) K.g, 29.3% of their weights were in the range (61- 75) k.g, 20.1% of their weights were between (76- 90) k.g, and 9.3% of their weights were more than (90) k.g.

And finally their distribution according to their length; 35% of their lengths were between (161- 170) cm, 34.6% of them were between (150- 160) cm, and 20.5% of them were between (171- 180) cm.

	No	247	27.0
Total		916	100.0
Do you eat in fast food restaurants?	Yes	808	88.2
	No	108	11.8
Total		916	100.0

We conclude from the above table that 54.4% of Appendicitis patients consuming less than (6) cups of water a day, and 82.5% of them eat vegetables just once a day, and 87.3% of them were consuming fruits once a day, and 80.3% of them eat grains once a day.

As we conclude that 21.7% of Appendicitis patients preferred adding hot sauce to all of their meals, while 41.9% of them prefer that for some of their meals, and 36.4% of them didn't prefer to add hot sauce to their meals.

And also conclude from the above table that 94% of Appendicitis patients didn't follow specific food system, and 73% of them eat from bronchial restaurants, and 88.2% of them eat from fast food restaurants.

**Table 3:-** Hygiene life style.

Question		No	%
Do you wash your hands before eating?	Yes	461	50.3
	No	83	9.1
	Sometimes	372	40.6
Total		916	100.0
Do you eat foods from peddlers?	Yes	224	24.5
	No	313	34.2
	Sometimes	379	41.4
Total		916	100.0
Do you use bathrooms too much ( in public places or in crowded home)?	Yes	424	46.3
	No	492	53.7
Total		916	100.0
What type of bathrooms do you use?	Old ones (Arabian)	427	46.6
	Chair bathrooms	489	53.4
Total		916	100.0

We conclude from the above table that 50.3% of Appendicitis patients they wash their hands before each meal, and 24.5% of appendicitis patients eat foods from peddlers. and 46.3% of them always use public bathrooms or crowded home bathrooms, and 53.4% of them use chair bathrooms, while 46.6% of them used old ones (Arabian).

**Table 4:-** Chronic medical and surgical problems.

Question	Yes No. (%)	No No.(%)
Do you suffer from chronic constipation?	161 (17.6%)	755 (82.4%)
Did you diagnosed for any of this disease before feeling the pain?		
- Chronic inflammatory bowel disease	5 (0.5%)	911 (99.5%)
- Inflammation of the respiratory tract	54 (5.9%)	862 (94.1%)
- Parasitic infection in the digestive tract	40 (4.4%)	876 (95.6%)
- Colon tumor	8 (0.9%)	908 (99.1%)
- Appendix tumor	32 (3.5%)	884 (96.5%)
- Stomach injury(incident, beating or stap)	29 (3.2%)	887 (96.8%)
- A surgery in the right side abdomen	44 (4.8%)	872 (95.2%)

We conclude from the above table that 82.4% of Appendicitis patients didn't suffer constipation, and the 9% of them suffer from inflammation of the respiratory tract, and 4.8% of them had already conduct surgery in the right side abdomen, also 4.4% of Appendicitis patients suffered from parasitic infection in the digestive tract.

Also we conclude from the table that 3.5% of Appendicitis patients suffered from appendix tumor, and 3.2% of them suffered from abdomen injury, and 0.9% of them suffered from colon tumor, finally 0.5% of them suffered from chronic inflammatory bowel disease.

### **Discussion:-**

Acute appendicitis continues to be the commonest cause of surgical abdominal emergency (1). There are different factors are responsible for acute appendicitis perforation in different age groups (8). These include non-specific factors, as well as bacterial, fungal, and viral infections and dietary regimens with low fiber (16). Consequently this study aimed to to assess the relationship between appendicitis and lifestyle ; dietary and hygiene in Saudi Arabia .

In a report for World Health Organization, it was estimated that adult females needed of water 2.2L/day and males 2.5L/day (17). Equivalent to 8-8.5 cups of water daily, but in our study more than half of appendicitis patients consume less than 6 cups of water daily, and the most of them follow this rate of water consumption more than 2 months ago. This low consumption of water contributes at causing the slow bowel movement followed by constipation and thus lead to appendicitis. Case study reported that, Low water intake may also be a causative influence of appendicitis (18).

Concerning fiber consumption, results of this study showed a significant decrease in the containment of fiber at the usual food for acute appendicitis patients. Also there was a significant proportion of acute appendicitis patients weren't going to defecate daily. Our finding compatible with Imanieh et al., found that a high rate of constipation in patients with lower fiber intake, (16).which is consistent with the hypothesis indicating the role of dietary fibers in lowering the incidence of appendicitis. Whereas the water content of dietary fiber is three times its density(16), it forms softer and heavier stools with a larger volume and reduced passage time (19), it also increase mucus production by the intestinal mucosa (20),and to decrease contraction frequency of the cecal circular muscle (21). Thus lowering the probability of contracting appendicitis as compared to stools with lesser fiber (16). Volz was the first to describe the relationship between the presence of fecalith and inflammation of the appendix. The belief that luminal obstruction is an important factor in the pathogenesis of acute appendicitis is based on the finding of fecalith in many patients with advanced disease (22).

Most of our appendicitis patients eat grains only one time daily, Cummings and colleagues 14 found bran to cause the greatest increase in fecal weight of the dietary fibers they studied (23).

A beneficial role of spices has been reported in obesity, cardiovascular and gastrointestinal conditions, various cancers, neurogenic bladder, and dermatologic conditions (24), but spices also exhibit antibacterial activity and affect gut microbiota populations (25). This means that the spices have both beneficial and harmful effects on the digestive system. In the present study most of acute appendicitis patients preferred having spicy meals, But not on a daily basis, or continuously.

Also the most of our participants consume food restaurants, whether bronchial restaurants or fast food. It is known that food restaurants contains high levels of fat and low in fiber and this in turn hinders the process of digestion and aggravate constipation and thus increases the likelihood of suffering from acute appendicitis.

The causes of appendicitis have been hypothesized to be multifactorial, with diet considered to be a major predisposing factor and viral agents, bacteria, or environmental pollutants playing a secondary or precipitating role (26). In our study the participants showed moderate Hygiene life style. It is natural that this moderate Hygiene life style increase the chances of bacteria and viruses infection, which in turn increase the chances of acute appendicitis. Contrary to previous statements there is no evidence that disease rates were greatly influenced by the dietary changes in the second world war. It is concluded that dietary changes do not explain the time trends in appendicitis and that the epidemiology of the disease is more readily explained by a primarily infectious aetiology (27).

Knowing that appendicitis is difficult to diagnose in the steroid dependent patients who are taking steroids for other illnesses like Chronic inflammatory bowel disease and Inflammation of the respiratory tract due to anti-

inflammatory and immunosuppressive effects of steroids. Also steroids Inhibits pain so it hinder the diagnosis of acute appendicitis. The most of our participants didn't suffer from Chronic medical and surgical problems.

### Conclusion:-

This study showed defects in Dietary life style for acute appendicitis patients including, low consumption of water, a significant decrease in the containment of fiber at the usual food. This lead to a significant proportion of acute appendicitis patients weren't going to defecate daily. Also the acute appendicitis patients showed moderate hygiene life style, this could contributes in increasing the probability of appendicitis patients. There was low prevalence of chronic medical and surgical problems among acute appendicitis patients including.

### Recommendation:-

- Work on community awareness of risk factors that increase the chances of acute appendicitis.
- Guidance of children in schools on healthy diet and the importance of drinking water and personal hygiene because they are the most vulnerable to appendicitis.
- Adult females need 2.2L of water per day while males need 2.5L of water per day.
- The daily diet should contain a sufficient amount of fiber.
- Work to avoid constipation and treated as soon as it happens.
- Maintaining personal hygiene as much as possible.

#### Abstract

**Background:** Students' knowledge about first aid is considered a lifesaving and a preventive measure from injuries. As injuries are considered a threat to school students mainly in secondary schools, therefore first aid is vital for them to be able to deal appropriately with such injuries. Aim of the study was to assess the effect of a structured training course on students' knowledge and behavior regarding first aid in secondary schools.

**Methods:** Quasi-experimental pre-post study design including 220 participants selected by multi-stage sampling from all five educational sectors of Makkah, students' knowledge and behavior regarding first aid are assessed prior and after training which includes theoretical as well as practical parts.

**Results:** After the intervention, behavior score was improved significantly from 9.5% to 95.0% while knowledge score was improved significantly from 72.3% to 83.6%. 22.7% of the participants have received previous training. Mean knowledge and behavior score increased significantly from  $69\% \pm 15\%$  to  $75\% \pm 15\%$  and from  $46 \pm 12$  to  $79\% \pm 11\%$  respectively. There was positive correlation between knowledge and behavior.

**Conclusion:** First Aid Courses provided by Medical School Student result in a significant improvement in overall knowledge and behavior scores of the secondary school student. Repeated courses tend to have a significant improvement.

#### Introduction:-

Injuries between school students are from the most dangerous health problems worldwide today as it can cause significant lifelong disability or even death. So first aid is very important in such injuries. Laypersons are central factor for saving lives in emergency conditions. But, one chief barrier and primary concern of laypersons about providing first aid to injured persons is the apprehension to make mistakes. In Austria 68% stated that they could not

Address:- Assistant Professor General Surgery Department, Faculty of Medicine, Umm Al-Qura University Makkah, Saudi Arabia.

provide first aid because they feared to carry out something in the wrong way(1). Numerous studies have revealed a clear association between the level of first aid education and the excellence of first aid measures and actions provided (2, 3). This emphasizes the value of first aid training for the public. It is well-known that the school location can be one of the most common locations to witness an emergency (2), Early and appropriate management of such emergencies and injuries can reduce complications and mortality (4). Appropriately administered first aid indicates the discrepancy between life and death, quick versus delayed recovery and short-term versus long term disability (5) so this study was conducted on the grounds of evaluating the outcomes of giving a first-aid course to secondary school students 16 - 18 years old as they are a part of an age group that represent the majority of our population. It is well known that it's the school's responsibility to look after the students and try to avoid these emergencies and to deal with injuries that need appropriate first aid (6), but training the students to do so themselves is much more beneficial and helpful and seemed to be applicable (2, 7). (Burns,wounds,chocking,fractures, convulsions and fainting)are the topics which our training course had a focus on (6). According to a study was conducted in Riyadh, Saudi Arabia, 2012 aiming to evaluate peoples' opinions about receiving a practical first aid training course, their result showed that 50% of those who where interested to learn were between the ages of 15-19 years old.

Thus our main aim was to assess and evaluate students' knowledge and behavior before and after receiving the training, and to identify and correct those common mistakes they perform, that might lead to unwanted complications.

### **Methods:-**

A pre-postquasi-experimental intervention study was conducted on secondary school students from all five educational sectors of Makkah, a total of 14 governmental schools were selected. 6 schools were assigned for male students and 8 were assigned for female students. The final sample size was 220 student (104 male=47.27% and 116 female =52.72%)recruited by is multistage random sample. After that they obtain a written consent from their parents.

Aself-administered questionnaire was developed divided into 3 sections. The first section included socio-demographic background of each student and another two questions were added to assess their general background on first aid training. The second section included questions to assess the knowledge of first aid skills in the most important topics such as burns,wounds,chocking, fractures and convulsions. While the third section included case scenario based questions to assess their behavior towards different emergency cases based on the above-mentionedtopics. 9 questions for the knowledge section were assigned and 19 questions to assess the behavior, 5 of which were labeled as common mistakes questions. The scoring system was as follows: each correct answer was coded as 1 and false answers were coded as 0. Each section was given an individual scoring system in order to pass the training course. The overall passing score was 60% for each section (60% for knowledge and 60% for behavior). Any score that was 60% or above was labeled as good and any score that was less than 60% was labeled as poor.

The study was conducted through the following phases: preparation, assessment, implementation, and evaluation.

- **Preparation phase:** This phase involved:
  - Obtaining an approval from the ethical committee of the college of medicine at Umm Al-Qura University and alsothe ministry of education's approval to address the schools of Makkah was obtained.
  - Each school was visited to provide the students with a written consent for the parents attached to the site map, and a form of the pre-intervention questionnaire.
- **Assessment phase:** This phase involved:
  - Collection of the consents and the questionnaires. The questionnaires were solved under the teacher's supervision.
  - An SMS text message was sent to all included students with the day, place and time for the training course, the setting of the training took place in the skills lab of the college of medicine at Umm Al-Qura University.
- **Implementation phase:** This phase involved:
  - A group of 37 Male and female Undergraduate Well-Trained 6th year Medical students from Umm Al-Qura University have provided free an intensive first aid course for Our Sample, Delivered in one day

made up of two parts Theoretical part presented as a slide show and Role playing practical part focused on Burns, Wound, Fracture , Fainting and Convulsion .

- The students were divided into two groups, each group came in a different occasion to compensate with the number of instructors available and the capacity of the educational classes, and to insure adequate delivery of the information to the students.
  - Each group was given a one-day training course consisting of two parts, a theoretical part that was provided as PowerPoint slide show as well as practical part, which was explained by giving case scenarios of different emergency situations.
  - The training course was given by 6th year medical students who were provided with the same course adapted from the American Heart Association guidelines of 2010.
  - Our scientific material was developed according to the same guidelines of 2010. The topics included were burns,wounds,chocking,fractures, convulsions and fainting.
- **Evaluationphase:** This phase involved:
- A post-intervention questionnaire was provided immediately after the training has been completed to evaluate their knowledge and behavior post intervention.
  - The students were E-mailed with a certificate of attendance.

#### **Statistical Analysis:-**

Data entry and statistical analysis was done using SPSS 20.0 statistical software package. Data was presented using descriptive statistics in the form of frequencies and percentages for qualitative variables, and means and standard deviations for quantitative variables. To assess the differences in percentage on qualitative variables Chi- Square test was used with P value less than 5 %. Correlation between knowledge and behavior was done using spearman's correlation test.

#### **Results:-**

The questionnaire was given to 220 students who completed the questionnaires and got the consent from their parent and were fit to attend the course. Among those, 104 (47.3) were boys and 116 (52.7) were girls. There age 16-18 years. 50 students had attended a first aid course before. 16 were boys and 34 were girls. Total knowledge percentage has increased from 73.3% to 83.6%. (Figure1). There was a significant difference between male and female (P value <0.05) in pre and post knowledge score. Good knowledge increased by 25.9% in females as it changed from 65.5% to 91.4% post intervention. However in males good knowledge surprisingly decreased by 4.8% from 79.8% to 75% after the intervention.

The mean knowledge score increased significantly from  $69\% \pm 15$  into  $75\% \pm 15$  post intervention. The total behavior after the intervention shows statistically significant change as total behavior percentage increased by 85.5% and increased from 9.50% to 95.0% as demonstrated in (Figure2).

The mean behavior score increased significantly from  $46\% \pm 12$  to  $79\% \pm 11$ . There was no significant difference between male and female in pre and post behavior score.

(Table1) shows the most significant result regarding the knowledge and behavior throughout pre and post intervention assessment.

However, there was a significant week positive correlation between knowledge and behavior pre-intervention ( $r=0.132$ ;  $P<0.05$ ). The knowledge and behavior post-intervention changed into significant moderate positive correlation ( $r=0.350$ ;  $P<0.01$ ).

(Table2) demonstrates the wrong answers that be chosen by students which represent the common mistake in our society.

Figure1. Percentage of good and poor knowledge pre and post intervention.

Ensure safety of the surrounding environment is first step to do in case of a fracture injury
Applying cold packs over the fractured part is the appropriate action in case of a fracture injury
Stopping the bleeding is the ideal action to take if the fractured part was showing through the skin
Applying continuous pressure over the wound site in case of a bleeding wound
Leaving a sharp object that has penetrated the skin in place and calling an ambulance is the appropriate action to take
Covering the injured person with a dry blanket is the next step to do after putting out the flames
Sitting down on the nearest safe place is the appropriate action to take if you felt like losing your consciousness
Asking someone who is choking while eating food to cough forcefully is the appropriate action to take
Placing the child's abdomen on your forearm while his head is facing downwards and tapping gently on the back is the appropriate action to do in a choking child
Ensuring the safety of the surrounding environment in case of a convulsing patient is the appropriate action to take
The number of ambulance in Saudi Arabia is 997
Lose of consciousness inability to response for less than a minute then return to normal
Standing behind the person, press in their abdomen is the action to help person with obstructed airway
The ability to response is not a sign of convulsion
After the convulsion is over what is the best action to check their pulse and put them on their side

**Table 2:-** Percentage of common mistakes

Common mistakes	Pre intervention No %	Post intervention No %	P value
Trying to open the patient's mouth during convulsions	169 76.8%	38 17.3%	<b>0.000</b>

Using coffee beans to stop the bleeding nose if it continues	70 31.8%	3 1.4%	<b>0.000</b>

**Discussion:-**

The Aim of the current study was to assess the effect of a structured training course on students 'knowledge and behavior regarding first aid in secondary schools

The present study findings demonstrated that unexpected percentage of students with Good level of knowledge 73.3% pre-intervention, which increased significantly up to 83.6% post – intervention in both gender. Our results were consistent with, a study conducted in Karachi which showed that only 8.3% medical students had poor knowledge while 63.2% had good knowledge and 28.3% moderate knowledge (8, 9).

The foregoing present study finding is also in agreement with the results of Abd El -Ghany A., etal. (2014) Who reported that 76.5% had already good knowledge about first aid while 23.5% from them didn't have appropriate information about it. The value of medical knowledge in the health education should be noticed because improvement in knowledge is the an essential step in the way of correct practice and behavior modifications (10).

However, in the same Direction with the current study, a study was conducted in Egypt 2014, overall their population only 1 % had satisfactory knowledge at the pre-test phase, compared to 100% school students in the post-and follow up phase.

In addition to other studies conducted about first aid have shown higher result of poor knowledge than good knowledge, even in those was conducted on medical student or medical staff, Like in a Peruvian study that showed out of 52.5% medical students have had prior medical emergencies training, 60.4% had poor knowledge about first aid. A study conducted in Mangalore, India reported 17.8% medical student had poor knowledge, while in a Dutch study 81% junior doctors had poor knowledge about first aid.

This might be attributed to 22.7% of our students have attended to a first aid program before the current intervention as knowledge was improved from 84.0% pre intervention to 90% post intervention in previously trained group and shows statistically significant improvement in their behavior as well .

The foregoing present study finding is also in agreement with the results of Khan F. etal. (2010)(11) as reported that students having received previous training scored better than those who had no previous training but still the mean score itself is quite low emphasizing the need for update courses so as to remain one self-updated with latest improvements.

According to the present study results, After the intervention, percentage of students with appropriate behavior was improved significantly from 9.5% to 95.0%. at the same time as The mean behavior score increase significantly from 46 %  $\pm$ 12 pre intervention to 79 %  $\pm$ 11 post intervention.

Which is Consistent with Ann K., etal (2010)(12) who showed that there was significant increase in mean scores of first aid practice after training, most likely due to an improvement in knowledge after intervention.

As regards to correlation between knowledge and practice among studied students. The study results showed that there were statistically significant positive correlation between total knowledge and behavior right through the study. This may be accredited to the improved knowledge among students raise their awareness and drive to perform first aid properly. This result was in agreement with Kano M., etal. (2005) (13) who revealed that the first aid training significantly increased knowledge and practice as well.

Additionally, Muneeswari B. (2014) (14)revealed that there was statistically significant positive correlation between knowledge performance of the students

**Recommendations:-**

Based on results of the current study the recommendations are; It is necessary that first aid must be an essential part of the curricula in secondary school, Schools should develop process and procedures for first aid for students within secondary school, First aid and training program should be fundamental part of high school programs so that to ensure that students could obtain enough knowledge and have the ability to help the people in emergency circumstances, First aid should be accessible to students at school to reduce the morbidity and mortality of injuries

and accidents, And regular and frequent training courses are crucial for students in to recognize the practical aspects of first aid.

We would also hope to implement a mandatory training course to be included within the educational curriculum of secondary school students by the Ministry of Education based on the promising results of our study. Continuous education is recommended to maintain the gain and for continuous improvement.

#### **Limitations of the study:-**

Transportation was an issue for some students to Umm al-Qura University where the first aid teaching was done especially for females.

#### **Acknowledgment:-**

This research was supported by the medical student as for the budget and by the medical college for halls for presentations and training.

#### **We would like to thank our colleagues who did the data collection part of this research:**

### Abstract

Transmission coefficients for compounds of some biomedically important elements (Na, Mg, Al, Ca and Fe) have been measured by using an extremely narrow collimated-beam transmission method in the energy 59.5 keV. Gamma-rays of <sup>241</sup>Am passed through compounds were detected with a high-resolution Si(Li) detector and using energy dispersive X-ray fluorescence spectrometer (EDXRF). Results are presented and discussed in this paper.

