Reviewer's Comment / Report

General Assessment:

The article presents a well-structured and clinically relevant discussion on the interdisciplinary approach of Prosthodontics and Orthodontics in managing cases with supraerupted teeth. The abstract effectively summarizes the problem, the necessity of a combined approach, and the expected outcome. The introduction is well-written, highlighting the clinical challenges associated with delayed prosthetic rehabilitation and the importance of an interdisciplinary solution.

Clarity and Organization:

The content flows logically from the problem statement to the proposed interdisciplinary solution. The explanation of the consequences of missing teeth, such as supraeruption, drifting,

REVIEWER'S REPORT

and occlusal interferences, is clear and well-supported by literature references. The integration of supporting studies (Petridis et al. and Rosenstiel et al.) strengthens the argument.

Relevance and Contribution:

This case report emphasizes the value of a multidisciplinary treatment approach in modern dentistry, aligning with contemporary treatment philosophies. The discussion highlights practical implications, making it relevant for both prosthodontists and orthodontists dealing with complex cases involving supraerupted or malpositioned teeth.

Scientific and Clinical Rigor:

The article is well-referenced, demonstrating a strong foundation in existing literature. The discussion is grounded in clinical evidence and aligns with standard treatment protocols in prosthetic rehabilitation. The integration of orthodontic techniques before prosthetic restoration is appropriately justified, emphasizing both functional and esthetic considerations.

Conclusion:

The case report effectively underscores the importance of interdisciplinary collaboration in dentistry. The introduction and abstract provide a compelling rationale for combining orthodontic and prosthodontic approaches in managing cases of supraeruption, ensuring comprehensive patient care. The article is well-organized, clinically relevant, and contributes to the growing evidence supporting multidisciplinary dental treatment.
