#### Abstract

Let $S$ be a $\Gamma$-semigroup. We introduce the notion of gamma act over $\Gamma$-semigroup $S$ and study some important properties of such acts, with this respect, we study gamma subacts, congruences and homomorphisms, of gamma acts further , we give related basic results of gamma acts.And we will show the class of gamma acts is a generalization of S -acts and $\Gamma$-semigroups.

## 1. Introduction

The concept of $S$-act has been introduced as follows: if $S$ is a semigroup, a nonempty set $M$ is called a left $S$-act if there is a mapping from $S \times M$ into $M$ and the following condition is satisfied : $s_{1}\left(s_{2} m\right)=\left(s_{1} s_{2}\right) m$ for all $s_{1}, s_{2} \in S$ and $m \in M$ [1]. Every semigroup can be consider as act over itself. By a similar way we define right $S$-act .The $S$-act theory is a generalization of R-module theory .

The concept of $\Gamma$-semigroup has been introduced by M.K. Sen in 1981 as follows: if $S$ and $\Gamma$ are nonempty sets, $S$ is called a $\Gamma$-semigroup if there is a mapping from $S \times \Gamma \times S$ into $S$ and the following condition is satisfied :( $\left.\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{s}_{3}$ $=s_{1} \alpha\left(s_{2} \beta s_{3}\right)$ for all $s_{1}, s_{2}, s_{3} \in S$ and $\alpha, \beta \in \Gamma[2]$. A nonempty subset $A$ of a $\Gamma$-semigroup $S$ is called right ideal of $S$ if $A \Gamma S \subseteq A$ where $A \Gamma S=\{a \alpha s \mid a \in A, \alpha \in \Gamma$ and $s \in S\}$. And it is called a left ideal of $S$ if $S \Gamma A \subseteq A, A$ is called ideal of $S$ if it is both a left and a right ideal of $S$.

Let S and T be $\Gamma$-semigroups under the same $\Gamma$. A mapping $\mathrm{f}: \mathrm{S} \rightarrow \mathrm{T}$ is called a $\Gamma$-homomorphism if $f\left(s_{1} \alpha s_{2}\right)=f\left(s_{1}\right) \alpha f\left(s_{2}\right)$ for all $s_{1}, s_{2} \in S$ and $\alpha \in \Gamma$.

## 2. Gamma acts

In this section we introduce and study the concepts of gamma act over a fixed $\Gamma$-semigroup .
Definition 2.1 Let $S$ be a $\Gamma$-semigroup, A nonempty set $M$ is called left $S_{\Gamma}$-act (denoted by $S_{\Gamma} M$ ) if there is a mapping from $S \times \Gamma \times M$ into $M$ written $\left(s_{1}, \alpha, s_{2}\right)$ by $s_{1} \alpha s_{2}$ such that the following condition is satisfied

$$
\left(\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{m}=\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{~m}\right) \text { for all } \mathrm{s}_{1}, \mathrm{~s}_{2} \in \mathrm{~S}, \alpha, \beta \in \Gamma \text { and } \mathrm{m} \in \mathrm{M}
$$

Similarity one can define a right gamma acts .

Definition 2.2 A left $S_{\Gamma}$-act $M$ is called unitary if there exist $1 \in S, \alpha_{0} \in \Gamma$ such that $1 \alpha_{0} \mathrm{~m}=\mathrm{m}$ for all $\mathrm{m} \in \mathrm{M}$. We denote the element $1 \alpha_{\circ}$ by $1_{\alpha_{o}}$ i.e $1_{\alpha_{o}} \mathrm{~m}=\mathrm{m}$ for all $\mathrm{m} \in \mathrm{M}$.

Definition 2.3 Let $M$ be left $S_{\Gamma}$-act. An element $\Theta \in M$ is called a zero of $M$ if $s \alpha \Theta=\Theta$ for all $s \in S$ and $\alpha \in \Gamma$.
Note. An $\mathrm{S}_{\Gamma}$-act M can have more than one zero elements, see example 2.6 (A). And Every $\mathrm{S}_{\Gamma}$-act M can be extended to an $S_{\Gamma}$-act with zero by taking the disjoint union $\mathrm{M} \downharpoonleft\{\theta\}$, where $\{\Theta\}$ is a one-element $\mathrm{S}_{\Gamma}$-act with $s \alpha \Theta=\Theta$ for all $s \in S$ and $\alpha \in \Gamma$.

Definition 2.4 Let $S$ and $T$ be $\Gamma$-semigroups. A nonempty set $M$ is called gamma biact denoted by (T-S $)_{\Gamma}$-biact if

1. $M$ is a left $T_{\Gamma}$-act
2. $M$ is a right $S_{\Gamma}$-act
3. $\operatorname{t} \alpha(\mathrm{m} \beta \mathrm{s})=(\mathrm{t} \alpha \mathrm{m}) \beta \mathrm{s}$ for all $\mathrm{t} \in \mathrm{T}, \alpha, \beta \in \Gamma, \mathrm{m} \in \mathrm{M}$ and $\mathrm{s} \in \mathrm{S}$.

Definition 2.5 Let M be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact. Then M is called unitary $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact if

1. $M$ is unitary left $T_{\Gamma}$-act, i.e there exist $1_{T} \in T$ and $\alpha_{0 T} \in \Gamma$ such that $m=1_{T} \alpha_{0 T} m$ for all $m \in M$
2. $M$ is unitary right $S_{\Gamma}$-act, , i.e there exist $1_{S} \in S$ and $\alpha_{0 S} \in \Gamma$ such that $m=m \alpha_{0 S} 1_{S}$ for all $m \in M$

Note. All $\mathrm{S}_{\Gamma}$-act in following, consider unitary left $\mathrm{S}_{\Gamma}$-act unless otherwise we stated
In the following by many examples we illustrate the notion of gamma acts and show that the class of gamma acts is very wide.