### Introduction:

The gamma-ray transmission method is important, because give information about light transmittance of material. For example, permeable or less absorbing materials have large transmission coefficients but well absorbing materials have small transmission coefficients. The gamma-ray transmission method is used for many working. Several of these studies are listed. A thickness gauging model of steel plates with build-up treatment, which is based on a gamma-ray transmission technique, has been proposed. It is shown that the calculated values with the new model are in good agreement with experimental data obtained by the gamma-ray thickness gauge in the thickness range from 0 to 10 cm [1]. Gamma-ray transmission methods have been used accurately for the study of the properties of a porous medium such as soil. Different soil parameters are determined by using gamma-ray transmission method. To this end, the soil samples were collected from various regions of Turkey and a NaI (Tl) detector measured the attenuation of strongly collimated monoenergetic gamma beam through soil samples [2]. X-ray transmission factors of some boron compounds (H<sub>3</sub>BO<sub>3</sub>; Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub> and B<sub>3</sub>Al<sub>2</sub>O<sub>3</sub>) have been determined by using an extremely narrow-collimated-beam transmission method in the energy range 15.746–40.930 keV [3]. Measurements of the total porosity of TRe soil, sandstone rocks and porous ceramic samples have been provided. For determination of the total porosity, the gamma-ray transmission method and the Archimedes method (conventional) were employed [4]. Gamma ray transmission measurements have been used to evaluate the water equivalence of solid phantoms. Technetium-99m was used in narrow beam geometry and the transmission of photons measured, using a gamma camera, through varying thickness of the solid phantom material and water. Measured transmission values were compared with Monte Carlo calculated transmission data using the EGSnrc Monte Carlo code to score fluence in a geometry similar to that of the measurements [5]. Transmission factors of main parameters have been determined that affecting the properties of both normal- and heavy-weight concrete in order to increase knowledge and understanding of radiation attenuation in concrete at a later age. Water/cement (W/C) ratio, curing condition, cement quantity and air entraining agent (AEA) have been selected as the main parameters. Eight energy values have been selected within the energy interval of 30.85–383.85 keV to be used in the radiation source [6]. Gamma-ray transmission method has been applied for studying the properties of cultivated soil. Additionally, mass attenuation coefficients, bulk density, moisture content, porosity, and field capacity have been determined. Five soil samples have been collected from

different agriculture zones in Egypt [7]. The change according to the annealing temperature and time of  $\gamma$ -ray transmission factors or transmissivity of semiconductor crystals have been examined. Gamma rays of Am-241 passed through crystals have been detected by a high-resolution Si(Li) detector and by using energy dispersive X-ray fluorescence spectrometer [8].

According to the literature, there are not experimental data for transmission coefficients of these compounds at 59.5 keV photon energy. This study presents the first experimental data. The aim of this work is to complete this lack of the literature and create a basis for other studies.

### Theory:

When  $\gamma$ -ray beam passes through an absorber, it is attenuated. The degree of attenuation depends on the scattering and various absorption processes. The absorption coefficient  $\mu$  can be derived from the Lambert–Beer law

$$I = I_0 \cdot e^{-\mu x} \quad (1)$$

where  $I_0$  and  $I$  are the unattenuated and attenuated photon intensities, respectively, and  $\mu(\text{cm}^{-1})$  is the linear attenuation coefficient of the material. A narrow beam of monoenergetic photons with incident intensity  $I_0$ , penetrating a layer of material with mass thickness  $x$  (mass-per-unit area) and density  $\rho$  emerges with intensity  $I$  given by the exponential attenuation law,

$$\frac{I}{I_0} = \exp[-\mu x] \quad (2)$$

where  $I/I_0$  is the transmission coefficient ( $T$ ).

### Experimental:

The schematic arrangement of the experimental setup used in the present work is shown in Fig. 1. It consists of a  $3.7 \times 10^9$  Bq (100mCi)  $^{241}\text{Am}$  point source, which essentially emits monoenergetic (59.5 keV)  $\gamma$ -rays. The powder samples were compressed into pellets for 10 s at 15 ton by using a manual hydraulic press. Target had a diameter of 13 mm. The intensities of fluorescent  $\gamma$ -rays were measured using a high-resolution Si(Li) detector (FWHM of 160 eV at 5.96 keV) and the data were collected into 4096 channels of a multichannel analyzer. The spectra were collected for a period of 1000 s. A typical spectrum of 59.5 keV gamma ray transmissions through  $\text{FeCl}_2$  is shown in Fig. 2.

Fig. 1: Experimental geometry.

**Fig. 2:** Spectrum of 59.5 keV gamma rays obtained with absorber ( $\text{FeCl}_2$ ).

### Results and Discussion:

In this study, transmission coefficients for compounds of some biomedically important elements (Na, Mg, Al, Ca and Fe) have been measured. These compounds can be listed as follows;  $\text{NaO}_2\text{C}_2\text{H}_3$ ,  $\text{NaNO}_3$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{NaF}$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{Na}_2\text{SO}_3$ ,  $\text{NaCl}$ ,  $\text{Mg}(\text{NO}_3)_2$ ,  $\text{MgO}$ ,  $\text{Al}(\text{NO}_3)_3$ ,  $\text{AlCl}_3$ ,  $\text{CaO}_6\text{C}_6\text{H}_{10}$ ,  $\text{CaHPO}_4$ ,  $\text{CaF}_2$ ,  $\text{CaSO}_4$ ,  $\text{Fe}_2(\text{SO}_4)_3$ ,  $\text{FeCl}_3$ ,  $\text{FeCl}_2$ . Transmission coefficients ( $T$ ) for compounds are given Table 1. Experimental effective atomic numbers ( $Z_{\text{eff(Exp)}}$ ) show second column in the Table 1 [9]. Additionally, experimental effective atomic numbers with the change of the transmission coefficients for compounds shown in Fig 3.

In composite materials like alloys, soil, plastic, biological material, and so forth, for photon interactions, the atomic number cannot be represented uniquely across the entire energy region, as in the case of elements, by a single number. This number in composite materials is called "effective atomic number," and it varies with energy [10].

**Table 1:** Transmission coefficients for compounds of some biomedically important elements

Sample	$Z_{eff(Exp)}$	$T$
$\text{NaO}_2\text{C}_2\text{H}_3$	5.808	0.26138
$\text{NaNO}_3$	8.086	0.90575
$\text{Na}_2\text{CO}_3$	9.450	0.91214
$\text{NaF}$	9.897	0.80288
$\text{Na}_2\text{SO}_4$	11.648	0.88468
$\text{Na}_2\text{SO}_3$	12.364	0.88144
$\text{NaCl}$	14.230	0.79087
$\text{Mg}(\text{NO}_3)_2$	7.921	0.90430
$\text{MgO}$	10.042	0.89418
$\text{Al}(\text{NO}_3)_3$	8.535	0.92275
$\text{Al}$	13.029	0.89442
$\text{AlCl}_3$	14.832	0.86498
$\text{CaO}_6\text{C}_6\text{H}_{10}$	6.474	0.88790
$\text{CaHPO}_4$	12.290	0.87036
$\text{CaF}_2$	14.569	0.81274
$\text{CaSO}_4$	15.698	0.85019
$\text{Ca}$	19.317	0.78707
$\text{Fe}_2(\text{SO}_4)_3$	15.661	0.78193
$\text{FeCl}_3$	20.537	0.78763
$\text{FeCl}_2$	22.126	0.82135
$\text{Fe}$	26.839	0.14101

**Fig. 3:** Transmission coefficients versus experimental effective atomic numbers of compounds.

In Table 1 and Fig. 3, it is clearly seen that the increase in the effective atomic number with the transmission coefficients of Na and Ca compounds a significant change was't observed, but transmission coefficients decreased of Mg and Al compounds. Unlike them, the transmission coefficients increased for Fe compounds. According to this, Mg and Al compounds than Fe compounds have more absorption. So, Fe compounds have more transmittance. We were informed about the light transmittance of these compounds using the  $\gamma$ -ray transmission method. Furthermore; the method of gamma-ray transmission permits the measurement of several parameters, such as: density, spatial and temporal profiles of moisture and porosity of amorphous materials, and the spatial distribution of the pores in the sample [11].

### Conclusions and Suggestions:

As a result; experimental transmission coefficients for compounds of some biomedically important elements more sensitive measurable used with an extremely narrow collimated-beam transmission method in this study. Compounds of biomedically important can be used elements in different areas especially as medicine study. In the future, studies can be performed different energies, elements, compounds and experimental geometries. In this way, other studies are created basic and lacking will be eliminated in the literature.

Received: 19 December 2016  
 Final Accepted: 15 January 2017  
 Published: February 2017

##### Key words:-

Foam sclerotherapy, Varicose vein, STS, USG.

#### Abstract

**Objective:** Numerous methods of injections and compounds are available. The most commonly used are sodium tetradecyl sulphate, these can be foamed or injected in various concentrations presently there is no exact guideline for injection of STS Foam.

**Method:** we reviewed our prospectively complied data of patient who have undergone USGFS for smaller diameter veins with different concentration of STS and clinical outcome were assed.

**Results:** There was extremely high patient satisfaction. 81% registered complete success, and 19% felt that foam had been partially successful. Their QOL (quality of life) improved as they were more ambulant, could stand for longer duration, could work more, no requirement of compression bandage and felt better.)

**Conclusion:** Ultrasound guided foam sclerotherapy is a safe, fast and effective technique of treatment of varicose vein. FST seems to more be beneficial for smaller, recurrent, remnant varicosities.

*Copy Right, IJAR, 2017,. All rights reserved.*

#### Introduction:-

The attempts of minimally invasive procedure like sclerosing fluid for the treatment of venous inadequacy have been advancing. At to start with, sclerotherapy was broadly utilized as a trade for surgery, yet it lost enthusiasm after an imminent study, randomized by Hobbs in the 1970. Be that as it may, soon before the start of the 21st century, another technique created by Tessari restored this topic, supporting the late productions by Cabrera concerning the infusion of polidocanol as ultrasound-guided smaller scale froth known as echosclerosis.<sup>(1-3)</sup>

The likelihood of obliterating the vascular destruction through coagulation was described<sup>(4)</sup> in the 1950s. In a different line of exploration, started in France, there was applying cryosurgery for the treatment of varicose veins of the lower limbs.<sup>(5)</sup> From then on, there was a stamped increment in clinical and exploratory perceptions on the impact of low temperatures on the vascular system.<sup>(6-10)</sup> Since 1999, the use of endovascular abalation of the saphenous veins with radiofrequency (RF),<sup>(11-13)</sup> has been concentrated on. Over the previous years, another strategy Endovenous laser photocoagulation indicated promising results for the treatment of varicose veins of the lower limbs.<sup>(14,15)</sup>

Ultrasonography guided foam sclerotherapy has been in use since last 15 yrs, as modern version developed by cabrea et al. But healthcare are in dilemma to offer this t/t because it is tainted with lack of efficacy and needs special skills, so that in this era other minimally invasive treatment gained popularity like EVLA (endo-venous laser abalation) or radiofrequency abalation. But this minimally invasive treatment option is good for main trunks like

**Corresponding Author:- Suraj s. Mahadik.**

Address:- Department of Surgery, Dr. D.Y. Patil Hospital, Kadamwadi, Kolhapur.

GSV & SSV but when it concerned about smaller diameter and superficial vessels the laser treatment became so difficult and sometime it cause skin pigmentation and other complication and definitely needs skills, and literature also says foam sclerotherapy has adverse effect if injected more than 10cc or if injected in more than 6 to 8 mm vessels diameter, so considering superficial vessels sclerotherapy is the good minimally invasive treatment. But there is no exact guideline how much concentration to be used. So we take into account this subject and studied he 44 cases in which primary varices was taken care by endovenous laser ablation and superficial vein was considered for sclerotherapy.

### Materials & Method:-

All patients came to DYPH hospital with complains of varicose vein, undergoing UGFS for superficial varicose vein, in which truncal varicosities are treated with EVLA between May 2014 to May 2016 were included in study. Our study is a non-randomized assessment of foam sclerotherapy & its concentration.

All treatment were done as day care surgery using ultrasound machine truncal varicosities were marked and ablated by laser then superficial varicosities marked and its diameter measured and STS foam sclerosant injected. Foam was made by Tessari two-syringe method.<sup>(16)</sup> It is done with two 5ml syringe connected by 3 way cannula. 4ml air is filled in one and in other diluted sclerosant is taken. Now with repeated alternate pumping and pistoning the two syringes of air and sclerosant foam gets developed. This foam is then injected in to the vein under USG guidance. The movement of foam is assessed on the screen. The Doppler probe is immediately pressed directly over the vein. At least 1 minute time interval was taken for every separate administration of the foam. Patient was asked to dorsiflex and plantar flex his ankle to clear out any foam which may have entered into the deep vein. When the entire vein segment was seen to be in spasm and foam could be seen occluding the lumen, the needle was removed and compression was applied over the whole limb with leg elevated.

The class II stocking was applied directly along the line of saphenous trunk over padding. Post procedure they were asked to lie supine for 15 min. stocking was left undisturbed with leg elevated for 5-10 days depending upon the size of the vein. Patients were asked to take analgesia (PCM) as per requirement. Patients were asked to walk for 15 min to 1 hour daily.

fig no.1 - USG Guided mapping of varicose vein.

### Statistical analysis

During 2 yr of study we have collected data of 44 pt in which we used different concentration of STS. We discharged pt on next day of procedure, and followed up at 15, 30, 45 days and mentioned their complaints in form of local sign and symptoms like skin pigmentation, phlebitis, pain, cord feeling, induration. We followed our pt at 3 months and at that time follow up colour Doppler was done. Finding noted in terms of sclerosed with minimal local sign and symptoms, moderate symptoms, and partially sclerosed.

### Results:-

Table 1: Concentration of sclerosant (STS) among the study population

Concentration	Frequency	Percentage
0.25%	23	52.27%
0.50%	10	22.72%
0.125%	11	25.00%
Total	44	100%

0.50%	9	00	1
0.125%	0	10	1

**Discussion:-**

Sclerotherapy has been frequently used worldwide (alone or in combination with surgery) to treat all types and sizes of varicose veins, primary and/or secondary in nature. <sup>(17)</sup>

**Patient Selection:-**

Pre-treatment evaluation includes careful clinical history, physical examination and appropriate diagnostic tests .We in our study did duplex imaging of all patients prior to the intervention. Patient selection is very crucial. Though FST is being used to manage all types of varicosity we excluded large varicosity requiring multiple sessions of FST, for whom we felt surgery will be better option. We had total of 50 patients, 6 were excluded as per exclusion criteria. All diabetic and patients of peripheral vascular disease were also excluded. Our patients age ranged from 12 yr to eldest being 67 yr old. Mean age was found to be 39.29 + 13.00yrs.

**Sclerosing Agent:-**

Schadeck 1995 showed that 4% polidocanol (aethoxysklerol) resulted in more venous spasm following sclerotherapy than 3% STS although the disappearance of superficial venous reflux following sclerotherapy was not statistically significant. Goldman 2002 showed no difference in photographic appearance of varicose veins following sclerotherapy with polidocanol (aethoxysklerol) compared to STS (in varying concentrations, according to vein diameter), although polidocanol caused less skin necrosis .In contrast, Labas 2003 showed that STS improved cosmetic appearance of varicose veins and achieved greater symptomatic improvement at six months. For thread veins, 10% hypertonic dextrose had similar efficacy in terms of sclerosis to 0.15% STS (Prescott 1992). Complication rates in terms of pain, matting and pigmentation was not significantly different.

We have used STS injection (SETROL), 3%; 60 mg /2ml. No Patient had any known history of allergy to the drug. Patients were counseled about the procedure in detail in language they understood. A patients having heart ailment were also excluded from the study. The medicine was procured from hospital dispensary and similar formulation used in all patients.

**Clinical Outcome:-**

As per shown in table no.1 diameter of veins among study population was maximum between 2 to 3 mm measured on USG during procedure mean diameter was 2.77+ 0.94 & we have we used 3 different concentration during study period , firstly to start with study as per author's knowledge we titrated concentration of STS & used 0.5% in !0 patients then on follow up we came to know that due to this concentration patient had local signs and symptoms, so subsequently we lowered our concentration and used 0.25% in 23 patients while 0.125% in 11 patients and on follow up mentioned patients complaints in terms of pain, 9nduration, cord feeling, skin pigmentation, phlebitis.

We followed our patients at 15, 30, 45days and after 3 months where we have done follow up Doppler and mentioned status in terms of sclerosed with moderate local signs and symptoms, sclerosed in minimal signs and symptoms, and partially sclerosed. In table no 5 and 6 respectively.

At the end of 45 days as shown in table no 5 we found that only 5 patients had pain as a local complaints snd 20 patient had cord feeling while nil patients had phlebitis,At 3 months follow up as shown in table no 6 maximum of

25 patients out of 44 had fully sclerosed vein segment with very minimal local signs and symptoms. We also compared our data in terms of association between concentration of sclerosant used & diameter of vein segment in table no 4, on applying chi square test p value was 0.005 which shows statistical significance between concentration & diameter of vein. We compared our data in terms of local signs & symptoms at 15, 30, 45 days in table no 5 which shows p value of 0.001.

Association between local signs & symptoms & concentration used at 45 days in table no 8 shows p value of 0.04 is not significant but same association at 15 days shows p value of 0.7 which means as post-operative time increases there is decline in local signs and symptoms and improvement of patients QOL.

While association between follow up Doppler & local signs & symptoms at 45 days in table no 7 shows 9 patients had moderate signs and symptoms with sclerosed vein segment after using 0.5% STS foam while only 2 patients had moderate signs & symptoms and maximum of 15 patients had minimal signs and symptoms with sclerosed vein segment after using 0.25% concentration, though 6 patients had partially sclerosed vein segment in that patient second setting can be considered because it's always better to avoid local signs & symptoms by using higher concentration of foam.

We have always used diluted foam given slowly always under USG guidance only. No patient had matting, ulceration, periphlebitis or loss of vision.<sup>(18-21)</sup> This followed our learning curve. Hamel et al 2003 reported 2 of 80 patients had popliteal DVT after Polidocanol 03 % foam sclerotherapy. Barrett et al 2004 reported 3% of their cases had minor DVT. They reported Phlebitis which was a sequel of excessive inflammatory reaction of the sclerosing foam had occurred in 2% of legs (2 different patients), while Frullini and Cavezzi 2002 and Rabee et al 2004 reported only 1% of phlebitis. We had three cases of thrombophlebitis which was managed with bed rest, analgesics. No skin necrosis, sclerosant induced ulcer, wound infection or neurasthenia reported in our study because of most likely because of constant USG guidance, and dilute solution of sclerosant.

In our preliminary data, the clinical outcome was full success (no visible varices or incompressibility of the treated vein segment and absent or improved symptoms) in 81% and partial success was 19%. This study demonstrates a high patient satisfaction with improvement of the quality of life and a high rate of closure of the visible varicosities with foam therapy. Results achieved in this study are comparable with other reports (Brett et al 2004, Hamel Desnos et al 2003, Rybak 2003, Wright 2003, Frullini and Cavezzi 2002, Frullini et al 2000 and Cabrera et al 2000). Barrett et al 2004 had reported that, 3 months follow up were enough but others (Desnos et al 2003, Rabee et al 2004 and Breu and Guggenbichler 2004) did not accept that because this period was too short to establishment of alternative venous path-way. Hence we followed up our patient for 01 year. We had no patients who were found to have recanalization.

We also compared our data of FST with conventional surgery of SF ligation, stripping of GSV and multiple phlebectomy in terms of recurrence, operation time, hospital admission, antibiotics usage, analgesics, and complications. We had total of 40 patients of open surgery on follow up.

For open surgery along with inpatient admission, usage of antibiotics (3 doses), requirement of analgesic for mean of 48 hours they were admitted for 4- 7 days. 03 of the patients had hematoma and one patient had post op site infection managed conservatively. Operation time for open surgery was mean of 90 minutes. They all required spinal anesthesia. Time for them to return back to normal job was 9- 15 days. On follow up 4 patients had recurrence of varicosity.

Our study was seen in conjunction to other studies in the literature. Lupton et al. 2002 studied patients randomized to receive 2 consecutive treatments (at 1 month interval) with laser irradiation to telangiectasia on one leg and with sclerotherapy on the other leg. The size matched vessels on thighs; knees, calves, ankles and popliteal fossa were treated by the same operator clinical improvement score 26-50% for both sclerotherapy treated legs and for laser treated legs. At 1 month after 1<sup>st</sup> sessions and after 2<sup>nd</sup> session, improvement score of 51-75% for sclerotherapy treated legs and 26-50% for laser-treated legs.

