#### Abstract

Heavy metals are a major problem because they are toxic and tend to accumulate in living organisms. This study was carried out with the aims of studying on histopathology of  $\text{Cu}(\text{SO}_4)$  toxicity on gill and liver tissues of catfish *Clarias batrachus* within the period of 96 h. Totally, 140 fishes with mean weight  $60 \pm 10$  g were stocked in 12 aquariums with capacity of 200 L water and divided in to 3 trails including control, 0.3 ppm and 0.5 ppm of Cu with 3 replicates. Tissue samples were fixed by bouin's solution and sectioned in 7  $\mu\text{m}$  based on histological regular method and stained with Hematoxylin and Eosin (H & E) method for microscopic study within the period of 96 h. Results showed some damaged such as hyperplasia, telangiectasis and edema, necrosis of second filaments, jerky movement, aneurism, hyperaemia and fusion of second filaments in gills; and cell atrophy, necrosis, fatty degeneration, hyperaemia and bile stagnation at different treatments in comparison with control. Gill and liver tissue damages were severer with the increase of Cu concentration and days. Therefore, Cu had acute toxicity effects on gill and liver tissues in Catfish at 0.3 and 0.5 ppm concentrations.

#### Introduction:-

Heavy metals are serious danger for the earth ecosystem. Accumulation of heavy metals in water, air and soil is a major environmental problem. A little amount of copper is produced from destroying of soils and rocks (Kasraiee, 2009). Naturally, heavy metals formed lower than 1% of body weight and their concentration fluctuations lead to environmental impermanent and disaster in animals (Clark, 1986). Industrial development and environment chemical pollution threatens aquatic animal life. Environmental pollutions with heavy metals were increased in the world and it may be bioaccumulated in fish tissues (Mansour and Sidky, 2002). Therefore, heavy metals are the most important pollutant of aquatic ecosystem that is the cause of major problems for human (Karan *et al.*, 2002). Some metals such as copper and ferric are needed in little amount for natural development, but some of them such as Cu, Cd, Pb and Hg are toxicant at lower concentrations. Therefore, discharge of industrial, mineral, agricultural, house sewage and fuel (Swarup *et al.*, 2006; Patra *et al.*, 2005; Woodling *et al.*, 2001), algacides and fungicides used in aquaculture (Onwumere and Oladimeji, 1990) are considered as aquatic ecosystem pollutants so that

industrial wastewaters are the main source of pollution (Kaviraj and Das, 1995) that include various kinds of toxic pollutants such as suspended solid, minerals, poisons and pesticides (Kumar and Singh, 2010). Therefore, heavy metal pollutions have harmful effects on environmental equivalent and animal diversity (Vinodhini and Narayanan, 2008). Copper is one of these pollutants and also added to ponds as a micronutrient for increasing in production of planktons and fish (Adhikari and Ayyappan, 2004). Catfish is a warm water fish that feed on planktons. Copper may be transferred by plankton to fish and human finally. Higher amount of zinc leads to pathologic disasters in tissues and causes fish death. Some studies were done in Iran that showed the effects of Cu on different tissues of *Cyprinus carpio* (Mohammad Khanlo Ashaieri, 2003; Rostami *et al.*, 2000; Rostami and Soltani, 2009) in rainbow trout (*Oncorhynchus mykiss*) (Farangi and hajimoradloo, 2007) and in fingerlings of *Acipenser persicus* (Moshtaghi *et al.*, 2009; Fathollahi *et al.*, 2010). Therefore, the aim of this study was investigating histopathological effects of Cu acute toxicity on gill and liver tissues in *C. batrachus*.

### Materials and Methods:-

Adult and live fish *C. batrachus* were collected from the fish farm Patra and Bhadbhada Bhopal M.P.) brought to the laboratory, cleaned by using 0.1% KMnO<sub>4</sub> to avoid dermal infection. Fishes were acclimatized in glass aquaria for 15 days and were fed with fish food (earthworms) and water in the aquaria was replaced by freshwater at every 24h.

140 fishes with mean weight  $60 \pm 10$  g in 3 treatments (0.3 and 0.5 ppm) with 3 replicates were stocked in aquarium with capacity of 200 L water. Firstly, the fishes were adapted to clinical conditions and then introduced to detected concentrations. Desired concentrations of Cu were measured by the Germ/volume method and using  $C2V2 = C1V1$  formula. Firstly, the total required Cu was measured and then dissolved in a specific volume of the whole water for providing stock solution. Then, specific volumes of the stock were poured into aquariums. Samples of gill and liver tissues were collected at 24, 48, 72 and 96 h, fixed by Bouin's solution and dehydrated based on standard method, clarified, embedded, sectioned with 7  $\mu$ m diameters by using microtome set (model Letiz 1512, Germany), stained based on Hematoxylin and Eosin (H & E) method (Hallajian, 2010) and were studied by light microscope.

### Results:-

Clinical studies results showed some apparent signs such as fast opening and closing of operculum and mouth, fidgety and air swallowing.

#### (A) Microscopic study of gill:-

Some damages including hyperplasia, telangiectasis, and edema, necrosis of second filaments, jerky movement, aneurism, hyperemia and fusion of second filaments in gills at 0.3 and 0.5 ppm concentrations than control and severe with increase of concentration and days

#### (B) Microscopic study of liver:-

Microscopic studies of liver samples showed some damages such as cell atrophy, cell necrosis, fatty degeneration, hyperemia, bile stagnation and melanomacrophage at 0.3 and 0.5 ppm than control (Figures 4, 5 and 6). Liver damages were lower at 0.3 ppm than 0.5 ppm of Cu. Therefore, with the increase of zinc sulphate concentration and days up to 72 h liver damages were severe but at 72 & 96h.

### Discussion:-

Heavy metals have an important physiological effects and causes of many diseases if decreased or increased. Copper is a mineral ingredient and its toxicity has bad effects on the body of fishes (Donmez *et al.*, 1993). Gill structure in Catfish includes primary and second lamella. Secondary lamellas of this fish are long and free from the end of distal. A normal secondary lamella complex was from two thin layers of epithelial cells, blood vessels and row of cells (Athikesavan *et al.*, 2006). Copper has effects on chloride cells, gill morphology and physiology such as pH reduction in blood vessel, decrease in oxygen absorption and heart beat and delays egg hatch time and increase of larvae survival. Cu is resistant to deposition and lingering in environment for long time. Acute damages caused by Cu on gill include lamella fusion, hyperplasia, hyperemia, cell necrosis and telangiectasis after 12 h. These disasters in fish are kind of responses to environment conditions, so that fusion of secondary filaments is due to mucosa glycoprotein on cells (Chreck and Moyle, 1990) which lead to increase exposure of lamella with air or oxygen for collapse and adhesiveness, hyperemia and hyperplasia that indicated an immune response to chemical matters such as heavy metals (Rostami *et al.*, 2000). Hypertrophy and hyperplasia caused to disaster in gill epithelium cells because of reduction in water flow between gill filaments that decreased respiratory function (Marioara *et al.* 2009). Some similar effects have been reported by Marioara *et al.* (2009) and Athikesavan *et al.* (2006) about Cadmium effects on Silver Carp; Naji *et al.* (2007) about Cu effects on Common Carp; Gorouiee *et al.* (2008), Collins and Brown (1998), and Jeney (1992) about aluminum sulfate effects on *Rutilus frisikuttum*, *Onchorhynchus mykiss* and *Cyprinus carpio*, respectively. Fernandez *et al.* (2008) indicated that long term exposure to heavy metals cause respiration, blood circulation and osmoregulation disasters in fishes. Alvarado *et al.* (2006) observed that high increase in chloride cells of gills led to thickness in epithelial cells, increase in migration of chloride cells into secondary lamella edge, hypertrophy and fusion of secondary lamella of gills. Liver play a main role in detoxication. Histological studies of liver showed cell atrophy, cell necrosis, hyperaemia and bile stagnation after 12 h exposure to Copper sulphate. Rostami *et al.* (2000), and Rostami and Soltani (2009) reported cell necrosis, increase of

*Hemosydrine* in Common Carp exposed to Cu. Kamaraju and Ramasamy (2011) indicated that increase in  $\text{NiCl}_2$  concentration lead to decrease in glycogen level. Yilmaz *et al.*, (2011) showed that with increase of  $\text{CdSO}_4$  concentration in *Leuciscus cephalus*, some disasters in liver such as fatty degeneration, cell necrosis and kopfer cells were severed according to present study results.

### Conclusion:-

Based on obtained results at present study, zinc sulphate induced some histopathological disasters and leads to fish death. Toxicity rate of Cu in fishes was severe with the increase of concentrations and days.

### Abstract

Green banking is a new concept of banking were in all other activities of banking remains the same, but extra protection is given on sustainability environmental protection through paper less banking. It is that part of banking which aim at reduction of operational cost, improving efficiency and total productivity. This paper makes an attempt to find out the awareness and adoptability of concept of green banking. We know that India is a developing nation were nearly 40% of population are youths. It makes an investigation into the various modes of e – banking services available to the customers and extent they use the services.

### Introduction:-

Glaucoma is the second leading cause of blindness in the world and the estimated prevalence of Glaucoma around the world is estimated 60 million people with glaucomatous optic neuropathy and an estimated 8.4 million people who are blind as the result of glaucoma. The prevalence in Saudi Arabia has not been determined however, These numbers are set to increase to 80 million and 11.2 million by 2020.

People with diabetes are vulnerable to develop glaucoma as are non-diabetics. Lack of knowledge about the disease may cause patients to present late and miss the opportunity to reap the benefits of early intervention.

### Objectives:-

To evaluate the awareness and knowledge on Glaucoma among diabetic patients in Hail city and yearly screening measure.

### Materials & Methods:-

a community based cross sectional study was conducted in Hail city Among diabetic patients. the questionnaire was designed to be three parts:

first part related to personal information (age, gender, education level) and diabetic duration. Second part focused on the awareness and knowledge through 8 questions (four questions evaluating their awareness and four assessing their knowledge). The third part had two questions dealing with the source of information about glaucoma and any screening done regularly. Diagnosed cases of glaucoma were excluded from participating. The questionnaire began with the entry level question "have you heard about glaucoma"

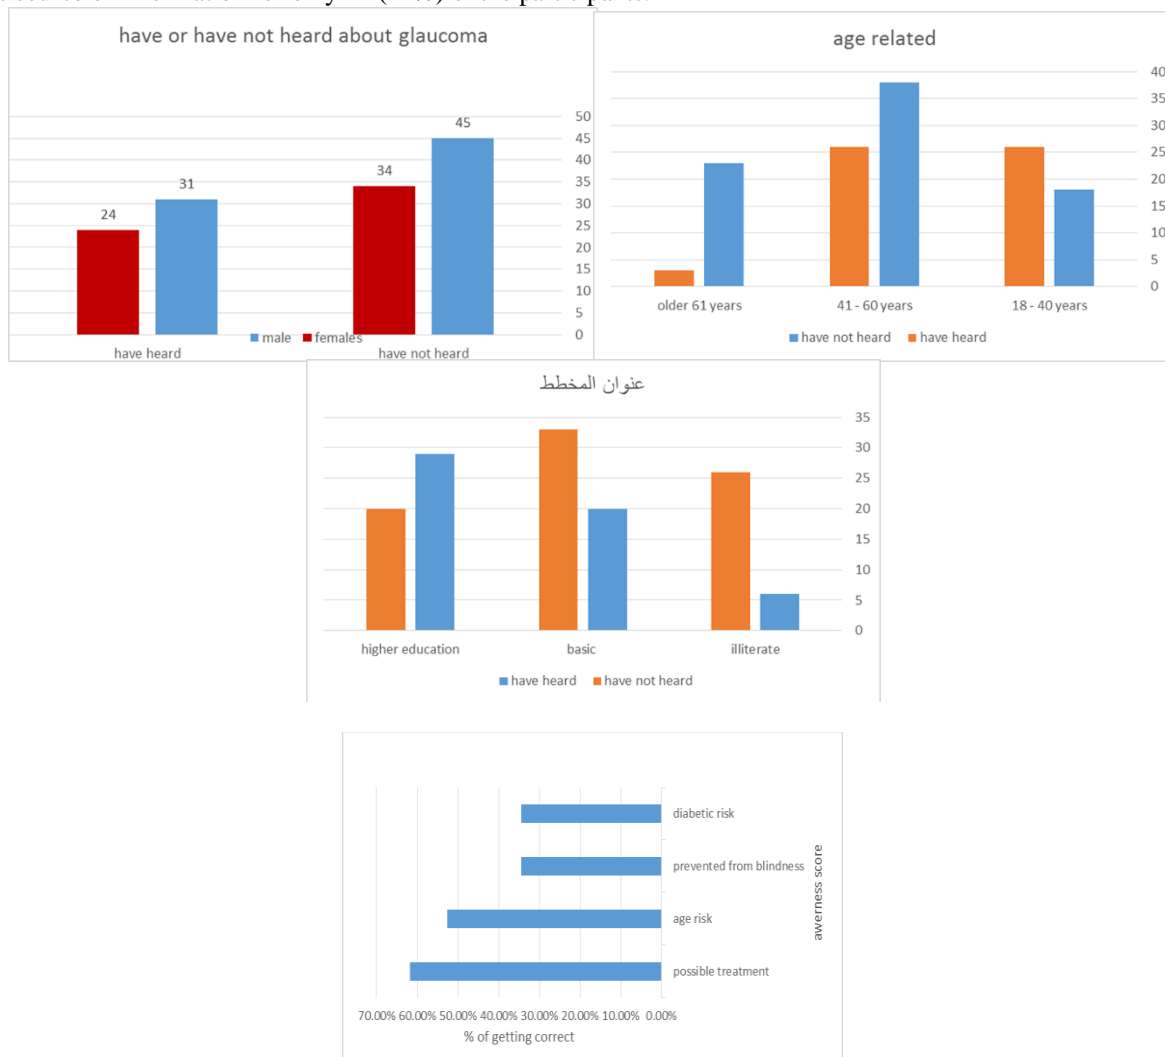

However, not having heard the term itself meant lack of awareness

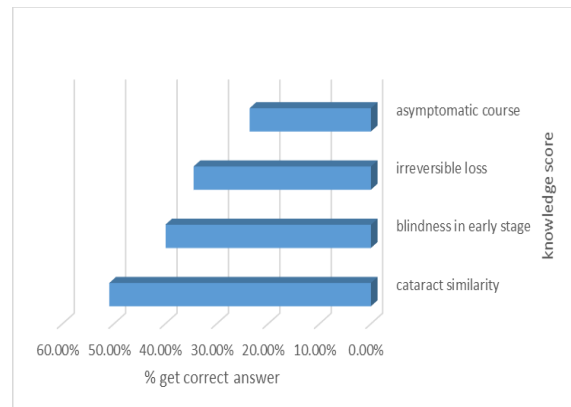

### Results:-

A total of 134 diabetic patients were collected, Age range 18 - 70 The mean age was 53 years. Males were about 76 participants (56.7%) and female 58 (43.3%), Among the 32 (23%) illiterate participants 22 were male and 10 were female 102 (77%) participants were educated at different level, 82 (61.2 %) have more than 10 years duration with diabetes, A total of 55 (41%) participants had heard about glaucoma, And the remaining who have not heard are consider as not aware, (26.2 %) were aware, and (21.2 %) had some knowledge about glaucoma. Awareness of glaucoma in terms of age and gender no difference.

Literate participants were more likely to be aware and likely to be knowledgeable than illiterate participants .The level of education had a significant association with both awareness and knowledge.

Source of information about glaucoma among the respondents was also assessed during the survey. Source of information for 28 (50.9) participants was from family or friends. Another 15 (27%) participants had received information from visiting hospitals, medical personnel, eye camps or other healthcare recourses. TV and other media was source of information for only 12 (21%) of the participants.

### Discussion:-

This study assesses the awareness and knowledge about glaucoma among diabetic patients. The goal of this study to evaluate the understanding of glaucoma, that is, a silent clinical course, irreversible loss, and the importance of screening. Some of participants had heard the term glaucoma (جلوكما) even though, they were a few actually aware, we attributed that as the term may confuse as there is a similar term in Arabic ماء ازرق and cataract ماء أبيض. We did not find any relationship between age or gender and glaucoma awareness, like many other studies. In this study, awareness and knowledge was better among individuals with higher education. As expected, small percentage knew that glaucoma has asymptomatic course and this must raise alert. Lack of awareness could often lead to under-diagnosis and late presentation, as noted in several previous studies and therefore, adversely affected the eye care-seeking behavior. Satisfied percentage knew could be vision loss irreversible, friends and family as the most common source of glaucoma information. Studies from the UK have reported the successful role of media in increasing the awareness about glaucoma. \*

### Conclusions:-

glaucoma awareness and knowledge is suboptimal in Hail among diabetic patients and their knowledge about yearly screening benefits is nearly poor. We recommend the use of public awareness campaigns through various media.

Primary ovarian tumors, krukentburg tumor, CK7, CK20, CDX-2, luteoma of pregnancy.

#### Abstract

Krukentburg tumor is a rare metastatic ovarian carcinoma usually occur in female between 30-40-year-old and rarely seen after menopause. Stomach is the most common primary site.

Histopathological features of krukentburg tumors appears as diffuse stromal proliferation, mucus-production, and numerous signet-cells and these tumors spread mostly by lymphatic route. Treatment and prognostic factors are not well established.

This study describes a 34-year-old female with a unilateral ovarian mass discovered accidentally during cesarean section delivery and it was misdiagnosed as luteoma of pregnancy, but histopathological examination showed a diffuse infiltration of the ovary and omentum by malignant cells, some of which have signet ring morphology. These findings were not correlated with luteoma of pregnancy or any other types of primary ovarian tumors like primary surface epithelial tumor, sex cord stromal tumor or germ cell tumor. A panel of immunohistochemical markers were ordered and the results were as follow: (negative CK7, AFP, and alpha inhibin, and positive EMA, CK20 and CDX-2). these findings were diagnostic for metastatic adenocarcinoma either from the stomach or pancreas (krukentburg tumor). Two weeks later, the patient was evaluated and a large gastric tumor was found in her stomach and she underwent gastrectomy.

### Introduction: -

Ovarian cancer is the second most common cancer among all gynecological malignancies and it's one of the leading causes of cancer death among women. Malignant ovarian lesions include primary lesions that develop from the ovarian tissue itself or secondary lesions due to ovarian metastasis from primary lesion elsewhere.<sup>[1]</sup>

Primary ovarian tumors include surface epithelial stromal tumors, sex-cord stromal tumors, germ cell tumors and other more rare types. **Ovarian epithelial tumors** account for the majority of all ovarian tumors. And they are classified according to histological cell type into serous, mucinous (formed by cells of the endocervical epithelium or those of the intestinal epithelium), endometrioid (formed by cells of the internal lining of the endometrium) clear and transitional tumors. These tumors usually range from being benign to borderline or malignant tumor.<sup>[1]</sup>

Krukenberg tumors are rare secondary ovarian cancer due to metastatic adenocarcinoma of the gastrointestinal tract, mainly originate from the stomach. It is bilateral in most of the cases. They are rarely discovered during pregnancy, thus, possess diagnostic challenges to the physicians since its usual symptoms can be attributed to pregnancy. Local extension of the tumor produces gastrointestinal symptoms which could be confused with the effect of pregnancy hormones on the gastrointestinal tract or misdiagnosed with hyperemesis gravidarum. Abdominal distention can also be masked by the gravid uterus. Furthermore, new onset ovarian masses discovered during pregnancy or delivery can be mistaken with pregnancy luteoma, which is, benign ovarian neoplasm that is usually asymptomatic and discovered incidentally during surgeries or imaging.<sup>[2]</sup>

These metastatic tumors usually occur in age group between 30-40 years and rarely seen after menopause. Diagnosis of krukenberg tumors made histologically by the presence of diffuse stromal proliferation, mucus-production and neoplastic signet ring cells.<sup>[3]</sup>

The prognosis of patients with this type of tumor are extremely poor, median survival of 7–14 months. Treatment guidelines has not been established well because of rarity of the disease. And still there is no optimal therapy for this tumor.<sup>[4]</sup>

### Case presentation: -

A 34-year-old pregnant woman on her usual state of health came to the hospital for cesarean delivery. During C/S, her surgeon accidentally discovered a unilateral ovarian mass. Thereafter, oophorectomy and partial omentectomy were performed. The specimen was sent for further evaluation.

The patient did not report any complaint before, and her family history was noncontributory.

### Pathological findings: -

Gross examination revealed a 12X7 cm tumor with smooth external surface and there were no nodules. The cut section showed fleshy whitish tissue with central areas of necrosis and hemorrhage. The microscopic examination showed a diffuse infiltration of the ovary and omentum by signet ring cells, which contain mucin that pushed the nucleus against cell membrane. (Fig.1,2). These findings were not correlated with luteoma of pregnancy or any primary ovarian tumors like surface epithelial tumor, sex cord stromal cell tumor or germ cell tumor but these findings were suspicious for metastatic krukenberg and adenocarcinoma.

Therefore, we ordered a panel of immunohistochemical markers to reach the definitive diagnosis.

The results of immunohistochemical staining for tumor cells were as follow: positive for CK7, CK20 Fig.3(A), CDX-2 and CD99 (Diffuse immunoreactivity). EMA was also positive Fig.3(B). At the same time, tumor cells staining negative for AFP, S-100, HMB-45 and NSE. Inhibin was completely negative.

Further investigations were done to identify the primary site of the tumor and after two weeks of extensive work up for this patient; the primary tumor was found in stomach and it was a gastric adenocarcinoma.

**Fig.1:-** Diffuse infiltration of ovarian stroma by malignant cells arranged singly and in small aggregates, some of these cells have vacuolated cytoplasm (signet ring appearance)

Finally, our patient underwent gastrectomy.

**Fig.3:-** (A) positive CK20. (B) positive EMA.

**Fig.2:-**The omentum showed diffuse multiple signet ring cells.

**Discussion: -**

Metastases of mucin-secreting signet ring cell cancer (SRCC) to ovarian tissues are known as Krukenberg tumor, which is uncommon metastatic ovarian cancer originate from gastrointestinal tract. Stomach is the most common primary site, followed by colon, appendix, and breast cancer. Usually occur in age group between 30-40 year old.<sup>[5]</sup> as in this case, she is a 34-year old.

Krukenberg tumor rarely occurs during pregnancy, diagnosis sometimes is difficult as the presenting symptoms are usually attributed to the pregnancy and there is a maternal and fetal risk for invasive workup.

In most of cases, primary tumor and its metastasis to ovary are diagnosed at the same time, but in 20–30% of cases, ovarian metastasis diagnosed after primary tumor resection.<sup>[6]</sup>

It has been reported that 80% of metastatic ovarian carcinomas are bilateral<sup>[7]</sup> and most ovarian carcinomas that have been metastasized from primary tumors of the large intestine shows solid and cystic components.<sup>[8]</sup>

Our case is parallel to this experience, since the patient had a unilateral metastatic ovarian tumor and the diagnosis of primary gastric adenocarcinoma was established after 2 week of accidental discovery of metastatic krukenburg tumor.

At the beginning, the ovarian mass in our case was misdiagnosed as luteoma of pregnancy which is a non-neoplastic hormonal dependent lesion of the ovary arises from pre-existing luteinized stromal cells, usually discovered incidentally during C/S or postpartum tubal ligation, regress spontaneously postpartum unless there's indication of surgery and it needs accurate diagnosis as it may be misdiagnosed as malignant ovarian tumor which results in unnecessary surgery.<sup>[2]</sup>

In our case, the histopathological findings were not consistent with the diagnosis of pregnancy luteoma as it shows diffuse infiltration of the ovary and omentum by malignant cells that produce excessive mucin intracellularly. The mucin forms large vacuole within the cells and pushes the nucleus from the center to the periphery against the cell membrane leading to the characteristic feature called “signet ring appearance”.

Several mechanisms of metastasis have been reported, lymphatic is the most common route of metastasis, followed by hematogenous spread, direct invasion and peritoneal seeding.<sup>[6]</sup>

There are only 50 cases of Krukenberg tumors occurring during pregnancy have been reported in the literature and there was no significant impact on fetal survival as most (97%) of the reported cases have led to the delivery of healthy baby.<sup>[9]</sup>

Symptomatic patients usually present with abdominal pain, distention, vomiting and weight loss. Virilization and hirsutism may occur due to an effect of estrogen and androgen hormones, other gynecological symptoms such as amenorrhea, menstrual irregularity, and vaginal bleeding are much less frequent in the literature cases.<sup>[6]</sup> The pseudo-Meigs syndrome is a rarely associated condition, which is malignant ovarian tumor with benign hydrothorax and ascites.<sup>[4]</sup>

Here, we present an unusual case of Krukenberg tumor which discovered accidentally during C/S delivery, not preceded by any significant symptoms.

Sometime it is difficult to differentiate morphologically between primary signet ring cell carcinoma of the ovaries and Krukenberg tumors, because usually they are resembling to each other.

Immunohistochemistry is a valuable diagnostic tool in differentiating between them. primary ovarian surface epithelial tumors are mostly positive to CK7 and negative to CK20 and CDX-2. By contrast, metastatic adenocarcinoma is less frequently to be positive for CK7 but is positive for CK20 and CDX-2 in most cases.

Park et al<sup>[23]</sup> found that 71% (207 of 289) of the gastric carcinomas stained positively for CK7, whereas only 9% (21 of 225) of the colorectal carcinomas proved to be CK7 positive, and 41% (117 of 289) of the gastric carcinomas and 73% (165 of 225) of the colorectal carcinomas were CK20 positive.<sup>[4]</sup>

Our patient's tumor stained positively for both CK7 and CK20, indicative of gastric origin.

The treatment strategy is controversial in Krukenberg tumor. surgical resection and aggressive chemotherapy can possibly improve the outcome.<sup>[5]</sup> In advanced disease, palliative treatment (Chemotherapy and Radiotherapy) is considered.<sup>[6]</sup>

The prognosis is poor, the median overall survival time is 2 years. The prognostic factors still not well established. One study reported that, regardless of cancer stage patients who underwent metastectomy and chemotherapy had better prognosis than those who are received chemotherapy alone.<sup>[10]</sup>

Survival of patients who underwent both metastasectomy and gastrectomy was longer than the patients who underwent metastasectomy only. Gastrectomy and absence of ascites are considered as risk factors associated with good survival rate. Inability of resection for the primary tumor is indicate a poor survival rate.<sup>[10]</sup>

Rarely, metastatic ovarian tumors are discovered before primary site, If the primary tumor is identified after the discovery of secondary tumor the prognosis is poor.<sup>[5]</sup> As in our case.

CA 125 level normally elevated during pregnancy and immediately after delivery. However, markedly elevation is commonly seen during cancer.<sup>[11]</sup> CA 125 levels are considered as a useful prognostic marker in evaluating patient's outcome after tumor resection.<sup>[5]</sup> Patient's age and size of ovarian tumor has no role in prognosis.<sup>[4]</sup>

### Conclusion:-

Krukenbuerg tumors are uncommon metastatic gastrointestinal cancer to the ovary mostly from the stomach, presenting with vague symptoms, radiological imaging, histological findings and immunohistochemical evaluation aid in diagnosis and identification of the primary malignancy.

Unfortunately, there are limited treatment options and no optimal treatment has been established. It has a poor prognosis and short median survival time. However, better outcome depends on early diagnosis. As in our case synchronous diagnosis and treatment of the primary cancer and its metastatic tumor along with regular follow-up can prolong the survival time.

Leuteoma of pregnancy should be considered as a differential diagnosis for any ovarian mass diagnosed during pregnancy to avoid unnecessary surgery, the former lesion regress spontaneously in postpartum period.

We report this case because of the relatively rarity of accidentally discovered metastatic ovarian tumor from gastric adenocarcinoma during CS delivery which was preceded by a normal full-term pregnancy.

#### Abstract

**Background Aims:** In this study, the effects of perfusion pressure, insulin, L-carnitine, propionate and 2,4-dinitrophenol on the utilization and oxidation of acetoacetate were investigated in the isolated non-working perfused heart from normal and diabetic rats.

**Materials and Method:** Hearts from Male Wistar albino rats were used. In the diabetic subgroup, Diabetes was induced by an intravenous injection of alloxan. The hearts were perfused at a perfusion pressure of 40 or 80 mmHg for 1 h with Krebs-Henseleit Medium, with the concentrations of calcium and magnesium halved, and oxygenated by equilibration with 5% carbon dioxide and 95% oxygen. Determination of acetoacetate and D-3-hydroxybutyrate levels were made by the method of Mellanby and Williamson and Williamson and Mellanby respectively, and comparison between groups was done using the two-tailed Student's t-test for independent samples.

##### Results

- Increasing Perfusion Pressure: No effect in both normal or diabetic hearts.
- Insulin: No effect on acetoacetate utilization.
- Diabetes: A decrease in the utilization and oxidation of acetoacetate and the production of D-3-hydroxybutyrate.
- L- carnitine:
  - Normal hearts: no effect on acetoacetate utilization.
  - Diabetic hearts: acetoacetate utilization was enhanced
- Propionate:
  - Normal hearts: Inhibited utilization of acetoacetate without affecting the rate of oxidation. The rate of D-3-hydroxybutyrate production was inhibited.
  - Diabetic hearts: Enhanced the utilization and oxidation of acetoacetate while reducing the production of D-3-Hydroxybutyrate
- Dinitrophenol:
  - Normal hearts: Enhanced the utilization and oxidation of acetoacetate and decreased the production of D-3-

hydroxybutyrate

- Diabetic hearts: utilization and oxidation of acetoacetate were enhanced without effect on production of D-3-hydroxybutyrate.

**Conclusion:** Diabetes inhibits and insulin has no significant effect on myocardial acetoacetate utilization and oxidation. Insulin, L-carnitine, or propionate are not suitable to ameliorate the utilization of acetoacetate in hearts from normal or diabetic animals, whereas Dinitrophenol enhances the catabolism of acetoacetate.

## Introduction:-

It has long been known that the isolated non-working perfused heart utilizes acetoacetate as a preferred substrate of oxidation, even in the presence of glucose and insulin<sup>1, 2</sup>, whereas acetoacetate and/or D-3-hydroxybutyrate (D-3-HB) as sole substrate(s) do not maintain cardiac function in the isolated working heart<sup>3</sup>. Ketone bodies oxidation is preserved in advanced heart failure to maintain adequate myocardial function<sup>4</sup>. Insulin inhibits the utilization and oxidation of acetoacetate in hearts from normal rats<sup>1, 3</sup>, and in contrast, insulin stimulates the utilization and oxidation of D-3-HB in hearts from normal and diabetic rats<sup>5, 6</sup>. Propionate has been shown to enhance the utilization and oxidation of acetoacetate in the non-working heart<sup>7</sup> and improves heart contractile function in the working heart<sup>8</sup>, whereas propionate inhibits the utilization, but not the oxidation of D-3-HB<sup>9</sup>. Carnitine enhances the removal of acetoacetate in vivo and in vitro studies<sup>10, 11, 12, 13</sup>, but has no effect on the removal of D-3-HB<sup>12, 13</sup>. Ischemia-reperfusion stimulates myocardial D-3-HB utilization<sup>14</sup>. The deletion of succinyl-CoA:3-oxoacid-CoA transferase (SCOT) in mouse hearts promotes accelerated pathological remodeling<sup>15</sup> (the rate-limiting enzyme for myocardial oxidation of  $\beta$ -hydroxybutyrate and acetoacetate) and in advanced human heart failure the myocardial utilization of D-3-HB is increased and there is a significant increase in the expression of the gene encoding succinyl-CoA:3-oxoacid-CoA transferase<sup>16</sup>. In mouse models, cardiac hypertrophy and failure causes increased expression of  $\beta$ -hydroxybutyrate dehydrogenase 1 (BDH1) and the heart is shifted to ketone bodies as a significant source of energy<sup>17</sup>. The data support the importance of ketone bodies as a source of energy and their significant regulatory role in heart metabolism<sup>18</sup>. The utilization and oxidation of D-3-HB were inhibited in hearts from diabetic rats<sup>5, 6</sup>. No data were found in the literature on the effect of diabetes on the metabolism of acetoacetate in heart, and very limited data is available on acetoacetate as a sole substrate in the heart<sup>19</sup>. Although the first step of D-3-HB oxidation is its conversion to acetoacetate there is a difference in the reported effects of insulin, propionate, and L-Carnitine on the metabolism of acetoacetate and D-3-HB, this encouraged us to carry out this investigation. An attempt was also made to improve the utilization and oxidation of acetoacetate in the heart.

## Materials and Methods:-

### Animals:-

Male Wistar albino rats weighing 200-350 g were housed at a constant temperature of 22°C  $\pm$  and a 12 h light/ 12 h dark cycle. The animals were given continuous access to tap water and a rat pellet diet containing 13% protein and 3% fat<sup>20</sup>.

### Induction of Diabetes:-

The rats were made diabetic by a single intravenous injection of alloxan (40 mg/kg). Rats were used 4 weeks after alloxan administration. There was about 30% reduction the body weight of diabetic rats. The concentration of blood glucose was about 16.6 mM<sup>5</sup>.

### Chemicals:-

All chemicals, of the highest available grade were obtained from Sigma London Chemical Corp. Ltd., U. K.

### Analytical Methods:-

The determination of acetoacetate and D-3-HB were made by the method of Mellanby and Williamson<sup>21</sup> and Williamson and Mellanby<sup>22</sup> respectively.

**Media:-**

Hearts from normal or diabetic rats were perfused at a perfusion pressure of 40 mmHg or 80 mmHg for 1 h with Krebs-Henseleit Medium<sup>23</sup>, modified in that the concentration of calcium and magnesium were halved (MKHM), and oxygenated by equilibration with 5% carbon dioxide and 95% oxygen. The initial concentrations of acetoacetate (Li-salt), propionate, L-carnitine, DNP, insulin as shown in the results.

**Perfusion Method:-**

Hearts were perfused as described previously<sup>20</sup>. Hearts were perfused at a perfusion pressure of 40 mmHg or 80 mmHg; the perfusate temperature was 37°C. The technique involves the continuous infusion of fresh perfusate into a volume of recirculating perfusate that is kept constant by balanced withdrawal. Perfusate was introduced at  $32.6 \pm 0.1$  (80) ml.h<sup>-1</sup>. Fractions were collected for 5 minutes, alternate functions were analysed to determine acetoacetate and D-3-HB concentrations. The mechanical performance (rate, vigour and rhythm) of the heart were noted periodically<sup>24</sup>. These parameters along with the metabolic stability were used as criteria of a successful preparation. Coronary flow was measured at the end of each experiment,  $48 \pm 1$  (6) and  $109 \pm 7$  (9) ml.g.dry wt<sup>-1</sup>.min<sup>-1</sup>. at 40 and 80 mmHg respectively.

**Calculation and statistical analysis:-**

Calculation as described before<sup>20</sup>. Comparisons between groups were assessed using the two-tailed Student's t-test for independent samples.

**Results:-****Effect of Perfusion Pressure:-**

Increasing the perfusion pressure from 40 mmHg to 80 mmHg in hearts from normal (Groups 1 and 2) or diabetic animals (Groups 7 and 8), had no significant effect on the utilization and oxidation of acetoacetate and D-3-HB production.

**Effect of Diabetes:-**

At a perfusion pressure of 80 mmHg, the rates of acetoacetate utilization and oxidation and D-3-HB production were inhibited by 38%, 30% and 36% ( $P < 0.003$ ,  $P < 5.8 \times 10^{-5}$ ,  $P < 0.001$ ) respectively, in hearts from diabetic animals (Group 8), whereas at 40 mmHg the rates of acetoacetate utilization and oxidation, and D-3-HB production were inhibited by 42%, 46%, 36% ( $P < 2.26 \times 10^{-4}$ ,  $P < 0.003$ ,  $P < 4.05 \times 10^{-4}$ ) respectively (Group 7).

**Effect of Insulin:-**

Insulin had no significant effect on the utilization of acetoacetate in hearts from normal or diabetic animals (Groups 3 and 9).

**Effect of L-Carnitine:-**

L-Carnitine had no effect on acetoacetate utilization in hearts from normal animals (Group 4), whereas in hearts from diabetic animals (Group 10) the rate of acetoacetate utilization is enhanced by 16% ( $P < 0.02$ ) without effecting the rate of acetoacetate oxidation, but the production of D-3-HB was increased by 44% ( $P < 0.05$ ).

**Effect of Propionate:-**

In hearts from normal animals (Group 5) propionate inhibited the utilization of acetoacetate by 20% ( $P < 0.02$ ) without affecting the rate of oxidation, but the rate of D-3-HB production is inhibited by 72% ( $P < 6.1 \times 10^{-8}$ ). On the other hand, in hearts from diabetic animals (Group 11) propionate enhanced the utilization and oxidation of acetoacetate by 46% and 78% ( $P < 0.003$ ,  $P < 0.002$ ) respectively and the production of D-3-HB was reduced by 38% ( $P < 0.1$ ).

**Effect of 2,4-Dinitrophenol:-**

Dinitrophenol enhanced the utilization and oxidation of acetoacetate by 35% and 56% ( $P < 7.27 \times 10^{-5}$ ,  $P < 7.82 \times 10^{-6}$ ) respectively and decreased the production of D-3-HB by 18% ( $P < 0.003$ ) in hearts from normal rats, whereas in hearts from diabetic rats utilization and oxidation of acetoacetate were enhanced by 60% and 80% ( $P < 0.003$ ,  $P < 0.004$ ) respectively, without affecting the production of D-3-HB.

**Discussion:-**

Although the rate of coronary flow was increased (from 48 to 109 ml.g.dry wt<sup>-1</sup> min.<sup>-1</sup>) on increasing the perfusion pressure from 40 to 80 mmHg, the rates of acetoacetate utilization and oxidation were not affected nor was the rate of D-3-HB production. On the other hand, increasing the perfusion pressure 3-fold (25 to 75 mmHg) increases the oxidation of acetoacetate about 34% without affecting the acetoacetate utilization, but decreases the production of D-3-HB by 45%<sup>7</sup>. Comparing the rates of acetoacetate oxidation of non-working rat heart<sup>1</sup> and working heart<sup>3</sup> indicates that there is no effect of work-load on the oxidation of acetoacetate. Whereas, the utilization and oxidation of D-3-HB was enhanced by 30% and 44% respectively<sup>9</sup> on doubling the perfusion pressure (40 to 80 mmHg).

Chronic diabetes (4-weeks) inhibited the utilization and oxidation of acetoacetate and D-3-HB production, this finding is compatible with the decrease in the activity of 3- hydroxybutyrate dehydrogenase [EC 1.1.1.30] (51%) in heart mitochondria<sup>25</sup>. Since the oxidation of acetoacetate is inhibited, it is most likely that the activity of 3-oxoacid CoA-transferase [EC 2.8.3.5] is decreased. Grinblat et al.<sup>25</sup> reported 50% decrease in heart mitochondria three months after onset of diabetes, whereas the acetoacetyl CoA - thiolase [EC 2.3.1.9] was not affected. Sultan<sup>6</sup> reported that diabetes (4 weeks) inhibits the utilization and oxidation of D-3-HB. Therefore, the rise of the blood level of ketone bodies during diabetes is due to over production and the decrease in the utilization and oxidation of ketone bodies.

Since insulin has no effect on acetoacetate utilization and oxidation, and enhances the utilization and oxidation of D-3-HB<sup>5,6</sup>, introducing insulin therapy in ketosis, if it does not improve the overall utilization of ketone bodies, will not deteriorate the case. The reduction in the rate of acetoacetate utilization and oxidation in diabetes is unlikely due to the lack of insulin. It seems that the defect in the catabolism of acetoacetate in diabetes can be corrected by introducing anaplerotic substance such as propionate which could enrich citric acid cycle with succinyl CoA (an essential metabolite for acetoacetate oxidation), but the inhibitory effect of propionate on D-3-HB utilization<sup>9</sup> preclude the use of propionate to ameliorate ketone bodies catabolism. It has been found that Propionate caused a drastic reduction of free CoA and L-carnitine in the heart, F.Di Lisa etd (1994)<sup>30</sup>.

L-carnitine had no effect on acetoacetate utilization in heart from normal rats, whereas, the 16 % increase of acetoacetate utilization in diabetic state is compensated by the increase in the rate of D-3-HB production, since the rate limiting step of acetoacetate and D-3-HB oxidation, 3-oxoacid CoA-transferase [EC 2.8.3.5], is inhibited in diabetes. Although, it has been reported that carnitine enhances the removal of acetoacetate in diabetes<sup>12, 13</sup>, L-carnitine is not suitable to ameliorate the oxidation of acetoacetate in normal or diabetic states, moreover L-carnitine has no effect on D-3-HB utilization or oxidation in the perfused rat heart (unpublished observation), and does not stimulate D-3-HB utilization in heart mitochondria<sup>26</sup>. L-carnitine is reported to increase the concentration of tissue CoA<sup>11</sup>, according to Russell and Taegtmyere<sup>8</sup> such a change could improve the oxidation of acetoacetate, but the presented data did not support that CoA alone could be a limiting factor for acetoacetate oxidation. Propionate and L-carnitine addition alone to acetoacetate had negligible effects on contractile function Russell etd (1995)<sup>31</sup>.

Dinitrophenol (DNP) is an un-coupler (uncouples oxidative phosphorylation), its stimulatory effect on the utilization and oxidation of acetoacetate is likely mediated through its capability to alter the NADH/NAD<sup>+</sup> ratio in the mitochondria. The decrease in D-3-HB production in the normal state and the increase in the percent oxidation of acetoacetate in the diabetic state support such a suggestion, moreover, DNP enhances the utilization and oxidation of D-3-HB in isolated perfused heart in a concentration-dependent manner<sup>14</sup>, by decreasing myocyte NADH<sup>27</sup>, raising Ca<sup>2+</sup> cytosolic concentration, and AMP/ATP ratio<sup>28, 29</sup> through stimulating AMPK/p38 MAPK<sup>32</sup>. The regeneration of NAD<sup>+</sup> could enhance  $\alpha$ -ketoglutarate dehydrogenase ( $\alpha$ -KGDH) which is reported to be inhibited by acetoacetate<sup>10</sup>, and thereby the oxidation of ketone bodies is enhanced by providing succinyl CoA.

In conclusion, increasing perfusion pressure, and giving insulin, failed to improve the catabolism of acetoacetate in hearts from normal or diabetic animals. Acetoacetate utilization and oxidation are inhibited in hearts of diabetic animals. L-Carnitine and propionate are not good candidates to ameliorate the catabolism of acetoacetate. 2,4-Dinitrophenol enhanced the utilization and oxidation of acetoacetate in hearts from normal or diabetic animals suggesting that NADH/NAD<sup>+</sup> ratio plays an important role in the regulation of ketone bodies' metabolism. It is possible that dinitrophenol stimulated acetoacetate oxidation act through AMPK/ p38 MAPK signaling pathway as suggested for D-3-HB<sup>14</sup>.

**Table 1:-**

Hearts from normal (Groups 1 to 6) and diabetic (Groups 7 to 12) rats were perfused with MKHM containing acetoacetate (Ac) as indicated in the table for 60 minutes. The addition of other substances are shown in the table, and their initial concentrations are insulin (2mU.ml<sup>-1</sup>), L-carnitine (5 mM), propionate (4 mM), DNP (0.05 mM). The perfusate concentration of Ac and D-3-HB and the rates of utilization, oxidation and production were given for the last 30 minutes of perfusion period. The perfusion pressure is 80 mmHg except for groups 1 and 7, it is 40 mmHg and indicated by \*. Values are means  $\pm$  SEM for the numbers of observations in parentheses.

Group	Addition	Initial conc. Ac (mM)	Perfusate con. Ac (mM)	Perfusate con. D-3- HB(mM)	Utilization of Ac	Oxidation of Ac	Production of D-3-HB

#### Abstract

**Background :** Self medication refers to the treatment of common health problems with medicines approved as safe and effective for use without consulting a physician and without any medical supervision.

**Objective :** The aim of the present study were to determine the prevalence of parental self-medication among children in Almadinah, Saudi Arabia , and parental knowledge and attitude about common medicine use practices in children ,in addition to the factors influencing self-medication.

**Methods:** A cross-sectional study was conducted. convenient random sampling method was used to select the participants. Data were collected using an online questionnaire tool.

**Results :** A total of 170 participants from Almadinah were involved in the study 50% of the them were fathers, and 50% were mothers .Most of them didn't have health insurance, while only 23% of them had. 63% of the sample use medicines without medical prescription for their children. We notice that 83% of the participants' children haven't been suffering any chronic disease. High temperature is the most popular case in which the parents use medicines without medical prescription for their children, then colds. The most used medication was Antipyretic. It can be noted that the majority of parents were giving their children drugs without a prescription, although they are convinced of the seriousness of the use of medications without a prescription. Parents depend on old medical prescription and pharmacist as major sources of information at self-medication.

**Conclusion :** The study revealed the fact that parental self-medication among public in Almadimah is a routine practice. we suggested that Parents' should be awareness about the riskiness of self-medication, especially in children to ensure that they will receive best medical Care.

## Introduction:-

Self medication refers to the treatment of common health problems with medicines approved as safe and effective for use without consulting a physician and without any medical supervision. This practice is widespread around the world <sup>(1)</sup>. The practice of self-medication among children consider really important since they constitute a large percentage of the population in developing countries and are prone to many illnesses <sup>(2)</sup>. Unjustified and inappropriate self-medication results in wastage of healthcare resources and increases resistance of pathogens, drug-drug interactions, and adverse drug reactions leading to hospital admissions <sup>(3-6)</sup>. Younger children are often given medications by their parents because the first response by most families to many illnesses in their children has been found to be the use of non-prescribed drugs. Paediatric OTC drugs cover a wide range of medications including cough and cold medicines (CCMs), antipyretic analgesics (e.g. paracetamol and ibuprofen), vitamin supplements and dermatological products, antibiotics, antispasmodic agents etc. <sup>(7)</sup> The conditions for which the drugs were used included fever, diarrhea, vomiting, cough and upper respiratory tract infections <sup>(8)</sup>. Most drugs in children are used to be administered outside hospitals, both as prescribed and non-prescribed ones <sup>(9)</sup>. Various studies have evaluated self-medication in children and reported higher rates of self-medication which was often inappropriate and parents were reported to have inadequate knowledge about self-medication <sup>(10,11)</sup>. To our knowledge, no information is available regarding the self-medication prevalence in the community in Saudi Arabia. Therefore, it is important to have data on self-medication in this area so that future interventions can be planned. Hence, the aim of the present survey carried out in the general population in Almadinah, were To determine the prevalence of parental self-medication use among children in KSA, to investigate the effect of these medication to child's health and to know the factors influencing self-medication.

## Material and Methods:-

A descriptive cross sectional study was undertaken among the population of Al- madinah, Kingdom of Saudi Arabia. A sample of (170) persons was selected randomly and answered the questionnaire randomly. The questionnaire was the study tool prepared by the research team with the help of experts and specialists in this field of study, the questionnaire contained four main sections; the first section represented the social and demographic data, which includes sex, age, job, living place, monthly income, health insurance availability, educational level, and the number of children, while the second section contained (5) questions to measure the spread of dispensing medicines without a medical prescription, the third section contained (7) questions in order to measure the awareness and behavior of the parents toward the dispensing without a prescription, and the fourth section aimed to know the factors affecting the dispensing without a prescription.

## Statistical Analysis:-

The statistical analysis program (SPSS v.22) was been used in the study in data entry and analysis, with the use of necessary statistical methods to achieve the objectives of the study. The following statistical methods were used:

- Frequencies.
- Percentages.
- Graphs.
- Chi-square test.

## Results:-

**participants' distribution according to their personal and demographic data:**

**Table 1:-** Personal data for the participants (N = 170)

Variable		#	%
Gender	Male (father)	85	50%
	Female (Mather)	85	50%
Age (years)	Less than 30 years	65	38%
	More than 30 years	105	62%
Occupation	employee in the health field	11	6%
	employee in unhealthy field	99	58%
	unemployed	60	35%
Living	City	164	96%
	Village	6	4%
Monthly income	Less than 5,000 r.s	41	24%
	5000-10000 r.s	53	31%

	More than 10,000 r.s	76	45%
Do you have health insurance	Yes	39	23%
	No	131	77%
Education level	Secondary or less	29	17%
	Collectors or more	141	83%
Number of children	1-3	106	62%
	4-6	44	26%
	More than 6	20	12%

It is clear from the previous table that 50% of the participants were fathers, and 50% were mothers, 62% of their ages were more than 30 years old, while 28% of them were less than 30 years old.

And their distribution according to their jobs; 58% of them were employee in the health field, only 6% were working in the health field, and the rest of them were unemployed. And the participants' distribution according to their living place, most of them were living in cities.

We found that 45% of the participants' monthly incomes were more than (10000) Riyal, 31% of their incomes were between (5000-10000) Riyal, and 24% of their incomes were less than (5000) Riyal.

While their distribution in terms of having health insurance; most of them didn't have health insurance, while only 23% of them had.

83% of the participants had university degrees, and the rest had secondary certificates or less.

Finally their distribution according to the number of their children; 62% of them had from (1- 3) children, 26% of them had (4- 6) children, and 12% of them had more than 6 children.

**The next ( diagram 1) concludes the previous results.**

**Measuring of the spread of dispensing medicines without a medical prescription:**

The next( table 2) shows the participants' distribution according to using medicines for their children without medical prescription:

Answer	#	(%)
Yes	107	62.9
No	63	37.1
Total	170	100.0

We notice from the previous table that 63% of the sample members (mothers and fathers) use medicines without medical prescription for their children.

Then next (table 3) shows the participant's distribution whether their children have been suffering chronic diseases or not:

Answer	#	(%)
Yes	29	17.1
No	141	82.9
Total	170	100.0

We notice that 83% of the participants' children haven't been suffering any chronic disease, while 17% of their children have been suffering chronic diseases; as diabetes and asthma.

The next ( diagram 2) shows the most popular cases in which the parents use medicines without medical prescription for their children:

We notice from the table that (high temperature) is the most popular case in which the parents use medicines without medical prescription for their children, then colds, after that headache, diarrhea, stomach pain and vomiting ordered from the most to the least cases they may use medicines without medical prescription for their children.

The next ( diagram3) shows the most used medicines without medical prescription:

It is noticed that the most used ones was as the following order:

Antipyretic, Cough medicines, bronchioles drugs, analgesics, antibiotics, vitamins, Antidiarrheal and sensitivity drugs.

**Measuring the awareness and behavior of the parents toward the dispensing without a prescription ( table 4 )**

	Agree	Disagree	I don't know			
	# (%)	# (%)	# (%)	P-valu	Relative weight	Ranking
when the child's temperature is high, he should be given antipyretic	161 (94.7)	6 (3.5)	3 (1.8)	0.00**	97%	1
when the child's temperature is high, he should be given antibiotic	17 (10.0)	135 (79.4)	18 (10.6)	0.00**	44%	7
No side effects will result cause of using medicines without medical prescription	20 (11.8)	115 (67.6)	35 (20.6)	0.00**	48%	6
Use of medications without a good recipe leads to hide the symptoms of the disease and the difficulty of diagnosis	78 (45.9)	25 (14.7)	67 (39.4)	0.00**	77%	5
I think many parents are using drugs without a prescription	117 (68.8)	20 (11.8)	33 (19.4)	0.00**	86%	4
parents should be told about the danger of using drugs without a prescription	148 (87.1)	12 (7.1)	10 (5.9)	0.00**	93%	3
The physician should diagnose the disease and make the necessary tests before treatment description	156 (91.8)	10 (5.9)	4 (2.4)	0.00**	95%	2

\*\*Chi Square test - Significant at the 0.01 level.

It is noted from the (table 4) that most paragraphs won the highest approval rate by the participants: the paragraph which states that "when the high temperature of the child should be given antipyretic," came the first order of relative weight of 97%, followed by a paragraph which states "must The doctor diagnosed the disease and the work of the necessary tests before treatment Exchange, "a relative weight of 95%.

It can be noted that the majority of parents were giving their children drugs without a prescription, although they are convinced of the seriousness of the use of medications without a prescription.

**The factors affecting the dispensing without a prescription:-**

The next (diagram 4) shows the most important reasons lead the parents to use medicines without a prescription for their children.

It is clear from the previous diagram that the most important reasons made the parents use medicines without a prescription for their children, were ordered as follows (Simple disease which don't need to ask a doctor, have previous medical prescription for the same disease, avoid overcrowded clinics, the pharmacist information is enough and saving time).

### Discussion:-

Self-medication is still an important public health problem throughout the world, since it is a fairly common practice. Unjustified and inappropriate self-medication results in wastage of healthcare resources and increases resistance of pathogens, drug-drug interactions, and adverse drug reactions leading to hospital admissions [12,13,14,15]. Most of the studies on self-medication in children have investigated the use of medicines by children themselves [16,17]. Few studies have evaluated parental attitude and practice towards self-medicating their children [18,19,20]. Therefore this study has highlighted the prevalence of parental self-medication use among children, and parental knowledge and attitude about common medicine use practices in children in KSA, in addition to the factors influencing self-medication.

At the current study participants were divided into males and females equally, this showed that both parents involved in dealing with health problems of their children. However study in India showed that most of respondents were female [21] which indicates that mothers are more involved in dealing with health problems of their children. While in Baghdad city fathers purchasing self-medicated were relatively more than mothers [22], the possible explanation of this slight difference is that some women considered that the father is more appropriate for this mission or they could not leave their homes without companionship of a male relative from the first degree [23].

Despite the lack of evidence for the effectiveness of many over-the-counter (OTC) medications [24,25], and the possible risks associated with their improper use among young children, [26,27], they remain widely used [28]. The results of our study showed high prevalence of parental self-medication use among children 62.9%. These results are consistent with another study in Saudi Arabia reported that 53.8% of the parents practiced self-medication in their children [29]. This proportions consistent with the global variation of prevalence of self-medication which has been reported by various studies to range between 30-70% [30]. The reasons for such huge global variation many be numerous including different methods used for collecting information, availability of free medical care for children in the public sector hospitals in some countries [31]. Also cultural, social and educational factors have been shown to affect self-medication [29].

The common ailments of children including headache, fever, flu, diarrhoea and sore throat can be treated at home [32]. This study revealed that the most frequent symptoms which motivated the parents to practice self-medication for their children were fever followed by colds, headache, diarrhea, stomach pain and vomiting respectively. This is consistent with most of the other studies on parental self-medication in children which reported that fever, cough and cold as the common symptoms for using medicines without consulting a doctor [19,20,21,29]. Also our study revealed that the most common used drug were Antipyretic, Cough medicines, and bronchioles drugs respectively.

According to our results parents showed good awareness and behavior toward the dispensing without a prescription, there is contradict between this results and previous study in KSA which reported that most participants had poor knowledge positive attitude toward self-medications[33].The reason for the different in results, the is time difference between the two studies, and the difference in regions that were targeted by these two studies in the KSA.

In the present study 11.8% of parents believed that no side effects will result cause of using medicines without medical prescription. While most of parents believed that side effects will result cause of using medicines without medical prescription. These results differed with study from UK found that parents were generally unaware of potential side effects of OTC medicines because they believed that “over-the-counter medicines are not strong and were unlikely to harm their child,” [34]. And study from Japan reported little awareness about adverse effects of non-prescription medicines among participants[35].This difference is due to different at sociodemographic indicators in different countries.

At this study the reasons of Self-medication are Varied, the most common reason was that the disease is simple which don't need to ask a doctor. Actually some minor ailments can be relieved with SM medications such as Paracetamol or other traditional remedies, without seeking for consultation from general practitioners or pediatricians [32].

Parents knowledge and information of the children's ailments may be obtained from doctors, pediatrics, pharmacists, friends, books, magazines, newspaper or the internet [36].The commonest source of information about self-medicated drugs at our study , and at many other studies was old medical prescription [22,37]. Because parents considered that the prescription will be the same if they visited the physician and also considered that they had good experience and became familiar with the appropriate medication for managing this current condition [38].

Also pharmacist information represent another other important source of information for parents at children's ailments and it the reason for 14% for self-medication. this is consistent with the results of other studies Saudi Arabia [23], in Iraq [22], and Indonesia [39], that's considered pharmacist information as one of the major sources of information for parents at children's ailments. Which highlight the important roles of community pharmacies in wide pervasion of SM in the community[40].

Although regulations do not allow pharmacists to prescribe drugs, this may be explained by the fact they are more easily accessible and the service is faster.

### **Conclusion:-**

There is high prevalence of parental self-medication use among children in KSA. However parents showed good awareness and behavior toward the dispensing without a prescription. The major reason for self-medication the simplicity of disease or symptoms so it don't need a doctor. The most frequent symptoms which motivated the parents to practice self-medication for their children are fever followed by colds, headache, diarrhea, stomach pain and vomiting respectively. And the most common used drug are Antipyretic, Cough medicines, and bronchioles drugs respectively. Parents depend on old medical prescription and pharmacist as major sources of information at self-medication.

### **Recommendation:-**

- Parents' should be awareness about the riskiness of self-medication, especially in children.
- Distributing brochures to parents about the riskiness of self-medication in centers of vaccinate children to ensure they arrive for most parents.
- Exploit the various media effectively to raise awareness among parents about the riskiness of self-medication.
- Pharmacists should committed to regulations which do not allow pharmacists to prescribe drugs.
- Pharmacists can play crucial roles in enhancing the proper practicing of self-medication because they are reliable sources of information for many parents.

### **Acknowledgment:-**

The authors would like to thank Dr. Hany Mahmoud Abo-Haded , Assistant Professor of Pediatrics & Pediatric Cardiology, TaibaUniversity , Medina, KSA , for his valuable input though revising the tools and the manuscript of this study.

#### Abstract

Lipid peroxidation is a crucial step in the pathogenesis of free radical-related disease states, including glomerulonephritis, rheumatoid arthritis, gastrointestinal and cardiovascular diseases. Antioxidants play a significant role in protecting living organism from the toxic effect of various chemicals by preventing free radical formation. Pomegranate is a good source of polyphenols and other antioxidants. The purpose of the present study is to evaluate the effect of pomegranates juice and peel administration on antioxidant enzymes activities and lipid profile in carbon tetrachloride-induced hyperlipidemic rats. Hyperlipidemic rats were treated with pomegranates juice and peel for 8 weeks. Results showed that all hyperlipidemic rats administrated juice and peel had significant decrease in TBARS concentration and increase in GSH, GPx, GST, CAT and SOD in plasma compared to CCl<sub>4</sub> group. Lipid profile parameters (except HDL-C) decreased significantly with juice and peel administration compared to CCl<sub>4</sub> group. In conclusion, consumption of pomegranate juice and peel showed significant improvement of lipid parameters and antioxidant enzyme activities in hyperlipidemic rates suggesting therapeutic potential of using pomegranate as a medicinal plant for managing hyperlipidemia and modifying the risk of CVD.

#### Introduction: -

Human are continuously exposed to different kindsof chemicals such as food additives, industrialchemicals, pesticides and other undesirablecontaminants in the air, food and soil(Stavric, 1994).These substancesmostly induce a freeradical-mediated lipid peroxidation leading todisruption of biomembranes and cellular dysfunction. Lipid peroxidation is thought to play an important role in the pathogenesis of free radical-related disease states, including glomerulonephritis, rheumatoid arthritis, gastrointestinal and cardiovascular diseases(Cho et al., 2003). Oxidative stress has been linked to an altered lipid profile and endothelial damage which is a crucial event in the most common pathological processes underlying cardiovascular diseases (CVD)(Halperin et al., 2006). Additionally, the well-known side effects of the current synthetic lipid-lowering drugs have increased the need to move toward alternative treatment for the prevention of hyperlipidemia including medicinal plants and natural antioxidants(Pahan, 2006).

Antioxidants play a significant role in protecting living organism from the toxic effect of various chemicals by preventing free radical formation(Sheweita et al., 2001). Studies have demonstrated that there are approximately 5000 known plant phenolics and many of them have antioxidant activity(Pace et al., 2006). During last years, the

interest in the antioxidant properties of the phenolic compounds in vegetables and fruits among agricultural and food scientists, nutritionists, food industry professionals and consumers had increased, derived from their strong activity and low toxicity compared with those of synthetic phenolic antioxidants, such as butylated hydroxytoluene (Dolatabadi et al., 2010).

*Punica granatum* L., commonly called pomegranate has an ancient history; sculptured representations of the fruit are found on the ancient monuments of Egypt and the Assyrian ruins. The tree is native to the region of Persia and the Himalayan ranges of India and has been cultivated in Iran, Afghanistan, Pakistan, North India, Armenia, Azerbaijan, Georgia, and the Mediterranean region for several millennia (Jurenka et al., 2008). Pomegranate has been used in various regions and folk or traditional medicine because of its enormous compounds with lots of activities and without toxicity (Lansky et al., 2007). Pomegranate juice is an affluent source of polyphenols with high antioxidative potential. Moreover, its antihypertensive, and anti-inflammatory effects have been shown in limited studies in human and murine models. Pomegranate juice showed an antioxidant activity three times higher than red wine and a green tea infusion (Gil et al., 2000). Pomegranate juice also displayed potent antiatherogenic action in atherosclerotic mice and humans (Aviram et al., 2000).

Carbon tetrachloride ( $\text{CCl}_4$ ), a well-known model agent for producing chemical hepatic injury, requires biotransformation by hepatic microsomal cytochrome P450 to produce toxic metabolites, namely trichloromethyl free radicals ( $\text{CCl}_3\cdot$ ) and subsequent derivative ( $\text{Cl}_3\text{COO}\cdot$ ) (Brautbar et al., 2002). These radicals may interact with membrane lipids leading to peroxidation (Aamir et al., 2011).  $\text{CCl}_4$  causes an imbalance between the synthesis and degradation of lipids (Boll et al., 2001). In view of this, this study was carried out to evaluate the effect of pomegranate juice and peel administration on antioxidant enzymes activities and lipid profile in carbon tetrachloride-induced hyperlipidemic rats.

### Materials and Methods:-

The component used in the preparation of products and standard diet were purchased from local markets in Alexandria, Egypt.  $\text{CCL}_4$  was purchased from Merck; Darmstadt. The dose of  $\text{CCL}_4$  used was 1 ml/kg BW twice a week (Zuinen et al., 2007). Commercial kits were obtained from Biosystems S.A. (Spain), Diamond (Germany) and Randox (United Kingdom). Methanol, Folin-Ciocalteu (Prolabo) reagent, Sodium Carbonate, Gallic Acid, Rutin,  $\text{AlCl}_3$ , DPPH reagent were obtained from Central laboratory unit for advanced environmental and biological analyses, High institute of public health, Alexandria University. The study was approved by the ethical committee of the High Institute of Public Health, Alexandria University.

### Preparation of Pomegranate juice:-

Pomegranate was purchased from local markets in Alexandria, Egypt. The fresh pomegranate fruits, free of blemishes or obvious defects were washed and cut into pieces, the rind was removed, and seeds were separated. Juice was obtained using a commercial blender (Braun blender, Germany), filtrated with a Buchner funnel and immediately diluted with distal water to volume of 1:3 and stored at  $20^\circ\text{C}$ . The chosen dose of Pomegranate juice for the experiment was 5 ml/Kg BW (Osman et al., 2011).

### Preparation of pomegranate peel powder:-

The pomegranate peel was collected, washed, cut into small pieces and dried in air then in an oven at  $50^\circ\text{C}$  till complete dryness. The dried peel was grounded to fine powder in a mechanical blender and stored at  $3 - 4^\circ\text{C}$  until used. For the experimental protocol, 5% of pomegranate peel powder were added to the standard diet (Abdou et al., 2012).

### Experimental animals and protocol:-

Fifty male rats about 130-150 gm were obtained from the Medical Research Institute, Alexandria University, Alexandria, Egypt. The animals were housed in cages under standard condition of illumination with a 12-h light-dark cycle at  $25 \pm 1^\circ\text{C}$  (Childs et al., 2002). Animals were housed 5 per cage and fed on standard rodent pellet diet (Gold Mohar, Lipton - India, Ltd), and tap water ad libitum for two weeks before the beginning of the experiment for rehabilitation. Diets were presented to rats in special non-scattering feeding cups to avoid loss of food and contamination. Every day the animals were observed for the external appearance, shape, color, distribution of hair and physical activity. The animals were then divided randomly into the following five groups:

**Group (1):** Ten rats served as control group given the standard diet for 8 weeks.

**Group (2):** Ten rats were given the standard diet and treated with CCL<sub>4</sub> alone (1 ml/Kg BW) twice a week for 8 weeks.

**Group(3):** Ten rats were given the standard diet and treated with combination of CCL<sub>4</sub>(1ml/kg BW) and pomegranate juice(5 ml/Kg BW) for 8 weeks.

**Group (4):** Ten rats were treated with combination of CCL<sub>4</sub>(1 ml/Kg BW) and pomegranate peel alone added to standard diet by 5% for 8 weeks.

**Group (5):** Ten rats were treated with combination of CCL<sub>4</sub> (1 ml/KgBW), pomegranate juice (5 ml/Kg BW) and pomegranate peel by 5% for 8 weeks.

#### Measured parameters and techniques:

At the end of the experiment, rats were fasted overnight and anesthetized with chloroform. The blood samples were collected in tubes with heparin (anti-coagulant). The heparinated blood samples were placed immediately in ice. Plasma samples were obtained by centrifugation at 860xg for 20min, and were stored at -20°C until analyses. Liver was immediately removed at the end of the experiment; weighed and washed using chilled saline solution. Tissues were minced and homogenized (10% w/v) in ice-cold sodium potassium phosphate buffer (0.01 M, pH 7.4) containing 1.15% KCl in a Potter–Elvehjem type homogenizer. The homogenate was centrifuged at 10,000 ×g for 20 min at 4°C. The resultant supernatant of the organs was used for the measurement of different enzyme activities.

#### Estimation of antioxidant enzymes in plasma and liver:-

The activity of Glutathione S-transferase (GST; EC 2.5.1.18), Glutathione reductase (GSH) Glutathione peroxidase (GPx; EC. 1.1.1.9) was determined by the methods of **Habig et al.,(1974)**, **Beutler et al., (1963)**, and **Chiu et al., (1976)** respectively. Catalase (CAT; EC 1.11.1.6) activity was assayed using the Luck method involving the decomposition of hydrogen peroxide (**Luck, 1971**). Superoxide dismutase (SOD; EC 1.15.1.1) activity was measured according to **Misra and Fridovich (1972)**. Plasma thiobarbituric acid-reactive substances (TBARS) were measured by the method of **Tappel and Zalkin (1959)**.

#### Lipid profile:-

Plasma concentrations of total lipids, total cholesterol (TC) and triglycerides (TG) were determined per the methods of **Frings et al., (1972)**, **Watson (1960)**, and **Fossati et al., (1982)**, respectively. High-density lipoprotein (HDL-C) was measured according to the methods of **Warnicket al., (1983)**. Low-density lipoprotein (LDL-C) was determined by the calculation (cholesterol-(TG/5+HDL-C). Very low-density lipoprotein (VLDL-C) was calculated by dividing the values of TG by factor of 5.

#### Statistical analysis:-

Data were analyzed using SPSS software package version 20 (SPSS, Chicago, IL, USA). P value (< 0.05) was considered significant. The data were assessed for normality using Kolmogorov-Smirnov test. The data were normally distributed and presented as mean ± standard deviation. One way ANOVA test was used to compare the mean for different measures among the different experimental groups, followed by post-hoc pairwise comparison with adjustment of P value using Bonferroni correction.

#### Results and Discussion:-

Data in Table 1 shows the effects of pomegranate juice and peel on antioxidant enzymes activities in CCl<sub>4</sub>-induced hyperlipidemic rats. CCl<sub>4</sub> significantly (p<0.05) increased TBARS and decreased GSH levels as well as GPx, GST, CAT and SOD activities in plasma of the rat group treated only with CCl<sub>4</sub> as compared to control group. In other words, CCl<sub>4</sub> induced oxidative stress in plasma as manifested by the alterations observed in antioxidant defense systems both enzymatic and non-enzymatic. Lipid peroxidation is one of the principal causes of CCl<sub>4</sub> toxic effect and is mediated by the free radicals' derivatives of CCl<sub>4</sub>. Our results are in consistence with the results of **Shih et al. (2005)** who confirmed that the hepatic activity of superoxide dismutase was markedly decreased by CCl<sub>4</sub> treatment. Also, **Comporti (1985)** indicated a substantial increase in ROS, MDA levels and depletion of GSH levels in CCl<sub>4</sub> intoxicated rats.

On the other hand, our study demonstrated that treatment of hyperlipidemic rats with combination of CCL<sub>4</sub>, pomegranate juice and peel caused significant (p<0.05) decrease in TBARS concentration and increase in GSH, GPx, GST, CAT and SOD activities. In other words, pomegranate juice and peel reduced the toxic effects of CCl<sub>4</sub> (Table1). The significant elevation in GSH, GST, SOD, GPx and catalase of plasma indicates the protection offered

by juice and peel against CCl<sub>4</sub> induced toxicity. It is known that some flavonoids are able to reduce xenobiotic - induced toxicity in animals and counteract the damaging effects of oxidative stress, cooperating with natural systems like glutathione and other endogenous protective enzymes (Kadarian et al., 2002). These results are in agreement with Mohieldin et al. (2011) who revealed that treating rats with carbon tetrachloride and pomegranate peel ethanolic extract had significantly decrease the GST, catalase and SOD activity, and significantly increase the GST, catalase and SOD activity when compared with CCl<sub>4</sub>-treated group during the hepatoprotective and curative periods. Our findings are also confirmed by the findings of Aviram et al., (2004) who reported that total antioxidant status in serum of patients with carotid artery stenosis was substantially increased, by 130% after 12 months of juice consumption. The effect of juice may be related to its potent tannins and anthocyanins which scavenge wide spectrum of free radicals. (Gil et al., 2000), (Aviram et al., 2000).

Pomegranate peel administration showed insignificant higher levels of plasma GSH, GPx, GST, CAT, and SOD when compared to juice, which is may be due to the slightly higher content of polyphenols in peel than in juice. Aviram et al., (2000) found that the inner and outer peels contain 20–30 fold more polyphenols than do the aqueous fractions of the seeds and Juice (566 and 739 µmol polyphenols/mg compared with 22 and 25 µmol polyphenols/mg, respectively).

The decrease of TBARS in plasma of the hyperlipidemic rat groups treated with juice and peel (Table 1) agrees with the results of Naveena et al., (2008) who reported that the free radical scavenging activity of pomegranate peel phenolics involves electron donation to free radicals that converts them to relatively more stable compounds. Several studies have confirmed the antioxidant and free radical scavenging activity of phenolic compounds derived from pomegranates, the antioxidant activity of plants extracts depends on the concentration of phenolic compounds, and the antioxidant power of pomegranate peel extract has been found to linearly increase with the concentration of peel phenolics up to the level of 400 µg/g (Sönmez et al., 2005), (Rosenblat et al., 2006).

Data listed in Table 2 shows the effect of pomegranate juice and peel on lipid profile of CCl<sub>4</sub>-induced hyperlipidemic rats. Treatment of rats with CCl<sub>4</sub> caused a significant increase ( $p < 0.05$ ) in plasma TG, TC, LDL-C and VLDL-C, while HDL-C was significantly decreased ( $p < 0.05$ ) compared to control group. These findings are in agreement with Uličná et al. (2003) who reported that the long-term intraperitoneally administration of CCl<sub>4</sub> to experimental animals induced, as expected, pathological changes in the liver. CCl<sub>4</sub> treatment of rats also caused a severe increase of hepatic triacylglycerol, total cholesterol and Malondialdehyde. The highly reactive free radical (trichloromethyl, CCl<sub>3</sub><sup>•</sup>) in the presence of oxygen leads to auto-oxidation of fatty acids and causes functional and morphological changes in the cell membrane. Scavenging of free radicals is one of the major anti-oxidation mechanisms to inhibit the chain reaction of lipid peroxidation. ROS are highly reactive and can react with many intracellular molecules, mainly unsaturated fatty acids (phospholipids, glycolipids, glycerides and sterols) and transmembrane proteins with oxidizable amino acids. The oxidation of these molecules causes the increase in the cellular membrane permeability. ROS can attack the unsaturated bonds of the membrane lipids in an autocatalytic process, with the genesis of peroxides, alcohol and lipidic aldehydes as by-products of the reaction. Thus, the increase of free radicals in cells can induce the lipid peroxidation by oxidative breakdown of polyunsaturated fatty acids in membranes of cells (Henke et al., 2005).

Meanwhile, our study reported that treatment of hyperlipidemic rats with pomegranate juice caused a significant decrease ( $p < 0.05$ ) in plasma lipids except HDL-C, which was significantly increased ( $p < 0.05$ ) compared to control group. These results are in agreement with Esmailzadeh et al., (2006) who found that pomegranate juice significantly reduced TC, LDL-C, the ratio of LDL-C/HDL-C, and the ratio of TC to HDL-C. Another study on mice fed pomegranate juice, plasma lipid peroxidation was markedly lower, and this effect was dependent on concentration (Aviram et al., 2000). Furthermore, Aviram et al., (2004) showed that pomegranate juice consumption for 3 years on patients with carotid artery stenosis reduces common carotid intima-media thickness, blood pressure and LDL-C oxidation. Khoo et al., (1990) reported that LDL-C aggregation was inhibited in vitro by pomegranate juice; this inhibition may be related to hydrophobic interactions between constituents of pomegranate juice and the lipoprotein. Pomegranate juice was indeed shown to possess impressive antioxidative properties due to its polyphenolics, tannins and anthocyanins (Gil et al., 2000). Additionally, phenolic compounds derived from pomegranate, vitamins C and E, melatonin and lycopene have been used as antioxidant agents to prevent various lipid-peroxidation-induced damages in different organs (Sönmez et al., 2005), (Rosenblat et al., 2006), (Sönmez et al., 2007), (Türk et al., 2007). Polyphenolic flavonoids not only affect cellular oxygenases but also cause

conformational changes in plasma membrane constituents, such as cellular receptors for lipoproteins(Aviram et al., 2000).

The decrease in plasma lipid profile of hyperlipidemic rats treated with peel which is showed in the present study is in agreement with Hossin(2009)who evaluated the pomegranate peel powder as a dietary fiber source for the treatment of hypercholesterolemia and atherosclerosis and found that dietary supplementation with peel powder at a concentration of 5, 10 and 15 g/100 g for a period of four weeks significantly reduced serum TC, TG, LDL-C, VLDL-C and lipid peroxidation levels in Hypercholesterolemic rats. Results of the present study confirm these findings(Table2).He also reported that all Hypercholesterolemic groups administered with different level of pomegranate peel extract (1, 2 and 3%) had significant decrease in serum TC, LDL-C-, VLDL-C, lipid peroxidation and atherogenic index and triglycerides comparing with control positive. Additionally, Ibrahim (2010)noticed that feeding the rats on standard diet containing 400 or 800 mg/Kg BW pomegranate peel extract for 4 weeks obviously decreased ( $P<0.05$ ) levels of TC, TG and TL.Pomegranate peel polyphenolic extract is effective in lowering serum and hepatic lipids(Cheng et al., 2005).

In the current study pomegranate peel was shown to be more influential in lowering level of lipid profile than juice, which is consistent with the findings of Aviram et al., (2000) who compared between the juice and the peel in terms of total polyphenol content. The researchers analyzed the antioxidant properties of pomegranate constituents other than the juice; they prepared aqueous solutions of the inner and outer peels and the crushed seeds and found that the aqueous extracts of the inner and outer peels were more powerful antioxidants than the juice, suggesting that the inner and outer peels may contain more potent antioxidant polyphenols. The aqueous extract obtained from the crushed seeds was found to be a weak antioxidant against LDL-Coxidation.

Based on the previous results, the authors concluded that the consumption of pomegranate juice and peel caused significant improvement of lipid parameters and antioxidant enzyme activities in hyperlipidemic rats suggesting therapeutic potential of using pomegranate as a medicinal plant for managing hyperlipidemia and modifying the risk of CVD.

#### Abstract

The research aims to find out what factors help in strengthening the trust in the process of shopping through digital online mediums. From the population, a sample of girl students studying management courses were taken along with Baby Boomers, Gen-X and Gen-Y respondents. They were then assessed by asking them to find out the factors because of which, they have developed some level of 'trust' based on the e-commerce sites. A total of twenty online shopping websites were given to them to analyze the factors that led to building of trust in the purchase process and transactions made by them. The aim of this research is to provide insight into fundamental processes that are related to digital buying. The survey by twenty seven girl students had been instrumental in identifying intentions and perceptions in the cases of online buying. The study also tries to understand the different challenges faced in the buying process. The research concluded that there are many factors that are responsible for building trust for online purchase from a particular website. A sample of two hundred and forty respondents was collected and a self-administered questionnaire was prepared. Factor Analysis, T test, one way Anova test was conducted to know the significance of apparent trust, credibility and perceived worthiness.

#### Introduction:-

The research study aims to find out the factors and reasons as to what leads to dis-trust while consumer are online and wanting to purchase the branded or non-branded products and services digitally online and what intentions and perceptions make them avoid taking risk that they think can be true. (Jacob &Kaplan, 1999; Yate Stone, 1999), have divided the risk perceived by customers into various types and categories, and defined what types of risks are majorly involved that act as a barrier towards digital online buying behaviour. These types of risks depend upon the category of the goods, products or services. For example, if the product or service is a debit card or credit card transaction, it is "financial risk", that customer's financial safety is at stake. Similarly, while these girls from the sample are wanting to purchase shoes or clothes or mobiles, etc, they not only come across the 'financial risk' but also 'functionality risk', related to the product of interest. The other types of risks perceived by these respondents are the 'physical safety risk', 'psychological risk' and 'social risk.' Joycee (2012) with Levitt (1993), talk about how the 'World Wide Web' is going to come up as the most progressive and liked channel for manufacturers, wholesalers-retailers, sellers and buyers as in market-space instead of market place, and in near future unlimited use

of online digital shopping of products and brands will be the trend for communicating for reaching consumer directly, with a shorter sales cycle. These online customer generations can be taken out of their perceptual risk of purchasing the branded products. If the e-commerce transactions are consistently fair and reliable and credible, trust starts building up. 'Trust is defined as a person's expectation of the other's cooperative behavior in situations where it is possible to suffer some damage if the other behaves selfishly (Yamagishi, 1998).' (Wong, 2008) throws light on the virtual web spaces' advantages and convenience over a traditional marketing and selling system. The virtual reality is more economical and carries capability in offering a vast array of products with multi-fold alternatives available in order to cater to the needs of more segments of online buyers and provide them with customer delight. It can be obviously witnessed that in today's e-business scenario, the growth is mammoth, not only in buying of the railway tickets, airlines, booking of hotels, movies, re-creation, but also moving towards purchase of products and services from diverse sectors like beauty, healthcare, clothes and apparels, make-up, wallets, shoes, belts and other accessories. The factors that have been analyzed for this sea-change have been very critical towards the success of the websites' credibility. It is noteworthy that higher the brand value of a product, higher is the 'perceived risk' associated with it.

The emphasis on building up and sustaining trust has been supported by varied researchers and scientists. Goritzz (2008) describes 'trustworthiness as promotor of both intention to buy and combat perceived risks'. This research tries to throw light on the need for "factors that guarantee trust" for shopping online. In the e-commerce scenario, customers can't see, touch, smell, or taste the goods and they may not place a query, if in doubt. One of the most important factor by which the e-commerce or m-commerce can be made trustworthy is, by providing and involving the customer in more information about the product of interest. Consumer once recognizes the need for the product, and goes online for finding primary and secondary information about the available brands in that category, they are actually engaging themselves in the information search about possible brands and their variants available. Once this customer has an awareness set of chosen brands, and does alternative evaluations, he comes to the decision of purchase online. This is the beginning of development of trust and may lead to online loyalty for the shopping website.

There has been whole sole emphasis on the innovation and creation of 'interfaces' through which the e-commerce website can communicate the trust factors effectively. The internet also allows consumers to access an unlimited range of products and services from companies around the world, and it has reduced the time and effort consumers spend on shopping (Ko et al., 2004 and Lim, Yap and Lau, 2010). Hernandez, Jimenez and Martin (2011) carried out a research to analyse whether individuals' socioeconomic characteristics, namely, age, gender and income influence online shopping behaviour. Their results indicated that these factors do not condition the behaviour of the experienced e-shopping. In their study, they also claimed that the effects of some variable thought to be crucial from findings from previous studies may have changed and this could be a result of the rapid evolution of e-commerce in recent years. The research by Sorce, Perotti and Widrick (2005) conducted among 300 samples also identified that age was negatively correlated with online pre-purchase search but was positively correlated with online purchasing when pre-purchase search behaviour was taken into consideration. The research conducted by Sorce, Perotti and Widrick (2005) revealed two interesting findings which must given voice here.

### **Contextual Study:-**

Firstly, it was found that there was not significant differences in terms of the act of shopping online but when asked if they had searched for or purchased specific products or services online, younger shoppers reported searching for more products than the older group. Secondly, when the search for the product was taken into consideration, older consumers were more likely to purchase once they had searched for the item online. Despite the numerous researches on purchasing behavior in relation to different generation, there is a gap in the research related to perceptions of the challenges of online purchasing among the three generations which this research aims to fill. This paper is divided into the following sections. The first section reviews the literature of online purchasing. The method section furnishes details on data collection, framework of study and analysis. Then, in the findings section, the analysis of the responses obtained from the survey are discussed. The conclusion section highlights the key findings and provides recommendation for future research. The internet has entered the mainstream consciousness of society over the past decade and Jhe (2014) attributes this to the web's graphical interface as well as the change in the controlling body, where it has moved from the government to the private sector. They went on to add that companies have started using the internet with the aim of cutting marketing costs, thereby reducing the price of the products and services in order to stay ahead in the highly competitive market. According to Changchit (2006), an increasing number of people are gravitating towards more intensive use of the internet as the accessibility of technology, the

availability of information, and the ability to interact through the internet increase and evolve. Internet based services offer many advantages to providers and to users. Principal advantages are convenience, speed, accessibility, timeliness and cost effectiveness. However, the drawbacks are that many computer applications were originally designed to deliver these advantages rather than provide high levels of security (Johnson and Krone, 2007).

Apart from the issue of systems' security, an internet user may also be vulnerable to exploitation or attack in terms of the security applied in conducting any online transaction (Johnson and Krone, 2007). Fraud and internet crime are recognised as important issues for governments and private businesses worldwide. An area of growing concern is the impact of criminal activity on householders who use the internet (Johnson and Krone, 2007). In addition, according to Browne, Durrett and Wethebe (2004), other internet business problems include the need to structure internal and external business processes to serve customers appropriately, the need to provide adequate technological and physical infrastructures, and the need to understand customer consumption processes in 'virtual' and physical environments. According to Hernandez, Julio and Martin (2011), in the last few decades, extensive research has been conducted into information technology (IT) adoption, testing a series of factors considered to be essential for improved diffusion and these researches can be divided into three groups where some studies analyse IT characteristics such as usefulness, ease of use and/or security (Davis, 1989; Yu et al., 2005), others focus on the emotions and experiences of users (Agarwal and Prasad, 2000 and Fiore and Kim, 2007) and a third group attempts to determine the importance of socioeconomic user characteristics, such as age, gender, educational level, place of residence and income.

### **Online Purchasing and The Generations:-**

Generation is a strong determinant of online purchasing behavior. This has been proven in past researches where generally it has been found that Generation Y contributes to the highest percentage of online purchasing, followed by Generation X and Baby Boomers. According to Lachman and Brett (2013), Generation Y takes shopping seriously and spends a lot of online time researching, fantasizing, considering flash-sale promotions, checking out what celebrities are wearing and then imagining how they would look in similar outfits, using pinterest.com to share items with family members, and keeping up with food and fashion blogs. This is supported by the findings of Consumer Behavior Report (2008) which stated Generation Y is more immersed in online and mobile activities including social networks (86%), podcasts (57%), blogs (50%) and text messaging (96%) than any other generation. However, the National Australia Bank's Online Retail Sales Index shows that online spending is dominated by Generation X (cited in Bainbridge, 2013). Although studies have indicated differences in their researches with regards to online purchasing and generation, it can generally be summed that the highest percentage of online shopping is done either by Generation X or Y with Baby Boomers being the lowest. As a result of the contradictions in the findings of research on age and online purchasing with some indicating that younger generation tend to shop more online (Dholakia and Uusitalo, 2002 and Joines et al., 2003) while others have found that older consumers were more likely to shop online (Donthu and Garcia, 1999 and Korgaonkar and Wolin, 1999), Sorce, Perotti and Widrick (2005) have concluded that demographic factors versus shopping motivations and attitudes in predicting online shopping remains an open question.

### **Perceptions of Online Purchasing:-**

Consumers' perceptions towards online shopping has been broadly researched by various researchers and scholars with a wide range of methods to compare consumer behavior in online shopping to that of traditional offline shopping behavior (Gupta, 2013). According to Li and Zhang (2002), there are in-depth studies on online shopping attitudes and behavior in recent years where most of them have attempted to identify factors influencing or contributing to online shopping attitudes and behavior. Internet knowledge, income and education level were found to be powerful predictors of internet purchases among university students according to an online survey of 425 U.S. undergraduate and MBA students (Case, Burns, and Dick, 2001). Ho and Wu (1999) discovered that there are positive relationships between online shopping behavior and five categories of factors which include e-stores logistical support, product characteristics, websites technological characteristics, information characteristics and homepage presentation. Schubert and Selz (1999) examined the quality factors of electronic commerce sites in terms of information, agreement and settlement phases. Researchers have also carried out various researches using different methods and have revealed findings that are similar as well as different with regards to consumers' perceptions of online shopping. Changchit (2006) carried out a survey in South Western United States University (US) to identify the differences between consumers who prefer online shopping and those who prefer offline shopping. The responses from 107 individuals indicated differences in the perception of the consumers as to the factors of past experience, benefits, convenience and levels of uncertainty between those who preferred online shopping and those

who did not. One significant finding was that positive past experience had a positive relationship with desire to shop online. Parment (2013) asserted that Baby Boomers in Sweden showed a higher degree of involvement for grocery product and paid more attention to optimizing purchase decision especially on clothes for example by avoiding poor quality of clothing and by making sure different elements of the wardrobe fit together as compared to Generation Y. On the other hand, Generation Y is more interested on online purchasing based on emotional involvement.

There has been quite intensive in-depth studies on finding out the factors influencing online buying. (Chang et al., 2004; Limayem et al., 2000; Sim and Koi, 2002; Ahn, Ryu and Han, 2004; Liu and Wei, 2003 as well as O'Cass and Fenech, 2003 cited in Thananuraksakul, 2007). Apart from lot of emphasis on providing product information, there are many other variables that enhance and boost the e-commerce transactions, which include economy, comfort and convenience, variety of brands, travel time and information search saving, user-friendly, and holding a win-win situation for both the parties. Mann (2012) suggested other variables, '(Lohse and Spiller, 1998 and Park and Kim, 2003), geography and store accessibility (Farag et al., 2006), perceived risk and online shopping benefits (Pires, Stanton, Eckford 2004), typology of online stores (Moe, 2003), pleasure and web trust (Ha and Stoel, 2009), attitudes to online shopping (Dittmar et al., 2004 and Ahn et al., 2007)' and the impact of consumers' socio-economic conditions (Farag et al., 2006). (KuestasAbdulghader et. al., 2012). Talks about increasing concern on other factors challenging for online purchase 'insecurity, lack of customers' protection and trust which are vital elements for a successful online transaction between countries, organizations' as well as individuals.

#### Research Objectives:-

- To explore the variables that impact the digital marketing transactions.
- To understand the state and level of affiliation between these factors.
- To find out the challenges that e-commerce faces vis-à-vis traditional commerce.
- To know marketing plans used for online marketing for Baby Boomers, Gen X and Gen Y.

'Kotler et.al (2005) and Mc Carthy (1978) designed a basic prototype as shown in Figure- 1.'

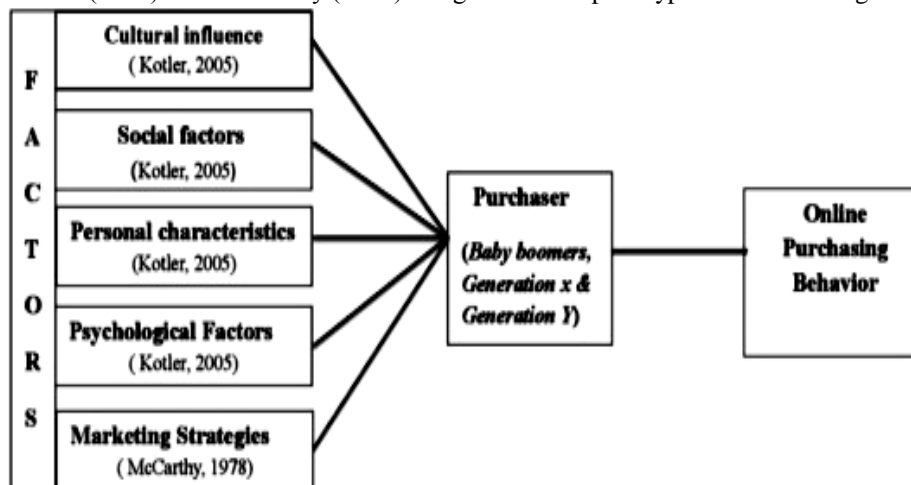

Fig.1:-

#### Research Framework:-

A total of 240 questionnaires were distributed among the three generations comprising of both males and females. The demographics of these samples are shown in Table 1.

**Table 1:-** Gender Distribution of Samples.

	Frequency	Percent
Male	132	55
Female	108	45
Total	240	100

The findings indicate that a total of 55% (132) of this samples were males and 45% (108) were females. Since past literature indicates that educational background and income plays a significant role in determining the consumers' intention to purchase online, the researchers sought to identify this background information through the questionnaire.

**Table 2:-** Educational Background of the Sample.

Educational Background	Teenagers	Males	Females
Secondary School	18.8	13.8	1.2
Diploma	18.8	26.2	9
Bachelor's Degree	25	35	81.2
Master's Degree	22.5	15	6.2
PhD	10	6.2	1.2
Other Professional Qualification	3.8	3.8	1.2
Incomplete	1.2	0	0
Total	100	100	100

**Table 3:-** Income Bracket of Samples.

Income Brackets	Teenagers	Males	Females
RM 2000 and below	10	6.2	31.2
RM 2000 - RM 4000	8.8	33.8	15
RM 4001 - RM 6000	21.2	28.8	15
RM 6001 - RM 8000	20	10	10
RM 8001 and above	36.2	18.8	20
Incomplete	3.8	2.5	8.8

As shown in Table 2, 25% of Teenagers are degree holders, 23% are Masters holders and 10% are PhD holders. With regards to Males, 61% are degree holders, 15% are Masters Holders and 6 are PhD holders. A large percentage, 81% of the Females, are pursuing a Bachelor's degree or have completed their first degrees, 6% are master holders and 1% are PhD holders. Table 3 indicates that the largest percentage (36%) of the Teenagers are earning an income of Rs. 8000 and above while the majority of Males (34%) fell under the income group of Rs 2000 to RM 4000. On the other hand, a large percentage (31%) of Females are earning an income ranging between Rs 2000 and below. The samples' employment status and number of years employed were also identified as past literature has indicated that there is a significant relationship between these with the intention to purchase online. Table 4 and Table 5 indicate the findings.

**Table 4:-** Employment Status of Samples.

		Frequency	Percent	Valid Percent	Cumulative Percent
	0	3	1.2	1.2	1.2
	Full Time	141	58.5	58.8	60
	Part Time	15	6.2	6.2	66.2
Valid	Contract	5	2.1	2.1	68.3

Table 4 shows that a large percentage of the samples are employed fulltime (59%). 24% of the samples are unemployed. These samples are representatives of Generation Y and they are still studying. A small percentage of samples are freelance workers (8%), part time workers (6%) and contract workers (2%). Table 5 shows the years of experience of the samples. In terms of years of experience, a large percentage have been working for more than 16 years (37%). On the other hand, 10% of the samples have been working between 11 to 15 years, 12% between 6 to 10 years, 12% between 1 to 5 years and 23% less than a year.

#### Online Purchasing Experience According to Gender and Generations:-

From the questionnaire collected, the researchers did a frequency count as to the number of samples according to gender and generation who have done online shopping. Table 7 and Table 8 show the findings. The findings in Table 6 indicate that both males and females have experience shopping online. 80% of males and 78% of females from the sample size have previously done online shopping. Thus, it shows that there is not much difference according to gender with regards to purchasing online. This findings contradicts past researchers (Alreck and Settle, 2002, Brown et al., 2003, Donthu and Garcia, 1999, Korgaonkar and Wolin, 1999 and Levy, 1999; Li et. al., 1999; Rodgers and Harris 2003; Slyke et al., 2002 and Stafford et al., 2004 cited in Zhou, 2007) who found that male consumers make more online purchases and spend more money online than females; they are equally or more likely to shop online in the future, and are equally or more favorable of online shopping. Literature review has also revealed that most of the internet shoppers are men, earning high incomes and owning a university education (Dholakia and Uusitalo, 2002 and Li et al., 1999; Vrechopoulos et al., 2001 cited in Nayyar and Gupta 2010).

**Table 6:-** Online Purchasing Experience According to Gender.

			Have you done any online shopping?			Total
			Yes	No	Missing	
Gender	Male	Count	105	27	0	132
		% within Gender	79.5%	20.5%	0%	100%
	Female	Count	84	23	1	108
		% within Gender	77.8%	21.3%	0.9%	100%
Total		Count	189	50	1	240
		% within Gender	78.8%	20.8%	0.4%	100%

The findings indicate that all three generations do some form of purchasing online. However, both Generation X and Y do it more than Baby Boomers. 83% of Generation X and 81% of Generation Y have purchased products/ services online. In the case of Baby Boomers, only 73% have done online shopping. The higher percentage of Generation X and Y purchasing online is linked to the fact that these generations were born during the time when technology had already advanced. The findings of this research is supported by Parment's (2013) study on Generation Y which indicated that the constant and overwhelming flow of information has become the rule for them as they are multi-taskers who use their mobile phones for just about anything. Parment's findings can also apply to Generation X. According to Hernandez, Jimenez and Martin (2011), a review of literature shows that computer skills are more easily learned by younger individuals (Czara et. al., 1989) and older people perceive greater risks (Morris and Venkatesh 2000). Further they cited Trocchia and Jada, (2008) who also showed similar findings where they listed three obstacles which make older consumers reluctant to do online shopping which comprise lack of IT experience, resistance to change and their insistence on trying out the product before purchase. These findings are proven true in the current study which shows the Generation X and Y do online purchasing to a larger degree compared to Baby Boomers.

**Table 7:-** Online Purchasing Experience According to Generations.

			Have you done any online shopping?			Total
			YES	NO	Missing	
	Generation Y	Count	65	15	0	80
		% within Generation	81.2%	18.8%	.0%	100.0%
Generation	Generation X	Count	66	14	0	80
		% within Generation	82.5%	17.5%	.0%	100.0%
	Baby Boomers	Count	58	21	1	80
		% within Generation	72.5%	26.2%	1.2%	100.0%
Total		Count	189	50	1	240
		% within Generation	78.8%	20.8%	.4%	100.0%

Factors Affecting Online Purchasing Prior to analyzing the factors that affects the online purchasing among the three generations, the researchers sought to identify the most common products purchased by the three generations and also the preferred method of purchasing these products. A list of commonly purchased products was given to the samples who were then asked to identify their preferred method of purchase; over the internet or at the retail store. The selection of products was made based on a pilot study that was carried out to identify the most commonly purchased products at a regular basis. Table 8 shows the findings.

**Table 8:-** Commonly Purchased Product (%).

Variables	Baby Boomers		Generation X		Generation Y	
	Online	Retail	Online	Retail	Online	Retail
Groceries	1	99	6	94	4	96
Cosmetics	10	90	15	85	6	94
Books/ CDs	26	74	30	70	25	75
Clothes	9	91	16	84	24	76
Furniture	5	95	14	86	9	91
Electronic gadgets	21	79	30	70	25	75
Computers/Mobiles	19	81	30	70	14	86
Airline/Railway tickets	51	49	59	41	74	26
Cinema tickets	65	35	72	28	74	26
Holiday packages	49	51	58	42	59	41

Out of the ten products/services given in the list, the findings indicated that the three generations' preferred method of purchasing was similar for three specific products: cinema tickets (Baby Boomers, 65%, Generation X, 72% and Generation Y, 74%), airlines/ railway tickets (Baby Boomers, 51%, Generation X, 59% and Generation Y, 74%), and holiday packages (Baby Boomers, 49%, Generation X, 58% and Generation Y, 59%) where they all opted buying over the internet as their preferred method. One significant observation is that in the case of holiday packages, the difference in percentage of Baby Boomers' preference between purchasing at retail store and online is not very significant (2%). The rest of the seven products inclusive of groceries (Baby Boomers, 99%, Generation X, 94% and Generation Y, 96%), cosmetics, (Baby Boomers, 90%, Generation X, 85% and Generation Y 94%), books/CDs (Baby Boomers, 74%, Generation X, 70% and Generation Y, 75%), clothes (Baby Boomers, 91%, Generation X, 84% and Generation Y, 76%), furniture (Baby Boomers, 95%, Generation X, 86% and Generation Y, 91%), electronic gadgets (Baby Boomers, 79%, Generation X, 70% and Generation Y, 75%), and computer products/mobiles (Baby Boomers, 81%, Generation X, 70% and Generation Y, 86%) showed a tendency among the samples from the three generations to purchase at retail stores. The findings here contradicts the findings of Monsuwé et al. (2004 cited in Haslingger, Hodzic, Opazo, 2007) who compared the traditional way of shopping and online shopping and concluded that online shopping is a more convenient way compared to the traditional ones. His conclusion was based on the fact that the internet allows for more information to be gathered with a minimal amount of effort, inconvenience, and invested time by the consumer. Monsuwe's findings is applicable to the current findings where the samples from the three generations preferred purchasing cinema tickets, airline/ railway tickets and holiday packages online. This is probably because the above activities are time consuming.

Past researchers have identified numerous factors that influence online purchasing behavior. Based on these findings, four main categories of factors were identified: personal characteristics psychological factors, factors related to cultural influence and social factors. The respondents were asked to indicate their agreement on whether

these factors affect their intention to purchase online. A correlation analysis was done to determine the relationship between the variables. The analysis was done to determine whether the demographic factors such as gender, generation, education, employment and salary influences the consumers' online purchasing behavior. The result proved that there is a positive correlation between generation and social factors with ( $r = 0.178$ , sig. level = 0.006). The social factors indicated in the questionnaire comprise the following statements; products are also used by family and friends, products are endorsed by celebrities, suppliers are engaged in corporate social responsibility and there is online feedback of products. The findings indicate that these factors are significant in influencing the consumers' decision to do online purchasing. Meanwhile the findings indicated that personal characteristics, psychological factors, factors related to cultural influence and marketing mix strategies did not significantly influence the generations in their online purchasing behavior. Besides that, the income of consumers also has a significant positive relationship with personal characteristics ( $r = 0.141$ , sig. level 0.029) and social factors ( $r = 0.166$ , sig. level 0.11). The personal characteristics include lifestyle, the liking for the products, current position whether they are students, office workers or professionals as well as trends of the generations. This proved that consumers who have high incomes do more online shopping. Baby Boomers, who earned higher also, preferred to buy products of current trends to upgrade their lifestyle. This finding is consistent with previous researchers where it was found that income is positively related to the tendency to shop online (Bagchi and Mahmood 2004; Donthu and Garcia, 1999, Korgaonkar and Wolin, 1999 and Li et al., 1999; Susskind 2004 cited in Zhou 2013; Cunningham and Cunningham, 1973 cited in Nayyar and Gupta 2010). The findings also indicated that psychological factors, factors related to cultural influence and marketing mix strategies have negative relationship with salary. In the studies of Hernandez, Jimenez and Martin (2011), higher income causes internet users to perceive lower implicit risks in online purchasing and thus increase their demand for such activity while on the other hand, low income is a deterrent to online transactions as they do not have the ability to withstand possible financial losses.

The findings in this study is consistent with past literature. However, caution must be taken in coming to a conclusion as the study of Hernandez, Jimenez and Martin (2011) has also proven that the user's income only has effect on the first e-commerce activity which changes once users have acquired experience in the activity. Their view is supported by the study of Al-Somali et. al. (2009). This research, however, did not study the difference in relationship between age and first instance of online purchasing and subsequent online purchasing. At this point, it is also important to take note of the implication from Sorce, Peratti and Widrick's study (2005) where it is stated that different marketing approaches are necessary for the different consumer age segments. Older consumers may need to be induced to get online in the first place, while younger consumers will require enticement to translate their shopping and browsing into actual purchasing.

**Table 11:- Marketing Strategies.**

		Product		Price		Place		Promotion	
		1	2	1	2	1	2	1	2
Baby Boomers	Count	65	15	55	25	59	21	49	31
	Expected Count	57.2	22.8	54.9	25.1	58.5	21.5	47.9	32.1
	% with Generation	81.2%	18.8%	68.8%	31.2%	73.8%	26.2%	61.2%	38.8%
Generation X	Count	55	25	58	22	60	20	56	24
	Expected Count	57.5	22.5	54.2	24.8	57	21	48.3	31.7
	% with Generation	68.8%	31.2%	72.5%	27.5%	75%	25%	70%	30%
Generation Y	Count	52	58	52	28	57	23	39	41
	Expected Count	57.2	22.8	54.9	25.1	58.5	21.5	47.9	32.1
	% with Generation	65%	35%	65%	35%	71.2%	28.8%	48.8%	51.2%

The researchers asked the respondents to identify which marketing strategies affects their online purchasing behavior and the results indicated that for the Baby Boomers, the product strategy was the most significant (81.2%) followed by place (73.8%), price (68.8%) and lastly promotion (61.2%). In the case of Generation X, the findings indicated a difference where place was indicated as the most significant (75%), followed by price (72.5%), promotion (70%) and lastly product (68.8%). The perceptions as to the strategy which had a significant impact on the decision to purchase online for the Generation Y was similar to Generation X where they identified place as the most significant variable (71.2%), followed by both product and price (65%) and promotion (48.8%). In this study, the researchers did not expand the term 'promotion' with that of trust as done by some researchers (Bhattacharjee, 2002, Gefen, 2003 and Mc Knight et al., 2002 and Yoon, 2002). According to Chang et. al, all these researchers

found a significant positive effect of trust on intention to purchase where trust is conceptualized as a construct where the truster (online purchaser) is willing to be vulnerable to the action of the trustee (marketer or producer).

### Conclusion & Discussion:-

This research was carried out among samples from the three generations to identify the perceptions and challenges of online shopping in Malaysia. The purpose was to identify whether there were any differences between the perceptions of the three generations. The findings indicated that the percentage of both females and males shopping online is almost similar. With regards to generations, the findings are consistent with past literature where it is shown that generation X and Y do online shopping more than Baby Boomers. In terms of products that are most purchased online by the three generations include cinema tickets, airline/railway tickets and holiday packages. The findings on the factors affecting online purchasing indicated that personal characteristics, psychological factors, cultural influence and marketing mix strategies do not significantly influence the generations in their online purchasing behavior. The only factor that was found to be significant in influencing the consumers' decision to do online purchasing is social factors which comprised of products used by family and friends, products endorsed by celebrity, suppliers engaged in corporate social responsibility and there is online feedback of product. In terms of challenges of online purchasing, all three generations indicated risk of credit card transaction as the most significant. The limitations in this study include the sample size which is relatively small for generalizations. A larger sample would give more valid results. The research also did not take into consideration the difference in perception of a new user with that of an experienced user to online shopping. Another limitation is that the characteristics of Malaysia's unique population which is rich in cultural diversity with its unique practices and taboos was not taken into consideration in the analysis of the sample's perceptions and challenges of online shopping. Thus, it is recommended that research in this area can be further extended to analyze the differences in perceptions between the three predominant races in Malaysia as well as differences between the genders. It is also recommended that online marketers take into consideration the challenges that are perceived by online purchasers in order to cultivate a good impression on online shopping among the three generations.

### Abstract

Empowerment is a process, which generates changes in ideas and perceptions and creates awareness about one's rights and opportunities for self-development in all important spheres of life. It enables individuals and groups to change the balance of power by way of knowledge, know-how and experience to strengthen one's capacity and self-reliance. Many factors affect empowerment level of women such as caste, family's socio-economic status, custom, culture, age and education of family members as well as women's herself etc. Thus the study was conducted to know the role of SHGs participation in women empowerment. Random Sampling techniques were used and total 240 women respondents were selected to three blocks of Kanpur District. The study revealed that as age increases with correlation coefficient of 0.2436, 0.2447, 0.2478 and 0.3280. Occupation was observed significantly positively correlated with economic, socio-cultural and politico-legal empowerment. **Sharma and Sharma (2010)** stated that for Indian rural womenfolk, micro-finance is all about self-sufficiency, employment creation, income generation, social safety as well as sustainable livelihood of the of the poor women's group. Micro-finance intertwines two major pillars of India viz., democracy and micro-entrepreneurship at the grass root level.

### Introduction:-

Now-a-days economic development is one of the factors that have changed the entire scenario of social and cultural environment within the country especially for the women. Women empowerment has been recognized as the central issue in determining the status of women and it has been considered as one of the strategies to tackle the socio-economic poverty. Women have taken up self-help movement through savings as a mass movement. Development agenda of the country in the last few years placing the people, especially women, in the forefront has enabled formation of a large number of SHGs throughout the country. The ultimate objective of all these efforts is to make women economically independent and self-reliant- Many factors affect empowerment level of women such as caste, family's socio-economic status, custom, culture, age and education of family members as well as women's herself etc. Economic empowerment is one of the approaches which have been widely used with women empowerment. One can be empowered either externally by capacity building or internally by developing self-expression, both are interdependent/ Control and management of resources develops the ability for self-expression in various ways as self- confidence, ability of decision making, skill overcome external barriers for accessing resources

**Corresponding Author:- Anchal Sharma.**

**Address:-** College of Home Science Chandra Shekhar Azad University of Agriculture & Technology Kanpur (U.P.).

etc. women must go through intrinsic transformations regarding knowledge, skill and understanding which can be enhanced by group method which also involves empowerment of an individual. Many factors affected their choice of work as interest and educational background, family, social status, income level, technical knowledge, entrepreneurial background etc. Some activities like hand-made papers, bee-keeping, making of soap, jiggery, pulse processing, fruit processing and preservation, bamboo and cane work, weaving of doormats, manufacturing of candles etc. considered and identified as the convenient entrepreneurial activities for housewives. The SHG bank linkage programme is unique but faces several challenges regarding sustainability of the programme. The first and foremost challenge is how to maintain the quality of SHGs when there is mushroom increase in their number. The poor quality is seen in the book keeping, audit of groups in the country, which are accumulating regular savings, undertakes credit functions by means of intrinsic resources and credit from banks successfully. **Nagayya and Rao (2009)** reviewed the SHGs-Bank linkage programme at national and state level with special reference to Andhra Pradesh in detail and certain aspects of other three southern states-Tamil Nadu, Karnataka and Kerala. Banks have an important role to play and stake in inclusive banking in stepping up the success rate in the functioning of SHGs and support organizations of various categories. Self-help promotional Institutions and banks should pursue the task of spreading healthy management practices among SHGs, uniformly in developed and less developed regions. **Dutta and Panda (2009)**, indicated that Impact Assessment is the structured study, which measures the impact on employment, income generation, nutrition, education, health, consumption, business development (micro entrepreneurship) and gender equity on MFI's clients. Impact assessment refers to the assessment of how financial products and services affected the lives of the poor. Impact assessment is the measurement of the income growth, assets growth and vulnerability reduction of the poor by the microfinance programme. The indicators for impact assessment are not limited to economic development but extended to developmental growth like health, education, empowerment, gender, etc. **Estable and Torreguitart (2010)** studied about the effects of micro-finance in developed countries, and specifically the start-up of micro-business by women entrepreneurs with limited access to credit, having benefit from a micro-credit programme to developed their self-employment projects. as a part of general project to try to understand the impact of the existing micro-finance institutions (MFIs). The present research aims to study the social impact of the micro-business started up by women entrepreneurs granted with micro-loans, by means of a qualitative approach, the study proposed involves a total of ten women, clients of three different MFIs based in Catalonia. Semi-structured interviews have been used to conduct the research. The results have been analysed with the help of a frame. Work in which parameters related to the women micro-entrepreneurs, to their entrepreneurship experiences, and to the MFIs granting their loans are regarded as indicators of the personal and family impacts, of their professional lives and of the social impacts of micro-finance. The observed impacts are mostly related to personal and family issues, on account of the limited capacity of the micro-credit instrument to better the women's standard of living. Social impacts, although expected to be marginal, are also revealed by the study.

### Research Methodology:-

Present study on "Effect of independence variables on empowerment of SHG members through entrepreneurial activities and loan Practices adopted" was conducted in rural areas of Kanpur District. Three blocks namely Chaubepur, Shivrajpur and Kalyanpur were purposively selected from the study areas. 8 villages were than purposively selected from each blocks to get a total of 24 villages. One SHG from each village and 10 respondents from each SHG was randomly selected to get a total of 240 respondents.

### Results & Discussion:-

The present study were based on two main objectives such as Socio-Personal the respondents and empowerment of rural women through Self Help Group. Majority, about forty- three per cent respondents were belonging to 35 to 45 years of age followed by 28.75 per cent were of 25 to 35 years. About twenty- five per cent respondents were educated up to high school whereas, 16.66 per cent respondents were educated up to middle school. Majority, (47.08%) respondents were belonging to OBC caste followed by 31.66 per cent respondents were of SC/ST category. Majority (63.75%) respondents were belonging to joint family and about forty-nine per cent respondents were having 5 to 8 members in their family. More than forty per cent respondents were having the pucca house and 34.16 percent heads of family were labour.

**Loan Practices Adopted:-****Loan Practices Adopted:-**

Majority about forty two per cent respondents borrowed loan only once whereas, about thirty one per cent borrowed up to 5000 from bank and maximum (31.66%) respondents repaid loan up to 30%. Maximum about forty four per cent respondents borrowed loan from SGSY and majority i.e. 75.42 per cent respondents borrowed Rs. Up to 25,000 and paid 7.5 per cent per annum interest to the bank.

**Table 3:-** Distribution of Respondents on the Basis of Entrepreneurial Activities N = 240.

S.No	Entrepreneurial activities	Regularly	Occasionally	Never
<b>A</b>	<b>Agricultural activities</b>			
1	Vegetable & seed production	65 (27.10)	70 (29.17)	105 (43.75)
2	Honey bee keeping	16 (6.67)	8 (3.33)	216 (90.00)
3	Dairy farming	112 (46.67)	50 (20.83)	178 (74.17)
4	Goatary/ Poultry farming	85 (35.42)	60 (25.00)	95 (39.58)
5	Vegetable vending	107 (44.58)	33 (13.75)	100 (41.66)
6	Vermi compost & NADEP	32 (13.33)	59 (24.58)	149 (62.08)
<b>B.</b>	<b>Non-Agricultural activities</b>			

1	Food processing	83 (34.58)	29 (12.10)	128 (53.33)
2	Agarbatti making	8 (3.33)	94 (39.17)	138 (57.50)
3	Candle making	13 (5.42)	128 (53.33)	99 (41.25)
4	Tailoring	70 (29.17)	53 (22.10)	137 (57.10)
5	Flour milling	3 (1.25)	2 (0.83)	235 (97.92)
6	Shop at local level	133 (55.42)	00 (0.00)	107 (44.58)
7	Basket making/ mat making	29 (12.10)	41 (17.10)	170 (70.83)

(Figure in parenthesis indicates percentage)

#### Entrepreneurial Activities:-

About forty seven per cent respondents were 'regularly' engaged in "dairy farming" followed by 44.58 per cent respondents 'regularly' engaged in "vegetable vending". More than thirty five per cent respondents 'regularly' engaged in "goatary". Among non-agricultural activities, about fifty five per cent respondents were found 'regularly' engaged in "local level shop" followed by about thirty five per cent 'regularly' engaged in "food processing".

**Table 4:-** Relationship Between Empowerment of SHGs Members and Selected Independent variables. N = 240

Variables	Empowerment of SHGs Member			
	Economic empowerment	Socio-cultural empowerment	Politico-legal Empowerment	Self - Esteem
Age	0.2436*	0.2447*	0.2478*	-0.3280*
Education	-0.0692	-0.0729	0.0744	0.2126*
Caste	0.1120	0.0836	0.1054	-0.1354
Family Size	-0.0191	0.0119	-0.065	0.0410
Family type	0.3586*	-0.3008	-0.3691	0.2501*
Type of house	0.3384*	0.3323*	0.4115*	0.3288*
Occupation	0.4490*	0.4238*	0.4433*	0.3595*

(\* Significant at 5.0% level of significance)

To assess the relationship between empowerment of SHG members and selected independent variables correlation coefficient was assessed. The computed 'r' value showed that age is significantly positively correlated with all types of empowerment indicating as age increases economic empowerment, socio-cultural empowerment, politico-legal empowerment and self-esteem empowerment of respondent's also increase. Education is negatively correlated with economic empowered, socio-cultural empowerment, politico-legal empowerment but significant positive correlation was found between education and self -esteem empowerment. As education increases self-esteem empowerment of respondents also increases, as her level of education increase she understand her better and feel her own problems and find out solutions for them also.

No significant correlation was found between caste and economic, socio – cultural and politico-legal empowerment while negative correlation was found between self-esteem empowerment and caste. Family size was also negatively correlated with economic and politico-legal empowerment but positively correlated with socio cultural and self – esteem empowerment. On the other hand family type was significantly positively correlated with self-esteem empowerment, respondents belonging to nuclear family were found more self-esteem empowered but family type was negatively correlated with economic, socio cultural and politico legal empowerment. Positive significant correlation was observed between type of house and economic empowerment, socio-cultural empowerment and politico-legal empowerment but negative correlation was found between type of house and self-esteem empowerment. Occupation was observed significantly positively correlated with economic empowerment, socio-cultural empowerment and politico-legal empowerment as level of occupation increases economic, socio-cultural and politico-legal empowerment also increases but negative correlation was found between occupation and self – esteem empowerment. Thus, null hypothesis is partially rejected on the basis of the above findings.

#### Conclusion:-

It is concluded from the present study that SHGs today play a major role in poverty alleviation in rural India. A growing number of poor people (mostly women) in various parts of India are the member of SHG and actively engage in saving and credit, as well as in other activities. Empowerment by way of participation in SHG brings

enviable changes and enhances the living conditions of women in poor and developing countries like India. About ninety-six per cent respondents were strongly agreed upon “SHGs helped women to stop migration” and a majority of respondents were ‘strongly agree’ on SHGs “have little effect in changing an attitude of men towards women”. Several factors and strategies have been provided by the SHGs that have made a positive contribution to the economic empowerment of women such as saving, credit and income generation thereby ensuring economic independence. When a woman becomes members of SHG, her sense of public participation enlarged, a horizon of social activities, high self- esteem, self-respect and fulfilments in life, expended and enhances the quality of status of women as a participant. Nearly ninety-two per cent respondents want to be Pradhan as they feel more confident since they come out from home and understand what is running in society so they also want to contribute their part for its betterment. SHGs are the major sources of inspiration for women’s welfare. Women are an integral part of our country and economy. All round development and harmonious growth of nation would be possible only where women are considered as equal partners and SHG provides women a floor where she expresses herself and share responsibilities and thus, her self-confidence develop to its maximum and she reaches the top of her self-esteem.

#### Abstract

Although high quality multiple sequence alignment is an essential task in bioinformatics, it becomes a big dilemma nowadays due to the gigantic explosion in the amount of molecular data. The most consuming time and space phase is the distance matrix computation. This paper addresses this issue by proposing a vectorized parallel method that accomplishes the huge number of similarity comparisons faster in linear space.

#### Introduction:-

Multiple sequence alignment of several nucleotides or amino acids is an important tool in bioinformatics. It can identify patterns or motifs to characterize protein families, and is therefore utilized to detect homology between sequences as well as to perform phylogenetic analysis [1].

It is playing an increasingly important role in diverse areas, such as elucidation of the tree of life [2], studies of epidemiology and virulence [3], drug design [4], and human genetics [5]. Most popular MSA tools, ClustalW[6], T-Coffee[7], MAFFT[8], and DIALIGN[9], utilize the progressive method that was at first introduced in [10].

It typically consists of three stages. Stage 1 computes a Distance Matrix (DM) comprised of the distance value between each pair of input sequences. Stage 2 computes an evolutionary tree from the DM using some phylogeny reconstruction methods like Neighbor-Joining (NJ) [11] which guides the final multiple alignment process. In stage 3, first closely related sequence or group of sequences is aligned then the most divergent sequences are aligned to get the final MSA.

However, there are some obstacles that must be handled carefully when using the progressive method. First, complexity is of increasing relevance due to the rapid growth of sequence databases, which now contains enough representatives of larger protein families to exceed the capacity of most current programs.

For example, aligning two sequences with one megabyte length each requires several terabytes of memory, which cannot be provided by most of the commodity computational resources. Second, computational load of multiple alignment calculations is of great increasing.

For example, computations of modern homologous sequence data sets could take days. In fact, the best methods sometimes fail to deal with these complexities efficiently and obtain biologically accurate alignments at the same time. The present study overcomes these obstacles by using two main approaches.

Address:- Education College for Girls, University of Mosul, Mosul, IRAQ.

The first is the vectorization, where all matrices are compensated by vectors, which in turn reduces the memory requirement and speedup execution without affecting the accuracy.

The second approach is parallelism, the widespread programming method nowadays that allows multiple independent processes which share the same resources, to be executed concurrently at less time. Thus, this work proposes an optimized method for the progressive MSA distance matrix computation using vectorization and parallelism.

It aims at producing a superlative MSA tool over existing ones in space and execution time. Implementation tests uses MATLAB@2012 compiler and explicit parallel programming with the fork-join model of parallel execution on core i7.

MATLAB was the most appropriate programming language for our work because it is an interpreted language of a high-level scripting and interactive sessions. It tends to be easier to code and debug. Its package comes with sophisticated libraries for matrix and vector operations, general numeric methods and plotting of data. It supports parallelism and MEX-files including C++ codes that accelerate execution and offer full control over parallelization [12]. The multi-core was the candidate platform for implementation due to its availability, but it is intended to extend our work for clusters; grids; or clouds. A multi-core processor uses the shared memory storage mechanism. The relationship between its cores is tightly coupled, and they are often interconnected by shared-cache, therefore, there is almost no communication overhead between cores [13].

### **Related Work:-**

This section surveys the most popular parallel tools developed for MSA using multi-cores. It highlights their parallel techniques and their performance enhancement. ClustalW presented a fully multithreading optimized version called MT-ClustalW [14]. It utilized the machine resources and achieves higher throughput. It was 2 times faster than the sequential ClustalW using 8 threads. While on Cell BE [15], it makes extensive use of vectorization and schedules the application across all cores which speed up the pairwise alignment phase. In addition, it applies loop unrolling and loop skewing optimizations that speedup the progressive alignment phase. It achieves an overall speedup of 9.1. Also on a QS21 Cell Blade, it demonstrates a speedup of 24.4 times when using 16 synergistic processor units compared to single-thread execution on the power processing unit, and 3.8 times faster than a 3-thread version running on an Intel Core2 Duo[16]. Cloud-Coffee [17] is the parallel implementation of T-Coffee that is based on shared-memory architectures, like multi-core. It was benchmarked on the Amazon Elastic Cloud (EC2) and runs 3.7 times faster. In [18], all stages of MAFFT have been parallelized using the POSIX Threads library with the best-first and simple hill-climbing parallelization strategies. It achieved a speedup of 10 times with different random numbers on a 16 core PC. DIALIGN-TX-MPI [19] is the parallel version of DIALIGN-TX that was implemented using both OpenMP and MPI on a heterogeneous multi-core cluster. It used an iterative heuristic method for MSA that is based on dynamic programming and generates alignments by concatenating ungapped regions with high similarity. It obtains a speedup of 3.13. MSAProbs [20] combines a pair-HMM and a partition function to calculate posterior probabilities. It investigates weighted probabilistic consistency transformation and weighted profile-profile alignment, to achieve high alignment accuracy. In addition, it is optimized for modern multi-core CPUs by employing a multi-threaded design in order to reduce execution time. It statistically demonstrates dramatic accuracy improvements over previous tools. MSACompro [21] incorporates predicted secondary structure, relative solvent accessibility, and residue-residue contact information into the currently most accurate posterior probability-based MSA methods. It uses a multiple-threading implementation on a 32 CPU cores machine. Benchmarks clearly show improvements in accuracy over MSAProbs and all leading tools. We concluded from the study of the above tools that MSACompro and MSAProbs are the most accurate but at expense of speed. Sample-Align-D is the fastest but not available. Clustal and MAFFT are fast, available, portable and can align huge number of sequences but less accurate. MUSCLE and T-coffee provide a good compromise between time spent and quality of the resulting alignment. And most of them exhaust large storage space due to the usage of matrices. Thus this research aims at addressing the problems concerning space and time.

### Proposed Approach:-

Some attempts have been made to accelerate DM computations using GPU's [22], and CUDA [23]. This section explains our proposed algorithm. It depends mainly on the espoused idea in this work of switching from matrices to vectors. Its main goal is to speedup computations and reduces storage. The baseline equation used to compute the elements of the distance matrix  $DM(N \times N)$  for aligning  $N$  sequences  $\{S_1, S_2, \dots, S_N\}$  is:

$$DM(i, j) = 1 - \text{nid}(S_i, S_j) / \min(L_i, L_j) \quad \forall 1 \leq i, j \leq N \quad (1)$$

where  $\text{nid}(S_i, S_j)$  is the similarity score between  $S_i$  and  $S_j$ . It is computed by using the most popular optimal local alignment known as the Smith-Waterman algorithm (SM) [24]. It compares two sequences by computing a distance that represents the minimal cost of transforming one segment into another, with respect to the given scoring system. It identifies common subsequences between any two sequences  $S_1$  and  $S_2$  of length  $L_1$  and  $L_2$ , by computing the similarity  $H(i, j)$  of two sequences ending at position  $i$  and  $j$ , using the following recurrence:

$$H(x, y) = \max \begin{cases} 0, \\ H(x-1, y-1) + \text{sbt}(S_i(x), S_j(y)), \\ H(x-1, y) + g, \\ H(x, y-1) + g, \end{cases} \quad \forall 1 \leq i, j \leq N \quad (2)$$

where  $\text{sbt}$  is a nucleotides or amino acid substitution matrix, and  $g$  is a gap penalty.

The proposed algorithm vectorizes all above matrices. First, it benefits from the fact that computing any anti-diagonal in the matrix  $H$  is based only on the values of the previous two anti-diagonals. Based on Equation (2), each cell  $H(i, j)$  depends only on its Northern  $H(i, j-1)$ , Western  $H(i-1, j)$  and North-Western  $H(i-1, j-1)$  previously computed. Thus, just one vector  $V$  for current anti-diagonal, with two buffers  $V1$  and  $V2$  for two previously computed anti-diagonals, are enough to compute the similarity score.

This is done by computing all cells along anti-diagonal  $V$  in parallel. The value of each cell is evaluated in terms of its diagonal neighbour stored at  $V1$ , with its left and upper neighbours stored at  $V2$ , and the maximum value is selected indicating the highest score, using the following equation repeatedly along all  $2L-1$  anti-diagonals, where it is assumed that all sequences have the same length  $L$ , for simplicity.

$$\begin{aligned} V^i(k) &= \{H(k+1, i-k+1)\}_{k=2}^i \\ &= \left\{ \begin{array}{l} \max(0, H(k, i-k) + \text{sbt}(S_1(k), S_2(i-k+1)), \\ H(k, i-k+1) + g, H(k+1, i-k) + g) \end{array} \right\}_{k=2}^i \\ &= \left\{ \begin{array}{l} \max(0, V^{i-2}(k-1) + \text{sbt}(S_1(k-1), S_2(i-k)), \\ V^{i-1}(k-1) + g, V^{i-1}(k) + g) \end{array} \right\}_{k=2}^i \\ V^i(k) &= \max \left\{ \begin{array}{l} 0, \\ V^i1(k-1) + \text{sbt}(S_1(k-1), S_2(i-k)), \\ V^i2(k-1) + g, \\ V^i2(k) + g \end{array} \right\} \quad (3) \end{aligned}$$

**Fig. 1** illustrates the main idea when aligning the two sequences  $S1=\{\text{ACCGTCG}\}$  and  $S2=\{\text{TCCGTCA}\}$  of length 7. It shows the computation of the similarity matrix  $H$ , with the linear gap cost (-8) and a substitution cost of (5) if the characters are identical and (-4) otherwise, and how it is replaced by  $V$ , using  $V1$  and  $V2$ .

Fig. 1:- Relation between H, V, V1, V2.

Second, the proposed algorithm also replaces the distance matrix DM by a distance vector DV. It exploited the fact that DM is symmetric, and stores only its minor diagonal with its upper triangle, dispensing repeated values. It computed the values of DV by the following equation:

$$DV(k) = 1 - (dv_k) / \min(L) \quad (4)$$

Where  $(dv_k)$  is the number of similarity score in the optimal local alignment of  $S_i$  and  $S_j$ . Fig. 2 shows the correspondence between DV and DM cells when  $N=5$ .

Fig. 2:- The relation between DM, DV.

### Results and Discussion:-

This section presents results obtained when measuring the performance of the above proposed parallel method implemented using MATLAB® R2012a on a core-i7 processor with 8 cores of 3.4GHz and 8GB RAM running on Windows7. Evaluations were concerning two attributes of MSA tools that are of great importance to users. They are time and space.

**Runtime:-**

The most important criterion of measuring the quality of our tool is the consumed time during its execution. A set of performance evaluation experiments has been conducted using ten protein sequence datasets, consisting of sequences with different combinations of sequences' number (N) and length (L), selected from the Human Immunodeficiency Virus (HIV) dataset downloaded from NCBI. Table (1) presents the execution time and speedup of the proposed parallel algorithm for computing the distance vector DV, and the original algorithm computing the distance matrix DM. It shows that the greater the length of sequences, the more acceleration of DV due to the high computation speedup of the optimal exact matches.

**Table 1:-** Performance Comparison between DM, DV Computations

N	L	DM(sec.)	DV (sec.)	Speedup
400	856	760.812	141.245	5.386
400	408	213.575	48.063	4.444
600	462	595.460	142.750	4.171
800	454	1087.349	230.806	4.711
1000	858	4895.379	900.068	5.439
1000	446	1640.334	385.649	4.253
2000	266	2624.920	570.873	4.598
4000	247	22720.202	5579.069	4.072
4000	83	4989.181	1462.492	3.411
8000	73	16972.691	4733.101	3.586

Our work has achieved higher performance due to four reasons: (1) the superiority of MATLAB on other languages at dealing with vectors, (2) the optimal use of Multi-core machine when parallelizing the computation of DV independent elements, (3) the perfect use of C++ mix-file when dealing with memory, (4) the use of RAM only for storing the V's and H's.

**Usage Space:-**

Storage space is the second parameter of measuring the quality of the MSA tool because of the huge growth of sequence databases that exceed current programs' capacity. It is measured by the space needed to store data. Experiment results of used storage during computations of both DM and DV were recorded as given in Table (2), with respect to the size of the N input sequences. It is clear that the proposed algorithm has reduced the overall space almost to the half. This is because the space required for the matrix DM whose size is  $N \times N$  has been reduced to DV of size  $N \times (N-1)/2$ .

**Table 2:-** Storage Comparisons between DM, DV

N	L	DM(Mbyte)	DV(Mbyte)
400	408	0.64	0.31
400	856	0.64	0.31
600	462	1.44	0.70
800	454	2.56	1.25
1000	446	4	1.95
1000	858	4	1.95
2000	266	16	7.80
4000	247	64	31.19
4000	83	64	31.19
8000	73	256	124.78

In addition, Table (3) shows the RAM storage exhausted when storing H's in comparison to that of V's. This remarkable achievement comes from the fact that SW algorithm consumes  $(L+1)^2$  word to find similarity between two sequences of length L, while DV uses only  $3(L+1)$  word.

**Table 3:-** Storage Comparisons between H's, V's

<b>L</b>	<b>H's(Kbyte)</b>	<b>V's(Kbyte)</b>
408	334.56	2.45
856	1468.90	5.14
462	428.74	2.78
454	414.05	2.73
446	399.62	2.68
858	1475.76	3.54
266	142.58	1.60
247	123.01	1.49
83	14.11	0.51
73	10.95	0.44

### Conclusion and Future Work:-

The contribution of this work contain optimizations for SW algorithm, and DM computation for addressing the problem of building a parallel tool for multi-cores that produces the best alignment of multiple sequences in short time without using much storage space. Results prove that the proposed approach for DM and SW has good ability to aligning large number of sequences through powerful improved storage handling capabilities with efficient improvement of the overall processing time.

For future, it is planned to apply the same mechanism on NJ stage, and combine all algorithms to produce the aligner. Then the aligner will be extended to operate on different parallel platforms. Challenges expected to be tackled when merging optimization techniques for improving accuracy may affect performance improvements.

Supplier selection, online business, online business seller.

#### Abstract

In the current economic climate, online businesses are developing fast, with increasing responses from customers further encouraging online business. The use of IT enables wider opportunities for business expansion as well as presenting fresh challenges for businesses, which has led to many people deciding to venture into online business. When it comes to business success, the supplier plays an important role, and in choosing the right supplier, the overall performance of business operation can be immensely improved. Therefore, this paper aims to determine the factors that influence supplier selection for online sellers in Malaysia. In previous studies, the main focus proved to be research on supplier selection and the impacts of this on customer organisation and sales figures in physical stores, whereas this study will attempt to focus on online sellers; making the purpose of this study to identify and determine the factors that affect online business sellers in Malaysia in the selection of suppliers. Furthermore, this study attempts to use a combination of TPB and supplier selection criteria models to examine these factors. The increase of market globalisation and competition enabled by Internet-based technologies has contributed to significant changes in the order of stages in supplier selection factors, as well as introducing new criteria to the supplier selection process. As described above, gaps exist in previous research in this area, and there is an overall lack of research on this topic in Asian countries. Due to the lack of existing studies, this study contributes research by investigating the effects of quantity, quality, relationship, reliability, flexibility, delivery and cost on intention and their impacts on the behaviour of online sellers in Malaysia. It is hoped that this research will assist online sellers in selecting the correct supplier for their business, whilst reducing the overall cost and enhancing business competency and client services.

**Introduction:-**

Nowadays, the advance of Information Technology (IT) supports a large volume of user-generated content. IT provides more opportunities and challenges for business transformation. Many entrepreneurs have changed or expanded their business from a physical store to electronic business, which has also been accepted by users at the present time.

As proven by the exponential growth of existing online businesses, most consumers prefer to shop online. There are many e-commerce web stores that offer online purchase; such as ZALORA, Lazada, Groupon, 11street and Amazon. Some of the online sellers also sell through Facebook, Twitter and Instagram, which demonstrates that it is not only large organisations that can run business via online, but smaller companies such as enterprises, can also set up online stores and offer online purchase to their customers.

Supplier plays an important role in the success of enterprises. Choosing the right supplier determines the overall performance of business operation. When the chosen supplier provides the best quality of products with multiple options provided and at the best price, the sellers receive a lot of benefits, showing these enterprises have more chances to offer their customers the best selling. Therefore, it is important to understand and determine the factors that influence supplier selection because it could result in a significant impact on customer impression. Thus, the researcher aims to identify and understand determinant factors that influence supplier selection for online business sellers in Malaysia.

**Significance of the Study:-**

In previous research, there are a lot of literatures about quantity, relationship, reliability, flexibility, quality, delivery, cost, intention and behaviour in various areas (Camen et al., 2012; Teng & Jaramillo, 2010). Even though there are a lot of literatures in these variables, there are very limited scholars who focused on determinant factors that influence supplier selection for online business sellers in Malaysia. In Malaysia, there are many online sellers involved in this area. However not all business sellers could survive in the competitive market since they did not know how to choose the right supplier to supply the product. This situation affects their business performance and as a consequence, many sellers are no longer interested in continuing their online business.

The following are some of the practical benefits from this study which can improve knowledge and performance of online business sellers in Malaysia:

- The study on the factors that influence supplier selection for online business sellers in Malaysia provides the important know-how regarding the significance of the supplier selection, enabling them to gain greater profitability whilst achieving higher productivity in supply chain, higher level performance for their business and further enhancement its competitiveness in the marketplace.
- The results of the study can also be applied by online business sellers in Malaysia to determine their objectives and future direction. Therefore, better strategy planning can be achieved when making a decision, leading to better company reputation on a global scale.
- This study highlights the determinant factors that influence supplier selection for online business sellers in Malaysia. Thus, this provides a guideline to online business sellers in Malaysia in selecting the best suppliers and therefore encouraging them to invest in these initiatives using the right methodologies, without affecting business reputation.
- This study provides useful insights for online business in Malaysia regarding the roles that influence supplier selection. This is important to enable online business sellers identify the important factors that can help them improve their performance in business and lead to increased productivity.

In terms of research contribution, this study attempts to enrich the current published literature by providing empirical support on the determinant factors that make effective supplier selection for online business sellers in Malaysia. This study will also extend the theory and model and enhance the literature on determinant factors that influence supplier selection for online business sellers in Malaysia. Therefore, it is hoped that this research will be of benefit to the scholarly practitioner, researchers, and in particular online sellers in Malaysia, thus contributing to improving Malaysia's economic scale.

**Objective of the Study:-**

Generally, long term cooperation relationships give positive impacts to online sellers. Therefore, selecting the right supplier is very important to achieve the objective and goals. Thus, the objectives of this study are:

- To investigate the factors that influence supplier selection for online business sellers in Malaysia.
- Examine factors that give an impact on online seller performance.
- Identify the relationship between intention and behaviour for supplier selection.
- Investigate intention and behaviour that influence supplier selection.

**Literature Review:-****Problem Statement and Issues:-**

According to Alstete (2002), many entrepreneurs faced obstacles when starting and running their businesses. Among those barriers, one that is crucial is supplier selection. It is necessary for each company and seller to have supplier evaluation processes, suggesting that selecting the supplier is a fundamental early step in running a business. Measuring supplier performance is important to ensure a well-functioning supply chain and company competitiveness. The goal is to improve performance, especially of the key suppliers. Understanding supplier performance may help sellers to prevent risk and improve cooperation. Evaluation is necessary to know that the supplier is doing well in each area of action. Therefore, careful selection of supplier's evaluation criteria is important.

With the use of internet as a new platform in business, entrepreneurs will have more opportunities to structure and restructure their businesses, utilising all those possible mediums to market their goods and services as well as finding the best possible sources and suppliers which can offer them fruitful, favourable returns. Also, globalisation offers everyone the same chances to use the internet, making it an essential requirement for business sellers nowadays. Thus, most business sellers are now taking steps to use the internet as a platform for their business activities. Therefore, businesses are now able to run 24 hours, 7 days a week without the constraints of time and place. Although online businesses in Malaysia are increasing, there are several factors that may directly or indirectly influence their effectiveness; such as the products offered, reliability, suppliers, cost, etc.

Every business wants quality products. This is because product quality would ensure customers' satisfaction and thus will benefit the traders. Online businesses should always make sure the goods or services to be sold to the end user have high quality with a low cost. Thus, selecting a supplier is a tough decision. Online sellers are faced with myriads of possible risks if they chose the wrong supplier. The risks are usually related to their company profit and money. Therefore, online businesses should be careful in selecting suppliers, because wrong selection will affect their profitability.

Security is also a crucial factor in looking for suppliers. When trust exists it means that online sellers will feel secure and be assured of their relationship with the supplier. Security includes various aspects, for instance, product details and information, warranty, supplier identity confirmation as well as reviews of the products or services. There are many cases of identity theft using the information provided online by the individual who seeks to steal money from the personal account of someone who does internet banking. There are also many issues that need to be considered in addressing the issue of security for the future stability of the online world. Because personal and financial information can be intercepted and used for fraudulent purposes, an online investment involves a greater safety concern than conventional trade. Users need to feel safe when conducting financial transactions, and it is still one of the main obstacles to the growth of e-commerce (Lee and Turban, 2002).

In addition, who to buy from and how much to buy are some simple, basic questions yet critical during supplier selection processes. Suppliers who possess the criteria that can help reducing sellers' costs and have effective control of resources should be chosen first as they offer enormous potential to online sellers. Many researchers stated that the most important function in the purchasing department is selecting the sources of supply. Performance of the company will be affected if they make an unsuitable selection. Thus, online sellers should keep updated with the demand from a new supplier. They should carefully select those criteria that can fulfill supplier's demands as well as their demands during the decision making process.

One thing to be emphasised, is that the quality of the production and services mainly depends on the performance of suppliers. This is why effective purchasing is very important, because it can bring competitive advantages to online business accomplishment. However, the big issue that is always highlighted by the entrepreneurs is suppliers cannot provide the highest quality of the products they supplied but they offer the lowest cost of the product in the market. In other words, quality and cost tend to be two conflicting factors.

Practically speaking, product quality and cost are difficult things to determine (Baxter et al., 1989; Manoochehri, 1984). Sellers should refer to the overall quality performance which helps supply chain managers to select the right sources of supplies with the consideration of time, delivery and price. In this study, the researcher will demonstrate that quality and costs play an important role and they are interrelated.

Our daily life is greatly simplified with advanced technology, including buying and selling online. Online business is not something new but a transition from conventional methods in store to a cyberspace platform. Nowadays, technology advances in social media such as Facebook, Instagram and Twitter can be seen as an opportunity for sellers to generate income using different mediums. It lets many business sellers out there try their luck with online business. However, do they realise that they need to register as a merchant business with Company Commission of Malaysia (SSM)? The main concern of registering with SSM is the safety of consumers when buying and selling online. Besides the need to register with the SSM under the Registration of Businesses Act 1956, the business must also comply with Regulation Consumer (Electronic Transactions, 2012) enforced by Ministry of Domestic Trade, Co-operatives and Consumerism (KPDNKK).

Malaysia is moving from Sales and Services Tax (SST) to Goods and Services Tax (GST) and it was first introduced in Malaysia on 1st April 2015. In this respect, Malaysia Internet Entrepreneur Association (PUIM) expected that small online businesses would be affected by the implementation of the GST. According to the President PUIM MohdAzrulMohdNor, more than 85% of online sellers in the database PUIM consist of those who conduct business on a small scale. This means that they do business whether as an employee or assisted individuals only. Many businesses are still new in this field and the implementation of GST gives them surprising news because there are new members registered with SSM. Businesses that have a transaction worth more than RM500,000 per year are expected to receive the most significant effect. If GST is implemented, then the online sellers have to increase the price of their goods, which is a disadvantage to both the consumers and sellers.

Apart from that, effective supplier relationship can be developed if the supplier selection is appropriately done in the early stages. Supplier selection is a very important aspect in a business. Whether it is a small or large business; or if it is an offline or online business, it is the matter of choosing the right supplier that needs to be prioritised. The right selection of suppliers will also show the way and objective of the company. Previous empirical research also showed that the knowledge in selecting supplier is useful for managing various activities in supply chain. For example, the factors like quality, delivery and price have to be considered for supplier selection and the scientific way of selecting the supplier will enhance the function of overall supply chain.

Increased competition and globalisation of markets facilitated by Internet-based technologies have contributed to dramatic changes in the ranking of supplier selection factors as well as introducing new criteria to the supplier selection process. Due to the lack of research in Asian countries and existing gaps in previous studies as described above, this study investigates the effects of quantity, relationship, reliability, flexibility, quality, delivery and cost on intention and their impacts on behaviour of online sellers in Malaysia.

#### **Research Gap:-**

Previous studies indicated that most of the focus study in supplier selection was on customer organisation and sales in physical stores (Park & Chang, 2010; Ordoobadi, 2009; Teng et al., 2005). There is only few research of supplier selection targeted in the Malaysia context (Muhammad et al., 2006) and there are no studies which examine the satisfaction of the online seller when choosing the supplier. This study aims to explore and view the scope of supplier selection that affects business online sellers in Malaysia. This will be done by examining thoroughly all the factors listed in the previous section.

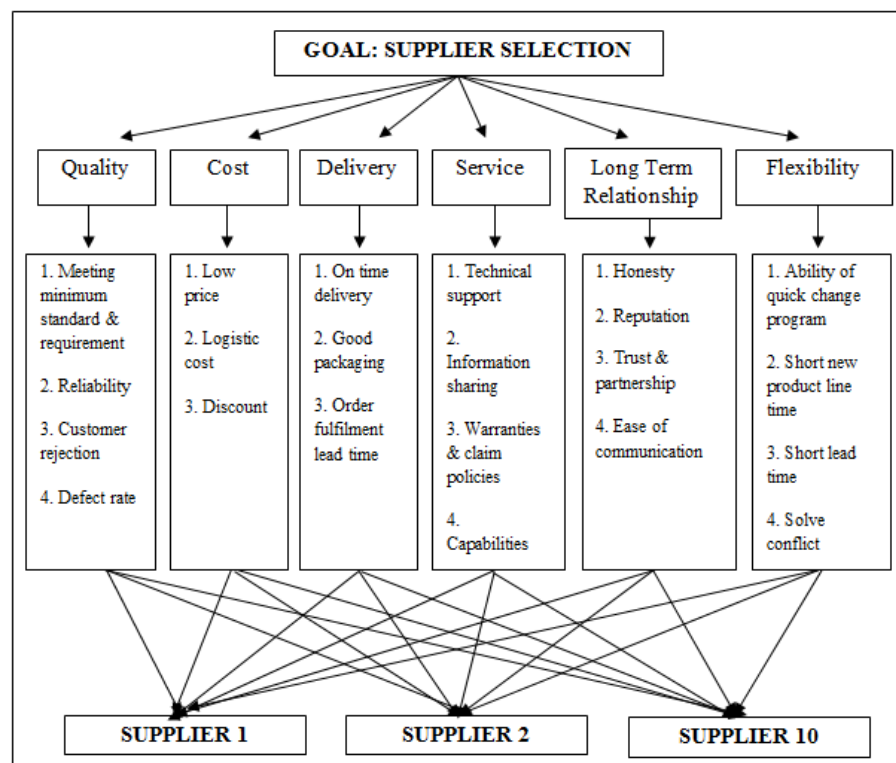

**Theory Used:-****The Theory of Planned Behaviour:-****Figure 1:-** The theory of Planned Behaviour

Theory of Planned Behaviour (TPB) is a theory to explain the intent of the individual to do a particular behaviour (Ajzen 1991). TPB is a theory that has been recognised in the field of psychology, which aims to predict and explain human behaviour. TPB is a continuation of the theory of Reasoned Action (TRA).

Any behaviour must be accompanied by intention. Intention can be seen as a factor that motivates and influences the behaviour of an individual. According to these scholars, attitude, subjective norm and perceived behavioural control reflect intention and influence individual behaviour. Intention will affect behaviour when the individual has a personal positive attitude towards particular behaviours. Normally, the behaviour that is taken by an individual is because of the belief that the action taken was liked by others.

This study uses TPB to investigate the factors that influence the intention of online sellers that will influence their supplier selection. TPB has been used in many different studies in information systems (Mathieson, 1991). TRA and TPB have also been the basis for several studies of internet purchasing behaviour (Limayem et al., 2000; Jarvenpaa and Todd, 1997 b).

Source: Adoption from Yadav&Sharma (2016)

Selection of suppliers has a big impact because it will affect the operation after the selection (Yadav& Sharma, 2016). Supplier selection processes will usually be influenced by the criteria needed to solve the problem (Lui et al., 2005). Therefore, selecting the supplier is complicated because there are a lot of criteria to consider. Online sellers should be careful in choosing suppliers and examine the factors that can help them with later sales operations.

There are two aspects that are emphasised upon when choosing the supplier; the assessment of suppliers and procedures and methods when selecting the supplier. Online sellers need to understand that each supplier has a different background and organisation (Yadav& Sharma, 2016). They have a different concept for the management of their operations. Therefore, it is a question of how to choose the appropriate one when the seller selects suppliers. Online sellers should evaluate several factors such as quality, cost, delivery, services, relationships, flexibility and others. Business success often depends on the construction of a network built with the supplier and thus making informed decisions in choosing the supplier is very important (Yadav& Sharma, 2016; Matook et al., 2009).

In this study, researchers have combined TPB and supplier selection criteria in building a theoretical model of the new framework, with the aim of determining factors that influence supplier selection for online business sellers in Malaysia. It is hoped that the results of the study will help sellers in Malaysia to carefully consider the factors affecting their business and make the right decision in choosing the supplier.

#### Theoretical Framework:-

Figure 2 below shows a model that focuses on aspects of quantity, relationship, reliability, flexibility, quality, delivery, cost, intention and behaviour.

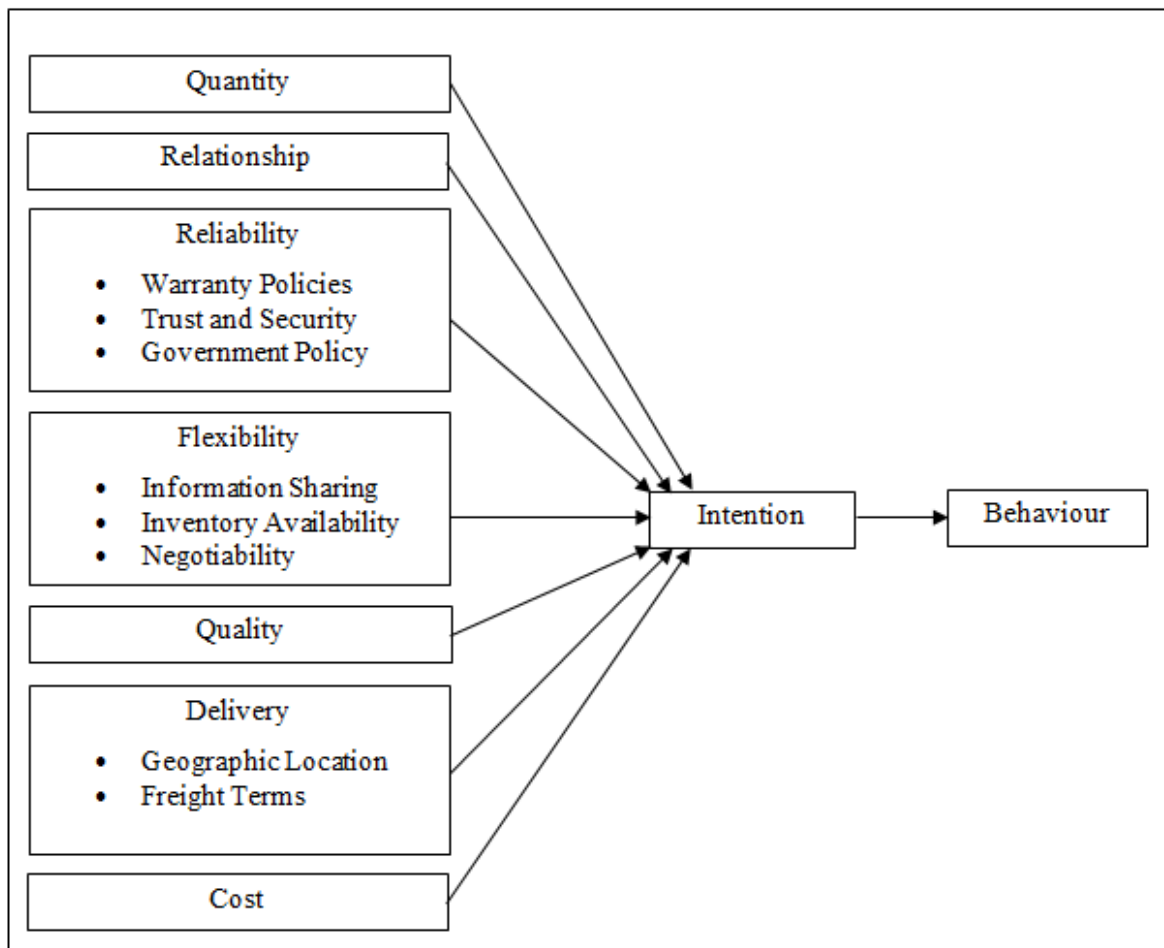

Figure 2:- Conceptual Research Framework

The purpose of this study is to determine factors that influence supplier selection for online business sellers in Malaysia. The hypotheses concern the following nine variables; quantity, relationship, reliability, flexibility, quality, delivery, cost, intention and behaviour.

**Quantity:-**

Quantity is an important element to consider when choosing a supplier. Providing a minimum order quantity (MOQ) is among the characteristics of suppliers preferred by online sellers. However, quantity discount changes following the orders placed. Quantity discount contract is an important element and is influenced by several factors; inventory is one of these factors. The use of quantity discounts is a way to streamline the buyer and seller and it is commonplace in the supply chain. Normally, the more quantity the online seller buys, the cheaper price per unit of goods to be purchased. However, it is difficult for online sellers when buying in large quantities because they need to keep the goods as ready stock.

In addition, online sellers also take the risk because the purchased goods will not necessarily get demand from their customers, thus there is no guarantee that all the stock can be sold in a certain period of time. It is important for a company to reduce their inventory costs and find a balance between the number of orders per year and annual holding costs. Minimising the quantity of orders can indirectly provide an opportunity to explore new opportunities in market. Therefore, in this study, the researcher will examine the relationship between quantity and intention. Thus, the following hypothesis is proposed:

**Hypothesis 1:-** Quantity has a positive impact on intention.

**Relationship:-**

Establishing good rapport is often the element that will contribute to a positive relationship between two parties. In business, online sellers can build relationships with suppliers through various transactions. Normally, this relationship occurs if the online seller gets satisfied with what they want. However, online seller acceptance is different according to their motivation and vision. Relationship on the length of time not only depends on the intent provider only, but should be in line with the online seller's intention to continue to conduct transactions with suppliers (Deb, 2014). Thus, among the issues in developing online seller-supplier relationship is not just the demand from supplier, but also lies with the online seller. Some online sellers will not feel the need for a relationship and this usually causes this relationship not to apply.

Relationships between suppliers and retailers, especially online sellers has not been studied very much before. Therefore in this study, the researchers wanted to know whether the relationship is very important in the selection of suppliers' online seller and thus this hypothesis is proposed:

**Hypothesis 2:-** Relationship has significant impact on intention.

**Reliability:-**

In this study, researchers wanted to investigate the aspect of reliability related to warranty policies, trust and security.

**Warranty Policy:-**

Warranty is also known as an important contract between producers and buyers. Warranty refers to a contract that requires manufacturers and vendors to fit problems or failures in the promised time frame. Warranty can be seen as a form of guarantee of manufacturing to customers for the reliability of its product to consumers. If the product fails to function properly, it is the responsibility of the manufacturer to provide services such as new product replacement, repair or refund payment. Warranty attracts the eyes of customers to purchase goods and services, as they know that they have the rights to complain, refund and replace what they have purchased.

Online sellers need to take a high risk if the goods are sold to the end user have damage and how they as a seller handle this problem. If there is any damage, online sellers need to answer and respond to it. But if the damage is born by the manufacturer, it is a good thing that can promote their business. Therefore, to determine whether the warranty had a positive impact on intention, the following hypothesis is proposed:

**Hypothesis 3a:-** Warranty policies have a positive impact on intention.

**Trust and Security:-**

Trust in online transactions is one of the main elements of success in online selling businesses. The result of trust is very significant on influencing buyers' intention and behaviour. Lack of trust leads to lack of customer acceptance on online purchasing. The purpose of establishing trust is to develop a continuous interaction and acceptance which has a high probability of leading to long-term commitment of business relationship.

Normally, online sellers will use the internet as a medium to find suppliers. So, it is an important issue if the website or online store owned by the suppliers does not provide trustable sources or information, which is less likely to lead to a purchase action. Suppliers need to understand the basic things that can help in building confidence in the online seller. If the trust exists in the supplier, it will improve the online sellers' intention to have a relationship in business.

Apart from trust, security is another reason of selecting a supplier. If the online businesses develop trust in a supplier, it also means that they are assured on the security of the deal. In other words, they have been assured of the goods' safety and quality as well as supplier identity. Being assured of these whole aspects is important because there are cases of goods defects and identity theft which results in a big loss to the company. In the case of identity theft, this issue is quite common nowadays since there are people who can hack the internet banking sites to steal money and personal information. This issue is a big threat in online business and needs to be considered for the future stability of e-commerce (Lee and Turban, 2002).

Therefore, there must be trust and security in online trading companies and the security features should be taken into account so that they can encourage online sellers' behaviour in online payment transactions. In this study, the researcher will also examine this aspect of trust and security with intention toward behaviour. Thus, the following hypothesis is proposed:

**Hypothesis 3b:-** Trust and security has a positive impact on intention.

**Government Policy:-**

Government policies play an important role in promoting innovation and drive the country towards high technology. In this study, researchers wanted to see whether the government's policy is helping online sellers, or whether regulations became a burden. Internet is a new medium that is used by the warm user everywhere. It is a communication tool that can connect one person to another regardless of frontiers. With the advent of new media in Malaysia, the Malaysian government is faced with various challenges. These challenges can be used for development of the country or can pose a risk.

New medium known as Information and Communications Technology (ICT) can help in the economic development, but in reality it is difficult to be controlled and monitored. If viewed from the perspective of online businesses, the Malaysian government has implemented several new policies that should be followed. Among the things that have been emphasised upon by the government of Malaysia is the registration of companies in the Companies Commission of Malaysia (SSM). The SSM's vision is "to be a world class corporate and regulatory authority that meets business needs through effective registration, information, regulation and advice"

There is a question on the necessity to check the SSM, because many users now prefer shopping online. Therefore, registering a company with SSM can increase confidence and trust of internet users with business status, and thus indirectly boosts the credibility of the online company for the long term. If the online business faces any problem, especially with regards to the authorities, it is easy to solve because the company is already legally registered.

Canada started GST on January 1st, 1991; Singapore on 1st April, 1994; Australia also introduced GST in July 2000; while Malaysia started on April 1st, 2015. Looking at other countries and their implementation, Malaysia looks delayed in the implementation of the GST. Malaysia has changed from sales and services tax (SST) to the Goods and Services Tax (GST). GST is a tax on domestic consumption. It must be paid when the money is spent on goods or services, including the purchase of imports. Since GST is a tax on the transaction, it is subjected to every level of business processes and ultimately can be born by consumers. Therefore, the following hypothesis is proposed:

**Hypothesis 3c:-** Government policy has significant impact on intention.

**Flexibility:-**

Flexibility is another factor that should be considered. This study would like to evaluate flexibility based on three factors; inventory availability, information sharing and negotiability.

**Inventory Availability:-**

Managing inventory is an important thing and it requires the power of suppliers and buyers forecasting sales (Ballou, 2000). Almost all of the literatures on inventory management state the important criteria in the inventory management are to minimise costs and maximise profit (Koumanakos, 2008). This is explained in the habit whereby suppliers aim to reduce a lot of the cost when it comes to production and at the same time seeking to maximise profits and meet customer demand.

Online sellers prefer to choose suppliers who can maintain a certain quantity of stock. Normally, suppliers will also ask the buyer to forecast the required amount in advance. This is to make sure that insufficient supply does not occur. In this study, factors of available inventory are measured in terms of quantity, whether the online sellers wants to buy in quantities less than expected or better than expected, and also whether the provider can give it to them. Therefore, the following hypothesis is proposed:

**Hypothesis4a:-** Inventory availability has a significant impact on intention.

**Information Sharing:-**

The second factor that needs to be regarded in flexibility is information sharing. Examples can be seen as the online seller updates necessary information related to inventory, production planning, order status, and many others. The supplier is also required to forecast quantities of stock to be purchased by the online seller to arrange the company's plans. In this situation, both sides need to have compatibility in information sharing (Teng and Jaramilli, 2005). Thus, the following hypothesis is proposed:

**Hypothesis 4b:-** Information sharing has a significant impact on intention.

**Negotiability:-**

Negotiability is the third factor for flexibility. Almost all companies use contract buyers and suppliers (Teng and Jaramilli, 2005). There are conditions required to be met by online sellers and suppliers, especially related to inventory. Negotiability can be associated with mutual trust, which has existed in the supply chain for a long time (Min, 1994). Therefore, this study tries to assess whether the online seller is able to comply with the purchase agreement in accordance to the agreed quantity, and also whether this negotiable factor exists within the provider. Thus the following hypothesis is proposed:

**Hypothesis 4c:-** Negotiability has positive significant impact on intention.

**Quality:-**

Quality is one of the things which should be prioritised in the selection of suppliers. The word quality is rather difficult to understand and interpret. Everyone has their own interpretation of the word quality. Normally, quality is defined as the characteristics contained in a product and whether those features can give satisfaction to customers. Efficient quality management can help in achieving the success of a business. Thus, it could provide a competitive advantage in a market.

