Reviewer's Comment for Publication:

The study addresses an important clinical issue and contributes valuable evidence on the impact of a structured nursing intervention model in improving the clinical health status and functional recovery of burn patients. The quasi-experimental design is appropriate, and the application of Orem's Self-Care Deficit Theory provides a solid theoretical framework. The data collection tools are well-chosen, and the statistical analyses are suitably applied. However, minor revisions are suggested—mainly to refine some grammatical expressions, shorten lengthy paragraphs in the Introduction and Methodology, and ensure reference consistency (years and citation style). The results are clearly presented, and the conclusions align with the objectives. Overall, this is a well-structured, original, and clinically relevant study suitable for publication after minor revision.