### **Conclusion:-**

Foam sclerotherapy is good minimal invasive treatment for superficial varicosities. In our study we done sclerotherapy in total 44 patients in which the truncal reflux and large tributaries were treated by EVLA. We firstly

marked superficial varicosity under USG guidance and diameter of affected vein noted. Then according to our experience titer concentration of the foam and injected in marked segment of affected vein under USG guidance. Throughout study we used 0.50%, 0.25%, 0.125% of STS foam sclerosant. We followed our patient at 15, 30, 45 days and mentioned local signs and symptoms. We correlated our data which shows there is statically significance correlation between concentrations of foam used and diameter of treated vein in view of effectiveness, closure, prevention of known side effect. We also followed our patient at 3 months and color Doppler was done, which shows 57% of patient gives better results in term of very minimal local sign and symptoms while 25% gives moderated local sign and symptoms. But all of them went to work within 1<sup>st</sup> week of treatment. We also correlated our data with follow up Doppler and concentrations used in study which shows no statically significance. So conclusively at the end of study diameter of vein and concentration used has the correlation and as the lower concentration also gives better result and avoid the local sign and symptoms and gives psychological satisfaction to the patient in form of completeness of treatment as visible veins get disappear. We can safely use this 0.25%, 0.125% concentration under 6mm of diameter vein. As compared with surgery this procedure is minimally invasive, cost effective, and early return to work.

#### Abstract

Cloud computing plays an important role for storing large data. It is a large pool of easily and accessible virtualized resources. The major resources are hardware, development platforms and services. Since the data is open, security of data is a major issue which has to be focused. To ensure the security of data in cloud environment, we propose a method called modified RSA (M RSA) algorithm along with homomorphic encryption. Homomorphic Encryption enhances the security measures of un-trusted systems or applications. It converts the data into cipher text which is analyzed and worked with it as if it were still in its original form. It allows complex mathematical operations to be performed on encrypted data which does not compromise the process of encryption. This paper presents an effective analysis of RSA and a new modified RSA with Homomorphic operations. In the modified RSA (M RSA) encryption scheme clustering of prime numbers for the generation of keys for encryption and decryption is done which fastens the process of encryption. The weakness of RSA lies in the generation of Prime numbers. This is achieved by a new classification technique in modified RSA (M RSA). Hence, elimination of redundant messages is done on the same values of the product of two prime numbers by classifying the keys. Hence, Security is enhanced.

#### Introduction:-

Cloud Computing is the most innovative driving force in many small, medium and large sized companies. It has three delivery models named as Saas, Iaas, Paas. It has four deployment models such as private cloud, public cloud, hybrid cloud and community cloud [17][5]. As the services of cloud computing are used by many of the cloud users, the major concern is the security of their data in the cloud. Data security is always of major concern. It plays an important role in trust worthiness of computing. Cryptography is the art of protecting secret information. There are two types of cryptography: secret-key cryptosystem and public-key cryptosystem [4][5]. The first type is the secret-key cryptosystem which uses the same key to encrypt and decrypt the ciphertext. For this reason, this type is also called as symmetric cryptosystem. Since it takes less computational time, it has several drawbacks. There are too many keys along with the key distribution problem, authentication and nonrepudiation problem are of concern. Hence, to solve the problems of symmetric cryptosystem, RSA cryptosystem is the one of the most popular approach for such problems. The RSA cryptosystem was developed in 1977 by Ronald L. Rivest, Adi Shamir, and Leonard Adleman at MIT and first published in 1978 [7]. During the year in 1978 R.L. Rivest, A. Shamir, and L. Adleman

developed the RSA public-key cryptosystem[4]. The RSA cryptosystem simply uses the concept of modular exponentiation which says that the modulus 'n' is the product of two large prime's p and q and the Public key and private key are obtained by:

$$e = d^{-1} \pmod{\phi(n)}$$

The encryption process is performed using the public key 'n' and 'e' as follows:

$$C = M^e \pmod{n}$$

Where M is the plaintext such that  $0 < M < n$  and C is the ciphertext which can be decrypted using the private key 'n' and 'd' as follows:

$$M = C^d \pmod{n}$$

At present security should be provided to encrypt data that is stored both in Public Cloud and Private Cloud. Security also provides secure transmission from a local machine to a cloud data store. The stored data is encrypted and the channel of data transmission is well secured with the help of key exchanges. But actually performing computations on the data stored in the cloud, it requires decrypting it first, which makes critical data available to the cloud provider. The proposal here is to encrypt data before sending to the cloud providers. Thereby performing computations on clients' data at their request. To achieve this it is also necessary to hold the cryptosystems based on Homomorphic Encryption.

### Homomorphic Encryption:-

Homomorphic Encryption can either be a Fully Homomorphic Encryption (FHE) or Somewhat Homomorphic Encryption (SHE)[3][4]. It has the property of malleability. Malleability is a property of some cryptographic algorithms. It states that an encryption algorithm is malleable if it is possible for an adversary to transform a ciphertext into another ciphertext which decrypts to a related plaintext. Homomorphic encryption is the process of performing encryption on encrypted data. The encrypted data which is stored in the cloud is encrypted using homomorphic operations and decrypted with operations. The operations are Additive and Multiplicative operations[3][4][5].

Fig 1.1:-

If the process has both additive and multiplicative operations performed on the encrypted data, then it is Fully Homomorphic Encryption (FHE). The partially Homomorphic encryption allows either additive or multiplicative operations on encrypted data. RSA encryption allows multiplicative operations on encrypted data.

Homomorphic encryption plays an important role in cloud computing. It allows companies to store encrypted data in a public cloud and take advantage of the cloud provider's analytic services.

For example, a user sends a request to add the numbers 1 and 2, which are encrypted to become the numbers 33 and 54, respectively. The server in the cloud processes the sum as 87, which is downloaded from the cloud and decrypted to the final answer, 3. A normal symmetric cipher -- DES, AES is not homomorphic[2]. The RSA algorithm is homomorphic but only with respect to multiplication.

**Related work:-**

Craig Gentry of IBM, in 2009, has proposed the first encryption system "Fully Homomorphic". The system computes and evaluates an arbitrary number of additions and multiplications and also calculates any type of function on encrypted data[1][3]. The internal working of this adds another layer of encryption and for every few steps it uses an encrypted key to unlock the inner layer of scrambling. Hence, this decryption "refreshes" the data without exposing it and allowing an infinite number of computations on the same.

The application of fully Homomorphic encryption is an important brick in Cloud Computing Security. The outsourcing of the calculations on confidential data to the Cloud server is possible, keeping the secret key that can decrypt the result of calculation [3].

**Proposed Method of MRSA:-**

The new method mRSA is the encryption process which is carried out with two prime numbers p,q. In RSA algorithm, we take two prime numbers and generate the keys for encryption. In this new approach generation of keys is done by taking prime numbers which are clustered using Euclidian Distance which solves the problem of redundant messages. The clustering simplifies the selection of prime numbers which are nearest to each other. So a situation in which the cipher text is the same as the plaintext in some values of n which is the product of two prime numbers p and q are resolved and messages which are redundant is eliminated.

The MRSA aims at classification of prime numbers for key generation. An agreement is done for communication with the parties with a secure set of alternative prime numbers (PR). This helps in alternative values of prime number for p or q or both. In addition, this set of prime numbers is divided into different classes. Each class contains a specified number of primes. We generate the prime numbers by taking odd numbers within the range N. This is a process of filtration. We eliminate all even numbers except 2, since they are not prime. This clustering is done by taking into account the number of cluster or classes. Then each of the prime numbers starting from the beginning are taken one at a time and grouped one by one, cluster by cluster i.e., 2 in c1, 3 in c2, 5 in c3, 7 in c4 and so on.

The number of clusters must be less than the half of the range of N and prime numbers within the range and can be limited. To select a certain neighbor of one of the classes in that set it is dependent on a secure distance (d1). This distance will be used to choose one prime number or both. By assigning another secure distance (d2) inside the selected class we generate the keys for encryption [16]. The purpose of the distance (d1) is to use an agreement secure parameter to choose one of the classes inside the set of all classes and this distance must be changed periodically to remove the redundant messages and to enhance more security for the RSA algorithm. Ciphers are generated for the corresponding keys due to a specific value of n and we can generate a new secure value of n to overcome these redundant values of messages.

Selection of the prime number 'p' is done from the clusters say p'. Then we compute 'n' i.e. n'. An agreement secure parameter is generated. In order to acknowledge the receiver by changing 'n', the sent ciphertext must be appended by a secure agreement parameter, denoted by f, inside the ciphertext[9][10]. This suggested parameter is used to prevent sending the value of alternative value as a public key, so we get a more secure procedure for RSA algorithm by reducing the public key into one parameter that is the public key of the user only because in the traditional method of RSA, the public key consists of two parameters; the value of n and the public of the user (e)[11].

**Algorithm:-**

The Algorithm has three phases:

**Clustering Algorithm:-**

1. Let C be the cluster where c1,c2,c3...cn be subsets of C.
2. Enter C value. Ex C=5.
3. Let N be the number of prime numbers starting from 2.
4. Input N. Say N=50.
5. Eliminate all even numbers within N value.
6. Let it be N1.
7. Then select all the prime numbers from N1.
8. Depending on C, Place the numbers one by one in each cluster as shown in fig 1.3.

9. Now choose the one prime number from one of the cluster.
10. Select the next prime number and find the nearest from the first by Euclidean distance.

**Key Generation:-**

Choose two prime numbers from PR

$$n = p * q$$

$$\phi(n) = (p-1) * (q-1)$$

Let e be the public key

Let d be the private key

$$c = m^e \pmod n$$

if  $c = m$  then

**Sender operation:-**

- 1: Choose d1 of the one of subsets Ci in S for the secure class
- 2: Choose d2 inside Ci to pick one alternative prime p'
- 3: Compute  $n' = p' * q$
- 4: Compute  $\phi(n') = (p'-1) * (q-1)$
- 5: Choose alternative public key, lets e'
- 6: Generate the corresponding private key d'
- 7: Compute the ciphertext  $C' = m^{e'} \pmod n'$
- 8: Combine the agreement factor f with the new ciphertext and send C'' as:  
 $C'' = [C', f]$

**Multiplicative Homomorphic encryption:-**

Generate two ciphers and suppose we have two ciphers C1 and C2 such that:

$$C1 = m1^e \pmod n$$

$$C2 = m2^e \pmod n$$

$$C1.C2 = m1^e m2^e \pmod n = (m1 m2)^e \pmod n$$

**RSA with Homomorphic Encryption:-**

The RSA cryptosystem is the most widely used public-key cryptosystem. It was developed in the year 1978 by Rivest, Shamir, and Adleman. It is one of the first homomorphic encryption schemes

**Key Generation:** KeyGen(p, q)

**Input:-** Two large primes – p, q

Compute  $n = p * q$

$$\phi(n) = (p - 1)(q - 1)$$

Choose e such that  $\gcd(e, \phi(n)) = 1$

Determine d such that  $e * d \equiv 1 \pmod{\phi(n)}$

**Key:-**

public key = (e, n)

secret key = (d, n)

**Encryption:-**

$$c = m^e \pmod n$$

where c is the cipher text and m is the plain text.

RSA has a multiplicative homomorphic property i.e., it is possible to find the product of the plain text by multiplying the cipher texts. The result of the operation will be the cipher text of the product. Given  $c_i = E(m_i) = m_i^e \pmod n$ , then  $(c1 . c2) \pmod n = (m1 . m2)^e \pmod n$

**Example:-**

- Choose  $p = 3$  and  $q = 11$
- Compute  $n = p * q = 3 * 11 = 33$
- Compute  $\phi(n) = (p - 1) * (q - 1) = 2 * 10 = 20$

- Choose e such that  $1 < e < \phi(n)$  and e and n are co-prime. Let  $e = 7$
- Compute a value for d such that  $e \cdot d \equiv 1 \pmod{\phi(n)}$ . One solution is  $d = 3$
- Public key is (e, n) => (7, 33)
- Private key is (d, n) => (3, 33)

**Example of homomorphic property:-**

Now, let  $m_1=2$  and  $m_2=3$   $c_1 = m_1e \pmod n = 27 \pmod{33} = 29$   $c_2 = m_2e \pmod n = 37 \pmod{33} = 9$   $c_1 \cdot c_2 = 29 * 9 = 261$  By decrypting  $(c_1 \cdot c_2)$  we get:  $2613 \pmod{33} = 6 = 2 * 3$ .

**Results:-**

The Analysis of the two algorithms is below. With different file sizes in kilo bytes (KB) is taken and the estimation of time with respect to encryption and Decryption time (msec) is shown in the graph.

It is clear that the mRSA takes less time and secure and efficient than RSA with homomorphic operations.

**Encryption Time Analysis:-**

**Table 1:-**

File Size (KB)	RSA (msec)	MRSA(msec)
26	27	24
85	53	45
100	87	64
143	112	109
187	157	126
258	179	168
544	453	423
800	1098	976
1024	1478	1478

**Fig 1.2:-**

**Decryption Time Analysis:****Table 2:-**

File Size (KB)	RSA (msec)	MRSA(msec)
26	167	164
85	278	272
100	324	324
143	379	389
187	478	467
258	567	559
544	772	776
800	995	976
1024	1114	1101

**Fig 1.3:-****Conclusion:-**

The cloud security is based on Homomorphic encryption, is a new concept of security which enables us to provide results of calculations on encrypted data without knowing the raw data on which the calculation was carried out, with respect of the data confidentiality. Our work is based on the application of partially Homomorphic encryption to the Cloud Computing security. It also analyzes and the improvement of the existing cryptosystems to allow servers to perform various operations requested by the client. The improvement of the complexity of the Homomorphic encryption algorithms and compare the response time of the requests to the length of the public key is to be considered. Also this method reduces the redundant messages occurred in RSA method. We see that for some values of  $n$ , there is a major problem in which the message and its corresponding ciphertext are the same. At the presence of recent active attacks, this problem can be exploited by many attackers. For this reason, this method mRSA presents an active solution by changing the value of  $n$ . Hence, MRSA is more secure and efficient than RSA with homomorphic operations.

 Chromogenic methods.

#### Abstract

Candida species especially Non albicans Candida are increasingly being isolated from clinical specimens. Candida spp. are the most common cause of fungal infections and are the fourth leading cause of health care associated infections. The main aim of the study is to isolate and identify the various Candida species from clinical samples by both Conventional and chromogenic method and to check which one is better and specific method. Samples such as blood, urine and pus received in laboratory from patients of all age group and both sexes with suspected Candida infection and the positive isolates were identified by conventional as well as chromogenic method. Total 80 isolates of Candida species were recovered from the clinical specimens. *C.krusei* was most commonly isolated yeast followed by *C.albicans*. CHROMagar falsely identified *C.parapsilosis* as *C.glabrata*. Species identification using CHROMagar is rapid, technically simple, and easy as compared to conventional method.

#### Introduction:-

Candida species are the fellow members of the normal flora of the skin, mucous membranes and gastrointestinal tract. They are an endogenous opportunist which means that they can cause secondary infection in individuals with some underlying immunocompromised conditions<sup>(1)</sup>. The genus is composed of a heterogeneous group of organisms and more than 17 different Candida species are known to be the aetiological agents of human infections<sup>(3)</sup>. The major etiological agent is *Candida albicans*, whereas different Candida species can cause a variety of infections including *C. tropicalis*, *C. dubliniensis*, *C. parapsilosis*, *C. krusei*, *C. guilliermondii*, *C. glabrata*, and *C. kefyer* which epitomize many clinical forms of candidiasis. Some of these species forgather as secondary infections to another species, for example; *C. parapsilosis* is secondary infection only when *C. albicans* as a cause of Candida endocarditis.<sup>(4)</sup> Among species of Candida, *C. albicans* is most often colligated with serious fungal infections. Other Candida species also have emerged as clinically important opportunistic pathogens<sup>(5)</sup>. The vast majority of invasive Candida infections are caused by only four species which include *C. albicans*, *C.glabrata*, *C. parapsilosis* and *C.tropicalis*. The clinical manifestations of disease are extremely varied, ranging from acute, sub acute and chronic to episodic. Involvement may be localized to the mouth, throat, skin, scalp, vagina, fingers, nails, bronchi, lungs, gastrointestinal tract or become systemic as in septicaemia, endocarditis and meningitis<sup>(1)</sup>. Identification of yeast pathogens by traditional methods like germ tube test, growth pattern on cornmeal agar are labour intensive and requires several days and specific mycological media. Chromogenic media contain chromogenic substrates which react with enzymes secreted by target microorganisms to yield colonies of varying colours.

**Material & Methods:-**

Present prospective study was conducted in tertiary care hospital from January 2016 to June 2016. Various samples received in laboratory from patients of all age group and both sexes with suspected Candida Infection. Clinical details were noted in the case record form. Patients who were on antifungal treatment were excluded. The specimens for laboratory investigation were collected undertaking strict aseptic precautions. The various clinical specimens collected were blood, urine, pus etc. Two swabs/specimens were taken from each case. One of the specimens was subjected for direct examination and the other for the culture. All the above samples were subjected to various mycological tests.

- 1) Direct examination by KOH Mount
- 2) Gram stain

**Fig A-Candida on Gram stain**

- 3) Culture on SDA (at 25°C and 37°C)

4) Germ tube test for speciation: A small portion colony of the yeast to be tested was suspended in a test tube containing 0.5 ml human serum. The test tube was incubated at 35°C for 2-3 hours. A drop of yeast-serum suspension was placed on a microscopic slide, overlaid with a cover slip and examined microscopically for presence of germ tubes.

Observation: Filamentous extension from yeast cell with no constriction was considered as germ tube.

**Fig B- Germ tube formation**

**Growth pattern on CMA for speciation:-**

Isolated colonies of *Candida* were picked up with inoculating loop. Three parallel cuts 1 cm apart was made into the surface of Cornmeal-Tween agar, holding the inoculating loop at about a 45-degree angle. A sterile cover slip was laid on the surface of agar, covering a portion of the inoculated streaks. The inoculated plates were incubated at 25-30°C for 24-72 hours. At the end of incubation period plates were examined microscopically (under 10x and 40x) at the edge of cover slip and the pattern of growth was observed to make a presumptive identification.

**Fig C-** *C.krusei* on CMA

**Growth on CHROMagar:-**

Isolated species were inoculated on *Candida* CHROMagar to improve species identification based on coloured colony morphology. These agar plates were incubated at 37<sup>0</sup> C for 48 hours. The species were identified by characteristic colony colour.

- ❖ *C. albicans*- Light green coloured colonies
- ❖ *C. tropicalis* - Blue to metallic blue coloured colonies
- ❖ *C. glabrata* - Cream to white smooth colonies
- ❖ *C. krusei*- Pink colonies
- ❖ *C. dubliniensis* - Dark green colonies

**Fig D-** *Candida* species on *Candida* CHROMagar

**Observation and Results:-**

In present study, 80 isolates of Candida species were recovered. Species identification was done by both conventional method and Candida CHROMagar.

Samples included in the study were 80. Out of which blood (40), urine (26) and Pus (14) respectively.

Fig1-Distribution of Various samples size-

Fig 2-Showing Candida isolates in various samples such as Blood, Urine and pus.

Fig 2:- Showing number of Candida isolates in various samples such as Blood, Urine and pus.

**Table 1:-**Distribution of different species of Candida-

Candida species	Number of isolates(n=80)	Percentage (%)
<i>C. krusei</i>	28	35%
<i>C. albicans</i>	26	32.5%
<i>C. glabrata</i>	12	15%
<i>C. tropicalis</i>	09	11.25%
<i>C.parapsilosis</i>	05	6.25%

Table1-Total number of Candida species isolated was 80. Out of 80 isolates, Candida krusei (35. %) was the most common species followed by C.albicans 32.5%) was most common followed by C. glabrata (15%), C.tropicalis (11.25 %.), C.parapsilosis (6.25%).

**Table 2:-**Identification of various species of Candida by conventional method and Candida CHROMagar

Candida species (n=80)	Conventional method	CHROMagar
<i>C. krusei</i>	28	28
<i>C.albicans</i>	26	26
<i>C.glabrata</i>	12	17
<i>C.tropicalis</i>	09	09
<i>C.parapsilosis</i>	05	-

Table 2-Showing Candida species isolated from Conventional method and CHROMagar.

**Table 3:-**Sensitivity and specificity of Candida CHROMagar for each species

Species	Sensitivity (%)	Specificity (%)
<i>C. krusei</i>	100%	100%
<i>C.albicans</i>	100%	100%
<i>C.glabrata</i>	100%	72.22%
<i>C.tropicalis</i>	100%	100%

Table 3- We obtained 100% sensitivity and specificity of Candida CHROMagar for *C. krusei*, *C. albicans*, *C.tropicalis* but sensitivity and specificity of Candida CHROMagar for *C. glabrata* was 100% and 72.22% respectively.