Examples 2.6
A. Let $S=\mathbb{Z}, \Gamma=\mathbb{N}$, Then $S$ is $\Gamma$-semigroup $\left(z_{1}, n, z_{2}\right) \rightarrow z_{1} . n . z_{2}$ with usual multiplication of integer numbers. Let $M$ be a nonempty set. Then $M$ is an $S_{\Gamma}$-act under the mapping from $S \times \Gamma \times M$ into $M$ which define by ( $\mathrm{z}, \mathrm{n}, \mathrm{m}$ ) $\rightarrow \mathrm{m}$ for all $\mathrm{s} \in \mathrm{S}, \alpha \in \Gamma, \mathrm{m} \in \mathrm{M}$.
B. If $S$ is a $\Gamma$-semigroup and $M$ a nonempty set. Any fixed element $m_{o}$ in $M$ gives rise on $S_{\Gamma}$-act structure of $M$ by the mapping $S \times \Gamma \times M \rightarrow M$ define by $(s, \alpha, m) \rightarrow m_{\circ}$ for all $s \in S, \alpha \in \Gamma, m \in M$
example (B) shows that any nonempty set can be concider as $S_{\Gamma}$-act for any $\Gamma$-semigroup $S$. In particular every singleton set is a one-element $S_{\Gamma}$-act.
C. Let $S=\{5 \mathrm{n}+4 \mid \mathrm{n}$ is a positive integer $\}, \Gamma=\{5 \mathrm{n}+1 \mid \mathrm{n}$ is a positive integer $\}$. Then S is a $\Gamma$-semigroup where $\mathrm{s}_{1} \alpha \mathrm{~s}_{2}=\mathrm{s}_{1}+\alpha+\mathrm{s}_{2}$. Now let $\mathrm{M}=\{5 \mathrm{n} \mid \mathrm{n}$ is a positive integer $\}$. Then M is an $\mathrm{S}_{\Gamma}$-act where $\mathrm{s} \alpha \mathrm{m}=\mathrm{s}+\alpha+\mathrm{m}$, where + is the usual addition .
D. Let $S$ be a $\Gamma$-semigroup. A polynomial in one indeterminate $X$ with coefficients in $S$ respect to $\Gamma$ is to be an expression $P(X)=s \beta X, s \in S, \beta \in \Gamma$, where $X$ is a any symbol. The set $S[X]$ of all polynomials is a nonempty set becomes to an $S_{\Gamma}$-act under the mapping from $S \times \Gamma \times S[X]$ into $S[X]$ define by $(r, \alpha, P[X]) \rightarrow(r \alpha s) \beta X$
E. Every $\Gamma$-semigroup S is an $\mathrm{S}_{\Gamma}-$ act with $\mathrm{s}_{1} . \alpha . \mathrm{s}_{2}$ being the $\Gamma$-semigroup structure in S .
F. Let $S=[0,1], \Gamma=\left\{\left.\frac{1}{n} \right\rvert\, n\right.$ is a positive integer $\}$ and $M=S$, Then $M$ is an $S_{\Gamma}$-act under usual multiplication of real numbers.
G. Consider the following two sets $S=\left\{\left.\left[\begin{array}{ll}a & 0 \\ b & 1\end{array}\right] \right\rvert\, a, b \in \mathbb{R}\right\}$ and $\Gamma=\left\{\left.\left[\begin{array}{cc}x & 0 \\ 0 & 1\end{array}\right] \right\rvert\, x \in \mathbb{R}\right\}$ and let $M=S$.Then M is an $\mathrm{S}_{\Gamma}$-act under the usual product of the matrices.
H. Let $\mathrm{S}=\{\varnothing,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}\}, \Gamma=\{\varnothing,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}\}$ and $\mathrm{M}=\mathrm{S}$. Then M is an $\mathrm{S}_{\Gamma^{-}}$ act where $\mathrm{ABC}=\mathrm{A} \cap \mathrm{B} \cap \mathrm{C}$. for all $\mathrm{A}, \mathrm{C} \in \mathrm{S}$ and $\mathrm{C} \in \Gamma$.
I. Let R be an $\Gamma$-ring and M is an $\mathrm{R}_{\Gamma}$-module [3]. It is clear that any $\mathrm{R}_{\Gamma}$-module is $\mathrm{R}_{\Gamma}$-act .
J. Let M be an R -module, define a mapping.$: \mathrm{R} \times \mathrm{R} \times \mathrm{M} \rightarrow \mathrm{M}, \mathrm{By}(\mathrm{r}, \mathrm{s}, \mathrm{m}) \rightarrow(\mathrm{rs}) \mathrm{m}$ being the $\mathrm{R}-$ module structure of $M$, Then $M$ is an $R_{R}$-act.
K. Let $S$ be a $\Gamma$-semigroup and $I$ be a left ideal of $S$. Then $I$ is a left $S_{\Gamma}$-act under the mapping . : $\mathrm{S} \times \Gamma \times I \rightarrow I$ define by $(\mathrm{s}, \alpha, \mathrm{r}) \rightarrow \mathrm{s} . \alpha . \mathrm{r}$, for all $\mathrm{s} \in \mathrm{S}, \alpha \in \Gamma$ and $\mathrm{r} \in \mathrm{I}$
L. Let $M$ be an arbitrary semigroup and $S$ an arbitrary nonempty subset of $\mathbb{Z}$, Then $M$ is $\mathbb{Z}_{S}$-act under the mapping $\mathbb{Z} \times S \times M \rightarrow M$ define by $\left(n, n^{\prime}, m\right) \rightarrow\left(n . n^{\prime}\right) m$.
M. let $\mathbb{R}$ be set of of all real numbers. $\mathbb{R}^{n}$ is an $\mathbb{R}_{\mathbb{R}}$-act . by the mapping from $\mathbb{R} \times \mathbb{R} \times \mathbb{R}^{n}$ into $\mathbb{R}^{n}$ define $\left(\mathrm{r}_{1}, \mathrm{r}_{2},\left(\mathrm{x}_{\mathrm{i}}\right)_{\mathrm{i}=1}^{\mathrm{n}}\right) \rightarrow\left(\mathrm{r}_{1} \mathrm{r}_{2} \mathrm{x}_{\mathrm{i}}\right)_{\mathrm{i}=1}^{\mathrm{n}}$ for all $\mathrm{r}_{1}, \mathrm{r}_{2} \in \mathbb{R}$ and $\left(\mathrm{x}_{\mathrm{i}}\right)_{\mathrm{i}=1}^{\mathrm{n}} \in \mathbb{R}^{\mathrm{n}}$.
$N$. Let $S$ be $\Gamma$-semigroup. Then $S \times \mathbb{Z}=\{(s, z) \mid s \in S, z \in \mathbb{Z}\}$ is an $S_{\Gamma}$-act by the mapping from $S \times \Gamma \times(S \times \mathbb{Z})$ into $S \times \mathbb{Z}$ define by $\left(s, \alpha,\left(s^{\prime}, z\right)\right) \rightarrow\left(s \alpha s^{\prime}, z\right)$.
O. Let $G$ be a group, $\Lambda_{1}, \Lambda_{2}$ two index sets and $\Gamma$ the collection of some $\Lambda_{1} \times \Lambda_{2}$ matrices over $G^{\circ}=G \cup\{0\}$,the group with zero Let $S=\Gamma$. Then it is easy to see $S$ is a $\Gamma$-semgroup. $M=\left\{(a)_{\mathrm{ij}} \mid \mathrm{i} \in \Lambda_{1}, \mathrm{j} \in \Lambda_{2}\right.$ and ( $\mathrm{a}_{\mathrm{ij}}$ ) the $\Lambda_{1} \times \Lambda_{2}$ matrix over $G^{\circ}$ with $\mathrm{a}_{\mathrm{ij}}=\mathrm{a}$ and 0 otherwise $\}$. For any $(\mathrm{a})_{\mathrm{ij}},(\mathrm{b})_{\mathrm{jk}},(\mathrm{c})_{\mathrm{kv}} \in \mathrm{M}$ and $\alpha=\left(\mathrm{p}_{\mathrm{ji}}\right), \beta=\left(\mathrm{q}_{\mathrm{jj}}\right) \in \Gamma$ we define $(a)_{i j} \alpha(b)_{j k}=\left(a p_{j k} b\right)_{i k}$. Then it is easy verified that $\left[(a)_{i j} \alpha(b)_{j \mathrm{j}}\right] \beta(c)_{\text {kv }}=(a)_{i j} \alpha\left[(b)_{j k} \beta(c)_{k v}\right]$.Thus $M$ is $S_{\Gamma}-a c t$.
P. Let $S=\{a, b, c, d, e\}, \Gamma=\{\alpha, \beta\}$ and $M=S \times S$. Put the binary operations in the tables below

| $\alpha$ | a | b | c | d | e |
| :--- | :--- | :--- | :--- | :--- | :--- |
| a | a | b | c | d | e |
| b | b | c | d | e | a |
| c | c | d | e | a | b |
| d | d | e | a | b | c |
| e | e | a | b | c | d |

| $\beta$ | a | b | c | d | e |
| :--- | :--- | :--- | :--- | :--- | :--- |
| a | b | c | d | e | a |
| b | c | d | e | a | b |
| c | d | e | a | b | c |
| d | e | a | b | c | d |
| e | a | b | c | d | e |

And consider the mapping from $S \times \Gamma \times M$ into $M$ by $\left(s, \alpha,\left(s_{1}, s_{2}\right) \rightarrow\left(s s_{1}, s \alpha s_{2}\right)\right.$. Since $\left(s_{1} \alpha s_{2}\right) \beta m=s_{1} \alpha\left(s_{2} \beta m\right)$ for all $\mathrm{s}_{1}, \mathrm{~s}_{2} \in \mathrm{~S}, \alpha, \beta \in \Gamma$ and $\mathrm{m} \in \mathrm{M} . \mathrm{M}$ is an $\mathrm{S}_{\Gamma}$-act.

