The mangrove species like, *Acanthus ebracteatus* Vahl., *Nypa fruticans* (Thumb.) Wurmb., *Heritiera littoralis* Dryand ex Ait., *Kandelia candel* (L) Druce, *Phoenix paludosa* Roxb., *Xylocarpus moluccensis* (Lam.) Roem., are presently classified as true mangroves due to their physiological and morphological adaptations and mostly supported the work of Santisuk (1983) and Singh and Odaki (2004). Other species, *Acanthus volubilis* Wall., *Acrostichum aureum* L., *Acrostichum speciosum* Willdenow, *Aglaia cucullata* (Roxb.) Pellegrin, *Brownlowia tersa* (L.) Kostern, *Cerbera odollam* Gaertn., *Cynometra iripa* Kostel, *Dalbergia spinosa* Roxb., *Dolichandrone spathacea* K.Schu., *Excoecaria indica* (Willd.) Mull. and *Suaeda maritima* L. (Dumort) are classified as mangrove associates due to the lack of adaptation modifications, poor capability of toleration to long term saline water inundation and most of them found as the understory vegetation.

Latiff (2012) included the mangrove species like *Nypa fruticans* (Thunb.) Wurmb., *Intsia bijuga* (Colebr.) Kuntz. and *Heritiera littoralis* Dryand ex Ait. as non exclusive mangroves. Wang et al., (2010) classified the species like *E. agallocha* L. and *H. littoralis* Dryand ex Ait. as mangrove associate although they have wide range of salinity tolerance and both physiological and morphological adaptation modifications. Similarly, the species *Pemphis acidula* Forst. is described as true mangrove by different workers (Table 3) but our present classification included it into mangrove associate due to lack of adaptation modifications, like aerial roots, viviparous or crypto viviparous seed development and salt resisting abilities etc. *Pemphis acidula* Forst is an understory mangrove with succulent leaves and the species need freshwater input. The species, *Acanthus volubilis* Wall. being having viviparous embryo development, classified as mangrove associate due to absence of required characters to be a true mangrove and the important one, this species is a climber and grow on the surface of other true mangrove species (i.e., most frequently on *E. agallocha* L.) and lack forming pure stands.

The previously recorded species *Heritiera kanikensis* (Majumdar and Banerjee, 1985) and *Sonneratia griffithii* Kurz., *Cynometra ramiflora* L. (Selvam, et al., 2004; Upadhyay, 2008) were not recorded during our present study. The mangrove species *Excoecaria indica* (Willd.) Mull. Arg. is commonly known as *Sapium indicum* Willd. in Bhitarkanika NP. But our present classification explained it as *E. indica* (Willd.) Mull. Arg. due to the presence of characters like spiny stem and trunk, leaf morphology etc. and the name is globally used. *H. fomes* Buch-Ham. is a globally threatened species of extinction but this is one of the dominating species of Bhitarkanika NP. Another species, *Brownlowia tersa* (L) Kostern. which is in the category of near threatened (Kathiresan, 2010) is abundantly found at the sites like Ragrapatia and river banks close to Dangmal, Bhitarkanika and Mahisamunda reserve forests of Bhitarkanika NP.

The recorded flowering period of each mangrove species favors the work done by (Upadhyay and Mishra, 2010) with small variation. The phenological study of mangrove species showed most of the mangrove species go flowering during winter or late winter but before start of monsoon rain due imposed stress of nutrient scarcity and high water and soil salinity.

Many mangrove species of Bhitarkanika are endemic and not found elsewhere in India. The species like *C. iripa* Kostel, *I. bijuga* (Colebr.), *Dolicandron spathecia* (L.f.) K.Schum., *A. volubilis* Wall., *A. ebracteatus* Vahl. etc. are endemic to Bhitarkanika NP and only found in some part of Sundarbans and Andaman mangrove ecosystem (Rajendran and Sanjeevi, 2004; Raghvan *et al.*, 2014). *E. indica* (Willd.) Mull. Arg. is only found close to Khola creek in Bhitarkanika NP and not elsewhere in India. The global trend of *E. indica* (Willd.) Mull. Arg. is decreasing. The mangrove plant, *N. fruticans* (Thumb.) Wurmb, was extinct from Bhitarkanika NP but it has been reintroduced to the site from Sundarban to maintain the diversity of the ecosystem (Panda *et al.*, 2013). Many associate flora are also endemic to this site and not found elsewhere in India. The number of true mangroves and dominating mangrove species of Bhitarkanika and Sundarban is of similar (Selvom, 2003). The present recorded mangrove diversity of Bhitarkanika ecosystem shows it is one among the most diversified mangrove ecosystems of world (Kathiresan and Rajendran, 2005) and if the mangrove associate flora is taken into consideration, then Bhitarkanika mangrove ecosystem will be the most species diversified ecosystem of India.

### Conclusion:-

Our present work classified two groups of mangroves (i.e., true or associate mangroves) based on individual species adaptation and not divided the exclusive or true mangroves further into 'major' and 'minor' as done by Tomlinson (1986). Mangroves have great ecological role and provides resource to the coastal livelihoods of Odisha. The past conditions favored the luxuriant growth of *E. agallocha* L. and *H. fomes* Buch-Ham. inside Bhitarkanika National Park but both are low saline tolerating species. The study noted many mangroves of Bhitarkanika National Park had site specific distribution. The sites with more freshwater inputs and water inundation, housed more number of species than the site with less fresh water input. But still there are some areas (i.e., Habelikhati, Ekakula) where many riverine mangroves (i.e., *Rhizophora* spp.) were found towards land in number of patches. The global climate change induced sea level rise may become a critical factor (Gilman, *et al.*, 2008) for the present existing dominating species of Bhitarkanika mangrove reserve forests and for change in mangrove habitat (Selvom, 2003; SAC, 2012 and Rao, *et al.*, 2015). The study of Upadhyaya and Mishra (2008), showed that more than 80% of death and damages of mangrove trees have been due to anthropogenic (human induced) disturbances. The mangroves and associates are likely to become vulnerable in near future due to both man-made and natural threats (Kathiresan, 2010). The Coastal Vulnerability Index (CVI) study also showed that some part in coastal area of Kendrapara district (close to Dhamara mouth) has high risk of vulnerable to coastal change (Kumar, *et al.*, 2010). Many species of this wetland is under pressure of extinction (Panda *et al.*, 2013) and must be conserved before the genetic erosion. Many mangrove species in Bhitarkanika were found as rare of occurrence (i.e., *C. tagel* (Per.) Rob., *B. parviflora* Wt. & Arn., *B. gymnorhiza* (L.) Lamk, *R. stylosa* Griff., *A. ebracteatus* Vahl., *A. volubilis* Wall., *E. indica* (Willd.) Mull. Arg., *I. bijuga* (Colebr.) Kuntz, *Tylophora* spp. and *Sarcobolobus* spp.) and these species should be given priority for conservation.

### Acknowledgements:-

The authors are thankful to Principal Chief Conservator of Forest (PCCF- Wildlife), Odisha and Divisional Forest Officer (DFO), Rajnagar block of district Kendrapara for their approval and collaboration during field surveys inside Bhitarkanika Wildlife Sanctuary & Mangrove National Park (Odisha), India.

#### **Abstract**

In order to cope up with fast changing world, creativity development from early life is essential. Thus, primary school teachers are required to foster children ability in discovery, solving problems, being creative in writing, art, music, developing their self-confidence as learners and maturing socially and emotionally. In establishing classroom and school environment conducive to creative thinking of children, teachers and school principals have great roles and responsibilities. The purpose of this study was to examine teachers' and school principals' awareness and practice in fostering children creativity. A total of 54 samples (45 teachers, 3 principals, 3 vice principals, and 3 supervisors) were selected from Debre Tabor Town elementary school teachers, principals, vice principals, and supervisors (281, 7, 4, and 4 respectively). Stage random sampling technique was used to select samples from the population. Data were collected through questionnaire, observations and focus group discussion. Results revealed that the level of teachers', Principals' and supervisors' awareness of characteristics of creative person such as tendency to practice with alternative solutions, synthetic ability, insight ability, sensitivity to problems, tolerance of anxiety, passionate involvement in tasks, affective pleasure in challenge, tolerance of ambiguity, risk taking, openness to experience, unconventional values, curiosity, preference for challenges and complexity, and independence of judgment was below the average. And also regarding their familiarity with statements indicating characteristics of creative person, teachers were more familiar with self- confidence ( $M=4.98$ ,  $S=0.51$ ) and least familiar with tolerance of ambiguity ( $M=2.65$ ,  $S=0.79$ ). Under affective processes teachers were more familiar with statements indicating affective fantasy in play ( $M=4.10$ ,  $S=0.66$ ) and least familiar with affective pleasure in challenge ( $M=2.99$ ,  $S=0.61$ ). From cognitive processes, teachers were more familiar with practical contextual ability ( $M=4.91$ ,  $S=0.58$ ) and least familiar with tendency to practice with alternative solutions ( $M=3.56$ ,  $S=0.52$ ). Regarding children creativity, teachers were focused more on the products than processes – missing to consider what is happening in children's mind. The school observation showed that 33.3% ( $N=1$ ) of the school has not stored children creative products and 66.7 % ( $N=2$ ) of the schools have stored some of children

products. Inversely, 66.7% (N=2) of the school never used different colors in children creative products and 33.3 % (N=1) of the schools used different colors. The focus group discussion result also showed that, there were lack of materials provision like different color chalk, marker, play materials, charts and the like. In measuring children creativity, teachers have been focused more on product. Teachers had been motivating children more to recall what they have learnt rather than motivating them to communicate their idea, imagination and creative work with other students. Suggestions were made on the ways of promoting teachers awareness and practice in fostering children creativity by organizing training for them, providing required materials and support.

## ..... **Introduction:-**

In literature, creativity is defined differently by different researchers. According to Runco (2003) and Runco, (2004), creativity is usually tied to originality – the development of original ideas that are useful or influential, ability of problem solving and problem finding, any thinking or problem solving that involves the construction of new meaning is creative. For Ryhmmar and Brolin (1999), creativity is exceptional human capacity for thought and creation. National Curriculum Handbook for Primary and Secondary Teachers (1999) as cited in Craft (2001) on the other hand describe Creativity as a thinking skills enable pupils to generate and extend ideas, to suggest hypotheses, to apply imagination, and to look for alternative innovative outcomes.

Creativity has clear benefit for individual and society as a whole. The current fast changing world places high demands on schools all over the world that students need to be creative and problem solver. Therefore, care should be given for students starting from their early life.

Researchers relate creativity development to the four generally acknowledged locations or expressions such as a creative person, creative product, creative process and creative environment (see Lemons, 2005; McCammon et al., 2010). These finding also suggested that young children's creativity can be nurtured through educational settings in three respects: the creative environment, creative programs and creative teachers and ways of teaching.

It was suggested that a process rather than a product orientation would be much more adequate for our understanding of creativity of children (Glăveanu, 2011). In this research, teachers' awareness and practice in fostering children creativity were assessed. In assessing so, the focus was on: person, process, product and press (environment) perspective of children creativity. In person perspective, teachers and school principals' level of awareness to the term indicating the creativity characteristics were assessed through questionnaire and focus group discussion. In the case of product perspective, teachers' familiarity and practice to the creative product were assessed through questionnaire, focus group discussion, and school observation. Similarly in the case of process perspective, methods in which teachers use to enhance children creativity and observing their creative outcome also assessed through both open ended questions and focus group discussion. In press perspective, teachers practice in creating conducive environments for children to foster creativity was assessed through questionnaire, observation checklists and focus group discussion. Data gained from these techniques were triangulated and summarized.

It is a worldwide concern to have creative and entrepreneur citizens. It could surprise people to think children as creative. Children play, sing, draw, tell stories and build blocks in such a natural and creative way that it goes without saying that there is such a thing as "children creativity" (Glăveanu V. P., 2011)

Creativity facilitates late-life adaptations and growth. It plays an important role in technological advance, in the social and behavioral sciences, and in the humanities and arts. Because of its role in innovation and entrepreneurship, creativity has become one of the key concerns of organizations and businesses (Runco, 2004)

When considering young children, it is appropriate to adopt a broad, democratic definition of creativity. In this way, every child can be considered to have creative potential and to be capable of creative expression (Sharp, 2004). There are two notions adults should consider on children creativity. The first if that, child creative ability will be

related to his or her personal stage of development. For example a young child's work may be adaptive and original for that particular child and/or in relation to children in their class or age group. The second is to put the emphasis on the creative process, rather than to judge the quality of their 'products'. This is because young children may not have developed all the skills they need to achieve a successful creative outcome (see Sharp, 2004, Craft, 2003 & Runco, 2003). On the other hand on Discussion document and proceedings of the Consultative Conference on Education 2009, children creativity discussed as follows:

Creativity can be understood as having the power or quality to express yourself in your own way. Children are naturally creative. They see the world through fresh, new eyes and then use what they see in original ways. One of the most rewarding aspect of working with children is the chance to watch them creative. Every child is born with creative potential, but this potential may be stifled if care is not taken to nurture and stimulate creativity. Young children are naturally curious. They wonder about people and the world. Even before they enter primary school, they already have the variety of learning skills acquired through questioning, inquiring, searching, manipulating, experimenting, and playing. Children need opportunities for a closer look; they need time for the creative encounter (p. 12).

As indicated in Sharp (2004), the creative process involves a number of components, most commonly: imagination, originality (the ability to come up with ideas and products that are new and unusual), problem solving (application of knowledge and imagination to a given situation) and the ability to produce an outcome of value and worth.

Creativity is manifested in the interplay of different processes (see Ferrari, et al, 2009; Amabile, 1998; Russ, 1996 & Runco, 2003): a) personal traits (i.e. tolerance of ambiguity, openness to experience, independent of judgment, unconventional values, curiosity, preference for challenge and complexity, self-confidence, risk-taking, intrinsic motivation); b) emotional or affective processes (i.e. affective fantasy in play, passionate involvement in tasks, affective pleasure in challenge, tolerance of anxiety) ; c) cognitive abilities (i.e. divergent thinking, transformation abilities, sensitivity to problems, tendency to practice with alternative solutions, wide breadth of knowledge, insight ability and evaluative ability) and d) intellectual abilities (i.e. synthetic, analytic and practical- contextual abilities).

Creativity thrives in the environment that allow questions, observing, exploring, skill-building, communicating, and self-expression. To develop creativity, the home or classroom environment should contain a variety of materials and encourage lots of different experiences (Davidson, 2003). The classroom learning will be democratic which emphasize taking the individual as the reference for the originality and value pillar (Ferrari, et al, 2009). Current pedagogical discourses attempt to view learners as the center of teaching and learning processes, with an active role in the production of knowledge and meaning, democratically bringing their expertise, experiences and ideas into the classroom (Williamson & Payton, 2009). Teaching for creativity implies allowing people to take responsibility for their own learning. Pupils out not to be considered as merely receivers of information: on the contrary, it is important that they assume the role of discovery, but support and guidance are needed in order for them to succeed. For this, teachers need to be prepared both on the pedagogical side, being aware of the ways and means to foster autonomy and student-centeredness (Simplicio, 2010). The thinking of children at all levels of ability is significantly influenced by the type of opportunities they are given (Runco, 1990). Offering the learners the right chances to develop their cognitive and creative potential should be a priority in the design of this project.

The government of Ethiopia has recognized the fundamental importance of care and education of children for holistic development (MoE, MH, MoWA, 2010a). In Ethiopia, there is a need to ensure a healthy start in life for children, enabling and stimulating environment for developing their talents and stimulating and help them to become caring and productive citizens (MoE, MH, MoWA, 2010b). Thus, this study was intended to assess the extent to which theories of children creativity development are implemented in the school. This was by examining teachers' and school principals' awareness and practice in fostering creativity. Hence, this is intended to describe the awareness and practices of teachers' and school principals in fostering children creativity. More specifically, the following objectives were intended to be achieved:

- To describe the level of teachers familiarity with creativity characteristics (person)
- To explain the level of teachers' awareness and practice on children creative product (product)
- To evaluate the characteristics of children creative product (product)
- To describe awareness and practice of teachers on the process of children creativity development. (process)
- To evaluate practices of teachers in creating conducive environments for children to foster their creativity (press)

- To measure the familiarity of teachers with creativity measurement criteria (assessment of creativity)

## Materials and Methods:-

### Sample and Sampling Techniques:-

Sample for the research was selected from elementary school teachers (n = 281), principals (n = 7), vice principals (n = 4), and supervisors (n = 4) found at Debre Tabor Town. Through simple random sampling technique, 54 samples (45 teachers, 3 principals, 3 vice principals, and 3 supervise) were selected from Fitawurari gebriyye primary school, Tewodros primary school, and Tabor primary and especial needs education school from government school. This is by using stage random sampling techniques in which samples of the study selected from selected schools.

### Research Design:-

The research design was survey study method. In this method there were different techniques used such as questionnaire, observation, and focus group discussion to triangulate the finding.

### Instruments:-

Different instruments were used in data collection. These are rating scale, open-ended questions, observation checklists, focus group discussion guides, and photo camera.

### Validity of the instrument:-

The validity of questionnaire was assessed by measurement experts. Experts have evaluated the extent to which each questionnaire are able to measure what they intended to measure.

### Reliability of questionnaire:-

The reliability of questionnaire was tested by Chronback alpha after pilot testing. After poor items are discarded, Chronback alpha for teachers familiarity to creativity characteristics, product and creativity assessment criteria rating scale was  $\alpha = .78$  ; and for classroom and school environment characteristics rating scale the reliability was  $\alpha = .73$ .

### Data Collection Technique:-

Data were collected through direct observation, focus group discussion and questionnaire. During observation, students' work products were observed in the store. The process of producing the output also discussed during focus group discussion.

## Results:-

### Person related Results:-

#### Teachers' familiarity to the statements indicating characteristics of creative person:-

**Table 1:-** Result of teachers' familiarity to the statements indicating characteristics of creative person

Characteristics	Mean	Standard deviation
<b>Personal traits</b>		
Tolerance of ambiguity	2.65	0.79
Openness to experience	3.01	0.66
Independence of judgment	2.91	0.92
Unconventional values	2.87	0.54
Curiosity	2.77	0.69
Preference for challenges and complexity	3.24	0.73
Self confidence	4.98	0.51
Risk- taking	2.98	0.67
Intrinsic motivation	3.96	0.59
<b>Emotional or affective process</b>		
Affective fantasy in play	4.10	0.66
Passionate involvement in tasks	3.97	0.71
Affective pleasure in challenge	2.99	0.61
Tolerance of anxiety	3.01	0.59
<b>Cognitive ability</b>		

Divergent thinking	4.78	0.62
Transformation ability	4.10	0.72
Sensitivity to problems	3.81	0.62
Tendency to practice with alternative solutions	3.56	0.52
Wide breadth of knowledge	4.84	0.53
Insight ability	3.69	0.91
Evaluative ability	4.21	0.93
Synthetic ability	3.94	0.79
Analytical ability	4.01	0.87
Practical-contextual ability	4.91	0.58

From the above table which indicates that the level of teachers' familiarity with statements indicating characteristics of creative person, teachers are more relatively familiar with self- confidence ( $M=4.98$  ,  $S=0.51$ ) and least familiar with tolerance of ambiguity ( $M=2.65$ ,  $S=0.79$ ) under personal trait. Under affective processes teachers are more familiar with affective fantasy in play ( $M=4.10$  ,  $S=0.66$ ) and least familiar with affective pleasure in challenge ( $M=2.99$ ,  $S= 0.61$ ). From cognitive processes, teachers are more familiar with practical contextual ability ( $M=4.91$ ,  $S= 0.58$ ) and least familiar with tendency to practice with alternative solutions ( $M=3.56$ ,  $S= 0.52$ ). More importantly, teachers' awareness to terms indicating creative personal trait such as tolerance of ambiguity, risk- taking, unconventional values, curiosity and independence of judgment are below average. Moreover, focus group discussion with directors, vice directors, some teachers, and supervisors also strength this finding.

There were two questions raised for the focus group discussion: (1) what are the characteristics of creative person? (2) What are the sources of these creative characteristics? In their discussion to the first question, participants have raised three important characteristics of creative children. These are neatness of their handwriting, ability to create new thing (for example physical play) that teachers are even not familiar with, and need of different colors and materials. For the second question a debating issues were raised in each group between the effect of nature and environment on children creativity. Some of them from each group argued that nature takes important part in creativity. In their argument, they raised an example of individuals getting enough care from their parents but not creative and individuals lack care from poor family but shows creative ability in the school. On the other hand others have supported the effect of the environment (such as the school and home environment) on children creativity. As they have argued, there are children in their schools who had got material support from siblings and showed excitement and improvement in drawing ability.

### Product of Children Creativity:-

#### Teachers' familiarity to the characteristic of children creative product:-

Teachers' response to 5 point likert scale about characteristics of children creative product was presented in the following table here after.

**Table 2:-** the result of teachers' familiarity to the characteristics of children creative product.

Products	M	SD
Creativity outcome by drawing	4.67	0.56
Creativity outcome by creating models	4.84	0.87
Creative outcome by coloring	3.58	0.69
Creative outcome by playing with peers	3.33	0.54
Creative outcome by playing with different materials	4.11	0.77

The above table indicates that teachers are most familiar with creativity of children by model ( $M = 4.84$ ,  $SD = 0.87$ ) and least familiar with creativity of children by playing with their peers ( $M = 3.33$ ,  $SD = 0.54$ ).

#### Focus group discussion result on product:-

To measure the level of teachers' familiarity and practice on characteristics of children creative product, focus group discussion with directors, vice directors, supervisors and some teachers was conducted. The discussion was based on the following questions: (1) Can we gain some original products from children? (2) In what ways we can observe children creativity?

To the response of the first question, group members have raised two distinct issues. The first one was as children creative product could be original and the second one was as every work of children is based on what they have seen and learnt from older person. Teachers who were agreed with the first issue raised the product of exceptional children as an example. On the other hand those teachers who were agreed with the second issue have raised children product such as drawing, model, picture and the like as they are not original but the result of modeling or imitating others to produce similar products. In the discussion on the second question, participants have raised ways they can observe children creativity. These are by allowing children to draw pictures, construct models, write letters in different modes, write poems, create drama and sing. However, they said so, they witnessed as they hadn't applied these ways to foster and observe children creativity as a result of scarcity of materials.

#### Result of school observation:-

Children creative products in sampled schools were also assessed through observation checklists and photo camera.

**Table 3:-** the result of observation checklists which indicates children creativity practice at school

Checklists	Never	Some	Most
Stored products of children creativity	33.3	66.7	0
Preparation of creative product in the school	100	0	0
Product show originality	100	0	0
Use of different colors	66.7	33.3	0

The above table shows that 33.3% (N=1) of the school has not stored children creative products and 66.7 % (N=2) of the schools have stored some of children products. Inversely, 66.7% (N=2) of the school never used different colors in children creative products and 33.3 % (N=1) of the schools used different colors. On the other hand, no schools ever allowed children to produce their creativity in the school. They used home assignment rather than creating conducive environments at school. Similarly no products of children creativity showed originality.

#### Process of children creativity development:-

##### Responses of participants to open ended questions asking the way they follow to observe children creative ability:-

The open ended question was asked participants to explain the methods they follow to observe children creative ability. Their responses were analyzed by using content analysis. Their responses were categorized into similar characteristics. As a result, the major category of methods in which teachers used to observe children creativity were belongs to the product not to the process.

**Table 4:-** Teachers response to open ended questions

<b>From their creative product of assignment/ home work</b>	From drawing pictures
	From creation of blocks, letters, and models
	From writing of poem/arts
	From modeling machines

#### Focus group Discussion process:-

The first discussion question was limited to ask understanding of participants' about the indication of children product. During the discussion, participants were asked to discuss on whether the products of children are the indications for their creative ability. In their discussion, some of the participants were said that the products of children are the indication of their creative ability. Their argument was based on the comparisons between children who had no involved in the creating products and who had involved in the product creation. They said that whatever the quality and type of the product, unless they have the interest and ability to create they couldn't participated in such activity. On the other hand others were arguing as products of children may/may not be the indication of their creative ability. They raised the main reason that as children can copy and perform what older person performed and as a result it will be considered as reproductive ability rather than creative ability.

#### Press (Environment):-

This perspective concerned about the eminence of classroom and school environment on children creative ability development.

**Practice of teachers in creating conducive environments for children to foster creativity: response of teachers on 3 point scale (average = 2):-**

**Table 5:-** the result of teachers practice in creating conducive environment which motivate students/children to create

Teachers practice in creating conducive environment which motivate students/children to create	Mean	Standard deviation
To question	1.98	0.62
To summarize what I have thought them in classroom	2.89	0.55
To explore the solution to a given problem	2.54	0.71
To skill-building	2.37	0.65
To communicate their idea, imagination and creative work with other students	1.49	0.89
To self-expression	2.23	0.58
To recall what they have learnt	2.96	0.54
To create different models, pictures, drawing and shapes	2.11	0.99

Table 5 indicates that teachers were slightly practicing in motivating children to communicate their idea, imagination and creative work with other students ( $M = 1.49$ ,  $S = .89$ ) which is below average and highly practicing in motivating children to recall what they have learnt ( $M = 2.96$ ,  $S = .54$ ) which is above average.

**Teachers practice in using different materials which can foster creativity in children: teachers response on 3 point scale:-**

**Table 6:-** the result of teachers practice in using different materials which can foster creativity in children

Teachers practice in using different materials which can foster creativity in children	M	S
Different color chalk	1.89	0.58
Different chart	2.56	0.98
Different Marker	1.67	0.67
Model	2.19	0.49
Picture	2.91	0.77
Graphs	2.96	0.55

Table 6 indicates that teachers were practicing slightly in providing different marker ( $M = 1.67$ ,  $S = .67$ ) and different color chalk ( $M = 1.89$ ,  $S = .58$ ) for children in order to enhance creativity which are below average, and highly practicing in providing graphs ( $M = 2.96$ ,  $S = .55$ ) which is above average. The result reveals that teachers practice in using different color chalk, marker, and model to enhance children creativity is very low when it is compared with the use of graphs, pictures and charts. This show us as there is a need of some training or intervention for teachers on how to use different materials to foster children creativity.

**Teachers practice in allowing children to involve in creative tasks:-**

**Table 7:-** the result of teachers practice in allowing children to involve in creative tasks

Teachers practice in allowing children to involve in creative tasks	M	S
Allowing children to use different color chalk	1.53	0.65
Allowing children to draw Different picture, graphs and charts	2.95	0.57
Allowing children to use different color (marker)	1.31	0.77
Allowing children to design different models	1.21	0.66

As the table 7 indicates teachers were working intensely on allowing children to draw different picture, graphs and charts ( $M = 2.95$ ,  $S = .57$ ). However, in allowing children to design different models ( $M = 1.21$ ,  $S = .66$ ), to use different color (marker) ( $M = 1.31$ ,  $S = .77$ ), and to use different color chalk ( $M = 1.53$ ,  $S = .65$ ), teachers are working below average. The resultrevealed that teachers are not effective in allowing them to use different materials such as color chalk, different markers in preparing different materials and models.

**School observation:-**

**Table 8:-** the result of school environment assessment

School environment are suitable	Mean	Standard deviation
To use different colors	1.91	.94
To play with different materials	1.26	.97

To construct different models, picture, graphs, and charts	2.54	.55
To celebrate and exhibit their creative product	2.43	.99
To solve different problems	2.47	.84
To work collaboratively	1.96	.73

Table 8 indicates that schools environment was conducive for children to work collaboratively ( $M = 2.89$ ,  $S = .73$ ) and to construct different models, pictures graphs, and charts ( $M = 2.54$ ,  $S = .55$ ). In contrast the result shows that there is lack of conducive school environment to encourage children to play with different materials ( $M = 1.26$ ,  $S = .97$ ) and solve different problems ( $M = 1.87$ ,  $S = .84$ ).

The discussion with participants of this research revealed that, lack of resources such as paper, color pencil, drawing chart, simple machines, school infra structures and others determine children creativity. On the other hand they have raised also the effect of social interaction among children and their peers, family, and the teacher. For example, they said, children motivated to do things and to play in group; they most of the time influenced by their peers; if any person from their family is out standing in education, they probably influenced by their older siblings; if the teacher assist, motivate and support children with material provision, their creative ability could be enhanced.

**Creativity Measures:-****Teachers' familiarity to creativity measurement criteria:-****Result from questionnaire:-****Table 9:-** result on criteria of creativity measures

Criteria	M	SD
Fluency	4.33	0.66
Flexibility	3.00	0.75
Elaboration	3.58	0.53
Originality	4.57	0.74
Resolution	4.01	0.69

Table 9 indicates the familiarity of teachers to criteria of measuring creativity. As the result reveals, teachers are familiar with each criteria almost at average and above average. Teachers are familiar with originality ( $M = 4.57$ ,  $S = .74$ ), fluency ( $M = 4.33$ ,  $S = .66$ ) and resolution ( $M = 4.01$ ,  $S = .69$ ) above average.

**Result from focus group Discussion:-**

The discussion questions for this part were: (1) can children creativity be measured? How? (2) What criteria should be considered in evaluating children creativity? Regarding the first question participants said that creativity can be measured by evaluating their product critically. However some of them were raised the difficulty of observing children creative ability while they create the product doubting the contribution of older person to the preparation of their children creative product. At the same time they were discussed on the second question. To the responses of the question, the criteria to evaluate children creativity raised by each focus group were summarized. There are two criteria raised by them: the ability of children to create something new in relation to other children, and the ability of creating similar object to the original – the ability of drawing picture similar to the real object.

**Discussion:-**

Teachers are familiar with some creative person characteristics such as cognitive ability and affective characteristics. But there was awareness gap in other cognitive characteristics such as tendency to practice with alternative solutions, synthetic ability, insight ability and sensitivity to problems. Regarding terms of emotional or affective processes, such as tolerance of anxiety, passionate involvement in tasks and affective pleasure in challenge, teachers' awareness was low. And also regarding terms indicating personal traits such as tolerance of ambiguity, risk taking, openness to experience, unconventional values, curiosity, preference for challenges and complexity, and independence of judgment, teachers need awareness creation training.

The result of this research also indicates that teachers awareness of how children's creative product demonstrated through coloring, how playing with peers indicate children creative products was below average. Although they have hints about children creative product, how children produce their creativity, they had not practiced in allowing children to produce creative products due to lack of raw materials. Regarding teachers' familiarity with criteria of creative evaluation, the result showed us the need of awareness creation and further involvement in evaluating children creative product. Thus in any support that will be provided on creativity measures, discussion on criteria such as flexibility and elaboration will be prioritized. From the conducted focus group discussion with participants, the result about measurement of children creativity revealed that most of teachers had been using product as an indication of children creativity. Others argued that children product might not use as indication of creativity because they may imitate produce what older children produced. This gives us insight to search for training on how to enhance, monitor, and measure children creativity through continuous improvement techniques.

On the other hand this research revealed that, elementary school teachers and principals' awareness and practices on how to enhance children creativity by allowing them to practice in the school, providing different colors, observing while they perform, supporting while they perform and storing their products need improvement. As participants of this research argued, observing children product is a method of measuring children creativity. This finding show that teachers have been focusing on the product perspective not on the process one. However it is impossible to know the totality of children creativity by observing only at their product because it is impossible to know what is happening in their mind. As Glaveanu, (2011) discussed, if we restrict creativity to products we are bound to miss out on much of what creativity is or can be.

Hence, this finding also showed that teachers need support on how to help children to question, create different product and communicate their thought with their college. Whatever the case, teachers are not effective in allowing them to use different materials such as color chalk, different markers in preparing different materials and models. From the result we can also conclude that there is a need to make school environment conducive by providing different colors for children, allowing them to play with different materials, work collaboratively with their college, solve different problems creatively and exhibit their creative product. In line with this study, Jeffrey and Woods (2003) discussed that the learning environment at school can either support or limit creativity so that teacher's creativity and ability helps to offer a creative learning environment with creative experiences.

### **Conclusion:-**

To strength the finding of this research, data from questionnaire, observation and focus group discussion result were triangulated. In general the findings of this research were summarized as follows.

Although teachers are aware of some characteristics of creative person, they lack knowledge about other characteristics such as tendency to practice with alternative solutions, synthetic ability, insight ability, sensitivity to problems, tolerance of anxiety, passionate involvement in tasks, affective pleasure in challenge, tolerance of ambiguity, risk taking, openness to experience, unconventional values, curiosity, preference for challenges and complexity, and independence of judgment.

Teachers awareness of how children's creative product demonstrated through coloring, how playing with peers indicate children creative products is below average. Their practice in allowing children to produce creative products is very low due to lack of raw materials.

Teachers' knowledge about observing and measuring children creativity is by considering children products as an indication of their creative ability. Elementary school teachers and principals' awareness and practices on how to enhance children creativity by allowing them to practice in the school, providing different colors, observing while they perform, supporting while they perform and storing their products need improvement.

The practice of using different materials such as color chalk, different markers in preparing different materials and models was another area which seeks improvement. And also, there is a need to make school environment conducive by providing different colors for children, allowing them to play with different materials, work collaboratively with their college, solve different problems creatively and exhibit their creative product. Thus, the result showed the great need of awareness creation and further involvement in evaluating children creative process and product.

### **Recommendation:-**

As a result of this finding the following recommendation should be taken in to consideration. First, to enhance children creativity teachers' knowledge and skill are mandatory. So, any concerned body especially educational institutions and professionals should provide training on how to enhance children creativity, and how to monitor the process of children creativity development. Second, it is important to make school environment conducive enough to scale up children creativity. Therefore material provision which contribute to children creativity should be provided by any organization.

Green banking, Demonetization,  
Adaptability, E- Banking

#### Abstract

Green banking is a new concept of banking were in all other activities of banking remains the same, but extra protection is given on sustainability environmental protection through paper less banking. It is that part of banking which aim at reduction of operational cost, improving efficiency and total productivity. This paper makes an attempt to find out the awareness and adoptability of concept of green banking. We know that India is a developing nation were nearly 40% of population are youths. It makes an investigation into the various modes of e – banking services available to the customers and extent they use the services.

It probes the reasons for the failure of services or popularity of service among the customers. Youths around the Mangalore region were interviewed and opinions were collected. Attempt was also made to interact with bank managers to collect their opinion the customer's request for e services, problems encountered with existing services and attempts made to promote e-services as a part of green banking approach.

It is found from our study that majority of the respondents are aware about the word green banking. But not adopted to the e- banking services, the paper concludes with the suggestion that e- banking promotion has to be done more effectively as most of the youth population themselves has not adopted to the use of e- banking as they are integral part in framing the future of the nation . Since India has witnessed demonetization, the effort should be made to promote e-banking as it is the right time which will help in development of the cashless economy where transactions through e -banking makes life easier, and there will be reduction in parallel economy. Country can have complete information about the transactions, there will be accountability, complete record with the govt, circulation of black money which has shadowed equal distribution of wealth and resulted in unrealistic inflation in the country can be encountered and overcome resulting in a welfare state.

**Introduction:-**

Green Banking is a new phenomenon in the financial world. It encompasses the type of banking which takes into account the social and environmental impacts with the intension of protecting and preserving the environment. Green banking is like a normal bank, which considers all the social and environmental factors with an aim to protect the environment and conserve natural resources. It is also called as Ethical Bank or Sustainable Bank. They are controlled by same authorities with an agenda toward taking care of the earth's environment and resources. Green Banking means promoting environmental friendly practices and reducing carbon footprint from banking activities. This comes in many forms like using online banking instead of branch banking, paying bills online, opening up accounts at online etc.

The government of India has issued guidelines and instructions to banks on Green initiatives. In order to implement the green initiatives of the government, all banks were asked to Increase use of Electronic Payment, Increase use of Core Banking Solutions, increase use of Video Conferencing , offer Centralized Payment system. Many banks in India have taken various green banking initiatives be it in the form of green products or services, green communication like online bill payment, green projects or green events. State Bank of India had launched its 'Green Channel Counter' facility on State Bank Day (1-7-2010), at 57 branches of the bank spread across the country as a step towards paperless Green Banking for deposit, withdrawal and remittance transactions.

**Green banking /Electronic banking services:-****Neft:-**

National Electronic Funds Transfer (NEFT) is a nation-wide payment system facilitating one-to-one funds transfer. Under this Scheme, individuals, firms and corporate can electronically transfer funds from any bank branch to any individual, firm or corporate having an account with any other bank branch in the country participating in the Scheme. The beneficiary can expect to get credit for the NEFT transactions within two business hours from the batch in which the transaction was settled. NEFT operates in hourly batches - there are twelve settlements from 8 am to 7 pm on week days (Monday through Friday) and six settlements from 8 am to 1 pm on Saturdays.

**RTGS:-**

The acronym 'RTGS' stands for Real Time Gross Settlement, which can be defined as the continuous (real-time) settlement of funds transfers individually on an order by order basis (without netting). The RTGS system is primarily meant for large value transactions. The minimum amount to be remitted through RTGS is ` 2 lakh. Under normal circumstances the beneficiary branches are expected to receive the funds in real time as soon as funds are transferred by the remitting bank. The beneficiary bank has to credit the beneficiary's account within 30 minutes of receiving the funds transfer message.

**Debit card and atm Card:-**

Debit cards are used to electronically withdraw funds directly from the cardholders' accounts. Most debit cards require a Personal Identification Number (PIN) to be used to verify the transaction. It is a payment card that deducts money directly from a consumer's checking account to pay for a purchase. Debit cards eliminate the need to carry cash or physical checks to make purchases.

**Credit Card:-**

Credit card are cards that allow their holders to make purchases of goods and services in exchange for the credit card's provider immediately paying for the goods or service, and the card holder promising to pay back the amount of the purchase to the card provider over a period of time, and with interest. The card issuer (usually a bank) creates a revolving account and grants a line of credit to the cardholder, from which the cardholder can borrow money for payment to a merchant or as a cash advance.

**Mobile Banking:-**

Mobile banking is a service provided by a bank or other financial institution that allows its customers to conduct financial transactions remotely using a mobile device such as a mobile phone or tablet. It uses software, usually called an app, provided by the financial institution for the purpose. Mobile banking is usually available on a 24-hour basis. Transactions through mobile banking may include obtaining account balances and lists of latest transactions, electronic bill payments, and funds transfers between a customer's or another's accounts. From the bank's point of view, mobile banking reduces the cost of handling transactions by reducing the need for customers to visit a bank branch for non-cash withdrawal and deposit transactions.

**E-lobby:-**

E-Lobby is fully computerized Electronic Lobby operational 24X7 .It is a novel concept which provides virtual banking to provide all the essential banking facilities under one roof even at the odd hours at night. When a common person these days work 9am to 9pm, E-Lobby brings a relief to them by providing them services beyond the normal banking hours also through its automated and advance machines like Automated Teller Machines (ATM's) -To Dispense Cash through ATM cards of customers of all banks. **Self service facilities which can be done at banking e-lobbies include**ATM withdrawals, cash deposits, card-to-card transfers, mobile phone top-ups, railway booking, passbook printing, NEFT, opening of FD/RD accounts, SMS alerts, cheque drop box, bill payments, mini statements, etc.

**Research Design:-****Objective of the study:-**

- To find out the awareness of the concept of green banking among the customers of D. K
- To find out the measures taken by the bank to promote green banking
- To know the customer's adoptability to internet banking, mobile banking, use of plastic cards and e-lobby services.
- To find out the conveniences and inconveniences of green banking to customers.

**Need for the study:-**

The needs for the study arise mainly because of changes that are taking place in the banking field as a result of reduction of operational cost and environment protection. The paper has made an attempt to find out the impact of modern banking facilities on youth. Paper has identified the need for adoption of modern banking facilities as it can reduce operational cost, saves time, provides better service to the customers and make banking as eco-friendly.

**Research Methodology:-**

The data was collected mainly from primary source of information through questionnaires and secondary data was collected from websites, magazines, newspaper articles and previous research study done in this field.

**Primary data:-**

The study was conducted with the use of primary data which was collected through structured questionnaire given to the graduates in and around Mangalore city. Specific sampling method was used. It was targeted to interact with 150 respondents ultimately. It was possible to collect the information from 147 respondents. Response from 3 respondents could not be received in spite of repeated attempts.

An interview was also made with managers of various the banks. 25 bank managers were targeted for the personal interview to collect their opinion about customer's awareness and adoptability and the problems reported to the banks in relation to the e-banking services. But it was possible to interview only 17 managers of different banks. 8 bank managers were very busy, couldn't be interviewed because of the work pressure caused by demonetization.

**Secondary data:-**

The paper also took the help of secondary data like various websites, newspaper articles, journals and study done by the researches in past.

**Limitations of the study:-**

- ✓ The study was conducted by using specific sampling method. The people who are not a part of the study will make a significant impact on the result of the study.
- ✓ The respondents were using the services of different banks. So opinion collected may be biased to a certain extent.
- ✓ In some cases the respondents were deprived of certain banking services in their locality which is also a part of limitation of study.
- ✓ In case of interview with the bank managers they have given their opinion to the best of their knowledge, and not based on the records maintained by them.

**Data Analysis And Interpretation:-****Awareness about the meaning of green banking**

PARTICULARS	RESPONDENTS	
	IN NUMBERS	IN PERCENTAGE
YES	95	65
NO	52	35
TOTAL	147	100

Majority of the respondents are aware about the meaning of Green Banking. Only 35% of the respondents are not aware about the meaning of Green Banking

**Awareness about the meaning of green banking:-**

PARTICULARS	VIEWS	RESPONDENTS	PERCENTAGE
YES	ELECTRONIC BANKING	6	6.3
	PAPERLESS BANKING	13	13.7
	BOTH	76	80
TOTAL		95	100

For most of the respondents Green Banking means it is both Electronic banking and paperless banking. Only few respondents told that it is either Electronic banking or Paperless banking

**Awareness of electronic banking facility.**

BANKING FACILITY	RESPONDENT	WEIGHTS
NEFT	36	8.5
RTGC	8	1.9
DEBIT CARD	147	34.6
CREDIT CARD	96	22.6
MOBILE BANKING	102	24
E-LOBBY	25	5.9
ALL	10	2.5
TOTAL	424	100

All the respondents are aware about debit card facility. Good number of respondents had the knowledge of mobile banking facility. Only few respondents are aware about all the modern banking facilities. Average number of respondents is aware about credit card facilities.

**Adoptability of the green banking facilities.**

BANKING FACILITIES	WEIGHTS	RESPONDENTS
NEFT	3.91	10
RTGC	1.17	3
DEBIT CARD AND ATM	57.42	147
CREDIT CARD	6.25	16
MOBILE BANKING	27.34	70
E-LOBBY	3.91	10
TOTAL	100	256

From the study it is clear that the majority of the respondents are aware about the green banking facilities. But they are not adopting them for their day today life. All the respondents are using debit card facility. Along with debit card only few respondents were using other facilities also.

#### Source of awareness.

SOURCES	WEIGHT	RESPONDENT
MEDIA	16.2	50
FRIENDS AND RELATIVES	27.8	86
BANKS	34.6	107
INTERNET	21	65
OTHER SOURCES	0.4	1
	100	309

Most of the respondents got information about green banking facilities from banks only. Good number of respondents got information from their friends and relatives. Other source of information is college.

**Reason for opting green banking:-**

REASONS	WEIGHTS	RESPONDENTS
SAVES TIME	10.3	16
CONVENIENT	14.2	22
EASY AVAILABILITIES	5.2	8
ALL THE ABOVE	70.3	109
	100	155

Majority of the respondents are using these facilities because of convenience, easy availability and saves time.

**Years of usage of electronic banking services.**

SERVICES	YEARS OF USAGE			TOTAL
	LESS THAN 1 YEAR	1-3 YEARS	MORE THAN 3 YEAR	
NEFT	4	3	3	10
RTGC	1	1	1	3
DEBIT CARD AND ATM	11	59	77	147
CREDIT CARD	8	4	4	16
MOBILE BANKING	48	22		70
E-LOBBY	6	4		10
	78	93	85	256

77 respondents are using debit card from more than 3 years. No one is using E-lobby and mobile banking more than 3 years. Most of mobile banking users started using that facility recently.

#### Frequency of usage of green banking services

SERVICES	FREQUENCY OF USAGE			TOTAL
	VERY FREQUENTLY	FREQUENTLY	RARELY	
NEFT	1	3	6	10
RTGC			3	3
DEBIT CARD AND ATM	34	88	25	147
CREDIT CARD			16	16
MOBILE BANKING	13	33	24	70
E-LOBBY	2	3	5	10
	50	127	79	256

Majority of the debit card holders are using debit card frequently. Only few users of NEFT and E-LOBBY are using those facilities frequently. Average number of users is using mobile banking facility frequently. Credit card holders are using the credit card rarely.

#### Update of pass book:-

PASS BOOK UPDATE	RESPONDENTS	PERCENTAGE
YES	115	78.2
NO	32	21.8
	147	100

Most of the respondents are updating their passbook. Only few respondents are not updating their passbook.

#### Frequency of updating passbook

PASS BOOK UPDATE	TENURE	RESPONDENTS	PERCENTAGE
YES	WEEKLY	2	1.7
	MONTHLY	26	22.6
	ONCE IN THREE MONTH	45	39.2
	YEARLY	42	36.5
TOTAL		115	100

Nearly 40% of the respondents are updating their passbook once in 3 months. Few respondents update their passbook monthly

**Views regarding modern banking service charges.**

MODERN BANKING CHARGES	RESPONDENTS	PERCENTAGE
CHEAPER	9	6
REASONABLE	136	93
COSTLY	2	1
	147	100

About 93% of the respondents have opinion that the service charges for modern banking facilities are reasonable. Only few respondents are felt that service charges are cheaper.

**Better modern banking service provider**

BANKS	VIEWS	PERCENTAGE
PUBLIC SECTOR	53	36
PRIVATE SECTOR	94	64
TOTAL	147	100

64% of the respondents are responded that private sector banks provide better services than the public sector banks.

**Views stating whether modern banking services has led to paperless banking.**

VIEWS	RESPONDENTS	PERCENTAGE
YES	105	71.4
NO	6	4
CAN'T SAY	36	24.6
TOTAL	147	100

Majority of the respondents have opinion that modern banking facilities will lead to paperless banking. Only few respondents are telling that it will not lead to paperless banking.

#### Hypothesis testing:-

**H<sub>0</sub>:** There is no significant relationship between gender and awareness of green banking facility

**H<sub>1</sub>:** there is significant relationship between gender and awareness of green banking facility

#### Findings of the study:-

- Majority of the respondents are aware about the meaning of Green Banking. Only 35% of the respondents are not aware about the meaning of Green Banking
- For most of the respondents Green Banking means it is both Electronic banking and paperless banking. Only few respondents told that it is either Electronic banking or Paperless banking
- All the respondents are aware about debit card facility. Good number of respondents had the knowledge of mobile banking facility. Only few respondents are aware about all the modern banking facilities.
- From the study it is clear that the majority of the respondents are aware about the green banking facilities. But they are not adopting them for their day today life. All the respondents are using debit card facility. Along with debit card only few respondents were using other facilities also.
- 34% of the respondents got information about green banking facilities from banks only. Good number of respondents got information from their friends and relatives. Among Other source of information major source is college.
- Majority of the respondents are using these facilities because of convenience, easy availability and saves time.
- 77 respondents are using debit card from more than 3 years. No one is using E-lobby and mobile banking more than 3 years. Most of mobile banking users started using that facility recently.
- Majority of the debit card holders are using debit card frequently. Only few users of NEFT and E-LOBBY are using those facilities frequently. Average number of users is using mobile banking facility frequently. Credit card holders are using the credit card rarely.
- 78% of the respondents are updating their passbook. Only few respondents are not updating their passbook
- Nearly 40% of the respondents are updating their passbook once in 3 months. Few respondents update their passbook monthly
- About 93% of the respondents have opinion that the service charges for modern banking facilities are reasonable. Only few respondents are felt that service charges are cheaper.
- 64% of the respondents are responded that private sector banks provide better services than the public sector banks.
- Majority of the respondents have opinion that modern banking facilities will lead to paperless banking. Only few respondents are telling that it will not lead to paperless banking.
- Tabulated value of chi-square at 5% level of significance and 6 degrees of freedom is 12.59 and calculated value is 30.19351. So we can conclude that there is significant relationship between gender and awareness of green banking facility. Majority of the female respondents are aware about green banking
- Tabulated value of chi-square at 5% level of significance and 5 degrees of freedom is 11.070 and calculated value is 46.90032. So we can conclude that there is significant relationship between gender and adoptability of green banking facility. Majority of the female respondents have adopted green banking.
- It is was found from our interaction with the bank managers that most of the customers are aware about green banking
- Bankers responded that customer face lot of technical issues during the execution of transactions such as delay in OTP, slow network and delay in response from their bank technical support team
- Bankers are of the opinion that security feature should be improved in case of e banking services because most of the customers are relying on traditional banking because of security threats caused by hackers.

- Some bankers have also stated that since some banks are in the interior parts and in rural areas reach of technology is difficult as the access to internet and mobile network is poor. They told that there are some educated customers in these parts they share their dissatisfaction because of the above.
- Majority of the bank managers agree that e-banking has led to reduction of operating cost, clerical work and saves a lot of time. The issue of debit card to all the customers itself has reduced frequent visit of customers to branch for withdrawal. This will reduce work in long run number of staff too. Other facilities can also help them in reducing their workload.
- Some of the bank managers also admitted that lack of knowledge and expertise among their own staff has led to poor response for e-banking services. Because they are not in a position to provide information or solve the issues of the customers which in some cases has also led the situation of complaints, closing of accounts with the bank.
- Majority of the bank managers stated that they are making all possible effort from their side to promote e-banking as it is a boon for them. Of course response depends on the customer's education level, knowledge, interest and even sometimes need too.

### **Suggestions:-**

- As effect of demonization all the banks and government of India is encouraging cashless transactions. It is very essential for the government to take the banks into confidence and make effort to educate the people regarding the various modes of cash less transactions.
- Banks should organize awareness programs were in at least once in a quarter at the branch level where in they call their customers and provide complete information's about the latest services, benefits and solutions for the problems in case if the customers encounter when they use a particular e-banking service. This will help in developing confidence of the customers and overcome the misconceptions about the e-banking services
- Banks should develop proper infrastructures so that there is a continuous and uninterrupted availability of service.
- All the mobile operators should improve their service coverage with proper availability of 3G / 4G services. Since mobile network is a key factor for internet and mobile banking services.
- Banks should setup more e-lobby centers where cash deposit, cheque deposit, passbook update and cash withdrawal is facilitated. This will help in reduce the customers at the branch saves time and, reduces operational cost.
- Staff has to be trained properly regarding the activation, execution and solving the issues relating to e banking services. It is pointed out from the survey that some staff doesn't provide e-banking facilities as they are not having the proper knowledge. They give escaping answers or postpone the request ultimately making the customers to get frustrated and forget about the option.
- Self-user creation should be encouraged in case of internet banking, mobile banking and other services. Because it can save time and activation can be done more quickly. This can reduce repeated visit of the customer to branch
- Banks should provide Internet Banking, Mobile Banking with activation pins when the customers open account with the bank in the form of Welcome Kit.
- Banks should remove transaction cost on various e-banking services, it should be minimized or eliminated if possible. After demonetization many customers are expressing their dissatisfaction because of cess charges levied on using of the debit/credit cards in petrol pumps. This will discourage the customers to go for cashless banking.
- Banks should improve the security features in the e-services so that risk of hacking and other misuse of the account can be eliminated. It's very essential to educate the customers regarding these security features because it will help them to build confidence about e-banking services and use the same.

### **Conclusion:-**

India is developing nation with majority of the population (about 65%) who belong to the age group of 21-35. It is cream of the country as it is the most productive population. Making this population technologically enabled will help in the advancement of the nation. It is believed that demonetization will increase the cash less transactions in the country. As India is a democratic nation real democracy can be achieved with the elimination of black money which is a major threat for the balanced economic development and equal distribution of wealth. For achieving the same the contribution of banks, RBI and Income Tax department is vital. Green Banking (E-Banking) is a main weapon which will help in achieving the welfare state.

1) Are you aware about the meaning of green banking?

A) Yes

B) No

If yes,

A) It is an electronic banking

B) Paperless banking

C) Both a and b

2) I) of the following which electronic banking facility you are aware of?( mark the relevant)

A) NEFT

B) RTGS

C) Debit card and ATM

D) Credit card

E) Mobile banking

F) E-lobby

Which of the following facilities you have adopted?

A) NEFT

B) RTGS

C) Debit card and ATM

D) Credit card

E) Mobile banking

F) E-lobby

G)

3) How you are aware of these services?

A) Media

B) Friends and relatives

C) banks

D) Internet

E) Any other ( specify)

4) You opted green banking services because

A) Saves time

B) Convenient

C) Easy availability

D) All the above

5)

Services	Use	Years(mark the relevant)			Frequency of usage		
		Less than 1 year	1 to 3 years	More than 3 years	Very frequently	Frequently	Rarely
NEFT	Yes /no						
RTGS	Yes /no						
Debit card and ATM	Yes /no						
Credit card	Yes /no						
Mobile banking	Yes /no						
E-lobby	Yes /no						

6) Whether you update your bank pass book?

A) Yes

B) No

a) Weekly

b) Monthly

c) Once in 3 months

d) Once in a year

7) Do you think modern banking service charges are

A) Cheaper

B) Reasonable

C) Costly

If it is costly which of the service do you think it is costly?.....

8) According to you , the modern banking services offered better by

A) Public sector banks

B) Private sector banks

9) Do you think that modern banking services has led to paperless banking?

A) Yes

B) No

C) Can't say

D)

10) According to you, which of the following measures you recommend for paperless banking?

A) E-statement and mobile statement

B) Transfer to other account through ATM cards instead of issuing cheques

C) Use of plastic cards(debit &amp; credit cards) for making payments instead of cash and cheque

D) Transfer through Aadhar number (along with branch IFSC code)

E) All the above.

F)

11) What are the demerits of the following services (mark the problems)

Types of services	Problems
NEFT	a)Weekend services are not available b)Technical problems c)Delay in OTP
RTGS	a)Weekend services are not available b)Technical problems c)Delay in OTP
DEBIT CARD AND ATM	a)Technical problems b) Non availability of cash c) Withdrawal restrictions

	d) High service charges
CREDIT CARD	a) High service charges b) High interest c) Restriction for usage( card limit)
MOBILE BANKING	a) Network problem b) Operating system problem c) Security
E-LOBBY	a) Technical problems b) Lack of knowledge c) Non availability

#### Abstract

**Objectives:** The study aimed to determine the distribution of ABO and Rhesus D (RhD) blood groups in Al-Madinah Blood Bank regular donors .

**Methods:** A cross-sectional study that was carried out at Al-Madinah Blood Bank during the period from 21 November 2016 to 15 December 2016 . The participants were regular blood donors , and the samples were collected during the time of blood donation.

**Results:** The frequencies of ABO groups were 45.3% for O group, 27.7% for A group , 18.9% for B group and 8.1% for AB group. For Rhesus factor it was 87.9% positive and 12.1% negative.

*Copy Right, IJAR, 2016., All rights reserved.*

#### Introduction:-

Until now , around 30 blood group systems are recognized according to International Society of Blood Transfusion[1]. Among these systems , ABO and Rh blood group systems have utmost importance. The importance of these two groups is due to the fatal complications that could be encountered in case there was incompatibility between the blood groups during the process of blood transfusion[2]. In addition to that , studies show relations between blood groups and some diseases [3-9].

In Saudi Arabia , some studies have been done to determine the distribution of ABO and Rh group systems . O group have had the highest incidence in the all-region of the kingdom and AB group were the lowest , while there was differences in the A and B groups distribution as A group tend to be higher in the west and lower in the east , while B group was higher in the east and lower in the south[10-13] .

#### Objective:-

To know the frequencies of ABO and Rhesus D (RhD) blood groups in AL-Madinah Blood Bank regular donors and compare our results with the others that carried out in the kingdom.

#### Methodology:-

It was a cross-sectional study that was carried out at Al-Madinah blood Bank during the period from 21 November 2016 to 15 December 2016 . The subjects were 307 and they were regular blood donors . The sample was collected during the blood donation process after explaining the idea of the research to the subjects and taking the consent from them . Then the ABO blood groups and Rh factor were determined and the frequencies of the distribution of them were calculated .

**Result:-**

The total number of the subjects was 307 as 305 were male and 3 were female . 59% of the participants were Saudis and 41% were non-Saudis. The non-Saudis nationalities were as following: Pakistani 10.1% , Egyptian 9.1% , Indian and Yamani each of both were 5.9% and 10% were other nationalities . The frequencies of ABO groups for all the sample were 45.3% for O group, 27.7% for A group , 18.9% for B group and 8.1% for AB group. For RhD it was 87.9% positive and 12.1% negative. Overall frequency of ABO and Rhesus blood groups were as following : 38.4% O+ , 25.1% A+ , 16.9% B+ , 6.8% O- , 6.5% AB+ , 2.6% A- , 2.0% B- and 1.6% AB- . For Saudis, ABO frequencies were : O 47.0% , A 28.2% , B 15.5% and AB 9.4% , while the RhD were positive in 87.3% and negative in 12.7% . The overall frequencies for Saudis were O+ 38.1% , A+ 26.5% , B+ 14.4% , O- 8.8% , AB+ 7.7% , A- and AB- 1.7% for each of them and B- 1.1%.

**Discussion:-**

The results of this study showed agreement with other studies that done in the kingdom in that O group has the highest prevalence and AB is the lowest[10-13]. In addition , it showed agreement in that A group has higher prevalence among Saudis in Al-Madinah (northwest) in compare with eastern region of the kingdom [10-12].

**Conclusion:-**

The study shows similarity in the frequencies of ABO and Rh blood groups with other studies that was done in Arabian Peninsula area .

**Conflict of interest and Funding:-**

The investigators have no conflict of interest to disclose , and they have not received any research grant from any organization for this project .

### Abstract

**Introduction:** Intradural extramedullary spinal cord tumors (IESCT) account for approximately two thirds of all intraspinal neoplasms. The purpose of this study was to determine short- and long-term outcomes of surgery in patients with IESCT, and to study the clinical features that could be helpful in treatment of patients with these lesions.

**Methods:** A retrospective review of 25 operative IESCT cases between 2012 and 2014 was performed. Outcomes were scored at one month and at mean follow-up of 9 months postoperatively. In addition, patient demographics, tumor subtypes and locations were also considered. Statistical analysis was calculated utilizing Chi-square and Student's t-tests.

**Results:** There were 8 men and 17 women (mean age 48 y/o, range 18-87 y/o). Men presented at a younger age than women (44 vs 53 y/o,  $P < 0.02$ ). 18 (72%) patients presented with severe radiculopathy and/or myelopathy. The remaining 7 (28%) had symptoms typical of disc herniation. Mean duration of symptoms prior to diagnosis was 11 months. Schwannomas (10 patients) had the longest mean duration of symptoms (14.9 months), followed by meningiomas (8 patients, 8.4 months), and ependymomas (7 patients, 2 months).

**Conclusions:** Intradural extramedullary tumors, easily detected by MRI, are mostly benign and excellent clinicoradiological results can be obtained by microneurosurgery. Therefore, more active surgical approaches by neurosurgeons are recommended to decrease morbidity.

### Introduction:-

Spinal tumors account for less than around 5-15% of the system neoplasms (1, 2). Intradural extramedullary spinal tumors (IESCT) represent around two thirds of those tumors (2, 3). Comparatively few printed reports have enough sample sizes to adequately analyze surgical outcomes, demographics, symptoms, and knowledge on growth varieties and locations (3,4,5,6). The foremost unremarkably encountered kinds of IESCT are schwannomas and meningiomas, with myxopapillary ependymomas encountered less oftentimes. The first objective of this study was to look at surgical outcomes following procedures for IESCT in a large retrospective cohort of patients. Secondary goals enclosed examination of clinical knowledge relating demographics, symptoms, growth location and sort that might be useful in clinical deciding.

## Materials and Methods:-

This is a retrospective study of twenty five surgical patients underwent operative removal of IESCT between 2012 and 2014 at Dr. D. Y. PATIL HOSPITAL KOLHAPUR. Parameters recorded according to patients demographics, symptoms (severity and duration), growth characteristics (anatomic and pathologic), operative follow-up and surgical outcomes.

Surgical intervention was indicated by combination of presenting symptoms (radiculopathy and/or myelopathy) and photography findings of magnetic resonance imaging (MRI), and computed tomographic (CT)-myelography.

Surgical outcomes were scored at one month and so at the mean follow-up amount. The mean follow-up was calculated from the interval between surgery and therefore the last complete clinical examination within the patient chart (in this study, 9 months). Patient records were fastidiously reviewed and surgical outcomes were scored strictly in step with the changed criteria of Odom, et al (Table 1) (7).

While recognizing the shortcomings of the Odom's criteria as a 'rough' outcome and morbidity assessment scale, we have a tendency to selected to use this methodology attributable to the uniform and standardized recording of those criteria altogether of our patient charts.

Descriptive statistics, Chi-square check and Student's t-test were used for knowledge analysis. Applied math significance was set at  $\alpha = 0.05$ .

### Figure 1

**Table 1:-** Modified Criteria of Odom, et al ().

<i>Excellent</i>	complete relief of pain and other symptoms*, return to full activity
<i>Good</i>	partial relief of pain, complete relief of other symptoms*, return to full activity
<i>Fair</i>	improvement with persistent limitation of activities
<i>Poor</i>	no improvement or further deterioration

\*note other symptoms = paresthesias, paresis, sensory loss

## Results:-

There were seventeen ladies and eight men (mean age  $48.7 \pm 16.56$  y/o, median 45.7 y/o, varies 18-88 y/o). Overall, men of younger age group presented than ladies (44.1 vs 53.5 y/o,  $P < 0.02$ ). The age distribution was bimodal with a serious peak around 40 y/o and a minor peak at around 70 y/o.

There were 3 primary growth types: schwannomas (10/25), meningiomas (8/25), and myxopapillary ependymomas (7/25) (Table 2A). Schwannomas were comparatively more common in men, meningiomas comparatively more common in ladies, and ependymomas distributed equally (Table 2A). Patients with meningiomas attended be older (57.6 y/o) than those with schwannomas (44.0 y/o) and ependymomas (40.2 y/o,  $P < 0.01$ ) (Table 2B). Growth locations varied between the 3 growths varieties in a very foreseeable fashion (Table 2C). Whereas schwannomas were distributed fairly equally among the 3 anatomic regions (cervical, thoracic, and lumbosacral), meningiomas predominated within the cervical and thoracic and ependymomas were predictably localized to the lumbar region. Of note, the magnitude relation of Schwannomas to Meningiomas to Ependymomas was around 5:4:2 during this study (actual magnitude relation 10:8:7).

The mean length of symptoms before designation was 11.3 months. Schwannomas had a statistically longer length of symptoms (14.9 months) than did meningiomas (8.4 months,  $P < 0.05$ ) for cervical and body part tumors. Ependymomas had shorter length of symptoms (2.0 months) than schwannomas (10.8 months,  $P < 0.05$ ) for lumbosacral tumors.

Out of twenty five patients, 20 (80.0%) had good results at one month, and twenty two (88%) had good results at 9 months postoperatively (the mean follow-up, range 1.5 to thirty six months). At the one month follow-up, 32% (8/25) patients had wonderful results, 56% (14/25) had good results, 8% (2/25) had fair results, and 2.5% (1/25) had Poor result. The patient with a Poor result at one month follow-up had terribly severe presenting symptoms, had very little immediate post-surgical improvement, and however was upgraded to the good result upon future follow-up.

At mean follow-up of 9 months (range 1.5 to thirty six months), overall outcomes improved considerably. Fifteen patients (60%) had wonderful results, thirty second (8/25) had good results, and 8 % ( 2/25) had fair results. Though at the 9 months mean follow-up the quantity of patients with poor results inflated by one, none of the patients had Poor results. The number of patients with wonderful results inflated by sixty fourth and therefore the number of patients with good results diminished by forty second (largely upgrades to wonderful). Just one patient with previously good result was downgraded to a fair result.

Three patients had multiple IESCT, all of that were schwannomas. One amongst these patients was NF-II positive. 3 patients developed repetition of their IESCT. 2 of those were schwannomas associate degreed one was an ependymoma.

While no metastases were noted throughout the 9 month mean follow-up amount (range one.5 to thirty six months), this study failed to specifically examine whether or not pathologic process illness did seem at a later time. No mortality was noted during this series, and therefore the solely complications enclosed a superficial wound infection and ending huskiness n one patient.

## Figure 2

**Table 1:-** Histological, demographic, and anatomic considerations for IESCT

### A. Distrubution of tumor by histologic type and patient gender in the series

Patient gender	Men	Ladies	Total
Schwanoma	3	7	10
Meningioma	3	5	8
Ependymoma	2	5	7
Total	8	17	25

### B. Tumor incidence by age group

Age	<40	40-80	>80
Schwanoma	3	3	4
Meningioma	1	4	3
Ependymoma	3	2	2
Total	7	9	9

### C. Tumor incidence by antomic location

Location	Cervical	Thoracic	Lumbar
Schwanoma	3	3	4
Meningioma	4	3	1
Ependymoma	1	3	3
Total	8	9	8

## Discussion:-

Surgery for IESCT is that the best treatment choice manufacturing wonderful overall results, with completes microsurgical excision being the modality of selection (6, 8). Trendy techniques change smart surgical outcomes with minmal morbidity and mortality (2, 3, 6, and 9). The present series corroborates this rivalry in this largely wonderful or smart results were achieved with few complications. In fact, no Poor results were noted during this study at the mean 9 month follow-up. Our findings believe those of others, with majority of clinical improvement noted either directly or at intervals 6 months of the operative intervention, with less notable clinical modification when this first amount (2). Alternative studies reported that length of surgical symptoms seems to correlate with operative improvement, which productive complete microsurgical neoplasm excision is of utmost importance (2,

10,11). In terms of mortality, our result correlate well with alternative series, with a reported vary between 0-4.4% (2, 5, 12, and 13).

Approximately 2/3 of patients during this study intimate with residual focal deficits, none of that were disabling. Others report similar outcomes among patients with similarities to our patient sample, with important improvement in 62-88% of cases and clinical worsening in exactly a minority of patients (1-5%) (2, 3). Number of the patient outcomes and practical scores on discharge and/or follow-up might differ across studies because of different assessment tools being used by different authors (2,3).

Reported frequencies of schwannomas among IESCT vary from forty third to sixty seven in alternative studies (53.7% during this series) (2, 6, 14,15). Schwannomas tend to supply localized pain, radiculopathy, and bodily structure equina syndrome. Most report schwannomas to be solitary, with a 2.5% malignancy rate, which carries a poor prognosis (16). During this study, schwannomas were the sole cluster of tumors while not a predominant location of incidence, and grooved seventy fifth of perennial tumors.

In this series, patients with meningiomas were older than those with alternative neoplasm varieties. Findings during this series believe the literature in this meningiomas area unit the second commonest IESCT, with about 80% localized to the pectoral region (71% during this series) (6, 10, 16,17). Between 75% to 85% of patients with meningiomas area unit ladies (81% during this series), UN agency tend to be older than patients with schwannomas or ependymomas (6, 10, 16). In line with previous reports, we have a tendency to found meningiomas to be additional aggressive in younger patients, with the higher incidence of myelopathy probably because of predilection of meningiomas for the thoracic region (18). Others describe higher operative morbidity related to IESCT set within the thoracic region (6). Meningiomas tend to supply the “dural tail” check in imaging scans in sagittal, axial, and coronal planes, and it's counseled that every one 3 planes of image be used (19). We have a tendency to follow this recommendation as a result of as several as 100 percent of meningiomas will be each intradural and meninges (20).

Myxopapillary ependymomas represent 14.9% on IESCT during this study, and though during this study ependymomas had equal distribution among men and ladies, another series reported doubly as several men as ladies (21). During this series, the mean age of the ependymoma cluster was below the mean age of patients with tumor or schwannoma. Symptomatically, ependymomas cared-for turn out bodily structure equina syndrome, localized pain, and radiculopathy.

A 4:2:1 quantitative relation of schwannomas to meningiomas to ependymomas was ascertained during this series. Though not specifically delineate by others, similar quantitative relation of neoplasm varieties will be noted in previous reports (2, 6, 15).

### Conclusions:-

Surgery for IESCT, with goal of complete neoplasm removal, may be a safe and effective choice. At the 9 month mean follow-up, majority of patients had complete or close to complete relief of symptoms and come back to full activity. In others, symptoms stopped progressing, and none of the twenty five patients worsened. Schwannomas and ependymomas were the sole histological varieties to recur. Demographic, tumor-specific and anatomic concerns are also clinically helpful once approaching IESCT.

### Abstract

The pineal gland hormone melatonin is known to have both anti inflammatory and immunomodulatory effect. The present study assessed the effects of intraperitoneal injection of 10 mg/kg melatonin on the healing of induced tongue ulcer. 40 male albino rats were subjected to tongue ulcer using biopsy punch, group I (n=20), received daily 6% ethanol as vehicle. Group II (n=20), received daily melatonin. Specimens were taken after 1<sup>st</sup>, 4<sup>th</sup>, 10<sup>th</sup> day. The histological examination revealed prominent inflammatory cells infiltrations and increased new blood vessels formation. Ultrastructural studies showed marked increase in collagen fibers synthesis. Immunohistochemical results using  $\alpha$  smooth muscle actin indicated significant difference between two groups after 4<sup>th</sup> days. Melatonin treatment improved the wound healing, both in terms of angiogenesis and orientation of collagen fibers. Considering our results, melatonin has powerful anti-inflammatory properties and has proven to be highly effective.

### Introduction:-

Oral mucosal wound or mouth ulcers are sores or open lesions in the mouth which are caused by various disorders<sup>(1)</sup>. Wounds are not just physical problems due to blood loss or tissue damage, but they may threaten the individual survival by development of infection and sepsis due to invasion of micro-organisms or contaminants. Mucosal wounds occur frequently, and the healing of the mucosa is important in most surgical outcomes. Although wound healing in the oral mucosa is improved by sound surgical principles, yet it is also mediated by biologic processes beyond the surgeon's control<sup>(2)</sup>. It should also be noted that ulcers and/or erosions can be the final common manifestation, often clinically indistinguishable, of a wide and complex spectrum of conditions including traumatic lesions, infectious, vesiculo-bullous, neoplastic and gastrointestinal diseases<sup>(3)</sup>.

The process of wound healing takes place in three stages, the inflammatory, proliferative, and remodeling phases<sup>(4)</sup>. These phases consist of a sequence of events that ultimately leads to the re-establishment of tissue integrity and function. Persistence of inflammation during repair may lead to the development of chronic wounds that are of great concern to society. During the inflammatory phase, several enzyme systems are induced and growth factors are recruited, such as nitric oxide synthase (NOS), which help in the progression of healing and are critical for the repair process<sup>(5,6)</sup>.

Platelets and fibroblasts, as well as macrophages and neutrophils, are important cellular elements of wound healing, engendering influential factors that affect processes of healing such as migration and proliferation. In addition, some specific proteins produced by the macrophages, such as growth factors, proteases, chemo attractants, and inhibitory factors, also play roles in the wound-healing process <sup>(7)</sup>.

Immune system cells and their products (including cytokines and growth factors) stimulate wound healing, especially during the proliferative phase and angiogenesis. Fibroblasts serve as the source of the endothelial cells that generate neovascularization during the angiogenesis process <sup>(8)</sup>.

Fibroblasts are the most abundant cellular components of connective tissue. They possess phenotypical heterogeneity and may be present in the form of smooth muscle cells or myofibroblasts (MFs). MFs are spindle-shaped cells with stress fibers and well developed fibronexus, and they display  $\alpha$ -smooth muscle actin immunohistochemically and smooth muscle myofilaments ultrastructurally. MFs play pivotal roles not only by synthesizing and producing extracellular matrix components, such as other connective tissue cells, but also are involved in force production. <sup>(9)</sup>

MFs generate forces in two ways. Initially, actin filaments present within the cell form a fibronexus by connecting intracellular actin and extracellular fibronectin fibrils using integrins. Integrins mediate the reorganisation and contraction of collagen matrices with the help of fibroblasts. Later, MFs connect to each other through gap junctions to form a "multicellular contractile unit". They again exert a force on the ECM by implicating the use of this unit. Both mechanisms exert a high level of tractional forces for wound closure <sup>(10,11)</sup>.

Wound healing in the oral cavity essentially occurs without scarring and is faster than skin healing. Fibroblasts in the oral mesenchyme possess a unique phenotypical character by constitutively expressing elevated  $\alpha$ -SMA levels, along with a higher capacity to contract collagen gel and a higher replicative potential than dermal fibroblasts, ultimately leading to a "scar-free" healing process. Factors, such as epidermal growth factor, vascular endothelial growth factor, bFGF, and insulin-like growth factor, present in saliva and crevicular fluid are responsible for wound healing in the oral cavity <sup>(12)</sup>.

The pineal gland hormone, melatonin (N-acetyl-5-methoxytryptamine) has a variety of physiological, immunological and biochemical functions. It is a direct endogenous free-radical scavenger and indirectly exerts chemoprotective, immunostimulatory and myelostimulatory effects <sup>(13)</sup>.

Melatonin is capable of entering the oral cavity by diffusing into the saliva from blood. As the majority of the melatonin remains bound to serum albumin, the amount of melatonin in saliva is approximately one third of that present in the blood <sup>(14)</sup>.

Melatonin is an anti-inflammatory agent known to reduce several hallmarks of inflammation. Melatonin down-regulates a variety of pro-inflammatory cytokines such as interleukin (IL)-1b, IL-6 and tumour necrosis factor- $\alpha$  by preventing the translocation of nuclear factor kappa B to the nucleus and its binding to DNA <sup>(15,16)</sup>. In addition, melatonin has been shown to inhibit the production of adhesion molecules that promote the sticking of leukocytes to endothelial cells and by reduces oxidative stress <sup>(15)</sup>. We therefore investigate if melatonin administration would improve the course of wound healing in albino rats' tongue ulcers

## Materials and Methods:-

This study was undertaken in the animal house of Faculty of Pharmacy of Mansoura University, based on an ethical approved protocol. 40 albino rats of average weight (150-200gm) were used in this study. The animals were fed a standard diet and free access to water.

The animals were divided into two groups

Group I: twenty rats were subjected to tongue ulcer and received daily 6% ethanol saline as a vehicle. Group II: twenty rats were subjected to tongue ulcer and received daily 10 mg/kg BW melatonin through intraperitoneal injection (IP).

## Melatonin preparation:-

Pineal indole melatonin (Sigma, St. Louis, MO, USA) was freshly dissolved in saline containing 6% ethanol (total volume of 1 ml/kg). Daily IP injections of 10 mg/kg BW were administered using a 1-mL syringe with a 25-gauge needle. To avoid interfering with the daily circadian rhythm, melatonin and saline were administered at 8:00 and 9:00 am<sup>(17)</sup>.

#### **Ulcer induction:-**

All surgical procedures were performed under general anesthesia, by intramuscular administration of 0.1 ml of ketamine hydrochloride (SIGMATEC Company) combined with 0.05 ml of xylazine hydrochloride (ADWIA Company), per 100 g body weight of the animal. After anesthesia, the lingual mucosa was antiseptically cleaned with 2% chlorhexidine then a surgical mucosal wound was made by using biopsy punch (Acu-Punch, Acuderm Inc., Ft. Lauderdale, FL, USA) to ensure that all ulcers will have the same size. The ulcer was circular in shape about 4mm in diameter and 2mm in depth.

#### **Specimens' preparation:-**

After ulcer induction both groups, specimens were obtained from each animal after one day, 4 days and 10 days respectively; tongue from each animal were removed and immediately fixed with 10% formalin solution and become ready for histological, and immunohistochemical for alpha smooth muscle actin. Specimens were put in glutaraldehyde fixative (4%) solution for electron microscope preparation.

#### **Computer Assisted digital image analysis (Digital morphometric study):-**

Slides of IHC (alpha smooth muscle actin) were photographed using Olympus<sup>®</sup> digital camera installed on Olympus<sup>®</sup> microscope with 1/2 X photo adaptor, using 40 X objective. The result images were analyzed on Intel<sup>®</sup> Core I3<sup>®</sup> based computer using VideoTest Morphology<sup>®</sup> software (Russia) with a specific built-in routine for stain quantification, results were expressed as integrated density.

#### **Statistical Analysis:-**

Data was analyzed using Statistical Package for Social Science software computer program version 17 (SPSS, Inc., Chicago, IL, USA). Quantitative data was presented in mean and standard deviation. Student's t-test was used for comparing means of the two groups. P value less than 0.05 was considered statistically significant.

#### **Results:-**

##### **Clinical Observations:-**

Three rats were excluded from our study; 2 rats from group I were died after one day of ulcer induction, one rats from group II was died after one week of ulcer induction. All these rats were compensated by others.

##### **Light microscopic results:-**

##### **Haematoxylin and Eosin Stain:-**

##### **After one day of ulcer induction:-**

The specimens of group I revealed discontinuity of the epithelium and the underlying connective tissue, the granulation tissue showed inflammatory cell infiltration (Figs. 1A&1a). While group II section showed granulation tissue formation, inflammatory cell infiltration and dilated blood vessels. Mitotic figures appeared in the epithelium which representing the beginning of the epithelial proliferation (Figs. 1B&1b)

##### **After four days of ulcer induction:-**

The sections of group I showed slight proliferation of the covering epithelium and formation of the granulation tissue with dense inflammatory cell infiltration (Figs. 2A, 2a). While in group II : The sections showed the beginning of the healing process via proliferation of the epithelium. The granulation tissue appeared with fibroblasts, collagen fibers, inflammatory cell infiltrations (lymphocytes and macrophage appeared) and newly formed blood vessels (Figs. 2 B, 2b).

##### **After ten days of ulcer induction:-**

Group (I) showed the healing process appeared by prominent proliferation of the covering epithelium to close the ulcer margin as well as the connective tissue stroma that showed fibroblasts, collagen bundles, newly formed blood vessels and few inflammatory cells (Figs. 3 A, 3a).

Group (II) showed complete reepithelialization of the ulcerative area with normal stratification, reorganization of the

epithelium and the underlying connective tissue (Figs. 3 B, 3b).

Immunohistochemical stain results:

The immunohistochemical positive results were detected as brown deposits using alpha smooth muscle actin stain (Figs. 4).

Statistical results: using Paired Student's t-Test. There were no significant difference after one and ten days, while after four days, there were significant difference in the mean of  $\alpha$  smooth actin of group I, II (Table 1).

Transmission electron microscope results

After one day; group I: There was little infiltration of the granulation tissue with neutrophils with widening of the intercellular spaces between the cells of the mucosa (Figs. 5, A). Group II: There was heavy infiltration of the granulation tissue with inflammatory cells (neutrophils) with normal intercellular spaces between the cells of the mucosa (Figs. 5, B)

After four days; group I: the sections showed irregular shaped fibroblasts and loosely arranged collagen bundles (Figs. 5 ,C).. Group II: the fibroblasts cells appeared regular spindle shaped with more closely packed collagen bundles (Figs. 5, D)

After 10 ten days; group I: the collagen fibers are loosely aligned (Figs.5,E) while in group II there were more better aligned collagen fibers (Figs. 5,F).

## Discussion:-

In this study, a model of wound healing has a clinical condition that is frequently encountered in traumatic oral ulcers. An experimental time period of 10 days was chosen because most oral wounds even if infected, would show complete healing by the end of this time period. The wounds of this study were all made under the same experimental conditions and were standardized for size, depth and site. The choice of male rats also cancelled the effect of sex hormones on wound healing.

Melatonin, a hormone secreted mainly by pineal gland has been found to have antioxidant and anti-inflammatory properties in the oral cavity where it reaches through saliva<sup>(18)</sup>. The histological study demonstrates that melatonin accelerates the process of normal wound healing by interfering and modulating key biological processes involved in driving the wound healing response including inflammation, angiogenesis and collagen synthesis in rats. the healing process appeared by prominent proliferation of the covering epithelium to close the ulcer margins as well as the connective tissue stroma that showed fibroblasts, collagen bundles, newly formed blood vessels and few inflammatory cell. The present study reported the beneficial effects of melatonin on wound healing, which comes in accordance with Soybir et al., who investigated the role of melatonin in an experimental wound healing model and detected a higher number of macrophages, fibroblasts, neovascularizations, and higher collagen density in treated animals. They determined that exogenous melatonin has positive effects on the angiogenic phase of wound healing<sup>(19)</sup>.

Angiogenesis occurs during the proliferative phase of healing which is an important part of the wound healing process<sup>(20)</sup>. Endothelial cells proliferate and migrate during new blood vessel formation and new vessels provide nutrients and oxygen to the newly formed tissue. These events are known to be initiated and driven by various growth factors especially VEGF165, the biologically active and most potent angiogenic protein known<sup>(21)</sup>. During normal wound healing, new blood vessel formation is initiated on day 3, peaks at day 7 and is essential for the formation of granulation tissue<sup>(22)</sup>. In the present study, the angiogenic process peaked after fourth day in the melatonin treated wounds, implying that granulation tissue formation was accelerated. This results on the effect of melatonin on angiogenesis in wounded tissue is supported by Pugazhenth et al., that melatonin treatment accelerate the angiogenic process, increasing the formation of new blood vessels and elevating the level of vascular endothelial growth factor protein expression during granulation tissue formation<sup>(23)</sup>.

The role of growth factors in the wound-healing process has been demonstrated. Platelet derived growth factor (PDGF) and TGF are well known growth factors secreted during wound healing by the  $\alpha$  granules of platelets, macrophages, and fibroblasts<sup>(24)</sup>. Both showed an increase in the content of collagen in the early phase of wound healing. Growth factors bind to the target with their specific cellular surface receptors and induce the cells to migrate, to divide, and to produce the other elements that influence the wound-healing process<sup>(25)</sup>. Melatonin induces

the production of interleukin-1, tumor necrosis factor (TNF)- $\alpha$  cytokines, and transforming growth factor (TGF). In addition, melatonin is an immunomodulator and a neuroendocrine hormone, and stimulates both monocyte cytokine and fibroblast proliferation, which influence angiogenesis<sup>(26-28)</sup>.

Melatonin mainly exerts antioxidant effects by interacting with melatonin receptor 1 (MT1) and melatonin receptor 2 (MT2) receptors on cells<sup>(29-30)</sup>. Perhaps, a potent anti-inflammatory property of melatonin is linked to its ability to act as a scavenger of exogenous and endogenous reactive oxygen species (ROS) and reactive nitrogen species (RNS)<sup>(31)</sup>.

During wound healing, fibroblasts differentiate into myofibroblasts, which generate large traction forces for wound closure and tissue remodeling. One of the best-characterized markers of myofibroblast phenotype is  $\alpha$ -SMA<sup>(32)</sup>.

In our study  $\alpha$ -SMA results peaks after 4<sup>th</sup> days, with significant difference in melatonin treated groups. In agreement with our results Cornelissen et al., found that normally no  $\alpha$  SMA was found until 4 days post wounding and the number of positive cells increase from 4 to 8 days post wounding, at 8 or 9 days the majority of the granulation tissue fibroblasts were stained for  $\alpha$  SMA and at about 12 days the proportion of  $\alpha$  -SMA positive cells are steadily decreased till 22 post wounding where they found no single positive myofibroblast in the newly formed connective tissue<sup>(33)</sup>.

The favorable effects of exogenous melatonin on wound healing were detected using ultrastructural study. Fibroblasts were denser with higher proliferation and more closely packed collagen fibers. Mechanisms associated with melatonin that may accelerate wound healing were presently investigated. One mechanism was TGF- $\beta$  associated collagen synthesis. Melatonin has been shown to induce production of TGF- $\beta$ ,<sup>(19)</sup> which plays a significant role in promoting collagen synthesis and healing the wound, also the direct action of pineal hormone on the myofibroblasts of the scar could be responsible for melatonin-induced augmentation of collagen level<sup>(34)</sup>. Moreover, this effect is dependent on the activation of melatonin membrane receptors on the cells synthesizing collagen<sup>(35)</sup>.

Melatonin affects the activity and the levels of cellular mRNA of antioxidant enzymes including superoxide dismutase, glutathione peroxidase, and glutathione reductase<sup>(36)</sup>. It may stimulate and regulate gene transcription of these enzymes via its receptors<sup>(37)</sup>. Melatonin can cross all biological membranes, and thus it can indicate protective effects against oxidative stress. Melatonin reaches the nucleus of the cell and protects essential intracellular structures, including DNA, from oxidative damage<sup>(38)</sup>.

Another investigation of the same authors revealed that collagen accumulation in the intact skin is under the control of the pineal gland. However, it was also reported that the effect of melatonin depends on the time of the application, so that morning injections increase the level of collagen in a wound<sup>(39)</sup>. Hence, in the current experiment, melatonin injections were administered in the morning, between 8:00 am and 9:00 am for regular collagen production during wound healing. Previous studies showed that dosage and duration of the exogenous melatonin administration is variable and depends on the purpose of usage. The suggested dose required to exert antioxidant properties was considered

10mg/kg BW, in animal experiments<sup>(40)</sup>. However Bulbulla et al. observed that subcutaneous melatonin application decreased collagen synthesis and epithelium proliferation and indicated undesirable effects on incision and anastomotic wound healing in normal and pinealectomized rats<sup>(41)</sup>.

Our study demonstrates that the administration of melatonin leads to significantly improved wound healing, the mechanism by which melatonin acts in this process, may be secondary to growth factors. Further research is required to establish in greater detail the effects of melatonin on the wound-healing process.

**Fig 1:-** Group I: A, a: showing discontinuity of the epithelium and the underlying connective tissue. The granulation tissue appears with inflammatory cell infiltration. ### Abstract

The spectroscopic properties of  $\text{Li}_2\text{O}-\text{Na}_2\text{O}_3-\text{B}_2\text{O}_3$  glass containing different concentrations of  $\text{MoO}_3$  (ranging from 0 to 1 mol %) were prepared by melt quenching are studied. Spectroscopic (XRD, infrared, optical absorption spectra and EPR) properties of these glasses have been carried out. As the concentration of  $\text{MoO}_3$  is increased especially beyond 0.4 mol %, the colour of the glasses increased, which is indicating the reduction of molybdenum ions from the  $\text{Mo}^{6+}$  state to the  $\text{Mo}^{5+}$  state. The Optical absorption Spectrum contains one broad absorption band around 695 nm is attributed to the excitation of  $\text{Mo}^{5+}$  ( $^4d_1$ ) ion. EPR studies reveal Molybdenum ions are expected to exist mainly in the  $\text{Mo}^{6+}$  state in the glass network. EPR, FTIR and Optical absorption spectra of paramagnetic ion in the above glasses reveal that the site symmetry of the transition metal ion is elongated octahedral.

### Introduction:-

The glasses containing transition metal ions came into prominence because of their notable spectroscopic properties and their suitability for fibre optic communications, luminescent solar energy concentrators (LSC)[1]. Among the many glasses, borate glasses have been known to be excellent host materials for transition metal oxides because of their glass forming nature compared to other conventional glass systems. Borate glasses are used as wave-guides, electro-optic switches, electro-optic modulators, magneto-optic materials, solid-state laser materials and non-linear optical parametric converters [2-4]. In addition, they are often used as dielectric and insulating materials and it is known that borate glass constitute a good shield against IR radiation [5]. In general  $\text{B}_2\text{O}_3$  glasses have a property of showing minimum expansion due to the large amount of boric oxide which is of great importance in obtaining thermal durability. It also decreases the tendency for glass to devitrify or crystallize.  $\text{B}_2\text{O}_3$  is a basic glass former because of its higher bond strength, lower cation size and smaller heat of fusion. The ions of molybdenum introduce high activity and selectivity in a series of oxidation reactions of practical importance in the glass matrices [6,7].

Molybdenum oxide belongs to the intermediate class of glass forming oxides. It does not readily form the glass but does so in the presence of the modifier with  $\text{MoO}_4^{4-}$ . Molybdenum ions in the glasses have been the subject of many investigations due to their catalytic properties. Interesting studies are available on the environment of molybdenum ion in different inorganic glasses [8-13]. Mo-O bond in molybdenum hexavalent oxide is identified as significantly covalent. The Mo ion exist a stable valence state viz., MoV and MoVI in the glass network. Molybdenum ions act both as network formers as well as network modifiers depending upon their concentration and nature of the host network. Mo-O bond in molybdenum hexavalent oxide is identified as covalent. The Mo ion exists at least in two

stable valence states viz., Mo (V) and Mo (VI) in the glass network. Earlier EPR studies on the glasses containing molybdenum ions have identified the presence of octahedrally coordinated Mo (V) ions along with octahedral distortion approaching tetragons [14,15]. These ions act both as network formers as well as network modifiers depending upon their concentration and nature of the host network. The  $\text{Mo}^{6+}$  ions are expected to participate in the glass network with tetrahedral  $\text{MoO}_4^{2-}$  structural units and may alternate with  $\text{BO}_4$  tetrahedral units. Most of the studies available on  $\text{MoO}_3$  containing glasses are on the understanding of their structure by spectroscopic investigations [16, 17] and ionic conductivity studies [18].

In the present work the influence of  $\text{MoO}_3$  in varying concentrations, on resonance and absorption properties of lithium-sodium-borate glasses are studied. Optical band gaps for both direct and indirect transitions and Urbach energies were calculated and those glasses were also characterized by XRD and FTIR studies.

### Experimental:-

The glasses of the system  $20\text{Li}_2\text{O} - 10\text{Na}_2\text{O} - (70-X)\text{B}_2\text{O}_3$  ( $X=\text{MoO}_3$ ) have been prepared by melt quenching technique varying the concentration of molybdenum ranging from 0.2-1.0(mol%) . The raw materials used were analytical pure (99.5%). Appropriate amounts of weighed chemicals  $\text{Na}_2\text{O}$ ,  $\text{Li}_2\text{O}$ ,  $\text{B}_2\text{O}_3$ ,  $\text{MoO}_3$  were grounded thoroughly in a mortar to produce homogeneous mixture. This homogenized mixture was then placed in porcelain crucibles and melted in an electrical furnace at  $870^\circ\text{C}$ - $920^\circ\text{C}$  for half an hour until a bubble free liquid was formed . The melt was then quenched to room temperature by pouring it on a plane brass plate and pressing it with another brass plate. Finally the vitreous samples were annealed for 3 hrs at 423K to relieve residual internal stress and slowly cooled to room temperature. The glasses so obtained were brown in colour with good optical quality and transparency. Details of experimental procedure and calculations are similar to the earlier work [14].

### Results and Discussion:-

#### X-ray diffraction:-

X-ray diffraction technique has been widely used to characterize inorganic glasses as it readily detects crystals in glassy matrix.

Figure 1:- The XRD patterns of molybdenum doped LNB glass system

Figure 1 represents the XRD patterns for  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  compositions of glasses and as can be seen diffraction patterns of all the prepared glasses do not demonstrate any detectable crystalline peaks indicating amorphous or non-crystalline nature of the samples.

#### Infrared Spectra:-

The prominent IR bands shown in Fig. 2 are observed for  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  glasses and these bands are effectively influenced by the molybdenum content in the glasses network. The molybdenum free glasses exhibited in the regions  $1300\text{-}1450\text{ cm}^{-1}$ ,  $1100\text{-}1200\text{ cm}^{-1}$ . These bands are identified as stretching relaxations of B-O bonds of the trigonal  $\text{BO}_3$  units. Broad absorption bands are observed at  $1050\text{-}850\text{ cm}^{-1}$  and  $800\text{-}700\text{ cm}^{-1}$ ; these bands are

identified due to stretching vibrations of the  $[\text{BO}_4]$  units. When molybdenum is added, two new bands attributed, to  $\nu_1$  and  $\nu_3$  vibrational modes of  $[\text{MoO}_4]^{2-}$  tetrahedral units and  $[\text{MoO}_6]^{6-}$  was located at about 810 and 550  $\text{cm}^{-1}$ . The bands at 448 and 548  $\text{cm}^{-1}$  were specific to the vibrations of Li–O bonds in  $\text{Li}_2\text{O}$  octahedral units. The summary of various band position of  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  is presented in the Table II

**Figure 2:-** FTIR spectrum of Lithium-Sodium-Borate glass system containing molybdenum ions of all concentrations.

**Table I:-** The summary of various band positions of IR spectra of  $\text{Li}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  glasses

Glass Code	Trigonal $[\text{BO}_3]$ units ( $\text{cm}^{-1}$ )	Stretching vibrations of $[\text{BO}_4]$ Units ( $\text{cm}^{-1}$ )	$\nu_1$ vibrational modes of $[\text{MoO}_4]^{2-}$ tetrahedral units ( $\text{cm}^{-1}$ )	$\nu_3$ vibrational modes of $[\text{MoO}_4]^{6-}$ tetrahedral units ( $\text{cm}^{-1}$ )

M1.0	1369	994	914	698

#### Absorption Spectra:-

The Optical absorption spectra of the  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  glasses are recorded at room temperature in the wavelength range 400nm-1400nm. The Optical absorption spectrum of molybdenum doped lithium sodium borate glass (with  $x=0.6$  mol %) is shown in the Fig. 3. The absorption edge is observed to shift towards higher wavelength side.

**Figure 3:-** Optical absorption spectrum of Lithium-Sodium-Borate glass system containing 0.6 mol % of  $\text{Mo}^{+5}$  ions at room temperature

The spectrum of  $\text{MoO}_3$  free glasses does not exhibit any absorption band. But small amount of molybdenum is added to glasses matrix shows a broad optical absorption band at about 695 nm (for  $x=0.6\%$ ). The intensity of this band was observed to increase gradually as the concentration of  $\text{MoO}_3$  increased. From the observed absorption edges (fig3a,fig3b,fig3c) direct, indirect band and Urbach energy gap are evaluated and are presented in Table II. The values of direct and indirect band gap energies, decreases from M0.2 to M1.0.

#### EPR Spectra:-

EPR spectra of  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  glasses doped with different concentrations of  $\text{MoO}_3$  were recorded at room temperature. The EPR spectra of these glasses consist of a main central line surrounded by less intense satellites. The EPR spectra of the glasses recorded at room temperature exhibit signals consisting of a central line surrounded by smaller peaks at about  $g_{\parallel}=1.811$  and  $g_{\perp}=1.956$  for M0.6 glass system and is shown in Fig.4.

Figure 4:- EPR spectra of M0.6 glass sample ( $\nu = 9.205\text{GHz}$ )

The EPR spectra obtained for the molybdenum ions in the titled glasses are similar to those obtained for various other glass systems [20–22]. The spectra shown in Fig. 4 can best be analyzed using a spin-Hamiltonian of the form:  $H = \beta SgB + SAI$ , where the symbols have their usual meaning. It contains the electronic Zeeman term ( $\beta$  is the bohr magneton,  $S = 1/2$  the electron spin,  $g$  is the  $g$  tensor and  $B$  is the applied field), perturbed by the hyperfine coupling term between the unpaired electron and the nuclear spin  $I$  of molybdenum ion,  $A$  being the hyperfine structure tensor. The central line arises from even molybdenum isotopes ( $I = 0$ ), while the smaller lines correspond to the hyperfine structure from odd  $^{95}\text{Mo}$  and  $^{97}\text{Mo}$  isotopes ( $I = 5/2$ ). The nuclear magnetic moments of  $^{95}\text{Mo}$  and  $^{97}\text{Mo}$  being close, so the isotope splitting is not resolved in the EPR spectra. It can be assumed that  $\text{Mo}^{5+}$  ions in the glasses studied has an octahedral coordination with a weak axial distortion. An octahedral site with a tetragonal compression usually shows of and  $g_{\parallel} < g_{\perp} < g_e (=2.0023)$  [23]. It is found that the values obtained for the glasses under study, are more close to those of the molybdenyl ions. The values of  $g_{\parallel}$  and  $g_{\perp}$  from these spectra have been evaluated and presented in Table III. Further, the  $g$  values obtained for these glasses are found to be consistent with the reported values for many other glass systems containing molybdenum ions.  $A_{\parallel}$  and  $A_{\perp}$  are the parallel and perpendicular components of the hyperfine tensor  $A$ . It is observed that the intensity of the resonance signal increases with increase in the concentration of  $\text{MoO}_3$ .

Table III:- EPR data of  $\text{Li}_2\text{O-ZnO-B}_2\text{O}_3$ :  $\text{MoO}_3$  glasses

Glass Code	$g_{\parallel}$	$g_{\perp}$	$A_{\parallel} (\text{X } 10^{-4} \text{ cm}^{-1})$	$A_{\perp} (\text{X } 10^{-4} \text{ cm}^{-1})$

M0.4	1.806	1.956	113.0	1.87
M0.6	1.811	1.956	107.3	1.88
M0.8	1.811	1.950	109.8	1.31
M1.0	1.810	1.940	106.2	1.67

The EPR transition can be explained as because of decrease of the effective charge of the surrounding oxygen ligands, there is decrease in their electron donating ability ( $\sigma$ -bonds), hence the charge of the central molybdenum remains high. Therefore, this induces the promotion of strong  $\pi$ -bond with the two axial oxygens of the compressed octahedron hence axially distorted environment is developed. By this the  $\text{Mo(V)}$  is strongly displaced in its octahedron so that it adopts a pyramidal configuration  $\text{MoO}_5$  with a very short  $\text{Mo-O}$  distance, which would correspond to the molybdenyl ion [24].

### Conclusions:-

The conclusions drawn from analysis of the results of the various properties of  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  glasses reported in this study are as follows:

- XRD spectra revealed amorphous of the sample.
- The FTIR Spectral studies indicate that the molybdenum ions occupy tetrahedral positions in higher concentrations.
- The Optical absorption Spectra of  $\text{Li}_2\text{O}-\text{Na}_2\text{O}-\text{B}_2\text{O}_3:\text{MoO}_3$  glasses exhibits bands associated with transitions at  $\text{Mo}^{5+}$  ions, indicating that the molybdenum ions is in pentavalent state, in addition to tetravalent and hexavalent states respectively in these glass samples.
- The EPR Spectra of these glasses exhibit a signal consisting of a triplet separated by smaller satellites. The signal has been identified as arising from tetragonally distorted octahedral positions of  $\text{Mo}^{5+}$  ions.

#### Abstract

The vast Mutagenic effect showed by application of mutagens (Sodium Azide -3mM, 5mM, 7mM; Ethyl Methane Sulphonate -5mM, 10mM, 15mM; And Gamma Irradiation -100kr, 200kr, 300kr). That clearly showed in field as well as laboratory testing; by using molecular markers, PCR (Polymerase chain reaction) ISSR( Inter Simple Sequence Repeat). Mutagenic variation founded in all the mutagens, but selected Genotypes were obtained from 100kr and 10mM Mutagenic lines. We demonstrate these genotypes for phenotypic screening and associated maturity, morphology, pigmentation traits. ISSR analysis done by two Primers and it was detected polymorphisms. For analysis, two primers were designed from consensus sequence regions on protein homolog genes, and used to amplify the genomic region. PCR samples were sequenced. The total number of polymorphic ISSR bands showed specific range and scored on all genotypes and their homology was measured.

#### Introduction:-

The genus Glycine consists of two subgenera, i.e. Glycine and Soja. Glycine max (L.) Merr. And G. soja Sib. & Zucc. Belongs to Soja subgenus. Glycine max is the cultivated soybean while Glycine Soja is its wild progenitor. Soybean (Glycine max (L.) Merrill) is an important crop as a source of protein and oil. Charles and Morse (1923) reported that the origin of soybean is china, Manchuria and Korea. Soybean is one of the best valued crops for its ability to fix nitrogen and provide seed protein and oil. In this importance the species are needed to develop new strain by mutagenesis to prove key step for identifying gene function in cultivar. A number of mutagen sources exist for introducing genomic variation. These include chemical, radiation, and transformation-induced mutagenesis of plant genomes (Waugh et al; 2006; Kuromori et al; 2009). Each of these methods results in a signature footprint of structural variation across the genome (Alonso and Ecker, 2006).

Molecular markers have become new tools and technique to help reduces workers effort(in identifying genotypes , save time i.e. work performed in short period of time, in most plant breeding programme, including introduction, selection and certification. Among them, SSR also known as micro satellite or short tandem repeat or simple sequence length polymorphisms is a repeated nucleotide sequence of 2-7 base pair units. Repeatability of fragment resulted from slippage in replication ( Schlotterer and Tautz, 1992) and unequal crossover (Smith, 1976). The SSR technique uses PCR to amplify DNA fragments by repeated cycles of DNA denaturing, annealing and extension using DNA polymerase enzyme. The resulting DNA was separated by banding on gel (Akkaya et al; 1992). This

method has many advantages such as rapid, reliable (Diwan and Cregan,1997), abundance (Lagerkrantz et al;1993),co-dominant(Akkaya et al;1992), high heterozygosity (Powell et al;1996), and high polymorphism(Akkaya et al;1995).

SSR has been used in the construction of genetic linkage map of human(Gyapay et al;1994),soybean shoe-marker Morgante, 1994; Akkaya et al;1995;Maughan et al;1995)and also used in DNA fingerprint of soybean (Yanagisawa et al;1994;Diwan and Cregan,1997).

SNP is single base variation between two identical DNA sequences. Brooks (1999) reported that SNP was single base pair positions in genomic DNA at which different sequence alternatives (alleles) exist in normal individuals of natural populations. This technology allows greater number of tests to be run at a significantly lower cost than existing technology. This technology has application in genome sequencing, SNP identification and typing, screening for genetically-linked diseases, identification of genetic drug targets, screening for individuals for potential drug side effects, gene cloning, screening potential tissue donors, screening cancer cells for genes conferring chemotherapy resistance. This technique has more advantages than markers such as isozyme, RFLP, RAPD, SSR. These advantages include very large number of polymorphic loci which distributed throughout the genome, marker present within coding regions, introns and regions that flank genes, simple and unambiguous assay techniques, high level of polymorphism in the population, stable Mendelian inheritance and low levels of spontaneous mutation (Brown, 1999).

Soybean genotypes were grown for said phenotypic characters indicating the different genetic variability among 12 genotypes. The objective of this study was to evaluate genetic variability and relationship among 12 soybean genotypes. by using PCR-ISSR .

## Materials and Methods:-

### Plant material and DNA isolation:-

Fresh seeds of soybean genotypes were used in this study for DNA extraction and isolation. The genotypes of soybean were grown in Aurangabad district (MS). The analyzed samples included dried soybean seeds that were used directly for DNA extraction. They found to yield DNA's comparable in quality and quantity when using EZI nucleic acid isolation analyzer (QIAGEN, 2007), CTAB method. Plant genomic DNA purification kit method, and DNA extraction with phenol purification and liquid nitrogen method, a soybean seed bulk sample was ground to fine powder. The experiment was carried out under the same conditions for all DNA samples.

### Molecular material:-

DNA was extracted from seeds of soybean genotypes (*Glycine max* (L.) Merrill.) were grown in Aurangabad (MS) and isolated genomic DNA was amplified with two primers.

**Table 1:-** Primers for PCR amplification of Soybean (*Glycine max* (L.) Merrill.) Used in the study

(GENO-8), 9. (GENO-9), 10. (GENO-10), 11. (GENO-11), 12. (GENO-12)

#### **Digestion of DNA:-**

The restriction enzyme recognizes a unique, specific sequence of, usually, 4-6 base pairs (bp) in length, termed a restriction site, where the enzyme cuts (restricts) the DNA. In general, restriction sites will occur throughout the genomic and, consequently, application of the enzyme to total genomic DNA (Restriction of DNA) results in its conversion into millions of fragments. The frequency of restriction sites will vary depending on both the restriction enzyme and on the genome.

#### **Polymerase Chain Reaction Amplifications:-**

Here, in study two primer pairs were used for PCR amplification. We performed different PCR optimizations of the PCR reaction mix and conditions for each primer pair.

#### **SPA/SPB Primer Pair:-**

Works carried in two tubes of a total volume of 25 $\mu$ l. The tubes contained 2 $\mu$ l of genomic DNA, 0.2 $\mu$ l of each primer, 2.5 $\mu$ l 10x PCR Buffer, 3.5 $\mu$ l of 50mmol/1MgCl<sub>2</sub>, 2.5 $\mu$ l of 10mmol/1 dNTPs, and 0.3 $\mu$ l of Taq DNA polymerase. The program was initiated on Bio-Rad PCR amplifier with 5 min of denaturation, followed by 10 cycles of amplification with denaturation for 15 sec at 94 $^{\circ}$ C first annealing for 20 sec at 54 $^{\circ}$ C and extension at 72 $^{\circ}$ C for 15 sec; followed by 40 cycles of amplification with denaturation for 1.5 min, second annealing for 1.5 min at 61 $^{\circ}$ C,an extension at 72 $^{\circ}$ C for 1min, and final elongation at 72 $^{\circ}$ C for 5min.

#### **LE5/LE6 Primer Pair:-**

Works carried in two tubes of a total volume of 25 $\mu$ l. The tubes contained 2 $\mu$ l of genomic DNA, 0.2 $\mu$ l of each primer, 2.5 $\mu$ l 10x PCR Buffer, 3.5 $\mu$ l of 50mmol/1MgCl<sub>2</sub>, 2.5 $\mu$ l of 10mmol/1 dNTPs, and 0.3 $\mu$ l of Taq DNA polymerase. The program was initiated on Bio-Rad PCR amplifier with 5 min of denaturatuion, followed by 10 cycles of amplification with denaturation for 15 sec at 94 $^{\circ}$ C first annealing for 20 sec at 55 $^{\circ}$ C and extension at 72 $^{\circ}$ C for 15 sec; followed by 40 cycles of amplification with denaturation for 1.5 min, second annealing for 1.5 min at 53 $^{\circ}$ C,an extension at 72 $^{\circ}$ C for 1min, and final elongation at 72 $^{\circ}$ C for 5min

All amplification products (10 $\mu$ l) were electrophorised in 1.5% (w/v) TAE Agarose gels containing 1 g/ml ethidium bromide. The electrophoresis was run in TBE at 100v for 40min and DNA bands were observed under UV light and photographed by image system.

**Fig.2.** Specificity of the PCR method using the primer pairs SPA/SPB and LE5/LE6 to identify the DNA. Agarose Gel Electrophoresis of PCR products amplified from genomic DNA of soybean genotypes.

**Fig 2:-** Specificity of the polymerase chain reaction method using the primer pairs SPA/SPB and LE5/LE6 to identify the DNA Agarose gel electrophoresis of PCR products amplified from genomic DNA of Soybean genotypes. Lane 1-100bp ladder size standard(M); Lane 1,III,V,VII,IX,XI and XII sample genomic PCR product of SPA/SPB; Lane II,IV,VI,VIII and X sample genomic PCR product of LE5/LE6.

#### PCR-RFLP Data analysis:-

The PCR-RFLP analysis were performed in Agarose gel electrophoresis and its makes the banding pattern with high molecular weight DNA running fast in the lane; while low molecular weight run slow shown in the lane. The high molecular weight DNA was digested with an appropriate restriction endonuclease and the digest was fractioned by electrophoresis in 1% Agarose gel by Shiraishi et.al. The banding patterns obtained from the ISSR markers were scored as present (1) and absent (0). The PCR-RFLP method enabled to identify nucleotides at each of the variable sites clearly reliable.

Each sample has amplified by using two primers for each fragment and it was treated as rearrangement in genome. The primers shows scoring and reproducibility were considered for the scoring of bands. The gel pictures were taken and documented to the computer by using alpha imager gel documentation system and each amplicon were measured by software. The dendrogram was plotted by using phylogeny free and tree view of DNA fingerprinting analysis tool (Dendrogram).

**Fig 3:-** Dendrogram based on bioinformatics phylogeny tool Free Tree and tree view of DNA fingerprint analysis.

## Result and Discussion:-

The selected samples of isolated DNA was run on 1 % w/v Tris-Acetate EDTA gel were to check the quality of DNA sample have shown high molecular weight of DNA band (Fig.1). The amplification of genomic DNA of twelve selected genotypes using ISSR marker yielded total amplified 207 fragments were obtained while analysis of ISSR some fragments showed monomorphic and polymorphic in nature (Fig.2). In ISSR number of amplified fragments were ranged from 118bp to 320 bp. The PCR amplification using ISSR primers have potential to reproducibility of amplification of the product. The dendrogram analysis was carried out by using bioinformatics phylogeny tools free tree and tree view of DNA fingerprint analysis (Fig.3). Earlier the comparative analysis of genetic diversity was also attempted by using SNP, ISSR and RAPD markers in soybean genotypes, Vigna genotypes and Mung bean genotypes. The twelve *Glycine max*. (L.) Merrill derived genotypes were clustered in three groups. Cluster-I, II and III. The narrow genetic diversity identified among the soybean genotypes which derived from variety of JS-335. The present study may be the serve as the source of new alleles in soybean breeding programme.

## Conclusion:-

The derived genotypes were identified for qualitative and quantitative characteristics. In cross breeding between the superior genetically different individuals which are having different gene of interest characteristics rather than involving individual belonging close relative genetic group. The analysis reported that in the present study could be useful to the selection of screened individuals for cross breeding purpose.

#### Abstract

**Introduction:** heart failure has emerged over the past several decades as a major global public health problem. In addition to the enormous costs in human suffering and loss of productivity, heart failure has imposed an increasingly heavy financial burden on health-care systems throughout the world.

**Subject and methods:** We held a cross sectional analytical study in the Cardiac Center in Al-Madina Al-Monawara. A total of 64 patient with heart failure admitted to the center between 1/3/2012 to 10/4/2012 were subjected to questionnaire to determine the risk factors including age, sex, occupation, smoking, physical activity, co-morbid conditions, and family history.

**Results:** About one third of the total patients admitted to the medical department in Madina Cardiac Centre have heart failure (30.3%). Half of the patients with heart failure are retired and illiterates. DM, hypertension and hyperlipidemia were a common findings in patients with heart failure (45%, 45%, and 40%) respectively. Ischemic heart diseases was the commonest etiology for those with heart failure (85%).

**Conclusion:** Many factors are associated with heart failure, the most common of which is ischemic heart disease. DM, hypertension and hyperlipidemia are also common findings in patients with heart failure.

#### Introduction:-

Heart failure has emerged over the past several decades as a major global public health problem, with rising prevalence reported in both industrialized and developing nations alike (1–6). In addition to the enormous costs inhuman suffering and loss of productivity, heart failure has imposed an increasingly heavy financial burden on health-care systems throughout the world. Although highly effective treatments including new drug therapies and devices have been developed for patients with chronic heart failure (specifically those with systolic dysfunction), episodes of decompensation that require hospitalization still occur commonly in this population (7,8).

Registry data from the USA and elsewhere provide insight into the clinical characteristics of patients who are hospitalized due to ADHF (9–11), these patients are, in general, elderly, with an average age in the low to mid-70s.

**Corresponding Author:-Mohamed Mosaad.**

Address:-Associate professor of internal medicine, Department of Internal Medicine, College of Medicine, Taibah University, Madinah, Saudi Arabia.

In Asia, however, the average age is considerably lower (12). Approximately half of them are female. Hypertension, coronary artery disease (CAD) and diabetes are common, and one-fourth have atrial fibrillation. Hypertension on admissions more frequent than previously imagined, with systolic pressure averaging between 140 and 150 mmHg. Blood pressure in patients hospitalized with decompensated heart failure in Japan, however, tends to be considerably lower (8). Patients with evidence of hypotension comprise only a small percentage of those hospitalized with ADHF. Approximately half of the patients admitted with decompensation in the USA have heart failure with preserved ejection fraction (HFpEF) and this percentage is even higher in Japan (8,14). Overall 60–90 day post-discharge morbidity and mortality risk, however, does not differ significantly between the HFpEF patients and patients with heart failure and reduced ejection fraction (HFrEF) (13). The echocardiography is the most useful complementary examination when evaluating patients with HF. It provides important information regarding heart morphology; quantifies the systolic and diastolic functions and helps define the etiology and prognostic parameters in response to different therapeutic interventions. In recent years, two new and fundamental echocardiographic evaluations were incorporated into daily practice: the evaluation of ventricular dyssynchrony and hemodynamic evaluation. The latter has been very important to understand the hemodynamic profile of patients with HF, especially decompensated ones or those difficult to manage (15).

**Aim of the work:-**

To establish a program for prevention and decreasing morbidity and mortality due to heart failure.

**Specific objectives:-**

1. To determine the major risk factors for developing heart failure in our community.
2. To determine echo findings in these patients

**Materials and Methods:-**

We held a cross sectional analytical study in the Cardiac Center in Al-Madina Al-Monawara. A total of 64 patient with heart failure admitted to the center between 1/3/2012 to 10/4/2012 were subjected to questionnaire to determine the risk factors including age, sex, occupation, smoking, physical activity, co-morbid conditions, and family history. And we recorded the echocardiographic findings and the final clinical diagnosis for every patient for determining the type, severity, and presence of etiological findings for the heart failure.

**Data Analysis:-**

The gathered data was processed using Statistical Package of Social Sciences version 17 (SPSS version 17 Inc., Chicago, IL, USA), data was analyzed presented in terms of percentage, means and standard deviations.

**Ethical consideration:-**

The search aim and method is explained for every patient and a verbal consent is taken, and every one had the right to accept or refuse sharing in our search.

**Results:-**

About one third of the total patients admitted to the medical department in Madina Cardiac Centre have heart failure (30.3%). Heart failure is more common in males (75%) and in those over the age of 65 (65%) (Table 2). Half of the patients with heart failure are retired and illiterates. DM, hypertension and hyperlipidemia were a common findings in patients with heart failure (45%, 45%, and 40%) respectively (Table 4). Ischemic heart diseases was the commonest etiology for those with heart failure (85%) (Table 3). Though most of the studied cardiovascular risk factors were prevalent in both patients with heart failure and those with the other cardiac diseases, only smoking and gout (Table 4) were significantly more in the patients with heart failure.

**Table 1:-** presence of chronic illness in the study subjects

### Discussion:-

In our study many factors are associated with heart failure, the most common of which is ischemic heart disease which is also the most common cause of HF in western countries (18) . Male sex , illiterates , DM, hypertension and hyperlipidemia are also common Factors and these findings were reported in many studies that investigated patients with HF. One of these studies is the First National Health and Nutrition Examination Survey done in the United States that followed 13643 patients who didn't have a history of HF over 20 years period and the incidence of HF was associated significantly with : male sex , less than a high school education, low physical activity, cigarette smoking, overweight, hypertension, diabetes, valvular heart disease and coronary heart disease(19). Also Framingham Heart Study found that patients with blood pressure  $\geq 100/160$  mm Hg have 2 times more risk for developing HF when compared to patients with blood pressure  $< 90/140$ mmHg. They also reported that Older people are at increased risk for developing HF (20) .

**Conclusion:-**

Many factors are associated with heart failure, the most common of which is ischemic heart disease. DM, hypertension and hyperlipidemia are also common findings in patients with heart failure.

**Study limitations:-**

The main limitation in our study is the cross-sectional study design, with its limitations, including recall bias. Also the low number of the patient included in the study .

**Conflict of interest:-**

The authors declare that they do not have any conflicts of interest to declare.

**Acknowledgments:-**

We would like to thank the administration of the Cardiac Centre in Al-MadinaAl-Monawara, for being helpful during the time of the study .

#### Abstract

Increasing demand for gas turbines (air and automobile industry) resulted in need for materials resistant at elevated work temperatures. Use of these materials increases the utilization factor since input temperatures are higher. For these applications high dynamic strength materials and materials with small elongation at elevated temperatures are needed. Furthermore, these materials should be resistant on corrosion of exhaust gases. High strength at elevated temperatures classifies them in the group of hard-to-machine materials. Since machining of super alloys generates great deal of heat, it must be dissipated using large quantity of metal working fluids (MWFs). Cost of metal working fluids is increasing as the number and extent of environmental regulations increase. To decrease the impact on environment new machining techniques are developed. These techniques use minimal quantities of metal working fluids in quantities from 10 to 50 ml/h. Furthermore, there is no cost associated with treatment and disposal of MWFs, simply because there is nothing to dispose. It is well known that flood technique produces large quantity of waste which is classified as hazardous. This work deals with research of machinability of these super alloys using dry and semi-dry machining techniques, as environmental friendly techniques and as answer to the ever rising costs of production of machining operation with flooding of cutting zone.

#### Introduction:-

Increasing impact of machining process on environment resulted in increasing costs of production mostly because of the cost of MWFs regarding its disposal since they are classified as a hazardous waste. Misunderstanding of the role of metal working fluid in machining and wrong assumption that MWFs application is needed but not necessary element of the machining process lead towards inadequate use of the metalworking fluids. This inadequate use increases the impact on environment even more. Yet, positive applications of MWFs, concerning cutting forces, surface roughness, tool life and cutting temperatures, are reported every day, so this necessary part of machining process somehow must be reconciled with environment protection. If MWFs are going to be used, impact on environment must be minimized, and now days this is obligatory requirement.

Basic functions of MWFs in machining are: lubrication, cooling, chip transport and protection of work piece and machine tool against corrosion (if only oil as MWF is used [1]). Cooling, chip transport and corrosion protection are pretty much explainable mechanisms but lubrication mechanism is still poorly explained. Extensive research is done and no proof is found for penetration of MWF into chip-tool interface. If there is no penetration how could lubrication occur? Still, there are no valid scientific explanations on how metal forming fluids actually work. Given explanations [2] are not fully accepted because there are no experimental conformations to support given theoretical assumptions. Hence, this field is still wide open for research.

Some experiments [2] about efficiency of MQL technique against conventional machining operations (flood machining) offered very interesting and promising mechanism of the penetration of MWFs into the chip-tool interface based on Rebinders' effect. These explanations could lead towards explaining how MQL actually works. Performed experiments led to conclusion that MQL enhance embrittlement of the material being removed, hence lowering cutting forces in that way. Since MQL machining is inferior in comparison to flood machining especially to high pressure supply of MWFs, the size of the particles and the way they enter into the cutting zone got to play important role in MQL machining. Maybe, that's the reason why in some cases (when machining aluminum) MQL machining gives better results even than flood machining [3]. Furthermore, Thakur et al. (2009) proved that MQL could successfully be used to perform machining of super alloy Inconel 718 [4].

Dry and semi-dry machining are promising alternatives for conventional (flood) machining. Dry machining considers machining with only compressed air to replace MWF, and in semi-dry machining beside compressed air some other components such as oil, water, CO<sub>2</sub>, liquid nitrogen etc. are used. There are no accepted classifications of MQL machining but literature and practice offer two levels of classification [5]. The first level includes the way in which aerosol is supplied into the machining zone (internal-through tool or external). Second level of classification includes the composition of the aerosol (simple: air-oil mixture or advanced: air-oil and some other components which enhance cooling and/or lubricating characteristic).

Studies showed that MQL machining with simple aerosol composition that includes only compressed air and oil has poor cooling capabilities and is not suitable for machining difficult-to-machine materials such as titanium and nickel based alloys where excessive heat generation is the main problem [6]. To increase cooling capability of the aerosol mixture, some other components such as: water, solid or gaseous CO<sub>2</sub> are added to the aerosol [2].

Another way to increase cooling capability of MWF is to use liquefied gases such as: carbon dioxide, nitrogen and helium as a cooling medium. As this machining is performed at very low temperatures it is often referred to as cryogenic machining. Nitrogen and helium are not considered as pollutants. On the other hand carbon dioxide is air pollutant and unlike nitrogen and helium is heavier than air and could cause CO<sub>2</sub> accumulation and oxygen deficiency problems on the shop floor [7]. Since carbon dioxide is gas without smell, its accumulation on the shop floor is very dangerous for machine tool operators.

Effectiveness of cryogenic machining in reducing tool wear, cutting force and surface quality of the work piece is already proven in experiments [8-11]. These experiments showed that cryogenic machining is superior in comparison to MQL and dry machining. However, due to the high initial costs of cryogenic machining systems, application and development of MQL machining systems is in constant up rise. One of examples of MQL machining which performs similar as flood machining (or even better [3, 12]) is advanced MQL machining with external supply of aerosol that includes compressed air, oil and water. The system supplies machining zone with water droplets covered with thin oil film. This semi-dry machining system is used in experimental research. In this experimental research, dry machining is performed without use of any metal working fluids.

Nickel-based super alloys are found in a wide range of applications. The most prominent use is in the manufacture of gas turbines for use in commercial and military aircraft, power generation, and marine propulsion [13]. Super alloys also find important applications in the oil and gas industry, space vehicles, submarines, nuclear reactors, military electric motors, chemical processing vessels, and heat exchanger tubing.

Application of nickel based super alloys depends upon their characteristics. Among the important characteristics high temperature creep resistance is one of most important properties. Creep takes place over time and results from long-term exposure to stress levels, and is more severe in materials subjected to heat for long periods. If the working temperatures are closer to the material melting point creep is even more intense. For example, a turbine blade made

of a non-creep resistant material and used in a high temperature environment may creep over time, contact the housing and damage the blade. Component failure is often the result of creep. Another important property of super alloys is corrosion resistance. Corrosion resistance arises from the formation of a protective oxide layer which protects the underlying material.

Since their introduction, a wide range of nickel-based super alloys have been developed. However, two families of nickel-based super alloys stand out. The first family of nickel-based super alloys, developed in the 1940s for use in early jet engines is known as Nimonic family. These alloys typically consist of more than 50% nickel and 20% chromium. The second family of nickel-based super alloys is the Inconel alloys, which are made using nickel, chrome and some iron. These two families become synonyms for heat resistant high strength materials.

Nimonic 263 is typical representative of heat resistant nickel based super alloys used for machine parts that work on elevated temperatures. Nimonic alloy 263 is an age-hardenable nickel-cobalt-chrome-molybdenum alloy which was designed to have excellent fabrication characteristics in the annealed condition but also very good aged strength properties. Nimonic alloy 263 was developed to provide a sheet material which could be readily fabricated and would offer improved ductility in welded assemblies to replace NIMONIC alloy 80A. It is supplied in the annealed condition and its excellent ductility in this condition makes it suitable for cold forming as well as hot working. Alloy 263 can be welded using matching composition filler wire in both Tungsten Inert Gas (TIG) and Metal Inert Gas (MIG) forms. Regarding the composition of Nimonic alloys, they are regarded as difficult-to-machine materials [14]. These materials produce excessive heat during machining operations. Since nickel based alloys have low heat conductivity, heat produced during machining operations results in very high cutting temperatures. High cutting temperatures led to excessive tool wear and low surface quality. Concerning this, large quantity of coolant is recommended during machining operations.

To make this experimental research as environmentally friendly as possible, oil used in experiments was refined rapeseed oil. Besides that, experiments showed that bio-based oils exhibit better results than petroleum based oils [15, 16].

### Experimental work:-

Experimental research was conducted in LORAM – Laboratory for Metal Cutting and Machine Tools of University of Zenica. Conventional lathe has been used. Experimental setup is shown in Figure 1. Three component dynamometer (Kistler Type-9265B) was used to measure cutting forces. Cutting temperature was measured by means of infrared camera Fluke Type-TI32 and surface roughness was measured with Perthometer M1. All three devices are shown in Figure 2.