## Discussion:-

The potential clinical importance of species-level identification has been recognized as Candida species differ in the expression of virulence factors and antifungal susceptibility. Non albicans Candida are on the rise due to increasing immunocompromised states. Non albicans Candida are more resistant to fluconazole, therefore species level identification has a direct impact on choice of empirical antifungal treatment.<sup>(6)</sup> The incidence of infections caused by Candida species has increased considerably over the past three decades, mainly due to the rise of the AIDS epidemic, an increasingly aged population, higher numbers of immune-compromised patients and the more widespread use of in dwelling medical devices. *Candida albicans* is the main cause of candidiasis; however, non-albicans Candida species such as *C. glabrata*, *C. tropicalis* and *C.parapsilosis* are now frequently identified as human pathogens.<sup>(7)</sup> Total 80 Candida species were isolated from various clinical samples. Among the various clinical isolates of Candida species we obtained *C.krusei* (28) as the most common isolate followed by *C. albicans* (26), *C. glabrata* (12), *C. tropicalis* (09), *C. parapsilosis* (Table1). Factors like increased use of antifungal drugs, use of broad spectrum antibiotics, long term use of catheters and increase in the number of immunocompromised patients contributes to the emergence of non-albicans Candida species.<sup>(8)</sup> For differentiation among different species of Candida conventionally germ tube test, growth pattern on cornmeal agar and sugar assimilation tests are being used which are technically difficult, time consuming and difficult to interpret which may take 72 hours to two weeks for species identification<sup>(9)</sup>, <sup>(10)</sup>Chromogenic agar is technically simple, easy to interpret and rapid method to differentiate among different Candida species. It facilitates the detection and identification of Candida species and provides result in 24-48 hours. Among the new tests, Candida CHROMagar is rapid and cost effective as compared to other expensive systems like API systems, Vitek 2 ID system and molecular methods.<sup>(11)</sup>

In our study, for *C. glabrata* specificity of Candida CHROMagar was 72.22% as 5 species of *C.glabrata* were falsely identified by Candida CHROMagar as *C. parapsilosis*. Shettar SK et al<sup>(12)</sup> reported that on Candida CHROMagar, *C.parapsilosis* gave same cream colour as that of *C.glabrata*. This may be because of *C. glabrata*; *C. kefyr*, *C. parapsilosis* and *C.lusitaniae* appear as a variety of beige/brown/yellow colours due to the mixture of

natural Pigmentation and some alkaline phosphatase activity. <sup>(13)</sup>*C.glabrata* and *C. parapsilosis* can be easily differentiated from growth pattern on Cornmeal agar as *C. glabrata* doesn't produce pseudo-hyphae. Thus, the combination of Cornmeal agar Hi Candida agar can be used for early identification of *C. glabrata*.<sup>(12)</sup>

### Conclusion:-

Our study showed *C. krusei* as most common Non –albicans Candida species causing candidiasis, which shows the rise of Non-albicans Candida among various clinical samples. CHROMagar is a simplistic, rapid, easy and inexpensive method with good sensitivity and specificity for identification of Candida species. CHROMagar can be reliably used for identification for *C. krusei*, *C.albicans*, *C. tropicalis* but for early identification of *C. glabrata* and *C. parapsilosis* both the corn meal agar and CHROMagar should be used.

#### *Abstract*

**Aim:** The aim of this study is to evaluate the effect of implant location and different implant attachment systems on the retention and stability of 4 implant-supported overdentures by measuring retentive forces during vertical, oblique and horizontal types of dislodgment forces.

**Materials and Methods:** The retention and stability of 4 implant supported overdenture at different implant locations in the arch with different attachment forms under multidirectional dislodging forces were evaluated. For that an experiment was undertaken utilizing a model simulating a maxillary edentulous ridge with 6 dental implants in positions on the model approximating the tooth positions in the natural dentition. A cobalt-chromium cast framework with 3 loops, acrylic resin inside the housing, and chains attached to a universal testing machine was used to measure peak load (N) required to disconnect an attachment. Kruskal wallis test followed by Mann Whitney U test were used for statistical analysis.

**Results:** The test results have shown significant difference ( $p < 0.05$ ) when tested within implant location and implant attachments at different directions of pull. Kruskal wallis test was performed to find whether there is any significant difference of mean present among three attachments in each group and significant difference between three groups among each attachment system. Mann Whitney U test was done to find any significant difference present between two attachments of each group and difference between two groups among each attachment system.

**Conclusion:** Within the limitations of this in vitro laboratory study, the following conclusions were made. Vertical retention increased as implant location was planned at canine and premolar location. Antero-posterior stability and horizontal stability of a simulated overdenture prosthesis increased with distal implant location up to canine and premolar location. Attachment type affects retention and stability differently by location.

**Introduction:-**

Edentulism is defined as loss of all permanent teeth.<sup>1</sup> Tooth loss is a multifactorial process.<sup>2</sup> while the rate of edentulism has been decreasing throughout the past three decades, the subsequent increase in the world population has resulted in an increasing growth of total edentulous persons.<sup>3</sup> Residual ridge resorption continues to be primary complication of edentulism. To minimize loss of residual ridge, exemplary complete denture therapy along with routine recall systems, should be goal of the treatment.<sup>2</sup> The traditional treatment modality of edentulism has been the fabrication of removable, tissue-supported complete dentures.<sup>3</sup> Three main factors are involved in optimal denture treatment: retention, support and stability.<sup>4</sup> It is critical to evaluate and properly estimate the importance of each of these three factors involved in the treatment. In choosing between treatment approaches, patients often choose the treatment that increases stability even when cost is a major factor.<sup>5</sup> One of the greatest challenges facing the clinician is to provide a removable prosthesis with adequate retention and stability. Amount of residual ridge is correlated with the retention and stability of the denture.<sup>6-10</sup>

Overdentures have been advocated as a means to preserve the structures associated with denture support which may augment retention and stability.<sup>5</sup> In contrast to the mandible, implant placement within maxilla may be limited by the anatomy, available bone and its relationship to the sinus architecture. Less favourable mid-term and long-term survival and success rates were originally reported for maxillary implants supporting overdentures. Compared with the mandible, the maxilla contains softer bone and a different distribution of occlusal forces. Therefore, a greater number of implants are required in the maxilla compared with the mandible. However, there are no specific guidelines for the number of implants necessary to support a maxillary overdenture. A minimum of four well-spaced implants is often recommended for an implant-supported and -retained overdenture. Many studies have demonstrated that the use of only four maxillary implants can successfully restore oral function for completely

maxillary edentulous patients. Evidence has supported the treatment philosophy of focusing on providing proper standard of care within the realms of simplicity versus overly complicated. The use of stud-style attachments is considered a simplified and cost-effective treatment as compared to bar and clip type implant overdentures. While many of these studies focus their attention on the retention, release, and stability between types and forms of attachments, few have investigated overdenture properties as a function of attachment location, distribution, and number of implants. The impact of distribution and number of implants and attachment systems upon retention and stability of overdentures has been alluded to in several studies. In consideration of the currently available studies, limited information exists regarding implant position, distribution, and number and the effect upon the retention and stability of maxillary implant overdentures. The purpose of this investigation was to provide an in vitro evaluation of retention and stability of four implant supported overdentures based on implant location.

**Materials and Method:-**

An experiment was undertaken utilizing a model simulating a maxillary edentulous ridge with 6 dental implants in positions on the model approximating the tooth positions in the natural dentition. A cobalt-chromium cast framework with 3 loops, acrylic resin inside the housing, and chains attached to a universal testing machine was used to measure peak load (N) required to disconnect an attachment. Three different types of attachments were used in 3 positions on the model in sequence of 4 implants at a time.

Auto polymerizing polymethyl methacrylate (PMMA) acrylic resin was incorporated in the intaglio and facial/lingual surfaces of the framework to allow for attachment of the matrix portions. The metal framework remained constant throughout testing. Three commercially available attachment designs were evaluated: Ball and socket, Locator, Dalbo attachments. The occlusal plane of the test model was set even with the horizontal plane of a metal plate and 3 bolts were placed to affix the model to the metal plate. The incorporation of the plate allows precise reproduction of the position of the model clamping to the testing apparatus for the different attachment systems. A universal testing machine (Tensometer) was applied to test forces required to dislodge the prosthesis in various directions as described previously. Three 6.2cm metal chains were attached to a washer with three eye bolts in a triangular orientation with machine screw nuts. The washer was attached in the center with bolt and nut to a ball/socket pivoting joint assembly incorporated into the universal testing machine. The use of the eye bolts and pivoting joint allowed for precise adjustment of the chains and to ensure that all chains were pulling evenly throughout the experiment. The testing machine instrumentation was calibrated and balanced using the testing machine's computer algorithm to account for the weight of the simulated prosthesis and chains. Three chains were attached to the prosthesis and a 3-point vertical pull was used to determine retention against a vertically directed

dislodging force parallel to the path of insertion. A 2-point oblique/posterior pull was used to determine stability to determine resistance against Para-axial, oblique dislodging forces. Two chains were attached: one in incisor region and alternating chains either on the right or left side molar region. To test posterior dislodging forces, the incisor chain was removed and the remaining two chains were attached in the molar regions. The chains were adjusted to reduce slack and force was applied until separation of the prosthesis occurred. The dislodging force applied resulted in a peak load measurement (Newton's, N). For each group, 9 measurements were made of peak dislodging forces. Means were calculated and differences among the systems, directions, and groups were identified. Four patrix portions of the attachment system were placed into areas designed as group numbers that approximate natural tooth positions: Group A (#11,13,21,23), Group B (#13,14,23,24), Group C (#11,14,21,24). Matrix housing portions of the attachment system were attached to the prosthesis following manufacturer guidelines with a bis-acryl material.

### Results:-

The present study was done to evaluate and compare the retention and stability of four implant supported overdentures based on implant location. In this study retention and stability of an implant overdenture was tested between different implant locations as group A (#11,13,21,23), group B (#13,14,23,24), group C (#11,14,21,24) and different attachment systems using tensometer. The following results of statistical analysis have been obtained in this study using SPSS software package. Descriptive statistics for the three groups and different attachments were tabulated in table 1, 2, 3, 4, 5 and 6 respectively. The test results have shown significant difference ( $p < 0.05$ ) when tested within implant location and implant attachments at different directions of pull.

**Kruskal wallis test** was performed to find whether there is any significant difference of mean present among three attachments in each group and significant difference between three groups among each attachment system. **Mann Whitney U test** was done to find any significant difference present between two attachments of each group and difference between two groups among each attachment system. **Table1 and graph1-** Shows the mean and standard deviation of different attachments among group A. The maximum mean value is of dalbo attachment (43.5N) at vertical pull. The minimum mean value is of locator attachment (14.4N) at oblique pull. Ball and locator attachments showed significant difference only at vertical and oblique pull ( $p < 0.05$ ). The results were not significant between ball and locator attachments at posterior pull ( $p > 0.05$ ). **Table2 and graph2-** Shows the mean and standard deviation of different attachments among group B. The maximum mean value is of dalbo attachment (59.8N) at posterior pull. The minimum mean value is of locator attachment (13.8N) at oblique pull. Ball and locator attachments showed significant difference only at vertical and posterior pull ( $p < 0.05$ ). The results were not significant between ball and locator attachments at oblique pull ( $p > 0.05$ ). **Table3 and graph3-** Shows the mean and standard deviation of different attachments among group C. The maximum mean value is of dalbo attachment (42.5N) at vertical pull. The minimum mean value is of locator attachment (15.5N) at oblique pull. Ball and locator attachments showed significant difference only at vertical and oblique pull ( $p < 0.05$ ). The results were not significant between ball and locator attachments at posterior pull ( $p > 0.05$ ). **Table4 and graph4-** Shows the mean and standard deviation of Ball and socket attachment among different groups. The maximum mean value is at group B (34.94N) at vertical pull. The minimum mean value is at group B (19.64N) at oblique pull. **Table5 and graph5-** Shows the mean and standard deviation of Dalbo attachment among different groups. The maximum mean value is at group B (59.78N) at posterior pull. The minimum mean value is at group C (35.60N) at oblique pull. Kruskal Wallis test was performed to find whether there was significant difference between three groups among dalbo attachment, results showed there is statistically significant ( $p < 0.05$ ) difference among group A, B and C at posterior direction of pull. **Table6 and graph6-** Shows the mean and standard deviation of Locator attachment among different groups. The maximum mean value is at group C (19.08N) at posterior pull. The minimum mean value is at group B (13.84N) at oblique pull.

### Discussion:-

It is evident that many treatment concepts involving overdentures are based on empirical experiences of individuals. Clinicians often base their selection of implant location and attachment system empirically on expected retentive qualities. Evaluating these factors the results allow the clinician to formulate a comparison of implant location to retention and stability of implant-retained overdenture prosthesis.

While retention and its effect upon overdenture prosthetic factors are related, few studies have established a consensus regarding what is considered sufficient retention. Zou et al The results of prospective study clearly indicate favorable outcomes for four interconnected implants supporting a maxillary overdenture with three different

abutments. This study was an effective measure of clinical factors related to prosthetic success and acceptance by the patients at several time points throughout treatment and patients preferred the attachment that provided greater retention. Based upon these studies, it can be established that an effective retentive force may be between 8 to 10 N. Overdentures, when in place in the oral environment, move in complex ways. Movement of overdentures typically occurs in six directions: occlusal, gingival, mesial, distal, facial, and lingual. While true uni-directional dislodging forces rarely occur in clinical scenarios, directional pull-testing is an effective way of measuring retention and stability of a prosthesis during in vitro laboratory evaluation. The present in vitro study investigated the effect of implant position on the retention and stability of a simulated prosthesis. To the knowledge, no studies have evaluated the effect of varying in vitro implant location upon dislodging forces of simulated 4-implant Maxillary overdenture prosthesis. The results of this study indicate that implant location affects in vitro retention and stability of an implant overdenture. The current in vitro study reveals that vertical retention increases with implant location up to premolar. Regarding vertically directed forces, one would believe that retentive values would not change when implant location was modified. In the testing procedures, it was noted that during 3-point chain pull tests, some antero-posterior movement occurred. While this may have affected the reported force values, the method employed better simulates the movement of overdentures in clinical situations rather than utilizing a rigid design. The type of attachment affects the effect of vertically applied forces. Horizontal stability of Dalbo attachment was affected by implant positioning, incisor and canine sites had the highest values. In the present study, antero-posterior chain pulls were evaluated as an indirect method of determining the effect of implant location upon posterior dislodging forces. In all attachments systems tested, a general trend was determined that an increased resistance to dislodgment occurred as implant location was moved distally. Interestingly, all systems except the Locator group showed significant increase in resistance in moving implant location. The variation between attachment systems is of great interest when formulating conclusions regarding the effect of implant position upon retention and stability. The present study shows that attachment type affects retention and stability different by location. The results of this study illustrate that attachment systems respond in different ways depending on their location in the edentulous arch.

The results of this study indicate that 4-implants may produce effective in vitro retention and stability of overdenture prosthesis. The testing performed is limited with specific conditions and methods and does not completely replicate clinical situations as the implant overdenture clinical reality is much more complex than a laboratory setting can replicate. Furthermore, the findings of this study also do not account for attachment wear, resiliency, and tissue effects. While this in vitro based analysis shows a statistical difference between groups, long-term comparative prospective controlled studies are needed to reach agreement on an accepted treatment concept. Factors such as the type and location of implants placed, quality and quantity of bone, and type of superstructure should be part of these studies. In evaluating implant location for implant-retained overdentures, it is important to consider the biomechanics of how the prosthesis functions. Previously considered in relation to removable partial denture design, Avant described the effect of indirect retainers upon the mechanical advantage of a distal extension base. The indirect retainer acts as the fulcrum, the direct retainer assembly acts as the resistance, and the power is the force that lifts the denture base away from the ridge. Avant described methods of lowering the mechanical advantage of the lever in order to keep the denture base from lifting away from the ridge. Determination of mechanical advantage is performed by measuring the ratio of the power arm to the resistance arm. When considering antero-posterior movement such as a dislodging force would provide, an implant overdenture may function as a class I, II or III lever. Fig. Components of a Class I, II and III lever system with the implant and attachment serving as the resistance / fulcrum point. Assuming the example of an implant-retained overdenture prosthesis that is intimately fitting the soft tissue support, the fulcrum is the anterior alveolar ridge, the resistance is the attachment system, and the power is the posterior dislodging force lifting the denture base away from the ridge. Analyzing an example where implant location is anterior, such as in the incisor region, figure (A) illustrates a class I lever system. The fulcrum and resistance point would be coincident, thus making for a short resistance arm. Moving implant location distally, such as in the 1st premolar location, as shown in figure (B), the resistance arm is substantially lengthened compared to that shown in figure 16 (A). This change would also modify the lever system to a class II. Fig. Components of a Class I, II lever system with the anterior residual alveolar ridge as the fulcrum point, implant and attachment serving as the resistance and power is the posterior dislodging force. The power required to exact a similar dislodging force would be much higher in example (B) due to the reduction in mechanical advantage by lengthening the resistance arm. This mechanical illustration may help explain the results of this study. As seen in the analysis of the antero-posterior dislodging force test, significantly higher forces were required to dislodge the prosthesis when implants were located distally on the test model.

**Summary and Conclusion:-**

The aim of this study was to evaluate the effect of implant location and different implant attachments on the retention and stability of implant-supported overdentures by measuring retentive forces during vertical, oblique and horizontal types of dislodgment forces.

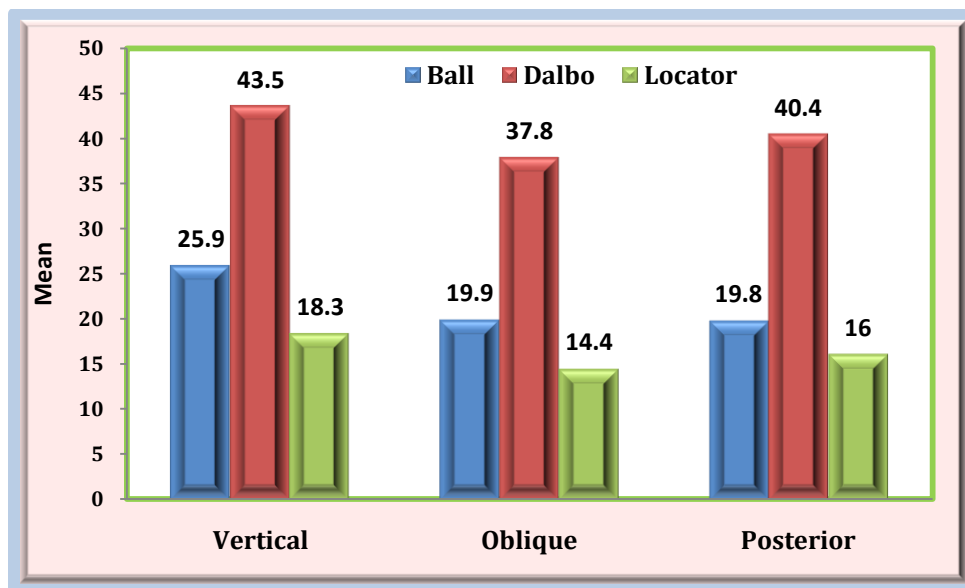

The results of statistical analysis obtained in this study using SPSS software. Within the limitations of this in vitro laboratory study, the following conclusions were made.

The interactions between attachment system, direction of force, and implant location were statistically significant ( $p < 0.005$ ).

1. Vertical retention increased as implant location was placed at canine and premolar location.
2. Antero-posterior stability and horizontal stability of a simulated overdenture prosthesis increased with distal implant location up to canine and premolar location.
3. Attachment type affects retention and stability differently by location

#### Abstract

**Background:**Polycystic ovarian syndrome(PCOS) constitutes one of the most common endocrinopathy amongst the reproductive age women.Over the last few decades it has gained a lot of public attention as reflected in various internet sites and newspapers. However, it is a very complex endocrinopathy presenting as a challenge to clinician to make diagnosis and manage appropriately.

**Aims:** To study the different clinical presentations among women with PCOS and to categorise them into different phenotypes.

**Method:** An explorative hospital based study was conducted including 120 women with PCOS, during a two year period between Dec.2014 to Dec.2016. Based on history, clinical examination, hormonal evaluation and ultrasound features, all women were categorized into 4 different phenotypes.

**Results:** Out of 120 women, 29(24.16%)presented with full blown syndrome(severe PCOS), 34(28.33%) had oligo/anovulatory PCOS, 25(20.83%) of them were found to be ovulatory variety and 32(31.17%) belonged to mild PCOS category.

**Conclusion:**PCOS is represents a continuum of symptoms. No single test or clinical feature is sine qua non of the syndrome. This study demonstrates the various phenotypic expressions of PCOS and it can be viewed as a lifelong disorder with progression from mild to severe variety later on in life. Approach to each patient should be tailor made.