Quality can be divided into several aspects including user-based, manufacturing-based, value-based, product-based and transcendent. From these viewpoints, online businesses need to make sure that an item to be retrieved from the supplier should have the features as discussed. In this study, the main and most important point to note is user-based. It is very important for online businesses to sell what customers want. High demand for a product usually will promise fruitful opportunity to succeed in internet business. Therefore, the following hypothesis is proposed:

**Hypothesis 5:-** Quality has a positive impact on intention

**Delivery:-**

Delivery is one factor that should be a concern when selection of a supplier is made. Delivery factors can be viewed in detail in two parts: geographical location and freight terms.

**Geographical Location:-**

Geographical location is more representative of the customer and is a determinant factor when selecting suppliers (Teng and Jaramillo, 2005). Not all suppliers can deliver the goods when the online seller's location is not included in the courier service company. For example, PosLaju has 5 zone coverage areas. Not all of them send directly to the customer, there are areas that require a customer to get stuff on their own in Pos Mini or outlets nearby. It usually occurs if the customer is considerably deepened. Therefore, in this study, the researchers want to examine in detail the factor of geographic location in the selection of suppliers for online sellers and thus this hypothesis is proposed:

**Hypothesis 6a:-** Geographic location has a positive impact on intention

**Freight Terms:-**

Freight delivery term of each company is different. Usually, a company will follow the conditions set by the rules of a nation (Teng and Jaramillo, 2005). Besides rules, each courier company has different price and freight term. In Malaysia, the courier services such as GDex, PosLaju, Skynet, Ta-Q-Bin, and City-Link have their own freight term and offer different prices as they strategies to attract people. Here, bureaucracy occurs since each company targeted as many customers as possible in order to fulfill their company's objective. Therefore, online businesses should consider which courier suits their needs and offers the best deal. Choosing the right courier can save cost and guarantees the safety of the goods delivered. Thus, the following hypothesis is proposed:

**Hypothesis 6b:-** Freight term has a positive impact on intention.

**Cost:-**

Low prices for goods and services can attract customers to buy it. In this case, it shows customers will definitely prefer to buy quality goods at a low price. Thus, indirect sales revenues will continue to increase and may lead to increased profits. While offering low price goods, online sellers need to find suppliers that provide low prices to them. Low cost delivered by the supplier does not necessarily give satisfaction to customers. Evaluation and selection of suppliers of traditional methods are more focused on price and ignore the direct costs and indirect costs that are related to the delivery, use, spare parts, and other qualities. When all costs are taken into account, it will provide a greater effect than the actual cost price of the goods. This is because lowest offer may not represent the overall cost, quality and delivery to suppliers. Therefore, the following hypothesis is proposed:

**Hypothesis 7:-** Cost has a positive impact on intention.

**Intention and behavior:-**

Online business has been growing rapidly due to the increasing consumer demand. In the context of e-commerce, intention of shopping online is caused by the main consequence of pre-purchase satisfaction. Through intention, one can predict the behaviour of online sellers. Rationally speaking, the reaction can only occur if the intention was present and that intention is to grow or be obstructed depending on the outcome.

According to Muhmin (2010), the evaluation criteria for the user, information search and evaluation has been carried out in advance. Thus, it is clear before making any purchase, online sellers will do research in advance and if the study of something is good, then it will encourage the intention to purchase. Intention reflects the desire of the user. Intention is described as the desire to do the behaviour.

Behaviour control directly or indirectly all depends on the intention. Individuals usually have the resources and opportunities necessary to perform the behaviour (Azjen, 1991). Thus, online sellers need to find detailed information when selecting suppliers. The presence of intention can persuade the behaviour to accept or reject the supplier. Intention that is present will affect the behaviour whether to accept or reject a decision made during the selection occurs. Thus, the following hypothesis is proposed:

**Hypothesis 8:-** Intention has a positive impact on behaviour.

**Methodology:-**

This study will discuss in detail the research methods that have been applied. The researcher attempts to determine the relationship between variables based on data obtained from a sample of a population. The researcher uses

quantitative methods to collect data from the respondents. Figure 3 below shows the overview of the quantitative research process.

**Figure 3:-** Overview of quantitative research process

The population is the entire group of objects in the form of people, events or incidents or other objects to be studied (Sekaran, 2000). In this study, the target population comprises of individuals who currently run businesses online in Malaysia. This is in line with the objective of the study which is to determine the factors that influence supplier selection for online business sellers in Malaysia.

Sampling is a process of selecting a sufficient number of elements of the population in order to understand the nature or characteristics of the population. A proper sample thus allows for generalising the nature or characteristic elements of the population (Sekaran, 2000.) The target respondents of this study consist of online sellers who are currently running businesses via Online Social Networking (OSN) such as Facebook, Instagram, Twitter, You Tube, and others. In this study, convenience sampling was applied during data collection to achieve the objectives of this study.

The research was constructed using convenience sampling. As the name implies, convenience sampling is a specific type of non-probability sampling method that relies on data collection from population numbers who are conveniently available to participate in the study. Researchers used sample cases that are accessible, such as certain organisations or certain members on social networking sites as their participants (Rowley, 2014). The advantages of convenience sampling are the simplicity of producing the sampling and ease of research, data collection can be facilitated in a short duration of time and with cost effectiveness.

### **Discussion and Conclusion:-**

The research conducted here inspects the elements that influence supplier selection for online business sellers in Malaysia, which will allow online sellers to learn about the factors that influence the selection of the supplier, as well as supporting them to make the most effective decision when attempting to choose the best type of supplier. Although online businesses may already have their own supplier selection ideas, this research hopefully could offer them some useful suggestion as an improvement in their strategy and direction in supplier selection. Following this research, it is expected that online sellers can be assisted in reducing the overall costs and improving their competency as well as client services, and other important aspects.

### **Author biography:-**

Juwairiah Haris is a Doctor of Philosophy (PhD) student in Universiti Sains Malaysia (USM). She is currently studying PhD at the Graduate School of Business (GSB) with focusing on Supplier Selection area. She holds the qualifications of Post Graduate (Master in Business Administration, MBA) from USM (2015), Bachelor Degree of Management (Major Marketing) from USM (2010) and Higher National Diploma (HND) Business and Marketing from Kolej Profesional MARA Seri Iskandar (2007).

Suzari Abdul Rahim is a Senior Lecturer in Graduate School of Business, Universiti Sains Malaysia. He received his Bachelor degree (Econ) from Staffordshire University UK and the Doctoral Degree (PhD) in Supply Chain Management from Brunel University of London, United Kingdom. Prior to his academic career, he has worked for various institutions in the Manufacturing and Telecommunications industry for a number of years fulfilling Supply Chain Management roles responsible for Procurement, Purchasing, Material Management, Supplier Relationship Management, Tender Management and Logistics. His current research interest is in the area of Halal logistics and supply chain management, investigating improvements and recommending logistics solutions for the Halal industry and community.

#### Abstract

**Purpose:** In addition to create challenging and congruent learning opportunities, it is important for Technical Education providers to create a supportive learning environment to help learners acclimate, connect with others and as well as access well-matched student support services to help them complete their studies and make them employable. Skill building is very crucial to ensure employability of academia to understand and make sure good jobs. Unfortunately, most of the Technical Education institutes in India have not identified the importance of such services, resulting huge unemployment and dissatisfied students. The purpose of this paper is to highlight supporting and extension services in connection to operating services in Technical Education and students' perception on them.

**Design methodology:** A qualitative research by a survey (through a structured questionnaire) of students who are studying or have studied Technical Education affiliated to the North Maharashtra University, Jalgaon on their perception regarding operating, supporting and extension services offered by TE institutes.

**Findings:** The research revealed that TE institutes, no doubt, are offering good operating services however lags in supporting and extension services. It is also found that students' satisfaction of selecting TE institute is highly associated to supporting and extension service than operating services offered by the institute.

**Research limitations:** The survey is delimited to the Technical Education belonging to North Maharashtra University, Jalgaon and located in Khandesh region of India.

**Practical implications:** India, compared to other nations, lacks formally trained manpower. In Korea, for example, the skilled workforce is 96 per cent, in Japan 80 per cent, in Germany 76 per cent and in Britain 70 per cent but in India it is only 10 per cent. Technical Education Institutes of India, can gain competitive edge in the future, by effective and creative ways to attract, retain and foster stronger relationships with students by interaction and mechanism of the market and industry. This is only possible by lubricating; operating, supporting and extension services, all services combined.

## ..... **Introduction:-**

The World Economic Forum's Global Talent Risk report (WEF, 2011) had cautioned that India would face huge skill deficits due to low employability [1]. In India, only about 14 percent of the labor force is employed in Formal jobs [2]. Other than initiatives like Smart City development, Skill India, Digital India, Start-up India, FDI enhancement, National Investment & Manufacturing zone, creation of Industrial Corridor will not only make India a global manufacturing hub but it will also generate a huge number of employment opportunities with growing Industrial demand [3]. According to NASSCOM (National Association of Software Companies), every year, over 3 million graduates and post-graduates are added to the Indian work force but only 25 per cent of technical graduates and 10-15 per cent of other graduates are considered employable by the industry. Education is a process of skill formation and in this aspect, it is treated at par with the process of capital formation. Education not only increases the productive skills of the individual but also his earning power. It gives learners a sense of wellbeing as well as capacity to absorb new ideas, increases his social interaction, gives access to improved health and provides several more intangible benefits [4].

In the past decade, there has been a sharp increase in the number of private institutes as well as universities in India; higher education is continuing to expand, mostly in an unplanned manner, without even minimum levels of checks and balances [5]. In India, as per the report of All India Survey on Higher Education (AISHE) 2014-2015, enrollment in Technical Education (approximately 30%) is the second largest among all higher education programs [40]. The Government of India encouraged the spread of Technical Education in last decade. Today it is reasonable to contend that the conceptualization and organization of academic work and the academic career structure no longer meet the educational and operational demands of the current environment and create many barriers to success [6]. The wide heterogeneity in quality of universities explains why only 25% of Indian engineering graduates are considered suitable for employment [7]. This is why the Indian National Assessment boards of Higher and Technical Education like NAAC and NBA have given weightages to the supporting and extension activities which are related to employability skills, for assessment of institutes with the academic and curriculum activities. As per National Assessment and Accreditation Council (2013), learning activities should have a visible element for developing sensitivities towards community issues, gender disparities, social inequity etc. and in inculcating values and commitment to society. Extension services also is the aspect of education, which emphasizes community services. These are often integrated with curricula as extended opportunities, intended to help, serve, reflect and learn. The curriculum-extension interface has an educational value, especially in rural India [8].

## **Effective Quality Services:-**

There is desperate need in India that 'Higher Education should be guided through Service Quality concepts to achieve excellence' [9]. There is consensus in the research literature in higher education that students exhibit several different approaches to learning. Qualitative and quantitative studies have confirmed a broad distinction between deep and surface approaches to learning [10].

Bonnema and van der Wald grouped factors of a student market in higher education with the following labels: university, college, employability aspects, course content, student experience, sporting aspects, financial aspects, direct sources, media sources and social sources [11]. Reference [12] define Quality in education from TQM perspective. They believe educational institution as an open system i.e. management system, a technical system and social system. It includes within it the quality of input in the form of students, faculty, supporting staff and infrastructure, the quality of processes in the form of the learning and teaching activity and the quality of outputs include examination results, employment, earning and satisfaction. Reference [13] have briefly examined the various factors which affect the effectiveness of Technical Education and they have categorized them into seven major heads; Administration, Infrastructure, Teaching Effectiveness, Students, Interaction with Industry and Society, Extra-Curricular Activities, Research and Development. Reference [14] explained five factor model of Service Quality in higher education. Among five factors, Administration, Student Safety, Faculty Communication, Facilities and Interpersonal Behavior of Faculty, they found faculty members' communication was most important factor and has significant contribution for the overall satisfaction of the students. Service includes all the activities required to keep the product or service working effectively for the buyer after it is sold and delivered. Value based services should be delivered through; operating services, supporting services and extended activities based on Student Mentoring, Support Student Progression and Student Participation and Activities to enhance skills and ability

development. Educational services are personal and characterized by intensive, intellectual, emotional and/or physical participation of students in a service process. Services are often realized in a number of steps, which, basically, constitute the very service process. Production and consumption of educational services take place simultaneously and students' participation in it is rather important. They evaluate service quality, hence the shaping of the service process—detailed planning on how to provide a service—is vital to maintain (improve) educational service quality. The process is so important that some authors describe it as a real essence of service [15].

### **Operating Services:-**

Operating services are those activities which are required for delivering a service to the acceptance of service. Reference [16] evidence in literature indicates that Continuing Professional Development of teachers is essential in creating effective colleges. Most scholars agree that the relationships between students and faculty are vital to student success in college [17]. Furthermore, Kuh et al. contend that faculty approachability and interaction can consist of many facets, including working with a faculty member on a research project, working with a faculty member on activities other than coursework (committees, program activities, etc.), discussing assignments and grades, and receiving prompt academic feedback on performance. In addition to that the adoption of Total Quality Management enhances credibility to meet the requirements of the faculty performance which leads to improve its competitive position among other similar academic institutions [18]. Audio-Visual aids are now common in conducting the education services [19]. Reference [20] supports an interactive session focuses on participating in shifting the paradigm toward learner-centered curriculum delivery. Teaching and learning in TE is a shared process, with responsibilities on both student and teacher to contribute to their success. Quality teaching and learning has broad horizons, taking place in a research-rich environment, where the subject matter is driven by the latest knowledge and research, delivered in a way which encourages students to develop academic literacy and both subject specific and generic skills which they can apply immediately in the real world. The application of educational technology enhances skills and cognitive characteristics with the explosion of learning and receiving new information, especially on mobile devices. The evolution and development of Information and Communication Technology (ICT) has resulted in a paradigm shift in the educational system. ICTs are changing the way people learn, offering new alternatives to the traditional classroom. ICTs have the capability of providing “personalized, just-in-time, up-to-date, and user-centered education activities” [21]. ICTs have encouraged new research and development in teaching and learning techniques. ICTs have the potential to drive innovative and effective ways of teaching-learning and research. The inclusion of learning tools, easier use of multimedia or simulation tools, easy and almost instant access to data and information in a digital form which allows for computations and data processing generates possibilities which were otherwise not feasible.

### **Supporting Services:-**

An assistance required for successful execution of program or process or service is known as Supporting service. Reference [22] found that students who feel at home, who are well connected to fellow-students and teachers and who take part in extra-curricular activities are more likely to graduate. The current education system lacks its focus on training young people in soft skills that can provide them with employment opportunities. As such, training in soft and employability skills is all the more relevant not least because the education system does not delve into personality development [1]. Another factor that impacts persistence is what is known as business procedures or bureaucratic factors. It can best be defined as the interaction that occurs between the student and the service providers at the institution [23]. For instance, common patterns of exchanges occur between the student and various offices such as the business office, residence life, financial aid, departmental offices that define major requirements, social/athletic events, parking management, etc. A number of colleges and universities offer students a wide variety of services and resources intended to promote persistence by providing academic assistance [24]. Most of the academic support services are tutoring centers which offer academic assistance in a variety of areas, such as speaking, writing, and mathematics. Reference [25] reported that academic resources such as these supporting services produced statistically significant positive impacts on student persistence. According to reference [26], college students must be actively involved and engaged in their surroundings if they are expected to learn and grow while attending college. While it is important for students to be academically involved and engaged, reference [27] contends that it is also important for students to become involved and engaged in other areas of college life, such as campus organizations, activities, athletic events, etc. Reference [28] suggested constant collaborative activities between professors and student support services, such as the incorporation of support services or other supportive resources into class curriculum, class visits to support centers, or simply encouragement to take advantage of support services, promoted student involvement and subsequent connectivity. Reference [29] explains that as universities

provided programs and delivered benefits exceed the charged fees, students would have a high sense of satisfaction. Reference [30] discusses the evolution of web services and describes how services such as fee payment, parking renewal, registration, career services, and personal counseling, as supporting services.

#### Extension Services:-

Motivation and students' approaches to learning are dynamically related to each other [31]. One important factor which affects students' persistence is that of being socially integrated and connected with others, especially other students. Education or an Institute, for most students, is not only a time of academic pursuits but also an opportunity to explore or enhance themselves as social beings. In fact, while some students desire to finish college, they do not consider themselves to be ultra-academic beings and instead want to partake in endeavors that develop them socially [32]. Reference [33] detected academic and social integration to be influential on study performance. They also distinguish four concepts in academic integration: academic-, social-, personal- & emotional adjustment and attachment. Greatest importance needs to be attached to extension work, as a learning and development instrument, for the benefit of community through students and teachers [34].

#### Students satisfaction:-

Reference [35] define satisfaction as a state felt by a person who has experienced performance or an outcome that fulfill his or her expectation. Satisfaction is a function of relative level of expectations and it perceives performance. Satisfaction is also perceived as the intentional performance which results in one's contentment [36]. Consumers, such as students, usually make a purchase decision based on their own valuation of the marketing efforts. However, their satisfaction is based on their evaluation of the products or services utilized and whether or not their expectations or needs were met [37]. Educational institutions use certain methodologies to determine the level of their students' satisfaction regarding the services and programs they offer to better fulfill student needs and satisfy student aspirations [38]. If the higher education sector knows about the factors that improve students' perception of satisfaction, it will can provide better services as well as improving existing ones. To gain competitive advantage, reference [39] recommend universities to highlight the strategic importance of social values gained by students when joining them. Moreover, they argued that universities must demonstrate how they provide support to their students' objectives achievement. Basically, this would affect the students' perception of satisfaction hence the university's competitiveness. Several factors influence students' level of satisfaction as well as their achievement and absorption capacity. To deliver knowledge with quality effectively, teaching methods by instructors, as well as the related supporting services, are two critical elements [39]. Determining and assessing students' satisfaction with their educational experiences is not so easy, but can be very helpful for the institutes to build strong relationship with their existing and potential students.

#### Conceptual Framework From Literature Review:-

(Fig 1: All-inclusive Service Model for Technical Education, Self-Creation through Literature Review)

Operating Services	Supportive Services	Extension Services
<ul style="list-style-type: none"> <li>• Curricular planning, implementation, enrichment</li> <li>• Internal &amp; Final Examination</li> <li>• Teaching-learning Process</li> <li>• Students Performance &amp; Learning outcomes</li> <li>• Research Promotion &amp; Research Publication</li> <li>• Computational facilities &amp; Internet</li> <li>• Library access</li> <li>• Laboratory access</li> <li>• Use of Technology</li> </ul>	<ul style="list-style-type: none"> <li>• Industry -Interaction</li> <li>• Publications</li> <li>• Technical Workshops/Symposium</li> <li>• Students guardian/mentor system</li> <li>• Feedback &amp; Assessment System</li> <li>• Employability development</li> <li>• Financial Aid</li> <li>• R &amp; D Cell</li> <li>• Guest Lectures &amp; Expert Talks</li> <li>• Education/Industrial Tours</li> <li>• Training &amp; Employability Development programs</li> <li>• Entrepreneurship Cell</li> <li>• Placements &amp; Higher Education assistance</li> <li>• Co-curricular and Extra-Curricular Activities</li> <li>• Transportation facilities</li> <li>• Residential Facilities</li> <li>• Administrative support</li> <li>• Banking &amp; Post facilities</li> <li>• Safety &amp; Security services</li> <li>• Medical facilities &amp; insurance</li> <li>• Awards &amp; Rewards</li> <li>• Learn and Earn</li> </ul>	<ul style="list-style-type: none"> <li>• Social Activities &amp; holistic development</li> <li>• Community development</li> <li>• Social Clubs</li> <li>• Involvement in National Agencies / NGO</li> <li>• Rural development activities</li> </ul>

### Research Methodology:-

The objective of this research was to find out students' perceptions and experience on services offered by the TE institutes and to find out relation between satisfaction and the services experienced. A qualitative research through a survey was made. It comprised of a structured questionnaire sent through e-mail to the current-students enrolled and passed-out students (alumni) belonging to the technical institutes affiliated to North Maharashtra University. Sample size (n) was calculated at 95% Confidence Level for which Standard Normal Variate (Z) is 1.96 & at Standard Error (e) of 0.03 by  $n = Z^2 (p)(1-p)/e^2$ ; where n = Sample Size to be used for this study, N = unknown population, p = Estimated Portion of Population N. For p = 90%, 'n' comes out to be 553. However, sample size of 664 was selected by quota sampling from technical institutes offering different programs in engineering, pharmacy and management & different students (Current as well Post-students/Alumni) based on their location of native place, gender. The questionnaire comprised structured and closed ended questions measuring different services offered by TE Institute and its' relation with the satisfaction of decision of selection of TE institute were sent through E-mail. Responses were obtained through a google form on a scale ranging from 0 to 5, where value zero is low weightage and value five is high weightage. The characteristics of the sample is described as below;

*By Gender:* Male: 454; Female: 210

*By Native Place:* District: 162; Taluka: 283; Village: 219

*By Technical Educational Program:* Engineering: 492; Pharmacy: 113; Management: 59

**Data Interpretation And Findings:-**

Campus & Social Life	3.50	0.000	<b>18.18</b>	<b>0.267</b>
		<b>MANOVA- General Linear Model; <math>p=0.000</math>; <math>Aprro. F=3.310</math> by Wilk's</b>		

It is revealed that students' satisfaction is associated with the services offered by the Institutes with  $p=0.000$  which is significant at  $p<0.05$  and approximate F-value=3.310, conducted by statistical software, Minitab 17, calculated by MANOVA – General Linear Model with Wilk's method. The students responded that they experience best services of Infrastructure and Technology (Mean=3.6), Faculty and Teaching Learning Methods (Mean=3.63) of the institutes wherein they are enrolled. However, their satisfaction for selection of TE Institute is highly associated with Campus Placements (F-value= 23.36, PLC= 0.309), Co & Extra-Curricular Activities (F-value= 18.98, PLC= 0.281), Industry Interactions and Tie-ups (F-value= 19.03, PLC= 0.279), and Campus and Social Life (F-value= 18.18, PLC= 0.267) of Institute wherein they are enrolled.

It is observed that Institutes are concentrating on operating services more than the supporting services and extension services. However, students' satisfaction is more associated with the supporting activities and extension activities than operating activities.

**Conclusion:-**

According to former Prime Minister of India, Dr. Manmohan Singh - 'The time has come to create a second wave of institution building and of excellence in the fields of education, research and capability building'. We need an educational system that is modern, liberal and can adapt to the changing needs of a changing society, a changing economy and a changing world. Infosys, an IT giant, last year sorted through 1.3 million applicants only to find that around two percent were qualified for jobs. Employability services can play a big role to help both institutes and their students to understand and evaluate their job readiness and work constructively to fix the lean points. Industry and Academia connect is necessary to ensure curriculum and skills development of students are in line with requirements. (knowledge + global professional skills = good jobs). We live in a world that requires the combination of different skills and knowledge sets for increasing success and competitiveness, TE leaders must work with all constituent services to forge the best possible strategic services to recruit, develop, retain, to produce employable

graduate students and to assist them for placements and further career path. Educational services can be driven on Five Pillars; make it easy, make it relevant, make it fresh, manage it, measure it. Such services should impart social, moral, integrity, character, spirituality and many more as it builds the qualities of humility, strength and honesty in a student. These sets of services should lead to purity of hearts and sincerity too. Education services must extend relationship with the world. In the next few decades, India will probably have the world's largest set of young people. Even as other countries begin to age, India will remain a country of young people. If the proportion of working population to total population increases by delivering employable services and skill development services, India will find productive job opportunities for such a working population and that would give India a big opportunity to leapfrog in the race for social and economic development and as a result growth rates would go up. No doubt!

#### Abstract

Chronic idiopathic urticaria is a common skin disease without a clear etiology in the vast majority of cases. The main therapeutic options are directed towards histamine receptors. When antihistamines failed, other therapeutic options maybe added such as systemic steroids, mast cell stabilizer and more recently Omalizumab. Herein we report a rare case of severe and recalcitrant urticaria that was resistant to many treatments modalities including the above-mentioned drugs. Extensive patient history led to two possible triggers, which are lip fillers and tooth filling. Removal of both fillings cured her disease completely. Dermatologists should be aware of any new procedures and materials administered to patients prior to development of urticaria.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

Urticaria for more than six weeks is considered chronic and in majority of cases more (80%) no exogenous causes can be determined. The term chronic idiopathic urticaria (CIU) [1,2,3] is commonly used. Antihistamines, systemic corticosteroids, mast cell stabilizers and biological therapy (omalizumab) are being used. Dermatologists often exposed to unresponsive cases to several treatment modalities. In this paper we are reporting a patient with severe and recalcitrant chronic urticaria for more than 7 months that is only completely resolved after removal of lip filler and tooth filling.

#### Case Report:-

46 years old female, medically free, presented to our clinic with history of severe urticarial for 7 months. The rash started to appear in the face with mild facial angioedema that progressed as generalized urticaria all over the body. The patient started by herself on Cetirizine 10 mg for two weeks, without benefit. Later on she was prescribed Hydroxyzine 25 mg and loratidine 10 mg. Minimal response was noted and after two weeks she was started on Prednisolone 40 mg in addition to the antihistamines. Up to 50% of the rash has improved over the body but angioedema over the face continued to appear. Montelukast 10 mg and doubling the dosage antihistamines brought only little benefit. Omalizumab injection was initiated every week at 300 mg that brought good benefit along with corticosteroid. Corticosteroid was tapered down till 10 mg but patient stopped it completely because of weight gain. Urticaria flared up very significantly with Angioedema of the face (while she still on Omalizumab). Prednisolone 40 mg was taken by the patient irregularly for social occasions to suppress the hives. At this stage, she sought medical advice with other dermatologist. Detailed history revealed that patient has both tooth filling and lip filler (JUVEDERM VOLIFT, Allergan, Inc. Irvine, California, USA) have been administered for her 2 and 1 months

prior to urticaria onset respectively. Patient was advised to remove lip filler first and in one month the tooth filling. Hyaluronidase was injected twice (three days apart) to dissolve the lip filler. However, within few days patient chose to remove the tooth filling by her dentist against our advice and not to wait for a month. In less than one week she noticed significant decrease in number of hives that completely disappeared in a month. She is off all treatments without any recurrence for more than six months.

### Discussion: -

None of the theories of pathogenesis of chronic urticaria (CU) has been fully established<sup>4</sup>. The best-developed hypotheses include the autoimmune theory, theories involving histamine-releasing factors, and the cellular defects theories<sup>5</sup>. IgE-mediated, cell-mediated and complement-mediated were established as main pathogenesis<sup>1</sup>. Dermatologists commonly failed to find out exogenous causes only in 20 to 30% they could be determined. In the literatures, unusual triggers had been reported such as hidden infection including *Helicobacter pylori*<sup>6</sup>, Hepatitis A<sup>7</sup> and Hepatitis C<sup>8</sup>, eye drops and tooth filling have been reported.<sup>9,10</sup> Local skin reaction to Hyaluronic acid at site of injection is well known with all types of fillers that can be confusing as angioedema. In two reports, angioedema affecting lips post fillers has been described, however in the first case<sup>11</sup> it seems to be an overt reaction to local filler rather than a classic immune-mediated angioedema. It occurs within minutes at the site of injection only and disappeared in few days. In the second one<sup>12</sup> Herpes Simplex Virus has been associated with the swelling. In both papers filler hasn't been dissolved and no recurrence has been reported. We expected in those patients that urticaria should continue to flare as long as fillers still in the body.

In contrast to our patient, generalized urticaria has happened within a three to four weeks of injection and only cleared after dissolving lip filler and removal of tooth filling. Another case of urticarial vasculitis (approved by skin biopsy) has been reported<sup>13</sup>. Three weeks after filler and resolved within six weeks later. However in this case filler hasn't been dissolved with hyaluronidase, which might doubt for the possible relationship to cause urticarial vasculitis. Another report of angioedema that related to hyaluronidase rather than lip filler<sup>14</sup>. The possibility that the angioedema in this patient was related to the dissolved filler rather than only hyaluronidase cannot be ruled out. The antigen exposure to the immune system following degradation by hyaluronidase is a possible pathogenesis.

In our patient, both lip filler and tooth filling were administered 1 and 2 months respectively prior to her symptoms. No clue to us which of them is the true culprit. Although we advised her to remove them one month apart, she decided removing them simultaneously, which creates uncertainty, which is the main culprit. Complete remission of urticaria within few weeks of removal of both fillings creates strong evidence for the cause-relationship. Nevertheless, the message from this patient is the importance of detailed and extensive history in finding the possible causes and relieving the frustration and safe huge cost.

##### Key words:-

Diabetes Mellitus, Liver, Mitochondrial  
 NAD<sup>+</sup>, Stearoyl-CoA desaturase1,  
 Vitamin D3

#### Abstract

**Background and Aim:** Vitamin D3 could ameliorate the effects of type 2 diabetes mellitus; however, liver changes in diabetes needs more studies and to highlight changes in liver cell mitochondrial NAD<sup>+</sup> and Stearoyl-CoA desaturase 1 (SCD1).

**Materials and Methods:** Forty adult Wistar rats, of both sexes, were randomly allocated into equal groups of control, vitamin D3 non-diabetic, diabetic, type 2 diabetic and vitamin D3 treated diabetic groups. At the end of the study, all rats were anaesthetized by i.p. Pentobarbitone (40 mg/kg B.W). Fasting blood glucose level was measured by rat tail, then after aortic cannulation, the separated plasma was used for determination of lipid profile, liver functions and insulin level. HOMA-IR and atherogenic indices were calculated. Liver specimens were used for detection of SCD1 gene expression by Real time PCR and mitochondrial NAD<sup>+</sup>.

**Results:** Glycemic parameters and plasma liver enzymes, liver mitochondrial NAD<sup>+</sup> were significantly elevated in the diabetic group compared to the control group, and were significantly lowered in vitamin D3 treated diabetic group compared to the diabetic group. The diabetic group had dyslipidemia compared to the control group, while lipid profile was improved in vitamin D3 treated diabetic group compared to the diabetic group. SCD1 gene expression in liver cells was downregulated in both diabetic groups (untreated and treated) compared to the control group.

**Conclusion:** Vitamin D3 reversed the damaging diabetic effects on liver functions efficiently, probably by ameliorating oxidative stress, however, it altered SCD1 gene expression and regulated its effect on diabetes to lesser extent.

#### Introduction:-

Diabetes mellitus is a worldwide problem, and increases in incidence and prevalence (Danaei et al., 2011). The relation between vitamin D and type 1 diabetes mellitus has been extensively studied in humans and animals, and it could be due to the immunomodulatory actions of vitamin D (Stene et al., 2000; Gregori et al., 2002; Mathieu et al., 2005; Luong et al., 2005).

**Corresponding Author:-Noha N Lasheen**

Address:- Lecturer of Physiology, Faculty of Medicine, Ain Shams University.

For type 2 diabetes mellitus to develop, impaired pancreatic  $\beta$  cell function and insulin resistance are often present. The prevalence of type 2 diabetes rises in obesity, which is often associated with hypovitaminosis D (**Palomer et al., 2008**). Vitamin D is efficiently deposited in body fat stores decreasing its bioavailability, thereby many obese persons could be chronically vitamin D deficient (**Holick, 2004**). **Zeitz et al. (2003)** reported that vitamin D receptor could be expressed in  $\beta$  cells. Thus, vitamin D deficiency could decrease insulin secretion in rats and humans, and its replenishment could improve  $\beta$ -cell function and glucose tolerance (**Boucher et al., 1995**). Also, it was suggested that vitamin D insufficiency could cause insulin resistance probably by elevated TNF- $\alpha$  level which is a cytokine inversely related to 25(OH) vitamin D (**Hotamisligil and Spiegelman, 1994**). In addition, **Ortlepp et al. (2003)** reported that alteration in vitamin D receptor and vitamin D-binding protein could affect glucose tolerance and insulin secretion. **Ogunkolade et al. (2002)** mentioned that vitamin D could affect type 2 diabetes mellitus through either controlling plasma calcium level, which regulates insulin synthesis and secretion, or directly on pancreatic  $\beta$ -cell function.

In addition, **DeLuca and Cantorna (2001)** mentioned that liver cells had cytosolic or nuclear and/or membrane-bound vitamin D receptors. However, few researchers studied the impact of vitamin D supplementation on altered liver functions in type 2 diabetes mellitus (**Yang et al., 2016**).

Fat metabolism changes in type 2 diabetes mellitus were proved to be present (**Shulman, 2000**). Stearoyl-CoA desaturase (SCD) is the rate limiting enzyme catalyzing the biosynthesis of monounsaturated fatty acids, the substrates for triglycerides synthesis and formation of cholesterol esters and phospholipids. SCD1 is the main SCD isoform expressed in liver (**Dobrzyn and Dobrzyn, 2006**). Abnormal monounsaturated fatty acid production could cause many diseases such as obesity, diabetes and cancer. Therefore, it is of value to study SCD1 expression in normal and disease states (**Miyazaki et al., 2003**). Although many studies are present regarding the effect of type 2 diabetes mellitus on SCD, little is known about the effect of vitamin D on the SCD gene expression in type 2 diabetes mellitus.

On the other hand, oxidative stress could be present in type 2 diabetes mellitus resulting in the development of diabetic complications in many organs (**Giacco and Brownlee, 2010**). However, changes in mitochondrial NAD<sup>+</sup> in liver cells in type 2 diabetes were not extensively studied. Therefore, it is valuable to study the drawbacks of diabetes mellitus (type 2) on liver functions and to elucidate the changes in SCD1 gene expression and mitochondrial NAD<sup>+</sup> in the liver tissues; in addition to study the possible effects of vitamin D3 in type 2 diabetes mellitus.

#### **Aim of the work:-**

This study was performed to demonstrate the effects of vitamin D3 treatment on liver functions in type 2 diabetic rats and to highlight the changes in SCD1 gene expression and mitochondrial NAD<sup>+</sup> in liver cells.

#### **Materials and Methods:-**

##### **Experimental Protocol:**

##### **Animals:**

This study was carried out on 40 adult Wistar rats, of both sexes, initially weighing 160-200 gm, purchased from animal farm from Helwan, Cairo, Egypt. Animals were kept in the Medical Research Center Animal House, Faculty of Medicine, Ain Shams University under standard conditions of boarding and feeding, with free access to water, ad libitum, throughout the whole period of the study. Rats were left for 7 days as a period of acclimatization, during which regular normal diets were introduced daily at 8 a.m., in the form of milk, bread and vegetables.

##### **Experimental Protocol:-**

##### **Rats were randomly allocated into the following groups:-**

**Group I:** Control group (n= 10): received a single i.p. injection of saline in equivalent dose of Streptozotocin and also equivalent dose of 1, 25(OH)<sub>2</sub>D<sub>3</sub> each 2 days for 8 weeks.

**Group II:** Vitamin D3 Supplemented Non-Diabetic group (n=10): which received i.p. injection of 5  $\mu$ g/kg 1, 25(OH)<sub>2</sub> D<sub>3</sub>, each 2 days for 8 weeks, only without induction of diabetes mellitus (**Yin et al., 2012**).

**Group III:** Type 2 Diabetic group (n =10): which were fed high fat diet for 2 weeks followed by single i.p. injection of Streptozotocin (Sigma Co.) in a dose of 35 mg/kg B.W. dissolved in 2 ml of 0.05 M citrate buffer (**Srinivasan et al., 2005**).

**Group IV:** Vitamin D3 Treated Diabetic group (n= 10): which were rendered diabetic by the same method as the diabetic group, and then they were treated with i.p. injection of 5 µg/kg 1, 25(OH)<sub>2</sub>D<sub>3</sub>, each 2 days for 8 weeks (**Yin et al., 2012**).

#### **Induction of Diabetes Mellitus Type 2:-**

High fat diet, introduced to diabetic groups, was prepared by adding butter, to increase its fat content to 16 -17%. Analytical composition of butter used in the present study was in accordance with **Holland and Welch (1992)**. After Streptozotocin injection into overnight fasted rats, they had free access of food and water, and were given 5% glucose solution after 6 hours of Streptozotocin injection to drink overnight to counter hypoglycemic shock. The diabetic state was assessed by measuring the non-fasting blood glucose levels from rat tail 72hrs after Streptozotocin injection. The rats with blood glucose level above 250 mg/dl were selected for the experiment and considered as diabetics (**Zhang et al., 2006**).

On the day of sacrifice, overnight fasted rats were weighed and anaesthetized by i.p. injection of pentobarbitone, in a dose of 40 mg/kg B.W. Fasting blood glucose (FBG) was measured in a blood drop from the rat tail by GlucoDr™ SuperSensor Test Meter, AGM- 2200, Korea. A midline abdominal incision was made and the abdominal aorta was cannulated to collect aortic blood in 2 tubes; EDTA containing tube for subsequent determination of HbA1c in whole blood sample and a heparinized tube, which were centrifuged and the separated plasma was stored at - 80 °C for later determination of insulin level to calculate homeostasis model assessment of insulin resistance (HOMA-IR), γ-GT activity and levels of AST, ALT in addition to lipid profile. Liver specimens were also stored at -80°C for later determination of mitochondrial NAD<sup>+</sup> and SCD1 gene expression.

#### **Determination of Plasma Insulin Level:-**

was performed according to **Flier et al. (1979)**, using enzyme linked immunosorbent assay (ELISA) technique kits supplied by Insulin ELISA kit supplied by DRG .

Homeostasis Model Assessment- Insulin Resistance (HOMA-IR) = [fasting plasma insulin (µU/mL) x fasting plasma glucose (mmol/L) /22.5] (**Salgado et al., 2010**). HbA1c were quantified by HPLC(**Jeppsson et al.; 2002**).

**Liver enzymes levels [Aspartate Aminotransferase (AST), Alanine Aminotransferase (ALT)] and Gamma Glutamyl Transferase (γ-GT) activity** were determined colorimetric assay according to **Reitman and Frankel (1957)** and **Tietz(1986)** using commercial kits from Biolabo (France).

**Determination of plasma levels of triglycerides, total cholesterol, LDL-cholesterol and HDL-cholesterol:** were performed according to the method described by **Vassault et al. (1986)**, **Rifai et al. (1999)** and **Fruchart(1982)** using kits supplied by Greiner Diagnostic, Germany.

**Atherogenic index** was calculated according to **Grundy et al. (1987)** as follows: Atherogenic index = Total cholesterol / HDL-C.

#### **Evaluation of Mitochondrial NAD<sup>+</sup> in Hepatic tissue:-**

Mitochondrial isolation from hepatic tissues which were stored frozen at -80°C till the day of NAD<sup>+</sup> determination, was performed according to **Saleh and Saleh (2010)**. Hydrolysis of mitochondrial nicotinamide adenine dinucleotide (NAD<sup>+</sup>) directly reflects mitochondrial pores opening. The NAD<sup>+</sup> was measured after perchloric acid extraction. In the case of isolated mitochondria, 0.1 ml of 21% (v/v) perchloric acid was added to 1 mg of protein/ml suspensions. The concentration of NAD<sup>+</sup> in the perchloric acid extract of the hepatic mitochondria was measured using an alcohol dehydrogenase reaction. The reaction mixture contained 1000 µl of buffer-substance (0.1 M Tris acetate [pH 8.8] and 0.5 M ethanol), 100 µl of the tissue extract neutralized and 20 µl of alcohol dehydrogenase. The reaction was initiated by enzyme addition and change of absorbance at 340 nm recorded by a spectrophotometer (Behring Werke AG, Marburg, and West-Germany).

**RNA preparation and real-time qPCR analysis:-**

Total mRNA was extracted from liver tissues using RNeasy kits with spin-column DNase digestion (Qiagen). Purity and concentration were determined with a Nanodrop 1000 spectrophotometer (Thermo Scientific). One  $\mu\text{g}$  of RNA was used to synthesize cDNA with a QuantiTect Rev. Transcription Kit (Qiagen) and diluted to 10  $\text{ng}/\mu\text{L}$ . Expression of mRNA was determined using RT<sup>2</sup> qPCR Primer Assay for rat stearyl-Coenzyme-A desaturase 1 (SCD1) catalogue no: 330001 (Qiagen) and SYBR green RT<sup>2</sup> SYBR Green ROX<sup>TM</sup> qPCR Mastermix on an Applied Biosystems Step One Plus RT-PCR system. PCR mix for one reaction Component Volume RT<sup>2</sup> SYBR Green Mastermix was prepared as follows (12.5  $\mu\text{L}$  cDNA synthesis reaction 1  $\mu\text{L}$  RT<sup>2</sup> qPCR Primer Assay (10  $\mu\text{M}$  stock) 1  $\mu\text{L}$  RNase-free water 10.5  $\mu\text{L}$  Total volume 25  $\mu\text{L}$ . The PCR Cycling conditions were adjusted following the manufacture instruction. Cycling program: Initial activation step for 10 min at 95°C to activate HotStarTaq DNA Polymerase, cycling: (Denaturation for 15 seconds at 94°C, annealing for 30 seconds at 60°C, then extension for 30 seconds at 70°C) X40 cycles. PCR products were quantified fluorometrically using SYBR Green, and normalized to the housekeeping gene rat glyceraldehyde-3-phosphate dehydrogenase (GAPDH) and relative to the control according to the following formula:

$$\text{Target amount} = 2^{-\Delta\Delta\text{Ct}}$$

Where  $\Delta\Delta\text{Ct} = \{[\text{Ct}(\text{target gene}) - \text{Ct}(\text{GAPDH})] - [\text{Ct}(\text{control}) - \text{Ct}(\text{GAPDH control})]\}$ .

Fold difference for gene expression was calculated as  $2^{-\Delta\Delta\text{CT}}$  using the endogenous control genes (liver). The identity and purity of the amplified product were assessed by melting curve analysis at the end of amplification.

**Statistical Analysis:-**

All results in the present study were expressed as mean  $\pm$  SE of the mean. Statistical Package for the Social Sciences (SPSS, Inc., Chicago, IL, USA) program, version 20.0 was used. Differences were considered significant when  $P \leq 0.05$ .

**Ethics Committee:-**

This study was approved by the Ethics Committee of Faculty of Medicine, Ain Shams University.

**Results:-**

The diabetic and vitamin D3 treated diabetic groups had significant rises in fasting blood glucose, fasting insulin, HbA1c levels and HOMA-IR compared to the control group, denoting the occurrence of type 2 diabetes mellitus. However, these glycemic parameters were significantly reduced in vitamin D3 treated diabetic group compared to the diabetic group. Vitamin D3 supplemented group (Positive control group) had insignificant changes in fasting blood glucose, fasting insulin, HbA1c levels and HOMA-IR compared to the control group (negative control), as shown in table (1).

**Table 1:-** Changes in fasting blood glucose (mg%), fasting insulin level ( $\mu\text{IU}/\text{ml}$ ), HOMA-IR and HbA1c level (gm%) in the different studied groups.

Regarding liver functions, plasma AST and ALT levels and  $\gamma$ -GT activity in plasma were significantly increased in both diabetic (untreated and treated) groups compared to the control group, while they were significantly reduced in vitamin D3 treated diabetic group compared to the diabetic group. On the other hand, no-statistical significance was detected in these parameters in vitamin D3 supplemented group compared to control group, as shown in table (2).

The diabetic group showed significantly elevated plasma levels of triglycerides, total cholesterol and LDL-Cholesterol, accompanied by significantly reduced plasma HDL-Cholesterol compared to the control group, whereas vitamin D3 treated diabetic group had significantly increased only plasma total cholesterol and LDL-Cholesterol levels compared to the control group. However, vitamin D3 treated diabetic group showed significantly decreased plasma levels of triglycerides, total cholesterol and LDL-Cholesterol accompanied by a significant rise of plasma HDL-Cholesterol compared to the diabetic group. Although atherogenic index was significantly elevated in untreated and treated diabetic groups compared to the control group, it was significantly decreased in vitamin D3 treated diabetic group compared to the diabetic group. Non-significant changes in lipid profile were present in vitamin D3 supplemented group compared to the control group, as shown in table (3) and fig.(1).

Similar levels of SCD1 gene expression was detected in Vitamin D3 supplemented group and control group with insignificant differences. However, the diabetic group showed downregulated SCD1 mRNA by 10 folds less than control group denoting that SCD1 mRNA levels and the enzyme activity in liver were strongly downregulated in both diabetic groups (treated and untreated). In addition, in vitamin D3 treated diabetic group, SCD1 mRNA level was significantly decreased compared to control group; however, it was significantly elevated compared to the diabetic group, as shown in table (4).

**Table 4:-** Changes of liver cell mitochondrial NAD<sup>+</sup> (nmol/mg tissue protein) and liver cell SCD1 gene expression [(fold)/ul] in the different studied groups.

Liver cell mitochondrial NAD<sup>+</sup> was significantly elevated in the diabetic group compared to the control group, and was insignificantly changed in vitamin D3 treated diabetic and vitamin D3 supplemented groups compared to the control group. On the other hand, there was significant decline in liver cell mitochondrial NAD<sup>+</sup> in vitamin D3 treated diabetic group compared to the diabetic group, as shown in table (4).

## Discussion:-

Induction of type 2 diabetes mellitus in rats was confirmed by assessment of biochemical indicators which includes; hyperglycemia, hyperinsulinemia and poor glycemic control. Poor glycemic control was evaluated by HbA1c, and elevated HOMA-IR as indicator for insulin resistance (Ahmad et al., 2016).

Vitamin D3 treated diabetic group showed reduction in hyperglycemia, hyperinsulinemia and insulin resistance compared to the diabetic group. These findings agree with the study of Talaei et al. (2013), who found that vitamin D3 supplementation could reduce insulin resistance in Type 2 diabetic patients. Obese persons, who might be diabetics, could have lowered circulating 25(OH) D levels (Bell et al. 1985; Wortsman et al. 2000), which could be due to the storage of vitamin D3 and 25 (OH) vitamin D3 in adipose tissue (Wortsman et al. 2000). Thus, Borissova et al. (2003) suggested that vitamin D3 supplementation could treat type 2 diabetes mellitus during the winter.

However, Vitamin D injection (Heshmat et al., 2011) and vitamin D intake did not change the glycemic control in the diabetics (Behradmanesh et al., 2011). Also, Boucher et al. (1995) found that vitamin D caused elevated blood glucose level in diabetic patients compared to the pre-treatment value 8-12 weeks after a single vitamin D injection in a dose of 2500 mg, they attributed the failure to correct diabetes by vitamin D in their study to the moderate increase of 25(OH) plasma vitamin D levels to be only 25 nmol/L.

These protective vitamin D3 effects in diabetes mellitus could be due to its anti-inflammatory properties, or it might affect calcium and phosphorus metabolism facilitating insulin secretion and synthesis via  $\beta$ -cell calcium-dependent

endopeptidases (Chiu et al., 2004). Calcium, also, is essential for  $\beta$ -cell glycolysis, which plays a role in signaling circulating glucose concentration (Boucher, 1998). Moreover, vitamin D could upregulate the insulin receptor gene (Maestro et al., 2002). These mechanisms could be supported by presence of vitamin D receptors on pancreatic  $\beta$  cells (Zittermann, 2006), and in skeletal muscle (Simpson et al., 1985), expression of  $1\alpha$  hydroxylase in pancreatic  $\beta$  cells (Bland et al., 2004) and presence of vitamin D response element insulin receptor genes transcription (Maestro et al., 2002).

In the current study, the diabetic group was dyslipidemic evidenced by elevated plasma levels of triglycerides, total cholesterol, LDL-Cholesterol and atherogenic index accompanied by reduced plasma HDL-Cholesterol compared to the control group. Similar findings were reported in Ahmad et al. (2016). Also, Kudchodkar et al. (1988) reported that elevated plasma triglycerides levels might be commonly present in diabetes mellitus, and could be due to deficient lipoprotein lipase activity (Bruan and Severson, 1992). Thus, Lopes-Virella et al. (1983) found that insulin treatment in diabetics lowered plasma triglycerides levels by normalizing lipoprotein lipase levels.

Treatment of type 2 diabetes mellitus by vitamin D, in this study, ameliorated the diabetes mellitus induced dyslipidemia, manifested by lowered plasma levels of triglycerides, total cholesterol, LDL-Cholesterol and atherogenic index together with higher plasma HDL-Cholesterol compared to the diabetic group. When comparing vitamin D3 treated diabetic group and the control group, only total cholesterol and LDL-Cholesterol were reduced. These findings were similar to the study of Al-Daghri et al. (2012), who found that vitamin D3 administration daily for 18 months caused lowered levels of total cholesterol and LDL cholesterol, without changes in levels of triglycerides and HDL cholesterol. Similarly, Shehab et al. (2012) found significant correlations with total cholesterol, LDL-cholesterol with vitamin D. This lipolytic actions of vitamin D3 could be due to upregulation of lipolytic enzymes hormone sensitive and lipoprotein lipases induced by  $1, 25(\text{OH})_2\text{D}$  (Huang et al., 2013).

However, the lipid lowering effect of vitamin D3 in the diabetic group, in the present study, disagree with the study of Breslavsky et al. (2013), who found no changes in levels of total cholesterol, LDL cholesterol, HDL cholesterol and triglycerides in type 2 diabetics despite vitamin D administration for 12 months. The discrepancy of vitamin D effects on lipid profile in type 2 diabetes mellitus was attributed to the requirement of  $25(\text{OH})\text{D}$  levels to be higher than 28-32 ng/ml in the type 2 diabetic persons to induce such possible extra-skeletal benefits of vitamin D (Hossein-nezhad and Holick, 2013).

The diabetic group had liver cell injury, evidenced by elevated plasma levels of AST, ALT and plasma  $\gamma$ -GT activity, which were in accordance to Hamadi et al. (2012). This damage could be due to the oxidative stress present in the diabetic group (Kakkar et al., 1998). Tangvarasittichai (2015) reported that increased glucose, free fatty acids (FFA) and insulin levels caused reactive oxygen species overproduction, increased oxidative stress and activate stress transduction factor pathways resulting to inhibited insulin activity and secretion causing the onset of type 2 diabetes mellitus.

Vitamin D3 treated diabetic group had lowered AST, ALT and  $\gamma$ -GT activity compared to the diabetic group, denoting hepato-protective effects of vitamin D3 which were similar to the study of George et al. (2012). They reported that the restoring effect of vitamin D3 could be mediated through vitamin D receptor modulation, thereby improving signal transduction and controlling free radicals in the liver of diabetic rats, suggesting a potential role for vitamin D3 in the treatment of diabetes-associated hepatic complications. In addition, the active vitamin D's roles of improving the hepatic steatosis and hepatic insulin resistance could be mediated through its receptor-activated peroxisome proliferator-activated receptors- $\alpha$  (PPAR- $\alpha$ ) signaling pathway (Yin et al., 2012; Zhao et al., 2013).

The protective vitamin D3 effect against liver cell injury observed in the current study may be attributed to its lipid lowering effect. Similar explanation was reported by Yin et al. (2012), who found that vitamin D3 preventing effect against hepatic steatosis was due to inhibited lipogenesis and the elevated FFA oxidation in rat liver.

Liver cell mitochondrial  $\text{NAD}^+$ , as an indicator of oxidative stress, was significantly elevated in the diabetic group compared to the control group. This new finding in type 2 diabetes mellitus could explain the oxidative stress present in diabetes mellitus, which was found in the study of Kakkar et al. (1998). They, also, suggested that oxidative stress could be the cause of development and progression of diabetes mellitus. The elevated  $\text{NAD}^+$  in liver cells of diabetic group could be due to transient upregulated mitochondrial oxidative capacity in the liver, similar to

the study on obese insulin-resistant persons with or without fatty liver resulting to oxidative stress (**Koliaki and Roden, 2016**).

The vitamin D3 treatment had decreased mitochondrial  $\text{NAD}^+$  in treated diabetic group in the present study. This is in accordance to the study of **Chang and Kim (2016)**, who found that 1,25(OH) $_2$ D treatment elevated NAD-to-NADH ratio, and suggested that vitamin D could cause fat mobilization and reducing intracellular fat accumulation and increase lipolysis.

The elevated mitochondrial  $\text{NAD}^+$  could be linked to higher plasma levels of liver enzymes present in the diabetic group. **Maxwell et al. (1997)** reported that diabetes mellitus could cause oxidative damage resulted from antioxidant protection defects, thereby many diabetic complications could be developed. Also, **Alam et al. (2014)** found that the antioxidant treatment of diabetic rats, which was quercetin, had lowered liver enzymes and oxidative stress markers. Thus, the hepato-protective effects of vitamin D3 in diabetes mellitus, observed in this study, assure the antioxidant and lipolytic effects of vitamin D3.

In addition, both diabetic and vitamin D3 treated diabetic groups showed downregulation of SCD1 m-RNA levels in liver cells. SCD1 enzyme has an important role in lipid metabolism and energy expenditure in mammals (**Wang et al., 2008**). SCD genes are regulated at the transcriptional level by the diet, hormones such as insulin and temperature (**Wang et al., 2005**). This could explain the changes present in SCD1 m-RNA levels in liver cells in both diabetic groups (treated and untreated). Moreover, **Popeijus et al. (2008)** reported that raised, rather than reduced, SCD1 mRNA levels could be negatively associated with insulin resistance.

**Droge(2002)** mentioned that SCD-1 could cause fat storage when its activity is elevated, and towards oxidation, when become less active. Hence elevated fatty acid oxidation could raise toxic free radicals levels, the presence of SCD1 downregulation and higher mitochondrial  $\text{NAD}^+$  in liver cells, in this study, could be linked together.

It was reported by **Ntambi et al.(2002)** that diabetic dyslipidemia could be attributed to downregulated SCD1 m-RNA levels in liver cells. Mice with whole-body SCD1 deficiency were lean, and developed severe hypercholesterolaemia and a marked decrease in HDL cholesterol levels when they were fed a low-fat, high-carbohydrate diet (**Flowers et al., 2006**). Also, the downregulated SCD1 in liver cells could be linked to the insulin resistance in the diabetic group. **Roden(2006)** reported that the hepatic SCD1 activity index was correlated with insulin sensitivity. **Stefan et al. (2008)** mentioned that SCD1 could affect insulin sensitivity via regulation of fat accumulation in the liver. High liver fat could cause hepatic and skeletal muscle insulin resistance (**Stefan et al., 2006**), thus hepatic SCD1 activity could regulate skeletal muscle insulin sensitivity(**Stefan et al., 2008**).

In this study, the novel finding of upregulated SCD1 m-RNA levels in liver cells in vitamin D3 treated diabetic group compared to the diabetic group, could explain the decreased insulin resistance. This suggestion could be supported by high SCD1 activity protected both from obesity and from palmitate-induced insulin resistance and lipotoxicity(**Busch et al., 2005**). Moreover,**Foster (2004)** reported that a marked stimulation of the transcription factor carbohydrate-responsive element binding protein were present in the fed state activating the genes of fatty acid and triglyceride synthesis. Thus, SCD-1 is lipogenic via more than one pathway. In the fasting state, SCD-1 levels decreased due to insulin decrease and glucagon increase. This, also, could explain the presence of downregulated SCD1 in liver cell in the vitamin D3 treated diabetic group compared to the control group.

Therefore, the vitamin D3 ameliorated liver damage, dyslipidemia, downregulation of liver cell SCD1 and controlled elevated liver cell mitochondrial  $\text{NAD}^+$  in type 2 diabetes mellitus.

### Conclusion:-

Diabetes mellitus resulted in deteriorated liver functions in diabetic rats and downregulation of SCD1 m-RNA levels in liver cells. Such changes could be caused by oxidative stress and were alleviated by vitamin D3 treatment.

### Conflict of Interest:-

The authors declared no conflict of interest in this study.

##### Key words:-

Four cases of Apexification, MTA

#### Abstract

Open apex is a common occurrence and conservative approach should be applied because the affected teeth are immature in nature. This article describes the management of open apices with periapical radiolucencies in maxillary incisors. Mineral trioxide aggregate (MTA) was used to form an apical barrier and rest of the canal was obturated with different technique. The case series intends to testify the efficacy of MTA as an agent for Apexification and its effect on periapical healing.

#### Introduction:-

A major problem in performing endodontic immature teeth with necrotic pulp and wide open apices is obtaining an optimal seal of root canal system. The complete formation of root and closure of the apical foramen occurs up to 3 years after the eruption. Traumatic dental injuries to young permanent teeth during this period may cause pulpal inflammation or necrosis and subsequent incomplete development of the dentinal walls and root apices [1]. These teeth present wide dentinal tubules that allow the penetration of bacteria and their irritants. The management of a non-vital tooth with open apex consists of the induction of a natural or artificial apical barrier which can act as a stop for the obturating material. **Apexification** is defined as 'a method to induce a calcified barrier in a root with an open apex or the continued apical development of an incomplete root in teeth with necrotic pulp' [2].

Various techniques were used to induce the apexification process. The most common traditionally used medicament is Calcium Hydroxide. It was first introduced by Kaiser and Frank in 1960's. The approximate time for induction of calcified apical barrier varies between 6 months and 24 months. Although technique is efficient with predictable outcomes, it has several disadvantages like prolonged treatment time, chances of re-infection and risk of cervical fracture [3].

Among the various materials, **Mineral Trioxide Aggregate (MTA)** is considered as one of the most promising materials because of its superior biocompatibility and less cytotoxicity due to its alkaline pH and presence of calcium and phosphate ions resulting in capacity to attract blastic cells and promote favourable conditions for cementum deposition. However MTA has certain disadvantages like high solubility, prolonged setting time of

In this article, 4 cases are described in which MTA was used to the successful closure of root apex in pulpless permanent maxillary teeth with wide open apex. These cases illustrate the potential benefits of MTA and its relative ease of use for management of open apex and apexification at easily accessed sites.

### **Case Reports:-**

Four cases of open apices reported at different time in the Department of Conservative Dentistry and Endodontics, Guru Nanak Institute of Dental Science and Research, Kolkata- 700114 with the **chief complaint** of discolouration in upper front teeth region of mouth. The age of the patients were in a range between 21 to 25 years. The medical and dental histories were non-contributory. All of the four cases were presented with similar features as follows :-

**History-** Trauma 12-13 years back.

### **Clinical presentation:-**

1. Discolouration
2. Offending tooth shows negative response in electric pulp test (EPT)
3. Non mobile and non tender

### **Radiographic presentation:-**

Circumferential periapical radiolucency with wide open apex along with thin root dentin. The bony support of the tooth was completely intact.

### **Treatment procedure:-**

The treatment protocol was performed as follows :-access cavity was prepared using no.2 round bur (Dentmark) and refined with endo Z bur (Dentsply) with rubber dam (Coltene) isolation. Working length was established by radiograph. Biomechanical preparation and circumferential filling was done with 80 K file. Irrigation was performed with 3% sodium hypochlorite and normal saline alternatively. Calcium hydroxide as an intracanal medicament was placed in the canal for 1 week and the access cavity was sealed with zinc oxide eugenol.

On recall visit, the tooth was found to be asymptomatic clinically and radiographically. Intracanal medicament was removed by irrigating with alternating solutions of 3% Sodium hypochlorite and saline. The canal was completely dried with size 80 absorbent paper point and the absorbable gelatin base foam (AbGel) placed apically as a barrier.

### **For the first two cases:-**

MTA was mixed with manufacturer's supplied liquid to a consistency of wet sand and placed in increments in the apical region of the canal and gently adapted using endodontic pluggers until entire canal was filled with MTA and correct placement of MTA apical plug was assessed radiographically. Access cavity was temporized with zinc oxide eugenol.

### **For rest of the two cases:-**

MTA was mixed with manufacturer's supplied liquid to a consistency of wet sand and placed in increments in the apical region of the canal and gently adapted to the apical portion using endodontic pluggers until an apical plug of 4-5 mm was reached. Correct placement of MTA apical plug was assessed radiographically. Following the placement of MTA over the barrier, butt-end of a paper point was used to clean out any excess material from the walls. Wet sterile cotton was placed in the canal above MTA and access cavity was temporized with zinc oxide eugenol.

On recall visit, the patient was asymptomatic and rest of the canal space was obturated with gutta flow and post obturation access cavity restoration was done with light cure composite resin (Filtek Z 250 XT, 3M ESPE) on the same day. The patients were recalled at every 1 month interval for a period of 6 months for clinical and radiographic assessment during this period.

**Case 1:-**

- (a)- Pre operative radiograph (21)  
(b)- Post operative radiograph  
(c)- 6 months follow up radiograph

**Case 2:**

- (a)- Pre operative radiograph (11)  
(b)- Post operative radiograph  
(c)- 6 months follow up radiograph

**Case 3:**

- (a)- Pre operative radiograph (11, 21)  
(b)- Post operative radiograph  
(c)- 6 months follow up radiograph

**Case 4:**

- (a)- Pre operative radiograph (21)  
(b)- Post operative radiograph  
(c)- 6 months follow up radiograph

**Discussion:-**

The completion of root development and closure of the apex occurs up to 3 years following eruption of the tooth (Nolla 1960). After crown formation, the inner and outer enamel epithelium develop as a two-layered epithelial wall to form Hertwig's epithelial root sheath (HERS), which plays a key role in the differentiation of odontoblasts. When the first layer of dentine has been laid down, HERS begins to disintegrate and only the cell rests of Malassez persist in the periodontal ligament. At the same time, HERS progresses in an apical direction until complete formation of the root. When teeth with incomplete root formation suffer pulp necrosis, the root development ceases and apical closure cannot be achieved. Calcium hydroxide pastes have been considered as the material of choice to induce the formation of a hard tissue apical barrier. In 1966, Coviello and Brilliant [5] in 1979 and Schumacher and Rutledge [6] in 1993 suggested calcium hydroxide as a permanent apical barrier. Its efficiency has been demonstrated by many authors, even in the presence of an apical lesion (Chosack et al. 1997, Felipe et al. 2006). However, calcium hydroxide for apexification requires long treatment period. The intracanal dressing needs to be change at regular intervals. Further, the alkaline pH causes collagen degradation and denaturation of dentinal organic proteins causing weakening of dentinal walls [7].

With the discovery of MTA by Torabinejad et al [8] it has become the material of choice for apexification. Single visit apexification is now a viable treatment option for the immature apex. The main constituents are Calcium silicate, bismuth oxide, calcium carbonate ( $\text{CaCO}_3$ ), calcium sulfate, calcium aluminate. It contains a hydrophilic powder that reacts with water and produces calcium hydroxide and  $\text{CaSiO}_4$  hydrated gel. MTA has a range of advantages such as biocompatibility [8] hard tissue formation, sealing ability, antibacterial property.

Interradicular biofilms are usually present in cases with long- standing periapical lesions. Complete obturation with bioactive materials such as MTA in such cases not only have an advantage of cementum formation, but materials like MTA possess antibacterial properties.[ In addition, GP sealer interface can harbor a tenacious gram- positive bacteria and fungi. Such organisms have an ability to survive between GP/sealer and dentin [9]. Further, it is important to seal the canal and prevent bacterial penetration. For this, it is required that the material should adapt and adhere to dentin wall. Various studies have shown MTA forms complete seal due to the interaction of calcium and phosphate ions that facilitates the formation of apatite crystals at material dentin interface hence prevents bacterial leakage [10].

Torabinejad et al. compared the antibacterial property of MTA, amalgam, super EBA (zinc oxide eugenol modified with ethoxybenzoic acid), zinc oxide eugenol (ZOE), and found that MTA has an antibacterial effect on five of nine facultative bacteria but no effect on any of the strict anaerobes. MTA is not affected by the presence of blood. Holland et al. theorized that the tricalcium oxide in MTA reacts with tissue fluids to form calcium hydroxide, resulting in an apical barrier [10].

The patient was kept on 6 months follow- up and radiographic assessment was done during this period. Periapical healing was seen on radiographic observance. This may due to the fact that MTA has superior marginal adaptation. Periapical radiolucency was almost completely healed after 6 months follow- up. In these cases, the circumferential diameter of radiolucency was decreased [11].

**Conclusion:-**

On the basis of radiographic follow-ups we can conclude that the MTA can be successfully used as an apical plug for apexification and subsequent reduction of periapical radiolucency.

##### Key words:-

Celiac disease, Awareness, and  
Epidemiological survey.

#### Abstract

**Background:** Although Celiac disease (CD) prevalence has progressively increased in the last 20 years worldwide, affecting as high as 2.5% of population in Saudi Arabia, the level of physician's knowledge of this disease has not been reported.

**Objective:** The aim of this study is to assess the knowledge of CD among Saudi physicians who face this common health problem in their clinics.

**Methodology:** We conducted this cross-sectional survey of 286 consultant physicians within 6 medical subspecialties and were based in 6 different medical centers in Riyadh, Saudi Arabia in the period from October 2013 to February 2014. A special questionnaire to test physician's knowledge of celiac disease was designed based on the relevant literature, and it was validated through a pilot study prior to data collection.

**Results:** In the physician survey only 131 (46%) physicians returned the questionnaires. The majority of our respondents had more than 10 years of practice (49.62%). There were several significant findings from the participants' response to the questionnaire. For example, Celiac disease is common in the west as in Saudi Arabia but only 23 (17.56%) out of 131 were not aware of this fact. Furthermore, 29 (22.14%) out of the 131 physicians did not know that intestinal biopsy is a mandatory test to confirm celiac disease.

**Conclusion:** There is a significant percentage of physicians who did not have enough knowledge about CD. This might affect the early detection of the disease and the patients' quality of life negatively.

#### Introduction:-

Celiac disease (CD) is a chronic systemic immune-mediated disease induced by dietary gluten proteins present in wheat, rye and barley. CD is an inflammatory disorder of the upper small intestine, most probably caused by an abnormal immune reaction to wheat gliadin<sup>(1)</sup>. The Celiac disease (CD) prevalence has progressively increased in the last 20 years and, recently, it was proposed that it might affect 0.6 to 1.0% of population worldwide, and as high as

2.5% in Saudi Arabia<sup>(2-7)</sup>. However, the lack of physician's awareness of celiac disease clinical features, associations, diagnosis treatment and complications may negatively affects their care. The high prevalence of celiac disease makes the early diagnosis of the disease of high importance. The association between the knowledge of the physicians about certain information in celiac disease and the delay of diagnosis and treatment is becoming more evident. The aim of this study is to detect the awareness of the CD disease among primary care physicians, internists, hematologists, endocrinologists, pediatricians and gastroenterologists at Riyadh, which might give us an idea about the delay in diagnosis and treatment plans of celiac disease in Saudi Arabia.

The rationale of this study was that the lack of knowledge of this common disease might delay the diagnosis and cause many serious complications, which could easily be prevented. We believe the information obtained would help to design and conduct educational and training program for involved physician about the celiac disease in the future.

### Materials and Methods:-

This is a cross-sectional survey of 286 physicians which was conducted Riyadh, Saudi Arabia from October 2013 to February 2014 among 6 medical subspecialties who face this CD commonly on their outpatient clinics. This group of physicians included: primary care physicians, gastroenterologists, internists, endocrinologists, hematologists and pediatricians who were based in 6 different medical centers in Riyadh. A special questionnaire to test physician's knowledge of celiac disease was designed based on previous studies and it was validated among 10 physicians prior to starting the study. Hard copies of this questionnaire were handed to a total of 286 physicians, where only 131 physicians have responded. This questionnaire composed of 16 self-administered English questions. The questionnaires asked physicians to choose the correct answer in each of the following topics: etiology, age at onset of symptoms, clinical features, associated diseases, complications of celiac disease, and the diagnosis and management of the celiac disease. There were 3 to 7 options in each of these categories, including some incorrect options and the choice of "I don't know".

We estimate the expected frequency will be 11% that we took from a previous research done in 2005 in USA under the title (physician awareness of celiac disease). Our confidence limits will be 5% with a worst expected percent about 6%, Our confidence level will be 99%. We added 10% non-responsive estimation to our sample size. The Data was entered on Microsoft Excel and checked by two members of the team. Then the data was sent to a statistician, for analyses using The Statistics and Data Analysis Program (Stata) 12.1 version. The Data collected from the questionnaires was divided according to the variables associated to the physicians' awareness about celiac disease (Gender, age, specialty, hospital were the physician works, years of practice).

### Results:-

In the physician survey only 131 (46%) physicians (110 (83.97%) male and 21 females (16.03%)) returned the questionnaires. 46 (35.11%) of our target physicians were between the age group of 30-40 years old. From the years of practice, the majority of our respondents had more than 10 years of practice 65 (49.62%), followed by 35 (26.72%) who had 1-5 years of practice <sup>[Table 1]</sup>. but only 66 (50.38%) had ever diagnosed a patient with celiac disease.

**Table 1:-**years of practice of the physicians that were included in the study, Riyadh, 2014.

Years Of practice:	Number	Percentage
<1 year	5	3.82
1-5	35	26.72
6-10	26	19.85
>10 years	65	49.62
Total	131	100%

The 16 questions which assessed the awareness of physicians attending at: King Khalid University Hospital (KKUH), king Saud Medical City (KSMC), King Abdulaziz University Hospital (KAUH), Dallah hospital, Al-Habeeb medical centers and some other medical centers. The highest respondents we got was 57 (43.51%) from King Saud Medical City (KSMC), followed by 30 (22.90%) from Al-Habeeb Medical Centers <sup>[graph 1]</sup>.

The specialties of our target physicians were: Primary Care Physician Gastroenterologist, Hematologist, Internal Medicine, Endocrinologist and Pediatrician. The highest respondents we got were 43 (32.82%) pediatricians, followed by 31 (23.66%) physicians from internal medicine <sup>[table 2]</sup>.

**Table 2:-** the number and percentage of physicians' specialties that were included in the study, Riyadh, 2014.

Specialty	Number	Percentage
Pediatrician	43	32.82%
Internal Medicine	31	23.66%
Primary Care Physician	24	18.32%
Gastroenterologist	19	14.50%
Endocrinologist	13	9.92%
Hematologist	1	0.76%
Total	131	100%

The results of physician questionnaires are summarized in <sup>[Table 3]</sup>.

**Table 3:-** the questions and correct answers of the questionnaire with the number and percentage of the physicians who answered them correctly, Riyadh, 2014.

Survey questions	Physician Awareness (%)
Wheat products Celiac disease is an intolerance to	118 (90.08%)
Celiac disease is affecting patients at any age	84 (64.12%)
Celiac disease is not common in the west compared to Saudi Arabia	23 (17.56%)
Bleeding of rectum is not one of the most common symptoms of Celiac disease	117 (89.31%)
Cough is not related to Celiac disease	60 (45.80%)
Asthma is not related to celiac disease	43 (32.82%)

Celiac disease is highly associated with diabetes type1 more than type2	94 (71.76%)
Colon cancer is not a complication of Celiac disease	24 (18.32%)
Intestinal biopsy is a mandatory test to confirm celiac disease	102 (77.86%)
Anti-tissue transglutaminase antibody (anti-tTG) is the most specific celiac antibody test	69 (52.67%)
blood tests for gluten autoantibodies are accurate only while on a gluten containing diet	60 (45.80%)
There is no need to do a genetic testing for the family members of a person diagnosed with celiac disease	53 (40.46%)
Gluten-free diet is a first step in the management of the celiac disease patient	128 (97.91%)
The damage of small intestine will be repaired again after the diet	111 (84.73%)
The gluten-free diet should be a lifelong diet	122 (93.13%)

### Discussion:-

In this study we investigated the awareness of Celiac disease among physicians, and the study showed that there is inadequate knowledge of Celiac disease among physicians.

Celiac disease (CD) is a chronic systemic immune-mediated disease induced by dietary gluten proteins present in wheat products. CD is an inflammatory disorder of the upper small intestine, most probably caused by an abnormal immune reaction to wheat gliadin.<sup>(1)</sup> In the survey 13 physicians (9.92%) out of the 131 physicians didn't know that Celiac disease is intolerance to wheat products.

The diagnosis of celiac disease requires a intestinal biopsy that shows the characteristic findings of intraepithelial lymphocytosis, intestinal villous atrophy and crypt hyperplasia affecting the lining of the upper small intestine.<sup>(8,9)</sup> In our survey 29(22.14%) physician out of the 131 physicians didn't know that intestinal biopsy is a mandatory test to confirm celiac disease.

The Identification of celiac disease is facilitated by widely available serologic tests, the most sensitive antibody tests for the diagnosis of celiac disease are of the IgA class particularly anti-endomysial antibodies, antigliadin antibodies and anti-tissue transglutaminase antibodies<sup>(9,10)</sup>.

The antigliadin antibodies are only sensitive in children younger than 18 months of age, Anti-tissue transglutaminase antibody (anti- tTG) is the most specific celiac antibody test.<sup>(10,11)</sup> In the survey 62 (47.33%) physician out of the 131 physicians didn't know that Anti-tissue transglutaminase antibody (anti- tTG) is the most specific celiac antibody test.

A range of symptoms, signs and complications may be associated with CD, depending on the degree of intestinal involvement. In the survey we tried to ask our physicians in different ways to test the knowledge of Celiac disease symptoms and signs. The physicians generally knew that bleeding per rectum is not one of the most common symptoms of Celiac disease. Approximately most of our physicians didn't know that cough, asthma and colon cancer are no related to celiac disease.

Although the prevalence of CD has been considered very low in Saudi Arabia, a recent study has shown a serology prevalence rate of 2.2% (1 in 45) among healthy students, which might be one of the highest rates of celiac disease in the world.<sup>(7)</sup> The prevalence of celiac disease among risk groups in Saudi Arabia is 9.5% in short stature children<sup>(13)</sup> and 10%<sup>(14)</sup> or 8.1%<sup>(15)</sup> in Type 1 diabetes children. In our survey more than 80% of our physicians didn't know that Celiac disease is very common in Saudi Arabia compared to the west. Although most of our physicians knew that Celiac disease is highly associated with diabetes type1 more than type2.

Treatment and follow up of Celiac disease involves a gluten-free diet, which means the elimination of all types of food containing gluten which means the elimination of wheat, barley and rye from their diet<sup>(16)</sup> Most of patients respond very well to the gluten-free diet and their clinical features decline in days or weeks, though the histology of intestine needs months to recover.<sup>(17)</sup> Generally 85% and above of our physicians knew that Gluten-free diet is a first step in the management of the celiac disease patient and should be a lifelong diet and the damage of small intestine will be repaired again after the diet.

The high prevalence of celiac disease makes the early diagnosis of the disease of high importance. The association between the knowledge of the physicians about certain information in celiac disease and the delay of diagnosis and treatment is becoming more evident. From the previous studies and our study we noticed a lack of physician's awareness of celiac disease clinical features, associations, diagnosis treatment and complications that may negatively affects patients care. These new studies have shown the importance of CD for our health care system. Although, this disease is widely spread, its yet often undiagnosed, mainly because of the lacks of awareness among physicians.<sup>(18,19)</sup> Most of the recent studies are showing a huge need for increasing awareness of the clinical manifestations of CD, as well as increasing awareness of dietary management plans.<sup>(20,21,22)</sup>

#### **Study Limitations:-**

Short time to conduct the research.

#### **Recommendation:-**

We need to increase the sample size, so it can more representation of Riyadh region physicians in addition once we have more data, we need to compare the awareness of the gastroenterologist to the awareness of the other physician groups.

#### **Conclusion:-**

We found that there is significant percentage of physicians did not have enough knowledge about Celiac disease that may affect the early detection of the disease and the patients' quality of life negatively and may lead to complications and delay their treatment.

#### **Acknowledgements:-**

We would like to offer our special thanks to prof. Abdulrahman Aljebreen for his patient guidance, enthusiastic encouragement and useful critiques of this research work and for his willingness to give his time so generously has been very much appreciated. We would also like to extend our thanks to Prof. Shaffi Ahmed and Prof. Ahmed Mandil for encouraging us to develop our research study and for allowing us to grow as a researchers, Their advice on both research as well as on our medical career have been priceless. We would like to think dr.Nazia Sadaf who helped us in analyzing our data her help was of great value. And finally we would like to acknowledge the support provided by our families' during the preparation of our research.

**Appendices:-**  
**Questionnaire:-**

The purpose of this survey is to determine the knowledge and the awareness of the physician about celiac disease. The questionnaire is voluntary and the data collected is strictly confidential.

---

**Name (optional):** \_\_\_\_\_

**Gender:** ☐ Male. ☐ Female.

**Age:** ☐ 25-30 ☐ 30-40 ☐ 40-50 ☐ >50

**Specialty:**

☐ Primary Care Physician ☐ Internal Medicine

☐ Gastroenterologist ☐ Endocrinologist

☐ Hematologist. ☐ Pediatrician

**Which of the following is the hospital that you work in?**

☐ King Khalid University Hospital (KKUH).

☐ King Abdulaziz university Hospital (KAUH).

☐ King Saud Medical City (al-shemaisi).

☐ Dallah Hospital.

☐ Al-Habeeb Medical centers.

☐ Other: \_\_\_\_\_

**Years of practice:** ☐ <1 year ☐ 1-5 ☐ 6-10 ☐ > 10 years

---

All the questions have one answer, so please pick the one you think is the correct.

1. How many celiac disease patients did you diagnosed in the past 1 year?

☐ <1 ☐ 1-5 ☐ 5-10 ☐ 10-15 ☐ >15

2. Celiac disease is an intolerance to

☐ milk products ☐ wheat products ☐ milk, wheat and oats products ☐ cow milk  
☐ I don't know.

3. Celiac disease affect patients at this age

☐ Children ☐ Adults ☐ Elderly ☐ at any age ☐ I don't know.

## RB approval:-

4. Celiac disease is common in the west compared to Saudi Arabia?  
☐Yes. ☐No. ☐I don't know.
5. Bleeding per rectum is one of the most common symptoms of celiac disease  
☐Yes. ☐No. ☐I don't know.
6. Which one of the symptoms is not related to celiac disease?  
☐Shortness of breath ☐Depression ☐palpitations ☐weight loss ☐fatigue ☐cough  
☐I don't know.
7. Which one of the following is not related to celiac disease  
☐ulcerative colitis ☐liver disease ☐asthma ☐Downs syndrome ☐diabetes mellitus  
☐hypothyroidism ☐I don't know.
8. Celiac disease is believed to be highly associated with diabetes type2 more than type1.  
☐Yes. ☐No. ☐I don't know.
9. Which of the following is not a complication of celiac disease?  
☐seizure ☐osteoporosis ☐intestinal lymphoma ☐infertility ☐small bowel cancer  
☐colon cancer ☐I don't know.
10. Intestinal biopsy is a mandatory test to confirm celiac disease.  
☐Yes. ☐No. ☐I don't know.
11. The most specific celiac antibody test is:  
☐Anti-gliadin Antibody (AGA) ☐Anti-endomysial Antibody (EMA) ☐Anti-tissue  
transglutaminase Antibody (anti-tTG)
12. The blood tests for gluten autoantibodies are accurate only while on a gluten containing diet.  
☐Yes. ☐No. ☐I don't know.
13. There is no need to do a genetic testing for the family members of a person diagnosed with celiac disease.  
☐Yes. ☐No. ☐I don't know.
14. The first step in the management of the celiac disease patient is  
☐gluten free diet ☐immunosuppression ☐antibiotics ☐lactose free diet ☐I don't know
15. The damage of small intestine will not be repaired again after the diet  
☐Yes. ☐No. ☐I don't know.
16. The gluten-free diet should be a lifelong diet.  
☐Yes. ☐No. ☐I don't know.

 Kelud mountain eruption

#### Abstract

Indonesia has been hit by several natural disasters, and Kelud mountain eruption which occurred on February 13<sup>th</sup> 2004 was one of the heaviest natural disaster occurred in Indonesia. The result shows that anticipation, preparedness, responses and recovery are provided by the Indonesian army Kodim (The Military District Command) 0818/ Malang district and Batu in cope with managing the natural disaster from Kelud mountain. Anticipation and preparedness include planting, fixing the drain/gutter, guiding and doing the natural disaster simulation. Meanwhile responses after Kelud mountain eruption include evacuation of victims, inventory loss, building the Aid Post, and distributing the logistics. Rehabilitation and reconstruction of facilities and infrastructures of the public interests and the people's properties are provided by Indonesian army as recovery action. However, the limited fund, unclear duties, limited education and training, also limited equipment become great obstacles for the successfulness of natural disaster managing. Thus, strategies in cope with solving those obstacle factors such as education and training, providing self-funding, and proposing the new regulations are discussed.

#### Introduction:

The constitution of Indonesian republic 1945 states: "... Indonesian Government protects all Indonesian people and Indonesian lands and develops the public welfares, educates the people's lives and joins to do the worlds' orders (diciplines) based on the independence and eternal peace and social justice,..." (the introduction of Indonesian constitution, 4<sup>th</sup> paragraph), it means that Indonesian government was created to protect all Indonesian people and Indonesian lands, develops the Indonesian society's welfare, joins the worlds' order (diciplines) based on the similarities in the freedom, eternal peaces and social justice that are accepted by the societies and the world's nations. As one of the nation's components, the Indonesian National Army (TNI) has the obligation to help managing the disasters happened to the whole Indonesian areas. The aid duties to handle the natural disaster done by the Indonesian National Army (TNI) is one of the military operations other than in cope with the war (OMSP) which

is mandated in the Indonesian Constitution No. 3 2002 which is about national Defense (the gazettes of Indonesian Republic the year of 2002 no.03, furthermore, the gazettes of Indonesian republic no. 4169), and then it is called UU PN, article 10 point (3) c namely; ‘ The Indonesian National Army has duty to do the Policy of the National Defense to do the Military Operation out of War’. According to Syamsul Maarif, (Syamsul Maarif, 2012: 141) : the role of Military in managing the disaster is also managed internationally. It is stated in the General Assembly Resolution of the United Nation Organization N. 46/182, human aids must be given on the bases of humanity, neutrality and without taking any sides. Besides, it is also stated that Guiding of the Military Asset Use and The civil defense in the Disaster aids. (Oslo Guidelines, 1994 – updates November 2006, revision 1.1 November 2007). The cooperation between the Indonesian National Army and the National Board for Disaster Management (BNPB) is very strategic especially in giving the responses that is very perceptive on the disaster. Today BNPB and the Indonesian National Army (TNI) have made the Memorandum of Understanding (MOU) between the Defense Ministry, the Indonesian National Army Commander and BNPB with MOU number: MOU / 01 / M / 2011; Kerma / 1 / I / 2011; MOU. 1 / BNPB / I / 2011. The scope of the cooperation involves the management of the disaster that covers the operational and administration activities. In the MOU it is stated that the Defense Ministry has duties: (1) helping the BNPB in the PRB, (2) doing the coordination and facilitating the aids from the other foreign countries which want to give the aids/helps involving the military in PB, (3) The Education of Magister Disaster Management for National Security (Syamsul Maarif, 2012; 139). The aid duty of the natural disaster management done by the Indonesian National Army (TNI) is one of parts of OMSP, which has become the main duties of the Indonesian National Army. As a lesson that happened to Nanggroe Aceh Darussalam, in 2004 there was tsunami, the headquarter of the Indonesian National Army had made a quick reaction force for disaster management (PRCPB) in accordance with the decision of the Indonesian National Army commander no. Perpang / 35 / XI / 2007 dated November 21 2007 about PRCPB of the Indonesian National Army (TNI). The Headquarter of the Indonesian National Army has arranged in detail about the training, the supply fulfillment and the preparation of the operation procedures involving the Indonesian national Army. The Military District Command (Kodim) 0818/Malang district area and Batu has involved in the management disaster of the volcano many times especially in the disaster of the volcano eruption like Semeru, Bromo and Kelud mountains. It causes the Military District Command (Kodim) 0818/Malang district area and Batu has readiness in facing the eruption disaster of the volcanoes. A squad like the Military District Command (Kodim) is the Task Force (Satgas) PRCPB of the Indonesian National Army in the level of the district/city that has duty to help the government district/city in managing the disaster (Book of Natural Disaster Management Guides on the land, 2009;19). The aim of this research is to review and analyze the Capacity of the Infantry of the Indonesian National Army in doing the duty of Kelud mountain natural disaster management; to review and analyze the factors that hinder in doing the duties from the Infantry of the Indonesian national Army in managing the Kelud mountain disaster. An event can be considered into a disaster if there are fatalities even though there is only one victim. It is caused by the new point of view about the safety theory in which human is used as the Center of Gravity. This point of view has developed since the end of the cold war in 1990. Definition of Human Security according to UNDP (1994) is: “Safety from constant threat of hunger, disease, crime and depression. It is also mean of protection from sudden and hurtful disruption in the pattern of our daily lives—whether in our homes, in our jobs, in our communities or in our environment.” In the development implementation, Human security must become the main attention in the nation policy. The government must guarantee that the societies’ interests become the main priority in every nation policy.

There are 2 (two) main categories in the Human Security namely Freedom From Fear and Freedom From Want. The threat that can disturb the continuity and the existence from the Human Security has big number. The United Nations Organization (PBB) categorizes the threat towards Human Security into 7 categories (UNDP, 1994); namely:

1. Economic security;
2. Food security;
3. Health security;
4. Environmental security;
5. Personal security;
6. Community security;
7. Political security.

There are 2 main categories in the Human Security namely Freedom From Fear And Freedom From Want. The threat that can disturb the continuity and the existence of the Human Security has big amount. The first four threats (economic security, food security, health security and environmental security) are grouped as **Freedom From Want** and the next three threats (personal security, community security and political security) are grouped into

**Freedom From Fear.** The natural disaster can be categorized as the threat of nontraditional that one day it can appear suddenly and can disturb the existence of the human being due to its effects. If it is related to the 7 threats mentioned above, the natural disaster can be categorized as a factual threat for the **environmental security** due to the effects that can take human's lives, can cause the destruction to the environment, can cause the wealth disappearance and etc. Capacity can be defined as a human's ability or organization's or a part of the organization to perform some functions effectively, efficiently, and sustainably to reach the organization's goals optimally. ([http://www.access-indo.or.id/documents/OCA\\_Manual.pdf](http://www.access-indo.or.id/documents/OCA_Manual.pdf)). According to Hilder brandand Grindle (1994:10) quoted by Monica Blage schudan John Young in Capacity Development for Policy Advocacy : Current thinking and approach hesamongencies supporting Civil Society Organisations (2006), it is explained that capacity is The ability to perform appropriatetasks effectively, efficiently and sustainably.

Elements that exists in the capacity according to Loubser (1993: 23) like quoted by Blage schudan Young (2006) consists of:

1. Specified objectives ;
2. Efforts ;
3. Capabilities;
4. Resources ;
5. Work organization

Millen (2006 ; 12) stated that capacity is "the individual, organizational or system' ability or to run their functions as they should be efficiently, effectively, and sustainably". Morgan in Millen (2006; 10) defined capacity as "the ability, skills, attitude understanding, values, relationship, behavior, motivation, sources, and conditions that make every individual, organization, networking/sectors and wider system possible to do their functions and reach the development goals which have been set from time to time". Managing disaster according to Cop pola in his book entitled Introduction to International Disaster Management, is divided into: Mitigation, Preparedness, Response, andRecovery. Phasing the disaster management is in the book entitled Integratingenviron mental safe guards into Disaster Management : afieldmanual. Sriyanie Mitht hapala, (2008; 75) explains that phasing the disaster management is divided into activities before the disaster happens, and activities after the disaster happens.

#### **Activities before the disaster happens are divided into:-**

##### **a. Prevention**

Prevention covers the protection done by building the structures and the infra structures to stop the disaster effects. It includes the policy and the legalization that influence the development plans.

##### **b. Mitigation**

Mitigation is an effort to reduce the impacts caused by the natural disaster. The activities done are by giving the counseling and suggestions about the disaster potential that happens.

##### **c. Preparedness**

Preparedness aims to reduce the loss of human lives as minimum as possible, building destruction and the infrastructures through fast and efficient actions towards rehabilitation responses. With the readiness, the society and the other stakeholders have possibility to give responses quickly, and precisely to the disaster and organized them well including the early warning, evacuation routes which have been planned and etc.

#### **Activities after the disaster happens:-**

##### **a. Response/Relief**

Response/Relief is collective actions done as soon as the disaster happens with purposes to save the victims, to lighten their sufferings and to reduce the economic loss due to the disaster. the actions done are by giving helps which include evacuating the victims to the safe locations, providing food, clothes, and etc.

##### **b. Recovery**

Recovery is activities done to return the humans psychologically and the infrastructures to the normal levels after the disaster happens. The activities done are by building the temporary houses and providing basic household facilities.

### Rebuilding

Rebuilding is a long period response done after the disaster happens. In this phase, the permanent infrastructures are rebuilt, the ecosystems are recovered and the livelihoods that are broken due to the destruction of the disaster are rehabilitated.

As the explanation (implementation) from the duties of Military Operation out of War (OMSP), it is mandated on the Indonesian Republic Laws No. 3 2002 about the Defense; the Indonesian Republic Laws No. 34 2004 about the Indonesian National Army; the Indonesian Republic Laws No. 24 2007 about the Disaster Management and the Doctrine of the Indonesian National Army Tridek 2007 and the Interim (temporary) Manuscript Doctrine of Kartika Eka Paksi 2007, The Headquarter of the Indonesian National Infantry Army formulated 11 guiding books PMSP from 14 duties of OMSP which become the main duties of the Indonesian National Infantry Army. Those guiding books are used as the basic rules and involvement rules in doing the duties of OMSP for the Indonesian National Infantry Army Force. Those guiding books also states that, in helping the central government or the local government to handle the natural disaster, the rapid reaction task force of the disaster management (Satgas PRCPB) from the Infantry Army are posted in all city levels and the operations are done in all Indonesian territories ( the headquarter of the Indonesian National Infantry Army, 2009, page 16). It is also done at the Military District Command (Kodim) 0818/Malang District and Batu in managing the eruption disaster of Kelud mountain.

### Materials and Methods:-

This research is qualitative research, it is a research based on the concept of “going exploring” which involves in- depth and case- oriented study upon some cases or single case (Finlay, 2006). This research aims to describe, elaborate and analyze the problems which appear in involving the Force of the Indonesian National Infantry Army of the Military District Command 0818/Malang District and Batu in managing the natural disaster of Kelud mountain eruption reviewed from the point of view of the personnel readiness. Therefore, the data source, the informants, or the interviewees, which will be extracted to get the information, are the soldiers of the Indonesian National Infantry Army who are involved, the leaders or the commanders of the forces, the field commanders of the Indonesian National Infantry Army personnel in the Military District Command 0818/Malang District and Batu in managing the natural disaster of Kelud mountain eruption, through the snowball interviews and observation at the sites. The data analysis are done with qualitative descriptive, through the stages of the data presentation, data grouping and conclusion taking as described in the model of data analysis technique presented by Miles and Huberman (Sugiono, 2006; 227),

**Figure 3.1:-** the components in data analysis by Miles and Huberman.

### Result And Discussion:-

On February 13<sup>th</sup> 2014, Kelud mountain in East Java erupted heavily, the mountain which is located 1,731 kilometers above the sea level was explosively erupted. 150 cubic meters of volcanic materials including ashes, sand, and stones from the mountain were erupted and the red hot lava blurted as high as 17 kilometers. The outburst height is correlated with the reach (scope) of the falling ashes; therefore, the spread came to almost all Java island areas. At that time around 180,000 people were at the Kelud mountain evacuated to the safe areas. They were from three regencies including Kediri, Blitar, and Malang. The evacuation took two hours from 21.15 p.m. until 22.55 p.m, and it was conducted by the Disaster Management Board of the city, and Indonesian National Infantry Army, as from

government. Evacuation also involved volunteers, and other social elements spreading in all regencies. The process ran smoothly and did not take any victims.

The Military District Command (Kodim) 0818/ Malang district and Batu is the the Indonesian National Infantry Army Corps under the Military Resort Command (Korem) 083/BDJ Military Command V/Brawijaya. This Corp is the Territory Corp that has duties and responsibilities to develop the defense potential in the area of Malang district and Batu. The Military District Command (Kodim) 0818/ Malang district and Batu has the main duties as the implementer of Kotama Pembina (City Coach), the Implementer of Operation Kotama (Pelaksana Kotama Operasi) and the implementer of Function Duties (Pelaksana Tugas Fungsi) (PTF) Kemhan (Defense Ministry) (The Military District Command Corp Report (Kodim) 0818/ Malang district and Batu, 2011, page 1). The organization structure of the Military District Command (Kodim) 0818/ Malang district and Batu that consists of leader echelons, service echelons, and implementer echelons (see appendix 4)

The Millitary District Command (Kodim) 0818/Malang district and Batu, has already made a fixed procedures (Protap) on The Disaster Management and Refugee Managing (PBP) due to the Kelud mountain eruption in Malang district and Batu as a guidance for the Military District Command (Kodim) in doing the duty to handle the disaster of the Kelud mountain eruption which happened in those cities. Regarding the aid service, the status of Military District Command (Kodim) 0818/Malang district and Batu is under the operation control (BKO) the Malang district government as the implementer corps (Satlak) PBP in Malang district areas. Indonesian govermenthas arranged the disaster management organization in cope with disaster management, including Kelud mountain eruption and refugee management which occurred in Malang district. The organization involves all stake holders in Malang district including government officials in Malang district, the Indonesian National Infantry Army, the Indonesian National police, the Non-Governmental Organizations (LSM), and civil. Arranging the organization is expected to create the relationship and synergistic cooperation among all related institution in managing disaster that occurs in Malang (the structure organization please refers to appendix 3).

The Regent of Malang as the chief of Implementer Unit (Satlak) PBP Malang district forms several Institution (boards) in cope with managing the disaster of the volcano eruption in Malang district,as follows:

**First. Fast Response Team (TRC).** This team has duty to record and make a prediction of the emergency needs fast if there is disaster in its area. This Fast Response Team consists of Trantib (the team who handles the neatness and diciplines), the Indonesian National Infantry Army, the Public Work (PU), Social **Sudin** and other needed elements.

**Second. The Task Force of Disaster and Refugee Management(Satgas PBP)** consists of the government staff (officials) (Functional Unit) and the society in that area that can integrate to do the further activities to save and to rehabilitate. For the integrated steps in managing the disaster and refugee management, the government establishes some Task Forces as follows:

**Rescue Task Force.** The task force has duty to do the activities to search and help the victims in the disaster areas and also evacuate them to the safe areas to get further aids (help);

**Health Task Force.** This task force does the medical evacuation, emergency treatment (medication) and if it is necessary this task force gives further aids(help);

**Public Work Task Force (PU).** This task force does the emergency improvement on the economy medium, communication, clean water supplies, sanitation, and the live medium for the societies of the disaster victims;

**Social Task Force.** This task force prepares the emergency tens (camps) and its equipment, organizing the soup kitchen, preparing the clothes and blankets for the victims who need;

**Cross-Community (Linmas) Task Force.** This task force has activities as follows: 1)arranging the Cross-Community potency that consists of the employees and societies of the vital object; 2) doing the disaster management and managing the refugees in its areas; 3) doing the consultation and coordination with the Tramtib Sudin ( the discipline force) and the Cross-Community (Linmas) in Malang district.

Based on the interview's result, observation and literature study, it can be concluded that the Capacity of the Indonesian National Infantry Army of the Military District command 0818/Malang district and Batu in doing the duties to handle the natural disaster of Kelud mountain by doing some activities, namely: arranging an organization to handle the disaster. the organization involves all stake holders in Malang District like: Government Officials in Malang district, the Indonesian National Army (TNI), Police (POLRI), non-governmental organization (LSM) and the societies. The purposes of arranging those organizations are creating the relationship and synergistic cooperation between all related institution in managing the disaster that happened to Malang district. (the organization structures can be seen in the appendix 3) In the phase of the implementation in managing the volcano eruption disaster and managing the refugees, it is divided into three phases, including activities before, during and after volcano disaster occurred. Those activities are conducted by socializing the Guiding Book in Managing the natural Disaster on the Land, published by the Headquarters of the Indonesian national Infantry Army in 2009 and the Fixed Procedures in Managing the eruption disaster of the volcano eruption and Managing the Refugees which is owned by the Military District Command (Kodim) 0818. Socializing the emergency response and the evacuation routes as preparation for the Kelud mountain eruption occurs anytime, and the implementation of the society evacuation, (moving) wealth and animals/pets during the Kelud mountain eruption which happened on February 13<sup>th</sup> 2014 to safe places that have been prepared before, and the rehabilitation of the household and the public structures and the infrastructure for the people's interest and free medical treatment for the societies. Similar with previous research, Gautam in his opinion regarding the role of Indian army, also demonstrated that other than defend national borders, army has another primary task that is acting as respondent on domestic front, including natural disaster.

However, implementation of the Indonesian national Infantry Army's duty in managing the natural disaster of Kelud mountain face some obstacles. Based on the interview's result and the observation, those obstacles are including:

**Limited Budgets.** The budgets provided by the Military District Command (Kodim) 0818/Malang district and Batu in implementing the devotion work (karyabhakti) or the United Army to build the village (Tentara manunggal Membangun Desa) (TMMD) is very limited. It really influences the effort of the Military District Command (Kodim) to help the local government Malang and Batu to handle the natural disaster in the phase of the pre disaster (before the disaster happens) and after the disaster happens. The elements and operations involved in emergency logistics and services to victims during natural disaster need pretty much big budget allocation.

**The unclear task priority in implementing the task to handle the natural disaster.** The Military District Command (Kodim) is the task Force (Satgas PRCPB) of the Indonesian National Infantry Army in the city levels that has the duty to help the local government to handle the disaster from the level of pre disaster, emergency response and the post disaster. In the implementation, the Military District Command (Kodim) also has the task priority in managing the disaster that can cause the Military District Command not optimal in doing the aid duty to the city government;

If we observe seriously the laws about the disaster management (managing disaster), from the laws of the Indonesian Republic No. 24 2007 about the Disaster management (managing disaster) and also the President Regulation No. 8 3008 (Perpres No 8/2008) about the National Board of the Disaster Management, it does not explain the duty of the Indonesian National Army in detail on every level in managing the disaster (Ditjen Strahan, 2010, page 5). The president regulation (Perpres) No. 8/2008 explains that the representation of the Indonesian National Army only occupies one of the positions as the member of BNPB (article 11, verse 2, letter J), also the Indonesian National Army involvement in managing the disaster covers the mobilization of the personnel and the logistics (alatista/the main equipment of weapon system) done by using the command systems (article 48 verse 1). It is not explained specifically about the limitation of the amount of the personnel mobilization, the mechanism of the alatista/ the main equipment of weapon system and its relation with the need of the nation defense and the command mechanism that is meant to (Ditjen Strahan, 2010, page 6). Moreover, the actor network in the emergency situation must act in a cooperative and mutually supportive way to be effective (Boin et al., 2010). There is also a requirement for flexibility and adaptive mechanisms that can respond to events as they happen. These essential challenges to emergency logistics management are increasingly getting attention from both practitioners and academic circles (Boin et al., 2010), and this may relate to the increasing scale and frequency of these events. Besides the Legal Protection, the obstacles faced by the Indonesian National Army generally in managing the natural disaster is that there is no clear procedure from the government related to the duty specification and the function of the Indonesian national Army especially the Infantry at the field, both at the headquarter levels and the local levels (Ditjen Strahan, 2010, page 6). The budget support also becomes an important issue that becomes the obstacle for the Indonesian

National Army in doing the duty to handle the disaster. the Indonesian National Infantry Army specifically and the Indonesian National Army in general does not have special prepared budgets to handle the disaster (Ditjen Strahan, 2010, page 85)

**Training and Education.** Training on the disaster management in the level of the Military District Command (Kodim) is still a training of rehearsal post directed to train the commander officials and the staff in giving the aids to the local government. Right now there is no Training and education directed to the ability development from the Military District Command (Kodim) personnel in managing the disaster. Organizationally, the Force in the level of the Military District Command (Kodim) is prepared as the task force quick reaction to handle the disaster (PRCPB) of the Indonesian National Infantry Army that involves directly to handle the disaster in the level of district/city, however, in the reality until now there is no training and equipment prepared specially to handle the disaster based on the disaster characteristics. The Military District Command (Kodim) 0818/Malang district and Batu is the same as the other territorial force. All forces under the Military Command (Kodam) IV/Brawijaya has duty to implement the Waskita Defense (PamWaskita). The duty is one of the OMSP duties related to the safety of the president, vice president, and the other state guests. The Military District Command Force (Kodim) 0818/Malang district and Batu often involve in those activities, it is caused due to the activities of the president and his vice president in doing their official travels either domestic or international ones through Aburrahman Saleh airport. The location of the Abdurrahman Shaleh airport has become the responsibility of the Military District command (Kodim) 0818/Malang district and Batu.

**Appliance Supplies.** Appliance supplies that can be used to help the local government in managing the natural disaster are very limited. If they are faced with the disaster that happened to some districts. Malang – Batu have not been able to help the local government optimally. The Indonesian National Army especially the Infantry involvement out of the war (OMSP) show that the Indonesian National Army takes the responsibility to face the threat towards nation which has nontraditional characteristic. At a glance, the duty of OMSP done by the Indonesian National Army can be described like the aid help given by the Indonesian national Army to the institution that needed (Ditjen Strahan, 2010, 136). However, basically those duties have already consorted the Indonesian National Army as the Main component of National defense. Problem that might appear when the Indonesian National Army does the duty of OMSP is that there is no Rules Of Engagement that is clean and transparent to manage the task duty. There is no authority order that influences the Indonesian National Army (TNI) preparation and the Indonesian national Army work performance in implementing those duties. Infrastructures and its maintenance are limited thus it influences the performance of TNI in disaster management duties. Previous research also demonstrated that appliances supplies, emergency-supporting infrastructures including ongoing maintenances are very much necessary things to be provided since disaster might occur anytime and have potentially break infrastructures in many ways (Clarke, 1999). In order to minimize the obstacles face on natural disaster management, the Military District Command (Kodim) 0818/Malang district – Batu did the training program suitable with the program that was in line with the program from the upper command. The training which was programmed to apply the duty of the OMSP especially training in managing the natural disaster for the Indonesian National Infantry Army Force, until now the training is still post rehearsal training. The Military District Command (Kodim) 0818/ Malang district – Batu.

Human resource development in an organization needs training, assessment and development achievement. Those three things must be done to improve the competitiveness of an organization and to evaluate the tasks implemented by each personnel. An organization has a standard for each work force on duty whose has to master their duty and responsibilities tasks. Every organization tries hard to give briefing and training for its personnel therefore, they master their own task and can increase their work performance from each individual. The human resource development has a very important role in an organization. The development is implemented in the education and training with purpose that the main duty carried can be done effectively and efficiently.

To handle the budget obstacle, based on the interview result with the informants who became the doer in managing the disaster, the strategies that need to be done by the Military District Command (Kodim) 0818/Malang district and Batu, are collecting the budget from the donor both from the donation proposal given to the wealthy societies, to companies located in the areas of Malang district and to the district government of Malang and the government of Batu, through the post of the disaster aid budget, grants or unexpected funds. Therefore, with the helps from the societies, entrepreneurs or the district and city government, limited budget and structures and infrastructures that support the disaster management can be solved. Similar with other countries such as Japan, Netherlands,

Switzerland and the UK, the defense ministry budget in cope with natural disaster management partly comes from humanitarian aid budget, other than from defense ministry budget itself (SIPRI, 2008).

Furthermore, the strategies to handle the obstacle of the unclear task that are supposed to be done, the Military District Command (Kodim) 0818/Malang district and Batu through the resort command (Korem) 083/Baladika Jaya Malang proposed a petition to the Commander of the Infantry Strategy Command to publish the implementation rules from the Indonesian National Army (TNI) Laws about the implementation of the Military Operation out of War especially in the natural disaster management help. Cooperation with the National Disaster Management Board (Institution) (BPNB) as an institution that has the authority to do the disaster management according to law in Indonesian Republic Constitution No. 24 2007 about Management (Managing) Disaster and the President Regulation of Indonesian Republic No. 8 2008 dated on January 26<sup>th</sup> 2008 about National Disaster Management Board (BNPB). Previous research also demonstrated that a well cooperation among well-trained public organizations, military and civil may become an effective way to manage natural disaster (Boin et al., 2010) The regulations from the Strategic Commander are intended that there will be specific roles from the Military District Command (Kodim) whose area gets the disaster and is under its responsibility, starting from the command systems, the personnel number and the equipment needed and also supported budget since the area is part of the military operation command out of war. The regulations from the Chief Commander are intended to make the previous regulations more perfect, namely the Chief Commander regulation No. Perkasad /96/XI/2009 dated on November 30<sup>th</sup> 2009 about the Guiding Book about Natural Disaster on Land Management. The decision from the Chief Commander of Indonesian National Infantry Army No. Kep/23/IV/2007 dated on April 24<sup>th</sup> 2007 about the task implementation of the OMP duty and OMSP for the Indonesian National Infantry Army. And the decision of the Chief Commander of the Indonesian National Infantry Army no. Perpang/35/XI/2007 dated on November 21<sup>st</sup> 2007 about PRCPB TNI.

### **Conclusion:-**

The capacity of the Indonesian National Infantry Army of the Military District Command (Kodim) 0818/ Malang district and Batu in implementing the duty of managing the natural disaster of Kelud mountain, was done since before the eruption happened, including implementing the greening on the barren forest, repairing the drainage, counseling to the societies through Babinsa about the areas which are prone from the natural disaster, procedural explanation in cope with natural disaster by commander of the military district and Babinsa, and simulation in dealing with natural disaster. During the mount eruption disaster, evacuating the victims to the refugee camps, keeping the safety of the victims who still could be saved and keeping the location safety, doing the inventory of lives loss, wealth gradually, building the aid posts and distributing the logistics to the refugees were conducted. Activities after the eruption also conducted including rehabilitation such as rebuilding the structures and the infrastructures of the public interests service and people's belonging in the disaster areas until it reaches the adequate levels in the post disaster areas with the main targets to normalize the implementation of the government and the society's lives; reconstruction including rebuilding the structures and the infrastructures of the government institution and society's organization in the disaster areas with the main target to grow and improve the economy activities, social and cultural activities, upholding the laws and disciplines and the rising all aspects of social lives. However, hindrance always occurred in the process of implementation of the Indonesian National Infantry Army in managing the natural disaster of Kelud mountain, including limited budgets, the unclear tasks, limited education and training, as well as limited appliance supplies. In order to solve those obstacles, some strategies are conducted, including education and training sustainably and with stages to improve the soldier human resource of the Indonesian National Infantry Army and the professionalism, seeking the own budget through the aid proposal to the wealthy societies, entrepreneurs, and the Local Government of Malang District and Batu, proposing the new regulations to make the previous regulation more perfect to the Strategic Commander of the Infantry Army (Pangkostra, there is a specific regulation about the authority of the Military District Command that supervises the area of the disaster, both the commands, the personnel and the equipment needed and the budget post that is used as well.

#### Abstract

**Background:** Colorectal cancer (CRC) is documented to be the third most common cancer worldwide in terms of incidence and mortality. Inflammatory bowel disease (IBD) patients are at higher risk for developing CRC as compared to the general population, as CRC is the most common cancer in the IBD population. This study aims to assess the awareness of CRC among IBD patients in Saudi Arabia.

**Methods:** A quantitative, observational, retrospective cohort study was conducted at King Khalid University Hospital (KKUH), in Riyadh, Saudi Arabia between November 2013 and February 2014. Directed-interview questionnaires were administered over the telephone to the 384 purposively-selected IBD-established patients.

**Results:** Prompted awareness of CRC symptoms and risk factors was much higher than unprompted awareness. When asked about risk factors, nearly 48% of patients could not recall any risk factors unaided. Overall, the most commonly identified risk factor for CRC unaided was IBD (27.1%), followed by diet (20.5%). However, 14.5% could not identify or did not know whether their own disease (IBD) is a risk factor for CRC.

**Conclusion:** Results from this study showed that the overall awareness of CRC symptoms and risk factors among Saudi IBD patients was poor. However, the knowledge towards CRC symptoms was observed higher than knowledge of risk factors, insinuating a possible gap in patient education. Customization of health-promotion programs for IBD patients is urgently needed to combat the rising incidence of CRC amongst them.

#### Introduction:-

Colorectal cancer is a common cancer and is ranked as the third in males and the second in females worldwide.<sup>1</sup> In Saudi Arabia, CRC frequency is documented as second to breast cancer. This rate is alarmingly increasing and is estimated to leap up to a fourfold increase by the year 2030<sup>2</sup>. Furthermore, it is also reported to be the third leading cause of cancer death in the United States.<sup>3</sup>

Several risk factors were proven to be associated with the development of CRC. Modifiable factors include obesity, sedentary lifestyle, cigarette smoking, alcohol intake, red meat ingestion, and decreased vegetable and fruit

consumption. On the other hand, non-modifiable factors constitute the following: Family history of CRC, older age and inflammatory bowel disease (IBD), which falls under the scope of this study.<sup>4</sup>

Previous studies assessing the awareness of CRC in several aspects, including epidemiology, symptoms/signs, and risk factors have revealed a poverty in the knowledge of the public, which is disconcerting given the fact that CRC still remains largely a topic of confusion in the general population. This has contributed significantly to the deleterious consequences on time of presentation and, therefore, on overall survival.<sup>5-11</sup> These findings were also consistent with the data of another study, which showed that the level of CRC knowledge among the Saudi general public was low, thus signifying the necessity of continuing public education and screening programs.<sup>12</sup> Furthermore, the lack of awareness was not only reported among the general public, but even more among patients following up in the gastroenterology clinics and the peripheral colorectal surgical unit.<sup>13,14</sup>

This issue needs to be taken seriously since it has been demonstrated that blurred recognition of CRC susceptibility among high-risk groups does exist. One study investigated the awareness of the potential risk for developing CRC in 195 overweight patients where only a third out of them could identify their weight as a risk factor.<sup>15</sup>

This, subsequently, provoked the interest to assess the awareness of CRC in a subset of the general population, IBD patients. This is due to the fact that these patients are at higher risk for developing CRC as compared to the general population and that CRC is found to be the most common cancer among them.<sup>16</sup>

Despite this, we are not aware of any studies addressing this issue locally or internationally. This adds to the uniqueness and indispensability of our study. Since we believe that assessing CRC awareness among IBD patients will help estimating the real magnitude of this issue which will draw the attention of decision-makers and health-care professionals to increase the efforts made for educating the patients and subsequently, lead to earlier presentation and improved survival rates.

## **Methods:-**

A quantitative, observational, retrospective cohort study was carried out to assess the awareness of CRC among IBD patients in King Khalid University Hospital (KKUH) in the periods between November 2013 and February 2014. Patients who were below the age of 12 or have had a history of CRC and/or colonic polyps were excluded from the study. 800 patients were present in the local IBD database compiled between the periods of 2009 and 2013, of which 580 (72.5%) were eligible to be enrolled into the study according to the exclusion criteria. Directed-interview questionnaires were administered to those eligible over the telephone to gather current data pertaining to their awareness. Of those, 317 (54.7%) responded to this study. The questionnaires were compiled and modified based on a pilot study conducted on 12 patients, and consisted in its final form of 16 questions that covered several variables, including demographics, family history of CRC, and overall knowledge of the disease (risk factors, signs/symptoms).

## **Data analysis:-**

Collected data was entered to Excel version 14.00 and categorical variables were expressed as frequencies. Data was analyzed using SPSS version 21. (SPSS Inc., Chicago, IL, USA) and all statistical tests were declared significant at level of 0.05 or less. Chi-square tests were used to examine differences in CRC awareness in relation to socio-demographic factors including gender, age, diagnosis, marital status, occupation, education level, income and having a diagnosed relative or friend of CRC.

## **Ethical considerations:**

Confidentiality with regards to patients' information was maintained and participants' consent was obtained verbally over the telephone. All patients were informed about the purpose of the research, the reason why they were chosen and their right to discontinue from participation at any time without being obligated by the investigators. Neither rewards nor incentives were given to the patients. No conflict of interest was present.

## **Results:-**

### **Socio-Demographic Characteristics:-**

Of the 580 IBD patients who were eligible to enroll, 317 (54.7%) responded to the study. A total of 317 IBD patients were interviewed over the telephone (Table 1). 55.2% had Crohn's disease (CD) while 44.6% were diagnosed with ulcerative colitis (UC) based on endoscopic criteria. 55.5% were male while 44.5% were female,

with a mean age of (Add mean/SD of age here) Patients less than thirty years of age formed a proportion of 55.3% while older patients ( $\geq 30$  years) formed the remaining group. 96.5% were Saudis, where those who reside in Riyadh formed the largest proportion of the respondents. 79.5% of the IBD patients have attained either a high school or university degree while 20.5% were from other educational levels (illiterate, reads & write, primary school, middle school and higher studies). 60.6% were either governmental employees or students. 52.4% of the patients were married. The monthly income of 80% of the patients was ranging from 1,333 or less to 5,333 USD. The vast majority had no first or second-degree relatives nor did they have any friends diagnosed with CRC (90.5% and 80.1%, respectively).

#### **Knowledge of CRC Risk Factors, Signs and Symptoms:-**

Responses to knowledge assessments including recognition of risk factors and signs and symptoms were variable (See tables 2 & 3). Out of the 317 patients, 35.3% have never heard of CRC and 62.1% of the patients either don't think or don't know whether CRC is common or not. When asked about sources of information, the internet was the most popular method used by IBD patients to learn more about CRC while doctors' education was the second most commonly chosen source of information (Chart 1).

#### **Knowledge of Risk Factors:-**

In questions relating to patients' knowledge of CRC risk factors, 59% of IBD patients answered "no" to the question "do you know any risk factors of colorectal cancer?"

Nearly 48% of patients could not recall any risk factors without aided while 45.5% of them still didn't manage to recall and answered "no" or "I don't know" after being prompted.

Overall, the most commonly identified risk factor for CRC unaided was IBD (27.1%) and it was followed by diet (20.5%). Out of all patients, 14.5% couldn't recognize or didn't know whether their own disease (IBD) is a risk factor for CRC. On the other hand, aid was needed by more than half of the patients (58.4%) to identify IBD as a risk factor. The least well-recognized risk factors for CRC, however, were by far diabetes mellitus (57.1%) and hypertension (53.9%). Similarly, Age and gender were not recognized by around half of the patients (50.8, 54.3%, respectively).

Most risk factors were correctly chosen by patients after aided, these include alcohol (66.6%), smoking (63.7%), family history (57.7%) and obesity (47.3%).

However, a proportion of 54.6% of the IBD patients incorrectly chose hemorrhoids as a risk factor for CRC after aided.

#### **Knowledge of Symptoms:-**

Around 50% of IBD patients believed they don't know any symptoms while approximately a similar proportion of them answered "yes" to the question "do you know any symptoms of colorectal cancer?". Abdominal pain was the most frequent symptom of CRC that was correctly believed by 28.7% of the patients without being prompted while 7.6% managed to name "weight loss" as a symptom of CRC. Other symptoms of CRC were answered correctly by the patients only after being aided, these include bleeding per rectum (53.9%) and change in bowel habits (59%). Difficulty of swallowing was correctly judged by 54.9% of IBD patients not to be a symptom of CRC. However, black stools (17%) and fatigue (14.5%) were the most frequent wrongly identified as not being symptoms of CRC after being prompted.

Around 50% of IBD patients correctly answered "yes" to the question "do you think that colorectal cancer can present without symptoms?" while about 39% of patients believed the opposite.

#### **Factors Associated With Knowledge of CRC Signs, Symptoms and Risk Factors:-**

A confidence interval of 95% was used and results showed that men demonstrated higher unprompted knowledge of risk factors than women, they were more likely to recognize IBD ( $p=0.056$ ) and smoking ( $p=0.015$ ) as risk factors for CRC. Older patients were also better at identifying symptoms of CRC compared to the younger age group. For example, those aged 30 or older correctly named that bleeding per rectum and fatigue are symptoms of CRC ( $p=0.038$ ,  $p=0.026$  respectively). Moreover, they could also identify obesity as a possible risk factor for CRC without being aided ( $p=0.016$ ). On the other hand, most patients who are less than 30 years of age wrongly believed

that CRC is not common compared to older patients ( $p = 0.001$ ). Patients who had university or higher study education showed higher recognition of symptoms and risk factors without being aided, they correctly identified bleeding per rectum as a symptom ( $p = 0.008$ ) and IBD ( $p = 0.006$ ), family history ( $p = 0.017$ ) as risk factors for CRC. The different knowledge levels between CD and UC patients were statistically insignificant.

### Discussion:-

Determining the IBD patients' awareness regarding CRC may offer significant information to incorporate the policy decision for screening promotion, early diagnosis and reduction of morbidity and mortality of CRC. Until now, and according to the available literature, this is the first study to assess the awareness of CRC among a cohort of IBD patients. This study showed that a large proportion of patients had poor awareness regarding symptoms and risk factors of CRC. Prompted awareness of CRC symptoms and risk factors was much higher than unprompted awareness which was also reported in an earlier study that was conducted among the general public of the United Kingdom.<sup>5</sup> Our study also shows that Saudi IBD patients were more aware of CRC symptoms than risk factors, this could be justified by the resemblance of presenting symptoms between CRC and IBD which might have confused and aided them in reaching a more rightful prediction.

When comparing the proportion of Saudi IBD patients who could recognize their own disease (IBD) as a risk factor for CRC after being aided to the general British population<sup>5</sup>, it is striking to say that the Saudi IBD patients' awareness to IBD as a risk factor is not that different from the general public but in fact less (58.4% and 61.9%, respectively) despite that they were expected to be better informed than average about CRC. This is worrisome since it implies that Saudi IBD patients are either experiencing poor public health educational programs or in denial to the fact that their risk is higher compared to the general population.

It is worth mentioning that IBD was the only common recognized risk factor among both the Saudi general public and within the Saudi IBD population possessing higher levels of education, which may guide the focus of the educational efforts to the other less identified risk factors.<sup>12</sup>

The most recalled symptom of CRC without prompt by Saudi patients was abdominal pain. Likewise, a Malaysian study among rural population reported that abdominal pain was the most frequent symptom identified unaided and the second most agreed symptom of CRC from prompted question.<sup>10</sup> Weight loss, however, was the least recognized symptom of CRC unaided among the Saudi IBD patients in this study, perhaps due to the fact that this symptom is non-specific to CRC and is not anatomically confined to the abdomen (as in the case of abdominal pain). This might compromise the professional help-seeking behaviors. Similarly, the same Malaysian study demonstrated that only less than 5% could relate weight loss to CRC without aided.<sup>10</sup>

Men knew more CRC risk factors than women, particularly smoking and IBD. This could be because men are aware that CRC is more pronounced among them or perhaps implies men's preference to think that cancer risk is modifiable in regards to smoking. Our results were in disagreement with a couple of studies including a local study among the general public that revealed a better awareness of CRC symptoms among women.<sup>5,12</sup> The fact that Saudi men in our study showed higher awareness is encouraging especially that previous studies have also shown that CRC is more common among Saudi males.<sup>17,18</sup>

Older patients showed higher knowledge of symptoms than younger patients especially in bleeding per rectum and fatigue, they have also shown better knowledge in some risk factors like obesity which is reassuring because they are at higher risk and in need to correctly recognize these symptoms and risk factors. Moreover, local studies have reported increased prevalence of CRC among older age groups.<sup>18</sup> However, interestingly, younger age group (<30 years) were more aware of the link between CRC and alcohol than older patients. This is consistent with findings from the same British study which reported that younger age groups had a higher awareness of alcohol as a risk factor for CRC.<sup>5</sup>

Diet was a well-recognized risk factor by the patients after aid and this provides a positive implication due to the predominance of unhealthy lifestyle habits among the Saudi population, for example being overweight<sup>19</sup>, poor fruit and vegetable, high meat and fat consumption.

Knowing someone with CRC or having a family history of CRC was present in very few patients in this study which hindered the process of finding any statistical significance.

Certain limitations of this study should be noted. The method of data collection used in this study was designed to offer a straightforward evaluation of knowledge levels, it hadn't been previously validated and therefore cannot be used for international comparison of CRC awareness. Moreover, due to the fact that our study is a single-center study and that most of our patients were Riyadh citizens receiving good level of education, findings may not necessarily be applicable to rural hospitals in Saudi Arabia.

### Conclusion:-

Saudi IBD patients' awareness of CRC symptoms and risk factors is alarmingly low, emphasizing the significance of the health-care professionals to continue educating them about their own risk of CRC and the need of more solid screening programs which will lead to the reduction of CRC incidence and mortality. Moreover, customization of health-promotion programs for IBD patients is noteworthy in order to increase their CRC awareness. Furthermore, since internet was the most frequented source of information, the need of establishing a well-structured website is indispensable. Lastly, further research should be conducted with validated questionnaires to permit comparison of awareness level of CRC among IBD patients worldwide.

### Acknowledgments:-

We would like to express our deep gratitude to Dr. Shaffi Ahamed and Mr. Philip Feeley who were of most assistance to us in regards to statistical analysis. We would also like to convey our gratitude to the medical students who participated in collecting the data for our study.

Igbo society, language, native narrative, African identity, postcolonial complexities.

#### Abstract

The present article studies Chinua Achebe's style of language used in his literary works that have helped shape the outcome of his native Igbo language as well as that of the English language. Since, Achebe has chosen the written word over the spoken as medium of linguistic and social reform, the analysis rest on the close reading of his magnum opus novel *Things Fall Apart* (1958) rather than perusal of his oral statements. Whereas his writings have catapulted him into a transcendental position in both the Western and African literary canons, his use of English language as his medium of expression has earned him much criticism from his fellow writers and critics alike. The paper has shown how well his narrative style is appreciated by both European and African readers.

**"Until the lions produce their own historians, the story of the hunt will glorify only the hunter."**

#### Chinua Achebe, Home and Exile:-

Born on the 15<sup>th</sup> of November in Ogidi in Eastern Nigeria, Chinua Achebe became one of the foremost authors of Africa of the twenty-first century. The author himself wrote of the time and place in which he was born and raised as "a strongly multiethnic, multilingual, multi-religious, somewhat chaotic colonial situation". (Achebe 39) In fact, Eastern Nigeria consists of many provinces that make up Igboland, dominated by the Igbo tribes of which Achebe's native town is one. Traditional Igbo societies are relatively autonomous and free from interference from other societies. The Igbo's pride themselves in their self governance and freedom from outside interference, which is their ideal aim in both the pre and post colonization period. Critics of the Igbo tribe have often claimed that they are a stateless or acephalous nation and their administrators have called them argumentative. The relationship of the Igbos with their British administrators has been tumultuous and complicated to say the least.

The infinity of possibilities that language exhibits enables it to capture the adaptability of man and prove that language is essentially an intricate form of expression that is in a constant state of metamorphosis. Cultures around the world change with the change of individual choices; language, being a part of culture, too changes with the change of culture.

The potency of a language is determined by its speakers. The evolution of a language is traced by the study of its native speakers and how they communicate within their communities. Linguist Steven Pinker argues that

communication is “rooted in our development as individuals, but also in the history of our language community.” (24) The present article is a study of one such speaker, Chinua Achebe, whose decisions about his language have helped shape the outcome of his native Igbo language as well as that of the English language. Since, Achebe has chosen the written word over the spoken as medium of linguistic and social reform, the analysis will rest on the close reading of one of his written text rather than perusal of his oral statements.

Achebe displays a sense of fearlessness in the statement of his purpose and an intention to deliberately engage his culture and international audience alike. It was with this determination that he wrote his first novel, *Things Fall Apart* (1958), with an aim to subvert and disrupt the prevailing notions of African servitude. He stated in reference to *A Man of the People*,

I wanted the novel to be a denunciation of the kind of independence we were experiencing in postcolonial Nigeria and many other countries in the 1960s, and I intended it to scare my countrymen into good behavior with a frightening cautionary tale. (Achebe 43)

The purpose of his writings is to shake up his audiences and countrymen with his voice before he allows them to sink into general apathy or stupidity.

The overwhelming success of *Things Fall Apart* has earned Achebe both acclaim and criticism. Whereas his writings have catapulted him into a transcendental position in both the Western and African literary canons, his use of English language as his medium of expression has earned him much criticism from his fellow writers and critics alike. As far as the novel is concerned, critics have invariably agreed that the novel describes “the effect of British missionaries and administrators on a typical village tribal society; the dislocation that change, religious and educational, brings to historic certainties” (Povey 254), and that it does so with a “tragic objectivity”. (Ravenscroft 9) The novel is greatly admired by its readers for its realistic depiction of Igboland, its rich symbolism, metaphor, imagery and the lessons it teaches about community and the convergence of cultures. Despite of using the usurping British tongue, Achebe successfully betrays a wholly African perspective on the English novels retains a leitmotif of African tribalism and betrays his multilingual abilities through an extensive use of the Igbo vocabulary.

Achebe’s decision use the hegemonic British tongue to espouse the native narrative has led to questions over his allegiance to his homeland and his beliefs about colonialism. Ngugi Wa Thiong’O’s disappointment with the African acceptance of English is discernible when he writes that “it is the final triumph of a system of domination when the dominated start singing its virtues.” (20) For Ngugi, Achebe’s choice of language was a loss of the African identity and culture. But, it would go without saying that Achebe’s *Things Fall Apart* proves Ngugi’s concerns as unfounded and that an African writer can retain his culture and belief while still writing in English for practical purposes.

In *Home and Exile*, Achebe makes a powerful statement, “until the lions produce their own historians, the story of the hunt will glorify only the hunter.” (73) The statement is an embodiment of Achebe’s life and works and the force that drives his conscious and subconscious language attitudes. Achebe is a historian, albeit self-elected. He is the narrator of the Igbos in particular and the Africans in general, narrating the story of the lion in the language of the hunter. It is quite sure that Achebe knew the risks of writing in the English language but despite this, he wrote *Things Fall Apart* with an intention to allow the western reader to be a partaker as well as a reveler in the African language and lifestyle. What follows is Achebe’s use of language to achieve his aim.

Chinua Achebe succeeds in using the narrator as the most potent tool to express African identity and reality in *Things Fall Apart*. In fact, Achebe’s concern as an African writer was the proper representation of Africa and its people. Achebe was very critical of Joseph Conrad and his depiction of the African nation and its people, so much so that he even called Conrad “a bloody racist”. (Achebe 328) Achebe accused Conrad of choosing “the role of purveyor of comforting myths”. (325) According to him, Joseph Conrad had rather enforced the European stereotypes that existed in the early twentieth century rather than representing Africa and its people in an appropriate manner. *Things Fall Apart* is the result of Achebe’s will to counter Joseph Conrad’s *Heart of Darkness* and to write a story that appropriately reflects his country, tribe and his people. The omniscient narrator is responsible for bringing the novel to life in *Things Fall Apart*, and by doing so in an objective manner. He encourages the readers of the novel to come to their own opinions about the African story.

The narrator is the chronicler of the disintegrating Igbo society and as such he is an insider of the Igbo community, omniscient but objective. Achebe allows the narrator to reveal his own personal observations about the Igbo way of life and their traditions and customs. The status of the narrator as an insider is revealed right from the outset of the novel as he captures the rise to fame of Okwonko as well as the physical changes that he has undergone in a span of twenty years, “that was many years ago, twenty years or more, and during this time Okwonko’s fame had grown like a bushfire in harmattan. He was tall and huge, and his bushy eyebrows and wide nose gave him a very severe look.” (Achebe 3) Such an intimate observation can only be given by an insider who is familiar with the characters involved. The narrator of the novel is established as a reliable spokesperson for Okwonko and his tribesman by virtue of his familiarity with the tribe and its people [characters].

The distinctly African style of narrative that the narrator used to detail the food and religion of the Igbo community and its tradition further confirms his native stature. The details of about yam foo foo as being the chief food in celebrations allow the readers to envisage a realistic African ritual:

yam foo foo and vegetable soup was the chief food in the celebration. So much of it was cooked that, no matter how heavily the family ate or how many friends and relations they invited from neighboring villages, there was always a huge quantity of food left over at the end of the day. The story was always told of a wealthy man who set before his guests a mound of foo-foo so high that those who sat on one side could not see what was happening on the other, and it was not until late in the evening that one of them saw for the first time his in-law who had arrived during the course of the meal and had fallen to on the opposite side. (Achebe 23)

The African’s appreciation for words, metaphor and figurative language is reflected in this passage. Oral traditions are distinctive tribal characteristics through which the history of the tribe is passed down the generations. In this passage, Achebe captures the importance of the oral tradition in the Igbo society. The narrator is the mouthpiece of the author who speaks as a wise sage would speak to his young pupils and teaching them of the significance of food and relationships within the community.

The discussion of the narrator’s power is not complete without giving him credit for the use of gender-specific language. The feminine language in the novel enters with Okonkwo’s wives and Ezinma, his daughter. The narrator addresses the heavy handed treatment of his wives by Okonkwo at first, but his voice become softer when he describes Okonkwo’s favorite wife Ekwefi or her daughter Ezinma. The readers are taken by surprise when Okonkwo displays an unusual sympathy and follows his wife and daughter to the oracle’s cave. This episode is only one of a few verbal repartees between Okonkwo and his wife and the narrator captures it as:

Tears of gratitude filled her eyes. She knew her daughter was safe. “Go home and sleep,” said Okonkwo. “I shall wait here.”

“I shall wait too. It is almost dawn. The first cock has crowed.”

As they stood there together, Ekwefi’s mind went back to the days when they were young. She had married Anene because Okonkwo was too poor then to marry. Two years after her marriage to Anene she could bear it no longer and she ran away to Okonkwo. (65)

In the passage above, the voice of the narrator captures an intimate display of vulnerability and the African humanity that twentieth century Europeans have never seen before. The passage above reveals the trust that Ekwefi has for her husband as well as the passionate bond that they share. Two years earlier, Ekwefi had trusted Okonkwo with her life and sexuality, now, she trusts him with the life of her daughter. This dialogue between the two is the only time in the novel that captures the soft side of Okwonko. The rough Okwonko is never harsh to Ekwefi, the wife he loves and never tries to prove his strength or show off his warrior like attitude. To Ekwefi, Okwonko is simply a man, a loving husband, a caring father who wishes to protect his daughter. He not only pursues his wife and tries to persuade her to return home to safety, but also allows her to defy him and stay by his side, a similar act of defiance that once brought a beating to Ojiugo but now encourages respect for Ekwefi.

Okonkwo’s intimacy to Ezinma is further extended in the later part of the novel when they begin to interact more at home. The narrator not only captures Okonkwo’s concern for his daughter but also shows the value that he places on her daughter as an individual. Okonkwo has a soft spot for his daughter. The narrator states that Ezinma matures in beauty and character during Okonkwo’s seven years of exile. She begins to receive the attention of men in Mbanta and this makes Okonkwo sad because “he never stopped regretting that Ezinma was a girl. Of all his children she

alone understood his every mood. A bond of sympathy had grown between them as the years had passed.” (98) This vulnerability of Okonkwo lets us readers take a deeper look into the softer side of the protagonist, a side that only the narrator is privy to. The humanity of the African culture is vividly captured by the narrator and successfully establishes the African citizens as a people with a voice.

The duality of the voices and the role of the narrator is a perplexing conundrum for many scholars. In the postmodern world, the role of the writer is doubted and questioned resulting in many critics rejecting this ethnographic narrator with ties to the author. A postmodernist would reject Achebe's reflection in his work and contend that the narrative devices are established accidentally or a result of unintentional language use. It will take Cary Synder, the literary critic to counter this dilemma, arguing that the shifting narrator “from the most credulous believer to the skeptic or cultural outsider... replicates the dynamic positioning of the native anthropologist – at once part of Igbo culture and apart from it”(168). The language of Achebe should not be equated with the author by the readers of *Things Fall Apart* and should give room for the acceptance of authorial intention on the grounds of an anthropological agenda. It must be accepted that Achebe is an insider and can depict the life and culture of Igboland with authority; it should also be accepted that Achebe, as an author, skillfully crafts the Nigerian world with objectivity and grace through his particular narrative devices.

The narrator plays a prominent role in understanding *Things Fall Apart* and the African image that the novel portrays. The absence of the narrator will probably lead to two undesirable positions, either Achebe would have to write from a more personal point of view and risk being esoteric and alienate his European audience, or, the novel could have taken a more objectified and critical perspective which Achebe desperately wants to Conrad, the criticalness of his contemporary Conrad. The purpose of the novel is to portray the African as a relatable and human entity. The narrator provides Achebe with the tool that he needs to construct an artistic, objective and delicate style of writing. The narrator's familiarity of the Igbo society and his ability to look into the thoughts and actions of the characters makes him the author's tool of choice.

‘Achebe's intention to create a new African image is manifested in his use of narrative devices. The objectivity of the narrator's language enables him to capture the events of the plot and the hidden observation of the characters. Achebe's skill of using an objective narrator is praised by Hilary Dannenberg as:

It is Achebe's ability to endow his narrative with a post-binary and thus a truly postcolonial complexity which lies at the heart of the groundbreaking nature of *Things Fall Apart*. Achebe's narrator is so nimble and mercurial that he subverts all binaries. This narratorial and ideological mercuriality is achieved through the inclusion of many layers of voice, perspective and culture in the text. (176)

The most important term in this quote is “postcolonial complexity.” Achebe does not intend to solve the problems in his linguistic spectrum. He offers no solutions; he only depicts the torrid state of affairs with simplicity and realism. It is this focused and detailed description that allows European and African readers to appreciate his narrative style.

Metabolic syndrome, Osteopontin,  
 Psoriasis

#### Abstract

**Background:** Psoriasis is a systemic, chronic, and hyper-proliferative immune mediated skin disorder. Osteopontin influences cell mediated immunity and plays an important role during both acute and chronic inflammation.

**We aimed** to assess metabolic syndrome and osteopontin and their associated systemic comorbidities in patients with psoriasis.

**Subjects and methods:** The study included 48 subjects: 24 patients of psoriasis of any age, both sexes with different grades of disease severity. Severity was assessed by psoriasis area and severity index (PASI) score. Their mean age was (33.25±12.9), 13 of them were females (54.2%) and 11 were males (45.8%). In addition to 24 healthy control group, 15 females (62.5%) and 9 males (37.5%). Their mean age was (31.63 ± 16.52). Clinical, demographic evaluation and dermatological examination of the psoriatic lesions (site of the lesion, morphology and progression of the disease and severity) was performed in addition to serological testing of serum OPN level, total cholesterol, low-density lipoprotein cholesterol, high-density lipoprotein cholesterol, triglyceride, and fasting blood glucose (FBG).

**Results:** psoriatic cases showed elevated body mass index, FBG, serum osteopontin, cholesterol, triglycerides and low density lipoprotein cholesterol and decreased levels of high density lipoprotein cholesterol than normal control. Metabolic syndrome and hypertension representing 25% and 41.6% respectively of psoriatic cases. In psoriatic cases, psoriasis area and severity index (PASI) score, had significant positive correlation with obesity, blood pressure, FBG, dyslipidemia, but no correlation with age, disease duration. Serum OPN had positive correlation with age, blood pressure but no correlation with BMI, disease duration, FBG or dyslipidemia.

**Conclusions** Psoriatic patients have a high prevalence of metabolic syndrome. High level of OPN can be used as an early detector of cardiovascular problems in psoriatic patients and this inflammatory cytokine can be used as a new target in the treatment of psoriasis.

## Introduction:-

Psoriasis (PS) is a systemic, chronic, relapsing and hyper-proliferative immune mediated skin disorder. It affects 1-3 % of the world population and its prevalence is highly variable, depending on ethnicity and climate. It is characterized by inflammatory skin and joint manifestations [1].

Psoriasis results from interaction between genetic predisposition and large spectrum of environmental factors that triggers the development of skin lesion. T-helper (Th) 1 and Th17 mediated inflammation have been proposed to be pathologically essential in psoriasis [2].

Metabolic syndrome (Met.S) is a clinical entity comprising risk factors such as hypertension, glucose intolerance, hyperlipidemia, abdominal obesity and increased inflammatory state. Psoriasis patients may similarly predispose for those inflammatory disorders. Experimental and epidemiological studies have linked certain interleukins, cytokines and hormones with cardiovascular disease (CVD). Metabolic syndrome (Met.S), obesity and DM, making psoriasis at risk in developing systemic comorbidities [3].

Osteopontin (OPN) is phosphorylated sialic acid –rich non-collagenous bone matrix protein. OPN is found in several biological fluids including human plasma, serum, breast milk and urine. It was named for its function as a bridge between cells and minerals. OPN has been implicated as an important factor in bone remodeling and expressed in immune cells, including macrophages, neutrophils, dendritic cells with varying kinetics [4]. Osteopontin influences cell mediated immunity and has Th 1 cytokine functions and is overexpressed in cancers of lung, breast, colorectal, stomach and ovary and found in atheromatous plaques within arteries. OPN plays an important role during both acute and chronic inflammation and is upregulated in tissues during several pathological processes including atherosclerosis, valve stenosis, myocardial infarction and rheumatic arthritis [5].

Psoriasis is associated with cardiovascular comorbidities, possibly due to overall systemic inflammation. There is increased risk for atrial fibrillation, atherosclerosis, coronary artery calcification, type 2 diabetes, dyslipidemia, hypertension, obesity, peripheral vascular disease, myocardial infarction, stroke, and cardiac death. Also systemic treatments for psoriasis include cyclosporine, methotrexate, retinoids, and biological drugs have adverse cardiovascular (CV) effects. Inflammation may be a prime factor in linking psoriasis to atherosclerosis. The two conditions share many similarities, both psoriasis and atherosclerosis are mainly mediated by T-helper (Th) 1 cells and characterized by a systemic overexpression of adhesion molecules, inflammatory markers, and neo-angiogenesis factors [6].

Osteopontin promoting the migration and activation of human DC and enhanced proliferation of vascular smooth muscle cells. Osteopontin expression increases under a variety of conditions of heart diseases and is associated with increased myocytic apoptosis and myocardial dysfunction [7].

Plasma OPN levels are higher in patients with coronary artery disease and have been correlated with its severity. Furthermore, plasma OPN has been reported to be a potential clinical marker for the prediction of atherosclerosis and further adverse cardiac events in patients with essential hypertension and patients with chronic stable angina. Osteopontin has also been implicated in the process of pathological vascular calcification. Increased osteopontin expression has been demonstrated in calcified human atherosclerotic plaques [8].

We aimed to assess metabolic syndrome and osteopontin and their associated systemic comorbidities in patients with psoriasis

## Patients and Methods:-

This study was carried out at the outpatient clinics of Dermatology, Venerology and Andrology and Internal Medicine Departments, Faculty of medicine of Zagazig University, in the period from March 2015 till March 2016. The study had the approval of The Institutional Review Board (IRB) at Zagazig University, Egypt.

## Subjects:-

The study included 48 subjects: 24 patients of newly diagnosed psoriasis of any age, both sexes with different grades of disease severity, different clinical presentations. Severity was assessed by Psoriasis area and severity index (PASI) score, 13 of them were females (54.2%) and 11 were males (45.8%). Their ages ranged 10-60 year with a mean

(33.25±12.9) . In addition to 24 control group, 15 females (62.5%) and 9 males (37.5%). Their ages ranged 10-70 with mean (31.63 ± 16.52).

#### **Exclusion criteria:-**

Patients receiving any systemic treatment for psoriasis for at least 2 months before inclusion in the study. Also we excluded alcohol consumers, smokers, patients on lipid lowering medications, corticosteroids or immunosuppressive drugs, respiratory, hepatic or renal diseases and also patients with thyroid dysfunction.

#### **Methods:-**

They consented to be included in the study. In addition to full history, physical examination was performed with stress on weight, height and body mass index (BMI) which was calculated by dividing weight (kg) by height in squared meters (m<sup>2</sup>). Dermatological examination of the psoriatic lesions (site of the lesion, morphology and progression of the disease and severity).

Assessment of disease severity: According to **Matteo and Michela, (2013) [9]**: Psoriasis area and severity index (PASI) score is a three point disease activity score that has been used to grade the disease severity. The score assesses four body regions: the head (H), the upper extremities (U), the trunk (T) and the lower extremities (L) corresponding to 10%, 20%, 30% and 40% of the total body surface area respectively. According to the extent of the lesion, each area of psoriasis involvement is given a numerical value (0 - 6) corresponding to the following scale. The PASI result is a score for psoriasis severity ranges from 0 (no disease) to 72 (maximal disease) according to **Langley and Ellis, 2004 [10]**.

#### **Procedure:-**

##### **Serological evaluation:-**

Venous blood samples (5ml) were collected under sterile conditions from all subjects to estimate serum OPN level by enzyme linked immunosorbent assay (ELISA) technique using a kit based on the principle of double-antibody sandwich technique and also to estimate lipid profile and FBS.

##### **Sample Collection and Storage:-**

Using a serum separator tube (SST), five ml of the blood sample was left to clot for 20 minutes at room temperature then subjected to centrifugation for 20 minutes at approximately 2000-3000 rpm to separate the serum. The serum samples were removed using a sterile pipette and stored at -70°C until assayed.

##### **Test principle:-**

The kit used a double-antibody sandwich enzyme-linked immunosorbent assay (ELISA) to assay the level of human osteopontin (OPN) in samples. We add osteopontin (OPN) to monoclonal antibody enzyme which is precoated with human (OPN) monoclonal antibody, incubation, then we add (OPN) antibodies labeled with biotin and combined with streptavidin-HRP to form immune complex, then carry out incubation and washing again to remove the uncombined enzyme. Then we add chromogen solution A, B, the colour of the liquid changes into the blue and at the effect of acid, the color finally becomes yellow. The chroma of the color and the concentration of the human substance (OPN) of sample were positively correlated.

The specific kit reagents used in the test were supplied from PELOBIOTECH GmbH – Am Klopferspitz 19 – 82152 Planegg - Germany.

##### **Statistical analysis:-**

The data were tabulated and statistically analyzed using Microsoft Office Excel 2010, and Statistical Package for Social Sciences version 20 (SPSS: An IBM Company). Data were represented as Mean ± SD, and were analyzed statistically by using analysis of variance (ANOVA), Chi-squared test (X<sup>2</sup>), paired T test and correlation coefficient (r). Values were considered significant if p < 0.05.

#### **Results:-**

Demographic and laboratory characteristics of patients and control groups are described in **Table (1)**: We found no statistical difference in age and sex distribution between groups. But there was significantly elevated body mass index (BMI) in psoriatic cases. Mean duration of disease was 7.92 ± 8.06, mean psoriasis area and severity index

(PASI) score was  $16.31 \pm 12.09$ . Metabolic syndrome was present in 25% of psoriatic cases compared to 12.5% of control group, hypertension was present in 41.6% of psoriatic cases compared to 20.8% of control group but the difference was insignificant.

**Table (2):** The level of FBG in cases was higher than that of control, but without statistically significant difference. There were significantly elevated levels of osteopontin, cholesterol, TG and LDL and significantly decreased levels of HDL in patients with psoriasis than control.

**Table (3), Fig. 1:** In the psoriasis group, PASI score had no significant correlation with age or disease duration, but PASI score had significant +ve correlation with obesity (BMI), systolic & diastolic blood pressure, FBG, dyslipidemia, (elevated cholesterol & TG & LDL) and significant -ve correlation between PASI score and HDL. In **Table (3), Fig. 2:** in the psoriasis group, serum OPN had significant +ve correlation with age, systolic and diastolic blood pressure. Serum OPN had no significant correlation with BMI, disease duration, FBG, cholesterol, TG, LDL and HDL.

### Discussion:-

Psoriasis is a chronic inflammatory immune-mediated disease affecting approximately 1-3% of the general population. Psoriasis is not just a disease of skin and joints, but also is a systemic disease that is connected with a range of comorbidities especially metabolic syndrome and cardiovascular diseases (CVDs) [11].

This dermatosis is considered to be a T-cell mediated disease with active hyperproliferation of keratinocytes and abnormal vascular expansion within the superficial dermis. This expansion is mediated by angiogenesis, an active vaso-proliferative process which appears to be a key inflammatory response early in the pathogenesis of psoriasis [12]. There is a number of Th lymphocyte subsets that have been detected in psoriatic lesions. Earlier reports indicated that activated Th1 cells in psoriatic lesions that produce  $IFN\gamma$ ,  $TNF\alpha$  and IL-2 were mainly involved in the pathogenesis of psoriasis [13].

Osteopontin is a phosphorylated acidic glycoprotein of pleiotropic properties and has been recently recognized as a potential inflammatory cytokine having a role in many diseases. OPN is produced by different cell lines and binds to several integrin receptors and is known to induce cell adhesion, migration, and survival of immune cells including neutrophils, macrophages, T cells, mast cells, and osteoclasts [14]. Secreted OPN appears to have a role in the development of psoriasis through inhibiting keratinocyte apoptosis, thereby supporting enhanced epidermal proliferation. OPN promotes vessel formation subsequently supporting the influx of inflammatory cells. OPN has a pro-angiogenic effect on microvascular endothelial cells, and has been involved in the onset of angiogenesis through a mechanism mediated by IL-1 [15]. Moreover, there are reports suggest that OPN and MMP-9 may be regulated by  $TNF\alpha$ , indicating that they may have a role in the pathogenesis of psoriasis [16].

Metabolic syndrome (Met.S) is a clinical entity comprising risk factors such as hypertension, glucose intolerance, hyperlipidemia, abdominal obesity and increased inflammatory state [17]. According to NCEP-ATP III (National Cholesterol Education Program Adult Treatment Panel III) metabolic syndrome involves 3 or more of the factors: Fasting plasma glucose  $\geq 110$ , Blood pressure: systolic  $\geq 130$  & diastolic  $\geq 85$ , Triglycerides (mg/dl)  $\geq 150$ , HDL-c (mg/dl): male  $< 40$  & female  $< 50$ , Central obesity (waist circumference): male  $> 102$  cm & female  $> 88$  cm.

We aimed to assess metabolic syndrome and osteopontin and their associated systemic comorbidities in patients with psoriasis.

In our study, FBS level was found to be non-significantly more in psoriatic cases rather than control. Cholesterol, LDL-c, TG levels were significantly elevated, and HDL-c levels were lower in psoriatic cases than control. Also

obesity was found to be statistically higher in psoriasis than control. Severity of psoriasis had significant positive correlation with obesity, FBS, dyslipidemia and hypertension.

According to the results of our study, psoriasis is positively associated with metabolic syndrome, and patients with more severe psoriasis were exposed to have metabolic syndrome than those with milder psoriasis. This result is consistent with **Armstrong et al., 2013 [18]** as they found that metabolic syndrome and its components was found to be more among subjects with psoriasis, and that patients with advanced psoriasis have greater odds of metabolic syndrome than those with milder psoriasis.

Psoriatic patients have a high prevalence of the Met.S. Psoriasis as a chronic inflammatory skin disorder is characterized by a variety of immunologic and inflammatory changes and may similarly predispose for those inflammatory disorders. This could likely be due to the effects of chronic inflammatory changes, in particular, the secretion of proinflammatory cytokines [19].

Chronic systemic inflammation induces endothelial dysfunction, altered glucose metabolism, and insulin resistance that play a significant role in the development of obesity, diabetes mellitus, dyslipidemia, and cardiovascular disease such as atherosclerosis and myocardial infarction or stroke [20]. On assessing the components of Met.S, psoriasis continues to stand as an independent risk factor with respect to altering levels of glucose tolerance and dyslipidemia. Subjects with psoriasis have a higher percentage of known DM. Patients with psoriasis have also an increased insulin resistance and probably worse impaired glucose tolerance, therefore a higher risk of diabetes [21].

Cytokines such as tumor necrosis factor (TNF)-alpha and interleukin-6 (IL-6) seem to play a central role. TNF- $\alpha$  plays a critical role in activation of innate and acquired immune responses leading to chronic inflammation, tissue damage and keratinocyte proliferation. TNF- $\alpha$  levels are markedly increased in skin lesions, synovium and serum of patients with psoriasis and these correlate with the severity of the disease. Decreased levels of TNF- $\alpha$  are associated with clinical resolution [22].

TNF- $\alpha$  may lead to insulin resistance by inhibiting insulin mediated tyrosine phosphorylation of the insulin receptor, as well as insulin receptor substrate-1. TNF- $\alpha$  has also been shown to be a potent activator of C-Jun amino-terminal kinase, which stimulates activator protein-1, a major regulator of pro-inflammatory activity and is connected with obesity [23]. Mouse models show that c-Jun amino-terminal kinase activity is abnormally elevated in obesity, while its absence is associated with decreased adiposity, improved insulin sensitivity and enhanced insulin receptor signaling [24].

We found that there was significant dyslipidemia in psoriatic cases than normal control. It was reported that macrophages activated by engulfing low density lipoprotein (LDL) immune complexes release large quantities of TNF- $\alpha$ . Treatment with TNF-inhibitors affect the increase of HDL levels, decreased LDL and triglyceride levels and strongly recommended the use of anti-TNF- $\alpha$  modalities, adalimumab and infliximab, for the treatment of obese psoriatics and suggested that anti-TNF- $\alpha$  treatment might prevent cardiovascular diseases in psoriasis [25].

Furthermore, interleukin-6, IL-8, Interferon - $\gamma$ , IL1, and IL-17 are also implicated in the generation of pro-atheromatous abnormalities like dyslipidemia, insulin resistance, endothelial dysfunction, clotting system activation, and pro-oxidative stress. TNF- $\alpha$  may affect endothelium dysfunction by decreasing the levels of nitric oxide synthase and cyclooxygenase-1 [26].

C-reactive proteins [27] and cellular oxidative stress [28] may also be responsible for altered lipid metabolism. Anti-psoriatic drugs such as oral retinoids and cyclosporine, can be also responsible for lipid profile disturbances in psoriatic patients because of their action on the circulating lipids. Including hypercholesterolemia, hypertriglyceridemia and low HDL-cholesterol [29].

Hypertriglyceridemia secondary to VLDL elevation is associated with both procoagulant and prothrombotic factors in the blood and affects the adhesiveness of platelets. Resting platelets circulate freely, adhering neither to each other nor to other cells. However, activated platelets adhere to all lipoproteins, especially VLDL. VLDL mediated platelet adhesion may play an important role in the progression of atherosclerosis. Furthermore, VLDL remnants are susceptible to retention within the arterial intima and thereby promoting atherosclerotic plaque growth [30, 31].

Regarding OPN, our study found significantly elevated serum OPN in psoriatic patients than in healthy controls. Also **Robati et al., 2016** [31] found higher levels of serum osteopontin in psoriatic patients than in healthy controls. That elevated serum levels of osteopontin in our study were positively correlated with increasing age. **Cheng et al., 2008** [6] noticed that, the level of OPN increased with increase of age. In our study plasma osteopontin values were not associated with sex, severity of psoriasis, duration of the disease or dyslipidemia. **Cheng et al., 2008** [6] reported the same result that, plasma OPN levels were not associated with sex, duration of the disease, disease severity or dyslipidemia.

**Tossi et al., 2015**, [32] measured serum levels of selenium, prolactin and osteopontin in both psoriasis and healthy control groups, there was no significant difference in selenium and prolactin levels between the two groups, but OPN was significantly high in psoriasis group. Lesional skin of psoriatic patients showed significant elevated OPN levels in comparison to controls [33, 34]. In psoriasis, OPN secreted by keratinocytes inhibits keratinocyte apoptosis, thereby supporting enhanced epidermal proliferation, OPN acts as a pro-inflammatory agent that participates in the up-regulation of Th cell lineages, among which are the Th1 and Th17 cells. OPN secreted by keratinocytes, possibly stimulated through IFN  $\gamma$  from T-cells and OPN from effector T cells attract additional inflammatory cells [15].

The relationship between the inflammatory cells present in psoriasis and OPN expression might be one of the responsible factors, where the environment is rich in inflammatory cells, such as macrophages, natural killer cells and T lymphocytes, which are known to be among the cells responsible for the expression of OPN [35].

Osteopontin is involved in the onset of angiogenesis which is considered as a corner stone in the psoriatic story. OPN expressed in inflammatory cells and endothelial cells of psoriatic patients. Its pro-angiogenic effect on microvascular endothelial cell is through promoting vessel formation subsequently supporting the influx of inflammatory cells [36].

The matrix metalloproteinase (MMP)-9 induced by OPN and TNF $\alpha$  acts as an angiogenesis promoting factor [37]. One study had demonstrated that OPN expression seems to be related to the CD34 expression, angiogenesis marker, expressed in the endothelial cell of psoriatic lesions skin [33].

In our study, elevated plasma OPN levels were found to be significantly associated with hypertension, but not significantly associated with fasting blood glucose. In agreement with us, **Cheng et al., 2008** [6] found that elevated OPN levels were significantly associated with hypertension but not significantly positively correlated with DM in psoriatic patients. Another study **Robati et al., 2016** [31] found higher levels of plasma OPN and mean intima-media wall thickness of the common carotid artery in psoriatic patients than healthy control and this supports increased cardiovascular risk in psoriatic patients and the possible role of OPN.

OPN was found to be expressed in smooth muscle cells in the atherosclerotic lesion in angiogenic endothelial cell and macrophages. OPN modulates proliferation, migration and accumulation of smooth muscle cells and endothelial cell involved in repair and remodeling processes of the vasculature. Osteopontin expression increases under a variety of conditions of the heart diseases and is associated with increased myocyte apoptosis and myocardial dysfunction [7]. Plasma OPN levels are higher in patients with coronary artery disease and have been correlated with its severity. Furthermore, plasma OPN has been reported to be a potential clinical marker for the prediction of atherosclerosis and further adverse cardiac events in patients with essential hypertension and patients with chronic stable angina [38].

In our results, we found non significant positive correlations between plasma OPN and severity of psoriasis. On the contrary, **El-Eishi et al., 2012** [35] found positive correlation between plasma OPN and psoriasis severity and found that plasma OPN was associated with the presence of metabolic syndrome components.

### Conclusion:-

Psoriatic patients have a high prevalence of the metabolic syndrome. OPN involvement in psoriasis enlarges the list of cytokines able to stimulate the inflammatory response in this disease. OPN is involved in the pathophysiology of psoriasis, in the onset and worsening of psoriasis and lastly a possible association with disease severity. High level of OPN is correlated also with cardiovascular risks in psoriatic patients. The possibility of using this inflammatory cytokine as a new target in the treatment of psoriasis, anti-OPN antibodies, may eventually become a useful therapeutic

approach in psoriasis. OPN may be used as early detector of cardiovascular problems in psoriatic patients and as a new target in decreasing cardiovascular risks in those patients.

### Abstract

Lamotrigine (LTG), an antiepileptic drug believed to be safe in pregnancy whereas *Cynodon dactylon* (CD) is a herb having antioxidant potential, used for the treatment of various diseases including epilepsy in alternative system of medicine. The study was planned to observe the effect of LTG alone and with *Cynodon dactylon* on growing brain of mice. Lamotrigine was given orally at a dose of 60mg/kg body weight on 7<sup>th</sup>- 9<sup>th</sup> gestational day, to the pregnant mice of treated group I (T I) whereas both Lamotrigine (60mg/kg, 7<sup>th</sup>- 9<sup>th</sup> day) and *Cynodon dactylon* juice (0.3 ml, 6<sup>th</sup>-17<sup>th</sup> day of gestation) were given to treated group II (T II). Control group (C) received the same volume of distilled water during 6<sup>th</sup>-17<sup>th</sup> day of gestation. On 18<sup>th</sup> day of gestation fetuses from all groups were collected and kept in 10 % formalin for fixation. After three days of fixation the brains were removed from the cranial cavity and observed macro and microscopically. Brain of T I group showed insignificant decrease in weight. The haemorrhagic patches and the prominent blood vessels on various surfaces of brain have been observed in T I group. The macroscopic findings in T II group brain were similar to the control group. The microscopic features of T I brain revealed destruction and oedematous appearance of parenchyma of hippocampus, loss of normal architecture of cortical and subcortical zone, dilated ventricles with disruption of ependymal lining, degeneration and clumping of choroid plexus as compared to control group. Treated group II showed reduction in pathological findings which were appeared in treated group I. Therefore there may be possibility that *Cynodon dactylon* (CD) fresh juice neutralised the effect of lamotrigine neurotoxicity in growing brain upto certain extent. This may happened due to antioxidant property of CD.