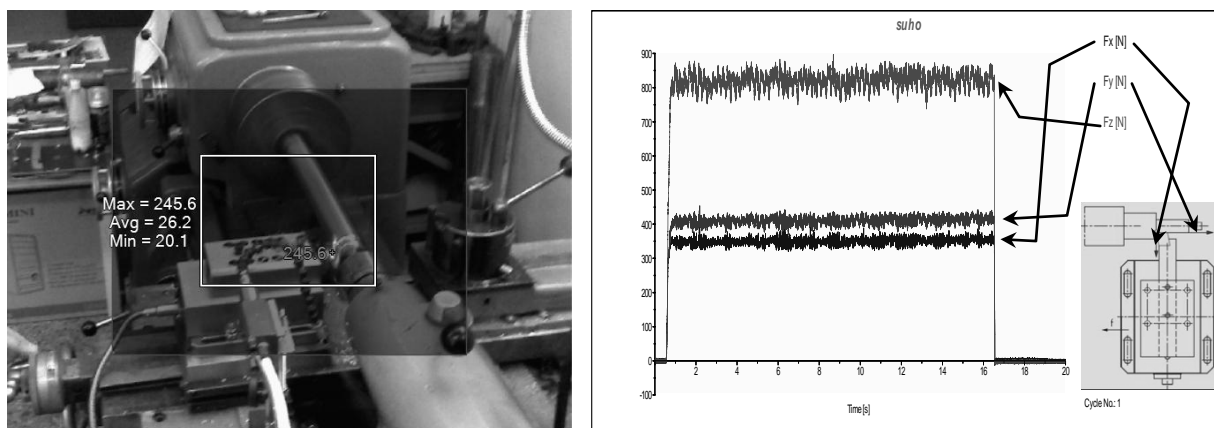

Figure 1:- Experimental setup

**Figure 2:-** Equipment for measurement of:  
a) cutting forces, b) temperatures and c) surface roughness

Temperature measurements should be used with caution since using this apparatus only temperature of chip that is being removed could be measured (Figure 3(left)). Temperature of tool tip cannot be measured with this apparatus, because it is not visible during machining. It was assumed that temperature of the chip being removed is in direct proportion to cutting temperature.

**Figure 3:-** Example of temperature measurement (left) and cutting forces measurement (right)

Semi-dry machining is performed using advanced MQL system type OoW (Oil-on-Water) produced by Daido Metal Co Japan. Main components of OoW system are presented in Figure 4. This MQL system makes droplets of water 100-200  $\mu\text{m}$  in diameter with oily film around it, as shown in Figures 5 and 6. Droplets captured on paper show that diameter of droplets is in the given range. Taking into account that diameter of droplets is larger after contact with hard surface, diameter of a flying droplet is closer to 100  $\mu\text{m}$ . Comparing to MQL with only compressed air and oil used (size of the particles 5 to 30  $\mu\text{m}$ ) these particles are up to 20 times larger. Studies show that size of the particles could be essential for effectiveness of MQL machining. Reported effectiveness of this system [2, 12, 17] indicates that size of OoW droplets could still be in acceptable range.

**Figure 4:-** Device for acquisition of Oil-On-Water droplets with detail of nozzle cross section

**Figure 5:-** Oil-On-Water droplets [17]

**Figure 6:-** Oil-On-Water droplets captured on paper with millimeter division

MQL system settings are as follows: oil consumption is in range from 10-50 ml/h and water from 300 to 1800 ml/h. The pressure of compressed air used for atomization of oil and water is 0.2 MPa.

Oil used in experiments is refined rapeseed oil with excellent lubrication properties. Rapeseed oil is probably the best natural lubrication media on the market but widely avoided because of residue oil that makes gummy and sticky stains on the machine and work piece, especially undesirable on finish surface of the work piece.

Work piece material is nickel based super alloy Nimonic 263 which is a typical representative of heat resistant alloys used in gas turbines. Chemical composition of Nimonic 263 is presented in Table 1, and its mechanical properties are shown in Figure 7. Two work pieces are selected. First one was in cast condition and second one was after casting forged with 60% deformation.

The aim of this research is to investigate difference between dry and semi-dry machining concerning cutting forces, cutting temperatures and surface roughness  $R_a$  and to optimize the MQL parameters such as: quantity of oil, quantity of water and nozzle position in relation to cutting force, cutting temperature and surface roughness.

**Figure 7:-** Tensile properties of bar. Heat treatment 2h/1150°C/WQ + 8h/800°C/AC

Two series of experiments are performed. In the first set of experiments, cutting speed, depth of cut and feed are varied and MQL parameters are held on constant level (quantity of water 250 ml/h; quantity of oil 50 ml/h; pressure of compressed air 0.2 MPa, nozzle position: rake side of the tool). This experiment was performed to check a level of cutting speed, feed, depth of cut and type of cutting tool to be used in second set of experiments which were conducted by varying MQL machining parameters. The second set of experiments was planned using full factorial experimental design and following, MQL parameters were varied: quantity of water, quantity of oil and nozzle position.

## Results and Discussion:-

### Experimental setup No.1 – castings:-

Settings for first series of experiments are shown in Table 2. Experiments were performed and cutting forces, temperatures and surface roughness were measured; data is presented in the Table 3. Graphical interpretation of results from Table 3 is shown in Figures 8, 9 and 10.

All experiments with first work piece are characterized by the intensive tool wear (Figure 11). It can be seen that wear occurs on rake face and flank face. Tool edge shown in Figure 11 is used in experiment number 5 on a machining length approximately 50 mm. Same tool edge was used for MQL and dry machining. First 25 mm was for MQL machining and remaining 25 mm was for dry machining.

**Table 2:-** Experimental settings for the first work piece

OoW (Oil on Water)	Quantities	Oil: 50 ml/h, Water: 250 ml/h, Air 6000 NI/h (100 NI/min)

**Figure 10:-** Chip temperatures for experiments with first work piece (refer Table 3.)

**Figure 11:-**Cutting tool SNMG 120408-SM rake face (left) flank face (right)

**Figure 12:-**Metallographic image of chip, MQL (left) and dry machining (right)

On the basis of generated experimental data for experimental setup No.1 presented in Tables 2 and 3, as well as Figures 8 to 12 the following conclusions were made:

- For the same depth of cut and feed, MQL machining gives 20% smaller cutting force when machining is performed at lower cutting speed of 23 m/min, Figure 8. That means 20% less energy for cutting process is needed when using MQL, concerning proper power calculation from spindle to drive.
- The largest difference between cutting forces (MQL vs. dry machining) is at a cutting speed of 100 m/min and at feed of 0.04 mm/rev, as shown in Figure 8 experiment number 4. Cutting force components for this experiment are shown in Figure 9. Analysis of cutting force components showed that, under given machining conditions, feed force component  $F_y$  decreased significantly. This is the main reason of this large difference between MQL and dry machining.
- As it can be seen in the Figure 10, temperature of the chip is always smaller with MQL machining. Maximum difference between MQL and dry machining is 38% in experiment number 4 (cutting speed 100 m/min, feed 0.04 mm/rev and depth of cut 0.25 mm) in favor to MQL machining. It is difficult to define influence of cutting speed, feed and depth of cut on chip temperature. On the other hand, chip temperature measurement was performed in a nonconventional way using infrared camera. In this way only temperature of chip moving away from the cutting zone could be measured and not in any case temperature on tool tip.
- Intensive tool wear shown in Figure 11 clearly indicate that this material belongs in a group of hard-to-machine materials. Figure show that tool wear is happening on both rake face and flank face. Metallographic images shown in Figure 12 reveal obstruction of proper flow of material with the formation of additional friction layer in root of the chip (designated with A in Figure 12).

#### **Experimental setup No.2 – cast then forged with 60% deformation:-**

Machining conditions for the experiment No.2 were: cutting speed  $v=60$  m/min, depth of cut  $d=1$  mm and feed  $f=1.5$  mm/rev. Selection has been made upon data from the experiment No.1. Selected tool for experiment No.2 is cemented carbide insert SNMG 120408.

Settings for this experiment are shown in Table 4. This experiment is performed according to factorial experimental design. Factor levels and intervals of variations are given in Table 5. Following factors have been controlled: quantity of water (ml/h); quantity of oil (ml/h) and nozzle position (rake face of the tool and flank face of the tool). Cutting speed, depth of cut and feed were held on a constant level  $v=60$  m/min,  $d=1$  mm and  $f=1.5$  mm/rev.

Experiments were performed and cutting forces, temperatures and surface roughness were measured; data is presented in the Table 6. Graphical interpretation of results from Table 6 is shown in Figures 13, 14, and 15.

**Table 4:-** Experimental settings for second work piece.

OoW (Oil on Water)	Quantities	Oil: 10 to 50 ml/h, Water: 300 to 1700 ml/h, Air 6000 NI/h (100 NI/min), Nozzle position: Rake side and Flank side

**Figure 13:-** Cutting force for experiments with second work piece (refer Table 6.)

**Figure 14:-** Surface roughness  $R_a$  for experiments with second work piece (refer Table 6.)

**Figure 15:-** Chiptemperature for experiments with second work piece (refer Table 6.)

The goal of these experiments is to investigate influence of three parameters of MQL system i.e.: quantity of water ( $W$ , ml/h), quantity of oil ( $O$ , ml/h) and nozzle position ( $NP$ , rake or flank face of the tool) on resultant cutting force ( $F$ ), surface roughness ( $R_a$ ) and cutting temperature ( $T$ ). In that sense full factorial DOE with two repetitions at central point is used. Plan matrix with natural level of factors and results of experiments are shown in Table 6. Just for comparison, two trials with dry machining were performed; results are shown in Table 6, too. For the purpose of regression analysis, following designations are used:

**W** – Water, ml/h

**O** – Oil, ml/h

**NP** – Nozzle Position, Rake face or Flank face of the tool

**WO** – Water Oil

**WNP** – Water Nozzle Position

**ONP** – Oil Nozzle Position

**WONP** – Water Oil Nozzle Position

Regression analysis of experimental data from Table 6 gave the following regression models:

- Resultant cutting force  $F$ :

$$F = 702.20 - 0.007 W - 0.41 O + 7.25 NP + 0.00009 WO - 0.009 WNP - 0.27 ONP + 0.00029 WONP \quad \dots\dots\dots (1)$$

- Surface roughness  $R_a$ :

$$Ra = 2.75 - 0.0002 W - 0.018 O + 0.34 NP + 0.00001 WO + 0.00009 WNP - 0.006 ONP + 0.000003 WONP \quad \dots\dots\dots (2)$$

- Cutting temperature  $T$ :

$$T = 228.83 - 0.057 W - 0.154 O - 29.75 NP + 0.00034 WO + 0.0179 WNP - 0.302 ONP + 0.0005 WONP \dots\dots\dots (3)$$

**On the basis of experimental data and presented regression analysis, following conclusions were made:-**

- Cutting forces are generally smaller with MQL machining, as shown in Figure 13. Exceptions are trials with minimal quantity of oil and minimal quantity of water when cutting forces are greater with MQL machining, regardless of nozzle position.
- Surface roughness  $R_a$ , shown in Figure 14 is mostly higher with MQL machining compared to dry machining without use of any MWFs. Exceptions are trials with maximum quantity of oil and minimum quantity of water when surface roughness  $R_a$  is at same level,
- Chip temperature shown in Figure 15 is always smaller with MQL machining. Depending on combination of parameters, quantity of oil, quantity of water and nozzle position this difference can be up to 54% in the favor to MQL machining,
- Second order fitted line plots shown in Figure 16, 17 and 18 are used to find minimum cutting force, surface roughness and chip temperature.

Minimal cutting force is obtained for the following combination of parameters (Figure 16.):

**Oil = 35.08 ml/h, Water = 1100 ml/h**

As shown in Figure 17 regression equation for surface roughness has no local minimum. Minimal surface roughness  $R_a$  is obtained when parameters are chosen left or right from local maximum i.e.:

**Oil = 18 ml/h, Water = 1166 ml/h**

Minimal chip temperature is obtained by the following combination of parameters (Figure 18.):

**Oil = 28.05 ml/h, Water = 1688.57 ml/h**

- Main effect plots for cutting force, surface roughness and chip temperature presented in Figure 19. show:

An increase of quantity of oil and water reduces cutting forces provided that increase of quantity of oil reduces cutting forces more quickly. Rake face position of nozzle gives smaller cutting forces compared to flank face position,

An increase of oil quantity reduces surface roughness  $R_a$ ; on the other hand an increase of water quantity increases surface roughness  $R_a$ . Flank face position of nozzle gives smaller surface roughness  $R_a$ ,

Naturally, increase of water quantity quickly decreases chip temperature. It is interesting that an increase of oil quantity slightly increases chip temperature. Rake position of nozzle gives smaller chip temperatures compared to a flank position of nozzle.

- From regression equations, it is obvious that nozzle position is the most influencing parameter on cutting force, surface roughness  $R_a$  and chip temperature. Although, MQL machining gives better results concerning cutting force and chip temperature, that advantage for example for cutting force is only 2.8% maximum.

**Figure 16.-** Fitted line plot of the resultant cutting force versus quantity of oil (left) and quantity of water (right)

**Figure 17:-** Fitted line plot of the surface roughness  $R_a$  versus quantity of oil (left) and quantity of water (right)

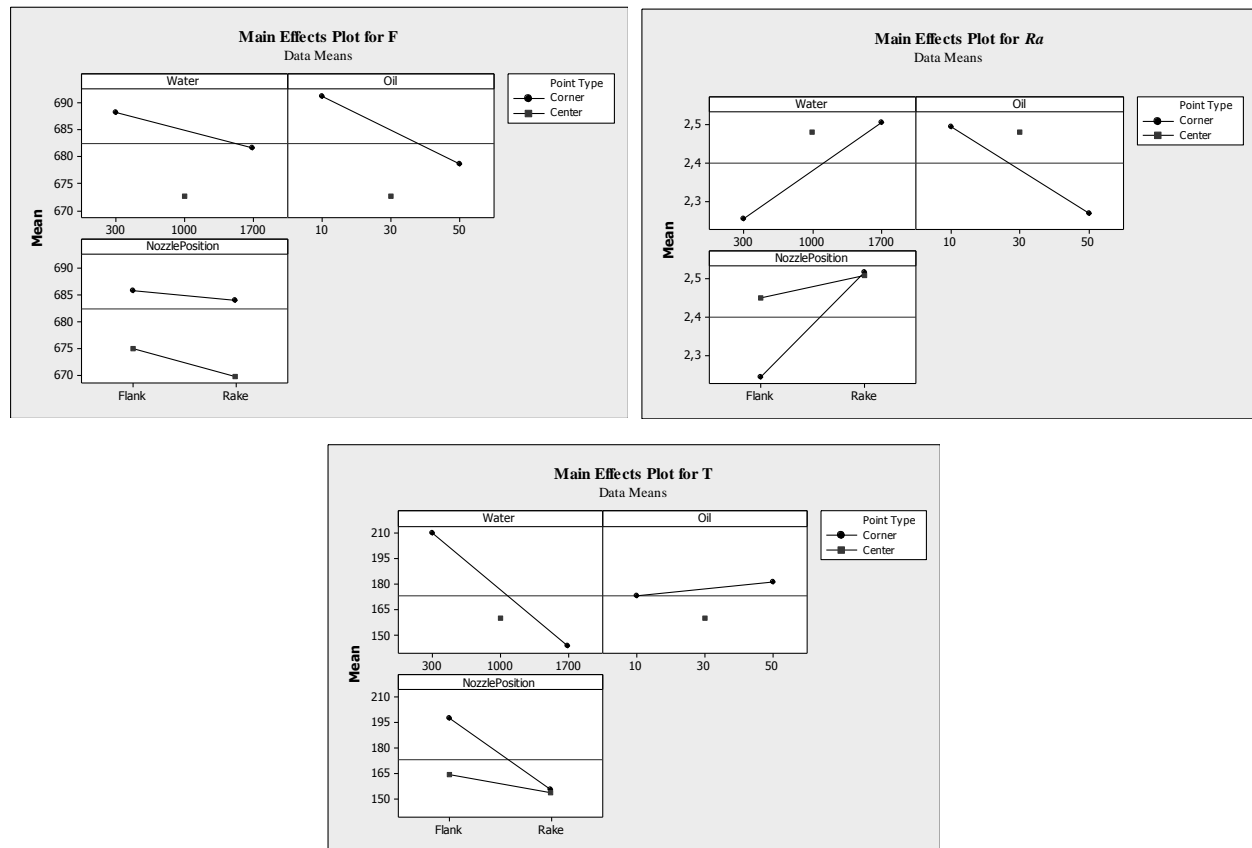

Figure 19:- Main effect plots

### Conclusion:-

Machining of nickel based super alloy, especially NIMONIC 263, according to literature [14,18] even with intensive supply of MWFs to cutting zone, is a difficult process characterized by short tool life.

The economical application of MQL machining in this research is analyzed through lower cutting forces, better surface roughness and smaller chip temperature. Experiments are performed in order to find MQL machining conditions under which MQL machining gives results similar to flood machining. These experiments showed that recommended machining data from literature (cutting speed, feed and depth) and recommended tool geometry do not give expected results. According to [18] tool life of uncoated carbide has 20 to 30 min tool life, whereas coated carbide tool used in experiments with PVD coating designed for high temperatures resistant alloys has tool life less than 1 min.

An experiment performed with cast specimen showed that cutting forces could be 20% smaller in comparison to the dry machining. That means that 20% less energy is needed when MQL is engaged. Chip temperature is 38% smaller with MQL. Intensive tool wear of both tools used in experiments points out that Nimonic 263 is hard-to-machine material. On the other hand, experiment with second specimen showed that application of advanced semi-dry machining technique (Oil-On-Water droplet) gives only 2.8% decrease of cutting force. It is obvious that MQL application must be optimized not only through optimization of MQL parameters like quantity of oil, quantity of water and nozzle position but through cutting force, feed and depth of cut as well.

Regression models (1), (2) and (3) clearly indicated that nozzle position is most influenced factor on cutting force, surface roughness  $R_a$  and chip temperature. But, in this research nozzle position parameter was of smallest attention and only two positions were chosen relatively to cutting zone (rake and flank). Future research of MQL machining should be performed with detailed definition of nozzle position like: angle of nozzle, distance from cutting zone, and pressure of compressed air used for atomization of oil and water.

Cutting force are smaller with MQL machining and minimal cutting force for given variation of MQL parameters is achieved with water quantity 1100 ml/h and oil quantity 35.08 ml/h.

Performed research shows that smallest surface roughness is achieved when aerosol mixture contains maximum quantity of oil and minimum quantity of water.

In comparison to dry machining cutting temperatures are significantly lower with MQL machining and that difference goes up to 54%.

#### Abstract

Natural products with medicinal value are gradually gaining importance in clinical research due to their well-known property of no side effects as compared to drugs. *Tinospora cordifolia* commonly named as “Guduchi” is known for its immense application in the treatment of various diseases in the traditional ayurvedic literature. Recently the discovery of active components from the plant and their biological function in disease control has led to active interest in the plant across the globe. Our present study in this review encompasses (i) the genetic diversity of the plant and (ii) active components isolated from the plant and their biological role in disease targeting. The future scope of the review remains in exploiting the biochemical and signaling pathways affected by the compounds isolated from *Tinospora* so as to enable new and effective formulation in disease eradication.

#### Introduction:-

*Tinospora cordifolia* commonly named as “Guduchi” in Sanskrit belonging to family Menispermaceae is a genetically diverse, large, deciduous climbing shrub with greenish yellow typical flowers, found at higher altitude.[1–3] In racemes or racemose panicles, the male flowers are clustered and female are solitary. The flowering season expands over summers and winters.[4] A variety of active components derived from the plant like alkaloids, steroids, diterpenoid lactones, aliphatics, and glycosides[4] have been isolated from the different parts of the plant body, including root, stem, and whole plant. Recently, the plant is of great interest to researchers across the globe because of its reported medicinal properties like anti-diabetic, anti-periodic, anti-spasmodic, anti-inflammatory, anti-arthritis, anti-oxidant, anti-allergic, anti-stress, anti-leprotic, anti-malarial, hepatoprotective, immunomodulatory and anti-neoplastic activities. In this review, we focus our attention to: (i) the reported genetic diversity in the Plant (ii) biological roles reported in humans and animals and active components from the plant. (iii) biological roles reported in humans and animals.

#### Material and Method:-

Published literature on recent developments in research in *Tinospora cordifolia*, including original articles and papers in Pubmed and Pubmed Central Databases were taken into study for the report. Information extracted from a total of 175 published articles of which five review articles and cross references thereof were collected. The search criteria were restricted to the roles of the plant in the field of medical advancements and the effects that has been observed with different experiments.

All the reports of experiments on different model types (*in vitro*, *ex vivo*, and *in vivo*) were taken varying from

animal and human model systems. Reported data was analysed and represented in the form of figures and tables for the current review. ChemDraw Ultra 9.0 Software, Cambridge soft Life Science Enterprise Solutions was used for drawing the figures in the review. The figures of the compounds were obtained as reported in different journal sources.

## Results:-

### ***Tinospora cordifolia*: A genetically diverse plant:-**

Reports on studies of morphological and physiological characters of the plant, including plant length, stem diameter, growth habit, floral morphology, flower color, stomatal density, trichomal density, lenticels density, petiole length, plant biomass, and other characteristics of the plant and diversity in the genetic components identified by markers have indicated the diversity in the medicinal plant which has profound importance for efficient and effective management of plant genetic resources. Reports using markers for random amplified polymorphic DNA,[5] and inter-simple sequence repeat primers[1,5] have pointed toward the genetic variation within the population. However, reports on conservation strategies and propagation of the germplasm are few.

### ***Tinospora cordifolia*: Biological roles:-**

A myriad of biologically active compounds, including alkaloids, diterpenoid lactones, glycosides, steroids, sesquiterpenoid, phenolics, aliphatic compounds, and polysaccharides have been isolated from different parts of the plant body [Table 1], Figure 1]. These compounds have been reported to have different biological roles in disease conditions thus enabling potential application in clinical research. *Tinospora cordifolia* extracts are extensively used in various herbal preparations for the treatment of different ailments for its anti-periodic, anti-spasmodic, anti-microbial, anti-osteoporotic, anti-inflammatory, anti-arthritic, anti-allergic, and anti-diabetic properties[6] [Table 1].

**Table 1**

Active components and biological roles in humans and animals

Active component types	Compounds	Source	Reported biological effects in animals	In humans

Anti-oxidant activity in mice, anti-cancer in ehrlich ascites carcinoma (EAC) mice, hypoglycemic activity in RINm5F rat insulinoma cell line	Anti-cancer, infections, immuno-mod Neurological, anti-diabetes

#### The major biological property of *Tinospora cordifolia* includes:-

##### Immunomodulatory property:-

The immunomodulatory property of *Tinospora cordifolia* is well documented. Active compounds 11-hydroxymustakone, N-methyl-2-pyrrolidone, N-formylannonain, cordifolioside A, magnoflorine, tinocordiside and syringin[6] has been reported to have potential immunomodulatory and cytotoxic effects.[13] They have been reported to function by boosting the phagocytic activity of macrophages, production of reactive oxygen species (ROS) in human neutrophil cells, enhancement in nitric oxide (NO) production by stimulation of splenocytes and macrophages indicative of anti-tumor effects. Aqueous *Tinospora* extracts has been also reported to influence the cytokine production, mitogenicity, stimulation and activation of immune effector cells. In mice, *Tinospora cordifolia* extracts has been shown to result in up-regulation of IL-6 cytokine, resulting in acute reactions to injury, inflammation, activation of cytotoxic T cells, and B cell differentiation. Active compounds in aqueous extracts like alkaloids, di-terpenoid lactones, glycosides, steroids, sesquiterpenoid, phenolics, aliphatic compounds or polysaccharides[19] in experimental rat model have been reported for their cytotoxic action. Dry stem crude extracts of *Tinospora cordifolia* with a polyclonal B cell mitogen, G1-4A on binding to macrophages have been reported to enhance immune response in mice by inducing secretion of IL-1, together with activation of macrophages. Reports on *Tinospora cordifolia* in prevention of oxidative damage also exist. The (1,4)-alpha-d-glucan (alpha-d-glucan), derived *Tinospora cordifolia* have been shown to activate human lymphocytes with downstream synthesis of the pro- and anti-inflammatory cytokines, *in vitro*. Synergistic effects of compounds in the immunomodulatory activity of *Tinospora cordifolia* are reported.[6]

##### Anti-diabetes property:-

The stem of *Tinospora cordifolia* is widely used in the therapy of diabetes by regulating the blood glucose in traditional folk medicine of India. It has been reported to mediate its anti-diabetic potential through mitigating oxidative stress (OS), promoting insulin secretion and also by inhibiting gluconeogenesis and glycogenolysis, thereby regulating blood glucose. Alkaloids, tannins, cardiac glycosides, flavonoids, saponins, and steroids as the

major phytoconstituents of *Tinospora cordifolia* have been reported to play an anti-diabetic role.

The isoquinoline alkaloid rich fraction from stem, including, palmatine, jatrorrhizine, and magnoflorine have been reported for insulin-mimicking and insulin-releasing effect both *in vitro* and *in vivo*. [10] Oral treatments of root extracts have been reported to regulate blood glucose levels, enhance insulin secretion and suppress OS markers. Initiation and restoration of cellular defence anti-oxidant markers including superoxide dismutase (SOD), glutathione peroxidase (GPx) and glutathione (GSH), inhibition of glucose 6-phosphatase and fructose 1, 6-diphosphatase, restoration of glycogen content in liver was reported in *in vitro* studies. [10] The crude stem ethyl acetate, dichloromethane (DCM), chloroforms and hexane extracts of *Tinospora cordifolia* inhibited the enzyme's salivary and pancreatic amylase and glucosidase thus increasing the post-prandial glucose level and finds potential application in treatment of diabetes mellitus.

The root extract has been reported to decrease the levels of glycosylated hemoglobin, plasma thiobarbituric acid reactive substances, hydroperoxides, ceruloplasmin and vitamin E diabetic rats. Oral administration of *Tinospora cordifolia* extract in "Ilogen-Excel" formulation (Ayurvedic herbal formulation) composed of eight medicinal plants including *Curcuma longa*, *Strychnos potatorum*, *Salacia oblonga*, *Tinospora cordifolia*, *Vetivelia zizanioides*, *Coscinium fenestratum*, *Andrographis paniculata*, and *Mimosa pudica* is reported to reduce GSH and vitamin C in blood and urine glucose and lipids in the serum and tissues in alloxan diabetic rats with a subsequent decrease in body weight. Decreased concentration of GSH, GPx, and SOD, catalase activity is reported in heart and brain of diabetic rats. *T. cordifolia* root extract (TCE) has been reported to cause an increase in body weight, total hemoglobin and hepatic hexokinase and lowering hepatic glucose-6-phosphatase, serum acid phosphatase (ACP), alkaline phosphatase (ALP), and lactate dehydrogenase (LDH) in diabetic rats thus having hypoglycemic and hypolipidaemic effect.

The protective effects of TCE were reported in presence of higher levels of anti-oxidant molecules and enzymes. TCE has been shown to significantly counterbalance the diabetes-associated OS in the maternal liver by lowering the levels of malondialdehyde and ROS and the increased levels of GSH and total thiols.

#### **Anti-toxic effects:-**

*Tinospora cordifolia* extracts have been reported to scavenge free radicals generated during aflatoxicosis. It exhibited protective effects by lowering thiobarbituric acid reactive substances (TBARS) levels and enhancing the GSH, ascorbic acid, protein, and the activities of anti-oxidant enzymes viz., SOD, CAT, GPx, Glutathione S-transferase (GST) and glutathione reductase (GR) in kidney. Alkaloids such as a choline, tinosporin, isocolumbin, palmatine, tetrahydropalmatine, and magnoflorine from *Tinospora cordifolia* showed protection against aflatoxin-induced nephrotoxicity. *Tinospora cordifolia* stem and leaves extract has shown hepatoprotective effect in Swiss albino male mice against lead nitrate induced toxicity. Oral administration of plant extracts prevented the occurrence of lead nitrate induced liver damage. Decreased level of SOD, CAT and increased level of aspartate aminotransferase (AST), alanine aminotransferase (ALT), ALP, and ACP were observed in mice suffering from lead toxicity. Synergistic administration of aqueous extract of stem and leaf along with the lead nitrate increased the activities of SOD and CAT and decreased the levels of AST, ALT, ALP, and ACP enzymes. Protective role of aqueous extract of stem and leaves of *Tinospora cordifolia* overcoming the toxic effects of lead is shown as its effects on the hematological values. Cyclophosphamide (CP) an anti-cancer drug has been reported to reduce the GSH content in both bladder and liver and lowered levels of cytokines Interferon- $\gamma$  and IL-2 an increased levels of pro-inflammatory cytokine TNF- $\alpha$ . This effect could be reversed on *Tinospora cordifolia* treatment indicating the role of *Tinospora cordifolia* in overcoming CP induced toxicities in cancer treatment.

#### **Anti-arthritis, anti-osteoporotic effects:-**

Single or synergistic formulations of *Tinospora cordifolia* with *Zingiber officinale* has been used in rheumatoid arthritis treatment in traditional medicine. *Tinospora cordifolia* have been reported to affect the proliferation, differentiation and mineralization of bone like matrix on osteoblast model systems *in vitro* and hence finds potential application as an anti-osteoporotic agent. Alcoholic extract of *Tinospora cordifolia* have been shown to stimulate the growth of osteoblasts, increasing the differentiation of cells into osteoblastic lineage and also increasing the mineralization of bone like matrix. Ecdysteroids isolated from the plant have been reported of protein anabolic and anti-osteoporotic effects in mammals. Beta-Ecdysone (Ecd) from *Tinospora cordifolia* extracts have been reported to induce a significant increase in the thickness of joint cartilage, induce the osteogenic differentiation in mouse mesenchymal stem cells and to relieve osteoporosis in osteoporotic animal models. Further 20-OH- $\beta$ -Ecd isolated

from *Tinospora cordifolia* has been reported of its anti-osteoporotic effects thus highlighting the role of *Tinospora cordifolia* in the treatment of osteoporosis and osteoarthritis.

#### **Anti-HIV effects:-**

TCE has been shown to demonstrate a decrease in the recurrent resistance of HIV virus thus improving the therapeutic outcome. Anti-HIV effects of TCE was revealed by reduction in eosinophil count, stimulation of B lymphocytes, macrophages and polymorphonuclear leucocytes and hemoglobin percentage thus, revealing its promising role of application in management of the disease.

#### **Anti-cancer effects:-**

The anti-cancer effects of *Tinospora cordifolia* are mostly studied in animal models. TCE have been shown to have a radioprotective role by significantly increase in body weight, tissue weight, testes-body weight ratio and tubular diameter and inhibit the harmful effects of sub-lethal gamma radiation on testes in male Swiss albino mice. In pre-irradiating mice, TCE significantly affected radiation induced rise in lipid peroxidation and resulted in the decline of GSH concentration in testes. Pre-treatment of HeLa cells by TCE have been shown to decrease the cell viability, increase LDH and decrease in GSH S-transferase activity. Dihydrotestosterone (DHT) in TCE has been reported to stimulate the growth and proliferation of Human LNCaP cells (which are androgen-sensitive human prostate adenocarcinoma cells). Androgenic compounds in TCE act via androgen receptor. Newly isolated compounds like (5R, 10R)-4R, 8R-dihydroxy-2S, 3R: 15, 16-diepoxyleroda-13 (16), 17, 12S: 18, 1S-dilactone (ECD), a diterpenoid from *Tinospora cordifolia* has been reported for its chemopreventive potential in diethylnitrosamine (DEN) induced hepatocellular carcinoma (HCC) in rats by decreasing anti-oxidant activities via SOD, CAT and detoxification enzymes like GSH, GPx and subsequent increase in the activities of the hepatic markers ((Serum glutamic oxaloacetic transaminase)SGOT, (Serum Glutamic Pyruvate Transaminase) SGPT, LDH) and decreased serum transaminase level thus confirming its anti-tumor effects and promising application as a potent chemo preventive drug for HCC.[26]

The radiosensitizing activity of DCM extract of *Tinospora cordifolia* has been reported in Ehrlich ascites carcinoma (EAC) mice enabling tumor-free survival via depletion of GSH and glutathione-S-transferase by elevated levels of lipid peroxidation and DNA damage to tumor cells. TCE hexane fraction has been shown to block the G1 phase in EAC mice and cause apoptosis by the formation of apoptotic bodies, nuclear condensation, activation of caspase-3, decreased cell number and ascites volume, increased expression of pro-apoptotic gene, *Bax*, and decreased expression of anti-apoptotic gene, *Bcl-2*. TCE could induce a reduction of papillomas, tumor yield, tumor burden, and tumor weight while increase phase II detoxifying enzymes in skin carcinoma animal models. The effect of a hydroalcoholic (80% ethanol: 20% distilled water) extract of aerial roots of *Tinospora cordifolia* on Swiss albino mice revealed a significant increase in acid-soluble sulfhydryl (-SH), cytochrome P (450) contents, and enzyme activities of cytochrome P (450) reductase, cytochrome b5 reductase, GST, DT-diaphorase (DTD), SOD, catalase, GPX, and GR activity in the liver highlighting the chemopreventive role of *Tinospora cordifolia* against carcinogenicity.

*In vivo* anti-angiogenic activity of TCE in B16-F10 melanoma was detected by increased levels of pro-inflammatory cytokines, including IL-1  $\beta$ , IL-6, TNF- $\alpha$ , granulocyte monocyte-colony stimulating factor (GM-CSF) and the vascular endothelial cell growth factor (VEGF), increased production of anti-angiogenic agents IL-2 and tissue inhibitor of metalloprotease-1 (TIMP-1) in the B16-F10 extract-treated animals. The polysaccharide fraction from *Tinospora cordifolia* was found to be very effective in reducing the metastatic potential of B16-F10 melanoma cells. Markers of neoplastic development were reduced significantly in the treated animals compared with the untreated control animals. Most of the synthetic chemotherapeutic agents suffer from toxic side effects.[ The effect of Guduchi extracts was comparable or better than doxorubicin treatment.

#### **Tinospora cordifolia: Anti-microbial activity:-**

The methanol extracts of *Tinospora cordifolia* have been reported to have potential against microbial infections. The anti-bacterial activity of *Tinospora cordifolia* extracts has been assayed against *Escherichia coli*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Proteus vulgaris*, *Salmonella typhi*, *Shigella flexneri*, *Salmonella paratyphi*, *Salmonella typhimurium*, *Pseudomonas aeruginosa*, *Enterobacter aerogene*, and *Serratia marcescens* (Gram-positive bacteria). In mice models, TCE has been reported to function in bacterial clearance and improved phagocytic and intracellular bactericidal capacities of neutrophils. TCE has been reported of immunostimulant properties on macrophages. Intra-mammary infusion of hydro-methanolic extracts of *Tinospora cordifolia* treatment

showed enhanced phagocytic activity of polymorphonuclear cells in bovine subclinical mastitis.

#### ***Tinospora cordifolia*: Anti-oxidant activity:-**

The anti-oxidant capacity of *Tinospora cordifolia* stem methanol extracts administered orally increased the erythrocytes membrane lipid peroxide and catalase activity. It also decreased the activities of SOD, GPx in alloxan-induced diabetic rats. *Tinospora cordifolia* Willd.(Menispermaceae) extracts possess possible inhibitors of aldose reductase and anti-oxidant agents thereby reducing chemotoxicity induced by free radicals.

TCE has been reported of its strong free radical scavenging properties against superoxide anion ( $O_2^-$ ), hydroxyl radicals (OH), NO radical, and peroxynitrite anion (ONOO<sup>-</sup>). The extract was also found to reduce the toxic side effects of CP in mice by the free radical formation. *Tinospora cordifolia* lowers the levels of malondialdehyde and ROS and the higher levels of GSH and total thiols. The protective effects of *Tinospora cordifolia* could be observed even in the fetal milieu, with higher levels of anti-oxidant molecules and enzymes.

*Tinospora cordifolia* has the ability to scavenge free radicals generated during aflatoxicosis. *Tinospora cordifolia* showed protection against aflatoxin-induced nephrotoxicity due to the presence of alkaloids such as a choline, tinosporin, isocolumbin, palmatine, tetrahydropalmatine, and magnoflorine.[8] A significant increase in the concentration of TBARS in brain along with a decrease in heart has been observed in diabetic rats. It also enhanced formation of SOD, GPx, and GSH in liver. Treatment with *Tinospora cordifolia* also inhibited glucose 6-phosphatase and fructose 1, 6-diphosphatase; and restored glycogen content in liver. *Tinospora cordifolia* has been shown to regulate blood glucose (5R, 10R)-4R, 8R-dihydroxy-2S, 3R: 15, 16-diepoxycleroda-13 (16), 17, 12S: 18,1S-dilactone (ECD), a diterpenoid from *Tinospora cordifolia* has been shown to possess chemo-preventive potential in DEN induced HCC rats. Treatment of ECD in both preventive and curative DEN induced animals increased the level of anti-oxidants and detoxification enzymes.[26]

An aqueous extract of *Tinospora cordifolia* has a radio-protective enhancing the survival of mice against a sub-lethal dose of gamma radiation. *Tinospora cordifolia* was effective in elevating the GSH levels, expression of the gamma-glutamylcysteine ligase and Cu-Zn SOD genes. Aqueous extract of *Tinospora cordifolia* inhibited radiation mediated 2-deoxyribose degradation by inhibiting the formation of ( $Fe^{2+}$ )-bipyridyl complex formation to confer radio-protective effects.

The arabinogalactan polysaccharide (TSP) isolated from *Tinospora cordifolia* showed good protection against iron-mediated lipid peroxidation of rat brain homogenate as revealed by the TBARS and lipid hydroperoxide (LOOH) assays.

*Tinospora cordifolia* also has the components that decrease the recurrent resistance of HIV virus to antiretroviral therapy (ART) and improve the outcome of the therapy. The effect of a hydroalcoholic (80% ethanol: 20% distilled water) extract of aerial roots of *Tinospora cordifolia* on carcinogen/drug metabolizing phase-I and phase-II enzymes, anti-oxidant enzymes, GSH content, LDH and lipid peroxidation has been shown in liver of Swiss albino mice. The enhanced GSH level and enzyme activities involved in xenobiotic metabolism and maintaining anti-oxidant status of cells are suggestive of a chemo-preventive efficacy of *Tinospora cordifolia*.

*Tinospora cordifolia* has been reported to contain an alpha-glucosidase inhibitor, characterized as saponarin (apigenin-6-C-glucosyl-7-O-glucoside). The leaf extract had appreciable anti-oxidant and hydroxyl radical scavenging activities. Pepticare, a herbomineral formulation of the Ayurveda medicine consisting of the herbal drugs: *Glycyrrhiza glabra*, *Emblica officinalis* and *Tinospora cordifolia*, has anti-ulcer and anti-oxidant activity in rats.

Hyponidd is another herbomineral formulation composed of the extracts of 10 medicinal plants (*Momordica charantia*, *Melia azadirachta*, *Pterocarpus marsupium*, *Tinospora cordifolia*, *Gymnema sylvestre*, *Encicostemma littorale*, *Emblica officinalis*, *Eugenia jambolana*, *Cassia auriculata* and *Curcuma longa*). Hyponidd administration also decreased levels of glycosylated hemoglobin, plasma thiobarbituric acid reactive substances, hydroperoxides, ceruloplasmin and alpha-tocopherol in diabetic rats.

Anti-oxidant activities of Dihar, a polyherbal formulation containing drugs from eight different herbs viz., *Syzygium cumini*, *Momordica charantia*, *Emblica officinalis*, *Gymnema sylvestre*, *Encicostemma littorale*, *Azadirachta indica*,

*Tinospora cordifolia* and *Curcuma longa* in streptozotocin induced type 1 diabetic rats. Dihar produced a significant decrease in serum creatinine and urea levels in diabetic rats.[7]

#### **Tinospora cordifolia: Effects on other diseases:-**

A dose dependent reduction in infarct size and in lipid peroxide levels of serum and heart tissue were observed with the prior treatment of *Tinospora cordifolia*. The activation of macrophages by cytotoxic T cells leads to increase in GM-CSF which leads to leucocytosis and improved neutrophil function. Octacosanol isolated from *Tinospora cordifolia* inhibits proliferation of endothelial cells and Ehrlich ascites tumor cells, inhibits neovascularization induced by angiogenic factors in chick chorioallantoic membrane and rat cornea *in vivo* angiogenesis assays and also inhibits secretion of ascites fluid in the growing tumor cells *in vivo*[33] by inhibiting activity of matrix metalloproteinases (MMPs) and translocation of transcription factor nuclear factor-kappa-B (NF-κB) to nucleus. Oral administration of 70% methanolic extract of *Tinospora cordifolia* stem reduces sperm motility and density, lowering of serum testosterone, protein, sialic acid, glycogen contents, and depletion of vesicular fructose of testes leading to reduction of male fertility in rats. The *in vivo* administration of alcoholic extract of *Tinospora cordifolia* has been reported to increase bone marrow derived macrophages (BMDM) in bearing Dalton's lymphoma (DL). The polyherbal preparations Caps HT2 of *Tinospora cordifolia*, could reduce plasma recalcification time and enhanced the release of lipoprotein lipase enzyme. Other polyherbal HP-1 has hepatocurative and anti-oxidant effects.

#### **Discussion:-**

*Tinospora cordifolia* has an importance in traditional ayurvedic medicine used for ages in the treatment of fever, jaundice, chronic diarrhea, cancer, dysentery, bone fracture, pain, asthma, skin disease, poisonous insect, snake bite, eye disorders.[2] Recent reports have shown the compounds and their biological roles in *Tinospora cordifolia* extract. Such properties may be exploited for production of new formulations, which may be better and promising over conventional one. Although genetically diverse and reports of application of tissue culture based propagation of *Tinospora* exist, effective conservation strategies of the germplasm for such an economically important medicinal plant with many biological role remains yet to be accomplished.

#### **Conclusion:-**

A plant with as diverse a role as *Tinospora cordifolia* is a versatile resource for all forms of life. There are reports as already discussed that the plant extracts have active compounds in the form of alkaloids, glycosides, lactones and steroids. All these active compounds have immunomodulatory and physiological roles of different types, thereby demonstrating the diverse versatility of the plant. Studies need to be conducted with aspects how the active compounds actually interact with the living systems and affects the structure-function relationships. Crystal structures of the membrane bound receptors and the activation of the downstream signaling cascades and the changes in the immediate environment of the site of action can lead us into identification of novel perspectives into our understanding of nature. The search into the vivacious sources of nature can also lead us into differential interactions among the evolutionarily related groups of organisms. The future scope of the review remains in exploiting the biochemical and signaling pathways of the active components of *Tinospora* thus, enabling effective disease targeting. With so much to offer to the scientific world of medicine, the plant *Tinospora* truly acts as an incredible source.

#### Abstract

Multidrug resistant strains of bacteria which are characterized as serious public health problem may arise due to over expression of efflux pumps. Efflux pumps in bacteria can be detected by using specialized instruments. In the present study simple instrument free agar cartwheel method was used to detect efflux pumps in *E.coli* with some modification. Four isolates of *E.coli* were collected and processed. Biochemical analysis of all the strains was done using standard protocol. Further cartwheel assay was performed. MIC method was used to confirm the observations of agar cartwheel assay. In Cartwheel assay, a total of 4 strains of *E.coli* were analyzed for the presence of efflux pumps, active efflux pump was detected in 1 isolate while it was not observed in 3 strains. Bacterial isolate which contains efflux pump also showed high MIC value for the antibiotics used. But in the presence of an EPI, a considerable decrease in the MIC of antibiotics was observed among isolate containing efflux pump, while there was no decrease in MIC of antibiotics for strains without efflux pumps. Present study revealed that cartwheel assay to detect efflux pumps is a reliable, fast and sensitive technique, which may reduce time and efforts to detect efflux pumps.

#### Introduction:-

*Escherichia coli* is a principal facultative organism present in the human gastrointestinal tract. Pathogenic strains of *E. coli* have the capability to cause different types of diseases in humans and animals because of the presence of definite colonisation factors, virulence factors and pathogenically associated genes. *E. coli* major cause of nosocomial infections in humans is a Gram-negative, flagellated, rod-shaped, Oxidase negative, motile, facultative anaerobe and classified under the family Enterobacteriaceae<sup>1</sup>. *E. coli* is genetically classified as the most versatile bacteria and is major source of many plasmid and phage mediated genes. It causes septicemia and diarrhoea in overall hosts including man, avian and animals such as cattle, piglets, kids, foals, lambs and buffaloes. The pathogenic strains of *E. coli* which are isolated from hospitalized patients were more resistant to amoxicillin, ciprofloxacin, cephalexin and Gentamycin compared to those from outpatients<sup>2</sup>. Some strains of *E. coli* develop resistance to third-generation cephalosporins and monobactams. Most members of gram negative bacteria family are less susceptible to most classes of the antibiotics, mainly lipophilic and amphiphilic ones; this is due to the presence of outer membrane in gram negative bacteria. Constant increase in drug resistant strains of bacteria becomes a big threat to human health<sup>3</sup>. Multidrug efflux pumps unfavorably affect the clinical effectiveness of existing antibiotics and also affect the process of discovery of new antibiotics<sup>4</sup>. Active efflux is established as

important factor of bacterial resistance in case of most classes of antibiotics. The mechanism of active efflux is mediated by efflux pumps<sup>5-7</sup>. Efflux pumps are known as membrane associated active transporters which help in expelling out toxic compounds, including antibiotics from the cell<sup>5-8</sup>.

Antibiotic efflux was first reported in 1980, in case of *E. coli* bacteria as a mechanism for tetracycline resistance. Recently the role of efflux mechanism is reported in bacterial resistance in case of almost all major groups of antibiotics<sup>5,7,9-11</sup>. Bacterial resistance to most of the classes of antibiotics is provided by membrane transporter proteins which are known as drug efflux pumps<sup>12</sup>. Efflux pumps are present as single component system or multi-component systems. Increasing resistance of bacteria against most classes of antibiotics in recent days becomes a big problem<sup>13</sup>. Resistance in antibiotics develops very rapidly because of the changes in the expression of efflux pumps. So it is important to characterize new antibiotics, efflux pump inhibitors and the agents which are resistance modifying<sup>14</sup>. Resistance of bacterial isolates to most classes of antibiotics is widespread mostly in developing countries. Schedule monitoring of antibiotic resistance gives data for the antibiotic therapy and control of resistance, and evaluates the effectiveness of both of these<sup>15</sup>. In spite of the fact that antibiotics are originally emerged for the treatment of infectious disease caused by bacteria in humans, multidrug resistance to most classes of antibiotics becomes a worldwide problem. Efflux pumps are reported in both gram positive and gram negative bacteria and as well as in eukaryotic organisms. Some of the bacterial efflux pumps are selective for only one substrate while some of them are not. The non-selective group of efflux pumps are involved in shifting of wide range of compounds and different classes of antibiotics which confer a multiple drug resistance phenotype<sup>5,6-11</sup>. The AcrAB efflux system present in *E. coli* is multidrug efflux pump which is a major efflux system present in *E. coli* and responsible for intrinsic resistance of the bacteria against antibiotics, dyes and detergents<sup>16-17</sup>. The AcrAB efflux pump existing in *E. coli* belongs to resistance- nodulation- division (RND) family of efflux pumps which is a more usual in Gram – negative bacteria. AcrAB – TolC is specified as one of the best efflux pump in case of *E. coli*<sup>18-27</sup>. AcrAB efflux pump is the only single efflux pump of RND family in case of *E. coli* which plays an important role in antibiotic resistance against different antibiotics because of its prenominal expression. The Ethidium bromide (Et Br) agar cartwheel assay is a newly investigated simple, instrument free method used for the detection of efflux pump activity in bacteria<sup>28</sup>. The present study was aimed to detect efflux pumps in Gram negative bacteria *E.coli* with the help of EtBr agar Cartwheel assay.

## **Material and Methods:-**

### **Microbial strains:-**

The strains of *Escherichia coli* used in the present study were procured from Sabine Schuster and Winfried V. Kern, Center for Infectious Diseases and Travel Medicine, University Hospital, and Department of Medicine, Albert-Ludwig's-University, Freiburg, Germany and from MTCC and NCTC. The *E. coli* strains used were one knock out strain 1- DC14, wild type strain K-12 AG100 and two standard strains with NCTC number 12923 and MTCC number 1302.

### **Chemicals and reagents:-**

Nutrient broth, DMSO, Methanol, CCCP, Ethidium bromide, Tryptic soy agar were purchased from Hi-media Pvt. Ltd.

## **Methods:-**

### **Characterization of *Escherichia coli* strains:-**

Characterization of *Escherichia coli* was performed by gram staining and biochemical analysis.

### **Gram's staining:-**

Gram's staining was done following the methodology of Aneja<sup>29</sup>. The smear on a glass slide was covered with few drops of the primary stain (Crystal violet). After a minute of exposure to the staining solution, the slide was washed with water. The smear was treated with few drop of Gram's Iodine and allowed to stand for a minute. This results in formation of a dye-iodine complex in the cytoplasm. Gram's iodine serves as a mordant. The slide was again washed with water and then decolorized with absolute ethyl alcohol or acetone. After the smear was decolorized, it was washed with water without any delay. The smear was finally treated with few drops of counter stain (Safranin). The slide was washed in water; excess water was removed using a blotting paper, dried in air and heat fixed before observing under microscope.

**Biochemical Analysis:-**

Biochemical analysis was done according to Bergey's manuals of systematic bacteriology (1993). Following biochemical tests were performed for identification of *E. coli* isolates;

**Indole test:-**

Tryptone broth was prepared. The broth was dispensed into the tubes and sterilized. Culture of *E. coli* was inoculated into the tubes and one tube was left uninoculated as control. The tubes were inoculated at 37°C for 48 hours. After incubation 1 ml of KOVAC's reagent was added to all the tubes including control. The tubes were shaken gently and allowed to stand for 1-2 min.

**Positive test result:-** The indole reagent change colour to red.

**Negative test result:-** The indole reagent remains pale yellow.

**Methyl Red Test:-**

This test was performed by inoculating a colony of *E. coli* in 0.5 ml sterile glucose phosphate broth. After incubating overnight at 37°C for 24-48 hours. Few drops of methyl red reagent was added and the tubes were shaken gently.

**Positive test result:** Red colour change.

**Negative test result:** No colour change.

**Voges Proskauer Test:-**

Glucose phosphate broth was prepared and inoculated with *E. coli* culture. Inoculated tubes were incubated for 24-48 hours at 37°C. 1 mL of 40% KOH and 3 mL of 5% solution of the alpha naphthol was added in the inoculated test tubes. The medium was shaken at intervals for enhancement of the reaction by aeration.

**Positive test result:** Colour change to pink.

**Negative test result:** No colour change.

**Citrate Utilization Test:-**

Citrate utilization test is used to determine the ability of bacteria to utilize sodium citrate as its carbon source. Simmons's citrate agar slant were prepared and streaked with 18-24 hours old culture of *E. coli*. The slants were incubated at 37°C for 24-48 hours.

**Positive result:** Growth in citrate medium or growth with colour change to blue in Simmons citrate tube.

**Negative result:** No growth in citrate medium.

**Urease Test:-**

Urease broth was prepared and inoculated with a loopful of *E. coli* culture. Then inoculated broth was incubated at 37°C for 24-48 hours.

**Positive test result:** Change in colour to red.

**Negative test result:** No colour change.

**Nitrate Reduction Test:-**

Nitrate broth was prepared and inoculated with *E. coli* culture. The inoculated broth was incubated at 37°C for 24-48 hours. After that 4-5 drops of mixture of solution A (8g of sulphanilic acid in 1000mL of 5N acetic acid) and solution B (5 of alpha naphthylamine in 1000mL of 5N acetic acid) were added.

**Positive test result:** Red colour after addition of sulphanilic acid and alpha-naphthylamine.

**Negative test result:** No colour change after addition of sulphanilic acid and alpha naphthylamine.

**Catalase test:-**

This test demonstrates the presence of catalase enzyme which catalyses the release of oxygen from hydrogen peroxide. This test was used to differentiate those bacteria which produce catalase enzyme from non-catalase producing bacteria. A small amount of colony of *E. coli* culture was transferred to surface of a clean, dry glass slide using an inoculating loop. A drop of hydrogen peroxide was placed on the slide.

**Positive test results:** Gas formation in the form of bubbles shows that the bacterium is catalase positive.

**Negative test result:** No gas formation shows negative result.

**Carbohydrate fermentation test:-**

Four test tubes were taken containing four different kinds of broth namely glucose, lactose, sucrose, Mannitol. Each tube consist of 1% sugar, 1% peptone water and 1% Andrade's reagent. Inverted Durham tube were kept in each tube. Tubes were autoclaved at 15 lb. (121°C) for 30 minutes. After cooling tubes were inoculated with loopful culture of *E.coli* and incubated at 37°C for 24 hours. The broth was examined for acid and gas formation.

**Positive test result:** Acid production was indicated by the colour change from red to yellow.

**Negative test result:** No colour change.

**Motility test:-**

Semi solid motility medium was prepared in a test tube and inoculated with *E.coli* culture with a straight wire by making a single stab down the center of the tube about 8- 10 mm deep into the medium and incubated at 37°C for 24hours. Examined after one day.

**Positive result:-**

Diffuse, hazy growths that spread throughout the medium rendering it slightly opaque.

**Negative result:-** Generally give growths that are confined to the stab-line, have sharply defined margins and the surrounding material completely transparent.

**Oxidase test:-**

Oxidase test is used to identify bacteria that produces oxidase enzyme of bacterial electron transport chain. A filter paper was soaked in substrate tetra methyl-p-phenylenediamine dihydrochloride. A loop full colony of *E.coli* culture was smeared onto the filter paper strip.

**Positive test result:** Dark blue-purple colour change within 10-30sec.

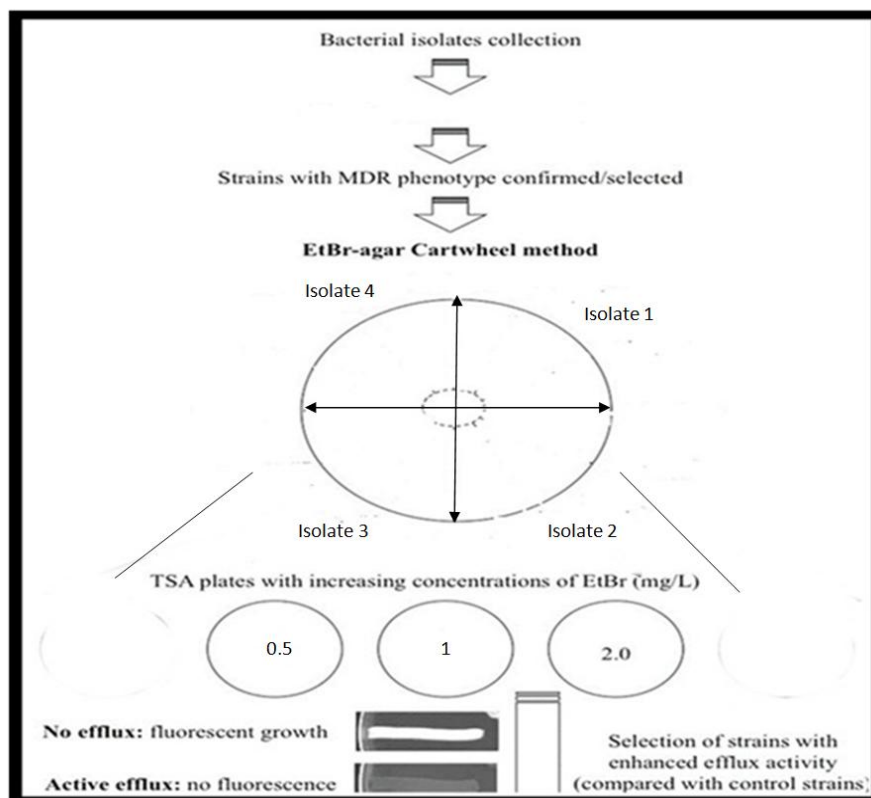

**Negative test result:** No colour change or colour change after more than 30 sec.

**Agar cartwheel assay for the detection of efflux pumps:-**

The Etbr- agar cartwheel assay method was used to assess the presence of efflux activity in *E.coli* strains following the methodology of with slight modifications<sup>28-30</sup>. All the strains of *E.coli* were grown in nutrient broth and incubated at 37°C for 24 hours. The TSA plates are then divided into four sectors, forming a cartwheel pattern. *E. coli* culture was inoculated by swabbing on tryptic soya agar plates starting from the center of the plate to the margin, these plates containing different concentrations (0.5µg/ml, 1µg/ml and 2.0µg/ml) of Etbr. Plates were incubated at 37°C for 16 hours and then observed under UV light (Gel Doc- it2 310 imager).The minimum concentration of Etbr that produces fluorescence of the bacterial mass was recorded. (fig.1)

**MIC Determination:-**

The MIC was determined in all strains of *E.coli* used for Etbr agar cartwheel assay to confirm the presence of efflux pumps. Pure cultures of *E.coli* were diluted in nutrient broth to a concentration between  $1 \times 10^5$  and  $1 \times 10^6$  cfu/mL. A stock dilution of the antibiotics i.e., Ciprofloxacin, Tetracycline and Erythromycin were made at approximately 100x the level of the expected MIC for *E.coli*. The concentrations used for each of the antibiotics were (0.003–128) µg/mL and Further 1:1 dilutions of antibiotics were made with nutrient broth in 96 well microtiter plates. Then the bacterial culture was inoculated from lower concentration to higher concentration of antibiotic in equal amount (30µl). Positive and negative control was also included. Then microtiter plates were incubated at 37°C for 24 hrs. And then plates were observed in ELISA plate reader (BioTek) at 490 nm. MIC was recorded as the lowest concentration where no growth was visually observed. Then MIC of antibiotics was again observed in the presence of an EPI (CCCP).

**Fig.1:-**Flowchart followed to test bacterial strains using the EtBr-agar Cartwheel method.

## Results:-

### Characterization of *E. coli* strains:-

Characterization of *E. coli* was performed by Gram's staining and biochemical testing.

### Gram's staining:-

The results of gram's staining are summarized in figure 2. Gram- negative bacilli of *E. coli* were seen under the microscope. Rod shaped pinkish colony of *E. coli* were appeared.

**Figure 2:-** Gram-negative rod shaped bacilli of *E. coli*

**Biochemical Analysis:-**

The results described in table 1 shows that all the strains of *E. coli* were positive for, Catalase test, Indole test, Methyl red test, Carbohydrate fermentation, Nitrate reduction and Motility test. The strains of *E. coli* showed negative results for, Oxidase test, urease test, Sucrose fermentation and Maltose fermentation.

**Table 1:-** Biochemical analysis of *E. coli* strains

Biochemical tests	<i>E. coli</i> strains			
	1-DC14	K12-AG100	MTCC	NCTC
Catalase test	Positive	Positive	Positive	Positive
Oxidase test	Negative	Negative	Negative	Negative
Indole test	Positive	Positive	Positive	Positive
Methyl red test	Positive	Positive	Positive	Positive
Voges Proskauer Test	Negative	Negative	Negative	Negative
Citrate utilization test	Negative	Negative	Negative	Negative
Urease test	Negative	Negative	Negative	Negative
Nitrate reduction	Positive	Positive	Positive	Positive
Glucose fermentation	Positive	Positive	Positive	Positive
Lactose fermentation	Positive	Positive	Positive	Positive
Maltose fermentation	Negative	Negative	Negative	Negative
Sucrose fermentation	Negative	Negative	Negative	Negative
Motility test	Positive	Positive	Positive	Positive

**Etbr Agar Cartwheel Assay:-**

Etbr agar Cartwheel assay was performed for the detection of efflux pumps. The result of Etbr assay is summarized in figure 3. Agar cartwheel assay was performed for all 4 strains of *E. coli*, out of these four strains efflux pump was detected only in K12-AG100 strain and the other three strains (knockout strain 1-DC14, MTCC strain 1302 and NCTC strain 12923) have shown fluorescence hence confirms the absence of efflux pump.

**Figure 3:-** Ethidium bromide fluorescence detected in three strains of *E. coli*. The resistant strain showing the absence of Etbr fluorescence confirming the presence of Efflux pump.

**Minimum Inhibitory Concentration:-**

The observations of Etbr agar cartwheel assay was further confirmed by the determination of MIC values for selected antibiotics, known to be efflux pump substrates viz., Tetracycline, Erythromycin and ciprofloxacin. The Wild type strain K12-AG100 containing AcrAB- TolC efflux pump has shown very high MIC values ranging from

0.5 µg/mL to 128 µg/mL for all antibiotics known to be efflux pump substrates. Further the assay was performed with an Efflux pump inhibitor EPI a significant decrease was observed in MIC of antibiotics for the resistant strain and these values were ranging from 0.5 µg/mL to 32 µg/mL. While three strains (1-DC14 Knockout strain, 1 MTCC strain and 1 NCTC strain) without efflux pump have shown very low MIC value of antibiotics which had remain constant even in the presence of an EPI (CCCP), (Table 2 and Fig 4). The observations of MIC assay were found similar to those of EtBr agar cartwheel assay.

**Table 2:-** MIC determination in *E.coli* strains for ciprofloxacin, Tetracycline and Erythromycin (µg/mL) to confirm the presence of active efflux pump

Sr.No	Name of strain	MIC for Tetracycline		MIC for Ciprofloxacin		MIC for Erythromycin	
		Without CCCP	With CCCP	Without CCCP	With CCCP	Without CCCP	With CCCP
1	1-DC14	4	2	1	0.5	2	2
2	K12-AG100	2.0	0.5	64	16	128	32
3	MTCC	0.06	0.03	0.05	0.05	0.003	0.003
4	NCTC	0.003	0.003	0.125	0.125	0.05	0.05

**Fig. 4:-** MIC of Ciprofloxacin, Tetracycline and Erythromycin (µg/mL) with or without CCCP for *E.coli* strains.

### Discussion:-

*Escherichia coli* has recognized as an emerging opportunistic pathogen of clinical relevance. The intrinsic resistance of *E.coli* has been attributed due to the outer membrane barrier. From many years, role of efflux mechanisms in bacterial resistance to most classes of antibiotics<sup>5,7,9,11</sup>. Ethidium bromide is a substrate for all efflux pumps and is not allowed to accumulate inside the bacterial cell<sup>32</sup>. Ethidium bromide used as a marker to detect efflux pump in resistant bacteria which have efflux pump mediated drug resistance mechanism. Those bacteria have efflux pump does not show EtBr fluorescence because they do not accumulate the EtBr and effluxed out. In the present study, EtBr Agar Cartwheel assay was performed to detect AcrAB-TolC efflux pump in *E.coli* isolates. In the present study, we observed the EtBr fluorescence among three strains 1-DC14 Knockout strain, MTCC-1302 and NCTC-12923 these strains get accumulated EtBr and shows EtBr fluorescence. While K12-AG100 wild type strain has not shown the EtBr fluorescence hence it confirms the presence of efflux pump.

Martins *et al.*, (2013) reported that Gram negative bacteria *Acinetobacter* has shown significant increase in the fluorescence after the incubation at 4°C while less fluorescence was observed at 37°C. The observations of the present study suggested that the drug efflux mechanism is an energy mediated mechanism and direct perpetuate to the temperature when the temperature decreased the energy of membrane decreased and the other factor may be responsible for less efflux is low metabolic rate at low temperature, which is not able to produce sufficient energy, hence the available energy is not sufficient to efflux out the accumulated compounds. Therefore, more fluorescence occurs at low temperature. In addition to this, the isolates having potentially less active efflux systems showed higher fluorescence and isolates having more active efflux systems showed less fluorescence<sup>32</sup>. In the present study, the MIC value was determined for the selected antibiotics, known as efflux pump substrates viz., Tetracycline, Erythromycin and Ciprofloxacin. K12-AG100 strain with known AcrAB-TolC efflux pump have shown very high MIC values ranging from 0.06 µg/mL to 128 µg/mL confirm the presence of AcrAB-TolC efflux pump. While the other three strains have shown very low MIC value. Further the assay was performed with an Efflux pump inhibitor (EPI) CCCP. A significant decrease was observed in MIC of antibiotics for the resistant strain and these values were ranging from 0.003 µg/mL to 64µg/mL. While the MIC of control sensitive strains (1 MTCC- 1302 and 1NCTC-12923) without efflux pump was not change and remain constant even in the presence of an EPI (CCCP). Similarly, Abdi- Ali *et al.*, (2006) has reported significant decrease in MIC of resistant antibiotics used in combination with EPI (CCCP). The observations of the study again suggested that the drug resistance in MDR isolates is mediated by an active efflux pump which effluxed out the accumulated drug.

### Conclusion:-

EtBr agar cartwheel assay is a simple trustworthy method and can be used for the detection of efflux pumps in bacteria and on the basis of present study it can be concluded that efflux pump over expression is an leading cause of drug resistance in *E.coli* therefore proper measures should be used to solve this problem.

utilization; non-prescription

#### Abstract

**Background:** Production and marketing of skin lightening products has become a multi-billion dollar industry, servicing all parts of the world, making it one of the most common forms of potentially harmful body modification practices worldwide.

**Objectives:** to study the practices of Saudi women regarding topical skin lightening agents.

**Subjects and methods:** This is a cross sectional study covered different areas of the Kingdom of Saudi Arabia. It included women aged between 16 and 60 years, Saudis and live in the kingdom permanently as well as has online access. Self-administered valid Arabic questionnaire has been used to collect data from the participants. It includes personal information, detailed information regarding the use of skin lightening agents and knowledge of the safety of these agents. Using all online tools (face book, twitter, what's app, etc...), the questionnaire was distributed.

**Results:** Six hundreds and five subjects were included in the study, their mean age was  $35.8 \pm 6.6$  years, with a range from 20–50 years, slightly more than half of them (50.9%) were singles while 45.6% were married. Sixty five percent of the participants (393 out of 605) were current users of topical skin lightening products and 198 (32.7) had previously used these products. Thus, overall, 438 women out of 605 (72.4%) ever used topical skin lightening products. Almost half of them (49.9%) obtained these preparations from the pharmacy without prescription. Among current users, 13.6% had used skin lightening agents continuously for more than one year. These agents were applied to the whole body in 11.9% of ever users whereas almost two-thirds of them (61.8%) used the products on their faces. Only 27.3% of the participants could recognize that Mercury is the most harmful chemical to human health, which could be one of the components of skin lightening agents whereas cortisone was chosen by 41.5% of them. Fifty-two women (10.1%) reported that they would use skin lightening creams that gave fast results, even if the components were unknown.

**Conclusion:** The utilization of skin lightening agents among Saudi women is a common practice, mostly without prescription.

**Introduction:-****Background:-**

Skin lightening is “the practice of utilizing chemical substances or any other products with a depigmenting potential in an attempt to lighten skin tone or provide an even skin complexion by lessening the concentration of melanin and obtain a reduction of the physiological skin pigmentation”.<sup>(1)</sup>

Whiteness of the skin is considered as important element in constructing female beauty worldwide, particularly in cultures with black colored skin as in Africa, South America and parts in Asia.<sup>(2)</sup> Skin bleaching preparations typically used by people with skin phototypes IV to VI on a cosmetic basis, primarily to lighten normally dark skin in order to fit within the larger society's definition of beauty that is linked to having a fair skin.<sup>(3)</sup>

Skin lightening is a growing phenomenon around the world and it's becoming a bigger business. The prevalence rates of using skin bleaching products are variable in different parts of the world. They ranged from 24% among Japanese women<sup>(4)</sup> and 30% among women from Ghana<sup>(5)</sup> to alarming rates in India (65%)<sup>(4)</sup> and Lagos, Nigeria (77%).<sup>(6)</sup>

Production and marketing of skin lightening products has become a multi-billion dollar industry, servicing all parts of the world, particularly low- and middle-income countries<sup>(4)</sup> making it one of the most common forms of potentially harmful body modification practices worldwide as they include potentially harmful over-the-counter creams, putting them at greater risk for a variety of negative health outcomes.<sup>(7)</sup>

The active ingredients used in skin lightening creams are hydroquinone,<sup>(8, 9)</sup> highly potent corticosteroids and mercury salts.<sup>(10)</sup>

The use of skin lightening creams can be potentially dangerous and harmful and carry out several complications ranging from dermatologic consequences include: epidermal atrophy, ochronosis, eczema, dermatitis, acne to more serious health risks include diabetes, skin cancer, foetal toxicity, renal and liver impairment and failure.<sup>(8-13)</sup>

The harms caused by using skin lightening products extend from the acute or chronic long-term exposure to the often hazardous chemical agents that are present in these products.<sup>(14)</sup> In addition, the damage from bleaching products is often exacerbated when users mix skin bleaching products with household chemicals such as toothpaste, laundry bleach, detergents and even automotive battery acid, a very common practice in some areas, to try to enhance their effect.<sup>(8, 10)</sup>

With this global growing phenomenon only few studies were conducted in Saudi Arabia. Therefore more studies need to be done to assess the magnitude of problem of usage of topical lightening agents among Saudi women.

This study aimed to study the practices of Saudi women regarding topical skin lightening agents.

**Subjects and Methods:-**

This is a cross sectional study covered different areas of the Kingdom of Saudi Arabia. It included women aged between 16 and 60 years, Saudis and live in the kingdom permanently as well as has online access.

The minimum sample size for this study has been estimated using Epi-info software and found as 571 women.

Self-administered valid Arabic questionnaire has been used to collect data from the participants. It has been created and used previously in KSA by Al-Ghamdi.<sup>(15)</sup> Permission to use the questionnaire was obtained from the author through an e-mail communication. It includes 27 questions; personal information (age, marital status, educational level, occupation and household average monthly income), detailed information regarding the use of skin lightening agents such as the age at which the participants started using them, the duration and frequency of usage, source of obtaining these agents, reason/s for usage during pregnancy and lactation, money spent monthly on bleaching agents, parts of bodies they applied these products to and the amounts (grams) applied. The women were also asked about the safety of the bleaching agents, whether or not they believed that bleaching creams obtained at herbal stores were safe, whether they thought bleaching creams might harm their skin or general health, and whether they were willing to use bleaching creams even if the components of the cream were unknown. From the given components

such as corticosteroids, hydroquinone and mercury, they were asked to choose the most dangerous component to human health.

Using all online tools (face book, twitter, what's app, etc..), the questionnaire was distributed. Only Saudi women living in KSA and aged between 16 and 60 years were asked to participate in the study by filling the questionnaire. It was explained that the research concern is skin lightening agents not regular cosmetics.

Approvals from the local training committee and local ethical committee were obtained prior to study conduction. Participants' permission (completing and sending the questionnaire was considered as consent).

Statistical Package for Social Sciences (SPSS) software version 22.0 will be used for data entry and analysis. Descriptive statistics (number, percentage) and analytic statistics using Chi Square tests ( $\chi^2$ ) to test for the association and/or the difference between two categorical variables will be applied. P-value equal or less than 0.05 will be considered statistically significant.

### Results:-

According to the study design, 605 subjects were included in the study, their mean age was  $35.8 \pm 6.6$  years, with a range from 20–50 years, slightly more than half of them (50.9%) were singles while 45.6% were married. Majority of them (78.8%) were university and above graduated. More than one-third of them (37.7%) were students and 26.4% were employees. Household average monthly income ranged between 10001 and 20000 SR among 31.1% of the participants whereas it exceeded 20000 SR among 10.9% of them.

As shown in figure 1, 65% of the participants (393 out of 605) were current users of topical skin lightening products and 198 (32.7) had previously used these products. Thus, overall, 438 women out of 605 (72.4%) ever used topical skin lightening products.

Details of using topical skin lightening agents among ever users are described in table 2. Almost half of them (49.9%) obtained these preparations from the pharmacy without prescription whereas 10% from beauty and cosmetic shops. The nature of the used agent was most frequently a mixture composed of a readymade drug at the pharmacy (42.7%) or a beauty non-medical product (29.9%).

The commonest reported reasons for using these preparations were just to lighten the color of the skin (34.5%), to heal pigmented areas like freckles (25.6%) or both (28.3%).

The age of the women when they first started using bleaching agents varied from 1 to 57 years (mean  $21.3 \pm 6.8$  years) and in 66.9% of them, it ranged between 16 and 25 years. Skin lightening products were used by 35.8% participants at least once daily. The monthly cost of the skin lightening agents ranged between 4 to 3000 Saudi Riyals (SR) (mean  $173.9 \pm 310.1$  SR). Seventy-seven women (18.9%) reported that they spent more than 200 SR per month on skin lightening preparations. The amount of the skin lightening agent consumed per month ranged between 1 to 1000 gm (mean  $29.0 \pm 103.9$  gm). Thirty-one women (11.3%) consumed more than 50 gm of skin lightening agent per month. Additionally, 6.8% of women continued applying the skin lightening agents throughout pregnancy whereas 15.9% did so during lactation.

Among current users, 13.6% had used skin lightening agents continuously for more than one year whereas 61.4% of them had used them continuously between 2 and 12 months. Overall the duration of continuing use ranged between one and 200 months ( $6.7 \pm 16.8$ ). Table 3

Figure 2 shows that these agents were applied to the whole body in 11.9% of ever users whereas almost two-thirds of them (61.8%) used the products on their faces, 46.7% used them on their necks and 24.9% used them on their hands.

Almost one-third of the respondents (38.7%) reported that the colour of their skin returned to normal once they discontinued the use of skin lightening products whereas 10.1% of then reported that their skin became even darker than before use. Skin dryness was reported by 8.2% of users.

Only 27.3% of the participants could recognize that Mercury is the most harmful chemical to human health, which could be one of the components of skin lightening agents whereas cortisone was chosen by 41.5% of them.

About one-fifth (20.6%) of the participants believed that misusing skin lightening products could harm their skin whereas 48.2% agreed that using skin lightening agents could harm their general health.

About one-third of the participants (32.4%) considered the use of skin lightening agents sold at herbal stores safe whereas 24.6% of them would recommend the use of skin lightening sold at herbal shops to others. Almost two thirds of the respondents (67.3%) wanted the color of their skin to be lighter than its normal color.

From figure 3, it is shown that 46.6% of the participants believed that lighter skin colour made them more beautiful, whereas 42.5% believed that lighter skin colour made them more self-confident. More than one-third of them (40.4%) used skin lightening agents to renew look. Only 12.3% of singles believed that lighter skin colour increase chances of finding a spouse and 14.9% of married participants believed that it stabilizes marriage.

Fifty-two women (10.1%) reported that they would use skin lightening creams that gave fast results, even if the components were unknown.

Table 3 showed that all studied socio-demographic factors were not significantly associated with current usage of skin lightening agents.

**Table 1:-** Socio-demographic characteristics of the participants.

Variables	Frequency N=605	Percentage
<b>Age (years)</b>

### Discussion:-

This study was carried out to fill a gap of knowledge regarding the magnitude of utilizing skin lightening agents despite their deleterious health risk among Saudi women.

The prevalence of current utilization of skin lightening agents in the current study was 65% whereas that of ever usage was 72.4%. This figure agrees with those reported in different places of the world. Prevalence rates of 67.2% has been observed in Singal, <sup>(16)</sup> Jordan (60.7%), <sup>(17)</sup> and Nigeria (72.4%). <sup>(18)</sup> In Malaysia, a rate of 60.6% has been reported. <sup>(19)</sup> In Lahore, <sup>(20)</sup> a rate of 59% of skin lightening agents usage was reported while in Sudan, a rate of 55.4% was observed among university students. <sup>(21)</sup> However, it is lower than that reported in another Saudi study (38.9%). <sup>(15)</sup> These figures are of great importance as the overuse of such preparations has various health outcomes.

In the current study, 13.6% had utilized skin lightening agents continuously for more than one year with an overall duration ranged between one and 200 months. Al Ghamdi reported that the duration of the skin lightening ranged between 1 to 150 months, <sup>(15)</sup> while in Senegal, the duration ranged between 1 to 420 months. <sup>(9)</sup>

Skin lightening agents are harmful to general health at a level that is comparable or even exceeds the level of other risk behaviours.<sup>(14)</sup> Despite of this fact, knowledge of the dangerousness of skin lightening agents is lacking in the present study as Mercury which is the most dangerous constituent of skin lightening agents, was identified by only 27.3% of the participants as the most toxic product of these agents whereas 41.5% selected cortisone. Similar results have been observed in another Saudi study.<sup>(16)</sup>

Regarding the amount of skin lightening cream used each month, it ranged between 1 to 1000 gm (mean  $29.0 \pm 103.9$  gm). In another Saudi study, it ranged between 2 and 600 g (mean 90.09 g/month). In African countries like Senegal,<sup>(9)</sup> the amount ranged between 15 and 350 / month while in Nigeria, the amount ranged between 60 to 150 gram/month.<sup>(22)</sup> The maximum amount used in the present study (1000 gm) is considered very high if we know that 45 gm of skin lightening cream is quite enough to cover the whole body.<sup>(15)</sup> The difference between our figures and those reported in African countries is attributed to the fact that skin colour in African countries is dark black while in Saudi Arabia, it is lighter.<sup>(15)</sup>

In the present study, 6.8% of women continued applying the skin lightening agents throughout pregnancy whereas 15.9% did so during lactation. Comparable results were observed in another study carried by Al Ghamdi in Saudi Arabia where 10.3% of women continued applying skin lightening agents during pregnancy and 20.8% during lactation.<sup>(15)</sup> These figures are very low compared to those reported in Senegal where rate of application of skin lightening products throughout pregnancy or lactation were 81% and 87%, respectively.<sup>(9)</sup>

In accordance with Hamed et al. (2010),<sup>(17)</sup> beauty and self-confidence were commonly identified as reasons for using these agents in the present study as they reported that women who use skin lightening agents were more likely to consider having a lighter skin colour plays a positive role in self confidence, perception of beauty, employment and marriage opportunities compared with non-users.

In the current study, 11.9% of women applied skin lightening agents to their whole body. This figure is higher than that reported in another Saudi study conducted among women visiting outpatient clinics (7.3%).<sup>(15)</sup> However, it is much lower than figures reported from African countries (Nigeria “81.3%”<sup>(22)</sup> and Senegal “92%”).<sup>(9)</sup>

In accordance with others,<sup>(15, 17, 21)</sup> the chief area for application of skin lightening agents in the present study was the face. This is could be due to the fact that the face is the beauty and attraction sign among females, also it has a relatively small surface area, but the women might think that the white face is more beautiful than the black one regardless the homogeneity of the face colour with other body areas.

Complications of continuous application of skin lightening agents reported in the present study were return of skin colour to its normal skin colour or even to darker on, skin dryness and skin rash. These adverse effects prevent the consumers to continue the application. Therefore, there is a need to aware the general population of women to seek medical advice instead of continuing using these preparations without advice.

Among important limitations of the present study its cross-sectional design that doesn't prove causality. Also, it includes women who had an internet access which limits the generalizability of results. However, it includes a relatively considerable sample size as well as it faces an important health issue rarely investigated in Saudi Arabia

Conclusively, the utilization of skin lightening agents among Saudi women is a common practice, mostly without prescription. Therefore we recommended supervising sale and marketing of these products, particularly the herbal preparations that have unknown or harmful components and enhancing public awareness about the dangerous effects of uncontrolled using of such agents.

#### Abstract

The present study aim to examine mapping of uranium distribution in the Cuddalore district, Tamil Nadu, India. Uranium is a relatively abundant element with the highest atomic number of all naturally occurring elements. The occurrences of groundwater are identified porous formation and in fractured and the weathered hard rock aquifer matrix. The geology of the district underline by different range of age from oldest Archean rocks to recent sediments. The study area occupy in 3,678 Sq.km. Totally 93 groundwater samples were collected during Pre- Monsoon, 2015. The collected samples were analyzed for major cations and anions in standard scientific manner. U was analyzed by using laser fluorimeter. The uranium concentration in the groundwater of this region ranges from 0.1 ppb to 24.67 ppb with an average of 1.82 ppb. The analysis results shows the following order of dominance of ion  $Cl^- > H_2SiO_4 > HCO_3^- > NO_3^- > Na^+ > Ca^{2+} > Mg^{2+} > K^+ > SO_4^{2-} > F^- > PO_4^{3-}$ . It is inferred that most of the samples are fresh to slightly saline in nature. The spatial interpolation maps were prepared for demarcating the Uranium enriched region. Thus the regions with higher “U” concentration were delineated and the process responsible for the higher U was determined by statistical analysis.

#### Introduction:-

The groundwater chemistry is concern with a global perspective in groundwater Scenario. The hydrogeological characteristics and geochemical assessment of the basin has been discussed by (Anandan et al. 2010a, b, ; Ravi Kumar et al. 2010; Prasanna et al. 2011). In this, Coastal aquifers constitute an important source of clean water supply, but are frequently faced with the problem of saltwater intrusion (Lenin et al., 2008). Uranium naturally occurs in three isotopic forms in soil, water, plants, animals and human beings. U-238 and U-235 are the parent nuclides of two independent decay series, while U-234 is a decay product of the U-238 series (Balvinder Singh et al., 2014). Uranium concentration in groundwater depends on several factors including lithological, geomorphologic and other geological conditions of the area (Sridhar-Babu MN, 2008). Uranium estimation of water systems of India has been reported by some authors likely Singh et al., 1984, 1995, 2001, 2002, 2008; Ramola et al., 1988; Sarin et al., 1992). Most of the uranium (upto 100 ppb) occurrences in groundwater in India are around the mining regions, uraniferous conglomerates and around granitic intrusions. In Statistical methods use statistics to determine associations between spatial variables and actual occurrence of pollutants in the groundwater. Their

limitations include insufficient water quality observations, data accuracy, and careful selection of spatial variables (Babiker et al. 2005). The estimation of uranium in water may be significant for the hydrogeochemical prospection and for health risk assessments. This study mainly focuses on the spatial distribution of uranium and its behavior of groundwater, moreover to evaluate the geochemical process in the study area.

## Description of the study area:-

### Study Area:-

The area chosen for study in Cuddalore district, which falls in between South of the Ponnaiyar river and North of the Vellar River. It covers an area about 3,678 Sq.km, and lies between  $15^{\circ} 5''$  and  $12^{\circ} 35''$  N,  $78^{\circ} 38''$  and  $80^{\circ} 00''$  E. It falls in Survey of India Map No: 56M/10, 14, 58M/11 and 15. (Fig1). The significant role for East of Pichavaram Mangroves; south of Cuddalore port, SIPCOT Industries, followed by Coleroon River flowing is there. Major part of the study area is devoted to agricultural activities, which include paddy, sugarcane, and groundnut and gingili cultivation. The geological reserves are Lignite, Limestone, White clay materials. In other important of Forest the total areas covered under the woodland in the district are 4171 lifts.

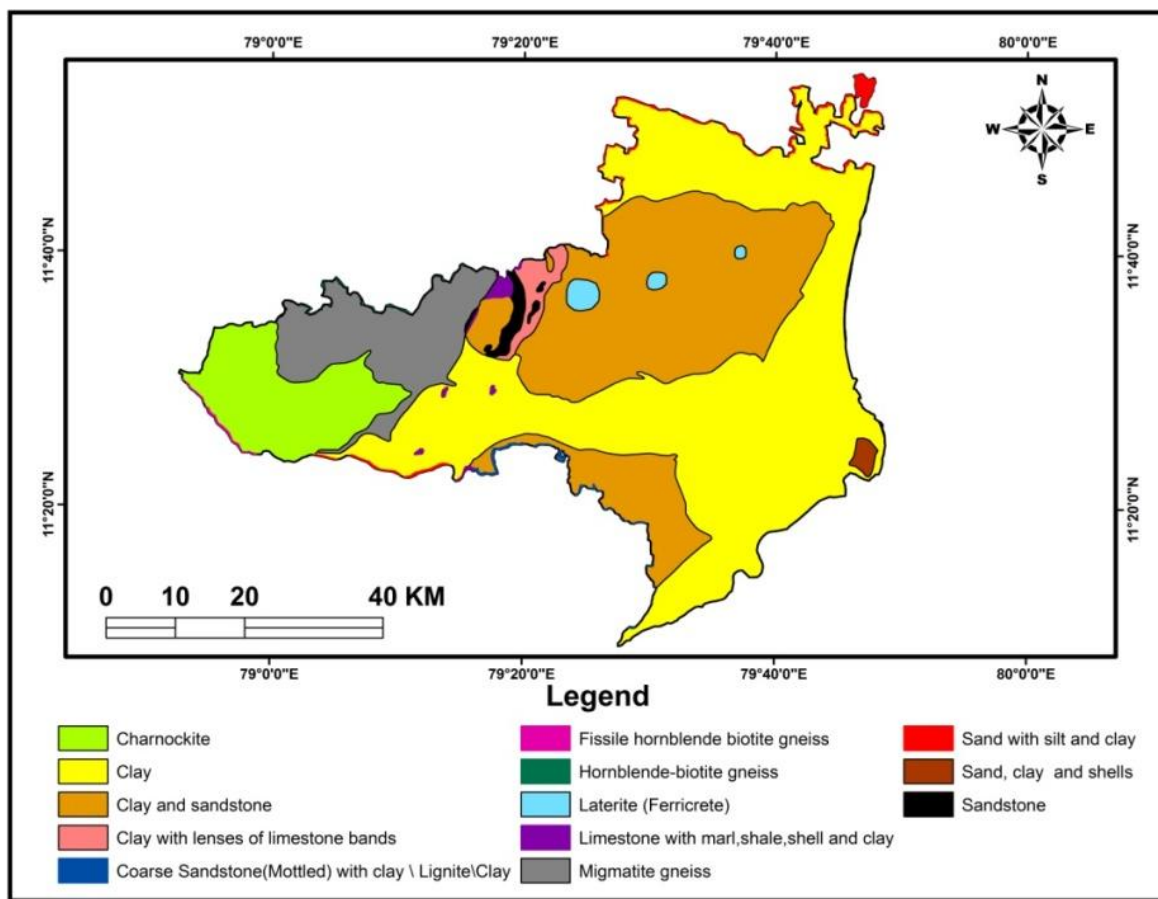

Fig 1:- Sampling Location map of the study area

**Fig 2:-** Geology map of the study area

#### Geology of the study area:-

The geology of the area plays a significant role for assessing groundwater potential zone of the region. This district underline by different range of age from oldest Archean rocks to recent sediments. Tertiary and quaternary sedimentary rocks mainly make up the study area (Fig 2). The litho units represents mostly cover by Clay and Clay Sandstone in sedimentary formations and other than expose clay with lenses of limestone bands and bottom layer of coarse s.s.t with mottled clay with lignite, then small portion of cover by massive rock of Charnokite formation.

#### Materials and Methods:-

In total 93 samples of groundwater were taken into consideration collected from the study area pre-monsoon 2015. Samples were collected using polythene bottles washed with clear acid and standard procedures were used for analysis. The parameter, such as Temperature, pH, EC (Electrical Conductivity) and TDS (Total Dissolved Solids) were analyzed in Thermo Orion ion electrode probe Portable kit) were measured in the field.  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{HCO}_3^-$ ,  $\text{Cl}^-$ , were analyzed in titrimetric Methods procedure adapting by (Ramesh, R., Anbu, M.1996).  $\text{SO}_4^{2-}$ ,  $\text{PO}_4^{3-}$ ,  $\text{H}_4\text{SiO}_4$ , and  $\text{NO}_3^-$  were determined by using UV Spectrophotometer HACH 6000 Instrument. The analytical precision for the measurements of ions was determined by calculating the ionic balance error, which is generally within  $\pm 5\%$ . The fluoride ions were analyzed in Thermo Orion ion electrode (F). The Na and K were analyzed in Flame photometer (Elico CL 378). The maps were prepared by Map info professional 8.5 and piper plot done by Aquachem4.0. Calculation & graphical representations were done by a computer program WATCLAST in C++.

#### Groundwater chemistry:-

##### pH:-

The chemistry of groundwater samples studied about pH range between lowest for 5.59 maximum of 8.7 and with an average of 7.05 observed in the study area. A Water with a pH > 8.5 could indicate that the water is hard and acidic to alkaline in nature. The Hardness of the water results in aesthetic issues.

**EC:-**

The Electrical conductivity (EC) values range from 95.7  $\mu\text{S}/\text{cm}$  to 4890  $\mu\text{S}/\text{cm}$  at 25°C, averaging of about 1253  $\mu\text{S}/\text{cm}$ . The EC values reported in channels near location 27 are high & inconsistent because of industrial discharge and urban waste disposition which results in leaching and accumulation of chemicals.

**TDS:-**

The total dissolved Solids were observed in maximum of 2410 ppm to 50.1 ppm in lowest with an average of 615 ppm in the study area. The cuddalore coastal region is generally occupied with alluvium soil. The study area is mostly covered by alluvial soil, because they having groundwater contain in very shallow depth. Some physical disturbance has been attempt it influence mining activities and under construction process, it cause the groundwater quality is suffered.

**Spatial Estimation of Uranium:-**

In this technique, on excitation of uranium complexes with UV light of 337.1 nm wavelength, the complexes emit green fluorescence that is measured by Photo Multiplier Tubes (PMT). Uranium concentration in aqueous samples is given by the measurement of fluorescence. The minimum detection limit (MDL) of the instrument was 0.2  $\mu\text{g L}^{-1}$ . To avoid error due to different uranium complexes sodium pyrophosphate reagent was used to convert various complexes into single form having same fluorescence yield (Sahoo SK, 2009). The spatial contribution of uranium is observed in higher concentration of U is  $>3.63$  ppb, minimum of 1.35 ppb with an average of 2.50 to 3.60 ppb. The majority of the samples fall in South side and Eastern part and rest of them is Western part of study area (Fig 3). In specifically, indicate that maximum range of U is noted in the South margin and South west and north side is falls in moderate range and minimum concentration noted in towards East and small amount of western part. The obtained values and falling locations were identified in the contamination places and its describing the nature of geochemical behavior of groundwater.

**Figure 3:-** Spatial distribution of Uranium in the study area

In specifically, indicate that maximum range of U is noted in the South margin and South west and north side is falls in moderate range and minimum concentration noted in towards East and small amount of western part. The obtained values and falling locations were identified in the contamination places and its describing the in order to classify their saturation of geochemical contribution in the groundwater.

**Statistical Analysis:-****Correlation matrix:-**

The correlation matrix for groundwater samples collected from Cuddalore region is shown in (Table 1.1). Moderate correlation was observed between pH,  $\text{HCO}_3^-$  and Ca, Mg and  $\text{Cl}^-$ ,  $\text{Ca}^{+}$  and U, Mg and Na, Mg, and Cl, Mg and

good correlation of  $\text{Na}^+$ ,  $\text{Cl}^-$ , and moderately correlate the  $\text{Na}$ ,  $\text{SO}_4^-$ ,  $\text{U}$ ,  $\text{Na}^+$  and  $\text{EC}$ ,  $\text{Na}$ ,  $\text{TDS}$  and  $\text{Cl}^-$ ,  $\text{TDS}$  and  $\text{EC}$ ,  $\text{HCO}_3^-$  and  $\text{TDS}$ ,  $\text{SO}_4^-$  and  $\text{U}$ ,  $\text{EC}$  and  $\text{TDS}$ ,  $\text{EC}$  indicating that all of them have the same origin (Chidambaram and Ramanathan 2000).

#### PCA analysis and Factor Analysis:-

Statistical computations adopting a discrete method to point out the Principal component analysis (PCA) is a powerful tool that attempts to explain the variance of a large dataset of inter-correlated variables with a smaller set of independent variables (Simeonov *et al.* 2003). PCA technique extracts the Eigenvalues and eigenvectors from the covariance matrix of original variables. The Principal Components (PC) is the uncorrelated (orthogonal) variables obtained by multiplying the original correlated variables with the eigenvector, which is a list of coefficients (loadings or weightings). It includes loading for the rotated component matrix, eigen values for each component, per cent and cumulative per cent of variance explained by each component. It indicates that principal components together account for **66.12%** of the total variance in the dataset, in which the first principal component is **29.2%**, second principal component is **46.04%**, and the third principal component is **57.05 %** & fourth principal component is **66.1%** of the total variance.

The Eigenvalues of the first three principal components ( $>1$ ) can be used to assess the dominant hydro geochemical processes. The concentrations of **Ca**, **Mg**, **Na** and **Cl** show high positive loadings (0.75-0.95) whereas concentrations of **EC**, **TDS**,  **$\text{SO}_4$** ,  **$\text{NO}_3$**  and **U** is the moderate positive loadings range between (0.50-0.75) and remaining of **pH**,  **$\text{K}^+$** ,  **$\text{HCO}_3$** , have low positive loadings (0.16-0.34), for the first principal component.

### Results and Discussion:-

The groundwater vulnerability assessment is a critical point in decision-making processes, aiming to land use and resource management optimization. Therefore, it is imperative the adoption of preventive measures as well as accurate monitoring processes. Here, we discuss about the spatial distribution of these factors will permit the identification of potential pollution sources, taking into account the primary activities in the subject area: agriculture, mining, industrial or urban activities. Groundwater is unsuitable for domestic use in 2 % of this area based on the limit of 60 ppb prescribed by the AERB (Atomic Energy Regulatory Board of India). The reported that the concentration of uranium was relatively higher than the USEPA drinking water limit of 30 ppb.

The concentration of uranium in groundwater greatly depends on the composition of the rocks in the aquifer. WHO, 2004 had recommended 15 ppb of uranium in drinking water as safe limit. The (table 1.3) shows that to understand the variability of uranium and also we can estimate the percentage of contaminate into the study area. Some anthropogenic activities like mining, milling, and nuclear fuel processing add uranium to various environmental components (EPA (2009)). These values represent mostly covered 0.1ppb to 1.0 ppb of 62 samples in 66.7 % were found very mild rate of pollution. Then 1 ppb to 2 ppb of 11.8 % 11 samples denotes small range of pollution, and remaining, 5 samples represents 2ppb to 3ppb 5.40 %, 3ppb to 4 ppb of 4 samples falls in 4.30% , and others 4ppb to 5 ppb in 3 samples are covers 3.22% & 5ppb to 7ppb of 2.15% in 2 samples were found and In such that we can infer the very highest range of uranium concentration is observed that following range: 9ppb to 1.0 ppb 1.07 % of 1 sample and 2.15 % sample are fall in > 10 ppb range of concentration in the study area (table 1.4). The source of u has been carried the mining activity and some chemical solvents are dissolves in surface water as well as groundwater due can possible to have the uranium or uranyl particle in that water system. So these proportions are demarcating the variability of geochemical contribution of uranium in the present groundwater.

**Table 1.3:-** Shows different range of Uranium concentration in the Cuddalore region

S.No	Country	Range of U( $\mu\text{g}\cdot\text{l}^{-1}$ )	References
1	Turkey	0.24 - 17.65	Kumru <i>et al.</i> (1995)
2	South Greenland	0.5 - 1.0	Brown <i>et al</i> (1983)
3	USA	0.01 - 652	Cothorn <i>et al</i> (1983)
4	Kuwait	0.02 - 2.48	Bou-Rabee <i>et al</i> (1995)

6	Central Australia	>20	Hostetler <i>et al</i> (1998)
7	Cochin, India	0.34 - 2.54	Prabhu R.S. <i>et al</i> (2008)
8	Cuddalore district, India	0.1 ppb 24.67 ppb	Present Study

**Table 1.4:-** Comparison of uranium concentration in drinking water in different countries

S.No	Conc. Range (ppb)	Percentage of "U "
1	<1.0	66.70%
2	1 - 2	11.82%
3	2 -3	5.40%
4	3 - 4	4.30%
5	4 - 5	3.22%
6	5 - 6	2.15%
7	6 -7	2.15%
8	9 - 10	1.07%
9	>10	2.15%

**Fig. 4:-** Vertical proportion of uranium percentage in groundwater in the cuddalore region during pre-monsoon.

The above chart is representing the concentration of uranium ion presence of cuddalore area denotes the visual observation of higher range of 66.70% of samples in fall <1.0 ppb, medium level of 1-2 ppb in 11.82%, rest of the samples are falls in 2-3 ppb in 5.4%, and other samples were found in 3-4 ppb to >10.0 ppb in minor distribution for this study area.

### Conclusion:-

The present study is conclude that majority of the samples were indicate the not affected in uranium contaminant, only few samples were found in higher concentration. Then, it is calculating by their spatial volume of uranium content. The obtained results shows the following order of dominance of ion  $\text{Cl}^- > \text{H}_4\text{SiO}_4 > \text{HCO}_3^- > \text{NO}_3^- > \text{Na}^+ > \text{Ca}^{2+} > \text{Mg}^{2+} > \text{K}^+ > \text{SO}_4^{2-} > \text{F}^- > \text{PO}_4^{3-}$ . It is inferred that most of the samples are fresh to slightly saline in nature. The Uranium spatial map was studied to estimate the volume and their saturation points were found. These distributions of samples are covered in Majority samples were fall in South side and Eastern part and rest of them is Western part of study area. In which, overall water geochemistry results reflects to support the human utility. The graphical value indicates the each location proportion of uranium ion individual rating of study status. The area denotes the visual observation of higher range of 66.70% of samples in fall <1.0 ppb, medium level of 1-2 ppb in 11.82%, rest of

the samples are falls in 2-3 ppb in 5.4% , and other samples were found in 3-4 ppb to >10.0 ppb in minor distribution. Hence, the statistical approach insist correlate uranium ion with other geochemical parameters denotes the agricultural and artificial activities additionally mining manmade factors are influenced by to enrich the uranium distribution of groundwater in the Cuddalore region.

Biofilm, Antifungal efficacy, Non albicans Candida

#### Abstract

Candida is one of the most frequently encountered opportunistic fungi that cause severe infection in humans because of its virulence factor. The ability of *Candida albicans* to form biofilms and adhere to host tissues and biomaterial surfaces is an important factor in its pathogenesis. One of the main characteristics of biofilms is their resistant to broad spectrum anti-microbial drugs. The aim of the study was to know the biofilm formation by various Candida species isolated from various clinical specimens. The study was carried out over a period of 1 year from January 2016 to December 2016 at the Department of Microbiology, Government Medical College and Hospital, Jammu. A total 120 Candida spp. were isolated from various clinical specimens. Speciation of Candida was done by standard yeast identification protocol and Candida CHROMagar. Biofilm formation was detected by Congo Red Agar, Tube method and microtitre plate method. Out of total 120 Candida spp. studied, biofilm production was seen in 63/100 (52.55%) isolates. While comparing all the three methods tube method proved more reliable, easy and more efficient. Antifungal efficacy of Coconut oil and Eucalyptus oil was also tested in this study against all Candida isolates. Eucalyptus oil was observed to be a better antifungal agent than Coconut oil in the present study. When coconut oil was tested against all *Candida albicans* isolates, the sensitivity of biofilm non producers was higher in comparison to biofilm producers.

#### Introduction:-

A biofilm is a polysaccharide matrix that acts as a protective structural layer for the microorganism. By producing a biofilm, the micro-organism creates a shield to protect itself. (Sachin C Deorukhkar & Santosh Saini, 2013) Formation of a biofilm is a virulence factor of a microorganism. Biofilm is produced by both fungi and bacteria. In mycology, Candida spp. forms most common fungal biofilm which is extremely difficult to treat. (Nimet Yigit et.al., 2011). Candida spp. has an ability to adhere to the surface of commonly used medical devices. Candida spp. is the fourth most common cause of bloodstream infection (BSI) and the third most common cause of urinary tract infection (UTI). (Saroj Golia et.al, 2012) Formation of Biofilm exhibits increased resistance to commonly available antifungal therapies; these infections are very hard to treat. Most often, treatment of biofilm infections involves the removal of the infected medical devices (Pahwa N et.al., 2014). The majority of medically important Candida spp.

has now been shown to develop biofilm including *C. albicans* and Non albicans Candida which includes *C. krusei*, *C. glabrata*, *C. tropicalis*, *C. dubliniensis* and *C. parapsilosis* (Serafino, A et.al.,2008 & Chander J.,2009). The Biofilms of Candida spp exhibits resistance to all available commonly used antifungal drug classes including the azoles (itraconazole, fluconazole, , voriconazole,), the echinocandins (caspofungin, micafungin, anidulafungin), the amphotericin B and flucytosine (Konopka K et.al., 2010). The formation of Candida biofilms carries important clinical repercussions because of their increased resistance to commonly available antifungal therapies and the ability of biofilms to withstand with host immune defences.( Khan MS et.al.,2012) Candida biofilms shows antagonistic impact on the health of the patients. The detection of biofilm becomes very necessary for the treatment of infection.( Ogbolu, D.O et.al., 2007) Various Phenotypic methods are used for the routine detection of Biofilms are - Microtiter Plate Method, Congo Red Agar and Tube adherence method. Fungal infections are treated with antifungal medications called antimycotics or antifungals. While antifungal are effective for many, some may experience side effects and rebound infection. To avoid side effects, one can use naturally occurring antifungals. (Ogbolu, D.O et.al., 2009) New studies shows that eucalyptus oil and coconut oil has powerful anti-fungal properties and it may be an effective treatment for biofilm. This antifungal efficacy of eucalyptus oil and coconut oil on the clinical Candida isolates was also tested in this study. The present study focused on-

1. Isolation and Identification of Candida spp. from various clinical specimens.
2. Detection of biofilm forming capacity of these isolates by various phenotypic methods.
3. Assessment of antifungal efficacy of plant oils on pathogenic Candida isolates.

### Materials and Methods:-

The present study was conducted over a period of one year (January 2016 to December 2016) in the Department of Microbiology, Government Medical College & Hospital, Jammu, (J&K). The clinical isolates recovered from both outdoor and indoor patients and were identified by using standard microbiological protocols. Total 4150 clinical specimens were processed out of which 120 Candida species were recovered. Clinical specimens like Blood, Urine and Pus were included in the study. Samples were screened for budding yeast like cells with the help of Gram stain, and then inoculated on Sabourad's Dextrose Agar with Chloramphenicol at 37 °C for 24 hours. For initial speciation, Germ tube test was done followed by formation of Chlamyospore formation on Corn meal agar. Simultaneously Candida Spp. were inoculated on Candida CHROM agar and incubated at 37 °C for 24 hrs and the species were identified by colour of the colonies on CHROMagar media as per manufacturer's instructions (TM Media).

Biofilm Formation- Biofilm formation was detected by three methods as described below.

#### Microtitre plate method;-

Biofilm formation was determined by using 96-well pre-sterilized polystyrene microplates (HiMedia) For each isolate, a suspension from an overnight culture on SDA was prepared in sterile distilled water and adjusted to 1 McFarland. Each well of the microplate was filled with 180 µl of Sabouraud dextrose broth (Himedia, India) supplement with 8% glucose and then 20 µl of the standard suspension of tested isolates was inoculated. Microplates were covered and incubated at 37°C for 24 hours. The medium in wells was removed and washed three times with sterile phosphate buffer solution (PBS). Microtitre plates were stained with 1% Safranin for 5 minutes and then percentage transmittance (%T) was read at 630 nm by an ELISA reader. All tests were done in triplicates and mean were calculated. Finally, adherent biofilm layers were scored as either negative; weak (+) (percentage transmittance (%T ≤ 20)); moderate, (++) (%T = 20-35); strong (+++) (%T =36-50) and very strong (++++) (%T ≥ 50).

**Fig 1:-** Biofilm formation by Candida species (Microtitre plate method)

**Congo red Agar Method:-**

Congo Red Agar (CRA) is a simple and qualitative method for detecting biofilm production described by Freeman et al using Congo Red Agar medium. CRA medium was prepared with brain heart infusion broth 37 g/L, sucrose 50 g/L, agar No. 1 10 g/L and Congo Red indicator 8 g/L. Firstly Congo red stain was prepared as a concentrated aqueous solution separately from the other medium constituents and autoclaved at (121°C for 15 minutes) and then added to the autoclaved brain heart infusion agar with sucrose which is cooled at 55 °C. CRA plates were inoculated with test organisms and incubated at 37 °C for 24 hr aerobically. Black colonies with a dry crystalline consistency will indicate biofilm production. The experiment was performed in triplicate and repeated three times.

**Fig 2:-** Biofilm formation by Candida species (Congo Red Agar)

**Tube Method:-**

A loopful of organisms from the surface of SDA plate was inoculated into tube containing 10ml of Sabouraud Dextrose Broth supplemented with glucose. The tubes were incubated at 35°C for 48 hours. After incubation, the culture supernatants were decanted and the tubes were washed with phosphate buffer saline (pH 7.3) and the dried tubes were stained with 1% Safranin. Excess stain was removed by washing with de-ionized water. Tubes were then dried by positioning them invertedly. Tubes were then observed for biofilm formation. Biofilm formation was considered positive when a visible film lined the wall of the test tube.

**Fig 3:-** Biofilm formation by Candida species (Tube method)

**Antifungal Efficacy Testing of Eucalyptus Oil and Coconut Oil:-****Preparation of Impregnated Paper Discs**

The commercially available extracts of Eucalyptus oil and coconut oil were used. A 0.04 ml of 100% concentration of the Eucalyptus oil and coconut oil extracts was impregnated into the discs. The impregnated discs were left to dry

for 24 hours in the incubator at 37°C. After drying, the discs were transferred back into the sterile container and stored.

#### Antimicrobial Sensitivity Test:-

Antimicrobial experiments on *Candida* species were carried out on SDA plates. The test strain were streaked on the plates using sterile wire loop and allowed to dry for 15 minutes. Sterile impregnated discs were applied onto the inoculated plates. The plates were then incubated at 37°C for 24–48 hours. Zones of inhibition were assessed after the period of incubation.

#### Result:-

Out of 4150 samples, only 120 (2.89%) were culture positive for *Candida* spp. Out of 120 *Candida* spp. isolated, 58 (48.33%) were identified as *Candida albicans* and 62 (51.66%) were identified as Non-*albicans* *Candida* species. All isolates were studied for biofilm production. Out of total 120 *Candida* species studied, biofilm production was seen in 63/120 (52.55%) isolates.

## Discussion:-

The present research work was conducted with aim to study the biofilm production by various *Candida* spp. isolated from various clinical samples at Government Medical College and Hospital, Jammu, India. It is increasingly obvious that infections caused by *Candida* spp. are an escalating clinical problem, and with a limited arsenal of antifungal and a growing menace of biofilms, a lot has to be done for proper disease management. In the present study, biofilm production was found to occur most frequently in Non-albicans *Candida* than *C. albicans*. This finding is in contrast to an earlier report that suggested that pathogenic Non-albicans *Candida* were more likely to produce virulence factor biofilm than *C. albicans*. (Calderone RA et.al.,2001) In the present study, Out of 4150 samples, only 120 (2.89%) were culture positive for *Candida* spp. Out of 120 *Candida* spp. isolated, 58 (48.33%) were identified as *Candida albicans* and 62 (51.66%) were identified as Non-albicans *Candida* species. All isolates were studied for biofilm production. Out of total 120 *Candida* species studied, biofilm production was seen in 63/120 (52.55%) which is in agreement to the findings of the studies conducted by Mythreyl SR. et al.( Mythreyi Shekar Rishpana et.al., 2015) In our study we found 44.82% of *C. albicans* were biofilm producers which correlate well with the findings of Melek Inci et al. (Melek Inci et.al., 2012) and Saurabh M et al. (Saurabh M et al., 2012) Similarly, 59.67% of Non-albicans *Candida* were biofilm producers which is agreement to the findings of S. Golia et al. (Golia, S. et.al.) and Sahar Ali M et al.( Sahar Ali M et al., 2013) In our study we found that Non albicans *Candida* was more biofilm produces as compared to *C. albicans*.

Since Biofilms have been bethinking as a virulence factor bestowing the Candidal infection, a reliable method for their diagnosis is necessary. Three different methods were used for the evaluation of biofilm i.e. Congo red agar,

Microtitre plate method and Test tube adherence method. Out of these three different methods, Test tube method is fast, simple, reliable, and reproducible method. Tube method was commonly used for early detection of Biofilm production in routine use. The findings of present study showed that it is the most sensitive method for detection of biofilms which is in concordant with the study conducted by Oliveira and Cunha et.al.( Oliveira et.al.,2011 ) Biofilms have great impact on public health because biofilm-associated *Candida* exhibit dramatically plummet susceptibility to antimicrobial agents. This susceptibility may be intrinsic (as a natural outcome of growth in the biofilm) or acquired (due to transfer of extra chromosomal elements to susceptible organisms in the biofilm). It is likely that biofilms evade anti microbial challenges by multiple mechanisms. Some researches indicate that plants oils are used as antifungals because of their broad spectrum antifungal activity. (Nisha VJ.et.al., 2015)

Plant oils are increasingly claimed to Antifungal. Efficacy of Coconut oil and Eucalyptus oil was also tested in this study against all *Candida* isolates. Selected oils have been suggested to have potent antimicrobial activity.

The disc diffusion assay is a standard method widely used for the rapid screening of natural products for antifungal activity. Plant oils were screened using this very convenient assay method. The results indicate that caution is needed, since different oils have different diffusion rates on agar plates. This may contribute to variations in the size of the inhibitory zones, leading to erroneous conclusions regarding their antifungal activity. Hence this assay was run in triplicate and the average zone size was considered for interpretation. Both the oils were effective and showed anti-*Candida* activity at low concentrations; however Eucalyptus oil showed better antifungal activity as compared to coconut oil.( Epka, O.D.,et.al., 1996)

When coconut oil was tested against *Candida albicans* isolates, sensitivity of 26.92% was of biofilm producers *Candida albicans* whereas 37.5% biofilm non producers *Candida albicans*. Biofilm producers *Candida albicans* showed 53.84% sensitivity to Eucalyptus oil whereas non biofilm producers *C.albicans* showed 71.87% .When coconut oil was tested against all Non albicans *Candida* isolates, the sensitivity of biofilm producers was 21.62% and biofilm non producers was 44%. Whereas in the case of Eucalyptus oil 32.43% sensitivity was obtained against biofilm producers and 68% of biofilm non producers Non albicans *Candida* which was in concordant with the study conducted by M. Bansal et.al.( M. Bansal, et.al.,2016) This shows that Biofilm producers *Candida* spp. resist the antifungal activity of plant oils. This can be due to failure of oil to penetrate the full depth of the Biofilm.

The results presented in this study clearly demonstrate the antifungal potential of the selected plant oils. Eucalyptus oil may be used as anti-biofilm agent at low concentrations. However, before they are considered for use as topical preparations, a careful exploration of their undesirable effects needs to be undertaken.

### Conclusion:-

Biofilm is one of the known virulence factors of *Candida* spp. Early detection of Biofilm production may be useful and apply for clinical decision because of its suggestive property for potential pathogenic capacity of *Candida* isolates. The results of the present study emphasize the role of biofilm in *Candida albicans* as well as non-albicans *Candida* as a virulence factor. It also encourages the need for further examination of the efficacy of plant oils against other forms of systemic and superficial fungal infections.

### Acknowledgement:-

Words cannot express how thankful I am to Mr. Rakesh Gandotra and Mrs. Sheetal Gandotra for their continuous encouragement, support and blessings. Your prayer for me was what sustained me thus far. I have to express my appreciation to my beloved husband Dr. Vishal Sharma, for sharing his pearls of wisdom and subserve successful completion of this research article.

#### Introduction:-

##### Definition:-

It is idiopathic disease caused by a dysregulated immune response to host intestinal microflora.

##### Types:-

A) ulcerative colitis (uc) which is limited to colon

B) Crohn disease (Cd) which can affect any segment all see the gastrointestinal tract.

#### **The etiology of IBD:-**

- 1) genetic predisposing.
- 2) an altered dysregulated immune response.
- 3) an altered response to gut.

#### **Complication:-**

Hemorrhage, perforation, fistules, toxic mega colon, cholangio carcinoma

**The annual incidence** of Crohn disease was 5.0 per 100,000 person years in Asia and Middle East, where the incidence rate of UC were 24.3 per 100,000 person years in Asia and Middle East

#### Abstract

Study on the diversity of molluscan fauna was carried out in different locations in the mangrove areas and estuary region of the East Godavari estuary ecosystem. This study determined the abundance and diversity of molluscs in the East Godavari estuarine ecosystem. A total of 14 Gastropods and 8 bivalves were reported from the mangrove areas and estuary region were documented. Onchidium Sp. which is considered to be the shell-less terrestrial gastropod mollusc was also recorded from this mangrove area.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Phylum Mollusca with more than 100000 recognized species (Feldkamp, 2002) play an important role in ecosystem function for forage of predators in their habitats. The term molluscs refer to an ecological group of invertebrates that belong to many lesser known creatures (Mardiastuti, 2001).

The term molluscs are relatively know compared to other components of the mangrove habitats (Kober, 2004; Mardiastuti, 2001; Smith & Nol, 2000). The Gastropoda with an estimated 75000 to 150000 species are the most diverse class of molluscs in the marine habitats (Strong et al. 2008) such as mangroves (Vermeij, 1973) and terrestrial habitats (Barker, 2001). It has been shown that gastropod assemblages massively contribute to feeding resources of waders within the mangrove ecosystem (Al-Sayed et al., 2008). Although classically the role of mangrove gastropods in nutrient dynamics has been largely overlooked, studies have demonstrated their central ecological role (Fratini et al. 2008).

Mangroves are intertidal vegetation along tropical and subtropical shorelines (Zhang et al. 2007), which have special physiological adaptations to frequently inundate by the tides (Lewis Iii, 2005). These unique ecosystems provide a large number of biological, ecological, economic, scientific, environmental, aesthetic and ethical values (Mitsch, 2005) including controlling tide level (Varnell et al. 2003) reducing effects of wave and wind energy against shorelines (Miththapala, 2008), stabilizing shorelines (Lee & Shih, 2004). Thus mangroves protect inland structures (Lewis Iii, 2005), support coastal fisheries (Walters et al., 2008), provide diverse habitat to support wildlife communities including a large number of waterbirds, especially waders (Lewis Iii, 2005), and so many other direct and indirect benefits (Gustavson et al. 2009; Zhou et al. 2010).

**Corresponding Author:- Jarugulla Eswar Satyanarayana.**

Address:- Department of Environmental Sciences, Acharya Nagarjuna University, Nagarjuna Nagar – 522510, Guntur, Andhra Pradesh, India.

Molluscs support economically in the fishery sector and the ambience of our coastal communities are frequently overlooked with diversity of these marine organisms. Molluscan populations as a source of food, ornamental purposes and commercial uses have brought under the shade of endangered species Shanmugam and Vairamani (2005).

Marine invertebrates are considered an important link between the initial detritus at the bases of the food web and the terminal consumers (Coull et al . 1995). The information regarding the role of invertebrates in the mangrove ecosystem are quite scanty, however, molluscs and crustaceans are important components of the ecosystem (Jiang and Li, 1995; Wells, 1983, 1990; Milward, 1982; Redfield, 1982).

In the Phylum, Mollusc, about 3270 species have been reported from India belonging to 220 families and 591 genera. Among them the Bivalves are the most diverse (1100 species) followed by Gastropods (190 species). In India, about 215 species of mollusc were reported from mangrove areas of east and west coasts (Boominathan et al. 2012). In Andhra Pradesh a total of 120 molluscs have been reported. In the present study 22 molluscs species were recorded. East Godavari estuary ecosystem of east coast of India is an estuarine mangrove complex and supports a wide variety of biological species.

## Materials and Methods:-

### Study area:-

Coringa Wildlife Sanctuary is located between 16°44' to 16° 53' N and 082° 14' to 082° 22' E and at the confluence of the river Godavari with the Bay of Bengal in the East Godavari District of Andhra Pradesh. The sanctuary is a part of the Godavari Estuary and has extensive mangrove cover. The total area is 235.7 sq.km. The average temperature of the region is 17°C to 40°C. Average Rainfall is greater than 1,000 mm. The Northern part of sanctuary is covered by the back waters of the Kakinada Bay and covers an area of about 100 sq. km.

Due to seasonal distribution of rainfall, East Godavari estuary ecosystem experiences seasonal flooding which introduces a lot of detritus and pollutants from the land.

The estuary region presently serves as a major drainage channel receiving domestic wastes as well as industrial effluents from the industrial area of Kakinada.

Visits to the sampling sites were made during 2015 to 2016. Four sites were thoroughly visited for molluscan diversity and their distribution pattern. Two sampling points were taken from the estuary region and two sites were taken from the mangrove area. Each sampling site was recorded using a Garmin etrex 10 GPS receiver. Photographs were taken at the sampling area and some of the samples were collected and were preserved in 70% alcohol for identification in the field station.

## Results and Discussions:-

The aim of the study was to assess the molluscan faunal biodiversity in the mangroves and estuary regions of East Godavari estuary ecosystem. During the study period 14 Gastropods and 8 bivalves from the mangrove areas and estuary region were documented (**Table- 1**). *Onchidium* Sp. which is considered to be the shell-less terrestrial gastropod mollusc was also recorded from this mangrove area.

In the present study, the recorded specimens were found to occur on mud banks, mud flats, mangrove forest, sandy muddy area swamps and hard substratum. Gastropods and bivalves are generally benthos organisms, they consider to be used as bio indicators of aquatic healthy. Gastropods and bivalves can produce a billion of larvae in the form of planktons that sustains the biotic population and they have a role in food chain. The observation of Gastropods and bivalves populations in mangrove ecosystem is important to evaluate their condition Dewiyanti and Karina(2012).

*Clithon oualaniense*, *Murex trapa*, *Pirenella cingulata*, *Placuna placenta*, *Nassarius dorsatus* and *Fusinus colus* are found in the estuary region, *Crassostrea bilineata* were densely found on the trunks, pneumatophores and stilt roots of mangrove plants are found at the adjacent mangrove areas.

22	<i>Onchidium</i> Sp. (Slug)	

Narasimham (1973) Radhakrishna and Ganapati (1967) observed that *Anadara granosa* and *Placuna placenta* were restricted in distribution along the western and southern side of the bay. Similar observations were made in the estuarine region of the Coringa Wildlife Sanctuary where the *Placuna placenta* and *Anadara granosa* were harvested by the shell collectors from the estuary region. Rajendar kumar (2016) has reported 10 gastropods and 5 species of bivalves recorded in the Coringa mangroves. Present study reported the molluscan fauna from both mangrove areas and estuarine regions.

*Telescopium telescopium* were found in the two sites of the mangrove areas which were abundant along the fish bone canals which were dug for facilitating water to the regeneration of the mangrove plantation by the forest department.

*Cassidula nucleus*, *Pythia plicata* and *Cerithidea obtusa* has been observed to be on the same trunk of a tree during the high tide.

**Molluscan fauna (Gastropods) recorded during the study in the Mangrove areas and estuarine regions in East Godavari estuarine ecosystem**

### Gastropods

*Assiminea brevicula* (Pfeiffer, 1855)

*Cassidula nucleus* (Gmelin, 1791)

*Cerithidea obtusa* (Lamarck, 1822)

*Littoraria melanostoma* (Gray, 1839)

*Neripteron violaceum* (Gmelin, 1791)

*Pythia plicata* (Ferussac, 1821)

*Telescopium telescopium* (Linnaeus, 1758)

*Terebralia palustris* (Linnaeus, 1767)

## Gastropods

*Clithon ovalaniense* (Lesson, 1831)

*Murex trapa* (Roding, 1798)

*Pirenella cingulata* (Gmelin, 1791)

*Nassarius dorsatus* (Röding, 1798)

*Fusinus colus* (Linnaeus, 1758)

*Onchidium Sp.*

Species richness and number of individuals were determined and calculated the species diversity by Shannon-Wiener Index, Table -2. The results shows that the species diversity at Creek A is 1.718 and Creek B is 1.870, the species richness was same for the two creeks and the estuary region. *Telescopium telescopium* and *Cerithidea obtuse* are found to be in abundant all over the mangrove areas. During the survey at the time of high tide *Cerithidea obtuse* tends to avoid the water by crawling on to the trees to a height of 30cm to 50cm. These findings were done during the subsequent surveys for the small carnivores monitoring in the Coringa Wildlife Sanctuary.

Molluscan fauna (Bivalves) recorded during the study in the Mangrove areas and estuarine regions in East Godavari estuarine ecosystem

### Bivalves

*Crassostrea bilineata* (Roding, 1798)

### Recommendations:-

It was evident from the observations that unsustainable harvesting of the shells may cause decline in the populations of some molluscan species in this region. Hence, awareness programmes should be conducted on the sustainable methods of harvest of the shells to the shell collectors in this region.

### Acknowledgements:-

We are grateful to the Government of India, United Nations Development Programme, Global Environment Facility and Government of Andhra Pradesh (GoI-UNDP-GEF-GoAP), EGREE Foundation for their financial support. We wish to acknowledge Dr. K. Thulsi Rao, State Project Coordinator, (GoI-UNDP-GEF-GoAP), EGREE Foundation. We are very much thankful to Mrs. Nirmala Grace, Research Scholar, for her help during the analysis. We wish to acknowledge Mr. B. Naga Prasad for his help in editing and alignment of photos. We also like to acknowledge Mr. D. Mahesh Babu and Mr. P. Ganesh, Field Assistants for their help during the field data collection.

#### Abstract

**Background:** Time management skill is considered very important for academic success and better quality of life. We aimed to investigate time management in Saudi medical students, and to explore relationship between these skills and socio-demographic features of participants and parameters of academic performance.

**Methods:** This cross-sectional survey was conducted in January 2017 using a self-administered questionnaire. Data were entered and analyzed using IBM-SPSS-20. Data were summarized and analyzed by using frequencies and percentages. Chi-square was used to test associations between time management and socio-demographic features. Pearson correlation was used to measure correlations between time management and parameters of academic performance.

**Results:** A total of 89 participants (37.1% males, 62.9% females) aged  $23 \pm 2.44$  (19-29) years participated in this study. Adequate and inadequate time management was found in 46% and 54% of the participants, respectively. There was no significant difference of time management in participants on the basis of their gender, study in private or government colleges, residence, rural or urban background, and educational qualification of their parents. More pre-clinical students had adequate time management than clinical students ( $p=0.019$ ). Significant positive correlations were observed between time management and total percentage of marks in last exam ( $r=0.331$ ,  $p=0.019$ ), and perceived academic satisfaction ( $r=0.356$ ,  $p=0.001$ ).

**Conclusions:** More than half participants had inadequate time management. There was no difference of time management on the basis of most of the socio-demographic features. Pre-clinical students seemed to manage their time better than clinical students. Time management is positively correlated with total percentage of marks in last exam, and perceived academic satisfaction. Students should increase their time management skills by reading books on this topic and attending relevant trainings and counseling sessions.

**Introduction:-**

Time management has been referred to as set of principles, practices and skills which enable a person to get things done by working smarter but not harder. Effective time management techniques help us to judiciously organize and plan time which we spend on various activities with the aim to increase productivity and quality of life, even when time is less and pressures are high (MindTools.com, 2017). Time management is an acquired skill which can be developed at any age to perform actions efficiently. It has been observed that there are some people who find that they have enough time for their daily activities, but some people struggle as they rush from one task to another without finishing anything. It is not because former type of people have more time but because they know how to use their time effectively by practicing good time management skills (SkillsYouNeed, 2017).

Time management is actually self-management. Time management cannot increase the amount of time we have in a day but it can bring a better life for us by making us more organized (Misra and McKean, 2000). One can enjoy his life by sparing and devoting more time for himself, for his family, relatives and friends; effective time management can enable us to do so (Efil I., 2007).

Currently, time management is considered a very important element for personal and corporate success especially in the professional environment (Koch, 1998). A study by Khatib (2014) has explored that effective time management is associated with higher academic performance, while poor time management in students is associated with higher perceived stress. Being unable to plan and use time properly and doing last-minute study for exams are some factors that can increase stress among students leading to poor academic performance (Britton and Tesser, 1991).