#### Introduction:-

PCOS is an enigmatic disorder with heterogenous features and is one of the most common endocrinopathy in the reproductive age group. Heterogeneity of the disease was evident from the very first description by Stein and Leventhal. Among the 7 women described in the original report, a variety of clinical symptoms were observed such as obesity, amenorrhoea, acne,hirsutism and all of them were associated with bilateral enlarged polycystic ovaries. These varying degree of presentation in each case emphasise the phenotypic variability of PCOS and, explains the very fact why it is called syndrome and why not a disease<sup>1</sup>.

A cluster of symptoms define a syndrome, a common etiologic factor cannot be used to explain the varied clinical presentations. In almost every tissue the hormone acts, but at a different rate, which depends on the receptor function

**Corresponding Author:-Dr.Malavika J.C MS, DNB (OBG).**

and post receptor signaling pathways, which accounts to variety of clinical presentations observed in hormonal disorders. This fact becomes further complicated in PCOS wherein more than one hormone is modified. Women with PCOS manifest with hypothalamic-pituitary-ovarian axis aberrations, hyperinsulinemia, hyperandrogenism, as well as adipose tissue dysfunctional adipokine secretion, all of which interact in different tissues (muscle, fat, liver and ovaries), thus leading to a variety of phenotypic presentations<sup>1,3</sup>.

The Rotterdam criteria used to diagnose PCOS requires the presence of atleast 2 of the features: oligo/anovulation, clinical / biochemical hyperandrogenism and ultrasound appearance of polycystic ovarian morphology. In 2006, the Androgen Excess Society (AES) pointed out that PCOS is basically anhyperandrogenic disorder and hence demonstration of acne, hirsutism and /or biochemical hyper-androgenism becomes a sine qua non of PCOS diagnosis. The second criteria required for the diagnosis of PCOS according to AES is either oligo/anovulation or polycystic ovarian morphology<sup>2,5</sup>.

The introduction of different phenotypes based on Rotterdam criteria makes PCOS represent a continuum of symptoms. PCOS may start gradually as a hyperandrogenic disorder and then lead on to anovulation or vice versa.

#### **Aim of the study:-**

To study the different clinical presentations among women with PCOS and to categorise them into different phenotypes.

#### **Objectives of the Study:-**

1. To study the most common clinical features among women with PCOS.
2. To categorise them into different phenotypes.
3. To evaluate all women with PCOS for hormonal imbalances.
4. To study the ultrasound morphology in all women suspected of PCOS.

#### **Methods:-**

**Type of study:** A hospital based explorative study.

**Place of study:** All women attending gynecology out-patient department at SS Institute of Medical Sciences and Research Centre with the complaints of menstrual irregularities, infertility and features of hyperandrogenism.

**Duration of study:** For 2 years between December 2014 to December 2016

**Sample size:** A total of 120 patients were recruited during the study period after taking informed consent.

**Inclusion criteria:** Those women who were diagnosed with PCOS according to the Rotterdam criteria were recruited irrespective of the age.

**Exclusion criteria:** Those women with non- ovarian causes of hyperandrogenism and infertility were excluded.

**Study procedure:** In OPD, a detailed history was taken. History was noted with respect cyclicity of menses, duration of menses and history of amenorrhea was noted. History suggestive of hypothyroidism (excessive weight gain, menstrual irregularities, menorrhagia) hyperprolactinemia (scanty menses, amenorrhea, premenstrual spotting, secretions from breast) were elicited.

General physical examination was done to note the height, weight and BMI. Clinical signs of hyperandrogenism like acne, hirsutism were noted. Signs of hyperinsulinemia such as acanthosis nigricans was looked for.

Ultrasound evaluation was done in relevant patients and polycystic ovarian morphology was diagnosed when 12 or more follicles were visualized measuring 2 to 9 mm or when the ovarian volume bigger than 10 ccm<sup>4</sup>.

Routine blood investigations such as complete hemogram, random blood sugar and urine routine examination were done. Hormonal evaluation comprising of serum thyroid stimulating hormone, s.prolactin, serum FSH, serum LH, serum Testosterone was done.

For women who wished to conceive, serial follicular monitoring was done to document the presence of absence of ovulation. Those women with anovulation were subjected for ovulation induction according to the institution protocols.

### Results:-

Out of 120 women who were recruited for the study, 18 were adolescents and 102 women were more than 20 years of age. Adolescents were studied separately owing to diagnostic difficulties.

Among the adolescent girls, the most common presenting symptom was menstrual irregularity. Out of 18 girls, 9(50%) of them presented with amenorrhea, 6 (33.33%) presented with oligomenorrhea, 3(16.6%) presented with regular cycles. All of them were unmarried. On estimation of BMI among adolescent girls, 8(44.4%) were overweight, 4(22.2%) were obese and 6 (33.3%) were of normal BMI. All of them were subjected to trans-abdominal sonography and 13(72%) had polycystic ovarian morphology and for documenting ovulation to categorize into different phenotypes, follicular monitoring was done and only 3(16.6%) demonstrated ovulation. Hormonal estimation revealed mildly raised serum testosterone (>80 but <200 ng/ml) in 8(44.4%) girls. Serum TSH was raised in 3(16.6%) girls and serum prolactin was raised in 1(5.5%) girl who were subsequently treated with appropriate medications. Serum LH was raised in 10(55.5%) girls.

Among the women aged more than 20 years, 75(73.5%) belonged to the age group 20-30 years and 27(26.47%) belonged to the age group 30-40 years. 89(87.2%) were married and 13(12.74%) were unmarried. Out of them, the most common complaint among them was oligomenorrhea(70.58%) and infertility(83.3%). Out of 102 women aged above 20 yrs, 72(70.58%) complained of oligomenorrhea, 16(15.23%) complained of amenorrhea, 14(13.72%) had regular cycles. 74(72.54%) of them presented with signs of hyperandrogenism (acne, hirsutism). On estimation of BMI, 65(63.72%) were found to be overweight, 15(14.7%) were obese and 22(21.56%) had normal BMI. On performing ultrasound (trans-abdominal was preferred by unmarried women and transvaginal ultrasound was done in married women) on all 102 women, 82(80.39%) demonstrated polycystic ovarian morphology and 20(19.6%) demonstrated normal ovarian morphology. Hormonal estimation revealed raised serum LH in 78(76.47%) women, serum testosterone was mildly raised in 62(60.78%) women.

Serial follicular monitoring was done in all women with PCOS to document the presence or absence of ovulation. Out of 120, ovulation was documented in 22 (21.56%) of them.

After collecting and analyzing the data, all adolescents and women were assessed for 3 features of PCOS namely, presence of oligo/anovulation, clinical /biochemical evidence of hyperandrogenism and ultrasound appearance of PCOM. The classification of phenotypes was done accordingly, as demonstrated in Table 1:

**Table 1:-** Categorization of PCOS phenotype according to the mode of presentation:

PCOS phenotype	Oligo/anovulation	Clinical/biochemical hyperandrogenism	PCOM on USG	n=120
1. Severe PCOS	+	+	+	29(24.16%)
2. Oligo/anovulatory PCOS	+	+	-	34(28.33%)
3. Ovulatory PCOS	-	+	+	25(20.83%)
4. Mild PCOS	+	-	+	32(31.37%)

### Discussion:-

Over the last few decades, various diagnostic criteria have been put up in search of ideal diagnostic approach. The following table 2 depicts the array of various definitions available in the literature:

**Table 2:-** Definitions and diagnostic criteria for PCOS:<sup>1,2,7</sup>

Definition/ year	Diagnostic criteria
NIH/ 1990	Requires the simultaneous presence of: 1. Clinical and /or biochemical hyperandrogenism 2. Ovarian dysfunction
ROTTERDHAM(ESHRE/ASRM) / 2003	Requires the presence of at least 2 criteria: 1. Clinical and /or biochemical hyperandrogenism

	<ol style="list-style-type: none"> <li>2. Ovulatory dysfunction</li> <li>3. Polycystic ovarian morphology</li> </ol>
AES/2006	Requires the presence of hyperandrogenism (clinical and / or biochemical) and either: <ol style="list-style-type: none"> <li>1. Ovulatory dysfunction</li> <li>2. Polycystic ovarian morphology</li> </ol>
Androgen Excess and PCOS Society/ 2009	Requires the simultaneous presence of: <ol style="list-style-type: none"> <li>1. Clinical and /or biochemical hyperandrogenism</li> <li>2. Ovarian dysfunction (ovulatory dysfunction and /or polycystic ovarian morphology)</li> </ol>

ESHRE=European Society of Human Reproduction and Embryology, ASRM= American Society for Reproductive Medicine, AES= Androgen Excess Society

It is important to state here that although various diagnostic criteria are available for the diagnosis of PCOS, other disorders ( Non Classical Congenital Adrenal Hyperplasia, Cushing's syndrome, acromegaly, hypothyroidism, hyperprolactinemia, virilising adrenal or ovarian neoplasm, premature ovarian failure ) which have overlapping clinical features needs to be excluded<sup>8</sup>.

The ultrasound definition of polycystic ovarian morphology is the presence of  $\geq 12$  follicles with a 2-to 9- mm diameter on the ovary. Ovarian volume of  $>10$  ml is also suggestive. One ovary consistent with polycystic ovarian morphology is sufficient for the diagnosis<sup>4</sup>. Although various studies have shown that polycystic ovarian morphology may also be found in 20-30% of normally ovulating women.

Four different phenotypes of PCOS have now been identified using the possible combinations of these criteria<sup>9,10</sup>:

- Type A: hyperandrogenism, chronic anovulation and polycystic ovaries.
- Type B: hyperandrogenism and chronic anovulation.
- Type C: hyperandrogenism and polycystic ovaries.
- Type D: chronic anovulation and polycystic ovaries

No single test is considered gold standard for the diagnosis of polycystic ovarian syndrome. A multimodality approach is required to diagnose the syndrome of polycystic ovaries.

The diagnosis of PCOS is all the more challenging in adolescent girls owing to menstrual irregularity due to anovulation which is commonly observed for few years after the onset of menarche. A high index of suspicion needs to be maintained when an adolescent persists to have menstrual irregularity for more than two years after menarche. With respect to features of hyperandrogenism in adolescents, slight acne and hirsutism is an anticipated problem because of transient functional hyperandrogenism and hence it is not of clinical significance. Hence, the combination of ultrasound and androgen evaluation will help to arrive at the diagnosis in an adolescent<sup>6</sup>.

Analysis of the study done reveals that PCOS can manifest with spectrum of symptoms, with the commonest among all age group being menstrual irregularity presenting as oligomenorrhea. Further, infertility is commonly seen among the reproductive age group women owing to anovulation. Hyperandrogenism is considered as the cardinal feature by AES criteria and it was demonstrated in women in our study. An ultrasound demonstration of polycystic ovarian morphology was seen in 99 (82.5%) women. An ultrasound appearance of PCOM is the result of chronic anovulation, one of the chief causes being PCOS. Other causes of chronic anovulation also need to be excluded at this point.

The variability of presentation of women with PCOS, with some of them having full blown syndrome (severe PCOS) to others having only 2 of the 3 features point towards the fact that PCOS is a continuum of symptoms. Women with mild or ovulatory PCOS can later on in life progress to develop severe PCOS<sup>11</sup>. A tailor made approach is required towards the diagnosis and management of different phenotypes. Adolescents who present with menstrual irregularity can be managed with oral contraceptives and those who come with acne can be managed with oral contraceptives with or without antiandrogens<sup>12</sup>. Women presenting with infertility as chief complaint benefit from weight reduction and metformin which are known to improve the insulin sensitivity and ovulation induction can be done with

clomiphene citrate or recombinant FSH. Laparoscopic ovarian drilling may be resorted to in women not responding to ovulation induction drugs.

PCOS is known to be associated with significant cardiometabolic risk like dyslipidemia, hyperglycemia, later on in life. Hence, a clinician should not only address the problem the woman seeks but also advise a woman with PCOS to embrace a healthy lifestyle, healthy eating habits and regular exercise to counter the long term effects of this metabolic syndrome<sup>13,14</sup>.

### Conclusion:-

PCOS is a heterogeneous collection of signs and symptoms, which form a spectrum of disorder, with mild variety seen in some women and full blown disorder seen in others. PCOS is viewed as a lifelong disorder with the syndrome progressing from mild to severe variety later on in life.

No single test forms the gold standard diagnostic test in the diagnosis of PCOS. PCOS is a syndrome and it is a diagnosis of exclusion. Hence, other endocrinopathies such as Non Classical Congenital Adrenal Hyperplasia, Cushing's syndrome, acromegaly, hyperprolactinemia, hypothyroidism, premature ovarian failure, virilizing adrenal or ovarian tumor needs to be excluded.

A tailor made approach needs to be under-taken in the management of women presenting with PCOS. Since PCOS is associated with significant cardiometabolic risk in later life, all these women need to be advised to embrace healthy lifestyle, healthy nutritional habits and regular exercise.

#### Abstract

This study was performed to demonstrate the ability of mesenchymal stem cells using biphasic scaffolds, to produce osteochondral graft, assess its function, and compare it with autogenous grafting of condylar defects. Eighteen male adult mongrel dogs ranging from 12-15 kg in weight were selected for this study and were randomly divided into two equal groups: Group A: Tissue engineering procedure was performed in 2 stages, Stage 1: Aspiration of bone marrow samples from the canine subjects was performed, Stage 2: In vitro isolation, expansion, differentiation and characterization of Mesenchyme Stem Cells was performed, followed by implantation of the tissue engineered graft. Group B: autogenous bone grafting was performed. After 16 weeks from implantation of the grafts in the created condylar defects, the dogs were sacrificed, and bone samples were prepared for histological assessment and follow up. Microscopic and histochemical analysis revealed well-formed tissue-engineered osteochondral graft in the test group (Group A), versus very limited cartilage regeneration in the control group (Group B). Moreover, Radiographic evaluation was performed immediately post-operatively, 6 weeks, 12 weeks, and 16 weeks postoperatively. Based on our findings, we concluded that the replacement of TMJ bone and cartilage with tissue-engineered osteochondral graft was superior to autogenous bone graft at the same step.

#### Introduction:-

Temporomandibular joint (TMJ) is a complex system that is regularly subjected to trauma, metabolic and inflammatory processes (Scheller, et.al. 2009). It is one of the most difficult tissues to treat due to the limited blood

supply and hence limited capacity for self-repair. The biological basis of TMJ problems is the deterioration of articular cartilage, which covers the bone at the joint surface and performs many complex functions (Sherwooda, et.al. 2002). The articular cartilage of TMJ has a surface layer of fibro-cartilaginous and deep layer of hyaline-like hypertrophic zone with a thin intermediate proliferative zone (Atkinson and Haut 2001). Thus it has unique properties, such as viscoelastic deformation, that allow it to absorb shock, distribute loads, and facilitate stable motion (Mao, et.al. 1992). Therefore, Osteochondral defect repair is a challenging problem in the field of oral and maxillofacial surgery (Hunziker 1999, Grande, et.al. 1999).

Tissue engineering provides a new era for therapeutic medicine; it is progressing very rapidly and extends to involve all tissues in our body. Engineering the osteochondral interface with its complex structure and its cartilaginous component with its zones of different structures and organization is very challenging (Wojciech, et.al. 2014).

Tissue engineering approaches have the potential to overcome the lack of donor tissue and create TMJ replacement that is both biologically and mechanically functional (Schek, et.al. 2005, Hu, et.al. 2003, Tanaka, et.al. 2006). The standard approach of tissue engineering is to seed cells on a three-dimensional (3D) biomaterial scaffold. The scaffold is designed to create a 3D environment that promotes tissue development of cells that are placed on or within the scaffold. Gene vectors, soluble factors, and chemical signals may be incorporated into the scaffold to help promote tissue development during in vitro incubation or in vivo implantation (Elisseff, et.al. 2005).

Since bone and cartilage require different competing conditions for their regeneration, growing a biphasic osteochondral construct in vitro containing a cartilage region and a bone-appropriate region to guide the growth of these two different tissues into a single implant is therefore very difficult (Scheafer, et.al. 2000, Jill, et.al. 2002). The Biphasic scaffolds have been studied for osteochondral regeneration, and it was reported that they could support cell growth and differentiation into bone and cartilage (Kreklau, et.al. 1999, Schaefer, et.al. 2002, Gao, et.al. 2001). Furthermore, numerous studies reported the successful use of tissue engineered osteochondral implants using biphasic scaffolds in the repair of TMJ defects (Weng, et.al. 2001, Chen, et.al. 2001, Schek, et.al. 2005).

However, to date few studies have attempted to produce a tissue engineered osteochondral graft, and assess its function compared to autogenous grafting. Therefore, the objective of this study was to demonstrate the ability of mesenchymal stem cells seeded in biphasic scaffolds, to produce osteochondral graft, assess its function, and compare it with autogenous grafting of condylar defects.

## **Materials & Methods:-**

**Ethics statement.** This study was approved by CU-IACUC, (approval number CU II S 17 16). Eighteen male adult mongrel dogs ranging from 12-15 kg in weight were selected for this study. All animals to be included were examined to be sure that they were free from any disease. The animals were hosted and quarantined in separate cages for one week prior to the surgery to become acclimatized to housing and diet. Then the animals were randomly divided into two equal groups: Group A: for tissue engineering procedure and group B: for autogenous bone grafting.

### **Group A (Tissue engineering):-**

Preparation of the engineered tissue involved 2 stages. Stage 1: in which aspiration of bone marrow samples from the canine subjects was performed, Stage 2: in which in vitro isolation, expansion, differentiation and characterization of MSCs from canine bone marrow samples was performed.

#### **Stage one: Bone marrow collection:-**

Under general anesthesia and strict aseptic conditions the head of each canine's tibia was palpated carefully for the detection of the tibia tuberosity followed by introduction of special biopsy needle (aspirating needle) for about 1.5 cm depth. Bone marrow samples were aspirated in 20-ml syringe containing 2 ml heparin (preservative free, 400 units per ml).

#### **Stage two: Tissue collection and engineering:-**

According to the departmental standard operating procedures (SOP), strict aseptic conditions were followed throughout this study. The bone-marrow samples were flushed by means of an 18-gauge needle and 10-mL syringe loaded with Dulbecco's Modified Eagle's Medium-Low Glucose (DMEMLG; Sigma, St. Louis, MO, USA) supplemented with 10% fetal bovine serum (FBS) (Biocell, Rancho Dominguez, CA, USA) and 1% antibiotic-antimitotic (Gibco, Carlsbad, CA, USA). Marrow samples were mechanically disrupted by passage through 16-, 18-,

and 20-gauge needles. Marrow cells were centrifuged, suspended in serum-supplemented medium, counted, plated at  $5 \times 10^7$  cells/100-mm culture dish, and incubated for two weeks in 95% air/5% CO<sub>2</sub> at 37°C, with fresh medium change every 3-4 days. Upon reaching 80-90% confluence, primary MSCs were trypsinized, counted, and passaged at a density  $5-7 \times 10^5$  cells/100- mm culture plate.

#### **Treatment of MSCs with Chondrogenic and Osteogenic Differentiation Factors:**

The same population of first-passage MSCs was treated separately with chondrogenic or osteogenic specially formulated medium. The chondrogenic medium was supplemented with DMEM-LG, 10%FBS, BMP-7, insulin like growth factor-1, antibiotic, dexamethasone, ascorbic acid, whereas the osteogenic medium contained 100 nM dexamethasone, 10 mM  $\beta$ -glycerophosphate, and 0.05 mM ascorbic acid-2-phosphate. Cultures were incubated for 1 week in 95% air/5% CO<sub>2</sub> at 37°C, with fresh medium change every 3-4 days.

#### **Histochemical staining of subcultures**

Histochemical staining was performed for subculture in osteogenic medium at days 7, 14, 21 and 30 to detect expression of alkaline phosphatase enzyme. Moreover, Von kossa staining was performed at 7, 14, 21 and 30 days of subculture, to detect extra cellular matrix mineralization (ECM) in osteogenic medium. Furthermore, Safranin-O staining was performed at day 30 of subculture to detect proteoglycans and glycosaminoglycan found in chondrocytes (in chondrogenic medium). All stained cultures were inspected by the naked eye and under the inverted phase contrast microscope.

#### **Cells seeding onto the Biphasic-scaffold:-**

The Biphasic-scaffold (composed of porous silica calcium phosphate (SCPC) color coded discs) was sterilized, and seeded by most of the trypsinized cells after four weeks of osteogenic and chondrogenic differentiation.

#### **Group B (autogenous bone grafting):-**

After subjection of each canine to general anesthesia, an extra-oral incision and flap reflection was performed. Autogenous graft was harvested from the buccal cortical plate of the body of the mandible using trephine bur (0.5 cm diameter) at a low speed under copious irrigation with saline.

