#### Abstract

International relations is truly the manner in which inter-state interactions take place, the behaviour by which they concern each other with issues that touch economic performance, political alignments and social cultural relations. However, it is more than that. In order to clearly understand these inter-state relations, one must truly look at the state cooperation or lack thereof. This paper sets the scene for the concept of global health by identifying the link between the concept and international relations. The insight into the need of health impact assessment is reviewed in the international relations where the key assumption is that issues of global health are ignored in international relations. There is hence the review of impact that the incorporation of global health issues can have in international diplomacy. The aim of this study is to stress the great amount of negligence that exists within the world of International cooperation in the field of Global Health. Global health cooperation is more important than ever. The International response to Covid-19 pandemic, as well as the lack of transparency within Global Cooperation, and interstate relations were examined in this study. The clear observation of military expenditure rises, and the extreme lack of financial redirection against states during times COVID-19 is seen. The lack of compassion from governmental and medical institutions in vulnerable states is also demonstrated. This research was undertaken in a form of Case studies in order to demonstrate the real time results and impacts on often quickly dismissed states. 3 One conclusion is the unpreparedness in terms of response in many countries it suggested the need for improved International Health Regulations. Governmental efforts, alongside community based initiatives and contributions towards health care maintenance have been taken into consideration. The issue lies in the neglect of other aspects of Health especially in times of crises. In my view, the term "Global Health" is widely misunderstood and misrepresented. The context within Global Health may arise from different political backgrounds and focused on different disciplinary principles. It requires a certain capability to deal with heterogeneous ideas in macro, micro, and behavioral economics; sociology, political science, international affairs, and public policy. Global health will necessitate moving beyond simple health advocacy in order to be fully comprehended. By contrasting different state responses to COVID-19

outbreaks, in hopes to prevent spreading, setting a precedent for populations, health managers, and leaders around the world on how to plan for, track, and respond to possible outbreaks. The Centers for Disease Control and Prevention (CDC) and the Centers for Disease Control and Prevention (CDC) were used to compare outbreak preparedness and management strategies for this report.

**Introduction:-**

International relations is truly the manner in which inter-state interactions take place, the behaviour by which they concern each other with issues that touch economic performance, political alignments and social cultural relations. However, it is more than that. In order to clearly understand these inter-state relations, one must truly look at the state cooperation or lack thereof.

This paper sets the scene for the concept of global health by identifying the link between the concept and international relations. The insight into the need of health impact assessment is reviewed in the international relations where the key assumption is that issues of global health are ignored in international relations. There is hence the review of impact that the incorporation of global health issues can have in international diplomacy. The aim of this study is to stress the great amount of negligence that exists within the world of International cooperation in the field of Global Health. Global health cooperation is more important than ever. The International response to Covid-19 pandemic, as well as the lack of transparency within Global Cooperation, and interstate relations were examined in this study.

The clear observation of military expenditure rises, and the extreme lack of financial redirection against states during times COVID-19 is seen. The lack of compassion from governmental and medical institutions in vulnerable states is also demonstrated. This research was undertaken in a form of Case studies in order to demonstrate the real time results and impacts on often quickly dismissed states. 3 One conclusion is the unpreparedness in terms of response in many countries it suggested the need for improved International Health Regulations.

Governmental efforts, alongside community based initiatives and contributions towards health care maintenance have been taken into consideration. The issue lies in the neglect of other aspects of Health especially in times of crises. In my view, the term “ Global Health” is widely misunderstood and misrepresented. The context within Global Health may arise from different political backgrounds and focused on different disciplinary principles. It requires a certain capability to deal with heterogeneous ideas in macro, micro, and behavioral economics; sociology, political science, international affairs, and public policy.

Global health will necessitate moving beyond simple health advocacy in order to be fully comprehended. By contrasting different state responses to COVID-19 outbreaks, in hopes to prevent spreading, setting a precedent for populations, health managers, and leaders around the world on how to plan for, track, and respond to possible outbreaks. The Centers for Disease Control and Prevention (CDC) and the Centers for Disease Control and Prevention (CDC) were used to compare outbreak preparedness and management strategies for this report.