### Introduction:-

Lamotrigine (LTG) [3,5-diamino-6(2,3dichlorophenyl)1,2,4triazine], is an anticonvulsant drug used in the treatment of epilepsy and bipolar disorder in the United States as an adjunctive treatment since 1994 and as monotherapy since 1998 (Goel P et al, 2012). Lamotrigine is used frequently in pregnancy as many workers claimed its malformation rate same as in normal population (Vajda et al, 2006; Richens A., 1994) but others found LTG to produce intra uterine growth retardation and other congenital malformations (Padmanabhan et al, 2003; Morrow et

**Corresponding Author:- Sharda Singh.**

Address:- Department of Anatomy, Institute of Medical Sciences, Banaras Hindu University, India.

al, 2006) and a few studies reported that LTG possess teratogenic action on fetal brain (Marchi et al, 2001; Manent et al, 2008; Mohanty et al, 2011). *Cynodon dactylon* (CD) is a herb having antioxidant property, used in treatment of various diseases including epilepsy in ayurvedic system of medicine. The present experimental study was conducted to observe the effect of *Cynodon dactylon* fresh juice on the teratogenic changes in foetal brain, induced by lamotrigine.

### Materials and Methods:-

**Experimental animal:** Pregnant Swiss albino mice were used as experimental animal for the present study, each weighing 20-25 g. Mice were caged in air conditioned animal house of Department of Anatomy, Institute of Medical sciences, Banaras Hindu University, Varanasi, India.

### Methods:-

Female mice were transferred to cage containing adult males of proven fertility overnight for mating and were inspected next morning for the presence of vaginal plug. The day of vaginal plug positive was considered as gestational day (GD) 0. Pregnant mice were divided into two groups (6 mice in each group), i.e. Control and treated. The treated group further subdivided into two i.e. treated group I (T I) and treated group II (T II). T I group was given Lamotrigine, orally through gavage tube at a dose of 60mg/kg body weight from GD 7 to 9. T II group were treated with 0.3 ml of *Cynodon dactylon* extract (fresh juice) from day 6 to 17, as well as lamotrigine from 7 to 9 day of gestation. *Cynodon dactylon* extract is freshly prepared everyday by dissolving calculated amount of lyophilized juice in distilled water. Control group was given distilled water for same duration through same route. On the 18<sup>th</sup> day of gestation the mice were sacrificed by cervical dislocation. The foetuses were collected by laparotomy and fixed in 10 % formalin for 2 to 3 days. After fixation, the brain were removed from the cranial cavity and examined for gross abnormalities, if any, then weight was measured and finally the organ was processed for microscopic study. The study protocol was approved by animal ethical committee, BHU. All procedures were in accordance with the guidelines of the Animal Welfare Act. Statistical analysis was done by using one way ANOVA to compare the mean weight of control and treated brains of different groups.

### Results:-

As compared to control group, the brain of both T I and T II showed reduction in weight, that was statistically insignificant. The mean weight of the control group was 0.0614 g (SD .0127), whereas in T I group 0.0599 g (SD = 0.0062) & in T II group .0604 (SD =.0045). On macroscopic examination the outer surface of the growing brain of T I group revealed prominent dilated blood vessels and haemorrhagic patches, whereas T II group showed the normal appearance of the brain as shown in control group (Fig 1). There was no significant difference in the length and breadth of any group of brain. On microscopic examination hippocampus and cortical zones showed the normal layering pattern in control group whereas T I group revealed destruction of hippocampal region and cortical zone along with oedematous appearance. T II group showed the less destruction of the normal pattern of the layering and disappearance of the oedematous spaces (Fig. 2, Fig.3). In higher magnification the cells of the cortical zone of T I showed the proliferation of the immature growing cells whereas in T II there was no any indication of proliferation of cortical cells but degenerative changes has been observed (Fig. 4). The ventricle of T I group revealed dilatation, destructed choroid plexus and thickening of proliferated immature growing cells in the periventricular area whereas the T II group showed the appearance of ventricle and periventricular area as in control group (Fig.5). In higher magnification the T I group showed the destructed ependymal lining of the ventricle along with the disintegration of choroid plexus whereas T II group showed the of lining ependymal layer of the ventricle at few places as compared to control group.

### Discussion:-

The present study was mainly focussed on the effect of *Cynodon dactylon* on teratogenic action induced by LTG in growing brain. The mean weight of brain was found decreased in T I group as compared to control, although it was not statistically significant. Haemorrhagic patches on the surfaces of brain and prominent dilated blood vessels, especially on basal surface were also seen in the present study. Mohanty et al, (2011) observed that the brain weight of growing foetuses exposed to LTG was found increased but, not significant statistically. They also reported that some of the LTG exposed foetus had well defined dark brown swellings over parieto-occipital region of head (exencephaly) and hemorrhages of various sizes over the body (C. Mohanty et al, 2011). The mice brain was used for the present study whereas rat brain was used for the previous study. Marchi et al, (2001) mentioned that fetuses of the LTG treated group had reduced body weight at birth, increased volume and diameter of the cerebral structure

(Marchi et al, 2001). Another study also reported no significant difference in mean brain weight and mean brain volume in control and experimental rat fetuses (Sah N et al, 2013). Further it was observed in the same report that one of the lamotrigine exposed rat fetus had exencephaly whereas no any such case was found in the present study. Microscopic study in present work showed derangement of architecture and interruptions in the continuity of the cortical layers, oedematous appearance in subcortical and periventricular zone, dilatation of ventricles and disruption of ependymal lining along with destruction and clumping of choroid plexus have been observed in the brain of treated group I fetuses. A similar finding was reported by Marchi et al (2001), who revealed that the use of lamotrigine during the organogenesis period was associated with histological alterations. They analyzed cortex, subcortex, ependyma and lateral ventricles in their study on rat brain, after giving LTG on 9-11 day of pregnancy. Their results revealed the subcortical density enhancement, and ventricle dilatation (Marchi et al, 2001). In another study it was observed that the LTG treated growing brain showed dilated ventricle with less differentiated cortical layers (C. Mohanty et al, 2011). Treatment of pregnant wistar rats with a high dose of LTG (20 mg/kg/day) resulted in clear morphological alterations in the parietal cortex and in CA1 and CA3 hippocampal field (Manent et al, 2008). Histological study of the cerebral cortex revealed ill defined plexiform layer and dilated lateral ventricle (Sah N et al, 2013). Excess oxidative stress may be one of the mechanisms that contribute to teratogenicity. The nervous system is particularly vulnerable to the deleterious effects of reactive oxygen species (Puchchakayala G, 2012). *Cynodon dactylon* has been proved for its neuroprotective activity against aluminium induced toxicity (Sumathi T et al, 2011). The methanolic extract of *Cynodon dactylon*, given orally was found to significantly increase the levels of superoxide dismutase, catalase and NADH dehydrogenase in comparison with the control group (Manju Bhaskar et al, 2015). *C. dactylon* has been proved to inhibit lipid peroxidation in CNS (Auddy B et al, 2003; Rai PK, 2010). Correlating our findings with the previous works we can interpret that free radical scavenging activity of *Cynodon dactylon* may be the responsible for the prevention of oxidative stress induced teratogenicity. Goodman et al, 1996 showed that pre-treatment with either estrogen or progestins could prevent excitotoxic and oxidative stress injury and enhance cell survival in cultures of embryonic hippocampal neurons. Roof, R.L. et al. 1992 have been showed that the high endogenous levels of progesterone in female rats dramatically reduced cerebral oedema. So the alternative hypothesis responsible for the neuroprotective effect of CD in LTG induced abnormalities growing brain might be presence of steroids in it.

### Conclusion:-

Lamotrigine treatment followed by supplementation of *Cynodon dactylon* resulted in reduction in macro and microscopic neuropathological findings. It is therefore possible that the antioxidant activity of *Cynodon dactylon* neutralised the effect of lamotrigine induced changes in various parts of growing brain and helps to prevent the teratological changes in brain cell and tissue.

#### Abstract

We describe a case of a 25-year-old pregnant woman who presented with severe primary pulmonary hypertension (PPH). Her echocardiogram showed severe right ventricular hypertrophy with dilatation and Moderate right ventricular systolic dysfunction. Right ventricle systolic pressure (RVSP) was estimated to be 125 mmHg. She had an elective caesarean section under general anaesthesia at 32 weeks of gestation. Pulmonary artery pressures measured by a pulmonary artery catheter before anaesthesia were 102 mmHg and pulmonary vascular resistance was 429. Intraoperative nitric oxide was used to reduce pulmonary artery systolic pressure (PASP). After the delivery of a healthy infant, PASP was controlled with nebulized iloprost and silandafil. Five days later she was transferred from intensive care unit after she was started on silandafil 50 mg three times daily and a small dose of warfarin.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Introduction:-

The mortality rate of primary pulmonary hypertension (PPH) complicating pregnancy is very high [1] and [2]. The only long-term 'cure' is a heart-lung transplant. Increased pulmonary vascular resistance combined with the normal physiological changes of pregnancy and delivery is difficult to manage. A successful outcome has been described following general anaesthesia for caesarean section in a woman with PPH and coarctation of the aorta [4]. We describe in this report the management of a pregnant lady with severe PPH delivered successfully with elective caesarean section under general anaesthesia.

#### Case report:-

A 25-year-old primigravida presented at 32 weeks of gestation with one month history of progressive dyspnea associated with central localised chest pain, palpitation and mild intermittent cough. There was no significant past medical history.

On examination she was tachypneic and tachycardic. Arterial pressure was 100/60 mmHg. She had signs of right ventricular overload including elevated jugular venous pressure (14 cm above sternal angle), lower limb edema and right parasternal heave. On auscultation she had an accentuated pulmonary component of the second heart sound and a pan systolic murmur of tricuspid regurgitation.

ECG showed right heart strain pattern, and chest radiograph showed a prominent right heart silhouette with prominent pulmonary arteries.

An echocardiogram showed severe right ventricle (RV) dilatation and hypertrophy (RVH) with moderate RV systolic dysfunction in addition to a huge right atrium (RA), Figure 1 and Figure 2, and severe tricuspid regurgitation (TR). Right ventricle systolic pressure (RVSP) was 125 mmHg (Fig. 3) with no evidence of left to right shunt with negative contrast injection. Left side of the heart was normal.

**Figure 1:-**Severe right ventricle and right atrium dilatation.

Figure options

**Figure 2:-**Severe right ventricular dilatation with right ventricular hypertrophy. Flattening of interventricular septum in systole indicating significant right sided pressure overload.

Figure options

**Figure 3:-** Severe Tricuspid regurgitation with peak TR velocity of (5.5 m/s) with high right ventricular systolic pressure (RVSP) of 125 mmHg.

#### Figure options

A ventilation/perfusion scan and duplex ultrasound (US) of the lower limbs excluded pulmonary embolic disease. Blood work for vasculitis screen did not reveal any evidence of vasculitis or connective tissue disease.

A clinical diagnosis of PPH was made and she was transferred to the intensive care unit and assessed by cardiology and pulmonary teams. She was started on diuretics and her dyspnea and lower limbs edema improved. Additionally she was given dexamethazone, silandafil 50 mg PO three times daily and intravenous infusion of heparin for two days prior to delivery.

An elective caesarean section and tubal ligation under general anaesthetic was planned after two days of admission. She was prepared for the procedure and anaesthetised by cardiac anaesthesia team. In the operating room she received midazolam 1.5 mg i.v. after which an arterial cannula and pulmonary artery catheter were inserted. Systolic pulmonary artery pressure (PAP) was 102 mmHg. After pre-oxygenation, anaesthesia was induced with propofol 40 mg, fentanyl 1 mg. She was intubated and the ventilated with oxygen and isoflurane. Vecuronium was used for muscle relaxation.

Nitric oxide 1.5 ppm was given after induction of anaesthesia and continued during the rest of the procedure. A live, healthy baby girl was delivered 10 min after induction of anaesthesia. The baby appeared heavily narcotized but promptly responded to naloxone. Augmentin 1.2 g i.v. was given after delivery and syntocinon 10 units i.v. as an infusion over 20 min to contract the uterus, which caused a slight increase in pulmonary artery pressures to 120 mmHg. Nitric oxide was continued after delivery and was well tolerated. The dose was gradually increased to 12 ppm. PAP decreased progressively to 90 mmHg by the end of the procedure. She was subsequently transferred to intensive care unit. The patient was extubated same day, 9 h after surgery with no complications.

Postoperative echocardiography was unchanged. Pulmonary artery systolic pressure (PASP) was equal to 102 mmHg. Intravenous heparin was recommenced four hours post-surgery to maintain an activated partial thromboplastin time of 2–2.5 the normal. Two hourly nebulized iloprost was introduced. This enabled the nitric oxide and pressure support ventilation to be weaned without any rebound increase in PAP. PAP remained at or slightly below systemic. Cardiac output remained fairly stable (8.1–9.2).

Post operative clinical course was uneventful in the intensive care unit and patient hemodynamics showed increased pulmonary vascular resistance (PVR) up to 800 and PAP up to 96. She was advised to continue on iloprost nebulizer 20mcg Q 6 h and silandafil 50 mg three times a day as well as home O<sub>2</sub>. She was also started on warfarin and was

discharged from intensive care unit on day five post operatively and from the hospital in day 11 days postoperatively in a stable clinical condition.

She was given the appropriate outpatient clinic appointments to be followed and assessed for heart and lung transplantation.

### **Discussion:-**

PPH is defined as a sustained elevation of PASP (mean greater than 25 mmHg at rest) in the absence of a demonstrable cause. Pulmonary vasoconstriction, medial hypertrophy, thrombosis in situ and dysfunctional pulmonary vascular endothelium are believed to be the underlying contributing mechanisms [4].

Pulmonary hypertension is poorly tolerated during pregnancy. Deterioration typically occurs in the second trimester with symptoms of fatigue, dyspnoea, syncope and chest pain. This corresponds to the physiological increase in cardiac output and blood volume of 40%. During labour, uterine contractions effectively add 500 ml of blood to the circulation. The labour pain increase right atrial pressure, blood pressure and cardiac output [5]. Women with PPH is advised against pregnancy. In early pregnancy a termination is considered. Where PPH is not diagnosed until late pregnancy an elective delivery with caesarean section is preferred. This facilitates cooperation between specialities, permits monitoring to be started in advance, the pain and haemodynamic consequences of labour to be minimized and an intensive care bed to be arranged. Premature spontaneous labour is common [2] therefore delivery is usually planned for 32–34 weeks gestation. In our patient the cardiovascular physiological changes of pregnancy had already occurred by the time of presentation. Identification of these hemodynamic changes has led to the use of anticoagulants, oxygen, and vasodilators, which have been shown in several reports to lead to an improvement in hemodynamics and outcome in nonpregnant patients with PPH [6].

An opioid-based general anaesthetic was considered appropriate for a failing right ventricle. It facilitated the control of PAP and the use of nitric oxide. Nitric oxide can be administered by facemask but is poorly tolerated, difficult to monitor and cannot be scavenged. A narcotic-based technique minimizes increased pulmonary pressures during laryngoscopy and avoids the excessive negative inotropic effect of inhalational agents. Care was taken to avoid reducing venous return during positive pressure ventilation. Narcotic-related neonatal depression is usually easily managed. O'Hare et al. [3] reported a successful outcome following an emergency caesarean section under general anaesthetic for a woman with PPH and coarctation of the aorta. They gave intravenous and aerosolized prostacyclin postoperatively.

Vasoconstriction is a prominent feature, leading to the rationale for using pulmonary vasodilators such as oxygen, nitric oxide, epoprostenol and iloprost in the short term and calcium antagonists in the long term. Nitric oxide has been used in the pre and post-delivery management of PPH in pregnancy, with clear reductions in PAP as evidenced by cardiac catheterization data, [8] but not during caesarean section.

Epoprostenol is a naturally occurring prostaglandin and potent vasodilator. It affects vascular remodelling and inhibits platelet aggregation. Iloprost is a synthetic analogue of epoprostenol with improved metabolic and chemical stability, which decreases PAP and PVR, increases cardiac output, and has minimal effect on systemic arterial pressure [9]. The pulmonary vasodilator effect lasts 60–120 min. In comparison, intravenous prostacyclin (epoprostenol) reduces PVR with similar efficacy but reduces systemic arterial pressure to a greater degree [10] with no clinically significant reduction in PAP. Neither iloprost nor prostacyclin is recommended in pregnancy because of concerns over the effect on uterine blood flow.

Patients with PPH are at risk of thrombosis and thromboembolism. The Mayo Clinic group has reported that anticoagulation may improve the outcome in severe pulmonary hypertension [11].

Pulmonary artery catheterization provides early warning of rising PAP, deteriorations in right ventricular function and the effects of therapeutic interventions. Its use has not been associated with improved survival [7], and there is an increased risk of pulmonary artery rupture and thrombosis in these conditions [12].

PPH complicating pregnancy remains a fatal condition with deaths reported to occur between two and nine days post-delivery [1] usually from right heart failure. Iloprost and nitric oxide therapies may have a role in controlling PAP in this condition but there is no evidence of improved survival.

An important component in the successful management of these patients involves a multidisciplinary team approach with an obstetrician, pulmonary or cardiology specialist, anesthesiologist, and experienced nursing staff [12].

#### Summary:-

PPH is likely to worsen during labour and delivery, resulting in a high maternal mortality rate. Early recognition and treatment with vasodilator and anticoagulation therapy may reduce the likelihood of complications. Elective caesarean section may be performed with intraoperative vasodilator administration. A multidisciplinary approach to the management of patients with PPH during pregnancy is of great importance for a successful maternal-foetal outcome.

#### Abstract

**Background:-** Colchicine is used in the treatment and prophylaxis of gout. It possesses a narrow therapeutic window, frequently resulting in dose-limiting gastrointestinal side-effects such as diarrhoea and emesis. As colchicine is a cellular anti-mitotic agent, the most serious effects include myelosuppression, myoneuropathy and multiple organ failure. This occurs with intentional overdose or with therapeutic dosing in patients with reduced clearance of colchicine due to pre-existing renal or hepatic impairment. Acute pancreatitis has rarely been reported, and only in association with severe colchicine overdose accompanied by multi-organ failure.

**Case presentation:-** We report a case of acute pancreatitis without other organ toxicity related to recent commencement of colchicine for acute gout, occurring in an elderly male with pre-existing renal impairment.

**Conclusion:-** 1) Colchicine should be used with care in elderly patients or patients with impaired renal function.  
2) Aside from myelosuppression, myoneuropathy and multiple organ failure, colchicine may now be associated with acute pancreatitis even with therapeutic dosing; this has not previously being reported.

#### Introduction:-

**Background:-** Colchicine is frequently used to treat and prevent recurrence of acute gout [1] but has a narrow therapeutic window, with dose-limiting gastrointestinal side-effects such as diarrhoea and vomiting [2]. Colchicine toxicity relates to its cellular anti-mitotic action and preferentially affects tissues that have a rapid turnover [3], leading to early gastrointestinal failure, myelosuppression and ultimately multi-organ failure [1, 2]. Colchicine in intentional overdose is difficult to treat and frequently lethal [4]. Acute pancreatitis related to colchicine has rarely been reported, and only in the context of severe toxicity [5, 6, 7].

**Case presentation:-** A 79 year old man presented to the Emergency Department with severe epigastric pain, nausea, vomiting without hematemesis, diarrhoea and anorexia. He has a history of red cell and platelet transfusion dependent myelofibrosis, iron overload due to multiple red cell transfusion, chronic renal failure, ischemic heart disease, left ventricular systolic dysfunction, cerebrovascular disease, peripheral vascular disease, hypertension, and hyperlipidemia. His regular medications include diltiazem, valacyclovir, nicorandil, bisoprolol, deferasirox,

frusemide and glyceryl trinitrate patches. Aside from the recent addition of colchicine, his medications are unchanged. The patient denied using herbal or over the counter products. He was independent with activities of daily living, was a life-long non-alcohol drinker and stopped smoking decades ago. There was no history of abdominal trauma.

The patient was alert and orientated with blood pressure 100/48 mm Hg, pulse 66/min regular, respiratory rate 20/min, SaO<sub>2</sub> is 97% on room air and temperature 36.8°C. There was marked epigastric tenderness without abdominal distension. Normal bowel sounds are present. No free subdiaphragmatic gas was visible on erect chest X-ray.

Several blood investigations were performed; serum lipase is elevated at 859 (reference range, RR 25–300 U/L). Serum urate is 0.92 (RR 0.15–0.5 mmol/L), albumin-corrected calcium 2.38 (RR 2.15–2.6 mmol/L), sodium 136 (RR 135–145 mmol/L) and potassium 5.0 (RR 3.2–4.5 mmol/L). There was a mild deterioration of serum creatinine to 332 (RR 70–120 µmol/L) and urea 38.9 (RR 3.0–8.0 mmol/L). Venous blood gases showed pH of 7.24 (RR 7.35–7.45), bicarbonate 18 (RR 22–27 mmol/L), base deficit -8.9 (RR -3.0 to +3.0 mmol/L) and lactate 1.0 (RR 0.2–2.0 mmol/L). Serum triglyceride level was 2.0 (RR 0.5–2.0 mmol/L). Liver function tests were deranged: aspartate transaminase 206 (RR 10–45 U/L), alanine transaminase 269 (RR 5–45 U/L), gamma glutamyl transaminase 145 (RR 10–70 U/L), alkaline phosphatase 209 (RR 40–110 U/L) and total bilirubin 9 (RR <20 micromoles/L). Prothrombin time was 16.1 (RR 11–16 seconds), INR 1.3 and APTT 33.4 (RR 22–35 seconds). Haematology parameters were unchanged from previous results, with haemoglobin 118 (RR 130–180 g/L), haematocrit 0.352 (RR 0.40–0.54), white cell count 7.8 (RR 4.5–11.0 × 10<sup>9</sup>/L) and platelets 34 (RR 150–400 × 10<sup>9</sup>/L).

The patient recovered over 48 hours with clear oral fluids and supportive medical treatment including intravenous fluids and analgesia as required. This coincided with declining lipase levels. Myelosuppression ascribable to colchicine did not occur.

An abdominal ultrasound demonstrated normal liver texture, oedematous pancreas, and multiple small incidental calculi within a normal walled gallbladder, no hepatobiliary ductal dilatation or pericholecystic fluid, normal pancreatic duct, enlarged spleen and multiple bilateral renal cysts without hydronephrosis.

### Discussion and conclusion:-

The incidence of acute pancreatitis varies in different countries and depends on cause, with the estimated incidence in England being 5.4/100 000 per year; in the United States it is 79.8/100 000 per year [14]. Precipitants of acute pancreatitis are extensive and wide ranging [10]; the most frequent causes are gallstones (30–60%) and alcohol (15–30%) [8, 14]. In 20% of cases, the cause remains unidentified [8]. Drugs are implicated in only 2–5% of cases, either by a hypersensitivity reaction or the generation of a toxic metabolite [14], although it is frequently difficult to prove causality [9].

Identifying the underlying cause of acute pancreatitis allows avoidance or treatment of the precipitant and improves chances of recovery [10]. This patient sustained mild and self-limited acute pancreatitis associated with recent commencement of colchicine for gout, which has not previously been reported. However, comorbidities implicated in acute pancreatitis make a trigger or co-factor role for colchicine more likely [9], rather than colchicine being the sole aetiological agent. In this case, microlithiasis [8], chronic renal failure [10, 11, 14] and frusemide [10] may have set the scene for acute pancreatitis precipitated by colchicine. With a normal bilirubin level, however, the patient had liver function tests which were more consistent with a hepatic rather than an obstructive enzymosis. Furthermore, he did not have hypercalcaemia or hypertriglyceridaemia, metabolic factors well known to contribute to pancreatic inflammation [8, 14].

There was no evidence of acute seroconversion to hepatitis A, B, C viruses; Epstein-Barr virus, Cytomegalovirus and herpes simplex 1 and 2 viruses. As such, acute viral hepatitis or pancreatitis was unlikely. Non-drug aetiologies for pancreatitis in this patient (renal failure, microlithiasis, ongoing use of frusemide) remained; despite this, rapid clinical recovery occurred with withdrawal of colchicine. This renders colchicine the most eminent association to pancreatitis in this case.

Sole attribution for acute pancreatitis to a single drug remains difficult due to high rates of concurrent contributory diseases in acute pancreatitis [9]. Aside from frusemide, of which there had been no recent dose escalation, none of

this patient's other prescribed medications have been reported to increase risk of acute pancreatitis [10, 14]. Nitrates have been known to reduce pancreatitis pain and relapse [13], with diltiazem improving survival in rat models of acute pancreatitis [12]

There have been several reports of acute pancreatitis related to colchicine; including accidental ingestion of a plant (*Colchicum autumnale*) thought to be wild garlic [3], intraurethral administration of colchicine for condyloma acuminata [5], and after intentional oral overdoses of colchicine [6, 7]. These patients had severe colchicine toxicity associated with multi-organ failure and death in one case [7].

Patients with renal impairment have reduced colchicine clearance, may be more susceptible to colchicine toxicity and require cautious dosing [1, 2]. In this case report, acute pancreatitis occurred in an elderly man with pre-existing renal impairment after two days of oral colchicine 1 mg daily for gout in the big toe. Unlike with colchicine overdose-related pancreatitis [5, 6, 7], this patient did not experience severe colchicine toxicity, myelosuppression or deteriorating multi-organ dysfunction. Clinicians need to be cautious when prescribing colchicine in patients with renal impairment [1, 2] as isolated acute pancreatitis (or potentially even more severe toxicity) may occur in these patients even with therapeutic doses of colchicine.

#### Abstract

**Aim:** To assess Public knowledge, attitudes and behavior towards Zika virus in Saudi Arabia.

**Methods:** A prospective cross-sectional survey conducted for a period of 2 months from June-2016 to July-2016. Knowledge scoring was given based on the percentage of correct responses. Data were collected using a self-prepared questionnaire and analyzed using descriptive statistics. Association of respondent's knowledge score with sex, age group, and educational level, was analyzed by Chi-square test.

**Results:** The total sample size of the present study was 284 members, of which 187 were males and 97 were females. There was no statistical difference regarding Zika virus infection in the knowledge between both genders. There was no statistical difference regarding Zika virus infection in the knowledge between age groups. The majority of respondents were found by completing secondary schooling with 66 (36.7%), followed by no education with 50 (27.8%), primary schooling in 45 (25%), and finally completing graduate with 19 (10.5%). There was significant difference in knowledge between education level groups ( $p < 0.0001$ ). 35.6% of them didn't hear about Zika virus, while 30.6% hear about the virus in the previous few months and 26% knew about it in the last year. About 46 % don't know if there is a treatment of Zika virus infection while about 11 % they said yes there is a treatment. The majority of them 57 % don't take any measure to protect themselves from the virus, 39.4% who said no they don't know how to protect themselves. 44% don't know if there is a national or global organization to protect them or their family from the virus and 45.4 % they don't know while 10.6 % they said yes. When they asked how to protect themselves from mosquito's bite or decrease the mosquito's exposure 64.1% said all of above (keep the environment clean, clean the body and hands and sterilization of water, don't keep collect water) while 20.1% don't know the exact protection way.

**Conclusion:** There is lack of public knowledge about Zika infection transmission, symptoms, treatment and prevention, thus needs more education by health facilities and social media.

#### Introduction

Zika virus infection is a rapidly evolving disease currently spreading in the continental United States and in US territories, the Caribbean, North America, Central America, and South America. The current outbreak has been in the news regularly since the Pan American Health Organization identified the first case in May 2015 [1].

The US Centers for Disease Control and Prevention (CDC) predicted that the high volume of travel to Brazil for the Olympics would increase Zika distribution worldwide, with the potential to increase the regions of spread in the current outbreak by 19 countries [2].

In 1947 in the Zika forest of Uganda, the first samples of the virus were isolated from a captive rhesus monkey. The next year, scientists recovered the virus from an *Aedes africanus* mosquito in the same forest [3]. Four years later, the first cases of the Zika virus were found in humans, both in

Uganda and the United Republic of Tanzania [4]. In 2007, the first largest outbreak of Zika was found on the Pacific Island of Yap with 185 suspected cases. Prior to this, only 14 cases of Zika had ever been documented, hence the concern; although other cases were likely to have occurred and were not reported. Outbreaks of Zika have been reported in tropical Africa, Southeast Asia, and the Pacific Islands [5]. Because the symptoms of Zika are similar to those of many other diseases, many cases may not have been recognized and thus measures of prevention are not being held out. As of February 2016, Brazilian national authorities estimate 500,000 to 1.5 million cases of the Zika virus and a total of 39 countries reporting local circulation of the disease [6].

The Zika virus does not cause severe disease in a healthy individual, affected individuals may not even show symptoms [7]. In pregnant women, it can cause their baby to be born with microcephaly thus the reason for large concern [8]. Additionally, there has been an increase in the incidence of Guillain-Barre Syndrome in regions of Zika virus affection [9]. Saudi Arabia has not reported of any cases of the presence of Zika virus, and to continue to prevent Zika virus in Saudi Arabia residents it is important to assess the knowledge of the residents regarding the spread of the virus, concern and its prevention [10].

In Africa, Zika virus exists in a sylvatic transmission cycle involving nonhuman primates and forest-dwelling species of aedes mosquitoes. In Asia, a sylvatic transmission cycle has not yet been identified. Several mosquito species, primarily belonging to the *stegomyia* and *diceromyia* subgenera of aedes, including *A. africanus*, *A. luteocephalus*, *A. furcifer*, and *A. taylori*, are likely enzootic vectors in Africa and Asia [3,11].

The incubation period for Zika virus is unknown, but if it is similar to that of other mosquito-borne flaviviruses, it is expected to be generally less than 1 week. In one volunteer, a febrile illness of 4 days' duration developed 82 hours after subcutaneous inoculation of Zika virus [12].

Common symptoms were macular or papular rash (90% of patients), fever (65%), arthritis or arthralgia (65%), nonpurulent conjunctivitis (55%), myalgia (48%), headache (45%), retro-orbital pain (39%), edema (19%), and vomiting (10%). No patient was hospitalized during the outbreak in Yap. These common symptoms occurred at frequencies similar to those in the Yap outbreak in a cohort of pregnant women with Zika virus infection in Brazil.<sup>69</sup> The rash is generally maculopapular and pruritic,<sup>69</sup> and fever, when present, is generally short-term and low-grade [13, 14].

Microcephaly is a clinical finding of a small head size for gestational age and sex and is indicative of an underlying problem with the growth of the brain. The findings of Zika virus RNA in the amniotic fluid of fetuses with microcephaly and in the brain tissue of fetuses and infants with microcephaly, as well as the high rates of microcephaly among infants born to mothers with proven antecedent acute Zika virus infection,<sup>69</sup> provide strong evidence linking microcephaly to maternal Zika virus infection [15, 16].

The mainstays of the routine diagnosis of Zika virus infection are the detection of viral nucleic acid by RT-PCR and the detection of IgM antibodies by IgM-capture enzyme-linked immunosorbent assay (MAC-ELISA). The detection of viral nucleic acid in serum provides a definitive diagnosis; however, in most instances viremia is transient, and diagnosis by RT-PCR has been most successful within 1 week after the onset of clinical illness [17,18,19].

As with the other mosquito-borne flaviviruses, treatment for uncomplicated Zika virus infection focuses on symptoms. No Zika virus vaccine exists; thus, prevention and control measures center on avoiding mosquito bites, reducing sexual transmission, and controlling the mosquito vector. Potentially effective methods of prevention that are focused on reducing infections among pregnant women include avoiding unnecessary travel to areas of ongoing Zika virus transmission, avoiding unprotected sexual contact with partners who are at risk for Zika virus infection,<sup>103</sup> and using mosquito repellent, permethrin treatment for clothing, bed nets, window screens, and air conditioning. The most effective *A. aegypti* vector control relies on an integrated approach that involves elimination of *A. aegypti* mosquito breeding sites, application of larvicides, and application of insecticides to kill adult mosquitoes [20,21,22].

The underlying reasons for the emergence of Zika virus in the past decade are unknown. Recent global increases in the incidence and spread of dengue, chikungunya, and now Zika virus — all with *A. aegypti* as the primary vector — suggest common underlying mechanisms for their emergence, such as globalization and urbanization [23].

## Problem Statement

After the outbreak of the Zika virus, there was a sharp rise in the incidence of the number of cases of microcephaly in the areas affected by the virus thus, indicating a link between the two. Microcephaly is a congenital malformation, which is associated with serious complications such as cerebral damage, thereby causing a concern about the Zika virus and stressing upon its prevention.

The current study aimed to assess the knowledge and attitude of the Saudi residents in regards to the Zika virus epidemic.

## Methods

### Study design and population

The present study was conducted Jeddah, from June 2016 to July 2016. The study was initiated after getting approval from the Institutional Ethical Committee, Ministry of Health, KSA. The method of study is a cross-sectional survey using a validated Google Forms (Online Survey) Tool [24] and the Population included in this study were selected in purposeful random method.

### Statistical analysis

All the data of the study populations was entered into Microsoft excel spreadsheet and descriptive statistics were used for demographic characteristics. Association of respondent's knowledge score with sex, age group, educational level and income was analyzed by Chi-square test using Graph pad prism.  $p \leq 0.05$  were considered significant.

## Results

The total sample size of the present study was 284 members, of which 187 were males and 97 were females. There was no statistical difference regarding Zika virus infection in the knowledge between both genders. Poor knowledge was observed in 61% of male and 71.21% of female out of the total respondents as shown in Fig. 1.

Fig. 1: Knowledge based on gender distribution

Out of total respondents, 64 (35.55%) were between the age group 26-35 years, followed by 53 (29.44%) in between the age group 36-45 years, 34 (18.89%) in between the age group >45 years then finally 29 (16.11%) in between the age group 18-25 years. There was no statistical difference regarding Zika virus infection in the knowledge between age groups. The results were presented in Fig. 2.

Fig. 2: Knowledge based on age group distribution

Total distribution of respondents with respect to education level shows that majority of respondents were found by completing secondary schooling with 66 (36.7%), followed by no education with 50 (27.8%), primary schooling in 45 (25%), and finally completing graduate with 19 (10.5%). There was significant difference in knowledge between education level groups ( $p < 0.0001$ ). The percentage of respondents with good knowledge was low in primary and secondary education level and high in graduates with 36.8% as represented in Fig. 3.

Fig. 3: Knowledge based on education level

35.6% of them didn't hear about Zika virus, while 30.6% heard about the virus in the previous few months and 26% knew about it in the last year. Among those who heard about the virus, only very little knew about it years ago. The majority of them didn't know someone who has been infected with Zika virus. Most of them said they don't know the cause of fever if someone of their family had it. 46% said they don't know the route of transmission of Zika virus, while 32% said that the cause are mosquitoes. The remaining 22% had different answers distributed between (sexually transmitted, pollution, and dirty environment). More than half of them didn't know the symptoms of Zika virus infection. 9.5% said that the symptoms are fever and headache. 33% said that fever and headache, joints pain, rash, fatigue and red eyes all are symptoms of the virus.

39% said yes there is a prevention way to protect against the virus, while 30% said maybe, 30% didn't know, and very few said no. 41% of respondents who knew a prevention way against the virus didn't know the exact way, while 47% said the mosquito's protection way.

About 46 % don't know if there is a treatment of Zika virus infection while about 11 % they said yes there is a treatment (Fig 4). Most of them don't know the word (microcephaly) means. When asked about if the pregnant women infected with the virus what is the side effect, about 150 responses (52.8%) said don't know, while 20.8 % said all of above (abortion, infected with virus, microcephaly of baby, difficulty of labor, malformation of baby, affected next baby). 55.6% didn't take any pregnancy prevention measure to protect from the virus while only 5.3 % take a prevention way (Fig. 5). The majority of them 57 % don't take any measure to protect themselves from the virus, 39.4% who said no they don't know how to protect themselves. 44% don't know if there is a national or global organization to protect them or their family from the virus and 45.4 % they don't know while 10.6 % they said yes. When they asked how to protect themselves from mosquito's bite or decrease the mosquito's exposure 64.1% said all of above (keep the environment clean, clean the body and hands and sterilization of water, don't keep collect water) while 20.1% don't know the exact protection way.

Fig. 5: Knowledge based on Zika virus Prevention during Pregnancy

## Discussion

The Zika could a potentially devastating disease affecting the lives of many. As an emerging threat, it is important to recognize how much the public understands about the Zika virus and whether they are familiar with the preventative measures and applying their knowledge to help prevent disease.

A total of 284 participants answered a questionnaire created to evaluate the knowledge about the virus and the results were variable, but the common theme from the results was that raising awareness about all aspects of the disease and its prevention is essential. According to whether the public knew about the Zika virus or not, the majority of people who answered the questionnaire were aware about the Zika virus. A similar result was received by the Harvard Opinion Research Program, which conducted a poll regarding the public's response regarding the Zika virus. Their survey also conveyed that the majority of their participants knew about the Zika virus [25]. A study regarding public knowledge done by the Harris Poll also showed that 'that three out of four Americans are very or somewhat familiar with the Zika virus' [26]. The consistent results through the three studies show that whether in Jeddah or the United States, the public is aware of the emerging of the Zika virus.

Even though our questionnaire indicated that the majority of the participants did know of the Zika virus, but majority of them did not know what symptoms a person of the Zika virus would present with neither did they show understanding that a person infected with the virus would most likely now show any symptoms. 9.5% of the participants said the symptoms were fever and headache and 33% answered fever, headache, joint pain, rash, fatigue and red eyes were symptoms of the virus and 56% which is the majority of the participants, did not know what the symptoms are. Likewise, in the Harvard survey referred to previously, 71% of the participants said that people with Zika would most likely show symptoms [26], which is not true as people affected by the Zika virus usually do not show any symptoms. This was also indicated in the article published in *Journal of American Medical Association* (JAMA) that mentioned that 80% of the Zika infections are usually asymptomatic, and due to that "individuals make not take precautions to avoid transmission" [28].

Regarding understanding about whether the Zika virus would affect pregnant ladies adversely, 52.8% of the participants denied that they knew about the effects of the virus on pregnancy. Additionally, a survey done by the Harris Polls in the United States found that not a lot of people

understood that a fetus can contract Zika from an infected mother and that Zika can adversely affect the brains fetus inside the womb [27,28]. However, inconsistent results were gathered by a poll done by The Associated Press-NORC Center for Public Affairs Research. This poll showed that two thirds of the participants knew about the birth defects associated with the Zika virus [29]. The discrepancy between this study and our study might be due to the fact that there were 312 confirmed Zika virus cases in the United States and this could have led to increasing awareness among Americans. Meanwhile, there have been no confirmed cases in Saudi Arabia leading a limited amount of knowledge of the virus. The difference between the two American studies might be due to the amount of participants that participated in the studies. The study done by the Harris Polls included 2,026, while the study done by The Associated Press included 1,004 adults [26].

In respect to the treatment of the Zika virus, about 40% of the participants said they did not know of any treatment for the virus, about 9% said there was a treatment, 36.3% said there might be a treatment and 14.1% said there is no treatment. This indicates that there is clearly a lack of knowledge regarding the treatment availability of the Zika virus. It is important for the public to realize that there is no treatment currently available for Zika and therefore, all measures should be done to prevent getting affected by the virus and consequently. Likewise, the poll done by The Associated Press-NORC Center for Public Affairs Research, Americans are unclear about the unavailability of any sort of treatment of the virus [29]. Additionally, our survey indicates that the majority of the population has very little knowledge of how the measures of prevention that one needs to take in order to prevent mosquito bites. For example, 64.1% of the participants mentioned that keeping the environment clean, sterilization of water, cleaning the body and hands, and removing collected water are all a part of preventing mosquito bites. 20.1% of the participants did not know how to prevent the virus. This indicates that there is gap in the public knowledge of prevention and the public isn't aware of other measures such as using mosquito nets and insect replants to prevent mosquito bites neither are they aware that the virus could be sexually transmitted and the use of condoms is a method of prevention of the spread of the virus. Likewise, the Harris Poll also established through their survey that 'there's a significant lack of understanding regarding the other ways Zika can be transmitted' and thus prevented [29], therefore indicating that awareness about prevention and transmission of the Zika virus needs to be introduced to a further extent, including awareness about other methods of prevention as indicated by the article published in the *Infectious Disease of Poverty Journal* "The Global Spread of Zika" which says "Aedes mosquitoes are active and bite during the day, so use of an effective repellent is highly recommended. The fitting of house door and window screens, use of air-conditioning, removal of yard and household debris and containers (e.g. disposed tyres, broken bowls and cups, flower vases) that provide breeding sites for mosquitoes, are all measures that contribute to control of the vector within a local community" [30].

The above analysis of the results is indicative of the fact that the public is aware of the presence of Zika virus to a certain extent most probably due to social media and television news channels; however, there is a limited amount of knowledge that people have regarding this issue for example the treatment, the symptoms, and the link to birth defects. Raising awareness about this issue is imperative to prevent the virus from spreading and eventually eradicating it.

The findings in this report are subject to a couple of limitations. First, our research includes the responses of 284 participants. The number of responses may not be enough to gather enough information regarding the knowledge of the Zika virus. Despite having 284 responses, the majority of the respondents were of ages between 20-30 while only 12% were below the age of 20 and 12% were above the age of 20. This is another limitation that was faced in this research. In order to gain a complete idea of the knowledge of the public, a wider scope of participants with a more variety of ages including more participants above and below the age of 20 and 30 is needed. Lastly, this research only represents the information in Jeddah and no other city in Saudi Arabia.

## Conclusion

In conclusion, our research demonstrates that awareness about the Zika virus and its prevention and other factors related to the virus is needed. Despite the public being aware of the presence of the virus, there is lack of knowledge about the symptoms, treatment and prevention and thus more education should be provided by health facilities.

#### Key words:-

Hyponatremia, Seizure, SIADH, Sodium.

#### Abstract

**Background :** Sodium is the dominant extracellular cation and its homeostasis is vital to the normal physiologic function of cells. Hyponatremia is defined as a serum level of <135 mmol/L. This study is to evaluate aetiological factors, clinical features of patients with hyponatremia in IMCU (Intensive Medical Care Unit).

**Methods:** An observational study was conducted in 100 patients admitted in Kanniyakumari Govt. Medical College from Jan 2016 to Dec 2016 who had serum Sodium <130mmol/L. History, examination and relevant details were taken.

**Results:** In the present study, the mean age was 68 years. 37% were asymptomatic. The major clinical presentation among those symptomatic was altered sensorium accounting for 45%. The commonest cause was SIADH (Syndrome of Inappropriate AntiDiuretic Hormone secretion) followed by extra-renal causes. The mortality was 5%.

**Conclusions:** Hyponatremia is one of the common causes of altered consciousness and seizures especially in elderly patients. It is very important to classify the hyponatremia and find out the correct etiology. Treatment of hyponatremia is highly rewarding and it should be done in a more scientific way. The common causes and the management protocol should be available in every IMCU.

#### Introduction:-

Sodium is the dominant extracellular cation and its homeostasis is vital to the normal physiologic function of cells. Normal serum sodium level is 135-145 mmol/L.

Hyponatremia is defined as a serum level of <135 mmol/L. It is estimated that nearly 7% of healthy elderly persons have serum sodium concentrations of 135 mmol/L<sup>1,2</sup> or less. Hyponatremia is a common electrolyte abnormality in hospitalized patients<sup>3,4</sup>

**Corresponding Author:- Eunice S.**

**Address:-** Assistant Professor of Medicine, Kanniyakumari Govt. Medical College.

Hyponatremia can be classified on the basis of serum osmolality into hyperosmolar, normoosmolar & hypoosmolar states. Hypoosmolar hyponatremia is further classified into hypervolemic, euvolemic and hypovolemic hyponatremia based upon the volume status.

### Materials and Methods:-

100 consecutive cases who had serum Sodium levels of  $<130$  mmol/L were identified and studied during a period of 12 months from Jan 2016 to Dec 2016. The patients of age 15 years or more and who were hyponatremic on admission were included in the study. Patients who developed hyponatremia during hospital stay were excluded. Detailed history including onset, duration, and progression of symptoms, history of illnesses such as congestive cardiac failure, chronic kidney disease, chronic liver disease, hypothyroidism, hypopituitarism, pneumonia, malignancies were recorded. History of drugs causing hyponatremia like diuretics, antidepressants, anticonvulsants, chemotherapeutic agents, and NSAIDs were taken and detailed general and physical examinations of the patients were done.

In sera, measurements of sodium, potassium, urea, creatinine, uric acid, albumin and glucose concentration were taken. Serum osmolality was measured using the formula<sup>5</sup>  
 $[2 \times (\text{Na} + \text{K})] + (\text{BUN}/2.8) + (\text{glucose}/18)$

### Na-Sodium; K-Potassium; BUN- Blood urea nitrogen

Other tests included urine sodium, osmolality, serum cortisol, ACTH level, thyroid function test, liver function test.

After establishing the diagnosis of hyponatremia, the patients were categorized based on the level of hyponatremia into mild, moderate and severe hyponatremia.<sup>6-8</sup>

126-130 mmol/l	-	Mild
121-125 mmol/l	-	Moderate
$\leq 120$ mmol/l	-	Severe

They were then further evaluated to find out the etiology. Serum and urine osmolality was calculated. Normal serum osmolality is 275-295 mosm/kg  $\text{H}_2\text{O}$ <sup>(13)</sup>. They were then assessed clinically to find out the volume status clinically if they had low serum osmolality.

Hypervolemia - Presence of bilateral basal crepitation, raised jugular venous pressure, bilateral pitting pedal edema, hepatomegaly.

Hypovolemia-Presence of tachycardia, postural hypotension, dry tongue, nature of skin turgor, urine output.

Those patients who had no signs mentioned above was considered to be euvolemic.

Student's t-test and analysis of variance (ANOVA) were statistical methods used to analyse continuous variables. Chi square test and Fisher's exact test were used to analyse categorical variables. The study protocol was approved by the ethical committee.

### Results:-

In the present study of 100 patients 48 were males and 52 were females.

Figure 1:Sex distribution

The patients were between 15- 85 years of age, predominantly between 65-85 years.

Polyneuropathy	-1

### Discussion:-

Hyponatremia is a common clinical problem which is being increasingly recognized in all departments. The management is highly rewarding as the patient comes back to a near normal state of health. At the same time, over treatment is also dangerous as it can lead to permanent neurological damage. As hyponatremia is becoming an increasingly common clinical state, a proper systematic study of the causes, management and outcome of hyponatremia is timely. Our study throws light to all the aspects.

Of the 100 patients studied, 48% were male 52% were female. The female preponderance in our study correlates well with most of the other studies. Mean age group is 68.34 years. It is well known that older group patients are more liable for metabolic abnormalities and a small tilt in metabolic stability will make them more symptomatic.

The prevalence of severe hyponatremia (<120 mmol/L), formed the major group which is in contrast to other studies by Thomas et al<sup>9</sup>, Gross et al<sup>10</sup> and Hochman et al<sup>11</sup> who had mild to moderate cases as the predominant group. This stresses the fact that hyponatremia is recognized and diagnosed quite late in our country. Lowest serum sodium was 100 mmol/L. Mean serum sodium at the time of presentation was 118mmol/L.

The causes of hyponatremia in decreasing order of frequency are as follows:

Causes	No. of patients
SIADH	39
Extrarenal loss	17
Chronic kidney disease	12
Cirrhosis	10
Diuretic induced	10
Hypothyroidism	6
Congestive cardiac failure	2
Central hypopituitarism	2
Nephrotic Syndrome	1
Hyperglycemia	1

In our study SIADH was the commonest cause of hyponatremia. Respiratory diseases like pneumonia (25.64%) followed by CVA (23.07%) was the commonest etiological factor for SIADH. This is comparable with other studies by Thomas et al<sup>9</sup>, Gross et al<sup>10</sup>, and Hochman et al<sup>11</sup>.

Cardiac failure was one of the important causes in other studies. In our study it was only 2%, which is in contrast to 18%, 13% and 25% by Thomas et al<sup>9</sup>, Hochman et al<sup>10</sup> and Gross et al<sup>11</sup> respectively. Other possible explanation being, patients with mild congestive heart failure are increasingly being treated in outpatient clinics. But our study is comparable with the study by Minneke. J. Coenradl et al<sup>12</sup>.

Majority of patients (62.9%) with hypoosmolar hypovolemic hyponatremia is due to extra renal loss which is comparable with other studies.

Many drugs produce SIADH. In our study anti depressants were the commonest cause which is comparable with other studies. Six patients who had hypoosmolar euvoletic hyponatremia were due to hypothyroidism which is comparable with other studies.

It is not difficult to diagnose hyponatremia who present with acute symptoms. It is important to recognize those patients without much symptoms, some of them having chronic hyponatremia and it is important to correct them at a slower pace.

63% of our patients were symptomatic and the rest 37% were asymptomatic. The major clinical presentation among those symptomatic was altered sensorium accounting for 45%.

23% had chronic hyponatremia which included patients with serum sodium <125 mmol/L and mild or no symptoms. The major causes include chronic renal failure and cirrhosis. Hence it is evident that it is very important to study serum electrolytes in patients who are having chronic illness.

We followed up the patient till the discharge or death of the patient with twice daily measurement of serum sodium and serial monitoring of other parameters. No complications of treatment was noted in our study.

The mean hospital stay of our patients was 11.6 days. The mortality in our study group was 5%. The cause of mortality include squamous cell carcinoma of lung, sepsis, hepatic failure, meningitis and periampullary carcinoma. It is well observed that death is due to underlying primary conditions and not due to hyponatremia itself.

### Summary and Conclusions:-

1. Total of 100 cases of hyponatremia admitted in IMCU during a period of 12 months were studied.
2. Of them 48% were male and 52% were female.
3. The mean age was 68.34 years. The commonest age group being 65-85 years and the least affected group was < 50 years.
4. Among the 100 cases 63% were symptomatic, who had seizures, altered sensorium or GI symptoms.
5. Their mean serum sodium level at the time of presentation was 118 mmol/L. Lowest serum sodium recorded was 100 mmol/L.
6. 65% of patients had severe hyponatremia  $\leq 120$  mmol/L
7. The commonest cause of hyponatremia was SIADH followed by extra renal losses due to vomiting and diarrhea and chronic renal failure.
8. The treatment was based on the basic principles but modified to suit the clinical situation.
9. The mean hospital stay was 11.6 days.
10. The mortality in our study group was 5%.

### Conclusion:-

Hyponatremia is one of the common causes of altered consciousness and seizures especially in elderly patients. It is very important to classify the hyponatremia and find out the correct etiology. According to this study the common causes of hyponatremia are SIADH followed by extra renal loss due to vomiting and diarrhea and chronic renal failure.

Our study shows that many people had serum sodium of <120mmol/L which we considered as severe hyponatremia. Such severe hyponatremia was not observed in many foreign studies. Treatment of hyponatremia is highly rewarding.

The mortality in our study group is 5% and most of them were due to the underlying primary disease and not due to hyponatremia itself.

It is necessary to recognize such an increasing electrolyte abnormality and to correct them. The common causes and the management protocol should be available in every IMCU.

#### Abstract

A two-year field experiments were carried out at the Experimental Farm of the Central Laboratory for Agricultural Climate, Agriculture Research Center, Egypt during 2015 and 2016 successive rice seasons. such investigation aimed to study the productivity and CH<sub>4</sub> emission capacity of two Egyptian rice varieties (Sakha101 and Sakha106) under different irrigation water depths (4, 8 and 12 cm) from the soil surface. Innovated siphon container were connected to a water valve to maintain the continually of the water head at the desired depths. The water depth treatments were laid out in a randomized complete block design with four replications for each variety in both seasons. A combined analysis was used between the two varieties in each season to interpret the data. Plant height cm, root length cm and chlorophyll SPAD at 30 and 55 days after transplanting, panicle length cm, number of tillers m<sup>-2</sup>, number of grains panicle<sup>-1</sup>, number of unfilled grains panicle<sup>-1</sup>, 1000-grain weight, grain yield t ha<sup>-1</sup>, straw yield t ha<sup>-1</sup> and harvest index were recorded. Methane fluxes were measured by using closed chamber method. Water depth affected significantly all studied characteristics. The maximum values of most of the studied characteristics were recorded at 8 cm water depth. On the other hand, the lowest values were observed at 12 cm water depth. CH<sub>4</sub> emission was dramatically reduced by decrease the water depth. There was significant correlation coefficient between methane emission and all studied agronomic characteristics except 1000-grain weight and harvest index. The methane emission from rice fields decreased significantly with the increase of plant growth and yield. Irrigation water depth at 8 cm seem to be the recommendable treatment to achieve the promising rice yield and methane mitigation value.

#### Introduction:-

Egypt is facing limited water resources, according to fast increase of population growth and its corresponding economic activities which caused a reduction in the per capita share of the limited fresh water resources. Rice crop is one of the major cereal crops feeding the Egyptian population. All of the rice areas in Egypt are under lowland

irrigated rice. These rice areas require a large amount of irrigation water. Most of the rice farmers think that increasing water depth in their rice fields up to maximum level will reflect directly on rice grain yield irrespective to these hazardous side effect on environmental system. Talpur *et al.* (2013) reported that the maximum plant survival and tallest average plant height were recorded in 5 cm water depth compared to 10, 15 and 20 cm from cultivation till to mid stage of growth. The maximum water depth of 20 cm produced the shortest root, while 5 cm produced the longest root. The weight of 1000 grains has more affected by a deeper water depth as compared to shallower water depth but the total yield was opposite of these. It was observed that the number of grains loss due to excessive water depth has an adverse impact as compared to deficient water depths.

Kima *et al.* (2014) indicated that water reductions at the vegetative stage delayed plant growth and affected grain filling rate and 1000-grain weight, but the recovery process induced by effective rainfall contribution was such that grain yield was not affected. In water scarcity context, applying 180% of soil saturation water seems suitable for increasing both rice production and irrigation water productivity in tropical climate conditions. They argue that, rather than the daily application of the small amount of water, saturated soil culture practice can be adopted in the specific agro-climatic zone by adjusting the irrigation water depth according to the irrigation intervals. Weekly application of a 3 cm water depth above soil surface can be recommended to farmers as an alternative to save irrigation water, time, energy, and increase outputs.

Methane is the second most important culprit of GHGs. Its emissions rose by about 40% from 1970, with an 85% increase from the combustion and use of fossil fuels. Agriculture, however, is the largest source of CH<sub>4</sub> emissions (Aulakh *et al.*, 2001). Agricultural lands (used for agricultural production, managed grassland and permanent crops including agro-forestry and bio-energy crops) occupy about 40-50% of the Earth's land surface and release a significant amount of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O in atmosphere (Cole *et al.*, 1997; IPCC, 2001 and Paustian *et al.*, 2004). Agriculture accounts for 10-12% of total global anthropogenic emissions of GHGs. This sector contributes about 47% and 58% of total anthropogenic emissions of CH<sub>4</sub> and N<sub>2</sub>O, respectively, with a wide range of uncertainty in the estimates of both the agricultural contribution and the anthropogenic total. Globally, agricultural CH<sub>4</sub> emission increased by 17% from 1990 to 2005, an average annual emission increase of 58 Mt CO<sub>2</sub>-eq yr<sup>-1</sup>. Methane is produced when organic materials are decomposed anaerobically. Water management practices have a strong influence on the processes involved in CH<sub>4</sub> emission from rice paddy fields. The presence of surface standing water is essential for the development of the anaerobic conditions in paddy soil by limiting the transport of atmospheric oxygen into the soil. In the Japanese rice cultivation; short-term floodwater drainage is commonly performed to aerate the paddy soil during the flooding period to prevent some negative effects of soil reduction on the growth of rice plant. Yagi and Minami (1990) detected a decrease in CH<sub>4</sub> emission rates during the period of midsummer drainage in Japanese rice paddy fields. Sass *et al.* (1992) demonstrated that CH<sub>4</sub> emission rates varied markedly with water regime, showing the lowest emission with multiple intermittent draining practices.

Zheng Bing-song, *et al.* (2006) reported that water deficiency is one of the primary yield-limiting factors in rice. Different rice genotypes showed different relative root parameters and relative nutrition content and water use efficiency under different water supply conditions (0 cm (submerged), 40 cm and 80 cm groundwater levels below the soil surface). The length and number of adventitious root are more important than seminal root length in water and nutrition uptake, and maintaining the grain yield and increasing dry matter, but the adventitious root number could not be served as an index for screening drought-resistant genotypes.

the main target of this work was to throw light on the role of irrigation water depth in rice field in mitigating methane emission in relation to growth, yield and yield components of rice crop.

### Materials and Methods:-

Two years field experiment were carried out at the Experimental Farm of the Central Laboratory for Agricultural Climate, Agriculture Research Center, Egypt during 2015 and 2016 successive rice seasons. such experiments were conducted to study the performance of two rice varieties (Sakha101 and Sakha106) under different irrigation water depths (4, 8 and 12 cm) from the soil surface. Irrigation water depths were kept using a smart control flow system (Fig. 1). Innovated siphon container were connected to a water valve and flow meter to maintain the continually of the water head at the desired depths under low pressure. The depths of water were controlled in each replicate through a perpendicular wires installed over the container of the siphon that poise by water balance. The water depth treatments were laid out in a randomized complete block design with four replications for each variety in both

seasons. A combined analysis was used between the two varieties in each season to interpret the data. Correlation analysis was done by Pearson correlation coefficient method using the PC software SPSS Ver. 14.

Seeds of the two varieties were soaked in water for 24 hours before sowing the nursery, then drained and incubated for 48 hours to hasten the germination. Pre-germinated seeds were uniformly broadcasted in the nurseries on 1<sup>st</sup> and 3<sup>rd</sup> of May in the two seasons, respectively. The permanent field was well prepared. Seedlings were carefully pulled from nursery after 25 days from sowing and transferred to the permanent field. Seedlings were handily transplanted in hills at the rate of 2-3 seedlings hill<sup>-1</sup> and at the spacing of 20x20 cm between hills and rows. The plot size was 12 m<sup>2</sup> (2x6m). The all recommended cultural practices were applied for each variety.

The studied growth characteristics were plant height (cm), root length (cm) and chlorophyll SPAD at 30 and 55 days after transplanting. Chlorophyll meter (model SPAD-502, MINOLTA, Japan) was used to determine the leaves chlorophyll content. The studied yield attributes traits were panicle length (cm), number of tillers m<sup>-2</sup>, number of grains panicle<sup>-1</sup>, number of unfilled grain panicle<sup>-1</sup>, 1000-grain (g) weight, grain yield (t ha<sup>-1</sup>), straw yield (t ha<sup>-1</sup>) and harvest index.

Methane fluxes were measured by using closed chamber method. This measurement system was a modified version of the system originally described by Schutz *et al.*, 1990. For the measurements, an air-tight acrylic glass chamber (15 cm in diameter and 1 m high) was carefully placed on the wooden frame. One day before the recording of CH<sub>4</sub>, this wooden frame was placed at a randomly selected measuring site inside each plot. In each replicate, two chambers were inserted into the soil after flooding. The closure period was 1 h, during which two gas samples from inside the chambers were taken at 30 min intervals. Methane emission was measured at 8.00–10.00 am and at 15.00–17.00 pm, and the average value was used as the flux value for the day. Methane emission rates were recorded after 65 days of transplanting. Average air temperature (32°C) was recorded just before measuring the CH<sub>4</sub> emissions. Methane concentration in the sampled air was measured using a FID-GC (Shimadzu GC-14APF). Statistical analysis: The analysis of variance by means of “MSTATC” computer software package was carried out as combined analysis for the two varieties in each season according to Gomez and Gomez (1984).

Fig 1. Smart control of irrigation water flows to experimental plots.

### Results and Discussion:-

Plant height at 30 and 55 DAT was varied significantly among different treatments combinations (Tables 1 and 2). At 30 DAT, the highest values of plant height were recorded when irrigation water was kept at 4 cm in depth for the two varieties. On the other hand, 8 cm water depth recorded the tallest plants at 55 DAT. These results were true in both the experimental seasons of 2015 and 2016 are in harmony with those of Talpur *et al.* (2013) and Kima *et al.* (2014).

In both seasons the length of rice roots showed significant differences with the water depths for both varieties (Tables 1 and 2). The longest length of root was measured in 4 cm water depth at 30 DAT and in 8 cm water depth at 55 DAT. Increasing water depth to 12 cm decreased root length significantly. Obvious reduction in either plant height or root length of rice plant grown in depth (12cm) at 30 and 55 DAT could be attributed to the deleterious impact of poor aeration on plant -water-soil relation and their address effects on growth criterion of rice plant. These results are in harmony with Zheng Bing-song *et al.* (2006), Talpur *et al.* (2013) and Kima *et al.* (2014). De Datta (1981) emphasized that extremely deep water resulted in poor growth and yield. Roots were deeper in Sakha106 compared to Sakha101. Ascha *et al.* (2005) reported that plant becomes adapted to water deficiency through the possession of pronounced root system, which maximizes water capture and allows access to water at depth.

Application of various water depths in rice varieties showed a significant impact on leave chlorophyll content at 30 and 55 DAT as shown in Tables 1 and 2. Chlorophyll content at 30 DAT decreased gradually by increasing water depth from 5 up to 12 cm while, at 55 DAT the highest values were recorded at 8 cm water depth for both varieties. Chlorophyll content in Sakha 106 was slightly higher than those in Sakha101. Kima *et al.* (2014) found a similar trend and reported that under shallow water depth, plants reduced evapotranspiration that led photosynthesis decrease which in turn induced chlorophyll decrease.

In both seasons panicle length was affected significantly by different treatments (Table 3). The longest panicles were observed when 4 cm water depth was applied either to Sakha101 or to Sakha106. Number of tillers per meter square was affected significantly by different water depth. Application of 8 cm irrigation water depth to Sakha101 recorded the highest number of tillers followed by the same water depth to Sakha106. Data in Table 3 showed also that water depth treatments affected significantly number of grain per panicle. Sakha101 at 8 cm water depth produced the highest number of grains per panicle followed by Sakha106 at the same depth. All above mention results were fact in either 2015 or 2016 experimental seasons. Similar trend was found by Talpur *et al.* (2013) and Kima *et al.* (2014).

Means of each column designated by the same letter are not significantly different at 5% level using Duncan's multiple range test.

Number of unfilled grains per panicle varied significantly according to water depth treatments (Table 3). Unfilled grains per panicle increased significantly with the increase in water depth for both varieties. The highest number of unfilled grains per panicle was measured at 12 cm water depth by Sakha101 rice variety followed by 8 and 4 cm by Sakha101. Meanwhile 1000-grain weight was affected significantly by water depth treatments (Table 4). Shallow water depth recorded highest values of 1000-grain weight. these results are fairly true in both the two seasons.

Water depth affected significantly grain yield as presented in Table 4. The maximum values of grain yield were recorded by Sakha106 at 8 cm water depth. On the other hand, the lowest values of grain yield were observed by Sakha101 at 12 cm water depth. This is agreed with results obtained by Talpur *et al.* (2013) and Kima *et al.* (2014). Reduction in rice grain yield under 12cm depth treatment in both cultivars and in both seasons could be attributed to the reduction in number of tiller/m<sup>2</sup>, number of grains/ panicle and the increase in number of unfilled grains/panicle (Table 3) as well as the decrease in 1000-grain weight (Table 4). It can be assumed that the increase in water depth up to 12cm caused a bad aeration conditions around root and shoots of rice plant. Adequate oxygen supplies are necessary to respiration and other essential physiological processes of plant and consequently rice yield and its components of deep water level plots was decreased. Sakha106 produced higher grain yield than Sakha101. This might be due to the substantial yield losses by the large percentage of unfilled grains in Sakha101.

**Table 4. Thousand-grain weight (g), grain yield( t ha<sup>-1</sup>), straw yield ( t ha<sup>-1</sup>) and harvest index of the two rice varieties as affected by water depth treatments.**

Treatments		1000-grain weight		Grain yield t ha <sup>-1</sup>		Straw yield t ha <sup>-1</sup>		HI

	12	26.80b	26.55c	8.88cd	8.17d	12.44c	11.38c	0.417b	0.418b

Means of each column designated by the same letter are not significantly different at 5% level using Duncan's multiple range test.

Straw yield was affected significantly by water depth treatments (Table 4). Sakha106 at 8 cm water depth produced the highest value of straw yield. Harvest index showed significant difference with the water depths used in this study. The maximum values of harvest index were measured at 8 cm water depth whatever the variety.

Methane emission values obtained under the three water depths in the two experimental seasons are presented in table 5. Methane flux ranged from 0.288-0.597 and 0.278-0.566 mg m<sup>-2</sup>hr<sup>-1</sup> in both seasons respectively. There was a significant differences in CH<sub>4</sub> emission values among water depths. Available results in Table 5 clear that methane emission values were increased as irrigation water depth increased. increasing water depth from 4cm to 8cm and 12cm level increase CH<sub>4</sub> emission from Sakha 101 plots by 28.6 and 107.1 % respectively in 1st season and by 9.4 and 89.6% in the second one. Analogous values for Sakha 106 cultivars plots were 17.9 and 89.37 % in 2015 and 14.9 and 92.6 % in 2016 season, respectively. There for, management of irrigation water level in rice fields can be used as a smart tool for mitigating CH<sub>4</sub> emission in irrigated paddy field. Variation in CH<sub>4</sub> emission rate was also

detected between the two investigated cultivars. Sakha 101 plots emitted more CH<sub>4</sub> ( 2.448 mg/m<sup>2</sup>/ha) as a total of the two seasons comparing with 2.307 mg/m<sup>2</sup>/ha for Sakha 106. Our data showed, CH<sub>4</sub> emission was dramatically reduced by decrease the water depth wherein, suitable water management practice can be established by assessing appropriate controlling the irrigation and flow rate to reduce CH<sub>4</sub> emission with any adverse effects on yield and soil fertility. These results confirm the phenomena that the aeration under 3 cm water depth in paddy soil led to decrease methane emission. However, under 12 cm of water depth, reduction condition was prevailing which provide a good condition to emit more methane than under oxidized zone. Genotypic differences in the emission of methane from rice paddies are reported also by Nirmali Gogoi *et al.* (2008).

**Table 5. Methane emission as affected by rice varieties and water depth treatments.**

Treatments		Methane mg m <sup>-2</sup> hr <sup>-1</sup>	
Variety	Water depth cm	2015	2016

	12	0.5459a	0.5356a

Means of each column designated by the same letter are not significantly different at 5% level using Duncan's multiple range test.

Regarding the correlation coefficient between methane emission and the studied agronomic characteristics, data in Table 6 revealed that there was significant correlation coefficient between methane emission and all studied agronomic characteristics except 1000-grain weight and harvest index. The correlation coefficient was highly significant and positive between methane emission and number of unfilled grain per panicle. On other hand, it was highly significant and negative between methane emission and each of chlorophyll content SPAD at 30 DAT, root length at 55 DAT, chlorophyll content SPAD at 55 DAT, panicle length, number of tillers per m<sup>2</sup> and straw yield. The correlation coefficient was significant and negative between methane emission and each of plant height at 30 and 55 DAT, root length at 30 DAT, number of grains per panicle and grain yield. These results demonstrated that methane emission from rice fields decreased significantly with the increase in the rice plant growth and yield. Denier *et al.* (2002) and Ali *et al.* (2009) reported similar trend.

**Table 6. Correlation coefficient between methane emission and agronomic characters.**

Characters	Methane
Plant height at 30 DAT	-0.650*

### Conclusion:-

Rice yield and CH<sub>4</sub> emission were positively affected significantly by irrigation water depth. Methane emission was dramatically reduced by decrease the water depth. Irrigation water depth at 8cm seem to be recommendable treatment to obtain the promising rice yield and CH<sub>4</sub> mitigation value. There was significant correlation coefficient

between methane emission and all studied agronomic characteristics except 1000-grain weight and harvest index. The methane emission from rice field decreased significantly with the increase of rice plant growth and yield.

#### Abstract

Low-intensity laser is proposed in clinical protocols based on biostimulative effects, yet dosimetry is inaccurate and their effects on DNA at therapeutic doses are controversial. The aim of this work was to evaluate the effects of low-intensity laser 805nm wavelength on *Escherichia coli* (*E. coli*) and *Staphylococcus aureus* (*S. aureus*) plasmids. Our findings in this study indicate that the 805nm laser has effect on *gram positive and gram negative bacterial* genetic profile. Studies about laser effects and safety strategies are necessary for professionals and patients exposed to low-intensity lasers at therapeutic doses.

#### Introduction:-

Since resistance to antibiotics is becoming an increasing problem, another possibility to battle bacterial infections are needed (Finger, *et.al.* 2013). Safety concerns about food, drinking water, health surveillance, and clinical diagnosis related to microbial pathogens have attracted increasing attention worldwide (Raj, *et.al.* 2015). Gram negative bacteria *Escherichia coli* (*E. coli*) are the leading cause of urinary tract infection, food borne illness, inflammation, bloody diarrhoea (Nataro and Kaper 1998). These are due to their ability to produce toxins and enzymes which help bacteria to avoid body immune response as well as resist antibiotic treatment (Lim, *et.al.* 2010). On the other hand, *Staphylococcus aureus* (*S. aureus*) is a Gram-positive spherical bacterium and it is equipped with a great variety of virulence factors, which include both structural and secreted products participating in pathogenesis of infection. In addition, it is one of the main causes of hospital and community-acquired infections which can result in serious consequences (Campanile, *et.al.* 2015).

Today, it is generally accepted that an exponential growth in the use of lasers has been observed in almost every area of pure and applied sciences. A wide variety of the laser propelled the invention of a several new ways research. Most of the electronic industry giants and many research laboratories are now competing to manufacture novel ranges of lasers (Nasim and Jamil, 2014). Furthermore, scientists have been agreed that the susceptibility of bacterial plasmid to laser light is varied from one Genus to another. Laser treatment has been applied for the development of an effective and safe technology for the inactivation of bacterial pathogens (Liang, *et.al.* 2013). It is well documented that the exposure of laser radiation was genotoxic in prokaryotic organisms also indicated that the presence of laser light selectively enhances damage on the guanine bases in DNA of pathogenic microorganism

(Geng, *et al.* 2008). However, gene expression and the corresponding protein production resulting from exposure to laser radiation have not been investigated well (Raul and David, 2013).

Low-level lasers have been used among scientists to cure many diseases based on its biostimulative effect. However, the photo-biological basis for its mechanism of action and adverse effects are not well understood. The aim of this study was using experimental model to evaluate the effects of 805nm laser on genetic bacterial pathogens.

## Materials and Methods:-

### Bacterial isolates:-

Two different bacteria (*E.coli* and *S. aureus*) were obtained from Teaching hospital (Erbil/Iraq). They were re-cultured on nutrient agar for 48 hours. Then they were cultured in nutrient broth and put them in shaking incubator for 24 hours. Identification and diagnosis for both bacteria had done by using api 20E system.

### Plasmid extraction:-

Once the bacterial culture in nutrient broth had been prepared, we harvested the bacterial culture by centrifugation at 8000 rpm in a micro centrifuge for 2 minutes at room temperature. Then we decant the supernatant and remove all remaining medium.

Plasmid extraction was performed by using GeneJET Plasmid Miniprep Kit for both bacteria. This methodology is based upon protocols described by manufacturer (Thermo Scientific). All extraction steps carried out at room temperature. Also all centrifugations carried out in a micro centrifuge at 12 000 rpm.

### Gel electrophoresis:-

Gel prepared at 0.5gms of powdered agarose, were mixed into 100ml of 1X TBE buffer. The mixture was then heated in microwave until it becomes clear. 1 $\mu$ L of Web Green was then added into the solution. The gel solution was poured into a gel tray; a comb was placed into the gel to create the wells for plasmid DNA samples. The gel was then allowed to cool and set for 30 minutes. After the mini agarose gel electrophoresis prepared, we added 10 $\mu$ L of the extracted plasmid DNA, with 1 $\mu$ L of loading dye and placed in the pores. The tray was then put in a tank containing TBE buffer. A voltage of 80 v/cm<sup>2</sup> was allowed to pass through the gel for 45 minutes till the trapping dye nearly reached the edge of the gel, then examined and photographed under UV light source.

### Laser Device and Irradiation Setup:-

The 805nm Diode laser was used in this study with spot size diameter of 5mm. The exposure time was adjusted for 5,10 and 15 minutes. The setup of chopped diode laser is illustrated in Figure (1).

**Figure 1:-** laser sensitivity test shows the setup of irradiation method by Diode laser (805nm).

### Samples Preparation and laser Irradiation:-

After both bacterial plasmids isolated, we added 50 $\mu$ L of distilled water for each of them (tubes). Then we transferred 10 $\mu$ L of the mixture (plasmid and distilled water) into Eppendorf tubes. The laser beam then used with the 805nm wavelength, the exposure time was adjusted for three different times for both isolated plasmids which are 5,10 and 15 minutes. At the end we utilized mini agarose gel electrophoresis to study laser effect on both plasmids at different times.

**Result:-**

Two different bacteria *E.coli* and *S. aureus* were selected in this study to detect the irradiation effects on their plasmid content. The irradiated DNA samples were immediately re-dissolved in 50 µl of distilled water. Agarose gel electrophoresis was used to separate different forms of plasmid DNAs (irradiated and non-irradiated plasmid). The agarose gel was prepared with 0.5gms agarose and 1µL of Web Green; the samples were then run in the agarose gel at 80 volts for 45 minutes. The table 1 displays the loading samples into the gel. The results of the gel run are given in Figure 2, which shows the plasmid profile for both microorganisms before laser irradiation. It can be seen well number 1 represents the ladder with the size of 1kb. Further down in the gel, lane number 2 and 3 show the *E.coli* and *S. aureus* genetic profile prior to diode laser respectively. Both plasmids before irradiation in the range of above 1kb in size which appears as double bands. However, the size of the *E.coli* plasmid(s) is bigger than *S. aureus* plasmid(s).

On the other hand, table 2 demonstrates the loading samples into the gel after irradiation. The consequences of the diode laser 805nm on both bacterial genetic profiles as shown in figure 3 and 4. It can be seen from the third figure that well number 1, 2 and 3 contain the extracted *E.coli* plasmid that irradiated with 805 diode laser for 5, 10 and 15 minutes respectively. Furthermore, figure 4 demonstrates that pore number 1, 2 and 3 contain the result of irradiated *S. aureus* genetic profile in three different times 5, 10 and 15 minutes respectively. The same result for *E.coli* and *S. aureus* were obtained as shown in both figures (3 and 4). Thus, there is no evidence of irradiation product band for both irradiated plasmids. This is referred to the impairment of irradiation on its plasmid profile.

The molecular weights of the unknown bands were determined using a calibration curve based on the known molecular weights of the constituents of the ladder and corresponding relative distances travelled.

**Table 1:-** Displays well content before laser irradiation and product band sizes (bp).

Well number	Sample type	Band size (bp)

**Figure 4:-** Gel electrophoresis image shows isolated *S. aureus* plasmid migration after 5, 10 and 15 minutes of irradiation with diode laser.

### Discussion:-

The problems of antibiotic resistance and pathogens in the environment are of unremitting concern for society. Traditional methods to remove and inactivate pathogens have included chlorine, UV, antibiotics, and a variety of physical and chemical processes (Capita and Alonso-Calleja, 2013, Bech, *et.al.* 2014). However, we are witnessing the emergence of pathogens that are resistant to these traditional methods. For example, emerging environmental pathogens such as *Mycobacterium avium* have been identified, which are resistant to traditional chlorine based treatments (Worley-Morse, and Gunsch 2015). Furthermore, antibiotics are no longer as effective due to the emergence of multiple types of antibiotic resistance, and there is concern of entering a post-antibiotic era. Clearly, there is a need to investigate alternative disinfection strategies for controlling pathogens in the environment and in engineered waste streams.

One novel approach to controlling environmental pathogens is the use of laser, which has received much attention in the medical field as a way to specifically damage plasmid DNA by disabling the antibiotic resistant gene.

We have investigated laser-induced DNA strand breaks in plasmids. The supercoiled plasmid was irradiated at 805nm wavelength. The plasmid may exist in supercoiled, relaxed-circular or linear conformation. Only one single strand break (SSB) is sufficient to relax DNA in supercoiled form to relaxed-circular form. One double strand break (DSB) will produce linear molecules (Adjei, *et.al.* 2016).

Generally, this study shows that the laser 805nm irradiation had a major effect on *E.coli* and *S. aureus* plasmids. The idea of inducing DNA cut photo chemically has attracted attention, the strand breaks of plasmid DNA might be due to singlet oxygen that is generated through the irradiation process which causes bacterial genetic profile to be cleaved due to the interaction with nitrogen base of DNA especially guanine bases which might be act as sinks for electrons holes within DNA owing to their propensity to be oxidized. The electron holes induced by laser irradiation may be propagated via stacking interactions in the DNA helix until it encounters guanine cluster, where it may persist longer than at other sites (Sies, *et.al.*1996, Adjei, *et.al.* 2016)

### Conclusions:-

In conclusion, we have demonstrated the possibility and advantages of using 805nm laser. Bacterial plasmid(s) could be impaired by laser irradiation for instance *E.coli* and *S. aureus* plasmids. This means that many antibiotics could be replaced by diode laser 805nm wavelength for curing infectious microorganisms. Overall, it is believed that the diode laser 805nm wavelength can meet the scientist's challenges from laboratories to industries.

Allele specific PCR

#### Abstract

Activating mutations in FLT3 occur in ~30% of adult AML, primarily consisting of internal tandem duplication (ITD) mutations (~25%) and point mutations in the tyrosine kinase domain (~7%), at the activation loop (residue D835). The early detection of FLT3- D835Y in AML patients is clinically important for AML patients in this small region of Saudi Arabia especially for determining drug responses, prognosis, and selection of therapy. The present study was conducted on 47 specimens among which 37 were from leukemia patients (5 were newly diagnosed AML, 7 ALL and 25 MPD) and 10 healthy controls. Genomic DNA from blood was isolated using DNA QIAamp DNA Blood Mini Kit from Qiagen and stored at -20°C until PCR. The Allele Specific-PCR based assay for FLT3 (D835Y) mutation was optimized in the Lab. The mutation was detected in 2/5 cases of AML, 0/25 of MPD and 0/5 of ALL. It was observed that patients with AML possessed significantly higher frequency of FLT3 D835 mutation (2/5) than other leukemia cases and healthy controls. The D835Y Flt3-TKD mutation was not detected in any of the healthy controls (0/10). It was concluded that allele specific PCR technique permits the direct detection of FLT3 c.2503G>T (D835Y) point mutation in AML patients and acts as useful genetic technique that is very valuable for molecular diagnosis, prognosis, drug response, and predisposition to AML patients. In addition, the test was simple, fast, and inexpensive procedure that does not require any special equipment other than a thermo cycler.

#### Introduction:-

**Acute myeloid leukemia** is a clinically and biologically heterogeneous disease and the most common cause of leukemia-related mortality in the United States, with an estimated 19,950 new cases and 10,430 deaths anticipated in 2016 (ACS 2016). Acute myeloid leukemia (AML) is also common among the Saudi Arabian population with a median age at diagnosis of 25 years (range, 0-99 years) among males and 28 years (range, 0-88 years) among females (1).

However, patients with a high risk of relapse, as determined on the basis of cytogenetics, Cell counts on presentation and the presence of FLT3 mutation, are considered for allogeneic bone marrow transplantation. Extramedullary relapse (EMR) occurs in approximately 2% to 8% of all AML cases (2). The occurrence of FLT3 mutations of AML was associated with poor prognosis and significantly change treatment towards FLT3inhibitor (3-4). The FLT3 gene is a member of class III receptor tyrosine kinase family, including c-kit, c-fms, and the platelet-derived growth factor receptors (5). FLT3 length mutations (FLT3-LM or FLT3-ITD for “internal tandem duplication”) represent one of the most frequent genetic alterations in AML. They show a frequency of 20% to 27% in AML in adults (6) and of 10% to 16% in childhood cases (7).

FLT3 (FMS-like tyrosine kinase 3, CD135) is a type 3 receptor tyrosine kinase that plays important roles in cell survival, proliferation, and differentiation during normal hematopoiesis. Activating mutations of FLT3 are now recognized as the most common molecular abnormality in acute myeloid leukemia and may play a role in other hematologic malignancies as well (8). FLT3-LM mostly are represented by internal tandem duplications and/or insertion-deletion mutations in exons 11 and 12 of the human FLT3 gene on chromosome 13q12, which codes for the juxtamembrane domain of the FLT3 protein. The mutations are heterogeneous and consist of internal tandem duplications of 6 to 30 amino acids, resulting in an elongated FLT3 protein with constitutive PTK activity. In addition to the juxtamembrane domain mutations, mutations in the tyrosine kinase domain (FLT3-TKD) have also been described in AML (9).

FLT3-TKD mutations are small mutations in the activation loop of FLT3, mostly representing point mutations in codon D835 or deletions of codon I836. These mutations alter the configuration of the constitutive activation, resulting in increased access of substrates and ATP that leads to autophosphorylation and subsequently triggers various intracellular signaling pathways (10). They induce constitutive tyrosine phosphorylation leading to activation of the receptor tyrosine kinase and are supposed to represent gain-of-function mutations (11). Corresponding activation loop mutations have been reported at position D816 of KIT (CD117 or proto-oncogene c-Kit) and also in other receptor tyrosine kinases. Most often, these result in replacement of aspartate at the 835<sup>th</sup> position by another amino acid (e.g. tyrosine, histidine, valine, or glutamate) (12). PCR-RFLP (restriction fragment length polymorphism) using EcoRV is one of the methods of detection for FLT3-TKD. It is important to note that digestion by EcoRV could not detect all FLT3-TKD mutations (13), however, sequence analysis showed that 50 – 68% of FLT3-TKD mutations were substitutions of the first nucleotide of codon D835, most commonly from G to T (14). Traditionally, FLT3-ITD, FLT3-TKD, and NPM1 mutations are detected by PCR followed by electrophoresis or Taqman RQ-PCR (15).

The traditional PCR technique is convenient and less expensive. High-resolution melting (HRM) curve analysis is a homogenous, closed-tube, post-PCR technique for rapidly and efficiently discovering genetic variations in DNA fragments (16), based on the sequence dependent dissociation behavior of DNA when exposed to increasing temperature. A Simplified method for the early detection of *FLT3*-D835Y in AML patients is clinically important in this region of Saudi Arabia especially for determining drug responses, prognosis, and selection of molecular-targeted therapy. *FLT3*-D835Y mutation may provide good predictive criteria of an unfavorable course in AML and could be used to identify patients at a high risk of relapse. This simplified strategy for detection of *FLT3*-D835Y mutations was feasible, reproducible, cheaper and simpler when compared with other methods. Our study aims to establish a conventional cost-effective detection method for *FLT3*-D835Y mutations in patients with acute myeloid leukemia (AML) in Tabuk population.

## Material and methods:-

### Ethical approval:-

The study was ethically approved by the Ethics committee, University of Tabuk.

### Selection of Cases:-

The subjects were recruited from the hematology OPD of King Khaled hospital, Tabuk

### Inclusion Criteria:-

Cytopathologically confirmed AML patients (M0-M2 and M4-M7FAB classification, or with refractory anemia with excess of blasts (RAEB) or refractory anemia with excess of blasts in transformation (RAEB-t) with an IPSS score of  $\geq 1.5$  Patients with therapy-related AML/RAEB/RAEB.

### Sample collection:-

4ml-5ml of venous blood was collected in EDTA vials from AML patients and healthy controls.

### Experimental Design:-

**Genomic DNA extraction:**

DNA extraction was done by using DNeasy Blood Kit (250) cat 69506 from Qiagen as per the manufactures instructions. The QIAamp DNA Blood Mini Kit provides silica-membrane-based DNA purification. The QIAamp DNA Blood Mini Kit was designed for processing up to 200µl fresh or frozen human whole blood. QIAamp Mini spin columns can be easily processed in a centrifuge or on vacuum manifolds. The DNA extract was dissolved in nuclease-free water, and stored at 4°C until use. The DNA quality and yield was assessed using Nanodrop spectrophotometer and agarose gel electrophoresis.

**Allele-specific PCR for FLT3 (D835Y) point mutation:-**

Allele-specific PCR was performed in a final volume of 25µL containing 5 µL of PCR-master mix purchased from Epigentek (USA), 0.25 µL of 25 pmol/µL of each primer as shown in table 1, 17.50µL of Nuclease free water. Finally 2µL of 50ng genomic DNA. The primers were designing using Primer3 software.

**Table: 1 Primers designed for FLT3-TKD c.2503C>A (D835Y)**

Primer		Sequence	Annealing Temp	PCR product
Forward wt	FLT3835CF1	5'-CATAGTTGGAATCACTCATGATATC-3	52.9	193bp

Reverse	FLT3835R	5'-TACTGAAGTTGAGTCTAGAAGAAAGA-3		

**Preparation of PCR mix**

The Methylamp Taq PCR Mix was premixed ready-to-use solution containing all reagents required for PCR (except template, primers and water). Methylamp Taq DNA polymerase ,5x Reaction Buffer: 1 0.4 M Tris-HCl, 0.1 M (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 0.1% w/v Tween-20 ,12.5 mM MgCl<sub>2</sub>: 1x PCR solution – 2.5mM MgCl<sub>2</sub> ,1mM dNTPs of each and remaining nuclease free ddH<sub>2</sub>O as depicted in Table 2. Finally the 2µL of DNA was added from each patient and control separately.

**Thermo cycling conditions**

The thermo cycling conditions for the PCR amplification of Allele-specific primers for FLT3 c.2503G>T (D835Y) point mutation were initial denaturation at 95°C for 10 minutes followed by 40 cycles 95 °C for 45 sec, 57.9°C for 45 sec, and 72°C for 45 sec followed by the final extension at 72°C for 10 minutes. The amplification products were separated by electrophoresis through 2% agarose gel stained with ethidium bromide. The PCR amplification for normal as well as mutant allele of FLT3-TKD c.2503C>A (D835Y) yielded 193bp bands sizes.

**Results:-**

The purity of DNA extracted was checked by using Nanodrop1000 Spectrophotometer from Thermo scientific, USA. All DNA samples were screened for purity by measuring optical density (OD) at 260nm (OD<sub>260</sub>) and 280 nm (OD<sub>280</sub>). DNA concentration (ug/ml) was calculated based on the OD<sub>260</sub> reading. A ratio of ~1.8 was generally accepted as “pure” for DNA .The optimal rang of ratio obtained were 1.7-2 .The DNA 260/230: 1.7-2; Pure DNA

must have a 260/280 ratio between 1.8 and 2. The quality of DNA was checked by running in 1% gel electrophoresis as shown in Figure 1.

#### Allele-specific PCR for FLT3 (D835Y) point mutation:-

The variations in the human DNA sequence between individuals can be an indication of predisposition to disease, affect the response to drug treatment, or more directly be the fingerprint of an inheritable trait or defect. Significant efforts at improving the speed, accuracy and sensitivity of detecting such polymorphisms have led to the development of a number of powerful approaches. Sequence-specific base pairing between the strands of DNA, according to the Watson-Crick model, forms the basis of many detection systems.

Allele-specific PCR presented here allows efficient discrimination of point mutation by allele-specific PCR in a single reaction with standard PCR conditions. A common reverse primer and two forward allele-specific primers with different tails amplify two allele-specific PCR products, which are further separated by agarose gel electrophoresis. PCR specificity is improved by the introduction of a destabilizing mismatch within the 3' end of the allele-specific primers. This is a simple and inexpensive method for SNP detection that does not require intensive PCR optimization. In the present study, two primers were designed one was meant for the amplification of wild allele (C) whereas the other primer was designed to amplify the mutant allele (A) of FLT-TKD gene. But both primers generated a common band of 193bp for normal and mutant genotype as depicted in figure 2.

**Figure 2. FLT3 835 mutation in AML patients and healthy controls:**

L= 100bp Ladder, N= Normal, M=Mutant,

P1 and P2 = Positive for FLT3-TKD mutation

P3,P4,P5= Negative for FLT3-TKD mutation

C1,C2,C3 and C4 Controls samples = Negative for FLT3-TKD mutation

The Allele Specific-PCR based assay for FLT3 (D835Y) mutation was optimized in the Lab . This is the most common KD mutation at codon 835, converting aspartic acid to tyrosine (D835Y). The mutation was detected in 2/5 cases of AML, 0/25 of MPD and 0/5 of ALL cases as depicted in figure 3. It was observed that patients with AML possessed significantly higher frequency of FLT3 D835 mutation (2/5) than other leukemia cases and healthy controls. Interestingly, all the controls were found to be negative for the D835Y FLT3-TKD mutation. FMS-like tyrosine kinase 3 (FLT3) is mutated in approximately a third of acute myeloid leukemia cases, predominantly in the forms of FLT3/internal tandem duplication mutations in the juxtamembrane domain or point mutations in the kinase domain.

**Figure 3. D835Y FLT3-TKD mutation in different subjects**

For routine diagnosis, this characteristic of AS-PCR means that it is a very time-efficient method. It is concluded that allele specific PCR that permits the direct detection of FLT3 c.2503G>T (D835Y) point mutation in AML patients and acts as useful genetic markers for molecular diagnosis, prognosis, drug response, and predisposition to AML patients. The test is therefore a simple, fast, and inexpensive procedure that does not entail any special equipment other than a thermo cycler. Other mutations have also been seen like D835V, D835E, and D835H, converting aspartic acid to valine, glutamic acid, and histidine at residue 835, respectively, mutations converting glycine to glutamic acid at residue 831 (G831E) and arginine to glutamine at residue 834 (R834Q), as well as the deletion of isoleucine at residue 836. They induce constitutive tyrosine phosphorylation leading to activation of the receptor tyrosine kinase and are supposed to represent gain-of-function mutations.(19) Corresponding activation loop mutations have been reported at position D816 of KIT and also in other receptor tyrosine kinases, eg, RET. (20). On dimerization by FL stimulation, wild-type FLT3 activates a series of downstream signaling targets, including the p85 subunit of phosphoinositide 3-kinase (PI3K), growth factor receptor-bound protein 2 (GRB2), proto-oncogene tyrosine-protein kinase SRC, and SH2-containing inositol phosphatase (SHIP), suggesting its involvement in the PI3K and mitogen-activated protein kinases (RAS-MAPK) pathway.

### Discussion:-

The studies on the frequencies of the FLT3-TKD mutations in AML were performed by Abu-Duhier *et al* (n = 97), (21) Yamamoto *et al* (n = 429),(22) Thiede *et al* (n = 979),(23) Moreno *et al* (n = 208),(24) and Fröhling *et al* (n = 224),(25) with AML showing a normal karyotype. According to these studies the FLT3 (D835Y) mutation has an incidence of 5.8% to 7.7% in AML patients and thus are less frequent than the FLT3-length mutation (FLT3-LM) also referred to as FLT3-ITD (internal tandem duplication)(26). Functionally, FLT3/D835Y bone marrow (BM) showed an equivalent or slightly higher engraftment ability compared with wild-type mice, and both are higher than that of the FLT3/ITD mice. These results suggest that the more quiescent HSC pool is not affected by signaling through the FLT3/D835Y mutations and that the FLT3/D835Y mutation does not mobilize the functional HSCs capable of long-term engraftment into cell cycle. According to these studies, FLT3-TKD show an incidence of 5.8% to 7.7% in AML and thus are less frequent than FLT3-length mutation (FLT3-LM) (26). Given the prevalence and propensity for poor outcome in AML patients harboring FLT3 mutations, a sustained effort has been underway to develop targeted inhibitors of the receptor-tyrosine kinase (FLT3-RTK). A variety of compounds have entered clinical trials and some have met with success.

Several FLT3 tyrosine kinase inhibitors have demonstrated in vitro and in vivo activity (28). The signaling properties of both mutation subtypes were suggested by Choudhary *et al* (29) who showed that FLT3-length mutation (FLT3-LM) gain a function over ligand-activated FLT3-wild-type, which is not gained by FLT3-TKD mutations. Gene-expression profiling with microarray analysis showed different gene-expression patterns for FLT3-LM and for FLT3-TKD positive AML. (30)

FLT3-length mutation (FLT3-LM) and FLT3-TKD mutations should be regarded as two biologically and prognostically different mutations within a single gene. The identification of new markers of leukemia and the use of increasingly sophisticated technologies for detection of important mutations should further facilitate routine monitoring of prognosis, MRD and elucidate the features of drug-resistant leukemic cells. The previous studies confirm that FLT3 activating mutations also occur in a significant percentage of AML patients. Early detection of

FLT3 mutations and an intensification of induction therapy might be useful for this group of patients to overcome the poor prognosis. Simplified methodologies for the early detection of FLT3- D835Y mutation in AML patients was clinically important for AML patients in a small region of Saudi Arabia especially for determining drug responses, prognosis, and selection of molecular-targeted therapy.

### Conclusion:-

The allele specific PCR optimization can be potentially useful for the detection of FLT3-TKI (D835Y) gene mutation in AML patients. The test is a simple, fast, and inexpensive procedure that does not entail any special equipment other than a thermocycler and therefore, can be easily optimized in any laboratory for routine use.

Urysohn-type Fredholm integral equation, Bernstein polynomials method, approximate solution.

### Abstract

In this paper a novel technique implementing Bernstein polynomials is introduced for the numerical solution of a class of Urysohn integral equations. These polynomials are utilized to reduce the solution of the given problem to the solution of a system of non-linear algebraic equations. The remaining set of nonlinear equations is solved numerically by using the approach to yield truncated Bernstein series coefficients of the solution function. Several illustrative examples with numerical simulations are provided to support the theoretical claims.

### Introduction:-

The topics of integral equations have been an increasing interest in the past years, because these kinds of equations appear in various fields of applied science and engineering. So, getting solutions with a high level of accuracy for the integral equations is a very important task. Considering that many real-world mathematical problems, especially in the area of applied mathematics are too complicated to be solved in exact terms, the using of numerical methods has been swiftly developed recently. There are many numerical methods for approximating solutions of the linear and non-linear Fredholm integral equations in one and two-dimensional spaces. In the literature cited below, among the numerous works that have been suggested, some famous approaches are listed as well. Eskandarughlu et al. in [1], presented a numerical method based on using spline piece-wise functions and Picard's method for solving the Urysohn -type integral equations. The Adomian decomposition method (ADM) for obtaining approximate series solution of Urysohn integral equations was presented in [2]. The numerical approximation solution of the Urysohn integral equation with two methods has been worked out in [3].

The numerical approximation of this kind of equation has been studied by means of the sinc approximation with the double exponential transformations in [4]. This numerical method combined the sinc Nyström method with the Newton iterative process that involves solving a nonlinear system of equations. Saberi-Nadjafi and Heidari in [4], offered a combination of the Newton-Kantorovich method and quadrature methods for solving nonlinear integral equations. The method solved the nonlinear integral equations of the Urysohn form in a systematic procedure. Also in [5, 6], two iterative schemes based on the homotopy analysis method have been used to the numerical solution of differential equations [7, 8, 9]. On the other hand, the artificial neural networks (ANNs) approach is one of the more applicable methods that have been used for approximating solutions of different kinds of integral equations. For further information on ANNs in this respect see [10, 11]. The ANNs is applied to solve both ordinary and partial differential equations with initial and boundary value problems [12]. In many problems in science and engineering, we have some unknown functions which are too complicated to be determined. The Bernstein polynomials method is one of the earliest analytic-numeric algorithms for approximating the unknown in different kinds of mathematical

Address:- Asst. Prof. Dr., Dept. Of Accounting by IT, Cihan University, Campus, Sulaimaniya, Kurdistan Iraq.

problems. This is an extremely useful way of expressing a complicated function in terms of simple polynomials. The only requirement is that the given function should be smooth. In other words, at a point of interest it must be possible to differentiate the function as often as we please.

### Bernstein Polynomials:-

The general form of the Bernstein polynomials [13-16] of  $n$ th degree over the interval  $[a, b]$  is defined by

$$B_{i,n}(x) = \binom{n}{i} \frac{(x-a)^i (b-x)^{n-i}}{(b-a)^n}, \quad a \leq x \leq b, \quad i = 0, 1, 2, \dots, n \quad (1)$$

Note that each of these  $n + 1$  polynomials having degree  $n$  satisfies the following properties:

1.  $B_{i,n}(x) = 0$  if  $i < 0$  or  $i > n$
2.  $\sum_{i=0}^n B_{i,n}(x) = 1$
3.  $B_{i,n}(a) = B_{i,n}(b) = 0$ ,  $1 \leq i \leq n-1$

Using MATHEMATICA code, the first 11 Bernstein polynomials of degree ten over the interval  $[a, b]$ , are given below:

$$\begin{aligned} B_{0,10}(x) &= (b-x)^{10}/(b-a)^{10} & B_{6,10}(x) &= 210(b-x)^4(x-a)^6/(b-a)^{10} \\ B_{1,10}(x) &= 10(b-x)^9(x-a)/(b-a)^{10} & B_{7,10}(x) &= 120(b-x)^3(x-a)^7/(b-a)^{10} \\ B_{2,10}(x) &= 45(b-x)^8(x-a)^2/(b-a)^{10} & B_{8,10}(x) &= 45(b-x)^2(x-a)^8/(b-a)^{10} \\ B_{3,10}(x) &= 120(b-x)^7(x-a)^3/(b-a)^{10} & B_{9,10}(x) &= 10(b-x)(x-a)^9/(b-a)^{10} \\ B_{4,10}(x) &= 210(b-x)^6(x-a)^4/(b-a)^{10} & B_{10,10}(x) &= (x-a)^{10}/(b-a)^{10} \\ B_{5,10}(x) &= 252(b-x)^5(x-a)^5/(b-a)^{10} \end{aligned}$$

Now the first six polynomials over  $[0, 1]$  are shown in Fig. 1(a), and the remaining five polynomials are shown in Fig. 1(b)

Fig. 1(a): Graph of first 6 Bernstein polynomials over  $[0, 1]$

Fig. 1(b): Graph of last 5 Bernstein polynomials over  $[0, 1]$

### Formulation of Integral Equation in Matrix Form:-

In many applications a matrix formulation for the Bernstein polynomials is useful. These are straight forward to develop if only looking at a linear combination in terms of dot products. Given a polynomial written as a linear combination of the Bernstein basis function [17]:

$$B(t) = C_0 B_{0,n}(t) + C_1 B_{1,n}(t) + \dots + C_n B_{n,n}(t)$$

It is easy to write this as a dot product of two vectors:-

$$[B_{0,n}(t) B_{1,n}(t) \dots B_{n,n}(t)] \begin{bmatrix} C_0 \\ C_1 \\ \vdots \\ C_n \end{bmatrix}$$

Which can be converted to the following form:

$$B(t) = [1 \quad t \quad t^2 \dots t^n] \begin{bmatrix} b_{00} & 0 & 0 & \dots & 0 \\ b_{01} & b_{11} & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \dots & \vdots \\ b_{0n} & b_{1n} & b_{2n} & \dots & b_{nn} \end{bmatrix}$$

Where  $b_{nn}$  are the coefficients of the power basis that are used to determine the respective Bernstein polynomials. We note that the matrix in this case is lower triangular. In the quadratic case (i.e.  $n=2$ )

The matrix Representation is:-

$$B(t) = [1 \quad t \quad t^2] \begin{bmatrix} 1 & 0 & 0 \\ -2 & 2 & 0 \\ 1 & -2 & 1 \end{bmatrix} \begin{bmatrix} C_0 \\ C_1 \\ C_2 \end{bmatrix}$$

The cubic case = 3 , the matrix Representation is:-

$$B(t) = [1 \quad t \quad t^2 t^3] \begin{bmatrix} 1 & 0 & 0 & 0 \\ -3 & 3 & 0 & 0 \\ 3 & 6 & 3 & 0 \\ -1 & 3 & -3 & 1 \end{bmatrix} \begin{bmatrix} C_0 \\ C_1 \\ C_2 \\ C_3 \end{bmatrix}$$

**Solution of a class of Urysohn integral equations:-**

In this section, first we consider the Urysohn integral equation (UIE) of the second kind given by

$$x(t) = f(t) + \int_0^1 K(t, s, x(s)) ds \quad (2)$$

Where  $x(t)$  is the unknown functions to be determined,  $k(t, s, x(s))$ , the kernel is a continuous function,  $f(t)$  being the known function. To determine an approximate solution of (2),  $x(t)$  is approximated in the Bernstein polynomial basis on  $[0, 1]$  as:

$$x(t) = \sum_{i=0}^n a_i B_{i,n}(t) \quad (3)$$

Where  $a_i$ ,  $i = 0, 1, \dots, n$  are unknown constants to be determined using Newton-Raphson method. Substituting (3) in (2), we obtain:

$$\sum_{i=0}^n a_i B_{i,n}(t) = f(t) + \int_0^1 K\left(t, s, \sum_{i=0}^n a_i B_{i,n}(t)\right) ds \quad (4)$$

Now we put  $t = t_j$ ,  $j = 0, 1, \dots, n$  in (4),  $t_j$ 's being chosen as suitable distinct points in  $[0, 1]$ , such that  $t_0 = 0$ ,  $t_n = 1$ , and  $t_j = t_0 + jh$ , where  $h = (1 - 0)/n$ . Putting  $t = t_j$ , we obtain the nonlinear system:

$$\sum_{i=0}^n a_i B_{i,n}(t_j) = f(t_j) + \int_0^1 K\left(t_j, s, \sum_{i=0}^n a_i B_{i,n}(t_j)\right) ds \quad (5)$$

The nonlinear system (5) can be solved by standard methods for the unknown constant  $a_i$ 's. These  $a_i$ ,  $i = 0, 1, \dots, n$  are then used in (3) to obtain the unknown function  $x(t)$  approximately.

The following algorithm summarizes the steps for finding the approximate solution for the second kind of nonlinear Urysohn integral equation.

**Algorithm (BPNUIE):****Step (1):**

Assume  $t_0 = 0$ ,  $t_n = 1$ , and  $t_j = t_0 + jh$ , where  $h = (1 - 0)/n$ .

**Step (2):**

Putting  $t = t_j$  in (4) to obtain nonlinear System (5).

**Step (3):**

Solved the nonlinear system (5) to calculate the unknown  $a_i$ ,  $i = 1, \dots, n$ .

**Step (4):**

Used  $a_i$  in (3) to obtain the function  $x(t)$  approximately.

**Numerical Examples:-**

In this section, the method presented in this paper is used to find numerical solution of two illustrative examples. The solution of the equations obtained here. All calculations in the following tables are performed using Matlab.

**Example1.** [4] Let us solve the Urysohn integral equation:

$$\int_0^1 \cos(\pi x) \sin(\pi t) y^3(t) dt = 5(y(x) - \sin(\pi x)), \quad 1 \leq x \leq 1,$$

By the explained Bernstein series method. The exact solution corresponding to this equation is  $y(x) = \sin(\pi x) + 1/3(20 - \sqrt{391})\cos(\pi x)$ .

For  $n = 4$ , the original integral equation is reduced to a fundamental non-linear system. The iterative process yields the results which have been gathered in Table 1. Figure 2 shows the exact solution and the approximate solution.

**Table 1:-** Numerical results for Example 1.

**Fig. 2:-** Comparison of the exact and approximate solutions for Example 1.

**Example2.** [5] Consider the Urysohn integral equation:

$$\int_0^1 (x-t)y^2(t)dt = y(t) - \ln(4(x+1)(1-x\ln 2 + x)^2) + 2x + \frac{5}{4}$$

With the exact solution  $y(x) = \ln(x+1)$  and use the present method for finding its approximate solution. The iterative process yields the results which have been gathered in Table 2. Figure 3 shows the exact solution and the approximate solution.

**Fig. 3:-** Comparison of the exact and approximate solutions for Example 2.

It follows from the results of these examples that  $y_n(x)$  converge as  $n \rightarrow \infty$  to the exact solution  $y(x)$  of the integral equation. A successful choice of the "zeroth" approximation can result in a rapid convergence of the procedure.

### Conclusion:-

In this paper, we presented a useful numerical method that originated mainly from the Bernstein polynomials for solving Urysohn type integral equation. As we explained above, this method converts the present problem to a system of non-linear algebraic equations which may not be solvable easily. Having determined the unknown Bernstein coefficients of the solution function, the series solution is produced for numerical purposes immediately. It is important to be noted that, the more terms must be evaluated to the higher accuracy level. The obtained numerical results from analyzed examples illustrated that in applications involving computations with polynomials, the Bernstein form offers an efficient algorithm for many basic functions.

Cutaneous Adverse drug reactions,  
 WHO Scale, Naranjo's Scale

#### Abstract

**Background:** Cutaneous Adverse drug reactions (CADRs) are among the most frequent Adverse Drug Events (ADEs). Considering their impact on patient's lives and relatively high incidence, identifying the risks and monitoring of CADRs is of great clinical significance to prevent patient from unwanted exposure to drug toxicity.

**Objective:** To determine the prevalence of different types of CADR's and there causal relationship with the offending drug.

**Material & methods:** A prospective, observational and non-invasive study was carried out in Department of Dermatology at a Tertiary care hospital for duration of 6 months. Patients with 18 years or higher with visible skin lesions suspected to be drug related were included. Assessment was carried out by WHO, Naranjo's and Hartwig and Siegel's classification graded on a 3-point scale. Descriptive statistics were used to examine the normality of data and describe the analysis.

**Results:** A total of 95 cases of suspected Cutaneous ADRs were recorded from a total population of 10,000 patients, among which 90 cases were analyzed showing 34 cases (37.8%) males and 56 (62.2%) females. Maximum patients belonged to the age group of 21-30 years (34.4%). The total Prevalence was found to be 0.9%, in which the highest Prevalence was seen in females (0.56%). The most common CADR observed was Steroid induced acne (38.6%) and most common group of offending drugs were Topical corticosteroids (38.8%). According to WHO and Naranjo's scale most of the observed cases were classified as Probable (97.8%) and as per the Hartwig and Siegel's classification, 56 cases (62.2%) were Moderate in severity. One case (1.1%) was fatal.

**Conclusions:** A wide range of clinical spectrum of CADRs was observed. Out of which Steroid induced acne was the most common Cutaneous ADRs seen. Topical corticosteroids were the most common offending agent with highest Prevalence in females. Most of the cases were of Probable and Moderate in severity. Fatal case was observed with Toxic epidermal necrolysis. Further identification and reporting

### Introduction:-

Adverse drug events (ADEs) are among the major challenges in modern medicine. Adverse drug reaction (ADR) has been defined in many ways. WHO defines ADR as any response to a drug which is noxious and unintended, and which occurs at doses normally used in man for prophylaxis, diagnosis, therapy of disease, or for the modification of physiological function.<sup>1</sup> A Cutaneous Adverse reaction caused by a drug is any undesirable change in the structure or function of the skin, its appendages or mucous membranes, and it encompasses all adverse events related to drug eruption, regardless of the etiology.<sup>2</sup>

In India epidemiological studies estimated that ADRs are fourth to sixth leading cause of death.<sup>3</sup> ADRs are one of the leading causes of morbidity and mortality, adding to overall healthcare cost. It is estimated that approximately 2.9–5.6% of all hospital admissions are caused by ADRs and as many as 35% of hospitalized patients experience an ADR during their hospital stay.<sup>4</sup>

Almost any medicine can induce skin reactions, and certain drug classes, such as non-steroidal anti-inflammatory drugs (NSAIDs), antibiotics and antiepileptic drugs, have drug eruption rates approaching 1–5%.<sup>5</sup> Most of the Cutaneous drug reactions are not serious but some are severe and potentially life-threatening. Serious reactions include Angioedema, Erythroderma, Stevens–Johnson syndrome (SJS) and Toxic epidermal necrolysis (TEN). Drug eruptions can also occur as a result of multi-organ involvement, as in Drug-induced Systemic lupus erythematosus. Drug reactions can be classified into immunologic and non-immunologic etiologies. The majority about 75–80% of adverse drug reactions are predictable & non-immunological in origin, the remaining 20–25% of adverse drug events are immune-mediated or unpredictable reactions. Skin reactions as a result of non-immunological causes are more common and include cumulative toxicity, overdose, photosensitivity, drug interactions, and metabolic alterations.<sup>6</sup>

Adverse drug reactions (ADRs) are a major cause of morbidity, hospital admission, and even death. Hence it is essential to recognize ADRs and to establish a causal relationship between the drug and the adverse event. It is desirable that ADRs should be objectively assessed and presented. Majority of CADR is diagnosed clinically. These reactions may differ with different classes of drugs. Generating data is essential to understand the pattern of CADR of different classes and generating information regarding offending drugs.<sup>3</sup> Recognition of the offending drug enables early withdrawal and improved outcomes. This will help the doctors to ensure safe drug usage and be aware of offending drugs thereby reducing morbidity and mortality. Observational studies are tools to know the pattern of reactions and causative drugs.

### Objectives:-

The objective of this study was to observe the types of Cutaneous Adverse drug reactions (CADRs) in the patients attending the Dermatology Department, Prevalence of Cutaneous Adverse drug reaction at Tertiary Care Hospital, to determine causal relationship with final outcome of CADR and to recognize the offending drug, to determine the severity index of the adverse reactions, prevent CADR and minimize hospitalization, to achieve a better treatment outcome and improve productivity and health.

### Materials and Methods:-

It was a prospective, observational, non-invasive study carried out at Out Patient and Inpatient Department of Dermatology at Osmania General Hospital, Hyderabad over a period of six months (January 2015–June 2015).

### Inclusion criteria:-

- Patients of either sex as inpatients and outpatients attending Dermatology Department.
- Patients more than 18 years of age.
- All patients attending Dermatology department, presented with visible skin lesions suspected to be drug related included in the study.

**Exclusion Criteria:-**

- Patients less than 18 years of age.
- Patients without visible skin lesions.
- Patients who could not recall the name of the suspect medicines consumed.
- If lesions turned out to be disease related (e.g., viral exanthemas, rash of rickettsial infections, and collagen vascular disease,) on closer examination.
- Patients who reported to have consumed indigenous (ayurvedic and homeopathic) medicines were also excluded.
- Patients unable to respond to verbal questions.

Demographic data like patient name, age, sex, brief description of the suspected ADR, Information about the suspected drug were recorded in the case collection form. Each case was assessed for its causality using the WHO-UMC assessment scale<sup>7</sup> and Naranjo's scale<sup>8</sup> of which Unlikely, Conditional or Unassessable cases were excluded. The final diagnosis of CADR was based on history of drug exposure, clinical findings and under supervision of consultant Dermatologist. Severity of ADRs was evaluated by Hartwig and Siegel's classification graded on a 3-point scale.<sup>9</sup>

**Results:-**

During the study period, a total of 95 cases of suspected Cutaneous ADRs were recorded from a total population of 10,000 patients attended the Dermatology Department from January 2015 to June 2015, out of which 5 cases were excluded because the offending drug was not identified or the data was insufficient to make any analysis. The remaining 90 cases were analyzed, among which one case was fatal. Maximum patients belonged to the age group of 21-30(34.4%), followed by 18-20 age group (22.2%), 31-40 age group (20%), 41-50(13.3%), >50 age group(10%). The total prevalence was found to be 0.9 (90%), in which the highest prevalence was seen in females (P=0.56/56%) and the prevalence of males was found to be 0.34 (34%). Table 1 shows the description about the age distribution, gender distribution and prevalence of CADR. Figure 1(a) shows details of age distribution pattern of CADR encountered during the study. 34 cases (37.8%) were males and 56 cases (62.2%) were females showing Female predominance. Figure 1(b) shows sex distribution patterns seen during the study. Figure 1(c) shows the Prevalence rate of the CADR.

The most common pattern of Cutaneous ADR observed was Steroid induced acne (38.6%). The second common CADR seen was Fixed drug eruption (FDE) (13.3%) followed by Erythematous rash (11.1%), Toxic Epidermal Necrolysis (TEN) and Urticaria recording (7.5%). Among which one was fatal experienced from TEN. Steven Johnson Syndrome recorded (4.4%). About (3.3%) of Vasculitis and Erythema was observed. About (2.2%) were seen with Erythroderma, Photosensitivity reaction and Drug rash eosinophilic systemic syndrome (DRESS). Alopecia, Exfoliative Dermatitis, Infectious eczema dermatitis, and Acanthosis like-nigricans were identified in only about (1.1%). Table 2 and Figure 2 show details of the Clinical patterns of CADR encountered during our study.

The most common group of offending drugs responsible for Cutaneous ADRs were Topical corticosteroids (38.8%), among which Betamethasone recorded the highest incidence of CADR followed by Antibiotics (24.8%), among which Ciprofloxacin was the common offending drug seen followed by Metronidazole, Tetracycline, Amoxicillin, 1 case was seen with each of Cotrimoxazole, Ceftriaxone and Dapsone. Use of tetracycline in one patient was fatal. Use of Anti-epileptic drugs was seen in (15.4%), where Phenytoin recorded the highest number of ADRs. NSAIDs were seen in (10%), (3.3%) with Anti-tubercular drugs, Oral and Parental corticosteroids with (3.3%). Rare cases about (1.1%) were seen with Antifungal (Fluconazole), Opioid Analgesic (Tramadol), Angiotensin converting enzyme inhibitors (ACEI) (Captopril), and Non-nucleoside reverse transcriptase inhibitor (NNRTI) (Efavirenz). Table 3 and Figure 3 shows detail results of therapeutic drugs classes implicated in CADR encountered in this study.

**Causality Assessment:-**

90 cases of CADR were assessed as per WHO and Naranjo's Scale. According to Naranjo's Scale, most of the cases were Probable (97.8%) and (2.2%) showed a Definite score. According to WHO Scale (2.2%) scored Certain, remaining all (97.8%) were of Probable. Unlikely, conditional, unclassifiable were excluded from the study Table 4 and Figure 4 show details of Causality Assessment of CADR based on Naranjo's and WHO scale.

**Severity Index:-**

Severity of CADR was assessed as per the Hartwig and Siegel's classification graded on a 3-point scale. The results of assessment of the severity index revealed that most of the cases were Moderate in severity accounting for (62.2%), followed by Mild with (26.7%) and (10%) were identified as Severe. One case (1.1%) was fatal. Table 5 and Figure 5 show the details of Severity Assessment of CADR encountered during the study period.

**TABLE 1:- AGE, SEX AND PREVALENCE OF CADR**

Age group	Males	Total no. of ADRs = 90	Total population 10,000	Females	Total no. of ADRs = 90	Total population 10,000	Total	Total no. of ADRs = 90	Total population 10,000

### Discussion:-

A Prospective, Observational and non-invasive study was carried out for a period of 6 months recording 95 cases, from a total population of 10, 000 patients attended the Dermatology Department, out of which 5 cases were excluded because the offending drug was not identified or the data was insufficient to make any analysis. The remaining 90 cases were analyzed, among which one case was fatal. Of the 90 cases, 34(37.8%) were males and 56 (62.2%) were females contributing to female preponderance, which was similar to that of studies reported in the literature by **Ruchika Nandha, et al (2011)<sup>10</sup>**, **V Sudershan et al (2011)<sup>11</sup>**, **Saraswoti neupane and Surya Raj Sharma (2012)<sup>12</sup>**, **Akram Ahmed et al (2012)<sup>13</sup>**, **Mahmood Farshchian et al (2015).<sup>14</sup>** Unlike in study of **Shalini Chawla et al (2011)<sup>15</sup>** and **Tejas K Patel, Sejal H Thakkar, DC Sharma- Review (2015)<sup>16</sup>** which showed male preponderance.

In our study, highest percentage of CADR was recorded in the age group of 21- 30 showing (34.4%) which is in accordance with studies reported by **Shalini Chawla et al (2011)<sup>15</sup>** where the mean age of patients who experienced CADR was 32, and **V Sudershan et al (2011)<sup>17</sup>** reported higher incidence in adult age group of 21-30 years. Adverse drug reactions reported in our study showed maximum incidence with the application of Topical corticosteroids (38.8%), followed by Antibiotics (24.8%), among which Ciprofloxacin was the common offending drug. (15.4%) were seen in patients who administered Anti-epileptic drugs where Phenytoin recorded the highest number of ADRs. NSAID was about (10%). Antitubercular, Oral and Parenteral corticosteroids were the offending agent recording (3.3%). Rare cases (1.1%) were seen in patients taken Antifungal agents, Opioid Analgesic, Angiotensin converting enzyme inhibitors (ACEI), and Non-nucleoside reverse transcriptase inhibitor (NNRTI). Studies carried out by **Bharani Kalpana R, et al (2014)<sup>18</sup>** have reported that oral Antimicrobials, Injectable Antimicrobials, NSAID's and Topical Steroids (Betnovate) were the leading cause of ADRs .All the other literature articles showed the highest offending drug to be Antimicrobials accounting for nearly 50% of the cases, followed by NSAIDs, Antiepileptic.

The common clinical pattern of Cutaneous ADR observed in our study was Steroid induced acne recording about (38.6%). The second common CADR was seen is Fixed drug eruption (FDE) with about (13.3%) followed by Erythematous rash that showed (11.1%), Toxic Epidermal Necrolysis (TEN) and Urticaria recording (7.5%).in which 1 was fatal with TEN wherein similar mortality with TEN was seen in the study of **Saraswoti neupane and Surya Raj Sharma (2012)<sup>12</sup>** Steven Johnson Syndrome (SJS) were identified in (4.4%). About (3.3%) of Vasculitis and Erythema was observed, (2.2%) were seen with Erythroderma, Photosensitivity reaction and Drug rash

eosinophilic systemic syndrome (DRESS). Rare cases about (1.1%) was seen in Alopecia, Exfoliative Dermatitis, Infectious eczema dermatitis, and Acanthosis like nigricans. Unlike in other studies Fixed drug eruption was the highest recorded clinical pattern of ADR by **Saraswoti neupane and Surya Raj Sharma (2012)**<sup>12</sup>. Some studies have observed urticaria and exanthematous rash as offending agents by **Karamsad Suthar J.V1 and Desai S.V (2011)**<sup>19</sup> recording both about 31.42%, whereas studies by **Balpande K.G., et.al (2013)**<sup>20</sup> recorded (32.75%) and (26.72%) respectively. Acute urticaria was the most common clinical presentation (59.2%) in the study by **Mahmood Farshchian et al (2015)**<sup>14</sup>

According to Causality assessment as per the Naranjo's scale, (2.2%) scored Definite, Remaining all about (97.8%) scored Probable and as per the WHO scale (2.2%) scored Certain, rest all (97.8%) were of Probable. Unlikely, conditional, unclassifiable were excluded from the study. Most of the studies showed the same assessment data giving high incidence of Probable cases about (55.89%) reported by **Mena Shrivastava et al (2011)**<sup>21</sup>, and about (90.62%) as reported by **Palanisamy S, Arul Kumaran KSG, Rajasekaran A (2009)**<sup>22</sup> and about (78.26%) reported by **Himangshu Mahato et al (2014)**<sup>23</sup>

The results of assessment of the severity index revealed most cases with Moderate about (62.2%), followed by Mild about (26.6%). (10%) were identified as Severe. One case (1.1%) was fatal which was similarly seen in the study by **Saraswoti neupane and Surya Raj Sharma (2012)**<sup>12</sup> In our study all the cases were Type B (Bizarre type) which was similarly seen in the study by **Karamsad Suthar J. and Desai S.V (2011)**<sup>19</sup> where 100% ACDRs were Type B (Bizarre immunological allergic drug reaction).

### **Conclusion:-**

Clinical patterns and the drugs causing ADR are remarkably similar to those observed in other studies except for minor variations. A wide clinical spectrum of Cutaneous ADRs ranging from Steroid induced acne to Fixed Drug Eruption (FDE), Erythematous rashes, serious Toxic Epidermal Necrolysis (TEN), Urticaria, Steven Johnson Syndrome (SJS) and Drug Rash Eosinophilic Systemic Syndrome (DRESS) was observed. Out of which Steroid induced acne was the most common Cutaneous ADRs seen. Topical corticosteroids were the most common and among which Betamethasone was offending agent causing Cutaneous ADRs. The study demonstrated the causal relationship that was established using WHO and Naranjo's algorithm. It was evaluated that majority of the cases assessed were "probable", with few cases of "certain". Analysis revealed the severity of Cutaneous ADR that showed majority of the cases as moderate followed by mild and severe. Fatal case was seen with TEN. These variations may be explained by the differences in drug usage patterns and short duration of the study. The aim of the study was achieved by assessing the prevalence, causality and severity assessment, offending drugs involved in CADR and clinical patterns recorded during the course of study. This helps in prevention and early detection of CADR and can be used as a guide to healthcare professionals to communicate more effectively regarding the management of such conditions.

Laparoscopic Cholecystectomy

### Abstract

Gall stones may be said to be contributing to varied pathology affecting gall bladder ranging from chronic cholecystitis to carcinoma. Cholelithiasis produces diverse histopathological changes in gall bladder mucosa namely acute inflammation, chronic inflammation, cholestasis, hyperplasia and carcinoma. The study was performed on a group of 118 patients who were admitted in department of surgery for cholecystectomy (laparoscopic) during period of 1 year and 16 days. Patients were divided in two groups based on S.Ferritin levels and histopathological examination of these patients was done. In both the groups, majority of subjects were diagnosed as chronic cholecystitis on histopathology. There is one interesting finding that acute cholecystitis is more prevalent in iron deficient cases. A finding suggesting higher prevalence of acute cholecystitis in iron deficient case might indicate if acute cholecystitis may be prevented using iron supplements. To establish this correlation a study with large sample size may be done.

### Introduction:-

A gallstone is a stone formed within the gallbladder out of bile components. Most people with gallstones (about 80%) never have symptoms. Complications of gallstones include inflammation of the gallbladder, inflammation of the pancreas, and liver inflammation. In those who are having gallbladder attacks surgery to remove the gallbladder is typically recommended. This can be either done through several small incisions or through a single larger incision. Surgery is typically done under general anesthesia. Among gastroenterological diseases, Gallstone disease is one of the world's most expensive medical conditions<sup>1</sup>. In the United States, there are more than 500 000 cholecystectomies, the total cost of which exceeds 5 billion dollars<sup>2</sup>.

Women are three times more likely to develop gallstones than men, and first-degree relatives of patients with gallstones have a twofold greater prevalence.<sup>3</sup>

Many conditions affecting gall bladder are characterized by finding of associated gallstones. Gall stones may be said to be contributing to varied pathology affecting gall bladder ranging from chronic cholecystitis to carcinoma. Cholelithiasis produces diverse histopathological changes in gall bladder mucosa namely acute inflammation, chronic inflammation, cholesterosis, hyperplasia and carcinoma. The prevalence of gallstone disease varies with age, sex and ethnic group. In India, gallstone disease is 7 times more common in the north as compared to the south. It is mainly due to dietic influence. <sup>4</sup>The histopathological diagnosis in most of the cholecystectomy specimens is chronic cholecystitis. However, other diverse, but benign histopathological changes of gallbladder mucosa are also seen namely acute inflammation, cholesterosis, metaplasia and hyperplasia. Very rarely cholecystectomy specimen may reveal an unexpected gallbladder carcinoma. Similarly, surgery is performed in clinically suspected (often supported by radiological and other investigational corroborative findings) cases of Gall bladder malignancy. Still in many cases cholecystectomy performed with provisional diagnosis of benign diseases based on clinical, ultrasonological and computerized tomographic scanning misses a significant number of early malignant lesions of gallbladder. <sup>5</sup>

### Material and Methods:-

This prospective study was conducted in the Department of Surgery in collaboration with Department of Pathology at tertiary care hospital, Lucknow, India. The ethical committee of the institute approved the study protocol.

The study was performed on a group of 118 patients who were admitted in department of surgery for cholecystectomy (laproscopic) during period of 1 year and 16 days

Patients suffering from cholelithiasis confirmed by Ultrasonography and admitted in the surgical ward for cholecystectomy were included in the study irrespective of their age, sex and parity. Both laparoscopic and open cholecystectomies were the procedures advocated for treatment. Patients suffering from empyema and mucocele of the gall bladder were excluded from this study.

Serum iron was estimated by time end point method with ferroZine reagent<sup>125</sup>. The normal reference values were supplied with the kit, for males (60-158 µg/dl) and for females (35-145 µg/dl).

All the gallbladder specimens collected during laproscopic cholecystectomy were submitted for histopathological examination in department of pathology. These specimens were analysed for histopathological changes in relation to gall stone disease.

### Observation:-

A total of 86 (72.9%) patients comprised Group I which comprised of patients having Serum ferritin levels within normal range (>60 µg/dl for males and >35 µg/dl for females). Remaining 32 (27.1%) subjects were anemic subjects with serum ferritin levels below normal range (<60 µg/dl for males and <35 µg/dl for females). Thus the ratio of iron deficient to non iron deficient patients in present study was 0.37:1

### Distribution of subjects according to Histopathological findings.

S.No.	HPE Findings	Total		Group I (n=86)		Group II (n=32)	
		No.	%	No.	%	No.	%
1.	Cholesterosis	1	1.2	1	1.2	0	0
2.	Acute Cholecystitis	16	13.5	11	12.8	5	15.6
3.	Chronic Cholecystitis	82	69.4	58	62.8	24	75.1
4.	Chronic cholecystitis with Pericholecystitis	5	4.2	3	3.5	2	6.3
5.	Chronic granulomatous cholecystitis	8	6.7	7	8.1	1	3.1
6.	Xanthocholecystitis	6	7.0	6	7.0	0	0

$$\chi^2=4.219(df=5); p=0.518$$

**Fig.1. Distribution of subjects according to Histopathological findings.**

Histopathological findings in 118 cases were studied. Of these 86 cases belong to group I and 32 belong to group II.

Acute cholecystitis was found in 16 cases, chronic cholecystitis in 86 cases, chronic cholecystitis with pericholecystitis in 5 cases, chronic granumatoscholecystitis in 8 cases and xanthocholecystitis in 6 cases.

In both the groups, majority of subjects were diagnosed as chronic cholecystitis on histopathology. Statistically, the difference between two groups was not significant ( $p=0.636$ ).

There is one interesting finding that acute cholecystitis is more prevalent in iron deficient cases.

**Image 1:- Cholesterosis with biliary sludge.**

Cholesterosis was seen in 1 case only (image.1). There was no inflammatory reaction in the wall of gallbladder. Foamy macrophages seen in lamina propria and epithelium, mucosal hyperplasia.

**Image 2:-** Acute cholecystitis

Acute cholecystitis was found in 16 cases (image.2). There are signs of inflammation present in gallbladder wall. The microscopic features are classical for acute inflammation and include hyperemia, polymorphonuclear leukocyte infiltration, edema and necrosis of the wall of the gall bladder.

**Image 3:-** Chronic cholecystitis with impacted stone.

**Image 4:-** Chronic cholecystitis with impacted cholesterol stone

Chronic cholecystitis was found in 86 cases (image.3, image.4). The gallbladder wall has mild chronic inflammation with rokitansky-Aschoff sinuses, smooth muscle hypertrophy, hyalinized collagen, lymphoid aggregates, variable mucosal changes.

**Image 5:-** Chronic granulomatous cholecystitis (cholesterol granuloma)

**Image 6:-** Chronic cholecystitis with foreign body granuloma

Chronic granumatoscholecystitis in 8 cases (image.7, image.8). Gallbladder wall is has multinucleated cells with granulomatous changes. There is rupture of Rokitansky-Aschoff sinuses with extravasation of bile, foamy macrophages with bile or iron, cholesterol clefts and multinucleated giant cell.

### **Discussion:-**

Over ninety one per cent patients presented with pain upper abdomen, a number significantly lower than that reported by Laghari et al where all patients had upper abdominal pain.<sup>6</sup> None of the patients in our study had any evidence of malignancy either clinically or on ultrasound examination.

The present study was carried out on 118 cholecystectomy specimens to determine the histopathological spectrum of gallbladder diseases. Histopathology not only establishes a tissue diagnosis in gallstone disease, but also contributes towards understanding its etiopathogenesis and can help in planning future treatment modality.

The most common histopathological finding in our study was chronic cholecystitis; 82 specimens were reported as chronic inflammation with mucosal ulceration, denudation, metaplasia to dysplasia and wall infiltration by chronic inflammatory cells like neutrophils, macrophages, plasma cells and varying degrees of fibrosis. A similar study by Memon<sup>7</sup> also reports chronic cholecystitis as major histopathological finding, identified in 64.8% cases. In both the groups, majority of subjects were diagnosed as chronic cholecystitis on histopathology. Statistically, the difference between two groups was not significant ( $p=0.181$ ) which suggests that there is no role of iron levels in histopathology of gall bladder.

Gallbladder polyps have an incidence ranging from 4.6 to 6.9 per cent<sup>8</sup>. In our study, no case of gallbladder polyp was identified. This low incidence can be attributed to small number of cases in our series. The prevalence of this pathology is much higher amongst males<sup>9</sup>.

Although there are myriad of premalignant conditions, carcinoma gallbladder has a strong association with gallstones<sup>10</sup>. The strong association between the two warrants attention paid to histopathology of specimen in all cases undergoing cholecystectomy for cholelithiasis, irrespective of presence or otherwise of any gross abnormalities. It is widely reported that long standing mucosal irritation by the stones cause atypical cellular changes and increased cellular proliferation. It has been hypothesized that in long standing cases, these areas of hyperplasia progress to metaplasia and carcinoma-in- situ<sup>11</sup>. Studies confirm presence of such changes in the vicinity of gallbladder carcinoma<sup>12</sup>.

There is one interesting finding in our study that acute cholecystitis was more prevalent in iron deficient cases which can be studied with large sample size.

### Conclusion:-

The histopathological spectrum of gallbladder disease after cholecystectomy was found to be quite diverse. The most common histopathological diagnosis in gallstone disease was chronic cholecystitis, which was associated with a variety of mucosal alterations and lesions like cholesterosis, metaplasia, empyema and adenomyoma. A finding suggesting higher prevalence of acute cholecystitis in iron deficient case might indicate if acute cholecystitis may be prevented using iron supplements. To establish this correlation a study with large sample size may be done.

### HELICOBACTER PYLORI ERADICATION EFFECT ON LIVER FAT CONTENT IN PATIENT WITH NON-ALCOHOLIC FATTY LIVER DISEASE.

Ahmed H. Arnaout.

Lecturer of internal medicine, faculty of medicine, Zagazig University.

#### Manuscript Info

##### Manuscript History

Received: 24 November 2016

Final Accepted: 25 December 2016

Published: January 2017

##### Key words:-

Helicobacter pylori, Non-alcoholic Fatty Liver Disease, Insulin Resistance, Alanine aminotransferase, aspartate aminotransferase.

#### Abstract

**Background:** Helicobacter pylori (HP) infection role in nonalcoholic fatty liver disease (NAFLD) pathogenesis is controversial.

**Aims:** This study aimed to evaluate the effect of HP eradication on liver fat content (LFC), liver function tests (LFT), lipid profile, and homeostasis model assessment-IR (HOMA-IR) index in NAFLD.

**Patients and Methods:** Patient with dyspepsia and increased serum levels of aminotransferases enrolled in the study. Exclusion criteria were factors affecting aminotransferases levels or HP treatment regimen. Patients with elevated aminotransferases levels and ultrasound findings of fatty liver disease were supposed for NAFLD. NAFLD liver fat score used to classify NAFLD, those with score greater than -0.64 and positive results for urea breath test (UBT), were included. Patients underwent lifestyle modifications and HP eradication. Alanine aminotransferase (ALT), aspartate aminotransferase (AST), alkaline phosphatase (ALP), triglyceride (TG), cholesterol (CHOL), high and low-density lipoprotein (HDL, LDL), fasting serum glucose (FSG), LFC, and HOMA-IR were checked at baseline, after eight weeks and twenty four weeks.

**Results :** One hundred twenty patients (58 males) with the mean age of 45.39 ( $\pm 9.24$ ) were included with repeated ANOVA measurement showed a significant reduction in anthropometric measurements, laboratory parameters (except for HDL) and LFC in both groups during the study; however, no significant difference was observed between the groups.

**Conclusions:** HP eradication per se might not affect LFT, lipid profile, LFC, and insulin resistance in dyspeptic NAFLD patients

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

Recently the relation between the gut microbes and the development and progression of liver cell damage has come to interest, regarding to this, helicobacter pylori (HP) deoxy-ribonucleic acid (DNA) was detected in patients with different causes of chronic liver disease (CLD) including non-alcoholic fatty liver disease (NAFLD) (1-4). Regardless of HP DNA existence in liver samples, no bacteria could be cultured (5).

**Corresponding Author:- Ahmed H. Arnaout.**

Address:- lecturer of internal medicine, faculty of medicine, Zagazig university.

Different theories for the mechanisms of the NAFLD development in patients with HP infection were issued, one proposed that HP species would produce liver specific toxin causes liver cell damage (6), another one suggested that HP invasion to intestinal mucosa might increase gut permeability and allow the bacterial endotoxin to pass via the portal vein to the liver (7). Because HP eradication is not such difficult in most cases, discovering its role in diseases apart from the stomach could be of great importance for public health, currently the way in which HP eradication would affect clinical state of patients with NAFLD is not well cleared (8-11).

### **Aim of the study:-**

The aim of this study was to determine the short term effect of HP eradication on liver fat content, LFTs, and metabolic profile (biochemical parameters and anthropometric measurements) in a sample of dyspeptic NAFLD patients.

### **Patients and Methods:-**

This study was done as a randomized clinical trial, each of the patients was assigned to treatment or control group, Participants signed a written consent prior to enrollment.

Adult patients referred to the gastroenterology clinic of a general hospital due to increased serum aminotransferase levels were selected. Serum alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels  $\geq 40$  units per liter (U/L) considered elevated (12). Patients with dyspepsia, positive results for anti HP antibody and ultrasonographic evidence of fatty liver were enrolled; the exclusion criteria were factors affecting serum aminotransferase or HP treatment strategy (13). All patients with elevated serum aminotransferase levels in the first blood sampling were rechecked after two months, and persistently elevated serum aminotransferase levels with ultrasonographic criteria for fatty liver supposed to have NAFLD (13). Considering the liver biopsy limitations, 'NAFLD liver fat score' used in enrolled patients to define NAFLD (14), those with NAFLD liver fat score greater than -0.64, and positive results for urea breath test (UBT) were included in the study.

Lifestyle modifications was provided to all participants and it consisted of providing calorie-restricted diets and programmed physical activity to achieve ideal body weight based on the guidelines for the diagnosis and management of NAFLD : update 2010 (15) with avoiding of rapid weight loss as it could worsen NAFLD (16), A dietitian checked the patients and controlled their calorie intake.

The patients in treatment group received quadruple treatment with omeprazole (20 mg twice daily), amoxicillin (1 g twice daily), bismuth subcitrate (240 mg twice daily), and clarithromycin (500 mg twice daily) for two weeks (17), the patients requested to bring used packages at the follow up visits weekly, evaluated for compliance and any potential side effects.

The percent of the liver fat content calculated based on the validated formula (14), A radiologist did the liver ultrasonography, the echogenicity of the right lobe of the liver compared to the right kidney with a 3.5 megahertz probe to identify fatty liver (18).

HP antibody (IgG) measured using a quantitative enzyme-linked immunosorbent assay technique, UBT performed by Helioprobe test kit to detect HP infection and eradication. Eradication investigated six weeks after the end of treatment (19). Waist circumference (WC) measured at midpoint between the lower border of rib cage and the top of iliac crest at the end of expiration (20). After a twelve-hour overnight fast, sera of the patients were tested for fasting serum glucose (FSG), ALT, AST, alkaline phosphatase (ALP), triglyceride (TG), cholesterol (CHOL), low-density lipoprotein (LDL) by enzymatic methods (13). Serum insulin concentrations measured based on an enzyme immunoassay. Quantitative measurement of insulin resistance (IR) was done by homeostasis model assessment-IR (HOMA-IR =fasting serum insulin  $\times$  fasting serum glucose/22.5) (21). Diabetes mellitus (DM) was diagnosed either previous diagnosis of DM or if FBS equal or greater than 126 mg/dl after double check.

Primary outcome measure was change from baseline fat content at 6 months. Secondary outcome measures were changes from baseline LFT, metabolic parameters, and anthropometric measurements at 6 months.

A statistical power analysis used to calculate the sample size. Considering the two-sided level ( $\alpha$ ) of 0.05 and the power of 90% ( $\beta = 0.1$ ), a total sample size of 46 patients was determined to detect one percent inter-group difference in liver fat content. 60 patients were enrolled in each treatment group of the study.

Data was summarized as means  $\pm$  SD for continuous and number (percentage) for qualitative variables. T test and Chi-square used to compare the mean values of continuous and categorical variable between the treatment groups. Repeated measure analysis of variance (ANOVA) was applied for comparing treatment groups regarding the changes of variables during the study. All statistical analyses were performed using SPSS version 17 (SPSS, Chicago, IL, The USA). The probability of the difference between the dependent and the independent variables were considered significant if a two-tailed P value was less than 0.05.

## Results:-

One hundred and forty five patients of suspected NAFLD were evaluated from April 2013 to April 2014. One hundred and twenty patients, with the mean age of  $45.35 \pm 9.24$  years, were included in the study. Table 1 represents patient characteristics. Reasons for leaving out were patient unwillingness to participate in the study ( $n = 10$ ), normalization of ALT during the lead-in phase ( $n = 14$ ), and pregnancy or lactation ( $n = 1$ ).

**Table 1:-** The baseline characteristics of participants

	Lifestyle Modification plus Helicobacter pylori eradication	Lifestyle Modification	P value
<b>Age, mean <math>\pm</math> SD, y</b>	$45.6 \pm 7.3$	$45.2 \pm 7.1$	0.7
<b>Gender</b>			0.5
Male	26	32	
Female	32	28	
<b>Diabetes mellitus</b>			0.5
Present	26	25	
Absent	32	35	

There were no medications side effects occurred requiring dose reduction or discontinuation of the treatment during the study. Good adherence to the therapy was followed by pill counting during the follow up visits. Based on UBT results, the eradication rate was 96 %.

All the continuous variables were normally distributed at the baseline measurement. Table 2 shows the comparisons of LFC, anthropometric measurements, and laboratory levels according to the treatment groups during the study. There was no significant difference between the treatment groups at baseline, eight weeks, and twenty four weeks.

**Table 2:-** The comparison of liver fat content, anthropometric measurements, and laboratory levels between the treatment groups during the study

	Lifestyle Modification plus Helicobacter pylori eradication	Lifestyle Modification	P value

<sup>a</sup> HOMA-IR : homeostasis model assessment – insulin resistance

Table 3 shows the results of repeated measure ANOVA with Greenhouse-Geisser correction that determined that the mean studied parameters differed statistically significantly between the time points. Post hoc tests using the Bonferroni correction revealed that all treatment groups showed statistically significant reduction in LFC, anthropometric measurements, and laboratory values (except for HDL) from baseline to the end of the study.

**Table 3:-** The Comparison of Liver Fat Content, Anthropometric Measurements and Laboratory Parameters Change regarding the treatment Groups during the Study<sup>a</sup>

Pair Wise Comparison Between Baseline and the End of treatment		
	Mean ± SD	P value
Liver fat content, %	3.4 ± 0.2	< 0.01
Waist circumference, cm	2.6 ± 0.3	< 0.01
Weight, kg	8.1 ± 0.2	< 0.01
Body mass index, kg/m <sup>2</sup>	2.8 ± 0.2	< 0.01
Aspartate aminotransferase, U/L	12.9 ± 1.2	< 0.01

Alanine aminotransferase, U/L	28.3 ± 2.0	< 0.01

Triglycerides, mg/dl	46.3 ± 5.9	< 0.01
Cholesterol, mg/dl	14.6 ± 2.3	< 0.01
Low density lipoprotein, mg/dl	12.6 ± 1.7	< 0.01
High density lipoprotein, mg/dl	-7.2 ± 0.5	< 0.01
Fasting plasma glucose, mmol/L	0.7 ± 0.1	< 0.01
Fasting serum insulin, mU/L	3.7 ± 0.4	< 0.01
HOMA-IR <sup>b</sup>	1.5 ± 0.1	< 0.01

<sup>a</sup> Negative values represent the increase of the parameter at that interval

<sup>b</sup> Abbreviation : HOMA-IR, Homeostasis model assessment-insulin resistance

No statistically significant difference in the changes of mean LFC, laboratory values, and anthropometric measurements between the treatment groups at the study intervals (All P values > 0.05 in between-subject effects model).

### Discussion:-

This study was designed to evaluate the effect of HP eradication on LFC, LFT, and metabolic parameters in NAFLD patients. In this study the result of HP eradication per se might not affect LFC, LFT, lipid profile, insulin resistance, and anthropometric parameters. As liver ultrasonography is to some extent limited for diagnosis and grading the NAFLD severity (18), however its availability and cost effectiveness makes it an appropriate tool for fatty liver screening and it was used to evaluate fatty liver in patients with persistently elevated liver enzymes level. It was done by a single radiologist to avoid inter-observer variability. Considering the possible complications and poor patient acceptance, “NAFLD liver fat score” was used instead of liver biopsy for NAFLD diagnosis. Sensitivity and specificity of the values greater than -0.64 are 86% and 71% respectively, to predict NAFLD (14).

To increase the feasibility and reproducibility of the study, a valid formula was applied to measure liver fat content. A previous study showed the validity of this equation to predict liver fat content considering proton magnetic resonance spectroscopy (PMRS) as the gold standard (14). There was a significant high correlation between liver fat content identified by PMRS and liver fat content calculated by the above formula (14) ( $r = 0.7$ ,  $P < 0.0001$ ).

The role of HP in extragastric diseases has come to interest. There is large body evidence showing the association of HP and CLD (22-26). The prevalence of HP like DNA in the liver tissue samples of patients with CLD was significantly higher than the patients with metastatic adenocarcinoma (2). In the study of Ponzetto et al. the prevalence of HP antibody (IgG) was higher in males with HCV associated cirrhosis compared to age-matched male blood donors (23). The genomic sequences corresponding to HP were determined in the liver tissues of patients with HCC and cirrhosis. It was proposed that HP might be implicated in the progression of cirrhosis in patients with HCV infection (24).

Specific studies regarding HP and NAFLD are increasing. The presence of HP DNA in one sample of liver tissue from a NAFLD patient was a novel finding in 2008 (3). Aller et al. showed that probiotics might decrease markers of lipid peroxidation and improve liver function tests (LFT) in NAFLD (27). Solga et al. reported that probiotics protect gut epithelial cells from the adhesion and invasion of HP (28). Therefore, it can be concluded that probiotics induce their therapeutic effects in NAFLD via avoidance of intestinal mucosa destruction by HP. It was suggested that HP infection was one of the risk factors for the development of NAFLD (25). The study by Polyzos et al. compared biopsy proven NAFLD patients with matched healthy controls (26). The anti HP antibody (IgG) was higher in NAFLD than controls. This study recommended that HP infection eradication might have therapeutic perspectives in NAFLD treatment.

Lifestyle modifications to control daily calorie intake is considered as the gold standard care in NAFLD patients. This strategy was applied to all participants. Obtaining the ideal body weight resulted in sustained improvement of biochemical (serum liver enzymes and insulin level) and histological findings in NAFLD (29). This is in agreement with the results of our study that showed the significant reduction of LFC, LFT, and metabolic indices (FSG, lipid profile, HOMA-IR, and anthropometric measurements) in both treatment groups during the study. In our study, changes in LFC and LFT were not significantly different in HP eradicated group from controls who did not receive

eradication treatment. This finding is somehow in accordance with the result of Stalke et al. (1). They reported no correlation between LFT and identification of HP DNA in the liver biopsy samples of CLD patients.

In our study, HP eradication had no additional effect on the metabolic indices changes. It was suggested that gut microbiota might regulate IR (30). Currently, there are controversial results about the effect of HP on insulin resistance. The positive correlation of HP with the metabolic syndrome and the inverse correlation with morbid obesity were reported (8-11). Gunji et al. studied a large sample of Japanese general population (8). HP seropositivity was higher in those with metabolic syndrome than the controls. They suggested that HP infection could be associated with metabolic syndrome. On the other hand, there are reports showing the enhanced risk of obesity following HP cure (10, 11). These studies proposed that increased Ghrelin following HP treatment improves the appetite and leads to weight gain. The controversial results of the above studies could be due to the difference in the duration of HP infection, and the type of gastritis in the studied populations.

The limitations of the study and Recommendations, as there is not enough evidence to show the benefit of HP eradication in all infected patients, only dyspeptic NAFLD patients were included in this study. Therefore, the results cannot be generalized to all NAFLD patients. Another limitation of the study was the lack of performing liver biopsy to define the histologic response. Comparing the effect of HP eradication on biochemical and histological changes in NAFLD patients (including non-dyspeptic) with longer follow up duration is recommended.

### Summary:-

This randomized clinical trial was performed on one hundred and twenty dyspeptic NAFLD patients who were randomly assigned to lifestyle modification alone or lifestyle modification plus HP eradication treatment. A dietitian checked the daily calorie intake. HP eradication treatment was performed by standard quadruple therapy for 2 weeks. HP eradication rate was 96 % in this sample of NAFLD patients. A comparison was performed between successful eradication group, and those who did not receive HP eradication. Repeated measure ANOVA showed a significant reduction in LFC, anthropometric measurements, and laboratory parameters (except for HDL) in both groups during the study; however, no significant difference was observed between the two groups.

Within the limitations of this study, it can be concluded that HP eradication in dyspeptic NAFLD patients did not provide any additional improvement in LFC, LFT, FSG, lipid profile, IR, and anthropometric measurements compared to lifestyle modification alone.

#### Abstract

**Background:** Healthcare workers such as medical interns are at high risk of infection. Strict compliance is considered as an efficient way to reduce and control hospital acquired infections. Also, it minimizes infection transmission between patients as well as healthcare workers.

**Objectives:** To assess the knowledge and practices of medical and dental interns about the standard precautions of infection control.

**Methodology:** A cross sectional study was carried out among medical and dental interns from Taibah University, Saudi Arabia. A simple random sample of 102 interns participated in the study; 83 of them were medical interns and 19 were dental interns. A valid and reliable data collection tool was used through an electronic self-administered questionnaire. Afterwards, the data analysis was done using SPSS program version 22. Ethical approval was issued by the Taibah University IRB committee.

**Results:** In this study, we had a (63%) response rate. Most of the interns (50%) had a satisfactory level of knowledge about the standard methods of infection control. However, (93%) of the interns displayed insufficient knowledge regarding the necessity in wearing surgical gloves while providing medical care to patients with AIDS. Our findings also showed that the greatest source of knowledge was from senior doctors (61%). In the practice scale, (73%) of the interns had competent practice even though (54%) of them reported that they recapped needles after using them.

**Conclusion:** The majority of medical and dental interns had satisfactory knowledge and competent practice about infection control, and they mainly learned and acquired from their doctors.

#### Introduction:-

Standard precautions are designed to minimize the risk of acquiring occupational infections in clinical centers. These infections could be gained from both expected and unexpected sources (1). As a result, healthcare workers such as medical interns are at a high risk of infections. Another reason why they need to be cautious is that they are the first responder to undiagnosed infectious cases (2).

Strict compliance of healthcare workers to infection control standard precautions prevent and control infections acquired in hospitals. Also it prevents the transfer of any infection between patients and healthcare workers (3)(4). Standard precautions also aim to prevent the transmission of infections from known and unknown sources and assist maintaining basic levels of patient safety and health care providers.

Previous studies on health science students and medical students found that the general knowledge and compliance of standard precaution were insufficient, especially in hand hygiene, sharp management, and individual protective equipment (5)(6).

A cross-sectional study carried out in Kuwait University found the prevalence of weak knowledge of standard infection control was 38.2% and that of poor practice was 27.7% (5)(7). The cause of the poor knowledge and compliance of interns to simple essential behaviors is inadequate guidelines and recommendations of standard precautions (6). Another cross-sectional study was also conducted in King Faisal University, Saudi Arabia. The research found that 80% of medical interns need to improve their expertise on infection control (6).

The aim of our study is to assess the knowledge and practices of medical and dental interns at Taibah University, Saudi Arabia about standard precautions of infection control.

**Objectives:-**

1. To assess the knowledge and sources of information of infection control precautions among medical students.
2. To evaluate the practice of infection control precautions among medical and dental intern.

**Methodology:-****Setting and Design:-**

A cross-sectional study design at Taibah University, Saudi Arabia. The duration of data collection was from July/2016 to September/2016.

**Subjects:-**

The data of all medical and dental interns, both of which were males and females, at Taibah University were collected. Interns or students from other fields such as nursing, pharmacy, and other applied medical sciences colleges were not included in our study.

**Data Collection:-**

A valid and reliable data collection tool was used through an electronic English version of a self-administered questionnaire. We also utilized a scale to assess the knowledge and practice of infection control. The knowledge scale was categorized into excellent, satisfactory, and poor. Those who gained from 15 to 18 considered as excellent, those who gained from 10 to 15 considered as satisfactory and those who gained below 10 considered as poor. The practice scale was classified into competent, weak, and unsafe. Interns who got from 65 to 90 have competent practice, while who got 49 to 64 have weak practice, lastly having a score from 16 to 48 considered as unsafe practice. The categorization was done to elicit the interpretation of data and ease the comparison between varieties of groups (8).

**Questionnaire Administration:-**

The questionnaire was given to each intern who had an informed consent of the right of not participating in the survey and the confidentiality of the process to take part in the study.

**Data Analysis:-**

The collected data were analyzed using Statistical Package for Social Sciences (SPSS) version 22. Any result with a p-value of <0.05 was considered statistically significant for the purpose of this study.

**Ethical Approval:-**

Ethical approval was issued by the Taibah University IRB committee, with acceptance number; 143799859, 31/5/2016.

### Results:-

Some of the medical interns, who had a background about standard precautions, were gleaned either by doctors at the hospital or by the hospital itself through providing a bedside liable and from the media as well. When the interns were students, their syllabus had no course devoted to teaching or training of infection-control management and standard precautions.

The total number of the interns (both genders) who participated in this survey, were 122 medical interns and 40 dental interns and the response rate was (63%). Among the respondents, (81%) of the participants were medical interns and (19%) were dental interns. Overall, the majority of interns (75%) studied infection-control practices in the university, while a few of them (26%) took part in previous extra courses on infection-control practice. (**Table.1**)

**Table.1:-** Distribution of socio-demographic characteristics of participants among medical and dental interns at Taibah University, Saudi Arabia.

(N=102)	N (%)
<b>Age</b> mean±SD	24±0.667
<b>Gender</b> Female Male	50 (49%) 52 (51%)
<b>Profession</b> Medical interns Dental interns	83 (81%) 19 (19%)
<b>When did you have hepatitis B virus vaccine?</b> Before your undergraduate clinical training years During your undergraduate clinical training years Just before your internship training Never had it	29 (28%) 21 (21%) 12 (12%) 40 (39%)
<b>Did you study infection- control practices during your undergraduate university studies?</b> Yes No	76 (75%) 26 (25%)
<b>Does your hospital/training centers provide formal bedside training about infection control (proper hand hygiene, using PPE, etc.)?</b> Yes No Yes but not sufficient	46 (45%) 26 (26%) 30 (29%)
<b>Did you have any previous extra courses about infection - control practices?</b> Yes No	26 (26%) 76 (74%)

Regarding the source of learning infection-control practices, the highest reference (62%) was from doctors. Also, (58%) of the participants claimed that they obtained this knowledge from the media (YouTube, TV, books, etc.), and (60%) think that they did not learn about infection control from their peers nor from healthcare providers (**Fig. 1**).

**Figure 1:-** Source of learning practice of infection control among medical and dental interns at Taibah University, Saudi Arabia.(N=102)

In the knowledge scale, we found that most of interns had satisfactory knowledge and that a few had excellent and poor knowledge. (**Fig. 2**).

**Figure 2:-** Assessment of knowledge scale among medical and dental interns at Taibah University, Saudi Arabia.(N=102)

In the practice scale, we found that vast majority of participants had competent practice and that a few of them had weak and unsafe practice. (**Fig. 3**)

**Figure 3:-** Assessment of practice scale among medical and dental interns at Taibah University, Saudi Arabia.(N=102)

For more details about knowledge of interns about infection-control practice, (93%) of them thought that there was no need to wear surgical gloves in all caring procedures provided to patients suffering from AIDS. As sweat and tears are non-infectious, we thought that we did not need standard precautions against them in this research. However, in our study, most of the interns mentioned that health care providers should take standard precaution against sweat (77%) and tears (73%). (**Table 2**)

**Table 2:-** Infection-control knowledge among medical and dental interns at Taibah University, Saudi Arabia.

(N=102)	Right answers N ( % )	Wrong answers N ( % )
Needles used for medication preparation or injecting patients should be discarded in the sharp box.	99 (97%)	3 (3%)
Spots of blood spilled from the patient must be cleaned using sterilizing agent dedicated for this purpose.	86 (84%)	16 (16%)
Facial mask and eye protection is not necessary if the necessary procedure for the patient may cause volatility or spill a patient's blood or body fluids.	94 (92%)	8 (8%)
Standard precautions should be applied to all patients regardless of the presence or absence of the source of the infection.	94 (92%)	8 (8%)
Wearing surgical gloves is necessary in all caring procedures provided to patients suffering from AIDS.	7 (7%)	95 (93%)
Standard Precautions are applied only to patients suffering from AIDS or hepatitis.	83 (81%)	19 (19%)
Standard precautions should be applied in cases in which there is a contact with the patient's sweat.	24 (23%)	78 (77%)
Standard precautions should be applied in cases in which there is a contact with the patient's tears.	28 (27%)	74 (73%)
Standard precautions should be applied in cases in which there is a contact with the patient's saliva or mouth secretions.	88 (86%)	14 (14%)
Standard precautions should be applied in cases in which there is a contact with the patient's vaginal secretions.	99 (97%)	3 (3%)
Standard precautions should be applied in cases in which there is a contact with the patient's urine or stool.	92 (90%)	10 (10%)
It is a must to use/wear the face mask when entering rooms for patients with chickenpox and measles.	84 (82%)	18 (18%)
Patients with illnesses spread by droplets or spray must wear the facemask throughout	94 (92%)	8 (8%)

the process of transferring them transferred from one ward to another.		
It is necessary to use isolation gown when entering rooms of patients who need contact precautions.	98 (96%)	4 (4%)
Patients with diseases spread by droplets or spray should not be isolated in private rooms.	84 (82%)	18 (18%)
Patients who are in need of using contact precautions should be isolated in private rooms.	77 (75%)	25 (25%)
Tools of patients who need contact precautions should not be used or shared with other patients.	96 (94%)	6 (6%)
Double surgical gloving is necessary when performing procedures or nursing care for patients with diseases spread by blood contact such as AIDS or hepatitis-B.	84 (82%)	18 (18%)

As for the assessment of infection control-practices, we found that (54%) of the interns recapped the needle after using it, a practice that can cause it to prick. (**Table 3**).

	NO	43 (42%)	15 (15%)	3 (3%)	

\*\* Likelihood Ratio \* Level of significance at  $<0.05$  (chi-square test was used)

## Discussion:-

The purpose of this study was to assess the knowledge and practice of infection control among medical and dental interns depending on many variables. We found in this study that the knowledge of infection control was satisfactory by (50%) unlike a study conducted in the king Faisal University in which (80%) of the participants needed to improve their knowledge of infection control (6).

In this study, (92%) of the interns recognized the importance of applying standard precautions to all patients regardless of the presence or absence of the source of the infection. This performance was higher than that in the King Faisal University in which only (41.8%) recognized that all patients were sources of infections (6).

About the knowledge of applying standard precautions to all body fluid as a source of infections, there were some variations between (23%) of the interns recognized to apply standard precautions to patient's sweat and (27%) to patient's tears. This appears to be the difference compared to the previous study in which (31.9%) of them recognized that all body fluids except sweat were sources of infections (6).

Many previous studies reported that students' attitudes toward infection-control practice were influenced by their senior doctors (9) (10). This finding corresponded with our results, which showed that the major source of learning infection-control practices was from the doctor's (62%) In other words, there was an increase in the responsibility of the doctors about practicing infection-control precaution at bedside.

The present study showed that (58%) of the interns learned about infection control from the media (YouTube, TV, book, etc.). This result is quite similar to that of a previous study in which self-learning and informal bedside clinical practices were the main sources of knowledge of infection control, especially about dealing with sharp injuries (11).

Overall in this study, we found that (74%) of the interns are competent in their practices, (22%) have weak practice, which is a similar outcome to a study done in the Kuwait university where they had a (27.7%) prevalence of poor practice (7).

