### Detailed Reviewer's Report

1. Streptococcus is a genus of spherical bacteria that often form chains, commonly found in the human body, and are responsible for a wide range of infections, from mild strep throat and skin infections to severe conditions like pneumonia, meningitis and flesh eating disease.
2. Different types, like group A and group B cause different diseases, and they are spread through respiratory droplets or contact with infected surfaces, with treatment typically involving antibiotics.
3. Streptococcus bacteria are normal residents in a dogs body but can cause serious infections, especially respiratory issues like kennel cough or pneumonia, often presenting as coughing, fever, lethargy and poor appetite, spreading through close contact.
4. Zoonotic risk assessment is a process to identify, evaluate and manage risks from diseases that spread between animals and humans, using a one health approach combining animal, human and environmental health.
5. It involves analyzing pathogens, host factors, transmission routes and human behaviors to predict spillover potential and develop prevention response strategies.

## **REVIEWER'S REPORT**

- 6. Case based insights refers to knowledge or understanding gained through the analysis of specific real world examples or scenarios.**
- 7. This approach is widely used in professional education and business for active learning decision making and problem solving.**
- 8. Key words must be given.**
- 9. In result part tables can be given.**
- 10. Significant points has been given good.**
- 11. Summary points should be added.**
- 12. References should be in alphabetical order.**
- 13. After a small corrections good to publish in your journal.**