The following proposition gives a new example of old ones .
Proposition 2.7 Let $M$ be an $S_{\Gamma}$-act, and $P(M)$ the power set of $M$, Then $P(M)$ is an $S_{\Gamma}$-act .
proof : Consider the mapping $S \times \Gamma \times P(M) \rightarrow P(M)$ define by $(s, \alpha, X)=s \alpha X$ where $s \alpha X=\{\operatorname{s} \alpha x \mid x \in X, s \in S, \alpha \in$ $\Gamma\}$. Then for all $\mathrm{s}_{1}, \mathrm{~s}_{2} \in \mathrm{~S}, \alpha, \beta \in \Gamma$ and $\mathrm{X} \in \mathrm{P}(\mathrm{M})$ we have $\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{X}\right)=\mathrm{s}_{1} \alpha\left\{\mathrm{~s}_{2} \beta \mathrm{x} \mid \mathrm{x} \in \mathrm{X}\right.$ s $\left.\in \mathrm{S}, \alpha \in \Gamma\right\}=$ $\left.\left\{\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{x}\right) \mid \mathrm{x} \in \mathrm{X}, \mathrm{s} \in \mathrm{S}, \alpha \in \Gamma\right\}=\left\{\left(\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{x}\right) \mid \mathrm{x} \in \mathrm{X}, \mathrm{s} \in \mathrm{S}, \alpha \in \Gamma\right\}=\left(\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{X}$

Example 2.8 It is well-known that both $\mathbb{Z}$ and $\mathbb{Q}$ is an $\mathbb{N}$-semigroups under the usual multiplication. Then $\mathbb{R}$ is an $(\mathbb{Z}-\mathbb{Q}) \mathbb{N}$ - biact . As well as $(\mathbb{Q}-\mathbb{Z}) \mathbb{N}$ - biact.

The following example shows that if M is an S -act, then M is an $\mathrm{S}_{\Gamma}-$ act for every nonempty set $\Gamma$.
Examples 2.9 Let $M$ be right $S$-act and $\Gamma$ be any nonempty set. Define $S \times \Gamma \times S \rightarrow S$ by ( $\left.\mathrm{s}, \alpha, \mathrm{s}^{\prime}\right) \mapsto \mathrm{ss}$ for all $\mathrm{s}, \mathrm{s}^{\prime} \in \mathrm{S}$ and $\alpha \in \Gamma$.Then

1. S is $\Gamma$-semgroup indeed $\left(\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{s}_{3}=\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{~s}_{3}\right)$ for all $\mathrm{s}_{1}, \mathrm{~s}_{2}, \mathrm{~s}_{3} \in \mathrm{~S}$ and $\alpha, \beta \in \Gamma$.
2. M is $\mathrm{S}_{\Gamma}$-act, in fact $(\mathrm{m} \alpha \mathrm{s}) \beta \mathrm{s}^{\prime}=\mathrm{m} \alpha\left(\mathrm{s} \beta \mathrm{s}^{\prime}\right)$ for all $\mathrm{s}, \mathrm{s}^{\prime} \in \mathrm{S}, \alpha, \beta \in \Gamma$ and $\mathrm{m} \in \mathrm{M}$.

In the following example. We show that the converse of Examples 2.9 may not be true in general and hence $\mathrm{S}_{\Gamma}$-acts are a proper generalization of S-acts.

## Examples 2.10

1. Let $M$ be a set of all negative rational numbers .It is clear that $M$ is not $M$-act under usual product of rational numbers. Let $\Gamma=\left\{\left.-\frac{1}{p} \right\rvert\, \mathrm{p}\right.$ is prime $\}$. Let $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$. Now if $\mathrm{a} \alpha \mathrm{b}$ is equal to the usual product of rational numbers then $a \alpha b \in M$ and $(a \alpha b) \beta c=a \alpha(b \beta c)$.hence $M$ is $M_{\Gamma}-a c t$.
2. Let $M=\{i, 0,-i\}$ and $S=\Gamma=M$. Then $M$ is $S_{\Gamma}$-act under the multiplication over complex numbers while $M$ is not $S$-act under the multiplication.

Note. The class of gamma acts is very wide .In the following example we see that a nonempty set to be a gamma act depends on the mapping of multiplication. as in the following example.

Example 2.11 Let $M$ be the set of all odd integer numbers . then $M$ is not $\mathbb{Z}_{\mathbb{Z}}$-act under the usual multiplication of integer numbers.

## 3. Gamma subacts and congruences

In this section we study gamma subacts, congruences of gamma act and investigate their properties .
Definition 3.1 Let M be an $\mathrm{S}_{\Gamma}$-act, A nonempty subset N of M is called $\mathrm{S}_{\Gamma}$-subact if $\mathrm{S} \Gamma \mathrm{N} \subseteq \mathrm{N}$, Where $S \Gamma N=\{\operatorname{san} \mid s \in S, \alpha \in \Gamma, n \in N\}$. In this case we write $N \leq M$.

Note . clearly $M$ be a trivial gamma subact on $M$ and if $M$ with zero element $\Theta$, then $\{\Theta\}$ be also trivial gamma subact, and any left ideal of $\Gamma$-semgroup S is an $\mathrm{S}_{\Gamma}$-subact on S .

Example 3.2 Clearly that $\mathbb{Z}$ is $\mathbb{Z}_{\mathbb{N}}$-act , and $\mathbb{Z}_{e}$ is the set of all even integers. Then $\mathbb{Z}_{e}$ is an $\mathbb{Z}_{\mathbb{N}}$-subact .
Example 3.3 Let $S=\mathbb{Z}, \Gamma=\mathbb{N}$, Then $S$ is a $\Gamma$-semigroup by the mapping $\left(z_{1}, n, z_{2}\right) \rightarrow z_{1} \cdot n . z_{2}$ be usual multiplication . Let $M=\{1,2,3,4,5,6\}$, Then $M$ is $S_{\Gamma}$-act by the mapping $S \times \Gamma \times M \rightarrow M$ define by $(z, n, m) \rightarrow 2$. Then any nonempty subset of $M$ that contains 2 is $S_{\Gamma}$-subact of $M$.

Example 3.4 consider the gamma act in Examples (2.6)(m), where $n=2$. Then if $N=\{(x, 0) \mid x \in \mathbb{R}\}$ and $\mathrm{M}=\{(0, y) \mid y \in \mathbb{R}\}$, then $M$ and $N$ are $S_{\Gamma}$-subact .

Proposition 3.5 Let $M$ be $S_{\Gamma}$-act, let $\left\{N_{i} \mid i \in I\right\}$ be collection of $S_{\Gamma}$-subact in $M$. Then.

1. If $\bigcap_{i \in I} N_{\mathrm{i}}$ is a nonempty, then $\bigcap_{i \in I} \mathrm{~N}_{\mathrm{i}} \leq \mathrm{M}$.
2. $\bigcup_{i \in I} N_{\mathrm{i}} \leq \mathrm{M}$.

Proof 1. Since $\mathrm{N}_{\mathrm{i}} \leq \mathrm{M}$ for all $\mathrm{i} \in \mathrm{I}$, then $\mathrm{N}_{\mathrm{i}} \neq \varnothing$ for all $\mathrm{i} \in \mathrm{I}$, then we get $\bigcap_{i \in I} N_{\mathrm{i}} \neq \varnothing$. Now Let $\mathrm{x} \in \bigcap_{i \in I} N_{\mathrm{i}}$, $\mathrm{s} \in \mathrm{S}$ and $\alpha \in \Gamma$. We get $\mathrm{x} \in \mathrm{N}_{\mathrm{i}}$ for all $\mathrm{i} \in \mathrm{I}$. Since $s \alpha \mathrm{x} \in \mathrm{N}_{\mathrm{i}}$ for all $\mathrm{i} \in \mathrm{I}$. Then $\operatorname{sax} \in \bigcap_{i \in I} N_{\mathrm{i}}$. we get $\bigcap_{i \in I} N_{\mathrm{i}} \leq \mathrm{M}$
2. $\mathrm{N}_{\mathrm{i}} \leq \mathrm{M}$ for all $\mathrm{i} \in \mathrm{I}$, then $\mathrm{N}_{\mathrm{i}} \neq \varnothing$ for all $\mathrm{i} \in \mathrm{I}$, then we get $\bigcup_{i \in I} N_{\mathrm{i}} \neq \varnothing$. Now let $\mathrm{x} \in \bigcup_{i \in I} N_{\mathrm{i}}, \mathrm{s} \in \mathrm{S}$ and $\alpha \in \Gamma$. Then there is some $\mathrm{i}^{\circ} \in \mathrm{I}$ such that $\mathrm{x} \in \mathrm{Ni}^{\circ}$, implies $s \alpha \mathrm{x} \in \mathrm{U}_{i \in I} N_{\mathrm{i}}$. Then we get $\mathrm{U}_{i \in I} N_{\mathrm{i}} \leq \mathrm{M}$

Proposition 3.6 Let M be an $\mathrm{S}_{\Gamma}-$ act, X is a nonempty subset from M . Then the set define by $[\mathrm{X}]_{M}:=\bigcap\{\mathrm{B} \mid \mathrm{X} \subseteq \mathrm{B}, \mathrm{B} \leq \mathrm{M}\}$, is the smallest $\mathrm{S}_{\Gamma}$-subact of M contains X .