Washing hands before and after patient contact is important. Still in our study only (56%) of the interns, wash their hands before patient contact, while (69%) wash afterwards. While in other studies, the overall frequency of hand washing before patient contact was (6.7%), and (23.7%) after (12). Another study in India reported that hand hygiene compliance by Healthcare Workers was less than (50%) (13).

When touching blood, body fluids, internal mucosa or in cases of wounds in the skin we found that (62%) of our interns wear sterile surgical gloves, while (60%) wear non-surgical gloves. This is found to be less than other studies, that had (75.5%) of respondents that reported to adhere to wearing gloves while performing procedures (11). A study in Uganda had (83.25%) of the respondents who always use gloves when drawing blood or placing cannulas (14). On the other hand, a study done on Healthcare workers had lesser results than ours, where only (43%) have always used gloves when drawing blood (15).

According to WHO, washing hands after removing medical gloves is required for glove usage and hand hygiene (16). In concern to this practice we found that respondents in our study have, lower rate (56%) compared to another study in Nigeria that had (77%) of doctors wash their hands before and after using gloves (17). Another study also had higher results in which (61%) of their respondents reported to always wash their hands after gloves usage (15).

In this study, (69%) of intern's wear face mask when there is a possibility of spitting out or spillage of any body fluids from the patient. This is a higher result in comparison to a previous study that had (50%) of doctors that wears cap and mask before invasive procedures (16).

Needle recapping after usage and giving injections is a behavior that increasing the risk of needle stick injury and infected by blood borne diseases. We found (54%) of the interns in our study a higher result in comparison to other studies, where in Nigeria only (31.3%) of the doctors perform it (16), and (44%) in a study at Uganda.

### **Conclusion:-**

The present study showed that the majority of medical and dental interns had satisfactory knowledge about infection control. Moreover, most of them learned infection-control practice from their senior doctors.

### **Limitation of the Study:-**

We used in this study a self-administered questionnaire to measure the practice. This method is not the best method, as it does not provide clear picture about it. Another limitation was low response rate (63%) especially among the dental interns (47%).

### **Recommendation:-**

We recommend that stakeholders in the medical profession should update their medical curricula by focusing and brainstorming on topics that would minimize the high risk of infections to which interns and patients are susceptible.

They should also use educational seminars, workshops, pamphlet and posters in universities and hospitals to educate doctors, nurses, and other medical professionals about infection control.

#### Abstract

**Introduction:** Antenatal Care is care before birth and includes education, screening, counseling, treatment, monitoring and promoting the well-being of the mother and fetus. Its importance cannot be overstated for both.

**Objective:** To assess the awareness of antenatal care importance among pregnant women attending antenatal care clinics in Madina, Saudi Arabia.

**Methodology:** A cross-sectional study carried on (1617) women who attended Maternity and Children's Hospital and National Guard Hospital in Madina during the period from August to September 2016. The data were collected through face to face interview and use of questionnaire format.

**Results:** A total of 1617 women were selected in the study, 74.7% of the participant's ages were between 20-34 years old. Most of them had a university degree with percentage of 40%. 80.9% started following up at first or second trimester and 80.1% were following up their pregnancies consistently and regularly. 89.7% believed in the importance of antenatal care visits. 89% believed that the use complementary supplements during pregnancy can prevent some problems.

**Conclusion:** The education has been a great role in the interest of mothers in Antenatal care. Most of women have no diseases, and they believe that the use of complementary grain during pregnancy reduces the incidence of some of the problems related to pregnancy. More than half of women have a good awareness about knowledge of the importance of the first visit and the importance of continued follow-up in the same place.

**Objectives: -****General objectives: -**

To assess the awareness of antenatal care importance among Saudi pregnant women attending ANC in Madina, Saudi Arabia

**Specific objectives: -**

1. To determine the role of mothers' education in antenatal care awareness.
2. To evaluate the knowledge about the importance of following up the whole period of pregnancy.
3. To assess the awareness of booking and its role in increasing the quality of care.
4. To inspect the effect of socioeconomic status on adherence to antenatal care.
5. To assess the awareness of taking specific supplements during pregnancy. e.g. folic acid.

**Introduction: -**

Antenatal Care (ANC) is “care before birth” and includes education, screening, counseling, treatment, monitoring and promoting the well-being of the mother and fetus.<sup>1</sup> ANC is based on providing women and their families appropriate advices and information which may help them to be in a good health during pregnancy, delivery, and postnatal recovery.<sup>2</sup> Also, providing mothers with appropriate supplements such as folic acid and vitamins that needed during pregnancy.<sup>3</sup> In addition, providing care of newborn, promotion of early, exclusive breastfeeding, and assistance with family planning in order to improve pregnancy outcomes. To achieve the full life-saving potential that ANC promises for women and babies, four visits providing essential evidence based interventions a package often called focused antenatal care are required. Good caring during pregnancy is so important for the health of the mother and the development of the unborn baby, it links the woman and her family with a formal health system which will increase the chance of using a skilled attendant particularly at birth and contributes to well health through the life cycle.<sup>2</sup> At any health care delivery system, Antenatal care is considered as a back bone of obstetrical services, it is substantial for health of pregnant women and it is the way in which maternal and fetal complications are determined and managed.<sup>3</sup> Roughly, a thousand mothers all around the world die daily due to pregnancy and delivery related causes,<sup>4</sup> which resemble 25% of maternal deaths according to World Health Organization. Although, maternal mortality rates in the past 25 years has decreased by about 44%, it is still considered by WHO to be intolerably immense. The vast majority of these fatalities take place in low-resource settings, and hence preventable in a great measure. This matter of concern, therefore, was a first priority in The Millenium Development Goals (MDGs) acknowledged by the international community in 2000 which obligate the medical community globally to promote maternal health as one of their recommendations.<sup>5</sup> Beside family planning, essential obstetric care, and safe delivery, antenatal care as one of the pillars of Safe Motherhood Initiative was encouraged by health providers as studies have proven that it can effectively curtail maternal morbidity and mortality.<sup>6,7</sup> Pregnant women in developed countries appreciate the role of antenatal care and they consider it full-fledged and accredited. On the other hand, its role in the perspectives of pregnant women in developing countries is debatable, thus, poor attendance is noted.<sup>3</sup> Shalash& Mohammed, 2012 stated that the vulnerability to diseases and death during pregnancy are decidedly higher among women who do not follow up in antenatal care clinics in contrast to women who do so.<sup>7</sup> Furthermore, continuity of antenatal care in reachable and high quality clinics prevent problems and lessen deaths during pregnancy.<sup>2</sup> Unsurprisingly, this would justify that developing countries have the largest share of maternal mortality which is 99%.<sup>8</sup> In our region, resolving the causes of lacking adherence to antenatal care has become an urgent demand since average number of ANC visits has dropped to the lower limit.<sup>9</sup> The reason of poor antenatal care attendance is undoubtedly multifactorial, with factors having important roles linked to health providers, pregnant women themselves, and other elements. A study was conducted to assess the ANC performance of physicians in Madina, Saudi Arabia revealed that overall performance was fair to low, which is definitely unfavorable and does not live up to WHO expectations. Faulty application of antenatal care programs, prolonged waiting time, number of facilities, dissatisfaction of women toward doctors’ attitude or their feedback, and other caregivers related dilemmas facing pregnant women indicate that antenatal care have rarely been subjected to assessment.<sup>10</sup> Regarding pregnant women, they have many variables can influence attendance including educational level, socioeconomic status, and most importantly level of awareness of antenatal care importance which considered as a key factor to determine commitment to ANC visits.<sup>11</sup> Women also can encounter various obstacles along the lines of transportation issues or that permission by the husband is not gained, a companion is not available to attend with her to the clinic, and other external troubles as might be cultural or traditional conflicts that she may face.<sup>12</sup> Al Otaiby et al., 2013 established a study that was one of the few of its kind in Riyadh, Saudi Arabia regarding awareness and recognition of antenatal care and they reported that antenatal knowledge scores were below average

with no difference regarding age or literacy level among this population.<sup>13</sup> Due to the scarcity of researches about the awareness of ANC in Saudi Arabia, we need more studies in different cities to assess the level of knowledge and awareness among pregnant women in our population in order to know to what extent should health authority raise public awareness of this issue. Our study aims to assess the awareness of antenatal care importance among Saudi pregnant women in Madina, Saudi Arabia and Find out the relationship between pregnant woman's knowledge with certain variables; age, educational level, socioeconomic status, gravidity, parity and number of prenatal care visits.

## **Methodology: -**

### **Study design: -**

This is a cross-sectional study which was conducted through a random sampling. The population was pregnant women mainly from Madina region in Saudi Arabia during August and September 2016. The aim of this study is to assess the awareness of antenatal care importance among Saudi pregnant women attending Antenatal clinics of several hospitals including MMCH and MNGH, and to explore the factors that influence antenatal care attendance. All recruited subjects of this study were actively involved in attending ANC clinics. Subjects who were too sick to participate and non-Saudi women have been excluded from the study analysis. A pre-designed structured Arabic and English languages questionnaires were used in this cross-sectional survey through face to face interview. The used questionnaires were formulated to include demographic aspects, clinical features, nutritional, medical, obstetric and psycho-social history. The questionnaires include 39 questions, discussing various aspects in the subject's socioeconomic, educational, medical and psychological life. The questionnaires' items were designed and written to suit the tradition and the Islamic culture of the Holy Madina City. The questionnaires with missing data more than 50% were excluded from the study analysis. The final study sample size was 1617 pregnant women. Approval was taken from the ethics committee at Maternity and Children Hospital in Madina, Saudi Arabia. Ethical consideration was considered to avoid physical or emotional harm in the study questionnaire. The confidentiality and privacy of the collected data were ensured through the use of anonymous questionnaire and during data entry and analysis. People were provided with information on the study aims and methods and each one of them has signed an informed consent to participate in this study.

### **Statistical analysis: -**

The collected data were analyzed using statistical analysis system (SAS). Data from the questionnaire has been entered as numerical or categorical, as appropriate. Two types of statistics have been done:

1. Descriptive statistics; where quantitative data was shown as mean  $\pm$  S.D for women in each group, and qualitative data was expressed as frequency and percent which plays the proportion of participants who are represented within each category.
2. Analytical statistics: where Chi- square test between qualitative variables. Also, unpaired women's t-test was used as a test of significance for comparison between two arithmetic means of two different groups. The level of statistical significance was defined as  $P \leq 0.05$ .

## **Results: -**

This section of the study gives descriptive analysis through the repeat tables and the diagrams for the participants' answers on all the questionnaire questions, and then it analyzes and clarifies the most important statistical analysis obtained to achieve the study objectives.

### **Population & Sample of the Study: -**

The population was all pregnant women mainly from Madina region in Saudi Arabia during August and September 2016, a random sample of (1617) woman was selected, and table (1) shows their properties according to their personal information:

**Table 1:-** The participants' personal data (n=1617).

<i>Personal Data</i>		#	%	<i>P-value</i>
<i>Age</i>	Less than 20	44	2.7	0.00**
	Between 20 - 25	445	27.5	
	Between 26 - 34	764	47.2	
	Between 35 - 40	320	19.8	
	Above 40	44	2.7	
<i>Weight (kg)</i>	Less than 50	85	5.3	0.00**
	50-70	865	53.5	
	71-90	536	33.1	
	91-110	99	6.1	
	More than 110	32	2.0	
<i>Height (cm)</i>	Less than 160	926	57.3	0.00**
	160-170	671	41.5	
	More than 170	20	1.2	
<i>Residency</i>	Urban	1391	86.0	0.00**
	Rural	226	14.0	
<i>Level of education</i>	Illiterate	83	5.1	0.00**
	Primary school	160	9.9	
	Intermediate school	171	10.6	
	High school	486	30.1	
	College	647	40.0	
	Higher education	70	4.3	
<i>Husband's education</i>	Illiterate	40	2.5	0.00**
	Primary school	107	6.6	
	Intermediate school	141	8.7	
	High school	578	35.7	
	College	678	41.9	
	Higher education	73	4.5	
<i>Income of household</i>	Excellent (>10000)	331	20.5	0.00**
	Average (5000 10000)	921	57.0	
	Below average (<5000)	365	22.6	

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

It is clear from the previous table that 47.2% of the participants' ages were between (26-34) years old, while 27.5% of them were between (20 -25) years old, 19.8% of them were between (35 -40) years old, 2.7% of them were less than (20) years old, and the same percentage for those who were more than (40) years old. And their distribution according to their weight, 53.5% of the sample members had their weights between (50 -70) kg, while 33.1% of them had their weights between (71-90) kg. And according to their lengths the distribution was as follows, 57.3% of them were less than (160) cm long, while 41.5% were between (160- 170) cm long, and 1.2% of them were more than (170) cm long. And when the participants were asked about their residence place, 86% said that they were living in Madina, while 14% of them were living in villages. When the participants were asked about their educational level; 40% of them had university degree, while 30.1% of them high school certificates. And the distribution according to their husbands' educational levels; 41.9% of them had university degree, while 35.7% of them had secondary school certificates. And finally, their distribution according to their monthly income; 20.5% of them had their income more than (10000) riyal, while 57% of them had their income between (5000- 10000) riyal, and 22.6% of them had a monthly income less than (5000) riyal.

The next diagram concludes the previous results: -

### Analysis of Results: -

#### First: Obstetric History:-

The following table shows the participants' distribution according to their Gestational age; 36.2% of them were in the third trimester, while 8.7% of them were in the first trimester, 7.7% of them were in the second trimester, 43.4% of them had given birth to their babies, and only 4% of them weren't pregnant.

Gestational age	Frequency	Percent
First trimester (1-12)	141	8.7
Second trimester (13-26)	124	7.7
Third trimester (27-end of pregnancy)	585	36.2
Delivered	702	43.4
Not pregnant	65	4.0
Total	1617	100.0

The next table shows the participants' distribution according to the number of pregnancies; number of deliveries, and number of miscarriages; 47.8% of them have already been pregnant for (2-4) times, while 22.9% of them got already pregnant just once, 15.6% of them have already been pregnant for (5- 6) times, and 13.7% of them have already been pregnant for more than (6) times. And according to the number of deliveries; 32.9% of them delivered from 2 to 3 babies, while 23.3% of them delivered just one baby, and 16.6% of them have never delivered any baby. The participants' distribution according to the number of miscarriages; 67.4% have never miscarriage their babies, while 28.1% of them had (1- 2) miscarriages, 4.1% of them had (4- 5) miscarriages, and 0.4% of them had more than (5) miscarriages.

Variable		#	%	P-value
Gravidity	1	370	22.9	0.00**
	2- 4	773	47.8	
	5- 6	252	15.6	
	More than 6	222	13.7	
Parity	Nulliparous	269	16.6	0.00**
	Primiparous	377	23.3	
	2- 3	532	32.9	
	4- 5	265	16.4	

	More than 5	174	10.8	
Abortion	None	1090	67.4	0.00**
	1-2	454	28.1	
	3-5	67	4.1	
	More than 5	6	0.4	

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

The next table shows the women participants' distribution according to whether they ever had abnormal pregnancies as ectopic or cluster pregnancy; according to the ectopic pregnancy; 97.1% of them have never had this type of abnormal pregnancy, while 2.7% of them have had ectopic pregnancy once or twice, 0.2% of them had it from (3-5) times. And according to the cluster pregnancy; 99.4% of them have never had this type of abnormal pregnancy, while 0.4% % of them have had ectopic pregnancy once or twice, 0.2% of them had it from (3-5) times.

Ectopic	1570 (97.1)	43 (2.7)	4 (.2)	0.00**
Molar	1607 (99.4)	7 (.4)	3 (.2)	0.00**

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

The following table shows the distribution of participants in terms of the number of times each birth is natural, assisted or cesarean. For natural childbirth 37.8% of the participants never had a natural birth while 17.2% had it once before and 23.7% had two or three natural births and a 21.2% had more than 3. The participants' distribution according to Assisted delivery it's found that 96% of the participants never used this method before while 2.7% used it once before and a 0.9% tried it two or three times and only 0.4% used it more than three times. The distribution regarding cesarean delivery, 65.5% from the participants never had a cesarean delivery while 20.3% tried it once, 11.8% tried it two or three times and 2.5% tried it more than three times.

Normal spontaneous delivery	612 (37.8)	278 (17.2)	384 (23.7)	343 (21.2)	0.00**
Assisted delivery	1552 (96.0)	44(2.7)	15(.9)	6(.4)	0.00**
Cesarean Section	1059 (65.5)	328 (20.3)	190 (11.8)	40(2.5)	0.00**

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

The following diagram illustrates the reasons for caesarean section for those who gave birth this way, where it's found that 27% of those who have it suffered from abnormal fetal position, and 25% the reason was fetal distress, and 10% due to CPD, and 4% due Antepartum hemorrhage, and 4% also due to Preeclampsia, and 3% due to carrying twins, and 27% for other reasons.

Second: Maternal health

The following diagram shows the distribution of the sample in terms of smoking; where we note that 99% of women were non-smokers, while only 1% smokers.

The following table shows a group of diseases of the participants.

Diabetes	108 (6.7)	1509 (93.3)	0.00**
Asthma	63 (3.9)	1554 (96.1)	0.00**
Hypertension	50 (3.1)	1567 (96.9)	0.00**
Epilepsy	3 (.2)	1614 (99.8)	0.00**
Sickle cell anemia	5 (.3)	1612 (99.7)	0.00**
Iron deficiency anemia	399 (24.7)	1218 (75.3)	0.00**
Urinary tract infection	441 (27.3)	1176 (72.7)	0.00**
Cardiac diseases	16 (1.0)	1601 (99.0)	0.00**
Systemic Lupus Erythematosus (SLE)	6 (.4)	1611 (99.6)	0.00**
Scleroderma (Systemic Sclerosis)	2 (.1)	1615 (99.9)	0.00**

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

It is noted from the above table that 6.7% of participants have diabetes, while 93.3% doesn't have diabetes, and 3.9% asthmatics, while the 96.1% non-asthmatics, 3.1% for patients with high blood pressure, while 96.9% were free of blood pressure, and 0.2% patients with epilepsy, while 99.8% is living without epilepsy, and 0.3% sickle-cell anemia, while 99.7% are not affected, and 24.7% of participants has iron deficiency anemia, while 75.3% of them are not diseased with it, and 27.3% people has rheumatoid urinary tract, while 72.7% is not diseased with it, and 1% of the participants diagnosed with heart disease, while 99% were free of heart disease, and 0.4% of the participants diagnosed with Systemic Lupus Erythematosus (SLE), while 99.6% are not affected, and finally, 0.1% of them are living with scleroderma, while 99.9% are not diseased by it.

### Third: Booking:-

The following table shows the distribution of participants according to the month that the pregnant woman started her pregnancy follow-up with the doctor. It's noted that 80.9% of participants started their follow-up at the first or second month of pregnancy, while 13.9% they began to pursue their pregnancy follow up with the doctor in the third month to the fifth of pregnancy, and 1.1% started at the sixth or seventh month and 0.4% of them began to get there to follow up in the eighth or ninth month.

1 - 2 months	1309	80.9
3 - 5 months	225	13.9
6 - 7 months	18	1.1
8 - 9 months	7	.4
I have not had a booking appointment	58	3.6
Total	1617	100.0

The following table shows the place of the follow-up of pregnant women; where we find that 45.9% of women go to private hospitals, while 23.6% of them to primary care centers and 16.1% of them do their follow-up in women and children's hospital, and 10.8 in other government hospitals.

MCH	260	16.1
Private hospitals	742	45.9
Other government hospitals	175	10.8
Primary health care	382	23.6
I don't follow up	58	3.6
Total	1617	100.0

The following diagram shows the ladies knowledge of the importance of the first visit and the importance of continued follow-up in the same place, It's noted in the figure that 51% of women have a good awareness of this, while 17% do not have as much awareness as needed, and 32% have no awareness at all.

From the diagram, it concludes that 72.5% of women follow-up their pregnancy at the same place they visited at the first time, while 23% continued their follow-up elsewhere.

And when asked about the reason that some of the woman changed the first place of their pregnancy follow-ups they answered as follow, 37% of them changed the place because of the quality of services provided, and 16% changed it because of lack of transportation, and 7% for financial reasons and 7% due to negligence, and 5% because of the

long wait times and congestion, and 5% due to the attitude of the physician, and 35% change the place up for other reasons.

#### Fourth: ANC related questions: -

The following table shows the distribution of participants in terms of whether they are following up their pregnancies consistently and regularly, and it's noted that 80.1% are getting them consistently and regularly, while 16.4% are not.

Yes	1294	80.1
No	265	16.4
I don't follow up at all	58	3.6
Total	1617	100.0

Women who don't follow their pregnancy consistently and regularly were asked about the reason and 45% of them said it was neglect, while 22% was the lack of transportation, and 4% because of the long wait times, and 3% due to the quality of services, and 22% for other reasons.

The following table shows the distribution of the sample in terms of how they believe the importance of the follow-up of pregnancy during the whole pregnancy; it's noted that that 89.7% believe in the importance of the follow-up, while 10.3% do not.

Yes	1450	89.7
No	167	10.3
Total	1617	100.0

The following figure shows the distribution of participants according to whether daily work duties affect their presence to the pregnancy follow-ups, and answered 85.8% said that work duties do not have an impact on the visits, while 11.2% of women answered that daily duties and work have an impact on their attendance to pregnancy follow-up.

The following figure shows the distribution of participants by whether the busyness of their husbands affect one way or another their attendance to prenatal care, and answered 75.4% of women are not affected by it, while 21.7% of women is affected by it.

**Fifth: Supplements: -**

The following table shows some of the supplements that pregnant women uses during pregnancy, and the proportions of each of them. For folic acid, we note that 92.1% of women take it during pregnancy, and for vitamin D, we find that 38.5% of women take it, while for iron, we find that 82% of women have it during pregnancy, and for calcium, we find that 75.6% of women have it during pregnancy.

Folic acid	1490 (92.1)	127 (7.9)	0.00**
Vitamin D	622 (38.5)	995 (61.5)	0.00**
Iron supplements	1326 (82.0)	291 (18.0)	0.00**
Calcium	1223 (75.6)	394 (24.4)	0.00**

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

The following diagram shows the distribution of the sample in terms of the extent of their belief that the use of complementary grain during pregnancy reduces the incidence of some of the problems related to pregnancy, where we note that 89% of the participants believe so, and only 11 % of them do not believe so.

**Sixth: Satisfaction: -**

The following table shows some of the things that women may not be satisfied with during the follow-up of pregnancy, 86.4% of women are not happy about the number of visits, and for the time between visits found that 83.4% of women are unhappy with it, but for the time being spend with your physician there were 89.1% of women are not satisfied, and for the waiting times it was found that 67.4% of women are not satisfied.

Number of visits	1397 (86.4)	220 (13.6)	0.00**
Spacing between visits	1348 (83.4)	269 (16.6)	0.00**
Time spent with provider	1441 (89.1)	176 (10.9)	0.00**
Waiting time	1090 (67.4)	527 (32.6)	0.00**

Chi-squared test: \*Significant at 0.05 \*\*Significant at 0.01

**Seventh: Outcome: -**

The following chart explains a variety of pregnancy related subjects, For the type of birth, found that 66.6% of women have natural childbirth, while 33.4% had Caesarean birth. As for the gender, there were 52.2% of male births, while 47.8% of female births. The percentage of babies born weighing less than 2.5 kg is 13.2%, while the percentage of babies born weighing (2.5-3 kg) is 52.9%, and those born weighing somewhere between (3.1-4 kg) is 32.5%, and percentage of babies born weighing more than 4 kg were is 1.4%. It found that 28.9 percent of births were transferred to the intensive care unit for newborns, while 71.1% of births have not been transferred to the unit care center for newborns.

#### Eighth: Relationships and correlations: -

The first hypothesis states that there is a relation between get booking appointment and each of (Age, Residency, Level of education, Income of household, and Gravidity).

Using the Chi-Square test was tested the NULL hypothesis which states that there is no relation between get booking appointment and each of (Age, Residency, Level of education, Income of household, and Gravidity), versus the alternative hypothesis which states that there is a relation between get booking appointment and each of (Age, Residency, Level of education, Income of household, and Gravidity), the next table shows the test results.

		When					Chi-	P-va
		1 - 2 months	3 - 5 months	6 - 7 months	8 - 9 months	I have not had a booking appointment		
Age	Less than 20	37	6	0	0	1	45.039	.000*
	20 25	384	47	4	0	10		
	26 34	626	103	9	5	21		
	35 40	240	60	5	2	13		
	Above 40	28	9	0	0	7		
Residency	Urban	1149	183	16	4	39	16.353	.003*
	Rural	166	42	2	3	13		
Level of education	Illiterate	60	13	1	1	8	65.786	.000*
	Primary school	113	29	6	2	10		
	Intermediate school	129	29	3	2	8		
	High school	386	83	4	1	12		
	College	568	63	4	1	11		
	Higher education	59	8	0	0	3		
Income	Excellent (>10000)	273	47	3	1	7	11.977	.152

	Average (5000 10000)	761	122	7	4	27		
	Below average (<5000)	281	56	8	2	18		
Gravidity	1	334	28	1	0	7	72.166	.000*
	2- 4	636	110	9	2	16		
	5- 6	199	38	3	3	9		
	More than 6	146	49	5	2	20		

\*Significant at the 0.05 level

**We conclude from the above table that: -**

1. There is **a relation** between get booking appointment and Age, where the P-value was less than 0.05 level.
2. There is **a relation** between get booking appointment and Residency, where the P-value was less than 0.05 level.
3. There is **a relation** between get booking appointment and Level of education where the P-value was less than 0.05 level.
4. There is **a relation** between get booking appointment and Gravidity where the P-value was less than 0.05 level.
5. There is no relation between get booking appointment and Income of household where the P-value was more than 0.05 level.

**The second hypothesis states that there is a relation between the knowledge of the importance of booking and following up and delivering later in the same place, and each of (Age, Residency, Level of education, Income of household, and Gravidity).**

Using the Chi-Square test was tested the NULL hypothesis which states that there is no relation between the knowledge of the importance of booking and following up and delivering later in the same place, and each of (Age, Residency, Level of education, Income of household, and Gravidity), versus the alternative hypothesis which states that there is a relation between the knowledge of the importance of booking and following up and delivering later in the same place, and each of (Age, Residency, Level of education, Income of household, and Gravidity), the next table shows the test results.

		She is well aware	She has a fair knowledge	She is unaware		
Age	Less than 20	11	10	23	16.062	.042*
	20 25	224	71	150

	5- 6	133	35	84		
	More than 6	113	39	70		

\*Significant at the 0.05 level

**We conclude from the above table that:-**

1. There is **a relation** between the knowledge of the importance of booking and following up and delivering later in the same place, and Age, where the P-value was less than 0.05 level.
2. There is **a relation** between the knowledge of the importance of booking and following up and delivering later in the same place, and Residency, where the P-value was less than 0.05 level.
3. There is **a relation** between the knowledge of the importance of booking and following up and delivering later in the same place, and Level of education, where the P-value was less than 0.05 level.
4. There is **a relation** between the knowledge of the importance of booking and following up and delivering later in the same place, and Income of household, where the P-value was less than 0.05 level.
5. There is no relation between the knowledge of the importance of booking and following up and delivering later in the same place, and Gravidity, where the P-value was more than 0.05 level.

**The third hypothesis states that there is a relation between the regularly attendance to ANC, and each of (Age, Residency, Level of education, Income of household, and Gravidity).**

Using the Chi-Square test was tested the NULL hypothesis which states that there is no relation between the regularly attendance to ANC, and each of (Age, Residency, Level of education, Income of household, and Gravidity), versus the alternative hypothesis which states that there is a relation between the regularly attendance to ANC, and each of (Age, Residency, Level of education, Income of household, and Gravidity), the next table shows the test results.

		Yes	No	I don't followup		
Age	Less than 20	34	6	4	10.694	0.220
	20 25	350	71	24		
	26 34	607	128	29		
	35 40	258	52	10		
	Above 40	31	8	5		
Residency	Urban	1106	225	60	.865	0.649
	Rural	174	40	12		
Level of education	Illiterate	64	17	2	5.117	0.883
	Primary school	121	32	7		
	Intermediate school	136	25	10

	More than 6	200	22		

**\*Significant at the 0.05 level**

**We conclude from the above table that:**

1. There is no relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and Age, where the P-value was more than 0.05 level.
2. There is no relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and Residency, where the P-value was more than 0.05 level.
3. There is **a relation** between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and Level of education, where the P-value was less than 0.05 level.
4. There is no relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and Income of household, where the P-value was more than 0.05 level.
5. There is no relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and Gravidity, where the P-value was more than 0.05 level.

### **Discussion: -**

World health organization (WHO) estimated that annually 529,000 women die globally as a result of pregnancy and childbirth.<sup>28</sup> Antenatal care (ANC) is an effective tool to reduce both infant and maternal mortality rates.<sup>1</sup> Al Otaiby et al., 2013 reported that antenatal knowledge scores were below average in Saudi Arabia.<sup>13</sup> This study aimed to assess the awareness of antenatal care importance among pregnant women in Madina, Saudi Arabia and its relationship with certain variables such as age, educational level, socioeconomic status, gravidity, parity and number prenatal care visits. This study includes 1617 women, their Demographics shows that the majority of them between

26-34 years old. About half of them had collage education and higher, while 35.7% had High school, this show the high education for many of them. Only 2.5% of them had Illiterate husband. This education has been a great role in the interest of mothers in ANC. Several other studies also found a strong positive impact of mothers' education on the utilization of health services,<sup>15,16</sup> because knowledge and education can improve the awareness of people about their rights and health.<sup>23</sup> The study results showed good obstetric history, most of women have never miscarriage their babies, while 0.4% of them had more than (5) miscarriages. 37.8% of the participants never had a natural birth, and 96% of the women never used assisted delivery before 34.5% had Cesarean Section for one time at least, The most common reason for 27% of those who have it suffered from abnormal embryonic situation. Vast majority nonsmokers, but at study in Lebanon almost one quarter (23%) of participants reported smoking during pregnancy.<sup>17</sup>

It may be the reason for differing proportion between the two countries is different customs, traditions and the nature of society. Results of the study have shown that vast majority of mothers had healthy pregnancy, 99.4% of women have never had abnormal pregnancy. Generally, most of women have no diseases; the most common diseases were Urinary tract infection 27.3%, followed by Iron deficiency anemia 24.7%. In recent study Prevalence of anemia (Hb<11gm/dl) on pregnant women in Pakistan was found to be 96%.<sup>18</sup> Iron, folate and vitamin supplements are routinely given to women attending antenatal care facilities along with advice for appropriate dietary practices to reduce anemia. 89% of the women believe that the use of complementary grain during pregnancy reduces the incidence of some of the problems related to pregnancy. Most of women take supplements that pregnant women use during pregnancy, such as; Folic acid, Vitamin D, Iron supplements, Calcium. In study in Pakistan, 64% of the women had never used any haematinics.<sup>18</sup> This may be due to differences in economic level between Saudi Arabia and Pakistan, so many women in Pakistan haven't get hematinics. All the mothers had registered antenatal, this same to Javali et al. study.<sup>19</sup> And Roy et al. study.<sup>20</sup> But Gupta et al. found that 89.6% of women had registered themselves.<sup>21</sup> This may be due to the low level of education and economic level in many areas in India. 80.9% of women started their follow-up at the first or second month of pregnancy. Gupta et al. found that 74.4% started their follow-up at the first or second month of pregnancy.<sup>21</sup> Javali et al., reported that 56.5% and 42.9% women under ANC registration in the 1st trimester and the 2nd trimester, respectively. <sup>19</sup> Berhe et al., reported that 48%, 42.4% women made their first visit in the 1st trimester, 2nd trimester.<sup>22</sup> More than half of women have a good awareness about knowledge of the importance of the first visit and the importance of continued follow-up in the same place. 72.5% of women follow-up their pregnancy at the same place they visited at the first time. 89.7% believe in the importance of the follow-up pregnancy during the whole pregnancy, while 80.1% are getting their pregnancies consistently and regularly, the most common reason for don't follow their pregnancy consistently and regularly was neglect. According to our results there was a relation between get booking appointment and age, residency, level of education, gravidity where the P-value was less than 0.05 level. But there was no relation between get booking appointment and income of household where the P-value was more than 0.05 level. Also in our study, there is a relation between the knowledge of the importance of booking and following up and delivering later in the same place, and age, residency, level of education, income of household where the P-value was less than 0.05 level. But there was no relation between the knowledge of the importance of booking and following up and delivering later in the same place, and gravidity, where the P-value was more than 0.05 level. According to our results there was no relation between regularly attendance to ANC, or follow-up the regular antenatal care visits throughout the whole period of pregnancy, and age. This finding conforms a study in India found that maternal age was not statistically associated with ANC.<sup>24</sup> But conflict with many other studies which found that maternal age is one of the important predictors for ANC, it was found that the young women were more likely to seek antenatal care than older one.<sup>25,26</sup> The reason of difference in the results is the difference in economic and cultural levels between the target groups in the two studies. Also in our study, there was no relation between regularly attendance to ANC, or follow-up the regular antenatal care visits throughout the whole period of pregnancy, and income of household, where the P-value was more than 0.05 level. Because most of the services of ANC in KSA rely on health insurance and therefore does not pose a financial burden on the family. There was a relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and level of education where the P-value was less than 0.05 level. This conform previous studies found a strong positive impact of mothers' education on the utilization of health services.<sup>15,16</sup> This is considered normal because whenever greater the parent level of education and culture, it increased awareness of their rights and the importance of the ANC. There was no relation between regularly attendance to ANC, or follow-up the regular antenatal care visits throughout the whole period of pregnancy, and gravidity where the P-value was more than 0.05 level. While study in Nepal revealed that there was statistically significant association between numbers of childbirth and the ANC visits ( $p < 0.05$ ).<sup>27</sup> The results of our study differ from the results of the study in Nepal because the level of education in Nepal is less than it in Saudi Arabia, as well

as economic level, so in Nepal mothers experience of pregnancy and delivery made them believe their maternal health knowledge was adequate.

**Limitations: -**

The generalizability of these results is subject to certain limitations. For instance, limited time allocated for study, since data has been collected in less than one month. The study was conducted only in 2 major hospitals, and inclusion of a greater number of centers or comparisons of urban and rural centers was not feasible. Lack of sufficient cooperation from the health institutions to provide information pertaining to patients. A worth mentioning limitation in this study is the unavailability of experts' opinion on the recommended content and delivery methods for antenatal education from the providers of this service. Knowing the providers' point of view and combining it with the responses of the target population will add to the validity of this study and will help in the development of effective antenatal education programs. More in-depth study of the sociodemographic aspects and job satisfaction of the health care providers would also be useful to give a more accurate measure of overall performance. Also, the rarity of study's topic in Saudi Arabia made us face many obstacles especially in the literature review. Furthermore, the scope of this study was limited in terms of its external validity. The methodology that was implemented in data collection yielded qualitative data that only can be interpreted relative to participants' populations.

**Conclusions: -**

In summary, all the mothers had registered antenatal Care, the education has been a great role in the interest of mothers in ANC. Most of women have no diseases, and they believe that the use of complementary grain during pregnancy reduces the incidence of some of the problems related to pregnancy. More than half of women have a good awareness about knowledge of the importance of the first visit and the importance of continued follow-up in the same place. There was no relation between the regularly attendance to ANC, and age, gravidity, residency, level of education, income of household. Also, there was no relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and age, gravidity, residency, income of household. But there was a relation between follow-up the regular antenatal care visits throughout the whole period of pregnancy, and level of education

**Recommendations: -**

Based on the findings of the present study, the following recommendations are suggested:

1. Enhance strategies to increase awareness of importance of follow up and delivery later at the same place of booking
2. Government should increase number of health care centers and improve the quality of services provided at these centers. Also, should recruit large numbers of qualified health care providers to decrease work load on the staff and to give each patient her full time of examination and consultation.
3. The patient's medical files should be linked by system in all hospitals of the kingdom so when patient change her hospital the other hospitals and health care centers can easily reach to her information.
4. Patient satisfaction surveys should be carried out routinely to improve the quality of services.
5. Different health education methods should be available to increase awareness of the women about the importance and components of antenatal care and how that help in decreasing the complication of pregnancy.
6. enhance the role of family physician to let the population trust them and follow up at health care centers.
7. Mass media including social media should play a consequential role in presenting the benefits of prenatal care like early diagnosis and treatment of some possible complications during pregnancy.
8. It would be more advantageous to attempt to re-conduct the study with a much larger sample size, and to carry out the study across many other cultural backgrounds and demographical aspects.
9. Further studies should be conducted to incorporate the views and responses of health care providers, as the study only depended on the responses of Saudi women.
10. Further research is recommended on the evaluation of the content of antenatal education and its cultural relevance.

**Acknowledgement: -**

At the outset, we would like to express our deep and sincere gratitude to the following people without whose support this research project would not have been a success. We would like to sincerely thank all the data collectors who helped us in our project, namely: Rawan Ghazi Shukri, Alhassan Ali Alghamdi, Abdullah Hasan Alhojaili, Daniyah Saud Aloufi, Somaya Soliman Alsuhaime, Fatin Salem Almaa'shi, Areej Mustafa Alawfi, Bashaer Abdulbaqi Ben Yayh, Raghad Zaid Aljuhani, Razzan Mohammed Ghazi, Abdulrahman Thaher Althaher, Thikra Mohammed al-blawi, Thammar Mohammed Ahmed and Balsam Taher Albondoqji

We also owe our gratitude to authority of Maternal and Children Hospital in Madina for facilitating our study by providing a suitable environment and encouraging us from the beginning up to this far. We are indebted and grateful to every patient who participated in this study. Finally, we are extending our thanks to everyone who has supported us to complete the research work directly or indirectly.

#### Abstract

**Background:**End-stage renal disease has become a public health concern worldwide. Type 2 diabetes is associated with significantly accelerated rates of diabetic nephropathy. There are controversies about the role of intact parathyroid hormone (iPTH) in the pathogenesis of osteodystrophy among diabetic patients on regular hemodialysis.

**We aimed to** estimate serum levels of iPTH, 25-hydroxyvitamin D and to clarify the possible relationships between iPTH and HbA1c ;which reflect the glycemic control as well as other clinical and biochemical parameters in end-stage renal disease patients on regular hemodialysis.

**Subjects and methods:** A case-control study of 84end-stage renal disease patients on maintenance hemodialysis thrice weekly. Patients were stratified into three groups;group1:28 diabetic patients with good glycemic control(HbA1c < 7), group 2:28 diabetic patients with poor glycemic control(HbA1c >7), and group3:28non diabetic patients, In all studied participants,blood urea, serum creatinine , calcium, phosphorus, albumin, alkaline phosphatase, lipid profile, HbA1c, fasting blood glucose (FBG),post prandial blood glucose (PPBG) and25-hydroxyvitamin Dwere measured.Also, we estimate serum iPTHlevels by ADVIA CENTAUR instrument using Chemiluminescence principle.

**Results:**Non diabetic patienton chronic hemodialysis had significantly higher values of serum 25-hydroxyvitamin D,serum iPTHmore than diabetic group, moreover diabetic patients with poor glycemic control had significantly lower values of serum 25-hydroxyvitamin D and serum iPTH, compared to good glycemic control.In diabetic patients with poor glycemic control,iPTHlevel was negatively correlated with Alkaline phosphatase,post prandial blood glucose, fasting blood glucose, as well as HbA1c. In patients with good glycemic control serum iPTHlevel was positively correlated with25-hydroxyvitamin D., there were significant negative correlations betweeniPTH level and creatinine, alkaline phosphatase, phosphorous, albumin, post prandial blood glucose, fasting blood glucose, as well as HbA1c.Stepwise linear regression analysis showed that, serum iPTH levels were independently correlated with 25-hydroxyvitamin D with diastolic blood pressure,

serum phosphorus, albumin, alkaline phosphatase, FBG, PPBG and HbA1c.

**Conclusion:** Non diabetic patient on chronic hemodialysis had significantly higher values of serum 25-hydroxyvitamin D and iPTH more than diabetic group. Moreover, in diabetic patients with poor glycemic control, serum iPTH level and 25-hydroxyvitamin D were significantly lower than good glycemic control patients.

## Introduction:-

End-stage renal disease (ESRD) has become a public health concern worldwide. According to the United States Renal Data System annual report (USRDS); it is high in Taiwan patients, Japan and USA and low in Philippines, Bangladesh and Russia [1]. Anand et al. [2] predicted an annual incidence of 239 pmp in people with diabetes and hypertension who live in sub-Saharan Africa, where renal replacement therapy (RRT) use correlated with regional income, with most patients unable to access RRT. Liyanage et al. [3] estimated that at least 432 000 people in Africa require RRT but are not receiving it. Regarding developing countries such as Egypt, the prevalence of ESRD have gone up and increased from 225 pmp in 1996 to 483 pmp in 2004. The main cause of ESRD in Egypt is hypertension, followed by diabetes, and still unknown causes represent about 15% of the cases [4].

Diabetes is a chronic metabolic disease, 415 million people have diabetes in the world and more than 35.4 million people in the MENA Region (the Middle East and North Africa region), by 2040 this will rise to 72.1 million. In Egypt, the prevalence of diabetes in adults are 14.9% and 7.8 million cases of diabetes were estimated in Egypt in 2015 according to International Diabetes Federation (2015). Type 2 diabetes (T2D) is associated with accelerated rates of micro and macro vascular complications [5].

There was great evidence that, the higher incidence of osteodystrophy among the diabetic patients on regular hemodialysis was attributed to high intact parathyroid hormone (iPTH) level (150-300 pg/ml), osteodystrophy due to high iPTH level is called High Turnover Bone Disease (HTBD) [6].

Interestingly, recent studies suggested that, there were another type of osteodystrophy in type 2 diabetic patients with ESRD on regular hemodialysis, due to low iPTH level and called Low Turnover Bone Disease (LTBD) [6].

Thus, diabetic patients on maintenance hemodialysis (MHD) are affected with alteration of iPTH level in opposite direction. Consequently, renal osteodystrophy can be of two types. High Turnover Bone Disease (HTBD) due to high iPTH level and Low Turnover Bone Disease (LTBD) due to comparatively low iPTH level [7]. It has been revealed in some studies that, usually diabetic ESRD patients on MHD have lower iPTH level than non-diabetic ESRD patients on MHD [8-10]. Increasing evidence suggests that, in both diabetic and non-diabetic haemodialyzed patients, impaired iPTH secretion appears to be the main determinant responsible for decreased bone turnover and 'adynamic bone disease' [11].

There are controversies about the mechanisms of renal-related bone disease, and the actual role of iPTH serum levels variation in the pathogenesis of renal osteodystrophy. Therefore, the purpose of current study was to estimate serum levels of iPTH and to clarify the possible relationships between iPTH and HbA1c; which reflect glycemic control as well as other clinical and biochemical parameters in ESRD patients on regular hemodialysis.

iPTH level was decreased in poor glycemic control diabetic patients on hemodialysis, moreover it was negatively correlated to measures of blood glucose, as well as biochemical parameters of end stage renal disease. Considering the controversy about the level of iPTH in diabetic patients on hemodialysis and its correlation with HbA1c and other biochemical parameters; our findings revealed the favorable effect of good control of blood glucose on iPTH. Furthermore, tight metabolic control of the diabetic patients is mandatory to avoid hypoparathyroidism. Ca and Vit D supplementations in ESRD may be fruitful in keeping iPTH level within target range.

### Subjects and Methods:-

This study included 84 patients of end-stage renal disease on maintenance hemodialysis thrice weekly; 4 hours each session for more than 3 months. Patients recruited from Hemodialysis and Endocrinology units of Internal Medicine Department of Zagazig University Hospitals, Egypt. Patients were matched as regard age, gender, and ethnic origin. Patients were stratified into three groups; group 1 (n=28); diabetic patients with good glycemic control with HbA1c <7, group 2; diabetic patients with poor glycemic control with HbA1c > 7 (n=28) and group 3 (n=28) non diabetic patients. All patients were subjected to thorough medical history and full clinical assessment. Patients suffering from any acute infection, acute renal failure, liver disease, cardiac disease, acute illness, parathyroidectomy, any endocrine disorder except diabetes mellitus, those who were taking hormone replacement therapy, bisphosphonates, aluminium hydroxide and steroids were excluded from the study. The ethical committee of Faculty of Medicine, Zagazig University approved our study protocol, and all participants assigned written informed consent.

### Blood sampling:-

Blood samples were drawn from all subjects after an overnight fasting and divided into 3 portions: and HbA1c; 1 ml of whole blood was collected into evacuated tubes containing fluoride for fasting blood glucose. Serum was separated immediately from remaining part of the sample and stored at -20 °C until analysis.

### Biochemical measurements :-

We determined fasting blood glucose using the glucose oxidase method (Spinreact, Girona, Spain). Total cholesterol and triglycerides were measured by routine enzymatic methods (Spinreact, Girona, Spain). HDL cholesterol was determined after precipitation of the apoB-containing lipoproteins. LDL cholesterol was calculated using the Friedewald formula (12). Biochemical parameters including serum levels of blood urea nitrogen (BUN), calcium, phosphorous, alkaline phosphatase, uric acid, creatinine, and albumin were measured with standard techniques by an automatic analyzer. Serum 25(OH) D levels tested by a high-performance liquid chromatography (HPLC). Serum iPTH was measured by ADVIA CENTAUR instrument using Chemiluminescence principle. The serum samples were immediately frozen at -70 °C until analysis.

### Statistical analysis:-

Statistical analyses were performed using the Statistical Package for the Social Sciences for Windows (version 22.0; SPSS Inc., Chicago, IL, USA). Data were expressed using descriptive statistic (mean  $\pm$  standard deviation) and were analyzed statistically by Chi-squared test ( $\chi^2$ ), paired T test. Pearson correlation coefficient was used to assess the association between iPTH, clinical, biochemical tests and other studied metabolic parameters in patients with hemodialysis. A linear regression analysis was performed to detect the main predictors of iPTH levels in hemodialysis patients. P-values were considered significant if <0.05.

### Results:-

Among patients on chronic hemodialysis, in the diabetic group, 69.6 % were male and 30.4% were female, their mean age was  $47.73 \pm 12.02$  year. In the non-diabetic group, 64.3% were male and 35.7% were female, their mean age was  $45.25 \pm 14.45$  year. Diabetic and nondiabetic patients were matched for age and gender.

Patients with poor glycemic control (PGC), 67.8 % were male and 32.2% female, their mean age was  $49.04 \pm 11.28$  year. In patients with good glycemic control (GGC), 71.4% were male and 28.6% were female, their mean age was  $46.43 \pm 12.79$  year. Both diabetic groups were matched for age and gender.

**Clinical and biochemical characteristics of the studied groups are summarized in Table 1:** Diabetic patient on chronic hemodialysis had significantly higher values of PPBG, FBG, HbA1c, LDL, TG, TC, PO4, albumin and Alkaline phosphatase than non diabetic group ( $p < 0.05$ ), and there was non-significant difference regarding other parameters, ( $p > 0.05$ ).

**Table 1:-** clinical and biochemical characteristics of the studied groups .

Variable	Diabetic (n=56)	Non-diabetic (n=28)	T	p
Systolic blood pressure (mmHg)	$136.5 \pm 15.43$	$131.25 \pm 18.14$	1.39	NS

**Linear regression analyses in diabetic patients on hemodialysis (n=56) :** stepwise linear regression analysis was done to assess the main independent parameters associated with serum iPTH. Our results showed that, serum iPTH levels were independently correlated with 25-Hydroxyvitamin D , diastolic blood pressure, serum phosphorus ,albumin,alkaline phosphatase,post prandial blood glucose, fasting blood glucose, hemoglobin A1c. (p< 0.001) (Table 4).

### Discussion:-

Worldwide, the incidence of individuals with end-stage renal disease (ESRD) has increased markedly over the past decades and imposes a major social and economic burden for healthcare systems [12].

Diabetes Mellitus (DM) is the main cause of chronic kidney disease (CKD). Given the prevalence of DM is estimated to increase from 366 million patients in 2011 to 552 million patients in the year 2030. Furthermore, it is well established that diabetic nephropathy particularly from type 2 diabetes and hypertensive nephrosclerosis are the leading causes of ESRD in developed and developing countries possibly because of increasing prevalence of obesity, diabetes and hypertension [13].

Numerous reports have described renal osteodystrophy as "the silent crippler"; affected patients may be completely asymptomatic. Nonetheless, if symptoms developed it is observed in the late stages of the disease, these symptoms including bone and joint pain as well as bone deformity and fractures. Adynamic bone disease is a severe state of renal osteodystrophy characterized by low levels of PTH, lack of bone cell activity and a low bone turnover [14]. The excessive suppression of PTH can lead to adynamic bone disease (currently the most common osteodystrophy), mainly because of low bone turnover [15].

Previous studies have shown advanced glycation end products (AGEs) which produced in diabetic state play an important role in the pathogenesis of both impaired secretion of iPTH and decreased bone formation. Furthermore, (AGEs) inhibit hypersecretion of PTH in response to low serum calcium [16]. Data on the association between T2DM and osteoporotic fractures is controversial. Martinez-Laguna D [17] reported 20% increased risk of hip fracture in the first years following T2DM disease onset compared to matched non-diabetic patients.

Nonetheless, numerous reports have linked the higher incidence of osteodystrophy among the diabetic patients on regular hemodialysis to high intact parathyroid hormone (iPTH) level, thus, the objective of the present study was to estimate the serum levels of iPTH and to clarify the possible relationships between iPTH serum levels and HbA1c which reflect the glycemic control as well as other clinical and biochemical parameters in ESRD patients on regular hemodialysis. Our study revealed clear evidence that, diabetic patient on chronic hemodialysis had significantly higher values of PPBG, FBG, HbA1c, LDL, TG, TC, PO<sub>4</sub>, albumin and Alkaline phosphatase, compared to non-diabetic patients on hemodialysis.

This was in agreement with the findings detected by **Paulo et al.**, [18], who reported a statistical significant difference regarding fasting blood sugar, phosphorus and glycated hemoglobin in diabetic group compared to non-diabetic group. Likewise, **Takeshi et al.**, [19], reported a high statistical significant difference between all groups regarding glycated hemoglobin. These results were in agreement with the study of **Ahmed R. et al.**, [20], they reported a statistical significant difference between all diabetic and non-diabetic patients regarding HbA1c, fasting blood sugar, serum albumin and phosphate.

Regarding the influence of hyperglycemia on clinical and biochemical parameters, our results revealed that in poor glycemic control group, systolic & diastolic blood pressure, FBG, PPBG, HbA1c, urea, alkaline phosphatase, TG, and cholesterol were significantly higher than in patients with good glycemic control. Similar results had been detected by other authors **Ahmed R. et al.**, [20] they reported a statistical significant difference between controlled diabetic and uncontrolled diabetic patients regarding fasting blood sugar and glycated hemoglobin.

The main finding of our study, non-diabetic patient on chronic hemodialysis had significantly higher values of serum iPTH more than diabetic group, moreover, patients with good glycemic control had significantly higher levels of serum iPTH and 25-Hydroxyvitamin D compared to poor glycemic control group.

These findings are in a close agreement with results reported by **Ahmed R. et al.**, [20], who have also determined that serum iPTH levels in diabetic patients on hemodialysis were lower when compared with those in non-diabetic patients, also poor glycemic control further reduced levels of serum iPTH, also good glycemic control was associated with higher levels of serum iPTH, while no statistical difference of serum levels of iPTH between controlled diabetic patients and non-diabetic patients, suggesting that proper glycemic control could eliminate the effects of diabetic state on serum iPTH level.

Previous studies also have shown that, despite the fact that serum iPTH levels are considered important for the understanding of the mechanisms leading to renal related bone disease, changes in iPTH biological action play a significant role in the pathogenesis of renal osteodystrophy [21]. Both high and low circulating iPTH levels have been linked respectively to high and low bone turnover osteodystrophy or adynamic bone disease in patients on hemodialysis [14, 22]. Pilz S et al; 2011 [23] showed low 25(OH)D concentrations in patients with CKD. Molina P et al 2014 [24] have reported that cholecalciferol decreases albuminuria and improves iPTH levels.

Our study demonstrated that, in diabetic patients with poor glycemic control, serum iPTH level was positively correlated with 25-Hydroxyvitamin D, on the other hand, serum iPTH level was negatively correlated with Alkaline phosphatase. In good glycemic control, serum iPTH level was positively correlated with 25-Hydroxyvitamin D, but there were significant negative correlations between serum iPTH level and creatinine, alkaline phosphatase, phosphorous and albumin, there were non-significant correlation between iPTH and other clinical and biochemical characters in both groups. Regarding correlation between serum iPTH and parameters of glycemic control. In diabetic patients with poor glycemic control, serum iPTH level was negatively correlated with post prandial blood glucose, fasting blood glucose, as well as HbA1C.

These results were in agreement with the studies of **Wasan et al.**, [25] and **Dan S et al.**, [26], they observed that in diabetic poor glycemic control group, there was a significant inverse correlation between serum iPTH and serum

alkaline phosphatase, cholesterol, triglycerides, fasting blood sugar, postprandial blood sugar and glycated hemoglobin.

Also our results revealed that diabetic patients with good glycemic control, serum iPTH level was negatively correlated with post prandial blood glucose, fasting blood glucose, as well as HbA1C. Similarly the study of **Dan S et al.**, [26] observed that, in the diabetic good glycemic control group there was a significant positive correlation between serum iPTH and serum albumin and creatinine, while there is a significant inverse correlation between serum iPTH and serum phosphate, alkaline phosphatase, fasting blood sugar, postprandial blood sugar and glycated hemoglobin.

These results were supported previously by **Murakami et al.**, [10], who reported that there was an inverse correlation between serum iPTH levels and glycemic control. Specifically, diabetic patients with poor glycemic control were characterized by low circulating iPTH, which is conversely found at higher levels in diabetic patients with good glycemic control. **Atmaca et al** [27] reported that, impaired blood glucose regulation in subjects with type II DM leads to functional hypoparathyroidism and advised further investigation for the effect on bone loss and fragility. Also **Polymeris et al** [28] revealed reduction in parathyroid hormone which was inversely correlated with elevated blood glucose during oral glucose tolerance test in non diabetic postmenopausal women.

Our study explored that, In diabetic patients on hemodialysis, stepwise linear regression analysis showed that, serum iPTH levels were independently correlated with 25-Hydroxyvitamin D, diastolic blood pressure, serum phosphorus, albumin, alkaline phosphatase FBG, PPBG and HbA1c.

Also, **Paula et al.**, [18], found that serum HbA1c levels were independent correlated with the serum iPTH levels in diabetic group. The inverse correlation noted between blood glucose and parathyroid hormone suggest that hyperglycemia may have an inhibitory action on the synthesis and secretion of parathyroid hormone and it is attractive to speculate that hyperglycemia together with an insulin deficit may lead to a hypoparathyroid state and a downregulation of PTH receptors [25].

**Paula et al.**, [18] detected the inhibitory effects of insulin on both the secretion and the action of iPTH in both primary and secondary hyperparathyroidism. however, it is still unclear as **Procopio M and Borretta G** [29] studies suggest that poor metabolic control per se, could inhibit low calcium-mediated iPTH secretion. **Guh et al.**, [30] detected the protective effect of diabetic process on the development of hyperparathyroidism and development of an adynamic bone lesion. In contrast, the uncontrolled hyperglycemia is parallel with increased risk of vascular calcification and increased cardiovascular mortality.

Also, **Gnudi et al.**, [31] reported that low bone turnover osteodystrophy represents a risk factor for accelerated peripheral vascular disease in patients on hemodialysis. While low blood levels of intact PTH strongly suggest the presence of adynamic bone, a high PTH level does not exclude this possibility. Histological studies have found adynamic bone in patients on hemodialysis despite PTH values above 44.0 pmol/L. This may be related to limitations of the PTH assay due to accumulation of inhibitory PTH fragments [32]. Despite the fact that K-DOQI [33] guidelines recommend keeping glycated hemoglobin below 7% in diabetic patients undergoing dialysis, this recommendation is not based on clinical trials for the population undergoing renal replacement therapy (RRT), and the target range might be challenged due to the lack of nationwide studies related to this issue, making way for an individualized approach for these patients [34].

### Conclusion:-

Non diabetic patient on chronic hemodialysis had significantly higher values of serum 25-hydroxyvitamin D and intact parathyroid hormone (iPTH) more than diabetic group. Moreover, in diabetic patients with poor glycemic control, serum iPTH level and 25-hydroxyvitamin D were significantly lower than diabetic patients with good glycemic. Thus, tight metabolic control of the diabetic process is very important to avoid hypoparathyroidism and low bone turnover in these patients. Alongside, individual titration of Ca and Vit D supplementations in ESRD patients on hemodialysis may be fruitful in keeping iPTH level within target range. Further studies should be done to investigate whether targeting iPTH and other determinants involved in renal bone disease in dialysis patients may prevent or delay the development of vascular calcifications.

### Abstract

**Background :** Electroconvulsive therapy (ECT) it is one of many methods used for treatment in hospital and ECT more we find them in the psychiatric clinic. However, the Electroconvulsive therapy has been demonstrated effective and safe treatment for a psychiatric disorder like depression, schizophrenia, and neuroleptic malignant syndrome, it has electrical polar which pass electrical through the brain when the patient under general anesthesia.

There are many stigmas is attached to the use of ECT, which undermines the acceptance of this treatment by the general public. In contrast to the negative view about ECT among the general public, studies, which have evaluated the knowledge and attitude of mentally ill patients who have received ECT and their relatives, suggest that they are mostly satisfied with the experience of ECT.

However, this is the first study focusing on awareness about ECT since there are no data on Qassim region about attitude or awareness of general public toward ECT.

**Objective:**

to explore the state of knowledge & attitudes toward electroconvulsive therapy (ECT) among a sample of health field and the general public in Saudi Arabia at "Qassim".

**Methods:** By use the Cross- sectional study ... Extensive electronic was administered to health field student and the general public in Saudi Arabia at "Qassim" (n=200) to investigate the source of ideas about ECT, the extent of knowledge and attitude toward ECT.

**Result:** It is good to know that most of the health field student are well informed about ECT the score was about 64% compared to the general public about 36% , the most age have the knowledge score is the age between 31-40 .however the source of knowledge more from the internet 34% in compare to other sources . The health field student and the general public have a good attitude towards ECT (is an inhuman treatment) 61% of the sample disagreed with this statement. The health field student and the general public attitude towards ECT (is a painful treatment) 73.5% of the sample agreed with this statement. While attitude towards ECT (is that Need anesthesia) from the health field student and the general public 57.5% of the sample disagreed with this statement. In the view of the most cases improved by treatment. From

the sample for the safety of ECT during pregnancy, show the health field student (29%) and the general public (14%) agreed to it implying that majority of the people did not consider ECT safe in pregnancy.

Keywords: Electro-convulsive therapy (ECT)

## **Introduction:-**

Electroconvulsive therapy (ECT) involves the induction of a grand mal seizure through the passage of an electrical current to the patient's brain with the aim of improving the patient's mental status under anesthesia and muscle relaxant. There is no solid based clarification for the mechanism of action and how the ECT works but the most credibility goes to the biochemical theory. ECT is widely prescribed worldwide and first indicated in the emergency treatment of severe depression with suicide or psychosis, medication-resistant schizophrenia. ECT is also commonly used as an effective alternative to medication for patients who have a comorbid medical condition.

Modified and non-modified ECT are the two forms of the treatment, modification comes in the form of using anesthesia together with the muscle relaxant to limit the intensity of convulsion and reduce its side effects as bone and teeth fractures. Most of the internationally established guidelines recommended the modified ECT in the last decade as the standard routine treatment. Unilateral treatment is prescribed for some patients instead of bilateral to overcome the most frequently occurring side effects as temporary memory loss, mental confusion, and headache.

Despite controversies surrounding its use still remains one of the most efficacious treatment for the much severe mental disorder.

However, a lot of stigmas is attached to the use of ECT, which undermines the acceptance of this treatment by the general public. In contrast to the negative view about ECT among the general public, studies which have evaluated the knowledge and attitude of mentally ill patients who have received ECT and their relatives, suggest that they are mostly satisfied with the experience of ECT.

Studies which have evaluated the attitude of patients before and after ECT also show the attitudes become more positive after an experience of the treatment.

However, this is the first study focusing on awareness about ECT since there are no data on Qassim region about attitude or awareness of general public toward ECT.

Aim In this study, to examine the knowledge and attitude of the general public toward ECT.

## **Objective:-**

to explore the state of knowledge & attitudes toward electroconvulsive therapy (ECT) among a sample of health field student and the general public in Saudi Arabia at "Qassim".

## **Methods:-**

Study Design: Cross- sectional descriptive study.

Study setting: this research done in Saudi Arabia at "Qassim".

Study Population: population less than 20, 20-30, 31-40 and more than 40.

## **Data collection Technique:-**

### **Type of questionnaire:-**

See the appendix

### **sample size:-**

200(100 for health field in Saudi Arabia at "Qassim" and 100 for general population)

### **Sample method:-**

A random sample will be collected from health field in Saudi Arabia at "Qassim" and the general public.

**The plane for data collection:-**

The sample is divided into two groups, one for health field in Saudi Arabia at "Qassim" and another group for general public through electronic Questionnaires.

**Table 1:-** knowledge score in relation to study TYPE.

College		Knowledge		Total
		yes	no	
health field student.	Count	64	36	100
	%	64%	36%	100%
General public	Count	31	69	100
	%	31%	69%	100%
Total	Count	95	105	200
	%	47.5	52.2%	100%

The table show that significantly less knowledge more among general public: 36% compared to 64% of health field student.

**Table 2:-** Description the relation between the age and the knowledge.

			knowledge score		Total
			Yes	no	
Age	Less than 20	Count	7	13	20
		%	35%	65%	100.0%
	20-30	Count	41	55	96
		%	42.70%	57.29%	100.0%
	31-40	Count	35	22	57
		%	61.14%	38.5%	100.0%
	>41	Count	12	15	27
		%	44.4%	55.5%	100.0%
Total		Count	95	105	200
		%	47.5	52.2%	100.0%

**Table 3:-** Illustrates the knowledge score related to sex.

		knowledge score		Total
		yes	no	
Sex	Male	54 48.2%	58 51.7%	112
	Female	41 46.5%	47 53.4%	88
Total		95	105	200

**Table 4:-** The table shows the source of knowledge

			Sources				Total
			book	T.V	Internet	Relative or friend experience	
Gender	male	Count	7	24	17	12	60
		%	11%	40%	28%	20%	100.0%
	female	Count	11	11	24	12	60
		%	18%	18%	40%	20%	100.0%
Total		Count	18	35	41	24	120
		%	15%	29%	34%	20%	100.0%

The table shows that they get the knowledge from internet 34% in compare to T.V: 29%, relative\friend experience: 20% and book: 15%

**Table 5:-** This table show the medical and non-medical attitude towards ECT (ECT is an inhuman TREATMENT).

			inhuman treatment		Total
			yes	no	
	Medical	Count	29	71	100
		%	29%	71%	100.0%
	Non medical	Count	49	51	
		%	49%	51%	100.0%
Total		Count	78	122	100
		%	39%	61%	100.0%

This table shows the medical and non-medical good attitude towards ECT 61% of the sample disagreed with this statement.

**Table 6:-** This table show the medical and non-medical attitude towards ECT.

			Painful treatment		Total
			Yes	No	
medical		Count	79	21	100
		%	79%	21%	100%
Non medical		Count	68	32	100
		%	68%	32%	100%
Total		Count	147	53	200
		%	73.5%	26.5%	100.0%

This table show the medical and non-medical attitude towards ECT 73.5% of the sample agreed with this statement

**Table 7:-** This table show the medical and non-medical attitude towards ECT

			Need anesthesia		Total
			yes	no	
	Medical	Count	46	54	100
		%	46%	54%	100.0%
	Non medical	Count	39	61	100
		%	39%	61%	100.0%
Total		Count	85	115	200
		%	42.5%	57.5%	100.0%

This table show the medical and non-medical attitude towards ECT 57.5% of the sample disagreed with this statement.

**Table 8:-** This table show the knowledge of the duration OF ECT.

			Duration		Total
			medical	Non medical	
	One	Count	26	21	47
		%	55%	44%	100.0%
	2-3 times	Count	25	15	40
		%	62%	37%	100.0%
	Depend on the disorder	Count	49	65	114
		%	42%	57%	100.0%
Total	Count		100	100	200
	%		100%	100%	100.0%

**Table 9:-** This table show side effect.

			Persistent Side effect		Total
			yes	No	
result	Medical	Count	57	43	100
		%	57%	43%	100.0%
	Non medical	Count	69	41	100
		%	69%	41%	100.0%

Total	Count	126	74	200
	%	55.6%	44.4%	100.0%

The table show most cases improved by treatment.

**Table 10:-** Comparison between efficacy of ECT VS medical treatment.

			efficacy		Total
			yes	no	
reading	Medical	Count	48	52	100
		%	48%	52%	100.0%
	Non medical	Count	40	60	100
		%	40%	60%	100.0%
Total		Count	88	112	200
		%	44%	56%	100.0%

**Table 11:-** this table show the medical and non-medical attitude towards ECT

			Safe In pregnancy		Total
			yes	no	
	Medical	Count	29	71	10
		%	29%	71%	100.0%
	Non medical	Count	14	86	100
		%	14%	86%	100.0%
Total		Count	43	157	200
		%	21%	78%	100.0%

The table show only a few of the medical (29%) and non-medical(14%) agreed to it implying that majority of the people did not consider ECT safe in pregnancy.

## THE SOURCE OF KNOWLEDGE

■ T.V ■ BOOK ■ INTERNET ■ RELATIVE \FRINED EXPERIENCE

### The score of health filed student and the general public attitude towards ECT ( ECT is an inhuman treatment ).

**Conclusion:-**

IT IS GOOD to know that most of the health field student are well informed about ECT , the score was about 64% compared to the general public about 31% , the most age have the knowledge score is the age between 31-40 .however the source of knowledge more from internet 34% the in compare to other sources . The health field student have a good attitude towards ECT (is an inhuman treatment) 71% of the sample disagreed with this statement. The health field student and the general public attitude towards ECT (is a painful treatment) 73.5% of the sample agreed with this statement. While attitude towards ECT (is that Need anesthesia) from the health field student and the general public 57.5% of the sample disagreed with this statement. In the view of the most cases improved by treatment. From the sample for the safety of ECT during pregnancy, show the health field student (29%) and the general public (14%) agreed to it implying that majority of the people did not consider ECT safe in pregnancy.

**Recommendation:-**

we consider that there are many options in the treatment that it has a benefit as well as side effects, but should the person know both, so he can choose what is he would prefer to the treatment. And we LIKE TO clear about the ECT treatment that it gives us a positive result, not causes any pain under general anesthesia and safe for pregnant and this is what approved in the previous researchers.

**The Appendix:- ....**

1) AGE...	2) GENDER...	3) EDUCATIONAL LEVEL
Below 20	Male	- Academic medical specialization
20-30	Female	- Academic non-medical specialization
31-40		- Non- academic
Above 40		

4) do you have information about electroconvulsive therapy sessions?

Yes / no

5) if yes, what are the sources of your information?

Book

Internet

Television

A relative or friend dealing with electroconvulsive therapy

6) do you think that the electrical therapy sessions method of treatment is inhumane?

Yes / no

7) do you think that electroconvulsive therapy sessions painful?

Yes / no

8) do you think that the fear and anxiety that accompanies attending the proceedings is the reason why many patients refused to use this type of treatment?

Yes / no

9) do you think that the electricity therapy sessions require anesthesia?

Yes / no

10) how many sessions needed by the patient to give the desired results?

One session

Two to three on average

Vary depending on the disease

11) do you think that therapy sessions lead to get used to it?

Yes / no

12) do you know someone who has this kind of treatment?

Yes / no

13) if yes, did he/she responded to treatment?

Yes / no

14) it does result in symptoms of long-term side effect?

Yes / no

15) do you think electroconvulsive therapy sessions safe for pregnant women?

Yes / no

**16) do you think the use of electroconvulsive therapy sessions more effective than drug?**

**Yes / no**

**17) do you think the electroconvulsive therapy session given to only hopeless cases?**

**Yes / no**

**18) do you think that modern scientific research proving effectiveness electroconvulsive therapy?**

**Yes / no**

#### Abstract

The most challenging research area in image processing is image denoising. This technique not only some self-possessed technical difficulties, but also may result in the demolition of the image (i.e. making it blur). There are various important component of large number of applications such as in medical diagnosis. In medical research there are different medical images like X- Ray, MRI, PET and CT gave minute to minute information about brain and whole body. The image denoising techniques includes parallel magnetic resonance imaging (pMRI) technique which can speed up MRI scan through a multi-channel coil array receiving signal simultaneously. Nevertheless, noise amplification and aliasing artifacts are serious in pMRI reconstructed images at high accelerations. An image enhancement method is proposed by using low rank matrix decomposition, LRMD and support vector machine, SVM. Low rank matrix decomposition is applied on image to remove the noises and enhancing the quality of an image. It describes the problem of finding and exploiting low-dimensional structures in high- dimensional data. The aim of Low Rank Matrix approximation based image enhancement is that it removes the various types of noises in the adulterate images simultaneously. The noise and aliasing artifacts are removed from the structured Matrix by applying sparse and low rank matrix decomposition method. The support vector machine exhibits video which is converted into different sizes of frames so that it can be enhanced easily. Then noisy image and enhanced image are compared to obtain higher signal to noise ratio and other parameters like Peak Signal to Noise Ratio PSNR, Structural Similarity Index Matrix SSIM and Mean Square Error MSE for qualitative assessment to the enhancement result. This method can effectively remove both noise and residual aliasing artifact from pMRI reconstructed noisy images, and produce higher peak signal noise rate (PSNR) and structural similarity index matrix (SSIM) than other state-of-the-art De-noising methods. Here we propose image de-noising using low rank matrix decomposition (LMRD) and Support vector machine (SVM). The proposed method gives more clear image with higher PSNR and improved SSIM value than the previous methods.

### Introduction:-

The digital signal processing having image which has an input and output (or a set of characteristics or parameters of image) image. In image processing we work in two domains i.e., spatial domain and frequency domain. The Spatial domain refers to the image plane itself, and image processing method in this category are based on direct manipulation of the pixels in an image and coming to frequency domain it is the analysis of mathematical functions or signals with respect to frequency rather than time.

**Fig 1:-** Medical original, noisy and denoised image

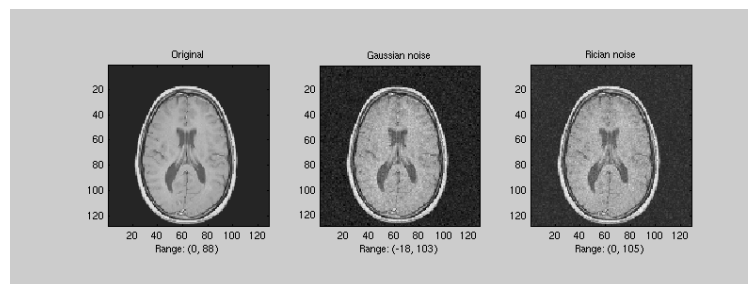

The sources of noise in digital images arise during image acquisition and transmission. The Noise degrades the image quality for which there is a need to denoise the image to restore the quality of image.

### NOISE Types:-

There are various types of noise have their own characteristics and are inherent in images in different ways.

#### Gaussian Noise:-

Gaussian noise is evenly distributed over the signal. This means that each pixel in the noisy image is the sum of the true pixel value and a random Gaussian distributed noise value.

**Fig 1.1:-** Gaussian noise and Rician noise image

As the name indicates, this type of noise has a Gaussian distribution, which has a bell shaped probability distribution function given by

$$F(g) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(g-m)^2}{2\sigma^2}}$$

Where  $g$  represents the gray level,  $m$  is the mean or average of the function and  $\sigma$  is the standard deviation of the noise. The Gaussian noise represent in Image 1.2 illustrates the Gaussian noise with mean (variance) as 1.5 (10) over a base image with a constant pixel value of 100.

**Fig 1.2:-** Gaussian noise  
(mean = 0, variance = 0.05)

**Fig 1.2:-** Gaussian noise  
(mean = 1.5, variance = 10)

### Salt and Pepper Noise:-

Salt and Pepper is an impulse type of noise and is also referred to as intensity spikes. It is generally caused due to errors in transmission. This is caused generally due to errors in data transmission. It has only two possible values, a and b. The probability of each is typically less than 0.1. The corrupted pixels are set alternatively to the minimum or to the maximum value, giving the image a “salt and pepper” like appearance. Unaffected pixels remain unchanged. For an 8-bit image, the typical value for pepper noise is 0 and for salt noise 255. The salt and pepper noise is generally caused by malfunctioning of pixel elements in the camera sensors, faulty memory locations, or timing errors in the digitization process. The probability density function for this type of noise is shown in Figure 1.3.

**Fig 1.3:-** salt and pepper noise

**Fig 1.3:-** salt and pepper noise

### Medical Image denoising:-

Image denoising is an important image processing task, both as a process itself, and as a component in other processes. Very many ways to denoise an image or a set of data exists. The main properties of a good image denoising model is that it will remove noise while preserving edges. Traditionally, linear models have been used. One common approach is to use a Gaussian filter, or equivalently solving the heat-equation with the noisy image as input-data, i.e. a linear, 2nd order PDE-model. For some purposes this kind of denoising is adequate. One big advantage of linear noise removal models is the speed. But a back draw of the linear models is that they are not able to preserve edges in a good manner: edges, which are recognized as discontinuities in the image, are smeared out.

The different digital medical imaging technologies Such as positron emission tomography (PET), magnetic resonance imaging (MRI), computerized tomography (CT) and ultrasound Imaging has revolutionized modern medicine. Today, many patients no longer need to go through invasive and often dangerous procedures to diagnose a wide variety of illnesses. Here the widespread use of digital imaging in medicine today, the quality of digital medical images becomes an important issue through worldwide. In medical line to achieve the best possible diagnosis it is important that medical images be sharp, clear, and free of noise and artifacts. The major challenges in the study of medical imaging because they could mask and blur important features in the images and many proposed de-noising techniques have their own problems. Image de-noising still remains a challenge for researchers because noise removal introduces artifacts and causes blurring of the images. The factors which affect noise modeling in medical imaging are capturing instruments, information transmission media, image quantization and separate sources of radiation. There are a number of shortcomings and these includes: acquisition noise from the equipment, ambient noise from the environment, the presence of background issue, other organs and

anatomical influences such as body fat, and breathing motion. Therefore, noise reduction is very important, as various types of noise generated limits the effectiveness of medical image diagnosis.

### Techniques Used:-

There are various main techniques are used to enhance the results of this thesis. These techniques are discussed below:

#### Low-Rank Matrix Decomposition:-

LRMR is derived from compressed sensing theory which has been successfully applied various matrix completion issues for example image compression video denoising and dynamic MRI Compared with classical denoising methods. Denoising techniques based on low rank completion enforce fewer external assumptions on noise distribution. These methods rely on the self-similarity of three dimensions (3-D) images across different slices or frames to construct a low rank matrix. The significantly varying contents between different slices or frames may lead an exception to the assumption of low-rank 3-D images and discount the effectiveness of these methods.

**Fig 2.1:-** Image represents Low-rank matrix decomposition

Low-Rank Matrix Decomposition It is derived from compressed sensing theory has been successfully applied various matrix completion problems, e.g., image compression video denoising and dynamic MRI Compared with classical denoising methods. Denoising methods based on low rank completion enforce fewer external assumptions on noise distribution. These methods rely on the self-similarity of three dimensions (3-D) images across different slices or frames to construct a low rank matrix. Nonetheless, significantly varying contents between different slices or frames may lead an exception to the assumption of low-rank 3-D images, and discount the effectiveness of these methods. In this paper, we propose to remove both noise and aliasing artifacts in pMRI image by using a sparse and low rank decomposition method.

#### Support Vector Machine (SVM):-

It is primarily a classifier in which width of the margin between the classes is the optimization criterion, i.e. empty area around the decision boundary defined by the distance to the nearest training patterns. These are called support vectors. The concept of (SVM) Support Vector Machine was introduced by Vapnik. The SVM classifier is widely used in bioinformatics (and other disciplines) due to its highly accurate, able to calculate and process the high-dimensional data such as gene expression and exibility in modeling diverse sources of data .SVMs belong to the general category of kernel methods. A kernel method is an algorithm that depends on the data only through dot-products. When this is the case, the dot product can be replaced by a kernel function which computes a dot product in some possibly high dimensional feature space. This has two advantages: First, the ability to generate non-linear decision boundaries using methods designed for linear classifiers. Second, the use of kernel functions allows the user to apply a classifier to data that have no obvious fixed-dimensional vector space representation.

Fig 2.2:- Image represents data mapping of support vectors in SVM

The support vector machines have proved to achieve good generalization performance with no prior knowledge of the data. The principle of an SVM is to map the input data onto a higher dimensional feature space nonlinearly related to the input space and determine a separating hyper plane with maximum margin between the two classes in the feature space. The SVM is a maximal margin hyper plane in feature space built by using a kernel function. This results in a nonlinear boundary in the data space.

#### Filters:-

In image processing filters are mainly used to suppress either the high frequencies in the image that is smoothing the image, or the lower frequencies that is enhancing or detecting edges in the image. The image can be filtered in frequency domain or in the spatial domain. In spatial domain there are two types of filters namely linear filters and non linear filters. The bilateral filter is a non-linear filter and edge-preserving noise-reducing smoothing filter for medical images. In this the weight can be based on a Gaussian distribution. Weights depend not only on Euclidean distance of pixels, but also on the radiometric differences (e.g. range differences, such as color intensity, depth distance, etc.). The intensity value at each pixel in an image is replaced by a weighted average of intensity values from nearby pixels. The bilateral filter can blur an image while respecting strong edges. The ability of bilateral filter to decompose an image into different scales without causing haloes after modification has made it ubiquitous in computational photography applications such as tone mapping, style transfer, relighting, and denoising of medical images. This text provides a graphical, intuitive introduction to bilateral filtering, a practical guide for efficient implementation and an overview of its numerous applications, as well as mathematical analysis. The formulation of it is simple and each pixel is replaced by a weighted average of its neighbors. This aspect is important because it makes it easy to acquire intuition about its behavior, to adapt it to application-specific requirements, and to implement it.

#### Parameters used:-

Following are the two main parameters that are used to calculate the results of the proposed work in this thesis. These parameters are:

#### Peak Signal-to-Noise Ratio (PSNR):-

Peak signal-to-noise ratio is an engineering term for the ratio between the maximum possible power of a signal and the power of corrupting noise that affects the fidelity of its representation. Because many signals have a wide dynamic range and PSNR is usually expressed in terms of the logarithmic decibel scale. Peak signal-to-noise ratio is the maximum gray scale value of the pixels in the fused image. Higher the value of the PSNR is better the performance of the fusion algorithm.

#### Mean Square Error (MSE):-

The mean square error (MSE) of a procedure for estimating an unobserved quantity measures the average of the squares of the errors that is, the difference between estimator and what is estimated. It would have the same effect of making all the values positive as the absolute value. There are two basic techniques used to compare the various image are the mean square error (MSE) and the peak signal-to-noise ratio (PSNR). A commonly utilized reference based assessment metric is the Mean Square Error (MSE). The MSE between a reference image and a fused image is given by the reference and fused images respectively and image dimensions. The MSE is the

cumulative squared error between the compressed and the original image, whereas PSNR is a measure of the peak error. Smaller the value of the MSE is better the performance of the fusion algorithm.

### Structure Similarity Index Matrix (SSIM):-

Structure similarity index matrix is a method for measuring the similarity between two images and it is a full reference matrix. In other words the measuring of image quality based on an initial uncompressed or distortion free image. This parameter is employed for measure the similarity between two images. SSIM enforced to recover on ancient ways like peak signal-to-noise ratio and mean square error. The distinction with reference to different parameters like MSE or PSNR is that it estimates perceived

### Conclusions:-

The formalism presented in this paper demonstrates that the LRMD and SVM techniques are combined to propose a new technique to further reduce the noise in medical images. In this paper, we propose different techniques like LRMD, MSE, Bilateral filter and SVM as a tool for image de-noising and enhancement. Low rank matrix decomposition and SVM will be used. The evaluation will be based on the PSNR and mean SSIM with their improved values as compare to the previous research. The parameter introduced is mean square error(MSE), it is proposed approach i.e. improved technique for medical image de-noising using these techniques and SVM will exhibit outcomes of noise reduction and image quality improvements with different noise levels which will qualify it to be suitable for image processing and denoising. The proposed approach drastically improves the quality of Parallel MRI scanning in particular medical images. Future work may be further applied new formulas or algorithm for the enhancement of denoised images. The proposed algorithm has been implemented on MATLAB tool. This approach can also be an effective technique to denoise the images used for digital image processing.

### Abstract

Combustion study of Iraqi natural gas used in diffused shape flame is necessary to improve energy conversion in power plants and other usage of thermal systems. Oxidization of fuel to get energy is not a function of chemical reaction speed which happened very fast. This response occurs when there is a mixture contains an amount of air with any selected fuel. This study concentrated on the effect of bouency on flame length since the mixture ejected up to down. Till now, most studies focused on burning fuel in horizontal flame where bouency force effect on its length assumed to be negligible. The result from this study leads to the conclusion that the short flame length that has no effect on the combustion chamber erosion.

### Introduction:-

Flame geometry (length and width) can give an indication about radiative heat transfer and fire spread inside a combustion chamber [1]. It is also an important parameter used in burner design as the optimum purpose of a perfect design to extract the maximum amount of energy from the burnt fuel. The shape of flame can clarify the burning process.

Many researchers studied the flame geometry used different approaches [1,2, 3, 4]. Forman [1] and Spalding [2] introduced a mathematical model of the flame. Becker et al [3] presented a correlation about flame dimension while Hamodat et al [4] used high speed camera to formulate the short exposures and put a correlation comparable with that found by Becker.

In the present work, a consistent computer program [5] was used to study the flame length and its behavior inside of a boiler using Iraqi Liquefied petroleum Gas LPG.

### Theory:-

The flame generated as a result of burning fuel flowing outside an orifice hole, nozzle in still air is called free diffusion flame. Two factors strongly affecting the vertical flame behavior: the buoyancy force due to density difference during boiler height and the momentum forces due to fuel and air velocities coming out of the orifice or nozzle and direction guides.

Address:- Assistant professor in Northern Technical University, Iraq.

Most of the researches and results obtained in the last twenty years were for horizontal flames, where the buoyancy forces can be neglected. Hawthorne et al [6] derived the following formula to predict the horizontal flame length ratio. They concluded that it depends on fuel specification and the aero-dynamic properties within the turbulent layers during combustion process.

$$\frac{l_f}{d_o} = 3.1 \left[ \frac{\lambda_b + 1}{1.31} (2Sc + 1) - 1 \right] \sqrt{\frac{\rho_f}{\rho_m}} \quad (1)$$

Where;  $l_f$ : flame length,  $d_o$ : nozzle or effective orifice diameter,  $\lambda_b$ : air-fuel ratio,  $Sc$ : Schmidt number ( $Sc \approx 0.8-0.85$ ),  $\rho_f$ : fuel density at injector outlet,  $\rho_m$ : average density of flame layers.

Injector diameter  $d_o$  at constant volumetric flow rate of fuel plays a big role on flame length controlling, where injection speed  $u_o$  will decrease as the diameter of nozzle increase [6].

Becker [3] proposed a dimensionless parameter to govern these forces. Richardson number (1/ Fraud number) which is defined as: buoyancy / input momentum.

$$Ri_o = g d_o / u_o^2 \quad (2)$$

Where;  $g$ : acceleration due to gravity,  $d_o$ : effective orifice diameter,  $u_o$ : mean fuel velocity at the orifice outlet.

$$d_o = d_i (\rho_f / \rho_a)^{0.5} \quad (3)$$

Where;  $d_i$ : orifice diameter,  $\rho_f$ : fuel density at orifice outlet,  $\rho_a$ : air density.

For  $Ri_o > 1$ , the flame will be buoyancy controlled, but if  $Ri_o < 1$ , the momentum will control the flame. For pure propane fuel, Becker [3] proposed the following formula:

$$l_f / d_o = 63.4 Ri_o^{-0.13} \quad (4)$$

For  $10^{-5} < Ri_o < 0.005$ .

A mathematical simulation of all processes inside the combustion chamber had been introduced in the current work. The simulation included the gas movement, heat transfer, chemical reactions and burning products. The physical process had been translated into mathematical differential equations which, in turn, had been solved using a consistent computer program [5]. The velocity components, temperature and pressure had been calculated at each node of the proposed mesh.

#### Combustion chamber description:-

The combustion chamber under investigation is a cylinder with inner diameter of (510 mm) with a conical entrance. The burner is fixed at the beginning of the cone. It contains two channels, the first one is of (140mm) in diameter which allows the primary air to enter the combustion chamber (10% of the total air volume). The second channel is an annular with adjustable directional gates which allows the secondary air to enter the system with an annular movement. Figure (1) shows the dimensions of talk about.

**Figure 1:-** dimensions of combustion chamber where; D1: diameter of burner(160mm), D0: diameter of jet(variable), D11: diameter of primary air entrance (140mm), X1: air channel length(100mm), X: combustion chamber length(2200mm), X2: turning cup length(80mm), D: diameter of combustion chamber(510mm), D2: diameter of turning cup (600mm).

The fuel (natural gas) is ejected through a nozzle of a diameter (5-26mm) which is located at the center of the burner. The velocity of the injected gas (fuel) is (340 to 12.6 m/sec) depending on the nozzle diameter and a different ejected fuel volume.

#### Grid generation description:-

In order to get an accurate result with the minimum computing time, the combustion chamber had been divided into longitudinal, radial and latitudinal grids. The longitudinal direction is divided into 176 elements while the radial direction is divided into 57 cylindrical elements. Another division is a latitudinal one. It contains 4 portions.

**Figure 2:-** longitudinal, radial and latitudinal grids.

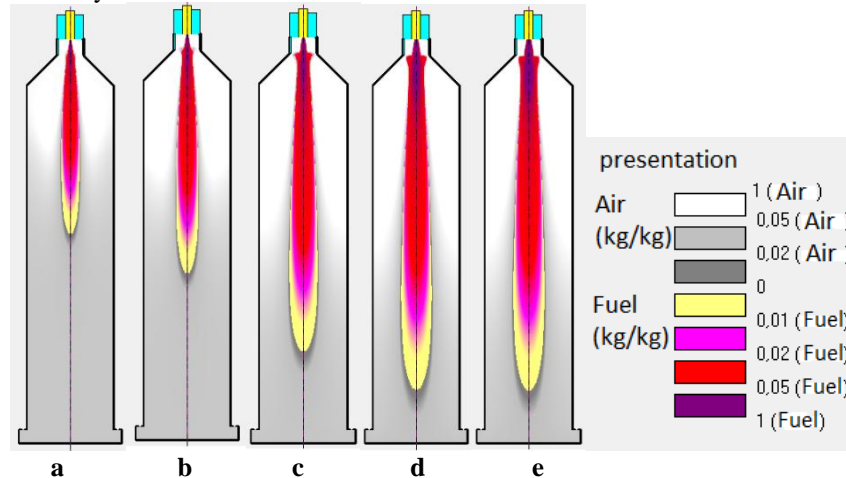

According to the combustion nature and in order to reduce the computing time, the elements are not equal in size. Figure (2) shows the combustion chamber grid division.

#### Iraqi natural gas specification.

CH <sub>4</sub>	C <sub>2</sub> H <sub>6</sub>	C <sub>3</sub> H <sub>8</sub>	H <sub>2</sub> S	N <sub>2</sub>
87.5%	3%	2%	2.5%	5%

#### Results:-

The best way that shows the effect of nozzle diameter changing on flame length is by comparing between different cases through the results of program which gives a graphical shape of flame inside of combustion chamber. All dimensions of flame clearly shown below:

**Figure 3:-** flame shape inside of combustion chamber, Fuel injector diameter in (a) situation is 6mm, 8mm in (b), 12mm in (c), 18mm in (d) and 22mm in (e).

The relationship between flame length and throttle diameter is directly until injection speed of 26.2 m/s (curve number 1 and 2) then still constant. But when fuel speed drop to 12.56 m/s, flame length will decrease (curve number 3). The following curves show flame behavior during variable fuel speed caused by nozzle diameter changing.

**Figure 4:-** effect of nozzle diameter changing on flame length

Fraud number content fuel injection speed as one of its parameters. It is an important factor to build dimensionless relationship of flame length divided by throttle diameter in one side and that number in the other side. Fraud number

can be said is the guide of combustion process that control flame length both in horizontal and vertical case [7]. As shown in figure, the down curve is divided into two parts. The first (basic) is to low injection speed of fuel. The limitation of this case is ( $Fr < 10000$ ). It may be represented by the following equation:

$$l_f/d_o = 21,9 Fr^{0,198} \quad (5)$$

Where:  $l_f$  - is flame length,  $d_o$  – nozzle diameter. The resultant equation is near to that given in [5] and [8]. The power of Fraud number in [8] is got from experimental work which is equal to 0.2. That mean, the present work gives identification of flame behavior as in real process.

The second (transition) part represented by curve 2. It is for high range of Fraud number ( $Fr > 30000$ ). In its equation, Fraud number has smallest power as shown below:

$$l_f/d_o = 79,8 Fr^{0,0635} \quad (6)$$

Here creation of entrance from first part in which strong effect of Fraud number to second part where lifting force acting on flame represented by bouency.

**Figure 5:-** Dimensionless graph shows effect of Fraud number on flame length divided by diameter of fuel injector.

The effect of pressure in the beginning of combustion chamber on flame also can be studied. In the figure below the difference in color shows the difference in pressure. Blue color mean low pressure (negative) at that location while purple is for positive pressure. Negative pressure resulted from high speed of fuel because the relation between pressure and flowing speed inversely. Pressure in primary air entrance plays big role in burning process because when its magnitude is negative will induce combustion process starting early inside of that canal. All that happened because of sucking force affect on air – fuel mixture in near space. So that; flame length in using of small diameter will be shorter than that in case of large diameter until fuel injection speed decrease to about 26 m/s, at that time buoyancy force resist flame elongation.

**Figure 8:-** pressure changing through combustion process. Fuel injector diameter in (a) situation is 6mm, 8mm in (b), 12mm in (c), 18mm in (d) and 22mm in (e).

### Conclusions:-

1. Flame length: Three equations can govern the flame length depending on nozzle diameter ( $d_o$ ) as shown in figure (4).
2. for small nozzle hole diameters ( 5-12 mm):  $l_f = 323.6 (d_o)^{0.7}$
3. for medium nozzle diameters ( 12-18 mm):  $l_f = -7.56 (d_o)^2 + 266 (d_o) - 268$
4. for large nozzle diameters ( 18-26 mm):  $l_f = 2291 / (d_o)^{0.034}$

### Discussion:-

The photos shown in figure (3) show the flame length for different diameters at constant volumetric flow rate (24 m<sup>3</sup>/hr) and for fixed combustion chamber length of (220 cm).

It can be noted that for small hole diameters, the combustion will start at the same moment of fuel impinging as shown in fig.(3-a). The fuel enters the combustion chamber with high activity. In the large diameter hole, there will be a delay in combustion which will increase the flame length, fig. (3-c,d). The reason behind this is the turbulence inside the combustion chamber due to fuel impinging velocity.

Figure (5) shows the relationship between Fraud number (Fr) with ( $l_f / d_o$ ). It can be noted that as the fuel injector diameter increase, (Fr) becomes more asymptotic to the vertical axis, while for small diameters; (Fr) increases and become constant steeping along the x-axis. As the injector diameter decreases, it is noted that (Fr) slightly changed.

##### Keywords:-

Scrambling face images, Arnold transform and kernel representation.

#### Abstract

Secure image communication is becoming increasingly important due to theft and manipulation of its content. Law enforcement agents may find it increasingly difficult to stay afloat above the ill intentions of hackers. To deal with this problem, facial image scrambling technique appears as a solution for privacy related applications. This project proposes scrambling face images for the purpose of privacy protection using Arnold transform. In the proposed method, the facial features are extracted using Kernel Principle Component Analysis and the feature selection method is used to select important features for classification. This paper presents a system that uses Arnold transform to scramble an image. The number of times the transform is applied depends on a secret message expressed in a higher base. Then kernel representation based classifier is used for classifying the facial images. This kernel classifier transforms the scrambled image data into a three dimensions space through the mapping. The experiments show that the proposed face verification system identifies ID Code of the authorized person and solves the challenging tests in the scrambled domain.

#### Introduction:-

In the digital world, the internet is used for faster transmission of large volume of important and valuable data. Various confidential data such as Government, Military and Banking and in other secured data, space and geographical images taken from satellite and commercial important document are transmitted over the Internet. Since internet has many points of attack; it is vulnerable to many kinds of attack, so this information needs to be protected from unauthorized access. To protect data from unauthorized access many data protection techniques are implemented. Digital image scrambling technology is an important way of securing digital image information. With the use of transformation techniques, it can change the original image into a disordered one. Making it hard to recognize; for those who get the image in unauthorized manner to extract information of the original image from the scrambled images.

The techniques in digital images protection technique consist of two categories. One is watermarking and the other is encryption. The watermark-based techniques embed an invisible signal into the image to form a watermarked version. At the receiver's end, the integrity of image contents can be verified by authenticating the embedded signal. For encryption algorithms, produces an unintelligible or disorder image from the original image. Image encryption method is also called image scrambling. The image encryption algorithms are classified into two kinds. One is

**Corresponding Author:- Abirami. P**

Address:- Department of Electronics and Communication Engineering, SCAD College of Engineering and Technology, Cheranmahadevi. India.

spatial-based method; the other is frequency-based method. The spatial-based methods are usually achieved by swapping the pixel positions or altering pixel values. Arnold transform is widely applied to image encryption. The frequency based methods are exploited discrete prolate spheroidal sequences to design an image scrambling scheme without bandwidth expansion. However, the decrypted image is only equivalent to the original image.

### **Related works:-**

Now-a-days privacy is the important thing in the case of human facial images. Number of studies has been proposed for protecting the face images.

R. Jiang et al. [7], proposes Face recognition in the Scrambled Domain via Saliency-Aware Ensembles of Many Kernels. Here, a saliency-aware face recognition scheme was used to work with chaotic patterns in the scrambled domain. In the scrambled domain, semantic facial components simply become chaotic patterns. In this context, it becomes difficult to exploit landmarks or 3D models for better accuracy. Template-based face description has been considered to emphasize the importance of semantic facial components. Given a training dataset, faces are forwarded to the training procedure. The offline procedure then learns its semantic saliency map. In the human perception system, concept-level semantic features are more meaningful than pixel level details. Scrambled facial recognition could generate a new problem in which many manifolds need to be discovered for discriminating these chaotic signals.

T. Honda et al. [5], proposes the hierarchical image-scrambling method has three special features: restoration of the original image from only the scrambled image and its key, controlling of the scramble-level by using parameters for the length of random number and opening the image with a general image viewer. The image format structure is retained; therefore, it can be opened with a general image viewer. It can be used to protect privacy by scrambling images and the information of scramble area and parameter sets is included in the image. The images cannot view private information that they do not have permission to access. Experimental results suggest that scramble level can be controlled linearly by using parameters. The image format structure is retained. Therefore, it can be opened with a general image viewer. A scrambled image can be opened without a specific image viewer and retains the image format structure. The transforming process of an image is non-restorable; therefore the transformed information cannot be used as original information. It also increases the processing time.

A. Melle et al. [10], proposes a reversible scrambling technique which acts in pixel domain. The encoding parameters are encrypted using a secret key and then stored separately or alternatively embedded in the image itself by watermarking. The Region of Interest is decoded by parameters decryption with full or partial knowledge of the secret key, thus leading to different levels of scrambling alteration. This approach forms an objective quality perspective, showing that the visual quality decreases with increasing strength of scrambling. It obtains significant drop in recognition score and limiting the resolution of the encoding parameters. The encoded data is encrypted with a secret key. Partial knowledge of encryption key gives a protected version of the original image at variable levels of scrambling.

P. Perakis et al. [11], proposes a 3D landmark detection method for 3D facial scans. It based on Facial Landmark detector Model. The procedure involves landmark detection, labeling and selection. The detected and classified geometric candidate landmarks, from the shape index and the spin image maps are used as the candidate landmarks. These points create combinations of five landmarks, one from each class. The two types of landmark position constraints are used to reduce the search space (pruning) by removing obvious outliers and thus speed up the search algorithm. It offers high tolerance to large expression variations. It achieved by the state-of-the-art accuracy significantly out performing. The detection of a landmark with absolute distance error will work under certain threshold only. 3D landmark detection methods claim pose invariance, they fail to address large pose variations.

S. Taheri et al. [14], proposes Component-based recognition of faces and facial expressions using a dictionary-based component separation algorithm. For this purpose, first generate two data-driven dictionaries, one for neutral components and the other one for the expression components. Knowing that the neutral component of the test face has sparse representation in the neutral dictionary and the expression part can be sparsely represented using the expression dictionary, then decompose the test face into these morphological components. The elements of the test face along with the dictionaries are then used for face and expression recognition. The algorithm finds a face model and facial expression that maximizes the likelihood of a given test image. The method for recognition of faces and expressions consider either the expression-invariant face recognition problem.

### Methodology:-

Digital images are increasingly sent over networks as documents, commercial items or law enforcement material. Due to the heightened activities of hackers all over the world, these images can easily end up in the hands of unscrupulous third parties who might profit/extort or modify them without the knowledge of the legitimate receiver. To safeguard the image information, research has been carried out in mathematics, cryptology and in information theory over the years. Previously, image watermarking, visual cryptology, information sharing and image scrambling has been proposed to counter image theft.

The objective of image scrambling is to generate a non-intelligible image which prevents human visual system or computer vision system from understanding the true content. It is very difficult for an authorized user to descramble the image using information regarding scrambling method and the variables are used in order to decipher the image.

This paper presents a system that uses Arnold transform to encrypt an image. The number of times the transform is applied depends on a secret message expressed in a higher base. Arnold transform is an ergodic theory; it is also called cat mapping and then it is applied to digital image. Arnold scrambling algorithm has the feature of simplicity and periodicity. According to the periodicity of Arnold scrambling, the original image can be restored after several cycles. Digital images are scrambled and restored with the use of random upper (lower) triangular matrix and this method is of great application value due to its easy operation in encryption and decryption.

**Figure.1:-** Block diagram of facial image scrambling method

### Description:-

The design three random strategies are used for scrambling the input image. These strategies improve the security and extend applications of Arnold transform.

They are as follows:-

- The first strategy is random division.
- The second is random iterative numbers.
- The third is random encryption order.

The proposed scheme is composed of three steps:-

- Face detection and feature selection.
- Image scrambling based on Arnold transform.
- Kernel mapping to extract the original image.

### Input image:-

The input image is taken as the behavioral sample. The images are collected from the Yale database. This database contains fifteen persons and each person's has eleven sample faces. For the face verification this experiment uses the small dataset by splitting it into training and test dataset.

**Figure 2:-** Input image

#### Face detection:-

The main function of this step is to determine whether the human face appear in the given image and check where the face is located. The human face has been selected from the input image and displays the patch in the input face image. This patch indicates that the face has been detected.

#### Image Scrambling:-

Scrambling is the preprocessing step. It is like a non-password security algorithm and it hides the information of the image. Digital image scrambling can convert images into irregular and meaningless pattern. After scrambling the images will become irregular pattern like structure, as a result the visual information is hidden from the public eye and privacy is protected even if the visual contents are distributed or browsed over different public network. This work uses Arnold transform based scrambling technique due to its periodicity and simplicity.

**Figure 3:-** Scrambled face image

#### Arnold transform:-

In the research of ergodic theory V.I Arnold proposed a method called Arnold transform. It has been called popular image scrambling method due to its simplicity and ease of use. This method is used to provide security to the images. In Arnold transform pixel position at  $(x, y)$  is transformed to another point  $(x', y')$  as follows:

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} \begin{pmatrix} x \\ y \end{pmatrix} \pmod{N} \quad \text{Equation (1)}$$

Where  $(x, y)$  and  $(x', y')$  are the pixel coordinates of the original image and the encrypted image, respectively.

Let  $A$  denote the left matrix in the right part of Equation (1),  $I(x, y)$  and  $I(x', y')^{(n)}$  represent pixels in the original image and the encrypted image obtained by performing Arnold transform  $n$  times, respectively.

Thus, image encryption using  $n$  times Arnold transforms can be written as:

$$I(x', y')^{(k)} = AI(x, y)^{(k-1)} \pmod{N} \quad \text{Equation (2)}$$

Where  $k = 1, 2, \dots, n$ , and  $I(x', y')^{(0)} = I(x, y)$ .

**Facial Feature Selection:-**

The main facial regions are selected for the purpose of scrambling. The possible regions are detected by testing all the valley regions. Then all the possible face regions such as human eye, nostril and mouth corners are selected and perform scrambling. It is a widely used feature extraction technique which helps matching between same object of different views.

**Kernel Principle Component Analysis (KPCA):-**

KPCA is a development of the PCA (Eigen faces) method. PCA method is used in the feature extraction step of a face recognition system. Face image data has a very high dimensionality. To reduce the dimensionality data would contain only important features that we need in order to perform classification. PCA Performs very well in reducing the dimensionality of the data. However, the performance of PCA method (or other linear methods) is not completely satisfactory for problems with high nonlinearity, such as face recognition. Basically, the KPCA is used to tackle the nonlinearity of face recognition problem. By using a nonlinear kernel function, a dimensional reduction is performed.

**Region Arnold Transform:-**

**Scrambling:** Apply Arnold transform with the use of random upper (lower) triangular reversible matrix, and this method is of great application value due to its easy operation in encryption by N iterations. Then replace those original pixels with the scrambled pixels. Repeat the computation from  $i = 1$  to  $i = K$ . The final result is the encrypted image. Therefore, digital images scrambled in this way become disordered in both pixel position

The security of our encryption scheme mainly depends on the random strategies. Since there are many possibilities of random division, attacker is very difficult to guess the division pattern. The used iterative number of Arnold transform when it is applied to the  $i$ -th regions. To improve security, this method produces a random order for processing these pixel regions.

After transformation Arnold transform produce new image and the image is difficult to identify by human eye or hackers. But after transformation the facial information is retained entirely in the image due to the properties of being cyclic and irreversible. Unlike encryption, scrambling process does not really hiding information from the access. It only prevents unwanted exposure of human faces.

**Classifier:-**

The extracted features from the scrambled images, then select important features for classification. This project uses a t-test for feature selection. After features are selected, classifications are performed using classifier. After scrambling process, the features are randomly scattered in the feature space. So, kernel classifier is suitable for randomly scattered distribution, it correctly classifies the randomly distributed features.

**Kernel Mapping:-**

A kernel is a similarity function. Instead of defining a slew of features, a single kernel functions is used to compute similarity between images. The special characteristics of kernel classifier are it transforms the scrambled image data into a 3D space through the mapping. This embedding on a higher dimension is called the kernel trick or kernel mapping. The deciphering is performed by kernel mapping. After the N iteration steps of kernel mapping the original image retrieved. Thus, the kernel mapping obtains the original image from the scrambled image.

**Figure 4:-** Kernel map

**Output Image:-**

The two general applications of this face recognition method, the first is the identification and the second is the verification. Face identification helps to identify the face image by deciphering the scrambled image. The face verification is used to check whether the identified image is sent by the authorized person and also identifies ID Code of the authorized person based on the trained database. Thus, the proposed method provides high secure and reliable.

This section presents results obtained from the proposed system. In the experiment all code was implemented in MATLAB 2013 a, and ran on a PC with 2.40 GHz Intel-core CPU. The Yale dataset contains 15 subjects and each subject has 11 sample images. This dataset shows that the proposed system attains high rate of accuracy and reduce time consumption.

**Table 1:-** Accuracy of various methods

METHOD	PCA	RDA	LDA	KLDA	LPP	KPCA
ACCURACY	76.0	76.0	80.0	81.5	83.1	91.5

**Figure 7:-** Accuracy graph**Conclusion:-**

A privacy protected facial verification system using kernel method in the scrambled domain is proposed. In this method, the features are extracted from the scrambled face using Kernel Principle Component Analysis feature extraction method and based feature selection method is used to select important features for classification. Through

the Arnold transform, decomposition and recombination of pixels, the algorithm scrambles pixel positions and changes pixel values. Then kernel mapping based classifier is used for classifying the face images. During recombination, inflow of pixel values is avoided by conversion of number systems. Apart from disordering pixel positions and changing pixel values, this algorithm is able to diffuse errors.

Experiments shows that proposed face verification system attains high rate of accuracy and reduce time consumption. This method provides high security of images in the transmission process. The security of our scheme depends on the random strategies. Since there are many possibilities of random division, iterative numbers, and encryption order, attacker is difficult to correctly guess all random strategies at the same time. Thus, the security is guaranteed. Furthermore, our evaluation indicated that our method can flexibly control of scrambling with parameter sets regardless of contents in an image, There is little increase in processing time compared to non-scrambling when scrambling a face in an image; therefore, it can be applied to embedded systems such as those equipped with surveillance cameras.

#### Abstract

The present paper is an effort to examine the price volatility in the gold spot market. A host of Generalized Autoregressive Conditional Heteroskedasticity (GARCH) models are used to analyze and gain a better understanding of the volatility of gold prices. The result of the GARCH (1, 1) model depicts that around 85% of the information associated with gold price volatility is derived from the previous days forecast. While the EGARCH model describes downward movement in gold daily return volatility is followed by higher volatility, the TGARCH (1, 1) model signifies that both positive and negative shocks have the same effect on future gold price volatility. This study has implications for both practitioners and academic researchers interested in price volatility in the gold spot market.

#### Introduction:-

Gold is a precious metal with which mankind has a long and very intimate relation. Gold is considered as a symbol of purity and good fortune. Most of the gold that the entire world holds lies in India. There are many investment areas such as stock markets, mutual funds, fixed deposits and government bonds amongst others, but people still prefer to invest in gold. It is also used in various other ways like to make ornamental objects and jewelry, in electronics, in laptop computers, in aerospace, in glass making etc. Due to its appeal, gold has been historically priced above other commodities most of the time. The gold price history of the last 50 years is depicted in **figure no. 1** below.

**Corresponding Author:- Dr. Anil Kumar Swain.**

Address:- Associate Professor, P.G Department of Commerce, Utkal University.

From the above graph it is clearly understood that the price of 10 gm of gold in the year 1964 was Rs.63.25 whereas in the year 2012 it was Rs.31, 050. The gold price of 10 gm in December 2013 was Rs. 29,600. Initially the increase in gold price was less from year to year but there is a drastic increase in the recent years. In the past decade, the increase in gold prices has been notable. However, a sudden jump in the price from Rs.18, 500 in 2010 to Rs. 26,400 in 2011 is an unpredictable increase. Various factors such as rise in investor demand, robust jewelry off take, geo-political concerns, US dollar movement against other currencies, Indian rupee movement against the US dollar, central banks diversifying into bullion, fall in supply, gold mine production etc influence gold prices in any country. In India, demand of gold and inflation are the two major factors which are responsible for gold price changes. The gold price variation can also be better understood by analyzing the demand and supply scenario of it in the country. The following figures i.e. figure no. 2 and figure no. 3 depict about the state of world wide supply and demand situation of gold by 2014 respectively.

Figure 2:-

Source: LBMA, Thomson Reuters GFMS

Figure 3:-

Source: World Gold Council

From the above figure it can be clearly understood that there is a mismatched scenario for supply and demand of gold in India. Though India stood first so far as demand for gold in the world is concerned with 31%, but does not stand even with in 10 highest gold producing countries of the world. Thus, it can be easily expected that the price of gold in the country mostly depends on the international market condition.

Having understood the importance of gold and its fluctuating price trend in the country, this paper is developed to analyze and gain a better understanding of the time varying dynamics of price volatility in the gold spot market. The present paper used three models from the ARCH family such as GARCH (1, 1), EGARCH (1, 1), and TGARCH (1, 1) model which are applied to the spot price of gold for a period of 5 and ½ years. When referring to the (1, 1) in each model, the first (1) represents the first order auto regression GARCH term and the second (1) represents the first order moving average ARCH term. In other words, the models suggest that future conditional variance is based on the past variance.

The outline of the paper is as follows. The next section briefly reviews the related literatures and discusses the contribution of this study. Section III and IV describes about the objectives and hypothesis of the study. Section V and VI explain about the data collection procedure and application of statistical tools. While section VII represents the empirical results of the applied tools, the final section summarizes the main findings of the study in form of conclusion.

### Review of Literature:-

This section provides brief review of earlier studies on price volatility in commodity markets. There are numerous studies that analyses the price volatility in the developed countries. However, such studies are not enough in number in developing countries like India. There are few researches in which the researchers have examined commodity price volatility from different perspectives. This study will add to existing literature by understanding the price volatility allied with gold spot market.

**Charles, Darne, and Kim (2014)** tested the weak form market efficiency for gold, platinum and silver. They used daily spot data repossessed from Thomas Financial Data Stream for a period of 37 years i.e. from 1977 to 2013 and employed the automatic portmanteau and automatic variance ratio test. They suggested that the gold and silver markets displayed a downward trend of predictability representing that gold and silver markets have become more efficient over time.

**Nawaz and Moomal (2012)** conducted a study on the volatility in gold price returns. The data for the study collected on daily basis for a tenure of 3 years starting from 1<sup>st</sup> January, 2009 to 31<sup>st</sup> September, 2011. The results investigated volatility by using models such as standard deviation and GARCH and found an unequal spread of residuals referred as heteroskedasticity. Furthermore, a fast mean reversion has been observed showing that the alpha and beta are far from 1. Based on results it was concluded that there has been volatility in gold prices.

**Coudert, Virginie and Raymond, Helene, (2011)** examined the role of gold as a harmless haven. They extended the existing writings in 2 means. First, they studied crunch 7 stages consecutively distinct by recessions and bear markets. Second, ARMA-GARCH-X model had been used to evaluate conditional co-variances between gold and stocks returns. The regressions were run on monthly data for gold and numerous stock market indices. The study indicated that gold succeeded as being a safe haven against all the stock indexes. The outcome demonstrated that it holds for crunches named as recessions or bear markets, as the covariance between gold and stocks returns is observed as negative or null in all circumstances.

**Marzo, Massimiliano and Paolo Zagaglia, (2010)** examined how the connection of gold prices and the U.S. Dollar had been impacted by the current anarchy in financial markets. They have used spot prices of gold and spot bilateral exchange rates against the Euro and the British Pound to analyze the pattern of instability spillovers. They have also used the GARCH models to judge the causal links of instability fluctuates in the two assets. They recognized the capability of gold to produce constant co-movements with the Dollar exchange rate which have continued the latest levels of market disruption. Their results even disclosed that exogenous rise in market insecurity have inclined to generate reactions of gold prices that are extra steady than those of the U.S. Dollar.

**Elder and Serletis (2008)** used daily data from the New York Mercantile Exchange on spot-month futures prices for crude oil, gasoline, heating oil, natural gas, and propane. The time frame for the study was from 3<sup>rd</sup> January,

1984 to 30<sup>th</sup> June, 2005. They found that the energy prices displayed long memories and anti-persistence, as well as the variance of each commodity series being dominated by high frequency components. This indicates that the time series for sample commodities propose weak form inefficiency.

**Kat and Oomen (2007)** examined the return properties of 142 commodity futures from January 1965 to February 2005 using a multivariate analysis framework. The study suggested that the volatility of commodity futures is comparable to that of US large cap stocks. It is also found that a consistently positive risk premium is lacking in commodity futures with an exception of energy. They also recommended that futures returns and volatility can vary considerably over different phases of the business cycle for many commodities under different monetary conditions. Furthermore, in almost all commodities they found significant degrees of autocorrelation, which affects the properties of longer horizon returns.

**Adrangi et al. (2006)** investigated price discovery on nearby future prices of various commodities listed on Chicago Board of Trade (CBT). Using the daily closing prices of contracts from 1969 to 1999 obtained from CBT, the researchers found that there is an existence of strong bidirectional causality in futures prices.

From the above literature review, it is observed that there are enormous amount of literature on the concerned subject considering the world-wide commodity market. However, it is comparatively less in case of price volatility in Indian commodity markets. In such circumstances, this study carries a significant importance to re-look on the price volatility in gold spot market in India. Therefore, the broad objectives of this study are mentioned below.

#### Objective of the study:-

The principal objective of this study is to evaluate the price volatility in the Indian gold spot market. To accomplish this basic objective, following sub-objectives are set:

1. To analyze the gold spot price trend during last 5 decades.
2. To analyze the presence of volatility clustering in the gold spot price trend during 2011–16.
3. To analyze the time varying volatility in the gold spot prices during 2011-16.

#### Hypothesis:-

(H<sub>0</sub>): Future conditional variance in gold spot price is not based on the past variances.

(H<sub>1</sub>): Future conditional variance in gold spot price is based on the past variances.

#### Data and Methodology:-

The present study is based on the secondary data of daily cash (spot) prices of gold collected from [www.mcxindia.com](http://www.mcxindia.com) for the periods January 1, 2011 to June 30, 2016. The data includes 1484 observations and various statistical tools like ARCH, GARCH, EGARCH and TARCH are employed to analyze the time varying volatility in the gold spot price. Further, the application of three GARCH models requires the data to be stationary. In order to test the stationarity of the data, the Augmented Dickey-Fuller test (1981) is performed. If the results indicate that the data are non-stationary, then the data will be transformed by taking the first difference of the daily spot price. The daily return series is used in all three GARCH models and calculated as  $R_t = \ln(P_t/P_{t-1})$ . All these tests are conducted using E-views software (version-8). A brief description about all these statistical tools is given below.

#### Augmented Dickey-Fuller Test (ADF):-

Augmented Dickey Fuller test (ADF) is used for detecting the presence of stationarity in the series. The early and pioneering work on testing for a unit root in time series was done by Dickey and Fuller (1979 and 1981). If the variables in the regression model are not stationary, then it can be shown that the standard assumptions for asymptotic analysis will not be valid. For a return series  $R_t$ , the ADF test consists of a regression of the first difference of the series against the series lagged  $k$  times as follows:

$$\Delta r_t = \alpha + \delta r_{t-1} + \sum_{i=1}^k \beta_i \Delta r_{t-i} + \varepsilon_t$$

$$\Delta r_t = r_t - r_{t-1}; r_t = \ln(R_t)$$

The null hypothesis is  $H_0: \delta = 0$  and  $H_1: \delta < 1$ . The acceptance of null hypothesis implies nonstationarity. The nonstationary time series can be transformed to stationary time series either by differencing or by detrending.

#### Arch and garch model:-

ARCH and GARCH models assume conditional heteroscedasticity with homoscedastic unconditional error variance. It means the changes in variance are a function of the realizations of preceding errors and these changes represent temporary and random departure from a constant unconditional variance. The advantage of GARCH model is that it captures the tendency in financial data for volatility clustering. Therefore, it enables to make the connection between information and volatility explicit since any change in the rate of information arrival to the market will change the volatility in the market. In empirical applications, it is often difficult to estimate models with large number of parameters such as ARCH (q). To outwit this problem, Bollerslev (1986) proposed GARCH (p, q) models. The conditional variance of the GARCH (p, q) process is specified as

$$h_t = \alpha_0 + \sum_{j=1}^q \alpha_j \varepsilon_{t-j}^2 + \sum_{i=1}^p \beta_i h_{t-i}$$

with  $\alpha_0 > 0$ ,  $\alpha_1, \alpha_2, \dots, \alpha_q \geq 0$  and  $\beta_1, \beta_2, \dots, \beta_p \geq 0$  to ensure that conditional variance is positive. In GARCH process, unexpected returns of the same magnitude produce same amount of volatility. The large GARCH lag coefficients indicate that shocks to conditional variance takes a long time to die out, thus volatility is 'persistent. If  $(\alpha + \beta)$  is close to unity, then a shock at time t will persist for many future periods. A high value of it implies a 'long memory.'

#### Exponential GARCH (EGARCH) Model:-

GARCH models successfully capture thick tailed returns and volatility clustering, but they are not well suited to capture the "leverage effect" since the conditional variance is a function only of the magnitudes of the lagged residuals and not their signs. In the EGARCH model of Nelson (1991)  $\sigma_t^2$  depends upon the size and the sign of lagged residuals. The specification for the conditional variance is:

$$\log(\sigma_t^2) = \alpha_0 + \sum_{j=1}^q \beta_j \log(\sigma_{t-j}^2) + \sum_{i=1}^p \alpha_i \frac{|\varepsilon_{t-i}|}{\sigma_{t-i}} + \sum_{h=1}^r \gamma_h \frac{\varepsilon_{t-h}}{\sigma_{t-h}}$$

Note that the left-hand side is the log of the conditional variance. This implies that the leverage effect is exponential, rather than quadratic and that forecasts of the conditional variance are guaranteed to be nonnegative thus eliminating the need for parameter restrictions to impose non-negativity as in the case of ARCH and GARCH models. The presence of leverage effects can be tested by the hypothesis that  $\gamma_h < 0$ . The impact is asymmetric if  $\gamma_h \neq 0$ .

#### Threshold GARCH (TARCH) Model:-

In ARCH / GARCH models both positive and negative shocks of same magnitude will have exactly same effect in the volatility of the series. T-GARCH model helps in overcoming this restriction. TARCH model was introduced by Zakoin (1994) and Glosten, Jaganathan and Runkle (1993). The generalized specification for the conditional variance is given by:

$$\sigma_t^2 = \alpha + \sum_{j=1}^q \beta_j \sigma_{t-j}^2 + \sum_{i=1}^p \alpha_i \varepsilon_{t-i}^2 + \sum_{h=1}^r \gamma_h \varepsilon_{t-h}^2 d_{t-h}$$

Where,  $d_t = 1$  if  $\varepsilon_t < 0$  and zero otherwise. In this model, good news,  $\varepsilon_{t-1} > 0$  and bad news  $\varepsilon_{t-1} < 0$ , have differential effect on the conditional variance; good news has an impact of  $\alpha_i$ , while bad news has an impact of  $\alpha_i + \gamma_i$ . If  $\gamma_i > 0$ , it indicates bad news increases volatility, and it can be said that there is a leverage effect for the i-th order. If  $\gamma_i = 0$ , then the news impact is asymmetric. The main target of this model is to capture asymmetries in terms of positive and negative shocks.

#### Forecasting Evaluation:-

Serial correlation test, ARCH effect test and Normality test are employed to measure the accuracy of the forecasting models.

### Analysis and Description:-

To examine the time varying volatility in the gold spot market, the various models of ARCH family like GARCH (1, 1), EGARCH (1, 1) and TARCH (1, 1) are analyzed. The present section begins with a preliminary statistical analysis of the data followed by an empirical analysis of each model. Finally, robustness checks are conducted to ensure that all GARCH models are correctly specified.

### Descriptive Statistics:-

Figure 4 below displays a summary of descriptive statistics along with histogram for gold spot price returns from January 2011 to June 2016.

From the above figure it is clearly understood that the mean gold return is -0.000223. The standard deviation is .009016. It can be seen that the gold price return varies from -0.043008 to 0.074909 stating that there is wide fluctuation in the daily return on gold price. The histogram displays the positive value for skewness at 0.313916 indicating the series distribution is skewed to the right. So far as kurtosis is concerned, gold price returns have a high peak and thicker tails than a normal distribution. Further, the Jarque-Bera test rejects normality at 5% level which indicates that the gold price returns are not normally distributed.

### ADF Test:-

To examine the time varying volatility in the gold spot market, application of ARCH family models are required. But, for the estimation of ARCH and GARCH models, the variable is required to be stationary. The Augmented-Dickey Fuller (ADF) test is a statistical procedure which examines for the presence of unit roots in time series data. The daily gold return data used in the study are found to be stationary as referenced in table 1 below (Annexure 1).

**Table 1:- ADF Unit Root Test**

Particulars	t- statistics	Probability
At level	-38.92274	0.00

Before employing ARCH family model, it is also necessary to examine the 5 and ½ year time series of conditional variance estimates from January, 2011 to June, 2016. Figure 5 below depicts the periods of high and low volatility in the daily gold returns during the sample period.

**Figure 5:- Conditional Variance of Gold returns**

It can be clearly noticed from the above graph that there are several periods of low volatility followed by periods of high volatility for a prolonged period and periods of high volatility followed by periods of high volatility for a prolonged period. During the year 2011, it can be seen that for number of times period of low volatility followed by another period of low volatility and it continues till the first quarter of 2012. From mid of 1 quarter of 2012 to last quarter of the year, number of high volatility periods followed by high volatility periods. During this period, the volatility is extreme and peaks near .08 and then reverts to .01. Further, the periods of low volatility continues from 1<sup>st</sup> quarter of 2013 to 3<sup>rd</sup> quarter of 2013. Thereafter, the period of high volatility starts again. Thus, it can be concluded that figure 5 indicates about the time varying nature of the time series. This kind of volatility pattern for residuals gives sufficient justification to run ARCH family models like GARCH, EGARCH and TGARCH. Further, the whole thing can be double checked by appointing ARCH test to examine the application of ARCH family model to the time series under study. The result of ARCH test presented in Annexure -2 depicts that the observed R square is 105.17 and corresponding P value is 0.00 meaning that the null hypothesis of no ARCH effect can be rejected at 1% confidence level and alternative hypothesis of presence of ARCH effect can be accepted. It implies clustering of volatility where large changes tend to be followed by large changes, of either sign and small changes tend to be followed by small changes.

#### The GARCH Models:-

GARCH (Generalized Autoregressive Conditional Heteroskedasticity) models help to forecast volatility when volatility changes over time. This concept is known as heteroskedasticity. It is a common finding in almost all financial time series data that they do not exhibit homoscedasticity and is therefore, changing over time. In the present study the daily gold return data also follow the same pattern and changing over time. Therefore, the employment of GARCH, EGARCH and TARCH models to evaluate time varying volatility in daily gold return series as well as various factors influencing such volatility is legitimate.

The GARCH (1, 1) is the most popular model used when modeling daily returns (Taylor, 2005). Table 2 below displays the results of the GARCH (1, 1) model. (Annexure 3)

**Table 2:-** GARCH (1, 1) Model.

Dependent Variable: Spot returns in Gold				
Method: ML - ARCH (Marquardt) - Normal distribution				
GARCH = C(2) + C(3)*RESID(-1)^2 + C(4)*GARCH(-1)				
Mean Equation				
	Coefficient	Std. Error	z-Statistic	Prob.
C	-0.000104	0.0002	-0.51733	0.6049
Variance Equation				
C	3.67E-06	7.13E-07	5.143865	0.0000
Residual Term	0.106173	0.01227	8.651586	0.0000
GARCH Term	0.850975	0.01793	47.46546	0.0000

The results indicate that both ARCH term and GARCH term at 0.106 and 0.851 respectively are significant at the 99% level of confidence. These two parameters when combined equate to 0.957 which is close to unity. It implies that a shock at time  $t$  will persist for many future periods or it has a 'long memory.' Thus, it can be interpreted that gold price changes affect the future forecasts of gold price volatility for a longer period of time. The model also depicts that around 85% of the information associated with gold price volatility is derived from the previous days forecast.

The EGARCH (1, 1) model evaluates the existence of asymmetry in the volatility of spot gold returns by analyzing the effect of positive and negative shocks on gold price volatility by assuming the conditional variance is exponential. Table 3 below displays the results of the EGARCH (1, 1) model. (Annexure 4)

**Table 3:- EGARCH (1, 1) Model**

<b>Dependent Variable: Spot returns in Gold</b>				
<b>Method: ML - ARCH (Marquardt) - Normal distribution</b>				
<b>LOG(GARCH) = C(2) + C(3)*ABS(RESID(-1)/@SQRT(GARCH(-1))) + C(4) *RESID(-1)/@SQRT(GARCH(-1)) + C(5)*LOG(GARCH(-1))</b>				
<b>Mean Equation</b>				
	Coefficient	Std. Error	z-Statistic	Prob.
C	-0.000201	0.000179	-1.117164	0.2639
<b>Variance Equation</b>				
C(2)	-0.627749	0.098042	-6.402888	0.0000
C(3)	0.211709	0.018422	11.49228	0.0000
C(4)	-0.013012	0.011847	-1.098377	0.2720
C(5)	0.950414	0.009279	102.4274	0.0000

From the results of the above table it is understood that there is no leverage effect in the EGARCH model since the coefficient of the EGARCH model i.e. C (4) is negative at -0.013012 and insignificant meaning that there is no negative correlation between the past returns and future volatility of gold returns. It depicts that downward movement in gold daily return volatility is followed by higher volatility than an upward movement of the same magnitude.

The TARCH (1, 1) model also known as Threshold ARCH determines whether downward prices are treated separately from upward prices (Seiler, 2004). Table 4 below depicts the results of TARCH model. (Annexure 5)

**Table 4:- TARCH (1, 1) Model**

<b>Dependent Variable: Spot returns in Gold</b>				
<b>Method: ML - ARCH (Marquardt) - Normal distribution</b>				
<b>GARCH = C(2) + C(3)*RESID(-1)^2 + C(4)*RESID(-1)^2*(RESID(-1)&lt;0) + C(5)*GARCH(-1)</b>				
<b>Mean Equation</b>				
	Coefficient	Std. Error	z-Statistic	Prob.
C	-0.000147	0.000208	-0.706625	0.4798
<b>Variance Equation</b>				
C	3.63E-06	7.83E-07	4.630197	0.0000
RESID(-1)^2	0.091081	0.012273	7.421131	0.0000
RESID(-1)^2*(RESID(-1)<0)	0.026033	0.016965	1.534558	0.1249
GARCH(-1)	0.853066	0.019140	44.56987	0.0000

From the above table it is clearly observed that the coefficient of TARCH term is positive (0.026033) and insignificant meaning that there is no leverage effect of TARCH model. This indicates that both positive and negative shocks have the same effect on future gold price volatility.

#### **Robustness Checks:-**

Finally, in order to verify the models are specified correctly, the diagnostic checking of all the models is being conducted. There are three conditions to be fulfilled by each of the models to be considered good or bad from the

statistical point of view. They are (a) presence of no serial correlation, (b) presence of no ARCH effect and (c) normal distribution of residuals. Results of all the three tests for each of the models are being depicted in the following table. (Annexure 6 - 8).

**Table 5:-** Diagnostic Checking

Models	Serial Correlation test	ARCH effect test		Normality test	
GARCH	Q stats > 0.05	Obs*R-squared	0.850233	Jarque-Bera	415.8612
		Prob.Chi-Square(1)	0.3565	Probability	0.000000
EGARCH	Q stats > 0.05	Obs*R-squared	4.042965	Jarque-Bera	531.4110
		Prob.Chi-Square(1)	0.0444	Probability	0.000000
TARCH	Q stats > 0.05	Obs*R-squared	1.526884	Jarque-Bera	390.7251
		Prob.Chi-Square(1)	0.2166	Probability	0.000000

Table 5 above indicates that the probability value of the Q (36) statistic is not significant since the reported value is above .05 in case of all the three models. Thus, the null hypothesis of presence of no serial correlation in the residuals is accepted in GARCH, EGARCH and TARCH models. This indicates that the first condition of diagnostic checking is desirable. Secondly, the probability value of Chi-square is more than 5% in case of GARCH and TARCH model while in case of EGARCH model the same value is more than 1%. Thus the null hypothesis of presence of no ARCH effect in the residuals can not be rejected at 5% confidence level in case of GARCH and TARCH model and at 1% level of confidence in case of EGARCH model. Therefore, the second condition of diagnostic checking of presence of no ARCH effect is accepted which is desirable. Thirdly, the probability values of Jarque-Bera statistics of all the three models are found to be less than 1%. Thus, the null hypothesis of residuals are normally distributed is rejected at 1% confidence level for all the three models which is not desirable. However, many economists say that although the residuals are not normally distributed, the model can be accepted. Therefore, it can be concluded that all the ARCH family models are specified correctly in the study.

### Conclusion:-

The present paper empirically analyzes time varying effects of price volatility using a family of ARCH models. Based on the theoretical and empirical literature that is reviewed in this study, the conditional variance hypothesis in the context of an emerging commodity market namely MCX has been investigated. The study examined the volatility in the gold spot price using daily data of closing price from MCX home page for a period of 5 and 1/2 years. It has examined the hypothesis by using different descriptive statistical tools namely mean, standard deviation, Jarque-Bera test etc and econometric tools like ARCH family models such as GARCH(1,1), EGARCH(1,1) and TARCH (1,1).

The results provide evidence that gold price changes affect the future forecasts of gold price volatility for a longer period of time. It means the volatility in the gold spot market exhibits the persistence of volatility. GARCH (1, 1) model also depicts that around 85% of the information associated with gold price volatility is derived from the previous days forecast. Further, the EGARCH model describes that there is no leverage effect meaning that there is no negative correlation between the past returns and future volatility of gold returns during the study period. Finally, the TARCH (1, 1) model indicates that both positive and negative shocks have the same effect on future gold price volatility. Various diagnostic checking tests like serial correlation test, ARCH effect test and normality test are also applied to verify the correctness of the used models. The outcomes indicate that all the ARCH family models are specified correctly in the study. Thus, the alternative hypothesis can be accepted that the future conditional variance in gold spot price is based on the past variances.

The present study subjects to certain inherent limitations. It is based on a limited period of 5 and ½ years i.e. from January, 2011 to June, 2016. Further, the study is meant for only gold and the spot price of it is collected from one commodity exchange i.e. MCX. The volatility in the gold spot market could impact the futures market. Therefore, the various players those who trade in gold should observe the futures markets in order to determine whether hedging gold price volatility is an appropriate risk management tool. Several other factors such as demand for gold and inflation would also be expected to have an impact on the spot price of gold in the country. These factors can be considered for further study in this area.

Maternal near miss events, Maternal mortality, Severe acute maternal morbidity, Maternal morbidity

#### Abstract

**Introduction:** Maternal Near Miss refers to a women who nearly died but survived a complication that occurred during pregnancy, childbirth or within 42 days of termination of pregnancy.

**Aims and Objective:** To use the new WHO near miss criteria to investigate maternal morbidity and mortality. To determine the Maternal Near Miss Incidence ratio, maternal near miss to mortality ratio and to calculate the mortality index for each event.

**Methods:** Women showing the presence of any one of the markers in WHO near miss criteria and all maternal deaths from October 2012 to March 2014 were included in the study. The study was conducted in department of Obstetrics and Gynaecology at Lady Hardinge Medical College and SSK Hospital, New Delhi, India.

**Observation:** There were 19,077 deliveries, 18,631 live births, 161 near miss cases and 35 maternal deaths during the study period. Haemorrhage accounted for most common near miss event (39%) followed by infection (28.5%), anemia (19.2%) and eclampsia (13.3 %). The Mortality Index were 33.8%, 12.5%, 6% and 4.5 % for infection, hypertensive disorder, anemia and haemorrhage respectively. Near miss to maternal death ratio was 4.6:1 and maternal mortality ratio was 188 per 1,00,000 live birth.

**Conclusion:** The quality of care received by critically ill obstetric patients in this centre is optimal for near miss events like haemorrhage and anemia as the mortality index were lowest for both events but needs to be improved for infections and hypertensive disorders of pregnancy.

#### Introduction:-

Maternal mortality is frequently described as “Just the Tip of The Iceberg” alluding that there is a vast base to the iceberg in the form of maternal near miss i.e. maternal morbidity which has remained largely undescribed.

Large differences were found among countries on the incidence of maternal near miss because of the different settings and variation in the criteria used to define the maternal near miss. In 2009, World Health Organization

(WHO) defined a maternal near miss case as “A woman who nearly died but survived a complication that occurred during pregnancy, childbirth or within 42 days of termination of pregnancy”[1]

Considering the lack of standardization, WHO in 2009 has developed a set of criteria to identify near miss cases [Table 1][1]. These criteria are intended to be used in any setting, regardless of the development status. The new near miss definition may enable comparison between facilities and over time. Furthermore, relating the proportions of maternal complications, maternal near miss cases and maternal deaths (i.e. mortality index or case fatality ratio) would be useful to assess the quality of care that women with severe complications receive even in tertiary care setting.

Survivors of severe complications related to pregnancy (condition known as maternal near miss cases) have been studied in detail in recent years, mostly in developed countries. But, even in developing countries, information on maternal near miss cases was found to be useful to identify health system failures in maternal health care. [2]This is because near miss cases share many characteristics with maternal deaths and can directly inform on barriers that have to be overcome after the onset of an acute complication. These cases can complement the information obtained from reviewing maternal deaths and function as surrogates of maternal deaths. This will be a useful piece of information in small and medium size health care facilities or settings where few maternal deaths occur [3][4][5]. Hence, this study was conducted to provide insight into the quality of maternal care provided in our institution.

### **Material and Methods:-**

This study was conducted in the Department of Obstetrics and Gynaecology in Lady Hardinge Medical College and S.S.K Hospital, New Delhi for a period of 18 months from October 2012 to March 2014. This is a tertiary care institution, which serves as the major referral centre for other public and private hospitals within New Delhi and nearby states. In addition to providing emergency obstetric services to women referred from other centers, the hospital also provides antenatal care and delivery services for both unreferral low and high risk pregnant women. The hospital provides emergency obstetric and gynecological care for 24 hours a day.

The near miss cases were pregnant and parturient women showing the presence of any one of the markers of life threatening conditions in all the three criteria (clinical, laboratory and management based) given by WHO as shown in Table 1. All women during pregnancy and up to 42 days post delivery were included in the study. The maternal deaths occurring during the study period were also reviewed.

In the present study, data was collected and extracted retrospectively from the case records by members of study team in a structured performa. All maternal deaths were reviewed as well. Using the provisional and final diagnosis documented in the admission- discharge register of the hospital, case files of women whose diagnoses met the WHO criteria were extracted. Overall, 161 near- miss cases were collected. For each case, information on socio-demographic characteristics, parity, gestational age at the time of the near miss morbidity, educational status, nature of the obstetric complication, presence of organ and/or system dysfunction were collected. Socio-demographic characteristic data, parity and gestational age were compared between the near-miss cases and maternal deaths.

The following near miss indices were calculated –

1. Maternal Mortality Ratio (MMR) calculated using live births as the denominator.
2. Maternal Near Miss Incidence ratio (MNMIR)- Refers to the number of near miss cases per 1000 live births
3. Mortality index for each near miss event in order to evaluate the standard of care provided for each disease category. This is defined as the number of maternal deaths due to a particular obstetric condition divided by the sum of near-miss morbidities and maternal deaths which resulted from this condition, expressed as a percentage. It reflects the proportion of each life-threatening obstetric condition which ended in maternal death. Higher the index indicates poor obstetrics care.
4. Maternal near miss: Mortality ratio- Proportion between maternal near miss cases and maternal death. Higher ratio indicates better care.

Data was analyzed using SPSS software version 17. The study population was characterized using descriptive statistics. The difference between proportions of two groups was analyzed using chi square/fischer exact test. P value <0.05 was considered statistically significant.

Above study was carried out after approval from ethical committee of our institution.

### Results:-

During the 18 months period, there were total 19077 deliveries, 18631 live births, 161 near-miss cases and 35 maternal deaths. This resulted in a MMR of 188/100 000 live births and overall Mortality Index of 17.85%. Maternal near miss incidence ratio was 8.43. Maternal near miss to mortality ratio was 4.6: 1 reflecting a suboptimal care in the institution. 80% of maternal near miss cases and 86% of maternal deaths were referred from other health centres.

Demographic characteristics of women who sustained near-miss complications and those who died are comparable as presented in Table 2. Most of the women in each group were within the ages of 21 and 30 years and had gestational age between 29 to 36 weeks. Most of the patients in both the group were unbooked for antenatal care. A booked case is when the pregnant lady has had a minimum of three visits for antenatal checkup after she was registered as per WHO criteria. There was no significant difference in age, parity, educational levels and booking status in the near miss events compared with maternal deaths but for gestational age, significant difference was found.

Hemorrhage accounted for the most common near miss event (39%), followed by infection (28.5%), anemia (19.2%) and hypertensive disorders (13.3%) as shown in Table 3.

Most common cause of maternal death was septicemia (65.7%) followed by hypertensive disorders (8.6%) and haemorrhage (8.6%) as presented in Table 4. The mortality index was 33.8%, 12.5%, 6% and 4.5% for infection, hypertensive disorders, anemia and hemorrhage respectively as shown in Table 5.

The nature of organ-system dysfunction/failure and the associated obstetric factors among the near-miss cases and maternal death are shown in Table 6. 68 (42.23%) of near miss cases have organ-system dysfunction. The two most commonly affected organ- system were vascular and cardiac (pulmonary edema) systems.

**Table 1:-** The WHO Near Miss Criteria

Dysfunctional system	Clinical Criteria	Laboratory markers	Management based proxies
Cardiovascular	Shock Cardiac Arrest	pH <7.1 Lactate >5mEq/ml	Use of continuous vasoactive drugs Cardio-pulmonary resuscitation
Respiratory	Acute cynosis Gaspings Respiratory rate >40 or <6bpm	Oxygen saturation <90% for ≥60 minutes PaO <sub>2</sub> /FiO <sub>2</sub> <200mmHg	Intubation and ventilation not related to anesthesia
Renal	Oliguria non responsive to fluids or diuretics	Creatinine ≥300μmol/l or ≥3.5mg/dl	Dialysis for acute renal failure
Haematologic/Coagulation	Failure to form clots	Acute severe thrombocytopenia (<50,000 platelets/ml)	Transfusion of ≥5 units of blood/ red cells
Hepatic	Jaundice in the presence of preeclampsia	Bilirubin >100μmol/l or >6.0 mg/dl	
Neurologic	Any loss of consciousness lasting >12h Stroke Uncontrollable fit/ status epilepticus Total paralysis		
Alternative severity proxy			Hysterectomy following infection or haemorrhage

### Discussion:-

Maternal mortality was used to assess the quality of obstetric care but this indicator is vulnerable to many flaws. A better assessment of obstetrical care now includes near miss events to be a useful complement tool for investigation of maternal mortality. Hence new “near miss” criteria take over maternal mortality ratio. In 2008, WHO recommended investigating near miss as a benchmark tool for monitoring maternal health care and has standardized the criteria for diagnosis. WHO criteria are unique in considering not only clinical but also laboratory and management based criteria.

A statistically significant difference was found between near miss events and maternal deaths as regard the gestational age because none of maternal deaths occurred before 12 weeks of gestation (Table 2).

In the present study, maternal mortality to near miss ratio was 1:4.6. This indicates that for every almost 5 women who survived life threatening complications, one died. This reflects a poor care and high maternal mortality in this setting. Other studies found the maternal death to near miss ratio as 1:5 and 1:7 respectively.[6][7] This is in contrast to what is observed in developed countries of the world. Studies carried out in Europe revealed a ratio of 1:117-223[8][9]. This ratio is indicative of the standard of obstetrical care. If this ratio decreases over a period of time, it reflects on the improvement achieved in obstetric care.

The most common near miss event in the present study was haemorrhage (39%) followed by infection (28.5%), anemia (19.2%) and hypertensive disorder (13.3%). The result were in accordance with various studies [10][11][12][13][14] where haemorrhage was the most common near miss event. In contrast to other studies, [6][15] hypertension was most common near miss event.

The most common cause of maternal mortality was septicemia (65.7%) followed by hypertensive disorders (8.6%) and haemorrhage (8.6%) in the present study. Similar results were seen in study conducted in south India [13]. The maternal mortality ratio at our setting was 188/100000 live births. The Brazilian study showed a similar mortality rate of 260/100000 live births [16]. In other developing countries the maternal mortality ratios were 423/100000 live births and 324/100000 live births respectively [17][18]. The major cause of maternal mortality was infectious diseases like tuberculosis, pneumonia and hepatic encephalopathy which were not related to pregnancy. There were three deaths due to haemorrhage and three deaths due to hypertensive disorder complicated with pulmonary edema and renal failure. Most of the maternal death were unpreventable in the present study as they occur in unbooked emergency cases that present too late to the hospital and die shortly after admission.

In this setting, the health care providers were faced with a high percentage of life- threatening obstetric situations. Despite the high morbidity from haemorrhage and anaemia (39%, 19.2% respectively) their mortality index was lower than that of the other events. This is due to presence of trained personnel, strict adherence to evidence based protocol and availability of all sorts of blood and blood products round the clock in the hospital. An increased level of care and effort are required to deal with near-miss events with high mortality index, e.g., infection and hypertensive disorder.

Lack of antenatal care services in peripheral health care centre, illiteracy, delayed diagnosis, late transfer, and inadequate utilization of resources might have been the cause for maternal morbidities and mortalities in our study.

One of the limitations of this study is weakness of retrospective method of data collection with respect to the quality of records. Other limitation is that ours is a tertiary referral center covering two nearby states, with most of the cases being referred from other health care centre in an already moribund state. The delays in referrals are a major cause of morbidity and mortality. Table 7 shows comparison of various studies in near miss and maternal death.

**Conclusion:-**

The quality of care received by critically ill obstetric patients in this centre is optimal for near miss events like haemorrhage and anemia as the mortality index were lowest for both events but needs to be improved for infections and hypertensive disorders of pregnancy. In a tertiary care hospital, it is possible to save most of the patients presenting with life threatening conditions by adopting evidence based protocol, training of personnel, improving the resources and multidisciplinary approach for managing severe morbidities. Overall reduction in maternal mortality can be achieved by improving the antenatal care and timely referral of cases to tertiary care hospital thus aiming to meet the Sustainable Development Goal 3.

#### Abstract

**Background:** Lower back pain is a common multifactorial disorder that could be of neurological, musculoskeletal or even psychiatric origin. It affects multiple age groups ranging from adolescent to the geriatric age group.

**Objectives:** Our aim in this study is to determine the prevalence of lower back pain, assessing its impact on students' lives and detection of the most common risk factors of lower back pain among Taibah university students.

**Methodology:** A cross sectional study was carried out. The study was conducted in Al-medainh city among Taibah university students at any level and any faculty. (i.e. the sampling selection method was random) with nearly sample size of 500. A specially designed self-administered questionnaire in Arabic was used.

**Results:** Most of the respondents (82.35%) were between 21 to 25 years of age. Females responded more than males did (74.35%). Nearly half of the sample (41.2%) was comprised of medical students followed by students of applied medical science and science, respectively. Ninety-five students were in their third academic year. Lower back pain was significantly prevalent among Taibah University students as (56.47%) were complaining of it.

**Conclusion:** The prevalence of lower back pain among Taibah university students was approximately higher compared to other similar studies with a percentage of (56.74%). The impact of lower back pain on the students though not major yet still lead to the absence of some of them from university and to the consumption of pain killers.

#### Introduction: -

Lower back pain is a common multifactorial disorder that could be of neurological, musculoskeletal or even psychiatric origin<sup>1</sup>. It affects multiple age groups ranging from adolescent to the geriatric age group<sup>1</sup>. It causes an impact on the patient's life socially and economically<sup>2</sup> in the form of either inability to work or working with the minimum physical activity leading to decrease in the income. It can also affect the patient psychologically subjecting him to an increased risk of developing anxiety and depression disorders<sup>4</sup>.

Lower back pain has a various risk factors. Some are related to habits such as smoking and alcohol consumption. Others include physical factors like strong physical activity, frequent lifting of heavy objects, postural stress. There are also some individual life style factors such as the occupation, age, gender, race, height and weight<sup>3</sup>. Furthermore,

**Corresponding Author: -Maryam Alshanqiti.**

Address: -Medical interns, Taibah University, Medina Saudi Arabia.

the deficiency of vitamin D was considered as a potential risk factor of Low back pain in the Gulf because of decreased adequate exposure to sunlight<sup>1</sup>. Finally poor general health and psychosocial factor are considered as significant risk factors as well<sup>3</sup>.

A remarkable number of preventive medicine literature has studied the influence of profession or lifestyle on the incidence of back pain<sup>5</sup>. University students however, usually have a demanding curricula, making the bulk of student's time consumed by long sitting hours spent either on studying or receiving lectures, hence leading to physical inactivity and a raising prevalence of lower back pain<sup>4</sup>.

According to recent studies, nearly 60-80% of individuals worldwide will suffer from LBP at a given time in their lives and 20-30% are already suffering from it<sup>3</sup>. Even though back pain in Arab countries presents at a much less frequency than some western nations, it still appears to be relatively common among its unindustrialized locations<sup>1,4</sup>. There are ongoing growing efforts aimed towards researching the prevalence of LBP in Saudi Arabia but reported data are still too limited to generalize such evidence<sup>1</sup>.

Our aim in this study is to determine the prevalence of lower back pain, assessing its impact on students' lives and detection of the most common risk factors of lower back pain among Taibah university students.

### **Methodology: -**

A cross sectional study was carried out. The study was conducted in Al-medainh city among Taibah university students at any level and any faculty. (i.e. the sampling selection method was random) with nearly sample size of 500. A specially designed self-administered questionnaire in Arabic was used.

The electronic self-administrated questionnaire, consisted of 3 main sections: students' demographic data, prevalence of lower back pain and it is associated symptomatology, risk factors and related medical history.

The statistical analysis was performed using the Statistical Package for the Social Sciences (SPSS), version 20.0. Chi Square analysis applied to compare the differences between the groups included in the study and a P value < 0.05 considered statistically significant.

### **Results: -**

The response rate of this survey was 85% (n=425/500). Most of the respondents (82.35%) were between 21 to 25 years of age (See figure 1). In figure 2 we can see that females responded more than males did (74.35%). Nearly half of the sample (41.2%) was comprised of medical students followed by students of applied medical science and science, respectively (Figure 3). Ninety-five students were in their third academic year (Figure 4). Lower back pain was significantly prevalent among Taibah University students as (56.47%) were complaining of it (Figure 5).

Regarding the association between lower back pain and students' demographics, there was a statistically significant association between lower back pain and gender (P=0.010). Females reported back pain more than did males. Lower back pain was more prominent among underweight students (71.67%). Among the medical students, responded (45.71%) have lower back pain. Majority (62.5%) of first year university students have lower back pain (Table 1).

Table 2 shows a statistically significant association between the lack of exercise and lower back pain (P=0.024). (61.54%) of the students that seldom exercise reported lower back pain. Long studying hours contributed to significant prevalence of lower back pain (P=0.039). Most of the students are usually studying on the floor which is significantly associated with lower back pain (P=0.002). Students that usually perform weight lifting exercises reported lower back pain less than those who don't do weight lifting with a statistically significant association with lower back pain (P=0.000). Many students are used to wear backpacks, among those (65.6%) are suffering from lower back pain with a significant association to the frequent backpack wearing (P=0.044). Drinking soft drinks is significantly associated with lower back pain (P=0.025). Among students who suffer from lower back pain (61.63%) have a positive family history (P=0.012). Anxiety and lower back pain are strongly associated among Taibah University (P=0.000). In our sample there is a strong evidence (P=0.000) that a bad body posture directly contributes to lower back pain with thoracic kyphosis being the most commonly associated with lower back pain (80.00%).

Most commonly reported symptoms associated with back pain among the participant are pain that improves by sitting (139 students) and increases by walking (97 students) suggesting a musculoskeletal origin. Alarming symptoms that necessitate medical attention also reported such as; paresthesia (101 students), pain radiating from

the back to the lower limb (82 students), urinary incontinence (29 students) and fecal incontinence (4 students) (See table 3).

Regarding the impact of lower back pain on Taibah University students', (15.36%) have absented from university due to lower back pain and (25.38%) of the students suffering from back pain used painkillers to relieve it.

**Figure 6:-**Absence from university due to back pain

**Figure 7:-** Using of painkillers due to back pain

**Discussion: -**

Lower back pain is a major problem throughout the world, and it is prevalent among adult population based on cross sectional study conducted in AlQassim (18.8%)<sup>5</sup>. Some studies have shown significant incidence in the rates of LBP between college students. As in Indian medical college revealed a LBP prevalence of 48% in medical students<sup>6</sup>, and 53% rate reported for medical students at Paracelsus Medical University in Austria<sup>7</sup>. Consistent with previous studies, we observed higher mean and median prevalence of lower back pain among Taibah university students approximately (56.74%). However, in the present study females reported LBP higher than males did, compatible with study done by Damian Hoy et al.<sup>2</sup>

In our study, we observed that incidence of LBP high in underweight students (71.67%). In contrast to Han et al, reported that women who are overweight, have a significantly increased likelihood of lower back pain<sup>8</sup>.

Lack of exercise is one of the main etiologies of LBP. In our study, we found significant association between prevalence of LBP and lack of exercise, a lower prevalence of lower back pain significantly found in students who usually perform weight lifting exercises. This finding supported by Damian Hoy et al<sup>2</sup> observed that low incidence of LBP in developing countries estimated to be attributable to higher levels of exercise.

On the other hand, long studying hours contributed to significant increase of lower back pain. Unlike Grace O et al<sup>9</sup>, they found no significant association between LBP and sitting for long time. However, (65.6%) among the students who complain of LBP used to wear backpacks and we found a significant association to the frequent backpack wearing consist with a study done by Heuscher et al.<sup>10</sup>

Abnormal body posture observed to be significantly higher in students suffers from LBP according to Nupur Aggarwal et al<sup>6</sup>. Similar to our study we found that (80.0%) of our respondents who have thoracic kyphosis suffer from LBP.

As a family history play, a significant risk factor for LBP based on Nupur Aggarwal et al<sup>6</sup> and other researches, among students who suffer from lower back pain (61.63%) have a positive family history.

Several psychological factors contribute to the prevalence of low back pain such as depression, anxiety and stress. According to that, Nupur Aggarwal et al<sup>6</sup> suggested that mental stress and depression are predisposing factors to LBP. Therefore, significant association between anxiety and LBP observed in the present study. Furthermore, have an influence on student's attendance in which (15.36%) have absented from university due to lower back pain.

**Limitation of the study: -**

Using of a self-administered questionnaire might create a misunderstanding of some asked questions. Also, students were not interviewed personally to assess the exact impact of low back pain on their lives.

**Conclusions: -**

The prevalence of lower back pain among Taibah university students was approximately higher compared to other similar studies with a percentage of (56.74%). The commonest risk factors included female gender, low BMI, lack of exercise, long studying hours on the floor, psychological factors in the form of anxiety, positive family history and most importantly bad body postures especially thoracic kyphosis. The impact of lower back pain on the students though not major yet still lead to the absence of some of them from university and to the consumption of pain killers.

**Recommendations: -**

Since lower back pain prevalence was higher in comparison to other studies, we recommend raising awareness of its risk factors among students to help them take the right precautions in order to protect themselves from developing such a condition in the future. Also, to teach the ones who already suffer from a LBP how to cope and if possible alleviate their pain aiming to achieve a better life style.

**Acknowledgment:**

We thank our supervisor Dr. Waleed Murshid, Professor and Consultant of Neurosurgery, Taibah University for his valuable suggestions and notes to improve our research. We also would like to thank all the respondents for giving from their time to answer the questionnaire.

Etomidate, Thiopentone Sodium.

### Abstract

The aim of this study was to compare the intubating conditions and haemodynamic response for rapid sequence intubation (RSI) of the induction agents, etomidate and thiopentone sodium, with a rapid acting neuromuscular blocking agent rocuronium in 100 ASA grade I-II patients of age 20-40 yrs, undergoing lower segment caesarean section. All the patients were divided in a randomized double blind fashion into two groups of 50 patients each. Group I patients received Etomidate(0.3 mg/kg) with Rocuronium 0.9 mg/kg and intubated at 90 seconds, group II patients received Thiopentone sodium(5-7 mg/kg) with rocuronium bromide 0.9 mg/kg and intubated at 90 seconds respectively. We observed intubating conditions in group I & group II, excellent intubating conditions were rated in 82% & 96% and good in 18% and 4%, respectively. The difference in intubating conditions of patients in both the groups was statistically significant (p value <0.05). Clinically acceptable intubation conditions (excellent & good) were observed in 100 % patients in both the groups, hence the difference being statistically non significant. There was no significant change in pulse rate and mean systolic blood pressure, diastolic blood pressure, mean arterial pressure from the baseline value after the administration of muscle relaxants in either of the two groups. We conclude that both the induction agents; Etomidate & Thiopentone sodium in combination with Rocuronium were comparable in terms of intubating conditions & haemodynamic response. Thus it could be concluded that either of them could be used for rapid sequence intubation in pregnant patients undergoing lower segment Caesarean section (LSCS).

### Introduction:-

Obstetric anaesthesiologists face the unique situation of providing anaesthesia for caesarean sections, where they have to provide care for both the mother and the unborn baby.<sup>29</sup>

Obstetrics patients undergoing caesarean section under general anaesthesia require rapid sequence induction and intubation (RSII) due to the high risk of aspiration. High rates of caesarean section surgeries are encountered by anaesthesiologists now a days. Despite the popularity of central neuraxial blockade, general anaesthesia may have to be offered to these patients at times because of their choice or conditions.<sup>29</sup>

Pulmonary aspiration is one of the concerns of general anaesthesia in obstetric patients. Risk factors for increased risk of aspiration include a prolonged gastric emptying time in labour, increased intra-abdominal pressure due to the gravid uterus and relaxation of the lower oesophageal sphincter due to hormonal changes. To reduce this risk, prophylaxis against acid aspiration is administered prior to anaesthesia. The use of rapid sequence induction with thiopental and succinylcholine has remained standard and largely unchanged for the last four to five decades and was developed to decrease the incidence of pulmonary aspiration.<sup>9</sup>

Rapid sequence induction and intubation (RSII) is an anaesthesia induction technique designed to facilitate rapid tracheal intubation in patients at high risk of aspiration. The main objective of the technique is to minimize the time interval between loss of protective airway reflexes and tracheal intubation with a cuffed endotracheal tube. Because the airway is unprotected during this time, it is the most critical period during which aspiration of gastric contents is likely to occur.<sup>29</sup>

The depolarizing neuromuscular blocking agent, succinylcholine has been the drug of choice for rapid sequence induction and intubation (RSII) and anticipated difficult intubations for its short and rapid acting properties. Nothing had yet replaced succinylcholine in the scenarios of difficult intubation before yet, with advent of Rocuronium antagonist (ORG-25969, sugamedax) that chelates the drug and act as the reversal agent, Rocuronium can also be used in difficult intubation situations in RSII. Rocuronium may provide an alternative to Succinylcholine when it is contraindicated in conditions, such as hyperpyrexia, hyperkalemia or known family history of abnormal cholinesterase enzyme activity. Rocuronium does not cross placenta, therefore can safely be used in obstetrical surgeries where risk of regurgitation requires rapid sequence induction.

The purpose of the present study was to compare the effects on intubation conditions and haemodynamic response for rapid sequence intubation (RSI) of the two well proven but different anaesthetic induction agents, etomidate and thiopentone sodium, with a rapid acting neuromuscular blocking agent rocuronium in patients undergoing caesarean section.<sup>9</sup>

## Methods:-

After obtaining institutional ethical committee clearance and informed written consent for surgery and general anaesthesia. 100 pregnant females of age 20-40 yrs, (ASA) grade I and II undergoing LSCS were selected for the study. All patients underwent a thorough pre-anaesthetic checkup. Patients with known sensitivity to drugs, systemic dysfunction, patient refusal, pre-eclampsia, eclampsia were not included in the study.

The patients were divided into two groups in randomized double blind fashion. Etomidate (0.3 mg/kg) with Rocuronium (0.9 mg/kg) (Group I, n=50) and Thiopentone (5-7 gm/kg) with Rocuronium (0.9 mg/kg) (Group II, n=50). Each group had 50 patients.

All patients were evaluated and examined thoroughly with regards to history, physical examination and investigations. After taking written and informed consent, patients were shifted to operation theatre. Intravenous line was maintained by inserting 18 G i.v. cannula in dorsum of hand. Patients were premedicated with inj. Ranitidine 50 mg i.v., inj. Metoclopramide 10 mg i.v., and inj. Pentazocine 0.5 mg/kg. Philips MP 30 multipara monitor was applied to monitor pulse rate, non-invasive blood pressure, ECG, SpO<sub>2</sub>, and EtCO<sub>2</sub>.

