Article overview:

Breast cancer is a significant health concern globally with varying incidence and mortality rates across different countries and regions. Sociodemographic indices and cultural factors play a crucial role in determining breast cancer risk. This review aims to summarize the current evidence on breast cancer risk factors in countries with different SDI and cultural backgrounds.

Strengths:

1. Clear methodology mentioning literature search engines, data extraction and quality assessment tool.
2. Detailed mentioning of study characteristics of different research studies.

Conclusion:

Understanding significant risk factors and variations for breast cancer is crucial for developing effective prevention and treatment strategies tailored to local populations. Further research is needed to address the gaps in knowledge and to improve breast cancer outcomes globally.