Proof. This clearly by proposition(3.5), that $[\mathrm{X}]_{M} \leq \mathrm{M}$. Now let $\mathrm{N} \leq \mathrm{M}$ and $\mathrm{X} \subseteq \mathrm{N}$, by definition of $[\mathrm{X}]_{M}$ we get $[\mathrm{X}]_{M} \subseteq \mathrm{~N}$. Then $[\mathrm{X}]_{M}$ is smallest $\mathrm{S}_{\Gamma}$-subact of M which contains X .

Let $M$ be an $S_{\Gamma}$-act, $N \leq M$. Define $N: M=\{s \in S \mid s \alpha m \in N$ for all $\alpha \in \Gamma$ and $m \in M\}$.
If $N$ : $M$ is a nonempty subset of $S$, then it is easy to see that $N: M$ is a left ideal of a $\Gamma$-semgroup $S$.
The proof of the following proposition follows from the definition.
Proposition 3.7 Let M be an $\mathrm{S}_{\Gamma}$-act, N and L be two $\mathrm{S}_{\Gamma}$-subacts and A , B are two nonempty subsets of M . Then

1. if $\mathrm{A} \subseteq \mathrm{B}$ implies that $(\mathrm{N}: \mathrm{B}) \subseteq(\mathrm{N}: \mathrm{A})$.
2. $(N \cap L: A)=(N: A) \cap(N: A)$.

Definition 3.8 Let $M$ be an $S_{\Gamma}$-act. An equivalence relation $\rho$ on $M$ is called a congruence on $M$, if $\left(m_{1}, m_{2}\right) \in \rho$, implies that $\left(\mathrm{s}_{\mathrm{m}}^{1}, \mathrm{~s} \alpha \mathrm{~m}_{2}\right) \in \rho$ for all $\mathrm{s} \in \mathrm{S}, \alpha \in \Gamma$ and $\mathrm{m}_{1}, \mathrm{~m}_{2} \in \mathrm{M}$.

Example 3.9 Let $M$ be an $S_{\Gamma}$-act, Then $I_{M}=\{(m, m) \mid m \in M\}$ is a trivial congruence, $M \times M$ is a universal congruence on M .

Example 3.10 consider the gamma act in Examples(2.6)(a), with $M=\{a, b, c\}$, put $\rho=\{(a, a),(b, b),(c, c)$, $(a, b),(b, a)\} \subseteq M \times M$, then $\rho$ is an congruence on $M$.

Proposition 3.11 Let $M$ be $S_{\Gamma}$-act, $\rho$ be congruence on $M$. Then the set denoted by $M / \rho$ of $x \rho$ where $x \rho$ the equivalent class contains $x$ is an $S_{\Gamma}$-act.

Proof. Define the mapping $\mathrm{S} \times \Gamma \times \mathrm{M} / \rho \rightarrow \mathrm{M} / \rho$ by $(\mathrm{s}, \alpha, \mathrm{m} \rho) \rightarrow(\mathrm{s} \alpha \mathrm{m}) \rho$, let $\mathrm{s}_{1}, \mathrm{~s}_{2} \in \mathrm{~S}, \alpha, \beta \in \Gamma$. First to show the mapping be well define, let $x \rho=x^{\prime} \rho$ then $\left(x, x^{\prime}\right) \in \rho$ and $\left(s \alpha x, s \alpha x^{\prime}\right) \in \rho$, implies ( $\left.s \alpha x\right) \rho=\left(s \alpha x^{\prime}\right) \rho$. and $\left(\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{x} \rho=\left(\left(\mathrm{s}_{1} \alpha \mathrm{~s}_{2}\right) \beta \mathrm{x}\right) \rho=\left(\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{x}\right)\right) \rho=\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{x}\right) \rho=\mathrm{s}_{1} \alpha\left(\mathrm{~s}_{2} \beta \mathrm{x} \rho\right)$. Then $\mathrm{M} / \rho$ is $\mathrm{S}_{\Gamma}$-act

Note. $\mathrm{M} / \rho$ is called quotient gamma act under congruence $\rho$ on M .
Proposition 3.12 Let M be $\mathrm{S}_{\Gamma}-$ act, $\left\{\rho_{\alpha} \mid \alpha \in \Omega\right\}$ be a family of congruences on M , then $\cap \rho_{\alpha}$ is the largest congruence on M contained in $\rho_{\alpha}$ for all $\alpha \in \Omega$.

Proof Clearly that $\cap \rho_{\alpha}$ is equivalent relation on M. Now let ( $x, y$ ) $\in \cap \rho_{\alpha}, s \in S$ and $\alpha \in \Gamma$, then ( $x, y$ ) $\in \rho_{\alpha}$ for all $\alpha$ $\in \Omega$ and (s $\alpha \mathrm{x}, \mathrm{s} \alpha \mathrm{y}) \in \rho_{\alpha}$ for all $\alpha \in \Omega$, then ( $\left.\mathrm{s} \alpha \mathrm{x}, \mathrm{s} \alpha \mathrm{y}\right) \in \cap \rho_{\alpha}$. we get $\cap \rho_{\alpha}$ be congruence on M . Now let $\sigma$ be a congruence on $M$ contained in $\rho_{\alpha}$ for all $\alpha \in \Omega$. Let $(x, y) \in \sigma$ then $(x, y) \in \cap \rho_{\alpha}$, we get $\cap \rho_{\alpha}$ is largest congruence on M contained in $\rho_{\alpha}$ for all $\alpha \in \Omega$

Let M be $\mathrm{S}_{\Gamma}$-act, and H be a nonempty subset of M . Define

$$
\ell_{\mathrm{S}}(\mathrm{H})=\{(\mathrm{s}, \mathrm{t}) \in \mathrm{S} \times \mathrm{S} \mid \mathrm{s} \alpha \mathrm{~h}=\mathrm{t} \alpha \mathrm{~h} \text { for all } \alpha \in \Gamma \text { and } \mathrm{h} \in \mathrm{H}\}
$$

it is clear that $\ell_{S}(H)$ is a congruence on $S_{\Gamma}$-act $S$ and if $M$ with zero element $\Theta$, then $\ell_{S}(\theta)=S \times S$.
Proposition 3.13 Let M be an $\mathrm{S}_{\Gamma}$-act, and A , B are two nonempty subsets of M . Then

1. if $A \subseteq B$ implies that $\ell_{S}(B) \subseteq\left(\ell_{S}(A)\right.$.
2. $\ell_{S}(A \cup B)=\ell_{S}(A) \cup \ell_{S}(B)$.

Definitoin 3.14 Let $M$ be $(S-T)_{\Gamma}$-biact. An equivalence relation $\rho$ on $M$ is called a congruence on $M$ if $\left(\mathrm{m}_{1}, \mathrm{~m}_{2}\right) \in \rho$, implies $\left(\mathrm{t} \alpha \mathrm{m}_{1} \alpha \mathrm{~s}, \mathrm{t} \alpha \mathrm{m}_{2} \alpha \mathrm{~s}\right) \in \rho$,for all $\mathrm{s} \in \mathrm{S}, \alpha \in \Gamma, \mathrm{m}_{1}, \mathrm{~m}_{2} \in \mathrm{M}$ and $\mathrm{t} \in \mathrm{T}$.

## 4. Homomorphisms gamma acts.

In this section we study the homomorphisms of gamma acts. In particular we investigate the behavior of gamma subacts and congruences under their homomorphisms.

Definition 4.1 Let $M$ and $N$ be two $S_{\Gamma}$-acts. A mapping $f: M \rightarrow N$ is called $S_{\Gamma}$-homomorphism if $f(s \alpha m)=\operatorname{saf}(m)$. for all $s \in S, \alpha \in \Gamma$ and $m \in M$. A homomorphism $f: M \rightarrow N$ is called

1. monomorphism if $f$ is injective mapping .
2. epimorphism if $f$ is surjective mapping
3. isomorphism if $f$ is bijective mapping .