Pre-oxygenation with 100% O<sub>2</sub> was done. Patients were induced with inj. Thiopentone sodium 5 mg/kg, or inj. Etomidate 0.3 mg/kg and inj. Rocuronium 0.9 mg/kg. After 90 sec., laryngoscopy was done, cricoid pressure was applied during placement of the proper size endotracheal tube and intubation was done. Endotracheal tube was fixed after checking for bilateral air entry. Anaesthesia was maintained with O<sub>2</sub> 50%, N<sub>2</sub>O 50% and isoflurane and neuromuscular blocker. At the end of surgery, when patient resumed some breathing effort, residual effects of neuromuscular block was reversed with inj. Neostigmine 0.05 mg/kg and inj. Glycopyrrolate 0.01 mg/kg. When the patient became fully awake, the patient was extubated after proper oral suction and oxygenation.

The following parameters were monitored at pre operative (baseline), after premedication, after induction at every 1 min. for 5 min., every 5 min. for 15 min and thereafter at every 15 min. till the end of procedure:-Heart rate (HR), Systolic blood pressure (SBP), Diastolic blood pressure (DBP), Mean blood pressure (MBP), Oxygen saturation (SpO<sub>2</sub>), End-tidal Carbon dioxide (EtCO<sub>2</sub>), Respiratory rate (RR), ease of laryngoscopy and intubating conditions were assessed using the criteria of Cooper & Colleagues.

### Scoring Condition for Intubating condition (given by Cooper and Colleagues)

SCORE	JAW RELAXATION (LARYNGOSCOP Y)	VOCAL CORDS	RESPONSE TO INTUBATION
0.	POOR (IMPOSSIBLE)	CLOSED	SEVERE COUGHING AND BUCKING
1.	MINIMAL (DIFFICULT)	CLOSING	MILD COUGHING
2.	MODERATE (FAIR)	MOVING	SLIGHT DIAPHRAGMATIC MOVEMENT
3.	GOOD (EASY)	OPEN	NONE
8-9 =EXCELLENT	6-7=GOOD	3-5=FAIR	0-2=POOR

**Excellent and good intubating conditions were considered clinically acceptable:** - All the observation were recorded, tabulated, and analyzed with SPSS (version 13.0, SPSS Inc., Chicago, IL) statistical software. Demographic data, systolic blood pressure, diastolic blood pressure, mean blood pressure, heart rate, respiratory rate, EtCO<sub>2</sub>, SpO<sub>2</sub>, condition of vocal cords and response to intubation data were compared between both the groups using unpaired student t-test. For intubating conditions, Chi-square test was used. The quantitative data were expressed as mean (standard deviation). A p-value less than 0.05 were considered significant.

On the basis of results obtained & statistical evaluation, inference was drawn.

#### Results:-

All the two groups were comparable to each other in terms of age, weight, gravida, parity and ASA grading.

TABLE-1 DEMOGRAPHIC DATA		
	GROUP I (n=50)	GROUP II (n=50)
AGE	25.07±3.50	25.36±3.46
WEIGHT	59.39±3.14	50.79±2.60

On comparison of intubating conditions in group I & group II, excellent intubating conditions were rated in 82% & 96% and good in 18% and 4%, respectively. The difference in intubating conditions of patients in both the groups was statistically significant (p value <0.05). More excellent intubating conditions were observed in group II compare to group I. (Table-2). Clinically acceptable intubation conditions (excellent & good) were observed in 100 % patients in both the groups, hence the difference being statistically non significant.

**Table 2:-** Intubating conditions

INTUBATING CONDITION	NO. OF PATIENTS		P VALUE
	GROUP I (n=50)	GROUP II (n=50)	
EXCELLENT	41(82%)	48(96%)	0.0001
GOOD	9(18%)	2(4%)	0.0001
FAIR	0	0	0
POOR	0	0	0

Baseline mean heart rate was  $82.45 \pm 8$  and  $80.94 \pm 8.17$  per min in group I and group II respectively (p value=0.37). Slight increase in mean heart rate was observed in both groups after the induction. Tracheal intubation caused further increase in mean heart rate in both groups compared with baseline and post induction values. At no time during the study period, significant difference was observed between both the groups ( $p>0.05$ ). (Graph 1)

Baseline mean blood pressure in group I was  $92 \pm 2.13$ mmHg and group II was  $94 \pm 4.91$  mmHg (p value 0.41). Decrease in MBP was observed after induction in both groups. At intubation there was an increase in these parameters. A gradual reduction in MBP was observed at 15 minutes after intubation. At no time during the study period, there was a significant difference between the groups ( $p>0.05$ ). (Graph-2)

**Graph 1:- Mean heart rate (bpm) at various time intervals**

**Graph 2:- Mean blood pressure (mmhg) at various time intervals**

**Discussion:-**

The aim of our study was to compare the effects on intubation conditions and haemodynamic response for rapid sequence intubation (RSI) of the two well proven but different anaesthetic induction agents, etomidate and thiopentone sodium, with a rapid acting neuromuscular blocking agent rocuronium in patients undergoing caesarean section.

One of the use of muscle relaxant is to provide conditions necessary for easy and atraumatic intubation.

Rocuronium is a low potency intermediate acting derivative of vecuronium with shorter onset time than the other non depolarizers. It is also devoid of cardiovascular side effects and does not cause histamine release.

In the present study we found that that clinically acceptable intubating conditions were formed in both group I & group II; excellent intubating conditions were rated in 82% (41/50) & 96% (48/50) and good in 18% (9/50) and 4%, (2/50) respectively. Similar results were found in the studies conducted by **Cooper R. et al (1992)<sup>4</sup>** and **Barve M. et al (2002)<sup>3</sup>**.

There was no significant change in heart rate, mean systolic blood pressure, diastolic blood pressure and mean blood pressure after the administration of the muscle relaxant in either of the groups in the study. The studies conducted by **Cooper R. et al (1992)<sup>4</sup>**, **Barve M. et al (2002)<sup>3</sup>** and **Gupta S. et al (2010)<sup>8</sup>** shows similar cardiovascular effects. In these patients rocuronium can be used safely as it does not cause bradycardia rather, it causes slight tachycardia which is not significant clinically. As there is no significant change in heart rate and mean blood pressure with rocuronium, it is the agent of choice in ASA PS I & II patients undergoing caesarean section cases.

**Conclusion:-**

We concluded that both the induction agents; Etomidate & Thiopentone sodium in combination with Rocuronium were comparable in terms of intubating conditions & haemodynamic response. Thus it could be concluded that either of them could be used for rapid sequence intubation in pregnant patients undergoing lower segment Caesarean section (LSCS).

Pulmonary Alveolar Microlithiasis;  
Double lung transplant

#### Abstract

Pulmonary alveolar microlithiasis is an uncommon infiltrative pulmonary disease characterized by deposition of microliths in the alveoli. Here, we present the case of a 45-year-old man with PAM who is a successful lung transplant recipient with end-stage PAM

**Introduction:** Pulmonary alveolar microlithiasis (PAM) is a rare idiopathic lung disease, characterized by the formation and accumulation of tiny, round corpuscles called “microliths” that consist primarily of calcium and phosphorus mixed with small amounts of magnesium and aluminum<sup>1</sup>. Most of the reported cases are of patients between 20 and 40 years of age. Autosomal recessive inheritance has been suggested to be a possible cause of the disease. Clinical features vary, and some patients may be asymptomatic for a long time until pulmonary function testing begins to demonstrate lung impairment along with progressive fibrosis and the development of a restrictive pulmonary defect culminating in cardiorespiratory decompensation.<sup>2</sup> Currently, there is no medical therapy capable of definitively changing the progression of the disease. Lung transplantation is required once end-stage lung disease is established.

Copy Right, IJAR, 2016,. All rights reserved.

#### Case Description:-

Mr. Ibrahim Mohammed is a 45-year-old gentleman known case of pulmonary alveolar microlithiasis, severe pulmonary hypertension and respiratory failure on home oxygen. He was admitted on 04 February 2016 because of decline in lung function and exertional dyspnea for 2 weeks, at that time a suitable lung transplant donor was available. There was no history of smoking, no family history of PAM. His crossmatch was negative for both T cell and B cell. The induction therapy was started with methylprednisolone 500 mg for each lung and CellCept, and broad-spectrum antibiotics meropenem, colistin, and vancomycin as per lung transplant protocol. The intraoperative course remained smooth, was done on ECMO without any major intraoperative issue. The ischemia time for the right lung was 6 hours and for the left lung was 6.5 hours.

Posttransplant, there was a mild reperfusion injury and was shifted to ICU intubated with minimal inotropic requirements. He was successfully weaned off from inotrope and extubated on the next day with stable vitals and good recovery. On 08 February 2015, he had tonic clonic seizures. For that he had to be re-intubated. The labwork was normal, electrolytes were normal. Neurology was taken onboard and MRI was advised. His MRI showed bilateral predominant frontoparietal area of cortical signal abnormality, diffuse sulcal FLAIR hyperintensity noted,

**Corresponding Author:-Dr.Ibrahim Saud AlTamimi.**

Address:-College of Medicine, Alfaisal University, Riyadh, Saudi Arabia.

which is of uncertain etiology. Since there was no clear cause for his tonic clonic seizure, his tacrolimus was switched to cyclosporine and CellCept was changed to azathioprine.

He was successfully extubated in the next 2 days and then shifted to the floor. His respiratory cultures were negative except legionella for which he was treated. The transbronchial biopsy showed no evidence of any cellular rejection. He was discharged home in a stable condition on 18 February 2016 with a followup clinic visit in 1 week with repeat lab imaging and spirometry. Physical examination revealed athin, chronically ill appearing male with respiratory rate of 20bpm . Prominent inspiratory crackles were noted bilaterally, other examination were unremarkable. The spirometry done before discharge showed FEV1 1.92, FVC 2.26, FEV1/FVC ratio 85.07. Specimen is received in formalin labeled right lower lobe. It consists of multiple fragments of brownish and tan soft tissue, measuring in aggregate 0.4 x 0.4 x 0.1 cm.

### Discussion:-

Although the first cases of PAM were described by Malphighi, the disease was first named by Phur. The disease exists on all continents, without regional or ethnic differences, although most of the cases (37%) have been reported in Europe and Asia Minor. Turkey is the country with the highest prevalence (16.3%), followed by Italy and the USA. The etiology of the condition remains unknown, although some theories have been posited. One theory is based on an exudate that is not easily absorbed and that is formed as a result of an abnormal inflammatory response to infections or irritants, ultimately undergoing calcification. Males and female are affected with equal frequency. There appears to be a family association in almost half of the reported cases.

A striking feature of this disease is discordance between the clinical and radiographic manifestation, many patient display only minor symptoms although impressive radiographic manifestation . Those patient who are symptomatic typically complain of dyspnea and nonproductive cough , and the disease may develop slowly into cor pulmonale.

The typical picture of PAM on chest X-ray is of fine, sand-like calcific micronodules (*sandstorm lung*) diffusely infiltrating both lungs; these characteristics are usually observed in the middle and lower zones. CT scans demonstrate micronodular calcific densities with a greater concentration in the subpleural parenchyma and along the bronchovascular bundles, whereas high resolution CT scans show thickening of the lobular septae with a distribution of microliths along the septae and around the centrilobular distal bronchioles.

**Figure 1:-** Chest radiograph (A) and computed tomographic scan (B) on admission.

Considering lung transplantation as a treatment method in PAM cases instead of medication or artificial respiratory support treatments, both of which are known to be ineffective, seems rational. The differences observed between the preoperative and postoperative periods demonstrated the importance of performing bilateral lung transplantation in such cases regardless of the recurrence risk.

Systemic corticosteroids, calcium-chelating agents and serial bronchopulmonary lavage have been shown to be ineffective and are used as palliative treatments. In the only postoperative death reported after bilateral lung transplantation, prolonged cardiopulmonary bypass (six hours) in combination with extensive pleural involvement and increased vascularity led to uncontrolled hemorrhagic complications. Shigemura et al. have reported the oldest successful lung transplant recipient, with ten years of follow-up.

Bilateral lung replacement is preferred to unilateral replacement, because the replacement of only one lung might result in persistent shunting of blood through the native lung, as PAM leads to filling of the alveolar spaces and the consequent creation of large areas of intrapulmonary shunt. However, two patients have undergone a single lung transplantation with acceptable results and have had no evidence of recurrence in the transplanted lung thus far. Furthermore, even for bilateral transplantation, it is not known whether PAM can recur. Recurrence after transplantation has not been reported to date, suggesting that, in fact, PAM is a result of local inflammatory responses or a genetically determined error in alveolar metabolism, rather than a systemic disorder.

lung transplantation has some drawbacks because not all patients are eligible for transplantation as factors such as age and comorbidities may pose an unacceptably high risk. In addition, patients with end-stage lung disease often become critically ill and may not survive until a donor organ is available. Lung transplantation creates new medical problems and the life expectancy after this operation remains limited.

**Conclusion:-**

we successfully performed a double lung transplantation in a case of respiratory failure resulting from end-stage PAM. Although elderly recipients with end-stage PAM may have technically difficult problems related to surgery, such transplantation can be done safely and successfully when sufficient strategies are used.

#### Abstract

The Vascular Endothelial Growth Factor 1,2,3 (VEGFR 1,2,3) protein sequences from various species like *Mus musculus* (Mouse), *Rattus norvegicus* (Rat) and *Homo sapiens* (Human) were retrieved from SWISS PROT database and compared for their homology and variability. DNAMAN Software was used to create multiple sequence alignment and in assessment of the homology and variability. The results of the phylogenetic tree assessment for VEGFR1, 2, 3 depicts that the sequences from *Mus musculus* (Mouse) and *Rattus norvegicus* (Rat) showed high homology when compared with the sequences of the *Homo sapiens* (Human). The intra sequence homology within the human VEGFR1,2,3 protein predicted and analyzed for secondary structure show a characteristic variability in the amino acid positions on the random coils, alpha confirmations and extended strands without significant variation in the length.

#### Introduction:-

Stem cells are totipotent primordial cells capable to differentiate into any known adult cell types with its typical physiological functions (Louveau I et al., 2016). The first stem cells originate within the developing embryo (blastocyst) and have two important characteristics that distinguish them from other types of cells. First, they are unspecialized cells that renew themselves for long periods through cell division. The second is that, under physiologic or experimental conditions, they can be induced to become cells with special functions such as the beating cells of the heart muscle or the insulin-producing cells of the pancreas (Adel Alhadlaq and Jeremy J. Mao, 2004). Stem Cells reside as resident population at various organs and can be isolated from variety of tissues like adipose tissue, bone marrow, embryos, olfactory ensheathing cells, peripheral blood, skin and umbilical cord blood. Further stem cells or progenitor cells can be mobilized from bone marrow upon signaling from the infarcted or damaged tissues.

There are different types of stem cells like **embryonic stem cells, endothelial stem cells, mesenchymal or stromal stem cells, hematopoietic progenitors, cardiac, cancer and neuronal stem cells, induced pluripotent stem cells** etc (Choudhery MS et al., 2015). **All these have been isolated, banked or used for research with few successful clinical applications. However identification of these cell with their characteristic phenotypic or genotypic markers are more difficult and challenging today. There are surface markers common for these cells with few**

exceptions like common leucocyte markers like CD45 which is mostly observed only in the cells of the hematopoietic origin (Kobolak et al., 2016). Further many progenitor stem cells usually shares surface markers making it difficult to isolate or characterize as functional lineages, though these markers are very particular for some discrete functional adult differentiated cells. Therefore the identification and characterization of the stem cells with the available markers or cluster of differentiation (CD) on the surface of these naïve cells becomes more difficult and generalized rather than specific. Therefore it becomes necessary to eliminate such older cells based on the other markers characteristic to the anatomical site of the cells or type of the cells. The best example of these cases is Vascular Endothelial Growth Factor (VEGFR) group of the markers which are very specific to endothelial progenitors or endothelial cells (Igarashi Y et al., 2016). The presence of VEGFR has been well characterized in the mesenchymal stem cells too (Totsugawa T et al., 2002), though MSCs functions are much varied. The VEGFR family consists of three members, Vascular Endothelial Growth Factor Receptor -1 (Flt-1), Vascular Endothelial Growth Factor Receptor -2 (KDR/Flk-1) and Vascular Endothelial Growth Factor Receptor -3 (Flt-4), all of which belong to the receptor type tyrosine kinase superfamily (Matthias Clauss, et al., 1996, Kasper G et al., 2007.). In the current investigation we intended to examine the variability of VEGFR1,2 and 3 among the experimental animals and human origin. We tend to investigate the degree of identity among human and animals and within animal groups. The VEGFR 1,2 and 3 amino acid sequences from human origin and from the murine origin (Mouse and Rat) were assessed for the homogeneity and difference in their protein confirmation. This will give the information on the degree of the cross reactivity of the VEGFR antibodies against VEGFR 1,2,3 and species cross reactivity with murine origin.

## Materials and Methods:-

### Retrieval of sequences:-

The amino acid sequences of the surface marker Vascular Endothelial Growth Factor Receptor (VEGFR) was retrieved using NCBI and SWISS-PROT. Sequences of all three receptors, namely, VEGFR1, VEGFR2 and VEGFR3 from different species such as Homo sapiens (Human), Mus musculus (Mouse) and Rattus norvegicus (Rat) were used for this study.

SWISS-PROT (<http://www.expasy.org/sprot/>) (Amos Bairoch and Rolf Apweiler, 2000) Swiss-Prot is a curated biological database of protein sequences from different species created in 1986 by Amos Bairoch during his doctoral work and developed by the Swiss Institute of Bioinformatics and the European Bioinformatics Institute. It strives to provide a high level of annotation (such as the description of the function of a protein, its domains structure, post-translational modifications, variants, etc.), a minimal level of redundancy and high level of integration with other databases. Now funded by the NIH, Swiss-Prot and its automatically curated supplement TrEMBL have joined with the PIR to produce the UniProt Knowledgebase, the world's most comprehensive catalogue of information on proteins. It is a central repository of protein sequence and function created by joining the information contained in Swiss-Prot, TrEMBL, and PIR.

NCBI-ENTREZ (<http://www.ncbi.nlm.nih.gov/>) (Sayers EW and Karsch-Mizrachi I, 2016)

Established in 1988 as a national resource for molecular biology information, NCBI creates public databases, conducts research in computational biology, develops software tools for analyzing genome data, and disseminates biomedical information - all for the better understanding of molecular processes affecting human health and disease.

The Entrez system can provide views of gene and protein sequences and chromosome maps. Entrez can efficiently retrieve related sequences, structures, and references. Some textbooks are also available online through the Entrez system. Entrez Global Query is an integrated search and retrieval system that provides access to all databases simultaneously.

The sequences of the surface markers VEGFR 1, 2 and 3 were retrieved in FASTA format.

**Multiple sequence Alignment:-**

The retrieved sequences were aligned using DNAMAN Software.

DNAMAN Software. DNAMAN carries out multiple sequence alignment, designing PCR primers, protein sequence analysis or drawing plasmids. DNAMAN's speed, flexibility, accuracy and high quality presentations make it one of the fundamental tools used extensively in molecular biology. We used the Multiple Alignment Sequence Editor of DNAMAN (MASED) as an efficient tool for multiple sequence editing. The result of a multiple alignment is loaded directly into MASED. MASED can recognize DNAMAN multiple sequence format (MSD format), GCG/MSF format, Clustal format and GDE format. DNAMAN can open MSD file directly into MASED, other format files must be opened with the File | Open Special | Multiple Alignment command. The multiple alignment editor can output an alignment in different formats: GCG/MSF, CLUSTAL, NBRF/PIR, and GDE. The multiple input and output capacity of DNAMAN makes it compatible with major sequence analysis software.

**Producing Trees:-**

MASED can produce multiple alignment trees. It calculates the homology matrix and establishes related distances between all pairs of sequences. Bootstrapping of a phylogenetic tree. Bootstrap test can be carried out for the confidence values on the phylogenetic tree. DNAMAN calculates the homology matrix and establishes related distances between all pairs of sequences. Consequently, DNAMAN can output a distance matrix of multiple alignment, and draw phylogenetic trees or homology trees. Bootstrapping tests can be carried out for the confidence value of a phylogenetic tree.

**Secondary structure prediction for proteins:-**

Secondary Structure Prediction was performed for the human VEGFR sequences using HNN - Hierarchical Neural Network method (Guerneur, 1997). Expression provides an interface to a large range of sophisticated secondary structure prediction algorithms. Protein Expression presently supports nine different secondary structure prediction algorithms. All computations are performed via the Network Protein Sequence Analysis server (PBIL, France). In this study, the prediction method followed was The HNN (Hierarchical Neural Network) prediction method.

**Results and Discussion:-**

Multiple Sequence Alignment of the retrieved sequences was obtained using DNAMAN Software. The VEGFR sequences within each class were compared for homology between the sequences from different origins.

**Vascular endothelial growth factor receptor 1:-**

The VEGFR 1 sequences from *Homo sapiens* (Human), *Mus musculus* (Mouse), *Rattus norvegicus* (Rat) were aligned as follows.

#### Phylogenetic Analysis:-

The phylogeny between the VEGFR sequences retrieved from various sources was established by plotting trees and the results were obtained as follows.

#### Vascular endothelial growth factor receptor 1:-

P17948-VEGFR1-human: 0.12358

P35969-VEGFR1-mouse: 0.03837

P53767-VEGFR1-rat: 0.03183

**Figure 1:-** Phylogenetic tree of VEGFR 1

#### Vascular endothelial growth factor receptor 2:-

P35968-VEGFR2-human: 0.10447

P35918-VEGFR2-mouse: 0.02910

O08775-VEGFR2-rat: 0.02315

**Figure 2:-** Phylogenetic tree of VEGFR 2

#### VASCULAR ENDOTHELIAL GROWTH FACTOR RECEPTOR 3

P35916-VEGFR3-human: 0.09399

P35917-VEGFR3-mouse: 0.01550

Q91ZT1-VEGFR3-rat: 0.02210

**Figure 3:-** Phylogenetic tree of VEGFR 3

The phylogenetic tree for VEGFR1 depicts that the sequences from *Mus musculus* (Mouse) and *Rattus norvegicus* (Rat) display greater similarity than with each of the sequences in comparison with *Homo sapiens* (Human) VEGFR 1 sequence. Similar results were obtained in case of phylogenetic tree generated between VEGFR2 as well as VEGFR 3 sequences of *Homo sapiens* (Human), *Mus musculus* (Mouse) and *Rattus norvegicus* (Rat).

### Secondary structure prediction for human vegfr:-

Secondary structure prediction was done for the Human VEGFR sequences using HNN Secondary Structure Prediction Method and the results were obtained as follows.

**Date Set 1:-** Human vegfr1: Hierarchical Neural Network result for: UNK\_129930

Date Set 1. Using HNN for VEGFR 1 sequence, the length of the sequence was found to be 1338. The protein is chiefly folded into random coils (50.07%) and also consists of alpha helix (29.07%) and extended strand (20.85%).

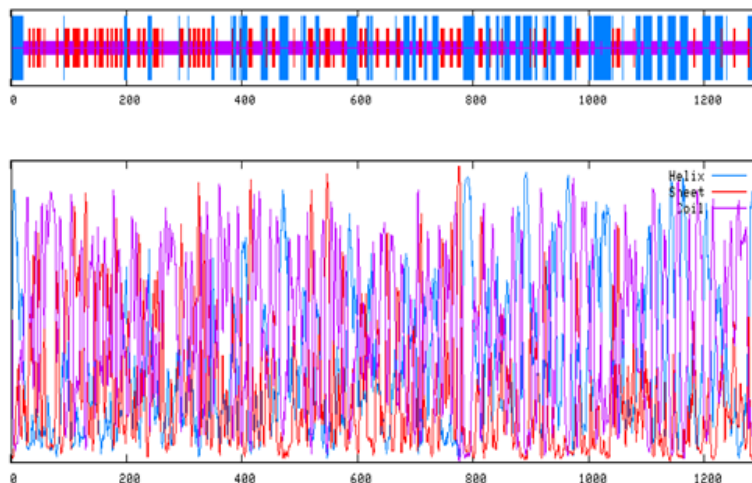

## Date Set 2:- HUMAN VEGFR2: Hierarchical Neural Network result for : UNK\_145240

Data Set 2.Using HNN for VEGFR 2 sequence, the length of the sequence was found to be 1356. The protein is chiefly folded into random coils (52.06%) and also consists of alpha helix (24.48%) and extended strand (23.45%).

**Data Set 3. HUMAN VEGFR3: Hierarchical Neural Network result for: UNK\_154230**

Data Set 3. Using HNN for VEGFR sequence, the length of the sequence was found to be 1298. The protein is chiefly folded into random coils (51.00%) and also consists of alpha helix (29.58%) and extended strand (19.41%).

**Discussion:-****Multiple sequence Alignment predicted the degree of variation of VEGFR 1 at genus levels:-**

Multiple sequence alignment (MSA) is an indispensable tool for studying the difference and homology of the macromolecules. There are many studies which compare with the protein sequence among different genus and species (Ramu Chenna et al., 2003). Therefore MSA becomes useful to know the difference in the amino acid composition which further gives the details of protein confirmation necessary for the functions like binding, activation etc. The current information of the VEGFR sequences retrieved from each species were assessed for homology using DNAMAN Software. The secondary protein structure further predicted showed the variations among each of the VEGFR1, 2, and 3 subtypes. More over the results are mostly from consistency-based programs with higher accuracy determined the reliability of the results. The VEGFR1 sequences showed an identity percentage of 87.58% between humans, mouse and rat (Table 1). On comparison of the individual VEGFR1 sequences among the species, we observed the homology between sequences from rat and mouse was 91.57% compared to the 80.92% homology between human and mouse and 81.12% homology between human and rat sequences respectively (Table 2).

In the case of VEGFR2 sequences, the indent percentage was found to be 90.14%. (Table 3) among human, mouse and rat. The individual comparison VEGFR2 sequences homology between rat and mouse was 92.44%, compared to the 83.36% homology between human and mouse and 82.85% homology between human and rat sequences (Table 4). The overall homology percentage for VEGFR 3 among the human, mouse and rat was 93.24% (Table 5). The sequence homology between rat and mouse is 95.78% compared to 85.46% human and mouse and 84.60% human and rat (Table 6). The homology between the VEGFR 1, 2 and 3 sequences from mouse and rat were more homogenous compared to humans showing the higher percent of variation with highly evolved vertebrate (Higgins DG et al 1996).

#### **Phylogenetic analysis of VEGFR 1,2 &3 reveals the evolutionary relationship between humans and murine species:-**

Phylogenetic trees were drawn using DNAMAN Software to establish the homology of the sequences from different sources. The algorithm and results were in compliance with the previous published works (Xin-Rong Liu et al., 2004) on evolutionary relationships and similarities among proteins. The phylogenetic tree for VEGFR1 depicts that the sequences from mouse and rat display greater similarity than with each of the sequences in comparison with humans (Figure 1). Similar results were obtained in case of phylogenetic tree generated between VEGFR2 (Figure 2) as well as VEGFR 3 (Figure 3) sequences of human, mouse and rat (Hernández-García et al., 2015).

#### **Secondary structure of VEGFR prediction shows the variation on the protein confirmation across species:-**

Secondary Structure prediction for human VEGFR sequences using Hierarchical Neural Network Secondary Structure Prediction Method was on par with the previous studies (Guermeur Y, 1997, Chandrasekaran V et al., 2007) and they proposed this algorithm for secondary structure for proteins. Using HNN for VEGFR 1 sequence, the length of the sequence was found to be 1338. The 50.07% protein is chiefly folded into random coils with 29.07% of alpha helix and 20.85% as extended strand (Data set 1). The length of the VEGFR 2 sequence was 1356. 52.06% protein is chiefly folded into random coils with 24.48% of alpha helix and 23.45% of extended strand (Data set 2). The length of the VEGFR 3 sequence was 1928. 51.00% protein is chiefly folded into random coils with 29.58% as alpha helix (29.58%) and 19.41% extended strand (Data set 3). Thus, secondary structure prediction reveals the structural similarity between the classes of VEGFR sequences. All classes of VEGFRs reveal that large regions of their secondary structure consist of random coils and the remainder is folded into alpha helix (Wu G et al., 2013).

#### **Conclusion:-**

The MSCs VEGFR 1, 2 and 3 show homology and identity upon multiple sequence alignment. The sequences retrieved from *Mus musculus* (Mouse) and *Rattus norvegicus* (Rat) show greater homology in comparison with *Homo sapiens* (Human). The Phylogenetic Tree asserts the similarity and homology among VEGFR sequences from different species. Secondary structure prediction of the VEGFR sequences from *Homo sapiens* (Human) revealed that all the three receptors, i.e., VEGFR1, VEGFR2 and VEGFR3 show about 50% similarities in their secondary structure in random coils while remaining regions exist either as alpha helices or as extended strands.

### Abstract

A field experiment was conducted during *Rabi* season of 2002-03 on sandy loam soils at Bapatla, Andhra Pradesh to study the effects of pre and post-emergence herbicides, alone or integrated with manual/mechanical weeding on weed pressure, productivity and economic returns of *Rabi* groundnut (*Arachis hypogaea*). Pendimethalin @ 0.75kg/ha as pre-emergence (PE) + imazethapyr @ 75 g/ha as post-emergence (PoE) herbicides at 21 days after sowing (DAS) + Intercultivation with wheel hoeing followed by hand weeding resulted in significantly higher growth attributes, yield attributes, yield and net returns over the unweeded control and was found at par with T1: Hand-weeding at 20 and 40 DAS, T7: Pendimethalin @ 0.75kg a.i./ha (PE) + Intercultivation with wheel-hoeing followed by hand weeding and T5: Pendimethalin @ 0.75kg a.i./ha (PE) + imazethapyr @ 50 g a.i./ha (PoE).

Groundnut is an important oil seed crop of India which is cultivated in India during *Rabi* nearly 6.41 million ha. Area with the production of 9.18 million tonnes and average productivity of 1.43 tonnes/ha (Srinivasarao et al., 2011). In Andhra Pradesh, Groundnut (*Arachis hypogaea*) is an important oil seed crop which occupies an area of 2.64 M.ha., production of 5.07 MT and productivity of 1.921 kg/ha respectively (Department of Agriculture, Andhra Pradesh, 2008-2009). Weed infestation is considered as one of the major factors in groundnut production. Weed interference resulted in yield loss ranging from 74 to 92% (Agostinho et al., 2006). Critical period of crop-weed competition for groundnut crop was reported to be up to 45 DAS and weed free environment during this period registered higher pod yield (Rao, 2000). Hand weeding and hoeing are common cultural and manual weed management methods for groundnut, but with scarcity of labours these methods are very costly and tedious. Use of pre and post emergence herbicides is the best alternative for weed control at critical periods. Combination of physical and chemical methods by use of post-emergence herbicides is the best alternative for weed control at critical periods. Combination of physical and chemical methods by use of post-emergence herbicides like imazethapyr or quizalofop-p-ethyl (Bhatt et al., 2008) were suggested for controlling weeds effectively at later stages of crop growth and maintenance of weed free environment at critical stages of crop growth (Sailaja et al., 2002). Therefore field experiment was initiated to find out an effective and economical integrated weed management practice in *Rabi* groundnut.

## Materials and Methods:-

Field experiment was conducted during *Rabi* season 2002-03 at Agricultural College Farm, Bapatla, India to find out the response of integrated weed management practices on growth and yield of groundnut. The soil of the experimental site was sandy loam in texture with soil pH was neutral in reaction (7.0) and an electrical conductivity of  $0.14 \text{ dSm}^{-1}$ . The soil organic carbon content was low (0.50%). The soil was low in available nitrogen (185 kg/ha) and phosphorus (18 kg/ha) but rich in available potassium (320 kg/ha). The experimental site was located at an 5.0 m above mean sea level,  $15^{\circ} 41' \text{N}$  latitude,  $80^{\circ} 30' \text{E}$  longitude and the experiment was laid out in randomized block design with three replications. Groundnut variety "TMV-2" was sown at spacing of  $30 \times 10 \text{ cm}$ . A basal dose of 20 kg N, 40 kg  $\text{P}_2\text{O}_5$  and 50 kg  $\text{K}_2\text{O}$ /ha was applied through urea, single super phosphate and muriate of potash respectively. Herbicides were applied through using manually operated knapsack sprayer fitted with flat fan nozzle using spray volume of 500 L/ha.

The details of the treatments  $T_1$ : Handweeding at 20 and 40 DAS;  $T_2$ : Wheel-hoeing at 20 and 40 DAS;  $T_3$ : Pendimethalin @ 1.0 kg a.i./ha as pre-emergence (PE);  $T_4$ : Imazethapyr @ 62.5 g a.i./ha post-emergence (PoE) at 21 days after sowing;  $T_5$ : Pendimethalin @ 0.75 kg/ha (PE) + imazethapyr @ 50 g a.i./ha (PoE);  $T_6$ : Pendimethalin @ 0.75 kg a.i./ha (PE) + imazethapyr @ 50 g a.i./ha (PoE) + Intercultivation with wheel-hoeing followed by handweeding;  $T_7$ : Pendimethalin @ 0.75 kg/ha (PE) + Intercultivation with wheel-hoeing followed by handweeding;  $T_8$ : Unweeded check;  $T_9$ : Weed free check (weekly hand weeding). Pre emergence herbicide pendimethalin was applied on first day after sowing where as post-emergence herbicide was applied at 21 days after sowing. Weed free check was achieved by weekly interval of hand weeding was done throughout the crop period. Regarding five plants were selected from each plot and regular biometric observations of crop and weed parameters were recorded from 30 days after sowing upto harvest. However, observation data recorded at 30 DAS and at harvest is given in tables for study the results and discussion. Weed density ( $\text{no}/\text{m}^2$ ) was recorded by putting a quadrat of  $0.25 \text{ m}^2$  at two random spots in each plot. Weed control efficiency and weed index was calculated by standard formulae. Plant Height and plant dry matter at 30 DAS and 60 DAS were recorded for randomly selected five plants. Data on Pod yield (kg/ha) and yield components viz., number of pods/plant. Grass returns were calculated based on local market prices of groundnut and net returns by subtracting the total cost of cultivation from gross returns. Benefit:cost ratio was computed by dividing gross returns with cost of cultivation.

## Results and Discussion:-

### Effect on Weeds:-

Predominant weeds identified in the experimental groundnut fields were *Cynodon dactylon*, *Echinochloa colonum*, *Digitaria sanguinalis*, *Dactyloctenium aegyptium*, *Panicum repens*, *Cyperus rotundus*, *Trianthema portulacastrum*, *Commelinabenghalensis*, *Tridax procumbens*, *Trichodesma indicum*, *Parthenium hysterophorus*, *Acanthospermum hispidum*, *Eclipta alba*, *Phyllanthus niruri*, *Amaranthus viridis*, *Cleome viscosa*, *Celotia argentea* and *Acalypha indica*. All the treatments were found to reduce significantly population densities of grasses, sedges and dicot weeds at 30 days after sowing and harvesting as compared to unweeded control. After weed free control, treatment of pendimethalin 30% EC @ 0.75 kg/ha as (PE) + imazethapyr 50% EC @ 50 g/ha as PoE + Intercultivation with wheel hoeing followed by hand weeding was found to have significantly lowest weed densities of grasses, sedges and broad leaved weeds as compared to unweeded control and at par with Pendimethalin 30% EC @ 1.0 kg/ha (PE) + Intercultivation with wheel hoeing followed by handweeding, pendimethalin 30% EC @ 0.75 kg/ha PE + imazethapyr 50% EC @ 50 g/ha PoE at 21 DAS and Handweeding at 20 and 40 DAS at 30 DAS and harvest for Grasses, Sedges and Broad leaved weeds. Table – 1. Our results support the findings of Kalhapure et al. (2013), who reported that pendimethalin 1.5 kg/ha PE + Imazethapyr 0.15 kg/ha as PoE + 1 handweeding at 40 DAS was at par with weed free control in controlling the weed density in groundnut. Thus, pre-emergence application of pendimethalin prevents emergence of monocot and grassy weeds by inhibiting root and shoot growth while imazethapyr was responsible for inhibition of Aceto Lactate Synthase (ALS) or aceto hydroxyl acid synthase (AHAS) in broadleaved weeds which caused destruction of these weeds at 3-4 leaf stage. Remaining monocot weeds were controlled by intercultivation with wheel-hoeing followed by handweeding. Pendimethalin 30% EC @ 0.75 kg/ha PE + Imazethapyr 50% EC @ 50 g/ha PoE at 21 DAS + Intercultivation with wheel-hoeing followed by handweeding recorded highest WCE (Weed Control Efficiency) followed by Handweeding at 20 and 40 DAS, Pendimethalin 30% EC @ 1.0 kg/ha (PE) + Intercultivation with wheel hoeing followed by handweeding and Pendimethalin 30% EC @ 0.75 kg/ha (PE) + Imazethapyr 50% EC @ 50 g a.i./ha (PoE) at 30 DAS and at harvest. However, Pendimethalin 30% EC @ 0.75 kg/ha PE + imazethapyr 50% EC @ 50 g a.i./ha PoE at 21 DAS + Intercultivation with wheel-hoeing followed by handweeding followed by handweeding at 20 and 40

DAS, Pendimethalin 30% EC @ 1.0 kg/ha (PE) + Intercultivation with wheel hoeing followed by handweeding and pendimethalin 30% EC 0.75 kg/ha PE + Imazethapyr 50% EC 50 g a.i./ha PoE resulted in the lowest Weed Index. Kalhapure et al. (2013), reported higher WCE and lower Weed Index with Pendimethalin 1.5 kg/ha PE + Imazethapyr 0.15 kg/ha as PoE + handweeding at 40 DAS.

#### Effect on Crop:-

Weed free recorded significantly taller plants and plant drymatter production,at 30 DAS and 60 DAS fallowed by pendimethalin 30%EC 0.75 kg/ha PE + Imazethapyr 50% EC 50 g a.i./ ha PoE + Intercultivation with wheel hoeing fallowed by handweeding which were on a par with each other but were significantly superior over all other treatments.Among Integrated Weed Management practices the maximum plant height and drymatter production at 30 DAS and 60 DAS were recorded with T<sub>6</sub> fallowed by T<sub>7</sub> and T<sub>5</sub> which were on a par with one another and found significantly superior over herbicides alone and wheel hoeing.This might be due to the minimizing the competition of weeds with main crop for resources viz.,space,light,nutrients and moisture with adoption of effective weed control methods.Singh and Giri(2001) has also concluded that proper weed control was responsible for increase in

plant height and dry matter production in groundnut. Significantly lower values of plant height and dry matter production were recorded in treatment unweeded check

#### **Yield attributes and Yield:-**

Yield attributes and yield was significantly affected by weed control measures (Table-2). Among the weed control measures, weed-free check recorded significantly highest number of pods/plant and pod yield followed by Pendimethalin 30% EC @ 0.75 kg/ha (PE) + Imazethapyr @ 50% EC @ 50 g a.i./ha + Intercultivation with wheel-hoeing followed by handweeding. These two treatments were significantly superior over rest of the treatments and were statistically on a par with each other. Among the integrated weed management practices Pendimethalin 30% EC @ 0.75 kg/ha (PE) + imazethapyr 50% EC @ 75 g /ha (PoE) + Intercultivation with wheel hoeing followed by handweeding recorded higher number of pods/plant and pod yield followed by Pendimethalin 30% EC 1.0 kg/ha (PE) + Intercultivation with wheel hoeing followed by handweeding and Handweeding at 20 and 40 DAS which were significantly superior over herbicide alone and wheel hoeing. Those results are in conformity with the findings of Sharma et al. (2015), also reported that Pendimethalin 30 % EC @ 0.9 kg/ha as PE + imazethapyr @ 75 g /ha as PoE at 20 DAS and Pendimethalin 30 % EC @ 0.9 kg/ha as PE + Handweeding and IC at 40 DAS resulted in 94.3 and 92.69 % higher pod yield respectively.

Pendimethalin 30 % EC @ 0.75 kg/ha as PE + Imazethapyr 50% EC @ 50 g/ha as (PoE) + IC with wheel hoeing followed by handweeding was most effective not only to control weeds but also in obtaining higher pod yields in groundnut. Thus, weed free environment created with the help of application of pre-emergence and post-emergence herbicides at early and later stages of crop growth facilitates better growth and development of plants, flowering, peg initiation and entry in to the soil + handweeding allows pulverization and more pod formation ultimately increasing pod yield/ha compared to weed control through manual weeding alone.

#### **Economics:-**

Pendimethalin 30 % EC @ 0.75 kg/ha as PE + Imazethapyr 50 % EC @ 50 g/ha (PoE) + Intercultivation with wheel hoeing followed by hand weeding recorded significantly highest net returns Rs. 24,217/- and Benefit:Cost ratio 2.72 followed by hand weeding at 20 and 40 DAS, Pendimethalin 30% EC @ 1.0 kg/ha + Intercultivation with wheel hoeing followed by hand weeding and Pendimethalin 30 % EC @ 0.75 kg/ha (PE) + Imazethapyr 50 % EC 50 g a.i./ha (PoE). where as weed free check recorded lower net returns (Rs. 20,674/-) and low B:C ratio 1.44 this might be due to the cost of cultivation of groundnut was increased in treatment weed free check due to higher need of human labours and their wages. The cost was reduced in treatment (T<sub>6</sub>), using herbicides to effective control of weeds with minimizing human labours Kalhapure (2013) also reported that highest net returns and Benefit :Cost ratio with Pendimethalin @ 1.5 kg/ha as PE + imazethapyr @ 0.15 kg/ha as PoE + Hand weeding at 40 DAS . Weedy check recorded lowest net returns (Rs. 9857) and B:C ratio (1.38).

Thus, Treatment Pendimethalin 30 % EC 0.75 kg/ha (PE) + Imazethapyr 50% EC @ 50 g a.i./ha was proved practically more convenient and economically best feasible integrated weed management practice for groundnut considering the present condition of scarcity and high cost of labours, quality of weed control, yield and B:C ratio of cultivation of Groundnut.

breast lump, carcinoma, fibroadenoma, benign.

### Abstract

**Introduction:** Though mostly benign in nature, breast lump can be malignant. Since breast carcinoma is the second most common killer of the female cancer, it is important to detect it at early stage. Our study aimed to analyse histopathology profile of breast lump.

**Methods:** Histopathology samples were received, processed, reported and recorded in the Pathology laboratory at the Department of Pathology, Govt. Medical College Srinagar. Data was analysed for the period of 1 year. Descriptive statistics was used to analyse the data.

**Results:** Out of 175 breast pathology specimens, seven of our patients were male, 142 (81.14%) were reported as benign and 33(18.86%) as malignant tumors. Mean age of carcinoma patients was 44.9 years. (41.38%) of the malignant neoplasm were of Stage IIIB.

**Conclusion:** Every fifth sample had carcinoma and it is mostly seen after 40 years of age.

### Introduction:-

Women presenting with breast lump is common in surgical practice. Breast lump is a cause of significant disquiet in view of widespread and unrestricted wakefulness in general public<sup>1</sup>. The lesions of the breast have varied etiology and may be inflammatory, benign or malignant. It therefore becomes necessary for a treating physician to distinguish benign from malignant conditions and their prevalence.

The diagnostic methods should be rapid, cheap, accurate and least invasive to evaluate and discriminate between benign and malignant etiology of breast lump in outpatient clinics. Such methods benefit both patients and surgeons by promoting proper preoperative diagnosis and management and by limiting the unnecessary investigative workup<sup>2,3</sup>. FNAC is a simple, reliable, economical, atraumatic, easily repeatable and complication free technique for the evaluation of mass lesions. Histopathological study of biopsy specimen is one of the easiest and cheapest forms of diagnostic method which is affordable, available to give tissue diagnosis. Tissue diagnosis is considered as the minimum requirement to start specific treatment in breast lump<sup>4</sup>.

Both incidence and mortality from breast cancer is on rise especially in developing countries. This study aimed to find out the histopathological characteristics of breast lump at a tertiary care hospital in Kashmir valley.

### Methods:-

This is a cross sectional study of breast biopsy specimen received from 1st June 2015 to 30<sup>th</sup> May 2016 at the Department of Pathology, Govt. Medical College Srinagar, catering a population of 6.8 million. The breast specimens received from the surgical specialty departments within and associated with the college formed the data

for our study. After being labelled, entered in the data system of the laboratory, the specimens were kept for fixation in 10% Formalin overnight. After grossing, tissue processing, and making blocks, thin tissue slices of 0.4 micron thickness were obtained and prepared on a slide. Slides were examined after staining with hematoxylin and eosin. The findings were recorded in the database.

### Results:-

175 breast pathology specimens were received in our department during the study period. Seven of our patients were male, 142 (81.14%) were reported as benign and 33 (18.86%) as malignant tumors with a benign to malignant ratio of 4.3:1. The age of patients at presentation ranged from 14 to 72 years with a median age of 27 years. The age wise distribution of breast lump lesions is depicted in table 1.

**Table 1:-** Age group wise distribution of breast lump pathology

Age group	Benign	Malignant	Total
≤20	44	0	44
21-30	46	1	47
31-40	38	10	48
41-50	11	11	22
51-60	2	7	9
61-70	1	2	3
>70	0	2	2

The major diagnoses were fibroadenoma (in 48% of cases) at a mean age of 24 years, invasive carcinoma (18.86%) at a mean age of 47 years, fibrocystic disease (9.14%) at a mean age of 32 years and breast inflammation (9.14%) at a mean age of 32 years. The histopathological results of breast lumps are presented in Table 2.

**Table 2:-** Histopathological distribution of breast lump

S. No	Diagnosis	Frequency	Percentage(%)
1	Fibroadenoma	84	48
2	carcinoma	33	18.86
3	Fibrocystic disease	16	9.14
4	Inflammatory disease	16	9.14
5	Epithelial hyperplasia	6	3.43
6	Gynecomastia	6	3.43
7	Benign phyllodes	4	2.29
8	Fibroadenosis	3	1.71
9	Lactational adenoma	2	1.14
10	Sclerosing adenosis	1	0.57
11	Tubular adenoma	1	0.57
12	Pseudoangiomatous stromal hyperplasia (PASH)	1	0.57
13	Hamartoma	1	0.57
14	Neurofibroma	1	0.57
	Total	175	100

Of the malignant cases, 25/33 (75.76%) were the infiltrative ductal carcinoma. Not otherwise specified. The remainder were lobular carcinoma (2 cases, 6.06%), medullary carcinoma (2 cases, 6.06%), invasive ductal carcinoma with Paget's disease (1 case), inflammatory carcinoma (1 case), tubular carcinoma (1 case) and malignant phyllodes tumor (1 case). Out of 33 malignancies, 29 were Modified Radical Mastectomy (MRM) specimen. Size of tumor ranged from 2.2cmx1.3cm to 12.5cmx9 cm. Lymph nodes were identified in all MRM specimens and were positive for tumor cells in 21 cases. Maximum numbers of lymph nodes seen in the MRM specimen were 18. Out of 29 MRM specimens 3 cases were in stage IIA, 5 cases were in stage IIB, 9 cases were in Stage IIIA and 12 were of stage IIIA.

### Discussion:-

In our study majority of the specimens 142/175 (81.14 %) were reported to be benign similar to the study done by Phillip L. Chalya et al.<sup>5</sup> (80.4%). Fibroadenoma (48%) was the most common benign breast lesion comparable to the study by Naveen et al.<sup>6</sup> (52%), Greenberg et al.<sup>7</sup> (50%) and Malik et al.<sup>8</sup> (49%). The reasons for the high

frequency of fibroadenoma among females in this study are not clear. Demographic factors might play a role, considering the large number of young females within the population of these groups. Maximum number of cases of fibroadenoma was seen in third and fourth decade of life, similar to other studies<sup>9,10,11</sup>

The fibrocystic disease was seen in 9.14% cases in our study which is at par with studies by Jamal A et al<sup>12,13</sup> (13.1% and 12%). Hormonal imbalance with prolonged exposure to estrogen is hypothesized to be the main cause of these disorders<sup>14</sup>. Majority of the patients belonged to the 3rd and 4th decades. Most of the cases of fibrocystic disease diagnosed in our study (around 76.58%) were Simple and this is less dangerous than proliferative fibrocystic disease (23.41%), which is associated with an increased risk of breast cancer<sup>14,15</sup>

Inflammation of the breast was found in 9.14% of biopsies. The pattern of inflammatory breast disease in our study is relatively close to that observed in Saudi Arabia and Jordan<sup>16,17</sup>. Social factors and personal behaviors could be the possible cause of this condition where repeated pregnancies and lactations with accompanying change of breast physiology predispose women to breast infections.

Breast cancer is the most common neoplasia in women. A principal finding of our study was malignancy rate of 18.87%, which were consistent with past studies<sup>12,18</sup>. Mean age of its presentation was in 44.9 years which is at par with study conducted by A.K. Al-Thobhani et al<sup>19</sup>. In our study invasive ductal carcinoma became the most common variety of breast cancer as indicated in published data<sup>20,21</sup>. Invasive ductal carcinoma is the most common histological type with a poor prognosis rate of 30-35% 10 year survival rate. In our study the tumor size ranged from 2 to 6 cm. Five year survival in breast cancer less than 1 cm is 93% while as it is 63 % for larger than five cm in size<sup>22</sup>. Lymph nodes were identified in all cases of MRM specimens however it was positive for tumor cells in only 21 cases. There is 6 % additional risk of cancer death by each positive lymph node<sup>23</sup>. 41.38% of the MRM specimens were of stage IIIB. Due to lack of proper screening majority of women with breast cancer in developing countries are diagnosed in clinical stages III and IV.

Factors such as genetics, racial, social, cultural, hormonal and dietary habits which contribute to etiopathogenesis were not studied in this study. Breast cancer and breast diseases screening programs should be developed at the hospitals. These programs should ideally include clear objectives, plans and managements. Programs should be free of cost to encourage large number of women to enroll in such screening programs.

### Conclusions:-

81.14% breast lumps were benign in our study. All but two malignant lesions were invasive ductal carcinoma, seen at a mean age of 44.9 years and advanced stage with nearly 41.38% of mastectomy specimens in stage IIIA.

Diabetic foot, Knowledge, foot care, complications

#### Abstract

**Background:** As many of diabetic complications, diabetic foot are avoidable however proper education is essential as it leads the patient to be aware of the problem and its prevention which can save the patient's feet from amputations.

**Objectives:** To assess knowledge of diabetic patients regarding foot care and its determinants.

**Subjects and methods:** A retrospective study has been carried out to compare diabetic patients without foot problems to those who had them. It included all diabetic patients from four major hospitals in Makkahwith and without Diabetic foot from Makkah city. A study-specific questionnaire was designed included general information, level of education, and added questions at the end to measure the knowledge.

**Results:** The study included 392 patients. Their age ranged between 13 and 90 years (53.6±13.3 years). Almost two-thirds of the patients were males (62%). Majority were Saudis (86.1%). Type II diabetes was reported by 52.1% of the patients. Regular compliance with diabetic clinic/center was mentioned by 65% of them. Adherence to anti-diabetics was reported by majorities (87%). History of feet wound lasted 3-4 weeks was reported among 42.9% of diabetic patients. Where is a history of amputation was reported among 20.9% of them. The mean knowledge score was 5.6 out of 10 (56%). Good knowledge regarding foot care was higher among younger patients (≤30 years) compared to older patients (>50 years (68% versus 41.4%, p<0.001). Majority of postgraduate patients (87%) compared to 34.7% of illiterate patients had good knowledge regarding foot care knowledge, p<0.001. The highest level of good knowledge regarding foot care was reported among patients with onset of diabetes between 11 and 20 years (70%) whereas the lowest level was reported among those with onset after 20 years (46.2%), p=0.011. Good foot care knowledge was more reported among type 1 than type 2 patients (73.3% versus 51.7%, p<0.001). Regular compliance with diabetic

Clinic/center was accompanied with higher knowledge level,  $p < 0.001$ . Also, adherence to anti-diabetics was accompanied with higher knowledge level,  $p = 0.011$ .

**Conclusion:** Knowledge of diabetic foot care in Makkah is moderate (56%), younger, more educated, type 1 diabetic patients and those who attended diabetic clinics regularly and being more compliant with anti-diabetics were more knowledgeable. Health education programs are recommended particularly to older and less educated patients. In addition, patients should be encouraged to attend diabetic clinics regularly.

## Introduction:-

Diabetes mellitus is one of the most common health problems affecting all age groups worldwide and was estimated to be 2.8% in 2000 and 4.4% in 2030.<sup>1</sup> The prevalence of diabetes in the Medicare population may be one-third higher than previously estimated.<sup>2</sup> Overall, approximately 8% of diabetic Medicare beneficiaries have a foot ulcer and 1.8% has an amputation. These prevalence rates are further elevated for the subset of beneficiaries with lower extremity peripheral artery disease.<sup>2</sup>

The prevalence rates for foot ulcer and lower extremity amputation among diabetic Medicare beneficiaries vary dramatically by geographic region. More than 16 million people in the United States (U.S.) have diabetes mellitus. The prevalence of diabetes among those over 65 years of age was last estimated by the Centers for Disease Control and Prevention (CDC) using 2008 data from the National Health Interview Survey. It is about 19.9 percent among those ages 65 to 74 and 17.1 percent among those more than 75 years of age. These estimates are based on self-reports and are thought to underestimate the true prevalence by one-third.<sup>2</sup>

The prevalence of diabetes in Saudi Arabia was 34.1% in males and 27.6% in females (mean age is 55 years), such high prevalence make diabetes an endemic and stands as a major health issue in our healthcare systems and society.<sup>3</sup>

One of diabetes common and serious complications is diabetic foot problem, which is a major cause of morbidity and mortality in patients with diabetes. Infection, ischemia and neuropathy are all contributing to produce tissue necrosis.<sup>3</sup>

Studies showed that up to 10% of patients with diabetes would develop a foot ulcer sometime during their lives<sup>4</sup> and it is the most common cause of non-traumatic lower limb amputation and precedes 85% of the cases<sup>5</sup>.

The prevalence of diabetic foot problems differs between countries in the world<sup>5</sup>. In Saudi Arabia, DF was prevalent in 13.5% of the diabetic patients referred to the nephrology clinic<sup>6</sup>; several factors make this prevalence higher as compared to the West including patient education.

As many of diabetic complications, diabetic foot are avoidable however proper education is essential as it leads the patient to be aware of the problem and its prevention which can save the patient's feet from amputations. Educators including physicians usually educate their patients on controlling their blood sugar either with insulin or diet mainly and rarely about the foot care.

As prevention requires knowledge it also needs change in behavior. To assess our ability to effect change in behavior we need to measure not only knowledge but also understanding the change of behaviors. This study was carried out using a structured questionnaire to assess the knowledge among diabetic patients regarding foot care.

## Subjects and Methods: -

A retrospective study has been carried out to compare diabetic patients without foot problems to those who had them. It included all diabetic patients with and without Diabetic foot from Makkah city, there was no age limit, the study excluded non-Makkah residents (pilgrims), non-diabetic.

A study-specific questionnaire was designed included general information, level of education, and added questions at the end to measure the knowledge.

Ethical approvals from Um AlQura University and the ministry of health in Makkah were taken to collect the data from four major hospitals in Makkah (AL Noor specialist hospital, King Faisal specialist hospital, Hera general hospital, king Abdulaziz hospital). Then, the questionnaires were distributed to patients from the general population with diabetes and from those attending and following in a diabetic center in Makkah. Patients were grouped into two categories; 1) diabetics without foot problems, and 2) and those with foot complications. Then data was collected and analyzed using (SPSS, version 22).

### Results: -

The study included 392 patients. Their age ranged between 13 and 90 years ( $53.6 \pm 13.3$  years). Almost two-thirds of the patients were males (62%). Majority were Saudis (86.1%). More than one-quarter of them were professionals (26.4%), retired (29.4%) or not working (26.1%). Almost one third of them (33.5%) were at least university graduated whereas 18.4% of them were illiterates.

Table 2 summarizes the diabetes-related characteristics of the participants. Among majority of the participants (84.9%), diabetes was diagnosed after age of 20 years. Type II diabetes was reported by 52.1% of the patients. Regular compliance with diabetic clinic/center was mentioned by 65% of them. Adherence to anti-diabetics was reported by majorities (87%).

History of feet wound lasted 3-4 weeks was reported among 42.9% of diabetic patients as shown in figure 1 whereas history of amputation was reported among 20.9% of them. Figure 2

Figure 3 showed that 78.3% of the patients knew that they should reach their sole of the foot and see if there is any problem, 42.9% knew that they should daily examine their feet. It was found that 90.3% of them recognized that washing feet should be daily, 54.8% of them recognized using warm water for that. Almost half of patients (46.9%) knew that a clean towel should be used to dry their feet after washing it. Less than half of them (48.7%) knew that they should crossed their legs on sitting. Around 54.6% of the participants knew that they should use a cream to moisturize their feet, 35.5% of them know that it should be used between their toes. We found also that 74.0% knew that they should cut nails by themselves, 35.2% knew the proper way of cutting nails.

The mean knowledge score was 5.6 out of 10 (56%). From table 3, it has been shown that good knowledge regarding foot care was higher among younger patients ( $\leq 30$  years) compared to older patients ( $> 50$  years) (68% versus 41.4%,  $p < 0.001$ ). Majority of postgraduate patients (87%) compared to 34.7% of illiterate patients had good knowledge regarding foot care knowledge,  $p < 0.001$ . Other demographic factors (gender, nationality, and occupation) were not significantly associated with foot care knowledge.

The highest level of good knowledge regarding foot care was reported among patients with onset of diabetes between 11 and 20 years (70%) whereas the lowest level was reported among those with onset after 20 years (46.2%),  $p = 0.011$ . Good foot care knowledge was more reported among type 1 than type 2 patients (73.3% versus 51.7%,  $p < 0.001$ ). Regular compliance with diabetic clinic/center was accompanied with higher knowledge level,  $p < 0.001$ . Also, adherence to anti-diabetics was accompanied with higher knowledge level,  $p = 0.011$ . There was no significant difference between patients with history of foot wound lasts 3-4 weeks/amputation and knowledge of diabetic foot care. Table 4

### Discussion:-

In the current study, the mean score of knowledge was 5.6 out of 10 (56%). In a study conducted by Al-Juaid in Taif, Saudi Arabia (2005),<sup>7</sup> a main knowledge score of 66% has been reported. In Najran, Saudi Arabia the main knowledge score was 6.5 out of 11 (60%).<sup>8</sup> In USA, Southeastern State, the main score of knowledge of a group of diabetic patients without foot ulcer was 13.75 out of 20 (68%) whereas it was 13.88 out of 20 among those with foot ulcer (69.4%).<sup>9</sup>

In the current study, younger patients were more knowledgeable than older patients. The same has been reported by Al-Juaid in another previous Saudi study.<sup>7</sup> This could be attributed to the fact that, younger patients were healthier and they can take care of themselves.

In accordance with other studies,<sup>7, 10, 11</sup> higher educated patients were more knowledgeable than others. The knowledge of appropriate foot care has been suggested to be positively influenced by patient education which in turn reduces the risk of foot ulceration and amputation in high-risk diabetics.<sup>12</sup> The association between education and knowledge may be due to the fact that, educated patient were able to read and understand some of educational supportive materials and also use information technology to obtain more information about the disease. In addition, in a study conducted in India, it was concluded that low knowledge scores were common with poor formal education, thus confirming relationship between education and knowledge.<sup>13</sup> Role of formal/school education is further confirmed by a study from Italy where the presence of foot complications was correlated with cigarette smoking, insulin treatment, and low levels of school education.<sup>14</sup>

Patients who regularly compliant with diabetic clinics visits and anti-diabetics were more knowledgeable regarding diabetic foot. This could be attributed to the fact that patients usually got their information from primary care centers sources which help them to be more compliant with anti-diabetics and also more knowledgeable of foot care.

Therefore, health education is an essential task in primary health care centers as well it is one of the important task and responsibility of primary health care physicians.

Type 1 diabetic patients in the present survey reported better foot care knowledge than those of type 2. This could be attributed to the fact that type 1 diabetes is more associated with complications including diabetic foot.<sup>15</sup> Therefore, they had to be more knowledgeable about it.

Patient's gender has shown no relationship regarding knowledge and practices of foot care whereas in another study conducted in India, low scores for foot care knowledge were more common in women (78.5%) than in men (62.5%). However this can be explained on the basis that in that particular study, there were more women with low educational status.<sup>16</sup>

In conclusion, Knowledge of diabetic foot care in Makkah is moderate (56%), younger, more educated, type 1 diabetic patients and those who attended diabetic clinics regularly and being more compliant with anti-diabetics were more knowledgeable. Health education programs are recommended particularly to older and less educated patients. In addition, patients should be encouraged to attend diabetic clinics regularly.

The present research has some important limitations. First, our sample was recruited from attendees of major hospitals in Makkah ignoring those attending primary health care centers, which limits the representative of the sample. The used tool was not subjected to tests of validity and reliability. Despite of that, our study has been able to determine the knowledge of foot care among diabetic patients in Makkah, Saudi Arabia and identifying factors associated with that knowledge.

*Li'an*, marriage dissolution, Patani  
 Province, Southern Thailand

#### Abstract

*Li'an* as a mode of divorce is seldom used among the Muslim society. It involves taking an oath to avoid *hudud* punishment for the charge of adultery (*zina*). This research begins from a study by Abdul Rahim Abdullah which interpreted the term *li'an* as taking a religious oath due to a husband's accusation against his spouse, deemed as slander (*qazaf*) in the absence of four witnesses, whether to accuse her of adultery or to deny paternity of a child conceived by her. Thus, the purpose of this research is to explain in detail the concept and meaning of *li'an* in Islam. This research examines the law on *li'an* and its implementation according to Islam. In addition, this research also studies *li'an* as a mode of marriage dissolution according to al-Qur'an and al-Hadith. It also uncovers reasons for the occurrence of *li'an* and its implementation based on al-Qur'an and al-Hadith as well as the effect of legal implications on couples who go through it. The research methodology employed is literature review in order to obtain adequate related information on *li'an*.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

*Li'an* is a method of taking oath to avoid *hudud* punishment for the charge of adultery (*zina*). *Li'an* is also a method for the purpose of denying paternity of a child. However, it is rarely practised as a form of divorce among the Muslim society.

#### Meaning of *Li'an*:-

*Al-Li'an* originates from the word (لاعن) and from *wazan* (فانل) which means to expel and being driven away from the mercy of Allah (al-Zuhayli, 1989). *Li'an* in *Ahwal al-Shakhsiyyah* (Muslim Family Law) terminology consists of specific words used as allegation by the accuser against his spouse for desecrating their conjugal bed and dishonour on the ground of adultery (*zina*). The act is named *li'an* because the words used by both parties in the procedure are swear words invoking the curse or wrath of Allah and in doing *li'an* the parties are distancing themselves from each other (al-Khin, 2007).

*Li'an* slightly differ according to the terminology of jurists from different schools of law (*fuqaha' al-Madhahib*). *Madhhab al-Hanafiyyah* states that *li'an* is a name which occurs between spouses with specific or prescribed pronouncements in their testimonies (Fath al-Qadir). In *al-Shafi'iyyah* school of law, the words used are for the

**Corresponding Author:- Ezad Azraai Jamsari.**

Address:- Department of Arabic Studies and Islamic Civilization, Faculty of Islamic Studies.

accusation of tarnishing the bedspread or carpet (dishonour) and relating it to denial of paternity for a child (al-Ramli, 1967). In *al-Malikiyyah* school of law, *li'an* is an oath taken by a husband, who is Muslim and accountable (*mukallaf*), that his wife has committed adultery or denying paternity of a child conceived by her. The wife also swears that the husband is falsely accusing her. Thus both spouses swear four times by pronouncement of *Ashhadu bi Allah* in the presence of a judge (*al-Sharh al-Saghir li Dardir*, 1/492). According to *al-Hanabilah* school of law, *li'an* is the testimony under oath of both spouses followed by an oath invoking the curse of Allah on himself and wrath of Allah on herself in the place of accusation for adultery (al-Bahuti, n.d.). And lastly, according to *al-Jafariyyah* school of law, *al-mubahalalah* (invoking mutual curses) between the spouses to avoid punishment for adultery and deny of paternity of a child through prescribed pronouncement before a judge (al-'Amili, n.d.).

#### **Legal Establishment of *Li'an*:-**

Legal authority for *li'an* is based on a few sources. The first is the commandment of Allah in al-Qur'an, surah al-Nur, 24:6-9 which bears the following meaning:

And for those who launch a charge against their spouses and have (in support) no evidence but their own, their solitary evidence (can be received) if they bear witness four times (with an oath) by Allah that they are solemnly telling the truth; And the fifth (oath) (should be) that they solemnly invoke the curse of Allah on themselves if they are tell a lie; But it would avert punishment from the wife if she bears witness four times (with an oath) by Allah that (her husband) is telling a lie; And the fifth (oath) should be that she solemnly invokes the wrath of Allah on herself if (her accuser) is telling the truth.

#### **The second source is a Hadith as follows, meaning: -**

Sahl ibn Saad RA said: An Ansari man came to Allah's Apostle (pbuh) and said: "O Allah's Apostle! If a man saw another man with his wife, should he kill him, or what should he do? So Allah revealed concerning his affair what is mentioned in the Holy Qur'an about the affair of those involved in a case of *li'an*. Then the Prophet (pbuh) said: "Allah has given His verdict regarding you and your wife". Sahl RA said: "So they both carried out the process of *li'an* in the mosque while I was witness". In another narrative, it is mentioned: "Both of them carried out *li'an*. I was present among the people with Allah's Apostle(pbuh)" (al-Bukhari, 1993).

The third source is consensus of scholars. Scholars are unanimous in this matter and none of them dissented (al-Zuhayli, 2007).

#### **Conditions for *Li'an*:-**

There are six conditions for *li'an*. The first is that a person who does *li'an* must qualify to take an oath (al-Irdabili, 1970), that is, he must have passed puberty age and be of sound mind (Sabiq, 1969). The second condition is that the husband must have first accused his wife of adultery (al-Bujayrimi, 1951). The third is that the words of curse and wrath of Allah must come after the four oaths, and the four oaths must be consecutive. Any long pauses between the oaths will nullify or invalidate the *li'an* and require repetition of process.

The fourth condition is that the two *li'an* of the spouses are not required to be consecutive. The fifth condition is that the prescribed pronouncement of *li'an* may not be altered, hence both husband and wife must be committed to the truth of the words spoken. If one of them alters the pronouncement such as the oath (I swear in the name of Allah) or changes the pronouncement of wrath with curse or vice versa, the *li'an* becomes not valid. The pronouncements of *li'an* are narrated as clear evidence in the Book of Allah, therefore it is obligatory to maintain outwardly clear or definite statement in *li'an*.

The fifth condition is that the judge is obliged to advise the couple doing the *li'an* of the risk of severe punishment on the day of Judgment from Allah on the one who tells untruth. The sixth condition is that *li'an* may only begin upon order of the judge after he has instructed on how to do the pronouncement. If a husband does *li'an* before getting permission from the judge, his *li'an* is not considered valid. *Li'an* on the part of the wife may only be done subsequent to the husband's *li'an* (al-Irdabili, 1970).

#### **Reasons for Occurrence of *Li'an*:-**

*Li'an* occurs for two reasons. First, when a husband accuses his wife of adultery without producing four witnesses to support his allegation. The accusation may be true, for example if he himself witnessed with his own eyes his wife

in a compromising situation, but there are no four witnesses to corroborate his allegation or if the wife confesses to adultery and her confession is accepted and admitted based on clear and proven testimony. Thus in such a case, the husband shall as best as possible divorce his wife without *li'an*. But if her adultery is not proven with clear evidence, the husband may submit his allegation.

The second reason for occurrence of *li'an* is when a husband rejects the child conceived by his wife. For example, he admits that he has not consummated their marriage, or the wife has given birth to the child before six months from consummation. In this case, the *qadi* or judge shall remind and advise the couple, as explained by the Prophet (pbuh) in his hadith narrated by Abu Hurairah as follows, meaning:

Any woman who brings to a people (a child from fornication) not from that people, will not get any share from Allah, and shall not enter Paradise. Any man who rejects a child, whom he knows to be his, will be driven away from Allah, and will be humiliated in the presence of people before and after (Abu Dawud, 1990).

### **Implementation of *Li'an*:-**

The majority of jurists hold the opinion that the process of *li'an* shall not be carried out except as recommended by Allah in al-Qur'an (Salleh, 2003), including the use of (prescribed) pronouncement. It also cannot be carried prior to a judge's order (Salih, 1979).

Before *li'an* can be carried out, it is commendable (sunnah) to select a suitable time for the event. The most suitable time is after *'asar* (afternoon prayer) on Friday. The venue would be the most honourable and glorious place in a country such as the place between *Hajar al-Aswad* and *Maqam Ibrahim* in Mecca, in the Apostle's (pbuh) Pulpit in Medina (al-Irdabili 1951), by the rock which was the *qibla* of past prophets (al-Haytami, 1971) or other places such as the top of the pulpit in a mosque (al-Bujayrimi, 1951).

At the event, there should be at least four witnesses, comprising of four pious, righteous and just believers. At the beginning of the ceremony, the judge will remind both parties, husband and wife, to fear Allah and advise them of a very grievous and lasting doom in the hereafter. This reminder has to be served more solemnly after they have finished the fourth oath, that is, before the fifth oath. While doing *li'an*, it is commendable to stand on their feet (al-Irdabili 1951).

As mentioned above, the first party to initiate *li'an* is the husband. He has to say "I bear witness in the name of Allah, that I am one of the truthful in the allegation of adultery against my wife and the child is from fornication and not mine". This statement is uttered four times. By the fifth oath, the husband must confirm with the statement, "I solemnly invoke the Allah's curse upon me if I tell a lie".

Before the fifth oath, it is recommended for the judge to read what was once said by the Apostle (pbuh) to Hilal, "Fear Allah. Verily the penalty in this world is lighter than punishment in the hereafter". It is also desirable that the judge order a man to close the mouth of the husband with his hand so that hopefully he may refrain from the fifth oath.

The same procedure is followed when the wife begins *li'an* against her husband. Before she begins it and before the fifth oath, the judge will also remind her of the grievous penalty in the hereafter. Then, he will order a woman to cover the wife's mouth with her hand with the hope that she will discontinue her intention to take the fifth oath. If she still intends to continue, the judge will so order (al-Bujayrimi, 1951). But in her case, the words Allah's curse are changed to Allah's wrath, with the pronouncement, "I solemnly invoke Allah's wrath upon me if he (the husband) tells the truth" (al-Haytami, 1971).

Imam Shafi'i held the opinion that if a husband forgets in his *li'an* to deny paternity of the child conceived by his wife, he may pronounce again in front of the judge. If the wife denies it, she may repeat her *li'an* against her husband (al-Shafi'i, 1973). According to an authentic opinion, the wife's *li'an* is irrelevant to paternity for the child (al-Bujayrimi, 1951).

**Legal Implications of Husband's Refusal to do *Li'an* Upon Allegation:-**

According to *Madhhab* Maliki, Shafi'i and Hanbali, if a husband accuses the wife of adultery and then refuses to do *li'an* against her, he shall be punished for *qazaf* (slandering). By his failure to produce four witnesses to corroborate his allegation, he is considered as someone else (not as her husband). This means that the husband's accusation of adultery is treated as against another woman, not as against his own wife.

Therefore, in *Madhhab* Maliki, Shafi'i and Hanbali, the husband is considered as having slandered (*qazaf*) and faces two options, either to present evidence or face hudud punishment. This is based on the Prophet's (pbuh) hadith narrated by Ibn 'Abbas as in the following meaning:

That Hilal ibn Umayyah accused his wife of committing adultery with Sharik ibn Sahma' in front of the Prophet. So the Messenger of Allah said, "Produce proof or face punishment on your back". Hilal said, "O Messenger of Allah, one of us sees a man go on top of his wife's abdomen, you ask for evidence". The Messenger of Allah said, "Produce proof, or face punishment on your back" (al-Jawziyyah, 1990).

This hadith is authority that if a husband willfully accuses his wife of adultery without producing four witnesses, it becomes mandatory to sentence him with hudud punishment for slander. But however, if he does *li'an* against his wife, the sentence is dropped. This principle is based on the majority opinion of scholars. However, *Madhhab* Hanafi holds the opinion that if a husband refuses to go through the *li'an* process against his wife, he shall not be sentenced for *qazaf*, but shall instead be imprisoned until he carries out *li'an* against his wife or he admits to telling untruth, in which case, the sentence for *qazaf* is imposed on him, that is, eighty stripes. Similarly, if a wife refuses to neutralize her husband's *li'an* against her in his accusation of adultery with her *li'an*, then according to Imam Malik and Imam Shafi'i, the judge shall sentence her with hudud punishment for adultery, that is, death by stoning (Said, 2001).

Similarly, Imam Abu Hanifah held the opinion that if a wife refuses to respond to her husband's *li'an*, she will not be sentenced for adultery. Instead, she shall be imprisoned first until she agrees to do pronounce *li'an* against her husband or admits to having committed adultery. If she admits guilt to her husband's allegation, the judge shall sentence her for hudud punishment for adultery. Imam Abu Hanifah's opinion is reasoned from the Prophet's (pbuh) hadith as follows, meaning:

It is not permissible to shed the blood of a Muslim, except for three reasons, adultery (*zina*) of the married man or woman, apostasy after believing (*murtad*), and killing another person not in retaliation (*qisas*).

Shedding of blood because of refusal to swear in *li'an* contradicts the principles of Islamic jurisprudence (*usul al-fiqh*). Thus most jurists do not make hudud punishment mandatory for refusal to swear in *li'an*, preferring to follow the better opinion of Imam Abu Hanifah. Strictly speaking, Islamic law protects against the claim for blood and a wife shall not be killed by stoning to death except if adjudged with utmost fairness with clear evidence or by her own admission of guilt. Nevertheless, Imam Maliki and Imam Shafi'i maintained their opinion that a wife who refuses to swear against her husband's *li'an*, shall be sentenced with hudud punishment for adultery, that is, death by stoning.

**Legal Implications of Husband's *Li'an* against His Wife:-**

When a husband initiates *li'an* against his wife in the manner described above, five implications arise as follows:

First, the husband will not be subject to hudud punishment of *qazaf* (al-Nasa'i, 1964). Second, the wife will be sentenced with hudud punishment for adultery unless she also swears in *li'an*. Third, their marriage is permanently dissolved. Fourth, where the husband's paternity for any child conceived or thereafter born is denied, the child shall not take the husband's name and will be surrendered to the wife. Fifth, it is forbidden for the man and woman to re-marry forever as mentioned in two hadith of the Prophet (pbuh). The first hadith was narrated by Ibn Umar RA that: "The Prophet (pbuh) carried out *li'an* between a man and his wife, resulting in denial of paternity for the woman's child (the child could not take the father's name). The Prophet (pbuh) separated the couple, and established the child's lineage only to the mother" (al-Bukhari, 1993). The second hadith was narrated by Sahl ibn Saad RA who

said, "After that event, it became the practice (*sunnah*) that a couple who carried out *li'an* must be separated, and can never ever re-marry" (Abu Dawud, n.d).

### Effects of *Li'an*:-

Upon the husband's *li'an*, the divorce is affirmed between him and his wife. The effect of divorce gives rise to five legal implications as follows:

First, the hudud charge of *qazaf* (slandering) on the husband is dropped. Instead, hudud charge will be imposed on the wife who shall have to do *li'an*. Second, a wife who chooses not to do *li'an* against her husband will be charged with adultery. If she chooses to swear in *li'an* against her husband, the sentence for adultery will be averted. Third, the couple will be permanently divorced by *talaq ba'in* (irrevocable divorce). Fourth, the husband will be denied paternity of the child if he rejected it in his *li'an* against his wife. Instead the child will only maintain lineage to its mother (the wife). Fifth, it is not permissible (forever) for the husband to re-marry the wife who did the *li'an*, even if she thereafter marries other husbands.

### Conclusion:-

In conclusion, Islam is a simple and perfect religion. The laws relating to divorce are not to encourage divorce but may be taken and implemented in critical situations, that is, when a husband and his wife no longer have mutual love and affection for one another and married life becomes meaningless. In such cases, Shariah law allows mutual repudiation of the marriage. Most of the divorce cases frequently occurring between couples in Muslim society are by the modes of *talaq*, *talaq* by *ta'liq*, *fasakh* and *khulu'*. In comparison, divorce by *li'an* very rarely happens.

Neurological diseases; determinants; prevalence; elderly population; depression; Alzheimer's disease; obsessive compulsive disorder (OCD).

#### Abstract

**Background:** The aging population presents a challenge for the public healthcare system. There is a need to more health and social support to that vulnerable group. Neurological diseases represent an important public health problem. Local level data concerning neurological diseases among elderly are essential for providing the needed health services. **Study objective:** To study some of the demographic characteristics of the elderly population and to estimate the prevalence of neurological diseases, its types and possible determinants among the elderly population of Arar city, Kingdom of Saudi Arabia. **Methodology:** The present cross sectional community based study was conducted in Arar city, the capital of Northern Borders Governorate of KSA, on 138 elderly people. Systematic random sampling technique was followed. Data was collected through personal interviews with the sampled elderly and filling the questionnaire, which guided us to the data of socio-demographic characteristics and neurological diseases, its types and its determinants. **Results:** The overall prevalence rate of neurological diseases observed in this study was 20.9%; the prevalence of stroke was 4.3%, parkinsonism was 3.6%, facial palsy 4.3%, headache syndrome was 6.5% and 2.1% previous nervous system surgery. Stroke is associated with depression. Headache and parkinsonism were more common in females but stroke was more in males.

**Conclusion and recommendations:** In light of the results of the present study; neurological diseases were prevalent among elderly population in Arar city, Kingdom of Saudi Arabia. Commitment from decision makers is the first step to decrease the burden caused by neurological disorders and its sequel on that vulnerable group. Health education campaigns and initiatives are needed to increase societal and professional awareness of public health aspects of neurological disorders. Strengthening the preventive, curative and rehabilitation care within the existing health systems. Defining the priorities for research, is one of the important ways for dealing with neurological disorders among geriatric population.

## Introduction:

Arab countries, including Saudi Arabia (KSA) are passing through a phase of epidemiological transition with increasing burden of non-communicable diseases (NCD) consequent to transformation of scenario with improvement of health care services in preventive and promotive domains. Among the NCDs, neurological disorders form a significant proportion of global burden of disease [1].

A neurological disorder is any disorder of the nervous system. Structural, biochemical or electrical abnormalities in the brain, spinal cord or other nerves can result in a range of symptoms. Examples of symptoms include paralysis, muscle weakness, poor coordination, seizures, confusion, pain and altered levels of consciousness. There are many recognized neurological disorders, some relatively common, but many rare [2].

The specific causes of neurological problems vary, but can include genetic disorders, congenital abnormalities or disorders, infections, lifestyle or environmental health problems including malnutrition, and brain injury, spinal cord injury or nerve injury. The problem may start in another body system that interacts with the nervous system. For example, cerebrovascular disorders involve brain injury due to problems with the blood vessels (cardiovascular system) supplying the brain [3].

Neurological disorders are common and represent a major public health problem. For example, 50 million people have epilepsy. Neurological disorders and some of the other conditions with neurological impairments and sequelae constitute over 6% of the global burden of disease. This burden is especially high in many low and middle income countries. Public health challenges describes and discusses the increasing global public health importance of common neurological disorders such as dementia, epilepsy, headache disorders, multiple sclerosis, neuroinfections, neurological disorders associated with malnutrition, pain associated with neurological disorders, Parkinson's disease, stroke and traumatic brain injuries [2].

Neurology has an especially close relationship with psychology and psychiatry, as all three disciplines focus on the functions and disorders of a single organ, the brain. The main targets of the traditional British "neurological examination" may be elementary motor and sensory processes, but any adequate assessment of "brain function" must take account of cognition and behavior. Cognitive and behavioral involvement is the rule, not the exception, among patients with disorders of the central nervous system (CNS) [4].

Thus far, no nationwide, if any, research has been conducted recently on the incidence and prevalence of strokes in Saudi Arabia. However, over the past decade there was one study which reported that the crude incidence rate for first-ever incidence of stroke in Saudi Arabia was 29.8/100,000/year [5]. In addition, they reported that, the important risk factors were: systemic hypertension (38%), diabetes mellitus (37%), heart disease (27%), smoking (19%) and family history of stroke (14%) [5].

In 10 years of work on stroke in Saudi Arabia, the incidence and prevalence of strokes were low when compared to those reported from Western countries. However, the high prevalence of diabetes mellitus as a risk factor were quite distinctive. Undetected and untreated hypertension and a low frequency of cigarette smoking in the stroke-prone age group could be one explanation of these findings [6].

Parkinson's Disease (PD) is a common neurodegenerative disorder. Epidemiological studies of PD from 1985 to 2010, worldwide data showed a rising prevalence of PD with age (all per 100,000): 173 in 55 to 64 years; 428 in 60 to 69 years; 425 in 65 to 74 years; 1087 in 70 to 79 years; and 1903 in older than age 80. A significant difference was seen in prevalence by geographic location with 646 in individuals from Asia ( $P < 0.05$ ). A significant difference in prevalence by sex was found ( $P < 0.05$ ) [7].

Among the urban and rural population of Al Kharga District, New Valley, Egypt, the results revealed that the total prevalence rate of neurological disorders in Al Kharga District, New Valley was 2.4% with no significant difference among both sexes. The highest prevalence rate was recorded among elderly people (60+ years; 9.25%) [8].

In a study conducted in in Fayoum, Egypt, stroke was found in 2.8% of the studied elderly; 2.0% of males and 0.8% of females, headache was found in 58.4%; 31% of males and 27.4% of females [9].

In in Southern Saudi Arabia, Al-Modeer study, stroke was found in 34.9% of elderly, more in males than females (39.4% of males and 27.1% of females), parkinsonism was 4.3% (5.4% in males and 3.5% in females [10].

Between 1982 and 1992, in a study conducted by Al Rajeh et al., in a hospital that exclusively treated the Saudi Arabian National Guard community rated the crude annual incidence rate at 43.8 per 100,000 Males predominated

in all types of stroke. In both male and female groups the most likely stroke-prone age was 60 to 70 years. Hypertension (56%), diabetes mellitus (42%), and cardiopathy (33%) were common risk factors [11].

In Thugbah community in the Eastern Province of Saudi Arabia to determine its point prevalence of neurological diseases. only 1.5% were more than 60 years old. The overall crude prevalence ratio for all forms of neurological disease was 131/1,000 population. Headache syndromes were the most prevalent disorder (20.7). Stroke, Parkinson's disease, and Alzheimer's disease were uncommon with respective PRs of 1.8, 0.27 and 0.22. The major medical diseases that may be neurologically relevant were diabetes mellitus, hypertension, and connective tissue disorders [12].

As very few studies have focused on the elderly population, there is a lacuna in data of neurological disorders in elderly in Northern region of Saudi Arabia.

## Objectives:

To study some of the demographic characteristics of the elderly population and to estimate the prevalence of neurological diseases, its types and determinants among the elderly population of Arar city, Kingdom of Saudi Arabia.

## Participants and methods:

### Study design and setting:

The present cross sectional community based study was conducted in Arar city, the capital of Northern Borders Governorate

### Study period and target population:

This study was conducted during the period from 1 June to 30 September 2016, on elderly people of age 60 years and more.

### Sampling:

The sample size was calculated using the sample size equation:  $n = z^2 p(1-p)/e^2$ , considering target population more than 1000, and study power 95%. Data was collected from 138 elderly participant aged 60 years and above. Systematic random sampling technique was followed. After identifying the first house randomly in the selected area, every 9th house was visited to include all the elderly subjects residing in those selected houses till the required sample is covered.

### Data collection:

Data were collected by means of personal interview with the sampled elderly using a predesigned questionnaire covering the following items:

- (1) Socio-demographic characteristics including age, sex, educational and marital status.
- (2) Smoking status and certain types of diseases that may be prevalent among elderly suggested to affect neurological diseases such as diabetes mellitus and obesity.
- (3) The questionnaire included also questions regarding the already previously diagnosed neurological diseases, its types and its determinants, after ensuring the diagnosis by reviewing the accompanied health records and prescriptions and asking the caregivers about the case.

### Ethical considerations:

Data collector gave a brief introduction to the participants by explaining the aims and benefits of the study. Informed written consent was obtained from all participants. Anonymity and confidentiality of data were maintained throughout the study. There was no conflict of interest.

### Statistical analysis:

We utilized the statistical package for social sciences, version 16 (SPSS Inc., Chicago, Illinois, USA) to analyze the study data. The results were displayed as counts and percentages. The X<sup>2</sup> test was used as a test of significance, and differences were considered significant at P value less than 0.05.

## Results:

Table (1) illustrates the sociodemographic characteristics and BMI status of the studied elderly population. The table showed that mean age ( $\pm$  SD) was 70 ( $\pm$ 9.25) years, male to female ratio was 47.8 to 52.2, married were 62.3 while 33.3 were widow, illiteracy constitutes 54.3%, primary school literates were 23.9% and total of 91.3% had less than secondary education, about half (45.7%) were obese, 26.8% underweight and only 24.6% had normal weight.

Table (2) illustrates the percentage distribution of neurological diseases among the studied elderly population. The overall prevalence rate of neurological diseases observed in this study was 20.9%; the prevalence of stroke was 4.3%, parkinsonism was 3.6%, facial palsy 4.3%, headache syndrome was 6.5% and 2.1% previous nervous system surgery.

Table (3) illustrates the relationship between neurological diseases and socio-demographic characteristics in the studied elderly population. Headache, parkinsonism are more common in females but stroke is more in males. Headache is common in 60-69 years age group but parkinsonism and stroke are more common in 70-79 years age group. There is specific distribution with marital status.

Table (4) illustrates the relationship between neurological diseases and DM, obesity, hypertension and smoking history in the studied elderly population. Headache, parkinsonism and stroke are more in non diabetics than diabetics, in non obese than obese, non smokers and in non hypertensive studied elderly population.

Table (5) illustrates the relationship between neurological diseases and psychiatric diseases in the studied elderly population. Alzheimer's disease is not associated with neurological diseases, depression is associated with Stroke. No psychiatric diseases was associated with headache or parkinsonism in the studied elderly population.

**Table (1): sociodemographic characteristics and BMI status of the studied elderly population, Arar, 2016**

Age group	No. (n=138)	%
• 60-	90	65.2
• 70-	36	26.1
• 80+	12	8.7
Mean age ( $\pm$ SD)	70 $\pm$ 9.25	
Sex		
• Female	72	52.2
• Male	86	47.8
Marital status

## Discussion:

Ageing is inevitable and it is a concern of every one. Elderly life is full of problems- physical, social and economic. Older people are helpless and a disability is more likely to occur in the old age [13].

Neurological diseases considered a major concern because of its increasing frequency and serious consequences and related disability and dependency. The present study is a descriptive cross sectional survey, conducted to estimate the prevalence of neurological diseases, its types and determinants among the elderly population of Arar city, Kingdom of Saudi Arabia. In the Northern Province of Saudi Arabia, well-known cultural barriers to discussing sensitive issues, especially with strangers, exist. the information provided by the elderly would form a basis for more in-depth and large scale studies concerning neurological diseases in this vulnerable group in our region.

The present study showed that, the age of elderly ranges from 60-92 years with a mean age ( $\pm$  SD) was 70 ( $\pm$ 9.25) years, male to female ratio was 47.8 to 52.2. in southwest Saudi Arabia by Al-Modeer et al, the age of elderly ranges from 60-104 years with a mean of  $77.2 \pm 8.9$ . Most of the studied elderly (55.9%) were females [10]. In Al Rajeh et al., in a hospital that exclusively treated the Saudi Arabian National Guard hospital, the mean age of the patients was 63 ( $\pm$ 17) years [11]. In a study conducted on elderly in Dubai, United Arab Emirates, the gender ratio of the elderly patients in the study was 2.1 female: 1.0 male. the age of elderly ranges from 60-113 years with mean (SD) age was 78.77 (9.50) years [16].

In the present study, married were 62.3% while 33.3 were widow, illiteracy constitutes 48.6%, primary school literates were 19.6% and total of 76.2% had less than secondary education. In Ibrahim et al in Jeddah, widowed elderly represented about one- fifth (21.8 %) of the sample which is less than our figure. The majority of elderly (78.4 %) had less than secondary education which is consistent with our figure [14]. Khadervalli et al [15] in their study reported only 27% as illiterate and 31% as primary school literates, which is better than our figures.

The overall prevalence rate of neurological diseases observed in this study was 20.9% with no significant difference among both sexes. This results are comparable to other studies. For example, in Thugbah community in the Eastern Province of Saudi Arabia, Al Rajeh et al., reported overall prevalence rate of neurological diseases 13.1% which is more than our figure [12]. In Al Kharga District, New Valley, Egypt, the results revealed that the total prevalence rate of neurological disorders among elderly people (60+ years) was 9.25% with no significant difference among both sexes [8].

In our study the prevalence of stroke (4.3%) were more in males than females .

In Fayoum, Egypt study, the prevalence of stroke (2.8%) were more in males than females, this less than our finding [9]. In Al-Modeer study, Stroke was found in 34.9% of elderly, more in males than females (39.4% of males and 27.1% of females), which is far higher than our figure [10]. A stroke registry revealed 0.04% (0.03% males, 0.017% females) of first-ever strokes affecting Saudi nationals [5] which is far less than our figure. Al Rajeh et al., reported overall prevalence rate of stroke 1.8% which is also less than our figure [12]. In a study conducted in Dubai,

cerebrovascular accident affected 38.8% of the studied elderly, more prevalent in males than females which is consistent with our result but the figure is far higher than our figure [16].

In the present study the prevalence of parkinsonism was 3.6% were more in males than females. In in Southern Saudi Arabia, Al-Modeer study, parkinsonism was 4.3% (5.4% in males and 3.5% in females [10] which is consistent with our figure . Epidemiological studies of PD from 1985 to 2010, worldwide data showed a rising prevalence of PD with age 0.0173% in 55 to 64 years; 0.043% in 60 to 69 years; 0.04% in 65 to 74 years; 0.01% in 70 to 79 years; and 0.019% in older than age 80. Al Rajeh et al., reported overall prevalence of parkinsonism 0.27% which is also less than our figure [12]. In Asian population it was 0.065%. A significant difference in prevalence by sex [7] which is consistent with our finding but the figures are far less than ours. In Dubai study, parkinsonism was found in 17%, more in males than females (23.9% Vs.13.7%) [16]. These results are comparable with our results but the figures are higher than ours.

In our study the prevalence of headache syndrome was 6.5% was more in females than males. In Thugbah community in the Eastern Province of Saudi Arabia, Al Rajeh et al. [12], reported that, headache syndromes were the most prevalent disorder ( 20.7%). In Egyptian, Fayoum study, headache was found in 58.4%; 31% of males and 27.4% of females [9]. These results are not comparable with our results.

### Conclusion and recommendations:

In light of the results of the present study; neurological diseases were prevalent among elderly population in Arar city, Kingdom of Saudi Arabia. Commitment from decision makers is the first step to decrease the burden caused by neurological disorders and its sequel on that vulnerable group. Health education campaigns and initiatives are needed to increase societal and professional awareness of public health aspects of neurological disorders. Strategies to address the associated stigma and discrimination needs to be part of the public health activities for neurological disorders. Strengthening the preventive, curative and rehabilitation care within the existing health systems. Defining the priorities for research, is one of the important ways for dealing with neurological disorders among geriatric population. The above recommendations need to be implemented and appropriately adapted to local conditions of our region.

 Spatial-Specific Multipliers.

#### Abstract

This paper provides the results of analysis of total, sectoral-specific, and spatial-specific multipliers and flow-on effects in Sumatera Island economy. The model employed was Inter-Regional Input-Output Model (IRIOM) developed using new hybrid procedures with special attention on Island economy. Data used for model were updated Indonesian data for the year of 2015. The results show that firstly, the important sectors of Sumatera Island economy could be based on total multipliers and flow-on effects of output, income and employment. Secondly, important economic sectors could be based on sector-specific multipliers effects; multipliers that occurred in own sector and other sectors. Thirdly, important economic sectors could be based on spatial-specific multipliers; multipliers that occurred both in own region and other regions. Fourthly, important economic sectors could be based on spatial distribution of flow-on; flow-on effects that occurred in own region as well as in other regions.

#### Introduction:-

Sumatra (Indonesian: *Sumatera*) is one of large island in Indonesia and the sixth-largest island in the world at 473,481 km<sup>2</sup>, including adjacent islands such as the Riau Islands and Bangka Belitung Islands. Sumatra is an elongated landmass spanning a diagonal northwest-southeast axis. The Indian Ocean borders the west, northwest, and southwest sides of Sumatra with the island chain of Simeulue, Nias and Mentawai bordering the southwestern coast. On the northeast side the narrow Strait of Malacca separates the island from the Malay Peninsula, an extension of the Eurasian continent. On the southeast the narrow Sunda Strait separates Sumatra from Java. The northern tip of Sumatra borders the Andaman Islands, while on the lower eastern side are the islands of Bangka and Belitung, Karimata Strait and the Java Sea (Wikipedia, 2016, <https://en.wikipedia.org/wiki/Sumatra>)

The ten administrative Provinces of Sumatra – including the smaller islands nearby – are: Nangroe Aceh Darussalam, a special province with Capital City Banda Aceh, North Sumatra with Capital City Medan, West Sumatra with Capital City Padang, Riau with Capital City Pekanbaru, Jambi with Capital City Jambi, South Sumatra with Capital City Palembang, Bengkulu with Capital City Bengkulu, Lampung with Capital City Bandar Lampung, Bangka-Belitung with Capital City Pangkal Pinang, and Riau Islands with Capital City Tanjung Pinang. Note some 4 million of these residents of Sumatra do not live on the island itself—but on nearby islands administered

collectively as "Sumatra". The final two of the provinces below do not have territory on the actual island (Anonymous, 2015).

According to Prihawantoro, S., *etal* (2013), the main economic activities in Sumatra Island were Sector-1 Agriculture, livestock and fishery (Nangroe Aceh Darussalam, North Sumatra, West Sumatra, Jambi, Bengkulu, Lampung), Sector-2 Mining and quarrying (Riau Mainland, Riau Island, South Sumatra), Sector-3 Manufacturing (North Sumatra, Riau Mainland, South Sumatra, Bangka-Belitung), and Sector-6 Trade, hotel and restaurant (North Sumatra, Riau Island). Based on the statistical data by the year of 2013 which is released by Badan Pusat Statistik, Sumatra Island itself contributes at about 20% of Indonesia's Gross Domestic Product (Anonymous, 2015).

In macroeconomics, a multiplier is a factor of proportionality that measures how much an endogenous variable changes in response to a change in some exogenous variable (see among others: Dornbusch, R., & Stanley, F., 1994; McConnell, C., *et. al*, 2011; Pindyck, R & Rubinfeld, D., 2012). In monetary microeconomics and banking, the money multiplier measures how much the money supply increases in response to a change in the monetary base (see among others: Krugman & Wells 2009; Mankiw, 2008). Multipliers can be calculated to analyze the effects of fiscal policy, or other exogenous changes in spending, on aggregate output. Other types of fiscal multipliers can also be calculated, like multipliers that describe the effects of changing taxes (such as lump-sum taxes or proportional taxes).

Literature on the calculation of Keynesian multipliers traces back to Richard Kahn's (1931) description of an employment multiplier for government expenditure during a period of high unemployment. At this early stage, Kahn's calculations recognize the importance of supply constraints and possible increases in the general price level resulting from additional spending in the national economy (Ahiakpor, J.C.W., 2000). Hall (2009) discusses the way that behavioral assumptions about employment and spending affect econometrically estimated Keynesian multipliers.

The literature on the calculation of I-O multipliers traces back to Leontief (1951), who developed a set of national-level multipliers that could be used to estimate the economy-wide effect that an initial change in final demand has on an economy. Isard (1951) then applied input-output analysis to a regional economy. According to Richardson (1985), the first attempt to create regional multipliers by adjusting national data with regional data was Moore & Peterson (1955) for the state of Utah. In a parallel development, Tiebout (1956) specified a model of regional economic growth that focuses on regional exports. His economic base multipliers are based on a model that separates production sold to consumers from outside the region to production sold to consumers in the region. The magnitude of his multiplier is based on the regional supply chain and local consumer spending.

In a survey of input-output and economic base multipliers, Richardson (1985) notes the difficulty inherent in specifying the local share of spending. He notes the growth of survey-based regional input-output models in the 1960s and 1970s that allowed for more accurate estimation of local spending, though at a large cost in terms of resources. To bridge the gap between resource intensive survey-based multipliers and "off-the-shelf" multipliers, Beemiller (1990) of the BEA describes the use of primary data to improve the accuracy of regional multipliers. The literature on the use and misuse of regional multipliers and models is extensive. Coughlin & Mandelbaum (1991) provide an accessible introduction to regional I-O multipliers. They note that key limitations of regional I-O multipliers include the accuracy of leakage measures, the emphasis on short-term effects, the absence of supply constraints, and the inability to fully capture interregional feedback effects.

Three other papers on the general topic of the use and misuse of regional multipliers are briefly noted. Grady & Muller (1988) argued that regional I-O models that include household spending should not be used and argue that cost-benefit analysis is the most appropriate tool for analyzing the benefits of particular programs. Mills (1993) noted the lack of budget constraints for governments and no role for government debt in regional IO models. As a result, in less than careful hands, regional I-O models can be interpreted to over-estimate the economic benefit of government spending projects. Hughes (2003) discussed the limitations of the application of multipliers and provides a checklist to consider when conducting regional impact studies. Additional papers focus on the uses and misuse of regional multipliers for particular types of studies. Harris (1997) discussed the application of regional multipliers in the context of tourism impact studies, one area where the multipliers are commonly misused. Siegfried, *et al* (2006) discussed the application of regional multipliers in the context of college and university impact studies, another area where the multipliers are commonly misused. Input-output analysis, also known as the

inter-industry analysis, is the name given to an analytical work conducted by Leontief in the late 1930's. The fundamental purpose of the input-output framework is to analyze the interdependence of industries in an economy through market based transactions. Input-output analysis can provide important and timely information on the interrelationships in a regional economy and the impacts of changes on that economy.

The notion of multipliers rests upon the difference between the initial effect of an exogenous change (final demand) and the total effects of a change. Direct effects measure the response for a given industry given a change in final demand for that same industry. Indirect effects represent the response by all local industries from a change in final demand for a specific industry. Induced effects represent the response by all local industries caused by increased (decreased) expenditures of new household income and inter-institutional transfers generated (lost) from the direct and indirect effects of the change in final demand for a specific industry. Total effects are the sum of direct, indirect, and induced effects.

One of the major uses of input-output information is to assess the effect on an economy of changes in elements that are exogenous to the model of that economy. The capabilities and usefulness of the Leontief inverse matrix which is the source of analytical power of the model are well known. However, the meaning and interpretations are sometimes confusing. West & Jensen (1980) clarified the meaning of some of the components of the multipliers and suggested a multiplier format which is consistent and simpler to interpret but retains the essence of the conventional multipliers.

The objective of this paper is to report the research in developing and applying a model that provides information on multipliers: total, flow-on, sectoral-specific and spatial-specific, so they can further be used for planning and evaluating regional economic development in Sumatera Island.

### Method of Analysis:-

An inter-regional input-output model divides a national economy not only into sectors but also regions (Hulu, 1990 and West et.al, 1982; 1989). An industry in the Leontief model is split into as many regional sub-industries as there are regions. The table consists of two types of matrices representing the two types of economic interdependence. The first are the intra-regional matrices, which are on the main diagonal showing the inter-sectoral transactions which occur within each region. The second are the trade matrices, termed inter-regional matrices, representing inter-industry trade flows between each pair of regions. These matrices show the specific inter-industry linkages between regions, allowing each economic activity to be identified by industry as well as by location.

The inter-regional model can be expressed similar to the equations for the national as well as the single region model. In the general case:

$${}^rX_i = \sum_j \sum_s {}^{rs}X_{ij} + \sum_s {}^{rs}Y_i; (i, j = 1, 2, \dots, n) \text{ and } (r, s = 1, 2, \dots, m) \quad (1)$$

There are  $(m \times n)$  equations of this type for each sector in each region showing that the output of each sector is equal to the sales to all intermediate sectors in all regions plus sales to final demand in all regions.

The spatial input coefficients are derived in the same way as the direct input coefficients in the national or the single-region model. For region  $s$ , the spatial input coefficients are expressed as:

$${}^{rs}a_{ij} = {}^{rs}X_{ij} / {}^sX_j \quad (2)$$

Substituting (2) into (1):

$${}^rX_i = \sum_j \sum_s {}^{rs}a_{ij} {}^sX_j + \sum_s {}^{rs}Y_i; (i, j = 1, 2, \dots, n) \text{ and } (r, s = 1, 2, \dots, m) \quad (3)$$

Since equations (1) to (3) refer to general case, it is more convenient to refer specifically to each of the intra-regional and the inter-regional matrices:

$${}^rX_i = \sum_j {}^{rr}X_{ij} + \sum_j {}^{rs}X_{ij} + {}^rY_i; (i, j = 1, 2, \dots, n) \quad (4)$$

and

$${}^sX_i = \sum_j {}^{sr}X_{ij} + \sum_j {}^{ss}X_{ij} + {}^sY_i; (i, j = 1, 2, \dots, n) \quad (5)$$

From (4) and (5), it is possible to determine regionally defined input coefficients, according to the relevant intra-regional and inter-regional trade matrices:

$${}^{rr}a_{ij} = {}^{rr}X_{ij} / {}^rX_j \quad (6)$$

$${}^{rs}a_{ij} = {}^{rs}X_{ij} / {}^sX_j \quad (7)$$

$${}^{sr}a_{ij} = {}^{sr}X_{ij} / {}^rX_j \quad (8)$$

$${}^{ss}a_{ij} = {}^{ss}X_{ij} / {}^sX_j \quad (9)$$

Equations (6) and (9) present the familiar intra-regional direct input coefficients, while equations (7) and (8) represent inter-regional trade coefficients.

Equations (6) to (9) can be substituted into equation (4) and (5) resulting the traditional input-output equations:

$${}^rX_i = \sum_j {}^r a_{ij} {}^r X_j + \sum_j {}^r s_{aj} {}^s X_j + {}^r Y_i; (i, j = 1, 2, \dots, n) \quad (10)$$

and

$${}^sX_i = \sum_j {}^s a_{ij} {}^r X_j + \sum_j {}^s s_{aj} {}^s X_j + {}^s Y_i; (i, j = 1, 2, \dots, n) \quad (11)$$

The equations outlined above can be extended in parallel to the national or single region input-output system. In matrix terms they can be expressed as:

$${}^r x = {}^r A {}^r x + {}^r y \quad \text{or} \quad {}^r x = (I - {}^r A)^{-1} {}^r y \quad (12)$$

and

$${}^s x = {}^s A {}^s x + {}^s y \quad \text{or} \quad {}^s x = (I - {}^s A)^{-1} {}^s y \quad (13)$$

where  $(I - {}^r A)^{-1}$  and  $(I - {}^s A)^{-1}$  are the inverse of the open inter-regional model. In general term, equation (12) and (13) can be written as:

$$x = Ax + y \quad \text{or} \quad x = (I - A)^{-1} y \quad (14)$$

Since the regional input coefficients of equations (6) to (9) or the A matrix in equation (13) contains both technical and trade characteristics, Hartwick (1971) separated these input coefficients ( ${}^r s_{aj}$ ) into trade coefficients ( ${}^r t_{ij}$ ) and technical coefficients ( ${}^s a_{ij}$ ). This separation is essentially the same as one that has been done for the single region model. Equation (13) can then be rewritten as:

$$x = T(Ax + y) \quad \text{or} \quad x = (I - TA)^{-1} y \quad (15)$$

Method employed for constructing Indonesian Inter-regional Input-Output model was hybrid method that specified for studying Island economy of Indonesia. In this model, the regions were disaggregated into 5 regions, namely 5 big-group of Island, namely SUM for Sumatera Island, JAV for Java Island, KAL for Kalimantan Island, NUS for Nusa Tenggara Island and OTH for Other Island which includes Sulawesi, Maluku and Papua Islands. Meanwhile, economic activities were disaggregated into 9 economic sectors, namely: Sec-1 for Agriculture, livestock, forestry and fishery, Sec-2 for Mining and quarrying, Sec-3 for Manufacturing, Sec-4 for Electricity, water and gas, Sec-5 for Construction, Sec-6 for Trade, hotels and restaurants, Sec-7 for Transportation and communication, Sec-8 for Banking and other finance, and Sec-9: Other services.

The GIRIOT (Generation Inter-Regional Input-Output Tables) procedures proposed and developed by Muchdie (1998) and have been applied using Indonesian data for the year 1990 (Muchdie, 1998; 2011). The GIRIOT procedure consists of three stages, seven phases and twenty four steps. Stage I: Estimation of Regional Technical Coefficients, consists of two phases, namely Phase 1: Derivation of National Technical Coefficients and Phase 2: Adjustment for Regional Technology. Stage II: Estimation of Regional Input Coefficients, consists of two phases, namely Phase 3: Estimation of Intra-regional Input Coefficients, and Phase 4: Estimation of Inter-regional Input Coefficients, and Stage III: Derivation Transaction Tables, consists of three phases, namely Phase 5: Derivation of Initial Transaction Tables, Phase 6: Sectoral Aggregation, and Phase 7: Derivation of Final Transaction Tables. These procedures have been revisited, evaluated and up-dated using Indonesian data for the year 2015.

One of the major uses of input-output information is to assess the effect on an economy of changes in elements that are exogenous to the model of that economy. The capabilities and usefulness of the Leontief inverse matrix which is the source of analytical power of the model are well known. However, the meaning and interpretations are sometimes confusing. West & Jensen (1980) clarified the meaning of some of the components of the multipliers and suggested a multiplier format which is consistent and simpler to interpret but retains the essence of the conventional multipliers.

As a measurement of response to an economic stimulus, a multiplier expresses a cause and effect line of causality. In input-output analysis the stimulus is a change (increase or decrease) in sales to final demand. Similar to those in the single-region model, in the inter-regional model West *et.al*, (1982; 1989) defined the major categories of response as: initial, first-round, industrial-support, consumption-induced, total and flow-on effects. Formulas of such effects are provided in Table 1.

DiPasquale & Polenske (1980) specify four types of multipliers, in which two of them are relevant in the context of the inter-regional input-output model; sector-specific and region-specific multipliers. Table 2 provides formula for the calculation of both sector-specific and region-specific multipliers for output, income and employment. The inter-regional sector-specific multiplier expresses the inputs required from the whole economy to satisfy a unit expansion

of a named sector's exogenously determined final demand. The inter-regional region-specific multiplier quantifies the inputs required from all sectors in a specified region to satisfy the unit demand expansion in a given region.

**Table 1:-Component Effects of Output, Income and Employment Multipliers**

Effects	Output	Income	Employment
Initial	1	$h_i$	$e_i$
First-round	$\sum a_{ij}$	$\sum a_{ij} h_i$	$\sum a_{ij} e_i$
Industrial-support	$\sum b_{ij} - 1 - \sum a_{ij}$	$\sum b_{ij} h_i - h_i - \sum a_{ij} h_i$	$\sum b_{ij} e_i - e_i - \sum a_{ij} e_i$
Consumption-induced	$\sum (b^*_{ij} - b_{ij})$	$\sum (b^*_{ij} h_i - b_{ij} h_i)$	$\sum (b^*_{ij} e_i - b_{ij} e_i)$
Total	$\sum b^*_{ij}$	$\sum b^*_{ij} h_i$	$\sum b^*_{ij} e_i$
Flow-on	$\sum b^*_{ij} - 1$	$\sum b^*_{ij} h_i - h_i$	$\sum b^*_{ij} e_i - e_i$

**Source:** West, *et, al* (1982; 1989).

**Note:**  $h_j$  is household income coefficient,  $e_j$  is employment output ratio,  $a_{ij}$  is direct input coefficients,  $b_{ij}$  is the element of open inverse of Leontief matrix, and  $b^*_{ij}$  is the element of closed inverse Leontief matrix.

**Table 2:-Inter-regional Sector-Specific and Region-Specific Multipliers**

	Output	Income	Employment
Sector-Specific	$\sum^{rs} b^*_{ij}; r = 1,..m$	$\sum^{rs} b^*_{ij} h_i; r = 1,..m$	$\sum^{rs} b^*_{ij} e_i; r = 1,..m$
Region-Specific	$\sum^{rs} b^*_{ij}; i = 1,..n$	$\sum^{rs} b^*_{ij} h_i; i = 1,..n$	$\sum^{rs} b^*_{ij} e_i; i = 1,..n$

**Source:** DiPasquale & Polenske (1980).

**Note :**  $r$  and  $s$  are the  $m$  origin and destination regions,  $i$  and  $j$  are the  $n$  producing and purchasing sectors,  $^{rs}b^*_{ij}$  is the element of closed inverse of Leontief matrix,  $m$  is the number of regions and  $n$  is the number of sectors.

Formula provided in Table 1 and Table 2 were used to calculate total and flow-on multipliers, sector-specific multipliers and spatial-specific multipliers.

## Results and Discussion:-

### Total Multipliers and Flow-on:-

Table 3 present total output, income and employment multipliers and flow-on effects in Sumatra Island. In term of output, the highest output multipliers was SUM-4 (Electricity, water and gas), 2.761. It means that an increase of final demand of the sector by 1.000 would increase total output by 2.761 including the initial increase of 1.000. It was followed by SUM-9 (Other services), 2.542 meaning that an increase of final demand of that sector by 1.000 would increase total output by 2.542 including the initial increase of 1.000. The lowest total multipliers was in SUM-2 (Mining and quarrying), 1.241. An increase of final demand of that sector by 1.000 units would increase total output by 1.241 including the initial increase of 1.000. The flow-on effects of output were the difference between total increase and initial increase. Flow-on effect is summation of direct, indirect and induced effects of an economic activity. In case of highest total multipliers (SUM-4) the flow-on effect was 1.761, meaning the impact of increase of final demand of SUM-4 (Electricity, water and gas) to total output was 1.761 as the initial effect was not included. The rank of total output multipliers might be different than that of output flow-on effects. The evidence from Sumatra Island economy showed that the rank of total multipliers were the same as flow-on effects where SUM-4 (Electricity, water and gas) had the highest output flow-on effects, followed by SUM-9 (Other services) and the lowest value of output flow-on effects was SUM-2 (Mining and quarrying).

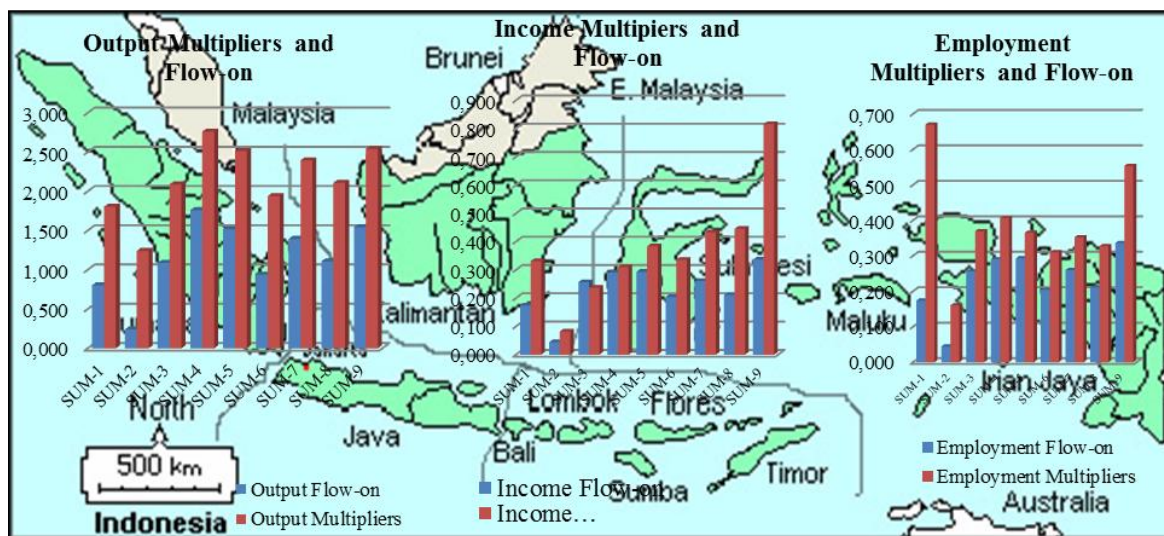

In term of household income, the highest total income multiplier was in SUM-9 (Other services), 0.815. It means that an increase of final demand of SUM-9 (Other services) by 1.000 units would increase initial household income by 0.553 and then would increase total income by 0.815. It was followed by SUM-8 (Banking and other finance) with total income multipliers of 0.445. The lowest total income multiplier was, again, in SUM-2 (Mining and quarrying) with total income multipliers of 0.082. Income flow-on effects were the difference between total income multipliers and initial income effects from the increase of final demand in that sector. It is the summation of direct, indirect and induced effects of an economic activity. For instance, in SUM-9 (Other services), the increase of final demand by 1.000 would have initial income effects by 0.553, resulting total income of 0.815. The income flow-on effect of SUM-9 (Other services) was 0.336. The highest income flow-on effect was in SUM-9 (Other services), followed by SUM-5 (Construction). The lowest income flow-on effect was in, again, SUM-2 (Mining and quarrying).

In term of employment, the highest total employment multiplier was in SUM-1 (Agriculture, livestock and fishery), 0.670. It means that an increase of final demand of SUM-1 (Agriculture, livestock and fishery) by 1.000 units would increase initial employment of SUM-1 (Agriculture, livestock and fishery) by 0.496 and then would increase total employment by 0.670. It was followed by SUM-9 (Other services) with total employment multipliers of 0.553. The lowest total employment multiplier was, again, in SUM-2 (Mining and quarrying) with total employment multipliers of 0.160. Employment flow-on effects were the difference between total employment multipliers and initial employment effects from the increase of final demand in that sector. It is the summation of direct, indirect and induced effects on employment from an economic activity. The highest employment flow-on was in SUM-9 (Other services), followed by SUM-5 (Construction). The lowest income flow-on effect was in, again, SUM-2 (Mining and quarrying).

**Table 3:-Multipliers and Flow-on Effects: Output, Income and Employment**

SECTOR	Output			Income			Employment		
	Initial	Flow-on	Total	Initial	Flow-on	Total	Initial	Flow-on	Total

**Figure 1:-Multipliers and Flow-on Effects: Output, Income and Employment**

#### Sector-Specific Multipliers:-

Table 4 and also Figure 2 provide sector-specific multipliers for output, income and employment in Sumatra Island economy. In term of output, there were 4 sectors in which multipliers occurred in own sector were less than 50 per cent, namely SUM-4 (Electricity, water and gas), SUM-5 (Construction), SUM-7 (Transportation and communication) and SUM-9 (Other services). Meanwhile, other 5 sectors in which multipliers occurred in own region were more than 50 per cent. These were: SUM-1 (Agriculture, livestock, forestry and fishery), SUM-2 (Mining and quarrying), SUM-3 (Manufacturing), SUM-6 (Trade, hotel and restaurant), and SUM-8 (Banking and other finance).

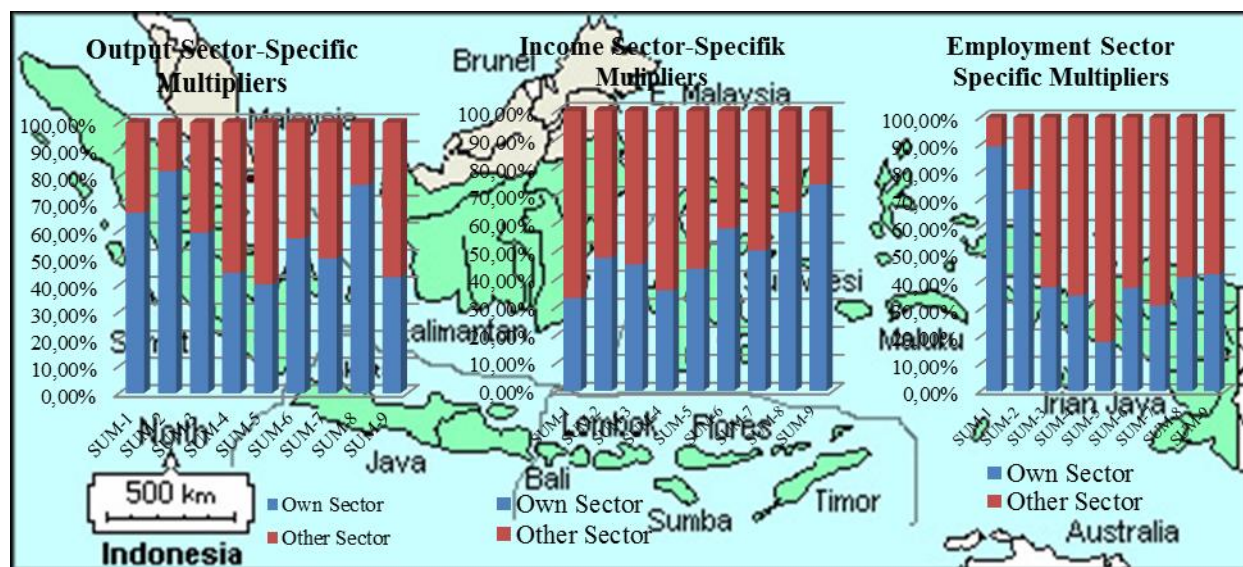

In term of income, there were 6 sectors in which multipliers occurred in own region were less than 50 per cent, namely SUM-1 (Agriculture, livestock and fishery), SUM-2 (Mining and Quarrying), SUM-3 (Manufacturing),

SUM-4 (Electricity, water and gas), SUM-5 (Construction) and SUM-7 (Transportation and communication). Meanwhile, other 3 sectors in which multipliers occurred in own region were more than 50 per cent. These sectors were: SUM-6 (Trade, hotel and restaurant), SUM-8 (Banking and other finance) and SUM-9 (Other services).

**Table 4:-Sector-Specific Multipliers: Output, Income and Employment**

SECTOR	Output			Income			Employment		
	Own Sector	Other Sector	Total	Own Sector	Other Sector	Total	Own Sector	Other Sector	Total
SUM-1	1.202	0.602	1.804	0.243	0.088	0.331	0.599	0.071	0.670
SUM-2	1.018	0.223	1.241	0.039	0.043	0.082	0.118	0.042	0.160
SUM-3	1.237	0.851	2.088	0.107	0.130	0.237	0.140	0.229	0.369
SUM-4	1.228	1.533	2.761	0.111	0.199	0.310	0.142	0.264	0.406
SUM-5	1.012	1.503	2.515	0.167	0.216	0.383	0.064	0.292	0.356
SUM-6	1.108	0.831	1.939	0.194	0.141	0.335	0.064	0.246	0.310
SUM-7	1.192	1.203	2.395	0.217	0.216	0.433	0.110	0.242	0.352
SUM-8	1.169	0.939	2.108	0.284	0.161	0.445	0.136	0.191	0.327
SUM-9	1.088	1.454	2.542	0.601	0.214	0.815	0.236	0.317	0.553

In term of employment, there were 7 sectors in which multipliers occurred in own sector were less than 50 per cent, namely SUM-3 (Manufacturing), SUM-4 (Electricity, water and gas), SUM-5 (Construction), SUM-6, SUM-7 (Transportation and communication), SUM-8 and SUM-9 (Other services). Meanwhile, only 2 sectors in which multipliers occurred in own sectors were more 50 per cent multipliers. These sectors were: SUM-1 (Agriculture, livestock, forestry and fishery), and SUM-2 (Mining and quarrying).

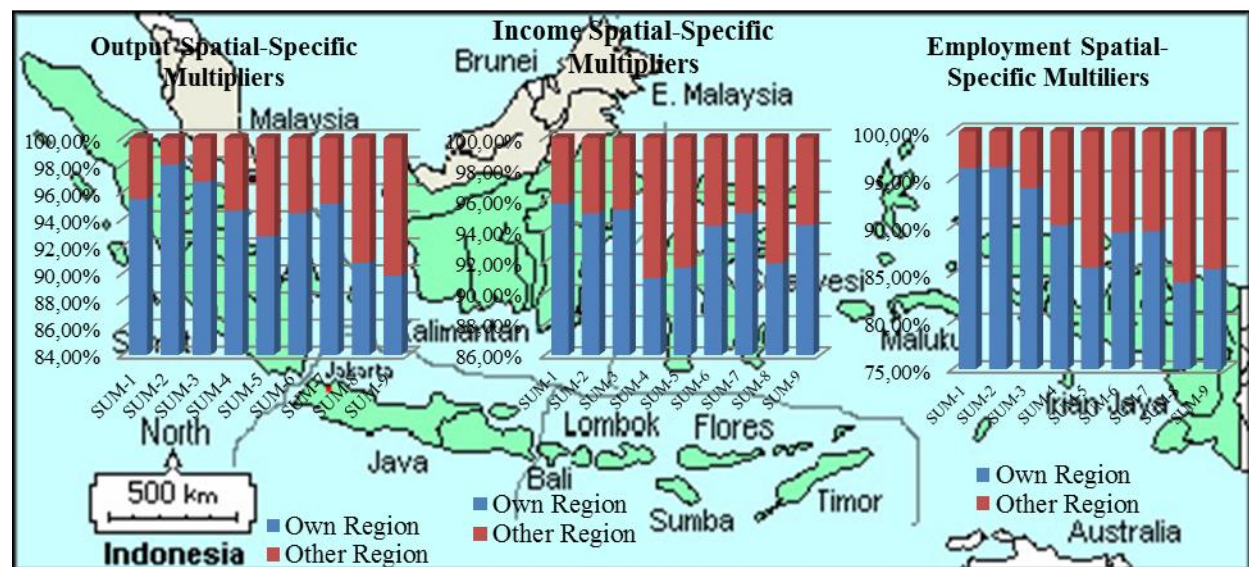

**Figure 2:-Sector-Specific Multipliers: Output, Income and Employment**

#### **Spatial-Specific Multipliers:-**

Table 5 and Figure 3 provide spatial-specific multipliers of output, income and employment multipliers in Sumatra. In term of output, all sectors had more than 50 per cent of multipliers that occurred in own region; in Sumatra Island. All sectors had less than 50 per cent of multipliers that occurred in other regions; other Islands. It applied for income. All sectors had more than 50 per cent of multipliers that occurred in own region; Sumatra Island. All sectors had less than 50 per cent of multipliers occurred in other regions; the rest of Indonesia. In term of employment, all sectors had more than 50 per cent of multipliers that occurred in own region; Sumatra Island. Again, all sectors had less than 50 per cent of multipliers that occurred in other regions; the rest of Indonesia.

**Table 5:-Spatial-Specific Multipliers: Output, Income and Employment**

SECTOR	Output			Income			Employment		
	Own Region	Other Region	Total	Own Region	Other Region	Total	Own Region	Other Region	Total
SUM-1	1.723	0.081	1.804	0.317	0.014	0.331	0.644	0.026	0.670
SUM-2	1.217	0.024	1.241	0.078	0.004	0.082	0.154	0.006	0.160
SUM-3	2.021	0.067	2.088	0.226	0.011	0.237	0.347	0.022	0.369

SUM-9	2.284	0.258	2.542	0.769	0.046	0.815	0.473	0.80	0.553

**Figure 3:-Spatial-Specific Multipliers: Output, Income and Employment****Spatial Distribution of Flow-on:-**

Flow-on effects are the difference between total effects (total multipliers) and initial effect. It consists of direct effects, indirect effect and induced effects of a change in final demand. As Table 3 and Figure 1 provided the total flow-on effects for every spatial sector in Sumatra Island, Table 6 and Figure 4 presents spatial distribution of flow-on effects in Sumatra Island economy. In term of output, all sectors had more than 50 per cent of flow-on occurred in own region. It means that, in all sectors, flow-on effects that occurred in other regions were less than 50 per cent. The highest output flow-on effect that occurred in other regions was in SUM-8 (Banking and other finance), followed by SUM-9 (Other services) and SUM-5 (Construction). The lowest output flow-on effect that occurred in other regions was in SUM-3 (Manufacturing).

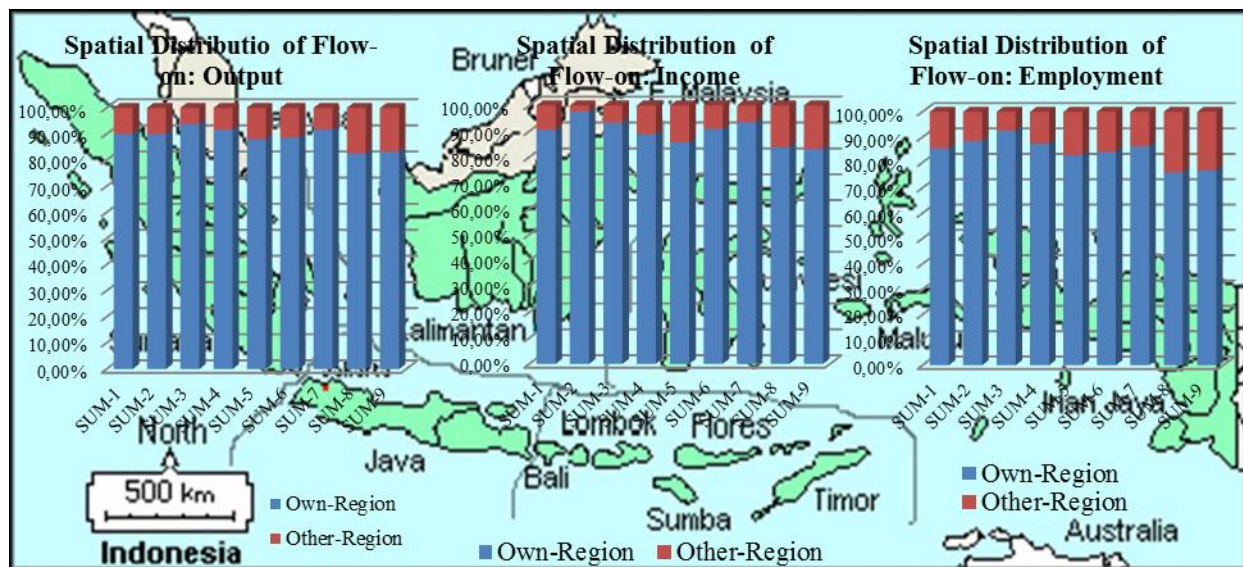

The same case also applies in income flow-on effects. All sectors had flow-on effects that more than 50 per cent of the flow-on occurred in own region. The flow-on effects that occurred in other regions were less than 50 per cent. The highest income flow-on effect that occurred in other regions was in SUM-9 (Other services), SUM-8 (Banking and other finance) and SUM-5 (Construction). The lowest income flow-on that occurred in other regions was in SUM-2 (Mining and quarrying).

In term of employment, again, all sector had employment flow-on that occurred in own region more than 50 per cent. All sectors had the flow-on effects that occurred in other regions were less than 50 per cent. The highest employment flow-on effect that occurred in other regions were in SUM-9 (Other services), SUM-8 (Banking and other finance) SUM-5 (Construction) and the lowest employment flow-on that occurred in other regions was in SUM-3 (Manufacturing).

**Table 6:-**Spatial Distribution of Flow-on: Output, Income and Employment

SECTOR	Output			Income			Employment

**Figure 4:-**Spatial Distribution of Flow-on: Output, Income and Employment**Conclusion:-**

The conclusions could be drawn were: firstly, the important sectors of Sumatra Island economy could be based on total multipliers of output, income and employment. Based on total output multipliers, three important sectors in Sumatra Island economy were SUM-4 (Electricity, water and gas), SUM-9 (Other services) and SUM-5 (Construction). Based on total income multipliers, three important sectors in Sumatra Island economy were SUM-9 (Other services), SUM-8 (Banking and other finance) and SUM-7 (Transportation and communication). Based on total employment multipliers, three important sectors in Sumatra Island economy were SUM-1 (Agriculture, livestock, forestry and fishery), SUM-9 (Other services) and SUM-4 (Electricity, water and gas). Based on output flow-on effects, three important sectors in Sumatra Island economy were SUM-4 (Electricity, water and gas), SUM-9 (Other services), and SUM-5 (Construction). Based on income flow-on effects, three important sectors in Sumatra Island economy were SUM-9 (Other services), SUM-5 (Construction), and SUM-4 (Electricity, water and gas). Based on employment flow-on effects, three important sectors were SUM-9 (Other services), SUM-5 (Construction), and SUM-4 (Manufacturing).

Secondly, important economic sectors could be based on sector-specific multipliers effects. It could be based on the highest multipliers that occurred in own sectors. Based on output sector-specific multipliers that occurred in own sector, three important sectors were SUM-2 (Mining and quarrying), SUM-1 (Agriculture, livestock, and fishery) and SUM-3 (Manufacturing). Based on income sector-specific multipliers that occurred in own sectors, three important sectors were SUM-9 (Other services), SUM-1 (Agriculture, livestock and fishery) and SUM-8 (Banking and other finance). Based on employment sector-specific multipliers that occurred in own sector, three important sectors were

SUM-1 (Agriculture, livestock and fishery), SUM-2 (Mining and quarrying) and SUM-6 (Trade, hotel and restaurant).

Thirdly, important economic sectors could be based on spatial-specific multipliers. It could be based on the highest multipliers that occurred in own regions; in Sumatra Island. Based on output spatial-specific multipliers that occurred in own region, three important sectors were SUM-2 (Mining and quarrying), SUM-8 (Banking and other finance) and SUM-6 (Trade, hotel and restaurant). Based on income sector-specific multipliers that occurred in own region, three important sectors were SUM-9 (Other services), SUM-8 (Banking and other finance) and SUM-6 (Trade, hotel and restaurant). Based on employment spatial-specific multipliers that occurred in own region, three important sectors were SUM-1 (Agriculture, livestock and fishery), SUM-6 (Trade, hotel and restaurant) and SUM-8 (Banking and other finance).

Fourthly, important economic sectors could be based on spatial distribution of flow-on. It could be based on the highest flow-on that occurred in own regions; in Sumatra Island. Based on output spatial distribution of low-on that occurred in own region, three important sectors were SUM-8 (Banking and other finance), SUM-9 (Other services) and SUM-6 (Trade, hotel and restaurant). Based on income spatial distribution of low-on that occurred in own region, three important sectors were SUM-8 (Banking and other finance), SUM-9 (Other service) and SUM-6 (Trade, hotel and restaurant). Based on employment spatial distribution of flow-on that occurred in own region, three important sectors were SUM-3 (Manufacturing), SUM-8 (Banking and other finance) and SUM-6 (Trade, hotel and restaurant).

### Abstract

What is the image of the Black in contemporary American society, and how is it represented in drama, a form of artistic expression where African American voice has long been silenced by stereotypes and editorial marginality? This is the question which black playwright August Wilson tries to answer in an unusual theatrical production. Gifted with a talent for catching dialect and accents, which ironically contributed to fight down his image and voice in American drama, Wilson enriches his pieces with his poetical skills he learned to use in his early days as artist. He notably shows that the African American destiny is open to other possibilities than what the racist society offered. More specifically in *Fences* (1986), he shows that the African American can find wholeness if he accepts to work hard and uses his rich cultural heritage. These, he says, are what will make him a responsible person.

### Introduction:-

Poet, essayist, multiple-prize winner including the Pulitzer Prize, Bush, McKnight, Rockefeller, and Guggenheim Foundation fellowship in playwriting, most of the adepts in African American literature present August Wilson as the first American playwright of African descent to have two plays running simultaneously on Broadway in late 1980s. And yet, nothing would have permitted to imagine African American drama at such a high level, at least before 1923 when a play produced by an African American playwright got performed in Broadway. As I have mentioned in a precedent work, a number of historical factors acted as hindrance to African American theatrical creativity. Among these, we have slavery and the conditions implied by it, that is, racist marginalization, lack of financial and editorial supports, and the stereotypes implied by the nature of drama as a genre used by white mainstream theatre to denigrate the image of the Black through minstrelsy and dialect poetry<sup>1</sup>. With an artistry which came to age in the 1970s and 1980s, Wilson has brought his work out of these mockeries and limitations; more than that, it has given a revitalized expression to black theatrical performance.

How significant is Drama to August Wilson who is reported to have started his literary career in poetry? What are the main issues developed in his work, and how does this personal artistry contribute to the enhancement of the African American in American theatrical development?

<sup>1</sup> - For further details on the African American's participation to American drama see: Kouamé SAYNI, "The African American Theatrical Expression in the USA: A Crippled Quest for Identity", *Particip'Action*, Vol 9, Janvier 2017 (97-110)

**Corresponding Author:- Kouame Sayni.**

Address:- Maitre-Assistant, Université Alassane Ouattara, Bouake.

This paper is an evaluation of African American drama through the work produced by August Wilson; it is the second of this kind of exercise which is meant to examine the development of American theatre in general, and African American play writing in particular with a focus on *Fences* (1986), Wilson's second major play. *Fences* (1986) tells the story of Troy Maxson, an ex-baseball player who is now obliged to work as a garbage collector because of the racism which crushed his dream of success in sports. Frustrated, he has decided to reshape the life of his family within the limits of a fence he wants to build to keep his household from the harm of society. In our work, we will first make an overview of Wilson's literary career, and take opportunity to expose his vision in play writing. Second, we will focus on *Fences* (1986), with the aim to probe in the significance of fence building.

## I/ An Overview of Wilson's Work

### a- From Poetry to Drama: Black Cultural and Historical Experience in Print

August Wilson is known as one of the most prominent African American playwrights today; but in reality his writing career was deeply inspired by the rising movement of black consciousness of the 1960s. This social, cultural, and political movement illustrated itself in poetry with more vitality than in other forms of literary production. This is not because poetry was more important than other forms of writings, but simply because it was the genre mostly used to echo the sentiment of Blacks to their cultural and historical heritage. For Wilson, two main events stimulated his poetical creativity. First, his involvement in the Black Power Movement which was the political expression of black consciousness; and second, his hearing of a record by black singer Bessie Smith, in 1965 which, he said, triggered his awareness that "I was a representative of a culture and the carrier of some very valuable antecedents"<sup>2</sup>.

These two events, and especially his connection with the black revolutionary aesthetic, inspired his writing of poems he dedicated to the leaders of the movement. One of these titles is "For Malcolm X and Others" which appeared in *Negro Digest* in September 1969; and another one devoted to the singer was entitled "Bessie" and got published in *Black Lines* in the summer of 1971. In 1973, Wilson wrote "Morning Statement", a poem he often cited as evidence of his mastery of his craft, and his poem "Theme One: The Variations" was included in the anthology *The Poetry of Black America* (1973).

During this time of poetic writing, Wilson also collaborated in drama projects. For example, he helped found the Black Horizons Theatre Company in Pittsburgh. But it was his move to St Paul, Minnesota in the early 1970s which served as a catalyst, permitting his skills as a dramatist to come to the fore. "St Paul" he said, "was a different environment from Pittsburgh". (Hilary DeVries, 1989, 25) Still, Wilson did not conceive of himself as a playwright until he received the first of several writing grants. After submitting an earlier play *Jitney* to Minneapolis's playwrights Center, he was granted a Jerome Foundation Fellowship in the 1970s. "I walked in and there were 16 playwrights," Wilson remembers about that grant. "It was the first time I had dinner with other playwrights. It was the first time I began to think of myself as one"<sup>3</sup>. This grant, two hundred dollars a month for a year, afforded Wilson the opportunity to re-work a previously written one-act play about a blues recording session into what became the full-length *Ma Rainey*, his first play which was accepted by the O'Neill Theatre center. When this play opened on Broadway at the Cort Theatre in 1984, it brought Wilson critical acclaim and launched his theatrical career.

Wilson published four other plays –*Fences* (1986), *Joe Turner's Come and Gone* (1984), *The Piano Lesson* (1990), *Two Trains Running* (1989) — which contributed to the confirmation of his skill as well as his fame on the national and international scene of drama. In 1988, Wilson became the first black dramatist to have two plays running concurrently on Broadway: *Fences* and *Joe Turner*.

### b- An Innovative Voice in Drama:-

When we consider the particular circumstances that determine the development of Drama in black artistic expression, August Wilson appeared as an exceptional playwright. Challenging American social and political norms, Wilson wanted to make of his theatrical artistry, one that expresses a totally new vision. First, because he had a potential in writing poetry, he used this competence as venue for play writing. In conditions marked by stereotypes and editorial marginality, the form of literary expression which had served to frame Blacks' skill in art was worth using to survive racist censorship.

<sup>2</sup> - Hilary DeVries, "The Drama of August Wilson", *Dialogue*, n° 1 1989, pp. 24

<sup>3</sup> - Bonnie Lyons, George Plimpton, "August Wilson, The Art of Theater", *The Paris Review*, n° 14, Winter 1999, 13-19

The second major impetus to Wilson's theatrical performance was the growing consciousness about black culture and history in the 1960s. In the boiling period of black consciousness, literature was the principal vehicle of the black voice in the American society. And for writers like Wilson, the main instrument which gave expression to this voice was black traditional culture and heritage. Wilson described his artistic agenda as an attempt to concretize black American tradition, to demonstrate how that tradition "can sustain a man once he has left his father's house"<sup>4</sup>. Indeed the theme that surges through his work is the need for black Americans to forge anew their identity, an identity that is at once African and American. And the main venue for this identity to blossom is in literary works where Wilson illustrated himself through such pioneer pieces as *Rite of Passage*, *Recycle*, and *The Homecoming* most of which were unpublished until the 1980s. Showing his concern for incorporating traditional black art forms and the lives of African American icons into his work, these early works were the ones which sharpened Wilson's skills into making his most serious plays like *Ma Rainey*, *Fences*, and *Joe Turner*. In 1977, Wilson wrote *Black Bart and the Sacred Hills*, a musical satire based on a group of poems about an outlaw of the Old West. Most critics consider this to be Wilson's serious theatrical debut; the play was produced in St Paul (Minnesota) in 1981.

Apart from these early works, the next major plays function according to a systematic project: each of them is set in a different decade starting from 1900 to the late 20<sup>th</sup> century. The idea, to paraphrase his vision about this writing project, is to take each decade and look back at one of the most important question that Blacks are confronted with, write a play about it. "Put them together", he says "and you have a history" (Bonnie Lyons, 1990, p.15). It is such a history that shapes each of the plays in what is known as "century cycle" or "ten-play cycle". For the purpose of concision, we will give an overview of the most common of these plays.

*Ma Rainey's Black Bottom* (1982), the first of this ten-play cycle was the real work of art which established Wilson's fame as a writer and a playwright. Set in the 1920s, the play looks at the economic exploitation of black musicians by white record companies and at the ways in which victims of racism were forced to direct their rage to each other rather than at their oppressors. The reading of the book brings out the pertinent question of identity through the notion of responsibility, which is also the core issue in the next books of the author. Concretely, the tension created by the characters' struggle for recognition ends in a violent conclusion. Ma, the recording star, knows the limits of her commercial success, admitting, "It's just like I been a whore". (*Ma Rainey*, 1982, p.35) The elderly pianist, Toledo, is an African nationalist who argues: "We done sold ourselves to the white man in order to be like him" (*Ma Rainey*, 1982, p.41). Levee, the headstrong trumpeter, is intent on making it in the white world, on seeing his name in lights. In the impossibility to confront his white oppressor, Levee inexorably takes it against his own people. Wilson describes Levee's condition in a rhetorical question: "How can I live this life in a society that refuses to allow me to contribute to its welfare?" Through this question that Levee puts in the play, one can perceive the notion of participation, the problem of one's place or responsibility in society. In 1984, *Ma Rainey* (1982) opened on Broadway at the Cort Theatre, bringing Wilson critical acclaim and launching his theatrical career. (Marilyn Elkins, 1997, p.782)

Coming in the third position in the list of Wilson's "Pittsburgh cycle", *Joe Turner's Come and Gone* (1984) deals with the same question of responsibility which is central to his work. Written in 1984, this play is considered as Wilson's favorite. It deals with the personal and cultural development of slavery and the black migration as one can see their manifestations in Pittsburgh. The desperate situation of people of African descent, trapped in sport and music as the only two possibilities left to them, leads them to turn back to their ancestral heritage as an alternative to failure in American society. As Wilson states, "if black folks would recognize themselves as Africans and not be afraid to respond to the world as Africans, then they could make their contribution to the world as Africans" (Hilary DeVries, 1989, p.24) This is what the protagonist Loomis chooses to do in *Joe Turner*, and so do the other leading figures in the subsequent plays. The story is set in 1911 and is imbued with African ancestral materials like ghosts, myths and spells, which become the basis for Loomis's search.

The framing of Black's identity is also central in *Fences* (1986), another important component of the cycle, which is going to be the focus of the next section of this study.

## II/ Fences (1986): Protection and Responsibility in African American Community

### a- The Metaphor of Separation from External Assaults

*Fences* (1986) is considered as the most popular of Wilson's plays, because of the huge critical response it received and the number of prizes it won compared to *Joe Turner* (1984) or *The Piano Lesson* (1990) which drew no less critical acclaim. But this multiple prize winning play chiefly consolidated its supremacy in the American and world theatre readership with the theme and the main setting of the story it represents: the heating period of the late 1950s and early 1960s. Perhaps the historical setting, that's to say, the increasing tension of the decade was influential in keeping *Fences* (1986) to the "hit" of the American theatrical production, more than the Pulitzer, or the John Gassner Outer Critics' Circle Award for Best American Playwright, to cite only two of the high ranked prizes the play brought to Wilson. And from this point of view, the title *Fences* is evocative of the social situation since it illustrates the fracture that existed in the American society in 1957, a society symbolized by the small unnamed city that bears all the traits of a Pittsburgh local town.

Troy Maxson, an African American garbage man, former prisoner and baseball player is in constant opposition with his family members, especially his sons who want to seize the only opportunity that the racially-ostracized society offered to them in the late 1950s. Cory, his younger son is offered a scholarship to integrate a training school for a football career. But Troy refuses to sign the papers because he is skeptical about the future of a black sportsman in the racist American social setting. As the type of father-son relationship crystallizes the story of Wilson's play, the reader—or spectator— notices that this relationship is strongly influenced by the racial tension that bowls along the streets during the late 1950s. As the play opens on a ritual scene of talk and drink between Troy Maxson and Bono his colleague and friend on a Friday night, it is the issue of racial inequality which dominates the conversation between the two friends:

**Troy:** I ain't worried about them firing me. They gonna fire me cause I asked a question? That's all I did. I went to Mr. Rand and asked him, "why?" why you got the white mens driving and the colored lifting?" Told him, "what's the matter, don't I count? You think only white fellows got sense enough to drive a truck. How come you got all whites driving and the colored lifting? He told me "take it to the union." Well, hell, that's what I done! (*Fences*, 2-3)

At a moment when the movement of desegregation had broken out with such resistant actions as Rosa Park's refusal to give her seat to white voyagers in Alabama public transport company in 1955, Troy Maxson's claim for equality in the distribution of tasks in the garbage company captures the general atmosphere of racial suspicion and vigilance. As a worker and active militant in their corporate union, Troy wants equal treatment. He protests against the fact that only white workers are posted in the position of driving the truck while blacks are assigned to lifting the rubbish. It is this injustice, basically nourished by racist hatred, which pushes him to complete the building of a fence around his house. The ancient two-story brick house Troy lives in with his family is "partially fenced" which means that the small dirty yard and his household are clearly exposed to the outward world. This seems absolutely unacceptable to Troy because of the potential danger the outside racist world represents to his family.

As an ex-con man and former player in the Negro Baseball League, Troy sees his life as a failure, because the racism in American institutions did not allow him to give full expression to his performances and benefit from his status as talented sportsman. Frustrated, he is not ready to expose his household to the same assault from that world; this is, to a large extent, the significance of this fence he is trying to build in his partially protected yard. The first person of the family that he intends to protect from the outside racist assault is Cory, his youngest son. Cory has been recruited in a football school and Troy is supposed to sign the paper authorizing him to join the team. To Rose, Troy's wife, who has been playing the mediator in convincing him to sign the papers of the recruiter, he replies: "The white man ain't gonna let him get nowhere with that football" (p.8). Later, upon her insistence, he burst out almost breathlessly:

I don't want him to be like me! I want him to move as far away from my life as he can get. You the only decent thing that ever happen to me. I wish him that. But I don't wish him a thing else from my life. I decided seventeen years ago that boy wasn't getting involved in no sports. Not after what they did to me in the sports. (*Fences*, p.39)

The experience that Troy had had as a baseball player was visibly painful from what we can read of his answers to Rose. He admits that though he had been a talented player in the past, and even if he was as good as the most

talented players like Babe Ruth and Josh Gibson, sports hadn't given him "a pot to piss in or a window to throw it out of" (p.9). This poor experience was caused, according to him, by the racist sentiment of white sports leaders who would not give colored players the same chance they gave whites: "they got colored on the team and don't use them. ...All them teams the same" (p.34) For Troy, thus, it is time to protect the "only decent thing that ever happen to [him]", and it becomes clear that he will use the fence which is being erected as protection, even if he is not fundamentally aware of Rose's motives for building it.

And yet there seems to be no doubt about the role of that fence as Bono unequivocally states: "Some people build fences to keep people out... and other people build fences to keep people in. Rose wants to hold on to you all. She loves you" (p.61). While the fence is supposed to protect Troy's family from white world racism, Bono senses it to be a barrier that is meant to safeguard Rose's love. This perspective developed by Troy's friend gives more than a symbolic character to the fence since Troy has been unfaithful to his wife and he is aware of it. Whenever he has had time to mention it with his friend, Bono has warned him about the possible danger of his unfaithful relation with Alberta, Troy's lover. Having the fence built is for Rose a kind of premonition, the necessity to anticipate an unpleasant interference in her marital life with Troy. Unfortunately, the completion of the fence comes up late, because Troy has already been with his lover for a long time and by the moment he reveals it to Rose, it is to inform her that he is "gonna be a daddy" (p.66) If for Rose the significance of the fence was the protection from a love intruder in her marriage, the fact that Troy announces he's going to have a baby with another woman is a total disillusion, which she expresses in moving terms:

I done tried to be everything a wife should be. Everything a wife could be. Been married eighteen years and I got to live to see the day you tell me you been seeing another woman and done fathered a child by her. And you know I ain't never wanted no half nothing in my family. (pp.67-68)

As one can see, the building of the fence has not saved Rose's love with her husband from an outside intrusion. As a result, she is totally left in disarray. Her statement above shows how disappointed she feels toward a man to whom she has devoted her life and who, in return, has had to do nothing but "lay in bed with another woman... and then bring it home to me" (p.70).

Even if Rose is right to blame Troy for his unfaithfulness and to accuse him for being ungrateful regarding the sacrifices she has made for their love, a careful examination of the story can also instruct the reader about the fact that such unfortunate intrusion could not be avoided, given the lack of vigilance from her. For, while she has wanted the fence to be completed and kept calling on her husband and Cory to work on it, the completion has always been deferred by Troy. One has to look in the lines of the following answer he gives her when she draws his attention to it: "I'm gonna walk down to Taylors'. Listen to the ball game. I'll be back in a bit. I'll work on it when I get back" (p.28). If the lack of vigilance has been disastrous for Rose's family with the intrusion of a rival in her home, the fact of postponing the building turns out even bitter to Troy himself. Indeed, not long after he informs Rose about his relation with Alberta, he is in turn informed that she has died in childbirth. Inconsolable, his mourning reveals the real significance of the fence for him:

Alright... Mr. Death. See now... I'm gonna tell you what I'm gonna do. I'm gonna take and build me a fence around this yard. See? I'm gonna build me a fence around what belongs to me. And then I want you to stay on the other side. See? You stay other there until you're ready for me. Then you come on. Bring your army. Bring your sickle. Bring your wrestling clothes. I ain't gonna fall down on my vigilance this time. You ain't gonna sneak up on me no more. When you ready for me... When the top of your list say Troy Maxson... (p.77)

Troy's mourning is nothing but an elegy; it is a sad expression of pain caused by death, a pain which has the effect of triggering a deep sentiment of defiance toward death itself as personified in his words. Hurt and dispossessed of his lover, Troy scowls his grief and challenges death with the fence he intends to erect in order to keep him "on the other side".

#### **b- The Fence of the African American's Responsibility**

More important than simply protecting the family from outward adversities is what the fence allows Troy to do, precisely in terms of charting an identity and a destiny for Maxson family which, in Wilson's play, represents the African American community. The issue of identity or destiny of the African American is a crucial issue in Wilson's

artistic work; and especially in *Fences* (1986) it is raised in the following terms: Is there an alternative to music and sports, the only outlets for the black in a racist American society? It is this question that sets the conflict between Troy Maxson, the main protagonist and father of the family, and Cory his youngest son.

In the story, indeed, Troy is portrayed as an uncompromising opponent to sports, because he considers himself as a living proof of this choice, which has earned him nothing, not even “a pot to piss in or a window to throw it out of” as he will often say. This is why he refuses to let Cory engage in the same career. And even if Cory refuses to listen to his father’s advice and holds on to his enrolment in a football school, Troy’s answer is evocative of what he suggests concerning the real destiny of his family in the racist social environment: Neither a football career nor the music of Lyons, the elder brother of Cory because they are the products of white racist ruling of American society. Troy rather insists on hard work, which he urges his children to embrace. Whenever one of them comes to ask him something, his answer is invariably negative. For example, when Cory entreats him to sign the paper of the football recruiter, he scowls at him saying: “The white man ain’t gonna let you get nowhere with that football noway. You go on and get your book-learning so you can work yourself up in the A&P or learn how to fix cars or build houses or something” (p.35).

To be trained to secure a job that helps everyone to take care of themselves is what matters for Troy. After all, he has done pretty well in supporting his family as a worker in the garbage-collect company of the town. Even if it is a lower job, it has permitted him to secure the minimum for them and he is ready to boast about it to Cory when answering his objection about his attitude to him:

**Troy:** You eat everyday [?]

**Cory:** Yessir!

**Troy:** You got a roof over your head [?]

**Cory:** Yessir!

**Troy:** Why you think that is?

**Cory:** (Hesitant) Cause you like me.

**Troy:** Like you? I go out of here every morning... bust my butt... putting up with them crackers every day ... cause I like you? You about the biggest fool I ever saw. (Pause)

It’s my job. It’s my responsibility! You understand that? A man got to take care of his family. ... Mr Rand don’t give me money come payday cause he likes me. He had to gives me cause he owe me. ... (pp.37-38)

The attention that one has toward one’s family and, precisely, the determination to provide for their needs is the measure of one’s responsibility in society. This responsibility is valued only by holding a job according to Troy. Linked together, these two notions are central in *Fences* (1986), which appears, thus, as a play in which the reader discovers a new framing of the African American identity. If responsibility is the most important thing for a man and, if for Troy it is nourished by work rather than music and sports, then one can say that it is the measure of one’s identity. Even if Wilson does not explicitly express his preference for his protagonist’s choice, the fact that Troy progresses from the position of simple garbage collector to position of driver in the company shows that other opportunities are opened to African Americans, precisely on the field of job market characterized by hard work and competition.

This perspective on work and responsibility developed in *Fences* (1986) is essential in the works of most of contemporary African American intellectuals like August Wilson and Shelby Steele, to cite the most popular of them. The point of contention in the debate is the association which is commonly drawn between African Americans and their racial heritage. Music and sports, for instance, described as the only outlets for people of African descent, are the expression of racial stigmatization. It is no wonder, then, that Wilson’s protagonist rejects them.

Still, Wilson does not totally break with the African American’s past. For example, in spite of Troy’s refusal of Lyons’ music, he is constantly tuning a song which plunges him back to his past:

Here it rings! Here it rings  
Had an old dog his name was Blue  
You know Blue was mighty true  
You know Blue was a good old dog  
Blue trees a possum in a hollow log

You know from that he was a good old dog (p.82)

Poetic in its rhetoric framing, this song which chants Troy's nostalgia for his "blue dog", also sounds like a blues that is regularly tuned to help him find his wholeness. In the end, Troy appears as a person with an ambivalent identity, an identity which cumulates the American values and the values of the African ancestral heritage. It is this double consciousness that Wilson articulates in the following statement: "if black folks would recognize themselves as Africans and not be afraid to respond to the world as Africans, then they could make their contribution to the world as Africans" (Hilary DeVries, 1989, p.24).

Sharing the same vision of responsibility and work as Wilson, Shelby Steele, has also written a lot on the issue of identity; but he is rather attached to American values of work, individual initiative and property ownership. As he writes in "On Being Black and Middle Class", these values are better than anything else for a respectable African American personality:

Hard work, education, individual initiative, stable family life, property ownership –these have always been the means by which ethnic groups have moved ahead in America. Regardless of past and present victimization, these "laws" of advancement apply absolutely to black Americans also. There is no getting around this. What we need is a form of racial identity that energizes the individual by putting him in touch with both his possibilities and his responsibilities. (Steele, 108)

Even if Steele talks about "racial identity", it is clear that the form of identity to which he refers has nothing to do with the race; it rather has to do with values which contribute to the promotion of a democratic and equalitarian society. Expressed in terms of work, education, individual initiative, or private ownership, these values shape, according to Steele, the notion of responsibility which African American intellectuals praise so much today.

Whether we are in a radically liberal perspective or in a double conscious worldview, the question of identity takes a new articulation in contemporary African American artistic production like in the drama of August Wilson. *Fences* (1986) is one among the theatrical works written by this playwright which charts a new definition to it.

### Conclusion:-

To learn about the life and work of playwright August Wilson is also to learn about the place of the Black in American theatrical development. For a long time, this place has been, marginal, as we showed in "The African American Theatrical Expression", a precedent work published in *Particip'Action* (2107)<sup>5</sup>. Because of the negative impact of some major phenomena like slavery, and the stereotypes that it contributed to develop about the image of people African descent, it has been historically difficult for African American artists to contribute to drama as easily as they did in other artistic genres. And yet, thanks to his artistic genius, playwright August Wilson has brought African American drama out of its historical lethargy.

Using his creative potentials as a venue, and notably his skills as a poet, Wilson has revitalized the public expression of African American drama since the black revolutionary movement of the 1960s. For example, he assigned himself the challenging task to "sketch the Black experience in the 20<sup>th</sup> century and raise consciousness through theater and echo the poetry in the everyday language of black America" (Bonnie Lyons et al., 1999, p.17). This exercise resulted in the writing of the ten-play series commonly known as "century cycle" or "ten-play cycle", and of which *Fences* (1986) is a significant component. In fact, these plays are the place where Wilson accomplishes one of his long-awaited goals: the shaping of a new identity for African Americans through drama.

This task has also been the concern of many other writers of African descent, principally those who constitute the contemporary middle class of the community and of which essayist Shelby Steele can be considered as the spokesperson. In a way because the African Americans of the popular class made abundant use of the black ancestral culture and racial heritage in the past, chiefly in claiming for rights and power during the Civil Rights movement, the middle class intellectuals of the community have always been reluctant to identify themselves with them. Worse, they have literally rejected what Shelby considers as a victim's identity. According to him this identity

<sup>5</sup> - Kouamé SAYNI, *ibidem*, p.100

is “devastating” for the image of African Americans in today’s American society characterized by values of work and competition.

This study has been an opportunity to cast a look at Wilson’s contribution to the framing of this new identity. After a quick but critical overview of his life and career, our exercise has focused on *Fences* (1986) through which Wilson tailors the main rhetoric of African American identity. Based on the building –more precisely, the completion— of the half-fenced home for the family of Troy Maxson, a frustrated garbage collector, the play points out the traumatizing heritage of racism in 1950 American society. Because racism led him to failure in sports, Troy cannot allow his family members to choose the same career, presented with music as the only two possibilities left to African Americans. A critical analysis of the tension that rises from the opposite positions in the family has given us an occasion to determine Wilson’s definition of his new vision for the destiny of the Black in contemporary American society. Relatively different from Steele’s perspective, it is a rather mitigated vision based on work and ancestral heritage.

Usability, Digital Divide, Digital, Agriculture.