Sometimes, time wasting factors in schools can be external issues which suddenly come up e.g. unplanned events, strikes, accidents, emergencies. These issues can affect students' studies adversely. Students usually have less control on these unforeseen issues (Achunine and Irondi, 1998). However, the internal time wasting factors of students can be even more important than the external factors. Some of these factors are lack of prioritization, procrastination and distractions. Some students may be overwhelmed by the task and they put it off till later dates. This procrastination is due to habitual laziness. It does not let us complete the task rather it brings more tension. Procrastination and lack of prioritization are two most important problems among students. Lack of time management skills can lead to procrastination especially when students don't meet the deadlines. Distractions, while studying, can also waste students' time. Some students may be distracted as they wrongly feel that some unrelated and unimportant things need their urgent attention (King, 2002). This may happen when students have heaps of work to be done and they are lazily looking for an appropriate time to study.

It has been observed that medical students have vast curriculum. It may be difficult for some of them to manage their study and leisure time which may lead to stress (Stecker, 2004; Yousafzai *et al.*, 2009; Waghachavare *et al.*, 2013; Oboko *et al.*, 2015). This further increases the importance of time management skills for medical students. There seem to be dearth of evidence on time management skills, academic performance and perceived academic satisfaction among Saudi medical students. Therefore, this study was conducted to: a) assess time management skills of Saudi medical students, b) investigate association between socio-demographic features of the participants and their time management skills, and c) explore correlation between total time management score and various parameters of academic performance of the participants.

**Methodology:-**

This study was a cross-sectional survey conducted in January 2017 among male and female medical students enrolled in various medical colleges of Saudi Arabia. The participants were aged  $\geq 19$  years and were studying in various years of MBBS from year 1 through 6. An online structured questionnaire was prepared for this survey using Google Forms. This self-administered questionnaire contained two sections. Section 1 consisted of information on socio-demographic features (age, gender, residence, parent's highest qualification etc.), academic performance and perceived academic satisfaction of the participants. Information was obtained on the following parameters of *academic performance*: GPA of last year, total percentage of marks in last exam, total number of A/A+ grades in last exam, total number of supplementary/failures in last exam, cumulative percentage of attendance during last year/semester, and total number of workshops/seminars/conferences attended during last one year. Information on parameters of academic performance was self-reported by the participants and was not confirmed from academic

records of the medical colleges. Students were requested to describe their perceived *academic satisfaction* on a scale of 1-10 with 10 being the most positive. Section 2 comprised of 25 standard questions to collect information on time management skills of the participants; this section was taken from the website of Wayne State University(2013).

Information on participants' age, gender, year of study during MBBS, type of medical college whether government or private, residence during study, permanent residence, highest qualification of father and mother were obtained. Students of 1-3 and 4-6 years of MBBS were considered in *pre-clinical* and *clinical years*, respectively. Each participant was supposed to answer each of the 25 standard questions of time management questionnaire. Participants' were to respond each question as 'always' or 'sometimes' or 'never'. 'Always' carried 2 scores, 'sometimes' carried 1 score and 'never' carried 0 score. For each participant, scores of all 25 questions were added up. Maximum scores that a participant could have achieved for 25 questions on time management were 50. A participant with a score of  $\leq 29$  was considered to have *inadequate time management* skills. A total score of  $\geq 30$  meant that the participant had *adequate time management* skills.

We informed all the participants about the purpose and scope of this survey before their voluntarily participation. We ensured anonymity and confidentiality of all the data. Furthermore, we considered various ethical aspects in line with Helsinki Declaration.

Data of only those participants (n=89) who filled the questionnaire properly were subject to analysis. Data on socio-demographic features of the participants, and their responses to all 25 standard questions on time management were entered and analyzed using IBM Statistical Package for Social Sciences (SPSS) version 20. The data were cross checked to ensure accuracy. Categorical data were summarized as frequencies and percentages. Chi-square test was used to measure association between each of the socio-demographic features of participants and their time management skills. Pearson correlation was used to test correlation between total time management score of the participants and other academic parameters (e.g. GPA, grades, supplementary/failures, academic satisfaction etc.). A *p*-value of  $\leq 0.05$  was considered statistically significant.

## Results:-

A total of 89 participants (37.1% males, 62.9% females) with age of  $23 \pm 2.44$  (19-29) years participated in this study. More than half (61.8%) of participants were students of clinical (4-6) years and the rest (38.2%) were students of pre-clinical (1-3) years of MBBS. Majority (86.5%) of the students were studying in government medical colleges. Most (85.4%) of the students were living in their homes (day scholars) and the rest of the students were living in hostels. Permanent residence of almost three-fourths of participants was in urban areas. Highest qualification of father and mother was at least secondary school education for 89.9% and 77.5% of total participants, respectively (Table 1).

Cumulative responses of the participants to each question of the time management questionnaire are given in Table 2. Most of the participants had less scores for questions No. 4, 13, 18, 20 and 21 of the questionnaire. However, participant got generally good scores for questions No. 1, 3, 6, 7, 17, 23 and 24. Mean time management score was  $27.91 \pm 8.56$  (range: 9-50).

Adequate time management skills (score  $\geq 30$ ) were found in 46% of the participants while inadequate time management (score  $\leq 29$ ) was observed in 54% of the participants (Figure).

Association between socio-demographic characteristics and time management skills of the participants is presented in Table 3. There was no significant difference of time management skills between male and female participants, students of private and government medical colleges, students living in hostels and homes, and rural versus urban students. Moreover, there was no statistically significant difference of time management skills between participants when we compared them on the basis of highest educational qualification of their parents. Adequate time management skills were present in 61.8% of pre-clinical students as compared to 36.4% of clinical students. Moreover, time management skills were inadequate in 38.2% of pre-clinical students as compared to 63.6% of clinical students. In a nutshell, pre-clinical students had significantly higher time management skills as compared to clinical students ( $p=0.019$ ).

Pearson correlation between total time management score and parameters of academic performance are given in Table 4. Significant positive correlations were observed between total time management score and total percentage

of the marks of last exam ( $r = 0.331$ ,  $p=0.019$ ), and perceived academic satisfaction ( $r = 0.356$ ,  $p=0.001$ ). Moreover, we found significant positive correlations between academic satisfaction and GPA of the last year/semester ( $r = 0.290$ ,  $p=0.016$ ), total percentage of the result of last exam ( $r = 0.390$ ,  $p=0.006$ ), and total number of A/A+ grades in last exam ( $r = 0.340$ ,  $p=0.002$ ). No significant correlation was observed between total time management score and other academic parameters of the participants.

**Table 1:-**Socio-demographic characteristics of the participants (n = 89)

Socio-demographic Characteristics	Frequency (%)
Age: Mean $\pm$ SD (Range)	23 $\pm$ 2.44 (19-29) years

**Table 2:-** Participants' cumulative responses to each question of the time management questionnaire

Questions	Participants' Responses n (%)			Total responses from the participants
	Never	Sometimes	Always	
1. I do things in order of priority.	5 (5.6%)	44 (49.4%)	40 (44.9%)	89
2. I accomplish what needs to be done during the day.	6 (6.7%)	61 (68.5%)	22 (24.7%)	89
3. I always get assignments done on time.	3 (3.4%)	37 (41.6%)	49 (55.1%)	89

4. I feel I use my time effectively.	29 (32.6%)	49 (55.1%)	11 (12.4%)	89
5. I tackle difficult or unpleasant tasks without procrastinating (delaying)	15 (16.9%)	57 (64.0%)	17 (19.1%)	89
6. I force myself to make time for planning.	7 (7.9%)	42 (47.2%)	40 (44.9%)	89
7. I am spending enough time planning.	11 (12.4%)	37 (41.6%)	41 (46.1%)	89
8. I prepare a daily or weekly "to-do" list.	17 (19.1%)	40 (44.9%)	32 (36.0%)	89
9. I prioritize my list in order of importance, not urgency.	14 (15.9%)	44 (50.0%)	30 (34.1%)	88
10. I am able to meet deadlines without rushing at the last minute.	21 (24.1%)	45 (51.7%)	21 (24.1%)	87
11. I keep up-to-date on my reading and homework assignments.	14 (16.1%)	48 (55.2%)	25 (28.7%)	87
12. I prevent interruptions from distracting me from high priority tasks.	14 (15.9%)	53 (60.2%)	21 (23.9%)	88
13. I avoid spending too much time on trivial/small matters.	15 (17.0%)	59 (67.0%)	14 (15.9%)	88
14. I am spending enough time on academic matters.	14 (16.1%)	41 (47.1%)	32 (36.8%)	87
15. I plan time to relax and be with friends in my weekly schedule.	21 (24.1%)	32 (36.8%)	34 (39.1%)	87
16. I have a weekly schedule on which I record fixed commitments such as classes and work hours.	26 (29.5%)	42 (47.7%)	20 (22.7%)	88
17. I try to do the most important tasks during my most energetic periods of the day.	9 (10.2%)	43 (48.9%)	36 (40.9%)	88
18. I make constructive use of my commuting (travelling) time.	18 (20.5%)	59 (67.0%)	11 (12.5%)	88
19. I periodically re-assess my activities in relation to my goals.	12 (13.8%)	47 (54.0%)	28 (32.2%)	87
20. I have discontinued any wasteful or unprofitable activities or routines.	18 (20.5%)	56 (63.6%)	14 (15.9%)	88
21. I screen and group my telephone calls to allow for control over telephone interruptions.	36 (40.9%)	41 (46.6%)	11 (12.5%)	88
22. I judge myself by accomplishment of tasks rather than by amount of activity or "busy-ness".	12 (13.6%)	51 (58.0%)	25 (28.4%)	88
23. My actions are determined primarily by me, not by circumstances or by other people's priorities.	8 (9.1%)	42 (47.7%)	38 (43.2%)	88
24. I have a clear idea of what I want to accomplish during the coming semester.	11(12.5%)	41 (46.6%)	36 (40.9%)	88
25. I am satisfied with the way I use my time.	33(37.5%)	33 (37.5%)	22 (25.0%)	88

### Discussion:-

Findings from this study suggest that more than half (54%) of the Saudi medical students have inadequate time management skills. We also found that there is no significant difference of time management skills in the participants on the basis of their gender, their study in private or government medical colleges, their residence in hostels or homes, their rural or urban background, and the educational qualification of their parents. Furthermore, we found that pre-clinical students are more likely to have adequate time management skills as compared to clinical students. We also observed significant positive correlation between total time management scores and total percentage of the marks of last exam, and perceived academic satisfaction among the participants.

We have observed that 54% of the medical students in Saudi Arabia have inadequate skills to manage their time effectively. This means that almost every one out of two medical students in Saudi Arabia seem not using his/her time smartly. This also means that time management is one of the self-management skills that some students are better at than others. In another study carried out by Eid *et al.* (2015) on nursing students in Egypt, it was explored that 85.5% of the nursing students have good time management skills while 14.5% have inadequate time management skills. This difference in findings of the two studies may be due to use of different questionnaires for assessing time management skills. Moreover, the participants in our study were medical students while in the Egyptian study were nursing students. An implication of poor time management among nearly half medical students in our study is that they are at risk of psychological stress and poor academic achievement as is mentioned by Khatib (2014).

In our study, there is no significant difference between males and females on the basis of their time management skills which is similar to the findings of some other studies (Jahanseir, *et al.*, 2008; Saketi and Taheri, 2010; Pehlivan, 2013; Adebayo, 2015). This means that both males and females may behave similarly to manage their time and similar importance should be given to both the genders during trainings on time management skills. However, in contrast to our findings, another study (Liu *et al.*, 2009) has demonstrated that females have better time management skills than males. While some studies (Guoging and Yongxin, 2000; Macan *et al.*, 2010) have reported that males have better time management than females.

Furthermore, we have observed that there is no significant difference in time management skills in our participants whether they are studying in private or government medical colleges, living in hostels or their homes, coming from rural or urban background, and having different educational qualifications of their parents. Its implication for academic counselors may be that, during teaching and training students on time management skills, equal importance should be given to all the students irrespective of their socio-demographic differences.

We found that pre-clinical (year 1-3) students are better than clinical (year 4-6) students on the basis of their time management skills. One possible explanation for this can be that medical students are at risk of psychological stress during their transition from pre-clinical years to clinical years (Oboko *et al.*, 2015). This increase in stress may be due to relatively more burden of studies during clinical years and may also affect the time management behavior of the students.

We have observed significant positive correlations between total time management scores and total percentage of the marks of last exam, and perceived academic satisfaction among the participant. It means that the students who can better manage their time might also get better results and may be more satisfied than their counterparts who are poor at time management. Moreover, no significant correlation was observed between total time management scores and GPA of the last year/semester. This finding is similar to the results of some other studies (Pehlivan, 2013; Eid *et al.*, 2015). In contrast to our finding, some other studies (Proctor *et al.*, 2006; Anand, 2007; Indreica *et al.*, 2011; Khatib, 2014) have reported significant positive correlation between time management skills and GPA. This difference may be due to difference in sample size and also because students in all these studies were enrolled in dissimilar programs.

Moreover, we have found significant positive correlations between academic satisfaction and GPA of the last year/semester, total percentage of the marks of the last exam, and total number of A/A+ grades in the last exam. This means that the medical students who get a higher GPA, better percentage of result, and more A/A+ grades can be more satisfied than the students who are performing poorly in all of these parameters of academic performance.

One of the strengths of this study is that we have investigated association between time management skills and various socio-demographic features of the participants by using a standardized time management questionnaire developed by Wayne State University (2013). Furthermore, we have also studied correlations between total time management scores and various parameters of academic performance of the participants. One of the limitations may be relatively small sample size (n=89) as compared to other similar studies. Caution must be taken to generalize the findings of this study due to its cross-sectional nature. We have used a self-administered questionnaire that may lead to some possibility of reporting bias.

### Conclusions:-

This study has shown that more than half medical students of Saudi Arabia have inadequate time management skills. There is no difference of time management skills among the participants on the basis of most of their socio-demographic features. Pre-clinical students seem to manage their time better than clinical students. Time management is positively correlated with total percentage of marks in the last exam and perceived academic satisfaction.

Since, a big proportion of medical students has reported inadequate time management and later is also correlated with some parameters of academic performance, we recommend some implications of this study for students, teachers and academic counselors. Students should increase their time management skills by reading books and other literature on this topic, and by attending relevant seminars and workshops. Teachers should act as role model to encourage students' participation in such activities. Academic counselors and psychologists should help the students by providing counseling sessions on time management and by organizing trainings on time management skills. It is also recommended to include the topic of time management in the courses of higher secondary education and university education so that by learning and using these skills student may improve their academic performance and quality of their life.

Further studies are recommended to investigate relation between time management skills of the students and psychological stress. Moreover, prospective studies may also be conducted to assess long-term effects of time management skills on various parameters of academic performance of students.

#### Abstract

**Introduction:** Acute hepatitis due to hepatitis a virus is usually a benign self-limiting disease conferring lifelong immunity. However, few cases have been reported in literature with fulminant hepatitis. We report this extremely rare case with multiorgan dysfunction including liver failure, hepatic encephalopathy, renal failure, pleural effusion, pericardial effusion and hematologic dysfunction as a sequale of this infection in an otherwise healthy male at the age of 18.

**Case presentation:** An 18 years old Pakistani male presented with two days history of fever, cough, headache and vomiting. His condition gradually deteriorated and on day 7 developed multiorgan dysfunction. Initially Immunoglobulin M anti hepatitis a virus was borderline 1.40 but repeated titers one week later confirmed the diagnosis of acute hepatitis a virus infection.

**Conclusion:** This original case report highlights the importance of focusing first uncommon manifestations of common illnesses while diagnosing difficult cases. Moreover this case also adds knowledge to the limited available data regarding complications and predictors of prognosis.

#### Introduction:-

Hepatitis A virus has plagued mankind for centuries by causing acute hepatitis associated with significant morbidity and occasional mortality. HAV is a 7.5-kb positive-strand RNA virus of the Picornaviridae family and the only member of the genus Hepatovirus [1]. All four genotypes belong to a single serotype. HAV is spread via the fecal-oral route. The incubation period averages 30 days (range 15 to 49 days). The prevalence of HAV infection varies among countries in Asia [2]. Countries with high endemicity for HAV infection include Pakistan, India, China, Nepal, Bangladesh, Myanmar and the Philippines. Most people in these countries are exposed during childhood. HAV infection usually results in an acute, self-limiting illness and only rarely leads to fulminant hepatic failure [3]. In young children, the disease is often asymptomatic, whereas in older children and adults there might be a range of clinical manifestations from mild, anicteric infection to fulminant hepatic failure. The risk of fulminant hepatitis is high in patients having an underlying chronic liver disease and are aged more than 40 years [4]. This case report describes a young person from a highly HAV endemic area with serologically confirmed acute HAV infection with multiorgan involvement.

**Case Presentation:-**

An 18 years old Pakistani male presented with about two days history of intermittent fever with chills, nonproductive cough, generalized headache, nausea and nonbilious vomiting. He vomited thrice on day 1 and five times on the next day. Vomitus contained food particles and was devoid of blood. Clinical examination was unremarkable except raised temperature ranging from 37.22°C (310.4 kelvin) to 39.44°C (312.6 kelvin) with relative bradycardia (pulse ranging from 56/minute to 84/minute). Initial investigations revealed raised serum alanine aminotransferase (2043u/l), low normal platelet count ( $165 \times 10^9/l$ ) and total white cell count ( $4.2 \times 10^9/l$ ) with normal differential count and morphology. Other investigations including haemoglobin, malarial parasite slides, bilirubin, alkaline phosphatase, aspartate aminotransferase, albumin, urea, creatinine, electrolytes, plasma glucose, widal test, DIC screening, urinalysis and chest radiograph were within normal limits. He was provisionally diagnosed as a case of anicteric hepatitis with differential diagnoses of malaria and enteric fever due to their high prevalence in the area. He was managed with antimalarial (artemether), third generation cephalosporin (Ceftriaxone) and supportive parenteral fluids. Samples for blood cultures, viral (including hepatitis and dengue) screening, typhi dot, serology for brucella, leptospira, rickettsia and toxoplasma were sent to laboratory.

On day 3, he developed dizziness and unsteadiness of gait and asterixis while fever with relative bradycardia, headache and vomiting continued. CT scan head revealed no abnormality. IgM anti HAV was borderline 1.40 (cut off 1.20). Repeated investigations showed rising serum alanine aminotransferase 3690u/l, prothrombin time 30 seconds (control 12 seconds), PTTK 46 seconds (control 32 seconds), fibrinogen 130 mg/dl, D-dimers >200<400, serum albumin 28 g/l, urea 13 mmol/l, creatinine 266 umol/l, sodium 133 mmol/l potassium 4.8 mmol/l, creatinine kinase 1112 u/l with CK-MB 6.1%, LDH 6130 u/l, AST 66 u/l, haemoglobin 12.8 g/l, total white cell count  $11 \times 10^9/l$ , platelets  $116 \times 10^9/l$ , pus cells(8-10/HPF) & red blood cells (5-7/HPF) seen on urinalysis. Other investigations including ECG, bilirubin, alkaline phosphatase, hepatitis B surface antigen, serology for hepatitis E, C, dengue, brucella, leptospira, rickettsia, toxoplasma and typhoid were normal. Antimalarial (artemether) was stopped when repeated malarial parasite slides were found negative. Vitamin K was added to treatment but his clinical and laboratory parameters continued to deteriorate.

On day 7, fever settled but his blood pressure rose to 170/110 mmHg and became oliguric with 24 hour urinary output falling to 150 ml while investigations revealed urea 14.1 mmol/l, creatinine 1204 umol/l, sodium 127 mmol/l, potassium 4.4 mmol/l, serum alanine aminotransferase 2149 u/l, bilirubin 77 umol/l, alkaline phosphatase 367u/l, prothrombin time 16 seconds, PTTK 39 seconds and fibrinogen 180 mg/dl. Ultrasonography showed bilateral pleural effusion (mild) and renal parenchymal disease with increased echogenicity  $\times$  normal sized kidneys (Right 11.2 cm, Left 11.6 cm).

Echocardiography showed minimal amount of pericardial effusion with no evidence of tamponade. He was managed with frusemide and haemodialyzed thrice on day 7,8 and 10 via dual lumen catheter in right subclavian vein.

On day 10, he started showing signs of improvement with better control of blood pressure, urinary output improving to 900 ml/24 hours and significant improvement in the levels of serum urea/creatinine as well as the liver function tests etc. Repeated IgM anti hepatitis A virus was positive, while rest of the investigations including blood cultures, serum cryoglobulins, aldolase, rheumatoid factor, complement levels, autoimmune and vasculitic screening revealed no abnormality. Dual lumen catheter was removed post dialysis on day 10.

On day 16, investigations revealed normal serum albumin, coagulation profile, cardiac enzymes, electrolytes and blood counts while levels of serum urea 11.2 mmol/l, creatinine 246 umol/l, alanine aminotransferase 127 u/l, bilirubin 38 mmol/l, alkaline phosphatase 594 u/l were showing gradual improvement.

Follow up on day 23 revealed completely normal clinical and laboratory parameters including renal, hepatic, cardiac, pleural and hematological functions. Monthly follow up during last five months has not shown any evidence of relapse.

**Discussion:-**

HAV infection usually results in an acute, self-limiting illness conferring lifelong immunity and only rarely leads to fulminant hepatic failure. Fulminant hepatic failure occurs more commonly in patients with underlying liver disease; particularly chronic hepatitis B and C infection, advanced age and addiction of intravenous drugs [3]-[6]. This case is very unusual as there was no pre-existing hepatic or non hepatic illness or other risk factors.

Few cases of acute renal failure and nephrotic syndrome have been reported in the literature in association with HAV infection [7]-[10]. Acute tubular necrosis was the most common form of renal injury in such patients while in others renal biopsy was suggestive of interstitial nephritis, immune complex mesangial glomerulonephritis [7], and IgA dominant glomerulonephritis. Only once IgA dominant glomerulonephritis was accompanied with cutaneous cryoglobulinemic vasculitis.

This is a truly rare event in which a young patient at the age of 18, experienced multiorgan dysfunction secondary to hepatitis A virus infection comprising of fulminant liver failure, hepatic encephalopathy, acute renal failure, pleural effusion, pericardial effusion and hematological dysfunction within short span of time and without preexisting underlying liver disease.

**Conclusion:-**

This emphasizes the importance of focusing on common illnesses with their uncommon manifestations while searching for solution of various clinical diagnostic mysteries even in the absence of poor prognostic markers.

## PHYSICAL ACTIVITI AMONG MEDICAL STUDENTS OF IMAM UNIVERSISTY AND ITS EFFECT ON THEIR ACADEMIC PERFORMANCE

**Algarni Ali and Aldughaytheir Mohammed.**

Al Imam Mohammad Ibn Saud Islamic University (IMSIU), Saudi Arabia.

### Manuscript Info

#### Manuscript History

Received: 26 November 2016

Final Accepted: 27 December 2016

Published: January 2017

#### Key words:-

Physical activity, GPA , Academic performance, medical students.

### Abstract

**Introduction:**Physical activity is defined as any bodily movement produced by the skeletal muscles that results in energy expenditure above the basal level, it is an important factor in improving the quality of life and preventing some medical condition. Many studies have shown that a regular physical activity increases thinking and learning skills

**Objectives:**The purpose of this study is to determine the percentage of students who are physically active and to find out whether physical activity has a beneficial effect on their academic performance or not.

**Materials & methods:**a cross-sectional surveydistributed to all the medical students of Imam university. We used the GPA and duration of daily studying to access the academic performance. Type and duration of physical activity were used to access the level of physical activity of the participants. We received 87 complete survey with a response rate of 18.5 %.

**Results:**29 students out of all participant were physically active, most of the student who were physically active had a GPA of 3.00 to 3.99 ( 18 students) followed by the students who scored a GPA of 4.00 to 5.00 ( 7 students ). Most of the students who were physically active spent more than 180 minutes of physical activity weekly (37.9%).We found that there was an association between physical activity and academic performance with a statistical trend toward significance ( p value = 0.09 ).

**Conclusions:**We found that students with a higher GPA tend to be more physically active than students with lower GPA. We recommend doing a similar study on a larger scale to determine the effect of physical activity on academic performance in the Kingdom of Saudi Arabia.

### Introduction:-

Physical activity is an important factor in improving the quality of life and preventing some medical conditions, it increases the strength of bones and muscle, reduces the cardiovascular risk and its associated with lower risk of developing diabetes mellitus type 2 and metabolic syndromes. [1, 2] Physical activity is defined as any bodily movement produced by the skeletal muscles that results in energy expenditure above the basal level. physical activity can be categorized into light, moderate, or heavy intensity as well as weekday and weekend activity, plus

Address:-Al Imam Mohammad Ibn Saud Islamic University (IMSIU), Saudi Arabia.

2024

several other categories. [3] Many studies have shown that a regular physical activity increases thinking and learning skills. [1, 2] Several hypothesis have described the mechanism of which physical activity could improve academic performance including increasing the blood and oxygen flow to the brain, increasing the levels of norepinephrine and endorphins, reduction of stress and improvement of mood [4, 5, 6].

### **Objectives:-**

The purpose of this study is to determine the percentage of students who are physically active and to find out whether physical activity has a beneficial effect on their academic performance or not.

### **Literature Review:-**

Dawn Podulka Coe et al discussed the Effect of Physical Education and Activity Levels on Academic Achievement in Children. They enrolled 214 Participants who were sixth-grade students and randomly assigned to physical education during either first or second semesters. Academic achievement was assessed using grades from four core academic classes and standardized test scores. They found that Students who either performed some vigorous activity had significantly higher grades ( $P < 0.05$ ) than students who performed no vigorous activity in both semesters. [7]

Sigfúsdóttir ID, Kristjánsson AL .et al dicussed Health behaviour and academic achievement in Icelandic school children, a cross-sectional survey data from 5810 Icelandic school children. They found that the correlation between physical activity and grades is positive and significant ( $P < 0.01$ ) and findings are consistent with previous work and affirm the complexity of the relationship of health to academic achievement. [8]

Pei-An Liao<sup>1</sup>, Hung-Hao Chang et al. discussed Physical fitness and academic performance: empirical evidence from the National Administrative Senior High School Student Data in Taiwan. They used a dataset of 149 240 university-bound senior high school students from 2009 to 2011 was constructed by merging two nationwide administrative datasets of physical fitness test performance and the university entrance exam scores. Using a Hierarchical linear regression models the study revealed An increase of 1 SD on students' overall physical fitness from the first to third school year is associated with an increase in the university entrance exam scores by 0.007 and 0.010 SD for male and female students, respectively. [9]

### **Material & Method:-**

We distributed the questionnaire to all first, second, third and fourth year medical students of Imam university. We used the GPA and duration of daily studying to access the academic performance and we used the type of physical activity and the duration these activities are to access the status of physical activity of each student. We collected back 103 questionnaires, 87 of them were complete and we excluded the 16 questionnaires that were incomplete. response rate was 18.5%. we analyzed the data using SPSS.

### **Result and Discussion:-**

Out of the 87 participant 48 student had a GPA of 3.00 to 3.99 which makes it the most common rang of GPA, followed by a GPA of 2.00 to 2.99 ( 20 students ). 17 student had a GPA between 4.00 to 5.00 (19.5%) and only 2 student had a GPA of <2.00.[Table 1] [ chart 1]

29 students out of all participant were physically active, most of the student who were physically active had a GPA of 3.00 to 3.99 ( 62.1 %) followed by the students who scored a GPA of 4.00 to 5.00 (24.1%). Then a GPA of 2.00 to 2.99 (13.8%). None of the student who had a GPA of <2.00 were physically active.[Table 1] [ chart 2]

Cardiovascular-gym exercise and walking were the two most commonly performed type of physical activity ( 33.5% each ). Sports were the third most common physical activity (27.6%). Only one student was performing weight lifting (3.4%).[Table 1]

(75.0%) of the physically active student with a GPA of 2.00 to 2.99 were walking, while only (25.0%) performed cardiovascular-gym exercise. Among the physically active group of students who scored a GPA of 3.00 to 3.99, thirty eight percent were performing sports, while (27.8%) performed cardiovascular-gym exercise, 5 out of the 28 student who scored a GPA of 3.00 to 3.99 were walking (27.8%). While only (14.3%) of the physically active

student with a GPA of 4.00 to 5.00 performed sports, (57.1%) were performing cardiovascular-gym exercise and (28.6%) were walking.[Table 1]

(50.0%) of the physically active student who had a GPA of 2.00 to 2.99 spent more than 180 minutes/week in physical activity. Most of the physically active student with a GPA of 3.00-3.99 performed activity for more than 180 minutes weekly (38.9%) and only (11.1%) spent less than 60 minutes weekly. 60 to 120 minutes weekly physical activity was the most common duration among the physically active student with a GPA of 4.00 to 5.00 (42.9%), followed by more than 180 minutes per week (28.5%). Among all student with different GPA more than 180 minutes of physical activity was the most common duration (37.9%) and less than 60 minutes was the least (10.3%).[Table 1]

All student with a GPA of less than 2.00 spent less than 60 minutes of daily studying. (90.0%) of the students with a GPA of 2.00 to 2.99 studied for less than 60 minutes daily and only (10.0%) studied for 60 to 120 minutes per day. Most of the students with a GPA of 3.00 to 3.99 spent 60 to 120 minutes studying daily (66.6%), (29.2%) studied for less than 60 minutes daily and only 1 student studied for more than 180 minutes per day. 60 to 120 minutes and 120 to 180 minutes of daily studying were the two most common duration that was spent by students who has a GPA of 4.00 to 5.00 (41.2% each) followed by less than 60 minutes studying per day (11.7%), and only (5.9%) studied for more than 180 minutes daily. Among all the students 60 to 120 minutes was the most common duration of studying (49.4%) followed by less than 60 minutes of studying daily (39.0%). Nine percent of the students studied for 120 to 180 minutes, and only (2.3%) studied for more than 180 minutes daily.[Table 1]

We found that there was an association between physical activity and academic performance with a statistical trend toward significance (p value = 0.09).

**Table 1:-** Characteristics of medical students of Imam university

		GPA				
		<2.00	2.00 – 2.99	3.00-3.99	4.0 – 5.0	total

(\*) for example : Elliptical, Treadmill, Stationary Bike ... etc.

(\*\*) for example : Football, basketball, volleyball... etc.

**Chart 1:-** GPAs of medical students of Imam university.

**Chart 2:-** GPAs of physically active medical students of imam university( percentage )

### Conclusion:-

In this study we found a difference in the GPA of the students of Imam university according to their physical activity status with a statistical trend toward significance ( p value = 0.09 ). We recommend doing a similar study on a larger scale to determine the effect of physical activity on academic performance in the Kingdom of Saudi Arabia.

#### **Abstract**

By its definition, "currency" alludes to a concurred medium for trade, a country's cash is the formal medium authorized by the chose representing element. All through history, guarantors have confronted one basic danger: falsifying. Regardless of innovative progressions, conquering fake creation remains a far off future. Logical assurance of legitimacy requires a profound comprehension of the crude materials, assembling forms included and the security forms applied. Objective of this paper is to make layman's familiar with the security features added to new 2000 and 500 currency notes so that they can differentiate between forged and genuine currency notes with simple examinations.

*Copy Right, IJAR, 2016., All rights reserved.*

#### **Introduction:-**

To fake intends to wrongfully make an impersonation of something with the purpose to exploit the prevalent estimation of the imitated item. Fake cash alludes to money that nearly look like the first money of a nation yet that is delivered without the legitimate authorize of the administration. Fake cash is unsafe to a country. Fake notes increment cash dissemination, conceivably prompting to swelling (1-3). Likewise, the general trust in the cash diminishes. Moreover, people who honestly secure fake cash are deceived. There are generally no administration approaches to repay them for fake notes that are seized. Then again, the people who deliver fake money can make huge benefits and back a variety of exercises, large portions of which may be against the national premium. Fakes are made in an assortment of ways-The least demanding and most regular path is to utilize a high determination scanner to catch both sides of a certified money note. The filtered pictures are then printed utilizing a shading inkjet or laser printer. This strategy functions admirably for little group takes note of that are normally not examined. Be that as it may, it is anything but difficult to recognize such fake notes in view of the nature of the paper that is utilized (4). A more refined strategy begins with a low group note, blanches or washes out the ink and after that prints a higher esteem note. Nonetheless, the generation of an excellent fake requires a substance to utilize a similar crude materials and printing process that are utilized to create honest to goodness cash. This out of the span of individual forgers because of the high cost and trouble in delivering the crude materials and types of gear. Security elements are frequently implanted in money notes to recognize veritable notes. Regular security highlights incorporate watermarks, security strings, inert pictures, smaller scale lettering, intaglio (raised print), optically factor ink and fluorescence (5). Notwithstanding confirming that a money note is real, the security highlights dissuade forging. Duplicating the security highlights expands the cost of forging, making it less productive. This paper concentrates on fantastic fake Indian fake notes. While the effective distinguishing proof of such notes more often than not requires master examination, it is a generally straightforward issue on the grounds that exclusive the honesty of the security highlights must be researched. A more troublesome assignment is to recognize the wellspring of a fake note. This requires point by point examination by legal researchers utilizing costly instruments. Likewise, no programmed technique exists to interface a fake note to source press. Indian money notes are printed at

committed government printing presses. The quantity of presses is restricted and extraordinary care is taken amid its printing. This paper essentially concentrates on the remarkable elements of money notes made for security reason and can help the layman to comprehend that straightforward mindfulness identified with notable elements of new monetary forms can help them to anticipate themselves of being casualties to forgers. In a noteworthy stride to check undeclared dark cash, the Government of India on the 8 November, 2016 declared demonetization of Rs. 500 and 1000 banknotes with impact from that day's midnight making these notes invalid. The Indian 2000 rupee banknote is of the most noteworthy division of Indian money. It was initially presented by Reserve Bank of India in November 2016. Indeed, even as Rs 2,000 notes printed by the Reserve Bank of India (RBI) are yet to achieve banks all over the place, a fake note of this section has surfaced many places of India. The fake notes found in different parts of the nation were photocopied adaptations, this note had highlights including the Gandhi watermark alongside the national image and a fake security string (6-7). Below some of the salient features of ₹ 2000 and ₹ 500 are mentioned which can help common people to differentiate between fake and genuine currencies.

### Material and Methods:-

Present study has been undertaken to study spectral examination of various security features in New Indian paper currency prescribed by Reserve Bank of India. New Currency note of Mahatma Gandhi series of denomination 2000 and 500 was selected for present study. The absorption spectral characteristics were examined by video spectral comparator (model 40). Various types of features were examined on paper currency note using different lights ranges (UV-365, 312, 254nm, Ultra Violet transmitted 365nm), by using different magnification ranges and spot light, various filters. In these ranges various security features were analyzed.

#### 1) New Security Features of Rs. 2000 notes (Figure 1a and b):

The Reserve Bank of India will issue ₹ 2,000 denomination banknotes in the Mahatma Gandhi (New) Series, without the inset letter.

#### Front side features:-

1. Size: 66mm x 166mm, smaller than the old notes,
2. Colour: Rs 2,000 note's paper will be available in a magenta base color.
3. Registered denominational numeral 2000 is seen.
4. Latent image with denominational numeral 2000 is observed.
5. Denominational numeral २००० in Devnagari is observed.
6. At the centre Portrait of Mahatma Gandhi is seen.
7. On the left side of the banknote Micro letters 'RBI' and '2000' observed.
8. On banknotes windowed security threads with inscriptions 'भारत', RBI and 2000 with color shift are observed. Thread Color changes from green to blue when the note is tilted.
9. Towards right side guarantee clause, governor's signature with promise clause and RBI emblem.
10. Watermarks of electrotypes and Mahatma Gandhi portrait (2000).
11. On the top left side and bottom right side number panel with numerals growing from small to big.
12. On bottom right denominational numeral with Rupee Symbol, ₹2000 in changing color ink (green to blue).
13. On left and right side raised print of seven angular bleed lines are present.
14. Emblem of Ashoka Pillar on the right.

#### Reverse side features:-

15. On the left of the note year of printing is seen.
16. Swachh Bharat logo with slogan is added as a new feature.
17. Language panel towards the centre on the reverse side.
18. Motif of Mangalyaan is added as a new feature.  
The notes are also meant to have some special features that have been designed keeping the visually-impaired individuals in mind.  
Intaglio or raised printings of Mahatma Gandhi portrait, Ashoka Pillar emblem, bleed lines and identity mark.
19. Raised print of ₹2000 horizontal rectangle form observed on the right.
20. On left and right side seven angular raised print bleed lines observed.

**Figure1a:-** Showing identifying features of Rs. 2000 currency of front side under VSC.

**Figure1b:-** Showing identifying features of Rs. 2000 currency of reverse side under VSC.

#### New Security Features of Rs. 500 notes (Figure2a and b):-

The RBI will issue ☐ 500 denomination banknotes in Mahatma Gandhi (New) Series with inset letter 'E' in both the number panels.

1. Size: The new Rs 500 note at 63mm x 150mm is smaller in size than previous one.

2. Color: Color is stone grey with Red Fort and Mahatma Gandhi's image on each side.
3. Registered denominational numeral 500 is seen.
4. The denomination numeral in latent image.
5. Denomination numeral in Devnagari script.
6. Mahatma Gandhi's portrait orientation changed.
7. When note is tilted windowed security thread changes from green to blue.
8. RBI emblem, Guarantee clause, Governor's signature shifted towards right.
9. Portrait of Mahatma Gandhi and electrottype watermarks.
10. Number panel with numerals growing from small to big on top left and bottom right sides.
11. On the bottom right denomination numerals with rupee symbol in colour changing ink from green to red.
12. Ashoka pillar emblem can be seen on the right side.

For Visually Impaired Mahatma Gandhi portrait, Ashoka Pillar emblem and identification mark in raised print.

13. 500 in raised print on the right with circle.
14. On the left and right five bleed lines in raised print.

### Reverse Side

15. Printed year on the left side.
16. Logo of Swachh Bharat with slogan.
17. Language panel towards centre.
18. Red fort image with Indian flag.
19. Numeral of denomination in Devanagari on the right.

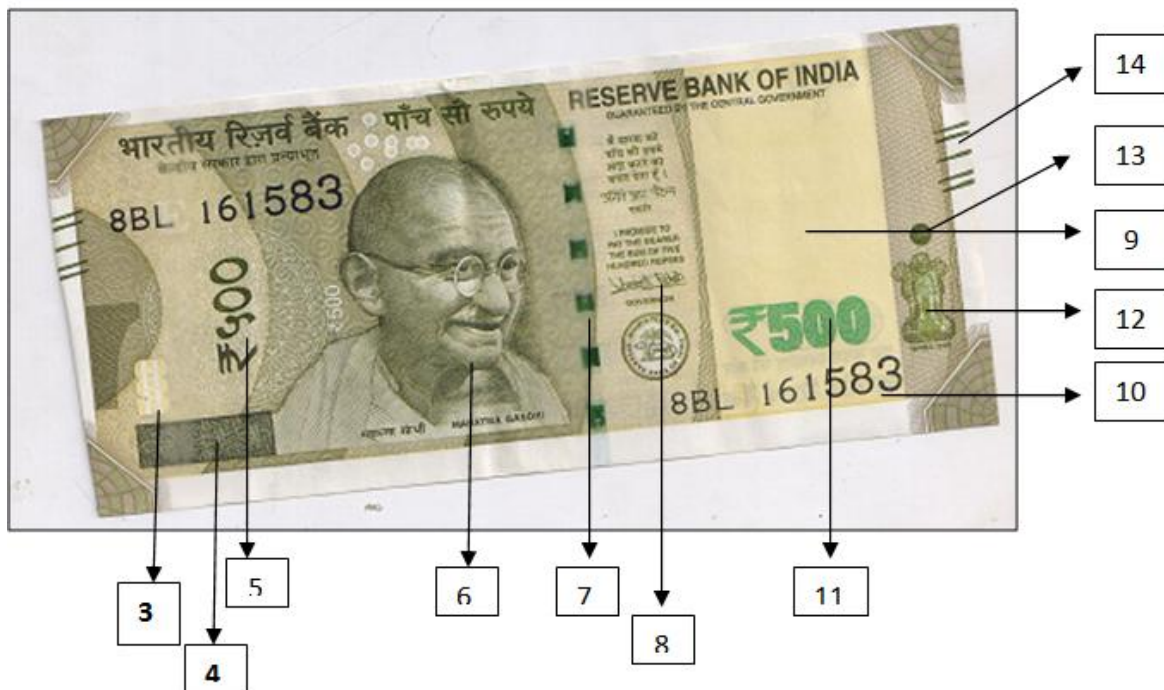

Figure 2a:- Showing identifying

**Figure 2b:-** Showing identifying features of Rs. 500 currency of front side under VSC.

### Conclusion:-

Exhibit study was done to dissect the different real elements of Indian cash of division 2000 and 500 utilizing Video Spectral comparator-40 (Freeman-Foster) to concentrate different certifiable components according to the rules of RBI. Exhibit study can be exceptionally useful in recognizing bona fide and fake Indian cash notes. The technique received is very advantageous and bona fide which can be increasingly embraced by bank authorities, security offices, cash exchangers and legal specialists. The methodology is exceedingly fitting, speedy and easy to use without much of a stretch be dissected and easily explained in report.

#### Abstract

In this paper, several methods for synchronization of chaotic systems are explained and compared. The idea is based on drive-response systems synchronization. The methods include: active control, recursive control, adaptive control, and partial linearization method which are implemented and applied to a Lorenz chaotic system. The partial linearization method is used to synchronize a subset of states of the system to synchronize other states as well. Active control and rebound control methods are used when the system parameters are known while adaptive control method is used when some of the parameters of the system are unknown. In these methods, synchronization is based on Lyapunov stability theory. Three methods, namely, adaptive, active and recursive and are implemented on a T system successfully. A new matrix method has been presented for synchronization based on the theory of Lyapunov-Krasovskiy theory and linear matrix inequality (LMI). This method has been implemented to a Rössler system with delay. Comparing to classical methods used to synchronize chaotic system the matrix method seems the best because of easy design of input, suitable for synchronization of chaotic systems with delay, simple calculations, no need to find a Lyapunov function for stability.

#### Introduction:-

Over the years, scientists have tried to invent with different methods, in order to make complex control systems stable and efficient. In this regard, one of the best methods has been proposed by scientists and Russian mathematician, Lyapunov. Lyapunov introduced a quasi-energy function model for nonlinear systems and then concluded that, if the system energy is constantly reducing, energy finally will finish and the system will be stable.

In this paper, we have investigated the synchronization of chaotic systems. Several methods for synchronization of chaotic systems, namely active control, recursive control, and adaptive control are reviewed and a special matrix method is proposed for design of chaotic system synchronization observer.

The remaining parts of this paper consist of four sections as follows: Inspection 2, an overview of the phenomenon of chaos in the systems is presented with some practical examples of chaotic systems. In section 3, the synchronization of chaotic systems is expressed. Conclusions are expressed in section 4.

**Corresponding Author:- Mohammad Arabian.**

Address:-Department of Electrical Engineering, ShahabDanesh University, Qom, Iran.

**Chaos phenomenon:-**

Chaos literally means anarchy, confusion and disorder. In chaotic systems, long-term behavior is not possible to predict. This characteristic is the result of high sensitivity of these systems to their initial condition. Chaotic behavior is not random behavior; it is deterministic.[1] But from the view of an observer unaware of the structure and function of chaotic system, the signal cannot be distinguished from a random signal using statistical tests. Since the signal can be measured only with limited precision, even if the chaotic signal generator is completely known, because of uncertainty in initial conditions, the output precision is constantly decreased[1]. Therefore, the future of signal, especially in the long-term cannot be predicted and thus, the behavior of signal seems random. Due to sensitivity to initial conditions, a small uncertainty in initial conditions will lead to huge amounts of uncertainty in long term, therefore the system is unpredictable [2]. Examples of the chaotic systems include: Burning a neon lamp, the point of incidence and magnitude of earthquakes, the trajectory of the fluid in a tube, population growth organisms, lightning in the sky, and the chain of random numbers generated by computer. [1, 2, 3]. The chaotic systems are studied in several fields of science such as mathematics, astronomy, physics, medicine, meteorology, engineering, mechanics, construction, pharmaceutical and aerospace and even in the fields of psychology, sociology, and management [2, 3].

The study of chaos has a lot of applications including:

- Ability to explain many events and natural phenomena, ability to predict disasters and avoid risks of accidents and reduce injuries
  - Control of behavior of the systems in the desired direction
  - Understanding the process leading to chaos in certain areas and under controlled conditions to achieve optimal conditions[2]
  - Developing algorithms and logic of measurement, computing, administrative and operational
  - Diagnose the cause of some irregularities, the correction of the laws of science and discovery of new laws[2]
- Due to the complex and unstable dynamics control, chaos control seems impossible but chaotic systems are capable of self-control and various control objectives are introduced as below:
- Remove chaotic behavior and sustainability point of balance
  - stabilization of unstable alternate routes (creation of sustainable Limit Cycle)
  - synchronization of two chaotic systems
  - iPod control chaos (chaos-chaotic anti-control off)
  - Control of bifurcation

**Synchronization:-**

In this paper synchronization of two chaotic systems is examined as follows. It is synchronization of changes in two systems so that they show the same behavior. For example, data transmission in telecommunication systems, both client and transmitter have access to a carrier signal for synchronization. In 1990, Pecorrat, Carroll showed that in specific circumstances two chaotic systems can become synchronized by applying error signal to systems [1]. Assume two identical copies of the dynamical system[2]

$$\dot{X} = f(x), \quad x \in \mathbb{R}^n \quad (1)$$

For example, two identical oscillators with different initial conditions. One of these systems is called drive and another one is called response.

$$\text{Drive System: } \begin{cases} \dot{Z}_d = Z(Z_d, y_d) \\ \dot{Y}_d = Z(Z_d, y_d) \end{cases} \quad (2)$$

$$\text{Response System: } \begin{cases} \dot{Z}_r = Z(Z_r, y_r) \\ \dot{Y}_r = Z(Z_r, y_r) \end{cases} \quad (3)$$

In equations (2) and (3),  $Z_d$  and  $Y_d$  are drive system's state variables and  $Z_r, y_r$  are state variables is the answer system.

Synchronization condition is defined as follows:

$$\lim_{t \rightarrow \infty} |Z_d(t) - Z_r(t)| \rightarrow 0 \quad (4)$$

$$\lim_{t \rightarrow \infty} |y_d(t) - y_r(t)| \rightarrow 0 \quad (5)$$

**Dynamic equations of error signal will be:-**

$$\begin{cases} \dot{e}_z = f_0(e_z, t) \\ \dot{e}_y = f_1(e_z, e_y, t) \end{cases} \quad (6)$$

Where  $e_z = z_d - z_r$  and  $e_y = y_d - y_r$ .

**Theorem [4]:** Suppose for every initial conditions  $z_d(0)$  and  $z_r(0)$  and  $y_d(0)$ , responses  $z_d(t)$  and  $y_d(t)$  in the interval are extremely large and equilibrium point  $e_z = 0$  in  $\dot{e}_z = f_0(e_z, t)$  is asymptotically stable in general and uniform. [3]  
 $\dot{e}_y = f_1(e_z, e_y, t)$  is stable. The purpose of synchronization is met then for any initial condition. There are other methods for synchronization, including synchronization with the passive-based, ActiveX control, recursion, adaptive control, partial linearization, and particular matrix methods. [1]

**ActiveX control Methods:-**

This method is used to synchronize two systems which are identical (T) in parameters. A system (T) in general is as follows: [5]

$$\text{T system: } \begin{cases} \dot{x} = a(y - x) \\ \dot{y} = (c - a)x - axz \\ \dot{z} = -bz + xy \end{cases} \quad (7)$$

When the coefficients  $a = 2.1$  and  $b = 0.6$  and chaotic system is  $c = 30$  is selected. Synchronization process is as follows. Consider the drive and response systems:

$$\text{Drive system: } \begin{cases} \dot{x}_1 = a(y_1 - x_1) \\ \dot{y}_1 = (c - a)x_1 - ax_1z_1 \\ \dot{z}_1 = -bz_1 + x_1y_1 \end{cases} \quad (8)$$

$$\text{Response system: } \begin{cases} \dot{x}_2 = a(y_2 - x_2) + u_1(t) \\ \dot{y}_2 = (c - a)x_2 - ax_2z_2 + u_2(t) \\ \dot{z}_2 = -bz_2 + x_2y_2 + u_3(t) \end{cases} \quad (9)$$

The error for the systems is define as:

$$e_1 = x_2 - x_1, e_2 = y_2 - y_1, e_3 = z_2 - z_1 \quad (10)$$

**The error dynamic equations are obtained as:-**

$$\begin{cases} \dot{e}_1 = a(e_2 - e_1) + u_1(t) \\ \dot{e}_2 = (c - a)e_1 - a(x_2z_2 - x_1z_1) + u_2(t) \\ \dot{e}_3 = -be_3 + x_2y_2 - x_1y_1 + u_3(t) \end{cases} \quad (11)$$

Then  $u_1$  and  $u_2$  and  $u_3$  are defined control functions for active control like below, error in the dynamic, non-linear segments are eliminated and will be only a function of  $e$ .

$$\begin{cases} u_1(t) = v_1(t) \\ u_2(t) = a(x_2z_2 - x_1z_1) + v_2(t) \\ u_3(t) = -x_2y_2 + x_1y_1 + v_3(t) \end{cases} \quad (12)$$

$$\begin{cases} \dot{e}_1 = a(e_2 - e_1) + v_1(t) \\ \dot{e}_2 = (c - a)e_1 + v_2(t) \\ \dot{e}_3 = -be_3 + v_3(t) \end{cases} \rightarrow \begin{bmatrix} \dot{e}_1 \\ \dot{e}_2 \\ \dot{e}_3 \end{bmatrix} = \begin{bmatrix} -a & a & 0 \\ c - a & 0 & 0 \\ 0 & 0 & -b \end{bmatrix} \begin{bmatrix} e_1 \\ e_2 \\ e_3 \end{bmatrix} + \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} \quad (13)$$

Now, it is sufficient to calculate the control vector  $\mathbf{v}$ , depending on the state variables so that the error is diminished. That is  $\dot{e} = -e$  the response of the equation is  $e^{-t}$ . That is the errors approach zero when  $t \rightarrow \infty$  [16]

The matrix  $A$  is chosen so that the eigenvalues of matrix  $A$  are  $-1$ .

$$\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = A \begin{bmatrix} e_1 \\ e_2 \\ e_3 \end{bmatrix} \rightarrow A = \begin{bmatrix} a - 1 & -a & 0 \\ a - c & -1 & 0 \\ 0 & 0 & b - 1 \end{bmatrix} \quad (14)$$

$$\begin{cases} \dot{e}_1 = -e_1 & e_1(t) = c_1 e^{-t} \\ \dot{e}_2 = -e_2 & e_2(t) = c_2 e^{-t} \\ \dot{e}_3 = -e_3 & e_3(t) = c_3 e^{-t} \end{cases} \quad (15)$$

**The initial values for the simulation are:-**

$$x_1(0) = 0.1, x_2(0) = 2.4, y_1(0) = -0.3, y_2(0) = -3.3, z_1(0) = 0.2, z_2(0) = 14.5$$

Figure (1) shows the changes of  $x_1$  and  $x_2$  where Figures (2) and (3) show  $y_1$  and  $y_2$  and  $z_1$  and  $z_2$  respectively. Figure (4) presents  $e_1, e_2$  and  $e_3$  versus time [7].

**Figure 1:-signals  $x_2$  and  $x_1$ .**

**Figure 2:-Signals  $y_1$  and  $y_2$**

**Figure 3:- Signals  $z_1$  and  $z_2$**

**Figure 4:-** signal  $e_1, e_2$  and  $e_3$

Synchronization by adaptive control

In particular situations, some parameters of the system are unknown. [9]

Once again there where the dynamic equations error as follows: [10]

$$\begin{cases} \dot{e}_1 = a(e_2 - e_1) + u_1(t) \\ \dot{e}_2 = (c - a)e_1 - a(x_2z_2 - x_1z_1) + u_2(t) \\ \dot{e}_3 = -be_3 + x_2y_2 - x_1y_1 + u_3(t) \end{cases} \quad (16)$$

**A positive definite Lyapunov function is defined as:-**

$$v(e_1, e_2, e_3, \tilde{a}, \tilde{b}, \tilde{c}) = \left(\frac{1}{2}\right)(e_1^2 + e_2^2 + e_3^2 + \tilde{a}^2 + \tilde{b}^2 + \tilde{c}^2) \quad (17)$$

Where  $\tilde{a} = a - a_1$ ,  $\tilde{b} = b - b_1$ ,  $\tilde{c} = c - c_1$  and  $a_1, b_1, c_1$  are the estimated values of the unknown parameters  $a, b, c$ . we assume control functions as:

$$\begin{cases} u_1(t) = -a_1(e_2 - e_1) \\ u_2(t) = -(c_1 - a_1)e_1 + a_1(x_2z_2 - x_1z_1) \\ u_3(t) = (b_1 - 1)e_3 - x_2y_2 - x_1y_1 \end{cases} \quad (18)$$

**The updating rules Are:-**

$$\begin{cases} \dot{a}_1 = -e_1^2 - e_2(x_2z_2 - x_1z_1) \\ \dot{b}_1 = -e_3^2 \\ \dot{c}_1 = e_1e_2 \end{cases} \quad (19)$$

**Then, the derivative of the Function v:-**

$$v(e_1, e_2, e_3, \tilde{a}, \tilde{b}, \tilde{c}) = e_1^2 - e_1^2 - e_1^2 < 0 \quad (20)$$

The signals  $x_2$  and  $y_2$  and  $z_2$  are from response system, while  $x_1$  and  $y_1$  and  $z_1$  are synchronized drive system variables. [10]

**The initial values for the simulation are as follows:-**

$$x_1(0) = 0.1, x_2(0) = 2.4, y_1(0) = -0.3, y_2(0) = -3.3, z_1(0) = 0.2, z_2(0) = 14.5, a_1(0) = b_1(0) = c_1(0) = 0.1$$

Figure (5) shows  $x_1 - x_2$ , Figure (6) shows  $y_1 - y_2$ , Figure (7) shows  $z_1 - z_2$ , and Figure (8) shows  $e_1$  and  $e_2$  and  $e_3$  versus time.

**Figure 5:-** .for  $x_1 - x_2$ **Figure 6:-** . $y_1 - y_2$ **Figure 7:-** . $z_1 - z_2$

Figure 8:-  $e_1, e_2$  and  $e_3$ **Synchronization by backstopping:-**

This method is efficient for up to two parameters in the design of the system (T) [11]. The dynamical equation of system error is:

$$\begin{cases} \dot{e}_1 = a(e_2 - e_1) + u_1(t) \\ \dot{e}_2 = (c - a)e_1 - a(e_1 e_3 + x_1 e_3 + e_1 z_1) + u_2(t) \\ \dot{e}_3 = -be_3 + e_1 e_2 + e_1 y_1 + e_2 x_1 + u_3(t) \end{cases} \quad (21)$$

There are three stages in backstopping, in the first step we define  $z_1 = e_1$ , then:

$$\dot{z}_1 = a e_2 - a z_1 + u_1(t) \quad (22)$$

Considering  $e_2 = \alpha_1(z_1)$  as a virtual controller. where  $\alpha_1(z_1)$  is designed to stabilize the  $z_1$  in (22), Then  $v_1$  is chosen as a Lyapunov function:

$$v_1 = \frac{z_1^2}{2} \quad (23)$$

$$\dot{v}_1 = z_1 \dot{z}_1 = -a z_1^2 + a z_1 \alpha_1 + u_1(t) z_1 \quad (24)$$

If  $u_1(t) = 0$  and  $\alpha_1 = z_1 - \frac{z_1}{a}$  then  $\dot{v}_1$  will be negative.

$\alpha_1(z_1)$  is a virtual control function.  $z_2$  is defined as:

$$z_2 = e_2 - \alpha_1 \quad (25)$$

$$\begin{cases} \dot{z}_1 = a z_2 - z_1 \\ \dot{z}_2 = (c - a) z_1 - a(z_1 e_3 + x_1 e_3 + z_1^2) - \left(1 - \frac{1}{a}\right) (a z_2 - z_1) + u_2(t) \end{cases} \quad (26)$$

In the next step, the second Lyapunov function is defined:

$$v_2 = v_1 + \frac{z_2^2}{2} \quad (27)$$

The derivation to of  $v_2$  will be:

$$\dot{v}_2 = -z_1^2 - z_2^2 < 0 \quad (28)$$

The functions are chosen as  $\alpha_2(z_1, z_2) = 0$  and  $u_2 = -z_2 - c z_1 + a z_1^2 + \left(1 - \frac{1}{a}\right) (a z_2 - z_1)$  then:

$$\begin{cases} \dot{z}_1 = a z_2 - z_1 \\ \dot{z}_2 = -a z_1 - z_2 - a(z_1 + x_1) z_3 \\ \dot{z}_3 = -b z_3 + z_1 y_1 + (z_1 + x_1) \left(z_2 + z_1 - \frac{z_1}{a}\right) + u_3(t) \end{cases} \quad (29)$$

To third Lyapunov function is  $v_3$ :

$$v_3 = v_2 + \frac{z_3^2}{2} \quad (30)$$

The derivative of  $v_3$  will be:

$$\dot{v}_3 = -z_1^2 - z_2^2 - a(z_1 + x_1)z_2z_3 + z_3m \quad (31)$$

Where

$$m = \left[ -bz_3 + z_1y_1 + (z_1 + x_1) \left( z_2 + z_1 + \frac{z_1}{a} \right) + u_3(t) \right] \quad (32)$$

If  $u_3(t) = (b-a)z_3 - z_1y_1 + (z_1 + x_1) \left( (a+1)z_2 + z_1 - \frac{z_1}{a} \right)$  and  $\alpha_2 = 0$ , then  $\dot{v}_3 < 0$  hence the equilibrium point  $(0,0,0)$  is asymptotically stable. By taking  $z_1 = e_1$ ,  $z_2 = e_2 - \alpha_1$ ,  $z_3 = e_3 - \alpha_2(z_1, z_2)$  it is observed that  $e_1$ ,  $e_2$  and  $e_3$  asymptotically approach zero, that means the synchronization between the systems. The initial values for the simulation are as follows:

$$x_1(0) = 0.1, x_2(0) = 2.4, y_1(0) = -0.3, y_2(0) = -3.3, z_1(0) = 0.2, z_2(0) = 14.5$$

Figures (9) to (12) show the variables  $x_1$ - $x_2$ ,  $y_1$ - $y_2$ ,  $z_1$ - $z_2$  and errors  $e_1$ ,  $e_2$  and  $e_3$  respectively [6,7,11].

Figure 9:-  $x_1$ -  $x_2$

Figure 10:-  $y_1$  -  $y_2$

Figure 11:-  $z_1-z_2$ Figure 12:- errors  $e_1$  and  $e_2$  and  $e_3$ **Synchronization using the particular matrix:-**

This method assumes unknown delay [14]. The equations are as follows for drive and response systems:

$$\begin{cases} \dot{x}_1(t) = -x_1(t) - x_2(t) + a_1[x_1(t - \tau_1)] + a_2[x_2(t - \tau_2)] \\ \dot{x}_2(t) = x_1(t) + \beta_1 x_2(t) \\ \dot{x}_3(t) = (x_1(t) - \gamma)x_3(t) + x_1(t)x_3(t) + \beta_2 \end{cases} \quad (33)$$

$$\begin{cases} \dot{y}_1(t) = -y_1(t) - y_2(t) + a_1[y_1(t - \tau_1)] + a_2[y_2(t - \tau_2)] - u_1(t) \\ \dot{y}_2(t) = y_1(t) + \beta_1 y_2(t) - u_2(t) \\ \dot{y}_3(t) = (y_1(t) - \gamma)y_3(t) + y_1(t)x_3(t) - \beta_2 u_3(t) \end{cases} \quad (34)$$

The equations in the form of a matrix can be written as follows:-

$$\begin{bmatrix} \dot{x}_1(t) \\ \dot{x}_2(t) \\ \dot{x}_3(t) \end{bmatrix} = \begin{bmatrix} 0 & -1 & -1 \\ 1 & \beta_1 & 0 \\ x_3 & 0 & x_1(t) - \gamma \end{bmatrix} \begin{bmatrix} x_1(t) \\ x_2(t) \\ x_3(t) \end{bmatrix} + \begin{bmatrix} a_1 & a_2 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1(t - \tau_1) \\ x_2(t - \tau_2) \\ x_3(t - \tau_2) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ \beta_2 \end{bmatrix} \quad (35)$$

$$\begin{bmatrix} \dot{y}_1(t) \\ \dot{y}_2(t) \\ \dot{y}_3(t) \end{bmatrix} = \begin{bmatrix} 0 & -1 & -1 \\ 1 & \beta_1 & 0 \\ y_3(t) & 0 & y_1(t) - \gamma \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} + \begin{bmatrix} a_1 & a_2 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} y_1(t - \tau_1) \\ y_2(t - \tau_2) \\ y_3(t - \tau_2) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ \beta_2 \end{bmatrix} - \begin{bmatrix} u_1(t) \\ u_2(t) \\ u_3(t) \end{bmatrix} \quad (36)$$

The values  $\tau_1$ ,  $\tau_2$  and  $\tau_3$  are delay parameters of the system.

According to data provided by the design of the control input Theorem 1 in [13], obtained control values as follows:-

$$u(t) = \begin{bmatrix} \zeta_1 & 0 & -1 + x_3(t) \\ 0 & \zeta_2 & 0 \\ 0 & 0 & \zeta_3 \end{bmatrix} \begin{bmatrix} e_1(t) \\ e_2(t) \\ e_3(t) \end{bmatrix} \quad (37)$$

The system error equation is obtained as follows:-

$$\begin{bmatrix} \dot{e}_1(t) \\ \dot{e}_2(t) \\ \dot{e}_3(t) \end{bmatrix} = \begin{bmatrix} \zeta_1 & -1 & -x_3(t) \\ 1 & \beta_1 - \zeta_2 & 0 \\ x_3(t) & 0 & y_1(t) - \zeta_3 - \gamma \end{bmatrix} \begin{bmatrix} e_1(t) \\ e_2(t) \\ e_3(t) \end{bmatrix} + \begin{bmatrix} a_1 & a_2 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} e_1(t - \tau_1) \\ e_2(t - \tau_2) \\ e_3(t - \tau_2) \end{bmatrix} \quad (38)$$

According to Theorem 1 in [14] system error dynamic equations for asymptotic stability will be making the following conditions.

$$\begin{cases} -\zeta_1 + 2|a_1| + |a_2| < 0 \\ \beta_1 - \zeta_2 + |a_2| < 0 \\ y_1(t) - \gamma - \zeta_3 < 0 \end{cases} \quad (39)$$

The initial values for the simulation are as follows:-

$$a_1 = 0.2, a_2 = 0.5, \beta_1 = 0.2, \beta_2 = 0.2, \gamma = 5.7, \tau_1 = 0.2, \tau_2 = 0.1, \zeta_1 = 1, \zeta_2 = 1, \zeta_3 = y_1(t) \\ [x_1(0) \ x_2(0) \ x_3(0)] = [-2 \ -4 \ 10], [y_1(0) \ y_2(0) \ y_3(0)] = [1 \ 2 \ 1]$$

Figures (13) to (16) show  $x_1$ -  $y_1$ ,  $x_2$ -  $y_2$ ,  $x_3$ -  $y_3$  and error  $e_1, e_2$  and  $e_3$  respectively [15].

Figure 13:-  $x_1$ -  $y_1$

Figure 14:-  $x_2$ -  $y_2$

Figure 15:- $x_3$ -  $y_3$ Figure 16:- errors  $e_1$  and  $e_2$  and  $e_3$ **linear method Details:-**

In this method, the synchronization of one state concludes synchronization of all other states. Integrated system is considered with the following equations:

$$\begin{cases} \dot{x}_1 = (25\theta + 10)(y_1 - x_1) \\ \dot{y}_1 = (28 - 35\theta)x_1 - x_1z_1 + (29\theta - 1)y_1 \\ \dot{z}_1 = x_1y_1 - \frac{8+\theta}{3}z_1 \end{cases} \quad (40)$$

The system will be up for  $\theta = 0$ ,  $\theta = 0.8$  and  $\theta = 1$ , respectively Lorenz chaotic system, Lu and Chen.

Considering the equation (40) as the actuator and the equation (41) as the system's response:

$$\begin{cases} \dot{x}_2 = (25\theta + 10)(y_2 - x_2) \\ \dot{y}_2 = (28 - 35\theta)x_2 - x_2z_2 + (29\theta - 1)y_2 + u \\ \dot{z}_2 = x_2y_2 - \frac{8+\theta}{3}z_2 \end{cases} \quad (41)$$

The error for the system is defined:

$$e_1 = x_2 - x_1, e_2 = y_2 - y_1, e_3 = z_2 - z_1 \quad (42)$$

Error dynamic equations will be obtained as follows:

$$\begin{cases} \dot{e}_1 = (25\theta + 10)(e_2 - e_1) \\ \dot{e}_2 = (28 - 35\theta)e_1 + (29\theta - 1)e_2 - e_1e_3 - z_1e_1 - x_1e_3 + u \\ \dot{e}_3 = e_1e_2 + x_1e_2 + y_1e_1 - \frac{8+\theta}{3}e_3 \end{cases} \quad (43)$$

So that the control vector  $u$  we is chosen as a linear Relationship:-

$$u = (35\theta - 28)e_1 - 29\theta e_2 + e_1 e_3 + z_1 e_1 + x_1 e_3 \quad (44)$$

$$\dot{e}_2 = e_2 \quad (45)$$

According to Theorem 1 in [13]. Implementation wishes to simulate this technique to the Lorenz system as follows:-

$$\begin{cases} \dot{e}_1 = 10(e_2 - e_1) \\ \dot{e}_2 = 28e_1 - 1e_2 - e_1 e_3 - z_1 e_1 - x_1 e_3 + u \\ \dot{e}_3 = e_1 e_2 + x_1 e_2 + y_1 e_1 - \frac{8}{3}e_3 \end{cases} \quad (46)$$

$$u = -28e_1 + e_1 e_3 + z_1 e_1 + x_1 e_3 \quad (47)$$

The initial values for the simulation are as Follows:-

$$\begin{aligned} [x_1(0) \quad y_1(0) \quad z_1(0)] &= [10 \quad 10 \quad 10] \\ [e_1(0) \quad e_2(0) \quad e_3(0)] &= [-5 \quad -10 \quad 10] \end{aligned}$$

Figure (17) to (20) show  $x_1 - x_2$ ,  $y_1 - y_2$ ,  $z_1 - z_2$  and errors  $e_1$ ,  $e_2$  and  $e_3$  respectively [15].

Figure 17:- for  $x_1 - x_2$

Figure 19:- $z_1-z_2$ Figure 20:- errors  $e_1$  and  $e_2$  and  $e_3$ 

### Conclusion:-

In this paper we dealt with the history of chaos, chaos theory and synchronization of chaotic systems. Synchronization methods used in this paper are Active control, backstopping control, adaptive control, partial linearization matrix method, which is based on synchronization systems with a delay. All these methods are based on Lyapunov theory.

SIMULINK environment of MATLAB software has been utilized for simulation of synchronization of chaos systems. The methods designed for easy synchronization of chaotic systems introduce suitable methods for synchronization of delayed chaotic systems, with simple calculations, and no need to calculations of Lyapunov function for stability in contrast to the classical methods.

#### Abstract

The field of pharmacovigilance (or drug safety surveillance) has evolved significantly over the last few years. Important utility of pharmacovigilance is detection and dissemination of signal. It has power to prevent the epidemics of serious adverse drug reaction before damage to community. The historical medical calamities (e.g. thalidomide tragedy) could have been prevented if process like signal detection and pharmacovigilance would have been practiced since that time. Post-marketing detection and surveillance of potential safety hazards are crucial tasks in pharmacovigilance. To disclose such safety risks, a wide set of techniques has been developed for spontaneous reporting data and, more recently, for longitudinal data. This paper gives a broad overview of the signal detection process and introduces some types of data sources mostly used.

#### Introduction:

All drugs are capable of producing side effect or adverse effect. Benefit risk profile of drug is made before releasing drug into the market and on the basis of this profile it is decided whether to use or not to use drug in patient. All adverse effects are not disclosed during clinical trials as there are some limitations like limited number of patients, subjects having single disease, specific population (children, elderly and pregnant women being excluded), small sample size (detection of rare adverse effect is difficult), shorter duration of a trial (limits the detection of long term adverse effects), inability to detect ADRs under real life situations (drug interaction, drug food interactions etc.). These drawbacks are overcome by post marketing surveillance. Pharmacovigilance is mainly the phase 4 of the clinical trials.<sup>1</sup> The thalidomide tragedy marked a turning point in toxicity testing, as it prompted United States and international regulatory agencies to develop systematic toxicity testing protocols and give rise to a development of a system for early detection of unknown adverse events of medicines.<sup>2</sup> The World Health Organization (WHO) defines Pharmacovigilance as a science related to the detection, assessment, understanding and prevention of adverse reactions towards a medicinal product or any other medicine related problems in human beings.<sup>3</sup> The main aim of pharmacovigilance is continuous review of all reported drug-drug related events which are serious or unexpected.<sup>4</sup> In accordance with data of European Commission (EC), adverse drug reaction (ADRs) are responsible for 5% of all hospital admissions, 5% of all patients in hospital experience an ADR and lastly ADRs cause minimum of 1.91 extra days of hospitalization. In United States (US), more than 100,000 deaths annually are because of ADRs. Hence, this scenario itself makes clear the importance of pharmacovigilance (PV).<sup>5</sup> Pharmacovigilance – an umbrella term used to describe the processes for monitoring and evaluating ADRs – is a key component of effective drug regulation systems, clinical practice and public health programmes.<sup>6</sup>

**What is safety signal?**

One of the most important activities of pharmacovigilance is signal detection. Taken together, adverse drug reactions (ADRs) impose an enormous burden on society, causing hundreds of thousands of deaths annually at a cost of several billion \$US.<sup>7,8</sup> A signal in pharmacovigilance is not only a statistical association. It consists of a hypothesis together with data and arguments, which may be in favour or against these arguments. These relate to numbers of cases, statistics, clinical medicine, pharmacology (kinetics, actions, previous knowledge) and epidemiology, and may also refer to findings with an experimental character. Council for International Organizations of Medical Sciences (CIOMS), defines a safety signal as “information that arises from one or multiple sources (including observations or experiments), which suggests a new, potentially causal association, or a new aspect of a known association between an intervention [e.g., administration of a medicine] and an event or set of related events, either adverse or beneficial, that is judged to be of sufficient likelihood to justify verificatory action.” The information must be suggestive of something new so that after further investigation it can suggest that the association may or may not be confirmed. An example of a “new aspect of a known association” would be refinement of an existing safety signal by identifying subgroups of individuals who may be at greater risk. It can be explained by an example. An oncology drug associated with a characteristic cardiomyopathy identified by small number of spontaneous reports. To gather more information ongoing surveillance initiated which gives the information that risk is especially high in pediatric patients or patient’s previously treated with radiation to the chest region.<sup>9</sup> A signal in pharmacovigilance is more than just a statistical association. It consists of a hypothesis together with data and arguments, arguments in favor and against the hypothesis. These relate to numbers of cases, statistics, clinical medicine, pharmacology (kinetics, actions, previous knowledge) and epidemiology, and may also refer to findings with an experimental character.<sup>10</sup> In simple terms we can say signal is an important navigator of the consequences of the medicinal products. Signal not always be a safety concern sometimes it could be a probable beneficial effect of drug.

**Need for signal detection:**

- Provide early warning for new serious adverse events of new drugs. The detection of a previously unknown safety issue can have great impact on the overall benefit–risk balance of a drug as evidenced for example by the market withdrawal of Rofecoxib upon the detection of its increased myocardial infarction risk.
- To update the risk management system and monitor pharmacovigilance data to determine whether there are new risks or whether risks have changed or whether there are changes to the benefit-risk balance of medicinal products and then reduces risks of costly failures by early detection of ADRs.
- It is a regulatory requirement for all Marketing Authorization Holders.
- Regulatory actions

**Signal management process:**

The signal management process can be defined as the set of activities performed to determine whether, based on an examination of individual case safety reports (ICSRs), aggregated data from active surveillance systems or studies, literature information or other data sources, there are new risks associated with an active substance or a medicinal product or whether risks have changed.<sup>10</sup>

The steps involved in this process are signal detection, signal validation, signal prioritization, signal assessment and recommendation for action.

**Signal detection:**

Signal detection is a process of identifying a signal from different data sources.

**Potential Sources of Data for Signal Management<sup>11</sup>**

- Regulatory Authority reports (e.g. Anonymised Single Patient Reports)
- Clinical Trials Serious adverse events
- Post-marketing reports (to MAH)
- clinical trials, post-authorization studies, registries, post-authorization named-patient use programmes, other patient support and disease management programmes, surveys of patients or healthcare providers
- Medical and scientific literature
- Non-interventional studies e.g. marketing projects
- Post-authorization safety studies
- Medical and scientific literature

- Product quality complaints associated with adverse events
- Medical enquiries
- Periodic Safety Update Reports (PSURs)
- Regulatory databases (e.g FDA AERS, MHRA drug analysis prints [DAPs] / product analysis prints [PAPs])
- Other databases (e.g WHO Vigibase)

**Databases that can be used for signal detection in post-authorization drug safety surveillance:<sup>12</sup>**

- Yellow Card scheme in the UK
- Eudravigilance (EMA)
- Adverse Event Reporting System (AERS /FAERS) used by the Food and Drug Administration (FDA) in the USA,
- World Health Organization (WHO) International Database maintained at Uppsala Monitoring Center (UMC) in Uppsala, Sweden.
- Italian spontaneous reporting database
- Dutch spontaneous reporting to the Lareb PV centre in the Netherlands
- Drug Safety Research Unit (UK)
- Intensive Medicines Monitoring Program (New Zealand)
- Other programmes:
- Vaccine Safety Datalink (VSD)
- Sentinel Initiative
- Observational Medical Outcomes Partnership (OMOP)
- IMI-PROTECT Project

**Methods for signal Detection:**

**Traditional method:** This method also known as qualitative method and involve review of ICSRs. This method is generally applies when data set is small.

**Data mining techniques:** This method is also known as quantitative method. It is generally based on statistical analysis. These methods are usually applied to a broad range of combinations of drug exposures and subsequent adverse events, often without limiting the search to pre-defined drug classes or specific medical conditions. They can be regarded as a broad search over the whole spectrum of drug-event combinations (DECs) in the underlying dataset.<sup>13</sup>

**Surveillance method:** Surveillance techniques have been developed to consolidate knowledge on these already suspected DECs and are often applied after the first data-mining step.<sup>14</sup>

**Statistical methods:<sup>14</sup>****Bayesian approach.**

- Multi-item Gamma Poisson Shrinker (MGPS)
- Bayesian Confidence Propagation Neural network

**Frequentist Approach:**

- Reporting Odds Ratio (ROR)
- Proportional Reporting Ratio (PRR)

Frequentist or classical methods are particularly appealing and therefore widely used due to the fact that they are relatively easy to understand, interpret and compute as they are based on the same principles of calculation using the 2x2 table. (Table 1)

**Table 1:-** Formal 2x2 contingency table

	Drug of interest	All other drug in the database	Total
Adverse drug reaction of interest	A	B	A+B
All other adverse drug reaction	C	D	C+D
Total	A+C	B+D	A+B+C+D

A= number of reports containing both the suspect drug and the suspect adverse drug reaction

B= number of reports containing the suspect adverse drug reaction with other medications (except the drug of interest)

C= number of reports containing the suspect drug with other adverse drug reactions (except the event of interest)

D= number of reports containing other medications and other adverse drug reactions

### Signal Validation:<sup>15</sup>

Signal validation is the process of evaluating the data supporting the detected signal in order to verify that the available documentation contains sufficient evidence demonstrating the existence of a new potentially causal association or a new aspect of a known association, and therefore justifies further analysis.

Following factors are considered during validation of signal:

- Clinical relevance including: strength of evidence for a causal effect (e.g. number of reports, exposure, temporal association, plausible mechanism, de/re-challenge, alternative explanation/confounders), seriousness and severity of the reaction and its outcome, novelty of the reaction (e.g. new and serious adverse reactions); drug-drug interactions; reactions occurring in special populations.
- Previous awareness: the extent to which information is already included in the summary of product characteristics (SmPC) or patient leaflet; whether the association has already been assessed in a PSUR or RMP, or was discussed at the level of a scientific committee or has been subject to a regulatory procedure.

### Signal Prioritization:<sup>15</sup>

#### Two methods for signal Prioritization:

##### WHO-Triage:

The aim of this adjudication process is the identification of those signals that are likely to indicate a yet-unidentified safety hazard, and the elimination of false-positives from the results (are already known and well documented; (b) occur very seldom or (c) are highly implausible from a medical perspective and thus can be regarded as artificial false-positive signals.).

After having reduced the number of potential signals by mere technical restrictions, the remainders need to be assessed on a qualitative level. A common step is to exclude—automatically if possible—all known and well-documented risks and to focus on the unknown or unexpected identified signals. The exact layout of this part of the triage highly depends on a number of factors, including the underlying data structure, the signal detection method used and personnel resources, as in-depth medical and pharmacological knowledge is necessary.

Once the triage is completed, the safety risk of every remaining signal needs to be rated to decide whether (a) impact analyses and subsequent confirmatory analyses need to be induced; (b) the signal should be monitored to sharpen the risk profile or (c) the signal can be discarded because of low potential risk.

### MHRA-Impact analysis:<sup>16</sup>

A new method of prioritizing signals of potential adverse drug reactions (ADRs) detected from spontaneous reports that is called impact analysis. This is an interim step between signal detection and detailed signal evaluation. Using mathematical screening tools, large numbers of signals may now be detected from spontaneous ADR databases. Regulatory authorities need to rapidly priorities them and focus on those that are most likely to require significant action. Using two scores ranging from 1 to 100, each with three input variables, signals may be categorized in terms of the strength of evidence (E) and the potential public health impact (P). In a two-by-two figure with empirically derived cut-off points of ten (the logarithmic mean) for each score, signals are placed in one of four categories (A-D) that are ranked according to their priority (A being the highest and D the lowest). A sensitivity analysis is then performed that tests the robustness of the categorization in relation to each of the six input variables.

**Signal Assessment:**<sup>14</sup>

The assessment of signals is done in terms of various factors. First, the data in the report(s) need to be of good quality when a signal of a new adverse drug reaction is considered. There should be sufficient data to fully assess the relationship of the drug to the event.

The subjective assessment of the quality of the reports is mainly based on the patient and drug information. Patient information includes completeness of information with- patient initials, age, sex, date of birth (DOB), weight, diagnosis for which the medications were being taken, relevant history, adverse event description, adequate description of the event, when did the event occur? When did the event subside? How the event was managed? What was the outcome? Whether the event abated on stopping the drug or reducing the dose of the drug? Whether the event reappeared on reintroduction? Any supportive laboratory data? Drug information includes suspected medication with their brand name and/or generic name, labeled strength, manufacture, dose used, frequency of use, route used and therapy dates, concomitant medications including self medication and herbal remedies etc.

**Cause and Effect Analysis:**

The most commonly used methods are WHO-UMC causality categories and Naranjo's Probability Scale.

This method gives guidance to the general arguments which should be used to select one category over another as shown in Table 2.

**Table 2:- WHO-UMC causality categories**<sup>17</sup>

Categories	Time sequence	Other drug/Disease ruled out	Dechallenge	Rechallenge
Certain	Yes	Yes	Yes	Yes
Probable	Yes	Yes	Yes	No
Possible	Yes	No	No	No
Unlikely	No	No	No	No

**Naranjo's Probability Scale:**<sup>17</sup>

Naranjo's probability scale is the most commonly used causality assessment method, which has gained popularity among clinicians because of its simplicity. It is a structured, transparent, consistent and easy to apply assessment method. The Naranjo's criteria classifies the probability that an adverse event is related to the drug therapy based on a list of weighted questions, which examine factors such as the temporal association of drug administration and event occurrence, alternative causes for the event, drug levels, dose – response relationships and previous patient experience with the medication. The ADR is assigned to a probability category from the total score as follows: definite if the overall score is 9 or greater, probable for a score of 5-8, possible for 1-4 and doubtful if the score is 0.

Drugs are evaluated individually for causality, and points are deducted if another factor may have resulted in the adverse event, thereby weakening the causal association.<sup>18</sup>

**Recommendation for action:**<sup>15</sup>

The recommendation for action may include a request for:

- Immediate measures including the possibility of suspending the marketing authorization of the medicinal product;
- Additional information to be provided by the marketing authorization holder, e.g. in order to confirm if a conclusion is valid for all indications and patient groups;
- Periodic review of the signal, for example through PSURs
- Additional investigations or risk minimization activities;
- An update of the product information through a regulatory procedure;
- Conduct of a post-authorization safety study

**Conclusion:**

Pharmacovigilance is not only restricted to collecting the ADR data but also to extract the signal to prevent the investible medical disaster and harm to patients. The proper signal detection and their assessment is the most important aspect in pharmacovigilance. Various methods are used for the detection of signals. Signals in

pharmacovigilance have a variety of sources. Pharmacovigilance may not rely upon one single method, but needs a strategy of complementary activities. Further development of statistical methods and technological solutions to analyze large amounts of data to detect signals for potential safety issues, while minimizing noise, would enhance the efficiency and effectiveness of pharmacovigilance activities.

#### Abstract

The present work describes a website designed for remote teaching, it enables the students to view the lessons and also test themselves after each lesson they view, they can get benefit from the useful articles uploaded to the page also can ask question and get answers. Distance learning is beneficial for eliminating time and money spent related to student travel and allowed Outreach College students access to adept instructors regardless of physical locale.

#### Introduction:-

A dramatic increase in the development of technology-based teaching and learning has been witnessed in the past decade. Many universities and corporations started rethinking the design and implementation of the learning systems [1]. To take advantage from the emergence of the Internet, it provides an inexpensive and flexible infrastructure that can greatly enhance the communication among distance learning system and students. The rapidly increasing expansion of the Internet has brought dramatic impact to one's life and education alike. Distance learning differentiates from the traditional learning in its ability to train anyone, anytime, and anywhere attributed to the openness of the Internet. Without the temporal and spatial limitation, one can have an independent and individual learning space.

Recent advances in the Web have rapidly changed our life in various ways. These advances provide new ways for people to communicate on a global scale and assess vast amounts of information. The Web provides educators with opportunities to implement a range of new teaching and learning practices, which redefine classroom- learning experiences. The Web enables a so-called WBI (Web-Based Instruction) system as a teaching aid. The WBI system, which integrates a hypertext information network with communication and collaborative tools, presents two important innovative features: first, it provides specific tools to manipulate the multimedia information contents of the Web pages; second, authorized users can modify the information network in the system [2],[3],[4]. In the end, education projects are developed because of the learner. Projects are developed because we want participants to gain specific knowledge and skills. Education projects are developed to promote public safety and the development of environmental and scientific literacy.

Each student has different cognitive abilities [5]. In [6]; [7]; [8]; [9]; [10] those problems can be overcome with the use of adaptive learning system. Many studies have been conducted on adaptive learning. Among them, studies that provide the most universal method of adaptability offer courseware by considering learner styles [11]; [12]; [13]; [14]; [15]; [16]; [17]. However, there are also theories that assert that a learning strategy created according to either a task or content is much more effective than the learning style [18]; [19]; [20]. It is thus necessary to provide adaptability according to the learning content along with the learning style [21].

**Corresponding Author:- Asst. Lec. Asan Baker Kanbar.**

Address:- Department of Computer Science, Cihan University Sulaimaniya Campus, Sulaimaniya, Iraq

Careful attention to the design and implementation of an education project will be reflected in learner outcomes [22]. As a result of rapid improvements in both computer and Internet technologies, features and functions of e-learning systems have been improved. It has also become easier to access online lesson content and interactive, electronic applications or tools from any-where, at anytime. At this point, internet and the related technologies have an important role to play in all of these improvements and changes [23]

## Methods And Techniques:-

### Design Structure of the Educational Web Page:-

In this project the educational website designed using ASP.NET. ASP.NET (Active Server Page) is an open source web framework for building modern web applications and services [24]. With ASP.NET you can quickly create web sites based on HTML, CSS and JavaScript etc., scale them to millions of users and easily add more complex capabilities like Web APIs, forms over data or real time communications [25]. In this project the web page system corresponds to web interfaces and tools that are included in the system and provided to administrators, teachers, or student according to their role in connection with the system. There are three different types of user: administrators, students, and teachers. In order to log into the system, all of these users must make their registrations and type their usernames and passwords on the login page of the system. In order to save information the database very important for the web page here we used SQL server. Database contains administrators, teachers and students information and also consists of all materials related to education in addition to dates and results of quizzes and exams which the students submitted.

### Role of Each Group:-

As we mentioned before three kinds of user groups will use this website, administrator, teachers, and student. The administrator the only user who can view and control the overall the page as well as can make changes for example add or remove lessons delete unwanted contacts and also control the blog and give permission to view or not view the messages.

The teachers can view the students progress reports these reports contain the information of the lessons the students had viewed and can see how long they viewed the lessons, teachers also can view the quiz results that the students had submit.

The users under the student category can make their registration and view the lessons submit to quizzes and exams and also can view the results of all the quizzes that they had.

There will be a communication among these groups by sending mail messages to each other by this way the students can ask questions and get answers besides there is a discussion forum where the users can discuss any case about the subjects and lessons so that they can get benefit and knowledge from each other's experience.

### Database Tables Design:-

A database is a collection of information that is organized so that it can easily be accessed, managed, and updated [26]. This educational web based system registration, member's information, lessons, quiz and exams marks, useful documents and other effective tables have been created, the design and the use of these tables explained as follow:

### Lessons Table:-

This table contains the lesson name and a brief explanation of the subject so that if the student wanted to watch the lesson is going to just click on the lesson names that have been choose.

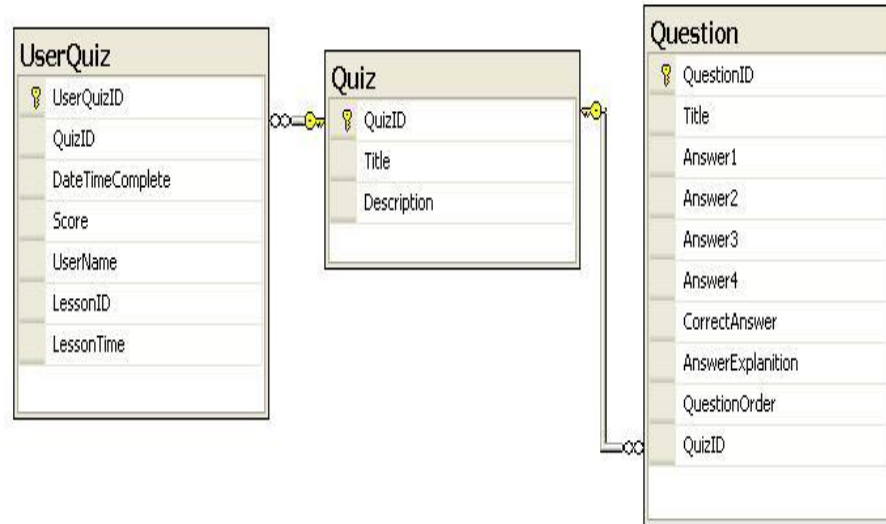

Lesson	
	LessonID
	Title
	Description

Fig.1:- Lesson Table

**Questions ,Quiz, and User Quiz Tables:-**

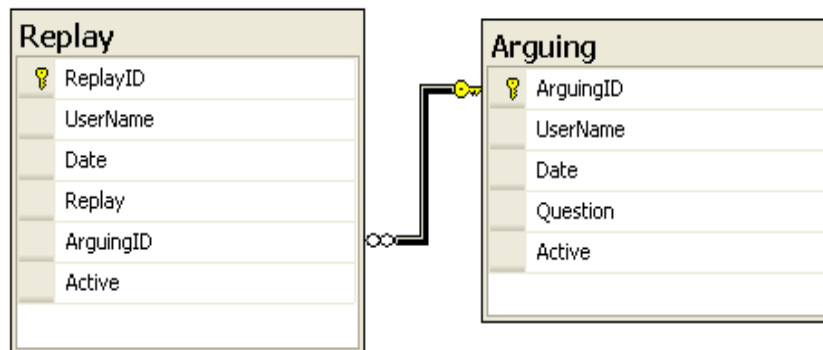

The students whom watching the lessons their performance and success evaluation is required for this purpose some exams and tests performed to serve this case, and all these data saves in the database as well as the information concerning the exam questions and answers and also the date that submitted is saved in these tables.

**Fig.2:-** Questions ,quiz, and UseQuiz tables

**Forum Tables:-**

This section contains two groups of tables. Arguing and replying table, these tables register all information about the questions, Answers, the name of the person who asked or answered the question and their date. The forum section is controlled by the administrator all questions and answers in any discussion waits for confirmation from the administrator of the page, the administrator will put 1 to activate or 0 to discard any unwanted question or answer, the table is shown in fig.3

**Fig.3:-** Arguing and Reply Tables

**Announcement Table:-**

In this table the announcement and it's date is saved, also this table is controlled by the administrator who can show the announcement by making the active field 1 or to hide the announcement by making it 0 . This table shown in Fig.5

Announcement	
	ID

**The Dataflow Diagram of The Designed Website:-****Login Page Dataflow Diagram:-**

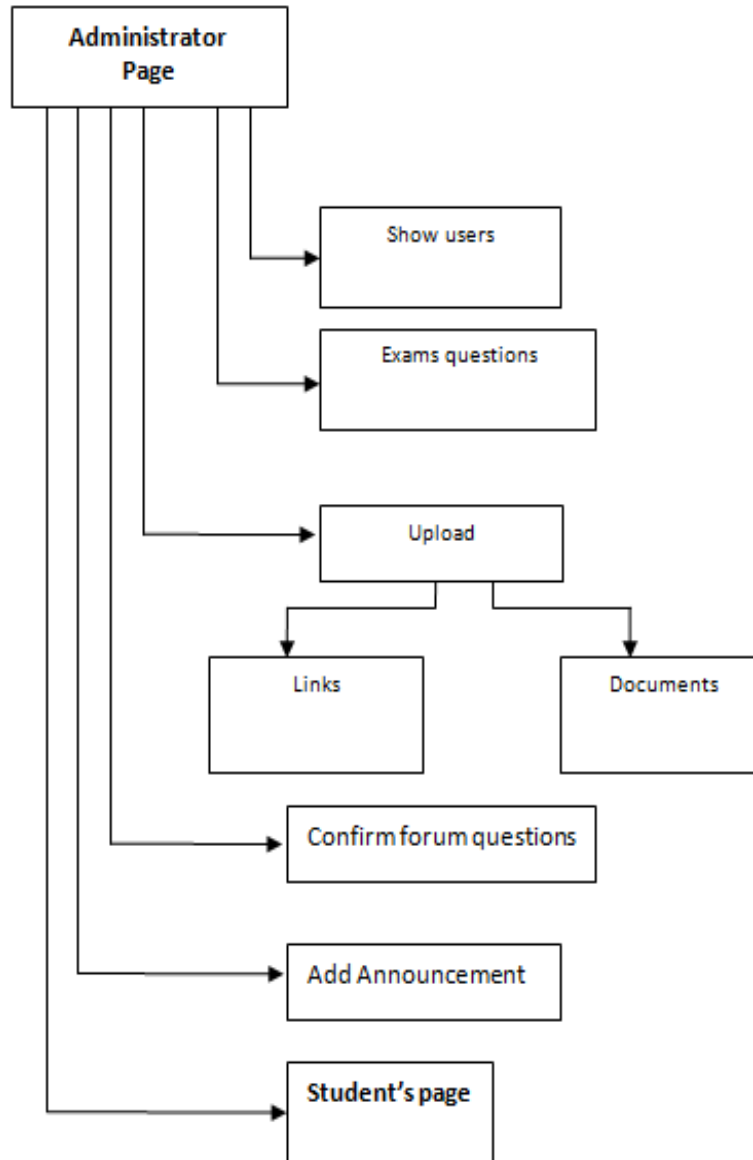

Any use wants to use this web page must register first, if the user was administrator so the website will show the administrator page, for the students the student page will be shown. Fig.8 shows this action.

#### Administrator Page Dataflow Diagram:-

After the administrator login process, the system automatically directs administrators the Admin user interface. The Admin page has been developed similar to the design of other management interface that is used by teachers. But it includes more options. Fig.9 shows the dataflow diagram of the administrator page.

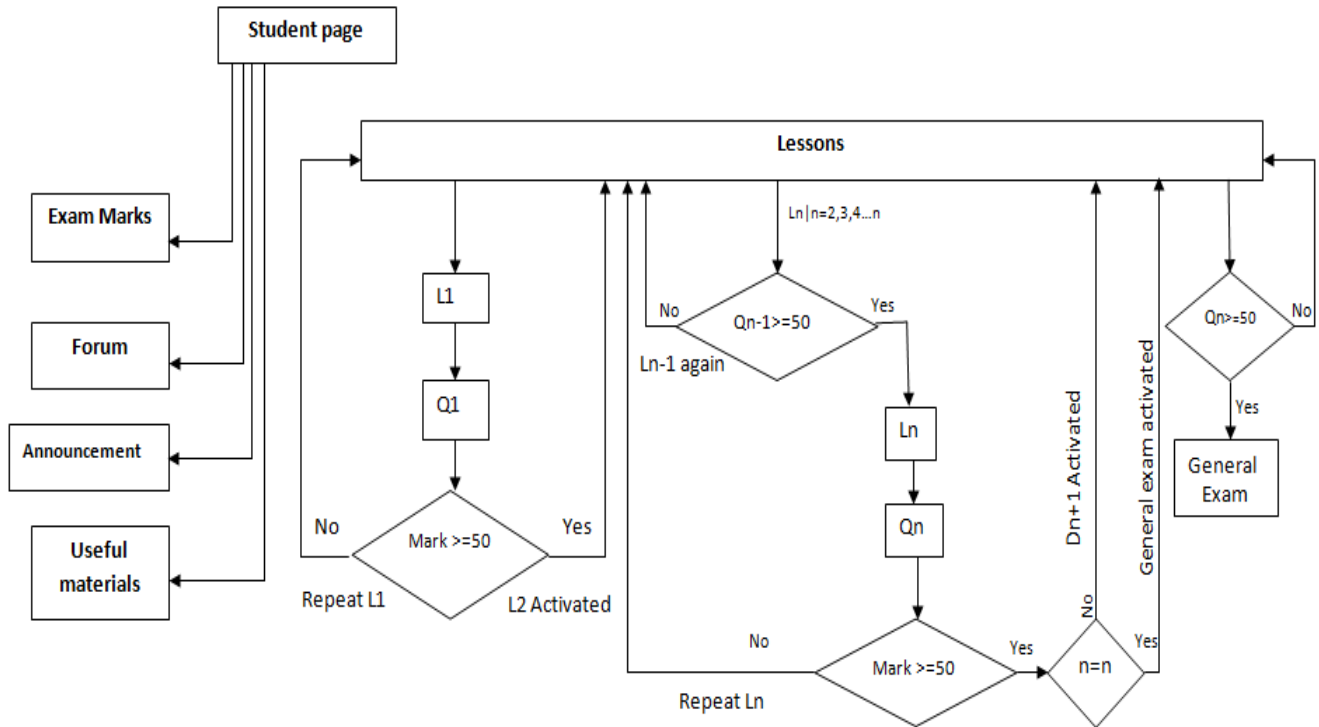

**Fig 9:-** Administrator page DFD

#### **Student Page:-**

The most important part is the student part here the student can see the course lessons title. Only first lesson contents will be active and can be viewed easily by clicking on the link provided by the system, the other lessons will be not activated unless the student pass the first lesson's quiz at that time the next lesson will be active and so on if the student didn't pass that quiz the next lesson will not be active, after the student passes all the quizzes the general exam will be activated so that the student can submit an exam contain questions about all the lessons that the student watched, beside the lessons the student can view past submitted exam marks, can enter the forum, see the announcements, and can get benefit from the useful materials part. The dataflow of the student page shown in Fig.10.

**Fig.10:-** Student Page DFD

#### User Communication Tools:-

In this system there are two different communication tools that can be used to communicate among system users. These communication tools used to improve the quality of the education activities by ensuring effective socialization processes among students and teachers.

The first communication tool is a forum, which is used to send messages or write comments on existing ones. The discussion subjects provided for users may be defined by teachers or other users via the management interface. The administrator can delete any illegal message or comment from the forum even can block the user account if the user insists on sending unacceptable messages.

The second communication tool of the system is an internal messaging tool, which allows students and teachers to send private messages each other.

#### Results and Future Work:-

There are some reasons that let us use asp.net as graphical user interface, web application exists in compiled form on the server so the execution speed is faster as compared to the interpreted scripts [27]. asp.net is not limited to script languages, it allows you to make use of .net languages like c#, j#, VB, etc. asp.net is a very valuable tool for programmers and developers as it allows them to build dynamic, rich web sites and web applications using compiled languages like VB and c#. the main advantage of this language is high security; code cannot be viewed from the browser. asp.net offers built-in security features through windows authentication or other authentication methods[28],[29].

One of the most important result we achieved in this project by activation constrains, that activation of the next lecture is depend on the student quiz result of the previous lecture so that the student must study hard to pass the quiz to activate the next lecture.

Besides the teacher can view the time that the student spent viewing and studying each lecture this done by timer starts when the student click to view the lecture and ends when clicking on quiz at the end of lecture so the lecture viewing time can be calculated the benefit of method is to give information if the student passed the lecture and

submit the quiz and may he or she can pass the quiz by chance; this information can help the teacher when assessment the students.

In the future this project can be developed by adding private chat between the users so that they can communicate privately get benefit from each other's experience, video conferencing also very important to share information between the users beside that can be virtual class so the students can attend any lecture the teacher demonstrate without any constrains all what they need is an internet connection.

### Conclusion:-

Today's economy is based on a global perspective. We need to compete and collaborate with the world. Thus education must be catered along these lines. We have seen that this is possible with the use of technology, technology is a necessity in today's world and we must be ready for it. Computers can provide universal success by dividing lessons into segments to the extent needed to make sure that everyone can accomplish something. They deliver results accurately and quickly, the closer the connection between the action and reward, the more valuable and more effective is the reward. With computers and technology, learning can be a 24/7 process. Teaching will not be bound by time constraints. Technology is a versatile and valuable tool for teaching and learning and becoming a way of life. The most important thing is that teachers need to be prepared to use these technologies effectively.

#### Introduction:-

Tobacco inhalation is inhalation of smoke from burned leaves of tobacco plant, most often in the form of cigarettes. Smokeless tobacco refers to chewing of tobacco. People may smoke casually for pleasure, habitually to satisfy an addiction, due to social pressure. There is overwhelming evidence that tobacco usage produce harmful effects in the mouth.<sup>1</sup>

WHO has reported that tobacco smoking has killed 100 million people worldwide in 20th century and warned that it could kill 1 billion people globally in the 21st century.

**Corresponding Author:- Mohammed Issa.**  
Address:- College of Density, Taibah University of Medina.

Smoking has been established as a risk factor for death from several systemic diseases, including lung cancer, respiratory diseases, and cardiovascular disease.<sup>1,2</sup>

Smoking has also been demonstrated to affect the oral health of smokers in a variety of way ranging from cosmetic effects, such a teeth staining or discoloration, to potentially harmful life-threatening conditions such as oral cancer.<sup>1,3</sup>

Some of the reported effects of smoking on oral health include increased susceptibility to periodontal disease, reduced response to both surgical and nonsurgical periodontal therapies,<sup>4,5</sup>.Also there is an increased risk of dental implant failure<sup>6</sup> and a higher risk for cancer and precancerous lesions.<sup>7,8</sup>

In susceptible patients, the clinical effects of smoking depends on number of cigarettes smoked daily and the duration of habit.<sup>9</sup>

Passive smoking includes inhalation of smoke from smoker's cigarette to anther individual and it can cause increased allergic reaction against specific allergens, reduced lung function and increased asthmatic attacks in patient with asthma. Despite the above established adverse effects of smoking on oral health, few studies examining dental patient's knowledge and awareness of such effects are available.<sup>10,11</sup>

Moreover, the available studies have focused mainly on oral cancer and only a very few have examined the awareness regarding other oral health aspects, affected due to smoking. The aim of this study is to assess the awareness of smoking's effects on oral and general health among smoker and non-smoker dental patients.

#### **Study objectives:-**

To assess the differences in knowledge and awareness of dental patient to the effects of smoking on oral and general health between smokers and non-smokers.

#### **Study design:-**

A cross-sectional analytic study using a self-administered questionnaire was given to patients attending the dental clinics in College of Dentistry at Taibah University.

#### **Sample size:-**

The new patients attending the dental clinics in College of Dentistry during 2015 were 11,303. Using the Roasoft sample size calculator<sup>1</sup>. with a marginal error expected of 5%, 95% confidence level and a response distribution of 50%.Itwas calculated that the sample size would be 372 with an additional 10% expected drop out the total sample size was calculatedas 418 participants.

#### **Patient selection:-**

Systemic random sample, a list patient in ascending manner in three days a week for two months and will be chosen patient number (1-3-5-7....)

#### **Inclusion criteria:-**

Smoker and non-smoker attending to dental clinics in College of Dentistry at Taibah University

#### **Exclusion criteria:-**

1. Children (Local law defines children as anyone under age 18).
2. Students.
3. Cognitively impaired or mentally challenged subjects.

#### **Ethical clearance form:-**

1. Ethical clearance was be sought before the start of the study from the Taibah University College of Dentistry Research Ethics Committee (TUCD REC).

2. Data will be collected coded and locked in a password-protected computer at the principal investigator office to ensure confidentiality and privacy of patient data.

### Statistical Analysis:-

Data entry and analyzes of results will be done using the Statistical Package for Social Sciences (SPSS) ver 21 for Windows software<sup>2</sup>. Descriptive statistics such as mean and standard deviation (SD) for continuous variables and frequency and percentage for categorical variables will be determined. Inferential statistics will then be followed using parametric and non-parametric test for univariate analysis followed by multivariate analysis using logistic regression. The level of significance is set at  $p < 0.05$ .

### Results:-

The present study was a cross-sectional descriptive study conducted to assess perception of dental patients visiting Dental College and Hospital about comparison of smokers and non-smokers awareness of smoking effects on oral health as a part of oral health care delivery. All 418 subjects completed the questionnaire, with response rate of 100%. of 418 subjects, 51.9% were smoker, 48.1% were non-smoker.

A cross-sectional analytic study using an online anonymous self-administered participant filled in the appropriate responses. The study was conducted among patients attending the Dental clinics at Taibah University in Al-Medina Al-Munawarah.

A total of 418 respondents responded to be enrolled in the survey. Out of the 418 respondents, 51.9% were smokers and 48.1% were not (Table 1).

The comparison between smoker and non-smoker with age group, the smokers group was higher between (31-50) 57.1%, also as compared between smokers and non-smokers in avoid reading about the hazards of smoking in newspapers, magazines and Email smokers who totally agree was totally agree 64.5% (Table 2).

The difference in knowledge between participants about the background on the diseases that may result from smoking. 82.4% of smokers stated yes while 63.5% of non-smokers stated yes (Table 3).

The difference in knowledge between participants about the smoking causes lung cancer. 88.4% of smokers stated yes while 94% of non-smokers stated yes (Table 3).

The difference in knowledge between participants about the smoking causes heart disease. 90.7% of smokers stated yes while 89.5% of non-smokers stated yes (Table 3).

The difference in knowledge between participants about the smoking causes discoloration of the teeth. 89.8% of smokers stated yes while 94% of non-smokers stated yes (Table 4).

The difference in knowledge between participants about the smoking causes a foul odour of the mouth. 67.8% of smokers stated yes while 94.5% of non-smokers stated yes (Table 4).

The difference in knowledge between participants about the smoking causes tooth decay. 52.1% of smokers stated yes while 69.7% of non-smokers stated yes (Table 4).

The difference in knowledge between participants about the smoking causes gum disease. 47% of smokers stated yes while 91% non-smokers stated yes (Table 4).

The difference in knowledge between participants about the smoking causes cancer diseases, including oral cancer. 63.9% of smokers stated yes while 90% of non-smokers stated yes (Table 4).

### Discussion:-

In Saudi Arabia, the use of tobacco is a common in the form of cigarettes and shisha. Cigarettes smoking affects oral health in a variety of ways ranging from staining to various serious conditions like oral cancer. Between these two extremities, there are various effects of smoking on oral health which thought not as a severe oral cancer still present potential for significant oral health morbidity and tooth mortality<sup>(1)</sup>.

In the current study, the awareness among patients about the difference in knowledge between participants about the smoking causes lung cancer. 88.4% of smokers stated yes while 94% of non-smokers stated yes. Was good in comparison with the study of Poonam Sood, Ridhi Narang, 82.8% of smokers stated yes, and 91.4% of non-smokers stated yes. However less compared with M. Terrades, 97.2% of smokers stated yes, and 99.2% of non-smokers stated yes <sup>(2),(3)</sup>.

The knowledge about relationship of smoking and heart diseases, 90.7% of smokers stated yes, and 89.5 of non-smokers stated yes. Was also higher in comparison with the study of Poonam Sood, Ridhi Narang, 71.7% of smokers stated yes, and 73.6 of non-smokers stated yes. However less compared with M. Terrades, 92.3% of smokers stated yes, and 95% of non-smokers stated yes <sup>(2),(3)</sup>.

The higher knowledge may be because many campaigns and advertisements have focused on smoking causative factors for lung cancer and heart diseases

The difference in knowledge between participants about the smoking causes discoloration of the teeth. 89.8 of smokers stated yes while 94% of non-smokers stated yes. Was good in comparison with the study of Poonam Sood, Ridhi Narang, 80.8% of smokers stated yes, and 84.16% of non-smokers stated yes. However less compared with M. Terrades, 93,1% of smokers stated yes and 99.2% of non-smokers stated yes <sup>(2),(3)</sup>.

The difference in knowledge between participants about the smoking causes a foul odor of the mouth. 67.8% of smokers stated yes, while 94.5% of non-smokers stated yes. Was less in comparison with the study of Poonam Sood, Ridhi Narang, 89.8% of smokers stated yes, and 95% of non-smokers stated yes . also less compared with M. Terrades, 87.5% of smokers stated yes, and 99.2% of non-smokers stated yes <sup>(2),(3)</sup>.

The difference in knowledge between participants about the smoking causes tooth decay. 52.1% of smokers stated yes while 69.7% of non-smokers stated yes. When this association has never been proved. Only 29.4% correctly

answered that there is no such association. It was good in comparison with M. Terrades, only 10.5% correctly responded that there is no such association<sup>(2),(3)</sup>.

The difference in knowledge between participants about the smoking causes gum disease. 47% of smokers stated yes while 91% non-smokers stated yes. It was good in comparison of non-smokers with M. Terrades, 85.1% stated yes and the study of Poonam Sood, Ridhi Narang 67.7% stated yes. While less in comparison of smokers with M. Terrades, 74.6% stated yes and the study of Poonam Sood, Ridhi Narang 58.5% stated yes <sup>(2),(3)</sup>.

The difference in knowledge between participants about the smoking causes cancer diseases, including oral cancer. 63.9% of smokers stated yes while 90% of non-smokers stated yes. It was good in comparison of non-smokers with M. Terrades, 89.3% stated yes and the study of Poonam Sood, Ridhi Narang 82.5% stated yes. While less in comparison of smokers with M. Terrades, 78.9% stated yes and the study of Poonam Sood, Ridhi Narang 67.6% stated yes <sup>(2),(3)</sup>.

This study suggests that smoking cessation should be stressed upon to improve periodontal health and reduce tooth loss among smokers. Dental health campaigns must run awareness programs on the well-proved association of smoking and periodontal diseases Reference. Moreover, dental practitioners should play a crucial role regarding advising and supporting the patients in quitting during regular dentist visits.

The dental team could identify the patients willing to stop smoking and guide them to specialist smoking cessation advice centers. It is recommended to conduct further surveys among the general population covering different age groups and comparative studies in other populations to determine the validity of these results.

#### **Limitations:-**

The present study reflects the perceptions of patients attending a dental hospital, so the results should be interpreted carefully as it may not reflect the perceptions of the general populations. Also, hospital setups encourage one to respond favorably. The presence of friends and relatives can have an effect on responses. The patients may not admit their actual smoking status in the presence of relative or friends  
The favorable responses may social desirability bias.

#### **Conclusion:-**

It can be concluded from this study that

1. The dental patients had a sound knowledge about the general and oral effects of smoking.
2. Smokers exhibited a willingness to follow the dentists' advice about quitting smoking.

#### **Recommendations:-**

1. It is recommended to conduct such surveys among general population covering different age groups.
2. Dentist should inform their patients about the effects of smoking and strongly advice and help them in quitting and take up a more active role in such activities.

#### **Acknowledgments:-**

We thank the participants for their cooperation to complete the research project.

##### Key words:-

Cholelithiasis, sleeve gastrectomy, Roux en Y gastric bypass.

#### Abstract

**Introduction:** Morbid obesity is a worldwide health problem; cholelithiasis considered the third most common disease between obese patients. Of 30 – 40 % of patients undergone corrective weight loss surgery developed cholelithiasis shortly after the surgery.

**Aim of the study:** to detect the relation and incidence of cholelithiasis those necessitate cholecystectomy after corrective weight loss surgery (sleeve gastrectomy and roux en Y gastric bypass) during a one year follow up and the necessary of prior cholecystectomy for those patients.

**Patients and methods:** Morbid obesity patients underwent corrective weight loss surgery (sleeve gastrectomy and roux en Y gastric bypass) in the period from June 2014 till June 2016, patients with unremarkable study at abdominal ultrasound before the surgery and patient with one year follow up after the surgery included in the study. Two comparative groups of patients were done: group A who underwent laparoscopic sleeve gastrectomy and group B who had laparoscopic roux en Y gastric bypass. The primary outcome measure was gallstones or mud formation with or without complications.

**Results:** 204 patients were included in the study, 163 patients had sleeve gastrectomy (group A) and 41 patients had bypass (group B), the mean age was 35.4 years for group A and 114 (69.9 %) of the patients were women, and it was 40.6 years for group B and 28 (68.2%) of patients were women, Gallstones requiring cholecystectomy after corrective weight loss surgery detected in 18 (11%) of 163 patients had sleeve gastrectomy and 4 (9.7 %) of 41 patients had roux en Y gastric bypass, group A patients developed gallstone after 8 months median time, while for group B it was 7 months. No significant difference found between the two groups of patients regarding the symptomatic gall bladder disease.

**Conclusions:** the incidence of cholelithiasis after corrective weight loss surgery was not so high for these patients and it is not recommended to do prophylactic cholecystectomy.

**Introduction:-**

The prevalence of obesity (BMI > 30) in Europe reached around 20 % and in United States became around 30 % that became an epidemic condition with other co-morbidities of metabolic disorders and so was accompanied by life expectancy reduction (1). Corrective weight loss surgery (Bariatric surgery) reduces the body weight and so ameliorates the co-morbidities, while weight reduction conservative management gives less satisfactory results (2), so surgery was recommended for morbid obesity treatment by NIH consensus conference (3).

Laparoscopic sleeve gastrectomy is one of the corrective weight loss surgeries that include removal of the fundus and most of the antrum of the stomach, creating a gastric tube or sleeve which reduces the oral intake (4). This procedure initially introduced as a part of duodenal switch operation, but now become a popular stand-alone procedure for weight loss surgery (5).

About 30% of the patients who are candidates for bariatric surgery either have undergone a prior cholecystectomy or are found to present gallstones at time of surgery, Gallstone represent the third most common disease observed among obese patients (6). Newly formed gallstones may be diagnosed in 27% to 43% of patients who have undergone bariatric surgery within a very short period of time (7), and it was found that the risk of developing gallstones can be as high as 52.8% in patients undergoing Roux-en-Y gastric bypass who are followed up for 1 year afterwards (8).

Patients with a rapid weight loss, following bariatric surgery, experience increased cholesterol saturation in the bile and also present increased concentrations of mucin in the gallbladder which is the most important pro-nucleating factors (9).

**Patients and Methods:-**

This study involved 286 patients followed prospectively were suffering from morbid obesity and underwent laparoscopic sleeve gastrectomy (LSG) and laparoscopic Roux-en-Y Gastric Bypass (LRYGB) in the period from June 2014 till June 2016, data collection began before the operation and continued forward until the latest visit after the operation. *Inclusion criteria:* Patients with negative abdominal ultrasound preoperatively, patient with at least one year follow up after surgery were included in this study, *exclusion criteria:* included: patients with gallstone disease preoperatively, history of cholecystectomy, presence of gallbladder polyp on preoperative ultrasound, patients who were lost to follow up after surgery and patients with a previous weight reduction procedure such as intra gastric balloon or gastric band, 82 patients were excluded from the study and 204 patients were included, All patients were discussed concerning the options of LSG and LRYGB and the possible risks of surgery were explained, a written and informed consent taken from all patient preoperatively, Preoperative abdominal ultrasound was performed for all patients to rule out gallstones, sludge or gallbladder polyp. Those with positive findings on ultrasound were discussed for concomitant laparoscopic cholecystectomy. Patients were followed up regularly, every 2-3 months; those with symptoms suggestive of cholelithiasis or its complications underwent further imaging with abdominal ultrasound or magnetic resonance imaging of the abdomen. The patients were divided into two groups for comparison. Group A patients who had (LSG), and group B included the patients who underwent (LRYGB). The primary outcome measure was the formation of symptomatic gallstones or sludge with or without complications. Positive findings according to the ultrasound, or MRI reports were recorded. Symptoms were considered attributable to gallstones or sludge if not clinically explainable by other causes. Patients who had complications such as acute cholecystitis, deranged liver function, acute cholangitis, or biliary pancreatitis at first presentation also were considered as symptomatic in the analysis.

Statistical analysis: Data were collected using Excel for Windows, and analysis was performed with the Scientific Package of the Social Sciences version 22 (SPSS). The chi- square test or Fisher's exact test was used for nominal variables as appropriate. The t-test was used to compare continuous variables. A p value less than 0.05 was considered significant.

**Results:-**

During the period from June 2014 till June 2016, 224 patients underwent LSG and 62 patients had LRYGB, after exclusion from the study, 163 group A patients and 41 group B patients were included in the study (table 1). Preoperative cholelithiasis was found in 16(7.1 %) of patients in group A and 5 (8 %) of patients in group B, all patients with gallstone disease that diagnosed preoperatively underwent concomitant cholecystectomy, 7 patients

(3.1 %) in group A had previous weight reduction procedures (a previous gastric band and a previous intragastric balloon placement), while in group B, 4 (6.4 %) patients had a previous intragastric balloon and all these patients were excluded from the study.

**Table 1:-** the incidence of cholelithiasis before surgery and exclusions of the patients.

	Group A LSG	Group B LRYGB
Total number of patients	224	62
Exclusion number (%)	61 (27.2 %)	21 (33.8%)
Cholelithiasis on preoperative US	16 (7.1%)	5 (8 %)
GB polyp on US	3 (1.3 %)	1 (1.6 %)
Previous cholecystectomy	13 (5.8 %)	4 (6.4 %)
Previous weight reduction procedures	7 (3.1 %)	4 (6.4 %)
Lost to follow up	22 (9.8 %)	7 (11.2 %)
Number of patients included in the study	163	41

The demographics of the patients in the study in both groups are shown in (table 2) the mean age of was 35.4 (18 – 49 years) for group A, 114 (69.9 %) of the patients were women and 49 (30.1 %) of the patients were men , whereas it was 40.6 (26 – 54 years) for group B and, 28 (68.2%) of the patients were women and 13 (31.8%) of the patient were men, the Preoperative mean BMI was  $50.3 \pm 6.9$  (range from 34.6-64.2) in group A patients, and  $52.8 \pm 7.4$  (range from 41.7 -65.6) in group B patients. The median follow up period was 12 month (range 10 - 14 months) for sleeve group and 16 months (range 12-24 months) in gastric bypass group.

**Table 2:-** the patient demographics in the study.

	Group A (n = 163)	Group B (n = 41)
Mean age : years (Range)	35.4 (18 – 49)	40.6 (26 – 54)
Gender	Male	13 (31.8%)
	Female	28 (68.2%)
Preoperative BMI* (Kg/m <sup>2</sup> )	$50.3 \pm 6.9$	$52.8 \pm 7.4$
Median follow up (months)	12	16

\*BMI= body mass index

Symptomatic gallstones requiring cholecystectomy occurred in 18 (11 %) of 163 patients had LSG, and in 4 (9.7 %) of 41 patients had LRYGB, and this difference was statistically not significant (p. Value > 0.05), group A patients developed gallstone after 8 months median time, while for group B it was 7 months and this difference was statistically not significant( p.value > 0.05). Mean BMI at the time of cholecystectomy was  $30.5 \pm 6.8$ kg in group A (range from 19.5- 47.6kg/m<sup>2</sup>) and  $35.3 \pm 5.1$  kg/ m<sup>2</sup> (range 26.2-42.8 kg/m<sup>2</sup>) in group B (p. Value 0.07) table 3.

**Table 3:-** the comparison of the patients who developed gallstone in group A and B.

	Group A	Group B
Number of patients	18 (11 %)	4 (9.7 %)
Gender	Male	1 (25 %)
	Female	3 (75 %)
BMI at the time of Bariatric surgery (Kg/m <sup>2</sup> )	$50.3 \pm 6.9$	$52.8 \pm 7.4$
BMI at the time of cholecystectomy (Kg/m <sup>2</sup> )	$30.5 \pm 6.8$ kg	$35.3 \pm 5.1$
Interval (months)	$8 \pm 3.4$	$12 \pm 7.2$

All patients who developed symptomatic cholelithiasis underwent laparoscopic cholecystectomy. No patient developed complications requiring re-admission or reoperation after cholecystectomy. No mortality occurred in our patients after cholecystectomy.

**Discussion:-**

Laparoscopic cholecystectomy in the morbidly obese may be associated with increased operative difficulty and morbidity compared with non-obese patients (10). However, the role of prophylactic cholecystectomy at the time of bariatric surgery remains controversial. The fact that pathological evidence of gallbladder diseases has been found in more than 75% of routinely resected specimens supports those who advocate prophylactic cholecystectomy (11).

On the other hand, the fact that only 7 to 16% of patients will develop symptomatic gallstones (12, 13), and that less than 10% of patients with negative ultrasound exams require subsequent cholecystectomy (14) does not support performing a prophylactic cholecystectomy. Of our LRYGB group, 9.7 % developed symptomatic cholelithiasis and underwent laparoscopic cholecystectomy, this result is the same in many studies done by Nagem et al (15) and Li et al (16) which reported a rate ranged from 6.7 to 11.8%, theoretically, cholelithiasis is less common after laparoscopic sleeve gastrectomy, because the procedure does not alter the gastrointestinal pathway (16,17).

In our LSG patients, 11% developed symptomatic gallstones, and this rate was not statistically significant ( $p$  Value  $>0.05$ ) from that of LRYGB patients, Li et al (16) also reported no significant difference in the rate for symptomatic and complicated cholelithiasis between LRYGB and LSG group of patients. Although rapid weight loss after bariatric surgery is a risk factor for forming gallstones, we should not neglect that a high number of patients already had gallstone disease or previous cholecystectomy before Bariatric procedure possibly because of obesity factor. In our study we found 5.8 % of sleeve patients and 6.4 % of LRYGB patients, already had their gallbladder removed or had gallstone disease before the operation. This result is similar to that of other studies (16, 18). Portenier et al (14) argued that the incidence of delayed cholecystectomy for symptoms or complications of gallstone formation was much lower than the  $\geq 30\%$  reported to develop gallstones and suggested an expectant approach of the asymptomatic cholelithiasis in LRYGB patients. We agree on the point that the percentage of patients developing gallstones is not as high as it was perceived to be.

However, routine preoperative ultrasound screening for gallstones and/or prophylactic cholecystectomy may still be beneficial in LRYGB patients, because access to the biliary tract after LRYGB is challenging (18). In addition, positive gallstones in workups may interfere with diagnosing other reasons when the symptoms are not specific.

These study findings had two important implications. First, because symptomatic cholelithiasis showed no statistical significant compared with gastric bypass; routine prophylactic cholecystectomy is not indicated for these patients. Second, from an etiologic point of view, the traditional belief that hormonal changes and left vagal hepatic branch denervation after gastric bypass result in gallstone formation may no longer hold true because patients who had food going through the usual gastrointestinal transit without duodenal exclusion did not have a lower risk for symptomatic gallstone formation (19,20).

The speed and the degree of weight loss after surgery may be solely related to symptomatic cholelithiasis rather than the choice of the procedure itself (20).

**Conclusion:-**

Cholelithiasis was common in our patients before weight reduction surgery. The rate for symptomatic gallstones after surgery was not so high. No significant difference in symptomatic gallstone disease was found between the patients who underwent laparoscopic gastric bypass and those who had sleeve gastrectomy. Routine prophylactic cholecystectomy should not be recommended for these patients.

### Abstract

The objective of this research was to analyze the sustainability status of the dimensions of economy, ecology, technology, and society, as well as organization in the integrated system of beef cattle breeding and crop farming in Jember Regency of East Java. Some analyses were included in this research, such as Analysis of Cost and Income, Analysis of Linear Programming, Analysis of Averagely Differential Rate (t-test), and Analysis of Sustainability. Result of research showed several findings. (1) The contribution of beef cattle breeding to the income of farmers/breeders was 8.18% but it was still smaller than the contribution of soybean farming with 31.13%, corn with 27.59%, and rice with 33.10%. In average, the cost for cattle feed was spent for Rp.2,575,000.- Workers who must look for greens, provide drinks to the cattle, clean the stall, and others, were valued as Rp.1,350,000.-. The biggest component of the cost in breeding work was the price of the calf that averagely reached Rp.8,000,000.-. The sale price of the harvested calf could attain Rp.16,250,000.-. The income rate of breeding work was then around Rp.3,482,000.-. (2) Integration between beef cattle breeding and crop farming at research area could be made into optimum under several conditions. Soybean was planted at 5.381 Ha land. Both corn and rice were planted at 6.667 Ha land. The maintained cattle should be 21 heads. The use of crop seed must be reduced, precisely 269 kg for soybean, 269 kg for corn, and 333 kg for rice. The use of Urea and organic fertilizers during Rainy Season I could be suppressed into the range between 1,849 kg and 3,333 kg. In other hand, the capital that needed to prepare for each planting season might be reduced to Rp.83,373,340.- ; Rp.109,840,000.- dan Rp.87,426,666.-. (3) If the optimum condition could be attained by farmers/breeders, then farmers' income in the research area would improve to Rp.531,085,000.- per year. This increment was very significant if compared to the actual condition of farmers' income, that reaching at Rp.486,553,100.-. Therefore, the implementation of optimal condition scenario was very recommended to be applied at research area. (4) The model of the optimization and sustainability of agribusiness with the integration system between beef cattle breeding and crop farming was important as cornerstone in formulating the policies for the favor of breeders. The policies kept breeders to apply

sustainable integration system. The combination of five dimensions of sustainability was used to measure the sustainability of agribusiness that involved the integration system between beef cattle breeding and crop farming. In whole, based on five dimensions of sustainability, then the agribusiness work with integration system between beef cattle breeding and crop farming at research area had the sustainability index rate of 42.40. This index showed that agribusiness work was less sustainable. Dimension with the worst sustainability index, and must be seriously attended, included the dimension of technology and infrastructure, and also the dimension of law and organization.