#### **Implantation of the engineered osteochondral tissue/ autogenous graft:-**

After subjection of each canine to general anesthesia, Under copious irrigation with saline and using trephine bur (0.5 cm diameter) at a low speed, a cylindrical bony defect was done at the condylar head having the same length and width of the engineered osteochondral tissue at the scaffold in group A, and the harvested autogenous graft in group B. The biphasic scaffolds seeded with differentiated cells and the autogenous bone grafts were implanted inside the surgical defects. The wound was closed in layers (Fig 1A and 1B).

**Fig 1:** (A) Clinical picture of the surgically created defect at the canine's condylar head. (B) Biphasic scaffold seeded with BM-MSCs after its placement at the created condylar defect. (group A)

The dogs were euthanized (sacrificed) after 16 weeks from implantation using hyper dosage of Thiopental Sodium 10% injected directly through the cannulated cephalic vein. The bilateral condylar bones with overlying capsules were freed in each dog by surgical dissection, examined grossly and bisected vertically by electrical saw. The bones were de-mineralized for one week in a mixture of formic acid and hydrochloric acid solution. Samples were then fixed for 24 hours in 10% neutral buffered formalin, then processed and paraffin-embedded in a standard manner.

### Assessment of the implanted osteochondral tissue/autogenous graft:-

Radiographic follow up was performed using lateral oblique contact film immediate post-operatively, 6 weeks, 12 weeks, and 16 weeks postoperatively.

While Histological assessment and follow up were performed using Hematoxylin and Eosin (H&E) stain, Tartrate resistant acid-phosphatase (TRAP) special stain, Goldner's Masson Trichome special stain, and Toluidine blue staining.

### Results:-

#### Histologic Evaluation:-

Bone marrow-derived MSCs in monolayer culture incubated for 4 weeks in osteogenic and chondrogenic medium reacted positively to alkaline phosphatase and Von Kossa silver stain indicating their osteogenic phenotype and mineral deposition respectively (Fig. 2A and 2B). Also they exhibited positive reaction to safranin O indicating their chondrogenic phenotype (Fig.2C).

**Fig. (2):** (A) BM-MSCs subjected to osteogenic differentiation showing +ve reaction to alkaline phosphatase histochemical staining (blue spots). (B) BM-MSCs subjected to osteogenic differentiation showing +ve reaction to Von Kossahistochemical staining (black spots). (C) BM-MSCs subjected to chondrogenic differentiation, showing positive reaction of their extra cellular matrix to Safranin O histochemical stain (red-orange stain)

Regarding the histological evaluation of the osteochondral defect repair, in group (A) the H&E stained sections from de-mineralized engineered condylar bones revealed repair of the defect by formation of an upper layer of well-formed cartilage in 100% of cases overlying mature osteogenic layer in 100% of cases (Fig.3A). While in group (B) H&E stained sections from de-mineralized grafted condylar bones revealed repair of the defect by formation of an upper layer of well-formed cartilage in 10% of cases overlying mature osteogenic layer in 100% of cases (Fig.3B).

**Fig. (3):** (A) H&E stained section at the biphasic/cell composite site showing the formation of well-formed cartilage layer overlying mature osteogenic layer. (B) H&E stained section at the autogenous graft site showing borders of the bony defect old bone (OB), trabeculae of new bone (NB)

TRAP special stain was used for the detection of osteoclasts and osteoblasts in the osteogenic layer of the engineered and grafted condylar bones. In both groups (A&B) Osteoblasts and osteoclasts were strongly positive to TRAP special stain at the osteogenic layer. This was illustrated by the presence of small orange-brown spots denoting the osteoblasts and large orange-brown spots denoting the osteoclasts in their Howship's lacunae (Fig. 4A and 4B).

**Fig. (4) :**(A) strong TRAP positive expression by osteoclasts present in their Howship's lacunae(arrow)in group A.(B) strong TRAP positive expression by osteoclasts present in their Howship's lacunae(arrow) in group B.

The use of Goldner's Masson Trichrome stain in both groups (A&B) demonstrated clear differentiation between mineralized mature bone that stained blue or green and un-mineralized new immature bone that stained red. It also provided excellent highlighting of bone-forming cells or osteoblasts (red-orange) lining trabeculae of immature bone (Fig.5A and 5B).

**Fig. (5) :**(A) Goldner's Masson Trichrome staining section exhibiting the presence of newly formed woven bone taking the light red stain, underlined with old mature bone taking a blue stain in group A. (B) Goldner's Masson Trichrome staining section exhibiting the presence of newly formed woven bone taking the light red stain, underlined with old mature bone taking a blue stain in group B.

In group (A) the Presence of chondrocytes, which reacted positively with the Toluidine blue stain by taking the blue color, was detected in all of the experiments, as shown in figure (Fig.6A). While in group (B) Presence of chondrocytes, was detected only in 10% of the experiments (Fig. 6B).

Fig. (6): (A) Toluidine blue special stain sections in the chondrogenic layer of the engineered osteochondral graft, showing the presence of chondrocytes (arrow) in the engineered cartilaginous layer.(B)Toluidine blue stained sections of the autogenous graft condyle showing areas of cartilage (C)

#### **Radiographic evaluation:-**

The radiographic follow up of (group A) showed increase in the radio-opacity at the implanted defect site packed with the seeded biphasic scaffold, accompanied with disappearance of the radiolucent rim separating between the seeded biphasic scaffold and the normal surrounding bone denoting de novo bone and cartilage formation at the defect site (Fig.7). As for (group B) radiographs showed complete integration between the autogenous graft and the normal condylar bone (Fig. 8)

**Fig. (7):** A lateral oblique radiographic picture showing total remodeling of the condyle (arrow), with difficulty to distinguish between the newly regenerated bone and the rest of the condyle.

**Fig. (8):** A lateral oblique radiographic picture showing total integration between the autogenous graft and the normal condylar bone.

#### **Discussion:-**

Temporomandibular joint (TMJ) is one of the most difficult tissues to treat due to the limited blood supply and hence limited capacity for self-repair. Since bone and cartilage require different competing conditions for their regeneration, growing a biphasic osteo-chondral construct in vitro is therefore very challenging.

The canine model was selected in this study according to the similarities between human and canine TMJ morphology and composition as proved in some studies(Aeressens, et.al. 1998, Reichert, et.al. 2009). Adult bone marrow was selected as the source of MSCs as these cells possess a multilineage differentiation capability into bone,

cartilage, adipose, tendon and muscle tissue (Ferrari, et.al. 1998, Jones, et.al. 2002). The differentiation of BM-MSCs into chondrogenic cells and osteogenic cells and active syntheses of chondral and osseous matrix in vitro is consistent with some previous work (Goldberg and Caplan 1994, Schaefer, et.al. 2000, Gao, et.al. 2001).

The data of the present study demonstrated that BM-MSCs derived chondrogenic and osteogenic cells continue their phenotypic differentiations in vivo. BM-MSC-derived chondrogenic and osteogenic cells were encapsulated into the SCPC biphasic scaffold with a dimension of 5mm diameter x 5mm height. This result is consistent with the result of (Alhadlaq and Mao 2003) who used a Poly-Ethylene Glycol hydrogel scaffold and encapsulated the BM-MSCs-derived chondrogenic and osteogenic cells into the shape of a human mandibular condyle with a dimension of 11 x 4 x 7 mm. Moreover, (Weng, et.al. 2001) have successfully used mature bovine chondrocytes and osteoblasts seeded on a polymeric scaffold molded into the shape of human mandibular condyle and yielded discrete layers of cartilage and bone. Furthermore, this result is consistent with other studies (Elisseff, et.al. 2000, Poshusta and Anseth 2001, Burdick and Anseth 2002, Halestenberg, et.al. 2002, Martens and Bryant 2003).

In the present study, the improvement in bone and cartilage repair found by the use of rh-BMP7 with the biphasic SCPC scaffold coincide with those of (Herford, et.al. 2002, Krebsbach, et.al. 2000) who used recombinant OP-1/BMP-7 delivered on bone-derived type I collagen scaffolds press-fitted into large focal defects in rabbit models. When implanted in TMJ, the silica calcium phosphate (SCPC) biphasic scaffold with its high porosity enhanced cell colonization and osteochondral formation within the graft material. Thus it may have a strong stimulatory effect on bone and cartilage cell function, and resorbs in harmony with the rate of new bone and cartilage formation. It also showed no signs of inflammation or immunologic rejection into the surrounding tissues.

Regarding the control group, the histologic characteristics of the newly formed bone in defects received autogenous bone grafts was similar to the normal bone formation, and mineralization. This finding agrees with those of (Zhu, et.al. 2006) who reported in a study on goats that the histological characteristics of the neocondyle from autogenous coronoid process were similar to the normal one with fibrous connective tissue covering the head of the neocondyle.

In the current study a mature osteogenic layer in 100% of cases was found due to its cortico-cancellous nature, which causes the new bone to be stiff, and can resist heavier forces. This finding agrees with the finding of several studies (Zhu, et.al. 2006, Liu, et.al. 2010, Zhu, et.al. 2008). Moreover, our study found the formation of an upper layer of well-formed cartilage in 10% of the control group cases overlying mature osteogenic layer which could be interpreted as a kind of tissue response to local mechanical stimulation and/or the periosteum that have exerted its chondrogenic and osteogenic potential. This finding agrees with several studies that reported the occurrence of the fibrocartilage proliferation and the sufficiently organized cartilage at the resected condylar surface after condylectomy (Murnane and Doku 1971, Sprinz 1963, Glanelly, et.al. 1965).

Comparing the 2 groups, this study showed very limited cartilage regeneration in the control group, and well-formed tissue-engineered osteochondral graft in the test group. Thus tissue-engineered osteochondral graft from BM-MSC represents another step toward therapeutic applications of TMJ reconstruction.

### **Conclusion:-**

Based on our finding, we can conclude that the tissue-engineered osteochondral graft was superior in the replacement of the bony and the cartilaginous part of the TMJ at the same step compared to the autogenous bone graft.

##### Key words:-

Topical corticosteroids (TCS), Misuse,  
Non-Prescription Medicines (NPM)  
Western Region, Saudi Arabia

#### Abstract

This cross - sectional study measured the prevalence of misuse and awareness of Western region populations related to topical corticosteroids (TCS) use and its effects. It also compared the variation of level of awareness and use according to gender, age group and level of education. A sample of 458 participants were selected randomly where a well designed validated self study questionnaire was developed for data collection. Collected data was analyzed using SPSS Ver. 20 where both descriptive and analytical analysis was applied. Main findings included that the problem of TCS and its abuse, misuse, and minimum awareness related to adverse effects to topical drugs have been widespread in Saudi Arabia specially at the Western region of the Kingdom. The study recommended to develop a national policy on Non-Prescription Medicines (NPM) and it should be supported to limit self-medication practice among the Saudi population and to increase their awareness relevant to misuse and adverse side effects of topical corticosteroids. Future national studies need to explore the safety and effectiveness of using topical corticosteroids.

#### Introduction:-

Topical corticosteroids (TCS) are of great value in treating a wide spectrum of dermatological diseases and since the time of its introduction in 1951, a new therapeutic era in dermatology has been emerged (1). The development of super potent corticosteroid in 1974 added more cutaneous diseases to the list of TCS indications. Meanwhile TCS misuse also appeared as a common problem adding a new complication which has been reported by Variety of investigators (2). Chronic misuse of TCS on the face produced a clinical condition which was described by various names, like light sensitive seborrheid, perioral dermatitis (3), rosacea-like dermatitis (4), steroid induced rosacea-like dermatitis (4), Steroid Rosacea (5), and steroid dermatitis resembling Rosacea (6).

Topical corticosteroids (TCS) are perhaps the most widely used agents amongst the therapeutic armamentarium and have been rightly acknowledged as a wonder drug in dermatological therapy (7). They provide immediate subjective and objective relief in symptoms in almost all inflammatory dermatoses thus justifying its rampant use. This usefulness of the drug has become a double edged weapon and made alarming proportion of individuals vulnerable to its abuse leading to serious local adverse effects especially on face (8). Vast sections of society have become victims of this magic drug owing to the craze of beautification leading to a virtual epidemic of acneform eruptions,

steroid rosacea/steroid dependent facies, telangiectasia, hypertrichosis and premature aged appearance of face. Aim of our study is to make awareness about misuse of TCS.

The adverse effects of TCS tend to occur with prolonged treatment and depend on potency of TS, its vehicle and site of application. The most common include atrophy, striae, rosacea, perioral dermatitis, acne and purpura. Hypertrichosis, pigment alteration, delayed wound healing and exacerbation of skin infections are less frequent (14). Systemic adverse effects from TS have also been described and they are more likely to develop when highly potent TS are used for prolonged periods on thin skin (e.g. face) or on raw/inflamed surfaces (13, 14).

#### Research Objectives:-

- To measure the Prevalence of misuse of topical corticosteroids among populations in western region of Saudi Arabia.
- To assess the level of awareness of Western region populations related to corticosteroids use and its effects.
- To compare if there any statistical variation between the level of use of corticosteroids and gender.
- To compare if there any statistical variation between the level of use of corticosteroids and age group.
- To compare if there any statistical variation between the level of use of corticosteroids and educational level.

#### Materials and Methods:-

##### Study Design and Sample Size:-

A prospective cross sectional study was conducted in Western Region of Saudi Arabia from October to December 2016. Sample of 458 subjects were selected randomly within the age of 20 up to 65 years old.

##### Methods and Tools of Data Collection:-

A validated self-administered pretested questionnaire was devolved and filled by all participants. The questionnaire consisted demographic variables and study variables to achieve study objectives.

##### Inclusion Criteria:-

- Saudi nationality
- Male and female between (20-65) years old.
- Western region citizens

##### Data Analysis:-

Collected data was analyzed using SPSS version 20 where descriptive analysis was conducted for basic or demographic data while Chi Square test was applied to calculate correlation between different dependent and independent variables.

##### Ethical Approval:-

Approval for research was obtained from Institutional Research Ethics Committee.

#### Results:-

##### Section 1:- Demonstrates Demographic Data

Table 1:- Shows The Distribution Of Participants According To The Demographic Data

N = 458

Variable	Category	Fr.	%
Gender	Male	137	30
	Female	321	70
Age Group in Years	< 20	50	11
	21 - 40	302	66
	41 - 60	101	22
	> 61	5	1
Educational Level	Secondary or below	105	23
	Under Graduate	330	72
	Post Graduate	22	5

\* Most of participants were female (70%), within the age group of 21 - 40 years old (66%) and under graduate students (72%).

**Section 2:- Demonstrates Knowledge and practices towards topical corticosteroids**

Table and Figure 2 Show The Distribution Of Participants According To The Use of topical corticosteroids

Use of corticosteroids	Fr.	%
Yes	359	78.4
No	99	21.6

The use of topical corticosteroids among participants was 78%.

Table and Figure 3 Show The Distribution Of Participants According To The Presence Of Prescription for topical corticosteroids

Source of corticosteroids	Fr.	%
Prescribed by physician	152	40.0
By help of pharmacist	55	20.0
Without any prescription	152	40.0

Only 40 % of participants used topical corticosteroids as prescribed by physician who is only authorized person to give different medications

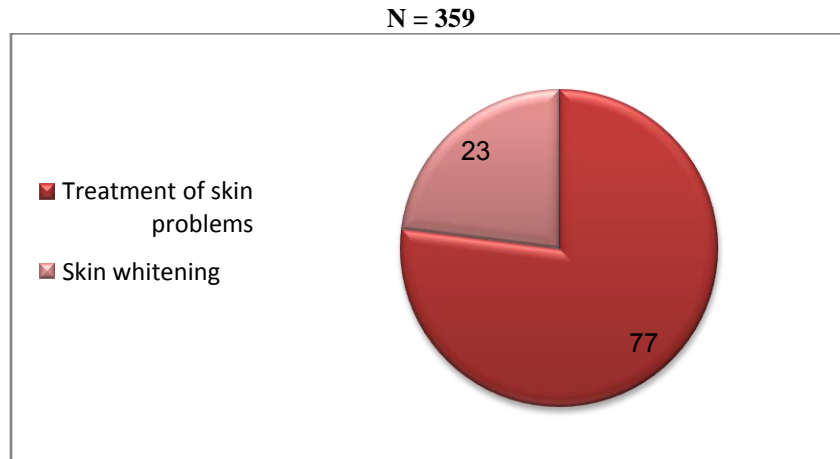

Table and Figure 4 Show The Distribution Of Participants According To The body parts where topical corticosteroids used

Body part	Yes	
	Fr.	%
Face only	91	19.9
Peripherals & trunk only	119	26.0
Face ,Peripherals & trunk	51	11.1
genitalia	98	21.4

Near to half of participants used topical corticosteroids on face 19.9%

Table and Figure 5 Show The Distribution Of Participants According To The Reasons for use of topical corticosteroids

Reason for use of corticosteroids	Yes	
	Fr.	%
Treatment of skin problems	278	77
Skin whiteness	81	23

About 23 % of participants used topical corticosteroids for other purposes rather than treatment.

Table and Figure 6 Show The Distribution Of Participants According To The Period of using topical corticosteroids

Period of use of corticosteroids	Fr.	%
< 3 Months	242	67.0
3- 6 Months	33	9.0
6-12 Months	10	3.0
> 1 years	74	21.0

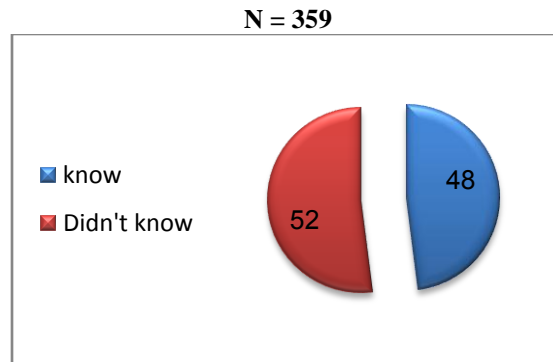

All participants used topical corticosteroids for at least **THREE** months, while about 21% used it for one year, Table and Figure 7 Show The Distribution Of Participants According To The way of using topical corticosteroids  
**N = 359**

Frequency of using corticosteroids	Fr.	%
Regular	85	24.0
Not Regular	274	76.0

About 24 % of participants used topical corticosteroids on regular basis

Table and Figure 8 Show The Distribution Of Participants According To Their Knowledge about side effects of topical corticosteroids

Side effects of corticosteroids	Fr.	%
know	174	48.0
Didn't know	185	52.0

Near to half of participants (52%) didn't know the side effects of

Table 9:- Shows The Distribution Of Participants According To Their use of topical corticosteroids and the gender

There was no statistical relationship between the participants knowledge towards side effects and the age group, P Value < 0.05.

### Discussion:-

This study measured the prevalence of misuse and awareness of Western region populations related to corticosteroids use and its effects. It also compared the variation of level of awareness and use according to gender, age group and level of education.

Misuse of topical corticosteroids appears to be a common problem worldwide, as stated by study, the prevalence of topical corticosteroids misuse was 60% (By help of pharmacist or Without any prescription). The use of TCS for skin lightening was statistically significant (23%). This may also explain the female predominance in this study.

As mentioned in the table (1) 458 individuals were participated in this study where most of them were female (70%), within age group of 21 - 40 years old (66%) and under graduate (72%). The showed that use of topical corticosteroids among participants was 78%. Only 33 % of participants used topical corticosteroids as prescribed by physician who is only authorized person to give different medications while the rest of participants used topical corticosteroids without any prescription or through the advice of pharmacist who is not authorized to give medication. Near to half of participants used topical corticosteroids on face and peripheral, 20% and 25%. About 39 % of participants used topical corticosteroids for other purposes rather than treatment. All participants used topical corticosteroids for at least **THREE** months. Majority of participants (62%) didn't know the side effects of corticosteroids.

In recent years, there has been an increasing trend for self-medication with non-prescription medicines (NPM). In parallel, more products have been deregulated for purchase without a prescription (11). Population-based survey in developed countries such as Australia, Scotland, United Kingdom and other Asian countries like Taiwan and Singapore found that between a half and two-thirds of the population used NPM, including complementary and over-the-counter medicines (OTC) (12).

Misuse of topical corticosteroids is very common in patients with facial dermatoses. Many patients prefer to use topical steroids as a fairness cream (9). To minimize adverse cutaneous and systemic reactions, especially with prolonged use, the rational use of topical steroids should include careful consideration of the patient's age, total area of application, quantity to be applied, efficacy of the selected corticosteroid, and frequency of application (10). Hence, one step to achieve rational prescribing is periodic auditing of prescriptions.

As shown in tables 8,9 and 10 there was statistical relationship between regular use of topical corticosteroids, side effects, its source and the gender, female were use more regularly, more knowledgeable and more use un prescript topical corticosteroids than others, P Value < 0.05.