#### Abstract

Agriculture is the backbone of Indian economy and 70% of Indian population is mainly dependent on Agriculture for their livelihood. Since ages, lots of developments are going on in this field. Information and Communication Technologies (ICT) is a resource society which provides access and knowledge. ICT is a resource society which needs active participation along with literate participation of the user. The internet nowadays is of little use to people who are not able to make use of electronic access to digital data to improve their lives. In the past decade, farmers had access to various agricultural information provided by many information and communication technology (ICT) projects in Indian agriculture. Different services are provided by ICTs. ICTs have the potential to reach many farmers with timely, useful and accessible content. But the content delivered has importance and relevance only if the information is content specific and localized. In India most of the population lives in rural areas and is dependent on agriculture for their living. But because of digital illiteracy, farmers are not aware of different data of agriculture available for them, in spite of numerous efforts taken by Government. The prime focus is on improving the usability of knowledge shared by different digital media. Hence minimization of digital divide in rural areas will take place. It will help to design and implement better service tools.

#### Introduction:-

India is an agriculture based developing country. Information dissemination to the knowledge intensive agriculture sector is upgraded by computers and mobile-enabled information services and rapid growth of mobile telephony. Mobile apps and websites in the area of agriculture can be the best option to increase countries net agriculture production. Today farmers receive diverse facts regarding farming like different types of seeds, crop diseases, crop selection, crop process weather, fertilizer, pesticides etc multiple resources are distributed on many different locations according to its origin, its producers or vendors. The data may have different format and contents, depicting heterogeneous nature in their structure and format. Therefore, developing a system from where the required information is available to the farmers directly and in localized form is needed.

This research focuses with following objectives.

**Corresponding Author:- Komal Raikar.**

Address:- Computer Engineering, Pillai College of Engineering(PCE), New Panvel, Maharashtra, India.

**Need and Objective:-**

This research focuses on following key points,

1. To know about usability and usability issues in agriculture domain
2. To identify the digital divide and the barriers to digital media among rural users especially farmers.
3. To improve the digital illiteracy among users.
4. To minimize digital divide and improve the usability of digital media by providing recommendations as solutions.
5. Help in decision making for the prediction of suitable crops with respect to climate and soil.
6. Identification of crop diagnosis by sending image through app.
7. To avoid linguistic problem solutions will be provided in local language.

**Literature Survey:-**

**Sukhpuneet Kaur et al.** [1] evaluated Educational Universities of Punjab and provides their ranks according to evaluation criteria. Usability is calculated using automated tools. Paper make use of two automated tools, **Site Analyzer**(which calculates different no of parameters such as Content, Design, Performance, SEO (Search Engines Optimization) and Page Analysis) and **Qualidator tool** (which checks Usability, Accessibility, SEO and Quality (technical quality)). Paper provides automated tool calculations for universities websites regarding the comparative importance of website assessment criteria's. From the results website designers can focus on the specific features where they are lacking and keep the website up-to-date.

**Sukhpuneet Kaur et al.** [2] discussed about the usability tools for testing and how they are used for determination of effectiveness and usability of websites. Performance evaluation is done by using tools which give detailed results of that website. The aim is to perform evaluation and comparison using the automated testing tools to determine their SEO (Search Engine Optimization), load time, speed, security, page size, performance, mobile and number of requests. The different Universities of Punjab were selected and evaluation was done using automated Usability Testing tools like **Site Speed Checker Tool**, **GTMetrix**, **Pingdom** and **Website Grader**. It was concluded which university website scores the maximum against the various factors used.

**Muhammad Faraz Khokhar et al.**[3] discussed about the different ways to empower or improve the role of technology. Also to bridge rural digital divide with ICT solutions. In the agriculture sector of rural belt of Pakistan those solutions were applied. E-boards and mobile phones for giving access to all latest agricultural updates and news were suggested. Idea was to provide automated updates on e-boards in form of pictography and text messages on users device such as phone that too in local language. In this way ,current updates are provided to the farmers. Research focused on making information easy and understanding. Thus, more usability and effectiveness is provided to the farmers, which helps to increase the productivity of crops. This helps in bring rural community to the (standards of) international level.

**Maria Tamoutsidou** [4] presented that agriculture is very much important domain for developing countries. There is need such that it should change to meet today's need. Agriculture has been a part of human life since the beginning of human race. The need for agricultural information is almost same as old agriculture itself. Paper proposed that E-learning in agriculture is a tool that provides various benefits to farmers education by expanding its access. Finally it was concluded that E-learning offers benefits and gives opportunities in agriculture area. So a proper education regarding E-learning is fruitful to the farmers.

**S. A. Adepoju and I. S. Shehu** [5] used automated tools such as **Web Accessibility checker**, **HERA** and **WAVE**. Calculation of usability level via accessibility evaluation of the federal universities in Nigeria is done using these tools. Usability was checked for conformance with both WCAG 1.0 and WCAG 2.0 using three tools. Different tools gave different errors. Based on the errors the website designers should try to minimize the error for increasing the usability.

**Soumalya Ghosh, A. B. Garg, Sayan Sarcar**[6] proposed an iconic interface for farmers. In Indian languages it had a special feature called as speech based interaction. It is essential for farmers to take the essential agriculture information. The proposed interface removes language gap of the Indian farmers with various multiple modes of interaction techniques. It also overcomes the digital gap among farmers.

**Ahmad A. Al-Ananbeh [7]** focused on two concepts such as Search Engine Optimization (SEO) and Usability. They evaluated automatically eighty Websites for universities in the Arabic region. Aim was to find out whether there is relevancy between Search Engine Optimization (SEO) and Usability. Attributes selected are: HTML errors checking, load time, and browser compatibility problems. For the selected attributes, tools used are HTML ToolBox, Page Rank Checker, and SEO Page Rank. Using these three tools, 80 websites for universities in the Arabic region were evaluated. Results showed that Usability is more important in many aspects than SEO. Primary focus should be on improving the usability and certain recommendations considering SEO PageRank into consideration. are given in order to increase the usability for websites.

**Sukhpal Kaur[8]** used automated tool called as **Sitechecker** for evaluation for web site accessibility. The tool performs the work of HTML validator. It also evaluates other contents such as CSS, hidden files, dead links, extra comments, java scripts, in the HTML code and code to text ratio in a web site.

**Fang Liu [9]** presented the importance of measuring usability and how it is measured. Using different evaluation techniques, web designers can know their users better, understand them in a better way and make their works meet various users' needs. Paper describes methods to evaluate a website. Evaluation techniques are usability testing, focus group, cognitive walkthrough, heuristic evaluation, thinking aloud and questionnaires. Paper concluded that designers should be aware about the techniques and should be used to evaluate websites skillfully.

**Gagandeep Kaur Grewal[10]** explained the importance for need of right information to the farmers for successful farming. For farmers various web portals and agricultural sites are available but many are not aware about it. Paper reviewed about the need for good communication among farmers and portals. Handy and useful information of weather, crops pests, irrigation schedule, etc should be available to the farmers from time to time.

**Ms. Ipsita Panda[11]** discussed how the Indian scenario as well as the global world is influenced by the digital divide. Rural library can play a much needed role in bridging digital divide. It will also help in literating the society and in building a well informed society.

**Rajender Singh Bist [12]** highlights the digital divide scenario in India. Further discusses various ICT initiatives undertaken by the government. The major challenges and key solutions in bridging the digital divide in the Indian context are provided.

**Neena Singh[13]** the paper informed about the role played by several programs taken by the government to bridge the digital divide. Also the initiatives taken in India towards digital access to information. Some of the projects initiated were as follows : "Grameen sanchar sevak," "Gyan Doot," the CARD and e-Seva projects, etc. It further discusses Digital Library Projects, viz. the National Science Digital Library (NSDL) and Vidya Vahini, digital mobile libraries and library networks and community information centers. These projects were initiated by the government to reach remote and rural areas. The other factors that help in bridging the digital divide in the country are good policy-making, political support and need for strong determination.

**Zhengjie Liu, Qingjun Meng[14]** they proposed that the main reasons for the digital divide are socio-economic factors. This is because most people have difficulties in understanding digital products' and their usability. The usability improvement for digital products help in the endeavor to eradicate the digital divide. The design should be user-centered design. It is a good method to eliminate usability factors of the digital divide. In short, it will help to bridge the digital divide.

**Tanuja R. Patil et al. [15]** discussed about making farmers available with precision agriculture information which will help them to get high crop rates and high crop yield using ICTs. SMS was the medium used to provide the information to various farmers. A software system was built to give the precise information about the crops using database. In local language automatic information delivery through website, app, as well as SMS was provided.

### **Review Of Research:-**

The study for improving the usability in agricultural area and for eliminating the digital gap among rural people especially the farmers will be done in following stages:

Stage 1: Review of agricultural information communication tools

Stage 2: Identification of Usability problems.

Stage 3: Recommendations and solutions to improve usability.

Stage 4: Development of tool to solve and improve usability in specific area.

Stage 5: Test usability with the help of users for development tool ie, website or application.

### Usability, issues of usability and evaluation of usability:-

The ISO 9241-11 standard defines usability as “the extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use”.

**Effectiveness:** It tells how users can achieve specified goals with accuracy and completeness

**Efficiency:** It tells with what rate users achieve goals with respect to the accuracy and completeness

**Satisfaction:** It tells how users accept the system, to what level they are comfortable in using it. [16]

A level of satisfaction is the highest when users find a Web site is useful with meaningful information and usable; this is can be termed an “**engaging user experience**”. Usability in agriculture has an important role to play in order to engage more and more farmers with newer digital data and technologies.

There is a limiting factor in use with many of the applications in agricultural with respect to new technology called as “User acceptance”. Farmers tend to become very conservative generally while choosing the technology. So with a mindset of reducing risks they tend to choose traditional or any old methods or techniques. The farmers also needs to trust on the reliability of data and accuracy of the information available. This needs to be changed so that there can be development in agriculture field by making farmers more and more involved in new methods.

A usability evaluation method is a systematic procedure in which data gets recorded for the communication that takes place between the user and the software. Various tools are available for evaluation of websites such as Website Grader, Dareboost, Qualidator, SEOptimer, GTMetrix, iwebchk, SortSite etc.

### Digital divide in agriculture:-

In common terms, definition of digital divide can be as the difference between those users who have access to digital data and can make effectively make use of it, and those who either lack it or don't use it effectively. Unequal access to digital content and different technologies has led to the digital divide among rural people. However, not everyone has access to this digital data or aware about how to use it. Especially the farmers are lacking behind in using the devices and the technology and the digital data available.

### Methodology:-

This can be divided into four steps.

#### Stage 1: Review of agricultural communication tools

**Table 1:-** Review of websites and apps

Sr. No	Name of Website/portal/apps	Features	Observation
1	Farmer.gov.in	Farmer Portal provides solution to the farmers and stakeholders to disseminate the information regarding fertilizers, seeds, pesticides etc.	<ul style="list-style-type: none"> <li>Navigation issue.</li> <li>Map is limited to district level.</li> <li>No disease diagnosis system.</li> <li>No proper language support.</li> </ul>
2	Mahagri.gov.in	This is a web portal of Agriculture Department of Maharashtra State (India), which is developed to provide information related to farming.	<ul style="list-style-type: none"> <li>Limited to only two languages i.e, English and Marathi</li> <li>Clumsy view of website</li> <li>Navigation issues</li> </ul>
3	Krishiworld	It provides information about agriculture and agriculture products, crops, fertilizers, floriculture vegetables and fruits	<ul style="list-style-type: none"> <li>More no. of ads</li> <li>Bad UI</li> <li>No diagnosis system</li> <li>Registration issues</li> </ul>
4	Kisan Suvidha	Latest information Call to kisan credit card	<ul style="list-style-type: none"> <li>Language issue</li> <li>Frequent crashes are seen</li> </ul>
5	Mkisan	Latest information	<ul style="list-style-type: none"> <li>App crashes</li> </ul>

**Stage 2: Identification of problems:-**

- Less knowledge about the latest technology.
- No availability of relevant and localized content.
- Productivity is very low because they are not aware about the new methods.
- Available systems focus on only one problem.eg: disease diagnosis, weather report, soil report etc.
- Language issues.
- Approach of systems are very area specific.
- Navigation issues.
- Lots of digital information but farmers are not able to make use of it.

**Stage 3: Recommendations and solutions to gaps identified:-**

With help of gaps identified, recommendations will be provided for designing the required framework. That will help farmers to take decision for agricultural activities with digital gadgets. Solutions to the farmers will be provided in the form of various services that will increase the usability of digital gadgets.

**Stage 4: Development of tool and testing in a specific area:-**

The agricultural app and website will be a tool which will help farmers to improve the productivity. Testing can be done by considering different types of users.

**Conclusion:-**

Therefore, a proper framework for an IT-based agricultural information dissemination system is required. Hence in this way an app and website be developed in the area of crop disease detection, decision making for the prediction of suitable crops with respect to climate and soil and pesticide recommendations which will improve the usability among farmers. The tool developed will provide multi-lingual support to user. This agriculture service provider tool will bridge the gap between the farmers and technology and would prove beneficial to all the rural people related to farming sectors. Need to increase the usability of digital media tools to minimize digital divide among rural people will be satisfied.

#### Abstract

Gallstone disease continues to be one of the leading problems in modern gastroenterology and in majority of cases requiring surgical management. This pathology has large impact on Saudi Arabian population and its Health system. Laparoscopic cholecystectomy has become a procedure of choice in current management of acute and chronic cholecystitis. The aim of this surgical audit based study was to analyze current management outcome in selected group of patients, who underwent laparoscopic cholecystectomy procedure in Saudi Arabian province of Al Kharj with relatively large local population. The multiple factors including patient's demographic characteristics, modality and results of investigations, as well as, surgical outcome were analyzed and compared. This study demonstrated satisfactory surgical outcomes in gallstone management in the Prince Sattam Bin Abdulaziz University affiliated hospital, which demonstrated low complications rate and cost effectiveness.

#### Introduction:-

Gallstones are known to medical practice since ancient times and remain one of the most frequent pathological conditions of the gastrointestinal tract in modern time. The high prevalence gallstone diseases more shown in developed countries reaching from 10 to 20.8%. However, it is less common in the developing nations and remaining as low as 4.1% (1). At the same time majority (about 80%) of the patients with gallstones remain asymptomatic during their entire life, and only about 3% of patients with periodical symptoms may develop acute cholecystitis, which require eventual surgical intervention for removal of gall bladder.

It was estimated that about 20% of adults at the age of 40 and over would develop biliary calculi. This figure may be increased by 30% by the age of 70 and above. Female-to-male ratio is reaching about 4:1 in the reproductive years, and almost equal in the older population (2).

It appears that, factors like diet and socio-economic conditions are directly correlated with the incidence of gallstone disease. Risk factors known to contribute to the development of gall stones also include the family history of gallstone, obesity, multiple pregnancies, fat diet, and low physical activity lifestyle. Some co-morbidities, which have physiological predisposing factors like abnormal absorption in biliary digestive system, such as, Crohn's disease and liver related pathology also increase gall stone formation.

Specific clinical features supported by ultrasound scanning evidence are base for establishing the diagnosis of acute cholecystitis and define the reasoning for surgical treatment. However, the timing of surgery still debatable, and up to date there is no standard approach among different surgical schools.

The aim of this study was to investigate current trends in approach of investigation and management of gallstone disease patients from the population area in search of the possibility of any improvement in outcome and hospital stay.

### **Materials and Methods:-**

This retrospective surgical audit study was based on the identified hospital database, obtained from medical records at King Khaled Hospital (KKH), which is a teaching hospital affiliated with the Prince Sattam Bin Abdulaziz University in Al Kharj Governate of Saudi Arabia covering the population of over 650,000 people.

Medical records of 132 patients admitted from 2010 to 2015 inclusive, who presented with acute or chronic cholecystitis and received surgical treatment as emergency or elective cases, were reviewed.

Inclusion criteria for this study were all patients, who had laparoscopic or open cholecystectomies, presenting to KKH with the diagnosis of acute or chronic cholecystitis or symptomatic cholecystolithiasis.

Patients were discriminated by the gender and included in two major groups, such as the emergency case or elective case. Patient's characteristics were divided in few sections: 1) symptoms upon the presentation and family history, 2) blood inflammatory and biochemical values, such as white cell count (WCC) and Liver Function Test (LFT), 3) evaluation of gall stones together with common bile duct measurement by ultra-sonography (US) 4) types of surgical procedures and related complications, and 5) duration of hospital stay.

All patients had ultrasonography study to confirm the presents of gallstones and evaluate the severity of acute cholecystitis as well as exclude the gallstones in the common bile duct, which may change the strategy for the patient's management.

All of the patients received prophylactic antibiotics before the surgery or intra-operatively in order to prevent the possibility of infection.

Data for all these characteristics obtained from the medical records of the patients was analyzed for statistical value. For analysis of data the SPSS version 23 (Statistical Package for the Social Sciences) and Excel for Mac 2016 computer software programs were used in this study, which included unpaired *t*-test for comparison of means within groups, where  $p < 0.05$  was considered as statistically significant.

### **Results:-**

In total, 132 patient's data was collected from medical records and analysed, including 122 females and 10 males (92.4% and 7.6% respectively). For the majority of the patient's age distribution falls in the 4th decade. The median age for males was 41.1 year (range 26-68 year) and for females 39.5 years (range 20-75 years) respectively. Distribution of age, gender and type of surgical intervention is shown in the Graph 1.

**Graph 1:-**Distribution of age, gender and type of surgical intervention.

The median age in the elective surgery group was with male to female ratio 1:11.9. This was not much statistically different compare to the emergency group where median age was and male to female ratio 1: 15 ( $p > 0.8$ ). In both groups the diagnosis of cholecystitis was made on the basis of clinical presentation, evaluation of inflammatory markers, liver function tests (LFTs) results and ultrasound evidence of gallstones in all patients admitted for treatment.

Regarding the symptoms on the presentation to the hospital, nausea with vomiting were experienced by 67.2% of the patients in elective group, and 87.5% in emergency group respectively. Intermittent or constant right upper abdominal pain was present in 98.2% of patients in selective group and 93.8% in emergency group, which made this symptom as most constant. The characteristics of the symptoms in elective and emergency cases shown in the Table 1.

**Table 1:-** Characteristics of the presenting symptoms.

Symptoms on admission	Elective (116)	Emergency (16)
Nausea and vomiting	78 (66.7%)	12 (70.6%)
Right upper abdominal pain	114 (97.4%)	15 (88.2%)
Epigastric pain	80 (68.4%)	15 (88.2%)
Pain in tip of the right shoulder	12 (10.3%)	4 (23.5%)

There was no jaundice in elective group, however, 3 out 16 patients (18.8%) in emergency group presented with jaundice. None of the elective patients had concurrent pancreatitis compare to emergency group, where pancreatitis was evidently diagnosed in 37.5% of patients. Only one patient in elective group was with chronic liver disease, however, no chronic liver pathology was identified in the emergency group of patients.

Elevated bilirubin with the deranged liver function test was found in 11 patients, where 10 patients belonged to emergency group. Mean values for levels of bilirubin and liver function test in elective and emergency groups shown in the Table 2.

**Table 2:-**Mean values for levels of bilirubin and liver function test.

	Elective (mean +/- SD)		Emergency (mean +/- SD)	
Bilirubin (umol/L)	20.06	11.9	21.9	14.5
ALT (u/L)	78.8	48.7	575.4	141.6
AST (u/L)	44.2	29.2	384.4	141.6
ALP (u/L)	89.7	48.4	184.8	54.0

Biliary dilatation on ultrasound study was found in 17 out of 116 elective patients (14.7%), while in emergency group it was reaching 43.7% respectively.

Gallstones on ultrasound were diagnosed in 115 out of 116 patients in elective group and in 15 out of 16 in the emergency group respectively. Biliary dilatation identified by ultrasonography study was found in 17.2% of patients in elective group compare to 77.7% in emergency group.

In 4 out of 116 patients (3.4%) laparoscopic cholecystectomy had to be converted to open procedure due to technical difficulties in dissecting Calot's triangle in order to identify important biliary structures, which could be challenging because of the extensive scarring process after gall bladder inflammation. There was no conversion to open procedure in the emergency group of patients, as acutely inflamed tissues helping in laparoscopic dissection, but increasing the chance of intra-operative bleeding.

In our study, median length of hospital stay (LHS) was 2.7 days ranging from 1 to 18 days. For the elective group the median LHS was 2.5 days, while in the emergency group it was 4.7 days respectively ( $p < 0.03$ ). In total 3 patients (2.3%) had complications, 1 intra-operative bleeding in the elective group and 2 postoperative wound infections, when the laparoscopic procedure had to be converted to open.

The diagnosis of chronic cholecystitis was associated with gallstones in 115 out of 116 elective surgery patients (99%) and acute cholecystitis in all 16 patients from emergency group.

There was no intra or post-operative mortality in this study. Intra-operative perforation of the gall bladder and bleeding were considered as well recognized procedural complications. Only one intra-operative bleeding has occurred in the whole series of cholecystectomies for elective group and no bleeding was recorded in emergency group. Post-operative wound infection has developed in one patient from each group during post-operative period.

### Discussion:-

The prevalence and incidence of gallstones in Saudi Arabia is not well established, although recent studies demonstrate high numbers, which vary from region to region (3). Abu-Eshy et al (2007) in their cross-sectional community-based study of gallstone disease in a Saudi Arabian Asir region demonstrated that the overall prevalence was 11.7%. This study was based on abdominal ultra-sonography with structured interview and shown that hypochondrium pain was significantly correlated with gallstone disease (4).

The trends for changes in diet habits in Saudi Arabia demonstrated the increase of fat and sugar consumption with high calories intake and reduction of high-fiber food, which is related to introduction of the fast food and more sedentary life style among the younger generation over the past few decades. This leads to the higher number of population with increased body mass index (BMI) among Saudis. Also, international reports shown that female population more effected by the early formation of gall stone and development of cholecystitis compare to male population. Multiple pregnancies, which are traditional for Saudi females appeared as one of the risk factors for cholelithiasis in this population group. The formation of cholesterol sediments, so called "gall bladder sand" occurs more frequently compare to males. In our study 28.2% of females had multiple pregnancies.

Malatani et al. (1996) in their study demonstrated that, cholesterol was the most common component of the gallstones (82.6% to 90.4%) in various regions of Saudi Arabia, which was followed by calcium, bilirubin, and carbonate (5).

The presents of gallstone disease may have no specific symptoms, as the majority of the population with gallstones (70-90%) can remain asymptomatic until complications develop, which include acute cholecystitis, cholangitis or biliary pancreatitis. In our study, dyspeptic symptoms were more prominent in the emergency group of patients compare to the elective (70.6% vs 66.7% respectively) ( $p < 0.05$ ), which correlates well with more acute condition supporting the diagnosis of severe cholecystitis or development of pancreatitis and influencing the decision making to perform cholecystectomy as emergency.

Diagnosis of acute or chronic cholecystitis was made based on symptoms and signs of localized inflammation in epigastric and the right upper quadrant areas and differentiated from biliary colic by the presence of elevated inflammatory markers and liver function test. Patients may present with a history of biliary colic or may have been previously asymptomatic.

Plain X ray films have never been a reliable diagnostic tool in detecting gallstones, as the frequency of radio-opaque stones is low and can be demonstrated only in 10-15 % of cases.

Ultrasonography currently is gold standard non-invasive method for clinical diagnosis of gallstones and cholecystitis with sensitivity reaching 98%. However, it can be inconclusive in some cases as remain operator sensitive. Its ability to demonstrate the presence of pericholecystic fluid, gall bladder distention with the wall thickness and gallstones with their location and common bile duct dilatation make it the method of choice in diagnosis and screening. Together with color Doppler it can show local hyperemia and severity of the inflammation.

Biliary dilatation in the elective group (17.7%) could be explained as a transient passage of the gallstone into duodenum, as there was no record of pancreatitis in this group. However, in the emergency group, biliary dilatation was 77.7%, which correlates well with development of pancreatitis in 60% of emergency patients ( $p < 0.05$ ).

Today, laparoscopic cholecystectomy is a gold standard procedure in the management of gallstones. The technological advances and evolution of laparoscopic technique require continues reeducation and retraining by surgeons.

About 20% of patients with acute gall bladder inflammation would require emergency surgery with deterioration of the patient's condition and formation of localized peritonitis due to empyema of gall bladder.

However, the optimal timing of surgery for the rest 80% of patients continues to be debatable. Multiple studies suggest that early surgery has reduced complications and lower conversion rate as well as shorter hospital stay. Early laparoscopic surgery, less than 72 hours after presenting symptoms, allow easier dissection of edematous planes before the fibrous scarring process occur (6).

In the large randomized trial by Gutt et al. (2013), laparoscopic cholecystectomy, performed within first 24 hours of hospital admission demonstrated superior results compare to conservative approach regarding morbidity and cost effectiveness (7).

In our study intraoperative cholangiogram (IOC) was used selectively only in cases of high suspicion of gallstones in common bile duct (CBD), equivocal ultrasound findings or transient pancreatitis.

Polat et al. (2000) documented findings of CBD stones in up to 12% of all patients during cholecystectomy and claim that intra-operative cholangiography (IOC) is effective in identifying stones in CBD during surgery. Thus, they recommend routine IOC to identify duct anatomy in order to reduce the incidence of CBD injury (8). This recommendation supported by the Ragulin-Coyne et al (2013), who reached similar conclusions (9). Moreover, gallstone complications, such as biliary pancreatitis and CBD injury during laparoscopic cholecystectomy can dramatically increase the cost of recurrent hospitalization by 10 fold, as well as morbidity and mortality of patients with the gallstone pathology.

### **Conclusion:-**

Laparoscopic cholecystectomy is an operation of choice in the management of gallstones and in case of acute cholecystitis should be used earlier after the onset of symptoms. In many cases it is important action to prevent the variety of complications caused by gallstones.

Intra-operative cholangiogram is valuable methods in depicting biliary anatomy, which may exclude bile duct injuries and identify stones in common bile duct. Thus, indicating to further necessity for bile duct exploration or to perform ERCP modality to prevent gallstone pancreatitis.

Our study demonstrate that current management of acute and chronic cholecystitis in Al KharjGovernate area has relatively low rate of complications and sufficiently cost effective. This could be explained by careful and appropriate diagnosis and timing for surgery in majority of the cases, included in this study.

### Abstract

Amaranthus spinosus is commonly known as spiny amaranth and is distributed all around the Asian continent as an annual weed. Though it is seen as a weed the nutritive quality of the species is high. This paper attempts to explain the various biochemical composition of the plant qualitatively and quantitatively. Qualitative analysis carried out suggests the better solvent which could be used for its effective extraction. This paper also puts lights into the taxonomical traits and anatomical characters of the species.

Copy Right, IJAR, 2016., All rights reserved.

### Introduction:-

The genus Amaranthus, a widely cultivated taxonomic group, consists about 60–70 species<sup>1</sup>. Collectively known as Amaranth, it is a cosmopolitan genus of herbs belonging to the family Amaranthaceae<sup>2</sup>. Most of amaranth species are summer annual weeds and are commonly referred to as pig weed<sup>3</sup>. A rich array of poems and folklore has hints about the flower of amaranth which does not fade easily. Its etymology as well, has traces to its everlasting flower, with the word Amaranth, coming from the Greek word Amaranthon, which means 'one that does not wither'<sup>4</sup>. Throughout history, Amaranth (Amaranthus sp.) has been highly priced as a consumable. The Incas, Mayans and Aztecs used it as a staple food<sup>5</sup>. Amaranthus spinosus L. is an erect, monoecious, perennial, up to 1 m, stems is terete or obtusely angular, glabrous or slightly pubescent, green, reddish-brown, glabrous, and branched. The leaves of A.spinosa are alternate and simple without stipules; petiole is approximately as long as the leaf blade. The blade shape is ovate-lanceolate to rhomboid, acute and often slightly decurrent at base, obtuse, rounded and often short mucronate at apex, entire, glabrous or slightly pubescent on veins when young<sup>6</sup>. The inflorescence of the species possess terminal and axillary spike, which are, erect, slender and elongated, with remote axillary spikes at base, present in lower clusters<sup>7</sup>. The anatomy of A.spinosa shows the presence of vascular bundles in the pith, known as medullary bundles, in addition to the normal ring of vascular bundles<sup>8</sup>. The presence of medullary bundles has been reported as an 'anomaly', which according to Esau is 'a growth pattern which occur less common'<sup>9</sup>. The nutritional composition of spiny Amaranthus is carotene (11.94), Vitamin C (43 mg), calcium (374 mg), carbohydrates (5.0g), protein (5.3g), fat (0.1g) 100g of the edible portion<sup>10</sup>.

### Materials and Methods:-

#### Taxonomical studies:-

The fresh plant within one week of flowering was collected. It was identified and was subjected to taxonomical identification of different characters. The plants were worked out with the help of The Flora of The Presidency of Madras (Gamble) Volume 2. The characters and variations were noted. The herbariums of the plant species were also prepared.

**Anatomical studies:-**

Some mature and fresh parts of the leaves, stems and roots of the species among were collected. With the help of a razor blade different transverse sections of stem and root were obtained by cutting along the radial plane of a cylindrical portion of the stem and root. Leaf was dissected with the help of papaya pith. All the fine dissections were kept in watch glass along with water. The sections were mounted as performed by Omosun, with modifications. The obtained sections were mounted temporarily; photographed using Leica photomicroscope and the characters were noted. Safranin was used to stain the sections and glycerine was used as the mountant. The sections were then photographed.

**Biochemical analysis:-**

The fresh plant material was extracted in water, acetone, methanol, and chloroform and the presence of various biochemical entities were checked qualitatively. The qualitative analysis was done by the procedures of Sadashivam and Manickam<sup>11</sup>. Qualitative analysis for carbohydrates was performed by Molisch's test, iodine was noted by iodine test. The presence of reducing sugars was confirmed by Benedict's test. Biuret test and Ninhydrine test were performed for the confirmation of proteins and amino acids respectively. Ferric chloride test were performed for the confirmation of tannin. Qualitative analysis of flavonoid and phenolics were also carried out.

**Quantitative analysis for biochemical constituents in plant samples:-**

The total moisture content was determined based on Jim et al. in 1999. The differences in weights of fresh samples and oven dried samples were determined to find out the total moisture content. Carbohydrate content was measured spectrophotometrically (Hedge & Hofreiter, 1962)<sup>10</sup> using anthrone method. Glucose was used as the standard. Reducing sugars were determined based on Miller, 1972. Starch content was estimated spectrophotometrically using anthrone reagent (Hedge & Hofreiter, 1962)<sup>10</sup>. Determination of crude fiber was carried out by the method of Maynard, (Ed) (1970). Protein determination was carried out based on Lowry et al., 1951<sup>12</sup>. Determination of amino acid was carried out following the protocol of Moore & Stein, 1948. Total phenol content was detected spectrophotometrically based on Mallick & Singh, 1980<sup>7</sup>. The tannin content was determined by Vanillin Hydrochloride method. Flavonoid content was determined spectrophotometrically.

**Results and Discussions:-**

The taxonomical characters of *A. spinosus* suggests that it an erect annual herb with green spiny stem which is sparsely pubescent. It was earlier reported that the leaf is glabrous. In the present study presence of small microscopic hairs in the leaf suggests it to be sparsely pubescent and hence a new trait in identifying the species. The inflorescence is catkin type and is green in colour is similar to the one reported by Xian S, 2003 but the presence of spine throughout the length of the spike is also reported in the present study. The 5 lobed structure of the perianth can also be used as a major lead in identifying the species.

**Table 1:-** Description of vegetative characters in *A. spinosus*.

Vegetative characters	DESCRIPTION
Habit	Erect annual herb
Stem	Green, erect, branched, glabrous, spiny, terate
Leaf	Alternate, sparsely pubescent, ovate margin,
Root	Tap root, highly branched

**Table 2:-** Description of reproductive characters in *A. spinosus*

Reproductive characters	DESCRIPTION
Inflorescence	Terminal, axillary & nodal, green spikes, catkin type, spines present
Flower	Male flower in terminal spike, female flowers only in nodes, perianth 5 lobed, bract length equals perianth length

**Figure 1:** *A. spinosus* L.

**A.** Habit **B.** Male flower **C.** Female flower **D.** Fruit **E.** Seed V.S **F.** Female Flower L.S **G.** Floral diagram: Female flower **H.** Floral diagram: Male flower

The stem anatomy shows the presence of a single layered epidermis with papilose elongated cells. The cortex is composed of lacunar collenchyma. The vascular bundles are scattered and numerous. The pith region has the presence of sandy crystals. The leaf anatomy suggests that it has the presence of multicellular epidermal hairs. The vascular bundle in the midrib region is C shaped with a large apical vascular bundle. The results were almost similar to the one reported by Chandurkar 1983 except for the presence of lacunar collenchyma in the cortex region.

**Table 3:-** Anatomical description of *A. spinosus*

Vegetative parts	Description
Stem	Epidermis: 1-2 layered papilose elongated cells Cortex: 8-10 layered lacunar collenchyma Vascular bundles scattered Pith zone contains sandy crystal
Leaf	Epidermal hairs present only abaxial surface Vascular bundle C-shaped
Petiole	5 C shaped vascular bundle with basal bundles small and apical one large
Root	Secondary xylem more than 7 and arranged in two groups. Distribution of parenchyma

**Figure 2:** *A. spinosus* L. S (a) Stem (b) Root (c) Leaf

Ali Khoddami 2013<sup>13</sup> reported that carbohydrate starch reducing sugar proteins and amino-acids can be extracted effectively by polar solvents. The result obtained here was almost similar with slight variations like *A. spinosus* showed a positive result with acetone which is a non-polar solvent but showed absence of starch when extracted with polar solvents. According to Sowmya and Lakshmi Devi in 2013<sup>14</sup> carbohydrate and proteins were extracted effectively only in ethanol, contradictory to this report, the present study shows that carbohydrates and proteins could be extracted using aqueous and acetone also. Tannin, flavonoids and phenolic were qualitatively estimated and the result shows that tannin was present only in alcoholic extraction of sample. All the other polar and non-polar solvents showed complete absence of tannin when extracted. Phenols and flavonoids were extracted using alcohol and acetone. Rest of the solvents shows its complete absence. This was similar to the one reported by Okwu, 2004. According to the qualitative analysis it could be concluded that polar compounds could be extracted with polar solvents and non-polar compounds with non-polar solvents.

Quantitative analysis shows that *A. spinosus* has protein and amino-acids in large concentration than the other biochemical compounds. Soluble sugar content as reported by Begum in 2000 is 5 mg/100mg of tissue. The present study gave almost similar value but by a marginal increase of 0.55 mg. Starch content was in close proximity with the one reported by Costea et al., 2001. The protein content and amino acid content was higher than the one reported by Begum in 2000<sup>15</sup>. The result obtained was also in close proximity with the one reported by Haque in 1985. Secondary metabolites obtained were present in minimal amounts in both the species. Tannin, flavonoid and total phenolic content were much lower than the concentration reported by Akubugwo et al. in 2007. According to his report the values for flavonoid, tannin and phenols were 0.83, 0.49 and 0.35 mg/100g of sample respectively. The

present study shows that the content of flavonoid gave a lower value of 0.0002mg. Tannin content and total phenolic content was also lower than the one reported earlier and ranged from 0.0001 and 0.0021 respectively. The increase in tannin, flavonoid and total phenolic content in both the species treated with inorganic fertilizer can be attributed as a stress response of the plant against salt stress, caused by the usage of inorganic salts. With respect to the experimental data, it can be concluded that plants treated with organic nutrients make a more nutritious and filling diet

**Table 4:-** Quantitative analysis of different biochemical components (100mg of sample) in *A.spinosus*.

Biochemical compounds	Concentration /100mg of sample
CARBOHYDRATES	5.55
REDUCING SUGARS	3.19
STARCH	3.56
PROTEIN	7.14
AMINO ACID	6.16
TANNIN	0.0001
FLAVONOIDS	0.0002
PHENOLICS	0.0021

**Table 5:-** qualitative test with different solvents

TEST	Aqueous	Ethanol	Petroleum ether	Acetone
Molish's test	+	+	-	+
Iodine test	-	-	+	+

Test for phenolics	-	+	-	+
Test for flavonoids	-	+	-	+

### Conclusions:-

The taxonomical character of *A.spinosus* suggests certain new traits for identifying the species. In the present study presence of small microscopic hairs in the leaf suggests it to be sparsely pubescent. The presence of spine throughout the spike and the 5 lobed structure of the perianth can also be used as a major lead in identifying the species. The anatomy of the species were similar to the previous reports except for the fact that cortex region of the stem showed the presence of lacunar collenchyma. According to the qualitative analysis it could be concluded that polar compounds could be extracted with polar solvents and non-polar compounds with non-polar solvents. Quantitative analysis shows that *A. spinosus* has protein and amino acids in large concentration than the other biochemical compounds. Increased concentration of nutritive compounds and decreased concentration of secondary metabolites suggests it to be a more filling diet.

#### Abstract

In *The Man in My Basement*, Walter Mosley attempts to analyze the depths of the psychodynamic consequences of prejudice. The novel symbolizes the troubled self of the individual black American, who has to reject the given masks imposed on him by whites and see himself as an autonomous individual. With the tropes of masking (concealment) and unmasking (revelation), this paper discusses the cultural and identity distortion of the African American and focuses on the process of his self-actualization through an operation for a cultural amendment in order to secure his subjectivity. The itinerary of this emerging self or regeneration constitutes the kernel of this paper.

#### Introduction:-

The history of African Americans is the history of a marginalized people with fragmented identities. The contemporary writing perspectives by African Americans are imbued with counter discourses that strategically reverse sail in order to bring an amendment to history. Walter Mosley’s *The Man in My Basement* is no exception. It specifically focuses on cultural amendment in the African American individual character as a step towards self-actualization.

In *The Man in My Basement*, Walter Mosley explores race and identity, and attempts to rewrite black identity into existence. Through a personal crusade, which highly articulates the “two-ness” of African Americans, the author first poses a black identity that hides behind the mask (the liar), and then proposes to “find ourselves” by “wearing the mask.” Thus, the novel examines the African American conflict between his desire for a private individual and his social responsibility, his inner struggle and tensions for a subjective self.

The major concern of this paper is to explore African American identity, focusing on the dialectic of the mask: between self-concealment and self-revelation. More specifically, I explore the process of self-actualization; first by articulating the existential and fragmented experience of the “man in the basement” focusing on the syndrome of invisibility, and then by framing the way the novel deconstructs this invisibility syndrome for an autonomous and authentic identity. The two sequences above constitute the framework of this paper.

#### External and Internalized Racism: Distortion of Identity:-

As Anderson Franklin and Nancy Boyd-Franklin (2000) point out, “Racial identity is a central facet in the African Americans’ development of their worldview.” (34) In *The Man in My Basement*, Walter Mosley uses the mask to reveal the difficulty in fully articulating a black self. In both a literal and an abstract sense, the mask plays a

significant role within the narrative. It is a social mask, which corresponds to conscious knowledge. What it hides is the true self, the unconscious self that is hidden behind the mask. Black people indeed, become recognizable only when they suppress their real self and conform to emasculating parodies of the white man's self-contradictory image of them.

Positing the mask as an important trope of African American identity, the concept of self-projection and perception by the others, we can hypothesize that Charles Blakey, the main character epitomizes African American dual self, an incomplete self-seeking integration into the social fabric. In order to understand this existential individual, it is pertinent that we see this being from the dual perspective of the mask: concealment and revelation. Put otherwise, what does it hide? What does it reveal?

The first use of the mask image is the expression of concealment as experienced by Charles Blakey. From this standpoint, Blakey is constructed as a character seized by psychological tension, struggling with self-definition and perspective, oscillating between a first self and a second self. As a matter of fact, whites' dominance over blacks is a combination of material as well as symbolic containment of blacks; they have been socialized and institutionalized to act and behave. Blakey, who lives in "a secluded colored neighborhood way back from the highway," (3) is burdened with a marginal identity. He develops a sense of worthlessness which is the result of his internalization of inferiority.

As Anderson Franklin and Nancy Boyd-Franklin (2000) write, in a racialized context, individuals are likely to "believe that their true personality and unique abilities are hidden by a cloak of psychological invisibility woven by attitudes of prejudice and discrimination on the part of others." (34) They conceptualize it as the "invisibility syndrome." This subjective sense of psychological invisibility, as they point out, "takes the form of a struggle with inner feelings and beliefs that personal talents, abilities, and character are not acknowledged or valued by others, nor by the larger society, because of racial prejudice." (33)

It is this invisibility which is experienced by Ralph Ellison's invisible man. It is as though he were surrounded by "mirrors of hard, distorting glass." People see only his "surroundings, themselves, or figments of their imagination," except him. (*Invisible Man*, 1952, 7) In the same fashion, Blakey connects his experience to the collective unconscious about the legacy of depersonalization and dehumanization associated with African American history. It is toward the end of the narrative, that he became aware of his invisibility, his invisible presence.

Before Anniston Bennet had come into my life, I was invisible, moving silently among the people of the Harbor. No one wondered about me; no one questioned me. Even my best friends simply accepted what they saw. The card player with a sharp tongue who couldn't back up half the things he said. The petty thief, the man across the street, dead Samuel's son. I might as well have been a tree at the end of the block. People saw me well enough to walk around, but that was just about it. And for my part I treated everything and everyone around me in the same way. (207)

Confronted with prejudice and discrimination, Blakey develops a psychological struggle for acceptance. People around Blakey do not pay attention to his inner existence. They visualize him only as a symbol, an abstraction. Blakey appears as a split subject, a victim of the dialectic between the private and the public, between the inside and the outside. As a matter of fact, he appears as a ghost, a shadow of himself. Under some gazes, Blakey appears as an invisible person; for he wears the mask of invisibility.

To some extent, racism blinds blacks to reality, and generates internal conflicts from the choices it demands. As a result, blacks' life is a simulation; that is the acceptance of artifice, of role playing, or the assumption of disguise as a way toward moral truth. This moral truth consists in wearing a mask to hide one's true image from their oppressors in order to stay alive, as the dying grandfather in Ralph Ellison's *Invisible Man* has recommended the protagonist's father: "Live with your head in the lion's mouth. I want you to overcome 'em with yeses, undermine 'em with grins, agree 'em them to death and destruction, let 'em swoller you till they vomit or bust wide open.'" (17)

This duplicity is a survival strategy which impacts on blacks' lives. It takes them aloof from reality, above ground or on the surface. In the process, what is authentic or real stays underground, hidden in a secret sanctuary. As Traise Yamamoto (1999) writes, "While masking can be used against self, used by others to deny singularity and subjectivity, its function as concealment points to its potential doubleness." (117) Concerning Charles Blakey, the

mask has completely obscured his identity and the symptoms of this invisibility syndrome operate in a number of ways. Basically, he sees himself and behaves according to what is expected from him by the others. With the feeling that his own worth is not valued or recognized because of prejudice and racism, his personal identity and ability are undermined.

He goes through that experience when Mr. Anniston Bennet came to him in his basement and told him: "I can make it very much worth your while." (5) For Blakey, this is a racist affront, a racial slur which creates and confirms within him the feeling of not being seen as a person of worth. It is this implicit assumption that Blakey tries to articulate in the following: "It was his tone that cut me off. Suddenly he was one of those nonsense-white-men in charge. What he seemed to be saying was 'I know something that you had better listen to, fool. Here you think you know what's going on when really you don't have a clue.'" (5)

Of course, these kinds of racial slurs are disorienting, distorting. They breed confusion and disillusionment. According to Anderson Franklin and Nancy Boyd-Franklin (2000), the outcome of "everyday racism becomes a part of the individual's intrapsychic structure; it is a catalyst for feelings of invisibility, which incline one toward alternative roles that appear able to resolve conflicted identity and provide acceptance." (37) Blakey sees himself through Bennet's eyes, and he lives in a zone of invisibility, an imaginary or assumptive world. In his daily life, Blakey strives to adapt to this experience of racism, this subjective experience of invisibility, which shows his superficial being instead of his authentic or intimate nature.

Moreover, Blakey remains affected by the syndrome of invisibility even in his relations with the members of his racial group. Oscillating between the invisible and the visible, Blakey struggles for a psychological visibility, perhaps to compensate for the indignities of racism. Telling lies is, for instance, one manifestation of his invisibility syndrome. As he puts it,

I've lied all my life. To my parents and teachers and friends at school. I lied about being sick and not coming in to work, about romantic conquests, my salary, my father's job. I've lied about where I was last night and where I was right then if I was on the phone and no one could see me. I have lied and been called a liar and then lied again to cover other falsehoods. Sometimes I pretend to know things that I don't know. Sometimes I lie to tell people what I think they want to hear. (51)

In order to gain the acknowledgement and the validation of the members of his group, Blakey becomes a ghost, a shadow of himself. He has become a constant liar; his life is made of facticity, falsehood, and irresponsibility, which are the ways he adapts to the contours of racism and people's expectations. As he notes,

The only chance I had at intimacy was with Clarence and Cat, but 90 percent of my time with them was spent under the influence of alcohol (...) Nobody saw me (...) Bethany and Narciss saw something that was like me — an image of what I thought I wanted to be — but they had no idea what was on my mind. (207-208).

Close to telling lies, Blakey is also a thief, another symptom of his invisibility syndrome. Stealing derives from his willingness to conform to social constraints and norms. An exemplary instance is when he got fired as a bank teller from Harbor Savings because he has stolen money in order to satisfy his girlfriend's desires: "My account was empty because I had paid for an electric food processor and China wanted to be taken out." (28)

This marginal social status due to racism is reinforced by the haunting memory of his uncle Brent that dominates Blakey's behavior. Actually, though racism is an absent cause in the narrative, Blakey's attitude is deeply affected by racial prejudice and discrimination. Early in the story, he makes a link between Bennet and his own uncle, Brent, a detail that resurfaces at various points in the novel. This connection or association holds from the fact that Brent unconsciously perpetrates white racism on him. Uncle Brent has internalized white racism, and behaves exactly like an Uncle Tom, a black who perpetrates whites' absurd racial myths. He blames the black race, and it is that self-blame that he projects onto Blakey whom he sees as a failure. "My uncle Brent used to say that I was lazy and worthless. He said it whenever my mother was out. 'I'm surprised that a boy like you don't starve 'cause he too lazy to lift the fork to his lips.'" (69)

For Uncle Brent, Blakey's life is doomed to failure, and this has something to do with his skin color. "Ricky was darker than his cousin but not nearly my color. When my uncle Brent used to see us coming, he'd say, 'If it ain't the three shit-colored patches on a tatty brown quilt.'" (9) White racism is relayed by him and his comments and judgments reflect whites' ideological fantasies about blacks, which affect Blakey's behavior. Blakey actually inherits the burdens, the expectations of his uncle, and his personal life and development are deeply impacted by stereotyped assumptions.

Influenced by the dominant white cultural values, Brent contributes to the distortion, the marginalization of the black race. For him, as Blakey reports, "Negro so poor, that he'd sell his shadow just to stand in your shade." (21) In addition, he used to hold a contradictory and debasing view about the Blakeys. Charles Blakey says that he used to steal money from Brent because

My father's family had come directly from Africa, but Brent said that my father really didn't know our roots. He said that we were like all other American blacks, that we came from 'slave-caliber Negroes who were defeated in war and sold into slavery because they didn't have the guts to die in battle.' He said that there was no such thing as free Africans who had 'chosen to come over and sell their labor in indentured servitude' and that American Negro citizens never existed before 1865, as my father claimed. (30)

Assigned to a zone of negation, Blakey has definitely succumbed to the distorted images ascribed on him by his uncle. "I was everything that my uncle Brent said that I was, and less. Nothing ever changed and I never got any better or worse." (104) For these reasons, Blakey despises him, holding him as responsible of his failure. "I blamed Brent for everything that ever befell me. My father's death, my mother's, the feeling I had that I couldn't tie my shoes right – all of that I blamed Brent for." (70)

On the whole, Blakey is the victim of an assumptive blackness which signifies absence, failure, meaninglessness and worthlessness. Confined in social expectations, definitions, norms and categorizations that negate the black self, Blakey's worldview is reduced to superficiality. His own self is blinded by the reductive and demeaning gazes projected onto him out of racism. Thus, locked in social conventions, stereotyped assumptions, his knowledge of the world is always biased. That bias is here rendered by his incapacity to appreciate a painting:

If I think a painting is ugly, somebody just tells me that I don't understand. If I think a painting is good, they tell me the same thing. It's like artists see a different place, a higher place, whereas I'm on the level of some stray dog who only knows how to hunt for pussy and food in a world that's black and white. (92)

Within imposed definitions of reality, what people see in him is not his true self, but what he has to pretend to be according to social constraints and norms. He wears an existential mask, a mask for a meaningful existence, which hides his demented world. His interactions with the people evolve from superficial rather than authentic and intimate relations. He has learned to repress not only his emotions, but his humanity. Alienation and psychological distress or paralysis, are among others the disorienting effects of his psychological invisibility. Ultimately, he sinks ineluctably and metaphorically underground:

I went back into the kitchen as if I were descending into a pit. Every step brought me lower. And all it was was just that double d; a stuttering skip and my fingers were tingling, the light in the room refused to illuminate. I didn't feel hungry; I didn't want a drink. My months of unemployment, my loneliness, my drunken poverty all came to the surface then. I would have liked to cry but I couldn't. The prince in my novel was reduced to a mass of unreadable words. (95)

Blakey's whole life is conditioned by white racism: an actualization of the white man's fantasy. All his experience brings to light the fact that he has been living in a world of illusion, imprisoned in his double consciousness: the mask which oscillates between the lens of the others and his perception of his existence. Locked in the conflicting cages of identity (who he should be and who he is), his self is cloaked within the imaginary realm of the mask. The source of his self-actualization, as the novel suggests, resides in the mask as the symbolic mandate for a recovery of the self, the overcoming of identity distortion.

### The Rehabilitation Process: Resurrection of the Black Self:-

*The Man in My Basement* deconstructs the experience or the syndrome of African American invisibility. In the perspective of recasting a new black identity, the novel functions as a conversion narrative, which implies a movement from inside to outside for an emerging sense of self-discovery. As Sean Homer (2005) writes, Hegel elaborates that "For the human subject to emerge it must not simply be conscious of its own distinctiveness but must be recognized as a human subject by another." (23) Self-hood therefore emerges through a process of developing self-consciousness triggered by a self-reflection activity. Self-consciousness in the novel is symbolized by protagonist's assimilation with the cultural heritage and materialized by his ancestors' relics which have been stored and forgotten in the basement of the familial house. Among those ancestral objects, the prime are three masks, three "passport masks" whose story or cultural significance help Blakey recover the truth about his identity. The masks here are no more figurative, but literal and they are no longer playing self-concealment role; but rather operate in the realm of self-revelation.

Thus, in order to come to self-consciousness, and overcome his invisibility, Blakey metaphorically travels inward to look inside himself with his own eyes, not from the eyes of others to discover his true self. In this perspective, "the man in his basement" stands as a metaphor of himself, his truer self that needs to be discovered for self-recovery. *The Man in My Basement* is therefore a quest for the self; and the development of Blakey's personal identity is a dynamic process of auto-revelation for self-realization, which evolves over the course of the novel, following a reversing sail trajectory.

It is a metaphorical quest into Blakey's black psychology, materialized by a self incarceration, an isolation or confinement into his basement, during which he receives help, guidance and lessons from two pivotal characters: Anniston Bennet and Narciss Gulli. The basement where he works as Bennet's warden, is described as "a large, dark room crowded with stuff from the Dodd and Blakey families. A little something was there from every generation. I had one great-auntie, Blythe, who considered herself a painter..." (39) This basement, according to Blakey is "more like a crypt." (37) But unlike the traditional aim of the prison for the African American: a system whose purpose is to define, confine, and control black Americans; Blakey's self-incarceration is a psychological prison which helps him reshape his identity from negative self-image to new positive self-image. In other words, it is an imprisonment that helps him break the iron bars of the white physical imposed prison.

When Bennet asks permission to inhabit Blakey's basement, he is asking to enter Blakey's inner world, his interior world, which will later reveal that which is hidden in Blakey. In accepting Bennet in the basement of his house, Blakey is begrudgingly accepting to uncover accidentally and make alive his past through the cultural objects of his ancestors. It is a confrontation with his past, his culture, a confrontation with himself. It is a self deeply anchored and abandoned in the basement of the house. Therefore, in opening his basement for Bennet, Blakey is unknowingly venturing upon a journey towards selfhood, that is a journey to meet himself, "the man in his basement." Among other things, the basement stands for the individual's interiority, or intimacy, the individual's consciousness. As Blakey argues, it is not for money, but because of knowledge and intimacy, that he has agreed to give in his basement to Bennet:

Anniston Bennet knew more about me than any other person – and he was still willing to enter this business deal. Those shocking blue eyes looked right into mine and knew what they were seeing. Not like Bethany and not like Clarence. Unlike Uncle Brent, Bennet made no judgments. If he felt he was better than me, it was only because he felt better than everyone, and that, in some strange whiskey-soaked way, made an equal in the world – at least in the world as seen through his eyes.  
124

Blakey and Bennet become associates, collaborators; and the primary lesson or principle Blakey learns from Bennet is that lies can destroy and be fatal instead of guaranteeing one's life. In other words, Bennet encourages Blakey into throwing off his mask, his invisibility syndrome. "In my experience, Mr. Blakey, people rarely renege on their promises. It's always easier to keep your word than to enter into lies or intrigue." (74) This requirement is supposed to jar Blakey into an awareness of his true nature, and activate the process of his self-recovery. Upon Bennet's requirement, Blakey is first a bit hesitant. He muses:

Looking back on it I should have been scared by his words, but instead I was confused. I wondered what point of view could see honesty as the stronger virtue in a world I knew was full of cheating and lies. Didn't they lie in commercials on TV and ads in newspapers? Didn't politicians lie about what they've done and what they're about to do? Clarence lied all the time to his wife, and he had more girlfriends than I did. (75)

When he accepts this principle, which is inscribed against the syndrome of invisibility imposed by the social norms and expectations, Blakey simultaneously accepts to re-envision reality. One reality he has become aware of thanks to Bennet is his visibility. Indeed, by spotting Blakey down in that black neighbourhood, and asking to use his basement, Bennet is contradicting Blakey's invisibility. It is a fact that contributes to arouse the fiber of visibility in Blakey, which eventually helps him connect with his deep self. Later, his closeness with Bennet makes him realize that there was no significant difference between him and Bennet. Though both men are racially different (Bennet is white and Blakey is black), the novel works to melt away or cleanse this human characteristic or categorization toward the end. The novel reveals no particular difference between Bennet and Blakey; they are just symbols of human identity, and both men experience self-imprisonment for self-rehabilitation.

Sharing almost the same experience with Anniston Bennet, Blakey engages into self-discovery. As a result, he confesses: "It was then that I realized what had happened to me. Really, what had happened to the world around me. Before Anniston Bennet had come into my life, I was invisible....And for my part I treated everything and everyone around me in the same way." (207) What Blakey realizes here is the permeability of the mask he has been wearing. Bennet knew everything about Blakey before both men met for the first time; this fact is a testimony of the superficiality of the mask. Before meeting Bennet, the use of this mask has allowed Blakey to shy away from his interlocutors.

When he asserts: "But now everything was different – half different, really," (207) it is like he has torn the quilt, the veil that has blinded him so far. He elaborates on the change as he states:

What had changed was that I saw. It was as if everybody had become like a mirror, and I saw reflections of what they saw instead of what it was they were trying to show me or tell me. Narciss had become a mirror and an echo chamber, giving me back every word uttered and gesture made. And when I saw or heard something I didn't like, I had the chance to alter my behavior. (208)

Moreover, Bennet teaches him that there is so much more to learn about the world, and nothing can be judged on absolute terms, because it is a multi-dimensional world based on simulation. The world is fluid and shifting; and sometimes reality merges into the unreal. As he summarizes, "There is more to the world than one plus one." (134) Bennet illustrates this lesson using the relationship between good and evil. According to Bennet, there is a dualistic conflict between good and evil. Evil is much more integral to the system of Good. Good turns into its opposite, that is, absolute Evil. Evil is just a mask that we contrast with Good that we are supposed to defend.

Blakey benefits from Bennet's philosophical knowledge and experience of the human nature to acquire a new vision of himself. However, Bennet is not the only agent who actually helps Blakey accomplish his self-actualization. Narciss Gulli, the curator plays a substantial role in Blakey's spiritual and cultural voyage for self-recovery. She is the one who teaches Blakey the function of the literal mask. For her, and as a specialist in anthropology, the masks found in the basement, are an art of individual assertion within and against the group. The acceptance of the masks is a metaphor of Blakey's reunion with black pride and African American culture. It is the manifestation of a rather positive meaning of blackness, a therapeutic intervention, which opens a space for possible transformation.

At the outset of their discovery, Blakey actually does not highly rate the objects in his basement. For him, they are useless, just "a pile of refuse that, if it weren't for her concern, I would have used to make a bonfire in the backyard." (57) Inside that pile, "there were three hand-carved masks, rust to dark brown, ivory I was sure." (62) For Narciss, these masks are the repository of Blakey's family history, his ancestors' soul, their identity, as she states: "It's the history of your history," (63) or, "the spirit of your heritage." (64)

In Narciss's lessons to Blakey, the salient perspective is the following: "Everything I know about antiques comes from the inside out. It's more than a business with me; it's a way to see our history." (65) It is this anthropological principle, which reverses the angle of vision: from the inside out but not from outside in. This strategy operates

Blakey's transformation. This principle poses the self, not as the objectified being, but the subject that perceives. In other terms, instead of being seen through the lens of the others, one has to see oneself through one's own self-defined perspective.

Blakey now assimilates himself with his ancestor's culture. The attachment with the masks is an effective way of reversing cultural hegemony and reviving African American culture. Like the nameless hero in Ralph Ellison's *Invisible Man*, Blakey has been looking for himself. When he finds out about the masks, he comes to the realization that his cultural heritage defines him. He has just discovered that he has been an invisible man.

I was looking for myself and asking everyone except myself questions which I, and only I, could answer. It took me a long time and much painful boomeranging of my expectations to achieve a realization everyone else appears to have been born with: That I am nobody but myself. (Ralph Ellison, 1952: 17)

By accepting the masks of his ancestors, Blakey breaks down the psychological barrier between the figurative mask and the literal mask, and thereby makes the mask as an element of superficial identity into a real and substantial object of identity. The mask, in its figurative sense (superficiality), has completely obscured Blakey's identity. With Bennet and Narciss, Blakey has realized the superficiality of his invisibility made possible by the mask. This realization is a significant stage in the self-discovery. Blakey's re-connection with the masks liberates him from his dualistic relationships for a better knowledge and understanding with his fellows. Thus, as Zizek (2001) points out,

'Role-playing and disguise can lead to a liberation and realization of the self.' "The dialectic at work here is that of symbolic identification, of assuming a symbolic mandate: insisting on a false mask brings us nearer to a true, authentic subjective position than throwing off the mask and displaying our 'true face.' (38)

The mask is the seat of one's personality, and research done by Narciss, the anthropologist reveals that Blakey's ancestral masks were used as passport.

That's what this is and it's also what we found in that box. They were used as identification but also as a way of bringing home along with you when you were away on a long journey. It's hard to say, but the masks you have could represent a family, maybe three brothers or friends who set sail for America as indentured servants. The majority of passport masks are made of wood, so the fact that these are ivory might have special significance. (96)

Thus, instead of concealment, the masks here are self-revelatory, passport for self-recovery or symbolic mandate for self-identification. What they reveal is contradictory to what Uncle Brent used to deny. The masks "were used for tribal identification, but they also were to remind their owner of their home and family – their people." (141) Through them, Blakey learns that his ancestors were indentured servants instead of slaves, and that his family "might descend from a direct bloodline of kings." (96)

The masks represent an important tool to fight back the invisibility and marginalization of the black experience. They are a source of a new life, and Blakey identifies with them. He bears a new meaning to them, celebrates them, and finds pride in them: "Every night I sat up late with my ancestors, Leonard, the geeky-looking one, Jojo, the warrior, and Singer, the mask with his lips set into an O. I named them and thought about them. I had made up their characters and histories, but they were real to me." (232) Blakey is now acutely conscious of the masks, his cultural heritage, and to some extent, his self-realization and assimilation with the masks entail self-consciousness. As he states, "I realized that my feeling of invisibility was false. People did see me. They knew when I passed in the street. My actions were noted no matter how small I thought I was." (223)

The masks have the potential to contribute to heightening the consciousness of black people about their identity; they are a source of his self-recovery, his self-empowerment that defies his invisibility. As Anderson Franklin and Nancy Boyd-Franklin (2000) argue,

The painful encounters with racism move some African Americans to immerse themselves in the ethnic and cultural traditions of African people as a means of attaining a status that provides an intrapsychic structuring for visibility. Achieving racial identity solidifies one's perspective about self in relation to others, and becomes a part of a protective mechanism shielding the individual from the effects of racism. (40)

The process of Blakey's self-realization is the process of his identification with his ancestors' masks. The masks discovered in the basement represent the hope of self-discovery which reconciles Blakey's racial and cultural heritage within the dominant white society. Blakey redefines himself by identifying himself with his ancestors' masks. Narciss Gulli is instrumental in Blakey's transformation, his self-realization. She specializes in anthropology, and she is a curator. Through her teaching about his ancestors' masks excavated in his basement, she leads him to self-discovery, and eventually he reshapes his self-identity, integrating the masks. The masks in question here are physical, they are cultural objects belonging to Charles Blakey's ancestors. The masks are metaphor of his African cultural heritage.

### Conclusion:-

*The Man in My Basement* is an exploration of race and identity. It is an existential and philosophical novel, which symbolizes a divided self or the projection of two selves, the true self and an imposed version of self. African American's life has been essentially led on the surface, hiding the ground where he has been obliged to hide his true self. *The Man in My Basement* is therefore a spiritual and archaeological journey into the African American familial treasure in order to excavate his real self. *The Man in My Basement* is therefore a cultural amendment.

In Walter Mosley's *The Man in My Basement*, the mask functions as a double-sided trope: a strategy of self-concealment to protect the subject and it serves as a metaphor for the construction of the true self, as well. In other words, it helps to hide the true identity, or make oneself invisible and, at the same time, it contributes to reshape the self for dignity, making the self visible. Realizing the devastating and marginalizing impact of racism, Mosley advocates the restoration of African Americans' identity through the celebration of their cultural heritage. My exploration of the individual's self actualization has focused on the trope of the mask first in its imaginary realm and then as a symbolic mandate.

#### Abstract

**Background:** Technology is becoming an essential part of life, especially for children born and growing up with it. Therefore, it is important to know how it is affecting them socially, physically and behaviorally. Different parents have different attitudes and behaviors that determine how they deal with their children, the variety of parenting styles can have different outcomes on the children's use of electronics.

**Objectives:** Firstly, to identify different parenting style among mother employees at Princess Nora University, then determine the effect of different parenting styles on the hours spent by children on electronic devices and lastly, assess the level of perceived potential negative hazards of electronics.

**Methods:** A cross-sectional study has been conducted, with a standard, multi-sectional modified questionnaire. Sample size was 280 females obtained by multistage stratified sampling.

**Results:** The most common parenting style was the Authoritative. Screen time use was positively correlated with permissive parenting style (.09), and was negatively correlated with the authoritarian and authoritative parenting style (-.01). The majority of mothers perceived that the use of electronics has a mild impact on their children's physical health. Overall, there is a significant relationship between permissive parenting style and setting restrictions on electronics use ( $p = 0.04$ ), and significant effect on children's time spent on electronics per week ( $p = .057$ ).

**Conclusion:** Findings showed no significance between parenting style and children's screen time use. However, children's health was affected, therefore, parents must apply restrictions on screen-time use.

#### Introduction:-

In recent modern days, parenting styles have changed according to the technological evolution. Every parent has a different approach to the uprising technological use depending on their parenting style which can be explained as

**Corresponding Author:- Eman M. mortada.**

Address:- PhD in public health and preventive medicine, Assistant Professor in health sciences department, Health and rehabilitation sciences college, Princess Noura Bint Abdelrhman University.

“parenting style as a typology of attitudes and behaviors that characterize how a parent will interact with a child across domains of parenting”<sup>(1)</sup>, and other authors defined it as “Complex activity that includes many specific behaviors that work individually and together to influence child’s outcomes. The construct of parenting style is used to capture normal variation in parents’ attempts to control and socialize their children”. As a result of the sudden invasion of technology and its increasing usage among children as they grow older ” Children’s screen time increases with age and patterns of screen time appear to be stable over time”<sup>(2)</sup>, and some studies suggested that communication and parenting style predicted disagreements between parents and children about technological devices and internet usage<sup>(3)</sup>.

Parenting style includes four basic patterns that were identified by Baumrind: The Authoritarian parents who are known to be obedience- and status-oriented are characterized by high standardized guidelines and demands, tend to be direct with their instructions and are unresponsive. Due to fear of losing control, they discourage open communication, provide ordinal and structural rules, which are expected to be obeyed by their children without any explanation. Authoritarian-Directive parenting can have two forms of styles: Authoritarian parents who are not intrusive or autocratic in their use of power, and authoritarian parents who are highly intrusive. The Authoritative parents who use supportive disciplinary methods are characterized by moderate demands, acceptance and responsiveness as well as open communication. They are assertive and restrictive rather than intrusive, thus setting clear rules and guideline for their children and tend to encourage their children to be autonomic, assertive and socially responsible as well as cooperative. The Permissive parents who are also known as (Indulgent) or (Nondirective) are characterized by high acceptance and responsiveness, and non-demanding. These parents lack control over their children and avoid confrontation. They are also known to be lenient, non-traditional, do not require mature behaviors and allow self-autonomy by giving their children the freedom to be independent .In some cases, some parents tend to be democratic permissive parents who are more conscientious, engaged and committed to their child unlike the non-directive permissive parents who are known to be less engaged and committed to their children. The Uninvolved parents who might encompass both rejecting-neglecting attitudes are characterized by unresponsiveness nor demanding, fail to monitor and supervise the child’s behavior and are uninvolved in with their children’s hobbies and activities.<sup>(4)</sup>

The Saudi community has shown an increased interest in technology in the past years, especially children and teenagers who are early adopters and heavy users of technology, who are referred to as digital natives and whose electronic devices are becoming an essential part of their daily lives, whether it’s for an educational or entertainment purposes<sup>(5)</sup>. This huge technology revolution alerted parents who are digital immigrants, about the impact of electronic devices on their children<sup>(5)</sup> and alerted them about several technological hazards which included intensive usage for technological devices, increased aggressive thoughts, angry feelings, physiological arousal, aggressive behaviors, and physiological desensitization to violence due to violent video game exposure<sup>(6)</sup>, and obesity, which is another hazard for technology use due to its bi-relationship with the amount of hours spent on devices like TV, computer and iPad, which means the more time spent on technology, the chance of becoming an obese increases.<sup>(7)</sup> A study conducted on parenting Style, the Home Environment, and Screen Time concluded that “The global increase in prevalence of childhood overweight and obesity has been ascribed to several trends including the increase in consumption of energy-dense diets and the increase in sedentary behavior (in particular the increase in screen time; time spent watching TV and on computers or game consoles)”<sup>(8)</sup>.

A great number of studies regarding parental control were conducted and concentrated on the impact of technology consumption on children’s physical activity and sedentary lifestyle “Parents with greater support for physical activity did not report higher use for parenting practices that restricted child’s screen media use. Greater reported use of restrictive TV parenting practices were associated with lower level of child PA”.<sup>(4)</sup> In contrast, there have been a number of researches conducted to study the benefits of technological devices use among children. In one study it was concluded that video games contributes to consolidates the cognitive skills by prompting reactions, improved alertness, attention and reinforces the mental abilities of children in addition to the satisfaction of emotional needs actively.<sup>(9)(10)</sup>

Level of autonomy available is affected by the number of children in a household and determined by the parents rules “family rules on watching TV are associated with less TV viewing and that high child autonomy is associated with more TV viewing”.<sup>(11)(5)</sup>

A previous study have highlighted that the amount of parent's knowledge about technology influences their control over their child's use of it. It was aforesaid that in many cases, parents who have enough knowledge about technology tend to check their children's browsing history and 30% of parents in the UK and US remain physically present to censor their children's internet use and go to the extent of blocking what they perceive as unsuitable.<sup>(5)</sup> In other words, parents have a great influence on their children's screen time.<sup>(2)</sup> Although parenting style was assessed in relation to different domains like (child's physical activity, dietary habits, and as mentioned previously, internet censorship). "Parental use of reinforcement styles for activity was positively related to children's physical activity. Parents' use of appropriate disciplinary styles was positively related to children's healthy eating"<sup>(12)</sup> and technology use on the side effects of the child's health and cognitive intelligence has been assessed in previous studies, yet gaps exist in assessing the association between the parenting style and the time spent on technology use. To fill this gap, we decided to conduct a study to assess the parenting style in relation to children's electronic use and try to identify the determinants of children's use of electronics especially the parenting style to see if a future intervention is needed.

#### **Research question:-**

Is there an association between different parenting style and children electronic use and screen time exposure?

#### **Hypothesis:-**

The screen time use is affected by the different parenting style.

#### **Objectives:-**

To identify different parenting style among mother employees at PNU. Then, to determine the effect of different parenting styles on the screen time and the hours spent by children on electronic devices use, and to assess the level of perceived potential negative hazards of electronics use, they observe in their children.

#### **Methodology:-**

##### **Study design and setting:-**

A cross-sectional study conducted from April 2016 to December 2016 at PNU.

##### **Target population:-**

PNU female employees in Riyadh, Saudi Arabia whom have preschool and school children, whether administrative and teaching employees, since mothers, not only spend a lot more time with children than fathers, but also has more opportunities than the father to influence her offspring's psychological growth and behavior.

##### **Sampling technique and sample size:-**

A multi-stage stratified random sample was done on the 13 colleges in PNU, which were categorized under three main types, which are Health Colleges, Science Colleges and humanities colleges. From them, we randomly selected the college of Art and Design, Computer and Information Sciences, Health and Rehabilitation Sciences, Business Administration, Arts and Sciences. Then total sample size of 297, was calculated by using open epi<sup>(14)</sup> adopting the following parameters: 80% power of the study to detect a statistical significant difference, 95% confidence interval and 34% of the members interviewed in the pilot study, reported that their children's exposure to electronic screens was less than 2 hours. The sample was stratified according to the number of administrative and teaching staff in each of the previously randomly chosen college.

##### **Tools for data collection:-**

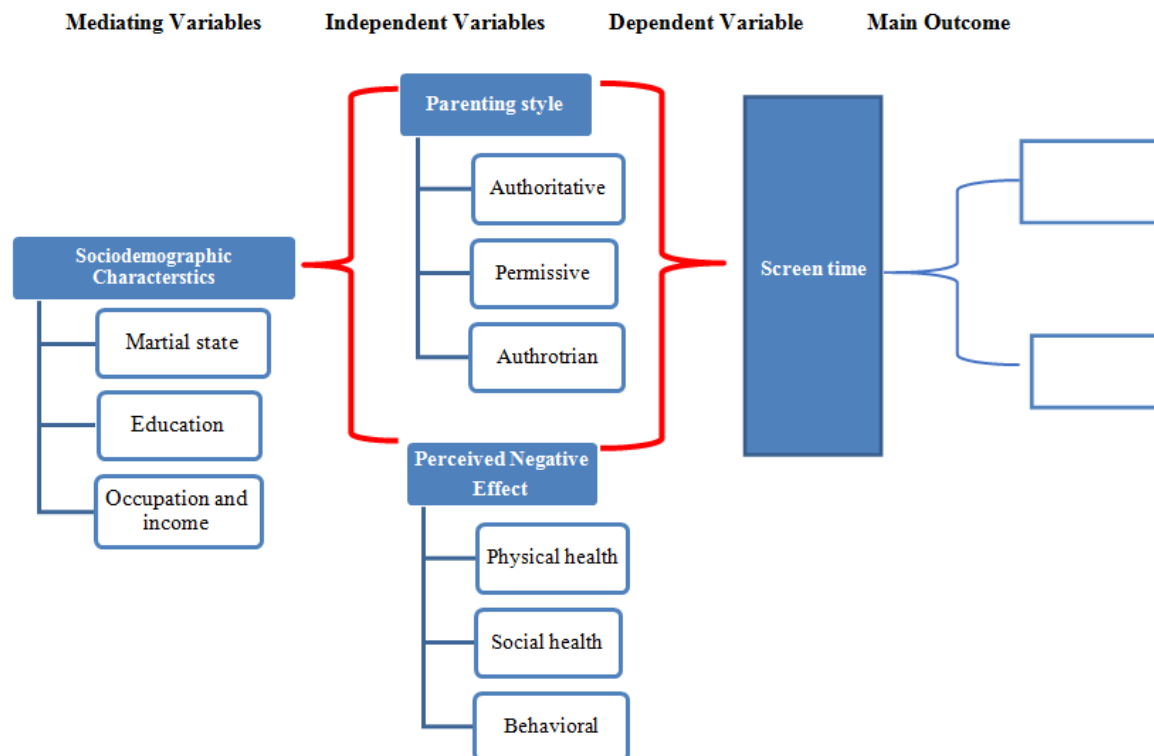

A standard multi-section modified questionnaire has been translated and used to collect data and it includes several parts and guided by the conceptual framework illustrated in figure 1:

**The first part** covers the family characteristics (Mother, father and children) and home-physical environment.<sup>(5)</sup> **The second part** includes questions about the use of electronic devices, which will include as the mothers were asked about the average time their child spent during recreational electronic use daily and during the weekend. In our study, we used 2 hours per day as the cut-off according to the international recommendations<sup>(14,15)</sup> in addition to asking the mothers about the frequency with which they set limits on the time of recreational electronics use. **The third part** of the questionnaire assesses the level of perceived potential negative hazards of electronics use, they observe on their children in different domains: **physical health** (9 items), **social relationships** (3 items), **behavioral changes** (2 items), and **educational performance** (2 items) with four point responses (None, Mild, Moderate and

Severe). <sup>(16)</sup>*The last part* is derived from the modified 21-item Parenting Styles and Dimensions Questionnaire (PSDQ) designed to categorize mothers' parenting style based on various behaviors displayed by parents towards their children. This scale has three dimensions that are authoritative parenting style includes (9 items), *authoritarian parenting styles includes* (6 items), and *permissive parenting style* includes (6 items). The response to each item is measured on a 5-point Likert scale, 1="never", 2="once in a while", 3="about half of the time", 4="very often", 5="always". <sup>(17)</sup>

#### Questionnaire translation process and validation:-

The questionnaire was translated into Arabic using forwards-backwards blind translation process by two bilingual expert translators, whose native language is Arabic and comparison (between the original English version and the back translation version) was done to measure the level Of agreement between both.

**Figure 1:-** Conceptual framework of factors used in the study

#### Pilot testing:-

The Arabic version of the tools has been pilot tested on 20 females in college of Nursing to assure comprehension and ease of administration, determining the time needed to fill the questionnaire in addition to calculating sample size based on the findings from the pilot study. According to the pilot test results, we made the necessary adjustments on the questionnaire. For example, we changed some of the open ended questions to close ended questions like age and nationality because a great number of participants left it blank.

#### Data management and Statistical analysis:-

After collecting data, it was analyzed by SPSS 20<sup>th</sup> version <sup>(18)</sup>. Checking the normality for the quantitative variables was performed using the Kolmogorov test, all variables were normally distributed except for the Authoritative subscale. Then the data were described by frequency and percentage for categorical data, mean and standard deviation for normally distributed continuous variable and median and IQR for the authoritative. Inferential analysis was performed using Independent T-test, One-Way ANOVA and for continuous normally distributed variables while Mann-Whitney and Kruskal-Wallis tests for continuous not normally distributed variables. Chi square to assess the association between recreational screen time use and educational achievement and social change. Spearman correlation coefficient to determine direction and strength of the relationship between different parenting style subscales and screen time use of their children on screen time. The reliability of the total parenting scale and its 3 subscales was assessed by using Cronbach alpha coefficient.

**Ethical considerations:-**

Before collecting data, an approval has been taken from the ethics committee and research center in health sciences and rehabilitation collage, PNU. Consent from the participant after being informed about the purpose of the study, the confidentiality of the shared information and anonymity of the participants.

**Results:-**

**Table 1:-** Personal Characteristics of mother employee working at princess Nora Bint Abdulrhman University (n=280)

Personal characteristics	Categories	Frequency	Percentage
Age groups (years)	25-35	137	48.9
	36-45	117	41.8
	More than 46	26	9.3
Nationality	Saudi	239	85.4
	Non-Saudi	41	14.6
Colleges	Art and Designs	63	22.5
	Computer and Information Science	42	15.0
	Health and Rehabilitation Science	54	19.3
	Business Administration	43	15.4
	Arts	41	14.6
Educational Level	Science	37	13.2
	High School	43	15.4
	Bachelor	140	50.0
	Master	41	14.6
	PhD	56	20.0
Work Nature	Educational	64	22.9
	Administrative	184	65.7
	Both	32	11.4
Marital Status	Married	261	93.2
	Divorced	13	4.6
	Widowed	6	2.1
Number of children	1-2	125	44.6
	3-4	112	40.0
	More than 5	43	15.4

Personal characteristics of the 280 mothers participated displayed in (Table 1). (48.9%) are aged between 25 to 35. (85%) were Saudi and (50.0%) of the participants hold a bachelor degree. (65.7%) of participants were administrative employee, (93.2%) were married, and the high proportion of them has 1-2 child (44.6%)

**Table 2:-** 0 Mean scores and the reliability scale for total parenting scale and subscales.

Parenting style	Minimum scores	Maximum scores	Number of items	M ± SD	Cronbach alpha
<b>Authoritarian</b>	6.0	30.0	6.0	17.97±5.60	.80
<b>Permissive</b>	6.0	26.0	6.0	16.48±4.01	.79
<b>Authoritative*</b>	9.0	45.0	9.0	32.15±8.66 Median=34, IQR=29-39	.88
<b>Total parenting scale</b>	25.0	89.0	21.0	65.96 ±9.46	.72

\* Not normally distributed

As shown in (Table 2), after calculating the mean score for the 3 parenting subscales and assessing their normality, we found that the average for the mean score of authoritarian subscale was ( $M = 17.97$ ,  $SD = 5.7$ ), the mean score of permissive subscale was ( $M = 16.48$ ,  $SD = 4.01$ ). Regarding the authoritative subscale the median was 34 and IQR was (29-39), and after assessing the reliability of three parenting subscales, wassatisfactory the Cronbach alpha coefficient were ( $\alpha = .80$ ,  $.79$  and  $.88$ ) forauthoritarian subscale, the permissive subscale and the authoritarian respectively.

**Figure 2:-** Different types of parenting style among PNU female employees.

According to the findings shown in figure 2, 44% of the participant mothers were adopting authoritative parenting style, 30% were authoritarian, while the rest 26% of participant were permissive

**Figure 3:-** Percentage of Screen Time Use by PNU Employee's children on Electronics Devices  
The majority of sampled mothers (63%) stated that their children spent more than two hours on their electronic devices (Figure 3).

**Table 3:-** Relationship Between Parenting Style, Perceived Negative Effect and Recreational Screen Time Use by The Children

	Recreational Screen Time		Test used	P value
	<2 h (n=103)	≥ 2 h (n= 177)		
<b>Variables</b>				
<b>Parenting Style</b>				
<b>Authoritative **</b>				
<b>M±SD</b>	31.98±9.03	32.24±8.45	-.22	.83
<b>Authoritarian</b>				
<b>M±SD</b>	18.10±6.04	17.90±5.41	.27	.78

<b>Permissive</b>				
<b>M±SD</b>	15.94±4.08	16.80±3.93	-1.65	.09
<b>Perceived negative effect</b>				
<b>Physical health problems</b>				
<b>M±SD</b>	3.65±3.99	6.75±5.16	-5.26	.00 *
<b>Behavioral health problems</b>				
<b>M±SD</b>	1.08±1.12	1.38±1.21	-2.03	.04 *

\*Significant difference at  $p \leq .05$ 

\*\* Mann Whitney

As displayed, there was no significant effect found for the three parenting style subscales on recreational screen time. Nevertheless, a significant difference was found between perceived negative effect and recreational screen time. There was a significant difference between mothers perception of both physical health problems and behavioral health problems and the recreational screen time they allow for their children,  $p$  (.00 and .04). (Table 3).

**Table 4:-** The Difference between Sociodemographic factors and screen time use

Sociodemographic factors	Categories	Recreational Screen Time		Total	Chi	P value
		2 hours No(%)	≥ 2 hours No(%)			
Age	25-35	62(60.2)	75(42.4)	137(48.9)	8.33	.02*
	36-45	33(32.0)	84(47.5)	117(41.8)

	Part time	11(10.7)	13(7.3)	24(8.6)		

\* Significant difference at  $p \leq .05$ 

As revealed, age of mothers was significantly related to the hours spent by children on electronics ( $\chi^2(2) = 8.33$ ,  $p = 0.02$ ). Younger Mothers aged from 25 to 35 (48.9%) are more likely to apply restrictions on time spent by their children on electronic devices than mothers aged from 36 to 45 (41.8%) and from 46 and more (9.3%). On the other hand, there was a significant relationship between the nationality of the mother and screen time use by the child ( $\chi^2(2) = 6.163$ ,  $p = 0.01$ ). (Table 4).

**Figure 4:-** Available Electronic devices for children in home

The most frequently available electronics for the children as stated by the mother were, iPad (76.4%), mobile (56.1%) and laptops (43.2%) (Figure 4).

**Figure 5:-** Practiced activities by the child on electronic devices

According to the mother's responses, the child's most practiced activities on electronic devices were video gaming (77.1%), internet surfing (49.3%) and activities on social media (23.6%) (Figure 5).

**Figure 6:-** Children with physical health problems as observed by their mothers due to Electronics use

The majority of the mothers perceived that the use of electronics have mild impact on their children physical health especially eye exhaustion, concentration loss, tiredness, headache and sleeping problems (41.8%, 41.1%, 33.2%, 30% and 28.9%) respectively as displayed in (figure 6).

**Figure 7:-** Children's behavioral health problems observed by parents

The most frequent behavioral changes the mothers observed on their children after using electronic devices were stubbornness, anger, hyperactive, violence, ignoring (4.3%, 15.7%, 4.3%, 6.8%, 2.1%) (Figure 7).

**Figure 8:-** Educational performance changes of children due to electronics use observed by mothers

The most observed change on the children's educational performance after using electronic devices as stated by the mothers was to the worse (42.9%) (Figure 8).

**Figure 9:-** Association between educational achievement and screen time use

After assessing the relation between educational achievement and screen time use, 50.8% of the children who their educational performance got worse spend equal or more than Two hours on the electronic devices (Figure 9).

**Figure 10:-** Mothers observations on social changes on their children

55% of the mothers did not observe social changes in their children (Figure 10).

**Table 5:-** The relationship between parenting style and child electronic use

\* Significant difference at  $p \leq .05$  Nationality is assessed by Mann Whitney

As illustrated in table 6, there was a significant association between permissive parenting style and educational level;  $f(257) = 3.23$ ,  $p = 0.02$ . There was no significant association between authoritarian parenting style and mothers characteristics, significant association between authoritative parenting style and nationality;  $t(232) = -4.19$ ,  $p = .01$ .

**Table 7:-** Correlation between Different Parenting Style Subscales and Screen Time Use of their Children on Electronic Use

	1	2	3	4
1. Screen time use	1			
2. Authoritative	-.009	1		
3. Authoritarian	-.020	-.356**	1	
4. Permissive	.090	-.272**	.488**	1

\*\*Correlation is significant at the 0.01 level (2-tailed).

As shown in the table 7, the authoritative and authoritarian parenting style were negatively correlated to the screen time use of their children ( $r_s = -.009$ ,  $p = .89$ ), ( $r_s = -.020$ ,  $p = .75$ ). Only the permissive parenting style is directly correlated to the screen time use ( $r_s = .090$ ,  $p = .15$ ).

## Discussion:-

The percentage of different maternal parenting style among female employees at PNU was identified and according to the findings, the majority of the participants were authoritative mothers and the minority were permissive ones. Our findings are consistent with a study conducted in Europe, where the majority were similarly authoritative, and the minority were authoritarian and permissive. It has been found that there is no significant correlation between different parenting style and screen time they allow for their children. In the authoritarian and the authoritative, the result showed a negatively correlated relationship with screen time. In contrast, permissive parenting style has a direct relationship, therefore, children with parents who are permissive have the ability to spend more hours on screen. Similarly, the permissive parenting style has a significant effect on the number of times the child use electronics per week, because of the low restrictions applied, then the other children with authoritarian and authoritative parents who apply high restrictions on screen time use. The association between permissive parenting style and television viewing among children, proportionate with the results of this study and showed that children with permissive parents were twice as likely to spend more hours watching TV compared with children from high-restriction families. <sup>(19)</sup> A body of researches has concluded similar results which stated that the permissive parenting style is associated with high rates of physical activities because of their support and low restrictions applied, unlike the authoritative parenting style which was not associated PA. Authoritative parent's children scored lower levels of physical activities because of their high demands, strict discipline and high restriction. Complementary to the previous findings, the authoritative parents were more likely to monitor their children's eating habits while the authoritarian parents apply restrictions on their children's eating habits unlike the permissive parents who were less likely to use restriction on their children in general. <sup>(20)</sup> The physical and behavioral wellbeing, and social ability of children were affected after the time spent on electronic devices as reported by the mothers and were more likely to be negatively influenced. Our surveys documented a statistically significant relationship between the screen time and perceived negative health effects on 63% of children who spent equal or more than two hours on electronic devices. The children's physical health was assessed and the results showed that the majority of children were suffering mildly from eye exhaustion, concentration loss, tiredness and headache, and sleeping problems, in addition to behavioral changes where children adopted violent and anger behaviors alone with social changes where children became unsocial. The educational performance was another important domain of the children's life that has been

influenced by the screen time use. A high percentage of mothers who reported that their children spent more than two hours on electronic devices faced a deterioration in their children's educational performance and in support for this finding, another study has suggested that heavy users of video games suffered from a detrimental effect on their educational performance, counter to the moderate users of video games and internet who had positive educational performance. Indeed, similar to our findings, a recent study conducted in Iran provided a robust evidence that more than 15% of children spend more than 10 hours per week playing video games and concluded that the longer the hours spent on playing games - the more negative affects detected such as aggressive behaviors. <sup>(21,22)</sup> Therefore, parents must apply restrictions to limit the effect of perceived negative hazards of electronics devices, and according to our study, an association between permissive parenting style and educational level was noted and a study conducted in Saudi Arabia found that there is a relationship between the parent's educational level and knowledge about internet use and risk of websites on children and unexpectedly suggested that the educational level of parents had no significant effect on how they apply restrictions on their children's internet use along counter to our study. <sup>(23)</sup>

Age of mothers played an important role in determining the application of restrictions upon children's screen time use and it was found that younger mothers are more likely to force restrictions upon their children compared to older mothers who were less likely to apply restrictions.

#### **Strengths and Limitation of the study:-**

To our knowledge, it is the first study in Saudi Arabia that assessed the effect of different parenting styles on the hours spent by children on electronic devices. In addition, we used a tool proved to be of high validity and reliability. The study faced several other limitations such as the short time of the study was an important obstacle that has limited the research, especially the data collection phase in addition to the availability for employees that also has affected the data collection because most of them were either on vacation or on giving lectures. In addition, no enough body of researches conducted in Saudi Arabia on the parenting style and its effect on the children's electronic use, which has made the comparative analysis difficult.

#### **Conclusion:-**

Our study presented findings that showed there is no significance between parenting style and level of control on children screen time use. However, children's physical, behavioral wellbeing, social and educational performance were affected when children spent more than two hours on electronics. Hence, parents must apply more restrictions and limitation to bind their children from the perceived negative hazards of electronic.

#### **Recommendations and Implications of the research:-**

The results we concluded in our study may participate in the implication of extensive policies therefore the following are recommended:

- 1- Additional studies in this domain are recommended in order to understand the effect of maternal parenting style on the children's electronic use on a bigger sample using different type of studies to generalize the results.
- 2- Further interventions are needed to improve the awareness of parents on the effect of electronic devices on children and how to deal with them and provide alternative activities for children to lessen the time spent on electronics.
- 3- Implement intervention programs in schools that targets children and aims to teach them about the consequences of excessive electronics use and encourage different physical activities.

Audit Quality , Expectations Gap,  
Audit, Performance Gap.

#### Abstract

The primary aim of this study is to find out the role of auditing quality in bridging the expectations gap in auditing, Which is considered one of the main factors that has a great effect on the profession of auditing, The study builds on the frameworks developed by Porter (1993), Porter & Gowthorpe (2004) and Porter et al. (2012). To investigate the influence / importance of the audit expectation gap to the auditing profession, the study also aims to Study and analyze the concept of audit quality and that of expectation Gap and to highlight the role of ways to improve the Audit in order to reduce this discrepancy, has been highlighted on literature and has been used both of the historical approach, inductive approach and descriptive approach to determine the role of auditing quality in bridging the expectations gap in auditing. This study concludes to compliance the auditor with auditing standards effective, auditor independence, importance of the role of professional institutions leads to ensure the reduction of the expectations Audit gap. And, the study recommends to necessary of focus on factors that lead to the emergence of the expectation gap and to raise awareness of the concept of the audit process and to issue audit standards that regulate the profession.

#### Introduction:-

Accounting and auditing plays an important role in developing and enhancing the economical companies and international works. as they are critical components of any economic enterprise and it plays an important role in contributing to the effective and efficient functioning of business operations, the capital markets, and the economy by adding credibility to financial statements (Lee, Azham & Kandasamy, 2008). While accounting keeps track of transactions as a basis for providing information about the enterprise through financial reporting to users of the information, audit expresses an opinion on the financial statements whether it presents a true and fair view of the enterprise (Okafor & Otolor, 2013). These information are considered as the green light for decision makers in their investments and knowing the expected revenues, costs and risks which participate in enhancing the investments whether on the level of the individual or the level of total income. (Al-Khaddash, et al, 2013).

Historically, Humphrey et al. (1992) argue that some hints of “audit expectation gap” (AEG) can be found on the back in the 19th century with the introduction of companies auditing, which appeared to exist for more than 100 years (Flint, 1988). Audit firms have been shaken in the atheist and the twentieth century because of the so-called scandal of Enron, leading to a major audit companies in the world such as the bankruptcy of Arthur Andersen, and

**Corresponding Author:- Hasen Mohamed . A . Albeksh.**

Address:- Department of business administration, Social sciences institute, Kastamonu university. Turkey.

increasing trust between the audit profession and the gap users of financial statements, which cast a shadow on the job market and review the services and raised doubts in production services in the review of the standards shortcomings audit and regulate the audit profession in general (Benston & Hartgraves, 2002 ; Albeksh, 2016).

The auditing profession believes that there is widely criticized and litigation against auditors, this may be due to auditors not meeting the Public's expectations of them on the state of affairs of the audit companies. The auditing profession believes that there is widely criticized and litigation against auditors, this may be due to auditors not meeting the Public's expectations of them on the state of affairs of the audit companies, to investigate the influence / importance of the audit expectation gap to the auditing profession. According to the frameworks developed by (Porter 1993 ; Porter & Gowthorpe 2004 ; Porter et al. 2012). In a way or another, users of financial information expects that the auditors function to verification of the financial reports to assure safety management's prepared financial statements is free of fraud and is of a high quality. This was a misunderstanding between the perception of auditors for the preparation of financial reports and what the public expects such perceptions are a recurring problem in the literature of accounting and auditing, and usually referred to as the audit expectations gap (Dibia, 2015).

The expectations gap in the audit of the most important issues addressed in accounting thought in the various countries of the world, and despite the many studies on the gap, but it still exists and is widening and require further research and study, in early 1970s, Liggio was first used the word of 'AEG' in the literature, and continues to be debated on until today (Liggio, 1974; Lee et al., 2010). In this context, the study examines the problems associated with the expectation gap in auditing, Which is considered one of the main factors that has a great effect on the profession of auditing, and the audit expectations gap has got with great interest by researchers in the field of auditing and the reason for this is that audit quality as the primary basis have role in narrowing of the expectations gap and then the confidence of investors in the financial and non-financial information, and in this area have tried many of the studies revealed the relationship between narrowing of the expectations gap and that the difference in views among all parties interested in the audit about the concept of expectations gap and the quality of the audit indicates that the crystallization of this concept once and for all as a concept and comprehensive reference , and this requires us to stand on the study of the concept of audit quality and its role in narrowing of the expectations gap in auditing profession.

The researcher followed both of the historical approach to keep track of previous studies that have to relation the study, inductive approach and descriptive approach to determine the expectations gap in the auditing, through extrapolation of studies and research to explaining and describe role of auditing quality in bridging the expectations gap in auditing, even the ideas, relations and the scientific and practical aspects which were included in these researches and studies were descriptive. The method used in this study is considered one of the qualitative descriptive studies non quantitative, which are characterized by giving the researcher an actual and clear theoretical basis in the understanding and interpreting.

It has been divided this paper into six segments. The first segment examines general introduction. The second segment discusses the theoretical framework and approach employed to support this paper where it examines basic concepts: the concept of audit quality and expectations gap and the structure of the components of this gap as well as the manifestations of this gap in the modern audit environment and the reasons that led to the emergence of the expectations gap. The third segment discusses the analysis and evaluation of previous studies in the fields of the expectations gap and Proposed means to narrow the expectations gap in the audit. The fourth segment addressed reflection of the Audit quality on the expectations gap. While the fifth segment addressed the role played by the accounting profession in bridging the gap in auditing of methods and procedures for monitoring the quality of professional performance for audit and activate the role of professional organizations in control of the profession and the issuance of new legislation accommodate the latest changes in the fields of the expectations gap. Finally, the sixth segment contains the results and recommendations which concluded for it this study.

### **Problem of the Study:-**

#### **Problem of the study in the main question as follow:-**

What is the role of auditing quality in narrowing the expectations gap in auditing?

The variation in understanding the role of auditors and their responsibility in society and the differences and conflicts of milestones and goals between the authors of the reports and financial statements published and users Under this conflict, the role of the external auditor as a neutral party comes only that there is a difference in

understanding his role, this led to expectations Gap in auditing, which affected to some extent, the confidence of user of financial statement in auditors' performance in the presence of variables in the modern business environment.

### **Significance of the Study:-**

Which reflected the importance of attention in auditing quality and the extent of their impact on the audit expectations gap in the presence of many variables in the modern business environment and the impact of these variables on the audit profession, derives this study scientific and practical importance in the quality of services provided by the auditor for all related parties in the financial statements that, and represents the scientific importance in drawing academics and research centers Scientific define the concept of the review and its impact on quality narrow the expectations gap to conduct further studies in this area and examine the importance of scientific and practical training for references as a criterion for the quality of the audit and its role in narrowing the expectations gap, and represent the practical relevance in a statement the importance of the quality of the review on factors narrow the expectations gap and the statement of the importance of audit quality According to the interpretation of the relationship between audit and the customer and users of financial statements.

### **Objectives of the Study:-**

1. Identify the role of auditing quality in narrowing the expectations gap in auditing.
2. Determination of the concepts of audit quality from different entrances, as well as the its importance and objectives and the means used to improve the performance of the audit process.
3. Determination of the concepts of expectations gap, as well as the its importance and objectives.
4. Identify the factors have an impact upon narrowing the audit expectations gap.

### **The Theoretical Framework:-**

#### **Concept of auditing quality:-**

Audit with the history of commercial and financial events began. If business and financial events occur which, in the modern sense, but there is not necessarily a matter of control. Many people and resources to the case is the definition of a comprehensive review which is expressed in different ways scrutiny (Erdoğan, 2002). It showed several terms in the field of auditing, which is used to describe the quality of the review process, including audit quality and quality control and quality assurance, and each of these terms are private interpretation has emerged, has concluded accountants, Hong Kong Association that quality assurance is an examination of internal and supervision of the audit quality procedures and carried out by the same bureau of quality supervision is intended to external examination by a neutral third party.

So that it has been a lot of important questions about the honesty of the fiscal reports of the auditor, and it has been prevailed a state of mistrust in the auditing profession plus the suspicion of the quality of audit services, and auditing profession had faced more pressures and criticism in purpose of study and assess the quality of the audit, and what increasing these pressures is the absence of the ways to evaluate these qualities (Albeksh, 2016).

DeAngelo (1981a) defines audit quality as the probability that an auditor will discover report a breach in the client's accounting system. The probability of discovering a breach depends on the auditor's technical capabilities and reveals it and the probability of reporting the error depends on the auditor's independence (DeAngelo 1981a; Goldman & Barlev 1974; Nichols & Price 1976 ; Adeyemi & Fagbemi, 2010). The Audit Quality is a management tool used to evaluate, verify, or confirm activities related to quality which serves as the compliance with the professional standards and the contractual terms when carrying out the audit (Syamsuddin, Habbe & Mediaty, 2014).

Audit quality is a discipline that relies on competent individuals using their experience and applying integrity, objectivity, and skepticism to enable them to make appropriate judgments that are supported by the facts and circumstances of the engagement. The qualities of perseverance and robustness are also important in ensuring that necessary changes are made to the financial statements, or, where such changes are not made, to ensure that the auditor's report is appropriately qualified. In addition to the judgmental nature of aspects of the underlying financial statements, there are a number of factors that make it challenging to describe and evaluate the quality of an audit, including that:-

- The existence, or lack of material misstatements in the audited financial statements provides only a partial insight into audit quality.

- Audits vary and what is considered to be sufficient appropriate audit evidence to support an audit opinion is, to a degree, judgmental.
- Perspectives on audit quality vary among stakeholders.
- There is limited transparency about the work performed and audit findings (IAASB, 2013; Albeksh, 2016).

Based on the above interpreted audit quality definitions and related aspects, it might be stated that audit quality is a multidimensional construct. In a simplified statement, it can be defined as a level of confirmation between the value audit creates and the expectations to audit of third-party users and audit clients (Vaicekauskas & Mackevičius, 2014).

#### **The Importance of Auditing Quality:-**

Audit quality is critical for financial markets to function smoothly. And importance of audit quality in the audit process outputs, represented by the auditors' report, which a lot of external users relied upon in the decision-making quality, so the quality of the audit is a common interest to all users of the audit process, including references, companies and administrations, associations and institutions the organization of the profession and creditors. In addition to the above, the adoption of a system to control the quality of the audit can bring many advantages and features, giving proper confirmation that the services performed by the auditors in offices audited, line with professional requirements and generally accepted auditing standards, according to the following:-

- Improve the audit program by following the instructions and guidelines issued in this regard.
- Methods of checking the quality of help to gain new customers for the Office of Audit and maintained.
- A high level of reliability in the functions of the audit means the financial statements are free of material misstatement.
- High quality audit can be considered as part of the owners to control the system from their inability to conduct the direct control of management.
- Quality Audit is one of the important issues that lead to the development of the audit with an advanced level of professional performance to the offices of the audit profession is considered ((DeAngelo 1981a ; Autrey & Crowley, 2013).

#### **Audit expectations gap:-**

Commission (Cohen, 1978) concluded after studying continued for four years to find out responsibilities of auditors that there are important expectations of the performance of auditors gap and expectations of users of financial statements about the performance of auditors and their responsibilities adversely affects auditing quality, and the Commission found that the responsibility lies with the auditors to reduce that gap.

#### **Definitions:-**

There are many definitions relevant on audit expectation gap, but it revolves around one idea which is the difference or the difference between what he is doing or what can be done by auditors and what should be, or expected to be undertaken by auditors on the basis of society's expectations required of them. (Aljaaidi, 2009). Liggio (1974a) defines it as the difference between the levels of expected performance as envisioned by the independent accountant and by the user of financial statements, through considering whether a gap may exist between what the public expects or needs and what auditors can and should reasonably expect to accomplish.

Porter (1993) carried out an empirical study of the audit expectation-performance gap and defined the expectations gap as the gap between society's expectations of auditors and auditors' performance, as perceived by society.

AICPA (1993), the 'audit expectation gap' refers to the difference between what the public and financial statement users believe the responsibilities of auditors to be; and what auditors believe their responsibilities are. While Epstein and Geiger (1994) defined audit expectation gap as: "differences in perceptions, especially regarding assurances provided between users, preparers and auditors".

Lee, Ali & Bien (2009) defined audit expectation gap "difference between what the public expects from an audit and what the audit profession accepts the audit objective to be." And mentioned that the AEG is "critical to the auditing profession because the greater the unfulfilled expectations from the public, the lower is the credibility, earnings potential and prestige associated with the work of auditors" (Lee, Ali & Bien 2009). Also, Audit expectation gap was originally defined as the difference between levels of expected performance as envisaged by auditors and users

of financial reports. and It is the gap between society's expectations of auditors and auditors' performance, as perceived by society (Shaikh & Talha, 2003).

Through looking at definitions of mentioned above reveals that the expectation gap may refer to the following:-

- Difference in perceptions on actual performance and expected performance of auditors.
- Existence of these perceptual differences in auditors, accountants or users of financial statements and the society independently and also comparatively.
- The focus of comparative analysis of audit expectation gap is attempted by considering accountants and auditors, the perceptions of society and auditors, investors and auditors (Salehi, 2011).

#### **The structure of components the expectations gap in auditing:-**

Some studies confirm that should blame for auditors because they not meeting users' expectations. Auditors had long been asked to detect errors or frauds. To a large extent, the profession's refusal of performing the fraud detection duties had fueled the 'expectation gap. and confirms that the 'expectation gap' is an outcome of the contradiction of minimum government regulation and the profession's self-regulation, especially, the profession's over-protection of self-interest which has widened the 'expectation gap (Lin & Chen, 2004).

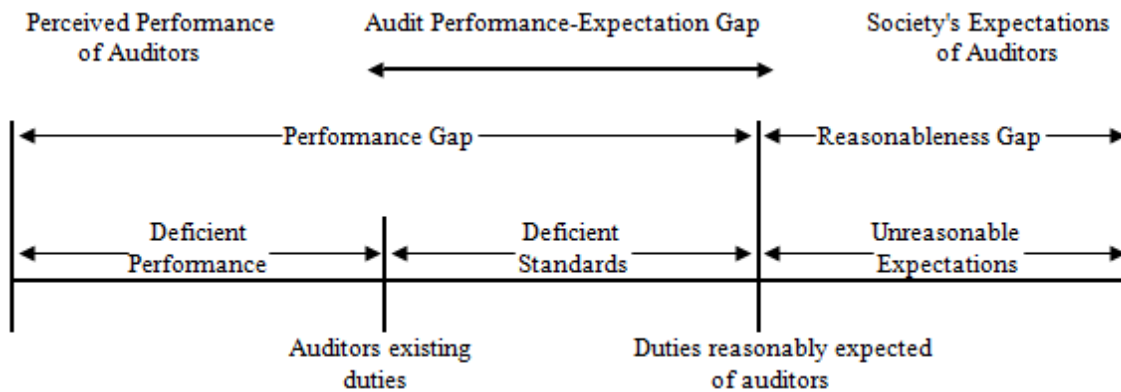

To knowledge of structure of the expectations gap components will help in reaching a correct understanding of the nature of the gap which helps to narrow it. But as researchers and scholars disagreed gap expectations of access to a specific concept for the gap expectations also differed in determining the structure of the components of the expectations gap (Porter, 1993) .

Adopting the title "audit expectation performance gap", she defined it as "the gap between society's expectations of auditors and auditors' performance, as perceived by society". She proposed that the gap comprises two major components, namely:

1. Reasonableness gap: represented a gap between what society expects auditors to achieve and what they can reasonably be expected to accomplish "this coincides approximately with the Cohen Commission's definition of the gap".
2. Performance gap: represented a gap between what society can reasonably expect auditors to accomplish and what society perceives they achieve. This component may be further subdivided into: (a) the deficient standards gap: represented a gap between the responsibilities that can reasonably be expected of auditors and auditors' existing responsibilities as defined by statute and case law, regulations and professional promulgations; and (b) the deficient performance gap: represented a gap between the expected standard of performance of auditors 'existing responsibilities and auditors' performance, as expected and perceived by society.

Additionally, the existence of the expectation gap is due to the shortage of regulations, and to the auditing and accounting standards being founded by the profession; i.e., where users rationally anticipate the auditors to call the users' attention to a special issue, but the profession does not want this since an inadequate standards gap exists (Porter 1993; Koh & Woo, 1998).

The Canadian Institute of Chartered Accountants (1988) sponsored a study on the public's expectations of audit. The commission developed a detailed audit expectation gap model that analyzed the individual components of the expectation gap into unreasonable expectation, deficient performance and deficient standard (Salehi, 2011). In this aspect, Porter (1993) has provided structure components of the expectations gap in the audit. The structure of the audit expectation-performance gap is depicted in Figure1:-

**Figure 1.** Shows structure of the audit expectation-performance gap.

Source: Adapted from Porter (1993).

Perceived performance	← Gap →	Society's expectation of auditors
Performance gap	Standard gap	Reasonableness gap
Reasonable expectation of auditor performance	Reasonable expectation of standard	Unreasonable expectations
		Over expectation of audit performance
		Over expectation of standards
		Miscommunication of users

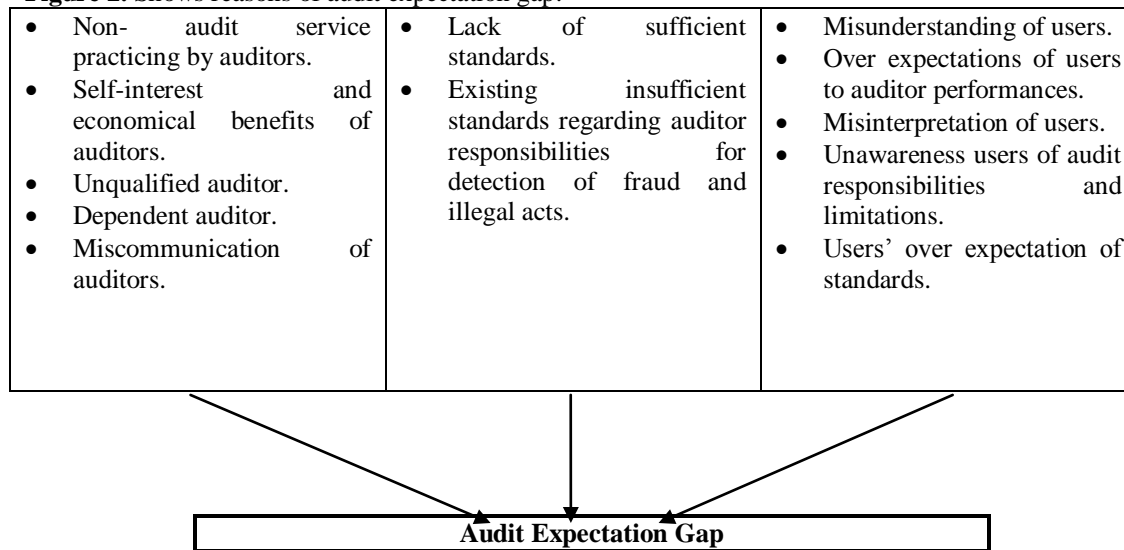

Source: Adapted from Porter (1993).

The researcher sees that the structure of the components of the expectations gap in the audit presented by Porter has included all the components and elements of the gap and pointed out the reasons that led to the occurrence of the profession, whether these reasons stemming from the audit profession or from outside the profession.

#### Reasons of audit expectation gap:-

One of the many issues that involve the accounting profession and the community is exists the expectation gap, researchers have already identified a number of causes for this gap while conducting their research into this issue the most important:-

- The probabilistic nature of auditing.
- The skepticism in the auditor independence.
- The ignorance, naivety, misunderstanding and unreasonable expectations of non-auditors about the audit function.
- The evaluation of audit performance based upon information or data not available to the auditor at the time the audit was completed.
- Insufficiency of self-control system in the audit profession.
- The evolutionary development of audit responsibilities, which creates time lags in responding to changing expectations.
- Decline the quality of professional performance in audit
- Corporate crises which lead to new expectations and accountability requirements.
- The profession attempting to control the direction and outcome of the expectation debate to maintain the status quo.
- lack of legislation and issues professional organization for the profession (Shaikh & Talha, 2003 ; Salehi, 2007 ; Humphrey, et al, 1993).

**Figure 2.** Shows reasons of audit expectation gap:-

### The Previous Studies:-

The growing literature on the AEG can be seen as an indicator that it is a significant problem, which needs additional research. It is not a new research area, there are several of the literature review have focused on the expectations gap and especially during the last two decades. The issue of "gap" between society's expectations of auditors and what auditors expect "or are perceived by society". Extant literature suggests that, while the term AEG was not applied to the gap between society's "or financial statement users" and auditors' expectations of an audit until about 30 years ago, the existence of the gap was recognised more than 100 years ago. Conducting numerous attempts to understand and define the scope and causes of the gap between auditor on the one hand, and the parties used for his services on the other hand, of these studies follows:

Porter (1993) Stated in his empirical study which conducted in New Zealand in 1989 and it aimed to investigate the audit expectation-performance gap to know the reasons and the components of the expectations gap in the return and propose curriculum narrowed through doing a survey to reach this goal, The study enables the duties which constitute the reasonableness, deficient standards and deficient performance components of the gap to be identified. It also provides the means to estimate the relative contribution of the duties to their respective components, and of the components to the overall gap between society's expectations of auditors and auditors' perceived performance. The study concluded to new insights into the structure, composition and extent of the audit expectation-performance gap but, more importantly, it signals a rational, comprehensive approach towards narrowing the gap. If adopted, this should bring society's expectations of auditors and auditors' performance into closer accord and, as a consequence, reduce the criticism and litigation which auditors face today.

There is no doubt that this study has provided a new vision of the details of the constituent tasks for each component of the gap components and the relative contribution of each component to the gap as a whole and this will help to develop an integrated, comprehensive framework to narrow the gap, the study found that narrow the expectations gap will lead to ease the pressure and reduction criticism oriented career.

As Conducted other study to Porter, et al (2012). Audit Expectation-Performance Gap Revisited: Evidence from New Zealand and the United Kingdom. Investigation of changes in the audit expectation-performance gap in New Zealand (NZ) and the United Kingdom (UK) revealed that, between 1989 and 1999, in both countries the reasonableness gap widened as developments in auditing external environment stimulated an increase in society's unreasonable expectations of auditors but the deficient performance gap narrowed as monitoring of auditors' performance resulted in societal perceptions of improved performance. Between 1999 and 2008, in the UK, widespread discussion of the environmental developments and related audit issues, along with more stringent monitoring of auditors' performance, resulted in a narrowing of the reasonableness and deficient performance gaps. In NZ, lacking these factors, these gaps widened. Additionally, changes to auditing standards resulted in some

'reasonably expected' responsibilities becoming actual responsibilities of auditors and, in both countries, the deficient standards gap narrowed. The research findings illuminate the means by which the audit expectation-performance gap might be narrowed.

While Salehi, (2007; 2011; 2016). Stated in his studies "Reasonableness of Audit Expectation Gap: Possible Approach to Reducing" Which aimed to focus on the reasonableness expectation gap, And "Audit expectation gap: Concept, nature and trace", which aimed to understand the nature and different dimensions of audit expectation gap around the world. In addition to "Quantifying Audit Expectation Gap: A New approach to Measuring Expectation Gap", which aimed to identifying the expectation gap about audit responsibility and quantifying the expectation gap in Iran. The researcher reached to conclusion that for reducing such a gap, a possible way is through increased public awareness of the nature and limitation of audit and the nature and different dimensions of audit expectation gap around the world. And the conclusion that this kind of gap should be reduced by the auditor himself, by improving audit responsibilities, educating various users, and mandating new standards, and that there is an expectation gap between auditors and investors in Iran.

Hassink, et al. (2009). Clarified in their study "Corporate fraud and the audit expectations gap: A study among business managers" which aimed to Assess the importance of a plausibility gap and gap-performance and gap of incomplete standards and this in a specified window companies to defraud, and he clarified that for this to distinguish between all these three elements of the expectations gap, business managers, based on their responsibilities to own about fraud, as banks use as an observer to evaluate the potential differences between the views of business managers and society in general has to be for the participants to be aware and experienced enough on fraud and therefore has been the study of the expectations gap, The findings revealed that there are clear evidence of the existence of great expectations gap in the context of fraud both in terms of the performance of the references or the extent of his commitment to legal texts accepted.

Olowookere, J. K. (2011). Pointed in his study entitled " Stakeholders Perception Of Audit Performance Gap In Nigeria. Which aimed to Search the nature and level of the expectations gap (performance gap) between the auditors and users of financial statements, which sought to determine the presence or absence of differences between the perceptions of financial and reliability of data users and useful for decision-making. The results of the study were the presence of a wide expectation regarding the responsibility of the Auditor gap, which had a negative impact on the credibility of the auditor and the confidence of users of financial statements, The study also showed the media should be more about the responsibilities of the auditor for the financial statements should also clarify the role of the auditor and the observance of quality control measures in the review of institutions' accounts.

The study recommended that it should be the owners of the profession inform the users of financial statements on more responsibilities of auditors as well as raise the educational level of the users of the financial statements, it are tools to limit the expectations gap in the review, also recommended that there should be quality control of audit firms is necessary in order to raise Auditors performance and compliance with recognized standards, also urged the training and continuous improvement of Auditors and the establishment of an independent government body to oversee the implementation of the laws applicable to the review and also recommended expanding the responsibilities of auditors to meet the public's expectations and reducing the missing standards gap through a review of existing auditing standards.

The study dealt with Okafor & Otolor (2013). under title "narrowing the expectation gap in auditing: The role of the auditing profession. The result shows that the public is ignorant of the duties of the auditor and this lack of knowledge is responsible for unreasonable expectations of the public from auditors. Based on the findings and conclusion, it was recommended that the public need more education on the duties and responsibilities of the auditor, the standard auditor's report should be expanded to include disclaimer clauses clearly showing that it is not a certificate or guarantee of the financial soundness of the audit , it should be clearly stated in the audit report that the auditor is not the compliance officer of the audited company and that the auditor's report should add that the opinion expressed by the auditor should not be construed to mean a guarantee of accuracy of the financial statements .

The study examined Humphrey, et al. (1992). which under title "The Audit Expectation Gap, investigated the expectation gap in both the UK and Spain. Auditors, finance directors and users were asked, inter alia, whether audit firms should not provide NAS to their audit clients. In both countries, the average response was close to neutral for all groups except UK auditors who expressed strong disagreement.

About this, A survey taken up by Al qtaish. (2014) in his study the factors affecting in narrowing the audit expectations gap from the viewpoint of the investors in Jordan which aimed to identify the nature of the audit expectations gap and analyzing the factors that may affect in narrowing the audit expectations gap from the viewpoint of the investors in Jordan, mentioned that, the study concluded a set of results including: the factors that influence audit expectations gap, which are: the efficiency of the auditor and his professional care, the auditor's responsibility for the certified accounting numbers, the verification of the auditor on the level of the disclosure in the financial statement, improvement of communication with the users of the financial statements, the auditor's commitment to integrity and honesty, and the independence of the Auditors. It was found that the effect of these factors was high and uneven. The study recommended that the necessity to enhance communication, information and the education of the users of the financial statements on the functions of auditing, responsibilities and duties of the auditor, management responsibilities, and the expansion of the auditor's responsibilities to meet the reasonable expectations, and to adopt the detailed auditor's report to mitigate the audit expectations gap.

#### **Evaluation of the Previous Studies:-**

The litigious environment which in the auditing profession today can be traced to the audit expectation gap and from here there are calls for operates a good monitoring of public opinion and attitudes towards the level of services and assurance provided by the auditors individually and as a profession. Where investors expect and counts begin to uphold a standard of absolute assurance, audit liability inevitably will increase substantially. It is necessary therefore that from both societal and professional perspective that the profession should try to narrow the expectation gap. To achieve this both groups need to become active agents or players for positive change.

These the evaluation are based upon the prior study's results in the field of the expectations gap, and through what the researcher mentioned above about a literature review and a critical and in depth evaluation of previous research about the role of auditing quality in narrowing the expectations gap in auditing profession. The literature has shown that most the studies which addressed the expectations gap of several entrances, it has the impact of a high level for this the gap on auditing profession, studies have focused upon the research in its concept and components and reasons leading to that gap as a plausibility gap and gap-performance and gap of incomplete standards, Other studies have dealt with the impact of factors such as an audit report and the expectations gap, and the role of auditing quality in reducing this gap among auditors and investors. The reasonableness gap widened as developments in auditing external environment stimulated an increase in society's unreasonable expectations of auditors, but the deficient performance gap narrowed as monitoring of auditors' performance resulted in societal perceptions of improved performance. The most study found that narrow the expectations gap will lead to ease the pressure and reduction criticism oriented career. and this will help to develop an integrated, comprehensive framework to limit of risk audit profession.

Last but not least, the common belief that external auditors are able to solve all the problems faced audit profession, while it is a part of the justice system in the audit profession. When the narrow the gap was discussed, researchers recommended that there should be quality control of audit firms in order to raise Auditor's performance and compliance with recognized standards, until be financial reports are reliability for users of financial statements and useful for decision-making, and necessity of vocational rehabilitation of the internal and external auditor. In addition to continuous training of auditors and make courses for auditing companies in the specializations of accounting and financial sciences to reinforce the important role of the commitment to auditing standards effected in audit quality to be an effective prevention from falling in cheating, manipulating, embezzlement and betraying honesty.

#### **Reflection of the Audit quality on the expectations gap:-**

Concept of audit quality is based on that commitment to professional standards issued by international and professional organizations achieve audit quality. Usually focus audit quality programs to these organizations about the extent of commitment audit firms to accepted professional standards (GAAS) own to audit which put in place to ensure minimum audit quality when the implementation of the audit. This concept of quality means that if the auditor's commitment to professional standards for the audit, it will achieve a good level of professional performance quality. The audit quality normally consists of two components: auditor competence and auditor independence. The deterioration in audit quality in a short tenure audit may be due to either lack of competence or loss of independence, while a loss in quality in a long tenure audit is most likely due to a loss of independence (DeAngelo, 1981a ; Enofe et al, 2013).

Auditing standards provide an important foundation supporting audit quality. In particular, the International Standards on Auditing (ISAs) issued by the IAASB describe the auditor's objectives and establish minimum requirements. However, the majority of the requirements in ISAs either provide a framework for the judgments made in an audit or need judgment for them to be properly applied ((IAASB, 2013).

As clarified Porter (1993) the audit expectation-performance gap and defined the expectations gap as the gap between society's expectations of auditors and auditors' performance, as perceived by society.

The quality gap is one a sub-components to the expectations gap in the audit, it has identified its one of the researchers quality gap as "the differences between the expectations of both users and auditors about the quality of performed audit services, and factors of formation and the formation of that quality, "and stressed that the main reason for its existence is to decrease the actual performance of references for auditing standards and quality standards recognized (Carcello, et al, 1992).

And considered decline the quality of professional performance in audit is one of the main reasons for the existence of the expectations gap. So it considered improving the quality of audit services one of the methods to narrow the expectations gap in the audit.

#### **The Role Played by the Accounting Profession in Bridging the Gap in auditing:-**

The accounting profession has recognized that there is the expectation gap as an issue of fundamental relevance that has a great effect on the profession of auditing. It is in the best interest of both the auditing profession from side and the society at large on the other hand, because the gap between society's expectations of auditors and auditors' performance, as perceived by society, the expectation gap in auditing profession be narrowed as much practicable (Ijeoma, 2014).

In 1988, Committee and the Auditing Standards Board in the American Institute of Certified Public Accountants (AICPA) tried to reduce the expectation gap by issuing series of statement of accounting standard. In this aspect, General Accounting Office and the AICPA in 1996 reported that an expectation gap still exists and no empirical evidence was however offered to that effect. Investors and other users of financial statement seek for absolute assurance but the auditing profession has relied on the concept of reasonable assurance. Current auditing standards still reflect material mismanagement focus or financial statement reasonable assurance.

In 1997, Statement on Auditing Standards No. 53 (SAS 53) "the auditors responsibility to detect and report errors and irregularities" which is one of the expectation gap SASs rely on the concept of reasonable assurance. The profession in further attempts to narrow the expectation gap issued new (SASs) statement of Auditing Standards, partly to address public criticism of the auditing profession and partly to increase level of service to audit clients and the public, and No. 82 (SAS 82) replaced one of the Expectation Gap standards. It was intended to provide more explicit guidance for the auditor's consideration of fraud in a financial statement audit.

Also, In 1988, the Auditing Standards Board (ASB) issued a number of pronouncements that have been referred to as the Expectation Gap standards. The intent of these standards was to reduce the gap between public expectations and the perceptions of auditors with respect to auditors' roles and responsibilities in conducting financial statement audits. The Expectation Gap standards were intended to:-

- Address public concerns regarding detection of errors, irregularities and illegal acts.
- Assist auditors in planning more effective audits.
- Improve external auditor communications.
- Improve internal communications for the purposes of the current study, the breach between public expectations and auditors' perceptions of their responsibilities will be referred to as "Expectation Gap" (Specht & Sandlin, 2011).

And in this regard (Erdoğan, 2012). Clarified that, Training on the audit, the whole exercise consists of checking with the academic knowledge of control theory. It is necessary to establish the cause of development and control theory. Courses in auditing, licensing, education and learning in graduate programs, and this is an important issue is related to a large extent on the quality of education and increase efficiency (Erdoğan Murat, 2012).

Last but not least, the common belief that auditors are able to solve all the problems faced audit profession, including expectation gap, while they are a part of the justice system in the audit profession. when the independence of the external auditor was discussed, researchers recommended to necessity of auditors commitment to audit and develop their standards on an ongoing basis to ensure the quality of work and narrow expectations in the gap and the need to audit the appointment of auditors with experience and skill to carry out the audit to narrow the expectations gap and pre-planning of the audit process because it ensures the continuation of the process effectively and thus narrow the expectations gap in the audit.

### **Results:-**

The study reached a number of conclusions, including:-

1. Auditors commitment to standards audit and develop their abilities on an ongoing basis leads to ensure the quality of work and to narrow the expectations gap in the audit.
2. The reasons that led to the emergence of the expectations gap and the reason was in the weakness of auditor independence and the lack of professionalism of the auditor and not the reasonableness of expectations of users of financial statements and lack of clear definition of the role of auditor in the community and inadequate system of self-censorship in the profession and the decline of professional performance and inadequate of financial reporting as well as lack of legislation and issues professional organization for the profession.
3. One of the most important reasons for the expectations gap in the revision auditor independence in doubt. As well as the reasons for the gap of lack of professionalism and lack of reasonable expectations of the profession and the public lack of effective communication and lack of financial reporting.
4. The admission of new clients and continuation of the relationship with a reputable existing customers good reduces the problems and increases to narrow the gap and the commitment of the references standard examination league program sufficiently on the quality of performance raises the audit quality degree and narrow the expectations gap and the commitment of the audit team of accounting and auditing standards narrowing of the expectations gap.

### **Recommendations:-**

In the light of the results of theoretical studies can provide a range of the following recommendations:-

1. The necessity of Auditors commitment to standards audit and develop their abilities on an ongoing basis to ensure the quality of work and to narrow the expectations gap in the audit.
2. The necessity of focus on the analysis and characterization of the expectations gap in the review, where it is one of the most serious issues facing the auditing profession and effect on audit quality and the decisions of investors.
3. The necessity of professional organizations, associations, scientific inventory of the most important proposals narrow the expectations gap in the review. And work on the application of the best proposals to get on high of audit quality.
4. The necessity of define the beneficiaries of the services of auditing the most important concepts used by the audit profession in order to reduce the size of the expectations of the unacceptable.
5. The necessity of focus on factors that lead to the emergence of the expectations gap and the most important are: uncertainty in the auditor independence and low professional performance and inadequate financial reporting issues, legislation and organization of the profession and not the reasonableness of expectations of beneficiaries and take the necessary measures to eliminate these factors.

### **Acknowledgement:-**

I would like to thank the anonymous reviewers and Editor in Chief for support of this the paper. I would also like to thank all the respondents who through their active participation in our survey contributed to the achievement of goals set in my work.

#### Abstract

**Objective:** To evaluate the knowledge and practice in chronic pain management among primary healthcare physicians (PHCPs).

**Methods:** A cross-sectional questionnaire-based study was carried out in a selected 15 primary healthcare centers in Jeddah, Saudi Arabia from October 15, 2016 to November 15, 2016. An auto-questionnaire was administered. The outcome measures included clinical practice score (CPS; range 20-100) and confidence level score (CLS; range 20-100).

**Results:** Physicians' practice showed a mean  $\pm$  SD (range) CPS =  $76.13 \pm 15.12$  (41.11; 100.00). Most frequently assessed parameters included topography of the pain; followed by prior medications and physical impact. Less frequently assessed parameters included underlying cause, psychological impact and pain onset time. Frequent physical examinations assessed the painful area; followed by general physical exam and inflammation signs. Less frequent examinations screened for neuropathic pain component and motor and sensory abnormalities. Physicians in high patient-flow centers ( $\geq 30$  patients seen per day) had lower CPS. Physicians' confidence in chronic pain management showed a CLS =  $69.60 \pm 16.61$  (30.00; 100.00). Physicians declared being less confident of cancer chronic pain management, use of antidepressants, non-cancer chronic pain management, and use of anticonvulsant drugs. Higher CLS was reported in family physicians (CLS =  $82.18 \pm 15.60$ ) as compared to pediatrics ( $73.50 \pm 14.09$ ) and general medicine ( $62.62 \pm 15.17$ ); ( $p = 0.000001$ ). CLS was proportional to age and experience.

**Conclusion:** Relatively insufficient practice and low levels of confidence among physicians regarding all aspects of chronic pain management was reported. Employing national or local protocols can be useful.

#### Introduction:-

Chronic pain is a common condition affecting 10% to 20% of the population across the world (Smith BH et al, 1999; Breivik et al, 2006). It is associated with physical disability and psychological, social and economic adverse

effects(Breivik Het al, 2006, Gureje Oet al, 1998). Consequently, chronic pain is responsible for severe, multidimensional impact on patients' quality of life (Becker Net al, 1997). According to The International Association for the Study of Pain (IASP), pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage, or described by the patient in terms of such damage(IASP Taxonomy, 2014).Chronic pain is defined in more subjective terms, as a pain persisting beyond normal tissue healing time. Practically, it is admitted that pain persisting for 3 months or more indicates chronicity of the pain ( Upshur CC,et al 2006; Purves AM et al, 1998).

Ideal management of chronic pain requires careful assessment of the underlying causes, evolution, intensity along with sensory components to determine the type of pain, particularly neuropathic versus nociceptive pain. Additionally, it also demands the assessment of associated psychological, social and economic repercussions, which conditions the therapeutic approach Turk DC et al, 1987; Haanpää ML et al, 2009; Karoly and Jensen, 2013).

Despite the emergence of specialty pain management centers, majority of patients with pain complaints seek medical assistance in primary healthcare centers( Smith BHet al, 1999; Breivik Het al, 2006; Upshur CC,et al 2006). Pain is one of the most frequent complaints encountered in almost 1 in 2 patients attending primary healthcare centers(Mäntyselkä Pet al, 2001). This highlights the need for optimal knowledge of pain and the practice in chronic pain management among primary healthcare (PHC) providers, especially physicians.

On the other hand, assessment of practice in chronic pain management among family and primary healthcare physicians (PHCPs) showed unsatisfactory levels of knowledge, low therapeutic goals and high prevalence of undertreated patients (Green CR et al, 2001; Ponte CD et al, 2005). Studies also showed that physicians are uncomfortable with the choice of drugs specified for the use in pain management especially with opioid analgesics, raising concerns about adverse effects, medication interactions and addiction, which often limits the prescribing of efficacious pain therapy (Bhamb Bet al, 2006; Von Roenn JHet al, 1993). This data highlights the lack of training and an urgent need for awareness among PHC providers.

Very few studies have assessed practice and knowledge about pain management in Saudi Arabia, majority of which were interested in nurses. This study showed a deficient knowledge, frequent misconceptions and inappropriate attitudes regarding assessment and treatment of pain. Need for training and national policies was highlighted (Eid Tet al, 2014; Kaki AMet al, 2009).

#### **Aim & objectives:-**

This study aimed to evaluate the practice and self-assessed confidence level in chronic pain management among PHCPs in Jeddah, Saudi Arabia. Factors associated with good/bad practice and low/high confidence were explored.

#### **Methods:-**

A cross-sectional study was conducted among PHCPs practicing in selected PHC centers in Jeddah, Saudi Arabia. A semi-structured questionnaire was administered to participants, which was divided into 3 parts:

Demographic data including age, gender, marital status, years of practice, and specialty; in addition to average number of patients seen per day, approximate percentage of pain complaints, approximate percentage of patients suffering from chronic pain, and whether the participant or one of his close relatives suffered from chronic pain.

Assessment of practice in chronic pain including 4 sub-parts: practice in patient interview (12 items), physical examination (6 items), investigations (8 items) and therapy (11 items) in chronic pain. Each item is a 5-point likert-type scale assessing the frequency of the related practice (1=never, to 5=always). A clinical practice score (CPS; range= 20 to 90) was calculated for patient interview + physical exam practice part by adding scores of related items. This score was used as an indicator for complete level of the clinical assessment in chronic pain and was analyzed as an ordinal variable.

Self-rated confidence regarding various aspects of chronic pain management (20 items); using 5-point likert-type scale (1=not confident; to 5=extremely confident). A confidence level score (CLS; range=20 to 100) was calculated by adding the scores of these items and was analyzed as a continuous variable.

The questionnaire underwent face and content validity by authors and reliability was tested by calculation of the Cronbach's alpha for each relevant part.

#### Sampling technique:-

Participants (PHCPs) were recruited using a stratified two-stage cluster sampling method (Sedgwick P, 2013). The city of Jeddah was divided into five sectors (strata); each containing 7 to 13 PHCs. Three PHCs (clusters) were randomly selected from each sector. A convenience sampling was used to include all physicians who were present at the participating PHC centers during the study period. Data was collected in an anonymous form.

The study was approved by the Medical Research and Studies Department, Directorate of Health Affairs – Jeddah, Ministry of Health.

#### Statistical Methods:-

Statistical analysis was performed with the Statistical Package for Social Sciences version 21.0 for Windows (SPSS Inc., Chicago, IL, USA). Categorical variables were presented as frequency and percentage; while both continuous and ordinal variables as mean  $\pm$  standard deviation (SD). Correlations were analyzed using independent *t*-test or OneWay analysis of variance (ANOVA) for continuous variables; chi-square test or Fisher's exact test for categorical variables; as appropriate; and nonparametric tests for ordinal variables. Significant factors of practice and confidence levels were analyzed as independent variables in linear regression analysis. A *p*-value  $< 0.05$  was considered for statistical significance.

#### Results:-

##### Characteristics of the study population:-

A total 124 PHCPs were included in the study. Of all the participants, 72.6% were females, 41.9% were aged between 30-39 years, 54.0% were married, and 32.3% had 0-5 years' professional experience. Regarding specialty, almost half of the participants (49.2%) were general practitioners, 22.6% were family physicians and 12.9% were pediatricians. Participants reported a mean  $\pm$  SD number of patients =  $38.89 \pm 26.89$  per day; among whom  $41.09 \pm 25.80\%$  were estimated to present with pain complaint and  $23.24 \pm 19.42$  were estimated to suffer from chronic pain. Half (50.0%) of the participants reported having personal or family history of chronic pain (Table 1).

**Table 1.** Characteristics of the population.

Parameter	Category	Frequency	Percentage

Estimated percentage of PHC patients suffering from chronic pain	Mean, SD	23.24	19.42
Personal of family history of chronic pain	Frequency, percentage	62	50.0

#### Assessment of practice in chronic pain:-

Analysis of reliability of part 2 of the questionnaire assessing PHCPs practice showed an excellent Cronbach's  $\alpha=0.933$  (37 items). Reliability of clinical practice part (interview + physical examination) was even better (18 items; Cronbach's  $\alpha=0.964$ ).

Assessment of overall clinical practice showed mean $\pm$ SD (range) CPS=76.13 $\pm$ 15.12 (41.11; 100.00). Assessment of patient's interview practice in chronic pain management showed moderate scores for all 12 interview items. On a scale from 1=never to 5=always, the most frequently assessed parameter during interview of patient with chronic pain was topography of the pain including localization and irradiations (mean $\pm$ SD score=3.98 $\pm$ 0.91), followed by prior medications (3.97 $\pm$ 0.85) and physical impact such as disability, sleep disturbance, etc. (3.96 $\pm$ 0.84). Whereas less frequently assessed parameters included underlying cause (3.84 $\pm$ 1.11), psychological impact (3.78 $\pm$ 0.99) and pain onset time (3.70 $\pm$ 1.33)(Figure 1).

**Figure 1:-** Assessment of patient's interview practice in chronic pain management among primary healthcare physicians.

Physicians replied to the following question: "When receiving a patient with a chronic pain, how often do you perform each of the following actions?". Possible answers were: 1=never; 2=rarely; 3=sometimes; 4=often; 5=always. Bars represent mean $\pm$ SD frequency in each item.

Assessment of physical examination practice showed that the most frequently carried out examination was careful examination of the painful area (mean $\pm$ SD=3.93 $\pm$ 0.78), followed by general physical exam (3.69 $\pm$ 0.86) and evaluation of inflammation signs (3.66 $\pm$ 0.98). The least carried out examinations included the screening for neuropathic component of the pain (3.54 $\pm$ 0.96), use of VAS to grade pain severity (3.53 $\pm$ 1.00) and screening for motor and sensory abnormalities (3.49 $\pm$ 1.02) (Figure 2).

**Figure 2:-** Assessment of physical examination practice in chronic pain management among primary healthcare physicians.

Physicians replied to the following question: “When receiving a patient with a chronic pain, how often do you perform each of the following actions?” Possible answers were: 1=never; 2=rarely; 3=sometimes; 4=often; 5=always. Bars represent mean $\pm$ SD frequency in each item. Regarding paraclinical and therapeutic practice in chronic pain management, PHCPs replied by yes/no to the question – “Have you ever prescribed the following for patients with chronic pain?” Analysis showed that the most frequently prescribed paraclinical investigations in chronic pain were x-rays and ultrasound of the painful zone (74.2% and 67.7% respectively), followed by MRI and inflammatory marker (62.1%) each. The most frequently prescribed treatments for chronic pain were non-steroidal anti-inflammatory drugs (NSAIDs), which were reported by 82.3% of the PHCPs, followed by muscle relaxants (65.3%), non-opioid analgesics (64.5%) and steroids (63.7%); whereas antidepressants, anticonvulsant drugs. Psychotherapy was only reported by 43.5%, 46.0% and 48.4% of the PHCPs, respectively (Table 2).

**Table 2:-** Assessment of paraclinical and therapeutic practice in chronic pain management among primary healthcare professionals.

Practice	Frequency	Percentage
<b>Paraclinical investigations</b>		
X-rays imaging for the painful zone	92	74.2
Ultrasound / Echography for the painful region	84	67.7
CT Scanner	67	54.4
Magnetic Resonance Imaging (MRI)	77	62.1
Electromyogram	72	58.1
Inflammatory markers	77	62.1
Psychiatric evaluation	71	57.3
Others	31	25.0
<b>Therapy Prescribing</b>		
Non-opioid analgesics	80	64.5
Non-steroid anti-inflammatory drugs (NSAIDs)	102	82.3
Steroids	79	63.7
Opioid analgesics	75	60.5
Anticonvulsant / antiepileptic drugs	57	46.0
Antidepressant drugs	54	43.5
Muscle relaxants	81	65.3
Physical therapy / Rehabilitation	67	54.0
Psychotherapy	60	48.4
Referral to specialist pain clinic	77	62.1
Others	15	12.1

Participants replied to the question: have you ever prescribed the following for patients with chronic pain? “Yes” answers were reported in the Table.

#### **Assessment of confidence in chronic pain management:-**

Analysis of reliability of part 3 of the questionnaire assessing PHCPs confidence showed an excellent Cronbach's alpha=0.948 (20 items).

Assessment of physicians' confidence in chronic pain management showed a mean $\pm$ SD (range) CLS=69.60 $\pm$ 16.61 (30.00; 100.00). Per-item assessments showed relatively higher confidence regarding the use of NSAIDs (mean $\pm$ SD score=3.82 $\pm$ 0.96), the assessment of pain severity (3.80 $\pm$ 1.05), knowledge about different types of chronic pain (3.77 $\pm$ 1.00) and assessment of impact of chronic pain on QOL (3.77 $\pm$ 1.04). Participants declared being relatively less confident regarding cancer-related chronic pain management (mean $\pm$ SD score=3.07 $\pm$ 1.31), use of antidepressants in chronic pain (3.19 $\pm$ 1.19), non-cancer chronic pain management (3.20 $\pm$ 1.39), and use of anticonvulsant drugs (3.20 $\pm$ 1.21) (Figure 3).

**Figure 3:-** Assessment of physician's confidence in chronic pain management.

Physicians replied to the following question: "How confident do you feel performing the following actions?" Possible answers were: 1=not confident; 2=not too confident; 3=confident; 4=very confident; 5=extremely confident. Bars represent mean±SD confidence level in each item.

#### **Factors associated with practice and confidence in chronic pain management:-**

When compared between male and female PHCPs, the female PHCPs had better practice indicators than male PHCPs with mean±SD CPS=78.28±14.27 versus 70.42±16.02;  $p=0.009$ , respectively. Participants who work in high patient-flow centers/services ( $\geq 30$  patients seen per day) had lower CPS as compared to those who work in low patient-flow services (mean±SD) CPS=72.52±15.26 versus 82.24±12.89;  $p=0.000422$ , respectively. However, no significant difference in practice was observed across age categories ( $p=0.062$ ); marital status ( $p=0.453$ ); years of practice ( $p=0.388$ ); and specialty ( $p=0.117$ ); or between physicians who had personal or family history of chronic pain and those who had not ( $p=0.202$ ).

Regarding confidence, CLS was proportional to PHCPs age ( $p=0.000025$ ) and years of practice ( $p=0.022$ ), and was higher in family physicians (mean±SD CLS=82.18±15.60) as compared with other specialties such as pediatrics (73.50±14.09) and general medicine (62.62±15.17); ( $p=0.000001$ ). Confidence was also higher in physicians with personal or family history of chronic pain ( $p=0.013$ ), as well as in physicians working in low patient-flow centers

(<30 patients per day) as compared with their counterparts ( $p=0.006$ ). However, no statistical difference was reported between the genders regarding confidence ( $p=0.804$ ) (Table 3).

**Table 3:-** Factors associated with low confidence and poor practice in chronic pain management among primary care physicians

Factor	Category	Practice (CPS)			Confidence (CLS)		
		Mean	SD	p-value	Mean	SD	p-value
Gender	Male	70.42	16.02	.009*	69.00	14.75	.804

#### Correlation between confidence and practice:-

Linear regression analysis showed a positive correlation between confidence and practice in chronic pain management, with a weak correlation coefficient ( $r=0.397$ ; odds-ratio [OR]=1.43; 95%CI: 1.24 to 1.67;  $p=0.000005$ ), (Figure 4).

**Figure 4:-** Correlation between confidence and practice in chronic pain management among primary healthcare physicians.

## Discussion:-

This study highlighted the insufficient practice and relatively low confidence in chronic pain management among PHCPs. The calculated scores including CPS and CLS were used as an indicator of the quality of clinical practice and self-assessed confidence of physicians in chronic pain management respectively. Results showed an unsatisfactory practice as well as the confidence. These results may reflect a lack of training among PHCPs along with a weak implementation of pain specialized healthcare chain. Comparable observations were reported in the USA, where patients' access to pain specialized centers is still inadequate due to lack of optimal training among healthcare professionals and uncoordinated interdisciplinary management. These results indicate the frequent undertreatment among patients and unmet needs for care within the society (Dubois and Follett, 2014). Studies from Europe estimated that 1 in 2 patients with chronic pain have inadequate management of their condition (<sup>a</sup>Breivik H, 2006; <sup>b</sup>Breivik H, 2012). On the other hand, pain management has recently emerged as a subspecialty. Therefore, cultural changes should be operated, both among patients and health professionals, to promote proper understanding of chronic pain, its related factors and specific assessment and the treatment aspects (Medicine Io, 2011).

Regarding clinical assessment, item-specific analysis demonstrated that physicians often failed to investigate the important features of chronic pain through patient's interview and physical examination, which further resulted in insufficient diagnosis and poor treatment decisions. For example, failure to explore psychological impact of chronic pain exposes the physician to the risk of missing the diagnosis of an adjacent psychiatric disorders such as anxiety or depression, which is highly associated with impaired quality of life and compromises management and therapeutic outcomes (Kroenke et al, 2013). The prevalence of depression in relation to chronic pain is higher than in the general population and was reported to be as high as 21%. In addition, patients suffering from chronic pain are highly exposed to social and professional exclusion (<sup>a</sup>Breivik H, 2006; <sup>b</sup>Breivik H, 2012). Psychosocial aspects constitute a major concern in chronic pain management and should be integrated in the treatment goals by promoting patient's rehabilitation and improving quality of life (Mills et al, 2016).

Participants estimated that approximately 25% of their patients suffered from chronic pain, which is as high as the prevalence reported in the general population (McQuay and Moore, 2008). Such a high prevalence makes chronic pain become a burdensome public health issue, both medically and economically (Nahin et al, 2015; Gaskin and Richard, 2012). Studies have demonstrated that patients with chronic pain have increased mortality and cardiovascular morbidity, and frequently associated multi-pathological conditions (Guthrie et al, 2012; Barnett et al, 2012). The existence of such comorbidities often limits pain management and restricts the use of efficacious therapeutic options. Consequently, PHCPs should be aware and attentive about the necessity of a comprehensive approach in the management of chronic pain as majority of these patients are exclusively managed in primary care; elicit considerable care resources and have greater use of emergency services while only a minority are referred to secondary care (<sup>a</sup>Breivik H et al, 2006; Briggs et al, 2011; McLeod and Nelson, 2013; Anderson et al, 2012).

Confidence in the use of opioids in chronic pain management was relatively low as compared to that in use of NSAIDs. The use of opioid analgesics is often limited by physicians' misconception and apprehensive attitude evoking concerns about medication misuse, addiction risk among patient and insufficient training (Canada RE et al, 2014; Jamison et al, 2014). This attitude exposes to an odd risk of undertreatment among patients with chronic pain and engenders unsatisfactory results. Adequate trainings on opioids use and misuse risk assessment should be proposed to PHCPs to improve their knowledge and confidence and to also dissipate their apprehensions and change their attitude towards the use of opioids in primary care for chronic pain (Kavukcu et al, 2015). Also, physicians should be trained on ways to assess the patients' benefits from opioids and how to ensure that the risks justify the benefits to boost their confidence in the use of these agents (Frank et al, 2014).

In addition, prescribing guidelines and protocols should be implemented to support the therapeutic decision making in chronic pain and to ensure better adherence to good practice (Canada RE et al, 2014). However, several other aspects in prescribing opioids should be taken into consideration, including availability, cost and form of the medication (transdermal, sublingual, etc.), in addition to individual tolerability, compliance and efficacy profiles requiring personalized titration and dosage techniques (Pergolizzi et al, 2008).

Considering other aspects of physical examination, participants reported frequent examination for neuropathic pain in patients with chronic pain, while underlying cause of pain is less frequently sought. Neuropathic pain, as opposed to nociceptive pain, results from damage or dysfunction of nerve fibers responsible for abnormal pain perception. It is a frequent condition encountered in up to 17% of cases of chronic pain and has been reported to be on the rise in

the last decade (Frank JW et al, 2014). It may be associated to specific syndromes, such as diabetic peripheral neuropathy, postherpetic neuralgia, trigeminal neuralgia and low-back pain with spinal disorders (Boogaard S et al, 2015; van Hecke O et al, 2014; Yamashita T et al, 2014). It is generally associated with greater impact on quality of life (Hiyama A et al, 2015). Several screening tools have been developed for clinical detection of neuropathic pain, such as the Neuropathic Pain Diagnosis Questionnaire (DN4) and the Neuropathic Pain Questionnaire (NPQ) which are reliable and simple to use in routine practice (Haanpää ML et al, 2009).

Female gender and low workload (<30 patients per day) were the only two favorable factors for good clinical practice in chronic pain management, including an adequate patient's interview and physical examination. The other factors such as age, years of practice and specialty had no effect on the practice. However, increased confidence level was associated with age and years of practice and was higher in family physicians as compared to their counterparts. In addition, the existence of a personal or family history of chronic pain increased the confidence but did not improve clinical practice. Overall quality of practice showed weak correlation with confidence level in linear regression ( $r=0.397$ ).

This data suggests that, beyond insufficient knowledge and confidence, a lack of awareness and investment exist among PHCPs in the management of chronic pain. Corrective measures should be undertaken to promote interest and good clinical practice in pain management among PHCPs.

### Conclusion:-

This study explored chronic pain management in PHC centers of Jeddah and revealed insufficient practice and low levels of confidence among physicians regarding different aspects of chronic pain management. Although physicians' confidence increased with age and experience and was shown to be higher in family physicians, the level of practice remains comparably inappropriate.

The correlation between confidence and practice indicates the importance of enhancing knowledge about chronic pain management by the means of training and increase of clinical exposure among physicians to improve their practice. However, the weak correlation coefficient suggests the existence of other adverse factors for good practice, such as a lack of awareness or investment, which requires the implementation of awareness raising strategy. The implementation of national guidelines and or local protocols can be useful in prompting physicians' confidence and improving physicians' adherence to good practice, especially regarding specific aspects such as opioids use, diagnosis and treatment of neuropathic pain and assessment and management of multi-dimension impact of chronic pain on patient's quality of life.

### Acknowledgment:-

We are grateful to the Directorate of Health Affairs – Jeddah and to all participating primary health care centers for their kind support in the realization of this study. We also thank Dr. Mohamed Amine HAIRECHE for his support in the preparation of the manuscript.

#### Abstract

The present article is an attempt that has been made to study the customer perception towards online shopping at Salem district. In this study an attempt has been made customer perception on online shoppers has been playing a vital role in these scenarios day to day activities in the mind of customers. Customer perception is typically affected in the way of broadly such as advertising, reviews, public relations, social media and personal experiences etc.,. Today we say that customers are mind blowing while go for an online shopping because the wide range of internet facilities in the era. The questionnaire was prepared through the inputs taken from the past researches and also from the feedback of the pilot study. Thus the validated final questionnaire was used to collect data from 150 respondents. The researchers have adopted random convenient sampling technique to gather the data. The data are analyzed using the simple percentage analysis and ANOVA (analysis of variances) methods. The result of this study reveals that customers are intake in the future online shopping in the way of intention for getting a products through internet websites such as EBay, Flipkart etc.,. The study suggested that the advertisers need to focus on their every customer's effort to ticket the market assuming that the influence of the television ads in the online shopping behavior.

#### Introduction:-

Customer's perception equities are built over a period of moment in time by hi-tech innovations, consistent high quality, hostile advertisement and encouragement and accessibility of the products is another influential success factor, as commodities are of small value, frequently purchased daily use items. So, there is always a chance of customer's discernment switching due to whim buying. (Purna Kumar 2013) author pointed that the Organisations have long used the traditional media like television, cinema, radio and newspapers for promotional purposes of online shoppers in the mind of customers. Advertisements have been ongoing in various forms such as print, radio, outdoor are prefer to influence the online or internet shopping.

## Objectives of the Study:-

### Primary Objective:-

- ❖ The primary objective is to the study perception of customers towards online shopping.

### Secondary Objective:-

- ❖ To determine consumer behaviour in online environment
- ❖ To identify the main influencers in online buying process
- ❖ To identify people's attitude towards benefits and risks of online shopping
- ❖ To find out the preferences of the consumer regarding the attributes of online shopping website.

## Materials and Methods:-

A straight survey was used to collect the data for this study. It was administered to random shoppers at local respondents and to students at Salem district in the interior town. The survey questions were compiled from previous study questions pertaining to the electronic trade shopping behaviors [1, 2, 3, 4, 5, 6, 7, 11, and 12]. These questions were premeditated to gather data on the subjects' perceptions toward online shopping, especially their enthusiasm to perceived online. To validate the clarity of these questions, four professors and nine researchers were asked to read through the survey questions. Revisions to the survey were made based on the feedback received. The survey consists of 52 questions. Besides 7 questions on demographics, the remaining 17 questions were designed to examine subjects' customer perceptions on online shoppers.

The questions has been collected randomly from different region in the Salem district both interior town and exterior region. The questionnaire has been collected 210 and out of 210 One hundred and fifty (150) individuals provided responses to the survey. However, sixty of the responses were not completed, and thus were excluded from the result. Details on the subjects' demographics are provided in Table 1 and 2 below (Results and Discussion).

## Results and Discussion:-

**Table 1:- Subject's Demographics.**

<b>Gender</b>	Male 96(64%)			Female 54(36%)
<b>Age (in years)</b>	18-25 42(28%)	26-35 48(32%)	36-40 39(26%)	41 and above 21(14%)
<b>Marital Status</b>	Married 54(36%)			Unmarried 96(54%)
<b>Educational Qualification</b>	Up to 10 <sup>th</sup> 24(16%)	Up to 12th 33(22%)	UG 57(38%)	PG and above 36(24%)
<b>Occupation</b>	Farmer 21(14%)	Employee 15(10%)	Professional 15(10%)	
	Business 24(16%)	House wife 5(3.3%)	Student 70(46.7%)	
<b>Family income (per annum in lakhs)</b>	Below 2 30(20%)	2-4 66(44%)	4-6 33(22%)	Above 6 21(14%)
<b>Place of residence</b>	Urban 72(48%)			Semi-urban 42(28%) Rural 36(24%)
<b>Methods of payment while purchasing in online</b>	Credit Card 39(26%)	Cash on delivery 75(50%)	Transfer Online 36(24%)	
<b>Most preferable website to purchase product</b>	Flipkart 51(34%)	Amazon 24(16%)	Snapdeal 30(20%)	
	EBay 27(18%)	Others 18(12%)		

## Interpretation:-

It was the evident table 1 shows that the genders of the respondents on male (64%) of the online shoppers are perceived day to day activities, 26-35 age groups of the respondents (32%) are mostly preferred online shopping's in the Salem district in both interior and exterior region , most of the respondents are unmarried (54%) are preferred online shoppers because of the time constraints in the tight busy schedule , most of the respondents under graduate (38%) are preferred used to go with online shopping for getting the products at easily, majorities of the respondents

are Student (46.7%) are go with online shopping because the internet is in his/her hand at any time to know the detail of the products, Mode of payment while purchasing in online Cash on delivery (50%) because some of the respondents are not trust the payment mode through internet, so especially in India most of the customers are used to preferred to go with cash on delivery, Most preferable website to purchase product for Flipkart (34%) are the majorities' perceived online shoppers and remaining are not much perceived from online shopping .

### Table 2:- ANOVA

In this table 2 we concluded that the [two groups] age (3<sup>rd</sup> question) and most preferable website to purchase product (13<sup>th</sup> question).

### NULL HYPOTHESIS (H<sub>0</sub>)

There is no significant difference between age and most preferable website to purchase product.

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	54.204	3	18.068	26.207	.000
Within Groups	100.656	146	.689		
Total	154.860	149			

### Interpretation:-

From the above table, it was identified that the calculated value (0.00) is less than the table value (0.05). Hence, the null hypothesis was rejected and was concluded that there is significant difference between age and most preferable website to purchase product.

### Conclusion:-

The consumer's perception on online shopping varies from person to another and the perception is limited to a certain extent with the availability of the proper connectivity and the exposure to the online shopping has to be improved to make the customer satisfied. The perception of the consumer also has similarities and difference based on their personal characteristics usage based on their needs and demand. The study reveals that mostly the students are attached to the online shopping and hence the elder people don't use online shopping much as compared to the younger ones, so awareness has been fashioned in the coming era. Finally we are suggested that the online transaction should be flexible for the customers who perceived in shopping.

### Abstract

Streets are an important part of open public spaces that reflect the character and the sense of place of cities. People depend on streets for many functional activities. One of these functions is its role as a channel of movement. Yet today, more and more streets are simply choked with car traffic vying for space with pedestrians and bicyclists. This means that priority is given to the function of the streets as a channel of movement for motor vehicles. Hence, this study tries to answer two questions. Firstly, does Nineveh Street have a role as a channel of movement in giving the sense of place to Mosul City Centre? Secondly, how do people use the street in terms of movement? The objective of the study is to examine the role of Nineveh Street in terms of movement and determine the travel mode used by people to move from one place to another in order to establish the role of Nineveh Street in giving the sense of place to Mosul City Centre in Iraq. This paper has adopted the mixed mode method. It used 330 questionnaire surveys which were designed to provide quantitative data, as well as 30 interviews and direct observation as a qualitative method.

### Introduction:-

Streets are considered one of the important parts of open public spaces which reflect the character and the sense of place of cities (Najafi and Shariff, 2011). They have different functions that give them their sense of place which is reflected in the city. People use streets for their social, cultural and leisure activities, and for travel, shopping, playing and meeting other people (Abbaszadeh, 2011; Sholihah, 2006; Moughtin, 2003). Accordingly, the main objective of this research is to identify the role of one of these functional characteristics of Nineveh Street, namely movement and its contribution to the sense of place in Mosul City Centre. Understanding streets characteristics and their roles in urban studies is important to reinforce the sense of place of city centres (Cadw, 2013). Hence, this study is significant in further forming the street character of the city.

Many authors and environmental psychologists such as Steele (1981), Shamai (1991), Lynch (1981), Barker (1979), Relph (1976) believe that the experience of place is an important factor contributing to the sense of place. In this study, sense of place is defined as the qualities that differentiate between one place and another (Shamsuddin, and

**Corresponding Author:-** Musaab Sami Al-Obeidy.

Address:- Assistant Lecturer, Department of Architectural Engineering - Cihan University/Sulaimaniya.

Sulaiman, 2002; Shamsuddin, et al., 2008). Therefore, the focus will be upon the qualities of the street which make it a channel of movement.

Sammas (2008) quoted from Jacobs (1961), recognised the role of streets as communication spaces, public spaces, places of social and commercial encounters and exchanges, places to do business, political spaces and symbolic and ceremonial spaces in the city. Nowadays, narrow streets accommodate old buildings, which, consequently, creates traffic congestion. For this reason, the street expansion policy has been introduced (Ja'afar et al., 2012). Besides, streets are the fundamental public space in every city, and the lifeblood of social and economic exchange. However, more and more streets are nowadays choked with car traffic vying for space with pedestrians and bicyclists. (PPS, 2012, pp.7). This means that priority is given to the function of the streets as a channel of movement for motor vehicles. Accordingly, having a central location in Mosul City, Nineveh Street is expected to be a crowded street for the movement from one place to another using various types of transportation such as cars, buses, and carts (Al-Janabi, 2013). With the development of transportation modes, streets of Mosul City could not accommodate the large numbers of cars. As a result, a lot of traffic jam takes place in them.

Hence, the study addresses two questions: Firstly, does Nineveh Street have a role as a channel of movement in giving the sense of place to Mosul City Centre? Secondly, how do people use the street in terms of movements? The objective of the study is to examine the role of Nineveh Street in terms of movement and determine the travel mode used by people to move from one place to another in order to establish the role of Nineveh Street in giving the sense of place to Mosul City Centre in Iraq.

### **Literature Review:-**

Since the present study examines the role of Nineveh commercial street, specifically its function as a channel of movement, this section explains the concept of city centre and street as one component of a city, and the role of streets as a channel of movement in relationship with sense of place.

#### **Concept of City Centre and its components:-**

Since the topic of this research refers to Mosul City Centre, it is necessary to explain the concept and definition of city centres. There are many definitions for city centre. According to Oxford (2012), a city centre defined as the central part or main business and commercial area of a city. According to Shamsuddin, et al. (2008), the street is one of the earliest components of urban spaces known to man and the most prominent 'public open space' which plays an important role especially in Asian cities. It determines the urban pattern of the cities by creating its 'sense of place'. Moughtin (2003) and Krier (1979) defined the street as one of the important elements that act as a public open space. The street acts as a medium of movement for all categories, including humans, vehicles, goods and services (Moughtin, 2003).

Depending on the predominant building use and activities taking place, streets are categorised into several types, such as civic streets, commercial streets, residential streets, pedestrian streets and a combination of commercial/residential streets (Shamsuddin and Sulaiman, 2002). This research studies Nineveh Street as one of the commercial streets in Mosul City Centre. According to many authors, commercial streets are regarded as one of the important street types. Nineveh street primarily functions as a pathway for people going from their own houses to the main square. Commercial streets, as described by Krier (1979), are by nature relatively narrower than residential streets, so that the passer-by can cast an eye over all the goods on display in the shops on the opposite side without having to cross the road. Hassan and Hamid (2010) state that commercial streets are one of the most important components of the urban system due to their facilitation of the shopping activity carried out by urban residents. Moreover, the dynamic space of a street is its formal body since it connects stable spaces which are specified by blocks on the two sides of the street. Therefore, the City Council (2003) reckons that commercial streets located in the centres should be designed to accommodate pedestrians, slow traffic, and to provide on-street parking, and create pleasant shopping environments.