## Introduction:-

Lower income of the farmers was caused by many factors. Among others were (1) limited ownership of farming land per farming household (RTP), with a width less than 0.50 ha, which should be not economically profitable for farming; (2) the declining land productivity due to strictly land intensification without land conservation; and (3) the relatively low price of farming product, especially during great harvest. Dealing with problems, then the integrated farming system comprising of rice, palawija, and beef cattle breeding, should be very relevant alternative to the existing problem-solving. Theoretically, integrated farming system could be functioned to conserve land fertility and to improve farming efficiency by utilizing the production input from inside the work (internal input). Rice farming might utilize the dung as the substitution to the synthetic fertilizers. Beef cattle breeding could use straw and other byproducts as the feed. Therefore, integrated farming system between rice and cattle would reduce the use outside input (low external output) which kept the system more efficient.

## Study Method:-

### Sample of Research:-

The population of research was farmers who applied one-year planting pattern involving soybean, corn and rice. These farmers also owned and bred beef cattle.

### Method of Data Analysis:-

Some analysis methods were used. Each was described as following.

#### (1) Analysis of Cost and Income

$$\pi = TR - TC \quad \text{or}$$

$$\pi = \sum_{i=1}^n QiPi - \sum_{j=1}^m XjPj$$

### Note:-

$\pi$	=	Profit obtained from the integration of crop farming + beef cattle breeding
TR	=	Earning derived from the integration of crop farming + beef cattle breeding
TC	=	Expense required in the integration of crop farming + beef cattle breeding
P	=	The price of input and output in the integration of crop farming + beef cattle breeding
Q	=	Output produced from the integration of crop farming + beef cattle breeding
n	=	Total of output; There were many kinds of output. These were:
i	=	1,2,3.....n (number and kind of output to receive)
j	=	1,2,3,.....m (number and kind of input to use)

1. Earning from crop farming
  2. Earning from the difference of cattle purchase and sale prices
  3. Earning from the sale price of organic fertilizers
- |   |   |  |
|---|---|--|
| X | = | Input used in the integration of crop farming + beef cattle breeding |
| M | = | Type and number of input to be used                                  |

Several costs were needed in crop farming, such as the cost for:-

- 1) Seeds: rice, corn, soybean, and peanut.
- 2) Workers.
- 3) Inorganic fertilizers.
- 4) Organic fertilizers.

**Several costs in beef cattle breeding were those for:-**

- 1) Cattle origins.
- 2) Workers for preparing the feed and maintaining cattle.
- 3) Greens, straws and others.
- 4) Concentrates.
- 5) Analysis of Linear Programming

**Maximizing the function of goal;-**

$$Max.Z = \sum_{i=1}^3 \sum_{j=1}^3 y_{ij} X_i + y X_4 - \sum_{i=1}^3 w_i X_{4+i} - w X_8$$

**Function of constraint:**

**Land**

$$\sum_{i=1}^3 a_{ij} X_i \leq A_j$$

**Seed Availability**

$$\sum_{i=1}^3 b_{ij} X_i \leq B_{ij}$$

**Fertilizer**

$$\sum_{i=1}^3 \sum_{k=1}^4 c_{kij} X_i \leq C_{kj}$$

**Cattle feed**

$$\sum_{i=1}^3 -d_{ij} X_i + d X_4 \leq 0$$

**Workers**

$$\sum_{j=1}^3 e_{ij} X_i + e_j X_4 - X_{4+j} - X_8 \leq E_j$$

**Working Capital**

$$\sum_{j=1}^3 f_{ij} X_i + e_j X_4 \leq F_j$$

**Note:-**

- |                 |   |  |
|-----------------|---|--|
| i               | = | crop species (soybean, corn, rice)                               |
| j               | = | planting season (MK I, MK II, MH I)                              |
| k               | = | fertilizer type (Urea, SP-36, Phoska, Organic)                   |
| y <sub>ij</sub> | = | gross earning of crop i at planting season j (thousand rupiahs)  |
| y               | = | gross earning of beef cattle breeding (thousand rupiahs)         |
| w <sub>i</sub>  | = | wage of workers for each crop farming (thousand rupiahs / HOK)   |
| w               | = | wage of workers in beef cattle breeding (thousand rupiahs / HOK) |

$X_i$	=	land width planted with crop i (i=1,2,3) in unit of Ha
$X_4$	=	number of cattle (head)
$X_{4+i}$	=	number of workers for crop i (HOK)
$a_{ij}$	=	land average width for crop i at planting season j (Ha)
$A_j$	=	land availability at planting season j (Ha)
$b_{ij}$	=	the average number of seed of crop i at planting season j (kg/Ha)
$B_{ij}$	=	the availability of seed of crop i at planting season j (kg/Ha)
$c_{kij}$	=	the average quantity of fertilizer type k used for crop i at planting season j (kg/Ha)
$C_{kj}$	=	the availability of fertilizer type k at planting season j (kg/Ha)
$d$	=	the quantity of greens (kg)
$d_{ij}$	=	the availability of greens at planting season j (kg)
$e_{ij}$	=	the average number of workers used for crop i at planting season j (HOK)
$e_j$	=	the average number of workers used to maintain cattle (HOK)
$E_j$	=	the availability of workers at planting season j (HOK)
$f_{ij}$	=	the average rate of capital used for crop i at planting season j (thousand rupiahs)
$f_j$	=	the average rate of capital used for maintaining the cattle (thousand rupiahs)
$F_j$	=	the availability of capital at planting season j (thousand rupiahs)

Based on the equation above, the analysis was done using Program Operational Management (POM). Result of analysis reflected the contribution of crop farming and beef cattle breeding to the earning of farmers.

**Analysis of Averagely Differential Rate (t-test):-**

$$H_0 : X_1 = X_2$$

$$H_A : X_1 > X_2$$

Note :  $X_1$  = earning of farmers after optimization.

$X_2$  = earning of farmers before optimization.

Statistic equation of t-test was described as following.

$$t - \text{hit} = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{(n_1 - 1)S_1^2 + (n_2 - 1)S_2^2}{n_1 + n_2 - 2} \left[ \frac{1}{n_1} + \frac{1}{n_2} \right]}}$$

**Note :-**

**Analysis of Sustainability:-**

The analysis technique was Multi Dimensional Scaling (MDS). All attributes in each dimension were assigned into an application program of Microsoft Excel, and then, these were analyzed with MDS using an application Excel for Rapfish.

**Table1:-**The Category of Sustainability Status

No.	Dimension Index	Category	Note
1	00.00 - 24.99	Poor	Less sustainable
2	25.00 – 49.99	Less	Less sustainable
3	50.00 – 74.99	Adequate	Quite sustainable
4	75.00 – 100.00	Good	Sustainable

Source : Pitcher (1999) and Kavanagh and Pitcher (2004).

**Result And Discussion:-****Beef Cattle Breeding:-****Table 2:-**Beef Cattle Breeding (Fattening) per Head per Year.

No	Component	Beef Cattle Breeding	Note
A	Average Cost (Rp)	13,425,000	Including stall costs.
B	Average Earning (Rp) :		
	(a) Principal (Cattle)	16,250,000	
	(b) Waste (Dung)	657,000	Dung was well done.
	Total	16,907,000	
C	Average Income (B-A)	3,482,000	
	R/C	1,26	

Earning obtained from the sale of 1 cattle was Rp. 16,250,000.-. This price was greatly determined by the quality of cattle during one-year fattening process. The heavier the cattle was the more expensive its price would be. This price was obtained from the average sale price of 1 cattle owned by respondent. Earning was also collected from the well-done dung of the cattle because it was useful for organic fertilizer with meaningful economic value. In the reality, farmers utilized dung/organic fertilizers to their crop farming. If the remaining existed, it would be sold to the needed farmers for the price Rp. 200.- per Kg. Economically, the income of farmers from breeding 1 cattle with one-year fattening process was Rp. 3,482,000.-. This income was low for farmers because beef cattle breeding was only side job for additional income to their primary work, precisely crop farming.

**Table 3:-**Crop Farming Per Year with Soybean-Corn-Price Planting Pattern

No	Component	Soybean Farming	Corn Farming	Rice Farming
A	Average Cost (Rp)	5,320,000	3,970,000	4,294,500
B	Average Earning (Rp) :			
	(c) Principal (Crop)	14,700,000	9,750,000	14,245,000
	(d) Waste (Barks/Cuts/Straws)	3,879,000	5,982,000	4,145,000
	Total: A+B	18,579,000	15,732,000	18,390,000
C	Average Income (B-A)	13,259,000	11,752,000	14,095,500
	R/C	3.49	3.95	4.28

**The Contribution of Beef Cattle Breeding to Household Farming****Table 3:-**The Contribution of the Income from Beef Cattle Breeding to the Income of Household Farming in One-Year Period

No	Component	Principal	Waste	Total	Income (Rp)	Contribution (%)
A	Beef Cattle Breeding	16,250,000	657,000	16,907,000	3,482,000	8.18
B	Soybean Farming	14,700,000	3,879,000	18,579,000	13,259,000	31.13
C	Corn Farming	9,750,000	5,982,000	15,732,000	11,752,000	27.59
D	Rice Farming	14,245,000	4,145,000	18,390,000	14,095,500	33.10
		54,945,000	14,663,000	69,608,000	42,588,500	100

**Table 4:-**The Integration Rate of Beef Cattle Breeding and Farming

No	Component	Waste			Contribution (%)
		Physic (Kg)	Price (Rp)	Value (Rp)	
A	Beef Cattle Breeding	3,285	200	657,000	4.48
B	Soybean Farming	8,620	450	3,879,000	26.45
C	Corn Farming	9,970	600	5,982,000	40.79
D	Rice Farming	8,290	500	4,145,000	28.28
	<b>Total</b>			<b>14,663,000</b>	<b>100.00</b>

**The Optimization of Farming and Breeding:-****Table 5:-**Primary Activity in the Optimum Integration between Farming and Breeding

No.	Activity	Unit	Optimum Rate
1	Planting the soybean at dry season MK I	Ha	5.381
2	Planting the corn at dry season MK II	Ha	6.667
3	Planting the rice at rainy season MH I	Ha	6.667
4	Maintaining the cattle	Head	21

In addition to the planting, to achieve the optimum farming pattern, it would need resources to support farming activity. These resources were also useful in farming and breeding, such as land, seed, fertilizers (Urea, SP-36, Phoska and Organic), workers, and capital.

**Table 6:-**The Use of Land Resource at the Optimum Farming Pattern

No.	Activity	Unit	Optimum Rate
1	Soybean	Ha	5.381
2	Corn	Ha	6.667
3	Rice	Ha	6.667

**Table 7:-**The Use of Worker Resource at the Optimum Farming Pattern

No.	Workers (HOK)	MK I	MK II	MH I
1	Available	6,100	6,100	6,100
2	Used	559	298	298
3	Remaining	5,541	5,802	5,802

**Post-Optimum Analysis:-**

If the optimum pattern of farming and breeding was successfully achieved by farmers at research area, then their income would be greater. It was said so because the reallocation of resources was more efficient. The income obtained from the optimum pattern scenario was estimated to Rp.531,085,000.- per year. Actual income rate was Rp. 486,553,100.- per year. Or, in other words, if optimum pattern was achieved, then the increment of income would be 9.15% of actual income. To ensure whether there was actual difference between income in optimum pattern and actual income, t-test was conducted on the average difference of two populations. By considering optimum condition and actual condition as two different populations. Result of t-test could be seen in the following table.

**Table 8:-**Result of t-test on Income Difference from Optimum Condition and Actual Condition

Explanation	Income (Rp 000)	Differential	t-count	t-table
Optimum Condition ( $\mu_{Opt}$ )	531,085	44,531.9	<b>4,453</b>	<b>2,042</b>
Actual Condition ( $\mu_{Akt}$ )	486,553.1			

**The hypotheses tested in this analysis were:-**

$$H_0 : \mu_{Opt} \leq \mu_{Akt}$$

$$H_0 : \mu_{Opt} > \mu_{Akt}$$

Criteria of Decision :  $H_0$  was rejected if  $t\text{-count} > t\text{-table}$

As the table showed, it was known that  $t\text{-count} = 4.453$  and  $t\text{-table} = 2.042$  or, in other words,  $t\text{-count} > t\text{-table}$ , which thus, the decision was that  $H_0$  was rejected. Therefore, it was concluded that statistically, the income at optimum condition was greater than actual income of the farmers. The implementation of optimum condition scenario was very recommended to be applied at research area.

**Analysis of Sustainability:-****Table 9:-**Summary of Result of Analysis on MDS-Rapfish

Dimensions	Stress (S)	R-Square (R)
Ecology	0.1569	0.9347
Economy	0.1596	0.9335
Socio-culture	0.1459	0.9429

Technology and Infrastructure	0.1584	0.9316
Law and Organization	0.1652	0.9412

### Dimension of Ecology:-

Result of MDS analysis on sustainability status in ecology dimension was plotted in Figure 1, while sensitivity (leverage) of each atribut in ecology dimension was shown in Figure 2.

**Figure 1:-**Sustainability Status of Ecology Dimension.

**Figure2:-**Sensitivity of Attributes in Ecology

Figure 1 indicated that sustainability status index of ecology dimension was 50.83. This rate remained at the range 50–74.99 which meant as adequately sustainable. In other words, the ecology condition in research area was quite supportive to the sustainability of agribusiness with the integration system between cattle and crop.

As shown in Figure 2, some attributes of ecology dimension were quite influential to the sustainability of the dimension, among others were the availability of processing site for RPH waste, the availability of RPH, and the supporting capacity of the feed. It was said so because the leverage rate of three attributes was greater than other attributes. It could be also said that to improve the sustainability of ecology dimension, then the abattoir must be available, nearby, and managed well, with easier access to the feed source.

### Dimension of Economy:-

**Figure 3:-** Sustainability Status of Economy Dimension.

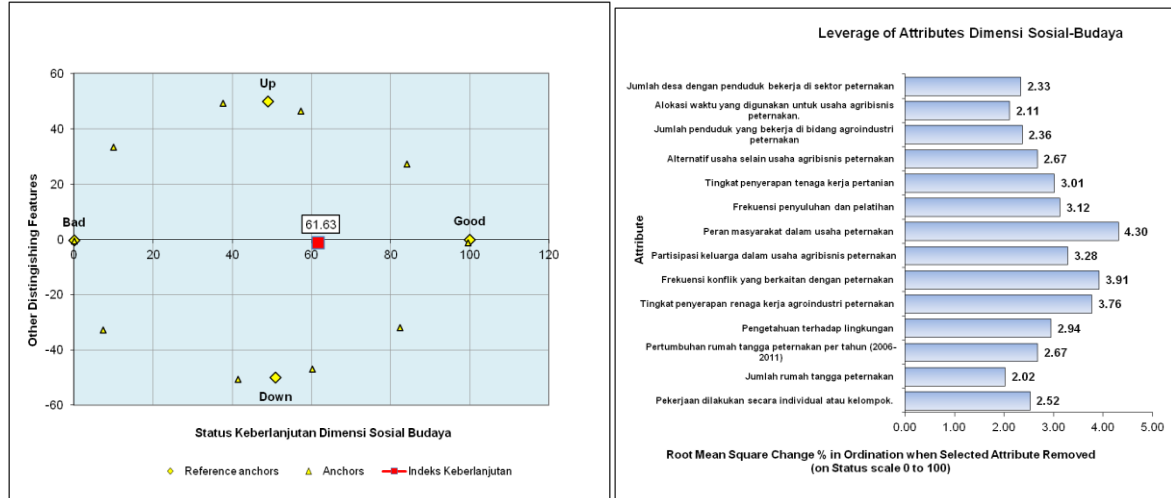

**Figure 4:-** Sensitivity of Attributes in Economy

Figure 3 displayed that sustainability status index of economy dimension was 63.33 which put this rate at the range 50 – 74.99. In other words, the sustainability was adequate. It was also meant that the agribusiness work with the integration system between cattle and crop at research area was quite profitable in term of economy. Although beef cattle breeding and crop farming quite economically meaningful, to preserve this position or improving it, some attributes must be given great attention because it gave great impact on economy dimension. As noted in Figure 4, some attributes that influenced the sustainability of economy dimension were the availability of feed industry, and the availability of livestock market or agribusiness sub-terminal as the place for breeders to sell the livestock.

#### Dimension of Socio-culture:-

Result of MDS analysis on the sustainability status of socio-culture dimension was indicated in Figure 5, while sensitivity (leverage) of each atribut in socio-culture dimension was shown in Figure 6.

**Figure 5:-**Sustainability Status of Socioculture Dimension. **Figure 6:-** Sensitivity of Attributes in Socioculture Dimension

Figure 5 indicated that the sustainability status of socio-culture dimension was 61.63. This index stood at the range of 50-74.99 meaning that this dimension was adequately sustainable. In other words, the social and cultural conditions of research area were adequately supportive to the existence of agribusiness work involving the integration system between cattle and crop. This work was the legacy inherited by generations. Most lands were owned by farmers/breeders as the legacy. Figure 6 showed that the attributes with great influence on the sustainability of socio-culture dimension included the participation of community into breeding work, the frequency of conflict, and the worker absorbance rate. This result of the analysis meant that although breeding and farming were greatly supported in research area, but this work did not sufficiently absorp workers. If such condition was neglected, the long-term sustainability of breeding/farming would be on the risk.

#### Dimension of Technology and Infrastructure:-

Output of MDS Analysis on sustainability status of technology and infrastructure dimension was displayed in Figure 7, whereas sensitivity (leverage) of each atribute in technology and infrastructure dimension was shown in Figure 8.

**Figure 7:- Sustainability Status****Figure 8:-Sensitivity of Attribute**

As shown in Figure 7, the sustainability status index was 18.84. This index was positioned at the range of 0.00-19.99 meaning as not sustainable. It occurred because in general, breeders/farmers still used traditional method to manage their work. Result of analysis also showed that if this condition was not improved or just keeping obstinate to use traditional method, then the agribusiness involving the integration system between cattle and crop would be hardly developed because it might be less competitive due to the lack of the availability of technology and infrastructure. As displayed in Figure 8, some attributes were very influential to the sustainability of technology and infrastructure dimension, and these were the distribution of artificial-insemination service post, the availability of agribusiness structure and infrastructure, and the availability of livestock product processing technology (post-production). In other words, the improvement of sustainability status of technology and infrastructure dimension could be focused on the provisioning of artificial-insemination service post, and by making available the structure and infrastructure that supported breeding activity, such as livestock extension house and others. Also, post-production technology for breeding could also improve the agribusiness that involved the cattle-crop integration system.

#### Dimension of Law and Organization:-

Result of MDS analysis on the sustainability status of law and organization dimension was plotted at Figure 9.

**Figure 9:- Sustainability Status of Law and Organization Dimension**

**Figure 8:- Sensitivity of Attribute of**

Figure 9 had shown that sustainability status index of law and organization dimension was 17.38. It remained at the range of 0.00-19.99, meaning that the dimension was not sustainable. It could be said that the support of government and immediate agencies to the agribusiness with cattle-crop integration system was still lacking. Attributes influencing greatly to the sustainability of this dimension was presented in Figure 10. As shown by this figure, there were eight attributes to measure law and organization dimension. In general, its leverage rate was almost similar or

considered as balancing. There were eight attributes that must be attended to improve the sustainability of law and organization dimension. Those with the highest leverage were the presence of breeder group, the presence of training and consultation center, and the presence of relevant social agency.

The combination of all five dimensions would be useful in measuring the sustainability of agribusiness involving cattle-crop integration system. This sustainability rate of this combination was shown in Figure 11.

**Figure 11:-Kite Diagram of Sustainability Status of The Model of Agribusiness with Cattle-Crop Integration System**

In average, the sustainability index rate of the agribusiness involving cattle-crop integration system in research area was 42.40, or in the range of 25.00-49.99 (less sustainable). As shown in kite diagram, if the index went out the diagram or approached to 100, it meant that sustainability status was better. Conversely, when it stayed inside diagram or went to the proximity of 0, the sustainability status would be worse. Of five dimensions explained, the dimension with the worst sustainability status was the dimension of technology and infrastructure, and the dimension of law and organization, with each sustainability status of 18.84 and 17.38 (meaning as not sustainable).

## Conclusion And Suggestion:-

### Conclusion:-

Based on the result of research and discussion, it was concluded in the following:

1. Result of analysis on sustainability status was described:
  - a. In term of dimension of ecology, the agribusiness with cattle-crop integration system was quite sustainable with the sustainability index of 50.83. The important attributes included the processing of RPH waste, the availability of RPH, and the supporting capacity of the feed. The economy dimension was also quite sustainable with the index of 63.33, where the sensitive attributes were the availability of feed industry, the availability of livestock market, and the availability of place to sell the livestock.
  - b. Socio-culture dimension had sustainability index of 61.63 which meant as quite sustainable. The influential attributes were the role of community in livestock business, the frequency of conflict, and the worker absorbance rate.
  - c. Technology and infrastructure dimension was not sustainable with sustainability index of 18.84. The sensitive attributes included the presence of artificial-insemination service post, the availability of agribusiness structure and infrastructure, and the availability of livestock product processing technology (post-production).
  - d. Law and organization dimension had sustainability index of 17.38. The influential attributes were the presence of breeder group, the presence of training and consultation center, and the presence of relevant social agency.
2. The model of optimization and sustainability of the agribusiness with cattle-crop integration system would be helpful in the formulation of policies for the interest of breeders because it allowed breeders to apply sustainable integration system. The combination of five dimensions of sustainability was used to measure the sustainability of agribusiness work with cattle-crop integration system. In whole, based on these five dimensions of sustainability, the agribusiness work with cattle-crop integration system at research area had the sustainability index rate of 42.40. This index justified the fact that agribusiness work was less sustainable. Dimension with the worst sustainability index, and must be seriously attended, included the dimension of technology and infrastructure and also the dimension of law and organization.

**Suggestion:-**

1. Beef cattle breeding contributed to the income of farmers at relatively smaller degree if compared to the farming activities. Based on the result of Linear Programming Analysis, and in order to achieve the optimum condition, the people of Tegalwangi Village was suggested to bred beef cattle in number of 21 cattles. The number on breeder was more than this suggested number. Therefore, to improve the contribution to farmers' income, then breeders could be educated to manage their breeding in more efficient and effective ways. It should be done to keep cattles providing better input or income.
2. It was also suggested that educating farmers in relative to their breeding method must be important, at least to achieve the optimum condition as shown by the result of analysis of Linear Programming. The increase of farmers' income from beef cattle breeding was also significant.
3. More attentions should be given to the improvement and the availability of technology, infrastructure and organization in research area, which would keep cattle-crop integration system more sustainable.

Intrathoracic migration, Neers  
Prosthesis.

### Abstract

High velocity trauma results in fracture dislocation of the proximal humerus. Dislocated fragments of the proximal humerus fracture very rarely migrate into ipsilateral hemithorax. The dislocation adds an extra level of difficulty to the treatment of complex multipart proximal humeral fractures with higher risk of osteonecrosis. Classified as 11B3 by OTA classification. To our knowledge this is among the very few cases reported till date of intrathoracic humeral head migration.

*Copy Right, IJAR, 2016., All rights reserved.*

### Introduction:-

Fracture –dislocation of the humeral head into the thoracic cavity is a rare injury and there is no consensus on its treatment. We report the presentation and management of this injury in a 50-year female in developing country.

### Case report:

A 50 year old female had a road traffic accident with the vehicle falling over the bridge. The patient was brought to the emergency department with pain and swelling of left shoulder and inability to move shoulder joint. The general examination was unremarkable. On local examination patient had tenderness over shoulder and left side of chest without any neurovascular deficit distally in the limb. All movements of shoulder joint were restricted. Radiological examination with x ray shoulder revealed comminuted fracture proximal humerus with ipsilateral intrathoracic dislocation of humeral head. NCCT shoulder and chest was done with 3-D images showing posterolateral migration of head into ribcage. Usg chest showed haemothorax. Patient was posted in **emergency** for **thoracotomy** for removal of humeral head. Under general anesthesia in right lateral position a lateral incision was taken on 4 th intercostal space, dissected layer by layer to expose the rib. The rib was cut and pleural space was entered. The humeral head without any soft tissue attachment was found posterolaterally in pleural space. An ICD was kept and incision closed in layers. Patient was allowed to stabilise after thoracotomy and later posted after 2 weeks for **SHOULDER HEMIARTHROPLASTY**. Under general anesthesia and in supine position a deltopectoral approach was used for exposure of proximal humerus. The greater tuberosity and lesser tuberosity fragments with attached muscles were identified which helped for clinical judgement. The humerus cannal was prepared and cemented Neers prosthesis of size 35mm was inserted. The prosthesis was reduced in glenoid cavity having good stability. The rotator cuff was repaired along with the reduction of greater and lesser tuberosity. Wound was given, drain kept and incision closed in layers. Physical therapy and rehabilitation programme followed with good range of motion.

Address:- Assistant Professor, Department of Orthopaedics, GMCH Aurangabad, (M.S.) India.

**Results and Discussion:-**

Fractures of the proximal humerus are sometimes associated with dislocation of the proximal fracture fragment , occurring more commonly anteriorly than posteriorly [7]. Rarely the dislocated fragment migrates into the ipsilateral hemithorax and may be associated with single or multiple rib fractures[1-6]. Associated pneumothorax or haemothorax occurred in some cases[2-4]. One case was managed nonoperatively with humeral head left within the thoracic cavity without apparent sequale[3]. Regarding the mechanism of ipsilateral intrathoracic dislocation one study suggested that a sudden abduction force was sufficient to both fracture the humerus and drive the dislocated humeral head between the ribs[3]. Another study suggested that a force along the humeral shaft could force the dislocated head into the thoracic cavity[4]. Needs carefull and vigilant x ray evaluation in emergency followed by CT scan. As the humeral head has no muscular or capsular attachment left so blood supply to head is disrupted , hence head osteonecrosis is inevitable so total shoulder arthorplasty or hemiarthroplasty is the surgery of choice.

#### Abstract

**Objectives:** The headache is one of the most common neurological disorders and was ranked the third cause of years lost due to disability. So This study conducted to identify the prevalence of headache and its impact on job performance in emergency department medical and paramedical staff.

**Methods:** A cross-sectional study using self-administered questionnaire. The sample of 308 medical and paramedical staff were selected randomly from emergency departments of Taif hospitals during the period from December 2016 - January 2017.

**Results:** Three hundred eight staff participated in the study. 158 (51.3%) Male and 150 (48.7%) Female. 132 (42.9%) Medical and 176 (57.1%) Paramedical. The last Three months prevalence of headache among participants was 272 (88.3%) and having statistical significant differences with Physical Activities ( $p=0.008$ ) and Smoking ( $p=0.020$ ). Regarding the Impact of headache, 86 (31.6%) Little to no impact and the others have severe impact 74 (27.2%), Remarkable impact 40 (14.7%) and Some impact 72 (26.5%). There were statistical significant differences ( $p \leq 0.05$ ) between Headache impact test and age, marital status, specialty, BMI, Physical activities, smoking, headache duration, specialist consultation, Medication use and frequency of absenteeism.

**Conclusion:** The primary headache prevalence is very high among medical and paramedical staff in emergency departments. Its characteristics are almost meeting the diagnostic criteria of the tension type headache. The impact of headache on job performance is little in the most of the staff, but there is significant percent of those with severe impact.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

The headache is one of the most common neurological disorders. It is been in the form of pain and disability that occur in primary headache disorders called cluster, migraine, tension-type headache. The headache can occur due to

**Corresponding Author:- Abdulrahman Ahmad Alzahrani.**

Address:- Medical Student, College of Medicine -Taif University, Saudi Arabia.

secondary causes such as medication-overuse headache.<sup>[1]</sup> So the headache is classified regarding the causes to Primary headache that is daily, benign and not caused by underlying disorders and Secondary headache is caused by underlying problems such as Head injuries and space occupying lesions (e.g. bleeding, tumors ...etc.).<sup>[2]</sup>

According to Global Burden of Disease Study 2013, Headache was ranked the third cause of years lost due to disability (YLD).<sup>[3]</sup>

The Most common type of headaches is primary headache (More Than 90%), and mostly episodic tension-type headache. Roughly everyone is suffered from this type of headache at least once in his life. In Saudi Arabia, the headache prevalence is 63% affecting mainly females and younger age. The tension-type headache has had the highest type prevalence (32%) and is considered as the common cause of the physician visits and work absenteeism. It is followed by the migraine headache that was (2.6 - 5%).<sup>[4-5]</sup>

The medical and paramedical staff are exposed to high work stress, that can let them suffering from psychosomatic symptoms such as Primary headache. The Headache disabilities have an actual effect on job performance, costs and outcomes. Some studies found that the 31% of Migraine headache sufferers were losing one workday in a period of 3 months, and absent an ordinary of 10.7 days/year for the sake of headache symptoms. The absenteeism due to migraine headache costs annually \$13 Billion Dollars and \$1,165 Dollars for each individual in the United States of America (USA).<sup>[6-8]</sup>

There is still a lack of sufficient studies to investigate the primary headache prevalence and its impact on the job performance of medical and paramedical staff in the Emergency departments. The goals of conducting this study are to determine the prevalence and impact on the job performance of primary headache among medical and paramedical staff in the Emergency departments of Taif city hospitals - Saudi Arabia.

#### Methods:-

A cross-sectional study was designed to assess the prevalence of Headache in the Emergency Department Health Related Staff and its effect on job performance, using self-administered questionnaire. It includes 3 parts: **The First Part** collects the sociodemographic data (Age, gender, marital status, specialty, Body Mass Index (BMI), physical activity, smoking, income and Family History) and determines the participant suffering from headache in the last 3 months. All those participants answered this question with "yes", they asked to continue the rest of the questionnaire. **The second part** included questions about the characteristics of headache. **The Third part** assessed the impact of headache on job performance by using Headache Impact Test (HIT-6)<sup>[9]</sup>. The score of (HIT-6) shows the burden of headache on normal daily life and job performance as the following:

- **Score 60 or More:** The headache have very severe impact on the life and job.
- **Score 56 – 59:** The headache have a remarkable impact on life and job.
- **Score 50 – 55:** The headache have some impact on life and job.
- **Score 49 or Less:** The headache have a little to no impact on life and job.

The sample of 308 medical and paramedical staff was selected randomly from emergency departments of Taif hospitals (King Abdul Aziz Specialist Hospital, King Faisal Hospital, Prince Mansour Military Hospital, Al-Hada Military Hospital and Al-Ameen Hospital), during the period from December 2016 - January 2017.

All medical and paramedical staff those work in emergency department, over 18 years old and either male or female were included in the study. The health care providers those suffered from headache due to secondary causes were excluded. All participants were informed about the nature of the study and oral consent obtained from those who agreed to participate in the study. All participants were informed that their participation in the study is voluntary. The data was coded and entered using Microsoft Excel 2010, and then analyzed using SPSS program version 0.21.

#### Results:-

##### Sociodemographic Data:-

Three hundred eight medical and paramedical emergency department staff participated in the study. Most of the participants were Male (51.3%), Age group ranged from (25 - 39) with 57.1%, Single (51.9%), Paramedical (57.1%), Body Mass Index (BMI) Mean and Standard Deviation (SD) (24 ±5), Not performing ≥ 30 min. of physical activities (48.1%), Non-Smoker and 5000-10,000SR Income/Month, (79.9%) and (55.8%), respectively. **Prevalence of Headache:-**

The last Three months prevalence of headache among participants was 88.3%. It was common in The age group ranging from 40-59 (96.2.1%), Male (89.9.2%), Divorced (100%), Paramedical (88.1%), Obese (95.5%), Those performing physical activities ≥ 30 min more than 3 times per week (94.4%), Smokers (96.8%), those with monthly income between 5000-10,000SR (90.7%) and those with positive family history of headache (90.2%).

There were statistical significant differences between headache occurrence in the last 3 months and Physical Activities ≥ 30 mins./Week ( $p=0.008$ ) and Smoking ( $p=0.020$ ). (**Table 2**)

**Headache Characteristics:-**

The characteristics of headache are represented in **(Table 3)**. 58.8% of the participants suffering from headache for less than three years. The headache is happening often weekly in 51.5% of participants. It is almost Bilateral (56.6%), Dull/pressing (52.9%) in character, Gradually (42.6%) in onset, Moderate in intensity (58.1%), not increasing in frequency (58.8%), occurring in the evening (53.7%), relieving in hours with medications (50%) and without medications (64%), worsening by physical activities (57.4%) and Not associated with nausea (66.9%), vomiting (85.3%), sensitivity to light (52.9%) and neurological deficiencies (83.8%), but associated with sensitivity to noise (53.7%).

There is 73.5% of participants didn't seek a consultation with specialist and didn't absent from work due to headache. 49.3% didn't use medications for their headache complaint.

### Discussion:-

The Headache is the most common of neurological disorders that cause disabilities and have an impact on job performance among population. [6, 8] Multiple studies have reported the prevalence of headache in the health workers. But the studies denoted the headache and its impact among emergency department staff are rare. To date, this study is the first one that assess the prevalence of headache and its impact on job performance among medical and paramedical staff in the emergency departments in the hospitals of Saudi Arabia.

The health care works need a concentration, hard work and effort. Absence or weariness of one of the emergency department staff for one day or some time can affect the health care process. [10] So the headache needs evaluating and managing among medical and paramedical staff as all and specifically those working in the emergency departments.

In our study, we found the last three months prevalence of headache among medical and paramedical emergency department staff is 88.3% (**Table 1**), 87.9% of medical and 88.6% of paramedical (**Table 2**). This prevalence is much higher than the mean of global headache prevalence 46% as well as the general population prevalence in Saudi Arabia 63%.<sup>[5,11]</sup> And the other studies among various Health Care Workers (HCWs) that conducted in Switzerland, Nigeria, Taiwan and North China offer 61%, 39.3%, 49.6% and 45.3%, respectively.<sup>[12-15]</sup> These stringent results refer to the burden of stress that affecting health care professionals and exactly the emergency department staff.<sup>[16]</sup>

The statistical significant difference is shown in (**Table 2**) between headache prevalence in the last 3 months and doing physical activities  $\geq 30$  min. more than thrice a week ( $p=0.008$ ), because the headache is triggered by physical activities in 57.4% of the participant and this is supported by Zivadinov and colleagues study, that suggested the physical activity is one of the most triggers of headache.<sup>[17]</sup> As well as the Smoking have an association with headache prevalence ( $p=0.020$ ), represented in the smokers have a higher prevalence of headache (96.8%) than non-smokers (86.2%). This implies that the smoking have a negative effect on the headache occurrence as in Qi Gan and colleagues study (2016).<sup>[18]</sup> But this issue is conflicting according to Taylor, F. R. (2015).<sup>[19]</sup>

The headache characteristics among the study sample were weekly in 51.5% (**Table 3**). It is almost Bilateral (56.6%), Dull/pressing (52.9%) in character, Gradually (42.6%) in onset, Moderate in intensity (58.1%), not increasing in frequency (58.8%), occurring in the evening (53.7%), relieving in hours with medications (50%) and without medications (64%), worsening by physical activities (57.4%) and Not associated with nausea (66.9%), vomiting (85.3%), sensitivity to light (52.9%) and neurological deficiencies (83.8%), but associated with sensitivity to noise (53.7%). Most of these characteristics are meeting the diagnostic criteria of the tension type headache of the headache disorders classification, 3<sup>rd</sup> edition - beta version (ICHD-3 beta) by International Headache society, except the triggering of headache by physical activities and the sensitivity to noise (phonophobia).<sup>[20]</sup> Regarding to the worsening of headache by the physical activities, it is one of the migraine criteria, according to the International Headache society (ICHD-3 beta). As for phonophobia, If it is occurring not more than once, It may be considered as tension type headache. Overall, these characteristics may suggest that the tension type headache is the most type of primary headache affecting the medical and paramedical staff in emergency department, and it is supported by Sokolovic et al (2013).<sup>[12]</sup>

Unfortunately, The headache have a severe impact on the life and job performance of 27.2% of the emergency department staff. (**Figure 1**) Also, 36.4% of them were absenting from work due to the headache for 5 to 10 days in the past year (2016). Hence, This causes work productivity decline and defect in the health care providing process.<sup>[10]</sup> These results can illustrate the high percent (60%) of seeking a consultation from a neurologist rather than other specialists and using a prescribed medications (39.1%). (**Table 4**) But when we discerned these sufferer staff, we found them almost have a risk factors of developing headache, such as: Obesity and over the counter medications use.<sup>[21]</sup> So the risk factors, mainly modifiable, have to be taken into account beside the life and work stress impact. The most age group were severely affected by primary headache is that between 40 - 59 years old, and that affected little to no impact were 25 - 39 years old. This is antithesis of many studies which assume the primary headache is decreasing during the aging.<sup>[22,23]</sup> Fortunately still there is 31.6% of participants have a little and even no impact by headache on their life and jobs, and they represent most of the medical and paramedical emergency department staff in Saudi Arabia.

Finally, we recommend conducting further studies to assess the prevalence of headache and its impact on life and job performance in the health care field employee as all. Also, the documentation of the headache suffering employee is important, to take into account their conditions and so help them to overcome it and improve their life quality. Subsequently, This will increase the work productivity and decrease the burden of headache.

## Conclusion:-

The primary headache prevalence is very high among medical and paramedical staff in emergency departments. Its characteristics are almost meeting the diagnostic criteria of the tension type headache. The impact of headache on job performance is little in the most of the staff, but there is significant percent of those with severe impact.

## Acknowledgments:-

We would like to extend special acknowledgment to the following Medical Students in College of Medicine - Taif University, Saudi Arabia: Hassan Ali Hassan Alshamrani, Badr Edrees Alnamie, Mazen Abdullah Alzaedi, Rahaf Ghazi Altwairqi, Nourah Ali Alshamrani and Abrar Fahad Alotaibi and The Medical Intern in College of Medicine -

Taif University, Saudi Arabia, Rayan Nasser Alharthi; for their valuable efforts and active role in Data collection phase.

### Abstract

This study is a contribution to the adaptation of a quality control system of food products namely HACCP plan (*Hazard Analysis Critical Control Point*) to hazards microbiological control of pasteurized milk and acidified milk manufacturing, following an investigation to establish a HACCP plan with the determination of critical control points (CCP). Microbiological control of contaminant germs has been performed in duplicate test for pasteurized milk; acidified milk; milk powder and ferment that was used to prepare acidified milk; and finally rinse water and consumption water.

Analyzed microbiological parameters of pasteurized milk and rinse water showed that pasteurization process, quality of cleaning and disinfecting operation was effective. However, the quality of ferment and then acidified milk product were unsatisfactory. These results were attributed to indirect inoculation operation after preparing the ferment due not only to a lack of hygiene, but also to the defailance of cleaning and disinfecting operation of the fermentation tank.

A HACCP plan gathered the key information of the study which revealed seven critical points at different stages of the manufacturing process which need to be controlled through preventive and corrective measures that the industry must undertake to prevent the frequency of microbiological hazard occurrence, probably at the origin of consumers' food borne-infection.

### Introduction:-

For many years, the quality control was to verify the safety of the finished product, which means their microbiological and chemical compliance with legislation. The dangers of food safety can occur at any stage of the food chain, and therefore require strict control over the entire chain (Leyral and Vierling, 2007).

Also, Food safety becomes a shared responsibility between all actors in the food chain, and food-borne diseases have direct impact not only on the consumers' health but also on the economical development. Therefore,

**Corresponding Author:- Elhassan Benyagoub.**

Address:- Faculty of natural and life sciences, Department of Biology, Ahmed Ben Bella University of Oran 1 (31000) Oran-Algeria.

intensification of building capacity in food safety is essential for most countries, particularly in developing countries.

By its biochemical composition rich on carbohydrate, fat, vitamins and minerals (Aggad *et al.*, 2009; Ahmed *et al.*, 2010), milk is considered as a favorable environment to the proliferation of microorganisms, especially pathogen germs (Ahmed *et al.*, 2010). These products have always been considered one of the main causes of food poisoning (Gran *et al.*, 2002).

For this purpose, the present study was undertaken, to establish a quality control system namely HACCP plan, with the determination of critical control points. A quality control operation of pasteurization step, cleaning and disinfecting operations was also studied.

#### **Status of milk in Algeria; a product of mass Consumption:-**

In Algeria, milk has an important place in the diet of everyone, whatever their incomes because, firstly, as a product rich in nutrients, milk can substitute for other expensive products like meat and, secondly, it's supported by the Algerian state (Amellal, 1995). The price support attributed by the state to the dairy offices was 43700 Dollar (USD) in 1982, which has grown to 2,3 million Dollar (USD) in 1992. In the space of a decade, the state has paid instead of consumers: 121 million Dollar (USD).

This high consumption is favored by the pricing policy of Algerian state, which encourages consumption compared to production status. Coupled with an extremely large population, this policy has led to an increase in demand, with more than two thirds of dairy consumption is covered by imports (Bourbouse *et al.*, 1989; Yakhlef, 1989; Mezani, 2000).

Milk intake per capita has improved during the same period as it was raised from 34 to 130 liters per year. While lower than the ration in European countries, where it's an average of 400 liters per year, it remains much higher than the average in Tunisia (87 liters) and Morocco (50 liters) (Boumghar, 2000).

#### **Insufficient rate coverage of needs on milk and dairy products:-**

The dairy industry is currently covering less than 40% of milk and dairy products requirements. Indeed, for a global demand estimated to 2,6 billion liters of milk equivalent in 1992, the production of dairy units was only 1,1 billion liters of milk equivalent.

The production deficit is compensated by importing milk. Between 1982 and 1992, the imports milk have attained 1,6 million tons and this costs the government 2,4 billion Dollars, either one-tenth the amount of the debt (Amellal, 1995).

#### **Material and Methods:-**

Sampling was performed at SUDLAIT Dairy industry in southwest of Algeria where the physicochemical and microbiological analyzes were performed in duplicate test during 2016 and involved the following samples "milk powder, pasteurized milk, acidified milk, ferment, rinse water and consumption water". Our purpose was firstly, to evaluate the hygienic quality of the analyzed products, secondly, identify the critical points and develop a plan or a standard quality manual for five Dairy industries visited in Algerian West.

#### **Physicochemical Analysis:-**

The physicochemical parameters studied were: temperature, titratable acidity, density, total dry matter, fat-free dry matter and fat content.

The titratable acidity was determined by measurement of lactic acid with sodium hydroxide in the presence of phenolphthalein at 1% as a color indicator according to (NA 678, 1994), The density of milk was measured by using a calibrated thermo-lactodensometer (AFNOR, 1993) The fat content was measured by the butyrometric of Gerber method according to (NF V 04-210, 1990).

Total dry matter is determined after drying in an oven at  $103^{\circ}\text{C} \pm 2$  (Drying method) according to (NA 679, 1994) and fat-free dry matter of milk was calculated by taking the difference between total dry matter and fat content of milk.

### Microbiological Analysis:-

Sampling was carried according to Algerian standard (NA 676, 1994; ISO 707, 1994). Microbiological analysis included after preparing decimal dilutions according to (ISO 8261, 2001), the detection and enumeration of bacterial indicators of fecal contamination; enumeration of total aerobic mesophilic flora incubated at 30°C for 72hours according to (NF V 04-016, 1985) on Plate Count Agar (PCA) (Fluka, Spain), detection and enumeration of total and fecal coliforms incubated at 37 and 44°C respectively for 24 to 48hours according to (ISO 4832, 1978) on the middle Violet Red Bile Lactose Agar (VRBL) (Biochem, Canada), search and enumeration in a liquid medium Rothe (Scharlau, Spain) for fecal Streptococci incubated at 37°C for 48hours following the method described by (Afif *et al.*, 2008) and finally, enumeration of fungal flora on Sabouraud 4% glucose agar (Fluka, India) according to (NA 5911, 1996).

Enumeration of Petri dishes having microorganisms was based on the standard set by legislation (AFNOR, 1980). The criteria of microbiological quality employed were in accordance with the publication on dairy products (**OJAR** 35, 1998), which is based on a 3-class plan following the specifications; n, c, m and M.

### Elaboration of HACCP plan:-

Two approaches are used throughout the world to ensure food safety: mean while the USA's way principally to control the sterilization step. The European Union 'EU' emphasizes quality management and security throughout production chains. Given the situation observed in the south countries and obtained results in Europe, it seems appropriate to use this approach to ensure dairy products safety in developing countries (Faye and Loiseau, 2000). The quality management by risks' analysis or potential hazards associated with a product or a process (HACCP approach) must be applied to the entire chain from the cow to the consumer (Leyral and Vierling, 2007). Hazard identification was based on 5M method (Medium, workforce, materials, methods and equipment) following the "cause-effect diagram" (Gouri Djaaboub, 2010; Blanc, 2007).

### Results:-

#### Physicochemical Analysis:-

The physicochemical analysis results of the samples do not reflect any abnormality and they were consistent to Official Journal of Algerian Republic (**OJAR** 87, 1999; **OJAR** 80, 1999; **OJAR** 94, 1998) and to the international standard (CODEX STAND 207, 1999).

The density values obtained were between 1,030 and 1,034. The samples analyzed of pasteurized milk had a fat contents ranging from a minimum value of 1,5% and a maximum of 2%. The value of titratable acidity was between 1,5 and 1,7% for pasteurized milk. The average values of total dry matter and fat-free dry matter were 99 and 84g/l respectively. The temperature of the product at the exit of the industry does not exceed + 8,5°C.

#### Microbiological Analysis:-

Examined milk powders showed a variable load of aerobic germs ranging from  $0,3 \times 10^3$  to  $1,2 \times 10^3$  cfu/g. The analysis also showed that the total and fecal coliforms were absent, while the average value of fungal flora was  $0,3 \times 10^3$  to  $1,2 \times 10^3$  cfu/g (Figure 1).

Milk powder:-

#### Consumption water:-

**Figure 1:-** Microbiological analysis of raw materials.

**GAMT:-** Total aerobic mesophilic flora, **LM:** fungal flora, **CT :** Total coliforms, **CF :** Fecal coliforms, **Str. D:** fecal streptococci.

The consumption water used in reconstituted milk production has also been tested; the results found were consistent with the Algerian standard.

The average loads of different bacteriological parameters determined for partly skimmed pasteurized milk are summarized in Figure 2. The aerobic bacteria of all analyzed samples showed levels that are located in the standards and varying between  $0,7 \times 10^3$  and  $1,8 \times 10^3$  cfu/ml. The origins of fecal contaminants "total and fecal coliforms" were almost negligible.

**Figure 2:-** Microbiological analysis of pasteurized milk packaged in bags.

**GAMT:-** total aerobic mesophilic flora, **LM:** fungal flora, **CT :** total coliforms, **CF :** fecal coliforms, **Str. D:** fecal streptococci.

Bacteriological analysis of acidified milk shows high contamination by a significant load of fecal coliforms, which had an average of  $1,53 \times 10^4$  cfu/ml during the period when the temperature is higher from the months of May to September (Figure 3), and for the month of January, the contamination was moderate but remains above the norm and had an average of  $5,6 \times 10^2$  cfu/ml fecal coliforms. While for the months from February to April, the load of total and fecal coliforms was consistent with the Algerian standard.

**Figure 3:-** Microbiological analysis of acidified milk.

**CT:-** total coliforms, **CF :** fecal coliforms.

In parallel, the analysis of the ferment used for the preparation of acidified milk also had a significant load of fecal coliforms in the same period of May to September (Figure 4), while for the months from February to April, the load of total and fecal coliforms was consistent with the standard's set.

**Figure 4:-** Microbiological analysis of ferment.

**CT:-** total coliforms, **CF :** fecal coliforms.

The rinse water showed a significant load of aerobic germs with an average of  $0,75 \times 10^3$  cfu/ml, a minor contamination by total and fecal coliforms was detected with an average load that is less than  $0,54 \times 10^3$  cfu/ml (Figure 5).

**Figure 5:** Microbiological analysis of rinse water.

**GAMT:-** total aerobic mesophilic flora, **CT :** total coliforms, **CF :** fecal coliforms, **Str. D:** fecal streptococci.

Analyzed bacteriological parameters for the reconstituted pasteurized milk and rinse water showed that the thermal treatment applied (pasteurization step) and quality of cleaning and disinfecting operation were effective, and also respected by the industry. A correlation was significant between the milk powder, pasteurized milk and the quality of cleaning and disinfecting operation for the searched microbiological parameters, because of a possible contamination of milk during manufacturing probably also present in the rinse water, and bad cleaning/ disinfecting operation of tubing 'closed circuit' may contaminate the product.

However the ferment quality and subsequently the acidified milk product were unsatisfactory. A correlation was significant for both products.

#### Assurance safety and hazard identification "HACCP approach"

The following table (Table 1) provides an illustration of a hazard identification approach, CCP and control measuring in the production process based on the interactive decision tree for dairy subsidiaries in west of Algeria - Raw milk, partly skimmed pasteurized milk packaged in bags and acidified milk.

**Table 1:-** Control measuring in the process production of reconstituted milk, pasteurized raw milk packaged in bags, and acidified milk.

Steps		Control measuring
<b>The raw material:</b> -Receipt of local raw milk -Milk powder		-Check and control the health program and maintenance of premises and separation zones, personal hygiene "uniform clothes + body and hand hygiene" -Managing the storage conditions of raw material, raw milk must be refrigerated no later than 2 hours after milking at 4°C maximum. -Systematical control of microbiological parameters especially physicochemical ones at the arrival of milk. -Strict compliance with hygiene "rule of 5M," sampling conditions of raw milk "healthy collection».
	<b>Pasteurization step</b>	-Check pasteurization scales (time/temperature) -Regular maintenance pasteurizer
	<b>Cleaning and disinfecting operation</b>	-To check the status, validity and the dose of used disinfectant. -To check the correct operation of CIP

Acidified milk	<b>Semi-direct /direct inoculation</b>	<ul style="list-style-type: none"> <li>-Use of selected cultures in sufficient load adapted to the production conditions (direct inoculation is recommended).</li> <li>-Create a sterile area during direct or semi-direct inoculation</li> <li>-Cleaning and disinfecting of the equipment</li> <li>-Respect the time of lactic fermentation, it should be sufficient</li> <li>-A good cleaning of tanks before and after preparation of acidified milk.</li> <li>- Compliance with strict hygiene rules 'GHP'.</li> <li>-Ensure closing of tank covert after inoculation process.</li> <li>- Control of titratable acidity of acidified milk, do not exceed 85°D (&lt; 8,5g/l lactic acid).</li> <li>-Keep tank cover closed after cleaning step.</li> <li>-Walk forward.</li> </ul>
	<b>Thermisation/cooling</b>	<ul style="list-style-type: none"> <li>-Check temperature of product at cooling exit before being packaged</li> <li>-Temperature of the product should be 4 to +6°C.</li> <li>- Titratable acidity should be below 85°D.</li> </ul>
	<b>Conditioning</b>	<ul style="list-style-type: none"> <li>-Sterile packaging; hermetic.</li> <li>-Keep the polystyrene packaging in a clean place</li> </ul>
	<b>Storage/marketing</b>	<ul style="list-style-type: none"> <li>-Cold preservation during the storage, transport and distribution especially temperature.</li> <li>-Respect the consumption deadline of the product</li> <li>-Extended loading and unloading of dairy products should be avoided.</li> <li>-Separation of dairy products in the storage location.</li> </ul>

### Discussion:-

The good physicochemical quality of samples reflects mastery and continuous control for replenishment and pre-pasteurization operations, which satisfy the physicochemical standards.

Microbiological analysis results of raw materials (milk powder and water for reconstitution) indicate the excellent microbiological quality of milk powder (low level of total aerobic microflora and no coliforms). These results fully meet the recommended standards by International Dairy Federation (IDF, 1974).

Getting the good hygienic quality of reconstituted milk is firstly the result of raw material quality, the stage of pasteurization and observation of the rules and hygiene measures at the local manufacturing involving maintaining continuous optimal cleanliness conditions, respect of individual hygiene of manipulators and prevention of exogenous re-contamination, as well as the effectiveness of the cleaning and disinfecting operation through CIP "Clean in place" before and after pasteurized milk manufacturing. These results were consistent with the study of Ould Moustapha *et al.*, (2012) which present the operational and technological origins to have a good hygienic quality of milk.

The presence of coliforms is generally used as an indicator of poor hygienic practices in the handling of milk (Elzyney *et al.*, 2007; Chye *et al.*, 2004). Enumeration of this flora for samples showed that there is a significant fecal contamination of the ferment and the acidified milk during periods when the temperature is high. That results from indirect inoculation operation after preparing the ferment due to a lack of hygiene, bad cleaning and disinfecting operation of fermentation tank, knowing that the high temperature promotes the growth of contaminating microorganisms.

Rigorous respect of general hygiene at the production and processing, eliminate the massive consequences of microbial contamination and gives a finished product that meets the microbiological standards of current regulations (Hamama *et al.*, 1995), we also must educate producers by setting up a training program with good manufacturing practices (Katinan *et al.*, 2012). A HACCP plan gathered the key information of the study revealed seven critical points at different stages of the manufacturing process (Milking at the farm, collection and transportation, receipt and storage of raw materials "raw milk", pasteurization, inoculation and maturation of acidified milk, refrigeration and storage of finished product, cleaning and disinfecting operation), that are imperative to be controlled through preventive and corrective measures that the industry must undertake to prevent the frequency of microbiological risks occurrence, probably at the origin of consumers' food borne-infection.

### Conclusion:-

The physicochemical analysis of pasteurized milk taken at the state of dairy industry showed no abnormalities, and for microbiological analysis, there is a low level of total and fecal coliforms, and no other contaminants such as fecal streptococci.

The consumption of acidified milk could be a risk to public health, especially in the summer season when the warm climate promotes the microbial growth. The lack of good hygiene practices, bad cleaning and disinfecting operations of fermentation tanks, the high values of the titratable acidity recorded explain the proliferation of fecal contaminants observed in the acidified milk product.

The imperative control of raw materials, finished products and control of the manufacturing process including pasteurization step, good hygiene practices and rapid cooling of the packaged product could help to provide consumers with high microbiological quality of dairy products. Thus, we must establish a quality policy "HACCP plan" as an accurate methodological tool in the searching for relevant control means adapted to the risk, with popularization of good manufacturing and hygiene practices 'GHP, GMP'.

#### Abstract

In the current study, the surface composite sheet of AA2024/al203 has been fabricated using friction stir processing technique. The processing parameters during fabrication process; such as rotation speed, travel speed and number of passes have been investigated. The number of passes has a significant effect on the mechanical properties through tensile test. The results revealed that tensile strength improved with increasing passes number.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Increasing demand for improving the properties of surfaces in order to meet with design and functional requirements. Friction stir processing (FSP) is one of the techniques for fabricating surface composites and modifying microstructural features, furthermore the improvement of mechanical properties. Process parameters are the key art of Friction Stir Processing. The stirring conditions (rotational and translational speeds) are important issues in FSP to obtain the desired mechanical properties.

Many researchers were discussed the relation between the process parameters and the quality of welded or processed metals according to [1,2,3,4]. The Tensile strength is found to be increased with increasing the rotational speed up to specified limit for AA6351 Al alloys as reported by [5]. The tensile properties and fracture locations have been investigated by many authors [6,7,8] they are fabricated metal sheets alloy using FSP. The results are revealed that the rotational speed has a significant influence on the tensile strength as a result of improving grain refinement of the material. The mechanisms of particle refinement during FSP of pure Al, and the effect of various processing parameters on the particle refinement have been studied by [9]. The investigators reported, that amount of heat generation during FSP was increased when rotational speed increase and decrease when transverse speed increase. Fabricating AA1050/SiC surface composite using FSP technique has been investigated by [10] the author concluded that, the formation of defects are causing at higher tool rotational speeds. The surface composite sheets are investigated by [11,12,13,14,15,16], they are concluded that tool rotation speed has a major effect on the mechanical properties and microstructure refinement.

The effect of multi-pass FSP on the, microstructure, micro hardness and tensile strength on the metal alloy and composites have been studied by [17,18,19,20,21,22]. Multi pass FSP not only improve the mechanical properties, but also get defect-free weld through adjusting the Welding parameters, including tool rotation rate, traverse speed, spindle tilt angle, and target depth [23]. multi-pass with even step (2, 4 up to 8-pass) FSP with 100% overlap was performed by [24]. The results reported that multi-pass FSP were improved tensile properties of composites including UTS, yield strength (YS) and elongation. The authors were reasoned this improvement because of reduced

porosity contents. CNT/2009Al is fabricated by combination of Powder Metallurgy and FSP by [25]. It was observed that as the FSP passes increased, there was good dispersion for CNT in the matrix, and the maximum tensile strength increased with increasing the passes number.

In the current investigation the aim of this work is to fabricate a surface composite sheet from AA2024 aluminum sheet and alumina nanoparticles, in order to enhance the tensile properties though overlap multi pass friction stir processing.

#### Experimental work:-

The wrought alloy sheets of AA2024 has been prepared and the Annealing is done at 410 °C for 2 hours, followed by slow cooling in the furnace to relief the remaining residuals stresses after cold and hot sheet metal working and improve ductility and dimensional stability. A rectangle slotted grooves are machined in each plate. The alumina nanoparticles are filled the grooves, then the friction stir processing has been carried out to fabricate the desired surface composite. The chemical composition for AA2024 wrought alloy is given in (Table 1). An automatic milling machine is used to perform FSP at different combination of processing parameters. The tool rotation speed was vary at different four rotation speed 900, 1100, 1500, 1800 rpm. Processing travel speed was chosen at three speeds (10, 15, and 20) mm/min, the last factor that effect on the process is the number of passes, and it is design to be processed at three overlap level.

**Table 1:-** Chemical composition of the as received AA2024 alloy (weight %)

Element	Cu	Mg	Mn	Zn	Fe	Si	Pb	Al
%	4.89	1.45	0.616	0.156	0.11	0.107	0.0193	Remain

#### Tensile Test:-

Tension test has been performed by MTS machine as shown in "Fig. 1". According to ASTM B557 with standard specimens along the processing zone as shown in "Fig. 2". The samples are tested in order to evaluate the tensile properties such as young's modulus, ultimate tensile strength (UTS) and yield stress (YS).

**Fig 1:-** Universal tension test machine

**Fig 2:-** Schematic drawing for standard tension test sample

#### Results and Discussions:-

The mechanical properties and material flow pattern are influenced with the Processing parameters such as tool rotation speed, longitudinal traverse speed and number of passes. The tool rotation speed effect on the tensile stress, but the ductility is decreased by 50% with respect to the base metal as shown in "Fig.3". As-received alloy has the highest elongation. The results reveal that, although the addition of Al<sub>2</sub>O<sub>3</sub> Nano powder increases the strength, it decreases the ductility which it was congruent with [26].

**Fig 3:-** Tensile strength samples tested at 900 rpm with 10 mm/min travel speed

Higher tool rotation speed increases the heat produced during friction stirring action, the high temperature in this metal matrix causes defects during processing specially in the first pass. The rotation speed 1500rpm and 1800 rpm resulting poor surface composite. The tensile strength curves show preference of low rotation speed rather than using higher speeds as shown in "Fig.4" and "Fig.5". The first pass noticed that, it is insufficient to improve the mechanical properties because some voids or defects are remained in the matrix. These results are in accordance to the previous results [27, 28, 29, 30].

Enhanced results for these metal matrixes composite are obtained at relatively low speeds with 10 mm/min and 15 mm/min traverse speed as shown in "Fig. 6". The improvement in the surface tensile properties is explained due to provide the sufficient heat during stirring process.

**Fig 4:-** Effect of rotational speed on tensile strength at 10 mm/min travel speed for the 1<sup>st</sup> pass.

**Fig 5:-** Effect of rotational speed on tensile strength at 15 mm/min travel speed for the 1<sup>st</sup> pass

**Fig 6:-** Effect of traverse speed on the ultimate tensile strength at constant rotation speed 900 rpm.

Ultimate tensile strength (UTS) results are represented in the comparison curves which, illustrates the effect of rotation speed on the ultimate tensile strength throughout different passes number as shown in "Fig.7" and "Fig. 8". Tool rotations speed performed at 900-rpm and 1100-rpm have a higher ultimate tensile strength than other speed specially when processed at 10 mm/min and 15 mm/min traverse speeds. Third pass causes an improvement in the tensile strength which, the maximum value for UTS is improved by 27 % rather than base metal. Tool rotation speed at 1800-rpm remarked that, having a lower UTS.

**Fig 7:-** Effect of rotational speed on UTS at 10 mm/min travel.

**Fig 8:-** Effect of rotational speed on UTS at 15 mm/min travel.

### Conclusion:-

This paper present the effect of processing parameters on the tensile properties of surface composite alloy fabricated by friction stir process. The results are concluded that:

- The average tensile strength of friction stirring processed specimen are improved by 10% as compared to the base metal
- The ductility of resultant metal matrix composite was decreased by 50% due to presence of alumina particles in the matrix.
- The superior tensile strength is achieved at low rotational speeds of 900-rpm and 1100 -rpm with medium travel speed 15 mm/min.
- Increasing the number of FSP passes lead to refinement the grain, furthermore good distribution of alumina nanoparticles in the composite matrix.

#### Abstract

**Introduction:** Melanoma is the most dangerous form of skin cancer. The National Cancer Institute estimated that there would be 76,100 new invasive melanoma cases and 9,710 deaths from melanoma in the US in 2014. Anatomic location was identified as a significant prognostic factor in patients with primary cutaneous melanoma (CM) by several investigators.

**Objectives:** The aim of this study is to assess the relationship between primary site of melanoma and survival in a large US adult population.

**Materials & methods:** We analyzed 227,509 US melanoma patients from the SEER (Surveillance, Epidemiology, and End Results Program Registry) from 1973 to 2011. We excluded duplicate cases. We compared the primary site and survival by using Kaplan-Meier curves. Hazard ratio (HR) were determined by unadjusted and adjusted Cox-regression model.

**Results:** In the unadjusted model, the primary anatomical site was significantly associated with survival. Melanoma patients who had a primary site as an overlapping lesion of skin (the tumor overlaps the boundaries of two or more adjacent anatomical sites) were 10 times more likely to die within 5 years of diagnosis compared to patients with non-overlapping lesions located on the head or neck (HR= 10.7, 95%CI=10.3 - 11.1). After we adjusted for age at diagnosis, gender, race, ethnicity and stage at diagnosis, patients with overlapping lesion of skin still had lower chance of surviving more than 5 years as compared to patients with non-overlapping head and neck lesions, followed by trunk (HR= 3.5, 95%CI= 3.3 - 3.6 and HR=1.2, 95%CI= 1.2 - 1.3, respectively).

**Conclusions:** Overlapping lesion of skin had the worst prognosis followed by trunk lesions, while lesions located at upper limbs & shoulders had better prognosis. Clinical correlation and timely diagnosis of primary melanoma sites might improve survival and prognosis in this population

## Introduction:-

Melanoma is the most dangerous form of skin cancer that represents 4.6% of all new cancer cases in the United States. The National Cancer Institute estimated that there would be 76,100 new invasive melanoma cases and 9,710 deaths from melanoma in the United States in 2014 [1,2]. Anatomic location was identified as a significant prognostic factor in patients with primary cutaneous melanoma (CM) by several investigators [3,4,5,6]. Understanding the role of anatomic site in melanoma survival is important for public health messages on skin awareness and sun protection. Moreover, because the role of screening in melanoma is considered important for early detection [7,8]. The location often has been classified into four anatomic regions: head and neck, trunk, and the upper and lower extremities [9,10,11,12]. But some authors have tried to subdivide anatomic location into higher and lower risk sites according to recurrence or survival rates [5,13,14,15]. Cutaneous head and neck melanomas (CHNM) constitute 12-21% of melanomas diagnosed annually [16,17]. CHNM have poorer outcomes relative to melanomas of other sites (MOS) [18,19,20]. Extremity lesions have generally been associated with a more favourable prognosis than trunk and head and neck lesions, even when adjusted for tumour type and thickness [21,22]. Other authors have confirmed that the anatomical location is a prognostic factor, but have demonstrated a poor prognosis in association with other areas, such as the BANS region (upper back, posterior arm, neck and posterior scalp) [23].

## Objectives:-

The aim of this study is to assess the relationship between primary site of melanoma and survival in a large US adult population.

## Literature Review:-

Warren H. Tseng et al argued that Tumor Location Predicts Survival in Cutaneous Head and Neck Melanoma. An analysis of the Surveillance Epidemiology and End Results (SEER) database of the National Cancer Institute of all patients with CHNM diagnosed from 1988 to 2006. Kaplan-Meier survival curves depicting overall survival (OS) and melanoma specific survival (MSS) dependent on location of tumor. Result shown that ten-year overall survival was 55.1% for all patients with cutaneous head and neck melanoma. For tumors of the scalp/neck, 10-year rates of overall survival was 57.2%. 10-year overall for cutaneous head and neck melanoma (CHNM) at sites other than the scalp/neck was 55.6%. the author concluded that Patients with melanomas of the scalp/ neck have poorer OS and MSS and those with lip melanomas have poorer MSS. These anatomic areas should not be overlooked when performing skin examinations [24].

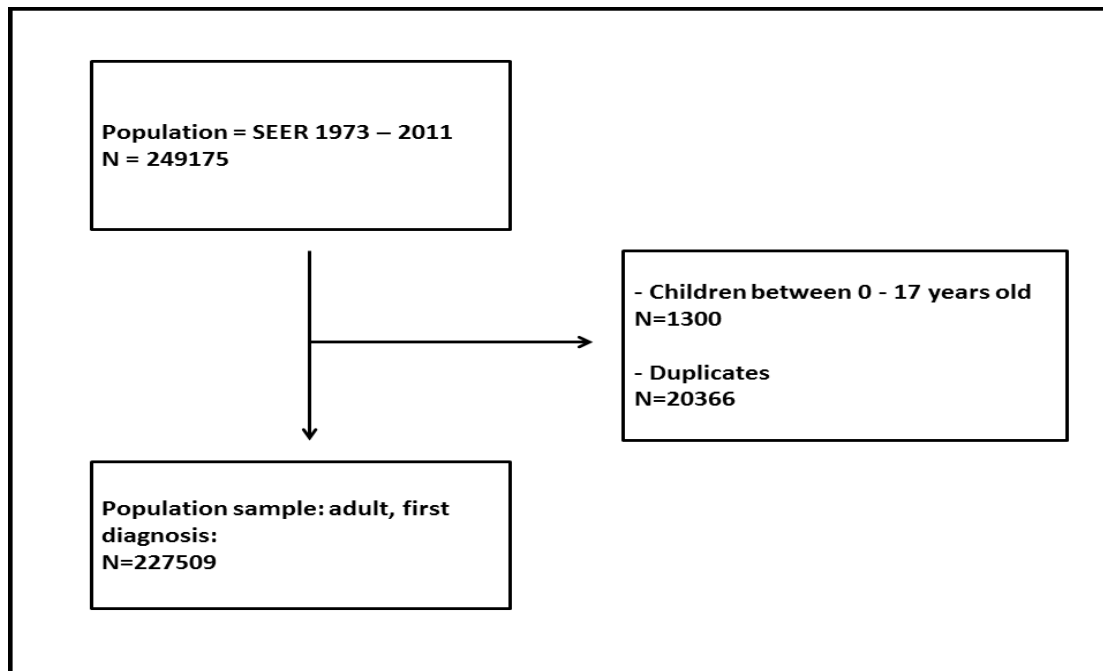

Claus Garbe, et al discussed Prognostic Classification of Anatomic Location of Primary Cutaneous Melanoma. In a series of 5093 patients with invasive primary cutaneous melanoma followed from 1970 to 1988 at four university centers in Germany who were investigated using the multivariate Cox proportional hazard model to analyze the importance of anatomic location for survival probability. The back and breast (thorax), upper arm, neck, and scalp (TANS regions) were identified as high risk sites as the univariate 10-year survival rates for primary CM showed significant site-related differences ranging from 63.4% (scalp), 68% (back) to 87.7% (lower arm), 82.4% (lower leg). The author concluded that the Anatomic location was confirmed as an independent prognostic factor for patients with primary cutaneous melanoma. The TANS regions were identified as high risk sites, and the lower trunk, thigh, lower leg, foot, lower arms, hands, and face were identified as intermediate sites [25].

H. M. SHAW, et al discussed Influence of Site of Lesion and Age of Patient in the Female Superiority in Survival. Statistical analyses of differences between survival rates were carried out by the Logrank method. Observed and expected differences were analyzed for significance by the chi-square test with one degree of freedom. final group comprised 753 patients (362 men and 391 women). Result showed that Melanoma of extremities had better prognosis than axial melanoma with 5-yr survival (<1.5mm thick) of 85.7% in men and 96.8 % in women. as opposed to axial melanoma 5-yr survival (<1.5mm thick) of 75.7% in men and 84.3% in women. The author concluded that The association between decline in prognosis with increasing age and decline in proportion of thin lesions with increasing age was much closer in men than women. In men and women matched by age, site, and thickness of primary lesions, women with very thick tumors still survived longer [26].

## Material & Method:-

In this study our population was 249175 US melanoma patients from the SEER (Surveillance, Epidemiology, and End Results Program Registry) during the 1973 to 2011 period. We excluded 20366 patients as duplicated cases and

1300 patients younger than 18 years old. The final group was 227509 US melanoma patients, we analyzed them using SPSS [Figure 1]. We used Kaplan-Meier curves to compare primary sites and survival with 5 years interval [Figure 2]. Hazard ratio (HR) were determined by unadjusted and adjusted Cox-regression model.

**Figure 1:-** Selection of melanoma patient from SEER database 1973 - 2011

**Figure 2:-** Kaplan Meier curve of survival time for adult melanoma patients in US (1973-2011)

### Result and Discussion:-

Patients with primary lesions located at trunk contributed the highest number of patients by 64457 followed by head and neck by 58138 Patients. Patients with Overlapping lesions were 14948 as the smallest group.[Figure 3]

The Mean Age of patients with primary site at Head & neck lesion are older (65.5) which is higher than other lesion. Men have higher percentage of overlapping lesion of skin and skin NOS (81.7%) while women contribute higher percentage of lower limb & hip lesion (70.4%). Most of melanoma patients are white (97.1%). Most of the melanoma patients are Non- Spanish-Hispanic-Latino (97.7%).Patients with overlapping lesion and Skin NOS diagnosed at late stage in contrast to other lesions. [Table 1]

Patients who survived 5 years or less are older (61.3) compare to those who survived more than 5 years. Patient with primary sites of melanoma located at lower limb/hip and trunk have higher percentage in more than 5 year category (63.9% and 63.5% respectively). While patients with primary site defined as overlapping lesion of skin and skin NOS have the lower percentage (26.5%) of surviving more than 5 years. Women diagnosed with melanoma have better higher percentage of surviving after 5 years compared with men (64.8% and 53.8% respectively). Patients diagnosed at early stage (63.7%) have more probability of surviving 5 years or more than those at late stage (36.3%). [Table 2]

In our unadjusted model the primary site was significantly associated with the survival. Melanoma patients whose primary site was overlapping lesion of skin/skin NOS are 10 times more likely to die due to melanoma compared to patients with lesions at head/neck (HR= 0.772). Women are 60% less likely to die from melanoma compared with men. Patients diagnosed at late stage are have worse prognosis in comparison to those diagnosed at early stage (HR= 11.229).

After we adjusted for age and stage at diagnosis, gender, race and ethnicity, overlapping lesion of skin/skin NOS and lower limb/hip were highly associated with unfavorable prognosis of melanoma compared to head/neck (HR= 3.500 and HR=1.900 respectively). Women are still less likely to die from melanoma compared with men (H=0.600). Patients who have the worst prognosis for melanoma are those diagnosed at late stage (HR=8.900) and white patients (HR=1.200). [Table 3]

Less than 10% of overlapping lesions patients survived 60 months. Around 43% of trunk and lower limbs and hip patients survived 60 months.Upper limb and shoulder and head and neck patients had the highest percentage of surviving 60 months by more than 50%. [Figure 4]

**Figure 4:-**Survival curve of primary sites (N=94294)

### Conclusions:-

This study have shown a very obvious difference in survival between the primary sites. Overlapping lesion of skin had the worst prognosis followed by trunk lesions while upper limb & shoulder lesions have a better prognosis. Timely diagnosis of primary melanoma sites will improve survival and prognosis of this population.

### Acknowledgments:-

We would like to thank Florida International University (FIU), Dr. Suliman Aba Al-Khail, Dr. Khalid Alqumaizi, Dr. Juan Zevallos, and Grettel Castro for their support and help.

#### Abstract

In case of snake envenomation the only therapy available is antiserum inoculation. The antiserum is raised in horses. The toxicity of the venom reduces the life of a horse. Moreover when a horse is given a dose of venom with adjuvant, it brings a lot of discomfort to the horse with local necrosis at the site. Because the proteins are integral part of snake venom an effort has been made in the present study to see the effect of electromagnetic spectrum on venom of *Bungaruscaeruleus* Indian common krait. Proteins are in general sensitive to radiation. After irradiation there is change in a number of physical and chemical properties of the proteins. It may further produce rearrangement of the protein. It decreases antigenicity of the proteins as is shown in present study where we can observe the loss of immunogenic components when exposed to UV, infra-red rays and to direct sunlight.

#### Introduction:-

The common four species of snakes responsible for casualties due to envenomation belong to two families of snakes: elapidae and viperidae. The venom of elapidae is neurotoxic and that of viperidae is cardiotoxic. The Indian common krait and cobra belong to elapidae family. The proteins are integral part of the snake venom. It is a mixture of thousands of different peptides, proteins, enzymes and chemicals. Most common snake venom enzymes include acetylcholinesterases, L-amino acid oxidases, serine proteases, metalloproteinases, and phospholipases-A<sub>2</sub>. These enzymes are necessary for a venom to be toxic. Higher catalytic efficiency, thermal stability, and resistance to proteolysis make these enzymes attractive models for every researcher (Kang et al., 2011).

Visible light, ionizing and non-ionizing radiations are part of electromagnetic radiations and are used vastly in medical, diagnostic and research fields (Angela Newing, 1999). These electromagnetic waves carry energy. Our eyes can perceive only a small portion of the electromagnetic spectrum which we know as visible light. Ultraviolet (UV) light is the portion of the electromagnetic spectrum between visible light and x-rays, with a wavelength of 100 to 400 nm. The red end of the electromagnetic spectrum is low frequency, low energy and long wavelength, whereas the blue end is high frequency, high energy and short wavelength. The visible light is in the middle of the electromagnetic spectrum. Infra-red rays are also present in electromagnetic spectrum felt in everyday life by human beings as heat. It is invisible like UV rays and is of longer wave length as compared to the visible light starting from the red edge of the visible spectrum at 700 nm to 1000000 nm. The UV light is used to expose the venom. It is generally with a wavelength of 100 to 400 nm. It is the portion of electromagnetic spectrum lying in between visible light and x-rays. Sources of UV radiation are sun as a natural source, lasers, and number of medical and research instruments like dental polymerising equipment. Shorter the wave length more damage caused by it to the substrate (Akram&Rubock 2005).

Address:- Lecturer of Microbiology, Department of Biotechnology, MVGU, Jaipur.

Since ionizing radiations are efficient in altering structure and properties of proteins and enzymes, they have been used to attenuate toxins of animal origin. The results are favourable as there is decrease in toxicity of the toxin under experiment (Esmat, 2003).

Gamma radiation is a potential tool used to detoxify a venom. It either slows down or stops enzymatic activities of venom. Gamma radiations work directly on the biomolecules or indirectly when the venom is in solution form.

These radiations act on the biomolecules in venom solution directly or indirectly. The direct process where radiations act directly on the enzymatic proteins and indirectly when the venom is in solution. In indirect way water radiolysis products too help in interaction and affect the action of radiations on protein biomolecules. In the present study also the venom has been used in solution form to observe the effect of radiation.

#### Aim and Objective:-

- The present study is an attempt to observe the effect of visible and invisible light on the toxicity and immunogenicity of the venom of *Bungarus caeruleus* (Indian common krait).
- This may further help to select the wave length of light suitable to reduce the toxicity of venom, to inoculate in horses or other experimental animals, for raising antivenom sera.
- This will further help in reducing local discomfort to the animal.

#### Materials and Methods:-

##### Material:-

1. Venom: the common krait or *B. caeruleus* venom used in this study was obtained from Central Research Institute Kasauli & the normal toxicity of this venom was checked before starting these experiments.
2. Slides- Glass slides of 20 × 5 cm were used for immunodiffusion tests.

##### Methodology:-

Experimental method was used in the present study. Throughout experiments, the toxicity was checked by inoculating aliquotes intravenously in mice and LD<sub>50</sub> was calculated. For immunodiffusion test, gel diffusion was used, followed by staining of slides.

Effects of light were observed by keeping equal quantities of venom in liquid state in different conditions like complete darkness, in day-light, sun-light, UV light and in infra-red rays. In all the above mentioned experiments the toxicity tests were observed after every 7 days interval for 28 days and immunological components by immunodiffusion tests.

#### Results:-

The venom showed reduction in toxicity by storing the venom in complete darkness after 28 days. The reduction in toxicity in day light is still marked. The venom was rendered more or less non-toxic by exposing the solution to direct sun light for three hours/day for 28 days. Immunodiffusion test also proved that 2 components of venom were lost in day light as compared to control venom. In case of complete darkness one component was lost.

The effect of invisible light i.e. UV rays, infrared rays was studied here. The results indicated that there is marked reduction of toxicity of Indian krait venom when the venom solution is exposed to U.V light. The toxicity is also reduced on exposure to infra-red rays. The effect of invisible light on krait venom's toxicity was confirmed by immunodiffusion test which showed that there was loss of 2 components of venom in both the situations.

**Table 1:-** Effect of visible light on venom of *Bungarus caeruleus* (Indian common Krait)

Interval after start (days)	Visible change if any	Venom control solution in N.S	LD <sub>50</sub> of solution of venom exposed to		
			Complete darkness	Day light	Sunlight
0	No change	1.6384	1.6384	1.6384	1.6384
7	No change	1.6384	1.6384	2.048	64
14	Turbidity sun light	1.7660	2.585	4	100

21	Turbidity sun light	1.7810	3.710	9.571	121.8
28	Turbidity in all	1.8130	4.595	10.24	312.5
No. of immunogenic components after 28 days		7	6	4	4

**Table 2:-** Effect of invisible light on venom of *Bungaruscaeruleus* (Indian common Krait)

Venom exposed to	LD <sub>50</sub> of venom exposed				Immunogenicity(no. of components)
	I	II	III	Mean	
Unexposed (control venom)	1.6384	1.7810	1.8130	1.7441	7
UV rays	180.0	198.2	198.4	192.2	5
Infrared rays	183.3	185.1	185.1	184.8	5

**Table 3:-** Effect of light on toxicity and immunogenicity on venom of *Bungarus caeruleus* (Indian common Krait)

Property	Venom Exposed to						
	Unexposed		UV Rays	Infra-red Rays	Complete darkness	Day light	Sunlight
Toxicity %	R	100	0.90	0.94	100	66.67	66.67
	L	0	99.10	99.06	0	33.33	33.33
Immunogenicity %	R	100	57.14	57.14	100	44.87	1.47
	L	0	42.86	42.86	0	55.13	98.53

Abbreviations: R – Retained, L – Lost

**Figure:-** Effect of light on immunogenicity on venom of *Bungaruscaeruleus*

- 1- Untreated venom  
2-- Venom exposed to UV light  
3 - Venom exposed to Sun light  
4-- Venom exposed to Day light  
5- Venom kept in dark  
6- Venom exposed to Infra-red light

The results of venom kept for 7 days did not produce any visible change in the venom kept in darkness, day light or sunlight. After 14 days some turbidity appeared in vial kept in sunlight. After 28 days the turbidity appeared in all the venom vials kept in dark, day light and sunlight.

The toxicity also showed fall in the case of day light and sun light. The venom became non-toxic when kept in sun light and lethal dose was calculated as 312.5 microgram in mice by intravenous route of inoculation. Daylight reduced the lethality of venom when kept for 28 days, and the LD<sub>50</sub> was calculated as 10.24 microgram. Complete darkness condition had effect on the LD<sub>50</sub> and it was calculated as 4.595 micrograms. The venom lost one immunogenic component in complete darkness and 2 components were lost in day light and sunlight condition after 28 days.

The venom exposure to infra-red rays and UV rays showed that the toxicity was lost upto 99.10% in infra-red while it was lost up to 99.06% in venom solution exposed to ultra-violet. Loss in toxicity was 33.33% in day light as well as sun light, but immunogenicity was lost up to 55.13% in day light and 98.53% in case of sun light.

**Discussion:-**

UV radiation and infra-red radiations are widely used in research labs, medical labs, antisera labsto control the bacterial and viral infection to avoid contamination and to keep the inoculating area completely free of microbes (Pauland Christina, 2006). The day light has capacity to kill partially the micoorganisms, whereas the sunlight makes the area exposed totally sterilised. This knowledge is used in hospitals and homes to sterilise the woollens and beddings along with other fomites. It is because of the bacteriostatic or bactericidal property of light on the protein content of the microbes.

In the present study the knowledge of action of light on the proteins has been used to observe the effect of light on the venom from *Bungaruscaeruleus*. This is done to try to turn venom into the venom/toxoid so as to reduce the toxicity of venom while retaining immunogenicity. This process can also make the venom less toxic to the animals in which antivenom is to be raised. The results of the present study indicated that venom is almost denatured by the action of day light, sunlight, UV rays and infra-red rays. The venom kept in darkness showed slight fall in toxicity with retention of 6 immunogenic components.

In the present study ionizing radiations like UV rays and non-ionizing radiations like infra-red rays have been used to observe the effect on Indian common krait venom along with visible part of the electromagnetic spectrum. The basic difference between these two types is the amount of energy they possess. Ionizing radiation has higher energy and has the ability to break chemical bonds, causing ionization of atoms and production of free radicals that can result in biological damage. Non-ionizing radiation doesn't have enough energy to cause ionization but disperses energy through heat and increased molecular movement (Zaider and Rossi, 1985; Hall, 2000).

The venom has been used in aqueous solution because irradiation of aqueous solutions induces chemical and structural alterations in proteins and peptides related to an attenuation or abolishment of biological activity and interferences in immunological properties. When the venom was subjected to visible and invisible spectrum of light it showed decrease in toxicity and immunogenicity. Whether the wave length of light was small as in UV light, large as in infra-red case or the middle spectrum that is direct sun light, it denatured the proteins and the immunogenicity was lost along with toxicity. The study also served to characterise the venom of *Bungaruscaeruleus* but further study is needed.

Proteins are in general sensitive to radiation and that is why the effect is so enhanced on venom when exposed to UV, infra-red rays and to direct sunlight. After irradiation there is change in a number of physical and chemical properties of the proteins. It may further produce rearrangement of the protein (Antoni, 1973). It decreases antigenicity of the proteins as is shown in present study, where we can observe the loss of immunogenic components when exposed to UV, infra-red rays and to direct sunlight. Generally as the wave length of radiation decreases the energy emitted by it increases that means the UV rays which have shorter wavelength as compared to infra-red are more lethal for the proteins but both types of rays are showing same result in the present study. Toxicity and immunogenicity are affected equally by these radiations.

#### Abstract

Cancer is a genome disease, initiated by mutations in genes that usually control cell growth and division. Matrix metalloproteinases (MMPs) have important roles in both of tumor invasion and spread. The present study was conducted to evaluate the effect of ionizing radiation (in the level of treatment doses of  $\gamma$ -rays). The action of collagenase gene was examined *in vivo* by using a model of solid tumor carcinoma (EAC). Eighty male mice were used for this experiment; it is divided into 8 groups, 10 mice / each; which were Normal and beside three groups of normal and like them of tumor transplanted mice each of them exposed to the following accumulated doses (6, 9 and 12 Gy). Whole body mice were exposed to gamma radiation from Cobalt-60 (<sup>60</sup>Co) twice a week with different doses after 12 days of injected EAC in the right thigh region. The different doses of ionizing radiation exposure resulting in different changes (Mutations) on the sequence of collagenase gene in normal and malignant implanted groups and the level of these mutations were height in the malignant groups.

#### Introduction:-

Health care workers (HCW) are at risk of serious infectious diseases. Respiratory protective devices can reduce the risk. This project investigates how they tolerate them to determine if that affects proper use.

#### Objectives:-

To estimate the subjective effects upon users of respirators during activities comparable to healthcare work and to assess the effects of combining face covering and respirators among female health workers.

#### Materials & Methods:-

This study is controlled experimental design with two factors: respirator type and activity type.

Measures of effects were based upon a rating instrument (questionnaire) designed by the Saudi Arabia Medical Students (SAMS) team. Ratings were based on ordinal 6 point scale. The following factors were measured: breathing difficulty, clarity of speech, heat and sweating, level of concentration, vision and comfortability.

**Corresponding Author:- Al-Zahrani R.**

Address:- Al-Imam Muhammad Ibn Saud Islamic University, college of medicine, Riyadh-Kingdom of Saudi Arabia.

Tasks were designed to be comparable to common health care work. These included: walking outdoor, climbing stairs carrying an object, reading out loud (comparable to patient interviewing) and level of concentration (comparable to attending meetings).

The tasks were designed to range from mild activities such as level of concentration (attending a meeting) and reading to strenuous ones such as walking and climbing stairs (carrying an object).

The activities have been pilot tested before the conduction. Factors such as (walking distance, pace, duration, temperature, voice level and object's weight) have been standardized.

Mask conditions were: N95 Respirator (3M Model 1860), Basic surgical mask (Walgreens Model Model # 023185056204), Face cover + N95 combination and No mask.

#### **Sampling Technique:-**

The order of tasks and mask type was assigned randomly among participants. Sixteen tasks sets of measures have been completed by each participant (4 mask conditions x 4 tasks). The whole process of questionnaires administration and collection took about one week.

Participants for the phase `1 pilot trial: Seven female medical students had volunteered to participate, their age group was between (23-26 year-old), and they were all healthy.

Data collection methods, instruments used, measurements: Types of masks have been used are; respirators (N95) and basic surgical mask along with the well recognized face cover that is commonly used (Niqab).

#### **Results:-**

There were statistically significant effects of both respirator type and activity level (Mixed linear model, SAS Proc Mixed). Wearing a respirator (N95) combined with face cover by (Niqab) shows the highest score in the interference with breathing and the level of comfortability in an average of 2.01 and 2.45, respectively. These differences were seen at all levels of exertion, not just the heaviest.

#### **Conclusions:-**

Better controlled studies are required to delineate whether such findings could be extended to those who are of different age groups, different sex such as bearded males and individuals with acute or chronic diseases in the Kingdom of Saudi Arabia.

#### **Acknowledgements:-**

We, the researchers, would like to extend our gratitude to all those people who helped and supported us in completing this project. Dr. Harber, Philip I. for supervising this project and Jing Su for helping us in data analysis. The Dean of College of Medicine Dr. Khalid Alqumaizi, Dr. Sami Aldaham and Dr. Aref Alrwaili for supporting us throughout the GHI program. We express our sincere gratitude to the Dean of Mel and Enid Zuckerman College of Public Health Dr. Iman Hakim, Cecilia Rosales and Jennifer L. Winkler for organizing the GHI program.

DNA extraction, Infected Potato, Protocols

#### Abstract

Transmission of tuber borne diseases is a major cause of yield reduction in potato cultivation. Molecular level diagnosis of the microbial pathogens is a challenge to obtain a sufficient quantity of DNA from infected potato tubers. Therefore, this study focused to find a simple protocol to extract microbial DNA from the infected seed potato. Three different DNA extraction protocols were performed and the extracted DNA was tested for the quantity and quality of DNA using agarose gel electrophoresis. Next Generation Sequencing of 16S rDNA and ITS1 region based amplification was used for the detection of bacterial and fungal pathogens in infected samples using Ion Torrent sequencing platform. Both the enrichment and the culture independent boiling methods of extraction yielded sufficient amount of total genomic DNA from the infected tuber samples. In each method, DNA yield varied depending on the type and severity of infection. The extracted DNA matched with the stringent quality control standards for sequencing on Ion Torrent PGM and amplified both 16S rDNA and ITS1 regions with clear distinctive and reproducible banding patterns in agarose gels. Both bacterial and fungal pathogens were detected with these modified extraction protocols. However, enrichment method was found to be suitable in detecting pathogens even in latent infections. In conclusion, these DNA extraction protocols provided simple, inexpensive and effective methodology in detecting microbial diversity in infected potato tubers.

#### Introduction:-

One of the most remarkable events in the field of microbial ecology in the past decade has been the advent and development of meta-genomics which is defined as "The direct genetic analysis of genomes contained within an environmental sample" (Thomas *et al*, 2012). Application of meta-genomic approaches on microbial diversity identifications has achieved a considerable progress during the past few years. Culture independent direct DNA extraction is the most crucial step in meta-genomic analysis (Jiang *et al*, 2015). However, many technical challenges regarding efficient DNA extraction protocols from various tissue samples are still remain unanswered.

Potato is a major crop of the world and a number of microorganisms thrive on the nutrients that can be found in potato (Follenweider, 2009). The potato plant is susceptible to many bacterial and fungal diseases which consistently

**Corresponding Author:- R. W. P. M. Rajapaksha.**

Address:- Department of Biotechnology, Faculty of Agriculture & Plantation Management Wayamba University of Sri Lanka.

cause yield losses in potato production. The presence of microbial populations in infected seed tubers including latent infections are difficult to detect and enumerate with accuracy due to lot of methodological limitations in DNA extraction. Therefore, direct microbial DNA extraction from potato tubers often yields only very small amounts of DNA insufficient for detection purposes. Like many plant tissues, potato tubers contain acidic polysaccharides (Yusuphetal, 2003; Noda *et al*, 2004) and various polyphenolics (Friedman, 1997) that are known to inhibit total nucleic acid extraction. Obviously, such inhibitors are likely to distort PCR and Next Generation Sequence analysis. However, detection of microorganisms present within infected plant tissues is indispensable in phytopathology as they are responsible for many important diseases. Therefore, a broad array of research efforts are directed towards revealing successful DNA extraction protocols. New research findings on culture independent direct microbial DNA extraction methodologies are required in various research areas.

The development of molecular approaches to community analysis have circumvented the need for cultivation because phylogenetically informative DNA sequences can be directly screened from the environment (Laurel *et al*, 2003). The method describes in the present study illustrates a suitable DNA extraction protocol which could be used in meta-genomic analysis for microbial detection.

## **Materials and Methods:-**

### **Seed Potato Sample Collection:-**

Both infected and uninfected seed potato tubers randomly sampled from the imported seed potato consignments at the entry ports of Sri Lanka were collected from the pathology division of National Plant Quarantine Service–Katunayake, Sri Lanka. The collected seed tubers were separately stored in a cold room under 4 °C at the National Plant Quarantine Service until taken for DNA extraction.

### **DNA Extraction:-**

#### **Enrichment Method:-**

Seed potato tubers were first washed in tap water and then in distilled water. Surface sterilization was done by washing with 10% NaOCl (Chlorox) for 1 min. Small pieces of seed potato tubers especially from the infected samples, stem end and eyes were crushed and incubated in 15 ml of liquid LB. The mixture was shaken for 12 hrs. under 120 rpm. The liquid culture was centrifuged for 10 min. at 12 400 g under 4 °C. The pellet was washed twice using a wash buffer (50 mM TrisHCl & 5 mM EDTA of pH 8.0) and re-suspended in lysis buffer (100 mM TrisHCl & 100 mM EDTA of pH 8.0, 1.5 M NaCl). The suspension was centrifuged for 15 min. at 12 400 g at 4 °C. Then NaOAc and 500 µl of ice-cold isopropanol were added to the supernatant and centrifuged for precipitating the DNA. The pellet was washed with 70% ethanol and re-centrifuged at 12 400 g for 10 min at 4 °C. Ethanol was completely removed by air drying. The DNA was re-suspended in de-ionized water.

#### **Lysis Method:-**

Seed potato tubers were washed with tap water and distilled water. Surface sterilization was carried out by shaking with 10% NaOCl for 1 min. and washed thoroughly with autoclaved distilled water. Seed potato tuber was crushed and filtered using a sterile gauze and 50 ml of the filtrate was centrifuged for 5 min. at 750 g. The supernatant was centrifuged again under 10500 g for 10 min at 4 °C. The cell pellet was re-suspended in 300 µl of TE Buffer. Then 2 µl of lysozyme solution and 1 µl of RNase A were added to the cell suspension. It was mixed by vortexing and incubated at 37 °C for 30 min. Further, 300 µl of lysis solution (2X) and 1 µl of proteinase K were added. The mixture was incubated at 65 °C for 15 min and cooled to room temperature and placed on ice for 3-5 min. Phenol Chloroform mixture of 700 µl was added and mixed vigorously for 10 sec. The debris was removed by centrifugation for 10 min. at 10 500 g at 4 °C. Ice cold isopropanol was added to the supernatant and mixed by inverting the tube several times. DNA was pelleted by centrifugation for 10 min. at 10,500 g at 4 °C and washed with 70% ethanol and air-dried at room temperature.

#### **Boiling Method:-**

Surface sterilization was carried out by washing the infected seed tubers with running water for 5 min. and shaking with 10 % NaOCl (Chlorox) for 1 min. The tuber was washed thrice with autoclaved distilled water and ground manually using a sterile motor and pestle. Then, 10 ml of autoclaved deionized water was added to the crushed potato paste and transferred whole content to an autoclaved container. The mixture was kept for 30-45 min. and filtered using a sterile gauze. The extract was collected and boiled for 5 min. in a water bath adjusted to 95-100 °C. The mixture was then vortexed for 30 sec. and centrifuged under 12400 g for 10 min. The pellet was washed with 3 ml of wash buffer (50 mM TrisHCl & 5 mM EDTA of pH 8.0) under 12400 g for 10 min. Then, 3 ml of lysis

buffer (100 mM TrisHCl & 100 mM EDTA of pH 8.0, 1.5 M NaCl) was added and kept for 30-45 min. with proper mixing in each 10 min. intervals. The homogenized mixture was centrifuged at 12400 g for 15 min. The resulting supernatant was then centrifuged under 12400 g for 15 min. with 150 µl of NaOAC and 1:1 ice-cold isopropanol added along the wall of the tube. The pellet was washed with 70% ethanol and re-centrifuged at 12400g for 10 min. Ethanol was completely removed by air drying. The DNA was re-suspended in de-ionized water.

#### DNA Quantity and Quality Assessment:-

The quality and quantity of DNA from each extraction was verified by 0.8% (w/v) agarose gel electrophoresis looking for no evidence of substantial band shearing or contamination either with RNA or polysaccharide. The concentration of amplified 16s rDNA and ITS1 fragments were tested prior sequencing using a Qubit fluorometric quantitation at Credence Genomics Pvt. Ltd. Colombo, Sri Lanka.

#### Next Generation Sequencing:-

Based on the results of amplification of 16s rDNA and ITS1 regions by PCR, the extracted DNA was submitted to Credence Genomics Pvt. Ltd. Colombo-Sri Lanka for meta-genomic library preparation and sequencing on Ion Torrent PGM platform to confirm the protocol yielded both bacterial and fungal DNA.

#### Results:-

In this study three different DNA extraction methods (Enrichment method, Lysis method and Boiling method) were assessed in order to determine the best method to extract microbial DNA from infected and uninfected seed potato tubers. The enrichment method was capable of yielding DNA from both infected and asymptomatic potato tubers with latent infections. The DNA extracted by enrichment method was found to have higher concentration of approximately 200 ng/ µl (Figure 1).

The culture independent boiling method for meta-genomic DNA extraction was quite efficient in yielding DNA from only infected potato tubers (Figure 2). Quality and quantity of the DNA were found better in both boiling and enrichment methods. Both enrichment and the rapid lysis methods revealed single, high molecular weight DNA bands with little evidence of shearing and less RNA or polysaccharide contamination. The relative band intensities were varied depending on the sample. However, 1 µl of sample resolved on the agarose gel with the 50 ng lambda DNA standard, consistently yielded approximately 5 ng of DNA per gram of potato tissue (Data not shown). Altogether 3 hrs. were needed for DNA extraction from boiling method whereas, enrichment DNA extraction method required approximately 16 hrs. The ratio of absorbance at 260 nm and 280 nm ( $A_{260}/A_{280}$ ) was 1.75. However, the lysis method for DNA extraction was unable to extract DNA properly for producing DNA bands on agarose gel. During the crushing of potato tubers, browning of the solution was observed due to phenolic compound available on the peel. The intensity of browning varied depending on the variety of potato. Upon DNA precipitation, despite the observation of a small brown pellet, the agarose gel failed to reveal any DNA.

PCR amplification of 16s rRNA gene (Figure 3) and ITS1 (Figure 4) regions confirmed the amplification availability of both bacterial and fungal DNA (Table 1). The DNA was sufficient for high throughput sequencing and passed the quality control measures of Credence Genomics Pvt. Ltd. Sri Lanka for Ion Torrent Next Generation Sequencing.

**Table 1:-** Concentration of PCR amplified fragments of four DNA samples extracted from Enrichment method

Sample No.	Concentration after PCR ng/µl	
	16s Rdna	ITS1
1.	0.224	0.059
2.	0.137	0.780
3.	0.211	0.214
4.	1.430	0.564

In conclusion the enrichment method extracted a higher value of DNA concentration and the extracted DNA was of high molecular weight for all extracted seed tuber samples. From this study it was suggested that the enrichment method might be a suitable choice for extracting DNA from both infected and uninfected potato tubers because it is capable of yielding DNA from both infected and asymptomatic tubers with latent infections.

Additional comparative studies are necessary to ensure that potato DNA extraction techniques are optimized for other plant materials. Following the results of this study, we recommend boiling method as a method of choice for meta-genomic DNA extraction from infected potato tubers based on the processing time, easiness of use and DNA extraction efficiency.

### Discussion:-

Polymerase chain reaction (PCR) and Next Generation Sequencing (NGS) based applications in molecular diagnostics for plant pathogens require good quality DNA for reliable and reproducible results. Imported seed potato tuber lots carry various important diseases therefore tissues from potato tubers are often used for DNA extraction to identify the pathogenic bacteria and fungi. The extraction of DNA from potato tubers often requires tedious protocols. Therefore, it was essential to develop a method reducing the number of handling steps, eliminating the need for long incubations or supplementation with expensive commercial based kits and reagents.

Culture independent boiling method for DNA extraction was efficient only with infected potato tubers where the symptoms are observable. The method is based on direct cell lysis with heat and a lysis buffer followed by precipitation with isopropanol. This method was unable to yield any DNA from uninfected tubers which may be due to low abundance of bacteria available. It was observed that the DNA yield will strongly depend on the amount of tissue taken for extraction and the severity of infection of potato tuber.

In latent infection, the bacteria may be found in all parts of tissues however, their density is usually low. When the pathogen populations are low, they need to be enriched above detection level. In enrichment method for DNA extraction, initial incubation of crushed potato with liquid LB acts as a common enrichment medium for bacteria available within the potato tissues and increased the bacterial cell number. This enrichment medium creates conditions that stimulate growth and multiplication of bacteria possibly facilitating the detection of all available pathogens within the sample which may include pathogens as well as the endophytes. That is similarly important as microbial endophytes that colonize potato tissue are widespread and some of the non-pathogenic endophytes could also turn into phytopathogens that are able to induce infection symptoms (Koiv *et al.*, 2015). Therefore, developed enrichment method allows multiplication of available pathogens which possibly enables isolation of most of the bacteria in the samples. Most sequencing technologies essentially require high nanograms or microgram amounts of DNA (Torsten Thomas, 2012). Therefore, enrichment media is one option employed to increase DNA yields. This method can multiply the number of available microorganisms and thus enrichment methods are widely used in microbial research. But there are potential problems associated with culture based methods.

Culture-based methods are important in investigating the microbial communities but they were identified as extremely biased in their evaluation of microbial genetic diversity by selecting a particular population of microorganisms (Rastogi *et al.*, 2011). The inability to culture many microorganisms in the provided media produce a major problem where the reports indicated that only 1-4% of the microbes can be cultivated under standard laboratory conditions (Chaudhuri *et al.*, 2006). The enrichment media used in culturing microorganisms under laboratory conditions are selective and only a subpopulation of the microbes in an environmental sample are grown in any given medium (Schneegurt *et al.*, 2003). The analysis using indirect methods such as incubation was also detected as producing artificial changes in the microbial community structure and metabolic activity. Other limitations to culturing include the inability to predict the proper culture medium to select unknown organisms, and the propensity of fast-growing organisms to outgrow and overshadow the more relevant organisms that grow more slowly. These issues can have significant impact on subsequent microbial community analysis. These several important reasons have led to the development of culture independent rapid lysis method for microbial DNA extraction for unbiased detection of microbial pathogens associated with infected seed potato tubers.

However, several limitations are associated with the culture independent microbial DNA extraction from potato tubers. Polysaccharides and polyphenols including flavonoids and other secondary metabolites interfere with the extraction of pure genomic DNA (Sahu *et al.*, 2012). Potatoes are a great source of phenolic compounds and they are present both in the peel and the flesh of potato tubers (Akyol *et al.*, 2016). In DNA extraction, brownish pellet indicates the contamination of phenolic compounds (Sahu *et al.*, 2012). In all tested DNA extraction protocols, browning of solution was observed which has been attributed to the oxidation of phenolic secondary metabolites in potato tubers. Certain protocols add Polyvinylpyrrolidone (PVP) into extracts to absorb such phenolics preventing their oxidation that renders DNA unusable for downstream applications (Young *et al.*, 1993). In many other protocols, an antioxidant such as DIECA (diethyldithiocarbamic acid) is used in very low concentrations (0.05%)

during enrichment to protect bacteria cells from oxidative stress due to the release of the plant compounds (Czajkowski *et al*, 2015). However, any chemical was not applied in these extraction protocols to remove the phenolic contaminants. Several centrifugation and pelleting steps of unlysed tuber materials was effective for removal of polysaccharide and phenolics continuously leeching in to the solution. Also, unlysed tissues settle in the bottom of the falcon tube were removed during the second step. Early removal of debris has also improved the clarity. Mechanical, thermal, and chemical processes that are used to refine DNA may damage DNA through endogenous enzyme hydrolysis, shearing, depurination, cross-linking, acid hydrolysis, and oxidation (Smith *et al*, 2005). These damaged or fragmented template DNA may severely reduce amplification efficiency in PCR or may render target sequences undetectable.

In boiling and enrichment methods for DNA extraction; DNA precipitation included the addition of NaOAc high salt solution before DNA was precipitated with IsoPropanol. Polysaccharides have a similar solubility to DNA and co-precipitate in either iso-propanol or ethanol inhibiting downstream molecular applications (Healey *et al*, 2014). The addition of a high salt buffer increases their solubility in ethanol, allowing their removal once the DNA has been precipitated and pelleted.

To better determine how well the extraction methods performed each of the methods were analyzed separately. The DNA was successful in NGS which may be due to either a lesser degree of inhibitors or a lower degree of damage to the template DNA during extraction. There was no significant difference between the DNA quality recovered by the enrichment method and rapid lysis methods which produced the most consistent, highest quality template.

The extensive research on meta-genomic DNA extraction targeting different substrates highlights the need to ensure that, extraction procedures are well benchmarked, and that multiple methods are compared to ensure representative extraction of DNA (Thomas *et al*, 2012). This research was basically focusing on development of culture independent meta-genomic DNA extraction method from potato tubers. The applied boiling method extracted the sufficient amount of DNA yields from the tuber material. For most of the analyzed tuber samples, this method recovered the highest levels of amplifiable DNA yields however the yield varies from one sample to another depending on the disease intensity which indicated that overall yield had greater influence over intensity of infection or the level of disease spreading.

### Conclusion:-

The optimized enrichment and boiling methods for DNA extraction are simple and rapid therefore, suitable for routine diagnosis assays from potato. The methods yielded sufficient quantities of DNA from the pathogenic microbes associated with the seed tubers. DNA was suitable for the detection of bacterial and fungal pathogens using PCR and NGS based analysis.

#### Abstract

The incidence of breast cancer is directly related to the age as it increases with it. The diagnosis of breast cancer at an age below 40 is relatively uncommon with the majority being diagnosed at the age of 50 or older. Breast cancer accounts for less than 1.8% in females younger than 30 years of age. In this paper, we report a case of a 26-year-old lady who presented with a picture of cholestatic hepatic disease and then later found to have invasive ductal carcinoma with hepatic metastasis confirmed by histopathology.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Worldwide, breast cancer is the most common cancer in females, accounting for 22% of all newly diagnosed cancers in this group of patients.<sup>[1-4]</sup> According to cancer incidence report of Saudi Arabia 2009, breast cancer ranked first among females accounting for 25.1% of all newly diagnosed female cancers.<sup>[1]</sup> The median age at diagnosis of breast cancer was reported to be 48 years compared to a median age in USA of 62 years at diagnosis.<sup>[2,3]</sup>

Breast cancer is uncommon in women younger than 30 years of age; the percentage of the new cases below the age of 30 is less than 0.65%.<sup>[4,5]</sup>

Breast carcinoma is not only uncommon in young female, but at a younger age it often tends to be more aggressive with poor survival as the survival rate in 20 years is less than 30% compared to older patients with the same tumor and stage.<sup>[5]</sup>

#### Case Report:-

A 26-year-old Saudi single female, presented to us complaining of an abdominal pain associated with nausea, anorexia, abdominal distension and weight loss of one-month duration. The patient has no previous medical or family history contributing to the present illness.

Physical examination revealed jaundiced sclera, distended abdomen consistent with ascites and hepatomegaly. The liver span was 16 cm. The other parts of physical examination were normal.

Liver function test, PTT, PT, and tumor markers are shown in [Table 1].

Tri-phasic CT scan revealed infiltrative hepatic lesion as shown in [Figure.1].

**Corresponding Author:-Hadeel Al Omran.**

Address:-Department of Internal Medicine and Pathology, King Fahad University Hospital, University of Dammam, Kingdom of Saudi Arabia.

Transcutaneous biopsy was taken from the right hepatic lobe and the findings were consistent with diffuse and glandular invasive carcinoma as shown in [Figure.2].

Immuno-histochemical staining showed tumor cells that are strongly positive for estrogen receptors and CK19. However, progesterone receptors and HER2 are negative [Figure 3 and 4].

Based on these findings, breast carcinoma was suspected, and indeed, breast examination showed left breast mass, measuring 3x3 cm that was fixed to the skin with no nipple discharge, along with cervical lymphadenopathy.

Our patients passed away within less than 4 weeks of her presentation due to disseminated intravascular coagulopathy secondary to hepatic metastasis from breast carcinoma and hepatic failure.

Because of the quick deterioration of the health state of the patient and death, it was not possible to perform a mammography or initiate any kind of interventional or palliative therapy.

**Table 1:- Rapid liver function deterioration within 4 weeks till patient death**

Investigation	On day of admission 15/1/2016	On day of death 9/2/2016

### Discussion:-

Invasive breast carcinoma is uncommon in women younger than 40 years old. It accounts for less than 1.8% in females with breast cancer younger than 30 years of age. <sup>[4]</sup>As far as we know, the youngest reported age of woman with breast cancer in the literature was 21. <sup>[6]</sup>

In Saudi Arabia, the median age at diagnosis of breast cancer is 48, a decade younger than the reported median age in the developed countries, where the median age at diagnosis is 61 and 58 years old for white and black women, respectively. <sup>[2,3]</sup> In general, it's been noticed in the literature that a higher proportion of patients were diagnosed with breast cancer at an age less than 40 in Africa and the Middle East; and the researches to reveal whether environmental factors or genetic differences contribute to this early occurrence, are ongoing. <sup>[7]</sup>

Several, however, uncommon factors contribute to the prognosis and the aggressive nature that might lead to an unfortunate ending in breast cancer patients, including young age at diagnosis as previously discussed, hormone receptor status, elevated tumor marker levels, hepatic metastasis as well as family history of familial syndromes of breast cancer; and our patient had many of these factors.

Breast cancer in young patients tends to be more invasive and aggressive clinically, biologically, and in term of its histological aspects leading to poor prognosis. <sup>[5,8]</sup> Younger patients often tend to have lower ER positivity and higher HER2 positivity; our patient showed the contrary. <sup>[7]</sup>

Young patients presenting with breast cancer may have abnormal single genes mutation transmitted as autosomal dominant such as BRCA1 and BRCA2, or genes as TP53 and CHEK2 which are transmitted as autosomal recessive genes that may play a fundamental role in developing breast cancer in patients younger than 40 years

of age.<sup>[3,7,9]</sup> However, our patient did not mention positive family history of breast cancer, ovarian cancer, prostate cancer or colon cancer that support familial risk of her breast cancer.

Investigations of our patient showed an isolated extensive liver metastasis with infiltrative pattern.

Some studies showed that isolated hepatic breast cancer metastasis ranges from 2% to 26% with a median survival of only a few months.<sup>[10]</sup> The liver function test of our patient showed bilirubin of 5 mg/dl and albumin level of 2 gm/dl indicating liver failure. Studies have shown that patients with breast cancer and marked impaired hepatic function secondary to breast carcinoma had poor prognosis and some patients died at the first cycle of chemotherapy. Just like our patient, the range of survival of such patients varies from only two weeks up till 6 weeks.<sup>[10]</sup> Features indicating very poor prognosis of patients with hepatic metastasis of breast cancer include extensive invasion of the liver, low albumin, less than 2gm/dl and high bilirubin, more than 5 mg/dl.<sup>[10]</sup> All in all, our patient had deleterious progressive hepatic metastasis and she passed away within less than 4 weeks from her admission. It was not possible to provide any active therapy such as palliative chemotherapy since the patient performance status at admission was 3 (based on ECOG) and presented with marked impaired liver function secondary to hepatic failure from the metastasis.

### Conclusion:-

Breast cancer in young females < 40 years of age is relatively uncommon hence, young age at diagnosis is considered as a poor prognostic factor. It often follows an aggressive and invasive course with poor outcomes as what happened with our patient whose symptoms were sudden and progressive with liver failure that lead to her death in less than 4 weeks.

**Figure1:-**Liver metastases; Characteristic appearance of liver metastases on a contrast-enhanced axial CT scan.

Protein enrichment, Potato peel, *Saccharomyces cerevisiae*, Chemical analysis, Fermentation.

#### Abstract

Disposal of kitchen waste is universal and likewise the need for food to the growing human population is inevitable, a sure solution is immediately needed. The bioconversion of potato peel into certain valuable products like single cell protein (SCP) has the ability to solve the worldwide food protein deficiency by obtaining an economical product for food and feed. The aim of using kitchen waste as substrate for the production of high nutritious food product may decrease environmental pollution due to utilization of kitchen waste as a substrate, up to some extent. However, using flour prepared from dried potato peels were inoculated with pure culture of *Saccharomyces cerevisiae* and then left for four days. Chemical analysis of the fermented potato peel mash revealed a significant ( $p < 0.05$ ) increase in the protein content of the potato peel mash when compared with unfermented potato peel. This result also shows that fermentation increased significantly the protein of the fermented potato peel mash, while a decrease in carbohydrate was observed. Moisture content of 125%, temperature of 30<sup>0</sup> and pH of 5.5 were maintained for growth of *S. Cerevisiae* on the mash. Therefore fermented peels could be a good source of protein enriched feed.

#### Introduction:-

Various forms of organic waste such as cellulose hemicelluloses, hydrocarbon and different types of agricultural waste were used in the production of protein enrich food<sup>1</sup>. Lignocelluloses wastes (LCW) refer to plant biomass wastes that are composed of cellulose, hemicellulose, and lignin. Potato (*Solanum tuberosum* L.) is one of the major world crops with world annual production of 180million tons on 2009 according to the Food and Agriculture Organization (FAO)<sup>2</sup>. The Potato peels are rich in phytonutrients, carbohydrates, high in starch (8-28%) but with only 1-4% protein. Anon reported that potato starch is a large grained starch containing 25% amylose and 73% amylopectin and high phosphate content<sup>3</sup>. A large amount of potato peels are discarded during processing for chips by many industries. Protein enrichment of potato peels through inexpensive means is therefore desirable<sup>4</sup>. Solid state bio processing (SSB), an aerobic microbial transformation, has been successfully exploited for enzyme and food production, phenolic enhancement, fruity aroma production as well as many other uses. Culture conditions of bioprocessing are more similar to the natural habitat of filamentous fungi, which leads, in many cases, to higher efficiency, as well as lower generation of liquid waste<sup>5</sup>. The materials that make up wastes should normally be recycled back into the ecosystem, e.g.:- straw, bagasse, citric acid, olive, and date waste, whey, molasses, animal

manures and sewage. The amount of these wastes can be very high and may contribute to a significant level of pollution in watercourses<sup>6</sup>. A variety of microorganisms and substrate are used to produce protein rich food. Yeast is suitable for production because of its superior nutritional quality. The supplementation of cereals especially with yeast, make them a good source of protein for animal. The necessary factor considered for its production is the demonstration of toxic and carcinogenic compounds originated from substrates, biosynthesized by microorganisms or formed during processing. *Saccharomyces cerevisiae* and *Candida* has been used to bio convert agro-industrial waste into valuable protein sources. Of all the essential plant nutrients, Nitrogen is the most often limiting to potato production on sandy soils. Nitrogen fertilizer recommendations for irrigated soils are based on crop yield goal and previous crop. Nitrogen supplementation of the raw substrate with ammonium sulphate in solid state bio processing may stimulate growth or improve process efficiency<sup>5</sup>. The objective of the present investigation were to study the protein enrichment of potato peel by the process of solid-state bio processing using *Saccharomyces cerevisiae* and its addition as a protein supplement to the diet of animals.

### **Material and Methods:-**

**Requirements:-** Lyophilized culture, inoculating loop, incubator shaker, laminar Air Flow, Erlenmeyer flask (250ml), measuring cylinder, distilled water, autoclave, ethanol (70%), cotton, refrigerator, centrifuge, colorimeter, etc.

### **Preparation of YEPD media:-**

**Medium components:** Pure culture of yeast (*Saccharomyces cerevisiae*) used was MTCC 170. It was revived on YEPD<sup>5</sup> (Yeast Extract 3.0g; Peptone 10.0g; Dextrose 20.0g; Agar 15.0g; distilled water 1.0 L) at 30<sup>0</sup> C for 48hrs and was stored at 4<sup>0</sup> C.

### **Procedure:-**

- YEPD medium (50ml) was prepared in Erlenmeyer flask (250ml) and autoclaved at 15psi for 15min.
- Inoculum (2ml) developed was transferred to the 50ml YEPD medium prepared in a flask and kept for 30<sup>0</sup>C for four days on rotatory shaker.
- Chemical analysis of the culture was done after every 24hrs of incubation for four days.

### **Culture revival of *Saccharomyces cerevisiae* (MTCC no. : 170):-**

**Medium components:-** Pure culture of yeast (*Saccharomyces cerevisiae*) used was MTCC 170. It was revived on YEPD<sup>5</sup> (Yeast Extract 3.0g; Peptone 10.0g; Dextrose 20.0g; Agar 15.0g; distilled water 1.0 L) at 30<sup>0</sup> C for 48 hrs and was stored at 4<sup>0</sup> C.

### **Procedure:-**

- Pure culture was obtained in lyophilized form from MTCC (microbial type culture collection), IMTECH.
- Culture was revived in Yeast extract potato dextrose (YEPD) broth medium consists of Yeast extract 3.0g; Peptone 10.0g; Dextrose 20.0g; Agar 15.0g; Distilled water 1.0L.
- Culture was spread to the YEPDA medium plates using spreader under sterile conditions and incubated at 30<sup>0</sup>C for 24hrs. Optical density of the culture was checked in colorimeter at 680nm.
- Sub culturing was done to maintain culture for further use.

### **Preparation of YEPD media supplemented with ammonium sulphate:-**

**Medium components:-** YEPD medium for *Saccharomyces cerevisiae* production was prepared<sup>5</sup>. It consists of (g/l): Yeast extract 3.0g; Peptone 10.0g; Dextrose 20.0g, ammonium sulphate 2.5%, distilled water 1.0L.

### **Procedure:-**

- YEPD medium (50ml) was prepared in Erlenmeyer flask (250ml), and ammonium sulphate (1.25g/50ml) was added and autoclaved at 15psi for 15min.
- Inoculum (2ml) developed was transferred to the 50ml YEPD medium prepared in a flask and kept at 30<sup>0</sup>C for four days on rotatory shaker.
- Chemical analysis of the culture was done after every 24hrs of incubation for four days.

**Substrate:-**

The potato peels used in this study was obtained from nearby fast food facilities. The peels were washed thoroughly with sterile distilled water, cut into tiny bits and dried in an oven at 60°C for 48 hrs. The dried peels were powdered by using Pestle and Mortar, subsequently sieved with 0.5mm screen mesh<sup>4</sup>.

**Preparation of potato peel media in YEPD broth:-****Medium components:-**

Dried potato peel powder (10g), specific medium for *Saccharomyces cerevisiae* production was prepared<sup>5</sup>. It consists of (g/l): Yeast extract 3.0g; Peptone 10.0g; Dextrose 20.0g, distilled water 1.0L.

**Procedure:-**

- YEPD medium (50ml) was prepared in Erlenmeyer flask (250ml) and autoclaved at 15psi for 15min. Inoculum (2ml) developed was transferred to the above prepared medium in a flask and kept at 30°C for 17-18hrs. Dried potato peels were weighed (10g). Moisture level (125% (v/w)) was adjusted and autoclaved at 121°C for 15min.
- Under aseptic conditions, YEPD growth media was transferred to flask containing dried potato peels which was then kept for fermentation at 30°C on rotatory shaker (150rpm) for four days.
- Chemical analysis of the culture was done after every 24hrs of incubation for four days.

**Preparation of potato peel media in YEPD broth supplemented with ammonium sulphate:-****Medium components:-**

Dried potato peel powder (10g), specific medium for *Saccharomyces cerevisiae* production was prepared<sup>5</sup>. It consists of (g/l): Yeast extracts 3.0g; Peptone 10.0g; Dextrose 20.0g, ammonium sulphate 2.5%, distilled water 1.0L.

**Procedure:-**

- YEPD medium (50ml) was prepared in Erlenmeyer flask (250ml) and autoclaved at 15psi for 15min. Inoculum (2ml) developed was transferred to the above prepared medium in a flask and kept at 30°C for 17-18hrs.
- Dried potato peels were weighed (10g). Moisture level (125% (v/w)) was adjusted. Ammonium sulphate was added (2.5%) in the flask containing dried potato peels and autoclaved at 121°C for 15min.
- Under aseptic conditions, YEPD growth media was transferred to flask containing dried potato peels which was then kept for fermentation at 30°C on rotatory shaker (150rpm) for four days.
- Chemical analysis of the culture was done after every 24hrs of incubation for four days.

**Solid State Bio processing:-**

Solid state bioprocessing was carried out in 250ml Erlenmeyer flasks containing potato peel (10g). Flasks were aseptically inoculated with inoculum suspension of *Saccharomyces cerevisiae* ( $2 \times 10^8$  CFU/ml). Flasks were covered with sterilized gauze covers and statically incubated at 30°C in a laboratory incubator for 4 days with intermittent manual shaking. Samples, as whole flasks in duplicate were withdrawn after each 24hrs. The time necessary to reach the peak of protein concentration was evaluated<sup>5</sup>.

**Result:-****Chemical analysis of fermented potato residue:-****Moisture content:-**

Fermented potato residue was dried at 60°C until its weight remained constant. The weight difference after drying was considered the moisture content.

**Moisture Content:-**

Item	Moisture content (%)
Unfermented potato peel	71.7%
Fermented potato peel	85.51%

**Water holding capacity:-**

Potato peel residue was soaked in water at 4°C for 24hrs and centrifuged at 14000 rpm for 1hr, the supernatant was discarded, and the amount of moisture of the residual pellet was determined as water-holding capacity.

**Water holding Capacity:-**

Item	Water holding capacity (%)
Unfermented potato peel	85.02%

**Determining pH level:-**

PH level were estimated in a suspension of sample (0.5g) in distilled water (10ml). Statistical analysis of data was determined by Analysis of Variance (ANOVA) and Tukey test was applied with accepted significance of  $p < 0.05$ . PH level was kept constant at 5.5 throughout the fermentation.

**Protein content in wet biomass:-**

Protein content was calculated by Folin Lowry method.

**Table1:-**Protein content of wet biomass of different media during fermentation.

Media	24 Hours ( $\mu\text{g/ml}$ )	48 Hours ( $\mu\text{g/ml}$ )	72 Hours ( $\mu\text{g/ml}$ )	96 Hours ( $\mu\text{g/ml}$ )
YEPD	2.2	3.5	6.2	6.2
YEPD+AS	14.2	17.7	24	26.6
YEPD+PP	21.3	23.1	27.55	30.2
PP+AS	28.4	34.6	40.8	45.3

**Fig 1:-**Conc Of protein in wet biomass (ug/ml)

The protein content of YEPDA was lower than the protein content in the substrate supplemented with ammonium sulphate during solid state fermentation for four days by *Saccharomyces cerevisiae*. But there was constant increase of protein content in the potato peel supplemented with and without ammonium sulphate as compared to synthetic media. With low concentration ( $2.2\mu\text{g/ml}$ ) of protein in synthetic media during first 24hr of fermentation, effect of nitrogen supplementation was examined as shown in fig-1. Supplementation with 2.5% of ammonium sulphate, results in the enrichment of protein level ( $45.3\mu\text{g/ml}$ ) of potato peel as compared to concentration ( $21.3\mu\text{g/ml}$ ) of potato peel without ammonium sulphate during solid state fermentation by *Saccharomyces cerevisiae*. This shows that ammonium sulphate have been utilized as a source of nitrogen which results in the increase in protein content of the potato peel during fermentation.

**Protein content in dry biomass:-****Table2:-**Protein content in dry biomass of different media after fermentation

Media	96 Hours ( $\mu\text{g/g}$ )
YEPD	7.1
YEPD+AS	29.3
YEPD+PP	34.6
PP+AS	49.7

**Fig 2:-**Conc of protein in dry biomass (96-hrs) (ug/ml)

The final dried biomass of substrate after 96hrs of fermentation results in the overall increase in the protein content as compared to wet biomass. Protein content in the final bioprocessed product reached 49.7µg/ml when supplemented with ammonium sulphate. Without supplementation of ammonium sulphate, bio processed sample reached around 34.6µg/ml in the dried biomass. This shows that *Saccharomyces cerevisiae* have utilized ammonium sulphate, source of nitrogen for protein enrichment.

### Discussion:-

The results obtained from this study revealed that fermentation can bring about desirable changes in the nutrient composition of potato peels. From this study, yeast showed potential to increase the protein content of the potato peel mash. The yeast *S. cerevisiae* demonstrated the best ability to enrich the peel mash in four days. The peels when fermented with *S. cerevisiae* had an improvement to 18.62%. This implied that yeast had significant ( $P < 0.05$ ) effect on the protein content. The increase in the crude protein observed could be attributed to the additional crude protein (extracellular enzymes) such as amylases production from the fungal mycelia<sup>9-12</sup> and thus secreted into the supernatant of fermenting mash in order to make use of the starches as a carbon source<sup>13</sup>. Furthermore, increase in the growth of the microorganisms in the fermenting potato peel mash may possibly account for increase in the protein content of the fermented peel mash as reported by some other workers<sup>14,15</sup>. Similar results using sweet potato have been reported by<sup>8, 16</sup>. An optimum temperature and pH range of 25°C and 5.5 respectively supported the highest crude protein formation when *S. cerevisiae* was grown on the potato peel mashes. This finding is in agreement with that of<sup>17</sup> who reported a temperature range between 25°C and 30°C to be favorable for the growth of most yeast. Similar findings were also reported by<sup>14</sup>. This observation further confirms that the increase in crude proteins observed is as a result of an increase in cell mass generated by the organism. Therefore, the commercial utility of protein enrichment of potato peel residue with *Saccharomyces cerevisiae* by solid state fermentation for animal feed appears to be promising as described by<sup>18</sup>. The water holding capacity of potato peel residue was 85.02%. The moisture content of the unfermented potato peel substrate was 71.7% which was lower than the water holding capacity. Whereas, the moisture content of fermented potato peel was (85.51%) lower than the moisture content in potato peel supplemented (86.89%) with ammonium sulphate. Similar findings were also reported by<sup>7</sup>.