If $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ is an $\mathrm{S}_{\Gamma}$-isomorphism, then we called M isomorphic to N denoted by $\mathrm{M} \cong \mathrm{N}$. The set of all $S_{\Gamma}$-homomorphisms from $M$ into $N$ denote by $\operatorname{Hom}_{S_{\Gamma}}(M, N)$. If $M=N$, then $\operatorname{Hom}_{S_{\Gamma}}(M, N)$ denote by $\operatorname{End}_{S_{\Gamma}}(M)$.

Definition 4.2 Let $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$-Homomorphism. Then we define the kernel and the image of f as follows .

1. $\operatorname{ker}(\mathrm{f})=\left\{\left(\mathrm{m}_{1}, \mathrm{~m}_{2}\right) \in \mathrm{M} \times \mathrm{M} \mid \mathrm{f}\left(\mathrm{m}_{1}\right)=\mathrm{f}\left(\mathrm{m}_{2}\right)\right\}$.
2. $\operatorname{Im}(f)=\{n \in N \mid$ there is $m \in M$ such that $f(m)=n\}$.

Definition 4.3 Let M and N be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact . A homomorphism $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ is called $(\mathrm{T}-\mathrm{S})_{\Gamma}$-homomorphism , if

1. $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{T}_{\Gamma}$-homomorphism
2. $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$-homomorphism
3. $f(\operatorname{tam}) \beta s=\operatorname{taf}(\mathrm{m} \beta \mathrm{s})$, for all $\mathrm{s} \in \mathrm{S}, \alpha, \beta \in \Gamma, \mathrm{m} \in \mathrm{M}$ and $\mathrm{t} \in \mathrm{T}$.

Example 4.4 Let M be an $\mathrm{S}_{\Gamma}$-act . and $\mathrm{N} \leq \mathrm{M}$. Then the mapping i : $\mathrm{N} \rightarrow \mathrm{M}$ define by $\mathrm{i}(\mathrm{n})=\mathrm{n}$ for all $\mathrm{n} \in \mathrm{N}$, is an $\mathrm{S}_{\Gamma}$-monomorphism .

Proposition 4.5 Let $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$-Homomorphism. Then

1. $\operatorname{Ker}(f)$ is a congruence on $M$.
2. If $G \leq M$, then $f(G)=\{f(m) \mid m \in G\} \leq N$. In particular $f(M) \leq N$.

Proof. 1. It is clear that $\operatorname{Ker}(\mathrm{f})$ is equivalent relation on M . Now let $\left(\mathrm{m}_{1}, \mathrm{~m}_{2}\right) \in \operatorname{Ker}(\mathrm{f}), \mathrm{s} \in \mathrm{S}$ and $\alpha \in \Gamma$. implies $\mathrm{f}\left(\mathrm{s} \alpha \mathrm{m}_{1}\right)=\operatorname{s\alpha f}\left(\mathrm{m}_{1}\right)=\operatorname{s\alpha f}\left(\mathrm{m}_{2}\right)=\mathrm{f}\left(\mathrm{s} \alpha \mathrm{m}_{2}\right)$, thus $\operatorname{Ker}(\mathrm{f})$ is a congruence on M
2. clearly $f(G)$ is a nonempty subset of $N$. Now let $s \in S, \alpha \in \Gamma$ and $n \in f(G)$. Then there is $m \in G$ such that $f(m)=n$, then $s \alpha n=s \alpha f(m)=f(s \alpha m) \in f(G)$.

The following example shows the converse of proposition(4.5) 1 . is also true .
Example 4.6 Let $M$ be $S_{\Gamma}$-act, $\rho$ be a congruence on $M$. Then the mapping $\pi \rho: M \rightarrow M / \rho$ define by $\pi \rho(m)=m \rho$ for all $m \in M$ is called canonical map, and clearly that $\pi \rho$ is an $S_{\Gamma}$-epimorphism and $\operatorname{ker}(\pi \rho)=\rho$

Proposition 4.7 Let M be an $\mathrm{S}_{\Gamma}$-act, and $\rho$ a congruence on M . Then

1. if $N \leq M$, then $N / \rho_{N} \leq M / \rho$.
2. if $W \leq M / \rho$, then there exist $L \leq M$ such that $W=L / \rho_{L}$, where $\rho_{L}=\rho \cap(L \times L)$

Proof. 1. It is clear .
2. clearly $\pi_{\rho}^{-1}(W) \leq M$, and let $\pi_{\rho}^{-1}(W)=L$. Then byl, we get $L / \rho_{L} \leq M / \rho$ and it is clear to see that $L / \rho_{L}=W$.

Proposition 4.8 Let $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$ homomorpohism, and $\rho$ be congruence on M then $\rho_{\mathrm{f}}=\{(\mathrm{f}(\mathrm{x}), \mathrm{f}(\mathrm{y})) \mid(\mathrm{x}, \mathrm{y}) \in \rho\}$ is a congruence on $f(M)$.

Proof. It is straightforward to check that $\rho_{f}$ is an equivalent relation on $f(M)$. Now let $(f(x), f(y)) \in \rho_{f}, s \in S, \alpha \in \Gamma$. Since $(x, y) \in \rho$ we get $(s \alpha x, s \alpha y) \in \rho,\left(f(s \alpha x), f(s \alpha y)=(\operatorname{s\alpha f}(x), \operatorname{s\alpha f}(y)) \in \rho_{f}\right.$. Then $\rho_{f}$ is a congruence on (M).

Proposition 4.9 Let $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$-homomorphism, $\rho$ a congrunce on M , and $\rho^{*}$ on $f(M)$ with $\rho_{f} \subseteq \rho^{*}$.Then there exsits a homomorphism from $M / \rho$ to $f(M) / \rho^{*}$ and $f(M) / \rho^{*}$ is an epimorphic image of $M / \rho$.

Proof. Let $f^{*}: M / \rho \rightarrow f(M) / \rho^{*}$ define by $x \rho \rightarrow f(x) \rho^{*}$. If $x \rho=y \rho$ then $(x, y) \in \rho$ and $(f(x), f(y)) \in \rho_{f} \subseteq \rho^{*}$, then $(f(x), f(y)) \in \rho^{*}$ and $f(x) \rho^{*}=f(y) \rho^{*}, f^{*}$ is well define. Let $x \rho \in M / \rho, s \in S \alpha \in \Gamma$. Then $f^{*}(s \alpha(x) \rho)=f^{*}((s \alpha x) \rho)=$ $(s \alpha x) \rho^{*}=s \alpha(x) \rho^{*}=s \alpha f^{*}(x \rho)$, Then $f^{*}$ is $S_{\Gamma}$-homomorphism act from $M / \rho$ to $f(M) / \rho^{*}$

Lemma 4.10 Let $S$ and $R$ be $\Gamma$-semigroups and let $\Phi: R \rightarrow S$ be $\Gamma$-homomorphism. If $M$ is $S_{\Gamma}$-act, then $M$ is $R_{\Gamma}$-act.
Proof . Define a mapping $\mathrm{R} \times \Gamma \times \mathrm{M} \rightarrow \mathrm{M}$ by $(\mathrm{r}, \alpha, \mathrm{m}) \rightarrow \Phi(\mathrm{r}) \alpha \mathrm{m}$.Then $\left(\mathrm{r}_{1} \alpha \mathrm{r}_{2}\right) \circ \beta \circ \mathrm{m}=\Phi\left(\mathrm{r}_{1} \alpha \mathrm{r}_{2}\right) \beta \mathrm{m}=\left(\Phi\left(\mathrm{r}_{1}\right) \alpha \Phi\left(\mathrm{r}_{2}\right)\right) \beta \mathrm{m}$ $=\Phi\left(\mathrm{r}_{1}\right) \alpha\left(\Phi\left(\mathrm{r}_{2}\right) \beta \mathrm{m}\right)=\Phi\left(\mathrm{r}_{1}\right) \alpha\left(\mathrm{r}_{2} \circ \beta \circ \mathrm{~m}\right)=\mathrm{r}_{1} \circ \alpha\left(\mathrm{r}_{2} \circ \beta \circ \mathrm{~m}\right)$ for all $\mathrm{r}_{1}, \mathrm{r}_{2} \in \mathrm{R}, \alpha, \beta \in \Gamma, \mathrm{m} \in \mathrm{M}$