#### **Streets as Channels of Movement:-**

Movement is the most important feature in determining the character of a street (Telford, 2007), and it is the main functional role of the street (Mahdzar, 2003). As a channel of movement, streets have several functions. They connect one place to another (Sholihah, 2005; Sammas, 2008). They are used by People to move from one place to another whether on foot or by cars. They provide a link between buildings, both within the street and in the city at large. They also facilitate the movement of goods (see Table 1.1). In correlation to this function, Sammas (2008) and

Sholihah (2005) quoted from Eichner and Tobey (1987) have identified various activities regarding the use of streets as a channel of movement.

**Table 1.1:-** Streets as channels of movement.

Functional Uses
Vehicular Circulation <ul style="list-style-type: none"> <li>• Through movement</li> <li>• Picking up/dropping off passengers</li> <li>• Curb side parking</li> <li>• Access to parking</li> <li>• Buses</li> <li>• On-street service</li> <li>• Off-street service</li> <li>• Emergency vehicle</li> </ul>
Pedestrian Circulation <ul style="list-style-type: none"> <li>• Through movement</li> <li>• Waiting for, boarding and alighting from vehicles (buses, taxis, cars)</li> <li>• Entering and leaving subways</li> <li>• Crossing streets</li> <li>• Entering and leaving buildings</li> </ul>

Source: Sholihah (2005) and Sammas (2008) quoted from Eichner and Tobey (1987).

Mahdzar (2003) affirms the importance of streets' function as a channel of movement. He states that the spatial function is performed where streets serve as a channel for urban space use or movement from one point of origin to another point of destination. Streets provide a link between buildings, both within the street, and in the city at large. They facilitate the movement of people as pedestrians or by vehicles and the movement of goods to sustain the wider market and some particular uses within the street (Moughtin, 2003, pp.130-133). What is important about a street is not only its width and the number of lanes through which one can move or the types of transportation modes used, but also what the street is linking and the kind of movement involved (Moughtin, 2003, p.130-133).

According to PPS (2008), streets are places where people walk, stroll, look, gaze, meet, play, shop and even work, but not places for cars. Although public movement involves walking, riding horses, camels and other animals, using pull carts, cycling, and driving more modern and sophisticated vehicles such as cars and motorcycles, many streets nowadays have become inundated with motorized vehicles to such an extent that the pedestrian and public life have almost been squeezed out (Sholihah, 2005; Sammas, 2008).

### Methodology:-

The study adopts both quantitative and qualitative methods (see Table 1.2). The use of these methods is determined by many factors, such as the nature of the research, the research objectives, the research questions, and the methodology used in previous research. An eclectic method is used in this study because quantitative and qualitative methods each has its strengths and weaknesses, so an eclectic method helps balance out any potential weaknesses in each data collection method (Gray, 2014).

As a quantitative method, the study relied on questionnaire surveys to examine the role of Nineveh Street in terms of movement and to determine the travel mode used by people to move from one place to another. The study used 330 questionnaire surveys based on 5.5% sampling error at 95% confidence level, which are employed by many considerable researchers (Shuhana 1997; Hilmilia 2005; Ja'afar, 2006; Ja'afar and Usman, 2009; Ja'afar, et al., 2012; Ujang and Dola, 2007; Ujang, 2010). A pilot survey was done before conducting the actual survey to ensure that the questions are understood by the respondents. Besides, the study made 30 semi-structured interviews, direct observations and photos as a qualitative method to measure the same street qualities measured by the quantitative method.

**Table 1.2:-** Research methodology used in the study

Research questions	Research objectives	Technique	Method
Does Nineveh Street have a role as a channel of movement in giving the sense of place to Mosul City Centre?	To examine the role of Nineveh Street in terms of movement in giving the sense of place to Mosul City Centre.	Questionnaire	Quantitative
		Direct observation	Qualitative

How do people use the street in terms of movements?	To determine the travel mode used by people from one place to another.	Questionnaire	Quantitative
		Direct observation	Qualitative
		Semi-structured interviews	Qualitative

For questionnaire design based on reference to the previous research of Dolbani (2000) quoted from Ujang (2010), the targeted population for this study was the static and mobile users. Static users comprise shop-owners, shopkeepers, vendors, office workers, residents, and students. Mobile users comprise shoppers and visitors. Meanwhile, this study used the approach of "non-probability sampling" of "Time-interval and Cluster Sampling" (cluster sample interval), as did Hilmilia (2005) and Ja'afar (2006). In non-probability sampling, the researcher chooses the sample based on who they think would be appropriate for the study.

### The Study Area and Justifications:-

Nineveh Street has been selected as the setting of the investigation of this study. It was chosen based on the functional characteristics that represent the character of Mosul City Centre after the first decade of the last century, which emerged after the British occupation of Mosul City, when the process of planning and architectural transformation occurred in these areas (see Figure 1.1). It is located within the main commercial/shopping district of the City Centre. It also receives the highest concentration of pedestrians, shoppers and visitors.

**Figure 1.1:-** Top view of case study area, Source: Google earth.

### Findings and Discussions:-

Nineveh Street played an important role as a channel of movement. From the survey, people used the street for many purposes in terms of movement. About 63% (N=63) of the respondents mentioned that they moved from place to place accessing this Street on foot. Besides, 20% (N=64) of the respondents said that they used this Street to go to certain buildings (see Figure 1.2). The other 13% (N=43) of the respondents used the Street to move from place to place by public transportation and 10% (N=33) used their own vehicles. In field interviews, many of the respondents explained why they used this street to move from place to place by walking. They often use this Street to go from one place to another by foot because walking is enjoyable, and closer to being a form of entertainment. In addition, this street directly connects with surrounding streets and nearby markets, which people cannot access by car.

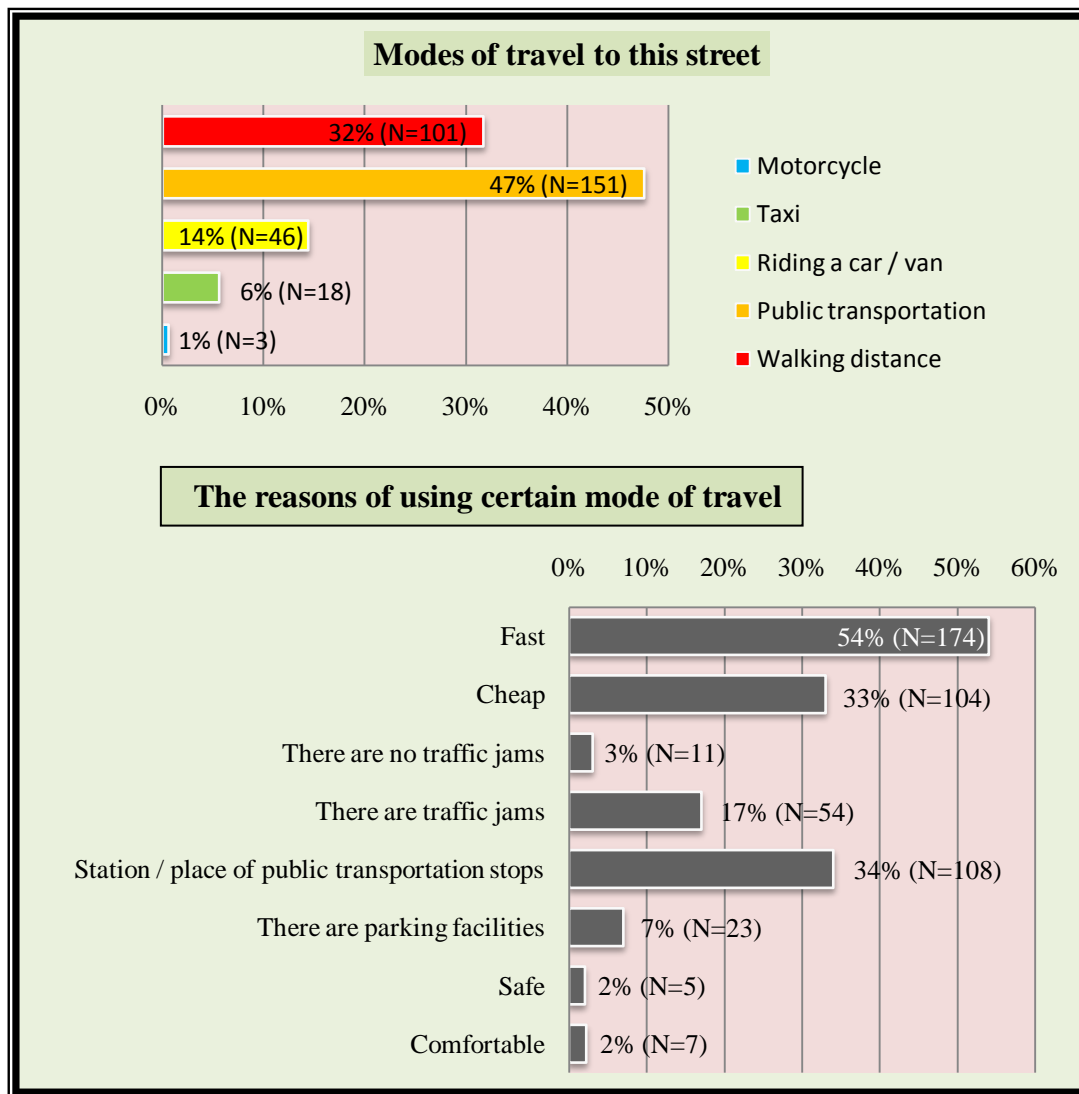

**Figure 1.2:-** The purpose of using the Street

The results of the survey show that Nineveh Street witnesses the arrival of a large number of respondents during daylight and as follows: 36% (N=114) respondents every day, 3% (N=10) respondents once every two days, 14% (N=44) respondents once a week, 4% (N=12) respondents two times a week, 10% (N=31) respondents once every two weeks, and 20% (N=64) respondents once a month (see Figure 1.3).

**Figure 1.3:-** Frequency of going to the Street

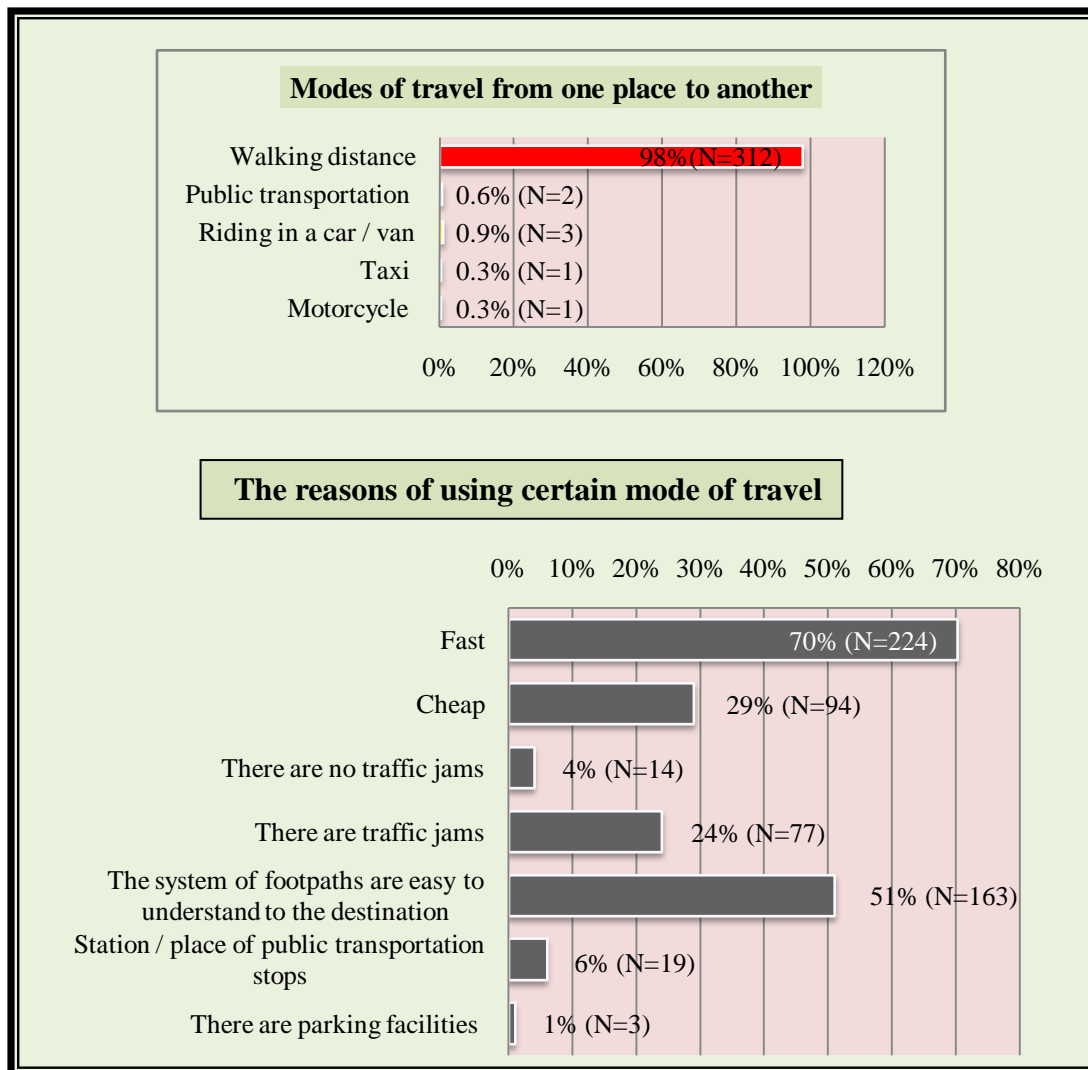

The results also show that the respondents implemented various modes of travel to reach the street from far places. The majority of them, about 47% (N=151), used public transportation (Figure 1.4). However, about 32% (N=101) of them reached the street on foot, while only 14% (N=46) of the respondents reached it by their own cars or by vans. Speed, low cost of the mode of travel and the presence of nearby public transportation stations are influential factors in people's choice of these modes of travel rather than others.

**Figure 1.4:-** Modes of travel to this Street from a distance and the reasons of selecting them

The survey also targeted people who were present in the street. Almost all the respondents chose walking as a mode of travel to move from one place to another (see Figure 1.5). Two striking reasons were behind people's preference of the walking mode: firstly, it is considered fast by 70% (N=224) of the respondents, and secondly, it makes it easy to understand and connect the destinations in the Street according to 51% (N=163) of the respondents. Other respondents reported cheap cost and traffic jam as reasons for preferring the walking mode to other modes of travel inside the Street. This result was also supported by many respondents who were interviewed.

**Figure 1.5:-** Modes of travel used by respondents in the Street and the reasons of selecting them

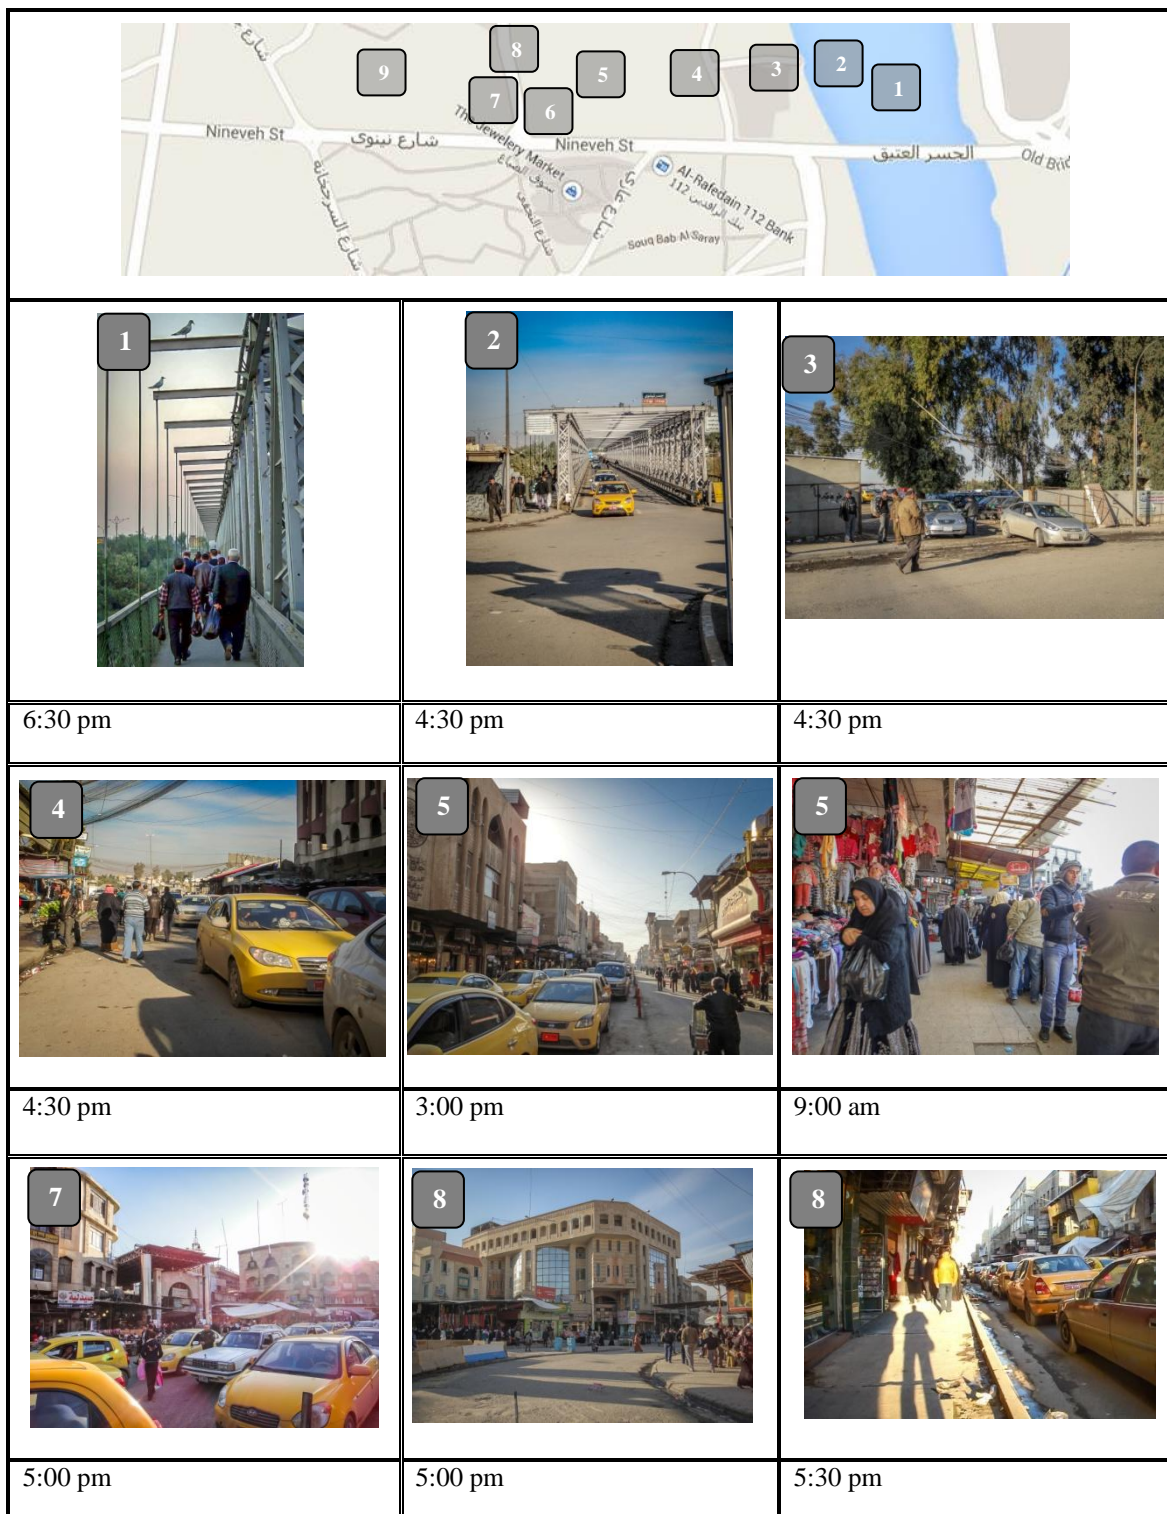

The analysis of the observation photo shows that Nineveh Street is very busy during the daytime (see Figure 1.6). Due to lack of safety in Mosul City after the war in 2003, many military checkpoints have been set up in Nineveh Street and other streets. Before Eid al-Adha and Eid al-Fitr, the directorate of traffic decided to prevent vehicles from entering Nineveh Street due to the vast number of people who visit the street for shopping (see Figure 1.7).

**Figure 1.6:-** Nineveh Street before the two Eids

In addition, there is no doubt that the location of Nineveh Street in the core of Mosul City Centre contributes to the creation of congestion along the street, especially at the street junctions with other streets. Figure 5.41 shows the intensity of the movement of vehicles and pedestrians along the street which was observed from 9 am - 6:30 pm.

**Figure 1.7:-** The role of the Street as a channel of movement

So, we can say that Nineveh Street plays an important role as a channel of movement. This result is consistent with what Ja'afar, et al. (2012) reported; however, they stated that priority is given to the function of the streets as a channel of movement for motor vehicles over other functions. Most of the respondents used Nineveh Street to move from one place to another or for other purposes in terms of movement. This was due to its location in the core of Mosul City Centre, its many links to other places, and its closeness to the public transportation area.

### Conclusion:-

The study demonstrates that the role of commercial streets as a channel of movement is strongly linked to the sense of place of city centres. Nineveh Street have played effective role in relating to the sense of place as reflected in the users' high degree of dependence on the streets for movement from place to place. This is because of its strategic location in the core of Mosul city centre and overlooking the Old Bridge is considered as the gateway for users who live on the left side of Mosul City. Nevertheless, Nineveh Street misses some of its sense because of the congestion that brought about by traffic and the military checkpoints. Political issues which lead to incredible jam and effect on the role of a street as a channel of movement can also weaken sense of place of city centres. In other words, bad political conditions should be counted as one of the negative factors that reduce the importance of commercial streets in terms of serving people to move from a place to another, thus reducing the sense of place of city centres.

In addition, people move from a place to another in the street by walking more than by other modes. There is no doubt that the commercial nature of the street was the main reason that encouraged people to walk; people should walk to buy things. They cannot buy a dress, for example, while driving a car as PPS (2014) mentioned. This means that sense of place can be created by streets when they are pathways, not car roads. Meanwhile, the importance of Nineveh Street as a commercial space was stated by Al-Obeidy (2015). He argues that Nineveh Street has played a pioneer role as a commercial space due to the presence of diverse goods and shops. This means that there are relationships among street functions. Therefore, in studying commercial street roles, this study recommends studying all the functional activities together to avoid lack of information, misinterpretation, thus unconvincing results.

Peripheral Giant Cell Granuloma (PGCG), maxillary anterior, differential diagnosis

#### Abstract

Peripheral giant cell granuloma (PGCG) is a benign lesion regarded as a hyperplastic reaction to local injury or chronic trauma, developing only within the oral cavity. The common site for PGCG is the premolar gingival tissue and the crest of the edentulous alveolar ridge. PGCG presents as a firm, soft, bright pedunculated or sessile nodule with various sizes; that range from small papules to enlarged masses; though they are generally less than 20 mm in diameter and is asymptomatic. We describe a 41-year-old male who presented with a peripheral cell giant granuloma of the maxillary anterior area.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Peripheral giant cell granuloma (PGCG) (giant cell epulis, osteoclastoma, giant cell reparative granuloma, or giant-cell hyperplasia) is an infrequent exophytic lesion of the oral cavity occurring on the gingiva and alveolar ridge usually as a result of local irritating factors such as tooth extraction, poor dental restorations, food impaction, ill fitting dentures, and calculus.<sup>1</sup> Peripheral giant cell granuloma accounts for less than 10% of all hyperplastic gingival lesions.<sup>2</sup> PGCG arise interdentally or from the gingival margin, occur most frequently on the labial surface, and may be sessile or pedunculated.<sup>1</sup> Histopathologically PGCG has a non-encapsulated mass of tissue containing reticular and fibrillar connective tissue containing ovoid or fusiform shaped cells and multi-nucleated giant cells.<sup>3</sup> We describe a 41-year-old male who presented with a peripheral cell giant granuloma of the maxillary anterior area.

#### Case History:-

A 41 years old male complained of growth in upper front tooth region since one and a half years. There was no history of any serious or significant illness. Patient brushed his teeth once daily with tooth paste and medium bristle tooth brush, using horizontal strokes. There was no history of smoking or tobacco chewing. Patient was apparently normal one and a half years ago when he observed a growth in upper front tooth region. The growth was sudden in onset and gradually increased in size to attain the present dimensions. Initially the growth was painless but since 6 months patient reported that the growth bleeds while brushing and pain is associated during brushing only. Patient also feels difficulty in speech. A solitary, sessile, round-ovoid growth with normal mucosal color is present on anterior maxillary gingiva. The growth measured 3x3 cm approximately (Fig. 1). On Palpation inspector findings were confirmed. The growth was firm in consistency, slightly rough on surface texture, non-tender on palpation and bleeds on provocation. Gingiva was generalized red and enlarged with generalised loss of stippling and knife edge margins. A provisional diagnosis of Pyogenic granuloma was done. Peripheral ossifying fibroma, Peripheral giant cell fibroma, Gingival hyperplasia and Peripheral giant cell granuloma were also considered in the differential diagnosis. Routine haematological and serological investigations were normal. Radiological examination revealed no evidence of bony involvement (Fig. 2). Histopathological features revealed stratified squamous epithelium overlying

**Corresponding Author:- Dr Gurwinder Kaur.**

Address:- Research associate, AHEAD academy, Rajinder Nagar, New Delhi-110059.

the connective tissue stroma. The epithelium shows ulcerations in some areas. The underlying mass of fibrillar connective tissue stroma consists of large numbers of plump spindle shaped connective tissue cells and many multinucleated giant cells which contain varying number of nuclei. Some of the giant cells are found in lumina of blood vessels. Numerous capillaries and haemorrhagic areas are seen around the periphery of the lesion. The findings were consistent with a diagnosis of **Peripheral giant cell granuloma**. Patient was explained about the condition and was reassured. The patient was placed on follow-up.

**Figure 1:-** Intraoral swelling observed in anterior maxilla.

**Fig. 2:-** Intraoral periapical radiograph showing no abnormal changes

**Fig. 3:-** Photomicrograph showing focal aggregates of multinucleated giant cells in deeper connective with overlying epithelium. Inset reveals higher power of giant cells. (x40,x400; H&E)

### Discussion:-

PGCGs can occur at any age, but most commonly are noted between the fourth and sixth decades and appear to be more common in women, with the most prevalent site being the posterior mandibular alveolar mucosa.<sup>4</sup> PGCG has clinical features which separates it from the fibrous and vascular gingival enlargements.<sup>5</sup> PGCG presents as a firm, soft, bright pedunculated or sessile nodule with various sizes: that range from small papules to enlarged masses; though they are generally less than 20 mm in diameter and is asymptomatic.<sup>5</sup> The growth of PGCG is generated by repeated trauma. There is a variation in color from dark red to purple or blue commonly with ulcerated surface.<sup>4, 5</sup>

The etiology of PGCG is still not precisely defined. Gottsegen suggested the development of PGCG often after periodontal surgery. Local irritating factors such as tooth extraction, poor dental restorations, food impaction, ill fitting dentures, and calculus are often considered predisposing factors for PGCG. Low socioeconomic status of the patients and unfavorable oral hygiene also seem to be predisposing factors to peripheral giant cell granuloma.<sup>6</sup> Choi had reported the correlation of PGCG with hyperparathyroidism secondary to renal failure.<sup>7</sup>

The differential diagnosis of PGCG includes pyogenic granuloma, fibrous epulis, peripheral ossifying fibroma, inflammatory fibrous hyperplasia, peripheral odontogenic fibroma, and papilloma, all of which present with similar clinical and radiographic findings.<sup>8</sup> Radiographic examinations typically reveal no findings, because the lesion is a soft tissue mass. PGCG has been found to be more common in the mandible as compared to maxilla.<sup>9</sup> The reported proportion is 2.4:1 and in most cases, it occurs anterior to molar region.<sup>10</sup>

The treatment of PGCG comprises surgical resection with elimination of the entire base of the lesion and suppression of the etiologic factor. If resection is only superficial, the growth may recur. Most lesions respond satisfactorily to thorough surgical resection, with exposure of all the bone walls. When the periodontal membrane is affected, extraction of the adjacent teeth may prove necessary to insure full resection though this is initially contraindicated.<sup>11</sup> There are no dissimilarities between cold scalpel or carbon dioxide laser resection of PGCG. The advantages of laser resection are that it causes less intraoperative bleeding, sterilizes the wound, requires no suturing and affords improved postoperative patient comfort.<sup>12</sup> Carbon dioxide laser is of limited applicability in lesions with adjacent bone involvement, where careful surgical curettage is required and laser resection is not indicated in such cases.<sup>12</sup> Recurrence of PGCG is infrequent, ranges as little as 5–11% have been reported.<sup>5</sup> Although incipient lesions

may bleed and induce minor changes in gingival contour, gradual growth in some cases produces an important tumor mass that adversely affects normal oral function.

Liu et al concluded that RANKL and OPG expressed in lesions may play an important role in the formation of multinucleated giant cells.<sup>13</sup> Histopathologic characteristics of PGCG are harmonious with periodontal ligament or periosteum origin.<sup>14</sup> The histopathological findings of PGCG is characteristic chiefly due to the considerable quantity of multinucleated giant cells that are scattered in the connective tissue stroma.<sup>14</sup> Vascular capillaries are profusely available, especially in the peripheral areas, and giant cells are occasionally recognised in the internal wall of these vessels.<sup>12</sup> Hemorrhagic foci are also observed with the release of hemosiderin pigment and posterior invasion by mononuclear phagocytes and inflammatory cells.<sup>15</sup> The fibrocellular reaction is similar to that of other reactive lesions such as fibrous hyperplasia and peripheral ossifying fibroma. The calcified material or newly formed bone may also be seen all over the cellular connective tissue, and some of the lesions may be either woven bone or lamellar bone produced by the mononuclear stromal cells, which might be similar to latent proliferative osteoblasts or osteoprogenitor cells.<sup>9</sup> The exact source or origin of the giant cells is still uncertain.<sup>9</sup> Many theories have been proposed in the English literature, as osteoblasts, phagocytes, endothelial cells, and spindle cells are thought to be responsible for giant cell proliferation.<sup>9</sup> Thus, in such cases a definitive diagnosis can only be established through histopathological examination.

PGCG is histologically identical to its central equivalent, the central giant cell granuloma (CGCG) and the brown tumor of hyperparathyroidism. Radiological investigations are hence imperative for diagnosis to confirm that this giant cell lesion arises within the oral mucosa and does not represent a central gnathic lesion with cortical perforation and soft tissue invasion. In conclusion, the timely and accurate diagnosis of PGCG, centred on the clinical and radiographic findings and histopathological study, allows conservative therapy with a minor possibility of less risk for tooth and bone loss for the teeth and adjacent bone.

Sustainable Competitive Edge, Balanced Scorecard, Strategy Map.

#### Abstract

India is the world's fastest growing large economy with GDP being 7.6% and IMF predicts that India would continue to retain this until 2020. (KPMG, Feb 2016). In the next 10 years, India is going to be young and restless as the projected median age in 2030 is 32 years which is much lesser than China and US which are 43 and 39 years respectively. By 2020, most of the countries are going to face labour force deficit including china (-10 million) and US (-17 million) where as India is going to have a surplus of about 47 millions. These metrics evidences, there is an ample of opportunities to explore and exploit the resources in India. The business environment in India is so favourable for companies to establish and reap the benefit. At the same time, this situation leads to increased competition. Thus achieving a Sustainable Competitive Edge would be predominant challenge that companies need to focus on.

Competitive Edge is the fact that the company has an advantage over its competitors and sustainability is the ability to continue at a particular level for a period of time. Achieving this two would be core objective of all the company. For this company should develop sound strategies and carry out rigorous action plan to implement these strategies. As an aid to this, Balanced Scorecard could serve as a best tool which can help companies in achieving its core objectives. This conceptual paper, explains the importance of Balanced Scorecard and how it could help companies in achieving its sustainable competitive edge. This paper, theoretically establishes the relationship between Business Strategy and Competitive Edge and Balanced Scorecard as a performance measurement tool acting as a mediating variable which could help companies in achieving Sustainable Competitive Edge.

#### Introduction:-

The present Global business environment and the constantly increasing global competition ask for innovation, knowledge enhancement and striving efforts of the stakeholders. In this changed business paradigm relying on only the financial measures, which are considered as the indicators of short-run performance, to measure the corporate performance is puzzling and often misleading. A recent survey conducted has highlighted that the change in the business environment can be summarized with following (MSG EXPERTS):

**Corresponding Author:- Dr. M. Muniraju.**

Address:-Chairman & dean, dept of commerce, bangalore university, Bangalore.

- Globalization and opening up of markets has not only increased competition but also has allowed companies to operate in markets previously considered forbidden.
- Inclusion of information technology as integral part of business environment has ensured that companies are able to process, store and retrieve the huge amount of data at ever dwindling costs.
- Globalization has encouraged free movement of capital, goods and service across countries.

Competitive Edge is the fact that the company has an advantage over its competitors and sustainability is the ability to continue at a particular level for a period of time. Sustainability involves long-term strategic planning that allies business growth with positive environmental and societal continuity. Sustainable Competitive Edge is an advantage that allows a business to be more successful than its competitors over a long period of time

Balanced scorecard is a strategic measurement and management system. It translates an organization's mission and strategy into a balanced set of integrated performance measures. It complements the traditional financial perspective with other non-financial perspectives such as customer satisfaction, internal business process, and learning and growth. It also mixes outcome measures, the lagging indicator, with performance drivers, the leading indicator, because "outcome measures without performance drivers do not communicate how the outcomes are to be achieved" (Kaplan and Norton 1996, p. 150). By selecting appropriate performance drivers and outcome measures to fit in the theory of business in a chain of cause and effect relationship, the organization will have a better idea of how to achieve its potential competitive advantage.

The measures for Balanced Scorecard on Four different perspectives are selected on the basis of a set of 'Strategic Objective' plotted on a Strategy Map. Within each perspective, goals are identified and links are established across and between the perspectives and suitable measures are identified for each objective. The methodology provides a greater contextual justification for choosing the measures and thus making it easier to work with. (Sabah M. Al-Najjar, July 2012)

Balanced Scorecard, being an effective tool for translating Strategies into action enables organizations to achieve breakthrough performance which in turn can provide a better platform for the companies to achieve sustainable competitive edge. Competitive advantage and firm performance are two different constructs with an apparently complex relationship (Ma, 2000). Understanding the sources of sustained competitive advantage has become a major area of study in strategic management (Porter, 1985, 1991; Barney, 1991; Peteraf, 1993; Ma, 1999a, 1999b, 2004; Flint & Van Fleet, 2005; King, 2007). When this strategy is well-formulated and implemented, it can significantly affect a firm's level of competitive advantage (Richard, 2000; Arend, 2003; Powell, 2003; Porter & Kramer, 2006).

To figure out the competitive edge, the companies should focus on its corporate strategy and how to translate strategies into achievable goals. The Balanced Scorecard is one of the most popular tool which helps management in translating corporate strategies into achievable goals or targets. Thus, Balanced Scorecard can serve as a best tool for companies to achieve sustainable competitive edge.

## **Review of Literature:-**

**Milad Abdelnabi Salem, Dr. Norlena Hasnan & Dr. Nor Hasni Osman (2012):-**

In this paper titled "**Balanced Scorecard: Weaknesses, Strengths and its Ability As Performance Management Systems Versus Other Performance Management Systems**" the authors have elucidated that performance management has become a legislative requirement for all companies, both Public and Private. Hence it is crucial to identify an appropriate tool that enables to measure the performance effectively. In this paper the author have made a theoretical framework of Balanced Scorecard and made a comparison with other performance measurement tools such as Total Quality Management, ISO 14001, Performance Pyramid, Performance Prism, EFQM Excellence Model, MBO, BOS etc. They have made a comparative analysis of advantages and limitations of Balanced Scorecard with each measurement tool and has concluded that though Balanced Scorecard suffers from certain criticism, still it has many advantages over other tools and that many organisations have used Balanced Scorecard to create strategy focused organisations and have got successful strategy execution.

**Manoj Anand, B S Sahay and Subhashish Saha (2005):-**

In this article titled "**Balanced Scorecard in Indian Companies**" Performance evaluation of financial measures alone has been severely criticized as it lacks holistic approach, historical in nature and their relevance in the present information age in building company's internal assets and capabilities is challenged. Kaplan and Norton's Balanced

Scorecard developed as an innovative and multi-dimensional corporate performance scorecard compels firms to align performance measurement from Non-financial variables and investigate their impact on the financial indicators. In this paper, the authors has made an empirical study on implementation of Balanced Scorecard by Corporates in India and explored its usage and has identified the management's motivation for its implementations and has concluded that establishing cause-effect relationship among different perspectives is the most critical issues among corporate India. They have also stated that Balanced Scorecard has resulted in improvement of the bottom line through cost reduction opportunities.

**Eric M Olson and Stanley F Slater (2002):-**

In this Paper titled “**The Balanced Scorecard, Competitive Strategy and Performance**” different organizations adopt different strategies based on various factors like organization structure, process etc. in order to be successful. In the same way, all organization cannot have equal emphasis on performance measures. The ‘balance’ in the Balanced Scorecard implies that all measures are equally important in all setting and this idea is challenged. The author has made an empirical study where more than 200 responded. He made the study to determine whether benefits can be derived from matching an emphasis in the scorecard to strategy type with the analysis made, the author found the emphasis made on different measures of Balanced Scorecard differed with the differences between high performers and low performers by strategy type. The study has provided new insight into the performance evaluations requirements of different strategy type and their associations for successful implementation.

**AliminIsmadi Ismail, RaduanChe Rose, Haslinda Abdullah and JegakUli (2010):-**

In this paper titled “**The Relationship Between Organisational Competitive Advantage And Performance Moderated By The Age And Size Of Firms**” the author empirically examined the relationship between the organizational Competitive Advantage and Performance by considering moderating variable Age and Size of the firm. The paper delivers valuable information to firms, specifically with regard to strategic management directed toward performance and attaining a competitive advantage.

**Ionel BOSTON and Veronica GROSU (2011):-**

In this paper titled “**Contribution of Balanced Scorecard Model in Efficiency of Managerial Control**” the authors studied the applicative use of Balanced Scorecard for measuring the economic and financial performance and highlight its importance as a means for communicating to all stakeholders. The concept of Balanced Scorecard is thoroughly studied and analysed and has been justified how it can produce changes and lead to results and achieve sustainable competitive advantage. The author has developed a Balanced Scorecard model for Alpha Group and has studied completely the pros and cons of Balanced Scorecard. The paper has concluded that Balanced Scorecard is able to fill the gap in management system which is created by lack of systematic process and that Balanced Scorecard ensures a coherent development of economic activities of the organization (long-term Strategies). Balanced Scorecard is more than a modern system of evaluating the economic-financial performance.

**Objectives of the Study:-**

1. To comprehend the importance of Balanced Scorecard and the Strategy Map in performance measurement
2. To conceptualize a relationship between Sustainable Competitive Edge and Performance Measurement

**Scope of the Study:-**

The present study is exclusive to the concept of Sustaining Competitive Edge and the role of Balanced Scorecard in achieving competitive edge. The paper focuses on the importance of Balanced Scorecard in the Indian Business Environment and how it could help Indian Companies to achieve sustaining competitive edge.

**Significance of the study:-**

India is the world's fastest growing large economy. India's Economy size (FY 2014-15) is US \$ 2 Trillion, being third largest in PPP terms. The projected Economic prospects during FY 2012 – 2030, India would have CAGR Growth of 6.7% whereas in China it is 6.6% and US 2.5%. These projected statuses assure huge potential for new age entrepreneurs, favourable ecosystem to spur innovation, increased women participation, rising rural and middle class market and largest base for young businesses etc.

It is very much evidence from the above that the Indian Companies and its business Environment has got huge potential in the near future. Exploring this situation, achieving Competitive edge and sustaining it over a period of time is going to be the need of the day. Thus, the present study plays a significant role in bringing some clarity on

the concept of Balanced Scorecard and how BSC model could help Indian Companies in achieving sustaining Competitive edge.

### **Research Methodology:-**

The Research approach adopted in this paper is a descriptive and theoretical study. On the theoretical background, the importance of Balanced Scorecard and what impact it could create on Sustaining Competitive Edge has been studied. This paper focused on analyzing the information provided by various literatures and documents and establishes the relationship between the Balanced Scorecard and Company's Competitive Edge.

### **Sources of Data Collection:-**

For the purpose of this research, secondary data has been collected to understand the current Indian Business environment. The concepts and information from various books, literatures, business reports and web sources has served as important sources for data.

### **Limitation of the Study:-**

This study is limited to understanding how sustainable Competitive Edge could be achieved by the Companies in the Indian Business environment alone. In relation to this, how Balanced Scorecard, as a performance measurement tool, could aid companies in achieving this goal. The Other Factors which could influence the Competitive Edge of the companies are not considered in this study.

With the mere description of Sustainable Competitive Edge, the whole study has been undertaken and how Balanced Scorecard could make a difference for the companies.

### **Discussion:-**

#### **Balanced Scorecard:-**

The concept of 'Balanced Scorecard' was first introduced in the journal "Harvard Business Review" (January-February, 1992) by Robert S. Kaplan and David P. Norton. The Balanced Scorecard is an organizational framework for implementing and managing strategy at all levels of an enterprise by linking objectives, initiatives and measures to an organization's strategy. The Balanced Scorecard is a strategic management system (not only a measurement system) that enables organizations to clarify their vision and strategy and translate them into action.

Kaplan and Norton want "to incorporate the valuation of a company's intangible and intellectual assets, such as high quality products and services, motivated and skilled employees, responsive and predictable internal processes, and satisfied and loyal customers" (Kaplan and Norton 1996, 7). So "the Balanced Scorecard complements financial measures of past performance with measures of the drivers of future performance.

#### **Balanced Scorecard Perspectives:-**

The Balanced Scorecard enables managers to view the well-being of the business from four important perspectives or quadrants. Each quadrant of the scorecard reports performance measures directly related to the corporate vision in the form of key performance measures or indicators (KPI). The Balanced Scorecard is a mechanism for translating an organization's vision and strategy into a coherent set of objectives and performance measures. It uses measurement to communicate the drivers of current and future success. The four perspectives of the Scorecard provide a balance between short term and long term objectives, between desired outcomes and the drivers of those outcomes, and between objective and subjective performance measures. Many measurement frameworks advocate a balanced range of measures. The Balanced Scorecard is prescriptive about this range, and about how one perspective defines the drivers of the next.

### Translating Vision and Strategy: Four Perspectives

The Balanced Scorecard starts with the vision and the strategy of a company. Then translate these vision, mission and strategies into tangible objectives and measures. For these objectives and measures, targets are set and initiatives are taken through continued learning and innovation. There is a link between these perspectives and its impact on the various variables can be understood better with the help of the strategy map.

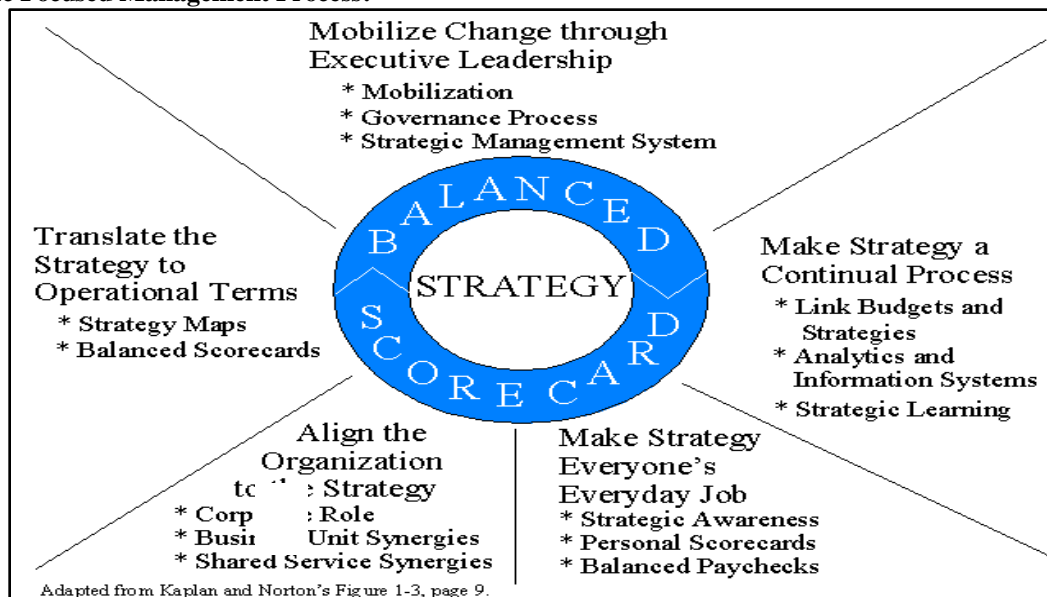

#### Strategy Map:-

A strategy map is a diagram that is used to document the primary strategic goals being pursued by an organization or management team.

#### The Kaplan and Norton approach to strategy maps has:-

- An underlying framework of horizontal perspectives arranged in a cause and effect relationship. Typically Financial, Customer, Process and Learning & Growth
- Objectives within those perspectives. Each objective as text appearing within a shape (usually an oval or rectangle). Relatively few objectives (usually less than 20)
- Vertical sets of linked objectives that span the perspectives. These are called strategic themes.
- Clear cause and effect relationships between these objectives, across the perspectives. The strategic themes representing hypotheses about how the strategy will bring about change to the outcomes of the organisation.

Strategy maps provide increased granularity for executives to describe and manage strategy at an operational level of detail. The Strategy mapping helps company to identify various perspectives and variables involved in each perspective. It also helps to establish the interrelationship with different variables and different perspectives.

**Strategy Mapping:-****Strategic Focused Management Process:-**

**Advantages of Balanced Scorecard:-**

Balanced Scorecard as a key performance measurement tools provides various advantages to the companies, which are as follows

- Focusing the whole organisation on the few key things needed to create breakthrough performance
- Breaking down strategic measures to lower levels of the organisation, so managers and employees both know what is required to achieve excellent overall performance
- Strategic initiatives that follow "best practices" methodologies cascade through the entire organization
- Increased Creativity and Unexpected Ideas.
- The Balanced Scorecard helps align key performance measures with strategy at all levels of an organization.
- The Balanced Scorecard provides management with a comprehensive picture of business operations.
- The methodology facilitates communication and understanding of business goals and strategies at all levels of an organization.
- Helping to integrate various corporate programmes (like quality and customer service)
- Usable Results - Transforms strategy into action and desired behaviors.
- The Balanced Scorecard concept provides strategic feedback and learning.
- A cross organizational team - More open channels of communications - Enthusiastic People.
- Initiatives are continually measured and evaluated against industry standards
- Unique Competitive Advantage
  - Reduced Time-frames.
  - Improved Decisions and Better Solutions.
  - Improved Processes.
- The Balanced Scorecard provides an effective way of communicating priorities to all levels of organization, and then all employees can see and understand how their work is related to the business and its success as a whole.

**Disadvantages:-**

Though Balanced Scorecard serves lot of advantages to the companies, it still suffers from some drawbacks. The most important among these are

1. The Balanced Scorecard decomposes the organization's primary objectives (financial perspective) into customer, internal process and learning and growth objectives (operating perspectives) in a way that is reminiscent of the way that the Dupont formula decomposed the return on capital employed metric into front-line operational measures. But such type of relationship does not necessarily hold between financial and operational measures and operational achievements do not guarantee the improved bottom-line measures; and in that case the management has to reexamine the basic assumptions of their strategy and mission to capitalize the operational achievements.
2. Companies may bias their scorecards to the dimension that support specific strategic path. In order to make scorecard useful, it should be prepared in conformity with the overall business strategies.
3. Sometimes it is difficult to integrate a company's scorecard into its planning, budgeting and resource allocation process; especially when scorecard metrics are changed.
4. Balanced scorecard considers different perspectives equally thus, ensuring a balance between these. But in some companies under unique situations, all perspectives may not have equal importance.
5. Creating the Balanced Scorecard is a critical step in the strategic process. So many organizations create a strategic plan and then dutifully ignore it because day-to-day issues tend to take precedence.

**Findings:-**

The Discussions and analysis reveals that there is an ample of opportunities to explore and exploit the resources for the Companies in India in the near future as in the projected Economic prospects during FY 2012 – 2030, India would have CAGR Growth of 6.7% whereas in China it is 6.6% and US 2.5%. To feat the opportunities, companies should work on achieving sustaining competitive edge. To achieve a competitive edge, companies should develop and execute sound strategies. Balanced Scorecard is a powerful management tool that could help companies in developing Strategies, convert those strategies into measureable terms and communicate to the lower level for their execution with the help of Strategy mapping. Balanced Scorecard helps companies to achieve competitive advantage through Reduced Time-Frames, Improved Decisions, Better Solutions and Improved Processes. Balanced Scorecard plays a vital role in the Strategy Mapping and measuring performance of the companies.

From the above discussions and analysis, theoretically a relationship can be established between Company's Business Strategies and Competitive Edge and Performance measurement through BSC acting as a mediating factor which can create impact on the sustaining the competitive edge.

### Conclusions:-

Every company strives harder to achieve competitive edge, which will ensure their sustainability in the business environment. Balanced scorecard, being one of the best tools that measure the performance of the company in real time can help companies in achieving sustainable competitive edge.

The real strength of the linkages between the strategy map, Balanced Scorecard and action plan is consistency. Instead of a fragmented approach where one part of the organization pursues a different agenda from another part, everyone uses the same overall strategy. The vision is consistent with the strategy to get there. People can be inspired to act because they see that it is feasible to get to where the management wants to head.

The scorecard periodically reminds the organization what the critical strategic issues are and gives the necessary feedback on the progress toward achieving them. It has neither beginning nor end. Its task is not directly concerned about the mission of the organization, but rather with internal processes (diagnostic measures) and external outcomes (strategic measures). The system's control is based on performance metrics that are tracked continuously over time to look for trends, best and worst practices, and areas for improvement. Thus, balanced scorecard can play an important role in bringing a big change in the organisation and can help the company in achieving sustainable competitive edge.

### Suggestions:-

Balanced Scorecard contemplates all the perspective equally which may not suit all the companies especially those which are facing unique circumstances. Assigning weights to different perspectives under differing circumstances may add more values.

Though Balanced Scorecard serves as best tool, still there is no complete acceptance by all the companies. The main reason behind it is companies find difficulties in formulating strategy itself. This could be overcome by provided training and expertise knowledge to the top management personnel so that a suitable business strategy can be formulated to suit the need the company.

Jejunum, CARI Shyama and Vanaraja

### Abstract

A study was conducted on jejunum of CARI Shyama and Vanaraja crossbreds of poultry developed to improve the livelihood of peoples in the tribal area with less availability of good quality feed. Jejunum is the part of intestine plays significant role in absorption of nutrients and improves the feed utilization. Grossly, length of jejunum was significantly more in chicks and pullets of Vanaraja, however, width was more in chicks and pullets of CARI Shyama. Histologically, height of villi decreased progressively from proximal to distal segment of jejunum. Height of villi was significantly more in pullets of CARI Shyama than Vanaraja. Density of collagen fibers was more in pullets of Vanaraja than CARI Shyama. PAS activity was comparatively more in all age group of CARI Shyama than Vanaraja.

Copy Right, IJAR, 2016., All rights reserved.

### Introduction:-

CARI Shyama and Vanaraja are two hybrids introduced by the central government in the tribal area to improve the livelihood of peoples as these breeds required less classified diet than exotic breeds in Indian climate and give production better than the desi breeds. Jejunum is the part of intestine plays significant role in absorption of nutrients and improves the feed utilization. Therefore this study was undertaken to explore the status of jejunum in different age group of these birds.

### Material and Methods:-

The present study was conducted on ten apparently healthy chicks (0 day old), growers (8 weeks old) and pullets (16 weeks old) of CARI Shyama and Vanaraja. Jejunum was collected, and preserved in 10% buffered formalin. The tissue samples were processed, cut and stained with H&E for normal histological structure, Van Gieson's for collagen fibers, Gomori's for reticular fibers, Periodic Acid Schiff (PAS) for mucopolysaccharides and AB-PAS for acid mucopolysaccharides (Singh and Sulochana, 1997).

### Result and Discussion:-

The jejunum was longest and coiled part of the intestine, suspended by the mesentery and arranged in the loops at the edge of dorsal mesentery confirmed the reports of McLelland(1975), Nickel *et al.* (1977) and Verma (1998). Well developed yolk sac was present in the day old chick. The remnant of yolk sac in the form of Meckel's diverticulum was also noticed in growers and pullets supported the findings of King and McLelland(1975) and Nasrin *et al.* (2012). Number of coils of jejunum also increased with age. In pullets, number of coils ranged between 11-13,

**Corresponding Author:- Payal Jain.**

Address:- Department of Veterinary Anatomy and Histology, College of Veterinary Science and A.H., Rewa (M.P.) India.

similar to the observation of Nickel *et al.* (1977).

Significantly higher length of jejunum was noticed in chicks of Vanaraja (18.1 cm) than CARI Shyama (15.55 cm), however width was significantly more in chicks of CARI Shyama than Vanaraja with an average value 0.21 cm and 0.15 cm, respectively. Nasrin *et al.* measured 22.38 cm length of jejunum in day old broiler chicks and reported jejunum as longest part of the small intestine.

In growers, significantly higher width was noticed in Vanaraja with an average 0.60 cm than CARI Shyama (0.56cm); however length was comparatively less in Vanaraja.

In pullets, pattern of length and width was similar to chicks and significant difference was noticed in the length, as length was higher in Vanaraja with mean value 74.77cm than CARI Shyama (65.4 cm). In the present study, length and width of jejunum ranged as 65-75cm and 0.50-0.60 cm in growers and pullets, were lesser than the findings of McLelland (1975), Nickel *et al.* (1977) and Verma (1998).

Blank- Villi of these categories were not present

Mean values with \* are significant ( $P < 0.05$ )**Fig.1:-** Photomicrograph of jejunum of CARI Shyama (group 3) showing glandular unit (g) and tunica muscularis (i) (H&E, 400X).

**Fig. 2:-** Photomicrograph of jejunum of Vannaraja (group 2) showing lymphatic nodule (LN) and tunica muscularis (i) (H&E, 400X)

**Fig.3:-** Photomicrograph of jejunum of Vanaraja (group 3) showing reticular fibers (arrow) in the core of villi (Gomori's, 100X)

**Fig.4:-** Photomicrograph of jejunum of CARI Shyama (group 2) showing AB-PAS activity (arrow) in mucosal epithelium (AB-PAS, 400X)

In chicks, more uniformity was observed in height and shape of villi in proximal part of jejunum than the distal part. Number of goblet cells was comparatively more in pullets of Vanaraja than CARI Shyama. Height of villi decreased progressively than the earlier segment; it is in accordance to the findings of Hodges (1974), McLelland (1975) and Verma *et al.* (1998). In chicks, villi were tongue or leaf shaped. The average height of villi was significantly more in pullets of CARI Shyama with mean value 922.4  $\mu\text{m}$  than Vanaraja (635.2  $\mu\text{m}$ ). Height of villi in pullets of CARI Shyama exceeded than in the duodenum and might be indicative of more active jejunum. Height of villi ranged between 150-200  $\mu\text{m}$  in chicks, 300-1100  $\mu\text{m}$  in growers and 300-1250  $\mu\text{m}$  in pullets. In growers, width of villi increased at all level in CARI Shyama, however in Vanaraja, width only increased at middle of villi. Observation in present study are in accordance to the reports of Hodges (1974), McLelland (1975), Verma *et al.* (1998) and Nasrin *et al.* (2012), that broad villi were observed in the jejunum. Significant difference in width was noticed only at base of villi in growers of CARI Shyama with mean value 198.24  $\mu\text{m}$  than Vanaraja (168  $\mu\text{m}$ ). Height of small sized villi was significantly less in pullets of Vanaraja (346.4  $\mu\text{m}$ ) than CARI Shyama (412.16  $\mu\text{m}$ ). In growers and pullets, distance between adjacent villi increased, which might be due to decrease in total number of villi. Cellularity of lamina propria decreased than earlier segment due to less infiltration of lymphocytes.

The glandular units in lamina propria were more in pullets of CARI Shyama than Vanaraja, however overall number of glandular units decreased than the earlier segment in all age groups (fig.1). Tubular glands were significantly larger in pullets of CARI Shyama than Vanaraja.

Lymphocytes infiltration was more marked in the pullets of CARI Shyama than Vanaraja. Less lymphocytic infiltration than the earlier region of intestine supported the finding of Bradley and Grahame (1960) and was not in agreement to McLelland (1975) who reported increased lymphatic infiltration in jejunum. Lymphatic nodule formation was noticed in the proximal segment of jejunum of growers and pullets (fig.2), however nodules were absent in chicks.

Significant differences were noticed in the thickness of tunica muscularis of growers of Vanaraja than CARI Shyama with the mean value 183.68  $\mu\text{m}$  and 139.2  $\mu\text{m}$ , respectively. In growers of Vanaraja, thickness of tunica muscularis was comparatively more than the duodenum, which is in agreement to the finding of Vaish (2005), however in other birds such pattern was not found. In pullets, total thickness of wall and tunica muscularis was significantly more in CARI Shyama with mean value 404.4  $\mu\text{m}$  and 188  $\mu\text{m}$  than 287.68  $\mu\text{m}$  and 126.72  $\mu\text{m}$  in Vanaraja, respectively.

Localization of collagen, elastic and reticular fibers was established in the core of the villi, inter glandular connective tissue, lamina muscularis, submucosa, inter muscular connective tissue and in subserosal connective

tissue. The density of the collagen fibers in the intestinal wall was more in comparison to elastic and reticular fibers which confirmed the findings of Verma *et al.* (1999) and Vaish (2005). In initial segment of jejunum, density of collagen fibers was more in chicks and growers of CARI Shyama, while in distal segment density was more in chicks and growers of Vanaraja.

Density of reticular fibers was more in chicks of CARI Shyama and growers of Vanaraja, while in pullets, density was more in Vanaraja (fig.3). Peculiar arrangement of fibers was seen in the jejunum as peripheral thick fibers were joined by thin fibers net in the core of villi. Crossing strands of reticular fibers in the circular muscle bundles were also noticed.

PAS positive material was noticed in the mucosal and glandular epithelium and in smooth muscles of lamina propria and tunica muscularis. In jejunum, activity was comparatively more in all age groups of CARI Shyama than Vanaraja. PAS activity was mild in chicks and growers of Vanaraja and mild to moderate in pullets; however activity was moderate to intense in chicks and pullets of CARI Shyama and moderate in growers. More activity was recorded in distal region of jejunum in chicks of CARI Shyama, which might be indicative of early maturity of these regions in the respective breed to digest the complex carbohydrate.

Droplet like AB-PAS positive material was noticed in the apical part of epithelium of villi and glandular units in chicks and pullet. Diffuse activity was noticed in growers (fig.4). In Jejunum, more activity was noticed in the initial two third segments, in chicks and pullets of Vanaraja and growers of CARI Shyama. However, in distal segment, activity was more pronounced in chicks and pullets of CARI Shyama and growers of Vanaraja.

#### Abstract

**Background:** Chronic nonspecific low back pain (i.e., low back pain of at least 12 weeks' duration and without a specific cause) is one of the most common health conditions worldwide. Chronic low back pain is highly associated with disability, emotional changes, and work absenteeism. Power lifting has many potential benefits for spinal health, but also has the potential to create or worsen back injuries. Extending or flexing the back muscles against resistance during power lifting may result in a number of injuries, including muscle strain and ligament injury. Currently no randomized studies examining the effect of this method for patient with low back pain have been published so the need of study is to find out the effect of McKenzie extension bias treatment method with that of back strengthening exercises in low back pain.

**Method:** A randomized controlled comparative trial with a 4 weeks treatment period was conducted. 40 consecutive power lifters both male and female between the age group 20-35 years with low back pain and at least 8 weeks duration of symptoms were randomized into two groups: Group A was treated with the McKenzie method and Group B was treated with back strengthening exercises. Oswestry scale and VAS scale was taken pre-treatment and post treatment. Results were recorded at the end of the treatment.

**Result:** The correlation coefficient  $r = 0.619$  is positive therefore there is improvement by using the Back strengthening treatment method in power lifters. The correlation coefficient  $r = 0.821$  is positive and therefore shows more improvement by using McKenzie treatment method. Coefficient of variation of McKenzie treatment method that is 11.9335 is better than coefficient of variation of back strengthening method that is 14.0311 since coefficient of variation of McKenzie is smaller than back strengthening.

**Conclusion-** It was found that both McKenzie treatment method and back strengthening exercises were effective for Low back pain but McKenzie treatment method is more effective than back strengthening method.

## Introduction:-

Chronic nonspecific low back pain (i.e., low back pain of at least 12 weeks' duration and without a specific cause) is one of the most common health conditions worldwide. Chronic low back pain is highly associated with disability, emotional changes, and work absenteeism. (1)

A typical response to experiencing back pain is to take it easy - either staying in bed or at least stopping any activity that is at all strenuous. While this approach is understandable and may even be recommended in the short term, when done for more than a day or two it can actually undermine healing. Instead, active forms of back exercises are almost always necessary to rehabilitate the spine and help alleviate back pain. When done in a controlled, gradual, and progressive manner, active back exercises distribute nutrients into the disc space and soft tissues in the back to keep the discs, muscles, ligaments and joints healthy. Consequently, a regular routine of lower back exercises helps patients avoid stiffness and weakness, minimize recurrences of lower back pain, and reduce the severity and duration of possible future episodes of low back pain. Depending upon the patient's specific diagnosis and level of pain, the back pain exercises and rehabilitation programs will be very different, so it is important for patients to see a spine specialist trained to develop an individualized program of back exercises and to provide instruction on using the correct form and technique. To be effective, a patient's program of back exercises should be comprehensive, working the whole body even if it targets the back. Two back exercises commonly advised by physical therapists to treat back pain are McKenzie exercises and dynamic lumbar stabilization.

Power lifting is a strength sport that consists of three attempts at maximal weight on three lifts: squat, bench press, and deadlift. It evolved from a sport known as "odd lifts", which followed the same three-attempt format but used a wider variety of events. Like most forms of exercise, power lifting has many potential benefits for spinal health, but also has the potential to create or worsen back injuries. Extending or flexing the back muscles against resistance (the weight) during power lifting may result in a number of injuries, including muscle strain and ligament injury. (2)

Disability related to lumbo-sacral pain is a major problem across many regions. Two recent consensus reports on the treatment of patients with chronic low back pain recommended back training programs as effective treatment for reduction of disability and improvement of physical function. (3)

Many back exercises can help strengthen the spinal column and the supporting muscles, ligaments and tendons. Most of these back exercises focus not only on the back, but also the abdominal (stomach) muscles and gluteus (buttocks) and hip muscles. Taken together, these strong 'core' muscles can provide back pain relief because they provide strong support for the spine, keeping it in alignment and facilitating movements that extend or twist the spine. Two of the most well-known back strengthening exercises are: McKenzie exercises and Dynamic Lumbar Stabilization. These back exercises are generally first learned by working with a physical therapist who can demonstrate the exercises and correct a patient's form to ensure strengthening and/or back pain relief is achieved. Although McKenzie exercises and dynamic lumbar stabilization exercises tend to be used for specific conditions, the two forms of physical therapy exercise may also be combined when appropriate.

Exercise therapy by the McKenzie method is a popular treatment for low back pain among physical therapists. It is grounded in finding a cause and effect relationship between the positions the patient usually assumes while sitting, standing or moving, and the location of pain as a result of those positions or activities. The therapeutic approach requires a patient to move through a series of activities and test movements to gauge the patient's pain response.

There are three types of classifications:

- Postural Syndrome: is the result of prolonged positions or postures that can affect muscles, tendons, or joint surfaces. Pain may be local and reproducible when end range positions, such as slouching, are maintained for sustained periods of time.
- Dysfunction Syndrome: Implies some sort of adaptive shortening, scarring or adherence of connective tissue causing discomfort. A dysfunction may be intermittent or chronic, but its hallmark is a consistent movement loss and pain at the end range of movement. When the patient moves away from end range their pain is decreased.
- Derangement Syndrome: is the most common syndrome of the three. Certain movements and particular movement patterns can cause more sensitivity. Such as a flexion or extension, the symptoms (low back pain) become either more central (just in the low back) or less intense.

In this study, patients treated were suffered from derangement syndrome due to lifting heavy weight and postural deformity.

The McKenzie assessment consists of taking a patient history and performing a physical exam. Both are used to gauge the degree of impairment as well as identify any red flags that might be contrary to exercise-based treatment (e.g. fracture, tumor, infections, or systemic inflammatory disease). During the McKenzie physical examination, patients are taken through movements that help classify the patient and determine the best treatment approach. The movements are intended to either increase or decrease symptoms. For example, patients may be asked to perform single and/or repeated flexion or extension movements forward and backward.

McKenzie treatment prescribes a series of individualized exercises. The emphasis is on active patient involvement, which minimizes the number of visits to the clinic. It is important for the patient undergoing the McKenzie method of treatment to know what to do to manage any future low back pain episodes. The McKenzie approach then uses that information to develop an exercise program designed to centralize or alleviate the pain. The goal of McKenzie Method is to centralize the pain or move the pain from the leg into the low back. Although no randomized controlled trials have been published to support the effectiveness of the method. (4)

Currently no randomized studies examining the effect of this method for patient with low back pain have been published so the need of study is to find out the effect of McKenzie extension bias treatment method with that of back strengthening exercises in low back pain.

### **Materials and Methodology:-**

Materials: Pen, paper, Questionnaire, outcome measures: Oswestry disability index and visual analog scale

### **Methodology:-**

The study was performed across the gymnasiums of pune where the power lifters who had left the gymnasium were called for the assessment and treatment purpose. . Subjects were taken between the age group of 20- 35 years, both male and female. Total 89 Power lifters were called to the gym for assessment from which 27 power lifters were excluded due to recent history of fracture and previous history of Spondylolisthesis. 12 power lifters did not showed up later. Finally 40 power lifters agreed to take the treatment and filled the consent form. Those 40 power lifters were divided into 2 groups: 20 were treated by using McKenzie method and remaining 20 were treated by back strengthening exercises. Visual Analog scale and Oswestry Scale was taken before and after the treatment. The treatment period was 8 weeks and after that home exercise protocol was given. It was seen that there was improvement in the patient's low back pain as the pain score reduced in VAS scale. Similarly in Oswestry scale the percentage of pain reduced when compared to the pain patient felt before treatment. Complete assessment was done. Subjects from this study were selected from a subject group normally considered suitable for strengthening training in as much as all patients with clinical signs of affected nerve root were excluded.

### **Procedure:-**

For study research, 40 subjects were selected. According to the inclusion and exclusion , each patient was explained the purpose of the study and a consent form was given to be filled by the patient. Two treatment protocols were followed: McKenzie Exercise protocol and Backstrengthening exercises. Oswestry disability scale and Visual analog scale was taken before and after the treatment session.

**Results:-****Result 1:-** Improvement in back pain by using VAS in McKenzie treatment method.**Graph:-**

Interpretation: Correlation coefficient  $r=0.821$  is more than 0.5, therefore it is positive so there is improvement seen in VAS by using McKenzie treatment method.

**Result 2:-** Improvement in back pain by using VAS in Back strengthening treatment method.**Graph:-**

Interpretation: Correlation coefficient  $r=0.619$  is more than 0.5 therefore it is positive so there is improvement seen in by using back strengthening exercises.

**Result 3:- McKenzie vs. back strengthening by using VAS**  
**Graph:**

Interpretation: Coefficient of variation of McKenzie treatment method using VAS is 11.9335 is less than coefficient of variation of back strengthening method that is 14.0311 since coefficient of variation of McKenzie is lesser than back strengthening therefore McKenzie is better.

**Result 4:- Mean value of Oswestry scale in McKenzie method**  
**Graph:**

Interpretation: The mean Oswestry scale value of McKenzie method before treatment was 48% and after the treatment it was 34

**Result 5:- Mean value of Oswestry scale in Back strengthening**  
**Graph:-**

Interpretation: The mean Oswestry scale value of back strengthening method before treatment was 46% and after the treatment it was 34%.

**Result 6:- McKenzie vs. back strengthening by using Oswestry scale**  
**Graph:-**

Coefficient of variation of McKenzie treatment method using Oswestry scale is 12.84 is less than coefficient of variation of back strengthening method that is 16.56.

**Discussion:-**

In this study it was found that in McKenzie group the Pain score were considerably lower as compare to back strengthening after completion of the treatment. It seems reasonable to conclude that the McKenzie treatment method has some potential as compared to back strengthening in the treatment of low back pain because the McKenzie treatment method follows a specific pattern of exercises whereas back strengthening exercises are effective but do not follow any pattern.

No previous study has been published comparing McKenzie exercises with strengthening training for low back pain patients. However several recent studies have provided evidence that treatment program containing active exercises are equally effective in patient with chronic low back pain, irrespective of the type of exercises compared.

Our explanation might maintain that any type of intensive exercise program that manages to make the patients expand the limits to their physical functioning may provide the patients with a method for increasing the feeling of pain control, thus inhibiting negative pain behaviour relating to a chronic low back problem. (3) When done in a controlled, gradual, and progressive manner, active back exercises distribute nutrients into the disc space and soft tissues in the back to keep the discs, muscles, ligaments and joints healthy.

In Tom Petersen et al, the McKenzie method and intensive dynamic strengthening training seems to be equally effective in the treatment of patients with sub-acute or chronic low back pain where as in my study McKenzie method as well as Back strengthening method both were effective but McKenzie treatment method was more effective than back strengthening (3).

In Roger Adams et al, the study says that McKenzie method is effective in back pain which supports this study since in this study McKenzie treatment method was effective and relieved the low back pain (5).

In Keating JL et al, McKenzie exercises were found to be more effective than intensive strengthening for short term and long term pain and short term function, which supports my study(6).

Machado, L. A de Souza et al, suggests that the McKenzie method is more effective than strengthening protocol for acute low back pain which supports the study (7).

Alessandra N Garcia et al suggested that the McKenzie and back school's approaches may be beneficial for the treatment of patients with chronic nonspecific low back pain for the outcomes pain intensity and disability which supports my study. (1) (8)

Based on the results from the articles by Miller *et al*, spinal stabilization/back strengthening exercises and McKenzie exercises appear equally effective in decreasing pain and disability for individuals with chronic low back pain. Miller *et al*. found statistically significant improvements in pain reduction, for both McKenzie ( $p=0.05$ ) and spinal Stabilization groups ( $p=0.002$ ), but no statistically significant differences were detected between groups for pain reduction or disability scores ( $p>0.05$ ). Poor internal validity, particularly lack of blinding and concealment of group allocation, means that results should very cautiously be applied to the clinical population. (9)

Skikic EM et al suggested that McKenzie exercises for low back pain are beneficial treatment for increasing flexibility of spine and improving the pain with better results in pain relief. Although done by minimally trained physiotherapists in McKenzie approach, McKenzie exercises are successful method for decreasing and centralizing the pain and increasing spinal movements in patients with low back pain which supports my study. (10)

Tarang Srivastava et al, suggested that there was definite decrease in the value of VAS in both the groups but there was more significant improvement in experimental group in comparison to the controlled group. It may be quite safely stated that McKenzie technique is an effective, scientific and economical method for reducing dysfunction pain which supports the study. (11)

Ajit Dabholkar et al says that the effect of extension based treatment program in McKenzie's derangement syndrome improves the recruitment of multifidus on the affected side. Effect of extension based treatment program in McKenzie's derangement syndrome improves the endurance of back extensor muscles. Effect of extension based treatment program in McKenzie's derangement syndrome was found to be functionally beneficial. (12)

Given the outcomes of the current study, the equally distributed amount of time spent with each patient, the types of patients investigated, and the apparent difficulties in proving the effectiveness of a particular type of active exercises over that of others, It seems reasonable to conclude that the McKenzie treatment has some potential, as compared with strengthening training, in the treatment of non-specific chronic low back pain. This conclusion is supported by the results from the supplementary analysis of the patients who completed the full intervention. A strong tendency in favor of the McKenzie treatment was found with regard to a change in the back pain at the end of the treatment that reached a statistically significant difference at the 2 month assessment. (3) (13)

Therefore on the basis of the data, it appears that in managing patients with more than 8 weeks of low back pain, McKenzie treatment method is more effective than compared to back strengthening method.

Larger sample size can be taken to obtain more accurate results. More such studies should be done by comparing different treatment methods for nonspecific low back pain. If the patient continues the exercises it might give a better and permanent recovery.

#### Abstract

**Objective:** The epidemiology of ESRD is important as it determines the need for RRT, a complex, costly and lifelong package of care for which demand and provision have grown significantly in the last decade. Aim of this study is to describe the prevalence and etiology of ESRD in EL-Minia Governorate using a structured questionnaire.

**Methods;** Epidemiological, clinical and laboratory data of patients with ESRD on regular hemodialysis from all districts of El-Minia governorate were collected on a structured questionnaire.

**Results;** Out of 1700 ESRD patients on regular HD (314 per million population, pmp), only 1433 patients (84.3%) agreed to participate in this study, with mean age of  $51.6 \pm 13.7$  years. Male patients were 67.8% (n = 972), 79.9% were living in rural areas. Illiterates were 60.6% of all patients. HTN represents the main cause of ESRD 32.03%, while unknown etiology represents 26.87%, and 11.4% DM.

**Conclusion;** In Egypt, Low prevalence may be due to lack of documentation programs and registration for ESRD and short life expectancy for these patients due to lack of health care

#### Introduction: -

CKD is a major cause of morbidity, mortality, and high medical costs in the United States, particularly among older adults. Nearly 1 in 7 adults has CKD, and recent data suggest that the number of deaths from CKD has doubled in the past 2 decades [1]. In people aged 65 through 74 worldwide, it is estimated that one in five men, and one in four women, have CKD [2]. The lack of community-based screening programs has led to patients being detected with CKD at an advanced stage. It is possible that early detection of kidney disease through community based screening programs might have an impact on this problem through earlier intervention [3]. The epidemiology of ESRD is important as it determines the need for RRT, a complex, costly and lifelong package of care for which demand and provision have grown significantly in the last decade. One year of dialysis costs about £25,000, the first year of transplantation £15,000, with subsequent years over £5,000. It has been estimated that RRT costs consume 1.5–2% of the NHS budget, a figure that is predicted to rise to at least 3% [1]. Aim of this study is to describe the prevalence and etiology of ESRD in EL-Minia Governorate using a structured questionnaire.

## Patients and Methods: -

### Patients: -

The study included the patients with ESRD on regular hemodialysis in all districts of El-Minia governorate. El-Minia Governorate is one of the Upper Egypt's Governorates, about 234 kilometres to the south of Cairo, it comprises nine districts (fig.1), its population was 5405353 populations according to the records of the Egyptian Ministry of Health and population and the Central Agency of Egypt for public mobilization & Statistics 2015.

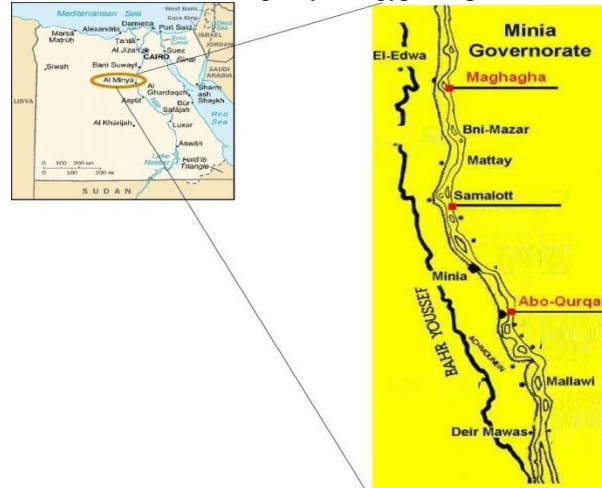

Figure.1: - El-Minia Governorate

The study was conducted between December 2014 to May 2015, the study included 14 dialysis unites, El- Minia University hospital, all general hospitals in the nine districts (El-Edowa general hospital, Maghagha general hospital, Bani-Mazar general hospital, Matti general hospital, Samalout general hospital, El-Minia general hospital, Abo-Korkas general hospital, Mallawi general hospital, Deir-Mawas general hospital), El-Minia Insurance hospital, El-Minia Fever hospital, and two special centers (Samalout One Day Surgery hospital and Konoze center).

### Methods: -

Data were collected on a structured questionnaire. The questionnaire included name of the dialysis unit, name of the patient, age, sex, and residence, degree of education, marital status, and their occupation, history of smoking, and the cause of ESRD, history of HCV and HBV infection and if the patient was HCV positive we asked about the time of infection whether it was from the start of the dialysis or not, and asked about risk factor of HCV infection include the following (history of Blood transfusion, going to the dentist, chronic injection, surgeries, relatives infected by HCV, and if the patients deals with other HCV patients, history of bilharziasis and if he was injected with its medication (tartar treatment). Clinical examination was done with special attention to type of vascular access and blood pressure measurement. Blood pressure was measure with a standard sphygmomanometer while the patient was seated, BP measured according to the standared guidelines of the eighth report of the joint national committee (JNC-VIII) on prevention, detection evaluation and treatment of high BP [4]. Hypertension was considered as a cause of ESRD when renal failure was progressive in a patient with long-lasting hypertension, with moderate proteinuria, and no evidence suggestive of another diagnosis. Diabetic nephropathy was diagnosed as history of long-standing diabetes mellitus, with persistent proteinuria, occurrence of diabetic retinopathy and absence of any other renal disease. Diagnosis of chronic glomerulonephritis present on the base of presence of microscopic proteinuria and hematuria with hypertension. Obstructive uropathy was diagnosed by history of being a stone passer and imaging studies. Data obtained from the patients' files included date of the first dialysis session, their laboratory investigations include viral marker (HCV, HBV infection), Urea before dialysis, Urea after dialysis, Creatinine, Hb level, serum iron, Total iron binding capacity (TIBC), serum ferritin, albumin, serum Ca, serum Phosphorus, and parathrmone hormone level, random blood sugar for diabetic patients only, not all patients under go this investigation in dialysis units as it not reported in their files. Data obtained from imaging studies (abdominal ultrasound) the site, size, shape and echogenicity of both kidney, and the stat of the liver, spleen and other organs. Ultrasound can help to identify polycystic kidney disease, cancer, stones, and obstruction. Data obtained about dialysis units: Type of dialysate, type and size of filter. Ethical consideration; the study was conducted after obtaining approvals from the ethical committee of the faculty of medicine Minia University and Beni Suf Faculty of Medicine. Informed consent was obtained from every patient prior to starting filling the questionnaire.

**Statistical methods: -**

Data management; the collected data were coded and entered to the computer. SPSS "Statistical package for social sciences" Version 19 was used for performing the statistical analysis. Qualitative data is presented as frequencies and percentages whereas quantitative data were presented as means and standard deviations. Chi squared test, student t test and other tests of significance were performed whenever needed. P values of less than 0.05 were considered significant.

**Results: -**

Out of 1700 ESRD patients on regular HD (314 pmp), only 1433 patients (84.3%) agreed to participate in this study, their age ranged 13–93 years with mean age of  $51.6 \pm 13.7$  years. Male patients 67.8% (n = 972) were more than female patients 32.2% (n = 461), 79.9% of ESRD patients are living in rural areas and 20.1% are living in urban areas, illiterates were 60.6% of all patients while 39.4% were educated (**table 1**). 14% were smoker, 24.5% were ex-smokers and 61.5% were non-smoker. About the marital status of ESRD patients, 10.9% were single, 76.6% were married and 11% were widow. Only 13.6% of ESRD patients work, and 86.4% not work (**table 1**). As regard causes of ESRD, patients with HTN represents 32.03%, unknown etiology were 26.87%, 11.4% DM, 15.14% were due to obstructive uropathy, 9.14% due to Glomerulonephritis (GN), 1.39% were due to Analgesic nephropathy, 1.95% were due to Polycystic kidney, 0.49% were due to bilharziasis, 0.49 were due to Systemic Lupus Erythematosus (SLE) and 1.12% were due to other causes (obstetric cause and malignancy) (**fig. 2**). 32.7% of the patients were in El-Minia city (the capital of El Minia governorate) as it contains 4 units so the main bulk of patients present in it, 12.6 % of the patients were in Abo-Korkas and 12.4% of the patients were in Mallawi(**fig.3**). The prevalence of ESRD among different age groups was 8.9% in those aged < 30 years, 12.1% in those aged 30–40 years, 19.3% in those aged 41–50 years, 31.8% in those aged 51–60 years, and 27.9% in those aged >60 years. The incidence increased by age and peaked in the 51–60 years age group, slightly decrease after the age of 60 years (**table 1**). 12.5% of female patients were less than 30 years, while only 7.2% of male patients were in the same age group. In female patients, the incidence increase by age, peaked at 41–50 years age group and slightly decrease after the age group 51–60, as regard male patients the incidence increased by the age, peaked in the 51–60 years age group and slightly decrease after the age of 60 years (**table 2**). 11.1% from all patients living in urban area were less than 30 years, while 8.4% from all patients living in rural area were in the same age group, the incidence increased by the age and peaked in the 51–60 years age group, slightly decrease after the age of 60 years and at this age the incidence of the disease were more in rural area (**table 2**). Table 2 show the highly significant difference (P-value <0.001\*) between patients with different age groups according to their level of education as regard this table the incidence of educated patients with ESRD were decreased progressively with age, while the incidence of illiterate patients with ESRD were increased progressively with age (**table 2**). In our study, diabetic nephropathy as a cause of ESRD was found to be higher in urban area than rural area (13.2% vs 10.8%), also higher in female than male (14.2% vs 10%) and higher in illiterate than educated patients (12.8% vs 9.9%) (**table 3**). Obstructive uropathy was higher among male patients 19.6% with male to female ratio 7:1, polycystic kidney and bilharziasis higher among male patients 2.1%, 0.7% respectively, analgesic nephropathy was higher in female patients as 2.2% of female patients develop analgesic nephropathy, also SLE was higher in female patients 1.3% than male patients (**table 3**). The incidence of obstructive uropathy, analgesic nephropathy and bilharziasis as a cause of ESRD (16%, 1.6% and 0.5% respectively) were higher in patients living in rural area than those living in urban area, also the incidence of unknown cause was higher in patients living in rural area 28.4% but the incidence of GN, polycystic kidney, SLE as a cause of ESRD (13.5%, 4.3%, and 1.4% respectively) were higher in patients living in urban area than those living in rural area (**table 3**). The incidence of hypertensive nephropathy (34%), diabetic nephropathy (12.8%), obstructive uropathy (15.5%), analgesic nephropathy (1.7%) and bilharziasis (0.7%) were higher in illiterate patients but the incidence of GN (15.6%), and SLE (1.1%) were higher in educated patients (**table 3**). The incidence of house wife was higher in both areas (81.8% in urban, and in rural 98.7%) (**table 4**). The incidence of don't work male patients were higher in rural area 88.9%, worker patients were higher in urban 43.5% (**table 4**). The incidence of lupus nephritis 4.5%, analgesic nephropathy 2.3% were higher in female patients living in urban area (**table 5**). The incidence of obstructive uropathy (20.6%), analgesic nephropathy (1.3%), to bilharziasis (0.8%), were higher in male patients living in urban area (**table 5**). As regard virus status of HD patients in our study, there were 744 patients with positive HCV antibodies (52%) including 199 were negative at start of HD then seroconverted, while 689 patients were negative to HCV antibodies (48%), and only 1.4% were positive HBsAg (**table 6, fig.4**). Out of 199 seroconverted patients 164 patients (82.4%) were on different frequencies blood transfusion, only 35 patients (17.6%) never receive blood transfusion and were on erythropoietin and iron replacement therapy, 36.7% of them under go surgeries and 15.6% going to dentist (**table 7**). There was highly significant difference between seroconversion of HCVab+ve and those who remains HCVab–ve as regarding the age and duration of dialysis (P

value=0,000) (**table 8**). In **table 9** a correlation test show that seroconverted patients had longer duration of dialysis than other HCV negative patients. There was no statistically significant difference between seroconversion of HCVab+ve and those who remains HCVab-ve as regard the gender (P value=0.562) (**Tab 10**). The rate of seroconversion of HCVab is variable in different districts of ElMinia governorate, the highest in University hospital (44.7%) and the lowest in Malawi hospital (5.6%) (**Tab 11, Fig 5**). Our study showed that a highly significant difference was present among patients received parenteral therapy for Schistosomiasis than those who did not receive parenteral therapy, as 79.5% of patients who did not receive parenteral therapy was negative for HCV infection, while 51.1% of those received parenteral therapy for Schistosomiasis were positive for HCV infection (**Table 12**). Out of 1433 HD patients 20 patients were positive for HBVsAg (1.4%), 8 (0.6%) patients were Combined positive for HBVsAg and HCVabs and 12(0.8%) patients were positive for HBVsAg only (**table 13, fig 6**). The incidence of hypertensive patients was 67.06%, diabetic patients were 11.6%, cardiac patient were 2.7% (**table 14**). In our study diabetes represent 11.4% of the cause of ESRD, 60.73% of the diabetic patients were controlled with medical treatment, 38.05% patients were controlled without medical treatment and 1.22% was not controlled with medical treatment (**table 15**). 59.52% of hypertensive patients were controlled with medical treatment, 43.34% was not controlled with medical treatment (**table 16**). In our study number of patients undergoes laboratory investigation widely variant; Hb level, Creatinine and urea before dialysis were the most common laboratory investigation done to HD patients in El-Minia governorate (**table 17**). In our study, we found that the mean duration of dialysis was  $59.1 \pm 39.7$  months. As regard the vascular access, only 2.6% of the cases used jugular venous catheter, 0.1% of the cases used femoral venous catheter during dialysis and 97.3% of patients used arteriovenous fistula (**table 18**). As regard type of dialysate solution used for dialysis, 1138 patients (79.4%) used acetate solution in dialysis while only 295 patients (20.6%) used bicarbonate solution. Dialysis units of Minia General hospital and Kono center are the only units that used only bicarbonate solutions for all patients (**table 19**). As regard Size of filters used for dialysis, 1036 patients (72.3%) used filters of size 1.3 m<sup>2</sup>, while only 332 patients (23%) used filters of size 1.6 m<sup>2</sup> (**table 20**).

**Discussion: -**

The lack of community-based screening programs has led to patients being detected with CKD at an advanced stage. It is possible that early detection of kidney disease through community based screening programs might improve this problem through earlier treatment [3]. Hemodialysis is the most frequent type of RRT. Mortality is highest during the first 3 months of hemodialysis. Treatment with dialysis or kidney transplantation produces an immense financial burden for many patients who need it [2]. The total cost of the ESRD program in the US was approximately \$49.3 billion in 2011. Medicare costs per person per year were more than \$75,000 overall, ranging from \$32,922 for transplant patients to \$87,945 for those receiving hemodialysis therapy [5]. The epidemiology of ESRD is significant as it limits the need for RRT. The rapid increase in the prevalence of ESRD requires practical strategies to prevent its development and progression, especially in the developing world [6]. El-Minia Governorate is one of Egypt Governorates located in the central part of Egypt. In the current study, the total number of patients on RRT were 1700 living in nine districts covering 5.4 million populations only 1433 patients (84%) agree to participate in this study, in El-Minia Governorate in 2006 the total number of patients on RRT were 1356 only 800 patients (59%) agree to participate in the study and in 2007 they were 1615 only 950 patients (59%) agree to participate in the study [7]. As regard these results the number of ESRD patients was increased annually. The results of our study revealed that in El-Minia Governorate the prevalence of ESRD patients on regular hemodialysis were 314 PMP, this rate was 250 PMP in 2002 [8] and progressively increased to 260 PMP in 2005 [9] then became 308 PMP in 2006 [10], and was 367 pmp in 2007 [7]. In other Egyptian governorates, the prevalence of ESRD patients on regular hemodialysis was 330 pmp in Menoufia Governorate in the year 2013 [11], 282.6 pmp in Kafer El-Shakh Governorate during the year 2012 [12]. The prevalence worldwide was greatly differing. According to USRDS the prevalence was highest in Taiwan with 2447 pmp and was lowest in Philippines with 110 pmp. In United States was 1811 pmp[13]. In Europe, the prevalence in 2004 was 760 pmp and increased to 889 pmp in 2008 [14]. In Egypt, Low prevalence may be due to lack of documentation programs and registration for ESRD also short life expectancy for these patients due to lack of health care may play a rule. In the current study 32.7% of patients on regular HD present in El-Minia city this due to the presence of three large hospitals (university hospital, health insurance hospital, and El-Minia general hospital) in addition to Konozcenter. In the current study, the mean age was  $51.6 \pm 13.7$  but in the year 2006 it was  $46 \pm 13$  years [10], this difference may also reflect improvement in the medical services provided for diagnosis and management of ESRD patients which is still much less than in developed

countries. In France, the median age of patients on RRT is 70.4 years [15]. This marked increase in median age in patients in the European countries may reflect the improvement in ESRD care that requires strong support from the government. The incidence of ESRD in our study increased by age peaked in the 51–60 years age group, and slightly decrease after the age of 60 years. In Bani Suef governorate the mean age was  $42.45 \pm 16.2$  years [16], in Menoufia Governorate in the year 2013 the mean age was 52 years [11], and it was 51 years in Kafer El-Shakh Governorate during the year 2012 [12]. In Egypt, the mean age was 45.6 years in 1996 and increased to 49.8 years in 2008 [17]. On studying the patient's residence and its relation to ESRD we find that large number of ESRD patients (79.9%) live in rural areas and have limited contact to healthcare, only 20.1% are living in urban areas, also in El-Minia Governorate at the year 2006, 55% of patients were living in rural areas and 45% are living in urban areas [10]. In the current study, we found that in the age groups < 30 years patients living in urban area (11.1%) were more than those in rural area (8.4%) while the reverse occur after the age > 60 as 23% in urban area and 29% in rural area this difference in the age groups reflects the difference in awareness of the patients as 75.2% of the age > 60 years were illiterate. The incidence of obstructive uropathy, analgesic nephropathy, bilharziasis and unknown aetiology as a cause of ESRD was higher in patients living in rural area than those living in urban area. The incidence of hypertensive nephropathy (34%), diabetic nephropathy (12.8%), obstructive uropathy (15.5%), analgesic nephropathy (1.7%) and bilharsiasis (0.7%) were higher in Illiterate patients but the incidence of GN (15.6%), and SLE (1.1%) were higher in educated patients. These differences may reflect the strong link between level of education, living in rural area, health services available and awareness of the patients about the disease status and early referral to nephrologist. In the United Arab Emirates, the highest incidence rate of ESRD was reported in Abu-Dhabi city among the 45–55 years age group [18], while in Kuwait it was 45 years [19]. The incidence of ESRD was more common in male gender worldwide, as USRD System, 2012 revealed that in the US males constituting 56%, UK, 2009 revealed that males constituting 60% in the UK, in the KSA males constituting 54.5% [20]. In our study the prevalence in male was nearly twice that of females (67.8% vs 32.2%). Our results show that only 13.6% of ESRD patients work, and 86.4% not work, this reflects the major health problem of ESRD patients because it is a devastating medical condition, and the cost of treatment is a huge economic burden. In the current study the incidence of ESRD of unknown etiology was 26.87%, and during the year 2006 was 27% [9], in Bani Suef governorate was 42.2% [16], in Menoufia Governorate in the year 2013 was 20.5 % of all causes of ESRD [11], and it was 15.2 % in all Egypt [21]. In Sudan, uncertain etiology of ESRD was estimated to be more than 40% [22]. While in the US it was only 3.9% [13]. In Saudi Arabia it was 19.9 % [23]. The incidence of ESRD due to unknown etiology in Egypt is like that in Saudi Arabia, but so much higher than that in the US. This difference may be attributed to lack of awareness of the patients, delay referral to nephrologist in developing countries and reduced health care system. In the current study, hypertensive nephropathy was the first leading cause of ESRD in El-Minia Governorate and the incidence was 32.03%, while it was 27% in the year 2002 [8], 20% in the year 2006 [10]. In Bani Suef governorate hypertension represented 15.2% [16]. In Menoufia Governorate in the year 2013 hypertension (31.1 %) was the main cause of ESRD [11], also the main cause of ESRD in Cairo was hypertension (29.7%), followed by DN (12.5%), in Canal governorates it was 27.3%, followed by DN (10.7%) [12]. In Tabuk Saudi Arabia 24% of patients were hypertensive [24]. In Sudan hypertension was responsible for about 26% [22]. Similarly, In US it was 28% [13]. But this percentage of HTN may be not accurate as a cause of ESRD as it is difficult to decide if long-standing hypertension is the cause of ESRD or a previous undiagnosed renal disease is the cause of secondary HTN. In our study the prevalence of hypertension was higher in females 33.3% than in males 31.5%. In our study the incidence of diabetic nephropathy was 11.3%, it was 5% during the year 2005 [8], 8% during the year of 2006 [10], and 13% in the year of 2007 [7]. In Bani Suef governorate it was 13.2% [16]. The prevalence of diabetic nephropathy was higher in females 14.2% than in males 10%, and more in urban 13.2% than in rural 10.8%, this agree with [7] in 2007 diabetic nephropathy was higher in urban (8%) than in rural areas (5%), also in Emarate prevalence of diabetic nephropathy appears to be higher in urban and more developed areas than rural areas [18]. In Menoufia Governorate in the year 2013 diabetic nephropathy was 15.9 % [11], 14% in Kafer El-Shakh Governorate during the year 2012 [12]. The prevalence of DN in Egypt as a cause of ESRD was 8.9% in 1997 and increased to 13.5% in 2008 and accounting the 2nd cause of ESRD as the main cause is hypertension 36.6% [21]. In South Africa, it was 14% to 16%, and in Sudan it was 9% [25]. In France, during the year 2007, 39% of patients with ESRD on HD were diabetics [15]. According to the 2008 United States Renal Data System annual report the major cause of ESRD leading to kidney failure in the US was diabetes [26], 28.9% of patients on RRT while in Iran diabetes mellitus constitutes 30.1% of ESRD patients [27]. In Gulf countries like Qatar, diabetic nephropathy was the commonest cause of ESRD 48% [28], and in Saudi Arabia it was 25.2 % [23]. In France in year 2007, 39 % of ESRD on regular hemodialysis was due to DN [15]. In United Kingdom DN accounts 14.7 % the 2nd cause of ESRD following GN 16% [29]. This difference in prevalence of DN as a cause of ESRD may be due to the low prevalence of obesity in the less developed areas compared to that in the developed regions because of their

rapid economic growth and associated changes in lifestyle. Chronic glomerulonephritis was seen in 9.14% in the current study, in 2006 it represented 11% of ESRD patients [10], while it was only 1% in the US. In our study hepatitis C prevalence was found to be 52%, In Menoufia Governorate in the year 2013 hepatitis C prevalence was 38.6 % [11], and was 39.7% in the Kafer El-Shakh Governorate during the year 2012 [12]. In Bani Suef governorate was 55.79% [16]. There was a wide variation in hepatitis C prevalence in dialysis patients present worldwide. It was 52% in Egypt [21], 54.4 % in Syria [30], 21 % in Jordan [31], and in Saudi Arabia 18.9 % [32]. Our study showed that 51.1% of patients received parenteral therapy for Schistosomiasis were positive for HCV infection, this is because previous parenteral therapy for Schistosomiasis without adequate sterilization techniques has been concerned as the cause for this high prevalence rate of hepatitis C in Egypt. Hepatitis C prevalence was high in El-Minia Governorate may be credited to the high hepatitis C prevalence in the general population, also blood transfusion used by high rate in dialysis units to treat anemia instead of erythropoietin and iron therapy, as it is costly, and lack of infection control standard methods in dialysis units. In our study, HCV seroconversion rate was 22.4% among patients who were HCV-free at the start of the study, while it was 14.5% in Menoufia governorate [21], and in Bani Suef governorate was 7.33% [16]. In the current study the duration of dialysis was significantly high (P-value 0.0001) in seroconverted patients than those remain HCV ab negative, this agree with a study in Bani Suef governorate as the duration of dialysis was significantly high in HCV seroconverted patients [16], in Menoufia governorate **Zahran, 2014** showed that the duration of dialysis was the predictor of HCV seroconversion [34]. Also, in India a study demonstrated that the duration of haemodialysis was the important risk factors for HCV seroconversion [35]. **Okuda and Hayashi, 1996** showed that 31.6% were seroconverted at a large dialysis unit in USA a study on 152 patients who had not received blood, and seroconversion was correlated with the dialysis duration [36]. In our study the age was a highly significant risk factor for seroconversion as age decreased incidence of seroconversion increased, the study of **Selm, 2010** in Yemen showed that old age was significant risk factor for seroconversion [37], while in Bani Suef governorate age was insignificant risk factor for seroconversion [16]. Our results agree with a study in Bani Suef governorate that gender was insignificant risk factor for seroconversion [16], while in Yemen male gender was significant risk factors for HCV seroconversion [37].

### Recommendations:-

As a significant proportion of ESRD patients discovered their kidney problem very late and were not well equipped for renal replacement therapy with a high prevalence of hepatitis C. We recommend the following; first, education program for physicians should be strengthened with special emphasis on etiological factors causing ESRD, increase awareness of primary health care physician and treating physician about the proper time for referral to the nephrologists and increase awareness of nephrologists about the proper time for preparing patient for renal replacement therapy. Statistical evaluation and patient registry of ESRD patients for each governorate is useful to explain the characteristics of ESRD patients and dialysis therapy, to assess complications on the scientific evidence basis, for improving quality of dialysis therapy and to provide information about socioeconomic health administration for a future health plan. Another study for assessment of dialysis adequacy, anemic state of the ESRD patients would be practical and beneficial in providing safe and cost-effective HD treatment. Also, to improve the quality of dialysis therapy all laboratory investigation must be regularly evaluated to all ESRD patients. Proper control of hypertension and follow-up of diabetic patients and annual registry of diabetics on HD. Using of iron therapy and erythropoietin instead of the high rate of blood transfusion to treat anemia in dialysis units and proper use of guidelines for infection control in dialysis units to prevent HCV Seroconversion.

### Abstract

This study was planned to determine the practice of university students regarding testicular cancer and testicular self-examination.

The population of this quasi-experimental study was male nursing students (n=150). The sample consisted of 98 students who had agreed to participate in the study. The data was collected through a questionnaire, which was developed by the researcher in the direction of the literature. In the analyses; the percentage, mean, and t-tests, and Kruskal-Wallis H test were performed.

The students mean age was  $21.12 \pm 1.82$ . There was no testicular cancer students' in the students' families. While more than half of the students (59.2%) reported that they had prior knowledge regarding testicular cancer, the remainder, (54.1%), stated that they acquired their knowledge from their degree course. 49% of the students reported that they knew how to perform a testicular self-examination, but 31.6% said that they had. The average correct answer to 22 questions concerning testicular cancer and testicular self-examination was  $16.55 \pm 2.14$  prior to study, and the average correct answers was  $18.22 \pm 2.93$  after education. This increase was statistically significant ( $p < 0.001$ ).

As a result, it was determined that most university students have a moderate level of knowledge on testicular cancer and testicular self-examination.

### Introduction:-

The incidence of cancer is increasing worldwide every year. According to data from 2012, the incidence of cancer in males was 205.4 at 100.000 (Ferlay et al., 2013). According to 2010 data, the ratio was 234.4 out of 100,000 in Turkey (Turkey Cancer Statistics, 2010).

Although testicular cancer is rarely seen, it is the most common cancer among 15-35 year olds (Turkey Cancer Statistics, 2010). Testicular cancer represents 1% of male neoplasm, and 5% of urological tumours (Albers et al., 2015). According to the 2010 data, incidences of testicular cancer was 3.4 out of 100,000, in Turkey (Turkey Cancer Statistics, 2010).

Testicular tumours show excellent cure rates with staging at the time of diagnosis; and adequate early treatment based on chemotherapeutic combinations, either with or without radiotherapy and surgery (Kuzgunbay et al., 2013).

**Corresponding Author:- Melike DEMIR DOGAN.**

Address:- Gumushane Universitesi Saglik Bilimleri Fakultesi, Bablarbası Mahallesi 29100 / Gumushane.

Testicular cancer is highly curable if caught early, with a five-year survival rate of 90% (American Cancer Society, 2013). A testicular self-examination is the easiest way for an early detection of physical abnormalities in the testicles. The American Medical Association, and the American Urological Association suggests that public information and education regarding testicular self-examination for an early diagnosis of testicular cancer (Kuzgunbay, 2014). The European Association of Urology recommends a testicular self-examination to men with clinical risk factors (Albers et al., 2015).

Testicular self-examination involves palpating the testis, epididymis, and spermatic cord between the thumb and the first two fingers. This practice should be done either in the shower or after the shower using a mirror, once a month (Göggeldi and Koçak, 2010).

Studies have shown that the knowledge and awareness of society concerning testicular cancer and a testicular self-examination is limited (Kuzgunbay et al., 2013; Khadra and Oakeshott, 2002; Brenner et al., 2003; Casey et al., 2010). Thus, a knowledge of testicular self-examination is critical in self-detection and the subsequent treatment of testicular cancer. For this reason, this study was planned to determine the knowledge and practice of university students of testicular cancer and testicular self-examination, and then it was conducted to determine the extent of knowledge after study.

## **Methods:-**

### **Setting and Participants:-**

This quasi-experimental study was conducted in the Gümüşhane University health school department of nursing, from December 2014 to February 2015. The population of the study were male nursing students (n=150). The sample consisted of 98 students who had agreed to participate in the study.

### **Measures and instruments:-**

Data was collected through a questionnaire which was developed by the researcher in the direction of the literature. The socio-demographical form included 14 questions, which included socio-demographical characteristics and those related to testicular cancer and testicular self-examination. The knowledge form included 22 questions, which also included general knowledge towards testicular cancer and testicular self-examination.

The students completed the socio-demographical form prior to study. They also completed the knowledge form, which include 4 question about testicular cancer, and 18 questions about the testicular self-examination before education. Afterwards, 30-minutes of training was given on testicular cancer and testicular self-examination. The Students were asked to fill out information forms again after this training.

### **Ethical considerations:-**

The required permission was taken from the administration of the Gümüşhane University Health School Nursing Department. The students were informed, and verbal consent was obtained.

### **Data analysis:-**

The descriptive statistics, means, median, frequencies, and percentages, were used to show the socio demographic characteristics of the students. The comparisons were made using the t test and Kruskal-Wallis H test for all the statistical analyses, and a 2 sided p value of less than 0.05 was considered statistically significant.

## **Results:-**

### **Socio Demographic Characteristics of Students:-**

The students mean age was  $21.12 \pm 1.82$ . There was no history of testicular cancer in the students' families. The students had spent the majority of their life in the city. It was determined that half of the students (50%) were living in the school dormitory, and 47% either in the family home, or with friends. Half of the students' mothers were primary school graduates (56.1%), but the vast majority of mothers were housewives (93.9%). Half of the students' fathers' were also primary school graduates, and 34.7% were labourers. The majority of the students' level of income was moderate (71.4%). The majority of those participating in the study were non-smokers (63.3%) and did not consume alcohol (92.9%) (Table 1).

**Testicular Cancer and Testicular Self-Examination:-**

58 of the students (59.2%) reported that they had knowledge about testicular cancer, and that they had acquired this information in undergraduate courses (54.1%). The students reported that they did not know how to perform a testicular self-examination (51%) and that they had never performed one either (68.4%). Only 13.3% of the group was found to have performed a regular monthly testicular self-examination (Table 2).

The students reported that the reason for not doing a testicular self-examination were; not knowing how to do a testicular self-examination (47.3%), a disregard for a testicular self-examination (27%), and the fear of discovering something negative during the testicular self-examination (25.7%) (Table 2).

**Table 2:**Information about Testicular Cancer and Testicular Self-Examination

Disregard of testicular self-examination	20	27.0
Fear from a bad thing during testicular self-examination	19	25.7

The mean for correct answers given in the test of knowledge by the participants before study was  $16.55 \pm 2.14$ , and  $18.22 \pm 2.93$  afterwards. This increase was statistically significant ( $p < 0.001$ ).

There was a significant difference between the students' class and level of knowledge before training ( $p = 0.03$ ) which showed the lowest mean score was for the lower class. There was a significant difference between the students' mothers' education and level of knowledge before training ( $p = 0.03$ ). Students whose mothers were university graduates, were found to have a lower mean score. After the study, there was not a significant difference between the students' class and the level of knowledge and between the students' mothers' education and level of knowledge (Table 3).

**Table 3:** Comparison of some socio-demographic characteristics with the average number of correct answers to given the knowledge test before and after education

## Discussion:-

The chances of curing testicular cancer are high if detected at an early stage. Early diagnosis is important in terms of being conscious individuals do testicular self-examination (Yılmaz et al., 2009; Ugurlu et al., 2011; Pinar et al., 2011). Thus, this study was planned to determine the knowledge and practices of university students regarding testicular cancer and testicular self-examination. It was also conducted to determine the exchange of knowledge through training.

Our study showed that 59.2% of the students had information regarding testicular cancer, and 54.1% had acquired this information in undergraduate courses. A study reported that 11.1% of the participants had knowledge concerning testicular cancer, and 5.6% of them received this information from school (Kuzgunbay et al., 2013). In our study, nursing students were considered to be better informed as a result of being a student.

Our study showed that 51% of the students did not know how to perform a testicular self-examination, and 68.4% of them had not performed one before. A study which questioned male university students on testicular cancer, identified that the participants were generally uninformed about testicular cancer risks and screening (Rovito et al., 2011). A study which surveyed 7304 college students throughout Europe, reported that 87% of the participants had never performed a testicular self-examination (Wardle et al., 1994). Göçgeldi and Koçak reported that 8.8% of the participants had performed testicular self-examination at least once in their lifetime (Göçgeldi and Koçak, 2010). Another study which was conducted in Turkey, showed that 3.3% of students knew how to do a testicular self-examination, and had performed one (Altinel and Avci, 2013). Referring to these studies; it can be observed that a higher proportion of our students do perform testicular self-examinations. This rate is affordably normal because they are nursing students. A study which was conducted on male nursing students reported that 89.4% of them did not know how to do a testicular self-examination (Asgar and Çam, 2014). According to this study on nursing students, it was determined that it is advantageous for our students to know how to perform a self-examination.

In our study, only 13.3% of the students had done a regular monthly testicular self-examination. A study which surveyed 7304 college students showed that only 3% of them performed a monthly self-examination (Wardle et al., 1994). Another study reported that 2.5% of the participants had performed a testicular self-examination, but only 1% of these had been performing it routinely once a month (Kuzgunbay et al., 2013). A study conducted in 2011 with 750 participants, showed that the ratio of regular testicular self-examination was found to be 1% (Ugboma and Aburoma, 2011). In a study conducted with university students, the rates for doing a regular testicular self-examination was found to be 2.5% (Uğurlu et al., 2011). Another study reported that the rates for performing a regular testicular self-examination was 4.3% (Özbaş et al., 2011). According to these studies, the result of our work was more positive than the aforementioned ones. However, a study conducted in England, in 2002, showed that the ratio of regular testicular self-examination performed was found to be 22% (Khadra and Oakeshott, 2002). These results may be considered similar to our result.

In our study, the students reported that the reasons for not doing a testicular self-examination were: not knowing how to do a testicular self-examination (47.3%), a disregard for testicular self-examination (27%) and a fear of finding something bad during a testicular self-examination (25.7%). A study conducted with 750 participants, reported that 27% of the men were afraid of detecting a lump, and thus declined doing a testicular self-examination (Ugboma and Aburoma, 2011). These results are similar to our study.

Our study showed that knowledge of testicular cancer and testicular self-examination was of a moderate level. A study which was conducted in Africa, reported that knowledge of testicular cancer and testicular self-examination was not common (Setdwe, 2014). Moreover, the other two studies reported that knowledge of testicular cancer and of testicular self-examination was low also (Rudberg et al., 2005; Vadaparampil et al., 2009). This difference is normal because it concurred with our study on the nursing students.

Our study showed that the education given to the participants regarding testicular self-examination contributed to the increase in the level of knowledge of the participants. Similar results were seen in the Göçgeldi and Koçak's study also (Göçgeldi and Koçak, 2010). Consequently, courses on testicular cancer and testicular self-examination will be held in order to raise awareness. This will certainly increase the amount of testicular self-examinations carried out by the male population.

### **Conclusion:-**

As a result of our study, the rate of men who knew how to perform a testicular self-examination, and who did this regularly, was found to be better than that in other studies. In fact, this ratio is better than the other study, but regarded as low for students making nursing their profession. It would be difficult to create an awareness in society on this issue in health care workers who have not performed a testicular self-examination regularly.

As a result, courses on the subject were found to be effective. We suggest that young men attending healthcare institutions for any reason, should be given opportunistic health education on testicular self-examination.

#### Abstract

In this paper seismic performance of multistory building is checked with asymmetrical plan. At re-entrant corner maximum damage is occurred during earthquake. A G+20 and G+22 building having plan asymmetry is modeled in finite element analysis using STADD-Pro v8i. Accidental torsional load is applied with reference to 1893(part-1)-2002. In this paper we provide architectural relief and providing shear wall at re-entrant corner in the buildings.

#### Introduction:-

A building should possess four main attributes, namely simple and regular configuration, and adequate lateral strength, stiffness and ductility to perform well in earthquake. Buildings having simple regular geometry and uniformly distributed mass and stiffness in plan as well as in elevation, suffer much less damage than buildings with irregular configurations. But due to architectural consideration we have to construct buildings with irregular according to 1893 clause 7.1 irregular define in two ways plan irregularities and vertical irregularity.

Torsion is caused in building during earthquake due to various reasons, mainly due to non-symmetric mass distribution and stiffness. Torsion is generated in asymmetrical building when the distance between storey's center of rigidity and storey's center of mass is greater than 20% of the width of the structure in either major plan dimension. In torsion irregularity, inertia force acts through the center of mass while the resistive force acts through the center of rigidity as shown in fig 1.

**Fig 1:-** Generation of torsional moment in asymmetric structures

The torsion will be developed at Re-entrant corners in L-shape and T-shape Building. The Re-entrant corner, lack of continuity corner is the common characteristic of overall building configuration that in plan. L-shape and T-shape occurs due to lack of tensile capacity and force concentration. According to IS-1893(Part1)-2002, Plan configurations of a structure and its lateral force resisting system contain re-entrant corners, where both projections of the structure beyond the re-entrant corner are greater than 15 percent of its plan dimension in the given direction. In fig 2 shows differential motion between different parts of building, resulting in local stress concentration at the notch of the re-entrant corners.

**Fig 2:-** Examples of building with plan irregularities

There are many remedies to avoid the torsion irregularity are as follows

1. By providing shear wall.
2. By providing uniform box
3. By providing Architectural Relief
4. By providing Diagonal Reinforcement

There are many research carried out on the torsional behavior of building. They give the better solution to avoid the torsion. But they didn't apply it on actual building. In my research paper work, I have applied the solution such as shear wall and architectural relief providing to the building. By analysis I observed that architectural relief is better solution.

### Objectives

1. To study the torsional effect due to plan irregularity on L-Shape Multi-Storied Building at Re-entrant corner.
2. To study the torsional effect due to plan irregularity on T-Shape Multi-Storied Building at Re-entrant corner.
3. To discuss remedies for torsion irregularities and giving optimize solution for cases as per IS 1893(Part-I)-2002.

### Literature Review:-

1. Mr. Sandesh N. Suryawanshi<sup>1</sup>, Prof. S. B. Kadam<sup>2</sup>, Dr. S. N. Tande<sup>3</sup>(2014)“Torsional Behavior of Asymmetrical Buildings in Plan under Seismic Forces”

In this paper tells us about the torsional behavior of asymmetric building subjected to ground motion using Response Spectrum method. Then he used the non-linear push over analysis has been used to find the structural description.

In this paper the gravity load analysis & lateral load analysis as per the seismic code IS 1893(part-1):2002 is carried out for three building one is symmetric and other two are asymmetric in plan for variation in building height. Determining the torsional moment, Base shear, displacement & time period by Response spectrum method & there capacity & demand is equivalent using non-linear push over analysis. This paper concluded that time period and base shear calculation by using equivalent static method is approximately equal with response spectrum method in SAP. It also concluded that torsional moment is more in the asymmetry building so beam and column are necessary to design considering torsional moment. The base shear and roof displacement of asymmetry building is more than symmetrical building. By using push over analysis performance of symmetrical building is better than asymmetrical building.

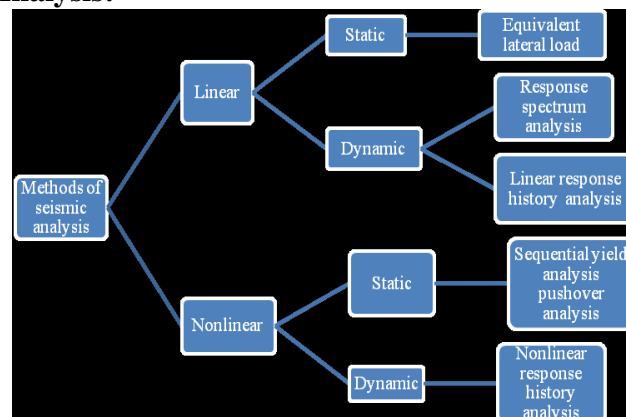

**Prof. Wakchaure M. R<sup>1</sup>, Nagare Y U<sup>2</sup> (2013) “Effect of Torsion Consideration in Analysis of Multi Storey frame”**

This paper tells that the study on the influence of the torsion effects on the behavior of structure is done. In this paper two building are considered one is without considering torsion and other is considering the torsion. The building is analyzed and design using method and as per IS1893 (part1):2002. the result are compared in terms % Ast in column. This paper concluded that In the asymmetric building second building, that is without considering torsion, it was observed that the area of steel in the beams at critical stage are much smaller than those obtained in the case of first building, that is with considering torsion. The bottom bars should be more critical, because they seem to be subjected to more tension than the top bars therefore torsional behavior of asymmetric building is one of the most frequent source of structural damage and failure during strong ground motions. He also concluded that the torsion is the most critical factor causes damage in building, so the irregular buildings are analyzed for torsion.

**M.D. Bensalah, M. Bensaibi, A. Modaressi, (2012) “Assessment of the Torsion Effect in Asymmetric Buildings under Seismic Load”**

This paper studied on the influences of torsional effect on the behavior of the structure. In this paper two buildings are considered one symmetrical and other un-symmetrical building in terms of rigidity. He focused on some parameter such as displacement, ductility, reduction factor and dynamic non accidental eccentricity. This paper concluded that lateral yielding strength in terms of capacity of asymmetric structure is higher than symmetrical structure. The ductility increases with increasing input motion (Arias intensity) and decrease with increasing predominant period with significant variation in asymmetrical structure than those symmetrical structures. The reduction factor decreases when the dominant period of the earthquake increases.

**Methods for Seismic Analysis:-**

**Fig 3:- Methods of seismic analysis**

The method of analysis used here is Response Spectrum method and analysis using Stadd-Pro.

**Linear static method:-**

The linear static method also known as Equivalent Static Method is used to estimate the demand for the buildings whose response is particularly dominated by the first mode and expected to behave in elastic range. In this method the lateral loads are calculated based on the fundamental period of the structural and applied on the design centre of mass at every floor level and the demands are estimated. The magnitude of these pseudo lateral loads has been selected with the intention that when applied to the linearly elastic model of the building, it will result in design displacement expected during the design earthquake.

If the building responds elastically to the design earthquake, the calculated internal forces will be reasonable approximation of those expected during the design earthquake. If the building Responds in elastically to the design earthquake as is quite common in most of the cases, the actual internal forces that would develop in the yielding building will be less than the internal forces calculated using the pseudo lateral load.

To take these inelasticity account the Response reduction factor (R) is used to calculate the reduced forces. IS1893:2002 uses the empirical formulae to estimate the fundamental time period of the structure. It is used for spectral acceleration determination from the response spectrum, which in turn is used for the calculation of Base

shear modified by some coefficient. Then this base shear is distributed in the parabolic fashion along the height of building. The effect of the torsion is taken into consideration by calculating the design center of mass by means of design eccentricity.

Design eccentricity is the sum of the actual eccentricity (distance between centre of mass and centre of rigidity at floor level) and accidental eccentricity (5% of the horizontal dimension at the given floor level measured perpendicular to the direction of the applied load). For two dimensional modeling the design forces are suitably increased to account for torsion.

#### **Linear Dynamic Method:-**

For the building whose response is dominated by more than one mode, the Linear Dynamic Method is used to estimate the demand of the structure. There are two ways to carry out the Linear Dynamic Analysis.

1. Response Spectrum Method
2. Time History Method

#### **Response Spectrum Method:-**

In this method the load vectors are calculated corresponding to predefined number of modes. These load vectors are applied at the design centre of mass to calculate the respective modal responses. These modal responses are then combined according to SRSS or CQC rule to get the total response. From the fundamentals of dynamics it is quite clear that modal response of the structure subjected to particular ground motion, is estimated by the combination of the results of static analysis of the structures subjected to corresponding modal load vector and dynamic analysis of the corresponding single degree of freedom system subjected to same ground motion. Static response of MDOF system is then multiplied with the spectral ordinate obtained from dynamic analysis of SDOF system to get that modal response.

#### **Time History Analysis (Response History Analysis):-**

Dynamic analysis using the time history analysis calculates the building responses at discrete time steps using discredited record of synthetic time history as base motion. If three or more time history analyses are performed, only the maximum responses of the parameter of interest are selected.

#### **Non-linear Static Method:-**

This can be defined as the procedure in which the structure (taking into account the material nonlinearity) is pushed till collapse to generate the pushover curve, which is then used to estimate the target displacement at which the response quantity is extracted from the deformed modal. This is discussed later in detail.

#### **Non-linear Dynamic Analysis:-**

This is the most accurate method to determine the seismic responses of structures. In this method the structure is subjected to actual ground motion which is the representation of the ground acceleration vs. time. The ground acceleration is determined at small time step to give the ground motion record.

Then the structure response is calculated at every time instant, to know its time history and the peak value from this time history is chosen to be the design demand. Hence "a Mathematical model directly incorporating the nonlinear characteristic of individual component and element of the building shall be subjected to earthquake shaking represented by ground by ground motion time history to obtain forces and the displacement"(FEMA 356 & FEMA 273).

#### **Using Stadd-Pro:-**

In the analysis of the building we consider the accidental torsion in Stadd-Pro. In Stadd-Pro uses the Finite Analysis Method.

#### **Building Details:-**

In the present study the seismic load analysis and lateral load analysis as per the seismic code IS 1893 (Part 1): 2002 are carried out. For Two Buildings, one is L-Shape and other T-shape asymmetric in plan for building height G+20 and G+22 for comparison criteria is that numbers of columns are kept same for all three buildings and an effort is made to study the effect of seismic loads on them also determine torsional moments, base shear, displacement and time period by using response spectrum method.

Problem statement –A G+20 and G+24 storied bare RC Ordinary Moment Resisting Frame has plan as shown in fig. is situated in seismic zone III

A) T-shape Building -

In X-direction-6 Bays of 5m @30m

In Z-direction- 6Bays of 5m @30m

B) L-shape Building

In X-direction- 6Bays of 5m @30m

In Z-direction- 8Bays of 5m@40m

Beam size - 0.23m x 0.45m

Column size - 0.23m x 0.45m

Thickness of slab- 150mm

Height of storied – 3m

Plinth height above GL – 1.5m

Unit weight of concrete – 25kN/m<sup>3</sup>

Live load – 3kN/m<sup>2</sup>

Grade of concrete – M20

Grade of Steel – Fe415

### Discussion:-

- 1) As the height of L-shape building increases, there is increases in the base shear by 9.54% from the results tabulated in table 5(a) & 6(a).
- 2) The torsional moment in L- Shape building decreases using architectural relief by 37% from results tabulated in table 1(b).

### Conclusions:-

In this paper modeling of multistoried building with plan irregularity is done. In accordance with IS1893-2002 for simulation purpose finite element analysis STADD-Pro V 8i is used following conclusions are formed after studying T-shape and L-shape Building with variation of height.

- 1) Increase in height of L-shape building directly increase in relative displacement & stress at re-entrant corners
- 2) Architectural Relief is given for L-Shape building relatively considerable decrease in displacement and also decrease in stresses at re-entrant corners.

- 3) Increase in height of T-shape building directly increase in relative displacement and stress will be developed at re-entrant corner.
- 4) A T-shape building with shear wall and without shear wall is analyzed and it is observed that nodal displacement and beam displacement reduced comparatively but stresses at re-entrant corners does not vary
- 5) In T- shape building shear wall must be provided at re-entrant corners only
- 6) Architectural Relief is the better solution on the re-entrant corner on which maximum earthquake damage is done.
- 7) The torsional moment in symmetrical building is very less as compared with unsymmetrical building.

#### Abstract

This Paper discuss about need of fort rehabilitation and techniques used for fort rehabilitation. In order to pass on to future generations what is currently identified as being of cultural significance today, we must imbibe good conservation practices especially for the heritage buildings in order to prevent them from deterioration and extend the life and basic functions of these buildings. Heritage buildings were constructed in the past that have high historical, architectural, spiritual, social, political and economical values. Similarly heritage buildings are highly valuable and informative in terms of socio-cultural, socio-political, socio-economical and even technological activities of a specific society or group of individual. we need to prevent deterioration of fort and use the special techniques for fort rehabilitation

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Introduction:-

Forts have been created for thousands of years and they are often the most durable and famous symbols of ancient civilizations. These are the icons of the nation having their own cultural and historic values therefore, it is very essential to conserve them. Forts which have no further utilization tend to decay rapidly, while which are still in use have a better chance of being maintained. Rehabilitation involves contribution of high end technology, advanced skills and calculations. This is a very responsible job of saving hazardous failure of structures due to deterioration. The success in rehabilitating the structure totally depends on gaining expertise in the field and day to day advancements. Rehabilitation is highly recommended for age-old buildings showing signs of decay and save human lives from failures.

#### Types of fort:-

Traditionally the Forts in Maharashtra were of the following types:

##### Hill Forts:-

The hill forts were constructed from stones carved out from the very mountains and joined with the help of lime, rubble, gravel, stones, bricks, molten metal and sand. Lime mortar was ground on the fort itself with the help of a roller passing through a circular channel. The stones formed the outer layer of the fort. Stone layers were often sandwiched between earth, rubble and mortar. At several places the stones appear joint in the male female format devoid of any use of mortar. The stones were joined by mortar. There were even instances of molten metal used to fill up fissures and strengthen the construction. Together they gave a construction that's lasted for centuries.

**Corresponding Author:-Harshal R Jadhav.**

Address:-Post Graduate Student, Department of Civil Engineering, ICOER, PUNE.

**Land Fort:-**

These forts were created on the plains. In Marathi they were called Bhuikot. e.g Chakan fort, Bahadurgad, Solapur fort, Ahmednagar fort etc

**Sea Fort:-**

These forts were created in the middle of the sea at a shallow point with a solid foundation base and protected by its vicious waves. In Marathi they were called 'JalDurg'. Ch. Shivaji was quick to realize the importance of sea forts. They provided a efficient base for controlling sea traffic and trade. e.g Janjeera, Sindhudurg, Padmadurg, Khanderi , Underi etc.

**Forest Fort:-**

These forts were created amidst a dense jungle, protected by the trees, the reptiles and wild animals. They were the 'Vana Durg'. e.g Javali.

**Human Fort:-**

Human war formations, encampments often resembled forts. These were the 'Nar Durg'. Barring the last which is a type of a field fortification.

**Causes of Deterioration of Fort:-****Natural Factors:-****Floods:-**

Floods can cause massive damage where forts are being destroyed by nature's water pressure. Though some might dry out, yet the moisture remaining within the floors, walls and roof may cause serious mold problems that will eventually wear the building away and create health dangers.

**Biological Factors:-**

Biological agencies such as mosses, fungus, algae, and insects affect construction materials like timber, bricks, stucco etc. Biological agencies attack generally wet timber that has over 20% moisture contents. Wet timber decomposes in damp condition, and once germination occurred it enters cracks and spreads fast making the timber to loose cellulose, thereby loosing its strength and shape which results in cracks, shrinkages and loose fittings.

**Moisture:-**

Moisture is regarded as a key agent causing gradual deterioration of Fort. It can be in solid, liquid or vapor form and it is always present in the atmosphere. When the surface temperature falls, condensation occurs and this can cause severe damages to heritage buildings.

**Ground salts and water:-**

Soluble salts are a principal agent of decay in porous building materials and a source of great frustration to those involved in the conservation of historic buildings. The behavior of salts may seem unpredictable since they can remain dormant for long periods and then suddenly become active causing damage and disfiguring historic fabric. In other cases the action of salts is progressive, weakening surfaces on a microscopic level over decades and centuries, causing natural erosion of the kind that would occur to stone in a quarry face. Weathering of Natural Building Stones and his description remains the most comprehensive source on the subject, outlining all the essential facts, the salts typically found and the mechanisms of crystallization and decay. Ground water table and salinity i.e. higher salt loads on building materials, for example due to capillary rising damp from the soil. The higher salt load may lead to faster decay of heritage building materials.

- Both increasing and decreasing ground water tables.
- Increasing salt concentration in ground water.

**Windstorm:-**

Wind primarily causes loading and mechanical damage to structures and materials. Windstorm damaged roofs was quiet often recorded in the past at is still as a major threat to historical structures. Most of the damage caused by the strong winds concerned the roof covering. Wooden shingles were much more resistant than for example ceramic of slate tiles.

**Social Factors:-****Fire**

Fire has long been enemy of heritage buildings. Uncontrolled fire can cause an entire destruction of heritage buildings and its contents in only a few hours and its major effect is the potential loss of authenticity. Although the destroyed parts of the buildings can be replicated, the loss of the original historic fabric takes away from the building the cultural significance which makes it unique and important.

**Urban Development:-**

Large urban scale development has continued to threaten the existence of heritage buildings in the region for a long time. Many heritage buildings are being demolished to pave way for the construction of wider roads, schools, hospitals, shopping malls and parking. Some of these buildings, especially those located in the central business district, have been under threats of demolition from the public and private developers seeking more lucrative ventures only.

**Vandalism:-**

It is the behavior attributed originally to the Vandals, in respect of culture: ruthless destruction or spoiling of anything beautiful or venerable. The term also includes criminal damage such as graffiti and defacement directed towards any property without permission of the owner.

**Literature Review:-**

During last few decades lot of research has been carried out to discuss the special techniques for rehabilitation of fort. In this chapter the research work carried out by various by researchers on Rehabilitation of fort for better understanding of the present work.

**Necessity of Rehabilitation:-**

In this paper for the rehabilitation of any heritage structure or monument, first of all the grade of the building should be taken into account. Depending upon the grade of that structure, the rehabilitation program should be planned with the permission of Heritage Conservation Committee. Secondly, engineers should be aware of the materials available in the market. Engineers should select proper material and technique for the rehabilitation of the particular monument so that its aesthetic look is not changed. Properties of the old materials and new should match each other. All conditions of using the new materials should be suitable. For strengthening of members materials like FRP can be useful rather using jacketing of the members. Epoxy can be used for better strengthening instead of using cementations grout. While using these materials or techniques, compatibility of the new materials with old materials should be checked properly. And a periodic maintenance should be adopted. (Mulani and Kumthekar, 2015).

Egypt with its long distinctive history as the oldest civilization of the world and has hosted most of other civilizations; has a unique historical patrimony of buildings and sites that are considered a world heritage and need to be conserved. However, with the huge amount of these historical building and sites, which need substantial investments for conservation, the problem of prioritization comes on the surface. Rehabilitation and conservation strategies should aim to avoid the idea of static preservation, and not attempt to fossilize the past and convert it into a sort of open-air museum. Therefore, there is an urgent need for rehabilitation approaches which, maintain and sustain the essential qualities of the historical areas in old cities and of the life of the resident communities, but which can also adapt these physical structures and organic approach of revitalization is needed. Adaptation of form and function can proceed, however, within a stable matrix of building and urban patterns. Selectivity is crucial. This implies, for example, a choice of new design concepts and relevant new technologies to enable older buildings and areas to adapt successfully to modern needs but without destroying existing urban form. (Ayman and Nour, 1964).

The existing buildings nearing its serviceability life and showing sign of breakdown does calls for technical intervention for enhancing their life and to avoid any accidental failure due to seismic event or other structural reason. The deterioration of the structures takes place due to weathering action, Fire, Natural calamities like earthquake, Flood, Tsunami, cyclones, Soil and structure interaction, defects in construction and many more. Post the technical evaluation of such structures, the decision to repair or replace a structure or its component has to be taken. This has to be in compliance with economy, construction feasibility and as per latest trends and techniques. The approach towards rehabilitation of any building can be categorized in following steps and actions. Evaluating various retrofitting options, materials, feasibility and economy, Performing structural calculations and capacity

demand ratio for structural members, Suggesting retrofitting/construction system and getting the rehabilitation of the building done, Post retrofitting tests on the building.(Chandar, 2014)

In this paper it is discussed that India has a very rich historic background which is evident from various buildings, forts, temples, landscapes, objects of historic era. Many of these were constructed several hundred years ago when the Indian Civilization was at its peak. Their architecture, design and construction at the time when computers, code of practice, design guidelines, research institutions and modern construction techniques did not exist makes one to realize the wisdom and expertise of our forefathers. These structures have managed to survive for hundreds of years while most of the modern constructions need repair after couple of years of service. Physical materials of an earlier time, that might have been state of the art at the time of construction, might have failed and now need replacement with contemporary better functioning, but aesthetically similar materials. Such reasons make it mandatory to instigate a systematic approach in the area of heritage conservation. Deterioration of the structure may be caused due to various reasons, some of which are long life, lack of maintenance, unchecked growth of trees and creepers on the structures, improper drainage system, irregular inspection, material deterioration and weathering effect etc. Also, modern codes and building standards, observance of cultural context, conservation criteria, attainable benefit, traditional and innovative methods etc. pose major challenges in restoration of heritage structure. The best therapy to reduce decay is preventive maintenance. Adequate maintenance can limit or postpone the need for subsequent intervention. The choice between “traditional” and “innovative” techniques should be weighed up on a case-by-case basis and preference given to those that are least invasive and most compatible with heritage values, bearing in mind safety and durability requirements. The removal or alteration of any historic material or distinctive architectural features should be avoided whenever possible. Deteriorated structures whenever possible should be repaired rather than replaced.(Sandbhor and Botre, 2013)

### **Methodology:-**

For carrying out the proposed work, following methodology will be adopted for data collecting and analysis.

1. Collection of relevant research data from national and international journals, web source etc.
2. Physically visiting the forts & collecting information.
3. Interviewing the personal associated with rehabilitation.

Interviewing the personal associated with the archeological department to study the feasibility the various materials recently developed in market

### **Techniques Used In Fort Rehabilitation:-**

There are new materials and techniques which can be used for rehabilitation work .By this new technique the work can be done in a perfect way. Some of the techniques and material are as follows:

1. Epoxy injection
2. Guniting or Shotcrete
3. Mortar repair for cracks
4. Foamed concrete
5. Mortar and dry pack
6. Vacuum Concrete
7. Shoring and underpinning
8. Repointing
9. Grouting Techniques

### **Epoxy injection:-**

Resin injection is based to repair concrete that is cracked or delaminated and to seal cracks in concrete to water leakage. Two basic types of resin and injection techniques are used to repair concrete; epoxy resins and polyurethane resins. Epoxy resins cure to form solids with high strength and relatively high module of elasticity. These materials bond readily to concrete and are capable, when properly applied, of restoring the original structural strength to cracked concrete. The high modules of elasticity causes epoxy resin systems to be unsuitable for rebonding cracked concrete that will undergo subsequent movement. The epoxies, however, do not cure very quickly, particularly at low temperatures, and using them to stop large flows of water may not be practical. Cracks to be injected with epoxy resins should be between 0.005 inch and 0.25 inch in width. It is difficult or impossible to inject resin into cracks less than 0.005 inch in width, while it is very difficult to retain injected epoxy resin in cracks greater than 0.25 inch in width, although high viscosity epoxies have been used with some success Epoxy resins

cure to form relatively brittle materials with bond strengths exceeding the shear or tensile strength of the concrete. If these materials are used to rebound cracked concrete that is subsequently exposed to loads exceeding the tensile or shear strength of the concrete, it should be accepted that the cracks will recur adjacent to the epoxy bond line. In other words, epoxy resin should not be used to rebond “working” cracks. Epoxy resins will bond with varying degrees of success to wet concrete, and there are a number of special techniques that have been developed and used to rebond and seal water leaking cracks with epoxy resins. These special techniques and procedures are highly technical and, in most cases, are proprietary in nature. Polyurethane resins are used to seal and eliminate or reduce water leakage from concrete cracks and joints. They can also be injected into cracks that experience some small degree of movement. Such systems, with the exception of the two-part solid polyurethanes, have relatively low strengths and should not be used to structurally rebond cracked concrete. Cracks to be injected with polyurethane resin should not be less than 0.005 inch in width. No upper limit on crack width has been established for the polyurethane resins at the time this is being written. Polyurethane resins are available with substantial variation in their physical properties. Some of the polyurethanes cure into flexible foams. Other polyurethane systems cure to semi-flexible, high-density solids that can be used to rebond concrete cracks subject to movement. Most of the foaming polyurethane resins require some form of water to initiate the curing reaction and are, thus, a natural selection for use in repairing concrete exposed to water or in wet environments. At the time this is written, there are no standard specifications for polyurethane resins equivalent to the standard specification for Epoxy-Resin-Base Bonding Systems for Concrete.

The injections in cracks, internal or at the face, of a masonry wall are a solution of strengthening that is irreversible. They are, however, used frequently because, they preserve the original aspect of the exterior of the wall. It is particularly indicated for the rehabilitation of the masonry that has internal cracks connected between them. For this solution a cementitious based grout is used or a hydraulic based grout or others such as organic resins based grout. This solution is based on the injection in holes previously made with injection tubes and spread throughout the wall, to fill with the grout the internal cracks. For the external Cracks the coating should be removed previously and the Injection tubes may be used the aggregate grading of the grout depends on the size of the cracks but it can be used a grout without the sand. This technique shows improvements in the mechanical characteristics of the masonry. It seems a better application in stone masonry. To deliver a specific injection grout one must carry on in-situ and laboratory tests to refine the grout. Depending on the used process, there are several solutions for the injections. The process of Epoxy injection is shown in figure 8.1.

**Figure 1:- Epoxy injection**

1. Injection under pressure: It is frequently used in masonry. To avoid Structural failure of the wall, the holes are done from bottom to top and from side to centre.
2. Injection trough gravity: It is used to highly damaged walls.

Injection trough vacuum: It is used in small interventions, mainly architectural, statues, etc. The grout is very fluid for instance resins can be used. In old structures, the inorganic grouts, non cementitious, like hydraulic lime, should be preferred because of compatibility issues with the already existing mortars. The organic mortars (polyester or epoxy), more fluid, should only be used when there are needs for higher resistance, hopefully without

#### **Gunite or Shotcrete:-**

Gunite can be defined as mortar conveyed through a hose and pneumatically projected at a high velocity on to a surface. Recently the method has been further developed by the introduction of small sized coarse aggregate into the mix deposited to obtain considerably greater thickness in one operation and also to make the process economical by reducing the cement content. Normally fresh material with zero slumps can support itself without sagging or peeling

off. Sometimes use of set accelerators to assist overhead placing is practiced. The newly developed 'Ready set cement' can also be used for shotcreting process. There is not much difference guniting and shotcreting. Guniting was first used in the early 1900 and this process is mostly used of pneumatically application of mortar of less thickness, whereas shotcrete is a recent development on the similar principal of guniting for achieving greater thickness with small coarse aggregates. There are two different processes in use, namely the 'Wet-mix' process and the 'dry-mix' process. They dry mix process is more successful and generally used.

#### Abstract

Deterioration of food can be caused by various factors such as physical, chemical, enzymatic or microbiological. Due to increasing side effect of chemicals in food, consumers demand for some natural alternative to these chemical preservatives. One of these alternatives is use of plant essential oils. The aim of this study was to understand the effect of combination of two commercial essential oils (rosemary/eucalyptus oil) on the membrane of one gram positive and one gram negative bacteria at MIC concentration. The release of cell constituents at 260 nm and potassium ions from the bacterial cell were measured after they were treated with essential oil combination of rosemary /eucalyptus oil at their MIC concentrations. The result showed that there was damage in the cell covering of bacteria because of the treatment of combination of oils. The assays performed to study the effect of combination of oil on cell membrane of both selected bacteria exhibited that the combination at MIC concentration damaged the cell membrane of both bacteria. These results provide the useful information that the rosemary /eucalyptus oil combination might be used as efficient and safe natural antimicrobial agent in food industry.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Essential oils are the aromatic liquids, result of secondary metabolism in plants (Guenther, 1948). Essential oils are natural antimicrobials, which are used in flavor and fragrance industries (Van de Braak and Leijten, 1999). In food industries the essential oils are used as natural preservatives, which are the demand of time. As the chemical preservatives have their own set of problems like carcinogenicity, teratogenicity, acute toxicity and the environmental problems they cause due to long degradation time taken by them (Smid and Gorris, 1999).

Essentials oils have antibacterial, antifungal, antioxidant and anticarcinogenic properties which help them to be used as food additives. Essential oils when used as antimicrobial in food are required in higher quantity, which can demonstrate negative effect in taste and odor of food (Yamazaki et al., 2004.). To tackle this problem the combinations of different oil can be used which solves two purposes, one being the increase in antimicrobial effect and second is the decrease of concentration required of the oils.

Rosemary and Eucalyptus oils are good antimicrobials alone. There is no information regarding their antibacterial action on bacteria. Hence, in the present study the mode of action of this combination at MIC value for *E. coli* and *Micrococcus yunnanensis* will be studied on their cell walls by determining the release of cellular materials at 260 nm and potassium ion efflux.

## Materials and Methods:-

### Material:-

**Essential oil combination:-** Rosemary/Eucalyptus oil combination.

**Bacterial strains:-** *Micrococcus yunnanensis*, *E. coli*.

### Methods:-

**Preparation of inoculum:-** The bacterial inoculum used for testing the activity was prepared in nutrient broth. Five ml of broth was suspended in test tubes and autoclaved. The medium was cooled and inoculated with a loopful of bacterial cultures from the nutrient agar slants under aseptic conditions and then incubated at  $37 \pm 1^\circ\text{C}$  for 24 hours. In order to standardize the inoculums density for test,  $\text{BaSO}_4$  turbidity standard equivalent to 0.5 McFarland (turbidity equals to  $0.5 = 1$  to  $2 \times 10^8$  CFU /ml) was used (Burt, 2004).

**Determination of minimal inhibitory concentration (MIC):-** Investigation of the MIC of Rosemary and Eucalyptus essential oils was done in 96 well titre plate (Schelz *et al.*, 2006). In each well Muller Hinton broth (90  $\mu\text{l}$ ) was added. The essential oils alone were taken from range 100  $\mu\text{l}$  to 3.25  $\mu\text{l}$  along x axis. 10  $\mu\text{l}$  of working inoculum suspension ( $8 \times 10^8$  CFU/ml) was added to the each well. The bacteria tested were 80  $\mu\text{l}$  in which well. Ciprofloxacin was used as positive control and DMSO was used as negative control. The plate was incubated at  $37^\circ\text{C}$  for 24 hours. The plates were then incubated for 24 hour at  $37^\circ\text{C}$ . After incubation, O.D was measured using ELISA reader at 595 nm. The lowest dilution showing no visible growth was considered as the MIC for that individual oil. The tests were performed in triplicate.

**Determination of Fractional Inhibitory Concentration Index (FICI):-** Fractional inhibitory concentration index was determined by checkerboard titration method but with some modifications (CLSI, 2005). Along the rows Rosemary oil concentration was reduced to half in each subsequent well, whereas Eucalyptus oil concentration was fixed at 50  $\mu\text{l}$  and in another row eucalyptus oil concentration was reduced and rosemary oil concentration was fixed at 50  $\mu\text{l}$ . The bacteria tested were 80  $\mu\text{l}$  in which well. Ciprofloxacin was used as positive control and DMSO was used as negative control. The plates were then incubated for 24 hour at  $37^\circ\text{C}$ . After incubation, O.D was measured at 595 nm. The combination which showed maximum inhibition at lower concentration was taken as MIC.

### Fractional inhibitory concentration indices (FICI) were calculated using the formula:

**FICI** = (MIC of EOA in combination with EOB / MIC of EOA alone) + (MIC of EOB in combination with EOA/ MIC of EOB alone).

Where, EOA= rosemary oil and EOB= eucalyptus oil. The results were interpreted according to FIC indices as follows:

FICI  $\leq 0.5$ : Synergy;  $0.5 < \text{FICI} \leq 4$ : Additive; and FICI  $> 4$ : Antagonistic (Leclercq *et al.*, 1991). All the experiments were repeated thrice.

**Mode of action:-** The effect of combination of essential oils at its MIC concentration was studied on cell membrane of both selected bacteria by following assays:

**Potassium leakage assay:-** The potassium leakage from cells was studied by following the methodology of Cox *et al.* (2000). 2 ml Suspensions of selected bacteria were exposed to essential oils combination (MIC) in sterile peptone water (0.1 g/ 100mL) for 0, 30, 60, and 120 minutes at  $37^\circ\text{C}$ . After predetermined interval the samples were collected and extracellular potassium concentration was measured by photometric method. Controls were devoid of Essential oils combination. Results were calculated as amount of extracellular potassium (mmol/L) in the growth media at each interval of time.

**Leakage of 260 nm and 280 nm cellular materials:-** This assay was performed according to the methodology of Carson *et al.* (2002). To 2 ml of bacterial culture in sterile peptone water (0.1 g/ ml) essential oil(s) combination at their MIC concentration was added. The mixture was incubated at  $37^\circ\text{C}$  for 0, 30, 60 and 120 minutes. Cells for measurement were collected after 0, 30, 60, and 120 minutes, cells were then centrifuged at 3500 rpm for 15

minutes. The supernatant were collected and absorbance was measured at 260 nm UV/Vis Spectrophotometer. Controls were kept under same conditions, except that they were not treated with essential oils combination. The experiment was performed in triplicates and mean values were plotted against time.

### Results:-

#### Determination of Minimum Inhibitory concentration (MIC) and Fractional inhibitory concentration (FIC) of essential oils alone and in combination:-

The combination effect of oils on *E. coli* and *Micrococcus yunnanensis* (taken as models for further studies) was studied by Checkerboard method.

In tables (i) and (ii) the results of combination of rosemary oil and eucalyptus oil are summarized for *E. coli* and *Micrococcus yunnanensis* respectively. In case of *E. coli* when 6.25  $\mu$ L of rosemary oil was mixed with 50  $\mu$ L of eucalyptus oil, **0.125 $\pm$ 0.01** MIC was obtained. Whereas for *Micrococcus yunnanensis* **0.098 $\pm$ 0.01** MIC was obtained when 12.5  $\mu$ L rosemary oil was mixed with 50  $\mu$ L eucalyptus oil.

**Table i:-** Determination of MIC of rosemary oil with eucalyptus oil against *E. coli*.

Concentration of oil	Rosemary oil conc. ( $\mu$ L)					
	100	50	25	12.5	6.25	3.125
Eucalyptus( 50 $\mu$ L)	0.431 $\pm$ 0.01	0.279 $\pm$ 0.04	0.248 $\pm$ 0.03	0.245 $\pm$ 0.01	0.125 $\pm$ 0.01	0.458 $\pm$ 0.02
Rosemary oil alone	1.417 $\pm$ 0.2	1.304 $\pm$ 0.4	1.186 $\pm$ 0.3	1.224 $\pm$ 0.4	1.262 $\pm$ 0.4	1.313 $\pm$ 0.6
Control	0.100 $\pm$ 0.01	0.098 $\pm$ 0.09	0.100 $\pm$ 0.02	0.099 $\pm$ 0.05	0.100 $\pm$ 0.01	0.100 $\pm$ 0.08

**Table ii:-** Determination of MIC of rosemary with eucalyptus oil for *Micrococcus yunnanensis*:

Concentration of oil	Rosemary oil conc. ( $\mu$ L)					
	100 $\mu$ L	50 $\mu$ L	25 $\mu$ L	12.5 $\mu$ L	6.25 $\mu$ L	3.125 $\mu$ L
Eucalyptus( 50 $\mu$ L)	0.376 $\pm$ 0.07	0.294 $\pm$ 0.06	0.127 $\pm$ 0.03	0.098 $\pm$ 0.01	0.122 $\pm$ 0.03	0.113 $\pm$ 0.01
Rosemary oil alone	1.482 $\pm$ 0.2	1.379 $\pm$ 0.6	1.263 $\pm$ 0.4	1.188 $\pm$ 0.4	1.253 $\pm$ 0.1	1.246 $\pm$ 0.5
Control	0.093 $\pm$ 0.1	0.095 $\pm$ 0.03	0.092 $\pm$ 0.01	0.093 $\pm$ 0.02	0.094 $\pm$ 0.01	0.094 $\pm$ 0.03

In tables (iii) and (iv) the results of combination of eucalyptus oil with rosemary oil are shown. For *E. coli* the best MIC value of **0.166 $\pm$ 0.02** was depicted by eucalyptus oil (6.25  $\mu$ L) with rosemary oil (50  $\mu$ L). **0.144 $\pm$ 0.01** values were obtained in case of *Micrococcus yunnanensis* when mixed in ratio of 1:1 with rosemary oil. Eucalyptus oil combination with rosemary oil exhibited better result as compared to eucalyptus oil alone.

**Table iii:-** Determination of MIC of Eucalyptus oil with rosemary oil for *E. coli*.

Concentration of oil	Eucalyptus oil conc. ( $\mu$ L)					
	100 $\mu$ L	50 $\mu$ L	25 $\mu$ L	12.5 $\mu$ L	6.25 $\mu$ L	3.125 $\mu$ L
Rosemary( 50 $\mu$ L)	0.516 $\pm$ 0.01	0.336 $\pm$ 0.01	0.254 $\pm$ 0.01	0.202 $\pm$ 0.01	0.166 $\pm$ 0.02	0.178 $\pm$ 0.01
Eucalyptus oil alone	1.488 $\pm$ 0.3	1.377 $\pm$ 0.3	1.238 $\pm$ 0.6	1.013 $\pm$ 0.2	1.805 $\pm$ 0.2	1.728 $\pm$ 0.5
Control	0.101 $\pm$ 0.03	0.095 $\pm$ 0.02	0.101 $\pm$ 0.02	0.099 $\pm$ 0.01	0.100 $\pm$ 0.03	0.101 $\pm$ 0.04

**Table iv:-** Determination of MIC of Eucalyptus oil with rosemary oil for *Micrococcus*.

Concentration of oil	Eucalyptus oil conc. ( $\mu$ L)					
	100 $\mu$ L	50 $\mu$ L	25 $\mu$ L	12.5 $\mu$ L	6.25 $\mu$ L	3.125 $\mu$ L
Rosemary( 50 $\mu$ L)	0.255 $\pm$ 0.01	0.144 $\pm$ 0.01	0.156 $\pm$ 0.8	1.231 $\pm$ 0.1	1.195 $\pm$ 0.5	1.190 $\pm$ 0.5
Eucalyptus oil alone	1.116 $\pm$ 0.6	1.006 $\pm$ 0.6	1.103 $\pm$ 0.3	1.17 $\pm$ 0.5	1.156 $\pm$ 0.2	1.178 $\pm$ 0.5
Control	0.093 $\pm$ 0.02	0.095 $\pm$ 0.03	0.092 $\pm$ 0.01	0.093 $\pm$ 0.05	0.093 $\pm$ 0.02	0.093 $\pm$ 0.01

**Determination of Fractional Inhibitory Concentration Indic (FICI):-** The FIC value of the combinations was calculated, the results are shown in table (v). The combination of rosemary and eucalyptus showed synergistic effect for both the organism.

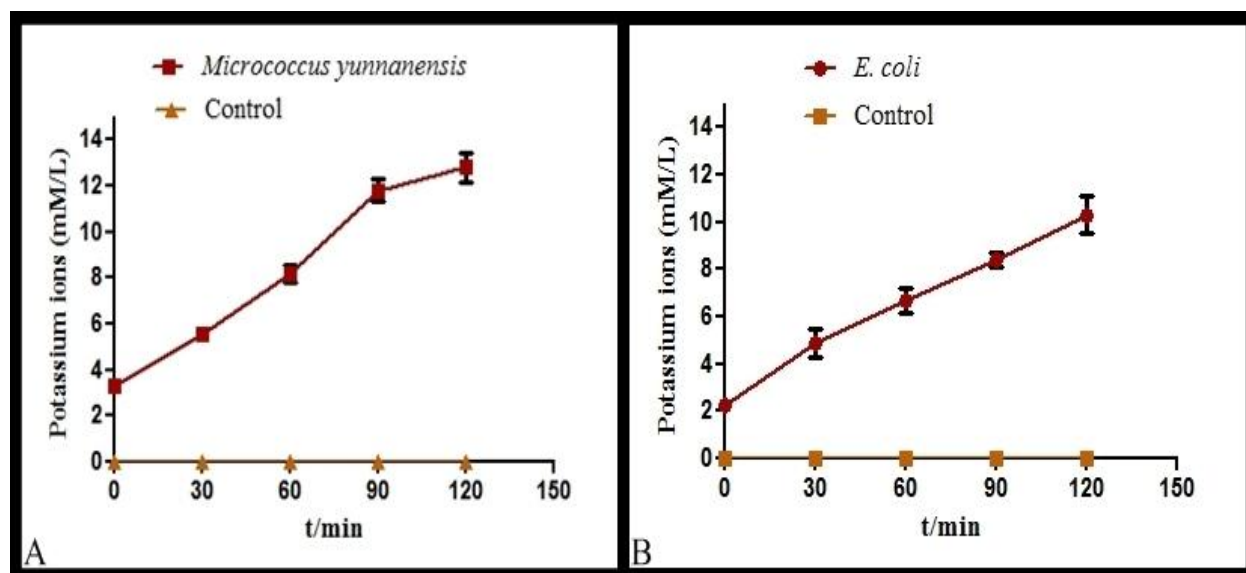

**Table v:-** Combination effects of rosemary and eucalyptus oil combination against food-borne bacteria using checkerboard titration method

Food borne bacteria	Oil combination		
	Rosemary +Eucalyptus		
	FIC	FICI	Remarks
<i>E. coli</i>	0.105 (Rosemary)	0.268	S
	0.163 (Eucalyptus)		
<i>Micrococcus yunnanensis</i>	0.082 (Rosemary)	0.225	S
	0.143 (Eucalyptus)		

S: Synergistic; ADD: Additive; ANTA: Antagonistic.

**Mechanism of action:-** The effect of rosemary and eucalyptus oil combination at their MIC concentration on cell membrane of *E. coli* and *Micrococcus yunnanensis* was studied using two assays:

**Assay of Potassium ions efflux:-** The mode of antibacterial action of combination of oils (rosemary and eucalyptus) at MIC against two tested food borne pathogen was further confirmed using the assay for the release of  $K^+$  ions from treated cells of *E. coli* and *Micrococcus yunnanensis* (**figure i (A, B)**). Treatment of bacterial cells with oil combination at the MIC concentration induced a major efflux of intracellular  $K^+$  ions. The leakage of potassium ions in case of both the bacteria increased with increase in time interval (**figure i (A, B)**). However no  $K^+$  ions efflux was observed in control cells of the tested bacteria during the study.

**Figures i (A, B):-** Effect of Rosemary and Eucalyptus oil combination at MIC concentration on the leakage of potassium ions from the tested food borne bacteria: **A)** *Micrococcus yunnanensis*, and **B)** *E. coli*.

#### Leakage of Cellular Metabolites:-

The results of the release of cellular material at the absorbance value of 260nm from *E. coli* and *Micrococcus yunnanensis* cells exposed to concentration (rosemary + eucalyptus) of oils at the MIC concentrations indicated that the higher exposure time led to higher cell leakage of nucleic acids (**figure ii(A, B)**). However, no changes in the absorbance of untreated cells (control) of tested bacteria were seen. At 30 and 60 minutes of treatment, significant increase in the absorbance of the bacterial cells treated with oil combination was demonstrated. The leakage of the material absorbing at 260nm from the bacterial cells treated with combination of rosemary and eucalyptus at MIC, confirms the damage of cell membrane.

**Figures ii (A, B):-** Effect of Rosemary and Eucalyptus oil combination at MIC concentration on the release rate of material that absorbs at 260 nm from: **A)** *Micrococcus yunnanensis*, and **B)** *E. coli*. Data are expressed as mean values  $\pm$  standard deviations (S.D.),  $N=3$ . CT=control without treatment.

### Discussion:-

Essential oils are natural antimicrobials produced by many aromatic plants and exhibit a great potential to be used in food industry, but their use is restricted due to strong smell and alteration of taste food. To overcome such problem combination of oils can be good option.

In this study commercially available rosemary and eucalyptus essential oils were briefly studied, obtained from local market of Solan, Himachal Pradesh for their potential to be used as food preservative. Rosemary and eucalyptus oil showed potent synergistic interaction ( $FICI=0.268$  for *E. coli* and  $FICI=0.225$  for *Micrococcus yunnanensis*). Similar study on synergism of essential oils was done by **Gibriel et al. (2013)** he reported that the combination of rosemary and cumin showed synergistic effect and rosemary and thyme oils combination demonstrated additive effect against *E. coli*. In another antibacterial combination study by **Anwesa Bag and Rabi Ranjan Chattopadhyay (2015)** on three combinations (coriander/cumin, coriander/ mustard and cumin/mustard) against *Bacillus cereus*, *Listeria monocytogenes*, *Micrococcus luteus*, *Staphylococcus aureus*, *E. coli* and *Salmonella typhimurium*, only coriander/cumin combination showed synergistic interaction ( $FICI: 0.25-0.50$ ) against the studied bacteria except *S. typhimurium* and *M. luteus* where it showed additive effect ( $FICI: 0.75-0.81$ ). Other tested combinations showed additive effect ( $FICI: 0.75-2.25$ ) against all the studied bacteria. The results of present investigations depicted that oils when used in combinations gave MIC value at lower concentrations as compared to MIC value of oil when used alone. These findings collaborates with illustrations of **Tajkarimi et al. (2010)** who stated use of less concentration of essential oils combination in food stuff to avoid the sensory impact of higher concentration and also providing the food safety is the foundation of usage of essential oil combination.

One of the indicator of increased permeability and loss of viability by cells is the loss of potassium ions into extracellular space, confirmed by various studies of **Cox et al. (2001)** and **Bouhdid et al. (2010)**. In this study, we report the effect of rosemary and eucalyptus oil combination on *Micrococcus yunnanensis* and *E. coli*.  $K^+$  release during exposure to the oil combination was measured in both strains, and was found to be induced at MIC concentration. The release of potassium ions was observed to increase with time interval in case of both bacteria. Therefore, it can be concluded from results that rosemary and eucalyptus oil combination interact with cellular membranes of bacteria, changing their permeability to cations like  $K^+$ . These results collaborates with illustrations of various researchers namely, **Bajpai et al. (2015)** examined the effect of *Ginkgo biloba* essential oil on *B. cereus* and *E. coli*, and evaluated that oil caused release of potassium ions; **Bouhdid et al. (2010)** noticed the increase in potassium ion concentration extracellularly in case of *S. aureus* and *P. aeruginosa* when exposed to *Cinnamomum verum* oil; **Trombetta et al. (2005)** who reported that oregano essential oil cause potassium ion release in *S. aureus* and *P. aeruginosa*.

