Detailed Reviewer's Report

1. The back of the tongue is naturally covered in normal bumps, including large, dome shaped circumvallate papillae and smaller foliate papillae on the sides, which contain many taste buds.
2. Other bumps can be caused by temporary issues like canker sores irritation from acidic foods, or infections. If bumps are persistent, unusually large, or accompanied by severe pain, swelling or other concerning symptoms, it is best to see a doctor or dentist to rule out serious conditions like allergies, infections or cancer.
3. An incisional biopsy is a medical procedure where a doctor surgically removes only a portion or sample of an abnormal lump, growth or suspicious skin area, rather than the whole thing, using a scalpel to cut into the tissue.
4. This sample is then examined under a microscope to diagnose conditions like skin cancer, inflammatory disorders or infections, helping determine if the issue is benign or malignant and guiding further treatment.
