### **Reviewer's Comment / Report**

The study presents a well-structured and detailed comparison of total obstetric hysterectomy (TOH) and supracervical obstetric hysterectomy (SCOH) in cases of placenta previa with placenta accreta spectrum (PAS). The research is significant given the increasing incidence of PAS and the associated maternal morbidity and mortality.

The abstract effectively summarizes the study's background, objectives, methodology, key findings, and conclusions. The numerical data on blood loss, operative duration, and postoperative complications provide valuable insights into the comparative outcomes of TOH and SCOH. The inclusion of statistical values enhances the reliability of the study.

The introduction lays a strong foundation for the research by explaining PAS, its risk factors, and its increasing prevalence. The discussion highlights the importance of surgical decision-making and the impact of internal iliac artery ligation on maternal outcomes.

Overall, the study contributes valuable knowledge to obstetric surgical management, and the structured presentation ensures clarity and coherence throughout the document.