Proposition 4.11 Let M , N be $\mathrm{S}_{\Gamma}$-acts . Then $\operatorname{Hom}_{\mathrm{S}_{\Gamma}}(\mathrm{M}, \mathrm{N})$ is an $\mathrm{S}_{\Gamma}$-act.
Proof. Consider the mapping $S \times \Gamma \times \operatorname{Hom}_{\mathrm{S}_{\Gamma}}(\mathrm{M}, \mathrm{N}) \rightarrow \operatorname{Hom}_{\mathrm{s}_{\Gamma}}(\mathrm{M}, \mathrm{N})$ which define by $(\mathrm{s}, \alpha, \Phi)=\mathrm{s} \alpha \Phi$, where $\mathrm{s} \alpha \Phi(\mathrm{m})=$ $\mathrm{s} \alpha \Phi(\mathrm{m}), \mathrm{m} \in \mathrm{M}$. Since M be $\mathrm{S}_{\Gamma}$-act, clearly that $\operatorname{Hom}_{\mathrm{S}_{\Gamma}}(\mathrm{M}, \mathrm{N})$ is $\mathrm{S}_{\Gamma}$-act

Proposition 4.12 Let $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be an $\mathrm{S}_{\Gamma}$-homomorphism, and $\rho$ a congruence on M such that $\rho \subseteq \operatorname{Ker}(\mathrm{f})$. Then there exists unique $S_{\Gamma}$-homomorphism $\bar{f}: M / \rho \rightarrow N, \bar{f} \pi \rho=f$ and $\bar{f}$ is $S_{\Gamma}$-epimorphism if and only if $f S_{\Gamma}$ epimorphism .
Proof. First we must show $\bar{f}$ is well define. Let $x \rho, y \rho \in M / \rho$ such that $x \rho=y \rho$, then $(x, y) \in \rho \subseteq \operatorname{Ker}(f)$ then $f(x)=$ $f(y)$. Then $\bar{f}(x \rho)=\bar{f}(y \rho)$, this shows that $\bar{f}$ is well defined. $\bar{f}(\operatorname{s} \alpha x \rho)=\bar{f}((s \alpha x) \rho)=f(s \alpha x)=\operatorname{s\alpha f}(x)=\operatorname{s} \bar{f}(x \rho)$, then $\bar{f}$ is $S_{\Gamma}$-homomorphism and clearly $\operatorname{Im}(f)=\operatorname{Im}(\overline{\mathrm{f}})$. Let $\mathrm{x} \in \mathrm{M}$, the $(\overline{\mathrm{f}} \pi \rho)(\mathrm{x})=\overline{\mathrm{f}}(\pi \rho(\mathrm{x}))=\overline{\mathrm{f}}(\mathrm{x} \rho)=\mathrm{f}(\mathrm{x})$
for all $x \in M$ then $\bar{f} \pi \rho=f$ and clearly $\bar{f}$ is a uniqe and $\bar{f} S_{\Gamma}$-epimorphism if and only if $f S_{\Gamma}$-epimorphism .
From proposition(4.12), if $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ is an $\mathrm{S}_{\Gamma}$-homomorphism, then $\mathrm{M} / \operatorname{ker}(\mathrm{f}) \cong \operatorname{Im}(\mathrm{f})$
Theorem 4.13 Let $\rho_{1}$ and $\rho_{2}$ be two congruences on $S_{\Gamma}$-act $M$. with $\rho_{1} \subseteq \rho_{2}$. Define

$$
\rho_{2} / \rho_{1}=\left\{\left(x \rho_{1}, y \rho_{1}\right) \in\left(M / \rho_{1}\right) \times\left(M / \rho_{1}\right) \mid(x, y) \in \rho_{2}\right\} . \text { Then }
$$

1. $\rho_{2} / \rho_{1}$ is a congruence on $M / \rho_{1}$.
2. $\left(M / \rho_{1}\right) /\left(\rho_{2} / \rho_{1}\right) \cong M / \rho_{2}$.

Proof. 1. First we show that $\rho_{2} / \rho_{1}$ is an equivalent relation on $M / \rho_{1}$, let $x \rho_{1} \in M / \rho_{1}$, implies $\left(x \rho_{1}, x \rho_{1}\right) \in \rho_{2} / \rho_{1}$. If $(x \rho 1, y \rho 1) \in M / \rho_{1}$ then $(x, y) \in \rho_{2}$ and $(y, x) \in \rho_{2}$ therefore $\left(y \rho_{1}, x \rho_{1}\right) \in \rho_{2} / \rho_{1}$. Next if $\left(x \rho_{1}, y \rho_{1}\right)$ and ( $\left.y \rho_{1}, z \rho_{1}\right)$ then $(x, y),(y, z) \in \rho_{2}$ we get $(x, z) \in \rho_{2}$, then $\left(x \rho_{1}, z \rho_{1}\right) \in \rho_{2} / \rho_{1}$. Finally let $s \in S, \alpha \in \Gamma,\left(x \rho_{1}, y \rho_{1}\right) \in \rho_{2} / \rho_{1}$, then $(x, y) \in \rho_{2}$ and $(\mathrm{s} \alpha \mathrm{x}, \mathrm{s} \alpha \mathrm{y}) \in \rho_{2}$ implies that $\left(\operatorname{s} \alpha \rho_{1}, s \alpha y \rho_{1}\right) \in \rho_{2} / \rho_{1}$.
2. Define $\Phi:\left(M / \rho_{1}\right) /\left(\rho_{2} / \rho_{1}\right) \rightarrow M / \rho_{2}$ by $\Phi\left(\left(x \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)\right)=x \rho_{2}$ for all $x \in M$. If $\left(x \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)=\left(y \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)$ then $\left(x \rho_{1}, y \rho_{1}\right) \in \rho_{2} / \rho_{1}$ and $(x, y) \in \rho_{2}$ implies $x \rho_{2}=y \rho_{2}$. let $x \rho_{2} \in M / \rho_{2}$ then $x \in M, x \rho_{1} \in M / \rho_{1},\left(x \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right) \in$ $\left(\mathrm{M} / \rho_{1}\right) /\left(\rho_{2} / \rho_{1}\right)$ such that $\Phi\left(\left(\mathrm{x} \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)\right)=\mathrm{x} \rho_{2}$ and hence $\Phi$ is onto ,let $\Phi\left(\left(\mathrm{x} \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)\right)=\Phi\left(\left(\mathrm{y} \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)\right)$, implies that $x \rho_{2}=y \rho_{2},(x, y) \in \rho_{2}$ then $\left(x \rho_{1}, y \rho_{1}\right) \in \rho_{2} / \rho_{1}$ and $\left(x \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)=\left(y \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)$ this shows $\Phi$ is injective. Finally, let $\mathrm{s} \in \mathrm{S}, \alpha \in \Gamma$ and $(\mathrm{x} \rho)\left(\rho_{2} / \rho_{1}\right) \in\left(\mathrm{M} / \rho_{1}\right) /\left(\rho_{2} / \rho_{1}\right)$, then $\left.\Phi\left(\mathrm{s} \alpha\left(\mathrm{x} \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)\right)=\Phi\left((\mathrm{s} \alpha \mathrm{x}) \rho_{1}\right)\left(\rho_{2} / \rho_{1}\right)\right)=(\mathrm{s} \alpha \mathrm{x}) \rho_{2}=\mathrm{s} \alpha(\mathrm{x}) \rho_{2}=$ $\left.\operatorname{s} \alpha \Phi\left(\left(x \rho_{1}\right) \rho_{2} / \rho_{1}\right)\right)$.Then $\left(M / \rho_{1}\right) /\left(\rho_{2} / \rho_{1}\right) \cong M / \rho_{2}$

## 5. Finite generated, cyclic and simple gamma acts.

Let $M$ be an $S_{\Gamma}$-act and $X$ a nonempty subset of $M$ we have proved that $[X]_{M}$ is the smallest $S_{\Gamma}$-subact of $M$ which contains $X$. Note that $[X]_{M}:=\bigcap\{B \mid X \subseteq B, B \leq M\}$ is the $S_{\Gamma}$-subact generated by $X$. In the following proposition we describe $[\mathrm{X}]_{\mathrm{M}}$ in terms of their elements .