As shown in tables 11,12 and 13 there was statistical relationship between regular use of topical corticosteroids, side effects, its source and the educational level, under graduate participants were use more regularly, more knowledgeable and more use un prescript topical corticosteroids than others, P Value < 0.05.

As shown in tables 14 there was statistical relationship between regular use of topical corticosteroids, and the educational level, age group of 21- 40 years old were use more regularly than others, P Value < 0.05 while as shown in table 15 and 16 there was no statistical relationship between the source of topical corticosteroids and knowledge of side effects and the age group, P Value > 0.05.

### **Conclusion:-**

Thus as indicated by data in our study, the problem of TCS and its abuse, misuse, and minimum awareness related to adverse effects to topical drugs have been widespread in Saudi Arabia and specially at the Western region of the Kingdom.

Western region consumers mainly purchased Non Prescript Medications NPM to treat problems of skin, skin lightening and other purposes. The choice of NPM was associated with socio-demographic profile such as gender, age and educational level.

The development of a national policy on NPM should be supported to limit self-medication practice among the Saudi population and to increase their awareness relevant to misuse and adverse side effects of topical corticosteroids. Future national studies need to explore the safety and effectiveness of using topical corticosteroids.

### Abstract

This study aimed to identify the relationship between company image and Purchasing decision at Orascom Telecom Djazzy in Béchar. The study identifies a community of mobile services users in Béchar "Djazzy Foundation was chosen as a sample of them reached their size (26) customer, for completion of this study, we prepared a questionnaire composed of three sections : Devoted the first part of personal information , the second of them Factors affecting the Enterprise image consists of 12 questions, and Part III ;Purchasing decision consists of (07) question, was this relationship is tested using spss 19 statistical program , there is no impact to the image of the institution on the decision of purchasing for the consumer, And there is found a set of recommendations that can help your organization to adopt this important element

### Introduction:-

Value judgment made by an individual on a company (corporate image), brand (brand image), a product (product image) or a person (personal image). Part of the value of a brand, it is the combination of actual values of received ideas, emotional feelings, impressions, objective, subjective, conscious or unconscious, and the personality of the brand, the product of the individual or the company. The term 'goodwill' is sometimes used to denote the image of a company, the degree of confidence that bring clients and consumers of its products. However, should not confuse branding with the brand identity. Christian Michon explains in this regard that: "the concept of identity is fundamentally different from the concept of branding. The identity is part of a context more wide of the company and its history as a source of communication. Brand has as a key source of perception: the product, its attributes and advertising.

The problem of the study" :

What is the effect of company image on Purchase Decision IN Orascom Telecom institution "jazzy" Béchar – Algeria-

### Hypotheses:-

- There is a positive relationship between the corporate image and Purchase Decision.
- There are significant relationship between personal factors and the Purchase Decision.
- There are significant relationship between Social factors and the Purchase Decision.
- There are significant relationship between Organizational factors and the Purchase Decision.
- There are significant relationship between informational factors and the Purchase Decision

**Corresponding Author:- Ilyes Slimani.**

Address:- Laboratory of study economics & development local in south west of Algeria department of management, university of bechar, Algeria.

**Objectives of the study:-**

- Knowledge of how to measure the company's image, and how they are configured and improvement;
- determine the effect of the company's image on Purchase Decision.

**Corporate image and Purchase Decision:-**

Some terms are so basic to a discipline that it is difficult to define them using only other terminology from within a discipline. The concept of corporate image is one such foundational term. The purpose of this paper is to review the various definitions of corporate image which have been proposed over the years and to attempt to develop a synthesis. A model is developed to differentiate among the concepts of corporate personality, corporate identity and company image. A special emphasis is placed on identifying the dimensions which underlie corporate image. Recommendations are made for measuring this important concept, depending upon the stakeholder group of interest to the researcher.

Mental picture that springs up at the mention of a firm's name. It is a composite psychological impression that continually changes with the firm's circumstances, media coverage, performance, pronouncements, etc. Similar to a firm's reputation or goodwill, it is the public perception of the firm rather than a reflection of its actual state or position. Unlike corporate identity, it is fluid and can change overnight from positive to negative to neutral. Large firms use various corporate advertising techniques to enhance their image in order to improve their desirability as a supplier, employer, customer, borrower, etc.<sup>i</sup>

**The Definition of corporate image:-**

The perception people have of your business when they hear your company name. A business's image is composed of an infinite variety of facts, events, personal histories, advertising and goals that work together to make an impression on the public

Corporate image and reputation is considered to be a critical factor in the overall evaluation of any organization (Bitner, 1990, 1991; Gronroos, 1984; Gummesson and Gronroos, 1998; Andreassen and Lanseng, 1997; Andreassen and Lindestad, 1998; Kandampully and Hu, 2007; Sarstedt et al., 2012) because of the strength that lies in the customers' perception and mind when hearing the name of the organization (Fombrun, 1996; Hatch et al., 2003; Nguyen, 2006; Bravo et al., 2009). Thus, continuous research on corporate image and reputation is a must for those organizations that want to successfully differentiate their positioning in the market.<sup>ii</sup>

Companies' increasing concern about their image, identity and culture must be seen in relation to a number of changes that influence their roles and opportunities. Today, the information we receive is no longer scarce; actually the amount of information is drowning us. This abundance has created much confusion. Demand and supply for information are disoriented and, thus, become increasingly dependent on the guidelines and criteria for sorting information in order to reduce confusion. Orientation is less and less a matter of gathering information and more and more a matter of sorting and connecting. The company's consumers, stakeholders and employees are all influenced by this development.<sup>iii</sup>

**The Definition of Purchase Decision:-**

The decision of buying an item does not instantly take place. Behind the visible act of purchasing an item, stands a buying decision process that smart companies should investigate. Motivation,

perception, learning, memory, personality, and attitude play an important role in the unfolding of the decision process that presupposes the consumer's covering of five stages: problem recognition, information search, evaluation of alternatives, purchase decision, and post purchase behaviour.

Marketers' task is to study consumer behaviour in order to achieve a thorough understanding of all five stages unfolding in this process, not only of the purchase decision as such. Buying behavior differs greatly depending on the purchased item, therefore, the types of decision behaviour need to be known and studied. They are: complex buying behaviour, dissonance-reducing buying behaviour, habitual buying behaviour, variety-seeking buying behaviour<sup>iv</sup>

**Actors Affecting in corporate image:-**

the factors affecting the mental image of the institution in the following points:

- Personal factors.
- social factors:
- organizational factors:
- informational factors

**Research questions and Model of the study:-**

**Figure 1:-** Model of the study

**Study Design:-**

This study aimed to identify the relationship between company image and Purchasing decision at Orascom Telecom Djezzy in Béchar. The study identifies a community of mobile services users in Bechar "Djezzy Foundation was chosen as a sample of them reached their size (26) customer, for completion of this study, we prepared a questionnaire composed of three sections : Devoted the first part of personal information , the second of them Factors affecting the Enterprise image consists of 12 questions, and Part III ;Purchasing decision consists of (07) question, was this relationship is tested using spss 19 statistical program , there is no impact to the image of the institution on the decision of purchasing for the consumer, And there is found a set of recommendations that can help your organization to adopt this important element

We used to divide the Likert where it meets every question from the axis of the questionnaire five options divided into grades as follows:

class V	Fourth class	third-class	second-class	First-class
Acceptable strongly	Acceptable	balanced	not agree	Strongly isagree

### Test the hypotheses of the study:-

#### First hypothesis: the effect of personal factors on the buying decision:-

**H0:** There are no significant differences between the personal factors and decision-purchasing relationship.

**H1:** There are significant differences between personal factors and decision-purchasing relationship.

**Table 2:-** The results of the measurement The effect of personal factors on the buying decision.

Independent variables The personal factors	The correlation coefficient	The regression line	The variable décision-purchasing			
			R	R2	F	sig
	0.057	3.474	0.057	0.003	06.653	0.683

Source: the preparation of researchers and the adoption of the spss 19.

When the value of freedom Degree (13.28) = 2.391

Analysis: The above table shows that the bilateral link value (R) between personal factors and decision SPV was (0.057), an increase of (5.7%) is a very weak link, as was the coefficient of determination (R2 = 0.003) that is (0.3%) of change SPV in the decision due to the change in the personal factors. Note that the significance level (Sig 0.683) is greater than the level of significance (0.05) This shows that there is no statistically significant differences between the decision SPV and personal factors, I accept the hypothesis of bad and reject the alternative hypothesis which there are no statistically significant differences between the decision relationship SPV and personal factors and thus can be written regression equation between personal factors (x1) and decision SPV (y) as follows:

$$Y=3.474+0.057X_1$$

#### Second Hypothesis : the relationship between social factors and buying decision:-

**H0:** There is no statistically significant relationship between social factors and the purchasing decision.

**H1:** no statistically significant relationship between social factors and the purchasing decision.

**Table 3:-** Results of measuring the relationship between social factors and the buying decision

Independent variables The social factors	The correlation coefficient	The regression line	The variable décision-purchasing			
			R	R2	F	sig
	0.058	3.265	0.067	0.003	2.202	0.643

Source: the preparation of researchers and the adoption of the spss 19.

The above table shows that the bilateral link value (R) between social factors and decision SPV was (0.067), an increase of (6.7%) is a very weak link, as was the coefficient of determination (R2 = 0.003) that is (0.4%) of change SPV in the decision due to the change in social factors. Note that the significance level (Sig 0.643) is greater than the level of significance (0.05) This shows that there is no statistically significant differences between the decision SPV and social factors, I accept the hypothesis of bad and reject the alternative hypothesis which there are no statistically significant differences between the decision relationship SPV and social factors and therefore can be written regression equation between social factors (x2) and the decision SPV (y) as follows

$$Y=3.265+0.058X_2$$

**The third hypothesis: the relationship between organizational factors and purchasing decision.****H0:** There is no significant relationship between organizational factors and purchasing decision.**H1:** There are significant differences between organizational factors and decision-purchasing relationship**Table 4:-** The results of measuring the relationship between organizational factors and purchasing decision

Independent variables The organizational factors	The correlation coefficient	The regression line	The variable décision-purchasing			
			R	R2	F	sig
	-0.077	3.935	0.097	0.009	12.277	0.503

Source: the preparation of researchers and the adoption of the spss19.

Comment: The above table shows that the bilateral link value (R) between social factors and decision SPV was (0.097), an increase of (9.7%) is a very weak link, as was the coefficient of determination (R<sup>2</sup> = 0.009) that is (0.9%) of change SPV in the decision due to the change in regulatory factors. Note that the significance level (Sig0.503) is greater than the level of significance (0.05) This shows that there is no statistically significant differences between the purchasing decision and organizational factors differences, we accept the hypothesis of bad and reject any alternative hypothesis there is no statistically significant relationship between purchasing decision and organizational factors and thus can be written regression equation between organizational factors (x<sub>3</sub>) and the decision SPV (y) as follows:

$$Y=3.935-0.077X_3$$

**The fourth hypothesis: the relationship between the informational factors on the buying decision.****H0:** There is no statistically significant relationship between informational factors on purchasing decision.**H1:** no statistically significant relationship between informational factors on purchasing decision.**Table 5:-** Results of measuring the relationship between the informational factors on the buying decision

Independent variables The informational factors	The correlation coefficient	The regression line	The variable décision-purchasing			
			R	R2	F	sig
	0.093	3.354	0.096	0.009	4.346	0.496

Source: the preparation of researchers and the adoption of the spss19.

The table above shows that the binary value of the link (R) between the informational factors and the decision factors were SPV (0.096), an increase of 9.6% is a very weak link, as was the coefficient of determination (R<sup>2</sup> = 0.009) ie (0.09%) the change in the purchasing decision is due to the change in informational factors. Note that the significance level (Sig0.496) is greater than the level of significance (0.05) This shows that there is no statistically significant differences between the decision of purchasing and informational factors, I accept the hypothesis of bad and reject any alternative hypothesis there is no statistically significant relationship between purchasing decision factors and the informational factors (x<sub>4</sub>) and the decision SPV (y) as follows and thus can be written regression equation between informational factors :

$$Y=3.354+0.093X_4$$

**Hypothesis Basic key:-**

There is a positive correlation significant differences between the image corporate and the purchasing decision.

**H0:** There is no statistically significant relationship between the image corporate and the purchasing decision**H1:** There are significant differences between the image corporate and the purchasing decision**Table 6:-** Results of measuring the relationship between the image corporate and the purchasing decision

Independent variables corporate image	The correlation coefficient	The regression line	The variable décision-purchasing			
			R	R2	F	sig
	0.058	3.479	0.041	0.002	9.719	9.719

Source: the preparation of researchers and the adoption of the spss19.

Comment: The above table shows that the bilateral link value (R) between the corporate image and purchasing decision was (0.041), an increase of 4.1% is a very weak link, as was the coefficient of determination ( $R^2 = 0.002$ ) that is (0.2%) of change purchasing decision in the decision due to the change in the corporate image. Note that the significance level (Sig0.769) is greater than the level of significance (0.05) This shows that there is no significant differences between the purchasing decision and corporate image, we accept the hypothesis of bad and reject any alternative hypothesis there is no statistically significant relationship between purchasing decision and corporate image and thus can be written regression equation between the corporate image (x) and the purchasing decision (y) as follows

$$Y = 3.479 + 0.058X$$

### Conclusion:-

Through this analytical study and exploit the field experiences and after friction with company customer "Djezzy" can say that "Djezzy" corporate no longer has a good standing among customers for the time being through the current conditions that led to the decline in its image in the minds of consumers (béchar province) and that influenced their Purchase Decision and through our study based on the outputs of spss show us that a weak correlation coefficient, which is estimated at 0.041  $R =$ , which assured us that there is no impact to the corporate image on the decision of purchasing the final consumer and explain to us by introducing a questionnaire that promotional offers big role in improving the corporate image in the minds of consumers.

Health the hypothesis that the image on the Enterprise is the main and influential only motivation to make the consumer chooses a commodity without the other, the picture is never the sole motive but there are other motives affect consumer behavior...

### LEVEL OF USABILITY OF THE MULTI FACTOR AUTHENTICATION PROCESS OF ONLINE BANKING: A USER EXPERIENCE STUDY.

**Gamage M. P.**

#### Abstract

Most banks now offer their services online, which is known as online banking. Bank activities involve very sensitive information. Due to the high level of fraud banks have recently introduced a new authentication method which requires the users to provide more than one factor to authenticate themselves which is known as Multi Factor Authentication (MFA). But means of improving the security might compromise the level of usability of the website. Being a country with less IT literate people the researcher assumes that introduction of MFA might have an impact on the Sri Lankan online users. This paper presents an empirical study on the level of usability of MFA mechanisms used by Sri Lankan banks at present as experienced by the users. According to the results it was identified the number of online banking users are less in Sri Lanka, but they are accepting the MFA methods as usable.

*Copy Right, IJAR, 2017., All rights reserved.*

#### Introduction:-

Most of the businesses have their own websites which provides their customers the ease of performing transactions from wherever they are. But when developing the website it is essential to check that the website furnishes to the purpose. Website users prefer websites that are convenient to use and in overall which provides them an appealing online experience. "On the Web, usability is a necessary condition for survival" [1]. "If a website is difficult to use, people leave. There's no such thing as a user reading a website manual or otherwise spending much time trying to figure out an interface. There are plenty of other websites available; leaving is the first line of defense when users encounter a difficulty" [1].

"Based on the principles of Human Computer Interaction (HCI), web usability has become a recognized success factor for all e-business, including online banking" [2]. When considering online banking websites to enhance user experience further and to attract more customers it is necessary to understand the level of usability of the bank website. Past research confirms that website navigation issues, security fears and ambiguity in content are the major concerns that user face [2-6]. According to the study it demonstrates that ultimate result of a bad user experience is 50% of customers registered for online banking disregarding the use of the website [2]. Also since Bank websites deal with sensitive information like username, passwords, credit card details, account information; they are one of those that make security a priority. When the banks try to improve the authentication process through more secure mechanisms it definitely has a negative impact on the level of usability. Therefore website usability and security can be claimed as the most vibrant issues in online banking.

Address:-Sri Lanka Institute of Information Technology (SLIIT), BoC Merchant Tower,  
Colombo 03, Sri Lanka.

Users are allowed to access their personal information through the website after an authentication process. So the security of the authentication process which serves as the entry point for the customer is extremely important. Banks have introduced Multi Factor Authentication (MFA) method in order to improve the security reassuring more online customers. MFA aims to improve the traditional password-based authentication method known as Single Factor Authentication (SFA) by demanding users to provide a supplementary authentication factor such as a separate transaction password or a verification code. When banks try to enhance security mechanisms it undeniably affect the level of usability of the website. So there is a tradeoff between the level of usability and security of a bank website.

Recently banks in Sri Lanka also started implementing this MFA method. Sri Lanka is a country with less Information Technology (IT) literate people. So this study aims to find out level of usability of the introduced MFA methods as perceived by the users and to analyze if it has greatly affected the usability than the SFA for the current online banking users.

The main objectives of the study are;

- Identify MFA methods introduced in online banking
- Find the level of usability of the available MFA methods
- Identify if the introduction of MFA has greatly affected the usability than the SFA

### **Literature Review:-**

Online banking facility provides as an essential gateway for the banking customers to interact with their bank to get the services they need. In order to make the online experience a better one the banks should consider the level of usability of their websites. Also banks try to incorporate advanced security mechanisms to their online banking websites in order to reassure the customer to use the online facility without any fear of fraud. So the security and usability of online banking are a key concern. At present there are many researches which discuss the usability issues of bank websites [7-10].

The major problem with the definition of usability is that it is quite difficult to precisely explain the term. The most common explanation of usability is simplified to ease-of-use [1], [8]. In spite of many other definitions on usability, Jakob Nielsen's [1], [11] definition on web usability is extensively used by usability experts. Jakob Nielsen was named as "the reigning guru of web usability" by Fortune and as "perhaps the best-known design and usability guru on the Internet" by Financial Times [12]. Usability is defined by five eminence components by him as;

- Learnability: "How easy is it for users to accomplish basic tasks the first time they encounter the design?" [1].
- Efficiency: "Once users have learned the design, how quickly can they perform tasks?" [1].
- Memorability: "When users return to the design after a period of not using it, how easily can they reestablish proficiency?" [1].
- Errors: "How many errors do users make, how severe are these errors, and how easily can they recover from the errors?" [1].
- Satisfaction: "How pleasant is it to use the design?" [1].

The main gateway provided for security is the authentication process. So the banks try to improve their online banking authentication mechanisms more and more. But this definitely will have an impact on the level of usability of the online banking website. At present there are different authenticating mechanisms available [13] [14].

Traditional authentication or SFA uses one factor for user authentication on a website. Often it is a knowledge-based factor, such as a password which is set during the registration process. Ma and Feng have appraised the usability of three alternative authentication methods that are available; the text passwords, mnemonic passwords and graphical passwords [15]. According to the results presented text passwords and graphical passwords proved to be equally memorable [15] and that mnemonic passwords had a higher failure rate [15]. Also they identified that the use of graphical passwords consumed more time when compared to other types [15]. The results gathered through a questionnaire and in-depth interviews with 86 contributors were used by Nilsson to compare authentication using 'security box' method (one time password) and 'fixed passwords' method (password is preset) [16]. The results exposed that security boxes are perceived as more dependable by the users [16]. L. Gorman in his study compares passwords, security tokens, and biometrics and their possible combinations for MFA [17]. Different authenticating mechanisms in use as identified by him are;

- Knowledge-Based (what you know) - characterized by secrecy [17].
- Object-Based (what you have) – characterized by physical possession [17].
- ID-Based (“who you are”) – characterized by uniqueness [17].

In the study done by Cristofaro et al. they conducted an online survey with 219 Mechanical Turk users, to measure the usability of diverse MFA methods [18]. The methods considered in the study are one-time codes generated by security tokens, one-time PINs received via SMS or email, and dedicated smartphone apps [18]. They recorded contexts and motivations, and also considered their influence on usability of different MFA methods. The study acknowledged that the existing differences among the usage of MFA methods be subject to individual characteristics of people, more than the actual technologies or contexts of use. [18]. Also the study result shows that users perceived MFA as usable [18]. According to the study done by Gunson et al. MFA methods were perceived as less usable but more secure than SFA methods [19].

All above studies discuss about different authentication methods and their usability of websites in general. This study focuses about the application of MFA methods only in the context of online banking.