*E. coli* and *Micrococcus* suspension treated with combination of rosemary and eucalyptus oil at MIC, lost significant 260 absorbing materials with increase of time interval, suggesting that nucleic acids and certain protein were lost through a damaged cytoplasmic membrane. Similar studies was carried out by **De Souza et al. (2013)** who studied the effect of rosemary and oregano oil on *Pseudomonas aeruginosa*, when used alone and in combination. It was

observed that immediately after the contact of essential oil alone or in combination with bacteria caused leakage of 260 nm absorbing material. **Ifesan et al. (2009)** observed the leakage of 260nm absorbing material by *S. aureus* when exposed to *Eleutherine Americana*. **Carson and Riley (2002)** showed leakage of 260nm absorbing material by *S. aureus* when treated with tea tree oil.

### Conclusion:-

The present study confirms the antimicrobial action of rosemary and eucalyptus oil combination on the permeability of cell membrane at its MIC conc. on the tested bacteria. It leads to the loss of some cellular components from the cell to outside. In future studies should be dedicated to see the implication of essential oil combination treatment to different food matrices. The toxicology study of the combination should also be carried out.

#### Abstract

**Introduction:** Osteoporosis is a major public health problem, which affects millions of people around the world and its frequency increases by age, and the Kingdom of Saudi Arabia (KSA) is not an exception. Osteoporosis is a disease characterized by low bone mass and micro-architectural deterioration of bone tissue.

**Objectives:** This study aimed to evaluate knowledge and awareness of osteoporosis among general Saudi adult in Riyadh.

**Methodology:** An Observational, descriptive cross-sectional study conducted on 150 males and females participants of general Saudi adult in Riyadh city, 2016. Inclusion criteria: Saudi adults, and Exclusion criteria: other than Saudi nationalities and children. The Sample technique used in this study: convenience consecutive sampling. The data was cleared, coded, entered and analyzed by SPSS (Static Package For Social Science) and Microsoft excel was used to generate figures and charts. Chi-square test with significance level (P value 0.05).

**Results:** Out of 150 participants, 145 have heard about osteoporosis. About (60.66%) of participants have moderate general knowledge about osteoporosis. while only (25.33%) have good general knowledge about osteoporosis. Males participants had the best knowledge about the high risk age group of getting Osteoporosis (55.44%) compared to females participants (44.89%). Approximately most of the participants (48%) thought that they are susceptible to contracting osteoporosis at a point of their lives. Out of 49 females, who participated in the study, on asking about their susceptibility to contracting osteoporosis, approximately half (51.02%) of them knew that they are susceptible of contracting osteoporosis, while males were (46.53%) out of 101. This indicates that there is no statistically significant between males and females on perceived susceptibility. This study showed there is significant relations (P-Value: 0.046) between participants with high perceived knowledge (87.76%), low perceived knowledge (66.67%) and their knowledge about relation between eating a diet low in milk products and getting osteoporosis.

Address:- Consultant of Community Medicine, College of Medicine, Almaarefa Colleges for Science & Technology, Riyadh, Saudi Arabia- P.O.Box 71666 Riyadh (Diriyah) 11597.

**Conclusion:** Knowledge and awareness are moderate towards this disease. This finding is similar to other studies done in the kingdom in different cities implying no serious actions were taken to improve this situation. Health authorities should create programs to upraise the awareness of the community for this important disease, especially at primary health care levels and community pharmacies.

## ..... Introduction:-

Osteoporosis is an irreversible [1] systemic skeletal disorder that affects bone density and quality, leading to bone fragility and increased risk of fractures [2]. It is a major public health problem [1], which affects millions of people around the world and its frequency increases by age [2]. It affects almost: one-tenth of women aged 60, one-fifth of women aged 70 years, as well as two-fifths of women aged 80 years [3] but men are also at risk [1], and the Kingdom of Saudi Arabia (KSA) is not an exception [2]. It was also considered as one of the major contributors of mortality and morbidity among elderly people [1]. The prevalence of osteoporosis among Saudi population was estimated at 34% in a review of the published articles in to 2011 [2]. Sun-light exposure can increase the bone mineral density of vitamin D deficient bone and lead to the prevention of non-vertebral fractures [11], Women in particular receive little or no sun-light since they cover their bodies with dark veils completely. Studies about the prevalence of this disease in Kingdom of Saudi Arabia (KSA), have shown that among postmenopausal Saudi women 50–80 years of age, 39.5 % had osteoporosis [4]; there were 24.3, 62 and 73.8 % of affected women in the age groups 50–59, 60–69 and 70–80 years, respectively [3], among Saudi males 21.4 % were osteoporotic [4]. There is evidence suggesting that osteoporosis knowledge is one contributor to osteoporosis prevention behavior [1]. Awareness about osteoporosis can aid in its prevention [3]. Knowledge, perception of personal susceptibility and belief in the seriousness of the disease are important for influencing behavioral change by prevention programs [2]. The assessment of these parameters can be done through what is called knowledge, attitude and practice, hereafter referred as “KAP” [4]. Small numbers of KAP studies was carried out with regard to this disease, especially in Asian countries [1]. In KSA, there is scarcity of local studies which discussed the level of awareness toward osteoporosis, in both females and males members. The study compares KAP scores between males and females, and also to investigate the relations between socio-demographic characteristics and KAP scores. Awareness about osteoporosis can aid in its prevention [3]. Estimating the level of knowledge of populations through this research can help to guide prevention public health programs and tailor them according to needs of community [3]. Osteoporosis includes several controllable and uncontrollable risk factors; the controllable risk factors (environmental) include low activity level, sedentary lifestyle over many years, smoking, alcohol abuse and inadequate diet including eating disorder, low calcium intake, low vitamin D intake and excessive consumption of soft drinks [1]. Caffeine use of more than three cups of coffee every day might increase calcium excretion in the urine and it affects bone health. Whilst the uncontrollable factors include gender, family history, ethnicity and race, advancing age, postmenopausal status and body frame size [2]. Although there is an increased interest in the level of knowledge and believes among general physicians about osteoporosis, it remains a sidelined issue in the clinical practice field [1]. More and more sedentary lifestyle of children and adolescents is also alarming [3]. This trend is even more serious among adolescent females who live a sedentary lifestyle more often than boys [4]. One of the risk factors of osteoporosis and thus also easier occurrences of fractures is smoking. The explanation of the negative influence of smoking on the bones is not simple because the individual elements of the smoke interfere differently with the bone tissue metabolism [2]. This study aimed to assess level of knowledge and awareness toward osteoporosis among Saudi adults population [2]. One of The goals of this work was to evaluate the knowledge, attitudes and practices of adolescent females in relation to the risk factors of osteoporosis, specifically their physical activity, smoking and diet and to find out the differences in the knowledge in relation to age, sex and school types. In the nutrition area the goal was to set the average intake of nutrients that are in relation to the bone health – calcium, phosphorus, vitamin D, proteins and sodium [2]. Our study aims to assess the level of knowledge regarding osteoporosis.

**Objectives:-****General Objective:-**

To assess level of knowledge toward osteoporosis among Saudi adult population.

**Specific Objectives:-**

1. To assess Knowledge about effect of physical activity on osteoporosis among Economic classes.
2. To compare between knowledge about prevention of osteoporosis and education levels.
3. To assess knowledge about relations between eating dithery milk products and getting osteoporosis among High and low perceived knowledge adults.
4. To compare between male, female and knowledge about common ages get osteoporosis.
5. To assess knowledge about susceptibility to contracting osteoporosis among adult females.
6. To assess knowledge about complication of osteoporosis among employers.
7. To investigate awareness about risk factors of osteoporosis among illiterate and educated people.
8. To compare between general knowledge about osteoporosis and people have good and low perceived knowledge.

**Methodology:-**

An Observational, descriptive cross-sectional study conducted on 150 male and female participants of general Saudi adult in Riyadh city 2016. Inclusion criteria: Saudi adults, and Exclusion criteria: other than Saudi nationalities and children .The Sample technique used in this study: convenience consecutive sampling. The data was cleared, coded, entered and analyzed by SPSS (Static Package For Social Science) and Microsoft excel was used to generate figures and charts. Chi-square test with significance level (P value 0.05).Consent was obtained before data collection from each participant.

**Results:-**

After data collection we realized that majority of participant were male (67.3%). More than half (54.7%) of respondents are between 20-24 years. Almost half of participants (48.7%) were university educated. Fifty two percent of the sample living in own villa (High class).

From all questions that asses level of general knowledge of osteoporosis, about sixty one percent of all participants , have moderate general knowledge about Osteoporosis as shown in table 1-A.

In table 2-A showed that (44.7%) of respondents answered correctly that smoking can cause Osteoporosis. About 50% (47.3%) of participants answered that Osteoporosis can't be hereditary .while only (31.3%) were correct. About drinking cola as risk factor of osteoporosis,(82%) of participants mentioned that Cola affect bones as risk, while (11.3%) don't think so. Regarding Milk-Rich diet and getting Osteoporosis,(79.3%) of all participants said Yes. There was no big difference between people agreed(38%) or disagreed(30%) about irregular period in excessive exercise, as risk of Osteoporosis increase. So (54%) of respondents have good knowledge of risk factors about osteoporosis , while (35.33%) they carrying moderate knowledge about them .

Table 3-A showed that (62.7%) of participants thought that Osteoporosis can be prevented by physical activity, while only (22.7%) of participants didn't. The majority (82.7%) identify exposure to the sunlight one of prevention methods of osteoporosis. Also (55.3%) stated that children at age 6 need more calcium .

Most of participants (48%) thought that they are susceptible to contracting Osteoporosis.

The majority of participants rated their knowledge as either moderate knowledge (37.3%) or poor knowledge (30%). While only (32.7%) rated their knowledge as good.

(69.3%) of the participants know that Osteoporosis can lead to fractures .While (48%) of participants believed Osteoporosis can't lead to death as mentioned in table 4-A. Table 4-b:approximately 50% of participants out of have poor knowledge regarding Osteoporosis complication ,and (34%) have good ideas .

### Discussion:-

Our study showed the General knowledge of osteoporosis is moderate (60.66%) for the majority of the studied sample and this goes in line with Maria Tahir<sup>1</sup>, 26 January 2016 [6] both studies showed moderate knowledge about osteoporosis. Notable, the comparison study focus on female only.

Our study showed that the majority of participants have moderate and good knowledge (89.33%) in the questions, cause of osteoporosis include family history, post-menopausal status and excess in soft drinks and this goes in line with Maria Tahir<sup>1</sup>, 26 January 2016 [6] and Yosria El-Said Hossien<sup>2</sup>, May 20, 2014 [9]. Notable, the comparison study focus on female only.

In our study the majority of participant whom answered correctly (on: smoking is a risk factor for osteoporosis) had a secondary school education level (49.21%). Which goes in contrary to a study done by Mohammed Yehia Saeedi<sup>13</sup> El. Tlt; in Riyadh, Saudi Arabia, 2014, [2], where he found: the majority of the participants considered the smoking as a risk factor for osteoporosis (88.5%), were all with university education. That contributed to the fact that our sample was from the general population, and his was among primary health care physicians.

Our study goes in line with (Afraa talal<sup>14</sup> et al), (19 June 2013 in Riyadh), [1] which showed more susceptibility toward osteoporosis among female, our results indicates (60.64%) of the participants who agree with this, and our study shows that there is no statistically significant difference ( $p = 0.419$ ) between knowledge if osteoporosis more common in female among poor and high knowledge. And the reason may be due to they think it related to menopause.

Our study revealed that (79.33%) of participants with different education levels have answered correctly on whether there is relation between eating a diet low in milk products and getting osteoporosis. Similar results were found by Noman-ul-Haq<sup>1</sup> El Tlt; in Quetta, Pakistan, 2015, [6] which showed that, (82.1%) answer correctly. On the other hand, a study done by Yosria El-Said Hossien<sup>1</sup> El Tlt; in El-Minia, Egypt, 2014, [9], stated that only (5.7%) answered correctly. That might be attributed to the fact that her study was done on secondary school students, but our study was done on general population with the majority of participants (48.7%) with university education.

Our study showed the majority of the studied sample answered to “Sunlight exposure can prevent from osteoporosis” correctly (82.7%) and this goes in line with Yosria El-Said Hossien<sup>2</sup>, May 20, 2014 [9]. The majority of the studied sample has a moderate knowledge about prevention (62%) and goes in line with KafiFraih Alshammari<sup>3</sup>, .2014.11.3 [36] and Maria Tahir<sup>1</sup>, 26 January 2016 [6], which mentioned prevention of osteoporosis by exposure to sunlight, physical activity and calcium intake. Notable, the comparison study focus on female only.

**Table 1-A :- Level Of General Knowledge of Osteoporosis:**

Have you ever heard about osteoporosis ?	YES	NO	I don't know		Total
No.	145	5			150

**Conclusion:-**

In conclusion, general knowledge about Osteoporosis considered to be moderate among Saudi population as this study reveals. Thus knowledge and awareness are also low towards this disease. This finding is similar to other studies done in the kingdom in different cities implying no serious actions were taken to improve this situation.

**Recommendation:-**

Ministry of Education should be involved in health education about osteoporosis and its related factors in schools or even could provide educational program via their curriculum to improve the awareness of this disease among students and thus ensuring that they received accurate information .

Health authorities should create programs to upraise the awareness of the community for this important disease, especially at primary health care levels and community pharmacies.

A good knowledge and awareness of a disease are pre-requisites for success of preventive measures, modifications in life styles and treatment adherence.

The study suggested that better training and motivation may improve cooperation SAUDI population, which will consequently lead to methods of breaking down barriers to change in clinical practice and promoting the fully integrated care of patients with OP.

#### Case Report:-

A 30-year-old man presented with a 2-month history of numerous, flat to slightly raised, ill defined, non-tender, painless and purple lesions involving the dorsum of the tongue with scattered islands of leukoplakia.

**A:** Gross picture of the tongue showing multiple, flat to slightly elevated, non-tender, ill-defined, and whitish-purple lesions.

Patient had no other lesions within the oral cavity. Biopsy of the lesions showed malignant melanoma. Full oncological workup showed no evidence of regional or distant metastasis. Patient was managed with subtotal glossectomy, bilateral supraomohyoid neck dissections and reconstruction with a revascularized radial forearm free flap. Histopathological examination showed sheets of epithelioid and spindle-shaped malignant melanocytes.

**B:** Histopathological examination of tongue biopsy showing sheets of epithelioid and spindle-shaped malignant melanocytes (H&E stain, magnification power: 40x).

Immunohistochemical examination showed positive reactivity to S-100 and HMB-45 proteins (Figure 1D). The bilateral supraomohyoid neck dissections were negative for malignancy. Final histopathological diagnosis was

compatible with primary malignant melanoma of the tongue. Postoperatively, no adjuvant therapy was administered and patient had an uneventful recovery course. No recurrence was detected during a 12-month follow-up.

**C:** Immunohistochemical staining of tongue biopsy showing positive reactivity to S-100 protein (Magnification power: 40x).

Oral malignant melanoma (OMM) is an exceedingly uncommon neoplasm. Its reported incidence is approximately 1-2 cases per 10 million individuals per year.<sup>[1]</sup> Hard palate and maxillary gingiva are the two most frequent sites of involvement in primary OMM.<sup>[1]</sup> Primary malignant melanoma of tongue is exceptionally rare. As of 2012, less than 30 cases of primary malignant melanoma of the tongue have been reported in English literature.

**D:** Immunohistochemical staining of tongue showing positive reactivity to HMB-45 protein.

### Discussion:-

Primary OMM can originate from pre-existing melanocytic (pigmented) lesions or de novo (mostly) from malignant transformation and uncontrolled proliferation of neural crest-derived melanocytes that are normally situated in the basal layer of oral mucosa.<sup>[1]</sup>

Risk factors for development of OMM are poorly understood.<sup>[2]</sup> Poor oral hygiene, cigarette smoking, tobacco chewing, alcohol intake, sun exposure, dentures and other oral apparatuses have been assumed as potential etiological factors in the past. However, there has been no strong evidence to validate these assumptions, and etiology of oral melanoma remains largely unknown.<sup>[2]</sup> At present, almost all primary oral cavity (mucosal) melanomas are believed to originate in a de novo fashion.<sup>[1]</sup>

Clinical symptoms of malignant melanoma of tongue include: bleeding (most common presenting symptom), pain (occurs late in the course of disease) and melanotic pigmentation (present in almost one-third of patients).<sup>[2]</sup> Other oral symptoms may include: gingival discoloration/disfiguration, tooth mobility, tooth erosion, numbness, ulceration, irritation, dysphagia, dysphonia and breathing difficulty.

Histopathological and immunohistochemical examination provide the definitive diagnosis of OMM. Immunohistochemically, melanocytes typically stain positive for HMB-45, S-100 and Melan-A.<sup>[3]</sup> HMB-45 is more specific than S-100 protein. Melan-A is positive in nearly 80% of melanomas.

Surgical resection with at least 1.5 cm tumor-free margins, whenever technically feasible, is the gold standard of management in patients with OMM.<sup>[4]</sup> As lymph node metastasis is present in roughly 25% of patients at time of clinical diagnosis,<sup>[5]</sup> neck dissection is highly recommended.

Surgery can be utilized in conjunction with radiotherapy, chemotherapy or immunotherapy — although effectiveness of such therapeutic modalities is largely unclear.<sup>[6]</sup>

Prognosis of OMM, despite aggressive management, is extremely grave with an estimated 5-year survival rate of roughly 15%.<sup>[1]</sup> Plausible reasons include: (1) absent clinical signs and symptoms early in the course of disease, (2) delayed diagnosis, (3) anatomic restrictions to achieve radical surgical resection with tumor-negative margins, (4)

rich vascularity of oral cavity mucosal membranes and hence facilitating rapid hematogenous metastasis, and (5) increased propensity to recur locally (within 10-15 years), invade regional lymph nodes (25%) and metastasize distally (10%).[5,6] Long-term follow-up is highly recommended.

**Conclusion:-**

In conclusion, OMM of the tongue is an exceedingly uncommon, yet, highly aggressive neoplasm with an extremely graving prognosis. Diagnosis is often delayed and most patients present with advanced disease and regional lymph node invasions and/or distant metastases. Careful history taking, meticulous physical examination and early biopsy of pigmented and non-pigmented lesions suspicious for malignant melanoma of tongue are highly recommended. Immunohistochemical examination provides the definitive diagnosis of OMM. Early diagnosis and prompt appropriate management yield better prognosis

documentation, emergency medical services, quality assessment, trauma cases

### Abstract

**Background:** The quality assessment would enhance accountability in emergency medical services (EMS) and provide EMS agencies with data to measure their system's overall performance and to develop sound strategic quality improvement planning. The aim of this study was to determine the quality assessment of emergency medical service documentation for trauma cases.

**Methods:** The quality assessment of emergency medical services (EMS) documentation for trauma cases was conducted in the Emergency Medical Communication Centre, Hospital Tengku Ampuan Afzan (HTAA), Kuantan Pahang. A stratified convenience sampling was used as sampling method and the EMS documentation checklist was adopted by Monash University, Centre for Ambulance and Paramedic Studies. The score of the documentation will be reflected with the health care personnel background. The data were analysed by using (SPSS) version 19.0 for windows.

**Results:** 235(100%) of EMS healthcare personnel had fulfilled the requirement for date, patient details, caller details, police notification and also hospital destination. However, for the medications given, only 15 out of 235 documents were documented and 235 (100%) were excluded the adverse effect and allergic reaction of medication to the patient. The overall mean of the quality assessment documentation was 75.013 while the standard deviation was 11.780. Based on the result shown, there was a significant association between years of employment with the quality assessment ( $t=-4.01$ ,  $p<0.001$ ).

**Conclusion:** Only 40% of the documentation were categorised as quality documentations. And only years of employment had significant association with the quality of emergency medical service documentation. Meanwhile, there was no significant association of races and gender with the quality emergency medical service documentation.

### Introduction:-

Emergency Medical Services (EMS) is a specialty domain that offers clinical care to a wide range of acute medical infirmities, illness or injury. The quality assessment would enhance accountability in EMS and provide EMS agencies with data to measure their system's overall performance and to develop sound strategic quality improvement planning (EI Sayed MJ, 2011). High-quality EMS services must consistently meet customers' needs and expectations, and develop the full potential of resources used in the process (Badsar et al, 2013). Current recommendations by the American College of Surgeons Committee on Trauma (ACS-COT) include a performance improvement (PI) process, which describes the continuous evaluation of the center and providers through a structured review of the process of care and patient outcome (Laudermilch et al., 2010). Trauma patients are a reasonable subgroup to begin to evaluate the integrity of information transmitted between EMS providers and receiving clinicians, as the trauma literature describes a set of prehospital data points that are known to have an impact on the outcome and therefore should be included in the EMS report and known by the receiving team (Carter et al., 2009).

A study done by Bette (2009) stated that the most important role of documentation is to assure high quality patient care. The ambulance service patient report form (PRF) contains important documentation of the early phases of care, and because of the dynamic nature of trauma and acute illness, this clinical information may be important for the interpretation of clinical findings and treatment strategies after admission (Knutsen&Fredriksen, 2013). However, according to Staff and Sovik (2011) EMS documentation is often performed in chaotic and complex settings: in the dark, rain, and cold, under time pressure, and sometimes under threat to personal safety. At the same time, when reviewing patient care, for audit or review, the written record is often the only data source available, and is admissible as evidence in legal proceedings (Murray et al., 2010).

### Material and Methods:-

A retrospective study on quality assessment of emergency medical services (EMS) documentation in trauma cases at Emergency Medical Coordinating Centre, Hospital Tengku Ampuan Afzan (HTAA), Kuantan, Pahang was done. All patients' documents admitted to emergency medical services and reported on the emergency medical communicating centre (EMCC) in HTAA with trauma cases (n=235) from 1<sup>st</sup> June 2014 until 31 December 2014 were collected and quality assessment, emergency medical services documentation checklist was used as a research instrument. The checklist consists of seven key data which are patient information, observation, assessment and management, call cut, time of arrival and incident time, and health care personnel name and background. The collected data were analysed using the Statistical Package of Social Sciences (SPSS) version 19.0 for windows. The ethical approval was taken from Kulliyah of Nursing Research Committee (KNRC), International Islamic University Malaysia Research Ethics Committee (IREC) and hospital data protection officer.

### Results:-

235(100%) of EMS healthcare personnel had fulfilled the requirement for date, patient details, caller details, police notification and also hospital destination. However, for the medications given, only 15 out of 235 documents were documented and 235 (100%) were excluded the adverse effect and allergic reaction of medication to the patient. Some of the documentations were not completely recorded regarding the management to the patient. In addition, most of the documentations were handover with 229(97.4) without completing the required elements from the checklist. There were 53 out of 235 documentations were not legible. The details were shown in table 1.

**Table 1:-** Frequency and percentage of the quality assessment

No.	Data item	Complete n (%)	Incomplete n (%)
1	Is the date, time and call card number is filled up?	235(100)	0(0)

2	Are all patient ID field complete?	235(100)	0(0)
3	Are all patients' address fields complete?	235(100)	0(0)
4	Is patient's charge classification specified?		
5	Are patient's caller details recorded where?	235(100)	0(0)
6	Are attending police call where recorded?	235(100)	0(0)
7	Is patient pick up location specified?	235(100)	0(0)
8	Is hospital destination specified?	235(100)	0(0)
9	Are all ambulance crew details complete?	220(93.6)	15(6.4)
10	Are call out, arrival times and incident time complete?	235(100)	0(0)
11	Is 'the triage' field stated?	197(83.8)	38(16.2)
12	Are observation fields complete?	95(40)	140(60)
13	Is the main problem identified?	80(34)	155(66)
14	Is previous history identified?	0(0)	235(100)
15	Are medications listed?	15(6.4)	220(93.6)
16	Allergies and adverse reactions to medication clearly displayed?	0(0)	235(100)
17	Is a complete event history documented?	205(87.2)	30(12.8)
18	Are on attendance observations documented?	174(74)	61(26)
19	Are examination procedures documented?	25(10.6)	210(89.4)
20	Is initial assessment documented?	102(43.4)	133(56.6)
21	Is time critical assessment documented?	223(95)	15(5)
22	Is road traffic section complete (for appropriate documentation)?	235(100)	0(0)
23	Is physical examination clearly stated?	86(36.6)	149(63.4)
24	Are CPR and first aid check boxes use where appropriate?	201(85.5)	34(14.5)
25	Are all sections of the patient management documented?	49(20.9)	186(79.1)
26	Is final assessment documented?	227(96.6)	8(3.4)
27	Are MPT reasons documented?	189(80.4)	46(9.6)
28	Are patient refusals documented? (if applicable)	0(0)	235(100)
29	Is handover section complete?	229(97.4)	6(2.6)
30	Is EMS documents approved by ambulance office?	176(74.9)	59(25.1)
31	Is ambulance officer badge number documented?	235(100)	0(0)
32	Is the patient response documented?	24(10.2)	211(89.8)
33	Is the documentation legible?	182(77.4)	53(22.6)

Table 2 presented mean and standard deviation of quality assessment, emergency medical service documentation for trauma cases. The overall mean of the quality assessment was 75.013 while the standard deviation was 11.780. The

total score for the quality assessment checklist was 100%. However, the researcher set the minimum score was 80% to pass and the documents can be categorised as quality documentation. The highest score for the quality assessment of emergency medical service documentation for trauma cases in the year of 2014 was 97% and the lowest score was 44%.

Table 2: Mean and standard deviation categorised by quality assessment documentation

Variable	mean	SD
Quality assessment emergency medical services of documentation for trauma cases (n=235)	75.0128	11.779

The majority of the documentations was handled by male healthcare personnel 198 (84.3%) out of 235 emergency medical service documentation. It then followed by 37 (15.7%) handled by a female. There were 219 (93.2%) of Malay health care personnel involved and 16 (6.8%) were non-Malay. All the health care personnel had diploma qualification. The mean and the standard deviation of years of employment were 2.46 and  $\pm 1.26$  as shown in table 3.

Table 3i : Analysis of socio-demographic data frequency and percentage (N=235)

Variable	Frequency (n)	Percentage (%)
<b>Gender</b>		
Male	198	84.3
Female	37	15.7
<b>Race</b>		
Malay	219	93.2
Non-Malay	16	6.8
<b>Qualification</b>		
Diploma	235	100
<b>Years of employment</b>	2.46	1.26

Based on the result shown, there was a significant association between years of employment with the quality assessment ( $t=-4.01$ ,  $p<0.001$ ). Those who score  $\geq 80\%$  were having  $2.85 \pm 1.30$  years of experience, whereas those who scored  $<80\%$  were having  $2.19 \pm 1.17$  years of experience. In addition, the gender and the races were not significant to the quality of emergency medical services with the p-values were 0.006 and 0.779. It showed in Table 4.

Table 4:-Analysis of socio-demographic data and quality assessment emergency medical services documentation for trauma cases (N=235)

## Discussion:-

The result showed that only 95 out of 235 emergency medical service documentation were categorised as quality documentation with the score 80% and above. All the EMS healthcare personnel documented the patient's details, time and address, hospital destination and police call record. These elements should be prioritised to confirm the

cases and to transport the patient with the rapid response time and patient time arrival to the destination hospital at the exact time for further treatment and intervention. According to Staff and Sovik (2011) evaluation of the time of trauma to definitive care is of great importance, where patients may be in need of rapid transportation to a competent surgical facility. However, the most critical elements such as patients overall observation, intervention and medication given mostly were not documented and missing. This study found that only 15 out of 235 documents for trauma cases were documented the medication given. Medication administration was the most crucial elements that should be documented as there were a lot of cases regarding medication error done by the healthcare personnel. According to Risavi, Buzzard and Heile (2013) the top three causes of complaints in EMS system were rude or unprofessional behaviour, failure to transport and also problems with medical treatment. This showed the medication treatment was the most crucial intervention that should be documented in the patients' documentation form in terms of effective treatment and patient safety.

General observation of patients may help the secondary treatment in the emergency department in saving time of diagnosing and provide better treatment. In addition, some of the documents were illegible. Those documents may be affected by the inappropriate time management for documenting the treatment, while conducting the intervention and transporting the patient. It can be shown in the results which were related to the competency of the healthcare personnel to document all the intervention while handling the patients. A quality criterion in documentation was for appropriate care and is crucial for clinical audit and trauma research.

The result showed that the years of employment affect the quality of emergency medical documentation. There was a significant association between the quality of emergency medical service documentation and the years of employment. Basically, the quality of work will be affected by the work experiences. According to Fapuhunda (2013) employees who have positive perceptions and experiences in their workplaces will have an increased desire, willingness and ability to go the extra mile. This showed that the working experience had a more influencing factor to produce the quality of documentation indirectly produce the quality of health care personnel. Other than that, there was no significant association of gender and races with the quality assessment emergency medical service documentation. A study showed that gender also one of the affecting factors to produce the quality of documentation. Women had lower job quality compared to men (Ervasti, H.2008) However, in this study, gender of healthcare personnel was not reflecting the quality assessment emergency medical service documentation.

### Conclusion:-

By performing the quality assessment for emergency medical service documentation, the quality of documentation can be described and provide better skills of documentation to the emergency medical services health care personnel to become more effective to achieve better management and intervention. Knowledge gained from this study will help the healthcare personnel to improve their performance and to realize the importance of documentations in order to achieve a quality patient care. It also can add a new knowledge about the quality of emergency medical service documentation to increase the standard of quality documentation and upgrading the Malaysia healthcare system for the sake of the holistic healthcare institution.

#### Abstract

Biomethanization or biogas production from olive mill solid waste (OMSW) attempted by co-digestion with Turkey manure at mesophilic conditions. A series of laboratory experiments were performed in anaerobic batch operating reactors, fed with mixtures of OMSW and Turkey manure at various concentrations. Anaerobic co-digestion is well-established process for treating solid organic wastes evaluated for biogas (methane) production.

The biogas production and some biochemical parameters of anaerobic digestion at 30°C for 40 days were studied as affected by two factors: (a) The type of the animal waste. (b) The ratio of animal waste to OMSW that constitute four levels (100:0 for P<sub>1</sub>; 80:20 for P<sub>2</sub>; 60:40 for P<sub>3</sub> and 40:60 for P<sub>4</sub>) of 8% total solid.

The total volume of biogas production at P<sub>1</sub> was (6247ml), P<sub>2</sub> (4316ml), P<sub>3</sub> (1847ml) & P<sub>4</sub> (1613ml). The results indicated that there was a gradual decrease in total gas production in the digester by increasing the OMSW ratio, and the highest production was in the first week of the experiments in all digesters.

#### Introduction:-

Animal and agricultural wastes constitute a high proportion of biomass and their utilization and recycling is important for economic and environmental aspects. Anaerobic digestion one of the most widely used processes for treating these wastes and represents an attractive method for treating organic wastes for biogas production as alternative energy sources (Marques, 2001).

The two phases olive oil extraction process is the most important technology for olive oil production. In this technology, the olive paste is separated into two phases: olive oil and wet pomace or olive mill solid waste (OMSW). The OMSW is a semi-solid by-product composed by olive husk, olive pulp and olive vegetation water, which is usually reprocessed to further extract the residual oil increasing oil yields (Demerche et al., 2013)

OMSW represents poor agricultural residues that cannot be used alone for ruminant nutrition because it has high amounts of lignocellulosic materials that have low digestibility (Al-Masri, 2012). On the other hand, the other wastes such as Turkey manure are different because it already hydrolyzed but is considered as a source of mixed

microbial culture that can be used in anaerobic digestion. These raw materials alone do not give specific applications up to date.

However, their elimination, mostly by burning, is the cause of various environmental problems (pollution and fires). The large volumes of OMSW generated in Gaza Strip pose important environmental problems such as aquifer contamination, eutrophication, undesirable smells, etc. (Tortosa et al., 2012 and 2014). However, OMSW in addition to animal wastes can be used as a source of fermentable organic matter in biomass technologies for gas production in a biomethanization process (El-Bashiti, 2010; Rodriguez-Gutierrez et al., 2012).

While some of the manure can be used as fertilizer, not all of it can be consumed in this way and the excess is an environmental liability. Another possibility is to use the manure as a direct or indirect source of fuel for remote power generation, avoids the cost of disposal, reduces odor and other nuisances associated with large livestock and poultry operations. The potential applications of the energy-from-manure concept include space heating, steam, and electricity (Ahn and Smith, 2008; Serio, 2002; Ro et al, 2010).

Because of lack of natural gas resources in Gaza Strip as a result of Israeli siege. Therefore, our goal of this research was to find a natural alternative. The alternative solution is to produce biogas from the natural resources, which can be available in Gaza Strip such as OMSW and animal manure as a source of digester culture.

## Materials and Method:-

### Materials:-

Turkey waste was collected from a farm at Rafah city in the south of Gaza Strip. OMSW was collected as by-product of olive production. Both Turkey manure and OMSW were dried at room temperature. The OMSW was ground and sieved by 0.2 cm sieves size.

### Method:-

Four digesters were prepared with four different Turkey waste and OMSW ratios P1, P2, P3, P4 as described in Table (1). Each digester was filled by tap water to 1 liter. The pH was adjusted at 7 and electric conductivity(E.C) was measured by sharp electric conductivity water proof (Table 2).

Then the digesters were kept at 30 °C in water bath for 40 days. The released biogas was collected in the graduated cylinders by water displacement (Figure 1&2). At the end, the final pH and E.C were measured.

**Table 1:-** Anaerobic digester of different ratios of Turkey waste to OMSW

Digester	Turkey waste/ OMSW (%)	OMSW (g)	Turkey waste (g)
P1	100/0	0	80
P2	80/20	16	64
P3	60/40	32	48
P4	40/60	48	32

**Table 2:-** pH was adjusted at 7 and electric conductivity (E.C) values at the beginning of the experiments.

Digester	Turkey waste/ OMSW(ratio)	E.C (m.s)	pH
P1	100/0	6.9	7
P2	80/20	6.1	7
P3	60/40	6.25	7
P4	40/60	5.5	7

**Figure 1:-** The experimental set up of biogas production and collection.

**Figure 2:-** The photograph of the experimental set up of biogas production and collection.

### Results:-

As shown in Table 3 and Figure 3, P1 has the highest amount of total biogas production and the lowest amount was found at P4. The highest productivity of biogas was found in the first week by P1&P2 (Figure 4). At the last week, P2 produces large amount of biogas when compared with the others (Figure 4). At the end of the fermentation process, we found the PH at the acidic range, and Electric conductivity was increased (Table 4).

**Table 3:-** Rate of biogas production within different time intervals and total biogas production of different ratios of Turkey wastes and OMSW.

Turkey waste\ OMSW ratio of total 80g	Volume of Biogas (ml)										Total biogas production (ml)
	Day										
	1	2	3	4	5	6	7	8-21	22-27	27-40	
P1(100/0)	1000	730	1090	200	1140	720	640	586	82	59	6247
P2(80/20)	1000	850	420	125	570	70	20	53	59	1149	4316
P3(60/40)	0	600	700	110	256	50	10	42	33	46	1847
P4(40/60)	0	450	587	200	208	25	5	36	30	45	1613

Figure 3:- Total biogas production (ml) at the end of the fermentation process.

Figure 4:- Volume of biogas production during anaerobic fermentation (days).

Table 4:- The pH and electric conductivity at the end of fermentation process

Reactor	pH (final)	E.C (final)m.s
P1	4.98	14.73
P2	4.77	17.76
P3	4.73	13.83
P4	4.53	10.69

## Discussion:-

High production at p1 refers to its Turkey content only as a digestive materials. The low product in other digesters refers to their contents of OMSW ratio. Percentage of biogas production is very low due to its content of high level of poly phenols (Battista et al, 2014), which considered as a toxic substances to the microorganisms.

Also, the late production of biogas is referring to the lignocellulosic compounds that constitute the major content of OMSW that increase the time of hydrolysis. Therefore, we needed to pretreatment of lignocellulosic materials to break it into simple components for easily digestion (Vintila et al, 2010).

The optimum pH for Anaerobic digestion is within a range of 6.8 to 8.0 (Ogiehor and Ovueni, 2014). More acidic or basic mixtures will ferment at a lower speed. *Because* the high amounts of dissolved CO<sub>2</sub> can *affect* the pH (Dobre et al, 2014). Accumulation of volatile fatty acids (VFA) lead to imbalance in an anaerobic digester, which causes harp decrease in the pH (Acharya et al, 2011 and Zhang et al, 2015).

## Conclusion and Recommendation:-

It was good idea as an alternative solution, to produce biogas from natural resources in order to provide a healthy product, which is friendly to environment, easy to produce, and available for common people. Thus, biomethanization or biogas production from OMSW and Turkey manure can be the most optimal method to fulfill our requirements for its safety, affordability, and availability in nature.

To be more beneficial and vital process, we strongly recommend pretreatment of the OMSW to help in degradation of the lignocellulosic materials before biomethanization process to increase the biogas productivity.

Fishermen, socio-economic condition,  
Fishing.

#### Abstract

The study focused on the socio-economic and cultural profile of the fishermen living in community villages in Puducherry Region. The objective of the study is to analyse the socio-economic conditions as well as the problems faced by the fisher folk. To study the factors 200 sample respondents were interviewed with duly constructed schedule of questions by using the simple random sampling method. The outcome of the study revealed that 92% belong to Hindus and very meager (8%) from Christian community. Fishermen venture into sea is aging between 41 and 45 years (43%) and they only have primary level education. Regarding their income it ranges between Rs. 5,000 and Rs.20,000 p.m. Only 12% of the respondents earn more than Rs.20,000 p.m. Majority of the respondents are living in the Government provided tsunami houses. Rest of them dwells in their own house. Good majority of the fishermen habituated to use latest mobile phones (86%) and accustomed to live with basic necessities such as TVs and other home appliances despite of their low income. Puducherry is famous for liquor since its French regime. Therefore most of the fishermen (62%) addict to liquor. More than 30% of their total income is spent for consumption of liquor. This is the cause of concern for this community. The major problems of fishermen were identified as selling of fish, price fixing, marketplace & finance for investment. Those problems are perceived by the fishermen as serious issues. The fishermen expect the from the Government to arrange certain facilities like short period loans, transportation, set up of more fish markets and processing units open for marketing of fish.

#### Introduction:-

Fishing is the ancient and one of the most important livelihood options of the inhabitants of the coastal line of the country since the time immemorial. Fish and fisheries is an important sector in most of the developing and developed countries of the world from the standpoint of income and employment generation. It is one of the oldest economic activities of the human race and ranks next to agriculture. The fisher folk purely depend on the marine

environment for their day-to-day affairs and it has been considered as the custodian of livelihood security. The fisheries sector contributes to the national income, exports, food and nutritional protection and employment generation. Approximately, 1% of the total populations rely on the fishery sector in India as a primary source of income and life dependency. (Ministry of Statistics and Programme Implementation, 2011). India occupies the third position in fish production and second in aquaculture production in the world ranking. The fish production in the country in 2014-15 was 100.69 lakh tones, of which 34.91 lakh tones were harvested from marine sector and the rest was from inland sector. The rapid economic growth and expansion of the domestic retail sector in India has created a significant market for fresh and processed fish and fishery products within the country (Sathiadhas, *et al.* 2011). Indian fishery sector significantly contribute to foreign exchange too.

#### **Puducherry and Fishery:-**

The Union Territory of Puducherry comprises of four regions, viz., Puducherry, Karaikal, Mahe & Yanam. The UT's capital is the city of Puducherry. The UT of Puducherry has total fishermen population around 95,467 (Dept. of Fisheries statistics, Puducherry) of which 29,383 fishermen are actively engaged in fishing from 29 marine fishing villages and 23 inland fishing villages / hamlets scattered across the region. For this study, the researcher has taken three dense populated fishing villages. First, Veerampattinam village has 1,777 fishermen families, second Vambakeerapalayam has 1,390 fishermen families and the third one is Solainagar has 767 fishermen families.

#### **Review of Literature:-**

**Basavakumar et al. (2011)** the research paper entitled "A study on profile of fishing community of a village in Karnataka" from Dharwad district. The study revealed that the male population constitute around 52.33 per cent and 13.84 per cent of fishermen are only literate. It is noted that 56.14 per cent respondent's income was less than of 30,000 per month. The study also reveals that smoking, betel nut chewing and consumption of liquor were the common habits of adult fishermen.

**Bijayalakshmi and Ajitkumar (2014)** in their research paper "Socio-economic conditions and cultural profile of the fishers in India- a review" states that the socio-economic conditions of the fisheries in India are considerably low. Fishers generally have pursued less education and live under improper housing conditions. With a very low income from fishing, fishers supported large members in the family which compels the fishermen to borrow credits to fulfill their basic needs. The study concluded that proper fishery management policies, effective input supply, technical and social supports may improve the livelihood of the fishers which will ultimately increase the overall fisheries productivity of India.

**Tapashi and Methra (2014)** in their paper "Socio-economic and cultural profile of fish farmers: A study in and around Lumding town, Nagaon District of Assam" the data were collected from 110 respondents by using random sampling method. It was found that most of the inland fish farmers belong to the scheduled caste and majority of the fish farmers had their own land and practiced fish farming as a primary occupation for many decades. Their income from fish farming was too low (between Rs. 20,000 and 30,000/- p.a.). Most of them took financial help from their friends and relative of their day to day investment. They spent their major earnings for basic needs, food and children's education. Poverty, lack of marketing facilities and lack of technical training are the major hurdles they face.

**Kadam (2015)** in his paper entitled "Socio economic conditions of fishermen of Masoli Reservoir, in Gangakhed (Tq), Parbhani Dist., Maharashtra state, India" the data collected from 35 families. The results disclosed that 45.26% of the fishers are literate and the economic status of the people was fairly poor as they are unable to engage work due to many reasons. They used traditional fishing methods instead of modern aquaculture techniques. The Govt. of Maharashtra provides fishermen welfare programmes such as Group Accident Insurance Scheme for active fishermen, Development of Model Fishermen Villages etc.

**Jacob and Rao (2015)** in their article "Socio-ecological studies on marine fishing villages in the selective south coastal districts of Andhra Pradesh", the study revealed that the fishermen in coastal villages are in pathetic condition because of poverty and lack of financial support either from the Govt. or from the banks. The study reveals that almost, 90% of the traditional fishermen live below poverty line. The large scale industrialization in the recent years in coastal areas without having any strict regulatory framework has a devastating impact on the marine livestock, health of fishermen and their livelihood. The fishing villages are totally deprived of the basic infrastructure such as proper drinking water, connectivity of road, street electrification and good sanitation.

**Statement of the Problem:-**

Pondicherry lies on the east coast of Bay of Bengal therefore; emergence of fishing and related activities is inevitable among the people of coastal villages naturally called as fishermen. Their productive capacity, performance and earnings are based on their living style, comforts, societal investments and economic status. Despite the enormous increase in the fishermen population, their prosperity, welfare and development is measured by the Government are seemed to be not up to the mark. Hence, this is to be addressed. Majority of the fishermen family live in below poverty line. Their financial instability, low profile in socio-economic status brought them down to earth not allowing them to prosper in their life. The fishermen's children aspire for good education but they are unable to pursue because of the inability of family head to spare considerable money for that purpose. All these factors rely on the prosperity of the fishermen community who dwell in the areas in which basic facilities like pure drinking water, sanitation and toilets are still inadequate. Taking in to account of the facts, it would be pertinent to study the socio-economic factors and problems of fishermen community in Pondicherry Region.

**Objectives of the Study:-**

The following are the basic objectives of the study.

1. To study the Socio-Economic status and problem faced by the fishermen in Puducherry Region.
2. To suggest better ways and means for improving the standard of living of the fishermen.

**Methodology:-**

The data required for the study have been obtained from both primary and secondary sources. The primary data were collected through interview schedule and secondary sources of data were collected through books, journals, magazines and related websites. Three fishermen outfits had been chosen for this study Viz., Veerampattinam, Vambakeerapalayam and Solainagar in Puducherry region. The combined populations of three villages are 15,736. Out of which 70 respondents from each villages has been chosen on the basis of simple random sampling method. Out of 210 samples ten respondents neither provide necessary information nor co-operate to the investigator. Hence, 200 samples were finally taken for the study.

**Socio-Economic Research Variables:-**

In the fisheries, socio-economic status of fishermen plays a key role in their productive activities. Socio-economic parameters such as religion of fishermen, castes, age, marital status, standard of living, duration of stay, family structure, member of family, earning members in family, employment of sons /daughters, member of family venture into sea, occupation of female households, residence ownership, nature of house, toilet facilities, food habit, source of lighting, household amenities, cultural activities, competition among inland fishermen, consumption habits of fishermen are considered as important variables for analysis.

**Analysis and Interpretation:-**

The Socio-economic profile of the Fishermen in the study area was analysed and the results are presented in table 1.

**Table 1:- Socio-Economic Profile of Fishermen**

No.	SOCIOECONOMIC PROFILE		Frequency	Percentage
1.	<b>Religion of Fishermen</b>	Hindu	184	92%

Source: Primary data

**Religion, Caste & Age of respondents:** Hindus were featured as the absolute majority (92 per cent) among the fishermen in those villages. Meager 8 per cent are Christians. No Muslim fishermen found in the study area. Most of the fishermen are belong to fishermen community which comes under “Extreme Backward Class” (EBC). Majority of the fishermen (43 per cent) are at the age group between 41 and 45 years, 25 per cent of respondents are above 45 years, 14 per cent of the respondents aged between 36 years and 40 years, 11 per cent respondents are aged below 30 years. Meagre (8 per cent) respondents are aged between 31 and 35 years.

**Education, Marital Status and Standard of living:** Education plays a vital role in efficient management and successful production of fish. An educated fisherman easily adopts new technology than an uneducated one. With regard to the education status of fishermen, 65 per cent of respondents have only primary level of education, 14 per cent of respondents at secondary level. Further, it was found that 16 per cent of the respondents are uneducated. Fishermen possess higher secondary education and above are only 5 per cent.

Marital status is the important factor for socio-economic and cultural profile of fisher folk because this factor molds behaviour of the any individual. It is evident from this study that 88 per cent of the respondents are found to be married and the remaining 12 per cent are unmarried. Taking into account of standard of living, the study divided into two categories viz., living below and above poverty line. The Government of Puducherry issued ration cards based on their income level. The red ration card holders are identified as living below the poverty line and yellow ration card holders are treated as living above the poverty line. The study reveals that 95 per cent fishermen (possess red cards) are living below poverty line and the rest (5 per cent yellow card holders) are in the above poverty line.

**Duration of stay:** Regarding duration of stay, most of the fishermen (69 per cent) live in the same locality for more than 35 years. The study also revealed that 31 per cent of the respondents migrated from other locality (villages) within Puducherry region for getting better employment, children’s education, transportation etc.

**Family Structure:** Family structure is another important factor for analyzing socio-economic status of fishermen. In the present of study, families were classified into two types such as nuclear family and joint family. Majority (65 per cent) of fishermen are living as nuclear family and 35 per cent as joint family. The size of the family has considerable influence on the income and expenditure pattern of the family.

**Number of members in the family:** Around 60 per cent of the fishermen family have 4 to 5 members followed by fishermen family have more than 5 members (32 per cent). Only 9 per cent have only 3 family members.

**Number of earning members in the family:** It was revealed that, majority (82 per cent) of the respondents family three members work and earn income for their family. Only 8 per cent of the respondents, all the members of family go for work and earn for their livelihood.

**Employment of their sons / daughters:** God majority of the fishermen (71.59 per cent) sons & daughter (unmarried) engage fishing and related activities. Only 20.46 per cent of the fishermen children go for private job. Very meagre 2.27 per cent fishermen sons and daughters could get the Government job and 5.68% of sons/daughters of fishermen are students.

**Occupation of fisherwomen:** The occupation of fisherwomen (60.2 per cent) is fish vending and 39.8 per cent of fisherwomen manage house.

**Ownership of residence:** The residential house of the fishermen (63 per cent) is Government provided Tsunami houses. 35 per cent of fishermen reside in their own house and only 2 per cent live in rented house.

**Nature of house:** Housing pattern is one of the most important indicators used to assess the economic well-being of any community. During the survey, attempts were made to find out the conditions of living house of the fishermen. The study revealed that good majority of fishermen are living in concrete house (81 per cent) followed by the titled house (17 per cent) and thatched house is 2 per cent. This reflects the better living condition of the people in the study area. The reason because the Govt. has provided tsunami house to fishermen.

**Usage of telephone /mobile phone:** Majority (86 per cent) of the fishermen use mobile phones where as only 2 per cent use landline telephone. Both mobile phone and landline telephone using respondents are only one per cent. It is interested to state that 11 per cent of the respondents neither use mobile nor use landline phone because they are unable to buy the costly gadgets. During emergency needs they use phone of their relatives or neighbours.

**Food Habit:** Regarding food pattern of the fishermen in Puducherry region, cent of fishermen take rice with fish gravy. Because they like the taste of food and most of them add fish in day-to-day food habit. No one prefers wheat related food in their homes.

**Source of lighting:** It was found that all the respondents in the study area are using the electricity as source of lighting. They use the Kerosene lamp or candle as alternative source of lighting if electricity fails.

**Entertainment Actives:** The entertainment activities of fishermen are watching T.V (78 per cent) followed by reading newspaper& magazines (in vernacular) is 18 per cent then going to cinema theaters is 3 per cent and listening to FM radio is only one per cent.

**Conflicts / Competition:** The study reveals that 96 per cent of the fishermen expressed that there is no conflict/competition between the fishermen in respect of their employment or any other socio-cultural aspects.

**Table 2:-** Adequacy basic facilities to the Fishermen

No.	Basic Facilities	Adequate	Inadequate	Total
1.	Access to safe drinking water	69%	31%	100%
2.	Proper Sanitation facilities	69%	31%	100%
3.	Access to healthcare facilities	78%	22%	100%

Source: Primary data

From the above table it is found that the basic facilities like provision of clean& safe drinking water, proper sanitation facilities and accessibility of healthcare facilities are considered as vital factors for the healthy society. The study reveals that 70% of the respondents agreed that the Government of Puducherry have provided a good sanitation facility, safe and clean drinking water facilities. Good majority of respondents opined that health care facilities are adequate.

**Table 3:-** Toilet facilities available to the Fishermen

Toilet Facilities	Frequency	Per cent
Yes	160	80%
No	40	20%
<b>Total</b>	<b>200</b>	<b>100%</b>
<b>If No, Toilet facilities</b>		
	Frequency	Per cent
Open Place	32	80%
Govt. Provided common toilets	8	20%
<b>Total</b>	<b>40</b>	<b>100%</b>

Source: Primary data

Table -3 shows that the availability and usage of toilets are one of the important yardsticks of the socio-economic factors to measure their life style. Hence, the question was raised among the respondents to find the availability and usage of toilets. It was found that 80 per cent of fishermen have own toilet facilities in their residence, but 20 per cent of fishermen have no toilet facilities and they go either open place or common toilets for their natural calls.

**Table 4:-** Monthly Income of Fishermen

No.	Monthly Income	Frequency	Per cent
1.	Below Rs. 5000	0	0%
2.	Rs. 5000-10000	24	12%
3.	Rs. 10001-15000	106	53%
4.	Rs.15001-20000	46	23%
5.	Above Rs. 20000	24	12%
	<b>Total</b>	<b>200</b>	<b>100%</b>

Source: Primary data

In general, employment and income are the twin decisive factors mostly used to determine the living standard of any community. Equitable distribution of income further enhances the social harmony among different sections of population. In this connection, the monthly income of the respondents was found that 53 per cent of respondents earn income between Rs. 10,000 and 15,000 p.m. followed by 23 per cent earn between Rs. 15,000 and Rs. 20,000 p.m. Only 12 per cent of the fishermen earn more than Rs. 20,000 p.m.

**Table 5:-** Habits of the Fishermen

No.	Habits of fishermen	Frequency	Per cent
1.	Beedi / Cigarettes / Pan	2	1%
2.	Liquor	124	62%
3.	All of these	28	14%
4.	Clean habits	46	23%
	<b>Total</b>	<b>200</b>	<b>100%</b>

Source: Primary data

**Exhibit -2: Habits of Fishermen****Table 5a:-** Income spent on Alcohol consumption

	Income spent on Alcohol consumption	Frequency	Per cent
1.	Spent less than 10%	12	8%
2.	Spent 10-20%	16	10%
3.	Spent 20-30%	106	69%
4.	Spent above 30%	20	13%
	<b>Total</b>	<b>154</b>	<b>100%</b>

Source: Primary data

**Exhibit -3: Income spent on Alcohol Consumption (On Monthly Income)**

**Table 5b:-** Place of consumption of Alcohol

	Place of Consumption of Alcohol	Frequency	Per cent
1.	Bar	102	67%
2.	Home	50	33%
	<b>Total</b>	<b>152</b>	<b>100%</b>

Source: Primary data

It is evident that liquor consumption is quite common among the people of Puducherry, particularly among the fishermen community. Table-5reveals that majority 102 respondents of the respondents have the habit of consume liquor regularly. Out of which, 67 per cent of respondents go to local bars for liquor in-take, rest of them consume liquor in their home itself. Further, it is keen to observe that majority (69%) of the respondents spend around 30 per cent of their total earnings for liquor consumption. It is noteworthy to state that 46 (23 per cent) respondents have clean habits.

### Problems Faced by Fishermen:-

The study also analysed the basic problems faced by the fishermen community. The data were analysed and results are presented in the table 6.

**Table 6:-** Problems faced by the fishermen

(NAP-Not at all Problem, MIP-Minor Problem, MOP-Moderate Problem, SP-Serious Problem)

S.No	Problems faced by the fishermen	NAP	MIP	MOP	SP	Mean Score	SD	Rank
1.	During the fishing	84%	16%	0%	0%	1.16	.368	8
2.	During fish selling	53%	35%	8%	4%	1.65	.833	6
3.	Related with gears and crafts	74%	12%	14%	0%	1.40	.725	7
4.	In the society	15%	65%	13%	7%	2.12	.742	4
5.	In the family	38%	42%	16%	4%	1.86	.829	5
6.	Related to transportation of fish products	8%	26%	35%	31%	2.89	.942	2
7.	Obtaining loan from banks and other financial sources	23%	5%	72%	0%	3.21	1.289	1
8.	Owners, labours, buyers and sellers	5%	54%	32%	9%	2.45	.730	3

Sources: Primary Data

From the above table the results reveals that while ranking the problems faced by the fishermen, the mean score (3.21) the highest refers the procurement of finance from banks and other financial sources is a fundamental problem faced by the fishermen because, tedious of formalities. Demanding security for the loans is a hectic problem for the fishermen. Second major problem cited by the respondents is transportation. The respondents expressed that transporting their fish products to market and other places found costly since petrol / Diesel prices, rent for load carriers are more expensive. Problem with owners of boats / launches / crafts, labours, buyers and sellers is the third problem of fishermen. Fixing the wages for labours and rent for crafts, fixation of selling price for fish products are also some of the other problems faced by the fishers.

### Findings:-

The present study highlights some of the major findings are as follows:

- The socio-economic conditions of the fishermen in Puducherry region (villages like Veerampattinam, Vambakeeralayam and Solainagar) are moderate (neither poor nor good).
- Good majority (92%) of fishermen belong to Hindu region only 8 per cent belong to Christian community.
- The study reveals that 67 per cent of the fishermen are engaged in active fishing at the age group of more than 40 years. Only 11 per cent of fishermen belong to below 30 years category venture in to sea.
- The study reveals that 88 per cent of the fishermen are married.
- It is found that 65 per cent of the fishermen have primary education only.
- Majority (95%) of respondents live below the poverty line.
- The study found that 65 per cent of fishermen are living as Nuclear family.
- The study reveals that 63 per cent of fishermen sons venture into sea and involving in fish catch.
- It is also found that 60.2 per cent of fisherwomen engage fish vending.

- Regarding residence it is found that 63 per cent of fishermen live in Government provided Tsunami houses.
- The study also reveals that 81 per cent of the fishermen live in concrete houses.
- For communication, 86 per cent of fishermen use mobile phone, out of which 70 per cent are smart phone users.
- It is found that all respondents (100%) are using electricity for lighting.
- Good majority of the fishermen's food habit is rice with fish related dishes.
- The entertainment activities of the fishermen are watching television, newspaper reading and listening FM radio.
- Majority (96 per cent) of respondents opined that there is no conflicts and competition between themselves and inland fishermen.
- The study reveals that 80 per cent of fishermen have toilet facilities. Rest of them use either open space or municipality common toilets for their natural calls.
- The study found that the basic facilities like drinking water, sanitation and healthcare facilities are adequate.
- The study found that the 53 per cent of fishermen monthly income is between Rs. 10,000 and 15,000.
- The study reveals that 76 per cent of fishermen have a habit of consumption of liquor. More than 53 per cent of fishermen spend around 30 per cent of their monthly income for liquor consumption.
- The major problem faced by the fishermen is finance related issues.

### Suggestions:-

The following are the important suggestions.

1. The Government should arrange regular awareness program against use of alcohol, drugs and pan masalas.
2. As per the central Government's clean India programme, the UT administration should ensure the provision of toilets to every house of fishermen so that the use of open space as toilets may be avoided.
3. The children from fisheries communities should be provided with more reservation for their higher education and employment.
4. The government must take steps to solve transportation blocks for the fishing community. So that caught fish can be marketed in the right time at the right place. If there are ways to sell the fish through government channels like fishermen sangam, and through fisheries department etc. will benefit to the fisher folk.
5. Sophisticated markets and processing units should be opened for the marketing of the fish products. Hence it will boost up their economy and paves way to change in the lifestyle.
6. More technical devices should be introduced in the fisheries sector. It will enable the fishermen to catch more fish.
7. Government should make necessary arrangements with bankers for easy availability of bank loans for the financial needs of fishermen community for periodical investments and working capital etc.

### Conclusion:-

Though tremendous increase in GDP from the fisheries sector during the last two decades, living conditions of fishermen all over India is still remains unchanged. In this situation, it is highly essential to take steps to improve their income and reduces their expenditure to obtain a socio-economic balanced society. More particularly, the socio-economic profile of the fishermen in Puducherry region ranked as moderate living, efforts should be taken by the local administration to uplift their lifestyle by providing good education, create awareness and create more responsibility towards the society through various awareness / welfare programmes and financial schemes.

#### Abstract

**Objective:** establishing a clear and direct correlation between the aggressive behaviors of the children and the exposure to TV violent programs.

**Method:** 593 children represented the main sample of this research. 51,5% of the sample are males, whereas 48,5% are females. They had ages among 6 and 13 years old. They are residents in Al-Ahsa region (2016). The qui-square test was the main tool to check the influence of the TV watching by children and their aggressive actions.

**Results:** Almost all the respondents (99,3%), reported watching TV, most of them reported watching TV 2hours per day (33,4%) , while the most of the children (43,7%) esteemed to watch TV a period that exceeds 4 hrs / week. Data analysis prevailed that Children's the TV exposure was not related to children's behavior according to parents ( $p=0,379$ ) and teachers ( $p=0,078$ ).

**Conclusion:** Although this research detected a lowproportion of aggressive children, the aggressive behavior is still a recurrent broad global problem that should be reported and treated in early ages. This can happen through reducing the exposure to media as it the key reason for the growth of violence among children.

Copy Right, IJAR, 2016,. All rights reserved.

#### Methodology:-

The researcher depended on the descriptive analysis approach to estimate the socio-demographic factors and behavior characteristics under the influence of TV watching and computer use.

#### Case study population:-

It composed of children who are residents of Al-Ahsa region. They were withages among 6 and 13 years old. In this case study, the parents and the teachers have responded to 2 questionnaires (BPI questionnaires).

#### Study tool:-

The pre-formed and self-administered questionnaire was prepared and it requires information about:

1. Socio-demographic and lifestyle data such as: age, gender, residence, number of brothers and sisters, parent's education level, parent's monthly income, TV watching, average/day, average/week, Computer use, average computer/day, average computer/week.

#### Corresponding Author:-.

Address:- AlAhsa, Eastern Region, Kingdom of Saudi Arabia

2. Behavior score by parents' assessment including 28 questions. A score of 1 was given to "always" and 2 to "sometimes" and 3 to "never". For each subject, the researcher calculated a maximum score of 84. A scoring system was used with the purpose to measure the value of the respondents' aggressive behavior. The children behavior was categorized into 3 levels indicated by inadequate behavior (0-28), average behavior (29-56) and adequate behavior (57-84).
3. Behavior score by teachers' assessment including 25 questions. A score of 1 was given to "always" and 2 to "sometimes" and 3 to "never". For each subject, the researcher calculated a maximum score of 75. A scoring system was applied to measure the respondents' aggressive behavior. The children behavior was categorized into 3 levels indicated by inadequate behavior (0-25), average behavior (26-50) and adequate behavior (51-75).

#### Statistical analysis:-

(SPSS, version 20) was the program that was used to apply the descriptive analysis on the data using the Statistical Package for Social Sciences in the program.

The correlation of the participants' scores of the behaviors as a function of the exposure to TV was evaluated using:

1. The frequencies and the percentages.
2. The Chi-squared test which is famous for its accurate results.

The statistical significance for the data was accepted at value of  $p < 0.05$ .

#### Results:-

##### Socio-demographic and lifestyle characteristics:-

The socio-demographic characteristics gave results that are listed in the next table (1)

**Table 1:-Socio-demographic factors**

Data		Frequency	Percent (%)
<b>Gender</b>			
	Male	305	51,5

	Total	591	100,0

Our study included 593 children from Al-Ahsa region aged between 6 and 13 years old with a meanage of (7,90 years). Overall, studied children had between 0 and 13 brothers (mean number: 2,53) and between 0 and 10 sisters (mean number: 2,33). By looking at table (1), related to the distribution of respondents according to demographic factors:

The survey included(51,5%) of males and (48,5%)of females.

Nearly the half of participants lived in Falt (50,2%).

Most of the children's families had enough monthly income (42,6%)and only 10% had a high monthly income.

The majority of the children had parents with education as follows:afather with high level of education (37,5%) and a mother with an intermediate level of education (30,3%).

The lifestyle characteristics are shown in tables below

**Table:-Watching TV**

Data		Frequency	Percent (%)
<b>Watching TV</b>			
	Yes	586	99,3
	No	4	,7
	Total	590	100,0
<b>Average/day</b>			
	< 1 hour	10	1,7
	1 hour	184	31,5
	2 hours	195	33,4
	3 hours	121	20,7
	4 hours	63	10,8
	> 4 hours	11	1,9
	Total	584	100,0
<b>Average/week</b>			
	<1 hour	1	,2
	1 hour	34	5,9
	2 hours	75	13,1
	3 hours	70	12,2
	4 hours	143	24,9
	> 4 hours	251	43,7
	Total	574	100,0

Approximately all of the children,(99,3%), were reported to watch TV. While, 2hours per day TV viewing was reported by the third of participants (33,4%),also 31,5% of respondents reported spending 1 hour daily watching television.

43,7% of the children are esteemed to spend more than 4 hours weekly on TV watching.

**Table :-Computer use**

Data		Frequency	Percent (%)
<b>Computer use</b>			
	Yes	501	85,5
	No	85	14,5
	Total	586	100,0
<b>Average Computer/day</b>			
	< 1 hour	17	3,5

	1 hour	269	54,9
	2 hours	125	25,5
	3 hours	47	9,6
	4 hours	21	4,3
	> 4 hours	7	1,4
	Other	4	,8
	Total	490	100,0
<b>Average Computer/week</b>			
	< 1 hour	3	,6
	1 hour	84	17,0
	2 hours	88	17,8
	3 hours	88	17,8
	4 hours	121	24,4
	> 4 hours	111	22,4
	Total	495	100,0

High number and percentage, 501 and 85,5%, of the little participants were report to using computer. Overall, almost the half of respondents (54,9%) were allowed to use the computer 1 hour daily, while the quarter (25,5%) used the computer 2 hours daily. Among the participants, approximately the quarter (24,4%), were permitted to use the computer for 4 hours per week where 22,4% of children used computer for more than 4 hours weekly, and nearly 17% of the studied respondents used the computer 1 hour, 2 hours or 3 hours weekly (17%, 17,8%, 17,8% respectively).

#### Behavior scores:-

Data		Frequency	Percent (%)
<b>Score by parents</b>			
	Inadequate behavior	9	1,5
	Average behavior	240	40,9
	Adequate behavior	338	57,6
	Total	587	100,0
<b>Score by teachers</b>			
	Averagebehavior	118	39,5
	Adequatebehavior	181	60,5
	Total	299	100,0

Referring to the responses of the parents, most of the children had an adequate behavior (57,6%), where 40,9% had average behavior, and only 1,5% had aggressive behavior.

Referring to the responses of the teachers, the majority of the investigated children (60,5%) had an adequate behavior and approximately 39,5% of participants had average behavior.

#### The Correlation between the aggressive behavior of the children and the exposure to TV:-

Data analysis showed that Children's television exposure was not related to children's behavior according to parents ( $p=0,379$ ) and teachers ( $p=0,078$ ). Referring to the BPI by teachers ( $p=0,012$ ), the study of relationship between the children's aggression and the television exposure showed a significant association between the aggressive actions against others and the daily-spent time in watching TV during childhood. On the other hand, referring to the BPI by parents ( $p=0,212$ ), the effect sizes for the relationship between television exposure and inadequate behavior were not statistically significant as it was close to zero. Furthermore, while a significant association was observed between weakly-TV exposure and child behavior according to parents, ( $p=0,000$ ); the effect of weakly-TV exposure was not significant referring to the BPI by teachers, ( $p=0,104$ ).

**Table:-** Correlation between the aggressive behavior of children and the exposure to TV

### Recommendations:-

Huesmann, L. R. et al. mentioned that children as increasingly becoming heavy media consumers (1), they also noted the violent content of much of the media directed at children and their harmful influence on the advancement of the outcomes of the behaviors of the children. This study suggests that the ACT program can detect the influence of media violence on the advancement of the young children, and it can teach parents some strategies that can help them decreasing the watching of violence TV programs by their children. Further, the researchers recommended the restriction as much as possible of violent TV programs by parents for young children and preteens, and stressed on the importance of the strict control on the media content before allowing their child to view TV programs even those that seemed to be safe.

In addition, the American Academy of Pediatrics suggested dropping the total time that children spend watching TV to just 1 to 2 hrs / day high quality entertainment programs (2) and this suggestion was also adopted by Robertson LA et al. who wanted to study “check if the excessive watching of the television during the childhood and the adolescence is related to the increased antisocial behavior in the early adulthood” (3), in fact researchers have found that each extra hour of watching the TV can increase the tendency to the odds for antisocial outcomes.

Behavior aggression is multi-factorie<sup>1</sup>, it can also be present as a part of other neuro-psychic disorders and psychiatric syndromes (autism, Tourette...), or related to direct or indirect exposure to violence (4), in all cases children should be supported at many levels: socially by parents and close entourage, and at larger scale by the teachers or even medical stuff experts. Actually, several aggressively control activities can be set<sup>1</sup> to help children to solve their violent behavior issues. Ruble and Seidman (Ruble & Seidman, 1996, cited in National Crime Prevention 1999: 52) reported the need for preventive programs targeting the child and his parents. Hence sincere work should be exerted to at the level of the parents / children relationship. Additionally as verbal skills had found to be inversely correlated with the impulsivity and the crime behavior (Moffitt, 1993; Lynam, Moffitt & Stouhamer-Loeber, 1993; Moffitt & Silva, 1988), better communication skills by early language intervention and development makes easy for the child to socialise (Keenan & Shaw, 1997) and feel being understood.

High quality care of children is essential as it seems that the behavior of the children has a direct relationship with the quality of this care. In their study Vandell and Wolfe (Vandell & Wolfe, 2000) have found that the more quality of care was high, the fewer reports of behavior problems were.

Parents and educators could also play a primordial role helping children to develop social skills, by being patients and spending more time directly teaching them skills.

### Conclusion:-

According to this research, most of the children that were included in this study showed an adequate behavior. On the other hand, although both parents and teachers detected low proportions of aggressive children, effective efforts and strategies for reducing children's exposure to media should be followed. This is because many studies stated the negative effect of the exposure to TV on the health and the behavior of the children. This can surely avoid the society the risk of the development of the aggressive and violent actions and behaviors in adulthood.

#### Abstract

**Overview:** Combined PET/CT systems have emerged as promising imaging modalities and are being more routinely used in clinical situations. <sup>18</sup>F-FDG PET/CT is an established entity in the work-up of several oncologic disorders and is making forays in the diagnosis of inflammatory diseases, leading to increased use for cardiac and neurologic applications. Although PET is on the move in cardiovascular medicine and new developments are likely to increase its application and impact in clinical practice, some similarities and interrelationships between its cardiac applications and applications for tumor imaging should be noted.

**The study aimed** to prospectively study the clinical experience with PET/CT in Cardiac diseases and in pediatric malignancies to evaluate and compare the efficacy of this imaging system in both diseases, and to determine if it provided additional diagnostic information on the disease status.

**Methodology:** Thirty two cardiac patients with previous history of myocardial infarction & left ventricular dysfunction and coronary artery disease (CAD) were underwent the imaging procedures consisting of PET/CT, echocardiography and invasive angiography. Diagnostic sensitivity of these less invasive modalities for detection of myocardial viability was compared to invasive coronary angiography. Additionally, 54 pediatric cancer patients were included in this study [28 had lymphoma and 26 had soft tissue sarcoma (STS)]. Seventy two scans were performed for whole body in all patients for initial diagnosis and staging.

**Results:** In the current study, Coronary angiography was used as the gold standard; PET/CT has high diagnostic value in the assessment of myocardial viability when compared to echocardiography; and also in malignant disease if distant metastases or second primary tumors are detected with regard to staging of the primary tumor. It may influence the treatment decision in both diseases. The diagnostic sensitivity of cardiac PET/CT, cardiac angiography and echocardiography was 98.2%, 93.4% and 82.5%, respectively. Diagnostic sensitivity of PET/CT in myocardial viability at per-vessel based assessment

Address:-Assistant Prof. of Safety and Prevention of Oncology in Radiation protection Department.

was 80.2% for LAD (left anterior descending), 77.6% for LCX (left circumflex), and 100% for RCA (right coronary) coronary arteries. The overall sensitivities, specificities & positive and negative predictive values of the imaging system for all the suspicious sites in pediatric malignancy were 94.22%, 92.72%, 93.68% and 93.33% respectively. The sensitivities and specificities for initial staging of malignant lymphomas were ranged 70%-100% and 90.48%-100% respectively. They ranged 80%-100% and 92%-100% respectively in STS.

**Conclusion:** The study concluded that the PET/CT is the gold standard for noninvasive functional imaging in cardiovascular disease as well as in oncology. It has high diagnostic value in the assessment of myocardial viability in patients with known CAD. Technical developments in PET/CT scanning in cancer management may increase the precision of radiotherapy planning and thus improve tumor control and reduce treatment-related morbidity. The use of PET/CT in the management of pediatric malignancy is recommended to facilitate the sparing of normal structures and the escalation of dose. Further studies are recommended in cardiovascular patients for the incorporation of PET/CT into patient management is warranted.

## Introduction:-

Cardiovascular diseases are progressive and there are a number of physiological and morphological changes that occur with aging that could alter cardiovascular function and subsequently increase risk of cardiovascular disease (Li et al., 2014). Despite considerable advances in prevention and treatment over the last decades, cardiovascular diseases remain the most frequent causes of death worldwide and represent a great challenge for modern research and medicine. This requires urgent development of sensitive and noninvasive methods for early detection and personalized treatment of cardiovascular diseases (Gaemperli and Kaufmann, 2011). Traditional medical imaging techniques have been routinely used to provide early diagnosis and prognosis of cardiovascular diseases (Schwaiger et al., 2010). Ideally it would be possible to detect molecular and cellular processes early and characterize cardiovascular diseases before manifestation of gross anatomical features or physiological consequences. Current advanced molecular imaging modalities include positron emission tomography (PET), single photon emission computed tomography (SPECT), magnetic resonance imaging (MRI), and optical imaging, all of which could provide critical molecular and cellular level information for early diagnostics, advanced therapeutics, and better understanding of fundamental biological processes of cardiovascular disease (Jang et al., 2012; Li et al., 2014).

Positron emission tomography (PET) has contributed significantly to the advances in our understanding of cardiac physiology and pathophysiology for more than 20 years (Nekolla et al., 2009). The introduction of PET/CT scanners combined the functional data of PET with the detailed anatomic information of CT into a single examination. The poor spatial resolution of PET is substantially compensated for by integrated PET/CT, with co-registration of functional imaging with PET and anatomic imaging with CT (Xu et al., 2012/2015). In addition to being a powerful research tool in cardiology, recent technical development and improved availability facilitated also its routine clinical use in cardiology. PET is the most reliable non-invasive tool for the identification of myocardial viability and also allows accurate assessment of myocardial perfusion and coronary artery disease (CAD), which is known to be the leading cause of mortality in adults. Assessment of myocardial perfusion plays an important role in the diagnostic work-up of patients with suspected CAD as well as in the assessment of prognosis and guiding of therapy in patients with established CAD (Nekolla et al., 2009).

Although PET is on the move in cardiovascular medicine and new developments are likely to increase its application and impact in clinical practice, some similarities and interrelationships between its cardiac applications and applications for tumor imaging should be noted. First, the success of PET as a key modality in tumor staging and evaluation of anti-tumor therapy has resulted in dissemination of the technique and in improved availability for cardiac imaging. Second, expensive equipment, such as scanners, radiochemistry laboratories, and cyclotrons, is most effectively used when it serves multiple areas of PET imaging applications. And finally, many existing and novel biologic targets for PET imaging are important not only in heart and vessels, but also in tumors. This is highly

relevant not only because advances in tumor biology may help advance cardiovascular biology via improved understanding of related biomechanisms, but also because multiple applications in heart, vessels, and tumors will be helpful to stimulate interest in commercialization of compounds with a broader spectrum of target groups (Bengel et al., 2009).

Cardiac PET imaging is another well-established tool for the evaluation of ischemia, blood flow quantification, myocardial viability and perfusion (Berman et al., 2006; Machac, 2005). Cardiac PET utilizing  $^{18}\text{F}$ -FDG is considered the most sensitive modality for detecting hibernating viable myocardium and predicting left ventricular functional recovery post-coronary revascularization. PET has higher spatial and temporal resolution than SPECT due to more robust methods of attenuation correction, thus, PET allows quantification of resting and hyperemic regional myocardial perfusion. When PET was integrated into clinical patient management, a significant reduction in cardiac events was observed in patients with  $^{18}\text{F}$ -FDG PET-assisted management, according to randomized controlled trials (Abraham et al., 2010; Beanland et al., 2007). PET images provide incremental prognostic information to the clinical and angiographic findings with regard to event-free survival. An increased extent and severity of perfusion defects with stress PET were reported to be associated with increased frequency of adverse cardiac events, thus, this indicates PET can be used to predict cardiac mortality (Dorbala et al., 2009). Cardiac PET is not yet as widely available as SPECT imaging. Furthermore, experience in image interpretation and operation may vary widely. Cardiac PET will continue to play a key role in the investigation of myocardial viability and perfusion contributing more to available data (Sun, 2013).

Combined PET and CT systems (PET/CT) have emerged as promising imaging modalities and are being more routinely used in clinical situations (von Schulthess et al., 2006). Although many studies about whole-body PET/CT for various cancers were done, the results were still controversial and inconclusive. In several previous studies,  $^{18}\text{F}$ -FDG PET/CT was shown to be more sensitive and specific than conventional imaging procedures for the detection of distant malignancies in cancer patients at initial staging before treatment or restaging after treatment (Antoch et al., 2004; Fuster et al., 2008; Ng et al., 2009; Strobel et al., 2007; Veit-Haibach et al., 2009). Despite growing numbers of reports on imaging adult malignancies with PET/CT, little data have been reported so far about the clinical relevance of this modality in pediatric patients (Xu et al., 2012/2015).

Although radiation exposure from CT when used for attenuation correction can be limited (Souvatzoglou et al., 2007), the radiation dose from coronary CT angiography (CTA) is  $>10$  mSv in recent clinical trials has been  $>10$  mSv, which is clearly higher than from standard radiography or X-ray angiography (Bluemke et al., 2008). Moreover, precise alignment between emission and “transmission” PET images may benefit from repeated, simultaneously acquired attenuation maps. – From a practical point of view, advances in CT technology are likely to result in substantial changes in hardware in hybrid PET/CT systems while advances in MRI are frequently based on imaging sequences and less complex pieces of hardware, such as coils, which makes upgrading easier and less expensive. – Both cardiac MRI and PET examinations can be rather time consuming. Thus, improvements in patient compliance as a result of reduced scan time could be significant, particularly in patients with dyspnea due to heart failure who have difficulty holding their breath during MRI acquisitions (Nekolla et al., 2009).

**The study aimed** to prospectively study the clinical experience with  $^{18}\text{F}$ -FDG PET/CT in Cardiac disease and in pediatric malignancies to evaluate and compare the efficacy of this new imaging system in both disease, and to determine if PET/CT provided additional diagnostic information on disease status.

## **Patients and Methods:-**

### **Cardiac patients:-**

A multi-centric prospective study that involved patients with previous history of myocardial infarction & left ventricular dysfunction and coronary artery disease (CAD) over a period of 6 months was performed. All patients were suggested to undergo full clinical history and examination, cardiac PET/CT myocardial viability, echocardiography and invasive coronary angiography examinations with an interval of less than 20 days between the imaging tests. Coronary angiography was used as the gold standard. Thirty two patients (17(53.1%) male & 15(46.9%) female; mean age  $58.5 \pm 10.5$  years) are concluded in the study. Consent forms were obtained from all patients, and ethical approval was granted from institutional review boards.

All patients were informed for fasting at least 6 h before the scan and baseline blood sugar was checked. Blood sugar was checked 45–60 min after injection of a glucose loading dose (50–75 g). If it was  $< 140$  mg/dL, a 444

MBq(12 mCi) of  $^{18}\text{F}$ -FDG was injected intravenously. If it was  $> 140$  mg/dL, intravenous regular insulin was injected according to blood glucose level. Myocardial  $^{18}\text{F}$ -FDG PET/CT study was performed 45–60 min after injection of  $^{18}\text{F}$ -FDG. The data were analyzed based on a 5-point scale examining the segment of three main coronary arteries, namely: left anterior descending (LAD), left circumflex (LCX) and right coronary artery (RCA): 0 = normal perfusion, 1 = mild defect, 2 = moderate defect, 3 = severe defect and 4 = absent uptake. For echocardiography, the assessment used was according to the 16-segment model as recommended by the American Society of Echocardiography (Klocke et al., 2003).

Coronary angiography was carried out using the standard Seldinger's technique on an angiographic machine by femoral approach which was performed by cardiologists. The minimal lumen diameter was measured in projections showing the most severe narrowing. The degree of stenosis was classified into four categories: (1) no stenosis, (2) minimal or mild stenosis ( $\leq 50\%$ ), (3) moderate stenosis ( $50\%–70\%$ ), and (4) severe stenosis ( $> 70\%$ ). CAD was defined when lumen diameter reduction was greater than 50% (moderate or severe stenosis).

Resting echocardiography was performed by a consultant cardiologist using a standard protocol. Images were acquired in the normal parasternal long-axis and short-axis views, with particular attention paid to determine the regional cardiac function. Calculations of the regional wall motion were assumed using a 16-segment model according to the American Society of Echocardiography (American Society of Nuclear Cardiology Imaging guidelines., 1999; Cerqueria et al., 2002; Schiller et al., 1989). These 16 segments were classified as 0 = normal; 1 = hypokinetic; 2 = akinetic; and 3 = dyskinetic. The segments founded within the infarction-related coronary segment were the segments analyzed for wall motion. Then, the regional wall motion score was calculated.

#### **Pediatric Patients with Malignancy:-**

Fifty four pediatric patients (33(61.1%) male and 21(38.9%) female) with suspected or known malignancy, evaluated by  $^{18}\text{F}$ -FDG imaging using a combined PET/CT system, between May 2011 and October 2015, included in the study. The male to female ratio was 1.57:1. The patient's age was from 9 month to 18 years (y) old with a median age of 12 y at their first PET/CT examination. 33 (66.7%) of the patients were below 10 years old. Twenty eight patients had lymphoma and 26 had STS soft tissue sarcoma. The indication, purpose, and findings of each PET/CT examination were taken in consideration, in addition to other imaging findings as well as clinical information. PET/CT examination was performed for whole body in all patients (72 scan) for initial diagnosis and staging.

Three hundred and twenty four suspicious sites were evaluated in the 54 included patients. Patients were selected according to their reports which indicate areas of increased FDG uptake. PET findings were considered positive when uptake occurred at sites of suspected disease, in asymmetrical lymph nodes or in nodes unlikely to be affected by inflammation (mediastinal, except for hilar, and abdominal). PET findings were adjudged negative for neoplastic localizations in the following instances: physiological uptake (urinary, muscular, thymic or gastrointestinal), symmetrical nodal uptake, very low uptake and non-focal uptake. PET findings were compared with the results of other diagnostic procedures (including CT and ultrasound), biopsy findings and other clinical data.

After at least 4 h of fasting, a total body PET scan was done one hour after IV injection of 300 MBq of  $^{18}\text{F}$ -FDG. 64 MSCT scan was performed using GE Discovery VCT simultaneously and used for attenuation correction, anatomical localization and diagnosis. Max. Variant of SUV; a semi-quantitative analysis would be done for selected ROI.s and the normal threshold is  $<2.5$ .

#### **Statistical Analysis:-**

The usefulness of diagnostic tests is known as their ability to detect a person with disease or exclude a person without disease. It is usually described by terms such as sensitivity, specificity, positive predictive value (PPV) and negative predictive value (NPV) (Akobeng, 2007).

- **Sensitivity** is the ability of a test to correctly classify an individual as 'diseased', i.e. probability that a test result will be positive when the disease is present (true positive rate) (Parikh et al., 2008). *Sensitivity* = the number of ill persons with positive test results / the number of all persons who have the disease (Nyari, 2011).
- **Specificity** is the ability of a test to correctly classify an individual as disease-free is called the test's specificity, i.e. the probability that a test result will be negative when the disease is not present (true negative rate) (Parikh et al., 2008). *Specificity* = the number of healthy persons with negative test results / the number of all healthy persons (Nyari, 2011).

- **Positive Predictive Value (PPV)** is the probability that the disease is present when the test is positive (MedCalc Software., 2016).  $PPV = \frac{\text{the number of persons diagnosed as have that disease with positive test results}}{\text{the number of all positive test results}}$  (Nyari, 2011).
- **Negative Predictive Value (NPV)** is the probability that the disease is not present when the test is negative (MedCalc Software, 2016).  $NPV = \frac{\text{the number of healthy persons with negative test results}}{\text{the number of all negative test results}}$  (Nyari, 2011).
- **Prevalence** is defined as the prior probability of the disease before the test is carried out (Peacock and Peacock, 2011). *Prevalence* rate is the total number of cases of a disease existing in a population divided by the total population (Health.ny.gov, 2015).
- **Accuracy** is the efficiency of a test that indicates the percentage of patients who are correctly classified as having disease or not having disease (Mahon et al., 2011).  $Accuracy = \frac{\text{the total number of ill persons with positive test results and healthy persons with negative test results}}{\text{the total number of population}}$ .

## Results:-

### Cardiac Patients:-

The patient's characteristics are shown in table (1). A total of 1088 segments in all patients were analyzed for cardiac PET/CT imaging examinations, while for echocardiography there were 512 segments that were analyzed in comparison with PET findings. Comparison was also performed between the accuracy of coronary PET and that for angiography and echocardiography. All patients were found to have CAD and the triple vessel disease with  $\geq 50\%$  stenosis involving LAD, LCX and RCA was founded in 37.5% of them, and revealing severely reduced FGD uptake in different regions. By invasive coronary angiography, there were a significant coronary stenosis or occlusion ( $> 70\%$  lumen stenosis); with mild to moderate stenosis in 260 of the coronary arteries (LAD, LCX, and RCA) and by echocardiography it was found in 230 of the coronary arteries. So, the cardiac PET has the highest diagnostic value in the assessment of all of the three main coronary arteries.

**Table 1:-**patients Characteristics:

Items	Patients		Items	Patients	
	No.	%		No.	%
<b><i>Diagnoses:</i></b>			<b><i>Risk factors:</i></b>		
Ischemic Heart Disease	4	12.5	Hypertension	26	81.3
Ischemic Dilated Cardiomyopathy	7	21.9	Diabetes Mellitus	24	75
Thrombolysis	6	18.8	History of Smoking	5	15.6
Myocardial Infarction	3	9.4	Dyslipidemia	10	31.3
Triple Vessel Disease	12	37.5	Obesity	13	40.6
Double Vessel Disease	10	31.3			

The diagnostic sensitivity of cardiac PET/CT, cardiac angiography and echocardiography was 98.2%, 93.4% and 82.5%, respectively, as shown in Figure (1). The specificity was not analyzed, since all patients had confirmed CAD, (true negative value was zero).

**Figure 1:-**Diagnostic sensitivity of cardiac PET/CT, cardiac angiography and echocardiography

Diagnostic sensitivity of PET/CT in myocardial viability at per-vessel based assessment was 80.2% for LAD, 77.6% for LCX, and 100% for RCA coronary arteries (figure 2)

**Figure 2:-** Diagnostic sensitivity of PET/CT in myocardial viability at per-vessel based assessment

The mean score for assessment of myocardial viability by PET/CT at per-vessel based analysis was  $3.5 \pm 0.83$ ,  $3.9 \pm 0.44$ , and  $4.1 \pm 0.10$ , corresponding to the LAD, LCX and RCA coronary arteries, respectively (table 2). The cardiac PET/CT was found to be superior in terms of image quality with more accurate assessment of all of the segments.

**Table 2:-** The mean score for assessment of myocardial viability by PET/CT at per-vessel based analysis

Item	LAD	LCX	RCA
The mean score	$3.5 \pm 0.83$	$3.9 \pm 0.44$	$4.1 \pm 0.10$

#### **Pediatric Patient with Malignancy:-**

The results of the present work are presented in tables (3-6). A table (3) shows the patients characters. The stage of the malignant disease patients can be seen before and after the evaluation by PET/CT in table (4).

**Table 3:-** Patients Characteristics

Items	Lymphoma (28 Patients)		Soft Tissue Sarcoma (26 patients)		Total (54 patients)	
	No.	%	No.	%	No.	%
Age						
<10 years	21	75	15	57.7	36	66.7
>10 years	7	25	11	42.3	18	33.3
Sex						
Male	16	57.1	17	65.4	33	61.1
Female	12	42.9	9	34.6	21	38.9
Stage

Absent	20	71.4	24	92.3	44	81.5

**Table 4:-**Evaluating the Stage of Pediatric Malignancy by of PET/CT Scan

Stage	Lymphoma (28 Patients)		Soft Tissue Sarcoma (26 patients)		Total (54 patients)	
	Before PET/CT	After PET/CT	Before PET/CT	After PET/CT	Before PET/CT	After PET/CT
I	9	7	4	5	13	12
II	7	10	5	4	12	14
III	8	9	14	16	22	25
IV	4	2	3	1	7	3

The true positive and negative sites of the 324 regions analyzed, was 163 and 140 respectively. The overall sensitivities, specificities & positive and negative predictive values of the imaging system for all the suspicious sites were 94.22%, 92.72%, 93.68% and 93.33% respectively. (Tables 5)

The sensitivities and specificities of 18F-FDG PET/CT for initial staging of malignant lymphomas were ranged 70%-100% and 90.48%-100% respectively. They ranged 80%-100% and 92%-100% respectively in STS. The negative and positive predictive values in evaluating the stage of lymphoma were 85.71%-100% and 50%-100% respectively. It was 83.33% -100% and 33.33% -100% respectively for STS (Table 6).

**Table 5:-** Efficacy of PET/CT Scan in Detecting the Site of Lesion in Pediatric Malignancy

PET/CT Scan	Prevalence	Sensitivity	Specificity	PPV	NPV	Accuracy
Head & Neck	60.34%	94.30%	86.96%	91.67%	90.91%	91.38%
Chest	37.25%	84.21%	96.88%	94.12%	91.18%	92.16%
Abdomen & Pelvis	58.47%	98.55%	95.92%	97.14%	97.92%	97.46%
Extremities	40.63%	92.31%	94.74%	92.31%	94.74%	93.75%
Bony skeleton	40.91%	88.89%	84.62%	80.00%	91.67%	86.36%
Body LN chains	65.12%	92.86%	86.67%	92.86%	86.67%	90.70%
Total	53.40%	94.22%	92.72%	93.68%	93.33%	93.52%

PPV: Positive predictive value, NPV: Negative predictive value

## Discussion:-

Coronary artery disease (CAD) is the leading cause of death in advanced countries and its prevalence is increasing among developing countries (Lloyd-Jones et al., 2010; Gaziano et al., 2010). Various less-invasive imaging modalities are increasingly used in the diagnosis of CAD including coronary CT angiography, cardiac magnetic resonance imaging (MRI), and cardiac single photon emission computed tomography (SPECT), positron emission tomography (PET) and integrated SPECT/CT and PET/CT (Sun et al., 2011). To improve early diagnosis and patient management, it is essential to have an overview of the diagnostic value of different imaging modalities in CAD (Sun, 2013). Due to their success in oncology, all currently offered PET imaging systems are hybrid PET-CT scanners. This has brought challenges for cardiac imaging that is related mainly to the use of a separate CT for

attenuation correction of subsequently acquired PET data (Bengel et al., 2009). Although less routine than whole-body imaging, cardiac PET using  $^{18}\text{F}$ -FDG have been demonstrated as a valuable tool in the adult population and to a lesser degree in children. Cardiac imaging using  $^{18}\text{F}$ -FDG plays an important role in the assessment of myocardial viability and can be particularly valuable when used in conjunction with other imaging modalities such as  $^{99\text{m}}\text{Tc}$ -sestamibi scanning. To enhance  $^{18}\text{F}$ -FDG uptake into viable myocardium, patients are administered oral or intravenous glucose before the injection of  $^{18}\text{F}$ -FDG (McQuattie, 2008).

This prospective study investigates the diagnostic value of non-invasive cardiac modalities with the aim of determining myocardial viability in patients with known CAD through comparing  $^{18}\text{F}$ -FDG PET/CT and echocardiography with invasive coronary angiography as the gold standard. Our results showed that cardiac  $^{18}\text{F}$ -FDG PET/CT has superior diagnostic value in patients with CAD, when compared to echocardiography and cardiac angiography either at per-patient or per-vessel based analysis. The diagnostic sensitivity of cardiac PET/CT, cardiac angiography and echocardiography was 98.2%, 93.4% and 82.5%, respectively. Diagnostic sensitivity of PET in myocardial viability at per-vessel based assessment was 80.2% for LAD, 77.6% for LCX, and 100% for RCA coronary arteries. Although based on a small number of patients, results of this study highlight the high diagnostic value of  $^{18}\text{F}$ -FDG PET/CT in the detection of myocardial viability. Combined SPECT/CT and PET/CT systems are today well established in clinical routine imaging with promising results reported (Namdar et al., 2005; Rispler et al., 2007; Groves et al., 2009; Sato et al., 2010; Al Moudi et al., 2011), although more multicentric trials are needed to validate the diagnostic value of the hybrid imaging modalities (Sun, 2013).

Recent advances in radiopharmaceuticals, hardware, and software of cardiac PET imaging have improved the diagnostic accuracy and risk assessment of patients with suspected cardiac disorders (Underwood et al., 2014; Danad et al., 2013; Flotats et al., 2011; Ratib and Nodulous, 2014). For example, the rapid evolution of hybrid PET/CT and PET/MR imaging with the advanced tracers has provided a new perspective on cardiac imaging by providing combined anatomic and functional evaluation of coronary disease and alterations in cardiac function. Because of the pivotal role of tracers in the realization of the power of cardiac PET imaging, the design and development of tracers is becoming one of the major subjects of cardiac PET imaging (Sogbein et al., 2014; Li, 2014). Additionally, the assessment of myocardial viability with  $^{18}\text{F}$ -FDG PET is based on its ability to distinguish the two main pathogenic mechanisms for chronic myocardial dysfunction in ischemic cardiomyopathy: irreversible loss of myocardium due to prior myocardial infarction (scar), and at least partially reversible loss of contractility owing to chronic or repetitive ischemia (hibernating myocardium) (Schinkel et al., 2007). The distinctive feature of these two mechanisms is that revascularization has the potential to restore contractile function of the hibernating myocardium but not scar (Ghosh et al., 2010). This distinction may be of paramount importance in clinical decision-making because of the upfront morbidity and mortality associated with revascularization procedures in patients with severe left ventricular dysfunction (Al Moudi et al., 2014). It is likely; however, that increasing availability of 64-slice CT in PET-CT systems, along with new prospectively gated CT acquisition techniques, which lower radiation exposure for CT angiography by more than 70%, will contribute to a more widespread use in hybrid PET-CT protocols. Innovative integrated imaging protocols may include CT for morphologic assessment of coronary arteries and PET for functional assessment of myocardial blood flow. A CT delayed enhancement study may be done after CT angiography to identify the presence or absence of scar. This may obviate the need for a rest perfusion study (Bengel et al., 2009). It should be noted, however, that positron emitting tracers typically provide less radiation burden to the patient when compared with SPECT tracers used for the same diagnostic purpose, which is, in part, due to their much shorter half-lives. Also, the radiation burden to staff involved in cardiac PET imaging has been investigated, and due to differences in radiotracer administration, scan acquisition, and stress-testing tasks, doses with PET seem to be lower for staff (as for patients) when compared with single-photon emitting tracers (Bengel et al., 2009).

Additionally, hybrid tomographs make it possible to perform a rapid and comprehensive evaluation of functional and anatomical severity of CAD by assessment of myocardial perfusion and non-invasive angiography. On the one hand, optimal evaluation of hemodynamic consequences requires integration of anatomical information with demonstration of myocardial ischemia. On the other hand, myocardial infarction and sudden cardiac death result from the rupture of plaques that do not necessitate significant flow limitations. Several features, such as severe luminal obstruction, thin fibrous cap, large lipid core, and the presence of active inflammation are characteristic of vulnerable plaques. Non-invasive imaging of plaque burden in combination with the features of plaque vulnerability might, therefore, lead to an improved assessment of individuals at risk of acute coronary events and help to refine estimates of the cardiovascular risk in the subclinical phase of atherosclerosis (Nekolla et al., 2009). The incremental value of hybrid

imaging lies in accurate spatial co-localization of myocardial perfusion defects and anatomic coronary arteries. This combined technology allows detection and quantification of the burden of calcified and non-calcified plaques, quantification of vascular activity and endothelial health, identification of flow-limiting coronary stenosis, and potentially identification of high-risk plaques in the coronary artery tree (Di Carli and Murthy, 2011).

Successful management of solid tumors in children requires imaging tests for accurate disease detection, characterization, and treatment monitoring. Technologic developments aim toward the creation of integrated imaging approaches that provide a comprehensive diagnosis with a single visit. These integrated diagnostic tests are not only convenient for young patients but also save direct and indirect health-care costs by streamlining procedures, minimizing hospitalizations, and minimizing school or work time lost for children and their parents (Uslu et al., 2015). However, modern radiotherapy techniques heavily rely on high-quality medical imaging. PET provides biologic information about the tumor, complementary to anatomic imaging. Integrated PET/CT has found its way into the practice of radiation oncology, and  $^{18}\text{F}$ -FDG PET is being introduced for radiotherapy planning. The functional information possibly augments accurate delineation and treatment of the tumor and its extensions while reducing the dose to surrounding healthy tissues. In addition to  $^{18}\text{F}$ -FDG, other PET tracers are available for imaging specific biologic tumor characteristics determining radiation resistance (Troost et al., 2015). The use of  $^{18}\text{F}$ -FDG in PET/CT is well documented as a valuable tool in the staging and diagnosis of disease for many oncology patients. Although considered routine in adults, PET/CT in children has been somewhat limited. On the other hand, paramount to any successful PET/CT examination is the establishment of acquisition protocols that allow high quality images to be obtained while ALARA principles are followed (McQuattie, 2008).

In the current study, The overall sensitivities, specificities & positive and negative predictive values of the imaging system for all the suspicious sites were 94.22%, 92.72%, 93.68% and 93.33% respectively. The sensitivities and specificities of  $^{18}\text{F}$ -FDG PET/CT for initial staging of malignant lymphomas were ranged 70%-100% and 90.48%-100% respectively. They ranged 80%-100% and 92%-100% respectively in STS. The negative and positive predictive values in evaluating the stage of lymphoma were 85.71%-100% and 50%-100% respectively. It was 83.33% -100% and 33.33% -100% respectively for STS. Some studies reported the sensitivities and specificities of  $^{18}\text{F}$ -FDG PET/CT for initial staging of malignant lymphomas were 96%–99% and 95%–100%, respectively (Kabickova et al., 2006; Furth et al., 2006; Cheng et al., 2013; Miller et al., 2006; Paulino et al., 2012; Punwani et al., 2010; Uslu et al., 2015). Others, reported high negative predictive value (negative predictive value, 85.7%–100%; positive predictive value, 41.2%–85.7%) which is comparable to the present study (Riad et al., 2010; Bakhshi et al., 2012; Ilivitzki et al., 2013; Uslu et al., 2015). Furth et al., 2009 reported that a negative  $^{18}\text{F}$ -FDG PET/CT scan after 2 cycles of chemotherapy is a strong indicator of relapse-free survival, with a negative predictive value of 100% in HL patients. Therefore, an  $^{18}\text{F}$ -FDG PET/CT scan has been advocated by many investigators and has led to early intensification of chemotherapy in apparent non-responders (Furth et al., 2009; Levine et al., 2006; Meany et al., 2007; Uslu et al., 2015). Additionally, PET or PET/CT has clear advantage in evaluating soft-tissue masses and, thus, has been reported to be useful in patients with lymphoma or other malignancies after treatment (Weber, 2005). Early detection of distant malignancies in cancer patients is crucial for guiding subsequent staging procedures and treatment (Xu et al., 2012/2015). In several previous studies,  $^{18}\text{F}$ -FDG PET/CT was shown to be more sensitive and specific than conventional imaging procedures for the detection of distant malignancies in cancer patients at initial staging before treatment or restaging after treatment (Ng et al., 2009; Fuster et al., 2008; Antoch et al., 2004; Strobel et al., 2007; Veit-Haibach et al., 2009). The introduction of PET/CT scanners combined the functional data of PET with the detailed anatomic information of CT into a single examination (Xu et al., 2012/2015). The combination of high-quality PET scans with diagnostic or low-dose CT scans aids physicians in the staging, therapy planning, and treatment of many pediatric oncology patients. Fusion of the physiologic PET scan with the anatomic CT scan can help in distinguishing disease from other physiologic processes and can be an invaluable tool for referring physicians when they are evaluating for recurrence of disease. This relatively noninvasive scan can provide, through a single study, information and insight that in previous years required multiple scans using several different imaging modalities (McQuattie, 2008).

### Summary and Conclusion:-

Cardiac PET is a powerful, quantitative, noninvasive imaging technique that is increasingly penetrating the clinical arena. For clinical assessment of myocardial perfusion and viability, evidence for diagnostic and prognostic usefulness is increasing and cost-effectiveness due to high accuracy despite high single-test costs is suggested. The advent of hybrid imaging enables routine combination of PET with CT-derived morphologic parameters. New molecular imaging compounds will be key elements in the emerging paradigm of personalized medicine (Bengel et

al., 2009). Additionally, integrated PET/CT has found its way into the practice of radiation oncology, and  $^{18}\text{F}$ -FDG PET is being introduced for radiotherapy planning. The functional information possibly augments accurate delineation and treatment of the tumor and its extensions while reducing the dose to surrounding healthy tissues. In addition to  $^{18}\text{F}$ -FDG, other PET tracers are available for imaging specific biologic tumor characteristics determining radiation resistance (Troost et al., 2015). **The study aimed** to prospectively study the clinical experience with  $^{18}\text{F}$ -FDG PET/CT in cardiac diseases and in pediatric malignancies to evaluate and compare the efficacy of this new imaging system in both diseases, and to determine if PET/CT provided additional diagnostic information on disease status. The study concluded that the PET/CT is the gold standard for noninvasive functional imaging in cardiovascular disease as well as in oncology. It has high diagnostic value in the assessment of myocardial viability in patients with known CAD. Technical developments in PET scanning in cancer management may increase the precision of radiotherapy planning and thus improve tumor control and reduce treatment-related morbidity. **Recommendation** regarding the use of PET/CT in the management of pediatric malignancy to facilitates the sparing of normal structures and the escalation of dose. Further studies were recommended in cardiovascular patients for the incorporation of PET/CT into patient management is warranted. The goals of future investigation will be to refine these technologies, address the issue of cost-effectiveness, and validate a range of clinical applications in large-scale clinical trials.

#### Abstract

The effect of *Boswellia dalzielii* Hutch extract on the liver integrity of selenite-induced cataract pups was investigated. Nine groups of five pups each were used for this study. Group 1 received normal saline, groups 2 to 9 received 30µmol/kg BW of sodium selenite. Eight days post administration of selenite, the presence of cataract was confirmed with the aid of an ophthalmoscope, after which the treatment commenced and lasted for 28 days. The extract significantly ( $p < 0.05$ ) lowered alkaline phosphatase activity and total bilirubin concentration. The obtained results infer that *B. dalzielii* Hutch leaf extract had no harmful effect on the liver integrity of selenite-induced cataract pups.

#### Introduction:-

The liver is an organ of great importance which plays an essential role in metabolism of xenobiotics and toxins in the body (Onoriose *et al.*, 2012). Strinath *et al* (2010) reported that such compounds produce a wide variety of toxic metabolites which adversely affect the functions and integrity of the liver. Prolong intake as well as over dosage of some drug and toxins stimulate oxidative stress and liver injury. Quantitative determination of the liver function parameters are essential pointer to the level and type of liver disorder (Rekha *et al.*, 2009). Because detoxification of xenobiotics and toxins are functions of the liver, damage to the liver becomes a major health challenge (Mitra *et al.*, 1998).

*Boswellia dalzielii* Hutch is a savannah tree which belong to the family of Burseraceae (Younoussa *et al.*, 2014) and it is mostly called the "Frankincense tree" (Sani and Qamar, 2015). The qualitative and quantitative phytochemical analysis of the leaves reveal the presence of flavonoids, saponins, steroids, glycosides, tannins, terpenoids, alkaloids, balsam and resins (Onoriose, 2012; Uzama *et al.*, 2015). Uzama *et al* (2015) reported that the proximate analysis of the leaf revealed: moisture 12.24%, ash 7.43%, crude fibre 32.85%, crude lipids 20.41%, crude protein 1.00% and carbohydrate 26.07%. That of the bark is: a moisture of 8.51%, ash 14.23%, crude fibre 42.86%, crude lipid 14.23%, crude protein 0.40% and carbohydrate 19.56%. The phytochemical studies on *B. dalzielii* revealed potent antioxidant constituents such as catechin, quercetin, kaempferol, myricetin, epicatechin, luteolin, alpha-beta-pinene and others (Onoriose, 2012). Aliyu *et al* (2007) reported that the aqueous extract of *B. dalzielii* tree bark significantly strengthens the liver and it was recommended in the management of hepatic disorders. Onoriose *et al.*, (2012) reported that the methanolic extract of *B. dalzielii* Hutch could alleviate the toxic action of  $\text{CCl}_4$  in the liver of rat. Onobrudu *et al* (2016) reported that *B. dalzielii* Hutch leaf extract is a potential anti-oxidant modulator for the development of anti-cataract formulation but its safety on the liver of selenite-induced cataract pups has not been

studied. Hence, this present study was designed to investigate the effect of the methanol leaf extract of *B. dalzielii* Hutch on the liver integrity of selenite-induced cataract pups.

## Methods and Materials:-

### Collection and identification of plant leaves:-

The leaves of *Boswellia dalzielii* Hutch were obtained from Maitunku hill, Bambam, Dadiya District in Gombe state, Nigeria. Identified and confirmed by Dr. Ekeke Chimezie, University of Port-Harcourt Reference Herbarium for Research and Germplasm Conservation, Department of Plant Science and Biotechnology, University of Port-Harcourt, Nigeria and was given the voucher number UPH/V/1247.

### Extraction of plant

Collected leaves were air dried, pulverized and 600 grams of the pulverized plant samples was soaked in 6 L of methanol, and allowed to stand overnight for 24 hours. Thereafter it was sieved, concentrated using rotary evaporator, weighed and stored in an air tight plastic can.

### Experimental animals

Neonatal Wistar albino rat pups which initially weighed 10–18 g on the seventh day of age were obtained together with their dams from Biochemistry Department, University of Port Harcourt. The pups were kept along with their dams in wired cages, at  $27 \pm 1$  °C. All authors hereby declare that "Principles of laboratory animal care" (NIH publication No. 85-23, revised 1985) were followed, as well as specific national laws where applied.

### Experimental design

A total of 45 neonatal Wistar albino rat pups, initially weighed 10–18 g on the seventh day of age, kept along with their dams in wired cages, were used. They were divided into nine groups comprising of five pups each, such that the difference in weight between one rat group and another was  $\pm 1$  g. Group 1 received normal saline, groups 2 to 9 received  $30 \mu\text{mol} \cdot \text{kg}^{-1}$  BW of sodium selenite. The  $30 \mu\text{mol} \cdot \text{kg}^{-1}$  body weight of sodium selenite was adopted from Mohammed (2012). Eight days post administration of selenite, the presence of cataract was confirmed and the treatment commenced and lasted for 28 days. The extract was administered at doses of 300 mg/kg body weight, 400 mg/kg, 500 mg/kg, 600 mg/kg and 700 mg/kg to groups 5 to 9 respectively; groups 3 and 4 received 50 mg/kg each of vitamins A and C respectively; while groups 1 and 2 received water in place of the extract. At the end of the treatment period, the animals were anaesthetized with chloroform and sacrificed by cutting through their jugular vein. The blood pooled from each rat was collected into labelled plain bottles, centrifuged at 1200 g for 5 min and the serum separated into clean plain bottles for biochemical analysis.

### Biochemical assays on the serum

#### Serum alkaline phosphatase (ALP) activity

Serum alkaline phosphatase was determined using the Reflotron Assay method by Roche Diagnostics Ltd, Bell Lane, Lewes, United Kingdom. The principle states that Alkaline phosphatase hydrolyzes O-cresolphthalein phosphate to O-cresolphthalein and transfers the phosphate group to the acceptor molecule methylglucamine. The coloured hydrolysis product O-cresolphthalein that is produced per unit of time under alkaline conditions is directly proportional to alkaline phosphatase activity.

#### Determination of alanine aminotransferase (ALT) activity

Serum ALT was determined using the Reflotron Assay method by Roche Diagnostics Ltd, Bell Lane, Lewes, United Kingdom. The principle states that in the presence of ALT,  $\alpha$ -ketoglutarate and alanine are converted to glutamate and pyruvate. The resultant pyruvate is cleaved by Pyruvate oxidase into acetyl phosphate, carbon dioxide and hydrogen peroxide. Hydrogen peroxide converts an indicator into its oxidized blue form. The formation of the dye is measured kinetically at 567 nm as a measure of ALT activity.

#### Determination of the aspartate aminotransferase (AST) activity

Serum aspartate aminotransferase was determined using the Reflotron Assay method by Roche Diagnostics Ltd, Bell Lane, Lewes, United Kingdom. The principle states that in the presence of AST,  $\alpha$ -ketoglutarate and alanine sulphinate are converted to glutamate and pyruvate. The resultant pyruvate is cleaved by pyruvate oxidase into acetyl phosphate, carbon dioxide and hydrogen peroxide. Hydrogen peroxide converts an indicator into its oxidized blue form. The formation of the dye is measured kinetically at 567 nm as a measure of AST activity.

### Determination of total protein (TP) concentration

Serum total protein was determined according to the Biuret method using Randox kit by Randox Laboratories Ltd, England, and United Kingdom. The principle is based on the fact that cupric ions, in an alkaline medium, react with protein peptide bonds resulting in the formation of a purple coloured complex. The intensity of the final coloured complex is measured colorimetrically at 540 nm and it is proportional to the concentration of the total protein in the sample.

### Determination of serum albumin

Serum albumin was determined by the Bromocresol green colorimetric method using Randox kit by Randox Laboratories Ltd, England, United Kingdom. The principle is based on the fact that Bromocresol green is an indicator which is yellow between pH 3.5- 4.2 when it binds to albumin the colour of the indicator changes from yellow to blue green. The absorbance of the albumin-bromocresol green coloured complex is directly proportional to the concentration of albumin at 578 nm.

### Determination of serum total bilirubin concentration

Serum total bilirubin was determined using the Reflotron Assay method by Roche Diagnostics Ltd, Bell Lane, Lewes, United Kingdom. Before the reaction start, the protein bound indirect bilirubin is released by means of dyphylline [7- (2,3-dihydroxypropyl)-theophylline]. Both the direct and the indirect bilirubin react with the diazonium salt 2-methoxy-4-nitrophenyldiazonium. Indirect bilirubin is released by means of dyphylline. The bilirubin concentration is proportional to the dye formed at 567 nm and 37 °C.

### Statistical analysis of data

Data were expressed as mean  $\pm$  standard deviation (SD). The results were analysed statistically by one way analysis of variance (ANOVA), followed by multiple comparison test of least significant difference (LSD). Significance was accepted at a  $p$ -value of 0.05.

## Results

**Table 1** Effect of the methanol leaf extract of *Boswellia dalzielii* Hutch on serum indicators of liver integrity in selenite-induced cataract pups

Treatment groups	ALP activity(U/L)	AST activity (U/L)	ALT activity(U/L)

Values in the same column with different superscript letters (a, b, c, d, e and f) are significantly different at  $p < 0.05$

Table 1 and 2 shows the Effect of the methanol leaf extract of *B. dalzielii* Hutch on liver function parameters.

The ALP activity of the vitamin A and 500 mg/kg extract treated group showed significant ( $p < 0.05$ ) reduction when compared to the toxic control group. The ALP activity of the extract treated (300 mg/kg, 400 mg/kg, 600 mg/kg and 700 mg/kg) and vitamin C treated groups showed increase when compared to the toxic control group, although the increase was not significant at ( $p < 0.05$ ). The activity of ALP ranged from 124.00 U/L in 500 mg/kg extract treated pups to 147.63 U/L in 400 mg/kg extract treated group. The plasma AST activity of the vitamin C and 700 mg/kg extract treated group showed significant ( $p < 0.05$ ) increase when compared to the toxic control group. The AST activity of the 300 mg/kg, 400 mg/kg, 500 mg/kg and 600 mg/kg extract treated and vitamin A treated groups showed non-significant ( $p < 0.05$ ) increase when compared to the toxic control group. The activity of AST (U/L) in the 700 mg/kg extract treated group ( $78.60 \pm 07.23$ ) was highest followed by the vitamin C treated group ( $70.82 \pm 14.48$ ) and was lowest in the toxic control group ( $53.40 \pm 10.53$ ). The ALT activity (U/L) was highest in vitamin C treated group ( $22.65 \pm 04.78$ ) followed by 500 mg/kg extract treated group ( $22.08 \pm 02.08$ ) and was lowest in the toxic control group ( $14.28 \pm 04.29$ ). The ALT activity of the vitamin C treated and 500 mg/kg, 600 mg/kg and 700 mg/kg extract treated groups showed significant ( $p < 0.05$ ) increase when compared to the toxic control group, while the ALT activity of the 300 mg/kg and 400 mg/kg extract treated, and vitamin A treated groups showed non-significant ( $p < 0.05$ ) increase when compared to the toxic control group. As shown (Table 2), the plasma total protein concentration of the vitamin A ( $03.70 \pm 0.30$ ) treated showed significant ( $p < 0.05$ ) reduction when compared to the toxic control group ( $04.04 \pm 0.34$ ), while the total protein of the 300 mg/kg, 400 mg/kg, 500 mg/kg, 600 mg/kg and 700 mg/kg extract and vitamin C treated groups showed reduction when compared to the toxic control group, although these changes were not significant at  $p < 0.05$ . The plasma albumin concentration of the vitamin C treated group showed significant ( $p < 0.05$ ) increase when compared to the toxic control groups. Plasma albumin concentration of the 600 mg/kg extract treated group showed non-significant ( $p < 0.05$ ) reduction when compared to the toxic control group, while 300 mg/kg, 400 mg/kg, 500 mg/kg and 700 mg/kg extract treated and vitamin A treated groups showed non-significant ( $p < 0.05$ ) increase when compared to the toxic control group. Total bilirubin concentration 400 mg/kg, 600 mg/kg and 700 mg/kg extract treated groups showed significant ( $p < 0.05$ ) reduction, while the vitamin A treated and 300 mg/kg extract treated groups showed non-significant ( $p < 0.05$ ) reduction when compared to the toxic control group. The total bilirubin concentration of the vitamin C treated and 500 mg/kg extract treated groups showed non-significant ( $p < 0.05$ ) increase when compared to the toxic control group. The direct bilirubin of the extract treated (300 mg/kg, 600 mg/kg and 700 mg/kg) groups showed reduction when compared to the toxic control group, while 400 mg/kg and 500 mg/kg extract treated and vitamins C and A treated group showed increase when compared to the toxic control group. These changes in direct bilirubin were not significant at ( $p < 0.05$ ).

## Discussion

In this study, the treatment produced dose dependent significant increase in serum activities of alanine aminotransferase. However, this was not accompanied by a similar elevation in AST and ALP activities, and therefore did not confirm whether the increase in plasma ALT activities was due to liver inflammatory reactions or damage. Hepatocellular damage that involves the cytoplasmic or mitochondrial membranes is often characterized by increase in the activities of aminotransferase enzymes (Crook, 2006). Plasma enzyme activities of aminotransferases are elevated when the membranes of only very few cells of the hepatocytes are damaged. The raised plasma transaminase concentrations observed in this study are indicative of hepatocyte damage.

The liver responds to any type of hepatobiliary obstruction by inducing ALP synthesis which enters the blood circulation to elevate the level of the enzyme in the serum (Burtis and Ashwood, 2001). Therefore, the reduction in the plasma activities of ALP observed in *B. dalzielii* treated groups indicates that there was no obstruction of the hepatobiliary system in the experimental pups.

Compared to the toxic control group, the treatment dose dependently lowered the plasma total bilirubin levels of the treated animals, while having no significant effects on the plasma conjugated bilirubin levels. This means that there was no deterioration of the hepatobiliary system, and no compromise of the ability of the liver to take up, process and secrete bilirubin into the bile.

The plasma albumin and total protein levels of the treated animals were higher but not significantly, than those of the toxic control groups at the 5% level. The increase in the levels of albumin and total protein as observed in this study reflects restoration in the capacity of the liver to synthesize protein. Earlier, studies have reported the ability of the extract to enhance the integrity of the liver (Aliyu *et al.*, 2007), and alleviate liver damage in Wistar rats (Onoriose, 2012). However, the increased levels of plasma ALT activities produced by the high doses of the extract

confirms earlier concern raised by Abdulazeez *et al* (2013), that the consumption of *B. dalzielii* extract at high doses and over a lengthened duration should be done with caution as it seems to compromise the integrity or function of the liver.

## Conclusion

This study revealed that the extracts had no deleterious effect on the liver integrity of selenite induced cataract pups hence it is a potential agent for the management of cataract.

Appendicitis Abdominal trauma.

#### Abstract

Appendicitis and trauma may exist together, which causes an interesting debate whether trauma has led to appendicitis. We report a case of appendicitis after an abdominal trauma. Our patient developed acute appendicitis following a stab wound in the right iliac fossa. Surgical exploration confirmed the traumatic origin of appendicitis, appendectomy was performed and our patient made an excellent recovery. In non operative management of abdominal trauma, physical examinations and radiological explorations should be repeated in order to diagnose traumatic appendicitis.

#### Introduction:-

Trauma and appendicitis are the commonest emergency conditions requiring surgery, especially in young adults. The pathological process in appendicitis generally starts with obstruction of the appendiceal lumen and may progress to peritonitis and development of intraabdominal abscess via appendiceal inflammation and perforation. An abdominal trauma may be responsible for damage of digestive tract or solid organs (liver or spleen). Occasionally, appendicitis and trauma exist together, which causes an interesting debate whether trauma has led to appendicitis. Actually, the role of abdominal trauma is still uncertain in the etiology of appendicitis. Blunt abdominal trauma or penetrating trauma like a stab wound may lead to an acute inflammatory response which is suggested to be the probable mechanism of traumatic appendicitis.

We report a case of appendicitis after an abdominal trauma (stab wound). To our knowledge, it is the first case of acute appendicitis after a stab wound reported in the literature.

#### Case report:-

A 24 year-old man was admitted to the emergency department because of an abdominal injury following a stab wound which occurred on the same day. He said he was assaulted one hour before his admission by a stab wound in the right iliac fossa. His assailant used a sharp instrument (kitchen knife). The physical examination showed a conscious patient hemodynamically stable whose temperature was 37°C, whose pulse rate was 80 beats/min, whose respiratory rate of 20 breaths/min and whose blood pressure was 130/80 mmHg. Abdominal examination was normal out of mild tenderness at the abdominal wound which was located in the right iliac fossa. Laboratory investigations showed that the hemoglobin level was 12.8 g/dl, and the white blood cell count was 9800/mm<sup>3</sup>. Abdominal ultra sonography (US) was normal. So, a non operative management was decided. The penetrating abdominal wound (2 centimeters in length) was located in the right iliac fossa. It was disinfected and sutured. The

day after his hospitalization, he had acute right iliac fossa pain. On examination, he was found to have a blood pressure of 120/80 mmHg, a pulse rate of 80 beats/min and a respiratory rate of 20 breaths/min; he was mildly pyrexial at 37.5°C. Abdominal examination revealed tenderness in the right iliac fossa. Laboratory investigations showed that the hemoglobin level was stable, but the white blood cell count was significant for a leukocyte count of 14,000/mm<sup>3</sup> with 80% polymorphonuclear leukocytes. Then, abdominal US showed acute appendicitis (Figure 1). An emergency operation was performed. At laparotomy, a right paracolic retroperitoneal hematoma was detected. The patient had pelvic appendix in position. The appendix was hyperemic and edematous. Hematomas of the caecal wall and of the appendiceal wall were found (Figure 2). Appendectomy was performed. Histopathology confirmed diagnosis of acute appendicitis. Our patient made an excellent recovery, and he was discharged from the hospital in stable condition 2 days later.

**Figure 1:-** Abdominal ultra sonography of our patient showing appendicitis.

**Figure 2:-** Intra operative photo showing the right para colic retroperitoneal hematoma and the appendicitis.

This study was performed according to the declaration of Helsinki and approved by the Local Ethical Committee.

### Discussion:-

The acute appendicitis is the most common abdominal surgical emergency. It is an acute inflammation of the appendix related mostly with obstruction of the appendiceal lumen. This obstruction is usually caused by an inspissated stool, a mucus plug, or a foreign body [1]. Non-obstructive causes are also discussed such as bacterial invasion of the lymphoid tissue of the appendix [2]. Abdominal trauma was also mentioned as a possible etiologic factor in acute appendicitis. Interest in the association between appendicitis and blunt abdominal trauma may have begun with illusionist Harry Houdini's untimely death in 1926: he is said to have died from a rupture appendix after a blow to the abdomen. During the 1930s, reports of blunt abdominal trauma and subsequent appendicitis began to appear [3] (Table 1). However, only few cases of minor BAT and TA have been reported in the literature, which may be attributed to the rarity or the difficulty to diagnose this relationship. Hennington and al. reported two cases of blunt abdominal trauma producing acute appendicitis. In both cases, blunt abdominal trauma has produced appendiceal edema with inflammation and hyperplasia of appendix lymphoid tissue, and then, obstruction of the appendiceal lumen, leading to acute appendicitis [4]. Ciftçi and al reported 5 cases of appendicitis occurring after abdominal trauma suggesting the same mechanism [2]. It is well known that intra-abdominal pressure increases in varying degrees in every blunt abdominal trauma case [5, 6, 7]. According to Ramsook [3], a sudden increase in intra abdominal pressure may lead to an increased intra ceecal pressure followed by a rapid distention of the appendix which may result in appendicitis.

Serour and al have claimed that direct appendiceal injury is generally coexistent with other intra-abdominal organ injuries, and that the appendix is very rarely affected by direct trauma as it is very mobile and its dimensions very small [8]. As for our patient, hypothesis of appendicitis and abdominal trauma both existing together was easily dismissed because he was attacked by a sharp instrument. The stab wound in the right iliac fossa produced a penetrating abdominal wound. Then, the sharp instrument traumatized the meso colon and the meso appendix, causing the para colic retroperitoneal hematoma and hematomas of the caecal wall and the appendiceal wall. The result of these anatomic lesions was acute appendicitis due to the consequent luminal obstruction of the appendix.

**Conclusion:-**

Appendicitis may follow abdominal trauma. Blunt abdominal trauma leading to appendicitis is rare, and occasionally, appendicitis and trauma exist together, which causes an interesting debate whether trauma has led to appendicitis. We report a case of abdominal trauma due to a sharp instrument which directly led to acute appendicitis. As the abdominal trauma was not a BAT, it was easy to relate the stab wound in the right iliac fossa to acute appendicitis. In non operative management of abdominal trauma, physical examinations, abdominal ultra sonography and/or abdominal computed tomography should be repeated for diagnosis of traumatic appendicitis in order to prevent potential complications of appendicitis.

### Abstract

In order to allocate resources for real-time traffic flows to meet their Quality of Service (QoS) requirements, Priority based fair Resource Allocation and Admission Control (PRAAC) technique for Multi-class downlink Traffic in LTE-A networks is proposed. In this technique, priority of the nodes is estimated based on the Tolerance of Latency, bandwidth and data arrival rate. This technique includes a two level resource allocation scheme, wherein the first level a radio admission control (RAC) scheme is introduced. In the second level, RAC combines the complete sharing (CS) and virtual partitioning (VP) resource allocation models. Simulation results show that the proposed technique achieves better throughput for Video and the Exponential traffic performs well when compared to CBR traffics in all aspects.

### Introduction:-

The past few years have brought new possibilities that changed the mobile users' expectations regarding connectivity. New social applications, high-definition multimedia, and other services have made mobile terminals the main connectivity tool for several users, i.e., users want to have the same experience as on a fixed computer. The upcoming standard from 3rd Generation Partnership Program (3GPP) named long-term evolution advanced (LTE-A) targets the support of such high requirements services. Relaying is an appealing technology that was introduced in LTE-A to provide seamless connection and high achievable data rates to the users located in the cell-edge or in coverage holes. Relay nodes (RN) are low power evolved NodeB (eNB) which, when deployed in the macro cell, improve the signal quality between the user equipment (UE) and eNB by dividing the radio link into two hops: the so-called backhaul link between the RN and the eNB, which in this context, is referred to as the Donor eNB (DeNB), and the so-called access link between the RN and the UE [1].

Resource allocation among multiple users sharing the whole spectrum bandwidth is one of the key design tasks in LTE systems. The aim here is to optimally assign resources to those users which need them, keeping in view not only their resource requirements, but also their instantaneous channel quality, instantaneous service quality, and the allocation history. Although, the presence of RN (multi-hop transmission) has proved to enhance the LTE system, it introduces some additional design challenges in the traditional resource allocation task [1]. In order to maintain minimal QoS, proper utilization of the bandwidth in the form of appropriate distribution is to be done. The resource allocation impacts on the applications utilizing the LTE network.

Address:- Department of ECE, Pondicherry Engineering College.

Non-Real Time (NRT) services must possess minimum bit-rate and Real Time (RT) services require a high level of QoS [12]. The NRT services are bandwidth adaptive and do not require QoS guarantees. Several calls can be accommodated in a system by reducing the allocated bandwidth for the existing NRT traffic calls and by reducing the requested bandwidth for the incoming NRT traffic calls. Though decreasing the same amount of bandwidth from the NRT traffic calls to accept a handover call and a new call reduces the call blocking probability, it cannot reduce the handover call dropping probability significantly [11].

Too much users and limited Resource Blocks (RB) leads to infeasibility in guaranteeing all ongoing users' QoS as a result calls will be blocked and/or lost. Their types are New-call blocking, the failure of the initial call connection establishment and Handoff call dropping, the blocking of in-service calls when they move from one cell to another [9,10]. From user's point of view, it is better to block a new call rather than dropping a call in the middle [12].

The scheduling problem in downlink LTE should provide solution for resource allocation and fairness for all types of classes. The resource allocation should clearly describe the admission control and bandwidth allocation mechanisms.

A novel RAC scheme [13] was proposed for handling multiclass services in LTE systems to maximize the number of admitted users to enhance the system capacity. A combined complete sharing (CS) and virtual partitioning (VP) resource allocation model was presented for optimization and a service degradation scheme was found out for resource limitations. But it fails to present the standard techniques to determine the priority of each user of each class. Moreover fairness among the users of same group is not handled.

### Literature Review:-

Mohammad J. Abdel-Rahman et al [3] have proposed novel stochastic joint channel and BS allocation schemes that account for uncertainty in channel availability. First, they developed two static (proactive) joint allocation models. They referred to these models as Het-SMKP1 and Hom-SMKP. In these models, the allocation is done once such that user demands are probabilistically met. In Het-SMKP1, a user can request different probabilistic rates for different small cells, whereas in Hom-SMKP each user requests the same probabilistic rate for the entire network. Second, they proposed an adaptive (proactive and reactive), two-stage allocation model for heterogeneous rate demands, which they referred to as Het-SMKP2. The adaptive model allows for correcting the initial resource allocation once the channel availability uncertainties are partially resolved.

DardouriSamia et al [4] have proposed a scheduling algorithm in two levels based on cooperative game theory, aiming at improving performance and justice in the distribution of radio resources. Simulations demonstrate that the proposed algorithm improve the level of the system's QoS more effectively than other algorithms under the circumstance that guarantees users minimum QoS requirement.

NasimFerdosian et al [5] have presented a greedy algorithm to evaluate user candidates which are waiting for scheduling and select an optimal set of the users to maximize system performance, without exceeding available bandwidth capacity. The greedyknapsack algorithm is defined as an optimal solution to the resource allocation problem, formulated based on the fractional knapsack problem. A compromise between throughput and QoS provisioning is obtained by proposing a class-based ranking function, which is a combination of throughput and QoS related parameters defined for each application.

MundeleTshienda Serge et al [6] have proposed optimal resource allocation strategy. In this method two variants of technique called Queue Based Control (QBC) are presented. These two variants are QBC version 1 and QBC version 2. Performance of QBC version 1 and QBC version 2 showing that QBC version 1 is having better Delay and Los performance as compared to QBC version 2, and QBC version 2 is having better power consumption performance as compared to QBC version 1. It means both this techniques are based on concepts of carrier aggregation of LTE networks. Both approaches showing that, they failed to address the tradeoff between power efficient and QoS efficiency.

M. J. Rezaei et al [7] have proposed a new fairness index to measure resource allocation performance for real-time/delay-tolerant applications. This index can suggest a new approach for resource allocation. There are several methods in resource allocation of cellular networks which employ fairness index for performance evaluation. Here, they focused on utility-function-based resources allocation and related algorithms. According to the suggested

method, the base station (BS) allocates resources based on different services requirements. Appropriate utility function for each application is defined, and the requested quality-of-services (QoS) are satisfied through solving the corresponding optimization problem.

### Proposed Solution:-

#### Overview:-

Based on the problems identified, we propose to develop a multi level resource allocation technique for prioritized multi-class downlink traffic flows in LTE-A networks. Here the priority of the user class will be determined based on the parameters such as class type, Data Arrival Rate, Requested bandwidth, Bandwidth Utilization and Tolerance Level. Once the priority is determined, using the CS and VP schemes, resource will be allocated to the various classes of the traffic as per [13].

In this approach initially, when the data packets arrives, the node enters into the first level. In this level, the priority of the node is checked based on the fault tolerance, data arrival rate and bandwidth. In the second level the resource required for the nodes is allocated based on the complete sharing (CS) and virtual partitioning (VP) schemes. This schemes describes whether a service data flow can drop the resources allotted to it in order to acknowledge a service data flow with a higher priority level.

#### Priority Assignment:-

##### Data Arrival Rate:-

Through the data arrival rate, it is possible to estimate the number of data packets received by a node in the network.

$$r_a = \frac{s_i}{R} \quad (1)$$

Where,

$r_a$  is the data arrival rate

$s_i$  is the data packet size

$R$  is the data rate.

##### Utilized Bandwidth:-

The utilized bandwidth by the nodes in the network is estimated by the following equation

$$B_u = B - r_k \quad (2)$$

Where,

$B_u$  is the utilized bandwidth

$B$  is the total bandwidth

##### Tolerance of Latency (TOL):-

Along with the user's requirement of resources, the tolerance of latency (TOL) is also specified which indicates the minimum level of delay the user can expect. It ranges from 0 to 2, where 0 stands for no tolerance, 1 for medium level and 2 for highest tolerance.

##### Setting Priority of Users:-

Initially the node's data arrival rate, utilized bandwidth and TOL are estimated.

If  $DA > DA_{th}$  and  $BW > BW_{th}$  and  $TOL = 0$

Then set  $Pr = 4$

Else If  $DA > DA_{th}$  and  $BW > BW_{th}$  and  $TOL = 1$

Then set  $Pr = 3$

Else If  $DA > DA_{th}$  and  $BW < BW_{th}$  and  $TOL = 1$

Then set  $Pr = 2$

Else If  $DA > DA_{th}$  and  $BW < BW_{th}$  and  $TOL = 2$

Then set  $Pr = 1$

Else If  $DA < DA_{th}$  and  $BW < BW_{th}$  and  $TOL = 2$

Then set  $Pr = 0$

**Resource Allocation:-**

According to the resource allocation, the pre-emption vulnerability information describes whether a service data flow can lose the resources allotted to it in order to admit a service data flow with a higher priority level. Therefore, the network categorizes the multiclass services into three groups.

- Group 1 represents the services where the resources can be pre-empted.
- Group 2 and 3 are for services where the resources cannot be pre-empted while group 2 can pre-empt the resources that are allotted to services in group 1.
- Group 3 can be described based on the traffic flows that need to provide a guaranteed bit rate while service groups 1 and 2 have to provide a variable bit rate.

These groups are respectively discussed to as “guaranteed bit rate” and “maximum bit rate”.

**Complete Sharing (CS) and Virtual Partitioning (VP) Schemes:-**

Here the resource allocation method adopts the basic concept of the Complete Sharing (CS) and Virtual Partitioning (VP) schemes and keeps the system ready for resource allocation in using radio admission control scheme. Here in radio admission control scheme according to the feature of every service group, within service group 1, network have CS, where each service class shares the nominal bandwidth B1. Groups 2 and 3 also have CS and the nominal bandwidth B2 is completely mutual. In group 1 and 2 have VP, where the nominal bandwidth B2 is fully utilized and also acknowledge some traffic of service group 2 subject to pre-emption by degradation of the services in group 1 by which the system capacity can be enlarged.

i.

$$r_k = \begin{cases} r_k^g, & \sum_{i=1}^1 \sum_{j=1}^{n_i} r_j + r_k^g \leq B1 \\ r_k^{\max}, & \sum_{i=1}^1 \sum_{j=1}^{n_i} r_j + r_k^{\max} \leq B1 \\ 0, & \text{otherwise} \end{cases} \quad (3)$$

Where,

$r_k$  is the instantaneous bandwidth allocated to service class k user;

$r_k^g$  is the guaranteed bit rate of service class k;

$r_k^{\max}$  is the maximum bit rate of service class k;

B1 is the nominal bandwidth for Group 1,

where  $B1 = \alpha * B$ ;

B is the total amount of bandwidth available in the system;

$\alpha$  is the ratio of nominal bandwidth to system capacity for Group 1;

ii.

$$r_k = \begin{cases} r_k^g, & \sum_{i=l+1}^K \sum_{j=1}^{n_i} r_j + r_k^g \leq B2 \\ r_k^{\max}, & \sum_{i=l+1}^K \sum_{j=1}^{n_i} r_j + r_k^{\max} \leq B2 \end{cases} \quad (4)$$

Where,

K is the total number of service classes where Group 1 includes traffic classes from 1 to l, Group 2 includes traffic classes from l+1 to m and Group 3 includes traffic classes from m + 1 to K;

B2 is the nominal bandwidth for Group 2 and 3,

where  $B1 + B2 = B$

iii.

$$r_k = \begin{cases} r_k^g, & \sum_{i=l+1}^K \sum_{j=1}^{n_i} r_j + r_k^g > B2 \text{ and } R_a \geq r_k^g \\ 0, & \text{otherwise} \end{cases} \quad (5)$$

Where,

 $R_a$  is the service degradation.

iv.

$$r_k = \begin{cases} r_k^g, & \sum_{i=l+1}^K \sum_{j=1}^{n_i} r_j + r_k^g \leq C2 \\ 0, & \text{otherwise} \end{cases} \quad (6)$$

During the resource allocation in the network the Radio Admission Control (**RCA**) rules combines the CS resource allocation and VP resource allocation models.

When a new call is organised in service class  $k$  which belongs to service group 1 and the remaining bandwidth in Group 1 is greater than or equal to  $r_k^k$ , the call is acknowledged into the system; otherwise the call is excluded. The allotted bandwidth  $r_k$  is given by (3).

In the second rule a new call in service class  $k$  which belongs to service group 2 and the residual bandwidth in Group 2 and 3 is greater than or equal to  $r_k^k$ , the call is admitted into the system and the allotted bandwidth  $r_k$  is given by (4).

If a new call in service class  $k$  which belongs to service group 2 and the remaining bandwidth in Group 2 and 3 is less than  $r_k^k$ , according to pre-emption over Group 1, network assume that the bandwidth consumed by using the service degradation  $R_a$ . If  $R_a$  is larger than or equal to the necessary bandwidth, the call is admitted into the system; else the call is rejected. The allotted bandwidth is given by (5).

When a new call which belongs to service group 3 in service class  $k$  and the left out bandwidth in Group 2 and 3 is larger than or equal to  $r_k^k$ , the call is sent the system else the call is rejected. The allotted bandwidth  $r_k$  is given by (6).

## Simulation Results;-

### Simulation Model and Parameters:-

In this section, we simulate the proposed PRAAC scheme using Network simulator (NS2) [14] which is a general-purpose simulation tool that provides discrete event simulation of user defined networks. We have used the LTE/SAE implementation model for NS2. We compare the proposed PRAAC scheme with the radio admission control (RAC) scheme.

The simulation parameters are given in Table 1.

**Table 1:-** Simulation Parameters

Number of cells	5
Number of eNB	5
Number of UE	31
Area Size	1200x1200
Simulation time	50 seconds
Traffic Type	CBR, Exponential and Video
Packet Size	500,750,1000 and 1250 bytes
Total Bandwidth	100Mb
Traffic Rate	10Mb
MT Speed	30m/s

Transmission power	40 dBm
Scheduling duration	2 ms
Cell radius	500m
Number of Flows	6,12,18 and 24.

The scenario is defined for the urban macrocell environment of 1000m with heterogeneous distribution of users and services. The simulation consists of 5 cells and the users are occupied in 1200 m x1200 m NS2 simulation grid. The simulation time take 50 seconds, depending on the growing number of users and BSs in the network as well as its load, thus consuming a substantial amount of time. The simulation topology is given in the Fig 1.

**Fig 1:- Simulation Topology**

### Traffic generators in NS2

In order to make the simulation results more reliable different traffic generators that have a diverse range of statistical properties are used. This helps to analyze the network performance more effectively. In this research work, three applications are considered namely CBR VoIP, Exponential VoIP and Video traffic.

### CBR Traffic

CBR traffic generate packets at fixed bit rate and it come under guaranteed bit rate. The applications include services such as video conferencing, telephony (voice services) or any type of on-demand service, such as interactive voice and audio. Configuration parameters for CBR traffic are presented in Table 2

**Table 2 Parameters for CBR traffic**

Parameters	Values	Discription
Packet Size	210	Application payload size in bytes
Rate	488 x 103	Sending Rate in bps
Max.packets	167	Max. number of application payload packets that CBR can send
Interburst transmission interval	3.44 ms	-

### Exponential Traffic

Exponential traffic generates On/Off periods. During "on" periods, packets are generated at a constant bit rate. During "off" periods, no traffic is generated. Burst times and idle times are taken from exponential distributions. The application includes real time VoIP, compressed audio and video. The configuration parameters are described in Table 3

**Table 3 Parameters for Exponential traffic**

Parameters	Values	Description
Packet Size	210	Application Payload size in bytes
Rate	$64 \times 10^3$	Sending rate in bps during ON period
Burst time	0.5	Average On period in secs
Idle Time	0.5	Average Off Period in secs

### Video as Trace file

The video flow is a trace-based application that sends packets based on realistic video trace files. Traffic trace generates payload burst according to given trace file. Trace objects are used to generate traffic from a trace file. Unlike other traffic generators, traffic trace file is to be specified in the OTcl domain using the OTcl command. A trace file consists of any number of fixed length records. Each record consists of two 32 bit fields. The first indicates the interval until the next packet is generated in microseconds. The second indicates the length of the next packet in bytes. The application includes VBR H.264 compression video. Context Adaptive Binary Arithmetic Coding (CABAC) which is used as entropy coding. The video size considered here is 1920 \*1080 with frame rate of 30.

### Results:-

#### Performance results for the proposed (PRAAC) method

**Fig 2 Aggregate Throughput performance of PRAAC method for various types of traffic**

Figure 2 shows aggregate throughput versus transmission rate for CBR, Exponential and Video traffic based on the proposed PRAAC method for 40 number of users. Aggregate throughput is the sum of throughput that is delivered to all terminals in a network.

From Figure 2 it can be observed that the video traffic by adopting H.264 compression standard achieves better throughput such that the video bit stream are improved and consequently experiences an enhanced fluent video quality. Further the throughput of Exponential traffic outperforms CBR traffic. It is because the exponential traffic allows a higher bitrate to be distributed to the more complex segments of audio/video files while less space is allocated to less complex segments. i.e., it adjusts the bit rate down and to the upper limit based on the data required by the system. While CBR traffic will not realize the differentiation between the more complex segments and less complex segments and maintains constant bit rate over the entire audio/video clip. This leads to congestion in the network and thus decreases the throughput when compared to the exponential traffic.

Figure 3 Delay performance of PRAAC method for various types of traffic

Figure 4 Fairness Index performance of PRAAC method for various types of traffic

From Fig 2 it can be observed that the video traffic by adopting H.264 compression standard achieves better throughput such that the bit stream are improved and experience an enhanced fluent video quality. Further the throughput of Exponential traffic outperforms CBR traffic. It is because the exponential traffic allows a higher bitrate to be distributed to the more complex segments of audio/video files while less space is allocated to less complex segments. i.e., it adjusts the bit rate down and to the upper limit based on the data required by the system. While CBR traffic will not realize the differentiation between the more complex segments and less complex segments and maintains constant bit rate over the entire audio/video clip. This leads to congestion in the network and thus decreases the throughput when compared to the exponential traffic.

Fig 3 shows Delay versus transmission rate for CBR, exponential and video traffic based on the proposed PRAAC method with the number of 40 users. The figure shows that there is a dramatic increase in the delay of CBR traffic when compared to Exponential traffic. This is due to the characteristics of CBR sources whose constant stream of packets cause traffic congestion. Further it can be observed that the video traffic also realizes unpredictable delay when compared to Exponential traffic. It is because of the bursty nature of video traffic and high storage space. As known H.264 has a complex process which is more susceptible to errors when compared to CBR VoIP and Exponential VoIP.

Fig 4 illustrates Fairness Index versus transmission rate for CBR, exponential and video traffic achieved by the proposed PRAAC method with the same fixed number of 40 users. From the figure it can be seen that when the

transmission rate increases the network experiences better fairness for the Exponential traffic when compared to CBR and Video traffic and also it depicts that the average throughput only reflects the long term fairness.

### Conclusion:-

In this paper, Priority based Fair Resource Allocation and admission control Technique (PRAAC) for Multi-class downlink Traffic in LTE-A networks is proposed. It includes a two level resource allocation scheme, wherein the first level a radio admission control (RAC) scheme is introduced. This RCA combines the complete sharing (CS) and virtual partitioning (VP) resource allocation models. Through this approach it is possible to achieve an enhanced Quality of Service (QoS) for multimedia services mainly in LTE downlink system. Simulation results show that the proposed technique PRAAC achieves better throughput for Video and the Exponential traffic performs well when compared to CBR traffics in all aspects.

#### Abstract

In the present study, an attempt has been made to distinguish and separated the true mangroves from mangrove associates. The characteristics chosen for true mangrove identification were presence of aerial roots, viviparous or crypto-viviparous embryo development, tidal dispersal of propagules, ability to form pure stands, absence of understory, highly efficient mechanisms for nutrient retention and physiological mechanisms to tolerate salt. The present investigation which was carried out between the periods from September 2014 to July 2016 had recorded a total 29 true mangrove species and 72 associate species from various regions of Bhitarkanika National Park. The recorded true mangroves belong to 11 families and 15 genera and the associates recorded from 39 family and 56 genera. Among the studied true mangrove families, Rhizophoraceae showed maximum richness both at species and generic level with 10 true mangrove species. The present study will solve the confusion about actual number of true mangrove species of Bhitarkanika Wildlife Sanctuary & Mangrove National Park (Odisha), India and will help for conservation of the endemic and diverse flora of this internationally important mangrove wetland.

#### Introduction:-

Mangroves are diverse group of trees and shrubs that flourish in flooded and saline habitats (Hogarth, 2015) and share a common ability to live in waterlogged saline soils subjected to regular tidal flooding (Kathiresan and Bingham, 2001). The mangrove habit is the complex of physiological adaptations enabling survival and success. The mangroves thrive in such environment where normal flora can't exist due to their highly specialized morphological and physiological adaptations; most striking adaptations are various forms of aerial root (Hogarth, 2015). Mangroves act as nutrient sinks and protect offshore ecosystems and often referred to as bio-shields or natural sea defense (Roy *et al.*, 2009). Mangroves are quite old, possibly arising just after the first angiosperms, around 114 million years ago (Duke, 1992). The mangrove ecosystems are widely recognized as providers of a wide variety of goods and services to people, including storm abatement, sediment trapping, land accretion, nutrient uptake & transformation and provision of a variety of plant and animal products (Badola and Hussain, 2003).

However, across the globe, the world's mangroves are threatened (Arunprasth and Gomarhinayagam, 2014; Rao *et al.*, 2015). The continued decline of the mangrove forests is due to conversion to agriculture, aquaculture, tourism, urban development and overexploitation (Alongi, 2002; Giri *et al.*, 2008; Latiff, 2012). Reduced mangrove area and health will increase the threat to human safety and shoreline development from coastal hazards such as erosion, flooding, storm waves and surges, and tsunamis (Danielsen *et al.*, 2005; Chaudhuri *et al.*, 2015).

Along the Orissa coast, mangroves are present on the Mahanadi delta & Brahmani- Baitarani delta between 86° 48' - 86° 58' E longitude and 20° 30' - 20° 50' N latitude (Nayak and Bahuguna, 2001). The mangrove area in Odisha is nearly 200 sq.km in extent and its degradation was placed at 20 sq.km over ten years, as percent estimates (Arunprasth and Gomarhinayagam, 2014). The Brahmani-Baitarani delta is enriched with rich mangrove genetic diversity and has been declared as the Bhitarkanika Wild Life Sanctuary (650 sq.km deltaic area of major rivers like Brahmani, Baitarani & the Dhamra, many creeks, mudflats and mangrove forests) in 1975 (Nayak and Bahuguna, 2001; Upadhyay and Mishra, 2008). The Bhitarkanika mangrove vegetation is very thick, difficult to penetrate and legally protected (SAC, 2012).

The 'true' or 'exclusive' mangroves are those that occur only in mangrove habitat (Santisuk, 1983; Tomlinson, 1986; Duke, 1992 and Giesen *et al.*, 2007) or only rarely elsewhere and the 'mangrove associates' or non-exclusive mangroves are those which comprise a large number of species typically occurring on the landward margin of the mangal and often the non-mangal habitats such as rainforest, salt marsh, peat swamp or low land fresh water swamps (Santisuk, 1983 and Hogarth, 2015). According to Tomlinson (1986), the following criteria are required for a species to be designated a "true or strict mangrove": complete fidelity to the mangrove environment, major role in the structure of the community and has the ability to form pure stands. The exclusive mangroves show the characteristics like aerial roots, viviparous or crypto-viviparous embryo development, tidal dispersal of propagules, absence of understory and growth rings, highly efficient mechanisms for nutrient retention and physiological mechanisms to tolerate salt (Alongi, 2009).

Adaptation to salt tolerance is of three types i.e., salt excluders, salt secretors and salt accumulators (Ong and Gong, 2013). The salt excluders are from the members of the genera like, *Rhizophora*, *Bruguiera* and *Ceriops* of the family Rhizophoraceae. The species in the genera *Acanthus*, *Aegialitis*, *Aegiceras* and *Avicennia* have salt-secreting glands on the leaf surface. The species like *Sonneratia*, *Xylocarpus* and *Excoecaria* are the salt accumulators. Various types of root adaptations of mangroves in the habitat are lenticels (*Bruguiera spp.*), pneumatophores (*Sonneratia spp.* & *Avicennia spp.*), knee roots (*Bruguiera spp.*), cable roots (*Avicennia spp.*), and stilt roots (*Rhizophora spp.*) (Ong and Gong, 2013).

A total 114 species of mangroves and associates were found in the world (Tomlinson, 1986) which includes 54 true mangroves found exclusively only in the mangrove habitats. But, Chapman (1975) described 11 families comprising of 55 species as true mangroves found exclusively in the mangrove swamps. Hogarth (2015) described occurrence of around 70 true mangrove species in 28 genera and belonging to 20 families. Giesen *et al.* (2007) described 52 species in Southeast Asian countries as true mangrove species which includes 42 trees and shrubs. Mangrove associates are usually not immersed by high tides. They comprise of herbs, ferns, creepers, vines, shrubs, trees and orchids and are mostly found in the landward margin (Giesen *et al.*, 2007). Wang *et al.* (2010) based on leaf trait and salt content classified the controversial mangrove species like *Acrostichum aureum*, *Acrostichum speciosum*, *Excoecaria agallocha*, *Heritiera littoralis* as mangrove associates, the species like *Acanthus ilicifolius*, *Acanthus ebracteatus*, *Xylocarpus granatum*, *Pemphis acidula* as true mangroves. Mangrove region of India constitutes major forests area with rich diversity of flora and fauna but with uneven distribution (Rajendran and Sanjeevi, 2004). The actual true mangrove species of India is a matter of controversy as there exists a difference in the definition of true species and the mangrove associates. Various taxonomists/authors have worked extensively on this topic yet there is no consensus on the agreement of true mangroves versus mangrove associates. Indian mangroves are diverse and variously estimated due to the addition of associate species, 82 species (Mandal and Naskar, 2008), about 125 species, comprising of 39 mangroves and 86 mangrove associates (Kathiresan, 2010). The review of Ragavan *et al.* (2016) on Indian mangroves showed 46 true mangroves which consists of 42 species and 4 natural hybrids. About 26 true mangrove species and 58 mangrove associates, giving a total of 84 species have been recorded from Sundarbans (Banerjee, 1998), while 24 pure mangroves are reported from Kerala (Mahandas, 2012).

The number of mangrove species of Bhitarkanika is varied in opinions and thought to be about 55 (Banerjee and Rao, 1990), 62-67 (Nayak and Bahuguna, 2001), 51 (Pattanaik *et al.*, 2007), 57 (Mandal and Naskar, 2008), 64

(Hussain and Badola, 2010). The Bhitarkanika NP with such diverse species of mangroves is considered as the third important mangrove habitat among the Indian mangals with respect to mangrove species diversity (SAC, 2012). The number of true mangrove species of Bhitarkanika NP is also varies, 28 (Hussain and Badola, 2010), 35 (Raghvan *et al.*, 2016). The flora of Bhitarkanika is typical of the Sundarbans (Barik and Chowdhury, 2014), and Indo-Malesian type (Banerjee and Rao, 1990).

The present investigation tried to give a detail mangrove species list of Bhitarkanika Wildlife Sanctuary & National Park, separated the true mangroves from associates based on the characteristic features like viviparous and crypto-viviparous seed germination, salt adaptation strategies, ability for tidal dispersal of propagules, root modifications like pneumatophores, stilt roots, buttress and knee roots, horizontal spreading roots & presence of lenticels, whether the species can form pure stand or not and formation of understory or not, etc.

### Study Area:-

The present study was carried out inside the mangrove forests which is a part of Bhitarkanika Wildlife Sanctuary and situated between 20° 30' to 20° 47' N latitude and 86° 39'E to 87° 04' E longitudes in Kendrapara district of Odisha along the east cost of India. It occupies an area of 672 sq km. Bhitarkanika mangrove ecosystem flourishes in the deltaic region, formed by the rich alluvial deposits of Brahmani, Baitarani & the Dhamra River.

**Map 1:-** Study sites of Bhitarkanika Wildlife Sanctuary & National Park (Odisha), India.

The river, Brahmani played major role for the establishment of mangrove forests. The river, Brahmani is branched one at Hansina bridge and another at Khola and both enters to Bhitarkanika Wildlife Sanctuary and National Park with different names. Both these river again meet at Gupti and one flows towards Ekakula and meets Bay of Bengal with the name of Pathasala river and Maipura river, the other flows towards Bhitarkanika and Dangmal forest blocks by the name of Bhitarkanika River.

## Materials and Methods:-

Intensive field study to different locations within Bhitarkanika National Park was carried out during, September-2014 to July-2016. The sites covered for data sampling were Dangmal, Bhitarkanika, Ragarapatia, Habelikhathi, Ekakula, Mahishamunda, Kalibhanjadiya island, Khola, Gupti, Orasahi, Satabhaya, Bagulidiya, Krishnapriyapur and other riverine sites which come under reserve forests of the Bhitarkanika National Park. The present mangrove species and associate flora of each forest sites were recorded, photographed and identified with available literature, Hains (1921-25), Saxena and Brahamam (1994-1996), Santisuk (1983), Tomlinson (1986), Banerjee and Rao (1990), Naskar (2004), Rajendran and Sanjeevi (2004), Selvam *et al.*, (2004), Singh and Odaki (2004), Spalding *et al.*, (2010), Panda *et al.*, (2013), Giesen *et al.*, (2007) and Roy *et al.*, (2009). The identified mangrove species are categorized into true or exclusive and mangrove associate as the characters used by Santisuk (1983), Tomlinson (1986), Hutchings and Saenger (1987), Duke (1992), Spalding *et al.*, (1997), Singh and Odaki (2004), Giesen *et al.*, (2007) and Wang *et al.*, (2010) with consideration of local physiological adaptations of these mangroves.

The species of contention for present classified true or associate mangroves were also justified by comparing the literature explained by different workers. A check list of mangrove species and their associates has been prepared for Bhitarkanika mangrove National Park.

## Results and Discussion:-

Present study recorded a total of 29 true mangrove species (Table 1 and Plate 1) and 72 mangrove associates from different reserve mangrove forest sites of the Bhitarkanika National Park (Table 2 and Plate 2). The classified true mangroves have adaptation mechanisms to resist the physiologically dry surrounding environment and they generally form pure stands in Bhitarkanika National Park.

### True or exclusive Mangroves:-

The recorded true mangroves belong to a total of 11 angiosperm family and 15 genera (Table 1 and Fig. 1). Highest number of true mangrove species were recorded from the family Rhizophoraceae i.e., 10 species. The family Meliaceae, Avicenniaceae and Sonneratiaceae were found to have 3 true mangrove species each. Another three family Acanthaceae, Arecaceae, Sterculiaceae were found to have 2 true mangrove species each. Single species of true mangrove were recorded from four families, i.e., Combretaceae, Euphorbiaceae, Plumbaginaceae and Myrcinaceae. The study also noted that the species *A.ilicifolius* L., *A.officinalis* L., *A.marina* (Forsk.) Vierh., *E.agallocha* L., *H.fomes* Buch-Ham., *H.littoralis* Dryand ex Ait., *P.paludosa* Roxb., *R.mucronata* Lamk., *C.decandra* (Griff.) Ding Hau, *K.candel* (L) Druce, *S.apetala* Buch.-Ham., *X.granatum* Koenig, as the frequently occurring true mangrove species of Bhitarkanika National Park. Other species showed site specific restricted distribution and rare type of occurrences. The species like *R.apiculata* Blume is restricted to Khola and Habelikhathi, *B.sexangula* (Lour.) Poir. and *B.gymnorhiza* (L.) Lamk. were recorded from forest blocks of Dangmal, Bhitarkanika, Khola and Krishnapriyapur sites, *C.tagal* (Perr.) C.B. Robinson was recorded from Ranahansua and Habelikhathi reserve forests. The species like, *R.stylosa* Griff., *A.corniculatum* (L.) Blanco, *A.alba* Blume were recorded as the riverine mangroves of Maipura river and its branch Angari at Satabhaya. The mangrove species, *L.racemosa* Willd. and *A.rotundifolia* Roxb. were only recorded from Kalibhanjadiya island, Habelikhathi and Ekakula reserve forest sites which are situated close to Bay of Bengal. *A.ebracteatus* Vahl. is of rare occurrence and recorded only from Ragrapatia and Khola reserve forests. *X.mekongensis* Pierre and *X.moluccensis* (Lamk.) Roem., mostly confined to Dangmal and Bhitarkanika forest blocks. *S.alba* J Smith was found at Ekakula and *S.caseolaris* (L.) Engler was recorded to occur at Khola jetty and as a riverine mangrove of Bhitarkanika and Maipura river. The recorded exclusive and true mangrove species were of three growth forms in habit (i.e., tree, shrub and herb). Out of 29 true species, 26 species were trees, 2 species were herbs, (*A.ilicifolius* L., and *A.ebracteatus* Vahl.) and one species (*P.paludosa* Roxb.) was recorded as shrub (Fig. 3). All the present listed true mangrove species showed their prominent morphological and physiological adaptations like presence of one or more type of aerial roots, ability to resist long term saline water inundation, all form pure stands and lack understory vegetation, most of them have viviparous or crypto-viviparous embryo development and the species of family Rhizophoraceae with long distance seed or propagule dispersal abilities.

### Associate mangroves:-

The mangrove associate flora study listed a total of 72 plant species which belongs to 39 families and 56 genera (Table 2 and Fig. 2). Highest number of species recorded from the families Fabaceae & Asclepiadaceae, i.e., 8 species each. The second highest numbers of mangrove associate species, (i.e., 5) were recorded from the family

Poaceae. Five families were found to bear 3 associate species each, i.e., Caesalpiniaceae, Salvadoraceae, Pandanaceae, Malvaceae and Chenopodiaceae. Another five families were found to bear 2 associate species each and these families were Pteridaceae, Verbenaceae, Amarylidaceae, Convolvulaceae and Aizoaceae. A total of 26 families were found to have one species each and these families were Acanthaceae, Meliaceae, Apoceanaceae, Bignoniaceae, Cyperaceae, Flagillariaceae, Colchicaceae, Boraginaceae, Rubiaceae, Anacardiaceae, Asteraceae, Rutaceae, Lythraceae, Celastraceae, Goodeniaceae, Solanaceae, Blechnaceae, Tamaricaceae, Combretaceae, Loranthaceae, Araceae, Ebenaceae Opuntiaceae, Tiliaceae, Leguminaceae and Euphorbiaceae (Table 2 and Fig. 3). The growth habit study of the recorded associate species resulted, Herb (20 spp.), Shrub (16 spp.), Tree (14 spp.), Climber (17 spp.), Fern (3 spp.), Creeper (2 spp.) (Fig. 4). All the recorded mangrove associates lack the adaptation characters to be a true mangrove and depend on true mangrove species for their own existence on this mangrove wetland. The comparison of growth habit of the recorded mangrove associates showed 58 species as non tree plants and generally found understory or hanging on the surface of true mangrove species.

Besides associate mangrove flora, Bhitarkanika Wildlife Sanctuary and National Park was found to host many non-mangroves of purely terrestrial angiosperms and cryptogams but present study excludes listing of them.

### Species of Contention:-

A total of 17 mangrove species were found to be in a position of controversy and various opinions exists whether they are true or mangrove associates (Table 3).