Proposition 5.1 Let $M$ be an an $S_{\Gamma}$-act and $X$ a nonempty subset of $M$. Then $[X]_{M}=U_{u \in X} S \Gamma u$ where $\mathrm{S} \Gamma \mathrm{u}=\{\mathrm{s} \alpha \mathrm{u} \mid \mathrm{s} \in \mathrm{S}$ and $\alpha \in \Gamma\}$.

Proof. Let $W=\bigcup_{u \in X} S \Gamma u$., $x \in W, s \in S$ and $\alpha \in \Gamma$. There is $s^{\prime} \in S, \alpha^{\prime} \in \Gamma, u_{0} \in X$ such that $x=s^{\prime} \alpha^{\prime} u_{0}$, then $s \alpha x=s \alpha\left(s^{\prime} \alpha^{\prime} u_{0}\right)=\left(s \alpha s^{\prime}\right) \alpha^{\prime} u_{0} \in S \Gamma u_{0} \subseteq W$, we have $W \leq M$. Since for all $x \in X, x=1 \alpha_{0} x \in S \Gamma x \subseteq W$ then $X \subseteq W$ . By definition of $[X]_{M}$ we get $[X]_{M} \subseteq W$. Now if $x \in W$, then $x=s \alpha u^{\prime} \in[X]_{M}$ where $s \in S, \alpha \in \Gamma$ and $u^{\prime} \in X$, then $\mathrm{W} \subseteq[\mathrm{X}]_{\mathrm{M}}$. we get $\mathrm{W}=[\mathrm{X}]_{\mathrm{M}}$.

Proposition 5.2 Let $M$ be an $S_{\Gamma}$-act and $A$, B nonempty subsets of $M$.Then

1. $[\mathrm{A} \cap \mathrm{B}] \subseteq[\mathrm{A}] \cap[\mathrm{B}]$
2. $[\mathrm{AUB}]=[\mathrm{A}] \mathrm{U}[\mathrm{B}]$
3. if $f: M \rightarrow N$ is an $S_{\Gamma}$-homomorphism, then $f\left([A]_{M}\right)=[f(A)]_{N}$
4. if $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ is an $\mathrm{S}_{\Gamma}$-epimorphism and $\varnothing \neq \mathrm{C} \subseteq \mathrm{N}$, then $\left[\mathrm{f}^{1}(\mathrm{C})\right]_{\mathrm{M}} \subseteq \mathrm{f}^{1}\left([\mathrm{C}]_{N}\right)$

Proof. 1. Let $x \in[A \cap B]$ then there is $s \in S, \alpha \in \Gamma, x^{\prime} \in A \cap B$ such that $x=s \alpha x^{\prime}$, then $x=s \alpha x^{\prime} \in[A], x=s \alpha x^{\prime} \in$ $[B]$. Then $x=s \alpha x^{\prime} \in[A] \cap[B]$, we get $[A \cap B] \subseteq[A] \cap[B]$.
2. $[\mathrm{A} \cup B]=\mathrm{U}_{\mathrm{u} \in \mathrm{A} \cup \mathrm{B}} \mathrm{S} \Gamma \mathrm{u}=\left(\mathrm{U}_{\mathrm{u} \in \mathrm{A}} \mathrm{S} \Gamma \mathrm{u}\right) \mathrm{U}\left(\mathrm{U}_{\mathrm{u} \in \mathrm{B}} \mathrm{S} \Gamma \mathrm{u}\right)=[\mathrm{A}] \mathrm{U}[\mathrm{B}]$. We get $[\mathrm{AUB}]=[\mathrm{A}] \mathrm{U}[\mathrm{B}]$.
3. Clearly that (A) is nonempty and since $[A]_{M} \leq M$, then $f\left([A]_{M}\right) \leq N$ by proposition 4.5 and
$\mathrm{f}\left([\mathrm{X}]_{\mathrm{M}}\right)=\left\{\mathrm{f}(\mathrm{s} \alpha \mathrm{x}) \mid \operatorname{sax} \in[\mathrm{x}]_{\mathrm{M}}\right\},[\mathrm{f}(\mathrm{X})]_{\mathrm{N}}=\{\operatorname{s\alpha f}(\mathrm{x}) \mid \mathrm{x} \in \mathrm{X}\}$ and since f is $\mathrm{S}_{\Gamma}$-homomorphism we get $f\left([A]_{M}\right)=[f(A)]_{N}$
4. it is clear $f^{1}(C)$ is a nonempty subset of $N,\left[f^{-1}(C)\right]_{M}=\left\{s \alpha x \mid s \in S, \alpha \in \Gamma\right.$ and $\left.x \in f^{-1}(C)\right\}$,
$f^{1}\left([C]_{N}\right)=\left\{x \in M \mid f(x) \in[C]_{N}\right\}$. If $x \in\left[f^{-1}(C)\right]_{M}$ then there exist $s \in S, \alpha \in \Gamma$ and $x^{\prime} \in f^{-1}(C)$ such that $x=s \alpha x^{\prime}$, then $f(x)=f\left(s \alpha x^{\prime}\right)=\operatorname{s\alpha f}\left(x^{\prime}\right) \in[C]_{N}$.

Definitoin 5.3 A nonempty subset $U$ of $S_{\Gamma}$-act $M$ is said to a set of generating elements or generating set of $M$ if $M=[U]$. We say that $M$ is finitely generated if $[U]=M$ for some subset $U$ of $M$ which $|U|<\infty$. And $M$ is a cyclic if $M=[\{u\}]$ for some $u \in M$. In particular $M=[M]$.

Proposition 5.4 Let $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$-homomorphism .Then

1. If M is finitely generating (cyclic), then $(\mathrm{M})$ is finitely generating (cyclic) .
2. If $\mathrm{M}=[\mathrm{U}]$ and $\boldsymbol{\Phi}: \mathrm{M} \rightarrow \mathrm{N}$ be $\mathrm{S}_{\Gamma}$-homomorphism, then if $\mathrm{f}(\mathrm{u})=\Phi(\mathrm{u})$ for all $\mathrm{u} \in \mathrm{U}$ implies $\mathrm{f}=\Phi$.

Proof. 1. Follows from Proposition (5.2).
2. For $m \in M, f(m)=f(s \alpha h)=\operatorname{s} \alpha f(h)=s \alpha \Phi(h)=(s \alpha h)=\Phi(m)$ for some $s \in S, \alpha \in \Gamma, h \in U$.

Note. Let M be an $\mathrm{S}_{\Gamma}$-act and let $\mathrm{m}^{\circ} \in \mathrm{M}$. Then $<\mathrm{m}^{\circ}>=\mathrm{S} \Gamma \mathrm{m}^{\circ}=\left\{\mathrm{s} \alpha \mathrm{m}^{\circ} \mid \mathrm{s} \in \mathrm{S}, \alpha \in \Gamma\right\}$ is a cyclic $\mathrm{S}_{\Gamma}$-subact of M generated by $\mathrm{m}^{\circ}$.

Example 5.5 Consider the gamma act in example(2.6)(m) where $n=2$.Then $[(1,0)]=\{(\mathrm{s} \alpha, 0) \mid \mathrm{s} \in \mathrm{S}, \alpha \in \Gamma\}$ and $[(0,1)]=\{(0, s \alpha) \mid s \in S, \alpha \in \Gamma\}$.

Example 5.6 Consider the gamma act in example(2.4)(H).Then $[\{a\}]=\{A B\{a\} \mid A \in S, B \in \Gamma\}=\{\varnothing,\{a\}\}$ and $[\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}]=\{\mathrm{AB}\{\mathrm{a}, \mathrm{b}, \mathrm{c}\} \mid \mathrm{A} \in \mathrm{S}, \mathrm{B} \in \Gamma\}=\mathrm{S}$. We get $\mathrm{S}_{\Gamma}$-act S be cyclic $\mathrm{S}_{\Gamma}$-act generated by $\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$.

Example 5.7 It is well-known that $\mathbb{Z}$ is $\mathbb{Z}_{\mathbb{N}}$-act . $\mathrm{A} \mathbb{Z}_{\mathbb{N}}$-subact $\mathbb{Z}_{\mathrm{e}}$ is cyclic.
Definition 5.8 Let $M$ be an $S_{\Gamma}$-act. Then

1. M is a simple $\mathrm{S}_{\Gamma}$-act, if it contain no gamma subact other than M .
2. $M$ is a 1-simple $S_{\Gamma}$-act, if it contain no gamma subact other than $M$ and 1-element gamma subacts .

