### Reviewer's Comment for Publication.

#### Abstract:

The abstract gives a quick overview of the case. It explains what type of rare tumor was found and how it was diagnosed using lab tests. It clearly points out the connection to HPV.

#### Introduction:

The beginning of the article tells us about how rare this type of cancer is. It also explains why it's important to study it. This part sets the stage well for what the case report is about.

#### Material and Methods:

This section talks about how the patient was diagnosed—starting with symptoms, MRI scan, biopsy results, and lab tests. The doctors used special tests (immunohistochemistry) to identify the types of cancer cells. Everything is described clearly and step by step.

#### Result and Discussion:

The patient had two types of cancer together—one related to HPV and one rare type called mesonephric carcinosarcoma. Special lab tests showed which markers were present in each part. The authors also talk about how this mix of cancer types may support the idea that one kind of cancer can turn into another. They compare their findings with other reports from around the world.

#### Relevance and Contribution:

This is an important report because such cases are very rare. It helps doctors understand how to use lab tests to make a correct diagnosis and shows how HPV might be involved in causing these cancers.

#### Clarity and Writing:

## **REVIEWER'S REPORT**

The paper is mostly clear and well-organized. A few small improvements in grammar, reference formatting, and picture arrangement could make it even better.

Recommendation:

Manuscript accepted for the publication.