### Conclusion:-

The results obtained in the study have shown that growing of yeast on potato peel mash can enrich its protein content. This could be attributed to the ability of *Saccharomyces cerevisiae* to utilize ammonium sulphate as a source of nitrogen in protein enrichment, apart from this, to make use of potato peel carbohydrate as a source of carbon. The increase in the microbial biomass in the potato peel supplemented with ammonium sulphate account for the increase in the protein content by yeast during fermentation.

methemoglobinemia

#### Abstract

Acquired methemoglobinemia is a dyshaemoglobinemia which results from exposure to various oxidizing agents, results in impaired oxygen delivery to the tissues and can be potentially fatal if untreated. Deliberate ingestion of certain herbicides, insecticides, and pesticides may produce this condition. We report 2 cases of methemoglobinemia due to intentional ingestion of pesticides which were marketed to be safe and contain only biological extracts and fillers. Methylene blue, ascorbic acid, blood transfusion and exchange transfusion are the various modalities of treatment.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Introduction:-

Methemoglobin (MetHb) is a dyshemoglobin, represents the oxidized form of hemoglobin (Hb), the ferrous ( $\text{Fe}^{2+}$ ) state of iron is transformed into ferric ( $\text{Fe}^{3+}$ ) state, which makes it incapable of binding to oxygen. Acquired methemoglobinemia is more common than inherited and results from exposure to various oxidizing agents such as nitrates, nitrites, aniline, dapsone, local anaesthetics, herbicides and pesticides. We report 2 cases of methemoglobinemia induced by ingestion of pesticides with suicidal intent.

#### Case presentations:-

##### Case 1:-

A 25-year-old woman presented to emergency with alleged history of poisoning with pesticide within 40 minutes after consumption. She was found unresponsive and was intubated and mechanically ventilated. At presentation, she was cyanotic with pulse rate, 90 beats/min; respiratory rate, 28 breaths/min; and blood pressure, 130/80 mmHg. Bilateral breath sounds were clear. Bilateral pin point pupils with sluggish reaction to light were noted. Within 3 hours after admission, she became hemodynamically unstable and developed generalized tonic clonic seizures. Oxygen saturation measured by pulse oximetry ( $\text{SpO}_2$ ) was 67 % at ambient air and 88% with 100% oxygen. Her blood samples appeared chocolate brown. Arterial blood gas (ABG) analysis with CO-oximetry (SIEMENS Rapid point 500) showed a partial pressure of  $\text{O}_2$  ( $\text{pao}_2$ ) 467.5 mmHg, arterial  $\text{O}_2$  saturation of 99% ( $\text{SaO}_2$ ) and MetHb of 78%. She was treated with 1% methylene blue, ascorbic acid, exchange transfusion, antiepileptics, and inotropic support but despite of treatment, she expired on day 3.

**Case 2:-**

A 25-year-old man was brought to emergency with alleged history of poisoning with about 100ml of pesticide within 90 minutes of ingestion. At presentation, he was conscious, coherent and cyanotic. His vital signs were as follows: pulse rate, 120/min; blood pressure, 130/80mmHg and respiratory rate, 26 breaths/min. SpO<sub>2</sub> was 70% at ambient air and 86% with oxygen supplementation of 6L/min. Bilateral breath sounds were clear. Bilateral pin point pupils with sluggish reaction to light were noted. Within 30min. of hospitalization, he became unconscious for which he was intubated and mechanically ventilated. ABG analysis with CO-oximetry showed pO<sub>2</sub>, 621mmHg, SaO<sub>2</sub>, 99% and MetHb, 80%. Patient had troponin I&T positive and urine for myoglobin was positive.

He was administered 1% methylene blue (1mg/kg). CO-oximetry after 1 hour showed MetHb of 50 %. A single volume of exchange transfusion was done. He gained consciousness and became oriented. Two doses of 1% methylene blue were repeated with an interval of 12 hours to prevent rebound methemoglobinemia and MetHb was 6.2% after 3<sup>rd</sup> dose. In addition, he received inj. vitamin C 500mg in 5% dextrose once daily. He was extubated on 4<sup>th</sup> day and discharged after 7 days of admission, MetHb was 2% at the time of discharge without any neurological deficit.

**Discussion:-**

Methemoglobinemia (MetHb > 2%) is an altered state of hemoglobin which results when there is an overwhelming oxidative stress exceeding the normal protective mechanisms. Acquired methemoglobinemia is induced by exposure to various oxidizing agents, most commonly due to nitrates and nitrites (1, 2).

The clinical manifestations (Table I) of methemoglobinemia are due to impaired oxygen delivery to the tissues and hence correlate with severity of methemoglobinemia.

Table I: Levels of methemoglobin and associated clinical features (3)

Methemoglobin %	Signs and symptoms
< 15%	Asymptomatic
20-30%	Cyanosis, headache, fatigue, mental status changes, syncope, dizziness, and exercise intolerance
30-50%	Shortness of breath and headache
50-70%	Lethargy, stupor, dysrhythmias, seizure, coma
>70%	Death

The onset of signs and symptoms in our cases was 30-60 minutes after pesticide ingestion. We observed bilateral pin point pupils in two cases and positive troponin and myoglobin in one case but this finding was not seen with similar poisoning described by George et al (4).

Common insecticides that induce methemoglobinemia include indoxacarb, aluminium phosphide, and paraquat. The pesticide consumed in our case reports contains biological extracts, stabilizers and fillers which was marketed to be safe and no mention of an antidote. We found only one case report (4) of toxicity with the similar pesticide in the literature. Biological extracts are rich in nitrogenous products and hence can potentially cause methemoglobinemia (4).

Figure 1:-

Methemoglobinemia should be suspected clinically by the presence of cyanosis in the presence of a normal PaO<sub>2</sub> and chocolate-brown colored blood (Figure1). The presence of methemoglobinemia can be suspected when the SpO<sub>2</sub> is significantly different from the SaO<sub>2</sub> ("saturation gap"). This saturation gap between SaO<sub>2</sub> and SpO<sub>2</sub> greater than 5% is a diagnostic clue to the presence of MetHb(5). To confirm methemoglobinemia, carbon monoxide (CO)-oximetry is required. Even CO-oximeters cannot distinguish between MetHb and sulfhemoglobin due to similar absorbance peaks at 630 nm (6). MetHb was detected by absorption spectrophotometry after addition of sodium cyanide in the clinical biochemistry laboratory.

Figure 2:-

Management of acute methemoglobinemia begins with discontinuation of the offending agent. Methylene blue (MB) is the first line antidotal therapy which provides an artificial electron transporter for the reduction of MetHb via the NADPH dependent methemoglobinreductase system. Methylene blue is indicated when MetHb exceeds 25-30% in asymptomatic patient or when the patient exhibits symptoms of oxygen deficiency, such as dyspnea and alteration of

consciousness (7). The recommended dose of 1% methylene blue for adults is 1-2mg/kg diluted in 100ml of isotonic saline, infused intravenously over 5 minutes. The response is usually rapid within 30 minutes; the dose may be repeated in one hour if the level of methemoglobin is still high one hour after the initial infusion (8). Dextrose containing fluids should be co-administered in order to increase NADPH formation. Injection ascorbic acid (300 to 1000 mg/day) may be useful which activates alternate minor pathway. Serial measurements of methemoglobin levels should be performed following treatment with MB as rebound methemoglobinemia may occur up to 18 hours after MB administration. The dose can be repeated hourly up to a maximum of 7mg/kg over 24 hours (9). As observed in one of our patients, symptoms of dyspnea and depressed mental status improved within 30 minutes of MB injection. Caution should be exercised to avoid over dosage (>7 mg/kg) because cumulative doses of MB can cause dyspnea, chest pain, hemolysis and paradoxical methemoglobinemia in some susceptible subjects. Methylene blue should not be administered to patients with known glucose 6-phosphate dehydrogenase (G6PD) deficiency.

Severe methemoglobinemia (MetHb>70%) is usually fatal, as evidenced in our first case though survival has been reported with a MetHb level of 80% in our case 2 and previous reports (4, 10).

In case of unresponsive methemoglobinemia with MB, exchange transfusion or hyperbaric oxygen may be beneficial (5).

Fig 1 : ABG suggestive of methemoglobinemia (met Hb :80.17%)

Fig 2 : Chocolate brown colored blood due to methemoglobinemia on the left

### Conclusion:-

We conclude that every physician should be cautious in cases of poisoning with unknown chemical composition which may potentially cause fatal complications like methemoglobinemia. A high index of clinical suspicion of methemoglobinemia is required in all cases of unexplained cyanosis.

### Consent:-

Written informed consent was obtained from the patient's guardian/parent for the publication of this report.

**Conflicts of interest:** None

Decision Support Systems Co-evolutionary Algorithms Matching Suppliers Maximize Profit.

#### Abstract

This study is proposed for a small and medium-sized steel construction company to answer their problem in choosing suppliers on a project. A steel construction company's project usually works with a same basic material for many types of item such as steel. Furthermore, the price for each item from the supplier is not based on the item type but its volumes. This study will perform a simulation of decision support system to help the company in decision making about which supplier will supply the item to gain the maximize profit. In this study, a co-evolutionary algorithm is used as the basic foundation for the application to optimize the profit by matching the right supplier for each item. The objective of doing this simulation is to proof that there is a rise in profit of the company by doing a matching the right supplier for the company. In this study will consider two kind of scenarios: (i) without considering discount (ii) with considering discount and divided into 2 cases in each scenario: First case is when the company use the same type of goods which make the price from each supplier is only based on their volumes. The second case, is when the company use different type of goods which make the price from each supplier become more variety. These scenarios are proposed see how co-evolutionary algorithms perform in making a decision when the parameters become more varieties and developed by using Java Net Beans.

#### Introduction:-

Generally, the optimal solution for effective purchasing is the buyer was free to choose from a range of different sources. Mostly, all companies choose the supplier who providing the lowest price. There is a strong trend in many companies towards reducing the total numbers of suppliers as well as concentrating more on developing the relationships with the remaining ones that the company is dealing directly with. This can be achieved by forming systems of suppliers, with the right suppliers for each item in the company.

The main issue in this study is doing this simulation of decision support system to help the company to proof that there is a rise in profit of the company by doing a matching supplier with using co-evolutionary algorithm. In this study, the numerical example based on the steel-construction company (SCC) case, which in this case SCC can receive multiple project from a single company. Before doing the project, SCC will make a contract first with the

**Corresponding Author:-Friska Natalia.**

Address:-Department of Information System, Universitas Multimedia Nusantara, Tangerang, Indonesia.

related company. The contract is established by submitting a proposal about project timeline, budgeting, resources, etc. After the proposal is submitted and approved by the related company, SCC will start doing the project. Usually, the company will check the total cost and the duration needed to finish the project on the proposal and the proposals have the lowest cost and duration will be approved. In order to maximize the profit, SCC will choose the most expensive item from many suppliers so SCC can maximize the profit since SCC is a service company. Choosing the best supplier isn't that simple because of the variant item needed in a project and many suppliers can supply the same item with higher cost. Therefore, in this study proposes a solution by demonstrating a decision support system using co-evolutionary algorithms in matching suppliers. Decision support system is an interactive computer-based system to support user in assessing and deciding an option [6]. The applicability and efficiency of solution procedure is demonstrated through numerical example and a co-evolutionary algorithms and genetic algorithm (GA) is proposed as a solution method [7]

### Background and Related Works:-

A study of coevolutionary algorithm and genetic algorithm for multiobjective optimization is performed used in the previous research by [3]. In their study, they were comparing coevolutionary algorithm (CGA) with 7 other algorithm in optimizing multiobjective function. The other algorithm is: random search (RAND), Fonseca and Fleming's multiobjective GA (FFGA), the Niched Pareto GA (NPGA), Hajela and Lin's weighted sum approach (HLGA), the Vector Evaluated GA (VEGA), the Nondominated Sorting GA (NSGA), a single-objective EA using weighted-sum aggregation (SOEA), and the Strength Pareto GA (SPEA). The used test function provide a range of difficulties for multiobjective optimization (e.g., multimodality, deception, isolated optima). In each optimization, it is desired to minimize the objective vector by finding its Pareto-optimal front. The result show that the CGA performed very well compared to the other evolutional algorithm and random search. It could be argued that the CGA qualitatively performed on par with or outperformed the other algorithms based on four of the six functions.

Based on previous research [4], genetic algorithm works well in searching and optimizing a solution. Genetic algorithm have a simple and understandable principles but it is complex to design the chromosome and implement it. These principles is rather similiar with the problem that coevolutionary algorithm had.

The study of using coevolutionary algorithm and genetic algorithm to collaborate between 2 company already performed by [1]. Their study proposed a collaboration between 2 delivery service company in 3 different region based on the terminal status and the service center location. A coevolutionary algorithm and genetic algorithm is applied in the proses and the result was satisfying. After that, they extend the study with proposes a sustainable alliance model, which deals with selecting service centers in each merging region with low demand in express delivery services by using a co-evolutionary genetic algorithm based heuristic is developed for network design, which may be implemented under a distributed decision-making scenario assumed in collaboration system by [2].

This study will develop the solution model of decision support system to matching suppliers with using co-evolutionary algorithm. The objective in this study is to maximize the profit of the company by doing a matching supplier in steel-construction company (SCC) with two kind of scenarios: without considering discount and with considering discount and also in each scenario considering for each item are made with same or different raw materials.

### Problem Definition :-

The main problem in this study is how to maximize the profit by matching the right supplier for each item. This study considers a small to medium steel-construction company (SCC) in choosing supplier in a single project. Matching or choosing the right supplier become difficult as the types of item and the decision parameter increased. The more item used in a project, the more difficult it is for SCC to decide which supplier will supply the item. In this study will consider two kind of scenarios: (i) without considering discount (ii) with considering discount and based on the required problem, the problem is divided into 2 cases in each scenario:

#### a) Case 1

Assumptions:

There are  $m$  companies whose distribute the raw materials that needed for make items.

There are  $n$  items. All of these items are made with the same raw materials.

Labor works for each raw materials are same for each company.

Let  $i$  denoted the order of company that being used for supplying raw materials where  $i$  denote the set of possible companies.  $\therefore i \in I$ . Therefore,  $\max\{i\} = m$ .

Let  $j$  denoted the item that made from raw materials where  $j$  denote the set of possible items.  $\therefore j \in J$ . Therefore,  $\max\{j\} = n$ .

The goal of the problem is to maximize the profit whereas the profit function for the  $i$ -th company computed as follows:

$$g(i) = p(x_i + h_i) * \sum_{j=1}^n q_j \quad (1)$$

The problem become maximization problem with the statement

$$\text{Max}\{g(x_i)\} \quad (2)$$

The notations are defined as follows:

Let  $p$  be the desired profit as a fraction of the total cost.

Let  $x_i$  be the cost in Rupiah of the raw material for the  $i$  th company for each kilogram.

Let  $h_i$  be the cost in Rupiah of the labor works for the  $i$  th company for each kilogram.

Let  $q_j$  be the quantity in kilogram of raw material being used in for the  $j$  th item.

Let  $g(i, j)$  be the profit function for  $j$  th item that supplied by the  $i$  th company.

## b) Case 2

Assumptions:

There are  $m$  companies whose distributed the raw materials that needed for make items.

There are  $n$  items. For each item are made with different raw materials.

Labor works for each raw materials are same for each company.

Let  $i$  denoted the order of company that being used for supplying raw materials where  $i$  denote the set of possible companies.  $\therefore i \in I$ . Therefore,  $\max\{i\} = m$ .

Let  $j$  denoted the item that made from raw materials where  $j$  denote the set of possible items.  $\therefore j \in J$ . Therefore,  $\max\{j\} = n$ .

The goal of the problem is to maximize the profit whereas the profit function for the  $i$  th company of the  $j$  th item computed as follows:

$$g(i, j) = p(x_{ij} + h_i) * q_j \quad (3)$$

Since for each item we only need to find 1 company that maximizes the profit, the problem become maximization problem with statement

$$\forall_{j \in J}, \max_{i \in I} \{g(i, j)\} \quad (4)$$

The notations are defined as follows:

Let  $p$  be the desired profit as a fraction of the total cost.

Let  $x_{ij}$  be the cost in Rupiah of the raw material for the  $i$  th company of the  $j$  th item for each kilogram.

Let  $h_i$  be the cost in Rupiah of the labor works for the  $i$  th company for each kilogram.

Let  $q_j$  be the quantity in kilogram of raw material being used in for the  $j$  th item.

Let  $g(i, j)$  be the profit function for  $j$  th item that supplied by the  $i$  th company.

Let  $i_j^*$  be the company that supply the  $j$  th item which makes  $g(i, j)$  maximum as  $i^* \in I$  and  $j \in J$ .

It is easier to find the maximum profit through finding the company that maximizes profit for each item ( $i_j^*$ ). Therefore, the equations can be divided into several parts based on the item.

$$\begin{cases} g(i, 1) = 0.2(x_{i1} + h_i) * q_1 \\ g(i, 2) = 0.2(x_{i2} + h_i) * q_2 \\ \vdots \\ g(i, n-1) = 0.2(x_{in-1} + h_i) * q_{n-1} \\ g(i, n) = 0.2(x_{in} + h_i) * q_n \end{cases} \quad (5)$$

### Research Method and Algorithm Development:-

In this study, a heuristic algorithm based on co-evolutionary algorithm and genetic algorithm is proposed. The solution procedure is implemented using a genetic algorithm (GA), which is a stochastic solution search procedure proven to be useful for solving combinatorial problems by adopting the concept of evolution [5]. In order to do this, the first step is design the suitable chromosome for each supplier. As shown in Fig1, a chromosome consists of 13 genes. Each gene represents the status of each item purchased. Each gene only has 2 type of value, "0" or "1". 0 means the item will not be purchased from the specified supplier, while 1 means the item will be purchased from the specified supplier. To evaluate the fitness values for each supplier, the co-evolutionary algorithm is performed, in which GA is also applied.

I1	I2	I3	I4	I5	I6	I7	I8	I9	I10	I11	I12	I13
1	0	1	1	1	0	0	1	0	1	1	1	0

**Fig1.** Chromosome design for each supplier

According to Fig 2, the chromosome is composed of three parts based on the supplier. The first one, ranging from the first gene to the thirteenth gene, denotes the type of item that will be supplied by the first supplier. The second part, ranging from the fourteenth gene to the twenty-sixth gene, indicates the type of item that will be supplied from the second supplier. The third part, ranging from the twenty-seventh gene to the thirty-ninth gene indicates the type of item that will be supplied by the third supplier.

Supplier A													Supplier B													Supplier C													
1	0	0	1	1	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0	1	1	0	0	0	0	0	0	0	1	0	0	1	0	0	1	0	1	0	0

**Fig 2.** Chromosome design for calculating fitness value

The procedure of the co-evolutionary algorithm can be summarized as follow steps:

1. Generate the population randomly for each supplier as shown in Fig 1.
2. Matching process for each chromosome from each supplier as shown in Fig 2.
3. Verify each chromosome as shown in Fig 5 with the following condition:
  - a. Each item can only be supplied by 1 supplier.
  - b. Each item must be supplied.
4. Calculate the fitness value for each chromosome based on the given equation (Depends on the scenarios: if considering discount then calculate the fitness function must be added the parameter which represents: If in a single supplier, SCC ordered more than 6 types of item, the SCC company will get a 2% discount).
5. Descending sort of the chromosome based on the fitness value.
6. Choose the top-ten best chromosome from each supplier and save all of them into a temporary variable.
7. A roulette wheel selection is doing to fill the other 90 chromosome which has been disposed from step 6.
8. In this study, the single-cut point crossover applied as the genetic operator based on the cross over rate. The process is shown in Fig 3. There are two processes in the crossover. First, generate a random number from 0-38 (e.g. 19) and the second is from the twentieth gene to thirty-ninth gene will be swapped with the same range of gene from the chromosome below.
9. Apply the binary mutation genetic operator. The process is shown in Fig 4. First, generate a random number from 0-38 (e.g. 5). The chosen gene value will be flipped from "0" to "1" and from "1" to "0".
10. Verify each chromosome with the same condition as step 3 describes in Fig 5.
11. Recalculate the fitness value.
12. Descending sort of the chromosome based on the fitness value to find best chromosome.
13. Repeat from step 1 through 13 until 100 generation is reached.

The genetic operators are used in the proposed GA: crossover, mutation, and selection. The single-cut point cross over method is used. The parameter values for GA are: the population size equals to 100; the maximum number of generation is 100; the mutation rate is set at 10%; the cross over rate is set 50%, Gen (2008).

Fig 4. Mutation

Fig 5. Verification

#### A Numerical Example And The Results:-

This study considers a single SCC using 13 type of item in a project with considering two kind of scenarios: without considering discount and with considering discount. There are three practicable suppliers that can supply those items with a different price for each item. For each item, only one supplier will be chosen (Supplier A, B and C).

Table1:-Price List

Item Code	QTY	Supplier A's Price/pcs	Supplier B's Price/pcs	Supplier C's Price/pcs
I1	10pcs	Rp.915.600,00	Rp.917.300,00	Rp.975.500,00
I2	10pcs	Rp.1.196.800,00	Rp.1.150.000,00	Rp.1.175.800,00
I3	5pcs	Rp.1.491.200,00	Rp.1.502.500,00	Rp.1.500.000,00
I4	10pcs	Rp.1.792.000,00	Rp.1.805.000,00	Rp.1.665.000,00
I5	50pcs	Rp.571.000,00	Rp.565.000,00	Rp.600.000,00
I6	20pcs	Rp.979.000,00	Rp.975.000,00	Rp.990.000,00
I7	30pcs	Rp.192.000,00	Rp.212.000,00	Rp.225.000,00
I8	50pcs	Rp.111.000,00	Rp.132.000,00	Rp.120.000,00
I9	32pcs	Rp.1.010.000,00	Rp.1.050.000,00	Rp.1.050.000,00
I10	22pcs	Rp.1.296.000,00	Rp.1.315.000,00	Rp.1.275.000,00
I11	13pcs	Rp.2.600.000,00	Rp.2.600.000,00	Rp.2.611.000,00
I12	9330Kg	Rp.1000,00	Rp.800,00	Rp.1100,00
I13	480pcs	Rp.4.500,00	Rp.4.800,00	Rp.4.500,00

Table 1 shows the price given by the supplier for each item. The types and quantity needed already given by the company issuing the project. The profit will be calculated based on the scenarios:

- First scenario: Multiplying the price with the quantity of each item. The result will be summed and multiplied by labor price and 20% for the profit.
- Second scenario: Multiplying the price with the quantity of each item. The result will be summed and multiplied by 5% for labor price and 20% for the profit. If in a single supplier, SCC ordered more than 6 types of item, the SCC company will get a 2% discount.

c)

The main issue in this study can be show as the comparison between the profit produced by each supplier's price list and the profit produced by co-evolutionary algorithm. Fig 6 shows the results of co-evolutionary algorithm and genetic algorithm implementation. The chromosome suggested the SCC to buy the item as shown in Table 2 for First scenario and Table 3 for Second scenario.

The profit gained from each supplier and co-evolutionary algorithm suggested shopping list for first and second scenario shows in Table 4 and Table 5 respectively. Based on the Table 4, the summarization of observation can be seen as follows: first, before using co-evolutionary algorithm, the maximum profit that can be gained is Rp. 47.570.380 by choosing supplier C for supplying the entire item. After using the co-evolutionary algorithm, the maximum profit that can be gained is increased by 1,49% (Rp. 48.279.000,00). Second, the company won't be needed to determine which supplier will supply each item since co-evolutionary algorithm already gave the suggested shopping list. From the Table5 can be summarize as follows: firstly, before using co-evolutionary algorithm, the maximum profit that can be gained is Rp. 49.948.899,00 by choosing supplier C for supplying all of the item. After using the co-evolutionary algorithm, the maximum profit that can be gained is increased by 12,16% (Rp. 56.020.692,00). Secondly, the company won't be needed to determine which supplier will supply each item since co-evolutionary algorithm already gave the suggested shopping list.

Based on these results we can conclude that the best matching supplier in this study is Supplier C by considering the discount or not. As we can see in Table 4 and Table 5, the profit still the highest by choosing Supplier C. This means, less time is needed to make the proposal. By doing this, not only the profit is increased, but the work duration of a project will be faster.

**Table4:-**Profit gained for first scenario

List	Profit
Supplier A	Rp. 46.653.640,00
Supplier B	Rp. 46.869.570,00
Supplier C	Rp. 47.570.380,00
Co-evolutionary algorithm	Rp. 48.279.000,00

**Table5:-**Profit gained for second scenario

List	Profit
Supplier A	Rp. 48.986.322,00
Supplier B	Rp. 49.213.049,00
Supplier C	Rp. 49.948.899,00
Co-evolutionary algorithm	Rp. 56.020.692,00

### Conclusion:-

This study develops the solution model to optimize the profit by doing matching suppliers with the company with using co-evolutionary. In order to reach a more suitable supplier for a single project, there are many things need to be learned first e.g. supplier's cost, delivery time, additional charge. The proposed model considers decision support system as an interactive computer-based system to support user in assessing and deciding an option. In this study, the scope of decision parameter is limited by gaining profit from three parameters which is item types, supplier's price list and discounts. The profit gained from coevolutionary algorithm is compared with each supplier's price list which is shown in Numerical Example. For future research, the decision parameter scope can be extended to reach a more complex issue and find better solution procedure.

Rheumatoid arthritis, trace minerals, superoxide dismutase, disease activity score

#### Abstract

**Objectives:** Rheumatoid arthritis (RA) is chronic autoimmune disease marked by tissue inflammation and joint destruction. Sex differences and essential element derangement in the incidences of RA are well described. **Methods:** The present study aims to determine serum mineral level, superoxide dismutase (SOD) activity and disease activity score (DAS) in female and male RA subjects and association of minerals with disease activity in both the sexes.

**Results:** Female RA patients had significantly reduced serum Zn as compared to male RA subjects. Females had non significantly low values for copper, magnesium and phosphorous as compared to male RA subjects. SOD and DAS were significantly increased in female RA subjects. The RA subjects had higher levels of serum zinc, copper and lower levels of serum Mg when compared with reference values. However none of them were found to be associated with disease activity.

**Conclusions:** The results suggest derangement of minerals in RA where mineral evaluation and supplementation especially of magnesium in RA patients would be helpful.

#### Introduction:-

Rheumatoid arthritis (RA) is chronic inflammatory autoimmune disorder of unknown etiology affecting various symmetric joints of the body. Like other autoimmune diseases RA is also more prevalent in females as compared to males<sup>1-4</sup>. Female to male ratio in RA is 3:1<sup>5</sup>. The differences in over occurrence and development of aggressive disease in females is not clear but genetic and hormonal factors are suggested to be involved<sup>6-11</sup>.

Several observational studies suggest that women with RA have worst disease as compared to men<sup>12-16</sup>. In recent studies RA seems to have derangement of mineral content like Mg, Zn, Cu and P. Their optimum concentration is required for normal functioning of the body. However alterations in level of these trace minerals as Mg<sup>17</sup>, Zn<sup>18</sup> and Cu (Copper) have been implicated in pathogenesis of RA as they are the co-factor of important enzymes involved in collagen and bone metabolism, the antioxidant defense system<sup>19</sup> and the immune system<sup>20</sup>. The development and progression of RA was suggested due to marginal deficiencies of Zn and Cu based on their

serum levels<sup>21,22</sup>. Many of these trace elements are present in bones as iron, copper, zinc, manganese, fluoride, strontium and boron<sup>23</sup>. As the changes in the concentration of trace elements has been linked to inflammatory response therefore the present study was undertaken to analyze i) The concentration of Zn, Cu, Mg and P in female and male RA subjects along with activity of superoxide dismutase (SOD) and disease activity score (DAS-28-CRP). These may help in determination of possible roles of these in disease activity of female and male RA patients.

### Materials and Methods:-

The study was started after approval from Institutional Ethical Committee and written informed consent was obtained from all the participants. 46 samples (31 females, 15 males) were randomly collected from the OPD of Orthopaedics from different centers during the study period. Patients were recruited with active RA who fulfilled 4 or above criteria of American College of Rheumatology (ACR)<sup>24</sup>.

Clinically the patients presented symmetric arthritis with complaints of severe multiple joint pain along with morning stiffness (>1hr) of joint, presence of rheumatoid nodules along with radiographic changes like erosion, swelling (>3 joint especially phalanges), multiple joint involvement and deformity of peripheral joints (metacarpophalangeal (MCP) and proximal interphalangeal joint (PIP)) and decreased range of motion. The patients did not had any renal disease and were non hypertensive. Blood was drawn from overnight fasting patients for all the analysis.

### Laboratory Analysis:-

The laboratory analysis for minerals was done by commercial kits from Coral clinical system (The Tulip group, India). Serum level of magnesium were estimated by Calmagite Method by using the UV- 1800 SHIMADZU UV Spectrophotometer at the wavelength of 510nm. Serum level of the Copper and Zinc were measured by colorimetric method by using the UV- 1800 SHIMADZU UV Spectrophotometer at the wavelength of 580nm, 570nm respectively. Serum Phosphorous level by Molybdate UV Method by using the UV- 1800 SHIMADZU UV Spectrophotometer at the wavelength of 340nm. SOD estimation was done according to Mishra and Fridovich, 1972<sup>25</sup>. DAS-28 was measured according to counts of affected joint count and final value was calculated using CRP values.

### Statistical Analysis:-

The data was analyzed with Student's independent t- test. The correlation of change in biochemical parameters was done by Pearson correlation analysis. A two-tailed ( $\alpha=2$ )  $p<0.05$  was considered to be statistically significant. Graphpad Prism (version 3.0) and SPSS-15 were used for the analysis.

### Results:-

The study was done on 46 RA patients (31 females and 15 males). Their was no significant difference in the BMI of female and male patients. Female patients and male patients had significant difference in the mean age. They had reduced levels of serum zinc (131.48 $\mu$ mg/dl Vs 138.32 $\mu$ mg/dl  $p<0.05$ ), serum copper (153.65mg/dl Vs 157.06mg/dl), serum magnesium (1.006mEq/l Vs 1.106mEq/l) and serum phosphorous (6mg/dl Vs 6.166mg/dl) as compared to male participants (table 1). Both female and male RA subjects had reduced levels of serum magnesium as compared to reference values. The activity of super oxide dismutase (SOD) and disease activity score (DAS-28-CRP) were significantly high in female patients as compared to males (table 1).

Intercorrelation between different parameters studied showed no correlation of any of the essential minerals tested with DAS-28-CRP or SOD in neither females (Table 2) nor males (table 3). However female patients showed significant negative correlation ( $r=-0.434$ ;  $p<0.05$ ) between phosphorous and copper (table 2).

## Discussion:-

There was no significant difference in the BMI of female and male patients. Females have more aggressive and painful disease than males. As female patients in our study had less average age than males suggesting early onset of RA in them as compared to males. There are differences in functional capacity in female and male subjects with RA where females have more functional impairment than males<sup>26</sup>. In our study also DAS-28-CRP is higher in females as compared to males. These differences may be due to general strength of bones and muscles, bone mineral density (BMD), hormones etc. However the widely used measure of function, the health assessment questionnaire (HAQ), is cross-sectionally higher (worse) in women<sup>26</sup>.

In the present study, we found decreased level of serum magnesium in female and male RA subjects as compared to reference range, though no significant difference was observed between the two sexes in serum magnesium levels. Chronic inflammatory conditions in RA may alter the levels of magnesium and possible mechanism of reduced magnesium may be due to chronic inflammation and autoimmune injury<sup>17,27,28</sup>. Our results are in accordance with<sup>17,27-29</sup> suggesting that RA, is associated with serum magnesium disturbances<sup>28</sup>. Mg is one of the essential nutrient of the body and studies suggest its role in reducing chronic inflammation<sup>30</sup>. Decreased Mg level is considered as marker for RA<sup>17</sup>. Magnesium is an activator of sodium potassium ATPase, is antiarrhythmic and is associated with cardio vascular disease susceptibility<sup>31-32</sup>. Inflammation triggers its deficiency in animal models. In humans, low serum magnesium concentrations have been associated with high C-reactive protein (CRP) levels<sup>33</sup>.

The level of phosphorous and copper was non-significantly higher in male RA patients as compared to females. In female RA patients, phosphorous showed inverse correlation with copper ( $r = -0.434$ ;  $p < 0.05$ ). There is strong association between elevated phosphorous and Ca and phosphorous products and the development of calciphylaxis. Phosphorous influences a number of pathways involved in vascular calcification. It also has a role in induction of differentiation of vascular smooth muscle cells into osteoblast-like cells capable of extraskelatal mineralization which is important process in development of vascular calcifications. Thus phosphorous may have a role in augmenting inflammation.

Both female and male RA patients had higher serum copper levels as compared to reference values. RA patients are shown to have high levels of copper<sup>34,35</sup>. Their levels have been shown to increase in all inflammatory processes including RA. Ceruloplasmin, a copper containing enzyme is found to be significantly elevated in inflammatory conditions and has anti-inflammatory activity<sup>36-37</sup>. Our findings are consistent with Scudder et al 1978<sup>38</sup> and Tuncer et al 1999<sup>39</sup>. Hypercuperemia associated with inflammatory response may be due to oxidative stress<sup>40</sup> as positive correlations were found between serum Cu levels and inflammatory markers as serum CRP and ESR in RA patients<sup>41</sup>. Yang et al, 2016<sup>42</sup> have reported that RA patients living where farm soil has high copper had higher WBC count, ESR, DAS-28 and platelet count than people living in areas with low levels of copper. Cu is an environmental bioelement having key role in the cell's physiology. It is cofactor or component of the enzymes, participating in anti-oxidative processes, or in detoxification of oxygen free radicals. Cu complexes were effective in treating arthritis as Cu complexes have anti-inflammatory properties. Antiarthritic drugs in their active forms are complexed with copper<sup>35</sup>. The hypercuperemia was also suggested to be the outcome of dyslipidemia<sup>43</sup> or inflammation, as the cytokines have been reported to enhance the release of Cu thioneins during the oxidative burst of polymorphonuclear cells<sup>44</sup>. As many studies have reported higher levels of copper in active RA, therefore copper has been suggested to be used as an additional biochemical biomarker for RA<sup>45</sup>.

In our study the levels of zinc were significantly higher in males as compared to females. This clearly shows that RA patients are not deficient in Zinc or copper<sup>19</sup>. However, Zoli et al., 1998<sup>46</sup> reported lower zinc levels in RA patients. As zinc is considered anti-inflammatory with studies showing negative correlation between zinc and levels of IL-1 $\beta$  and TNF- $\alpha$ . Mierzecki et al, 2011<sup>18</sup> have reported nonsignificant but higher levels of zinc in serum of RA patients. Though zinc levels should have been lower considering the role of proinflammatory cytokines as IL-1 and TNF- $\alpha$  which inhibit albumin synthesis in liver and lower their zinc-binding capacity, which should in turn reduce the plasma zinc levels. However lower values of zinc in other studies may be due to pharmacological treatments or other effects which also need to be considered. Serum zinc levels have been shown to decrease during acute-phase response of inflammation and with treatment with NSAIDs<sup>44</sup>. Probably alterations in inflammation may have some role in the levels of essential minerals.

Inflammation may be the primary cause for systemic alterations in the levels of minerals and enzymes which further modulate acute phase plasma proteins<sup>47</sup>. The study Chavan et al. 2015 by<sup>29</sup> have shown negative correlation between serum magnesium with TC, triglycerides, LDL-c and positive correlation with HDL-c. Thus lower serum magnesium may be associated with worsened lipid profile and increased CVD risk of RA patients.

In our study SOD activity is significantly increased in female RA patients as compared to males. The treatment of Methotrexate (for control of RA) has been reported to increase Zn-SOD activity in rats<sup>48-49</sup>.

Increased activity of SOD<sup>50-51</sup> may also be due to increased O<sub>2</sub><sup>-</sup> production by hyperactive cells<sup>52-53</sup>. Higher SOD levels may be an after effect to nullify excessive free radical production. Post treatment the antioxidants are increased which lead to lower plasma MDA and increased total antioxidant capacity (TAC)<sup>54,55</sup>.

RA is associated with serum mineral disturbances and oxidative stress. Our results show that male and female patients of RA neither differ much in copper, phosphorous and zinc levels nor the minerals are associated with DAS. Serum magnesium was lower in both sexes in RA subjects. Serum magnesium and serum copper may be useful biomarker for RA.

### Abstract

This paper has been written on the basis of qualitative and quantitative data collected from secondary source and discussed work participation of tribal women in Gajapati district in a descriptive manner. The tribal women have been equal partners with tribal men in the contribution to household economy. Women do more physical labour in their agricultural fields and forest than that of the tribal men. Tribal women have usually enjoyed a higher social status in their own communities. The literacy rate among the tribal's and more so in case of tribal women is quite low and this is also associated with poor nutritional and health status among the tribal's. They are engaged in various traditional occupations like mixed farming, hunting, Jhoom cultivation and shifting cultivation to settled agriculture. A very negligible percent are engaged in non-agricultural activities. The Scheduled Tribes constitute 8.2% of India's total population. 9.2% of the country's scheduled tribe population is found in Odisha, which is third highest in the country and the scheduled tribes account for 50.78% population of the district.

### Introduction:-

Agriculture is the most primitive occupation of the tribal people. The people had changed their cultivation pattern from traveller's cultivation to settled cultivation, but some of the practices have remained unchanged among many groups of farmers. They are engaged in various traditional occupations like mixed farming, hunting, Jhoom cultivation and shifting cultivation to settled agriculture. The tribal people are practices traditional agricultural wisdom for their livelihood.

Tribal people have traditionally lived in about 15% of the country's geographical areas, mainly forests, hills and undulating inaccessible terrain in plateau areas, rich in natural resources. They have lived as isolated entities for centuries, largely untouched by the society around them. This seclusion has been responsible for the slower growth, dissimilar pattern of their socio-economic and cultural development and inability to negotiate and cope with the consequences of their involuntary integration into mainstream society and economy. Tribals continue to be socio-economically backward. One of the most distinguishing features of the rural economy of Gajapati has been the growth in the number of agricultural workers, cultivators and agricultural labourers engaged in crop production. Agricultural labourers, especially in smaller villages away from towns and cities, are generally unskilled workers carrying on agricultural operation in the centuries old traditional wages. Agriculture is the back bone of many developing countries. Women account for more than half of the work force by participating in different activities, either directly or indirectly. The gender division of labour varies from one society and culture to another, and within

each culture external circumstances influence the level of activity (Nigist, 2004). Women are the unavoidable part of any development programmes whether it is for developed or developing country (Raksha et al, 2016). Odisha is one of the poorest states in India, with an estimated 47% of its population living on less than a dollar a day (Haans & Dubey, 2003). A regional and social group-wise analysis of poverty in Odisha highlights the fact that the population in Scheduled Areas is comparatively much poorer than the population in non-Scheduled Areas, and that Scheduled Tribes are the poorest groups (Kumar, K., 2005). Women have played and continue to play a key role in the conservation of basic life support systems such as land, water, flora and fauna (Prasad C. et al, 1992). Women play a central role in the agriculture economy (Chauhan, J., et al, 2016).

Women's work participation is considered as an important indicator of women's participation in economic activities of the State. Women's contribution though not recognized in all spheres of activity is significant. Despite their overall input to the economy they have limited access and control over the resources and productive assets. Wage gaps and discrimination against women in labour markets lower their participation. Women's work participation among the Scheduled Tribe in India fell marginally from 44.8% in 2001 to 43.5% in 2011. In Odisha Women's work participation rate increased from 42.2% in 2001 to 43.9% in 2011. In Gajapati district women's work participation rate decreased from 49.7% in 2001 to 46.8% in 2011. The economy of Schedule Tribe areas is primarily subsistence oriented and based upon a combination of agriculture, forestry and wage labour (Odisha review, 2014).

As per 2011 census, Out of sixty-two (62) scheduled tribe population of India is 84,326,240 constituting 8.2%, Odisha scheduled tribes (ST) population as 8,145,081 constituting 22.1% and Gajapati district scheduled population as 263,476 constituting 50.78%. district wise distribution of the individual scheduled tribe shows that khond have the highest proportion i.e. 93.3 percent in kandhamala district, followed by Nayagarh as 76.9 percent, Baudh 76.4 percent and Rayagada i.e. 71.1 percent of the district. Gond has the highest concentration in Nabarangapur districts followed by Nuapada district whereas Santal and Kolha are primarily concentrated in Mayurbhanj district. Other four scheduled tribes i.e. Munda, Saora, Shabar and Bhottada are primarily concentrated in Sundargarh, Bargarh, Gajapati and Nabarangapur district. The scheduled tribes account for 50.78 percent population of Gajapati district and khond as 14.86%, Saora 32.21% and Shabar 50.84% are the largest tribal groups in the district (Census 2011, Orissa review).

In Odisha all Scheduled Tribe workers (in percentage)

Economic category	All Scheduled Tribes	Khond	Gond	Santal	Kolha	Munda	Saora	Shabar	Bhottada
Cultivators	<b>33.3</b>	39.1	39.1	32.3	25.8	23.4	<b>29.6</b>	27.5	32.6
Agricultural Labourers	<b>46.9</b>	46.8	46.6	45.1	47.6	41.7	<b>54.3</b>	55.3	58.2
Household Industry Workers	<b>4.8</b>	3.6	3.3	9.3	7.9	5.3	<b>2.8</b>	1.4	0.7
Other Workers	<b>15</b>	10.5	11	13.3	18.8	29.5	<b>13.3</b>	15.8	8.6

\*Source: Data highlights- the scheduled tribes, Orissa, Census of India 2001.

The Work Participation Rate of the Scheduled Tribes population is 49 per cent, which is equal to that of all Scheduled Tribes at the national level (49.1 per cent). There has been a slight decline of 0.4 per cent in the Work Participation Rate of the tribes during 1991-2001. While there has been a decline in male Work Participation Rate from 58.9 to 54.8 per cent, female Work Participation Rate (43.2 per cent) has increased by 3.4 per cent during 1991-2001. Among the total workers, 57.4 per cent are main workers and this proportion is much below the national average recorded for all Scheduled Tribes (68.9 per cent).

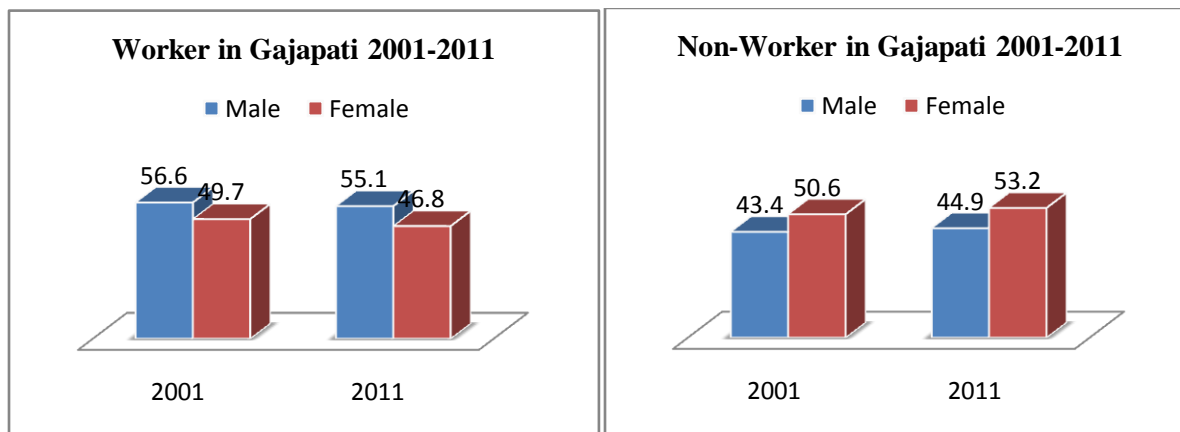

Among the major tribal groups i.e. Khond, Gond, Shabar, Saora and Bhattada have higher work participation rate than that of the State as well as national average for recorded for all scheduled tribes. Agricultural labourers constitute the highest proportion 46.9 percent among the total workers. Cultivators 33.3%, other workers 15% and Household Industry constitute between as 4.8%. These Soura populations contribute to the four Economic Categories i.e. Cultivators 29.6 percentage, Agricultural Labourer 54.3 percentage, Household Industry Workers 2.8 percentage only and Other Workers 13.3 percentage (see figure-1).

#### Worker and Non-Worker in Gajapati 2001-2011

	Worker and Non-Worker in Gajapati 2001		Worker and Non-Worker in Gajapati 2011	
	Worker	Non-Worker	Worker	Non-Worker
Male	56.6	43.4	55.1	44.9
Female	49.7	50.6	46.8	53.2

(Source: Census of India 2011 final data, Registrar General of India), Databook for PC: 4<sup>th</sup> Aug-2014. Census of India 2011, Primary Census Abstract Figure at a Glance and Data Highlight.

#### Worker and Non-Worker in Gajapati 2001-2011

In Gajapati district we find Women constitute 50% of the workforce where as men constitute 57% of the total workers. Among non-worker women are more (50.6) in comparison to men (43.4). This is trending all India, all Odisha level also. But same how 50% Women Work Participation Rate shows a significant highest of Women Work Participation Rate (WWPR) in Gajapati district. May be due to high concentration % of tribal population are engaged as marginal worker for their own survival. This is a marginal status of tribal women in Gajapati district. Which will be further clarified while stratify women engaged in Agrarian sector (see figure-2).

**Agricultural related activities** are picking and threshing of paddy crops followed by harvesting, winnowing, storage, making threshing yard, bagging/packing and marketing of agricultural produce. The roles of tribal farmwomen in all these operations were observed up to the highest importance level (*Chayal and Dhaka, 2010*). Agriculture production is dependent on rainfall (*Hans Asha, 2014*)

Agricultural pattern in our study area is primarily based on hill cropping pattern. Mostly people go for the cultivation of Ragi, Corn, Janna as main crop in year. And for secondary crop almost all families go for Jhudunga, Kandula and Kulata. Mostly people go for kharif cultivation and very few people go for rabbi cultivation where these are mostly found in wet land area (joba khiari). There is no irrigation facility in our study area of Gajapati district, though the river Mahendra Tanaya is flowing in this district. The perusal of the data in regards to participation of tribal farm women in sowing operation revealed that the highest participation of tribal farmwomen was observed in sowing, transplanting followed by stubble collection, clod crushing and seedbed preparation (*Chauhan, N. M. & Thakor, R, 2006*).

Our study area among men 77 per cent are agricultural farmers and 23 per cent are wage labourers. From among our women respondents 97 per cent are daily worker and 3% are housewives. But these daily wage workers among women also constitute agricultural workers.

Our study area are reflects that very few families are doing multi crop cultivation i.e. around 13%. Nearly 87% are depending on their single crop cultivation which is a very poor source of earning. Cash cropping in our study area are such as Mango, Banana, Cashew, Lemon, Orange, Jackfruit and Pineapple cash crop. The cash crops in the area are mainly citrus fruits, Cashew, Mango and Orange etc.

One of the most distinguishing features of the rural economy of India has been the growth in the number of agricultural workers, cultivators and agricultural labourers engaged in crop production. The phenomena of under-employment, under-development and surplus population are simultaneously manifested in the daily lives and living of the agricultural labourers. They usually get low wages, conditions of work put an excessive which they get is extremely irregular.

Agricultural workers constitute the most neglected class in Indian rural structure. Their income is low and employment irregular. Since, they possess no skill or training, they have no alternative employment opportunities either. Socially, a large number of agricultural workers belong to scheduled castes and scheduled tribes. Therefore, they are a suppressed class. They are not organized and they cannot fight for their rights. Because of all these reasons their economic lot has failed to improve even after four decades of planning.

### Summary:-

This paper focuses attention to the practices of the resources poor tribal farmers that makes use of low cost renewable inputs, family and community labour for solving the food crises through their traditional wisdom which need documentation to make the future agriculture a sustainable one. The study on the farmer's traditional wisdom on agriculture was initiated through non-random selection of respondents from Lanjia Saora tribe of Gumma & Rayagada block of the district. A typical tribal village is situated a little away from the main road and mostly inside the forest. Generally, the houses are constructed on the both side of a wide village road. The cowsheds are constructed on the middle of the road earlier. Now they are having a cowshed in their house in front side or in the end of house row. This system has changed due to reduced number of wild animals and effective forest. Most of the houses have some backyard and they raise a kitchen garden. Gradually, this kitchen garden extends to the field which again merges with the forest. The village has been set up where there was plain land and a stream. This selection of their dwelling place shows their intelligence and foresight. The villagers are used cow-dung like a fertilizer in their own cultivators land. Mostly of the house have same backyard and they raise a kitchen garden. Gradually, this kitchen extends to the field which again merges with the forest. In other hand women are engaged in other agricultural occupations like dairy, farming, horticulture, raising of live-stock, bees and poultry.

Today much of tribal people are loss of livelihood is an indication of displacement, migration and human distress. Scheduled tribe women in search of work in the last few years have been trafficked for work in different parts of the country. The migrant tribal women and girls faced a number of problems immediately after their migration to cities which included difficulty of communication in local language, residential accommodation, employment, education of children, local contacts, adjustment with city life and environment. Women migrants especially from tribal areas to urban areas are highly traumatized.

#### Abstract

Scalp Psoriasis is a chronic dermatosis characterized by an unpredictable course of remission and relapse. It is characterized by well defined dried, erythematous plaques with silvery scale which have a predilection for scalp. The disease not only affects the patient physically but also disturbs mental and social health of the patient. According to W.H.O., it is one of the most common dermatological disease affecting upto 2.5% of the World's population and in India, prevalence of Psoriasis varies from 0.44 to 2.88%. Kitibha Kushta is described as Vata-Kaphaj disease. Kitibha Kushta has signs and symptoms :Shyava, Krushna / aruna varna kina (Erythrema)Khara/Parushata of the Kina (Dryness and scaling)Srava (flow of exudates in early stage)Vrutta (Rounded plaques), Ghana (Stable plaque) Ugra Kandu (Severe Itching)Vartate cha samutpannam (Flare up of psoriasis)Which can be compared with psoriasis. The intrinsic nature of psoriasis posed an ultimate challenge to the skill and humanity of the medicinal world. Ayurveda provides maximum relief to such disease with Panchakarma. In this case study first Rukshana-Pachana, Virechana Karma as shodhan chikitsa, shirobasti as bahi parimarjan chikitsa and shaman oushadhi were given. At the end of 60-days treatment in virechana, shrobasti and shamana oushadhi showed good results in scalp psoriasis as the overall effect of therapy.

Modern science treat this condition with PUVA and cortico steroids but these drugs having local and systemic side effects. The intrinsic nature of psoriasis posed an ultimate challenge to the skill and humanly of the medicinal world.

In this condition, Ayurveda provides maximum relief through Panchakarma. The main line of treatment for Kushta, considering the elimination of vitiated dosha shodhan chikitsa (Virechan karma), Bahi parimarjan chikitsa(shirobasti) and shaman oushadhi to bring samyavastha (balanced condition) showed good results in this case study.

### Case Report:

A 27 yr. old male patient came to Panchakarma OPD of Government Ayurved College, Nanded, Maharashtra, India presented with dried, rounded well defined, silvery plaque with thick scaly (Since 6 months) itchy lesions on scalp (since 6 months) with constipation (since 6 months) and hair fall (since 3 month) and weight gain (since 1 year).

Patient was diagnosed as Scalp psoriasis by dermatologist 6 years back. Patient had taken allopathic treatment before coming to our hospital but not relieved.

Patient was thoroughly examined and detailed history was taken. Patient was bank manager by occupation. Patient did not have history of any other major illness.

### On examination:-

General condition – moderate, afebrile

Pulse rate - 74 / min, Regular

Patient had H/o scalp psoriasis since 6 years No pallor.

### Routine Investigation:-

Such as complete blood count, random blood sugar, urine routine and microscopic were in normal range.

Patient has – 72 kg weight

1. O/E Patient has dry scaling (Parushta and rukshata)
2. Itching (Kandu)
3. Erythrema (Krushna and shyava varna)
4. Thickened skin (ghanata) are found in present study as the leading symptoms.
5. weight gain and
6. hair fall as associated symptoms.

### Sign and Symptoms:-

- |                       |   |          |

### Treatment Given:-

- 1) Rukshan/Pachan : given with triphala (*Terminalia chebula*, *Emblia officinalis* and *terminalia belirica*) + Musta (*Cyperus rotundus*) and Shunti (*Zingiber officinale* -> Kwatha (Decoction) given – 40ml BID before meal for 5 days, prepared as per procedure mentioned in Sharangdhar samhita and Nirama Lakshanas observed.
- 2) Snehapana with guggulu tiktaka ghrita given for 5 – days with increasing quantity every day with kosha Jala (luke warm) water as Anupana.

Day	Quantity	Time given	Time of Appetite
1 <sup>st</sup>	30 ml	9.00 a.m.	12.00 noon
2 <sup>nd</sup>	60 ml	7.30 a.m.	12.30 noon
3 <sup>rd</sup>	90 ml	7.30 a.m.	2.00 p.m.
4 <sup>th</sup>	120 ml	8.00 a.m.	5.30 p.m.
5 <sup>th</sup>	150 ml	8.00 a.m.	7.30 p.m.

After 5 days samyak snigdha lakshanas observed.

- 3) 3 days sarvang Abhyanga (with murchita tilataila) and Peti sweda (Bashpa) was given. Samyak singdha and samyak swinna lakshanas observed. .
- 4) Virechana : On 3<sup>rd</sup> day at 9.30 a.m. in the morning after snehana and swedana.
- 5) Virechana with Nimbamritadi castor oil – 100 ml with Triphala Kwatha – 50 ml was given. After 1 hour, virechana vega started. Total – 11 vega passed in 12 hours. Pulse rate and blood pressure are within normal limits.
- 6) In Paschat Karma – Samsarjana Krama with Peyadi Krama advised for 5 days.
- 7) Shirobasti – with Ksheerabala taila and Brahmi taila for 25 min to 30 minutes given at 11.00 a.m. for 7 days.
- 8) Shaman Oushadhi : Combination of Arogya vardhini Rasa (20 gm) + Guduchi satwa 2 gm + Rasamanikya rasa – 200 mg + shataputi abhrak bhasma + Raktapachak – 100 mg + chopachini churna (*Smilax china*) + Avipittakar choorna – 20 gm was given twice a day after meal and khadirarishta m 15 ml BID was given for 30 days and Nimba taila was used for external application for 30 days With above mentioned line of treatment patient got relief from the symptoms of psoriasis.

### Discussion:-

In above case study, patient was suffering with scalp psoriasis i.e. Kitibha Kushta at Shiras. Considering Kapha-vataja Prakruti and medopradoshaja vikara (Sthoulya), Rukshana Kwatha was selected and Snehapana was planned with Guggulu tiktaka ghrita

Considering lesions on scalp i.e. shiras and hair fall, shirobasti was selected from masthishyaka / Bahi parimarjan chikitsa. Kitiba Kushta is raktapradoshaja vikara and patient was suffering with constipation so – virechan karma was selected as shodhana.

Shama oushadhi has kushtaghna as well as Rasayana effect on skin.

By overall effect of therapy, patient got complete relief from the symptoms of Kitibha Kushtas i.e. scalp psoriasis and patients weight was reduced by 6 kgs and hair were found differ in texture were found and long hairs are found.

**Conclusion:-**

In this case study, we got good results of Panchkarma and Shaman oushadhi.

The treatment given for Kitibha Kushta (Scalp psoriasis) was Rukshani Pachana, Shodhan i.e. virechana, shirobasti and shaman oushadhi helped for removing sanga and sroto vishodhana, amapachana and removal of vitiated doshas to bring equilibrium i.e. balanced condition of doshas. So above treatment helped to relieve symptoms of disease and an attempt was made to provide safe and effective treatment to the patient.

#### Abstract

**Background:** Nosocomial infections (NI): “defined as those occurring within 48 hours of hospital admission, 3 days of discharge or 30 days of an operation”. NI is Major complication in pediatric patients at different hospital wards. NI is associated with significant morbidity and mortality. Studies had shown that NI are associated with prolonged hospital stay and increase economic burden on the health care system.

**Objectives:** -Identify the commonest organism which causes nosocomial BSI, pneumonia or UTI among pediatric patients at KAUH, 2015-2016. To know the prevalence of nosocomial BSI, pneumonia and UTI among pediatric patients at KAUH, 2015-2016. -Identify the commonest predisposing factors which lead to nosocomial BSI, pneumonia and UTI among pediatric patients at KAUH, 2015-2016.

**Methods:** This is a retrospective study done at King Abdulaziz University Hospital Jeddah Saudi Arabia 2015-2016. This include all pediatric patients who developed fever after 48 hours of hospital admission, 3 days of discharge or 30 days of an operation in pediatric ward 2015-2016.

**Results:** The number of patients who admitted was 1502 patients, 111 patients got NI. Infants are more reliable to have NI by (62.2%). Patient who had cardiovascular disease (18.9%) is more susceptible to have NI. The commonest type of infections were UTI (25.2%), BSI (21.6%) and pneumonia (19.8%). Gram negative were the dominant (48.9%). The commonest pathogen was Coagulase negative staphylococci (25.3%). The most predisposing factors were Immunosuppressive medications (22.5%), Central venous catheter (22.5%) and Nasogastric tube (19.8%).

**Conclusions:** Infant patients are more reliable to get NI. The UTI is the commonest type of infection. Gram negative are the commonest but, the Coagulase negative staphylococci is the common organism. Immunosuppressive medications, Central venous catheter and Nasogastric tube are the most predisposing factors.

### Introduction:-

Nosocomial infections (NI): “defined as those occurring within 48 hours of hospital admission, 3 days of discharge or 30 days of an operation” (1). NI are a Major complication in pediatric patients at different hospital wards. NI are associated with significant morbidity and mortality. Studies had shown that nosocomial infection is strongly associated with prolonged hospital stay and increase the economic burden on the health care system (2). Many studies had shown that the most common organisms are gram-negative bacteria as *Klebsiella pneumoniae*, *E.coli*, and *Pseudomonas aeruginosa*, followed by gram positive bacteria as *Staphylococcus aureus*, and enterococci (3). The most common type of infections are blood stream infection, followed by pneumonia, and UTI(4). There are multiple risk factors that precipitate NI as prolonged hospital stay, and patients who are admitted to ICU are more prone to have NI (5). Patients who are on mechanical ventilation device, central venous line, or urinary catheter are at higher risk to develop NI. (6) In Tunisia, a prospective cohort study was done and showed over all incidence of NI is (6.5%), mostly caused by Gram-negative bacteria (68%) with *Klebsiella pneumoniae* accounting (22.7%), the commonest type is BSI (7). On the other hand, in a multicenter European prospective study showed that the overall incidence of NI is (2.5%), mostly caused by bacteria accounting for (68%). Most of these bacteria are gram negative bacilli but, that coagulase negative *Staphylococcus* is the main pathogen. The same study showed that antibiotic resistant was highest in PICU compared to the general pediatric unit. (8) Locally, at Al-Hada Armed Forces Hospital in Taif, Saudi Arabia during the year 2004. A prospective study was for all patients admitted there. The most common site of infection was pneumonia (32.3%), followed by urinary tract infection (UTI) (25.7%) and blood stream infections (BSI) (18.6%). The most common organism was Gram negative (66.2%). *E.coli* was the most common organism (22.3%) (9).

### Research objectives:-

1. Identify the most common organism which causes nosocomial blood stream infection, pneumonia or Urinary tract infection among pediatric patients at KAUH,2015-2016.
2. To know the prevalence of nosocomial blood stream infection, pneumonia and Urinary tract infection among pediatric patients at KAUH,2015-2016.
3. Identify the most common predisposing factors which lead to nosocomial blood stream infection, pneumonia and Urinary tract infection among pediatric patients at KAUH,2015-2016.

### Research Methodology:-

This is a retrospective observational study done at KAUH, Jeddah, Saudi Arabia 2015-2016.

This include all pediatric patient who admitted to the pediatric ward between 15 February 2015 to 16 February 2016

Inclusion criteria: “infection than occurring within 48 hours of hospital admission, 3 days of discharge or 30 days of an operation” (1).

Statistical analysis: In the present study, statistical analysis using "IBM SPSS statistics ver. 20.0" was applied to evaluate and test the hypothesis.

Descriptive statistics, charts (Frequencies and percentage) .

study tools: a data gathered by hospital system using a data sheet with include demographics, date of admission, date of discharge, comorbidity, diagnosis, length of stay, investigation (on admission, with infection, after infection)

imaging, medication, risk factor(blood transfusion, immunosuppressant medication, stress ulcer prophylaxis ,central line, PICC line, NGT, TPN, urinary catheter, ventilator, tracheostomy ), outcome.

### Results:-

The total number of patients who admitted between 15 February 2015 to 16 February 2016 was 1502 patients, 111 patients got a nosocomial infection.

Among the different age groups, the Infants are more reliable to have a nosocomial infection by (62.2%).The patient who had an underlying cardiovascular disease (18.9%) are more susceptible to has a nosocomial infection, followed

by a neurological disease (16.2%) and gastrointestinal disease (16.2%). The most common type of infections in this study was UTI (25.2%) followed by blood stream infection (21.6%), pneumonia (19.8%).

Gram-negative organisms were the dominant by (48.9%). gram positive caused (43.3%) , fungi caused (7.8%) .

The most common pathogen was Coagulase-negative staphylococci (25.3%), followed by pseudomonas aeruginosa (14.5%) and Enterococcus faecalis (7.2%).

The three most potential predisposing factors were Immunosuppressive medications ( 22.5%), Central venous catheter (22.5%) and Nasogastric tube (19.8%). This study also showed that increase length of stay may increase the chance to get a nosocomial infection.

The majority of patients recovered within one week (57.7%). the mortality were only (3.6%).

	Recovery > 1 week	38	34.2
	Recovery with comorbidities	5	4.5
	Mortality	4	3.6
	Total	111	100.0

### Discussion:-

The goals of the study were to know the most common organism that cause nosocomial infection, most common site of infection and the risk factors. Coagulase-negative staphylococci was the most common infection which present (25.3%) of our samples.

Coagulase-negative staphylococci are part of normal flora of the human skin, and it can be transmitted throw any invasive devises to the blood and cause infection, that's why it's the most common infection in hospitals.

A study of 24,179 cases of nosocomial in 49 hospitals across the United States suggest that (31%) of sample were coagulase negative staphylococci (11).

But on the other hand, a study of 841 patients done in tertiary care teaching hospital showed that klebsiella pneumonia was predominant (12).

The data indicate that the UTI is the most common site of infection.

A study done in United States, 110709 pediatric patients with 6290 nosocomial infections suggest that the blood stream infection is more frequently than UTI (13).

Prolonged hospital stay and frequently used of invasive devices with poor hygiene can cause hospital acquired infection and may cause complication such as sepsis and maybe death .

Immunosuppressive medication, central venous catheter and nasogastric tube are most common predisposing factors. Study of 911 cases was performed at St Louis Children's Hospital, showed that patients with bloodstream infection were more likely to have multiple central venous catheters (14). On the other hand, in Egypt, there is a study conducted in devices associated infection, they found that the Patients who are on mechanical ventilation device, central venous line, or urinary catheter are at higher risk to develop NI (6). But in our study we found that Patients who are on central venous line, peripherally inserted catheter and Nasogastric tube are at higher risk to develop NI.

### Conclusion:-

Infant patients are more reliable to get a Nosocomial infection than the other pediatric age groups. In this study, the UTI is the commonest type of infection. Gram negative organisms are the most common to cause an NI but, the Coagulase-negative staphylococci is the common organism. Immunosuppressive medications, Central venous catheter and Nasogastric tube are the three most potential predisposing factors. The majority of patients recovered within one week.

### Perspectives:-

We believe that we need further similar studies with multicenter and larger sample size. Also, a control group that involves patients with a non-nosocomial fever might help to understand the possible risk factors for the development of nosocomial infection.

Low cost supplementary ingredients,  
Chappati, Malnutrition, Sensory  
evaluation

### Abstract

**Background:** Chappati, a low cost supplementary traditional food in India, is often used as a supplementary food. However, its nutritional quality depends on the composition of ingredients. Therefore, a study to be conducted to develop a low cost nutritionally rich and acceptable *chappati*, for use of the common people.

**Objective:** To develop *chappati* with same ingredients of different composition in order to make the most nutritionally rich chappati at low cost and acceptable for consumption.

**Design:** An experimental study (a comparative nutritional analysis).  
**Setting:** Laboratory based on Viharilal College of Home Science.

**Subjects & Methods:** Chappati was prepared by mixing low cost ingredients such as- Bajra (pearl millet) Flour, Soya bean Flour, Sesame seeds, Groundnut Flour, Rice Flour in three different proportions and marked as 1, 2, and 3. Nutrient contents (carbohydrate, protein, fat and iron) of these products and the raw samples were analyzed. Sensory evaluations of the products are carried out for determining the acceptability. Protein quality of these products was evaluated.

**Results:** Nutritional analysis indicated that all the products were rich in carbohydrate and protein. But comparison showed that product-3 was rich in protein and iron. Protein quality of product-3 found to be highest.

**Conclusion:** Product Sample-3 (proportion-3) was found to be nutritionally richest in terms of the nutrients analyzed. It may be used to provide adequate nutrients and can be used as a protein supplement.

### Introduction:-

The word "Supplementation" is derived from the word "Supplement" which means something or any nutrient is added to the food to improve the quality of food and the process of making up for a deficiency, especially any nutrient deficiency [1].

The food which are low in cost and rich in nutrients in adequate amounts as compared to the high cost nutrient rich food. Impact of low cost food supplementation on the child growth, merits careful evaluation, in the view of reliance of many States and non-governmental organizations on this intervention to improve child health in Low & Middle Income Countries(LMIC)[2].

*Bajra*,Soyabean,Sesame seed, Groundnut,Rice –All the low cost ingredients are rich in adequate amount of carbohydrate, protein, fat, vitamins & minerals(specially iron)[3].

Previous study reported that,two type of ready to eat supplementary food formulations were developed by roller drying based on wheat, soy protein concentrate, whey protein concentrate, and green gram flour and was fortified with vitamins and minerals to meet the one third of the recommended daily allowance (RDA). However, the formulations were nutritionally better than only cereal based supplementary food formulations available commercially. The product could be served in the form of porridge with water/milk or in the form of small *chappati*[4].

Another study reported that, onfortified spreads peanut can be used as supplementary foods instead; these are energy-dense, lipid-based pastes with added powdered micronutrients [5].

#### Objectives:-

- ✚ To compare the nutritive value among the three proportions taken as sample.
- ✚ To compare the nutritive value of raw & cooked product of the sample ingredients of three proportions.
- ✚ To evaluate the acceptability rate of three products made by three proportions among the community.
- ✚ To evaluate the quality of protein among three proportions.
- ✚ To develop *chappati* with same ingredients of different composition in order to make the most nutritionally rich *chappati* at low cost and acceptable for consumption.

#### Materials & Methods:-

At first, all the raw materials were grounded into powdered form. These were mixed in three different proportions are as follows-

INGREDIENTS	PROPORTION-1	PROPORTION-2	PROPORTION-3
Bajra	20 gram	30 gram	10 gram
Soya bean	20 gram	30 gram	30 gram
Sesame	20 gram	20 gram	40 gram
Groundnut	20 gram	10 gram	10 gram
Rice	20 gram	10 gram	10 gram

Then *chappatis* were prepared from these three proportions according to conventional method.

#### Carbohydrate Estimation Method:-

**Anthrone Method**-100 mg sample was weighed into a boiling tube. It was hydrolyzed by keeping it on boiling water bath for three hours with 5 ml of 2.5 N HCL and cooled to room temperature. After that it was neutralized with sodium carbonate until the effervescence ceased. The volume was made up to 200 ml with distilled water and

centrifuged at 3000R.P.M for 15 minutes. Then supernatant was collected and 1 ml aliquot was taken for analysis. Then 4 ml of anthrone reagent was added and heated for eight minutes in a boiling water bath, cooled rapidly and green colour appeared. The reading was taken at 630nm in spectrophotometer (Parkin Elmer lambda 25) [6].

**Protein Estimation Method:-**

**Lowry Method-** 0.4 gm (400 mg) sample was taken in 20 ml buffer solution (Measured the pH at 7.6). Then it was homogenized & kept overnight for extracting protein. Then cold centrifuged for 20 minutes at 5000 R.P.M (Rate per Minute). Then 1ml supernatant was collected. After that 5ml of Lowry reagent was added & allowed to stand for 10 minutes. Then 0.5ml Folin's reagent was added & kept it for 30 minutes. The reading was taken at 630nm in spectrophotometer (Parkin Elmer lambda 25) [7]. And protein quality also measured by using NDP calorie%.

**Fat Estimation Method:-**

**Soxhlet Extractor Method-** At first, 5 gm dried sample was taken. Covered it tightly by the filter paper & wrapped by string. 100ml petroleum ether was taken in a round bottom flask. The sample was placed in the extractor of the soxhlet apparatus and it was run for at least 16 hours. After complete extraction of fat from the sample, the solvent was poured into a weighed Petridish and the ether was evaporated. Then the final weight of fat containing Petridis was taken. Thus the amount of fat was estimated [8].

**Iron Estimation Method:-**

At first 500mg sample was taken in a 25ml volumetric flask. Then 10ml nitric acid was added & kept for overnight. Then it was heated for 6 hours. Then 2ml per-chloric acid was added & again heated for until the sample became transparent liquid. Then the volume make up with the double distilled water and filtered. Then reading was taken by atomic absorption spectrophotometer [9].

**Results:-dFigure.1:-Nutritional evaluation of three different proportions and their products**

According to figure, in 100g sample, carbohydrate content of raw sample-1,2,3 were 38.8%,29%,18%.Carbohydrate content of product sample-1,2,3 were 39.4%,30%,19%.Protein content of raw sample-1,2,3 were 17.08%,23.25%,29.25%.Protein content of product sample-1,2,3 were 15.87%,21.83%,28.87%.Fat content of raw sample-1,2,3 were 22.66%,20.66%,18.83%.Fat content of product sample-1,2,3 were 20.5%,18.5%,15.5%.Iron content of raw sample-1,2,3 were 12%,9.5%15%.Iron content of product sample-1,2,3 were 13%,10%,17%.

**Figure.2:-** Sensory evaluation of three different proportions and their products

According to figure, acceptability rate of product-1,2,3 were 3.18%,2.95%,3.36%.

**Figure.3:-** Protein quality estimation of three products made by three different proportions

According to figure, protein quality of product-1,2,3 were 2.6%,3.7%,5.07%.

### Discussion:-

**Fig-1** shows that the carbohydrate content of three mixes were slightly increased after cooking. Protein content of three mixes were decreased after cooking. Fat content of all the mixes were decreased after cooking, but among them fat content of **raw sample-3** is highly decreased. Iron content of all the mixed are increased after cooking.

**Fig -2** shows that acceptability rate of **product sample-3** is highest among the three different mixed.

**Fig -3** shows that protein quality of product-3 was highest among three products.

Studies have shown that, for adults, diets with an NDP Cal% of 5% would be adequate to maintain health. According to this study while the quantity of all the three products were comparable, product-3 was most suitable for adults in terms of protein quality.

### Conclusion:-

The study was based on nutritional evaluation of the low cost food (*chappati*) that can be used as supplementary food.

Among all the three products developed, protein and iron contents were found to be highest in one of the products. Moreover, quality of the protein in this product also was found to be highest.

Therefore, this particular product (*chappati*) is most suitable as a supplementary food among the three products developed.

### Aknowledgement:-

I sincerely acknowledge the Dep't of Home Science, Calcutta University for permitting me to do the experiment

**Financial Support:** None.

**Conflict of Interest:** None declared.

#### Abstract

Background: Thyroid gland is one of the important organ in human body and the burden of thyroid diseases in the general population is enormous specially in females. In Saudi Arabia its pattern is differ from area to area. Aim of the study: The present work was conducted to study the pattern of thyroid disorders among patients attended to the endocrinology clinics in Prince Sattam bin Abdul-Aziz University hospital and King Khalid hospital, Alkhraj Province, Saudi Arabia. Results: The patients complaining of different thyroid disorders were 203 (12.93%) cases. 113 (55.7%) was found to have hypothyroidism and 90 (44.3%) had hyperthyroidism. Iodine deficiency was associated with hypothyroidism in females but it was common in males with hyperthyroidism. The etiology and risk factors of hypothyroidism were stress, malignant tumors and diabetes in males while the were bad nutrition, Iodine deficiency, goiter, benign thyroid tumor and family history in females. Diabetes, graves, disease, benign and malignant tumors were common in males but bad nutrition, iodine deficiency, goiter and family history were the more frequent in females suffered from hyperthyroidism. Total cases with goiter were 68 most of them were with male (61.76%). The palpable goiter was more common than visible type (66.67%) in hypothyroidism and (64.29%) in hyperthyroidism. Malignant thyroid were found mainly in males (61.29%) with papillary type of cancer (41.94%) and the common presenting manifestation was hyperthyroidism (70.97%). Conclusion: Thyroid disorders are common in Alkhraj Province especially in females. The pattern is more or less similar to that detected in other Saudi cities. Goiter and malignant thyroid are more common in males. Recommendation: More studies should be carried out in Alkhraj Province to stress on the individual thyroid disorder so as more comprehensive studies could be obtained.

Address:- Assistant Professor of General Surgery, College of Medicine, Prince Sattam Bin Abdulaziz University, Saudi Arabia.

Thyroid gland is one of the imperative organ in human body and the encumbrance of thyroid disorders in the community is tremendous exceptionally in females . Thyroid diseases make numerous issues, even though most of them undergo medical or surgical management. Thyroid disorders are in general grouped and showed into two major classifications which are either because of diminished activity of the gland (hypothyroidism) or due to its over action (hyperthyroidism). The previous one is more common in older people (La Franchi, 1994& Griffith et al 1999).

The epidemiology of thyroid disorders in iodine- sufficient areas deals mainly with thyroid autoimmune diseases and sporadic goiter (Elahi et al 2005). However in iodine deficient areas, other type of thyroid tumors and goiters are more common . The rate of Multi-nodular goiter is different as per the countries and seems to be generally dependant on the iodine status( Abu-Eshy et al 1994)

The types of thyroid disease incorporate nontoxic goiter, Graves 'malady, Hashimoto's thyroiditis and thyroid neoplasm (Rallison et al.1991). There are two basic important thyroid gland autoimmune diseases which are Hashimoto thyroiditis and Graves disease. The first one is the most widely recognized reason for hypothyroidism, whilst the last one is the leading cause for hyperthyroidism (Rossi et al., 1985 There is a notable geographical reliance in thyroid disorders due to the various quantities of trophic iodine ingestion that happen in various geographic areas (Knudsen et al., 2000).The number of individuals in the community who have microscopic nodules, palpable goiter , and occult papillary carcinoma must be considered .

Risk factors of thyroid disorders include: Gender (thyroid disease are higher in women than in men), Diet rich in goitrogens or lacking in iodine , Family history, Pregnancy , Radiation to the neck and Smoking (Abdul Rahman et al 1997 )

The frequency and types of thyroid disorders were studied in Saudi Arabia by a few specialists (Al-Tameem, 1987; Koriesh et al., 1988; Abu-Eshy et al., 1994; Al-Zahrani et al., 2005). However little is thought about thyroid disorders studies in Alkharj province, so the present review was attempted study the types and causes of the disease among patients presented to the outpatient clinics of the University Hospital , Alkharj province, Saudi Arabia.

### **Patients and Methods:-**

This is retrospective study included 203 patients with thyroid disorders presented to the outpatient clinics of Prince Sattam bin Abdul-Aziz University Hospital , and king Khalid hospital in Alkharj Saudi Arabia during the year 2014. They were diagnosed clinically to have thyroid dysfunction disease . That was reflected either by manifestation of hypothyroidism ,hyperthyroidism or enlargement of thyroid gland. Data was collected from admissions and outpatient medical records. The data contained causes risk factors ,social-demographic data and clinical presentation, The results had been noted and analyzed.

### **Results:-**

The total number of patients presented to the endocrinology clinics in Prince Sattam bin Abdul-Aziz University Hospital and King Khalid Hospital was 1569.The patients complaining of different thyroid diseases were 203 (12.93%)

**Table (1):-** Represented the age distribution of the subjects according to thyroid dysfunction. The mean age of the patients was 44 years.

**Table (2):-** The results of present study showed that among the 203 patients, 90 cases (34 male and 56 female) was found to have hyperthyroidism and 113 (37 male and 76 female) have hypothyroidism.

**Table (3):-** Concerning **hyperthyroidism**: The stress (8.45%) , DM (21.13%) and iodine deficiency (12.68%) were the common risk factors, And graves' disease (14.08%) , Benign neoplasm (16.90%) and malignant neoplasm (8.45%) were the more frequent etiology in males. Furthermore the bad nutrition (29.55%) was the most risk factor , And the goiter (21.97%) and family history (15.15%) were the more frequent etiology in females.

**Table (4):-** Regarding to **hypothyroidism**: Stress (72.70%) , DM (76.10%) were the common risk factors, And graves' disease (66.70%) , , Malignant neoplasm (80.00% ) were the more frequent etiology in males.

While Mal-nutrition (86.70%) , Iodine deficiency (25.00%) were the common risk factors, And Goiter (88.90%) , Benign neoplasm (73.70%) , Family history (86.60%) were the more frequent etiology in females.

**Table (5):-** Revealed that palpable goiter was more common 66.7% in patients with hypothyroidism than visible type and it was more common (35.7%) in patient with hyperthyroidism. And the total cases with goiter was (68).

**Table (6):-** Total cases with goiter was (68), Males were more frequent (42) than females (26).

Subjects with thyroid goiter ( 68 cases) in the current study were demonstrated either by diffuse type ( 39 cases) or solitary nodular type ( 29 cases).

The histopathological studies obtained from the patients files revealed that ( 18 cases) out of the ( 29 case) with solitary nodules were benign.

**Tables (7):-** As regarding thyroid cancer, patients with thyroid cancer in the current study were mainly males (61.29%)

**Tables (8):-** Pattern of thyroid carcinoma among patients with thyroid malignancies, the papillary type was the most common (42%)

**Tables (9):-** And the common presenting manifestation of thyroid carcinoma was with hyperthyroidism (71%).

**Table (10):-** The most common manifestation in Patients complaining of **hyperthyroidism** in the present work was palpitation ((45.6%).

Each patient of total ( 90) has more than one of these clinical manifestations.

**Table (11):-** The most common manifestation in Patients complaining of **hypothyroidism** in the present work was obesity (59.29%).

Each patient of total ( 113) has more than one of these clinical manifestations.

<b>Table 1: Age distribution in relation to thyroid dysfunction</b> among patients with thyroid disorders in Prince Sattam bin Abdul-Aziz University hospital and King Khalid hospital, Alkharij Province , Saudi Arabia during the year of 2014.					
Age categories	Hypothyroidism		Hyperthyroidism		Total cases
	Number	%	Number	%	
0-10 years	7	6%	0	0%	7
10-20 years	8	7%	8	9%	16
20-30 years	13	12%	17	19%	30
30-40 years	19	17%	20	22%	39

Dry skin	38	33.63%
Cold	46	40.71%
Goiter	23	20.35%
Obesity	67	59.29%

Diseases of the thyroid are of great importance because most are amenable to medical or surgical management. Patients with thyroid diseases usually presented by conditions associated with excessive release of thyroid hormones (hyperthyroidism), deficiency of the hormone hypothyroidism), and mass lesions of the thyroid (**Maitra et al ;2008**)

Risk factors of thyroid disease include: Gender, Diet rich in goitrogens or deficient in iodine , Pregnancy , Radiation to the neck , Family history and Smoking (**Marita et al , 2008**)

Hypothyroidism results from deficient production of the thyroid hormone or defects in thyroid hormone receptor activity. The disorder may be acquired or congenital manifested at birth or delayed as a result of a variety of congenital defects. Congenital causes of hypothyroidism may be sporadic or familial (**Ordoorkhani et al., 2005**).

The current study revealed that out of 175 patients , 98 cases ( 27 male and 71 female ) was found to have hypothyroidism and 57 (26 male and 31 female) had hyperthyroidism. likewise , it was documented by many authors that hypothyroidism is more common in females while hyperthyroidism is more common in males ( **Martin ; 2013.**) In addition stress (59.4%) , malignant tumors ( 75% ), Hashimootothyroidiis, and DM as risk factors of hypothyroidism were more prevalent in males than females. While the common risk factors in females were bad nutrition, iodine deficiency, goiter , benign thyroid tumor and family history were more prevalent in females with hypothyroidism comparable with males (**Wang et al ;1997 & Morganti et al ; 2005**). Similarly, Flynn et al; 2004 reported that conditions such as bad nutrition and poorly controlled diabetes were among causes of hypothyroidism in females. Our results on the contrarily revealed that the uncontrolled DM was found as a risk factor in males .**Akbar et al. 2006** as well as our study reported that family history of hypothyroidism is associated with an increase risk and the role of familial susceptibility to thyroid disorders was highly related . Congenital hypothyroidism in the current work increased significantly in males (18 %) than in females (9 %) which is in consistent with the study of Wintergerst et al (**Wintergerst et al ;2014**)

Concerning hyperthyroidism, stress, DM, graves disease, benign and malignant tumors were common in males. Moreover, bad nutrition, iodine deficiency, goiter, family history and radiation were the more frequent in females. Likewise same results were obtained by Abdul Shakoor et al while other authors didn't find relation with family history to thyroid diseases (**Abdul Shakoor et al 2014**)

Iodine deficiency was associated with hypothyroidism in females but it was common in males with hyperthyroidism. likewise high iodine deficiency was recorded in hypothyroidism females and hyperthyroidism males. Epidemiological studies has shown that pattern of thyroid dysfunction in a community is largely determined by iodine intake level (**Knudsen et al. 2000**). Kutras (2001) reported that iodine deficiency, thyroid autoimmunity, infection and previous irradiation are the common etiological factors of thyroid disorders In iodine deficient communities incidence of hypothyroidism is low while nontoxic goiter and hyperthyroidism due to toxic nodular goiter is common and increases with age. Like the results of the present study , high incidence of Hashimoto thyroiditis was recorded in hypothyroidism males. Hanna and **LaFranchi** (2002) reported that thyroid autoimmune diseases like Graves' disease and Hashimoto's thyroiditis are common

reason of thyroid diseases. **Takasu et al.** (1990) described eight cases of autoimmune thyroid disease with an alternating pattern of thyroid function.

Goiter in the present study was found to be higher in males (60.7%) than in females (39.3%) . On the other hands **Elhai et al** (2005) reported an incidence of 60.6% in females. This may be due to the kind of their patients which were referred from a centre for nuclear medicine . On the contrarily one again, **Al-Bouq et al.** (2006) reported that the incidence of goiter was much less than that of ours (19.6%) in Medinah Munawarah, Saudi Arabia. A high incidence of goiter was also recorded in Gizan, Saudi Arabia (**Sulimani et al. 1995**), Bombay, India (**Dodd and Samul ,1993**) and Tunisia (**El-May et al.1997**). The appearance of goiter depends on many factors like sex, family history, iodine intake and thyroid autoimmunity. Low iodine intake enhances the TSH sensitivity and positive influence of growth factors involved in the physiological regulation of thyroid growth.

In Saudi Arabia thyroid cancer is the fourth most common cancer in all age and the second most common cancer in female ( **National Cancer Registry ;1997**).

The number of cases with malignant thyroid in the current study among cases admitted to the endocrinology clinic was 28 (12.9 % and 9.2 % in hypothyroidism and hyperthyroidism, respectively. It was reported that incidence of malignant thyroid varies from one geographical area to the other. It was recorded as 13% in Asir , (**Abu-Eshy et al ; 1994**) and 21% in Riyadh (**Al-Tameem , 1987**) There are different causal factors of malignant thyroid such as prolonged high level of TSH and iodine deficiency (Belfiore et al.1992).

Papillary carcinoma in the present work was the most common histological subtype (64.3%) followed by medullary carcinoma (14.3%), then follicular variant (10.7%) .The least was the undifferentiated (7.1%). In a retrospective study done by Hussain et al ; 2013 during the year of 2000-2010 to investigate the Incidence of thyroid cancer in the Kingdom of Saudi Arabia, Similar pattern was recognized ( **Hussain et al 2013** ) This figure is lower than that found in The Republic of Yemen (21%). (**Al-Hureibi et al; 2004**) Our finding further coincides with the study carried out in Riyadh ( **Alghamdi. Et al ; 2014**)

Thyroid nodule presenting as either a solitary nodule or a multinodular goiter (**Mazzafferri; 2004**). Most of thyroid nodules are more common in women. One or more palpable thyroid nodules affect 4% of the adult population; most of these nodules are benign (**Rossi; 2006**). Majority of solitary nodules of the thyroid proved to be localized, non-neoplastic conditions (**Mazzafferri; 2004**). Likewise, our results confirmed this fact as most of our patients with solitary nodules were found negative for malignancy.

In the present study, it was found that the cancer was more more frequent in males (75%) than females (25%). Similar results were obtained by (Hussein et al 2013). Considerable geographical variations were present in thyroid cancer incidence in Saudi Arabia.(**Bazarbashi et al ; 2008**).

In the present study, most of the patients with hyperthyroidism were complaining of palpitation (87.7%) and tremors (63.2%)

About half of the case ( 49.1% ) had weight loss and (35.1%) had sweating .Others had exophthalmos , goiter , exophthalmos and irritability .Similarly symptoms recorded by (**Michelageli et al ,200** ) were palpitation, tremors and weight loss each were over 50%. Other symptoms recorded included excessive sweating (45%), heat intolerance (31%), and nervousness (27%). On the hand, exophthalmos, tremors, and tachycardia ranked top on the list of clinical signs representing over 40% for each. However they added clinical manifestation that not included in the present work which were Proximal myopathy ( 8% ) and atrial fibrillation (4%) of patients. Graves' ophthalmopathy in their study was noted in 54% of their patients.

### Conclusion:-

Thyroid disorders are common in Alkharj province especially in females .The pattern is more or less similar to that detected in other Saudi cities. Goiter and malignant thyroid are more common in males .

**Recommendation:-**

More studies should be carried out in Alkharj province to stress on the individual thyroid disorder so as more comprehensive studies could be obtained.

**Limitation of the Study:-**

This hospital-based retrospective study, included those attended the university hospital only . To represent Alkharj province as a whole, the study should extend to cover more areas of Alkharj province especially the remote villages.

**Acknowledgment:-**

We would like to thank doctor Mohamed Abdelrazik, the assistant professor of general surgery for his continuous help and support to get the patients' files and registries .

### Abstract

Evaluation is an integral part of teaching and learning process focusing on actual teaching practice, deeply transformative force in society, offering feedback and optimization to the teaching activities. The carried out research was a qualitative approach to the initial primary, forecasting, diagnostic evaluation of school environmental projects, focusing to the needs of stakeholders and participants, the recording of objectives, type and model, schedule and budget of evaluation giving emphasis to the service or not of requirements and expectations of the project stakeholders, the used methodology and the materialized activities that matches the objectives. An Evaluation Tool for the forecasting evaluation of school projects of Environmental Education developed to serve the needs of the research.

The design of evaluation, especially the forecasting initial evaluation, is extremely neglected in Greek SPEEs which submitted for approval of implementation in Secondary Education of Crete, also in the rest regions of Greece as bibliographic research appealed, mainly attributed to the type of the used Application Form which needs upgrade, also to the lack of the proper teachers' training. In order to design educational interventions in the Greek schools of the 21st century with aims-centered characteristics, innovative, sustainable, integration and digital, the School Projects of Environmental Education, need to be materialized in more comprehensive framework with detailed templates of Application Form and Final Report by well-educated teachers.

### Introduction:-

Evaluation and inspection systems can provide valuable feedback to the schools, to build upon the didactic and pedagogical achievements and meet the educational changing needs. Evaluation is treated as an integral part of the teaching and learning process and focuses on actual teaching practice, deeply transformative force in society, offering feedback and optimization of processes. European Parliament and Council set up, in 2001, the framework of school evaluation processes with the recommendation to the Member States to establish transparent quality assurance systems and encourage school communities to create a balanced framework of school self-assessments, and any external evaluations. Next years must be involved stakeholders in all processes which can disseminate good practices and achievements of knowledge and experience (EC, 2007).

Address:- Ph.D., Med, School Advisor for Secondary Science Teachers of West Crete, Greece.

The success of a school project of Education for the Sustainable Development (ESD) attributed to many factors, among them are good and decentralized project management, interdisciplinary approach, team work, attainable outcomes, professional core tasks, analytical definition of the project, appropriate indicators of success, initial well defining of the problem, working with real problems, capacity building of participants who will work as facilitators rather than teachers, initial training change agents, understanding sustainability of the school and local community, develop visions and alternative ideas for a sustainable future (Hesselink et al, 2000). Obviously, like any project, an ESD project needs to be organized and managed in a professional way in order to obtain the expected results. But considering that ESD projects are often very complex in nature, because many actors and interests are mostly involved, professional project management becomes even more essential for achieving goals, and this type of management needs very well organized primary and forecasting evaluation in the design phase.

Several studies are internationally referred to theoretical approaches, types, methods, techniques and evaluation plans of Environmental Education (EE) with indicators/criteria, that most have been used in the educational evaluation, mainly concern the performance of students. Design and planning criteria of school educational projects are developing rapidly in recent years, specializing in criteria of framework or input, process, outcome, divided into general and particular, depending on the reference range on the faces of the evaluating objects. High care is required in the entire evaluation in terms of validity, reliability, persuasiveness, acceptance, use and ultimately usefulness of the selecting criteria, depends primarily on their accuracy and appropriateness (Dimitropoulos, 1999).

Since students have a strong natural interest about the environment, helping them to conduct research on environmental issues, and following up on the research with action as responsible citizens, is an effective way to create broader environmental knowledge. By investigating and evaluating environmental issues and actions, they improve science learning and teaching in conjunction with current school curriculum, and develop tools to investigate and evaluate environmental issues of environmental education quality standards (Hungerford et al, 1996). EE needs equipped teachers with skills of mentoring, discussion and dialogue, cooperation and work in groups, to encourage students to participate in discussions and connect the lesson with prior knowledge and experiences, with the school curricula, supporting them to construct critical and creative thinking, bring them in reflection processes and self-evaluation (EC, 2007).

Due to educational research, our concepts of learning continue to evolve, but there is still a long way until the lessons from research are fully assimilated in the teaching methods and the school organization (EC, 2007). Forecasting evaluation, as initial assessment of school educational projects has to be carried out in the startup phase of the projects to estimate variables and resources related to the design and structuring, to the human and economic resources, to the ways of cultivating values and behaviors for the personal development of the participants and the progress of the school and local community. It allows the evaluator to focus on specific characteristics, parameters and procedures in order to recognize interactions and problems from the beginning, in the planning phase of project (Koutouzis & Chatziefstratiou, 1999). The forecasting evaluation can be carried out in the school forum, at a school conference, with an open discussion of all those who intend to participate in the project, or by a committee of students and teachers. They may set specific criteria or simply the evaluation questions about the topic, the content, the aims, the methodology and the actions that will be developed in the SPEE. Some questions that can be set from the outset of the design in the construction phase of the project can be: why is the topic interesting for me, to school? How the decision was made for dealing with this issue? How to check whether the project objectives can be achieved and to what extent? Is there correspondence to the project goals and actions to the school curricula? What will be the new knowledge I'll acquire? How this knowledge will be useful to me personally, to my peers, at school, in society at local, national and global level? Is there anything that would change in the design of the project and what is that? Will be the project method useful and appropriate for approaching this issue-Why? (NTUA, 2007; EKDDA, 2012).

In Greek secondary schools, EE is applied, volunteered, beyond the obligatory timetable, guided by the Greek Ministry of Education (Circular YPEPTH Doc. Ref. 117 302 / C7 / 19.10.2007) and the local Educational Administrations. Regarding the materialized SPEEs every school year, the most of them are not evaluated at all, relies on teachers good disposition, since the evaluation is proposed-not imposed (Mavrikaki, 2001). The evaluation, as part of the project, is not included in the Application Form of SPEEs (AF-B), not even mentioned in the designing of the projects. Generally, in SPEEs, the greater weight is given to the activities and the implementation procedure and not to the primary, formative or final evaluation (Zygouri, 2005; Mavrikaki, 2001; Kalathaki & Sfakianaki,

2008). In this research, SPEEs of Heraklion (Crete, Greece) were checked if initial evaluation, as forecasting, had been taken place in the planning and structuring phase.

### Method:-

The describing research is a qualitative approach of the evaluation design the primary phase of SPEEs planning. In the research, SPEEs that materialized in school year 2005-2006 in Heraklion (Crete) Secondary Education, were checked on the prediction of evaluation in their planning and structuring phase, if they had incorporated a forecasting evaluation as assessment of important factors with sequent effectiveness and reflection to the participants, stakeholders, aims and actions of SPEEs.

The research sub-queries concern the prediction of the process and techniques of the projects' evaluation, more specifically the analysis of needs, the recording of the objectives matched to the planned activities, the selection of type and model, the educational schedule and budget. Greek Centre of Public Administration and Local Government (EKDDA, 2012) has established indicators for assessment programs, following some of them are gleaned those are relevant to the initial/forecasting evaluation of SPEEs. These indicators help in the creation of research questions and sub-queries about the existence or not of the initial/diagnostic evaluation in SPEEs, oriented to: a. satisfaction of personal interest and objectives of the school curricula and strategic objectives, b. completeness, communicability, organization, activation interest, cooperation, educational materials, training methods for teachers, c. open to participation with timely information on participation, support the implementation by management of the school, cooperation and support by the school-the program is hypothesis of the whole school community, d. infrastructure for implementation, visual aids, access to resources and materials.

Twelve specific criteria were developed in the applied Tool (Table 1) for the initial evaluation of SPEEs, with four research objects, regarding the evaluation design and planning in order to reveal if they are aims-centered, innovative, sustainable, participative and digital, if they have designed in accordance to the principles of EE and ESD. The Tool is suitable for qualitative approaches of primary/forecasting/diagnostic evaluation of SPEEs, focusing to the needs of stakeholders and participants, the recording of objectives, type and model, schedule and budget of evaluation. In the construction of the evaluation Tool, were took into consideration the principles for design and evaluation of SPEEs from Greek literacy of EE (Flogaiti, 1993; Zygouri, 2005; Flogaiti, 2006; NTUA, 2007; Aegean, 2004), the objectives and methodology as expressed in the Tbilisi conference (1977) and Thessaloniki (1997) (UNESCO, 2004) and quality indicators developed by UNESE experts (UNECE, 2006) and Frangoulis (2006), also the Evaluation Tool of the environmental teachers' training projects regarding the determination of requirements for the SPEEs implementation (Kalathaki, 2015).

**Table 1:-**Evaluation tool for the forecasting evaluation of school environmental education projects (SPEES)

<b>1 PRACTICAL ISSUES OF APPLYING THE FORECASTING EVALUATION</b>
a. who will carry out the forecasting evaluation procedure (school forum, open discussion, committee of students and teachers)
b. establishing monitoring and evaluation indicators and criteria (input, process, outcome, attainable outcomes, professional core tasks, transparent and balanced framework )
c. timing of the project's actions
<b>2. SERVICE OF REQUIREMENTS AND EXPECTATIONS OF THE STAKEHOLDERS</b>
a. of the operator of the project implementation (school, educational directorate)
b. of the participants to the project (students, teachers, local authorities, bodies, scientists, organizations, universities, enterprises, etc.)
c. of the recipients of the project results and evaluation report (school and local community, educational authorities, acceptance, use and ultimately usefulness)
<b>3. METHODOLOGY OF THE FORECASTING EVALUATION</b>
a. the selection of the type and model of evaluation (primitive, formative, final, self-assessment)
b. the links to the school curricula (divided into general and particular, interdisciplinary, modern characteristics, ICTs)
c. valuation of the project objectives (knowledge, skills, values, principles of Education for the Sustainable Development), setting evaluation's objectives
d. efficiency of available resources (educators, economical support, infrastructure)
<b>4. RELEVANCE OF OBJECTIVES AND ACTIVITIES</b>
a. educational activities,

## b. social and environmental interpretive actions.

The Tool applied in the archival material of 22 SPEEs, printed and digital, of the Application Forms (AF) and Final Reports (FR) for content analysis (Cohen & Manion, 1994; Bell, 1997; Iosifidis, 2003). The AFs were of two types A and B, because 8 of the studied SPEEs were funded, also, by Aegean University which required specific type of Application Form (AF-A), more analytical. The AF-B is the demanding type by the Greek Ministry of Education.

The applied research criteria of the Tool are referred to the stakeholders and participants of the project, the educational objectives and actions, the requirements and usefulness of the project, the type and model of the evaluation, concerning the beginning of the project: 1. Practical Issues of applying the Forecasting evaluation: a. who will carry out the forecasting evaluation procedure, b. establishing monitoring and evaluation indicators and criteria, c. timing of the project's actions, 2. Service of requirements and expectations of the stakeholders: a. the operator of the project implementation, b. the participants to the project and c. the recipients of the project results and evaluation report. 3. Methodology of the forecasting evaluation regarding: a. the selection of the type and model of evaluation, b. the links to the school curricula, c. valuation of the project objectives, 4. Relevance of objectives and activities: a. educational activities, b. social and environmental interpretive actions.

### **Results and Findings:-**

As the research revealed, there is not planned evaluation process in the initial design of the studied SPEEs. Greek Ministry of Education does not request in the AFs-B explanations on who, why and what in SPEEs' evaluation.

### **Practical issues of applying the forecasting evaluation:-**

#### **Who will carry out the forecasting evaluation procedure?**

The forecasting evaluation can be carried out in the school forum, at a school conference, with an open discussion of all those who intend to participate in the project, or by a committee of students and teachers. The asked evaluation in the AF-Bs is only indicative, (circular YPEPTH, 2007), where requested to complete the question "Who will do the evaluation of SPEE? (From A. Students/Self-assessment, B. Teachers). In the studied SPEEs, teachers had to select the type of planning evaluation in the project by clicking only the option, they had nothing to describe and explain about. The proposed AFs-A template by Aegean University was more detailed and demanding than the Greek Ministry of Education AF-B, it was more thorough fulfilling about the project evaluation. It asked the type of Evaluation a. primitive/forecasting, b. formative c. final and possible uses of the project evaluation findings (Aegean, 2004).

Similarly, in FRs, which have not a template as AFs had, teachers did not make systematic evaluation, they express particularly evaluative judgments, in relation to what they experienced themselves and gained their students, mainly in the final phase of SPEEs. Also, there were not any data from SPEEs' archives justifying the need of their evaluation. Lack of systematic evaluation in SPEEs of Secondary Education of Lasithi prefecture of Crete pointed also Drakonaki (2006), where only 5% of SPEEs had evaluation and that was on final evaluation. In 70% of SPEEs, the teachers did rudimentary judgments, since most of them had not thought to evaluate their project. Generally, evaluation in SPEEs which are materialized in Secondary Education in Greece, where it carried out, is empirical and inadequate, with no evidence whether the projects are effective or not (Zygouri, 2005).

#### **Establishing monitoring and evaluation indicators and criteria:-**

The indicator framework for educational projects should facilitate clear and transparent reporting, also effective communication about the objectives and achievements of each stage of implementation. UN (2015) established thematic Indicators to Monitor the Education 2030 Agenda by the Technical Advisory Group Proposal, October 2015, of ESD and global citizenship education (GCE), new territories, and with differences in approach, for developing comparable indicators. Among the indicators, at the level of measuring inputs, it could be measured the extent to which elements of ESD/GCE are found in curricula as subjects and approaches to learning. At the level of measuring knowledge, there is consensus that progress in the acquisition of knowledge and skills related to SD and global citizenship needs to be monitored, even if it is not linked to changes in attitudes and behaviors, linked to the age group.

**Timing of the project's actions:-**

The evaluation will answer when and whether the expected outcomes of the project have been realized also when and whether the expectations of the schools and the participants have been met. There was no evidence for the alignment control of the assessment timing with the project completion deadlines.

**Service of Requirements and Expectations of Stakeholders:-**

The project proposal must include adequate activities to evaluate the outcomes of the individuals and the project as a whole. So, the project plan ought to provide information on the impact expected on the students, teachers and others, and on the school overall. Also it has to make suggestions to how the school will integrate the competences and experiences that will be acquired through the project materialization (Erasmus, 2014).

**Forecasting Evaluation concerning the Operator of Implementation:-**

Public dialogue increasingly revolves around the request of schools' cooperation with other bodies and organizations. Evaluation and inspection systems can provide valuable feedback to school to build upon, not only its achievements but also the benefits of the total school community, and meet changing needs. Unfortunately, parents, students and other members of school and local communities are involved less and less often in the school projects and evaluations than teachers and school councils (EC, 2007).

Needs and expectations of the project operator, that is the school and school community, and wider the Educational Administration of Crete, were not recorded in any of the researched SPEEs. Also, there were no relevant evidence, indicating ways thought the implemented SPEEs to response to the requirements of the award and funding bodies, or even the evaluation's, recipients which are, among the others, the collaborative institutions, organizations, bodies and citizens. In no project sought persons available to engage in the evaluation process, even the comfortable periods for applying evaluation. No data was about the efficiency of educators and human resources in connection with the use of infrastructure and other available resources. Also, no explanation had been on how the school will integrate the competences and experiences acquired by the project in its strategic development in the future (Erasmus, 2016).

**Forecasting Evaluation concerning the Participants:-**

Primarily, it has to be answered the number of people will be affected by the outcomes of the project and how will be achieved this number. The proposal is good to identifies and addresses clearly the specified needs of the applicant school in terms of educational development of students and teachers. It also has to be described how the project will be aligned with the profile of the students and teachers who will materialize the project (Erasmus, 2014). Teachers, by investigating and evaluating environmental issues and actions, get students to think for themselves and to analyze their own ideas and teach the learners how, not only what, to think (Hungerford et al, 1996).

Given the empirically proved importance of the teacher education, educator in the inspiration and formation of the teacher, in teacher education, the educator is an extremely marginalized part of research (cf. Van der Walt et al., 2011). The reality of increasingly multicultural society's worldwide necessitates the inclusion of multicultural and intercultural education in teacher education programs. This entails not only a knowledge of other cultures and their cultural heritage, but is also a matter of attitude of creating intercultural sensitivity (Wolhuter, 2011). There is also the issue of making teacher education accessible to members of the entire spectrum of cultural groups. Some intellectuals of the EE area believe that ESD should not just focus on school audiences, but also and perhaps foremost on situations where informal and non-formal education takes places, i.e., the workplace, recreation areas, people's homes, etc., as well as in policy and decision making processes. Some even prefer to speak of learning rather than of education. Since, in their eyes, education has strong connotations with in-school and formal learning whereas, the 'broader' concept of learning refers to learning taking place at all levels in all situations formal, informal and non-formal (Hesselink et al, 2000). Having this point of view for SPEEs, teachers need suitable education and training to receive before they undertake the implementation of a SPEE. There were no evidence in the researched archival material about training and education of teachers and whom they would consult and support professionally on designing and implementing the project and especially the evaluation. In a metacognitive approach of the evaluation applied in the studied SPEEs, about the same archival material, Kalathaki and Sfakianaki (2008) remarked to have a substantial positive impact on the participants' competences and future professional practice.

In the studied archival material, it was not mentioned needs and expectations of students and teachers who participated in the project on their specified investigation of needs of the target populations. The survey of Aggelidou & Kritikou (2006) reported data on the non-satisfaction of the teachers' expectations who participated in

the SPEEs materialized in Secondary Education of Attica and who, in the following years, did not participate in new. They related their attitude, mainly, to difficulties and adversities of the school environment, generally in inadequate support of the projects by the school directors, the colleagues and the Educational Administration which could have been avoided with a better initial/forecasting evaluation of the implemented SPEEs.

#### **Initial Evaluation concerning the Recipients of the Evaluation Results:-**

Identification of the recipients of results and conclusions of the project's evaluation is important element of the project. It was requested to be recorded in the AFs-A, not in the simpler AFs-B. In this criterion, analogies found to the recordings of the recipients of the project results, even it was not given concrete recipients' description and categorizations of the conclusions in AFs and FRs, not even their fitted profile to the project (Ioannidou et al, 2005).

The objectives of the evaluation does not necessarily coincide with the educational objectives of the project. In forecasting evaluation as primary assessment, usually carried out an initial investigation of the level of the aims' satisfaction and the results may lead to a redefinition of the objectives, methods, partners, even of the project scope. Regarding the service of the purpose and objectives of SPEEs evaluation, no recordings of evaluation targets were detected in the AFs-B and FRs of the studied projects. In the AFs-A there is a special field on the utilization of the findings of the evaluation, with widespread references of joint drafting and/or general information on the projects' objectives, the used educational techniques to achieve these goals, but without clear assignments of the initial evaluation of these objectives and the methodological tools. In all AFs-A becomes clear definition of additional knowledge, but not participants' skills that each SPEE aimed to provide, with clarity in the wording of cognitive and psychomotor objectives and how to evaluate them during all phases of project materialization.

In educational projects' design, must be also assessed the structuring and the project development, so the findings of the evaluation to be useful in the future to redesign the educational process, when repeated (Koutouzis&Chatziefstratiou, 1999). Below are some excerpts from the AF-As of two projects. The program A7 had aims, among the others, *"identifying processes to bridge the gaps and reconstruction of distortion of the practical-experiential knowledge, exchange of information, processing and synthesis of materials, further facilitate planning, control, comparison of views, proposals configuration authority"*. In the program A8 was written *"The exploitation of the program will be done first by the school environmental team, as group experience. Also can be used by other teachers and schools"*.

#### **Methodology of the Forecasting Evaluation:-**

UNESCO (2012) proposes teaching with multiple perspective approach. Eight complementary and specifically approaches are selected, as of high importance, for understanding the complexity of the world today, for understanding long-standing global inequities and problems, and for their appropriateness for secondary students. They are scientific, historical, geographic, human rights, gender equality, values, cultural diversity and sustainability perspectives.

#### **Selection of the type and the model of evaluation:-**

There were not retrieved data from the AFs-B and the FRs to answer this criterion of selection the type and the model of evaluation (Vergidis&Karalis, 1999). Only the 8 AFs-A approved for funding by the Aegean University had descriptions in special field about initial, formative and final evaluation of SPEEs, to report and analyze the type, means and utilization of project evaluation. It was the same teachers who completed the two types of AFs, but, because it was not requested in the AF-B, they had not made any reference on this matter. In the FRs of the SPEEs, fragmentary evaluation elements were noticed. Only one program, A5, proposed in AF-A to materialize external evaluation: *"Evaluation by third parties with a questionnaire during the presentation of the project"*. In the AF-A of the project A1 designed *"Monitoring of the change, if any, to the knowledge, attitudes and behaviors of students"*. In the AF-A of the project A3, during the initial evaluation planned to be done *"Detection of particular inclinations and skills of the students to take into account of the division of labor ("students as painters, actors, lyricists")*.

The self-evaluation, from the beginning to the end of the SPEE, does not aim to control, but improving quality of educational work. It motivates all school factors, engages many people in joint determined actions, commits towards predetermined designs, builds collaborative behaviors, concrete problems and suggests areas for self-education and training (Papaioannou, 2013). No self-evaluation references were detected in the studied SPEEs.

**Project's links to the school curricula:-**

All school projects' results ought to be incorporated in the management and pedagogical, curricular framework and practice of the school. Applying in SPEEs the characteristics of new curriculums of the 2010 Greek educational reforming of Greek schools called 'New School', the projects, as all educational activities, must be aims-centered, innovative, sustainable, integration and digital. More analytically, a. the aims-centered projects propose objectives relating not only to building knowledge, but also to develop skills and desirable attitudes, b. the innovative projects put the focus of learning process on the students and their contribution to the initiation in research procedures and processes that promote scientific way of working and thinking ("young scientists" or "young investigators"), has a proper evaluation, etc., c. the sustainable projects help people to become sensitive to environmental issues and stakeholders for the sustainable development, d. the integration projects adopt collaborative teaching and learning processes by fostering responsibility, honesty, mutual aid, self-confidence and acceptance of the other, of the different, e. the digital projects adequately integrate ICTs to achieve specific learning objectives (PI, 2011). As Information and Communication Technologies (ICTs) have an enormous potential to support autonomous learning, the collaborative construction of knowledge and skills development, they must be exploited, in the higher possible degree, in all educational projects (EC, 2007). There were no references on the assessment of the researched archival material regarding the above characteristics in the projects' design. Of course the projects had some or all the above characteristics, indications immersed from the describing materialized activities, but hadn't not expressly referred in the AFs or elsewhere as initial/forecasting valuation approach.

**Evaluation of the project objectives:-**

In EE are evaluated/assessed individuals, resources and procedures. Evaluation items of SPEEs (Dimitriou, 2007) may be the knowledge, skills for the recognition of environmental issues and the mesh of relationships that create them (values, attitudes, physical, social, economic, cultural factors), skills to investigate environmental problems (data collection from various sources of information, data synthesis for investigating problems, recognition alternatives), attitudes, values, participation and possibility to take action to protect the environment. The targets of the projects should be clear, concrete and realistic because lack of clarity of objectives is one of the major causes of ESD projects going astray (Hesselink et al, 2000).

The SD agenda calls for an explicit focus on equity, including equity-specific goals on gender equity and reductions in inequalities. In response, education indicators should aim to capture variation across different sections of the population defined by group and individual characteristics, such as sex, wealth, location, ethnicity, language or disability, and combinations of these characteristics (UNESCO 2012; UN, 2015). 'The Future We Want' Conference's outcome document emphasizes the importance of greater international cooperation to improve access to Education including through building and strengthening education infrastructure, increasing investment in Education, particularly to improve the quality of Education for all in developing countries (Rio+20, 2012). It encourages international education exchanges and partnerships, including the creation of fellowships and scholarships to help achieve global education goals.

Where evidence retrieved about the type of SPEEs evaluation, revealed that the evaluation is independent from the project objectives, is not systematic and written only the positive outcomes that experienced students and teachers. In the FR of the project A3, teacher says that *"The environmental team having put high goals, I think, that has managed to achieve them"*. According to Mager (in Aegean/spee, 2004), when didactic aims formulated, they must respond to the questions of what the participants must be able to do (activity), under what conditions they can do it (conditions) and how well has to do it (criteria).

**Efficiency of available resources:-**

Forecasting evaluation of the efficiency and efficacy of the available resources for the project materialization, such as educators, economical support, infrastructure is fundamental for SPEEs implementation because the planned educational actions are usually much demanded and uncommon to the used school methodology of lessons and educational projects. All AFs had forecasting budget for the economic needs of the studied SPEEs. The AFs-A had analytical budget records and some explanations on the monitoring mechanism of the economic potential of the project with the estimated materials of type, quantity, cost, transportation on how many and who, publications, and in a few of them about the forecasting revenue. The AF-B had records about the total amount and, in some cases partial needs. In FRs there were no references about the way they work in order to support economically the project actions which constitutes part of forecasting evaluation.

### **Relevance of Objectives and Activities:-**

Specifying the relevance of objectives and activities, the educational activities ought to match the objectives. Programing of activities has to be clearly defined, comprehensive and realistic, matched to the capacity of the participating organizations (Erasmus, 2016). The planned activities must versus needs with a prediction about what will be future activities matching the identifying needs and objectives. With the educational activities and actions in social and environmental interventions, in the school and the society, communication becomes a broader concept in dissemination and exploitation of the project results, with the information and promotion activities to raise awareness and enhance the visibility of the project's activities (Erasmus, 2016).

When objectives set out at the levels of ecological foundation, at the level of conceptual education for environmental consciousness and shaping environmental attitudes, at the level of life and action skills with eco-management level greatly assist the selection of appropriate activities to achieve effectively them (Zachariou, 2007).

In order more effectively to be achieved the objectives of SPEEs, would be selected appropriate pedagogical, teaching methods and instructional materials, especially active participatory methods in interdisciplinary, multidisciplinary and holistic approach of the issue. To this contribute, also, the clear definition of the objectives and the determination of the type, model, methods and assessment techniques which will be applied from the beginning of the process.

### **Educational activities:-**

The subject content of ESD needs proper understanding, taught with learner-centered methods, communication at a mutually agreed time between the teacher and the environmental team, benefiting effectively of issues involved in the renewal of a common world (Ojedokun, 2012). The educational activities must negotiate issues at a more detailed level than simple information, such may be visits, magazine publishing, seminars, educational projects on television, educational videos, etc. (Aegean, 2004).

The educational software applications, which are frequently used to cultivate knowledge and skills in various issues of SPEEs, is special software with clear learning and teaching purposes in various forms of multimedia applications and robotics, applets or general software, mostly web2.0 technologies and applications. The study of FRs showed that all the phases of the projects had been properly developed, with many actions and activities, in order to achieve their objectives.

Over and above the dissemination of project results, the transfer of competences acquired during themobility and actively involvement of the participants are also of high educational importance for the project benefits.

### **Social and environmental interpretive actions:-**

Interpretative activities and actions serve the reveal of the physical processes to the learners with the presentation of complex and simpler issues at an understandable level to the general public, without the use of specified terminology. They include exhibitions, brochures, tours, pathways, lectures, presentations, voluntary environmental activities, etc. (Aegean, 2004; Katsikis, 2000). Useful tools in the design and implementation of such activities are the multimedia and Internet sites become a very flexible and powerful tool for disseminating educational activities. According to the annual Circular of Ministry of Education for Environmental Education, the basic principles to be designed the SPEEs' activities, are the interdisciplinary approach, the experiential approach, the opening of school to society, the development of democratic dialogue and the cultivation of critical thinking. As teacher El said, "Was an attempt to bring the school closer to the community, get to know the students the principles and institutions of public administration to manage growth, to learn about the management practices developed in areas of great ecological and cultural interest of the site and elsewhere." "The program aim (AF) was" to make students aware of the geophysical and cultural identity of the regions with different biodiversity than that of their place".

Democracy in schools also has a practical reason to exist as an effective way for creating a climate of confidence and responsibility within schools. The contribution of school staff, including teachers is key to the success of each school (EC, 2007).

### Conclusion:-

In SPEEs, evaluation is organic part of the project and assigned to weighty significance, since it is an inquiry educational process. In Greek Secondary Education, the evaluation in the educational process is limited and in this general climate, happens the inexistent initial evaluation of SPEEs. The carried out research was a qualitative approach to the initial, forecasting, diagnostic evaluation of school environmental projects, focusing to the needs of stakeholders and participants, the recording of objectives, type and model, schedule and budget of evaluation. As concluded from the research, the design of the evaluation is extremely neglected in SPEEs submitted for approval of implementation in Secondary Education, as none of the type of Application Forms (AFs) and Final Reports (FRs) had recordings about evaluation objectives, timetable and required financing when SPEEs were designed. This lack is, mainly, attributed to not requirement in the completion and submission of the AF-B to the local educational Administrations. The studied SPEEs not provide forecasting assessment of the expecting results in terms of the students themselves and the usually involved school and local community. Actually, this would be concomitant to the recording of students' and stakeholders' expectations from the educational project, if it carried out a primary research, at the beginning of the project designing, to reveal the needs and expectations of the school and local community, as it happens in Adult Education projects. Due to educational research, our concepts of learning continue to be evolved, but remains a long way until the outcomes from the international researches to be fully assimilated in teaching methods and school organization of Greek SPEEs.

### Recommendations:-

According to the research results and reported highlights of other researchers, it is required previously specialization and training of teachers in the design and implementation of evaluation process, particularly in setting the objectives, the choice of form and type, to select appropriate activities that match more effectively to the SPEEs' targets and the way they will be evaluated in the initial, formative and final level. The requested by the Greek Ministry of Education template of AF-B is substandard and needs upgrade, taken into consideration the Application Form (AF-A) suggested by Aegean University. In order to design aims-centered, innovative, sustainable, integration and digital environmental educational interventions in the Greek schools of the 21st century, need to prepare comprehensive frameworks with detailed project templates, by well-educated teachers. By evaluating and reflecting thoroughly the past we can looking more hopefully at the future.

##### Key words:

Gastric outlet obstruction, duodenal ulcer, antral carcinoma, gastric bazoar, pseudo pancreatic cyst, carcinoma head of the pancreas.

##### Key message:

Etiology of GOO is changing from benign to malignant pathology in present era.

#### Abstract

**Background:** Gastric outlet obstruction (GOO) also known as pyloric obstruction is the clinical & patho-physiological consequence of any disease process that produces a mechanical impediment to gastric emptying.

**Aims & Objectives:** To identify the causes, review the modes of clinical presentation and evaluate diagnostic methods & management strategies of GOO in adults.

**Material & Methods:** A prospective observational study conducted in 70 patients attending dept. of surgery, Silchar Medical College and hospital, a tertiary care center during the period of July 2014 to December 2016 of G.O.O. were included in this study. Causes of functional non-mechanical cause of G.O.O were excluded. Only patients of 20 years & above were included in this study. Saline load test, upper gastro-intestinal endoscopy and routine laboratory investigations were done in all cases while Barium meal study was done in few cases to make the diagnosis.

**Results:** Age group of 50-59 was maximum sufferers 40%, followed by age group 40-49 with 30% sufferers. Male-Female ratio was 1.9:1. Antral carcinoma (60%) followed by cicatrized duodenal ulcer seen in 34% of the cases; two case was due to gastric bazoar (3%), one case was due to pseudo-pancreatic cyst and one case was due to carcinoma head of the pancreas.

**Conclusion:** In vast majority of cases, GOO diagnosis can be established clinically. Males are more sufferers and antral carcinoma is main cause of G.O.O. After proper diagnosis, relief can be given to patients by surgical treatment. The type of procedure depends on underlying cause.

##### Abbreviations:

GOO-Gastric outlet obstruction, VGP-Visible gastric peristalsis, DU-Duodenal ulcer, CA-Carcinoma.

## Introduction:-

Gastric outlet obstruction (GOO, also known as pyloric obstruction) is the clinical and patho-physiological consequence of any disease process that produces a mechanical impediment to gastric emptying. Clinical entities that can result in GOO are generally categorized into 2 groups - benign and malignant. This classification facilitates discussion of investigations and treatment. Until the late 1970s, benign disease was responsible for the majority of cases of GOO in adults, while malignancy accounted for only 10 to 39 percent of cases [1, 2]. By contrast, in recent decades, 50 to 80 percent cases have been attributable to malignancy [2, 3, 4].

GOO can be a diagnostic and treatment dilemma. As part of the initial workup, the possibility of functional causes of obstruction, such as gastroparesis due to diabetes or paralytic ileus due to any metabolic cause should be excluded. Once a mechanical obstruction is confirmed, definitive treatment is based on recognition of the specific underlying cause i.e. benign and malignant. Diagnosis and treatment should be done as early as possible, as delay may result in further compromise of the patient's nutritional status and also increase the oedematous tissue, which complicate surgical intervention.

Cicatrised DU was the most common cause of GOO [1] but due to wider usage of H2 blockers and PPIs, better health care facilities with new investigating equipments & techniques, its incidence is on decline and is replaced by carcinoma stomach which is detected early by new investigating modalities.

The lack of uniformity in criteria in accepting a case of GOO lead to differences in incidences and clinical features in different centres, still, any one of the following can be used to diagnose gastric outlet obstruction.

1. Projectile vomiting of undigested food consumed previous day.
2. Visible gastric peristalsis (VGP).
3. Gastric succussion splash 3-4 hours after the last meal.
4. Palpable hypertrophied stomach.
5. Delayed emptying of stomach on barium meal studies.
6. A gastric residue of more than 500 ml in an adult.
7. An aspirate of more than 250 ml on saline load test.

## Aims & objectives:-

1. To identify the causes of GOO in adults.
2. To review the changes in presentation of GOO in view of changing trends in the management because of new drugs and investigatory modalities.
3. To evaluate diagnostic methods and management strategies of GOO in adults.

## Material and Methods:-

This is a clinical observational study comprising of 70 consecutive cases of GOO in adults due to various causes. Patients for the study were selected from the surgical units of *Silchar Medical College and hospital, Silchar during the period of July 2014 to December 2016.*

The pre-requisites for selecting a patient in this study were as follows:

1. One or more of the following clinical features; projectile vomiting, especially persistent vomiting of undigested food; gastric succussion splash heard 3-4 hours after the last meal; visible gastric peristalsis or presence of a palpably distended and hypertrophied stomach.
2. Fasting overnight gastric aspirate more than 200ml.
3. Saline load test of Goldstein: The volume of saline remaining half an hour after instillation of 600 ml of 0.9% NS solution. Any volume more than 250 ml. was considered significant.
4. Upper Gastro intestinal endoscopy demonstration / Radiological demonstration of gastric outlet obstruction.
5. Demonstration at operation of gross narrowing of the gastric outlet.

The cases that were willing to undergo surgery, 20 years or more in age, irrespective of sex were included in this study while patient having functional cause of obstruction were excluded. After admission of the patient a detailed clinical history was taken. Physical examination was carried out in detail, noting the state of hydration and

nutritional status. Particular attention was paid to abdominal examination for the presence of VGP, tenderness, palpable masses and succussion splash.

On the basis of the history and physical findings, a diagnosis of GOO was made and the patient investigated. Saline load test performed bedside in every patients.

### Results and Observations:-

The clinical material for this study consists of 70 adult patients with gastric outlet obstruction. All these patients were selected from the general surgical units of Silchar Medical College & Hospital, Silchar. A thorough study of these cases was made regarding the history, clinical examination, investigations, operative findings, treatment, post-operative management and tables & figures are depicting clinical parameters is also presented.

Out of 70 cases, 42(60%) cases had malignant growth in the gastric antrum as shown in figure 2, 24(34%) cases had cicatrized duodenal ulcer as shown in figure 1, 2(3%) had gastric trichobezoar, 1(1.5%) had pseudo pancreatic cyst and 1(1.5%) had carcinoma head of the pancreas as the cause of gastric outlet obstruction. Distribution according pathology is shown in Table 1.

**Table 1. Distribution according to pathology.**

Sl. No.	Cause	Male	Female	Total no. Of cases	Percentage
1	Cicatrized duodenal ulcer	14	10	24	34%
2	Antral carcinoma	30	12	42	60%
3	Gastric trichobezoar	01	01	02	03%
4	Pseudo pancreatic cyst	00	01	01	1.5%
5	carcinoma head of the pancreas	01	00	01	1.5%

**Figure 1:-** Barium meal X-ray showing GOO pyloric stenosis due to chronic DU.

**Figure 2:-** Endoscopy showing GOO due to antral carcinoma.

The endoscopic biopsy specimen from gastric mucosa was taken from 67(95.7%) cases, except for GOO due to gastric trichobezoar and pseudo pancreatic cyst. 50% of cicatrised duodenal ulcer cases were H.pylori positive. H.pylori quick test results are shown in figure 3.

