Detailed Reviewer's Report

1. A spindle cell is a type of cell that is long and slender, with a cigar shaped nucleus and is found in various tissues throughout the body, such as smooth muscle and fibroblasts.
2. These cells are important for natural functions like wound healing, but the can also form tumors called spindle cell neoplasms, including spindle cell sarcomas and spindle cell carcinomas.
3. Superficial fibromatosis refers to a group of benign, slow growing tumors that arise from the fascia or aponeuroses causing subcutaneous nodules or cords that can lead to limited mobility.
4. Deep fibromatosis, also known as desmoid tumors, is a rare locally aggressive but non metastasizing tumor that arises from deep soft tissues.
5. These tumors are characterized by a proliferation of fibrous tissue that can infiltrate surrounding muscle, nerves and fat causing pain and loss of function.
6. Beta catenin is a protein with two main functions it helps hold cells together at adherences junctions, and it is a key component of the signaling pathway, which regulates cell growth and development.

REVIEWER'S REPORT

- 7. When the pathway is inactive beta catenin is broken down in the cytoplasm.**
- 8. Key words are good to understand.**
- 9. Informations are given good with significant points.**
- 10. Histopathology and tables are good.**
- 11. Summary points can be included.**
- 12. References should be in alphabetical order.**
- 13. After a small corrections good to publish in your journal.**
