Reviewer's Comment for Publication.

Abstract:

The abstract clearly summarizes the clinical case and outlines the objective to manage gingival recession in a tooth with internal root resorption using a coronally advanced flap (CAF) combined with connective tissue graft (CTG). It briefly discusses the endodontic intervention (MTA filling), the periodontal surgical technique, and the follow-up outcome.

Introduction:

The introduction explains the clinical problem of gingival recession and its esthetic and functional impact. The introduction is focused and supports the relevance of presenting this rare and complex case.

Data and Methodology:

The methodology is thoroughly described, with step-by-step details on diagnosis, root canal treatment using MTA, and the surgical technique.

REVIEWER'S REPORT

Results and Discussion:

The outcomes are presented clearly, showing full root coverage, esthetic improvement, and tissue health at follow-ups. The discussion supports the clinical success with references to published studies that validate the CAF + CTG approach.

Relevance and Contribution:

The case contributes to clinical knowledge by demonstrating successful periodontal plastic surgery in a tooth with severe internal root resorption—an uncommon and complex situation.

Clarity and Organization:

The paper is easy to understand. Structured in a clear and logical order.

Overall Assessment:

This is a well-documented clinical case showing the successful application of a coronally advanced flap with connective tissue graft in a complex case involving internal root resorption.. The article is informative, well-written, and clinically relevant. It makes a valuable contribution to the literature on periodontal regeneration and interdisciplinary dental care.