**Figure 3:-** Association of H.pylori with cause of gastric outlet obstruction

The maximum incidence (40%) of GOO was seen in 50-59 years of age of which 28.5% was due to antral carcinoma, while 40-49 years age group incidence was 30% of which 20% was due to cicatrized DU, one case of pseudo pancreatic cyst was seen in 30-39 years of age group, one case of carcinoma head of the pancreas was seen in 60-69 years age group. and two cases of gastric Trichobezoar was seen as a cause of G.O.O. Distribution according to underlying pathology is shown in table 2.

**Table 2:-** Age Distribution with underlying pathology.

Age	Cicatrized DU(%)	Antral CA(%)	Gastric bezoars(%)	Pseudo pancreatic cyst (%)	CA head of pancreas(%)	Total(%)
20-29	-	-	01(1.5%)	-	-	01(1.5%)
30-39	03(4%)	01(1.5%)	-	01(1.5%)	-	05(07%)
40-49	14(20)	07(10%)	-	-	-	21(30%)
50-59	7(10%)	20(28.5%)	01(1.5%)	-	-	28(40%)
60-69	-	14(20%)	-	-	01(1.5%)	15(21.5%)
Total	24	42	02	01	01	40

In this series 46(65.7%) patients were males and 13 (34.3%) patients were female. Male to female ratio (M:F) was 1.9:1 as seen in figure 4.

In this series, 28 patients (40%) were farmers, 18(26%) patients were manual labourers, 10 (14%) patients were Drivers, 9 (13%) patients were housewives and 5 (7%) patients were businessman as seen in figure no 5.

**Figure 4:-** Gender distribution.

**Figure 5:-** Distribution according to occupation of the patients.

Pain abdomen and vomiting were found in most of the cases as shown in table 3.

**Table no 3:-** Distribution of symptoms with their frequency.

Symptom	No. Of cases	Cicatrized DU	Antral CA	Gastric bezoars	Pseudo pancreatic cyst	CA head of pancreas
Pain abdomen	64	24	28	01	01	00
Vomiting	70	24	42	02	01	01
Lump abdomen	21	00	19	00	01	01
Appetite loss	54	11	42	00	00	01
Weight loss	43	08	34	00	00	01
Post-prandial fullness	55	15	37	01	01	01
Melena	25	03	21	00	00	01
Jaundice	02	00	00	00	01	01

**Figure 6:-** Frequency of signs

Almost 70% to 80% patients with Cicatrised DU and Antral cancer had VGP & succussion splash. More than 45% antral cancer patients had palpable mass, pallor & Ascitis as in figure 6.

Most common surgical operation done was Truncal vagotomy with posterior gastro-jejunostomy for cicatrized duodenal ulcers followed by Billroth II gastrectomy for antral carcinoma, Gastric Trichobezoar were removed by gastrotomy in two cases and pseudo pancreatic cyst was drained by Jurasz Cysto-gastrostomy as shown in table 4.

**Table no 4:-** Types of surgical procedures done in the study

Cause	Surgical Procedure done	No. of cases	Percentage
Cicatrized DU	Truncal vagotomy with posterior gastro-jejunostomy	24	34%
Antral CA	Billroth II gastrectomy	21	30%
	Anterior gastro-jejunostomy	14	20%
	Palliative feeding jejunostomy	07	10%
Gastric bezoars	Gastrotomy and removal of bezoar	02	03%
Pseudo pancreatic cyst	Jurasz operation(Cysto-gastrostomy)	01	1.5%
CA head of the pancreas	Anterior gastro-jejunostomy with T-tube biliary drainage	01	1.5%

Six patients of antral carcinoma died in post-operative period, four with electrolyte imbalance and the other two because of severe lower respiratory tract infection and septicaemia. Post-operative hospitalization ranged from 8 to 21 days with an average of 14 days. Sutures were removed between 7th and 10th post-operative day.

### Follow up:-

All the 64 cases were followed up post operatively for the period of 6 months. All the antral carcinoma patients received chemotherapy post operatively, of 34 patients 15 who underwent Billroth II resection received cisplatin and 5 FU regimen and rest with unresectable disease received epirubicin, cisplatin and 5 fluorouracil (5FU) regimen for 6 cycles at an interval of 21 days. Before every cycle complete blood count, liver and renal functions were assessed and 8 patients lost the follow up after 3 months. All 24 cases of duodenal ulcer were symptom free; Patients with gastric bezoar followed up and were symptom free; also patient with pseudo pancreatic cyst was followed up and he had recurrent attacks of dull aching pain in epigastrium, dyspepsia and was given oral opioid analgesics along with proton pump inhibitor (PPI) and pancreatic enzyme supplementation. On follow up of patient with CA head of pancreas he is found to be jaundice free and receiving adjuvant chemotherapy as in table 5.

**Table 5:-** follow ups of patients after surgery.

Follow ups	1 month	3 months	6 months	remarks
Cicatrized DU	24	24	-	Symptom free
CA Antrum	34	34	26	All received adjuvant chemotherapy & 8 patients lost follow up after 3months
Gastric bazoar	2	2	-	Symptom free
Pseudo pancreatic cyst	1	1	1	Had recurrent attacks of pain on treatment
CA head of the pancreas	1	1	-	Jaundice free & receiving adjuvant chemotherapy

### Discussion:-

The commonest cause of GOO was antral carcinoma & the next common cause was cicatrized duodenal ulcer in our study. These observations were similar to that of McQuaid [5] and Dullas N shone [6] studies.

Until the late 1970's benign disease was responsible for a majority of cases of GOO in adults, while malignancies accounted for only 10 to 39 % of cases. Contrasting to this, in the recent decades due to the discovery of *Helicobacter pylori* and proton pump inhibitors, 50 to 80 percent cases have been attributed to malignancy [7]. Similar findings were observed in McQuaid et al study in 2010 [5]. In Dallas N shone et al study in 2008 [6], cause of G.O.O in 61% (n=20) cases was malignancy and in 39% (n=31) cases was duodenal ulcer.

Most patients were in the fifth & sixth decade in this study. In antral carcinoma cases the maximum incidence seen in the age group of 50-59 years. Life span was 20 to 69 years. In series of Fisher et al [8] the average age was 54 yrs with a span from 20-89 yrs & men outnumbered women by 2:1. Men outnumbered women by 1.9:1 in our study as

compared to 5.5:1 observed by Yogiram Chaudary [9]. This higher incidence in males, worldwide can be explained as because of more consumption of gastric irritants by males compared to females.

In our series 40% of the patients were farmers, 26% manual labourers and 14% were drivers who gave history of irregular diet habits, which seems to contribute to disease process. The series of Donald D Kozoll & Karl A Meyer [10] also showed the same pattern with non-skilled day labourer group listed most frequently with obstruction.

All the cases were subjected to serum electrolyte estimation in our study. Out of them 18 cases (25.7%) showed electrolyte imbalance. In series of Maichel L Schwartz [11] electrolyte imbalance was present in 30%.

Common symptoms and signs in our study were vomiting, pain abdomen & dyspepsia and succussion splash, VGP & pallor respectively.

Upper GI endoscopy was done in all 70 cases (100%). 42 (60%) cases had carcinoma stomach in which 31 cases showed antral growth and other 11 cases showed Prepyloric growth. 24(34%) had cicatrized duodenal ulcer, 2(3%) had gastric bezoar, 1 (1.5%) had pseudo pancreatic cyst and 1 (1.5%) had CA head of pancreas. It is similar as found by Misra SP in 1998 [12]. 50% of cicatrized DU's in this study were H. pylori positive.

### Conclusions:-

The present study is a clinical observational study of gastric outlet obstruction. Since the study has been based on a small number of cases with a limited follow up, it will be rather difficult to come to definite conclusions. However some of the conclusions which can be drawn from this study are as follows:-

1. The commonest cause of G.O.O in adults was ca antrum (60%), followed by cicatrized duodenal ulcer (34%).
2. Males are commonly affected with G.O.O in adults.
3. Vomiting and succussion splash are the most common and constant symptom and sign of G.O.O.
4. In the vast majority of cases, the diagnosis can be established clinically. .
5. The saline load test was found to be an effective bed side investigative procedure to assess the degree of G.O.O.
6. Upper gastro intestinal endoscopy should be advised in all suspected cases of G.O.O. It can diagnose the cause of obstruction very effectively than any other investigative modality.
7. Surgical procedure for antral carcinoma depends on stage of disease, operability and resectability of tumour. Majority of patients with duodenal ulcer can be treated with Truncal vagotomy with posterior gastrojejunostomy.

##### Key words:-

IAP (Intra-abdominal pressure),  
nasogastric decompression, intestinal  
obstruction.

#### Abstract

**Introduction:** We follow the age-old teaching of inserting nasogastric tube to decompress the stomach and reduce intra-abdominal pressure whenever a patient comes to us with intestinal obstruction. But how much does this decrease the raised intra-abdominal pressure is hardly known and evidence based. So in this study we attempt to find the difference in intra-abdominal pressure that occurs by insertion of nasogastric tube and decompression.

**Aims and objectives:** To find the difference in intra-abdominal pressure on insertion of nasogastric tube and decompression in patients with intestinal obstruction.

**Method of study:** Interventional study. 75 patients with intestinal obstruction who presented to emergency department of Silchar Medical College and Hospital were included in the study. Patient who had no vomiting in the last 2 hours before presentation were only included for this study. Intra-abdominal pressure was measured via Foley's catheter method before and after insertion of nasogastric tube and decompression. Results were obtained based on the difference in intra-abdominal pressure and percentage variation.

**Conclusion:** From this study we found that insertion of nasogastric tube in emergency department in patients with intestinal obstruction reduces the intra-abdominal pressure by 2.81mmHg (mean of 75 patients) in short time even when no other intervention has been carried to reduce the intra-abdominal pressure before operation. On an average there was 18.18% reduction of IAP after nasogastric decompression.

#### Introduction:-

We follow the age-old teaching of inserting nasogastric tube to decompress the stomach and reduce intra-abdominal pressure whenever a patient comes to us with intestinal obstruction. But how much does this decrease the raised intra-abdominal pressure is hardly known and evidence based. So in this study we attempt to find the difference in intra-abdominal pressure that occurs by insertion of nasogastric tube and aspiration.

##### Aims and objectives:-

To find the difference in intra-abdominal pressure on insertion of nasogastric tube and decompression in patients with intestinal obstruction.

**Method of study: Interventional study:-**

75 patients with intestinal obstruction who presented to emergency department of Silchar Medical College and Hospital were included in the study. Patient who had no vomiting in the last 2 hours before presentation were only included for this study. Intra-abdominal pressure was measured via Foley's catheter method before insertion of nasogastric tube.[1]

With the patient lying supine, 100 ml of sterile water were instilled via manometer tubing into the bladder following drainage of viscera. The mid-axillary line was used as the zero reference, and cavity pressure noted in centimeters of water (cmH<sub>2</sub>O) at end expiration.[2] The IAP was converted to mmHg by multiplying with 0.735

Then nasogastric tube of 16F size, was inserted till 55 cm marking and maximum decompression done. After ten minutes of decompression IAP was measured again. The difference in IAP was found in all cases. No other intervention that alters the IAP were done before taking these values. In all patients IAP was measured by same method in supine position. Pediatric patients and pregnant women were excluded.

**Results and observations:-**

The recording of intra-abdominal pressure in all the patients with intestinal obstruction before and after nasogastric decompression is plotted in the form of graph below:

The maximum change in intra-abdominal pressure observed was 5 mmHg in one out of 75 patients. Minimum change in intra-abdominal pressure observed was 1 mmHg in 4 out of 75 patients. Among the patients who presented to us with intestinal obstruction the maximum intra-abdominal pressure noted was 21 mmHg and minimum IAP at presentation was 10mmHg. The difference in IAP of 2mmHg, 3mmHg and 4mmHg were noted in 24 patients, 32 patients and 14 patients respectively. So difference of 3mmHg was found in maximum number of patients in our study due to nasogastric decompression. Through this study we observed that maximum of 31.25% reduction of IAP occurred after nasogastric decompression and minimum of 8.3% reduction of IAP in two patients. 16-20% reduction of IAP occurred in maximum number of patients (32). Percentage reduction of IAP were divided into 6 categories and mentioned in diagram below.

### Discussion:-

Since the 1930s routine use of the nasogastric tube to achieve postoperative gastric decompression has enjoyed widespread acceptance, and for decades patients' complaints were not taken into consideration by anesthesiologists and surgeons. Nasogastric decompression facilitate exposure of operative field during surgeries for intestinal obstruction. It helps to drain the gastric remnant which can relieve nausea and abdominal distension. Besides, it may help decrease diaphragmatic splintage and hence decrease chance of chest infection when ileus occurs. Perceived importance in earlier years was well expressed by WJ Mayo: 'Would rather have a resident with a nasogastric tube in his pocket than a stethoscope.'[9]

However, nasogastric intubation could cause patient discomfort; also it has been shown that it would cause gastro-esophageal reflux which may be associated with chest complication. At one point or the other each surgeon would have experienced to see the patient who removed nasogastric tube himself due to discomfort. So it is highly essential to have evidence based establishment of influence of nasogastric decompression on Intra-abdominal pressure.

Since the abdomen and its contents can be considered as relatively non-compressive and primarily fluid in character, subject to Pascal's law, the IAP can be measured in nearly every part of the abdomen. In 1875, Oderbrecht measured IAP within the urinary bladder.[3] Different direct and indirect measurement methods have been reported. In this study we have used the intra-vesical method which is considered gold standard in most of the studies and cost effective as well.

Normal IAP ranges from sub-atmospheric to 0 mmHg. Normal IAP is approximately 5–7 mm Hg in critically ill patients. The World Society of the Abdominal Compartment Syndrome (<http://www.wsacs.org>), in its latest consensus statement [2], defined IAH as sustained or repeated IAP of  $\geq 12$  mmHg. Likewise, abdominal compartment syndrome (ACS) was defined as IAP  $> 20$  mmHg in combination with at least one new end-organ failure.

IAP increases with inspiration (diaphragmatic contraction) and decreases with expiration (diaphragmatic relaxation).[4] Thus all the measurement in our study was taken just after expiration of patient. It is also directly affected by the volume of the solid organs or hollow viscera (which may be either empty or filled with air, liquid or

fecal matter), the presence of ascites, blood or other space-occupying lesions (such as tumors or gravid uterus), and the presence of conditions that limit expansion of the abdominal wall (such as burn or third-space edema). But how much does the nasogastric decompression help in reducing IAP is the main interest of this study.

The potential contribution of body position in elevating IAP should be considered in patients with moderate to severe IAH or ACS. Other studies say Head of bed elevation can significantly increase IAP compared to supine position, especially at higher levels of IAH.[5] Such increases in IAP become clinically significant (increase >2 mmHg) when the patient's head of bed elevation exceeds 20°. To avoid error in measurement due to change in posture, all our readings were taken in supine position.

Abdominal Compartment Syndrome (ACS) and Intra-abdominal Hypertension (IAH) affect all body systems, most notably the cardiac, respiratory, renal, and neurologic systems. ACS/IAH affects blood flow to various organs and plays a significant role in the prognosis of the patients. Abdominal perfusion pressure is the difference in mean arterial pressure and the intra-abdominal pressure in mmHg. So for each mmHg of decrease in abdominal pressure there is chance for intra-abdominal perfusion to increase. Literature shows reduction of mesenteric blood flow and higher chance of gut mucosal ischemia and reduction in portal circulation with increase in IAP more than 10mmHg. There are studies showing reduction bowel tissue oxygenation with normal cutaneous oxygenation in patients with intra-abdominal hypertension. [6] In our study we observed that 15 out of 75 patients reached IAP of 10mmHg and below following nasogastric decompression.

For every mmHg rise in IAP there is incremental reduction in renal plasma flow which is irreversible by just fluid management[7], [8]. So reduction of IAH in the earliest can help renal system to recover its flow and function.

It has been established already that there is direct relationship between duration of increased IAP and morbidity of patient. In our study the mean difference found was 2.81mmHg of reduction in IAP just by nasogastric decompression in ten minutes interval. On an average there was 18.18% reduction of IAP after nasogastric decompression. Even when mean reduction in IAP of 2.81mmHg by nasogastric decompression appears to be smaller, it can highly contribute for reducing IAP apart from non-operative techniques like per rectal evacuation in patients with intestinal obstruction. This reduction of IAP will help to maintain perfusion of intra-abdominal organs during the time spent before operative intervention.

### Conclusion:-

From this study we found that insertion of nasogastric tube in emergency department in patients with intestinal obstruction reduces the intra-abdominal pressure by 2.81mmHg (mean of 75 patients) in short time even when no other intervention has been carried to reduce the intra-abdominal pressure before operation. If the study can be carried on large scale an evidence based value of difference in intra-abdominal pressure following nasogastric decompression by Ryle's tube can be firmly established.

**Conflict of interest:** none

#### Abstract

The aim of the survey was to determine the prevalence of caries in the anterior teeth in the Dakshina Kannada population. The basic research design included performance of dental examination based on WHO criteria and questionnaire survey on 4000 patients from the Dakshina Kannada district visiting the outpatient section of the Department of Conservative Dentistry and Endodontics and Rural Satellite Centres of A. B. Shetty Memorial Institute of Dental Sciences, Nitte University, Deralakatte, Mangaluru from 2014 to 2015. The data obtained were statistically analyzed. A significant correlation was deduced between gender, age, diet, oral hygiene habits and caries of the anterior teeth

*Copy Right, IJAR, 2016, All rights reserved.*

#### Introduction:-

Dental caries as old as humankind is a chronic, infectious disease caused by bacterial by-products that leads to the dissolution of the tooth surface.<sup>1</sup> Dynamic balance between demineralizing and remineralizing factors determines the eventual outcome of dental caries. Demineralizing factors include acidogenic bacteria, inhibited salivary function and frequency of ingestion of fermentable carbohydrates. Dental caries manifests as a continuum of disease states ranging from subclinical atomic level of demineralization to frank cavitation.<sup>2</sup> Caries is largely preventable by early diagnosis, identification of individual risk factors, patient counselling and education, and initiation of preventive care procedures. The progressive nature of dental disease can quickly diminish the general health and quality of life especially in the case of caries in anterior teeth. Failure to identify and prevent dental disease leads to consequential and long-term adverse effects. Untreated dental disease can compromise the patient's ability to eat, sleep and function well at home and the society. An aesthetic healthy smile in addition to being an important determinant of overall physical aesthetics has been observed to have a considerable bearing on social interaction, playing an important role in how an individual is felt and perceived by others. The unaesthetic nature of untreated anterior carious teeth can also compromise the individual's self-esteem and social development leading to intense psychological repercussions in certain instances. Despite significant achievements in public health programmes individuals still suffer from dental caries and are without basic dental care.<sup>3</sup> The infectious dental disease is reversible, if detected early enough. Establishment of a healthy lifestyle, good oral hygiene and nutrition, periodic oral health check-up is of paramount importance to prevent dental caries.

Address:- Vice Principal, Dean of Dental Faculty, Head – Department of Conservative Dentistry and Endodontics, A. B. Shetty Memorial Institute of Dental Sciences, Nitte University.

An insight pertaining to the aetiology of dental caries may be provided from a patient's caries pattern. Hence adequate knowledge and information regarding the prevalence of caries will form the inherent basis for caries prevention programmes and treatment plans. This survey conducted aimed at determining the prevalence of caries in the anterior teeth based on gender, age, location, diet, frequency of oral hygiene measure practiced and surface of the tooth involved.

### Materials and Methodology:-

An epidemiological study was conducted on 4000 patients in the year 2014 and 2015 aged above 15 years randomly selected from the outpatient department of A. B. Shetty Memorial Institute of Dental Sciences and satellite rural centres of Nitte University. Subsequent to obtaining permission from the ethical clearance committee of the institute and written consent from the patients a standardized prepared questionnaire based on the WHO Oral Health Assessment form 2013 was filled by the clinical examiner prior to and after the clinical examination.

### Inclusion Criteria:-

Male and female patients aged above 15 years of age  
Anterior maxillary and mandibular teeth

### Exclusion Criteria:-

Patients with intellectual disability  
Patients undergoing orthodontic treatment  
Edentulous patients  
Maxillary and mandibular premolars and molars

Armamentarium used for the examination was sterile mouth mirror, probe, tweezer and cotton rolls.

The patients were examined for anterior caries on a dental chair under adequate illumination. The data collected were analyzed statistically.

### Results:-

**Table 1:-** Total prevalence of caries in anterior teeth

TOTAL PATIENTS		PATIENTS WITH ANTERIOR CARIES	
2014	2015	2014	2015
2000	2000	480 (24%)	402 (20.1%)

Out of the 4000 patients examined over a period of 2 years, caries in the anterior teeth was observed in 480 (24%) and 402 (20.1%) patients in the year 2014 and 2015 respectively.

**Table 2:-** Prevalence of caries in different age groups

AGE GROUP (IN YEARS)	TOTAL PATIENTS		PATIENTS WITH ANTERIOR CARIES	
	2014	2015	2014	2015
15-25	200	264	10 (02.08%)	9 (02.23%)
26-35	280	424	30 (06.25%)	42 (10.45%)
<b>36-45</b>	<b>440</b>	<b>509</b>	<b>170 (35.42%)</b>	<b>188 (46.77%)</b>
46-55	480	317	155 (32.29%)	96 (23.88%)
56-65	400	308	65 (13.54%)	43 (10.70%)
>65	200	178	50 (10.42%)	24 (05.97%)

Highest prevalence of caries was observed in the age group of 36 – 45 years 170 (35.2%) in the year 2014 and 188 (46.7%) in 2015 followed by 46 – 55 years.

**Table 3:-** Prevalence of caries based on gender

GENDER	TOTAL PATIENTS		PATIENTS WITH ANTERIOR CARIES	
	2014	2015	2014	2015
FEMALE	1200	919	200 (41.60%)	175 (43.53%)
<b>MALE</b>	<b>800</b>	<b>1081</b>	<b>280 (58.30%)</b>	<b>227 (56.46%)</b>

Males exhibited higher prevalence of caries in anterior teeth 280 (58.30%) and 227 (56.46%) when compared to the female gender

**Table 4:-** Prevalence of caries based on location

LOCATION	TOTAL PATIENTS		PATIENTS WITH ANTERIOR CARIES	
	2014	2015	2014	2015
RURAL	1247	1341	260 (54.17%)	180 (44.77%)
URBAN	753	659	220 (45.83%)	180 (44.77%)

The prevalence of caries in anterior teeth in the year 2014 was higher in the rural population 260 (54.17%) when compared to the urban population, whereas in the year 2015 the prevalence of caries was 44.7% in both the rural and urban population.

**Table 5:-** Prevalence of caries based on diet

DIET	TOTAL PATIENTS		PATIENTS WITH ANTERIOR CARIES	
	2014	2015	2014	2015
VEGETARIANS	480	370	150 (31.25%)	127 (31.59%)
MIXED DIET INCLUDING FISH	1220	1430	130 (27.08%)	75 (18.66%)
MIXED DIET EXCLUDING FISH	300	200	200 (41.66%)	200 (49.75%)

The prevalence of caries in anterior teeth was observed to be more in patients following mixed diet but devoid of fish 41.66% in 2014 and 49.75% in 2015.

**Table 6:-** Prevalence of caries based on brushing frequency

BRUSHING FREQUENCY	TOTAL PATIENTS		PATIENTS WITH ANTERIOR CARIES	
	2014	2015	2014	2015
1	1314	1343	249 (51.88%)	198 (49.25%)
2	712	622	107 (22.29%)	99 (24.63%)
>2	74	35	124 (25.83%)	103 (25.63%)

Prevalence of caries in anterior teeth was highest among patients brushing once daily 51.88% in 2014 and 49.25% in 2015.

**Table 7:-** Prevalence of caries based on specific anterior tooth

TOOTH NUMBER	NUMBER OF TEETH WITH CARIES	
	2014	2015
11	325 (33.44%)	302 (33.82%)
12	195 (20.07%)	170 (19.04%)
13	15 (01.54%)	17 (01.90%)
21	300 (30.86%)	280 (31.36%)
22	27 (02.77%)	17 (01.90%)
23	6 (00.62%)	7 (00.78%)
31	20 (02.05%)	17 (01.90%)
32	12 (01.24%)	14 (01.57%)
33	4 (00.41%)	6 (00.68%)
41	40 (04.11%)	38 (04.25%)
42	20 (02.06%)	21 (02.35%)
43	8 (00.83%)	4 (00.45%)

Maxillary right central exhibited the highest prevalence of caries 33.44% and 33.82% in 2014 and 2015 respectively.

**Table 8:-** Prevalence of caries based on the surface of the tooth involved

TOOTH SURFACES	SURFACES WITH CARIES	
	2014	2015
MESIAL	730 (67.97%)	688(66.47%)
DISTAL	285 (26.54%)	321(31.01%)
LABIAL	15 (1.40%)	13(1.25%)
LINGUAL	25 (2.33%)	19(1.83%)
INCISAL	19 (1.77%)	14(1.35%)

Prevalence of caries was most observed in the proximal surfaces, mesial 730 (67.97%), 688 (66.47%) and distal 285 (26.54%), 321 (31.01%) in 2014 and 2015 respectively.

### Discussion:-

This study concluded that the distribution of caries was slightly higher in males than females, but not of much significance in contrast with the research conducted by Hegde M N et al<sup>3</sup> and the research conducted by Lukacs J R et al<sup>4</sup>. The earlier studies attributed the higher prevalence of caries in anterior teeth in females to early eruption of teeth, longer exposure to cariogenic environment, easier access to food supplies and frequent snacking during food preparation.<sup>2</sup> The decrease in the prevalence of caries among the female population may be due to an increase in the awareness of oral health importance among the rural population. Exposure to various oral health awareness programmes conducted in schools, colleges and in rural satellite dental care centres may also be a contributory factor to the decreased prevalence.

The prevalence of caries in anterior teeth was assessed in various age groups. Out of the 4000 patients examined, prevalence of caries was more in the age group of 36 – 55 years of age. Similar results were recorded in studies conducted by Hegde M N et al<sup>3</sup> and Cleaton-Jones et al<sup>5</sup>.

The prevalence of caries in anterior teeth in the rural population was higher than that of the urban population in the year 2014 whereas in the year 2015 similar prevalence was observed. The higher prevalence of anterior caries in the earlier years corroborated by study conducted by Hegde M N et al may be due to various socio-economic factors, such as lack of knowledge and practice of oral hygiene practices, inadequate infrastructure and facilities available for oral health screening and treatment.<sup>6</sup> The decrease in the disparity in prevalence of caries in the anterior teeth among the rural and urban population is due to the increase in oral health awareness among the rural population contributed by various oral health awareness programmes conducted by rural satellite centres located in the areas.

A strong correlation was observed between prevalence of caries in anterior teeth, diet excluding fish and diet including fish. Fish is a common part of the diet in population of Dakshina Kannada located in west coast of Karnataka, India. The decreased prevalence of caries in anterior teeth may be attributed to the increased intake of fish which is rich in fluoride and proteins. Proteins in the diet increase the pH in the oral environment due to putrefaction. Hence the population may be protected from dental caries.<sup>7, 8, 9</sup>

This study showed that the prevalence of caries was dependent on the oral hygiene habits of the population. It was observed that lesser the frequency of brushing higher the prevalence of caries in anterior teeth. Similar results were reported in studies conducted by Hegde M. N. et al<sup>3</sup> and Tarsitani et al<sup>6</sup>.

Prevalence of caries was more in the maxillary anterior teeth than the mandibular anterior teeth. This finding may probably be due to the proximity of the mandibular teeth to the submandibular and sublingual salivary gland duct openings. Similar findings were reported by Hegde M. N. et al and Mustafa D. et al. The results of the present study show that the prevalence of caries was most common in maxillary right central incisor followed by the maxillary left central incisor and maxillary right lateral incisor.

Certain areas of the tooth are more susceptible to caries such as pit and fissures and proximal surfaces. Approximal surfaces of the anterior teeth showed the highest prevalence of caries in accordance with the study conducted by Hegde M. N. et al and Mustafa De merci et al.<sup>10</sup> Prevalence of caries was observed more in the mesial surface followed by the distal surface. This may be due to inadequate oral hygiene practices. Proximal surfaces of the anterior teeth are not self-cleansing hence may present as a retention area, thereby promoting caries

### Conclusion:-

According to the study conducted it can be concluded that prevalence of caries in the anterior teeth can be strongly correlated with age, location, diet, oral hygiene habits and the surface of the tooth. Association between gender and caries was not observed.

#### Abstract

Cooling has always been a difficulty faced in the automobile sector. High elevated temperatures have to be achieved and thus there is a requirement for high grade cooling in automobiles. In addition to that, other components in mechanical sector like, gas turbines, compressors, flywheels, etc all require an extensive cooling mechanism. The major contributing factor in any cooling system is the coolant fluid and the heat transfer surface area from which the heat is rejected. The general challenge when concerned with fabrication of any component is its surface finish. Not all surfaces have a smooth contour. Hence, in our project, we will be performing an experimental study on the cooling rate of a metallic component using air impingement cooling. Air impingement cooling is a procedure where, high pressure air is used as a coolant fluid over the whole surface to be cooled. Due to surface finish being a concern, the experiments will be carried out on a copper plate with a rough surface. The major advantage however with a rough surface is the increase in effective heat transfer surface area. The conventional cooling methods include-Air Cooling or Oil cooling at the domestic level. To improve on this, we would like to explore the more advanced process called Impingement cooling. Impingement cooling has the distinctive advantage of being more effective and provides with higher heat transfer rates. It is a common process that is used in the cooling of gas turbine blades and other high temperature, high precision components. Jet impingement is an attractive cooling mechanism due to the capability of achieving high heat transfer rates. This cooling method has been used in a wide range of industrial applications such as annealing of metals, cooling of gas turbine blades, cooling in grinding processes and cooling of photovoltaic cells. Jet impingement has also become a viable candidate for high-powered electronic and photonics thermal management solutions and numerous jet impingement studies have been aimed directly at electronics cooling. The set up includes a copper plate which acts as the metal body (Rough surface), an air compressor's blow off which serves as the Air impinger. The copper plate contains equal spaced holes which makes it a rough surface. This rough surface is then heated using the furnace. Then, the experiment is then conducted by using the Air compressor. At equal intervals of time, the temperature is measured. The experiment is repeated for natural convection too. The temperatures are measured using an IR gun (Infra Red gun).

Temperatures are seen for both Natural convective cooling and Impingement cooling and a graph is plotted. Then, the results are deducted.

## ..... **Introduction:-**

This report presents a concise review of the Air Jet Impingement technique on flat surfaces. Impingement is an age old technique which was initially used on gas turbine blades in late twentieth century. This review is aimed at using the technique to a more sophisticated purpose.

**Cooling has been an age old technique. We know that there are three basic modes of heat transfer. They are:**

**Conduction:-**

**Convection:-**

**Radiation:-**

Phase change is a trending mode of heat transfer which is still in its developing stage. The project revolves around how convection is booming in the present world of Cooling. Convection is of 2 types viz. natural and forced.

## **Background:-**

Our project is based on a type of forced convection called as Impingement. Impingement is a new way of forced convection where the fluid is forced on to the hot surface at a very high force. This method is used in industries for various applications like annealing of metals, cooling of gas turbine blades, cooling in grinding processes and cooling of photovoltaic cells. Jet impingement has also become a viable candidate for high-powered electronic and photonics thermal management solutions and numerous jet impingement studies have been aimed directly at electronics cooling.

Impingement technique has been widely researched for its high value of heat removal rate and how it behaves. The jet flow characteristics are highly complex and consequently the heat transfer from a surface subject to such a flow is highly variable. Numerous jet configurations have been studied and numerous experimental parameters exist that influence both the fluid flow and the heat transfer.

Jet impingement's most sought after feature is its fluid flow characteristics. Comprehensive studies of the mean fluid flow characteristics of both a free and an axially symmetric impinging air jet have shown that Three zones can be identified in an impinging jet flow.

Firstly, there is the free jet zone, which is the region that is largely unaffected by the presence of the impingement surface; this exists beyond approximately 1.5 diameters from the impingement surface. A potential core exists within the free jet region, within which the jet exit velocity is conserved and the turbulence intensity level is relatively low. Beyond the potential core the shear layer has spread to the point where it has penetrated to the centreline of the jet. At this stage the centreline velocity decreases and the turbulence intensity increases. Second, a stagnation zone that extends to a radial location defined by the spread of the jet. The stagnation zone includes the stagnation point where the mean velocity is zero and within this zone the free jet is deflected into the wall jet flow. Finally, the wall jet zone extends beyond the radial limits of the stagnation zone.

In a jet flow, vortices initiate in the shear layer due to Kelvin Helmholtz instabilities. As the vortices move downstream of the jet nozzle each vortex can be wrapped and develop into a three dimensional structure due to secondary instabilities. A schematic of the breakdown process of toroidal vortices in an axially symmetric jet flow is presented in figure

Vortices, depending on their size and strength, affect the jet spread, the potential core length and the entrainment of ambient fluid. In certain cases jet vortices can pair, forming larger but weaker vortices. With distance from the jet nozzle the vortices break down into random small scale turbulence. In the vortex pairing case, the vortices initiate in the shear layer at a certain frequency. These vortices pass in the shear layer of the jet at the same frequency as the frequency at which they roll up. As the vortices pair off the passing frequency halves.

In this case instabilities in the boundary layer of the flow within the nozzle form vortices once the jet exhausts from

the nozzle. These vortices are typically small and initiate at high frequencies. The vortices grow and merge as they are convected downstream to form larger scale vortices in a process similar to the pairing mentioned previously.

It is known that fluids in motion can separate into regions of high and low temperature and this phenomenon is termed “energy separation”. Energy separation involves the re-distribution of total energy in a fluid flow without external work or heating. Energy separation can be initiated within the jet nozzle boundary layer flow and is enhanced later with the onset of vorticity. Because of this the naturally occurring vortex structures of an impinging jet have been the focus of much research. The maximum energy separation peaks at approximately  $H/D = 0.5$  where the strength of the vortex is a maximum. Beyond this, at about  $H/D = 1$  the maximum energy separation decreases until it is no longer discernible at  $H/D = 14$ .

#### Heat Transfer characteristics:-

The heat transfer distribution to an impinging jet varies significantly in shape and magnitude with the various test parameters. The first definition of the convective heat transfer coefficient can be used when the thermal boundary condition is one of uniform heat flux. At heights of the nozzle above the impingement surface that correspond to within the potential core length, the stagnation point heat transfer is relatively low and constant. Nusselt numbers increase with  $H/D$  for distances beyond the potential core length until it reaches a maximum at  $H/D = 8$ . This increase is attributed to the penetration of turbulence induced mixing from the shear layer to the centreline of the jet. The decrease beyond  $H/D = 8$  is due to the lower arrival velocity of the jet. Similar variation of the stagnation point Nusselt number has been reported by Lee et al. At heights of the nozzle above the impingement surface that correspond to within the potential core length, the stagnation point heat transfer is relatively low and constant. Increases with  $H/D$  for distances beyond the potential core length until it reaches a maximum at  $H/D = 8$ . This increase is attributed to the penetration of turbulence induced mixing from the shear layer to the centreline of the jet. The decrease beyond  $H/D = 8$  is due to the lower arrival velocity of the jet.

The surface finish of the impingement surface is another parameter for the enhancement of heat transfer to an impinging jet. An array of jets impinging on a dimpled surface was explored. In certain cases, it was found that the heat transfer could be enhanced by up to 50 %, depending on the cross-flow condition and on the height of the jets above the impingement surface.

**Fig 1.1:-** Heat Concentration on the plate with increasing enthalpy.

#### Research Objectives:-

The current research investigates the fluid flow and heat transfer for a submerged, un-confined axially symmetric impinging air jet, for a range of impingement parameters. Mean and fluctuating heat transfer distributions are compared with local velocity measurements. Of particular interest to the current investigation are the secondary peaks that occur in the mean heat transfer distribution when the jet nozzle is placed within 2 diameters of the impingement surface. An important objective of the current research is to reveal the convective heat transfer mechanisms that influence the magnitude and location of these peaks.

Control of the vortex development in the shear layer of the free jet and its influence on heat transfer has been a major

area of interest in this field in recent years. It has been shown that by exciting the jet, acoustically or otherwise, the vortex development can be controlled and this has a consequence for heat transfer. Another objective of this research is to understand the influence that various stages within the vortex development have on the convective heat transfer in the wall jet.

One important application of jet impingement is the cooling of a grinding process. To date this has been achieved using flood cooling with a traditional coolant such as an oil and water mixture. For both environmental and economic reasons, it would be preferable to cool the process using air. The final objective of this research is to investigate the convective heat transfer mechanisms that occur in an air cooled grinding process, with a view to determining an optimal jet set-up.

### **Literature Review:-**

This chapter presents previous research results and conclusions that are necessary in understanding the characteristic behavior of impinging jet flow. The first section explains the qualitative flow behavior of the jet before and during impingement. The second section presents experimental works that explain the effects of changing certain physical criteria such as nozzle-to-surface distance or jet Reynolds number; effects of different surface shapes, effects of multiple jets, as well as the effects of system rotation on the flow behavior. The third section presents simulation works in predicting jet impingement flow.

Convective heat transfer to an impinging air jet is known to yield high local and area averaged heat transfer coefficients. The current research is concerned with the measurement of heat transfer to an impinging air jet over a wide range of test parameters. mean and fluctuating surface heat transfer distributions up to 6 diameters from the geometric centre of the jet are reported. The time averaged heat transfer distributions are qualitatively compared to velocity flow fields. Simultaneous velocity and heat flux measurements are reported at various locations on the impingement surface to investigate the temporal nature of the convective heat transfer.

At low nozzle to impingement surface spacings the heat transfer distributions exhibit peaks at a radial location that varies with both Reynolds number and H/D. It is shown that fluctuations in the velocity normal to the impingement surface have a greater influence on the heat transfer than fluctuations parallel to the impingement surface. At certain test configurations vortices that initiate in the shear layer impinge on the surface and move along the wall jet before being broken down into smaller scale turbulence. The effects of these vortical flow structures on the heat transfer characteristics in an impinging jet flow are also presented. Specific stages of the vortex development are shown to enhance vertical fluctuations and hence increase heat transfer to the jet flow, resulting in secondary peaks in the radial distribution.

Air jet cooling of a grinding process has been investigated as large quantities of heat must be dissipated to avoid high temperatures that have an adverse effect on the workpiece and the grinding wheel itself. Convective heat transfer distributions

along the axis of cut are compared to local flow characteristics for a range of jet and grinding wheel configurations. It has been shown that the jet velocity must be significantly higher than the tangential velocity of the grinding wheel in order to penetrate the grinding wheel boundary layer and effectively cool the arc of cut.

### **Anatomy of Jets:-**

#### **Structure of Free jets:-**

The behavior of free jets and impinging jets on flat surfaces using a smoke wire visualization technique was investigated in the year 1999 and the following visuals were presented

**Fig. 2.1:-** Visualization pictures showing effect of increasing Reynolds number  $Re = 6,000$  to (b)  $Re = 10,000$  on free flow structures

The above figure shows the visualization results of free jets issuing from a nozzle of diameter  $D = 47.2$  mm at two different Reynolds numbers of  $Re = 6,000$  and  $10,000$ . It is seen that at lower Reynolds number a large, well-defined, vortex structures were observed, which were no longer present at the higher Reynolds number. This was attributed to the increase in the turbulence intensity value at the nozzle edges from 9% to 14%. Thus, it was concluded that at lower Reynolds numbers, where the turbulence intensity level of the shear layer at the jet edge was less than 10%, large vortex structures would form, but no vortex structures would be present at higher Reynolds numbers, where the turbulence intensity level was greater than 14%. With low levels of turbulence intensity at the nozzle's edge, entrainment of surrounding fluid into the jet causes enough instability to create small disturbances in the flow, resulting in the formation of small vortices which roll up and grow in size as they are convected downstream and as more surrounding fluid is entrained into the jet. Eventually, these vortices grow big enough to reach the jet centreline at the end of the potential core, where the vortices will meet up before breaking down, creating high levels of turbulence. For the higher Reynolds number case, the higher levels of turbulence intensity resulted in an earlier transition to turbulent flow, which occurred closer to the jet exit nozzle than for the lower Reynolds number flow.

#### Structures of jets impinging on flat surfaces:-

In 1999, a few scientists obtained flow visualizations of jet impingement on a Flat Surface which is shown in the following figure.

**Fig. 2.2:-** Flow structures of a jet impinging on a flat surface (a)  $H/D = 4$  (b)  $H/D = 3$  (c)  $H/D = 2$  (d)  $H/D = 1$

At  $H/D = 4$  (Figure 2.2 (a)), the impingement occurs just at the end of the potential core resulting in the vortex structures breaking down at the impingement point. Because of this, no large vortex structures were observed radially along the flat surface after the impingement point. At  $H/D = 3$  (Figure 2.2 (b)), the vortex structures formed in the free jet continued radially along the flat surface after impingement because jet impingement occurs within the potential core region, and the transition to fully turbulent flow occurs further downstream from the stagnation point, resulting in the flow vortex structures retaining their form for a longer duration. At  $H/D = 2$  (Figure 2.2 (c)), no large vortex structures were observed along the jet because the structures have no time to form before impingement takes place, although small vortex structures did develop radially along the flat plate after the impingement. At  $H/D = 1$  (Figure 2.2 (d)), due to the close proximity of the jet nozzle to the surface, the strong axial flow resulted in a subsequent strong radial deflection with no large vortex structures forming at all, before or after impingement.

The Jet impingement flow structures are divided into four zones as shown in the figure below.

**Fig. 2.3:-** Flow zones of an impinging jet

In this figure, Zone 1 is the developing zone, which encompasses the jet nozzle exit up to the end of the potential core. The potential core is the region where the fluid velocity is almost equal to the nozzle exit velocity. It was suggested that the end of the potential core is reached when the axial velocity falls to 95% of the jet exit velocity. The reduction of the jet velocity is due to the entrainment of fluid into the jet forming a mixing or shear layer which surrounds the potential core.

Zone 2 is the established jet zone. If the nozzle-to-surface distance is sufficiently long, the flow will progress beyond the potential core length. This region will subsequently be fully turbulent and the centreline axial velocity will continually reduce as the flow moves away from the nozzle exit. the reduction of the centreline velocity is inversely proportional to the square root of the axial development distance for slot jets whilst for circular jets it is inversely proportional to the distance.

Zone 3 is the deflection zone. This region is also called the impingement zone or the stagnation zone. This is the region where there is a rapid decrease in axial velocity and an increase in static pressure. The extent of this zone is approximately nozzle diameters from the impingement surface. Zone 4 is the wall jet zone. The deflected flow from Zone 3 follows and spreads over the surface, creating a wall jet. The wall jet momentum will eventually decay due

to the effects of wall friction at the surface and the mixing with the surrounding fluid.

#### Experimental studies of impinging jets:-

##### Single Jet Impinging on Flat Surfaces:-

An early experimental work on impinging flows done by Gardon & Carbonpue (1962) investigated the effects of various nozzle-to-surface ( $H/D$ ) distances on the heat transfer rate. They found that the maximum stagnation heat transfer rate occurred at nozzle-to-surface distances of between 6 to 7 jet diameters.

The lateral variation of heat transfer coefficient at various Reynolds numbers for a nozzle-to-surface distance of  $H/D = 2$  is shown in the graph below. The profiles show that the overall heat transfer coefficient increases with an increase in Reynolds number. A number of heat transfer coefficient peaks were also observed. Two peaks were observed at Reynolds numbers between 14,000 to 28,000, at lateral positions of  $x/D = +0.5$  and  $+1.9$ . At Reynolds numbers between 2,800 and 10,000, up to three peaks were observed at lateral positions of  $x/D = +0.5$ ,  $+1.4$  and  $+2.5$ .

Fig. 2.4:- Lateral variations of local heat transfer coefficients

The conclusions said that the first peak is not caused by the effects of turbulence but by the mechanism of the axisymmetric impinging jet flow, regardless of whether the flow is laminar or turbulent. Also, the first peak is caused by the rapid increase in lateral velocity as the flow accelerates in the deflection region. Next, the second peak, at  $x/D = +1.9$ , is caused by the transition from laminar to turbulent boundary layer flow. Then, the third peak at  $x/D = +2.5$  for flows between  $Re = 2,800$  and  $10,000$  is caused by the toroidal vortices as observed. The local heat transfer coefficients exhibit local minimum values at the stagnation point.

#### Computational studies of Impinging jets:-

##### Modelling of impinging jets:-

Many of the widely used turbulence models for predicting momentum and heat transfer have been developed by reference to flows parallel to walls, such as simple boundary-layer flows. To use these models in complex flows, it is important that they can perform accurately regardless of the flow orientation relative to the bounding surfaces. In particular, for impinging jets, the models should be able to predict correctly both flows parallel to and normal to the walls. There are a number of significant differences between shear and impinging flow characteristics, which the

models must be able to reproduce.

Due to these differences in the flow behaviour, many turbulence models such as linear k- $\epsilon$  models, and even some stress transport models, give incorrect predictions of impinging flows. An advanced low Reynolds number second moment closure model with reasonable success on impinging jet flow and flow through ribbed passages. However, second moment closure models use a lot of computational resources because of their complexity.

Further development of the eddy viscosity approach has resulted in non-linear eddy viscosity models (NLEVM) which introduce additional non-linear terms into the stress-strain relation. A cubic stress-strain relationship into the two-equation k- $\epsilon$  eddy viscosity model tested over a range of applications including flow in a curved channel, through a rotating pipe, transitional flow over a flat plate, impinging flow and flow around a turbine blade. In each of these cases, the model produced a significant improvement in results compared with the linear model, requiring only 10% more computing time. Particularly in the case of flat plate impinging jet simulations

**Table 2.1:-** Differences between impinging flow and shear flow

<b>Impinging Flow</b>	<b>Shear Flow</b>
Turbulence energy is dominated by normal straining near the impingement region.	Turbulence energy is generated by the shear effects.
RMS fluctuating velocity normal to the wall is larger than that parallel to the wall at the impingement zone.	Stress component normal to the wall is small compared with other components.
Turbulence length-scales near the wall are strongly affected by those of the incoming jet.	Turbulence length-scales are determined by the distance from the wall.
Convective transport of turbulence energy is important near the stagnation point.	Convective effects are negligible whilst the generation and dissipation processes are roughly balanced.

#### **Research Methods:-**

Current research in improving impingement jet performance and predicting jet behavior falls into two categories, experimental and numerical. Where possible, researchers use experimental results to assist in the development and validation of numerical tools for predicting flow and heat transfer behavior.

Impingement heat transfer experiments focus on measuring the flow field characteristics and the surface heat transfer coefficients. In an experiment a single jet or jet array is constructed and positioned above a solid target such as a plate or cylindrical surface. A pump or blower forces fluid onto the target plate while instrumentation collects information about fluid properties and target surface properties. Most impinging jet industrial applications involve turbulent flow in the whole domain downstream of the nozzle, and modeling turbulent flow presents the greatest challenge in the effort to rapidly and accurately predict the behavior of turbulent jets. Numerical modeling of impinging jet flows and heat transfer is employed widely for prediction, sensitivity analysis, and device design. Finite element, finite difference, and finite volume computational fluid dynamics (CFD) models of impinging jets have succeeded in making rough predictions of heat transfer coefficients and velocity fields. The difficulties in accurately predicting velocities and transfer coefficients stem primarily from modeling of turbulence and the interaction of the turbulent flow field with the wall.

The computation grid must resolve both the upstream and downstream flow around the nozzles or orifices and must extend sufficiently far to the side of a single jet or array (typically eight to ten diameters) to provide realistic exit conditions. Zero-gradient and constant-static-pressure conditions have been used at the far-field model boundaries. Successful, stable modeling using both of these conditions can depend on properly shaping the boundary at the edge of the model domain.

Turbulent impinging jet CFD the variety of numerical models has grown and computational research has taken on a larger importance in predicting the physical behavior of impinging jets. The continuing increase in computing power has enabled more rapid computation including optimization by parametric variation. An inexpensive desktop computer may solve precise, high-resolution two-dimensional models within a day. Three-dimensional models and unsteady models are now possible without the use of super-computers, and have execution times ranging from several days to several weeks. The examples in the following review are primarily from impinging jet numerical

modeling conducted since the original review by Polat et al.

Useful as a theoretically simple approach, the direct numerical simulation (DNS) method is the most complete and physically exact numerical method employed to predict the impinging jet flow field and transfer rates. This method solves the full Navier–Stokes, continuity, and energy/mass diffusion equations using discrete units of time and space, but requires an extremely small grid to fully resolve all the turbulent flow properties, because the microscopic turbulent length scales involved in jet impingement are far smaller than the macroscopic lengths involved (e.g.  $D_0$  or  $H$ ). The consequently long computation time practically limits the use of DNS to Reynolds numbers much lower than those in the gas turbine impingement heat transfer application. Since the DNS computational time to resolve turbulent eddies grows with the local turbulent Reynolds number ( $Re_t$ ) to the third power, this modeling method may be of academic interest for laminar flows but will remain impractical for turbulent jets for the foreseen future. Typical DNS CFD studies, using supercomputers, were limited to Reynolds numbers of the order of 10,000. To represent practical application successfully, the majority of DNS computations were limited to  $Re_{0.1,000}$ , with even lower limits for highly complex flows.

In an attempt to remedy this situation, some CFD models use Large Eddy Simulation (LES). The time-variant LES approach tracks flow properties with the full equations down to some user-defined length scale (typically the grid spacing), and then uses additional sub-grid-scale equations to describe turbulent flow behavior at smaller scales. The LES method has shown encouraging results and clarified the understanding of formation, propagation, and effects of flow eddies upon the velocity fields and jet transfer characteristics, but it requires high resolution in space for accuracy, may require high resolution in time for stability and accuracy, and therefore still needs a great amount of computing power or time to produce satisfactory solutions for the transitional and turbulent flows of interest here.

### Summary:-

An investigation of documented research results has been performed regarding jet impingement cooling on flat surfaces. Both experimental and numerical studies have been surveyed, as well as situations with multiple jets and rotation effects, in addition to impingement on both concave and convex surfaces. Based on the investigation, an understanding of the flow behavior and characteristics has been achieved.

Through visualization results of low Reynolds number jet flows, it was found that large vortices develop within the surrounding mixing layer of the jet before impingement and these vortices are translated to the impinging surface, resulting in increased turbulence and heat transfer levels. The vortices will eventually disperse downstream due to momentum loss. For curved surfaces, the centrifugal forces created by the surfaces act to destabilize the flow for a boundary layer developing on a concave surface and stabilize the flow for the corresponding convex surface case. In both cases, experimental results suggest that the heat transfer rate is increased compared with that of flat plate impingement.

Generally, increasing the Reynolds number,  $Re$ , will increase the heat transfer rate at the impinged surface. The main peak in the heat transfer profile is caused by the deflection of the flow near the stagnation point resulting in a rapid lateral velocity where the flow follows the impinging surface. Increasing the nozzle-to-surface distance  $H/D$  to a position just beyond the jet's potential core will generally increase the heat transfer rate because at that relative high  $H/D$ , the flow reaching the surface is already fully turbulent. At lower  $H/D$ , secondary peaks are observed in the heat transfer profiles caused by the transition of the wall jet from laminar to turbulent flow. In some cases, a minima is observed at the stagnation point because, due to the low  $H/D$ , the flow reaching the surface is within the non-turbulent potential core region.

Predictions using the two-equation  $k-\epsilon$  linear eddy viscosity model have proved to be inaccurate for simulations involving flat plate jet impingement and rotating flows. This is because the linear  $k-\epsilon$  model fails to capture correctly the normal stress anisotropy in impingement flow and the effects of Coriolis forces in rotational flow. However, for jet impingement on a concave surface, the  $k-\epsilon$  linear model did show reasonable correlation with experimental results. For flat plate impingement and rotating flow, predictions using two-equation  $k-\epsilon$  non-linear cubic eddy viscosity models can give reasonably good results due to the inclusion of additional non-linear terms in the stress-strain relation. Second moment closure models generally gave better predictions for jet impingement and rotating flows but at the cost of higher computational time and resources due to their complexity.

**Jet Impingement:-**

Impinging jets have attracted much research from the viewpoint of the fluid flow characteristics and their influence on heat transfer. The jet flow characteristics are highly complex and consequently the heat transfer from a surface subject to such a flow is highly variable. Numerous jet configurations have been studied and numerous experimental parameters exist that influence both the fluid flow and the heat transfer. The overall objective of the current research is to conduct a fundamental investigation of the heat transfer mechanisms for an impinging air jet. Much of the research presented in this chapter has been conducted as independent investigations into jet impingement fluid flow and impinging jet heat transfer.

This chapter is divided into 3 parts. The first showing the jet fluid flow characteristics which includes all the aspects of the flow that have been shown to influence the heat transfer. Second section describes the various parameters which influence the heat transfer. Third part shows some novel techniques that enhance Heat transfer to an impinging air jet.

**Fluid Flow Characteristics:-**

This section presents some of the latest research on impinging jet fluid flows that has a consequence for heat transfer and has not been presented in the previous reviews of mean characteristics of jet flow.

**Jet Flow Characteristics:-**

Three zones can be identified in an impinging jet flow. Firstly, there is the free jet zone, which is the region that is largely unaffected by the presence of the impingement surface; this exists beyond approximately 1.5 diameters from the impingement surface. A potential core exists within the free jet region, within which the jet exit velocity is conserved and the turbulence intensity level is relatively low. A shear layer exists between the potential core and the ambient fluid where the turbulence is relatively high and the mean velocity is lower than the jet exit velocity. The shear layer entrains ambient fluid and causes the jet to spread radially. Beyond the potential core the shear layer has spread to the point where it has penetrated to the centreline of the jet. At this stage the centreline velocity decreases and the turbulence intensity increases. The stagnation zone includes the stagnation point where the mean velocity is zero and within this zone the free jet is deflected into the wall jet flow. Finally, the wall jet zone extends beyond the radial limits of the stagnation zone.

**Fig. 3.1:-** Jet flow characteristics.

**Fig. 3.2:-** Impinging Jet zones.

The jet emerges from a nozzle or opening with a velocity and temperature profile and turbulence characteristics dependent upon the upstream flow. For a pipe-shaped nozzle, also called a tube nozzle or cylindrical nozzle, the flow develops into the parabolic velocity profile common to pipe flow plus a moderate amount of turbulence developed upstream. In contrast, a flow delivered by application of differential pressure across a thin, flat orifice will create an initial flow with a fairly flat velocity profile, less turbulence, and a downstream flow contraction (vena contracta). Typical jet nozzle designs use either a round jet with an axisymmetric flow profile or a slot jet, a long, thin jet with a two-dimensional flow profile.

After it exits the nozzle, the emerging jet may pass through a region where it is sufficiently far from the impingement surface to behave as a free submerged jet. Here, the velocity gradients in the jet create a shearing at the edges of the jet which transfers momentum laterally outward, pulling additional fluid along with the jet and raising the jet mass flow.

In the process, the jet loses energy and the velocity profile is widened in spatial extent and decreased in magnitude along the sides of the jet. Flow interior to the progressively widening shearing layer remains unaffected by this momentum transfer and forms a core region with a higher total pressure, though it may experience a drop in velocity and pressure decay resulting from velocity gradients present at the nozzle exit. A free jet region may not exist if the nozzle lies within a distance of two diameters ( $2D$ ) from the target. In such cases, the nozzle is close enough to the elevated static pressure in the stagnation region for this pressure to influence the flow immediately at the nozzle exit.

As the flow approaches the wall, it loses axial velocity and turns. This region is labeled the stagnation region or deceleration region. The flow builds up a higher static pressure on and above the wall, transmitting the effect of the wall upstream. The non-uniform turning flow experiences high normal and shear stresses in the deceleration region, which greatly influence local transport properties. The resulting flow pattern stretches vortices in the flow and increases the turbulence. The stagnation region typically extends 1.2 nozzle diameters above the wall for round jets

After turning, the flow enters a wall jet region where the flow moves laterally outward parallel to the wall. The wall jet has a minimum thickness within 0.75–3 diameters from the jet axis, and then continually thickens moving farther away from the nozzle. This thickness may be evaluated by measuring the height at which wall-parallel flow speed drops to some fraction (e.g. 5%) of the maximum speed in the wall jet at that radial position. The boundary layer within the wall jet begins in the stagnation region, where it has a typical thickness of no more than 1% of the jet diameter. The wall jet has a shearing layer influenced by both the velocity gradient with respect to the stationary fluid at the wall (no-slip condition) and the velocity gradient with respect to the fluid outside the wall jet. As the wall jet progresses, it entrains flow and grows in thickness, and its average flow speed decreases as the location of highest flow speed shifts progressively farther from the wall. Due to conservation of momentum, the core of the wall jet may accelerate after the flow turns and as the wall boundary layer develops. For a round jet, mass conservation results in additional deceleration as the jet spreads radially outward

**Vortex Development:-**

In a jet flow, vortices initiate in the shear layer due to Kelvin Helmholtz instabilities. As the vortices move downstream of the jet nozzle each vortex can be wrapped and develop into a three dimensional structure due to secondary instabilities.

**Fig. 3.3:-** Vortex development

Vortices, depending on their size and strength, affect the jet spread, the potential core length and the entrainment of ambient fluid. In certain cases jet vortices can pair, forming larger but weaker vortices. With distance from the jet nozzle the vortices break down into random small scale turbulence. In the vortex pairing case, the vortices initiate in the shear layer at a certain frequency. These vortices pass in the shear layer of the jet at the same frequency as the frequency at which they roll up. As the vortices pair off the passing frequency halves. In general, turbulent jets have a fundamental frequency at which the pairing process stabilizes and this is determined by the turbulence level of the jet.

**Fig. 3.4:-** Vortex Separation

In this case instabilities in the boundary layer of the flow within the nozzle form vortices once the jet exhausts from the nozzle. These vortices are typically small and initiate at high frequencies. The vortices grow and merge as they are convected downstream to form larger scale vortices in a process similar to the pairing mentioned previously.

#### **Energy separation:-**

It is known that fluids in motion can separate into regions of high and low temperature and this phenomenon is termed “energy separation”. Energy separation involves the re-distribution of total energy in a fluid flow without external work or heating. Energy separation can be initiated within the jet nozzle boundary layer flow and is enhanced later with the onset of vorticity. Because of this the naturally occurring vortex structures of an impinging jet have been the focus of much research. Heat transfer Characteristics The heat transfer distribution to an impinging jet varies significantly in shape and magnitude with the various test parameters. This section focuses primarily on differences between various investigations available in the literature. This includes the effects of some parameters that have not been considered in the current research. In general, the heat transfer distribution is presented as the variation of the local Nusselt number with radial position.

#### **Enhancement techniques:-**

Several techniques have been investigated with a view to enhancing the heat transfer to an impinging air jet. These include increasing the turbulence in the jet, the addition of swirl or artificially exciting the jet. This section identifies some of these techniques, explains the principles behind them and then briefly describes some of the findings of the various research conducted.

#### **Nozzle geometry:-**

The jet nozzle geometry is believed to have a significant effect on the heat transfer to the impinging air jet. Several studies attribute inconsistencies between reported data and their own research to slight differences in the nozzle geometries. For this reason, the effect of nozzle geometry on heat transfer has attracted much research. One of the most important aspects of the nozzle geometry is confinement. A long pipe nozzle issuing a jet into a open space is considered to be unconfined, however in many cases, a nozzle is machined into a plate. This situation is considered to be semi-confined.

#### **Nozzle Shape:-**

The effect of nozzle inlet chamfering, with a view to enhancing the ratio of area averaged heat transfer coefficient to the pressure drop across the jet nozzle. This was done by finding the optimum inlet chamfering angle. It was concluded that while the inlet chamfer angle has a large effect on the pressure drop across the nozzle; the effect on the heat transfer coefficient was not significant. A chamfer angle in the vicinity of approximately  $60^\circ$  was shown to be the optimum set-up as this removed a sharp corner at the inlet which reduced the effect of a vena contract within the nozzle. Both smaller and larger angles were more similar to a sharp edged orifice.

For a semi-confined jet orifice, the effect of jet exit chamfering on the heat transfer to the impinging air jet. It has been shown that for a sharp edged orifice the maximum turbulence intensity is greater than that with less chamfering or no chamfering (square edged). The nozzle exit chamfering has been shown to induce more jet expansion than the sharp edged orifice. Results reported in their investigation were also compared to previous investigations that employed both contoured nozzles and fully developed flow from long pipe jets. All the data presented by Lee and Lee [62] have shown enhancements in the heat transfer by 25

° 55 % and 50 ° 70 % with respect to the fully developed pipe jet and the contoured nozzle respectively, at low  $H/D = 2$ . This enhancement is attributed to the higher turbulence intensity of the orifice jets. The nozzles investigated included a semi- confined hyperbolic shaped nozzle, a semi-confined orifice and an unconfined jet. In general, the pressure distribution along the impingement surface decreases from a maximum at the geometric centre with increasing radial distance. However, at low  $H/D < 2$  the pressure is reported to be sub-atmospheric between  $0.6 < r/D < 2.2$ .

### **Jet Excitation:-**

Jet excitation has been shown to have the potential to significantly influence heat transfer to an impinging jet. A jet has a natural frequency at which vortices form and develop and it is thought that this naturally occurring frequency has an effect on the heat transfer distribution. Artificial excitation can control the development of vortices in the jet flow and therefore has the potential to enhance the heat transfer from the surface. This is the most recent enhancement technique investigated by researchers.

The impinging air jet acoustically and reported on the resulting flow and heat transfer distributions. It has been shown that, depending on the frequency of excitation, the area averaged heat transfer can be enhanced or reduced at low nozzle to impingement surface spacings. In the case where the jet is excited at a sub harmonic of the natural frequency of the jet, the heat transfer is reduced. This frequency has the effect of strengthening the coherence of the naturally occurring frequency. It is thought that the energy separation due to a more coherent flow structure has an adverse affect on the heat transfer to the jet. The jet was also excited at a frequency higher than that of the natural jet frequency. In this case the excitation had the effect of producing intermittent vortex pairing. This results in a break down of the naturally occurring vortex. Consequently, the effects of energy separation are reduced and transition to small scale turbulence effectively increases the heat transfer to the impinging air jet.

Acoustic excitation was applied to the shear layer of the jet also. Two naturally occurring frequencies were identified in the spectrum of the velocity data acquired in the free jet. The larger occurred at approximately 1kHz and this corresponds to the fundamental frequency of vortex generation. A subharmonic of this frequency at 500Hz is present and is due to the frequency of vortex pairing. Three shear layer excitation frequencies were applied to the jet, (1950,2440,3250Hz). When the jet is excited at a multiple of the natural jet frequency, the vortex is maintained at larger distances downstream. This is because the excitation frequency suppresses the effects of vortex pairing. Results have shown that while the frequency of the jet flow is affected strongly by the acoustic excitation of the jet it has a less significant effect on the vortex frequency. At higher excitation frequencies, the vortex frequency is increased marginally. In general, the excitation frequency has the potential to change the potential core length, depending on whether the excitation frequency encourages or discourages vortex pairing. Therefore, the heat transfer rate can be affected by changing the location of the impingement surface relative to the jet development stages without changing its location relative to the nozzle exit. When the excitation frequency was equal to, or close to being equal to, a harmonic of the natural frequency of the jet, vortex pairing was suppressed. This elongated the potential core of the jet. Otherwise the jet excitation facilitated vortex pairing and reduced the potential core length.

The difference between main- stream jet excitation and shear layer excitation was investigated. Essentially no significant difference was noted between the two excitation techniques. Results were presented for a range of Strouhal numbers and for two different excitation power levels from 80dB to 100dB. Only slight differences in the jet structure are noticed to vary with excitation technique. When the main flow was excited the potential core is reported to be slightly shorter and the turbulence intensity to be elevated slightly. It has been shown that a significant excitation power level (approx. 90dB) is required to have an appreciable effect on the jet velocity or turbulence intensity. Once again however, the power level is a factor that amplifies the effect that a particular excitation has. Finally, for a heated plane jet that when the excitation frequency is within 4.5Hz of the natural frequency of the jet, the vortices are strengthened by the excitation.

**Other techniques:-**

Several other techniques have been employed with a view to enhancing the overall heat transfer to an impinging jet flow. Some of these techniques are:

**Intermittency:-**

An intermittent jet flow has been used to provide enhancement of the convective heat transfer to a free surface water jet. Depending on the location on the impingement surface the heat transfer could be enhanced by up to 100 %. This is explained on the basis that the intermittent flow forces renewal of the hydrodynamic and thermal boundary layers that form along the wall jet. An investigation presented results for another self-oscillating jet. Results were presented for oscillation frequencies from 20Hz to 100Hz. A significant enhancement in the heat transfer to the jet of up to 70 % was reported for the specific range of heights ( $H/D \geq 24$ ) and Reynolds number of 14000. In another investigation, different sort of nozzle geometry, that of a precessing jet effectively the precessed jet motion is that of self-sustained unsteadiness. It was found that for the range of parameters studied, however, the heat transfer to the jet was reduced. Effectively there are two main competing effects. The first is that the interaction of the jet with the ambient flow increases the mixing and turbulence of the flow along the plate. However, this interaction has the consequence of reducing the arrival velocity of the impinging jet. It is thought that the heat transfer is highly sensitive to the amplitude and frequency of the oscillations and therefore the enhancement

**Turbulence Promoters:-**

In an attempt to enhance the heat transfer by increasing the turbulence in the jet flow, installed mesh screens across the nozzle exit with various mesh solidity. The mesh screen has the effect of increasing turbulence in the stagnation zone. It also reduced the pressure in this zone and this resulted in enhancement of the heat transfer coefficients by up to 4 % at low  $H/D$  and a mesh screen solidity of 0.83.

**Surface Finish:-**

The surface finish of the impingement surface is another parameter for the enhancement of heat transfer to an impinging jet. In an investigation] an array of jets impinging on a dimpled surface was explored. In certain cases, it was found that the heat transfer could be enhanced by up to 50 %, depending on the cross- flow condition and on the height of the jets above the impingement surface.

The literature to date has shown that the heat transfer to an impinging air jet is highly sensitive to each of the many experimental parameters that exist. The shape of the heat transfer distribution in particular varies considerably with height of the jet nozzle above the impingement surface. While abrupt increases in turbulence in the wall jet are used to explain the location and magnitude of secondary peaks in heat transfer the literature fails to provide an in depth explanation of the heat transfer mechanism that causes this increased heat transfer.

In more recent years, attention has been focused on the potential of vortices within an impinging jet flow to enhance the heat transfer. It has been revealed that vortices serve to enhance energy separation within the flow. Research has also shown that the development of a vortex can be influenced by artificial excitation of the jet flow and that, depending on the excitation frequency, the time averaged heat transfer can be enhanced. An understanding of the heat transfer mechanisms at various stages within the vortices' development is not available however.

Finally, it is apparent that the jet nozzle has a significant effect on the overall heat transfer. Discrepancies between studies have been attributed to slight differences between nozzle geometries. The jet exit flow condition is dependent on the nozzle shape and therefore each investigation is nozzle specific. The current investigation presents data for the most common nozzle type found in the literature, i.e. a hydro- dynamically fully developed jet that issues from a long pipe.

**Experimental Set up and measurement techniques:-**

In this chapter, we describe the experimental rig design and the measurement techniques employed. The experimental rig has been designed to allow for the variation of parameters beyond the scope of this project and these are detailed in this chapter. The specifics of the fluid flow and heat transfer measurement techniques used are also detailed in this chapter. Finally, the acquisition hardware and software are described.

**Experimental rig:-**

The experimental rig is to be used for both the impinging air jet and for the study of air jet cooling. The rig consists of an Air Compressor connected to a shower which acts as an impinger, Copper plate which acts as a rough surface and a table fan to measure the fundamental investigation.

**Fig. 4.1:-** Schematic diagram of set-up

**Experimental Equipment:-**

The experiment consists of the following equipment.

**Shower:-**

**Fig. 4.2:-** Stainless Steel Shower

The Stainless steel Shower is used for impingement cooling of the plates. The Shower is connected to the flexible pipe and the other end of the flexible pipe to the outlet of the air compressor. The shower is placed right above the

Heated plates and air impacts the hot plates at right angles.

**Copper Plates:-**

**Fig. 4.3:-** Copper plate of thickness 0.1in

**Fig. 4.4:-** Copper plate of thickness 0.5in

The above are the copper plates on which the experiment is conducted. There are two copper plates which are used. One of thickness 0.1in and the other of thickness 0.5in.

**Air Compressor:-**

**Fig. 4.5:-** Air Compressor.

**Infra Red Thermometer:-**

**Fig. 4.6:-** Infra Red Thermometer.

**The Infra Red Thermometer uses Infra Red waves to detect temperature. When the laser light is incident on the plate, the infra red waves reads the temperature and displays the temperature.**

**Set-up for Fundamental investigation:-**

The main elements of the experimental rig are a nozzle and an impingement surface. Both are mounted on independent carriages that travel on orthogonal tracks. The flat impingement surface is instrumented with two single point heat flux sensors and the ability of the carriages to move in this way enables the jet to be positioned relative to the sensors at any location in a two dimensional plane.

**Fig. 4.7:-** Actual set up.

**Measurement Technique:-**

There are 3 experiments being conducted. First by natural convection, second by forced convection and finally by impingement. Each of the experiment has a separate measurement mode. They are listed below:

**For Natural Convection:-**

The copper plate is heated by using the furnace to a temperature of about  $450^{\circ}\text{C}$ . The temperature is measured using an Infra Red gun. This metal plate is then carefully taken from the furnace and kept in the open to undergo natural convection. The temperature is noted down at every 15 minutes and the experiment is repeated with the second metal plate.

**For Forced Convection:-**

The copper plate is heated by using the furnace to a temperature of about  $450^{\circ}\text{C}$ . The temperature is measured using an Infra Red gun. This metal plate is then carefully taken from the furnace and kept under a table fan for forced convection to occur. The temperature of the plate is checked at every 15 minutes and the experiment is repeated with the second metal plate.

**For impingement:-**

The copper plate is heated by using the furnace to a temperature of about  $450^{\circ}\text{C}$ . The temperature is measured using an Infra Red gun. This metal plate is then carefully taken from the furnace and kept under the shower of the air compressor for impingement to occur. The temperature of the plate is checked at every 15 minutes and the experiment is repeated with the second metal plate.

### Conclusions:-

The main objective of this thesis is to explore the technique of Air Jet Impingement as a technique for cooling automobiles. With it's existing uses it has been seen that Impingement cooling can be a method to cool Automobile Engines at a very fast rate.

However, before the experiment was conducted, simpler computational domains were taken into account. Such as, Flat plate with uniform roughness was used. Also, copper plates were used due to it's high conductivity. The temperature of the plates were not allowed to go beyond  $450^{\circ}$  C and the pressure from the Air compressor was maintained at a constant pressure.

A comparison of the types of present cooling techniques viz. Natural Convection, Forced Convection and Impingement cooling is done and the best method is identified.

The following conclusions can be derived from these numerical investigations involving both the copper flat plates.

1. The ambient temperature of the environment had a major role to play in cooling the surfaces. Temperature during the experiment was around  $46^{\circ}$  C, hence the higher time for cooling during cooling.
2. For the conditions investigated the RMS velocity or turbulence intensity is a maximum in the wedge made between the grinding wheel and the grinding surface.
3. The Angle of incidence on to the plate had a major role to play.
4. It has been seen that a high speed jet effectively penetrates the boundary layer flow around the grinding wheel providing good cooling of the grinding zone.
5. Vortices that roll-up naturally in the shear layer of the free jet, close to the nozzle exit, have been shown to merge forming larger yet weaker vortices, before being broken down into smaller scale random turbulence. Stages within the merging processes have been identified to occur at various distances from the jet nozzle.
6. The effect that the actual vortex structure has on surface heat transfer has attracted little attention. It has been shown here that axial velocity fluctuations close to the impingement surface have a far greater influence on the heat transfer than fluctuations parallel to the surface. Vortices that impinge upon the surface determine the magnitude and frequency of the fluctuations in both directions. Because of this, the various stages of the vortex merging process influence the mean and RMS Nusselt number distributions at low H/D.
7. Vortices that impinge at later stages in their development are weaker and therefore as they breakup in the wall jet, the magnitude of the velocity fluctuations normal to the surface is reduced. This does not enhance the heat transfer in the wall jet, to the same degree as stronger vortices do. In general, the breakdown of strong vortices (in the early stages of the vortex development), has a favorable effect on the heat transfer in the near wall jet. Enhancement of the heat transfer in this region could be achieved by exciting the jet so that strong coherent vortices impact on the heated surface.

**Further Work:-**

The current research on impinging jet flow has been concerned with the effect of vortices at different stages in their development on the surface heat transfer. Recent studies have shown that jet excitation has the potential to control the development of vortices in a jet flow. With the knowledge gained from the current research, further work would include the artificial excitation of the impinging jet flow. This would facilitate an in depth investigation of the effect of the vortical jet flow on the surface heat transfer, for a wider range of parameters to include the vortex strength, passing frequency, etc.

Also. With impingement on the rise, it would be of a great intensity if it enters the Automobile Industry to cool the Automobile Engines as that would lead it to Higher vehicle life, higher engine usage, low cost of maintenance and higher profit rates.

**Acknowledgement:-**

This project completion gives us immense pleasure .We would like to convey our sincere gratitude to K.V.Ramana Sir Professor of Mechanical Department .

We would also expand our deepest gratitude to all those who has directly and Indirectly guided us in writing this thesis .We also thank our KL University for their concern

#### Abstract

The analysis in specific aims was using *Gaduhan Model* that was considered as suitable to the existing conditions in Jember Regency. Some analyses would be used in this research, and these included Analysis of Regression, Individually Coefficient Test (t-test), Simultaneously Coefficient Test (F-test), and Classical Assumption Test. Result of research had given some results. (1) Household economic model could explain the behavior of deciding the production of farming and breeding. This decision was influential to the income of farmer household. This decision was numerous, including that about grass-collection worker, on-family breeding worker, concentrate cost, green feed cost, off-family rice-field farming worker, on-family rice-field farming worker, rice-field fertilizer cost, income from rice-field farming, off-family garden farming worker, on-family garden farming worker, income from garden farming, income from beef cattle breeding, income of the family, income from garden field, total cost of rice-field farming, and income from rice-field farming. (2) Income from beef cattle breeding was influenced by the number of beef cattle bred and the number of grass-collection worker. The cost of concentrate was influenced by the purchasing cost for livestock feed greens (HMT). Therefore, HMT cost would be influenced by the number of beef cattle bred. (3) If governmental policy was designated to improve the income of farmer household, then the most effective policy scenario would be the scenario of providing financial aid for rice-field farming at rate of Rp 1,000,000.-. The allocation for each decision was set at percentage point, such as: Grass-collection worker (0.04%); On-family breeding worker (0.24%); Concentrate cost (0.00%); Green feed cost (0.00%); Off-family rice-field farming worker (439.00%); On-family rice-field farming worker (45.31%); Rice-field fertilizer cost (4.42%); Income from rice-field farming (7.25%); Off-family garden farming worker (34.07%); On-family garden farming worker (0.00%); Income from garden farming (1.593%); Income from beef cattle breeding (0.00%); Income of the family (30.33%); Income from garden field (1.76%); Total cost of rice-field farming (44.40%); Income from rice-field farming (25.85%); and Garden farming worker (5.94%). (4) If the government could select

the proper policy, then policy goal would be conforming to the result of this research, respectively the improvement of household income.

### Introduction:-

Beef was animal-based protein source. It stood as one of *agents of development* that determined the competitiveness of human resource at certain nation. The consumption of animal protein by Indonesia community was still lower compared to other ASEAN countries. Beef consumption was still driven on demand, and the fulfillment was always problematic. A gap between consumption demand for local beef and its production occurred annually. The possible cause was the growth of the middle-to-upper class population. This increasing demand was reflected in the increased beef consumption from 1.95 kg per capita on 2007 to 2 kg per capita on 2008. This rate was still ascending to 2.24 kg per capita on 2009. This consumption increase might impact on the increasing demand for beef and internals, precisely from 455,755 tones on 2008 to 516,603 tons on 2009. Such beef demand was equivalent to the number of 2.432 millions beef cattle bred on 2008 and 2.746 millions beef cattle on 2009. Fulfilling this demand, the imported beef and internals were also advancing toward 110.246 tones. The imported origin cattle (calf) also upsurged to the rate of 768,133 calves on 2009. Import measure was taken because local beef cattle only supplied 49% beef demand of national beef demand on 2009.

### Study Method:-

#### Research Sample:-

The sample of farmer was selected based on some conditions. Farmer must have minimally one beef cattle to breed. Beef cattle must be prime or adult, and had been grown at least one year. The breeder must have experience minimally at least three years in breeding.

#### Data Analysis Method:-

Some analyses methods were used in this research.

#### Analysis of Regression:-

$$Y = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + b_6X_6 + b_7X_7 + b_8X_8 + b_9X_9 + b_{10}X_{10} + e$$

#### Where:-

Y	:	Number of beef cattle bred
B	:	Coefficient of regression
X <sub>1</sub>	:	Age of breeder
X <sub>2</sub>	:	Breeding experience of breeder
X <sub>3</sub>	:	Education background of breeder
X <sub>4</sub>	:	Land width occupied for beef cattle breeding
X <sub>5</sub>	:	Income of beef cattle breeder
X <sub>6</sub>	:	Price of the origin calf
X <sub>7</sub>	:	Price of the concentrate
X <sub>8</sub>	:	Feed consumption
X <sub>9</sub>	:	Non-feed consumption
X <sub>10</sub>	:	Development pattern (0 = Fattening, 1 = Origin calf)
e	:	Disturbance term

#### Individually Coefficient Test (t-test)

$$H_0 : b_i = 0 \quad (i=1,2,\dots,10)$$

$$H_a : b_i \neq 0$$

By determining degree of confidence at 95% ( $\alpha = 0,05$ ), and also degree of freedom at  $(Df) = n-k-1$ , then t-table could be set and used as the reflection of region that accepted or rejected hypothesis. The t-count rate could be obtained using the following equation:

$$t = \frac{b_i}{Sb_i}$$

where :

$b_i$  = coefficient of regression of independent variable  $i$ .

$Sb_i$  = standard error of coefficient of regression  $b_i$

Opportunity value (p-value) that was obtained from t-test was then compared with  $\alpha$  by using the following criteria:

- If  $p\text{-value} > \alpha$ , then  $H_0$  was accepted, meaning that there was a significant effect from independent variable on dependent variable.
- If  $p\text{-value} < \alpha$ , then  $H_0$  was rejected, meaning that there was no significant effect from independent variable on dependent variable.

Simultaneously Coefficient Test (F-test)

$H_0 : \beta_1 = \beta_2 = \dots = \beta_{10} = 0$

$H_a$  : there must be minimally one  $i$  where  $\beta_i \neq 0$  ( $i=1,2,\dots,10$ )

By setting the degree of confidence at 95% ( $\alpha = 0,05$ ) and degree of freedom at  $(Df) = k/(n - k - 1)$ , then F-table could be measured to be used as the reflection of region that accepted or rejected hypothesis. The F-count rate was derived from the following equation:

$$F = \frac{R^2 / (k)}{(1 - R^2) / (n - k - 1)}$$

Opportunity value (p-value) from F-test was compared with  $\alpha$  through some criteria as following:

- If  $p\text{-value} > \alpha$ , then  $H_0$  was accepted, meaning that there was no significant and simultaneous effect of all independent variables on dependent variable.
- If  $p\text{-value} < \alpha$ , then  $H_0$  was rejected, meaning that there was significant and simultaneous effect of all independent variables on dependent variable.

### Classical Assumption Test:-

Classical assumption test helped determining whether an estimation had the required characteristics, such as *unbiasedness*, *consistency*, *sufficiency*, and others. Therefore, the estimated coefficient of regression would be the best linear estimator due to its unbiasedness (*Best Linear Unbiased Estimator* = BLUE) but if it could meet some classical assumptions. In reality, classical assumptions were failed to be met and therefore, further test was conducted to examine how far these classical assumptions could be fulfilled.

According to Gujarati (2001), multiple linear regression model with OLS method could be used as unbiased estimator if it met BLUE requirements, such as:

- *Best* = It gave the best coefficient of regression.
- *Linear* = Independent variables were linearly related with dependent variable.
- *Unbiased* = The expectancy rate of coefficient of regression was similar to its actual rate ( $b_i$ ).
- *Efficient estimator* = The obtained regression model had minimum variance.

### Normality Test:-

It was conducted by comparing opportunity rate (p-value) from *Anderson Darling* Test with  $\alpha$  on several conditions:

- If  $p\text{-value} > \alpha$  then  $H_0$  was accepted.
- If  $p\text{-value} < \alpha$  then  $H_0$  was rejected.

Where  $H_0$  = normally dispersed data

$H_a$  = abnormally dispersed data

**Multicollinearity Test:-**

**Whether multicollinearity test did exist or not was detected by the following methods:-**

1. Coefficient of determination (R<sup>2</sup>) was high, and t-value from the estimated regression of all variables was significant.
2. If R<sup>2</sup> must be very high (more than 0.8), and no coefficient of regression was statistically significant, then there would be multicollinearity symptom.
3. Variance Inflation Factor (VIF) was examined, where if VIF stood below 10, it meant that multicollinearity symptom did not exist.

**Heteroscedasticity Test:-**

Heteroscedasticity occurred because the variance of the residual was not similar across each observation. It was tested using Glejser Test. If the significance rate of Glejser score was lower than 0.05 (5%), then the regression equation contained heteroscedasticity. Converse result would be no indication of heteroscedasticity or homoscedasticity.

**Auto-correlation Test:-**

Detecting whether there was auto-correlation was using *Durbin Watson* Model. It was explained as following:

1. OLS Regression was operated to obtain residual  $e_i$ .
2. Term  $d$  was counted with the following formula:

$$d = \frac{\sum_{t=2}^{t=N} (e_1 - e_{t-1})^2}{\sum_{t=1}^{t=N} e_t^2}$$

3. For certain sample size, with many explanatory variables, critical rates of  $dL$  dan  $dU$  were estimated
4. If  $d$  remained between  $dU$  and  $4-dU$ , then non-auto-correlation assumption was met. If  $d$  stood between 0 and  $dL$ , then there would be positive auto-correlation, while if  $d$  existed between  $4-dL$  and 4, then there must be negative auto-correlation.
5. The assumption of no occurrence of auto-correlation was met if Durbin-Watson statistic rate was found between  $dU$  and  $4-dU$ .

**Simultaneous Equation System Model:-**

Simultaneous Equation System Model was used as the second analysis technique to answer the second goal from the model of simulation for the policy of beef cattle breeding development, that in this case must be made compatible to the existing condition. The specification of this model included several items:

**The use of worker at farming work;-**

Worker who was used at farming work was divided into three groups, such as: breeding worker, rice-field farming worker, and garden farming worker. The use of on-family breeding worker (TKSPDKL) was estimated to be influenced by household member (ARTP), number of beef cattle (JSP), and family income (INCKL). The structural equation covering all these items was written as:

$$TKSPDKL = B0 + B1*ARTP + B2*JSP + B3*INCKL + B4*D;$$

Worker for rice-field farming was assigned into two groups, off-family rice-field farming worker (TKUTLKL) and on-family rice-field farming worker (TKUDKL). Off-family rice-field farming worker was estimated to be influenced by occupied land width (LHN), income from rice-field farming (KUT), and family income (INCKL). On-family rice-field farming worker (TKUDKL) was estimated under influence of occupied land width (LHN) and income from rice-field farming (KUT). The structural equation was described as following:

$$TKUTLKL = F0 + F1*LHN + F2*KUT + F3*INCKL + F4*D ;$$

$$TUTDKL = G0 + G1*LHN + G2*KUT + G3*D ;$$

Worker for garden farming (TKBUN) was also separated into two, respectively off-family garden farming worker (TKBUNLKL) and on-family garden farming worker (TKBUNDKL). Off-family garden farming worker (TKBUNLKL) was estimated to be influenced by occupied land width (LHN) and off-family rice-field farming

worker (TKUTLKL). On-family garden farming worker was estimated under influence of occupied land width (LHN). Structural equation was written as:

$$TKBUN = TKBUNDKL + TKBUNLKL;$$

$$TKBUNLKL = J0 + J1*LHN + J2*TKUTLKL + J3*D$$

$$KBUNDKL = K0 + K1*LHN + K2*D ;$$

#### Cost for Beef Cattle Breeding:-

Total cost of beef cattle breeding (TBSP) was comprised of variable cost and fixed cost. Variable cost included the cost for beef cattle concentrate (BKONSP), the cost for beef cattle medicine (BOBTSP), the cost for green feed (BHMT), the cost for origin calf (HABIT) and the cost for other structure and infrastructure (BSPL). The equation was arranged as:

$$TBSP = BKONSP + BOBTSP + BHMT + HABIT + BSPL$$

#### Income From Beef Cattle Breeding:-

Annual income from beef cattle breeding (KSP) was obtained from the summation of all incomes that related with beef cattle breeding (RESP), and then, it was subtracted with the total cost of beef cattle breeding (TBSP). Monthly income from beef cattle breeding was derived by dividing the profit of beef cattle breeding in a year (KSP) with the number of months in a year. Therefore, the equation was written as:

$$KSP = RESP - TBSP;$$

$$KSPBLN = KSP/12;$$

Incomes that related with beef cattle breeding (RESP) was estimated to be influenced by the number of beef cattle bred (JSP), the quantity of concentrate (JKON), and the grass-collection worker for beef cattle (TKSPRMP). The structural equation was written as following:

$$RESP = E0 + E1*JSP + E2*JKON + E3*TKSPRMP + E4*D ;$$

#### Identification of Model in the Simultaneous Equation System:-

Model must be identified before making an estimation. The aim was to facilitate the determination of estimation method. There were three types of model identification, such as (1) *under identified* or *unidentified*, (2) *exactly identified*, and (3) *over identified*. If a certain equation system was said as *under identified*, there would no statistical models be used to estimate all parameters in simultaneous equation model. If the equation was considered *exactly identified*, the most proper technique was *indirect least squares* (ILS). If simultaneous equation was called as *over identified*, then various techniques could be used such as *Two stage least square* (2SLS), *Three stage least square* (3SLS), *Limited Information Maximum Likelihood* (LIML), or *Full Information Maximum Likelihood* (FIML). Indeed, 2SLS method was the most frequently used because it was compatible with software SAS.

Identification was conducted in two methods. First was testing the structural model (*order condition*), while the second was testing against model in *reduced form* (*rank condition*). Because first method was more simple and more easier, then the study of dissertation preferred to use first method. The condition to say certain equation as *identified* was that the number of variable excluded from the equation, but included within other equation, must be minimally equal to the number of equation in the simultaneous equation model after being subtracted with one. It was written as following (Gujarati, 2000).

The equation would be *identified* if  $(K-M) \geq (G-1)$

**where:**

G : number of equation (endogenous variable)

K : number of variable in the model (endogenous and predetermined)

M : number of variable (endogenous dan exogenous) in the *identified* equation

The conditions of the equation could be exposed into the details as following:

1. If  $(K-M) < (G-1)$  then the equation was considered as under identified
2. If  $(K-M) = (G-1)$  then the equation was considered as exactly identified
3. If  $(K-M) > (G-1)$  then the equation was considered as over identified

**Identification of Model in the Simultaneous Equation System:-**

Model identification was conducted before making an estimation. This process was aimed to facilitate the determination of estimation method. There were three types of model identification: (1) *under identified* or *unidentified*, (2) *exactly identified*, and (3) *over identified*.

**Model Validation:-**

Model validation was carried out to understand whether endogenous variable in the simultaneous equation model could be used to describe the information that was not different from actual rate.

**Policy Simulation:-**

Recent governmental policy was designated to provide working capital aid to the breeders through the direct loan aid to the community (BPLM). This aid was given to the breeder group who was seriously attended by policy maker. To ensure the benefit of this governmental policy, this research attempted to simulate household economic policy, involving some policies such as: (1) feed consumption, (2) non-feed consumption, (3) production cost for beef cattle breeding, (4) production cost for rice-field farming. Household economic model of beef cattle breeders was made from simultaneous equation system.

**Result:-****Income That Related with Beef Cattle Breeding (RESP):-**

The sign of explanatory variable in the equation of all incomes that related with beef cattle breeding at Gaduhan Pattern (RESP) was compatible with the expectancy and economical behavior from the worker who maintain the number of beef cattle bred (JSP) and also from the grass-collection worker (TKSPRM). Therefore, the income of beef cattle breeding at Gaduhan Pattern (RESP) was influenced by the number of beef cattle bred and the number of grass-collection worker. The greater number of beef cattle bred, the greater also be obtained the incomes from beef cattle breeding at Gaduhan Pattern in Jember Regency. The higher ownership rate for beef cattle was closely related with not too high production input cost. It conflicted with the finding in the ownership scale below five beef cattles. Great number of beef cattle bred would minimize the loss due to unreliable production input. Grass-collection worker was one determinant in this situation. Greater number of grass-collection worker at Gaduhan Pattern would reduce the income of beef cattle breeding at Gaduhan Pattern because production input cost was not efficient, possibly due to the excessively high cost to expend in production input. It definitely decreased farmer income.

Result of regression against the income from beef cattle breeding was shown in the table. The equation of regression was written as:

$$\text{RESP} = 480.804 + 15961.7\text{JSP} + 0.146 \text{BKONSP} - 1719.25\text{TKSPRM} + 33.461 \text{D}$$

**Table:-** Result of Regression Analysis on The Income from Beef Cattle Breeding

Variable	Parameter Estimation	Standard Error	t-value	Pr >  t
JSP	15961.700	598.074	26.690	<.0001
BKONSP	0.146	0.171	0.850	0.402
TKSPRMP	-1719.250	748.817	-2.300	0.030
D	33.461	436.044	0.080	0.939
F-value = 771.83 Pr > F = <0.0001 R <sup>2</sup> = 0.99133				

Source: Analysis on Primary Data, 2016

The above table showed that parameters were tested partially (t-value) and simultaneously (F-value). Simultaneous test obtained F-value=771.83 with Pr > F = <0.0001 (<0.10). Therefore, in simultaneous manner, number of beef cattle bred, concentrate cost, number of grass-collection worker, and beef cattle development pattern, were obviously influential to the income of beef cattle breeding.

Coefficient of determination (R<sup>2</sup>) of the model was 0.99133, meaning that 99.133% diversities of beef cattle breeding income were explained by number of beef cattle bred, concentrate cost, number of grass-collection

worker, and beef cattle development pattern, while the remaining 0.867% were explained by other variable out of the model, and these were vulnerable to error.

The number of beef cattle bred was obviously and positively influencing the income of beef cattle breeding as shown by  $Pr > |t| = <0.0001$  ( $<0.10$ ). It proved that greater number of beef cattle bred, the higher the income that was obtained from beef cattle breeding.

In other hand, number of grass-collection worker had obvious but negative effect on beef cattle breeding income as shown by  $Pr > |t| = 0.030$  ( $<0.10$ ). Therefore, it could be said that the greater number of grass-collection worker, the lower the income derived from beef cattle breeding.

#### Model Validation:-

Model validation was aimed to determine model predictability. Result of model validation would describe how close was the predicted rate with the actual rate, based on endogenous variable observed. The explanation was given in the following table.

**Table:-** Result of Statistical Test against Model Predictability Rate

Variable	Label	Actual Mean	Predicted Mean	UM	US	UC
Grass-collection worker	TKSPRMP	1.4688	1.4677	0.00	0.13	0.87
On-family breeding worker	TKSPDKL	1.9063	1.9063	0.00	0.18	0.82
Concentrate cost	BKONSP	5554.7	5557.8	0.00	0.12	0.88
Off-family rice-field farming worker	TKUTLKL	0.1875	0.0418	0.16	0.26	0.58
On-family rice-field farming worker	TKUTDKL	1.5313	1.1016	0.21	0.24	0.55
Rice-field fertilizer cost	PPKUT	156110	156112	0.00	0.22	0.78
Income from rice-field farming	REUT	7871263	7442892	0.04	0.47	0.49
Off-family garden farming worker	TKBUNLKL	0.3438	0.2706	0.02	0.25	0.73
On-family garden farming worker	TKBUNDKL	1.2813	1.2812	0.00	0.33	0.67
Income from garden farming	REBUN	2696151	2662506	0.00	0.11	0.89
Income from breeding	RESP	24218.8	24220.5	0.00	0.00	1.00
Family income	REKL	11384108	9313169	0.34	0.20	0.46
Income from garden field	KBUN	2953125	2405533	0.19	0.16	0.65
Total cost of rice-field farming	TBUT	547487	547489	0.00	0.00	1.00
Income from rice-field	KUT	8418750	6895404	0.30	0.37	0.33
Garden farming worker	TKBUN	1.625	1.5518	0.01	0.23	0.76

Source: Analysis on Primary Data, 2016

Note:

UM = biased proportion

US = variance proportion

UC = covariance proportion

Based on test statistic, predictability criteria included UM, US and UC scores. As shown in the table, most UM scores tended to approach zero, and therefore, the model did not experience systematic bias. In addition, US scores also approached zero, meaning that its predicted rate always followed the fluctuation of actual rate. In other side, model validation showed that most UC scores were approaching to one. In other words, model error was negligent and irregular, but it dispersed to all observation data. From these results of model validation, it could be said that the resultant model was valid to be used as *simulation tool*.

#### Analysis on The Change of Input to Beef Cattle Breeding:-

The simulation of the policy for beef cattle breeding involved various policies. These concerned with feed and non-feed consumption, the production cost for beef cattle breeding, and the cost of rice-field farming.

### Simulation of the Policy for Feed and Non-Feed Consumption

The policy that was used in the simulation was to provide the financial aid for feed and non-feed consumption which the aid was counted for Rp 1,000,000.00. This aid was directly influential to the income of breeder household. Result of the simulated policy was displayed in the table.

**Table:-**Simulation of the Policy for Feed and Non-Feed Consumption with Financial Aid of Rp. 1,000,000.00

Variable	Base Simulation	Simulation Scenario	Change
Grass-collection worker	1.4677	1.4683	0.04%
On-family breeding worker	1.9063	1.9109	0.24%
Concentrate cost	5557.8	5557.8	0.00%
Green feed cost	8414.1	8414.1	0.00%
Off-family rice-field farming worker	0.0418	0.063	50.72%
On-family rice-field farming worker	1.1016	1.1171	1.41%
Rice-field fertilizer cost	156112	163018	4.42%
Income from rice-field farming	7442892	7505239	0.84%
Off-family garden farming worker	0.2706	0.2813	3.95%
On-family garden farming worker	1.2812	1.2812	0.00%
Income from garden farming	2662506	2667406	0.18%
Income from breeding	24220.5	24219.6	0.00%
Family income	9313169	9373510	0.65%
Income from garden field	2405533	2410432	0.20%
Total cost of rice-field farming	547489	554395	1.26%
Income from rice-field	6895404	6950845	0.80%
Garden farming worker	1.5518	1.5625	0.69%

Source: Analysis on Primary Data, 2016

Table above explained that the aid would reduce feed and non-feed consumption but it increased off-family rice-field farming worker to 50.72%, rice-field fertilizer cost to 4.42%, off-family garden farming worker to 3.95% and total cost of rice-field farming to 1.26%. The income of rice-field farming increased to 0.84%, so did garden farming worker and income from rice-field, which each increased to 0.69% and 0.80%. Other variable with value less than 0.50% was subjected to the change. Based on this simulation, there was subsidy given to feed and non-feed consumption to encourage breeders to use off-family worker. Family member might be put in the other job that was more productive, or that was focusing more in education background rather than merely helping the farming and breeding works.

### Simulation of the Policy for Beef Cattle Breeding Cost:-

In addition to the simulated policy for feed and non-feed consumption, other simulation was to provide financial aid of Rp 1,000,000.00 to reduce beef cattle breeding cost, especially for concentrate cost and green feed cost. Result of simulation was displayed in the table.

**Table:-**Simulation of the Policy for Beef Cattle Breeding Cost with Financial Aid of Rp. 1,000,000.00

Variable	Base Simulation	Simulation Scenario	Change
Grass-collection worker	1.4677	1.4683	0.04%
On-family breeding worker	1.9063	1.9109	0.24%
Concentrate cost	5557.8	4075.8	-26.67%
Green feed cost	8414.1	7414.1	-11.88%
Off-family rice-field farming worker	0.0418	0.063	50.72%
On-family rice-field farming worker	1.1016	1.1171	1.41%
Rice-field fertilizer cost	156112	163018	4.42%
Income from rice-field farming	7442892	7505239	0.84%
Off-family garden farming worker	0.2706	0.2813	3.95%
On-family garden farming worker	1.2812	1.2812	0.00%
Income from garden farming	2662506	2667406	0.18%
Income from breeding	24220.5	24190.4	-0.12%

Family income	9313169	9373510	0.65%
Income from garden field	2405533	2410432	0.20%
Total cost of rice-field farming	547489	554395	1.26%
Income from rice-field	6895404	6950845	0.80%
Garden farming worker	1.5518	1.5625	0.69%

Source: Analysis on Primary Data, 2016

Table above illustrated that the financial aid for beef cattle breeding at Rp1,000,000.00 would decrease average concentrate cost for 26.67% and also reduce green feed cost for 11.88%. This aid did not improve breeder income because income from breeding had declined by 0.12%. Such condition was caused by a tendency of breeders to use off-family worker after receiving the financial aid for beef cattle breeding cost. Therefore, average income from the breeding decreased. In other hand, income from other farming (rice-field farming and garden farming) increased for 1.26% and 0.20%. General income of the family also improved by 0.65%.

#### Simulation of the Policy for Rice-Field Farming Cost:-

Other simulation done in this research was financial aid of Rp 1,000,000.00. Result of this policy simulation could be seen in the table.

**Table:-** Simulation of the Policy for Rice-Field Farming Cost with Financial Aid of Rp. 1,000,000.00

Variable	Base Simulation	Simulation Scenario	Change
Grass-collection worker	1.4677	1.4683	0.04%
On-family breeding worker	1.9063	1.9109	0.24%
Concentrate cost	5557.8	5557.8	0.00%
Green feed cost	8414.1	8414.1	0.00%
Off-family rice-field farming worker	0.0418	0.2253	439.00%
On-family rice-field farming worker	1.1016	1.6007	45.31%
Rice-field fertilizer cost	156112	163018	4.42%
Income from rice-field farming	7442892	7982464	7.25%
Off-family garden farming worker	0.2706	0.3628	34.07%
On-family garden farming worker	1.2812	1.2812	0.00%
Income from garden farming	2662506	2704907	1.593%
Income from breeding	24220.5	24219.6	0.00%
Family income	9313169	12138236	30.33%
Income from garden field	2405533	2447933	1.76%
Total cost of rice-field farming	547489	304395	-44.40%
Income from rice-field	6895404	8678069	25.85%
Garden farming worker	1.5518	1.644	5.94%

Source: Analysis on Primary Data, 2016

As noted in table above, financial aid of Rp 1,000,000.00 that was given to rice-field farming cost was contributive to the reduction of total cost of rice-field farming for 44.40%. The aid also improved the earning from rice-field by 7.25%, income from rice-field by 25.85%, income from garden farming for 1.76%, and family income by 30.33%. Significant increase was also found in the off-family rice-field farming worker by rate of 439% and on-family rice-field farming worker at rate of 45.31%.

#### Contribution to the Research:-

##### Theoretical Contribution:-

The review on the results of some previous researches had found a surprising fact. The use of simultaneous equation model to understand household economic was still lacking of research. Research about alternative policy to develop household economic in the beef cattle breeding was also not yet delivered.

Chayanov developed a household economic model to help the farmer to allocate production factors owned by the farming household. The decision about production and consumption in the farming household was inseparable. Household economic model of the farmers that was formulated by Chayanov was operated by maximizing the utility

of three items, including: (1) Function of production, (2) Minimally accepted income rate, and (3) Maximum work-day at farmer household.

'Research on household economic in the beef cattle breeding attempted to develop Chayanov's theory of household economic model by involving some simultaneous equations and by making connection between these equations and the alternative policies that related with work development. These policies included those about input improvement, process improvement, output management, and consumption change, in order to increase the income of beef cattle breeders.

One of distinctive character from household economic model of farmers was the relationship between decision on production and decision on consumption. In simultaneous equation model, the analysis was done through simulation by experimenting the change of input and output prices. Policy simulation could be operated by exploiting some policy variables (simultaneously) which could impact on farmer household. The benefit of simulation analysis was that it could resolve the problem in non-linear equation in the model where farmer household might have different exogenous variable. Elasticity analysis could help determining the variance of farmer household size (Smith and Strouss, 1986). The analysis against the impact of price change could be also conducted with a combination of more than one policy variable.

#### **Practical Contribution:-**

Simultaneous equation model was useful to simulate few policy alternatives to increase household economic welfare of beef cattle breeders. Result of single simulation indicated that the policy that could increase household income was financial aid of Rp 1,000,000.00 to support rice-field farming cost.

#### **Conclusion And Suggestion:-**

##### **Conclusion:-**

By taking account all the results of research and discussion, it was concluded that:

1. Household economic model that was formulated in this research could explain the behavior in deciding about farming and breeding productions, and this decision was strongly influential to the income of farming household. Some decisions must be made, such as about grass-collection worker, on-family breeding worker, concentrate cost, green feed cost, off-family rice-field farming worker, on-family rice-field farming worker, rice-field fertilizer cost, income from rice-field farming, off-family garden farming worker, on-family garden farming worker, income from garden farming, income from beef cattle breeding, income of the family, income from garden field, total cost of rice-field farming, and income from rice-field farming.
2. Income from beef cattle breeding was influenced by the number of beef cattle bred and the number of grass-collection worker. Concentrate cost remained under influence of the cost to purchase livestock feed greens (HMT). HMT cost itself was influenced by the number of beef cattle bred.
3. If governmental policy was indeed aimed to improve the income of farmer household, then the most effective policy scenario would be the scenario of providing financial aid of Rp 1,000,000.00 for rice-field farming. This aid was allocated to some decisions, which were described at percentage point, such as: Grass-collection worker (0.04%); On-family breeding worker (0.24%); Cconcentrate cost (0.00%); Green feed cost (0.00%); Off-family rice-field farming worker (439.00%); On-family rice-field farming worker (45.31%); Rice-field fertilizer cost (4.42%); Income from rice-field farming (7.25%); Off-family garden farming worker (34.07%); On-family garden farming worker (0.00%); Income from garden farming (1.593%); Income from beef cattle breeding (0.00%); Income of the family (30.33%); Income from garden field (1.76%); Total cost of rice-field farming (44.40%); Income from rice-field farming (25.85%); and Garden farming worker (5.94%).
4. If the government could select the proper policy, then policy goal would be matching with the result of this research, respectively the improvement of household income.

##### **Suggestions:-**

There were many policies to be made about food. The recommended food policies for farming-breeding works would be those about the occupied land width, the increase of production through the utilization of production input, the on-family and off-family based employment, and the earning and income of farming-breeding works, and the income of household that would be spent on consumption and investment.

### HYPOTHALAMIC CAVERNOMA IN A 28 YEARS OLD SAUDI LADY: CASE REPORT

**Naif Edah Alomairi.**

Assistant professor of neurology, Head of Internal Medicine Department, College of Medicine - Taif University, Saudi Arabia.

#### Manuscript Info

##### Manuscript History

Received: 28 November 2016  
Final Accepted: 27 December 2016  
Published: January 2017

##### Key words:-

Vascular malformation, cavernoma, angioma, haemangioma.

#### Abstract

**Background:** Cerebral vascular malformations occur in 0.1-4% of the general population. Cavernoma is a subtype of these malformations with 0.4% incidence rate. Symptoms vary from absence to various neurological sequelae. We believe it's important to report this case because it strongly emphasizes that patients should not be profiled, and chronic complaints may need reassessment.

**Case Presentation:** We report a case of 28-years old Saudi lady with cerebral cavernoma. She is complaining of chronic headache for five years with recurrent attacks of severe headache for the last two years.

**Conclusion:** Cavernoma is the least common vascular malformation in central nervous system which may cause serious complications. Decision about management depends on whether it is symptomatic or not. Hence, patients should be evaluated carefully and chronic complaints should always be revisited.

#### Introduction:-

Cavernous malformations are also referred to as cavernous angiomas, cavernous haemangiomas or cavernomas. It occurs sporadically or in a familial pattern.<sup>(1)</sup> It is the least common cerebral vascular malformation with an incidence rate 0.4% of the general population.<sup>(2,3)</sup> Symptoms are related to its site, size, venous drainage and association with other malformations. We present a patient with history of chronic headache. She presented to our emergency department with worsening of that headache for three days and was found to have a leaking cerebral cavernoma. This case asserts that chronic complaints may need reassessment.

#### Case Presentation:-

The patient is a 28-year old Saudi lady presented with an attack of severe headache, associated with nausea, vomiting and blurring of vision for three days. It is occipital, of thunderclap nature and occurs in several episodes daily. Each lasts for minutes and associated with symptoms of meningism.

These attacks started two years back with a frequency of one every 4-5 months. Frequency and severity were increasing recently.

She has five years history of chronic headache which was diagnosed as migraine and cerebral venous thrombosis (received anticoagulant for a year).

There are no other neurological symptoms and she has no other medical problems or receiving any regular medications. Family history is positive for epilepsy (maternal aunt and uncle). She is married with three kids and has no special habits.

On examination, the patient had an average built, general and systemic examination were normal.

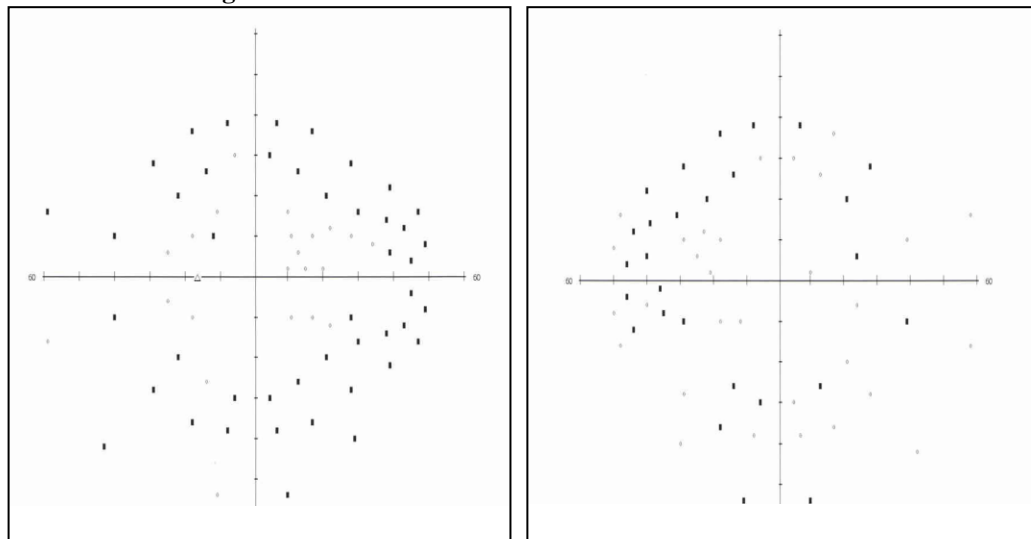

Full neurological examination came normal apart from ophthalmological exam which showed:

- Pupils: equal and reactive with relative afferent pupillary defect (RAPD) more in left eye.
- Visual acuity: Right eye: 20/25, Left eye: 20/30.
- Extra ocular movements (EOMs): normal eye movements in all directions.
- Fundi: Bitemporal optic atrophy. (**Figure 1**)
- Visual fields: Binasal hemianopia. (**Figure 2**)
- Her blood tests were normal.
- Magnetic Resonance Image (MRI) (**Figure 3**), Magnetic Resonance Venography (MRV) and Magnetic Resonance Angiography (MRA) brain are done.

**Figure 1:-** Fundus examination showing bitemporal optic atrophy.

**Figure 2:-** Visual fields show loss of nasal fields.

**Figure 3:-MRI shows Hypothalamic Cavernoma, Popcorn apperance (yellow and red arrows)****Discussion:-**

Cerebral vascular malformations occur in 0.1 to 4.0 percent of the general population. Four general subtypes of congenital malformations have been described: developmental venous anomalies, capillary telangiectasias, cavernous malformations and arteriovenous malformations.<sup>(2,3)</sup>

Three genetic loci (CCM1, CCM2, and CCM3) responsible for familial cavernous malformations (CMs) have been reported.<sup>(4-6)</sup>

The cerebrum is the most common location for CMs (70-90%).<sup>(7)</sup> They have been reported throughout the supratentorial compartment, but most commonly are subcortical and inclined to the rolandic and temporal areas. Posterior fossa lesions involve approximately 25 percent of CMs in most large series, with the majority located in the pons and cerebellar hemispheres. There have been just 36 cases of spinal cord cavernous malformations announced in the literature.<sup>(8)</sup>

Supratentorial CMs commonly present with hemorrhage, seizures, and progressive neurologic deficits. This may be the result of mass effect and secondary compromise of the microcirculation, or of microhemorrhages with local hemosiderin deposition irritating cortical or subcortical tissue. Annual bleeding rates of 0.25 to 1.1 percent have been reported.<sup>(9,10)</sup>

Infratentorial CMs commonly present with hemorrhage and progressive neurologic deficits. The lesions of brainstem are worse than that in other areas. The annual bleeding rate for brainstem lesions is 2 to 3 percent per year, with recurrent hemorrhage rates approaching 17 to 21 percent.<sup>(11)</sup> Progressive neurologic decline is observed in 39 percent.

The natural history of asymptomatic lesions is significantly different from CMs presenting with clinical sequelae. 50% of 122 patients (age ranged from 4 - 82 years and mean 37 years).<sup>(12)</sup> on follow up mean of 34 months, the hemorrhage rate in the asymptomatic patients was 0.6% and 4.5% in the symptomatic patients. In another cohort, five year rates of hemorrhage were 2.4 percent for a first hemorrhage and 29 percent for a recurrent hemorrhage.<sup>(13)</sup> The risk of recurrent hemorrhage declines over time.<sup>(13,14)</sup> While prior hemorrhage is a consistent risk factor for subsequent hemorrhage, studies have found inconsistent results as to other risk factors for hemorrhage and neurologic disability, including gender, lesion size, location, and multiplicity.<sup>(12-15)</sup>

CMs blood flow is low. Therefore, they usually are indicated to as "angiographically occult", due to may not be seen on angiography. MRI usually establishes the diagnosis. Characteristic findings on T-1 and T-2 weighted images include a "popcorn" pattern of variable image intensities consistent with evolving blood products. A dark hemosiderin ring, best seen on T2 or gradient echo sequences at the periphery of the lesion, is suggestive of remote hemorrhage.<sup>(16)</sup>

Computed tomography usually demonstrates a nonspecific, irregular, hyperdense mass with variable degrees of calcification. Angiography demonstrates a capillary blush or early draining vein in approximately 10 percent of patients. Digital subtraction angiography appears to be much more sensitive than MRI for detecting the presence of CM-associated atypical venous drainage.<sup>(17)</sup>

Asymptomatic CMs are observed, irrespective of location. Surgical resection indications of accessible symptomatic lesions of cerebral and cerebellum include progressive neurologic deficit, intractable epilepsy, and recurrent hemorrhage.<sup>(18-19)</sup> Patients with symptomatic CMs entirely surrounded by eloquent tissue (e.g., rolandic cortex, brainstem, thalamus/basal ganglia) are usually observed despite the poor natural history associated with untreated brainstem and thalamic lesions.

In our case, first MRI, MRV done five years ago showed the suprasellar lesion. However, her normal variant hypoplastic transverse sinus made her diagnosed as cerebral venous thrombosis in presence of headache and bilateral papilledema. She continued on anticoagulant for one year. Since that time she has chronic headache which is considered migraine and treated for migraine headache.

During one of her attacks of severe headache She presented to our emergency department and was associated with nausea, blurring of vision and symptoms of meningism. On examination, we found her discs abnormality which is confirmed by fundus photography and visual fields. We revised her images again and new one is done (**Figure 3**). We conclude that she has never cerebral venous thrombosis and this is a normal variant of hypoplastic transverse sinus. Moreover, she has progressive neurological deficit which is bilateral optic atrophy due to compression of the optic chiasma by the lesion. Leaking from the cavernoma is the cause of her intractable headache due to meningeal irritation. CSF xanthochromia was checked and confirm the leaking. Accordingly, we referred the patient to the neurosurgery team.

### Conclusion:-

Cavernous malformations are the least common vascular anomaly of central nervous system. It may be asymptomatic or cause various neurological deficits.

Surgical intervention is recommended only if it is symptomatic.

This case reminds us how serious diseases can masquerade in old complaints. Patients should never be profiled and chronic complaints should always be revisited.

#### EXPLORING PREVALENCE OF LONG TERM DIABETES MELLITUS VASCULAR COMPLICATIONS IN KING FAHAD GENERAL HOSPITAL

Wyed Al Harbi, Daniah Ahmad Faraj, Lubna Ismail, Lujain Asiri and Alia Ismail.  
 King Fahad General Hospital.

#### Manuscript Info

##### Manuscript History

Received: 03 November 2016  
 Final Accepted: 28 December 2016  
 Published: January 2017

#### Abstract

##### Study objective(s):-

##### Primary objective:-

To assess the cumulative and individual prevalence of microvascular and macrovascular complications among study population.

##### Secondary objective(s)

- To Map Cardiovascular Risk Factors among study population.
- Correlate diabetic complication prevalence with level of diabetes control (A1C target level)

##### Study Design &Duration:-

A retrospective cross sectional study design will be used. Patients' files will be used as source of data collection in a brief case report form. To avoid duplication unique patient file number will be used as subject number preceded by investigator number. A random data source verification of 20% of the case report forms as quality control of collected data. Patients will be enrolled inn 1 month

##### Study population:-

##### Inclusion criteria

- Male or Female patients of all age groups.
- Established diagnosis of DM for more than 10 years.
- Patients presented to the outpatient clinic during the last three months.

##### Exclusion criteria

- Incomplete patient's file

**Expected number of patients:** 375 patients attending to King Fahad General Hospital, Jeddah, Saudi Arabia.

Expected number of investigators: **3 investigators.**

##### Recruitment modalities:-

##### Selection of patients

In order to allow extrapolation of the results to the broadest possible population, all consecutive patients who meet the eligibility criteria and agree to participate upon a signed consent form will be included in the study. Each physician should recruit about 125 consecutive DM patients.

**Endpoint(s):-****Primary endpoints**

- Number of Micro/Macrovascular complications
- Proportion of patients having micro/macro complications
- Frequency of micro/macrovascular complications per patients
- Proportion of individual micro/macrovascular complication among study population.

**Secondary endpoints**

- Proportion of Cardiovascular risk factors among study population and its correlation to DM vascular complications

**Difference in prevalence of micro/macrovascular and individual complications in patients with target A1C < 8 % or > 8% at the time of diagnosis****MAIN DATA COLLECTED:-**

Data will be collected during a single visit in an individual case report form (CRF). No tests will be specifically done for this study.

**The following data will be collected:**

- **Date of last visit,**
- **Inclusion/exclusion criteria check,**
- **Patient profile:**
  - Demographic characteristics (age, gender, marital status, etc.),
  - Lifestyle habits (smoking status, physical activity),
  - Vital signs, weight, waist circumference, body mass index, blood pressure).
  - Family History of DM and Cardiovascular disease
  - Relevant history of risk factors for DM
- **Characteristics of diabetes:**
  - Type of Diabetes
  - Duration of diabetes,
- **Cardiovascular Risk Factors**
- **Microvascular Complications**
  - Retinopathy (Date of Diagnosis, A1C level)
  - Nephropathy (Date of Diagnosis, A1C level)
  - Neuropathy (Date of Diagnosis, A1C level)
- **Macrovascular Complications**
  - Ischemic heart Disease (Type, Date of Diagnosis, A1C level)
  - Cerebrovascular Disease (Type, Date of Diagnosis, A1C level)
  - Peripheral vascular Disease (Type, Date of Diagnosis, A1C level)

**Statistical considerations:-****Sample size calculation**

Number of subjects: N= 375

**Sample size:**

Distribution by country or region: Limited to one center as pilot study

**Statistical power and sample size justification:-**

According to Litwak et al. 2013;<sup>14</sup> the prevalence of microvascular and macrovascular complications among diabetic patients in Middle East/Gulf area including Saudi Arabia was 65.8% and 28.7% respectively; accordingly:

Sample size for Microvascular complications: In our study; it is hypothesized that the prevalence of microvascular complications among diabetic patients would be 60% with a precision of  $\pm 5\%$ . A sample size of 369 individuals will allow for a confidence level of 95% considering a 2-tailed test.

Sample size for Macrovascular complications: In our study; it is hypothesized that the prevalence of macrovascular complications among diabetic patients would be 25% with a precision of  $\pm 5\%$ . A

sample size of 288 individuals will allow for a confidence level of 95% considering a 2-tailed test.

**Statistical Analysis Plan:-**

Statistical analysis will be based on all patients enrolled in the registry. Descriptive analysis will be performed. Patient 's characteristics (demographic data, risk profile, treatment, etc.) will be described for all the included patients.

Quantitative data will be summarized using mean, median, standard deviation and range for continuous parameters and counts and percentages for categorical parameters. All statistical tests will be performed using two-tailed tests at a 5% level of significance. Moreover, statistical test will be performed on comparing different groups. Chi square test will be used to compare between categorical parameters. The results will be calculated at 95% CI and 5% level of significance. For parametric data; two-tailed paired t-test and repeated measures ANOVA will be used when comparing between repeated measurements while independent t-test and one way ANOVA when comparing between study groups. Non-parametric tests of significance would be used with data not normally distributed. Logistic Regression analysis would be performed to detect positive and negative predictors of microvascular and macrovascular complications.

**Estimated duration of the study:-**

**Estimated enrollment duration:** 1 month

**Estimated dates:**

- FPI: 1 JAN 2017
- LPI: 31 JAN 2017
- LPO: 31 JAN 2017
- Database lock date: 28 FEB 2017

Report date: 31 MAR 2017

**Introduction and Rationale:-**

**Background:-**

Diabetes is one of the largest global health emergencies of the 21st century. Each year more and more people live with this condition, which can result in life-changing complications. In addition to the 415 million adults who are estimated to currently have diabetes, there are 318 million adults with impaired glucose tolerance, which puts them at high risk of developing the disease in the future. Nearly each 6 seconds a patient would die because of diabetes and its complications reaching up to 5 million deaths a year ahead of cancer, tuberculosis and Malaria mortalities.<sup>1</sup>

The number of people with type 2 diabetes is growing rapidly worldwide. This rise is associated with ageing populations, economic development, increasing urbanization, less healthy diets and reduced physical activity.<sup>2</sup> Over the past three decades, major social and economic changes have transformed many of the countries in the Middle East and North Africa (MENA) region. Some Gulf States have undergone rapid economic growth and urbanization, associated with reduced infant mortality and increasing life expectancy.<sup>3</sup>

The age adjusted comparative prevalence rate of Diabetes Mellitus across the MENA region is estimated to be 10.7% with 35.4 million patients suffering from diabetes with 17.1 billion USD health expenditure for Diabetes and costlier 342 thousand deaths a year. The age adjusted prevalence of impaired glucose tolerance account for 8.6% adding another 30.2 million progressing to overt Diabetes Mellitus. Even Type 1 DM which is the by far less common compared to T2 DM the prevalence is 60.1 Thousand patients.<sup>3</sup>

Saudi Arabia has the highest prevalence across the MENA region in Type II DM reaching >20% of adult population aged 20-79 years old. Saudi Arabia also have some of the world's highest annual incidence rates of type 1 diabetes in children, with 31.4 new cases per 100,000 population, hence, Saudi Arabia has 16,100 children with type I diabetes, by far the highest number in the region, and over a quarter of the region's total of 60,700.<sup>3,4</sup>

Moreover, the diabetic population consumes a disproportionate share of health care resources because of both micro-vascular and macro-vascular complications. Strategies to lessen the disease burden in these patients include hygienic measures (diet and exercise) as well as rigorous treatment of hypertension, dyslipidemia and hyperglycemia.<sup>5</sup>

Diabetic patients are at high risks of developing microvascular complications of small blood vessels or macrovascular complications affecting larger blood vessels.<sup>6</sup> Microvascular complications are long-term complications and can be classified into diabetic retinopathy nephropathy or neuropathy.<sup>7</sup> The narrowing of arteries leads to decreased blood flow to the heart, or to the brain, or to the limbs leading to several macrovascular complications.<sup>8</sup>

There are a large number of epidemiological studies or national registers which have been conducted worldwide, particularly in the westernized countries, in order to assess the quality of care in diabetic patients, or to check compliance with national treatment guidelines and national program for improvement of quality of care of these patients. There has also been an international collaboration of different registries from various countries aiming to better understand global pattern of the diabetic disease.<sup>9,10</sup>

### **Rationale:-**

Local data available from Saudi Arabia are derived from 2 studies conducted in Eastern and central regions. One published in 2000 by Khan *et al* conducted in Al-Hasa area estimated the prevalence of retinopathy by 13.6%.<sup>11</sup> The most recently published study by Aboud FA *et al* in 2016 is again single center study including Type 2 DM patients attending Al-Wazarat Healthcare Center in the central region. Out of the 748 participants, 111 (14.8%) had retinopathy, 112 (15%) had nephropathy, and 5.6% had neuropathy. Approximately 63 (8.7%) had myocardial infarction (MI), 49 (6.6%) had cerebrovascular accident (CVA). The prevalence of both micro- and macro- vascular changes in the same patient were 42 (5.6%).<sup>12</sup> Overall, the prevalence of microvascular and macrovascular complications of Diabetes Mellitus seem to be lower than reported in international studies such as the United Kingdom Prospective Diabetes Study (UKPDS).<sup>13</sup>

This situation highlights the need to consistently assess the current prevalence of microvascular and macrovascular diabetic complications in the western region of Saudi Arabia and to put in place some actions in order to improve the quality of care of these patients.

The aim of this study is to explore the prevalence of microvascular and macrovascular complications among male and female patients having diabetes for more than 10 years at King Fahad General Hospital, Jeddah Saudi Arabia.

**Study objectives:-****Primary:-**

To assess the cumulative and individual prevalence of microvascular and macrovascular complications among study population.

**Secondary:-**

To Map Cardiovascular Risk Factors among study population.

Correlate diabetic complication prevalence with level of diabetes control (A1C target level)

**Study Design:-****Description of the study design:-**

A retrospective cross sectional study design will be used. Patients' files will be used as source of data collection in a brief case report form. To avoid duplication unique patient file number will be used as subject number preceded by investigator number. A random data source verification of 20% of the case report forms as quality control of collected data.

**Duration of study participation:-**

Data will be collected as one single visit. Patients will be enrolled over a period of one month.

**Evaluation Criteria:-****Primary evaluation criteria:-**

Number of Micro/Macrovascular complications

Proportion of patients having micro/macro complications

Frequency of micro/macrovascular complications per patients

Proportion of individual micro/macrovascular complication among study population.

**Secondary evaluation Criteria:-**

Proportion of Cardiovascular risk factors among study population and its correlation to DM vascular complications.

Difference in prevalence of micro/macrovascular and individual complications in patients with target A1C < 8 % or > 8% at the time of diagnosis.