Examples 5.9 clearly one element $S_{\Gamma}$-act is simple
Clearly every simple is a 1 -simple, but the converse may not true as in the following example .
Let $S=\mathbb{Q}, \Gamma=\mathbb{Z}, M=\mathbb{Q}$. Then $M$ is a $\Gamma$-semigroup by usual multiplication of numbers .i.e $\left(r_{1}, \mathrm{Z}, \mathrm{r}_{2}\right) \rightarrow \mathrm{r}_{1} \cdot \mathrm{z} . \mathrm{r}_{2}$ be usual multiplication of numbers. Let $N=\{0\}$ is clear that $N \leq M$ but $N \neq M$ then $M$ is not simple $S_{\Gamma}$-act but 1simple since. let $N$ be non singleton $S_{\Gamma}$-subact of $M$. Let $0 \neq x \in N$, then $\frac{1}{x} \in S$ and $\frac{1}{x} \cdot 1 \cdot x=1 \in N$. Now to show $\mathrm{N}=\mathrm{M}$ let $\mathrm{y} \in \mathrm{M}=\mathrm{S}$ then $\mathrm{y} \cdot 1.1=\mathrm{y} \in \mathrm{N}$. we get $\mathrm{N}=\mathrm{M}$.

Proposition 5.10 Let $M$ be an $S_{\Gamma}$-act.If $M$ is simple. Then $M=S \Gamma m$ for every $m \in M$.
Now we give condition under which cyclic gamma acts are simple .
Proposition 5.11 Let $M$ be cyclic $S_{\Gamma}$-act generated by $u$, and $\rho$ be a congruence on $M$. Then the cyclic gamma act $M / \rho$ is simple if and only if u $\cap S \Gamma m \neq \emptyset$ for any $m \in M$.

Proof. Assume that $M / \rho$ be simple, $\pi \rho: M \rightarrow M / \rho$ be the canonical epimorphism and $m \in M$. Then $\pi \rho(S \Gamma m)$ is a gamma subact of $M / \rho$. Since $M / \rho$ is a simple we have $\pi \rho(S \Gamma m)=M / \rho$. Hence there exist $x \in S \Gamma m$ such that $\pi \rho(x)=$ up. Thus $x \in u \rho$ and u $\cap \mathrm{S} \Gamma \mathrm{m} \neq \emptyset$.
Conversely. Let $N \leq M / \rho$ and $t \in \Pi_{\rho}^{-1}(N)$.By hypothesis there exist $s \in S, \alpha \in \Gamma$ such that s $\alpha t \in u \rho$. Now $u \rho=\pi \rho(s \alpha t)=s \alpha \Pi \rho(t) \in N$. This implies $M / \rho=S \Gamma u \rho \leq N$. Hence $N=M / \rho$.

Definition 5.12 Let $M$ be an $S_{\Gamma}$-act and $N \leq M$.A Rees congruence $\rho_{N}$ is a congruence on $M$ define by a $\rho_{N} b$ if and only if $\mathrm{a}, \mathrm{b}$ in N or $\mathrm{a}=\mathrm{b}$. We denote the resulting factor by $\mathrm{M} / \mathrm{N}$ and call it the Rees factor of M by the gamma subact N . Clearly $\mathrm{M} / \mathrm{N}$ has a zero element which is the class consisting of N , all other class are one-element sets

The following statement is a corollary of the previous proposition. And can also be obtained straightforward from definition of a simple act.

Proposition 5.13 Let $N$ be a gamma subact of $M$. The Rees factor $M / N$ is a simple if and only if $N=M$
Definition 5.14 Let $M$ be $S_{\Gamma}$-act. $M$ is called decomposable, if there are two sub act $B, C$ of $M$ such that $\mathrm{M}=\mathrm{A} \cup \mathrm{B}, \mathrm{A} \cap \mathrm{B}=\varnothing$, otherwise M is call indecomposable.

Proposition 5.15 Every cyclic $\mathrm{S}_{\Gamma}$-act is indecomposable .
Proof. let $M=[\{u\}]$ and let $M=A \cup B(A, B \leq M) u \in M=A \cup \underline{B}$ then either $a \in A$ or $a \in B$. If $a \in A$ then $\mathrm{M}=[\{\mathrm{a}\}] \subseteq \mathrm{A}$. Then $\mathrm{M}=\mathrm{A}$, or $\mathrm{a} \in \mathrm{B}$ implies $\mathrm{M}=\mathrm{B}$

Lemma 5.16 Let $M$ be $S_{\Gamma}$-act, $I$ be nonempty set, $A_{i}$ be indecomposable $S_{\Gamma}$-subact of $M$ for all i $\in I$, and $\bigcap_{i \in I} A i \neq \varnothing$. Then $\bigcup_{i \in I} A i$ is indecomposable $S_{\Gamma}$-subact .

Proof. Clearly $U_{i \in I} A i$ is an $S_{\Gamma}$-subact from $M$. Assume there exists $A$ decomposition $U_{i \in I} A i=B U C$, let $x$ $\in \bigcap_{i \in I} A i \subseteq \bigcup_{i \in I} A i=B \cup C$ with $B \cap C=\varnothing$. Then either $x \in \bigcup_{i \in I} A i \cap B$ or $x \in \bigcup_{i \in I} A i \cap C$. And since

$$
A_{i}=A_{i} \cap(B \cup C)=\left(A_{i} \cup B\right) \cap\left(A_{i} \cup C\right)=\varnothing, \text { a contradiction! }
$$

Definition 5.17 Let M be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact . A nonempty subset N of M is called

1. A right $(T-S)_{\Gamma^{-}}$-subbiact , if $N$ is $S_{\Gamma}$-subact on $M$, i.e. $N \Gamma S \subseteq N$.
2. A left $(T-S)_{\Gamma}$-subbiact , if $N$ is $T_{\Gamma}$-subact on $M$, i.e $T \Gamma N \subseteq N$.
3. $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact, if it is right and left $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact ,i.e $\mathrm{T} \Gamma \mathrm{N} \subseteq \mathrm{N}$ and $\mathrm{N} \Gamma \mathrm{N} \subseteq \mathrm{N}$

Definition 5.18 . Let M be (T-S) $)_{\Gamma}$-biact . Then M is called

1. Right simple (T-S) $\Gamma_{\Gamma}$-biact. If it has not right $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact other than M
2. Left simple (T-S $)_{\Gamma}$-biact. If it has not left $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact other than M
3. Simple $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact . If it has not neither left nor right $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact other than M

Theorem 5.19 Let M be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact. If M is a left or right simple $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact, then M is a simple $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact .
Proof. consider M is right simple (T-S) $)_{\Gamma}$-biact, Let N be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact on M . Then N is left and right
$(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact on M , and since M is a right simple, N is a right $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact implies that $\mathrm{N}=\mathrm{M} . \mathrm{M}$. By the same we proof if $M$ is a left simple (T-S $)_{\Gamma}$-biact .

Theorem 5.20 Let M be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-biact. Then

1. $M$ is a right simple if and only if $m \Gamma S=M$ for all $m \in M$.
2. $M$ is a left simple if and only if $T \Gamma m=M$ for all $m \in M$.

Theorem 5.22 Let $M$ be $(T-S)_{\Gamma}$-biact. Then $M$ is a simple $(T-S)_{\Gamma}$-biact if and only if $T \Gamma \mathrm{~m} \Gamma \mathrm{~S}=\mathrm{M}$ for all $\mathrm{m} \in \mathrm{M}$.
Proof. $\Rightarrow \quad$ it is clear
Conversely let N be $(\mathrm{T}-\mathrm{S})_{\Gamma}$-subbiact , and $\mathrm{n} \in \mathrm{N}$, implies $\mathrm{T} \Gamma \mathrm{n} \Gamma \mathrm{S}=\mathrm{M}$. Now let
$\mathrm{m} \in \mathrm{M}=\mathrm{T} \Gamma \mathrm{n} \Gamma \mathrm{S}$, then $\mathrm{m}=\tan \beta \mathrm{s} \in \mathrm{N}, \mathrm{t} \in \mathrm{T}, \alpha, \beta \in \Gamma$ and $\mathrm{s} \in \mathrm{S}$. Implies that $\mathrm{M}=\mathrm{N}$.
