Detailed Reviewer's Report

1. An insulinoma is a rare tumor in the pancreas that produces too much insulin, which can cause dangerously low blood sugar levels.
2. Symptoms of hypoglycemia include confusion, dizziness, sweating and a rapid heart rate, and in severe cases, it can lead to seizures or coma.
3. Most insulinomas are benign and small though they can sometimes be cancerous.
4. Somatostatin contributes to the body by inhibiting the secretion of various hormones, including growth hormone, insulin, and glucagon and by regulating gastrointestinal functions like motility and acid secretion.
5. It also plays a crucial role in the brain by modulating neurotransmission and is involved in functions related to cognitive processes mood and neurological disorders.
6. Neuroendocrine tumors are tumors that originate in neuroendocrine cells, which are a hybrid of nerve and endocrine cells.