**Selection of Patients:-****Sample Size:-**

It is planned the 3 investigators to recruit 375 patients in King Fahad General Hospital, Jeddah, Saudi Arabia.

**Inclusion Criteria:-**

Male or Female patients of all age groups.

Established diagnosis of DM for more than 10 years.

Patients presented to the outpatient clinic during the last three months.

**Exclusion Criteria:-**

Incomplete patient file

Modalities of recruitment

To allow extrapolation of the results to the broadest possible population, all consecutive patients who meet the eligibility criteria will enrolled in the study. Each selected investigator will include about 125 consecutive patients' files that meet eligibility criteria. This consecutive recruitment will limit biases of patient selection. The total recruitment period will be 1 month.

**Data Collection:-****Data Collection Schedule:-**

All data will be collected during one single visit (see Section 2.2 Study Flow Chart) in an individual Case Report Form (CRF).

**Data Collected:-**

Data will be collected from the medical chart. No tests will be specifically done for this study.

**Patient Data:-****The Following Data Will Be Collected:**

- Date of last visit,
- Inclusion/exclusion criteria check,
- **Patient profile:-**
  - ❖ Demographic characteristics (age, gender, , marital status, e),
  - ❖ Lifestyle habits (smoking status, , physical activity),
  - ❖ Vital signs, weight, waist circumference, body mass index, blood pressure).
  - ❖ Family History of DM and Cardiovascular disease
  - ❖ Relevant history of risk factors for DM
- **Characteristics of Diabetes:-**
  - ❖ Type of Diabetes
  - ❖ Duration of diabetes,
- **Cardiovascular Risk Factors:-**
- **Microvascular Complications:-**
  - ❖ Retinopathy (Date of Diagnosis, A1C level)
  - ❖ Nephropathy (Date of Diagnosis, A1C level)
  - ❖ Neuropathy (Date of Diagnosis, A1C level)
- **Macrovascular Complications:-**
  - ❖ Ischemic heart Disease (Type, Date of Diagnosis, A1C level)
  - ❖ Cerebrovascular Disease (Type, Date of Diagnosis, A1C level)
  - ❖ Peripheral vascular Disease (Type, Date of Diagnosis, A1C level)

**Site/ Investigator questionnaire:-**

Not applicable.

**Patient/Subject tracking log:-**

Not applicable:-

**Logistic Aspects:-**

Not applicable.

**Management of data:-****Data Collection, Validation and data quality control at mandated CRO LEVEL:-**

Data will be collected using paper CRFs. Patient profile and medical history will be collected from clinical records which are considered as source documents.

The computerized handling of the data by the mandated Contract Research Organization (CRO) may generate additional requests to which the participating investigator is obliged to respond by confirming or modifying the data questioned. The requests with their responses will be appended to the CRFs held by the Investigators.

**Data collection and validation procedures will be detailed in appropriate operational Documents:-****Monitoring And Site data quality control:-**

Data quality control will be performed at site level, where each investigator will randomly select and review 10% of CRF filled by his/her colleague against the patient file. That means 20% of the the CRFs will be cross checked.

Data quality control must be performed by qualified designated personnel. The methodology of data quality control and appropriate consecutive corrective actions will be detailed in the study manual.

**Pharmacovigilance:-**

The investigator should ensure that no product names / brand names are collected through the CRF. For this disease observational study, there will be no systematic collection of safety data.

However, all adverse drug reactions (ADRs) to any product that occurred during the course of the study must be recorded and transmitted to SFDA within 24 hours e.g. ADRs that are discovered at the time of a reviewing patents' files, data source verification and cross checking by another investigator or ADRs discovered during data entry into the database.

According to the International Conference on Harmonization (ICH) E2D guideline, ADRs are noxious and unintended responses to a medicinal product (the phrase 'responses to a medicinal product' means that a causal relationship between a medicinal product and an AE is at least a reasonable possibility).

According to local regulation, investigators must comply with Saudi Arabian regulations for the spontaneous reporting of ADRs as described in local regulatory requirements issued by Drug Sector/Saudi Food and Drug Authority (SFDA) which relate to Good Pharmacovigilance Practice Guidelines dated 01-SEP-2015, which describe the responsibility of the investigators and sponsor in reporting ADRs to SFDA / National Pharmacovigilance Center.

Per the ICH E2A guideline, a serious ADR is any untoward medical occurrence that at any dose:

- results in death,
- is life threatening (a reaction in which the patient was at risk of death at the time of the reaction e.g. allergic reaction: angioedema of the larynx would be life-threatening),
- requires inpatient hospitalization or results in prolongation of existing hospitalization,
- results in persistent or significant disability / incapacity e.g. loss of visual acuity, fractured neck of femur, convulsions with neurologic sequelae,
- is a congenital anomaly / birth defect, during pregnancy or after birth or any anomaly that results in fetal loss?
- is a medically important reaction (reactions that may not be immediately life-threatening or result in death or hospitalization but may jeopardize the patient or require intervention to prevent one of the other outcomes listed in the definition of seriousness). NB: it is the responsibility of the investigator to assess these events as medically important.

The investigators are responsible within 24 hours from his/her awareness of the ADR with special care to follow up serious cases until final outcome/resolution.

**SFDA requires the investigators to report the following special cases:-**

- Drug exposure via parent, with or without ADR,
- Lack of efficacy,
- Overdose (intentional or unintentional) with or without ADR,
- Drug misuse, with or without ADR,
- Drug abuse,
- Unintended beneficial effects,
- Medication errors, with or without ADR,
- Suspected transmission of infectious agents.

SFDA ADR form is attached in **Annex I**.

**Safety Observations:-**

- The Investigator should take all appropriate measures to ensure the safety of the patients, notably he/she should follow up the outcome of any ADR related to any product (clinical signs, laboratory values or other, etc.) until the return to normal or consolidation of the patient's condition;
- In case of any serious ADR related to any product, the patient must be followed up until clinical recovery is complete and laboratory results have returned to normal, or until progression has been stabilized. This may imply that follow-up will continue after the patient has left the study;
- According to the American Diabetes Association, hypoglycemia is a condition characterized by abnormally low blood glucose levels, usually falling below 70 mg/dL.
- The Investigator will assess the severity of all AEs/SAEs (including hypoglycemia) as Mild, Moderate, or Severe, based on the following definitions (developed from Clinical Data Interchange Standards Consortium CDISC Study Data Tabulation Model standard terminology v3.1.1):

- **Mild:** A type of AE that is usually transient and may require only minimal treatment or therapeutic intervention. The event does not generally interfere with usual activities of daily living.
- **Moderate:** A type of AE that is usually alleviated with additional specific therapeutic intervention. The event interferes with usual activities of daily living, causing discomfort, but poses no significant or permanent risk of harm to the research participant.
- **Severe:** A type of AE that interrupts usual activities of daily living, or significantly affects clinical status, or may require intensive therapeutic intervention.

**Statistical Considerations:-****Determination of Sample Size:-**

**Sample size:** 375 patients

**Statistical power and sample size justification:-**

According to Litwak et al. 2013; the prevalence of microvascular and macrovascular complications among diabetic patients in Middle East/Gulf area including Saudi Arabia was 65.8% and 28.7% respectively; accordingly:

Sample size for Microvascular complications: In our study; it is hypothesised that the prevalence of microvascular complications among diabetic patients would be 60% with a precision of  $\pm 5\%$ . A sample size of 369 individuals will allow for a confidence level of 95% considering a 2-tailed test.

Sample size for Macrovascular complications: In our study; it is hypothesised that the prevalence of macrovascular complications among diabetic patients would be 25% with a precision of  $\pm 5\%$ . A sample size of 288 individuals will allow for a confidence level of 95% considering a 2-tailed test.

Adopting the higher sample size rounded to 375 subject would be required.

**Distribution by country or region:-**

Limited to one center as pilot study

**Disposition of patients:-**

No tracking log will be used in the study. However, all investigators and patients included in the study will be accounted for. The study enrollment period (dates of first and last patients recruited, duration of recruitment period) and the number of patients per investigator will be given.

**Analysis Populations:-**

Two populations of patients will be defined:

- The **enrolled population:** all patients included in the study,
- The **analysis population:** all patients with DM included in the study who fulfilled eligibility criteria.

**Statistical Methods:-**

This section provides specifications for preparation of a final Statistical Analysis Plan (SAP), which will be issued prior to database lock. Any differences compared to this statistical section should be identified and documented in the final SAP. Statistical analysis will be based on all patients enrolled in the registry. Descriptive analysis will be performed. Patients' characteristics (demographic data, risk profile, treatment, etc.) will be described for all the included patients.

Quantitative data will be summarized using mean, median, standard deviation and range for continuous parameters and counts and percentages for categorical parameters. All statistical tests will be performed using two-tailed tests at a 5% level of significance. Moreover, statistical test will be performed on comparing different groups. Chi square test will be used to compare between categorical parameters. The results will be calculated at 95% CI and 5% level of significance.

For parametric data; two-tailed paired t-test and repeated measures ANOVA will be used when comparing between repeated measurements while independent t-test and one way ANOVA when comparing between study groups. Non-parametric tests of significance would be used with data not normally distributed. Logistic Regression analysis would be performed to detect positive and negative predictors of microvascular and macrovascular complications

**Analyses Variables:-**

Information about the patients will be collected through the CRF. All data collected during the registry will be analyzed in the appropriate descriptive analysis. Statistical analysis will be performed by a statistical programmer using SAS software, release 9.4 or higher (SAS institute, Cary, NC, U.S.A).

**Interim Analysis:-**

No interim analysis is planned for this registry.

**Responsibilities:-****Study Committees:-**

The chairperson will be responsible for coordinating the conduct of this study. She/He was involved in the preparation and approval of the protocol and its amendment(s), will assess the progress of the study at site level and is given full authority for presentation/publication of the results.

**Responsibilities of the Investigators:-**

The Investigator will perform the study in accordance with this protocol, applicable local regulations and international guidelines.

**It is the Investigator's responsibility to:-**

- Fill in the CRF and record all data pertinent to the study. She/he will ensure that the information reported in the CRF is precise and accurate.

The ICF and the Information Sheet used by the Investigator for obtaining the Patient's Informed Consent must be reviewed and approved by the Sponsor prior to submission to the appropriate Ethics Committee (IRB/IEC) for approval / favorable opinion.

The Investigators are responsible for taking all reasonable steps and providing adequate resources to ensure the proper conduct of the study.

**Investigators are responsible for:**

- Local submission(s) complying with data protection rules,
- Any other local submission(s).

**Ethical and Regulatory Standards:-****Ethical Principles:-**

This study will be conducted in accordance with the principles laid by the 18<sup>th</sup> World Medical Assembly (Helsinki, 1964) and all subsequent amendments.

**Laws and Regulations:-**

This study will be conducted in accordance with the guidelines for Good Epidemiology Practice [US (14) & European(16)].

The Investigators should locally ensure all necessary regulatory submissions (e.g. IRB/IEC) are performed in accordance with local regulations including local data protection regulations.

**Administrative Expectations:-****Record Retention:-**

The Investigator shall arrange for the retention of study documentation until the end of the study. In addition the Investigator will comply with specific local regulations/ recommendations with regards to patient record retention.

It is recommended that the Investigator retains the study documents at least 5 years (5) after the completion or discontinuation of the study.

However, applicable regulatory requirements should be taken into account in the event that a longer period is required.

**Confidentiality:-**

All material, information (oral or written) and unpublished documentation provided by the Investigator, including the present protocol and the CRF, are exclusive property of the investigator.

These materials or information (both global and partial) cannot be given or disclosed by the Investigators or by any person of her/his group to unauthorized persons without the prior formal written consent of Investigators.

The Investigator shall consider as confidential all the information received, acquired or deduced during the study and will take all necessary steps to ensure that there is no break of confidentiality, other than for information to be disclosed by law.

**Data protection:-**

The patients' personal data and the Investigators' personal data which may be included in the study database shall be treated in compliance with all local applicable laws and regulations.

When archiving or processing personal data pertaining to the Investigator and/or to the patients, The investigators and delegated CRO shall take all appropriate measures to safeguard and prevent access to this data by any unauthorized third party.

**Insurance:-**

Not applicable.

**Premature discontinuation of the study:-**

The investigators can decide at any time and for any reason to prematurely stop or to interrupt the study; the decision will be communicated in writing to If appropriate, according to Saudi regulations, Ethic Committee(s) (IRB/IEC) and SFDA should be informed.

**Ownership and use of data and Study Results:-**

No use of the data will be possible without the authorisation of the Investigators conducting the study.

**Publications:-**

All study Investigators will have full authority of primary presentation and/or primary publication of results. No other publication is allowed before the primary publication. Any subsequent presentation or publication by a study participant (including for substudies) must be approved by the investigators and make reference to the study and the primary publication.

**Protocol Amendments:-**

Any change to the protocol will be recorded in a written amendment, which will be signed by the Investigator. Amendment to the protocol may require regulatory submissions (e.g. IRB/IEC) in accordance with Saudi regulations.

3D geometry, Line Clipping, Computer Graphics, 2D geometry.

#### **Abstract**

In computer graphics there are many line clipping algorithms which can be extended to 3D space. This paper is a review on Cohen-Sutherland and Liang-Barsky line clipping algorithms. Mostly all of the 3D line clipping algorithms involves basic three steps to check either a line segment lies completely inside the clipping volume or lies completely outside the clipping volume or crossing calculations when it is not entirely inside or outside. [1]

#### **Introduction:-**

In context of computer graphics, it is very essential to clip an area or a volume of interest which is to be displayed on the computer monitor. This division of interest is normally a rectangle or a general polygon in 2-Dimension and known as the clipping window. When it comes to 3-Dimensional clipping, a volume is used to extract a part from a 3-Dimensional scenario. Broadly the lines are clipped by clipping volume and it is known as polyhedron. And these Cuboids are extensively used as the clipping volume. 3-Dimensional clipping is one of the most essential processes such as video games, medical applications, computer aided design and many various applications. Occasionally it is important to dispose the data that is not within the visible range to avert the overflow of the internal registers of the display device.

Moreover, less memory consumption can be acquired by loading only a certain part of a scenario to the memory by clipping unnecessary parts. Therefore, bettering the performance of the clipping algorithm has a better impact on performance of the comprehensive graphics system.

Cohen-Sutherland line clipping algorithm, Liang-Barsky line clipping algorithm, Cyrus-Beck line clipping algorithm and Nicholl-Lee-Nicholl line clipping algorithm are the traditional line clipping algorithms. The Cohen-Sutherland and the Liang-Barsky algorithms can be continued to 3-Dimensional clipping. Nicholl-Lee-Nicholl algorithm achieves lesser comparisons and divisions which makes it faster than others. Nevertheless, it is difficult to expand for 3-Dimensional clipping. [1]

#### **Cohen-Sutherland Line Clipping Algorithm in 3D Space:-**

Cohen-Sutherland algorithm is one of the elementary and widely used clipping algorithms in computer graphics. This algorithm works very quickly in situations like the line segment is completely inside or outside of the clipping window. When the line segment is not lies inside or outside, this algorithm becomes ineffective due to repeated calculations. This algorithm can be easily extended to 3-Dimensional clipping, but space is required to divide into 27 mutually exclusive volumes, when the clipping volume is a cube or a cuboids. Again each volume is assigned a region code. Throughout the clipping process those region codes should be reserved in the memory. So in terms of

space and time complexity Cohen – Sutherland algorithm lacks results for complex problems. According to Hearn and Baker [3] all most all the 3D line clipping algorithms involve three steps:

1. For a given line sector check if it lies entirely inside the clipping volume.
2. If it does not fall between check whether it lies completely outside the clipping volume.
3. Diversely, perform intersection calculations with one or more clipping planes.

**The Cohen-Sutherland algorithm extends to 3D very simply. The outcode for 3D clipping is a 6-bit code. For a parallel canonical view volume the bits represent:**

- bit 1 - point above view volume ( $Y > 1$ )
- bit 2 - point below view volume ( $Y < -1$ )
- bit 3 - point to the right of view volume ( $X > 1$ )
- bit 4 - point to the left of view volume ( $X < -1$ )
- bit 5 - point behind view volume ( $Z < -1$ )
- bit 6 - point in front of view volume ( $Z > 0$ )

Nine line clipping regions of Cohen-Sutherland in 3D space

As in the 2D case, the line may be trivially accepted (both outcodes=000000), or trivially rejected ((code 1 AND code 2) not 000000). Otherwise line subdivision is used again. The points of intersection with the clipping edges are found using a parametric representation of the line being clipped. Consider the general line from P0 ( $x_0, y_0, z_0$ ) to P1 ( $x_1, y_1, z_1$ ). Its parametric representation is:

$$x = x_0 + t(x_1 - x_0) \quad (1)$$

$$y = y_0 + t(y_1 - y_0) \quad (2)$$

$$z = z_0 + t(z_1 - z_0) \quad (3)$$

$$0 \leq t \leq 1$$

As  $t$  varies from 0 to 1 these equations give the coordinates of all the points on the line between P0 and P1.

EXAMPLE: To calculate the intersection of a line with the  $y=1$  plane,  $y=1$  is substituted into equation (2). Rearranging this gives:

$$t = \frac{1 - y_0}{y_1 - y_0} \quad (4)$$

Substituting (4) into (1) and (3) yields:

$$x = x_0 + \frac{(1 - y_0)(x_1 - x_0)}{y_1 - y_0} \quad (5)$$

$$z = z_0 + \frac{(1 - y_0)(z_1 - z_0)}{y_1 - y_0} \quad (6)$$

As all the values in equations (5) and (6) are known, these two equations can be solved to find the x and z coordinates of the point of intersection. Using this information the line can be divided in two. [6]

### Liang-Barsky Line Clipping Algorithm in 3D space:-

Consider the parametric definition of a line:-

- $x = x_1 + u\Delta x$
- $y = y_1 + u\Delta y$
- $\Delta x = (x_2 - x_1), \Delta y = (y_2 - y_1), 0 \leq (u, v) \leq 1$

Mathematically, this means

- $x_{\min} \leq x_1 + u\Delta x \leq x_{\max}$
- $y_{\min} \leq y_1 + u\Delta y \leq y_{\max}$

Rearranging, we get

- $-u\Delta x \leq (x_1 - x_{\min})$
- $u\Delta x \leq (x_{\max} - x_1)$
- $-v\Delta y \leq (y_1 - y_{\min})$
- $v\Delta y \leq (y_{\max} - y_1)$

In general:  $u * p_k \leq q_k$ . There are many cases, if  $p_k = 0$  then line is parallel to boundaries and if for the same k,  $q_k < 0$ , reject the line otherwise accept the line. If  $p_k < 0$  then line starts outside this boundary and  $r_k = q_k / p_k$ ,  $u_1 = \max(0, r_k, u_1)$ . If  $p_k > 0$  then line starts outside this boundary and  $r_k = q_k / p_k$ ,  $u_2 = \min(1, r_k, u_2)$ . And if  $u_1 > u_2$ , the line is completely outside. It can easily extend to 3D by adding equation for  $z = z_1 + u\Delta z$  and 2 more p's and q's. [5]

### Conclusion:-

In this paper I defined Cohen-Sutherland and Liang-Barsky line clipping algorithms in 3-Dimensional space. Three-dimensional objects are clipped against a bounding volume as opposed to a clipping rectangle. Specifically, when clipping in 3D space we need to consider the intersections of lines and planes or polygons and planes as opposed to the clipping of lines against lines, which is the case with 2D space. A simple technique often employed to reject objects completely outside the clipping volume and to accept objects entirely inside it is to create a bounding sphere for the object and to subsequently test its edges against that of the view volume. A bounding volume, or bounding box, is simply a volume containing a geometric object. Cohen-Sutherland is the simplest line clipping algorithm but the Liang-Barsky algorithm is more efficient, since intersection calculations are reduced. [2]

#### Abstract

Correlation between serum zinc and glycosylated hemoglobin levels in type II diabetes mellitus.

#### Key words:-

serum zinc, glycosylated hemoglobin,  
type II Diabetes mellitus.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Diabetes mellitus (DM) is one of the major emerging health problem in developing countries resulting in morbidity and mortality of an individual and reducing the longevity of life. Although elaborate research works have been carried out to elucidate the multivarous aspects of this disease, many associated factors which will help to achieve better glycemic control are yet to be explored.[1] Universally there is a marked rise in type II DM cases and associated hypertension, stroke and renal problems and in turn they have become major contributors to morbidity and mortality. India being the second largest populated country in the world is also having 61.2 million cases in 2011 and is estimated to have 101.2 million type 2diabetic people by 2030.

Diabetes mellitus (DM) is a metabolic disorder with hyperglycemia and its related complications due to abnormality in insulin release, action or both. Insulin resistance plays a key role leading to all metabolic dysfunctions. Insulin resistance leads to increased visceral fat, dyslipidemia, hypertension, ,vasculopathy, increased platelet aggregation, endothelial dysfunction and accelerated atherosclerosis.[2] The altered metabolism of various minerals and trace elements has been implicated in diabetes mellitus and these elements may play a vital role in the itiopathogenesis and progression of the disease. Of these trace elements- magnesium, zinc and copper are important for various physiologic functions.[3] Oxidative stress caused by reactive oxygen species is the basis of pathogenesis of many diseases including DM. Trace elements play a role in production of oxygen free radicals.[4,5] .Zinc is a cofactor in the enzymatic pathways of production, storage and release of insulin. Zinc is also responsible for the structural stability of insulin, alteration of which leads to insulin resistance. Since glycosylated hemoglobin is an indicator of long-term glycemic control, HbA1c was measured and compared with serum zinc level.

#### Aim:-

To correlate between serum zinc and glycosylated hemoglobin levels in type II Diabetes Mellitus.

### Materials and Methodology:-

The present study was undertaken in the Institute of Physiology, Madurai Medical College, Madurai. After obtaining Institutional Ethical clearance, 60 males in the age group of 40-60 yrs, newly diagnosed with type 2 DM were selected based on history, examination, and relevant investigations. 60 age- and sex-matched volunteers without diabetes mellitus were taken as controls. Persons on micronutrient supplementation, drugs which interfere with zinc metabolism, oral hypoglycemic agents, insulin therapy, pregnant women or chronic diseases were excluded from the study.

Patients were classified as diabetic based on the American Diabetic Association 2010 criteria for diagnosis of DM.[8]. After getting prior informed written consent, with strict universal precautions 5 mL of venous blood was collected from antecubital vein by venepuncture using a sterile disposable syringe. Serum Zinc was estimated by colorimetric method,[9,10], glycated haemoglobin by ion exchange resin method,[7,11,12], blood glucose (fasting and postprandial) by Glucose oxidase/Peroxidase method,[13,14]. Statistical analysis of the data was performed by using SPSS software. 'p' value of less than or equal to 0.05 was considered significant. Correlation was found out in SPSS by using regression equation.

### Results and Discussion:-

Age distribution of cases and controls was not statistically significant with  $p > 0.05$ . The mean fasting and postprandial blood glucose in newly diagnosed type 2 DM cases were found to be statistically significant than that of the controls with  $P < 0.001$ . Mean serum zinc was lower in cases ( $69.65 \pm 5.6 \mu\text{g/dl}$ ) vs controls ( $86.54 \pm 9.3 \mu\text{g/dl}$ ) with  $p < 0.001^*$ . Mean HbA<sub>1c</sub> was higher in cases ( $7.03 \pm 0.67\%$ ) than controls ( $5 \pm 0.29\%$ ), with  $p < 0.001^*$ . Williams *et al.*, [21] reported DM to be a condition most frequently associated with hypozincemia, where they observed 17% decrease in serum zinc concentration in diabetics, compared with controls.

**Table 1:-**

S.No	Cases	Controls	'p' value	Pearson's correlation coefficient
Mean S.Zinc	$69.65 \pm 5.6 \mu\text{g/dl}$	$86.54 \pm 9.3 \mu\text{g/dl}$	.001*	<b>Negative Correlation - 0.826</b>
Mean HbA <sub>1c</sub>	$7.03 \pm 0.67\%$	$5 \pm 0.29\%$	<0.001*	

Correlation between glycated hemoglobin (HbA<sub>1c</sub>)% and serum zinc concentration in cases reveal a negative correlation between s.zinc and HbA<sub>1c</sub> with Pearson's correlation coefficient - **0.826**.

The findings of the present study are consistent with Reefat *et al.*, [28] who showed negative correlation between serum zinc concentration and baseline HbA<sub>1c</sub>% value in cases. Marchesini *et al.*, [29] explained hypozincemia in diabetic population due to the low gastrointestinal absorption and high urinary excretion of zinc.

### Discussion:-

Diabetes mellitus is a multifactorial disease. The metabolic derangements in diabetes causes pathophysiologic changes in multiple organ systems due to micro vasculopathy.

Present study revealed significant decrease in serum zinc levels in diabetic patients. Zinc plays a key role in various enzyme systems in the body.[13] Zinc is a potent antioxidant. Chronic zinc deprivation may lead to increased oxidative damage. Pujar S *et al.*, [13] in their study also showed significant decrease in serum zinc levels in type 2 diabetic patients. The reason for decreased serum zinc in diabetics may be due to impaired absorption, increased urinary excretion due to altered renal function, or genetic factors or during infections in which zinc plays a role in defence.[26]

Hence it may be concluded that there is significant reduction of serum zinc in type 2 DM patients. Alterations in Zn homeostasis has adverse effect on carbohydrate metabolism. High renal tubular load of glucose in diabetics interfere with tubular reabsorption of zinc causing hyperzincuria. Zn also increases insulin sensitivity by increasing the

sensitivity of insulin binding to its receptors.[2].Disordered metabolism of zinc may interfere with achievement of glycemic control in DM and in turn leads to development of complications.

#### **Conclusion:-**

Present study revealed inverse relationship between serum zinc and glycemic control. Hence micronutrient supplementation with emphasis on zinc may pave the way for good glycemic control in Type II diabetes mellitus and reduce morbidity and mortality.

#### **Conclusion:-**

Our study shows a decrease in levels of serum zinc among the type 2 DM patients. This causes poor glycemic control in type 2 DM by the involvement of zinc in oxidative stress and increase. Increased levels of copper and decreased level of magnesium and zinc are associated with increased values of HbA1c. This shows that the impaired metabolism of these minerals may have a contributory role in the progression of DM and later development of complications. However further studies are needed to be carried out to determine the molecular role of zinc, magnesium and copper in the development of diabetic complications.

#### Abstract

Seeing how the number of teenagers undergoing cosmetic surgeries is on the rise, and how most people undergoing cosmetic interventions are unaware of their consequences.

**Objectives:** This study assessed the awareness and estimated the occurrence of cosmetic surgeries among 530 female students from the University of Dammam's College of Applied Sciences and Community Service. It also aimed at assessing the association between age and future cosmetic surgeries, as well as determining the prevailing body image, BMI, and attitude, and their relationship with cosmetic surgeries among these students.

**Methodology:** A stratified random sampling method with proportionate allocation was conducted.

**Results:** About 40% of the females above 15 years old reported had undergoing a cosmetic surgical intervention, with hair removal by laser being the most frequently preformed. Also, 59% of the students had a body mass index within the normal range. In addition, mean total knowledge score for those who "did not perform surgery" is 11.22. While, mean total knowledge score for those who "performed surgery" is 12.18.

**Conclusion:** In general, there was an increased awareness about cosmetic interventions. The study also found that previous conductance of cosmetic surgery substantially affected the level of knowledge about these procedures. Further studies are required to determine the reasons behind seeking these cosmetic interventions.

Cosmetic surgery is usually performed to correct a physical abnormality or to enhance an otherwise normal physical feature and, therefore, improve a person's appearance. In the not so distant past, it was confined only to surgery that was absolutely necessary to the health and well-being of the patient, such as skin-grafting for serious burn injuries, repairing a broken nose or jaw, or treating an unseemly birthmark across the face. Cosmetic surgery was first used regularly after World War I, when treatment and reconstruction of war injuries gave hope to young soldiers <sup>[1]</sup>. Cosmetic surgery has increased dramatically in popularity over the past 10 years <sup>[2]</sup>, and it is constantly on the rise, seeing how more and more people are turning to cosmetic surgeries in their search for physical perfection.

According to the International Society of Aesthetic Plastic Surgery (ISAPS), two studies were conducted in 2010 and 2011 to determine the top 25 countries by total number of cosmetic procedures showed that Saudi Arabia ranked as 23<sup>rd</sup>, 22<sup>nd</sup> top country worldwide respectively, by total number of 45,398 procedures in 2010 and 46,962 procedures in 2011 <sup>[3,4]</sup>.

In Saudi Arabia and worldwide, Lipoplasty was the most prevalent cosmetic surgery; 19.9% of all cosmetic surgeries worldwide in 2011 were lipoplasties, and 9,601 of them were preformed in Saudi Arabia. The second most prevalent surgery was breast augmentation, comprising 18.6% of cosmetic surgeries worldwide, with 6,424 surgeries preformed in Saudi Arabia in 2011. Rhinoplasty was the third most prevalent cosmetic surgery in Saudi Arabia, with 5,630 procedures preformed in 2011. There were also, 4,984 blepharoplasties and 3,652 abdominoplasties performed in Saudi Arabia in 2011 <sup>[4]</sup>.

Almost all plastic surgeries have risks, and these risks vary in their severity and their duration. For instance, temporary numbness or loss of feeling at the site of the incision is fairly common in face-lifts and tummy tucks, though it's rarely permanent. Numbness after breast surgeries of any type is the most common. Loss of sensation in the nipple in particular occurs anywhere from 10% to 70% of the time, depending on the type of procedure. Another example is a seroma, which is a collection of watery body fluids that occurs most often in tummy tucks. It's common enough that many surgeons take preventative measures by inserting a drain during surgery. Tissue necrosis due to surgical manipulation is inevitable after any procedure, though risks increase dramatically if the patient is a smoker. Infections are rare in plastic surgery patients, since most patients are healthy to begin with. However, when they do happen, they can spread quickly and must be stopped immediately <sup>[5]</sup>.

The number of plastic surgeries is on the rise, and many of the people undergoing these procedures are unaware of their risks. Many doctors and institutions are taking advantage of these people and treating this sector as a booming business. This resulted in the percentage of teenagers undergoing these procedures to rise to a total of 2% of all procedures, adding up to about 230,617 procedures per year, including laser hair removal (69,434 procedures), rhinoplasty (33,892), and Botox injections (16,160). There are also about 8,892 teenage girls having breast implants <sup>[6]</sup>.

Moreover, in the field of cosmetic plastic surgery, common deaths are related to anesthesia with the highest probability of occurrence being 1 out of 13,000 and lowest 1 out of 300,000. Liposuction related surgery deaths are estimated to happen in every 5,000 cases due to the usage of general anesthesia. Tummy tucks accounted for 1 out of every 500 cases. For the elderly that undergo face-lift procedures, their risks are 1 in every 600 cases <sup>[7]</sup>.

Based on all of what we mentioned above, we decided to conduct this study among the University of Dammam female students to assess their awareness of cosmetic surgeries and to estimate the occurrence of cosmetic surgeries among them.

#### **Objectives:-**

General objectives: to assess the awareness of university students on cosmetic interventions, and estimate the occurrence of cosmetic surgeries among university students.

Specific objectives: To assess the association between age and future cosmetic surgeries among university students. Also, to determine the prevailing body image, BMI, attitude and their relationship with cosmetic surgeries.

#### **Methodology:-**

##### **Setting:-**

This cross-sectional study aimed to estimate the occurrence of cosmetic interventions and to assess the level of awareness about them among female students of the college of applied sciences, University of Dammam, Khobar, Saudi Arabia. This college was selected because of its accessibility and proximity to the survey conductors.

Research was conducted in a 2 weeks period. Started on 24/11/2013 and ended on 5/12/2013.

#### **Participants:-**

The target population consisted of 530 female students from the College Of Applied sciences, from 1st level to 8th level. The participants' ages fall in the range of 17 to 25 year old. Almost all the participants were Saudi nationals.

#### **Procedure:-**

Survey conductors followed a random stratified sampling method while distributing the questionnaires among the students of the college of applied sciences. All students anonymously completed a self-admitted questionnaire developed to assess the knowledge and rate of occurrence of interventional cosmetic surgeries. The questionnaire contained questions inquiring about the procedures they or any of their female relative had undergone. The participants were also asked whether they wanted to undergo cosmetic surgery or not, and which specific procedure they would like to have. Participants' attitude about cosmetic surgeries was assessed by a 1-4 scale, 1 being "strongly disagree", and 4 being "strongly agree". The rest of the questionnaire consisted of multiple-choice questions regarding various types of cosmetic surgeries and their procedure and subsequent side affect. These multiple-choice questions were aiming to estimate the total knowledge of university students concerning cosmetic surgeries. After collecting the questionnaires, the students were accompanied by the survey collectors to a scale where their weights and heights were accurately measured.

#### **Ethical Consideration:-**

An approval letter was addressed to the Dean of each college included in the research. Brief explanation of the study was conducted to each participated student and answering the questionnaire implied the consent. Confidentiality and anonymity was assured for all the information gathered. Participation in the research was voluntary.

#### **Statistical Design:-**

The statistical analysis was done using SPSS-Ver.20 statistical software package. All data collected was entered to SPSS. It was analyzed and categorized by medical students involved in research. We calculated the total knowledge score by adding the score of correct answers, yielding a maximum score of 30 and categorized into: 1= poor knowledge (<15), 2= average knowledge (15-23) and 3= good knowledge (> 23). Body Mass Index was calculated by the equation:  $\text{weight (kg)} / (\text{height (m)})^2$  and categorized into 1=underweight (<18.5), 2=normal (18.5-24.9), 3= overweight (25-29.9), 4=obese (30-39.9), and 5= morbidly obese ( $\geq 40$ ).

Data was represented by using descriptive statistics in the form of numbers and percentages for qualitative variables (Categorized BMI, Body Image, Past surgery Conductance, Attitude, Family Monthly Income, Age Groups and Future Surgery Conductance). Mean  $\pm$  standard deviation (SD) was applied for quantitative variables (Total Knowledge Score, Correct Answers and occurrence for each surgery). Frequency tables and cross tables were used. Also, statistical tests were used like: t-test and chi-square test. T-test was used for associating one qualitative variable and a quantitative variable, for example, the distribution of the mean total knowledge score (quantitative, dependent variable) by surgery conductance (Independent variable). Furthermore, the chi-square test was used for finding the relationship between two qualitative variables as between body image and BMI). Finally, the significance of all statistical tests was set at a P-value of 0.05 .

#### **Results:-**

Table 1 discusses the demographic characteristics of the data collected from the 530 students. Variable chosen where: level, age, marital status, family monthly income, and the educational level of the mother and the father. First, the percentage of students who were 25 year old was the lowest (1%), on the other hand, the percentage of students who were 20 year old was the highest (22.4%). Second, 86.6% of students were unmarried, while 13.4% were married showing that the majority of the students are not married. Third, 60.6% has a family monthly income greater than 15000 SR. This represents the highest percentage. This is followed by those who have a family monthly income ranges between 5000-15000 SR, representing 36.3%. In addition, the percentage of parents who had an educational level of "university and above" was 49.8%. This represents the highest proportion out of the 4 levels of education. Finally, the association between the educational level of the mother and the father with knowledge score showed no significance.

Table 2 shows the association between body image and body mass index. In general, the university students are aware of their current weight. 59% of the students had a body mass index within the normal range. Furthermore, 21.1% of the students were overweight, and this is considered to be slightly elevated. Only 0.8% of students were morbidly obese. Finally, 83.5% of the students who fall within the normal range of BMI considered themselves normal, and they were the most accurate.

Table 3 shows association between conductance of surgery-attitude and monthly income. First, concerning the attitude the following was found. 77.79% of the students accepted undergoing surgeries for medical reasons. Among them, 49% have already undergone surgery. In addition, 34.9% of those who believe that undergoing cosmetic surgeries is “Totally unaccepted” performed surgery. They might done hair removal by laser or skin peeling which they didn’t consider it a cosmetic intervention to change the appearance. Second, concerning the monthly income the following was found. About 65.5% of students who had undergone cosmetic surgeries had a monthly family income of 15000 SR or more, followed by 33.3% for whom who had a monthly family income falling between 5000-15000 SR. As a result, this strongly suggests the substantial role of general financial state on conductance of surgery.

Table 4 shows the distribution of the mean total knowledge score by conductance of surgery. The mean total knowledge score of those who had undergone surgery = 12.8, SD=3.172, this means that about 68% of total knowledge scores of those who had undergone surgery are between (9.6-15.97). On the other hand, the mean total knowledge score of those who had not undergone surgery = 11.22, SD=3.207, this means that about 68% of total knowledge scores of those who had not undergone surgery are between (8.01-14.43). Also, T-Test P-value 0.001 highly significant. As a result, past experience of cosmetic surgery plays a role in the knowledge about cosmetic interventions.

Table 5 shows the assessment of correct answers (Questions 34 – 63) by frequency and valid percentage. Question about “Indications of skin abrasion” was the most common correctly answered question by 70.9% of students. Next, the question concerning “Effective duration of Botox” was correctly answered by 65.8% of the students. Finally, the question with the third highest correct answer was about “Indications of plastic nose surgery” constituting 64.3% of the students. In contrast, question regarding “Function of Botox injections for facial wrinkles” was the least question answered correctly, only by 11.1% of student. (Low frequency of correct answer might be due requirement of pure medical knowledge in order to answer the question, since the answer was: the Botox exerts its effect chemically by inhibiting the postganglionic synapse innervating the muscles of facial expression). In addition, by categorizing the questions according to the cosmetic intervention they assess, and calculating the average of both the frequency and the valid percent, the following results were found to be: Questions assessing the knowledge about skin peeling, skin abrasion, and the hair removal by laser got the highest average valid percentage (62.1%, 46.7%, and 45.2%) respectively.

Table 6 shows the total Occurrence of each Cosmetic Intervention Among Females above 15 years old. 40.5% of the total females had undergone a cosmetic intervention. “Hair removal by laser” is the most common cosmetic intervention done among the total female population of the sample with the highest percentage of 22.8%. Moreover, the second common cosmetic intervention was “Skin abrasion”, conducted by 4.24% of students. Finally, the third common cosmetic intervention was “Skin care with laser”, conducted by 3.66% students.

Table 7 shows the association between age group and future surgery. The percentage of students who wish to undergo future cosmetic surgery increases with age, being 41.7% in students aged from 23-25 year old.

**Table 1:-**Demographic characteristics of data collected from 530 female students in the University of Dammam - College of Applied Studies and Community Services

Demographic characteristics		No. of females=530	Percentage
Year	1 <sup>st</sup> year	149	28.1%

**Conclusion:-**

This study was conducted to assess university female students awareness about cosmetic interventions, carries quite interesting findings regarding this concern. About 40% of participants reported undergoing a surgical cosmetic intervention, with hair removal by laser being the most common procedure conducted among collage girls. The study results show an increasing awareness about cosmetic interventions. Interestingly, previous conductance of cosmetic surgery substantially affects the level of knowledge about these procedures. There is a need for further studies deeply assessing the level of knowledge about cosmetic interventions and inquiring the reasons for seeking out these procedures.

**Recommendations:-**

It is highly recommended to conduct further studies and researches to collect more data and to ensure results. Furthermore, health care providers are recommended to increase public awareness about cosmetic plastic surgeries especially its complication. Finally, higher authorities should set strict laws and penalties to prevent malpractice.

**Acknowledgement:-**

We would like to thank University of Dammam, specifically Department of Family and Community Medicine for giving us the opportunity to do this study.

Finally, special thanks to University of Dammam, College of Medicine, Batch 211 for their collaboration in collecting the questionnaires.

##### Key words:-

site specific drug delivery, Anti-arthritis drug, bovine serum albumin microsphere.

#### Abstract

Non-steroidal anti-inflammatory drugs are the most commonly used and widely prescribed drugs all over the world. With the wide advantages, they are also associated with severe Gastro-Intestinal side effects. Developments of novel drug delivery systems have always been a challenge to formulation scientists because of their high instability and economic factor compared to the conventional dosage forms. Thus, the main objective of this review is to present an alternative way of developing NSAIDs as microspheres specifically using albumin polymers, which are playing an increasing role as drug carriers in the clinical setting. Hence, there is a prolonged release of the drug along with minimized side effects. A brief overview of the methods developed for the preparation of albumin microspheres and the most suitable techniques for optimum entrapment of drug have been emphasized. The in-vitro evaluations are also explained. In order to appreciate the medical application possibilities of albumin microspheres in novel drug delivery, some fundamental aspects are also briefly discussed.

#### Introduction:-

Rheumatoid arthritis (RA) is an autoimmune disease in which there is joint inflammation, synovial proliferation and destruction of articular cartilage. Immune complexes composed of IgM activate complement and release cytokines which are chemotactic for neutrophils. These inflammatory cells secrete lysosomal enzyme which damage cartilage and erode bone, while PGs produced in the process cause vasodilation and pain. It is a chronic disorder for which there is no known cure.

Aceclofenac is a non-steroidal anti-inflammatory drug (NSAID) used extensively in the treatment of rheumatoid arthritis, osteoarthritis and ankylosing spondylitis. Aceclofenac is a newer derivative of diclofenac having less gastrointestinal complication. The usual therapeutic dose and dosing frequency of conventional aceclofenac tablets is high (100 mg twice daily), because of the short biological half-life of the drug (3-4 h), it is an ideal candidate for modified release dosage forms. To reduce the frequency of administrations and to improve patient compliances, once daily sustained release dosage forms of aceclofenac is desirable. (Chandiran *et al.*, 2010)

NSAIDs are usually indicated for the treatment of acute or chronic conditions where pain and inflammation are present. Research continues into their potential for prevention of colorectal cancer, and treatment of other

**Corresponding Author:- Agarwal Anuj.**

Address:- Department of Pharmaceutical Sciences.National Institute of Medical Sciences University, Shobha nagar, Jaipur, Rajasthan, India.

conditions, such as cancer and cardiovascular disease. NSAIDs are generally indicated for the symptomatic relief of the following conditions:

- Rheumatoid arthritis
- Osteoarthritis
- Inflammatory arthropathies (e.g ankylosing spondylitis, psoriatic arthritis, Reiter's syndrome)
- Acute gout
- Dysmenorrhoea (menstrual pain)
- Metastatic bone pain
- Headache and migraine
- Postoperative pain
- Mild-to-moderate pain due to inflammation and tissue injury
- Pyrexia (fever)
- Ileus
- Renal colic
- They are also given to neonate infants whose ductus arteriosus is not closed within 24 hours of birth.

Aspirin, the only NSAID able to irreversibly inhibit COX-1, is also indicated for inhibition of platelet aggregation. This is useful in the management of arterial thrombosis and prevention of adverse cardiovascular events. Aspirin inhibits platelet aggregation by inhibiting the action of thromboxane -A. In 2001, NSAIDs accounted for 70,000,000 prescriptions and 30 billion over-the-counter doses sold annually in the United States. (Green *et al.*, 2001)

Gastric residence time (GRT) is an important parameter which may affect drug bioavailability of dosage forms. Many Drug Suffer from low bioavailability because of short gastric emptying time. Gastro retentive systems are the current approach to overcome the above problem of GRT. Among the number of approaches, mucoadhesive drug delivery system (FDDS) is one of the promising delivery system which adheres to the mucous layer of the stomach and thus remains in the stomach for long period of time.

In one such research study carried out by Chaturvedi *et al.*, efforts were directed to reduce the side effects of Aceclofenac and to extend the release time using synthetic polymers. Different microsphere formulations loaded by Aceclofenac were obtained and fully characterized for morphology, size, encapsulation efficiency and release rate of Aceclofenac. (Chaturvedi *et al.*, 2012).

### **Microspheres:-**

**Microspheres** are small spherical particles, with diameters in the micrometer range (typically 1  $\mu\text{m}$  to 1000  $\mu\text{m}$ ). Microspheres are sometimes referred to as microparticles. (Kataria *et al.*, 2010).

Microspheres are homogeneous, monolithic particles which improve the treatment by providing localization of the drug at the site of action and by prolonging the drug release. The objective of the present study was to formulate sustained release microspheres of aceclofenac using egg albumin as release retarding agent. (Rajamanickam *et al.*, 2010).

### **What is albumin and why albumin microspheres?**

Albumin is a major plasma protein constituent, accounting for ~55% of the total protein in human plasma. Since they were first described by Kramer, albumin microspheres have been extensively investigated in controlled release systems as vehicles for the delivery of therapeutic agents to local sites. The exploitable features of albumin include its reported biodegradation into natural products, its lack of toxicity, and its non-antigenicity.

Albumin microspheres are metabolized in the body, and the size of particles, degree of stabilization, and site of metabolism are the main factors influencing the extent of metabolism. Drug release from the microspheres can be widely modulated by the extent and nature of cross-linking, size, the position of the drug, and its incorporation level in the microspheres. Colloidal forms of albumin have been considered as potential carriers of drugs for their site-specific localization or their local application to anatomically discrete sites. Albumin has been used as a carrier for targeting drugs to tumors, and since the synovium of the rheumatoid arthritis patients shares various features observed in tumors, albumin-based delivery systems can be used to target drugs to the inflamed joint. Intravenous administration of the drugs coupled with albumin has been reported to improve the targeting efficiency of the drug to arthritic regions. (Hilpert *et al.*, 1989). The circulation half-lives of the drugs have been reported to dramatically

increase when the drug is conjugated with albumin. Increasing the circulation half-life of the formulation by reducing its uptake by the reticuloendothelial system has been shown to improve the targeting efficiency of the formulation to the arthritic paws of rats. There are several reports on the use of long circulating liposomes to target the drugs to the arthritic joints. However, there are only a few reports on the use of microspheres for targeting the drugs to the arthritic joints. (Thakkar *et al.*, 2005).

#### **Advantage and disadvantage of NSAID loaded albumin microsphere**

The following advantages make them a promising means for the delivery of NSAIDs.

- Albumin Microspheres provide constant and prolonged therapeutic effect.
- Reduces the dosing frequency and thereby improve the patient compliance.
- They could be injected into the body due to the spherical shape and smaller size.
- Better drug utilization will improve the bioavailability and reduce the incidence or intensity of adverse effects.
- Albumin microsphere morphology allows a controllable variability in degradation and drug release.
- Reduces GI toxic effects.
- Albumin has non-antigenic property and ability to control the physicochemical characteristics of the microspheres produced, depending on the cross-linking methods and characteristics of cross-linking agent. (Jeevana *et al.*, 2009).

#### **Some of the Disadvantages were found to be as follows:-**

- The modified release from the formulations.
- The release rate of the controlled release dosage form may vary from a variety of factors like food and the rate of transit through gut.
- Differences in the release rate from one dose to another.
- Controlled release formulations generally contain a higher drug load and thus any loss of integrity of the release characteristics of the dosage form may lead to potential toxicity.
- Dosage forms of this kind should not be crushed or chewed.
- Larger size of extended release products may cause difficulties in ingestion or transit through the gut.
- Possibility of distal intestinal toxicological manifestations because of sustained release and enteric coated NSAID formulations. (Kataria *et al.*, 2011).

#### **Methodology:-**

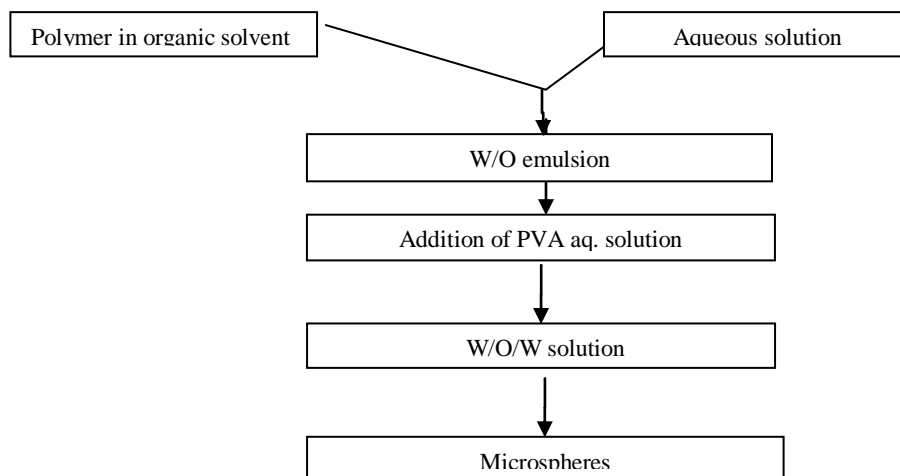

##### **Technologies used for prepare albumin microspheres:-**

The preparation of microsphere from natural polymers involves three steps:-

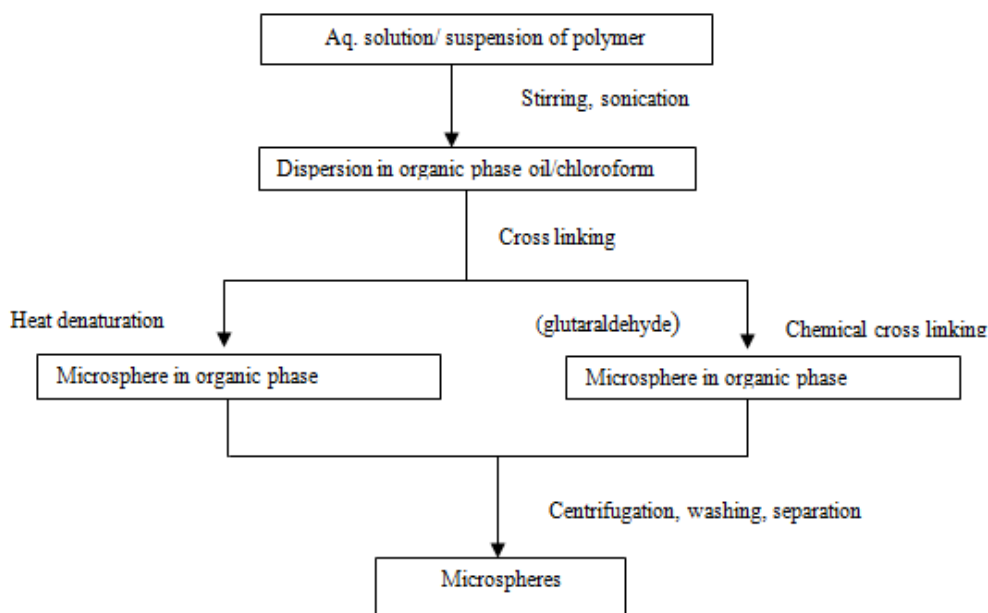

1. The solution of the polymer is dispersed in a continuous medium such as vegetable oil or an organic solvent using a suitable cross- linking agent.
2. It involves separation of the solid microsphere formed, by filtration, centrifugation or freeze-drying.
3. Purification (to remove the residual solvents, surfactant and other additives) and drying (air dried, vacuum dried, freeze dried). (Liggins *et al.*, 2004).

##### **Single emulsion technique:-**

The micro particulate carriers of natural polymers of natural polymers i.e. those of proteins and carbohydrates are prepared by single emulsion technique. The natural polymers are dissolved or dispersed in aqueous medium followed by dispersion in non-aqueous medium like oil. Next cross linking of the dispersed globule is carried out. The cross linking can be achieved either by means of heat or by using the chemical cross linkers. The chemical cross linking agents used are glutaraldehyde, formaldehyde, acid chloride etc. (Linda *et al.*, 2009). Heat denaturation is not suitable for thermolabile substances. Chemical cross linking suffers the disadvantage of excessive exposure of active ingredient to chemicals if added at the time of preparation and then subjected to centrifugation, washing, separation<sup>3</sup> The nature of the surfactants used to stabilize the emulsion phases can greatly influence the size, size distribution, surface morphology, loading, drug release, and bio performance of the final multiparticulate product. (Kataria *et al.*, 2010).

**Multiple emulsion / Double emulsion method :-****Figure 1:-** Multiple emulsion / Double emulsion method**Emulsion solvent evaporation:-****Figure 2:-** Emulsion solvent evaporation

**Emulsion cross-linking method:-****Figure 3:-** Emulsion cross-linking method**Spray drying and spray congealing technique:-**

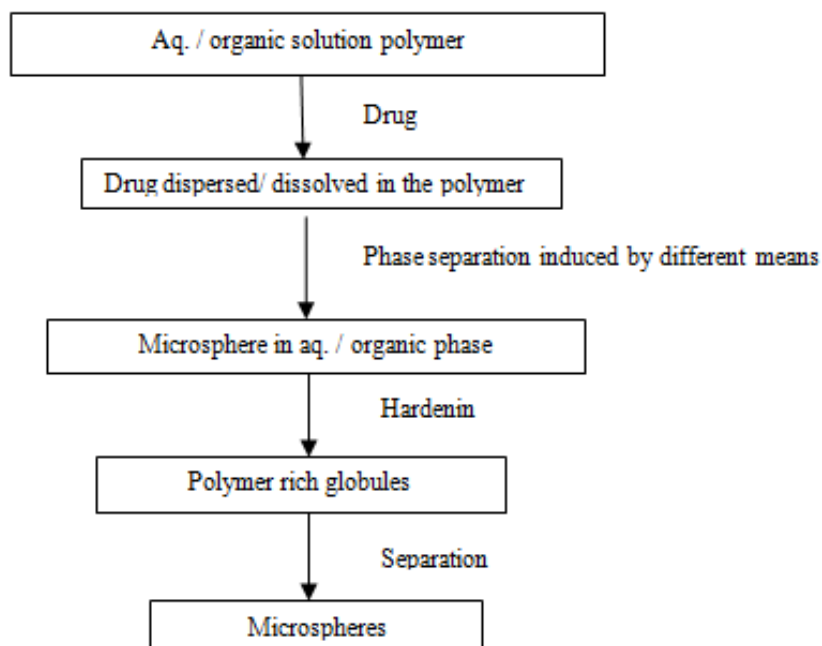

Spray drying and spray congealing method are based on the drying of the mist of the polymer and drug in the air. Depending upon the removal of the solvent or the cooling of the solution the two processes are named spray drying and the spray congealing respectively (Ying *et al.*, 2007). Spray drying technique involves dispersing the core material in a liquefied coating material and spraying the core-coating mixture in to the environment to effect solidification of coating. Solidification is accomplished by rapid evaporation of the solvent in which coating material is solubilized. The process control variables in this technique are feed material properties, feed rate, method of atomization and drying rate. Spray drying method is rapid, reproducible and easy to scale up. But due to the fast drying process the polymer may lose its crystallinity and leads to the formation of porous microparticles. (Mathew *et al.*, 2007).

**Coacervation method:-**

This method is simple and utilizes aqueous system for the preparation. This process consists of three steps under continuous stirring.

**The formation of three phases:-**

- Core material
  - Dispersing a core material in a solution of coating polymer
  - Immiscible polymer in liquid state (Coating material phase)
1. Coating is accomplished by controlled physical mixing of coating solution and core material in liquid manufacturing vehicle phase. (Muvaffak *et al.*, 2004)
  2. Rigidisation could be achieved by thermal, chemical cross-linking or desolvation techniques.

**Figure 4:-** Coacervation phase separation method. (Ghosh *et al.*, 2008).

#### **Emulsification-heat stabilization technique:-**

Emulsification-heat stabilization technique was carried out the preparation and characterization of albumin microspheres encapsulated with propranolol HCl by emulsion-heat stabilization technique. Bovine serum albumin microspheres (BSA) containing propranolol HCl were prepared by emulsification-heat stabilization technique. Briefly, a 5% solution of BSA containing 0.1% Tween80 was made, to which 4% propranolol HCl was added and used as the aqueous phase. The oil phase composed of 30 ml maize oil and 10 ml petroleum ether with 1% Span 80 as emulsifier were mixed together and allowed to stir for 10 min at 1000 rpm. The aqueous phase was added drop wise to the oil phase and stirred on a magnet stirrer at 1000 rpm for 30 min to form the initial emulsion. (Eroglu *et al.*, 2000). This emulsion was then added to 40 ml of maize oil preheated to 120° C and stirred at 1000 rpm for 15 min to allow the formation and solidification of microspheres. The microsphere suspension was centrifuged at 3500 rpm for 30 min and the settled microspheres were washed three times with ether to remove traces of oil on microsphere surfaces. (Rathod *et al.*, 2008). The microspheres were vacuum dried in a desiccator overnight and stored at 4°C in dark. The microspheres had mean diameters between 1-25 µm of which more than 50 percent were below 5 µm. The encapsulated drug was found to be about 9% w/w of that initially added to microspheres and the superficial drug was 25% of the total amount of the encapsulated drug. Also albumin microspheres were noted to possess good bio-adhesion in such a way that about 70% of microspheres remained adherent on the surface mucosa of rat jejunum. The total amount of drug released from microspheres after 12h was 70%. (Sayyed *et al.*, 2003).

#### **Sonication technique:-**

As the technique name itself is self-explanatory, it just involves a simple sonication for certain period of time till a desired size of albumin microspheres is obtained. The albumin solution of desired concentration is taken which is sonicated. To this add the drug which will then form intrachain cross-link with cysteine residues of albumin chains (Cheng *et al.*, 2004).

#### **Evaluation of microspheres:-**

Some of the evaluation characteristics considered for albumin microspheres are as follows:

#### **Drug Polymer Interaction Studies:-**

##### **IR spectroscopic studies:-**

The IR spectra of the free drug and the microspheres were recorded. The identical peaks corresponding to the functional groups and albumin (BSA, Egg albumin, Human serum albumin) features confirm that neither the polymer nor the method of preparation has affected the drug stability. (Deepa *et al.*, 2012).

**Particle size:-**

Average particle size of microspheres was measured by optical microscopy. (Prasad *et al.*, 2011).

**Percentage yield:-**

Prepared microspheres were weighed after drying, and percent yield was calculated by help of this formula. The yield was calculated as the weight of the microspheres recovered from each batch divided by total weight of drug and polymer used to prepare that batch multiplied by 100. (Patel *et al.*, 2013).

$$\% \text{ yield} = Y_p / Y_t \times 100$$

Where,  $Y_p$  = Practical yield,

$Y_t$  = Theoretical yield.

**Drug entrapment capacity:-**

The capture efficiency of the microspheres or the percent entrapment can be determined by allowing washed microspheres to lyse. The lysate is then subjected to the determination of active constituents as per monograph requirement. The percent encapsulation efficiency is calculated using following equation-

$$PDE = \text{Practical drug content} / \text{theoretical drug content} \times 100 \text{ (Nikam } et al., 2012)$$

**Morphology/Electron microscopy:-**

The morphological study of microspheres was done by scanning electron microscopy (SEM.). (Tuncay *et al.*, 2000).

**In vitro release studies:-**

In-vitro release studies can be performed according to USP XXII type I dissolution apparatus at suitable pH conditions. The temperature should be maintained at  $37 \pm 0.5^\circ\text{C}$  and the rotation speed of 100 rpm. Then 5 ml of sample should be withdrawn at various time intervals and replenished with an equal volume of fresh dissolution media. The drug content in the sample can be analyzed spectrophotometrically at specific wavelength (nm). (Jayaprakash, *et al.*, 2009).

**Conclusion:-**

It has been observed that microspheres are better choice of drug delivery system than many other types of drug delivery system because it is having the advantage of target specificity and better patient compliance. Its applications are enormous as they are not only used for delivering drugs but also for imaging tumours, detecting biomolecular interaction etc. So in future microspheres will have an important role to play in the advancement of medicinal field.

#### Abstract

**Introduction:** The definition of a deep inferior epigastric perforator (DIEP) flap is breast reconstruction for a female who had previous surgical procedure due to any certain illness. It's usually an autologous breast reconstruction flap to minimize the scar of the breast at the site of operation.

**Method:** We used these significant techniques to evaluate the flap, making sure sufficient blood flow is achieved and assessing the flap's binding capacity. It must be successfully done with radiological Multidetector Doppler ultra sound and CT Angiography (MDCTA). All of them used to evaluate and demarcate the flap tissue to diminish flap rejection. Our goal was to aesthetically normalize the anomaly, correct the patient's own self image and how she perceives it.

##### Conclusion:

The predictability and efficiency of DIEP flap in breast reconstruction is high. Multidetector Doppler ultra sound and CT Angiography (MDCTA) are a great asset especially in the rather expansive technology-driven, and they are perfectly attributed to integrated imaging technologies, as well as they have particular advantage which reduce operative time and stress.

#### Background:-

The deep inferior epigastric perforator (DIEP) flap has become the gold standard for autologous breast reconstruction owing to the reduced donor site morbidity and inconspicuous scar, abundance and reliability of transferred tissue as well as texture and contour emulation to the female breast.<sup>1,2</sup> The vascular anatomy of the DIEP and its perforators greatly varies not only among patients but also from one hemi-abdomen to the other in the same individual. Because of numerous congenital and acquired anatomical variations of the DIEP branching pattern, thorough knowledge of the perforators topography and perforator dominance is essential for accurate preoperative planning.<sup>3-8</sup>

The evolution of imaging technology has significantly contributed to the enhancement of predictability and reproducibility of DIEP breast reconstruction outcomes. Meticulous pre-operative imaging of the perforator flap and

mapping of the vessels facilitates precise flap design and harvest, reduces operative time and intraoperative complications while it improves outcomes and efficiency.<sup>4,9-11</sup>

The selected dominant perforator is usually medially located, bares a short intramuscular course and a diameter >1 mm, with an extended vascular distribution within the flap adipose tissue to match the flap and to allow preservation of muscle innervation.<sup>2,12</sup>

The pre-operative vascular mapping includes imaging modalities ranging from Color Doppler<sup>13</sup> to sophisticated stereotactic vascular representation systems.<sup>11,14</sup> The ideal imaging technique should have no risk to the patient, attain exceptional quality and highly informative images, and be fast and comfortable to the patient.<sup>11,12</sup> Pre-requirement for the reliability of each of the imaging techniques is a standardized protocol for accurate identification of DIEA perforators.<sup>13</sup>

This review presents current imaging methods integrated in DIEP mapping for breast reconstruction, emphasizing on ultrasonography and computed tomographic angiography.

### **Doppler ultrasonography:-**

Doppler flowmetry for planning the DIEP flap was first described by Blondeel et al in 1998 and can access the flow velocity, patency, location, and caliber of the perforator arteries and venus tributaries.<sup>15</sup>

Color Doppler Ultrasonography (CDU) exhibits 96% sensitivity nearly 100% positive predictive value.<sup>16,17</sup> It can identify perforators > 0.5mm in diameter and can be used in pre-operative planning, intraoperative decision-making, and post-operative follow-up.<sup>16-18</sup>

CDU is performed the day before or the morning before the operation with the patient in supine position, as in surgery, and allows for direct visualization of the perforator as it emerges from the deep fascia of the rectus abdominis.

Following the course of the DIEA from its origin to the umbilicus, CDU scans the entire flap at a radius of approximately 10 cm above and laterally to the umbilicus. The penetration point of the superficial fascia of the rectus abdominis to the flap skin is exactly located and marked accurately on the skin.

CDU is a low-cost, non-ionizing, bedside examination. Although a reliable method in estimating the vessel caliber, specificity and sensitivity of CDU may vary. Expertise is required while there is interobserver variability.<sup>11,12</sup> Subcutaneous vessels that are not perforators may be visualized resulting in false positives, while in overweight patients sensitivity further decreases. Moreover, the duration of the examination is 45-60 minutes, rendering the technique uncomfortable for the patient, who has to remain in the same position during the procedure.<sup>11,12</sup>

It is noteworthy that CDU does not provide information on the anatomic relationship between the deep inferior epigastric system and other structures, such as the superior inferior epigastric (SIE) system. In addition, as CDU is a real-time technique, further post examination analysis of data is not possible.<sup>11</sup>

### **CT angiography (CTA):-**

The introduction of CTA in preoperative vascular mapping has significantly improved DIEP flap dissection and survival, as it provides highly accurate information concerning the arterial as well as the venous anatomy of the DIEP flap and can display DIEA's course, branching patterns, number, size, intramuscular trajectory and location of perforators.<sup>19-23</sup> CTA has a sensitivity of 96%, a positive predictive value of 95% and may identify perforators as small as 0.3 mm. Moreover, CTA may reveal the structure and competence of the abdominal wall fascial layers.<sup>11,12,23</sup>

The rate and timing of the injection and the patient's cardiac output and body habitus determine the degree of enhancement. Careful optimization of single phase CTA prevents low opacification due to early scan as well as venous contamination due to late arterial phase. In multiphase CTA examination on the other hand, each phase should be independently validated and the radiation dose is multiple compared to single phase CTA.<sup>24</sup>

Kim et al.<sup>25</sup> reported the use of CTA to evaluate flap and recipient vessels, scanning the area from the clavicle to the pubic symphysis. They assessed the intercostal space, the internal mammary artery and vein, and the internal

mammary artery perforator to determine which intercostal space was most appropriate. The authors also used CTA for volumetric estimation of the contralateral breast and the abdominal flap.

The use of multidetector CT increases accuracy and may provide further data on the number of perforators, their distribution and axially to the flap subcutaneous tissue.<sup>12,16,17</sup> This information is highly beneficial in patients with lower abdominal scars, as it facilitates selection of the best perfused region of abdominal tissue supplied by the dominant perforator.<sup>12,26,27</sup>

CTA is a three-dimensional, non-invasive, operator- independent method, highly reproducible, requiring a short scanning time of 5 minutes<sup>11,12</sup>. Apart from the high spatial resolution,<sup>28-30</sup> there is availability of free software for post processing 3D digital reconstruction for detailed mapping of the vascular anatomy.<sup>11,31</sup> Also 4D reconstruction adds temporal resolution enabling dynamic analysis of perforator anatomy and may be used to delineate the perforasomes in lower abdomen.<sup>6,11,17,32</sup>

Among drawbacks, is the high cost of the investigation, which may be counterbalanced by the reduction in operative time and intraoperative complications, resulting from thorough and accurate preoperative mapping.<sup>11,12,32</sup> Another limitation is the exposure of the patient to ionizing radiation and the use of intravenous contrast medium, that is nephrotoxic and allergenic.

Compared to CDU, both methods provide reliable information about the size, localization, and course of DIE perforators. CTA is a more accurate method in detecting the course and location of perforators compared to CDU<sup>11,16</sup> but CDU is superior to a standalone CTA examination for measuring perforator diameters.<sup>33-35</sup> and for hemodynamic evaluation of both arterial and venous conduits of the perforator-complex.<sup>36</sup>

In order to increase the accuracy of preoperative mapping, CDU may be used in addition to CTA.

In this CTA showing the inferior epigastric artery which showing the perforator to determine for seorgone the mark line for the patient before the operation 14.

For this patient pre-operative once we compare for the left pic. Showing the scar and deformity of the breast. All this depend on the reconstruction of the breast and the prognosis.

#### **Perforator artery or perforator complex?**

Despite the fact that the majority of DIEP flaps are compromised due to venous congestion and rarely arterial insufficiency,<sup>37</sup> all techniques were until recently spotlighting on the dominant arterial-perforator, downsizing the importance of the accompanying venous – tributaries.<sup>36,38</sup>

It is well-perceived that, although any medially located arterial perforator >1 mm in diameter can perfuse any flap, not every associated vein can drain every flap.<sup>36</sup> Lately the concept of the perforator complex, which includes the triad of an arterial perforator, venous tributaries and nerve in any combination, has been brought in, suggesting that selection of the dominant perforator-complex based on dominant veins ensures optimal flap microcirculation, while diminishing intraoperative incidents and postoperative healing complications.

Figus et al.<sup>38</sup> demonstrated that if a dominant vein is identified first, the probability of detecting a suitable perforator- complex increases to 93.5%, while significantly decreases to 69.8% when a dominant artery is identified first.<sup>38</sup>

Our team introduced the perforator- complex imaging protocol termed as “CTA-guided CDU examination”,<sup>36</sup> which combines the use of CTA and CDU in the decision-making process of choosing the best suitable perforator-complex. The CTA results are used as a guide to conduct a CDU examination to investigate the size and patency of the accompanying venous tributaries. Selection of the suitable perforator complex based on the size and patency of the dominant vein resulted in better flap revascularization ( $p < 0.05$ ) and decreased postoperative complications ( $p < 0.05$ ) compared to dominant artery based selected complexes. Our preliminary results indicated that this protocol may identify more optimal perforator-complexes based on venous mapping and thus, further improve the pre-operative microsurgical planning.<sup>36</sup>

This figure. A. showing the vascular arteries and vein is determined, B. tissue is transfer from right side and anastomosed to the left breast. C. healing is done after the reconstruction and the both breast are similar.<sup>24</sup>

### Magnetic Resonance Angiography:-

There is little evidence associating preoperative Magnetic resonance angiography (MRA) with improved clinical outcomes.<sup>39-42</sup> Contrast enhanced MRA delineates accurately the intramuscular trajectory of the perforators and can identify vessels >0.8mm in diameter.<sup>11,40-42</sup>

Rozen et al. suggested that despite high sensitivity (100%) MRA was inferior to preoperative CTA due to low specificity (50%),<sup>43</sup> while Chernyak et al. reported a 97% concordance of MRA imaging with intraoperative findings in DIEP flap breast reconstruction.<sup>44</sup>

Despite its higher cost, MRA has certain advantages over CTA, namely elimination of exposure to ionizing radiation and safer required contrast medium. Nevertheless, gadolinium may also be nephrotoxic for patients with renal insufficiency.<sup>11,12,40-44</sup>

Masia et al. demonstrated that non-contrast magnetic resonance imaging was associated with high specificity and provided reliable information on the perforator branching within the subcutaneous abdominal tissue and the vascular connections between the superficial and the deep inferior epigastric vessels.<sup>45</sup>

Nevertheless, a serious limitation of MRA is possible patient discomfort, as it requires breath-hold for 10-20 seconds to avoid motion artifacts. Distress levels may increase in claustrophobic patients, while the technique is contraindicated in severely obese and patients with metallic implants.<sup>11,39,45</sup>

### Other methods:-

The use of dynamic infrared thermography (DIRT) for perforator mapping in DIEP flaps was first described in 1993.<sup>46</sup> DIRT has been used in the preoperative planning, intraoperative and postoperative monitoring of flap perfusion. Thermal images are captured with an infrared camera before, during and after exposure to a cold challenge provided by a fan blowing air for 2 min over the abdomen. After a recovery period of 3 min, the first appearing hot spots correlate with reliable perforator location.<sup>17,47</sup> Although a simple, low cost and patient safe method it can obviously provide only 2D perforator mapping, while there is no evidence supporting its accuracy.

Laser-assisted indocyanine green fluorescence angiography (LA-ICGFA)<sup>48</sup> involves peripheral injection of indocyanine green and capture of the cutaneous vascularity with the use of infrared energy. Images are recorded and software analysis data on flap perfusion and patency of anastomosis are collected. Apparently, the method, of anyway limited use, may be useful for intraoperative assessment and less for preoperative and postoperative monitoring.<sup>17</sup>

### Conclusions:-

Recent improvements in the predictability and efficiency of DIEP flap in breast reconstruction are to a great extent technology-driven and attributed to integrated imaging technologies. Advances in accurate preoperative perforator imaging have resulted in significantly reduced operative time and stress, increased flap survival and consequently patient satisfaction.

The choice of imaging technique depends on patient history, equipment availability and radiologic expertise. Standardization of protocols may further increase precision in vascular anatomy imaging and patient comfort and safety.

Heterosis, *Zea mays*, variability, morphological traits and yield

### Abstract

Study was conducted to assess the magnitude of heterosis and combining ability in the line  $\times$  tester cross material involved 100 hybrids generated by crossing 25 lines with four testers and 3 commercial hybrid check (900 M, DMH-2 and Prabha) in maize at Agricultural Research Station, Arabhavi. The analysis of variance indicated significant amount of variability among the genotypes for yield and yield contributing traits. Among the hybrids, ARYP-24  $\times$  CM-111 and ARYP-15  $\times$  CM-111 were found to be the best cross combinations for grain yield and its components.

### Introduction:-

Maize (*Zeamays* L.;  $2n = 20$ ) is an important cereal crop with high yield potential. The total production at world level has surpassed both sorghum and pearl millet gaining a third place after wheat and rice. The demand for maize grain is increasing every year due to its diversified use in poultry, piggery and industry. During the year 2005-06, the total area in the country under maize cultivation was 7.58 mha. and the total production was 14.70 mt. as compared to 14.17 mt. during 2004-05. The increased production from Andhra Pradesh, Gujarat, Karnataka, Maharashtra, Orissa and Tamil Nadu was due to the availability and adaptation of recently released hybrids (Anon., 2005).

Maize is mainly grown in the warmer parts of temperate regions and in humid-subtropical climate. The highest production is in areas with the warmest month isotherms from  $21^0$  to  $27^0$ C and a frost-free season of 120 to 180 days duration. Today, maize has become an all season crop in India.

Maize has more than 1000 industrial uses and mainly used for production of starch due to its high starch content (66.2 to 77%). Maize seed oil contains highest polyunsaturated fatty acid (PUFA), linoleic acid (61.9%) and it remains as liquid at fairly low temperatures which is helpful in combating heart diseases. Maize seed oil is also low in linolenic acid (0.7%) and contains a high level of natural flavour. Maize is used primarily as food for humans in Africa and Asian sub-continent. A number of genotypes viz., single cross, three way cross, double top cross, double cross hybrids, composites, synthetic population are being cultivated by farmers.

Beal (1880) was the first to conduct experiment on various hybridizations in maize. The inbreeding experiments were first reported by Darwin (1877) which continued for only one generation with limited impact on the future of maize breeding. East (1908) and Shull (1908, 1909) were first to report the results of their experiments on

inbreeding and restoration of vigour upon crossing. Shull (1909) published "A pure line method of corn breeding", which outlined the three essential steps a) large scale inbreeding to obtain many homozygous or near homozygous lines, (b) testing the selected pure lines in all possible crosses and (c) utilizing the best cross for practical corn production. In early days when relatively few lines were available, it was common to evaluate inbreds in all possible cross combinations.

The efficiency and success of hybrid maize breeding depends on the contribution of heterotic effects from the superior inbred lines. The superior cross combination may be exploited as commercial single cross. Usually, the hybrid development programme in maize involves development of inbred lines, evaluation of inbred lines, crossing of selected inbreds and production of hybrids. In this context, a programme on development of inbred lines was initiated by using inbreeding system utilizing yellow pool as the base population. Yellow pool is a blend of 50 elite lines received from Directorate of Maize Research (DMR), New Delhi and inter mated for four cycles at Agricultural Research Station, Arabhavi. The  $S_2$  lines derived from this population were evaluated by line  $\times$  tester analysis involving four diverse testers to know their performance, combining ability and nature of inheritance of different quantitative traits. The line  $\times$  tester ( $L \times T$ ) design is basically an extension of top cross analysis involving more than one tester (Kempthorne, 1957). Thus, keeping these views in background, the proposed work was undertaken to develop hybrids suitable for *kharif* season in Karnataka.

**\*Part of the Ph.D thesis submitted to the University of Agricultural Sciences, Dharwad**

### **Material and Methods:-**

Fifty elite breeding lines (Table 1) were received from Directorate of Maize Research (DMR), IARI, New Delhi for development of full season heterotic yellow pool. These lines were raised and allowed to open pollinate for four generations (intermating) without exercising any selection. In each generation, the plants were raised in half-sib family method and at the end of fourth generation, the seeds were collected and grown as base population at College of Agriculture, Dharwad in isolation and allowed to open pollinate. Sufficient care was taken to maintain more than 10 thousand plant population. Out of this population, 150 plants were tagged in each grid by dividing entire population into 10 grids of 150 sq. mt. at the time of tassel emergence, based on vigour, standing ability, silk and tassel traits and free from disease incidence, 800 cobs were selected based on grain yield (*per se*) performance and this material formed basis for further inbreeding and isolation of inbred lines.

The experiments were laid out at Agricultural Research Station, Arabhavi and the experimental details are mentioned below under.

After thorough land preparation, hand dibbling was done with two seeds per hill and thinned out to maintain single plant per hill during second week after sowing (10-15 days after sowing). The crop was applied with recommended dose of fertilizers as per the package of practices.

### **Observations on quantitative traits:-**

In these investigations, data were collected in respect of quantitative traits. Observations on quantitatively inherited traits were recorded on five competitive randomly selected plants. The average was taken as the mean of the treatment. The way in which observations were recorded is described below.

#### **Plant height at 60 days after sowing (cm):-**

Plant height was expressed in centimetres by measuring the plant stalk from the ground level to the base of the last leaf sheath of the plant.

#### **Ear height at 60 days after sowing (cm):-**

This observation was recorded at the same time as plant height (at harvest), measured as the height of the plant from the ground level to the uppermost ear bearing node and expressed in centimetre.

#### **Leaf area at 60 days after sowing (cm<sup>2</sup>):-**

The average of five leaves from five different plants at 60 days after sowing was calculated by using formula  $L \times B \times 0.75$  and expressed in square centimetre (Montgomery, 1911).

**Ear weight (g):-**

Five ears were sun dried and weight in grams was recorded at stable moisture content.

**Ear length (cm):-**

Length of the ear was measured and recorded in centimetres at the time of harvest as its total length (from the base to the tip of the ear).

**Ear circumference (cm):-**

Ear circumference at one-third length from the base of the ear was measured and recorded in centimetre.

**Number of kernel rows per cob:-**

Number of kernel rows in each ear was counted for five cobs and mean was worked out.

**Number of kernels per row:-**

The number of kernels in any one of the row in each ear was counted and mean was worked out.

**Number of kernels per ear:-**

Total number of kernels in each ear of the selected plants was recorded.

**Hundred grain weight (g):-**

One hundred randomly selected grains per cob were weighed and weight was recorded in grams.

**Shelling percentage:-**

The ratio of grain weight to the ear weight was expressed in percentage.

$$\text{Shelling percentage} = \frac{\text{Grain weight}}{\text{Cob weight}} \times 100$$

**Pith / shank / heart weight (g):-**

The total pith / shank / heart weight from each ear was recorded and the average heart weight was expressed as heart weight per plant in grams.

**Kernel yield per plant (g) :-**

At the time of harvesting, fresh ear weight was recorded in grams per plant. Moisture determinations were made from shelled samples from five random ears of each plot with the help of electronic moisture meter. The fresh ear weight data was used to work out the dry weight at 15 per cent moisture grain yield in grams per plant.

**Kernel yield per plot (kg/plot):-**

At the time of harvest, fresh ear weight was recorded in kilograms for each plot. This fresh ear weight was adjusted to zero per cent grain moisture and recorded as grain yield per plot. Moisture percentage was determined on universal moisture tested in a grain sample obtained from two rows of each of five ears selected at random at the time of harvest were used for genetical analysis following Combstock (1948) and Robinson (1968).

$$\text{Yield per plot (kg/plot)} = \frac{\text{Fresh ear weight} \times (100 - \text{AVM})}{\text{Final stand}} \times K$$

Where,

$$K = \frac{\text{Average stand/plot of the trial} \times \text{plot area} \times 0.9412}{100 \times \text{plot area}}$$

AVM = Average moisture

#### Kernel / grain yield per hectare (q/ha):-

Fresh dehusked ear weight per plot was recorded at the time of harvest. Moisture content of 100 grams of fresh kernels was recorded by moisture meter of each entry and the moisture percentage was calculated by using moisture conversion charts. Kernel yield per hectare was calculated using the formula given below:

$$\text{Yield (q/ha)} = \frac{\text{Fresh ear weight} \times 100 - \text{AVM}}{\text{Final stand harvest}} \times K$$

Where,

$$K = \frac{\text{Final stand harvest}}{\frac{\text{Average stand of the trial} \times \text{Area (ha)} \times 0.9412}{100 \times \text{plot area}}}$$

AVM – Average moisture

#### Statistical analysis:-

##### Analysis of variance:-

The data were subjected to statistical analysis for randomised block design (RBD) as described by Panse and Sukhatme (1962). The mean values of the entries in each replication were used for analysis of variance (ANOVA). The significant difference among genotypes was tested by 'F' test at one per cent and five per cent levels of probability.

#### Results:-

##### Performance of yellow pool base population:-

##### Mean and range values for ten quantitative traits among selected:- progenies in yellow pool base population:-

The yellow pool base population comprising of 10,000 plants was raised during *kharif* season. A total of 1500 plants were initially tagged based on plant morphological traits and finally 800 cobs were selected based on plant morphology and cob characters. The cobs harvested from such selected plants were assessed for following ten quantitative traits whose results are presented below.

##### Cob weight (g):-

The cob weight among 800 progenies ranged from 91.90 to 375.00 g. and the mean cob weight was 160.35g (Table 2). However, the median value (155.31g) was comparatively lower than mean value, while the mode value (170.00g) was relatively higher than the mean cob weight. The skewness of the results indicated the negative distribution in the base population. The kurtosis (1.57) and skewness (0.89) values supported the deviation from normal distribution. The cob weight trait recorded higher co-efficient of variance (23.49%) with coefficient range value of 0.61.

##### Cob length (cm):-

The cob length ranged from 9.00 to 23.00 cm (Table 2). The median (15.00 cm) and mode (15.00cm) values were comparable with the mean value (15.08 cm). The mode value (15.00cm) was equal to the mean value indicating a positively skewed distribution in the base population and a marginal deviation from the normal distribution. The cob length recorded higher coefficient of variance (13.89%) with a coefficient range of 0.44. As many as 312 progenies (39%) recorded cob length ranging from 15.08 to 17.17 cm (Table 2).

**Cob girth (cm) :-**

The cob girth in population ranged from 10.00 to 18.00 cm with a mean of 13.08cm (Table 2). The magnitude of median (13.00) and mode (13.00) were comparable with mean value. This indicated the positive skewness and narrow deviation from the normal distribution. The cob girth recorded relatively lower coefficient of variation (9.25) with a coefficient range of 0.29.

**Number of kernel rows per cob:-**

The number of kernel rows per cob ranged between 8.00 to 20.00 rows per cob (Table 2). The magnitude of median (14.00) and mode (14.00) were comparable with the mean number of kernel rows per cob (13.79). The magnitude of kurtosis indicated negative distribution (-0.19) while the skewness indicated positive distribution (+0.19). The data indicated negatively skewed distribution with narrow deviation from the normal distribution. The coefficient of variance with respect to number of kernel rows per cob was 14.69 with a coefficient range value of 0.43.

**Number of kernels per row:-**

The number of kernels per row ranged from 18.00 to 48.00 with a mean value of 30.90 (Table 2). The magnitude of median (31.00) was comparable with the mean value, while the mode value (28.00) was relatively lower than mean value. The skewness recorded positive distribution (0.30), while the kurtosis (-0.40) recorded negative distribution indicating the deviation from normal distribution. The coefficient of variation was 18.38 per cent with a co-efficient range of 0.45.

**Number of kernels per cob:-**

The number of grains per cob ranged from 200.00 to 774.00 with a mean of 428.09 (Table 2). The magnitude of median (420.00) and mode (336.00) were relatively lower than mean value. This indicated negatively skewed distribution from the normal distribution. The kurtosis was negative (-0.02) while skewness (0.58) had positive. The number of grains per cob recorded higher coefficient of variation value (25.64%) with a coefficient of range of 0.60.

**Hundred seed weight (g):-**

The range of 100-seed weight was between 16.53 to 46.53 g with a mean value of 29.55g (Table 2). The median value (29.21) and mode value (29.28) were relatively lower than the mean (29.55 g). This indicated negatively skewed distribution and deviation from the normal distribution in the base population. However, the kurtosis (0.42) and skewness (0.42) indicated relatively lesser deviation. The 100-seed weight recorded coefficient of variation of 16.88 per cent with a coefficient range of 0.48.

**Shelling percentage (%):-**

The shelling per cent in the base population ranged between 74.71 to 95.60 per cent (Table 2). The mean shelling percentage was 86.05. The magnitude of median (86.24) and mode (86.65) were comparable with the mean value (86.05) indicating negatively skewed distribution. The kurtosis value of 0.76 and skewness of -0.43 were recorded for the shelling percentage. The shelling percentage recorded minimum coefficient of variation (3.14) with a coefficient of range of 0.12.

**Grain yield per plant (g):-**

The grain yield per plant ranged between 72.73 to 318.18g, with a mean value of 138.15 g (Table 2). The median (133.93) was lesser than the mean value (138.15), while the mode value (151.91) was relatively higher than mean value. This indicated both negative and positive skewed distribution in the base population. The kurtosis (1.45) and skewness (0.90) were appreciably deviated from the normal distribution. The grain yield per plant recorded coefficient of variation of 24.27 per cent with a coefficient of range of 0.63.

**Distribution of progenies for various qualitative traits in base population:-**

The distribution for qualitative traits of the progenies in yellow pool base population were studied for grain colour, grain size, grain texture pith colour and tip filling and the same is presented here under.

**Grain colour:-**

Out of 800 progenies in the base population, 369 progenies were with yellow colour followed by 309 with orange yellow and 122 progenies had yellow orange grain colour (Table 3). The frequency of yellow population was relatively high (46.13%) followed by orange yellow (38.63%). The frequency of yellow orange progenies was minimum with per cent value of 15.25.

**Grain size:-**

Among the 800 progenies, 546 had medium grain size accounting for 68.25 per cent of the population followed by 219 progenies with bolder grain size (27.37%) (Table 3). Thirty four progenies recorded smaller grain size, while only one progeny recorded very bold grain size. Highest number of progenies (95.6%) recorded grain size which ranged between bold to medium grain size.

**Grain texture:-**

Out of the 800 progenies, 713 possessed flint grain texture accounting to 89.13 per cent of the population (Table 3). The other progenies exhibited grain texture such as dent (8 progenies), semident (26 progenies) and semi-flint (53 progenies) accounting to 10.87 per cent of the base population.

**Tip filling:-**

Moderate tip filling was recorded by 437 progenies accounting to 54.63 per cent, while 326 lines exhibited no tip filling accounting to 40.75 per cent of the base population (Table 3). Only 37 progenies recorded complete tip filling accounting for 4.63 per cent of the base population.

**Discussions:-****Characterization of yellow pool base population based on Quantitative traits:-**

The proportion of superior inbred lines is determined by the proportion of the superior genotypes in the base population and the effectiveness of selection during the inbreeding. Hence, selection of proper germplasm source is an essential part of breeding programme. The breeding methods, efficiency of selection and final success are highly dependent on the base population chosen. Tannar and Smith (1987) studied various maize population derived from synthetics using two methods of recurrent selection and population derived from open pollinated variety based on the changes in grain yield, grain moisture and lodging. The study indicated the importance of effective population size and selection during  $S_1$  or  $S_2$  was more effective in eliminating unfavourable allele in the population.

In an another attempt, made to establishing inbreeding tolerant base population, Choudhary and Choudhari (2001) using DH-8644 and Jogia local as a base population indicated the possibilities of establishing inbreeding tolerant base population by selecting crosses which showed non-significant inbreeding depression with better yield performance.

Out of ten quantitative characters recorded in 800 selected progenies on cob characters, the progenies exhibited very high coefficient of variation for cob weight, pith weight, number of kernels per cob and grain yield per plant coupled with relatively high estimates of coefficient of range values indicating the presence of high variability in the base population. Further the median and mode values indicated positive skewed distribution for pith weight with high mode value suggesting the greater scope for selection of progenies for lower pith weight there by shelling percentage can be improved. It is interesting to note that out of the traits which recorded high estimates of coefficient of variability, cob weight and the grain yield per plant revealed platykurtic distribution with a high mode value than their respective mean values indicating the presence of relatively high proportion of superior progenies with higher mean values for both the characters in base population. Carlone and Russell (1989) selected 247 progenies from BSSS population and advanced to  $S_2$  generation. Similarly, Venkatesh *et al.* (2001) selected 500 progenies from CMIP2-7 population and selfed it for two generation to obtain  $S_2$  generation. The results on the *per se* performance of line, crosses vis-à-vis revealed that high yielding sister line crosses (SLCs) recorded high values for various yield related traits.

Cob girth and shelling percentage exhibited lower coefficient of variability with a 0.29 and 0.12 coefficients of range values, respectively with a platykurtic distribution in both the cases. However, shelling percentage had the greater mode value than the mean indicating the presence of superior progenies with a high shelling percentage in the base population comparatively with cob girth. It is interesting to note that cob length, number of kernels per cob, number of kernels per row and 100-seed weight had more or less a similar coefficient of range value varying from 0.43 to 0.48 revealing the presence of moderate variability for these traits in the selected progenies in base population. Wide range of cluster mean, for various traits were observed by Saxena and Sandhu (1989) in a divergence study involving 140 genotypes belonging to diverse geographic region.

Selected 800 progenies were grouped into different classes based on their superiority over the mean (Table 4). When superior progenies were scored based on greater values than mean + two standard deviation ( $>M + 2 SD$ ) for ten

quantitative traits, two traits namely number of kernels per cob and number of kernel rows per cob had high frequency of progenies *i.e.*, 6.25 per cent for number of kernels per cob and 5.50 per cent for number of kernel rows per cob followed by 100-seed weight and grain yield per plot. However, there were no superior progenies for shelling percentage under this class. Similar results were quoted by earlier workers. Marker and Joshi (2005) reported genetic gain for two traits *vis-à-vis* 100-grain weight and ear diameter through full sib family selection.

In a similar frequency classification made considering the class value of  $M + SD$  to  $M + 2 SD$ , high frequency of superior progenies were scored for number of kernels per cob (33.50%) and number of kernel rows per cob (20.88%). These two traits also had similar trend in the higher class value. However, as many as 49.00 per cent progenies had shelling percentage between  $M$  to  $M + 2 SD$  followed by cob length with 39.00 per cent of the progenies. Out of ten traits under study, the base population had maximum number of superior progenies in higher class values for number of kernel rows per cob and number of kernels per cob which are important components of a grain yield, revealing the importance of the Yellow pool population for isolation of productive inbred lines at later generations.

These were also scored for grain colour, grain size, grain texture, pith colour and tip filling characters. As many as 713 (89%) progenies were flint type, 546 (68.25%) with medium grain size and 437 (54.60%) with a medium tip filling traits. However, there were only 37 (4.60%) plants with a complete tip filling and 122 progenies with a yellow orange grain colour. Majority of the progenies (87.40%) had the white pith colour.

The grouping made on the basis of qualitative cob character clearly revealed the presence of desirable alleles for grain texture, grain size and tip filling in the Yellow pool population.

##### Key words:-

IDE, attractivité du territoire, effets économiques, croissance économique, Maroc.

#### Abstract

L'objet de ce travail est d'évaluer les effets économiques de l'IDE sur la croissance économique, cas du Maroc, en relation avec le concept de l'attractivité du territoire. L'importance de l'IDE trouve sa justification dans sa capacité de générer des externalités positives « effets de Spillover », exercées sur l'ensemble des variables économiques (le capital humain, l'investissement domestique, les exportations, les différents secteurs d'activité et le tissu industriel) et par conséquent, sur la croissance économique du pays. Ainsi, la question fondamentale est de vérifier si le territoire marocain est suffisamment attractif pour générer ces effets économiques positifs théoriquement attendus et politiquement prétendus.

Cette étude examine la relation entre les investissements directs étrangers (IDE) et la croissance économique pour le cas du Maroc tout au long de la période de 1970 à 2011. Les résultats économétriques obtenus par un modèle à équations simultanées ont suggéré un effet d'entraînement avec l'investissement domestique, un effet de complémentarité en présence de la variable des exportations et un effet négatif du capital humain.

#### Introduction:-

Depuis les années 80, de nombreux pays en voie de développement ont opté pour le choix libéral et ont adopté des politiques d'attractivité, choix et politiques théoriquement justifiés par un certain nombre de vertus et effets positifs attendus de l'IDE par le biais de certains facteurs :

- un facteur capital où l'IDE est conçu comme source de financement non génératrice de service de dette.
- un facteur travail où l'IDE contribue à la création d'emploi, à la qualification de la main d'œuvre par le transfert de technologies, de connaissances, de compétences managériales et organisationnelles aussi bien que de nouveaux procédés et méthodes de production et de fabrication.
- des exportations où l'IDE contribue à l'augmentation du volume des exportations du pays d'accueil.
- un tissu industriel où l'IDE améliore la compétitivité entre firme multinationale et entreprise nationale.
- un environnement économique où l'IDE incite aux réformes d'assainissement et d'amélioration des performances globales de l'environnement macro-économique, ce qui est de nature à influencer toutes les autres variables.

Address:- Faculté des Sciences Juridiques, Économiques et Sociales, Université Cadi Ayyad Marrakech, Maroc.

Par ailleurs, à côté des effets positifs, il existe des effets négatifs sinon neutres à prendre en compte : un *effet d'éviction* à côté d'un *effet d'entraînement* pour l'investissement domestique et le tissu industriel, un *effet de substituabilité* à côté de celui de *complémentarité* pour les exportations et d'*effet de seuil* pour le capital humain.

Or, l'enseignement majeur que l'on peut tirer à la fois de la revue de la littérature des travaux théoriques et empiriques, c'est qu'il existe une " certaine interaction ", des " *effets mutuels* ", des " *relations causales bilatérales* " entre l'IDE et la croissance " : les flux d'IDE et l'implantation d'une firme dans " un territoire " mesurée entre autres par le niveau de la croissance économique alors que celle-ci est déterminée en retour par l'IDE. La relation d'interaction bilatérale ou le lien circulaire devient de plus en plus complexe si on introduit le " concept " de l'attractivité du territoire<sup>1</sup>. Il s'agit donc d'étudier l'interaction entre deux systèmes, le *système productif* et le *système attractif*, par le biais des *effets économiques*. De même, ce qui ressort de la revue de la littérature en matière de déterminants de croissance et déterminants de l'IDE, c'est que les premiers sont en grande partie les déterminants de l'IDE et que les seconds sont aussi les déterminants de la croissance. En termes de politiques économiques, ces mêmes déterminants constituent aussi bien les objectifs des politiques économiques (croissance) que ceux des politiques d'attractivité.

De ce qui précède, toute étude des effets de l'IDE sur la croissance doit tenir compte de l'attractivité du territoire. C'est dans cet esprit que nous formulerons cette relation en une seule question centrale qui constituera notre problématique; et qui guidera notre réflexion tout au long de notre travail :

**" Le territoire marocain est-il suffisamment attractif pour générer les effets économiques attendus ? "**

**Questions secondaires:-**

La meilleure façon de répondre à cette question consiste à s'en poser d'autres. C'en est là une question qui interpelle d'autres partant de sa première composante qu'est le diagnostic du système attractif au sens large du terme et de sa deuxième qui porte sur l'évaluation des effets dudit système attractif sur le système productif. Il serait donc possible de se demander :

**Question 1:-** si les " politiques d'attractivité " auxquelles le Maroc s'est engagé depuis les années quatre-vingt ont-elles atteint les objectifs escomptés en terme d'attractivité ? Cette question cherche à examiner l'efficacité du système attractif au sens large du terme (attractivité et politiques d'attractivité) pour expliquer l'écart existant entre l'attractivité effective et l'attractivité potentielle du territoire marocain.

**Question 2:-** si le territoire marocain, ou le système productif a-t-il les pré-conditions nécessaires et les performances globales requises pour tirer profit de la présence de l'IDE. ?

**Question 3:-** Quels sont les effets économiques de l'IDE sur la croissance économiques pour le cas du Maroc? C'est-à-dire comment pouvant nous évaluer la relation IDE-croissance et le lien entre le système attractif et le système productif ?

**Objectifs de l'étude:-**

Répondre à la fois aux questions découlant de notre problématique et à la nécessité méthodologique mentionnée dans les approches méthodologiques adoptées (référence et repérage), exige cinq objectifs de l'étude :

- Présenter une revue de la littérature sélective aussi bien théorique qu'empirique sur la relation IDE-croissance (question 1)
- Évaluer les effets dans le cadre d'une analyse économétrique entre (1970-2011) (.question 2 et 3)

**Effets de l'IDE à la lumière des travaux empiriques:-**

La revue de la littérature empirique distingue deux types d'effets sur la croissance, directs et indirects.

**Effets directs :-**

Les travaux empiriques qui se sont attachés à l'étude des effets de l'IDE sur la croissance dans les pays en voie de développement ont mis en évidence l'effet positif qu'exerce l'IDE sur la croissance économique et ce, à la fois par un effet d'entraînement sur l'investissement domestique, sur l'amélioration de la qualité de la main d'œuvre, la création des externalités positives qui améliorent la productivité totale des facteurs et l'efficacité économique du pays

<sup>1</sup>Au sens large du terme cela signifie à la fois les politiques d'attractivité et l'attractivité du territoire proprement dite

d'accueil. Nous citons à cet égard les travaux les plus reconnus ; Blomström(1986) et (1989) et Kokko(1994), Aitken, Hanson, et Harrison(1997) pour le cas de la Mexique, Blomstöm (1989) et Kokko,Tansini, Zejan (1994) pour le cas de l'Uruguay , Sjöholm(1999) et Blalock(2001) pour " l'industrie ", Batra et Tan(2002) pour la Malaisie, Djankov et Heckman(2000) sur les firmes " tchèques " et Javorcik(2004) sur les industries manufacturières lituanienne.

#### **Effets indirects:-**

Il sera question ici de présenter les effets de l'IDE sur le capital humain, sur l'investissement domestique, sur les exportations ainsi que sur le tissu industriel.

#### **IDE-capital humain:-**

Il est très bien utile de noter qu'un niveau de qualification de la main d'œuvre qui dépend lui aussi de la politique éducative . Le niveau de qualification du capital humain semble être un mécanisme déterminant de la génération ou non des effets de l'IDE.Même si l'IDE requiert un niveau et un seuil minimum de qualification du capital, après leurs installations, les FMN développent ce capital humain via l'amélioration des capacités organisationnelles des entreprises locales. (Blomstrom et Kokko (1988)). En revanche, les FMN dont l'activité est orientée vers le marché extérieur, investissent davantage dans la formation pour rendre le capital humain plus qualifié (Kumar(1996)). La capacité d'absorption dépend essentiellement de la capacité " d'apprentissage " (reading by doing).

Selon Blomström et kokko(2003a), les FMN n'affectent pas directement l'enseignement primaire et secondaire, mais elles permettent d'agir indirectement sur l'enseignement supérieur . Un capital humain qualifié permet facilement le transfert technologique, un secteur ou un pays détenant un niveau technologique avancé permet de tirer profit des retombées positives au niveau du capital humain (OCDE, 2002). En cas d'absence de transfert, les FMN sont dans une situation de monopole des FMN. Un effet d'éviction est exercé sur les entreprises locales (Haitit et Hammoudi H. (2005)). La « transférabilité » dépend également du type de formation (Alsan et al. (2006)).

#### **IDE-investissement domestique:-**

Les études portant sur la relation IDE-ID essaient de répondre à la question suivante : « Y a-t-il un effet d'entraînement ou d'éviction entre l'IDE et l'investissement domestique ? » Borenstein est considéré comme l'un des premiers auteurs qui ont largement étudié cette relation. Ces études ont montré également l'existence possible d'un effet de complémentarité (Rodriguez-Clare (1996); Markusen et Venables(1999)).Malgré la non significativité obtenues des coefficients, DE Gregorio et Lee (1998), Soya et Oneal (1999) ont trouvé un effet d'entraînement de l'IDE et non un effet d'éviction.

De même, Argosin et Mayer(2000) ont montré que l'IDE exerce un effet d'entraînement (Crowding in) sur l'IDE. Par contre, il exerce un effet d'éviction (crowding out) en Amérique latine. Au niveau théorique, de nombreux travaux se sont attachés à l'étude de la relation IDE et investissement domestique ( Markusen, et Venables(1999), travaux qui, ont mis l'accent sur le fait que " l'effet d'entraînement " est conditionné par la forme et la nature des stratégies des firmes multinationales.

#### **IDE-Commerce extérieur:-**

L'IDE a des effets à la fois directs ou indirects sur les deux composantes du commerce extérieur (Importations et exportations). Par exemple, au niveau des exportations, l'effet direct de l'IDE sur le commerce extérieur peut être réalisé au cas où la production des FMN se consacrerait soit à la " réexportations " vers le pays d'origine de la firme multinationale soit vers des marchés tiers. Le pays d'accueil est alors considéré comme " plate-forme de réexportation ".Mucchielli J-L (2002) confirme que la nature complémentaire ou substituable de l'IDE avec les importations affecte la balance commerciale. En s'implantant dans l'économie du pays d'accueil, une FMN peut voir sa production se substituer à l'importation du pays d'origine de la FMN. Or, ce dernier peut se substituer à l'investissement domestique (effet d'éviction).

L'IDE a en dernier lieu des effets dynamiques et à long terme sur la spécialisation internationale et au transfert des avantages compétitifs spécifiques des FMN (Henner (1997)). Moran(1998) confirme qu'une politique d'ouverture permet aux FMN d'accéder aux sources d'approvisionnement et de s'intégrer aux marchés internationaux. Lee , Ricci et Rigobon (2004), Rodriguez (2000) soutiennent que le débat sur la relation IDE-ouverture n'est pas encore tranché. L'IDE peut exercer un effet sur la croissance bien qu'il soit minime (Jansen(1995)) .

**Données et spécification du modèle d'analyse:-**

Notre analyse économétrique porte sur des données statistiques inhérentes à l'économie marocaine pour la période 1970 - 2011. La méthode empirique utilisée est basée sur un modèle à équations simultanées dans le cadre duquel on distingue deux types de variables : les variables endogènes et les variables exogènes, variables dont la définition sera explicitée une fois que sera présentée la forme générale dudit modèle.

**Présentation générale d'un modèle à équations simultanées:-**

Afin de tenir compte des insuffisances économétriques précédemment évoquées dans la revue de la littérature, nous entendons construire un modèle structurel composé de plusieurs équations simultanées. Le but recherché ici est de relier la croissance économique aux IDE et aux autres facteurs tels que les exportations, le capital humain, l'emploi, les infrastructures, etc. La forme générale du système peut s'écrire de la manière suivante :

$$f(Y_T X, \beta)_t = \varepsilon(t)$$

où  $y$  est le vecteur des variables endogènes,  $x$  le vecteur des variables exogènes et  $t$  est le vecteur des résidus possiblement corrélé ; le but de l'estimation étant de trouver le vecteur des paramètres  $\beta$ .

La structure du modèle est représentée par un système de huit équations simultanées qui se présente comme suit :

$$Y_t = A + \beta X_T + \varepsilon(t)$$

$Y_t$  : Vecteur des variables endogènes

$X_t$  : Vecteur des variables exogènes

$A$  : Vecteur des termes constants

$\varepsilon(t)$  : Vecteur des termes de l'erreur.

**Forme fonctionnelle :-**

Soit le système général de 5 (cinq) équation structurelles liant cinq variables endogènes à 12 variables exogènes :

En s'inspirant de travaux de Van den Berg et Ghosh Roy (2006), et Bende et Al(2000), nous adoptons un modèle de cinq équations simultanées qui se représente comme suit:

$$Cr_t = f(IDE_t, KH_t, EXPORT_t, ID_t) \quad [\text{eq.1}]$$

$$ID_t = f(Cr_t, IDE_t, CREDIT_t, INTERET_t) \quad [\text{eq.2}]$$

$$EXPORT_t = f(IDE_t, TXCHANGE_t, LIBER_t) \quad [\text{eq.3}]$$

$$KH_t = f(IDE_t, Depeduca_t, URBAN_t, SANTPIB_t) \quad [\text{eq.4}]$$

$$IDE_t = f(Cr_t, KH_t, IDE_{t-1}, OUVERT_t, INFLAT_t, INFRPIB_t, M2_t) \quad [\text{eq.5}]$$

**Forme structurelle:-**

Comme Van den Berg et Ghosh Roy (2006), Bende et al(2000), nous supposons dans le cadre de cette analyse une relation linéaire entre les différentes variables du modèle. Ain la forme structurelle de notre modèle se présente comme suit:

**Equation 1:-**

$$Cr_t = \alpha_0 + \alpha_1 IDE_t + \alpha_2 KH_t + \alpha_3 EXPORT_t + \alpha_4 ID_t + \varepsilon_{1t}$$

**Equation 2:-**

$$IDE_t = \gamma_0 + \gamma_1 Cr_t + \gamma_2 KH_t + \gamma_3 IDE_{t-1} + \gamma_4 OUVERT_t + \gamma_5 INFLAT_t + \gamma_6 INFRPIB_t + \gamma_7 M2_t + \varepsilon_{2t}$$

**Equation 3:-**

$$KH_t = \phi_0 + \phi_1 IDE_t + \phi_2 Depeduca_t + \phi_3 URBAN_t + \phi_4 SANTPIB_t + \varepsilon_{4t}$$

**Equation 4 :**

$$EXPORT_t = \delta_0 + \delta_1 IDE_t + \delta_2 TXCHANGE_t + \delta_3 LIBER_t + \varepsilon_{3t}$$

**Equation 5 :**

$$ID_t = \beta_0 + \beta_1 Cr_t + \beta_2 IDE_t + \beta_3 CREDIT_t + \beta_4 INTERET_t + \varepsilon_{2t}$$

**Définition des variables:-**

Il s'agit des variables endogènes et exogènes spécifiques au cas du Maroc pris comme cas d'étude pour la période susmentionnée.

(Voir en annexe 6 la définition de l'ensemble des variables)

#### Les variables endogènes:-

Les variables endogènes sont la croissance du PIB/tête ( Cr ) ; les flux nets d'investissement direct étranger en pourcentage du PIB ( IDE ) . Le capital humain est approximé par le taux de scolarisation brut au niveau secondaire ( KH )  
2

, la part de l'investissement domestique dans le PIB (FBCF en pourcentage du PIB ) , ( ID ), et les exportations des biens et services en pourcentage du PIB ( EXPORT ) .

#### Les variables exogènes:-

Ces variables sont le crédit accordé au secteur privé par rapport au PIB , qui indique la disponibilité et l'efficacité des intermédiaires financiers ainsi que la facilité d'accéder aux crédits ( CREDIT ) , les dépenses d'éducation en pourcentage du PIB ( Depeduca ) , le taux d'inflation annuel ( INFLATION ) , le coût du capital mesuré par le taux d'intérêt réel ( INTERET ) , la masse monétaire au sens de M2 ( M2 = Monnaie + quasi monnaie) comme approximation du niveau de développement financier ( M2 ) , l'ouverture économique (exportations et importations sur le PIB ) ( OUVERT ) , le taux de change du dollar en monnaie locale ( TXCHANGE ) , le degré d'urbanisation et de développement des institutions urbaines, permettant un accès plus facile aux différentes institutions (sociales, culturelles, sanitaires, sportives, etc.) est approximé par la population urbaine en pourcentage de la population totale ( URBAN ) ,Les dépenses de santé en pourcentage du PIB ( SANTPIB ) et les dépenses en infrastructure ( IFRAPIB ) . Les flux d'investissements décalés en pourcentage du PIB ( ID E ( t-1 ) ) ,la variable indicatrice de l'adoption d'une politique d'ouverture qui prend 1 depuis 1983 et 0 autrement ( LIBER ) .

#### Signes attendus:-

Sur la base des travaux à la fois théoriques et empiriques nous présentons dans le tableau ci-après les signes attendus des variables aussi bien endogènes qu'exogènes. Les variables endogènes sont représentées en caractère gra

**Table 1:-** Signes attendus des variables [pour la lecture du tableau :  $y = f(x)$ ]

$\begin{matrix} y \\ x \end{matrix}$	Cr	ID E	KH	ID	EXPORT
<b>Cr</b>		+		+	
<b>IDE</b>	+		+	+/-	+

LIBER					+

#### Tests de stationnarité des variables:-

Voir en annexe le tableau récapitulatif des tests de stationnarité de l'ensemble des variables étudiées (Annexe 6);

**Conditions d'ordre et de rang:-**

Les conditions d'identification peuvent faire l'objet d'un développement complexe, nous nous bornons ici à édicter des règles simples qui sont dans la pratique, appliquées en premier lieu. Soit :

- $g$  est le nombre de variables endogènes du modèle (ou encore nombre d'équations du modèle)
- $k$  est le nombre de variables exogène du modèle
- $g'$  est le nombre de variables endogènes figurant dans une équation
- $k'$  est le nombre de variables exogènes figurant dans une équation ;

Lorsque les restrictions ne sont pas des restrictions d'exclusion, les conditions nécessaires d'identifiabilité s'énoncent ainsi :

- $g-1 > g' + k - r \rightarrow$  L'équation est sous-identifiée;
- $g-1 = g' + k - k' \rightarrow$  L'équation est juste identifiée;
- $g-1 > g' + k - k' \rightarrow$  L'équation est sur-identifiée;

Ce qui peut se résumer ainsi : pour qu'une équation ne soit pas sous-identifiée, le nombre de variables exclues de l'équation doit être au moins au nombre d'équation du modèle <sup>1</sup>. Ces conditions nécessaires sont appelées conditions d'ordres d'identifiabilité.<sup>2</sup>

<sup>3</sup>

**Table 2:-** Les conditions d'ordre et de rang

	$g$	$g'$	$k$	$k'$	$r$	$(g-g')+(k-k')+r$	$g-1$	Conclusion
Cr	5	0	12	0	0	17	4	L'équation est sur-identifiée.
IDE	5	2	12	5	0	10	4	L'équation est sur-identifiée
KH	5	1	12	3	0	13	4	L'équation est sur-identifiée
EXPORT	5	1	12	2	0	14	4	L'équation est sur-identifiée
ID	5	2	12	2	0	13	4	L'équation est sur-identifiée

**Résultats d'estimations et éléments d'interprétations:-**

Dans le cadre de l'analyse économétrique de notre problématique qui met en relation l'étude de la problématique d'attractivité du territoire marocain à celle des effets économiques, nous présentons les résultats d'évaluation des effets indirects à l'aide du modèle à équations simultanées

<sup>4</sup>

**Déterminants de l'IDE:-**

Méthode d'estimation: 2MCO/Modèle:	
Variable dépendante : IDE	Période : 1970 – 2008
Constant	-3,80
	(-,316)
Cr	-0,981
	0,225
KH	0,058
	(0,225)
M2	,009133
	(,052)*
IFLAT	-,032143
	-,121

<sup>2</sup>Lorsque nous avons  $r$  restrictions, autres que celles d'exclusion, concernant les paramètres d'une équation (égalité de deux coefficients, par les conditions précédentes deviennent :

- $g-1 > g' + k - k' + r \rightarrow$  L'équation est sous-identifiée;
- $g-1 = g' + k - k' + r \rightarrow$  L'équation est juste identifiée;
- $g-1 > g' + k - k' + r \rightarrow$  L'équation est sur-identifiée;

IFRPIB	,824925
	,283
IDE(1-t)	,017896
	,014
OUVERT	,052637
	,144
$R^2 = 0,20861$	
$F = 0,194$	
IDE : investissement direct étranger, C: constante,Cr: croissance du PIB/Tête, KH : capital humain, M2: production d'énergie, OUVERT : l'ouverture économique, INFLATION : taux d'inflation. IFRPIB : IDE(1-t) : OUVERT/ ***, ** et * indiquent respectivement un niveau de significativité de 1%, 5% et 10%. ( ) : Les chiffres entre parenthèses sont les t de Student.	

Les résultats de la régression (équation 12) suggèrent que toutes les variables explicatives ( OUVERT , INFLAT , INFRPIB , IDE( t-1 ) ) ont le signe attendu théoriquement (exception faite de la variable de la croissance économique(Cr)), signe non significatif. Les variables monétaires ( INFLAT , M2 ) , le niveau d'infrastructure( INFRPIB ) et le degré d'ouverture ( OUVERT ) ainsi que la variable retardée de l'IDE semblent avoir un pouvoir explicatif de l'attractivité de l'IDE.

Cela pourrait être expliqué par l'hypothèse suivante : le pays a fourni depuis les années quatre-vingt des efforts soutenus et s'est engagé dans le processus de libéralisation et de l'ouverture de son économie et de l'encouragement du secteur privé. La série des réformes mises en place afin de rendre les pré-conditions macro-économiques de plus en plus propices aussi bien pour l'investissement domestique que pour l'investissement direct étranger ( IDE ). En outre, des mesures spécifiques ont été mises en faveur l'IDE. Le pays a fourni des efforts aussi bien au niveau de la politique d'ouverture ( OUVERT , IDE ( t-1 ) ), qu'en matière des réformes visant à créer les pré-conditions macro-économiques ( M2 , INFLAT , Cr , KH ). Le signe inattendu de la croissance économique peut être dû soit à la mesure de celle-ci soit au fait que le taux de croissance marocain n'est pas aussi suffisant pour attirer l'IDE. Son caractère volatil et sa dépendance aux aléas climatiques en témoignent.

La non significativité de l'ensemble des coefficients suggèrent que les politiques, les réformes et les mesures générales et spécifiques ne sont pas aussi suffisantes pour tirer profit des avantages de l'IDE.

Le Maroc doit s'ouvrir davantage sur l'extérieur et poursuivre les chantiers de réformes déjà entamés. La réforme du système éducatif, monétaire et financier, l'amélioration des infrastructures. Les chantiers ne sont entamés que récemment.

IL est encore tôt donc de juger leurs effets sur l'attractivité (tous les plans menés sont très récents et couvrent la période 2005-2011). Car il ne suffit pas de mettre en place des politiques d'attractivité, mais d'opérer un suivi rigoureux en vue d'atteindre les objectifs escomptés.

### 3. L'effet de l'IDE sur les exportations :

Méthode d'estimation: 2MCO/Modèle:	
Variable dépendante : EXPORT	Période : 1970 – 2008
Constant	19,345998
	2,115
IDE	3,910870
	4,315
TXCHANGE	-,008160
	-,102
LIBER	4,341362
	2,446
$R^2 = ,60116$	
$F = 17,08244$	
IDE : investissement direct étranger, C: constante,TXCHANGE: capital humain, EXPORT: production d'énergie,	

**LIBER :**

\*\*\*, \*\* et \* indiquent respectivement un niveau de significativité de 1%, 5% et 10%. ( ) : Les chiffres entre parenthèses sont les t de Student.

Les résultats de la spécification de l'équation 13 indiquent que toutes les variables ont le signe théoriquement attendu. Tous les signes sont statistiquement significatifs. Le processus de libéralisation des échanges extérieurs, et le nombre d'accords de libre-échange signés par le pays depuis l'adoption du programme d'ajustement structurel (PAS) favorisera l'expansion et l'évolution des exportations. L'ouverture économique et l'abolition progressive des restrictions aux exportations ont favorisé l'évolution de celles-ci. De même, l'adoption de la politique de la dévaluation par l'autorité monétaire améliore la compétitivité-prix à l'échelle internationale, le volume des exportations évolue par conséquent. Ce résultat est bel et bien satisfaisant, mais des obstacles aux exportations subsistent ; des goulots d'étranglement, des coûts de transaction engendrés par la lourdeur administrative et la bureaucratie rigide influencent les délais d'attente et constituent une entrave réelle à l'expansion du volume des exportations. Des efforts en la matière doivent être déployés pour les atténuer ou du moins les abolir.

On peut donc prononcer avec beaucoup de prudence, selon les résultats économiques obtenus qu'il y a lieu de citer " un effet de complémentarité " entre l'IDE et les exportations pour le cas du Maroc au cours de la période d'étude (1970-2011). Cela peut être expliqué par la nature et le mode des stratégies adoptées par les firmes multinationales implantées au Maroc. Les dites firmes adoptent le plus souvent une stratégie dite " verticale " ; c'est-à-dire qu'elles exploitent les avantages comparatifs du pays (ressources naturelles, main d'œuvre bon marché) afin de réexporter leurs produits vers leurs pays d'origine ou leurs sociétés mères. Ce qui contribue effectivement à l'évolution simultanée des deux variables et par voie de conséquence à la génération de " l'effet de complémentarité ". La politique de change vient renforcer cette complémentarité. Donc en terme de synthèse, les politiques économiques d'attractivité (génériques, spécifiques et différenciée) améliorent les avantages comparatifs du pays (prix bas des matières premières, main d'œuvre bon marché, procédure administrative allégée, etc.) ce qui incite et améliore l'attractivité et l'implantation des firmes multinationales à " stratégie verticale " à s'implanter d'abord et réexporter par la suite. Cette attractivité se trouve de plus en plus renforcée par l'accouplement de la politique d'attractivité à la politique commerciale (libre-échange et politique de change). Donc, l'amélioration à la fois des " avantages comparatifs " et de " la compétitivité " du territoire agit favorablement sur l'attractivité des firmes multinationales à stratégie verticale.

### 3. L'effet de l'IDE sur le capital humain :

<b>Méthode d'estimation: 2MCO/Modèle:</b>	
<b>Variable dépendante : KH</b>	<b>Période : 1970 – 2008</b>
Constant	14,021535
	2,368
IDE	6,829861
	3,784
URABN	1,484767
	6,549
Depeduca	1,079128
	,610
SANTPIB	,215835
	,040
$R^2 = ,87003$	
$F = 55,22416$	
IDE : investissement direct étranger, C: constante, KH : capital humain, URABN: production d'énergie, Depeduca: l'ouverture économique, SANTPIB: taux d'inflation.	
***, ** et * indiquent respectivement un niveau de significativité de 1%, 5% et 10%. ( ) : Les chiffres entre parenthèses sont les t de Student.	

Les résultats de la régression de l'équation 14 suggèrent que l'ensemble des variables explicatives ont le signe théoriquement attendu. L'IDE et l'urbanisation ont un effet positif significatif tandis que les dépenses d'éducatives et les dépenses de santé rapportée au PIB ont un effet positif non significatif.

Un tel résultat peut être expliqué ainsi : Il est d'abord utile de rappeler que cela rejoint les résultats obtenus par plusieurs travaux empiriques. Ce résultat se trouve conforté par plusieurs études empiriques : " les retombées de l'IDE par la formation de la main d'œuvre locale peuvent être plus importante que celles générées par l'enseignement public " (Cave, 1996). (Voir tableau récapitulatif de la revue de la littérature sélective de l'IDE).

L'IDE permet le transfert des compétences managériales et organisationnelles, de savoir-faire et de technologies, aux entreprises domestiques et au facteur travail national. De même, cela peut être attribué à l'existence des activités intensives en travail peu qualifié. Ce dernier facteur est jugé très explicatif et ne contredit pas l'interprétation de l'équation 12 des déterminants de l'IDE qui confirme que l'IDE exige un " seuil " quantitatif et qualitatif du capital humain pour qu'une firme multinationale puisse s'implanter.

Le capital humain : (KH) Quel que soit le sens de la relation entre le capital humain et l'IDE, le Maroc se trouve dans l'obligation ardente de mener une politique éducative apte à assimiler et approprier les technologies incorporées et transférées par l'IDE. Plusieurs raisons peuvent être avancées pour expliquer le fait que l'impact du capital humain (KH), mesuré ici par le taux de scolarisation secondaire, une variable " proxy ", se montre peu significatif (malgré le signe attendu ) sur le taux de croissance économique marocain tout au long de la période d'étude . On peut invoquer à propos deux raisons explicatives : l'inefficacité interne et l'inefficacité externe du système éducatif (voir chapitre 2 contextuel, section consacrée à du facteur travail). L'inefficacité interne du système éducatif signifie son incapacité de faire acquérir des compétences et des qualifications) en raison de la prépondérance de l'enseignement théorique au détriment de l'enseignement pratique.

L'inefficacité externe porte à son tour sur les changements et les déséquilibres intervenus sur le marché du travail (Sekkat (2004)). Un déséquilibre aussi bien quantitatif que qualitatif entre l'output du système éducatif (l'offre) et les besoins formulés par le système productif (demande). Ce phénomène se pose avec plus d'acuité au niveau de l'enseignement secondaire et du supérieur qui sont directement en prise avec le marché du travail. De plus, la plupart des diplômés de l'enseignement supérieur s'engagent dans la fonction publique, emploi jugé et considéré comme étant " non productif " Les deux sortes d'inefficacité (internes et externes) sont liées. Les deux systèmes, éducatif et productif se développent, évoluent et expriment leurs besoins indépendamment l'un de l'autre. Une réforme du système éducatif s'impose en tenant compte des besoins et des attentes du système productif. De même la spécialisation du système productif ainsi que les secteurs prioritaires productifs doivent être fixés en prenant en considérations la capacité du système éducatif à couvrir ses besoins.

#### 4. L'effet de l'IDE sur l'investissement domestique :

<b>Méthode d'estimation: 2MCO/Modèle:</b>	
<b>Variable dépendante : ID</b>	<b>Période : 1970 – 2008</b>
Constant	14,021535
	2,368
Cr	1,690662
	,919
IDE	2,055132
	,670
CREDIT	,284945
	1,245
INTERET	-,842588
	-1,411
$R^2 = ,02348$	
$F = ,19834$	
IDE : investissement direct étranger, C: constante, Cr: croissance du PIB/Tête, KH : capital humain, CREDIT: production d'énergie, INTERET: l'ouverture économique	
***, ** et * indiquent respectivement un niveau de significativité de 1%, 5% et 10%. ( ) : Les chiffres entre parenthèses sont les t de Student.	

Le taux de croissance, le crédit accordé au secteur privé, le taux d'intérêt et l'IDE ont tous le signe approprié et attendu théoriquement. Il y a lieu de citer un " effet d'entraînement " entre l'IDE et l'investissement domestique (équation 15). Cela pourrait être expliqué par les opérations de fusion-acquisition qui représentent 29,5% des flux d'IDE à destination au Maroc. Le signe positif mais non significatif signifie un " effet d'entraînement " faible. Cet

effet peut également s'améliorer en orientant l'IDE vers les secteurs ou les branches d'activités complémentaires à celles recherchées par les firmes multinationales, soit en aval, soit en amont. Les deux types d'investissement doivent se compléter. Pour ce qui est du taux d'intérêt, il représente le coût du capital son effet est négatif sur l'investissement domestique. Les firmes multinationales sont plus compétitives que les firmes domestiques ; leur pouvoir de marché, en termes d'avantages technologiques, de marque ainsi que des techniques avancées de marketing inhibent le déclenchement de l'effet d'entraînement de manière significative.

#### 5. L'effet de l'IDE sur la croissance économique :

<b>Méthode d'estimation: 2MCO/Modèle:</b>	
<b>Variable dépendante : Cr</b>	<b>Période : 1970 – 2008</b>
Constant	-3,886191
	-,544
KH	-,102469
	-,662
IDE	,101812
	(,074 )
ID	,143280
	(,661 )*
EXPORT	,258425
	,753
$R^2 = 0,20861$	
$F = 0,194$	
IDE : investissement direct étranger, C: constante, Cr: croissance du PIB/Tête, KH : capital humain, ID: production d'énergie, EXPORT: l'ouverture économique, ***, ** et * indiquent respectivement un niveau de significativité de 1%, 5% et 10%. ( ) : Les chiffres entre parenthèses sont les t de Student.	

Les résultats de l'ajustement de l'équation montrent que toutes les variables explicatives ont le signe attendu théorique, exception faite du capital humain. Ils décèlent le rôle prépondérant des déterminants classiques de la croissance économique (ID, EXPORT). L'IDE semble agir positivement sur la croissance économique mais de manière statistiquement non significative.