The experiment conducted by Weir et al. used 50 e-banking customers to compare the security and usability of MFA methods when using token devices [20]. Through the research it was identified that participants felt card-activated tokens and the push button token to be usable and secure but the chip-and-PIN method to be less usable [20]. According to M. Mannanthe and P. C. Oorschot the guaranteed online transaction security applies only for the users who fulfill certain security requirements stated by the banks [21]. After examining some of the requirements set by major Canadian banks they evaluated on security aspects using 123 technically advanced users from a university environment. The results strongly supported their view about the gap between expectations of the bank and the actions of user related to security of online banking. [21]

When considering the importance to improve the security methods and at the same time the importance of not complicating the usability of the online experience this research tries to find the effect of applying MFA methods for Sri Lankan online banking users. The assumptions of the researcher are;

- MFA is still not popular in Sri Lankan banks
- MFA will be perceived as less usable
- SFA and MFA will have a big difference on the level of usability

### **Methodology:-**

The sample considered for the survey are IT companies/institutes in Sri Lanka under the assumption that they would comprise people open to online activities such as online banking. Questionnaire Technique is used to collect data about the level of usability of the authenticating process, as well as to gather important feedback from online banking users. The questionnaire used for the analysis is created as an online survey questionnaire using an online questionnaire tool, and is emailed to the selected sample.

The first section of the questionnaire covers general data about respondents such as their gender, age, name of the bank and type of authenticating method used by the bank (SFA, MFA). To get an idea about the level of IT literacy factors like the length of time using computers, length of time using online banking services are counted. The second section, aims to collect the level of usability of the authenticating process. As the usability measurement technique the usability definition proposed by Jakob Nielsen is used. Accordingly the five usability characteristics considered are learnability, efficiency, memorability, errors and satisfaction [1]. A set of questions targets to address one of the characteristics (independent variables). User can rate a given question on a five-point Likert scale from 1 (strongly agree) to 5 (strongly disagree). The results obtained from these are used to get a measure on the level of usability (which is the dependent variable). Since online banking usually makes the user authenticate himself during different activities such as logging in, doing a money transfer, paying a bill, etc. for the study only one of the activities is considered. So the authenticating process used when ‘performing a money transfer to a third party account’ only is considered. The third section includes open-ended questions to capture additional particulars related to user authentication process.

## Results and Discussion:-

According to the results obtained the number of online banking users in Sri Lanka is identified as only 39%. So it is identified that in Sri Lanka online banking users within the IT industry is still very small, proving the assumption of the researcher that IT job/study related people are very much exposed to online transactions through internet otherwise.

When considering the age 82% which is a significant percentage are included into the 20 – 39 years age category. It can be assumed that this bias of age factor is introduced because in Sri Lanka IT literacy is very less among older generation.

98% of the respondents who participated had used computers for more than five years and 70% had been using online banking for more than three years. This provides evidence that the users using the online facilities are the ones with a high level of IT literacy and skills.

According to the results it can be seen that majority of the users are clustered around only 5 banks for the online service. So for the study the authentication methods of those five banks are considered. The banks authentication methods when doing a money transfer to a third party account are limited to;

- Logging password only (40% banks)
- Logging password + Transaction password (which is pre set) (20% banks)
- Logging password + SMS/email based one-time verification code (20% banks)
- Logging password + token based code (20% banks)

Other authentication methods like graphical passwords and biometric identification are not used in banks in Sri Lanka. It can be due to reasons like images taking more time to load and the high cost involved in implementing biometric authentication.

According to the results during a transaction through online banking 60% of the banks use MFA and only 40% of the banks are using SFA. So it is identified that majority of banks in Sri Lanka have already applied MFA. When doing the analysis, level of usability for SFA and MFA is independently considered.

When considering the efficiency (second usability characteristic) in SFA, 78% users agreed that they can easily authenticate themselves without any trouble. But some have issues like confusion among their own passwords they have to use for different online systems, which made them successful only after the second attempt. According to the study outcomes out of the users who used MFA only 64% has agreed that they often log in without issues. This result indicates that some difficulty is there with MFA. From the open ended questions it is identified that the reason for above is mainly due to factors such as confusion between different passwords they had to use (separate logging password and transaction password), time taken to access their phone/mail to find out the verification code and forgetting to have the security code generator token.

According to the preliminary analysis of the data, majority of (81%) responded positively about the usability (dependent variable) of MFA while only 13% responded negatively. This result proves that users accept the MFA method. When considering the results of users who use banks with SFA method majority of users (89%) who use SFA responded positively, while only 8% responded negatively. When comparing the percentage of positive respondents for SFA and MFA the results shows that there is no significant difference between the two methods as perceived by the users.

## Conclusion:-

This is an empirical study about the level of usability of the MFA mechanisms applied in online banking in the context of Sri Lankan banks. The study considered 95 online banking users in Sri Lanka who have long-term experience with the use of internet. The results show that still not all banks have applied MFA even with the huge rate of online fraud that happens. Even though the researcher thought MFA might have a big impact on the level of usability of the website it is proved otherwise. Users perceive MFA as usable and have accepted the use of the new method. Since there is no big difference between the percentage of positive respondents of MFA and SFA it can be recommended that banks should use MFA since it is more secure than the SFA. Due to the limited number of online banking users for the study only 95 user responses could be explored. In future can validate the results further by

enhancing the sample size and also by conducting a detailed analysis to check that the results obtained are truly related to the usability factor and not biased on the specific bank they used.

### **Acknowledgement:-**

I present my earnest thanks to my family members for the reinforcement provided throughout the study. Also I would like to add my gratitude for all participants of the survey questionnaire for spending their valuable time in helping my research.

#### Abstract

In modern days there are Allopathic medicines are most widely used for general treatments. Herbal medicine are major remedy of Traditional and Ayurvedic medicine systems. Herbal or Ayurvedic medicine are less toxic or side effects. Medicinal plants are playing an important role in the drug discovery and development of new molecules. There are a number of herbs which are used from ancient time Aruna (*Aconitum heterophyllum*) is important herbs because in this medicinal plant there are a lot off pharmacological activity like Anti-inflammatory, hepatoprotective , Digestive activity. But some species of Aconitum plant is poisons in nature. This review should be of interest to readers in the areas of Pharmacognostical and Pharmacological activity and indication of *Aconitum heterophyllum*. and *Aconitum Heterophyllum* is one of the herbs which are used for its medicinal properties. *Aconitum* species belongs to the family Ranunculaceae .it's about 300 species are found in all over the world but in India, only 24 species are found in the Himalayas sub-alpine and alpine region, suits required about 2400-3600 m altitude above sea level. Seed germination micro propagation method is used for the cultivation of *Aconitum plants*. *Aconitum heterophyllum* has a lot of pharmacological use like in the treatment of urinary infection, diarrhea, as an expectorant, Anti-inflammatory, hepatoprotective activity. It is a good source of diterpene alkaloids, flavonoids. There are some indication occurs in Aconitum heterophyllum roots part: Nausea, Bleeding piles, Periodic fever, Dyspepsia, Diarrhea, Dryness of mouth. When taken in larger doses may cause constipation

#### Introduction:-

*Aconitum heterophyllum* is a herbal medicinal plant .Aconitum species were used as the major component in the Indian Ayurvedic formulation as well as Chinese and Bhutanese herbal medicines. This species content many phytoconstituents having a lot of pharmacological activities like Anti-inflammatory, hepatoprotective activity, Digestive Property. It is known as Asian Monkshood.<sup>1,2,3</sup> There are many local or traditional name in India it is also known Indian atees ,Atis root (English) Ativisha, Shuklakanda, Aruna (Sanskrit) Vishada (Urdu) Atees (Hindi) Atis and Atvika (Bengali) Ataish (Telugu) Ati Vasa (Gujarati) Ativakhani (Marathi) Ati vish (Kannada) Ati-Vishsa (Malayalam) Ati-Vidayam Atis (Panjabi).<sup>2,4</sup> *Aconitum heterophyllum* is belonging to family of

**Corresponding Author:- Debashish Paramanick.**

Ranunculaceae plantae Kingdom 'Magnoliophyta' division, and Aconitum genus.<sup>3,4</sup> There are Around 300 species of Aconitum is found in all over the world in which only 24 species found in India. It consists of dried, tuberous roots of *Aconitum heterophyllum* Wall. ex. Royal, a perennial herb, native of western Himalayas and found in Kashmir, Uttarakhand Sikkim and Nepal at altitude between 2,500-4,000 m.<sup>5,6</sup> Its mostly species are highly toxic in nature Its several species also known as devil's helmet, Queen of all Poisons, or blue rocket.<sup>4</sup> In ancient time it were used for hunting spiko so it must need to deal with carefully.<sup>7,8</sup>

#### Development and Anthology:-

*Aconitum heterophyllum* is mostly found in sub-alpine and alpine region of the Himalayas. *Aconitum heterophyllum* cultivates in moist soil. Sandy loam and acidic soil is best for seed germination, survival, better growth and yield. In general, having sandy textured soil with rich organic matter is recommended for the cultivation. The cultivation of *Aconitum heterophyllum* suits required about 2400-3600 m altitude above sea level.<sup>3,6,7</sup> the rain fall required for the cultivation of natural and transplant populations of *Aconitum heterophyllum* is 664.2-1485.7 mm. *Aconitum heterophyllum* plants, grown from seeds and tuberous roots. Seeds Collect and germinated only in the beginning of the spring March-April.<sup>8,9</sup> generally produce one to two daughter tubers by the end of the growing season. Daughter tubers collected during autumn after the aerial shoots senesces and replanted in the spring. It produced leafy shoots in the first year of the growth , cultivated plants produced flowers in the second year of growth There are about 50-60 percent of seeds cooled for 30-45 days germinated and produced seedling. Seedlings raised from seeds after 120 days highest survival rate, nearly 45 and 29 percent under laboratory and field condition respectively The seedling remained in vegetative phase for at least 2 years It reproduce sexually in the 3rd year. Generally produce one to two daughter tubers by the end of the growing season. Daughter tubers collected during autumn after the aerial shoots senesces and replanted in the spring. B - *Aconitum heterophyllum*

**Fig. 1:-** Aconitum heterophyllum Plant

**Fig.3:-** Dried Root of Aconitum heterophyllum

**Fig 4:-** Diagrammatic histological of transverse section<sup>19</sup>

### Morphology of Aconitum heterophyllum:-

Roots of *Aconitum heterophyllum* is paired whitish grey in colour 2.0-7.5 cm long, 0.4-1.6 cm or more thick at its upper extremity decreasing in thickness towards tapering end.<sup>6</sup> Stems of aconitum heterophyllum are simple and branched 15-20 cm high green in colour. It is a tree which has flowers from august to September. The leaves of *Aconitum heterophyllum* heteromorphous in nature dark greenish in color. The upper parts of the leaves are amplexicaul and lowest parts of leaves are long petioles, It's have a spiral (alternate) arrangements.<sup>6, 1</sup>

### Infinitesimal Characters:-

Transverse section of mature root shows, single layered epidermis consisting of light brown tabular cells rupturing on formation of cork It consists of 5-10 rows of tangentially elongated, thin-walled cells, cork cambium single layered consisting of tangentially elongated, thin-walled cells, cortex much wider consisting of tangentially elongated or rounded, thin-walled parenchymatous cells with intercellular spaces, cells.<sup>6</sup> The structure of the root tubers of *A. heterophyllum* irregular and different from other species of aconitum the tubers have 4-6 "vascular stands". It is identical into pith and cortex these strands occur by the splitting of one vascular stands<sup>7</sup>.

**Table 1:-** Environmental growth environment for natural and transplant Populations of Aconitum heterophyllum<sup>7</sup>

Environmental characteristic	Natural	Transplanted
Altitude (m)	2450	1520
Soil texture	Silty loam	Loam
Soil pH	5.6	7.2
Soil organic carbon (%)	2.2-3.5	2.4-3.3
Soil bulk density (g/m <sup>3</sup> )	1.43	1.75
Annual total rainfall (mm)	1485.7	664.2
Minimum temp. (C)	-19.8	-11.8
Maximum temp. (C)	28.4	36.6

**Phytochemical Analysis** The extracts of *Aconitum heterophyllum* of three different samples Leaf, Root, and Stem were tested for their phytochemical contents were found Alkaloids, Carbohydrate, Protrine & Amino acid, Saponins, Glycosides, Quinones, Flavonoids, Terpenoids by the different type of test.<sup>7</sup>

### Aconitum heterophyllum Leaves:-

The methanolic extracts of the Aconitum heterophyllum leaf showed the presence of alkaloids, carbohydrates, protein & amino acid, saponins, phenolic compounds and tannins, cardiac glycosides, quinones. Whereas, flavonoids, steroids, glycosides, and terpenoids were found absent in aconitum heterophyllum leaves.<sup>10</sup>

**Aconitum heterophyllum Roots:-**

The phytochemical analysis of the *Aconitum heterophyllum* root extracts showed the presence of alkaloids, carbohydrates, protein & amino acid, saponins, phenolic compounds and tannins, cardiac glycosides, quinones, flavonoids, steroids, terpenoids. Glycosides were not present in *Aconitum heterophyllum* roots.<sup>10</sup>

**Table 2:-** Qualitative phytochemical screening of *Aconitum heterophyllum* Extract (+Positive, - Negative)<sup>[21]</sup>

S. No.	Chemical Constituent	Phytochemical test	Leaf	Root	Stem
1	Alkaloids	<b>Mayer's test</b>	+	+	+
		<b>Wagner's test</b>	+	+	+
2	Carbohydrates	<b>Fehling, test</b>	+	+	+
3	Protein & Amino acid	<b>Ninhydrin test</b>	+	+	+
4	Saponins	<b>Salkowask'y test</b>	+	+	+
5	Glycosides	<b>Bromine water test</b>	+	+	+
		<b>Cardiac Glycosides</b>	+	+	+
6	Quinones		-	+	+
7	Flavonoids		+	+	+
8	Terpenoids		-	+	+

**Aconitum heterophyllum stem:-**

The phytochemical analysis of the *Aconitum heterophyllum* stem extracts showed the presence of alkaloids, carbohydrates, protein & amino acid, saponins, flavonoids, steroids, cardiac glycosides, terpenoids quinones in methanol extract. Absence of phenolic compounds and tannins, glycosides was observed in the *Aconitum heterophyllum* stem.<sup>10</sup>

About 54 species of *Aconitum* have been chemically investigated these species are the rich sources of diterpene alkaloids and flavonoids as well as chemotaxonomic markers.<sup>11</sup>The diterpenoid alkaloids are divided in to two different type according to their substituents which affect the chemical and pharmacological properties of these alkaloids it have highly oxidative property C19-skeleton and C20-skeleton.<sup>12,13</sup> It Contain Atidine, 11, 13:11, 16-Diepoxy-16, 17-dihydro-11,12-secohetisan-2-ol, Anthorine Atisenol, 6-Benzoylheteratisine.<sup>14</sup> *Aconitum heterophyllum* also content different type of aconitine N-Diethyl-N-formylly aconitine,O-Methyl aconitine,Methyl-N-succinoyl anthranilate.<sup>14</sup>

**TLC analysis** In a qualitative assay, the alkaloid extracts of *Aconitum heterophyllum* turned milky color by the addition reaction with Mayer's reagent which confirmed the presence of alkaloid in the samples.The antibacterial activity of the alkaloid extract from the root of *A. heterophyllum* as well as eluted TLC bands was tested against different bacteria with certain human pathogens The crude alkaloid extract displayed moderate to strong level of antibacterial activity against *S. aureus*, *B. bronchiseptica*, *B. subtilis*, *P. putida* and *X. campestris* at higher concentration of 100 µg/ disc.<sup>15</sup>

**HPLC Analysis:-**

For the estimation of bioactive compound of *Aconitum heterophyllum* using a simple reversed phase HPLC-UV-DAD method. Peak heights were linear with relation to aconitine concentration with correlation coefficient >0.999. This assay is rapid, and highly reproducible and also found though a number of HPLC methods are used but the following assay system, comprising an acidic mobile phase, was found most suitable for the typical chromatogram development By optimize the extraction, separation and analytical conditions, a reliable and accurate high-performance liquid chromatography (HPLC) method coupled with photodiode array detector (DAD) was developed for simultaneous quantitative determination of six *Aconitum* alkaloids, i.e., aconitine, mesaconitine, hyaconitine, benzoylaconine, benzoylmesaconine, and benzoylhyaconine.<sup>16,17</sup>

### Chemical Structure of Some phytochemicals

#### Pharmacological Use:-

*Aconitum heterophyllum* has been used from centaury for the treatment and cure of many diseases externally and internally. Its juice of roots is used as an expectorant along with milk. Leaves and seeds are used for the treatment of tonsillitis. *Aconitum heterophyllum* seeds and roots are helpful in making a strong digestive system. Seeds have also diuretic properties which increase the intensity of urine and alleviate the burning sensation in the urine tract.<sup>18,19</sup>

**Digestive System-** In a diarrhea condition, fine powder of root with dry ginger, Beel fruits, (Bellpetra in India) Nutmeg (jaiphal in India) and (Atvika in India) mixed together in equal quantity and take two pinches with water three times a day.<sup>18</sup>

**Respiratory System-** The juice of *aconitum heterophyllum* root along with milk is given as an expectorant. Root powder is given orally in cervical lymphadenitis condition of patients.<sup>[1]</sup>

**Urinary System-** The seeds and roots of *Aconitum heterophyllum* have diuretic property, increase urine volume and reduce urinary tract burning.<sup>[1]</sup>

**Reproductive System-** The root of *Aconitum heterophyllum* is used for spermatorrhoea, and its root is also used in burning of vagina.<sup>[1]</sup>

**Hepatoprotective Activity-** *Aconitum heterophyllum* roots have hepatoprotective activity. This activity is due to the presence of antioxidants and others.<sup>17</sup> The *Aconitum* are also used as antipyretic and analgesic in the far western Nepal. Modern pharmacological study finds Caffeic acid of *A. koreanum* is anti-oxidative and anti-inflammatory. *Aconitum* is mixed with 2 spoon of ghee and taken two times in a day for fever and jaundice until recovery.<sup>24</sup> The *Aconitum* are also used as antipyretic and analgesic in the far western Nepal. Modern pharmacological study finds Caffeic acid of *A. koreanum* is anti-oxidative and anti-inflammatory. *Aconitum* is mixed with 2 spoon of ghee and taken two times in a day for fever and jaundice until recovery.<sup>20</sup> The root powder of *Ativihsa* with honey is prescribed for cough irritations and bronchitis. It is an anti-helminthic and in action it is effective against guinea-worms. It is also effective in blood pressure.<sup>21</sup> *Aconitum heterophyllum* roots have alexipharmic, anodyne, anti-atrabilious, anti-flatulent, anti-periodic, anti-phlegmatic, carminative property.<sup>22,18</sup>

#### Suggestion:-

There are some indications that occur in *Aconitum heterophyllum* roots part: Nausea, Bleeding piles, Periodic fever, Dyspepsia, Diarrhea, Dryness of mouth. When taken in larger doses may cause constipation.<sup>18</sup> Its some species are most poisons in nature.<sup>1</sup> In ancient time it is used as spike hunting so it must be handled with care.<sup>23,24</sup>

**Conclusion:-**

In the present review we have made an attempt to assemble the all information on *Aconitum heterophyllum* such as botanical, Photochemical, pharmacological, toxicological. *Aconitum heterophyllum* is a medicinal herb which is used in Indian medicine system, ayurvedic system. It is a important ingredient of Krsnadi Churna in Ayurvedic formulation this formulation are used for the baby sickness where as they are most sensitive so it must need to proof toxicity of this plant there are so many research are going on this plant till now no any toxicity related data available. It has many pharmacological property such as Alexipharmic, Anodyne, Anti-atrabilius, Anti-flatulent, Anti-periodic, Anti-phlegmatic, Carminative property, anti-oxidative and anti-inflammatory, expectorant but most species of aconitum are extremely toxic in nature.for the presence of some phytoconstituents. *Aconitum heterophyllum* is the intoxicating source of phytochemical constituents that are responsible for its pharmacological activities. This plant own medicinal value that was proved from the history of ancient-formulations.

**Conflict of interest:-**

The authors declare that there are no conflict of interest.

**Acknowledgment:-**

I take this privilege and pleasure to acknowledge the contributions of many individuals who have been inspirational and supportive throughout my review undertaken and endowed me with the most precious knowledge to see success in my endeavor. My review bears the imprint of all those people.

 review of literature

#### Abstract

A 64 year-old Saudi gentleman, originally from Gazan (southwestern region) of Saudi Arabia presented with history of decrease vision in the right eye for 25 years. Patient gave history of Rift Valley fever (RVF) 25 years ago, that nictitate his admission to the hospital for one week. He described right eye vision worsening after suffering from fever. Fundus of the right eye showed hypertrophic black chorioretinal adjacent to an atrophic scar in the macula, and the left eye showed defuse retinal pigment epithelial (RPE) mottling.

This case report aims to present the sequelae of retinitis secondary to RVF with brief review of literature of ophthalmic complications of RVF. Ocular involvements in RVF are found in up to 20 % of the cases. It may include retinal hemorrhages, anterior uveitis, vitreous reactions and macular edema and retinitis.
