Reviewer's Comment for Publication:

This case report effectively highlights the rarity and complexity of heterotopic pregnancy, emphasizing the importance of early diagnosis and prompt surgical intervention. The study reinforces the role of ultrasound as the primary diagnostic tool and demonstrates that salpingectomy is often the preferred treatment when an ectopic pregnancy is involved. While the report is well-structured and informative, including alternative management strategies and long-term patient outcomes would enhance its clinical significance.

Reviewer's Comment / Report

Strengths:

- Well-Documented Case Study:** The paper provides a clear clinical presentation, diagnostic process, treatment plan, and patient outcome, making it a valuable resource for medical practitioners.
- Thorough Literature Review:** The authors reference multiple case studies and research papers to support their findings and provide a broader perspective on heterotopic pregnancies.
- Emphasis on Diagnosis and Treatment:** The paper highlights the challenges in diagnosing heterotopic pregnancy and emphasizes the importance of ultrasound and surgical intervention in management.
- Clarity and Structure:** The study is logically structured, following a standard medical case report format, which enhances readability and comprehension.

Areas for Improvement:

- Limited Discussion on Conservative Management:** While surgery was necessary in this case, the paper could discuss situations where medical or conservative management might be considered.
- Lack of Long-Term Follow-Up:** The report would benefit from additional information on the patient's postpartum condition and any potential complications.
- Comparative Outcomes:** A discussion comparing different surgical approaches (salpingectomy vs. salpingotomy) and their long-term implications could add more depth to the study.