#### L'effet significatif de complémentarité pour les exportations:-

Les multinationales horizontales se réalisent en fonction de l'arbitrage du coût de l'échange. Ce coût affecte et détermine la décision ou non de s'implanter à l'étranger. Si ce coût est bas, la firme préfère produire localement et servir les marchés étrangers par le biais des exportations. Si ce coût est élevé, la firme a intérêt de se multinationaliser afin de détourner les barrières douanières et servir la demande étrangère pour l'unité délocalisée.) (note de bas de page) La majorité des IDE attirés par les pays en voie de développement (PVD), en l'occurrence le Maroc, sont des investissements de nature verticale. C'est ce qui justifie que l'origine des IDE drainés vers les pays en voie de développement sont d'origine des pays développés (l'Union européenne, les États-Unis, etc.)<sup>3</sup>

#### L'effet négatif non significatif du capital humain:-

Le signe attendu non significatif pour le seuil de signification de 5% semble imputé en partie au choix même de l'indicateur, même si pour le cas du Maroc, et pour d'autres pays en voie de développement (PVD), on constate qu'il y a une inadéquation entre les besoins des structures productives et le système d'enseignement, ce qui donne lieu à la fois à une faible productivité des nouveaux travailleurs et des effets d'apprentissage insuffisants pour générer des gains de productivité significatifs lors des transferts de nouvelle technologie. Cette absence de complémentarité entre la technologie et le niveau d'éducation requis aggrave le problème de l'assimilation et de la maîtrise des nouvelles technologies pour le cas du Maroc. Parallèlement, la formation de la main d'œuvre révèle des lacunes du système éducatif marocain et influence par voie de conséquence la productivité du facteur travail. Ces lacunes trouvent leurs explications en grande partie dans l'absence d'une vision claire des choix politiques en matière de la gestion des priorités éducationnelles et des objectifs stratégiques de développement. Les choix

<sup>3</sup>Pour le cas du Maroc, les IDE dirigés vers les pays en provenance de l'Union Européenne présente 50%.

politiques impliquent une baisse de la qualité de la formation de la main d'œuvre de moins en moins adaptée au marché du travail et au niveau de développement du pays <sup>4</sup>

De plus, le capital humain se trouve affecté significativement par la variable présentant le degré de l'urbanisation. L'appartenance aux zones urbaines contribue effectivement à l'amélioration de la qualité du capital humain. Les économies d'agglomération favorisent l'accès aux différents services et institutions sociales, culturelles, sanitaires et politiques. L'ensemble de ces facteurs améliorent la qualité du capital humain (formation, santé, éducation et loisirs). Les effets positifs et non significatifs des dépenses d'éducation et de santé rapportées au PIB peuvent s'expliquer par le niveau faible de ces dépenses par rapport aux attentes de la population qui ne cesse d'évoluer et de s'agglomérer dans le milieu urbain à cause de l'exode rurale.

#### **IDE-croissance:-**

Les caractéristiques de l'IDE peuvent expliquer en grande partie l'effet non significatif de l'IDE : sa volatilité, sa dépendance aux opérations de privatisation, sa faiblesse par rapport à l'attractivité potentielle et par rapport aux pays ayant des économies similaires et l'absence de réinvestissement des revenus générés des premiers investissements sont les principaux facteurs explicatifs de la non significativité de l'IDE sur la croissance économique. Quant aux investissements directs étrangers, le test économétrique soulève un effet positif non significatif. Parallèlement, les IDE se concentrent dans des industries peu porteuses en terme de transfert technologique. Les activités de concentration entre les branches sont limitées.

S'ajoutant à ceci, la concentration de l'IDE dans des secteurs où la contribution des nouvelles technologies est moins importante (Textile par exemple). L'IDE n'est pas pour autant significatif, bien qu'il soit de signe positif. Un tel constat pourrait être justifié par la concentration de l'IDE dans le secteur de l'industrie, dans le secteur de l'énergie surtout " certains types d'IDE, ceux qui forment des enclaves dans les ressources naturelles et le pétrole, devraient avoir une contribution relativement plus faible sur la croissance économique " (LTM, 2007). Ainsi la contribution à la croissance peut se limiter à la réalisation des revenus.

L'ensemble des résultats obtenus permettent de conclure avec beaucoup de prudence et de recul que l'effet de l'IDE sur la croissance est positif, à condition qu'il existe un minimum nécessaire de conditions économiques préalables, qui aident l'IDE à exercer ses effets économiques attendus.

Mais, pour le cas du Maroc, nous avons enregistré un effet négatif non significatif du capital humain sur la croissance économique, effets dûs aux problèmes du système éducatif du pays, et ayant un lien fort et étroit avec les effets attendus de l'IDE. Les retombées technologiques sont limitées. On peut de même expliquer la faiblesse des IDE par un certain nombre de facteurs structurels : l'instabilité politique, lourdeurs administratives, corruption, etc. C'est ce que nous chercherons à évaluer dans le cadre du modèle à effets indirects;

#### **Conclusion:-**

Sur la base des résultats obtenus, un certain nombre de recommandations peuvent être formulées à l'issue de cette conclusion:

- La politique d'attractivité doit être au centre des préoccupations des politiques économiques de croissance et de développement. Des efforts doivent être résolument engagés afin de moderniser les services de l'administration publique, simplifier et alléger les procédures administratives, investir davantage dans les infrastructures routières, ferroviaires et portuaires.
- Elle doit de même procéder à une réforme et une refonte du système judiciaire chargé de la sanction du non respect des engagements, veiller à ce que les droits de propriété soient pleinement respectés et assurés.

---

<sup>4</sup>En outre, le système éducatif et d'enseignement au Maroc se caractérise par l'instabilité des programmes et du mode de formation qui privilégie la répétition plutôt que la réflexion sur les aptitudes innovatrices de la main d'œuvre. De même, on peut souligner les problèmes posés par le programme d'ajustement structurel, qui par leur objectif budgétaire, fige le système éducatif et limite les possibilités de réformes et de modernisation nécessaires. La difficulté de gestion du système éducatif peut être surmontée pour peu que nous ajustions les moyens financiers destinés au système et aux besoins. En fait, le taux de scolarisation et le nombre des enseignants ne cesseront d'augmenter devant les ressources allouées au système. Il en résulte un manque de motivation et une baisse de la qualité de la formation de ce dernier.

- Les effets de l'IDE sur la croissance économiques doivent être étudiés en présence de la problématique de l'attractivité et dans le cadre d'une approche systémique exhaustive et multidimensionnelle.
- L'investissement domestique doit cohabiter avec l'IDE en générant "un effet d'entraînement". La mise à niveau des entreprises locales et l'encouragement/renforcement du secteur privé est de nature à améliorer leur compétitivité face à celle des multinationales.
- La diversification des exportations doit être poursuivie en ciblant les investissements orientés vers les exportations à fortes valeurs ajoutées.
- Une politique proactive en matière du système éducatif et de la formation professionnelle doit être envisagée compte tenu du fait que l'IDE ne peut générer ses effets escomptés sans l'existence préalable d'un seuil quantitatif et de qualification d'un capital humain capable de s'approprier et imiter la technologie transférée et incorporée.

#### Abstract

**Introduction:** Pulmonary interstitial emphysema is a life-threatening form of ventilator-induced lung injury. We present one of the few reported adult cases of pulmonary interstitial emphysema in a woman with respiratory failure admitted to our intensive care unit.

**Case presentation:** An 87-year-old Caucasian woman with a diagnosis of community-acquired pneumonia was admitted to our intensive care unit requiring invasive ventilation. The combination of a poor oxygenation index and bilateral alveolar/interstitial infiltrates on a chest radiograph fulfilled the criteria for adult respiratory distress syndrome; the cause was thought to be a combination of the direct pneumonic pulmonary injury and extrapulmonary severe sepsis. By day seven, the fraction of inspired oxygen, peak airway and positive end expiratory pressures weaned sufficiently to allow an uncomplicated percutaneous tracheostomy. On day 10, problems with ventilation necessitated recruitment maneuvers with a Mapleson C circuit, after which dramatic surgical emphysema was noted. An upper airway bronchoscopy showed no obvious tracheal wall injury, and computed tomography of her chest showed extensive surgical emphysema, perivascular emphysema and peribronchial emphysema, which were consistent with a diagnosis of pulmonary interstitial emphysema. Over the following days, despite protective ventilatory strategies and intercostal tube thoracostomy, lung compliance along with oxygenation deteriorated and our patient died on day 14.

**Conclusion:** The development of pulmonary interstitial emphysema is a rare but real risk when caring for patients with worsening lung compliance on the intensive care unit. Improved awareness of the condition, early protective ventilation strategies and timely treatment of any of the lethal complications will hopefully result in improved survival from the condition in adults.

#### Introduction:-

Pulmonary interstitial emphysema (PIE) is a barotrauma-related life-threatening condition, not uncommon to the neonatologist caring for pre-term babies. For the intensivist, despite being confronted by significant compliance

issues resulting from the fibroproliferative phase of adult respiratory distress syndrome (ARDS) on a daily basis, PIE in the critically ill adult is an extremely rare occurrence. The infrequency of PIE on the intensive care unit means that recognition of the condition, knowledge of its clinical sequelae, and its management among physicians is poor. We present the case of a woman admitted to our unit, who developed PIE, and died. We believe this to be one of the only few reported adult cases of barotrauma-related PIE.

### **Case Presentation:-**

An 87-year-old Caucasian British woman presented to our emergency department with a three-day history of shortness of breath, pyrexia and non-productive cough. Her only significant past medical history was well controlled hypertension. She was independent in her daily activities, did not smoke cigarettes and reported a good cardiorespiratory reserve prior to the onset of symptoms. The diagnosis of community-acquired multilobar pneumonia was made with a CURB-65 score of three. She was admitted to the high dependency unit with type 1 respiratory failure and a high alveolar-arterial oxygen gradient. She received intravenous antibiotics (piperacillin/tazobactam and erythromycin) and non-invasive high-flow continuous positive airway pressure (CPAP). By the fourth day, our patient had deteriorated, with a chest radiograph showing bilateral alveolar and interstitial infiltrates and a ratio of partial pressure of arterial oxygen to the fraction of inspired oxygen ( $\text{PaO}_2/\text{FiO}_2$ ) of  $< 26.6$  kPa, which required invasive ventilation. The criteria for ARDS were met and the cause was thought to be a combination of the direct pneumonic pulmonary injury and extrapulmonary severe sepsis. With protective lung ventilation, low dose methylprednisolone, antibiotic therapy and a negative fluid balance, gradual improvement was made; over the following five days respiratory parameters weaned sufficiently to allow an uncomplicated percutaneous tracheostomy to be performed. On day 10, a period of desaturation required recruitment maneuvers with a Mapleson C circuit that resulted in notable surgical emphysema. The cause was thought to be a tracheal injury sustained at the time of tracheostomy insertion. An adjustable flange tube was positioned under bronchoscopic guidance just proximal to the carina in an attempt to limit any further tracking of air through the potential tracheal defect. Despite these measures, a high alveolar-arterial oxygen gradient and peak airway pressures persisted. A chest radiograph showed more homogenous central pulmonary alveolar shadowing. An upper airway bronchoscopy showed no obvious tracheal wall injury and computed tomography (CT) of her chest showed extensive surgical emphysema and a small anterior left sided pneumothorax. On further review of the CT scan, it was felt that the perivascular and peribronchial emphysema was consistent with a diagnosis of pulmonary interstitial emphysema (Figure 1). Over the following days, despite protective ventilatory strategies and intercostal tube thoracostomy, lung compliance along with oxygenation deteriorated. By day 13, the deteriorating respiratory parameters along with inotropic requirements resulted in a decision to limit therapy and the patient died on day 14.

**Figure 1:-**

**Axial CT chest scan:-**

**Discussion:-**

In a large retrospective study, Greenough *et al.* found the incidence of PIE in pre-term infants requiring ventilation for respiratory distress syndrome to be around 19.5%, with a mortality rate of 24% [1]. These figures are known to be falling with the growing use of new ventilation strategies and availability of high frequency oscillatory ventilation. PIE almost exclusively occurs as a result of intermittent positive pressure ventilation (IPPV) with peak airway pressures exceeding 30 cm H<sub>2</sub>O [2]. When high airway pressures and dramatic shearing forces are applied to a non-compliant lung unit, the result is alveolar duct rupture, usually at the terminal bronchiole/alveolar junction [3]. This allows air to escape into the connective tissue of the peribronchovascular sheaths, interlobular septa and visceral pleura, occasionally migrating into the lymphatic and venous circulation [3]. The emphysema can be localized, unilateral or, as in our case, bilateral and diffuse. Pre-term babies are particularly prone to PIE, because of the high shearing forces and airway pressures required to re-recruit lung units with collapsing pressure exceeding their functional residual capacity, secondary to reduced surfactant levels [3]. Other postulated risks for PIE include increased amount of pulmonary connective tissue or a sudden reduction in extravascular lung water, which may offer a degree of protection against tracking interstitial emphysema. Poor lung compliance was pivotal in our case, but a reduction in extravascular lung water also perhaps had a role to play in the development of PIE.

Interstitial emphysema has a number of potentially detrimental sequelae [1, 4]. These include: compression atelectasis of adjacent healthy lung and resulting intrapulmonary shunt which is worsened by recruitment maneuvers; compression of surrounding pulmonary vasculature; and decompression of interstitial blebs into surrounding spaces, potentially resulting in pneumomediastinum, pneumothorax, pneumopericardium, pneumoperitoneum and surgical emphysema.

Although all the above can be very difficult to manage in a critically ill patient, the addition of a pneumothorax to PIE alone doubles the mortality [1].

PIE is generally felt to be a radiographic and pathologic diagnosis, although the presence of recurrent pneumothoraces and large persistent alveolar-arterial gradient in the presence of high peak airway pressures should at least arouse a suspicion of its presence.

Chest radiograph findings are often very subtle, and identification, given the frequent presence of overlying dense alveolar shadowing as a result of the lung injury and exudative processes, make the diagnosis difficult. However, the following findings may sometimes be distinguishable [4, 5, 6]: parenchymal stippling; lucent mottling and streaking extending to the mediastinum; perivascular halos (from perivascular air collections); subpleural cysts; lucent bands; and parenchymal cysts or bullae.

CT is a more sensitive tool for delineating the pathology, and the classic findings of tracking perivascular and peribronchial emphysema [7] were both demonstrated in our case (Figure 1).

The chosen treatment will, to an extent, depend on the distribution of the disease along with the severity and complications. The mainstay of treatment is to achieve adequate oxygenation with lower mean and peak airway pressures, hence minimizing interstitial leak through the defects [8]. This technique of protective lung ventilation and permissive hypercapnia is a familiar one to intensivists trying to avoid the many ramifications of volutrauma and barotrauma. There are a number of other therapeutic options that may be considered. Lateral decubitus positioning with the affected lung in the dependent position can be tried as an early conservative approach, encouraging plugging of the dependent lung. This is only of benefit when the disease is localized. Selective main bronchial intubation and occlusion can be useful, although only for unilateral disease. High-frequency ventilation (high frequency jet ventilation or high frequency oscillatory ventilation) can also be effective. Finally, extracorporeal membrane oxygenation can be used [1, 2, 3, 8].

Beyond these mainstays of treatment, there have been some case reports and series regarding the use of steroids and surgical resection for persistent localized disease, but such therapies have not established a good evidence base as yet.

Once the diagnosis of PIE is established, a high degree of vigilance must be maintained for any potentially serious complications, coupled with prompt and appropriate interventions.

### **Conclusion:-**

The meticulous employment of protective lung strategies throughout intensive care units has been a vital step towards avoiding volutrauma and/or and improving outcomes and survival in acute lung injury (ALI) and ARDS [9]. However, despite these measures, development of the fibroproliferative and fibrotic phases of ALI and ARDS are commonplace. The associated reduction in lung compliance produces a new range of challenges, which is distinct from the exudative and/or hypoxia phase faced in the early disease.

Recruitment maneuvers are commonly undertaken on the intensive care unit. They are vital for increasing the functional residual capacity above the closing capacity, and therefore providing improved lung compliance and oxygenation. When undertaking recruitment maneuvers and interpreting peak airway pressures, it is important to remember the differential lung time constants encountered throughout the diseased lungs. These variations result in an uneven distribution of pressure across the alveoli, and areas of lung with long time constants are at high risk of barotrauma. It is these areas that are at particular risk of developing PIE when exposed to the shearing forces experienced during IPPV.

The development of PIE is a rare but real risk when caring for patients with worsening lung compliance. Improved awareness of the condition, early protective ventilation strategies and timely treatment of any lethal complications will hopefully result in improved survival from the condition in adults.

#### Introduction:-

Pemphigus is a potentially fatal skin disease characterized by the appearance of vesicles and bullae. Pemphigus comes from the word *pemphix* which in Greek means a bubble or a blister. Originally coined by Wichman in 1971, Pemphigus includes a group of autoimmune blistering diseases of skin and mucous membrane. Intradermal blisters are its pathognomonic clinical feature and histologically characterized by IgG antibodies directed against the cell surface of keratinocytes. There are three primary subtypes of the disease that is, Pemphigus vulgaris, Pemphigus foliaceus, and Paraneoplastic pemphigus. Out of these most commonly seen variant is pemphigus vulgaris.

This disease has a very strong immunogenetic predisposition. Blisters are associated with the binding of antibodies to keratinocytes, desmosomes & desmosome free areas resulting in loss of cell adhesion. Disease activity can be linked to antibody titer. It affects all races with an equal gender predisposition. Mean age of onset is 50 to 60 years; however it may affect the younger and older individuals as well. The bullous lesions contain thin, watery fluid shortly after appearance but may soon become purulent or sanguineous. On rupturing a raw eroded surface can be seen. The loss of epithelium caused by rubbing apparently unaffected skin is known as NIKOLSKY's SIGN. It occurs due to prevesicular edema that weakens the dermal-epidermal junction. Mucosal lesions often precede the lesions on the skin and other parts of the body. Patients may have irregularly shaped gingival, buccal or palatine erosions<sup>1</sup>. Affected individuals are unable to eat or drink due to the associated pain. It is characterized microscopically by suprabasilar split, acantholysis which causes clumps of cells to be suspended free within the vesicular space known as *Tzanck cells*<sup>1</sup>. Direct Immunofluorescent testing (DIF) seems to be the mainstay in diagnosing this lesion.

#### Case Report:-

A 34 year old patient reported to the department of Oral Medicine in AB Shetty Memorial Institute of Dental Sciences with the chief complaint of severe pain and burning sensation in the mouth with a resultant inability to eat and drink since the last three days. The ulcers first presented three months back on the tongue and the buccal mucosa and appeared like a white plaque, when the patient attempted rubbing it off it lead to bleeding and fluid discharge. Following this he took admission in a local hospital and was treated symptomatically. Remission occurred but within two weeks recurrence of ulcers was seen. Following this the patient also took homeopathic medication but the condition worsened and led to the present state. The patient had no history of tobacco consumption or any other addiction. No history of long-term treatment for any chronic illness, continuous drug intake or any significant family history. There was no significant finding on general examination. On intraoral examination multiple erosive lesions

were found with erythematous halo surrounding them, affecting bilateral buccal mucosa, tongue, floor of the mouth & lower lip with sloughing. Tenderness was present on palpation & Nikolsky's sign was positive. The clinical presentation of recurrent oral ulcers and positive Nikolsky's sign in this case led to provisional diagnosis of vesiculo-bullous lesion affecting the oral cavity. Differential diagnosis included aphthous stomatitis, chemical burns, pemphigus vulgaris, dermatitis herpetiformis, erythema multiforme bullosum, epidermolysis bullosa, erosive lichen planus, bullous pemphigoid & Para neoplastic pemphigus.

A smear was prepared and studied which on H & E staining showed epithelial & inflammatory cells. In a few areas clumps of rounded epithelial cells with enlarged & hyperchromatic nuclei were visible suggestive of Tzanck cells. Incisional biopsy was taken from a representative site, the microscopic features demonstrated stratified squamous parakeratinized epithelium with certain areas showing suprabasilar cleft and acantholytic cells. Underlying connective tissue showed dense chronic inflammatory cell infiltrate comprising of plasma & lymphocytes. The diagnosis of Pemphigus was given based on the histologic findings and to further confirm the diagnosis DIF test was performed. DIF demonstrated in vivo deposits of IgG (IgG1, IgG4) on the surface of keratinocytes, thereby confirming the diagnosis.

The treatment plan comprised oral prednisolone 60 mg/day along with multi-vitamin supplementation and analgesic in the form of a lidocaine gel for local application. After six days of steroid therapy, the patient was symptomatically better and clinically reduced sloughing and erythema was seen. The patient was discharged since he was relatively comfortable and could consume oral diet. Patient was reviewed after one week, there was complete resolution of sloughing and a few erythematous zones were noted. Due to the remission of symptoms the dose of prednisolone was reduced to 40mg. Again after ten days the patient was reviewed and was completely asymptomatic, therefore we reduced the dose of prednisolone to 20mg tapering it over a period of one week and then stopping the medication.

### Discussion:-

Generally in Pemphigus vulgaris small asymptomatic blisters are seen, they are really thin walled & tend to rupture, thereby causing pain and hemorrhagic erosions. Lesions can be found in any place in the oral cavity but the sites most vulnerable are the ones subjected to constant friction<sup>2</sup>. Due to the presenting features the disease tends to be misdiagnosed as aphthous stomatitis, gingivostomatitis, or erosive lichen planus. As was the case with our patient, who in his earlier visit to a doctor was misdiagnosed as a case of aphthous stomatitis. Therefore we will stress on the importance of an early correct diagnosis, which enables the use of lower dosage of medications over a shorter period of time.

Since our patient reported to us with an aggressive lesion, with acute symptoms, we conducted a smear test, biopsy and DIF simultaneously. Also, culture sensitivity of the lesional exudates along with a complete blood profile of the patient was done. Till the diagnosis was confirmed supportive therapy in the form IV fluids and local care was provided. The culture sensitivity was negative and all the blood profile was completely normally, however the smear, biopsy and DIF suggested the presence of pemphigus vulgaris.

Once the diagnosis has been confirmed the treatment should be started as soon as possible with systemic corticosteroids that remain the treatment of choice for this lesion<sup>3</sup>. Corticosteroids do cause rapid remission but also lead to various adverse effects like peptic ulcers, weight gain, hypertension, diabetes & osteoporosis<sup>3</sup>. Therefore when steroids have to be used for longer periods of time adjuvants such as Azathioprine or Cyclophosphamide are added to the regimen<sup>4</sup>. Even in our patient ant acids were prescribed to prevent gastritis.

Emerging therapies include plasmapheresis, intravenous immunoglobulins, immunoadsorption, cholinergic agonists, tumor necrosis factor-alpha antagonists (infliximab & etanercept) & cholinergic agonists<sup>3</sup>. Out of all these therapies plasmapheresis is the one that is being extensively studied and its use questioned for the treatment of pemphigus vulgaris. In a study by Matthew S. Turner, BS the use of plasmapheresis in conjunction with immunosuppression has been studied. They have suggested a series of five plasma exchanges within a period of eight days followed by administration of immunosuppressive drugs to prevent a rebound flare of the disease. They have concluded that this line on treatment should be employed for patients who do not respond to the conventional treatment or for patients with a severe form of the disease<sup>5</sup>.

**Conclusion:-**

In this article we illustrated the common oral presentation of pemphigus vulgaris, the importance of cinching the correct diagnosis and preventing it from being misdiagnosed as some of the other oral lesions with similar presentation. It should be considered as a differential diagnosis whenever a patient presents with a history of multiple, chronic, non-healing ulcerations that begin as a blister or bullae. Definitive diagnosis can be achieved by histological inspection and DIF. Once diagnosis is confirmed we stressed on the importance of administration of systemic corticosteroids to reach a disease free state & also the use of some new treatment modalities for a more severe form of the disease.

##### Key words:-

Electronic Stories, Clothing Behavior,  
Teenage Girls.

#### Abstract

The purpose of this study is to investigate effects of electronic stories on clothing behavior for teenage girls. The study's samples consisted of 40 teenage girls from the third Medium School in Afif province in Saudi Arabia. The experimental method was used by applying the questionnaire before using electronic stories and after using electronic stories to know teenage girls clothing behavior, then used an SPSS program to do statistical analysis. The results showed the effectiveness of using electronic stories on the clothing behavior of teenage girls in aspects of The Self -Esteem, Modesty, Fashion, Attract Attention, Accommodation, Economic Level and father Education Level, depending on the results of the study the researchers set a number of recommendations.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Introduction:-

The clothing plays an important role in the person lives, its effect on their business and in their relationships with others, clothing is key to personality, the reliability on the importance of clothing notes in the reality that the eye sees the clothes before the ear listening to the language, before the mind even understands the culture and civilizations (Eyed, El-Sayed, 2003). The selection of clothing important and complex process, everyone can choose clothes that fit him in, not only that, but must feel the beauty in his clothes because this pushes the individual to improve his attitude, so the appearance affects an individual's confidence in himself, accepted socially and its compatibility with the community in which lives. The proper clothing behavior, it is the behavior which was compatible with the community and the environment to which they belong, as well as customs, values and Traditions in this community (Eyed and others, 2000).

Behavior for teenage girls is only a translation of attitudes and values acquired through socialization factors, stemming from the values and standards of the community to which they belong, is affected by parental attitudes towards choosing clothes and accessories (Abboud, 1997). The big problems will appear obvious in adolescence, according to somatic changes, emotional and mental, which make teenager in puzzled chose to childish fashion, or feminine fashion, which will Exposing to criticism from community members. Tiggeman, Pickering (1996) said musical image passages strongly affects of teenage girls than any kind of TV programs when showing how women must be in form and behavior.

The development of the era and the advent of the Internet has made techniques more interactive and social, which led to the proliferation of electronic media and the spread and development of electronic digital devices which obsess the minds of members of society in General and become The preoccupation of adolescents and youth. So the

researchers tried to take advantage of these devices, and to exploit the time, which spend with these devices in listen and watch electronic- stories related to clothing behavior to give them the opportunity to take advantage of them in clothing behavior, because the teenage girls often begin to have psychological changes and love imitating others that may affect their behavior, and Learn if there were importance of the electronic stories in the field of clothes, and Know if there is effect of the use electronic stores in clothing behavior (self-modesty, fashion, attracting Attention) among teenage girls.

## **Review of Literature:**

### **Electronic-stories:-**

Stories are produced and archived and published using digital media, It is brilliantly from the novel revolves around an event or person or place-could be real or fictional, and rehire sound and music and sound effects, text, images, graphics and video for specific purposes (Shehata, 2014).

The Type of Electronic Stories were as flowing (Abdel Basset, 2014):-

1. **Photographic Stories:** are collections of static images and text, to prepare these kind of stories are enough to know how to take pictures and how to develop slides from the power point program and put images in it.
2. **Video Words:** a set of words or phrases and images to produce a short film and simple, and teacher can do some pictures and ask the learners comment on it.
3. **Presentations:** a collection of texts and images to provide a specific subject, and one of the most common story industry operations.
4. **Drama:** which does not focus on the facts, but showing emotions, events and statements in the context of applying the granulation.
5. **Video clips:** merge images, texts, music and record conversations together to do a show about a particular topic.
6. **Anecdotal Painting:** a series of simple visualizations (like paste shapes, pictures, or drawing) specified in single frames, which offers a representation of the digital story content, containing all the events contained within the text catalog in a number of paintings that represent each one of the visible events, describe each image that we want to use.

### **Factors Affecting on the Clothes Selection:-**

There are several factors affecting selection of appropriate clothing, these factors (Aldirdeiry, 2002):

1. **Environmental factors:** climate, weather and geographical environment and history.
2. **Social factors:** regarding customs and traditions and community style and community formations.
3. **Cultural factors:** ideas and philosophies, religions and historical heritage and identity.
4. **Psychological factors:** personal characteristics, attitudes, values and behavior, motivations and desires and tendencies as well as the tradition.
5. **Economic factors:** economic level relates to the individual in terms of income and price for clothing.
6. **Technical factors:** regarding the importance of aesthetics in clothing.

### **Distinctive trends in Clothing behavior in Arab community:-**

There is a tendency for the Arab community and affects on the clothing behavior, this trend is modesty in clothing, it covered the whole body except the face and hands and loosely not describes size or shape of the body, and the dress itself not attractive and not transparent, should not resemble the dress of men (Altanikhi, 1982). This trend or mainstream shows authentic values, customs and traditions in Arabic communities and affected by the Islamic religion.

### **Teenage Girls:-**

The period between childhood and maturity, the period of time between 13-20 years, characterized by physical and psychological changes, which may occur and some behavioral and mental disorders. (Lohal, 1985) Said: teens are looking for economic autonomy and integration into a society in which no family-centered, thus showing the teen as a crucial transition seeking psychological autonomy and freedom from dependency sledge, which leads to changes on a personal level, especially the dialectical relationship between the self and the others.

**Self-esteem:-**

Individual expression of itself directly or indirectly and reach the maximum achievable potential and capabilities to satisfy, and re-equilibrium that allow him to use those capabilities and capacities in the service of the individual and society and the roles, responsibilities and usual duties (Arafat, 2001).

**Modesty:-**

It is a human social value the individual's commitment to ethics and religious teachings and societal customs and traditions, modesty in clothing means wearing clothes that cover the body and the details do not appear.

**Fashion:-**

The concept of fashion is a common method in the given time, and fashion style of expression in any art, clearly show in equilibrium or font or color. Fashion can also be a yardstick the people, classify the garments worn by the people are more or less in line with fashion, they have clothes and colors and textures that fit with it. (Al-fuhaid, 2015).

**Attract Attention:-**

Main in the clothing behavior as an attempt to attract the attention of others by using clothing.

**Accommodation:-**

An individual's place of residence in the countryside or in the city.

**Afif Third Medium School Girls:-**

Middle School for girls in Afif Province in Saudi Arabia.

**Hypothesis 1:-** There Are effect of electronic stories about the teenage girls clothing behavior in aspects of the self -modesty, fashion and attract attention.

**Hypothesis 1a:-** There Are effect of electronic stories about the teenage girls clothing behavior for accommodating variable.

**Hypothesis 1b:-** There Are effect of electronic stories about the teenage girls clothing behavior back to the family economic level.

**Hypothesis 1c:-** There Are effect of electronic stories about the teenage girls clothing behavior refer to The father education level.

**Hypothesis 1d:-** There Are effect of electronic stories about the teenage girls clothing behavior refer to The mother's education level.

**Methodology:-****Sample:-**

Consist of fourteen students teenage girls have been selected from junior high girls students from third middle school students on Afif province in Saudi Arabia academic year 2015-2016, and The description of the Study sample were as shown in (Table1).

**Table 1:-** Sample Description

No.Of sample	Variable		Frequency	Percentage %
( 40) students from the teenage girls	Accommodation,	Countryside	17	42.5
		City	23	57.5
	Economic Level	Low	6	15.0
		Medium	26	65.0
		High	8	20.0
	The Level of Education of the head of family	Just Right and Read	9	22,5
		Medium Certificate	9	22.5
		Bachelor	15	37.5
		Graduate	7	17.5

**Measure:-**

The Questionnaire consists of four subsections for each one of the clothing behavior aspects (self-modesty-fashion-attract attention) then formulated to the initial scale which consists of (27) variable. Then the questionnaire, view on a group of professor of Home Economics, College clothes professors and Faculty of education and Psychology faculty of education to voice their opinions and judge the suitability of scale for measuring the samples, and after the viewing added three variable matches the nature of society in the axis of decency, the scale reached (90%) agreement on the vocabulary. Then the final form of The questionnaire was designed.

**Validity and Reliability of The Tool:-**

To achieve stability and validity of the tool, the Alpha Crunbach method was used to, and the result found that the Reliability Coefficient equal 0.85 and the Self honesty Factor equal 0.92.

**Data Collection:-**

The experimental method was used according to the following steps:

1. The questionnaire was applied before using Electronic-stories which interest in personal, social and moral terms of clothes on a sample which consist of fourteen girls in teenage and enrolled in third middle school girls at the beginning of the second semester of the academic year 2015-2016
2. Visited the school twice a week and view some electronic stories which consist of electronic text stories, photo stories and educational videos in family education.
3. Been conducting The questionnaire after applying electronic stories at the end of the second semester of the academic year 2015/2016 on the same girls sample.
4. Scheduling and make appropriate data statistic analysis by use SPSS software to identify the study results.

**Result:-**

To find if there are statistically significant differences between the average grades of the experimental group students before and after applying electronic stories in aspects (self-modesty, fashion, attracting attention), The arithmetic mean, standard deviations and T test value was calculated as shown in (Table 2).

**Table 2:-** T Test Results of The Experimental Group

Variable		Members Number	Mean	Standard Deviation	Freedom Degrees	T value	Interpretation
Self Esteem	After Experimentation	40	37.9000	5.10806	39	7.359	Function 0.01
	Before Experimentation	40	42.2750	3.63027			
Modesty	After Experimentation	40	23.3000	4.53024	39	4.556	Function 0.01

Attract Attention	After Experimentation	40	17.1750	3.74089	39	2.306	Function 0.05
	Before Experimentation	40	17.7750	2.98275			
The Scale as a Whole	After Experimentation	40	101.3750	13.49774	39	6.838	Function 0.01
	Before Experimentation	40	111.7000	10.26870			

To find if there are statistically significant differences between the average grades for the experimental group students before and after applying electronic stories refer to variable accommodation (countryside, city), the researchers used one way analysis of variance (ANOVA) calculates the F - value as shown in (Table 3).

**Table 3:-** ANOVA Results of The Experimental Group in The Accommodation Variable

Variable		Sum of Squares	Def	Mean Square	F	Interpretation
Self -Esteem	Between Groups	.204	1	.204	.015	Not Function

To know if there are statistically significant differences between the average grades of the experimental group students before and after applying electronic stories refer to variable economic level (low, medium, high), the researchers used one way analysis of variance (ANOVA) to calculate the F - value as shown in (Table 4). And to determine the direction of Significant statistical differences the Scheff's test was used, as explains in (Table 5).

**Table 4:-** ANOVA Results of The Experimental Group in The Economic Level Variable

Variable	Measurement	Sum of Squares	Def	Mean Square	F	Interpretation

To know if there are statistically significant differences between the average grades of the experimental group students before and after applying electronic stories refer to variable The Level of Education of father (just right and read, medium certificate, bachelor, graduate). The researchers used one way analysis of variance (ANOVA) to

calculate the F - value as shown in (Table 6).And to determine the direction of Significant statistical differences the Scheff's test was used, as explains in (Table 7).

### Discussion:-

It is clear from (Table 2) that the arithmetic mean of the experimenter group girls grades after applied experimentation is greater than the arithmetic mean of their grades in the measurement before applied experimentation in all axes on the scale. The T-value is function in aspects of (self-modesty, fashion, the scale as a whole) on level (0.01), and at (0, 50) at the attract attention, and that's indicates statistical differences between the measurement before and after experimentation. This may be due to the electronic stories method of interesting and attractive for students in a change in clothing behavior due to their dependence on the interaction of personalities that reflect the reality of life the student in addition to blending images, music and events that help to acquire information and different behaviors and it turns out the difference in clothing behavior especially in two aspects self-esteem and modesty by fairly large. Because electronic stories which are used drew the attention of the students to know clothing is the language to Expressed yourself and personality reflects.

From (Table 3) it clear that there aren't statistically significant differences exist between the average score for the experimental group in clothing behavior back to the accommodation variable. There are no significant differences in aspects of self-esteem, fashion and attract attention, but there is a significant difference in the aspect of modesty (f-value 4.606), and this may be back to difference in alive between the city and countryside in constant to the traditional. From Table 4 f-value in self-esteem aspect is (6.218) which function at (0.05) level. And f-value in modesty aspect is (4.984) and it is functioning at the level (0.01). These mean there are significant statistic differences in aspects of self-esteem and modesty refer to the economic level variable while there are no significant statistic difference in scale of clothing in aspects of the fashion and attract attention. And f-value of the measurement as a whole is (4.370) and it is functionally at (0.05) level, these mean there are significant statistic differences in the clothing behavior refer to the economic level variable and social habit.

From (Table 4) f-value in self-esteem aspect is (6.218) which function at (0.05) level. And f-value in modesty aspect is (4.984) and it is functioning at the level (0.01). These mean there are significant statistic different clothing behavior in aspects of self-esteem and modesty refer to the economic level variable while there are no significant statistic differences in aspects of the fashion and attract attention. And the f-value of the measurement as whole is (4.370) and it is functionally at (0.05) level, these mean there are significant statistic differences in the clothing behavior refer to economic level variables.

(Table 5) found differences refer to a higher economic level, then medium and finally was low economic level, due to the high economic level owners attention to clothes and preservation, and have a different ways to clothes care, and clothes appropriate for each different events to achieve their self-esteem and modesty.

(Table 6) shows the value (f) in aspect of self-esteem modesty and fashion is a statistical function at a level (0.01) shows statistically significant differences between degrees of teenage girls in the aspects (self-modesty, fashion) while shows no differences in aspect (attract attention), because the value (f) is a statistic not functioning. The value (f) (5.602) for general is considering a statistical function value at (0.01) level, which shows statistically significant differences between degrees of teenage girls. Due to the level of education of the father.

It is clear from (Table7) differences refer to graduate level education first and then followed by the intermediate certificate then just write and reads. This may be due to the fact that most respondents were a daughter of some universities employee, which may cause statistical differences in the aspects (self-modesty, fashion) where the level of education of the father help in educating their children about appropriate purchasing methods with social status and the customs of the society with encourages to trendiness fashion.

(Table 8) Shown that the value (f) in all the aspect (self-modesty, fashion, attracting attention) of the questionnaire non-statistically function which indicating a lack of statistically significant differences refer to the mother's level of education variable (just reads and writes, medium certificate, bachelor, graduate), this may be due to the nature of the age for teen girls and what was the girl's behavior at that point where seeking independence from her mother's opinion trying to bring itself.

### Recommendations:-

From the above results the researchers recommends :

1. Encourage teenage girls to exploit times they spend online to watch the stories useful electronic and related to patterns of family and social life.
2. Teenage students should be encouraged to take advantage of family education curricula, and utilized in real working life, nor in cognitive side only.
3. Use the Lectures and cultural seminars in various social institutions and schools about how to choose and wear and how to improve clothing behavior.
4. The need to employ modern technology and activate electronic stories related curriculum life skills relating to teenage girls.

##### Key words:-

Sids, children, passive smoking.

#### Abstract

There is substantial evidence to conclude that maternal smoking caused a marked increase in SIDS. There have been almost 16 SIDS children and 76 death children as control group that have examined this relationship and all indicate an increased risk. Passive smoking during pregnancy has a certain relationship to preterm birth and spontaneous abortion. Complications are exposed women with insufficient health care and an increased incidence of other pathological conditions.

#### Introduction:-

Cigarette smoking is one of the most significant preventable causes of death and illness in the world. It accounts for some 400 000 deaths per year in the USA, approximately 100 000 in the UK and 4.9 million worldwide. Due to smoking tobacco being among the leading causes of many diseases such as lung cancer, heart attacks, COPD, erectile dysfunction, and birth defects. Among the diseases that can be caused by smoking are vascular stenosis, lung cancer, heart attacks and chronic obstructive pulmonary disease. Smoking during pregnancy may cause ADHD to a fetus. Male and female smokers lose an average of 13.2 and 14.5 years of life, respectively. At least half of all lifelong smokers die earlier as a result of smoking. The corresponding estimates for lifelong nonsmokers are a 1.1% probability of dying from lung cancer before age 85 for a man of European descent, and a 0.8% probability for a woman.

Tobacco smoke is a complex mixture of over 5,000 identified chemicals, of which 98 are known to have specific toxicological properties. The most important chemicals causing cancer are those that produce DNA damage since such damage appears to be the primary underlying cause of cancer.

**Table 1:-** The most genotoxic cancer causing chemicals in cigarette smoke

Compound	Microgram per cigarette	Effect on DNA
Isoprene	952.0	Single and double strand breaks in DNA.
Formaldehyde	60.5	DNA-protein crosslinks causing chromosome deletions and re-arrangements.
Ethylene oxide	7.0	Hydroxyethyl DNA adducts with adenine and guanine.
Acrylonitrile	29.3	Oxidative stress causing increased 8-oxo-2'-deoxyguanosine.
Acrolein	122.4	Reacts with deoxyguanine and forms

		DNA crosslinks, DNA-protein crosslinks and DNA adducts.
Acetaldehyde	1448.0	Reacts with deoxyguanine to form DNA adducts.
1,3-butadiene	105.0	Global loss of DNA methylation (an epigenetic effect) as well as DNA adducts.

### Sudden death infant syndrome :

Sudden infant death syndrome (SIDS), also known as cot death or crib death, is the sudden unexplained death of a child less than one year of age. Diagnosis requires that the death remains unexplained even after a thorough autopsy and detailed death scene investigation.

Globally SIDS resulted in about 22,000 deaths as of 2010, down from 30,000 deaths in 1990. Rates vary significantly by population from 0.05 per 1000 in Hong Kong to 6.7 per 1000 in American Indians. SIDS was responsible for 0.54 deaths per 1,000 live births in the US in 2005. SIDS deaths in the US decreased from 4,895 in 1992 to 2,247 in 2004. But, during a similar time period, 1989 to 2004, SIDS being listed as the cause of death for sudden infant death (SID) decreased from 80% to 55%. According to John Kattwinkel, chairman of the Centers for Disease Control and Prevention (CDC) Special Task Force on SIDS "A lot of us are concerned that the rate (of SIDS) isn't decreasing significantly, but that a lot of it is just code shifting".

In 2013, there are persistent disparities in SIDS deaths among racial and ethnic groups in the U.S. In 2009, the rates of death range from 20.3 for Asian/Pacific Islander to 119.2 for American Indians/Alaska Native. African American infants have a 24% greater risk of having a SIDS related death and experience a 2.5 greater incidence of SIDS than in Caucasian infants.

**Graf1:- SIDS death rates per 100,000 live birth by race/ethnicity 2009**

### **SIDS death rates per 100,000 live births by race/ethnicity, 2009 (CDC, 2013)**

### Risk factors:

The frequency of SIDS does appear to be influenced by social, economic, and cultural factors, such as maternal education, race or ethnicity, and poverty. SIDS is believed to occur when an infant with an underlying biological vulnerability, who is at a critical development age, is exposed to an external trigger.

SIDS rates are higher for infants of mothers who smoke during pregnancy. SIDS correlates with levels of nicotine and derivatives in the infant. Nicotine and derivatives cause significant alterations in fetal neurodevelopment.

Placing an infant to sleep while lying on the stomach or the side increases the risk. Especially at two to three months of age. Sharing bed with parents especially during first 3 months of life is one of the risk factors of SIDS. Elevated or reduced room temperature also increases the risk, as does excessive bedding, clothing, soft sleep surfaces, and stuffed animals. Bumper pads may increase the risk and, as there is little evidence of benefit from their use, they are not recommended.

SIDS rates decrease with increasing maternal age; with teenage mothers at greatest risk. Low birth weight is a significant risk factor. In the United States from 1995 to 1998, the SIDS death rate for infants weighing 1000–1499 g was 2.89/1000, while for a birth weight of 3500–3999 g, it was only 0.51/1000. Premature birth increases the risk of SIDS death roughly fourfold. From 1995 to 1998, the U.S. SIDS rate for births at 37–39 weeks of gestation was 0.73/1000, while the SIDS rate for births at 28–31 weeks of gestation was 2.39/1000.

Genetics plays a role, as SIDS is more prevalent in males. There is a consistent 50% male excess in SIDS per 1000 live births of each sex. Given a 5% male excess birth rate, there appears to be 3.15 male SIDS cases per 2 female, for a male fraction of 0.61. About 10 to 20% of SIDS cases are believed to be due to channelopathies, which are inherited defects in the ion channels which play an important role in the contraction of the heart.

Drinking of alcohol by parents is linked to SIDS. A particular study found a positive correlation between the two during New Year's celebrations and weekends.

#### Passive smoking:-

Passive smoking is the inhalation of smoke, called second-hand smoke (SHS), or environmental tobacco smoke (ETS), by persons other than the intended "active" smoker.

In 2006 report, the US Surgeon General concludes: "The evidence is sufficient to infer a causal relationship between exposure to secondhand smoke and sudden infant death syndrome." Secondhand smoking has been estimated to be associated with 430 SIDS deaths in the United States annually. Nicotine crosses the placenta and is found in the breast milk of mothers who smoke as well as mothers who inhale passive smoke. Maternal passive smoking increases the risk of non-syndromic orofacial clefts by 50% among their children. Maternal exposure to secondhand smoke exposure during pregnancy is associated with an increased risk of neural tube defects. A 2014 meta-analysis found that maternal secondhand smoke exposure increased the risk of miscarriage by 11%.

### Results:-

Significant negative impact is also complex effect on the total weight of newborns of smoking mothers. the gap reaches 250-300 g in our study was the average of 142 g, which is significantly difference  $p < 0.01$  of new experimental work implies that the parts sidestream "cigarette smoke after 5 - weeks Exhibitions are able to increase the excitability of C fibers in the lungs thus indirectly influence the reflective enhance the effect of substance P in NC. Solitary tract and cause as well as prolonged apnea. This may passively smoking involved in the eventual emergence of SIDS, and the occurrence of apnea, bronchoconstriction and mucus hypersecretion. it has also been found that children of smoking mothers during pregnancy died later and longer under hypoxic test than children nonsmoking mothers Children smokers have more frequent and longer lasting obstructive apnea During smoking expectant mothers Nicotine probably due to direct vasoconstrictor Fetal Hypoxia Nicotine was detected in the placenta, the amniotic fluid and fetal blood of smoking mothers during pregnancy In this context, interesting finding of pulmonary neuroendocrine cell hyperplasia in SIDS children who smoked during pregnancy. Their dysfunction (with vasoconstriction and bronchoconstriction effect) may contribute to the pathophysiology of SIDS and from our previous observations suggest the children Passive smoking significant risk factor for SIDS.

**Table 2:-** The share of smokers in families with occurrences SIDS

Household members	Smoking	Counts		Statistical significance
Mother	no	SIDS (16) 6	Inspection (76) 66	$P < 0.01$ $P < 0.01$
Mother	Yes Only during pregnant Postpartum	9 10	8 10	$P < 0.01$ $P < 0.01$
Father	No Yes	3 13	47 29	$P < 0.01$ $P < 0.05$
Other members	Yes	9	11	$P < 0.01$

Passive smoking during pregnancy has a certain relationship to preterm birth and spontaneously abortion. Concert complications are exposed women with insufficient health care and an increased incidence of other pathological conditions (anemia, malnutrition, drug addiction etc.)

Based on the work in this area and to describe their own experience called fetal tobacco syndrome, which is actually proportional fetal growth retardation, associated with smoking at least five cigarettes per day during pregnancy and expectant mothers. On the other hand, the major finding of maternal smoking during pregnancy is a separate major factor in the development of obesity in school-age children. Here is manifested by a significant factor, intrauterine exposure to cigarette smoke on obesity as one of the major contributing factor "lifestyle diseases" and their adverse consequences.

### Discussion:-

According to American academy of pediatrics recommended both maternal smoking during pregnancy and smoke in the infant's environment after birth are major risk factors for SIDS.

Mothers should not smoke during pregnancy or after the infant's birth.

There should be no smoking near pregnant women or infants. Encourage families to set strict rules for smoke-free homes and cars and to eliminate secondhand tobacco smoke from all places in which children and other nonsmokers spend time.

The risk of SIDS is particularly high when the infant bed-shares with an adult smoker, even when the adult does not smoke in bed.

## Conclusion:-

Sudden infant death syndrome is unknown causes but some risk factor could be increase the mortality rate such as smoking , passive smoking bed share , young mother , Apparently life threatening event and ther is some factors could decrease the mortality such as breastfeeding and family education.

#### Abstract

Bacterial isolates from marine fishes were screened for L-Asparaginase production on M9 minimal agar medium. Eleven isolates were selected for the estimation of extracellular enzyme production by submerged fermentation. Highest enzyme activity observed was 39 IU/ml. Bacterial mass assessed as optical density using spectrophotometer showed strong correlation ( $p < 0.01$ ) with the extracellular enzyme production. In laboratory scale process optimization studies, conditions selected for L-asparaginase production were 40°C temperature, 7.0 pH and 3% sodium chloride concentration. The yield has been increased to 42 IU/ml upon fermentation with optimized process parameters. Taxonomic identity of the best extracellular enzyme producing bacterial isolate was studied by biochemical analysis, PCR amplification of a portion of 16S rDNA and comparative sequence analysis using NCBI tool. The isolate was identified as *Enterobacter hormaechei*. Halotolerance and sustained enzyme production at an elevated temperature might be advantages to exploit the bacterium on commercial scale for the production of extracellular L- asparaginase.

#### Introduction:-

The enzyme L- asparaginase (L- asparaginase amidohydrolase, EC 3.5.1.1) is among the list of essential medicines for basic health system by World Health organization (Robertson *et al.*, 2015; Andrade *et al.*, 2014). L- asparaginase is widely accepted for its anti-neoplastic activity and is used for the treatment of acute lymphoblastic leukemia and lymph sarcoma (Neelam and Kuldeep, 2007). L-asparaginase, when administered to patients, catalyzes the hydrolysis of serum L-asparagine into L-aspartic acid and ammonia. Neoplastic cells depend on serum L-asparagine for their survival whereas normal cells can synthesize it. In presence of pharmacological concentrations L- asparaginase, neoplastic cells are eliminated by depriving the essential amino acid. The pharmaceutical enzymes have advantageous characteristics like biodegradability, non-toxic nature and ease of administration at the local sites. Besides the therapeutic value, L-asparaginase has also been used in food processing industries due to their capability to reduce acrylamide content in fried and baked foods.

Various sources of clinically important L-Asparaginase enzyme like bacteria, fungi and plants were reviewed by Dhananjayam and Kannan (2014) and Kumar and Verma (2012). Novel sources like marine actinomycetes (Shivasankari *et al.*, 2016) and genetically engineered microorganisms (Kishore *et al.*, 2015) were also studied for

Address:- Department of Biotechnology, St. Peter's College, Kolenchery, Kerala 682311, India.

the enzyme production. Commercial bacterial producers are *Erwinia* spp., *E.coli* and *Pseudomonas* spp. (Peterson and Ciegler, 1969). On long term medication, the enzyme develops adverse immunological reactions (Burke 2014; Cortijo *et al.*, 2012). There is a continued demand for high quality L-asparaginase with more stable immunological properties for clinical applications. Enzymes from marine organisms, being halotolerant or halophilic in nature, might have more environmental adaptability and stable features. Most of the scientific reports were on cytoplasmic or periplasmic L-Asparaginases from bacteria. Considering the advantages of bacterial bioprocess, the present study envisages the screening for halotolerant bacterial strains with extracellular L-asparaginase production. The halophilic nature of the bacteria studied could be an added advantage to eliminate mesophilic contaminants during bioprocess.

## Materials and Methods:-

### 2.1 Sample preparation:

Samples of *Sardinella longiceps* (common name: Sardine) and *Rastrelliger kanagurta* (common name: Mackerel) were collected from retail outlets in and around Kochi, Kerala state in South India. A total of 24 samples of fishes were analyzed and each of the samples included a portion of the intestine, gills and skin with muscle.

### 2.2 Screening for L-asparaginase producing bacteria on M9 medium:

Screening for L- asparaginase production was carried out on M9 minimal medium (Gulati *et al.*, 1997). Ingredients per litre of the medium are  $\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$ , 6.0 g;  $\text{KH}_2\text{PO}_4$ , 3.0 g; NaCl, 0.5 g; L-asparagine, 5.0 g;  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ , 0.5g;  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$ , 0.15g; Glucose, 2g; bacteriological agar, 20.0 g. Phenol red (0.005%) is used as the pH indicator.

Fig 1:- L-Asparaginase producing colonies showing pink halo in the M9 medium

The M9 agar plates were surface plated with dilutions of the sample. The M9 medium contains L-asparagine as sole source of nitrogen. The pink coloration is due to the increase in pH around the colonies where ammonia is liberated by the hydrolysis of L-asparagine. Phenol red in the medium indicates the increase in pH as colour change from yellow to pink and thus suggestive of positive L-asparaginase production. The diameter of the pink zone represents the extent of enzyme production and was measured after 48 h incubation (Fig 1). Based on the zone diameter, 120 isolates were screened and categorized as 'excellent', 'good', 'medium' and 'poor' producers. The category 'excellent producers' had the diameter of pink halo above 14mm, 'good producers' has the halo between 13.9mm-10mm, 'medium producers' has 9.9mm-6mm and 'poor producers' has lesser than 5.9mm respectively.

### 2.3 Phenotypic characterization of the L- asparaginase producing isolates:

Phenotypic characterization was done by studying morphological and biochemical characteristics. Biochemical tests performed were IMViC tests, sugar fermentation test using glucose, sucrose and lactose, urease test, catalase test, hydrogen sulphide production, gelatin hydrolysis and starch hydrolysis test by standard procedures (Cappuccino and Sherman, 2011; <http://microbeonline.com/bacterial-identification-methods/>). Growth media used for biochemical studies were supplemented with 3% sodium chloride to maintain the halotolerant properties of the isolates.

### 2.4. Quantitative Assays on the Production of L-asparaginase:

Broth based assays were performed as an effort to screen the isolate that would produce highest yield of extracellular L-asparaginase. Eleven isolates which produced a conspicuous pink zone with more than 14mm diameter size was examined for enzyme activity by submerged fermentation in Tryptone glucose yeast extract (TGY) broth (Gulati *et al.*, 1997; Imada *et al.*, 1973). For enzyme production, a 250 ml volume of TGY broth in 500-ml Erlenmeyer flasks was inoculated 1ml of inoculum (0.2 OD at 600nm) of the bacterium to be tested. The broth is incubated in a shaker incubator at (180 rotations/min) at 37°C for 48h. After incubation, 0.1ml of

supernatant was tested with 0.9 ml of 0.1M Sodium borate buffer (pH 8.5) and 1 ml of 0.04M L-asparagine. The mixtures were incubated at 37°C for 15 minutes, and the reaction was stopped by the addition of 0.5 ml of 15% (w/v) trichloroacetic acid. Precipitated proteins were removed by centrifugation and the liberated ammonia was determined by using Nessler's reagent. Enzyme activity was calculated as international unit (IU) and one unit equals to the amount of enzyme which releases 1  $\mu$ mole of ammonia in 1 minute at 37°C (Wriston and Yellin, 1973).

## 2.5. Process optimization studies for L-Asparaginase production:

Among the eleven isolates, the strain which showed highest enzyme activity (Sp7) was selected for further process optimization. Consistent yield on M9 agar medium as well as TGY broth medium were considered for selecting the candidate strain. The production of the enzyme was evaluated at various pH ranging from 5 to 9. The TGY broth was adjusted to the test pH with 0.1N HCl and 0.1N NaOH. TGY broth was supplemented with 3% NaCl and the culture was incubated at 37°C in shaker incubator. At fixed intervals during incubation, growth at OD<sub>600</sub> and the enzyme estimation was done. Optimization of growth temperature was conducted in TGY broths at constant pH (7) and salt concentration (3%) at variable temperatures namely 30°C, 37°C, 40°C and 45°C. Similarly, the enzyme production and growth was evaluated at different sodium chloride concentrations like 1%, 3%, 5%, 7% and 9% in TGY broth at constant growth temperature (37°C) and pH (7).

## 2.6. Taxonomic characterization of the isolate by 16SrDNA:

Genomic DNA was isolated from 18h old cells by the method described by Wilson, 2001[16]. A 380bp stretch of 16S rDNA was amplified in a thermal cycler (Eppendorf, Germany) using specific forward primer, RW01 (5'-AAC TGG AGG AAG GTG GGG AT-3') and reverse primer, DG74 (5'-AGG AGG TGA TCC AAC CGC A-3'). Polymerase chain reaction (PCR) was carried out using conditions like initial denaturation at 95°C for 5 minutes followed by 30 cycles with 95°C for 25 seconds for denaturation, 55°C for 25 seconds for annealing and 72°C for 1 minute for extension and then at 72°C for 10 minutes final extension. The amplicons were separated in 1.2% agarose gel and viewed using gel documentation system (Vilber Lourmat, France). The band corresponding to ~380bp was purified and sequenced in both directions using Genetic Analyzer (Applied Biosystems, USA). The trimmed sequence was used as the query sequence to compare similar sequences using nucleotide BLAST tool from the website of National Centre for Biotechnology Information (NCBI).

## Results and Discussion:-

### 3.1 Phenotypic characterization of the L- asparaginase producing isolates:

Results of the biochemical characterization of L-asparaginase producing bacterial isolates were presented in Table 1. A total of 98 isolates were assigned to different bacterial genera. The prevalence of the genera in the two fishes was *Aeromonas* (17.34%), *Arthrobacter* (4.08%), *Bacillus* (8.16%), *Enterobacter* (10.20%), *Erwinia* (8.16%) *Flavobacter* (10.20%), *Pseudomonas* (5.10%), *Serratia* (14.28%) and *Vibrio* (24.48%). Twenty two isolates could not be assigned to any genera and required further biochemical tests for the identifying the taxonomic status. A few of these bacterial genera are currently exploited for commercial production (Peterson and Ciegler, 1969). L-asparaginase is increasingly in demand due to its specific action and ease in combination therapy. However, on long term usage, the enzyme induces immunological responses like tolerance or hypersensitivity reactions. This warrants the need for novel enzyme with stable properties and fewer immunological effects. In the study, marine bacterial isolates were considered as their enzymes are adapted to specific growth conditions of elevated salt concentrations. Halophilic and halotolerant bacteria were reported to be exploited commercially for pharmaceutical enzyme production (Ebrahiminezhad *et al.*, 2011, Shirazian *et al.*, 2016).

L-Asparaginase is generally a cytoplasmic enzyme or would be secreted into the periplasmic space by the bacteria. Present study attempted to look for the extracellular enzyme production because of the economic benefits of easy downstream processing. Extracellular L-asparaginase production was reported earlier Murthy *et al.* (2015). The strain selected (Sp7) for the process optimization experiments was a halotolerant bacterium as it did not exhibit growth above 7% NaCl concentration in the growth medium. Unlike extreme halophilic bacteria, halotolerant bacteria would not accumulate ions in its cytoplasm for the osmotic balance (Nieto and Vargas, 2002; Brown, 1976). Thus the enzyme would be stable in general physiological conditions and the metabolic properties of the extracellular enzyme might be optimal for the pharmacological purposes.

### 3.2. Quantitative Assays on the Production of L-asparaginase

Out of the 120 enzyme producing isolates screened on M9 agar, 11 isolates were categorized as 'excellent producers' followed by 34, 48 and 27 as 'good producers', 'medium producers' and 'poor producers' respectively

(Fig 2). 'Excellent producers' were belonged to the genus *Bacillus*, *Psuedomonas*, *Aeromonas*, *Enterobacter*, *Serratia* and *Vibrio*.

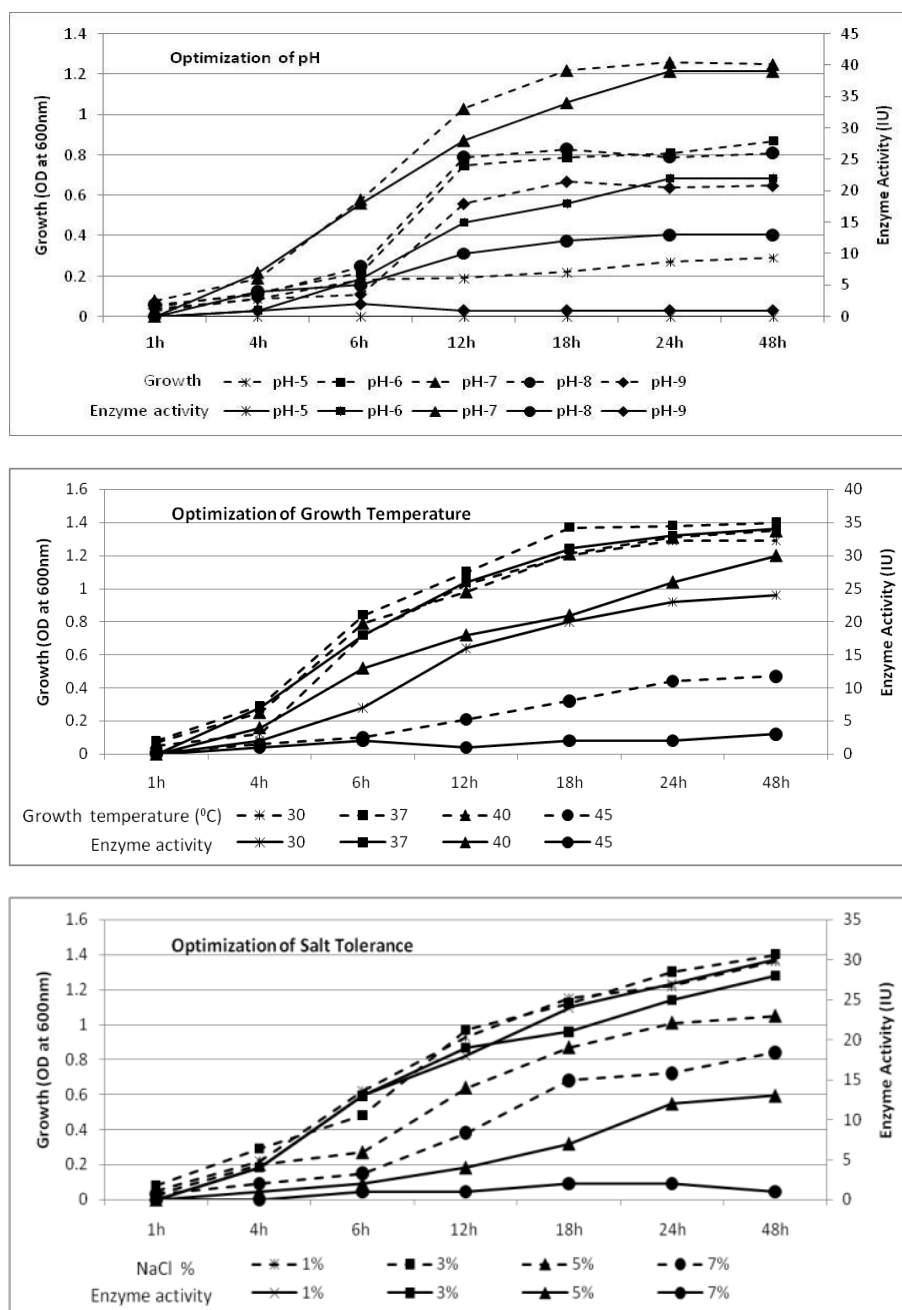

**Fig 2:0** L-Asparaginase production by halotolerant bacterial isolates from marine fishes

A total of eleven strains were assessed for their enzyme production in TGY medium by submerged fermentation. Growth conditions provided were 37°C temperature, 1% salt concentration and 7 pH. The active enzyme in the culture broth ranged from 11IU to 39IU per ml. The isolate, Sp7, showed the highest enzyme activity of 39IU/ml and was selected for further process optimization experiments. The Sp7 isolate showed 16mm pink halo on the M9 agar medium. The bacterium is Gram negative rods, non sporulating and showed positive reaction for biochemical tests like Vogues Proskauer test, Citrate utilization test, Urease test, Sugar fermentation test for lactose, sucrose and dextrose and Catalase test, and showed negative reactions for Indole test, Methyl red test, Starch hydrolysis test, Gelatin liquefaction test and H<sub>2</sub>S production test. Phenotypically, the isolate was identified as *Enterobacter* sp.

### 3.3. Process optimization studies:

Result of the optimization assays for pH, temperature, and salinity tolerance was graphically represented in the fig 3. In all the experiments growth of the bacterium positively correlated with the extracellular enzyme production ( $p < 0.01$ ). The parameters selected were pH 7, temperature 40°C and salt concentrations 3% for the laboratory scale production. In optimal physicochemical conditions, the enzyme activity was increased to 42IU/ml. The increase in production is apparently small (1.6%) and further studies on substrate optimizations and effective strain improvement strategies are to be performed to increase the yield. Halotolerance and the elevated growth temperature of the isolate could be advantageous for reducing mesophilic contamination during the production process.

**Fig 3:-** Effect of pH, temperature, and salt tolerance on growth and L-asparaginase production by *Enterobacter* sp.(Sp7)

### 3.4. Taxonomical analysis of Sp7 isolate:

The taxonomic identity of the selected isolate, *Enterobacter* sp. (Sp7) was further confirmed by 16S rDNA characterization. The 16S rDNA based identification has advantageous over conventional biochemical method as it provide species level and phylogenetic information (Fredricks and Relman, 1996). Fig 3 shows the separated amplicon (~380bp) in 1.2% agarose gel. Trimmed sequence data of the partial 16S rDNA sequence was used as the query sequence to align similar sequences of the NCBI using nucleotide BLAST tool. The sequence showed 100% sequence identity with *Enterobacter hormaechei*.

**Fig 4:-** Partial 16S rDNA amplicon from *Enterobacter* sp. (Sp7)

*Enterobacter hormaechei* belong to the family *Enterobacteriaceae* which comprises generally mesophilic bacteria. The species is already exploited for industrial purpose as it produces rhamnolipid with biosurfactant properties (Mojard *et al.*, 2016). In another study by Sullam and his team (2012) on the formation of gut bacterial community on the fish, the halotolerant nature of the bacterium was reported. *Enterobacter hormaechei*'s competent survival efficiency, adaptability to grow in wide range growth parameters and extracellular nature of L-asparaginase production would make it a good candidate as an industrial strain with potential for commercial exploitation.

**Table.1:-** Biochemical characterization of L- asparaginase producing bacterial isolates from selected marine fishes.

Biochemical tests	<i>Sardinella longiceps</i> (No. of bacterial isolates= 68)		<i>Rastrelliger kanagurta</i> (No. of bacterial isolates = 52)	
	Positive	Negative	Positive	Negative
Gram reaction	14 (20.59%)	52 (79.41%)	13 (25.00%)	39 (75.00%)
Citrate utilization test	40 (58.82%)	28 (41.18%)	41 (78.84%)	11 (21.16%)
Indole production test	32 (47.05%)	36 (52.95%)	33 (63.46%)	19 (36.54%)
Methyl red test	24 (35.29%)	44 (64.71%)	21 (40.38%)	31 (59.62%)
Vogues Proskauer test	44 (64.70%)	24 (35.30%)	30 (57.69%)	22 (42.31%)
Urease test	41 (60.29%)	27 (39.71%)	13 (25.00%)	39 (75.00%)
Lactose fermentation test	31 (45.58%)	37 (54.42%)	34 (65.38%)	18 (34.62%)
Sucrose fermentation test	28 (41.17%)	40 (58.83%)	28 (53.84%)	24 (46.16%)
Dextrose fermentation test	35 (51.47%)	33 (48.53%)	32 (61.53%)	20 (38.47%)
Starch hydrolysis test	26 (38.23%)	42 (61.77%)	9 (17.30%)	42 (82.70%)
Gelatin liquefaction test	41 (60.29%)	27 (39.71%)	31 (59.61%)	21 (40.39%)
Hydrogen sulphide production	26 (38.23%)	42 (61.77%)	12 (23.07%)	40 (76.93%)
Catalase test	32 (47.05%)	36 (52.95%)	23 (44.23%)	29 (55.77%)

### Conclusion:-

A strain of halotolerant bacterium, *Enterobacter hormaechei*, isolated from marine fish was found to be suitable for extracellular L- Asparaginase production. The stability exhibited by the enzyme at wide physico-chemical conditions and tolerance up to 7% salt concentration would make it a suitable strain for L-asparaginase production with lesser mesophilic contamination.

The membrane - redox potentials three - state line system dependent - full 9 stepped cycle of proton conductance, the solid beta state, the fluid alpha state, the gamma state.

### Abstract

The essence of our new idea in relating to how to decrease the intensity of cancer cell growth by changing and establishing the right balance between glycolysis process and the process of proton, electron conductance in the membrane - redox potentials three - state line system dependent - full 9 stepped cycle, which functioned with using of oxygen is **follows:**

a. Maintaining of normal intensity of glycolysis process by stimulation the proton, electron conductance in the 2-th stage of the full 9 stepped cycle of proton conductance inside human body in the level of isocitrate dehydrogenase, alpha ketoglutarate dehydrogenase and succinate dehydrogenase.

b. Maintaining of normal intensity of glycolysis process by stimulation of the formation of oxaloacetate from malate under action of malate dehydrogenase in the 2-th stage of the full 9 stepped cycle of proton conductance inside human body in the level of isocitrate dehydrogenase, alpha ketoglutarate dehydrogenase and succinate dehydrogenase.

1-th stage of the full 9 stepped cycle of proton conductance inside human body is distinguished by release of proton, electron from food substrates (carbohydrate, amino acids, fatty acids), under the undirect action of oxygen released from membrane surroundings of erythrocyte in the 9 stage, from this stage started the proton conductance within cycle.

The maintaining of increased fluid alpha states, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this stage of cancer cells more useful to decrease the cancer cell growth.

If needed to decrease the cell division rates during cancer should be increased the alpha state with high oxidizing potentials in the reaction medium of "Donators + membrane - redox potentials three - state line system +  $O_2$  + ADP + Pi +  $H^+$  + nH + membrane space = (ATP + heat energy) +  $H_2O$  + nH + matrix +  $CO_2$ "

### Introduction:-

Untill now we can not drive and regulate the intensity of metabolism reaction during cancer to more usefull needed direction because we do not know in which place of cells are existed driving point of regulations subjected to action of such kinds of manipulation and medicaments.

Revealed by us the membrane - redox potentials three - state line system is one of more important member of proposed by us the full 9 stepped cycle of proton conductance inside the human body and one of these places of cells, which easily subjected to action of manipulation and medicaments as driving point to conduct the usefull favorable direction of metabolism reactions during cancer, diabetes mellitus and hypercholesterinemia.

In such a case, membrane - redox potential's three - state line system serves the role of main driver.

We can create all the variants of useful reaction background forms of metabolism by changing the membrane - redox potentials three - state line system of the full 9 stepped cycle of proton conductance inside the human body.

If needed to decrease the cell division rates during cancer should be increased the alpha state with high oxidizing potentials in the reaction medium of "Donators + membrane - redox potentials three - state line system +  $O_2$  + ADP +  $Pi$  +  $H^+$  +  $nH$  + membrane space = (ATP + heat energy) +  $H_2O$  +  $nH$  + matrix +  $CO_2$ "

### Results and conclusion:-

We proposed that the biochemical characteristics of cancer cells more similar to Archea (prokaryotic) as if cancer cells acquired the some feature of Archea, as if normal cells made the evolutionary back steps to direction of the early evolution cells (as if Eukarya cells turn to Archaea- prokaryotic cells) with whom could be meet 4,4 billion years ago according to Woese classification .

The Archaea adapted to exist in extreme environments, niches devoid of oxygen and whose temperatures can be near or above the normal boiling point of water.

Archaea are prokaryotic cells which are typically characterized by solid membrane lipids that are branched hydrocarbon chains attached to glycerol by ether linkages. The presence of these ether linkages in Archaea adds to their ability to withstand extreme temperatures and highly acidic conditions.

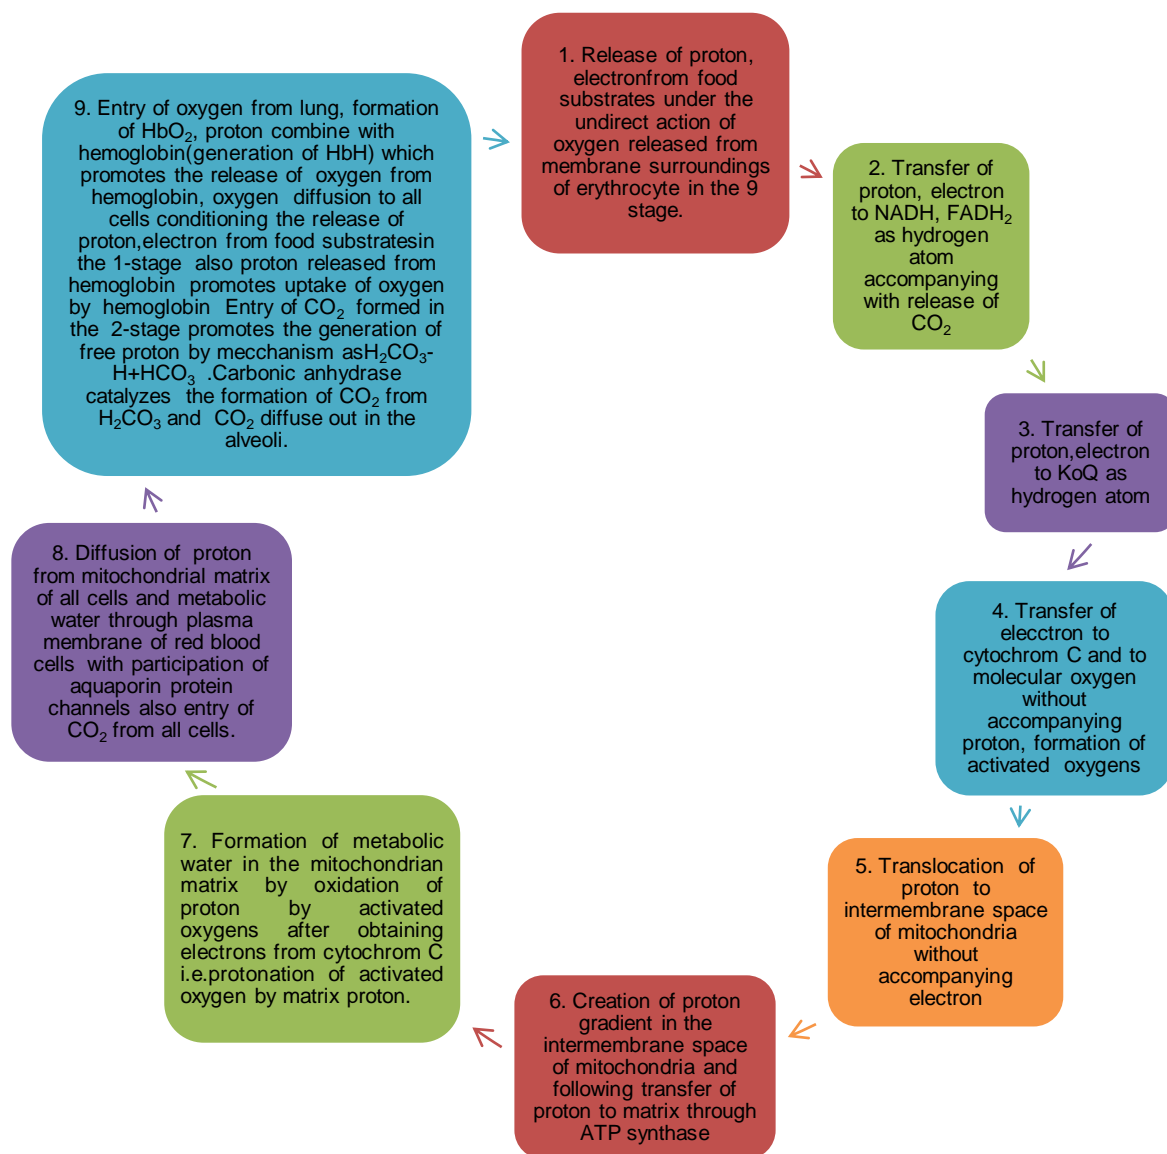

We can see abovementioned feature of Archea, possessing the solid beta state of membrane structures and their ability to withstand extreme temperatures and highly acidic conditions in example of cancer cells, behind these regulations may be existed the such lawfull process as rapidly growing tumor cells typically have glycolytic rates up to 200 times higher than those of their normal tissues of origin, this occurs even if oxygen is plentiful.

The Warburg effect is the observation that most cancer cells predominantly produce energy by a high rate of glycolysis .

Otto Warburg postulated this change in metabolism as glycolysis, is the fundamental cause of cancer.

Many substances have been developed which inhibit glycolysis, and such inhibitors are currently the subject of intense research as anticancer agents.

In this connection raised the questions that if most cancer cells produce energy by a high rate of glycolysis in the cytosol, what kinds of positive usefull changes should be induced in the membrane - redox potentials three - state line system dependent - full 9 stepped cycle of proton conductance because glycolysis followed by oxidation of donators in this cycle.

Also raised the questions how to use this positive useful changes in the anticancer treatment by causing the useful shift in the the membrane - redox potentials three - state line system dependent - full 9 stepped cycle of proton conductance such as from the solid beta state of membranes consisting of mainly saturated fatty acids conditioning a high levels of red potentials to the fluid alpha state of membranes, consisting of unsaturated fatty acids with high levels of oxy potentials, also from the gamma state of membranes consisting of decreased contents of saturated - unsaturated fatty acids, conditioning a decreased levels of redox potentials to the fluid alpha state of membranes with high levels of oxy potentials.

9-th stage of the the membrane - redox potentials three - state line system dependent - full 9 stepped cycle of proton conductance is distinguished by entry of oxygen from lung, formation of HbO<sub>2</sub>, proton combine with hemoglobin (generation of HbH) which promotes the release of oxygen from hemoglobin, oxygen diffusion to all cells conditioning the release of proton, electron from food substrates.

The abovementioned explanation shows that promotion of the release of oxygen from hemoglobin, oxygen diffusion to all cells conditioning the release of proton, electron from food substrates in the 9-th stage of the the membrane - redox potentials three - state line system dependent - full 9 stepped cycle of proton conductance by increasing the fluid alpha state of membranes, consisting of unsaturated fatty acids with high levels of oxy potentials in cancer cells may be used in the anticancer treatment.

**We proposed that:-**

The essence of our new idea in relating to how to decrease the intensity of cancer cell growth by changing and establishing the right balance between glycolysis process and the process of proton, electron conductance in the membrane - redox potentials three - state line system dependent - full 9 stepped cycle, which functioned with using of oxygen is follows:

a. Maintaining of normal intensity of glycolysis process by stimulation the proton, electron conductance in the 2-th stage of the full 9 stepped cycle of proton conductance inside human body in the level of isocitrate dehydrogenase, alpha ketoglutarate dehydrogenase and succinate dehydrogenase.

b. Maintaining of normal intensity of glycolysis process by stimulation of the formation of oxaloacetate from malate under action of malate dehydrogenase in the 2-th stage of the full 9 stepped cycle of proton conductance inside human body in the level of isocitrate dehydrogenase, alpha ketoglutarate dehydrogenase and succinate dehydrogenase.

1-th stage of the full 9 stepped cycle of proton conductance inside human body is distinguished by release of proton, electron from food substrates (carbohydrate, amino acids, fatty acids), under the undirect action of oxygen released from membrane surroundings of erythrocyte in the 9 stage, from this stage started the proton conductance within cycle.

The maintaining of increased fluid alpha states, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this stage of cancer cells more useful to decrease the cancer cell growth.

2-th stage of the full 9 stepped cycle of proton conductance inside human body is distinguished by transfer of proton, electron to NADH, FADH<sub>2</sub> as hydrogen atom accompanying with release of CO<sub>2</sub>, by which stage continued the proton conductance within cycle.

The maintaining of increased fluid alpha states, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this 2-th stage of cancer cells more useful to decrease the cancer cell growth.

4-th stage of the full 9 stepped cycle of proton conductance inside human body is distinguished by transfer of electron to cytochrom C without accompanying proton, which one is stages of continuity of the proton conductance within cycle and the increase of the fluid alpha state, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons.

The maintaining of increased fluid alpha states, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this 4-th stage of cancer cells more useful to decrease the cancer cell growth.

According to the full 9 stepped cycle of proton conductance inside human body proposed by Ambaga and Tumen-Ulzii (2015) 6- th stage of the full 9 stepped cycle of proton conductance inside human body is distinguished by creation of proton gradient in the intermembrane space of mitochondria and following transfer of proton to matrix through ATP synthase, which is played important role in continuity of the proton conductance within cycle.

The maintaining of increased fluid alpha states, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this 6- th stage of cancer cells more useful to decrease the cancer cell growth.

Also 7- th stage of the full 9 stepped cycle of proton conductance inside human body is distinguished by formation of metabolic water in the mitochondrian matrix by oxidation of proton by molecular oxygens i.e, by protonation of molecular oxygen by matrix proton, which is one of a previous stages of continuity of the proton conductance cycle and in this connection the increase of the fluid alpha state, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this 7- th stage of cancer cells more useful decrease the cancer cell growth.

9-th stage is distinguished by entry of oxygen from lung, formation of  $\text{HbO}_2$ , proton combine with hemoglobin (generation of  $\text{HbH}$ ) which promotes the release of oxygen from hemoglobin, oxygen diffusion to all cells conditioning the release of proton, electron from food substrates and the increase of the fluid alpha state, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons.

The maintaining of increased fluid alpha states, consisting of unsaturated fatty acids with high levels of oxy potentials conducting the flow of protons and electrons in this 9-th stage of cancer cells more useful to decrease the cancer cell growth.

#### Introduction:-

Recently, Saudi students have been noticed to pursue their education in medical field more likely than before. Due to the fact that medicine is one of the specialities that is known for its long journey and continuous stress, the quality of life (QOL) of medical students has emerged as an issue that has to be assessed carefully. This current study is the first of its kind to focus on medical students' life in the central region of Saudi Arabia.

#### Methodology:-

A cross-sectional study was conducted among second and third year medical students at Qassim University using WHOQOL-BREF instrument for data collection. Different domains were pointed out within the questionnaire including degree of satisfaction about physical, psychological health, environment and social life. Moreover, influencing factors like age, income, marital status, habitat and academic performance were considered, too.

#### Results and discussion:-

Generally, the results showed a low QOL of medical students, nonetheless, they scored highest at Physical health (Mean  $\pm$ SD:73.4 $\pm$ 4.1) followed by environment (Mean:49.6). On the other hand, the lowest score was found to be social relationship (Mean: 23) followed by psychological health (Mean: 36.8). To some points, this was not surprising as medical training is one of the most stressful undergraduate training worldwide. Moreover, students who are 21 years or more, third year students, living with their family and have an excellent income reported a higher QOL.

#### Conclusion:-

As our study results have shown a low QOL, measures such as reevaluating the curriculum and improving students' lifestyle must be taken to bring about a change. Furthermore, other studies are warranted to meticulously evaluate the quality of life and ensure a better support system for our students.

Bernard Soulier Syndrome, idiopathic thrombocytopenic purpura, thrombocytopenia, giant platelets, hereditary thrombocytopenia.

#### Abstract

Bernard-Soulier Syndrome (BSS) is a rare hereditary disorder. Platelets in patients with BSS are unable to adhere, leading to an increased bleeding tendency. BSS cases are often misdiagnosed as idiopathic thrombocytopenic purpura (ITP). We report here a seven years old girl diagnosed as Bernard-Soulier syndrome with homozygous deletion of 39 nucleotides in the exon 2 of GPIBA. Bernard-Soulier syndrome should be considered before the patient is diagnosed with immune thrombocytopenia.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Bernard-Soulier syndrome (BSS) was first known by two French hematologists – Jean Bernard and Pierre Soulier. They found out a patient from a consanguineous family with severe bleeding episodes, thrombocytopenia and very large platelets<sup>[1]</sup>. It is a rare hereditary disorder (1:1000000)<sup>[2]</sup>. Platelets in patients with BSS are unable to adhere, leading to an increased bleeding tendency<sup>[3]</sup>. BSS is a platelet function disorder, transmitted in an autosomal recessive manner. Caused by defects in the glycoprotein (GP)Ib/IX/V complex<sup>[4]</sup>. These genes stand for a group of linked proteins normally found on the surface of the platelets<sup>[5]</sup>. Composed of four subunits, GPIb $\alpha$  disulphide-linked to two GPIb $\alpha\beta$  subunits, GPIX and GPV in a ratio of 2:4:2:1, respectively<sup>[5]</sup>. The genes for each of these subunits have been cloned and are located in Chromosome (ch). 17p12 (GPIBA)<sup>[6]</sup>, ch.22q11.2 (GPIIB)<sup>[7]</sup>, ch3q21 (GP9)<sup>[8]</sup> and ch.3q29 (GP5)<sup>[9]</sup>. BSS cases are often misdiagnosed as idiopathic thrombocytopenic purpura (ITP)<sup>[5]</sup>. In this case report, we present one girl with causative mutations in GPIBA.

#### Case History:-

A seven years old Saudi girl previously healthy until the age of 5 years old when she presented on 15/1/2015 complaining of petechiae all over face, chest, arms, abdomen, and legs. Another systemic review was unremarkable. She was not on any medications. On examination she was conscious, alert, oriented, not distressed. No enlarged lymph nodes were palpable in any part of her body. Her abdomen was not distended, and her spleen and liver were not palpable. Other systemic examinations were unremarkable.

Laboratory findings were: CBC (HG: 11.7, RBC: 4.19, WBC: 11.2, PLATELET: 80).

Blood film: many large and giant platelets seen. Serologic examinations for Human Immunodeficiency Virus and hepatitis B and C were all negative. Also, ANA and direct coombs test were negative.

The patient diagnosed as idiopathic thrombocytopenia. Received IVIG and discharged in good condition. In addition, she had multiple admissions due to the same complain petechiae and low platelet count. She received IVIG many times, and she responded as platelet count increase at least by 30,000 but after two to four weeks platelets drop again even below 10,000. There was no response to steroids. She responded to anti-D once for four weeks. She received four doses of rituximab there was no response until 16 weeks. Bone marrow aspiration and biopsy were done on 30/3/2015 before receiving steroids; the result was cellular normal marrow. Normal megakaryocytes content on the marrow. No pathology on the marrow to explain the thrombocytopenia.

She was diagnosed as chronic ITP with frequent admission and poor response to treatment and due to hospital logistic issues platelets aggregation and flow cytometry not done. The doctor arranged an appointment for follow-up and genetic analysis for Bernard-Soulier syndrome. The result of Molecular genetic analysis of the genes GP1BA, GP1BB, GP9 showed a presence of a homozygous deletion of 39 nucleotides in the exon 2 of GP1BA. Finally, she diagnosed as Bernard-Soulier Syndrome (BSS).

### Discussion:-

Bernard-Soulier syndrome is an autosomal recessive disorder. Bernard-Soulier syndrome affects both males and females<sup>[10]</sup>. In Bernard-Soulier syndrome, thrombocytopenia is associated with morphologically abnormal large platelets and platelet dysfunction. The clinical manifestation is variable and includes purpura, epistaxis, gingival bleeding, menorrhagia, occasional gastrointestinal bleeding, hematoma, or hematuria. The diagnosis of platelet function disorders needs a detailed medical history and a series of laboratory tests.

In people with Bernard-Soulier syndrome:

- The bleeding time is difficult to perform in young children.
- The closure time is prolonged.
- Larger platelets.
- Platelets appear on the blood film.
- There are usually fewer platelets than normal.
- Platelets do not clump together normally in the presence of ristocetin.
- GPIb/IX/V is not detectable by flow cytometry<sup>[10]</sup>.

Reasons to suspect hereditary thrombocytopenia<sup>[11]</sup> (See Table 1)

Classification schemes for hereditary thrombocytopenia<sup>[11]</sup> (See Table 2)

On (Table 3 and 4) showed Mutations Identified and some diseases associated in Patients with Bernard-Soulier Syndrome, their ages ranged from 1 to 70 years. They had platelet counts from 22 to  $178 \times 10^9/L$ . The mean value of MPV was 12.6 fL, with a range from 10.4 to 17.2 fL<sup>[92]</sup>.

Mutation of the glycoprotein (GP) Ib/IX complex associated with Bernard-Soulier Syndrome (See Table 5)<sup>[92]</sup>

Idiopathic thrombocytopenic purpura, leukemia should be included in the differential diagnosis of patients with Bernard-Soulier syndrome. Patients with idiopathic thrombocytopenic may have detectable antiplatelet antibodies. In the past, Inherited thrombocytopenia were, considered very rare. Patients are subject to misdiagnosis of autoimmune thrombocytopenic instead of hereditary thrombocytopenia and inappropriate therapy, such as steroid treatment and splenectomy.<sup>[27-29]</sup>

Proposed definitions of ITP (Table 6)<sup>[30]</sup>

Proposed criteria for assessing response to ITP treatments (Table 7)<sup>[30]</sup>

Individual agents for treatment of ITP and the time to the first and peak responses if using the reported dose range (Table 8)<sup>[30]</sup>

Refractory ITP (Table 9)<sup>[30]</sup>

Here, we report one girl with Bernard-Soulier syndrome (BSS) who missed diagnosed as ITP. She demonstrated typical BSS features such as giant platelets and petechial rash. In Conclusion, Bernard-Soulier syndrome should be considered before the patient is diagnosed with immune thrombocytopenia.

**Table 1:-** Reasons to suspect hereditary thrombocytopenia. <sup>[11]</sup>

a) Lack of platelet response to therapies including steroids, IVIG, IV anti-D, and splenectomy and, rituximab.
b) A family history of thrombocytopenia.
c) Abnormal size of platelets on blood film.
d) Abnormal bleeding time in comparison with platelet count.
e) Onset at birth.
f) Associated features such as high tone hearing loss, absent radii, mental retardation, renal failure, cataracts, or the development of leukemia.

**Table 2:-** Classification schemes for hereditary thrombocytopenias. <sup>[11]</sup>

a) Thrombocytopenia due to poor production or accelerated destruction.
b) Mode of inheritance: X-linked (Wiskott-Aldrich syndrome) or autosomal dominant.
c) Platelet size on smear: very large, normal, or small (Wiskott-Aldrich Syndrome); other findings, e.g. Dohle-like bodies in neutrophils.
d) Associated features including clinical and laboratory findings: <ol style="list-style-type: none"> <li>findings on exam or by history, e.g., absent radii, renal failure, hearing loss (May Hegglin Anomaly)</li> <li>laboratory abnormalities, e.g., flow cytometry for platelet glycoprotein expression, platelet function testing, assessment of the von Willebrand factor multimer composition.</li> </ol>

**Table 6:-** Proposed definitions of disease<sup>[30]</sup>

Primary idiopathic thrombocytopenic	<ul style="list-style-type: none"> <li>It is an autoimmune disorder characterized by isolated thrombocytopenia (peripheral blood platelet count &lt;100 x 10<sup>9</sup>/L) in the absence of other causes that may be associated with thrombocytopenia. No confirmed clinical or laboratory parameters are currently available to establish its diagnosis with accuracy.</li> </ul>
Secondary ITP	<ul style="list-style-type: none"> <li>All immune-mediated thrombocytopenia except primary ITP*</li> </ul>
Phases of the disease	<ul style="list-style-type: none"> <li>Newly diagnosed ITP: within three months from diagnosis</li> <li>Persistent ITP: between 3 to 12 months from diagnosis.</li> <li>Chronic ITP: More than 12 months.</li> <li>Severe ITP: Presence of bleeding symptoms at presentation need treatment, or occurrence of new bleeding symptoms requiring additional therapeutic intervention with a different platelet-enhancing agent or an increased dose.</li> </ul>

**Table 7:-** Proposed criteria for assessing response to ITP treatments<sup>[30]</sup>

<b>Quality of response</b>
<ul style="list-style-type: none"> <li>CR: platelet count &gt;100 x 10<sup>9</sup>/L and absence of bleeding.</li> <li>R: Platelet count &gt;30 x 10<sup>9</sup>/L and at least 2-fold increase the baseline count and absence of bleeding.</li> <li>Time to response: time from starting treatment to time of achievement of CR or R.</li> <li>NR: platelet count &lt;30 x 10<sup>9</sup>/L or less than 2-fold increase of baseline platelet count or bleeding</li> <li>Loss of CR or R: Platelet count &lt;100 x 10<sup>9</sup>/L or bleeding (from CR) or &lt;30 x 10<sup>9</sup>/L or less than 2-fold increase of baseline platelet count or bleeding (from R)</li> </ul>
<b>Timing of assessment of response to ITP treatments</b>
<ul style="list-style-type: none"> <li>Variable depends on the type of treatment (see Table 8).</li> </ul>
<b>Duration of response</b>
<ul style="list-style-type: none"> <li>Measured from the achievement of CR or R to loss of CR or R.</li> </ul>
For response criteria in refractory ITP, see Table 9.

**Table 8:-** Individual agents for treatment of ITP and the time to the first and peak responses if using the reported dose range<sup>[30]</sup>

Agent/treatment	Reported dose range	Time to initial response*	Time to peak response*
Prednisone <sup>[46,47]</sup>	1-4 mg/kg PO daily x 1-4 wk	4-14 d	7-28 d
Dexamethasone <sup>[48,49]</sup>	40 mg PO or IV daily x 4 d for 4-6 courses every 14-28 d	2-14 d	4-28 d
IVIg <sup>[50,51,52]</sup>	0.4-1 g/kg per dose IV (1-5 doses)	1-3 d	2-7 d
Anti-D <sup>[53,54]</sup>	75 ug/kg per dose IV	1-3 d	3-7 d
Rituximab <sup>[55,56,57]</sup>	375 mg/m <sup>2</sup> per dose IV (4 weekly doses)	7-56 d	14-180 d
Splenectomy <sup>[58]</sup>	Laparoscopic	1-56 d	7-56 d
Vincristine <sup>[46]</sup>	up to 2 mg/dose IV (4-6 weekly doses)	7-14 d	7-42 d
Vinblastine <sup>[46,59]</sup>	0.1 mg/kg per dose IV (6 weekly doses)	7-14 d	7-42 d
Danazol <sup>[46,60]</sup>	400-800 mg PO daily	14-90 d	28-180 d
Azathioprine <sup>[60]</sup>	2 mg/kg PO daily	30-90 d	30-180 d
AMG53 <sup>[61,41,42]</sup>	3-10 ug/kg weekly SC	5-14 d	14-60 d
Eltrombopag <sup>[43]</sup>	50-75 mg PO daily	7-28 d	14-90 d

In the times to the initial and peak responses, the first number of days is the first time that a response could be reasonably expected and the second number of days is the time after which a response to this particular agent becomes less likely when administered at the dose and schedule listed in the table. Dosages, where not given on kilogram/body weight basis, are intended for adults.  
PO indicates per oral administration; IV, intravenous infusion; and SC, subcutaneous infusion.

**Table 9:- Refractory ITP<sup>[30]</sup>**

<b>Definition (all should be met)</b>
Failure to achieve at least R or loss of R after splenectomy*
Need of treatment(s) (including, but not limited to, low dose of corticosteroids) to minimize the risk of clinically significant bleeding. † Need of on-demand or adjunctive therapy alone does not qualify the patient as refractory.
Primary ITP confirmed by excluding other supervened causes of thrombocytopenia.
<b>Definition of on-demand therapy</b>
Any therapy used to temporarily increase the platelet count sufficiently to safely perform invasive procedures or in case of major bleeding or trauma‡
<b>Definition of adjunctive therapy</b>
Any non-ITP specific therapy that may decrease bleeding (e.g., antifibrinolytic agents, hormonal agents, DDAVP, recombinant factor VIIa, fibrin sealants). Platelet transfusion is also included.
<b>Definition of response to therapy in refractory ITP</b>
Ability to maintain a platelet count sufficient to prevent clinically significant bleeding†§
Ability to decrease toxic therapy (e.g., corticosteroids) does not qualify for response but should be reported
<b>Definition of response to on-demand therapy</b>
Control of bleeding in the specific situation
Achievement of a platelet count sufficient to perform procedure or minimize bleeding from trauma
DDAVP indicates deamino arginine vasopressin. *May not be applicable in children or in patients with accessory spleen. †Bleeding symptoms measured by a validated scale whenever possible (requires further studies). ‡Specific platelet thresholds cannot be provided, but in most instances, a platelet count of 50-70 x 10 <sup>9</sup> /L would fulfill this criterion. §A strict definition of response in terms of predefined platelet count cannot be given and may not be appropriate

when considering the risk/benefit ratio in refractory ITP, because the trade off between efficacy of a specific treatment and its short- and long-term toxicity varies among patients.

Leishmaniasis Recurrent Immunocompetent Liposomal amphotericin B

#### Abstract

**Introduction:-** Current treatment options for visceral leishmaniasis (pentavalent antimony, amphotericin B, liposomal amphotericin B and miltefosine) achieve long-term clinical cure in the majority of immunocompetent patients. Disease relapse is usually provoked by T-cell number or function impairment (corticosteroid or cytotoxic therapy, transplant recipients, advanced human immunodeficiency virus disease).

**Case presentation:-** We report a case of visceral leishmaniasis with multiple relapses in a 75-year-old Greek immunocompetent man. Visceral leishmaniasis relapses occurred despite appropriate treatment with liposomal amphotericin B 3mg/kg/day on days one to five, 14 and 21 (for the first episode and the first relapse) and miltefosine 150mg/day for 28 days (for the second relapse). The third relapse was treated with high-dose liposomal amphotericin B (10mg/kg for two consecutive days), followed by a secondary prophylaxis of 3mg/kg once per month, which prevented disease reappearance during one year of follow-up.

**Conclusion:-** An unusual case of recurrent visceral leishmaniasis in an older immunocompetent patient was treated with high-dose liposomal amphotericin B and a monthly prophylaxis with no evidence of a relapse after one year of follow-up.

#### Introduction:-

Leishmaniasis is a globally widespread group of parasitic diseases caused by different species of parasites that belong to the genus *Leishmania*. It is a zoonosis and the parasite is transmitted by the bite of an infected female phlebotomine sand fly. Clinically, it is subdivided into visceral (kala-azar), cutaneous and mucocutaneous forms. Visceral leishmaniasis (VL), the most severe form, is a disseminated intracellular protozoan infection that targets tissue macrophages in the liver, spleen and bone marrow. *Leishmaniadonovani* and *Leishmaniainfantum* can both cause VL, but *L. infantum* is the predominant pathogen in Mediterranean countries [1, 2].

The outcome and clinical features of the disease depend on both parasite properties (infectivity, pathogenicity, virulence) and host factors (age, nutritional status, and efficacy of innate and cell-mediated immunity). With

appropriate treatment, long-term clinical cure is usually achieved; however, eradication of parasites is unlikely in most patients, as evidenced by the fact that, despite initial clinical cure, the disease can reactivate several years later and parasites can be persistently detected with application of sensitive assay methods like polymerase chain reaction [3]. Disease relapse occurs frequently in patients with T-cell number or function impairment (corticosteroid or cytotoxic therapy, transplant recipients, advanced human immunodeficiency virus disease). Rarely, spontaneous reactivation can occur in immunocompetent patients, attributed mainly to drug resistance or suboptimal treatment regimens [4, 5].

Here we report the case of an older immunocompetent patient who had multiple VL relapses, despite appropriate treatment with liposomal amphotericin B (L-AmB) and miltefosine. His relapsing disease course was attributed to advanced age-induced immunosuppression as no other cause was identified.

### Case presentation:-

A 75-year-old Greek man, resident in an urban area, presented to our hospital complaining of high fever with chills and rigors, night sweats, fatigue and weight loss of 3kg in one month. His previous medical history was unremarkable. A physical examination revealed a moderately enlarged spleen.

Laboratory investigation showed leukopenia (leukocytes: 2100/ $\mu$ L), normochromic-normocytic anemia (hemoglobin: 11.3g/dL) and moderate thrombocytopenia (platelets: 101,000/ $\mu$ L). A high erythrocyte sedimentation rate (ESR) (90mm/hour) and C-reactive protein (4mg/dL) were also noticed. The biochemical tests were normal except for elevated serum globulins (4.2g/dL). The serum protein electrophoresis revealed a polyclonal  $\gamma$ -globulin pattern without detection of a monoclonal component. His chest X-ray and urine analysis were normal. His blood and urine culture results were repeatedly negative. A transthoracic echocardiogram revealed no pathology and his tuberculin skin test result was negative. An abdominal computed tomography scan with contrast medium revealed the presence of a few hyperechogenic splenic lesions. Serology results for hepatitis A, B, and C, Coxsackie virus, enteric cytopathic human orphan virus, herpes simplex virus, Epstein-Barr virus, cytomegalovirus, human immunodeficiency virus, human T-lymphotropic virus type 1 and 2, toxoplasma, *Bartonellahenselae*, *Francisellatularensis*, *Coxiellaburnetii* and *Rickettsia conorii* were negative. Wright and rapid plasma reagin tests were also negative. A full immunological screening with rheumatoid factor, antinuclear antibodies, antibodies to double-stranded deoxyribonucleic acid (DNA), anti-Sm, anti-Ro/SSA, anti-La/SSB, anti-ribonucleoproteins, anti-Jo-1, anti-Scl-70, anti-histones, anti-mitochondrial antibodies, anti-smooth muscle antibodies, centrally accentuated antineutrophil cytoplasmic antibodies (c-ANCA), perinuclear antineutrophil cytoplasmic antibodies (p-ANCA), anti-cardiolipin, and lupus anticoagulant was negative. A bone marrow aspiration showed numerous protozoan parasites (Leishmanian spp.) within macrophages. Serum test results for leishmania antibodies and K39 antigen were positive.

After confirming the diagnosis of VL, the patient was treated with L-AmB 3mg/kg/day on days one to five, 14 and 21 intravenously. His tolerance of amphotericin was excellent with no significant changes in his kidney and liver functions. Treatment was completed uneventfully and was associated with prompt remission of the patient's symptoms in conjunction with a gradual recovery of leukocyte and platelet counts and hematocrit level.

Six months later, he reported intermittent fever and deterioration of his health. The laboratory tests showed leukopenia, anemia and thrombocytopenia again. The physical examination was normal. His blood and urine cultures were still negative and a new abdominal computed tomographic scan showed no pathological findings. A bone marrow smear revealed the presence of leishmania amastigotes, though in much lower numbers than those detected six months previously. The patient received another complete course of intravenous L-AmB at the same dose, which resulted in complete clinical and laboratory remission.

However, three months later, the patient had to be hospitalized again for a new episode for VL that was confirmed with a new bone marrow smear. The laboratory and serological findings were compatible with the previous results. A total lymphocyte count and CD4+ percentage, as well as their absolute count, were measured in order to evaluate the immune status of our patient. CD4+ cell percentage and absolute count were found to be relatively low (22% and 450/ $\mu$ m<sup>3</sup>, respectively). Miltefosine (Impavido® 50mg/Zentaris GmbH, Germany) was administered in a dosage of 150mg per day (three capsules once daily) for 28 days. Treatment was generally well tolerated; gastrointestinal symptoms such as vomiting and anorexia were controlled with a split of the daily dose into two doses, which were co-administered with food.

Three months later, the patient required another hospitalization for irregular fever, sweats and fatigue. The laboratory tests once again revealed pancytopenia. His test results for leishmania antibodies and K39 antigen were positive. The patient was reluctant to be subjected to an additional bone marrow biopsy. However, there was a strong clinical evidence for a new episode of VL, therefore a new course of L-AmB administration was decided in a dose of 10mg/kg on days one to two, in combination with oral miltefosine. Unfortunately, the tolerance of miltefosine was very poor this time because of vomiting; this led the patient to stop the drug three days after initiation. Nevertheless, the administration of high-dose L-AmB resulted in complete clinicolaboratory response. In order to prevent further disease relapses, a secondary prophylaxis with L-AmB once per month at a dose of 3mg/kg was scheduled. Currently, almost a year after the last VL episode, the patient remains in good health with normal hematological indices.

### Discussion:-

Leishmania organisms are flagellated protozoa that are usually transmitted by female phlebotomine sand flies to mammalian hosts, where they reproduce as obligate intracellular parasites in the mononuclear phagocytic system. The cardinal pathogenetic characteristics of leishmania infection are: (i) the parasite replicates intracellularly in resident tissue macrophages, (ii) the host immune-inflammatory response regulates the expression and outcome of the disease and (iii) tissue infection is usually persistent [6]. Dissemination depends on different factors such as parasite properties, host factors and host responses. Ideally, after promastigotes enter macrophages, the immunocompetent host develops nonspecific (innate) and cell-mediated immunity in order to eradicate the infection, leading to spontaneous healing and prevention of reactivation. Secretion of proinflammatory Th1-type cytokines such as interferon- $\gamma$ , interleukin-12 and tumor necrosis factor- $\alpha$  prevents parasitemia and development of chronic disease. On the contrary, in immunosuppressed patients, immune responses are ineffective and dissemination of disease occurs frequently [7].

Current therapies for VL, such as pentavalent antimony, amphotericin B, L-AmB and miltefosine, lead to clinical cure in the majority of immunocompetent patients. Recurrent infections occur within a period of six months, commonly in patients with impaired cellular immunity such as individuals with advanced human immunodeficiency virus disease or immunosuppressed transplant recipients [8].

In this article, we report on multiple episodes of relapsing VL in an older patient. Beyond the known decreased capacity of cytotoxic responses during senescence, no other immune-suppressing factor was identified in our case. CD4<sup>+</sup> cell percentage and absolute count measured in the second VL relapse were found to be relatively low (22% and 450/ $\mu\text{m}^3$ , respectively). However, even in human immunodeficiency virus cases with CD4<sup>+</sup> cell counts reaching 250 to 300/ $\mu\text{m}^3$  the risk of relapse seems to be low [9]. To the best of our knowledge, there are very few reports of relapsing VL in the immunocompetent in the literature [10].

Initially, our patient was treated with L-AmB and the same regimen was given in his first episode of relapse. L-AmB is considered a highly effective regimen for VL treatment even in immunosuppressed patients [11, 12]. However, this treatment option failed to succeed in chronic suppression of the disease. Miltefosine, an alkylphosphocholine with antileishmanial activity, was used as an alternative treatment in his second episode of relapse. Studies in immunocompromised patients (human immunodeficiency virus seropositive) have shown that the antileishmanial activity of this drug is retained in this special population, suggesting that miltefosine might be a useful option in preventing relapses of the disease [13]. Unfortunately, even after miltefosine therapy, our patient had a new episode of VL.

L-AmB shows a concentration-dependent activity against Leishmaniaspp, where higher doses of L-AmB result in a greater reduction of the parasite load and in a persistence of drug levels in the liver and spleen for a long period after cessation of therapy [11]. In order to eradicate the infection, we decided to administer the high dose and shorter duration scheme of L-AmB (10mg/kg for two consecutive days) with a subsequent secondary prophylaxis. Current evidence in acquired immune deficiency syndrome-related VL suggests that maintenance treatment with L-AmB at a dose of 3mg/kg once every three or four weeks may suppress recurrent infection, probably by inhibition of the reproduction of the remaining parasites, which represent an endogenous reservoir responsible for future relapses [14, 15]. Our patient showed an excellent tolerance to therapy with no renal or electrolyte disturbances and exhibited a complete clinical and laboratory response.

**Conclusions:-**

An unusual case of recurrent VL in an older immunocompetent patient was effectively treated with high-dose L-AmB and a monthly prophylaxis with no evidence of relapse after one year of follow-up. High-dose and shorter duration regimens of L-AmB seem to be a well-tolerated therapy in older patients, while maintenance therapy may be needed in some cases in order to prevent future VL relapses.

Consent

Written informed consent was obtained from the patient for publication of this case report and accompanying images. A copy of the written consent is available for review by the Editor-in-Chief of this journal.

#### Abstract

**Metformin and its Side Effects:-** Objective: This research aims at investigating the effects of using metformin among Saudi patients in Riyadh.

**Methodology:** (67) males and (57) females have been selected randomly to participate in this research. Self-reported questionnaire has been given to participants. Continuous variables were expressed as mean  $\pm$  standard deviation and categorical variables were expressed as percentages. The t-test was used for continuous variables and chi square test was used for categorical variables. A p-value  $<0.05$  was considered statistically significant.

**Results:** many patients reported diarrhea and nausea as the main side effects of using this medication. However, 50% of participants have no complain. This project found no significant difference between two genders except age & using metformin.

**Conclusion:** metformin has been used widely among Saudi patients suffering from type 2 DM. Many patients complain from side effect of this medication.

#### Introduction:-

Metformin, or otherwise known as Glucophage, is an oral first-line medication to treat Type-2 diabetes. Type 2 Diabetes or Diabetes mellitus type 2 is a condition where a relative lack of insulin, along with insulin resistance and high blood pressure is observed. Metformin, along with this chronic long-term diabetes, can also be used to treat polycystic ovary syndrome, common amongst the overweight young women.

In type 2 diabetes cases, Metformin increases insulin sensitivity and improves glycaemic control in the patient. The glucose production decreases in the liver so that insulin could work efficiently (1). Coupled with this, Metformin is also said to prevent cardiovascular diseases and cancer complications in a diabetic patient (2). This has also been stated by many studies where the use of Metformin may have lowered cancer risks far greater than other anti-

diabetic drugs (3). In addition to that, in several clinical trials, antitumoral effects have been observed, especially in colon region and breasts (4). If taken with diet and exercise, Metformin works remarkably. It is repeatedly prescribed to the patients not to chew or crush the tablet. Instead, it is preferred to be swallowed as a whole.

Keeping its amazing benefits on one side, Metformin is said to cause some serious side effects as well. The common ones include nausea, vomiting, upset stomach with abdominal pains, or diarrhoea which are mostly characterized as gastrointestinal effects and will be discussed later on in Literature Review. Severe headaches and skin rashes are also very common. Apart from this, Metformin also rarely causes lactic acidosis, which is the excess building up of lactic acid in the body and can be fatal. This will also be elaborated in the literature review.

### **Literature Review:-**

Metformin should be avoided in cases when the patient experiences any sort of allergic reactions. For instance, hives, or difficulty in breathing, swelling up of facial organs such as tongue, lip or the entire face, or even throat swelling (5). These are the indications that Metformin dosage or the entire medication prescription needs to be consulted again with the doctor because of inadequate response of the patient towards the medicine.

Gastrointestinal effects of Metformin have repeatedly been studied and reviewed by physicians and scholars, and all of them state that these results, if not treated on time, can be fatal as well depends on the drug dosage. In a clinical trial, consisting of 286 subjects, all given Metformin, 141 or 53.2% of the respondents gave reports of diarrhoea while 25.5% of them said that they felt nauseous and even vomited (6). Gastrointestinal issues can cause serious discomfort, if not treated earlier. Most commonly, it is prominent when the dosage is increased or when Metformin is initially administered. To avoid this, either the dose should be decreased or if it's necessary to consume a larger dose, then it should be increased gradually so the body can get used to the daily consumption.

The most serious side effects of Metformin include Lactic Acidosis. It is also referred to as "metformin-associated lactic acidosis," or MALA. The few symptoms of Lactic Acidosis include severe drowsiness, muscle pain, tiredness, fast or difficult breathing, along with gastrointestinal symptoms as stated earlier, child or cold/blue skin, and others similar to these (7). Even though MALA is approximately 9 per 100,000 person-years (8), it can be fatal in many cases. A similar drug, called Phenformin, was called off from the market because of its high rates of causing lactic acidosis, around 40-64 per 100,000 patient-years (9). Metformin is relatively safer than Phenformin, and the risk of developing lactic acidosis is restricted to specific high-risk groups (9).

Along with all this, Metformin is also said to increase lactic acid production in the large intestine (10). Increased lactic acidosis is mostly common in the patients suffering from heart diseases, kidney issues, or even respiratory diseases (11).

Metformin does not usually cause hyperglycemia, but if it is used with other anti-diabetic drugs, low blood sugar can prevail. Coupled with this, if the patient is exercising too much, or not consuming enough energetic calories from his meals, or even drinking large amounts of alcohol, Metformin may lead to extremely lower levels of blood sugar, which is very dangerous for the patient.

The side effects of Metformin are usually more evident in older people, mostly above the age of 80 years. At that age, heart failures, strokes, liver or kidney diseases are more prevalent, and the doctor needs to be informed of them before Metformin is prescribed to the patient (12). Several studies, taking place in Texas between 2000 and 2006, stated the fact that ingest doses of 5000 mg caused more drastic effects in adults (13). Several other studies and data revealed the fact of some intentional overdose cases, resulting in the survival of the patient. The dose was as high as 63,000 mg, i.e. 63 grams of Metformin (14). This comparison shows that Metformin's side effects do not depend on its overdose. It majorly negatively harms the adult than the younger ones.

Metformin is said to be contraindicated in those people who have the diseases mentioned above, such as heart failures, kidney or liver diseases (defined as creatinine levels over 150  $\mu\text{mol/l}$  (1.7 mg/dl), or any respiratory or lung diseases (15). These may cause the patient to develop lactic acidosis at a much higher rate than otherwise. This has also been reinstated by several studies which link the high occurrence of lactic acidosis to the patient's infection of heart disease and his/her consuming of Metformin (16).

The effects of Metformin do not necessarily start right away. They depend on the body of the patient and vary accordingly. For some people, Metformin does not show any side effects such as the gastrointestinal ones for many days, or even months. On the other hand, for some, they begin on the very same day, or perhaps, two to three days later. There is no stringent rule for the occurrence of these side effects.

### Results and statistical Analysis:-

Data were analyzed using Statistical Package for Social Studies (SPSS 22; IBM Corp., New York, NY, USA). Continuous variables were expressed as mean  $\pm$  standard deviation and categorical variables were expressed as percentages. The t-test was used for continuous variables and chi square test was used for categorical variables. A p-value  $<0.05$  was considered statistically significant.

There is significant difference among different groups of duration of metformin use for gender, other medications, using metformin and side effect of Metformin use.							
* significant p value (level of significance < 0.05)							

Figure 1:-

Duration of metformin use for two genders. The data are presented by percentage (%). P-value had been calculated between two genders. Duration of metformin use for female gender was significantly lower in duration group more than 5 years when compared with all other duration groups.

### Discussion:-

Metformin is used as a prescription to type 2 Diabetes mellitus. This project investigated the harms resulting in the use of such medication among Saudi patients. Many patients reported diarrhea and nausea as the main side effects of metformin. However, half of participants don't get the same suffering. This project found no significant difference between two genders except age & using metformin.

Similar findings have been reported in other publications. In a clinical trial, consisting of 286 subjects, all given Metformin, 141 or 53.2% of the respondents gave reports of diarrhoea while 25.5% of them said that they felt nauseous and even vomited (Drug Facts and Comparisons, 2005). Gastrointestinal issues can cause serious discomfort, if not treated earlier. Most commonly, it is prominent when the dosage is increased or when Metformin is initially administered.

In conclusion, metformin is widely used among diabetic Saudi patients. Side effects as result of using this medication should be expected. Health education can help to reduce the severity of these complains.

Qualitative study should be launched to give in details explanations regarding the side effect of the use of metformin among diabetic patients in all age groups.

### Acknowledgments:-

Authors would like to express their sincere gratitude to Dr. Nasser Alkahtani for the continuous support he provided to them throughout preparing the manuscript.

#### Abstract

**Objective:** To find out if there is a difference in hearing levels between normal and blind people. To answer the following questions, "Is the concept of losing one sense will improve the other senses right or wrong? If someone born blind, will he have better hearing abilities than those with a good vision?"

**Study design:** A cross sectional study

**Methods:** Forty male students aged between 13-22 years old from two special education schools were randomly selected to evaluate their hearing levels from Eastern district, Saudi Arabia at the period from February 2016 to April 2016. They were divided into two groups. The first group included the student with visual impairment (13 students) and total blindness (7 students) for more than 5 years. The second control group is of 20 students with normal vision. A questionnaire was answered by each one. Anyone with history of ear disease was excluded from the study. A pure tone average thresholds (PTAs) were obtained for left and right ears for the frequencies 0.125, 0.25, 0.5, 1, 2, 4, and 8 kHz. Data were statistically evaluated using SPSS version 20.

**Results:** Hearing levels were normal in most of the participants with mild hearing loss in 4 ears of 3 participants (5%). The difference at the hearing levels between pure tone average for both ears in the visually impaired plus totally blind subjects compared to the control group was non-significant, P value = 0.829 ( $> 0.05$ ). While, there was significant difference at the hearing levels between pure tone average for both ears in the three groups (visually impaired, totally blind and normally sighted group) using ANOVA test, P value = 0.04 ( $< 0.05$ ) with the lowest hearing level at the totally blind group.

**Conclusion:** Loss of one sense does not potentiate other senses as some people believe. Blind people have the same level of hearing as normal population.

#### Introduction:-

Communication and people interactions in our daily life activities depend on hearing and vision [1]. Most blind people were not born blind, they become blind. This means that, having learned to rely on their sight in order to recognize and relate to the world, they must now radically revise their basic assumptions about that world [2-3].

It is reported that 285 million people are estimated to be visually impaired worldwide. Thirty nine million are blind and 246 million have low vision [4]. In Kingdom of Saudi Arabia (KSA) there was study conducted on 14,577 people representing the settled population of KSA. The survey revealed that 1.5% of the population are blind and another 7.8% are visually impaired according to the World Health Organization definition [5].

Hearing is one of the important senses by which we can understand & communicate with surroundings. Hearing thresholds of 25 dB or bigger in any ear is said to have hearing loss (HL). HL may be mild, moderate, severe or profound. It is reported as well that about 360 million people worldwide have disabling hearing loss [6].

Loss of one sense will affect other senses. Music experts often cite blind musicians Stevie Wonder and Ray Charles as examples of how a lack of sight can heighten or enhance hearing. Therefore loss of vision can result in changes in auditory perceptual abilities and in the way sounds are processed within the brain [7]. A number of studies have reported that people who become blind at an early age can hear notes and localize sounds more precisely than those with sight or people who go blind later in life [7]. In a same conception, a recent review on visual abilities in the profoundly deaf suggests that enhanced visual performance in those group [8&9]. King in 2015 reported that blind persons are dependent on their hearing as they develop superior auditory skills, either as a result of plasticity within the auditory system or through the recruitment of functionally relevant occipital cortical areas that lack their normal visual inputs [7]. Improvements in hearing abilities following blindness may result from an increase in cortical territory devoted to auditory processing (10).

To find out if there is a difference in hearing levels between normal and blind people. To answer the following questions, "Is the concept of losing one sense will improve the other senses right or wrong? If someone born blind, will he have better hearing abilities than those with a good vision?"

### **Material and Methods:-**

The study was conducted with the help of the hearing and speech department in the special education center, Khalid bin Al-Walid middle school, and Al-Mubarraz high school, Eastern district, Saudi Arabia from February 2016 to April 2016. Forty male students aged between 13-22 years old from both schools were randomly selected to participate. The participants were divided into two groups, each group consisted of 20 students based on the visual acuity. The first group included the student with visual impairment (13 students) and total blindness (7 students) for more than 5 years. The second group had 20 students with normal vision, constituting the control group. An informed verbal consent for their participation in the study was obtained at the beginning with explanation of what the research is about to all the participants. A questionnaire was answered by each one of them about their history [Fig1]. It includes the history of chronic diseases, ear problems, the use of hearing aids, family history of ear problems, the use ototoxic drugs and past history of ear surgery. Anyone with history of ear disease was excluded from the study. A pure tone average thresholds (PTAs) were obtained for left and right ears for the frequencies 0.125, 0.25, 0.5, 1, 2, 4, and 8 kHz. Data were statistically evaluated using SPSS version 20.

Name \_\_\_\_\_

Age \_\_\_\_\_ Gender \_\_\_\_\_ Nationality \_\_\_\_\_

1) Are you suffering from any chronic disease/ diseases?  
       Yes        No     if no go to Q3

2) What is the disease/ diseases?  
       Diabetes Mellitus    Hypertension     Others \_\_\_\_\_

3) Do you have any ear problems?  
       Yes        No     if no go to Q6

4) What is the problems? (You can choose more than one answer)  
       Congenital anomaly    Decreased hearing ability    Pain  
       Buzz                      Excess ear wax                      Dizziness

5) Do you use any hearing aids?  
       Yes        No

6) Does any of your family members suffer from ear problems?  
       Yes, Relation (.....)                      No

7) Do you use any drug regularly?  
       Yes                No     if no go to Q9

8) If you answered yes to the seventh question, what is the name of this drug / these drugs?  
       ( .....)

9) Did you perform any surgery in your ear in the past?  
       Yes, what was it? (.....)  
       No

Figure 1: Questionnaire

## Results:-

Our study included 40 participants. They all replied the questionnaire and the findings are shown in figure 2.

**Figure 2: questionnaire findings**

They were visually impaired subjects (13=32.5%), totally blind persons (7=17.5%) and normally sighted controls (20=50%). The average age of the visually impaired group was  $16 \pm 2.1$  years, the totally blind group was  $16.6 \pm 2.8$  years, and the normally sighted group was  $15.2 \pm 1.5$  years [table 1]. All the 40 participants were Saudi males.

**Table 1. Descriptive statistics regarding age of the study group**

	N	Mean	Minimum	Maximum	SD
Visually impaired	13	16	13	20	2.1
Totally blind	7	16.6	14	22	2.8
Normally sighted	20	15.2	13	17	1.5

Hearing levels were normal in most of the participants with mild hearing loss in 4 ears of 3 participants (5%) [table 2].

**Table 2. Pure tone averages in R and L ears**

Visually impaired		Totally blind		Normally sighted	
PTAs R ear (db)	PTAs L ear (db)	PTAs R ear (db)	PTAs L ear (db)	PTAs R ear (db)	PTAs L ear (db)
5	5	18	21	20	20
13	10	10	15	20	20
18	12	12	16	15	20
10	15	20	20	11	11
13	7	35	36	16	16
16	17	16	20	15	15
15	15	32	20	17	17
18	18			15	15
20	20			16	16
15	15			15	15
23	20			15	15
15	15			15	15
21	17			15	15
				25	25
				15	15
				15	15
				15	15
				15	15
				33	17

Pure tone average ranges from 5 to 23 dB for the visual impairment group (mean 14.9 dB), 10 to 36 dB for the total blindness group (mean = 20.8 dB), and 11 to 33 dB for the normal sighted group (mean = 16.6 dB). Using independent sample T-test SPSS version 20, there was non-significant difference at the hearing levels between pure tone average for both ears in the visually impaired plus totally blind subjects with the control group, P value = 0.829 ( $> 0.05$ ) [table 3].

**Table 3. Independent sample T-test results**

	N	mean	SD	t	df	P value
Visually impaired + Totally blind	20	16.97	6.33	0.217	38	0.829 ( $> 0.05$ )
Normally sighted	20	16.63	3.44			

While, there was significant difference at the hearing levels between pure tone average for both ears in the three groups (visually impaired, totally blind and normally sighted group) using ANOVA test, P value = 0.04 ( $< 0.05$ ) with the lowest hearing level at the totally blind group [table 4].

**Table 4. ANOVA test results**

	N	mean	SD	S error	F	P value
Visually impaired	13	14.9	4.4	1.2	3.505	0.04 ( $< 0.05$ )
Totally blind	7	20.8	7.8	2.9		
Normally sighted	20	16.6	3.4	0.7		

### Discussion:-

This study was planned based upon the hypothesis that sensory deprivation (e.g. blindness) may has some effect on the intact senses. Blind people depend more on their intact sensory modalities (e.g. hearing), making them sharper and perform better compared to normal performance in order to compensate the lack of visual inputs [6].

Our study showed that the mean pure tone average for both visually impaired and totally blind to be 14.9 dB and 20.8 dB respectively compared to 16.6 dB in normally sighted people. Which means that totally blind participants have significantly worse hearing abilities than sighted age matched controls, and that against our conception [11]. Participants with visual impairment didn't show significant difference from the sighted age matched controls, and that could be due to having some residual visual abilities.

Most of the previous studies which were similar to our study focused on the ability of a blind person to localize sounds in comparison with normally sighted person. Nilsson & Schenkman reported that due to sound being the only source of information used for sound localization for a long term, the blind has greater inter-aural time differences sensitivity and inter-aural level differences sensitivity compared to sight age-matched [12]. Another study by Kolarik et al. focused on the distance discrimination, suggesting that totally blind people have better sound distance discrimination than sight age-matched and no difference when comparing people with partial visual loss to sight age-matched [11].

### Limitations:-

Our study cannot be generalized to all the blind, since it was done only for a small number of blind people in a very limited area.

### Conclusion:-

Loss of one sense does not potentiate other senses as some people believe. Blind people have the same level of hearing as normal population.
